FOREWORD

The EuroMed (European-Mediterranean) region has experienced rapid market environmental changes over recent years. The challenges and threats to academics, practitioners, researchers and governments of the region often have distinct differences to those experienced in other geographic areas in the world.

The EuroMed Research Business Institute (EMRBI) aims to contribute to and share the understanding of different business environments and trends in the region through research, teaching and consulting. It also seeks to provide an updated overview of the emerging business practices and stimulate and nourish dialogue in the countries of the region and neighbouring countries.

The purpose of the EuroMed Conference of the Academy of Business is to provide a unique international forum to facilitate the exchange of cutting-edge information through multidisciplinary presentations of new challenge in global business with special emphasis on European and Mediterranean countries.

All full papers and abstracts submitted to the Conference are subject to a peer reviewing process, using subject specialists selected because of their expert knowledge in the specific areas.

Academics, practitioners, and students at all levels throughout the world submitted original papers for conference presentation and for publication in this Reading Book. All papers and abstracts were refereed. The result of these efforts produced empirical, conceptual and methodological papers and abstracts involving all functional areas of business with a special focus on European and Mediterranean aspects.

ACKNOWLEDGEMENT

Many people and organizations are responsible for the successful outcome of the 2nd Annual EuroMed Conference of the EuroMed Academy of Business.

Special thanks go to the University of Nicosia in Cyprus and the College of Management Rishon Lezion in Israel for their constant support and contribution. Moreover, our appreciation goes to the University of Salerno for organising the Conference.

A successful conference could not be possible without the special co-operation and care of the Track Chairs and Reviewers for reviewing the many papers that were submitted to this conference. Special thanks to the Session Chairs and Paper Discussants for taking the extra time to make this conference a real success.

The last but not the least important acknowledgment goes to all those who submitted their work to be considered for presentation at the conference.

TABLE OF PAPERS

THE INTERNATIONAL STRATEGIC ALLIANCES BETWEEN EUROPEAN FIRMS AND THE FIRMS OF MEDITERRANEAN PARTNER COUNTRIES.....	22
<i>Aguiari, Roberto¹; Fredrica, Sist²</i>

THE INTERNATIONAL STRATEGIC ALLIANCES BETWEEN EUROPEAN FIRMS AND THE FIRMS OF MEDITERRANEAN PARTNER COUNTRIES

Aguiari, Roberto¹; Fredrica, Sist²

¹*Professor in business, Department of business and law, via Silvio d' Amico 77, 00145 Rome - Italy*

²*Researcher, Department of business and law, via Silvio d' Amico 77, 00145 Rome - Italy*

Purpose. The main aim of this paper is to present the result of the developing research on the trend of co-operations between European firms and firms of Mediterranean Partner Countries (Algeria Egypt, Israel, Jordan, Lebanon, Morocco, Occupied Palestinian Territories, Syria, Tunisia, Turkey), from 2004 to 2008. The firms form alliances, as international strategy, if the environment and rules support their cooperation. When the economy of the country of partner is not stable, firms prefer equity alliances. The assumption is that the market integration process increases the collaborations between the firms of involved countries. The trend of flows of direct investment, in which the international strategic alliances are accounted, supports the assumption. The research question is: 'Is the Barcellona (1995) process increasing the formation of international strategic alliances between European firms and firms of Mediterranean Partner Countries?'

Design/methodology/approach. The research is an exploratory study, which analyzes data of the annual reports of the observatory of European Commission (MIPO) of the agency (ANIMA) created by European Commission to support the cooperation between countries. The data-set is the collection of equity international strategic alliances between European firms and firms of Mediterranean Partner Countries, through manual cross checks of the list of flows of direct investment in Mediterranean Partner Countries, from 2004 to 2008. The statistical analysis is descriptive and it is composed by a comparison of the equity international strategic alliances (EISA) with the risk rank of countries, and by the breakdown of trends of EISAs in every MPC with the year of agreements and the value of funds received by European Commission.

Findings. The statistical analyses show that EISA from European countries in MPCs are not influenced in a strong way by the risk of the MPCs. In Turkey, Morocco, Tunisia and Israel the EISAs are increasing. Further evidence is still to be obtained in the next steps of analysis.

Research limitations/implications. The implications of results of this study suggest topics of research that should be more inquired in literature. The entrepreneurs will be informed on the characteristics of investments in Euro Mediterranean area, thus they will take choices in the future on their business.

Originality/value. This paper contributes to develop and to understand the trends and changes of dialogue between European and Mediterranean firms in Barcellona (1995) process. The institutions will look at the work to understand the effects of their actions on enterprises and which area they have to reinforce. The entrepreneurs and management involved in an internationalization process valuating the opportunity of forming EISA.

Keywords (n. 6): equity alliances, international strategies, Euro-Mediterranean cooperation, internationalization process, European firms;

INTRODUCTION

In 1995, the Barcelona Euro-Mediterranean Ministerial Conference established an Euro-Mediterranean partnership in order to turn the Mediterranean into a common area of peace, stability and prosperity through the reinforcement of political dialogue and security, an economic and financial partnership and a social, cultural and human partnership.

The aims of Economic and financial partnership are: a sustainable and balanced socio-economic development and an improvement of the living conditions of the populations, an increase in the employment level and the encouragement of regional cooperation and integration. The ways chosen to achieve the aims are:

- the progressive establishment of a free trade area between the EU countries and Mediterranean partner countries (MPCs);
- the implementation of appropriate economic cooperation and concerted action in the relevant areas;
- a substantial increase in the European Union's financial assistance to its partners.

The Euro-Mediterranean industrial cooperation needed a specific policy on firms, so in 2004, the industry ministers of MCPs adopted the Euro-Mediterranean Charter of Enterprise. The policy dimensions¹ of the Charter are the areas of private sector that have to be improved to accelerate the cooperation between the enterprises of MPCs and Europe.

The main aim of this paper is to present the result of a conceptual analysis of a research, financed by Italian Minister of University and Research², on the trend of co-operations between European firms and firms of Mediterranean Partner Countries (Algeria Egypt, Israel, Jordan, Lebanon, Morocco, Palestinian Authorities, Syria, Tunisia, Turkey), from 2004 to 2008. The enterprises follow alliances, as international strategy, if the environment and rules support their cooperation. When the economy of the country of partner is turbulent, firms prefer equity alliances. The assumption is that the market integration process increases the collaborations between the firms of involved countries. The trend of flows of direct investment, in which the international strategic alliances are accounted, supports the assumption. Investments from European countries in MPCs are among the 50% of the total in the 2008 and the more attractive countries are Morocco with 68% inflows and Turkey with 62%, from European firms.

The research question is: 'Is the Barcellona (1995) process increasing the formation of international strategic alliances between European firms and firms of Mediterranean Partner Countries?'

¹ The ten areas of the Charter 2004 are: 1. Simple procedures for enterprises, 2. Education and training for entrepreneurship, 3. Improved skills, Easier access to finance and investment-friendly taxation, 5. Better market access, 6. Innovative firms, 7. Strong business associations, 8. Quality business support schemes and services, 9. Strengthening Euro-Mediterranean networks and partnerships, 10. Clear and targeted information for enterprises.

² PRIN2007, the project is developed jointly with other Italian Universities and the title is "Religioni, democrazia economica e cooperazione nello spazio euro mediterraneo. Partenariato e "buone prassi".

The concept is that:

- some enterprises begin to invest in emerging economies, and then the institutions of their countries support them; this support creates the opportunities for others enterprises interested in forming equity international strategic alliances, that will grow and continue forming a virtuous loop;
- on the other side, the emerging countries value the cooperation between the firms as a good opportunity of their economies and promote agreements to develop cooperation.

Leonardi (1998) analyzed a particular kind of cooperative strategies in Europe during the integration market process, he found an increase of the number of international merger and acquisitions between enterprises of countries, involved in the process, after every action of the governmental institutions to implement the process. The collaboration between firms existed, after agreements the number increased.

The degree of market integration between European and Mediterranean Partner countries is lower than in Europe, however it shows that the cooperative strategies are influenced by the integration markets actions, so this study inquiries if the agreements influence the other kind of cooperative strategies (Faulkner & Derond, 2001): the equity international strategic alliances (joint venture and minority stakes acquisitions). Although it is a conceptual paper, the descriptive statistical analysis of data on phenomenon studied is included.

The data analysis is based on the annual reports of the observatory of European Commission (MIPO) of the agency (ANIMA) created by European Commission to support the cooperation between countries. The data-set is the manual collection of equity international strategic alliances, between European firms and firms of Mediterranean Partner Countries, from the lists of flows of direct investment in Mediterranean Partner Countries. The lists describe the investments announced from firms, from 2004 to 2008. The Statistical analysis is descriptive and its composed by a comparison of the equity international strategic alliances (EISA) formed with the risk of countries, and by the breakdown of EISA in every MPC, to understand if the agreements have an impact on EISA.

In the reports analyzed, the institutions assess the regional integration policy and the records of its agreements through the breakdown of some economics data. The analysis of FDI, import/export of countries and their determinant factors shows the impact of the acts on such values in the time.

The study is structured in three sections: the literature review on international strategic alliances and on the characteristics of the firms of MPCs, the analysis of equity international strategic alliances in MCPs and the conclusion.

This paper contributes to develop and to understand the trends and changes of collaborative strategies between European and Mediterranean firms in Barcellona (1995) process. Entrepreneurs and the managerial practice will benefit in their international strategic analysis, because this study offers a global view of the relationship between European countries and MPCs on strategic alliances. The institutions will look at the work to understand the effects of their actions on enterprises and which area they have to reinforce. The research development are discussed in the conclusions.

INTERNATIONAL STRATEGIC ALLIANCES

Strategic alliances can be done with foreign partners to achieve some benefits of a global strategy (Nielsen 2003). "International strategic alliances" (ISA) are defined as international inter-company cooperative arrangements (Urban and Vendemini 1992, Lu and Burton 1998). This kind of strategic alliance is defined as a business form of cooperation between two or more industrial corporations of different countries, whereby each partner seeks to augment its competences by combining its resources with those of the other partners (Jain 1987, Lu and Burton 1998). Alternatively ISA has been defined as any form of commercial activity across national boundaries involving two or more organizations. The feature of ISAs is the "long-term" cooperation between two or more independent firms headquartered in two (bi-national) or more (multinational) countries. ISAs are different from open-market transactions, that are minimal short-term cooperation and begin and end with the exchange of any economic good between two firms. No strategic alliances may increase efficiencies for both sides, but have little potential significance to the strategic positioning of either organization (Contractor and Lorange 1988). In this study the international strategic alliances are business forms of cooperation between two or more firms of different countries and the identity of partners is not lost.

The drivers of an ISA are based on a variety of theoretical perspectives including transaction cost, resource dependency, organizational learning and strategic positioning theories (Nielsen 2003). Collusion, entry deterrence, erosion of competitors' positions or other means of augmenting market power are the more frequent incentives to collaborate between enterprises (Peridis 1992).

When a firm decides to form an ISA it has to decide the form, the object, the country and partner. The three main alliance forms are: traditional joint ventures, minority equity alliances and non-equity alliances (Contractor and Lorange 1988). They are strategic if they don't make lose the identity to the firm, for example, acquisition is not a strategic alliance (Yoshino and Rangan 1995). Traditional joint ventures are alliances with two or more partners to create a new incorporated firm in which each has an equity position and representation in the board of directors: dependent joint ventures, dominant parent ventures, dominant parent ventures, split-control ventures and shared management ventures. Minority equity alliances are similar to non-equity alliances except that one parent has taken a minority equity position in the order: passive minority equity alliance and multiple-activity minority equity alliance. Non-equity alliances are agreements between partners to cooperate in some way, but they do not involve the creation of a new firm, nor does either partner purchase equity in other: trading alliance, coordinated-activity alliance, shared- activity alliances and multiple activity alliance (Contractor and Lorange 1988). When a firm explores new opportunities, it prefers equity alliances even if it obtains less financial flexibility relative to non-equity alliances because of the feature of enterprise and its environment (Ireland, Hitt and Webb, 2006).

The object of alliance varies with the phases of the value added chain and so co-operations are R&D contracts, joint R&D, joint production, joint marketing and promotion, enhanced supplier partnership, distribution agreements, and licensing agreements. (Yoshino and Rangan 1995, Das and Teng 2000).

The choice of partner depends on goal and object of ISA, where the partner is compliant or complementary to the personality of the firm (Casson and Mol 2005).

The choice of country is oriented to the emerging markets or to developed markets, investors continue to view emerging markets as the markets where investing and making alliances. In terms of the investment locations selected as the most attractive, four of the top five countries ranked by the percentage of responses from experts are in the developing world. China is considered the most attractive location by 85%. India's ranking has increased suddenly given that up until recently, direct investment flows have been modest at best (UNCTAD 2005).

THE ENTERPRISES IN THE MEDITERRANEAN PARTNER COUNTRIES (MPCs)

The economic structure is characterized by the lack of large private enterprises, instead the small-medium enterprises and micro family enterprises are an important share, in these countries (Gallina, 2004), where the hydro-carbon sector is more developed than the others. The weaknesses of enterprises in MPCs were several when the process has begun, however the countries are working to improve the way of doing business in their countries and to support their enterprises. The MPCs are supporting the developing of enterprises to improve the social-economic context. In such cases, the economies are characterized by high level of under-economy. The aim of MPCs is to attract more international investments, they know they need to reform the private sector of enterprises to make their enterprises able to cooperate with European enterprises.

The Barcellona process monitors the implementation of policies in the ten MPCs to improve private sector of enterprises to make the results converging.

The MPCs see the Charter, adopted in 2004, as a guide for the enterprise policy, so they are engaging in reforming the ten areas indicated in the charter: 1. simple procedures for enterprises, 2. education and training for entrepreneurship, 3. improved skills, 4. easier access to finance and investment-friendly taxation, 5. better market access, 6. innovative firms, 7. strong business associations, 8. quality business support schemes and services, 9. strengthening Euro-Mediterranean networks and partnerships, 10. clear and targeted information for enterprises.

The countries involved in the implementation of charter asked to be monitored. European Commission et al. wrote a Report, in 2006, on the weaknesses of countries in which they had to improve to converge with the Charter. In 2008, the European Commission et al. edited the second Report to assess the developing of reforms in MCPs, it shows that the policies of Countries converge with the Charter, anyway Egypt, Jordan, Morocco and Tunisia are moving more rapidly, Algeria and Syria reform is at first stage, Lebanon and Occupied Palestinian Territories have made less marked progress, instead Israel is comparable to the OECD economies.

The economies of Algeria and Syria are still largely dependent on the hydro-carbon sector while private enterprise remains underdeveloped, however they started to introduce elements of enterprise policy and to give to private enterprises a driving role in economic development. (Report 2008)

The programs developed by European commission to support the enterprise development for the implementation of the industrial cooperation facilitate the way of doing business. The main programs that should increase the EISA are SME Cooperation and the Support for private sector ventures. (Report 2006)

THE INTERNATIONAL STRATEGIC ALLIANCES WITH MPCs

The industrial cooperation is one of the aims of Barcelona process and it is possible if the economies of MPCs support their policy of developing enterprises and if the MPCs assure the political stability for the investors.

The statistical analysis, in this section, is the description of phenomenon and is developed in two steps. At first the breakdown of the EISAs, formed with MPCs firms by European and non-European firms, from 2004 to 2008, is combined with the country risk rank by country. The second analysis of EISAs is for each country of MPCs to see how they change year by year, in order to the agreements.

The EISA are included in the direct flows of investment in MPCs, that are monitored by the observatory of European Commission, to understand how much the agreements are efficient. The average of European flows of investment in MPCs are the 44% from 2004 to 2008, it means that the topic is relevant for economies of the geographic areas analyzed.

In 2008, the flows inwards versus MPCs from Europe is 47% of total flows received (Figure 1). The more attractive countries are Morocco, Turkey, Tunisia and Algeria; Egypt, Syria and Israel follow them with a lower share, Jordan and Lebanon have the lower share.

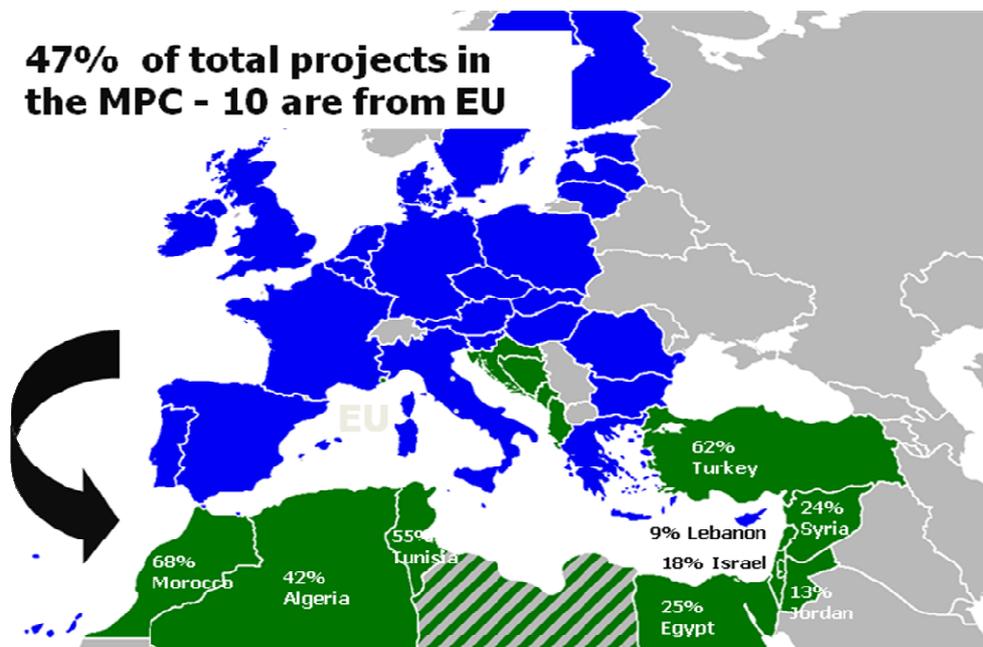

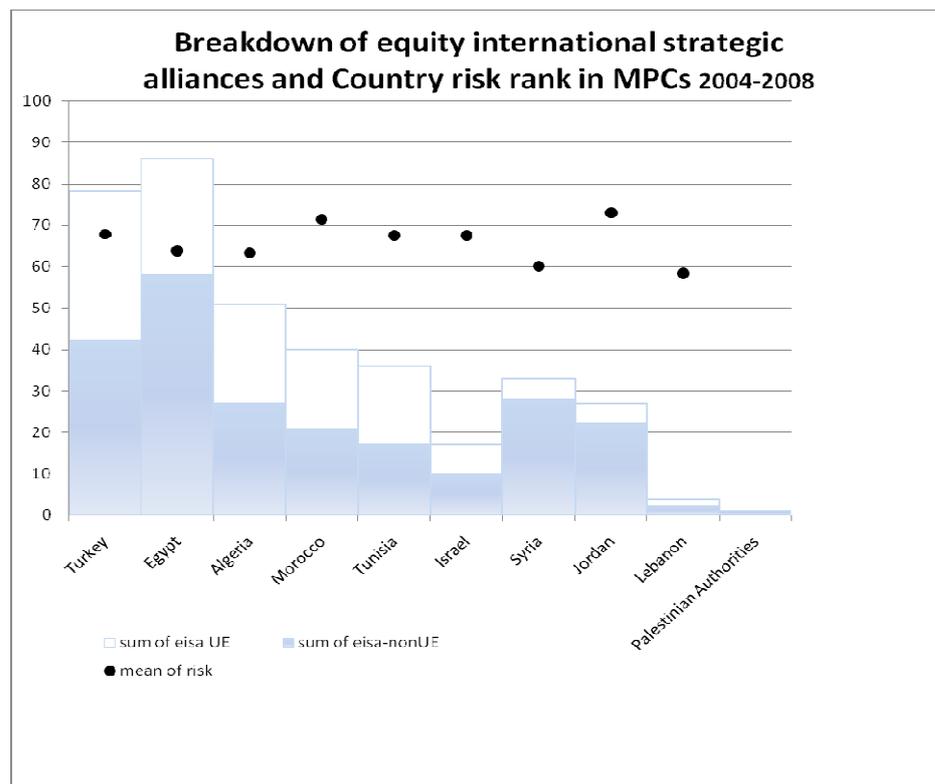

Figure 1 Share of EU-fdi in MPCs in 2008, Source: Elaboration of MIPO data

The investors can choose different kind of international investment in a foreign country. This study analyzes the joint ventures and minority acquisitions.

The graph 1 shows the number of equity international strategic alliances (EISA), from 2004 to 2008, for each country of MPCs by the European firms and the rest of the world. The risk rank³ had to explain the choice of the country of the partner. The 61% of total EISA formed, in these years, is between MPCs firms and European ones. The more attractive country for EISA is the Egypt, even if the share from Europe (n. 28 EISA) is less than the share from the rest of the world (n. 56 eisa no-Ue). Turkey, with 36 EISA, is the most attractive MPC for Europe. In these two countries, the risk explain the results, in fact Turkey, the country with lower risk, has higher number of EISA with Europe. It's not true for Algeria, Morocco and Tunisia. The number of EISA is higher in Algeria, that is riskier than Morocco and Tunisia.

Graph 1

³ The lower rank of risk show a high level of risk. Source: An Extract from International Country Risk Guide, Copyright, 1984-Present, The PRS Group, Inc.

<i>¹ For Syria, signature of the association agreement is awaiting a decision of the European Council. ² The agreement signed with Turkey in June 1995 was to establish the definite phase of the customs union, for which the original agreement dates back to 1964.</i>		

Figure 2

The year of ratification of Association agreements⁴, in MPCs, is different (Figure 2), so it's necessary the breakdown in every country by year.

Figure 2 shows which countries signed the Euro-Mediterranean Association Agreements and from when it is in force, if it's in force. The agreement with Lebanon is mainly concerned with non-political aspects of trade and cooperation between the parties. Syria is waiting for the decision of the European Commission Council. Turkey, Tunisia, Israel and Morocco are the first mover and also the countries with more EISAs. Algeria has a high number of EISAs, even if it has signed late the agreement.

⁴ "The European Union concluded seven Euro-Mediterranean Association Agreements between 1998 and 2005 with the Arab Republic of Egypt, the State of Israel, the Hashemite Kingdom of Jordan, the Republic of Lebanon, the Kingdom of Morocco, the Republic of Tunisia and the People's Democratic Republic of Algeria. These agreements provide a suitable framework for North-South political dialogue. They also serve as a basis for the gradual liberalization of trade in the Mediterranean area, and set out the conditions for economic, social and cultural cooperation between the EU and each partner country". http://europa.eu/legislation_summaries/external_relations/relations_with_third_countries/mediterranean_partner_countries/r14104_en.htm

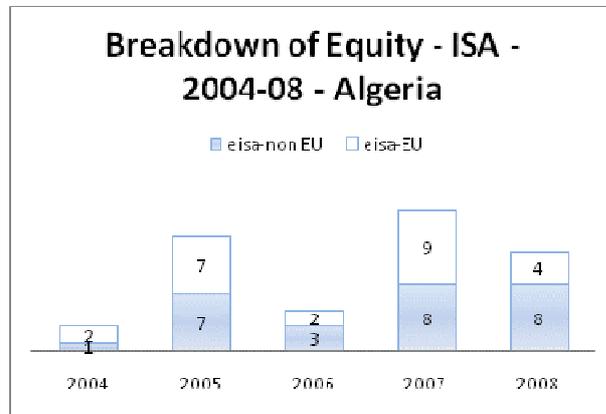

The behavior of firms can be explained by the amount of funds from the Facility for Euro-Mediterranean Finance Investment and Partnership program⁵ too.

<i>Countries</i>	<i>Finance contracts signed in the MPCs -Past 5 years in €</i>
<i>Egypt</i>	<i>1.833.343.440</i>
<i>Tunisia</i>	<i>1.497.950.000</i>
<i>Morocco</i>	<i>1.315.500.000</i>
<i>Syria</i>	<i>902.000.000</i>
<i>Lebanon</i>	<i>627.000.000</i>
<i>Israel</i>	<i>428.067.000</i>
<i>Jordan</i>	<i>186.918.138</i>
<i>Palestinean Authorities</i>	<i>55.000.000</i>
<i>Algeria</i>	<i>25.498.958</i>

Figure 3

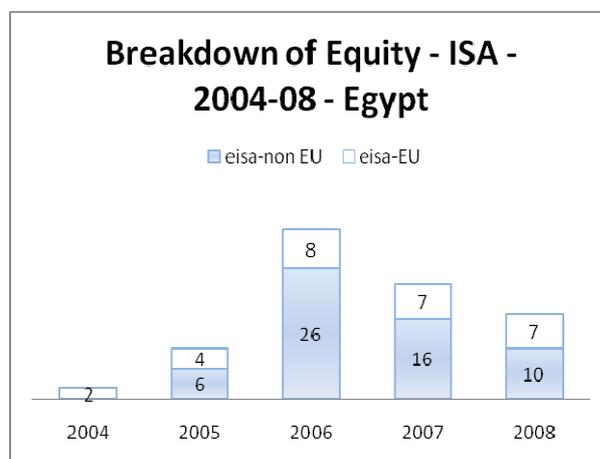

Algeria has n. 51 EISA, formed from 2004 to 2008, and the 47% with Europe. Every year the number of EISAs formed with EU and the rest of the world are among the same (graph 2), there is not a growing trend, but an up and down every year. This country signed the Euro-Mediterranean Association Agreements in 2002, and it is in force from 2005. Algeria received less funds from FEMIP Finance contracts signed in Mediterranean countries, in the past five years, of all MPCs, about 25.498.958 €.

⁵ <http://www.eib.org/projects/regions/med/> The Project Facility for Euro-Mediterranean Investment and Partnership (FEMIP) funds through Finance contracts signed in Mediterranean countries the MPCs. FEMIP brings together the whole range of services provided by the EIB to assist the economic development of the Mediterranean partner countries. Operational since October 2002, FEMIP is now a key player in the financial partnership between Europe and the Mediterranean, and has invested EUR 8.5bn between October 2002 and December 2008. As part of the European Neighbourhood Policy and of the Union for the Mediterranean, FEMIP encourages the modernization and opening-up of the economies of the Mediterranean partner countries. Activities are focused on two priority areas: support for the private sector and creating an investment-friendly environment.

Graph 2

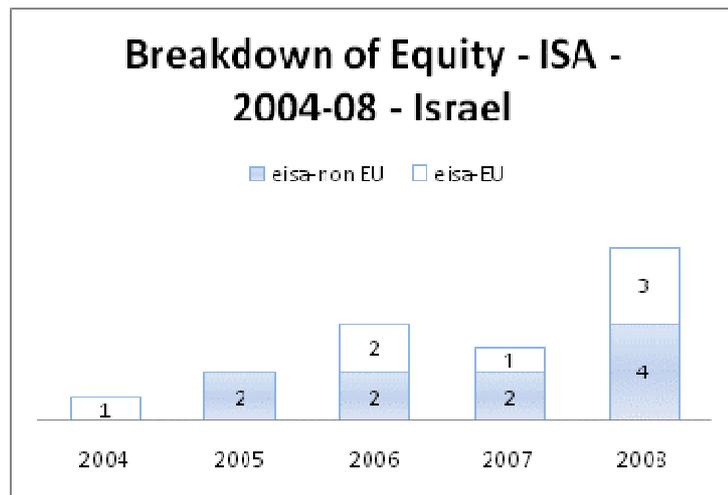

The Egypt has n. 86 EISA, formed from 2004 to 2008, and the 33% with Europe. This country is oriented to form EISAs with foreign countries, but the Europe is less attracted than the rest of the world. The trend is in decreasing (graph 3) after 2006 with the non European countries and is constant with Europe. Egypt signed the Euro-Mediterranean Association Agreements in 2001, and it is in force from 2004. Egypt is the second more attractive country of EISAs from Europe, and the country with more funds received from FEMIP Finance contracts signed in Mediterranean countries, in the past five years, of all MPCs, with 1.833.343.440 €.

Graph 3

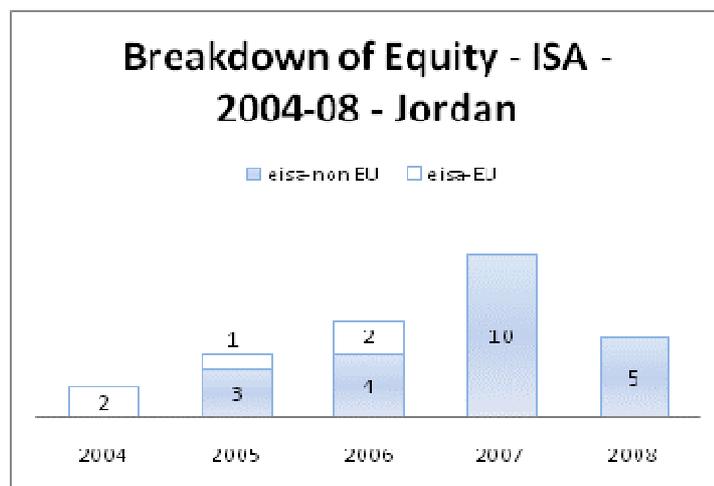

Israel has n. 17 EISA, formed from 2004 to 2008, and the 41% with Europe. The slowly growth of trend in forming EISAs (graph 4) shows that Israel is attracting foreign investments year by year and the share from Europe is increasing. Israel signed the Euro-Mediterranean Association Agreements in 1995 and it is in force from 2000. Israel is the sixth more attractive country of EISAs from Europe, and the also the sixth country for funds received from FEMIP Finance

contracts signed in Mediterranean countries, in the past five years, of all MPCs, with 428.067.000 €.

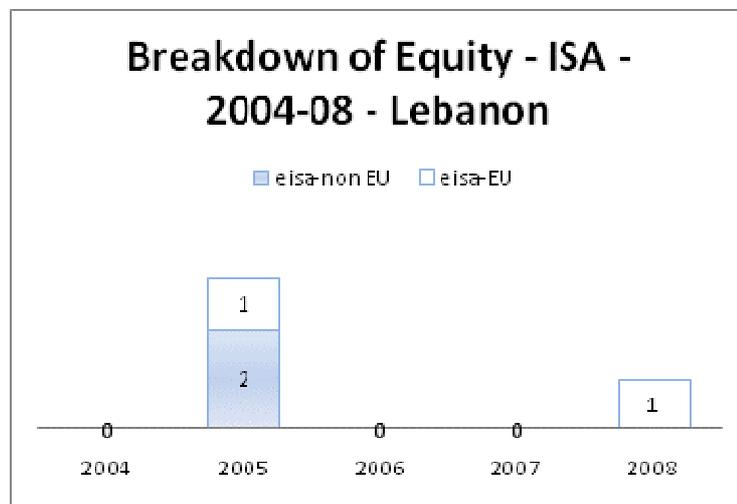

Graph 4

Jordan has n. 27 EISA, formed from 2004 to 2008, and the 19% with Europe. This country is oriented to form EISAs with foreign countries, but the share of Europe is decreased. The trend is in increasing (graph 5), except in 2008, that, however, is an year of crisis. Jordan signed the Euro-Mediterranean Association Agreements in 1997 and it is in force from 2002. Jordan is not attractive country for Europe to form EISAs, in last years, and is the seventh country for funds received from FEMIP Finance contracts signed in Mediterranean countries, in the past five years, of all MPCs, with 186.918.138 €.

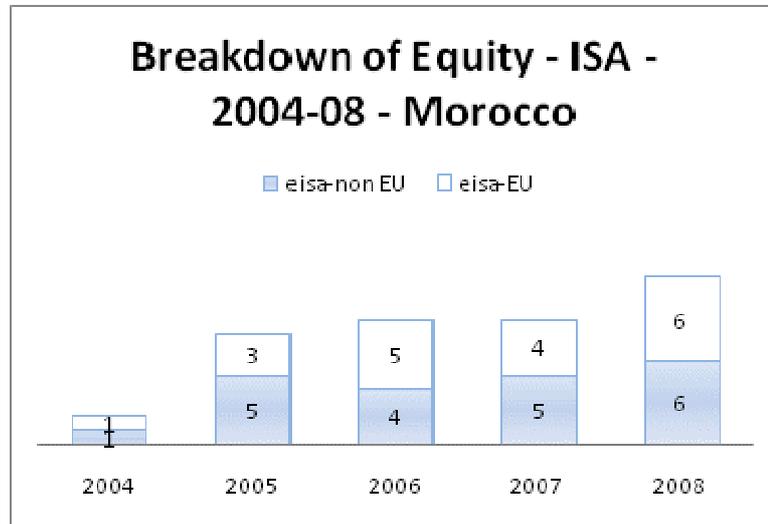

Graph 5

Lebanon has just n. 4 EISA, formed from 2004 to 2008, and the half is with Europe. This country is not oriented to form EISAs with foreign countries (graph 6). Lebanon signed the Euro-Mediterranean Association Agreements in 2002, and it is in force from 2006, and the agreement is limited on political aspects in cooperation. Lebanon is not a very attractive country for EISAs, but the agreement is enough late and is the fifth country for funds received from FEMIP Finance contracts signed in Mediterranean countries, in the past five years, of all MPCs, with 627.000.000 €, so it is interesting the evolution in next years.

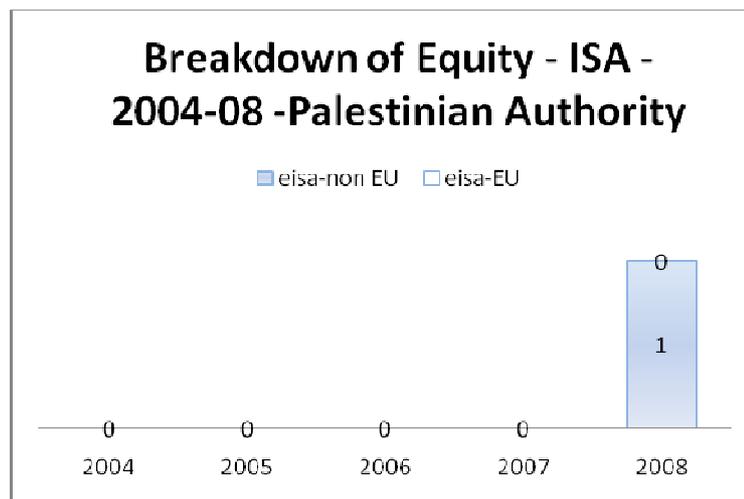

Graph 6

Morocco has n. 40 EISA, formed from 2004 to 2008, and the 48% with Europe. The clearer effect of agreements and financing is in Morocco. The growth trend in forming EISAs (graph 7) shows that Morocco is attractive and its policy is increasing, slowly, year by year the number of EISAs. This country signed the Euro-Mediterranean Association Agreements in 1996 and it is in force from 2000. Morocco is the third country for funds received from FEMIP Finance contracts signed in Mediterranean countries, in the past five years, of all MPCs, with 1.315.500.000 €.

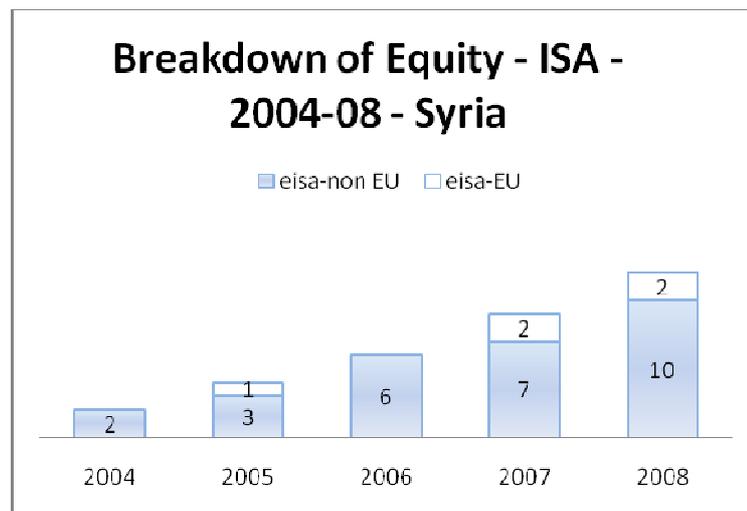

Graph 7

Palestinian Authority has only n. 1 EISA, formed from 2004 to 2008, with a non European country (graph 8). Palestinian Authority signed the Euro-Mediterranean Association Agreements in 1997 and it is in force from 1997. Palestinian Authority is not an attractive country for EISAs, even if the agreement is signed. The funds received from FEMIP Finance contracts signed in Mediterranean countries, in the past five years, of all MPCs, were 55.000.000 €.

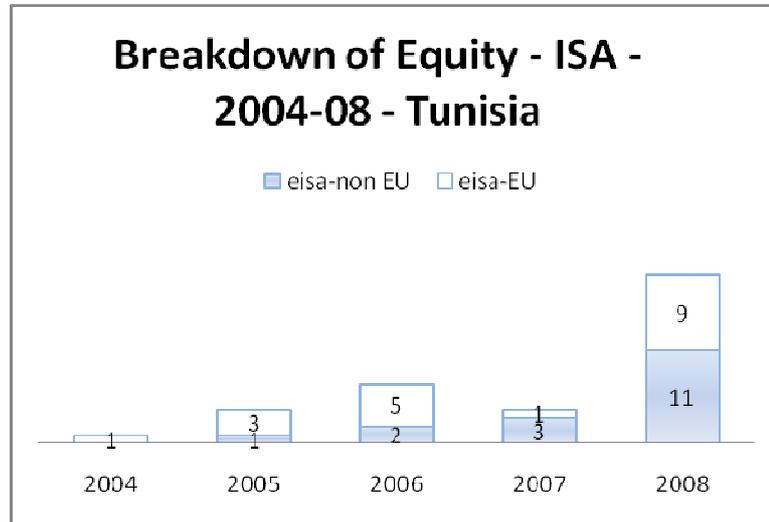

Graph 8

Syria has n. 32 EISA, formed from 2004 to 2008, and the 1,5 % with Europe. The slowly growth of trend in forming EISAs (graph 9) shows that Syria is attracting foreign investments year by year and the share with Europe is increasing, even if is low. Syria is waiting for the decision of European Commission Council to sign the Euro-Mediterranean Association Agreements. This country is the fourth one for funds received from FEMIP Finance contracts signed in Mediterranean countries, in the past five years, of all MPCs, with 902.000.000 €.

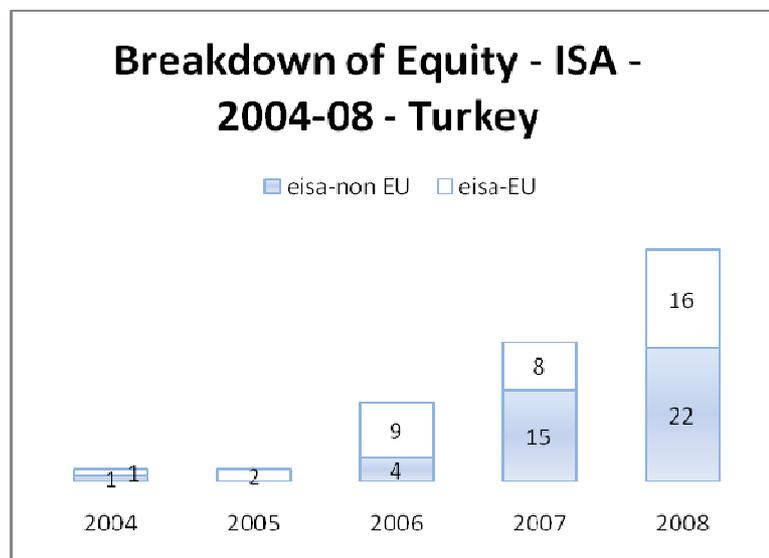

Graph 9

Tunisia has n. 36 EISA, formed from 2004 to 2008, and the 53% with Europe. The trend is a growth in forming EISAs (graph 10) shows that this country is attractive especially for Europe, despite the crisis, in the 2008 year, increased the EISAs in a significant number. Tunisia signed the Euro-Mediterranean Association Agreements in 1995, that it is in force from 1998. Tunisia is the second country for funds received from FEMIP Finance contracts signed in Mediterranean countries, in the past five years, of all MPCs, with 1.497.950.000 €.

Graph 10

Turkey has n. 78 EISAs, formed from 2004 to 2008, and the 46% with Europe. The growth is exponential and the proportion of share of EISAs with Europe is constant in the time. Turkey signed the Euro-Mediterranean Association Agreements in 1995, that it is in force from 1995. Turkey is not in the FEMIP Finance contracts program as a MPCs.

Graph 11

CONCLUSION

In most Mediterranean Partner Countries (not in Jordan), the share of EISAs with European countries is constant or is increasing, so the Process of Barcellona and the connected policies are supporting the formation of Equity international strategic alliances.

The concept is confirmed. In the geographic area studied, some European firms began to invest in MPCs countries, and then the governmental institutions of their countries support them creating the opportunities for others enterprises interested in forming equity international strategic alliances, that will grow in number. On the other side the MPCs are implementing the policies suggested by the European Commission to develop their economic structures.

EISAs are formed for a particular reason. The European firms form EISAs with MPC enterprises in a period in which the economic conditions of that country offer advantages in terms of resources. After reforms firms form an EISA to expand the market.

This approach is not only from institutional theory, because international entrepreneurship can be explained with several theories (the theory of transaction costs, resource-based view,...) and the success can be explain with the ability of firms to utilize internal resource (Zucchella, Scabini, 2007). The intent of authors is to understand the role of Institutions in forming EISAs in Barcellona Process.

The European firms form more EISAs with Turkey, Egypt and Algeria, and no evident correlation between the number of EISA and the country risk rank have been found. It's important to remember that the equity form of ISA is used in turbulent economies, so, in this case, where the countries are turbulent, the variable risk does not explain the different choice of countries. This result can suggest researchers to inquiry the relationship between the number of EISA and other variables as GDP, degree of economic freedom, ease of doing business and degree of trade openness.

The period analyzed is too short to generalize the effects of the agreements on the EISA in the market integration process. In fact the optimism of entrepreneurs after the agreement could conclude in a short time if the policies do not support the trend of growth with others actions.

The results are helpful for entrepreneurs and managers involved in international strategies and for European governmental institutions.

DOES BANK LENDING AFFECT OUTPUT? EVIDENCE FROM AN EMERGING MARKET

Al-Rjoub, Samer A.M.¹; Al-Rabbaie, Arqam²

¹Associate Professor of Finance, Department of Banking and Finance, Hashemite University, Zarqa 13133, Jordan

²Assistant Professor of Economics, Department of Economics, Hashemite University, Zarqa 13133, Jordan

Panel of bank-level data is aggregated to test whether changes in bank loan supply affect output through the monetary transmission mechanism. Money demand shocks, money supply shocks and loan supply shocks are used as instruments in the two-stage least square/IV procedure. Results shows that shock to loan supply have large and statistically significant effects on the supply of bank loans, but money demand and supply shocks have statistically insignificant effects on aggregate economic activity. Evidence presented in the article suggests that bank lending channel exist in Jordan and that the monetary policy appear to operate through a credit channel. Economists and policy makers can use monetary policy directly to constrain the ability of banks to make new loans, making credit less available to borrowers who are dependent on bank financing. Thus monetary policy can use credit channels as a source of fluctuations in economic activity. A credit channel exists in Jordan.

JEL Classification Numbers: E32, E41, E51

Keywords: Bank lending, Money demand and supply shocks, Loan supply shocks, Credit channel.

INTRODUCTION

A large literature in recent years has focused on credit markets as playing a critical role in the transmission of monetary policy actions to the real economy. In the bank lending channel view, banks play a particularly critical role in the transmission of monetary policy actions to the real economy and play a special role in the propagation of economic fluctuations (Brunner and Meltzer (1963), Bernanke (1983), Driscoll (2004), and revived more recently by Goddard et al. (2007)).

This study presents an empirical analysis of the role of banks in the monetary transmission process in Jordan, using aggregate bank data of thirteen banks for the period 1983-2001. The structure of loan supply in Jordan is suitable for providing empirical evidence on the role of banks in the monetary transmission process. There are many small firms (borrowers) which are bank-dependent, in the sense that they are unable to readily substitute other forms of finance for bank loans and in the sense that there is a lack of close substitute for deposit liabilities on the liability side of the banking sector's balance sheet. To this point a very low fraction of corporations and banks are allowed to issue debts through bond issuing in Jordan. This fact may due to the dominance of small size firms and low capital financial institutions in Jordan with the safety and soundness as the ultimate goal of the Central Bank of Jordan (CBJ). Jordan loan market can be described as heavily bank dependent with low elasticity of substitution between different forms of loans. By this Jordan economy stands as an excellent sample to test for credit channel and to examine the role played by banks in financial markets through the monetary transmission mechanism.

These characteristics give this study a peculiarity of constructing a modified macro-model and comparing the results with those of industrialized countries to see whether bank lending channel of monetary policy do exist in emerging markets.

The independence of bank as suggested in Kashyap and Stein (1994), Bernanke (1983), Driscoll (2004), and Peek and Rosengren (1995a) have three important consequences. First, banks serves as a lending channel for monetary policy through which the monetary transmission mechanism may work (the "lending channel" of monetary policy) as well as through the conventional interest-rate channel (the "money channel")⁶. Second, bank failures may help cause recessions (see for example Bernanke (1983) for a discussion of the role of bank failures in the Great Depression and Bernanke and Lown (1991) and Peek and Rosengren (1995a,b) for a discussion of the "credit/capital crunch" in the 1990-1991 recession in the united states). Third, bank regulatory actions may be a source of monetary policy innovations (shocks) potentially as important as other Federal Funds instruments (see Peek and Rosengren (1995a)). Peek and Rosengren (1995a) show that bank lending declines after imposing formal regulatory actions on banks.

Driscoll (2004) extend the work of the Bernanke and Blinder (1988) aggregate demand model of the lending channel to the case of a group of small open economies (the U.S. states) under fixed exchange rates. Driscoll introduce state-specific shocks to money demand in order to test for lending channels. He finds that shocks to money demand have large and statistically significant effects on the supply of bank loans, but small, often negative and statistically insignificant effects of loans on output.

Others like Kashyab and Stien (2000) examined the issue that the size and the liquidity of banks is a determinate of the bank lending reaction ; where small and less liquid banks react in their lending by more than do large more liquid banks while large banks are better able to neutralize monetary shocks than small banks (i.e. they react differently).

This paper extends both the aggregate demand model of Beranke and Blinder (1988) and the Driscoll (1999) model of state specific shocks to money supply and demand. Their model is applied and extended to assume that loan supply shocks (which might be caused by Basel accords I and II of loan rating and capital requirements) are also a candidate instrument in the model. This paper shows whether bank lending channel is valid for an emerging market economy.

Bernanke and Blinder (1988) provide a modified version of a traditional IS-LM framework into which they incorporate a bank-lending channel. Bonds and money are the only two financial assets and money is assumed to pay a zero nominal interest rate. Bernanke and Blinder modify this framework by distinguishing between money, bonds, and bank loans to determine

⁶ Policy actions that affect the reserve positions of banks will generate adjustments in interest rates and in the components of the banking sector's balance sheet. Traditional models of the monetary transmission mechanism focus on the impact of these interest-rate changes on money demand and on consumption and investment decisions by households and firms where certain borrowers so dependent on bank lending that any change in bank's willingness to lend immediately affect investment and spending decisions

the interest rates on bonds and loans and the level of output for a given price level, with equilibrium in the money market, bank loans market and aggregate demand-output equality.

In our model framework extension, this article assumes that regulatory-specific shocks in the money demand and supply of loans will lead to a regulatory-specific change to money supply and therefore to output through lending channel. And since by structure of the loan market in Jordan banks are not able to readily substitute for deposits and firms do not regard bank loans and bonds as perfect substitute, the two requirement of the lending channel exists.

The recent structural changes applied on the banking minimum capital requirements and the loan and customers rating may have a negative effect on the amount of loan extended to investors and prohibits investors with good investment ideas from being granted the loans, this may have a negative effect on banks profitability since they have to reduce default risk exposure by granting loans to those with high quality credit standards. These regulatory requirements or what are known now as the Basel accord II and I. This agreement will create shocks for both supply and demand of loans and hence output. According to Basel banks have to set their minimum capital requirement according to their country and bank rating and according to the risk-return profile of the market. Emerging countries such as Jordan are ranked to have high risk weights and hence capital which will lead eventually to limit loan supply offered by its banks (i.e. a shock). The rest of the paper is organized as follows. Section 2 describes data and set assumption and discusses the empirical strategy. Section 3 reports results while section 4 concludes.

DATA, ASSUMPTIONS AND EMPIRICAL STRATEGY

Annual data on total deposits and total loans in commercial and mutual savings banks are available for the Jordan Banks for 1980 to 2001 from the special banks annual bulletins and the Central Bank of Jordan monthly and annual statistical reports. The data on loans represent the book value of all commercial and industrial loans. The relevant measure of money for this model is those components of money, which affect the ability of banks to make loans. This consists of all bank deposits or M2 less currency and travelers' checks and M1 less currency. Following this line of literature Interest rates on these deposits were obtained by dividing the interest paid out on deposits by the quantity of deposits. GDP deflator is used to deflate nominal values for all variables. Since all data are demeaned from cross-sectional averages, in practice the deflator drops out. In what follows a list of the assumptions for the construction of the model is provided:

1. Jordan is a small open economy with many banks and firms that are in the phase of changing their structure and are exposed to external money demand and supply shocks.
2. Banks are changing their minimum capital requirements.
3. It is a modified version of a traditional IS-LM framework into which they incorporate a bank-lending channel.
4. Bonds and money are the only two financial assets.
5. Money is assumed to pay a zero nominal interest rate.

6. Money supply equal money demand.
7. Income is equal to expenditures on consumption, investment, government, and net exports.
8. Firms do not regard bank loans and bonds as perfect substitutes.
9. Banks do not regard loans and bonds as perfect substitutes.

The following is an extension of both Bernanke and Blinder (1988) and Driscoll (2004) aggregate demand model of the lending channel to the case of a group of small open economies under fixed exchange rate. This article assume that Jordan is a small open economy with many banks and firms that are in the phase of changing their structure and are exposed to external money demand and supply shocks. The followings are a detailed description of the model assumptions that are identical to those by previous studies:

By assumption the condition that money supply equal money demand is still exists and may be written as in the following:

$$m_t - p_t = \gamma y_t - (r_t - r_t^d) + \varepsilon_t \dots \dots \dots (1)$$

Where y_t is income (GDP) and r_t^d is the deposits interest rate, which may vary slightly across banks⁷, ε_t represents shocks to money demand.

Income is equal to aggregate expenditures, which is divided into consumption, investment, and government spending and net exports. Assume that government spending is exogenous, and net exports a function of the constant real exchange rate and possibly output.⁸ Investment will be a function of the interest rate on bonds, r_B and the interest rate on loans r_S . Firms do not regard loans and bonds as perfect substitutes.

$$y_t - p_t = -\theta r_{Bt} - \alpha r_{St} + \kappa_t \dots \dots \dots (2)$$

Where κ_t represents other unmodelled disturbances to aggregate demand (e.g. from fiscal policy or changes in tastes).

By structure of the loan market in Jordan banks are not able to readily substitute for deposits and firms do not regard bank loans and bonds as perfect substitute, and hence loans and bonds cannot be considered as perfect substitutes in the banks portfolio, where the supply of loans can be written as follows:

$$l_t^s = -\lambda r_{Bt} + \mu r_{St} + \beta(m_t - p_t) + \vartheta_t \dots \dots \dots (3)$$

Where ϑ_t represents shocks to loan supply (e.g. the new Basel accords I and II and any new structural changes in the banking sector).

⁷ This aspect is ignored in this research.

⁸ This assumption will not make difference in our study and hence whether exchange rate float or begged, shocks still exists.

Also, by structure of the loan market in Jordan, firms do not regard bank loans and bonds as perfect substitute, i.e., Loans and bonds are not perfect substitutes in the firm's portfolio, where the demand of loans can be written as follows:

$$l_t^d = \alpha_{Bt} r_{St} - \chi r_{St} + \omega y_t + v_t \dots \dots \dots (4)$$

Where v_t represents shocks to loan demand.

To solve the problem of separating the effects occurring through interest rates on loans and bonds and hence to determine the effects of monetary shocks on output through loans, the variables in equations (1) through (4) must be demeaned to eliminate liquidity preference channel. The demeaned equations are as follows:

$$\tilde{m}_t - \tilde{p}_t = \tilde{\gamma}_t + \delta \tilde{r}_t^d + \varepsilon_t \dots \dots \dots (5)$$

$$\tilde{y}_t - \tilde{p}_t = -\alpha \tilde{r}_{Bt} + \kappa_t \dots \dots \dots (6)$$

$$\tilde{l}_t^s = \mu \tilde{r}_{St} + \beta (\tilde{m}_t - \tilde{p}_t) + \vartheta_t \dots \dots \dots (7)$$

$$\tilde{l}_t^d = -\chi \tilde{r}_{St} + \omega \tilde{y}_t + v_t \dots \dots \dots (8)$$

As was indicated by Driscoll (2004) in order to test for the monetary effect on output one must use an instrument variable since OLS is biased. Least squares regression procedure will result in estimates that are inconsistent, while instrument variables estimation process will yield unbiased parameter estimates. This situation exists because there are new variables (instrument) which is highly correlated with the independent variable and at the same time uncorrelated with the error term in the least squares equation. Driscoll used the money demand shocks as one of the instruments, this paper extends by adding money supply and loan supply shocks as other instruments in estimation

To obtain money demand and supply shocks, equation 5 is estimated for the aggregate banking data. Both M1 and M2 adjusted are used. The reason for the adjustment rely on the fact that some of the components of M2 (i.e. M1 less currency) may not offer any monetary services, which may lead equation 1 to be miss-specified, furthermore a measure of money consisting of demand deposits and savings deposits (i.e. M2 less currency)⁹ is also used.

To estimate money demand shocks:

M2 less currency:

$$\tilde{m}_t - \tilde{p}_t = \tilde{\gamma}_t + \delta \tilde{r}_t^d + \varepsilon_t \dots \dots \dots (9)$$

M2 less currency:

$$\tilde{m}_t - \tilde{p}_t = \tilde{\gamma}_t + \delta \tilde{r}_t^d + \varepsilon_t \dots \dots \dots (10)$$

⁹ The authors deduct only the amount of currency in the hand of the public and ignored the amount of time deposits since the later is reported in the CBJ statistical bulletins as one amount combined with saving deposits. This will not affect the result severely.

To estimate money supply shocks:

M1 less currency:

$$\tilde{m}_t - \tilde{p}_t = \tilde{\gamma}_t + \delta \tilde{r}_t^s + \varepsilon_t \dots \dots \dots (11)$$

M2 less currency:

$$\tilde{m}_t - \tilde{p}_t = \tilde{\gamma}_t + \delta \tilde{r}_t^s + \varepsilon_t \dots \dots \dots (12)$$

Where \tilde{r}_t^s is the demeaned interest rate on loan calculated by dividing the interest rates received on loans by the quantity of loans.

The resulted estimated equations are as follows:

(i) money demand shocks:

M1 less currency:

$$\tilde{m}_t - \tilde{p}_t = -0.014 \tilde{y}_t - 11.21 \tilde{r}_t^d + \varepsilon_t \dots \dots \dots (9)'$$

T-statistic (-0.24) (-2.61) **

M2 less currency:

$$\tilde{m}_t - \tilde{p}_t = 0.647 \tilde{y}_t - 0.196 \tilde{r}_t^d + \varepsilon_t \dots \dots \dots (10)'$$

T-statistic (9.8)* (-0.04)

(ii) money supply shocks:

M1 less currency:

$$\tilde{m}_t - \tilde{p}_t = 0.119 \tilde{y}_t - 2.25 \tilde{r}_t^s + \varepsilon_t \dots \dots \dots (11)'$$

T-statistic (1.71) *** (-1.59)

M2 less currency:

$$\tilde{m}_t - \tilde{p}_t = 0.68 \tilde{y}_t - 0.62 \tilde{r}_t^s + \varepsilon_t \dots \dots \dots (12)'$$

T-statistic (6.91)* (-0.45)

In all the equations the interest rate coefficients are not statistically significant except for money demand equation using M1. This implies that loan rates in Jordan do not signal changes in money supply.

The coefficients of income are all positive and less than one in all the equations, this implies an inelastic income to any change in money. All the coefficients of income are significant except for equation (9)'. In what follows shocks from money demand and supply will be used in the two-stage least square/IV procedure.

RESULTS

Table 1 shows a positive and statistically significant correlation between output and lending. Lagged output at first and second lag has a positive effect of 0.345 and 0.438 respectively. A result supported by the fact that economic growth is cumulative and follows short cycles of certain momentum. Contemporaneous Loan also has positive effect of 0.109. Lagged loan exert no effect. Loan supply exerted by banks affects real economic activity. This result support the view that certain borrowers, such as small businesses, are very dependent on banks for financing and suggest that disruptions in bank credit could affect economic activity.

As said before one cannot conclude from this reduced form regression whether this relationship is due to loan supply and what the magnitude of this effect are in order to determine if the effect is small or large. In order to do so shocks to money supply and demand and loan supply are used as instrument for loan supply in the second stage regression. Table 2 presents the first stage regression of loans on output and the money demand; supply and loan supply shocks using all specification of money supply (M1 and M2 less currency).

Results from Table 2 shows that in the first-stage of the two-stage least squares/IV procedure, where loan is regresses on money demand, money supply, loan supply shocks, the coefficients on the money demand and supply shocks are statistically insignificant which imply that these shock are invalid instruments and will imply that loans will not respond to shocks to money demand or money supply. But as one learn from Table 2, when loan supply shock is used as a regressor, the coefficient on the loan supply shock is statistically significant which nominate it as a valid candidate instrument in the second stage square regression. Loan will respond to shocks to loan supply but not to money supply and demand shocks. This response indicates active lending channel of the monetary transmission mechanism.

Evidence presented in table 2 suggests that bank lending channel exist in Jordan and that the monetary policy appear to operate through a credit channel.

Monetary policy makers can directly use its instruments to constrain the ability of banks to make new loans, making credit less available to borrowers who are dependent on bank financing.

Table 3 reports the results of running the regression in table 1 but using loan supply shocks as instruments. The coefficients of loans are statistically significant at 10% level, and have the same sign. They suggest that increases in growth rate of loan supply lead to contemporaneous increase in income growth. If bank lending plays a central role in the monetary transmission then fluctuations in credit availability will be a source of fluctuations in economic activity, and this actually what does table 3 show.

CONCLUSION

This paper examines the link between monetary policy or regulatory actions and the equilibrium quantity of bank loans. This paper extends both the aggregate demand model of Beranke and Blinder (1988) and the Driscoll (2004) model of state specific shocks to money supply and demand. This paper assume that regulatory-specific shocks in the money demand, supply and supply of loans will lead to regulation-specific change to money supply and therefore change in output through lending channel. And since by the structure of the loan

market in Jordan, banks are not able to readily substitute for deposits and firms do not regard bank loans and bonds as perfect substitute, the two requirement of the lending channel exists.

A panel of bank-level data is used to test whether changes in bank loan supply affect output. Money demand, supply and loan supply shocks are used as instruments. Using these shocks as an instrumental variable, this paper finds that shocks to loan supply have large and statistically significant effects on the supply of bank loans. Loans have positive and statistically significant effects on output. They suggest that increases in growth rate of loan supply lead to contemporaneous increase in income growth.

Evidence presented in the article suggests that bank lending channel exist in Jordan and that the monetary policy appear to operate through a credit channel.

Economists and policy makers can use monetary policy directly to constrain the ability of banks to make new loans, making credit less available to borrowers who are dependent on bank financing. Thus monetary policy can use credit channels as a source of fluctuations in economic activity as a source of real business cycle.

Clearly, a lot more needs to be done in this area. Further research is expected to concentrate in two major venues. First, how banks can adjust the amount and terms of business lending when monetary policy is tightened, and second, other country studies are needed to be examined to test for bank lending channels and its contemporaneous affect on real activity to draw more general results on emerging markets as apposed to developed ones.

THE LEGISLATIVE DECREE 231/2001 ORGANISATIONAL MODEL: A POTENTIAL CONTROL TOOL FOR LOCAL PUBLIC GROUPS?

Alfiero, Simona¹; Secinaro, Silvana²

¹*University of Turin, ITALY*

²*University of Turin, ITALY*

Purpose – The purpose of the paper is to ascertain whether the implementation of an organisational model similar to the model defined in Legislative Decree 231/2001 may be a valid control tool for public companies which include other shareholding companies, defined as local public groups.

Design/methodology/approach – The paper is developed, through the tracing and study of all the documentation concerning the organisational models of the subsidiaries of Comune of Turin, taken as part of the sample and the relative subsidiaries: in particular the consolidated financial statements of the group and the financial year of the relative subsidiaries, the reports about corporate governance, the organisational models in 231/01 and the codes of ethics. The study of the abovementioned documentation has made it possible, partly through a deep analysis of the scientific contributions present on the subject, to develop a questionnaire/interview to submit to the parties who act as contacts on the board of directors of the groups sampled normally identified in the Internal Audit function.

Findings – The research highlights the need to adopt specific techniques and instruments that are suitable for identifying and analysing all risks that could concern the group of local public companies. It emerges in fact that Italian local public companies invest in systems to monitor performance and compliance, trying an integrated approach at group level. The objective is in fact the transversal and exhaustive nature of risk evaluation that leads to models of group organisation that are efficient and effective. Efficient, in such a way that the costs of managing the system are less than the benefits obtained in terms of risk coverage; effective in as much the organisational models integrated at group level increase the protection of the administrative and criminal accountability of the entire company group.

An unitary organisational model thus involves an integrated internal auditing system that must be well established inside the group of public local companies.

Originality/value – The paper constitutes a first attempt to examine *The Legislative Decree 231/2001 organisational model: a potential control tool for local public groups*.

Keywords: Local public group, Auditing, organizational model of Italian Legislative Decree 231/2001, public sector

Article Type: Research paper

Field of Research: Corporate Governance and Accountability, Auditing and Assurance

INTRODUCTION

In the past only a few of the major Italian companies spontaneously adopted selfregulatory tools such as codes of corporate conduct or codes of ethics. As a reaction to national corporate scandals such as those involving Cirio and Parmalat, things started to change as the need for corporate governance reforms was felt at the institutional as well as at the corporate level.

In particular the legislative, decree 231/2001 has introduced the culture of internal checks in companies as a prevention of offences, into Italy. The regulation imposes sanctions on companies as legal entities responsible for not having prevented its employees from committing offences in the interests of the company (offences against the public administration, IT offences, offences against safety in the work place, false declarations in the financial statements etc.). These are large monetary sanctions , the closing down of businesses in the case of recidivism, prohibition against dealing with the public administration as a precautionary measure. The law does not provide for a mechanism of credits or certifications for consulting firms that should support companies in the implementation of 231; on the contrary it requires companies to take part in the organisation and to produce paper documentation showing a mapping and reengineering of internal processes, integrating them with a system of operational risk prevention and control.

In this context the central place occupied by the subject of *governance*, or rather the collection of rules and mechanisms through which the equilibrium between the expectations and the contributions of the various parties involved in the life of the company is understood. (Airoldi, 1996).

Starting from a prospective of research focused on the analysis of the characteristics and the functioning of the boards of directors and the other organs of government within corporate groups, this paper proposes a framework for the analysis of the systems of governance, with the aim of highlighting similarities/differences and models of best practices to tend towards in the choices of governance adopted by the corporate groups, with particular attention to the implementation of the organisational model provided for by legislative decree 231/01 and the influences that the same may have on the regulation of infragroup relations.

LITERATURE REVIEW

The role attributed to corporate governance in recent decades has undergone significant evolution that is effectively summed up in the following definitions: [Governance is] “the process of supervision and control intended to ensure that the company’s management acts in accordance with *the interests of shareholders*” (“Cadbury Report. The Financial Aspects of Corporate Governance”, Financial Reporting Council, United Kingdom, 1992); “the governance role is not concerned with the running of the business of the company per se, but with giving *overall direction* to the enterprise, with *overseeing and controlling*, the executive actions of management and with satisfying legitimate expectations of accountability and regulation *by interests beyond the corporate boundaries*” (Tricker 1984).

Subsequently, with specific reference to the last ten years, the theme of *corporate governance* has been the subject of great interest by management studies and a great deal of research on the characteristics of boards of directors (Daily, Dalton e Cannella, 2003) and of the control bodies and the ways in which they function.

The function of control is not the only thing the Board of Directors is accountable for. The board in fact also represents a source for the company’s legitimisation towards the outside (Hillman *et al.* 2000), which might benefit from greater ease of access to the resources through the network activated by the individual board members. Other studies (Judge and Zeithaml,

1992; Stiles, 2001) underline the contribution of the board of directors to the strategic management of the company, i.e. its function of support and consultancy, that takes its form in the participation in the strategic decision making process and in active co-operation in the definition of company strategies.

The principles of governance in the public sector are the policies, processes and structures implemented by an organisation to direct and control its activities, attain its objectives, and protect the interests of different groups of stakeholders in an ethical manner (Puddu 2006).

In order to create local public groups, in which companies (public, private or mixed) are controlled by the local "municipality", three distinctive elements are necessary, as per the following:

- *a public economic entity*; even if this does not exclude an important role for "private" companies; in particular, the entity may be a single entity or made up of an alliance of municipalities or other local entities, that in terms of territorial and political characteristics, share the production means for public utility services:

- *a number of different types of legal entity*; bearing in mind that the specific nature of the public group is that it comprises companies of a private and public nature;

- *a single financial and strategic management team*, an aspect which is typical of any group of companies, but which in this specific case is accompanied by the peculiarity of financial and strategic decisions related to the public function of the local entity.

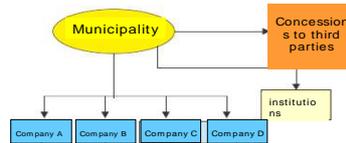

A) The Organisational Structure of the Group

The different needs and existing situations which are the basis of the creation of a local public group determine different configurations in organisational and managerial terms, which may be outlined and refer to the following three models:

- "traditional" groups;
- "mixed" groups;
- "empirical" groups.

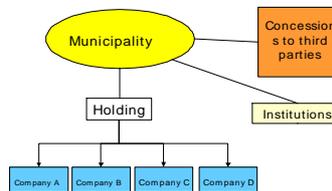

In the traditional model, the group is structured on two levels, with only one management and coordination centre where the municipality is a real holding. However, in this case there is the anomaly of a group of private companies, that work in different segments of a competitive market, that are subsidiaries of a parent company operating in accordance with the logic and administration timescales of the public sector.

Figure 1 : "Traditional" groups

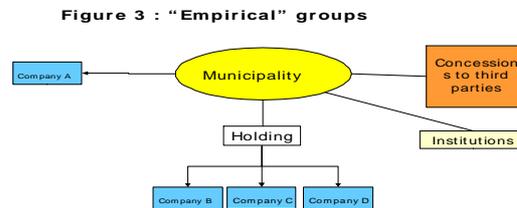

In the model which can be defined as being *mixed*, the municipality only reserves the right to act as the proprietor, while the holding has responsibility for coordination and management of subsidiaries. However, this approach is only applicable to companies limited by shares, the services provided remaining under the direct control of the entity through any other defined legal form.

Figure 2 : "Mixed" groups

In many cases groups are organising themselves as "empirical" structures, differentiating the logic of their structures not only on the basis of the type of service they provide, but also the different structures they wish the group's shareholding to take.

B) Control

The concept of control in accordance with article 2359 of the Italian Civil Code¹⁰ is not sufficient, since it would limit the units that need to be consolidated only to the companies limited by shares that the local entity has shares in.

The factors based on which it is possible to claim the existence of a control situation are the following:

- the identification of persons appointed to positions in the management organs of subsidiaries;
- a dominant influence when approving the main planning and control tools regarding corporate results;
- the ownership of voting rights that are sufficient to influence resolutions in the meetings of companies limited by shares, special companies and consortiums in which a number of local entities have shares.

The management aspect emerges along with the aspect of governance: the question is how control of the management of a municipality affects the management of the group, and whether or not the criteria used to prepare the balance sheets is uniform

The group member carries out an action with respect to the other members of the group which is variable due to the distance from the local organs set up for management purposes, the instruments employed in the exercising power of an economic nature as well as for the intensity and the direction of the influence exercised, with regard to the particular objectives to be pursued. In particular the instruments are influenced by the guidelines that mainly go through the corporate lines of governance defined by the organs, by the people involved and by the procedures that codify the guidelines into concrete managerial actions. It is scientifically and empirically proven that the corporate groups, by adopting mechanisms of communication and control that involve the management of the group, overcome the barriers placed by legal limits on individual units.

On the other hand, if we consider the better known “four dimensions of integration”¹¹, that summarise the motivational aspects correlated with the existence of a group, i.e. reciprocity, opportunism, expectations and faith, we notice that the sharing of the risk, the exchange of technologies, the rationalisation within the group have common bases of understanding for the development of the group itself (reciprocity). From another point of view, however, opportunism, according to which each subject tends to favour his own interests, it can create serious prejudices at the level of group co-ordination and expectations each entity places in the group and mutual trust. Opportunistic behaviour, regardless of the way in which it manifests itself, produces important consequences: it could induce the increase in the cost of a transaction between the companies with the risk of compromising any economy-of-scale-related benefits. The consequence is the increase in the costs of control since the companies are obliged to dedicate more energy to the monitoring of other people’s conduct. Furthermore the opportunism increases the risk of conflict while reducing the co-ordination of the group.

THE OBJECTIVE OF THE RESEARCH

The objective of the research is that of ascertaining whether the implementation of an organisational model similar to the model defined in Legislative Decree 231/2001 may be a valid control tool for public companies which include other shareholding companies, defined as local public groups.

METHODOLOGY OF THE RESEARCH

The analysis is developed, through the tracing and study of all the documentation concerning the organisational models of the subsidiaries of Comune of Turin, taken as part of the sample and the relative subsidiaries: in particular the consolidated financial statements of the group and the financial year of the relative subsidiaries, the reports about corporate governance, the organisational models in 231/01 and the codes of ethics

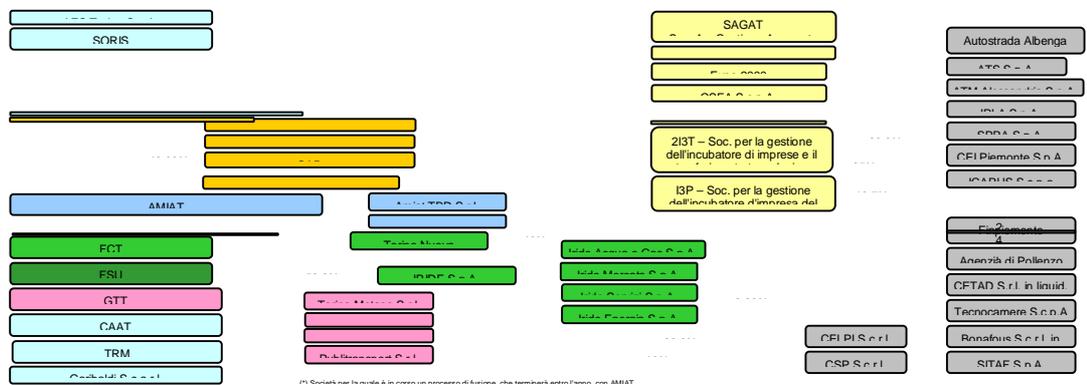

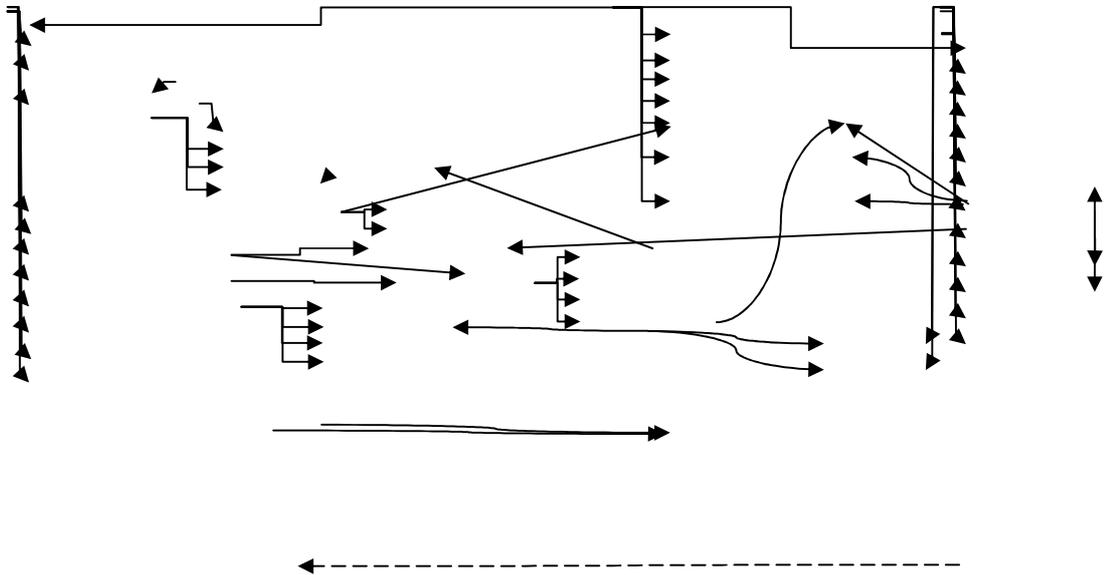

Figure 4: The sample

The study of the abovementioned documentation has made it possible, partly through a deep analysis of the scientific contributions present on the subject, to develop a questionnaire/interview to submit to the parties who act as contacts on the board of directors of the groups sampled normally identified in the Internal Audit function. The questionnaire aims at identifying and highlighting the governance-related decisions adopted by the subsidiaries of Comune of Turin, with particular attention to the organisational model provided for in legislative decree 231/01 and the influences the same may have on the regulation of subsidiaries of Comune of Turin, with regard to administrative accountability and interest of public stakeholders.

The questionnaire is organised into three sections:

- a. general information about the company ;
- b. corporate governance model;
- c. model of organisation, management and control pursuant to legislative decree n. 231/2001.

In particular the third section is structured into seven questions most of them closed:

1. Do you adopt the organisational model pursuant to legislative decree 231/2001? If not, you will?
2. Are the group's information systems uniform?
3. Is the same access to the group's information technology available to all and any of subsidiaries of Comune of Turin? Who is the party who regulates the operating procedures and the mechanisms of the group?
4. There is a responsible of the public infragroup control procedures?
5. Have you highlighted limitations and gaps in the organisational model pursuant to legislative decree 231/2001?
6. Has it been possible to highlight influences on the economic and financial situation of the individual company or the group following the implementation of the organisational model pursuant to legislative decree 231/2001?
7. If so, in what way?

100% of the sample answered the questionnaire making it possible for a sufficiently well organised analysis to be carried out.

From the questionnaire, it emerged that 88% of the companies belonging to the single groups examined adopt the organisational model 231/01

To the question regarding the possibility of regulating infragroup relations through the organisational model pursuant to legislative decree 231/2001 the answers were all the same except in one case. It, in fact, emerged how there are no clear and explicit references to

infragroup relations in the models adopted; in most of the cases, only the indication is given of the guidelines, very incomplete about the role the supervisory body should play with regard to the monitoring of a number of processes called sensitive and that involve more than one company in the group.

This gap was also indicated as a response to question eight that aimed at showing up the limitations encountered in the adoption of the said model.

Furthermore, the quality information emerging from the questionnaires relative to the institutional-, management- and governance-related aspects was later integrated with the quality information emerging from the analysis of the economical and financial documents of the reference group.

The reference sample, in 88% of cases, said it had homogenous information technology systems and certainly highlights the advantages, in economic and financial terms, in the adoption of the organisational model even if it is difficult to see.

DISCUSSION

The public sector is a typical example of a principal – representative relationship. Public entity managers – who carry out their duties as representatives of the principal – must periodically account for the manner in which they have used and managed resources to the principal, as well as to what extent the public's objectives have been achieved. An effective auditing function reduces the risks inherent in this kind of relationship. The principal relies on auditors for an independent and objective evaluation of the correctness of an agent's accounts, as well as information regarding the agent's use of resources in compliance with the wishes of the principal.

The necessity to have a third party attest to the credibility of financial reporting, profit or loss, and conformity and other criteria, is the result of many factors regarding the relationship between a principal and his agent:

1. Moral risks - conflict of interest: an agent may use resources and his authority to privilege his own interests, rather than those of the principal.
2. Distance: activities may be physically diverted from the direct supervision of a principal.
3. Complexity: a principal may not have all the necessary technical competences to control activities.
4. Consequences of errors: errors may be costly when agents manage large amounts of resources and are in charge of policies that affect citizens.

Since the success of a public administration is mainly measured by its ability to successfully provide services and carry out policies in a fair and appropriate manner, state audit functions must have the authority and competences necessary to evaluate whether public entities are carrying out their activities as planned, and if they are using their financial resources for the planned purposes in conformance with the requirements of laws and regulations. Audit activities based on verification answer the following questions: "Were policies implemented in

the same way as planned?" and "Are the managers implementing effective controls to minimise risks?".

Control activities must also be extended to companies with shares in public entities; their influence on public entities is almost always exercised with a more or less important presence on the Board of Directors.

Auditing supports the structure of governance by verifying the results of agencies and policies, in financial and operating terms, and also by examining compliance with regulations and the purpose of the organisation in question. Auditing activities also support accountability, ensuring access to information on results within and outside of organisations.

In fact, public managers are responsible for determining direction and defining objectives, evaluating risks and implementing effective controls in order to achieve objectives and prevent risks. In their role as controllers, public administration auditors evaluate and report on the results of these efforts.

The adoption of the organisational models pursuant to legislative decree 231/01 has the function of exempting the body that provides for its adoption from accountability in the commission of offences of fraud, bribery or corruption committed by its directors/employees.

And what if the company, part of a group of companies is responsible for an offence such as to involve the whole group? What are the protections of the group before the offences committed by the individual companies? Is the model pursuant to law 231/01 adopted by the single subsidiaries enough to protect the group?

There are offences for which the error of the individual involves the group. As an example it is sufficient to consider the offence of false declarations in the financial statements: if this is committed by a company in the group it follows that the reflections on the consolidated financial statements of the group are devastating. Who answers for it? In what way should the group be protected and the real culprits shown up? It is a complex mechanism of protection that must be identified in the interests of all the group's stakeholders.

The process of risk management and risk assessment must be based therefore on :

- identifying the risks of the group in relation to the offences of the subsidiaries that might be committed;
- in designing a preventative system of checking by the parent company, implemented through the construction of an adequate organisation system and the setting up of procedures for certain activities;
- in the adoption of a group code of ethics and a system of disciplinary sanctions that can be applied in the case that the measures provided for by the model are not complied with for the purpose of maintaining its effectiveness;
- in the identification of the criteria for choosing an internal control organisation equipped with the necessary functions that shall supervise the efficiency, the adequacy and the application of compliance with the model.

For the purposes of creating a risk management system, the aim is to divide the activities that pose a risk of offence for the group up into a series of procedures in order to prevent it being committed.

To activate a risk management system the company must therefore:

- map the company areas at risk
- determine the potential methods by which offenders can operate , in the areas specified above
- describe the system of controls activated and the adaptations for enhanced operation necessary.

In particular, it should be monitored the elements showing the involvement of the group can be broken down as follows:

- the systematic nature with which the people at the top of the company have had recourse to the instrument of corruption to win public contracts;
- the capacity of companies to create large availability of slush funds indispensable for being able to pay bribes to public functionaries able to influence the awarding of contract;
- the illegal management of the accounts of group companies with frequent and unjustified movement of capital between the various companies;
- the full agreement with the use of corruption by the reference shareholder;
- the serious, concrete and current danger of commissioning illicit acts of the same type as those for which proceedings are instituted.

The determination of the activities in the context of which offences might be committed presupposes an in-depth analysis of the company situation with the aim of establishing the areas that are involved in the potential cases of offence.

It is just as necessary to have an analysis of the possible ways of carrying out the said offences. This analysis must lead to an exhaustive representation of how offences can be committed with regard to the internal and external operating environment in which the company operates. In this analysis it will be necessary to take into account the history of the company – that is to say its past vicissitudes, even of a legal nature – and of the characteristics of the entities working in the same sector.

The analysis of the company's history and the corporate reality is essential for being able to determine offences that are easier to commit in the context of the company and the way they are committed. This analysis makes it possible to establish – on the basis of historical data – at which moment in the life and operations of the company risk factors are more likely to arise; what therefore are the moments in the life of the company that must more specifically be parcelled up and subject to procedures in order to be adequately and efficiently checked: for example the moment of the presentation of bids for the companies who take part in public appeals; the contacts with the competition; the methods of carrying out the contracts; the analysis of the attributes of external consultants (particularly concerning the their cost and effectiveness), the management of economic resources, the movements of money inside the group etc.

The guidelines developed by a number of associations representing companies suggest the separation of tasks between those who carry out crucial phases in the context of a process at risk, the attribution of authorising signatory powers and powers of signature coherent with the organisational and management responsibilities, the existence of a monitoring system that can indicate critical situations. It is also suggested in the specific sector of relations with the public administration, that a manager be appointed inside the company for each individual operation that falls into areas of risk, with the obligation to produce specific documentation for the activities carried out; the adoption of further internal control thresholds when being a member of a consortium or a temporary association of companies, the adoption of instruments aimed at checking the existence, not merely accounting, of the services carried out by consultants, the adoption of instruments and mechanisms that make the management of the financial resources transparent and that, in synthesis, prevent the creation – through the issue of invoices for non-existent operations, through unjustified movements of money between companies belonging to the same group, through payments for consultancy never actually supplied or if supplied, supplied at a value far below that declared by the company – hidden availability of cash. It is in fact evident that the committing of a wide variety of those offences that the compliance programs should try to impede presupposes the company's availability money that does not emerge from the official accounting and that therefore can be spent without any form of control.

The need for a group organisational model that clearly regulates the infragroup relations is clearly greater the faster the rate at which the risk is growing of offences being committed. But how must the risk be determined? Are there elements that can determine the level of criminal-administrative risk to which a group is subject?

To answer the questions referred to above, a set of variables must be taken into account that have a greater and an objective impact on the penal and administrative risk of the public holding:

- the number of subsidiaries in the group: the greater the number of subsidiaries in the group the greater the need for supervision of the infragroup actions;
- life cycle of the group: it is necessary to identify the phase of development in which the group finds itself, reconstructing the group's history
- analysis of the sector the group is part of: it is advisable to analyse the number of penal and administrative offences committed by the companies in the sector and compare them with the number of companies in the sector (the result can be called a judicial rating of the sector);
- the number of criminal – administrative priors the companies in the group have placing them in proportion to the number of companies in the group (judicial rating of the group).

The analysis of the four variables, that can be compared on the matrix leads to the determination of the group's degree of litigiousness and consequently the level of risk of being involved in administrative-penal offences pursuant to law 231/2001.

CONCLUSION

The research highlights the need to adopt specific techniques and instruments that are suitable for identifying and analysing all risks that could concern the group of local public companies.

It emerges in fact that Italian local public companies invest in systems to monitor performance and compliance, trying an integrated approach at group level. The objective is in fact the transversal and exhaustive nature of risk evaluation that leads to models of group organisation that are efficient and effective. Efficient, in such a way that the costs of managing the system are less than the benefits obtained in terms of risk coverage; effective in as much the organisational models integrated at group level increase the protection of the administrative and criminal accountability of the entire company group.

An unitary organisational model thus involves an integrated internal auditing system that must be well established inside the group of companies.

Furthermore, it becomes necessary for the public local group will have to entrust itself to an autonomous body of the company, imbued with its own powers of initiative and checking, the task of supervising the functioning and observing of the model and ensure it is updated.

With regard to this control organism this body may not be identified within the Board of Directors or group of directors without proxies; the solution proposed is that of entrusting such a task to the Internal Auditing function of the parent company. In companies of medium to large scale quoted or otherwise, the institution of this function that is an independent and objective activity of "assurance" and consultancy aimed at the improvement of the efficiency and effectiveness of the organisation.

ENDNOTES

1. C.c. 2359. Subsidiaries and affiliated companies.

The following are considered subsidiaries:

- 1) companies in which another company has the majority votes in ordinary meetings;
- 2) companies in which another company has enough votes to be a dominant influence in ordinary meetings;
- 3) companies that are subject to the dominant influence of another company because of particular contractual obligations.

For the purpose of applying numbers 1) and 2) of the first paragraph the votes that subsidiaries, trust companies and interposed persons are entitled to are also included: votes to which third parties are entitled are not included.

Companies in relation to which another company exercises a notable influence are considered affiliates. The influence is assumed to be applicable when at least a fifth of the votes, or a tenth if the company limited by shares is listed in the stock exchange, can be cast in ordinary meetings.

2. The four dimensions of integration have been theorised by A. Parche, in "Messy" research, mythological predisposition and theory development in international joint ventures, in *Academy of Management Review* 1980.

The aim of this paper is to investigate theoretical concepts and empirical evidence related to the effects of public subsidies on enterprises. Our findings on the performance of firms receiving public aids have been provided by means of a comparative analysis of the financial and economic situation of the selected firms considering two different points in time: before and after receiving the subsidy. The effects on investments, growth, efficiency, risks and profitability variables have been investigated.

Key Words: *Government subsidies; Efficiency; Financial performance; Empirical analysis.*

INTRODUCTION

In recent years, the importance of business incentive policies as economic development tools has been increasing throughout the world and a huge number of contributions have been proposed in the literature.

Although the usefulness of business subsidies was largely debated, there is no agreement on the effectiveness of investment incentives. On the one side there are those who are in favour of public aids to companies (Meyer-Stamer, 1996), while on the other side there are those who believe that public policies lead to inefficiencies in the economic system (Sakano and Obeng, 1997).

The objectives of public aids might include the need to improve the access of small and medium sized enterprises to obtain loans, to encourage new start-ups', to promote the adoption of new technologies or to enhance economical development in some geographical areas or sectors of the economy (Girma *et al.* 2003).

This range of objectives justifies the adoption of different methodological approaches as well as a variety of indicators for measuring effectiveness in studying the outcome of public subsidies.

The crucial issue is the evaluation of the effects on the performance of a certain number of firms who have received public grants. The literature on the topic is a well studied problem in both econometrics and statistics (Ashenfelter, 1978; Manski, 1990; Heckman and Robb, 1985; Rubin, 1973).

Among the different methods and techniques, the most used in the study of public subsidies efficiency refers to: sensitivity analyses (Rosenbaum and Rubin, 1983; Rosenbaum, 1995), instrumental variables (Angrist *et al.*, 1996; Imbens and Angrist (1994), difference-in-differences

(Heckman *et al.*, 1997), regression discontinuity design (Lee, 2001; Imbens and Lemieux, 2008). A recent review on the topics is Imbens and Wooldridge (2008).

Despite of the importance of causal effects of business incentives programs or policies, significant issues in the empirical evaluation still remain unsolved. The development of a proper evaluation system may be influenced by the availability of financial and economic information, the selection of a significant sample of assisted firms, the construction of a valid control group.

Furthermore, due to the difficulties related to the collection and storage of financial data, researchers have tended to restrict the extension of their analysis according to the data availability.

Within this framework, the aim of the present study is to explain the causal links from incentives to private firms and their performances in an economic and financial perspective. With this purpose, we analyse financial statements data of a sample of subsidized and non-subsidized firms which belong to a specific geographic area and a specific sector of activity.

In particular, focusing our attention on the grants distributed by the Law 488/1992, we limit the analysis to the touristic firms in the Campania region, one of the region in which this law intended to stimulate investments.

Our research, starting from a critical analysis of the financial statement data, aims to combine the typical financial analysis perspective with the quantitative analysis for the performance evaluation.

RESEARCH FOCUS AND RESEARCH QUESTIONS

There are different notions of subsidies provided by supranational (like the EU), national or local governments; in this research, we adopt a narrow concept, which include only monetary grants (excluding soft-loan, loan guarantee, tax break and so on), more specifically subsidies which take the form of project-related capital grants.

As previously mentioned, we have focused on the Law 488/1992. It has been the main policy instrument in the last years to enhance private investments with the further aim of downgrading gaps among the different geographical areas in Italy. Under this law, significant amounts of public money have been spent to stimulate investments¹² (Bronzini and De Blasio, 2006) in areas designated as Objective 1, 2 or 5b for the purpose of EU Structural Funds (together with some areas that do not qualify for Structural Fund support but which have been approved by the EC under Article 92(3)c). The investment projects covered by the Law 488 are:

- i) Setting-up;
- ii) Extension (projects that increase the capacity of the firm to produce its existing products or introduce new products);
- iii) Modernization (investments in innovation that increase productivity);
- iv) Restructuring (reorganization and technological renewals);

¹² From 1996 to 2003, the funds distributed to industrial enterprises amounted to €16 billion and involved 27,846 projects, mainly in the southern regions.

- v) Reconversion (adaptation of existing production facilities in order to manufacture different products);
- vi) Reactivation (takeover of unused production facilities by persons who had previously been involved in the management of the firm); and
- vii) Relocation (eligible only in cases where a transfer of the production facility is required by national or local authorities).

The ex-post impact of the law 488 have been investigated by a few authors in recent years (Pellegrini and Carlucci 2003; Pellegrini and Centra, 2006; Bronzini and De Blasio, 2006). Most contributions refer to a non specifically selected sample and the whole geographical extension of the program. In the same context, Gabriele *et al.* (2006) analyse the impact of public aids on a specific region (Trentino), highlighting the local effect of the additional investments.

We are interested in evaluating the impact of public grants related to the Law 488 in the south of Italy and specifically in the Campania region.

Our aim is to explain the causal links between incentives distributed to firms and their performances. The main research questions are:

1. Who are the firms that obtain public grants?
2. When a firm obtains public grants, what are the effects on its performance?
3. How these effects can be measured? What kind of tools should you adopt? And what indicators should you calculate?

To assess this points, we adopt an approach based on the financial statements analysis as a starting point of further empirical investigation.

National and international literature has largely debated the importance and the characteristics of financial statement analysis and there are different opinions about the capability of this approach to provide a clear picture of the status of a company (Anthony, 1966, p. 339 e ss.; Bernstein and Wild, 1993; Coda et al., 1974; Foster, 1978, p. 28 e ss.; Finnerty, 1986, p. 21 e ss., Helfert, 2000; Weston and Copeland, 1992, p. 190 e ss.).

Generally speaking, financial statements are the lens of a business, drawing a picture of a firm by translating economic factors into accounting numbers (Penmann, 2003, 17). Financial statement analysis focuses on different features of this business, organising the financial statements in a suitable way ¹³.

In more specific terms, financial statement analysis is based on different ratios, investigating the relationships among them, which highlight some aspects of the performance of a firm (Caramiello *et al.*, 2003, p. 10). This approach is also used in comparative analyses which put side by side financial statements of different firms in order to a better understanding of the economic and financial conditions of a specific company.

¹³ The accuracy of the analysis is related to the transparency and reliability of the financial statement data (Massari, 1983, 369).

Obviously, different methodologies can be used. In this paper, we adopt an approach that, even if it is mainly based on quantitative variables, it does not sacrifice the end product of the investigation. In fact, we implement a model (Coda, 1990), which has a great diffusion in Italian literature, based on four features of the business:

- Solidity;
- Profitability;
- Liquidity;
- Growth.

Using this model, it is possible to select a suitable set of financial ratios which are meaningful to the healthy ongoing of the firm, by analyzing growth, efficiency, risks, profitability and solvency of firms.

DATA COLLECTION AND EMPIRICAL ANALYSIS

Following the main finding of the empirical literature, we perform an analysis on a sample of subsidized and non-subsidized firms in order to evaluate the impact of business grants on the firms' financial and economic performance and to characterize the major differences between the two groups.

We refer to the touristic firms which have obtained subsidies under the provision of the Law 488/92 in 2002 (15th) in the Campania region.

As many authors have highlighted in different contexts related to the evaluation of financial performance (McDonald and Morris 1984, McGurr and Devaney 1998), the analysis of a specific sector of activity leads to better results compared to those obtained from a sample selected from different sectors. Therefore, in order to achieve a homogeneous sample, we restrict our analysis to the touristic sector focusing on limited companies. The choice of the touristic sector is supported by the recent interest of the local and regional authorities on its development as confirmed by different policies implemented in the last few years.

With the purpose of carrying out a comparative analysis, we consider a balanced approach choosing, for each subsidized firm, a firm that had not received subsidies but are similar in all other relevant aspects (Bergström, 2000).

We chose the year 2002 as a reference period, t , and collected financial statements one year before receiving the subsidy ($t-1$) and 4 years after (at $t+1$, $t+2$, $t+3$, $t+4$)¹⁴. Those firms that were placed under any kinds of insolvency procedures (such as bankruptcy composition with creditors, receiverships, extraordinary administration, winding-up etc.) in time $t+1$ to $t+4$ have not been included in the sample. The financial statement data for the selected firms were collected from the Infocamere database and from the AIDA database of Bureau Van Dijk (BVD).

¹⁴ Time horizon to be considered have been debated in the empirical literature; a common choice is to refer to a period of 3-4 years (Roper and Hewitt-Dundas, 2001; Venetoklis, 2000).

208 firms, belonging to the touristic sector, were included in the Law 488/92 receiving capital grants in Campania for the year 2002. Among them, we consider those companies that gained a grant greater than 100.000 euro not including 37 firms that received a lower amount.

The information provided by the financial statement of each selected firm in the period 2001-2006, will be elaborated following the financial analysis approach. This may require a preliminary revision of financial statements to allow a comparative analysis.

Generally speaking, consistency is one of the most important principles which firms have to respect in preparing their financial statements. However, in our specific case, this principle has a great importance, because Italian accounting standard n. 16 (OIC, 2005; see also IASB, IAS 20) suggests two different accounting criteria:

1. a grant relating to assets may be presented as deferred income;
2. a grant related to assets may be presented by deducting the grant from the asset's carrying amount.

Because firms, which have obtained grants under the Law 488, have adopted both methods, a preliminary revision is needed.

In the first step of our study, we perform a preliminary analysis on the data-set of the financial indicators in order to describe the main characteristics of the selected firms and investigate the behaviour of the financial indicators in the two different groups of subsidized and non-subsidized firms. In particular, we compare the initial situation of the firms, one year before the time period of receiving the subsidy and the final situation four years after receiving the aid.

This univariate preliminary analysis allows us to describe the behaviour of each indicator without taking into account the interrelations among them. A multivariate approach will also be considered in order to evaluate the overall financial performance.

The empirical results of the quantitative analysis, jointly with a judgmental process on qualitative consideration (theoretical finding on the economic effects of public aids, financial issues etc.), provide a selection of those indicators that discriminate the performance between treated and non-treated units.

In a second step of the study, a micro-econometric model will be considered in order to evaluate and compare the performance of the subsidized and non-subsidized firms.

⁴Researcher of Accounting, Department of Management Research, University of Salerno, Via Ponte don Melillo snc – Fisciano (SA), Italy

The aim of this paper is to investigate several aspects of bankruptcy prediction within both theoretical and empirical frameworks. In particular, we are interested in analysing the predictability of default risk for industrial firms throughout the Campania region.

Multivariate classification techniques were applied to a data-set of financial statements of a balanced sample of failed and healthy industrial enterprises for a given time period. The empirical findings on the predictive power of financial ratios aim to contribute to the elaboration of efficient prevention and recovery strategies in the area of interest.

Key Words: Bankruptcy, financial ratios, forecasting failure, multivariate analysis.

INTRODUCTION

Business failure is one of the most investigated topics within corporate finance and the empirical approach to bankruptcy prediction has recently gained further attention from financial institutions mainly due to the increasing availability of financial information. In corporate failure prediction, the objective is to have a methodological approach which discriminates firms with high probability of future failure from those which are considered to be healthy. Starting from the seminal paper of Beaver (1966), that first proposes to use financial ratios as failure predictor in a univariate context, and from the following paper of Altman (1968), that proposes a multivariate approach based on discriminant analysis, a huge number of contributions have been proposed in this field (recent reviews are Balcaen and Ooghe 2006 ; Ravi Kumar and Ravi, 2007).

Even if the Multivariate Discriminant Analysis (MDA) is still one of the most used techniques, different statistical approaches have been proposed throughout the years such as logit and probit models (Ohlson, 1980; Zmijewski, 1984; Lennox, 1999), classification trees or more recently artificial neural network (Wilson and Sharda, 1994; Serrano, 1997; Charalambous *et al.*, 2000; Pérez, 2006).

Despite the popularity of the application of these classic statistical methods to corporate failure prediction, significant issues still remain unsolved, such as: the arbitrary definition of

failure, the non-stationarity and the instability of the data, the choice of the optimization criteria and the sample selection.

Due to the difficulties related to the collection and storage of financial data, researchers have tended to restrict the scope of their analysis according to the data availability. Our aim is to investigate several aspects of bankruptcy prediction in a specific area of interest – the Campania region.

Classification techniques based on the analysis of financial information for the predictions and diagnosis of the risk of bankruptcy have been applied to a balanced sample of healthy and failure industrial firms throughout the Campania region. In particular we focus on the building sector according to the economic weight that it has among the whole industrial firms operating in the area of interest.

In this current body of research, after a preliminary analysis, which focuses on investigating and selecting the predictor variables, we obtain three Linear Discriminant Functions to measure the risk in which an industrial enterprise incurs in legal bankruptcy in three, two and one year in advance. The predictive capability of the models at different time horizons has been evaluated by means of a training and a test set.

The structure of the paper is as follows. In the next session, we briefly review the main research lines in forecasting default risk. Section 3 introduces the sample characteristics and the methodological approach. The main results obtained by the empirical analysis are reported in Section 4. The final section will give some concluding remarks.

CORPORATE FAILURE PREDICTION

The empirical literature of bankruptcy prediction has attracted the interest of researchers for many years. In fact, this field is as interesting today as it was in the 30's and, during the last 70' years, a remarkable body of both theoretical and empirical researches concerning this topic has been published.

The research focus of these studies was the best prediction methods and the best failure indicators. Authors adopted different methodological approaches.

The first relevant studies were published in the 1930's and the 1940's, after the Great Depression, when numerous companies collapsed. As a consequence, the prediction of bankruptcy was considered important. In this period, Smith (1930) published a pioneering research founded on ratio analysis of 29 companies of different sectors, which failed during the 1920's. He calculated 24 ratios, even if he thought that some of them (especially: Net Earnings to Total Assets; Net Income to Net Worth; Working Capital and Fixed Assets to Total Assets; Current Ratio) were "sensitive barometers of the progress of a company".

In the same period, Fitzpatrick (1931; 1932) published two relevant studies; in the first one, he analysed 20 companies which failed during the 1920's, calculating 13 ratios; in the second study, which was an extension of the previous research, he compared the same 20 companies with other analogous thriving firms.

After these studies, Beaver (1966) published a research based on a univariate approach, which represented a fundamental step in the evolution of bankruptcy prediction models. His model was based on a paired-sample design, because «each failed firm has a non-failed “mate” ...» (p. 76); he calculated 30 ratios (whose selection was based on three criteria: popularity; ratios performed well in one of the previous studies; ratio be defined in terms of a cash flow concept), articulated in six groups: Cash Flow ratios; Net Income ratios; Debt to Total Assets ratios; Liquid Assets to Total Assets ratios; Liquid Assets to Current ratios; Turnover ratios. After the calculation of a medium value of the ratios, he used a *Dichotomus Classification Test*, based on a *cut-off point* of each ratio, to predict failure. In fact, after the division of the original sample in two sub-samples, he established the cut-off point to classify companies; then, he classified the companies of the first group by adopting the cut-off point of the second one. In this way, he chose the best predictive ratio, Cash Flow to Total Debt, which had the minimum classification error: in fact, this ratio was substantially constant for thriving companies.

The basic limit of the study of Beaver was the adoption of a univariate approach, whose main implication is that each ratio is analysed autonomously; furthermore, this research represented a fundamental point of reference for future researches.

Few years later the study of Beaver, Altman (1968) proposed one of the most well-known bankruptcy prediction models, the so-called *Z-score model*. This model was more accurate than the previous approaches because it combined the ratio analysis with a rigorous statistic approach, the multivariate discriminant analysis (MDA). The main advantage of this model was that it emphasised the correlations among ratios.

Altman analysed the financial statements of a sample of 66 companies, divided into two groups (failed and non-failed firms) and founded his research on the estimation of a linear discriminant function based on a selection of five variables.

After this pioneer study, Altman further developed his research on the topic (Altman *et al.*, 1977; Altman and Hochkiss, 2005); recently he revisited his model in a Basel 2 environment (Altman and Heine, 2002).

Following these contributions, bankruptcy prediction studies have evolved and a large number of models have flooded the literature¹⁵. In this evolution, the MDA has been the main technique used to develop predictor models during the 1960's and the 1970's; furthermore, later on few other statistics approaches have been introduced in that field such as logistic analysis and artificial neural network.

Logistic regression analysis has been used to examine the relationship between binary or ordinal response probability and explanatory variables. Ohlson (1980) was one of the first authors who used logit analysis in the context of financial distress. This approach, in line with the purpose of the discriminant analysis, assigns a weight to the independent variables and a Z score in a form of failure probability to each company included in a sample.

Neural network fundamentally implements a *function f* that maps a set of given input values x to some output values y : $y = f(x)$. It consists of a large number of processing elements, *neurons*

¹⁵ For examples of empirical analysis on bankruptcy prediction of Italian firms see Appetiti (1984); Barontini (1992); Laviola-Trapanese (1997), Foglia *et al.* (1998), Becchetti-Sierra (2003).

and the connections between them. In fact, a neural network tries to find the best possible approximation of the function f as a complex combination of elementary nonlinear functions. This approximation is designated in the neurons of the network using *weights* that are associated with each neuron (Back et al, 1997, p. 3).

A recent review of bankruptcy prediction studies from 1930 to present day (Bellovari *et al.*, 2007) shows that MDA and neural network are the most promising methods for bankruptcy prediction models. Nevertheless, even if the use of MDA has decreased (Dimitras *et al.*, 1996), it remains a generally accepted standard method; as a consequence, different authors adopt MDA analysis as a basic method and neural network as a comparative technique (for a comparative analysis of failure prediction methods see Adnan and Humayon, 2006; Laitinen and Kankaanpää, 1999).

In this first step of our research, we focus on a classical MDA approach. In the next phase, we will compare the reached results with those of other techniques such as the artificial neural network.

METHODOLOGICAL APPROACH

Sample Description

The notion of business failure has been defined in many different ways in literature and a generally-accepted definition is not easy to agree on (Crutzen and van Caillie, 2007).

In many studies, business failure is defined as a series of different situations that lead to the closing down of the firm due to relevant financial problems (Morris, 1997). However, this definition only concentrates on the financial disease without taking into account other difficulties that can affect the firms health in the early stages of the failure process (Argenti, 1976). Therefore, it is necessary to clarify the meaning of business failure to which our study refers to. In a predictive prospective, the empirical literature distinguishes between two main aspects of the definition of business failure: economic and juridical.

In this paper, we have chosen the juridical concept, focusing on those companies that have had permanent financial disease, not including companies with temporary financial problems or companies which for any reasons have voluntarily chosen liquidation.

Therefore, our sample is composed of those companies that belong to a specific sector of activity and had entered the juridical procedure of bankruptcy in Campania in a given time period, t . The information on the legal status as well as the financial information for the analysis were collected from the Infocamere database and from the AIDA database of Bureau Van Dijk (BVD).

As many authors have highlighted (Mensah 1984, Lincoln 1984, McDonald and Morris 1984, McGurr and DeVaney 1998), the analysis of a specific sector of activity leads to better results compared to those obtained from a sample selected from different sectors. In order to achieve a homogeneous sample, we restrict our analysis to the building sector focusing on limited companies.

We adopt an approach based on a balanced-sample choosing the same sample size for both classes of failure and healthy firms. The debate on the sample proportion backs up this solution for different reasons. The population proportion significantly favours active firms and so a non-balanced sample would select a reduced number of failed firms and might lead to biased estimator. In addition, the true proportion among the two conditions is not easy to calculate in practice (Cortés *et al.* 2008). However there are also reasons in favour of different choices (Back, 1997).

The predictive capability of forecasting models for default risk depends on the time horizon to be considered. Usually, the empirical literature refers to a time horizon that shifts from two to five years according to the availability of the data (Keasey *et al.* 1990; Lennox 1999; Ward and Foster 1997). In our case, we evaluate the forecasting performance of the model one, two and three years prior to failure.

We chose the year 2004 as a reference period, t , in order to have at least 4 years of “future” annual reports (at $t+1$, $t+2$, $t+3$, $t+4$) to assure that the company selected as being healthy at time t does not get into financial problems in the next four years.

In the year 2004, there were 63 failed industrial firms¹⁶ which belong to the building sector in Campania.

In order to evaluate the availability and the significance of the financial information, a preliminary screening has been performed (table 1).

For each year of interest the whole population of failed firms was classified into two groups:

1. firms that presented their financial statements;
2. firms that did not present their financial statements or presented an incomplete report (data is not suitable for the purpose of our analysis) or stopped their activity.

Group	$t-3$		$t-2$		$t-1$	
A	43	68,25 %	35	55,56%	20	31,75
B	20	31,75 %	28	44,44%	43	68,25%
Total	63		63		63	

Table 1: Failed firms sample

In our analysis, we considered only those firms whose financial statements related to the three years prior to failure ($t-1$, $t-2$, $t-3$) were available, because these firms are a “going concern” and they provide all the information needed for the building of a model for each year of interest.

For each failed firm, a healthy firm in the same sector of activity (building sector) and same geographical area (Campania) was selected. In particular, the class of healthy firms was chosen according to the following criteria:

- were still active at the end of the year 2004 (time t);

¹⁶ “Failed” status is defined on the basis of the information provided by Infocamere - Italian Chambers of Commerce.

- were not placed under different kinds of bankruptcy procedures such as composition with creditors, receiverships, extraordinary administration, winding-up etc., in the period from 2004 to the 30th July 2009;
- had not changed the company name and had not made any operations such as merger & acquisitions in the years of interest.
- had provided all the information for the three years prior to time t , ($t-1$; $t-2$; $t-3$), and the four subsequent periods ($t+1$; $t+2$; $t+3$, $t+4$).

The Predictors data-base

In literature, researchers have been using numerous different factors and indicators to forecast failure during the years. The selection of a specific set of financial indicators as independent variables is one of the main problems.

According to Bellovari *et al.* (2007), we think that higher model accuracy does not depend on an elevated number of factors and indicators. Therefore, variables to be included in the analysis have been chosen on the basis of a few different criterias: they have a relevant financial meaning in a failure context, they have been commonly used in failure predictions literature, and finally, the information needed to calculate these ratios are available.

Consequently, we consider 37 indicators as potential bankruptcy predictors (listed in table 2) that reflect different aspects of the firms' structure: Profitability, Size and Capitalization, Leverage, Liquidity, Operating structure, Turnover.

The predictor data-base for the three years of interest (2003, 2002, 2001) was elaborated starting from the financial statements of each firm included in the sample for a total of 120 financial statements.

<i>V</i>	<i>Financial Ratios</i>	<i>Type</i>
V1	<i>Sales</i>	<i>Profitability</i>
V2	<i>Net income</i>	<i>Profitability</i>
V3	<i>Total Assets</i>	<i>Size</i>
V4	<i>Shareholders' Equity</i>	<i>Size and Capitalization</i>
V5	<i>Value Added</i>	<i>Profitability</i>
V6	<i>Total debts/Total assets</i>	<i>Leverage</i>
V7	<i>Operating income/Sales</i>	<i>Operating structure</i>
V8	<i>Net Worth/Fixed Assets</i>	<i>Size and Capitalization</i>
V9	<i>Net Worth - Fixed Assets</i>	<i>Size and Capitalization</i>
V10	<i>Net Worth/Total Assets</i>	<i>Leverage</i>
V11	<i>Net Worth/Capital Stock</i>	<i>Size and Capitalization</i>
V12	<i>Net Worth/Intangible assets</i>	<i>Size and Capitalization</i>
V13	<i>Current Assets/Total Assets</i>	<i>Liquidity</i>
V14	<i>ROE</i>	<i>Profitability</i>
V15	<i>ROA</i>	<i>Profitability</i>
V16	<i>ROS</i>	<i>Profitability</i>
V17	<i>Net income/Total Assets</i>	<i>Profitability</i>
V18	<i>EBITDA</i>	<i>Profitability</i>

Forecasting methods

We apply the classical methods of Multivariate Discriminant Analysis (MDA) in order to derive forecasting models for default risk (Anderson, 2003).

The MDA is used to determine which variables discriminate between two or more pre-defined groups, which in our case are failed and non-failed companies. This is achieved by the statistical decision rule of maximizing the between-group variance relative to the within-group variance. Based on the training set, the technique constructs a set of linear functions of the predictors, the linear discriminant functions, such as:

$$\mathbf{y} = \mathbf{a}'\mathbf{X}$$

in which \mathbf{X} is the data matrix of the input variables or predictors and \mathbf{a} is the vector of discriminant coefficients.

The total deviation is given by

$$\mathbf{y}'\mathbf{H}\mathbf{y} = \mathbf{a}'\mathbf{X}'\mathbf{H}\mathbf{X}\mathbf{a} = \mathbf{a}'\mathbf{T}\mathbf{a} ,$$

which can be partitioned into two components. The within variance:

$$\sum \mathbf{y}'_i \mathbf{H}_i \mathbf{y}_i = \sum \mathbf{a}' \mathbf{X}'_i \mathbf{H}_i \mathbf{X}_i \mathbf{a} = \mathbf{a}' \mathbf{W} \mathbf{a}$$

and the between variance

$$\sum n_i (\bar{y}_i - \bar{y})^2 = \sum n_i \{ \mathbf{a}' (\bar{\mathbf{x}}_i - \bar{\mathbf{x}}) \}^2 = \mathbf{a}' \mathbf{B} \mathbf{a} .$$

The ratio to be maximising is of the form

$$\mathbf{a}' \mathbf{B} \mathbf{a} / \mathbf{a}' \mathbf{W} \mathbf{a} .$$

Each firm receives a single composite discriminant score which is then compared to an optimal cut-off value, which determines to which group the company belongs to. If their discriminant score is less than the cut-off point, they are classified as failing, whereas if their score exceeds or equals the cut-off point, they are classified as non-failing.

Two types of misclassifications can be made: a type I error is made when a failing firm is misclassified as a non-failing firm, whereas a type II error is made when a non-failing firm is wrongly assigned to the failing group.

EMPIRICAL RESULTS

Preliminary Analysis

As illustrated in the previous session, the analysis was carried out on a balanced sample of 40 companies, 20 failed and 20 healthy, 70% of which were included in the training data set used for estimating the forecasting models, while the remaining 30% were selected for the test set used for evaluating the predictive power of those models.

In order to investigate the main characteristics of failed and healthy firms, a preliminary explorative analysis has been carried out on the set of 37 prediction variables (see table 2) for the three years of interest, 2001, 2002 and 2003. As an illustration, the results of summary statistics provided separately for the two groups of firms in 2003 are shown in table A of the Appendix.

The correlation matrix has also been performed to investigate the bivariate linear relations among the variables of interest. As expected, there is evidence of strong correlation structure among some of the variables that slightly change throughout the years. A synthesis of the results has been reported in Table 4, where significant linear relation among the indicators is described. We consider as significant those correlation coefficients greater or equal to $|0.80|$, point out that correlation below that value are not harmful for an appropriate variable selection.

Table 4: Financial Ratios Correlation Analysis. * bivariate linear relation with $\rho \geq |0.80|$ have been reported for t-1, t-2 and t-3.

Classification Analysis

A *t-test* for the means differences has been performed in order to evaluate the capability of each variable to discriminate between the two groups, failure and healthy companies. The results (in table B of the Appendix) suggest selecting as potential predictors of the failure status the indicators for which the *t-test* rejects the null hypothesis of equal means.

However, while univariate analysis suggests specific variables as candidates for model building, in a multivariate setting it may be the case that a collective set of variables might achieve a better degree of discrimination between the two groups of firms. To avoid potential biases, therefore, we supplement our model development process with other methods of selection of the variables. In particular, we use the stepwise method to determine the final set of variables to be included in the discrimination model. The step-by-step forward selection begins with no variables in the model and at each step all variables are evaluated to determine which one will contribute most to the discriminatory power of the model, measured by Wilks' λ statistics, and have to be included in the models. In the same way, that variable which fails to meet the criterion to stay will be removed. When all the variables in the model meet the criterion to stay and none of the other variables meet the criterion to enter, the stepwise selection process stops. As a tolerance level, we chose a λ statistics greater than 0.80 to stop the iterative process (Wilkinson and Dallal, 1981; Burnham and Anderson, 2002).

In order to investigate the predictor capability one, two and three years prior to failure, we construct three Linear Discriminant Functions (LDF) at t-1, t-2 and t-3.

Starting from the first year prior to failure, we estimate a LDF with five variables selected using the stepwise procedures together with the results of the statistical screening.

The selected variables for the final model are: Total debts/Total assets, Net Worth/Total Assets, ROA, ROS, and Interest Charge/Sales. Table 6 shows correlations among these statistically significant variables that have always a correlation coefficient $\rho \leq |0.80|$ showing a low or very moderate linear relationship among them.

	<i>Total-debts/Total assets</i>	<i>Net-Worth/Total Assets</i>	<i>ROA</i>	<i>ROS</i>	<i>Interest-charge/Sales</i>
<i>Total-debts/Total assets</i>	1,00000000				
<i>Net-Worth/Total Assets</i>	0,16236934	1,00000000			
<i>ROA</i>	0,06511079	0,5206530	1,00000000		
<i>ROS</i>	0,04536724	0,5313640	0,79893733	1,00000000	
<i>Interest-charge/Sales</i>	0,06449791	0,3417647	0,50315025	0,73542205	1,00000000

Table 6: Correlation Matrix selected variables - 2003

The discriminant coefficients of the LDF estimated from the information related to the year 2003 are reported in Table 7. Using the estimated values, we obtain the discriminant score that permits us to assign each firm to the first or to the second group (failed or healthy). Repeating the process for the training and the test data sets, we obtain the classification errors for each firm. The Confusion Matrices of table 8 summarize the prediction results a year prior to failure.

	Variables	Coefficients
V6	Total-debts/Total assets	0,0003129
V10	Net-Worth/Total Assets	0,0901252
V15	ROA	0,2852788
V16	ROS	0,0143223
V26	Interest-charge/Sales	0,3248475

Table 7: Coefficients of Discriminant Function (one years before)

Actual Class	Predicted Class				
		Training set		Test set	
		Failed	Healthy	Failed	Healthy
Failed		0,50%	0,00%	0,50%	0,00%
Healthy		0,038%	0,46%	0,00%	0,50%

Table 8: Confusion Matrices – First year before failure - 2003

The second model refers to the prediction of failure two year in advance. The variable selection has been redefined for the year 2002 and the final predictors are: Net-Worth/Total Assets, ROA, ROS and Interest-charge/Sales.

Even in this case, the correlations among the statistically significant variables (Table 9) are moderate and not highlight any heavy bivariate relation among them.

	Net-Worth/Total Assets	ROA	ROS	Interest-charge/Sales
Net-Worth/Total Assets	1,00000000			
ROA	0,18285984	1,00000000		
ROS	0,02738725	0,7935961	1,00000000	
Interest-charge/Sales	0,13773304	0,5032973	0,57318249	1,00000000

Table 9: Correlation Matrix selected variables - 2002

The estimated discriminant coefficient and the results of the classification for the training and test sets are shown in Tables 10 and 11.

	Variables	Coefficients
V10	Net-Worth/Total Assets	0,0788659
V15	ROA	0,1467619
V16	ROS	0,0629249
V26	Interest-charge/Sales	0,3655981

Table 10: Coefficients of Discriminant Function (two years before)

Actual Class	Predicted Class				
		Training set		Test set	
		Failed	Healthy	Failed	Healthy
Failed		0.50%	0,00%	0,43%	0,07%
Healthy		0.038%	0,46%	0,00%	0,50%

Table 11: Confusion Matrices – Second year before failure - 2002

The same process has been done for the third year before the failure. In this case, the ROE has been included in the model instead of the ROA that was included in model 1 and 2¹⁷.

Form the correlation matrix for the selected variables (table 12), it can also be underlined that the correlation between ROS and ROE is much lower than that between the ROS and ROA for the years 2002 and 2003.

	Net-Worth/Total Assets	ROE	ROS	Interest-charge/Sales
Net-Worth/Total Assets	1,00000000			
ROE	0,16960345	1,00000000		
ROS	0,07250876	0,2256320	1,00000000	
Interest-charge/Sales	0,43155702	0,1669879	0,59017738	1,00000000

Table 12: Correlation Matrix selected variables - 2001

The discriminant coefficient estimated with model 3 and the results of the classification for the training and test sets are shown in Tables 13 and 14.

	Variables	Coefficients
V10	Net-Worth/Total Assets	0,1376484
V14	ROE	0,0131991
V16	ROS	0,4535639
V26	Interest-charge/Sales	-0,2026336

Table 13: Coefficients of Discriminant Function (three years before)

Actual Class	Predicted Class				
		Training set		Test set	
		Failed	Healthy	Failed	Healthy
Failed		0.50%	0,00%	0,50%	0,00%
Healthy		0,038%	0,46%	0,07%	0,43%

Table 14: Confusion Matrices – Third year before failure - 2001

¹⁷ It can be noticed, reading Table 4, that the ROA for the year 2001 shows strong linear relation in terms of correlation coefficient with other three indicators while the ROE does not.

The predictive performance of the LDF seems to be influenced by the forecast horizon as we can see from the predictor errors, ε_t , that slightly increase from t-1 to t-3. The results are very similar as would be expected, given the similarity in the estimated variables. However, model 1 shows better prediction accuracy in the test set confirming that the time period prior to failure is a relevant issue.

As already underlined in § 2, most of the recent papers have dealt with multi-method analyses that can lead to comparative predictive performance evaluation. Following this line, the results obtained with the LDF should be compared with some other forecasting methods in order to better evaluate the predictor power of each model. However, since our interest was focused on a specific sector of activity in the Campania region in a given period of time, the number of population units for the failed companies and, consequently, the size of the selected balanced sample does not allow to successfully apply more complex techniques such as the Artificial Neural Networks. As it is well known, the performance of such techniques should lead to better results, compared to the classic MDA, only if the sample is of a reasonable size. Therefore, a comparative predictive performance evaluation with different statistical approaches is left to further investigation.

CONCLUSION

The prediction of business failure has been largely investigated in the literature of the last decades, however many of the theoretical and empirical findings have been assessed in a general context and not often related with a specific geographic area or a small economic district. This is mainly related to the collection and storage of financial data. Actually, despite the increasing number of datawarehouse even in Italy, is still not an easy task to collect data on a specific set of homogeneous firms.

In this paper, we have investigated the determinants of bankruptcy of the building sector in the Campania region. A data-set of financial statements of a balanced sample of companies for a given time period have been analyzed by means of classical classification techniques. To select the two balanced classes of healthy and failed firms, we used the concept of legal failure to include those firms which had gone bankrupt during the year 2004. This in order to have at least four future reports to evaluate the real status of the selected firms.

The predictive power of opportunely chosen financial indicators has been assessed within a univariate and multivariate frameworks. In the current body of the research, we have started with the application of the traditional discriminant analysis. In particular, three LDF have been estimated for the diagnosis and prediction of the risk of bankruptcy one, two and three years prior to failure.

The performance of the forecasting methods leads to good quality results with a low percentage of predictor errors. Moreover, as was expected, the predictor's capability decreases as the time horizon increases.

Overall, while the reached results show that the models achieve classification accuracy, empirical evidence of the screening analysis of the financial information suggests more than one issue that requires further investigation. The accuracy of the prediction models may be enhanced including non-financial predictors as well as considering the time as a relevant factor

switching from a static to a dynamical model. These issues together with the mentioned comparison analysis will be the purpose of a future study.

ACKNOWLEDGEMENTS

We would like to thank the Chamber of Commerce of Salerno for providing part of the data.

Purpose: The success of knowledge acquisitions is dependent upon firm's ability to integrate knowledge-based resources and thus share knowledge, in order to innovate. Regardless of the increasing number of knowledge acquisitions, however, an understanding of how successful firms direct their knowledge sharing activities remains absent. This paper argues that acquisition-based dynamic reconfiguration capabilities can be seen as a distinctive knowledge integration ability of successful firms. The purpose of this paper is, therefore, to reveal the underlying mechanisms and practices that act as micro-foundations of such dynamic capabilities, in order to understand how to manage more successful knowledge acquisitions.

Design/methodology/approach: The approach of this research is to review the literature while addressing two questions: 'which mechanisms and practices enable post-acquisition knowledge sharing' and 'how can these mechanisms and practices enable the creation of acquisition-based dynamic reconfiguration capabilities in order to enable more successful knowledge acquisitions.'

Findings: Three propositions regarding the micro-foundations of acquisition-based dynamic reconfiguration capabilities are given. First, the more frequent interaction the practices used entail the more tacit knowledge will be shared. Second, the more acquisition-experience the firm has the more positive the effect of using IT-based mechanisms and procedures for sharing explicit knowledge will be. Third, having acquisition-specific functions, especially those with a focus on HR-incentives, will affect post-acquisition knowledge sharing in a positive way.

Originality/value: This study is, to our knowledge, one of the first that focuses on the underlying mechanisms and practices that affect post-acquisition knowledge sharing and thus the micro-foundations of acquisition-based dynamic reconfiguration capabilities.

Article type: Conceptual paper

Keywords: knowledge-based view, knowledge acquisition, knowledge sharing, micro-foundations, dynamic capabilities.

INTRODUCTION

Powerful determinants of firm actions and outcomes are unique firm-level capabilities (Eisenhardt and Bird-Schoonhoven, 1996). This view which emphasizes firm-level heterogeneity characterizes broadly the resource-based view of the firm (Eisenhardt and Schoonhoven, 1996). According to the resource-based view, firms are compositions of resources which could create a competitive advantage if they sustain a resource position barrier¹⁸ (Wernerfelt, 1984). In order

¹⁸ Resource position barrier is defined as a situation in which "a holder of a resource is able to maintain a relative position vis-a-vis other holders and third persons, as long as these act rationally. That is, the fact that someone already has the resource affects the costs and/or revenues of later acquirers adversely. In these situations the holder can be said to enjoy the protection of a resource position barrier" (Wernerfelt, 1984).

to create such competitive advantage these resources must be scarce, valuable, and reasonably durable (Spender, 1996). Or have the so-called VRIN attributes, which is being valuable, rare, inimitable, and nonsubstitutable (Eisenhardt and Martin, 2000). These resources, tangible or intangible (Wernerfelt, 1984) such as e.g. technical know-how and capital, can be defined as the strengths, advantages, or assets of the firm (Eisenhardt and Schoonhoven, 1996).

The degree to which a firm sustains its competitive advantage depends on other firms' ability to acquire the resources needed to set off a competitive offensive (Grant, 1996). Sustaining competitive advantage, therefore, requires idiosyncratic and not easily transferable resources (Grant, 1996). Increasing competition among high-technology¹⁹ firms has shifted the source of competitive advantage for these firms from tangible resources and market power to intangible resources such as knowledge and know-how (Collins and Smith, 2006). Therefore, knowledge acquisition, defined by Huber (1991) as the process of obtaining knowledge, has become an increasingly important way for technology-based companies to gain access to new knowledge and capabilities. These firms usually apply the resource-based acquisition strategy of 'related complementary' with the primary objective of getting resources that combine effectively with those currently held (Wernerfelt, 1984). More specifically, these firms are interested in knowledge-based resources, and therefore, apply the knowledge transfer strategy which is mentioned by Ranft and Lord (2002).

It is particularly in the high-tech²⁰ industries that companies buy other, often smaller, companies in order to gain new knowledge and capabilities and thus participate in knowledge acquisitions. Technological complexity, the importance of specialized skills and expertise, fast-paced technological change, and knowledge-based resources' breadth and depth, trigger firms to engage in knowledge acquisitions with the primary objective of knowledge transfer; the acquisition and utilization of new sets of knowledge-based resources (Ranft and Lord, 2002). Knowledge, especially tacit²¹, being idiosyncratic and not easily transferable, therefore, has become the most strategically-important resource which firms possess (Grant, 1996). The knowledge-based view of the firm, an outgrowth of the resource-based view of the firm (Cloodt, 2005), emphasizes this. According to the knowledge-based view, organizations are dynamic, evolving, quasi-autonomous systems of knowledge creation and application (Spender, 1996). Creating knowledge requires individuals to specialize in specific areas, while applying it, in order to produce goods and services, requires bringing together many areas of specialized knowledge (Grant, 1996) and thus the sharing of knowledge. Since knowledge is the most

19 In line with Collins and Smith (2006) who use the definition of high-technology firms given by Milkovich (1987), high-technology firms are identified as companies that "emphasize invention and innovation in their business strategy, deploy a significant percentage of their financial resources to R&D, employ a relatively high percentage of scientists and engineers in their workforce, and compete in worldwide, short-life-cycle product markets" (p.80).

20 According to Ranft and Lord (2002), these industries include biotechnology, computer equipment, computer software, computer services, electronics, and telecommunication.

21 In the following section an explanation regarding different types of knowledge will be given.

strategically-important resource residing among organizational members, the integration of individuals' specialized knowledge becomes the essence of a firm's capability (Grant, 1996). This integration takes place through the use of certain practices and mechanisms aimed at sharing knowledge. Within the context of knowledge acquisitions this integration of knowledge, therefore, is one of the main objectives since knowledge acquisitions' success is dependent upon firms' ability to integrate knowledge-based resources and thus share knowledge, in order to innovate. Hence, given that most valuable resources are knowledge-related, coordination and integration of such resources creates nonreplicable value in the market (Teece, 2007).

This paper, being a part of an empirical research in progress, argues that in the context of knowledge acquisitions, acquisition-based dynamic reconfiguration capabilities which is concerned with post-acquisition knowledge integration is the needed ability that organizations must possess in order to have successful knowledge acquisitions. The purpose of this paper is, therefore, to reveal the underlying mechanisms and practices that act as micro-foundations of such dynamic capabilities which successful firms possess. Specifically, this paper aims to understand how firms can build such dynamic capabilities and thus manage more successful knowledge acquisitions. Through reviewing the literature, in order to creating a foundation for the subsequent empirical research, two questions are addressed: 'which mechanisms and practices enable post-acquisition knowledge sharing' and 'how can these mechanisms and practices enable the creation of acquisition-based dynamic reconfiguration capabilities in order to enable more successful knowledge acquisitions.' This insight is useful given that most acquisitions fail to meet expectations (Barkema and Schijven, 2008, Hayward, 2002). Puranam et al. (2003) have in fact demonstrated that failure rates in high-tech acquisitions may reach between 60 to 80 percent, figures which would indicate an absence of organizational acumen. Apparently, acquiring a firm does not guarantee that valuable knowledge will be successfully shared. Thus, value creation through acquisitions is extremely difficult (Inkpen et al., 2000) or does not take place at all (Meschi and Metais, 2006). Given that acquisitions usually have implementation and post-acquisition performance problems (Vermeulen and Barkema, 2001), creating an understanding regarding the micro-foundations of post-acquisition knowledge sharing processes is, therefore, vital. Furthermore, by revealing the micro-foundations of acquisition-based dynamic reconfiguration capabilities, this paper aims to make a contribution to the literature of the strategic management field and more specifically the literature of the knowledge-based view of the firm, in order to help understand how the process of knowledge sharing within knowledge acquisitions takes place. Thus, regardless of the contributions made until now, an understanding of the salient futures of knowledge sharing processes has remained absent in the literature (Foss, 2007).

In the next sections, first, dynamic capabilities will be discussed. Second, an explanation of organizational knowledge will be given. Third, different ways of managing organizational knowledge will be discussed along with their epistemological perspectives. After that, most appropriate mechanisms and practices for knowledge sharing in order to create acquisition-based dynamic reconfiguration capabilities will be given along with a number of propositions. Finally, some concluding remarks are mentioned.

DYNAMIC CAPABILITIES

In dynamically-competitive environments such as the high-tech industries, maintaining superior performance requires constantly renewing competitive advantage through innovation and development of new capabilities (Grant, 1996). In order to explore the dynamic aspect of knowledge creation and application, Kogut and Zander (1992) have introduced the concept of combinative capability²² which emphasizes the importance of synthesizing and applying current and acquired knowledge for the enhancement of innovation. Extending the idea of combinative capability, Grant (1996) mentions that deploying and extending a continuing core of capabilities, is what leads to continuous innovation in dynamically-competitive environments. This means, achieving flexibility in knowledge integration in order to creating dynamic capabilities which, according to Grant (1996), for many, are the solution to the problem of sustaining competitive advantage in dynamically-competitive environments.

According to Teece et al. (1997), 'dynamic capabilities' refers to two aspects of an ability of the firm. In this definition the term 'dynamic' refers to the renewing capacity of firms regarding their competences in order to deal with dynamically-competitive environments. 'Capabilities' refers to the key role of strategic management in properly adapting, integrating, and reconfiguring internal and external competences to react on dynamically-competitive environments. Teece et al. define dynamic capabilities as 'the firm's ability to integrate, build, and reconfigure internal and external competences²³ to address rapidly changing environments' (1997). Helfat et al. define dynamic capabilities as 'the capacity of an organization to purposefully create, extend, or modify its resource base' (2007). Dynamic capabilities could be seen as a meta-competence which goes beyond operational competences enabling firms to, not just inventing, but also innovating profitably (Teece, 2007). Dynamic capabilities enable firms to achieve evolutionary fitness which is enabling the firm to make a living (Teece, 2007). Taking into account that sustaining competitive advantage in dynamically-competitive markets has been seen as unlikely (Eisenhardt and Martin, 2000), having dynamic capabilities could enable firms to sustain their competitive advantage through constantly reconfiguring their resources. According to Teece et al. (1997), successful firms have been those in possession of dynamic capabilities.

Paying attention to the dynamic aspect of the environment, having only static, unique, and valuable resources as proposed by the resource-based view and the knowledge-based view is not enough since sustaining competitive advantage requires being able to adjust to the environment and thus having dynamic capabilities. Firms' output is indirectly affected by dynamic capabilities through the impact that these capabilities have on operational capabilities (Helfat and Peteraf, 2003). One of the most important factors affecting firms' success (or failure)

²² By combinative capability Kogut and Zander (1992) mean the intersection of the capability of the firm to exploit its knowledge and the unexplored potential of the technology. According to Kogut and Zander (1992), new learning, such as innovations, are products of a firm's combinative capabilities to generate new applications from existing knowledge.

²³ Teece et al. (1997) mention that, 'when firm-specific assets are assembled in integrated clusters spanning individuals and groups so that they enable distinctive activities to be performed, these activities constitute organizational routines and processes. Examples include quality, miniaturization, and systems integration. Such competences are typically viable across multiple product lines, and may extend outside the firm to embrace alliance partners.'

in dynamically-competitive environments, therefore, is creating and applying dynamic capabilities (Teece, 2007). One important type of dynamic capabilities which enhances firm's potential for growth is acquisition-based dynamic capabilities (Helfat et al., 2007). Acquisition-based dynamic capabilities is 'the capacity of the firm to purposefully create, extend, or modify the firm's augmented resource base, which includes the resources of partners' (Helfat et al., 2007). Acquisition-based dynamic capabilities consist of three main elements which are selection, identification, and reconfiguration (Helfat et al., 2007). This is quite in line with Laamanen and Keil (2008) who mention that acquisition capability which includes the ability to identify targets, negotiate deals, and manage the integration, is comprised by the knowledge, skills, systems, structures, and processes that an organization can use when doing acquisitions. According to Helfat et al. 2007, selection is the capacity to recognize when an acquisition would be the most suitable activity for gaining new resources. Identification is the capacity to find and negotiate with, the most suitable targets. Reconfiguration capability is 'the capacity to reshape resources within the target and acquiring firms'. This involves 'the capacity to combine resources from the target and the acquirer in order to create new resources, whether at the target or within the acquirer's original business unit or in some new organizational unit' (Helfat et al., 2007). Thus, in the context of knowledge acquisitions this acquisition-based dynamic reconfiguration capability is concerned with post-acquisition knowledge integration since it involves the capacity to be able to combine the resources of the firms involved.

In order to, eventually, create value through acquisitions firms should have the needed reconfiguration ability (Helfat et al., 2007). Possessing an strong post-acquisition capability might help enhancing the process of recombining resources (Helfat and Peteraf, 2003). The degree to which firms are able to integrate their knowledge-based resources within the post-acquisition phase mirrors their reconfiguration capability. If the creation of such acquisition-based dynamic reconfiguration capabilities, however, is dependent upon the degree to which knowledge integration can take place, than the firm's strategic flexibility is limited, on the one hand, by its repertoire of capabilities, since it is unlikely that these capabilities will extend far beyond those currently held. On the other hand, the time horizon and uncertainty associated with creating new capabilities (Grant, 1996). According to Grant (1996), having a flexible knowledge integration approach and network relationships (inter-firm collaboration through access to new knowledge) could help solve these problems. In the context of knowledge acquisitions, however, the latter solution is actually taken into account since knowledge acquisitions give access to the knowledge of the acquired firm and thus new knowledge. Nevertheless, even though, formally spoken, the acquiring company has access to the knowledge of the acquired company, still, knowledge integration is needed and thus the former solution proposed by Grant (1996) needs to be taken into account.

Knowledge integration is the source of micro-foundations of dynamic capabilities and an important aspect affecting business performance (Teece, 2007). In the context of knowledge acquisitions, transferring and integrating the acquired knowledge base into that of the acquiring company is one of the main objectives in order to enhance innovation (Cloudt, 2005). Transferring and integrating the acquired knowledge, however, is a complex process. Knowledge transfer and integration takes place through knowledge sharing among the employees of the firms involved. Knowledge sharing processes, therefore, could be seen as the micro-foundations of acquisition-based dynamic reconfiguration capabilities since these

processes enable the actual integration of knowledge. Knowledge sharing processes, however, differ from many other business processes since these processes have a number of salient features (Foss, 2007). An understanding of what these salient features are, however, is still missing in the literature (Foss, 2007).

The very fact that the knowledge to be acquired is tacit and socially complex might affect its survivor chance within the acquisition (Ranft and Lord, 2002). Another aspect affecting the knowledge acquisition process is the fact that the management has to deal with two (totally) different companies. These differences could be due to structural, social, cultural or differences in knowledge bases (e.g. Vermeulen and Barkema, 2001). For firms involved in knowledge acquisitions the sources of innovation are dispersed among two companies and embedded among their employees, therefore, creating dynamic capabilities becomes a great challenge. According to Jemison & Sitkin (1986) 'the acquisition process itself is a potentially important determinant of acquisition outcomes' (cited in Haspeslagh and Jemison, 1991). Therefore, in order to understand how successful firms direct their knowledge acquisition activities, a better understanding of the knowledge sharing processes is needed.

Understanding which mechanisms and practices successful firms apply for sharing knowledge in the post-acquisition phase in order to integrate different specialized knowledge, could help understand what the building blocks of the acquisition-based dynamic reconfiguration capabilities are. Identifying the micro-foundations of such dynamic capabilities, however, will be inherently incomplete or their implementation must be difficult. Otherwise firms' dynamic capabilities would not create the expected competitive advantage that they do (Teece, 2007). However, even though dynamic capabilities are idiosyncratic and path-dependent in emergence, they also have certain commonalities across firms, since there are more and less effective ways of dealing with certain organizational challenges (Eisenhardt and Martin, 2000). Stated in more popular parlance 'best-practice' regarding dynamic capabilities exists (Eisenhardt and Martin, 2000). Therefore, in order to create competitive advantage in dynamically-competitive environments, all knowledge regarding the creation of dynamic capabilities and thus such best-practices would be a good step forward. Before being able to detect such best-practices, however, a better understanding of organizational knowledge and its characteristics is needed in order to be able to understand the knowledge sharing processes. The next section focuses on these aspects.

ORGANIZATIONAL KNOWLEDGE

Sharing knowledge requires, in the first place, an understanding of the nature of knowledge. The degree to which knowledge can be shared is dependent upon its characteristics. A fundamental classification of organizational knowledge is made by Polanyi (1967), which is a distinction between tacit and explicit knowledge (Easterby-Smith and Prieto, 2008). According to Polanyi (Nonaka, 1994) 'explicit' knowledge can be codified and thus transmitted in formal and systematic language. Explicit knowledge is similar to 'knowledge about' (Spender, 1996). Tacit knowledge, however, is personally held, rooted in action, commitment and involvement in a certain context (Nonaka, 1994). Tacit knowledge is related with 'experience' (Spender, 1996). Articulating, capturing, and distributing explicit knowledge is easy, while tacit knowledge is more difficult to articulate and distribute (Easterby-Smith and Prieto, 2008). The latter may also

be because tacit knowledge is subconscious (Hislop, 2005). Tacit knowledge is subjective, bodily, of the here and now, and practice-based, while explicit knowledge is objective, of the mind, and the there and then, and concerned with theory (Gourlay, 2006). Tacit knowledge is shared through communication by creating mutual understanding, while explicit knowledge is captured in records of the past such as libraries, archives, and databases, which can be used if needed (Nonaka, 1994).

According to Polanyi (1966) the acquisition of knowledge from another, is 'both intellectual and practical'. Organizational knowledge is created through the interaction of tacit and explicit forms of knowledge (Easterby-Smith and Prieto, 2008). While Nonaka states that knowledge can only exist at the individual level, many other writers argue that knowledge can exist in social groups (Hislop, 2005). Based on this a different dichotomy of knowledge has occurred which is that of individual vs. group knowledge (Hislop, 2005, Hebert et al., 2005). Documented systems of rules, operating procedures, and formalized routines are examples of 'objectified knowledge' which can be seen as explicit group knowledge at the organizational level (Hislop, 2005). On the other hand, informal routines, narratives, and shared understanding are examples of 'collective knowledge' which is the tacit knowledge of the group that is not codified (Hislop, 2005). This classification, however, is also based on the distinction of tacit and explicit knowledge, while being socially embedded.

MANAGING ORGANIZATIONAL KNOWLEDGE

Dynamic capabilities are dependent of the knowledge evolution process which takes place through knowledge exploitation and exploration activities (Easterby-Smith and Prieto, 2008). On the one hand, knowledge exploration activities are focused on introducing the variations that generate new ideas, through e.g. alliances, organizational networking, and knowledge acquisitions (Easterby-Smith and Prieto, 2008) in order to increase innovation. On the other hand, knowledge exploitation activities are about replicating exiting methods into new contexts in order to increase efficiency (Easterby-Smith and Prieto, 2008). Both of these activities, however, can be the objectives of knowledge management (Swan et al., 1999).

Knowledge management, based on the tacit and explicit distinction of knowledge, has applied two different approaches in order to identify, develop, and leverage knowledge in organizations. The tacit and explicit distinction of knowledge has enabled scholars to consider various adaptation mechanisms with diverse characteristics for different types of knowledge (Spender, 1996). Knowledge management, comparable with organizational knowledge, is divided in two camps, those concerned with the technology of knowledge management and those who find human processes the primary task of knowledge management to pay attention to (Easterby-Smith and Prieto, 2008). The technology side is interested in managing knowledge and the mechanisms that help in doing so such as IT-infrastructures, data warehouses, and virtual centers of expertise (Easterby-Smith and Prieto, 2008). The human side focuses more on social relations, cultural factors and sense-making (Easterby-Smith and Prieto, 2008). Thus, the knowledge embedded in routines, practices and norms (Alvesson and Kärreman, 2001).

In a similar vein, Brown and Duguid (2000) make a distinction between process and practice. On the one hand, the process approach focuses on the way tasks are formally organized while being concerned with the structured coordination of people and explicit knowledge, which is

done in a top-down manner. On the other hand, the practice approach is concerned with the way tasks are actually performed. This approach emphasizes social interactions, especially informal, which occur in a bottom-up manner. According to Brown and Duguid (2000), tasks which seem highly independent according to formal processes, could be remarkably social in reality. For enhancing best practices, therefore, organizations should pay attention to the way such practices occur in reality in order to capture the tacit knowledge created through improvisation, narratives and communities that form such activities (Brown and Duguid, 2000). This does not mean that processes are not needed, but in order to be effective they must be based on practice.

The aforementioned two approaches are quite in line with the emergent and engineering approach mentioned by Van den Hooff and Huysman (2009). On the one hand, the emergent approach sees knowledge sharing as something not to be forced which should take place by the intrinsic motivation of the socially embedded employees in a bottom-up manner. On the other hand, the engineering approach assumes that managers can manage the process of knowledge sharing through stimulating and creating the needed environment, which is done in a top-down fashion through the use of organizational and technical infrastructures (Van den Hooff and Huysman, 2009). These contradictions in knowledge management suggest that technology is not the only aspect in order to facilitate knowledge sharing. Knowledge management is not seen only as a matter of building a large knowledge repository, 'but by connecting people so they can think together' (Alvesson and Kärreman, 2001). Process and practice, however, are not two competing views, but a reflection of the creative tension at the core of organizations involved in innovation (Brown and Duguid, 2000).

These two approaches of knowledge management are derived from two different epistemological perspectives of knowledge (Easterby-Smith and Prieto, 2008). These are the objectivist and the practice-based perspective (Hislop, 2005). The objectivist epistemology which is also referred to by Cook and Brown (1999) as 'epistemology of possession' views knowledge as an entity that people possess, but which can exist independently of people in a codifiable form (Hislop, 2005). Such knowledge can exist in a number of forms including documents, diagrams, computer systems, or be embedded in physical artefacts such as machinery or tools (Hislop, 2005). Thus, from this perspective knowledge is seen as being explicit. Even tacit knowledge can be converted, to a certain degree, into explicit knowledge according to this perspective. The root of the latter perspective is in the philosophy of positivism according to which the social world can be scientifically studied in order to quantify and measure social phenomena, leading to objective knowledge as an end result (Hislop, 2005). This perspective acknowledges the fact that much organizational knowledge is tacit while being optimistic about the ability of the organization to convert this knowledge into an explicit form (Hislop, 2005).

The practice-based perspective, on the other hand, emphasizes the fact that knowledge is embedded within practice and thus not codifiable (Hislop, 2005). Being referred to by Cook and Brown (1999) as the 'epistemology of practice', this perspective sees tacit and explicit knowledge as inseparable while being embodied in people and socially constructed (Hislop, 2005). Philosophy scholars of practice argue that practices underlie subjects and objects, emphasize non-propositional knowledge and explain the conditions underlying intelligibility (Schatzki et al., 2001). The way social practices are conducted cannot be made explicit, therefore, some tacit

component will remain unknown (Schatzki et al., 2001). Thus, we do not know how to set out tacit abilities into explicit forms (Schatzki et al., 2001). As Polanyi (1966) states 'explicit knowledge must rely on being tacitly understood' (Gourlay, 2006) which means that there is always some tacit aspect that remains unknown.

Many scholars argue that organizations evolve by the process of acclimating their members' knowledge, which is done mostly on a tacit level (Gourlay, 2006). The practice-based epistemology has its roots in a number of philosophical perspectives such as interpretive philosophy (Hislop, 2005) which emphasizes the role of individuals in articulating knowledge and shaping and interpreting the organizational context (Empson, 2001) and social constructionism (Easterby-Smith and Prieto, 2008) which views knowledge as being constructed from and through social relationships and interactions (Swan et al., 1999). In the context of knowledge acquisitions, this is an important aspect, since future innovation requires interaction and cooperation between the experts of the firms involved. This is quite in line with Eisenhardt and Schoonhoven (1996) stating that e.g. in product development alliances the employees of the firms involved must intensively interact in order to gain benefits. Thus, this view of knowledge as being socially constructed, through social interaction processes and embedded in communities of practice, emphasizes the importance of social coordination and (formal and informal) networking while trying to manage organizational knowledge (Swan et al., 1999).

UNDERLYING MECHANISMS AND PRACTICES OF DYNAMIC CAPABILITIES

Based on the literature of mergers and acquisitions, alliances, knowledge management, and human resources, various mechanisms and practices are discerned which could affect post-acquisition knowledge sharing and thus act as underlying mechanisms and practices of acquisitions-based dynamic reconfiguration capabilities. In the following sections these mechanisms and practices will be discussed and some propositions will be given.

The Importance of Practices

Mechanisms and practices of both types of knowledge management approaches have been mentioned by many scholars as being the building blocks of dynamic capabilities (Easterby-Smith and Prieto, 2008). Given that in case of knowledge acquisitions, the knowledge that is meant to be shared is usually of a highly ambiguous nature and thus tacit, personal interactions are extremely important in the post-acquisition phase (Ranft, 1997). According to Grant (1996), tacit knowledge can be integrated through the use of two types of mechanisms which are direction and routines. Direction involves converting tacit knowledge into explicit knowledge through the use of rules, directives, formulae and expert systems. However, this transformation of tacit knowledge into explicit means inherently a loss of knowledge since not all tacit knowledge can be converted. Organizational routines, the second type of mechanisms, solve this problem of the loss of tacit knowledge. By using routines there is no need to transform knowledge into an explicit form since knowledge integration through the use of routines takes place in coordinated work arrangements based on informal procedures and commonly understood roles and interactions among specialists. Dynamic capabilities of organizations are embedded in routines (Eisenhardt and Martin, 2000). Such routines are repetitive activities developed through the usage of firm's resources which enable knowledge transfer within the

firm (Heimeriks, 2008). 'Practice refers to the organization's routine use of knowledge and often has a tacit component, embedded partly in individual skills and partly in collaborative social arrangements' (Szulanski, 1996). 'In this sense, transfers of best practice could be conceived as replications of organizational routines' (Szulanski, 1996).

Lawson and Samson (2001) and Verona and Ravasi (2003) have mentioned physical, technical, structural, managerial systems, and cultural norms and values as important aspects for the development of dynamic capabilities (Easterby-Smith and Prieto, 2008). This, however, is quite a broad description. More specifically, skill development and mentoring have been mentioned as practices enabling the development of capabilities (Easterby-Smith and Prieto, 2008). Human resource scholars argue that commitment-based human resources practices such as e.g. job rotation and team-based work design aimed at creating mutual long-term exchange relations can enhance knowledge sharing through facilitating social climates of trust, cooperation, and shared codes and language (Collins and Smith, 2006). Thus, networking and socialization are important aspects which enhance knowledge sharing (Inkpen et al., 2000). Heimeriks (2008) mentions many authors who have come up with various intra-firm practices such as project teams, cross-functional committees, communities of practice which could affect knowledge sharing and enhance the organizational capability development process. Eisenhardt and Martin (2000) mention cross-functional teams, the creation of social bonds among business heads, experiential activities, routine use of brainstorming sessions and solving problems together, as being important for the development of certain dynamic capabilities. Thus, in dynamically-competitive markets dynamic capabilities are built through simple, experiential, unstable processes, which are based on fast-paced created knowledge in an iterative way (Eisenhardt and Martin, 2000). Hence, 'the basic path of capability development reflects a process of capability improvement, though perhaps somewhat fitful' (Helfat and Peteraf, 2003).

Somewhat in line with the importance of 'solving problem together' mentioned by Eisenhardt and Martin (2000), Zollo and Winter (2002, Zollo et al., 2002) explain that collective learning occurs when employees engage in constructive interactions in order to exchange their ideas. Collective discussions, debriefing sessions, workshops, seminars, performance evaluation processes could act as mechanisms which help articulate tacit knowledge in order to enhance organizational capability development process (Zollo and Winter, 2002). Another example is the creation of knowledge connections. By creating the opportunity for knowledge connections, social interactions between the acquired and acquiring company provide the foundation for evolving communities of practice (Von Krogh and Slocum, 1994). Knowledge connections are formed through formal and informal relationships between individuals and groups and are driven by the belief that sharing tacit knowledge is best achieved through 'mutual adaptation among members with common knowledge and shared implicit coding schemes accumulated through group interactions' (Lam, 1997). Examples of such knowledge connections are team buddy situations where a new employee is paired with the acquirer's personnel on a one to one basis.

Knowledge connections can also be created through site visit tours, and formal and informal meetings between parent and target organization. This is quite in line with Hislop (2005) who mentions that social interaction and face-to-face- communication is needed in order to share tacit knowledge. According to Hislop (2005) tacit knowledge can be shared through practices such as

the use of communities of practice, forums (electronic or face-to-face), implementation of a formalized mentoring system to pair experience and inexperienced workers, or by developing trust in projects through extensive face-to-face interactions. In the context of alliances Parise and Casher (2003) mention that communities of practice, formal and informal communication among alliance managers, trainings and workshops can act as practices enhancing the alliance capability development process (Heimeriks, 2008). Of course, in alliances the firms involved remain separate, however, regardless of the fact that in acquisitions the firms are eventually transformed into one entity, practice shows that the creation of this single entity is quite difficult since the management keeps dealing with two (totally) different companies. This is probably why successful knowledge integration remains difficult. Thus, from the point of view that the management has to deal with two different companies, acquisitions could be compared with alliances. Hence, all knowledge regarding the alliance capability development process, therefore, could also be helpful in the context of acquisitions.

In alliances, as Heimeriks (2008) mentions, the use of best practices, training courses, cultural trainings, workshops, and exchange of experiences can be seen as practices through which knowledge can be shared in order to build dynamic capabilities. These practices not only help to share knowledge within the organization, but also institutionalize knowledge through the creation of routines (Heimeriks, 2008). Thus, as Helfat et al. (2007) mention, inter-firm knowledge sharing processes should be created and institutionalized in order to enhance knowledge transfer. Taking this into account, the core of organization's capability development process then becomes 'remember by doing' (Heimeriks, 2008).

Since individual knowledge and perspectives remain personal unless they are amplified and articulated through social interaction (Nonaka, 1994) organizations should stimulate the occurrence and need for such interactions. The above mentioned arguments have already put forward that social interactions are fundamental for knowledge acquisitions in order to share tacit knowledge. This is in line with Prieto and Easterby-Smith (2006) who state that generating dynamic capabilities requires knowledge management to focus on people and social processes, consequently, compared to technological aspects social aspects are probably more important (Easterby-Smith and Prieto, 2008). Therefore, for firms involved in a knowledge acquisition, practice-based approaches such as site visit tours, job rotation, sharing of best practices, mentoring, project teams, trainings, workshops, and cross-functional committees will probably lead sharing more relevant (tacit) knowledge than IT-based approaches. In line with Brown and Duguid (2000) and Van den Hooff and Huysman (2009) the assumption is that this effect would probably be stronger if such practices are emergent in nature, occurring in a bottom-up manner (e.g. through suggestions and initiatives of core knowledge workers) and thus based on the way tasks are actually performed. As Easterby-Smith and Prieto (2008) mention, knowledge management and dynamic capabilities enhance performance when they are focused on the operational functioning of the organization. These arguments lead to the following proposition:

Proposition 1: Especially emergent practices which are based on relatively more frequent interaction among the employees of the acquiring and the acquired firm, have a greater effect on sharing relevant tacit knowledge in the post-acquisition phase than other mechanisms and practices.

Firm's Acquisition Experience and the Creation of Mechanisms

Regardless of the importance of the practice-based approaches for sharing tacit knowledge, there is some evidence that having knowledge which is codified by the acquirer enhances acquisition performance (e.g. Helfat et al. 2007). In the context of knowledge acquisitions, acquisition performance can be improved through enhancing knowledge sharing. For improving acquisitions' performance firms must develop an organizational capability which helps implementing acquisitions (Zollo and Singh, 2004). Thus, in order to enhance knowledge sharing so that acquisitions' performance is improved an organizational implementation capability is needed. In the context of knowledge acquisitions, given that the environment is dynamically-competitive, an acquisition-based dynamic reconfiguration capability is needed which deals with the acquisition implementation phase. Such organization capability can be built through codification of past experience and creation of mechanisms and procedures to share explicit knowledge. Hence, organizations can learn from their past acquisition experiences through articulation and codification of their lessons learned (Zollo and Winter, 2002) and the use of this knowledge in subsequent acquisitions. This is quite in line with Laamanen and Keil (2008) stating that serial acquirers accumulate their experience through the development of acquisitions program which enhance their subsequent acquisition performance. This for example, can be achieved through the creation of standard mechanisms and procedures, which will enhance post-acquisition knowledge sharing. Thus, codifying experience into technology and creating formal procedures enable the application of experience and enhance the creation of routines which help develop dynamic capabilities (Eisenhardt and Martin, 2000, Laamanen and Keil, 2008).

In their research Laamanen and Keil (2008) found that serial acquirers through accumulating their experiences and developing acquisitions programs tend to outperform other acquirers. In doing this, the frequency pattern with which the acquisitions are carried out matters since a stable frequency pattern ensures the accumulation of experience. The findings of Laamanen and Keil (2008), however, are quite contrary to that of Zollo and Singh (2004) who found that experience accumulation was non-significant while the degree of codification had a strong impact on acquisition performance. On the one hand, the non-significant effect of experience accumulation could be due to firms' heterogeneity and the occurrence of negative transfer. Inexperienced managers might rely on firm's acquisition experience which could lead to negative transfer (Helfat et al., 2007). Negative transfer occurs 'when one's search for an analogous condition from the past leads to a reliance on a situation that is superficially but not structurally similar to the current situation' (Helfat et al., 2007). It is especially difficult for less experienced acquirers to judge the similarity of the target firm with previous ones (Helfat et al., 2007) and thus to make sure that no negative transfer occurs. On the other hand, the positive effect of the degree of codification and articulation of acquisition experience mentioned by Zollo & Singh (2004) and thus the use of IT-based mechanisms and procedures in order to share knowledge in the post-acquisition phase, could be due to the existence of acquisition implementation knowledge within the firm.

In the context of alliances Helfat et al. (2007) mention that knowledge management's function is partly about codification of explicit knowledge regarding the different stages of alliances. Thus, one of the tasks of knowledge management is the creation of mechanisms and procedures

regarding the alliance process in order to enhance knowledge sharing. Some examples of such mechanisms which can be used for codifying explicit knowledge are intranets, groupware technology (e.g. Lotus Notes), decisions support systems, repository and retrieval systems, and searchable electronic database (directories of experts) (Hislop, 2005). Zollo and Winter (2002) mention also manuals, blueprints, spreadsheets, decision support systems, project management software, performance appraisals, and postmortem audits, as being important mechanisms for knowledge sharing and thus the development of dynamic capabilities. As Heimeriks (2008) in the context of alliances, mentions, alliance repositories and supporting management systems (e.g. performance metrics and global network infrastructure) could be critical aspects for the management of alliances. Zollo and Singh (2004) state that the acquirer can learn to manage post-acquisition integration through experience accumulation and codification of explicit knowledge in manuals, systems, and other tools. Thus, the importance of such mechanisms can also be expected in the context of knowledge acquisitions.

According to Zollo and Winter (2002), activities aimed at knowledge codification and articulation may become superior mechanisms in order to accumulate expertise when tasks' frequency and homogeneity are reduced. Thus, acquiring a firm may not be a daily task of the organization, but this does not necessarily mean that no learning benefits will occur in the codification process. Since such codification efforts force the employees to draw explicit conclusions regarding their experience (Zollo and Winter, 2002). Such learning mechanisms for knowledge articulation and codification are catalyzed by knowledge management and could enable the creation of dynamic capabilities (Easterby-Smith and Prieto, 2008). Through codifying past experience and creating certain IT-based mechanisms and procedures to share codified knowledge, the acquirer might be able to enhance knowledge sharing and thus improve the acquisition performance. By reflecting on past acquisition performances organizations can adjust the use of such mechanisms and if needed create new ones, this reflection and adjustment which results in reconfiguration of the way knowledge-based resources are used will lead to the dynamic aspect of acquisition-based dynamic reconfiguration capabilities. Of course, acquisition experience could also lead to the adjustment of practices that are used to share knowledge, but the assumption is that the more acquisition experience the firm has the greater the effect of IT-based mechanisms and procedures will be since firms will try to create standard procedures and tools to perform tasks as efficient as possible. These arguments lead to the following proposition:

Proposition 2: IT-based mechanisms and procedures, based on relatively more acquisition experience, which are aimed at sharing explicit knowledge will have a greater positive effect on post-acquisition knowledge sharing, than IT-based mechanisms and procedures which are based on less (or no) acquisition experience.

Only a few studies have focused on the effect of acquisition experience of serial acquirers on their performance (Laamanen and Keil, 2008). On the one hand, it is questionable whether acquisition experience would enhance performance since acquisitions are heterogeneous, irregular, and vary in their outcomes (Hayward, 2002). Vermeulen and Barkema (2001), mention that firms might learn from their acquisitions if such acquisitions are related to their business. According to Hayward (2002), acquisition experience alone is not sufficient to have superior performance, better performing firms are those that acquire companies with similar businesses to that of the firms of their prior acquisitions. In the same vein, Halebian and Finkelstein (1999)

mention that acquisition experience has an inverted U-shaped effect on acquisition performance, which is positive when firms acquire organizations that are similar to their prior acquisitions. Meschi and Metais (2006) mention that acquisition experience does affect acquisition performance. This effect, however, has a curvilinear distribution around the acquisition's announcement date. Hence, on the other hand, it could be that firms with more acquisition experience differ substantially from other firms in their acquisitions' performance and thus perform better (e.g. Laamanen and Keil, 2008). Hence, having acquisition experience could be seen as a principal mechanism to have the skills needed to manage acquisitions in the right way (Hayward, 2002). The literature, however, is quite contradictory regarding this. One thing that is clear is that, to the best of our knowledge, up until now, no attention has been paid to the effect of acquisition experience on post-acquisition knowledge sharing.

Zollo and Singh's (2004) research has focused on the U.S. banking industry while measuring performance by looking at return on assets (ROA). The research of Laamanen and Keil (2008) has focused on serial acquirers in seven industries (e.g. pharmaceuticals and biotechnology) and their acquisition performance which was measured by market returns to acquirer shareholders. Haleblian and Finkelstein (1999) look at the effect of acquisition experience on acquisition performance while measuring performance through abnormal returns. The research of Hayward has focused on the effect of acquisition experience on acquisition performance while measuring performance by looking at the created shareholder value. Meschi and Metais's (2006) research considers acquisition experience as experience in acquisition transactions which does not include post-acquisition knowledge integration. Again the measurement used for performance is abnormal returns. Focusing on post-acquisition knowledge sharing within knowledge acquisitions, therefore, could reveal some other interesting findings regarding the effect of acquisition experience. This leads to the following proposition:

Proposition 3: Firms with relatively more acquisition experience share more knowledge in the post-acquisition phase, than firms with less (or no) acquisition experience.

Acquisition-specific Functions

One important aspect distinguishing firms that have improved their alliance performance from those that have not, is the existence of an internal infrastructure which consists of management processes regarding alliances (Heimeriks, 2008). These management processes are created by specific functions which are formed to focus on the management of alliances. As Helfat et al. (2007) mention, organizations with higher alliance performance had better developed knowledge management functions regarding their alliances. 'Such firms have a better developed alliance manager function, which is responsible for developing both the tacit and codified knowledge associated with managing different stages of alliances' (Helfat et al., 2007). Thus, experiences will remain on a local level unless they are organized by explicit learning mechanisms. The existence of alliance managers, alliance specialist, and alliance departments could be vital aspects for the alliance management process (Heimeriks, 2008). Hence, an acquisition-management function, such as for example a M&A team (Zollo and Winter, 2002), analogous to the alliance function could also have a positive effect on firms' acquisition performance (Helfat et al., 2007). This effect, however, is probably through intervention in the

post-acquisition knowledge sharing process since such functions can give directions and decide which mechanisms and practices to use in order to enhance post-acquisition knowledge sharing.

Besides giving directions and deciding which mechanisms and practices to use, such acquisition-specific functions can also enhance knowledge sharing through the use of certain HR-incentives such as rewards, bonuses, and the use of retention strategies. Taking into account that personnel stability acts as a determinant for the sustainability of the organizational memory, an absence of such stability can create a disruption of the organizational knowledge development process (Heimeriks, 2008). Therefore, promotion policies and reward systems which are aimed to ensure the retention of core knowledge employees are important aspects (e.g. Inkpen et al., 2000). Eisenhardt and Martin (2000), however, have also mentioned routines regarding rewarding business heads for their individual success as being an important aspect of post-acquisition dynamic capabilities. Thus, skill reward systems are practices which could enable the development of capabilities (Easterby-Smith and Prieto, 2008).

Another important aspect to pay attention to is 'turnover'. Given that people and especially teams are the carriers of the knowledge that is meant to be shared, it is taken for granted that organizations should prevent the inevitable turnover of people that occurs after a deal is closed. Thus, the effectiveness of such functions requires personnel's stability (Zollo and Winter, 2002). Although most empirical data on the relation between turnover and performance show a negative correlation, the results are still mixed. Chakrabarti (1990) found a negative relation between turnover of senior technical employees and performance. Based on extensive quantitative research Ranft & Lord (2002) found, however, that the turnover of top management has a less negative impact on performance than the turnover of middle management and R&D employees. Retention strategies are thus needed as mechanisms to cope with this problem.

By making decisions and giving directions, managers judging what to do and not to do are crucial to organization's action (Helfat et al., 2007). Thus, managerial decision making is one of the important aspects regarding the internal selection environment of the firm (Helfat and Peteraf, 2003). Therefore, acquisition-specific functions through their capability of making decisions and giving directions in order enhance knowledge sharing affect the post-acquisition knowledge sharing process. 'strategic decision making is a dynamic capability in which managers pool their various business, functional, and personal expertise to make the choices that shape the major strategic moves of the firm' (Eisenhardt and Martin, 2000). Hence, dynamic capabilities are enabled through the decisions managers make (Helfat et al., 2007). Thus, dynamic capabilities are often combinations of simpler capabilities and routines (Eisenhardt and Martin, 2000). Perhaps the importance of managerial decision making is related to what Tsoukas (1996) refers to as the 'indeterminacy of practice' which is the fact that the 'distinctiveness of all situations that people act in requires them to continually make personal judgments' regardless of well defined rules as guidance for their actions (Hislop, 2005). Therefore, a theory of acquisition-based dynamic capabilities should take into account this 'soft side' of strategy (Helfat et al., 2007) and thus the importance of acquisition-specific functions. These arguments lead to the following proposition:

Proposition 4: The existence of acquisition-specific functions, particularly those that pay special attention to HR-incentives, has a positive effect on post-acquisition knowledge sharing.

Research Model

Taken together, the above mentioned propositions result in the following research model which is depicted below:

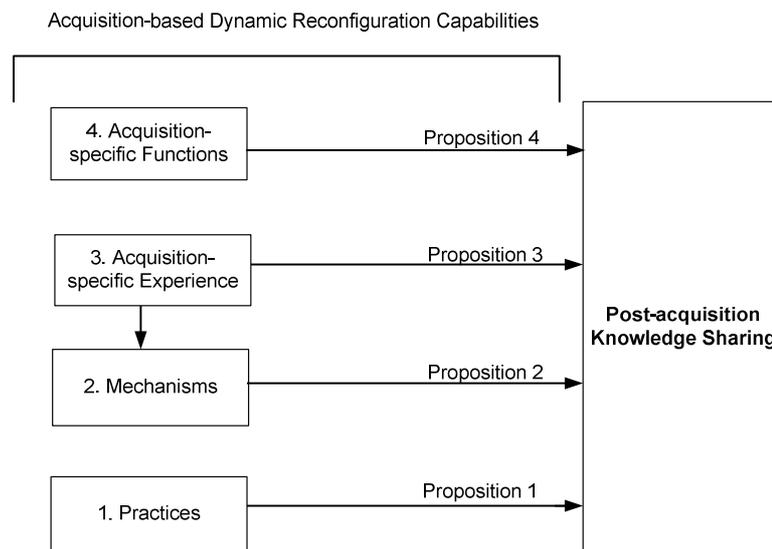

Figure.1 Research Model

The above depicted model primarily illustrates how the four main independent variables (i.e. practices, mechanisms, acquisition-specific experience, and acquisition-specific functions) affect the dependent variable post-acquisition knowledge sharing. The model also recognizes that acquisition experience through enhancing the mechanisms that are used to share explicit knowledge indirectly affects post-acquisition knowledge sharing and thus reinforces the effect of mechanisms on post-acquisition knowledge sharing.

The central reasoning is that, first, practices such as mentoring, enable the sharing of tacit knowledge. Second, mechanisms such as repository and retrieval systems, enable the sharing of explicit knowledge and their effect is even more when acquisition-specific experience improves them. Third, acquisition-specific experience enhances post-acquisition tacit and/or explicit knowledge sharing. Finally, acquisition-specific functions such as M&A department, affect tacit and/or explicit post-acquisition knowledge sharing through the decisions that they make. The relationships proposed in this model, however, should be tested empirically.

CONCLUDING REMARKS

The most important aspect affecting the success of knowledge acquisitions is being able to share relevant knowledge in order to innovate. Regardless of the increasing number of knowledge acquisitions, however, an understanding of how successful firms direct their knowledge sharing activities remains absent. Clearly, there is a need for systematic research on knowledge sharing through knowledge acquisition. This paper argues that acquisition-based dynamic reconfiguration capabilities can be seen as a distinctive knowledge integration ability

of successful firms. Trying to understand which underlying mechanisms and practices are the forces behind the creation of such capabilities would be a good step forward in order to understand how to manage more successful knowledge acquisitions. Although this present paper has not satisfied this need, it has set a foundation for the empirical research that will be conducted in the near future.

Supporting knowledge sharing depends to a large extent on the uniqueness of the particular situation. What works well in one organization will not necessarily work in another organization. This has implications for the way organizations can intervene in the process of knowledge sharing. Specifically, it is proposed that the more frequent interaction the practices used entail the more tacit knowledge will be shared, the more acquisition-specific experience the firm has the more positive the effect of using IT-based mechanisms and procedures for sharing explicit knowledge will be, the more acquisition-specific experience firms have the more post-acquisition knowledge will be shared, and that having acquisition-specific functions, especially with a focus on HR-incentives, will affect post-acquisition knowledge sharing in a positive way.

Since merely using mechanisms and practices is not enough, the suggestion is that organizations should use the lessons learned from their past experience in order to enhance knowledge sharing. Thus, mechanisms and practices along with the firm's acquisition experience lead to the creation of acquisition-based dynamic reconfiguration capabilities. Clearly, the value of the model introduced in this paper needs to be validated by empirical research. This, however, is an interesting research topic since, to the best of our knowledge, up until now, no research has been conducted regarding the micro-foundations of such capabilities within the context of knowledge acquisitions. This research, therefore, could make a significant contribution to the literature of the strategic management field and more specifically to the literature of the knowledge-based view of the firm.

It maybe, however, that knowledge acquisitions, are inherently too situation-specific as to provide a general causal explanation. Future research, therefore, will be probably conducted in an area that should be treated carefully with respect for organizational idiosyncrasies. Understanding the nature of knowledge sharing processes only by conducting quantitative research is not enough since it is important to understand the micro-processes of knowledge sharing that are embedded in this process. Therefore, our intention is to, first, set out a survey among practitioners (R&D experts and M&A managers) within one specific industry (i.e. Bio-industry) and then conduct a case-study within an organization that operates in the same industry in order to gather data which unravels the practice-side of the story while giving richer information regarding the mirco-processes of knowledge sharing and thus reinforcing our survey findings. Hence, to our knowledge, combining quantitative research and qualitative ethnographic research seems to be a good step forward, in order understand the process of knowledge sharing within knowledge acquisitions and thus the micro-foundations of acquisition-based dynamic reconfiguration capabilities.

VOLUNTARY DISCLOSURE AND FINANCIAL REPORTING IN ITALIAN SME. A STRATEGIC PERSPECTIVE

Antonelli, Valerio¹; D'Alessio, Raffaele²

¹*Full professor of Advanced Financial Accounting, Dipartimento di studi e ricerche, aziendali, Università degli studi di Salerno, Via Ponte Don Melillo, 84084 Fisciano (SA), Italy*

²*Associate professor of Financial Accounting, Dipartimento di studi e ricerche, aziendali, Università degli studi di Salerno, Via Ponte Don Melillo, 84084 Fisciano (SA), Italy*

In most studies, the relationships between voluntary disclosure in financial reporting and two main characteristics of the firms are examined. One characteristic is the size of the company, and the other is the company's listing status. Thus, large and listed firms are extensively investigated also in Italian literature. Less attention is paid to small and medium firms which are about 98% of the total in Italy.

Purpose of the paper – The paper aims to analyze main factors, both country-specific and not, influencing financial reporting quality and voluntary disclosure in Italian small and medium firms.

Design/methodology/approach – The paper offer a strategic point of view on the variables influencing voluntary disclosure and financial reporting quality in Italian context. Such variables and the set of cause-effect relationships connecting them are examined on the basis of mainstream Italian economia aziendale literature approaches referring to corporate governance, information systems, internal auditing, accounting regulation, earnings management, and stakeholder theory, by reviewing empirical and theoretical literature.

Findings. The paper shows Italian mainstream literature focussed on the variables influencing corporate disclosure and financial reporting. A systematic model is proposed.

Research limitations/implications – The study is based on a theoretical basis. Future research aimed at examining, by surveys and case studies, relationships between the variables of the model needs, in order to explain and predict corporate financial disclosures in Italian small and medium firms, are planned.

Practical implications – The comprehensive framework developed in this study for organizing and evaluating voluntary disclosures and financial reporting quality is an initial step in the direction of examining both phenomena from a strategic perspective.

Originality/Value - The paper proposes a model of analysis whose systematic structure is not yet developed in the literature

Keywords: Corporate governance. Voluntary disclosure. Italian literature

Paper type: Framework

INTRODUCTION

The paper shows Italian mainstream literature focussed on the variables influencing corporate disclosure and financial reporting. A systematic model composed of ten relations is proposed.

In most studies, the relationships between voluntary disclosure in financial reporting and two main characteristics of the firms are examined. One characteristic is the size of the company, and the other is the company's listing status. Thus, large and listed firms are extensively investigated also in Italian literature. Less attention is paid to small and medium firms:

- a) which prevail in Italian capitalism, and represent over 99% of total companies, and 93% of the workforce is employed in them, according to the Italian Institute of Statistics (ISTAT, 2008) (Table 1);

	1-9 employees	10-49 employees	50-249 employees	250 employees and more	Total
Primary industry	0,11	0,03	0,01	0	0,15
Traditional manufacturing	5,21	0,74	0,08	0,01	6,04
Specialized supply	1,09	0,29	0,05	0,01	1,44
R&S	0,61	0,06	0,01	0	0,68
Economies of scale	2,54	0,63	0,08	0,01	3,26
Housing	13,02	0,72	0,03	0	13,77
Commerce	26,94	0,8	0,06	0,01	27,81
Hotels and restaurants	5,74	0,36	0,02	0	6,12
Transports and communications	3,13	0,25	0,04	0,01	3,43
Firms services	25,63	0,48	0,07	0,01	26,2
Family services	10,79	0,25	0,05	0,01	11,1
Total	94,81	4,61	0,5	0,08	100

Table 1 – Small and medium firms in Italy Source: Istat (Italian Institute of Statistics), *Rapporto annuale (Annual Report)*, 2008, p. 70.

- b) where individual proprietorships and partnerships prevail (Table 2);

	Joint-stock company					Individual proprietorship and partnerships				
	1-9 employees	10-49 employees	50-249 employees	250 add. e oltre	Totale	1-3 employees	4-9 employees	10-19 employees	20 employees	Total
Primary industry	0,04	0,12	0,12	0,51	0,79	0	0,02	0,01	0	0,03
Traditional manufacturing	0,56	2,2	1,79	1,33	5,88	0,85	1,76	0,79	0,29	3,69
Specialized supply	0,28	1,16	1,27	1,03	3,74	0,16	0,29	0,18	0,06	0,69
R&S	0,08	0,25	0,35	0,87	1,55	0,13	0,11	0,03	0,01	0,28
Economies of scale	0,55	2,18	1,85	2,27	6,85	0,35	0,89	0,52	0,17	1,93
Housing	1,25	1,91	0,66	0,3	4,12	2,37	2,68	0,7	0,17	5,92
Commerce	2,08	2,51	1,32	2,11	8,02	5,76	3,81	0,59	0,12	10,28
Hotels and restaurants	0,48	0,8	0,35	0,67	2,3	0,95	2,28	0,56	0,18	3,97
Transports and communications	0,35	0,84	0,89	3,23	5,31	0,58	0,47	0,16	0,07	1,28
Firms services	1,73	1,55	1,47	3,4	8,15	1,64	1,12	0,18	0,12	3,06
Family services	0,45	0,92	1,14	1,16	3,67	0,99	0,8	0,1	0,03	1,92
Total	7,85	14,44	11,21	16,88	50,38	13,78	14,23	3,82	1,22	33,05

Table 2 – Type of companies in Italian firms Source: Istat (National Institute of Statistics), *Rapporto annuale (Annual Report)*, 2008, p. 73.

- c) are not IAS adopters. As a matter of fact, on 25 February 2005, the Italian Council of Ministers approved a Legislative Decree regarding the options provided by Article 5 of Regulation 1606/2002 of the European Parliament (the EU Accounting Regulation) to permit or require the adoption of the

International Financial Reporting Standards (which includes IASs and Interpretations) in respect of annual accounts and of non-publicly-traded companies (Table 3).

<p><i>Listed companies, issuers of financial instruments widely distributed among the public, banks, stock broking companies, fund management companies, regulated financial institutions</i></p> <ul style="list-style-type: none"> • Consolidated financial statements: IFRSs compulsory from 2005 • Separate financial statements: IFRSs optional from 2005. IFRSs compulsory from 2006. <p><i>Insurance companies</i></p> <ul style="list-style-type: none"> • Consolidated financial statements: IFRSs compulsory from 2005 • Separate financial statements: IFRSs not permitted in 2005. IFRSs compulsory from 2006 only for listed companies that do not prepare consolidated financial statements <p><i>Subsidiary and associated companies of the above companies, and other companies that prepare consolidated financial statements</i></p> <ul style="list-style-type: none"> • Consolidated financial statements: IFRSs optional from 2005 • Separate financial statements: IFRSs optional from 2005 <p><i>Companies other than the above</i></p> <ul style="list-style-type: none"> • Individual financial statements: IFRSs optional from a year to be determined by the Ministry for the Economy and Justice <p><i>Small Companies preparing financial statements in abbreviated form</i></p> <p><i>Individual financial statements: IFRSs not permitted</i></p>

Table 3 – Ias adopters in Italy

The paper is structured as follows: Section 2 provides a brief overview of mainstream studies on financial reporting quality and voluntary disclosure. Section 3 focuses on the main characteristics. Section 4 proposes a model for analyzing financial reporting and voluntary disclosure in a strategic perspective. Section 5 summarises the results of the analysis; and, Section 6 discusses the limitations of the paper and the directions of future research.

THEORETICAL FRAMEWORK FOR THE STUDY: CORPORATE GOVERNANCE, FINANCIAL REPORTING AND VOLUNTARY DISCLOSURE LITERATURE

The incentive of firms to voluntarily disclose information has been of interest to both analytical and empirical researchers in accounting. Analytical research has examined issues such as how competition affects disclosure (Verrecchia, 1983; Darrough and Stoughton, 1990), and the use of disclosure as a signal of firm value (e.g., Hughes, 1986). Empirical research on voluntary disclosure has a much longer history, with a stream of studies documenting the impact of firm characteristics such as size, listing, leverage and managerial ownership on disclosure. Skinner (1994) finds that large negative earnings surprises are more often preempted by voluntary corporate disclosures. More recent research suggests that disclosure affects the cost of equity capital (Botosan, 1997) and cost of debt capital (Sengupta, 1998) (Eng and Mak, 2003: 326).

The quality of financial reporting and other financial outcomes previously described are affected by characteristics of corporate governance and auditors. Researchers have attempted to understand their relationship using various perspectives. In the accounting and finance academic literature, particularly in the USA, an agency theory perspective is commonly used to

explain the concept of corporate governance. Control of ownership and various attributes of boards of directors and board committees are thought to be important factors in aligning management's objectives with those of the owners. The role of independent (outside) directors has been increasingly emphasized for proper corporate monitoring. This has been particularly true for audit committees, and more recently for compensation and nomination committees. Completely independent audit committees are now required for most publicly held companies. Independent auditors are also part of the monitoring process for financial reports. Various measures of auditor independence, including non-audit fees and auditor quality (usually size) have been employed to understand the corporate governance and monitoring environment (Kalbers, 2009: 193)

Full voluntary disclosure, however, rarely seems to occur in reality, and firms typically do not disclose more than regulation requires. One possible reason for the lack of full disclosure is that disclosure is costly to firms. First, there may be a direct cost associated with producing and disseminating information. In particular, information may need to be disclosed or certified by third parties such as accounting firms. Second, since disclosure reveals information to competitors or others who interact strategically with the firm, it may cause the firm to lose competitive advantage or bargaining power in various contexts. However, as pointed out in Fishman and Hagerty (1998), even if disclosure is costly, it does not imply that disclosure regulation is desirable. It is quite possible that firms' disclosure policies are socially optimal given the cost of disclosure. (Admati and Pfleiderer, 2000: 480).

Prior work suggests that voluntary disclosure is greater when the quality of information held by managers is relatively high and/or when information asymmetry is relatively great. Verrecchia (1990, 376) examines managers' decisions to voluntarily disclose proprietary information and concludes "the intuition that higher-quality information is accompanied by more disclosure appears to be a robust economic notion (at least a first-order effect), and thus might be useful in assisting future empirical investigations." Jung and Kwon (1988) show that the disclosure region (the set of signals which are voluntarily disclosed) increases as outsiders' beliefs become relatively more diffuse, suggesting that increases in informational asymmetry are accompanied by greater voluntary disclosure.

A commitment to increased levels of disclosure reduces the possibility of information asymmetries arising either between the firm and its shareholders or among potential buyers and sellers of firm shares. This, in turn, should reduce the discount at which firm shares are sold, and hence lower the costs of issuing capital (Leuz and Verrecchia, 2000: 92).

Owing to limits to investor attention, information that is presented in salient, easily processed form is assumed to be absorbed more easily than information that is less salient, or that is only implicit in the public information set (Hirshleifer and Tzoh, 2003: 339).

Regulated financial information provides valuable information to investors. However, because this research does not compare the relative informativeness of regulated and unregulated financial information, it does not necessarily imply that regulation is superior to a free market approach to disclosure. The finding that the value of regulated accounting data varies systematically based on firm characteristics, time dependent variables, and country-specific institutions is also subject to alternative interpretations. Do the differences reflect the

influence of systematic economic factors that make regulation more or less effective? Or, is the variation driven by correlated omitted variables such as firm and country growth, or risk? Another branch of accounting research examines the value relevance of information presented under proposed new financial reporting standards. This research uses the association between earnings and stock prices or returns as a measure of value relevance (Healy and Palepu, 2001: 413).

Shareholders and other stakeholders require companies to disclose information concerning their prospects for future performance and the sustainability of current value-creation drivers. This requires effective communication about the risks affecting a firm's strategies and the actions planned to take to capitalize on emerging opportunities as well as to minimize the risk of failures (Beretta and Bozzolan, 2004: 265; 267).

Scholars expect greater disclosure-related benefits will accrue to family firms. However, if earnings quality is better for non-family firms and non-family firms are more likely to make management forecasts of bad news, we expect greater disclosure-related benefits will accrue to non-family firms. Finally, family firms with founder CEO, rather than family firms with descendent CEO, are primarily responsible for family firms exhibiting better disclosure practices and disclosure-related consequences as compared to non-family firms (Ali *et al.*, 2000)

Other studies have examined the relationship between ownership structure and disclosure or management forecasts of earnings. Ruland *et al.* (1990) hypothesize that firms that release earnings forecasts have a higher proportion of outside ownership than other firms. Their hypothesis arises from Jensen and Meckling's (1976) theory that as the manager's share ownership falls, outside shareholders will increase monitoring of manager's behavior. As the manager's share ownership falls, the manager will have increased incentives to consume perks and reduced incentives to maximize job performance. To reduce monitoring costs by outside shareholders, the manager will provide voluntary disclosure. Eng and Mak, 2003: 329).

THE MAIN FACTORS INFLUENCING FINANCIAL REPORTING AND VOLUNTARY DISCLOSURE IN ITALY

Corporate governance

Italy is usually described in the literature as a country that features weak legal protection of minority investors, inefficient law enforcement, high ownership concentration, and an abundance of pyramidal groups and nonvoting shares (Di Pietra *et al.*, 2008: 77-78).

Main characteristics of corporate governance in Italy are:

- 1) the type of company and the related corporate governance mechanisms;
- 2) the famil firm model.

Type of company and corporate governance mechanisms. Under Italian Law two main types of company may be incorporated: S.p.A. (Società per Azioni) and S.r.l. (Società a responsabilità limitata).

Società per azioni is the normal form for larger companies (joint stock companies). An S.p.A. may be listed on the Stock Exchange although the absolute majority are not. It is however necessary for a company to be an S.p.A. in order to be listed thereon.

Società a responsabilità limitata corresponds to a closely held limited company. It is the kind of structure which is more suited to small-to-medium sized enterprises where limited liability is required. This is by far the most common type of company used by Italian entrepreneurs and that most frequently chosen by foreign parent companies when setting up their subsidiaries in Italy.

In 2003, a great reform of the Italian Civil Code was applied in order to change the corporate governance systems of Italian firms, with particular reference to auditing mechanisms. Besides, in Italian legislation three different governance models are allowed, i.e. the so called traditional model, the dualistic model and the monistic model (Table 4).

<i>Corporation</i>		%
<i>Traditional model</i>	24.399	98,12%
<i>Monistic model</i>	324	1,30%
<i>Dualistic model</i>	143	0,58%
<i>Total</i>	24.866	100,00%
<i>Limited liability company</i>		%
<i>Sole director</i>	266.902	71,00%
<i>Board of directors</i>	109.000	29,00%
<i>Total</i>	375.902	100,00%

Table 4 – Main types of company in Italy Source: *Il sole 24 ore (Main Italian economic newspaper), 2008*

Most of the small and medium firms did not modify their governance system, so they maintain the “traditional model”, even if it was emended by the above mentioned reform which assigned to an External Auditor or to an Auditing Company all the Financial Reporting auditing activities. In the companies which do not issue shares in the capital market and are not obliged to prepare a consolidated financial statement, all Financial Reporting Auditing activities are delegated to the Statutory Committee (Cortesi *et al.*, 2009: 78).

In the prevailing model (the “traditional” one), the governance structure of corporations is two-tiered: the managing board (*consiglio di amministrazione*) has the function of ratifying decisions that have been previously taken by the controlling group, and is supplemented by a board of auditors (*collegio sindacale*) who are responsible for internal monitoring.

Statutory auditors and audit firms should be independent when carrying out statutory audits. They may inform the audited entity of matters arising from the audit, but should abstain from the internal decision processes of the audited entity. If they find themselves in a situation where the significance of the threats to their independence, even after application of safeguards to mitigate those threats, is too high, they should resign or abstain from the audit engagement. The conclusion that there is a relationship which compromises the auditor's independence may be

different as regards the relationship between the auditor and the audited entity from that in respect of the relationship between the network and the audited entity.

Family firms model. Family firms are companies in which one or more families linked by kinship, close affinity, or solid alliances hold a sufficiently large share of risk capital to enable them to make decisions regarding strategic management (Corbetta, 1995). Owners/founders perceive their firm as a “value” which must be transmitted to their heirs. From their perspective, appointing professional managers to run the firm implies the substantial failure of an entrepreneurial system based on the strength of family ties. Firms controlled by the entrepreneurs who started them often close down - rather than becoming corporations - when their founders are about to retire and no viable conditions exist for the persistence of family control after their retirement. In other words, when their heirs are unable to continue the family business, or when there are no heirs, they prefer to close the firm down rather than hand over control to outsiders (Santarelli and Lotti, 2005: 184; 190).

Proponents argue that outside board members bring fresh perspectives and new directions (Jain, 1980); monitor the progress of the family business and act as arbitrators; help in the succession process by providing support for the newly elected leader; analyse perceived strengths and weaknesses more objectively; help reduce the loneliness of the owner-manager; and act as catalysts for change, sounding boards for the owner-manager, and low-cost consultants (Mueller, 1988; Heidrich, 1988).

Unlike managerial companies, the success of family firms depends on the ability to manage three networks: the familial network, which encompasses all the members of this institution (whether or not they are involved in the management or in the equity); the organizational network, which includes all the people who take part in the business (at the top, middle, and low levels, familial or not); and the environmental network, which involves the external stakeholders, such as customers, suppliers, banks, and other institutions (Bauer, 1993).

In many cases, the family council is adopted in order to comprise the actual members of the family, including in some cases in-laws, young adults, and family members not directly involved in the business. The family council's task is to develop a new generation of family members, regulate their involvement in the business, and align the business with the family's plans (Jaffe, 2005: 50).

Civil laws

In a European context, the effects of differences in reporting practices may have been mediated, to some extent, by various EU Directives and the gradual adoption of international financial reporting standards. At the same time, national disclosure requirements have been increasing significantly as various regulatory, statutory and governance initiatives have sought to ensure greater transparency and accountability in response to financial scandals (Bozzolan et al., 2006: 95).

With reference to Italian small and medium firms, in the enabling decree (Lgs. D. 127 of 9 April 1991), articles 1-20 amended the Civil Code with respect to the provisions of the Fourth Directive whilst articles 21-46 set out a new law concerning groups of companies, no reference being made to the Civil Code in the latter case (Riccaboni and Di Pietra, 1996: 14).

Annual accounts of small and medium firms are regulated by the civil code which derives its rules from the Fourth Council Directive of 25 July 1978 based on article 54 (3) (g) of the Treaty (78/660/EEC) emended by various following Directives.

In the Directive 2003/51/EC of the European Parliament and of the Council of 18 June 2003, from which article 2428 of the civil code is derived, stated that the annual report shall include at least a fair review of the development and performance of the company's business and of its position, together with a description of the principal risks and uncertainties that it faces. The review shall be a balanced and comprehensive analysis of the development and performance of the company's business and of its position, consistent with the size and complexity of the business. To the extent necessary for an understanding of the company's development, performance or position, the analysis shall include both financial and, where appropriate, non-financial key performance indicators relevant to the particular business, including information relating to environmental and employee matters.

In this context, the Internet has become a critical transmission mechanism, and the corporate website now offers a fast, flexible, almost costless, and incredibly accessible method for disseminating data. Contemporary technological developments such as XBRL (eXtensible Business Reporting Language) have significantly enhanced the Internet's potential as a mechanism for transmitting information. XBRL is a worldwide standard for the publishing, exchange, and analysis of financial reports and data. The information can also be reliably extracted and analyzed across companies with no manual intervention; in fact XBRL provides a widely embraced open standard technology for data exchange and transformation, is likely to bring major changes to the way companies provide both compulsory and voluntary information to both investors and regulators, and will likely impact the way shareholders use accounting information. Information issued in the XBRL format enables investors and analysts to use and analyze precisely categorized information instantly, without the need to convert the data into another format. XBRL also offers significant benefits to both the suppliers and consumers of financial and nonfinancial information such as decreased costs of publication, reduced preparation time, simplified information access, wider information availability, and enhanced analytical capabilities (Schuster, 2006: 5).

Anti-frauds laws

Stolowy and Breton (2004) use an all-inclusive term, "accounts manipulation", which they define as "the use of management's discretion to make accounting choices or to design transactions so as to affect the possibilities of wealth transfer between the company and society (political costs), funds providers (cost of capital) or managers (compensation plans)" (p. 6). They partition "accounts manipulation" into "creative accounting", "earnings management", and "fraud" (Kalbers, 2009: 191).

Financial regulation is directed at the control of fraud and at the regulation of standards in the market and in the business and financial service. The regulatory approach is normally associated with the form of law and enforcement which developed in Italy at the end of the 19th century. A regulatory approach is associated with a minimal use of criminal sanctions, although it is important to recognize that this emerged out of a long history of negotiation between business groups, regulators and government. To regulatory approaches the main of law is to secure and

maintain high standards of business and commerce, and enforcement should ensure an appropriate balance between the interests of industry and public protection. Finally, regulatory enforcement is normally taken to involve cooperative compliance strategies including persuasion, advice and education (Croall, 2003: 45-46).

Legislative Decree No 61 of 11 April 2002 regulating criminal and administrative offences in respect of commercial companies, in accordance with Article 11 of Law No 366 of 3 October 2001 ('Legislative Decree No 61/2002'), which came into force on 16 April 2002, replaced Title XI of Book V of the Italian Civil Code by a new Title XI, entitled 'Criminal provisions in respect of companies or groups of companies'.

That legislative decree was introduced in the context of the reform of Italian company law carried out by a series of legislative decrees adopted on the basis of the authorisation provided for by Law No 366 of 3 October 2001.

In particular, Legislative Decree No 61/2002 introduced into Articles 2621 and 2622 of the Italian Civil Code new criminal provisions penalising the submission of false information on a company, an offence also referred to as 'false accounting' (Table 5).

<p><i>'Article 2621 (False information on a company)</i></p> <p><i>Save as otherwise provided in Article 2622, managers, directors, auditors and receivers who, with the intention of deceiving members or the public and with the aim of securing for themselves or others an unjust profit, make statements of substantive fact which are untrue in the company's balance sheets, report or other company documents provided for by law which are intended for members or for the public, even if such facts are the subject of valuations, or who omit information, the communication of which is prescribed by law, concerning the economic position, assets, liabilities or financial position of the company or the group to which that company belongs, in a manner which is capable of giving those to whom that information is addressed a false impression of that position, shall be liable to imprisonment for a term of up to one year and six months.</i></p> <p><i>The same criminal liability shall also extend to cases where the information concerns assets held or administered by the company on behalf of third parties.</i></p> <p><i>Criminal liability shall be excluded in any event where the false statements do not distort to an appreciable extent the representation of the assets, liabilities, economic position or financial position of the company or the group to which that company belongs. Criminal liability shall also be excluded where the false statements or omissions distort the pre-tax financial results for the year by no more than 5% or distort the net assets by no more than 1%.</i></p> <p><i>Such acts shall not be punishable in any circumstances where they are the result of estimates which, viewed individually, do not differ from the true values by more than 10%.</i></p>
<p><i>Article 2622 (False information on a company detrimental to members or creditors)</i></p> <p><i>Managers, directors, auditors and receivers who, with the intention of deceiving members or the public and with the aim of securing for themselves or others an unjust profit, make statements of substantive fact which are untrue in the company's balance sheets, report or other company documents provided for by law which are intended for members or for the public, even if such facts are the subject of valuations, or who omit information, the communication of which is prescribed by law, concerning the economic position, assets, liabilities or financial position of the company or the group to which that company belongs, in a manner which is capable of giving those to whom that information is addressed a false impression of that position and thereby occasion financial loss to members or creditors, shall, on complaint by the injured party, be liable to imprisonment for a term of between six months and three years.</i></p> <p><i>Proceedings shall likewise be initiated on complaint where the act constitutes a separate, more serious offence detrimental to the assets of persons other than members or creditors, unless it has been committed to the detriment of the State, other public institutions or the European Communities.</i></p> <p><i>In the case of companies subject to the provisions of Part IV, Title III, Section II, of Legislative Decree No 58 of 24 February 1998, the penalty for the acts provided for in the first paragraph shall be one to four years' imprisonment and a prosecution in respect of the offence may be brought ex officio.</i></p> <p><i>Criminal liability for the acts referred to in the first and third paragraphs of this article shall extend to cases where the information concerns assets held or administered by the company on behalf of third parties.</i></p> <p><i>Criminal liability for the acts provided for in the first and third paragraphs shall be excluded where the false statements or omissions do not distort to an appreciable extent the representation of the economic position, assets, liabilities or financial position of the company or the group to which the company belongs. Criminal liability shall in any event be excluded where the false statements or omissions distort the pre-tax financial results for the year by no more than 5% or distort the net assets by no more than 1%.</i></p> <p><i>Such acts shall not be punishable in any circumstances where they are the result of estimates which, viewed individually, do not differ from the true values by more than 10%.'</i></p>

Table 5 - Financial statement fraud crimes civil code articles

The crime set forth by art. 2621 of the Italian Civil Code is committed when - with the purpose of deceiving the shareholders or the public and of obtaining for the offender or for others an

unlawful profit - statements, reports or other company notices and announcements, set forth by the law, addressed to shareholders or the public, contain material facts not corresponding to the truth, even if still under evaluation, or they fail to include information that is mandatory according to the law regarding the economic, assets and liabilities, or financial situation of the company or of the group to which it belongs, in a way that leads recipients to erroneous deductions on the above-mentioned situation. Liability is excluded if the false statements or the omissions do not alter in a significant way the representation of the economic, assets and liabilities, or financial situation of the company or of the group to which it belongs. Liability is however excluded if the false statements or omissions determine a change in the accounting's economic result, gross of withholdings, not exceeding 5 per cent or a change of the net assets and liabilities not exceeding 1 per cent. In any case, there is no liability if the conduct arises from estimates that - if individually considered - differ in an amount not exceeding 10 per cent compared to the correct one.

The crime set forth art. 2622 of the Italian Civil Code is committed when, with the purpose of deceiving shareholders or the public and of obtaining for the offender or for others an unlawful profit, the financial statements, reports or other company notices and announcements provided by the law, addressed to shareholders or the public, contain material facts not corresponding to the truth, even if still under evaluation, or the omission of information that is mandatory according to the law regarding the economic, assets and liabilities, or financial situation of the company or of the group to which it belongs, in a way that leads addressees to erroneous deductions on the above-mentioned situation, causing a patrimonial damage to the company, to shareholders or to creditors. The two crimes set forth articles 2621 and 2622 of the Italian Civil Code, indicate a conduct that almost entirely coincides and differs only in the event of the occurrence, (art. 2622 Italian Civil Code) or non-occurrence (art. 2621 Italian Civil Code) of a fact causing a patrimonial damage to the company, to its shareholders or to its creditors. Both the above-mentioned crimes are committed: (i) stating in financial statements, reports or other company announcements and notices as provided by the law, aimed at shareholders or the public, material facts that do not correspond to the truth (ii) through the omission, in the same documents, of information, that are mandatory by law, regarding the economic, assets and liabilities, or financial situation of the company or of the group to which it belongs; the above-mentioned conduct (commission or omission) must be carried out with the intention of deceiving the shareholders or the public and must lead the recipients of the abovementioned company notices and announcements to erroneous deductions since they are intended only to obtaining an unlawful profit for the offender or of third parties.

In particular:

- false or omitted information must be of such a nature to significantly misrepresent the information on the economic, property or financial situation of the company or of the group to which it belongs;
- criminal liability exists even if information concern property owned or administered by the company on a third party's behalf;
- the crime defined under art. 2622 of the Italian Civil Code will be punished on the basis of charges filed by another party with the exception for the crime being

committed to the detriment of the State, of other public bodies, of the EU or in case listed companies are involved. In this latter event, ex officio proceeding is envisaged.

Subjects that can be punished for this crime are Directors, General Managers, Managers in charge of drawing up the company's accounting statements, Auditors and Liquidators. According to the Court, percentage thresholds on criminal liability for false statements as outlined above cannot be qualified as 'preferential laws' because they do not subtract specific acts from the sphere of application of a more general criminal rule. They only constitute specific elements of punishable conduct introduced by legislators in the exercise of their exclusive discretion and power over criminal policies (Italian Constitutional Court, Judgment No. 161/2004).

Some scholars, write over and above the obligation of individuals and companies to comply with the law, a corporate culture of compliance is probably the single most important bulwark against the emergence of criminal practices among company agents. A corporate compliance function essentially addresses the legal and reputational risk that a company faces from the behaviour of its agents and organs (Nestor, 2004: 348).

The leading reasons cited in international literature for the expected increase in fraud are: a) economic pressures, b) inadequate punishment of convicted managers, c) weakening of society's values, d) insufficient emphasis on prevention and detection, and e) more sophisticated criminals. Poor internal controls, management override of internal controls, and collusion between employees and third parties are also seen as factors contributing to fraud. One important issue is the determination of the causes and the provision of an explanation for the situation (Belkaoui and Picur, 2000: 33).

In Italy, all the five reasons might so these changes toward a more lenient criminal law for accounting fraud were based on the assertion that financial standards had been too onerous for non-listed companies. Instead of a "one-size-its-all provision," a multi-tiered approach was claimed to be more appropriate.

Beasley (1996) shows that the incidence of financial statement fraud is negatively related to the proportion of outside directors of the board. The presence of an audit committee does not significantly affect the likelihood of financial statement fraud (Cox and Weirich, 2002: 375). Bonner *et al.* (1998) demonstrates the relationship between the type of fraud and litigation. They concluded that there existed some support for the hypothesized higher incidence of auditor litigation when a company's financial statements contain a fraud that is commonly occurring or that involves fictitious transactions and events (Cox and Weirich, 2002: 375).

Overall, the results suggest that size is a strong factor in predicting companies laws compliance. Larger firms are more likely to be in compliance with companies law than smaller firms. This result is robust to a variety of specifications (Webb, 2008: 21)

Tax laws

The law of 7 April 2003 n. 80 (G.U. n. 91 of the 18 April 2003) previews a deep rearrangement of the fiscal system, with the reduction of the several taxes existing today to five main taxes,

collected in a single code: income tax, companies' income tax, value-added tax, services tax, inland duty. The reforms aimed to the gradual elimination of the regional tax on productive activities (IRAP).

The tax of companies' income (IRES) is based on the application of a single rate of 27,5 %, will also foresee the possibility for companies to ask for a national and international fiscal consolidation system, fiscal neutrality for capital gains from the sale of participation interests (participation exemption) the extension of the CFC rules (foreign controlled companies) to the connected companies. The income corporation tax, is paid by companies that have corporate status, therefore stock corporations, limited companies, mutual companies, private and public organisations that both have and do not have business as their main activity (including associations, consortiums). It is also paid by companies and organisations, with or without corporate status, that do not reside but have permanent establishment in Italy.

The corporate tax base is obtained first by applying the relevant positive and negative adjustments to the business profit (loss) and then subtracting some expenses relating mainly to charities and gifts of the company towards specific institutions or for specific aims (Table 6).

<p><i>Profit (loss) resulting from the balance sheet</i></p> <p>+ <i>positive adjustment</i></p> <p>- <i>negative adjustment</i></p> <p>- <i>extra deductions (charities and gifts to specific institutions or for specific purposes)</i></p> <p>= <i>Corporate income for tax purposes</i></p> <p>+ <i>Dividend tax credit</i></p> <p>- <i>Losses from previous periods brought forward</i></p> <p>= <i>Taxable income</i></p>
--

Table 6 - The spine of the corporation income tax

Corporate income relevant for fiscal purposes is obtained from total business profits (loss) resulting from the company balance sheet adjusted according to specific fiscal rules. Specifically, components of the business profits have to be modified in order to take account of specific fiscal criteria, which may affect positively or negatively the corresponding accounting variables. These fiscal adjustments reflect the difference existing between the conventional accounting rules and business accounting for tax purposes.

Since both financial reporting and taxation have the need for economic results in common, it seems reasonable to connect the two systems in a way that allows reference from one system to the other. In Italy, taxation depends on financial reporting: so all entries in the books are relevant for taxation. The fact that taxation depends on financial reporting can lead to the reverse effect, namely the influence of tax rules on financial accounting. First, the taxpayer, knowing that entries in the books are relevant for taxation, might tend to understate his profits and exaggerate his expenses, in order to minimize taxation. Second, in order to minimize the workload of the reconciliation for tax purposes, the company let tax law prevail over the objective of the financial reporting. Third, in some cases tax law requires that in order to benefit

from these tax benefits, tax reporting techniques have to be used in the financial statements (Eberhartinger, 1999: 94-95).

In a general sense, the firm's taxation decisions are deliberate and the implications for strategy are intended outcomes. Firms incur a high level of expenditure attempting to obtain the best tax position, often both employing in-house expertise and using the services of external, expert tax consultants. It is to be expected therefore that tax decisions will be a carefully thought-through part of the strategy process (Galister and Hughes, 2008: 37).

In Italy, like in some other countries, financial reports effectively reflect tax laws, which are in turn influenced by political, economic, and social objectives, such as promoting or discouraging certain types of economic activities, promoting employment, controlling inflation, or redistributing wealth. Because the primary objective of tax rules is not to satisfy the information needs of capital market participants, financial and tax reporting provides incentives to reduce taxes by reporting systematically lower profits, and this too undermines the value relevance of financial reports (Ali and Hwang, 2000 :5-6).

Stakeholders behaviour and corporate social responsibility

A *primary* stakeholder group is one without whose continuing participation the corporation cannot survive as a going concern. Primary stakeholder groups typically are comprised of shareholders and investors, employees, customers, and suppliers, together with what is defined as the public stakeholder group: the governments and communities that provide infrastructures and markets, whose laws and regulations must be obeyed, and to whom taxes and other obligations may be due. There is a high level of interdependence between the corporation and its primary stakeholder groups (Clarkson, 1995: 106)

Secondary stakeholder groups are defined as those who influence or affect, or are influenced or affected by, the corporation, but they are not engaged in transactions with the corporation and are not essential for its survival. The media and a wide range of special interest groups are considered as secondary stakeholders under this definition. They have the capacity to mobilize public opinion in favor of, or in opposition to, a corporation's performance (Clarkson, 1995: 107)

Classes of stakeholders can be identified by their possession or attributed possession of one, two, or all three of the following attributes: (1) the stakeholder's power to influence the firm; (2) the legitimacy of the stakeholder's relationship with the firm, and (3) the urgency of the stakeholder's claim on the firm. The manager's perception of a stakeholder's attributes is critical to the manager's view of stakeholder salience (Mitchell *et al.*, 1997: 854, 871).

The preparation of a report on CSR, sustainability, environmental respect or corporate governance appears as a process that reveals a rather high level of subjectivity due to the wide variety of possible options available to an organization for selecting, measuring and disclosing information on these issues (Zambon and Del Bello, 2005: 138-139)

In recent years there has been increasing dissatisfaction with traditional financial reporting and its ability to provide stakeholders with sufficient information on a company's ability to create wealth (Bozzolan *et al.*, 2003: 543).

Although firms employ a wide variety of communication to report their stakeholder engagement efforts, traditionally, voluntary disclosure made in the annual reports is the single most comprehensive and most frequently employed mechanism for reporting engagement initiatives (Boesso – Kumar, 2009: 64).

Internal and external audit

Internal auditing is a sub-field of auditing that has been continuously evolving (Birkett *et al.*, 1999a, 1999b) requiring synthesis of research findings (cf. Allegrini *et al.*, 2006) and constant updating of the professional body of knowledge (Abdolmohammadi *et al.*, 2006).

Audit committees and an effective internal control system help to minimise financial, operational and compliance risks, and enhance the quality of financial reporting.

Auditing standards explicitly require auditors to provide reasonable assurance that material financial statement fraud is detected (Beasley, 1996: 444)

The main purpose of establishing audit committees is to assist the directors to function efficiently. In this respect the aims are threefold: first, to increase confidence in the credibility and objectivity of the company's published financial information; secondly, to assist directors in meeting their financial responsibilities; and thirdly, to strengthen their independent position (Hemraj, 2003: 153).

Internal auditing is an independent professional service which is not regulated by Italian laws and which is adopted in only a few Italian small and medium firms.

Watts and Zimmerman (1983) posit that auditors act in the interest of the managers that hire them, rather than in the interest of the firms' investors. They report evidence that is weakly consistent with this hypothesis using data on auditors' responses to proposed new accounting standards. An alternative explanation is that auditors provide formal assurance only on the annual report, making it difficult for them to provide timely signals to the capital markets. A third explanation is that auditors are concerned about minimizing their legal liability, rather than enhancing the credibility of financial reports. Accordingly, they lobby for standards that reduce their own risk, even though such standards reduce the value of financial reports to investors. Future research may be able to distinguish between these explanations (Healy and Palepu, 2001: 416).

The Internal Audit efforts implemented after the Legislative Decree 231/2001 which regards the administrative liability of corporations. Under this law the company is liable for crimes committed in its interest or to its benefit by individuals who represent, administer or manage the Company (Miglietta *et al.*, 2007: 50).

The Company is exempt from liability for the crimes committed by the aforementioned individuals, if it proves it has adopted and effectively implemented appropriate organizational and management models to avoid the crimes.

Furthermore it has to have charged an internal Board (i.e. Supervisory Body) with monitoring the functioning of and compliance with the models adopted.

The exemption from administrative liability for crimes is, for enterprises, an opportunity to reduce the risk of legal action, lawsuits or juridical proceedings (legal risk).

Firstly, the Board of Statutory Auditors verifies compliance with the law and with the articles of association and observance of the principles of correct administration. During the year, the Board of Statutory Auditors holds meetings, as well as additional informal sessions; at meetings of the Board of Statutory Auditors and the Board of Directors, and at least once per quarter, they obtained information from the Executive Directors concerning general business performance, the Company's business outlook, and the most significant transactions in terms of size and characteristics undertaken by the Company, including with respect to its subsidiaries; they took part in two Shareholders' Meetings and thirteen meetings of the Board of Directors, which were held in accordance with the articles of association and the legislative provisions that govern the functions of such meetings.

Secondly, the Board of Statutory Auditors assesses and verifies the adequacy of the organizational, administrative and accounting system and the reliability of said system to correctly represent operating circumstances by obtaining information from the respective department managers and examining Company's documents.

Thirdly, having followed the work done by the Internal Audit Office, including that managed and coordinated by the Internal Control Officer and by the Audit Committee, they confirm that the internal control system adopted by the Company is fully adequate.

Finally, the Board of Statutory Auditors attests that: (1) in the preparation of the accounts the standards laid down by Article 2423-bis of the Italian Civil Code have been complied with and there have been no deviations from the established accounting principles pursuant to the fourth paragraph of Art. No. 2423 of the Italian Civil Code; (2) the application of the Italian Civil Code provisions for the preparation of the accounts is consistent with the truthful and correct representation of the accounts.

As to information for stakeholders, the Board of Statutory Auditors has to control the Board of Directors' Report, prepared in accordance with Art. No. 2428 of the Italian Civil Code, and, in a particular way, if it gives full information relative to the performance of the company ...

In Italy, a separate board of auditors has traditionally performed the internal audit functions. Neither the board of directors nor the board of auditors have ever been able to exercise effective control over managers (and hence over the dominant shareholders who appoint them). More generally, Italian corporate law has historically provided poor protection for investors, while enforcement institutions, like courts or the Italian securities and exchange commission (Consob), have been unable to make up for the deficiencies of the law (Enriques and Volpin, 2007: 128).

The external auditing, in Italy, can be carried out by an independent professional auditors under three different forms which only partially overlap:

- 1) *società di revisione* (audit company) (legislative degree n.58/1998)
- 2) *revisore esterno* (legislative degree n.88/1992)
- 3) *collegio sindacale*.

The small and medium entity usually have a collegio sindacale which prepares an annual report included in the financial statements. From 2009, with local audit standard n.1 (Principio di revisione) for annual report there is a legally prescribed format that can ensure stakeholders about the degree of reliance that can put the credibility of financial statements and other documents.

Accounting professionals role in the firm

The Italian accounting profession belongs to the broader field of liberal arts - unique at international level. The regulation of the Italian accountancy profession has been completely reformed by the legislative decree nr. 139 enacted on 28 June 2005.

On January 1st 2008 the Ordine of Dottori Commercialisti and the Collegio of Periti Commerciali - professions established in the first half of last century and linked by common competences and purposes - merged in the Albo Unico of Dottori Commercialisti and Esperti Contabili (Legislative Decree no. 139 of 28.6.2005).

Two section will be created in the new roll: section A will be staffed by the “dottori commercialisti” (chartered accountants), and the section B by the “esperti contabili” (accounting experts).

The functions of this profession have steadily evolved, constantly expanding its areas of specialization and forms of consulting (Table 7).

		<i>DOTTORI COMMERCIALISTI</i>	<i>ESPERTI CONTABILI</i>
<i>Total</i>	<i>107,499</i>	<i>61%</i>	<i>39%</i>

Table 7 – Accounting professionals in Italy

Accounting professionals are the key advisers of enterprises. They oversee their entire course of life from birth - preparing business plans and associated economic, financial and tax evaluations - to development - offering financial, bookkeeping and legal advice, troubleshooting and auditing operations - to the eventual termination of activity - where assessments of the legal and economic propriety of operations are necessary. Accountants also participate in extraordinary corporate operations by providing advice on contracts, transactions and arbitration proceedings, or by offering operating advice in the case of corporate restructuring or subjection to administration by a commissioner.

FINANCIAL REPORTING AND VOLUNTARY DISCLOSURE IN A STRATEGIC PERSPECTIVE

System dynamics is an aspect of systems theory as a method for understanding the dynamic behavior of complex systems. The basis of the method is the recognition that the structure of any system — the many circular, interlocking, sometimes time-delayed relationships among its components — is often just as important in determining its behavior as the individual components themselves.

System dynamics is an approach to understanding the behaviour of complex systems over time. It deals with internal feedback loops and time delays that affect the behaviour of the entire system. What makes using system dynamics different from other approaches to studying complex systems is the use of feedback loops and stocks and flows. These elements help describe how even seemingly simple systems display baffling nonlinearity. The elements of system dynamics diagrams are feedback, accumulation of flows into stocks and time delays.

In Italian *economia aziendale* system dynamics is applied in modelling strategic management and performance (Coda, 1988) and strategic dynamics (Coda and Mollona, 2006) (Figure 1).

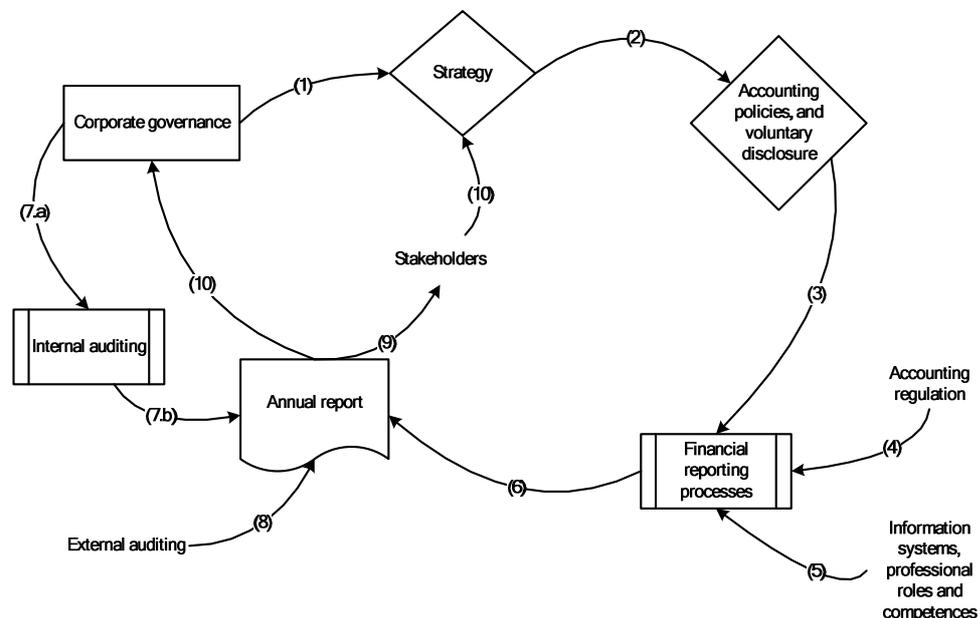

Figure 1 – The strategic dynamics model proposed

Relation (1) The strategy process usually involves both an intentional strategy process and an emergent process. However, while most firms have both types of processes at work, their respective importance will differ. It is possible to envisage a strategy process continuum. At one extreme are firms in which the strategy process is very deliberate and formalized and where managers are constrained from deviating from the intended strategy. At the other extreme are firms that have no formal strategic planning process, where senior managers devote little time to intentional strategy process. These firms rely on the independent or 'autonomous' action of managers that occurs outside any formal strategy. At this end of the continuum the line managers initiate the activities that, in aggregate, constitute firm strategy. Apart from these extreme cases, most companies follow a hybrid process and rely on a combination of intentional and emergent processes. They have both a formal, intentional process in which senior managers

articulate strategy, and a process in which a middle manager or a line manager can undertake a project outside the intended strategy (Mintzberg and Waters, 1985).

The basic strategic management processes for both family and non-family firms is similar in the sense that a strategy, whether implicit or explicit, must be formulated, implemented, and controlled. The differences are in the set of goals, the manner in which the process is carried out, and the participants in the process. In family firms, the owner-family is likely to influence every step of the process, whereas in nonfamily firms, family influences are at best (or worst) indirect (Sharma, Chrisman, and Chua, 1997: 2-3).

Board strategic involvement in small firms are somewhat conflicting. Some researches show that the board of small firms tends to be rather passive in its strategic involvement, and even claim that the strategic participation is not the dominant activity of the board in very small firms unless they are specific contextual conditions (Pugliese and Wenstop, 2007: 386).

A family business is more likely to have multiple, complex, and changing goals rather than a singular, simple, and constant goal. Tagiuri and Davis (1992) found the following to be the six most important goals: to have a company where employees can be happy, productive and proud; to provide financial security and benefits for the owner; to develop new quality products; to serve as a vehicle for personal growth, social advancement, and autonomy; to promote good corporate citizenship; and to provide job security. Because of the variety of goals in small family businesses, the various partial success measures will not provide uniformly appropriate success indicators for different small family businesses. Measuring success with different isolated partial success measures will thus indicate various levels of success for one and the same business and, as a consequence, also yield inaccurate comparative results across multiple companies in the same sample. These isolated partial success measures will also be influenced by company size, company age, industry and other variables that might not indicate success alone (Sharma, 2004).

Family firms are arenas characterized by financial and non-financial family goals. When financial goals prevail in a family, family members' motivation to operate in the family firm will be based on lower order needs and extrinsic factors, thus favoring the emergence of agency relationships. On the contrary, when nonfinancial goals prevail, this will foster motivation based on higher-order needs and intrinsic factors, thus favoring steward-principal relationships (Corbetta and Salvato, 2004: 357-358).

The nature of the founder's role in the family firm's development, understanding, and commitment to a vision, a set of goals, and a culture can be viewed in terms of the centrality of her/his position in the firm's top management group network. Four types of family business culture have been identified: paternalistic, laissez-faire, participative, and professional (Dyer, 1988). To have an effective firm strategy, founders must have a clear understanding of the organizational culture they have inspired and of its fit with the family firm's culture (Kelly, Athanassiou, Crittenden, 2000: 29).

Relation (2) Prior studies find that the quality of corporate disclosure is associated with certain firm characteristics. These studies measure corporate disclosure by developing a disclosure index or score to measure voluntary disclosure in financial statements.

Generally speaking, board composition (measured by the proportion of outside directors) is expected to be positively associated with voluntary disclosure. The role of the board of directors is to monitor management decisions. Having a higher proportion of outside non-executive directors on the board would result in better monitoring of the activities by the board and limit managerial opportunism (Fama, 1980; Fama and Jensen, 1983). Outside directors who are less aligned to management may be more inclined to encourage firms to disclose more information to outside investors. Then, it is expected that having more outside directors on the board will also result in more voluntary disclosure. Voluntary disclosure is measured by the amount and detail of non-mandatory information that is contained in the management discussion and analysis in the annual report (Eng and Mak, 2003: 327).

Relation (3) The financial reporting process, therefore, finds nourishment in the accounting policies, in relation to those, will be directed between the limitations imposed by the accounting regulation and will insert the content of voluntary disclosure who have been chosen.

Relation (4) Management decisions may cause financial reporting to range from “high quality” at one end of the spectrum to fraud at the other end. Some management behavior in financial reporting may be considered unethical, but not necessarily fraudulent (illegal). Because financial reporting is not an exact science, the competence and integrity of management are both relevant in preparing high quality financial reports (Kalbers, 2009: 195). The use of generally accepted accounting principles serves the need of a better quality of the information given by the financial statements and a consequent more effective accountability of the controlling agents (Pizzo, 2000).

The institution of more and more detailed accounting principles and procedures limits the controllino agent’s discretion in the drawing up of the financial statements (Melis, 1995).

This may have a positive influence on the corporate governance system, since by controllino and manipulating the quality of corporate information disclosed in the financial statements, the dominant stakeholder (i.e. the one that effectively controls the corporation) would be able to influence the uncertainty attached to the estimates that shareholders (and, in general, all the strategic stakeholders) make of any given variable (Forker, 1992). By doing so, the dominant stakeholder would make monitoring procedures less effective, thus he/she would become less accountable to the other strategic stakeholders.

Relation (5) An important role is played by the resources and skills that are available to that process, even in terms of specific skills in communication (Coda, 1991,b: 57-58) also consider the role of “Dottore commercialista ed esperto contabile” (Accounting professional). He brings accounting culture in the firm. In Italian SME he chooses, most often, accounting software and set the plan of accounts and suggests the most appropriate earnings management and tax planning or directly exercise discretion in the preparation of financial statements and decides accounting polices.

Relation (6) The result of the administrative process that is downstream of the guidelines of corporate strategy and the accounting policies and financial reporting processes is made by the annual report.

Relation (7) The need to optimize company risk assessment as a critical factor in achieving their own strategic aims, the international and national financial scandals, often a result of the weak internal control systems of the companies involved and the general inadequacy in the running of the same, as well as the frequent problems of internal revision, organization on behalf of the administrators and management responsibility, are all factors to be considered positive and stimulating because aimed at improving the administration of SME companies, in respect of the accounting rules and the interests of all the stakeholders.

Relation (8) The external audit is intended to enhance the credibility of the financial statements of a firm. Auditors are supposed to verify and certify the quality of financial statements issued by management. However, over the last several decades, a substantial and increasing portion of an accounting firm's total revenues have been derived from consulting services of various kinds. Provision of these nonaudit service can potentially hurt the quality of an audit by impairing auditor independence because of the economic bond that is created between the auditor and the client (Agrawal and Chadha, 2005: 376).

Relation (9) To what extent do other factors, such as the legal protection of investors' rights or other corporate control mechanisms, the auditing regime, or the relative importance of securities markets versus bank financing, influence the economic effects of financial accounting information? We expect the interactions between the quality of financial accounting regimes and effectiveness of corporate control mechanisms to provide evidence on the governance effects of financial accounting information per se. We expect the interactions between financial accounting regimes and other domestic institutions to provide evidence of the determinants of the total economic value of financial accounting information from better governance as well as other channels. The fourth theme is how the economic effects vary with specific features of the accounting regimes (Bushman and Smith, 2001: 292-293)

The active role of the reporting activity, resulting from the concrete way the stakeholder oriented report is constructed, has two orders of consequences: (1) to guide company activities through a particular representation of the results (perceived as objective), on the basis of which the company reacts by adjusting its objectives, actions, and activities; and (2) to concretize the stakeholder oriented concepts, namely CSR, sustainability, environmental respect and corporate governance: directly – through the narrative parts of the report, such as conceptual definitions and discursive descriptions of the stakeholder oriented activities performed; and or indirectly – through the structure and content of the data reported, that contribute to visualize and diffuse a company-specific picture of the concept (Zambon and Del Bello, 2005: 135).

Relation (10) The presence of a dominant stakeholder (top management, blockholder, large creditor, etc.) may influence negatively the quality of corporate communication, by making the financial reporting system pursuing his/her own interests, rather than pursuing the overriding "true and fair view" objective.

If unaccountable, the dominant stakeholder has an incentive to have an opportunistic behaviour.

He/she is likely to select accounting procedures to maximise his/her own utility (Gordon, 1964), manipulating the information in the financial statements to pursue that goal.

In fact, the presence of a dominant stakeholder was found to be associated with poor disclosure (Forker, 1992) and an overall inadequate quality of corporate communication (Fiori, 1999).

From a normative perspective, the presence of a dominant stakeholder should not have a significant influence on the quality of corporate communication, since the information flow should not be manipulated by the stakeholder who controls the corporation (Dezzani, 1981).

Wartick and Cochran (1985), following Carroll (1979), used the terms reactive, defensive, accommodative, and proactive to characterize corporate strategy or posture toward social responsiveness. This approach was converted into the RDAP Scale (Clarkson, 1995: 108).

Fairness and balance in the distribution to its primary stakeholder groups of the increased wealth and value created by the firm are necessary to preserve the continuing participation of each primary group in the firm's stakeholder system and to avoid favoring one group unduly and at the expense of other groups. If any primary group perceives, over time, that it is not being treated fairly or adequately, whether it is the employee, customer, or shareholder group, it will seek alternatives and may ultimately withdraw from that firm's stakeholder system. If that withdrawal occurs, the firm's survival will be threatened (Clarkson, 1995: 112).

Research has revealed significant variations in perceptions of family firm stakeholders regarding even the most fundamental issues (Poza, Alfred, & Maheshwari, 1997). Particular importance has to be paid to understand the extent of a alignment in the definition of success used by the key players of family firms. The tenets of stakeholder theory may prove useful in gaining such an understanding. An alignment of stakeholders' perspective on what "success" means to them could be an important predictor of success of family firms, as such an alignment can lead to agreement on appropriate mode and extent of involvement of key family and nonfamily members in the firm. On the contrary, a mismatch in the definitions of success or goals that different stakeholders strive to achieve for the family firm could point toward a tenacious source of conflict (Astrachan and McMillan, 2003).

LIMITATIONS OF THE PAPER AND FUTURE RESEARCH DIRECTIONS

The authors would acknowledge a number of limitations of this study. First of all, the study is based on a theoretical basis. Future research aimed at examining, by surveys and case studies, relationships between the variables of the model needs, in order to explain and predict corporate financial disclosures in Italian small and medium firms, are planned.

Hence, we propose a preliminary explanation of the influence of some involvement variables on voluntary disclosure and financial reporting quality. In particular, this article makes a contribution by integrating different theoretical perspectives on boards and their related roles, with concepts capturing from mainstream Italian *economia aziendale* literature approaches referring to corporate governance, information systems, internal auditing, accounting regulation, earnings management, and stakeholder theory.

The resulting model has some contingency qualities, although limited to considering some strategy, accounting policies, voluntary disclosure, financial reporting processes, accounting regulation, professional roles, external and internal auditing, and so on.

Our model may also be subject to relatively straightforward empirical testing.

Empirical approaches can be used to measure the comparative effects of these various dimensions in order to determine those that are most influential in fraudulent financial reporting. From a methodological point of view, identifying the population of firms involved in fraudulent financial reporting is problematic. First and foremost, fraud samples are limited to only discovered fraud. Frauds never discovered are not available for study. Frauds that are caught by the auditor and/or firm and subsequently corrected within the company are generally not revealed publicly and therefore, are similarly, not available for study (Kaminski et al., 2004: 21).

ACADEMIC ENTREPRENEURS' ROLE IN SCIENCE-BASED COMPANIES.

Armano, Bruno¹; Scagnelli, Simone Domenico²

¹*Business Administration Department, University of Turin, Turin, Italy*

²*Business Administration Department, University of Turin, Turin, Italy*

Purpose - The aim of this paper is to present the results of a study examining the role played by academic entrepreneurs in science-based companies grown in university incubators. We aim to verify if the presence of academic entrepreneurs improves survival skills and economic and financial performances of science-based companies when these leave the incubator. Moreover, we aim to verify if different levels of involvement of academic entrepreneurs (i.e. as shareholder, as member of board of directors, or both) can bring to different levels of financial performance.

Design/methodology/approach - The research has been carried out on a sample of science-based companies based, mainly in Northern Italy, and composed by 49 companies graduated from the Turin Polytechnic's Incubator, called I3P. Data about the presence of academic entrepreneurs have been obtained interviewing I3P CEO while companies' survival skills and financial performance have been assessed by calculating economic and financial indexes (i.e. Altman Z score, ROI, ROE). Statistical correlation has been analysed using SPSS.

Findings - The statistical analysis shows that there is a negative correlation between the variable used for addressing academic entrepreneurship and that used for evaluating companies' performance. However, it seems that there is a positive correlation between a deep involvement (both as shareholders and directors) of academic entrepreneurs and financial performance of analyzed companies.

Originality/value - While there is a broad attention on incubated companies, there are only few researches regarding graduated companies. We focused our attention on the role played by academic entrepreneurs in graduated companies.

Paper type Research paper

Keywords Academic entrepreneurship, science-based companies, university incubator, economic performances.

INTRODUCTION

Universities give their contribute to the growth of the economy with the creation of research centres and laboratories and sometimes with the establishment of scientific parks and incubators. In these structures science advances find the right environment and can lead to the creation and the development of new products and services. In an incubator ideas coming from scientific discoveries can be developed in start-up companies if the technology transfer process from universities to business is effective. Usually incubators and scientific / technological parks offer different advantages to start-up companies (i.e. a site, laboratories for scientific tests, secretary services, logistic services, etc...). Start-up companies pass only the first period of their life in the incubator and then leave. The industries in which these science-based companies are involved are very risky and so, while some of them continue their growth even out of the incubator, some others aren't able to stay in the market. Between the survived science-based companies, some obtain satisfying economic performances while some others earn only little profits. The presence (or not) of academics entrepreneurs in the board of science-based companies born and grown in

an incubator could be one of the reasons of the different performances of these companies. Even the role (only shareholder, only director or both) played by academics in science-based companies could influence economic and financial performances.

BACKGROUND TO THE RESEARCH

The role played by Universities in relation to entrepreneurial development has been investigated by different points of view. A research about 45 incubators (Allen, 1985) documented the various services offered and the role played by Universities in sustaining and fostering the growth of young entrepreneurial firms.

Others (Bonaccorsi and Piccaluga, 1994) developed a theoretical framework and a taxonomy to study university-industry relations. Other researches assessed the effects of business-university alliances on innovative output and financial performance (George et al, 2002) and pointed out the importance of university link and knowledge flows on the overall firm performance (Rothaermel and Thursby, 2005a).

This explain the widespread literature that exists about incubators and related companies (Wright, 2003). The function of university technology business incubators has been previously studied by providing conceptual frameworks for assessing and managing them (Mian, 1997) and by studying the relations between incubators and science parks too. Others argued the importance of close links among different knowledge provider entities (Aernoudt, 2004), (Phan et al., 2005).

Also Italian incubators has been studied, in particular by assessing their effectiveness in term of developing start-up companies, by showing that on-incubator firms perform better than off-incubator firms (Colombo and Delmastro, 2002) and that the firm propensity to a broad use of incubator's resources and support increases with the progression of its lifecycle (McAdam and McAdam, 2008).

Another branch of studies focused on academic spin-off companies (Lockett et al., 2005), (Mustar et al., 2006), for example by studying the national trends (Chiesa and Piccaluga, 2000) or exploring the typologies of companies originated in universities (Druilhe and Garnsey, 2004). By focusing on the venture capital activity in relation to the lifecycle of target firms, some best practices were developed for universities' incubator management (Wright et al., 2006). Finally others pointed out the role played by intellectual transfers (Cesaroni and Piccaluga, 2005) and studied knowledge management in an organizational perspective (Becker and Gassmann, 2006).

Many researches focused on the characteristics of entrepreneurs, some even on academics entrepreneurs, i.e. studying their attitudes and organizational characteristics (Grandi and Grimaldi, 2005). Another branch of researches focused on the behaviour of academics after the beginning of business activities: i.e. modifications of role identity (Jain et al., 2009), modifications of their research productivity (Lowe and Gonzales-Brambila, 2007).

In our opinion, there is a lack of research about the presence of academic people crossed by financial performances of science-based companies. Hence, the aim of this research is to analyse science-based companies born in incubators and to verify if the presence of academic people can strengthen or weaken the economic and financial performances of those firms. In particular we

aim to validate the hypothesis H1: Companies with academic entrepreneurship have better survival skills than other graduated companies. A past research showed that the entrepreneurial attitude of academics is related to effective technology transfer and can enhance the commercialization of research outputs (Renault, 2006). Besides, a positive effect could be related to a close link to research gains, to the availability of advanced technology and to continuous knowledge flows. However the presence of academic people could have a negative correlation with firms' economic and financial performances. The reason could be related to a lack of management skills and entrepreneurial experience of academics or to a lack of time caused by their academic commitments. Even the conflicts between the University and business cultures could sometimes depress the performance of science-based companies (Cyert and Goodman, 1997). A further aim of this research is to verify if different levels of involvement of academic entrepreneurs (i.e. only as shareholder, only as director, both shareholder and director) can bring to different levels of financial performance. Therefore, we aim to validate a second hypothesis H2: Higher grade of involvement of academic entrepreneurs can lead to better financial performance.

RESEARCH METHODOLOGY

This research study has been carried out on companies "graduated" by Italian incubator I3P where I3P stands for "Innovative Enterprise Incubator of Turin Polytechnic". This incubator is a non-profit joint-stock consortium built by Turin Polytechnic and other public entities.

I3P was established in 1999 to promote and support the creation of hi-tech enterprises, grouping the innovative potential developed in research institutions in Piedmont area.

In 2004, I3P was awarded by Oxford University as the world's best science-based incubator, after Tsinghua Science Park in Beijing in 2002 and the BioBusiness Centre in Oxford in 2003.

In this incubator, the maximum period a company can stay in the incubator is three years and then it must leave/graduate.

As at May 2009, no. 61 companies were reckoned as graduated by the incubator (Source I3P website); the companies belong to different industries and have different ownership structures. These organizations have to be considered small enterprises because their maximum annual turnover is not more than euro 1.5-2 millions and the average number of employees is between 2-10.

In the following table, there is a breakdown of these graduated companies.

	<i>Partnership firms</i>	<i>Limited companies</i>	<i>TOTAL</i>	<i>%</i>
<i>Aerospace</i>	-	1	1	1.7%
<i>Biotech</i>	1	1	2	1.7%
<i>Building & Architecture</i>	-	1	1	1.7%
<i>Chemicals & Material</i>	-	1	1	1.7%
<i>Electronics & Automation</i>	3	12	15	23.3%
<i>Energy</i>	-	4	4	6.7%
<i>Environment & Territory</i>	-	3	3	6.7%
<i>Information Technology</i>	3	27	30	50%
<i>Mechanics</i>	1	3	4	6.7%
<i>TOTAL SAMPLE</i>	8	53	61	100%
<i>Available financial statements</i>	-	49		

Table 1: Industry and ownership structure of the graduated companies.

Due to the fact that in Italy only limited companies provide public financial statements this research focused only on the no. 53 limited companies which account for 87% of the total graduated companies. Of these no. 53 limited companies we found financial data only for no. 49 companies (which account for 92% of the total limited companies).

These data were found directly by requesting the companies' financial statements (for years 2005, 2006, 2007) from the Italian Chamber of Commerce; shareholders and directors' lists were requested with financial statements.

Subsequently, in order to analyse the characteristics of the entrepreneurs in the analysed companies and the role played by academic people, we lead an in-depth interview with the CEO of I3P.

These specific research features and the related hypothesis are separately presented in the following paragraphs: academic involvement analysis and performance analysis.

Academic involvement analysis

We carried out an interview with the I3P CEO for addressing the following topics for each of the graduated company:

- Presence of academic entrepreneurs
- Type of involvement of academic people

It's important to mention that, for presence of "academic entrepreneurship", we mean the presence as shareholders and/or directors (in the science-based companies) of people with a role in an academic institution (i.e. full, associate and assistant professors). So we excluded all other types of academic link and/or collaboration (i.e. lecturers, instructors, scholarship holders, etc.). Once the academic link was verified we focused on the type of involvement of academic people; in other words we figured out for each company when the academic was only a shareholder, only a director or both a shareholder and a director.

We used a dummy variable to take into account these different levels of entrepreneurial involvement. A score of 0 is given to companies that have no academic entrepreneurs; a score of 1 is given to companies with the presence of at least one academic. Then another dummy variable is used to test the grade of academic's involvement; a score of 0 is assigned to companies with academics only involved as shareholders and a score of 1 is assigned when the academics act both as shareholders and as directors.

We omitted the score assignment for academics who act only as directors because none of the companies analyzed presented this case.

Hence, the resulting values were used to validate the following hypothesis:

- **H1:** companies with academic entrepreneurship have better survival skills than other graduated companies;
- **H2:** higher grade of involvement of academic entrepreneurs can lead to better financial performance.

Performance analysis

The objective of this part of the work is to assess the performance of graduated companies by focusing mainly on quantitative aspect (financial structure, profitability, turnover growth) and then taking into account the overall qualitative opinion arising from the I3P's CEO interview.

When entities are not listed in a stock market, financial and profitability ratios can be used as main tools to assess financial and economic performance (Chakravarthy, 1986). However, these measures may be biased because the sample is composed by entities operating in different industries with different industry-driven levels of fixed assets, variable/fixed cost ratios and competitiveness (Porter, 1980). To overcome these limits a comparison with specific industry ratio averages may be useful.

The ratios computed over the three years were:

- % intangibles rate: as weight of intangibles on total assets
- Leverage: as debts/equity ratio
- ROI: as operating profit divided by total assets
- ROE: as net profit or loss divided by total equity.

Although we carried out a comparison with the average industry ratios, this was not significant because of peculiarities of start-up companies (rapid levels of growth, technology development and finance absorption).

Therefore, in order to overcome the previous limits and to have a unique dependent variable to test on the economic/financial performance aspect, instead to develop a specific overall performance score, we used the Altman's Z score (Altman, 1968). While the Z values were essentially constructed to predict bankruptcy, it can also be a valuable index of the company's overall good performance.

In detail, we used the normal Z score model (Altman, 2002) that is:

$$Z = 1.2 (X1) + 1.4 (X2) + 3.3 (X3) + 0.6 (X4) + 1.0 (X5)$$

where: X1 = working capital/total assets, X2 = retained earnings/total assets, X3 = earnings before interest and taxes/total assets, X4 = equity book value/total assets, X5 = sales/total assets.

By measuring distance from bankruptcy, Z score could be taken as a variable for companies' economic and financial performance.

Incubated companies economic and financial performance may depend on the date of birth.

Due to these argumentation, while considering the amount of science-based companies in our sample (in 2007 more than 75% of the companies were outside the incubator), in the analysis we decided to take into account and study: the 2007's Z for companies younger than three years, the 2006's Z for three years old companies and 2005's Z for companies older than three years.

THE RESULTS

A total of no. 22 companies (42% of the total sample) have a link with Universities (mainly Turin Polytechnic) but only no. 16 (31%) have what we call "academic entrepreneurship". Financial data and information about the entrepreneurial involvement were available for all the 16 companies. None of the academics involved in the graduated companies acts only as a director, all academics involved are at least shareholders, while no. 9 of them act also as directors. The complete breakdown about the academic entrepreneurial presence is presented in the following table.

<i>Number of companies</i>	<i>Total</i>	<i>%</i>
<i>Graduated companies with available financial data</i>	49	100%
<i>Presence of Academic Entrepreneurship</i>	16	33%
<i>of which</i>		
<i>only as shareholder</i>	7	44%
<i>only as director</i>	-	-
<i>both shareholder and director</i>	9	56%
<i>Notes: number of companies.</i>		

Table 2 - Sample breakdown - Presence / involvement of academic entrepreneurship.

After the analysis of available financial data and computation of financial ratios, we studied how academic entrepreneurship influences the performance of these companies. The following table presents a synthesis of financial data and computed ratios crossed with data about academic entrepreneurship.

		<i>Academic Entrepreneurship</i>		<i>TOTAL</i>	
		<i>No</i>	<i>Yes</i>	<i>Mean</i>	<i>Std. Deviation</i>
<i>Annual Turnover</i>	Y2005	275.3	205.9	219.4	339.8
	Y2006	235.5	185.2	254.0	324.4
	Y2007	367.3	404.3	378.6	470.0
<i>Operating profit</i>	Y2005	3.2	-24.9	1.9	45.1
	Y2006	8.6	-12.1	-5.4	150.8
	Y2007	7.3	47.8	19.7	447.4
<i>Total assets</i>	Y2005	288.0	398.5	224.8	306.9
	Y2006	234.0	205.3	321.8	485.1
	Y2007	328.4	534.9	391.6	643.2
<i>Equity</i>	Y2005	65.4	68.2	53.5	136.9
	Y2006	67.7	23.6	66.3	124.7
	Y2007	58.2	146.9	85.4	176.4
<i>Notes: means computed on 49 companies - data in Euro/000</i>					

Table 3 - Financial data synthesis and academic entrepreneurship (descriptive statistics).

		<i>Academic Entrepreneurship</i>		<i>TOTAL</i>	
		<i>No</i>	<i>Yes</i>	<i>Mean</i>	<i>Std. Deviation</i>
<i>ROI</i>	Y2005	5.8%	1.3%	4.5%	19.0%
	Y2006	6.4%	-1.0%	4.1%	21.2%
	Y2007	10.3%	8.6%	9.8%	32.9%
<i>ROE</i>	Y2005	-4.6%	14.1%	1.1%	76.6%
	Y2006	-1.3%	-19.5%	-6.8%	69.6%
	Y2007	8.6%	-17.8%	0.5%	62.3%
<i>Leverage</i>	Y2005	3.9	2.5	3.4	4.1
	Y2006	4.5	2.1	3.7	5.9
	Y2007	4.2	3.5	4.0	4.0
<i>Notes: Means computed on 49 companies</i>					

Table 4 - Financial ratios and academic entrepreneurship (descriptive statistics).

As can be seen in the previous table, by focusing only on the financial data and the ratios' values it could appear that academic entrepreneurship leads to worse financial performance. However, high rates of standard deviation denote that data are "spread out" over a large range of values and this reduce, at this level of research, the reliability of making some conclusions.

In order to overcome these limitations, the Altman's Z score was computed over the three years data. As can be seen in the following table, the values of the score are quite different if in the companies are present academics.

<i>Z Score</i>	<i>Academic entrepreneurship</i>		<i>TOTAL</i>			
	<i>No</i>	<i>Yes</i>	<i>Mean</i>	<i>Std. Deviation</i>	<i>Min</i>	<i>Max</i>
Y2005	1.41	1.50	2.16	1.53	-1.60	6.12
Y2006	1.69	1.11	2.15	1.47	-1.45	5.69
Y2007	2.06	1.54	2.58	1.96	-2.80	7.77
<i>Notes: Means computed on 49 companies</i>						

Table 5 – Z scores and academic entrepreneurship (descriptive statistics).

In order to make some valuable considerations it is important to set out some levels of performance discrimination, in particular we used the discrimination range stated by Altman's further works (Altman, 2002):

- “Safe” zone: $Z > 2.99$
- “Grey” zone: $1.8 < Z < 2.99$
- “Distress” zone: $Z < 1.80$.

We used these levels as ranges for high, medium and low financial performance.

Furthermore, as seen before an important role over financial data / ratios is played by the graduation date (Rothaermel and Thursby, 2005b). As it can also be seen from the previous table older is the financial data worse is the related Z Score. For these reasons we assigned, as main performance variables, the Z scores of different years in relation to different graduation date (see previous methodology chapter).

In these terms, a breakdown of the resulting levels of financial performance distribution is presented in the following table.

		<i>Academic Entrepreneurship</i>		<i>Total</i>
		<i>No</i>	<i>Yes</i>	
<i>Financial performance (Z score)</i>	<i>High</i>	7 (21%)	3 (20%)	10 (20%)
	<i>Medium</i>	8 (24%)	2 (13%)	10 (20%)
	<i>Low</i>	19 (56%)	11 (69%)	31 (63%)
<i>Total</i>		33 (100%)	16 (100%)	49 (100%)
<i>Notes: number of companies.</i>				

Table 6 – Distribution of financial performance scores and academic entrepreneurship.

From the previous table, it seems that the companies with academic entrepreneurship are performing worse than other companies, because the majority of them gain a low score. The significance of this statement has been stated here in after with more statistical computations.

Afterwards if we also take into account the different grade of academic entrepreneurship it's possible to say that companies with higher involvement grade of academics (both shareholders and directors) perform better than companies with less academics involvement (only as shareholders), as it can be seen in the following table.

		<i>Academic Entrepreneurs' Involvement</i>		<i>Total</i>
		<i>only as shareholder</i>	<i>as shareholder and director</i>	
<i>Financial performance (Z score)</i>	<i>High</i>	1 (25%)	3 (75%)	4 (100%)
	<i>Medium</i>	2 (40%)	3 (60%)	5 (100%)
	<i>Low</i>	4 (57%)	3 (43%)	7 (100%)
<i>Total</i>		7 (44%)	9 (56%)	16 (100%)
<i>Notes: number of companies.</i>				

Table 7 - Financial performance and involvement grade of academic entrepreneurs.

As said before, the Z score together with the turnover growth are our main dependent variable for measuring financial performance. This choice allows further statistical analysis in order to better point out previous findings. Descriptive statistics of main variables are reported below.

<i>Main variables - Descriptive Statistics</i>					
	<i>N</i>	<i>Minimum</i>	<i>Maximum</i>	<i>Mean</i>	<i>Std. Deviation</i>
<i>1. Academic Entrepreneurship</i>	49	0	1	.31	.47
<i>2. Grade of Academic Entrepreneurship</i>	16	0	1	.56	.51
<i>3. Financial performance (Z score)</i>	49	-1.94	5.68	2.23	1.57

Table 8 – Main variables, descriptive statistics.

To deepen the possible relations between these variables we undertook a linear correlation analysis using Pearson's "r" coefficient with a two-tailed t-test of significance; the resulting Pearson's correlation coefficients are presented in the following table.

<i>Research's variables</i>	1	2	3
<i>1. Academic Entrepreneurship</i>	1		
<i>2. Grade of involvement of academic entrepreneurs</i>	<i>n/a</i>	1	
<i>3. Financial performance (Z Score)</i>	-.295*	.301*	1
Notes: * $p \leq 0.05$			
<i>n/a = coefficient not available because variable "1" is constant.</i>			

Table 9 – Statistical correlation between academic presence and financial performance.

Financial performance and the presence of academic entrepreneurship are a bit negative correlated; the significance is not so high ($p \leq 0.05$) but this means that the presence of academic people has a negative impact on economic and financial performance of an incubated company.

This may sound odd but it could be explained by observing that usually these companies are involved in science-based industries which require a high rate of resources and have to overcome difficulties to reach a positive cash flow in a short time. Usually, these resources are employed to develop new technologies and advanced knowledge, which can be accounted only in part as intangibles assets and quite often are recognized as research expenses (due to limitations related to accounting policies) leading to bad financial statements results.

On the other hand, if academics are more committed in management because, as in this case, they act as directors of the company, better financial performance could be achieved. This is validated by the positive correlation, with a level of significance ($p \leq 0.05$), between an higher involvement grade of academics and the financial performance stated by the Z Score.

CONCLUSIONS

This study adds some more argumentation to the considerable debate developed, in the recent years, about the outcomes of firm–university linkages in term of economical and financial performance. Some authors (George *et al.*, 2002) point out the difficulty of addressing the effect of university-business influence on these types of performance. These difficulties may be related to the unclearness of the measures used to evaluate academic influences. For example, revenues, is an accepted performance metric for more mature companies, but it can be not suitable for the incubator context (Rothaermel and Thursby, 2005a) where companies are just in the start up phase.

In our study we tried to use a wider measure of performance applied to all companies in an incubator context. As a matter of fact, the measure we took as main dependent variable, formerly the Altman's Z score, developed to assess the survival skills of a company, it is able to reflect both profitability and financial performance of the companies in our sample.

The analysis of our findings points out that there is a negative correlation between the dummy variable used for addressing the academic entrepreneurship presence and the variable used for evaluating companies' performance. This permits to fully invalidate our first hypothesis which claims: "Companies with academic entrepreneurship have better survival skills than other graduated companies"; hence, we can just state the contrary in term of financial performance: Companies with academic entrepreneurship have worse financial performance than other graduated companies.

This last statement might sound odd, but the negative correlation between the presence of academic entrepreneurs and companies' financial performance can be explained.

First of all, we have to consider the nature of the business and, after, the status of Italian academic people.

About the first explaining topic, the nature of business, companies with academic entrepreneurship operate in advanced technology sectors because of the large and specific knowledge availability in universities. Performances of these companies are subject to a high rate of uncertainty and become eventually more effective a lot of time after the starting phase; this results in a low economic and financial performance until the research expenses and resources involved finally give raise to some real innovation.

About the second explaining topic, the special status of academics and actually, Italians academics, we have to consider that these people are allowed to keep one foot in two shoes. In other words professors may continue their activity in academic institutions while they act companies' shareholders and/or directors.

It's quite common that scientists prefer to maintain university ties to share ongoing research results and gain access to the scientific knowledge pool, while, in the meantime, receive the

benefits of dividends payout (George *et al.*, 2002). Even a more recent research showed that university scientists take active steps to preserve their academic role identity even as they participate in technology transfer (Jain *et al.*, 2009).

Moreover, this particular status may explain the low risk awareness of academic people despite the high uncertainty of the business of incubated companies (Renault, 2006). Even the lack of experience in general management was pointed out in past research (Wright *et al.*, 2007) and could be another cause of low economic/financial performances. It can explain the lack of time in managerial activities requested by the business and the resulting slow performance of companies (Vohora *et al.*, 2004).

In our opinion this can also be related to the different commitments academic people are charged of, and could explain the positive relation found between the grade of involvement of academics (only as shareholders or as both shareholders/directors) and the related financial performances and the validation of our second hypothesis: higher grade of involvement of academic entrepreneurs can lead to better financial performance.

It is true that more the academics are committed into the business of a company (i.e. not just as a common shareholder but also as a director), more they are interested in the company goals achievement, decision making, and have influence on related financial performance.

Moreover, this last finding shall address the attention of public institutions and in particular Universities while stating and issuing their policies for external commitments involving their employees (i.e. to temporarily stop lectures or researches when managerial commitments arise). It's quite interesting to note that the Turin Polytechnic, the related University of the I3P incubator has started a review process of the policies about academics committed in external companies.

	<i>Hypotheses</i>	<i>Validation</i>		
		<i>No</i>	<i>Yes</i>	
<i>H1</i>	<i>Companies with academic entrepreneurship have better survival skills than other graduated companies.</i>	X		<i>(negative correlation)</i>
<i>H2</i>	<i>Higher grade of involvement of academic entrepreneurs can lead to better financial performance.</i>		X	<i>(positive correlation)</i>

Table 10 – Validation of hypotheses.

About the implications of this research we can say that, given the crucial value of innovation for survival in the advanced technology industry, these results suggest that academic people may have also a valuable role in entrepreneurship. Potential benefits of academic entrepreneurship could improve companies' performance only if academic people are not only used as "knowledge providers" but if they are really involved into the company management. It could also be useful to enhance the commitment of academic entrepreneurs in science-based companies permitting them to temporarily reduce their institutional commitments.

LIMITATIONS AND FURTHER RESEARCH NEEDS

Some limitations of this research can be pointed out. First of all, the most recent available financial data for companies graduated in 2008 were those related to 2007, 2006, 2005. Hence the analysis was carried out to assess the performance of all the companies in those years without taking into account year 2008; usually financial statements relating one year are available for consultation after June/July of the next year.

Some of the graduated companies (25%), during 2007, were still in the incubator and now are just leaving their start-up phase. Further studies should also address the generalization of our findings. The studied sample is all from I3P, an incubator focused on engineering sciences. Future research could extend the analysis to data on incubated companies across different technology incubators.

ACKNOWLEDGEMENTS

We want to thank the I3P Staff, in particular to its CEO, Eng. M. Vittone, the I3P graduated companies and the Turin Chamber of Commerce Staff, in particular Mrs. P. Musciacchio and L. Cioce for the precious collaboration and the financial statements provided.

GOVERNANCE AND FINANCIAL PERFORMANCES: EVIDENCE FROM NTBFs (NEW-TECHNOLOGY BASED FIRMS) GOVERNED BY ACADEMIC PEOPLE.

Armano, Bruno¹; Scagnelli, Simone Domenico²

¹*Business Administration Department, University of Turin, Turin, Italy*

²*Business Administration Department, University of Turin, Turin, Italy*

Purpose - The aim of this paper is to present the results of a study examining the governance of academic people in new technology based firms grown in university incubators. We aim to verify if the presence of academic people improves survival skills and economic and financial performances of NTBFs when these leave the incubator. Moreover, we aim to verify if different roles in the Academy can bring to different levels of financial performance.

Design/methodology/approach - The research has been carried out on a sample of 49 new technology firms based, mainly in Northern Italy, and graduated from the Turin Polytechnic's Incubator, called I3P. Data about the presence of academic people have been obtained interviewing I3P CEO while firms' survival skills and financial performance have been assessed by calculating economic and financial indexes (i.e. Altman Z score, ROI, ROE). Statistical correlation has been analysed using SPSS.

Findings - The statistical analysis shows that there is a negative correlation between the variable used for addressing academic governance and that used for evaluating companies' performance. Moreover, it seems that higher is the role of academic people in the Academy and lower is the financial performance of the related NTBF.

Originality/value - While there is a broad attention on incubated NTBFs, there are only few researches regarding NTBFs when these leave the incubator. We focused our attention on the relationship between the governance of academic people, their role in the Academy and the financial performance of NTBFs.

Paper type Research paper

Keywords Academic governance, financial performance, university incubator, new technology.

INTRODUCTION

The creation of laboratories and research centres and the establishment of incubators and scientific and technological parks for start-up firms are ways in which Universities give their contribute to the growth of the economy. Such activities are related to an effective technology transfer and lead to the realisation and commercialization of new ideas arising from science advances. Usually incubators and scientific / technological parks offer different advantages to start-up firms (i.e. a site, a laboratory for scientific tests, secretary services, logistic services, etc...) and, definitely, the right environment for the creation and the development of business ideas.

Usually start-up companies pass the first period of their life in the incubator and then leave. Some of these companies continue their growth even out of the incubator but some other aren't able to stay in the market. Moreover, some of these companies, once left the incubator, obtain satisfying economic performances while some others earn only little profits. A different governance could be one of the reasons of the different performances of new technology based firms, hereafter NTBFs.

BACKGROUND TO THE RESEARCH

The role played by Universities in relation to entrepreneurial development has been investigated by different points of view. A research about 45 incubators (Allen, 1985) documented the various services offered and the role played by Universities in sustaining and fostering the growth of young entrepreneurial firms.

Others (Bonaccorsi and Piccaluga, 1994) developed a theoretical framework and a taxonomy to study university-industry relations. Other researches assessed the effects of business-university alliances on innovative output and financial performance (George *et al.*, 2002) and pointed out the importance of university link and knowledge flows on the overall firm performance (Rothaermel and Thursby, 2005a).

This explain the widespread literature that exists about incubators and related companies (Wright, 2003). The function of university technology business incubators has been previously studied by providing conceptual frameworks for assessing and managing them (Mian, 1997) and by studying the relations between incubators and science parks too. Others argued the importance of close links among different knowledge provider entities (Aernoudt, 2004), (Phan *et al.*, 2005).

Also Italian incubators has been studied, in particular by assessing their effectiveness in term of developing technology-based firms (NTBFs), by showing that on-incubator firms perform better than off-incubator firms (Colombo and Delmastro, 2002) and that the firm propensity to a broad use of incubator's resources and support increases with the progression of its lifecycle (McAdam and McAdam, 2008).

Another branch of studies focused on academic spin-off companies (Lockett *et al.*, 2005), (Mustar *et al.*, 2006), for example by studying the national trends (Chiesa and Piccaluga, 2000) or exploring the typologies of companies originated in universities (Druilhe and Garnsey, 2004). By focusing on the venture capital activity in relation to the lifecycle of target firms, some best practices were developed for universities' incubator management (Wright *et al.*, 2006). Finally others pointed out the role played by intellectual transfers (Cesaroni and Piccaluga, 2005) and studied knowledge management in an organizational perspective (Becker and Gassmann, 2006).

In our opinion, there is a lack of research about the governance of new technology based firms; in particular about the characteristics of the people involved. Hence, we investigate the role played by academic personnel in firm's governance, and, specifically, in the governance of NTBFs, born and grown in university incubators (UIs). The aim is to analyse start-up firms born in incubators and to verify if the presence of academic personnel can strengthen or weaken the economic and financial performances of those firms. The arising effect could be positive or negative. A past research showed that the entrepreneurial attitude of academics is related to effective technology transfer and can enhance the commercialization of research outputs (Renault, 2006). Besides, a positive effect could be related to a close link to research gains, to the availability of advanced technology and to continuous knowledge flows. However the presence of academic people could have a negative correlation with firms' economic and financial performances. The reason could be related to a lack of management experience of academics or to a lack of time caused by their academic commitments. Even the conflicts between the

university and business cultures could sometimes depress the performance of NTBFs (Cyert and Goodman, 1997).

RESEARCH METHODOLOGY

The research has been carried out empirically on a sample of incubated new-technology based firms. The sample is based, mainly in Northern Italy, and it derives from the Turin Polytechnic's Incubator, called I3P.

This incubator is a non-profit joint-stock consortium built by Turin Polytechnic and other public entities; in 2004, it gained the Award for the World Best Science-based incubator.

I3P was established in 1999 to promote and support the creation of hi-tech enterprises, grouping the innovative potential developed in research institutions in Piedmont area.

Usually, the maximum period policy a company can stay in I3P is three years and then leaves. Actually, there are 61 NTBFs graduated by I3P.

These firms belong to different industries, have different ownership structures and have to be considered small enterprises; their maximum annual turnover is not more than euro 1.5-2 millions and the average number of employees is between 2-10.

Due to the fact that in Italy only limited companies provide public financial statements, we excluded no. 8 firms, so the sample is composed by no. 53 firms. Financial data were directly found by requesting the related financial statements (for years 2005, 2006, 2007) from the Italian Chamber of Commerce; no. 49 financial statements were available and were analysed (92% of the total limited companies).

In the following table, there is a breakdown of these graduated NTBFs.

	<i>Partnership firms</i>	<i>Limited companies</i>	TOTAL	%
<i>Aerospace</i>	-	1	1	1.7%
<i>Biotech</i>	1	1	2	1.7%
<i>Building & Architecture</i>	-	1	1	1.7%
<i>Chemicals & Material</i>	-	1	1	1.7%
<i>Electronics & Automation</i>	3	12	15	23.3%
<i>Energy</i>	-	4	4	6.7%
<i>Environment & Territory</i>	-	3	3	6.7%
<i>Information Technology</i>	3	27	30	50%
<i>Mechanics</i>	1	3	4	6.7%
TOTAL SAMPLE	8	53	61	100%
<i>Available financial statements</i>	-	49		

Table 11: Industry and ownership structure of the graduated NTBFs.

Afterwards, in order to analyse the governance of NTBFs and the role of academic people, we lead an in-depth interview with the CEO of I3P.

These specific research features and the related hypothesis are separately presented in the following paragraphs: academic governance analysis and performance analysis.

Academic governance analysis.

In the interview with the I3P CEO we addressed the following topics for each graduated NTBF:

- Presence of academic governance;
- Type of academic personnel in the governance.

For “academic governance” , we mean the presence of people with a role in the Academy (i.e. full, associate and assistant professors, lecturers, technicians of Universities or Polytechnics) in the board of NTBFs. Hence, we excluded all other types of academic link and/or collaboration (i.e. instructors, scholarship holders, doctoral students, etc.). We used a dummy variable to take into account the presence of this academic governance. A score of 1 is given if academics have a role in the boards of NTBFs and a score of 0 is given to all other cases.

About the type of academic people involved in the governance, we used the data from the interview together with the data arising from the directors’ lists attached to financial statements and the personnel’s lists of Piedmont’s academic institutions available on their websites.

This information was available for all the companies. If applicable, a score of 1 was assigned when a full or associate professor presence occurs, a score of 0 is assigned when an assistant professor, a lecturer or a technician presence occurs and no score is assigned to all other cases.

In our opinion, academics with a higher role in their Institution may have less time to spend in the firm's managerial activities; this can result in having less influence in goals achievement and in overall low financial performances.

Hence, by linking these data with the financials we developed the following hypotheses:

- H1: governance by academic people influences financial performance.
- H2: higher is the role in the Academy, lower is the financial performance of the related NTBF.

The ways we analysed financial performance are discussed in the following sub-paragraph.

Financial Performance analysis.

We assessed the financial performance of NTBFs by focusing on quantitative measures like financial structure, leverage and profitability.

When firms are not listed in a stock market, financial and profitability ratios can be used as main tools of analysis to assess financial performance (Chakravarthy, 1986). However, these measures may be biased because the sample is composed by firms operating in different industries with different industry-driven levels of fixed assets, variable/fixed cost ratios and competitiveness (Porter, 1980). To overcome these limitations a comparison with specific industry ratio averages can be used.

The ratios computed over the three years were:

- Leverage: as debts/equity ratio
- ROI: as operating profit divided by total assets
- ROE: as net profit or loss divided by total equity.

The comparison with the average industry ratios was not significant because of peculiarities of NTBFs (rapid levels of growth, technology development and finance absorption) and it was not used in the analysis of data.

Therefore, in order to overcome the previous limits and to have a unique dependent variable to test on the economic/financial performance aspect, instead to develop a specific overall performance score, we used the Altman's Z score (Altman, 1968). While the Z values were essentially constructed to predict bankruptcy, it can also be a valuable index of the firm's overall good performance.

In detail, we used the adaptation of the score developed for privately held firms (Altman, 2002) that is:

$$Z = 0.717(X1) + 0.847(X2) + 3.107(X3) + 0.420(X4) + 0.998(X5)$$

where: X1 = working capital/total assets, X2 = retained earnings/total assets, X3 = earnings before interest and taxes/total assets, X4 = equity book value/total assets, X5 = sales/total assets

Although Z score measures the probability of a firm's bankruptcy, it could be taken as a variable for assessing firms' financial performance.

Another limitation about this financial analysis could be the fact that the NTBFs' financial performance may depend on the different dates of birth.

Due to these argumentation, while considering the amount of start-up firms in our sample (in 2007 more than 75% of the companies were outside the incubator), in this research we decided to take into account and study: the 2007' s Z score for companies younger than three years, the 2006' s Z score for three years old companies and 2005' s Z score for companies older than three years.

THE RESULTS

The 42% of the total sample (no.22 NTBFs) has a link with the Academy (mainly Turin Polytechnic) but only the 30% (no. 16 NTBFs) has what we intend as "academic governance" . NTBFs which involves academics with a higher role in their Institution are no. 13 (81% of the total academics involved in NTBFs). The complete breakdown of these findings is presented in the following table.

<i>Academic role</i>	<i>Academic Governance</i>		<i>TOTAL (%)</i>
	<i>No</i>	<i>Yes</i>	
<i>Not applicable</i>	31	-	31 (58%)
<i>Other academic roles</i>	6	-	6 (11%)
<i>Assistant professor/Lecturer/Technician</i>		3	3 (6%)
<i>Associate/Full professor</i>		13	13 (25%)
<i>Total (%)</i>	37 (70%)	16 (30%)	53 (100%)
<i>Notes: number of NTBFs</i>			

Table 12 - Presence of academic governance and role in the Academy.

Although financial data were available for only no. 49 NTBFs of our sample, these data cover all the no. 16 firms with academic governance.

The following tables present a synthesis of financial data and computed financial ratios crossed with the academic governance presence.

		Academic Governance		TOTAL	
		No	Yes	Mean	Std. Deviation
Annual Turnover	Y2005	220.3	217.4	219.4	339.8
	Y2006	262.9	233.9	254.0	324.4
	Y2007	349.5	444.5	378.6	470.1
Operating profit	Y2005	6.9	-8.4	2.0	45.2
	Y2006	0.4	-18.5	-5.4	150.8
	Y2007	4.8	53.5	19.7	447.4
Total assets	Y2005	216.4	242.8	224.8	306.9
	Y2006	270.1	438.9	321.8	485.1
	Y2007	315.0	565.3	391.6	643.2
Equity	Y2005	64.9	29.4	53.5	137.0
	Y2006	60.4	79.6	66.3	124.7
	Y2007	56.9	149.9	85.3	176.4
<i>Notes: means computed on 49 NTBFs - data in Euro/000</i>					

Table 13 - Financial data synthesis and academic governance (descriptive statistics).

		Academic Governance		TOTAL	
		No	Yes	Mean	Std. Deviation
ROI (%)	Y2005	6.4%	0.0%	4.5%	19.0%
	Y2006	6.0%	-0.4%	4.1%	21.2%
	Y2007	10.0%	9.1%	9.8%	32.9%
ROE (%)	Y2005	-6.3%	18.0%	1.1%	76.6%
	Y2006	2.3%	-27.6%	-6.8%	69.9%
	Y2007	6.4%	-12.7%	0.5%	62.3%
Leverage	Y2005	4.1	2.0	3.4	4.1
	Y2006	3.5	4.4	3.7	5.9
	Y2007	4.1	3.9	4.0	4.0
<i>Notes: Means computed on 49 companies.</i>					

Table 14 - Financial ratios and academic governance (descriptive statistics).

As can be seen in the previous tables, by focusing only on financial data and ratios' values it could appear that NTBFs with academic governance are lower performing than other firms.

However, high rates of standard deviation mean data are "spread out" over a large range of values and this reduce, at this level, the reliability of testing our first hypothesis. Hence we carried out the correlation analysis presented hereafter.

About the influences of the academic role on financial performance, by focusing only on financial ratios we found, at this first level, that NTBFs which involve an academic with a higher role in the Academy are lower performing than other academic NTBFs. Again, the low number of academic NTBFs which involve people with a lower academic role may affect the reliability of this finding.

The resulting ratios about these academic NTBFs are presented in the following table:

		Academic Role		TOTAL	
		Assistant professor/ Lecturer/ Technician	Associate/ Full professor	Mean	Std. Deviation
ROI (%)	Y2005	7.8%	-1.9%	0.0%	24.9%
	Y2006	8.1%	-2.5%	-0.4%	23.9%
	Y2007	8.1%	9.4%	9.1%	35.6%
ROE (%)	Y2005	27.8%	15.6%	18.0%	52.1%
	Y2006	29.7%	-41.9%	-27.6%	79.3%
	Y2007	23.6%	-21.7%	-12.7%	72.6%
Leverage	Y2005	3.3	1.7	2.0	3.3
	Y2006	5.3	4.1	4.4	2.9
	Y2007	5.6	3.5	3.9	2.2
<i>Notes: Means computed on 16 companies.</i>					

Table 15 - Financial ratios and academic role of NTBFs with academic governance (descriptive statistics).

In order to overcome the previous limitations and to have a more comprehensive financial performance variable, the Altman' s Z score was computed over the three years data. As can be seen in the following tables, the values of the score are quite different between academic and non academic NTBFs and between the higher and the lower roles of the academic people involved.

Z Score	Academic governance		TOTAL			
	No	Yes	Mean	Std. Deviation	Min	Max
Y2005	1.87	1.67	1.81	1.30	-1.45	4.51
Y2006	1.94	1.49	1.81	1.32	-1.20	4.80
Y2007	2.27	1.99	2.18	1.73	-2.40	7.13
<i>Notes: Means computed on 16 NTBFs.</i>						

Table 16 – Z scores and academic governance presence in NTBFs (descriptive statistics).

Z Score	Academic role		TOTAL			
	Assistant professor/ Lecturer/ Technician	Associate/ Full professor	Mean	Std. Deviation	Min	Max
Y2005	1.96	1.62	1.67	1.34	-0.62	4.37
Y2006	1.85	1.41	1.49	1.45	-0.96	3.73
Y2007	2.22	1.93	1.99	1.67	-1.74	5.09
<i>Notes: means computed on 16 NTBFs.</i>						

Table 17 – Z scores and academic role of NTBFs with academic governance (descriptive statistics).

In order to make some valuable considerations it is important to set out some levels of performance discrimination, in particular we used the discrimination range stated by Altman's further works (Altman, 2002):

- "Safe" zone: $Z > 2.99$
- "Grey" zone: $1.8 < Z < 2.99$
- "Distress" zone: $Z < 1.80$.

These levels were used as ranges for high, medium and low financial performance.

Furthermore, as discussed before, an important role over financial data / ratios is played by the graduation date (Rothaermel and Thursby, 2005b); for this reason we assigned, as main performance variables, the Z scores of different years in relation to different graduation date.

In these terms, a breakdown of the resulting levels of financial performance distribution is presented in the following table.

		Academic Governance		
		No	Yes	Total
Financial performance (Z score)	High	11 (73%)	4 (27%)	15 (100%)
	Medium	10 (67%)	5 (33%)	15 (100%)
	Low	13 (65%)	7 (35%)	20 (100%)
Total		34 (68%)	16 (32%)	50 (100%)
<i>Notes: number of NTBFs.</i>				

Table 18 – Distribution of financial performance scores and academic governance of NTBFs.

		Academic Role		
		Assistant professor/ Lecturer/ Technician	Associate/ Full professor	Total
Financial performance (Z score)	High	1 (25%)	3 (75%)	4 (100%)
	Medium	1 (20%)	4 (80%)	5 (100%)
	Low	1 (14%)	6 (86%)	7 (100%)
Total		3 (19%)	13 (81%)	16 (100%)
<i>Notes: number of NTBFs.</i>				

Table 19 – Distribution of financial performance scores and academic role of NTBFs with academic governance.

Also from the Z score analysis, it seems that NTBFs with academic governance are lower performing than other firms and this performance is lower when the role in the Academy of people involved is higher.

In order to improve the reliability of these findings we carried out a correlation analysis and we took the Z score as our main financial performance dependent variable. This choice allows further statistical analysis in order to point out some other interesting relations. Descriptive statistics of the main variables used are reported below.

<i>Main variables - Descriptive Statistics</i>					
	<i>N</i>	<i>Minimum</i>	<i>Maximum</i>	<i>Mean</i>	<i>Std. Deviation</i>
<i>1. Academic governance</i>	53	0	1	.31	.47
<i>2. Academic role</i>	16	0	1	.81	-.40
<i>3. Financial performance (Z score)</i>	49	-2.40	7.13	2.17	1.72

Table 20 – Main variables study, descriptive statistics.

We used a linear correlation analysis using Pearson's r coefficient with a two-tailed t-test of significance; the resulting Pearson's correlation coefficients are presented in the following table.

<i>Study's Variables</i>	<i>Pearson's correlation coefficients</i>		
	<i>1</i>	<i>2</i>	<i>3</i>
<i>1. Academic governance</i>	1		
<i>2. Academic role</i>	<i>n/a</i>	1	
<i>3. Financial performance (Z Score)</i>	-0.289 *	-0.401*	1
<i>Notes: n/a = coefficient not available because variable "1" is constant.</i>			
* $p \leq 0.05$			

Table 21 – Analysis of correlation.

Although with not so much significance ($p \leq 0.05$), financial performance and academic governance are quite negative correlated; this means that the presence of academic people in the NTBFs' boards has a negative impact on economic and financial performance.

This may sound odd but it could be explained by observing that usually, NTBFs linked with Universities are those more involved in more risky industries which require a high rate of resources and need to overcome difficulties to reach a positive cash flow in a short time.

Usually, these resources are employed to develop new technologies and advanced knowledge, which can be accounted only in part as intangibles assets and quite often are recognized as research expenses (due to limitations related to accounting policies) leading to bad financial statements results.

On the other hand, the negative correlation between the role of academics – with a bit of significance ($p \leq 0.05$) – means that higher is the role in the Academy, worse is the performance of the NTBF. This finding could be explained because of the amount of commitments/activities that associate and full professor may have compared to lecturers or assistant professor, this lead to less time spent for managing the NTBF.

CONCLUSIONS

Our research adds more argumentation to the considerable debate developed, in the recent years, about the outcomes of firm–university linkages in term of economical and financial performance of NTBFs.

Previous studies (George *et al.*, 2002) pointed out the difficulty of addressing the effect of university-business link on these types of performance. These difficulties may be related to the unclearness of the measures and values used to evaluate academic influences. For example, revenues, are an accepted performance metric for more mature companies, but it can be not suitable for the incubator context (Rothaermel and Thursby, 2005a) where firms are just in the start up phase.

In this study we tried to use a wider measure of performance applied to all companies in an incubator context. As a matter of fact, the measure we took as main dependent variable, formerly the Altman's Z score, developed to assess the survival skills of a firm but able to reflect both profitability and financial performance of the companies in our sample.

The analysis of our findings points out that there is a negative correlation between the dummy variable used for addressing the academic governance presence and the variable used for evaluating the NTBFs' financial performance. This allows to validate our first hypothesis and saying that governance by academic people influences financial performance in a negative way.

This last sentence might sound odd, but the negative relation between the presence of academics as NTBFs directors and the financial performance can be explained.

On the one hand, an important role is played by the nature of business of NTBFs. Firms with an academic governance are more linked to advanced technologies and risky industries because of the large and specific knowledge availability in the Academy. Performances of these firms are subject to a high rate of uncertainty and become eventually more effective a lot of time after the starting phase; this results in a low financial performance until the researches and the investments finally give raise to some effective innovation and positive cash flow.

On the other hand, also the special status of academics and, actually, Italians academics, could explain this negative relation. Academic people are usually allowed to keep one foot in two shoes. In other words professors may continue their activity in the Academy while they act as companies' shareholders and/or directors.

It's quite common that scientists prefer to maintain university ties to share ongoing research results and gain access to the scientific knowledge pool, while, in the meantime, receive the benefits of dividends payout (George *et al.*, 2002).

Furthermore, this particular status may explain the low risk awareness of academic people despite the high uncertainty of the business of incubated NTBFs (Renault 2006). Even the lack of experience in general management (Wright *et al.*, 2007) and the lack of managerial skills (Vohora *et al.*, 2004) were pointed out in past research and could be other reasons of low economic/financial performances.

In our opinion this can also be related to the different commitments academic people are charged of, and could explain the negative relation found between the role played by academics

in their institution and the related financial performances of NTBFs. This validate our second hypothesis: higher is the role in the academy, lower is the financial performance of the related NTBF.

People with a lower role in the Academy like assistant professors, lectures or technicians usually have lower wages than full or associate professors; for these reasons those people might be more concerned to the achievement of positive returns related to the firms they are committed in.

	<i>Hypotheses</i>	<i>Validation</i>		
		<i>No</i>	<i>Yes</i>	
<i>H1</i>	<i>Governance by academic people influences financial performance.</i>		X	<i>(quite negative)</i>
<i>H2</i>	<i>Higher is the role in the Academy, lower is the financial performance of the related NTBF.</i>	X		

Table 22 – Validation of hypotheses.

This research may have some interesting implications. We can say that, given the crucial value of innovation for the survival of New Technology Based Firms, these preliminary results suggest that academic people may have an important role in the government of these companies.

Potential benefits of academic governance could improve companies' performance only if academic people is not only used as "knowledge providers" but really committed in the business.

This means that academics have to forget about their normal commitment in order to have more time to spend in firms' managerial activities.

Moreover, this shall address the attention of Public Institutions and in particular Universities while stating and issuing their policies for external commitments involving their workers (i.e. to temporarily stop lectures or researches when managerial commitments arise).

LIMITATIONS AND FURTHER RESEARCH NEEDS

This research could have some limitations. First of all, the most recent available financial data for companies graduated in 2008 were those related to 2007, 2006, 2005. Hence the analysis was carried out to assess the performance of all the companies in those years without taking into account year 2008; usually financial statements relating one year are available for consultation after June/July of the next year.

Some of the graduated companies (25%), during 2007, were still in the incubator and are just leaving their start-up phase. Another limitation is that, in our sample, there is a few number of academic NTBFs with academics of lower roles.

Further studies should also address the generalizability of the findings. The studied sample is all from I3P, an incubator focused on engineering sciences. Future research could extend the analysis to data on incubated companies across different technology incubators.

ACKNOWLEDGEMENTS

We want to thank the I3P Staff, in particular to its CEO, Eng. M. Vittone, the I3P graduated companies and the Turin Chamber of Commerce Staff, in particular Mrs. P. Musciacchio and L. Cioce for the precious collaboration and the financial statements provided.

PROJECT SUCCESS OR FAILURE CAN NOT BE DETERMINED BY MONITORING THE PROJECT LEVEL ARTEFACTS

Balzer, Hilli¹

¹*University of Pécs, International Ph.D. Program in Business Administration, Vice President of R&D, CogniTens – Hexagon Metrology, 66 King George st., Tel Aviv, Israel, 64337*

A qualitative study, comparing and describing novel approach to evaluate a software project's successful or failed ending. The paper asserts that projects success or failure can not be determined using a standard approach (i.e. comparing results to a pre-determined set of goals, timeframe and budget) due to the continuous stream of accepted changes from external and internal origins. Without a quantitative, stable frame-of-reference, standard metrics are rendered meaningless.

Following the higher work-unit granularity typical to modern software development methodologies, granularity that helps accommodate change, a change in the granularity of the monitoring methods is shown to support proper ongoing and final evaluation the project status. The new method changes the monitoring artefact from the project level to the level of a single contributor to the project, at a weekly time resolution. Personal velocity (formally defined in chapter 3 below) data is publicly evaluated on a weekly basis, with changes accommodated into work-plans and corrective action immediately taken. The method focuses on accountability enhancement, as a major factor in achieving results attributes (time, budget, and planned scope). Using simple statistical means, individual data can be integrated into true departmental and project level metrics, providing management with essential quantitative tools.

This paper describes a case study executed with software development groups in an Israeli high-tech company. The novel metric is presented with real-life data, augmented by an employee satisfaction survey.

This paper is part of the author's PhD thesis.

INTRODUCTION

Measuring software project success is traditionally done by comparing project initial specifications with the actual functionality, versus allocated time and budget. However, this naive metric rarely sustains the realities of continuously-changing exogenous factors, such as market realities, customers' needs and understandings, competitive pressures; and internal factors, from technical barriers to personnel issues to company politics. How can a project be measured for success, with an ever-shifting frame of reference?

Measuring project success has many practical facets, not the least of them managing, motivating and rewarding software development professionals, the main contributors to software-based projects. While professionals may contribute their best and more, a project may fail due to entirely-exogenous factor. For example a new competitor's lucrative offering may render their efforts useless (as happened to smartphone manufacturers worldwide when the first iPhone was introduced by Apple). A more common example is the challenge of preserving professionals' motivation and accountability for project's outcome under the barrage of continuous content, timing and focus changes. Measuring the project total tasks achievements,

while ignoring the effect of business-required changes which result in project delays, creates an environment where the software professionals tend to reject accountability for the project.

Measuring project success thus must support both the needs of management, from executives to project managers, and the needs of software professionals. For both groups, the metrics must be meaningful, providing true insights on performance, and enhance effective operations, motivation and accountability.

As described in the following literature review, the software industry responds to the need to handle continuous change by various project-management methodologies, with a common use of smaller work-units than typical to classic waterfall; the higher resolution of work units enables more orderly handling of change, especially when timed with the end of each work-unit.

In this paper a project measurement methodology is described, that exploits the higher resolution work-units to achieve similarly high-resolution metrics. The measurement methodology successfully separates internal software development from the influence of change, while closely monitoring individual contributors' performance, in both weekly and entire-project scale. Managers can follow performance and change assimilation, and also relate to entire project and development body performance metrics. The methodology is described by means of a case-study, presenting data of a 30-strong R&D group in an Israeli high-tech company for 3 years.

The measurement methodology is part of a modern, small work-unit software development process, with special means to enhance software professionals' accountability to the projects' ever-changing goals (see details below). Both exogenous and internal changes are accommodated on a weekly basis, in all-hands meetings, where plans, commitments, achievements, delays and challenges are all reviewed publicly, thus enhancing accountability and peer-support. Data is presented relating to employee motivation and accountability, via a comparative employee-satisfaction survey.

One system suggested in this paper to evaluate the real status of the project is with examining the developers work *velocity* (formally defined in chapter 3 below), by examining their ability to keep their work commitments in an ongoing stream of weekly commitments. The advantage of such artefact is a new ability for the Project Manager and the company's management to differ between exogenous changes (e.g., business constraints, where the company is willing to pay with schedule delays and higher cost by accepting those changes), from the delays done in the developers working environment (e.g., like quality and other design problems found in the project).

This can help answer the question: why is that project late? It can verify which part of the delay should be accepted because, for example, business needs, and which part of it is attributable to, for example, internal project errors.

The individual-contributor-level, weekly velocity data is used to monitor each contributor performance, enabling immediate corrective action by managers when deterioration is detected. With the entire-project view, local delays can spread throughout the group, supporting corrective action. In a short few-weeks time, a manager can test the effectiveness of corrective

actions, and act accordingly. This action-oriented approach helps to steer a project in a quickly-changing environment.

As detailed velocity data can be *integrated*, for example by statistical means (averaging over time and people, inspecting standard deviations etc.), the measurement can be applied to whole R&D groups, and to the entire project, thus giving useful, action-oriented feedback to all levels of management. Further study is required in order to map quantitative dependencies between velocity data and business results, like budgetary efficiency, fitness to market ever-changing needs, or technological agility.

LITERATURE REVIEW

Continuous changes in Project management

“Nothing endures but change”, Heraclitus (c. 535–c. 475 BCE)

Tom Demarco, the writer of the well known book: *Controlling Software Projects: Management, Measurement, and Estimation* (Prentice Hall/Yourdon Press, 1982), has lately discovered that his method does not provide the anticipated results in projects, in his new paper (*Software Engineering: An Idea Whose Time Has Come and Gone?*, 2009) Demarco says that “Strict control is something that matters a lot on relatively useless projects and much less on useful projects. It suggests that the more you focus on control, the more likely you’re working on a project that’s striving to deliver something of relatively minor value”. Demarco raises the question “why on earth are we doing so many projects that deliver such marginal value?” which reflects the much observed fact, that projects tend to fail its objectives regardless the way it was managed and controlled.

Continuous changes and classic project management methods

The software development process is usually viewed as a sequence of activities. Managing these tasks required specific process models like the waterfall model or the spiral model have been proposed for tracking the development progress in a project. Tausworthe’s Work Breakdown Structure approach (Tausworthe 1980) is used for describing atom elements of the development process that can be used as a sequence of activities in the project.

Jeffries, Anderson and Hendrickson (2001) agree that customers do not normally understand the software requirements at the beginning of the development process. The customer will make changes in the original requirements and in the new requirements as his understanding of the project details fold out. When encountering change, projects using the waterfall process may call upon a “Change Control” procedure: at the time the customer requests a change in the requirements, a committee or a project manager decides whether or not to approve the change (McConnell, 1997). Certain project managers plan for some contingency in order to avoid missing deadlines (Goldratt, 1997), while some project managers oblige their customers to swap requirements from scope. Significant administrative overhead is evident in managing a customer's request for a change. De-scoping, or requirement triage, is applied in order to reduce the product scope and meet the schedule (Davis, 2003).

Continuous changes and the new project management methods

The quick approach to software development is an expansion of the iterative approach. Methodologies belonging to this group concentrate on suitable work environments, osmotic information flow between team members, and low formal overhead expense. The fundamentals of this group were determined by many leading researchers of software and its application, and published in the agile software development manifest. Some examples of agile methodologies are Adaptive Software Development (ASD), Extreme Programming (XP), Feature Driven Development (FDD), Dynamic System Development Method (DSDM), Crystal Methodologies, and Scrum.

These methodologies developed as an alternative to classic engineering methodologies (Fowler 2003). Their most important feature is adaptability to changes. Organizations that apply these methodologies can "harness or embrace change by being better than competitors at responding to changing conditions and by creating change that competitors can't respond to adequately" (Highsmith 2002, p.32) Agile methodologies present well-established concepts and practices: "No single idea that hasn't been around for 30 years, but taken as a whole they are meaningfully different". (Larman, 2003b).

Customer Involvement Levels – Agile processes require an excessively high level of customer involvement in product development. Projects remain open until the Closure phase. The deliverable may be altered in the Planning phase and in the Sprint phase, during which the project is open to the environment: competitive and financial pressures, as well as time and quality pressures.

The Motorola case study

In the Israeli PMI conference held in 2007, Shapira F., a Project manager at Motorola Israel gave a lecture about Introduction of Agile Management in Motorola Israel – a case study. In the lecture, Shapira said that Motorola is using the classic Water Fall methodology for SW developing projects. Motorola Israel has recently (2007) introduced the Agile methodology of SW project. A special project tracking procedure was developed in cooperation with the Quality department.

Shapira said that still, the project took much longer than expected, the client didn't get all his requirements and the project cost more than it was budgeted. The Motorola's Project Manager concluded that "The project success is not depended on the process but rather on the accountability of people involved in the project"

Defining the meaning of project success or failure

On the early days of the high-tech industry (1970-1980), managing a software development projects was considered risky and full with uncertainty pitfalls (Alter and Ginzberg, 1978), most of the projects in these times were off schedule and over their initial budget (Zmud, 1980). Much research was focused on risk management in software projects, identifying risk factors and developing methodologies to prevent these factors from resulting in software project failures.

However, despite the many advances in software development methodologies, software development projects failure rates are still high and may even have increased.

There are many authors claiming about the difficulty encountered in managing software projects. In 1980, Putnam (Putnam 80) claimed that cost overruns of two to three hundred percent were typical. DeMarco (DeMarco 82) stated that fifteen percent of software projects failed to deliver anything and that projects with cost overruns of less than thirty percent were considered successful. Other (Shein 96) reported that only sixteen percent of software projects were successful. Software cost overruns, schedule delays, and poor quality have been endemic in the software industry for more than 50 years (Jones C. 2008).

A Massachusetts-based (Standish Group, 1994) consulting company which is a leader in evaluating risk, cost, and ROI for information technology investments, publishes new findings every year (CHAOS report). This company studied 365 companies – and around 8,000 information system applications in development. In 2004, the latest statistics published were: 15 percent of the projects have been failed while 51 percent of the projects met the challenged criteria (see below).

	<i>Date</i>	<i>Success Rate</i>
<i>First CHAOS report</i>	<i>1994</i>	<i>16%</i>
<i>"Extreme CHAOS"</i>	<i>2001</i>	<i>28%</i>
<i>Most recent CHAOS</i>	<i>2003</i>	<i>31%</i>

Table 1: Software project success rates reported by Standish Group

The CHAOS report divides projects into three types of resolutions:

- Success – completed according to specifications, on time and on budget. 16.2% of the projects studied fall in this category.
- Challenged – Completed over cost, over time, or without the required specifications. 52.7% of the projects fall under this category.
- Failed – Abandoned or cancelled projects – 31% of the projects fell under this category.

According to Scott Berinato of CIO.com, three-quarters of the IT projects conceived in the past seven years have experienced failure, cost overruns, time overruns, or rollouts with fewer features than demanded (Berinato, 2001). The Forrester group conducted a study which states that one-third of the IT projects would be an average of three months late (Hoffman, 2003). America spends over \$275 billion each year on about 200,000 software development projects, many of which fail (Crawford, 2001).

Julia King reported in 2003 that companies that aren't among the top 25% of technology users, three out of 10 IT projects fail on average.

RESEARCH PROJECT

Project description and objectives

The project investigates the influence of a new, possibly accountability-enhancing method and tools on an R&D organization day by day operation. The group consists of about 30 R&D personnel, working in a multi projects environment (There are several projects done simultaneously). Data was collected for the last 30 months. The objective of the new method implementation was to improve the project goals in such development environment (schedule, budget, quality, and content). During this period there was no employee attrition, so the information gathered was not influenced by personal talent changes.

The 3 principles of the methodology

Quantification – One of the tools to isolate the developer personal contribution and work velocity to the project from all the other factors must create a new way to quantify the personal contribution factor; transforming the un-quantifiable perceived contribution factor into tangible set of data and information items using measurement tools.

Publicity – Sharing of the developer personal contribution-related metrics with the entire group of project stake-holders. This sharing reduces any potential bias factor and increases the accountability factor of the developer – The software developer engineer peers can review the developer's assessment: If they approve it, they are automatically committed to that assessment and its consequent schedule. This kind of commitment process creates cross-commitment environment, letting everybody feel as being in the same boat.

Ongoing Follow-up – a common project real-life attribute is the ongoing stream of changes over the project lifecycle. The measurement method used in the project should be always maintained, reflecting current status as time passes towards the actual delivery date. The project management should evaluate the work velocity continuously, for every developer and for the entire group and project.

Research methodology

A case study approach was used in this paper. Informal interviews were conducted with project managers as well as software developers and a product manager. These informal interviews were supplemented with information from the project. The case study was based on field experiments (done in the last 30 months), for empirical data collection, based on mid to large software projects within a software development based company. Data was collected from project managers, software developers, company executives and engineering staff. 5 main software projects were analyzed (projects were completed in the period of 2006-2009) and from database tools (Work Log DB, MS-Project files) and records (meetings summaries, requirements logs, survey, etc...).

The major purpose of this case study is to evaluate applying high-granularity metric, ongoing weekly-based developer velocity, as an assessment tool, for increasing the overall project quality on an R&D organization in day by day operations, in a multi projects environment.

The research implemented at the case study provides an opportunity to evaluate whether the method and various tools suggested could significantly improve the project success rates, and the implications for personal accountability.

Background:

This case study demonstrates using tools which can measure in a high resolution the stakeholders work. This is done on a personal level using a high granularity time artefact – weekly based. These tools enable us to manage the ongoing changes stream in a manner that can be perceived by the project management as an excellent tool to differ between changes with work external origin (such as new customer requirements) and the work internal changes (such changes done by wrong design). This analysis make the changes get checked and could be handled on weekly basis.

The publicity aspect of the developer accountability is getting higher as this accountability is periodically viewed by the whole development group. These tools can put a spotlight on every developer's work velocity and by that the project management can isolate the project external changes from the "delays" occurred due to the work process. As the developer work can be viewed publicly, the accountability level of each developer gets higher towards his personal potential. This creates a work optimization in the developer level.

The case study is based on data acquired in a high-tech company, producing software-based products for the automotive industry.

The novel tool-set:

Last week – Next week process

Ongoing weekly meetings are conducted by the project manager with ALL the developers. At these meetings are used to go through the work achieved, level of completion, problems encountered, any delays, and the duration of time needed to complete previous committed tasks last week as regards to the work planned in that week, while monitoring the percentage of work accomplished by each developer. As this information is publicly told in this meeting to all peers, a common accountability of the whole group is established. This is done with all the developers. The second stage establishes commitment to the planned tasks for the coming week. The project manager describes, for every developer, what tasks were originally assigned and agreed to be done in the coming week; the developer can either re-commit for this schedule, or to change the schedule due to the need to complete last week's tasks. This information is being logged in the "last week next week" weekly report. This new schedule change is being recorded by the project manager and used to update the project plan, handling resources allocation problems (multi projects environment) as they occur.

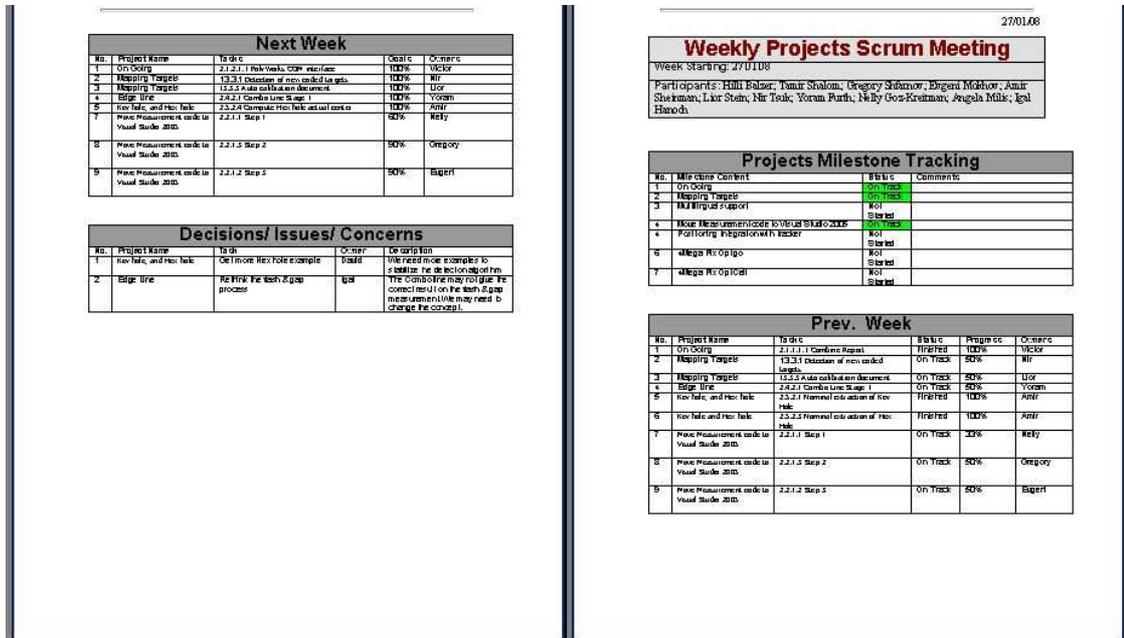

Figure 1: Weekly projects meeting status report

The project manager logs all developers' individual level of completion, into an MS-Excel report. The weekly average completion percent represents the developers working velocity. The velocity can have 3 types of values:

- Below 100% - Negative Velocity - This means that the project was late for that specific week.
- 100% - Buoyant Velocity – This means that the project is as planned / on track for that specific week.
- Above 100% - Positive Velocity – This means that the project is heading its objectives for that specific week.

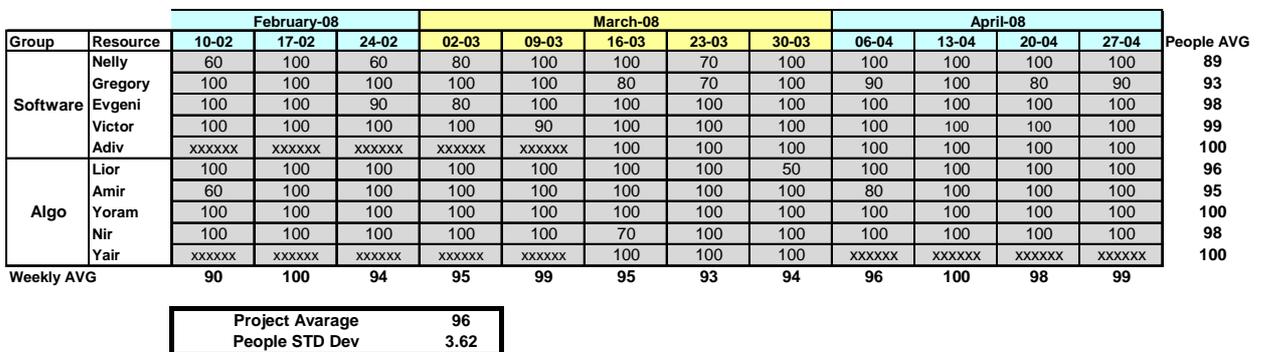

Figure 2: Project Developers Velocity monitor report

Measuring the Project Developers Velocity is in a higher granularity level than the project tasks status. The project tasks statuses are affected by both planned and unplanned changes in the project. While the Project Developers Velocity monitors the real work done compared to the planned work in the minimal work breakdown (1 week).

This method produces readily-actionable data: We can evaluate everybody, from the project manager and development manager (using total/weekly/personal averages and Project Standard deviation), to individual contributors - and take immediate action: In a week or two we can see if the action was effective.

For example, in Figure 2 above both the project average and standard deviation point towards a relatively high level of control firmness, with average velocity close to 100 (at 96), and a minute standard deviation. However, velocity deterioration of even one developer will markedly raise the standard deviation, and call for immediate action. Similarly, low levels of average velocity may require process adaptations, and very high velocity levels may point towards insufficient personnel utilization; in both cases, corrective action influence could be sensed in a matter of a few weeks.

Project assessment using these new tools and data

When the project has been completed, the project manager can collect the developers' statistical data of the work velocity throughout the project lifetime, and can analyze each developer in terms of personal contribution to the project success. When one is trying to measure the success or failure of a project, it is now possible to separate the different components of the result, so it will be possible to have a different success or failure result to each factor, regardless of the effect of the ongoing changes stream on the project.

Such information about the personal contribution of each developer to the overall result of the project can be used in a personal review meeting with the developers, showing the collected data regarding his accountability and his work velocity.

As with any other measurement factor, this too can be used by people for creating bias in the developers' results. But never the less, this ability is reduced due to the publicity principle that is used in the weekly "last week next week" meetings.

RESEARCH RESULTS AND INDUSTRIAL IMPACT

Results

The purpose of this case study is to show how these new proposed accountability-enhancing methods and tools work in an R&D organization in day-by-day operations, in a multi-projects environment. The results showed improvements in the overall projects success rates, and that could be manifested in several major factors such as projects quality, personnel perception of projects success, and employee general satisfaction.

Employee Survey

The company used a survey service which compares several factors and compares them to the industry average. The survey was done in 2008, and was taken by all the company employees. The data was collected anonymously and handled and analyzed by 3rd party survey service company. Results were compared to external Benchmarks from the survey service company's Employee Research Database (for the same or similar industries).

Initial numbers also testify for improved employee satisfaction within the group that follows this method, as compared to the entire corporation.

Group	Average	
		Company Leadership
70	28	I see strong evidence of effective leadership from senior leaders
48	17	Employees receive all the information they need to understand the organization's strategy and priorities
		Direct Manager
70	49	My manager provides the support I need to succeed
65	48	My manager involves me in decisions that affect my work
61	39	My manager provides regular feedback that allows me to improve my performance
		Peers
78	67	My coworkers respect my thoughts and feelings
		Customers
57	64	My relationships with my internal / external customers (clients) are rewarding
86	51	We are responsive to the changing needs of our customers
		People Focus
74	45	I am treated like a valued member of this organization
78	33	Employees are treated as important contributors rather than as a cost of doing business

Figure 5: An Employee Survey results, 2008

The Group column measured the organization survey participants after the new methods were accepted in the company, and were merged into the day by day work. The average column represents the average of similar R&D companies in the similar markets.

It is clear that the developers feels accountable for the organization goals, they common destiny sharing, and it is clear that every developer feels as a major part of the creation and ownership of the organization outcomes (projects). Comparing these results (Group column) with the industry average (average column) is especially manifested where the differences are maximal: Employees feel both well-lead (top row), and that their contribution is important (bottom row). Other important observations points towards effective change management (second row, and third from bottom regarding customer responsiveness); and overall proper group conduct (manager's support and feedback; coworkers' support). These results support and confirm the efficacy of the managerial method.

CONCLUSIONS

Software engineers are challenged daily with particularly high levels of uncertainty. Contrary to other fields of engineering, there are no standard solutions, methods or regulations to provide assurance. The relative ease of SW modifications, as opposed for example to hardware, encourages markets and managers to require numerous changes, many of them with excellent reasoning. Therefore, both the SW discipline as such, and its customers, contribute to a climate of continuous change. This climate challenges engineers and management with the formidable task of keeping focus on shifting targets, preserving accountability and quality, all under the real-life pressures of time, budget, market and competition.

In essence, time is the key resource for software engineers; other factors, like content, budget or quality, can be readily converted into time constraints. Consequently, software engineering methodologies use time management, or specifically higher schedule granularity, to adapt to this climate of continuous change; a notable example is Agile programming. In this paper this concept is further explored, via high time-granularity project management measurement methodology.

By measuring individual software professional's velocity, on a weekly basis, a metric, that is fast and actionable enough to adapt, is established. Simple statistical tools provide quick departmental, project and managerial-level views. Combining this method with public weekly sessions where all team members share accountability for ever-changing tasks, where problems are handled and where credit is granted, enhances accountability and satisfaction. The high-resolution, public measurement enables separation of internal and external factors, providing the metric with the coveted, but rather elusive, trust of software professionals.

A case study, analyzing this method's influence in a real-life R&D environment, reveals the method's practical value for practitioners at all levels. An external employee-satisfaction survey details multidimensional advantages, both for leaders and for employees. While further study is required to quantify this method's influence on business performance, it seems to hold significant practical value for software projects' success.

THE ESTIMATION OF PERFORMANCE EFFECTIVENESS OF ALBANIAN TOURISM STRATEGY . THE KEY PERFORMANCE INDICATORS

Bazini, Evelina¹; Elmazi, Liljana²

¹Faculty of Economy, University of Vlora, Albania

²Head of Marketing, Tourism Department, Director of Advanced Marketing School, Faculty of Economics, University of Tirana, Albania

Albanian tourism industry's three main issues are:

1. enhancing the competitiveness of Albanian tourism in our region and Europe.
2. The development of product and services related to tourism
3. The development of the integrated tourism management system.

The methodology

First the research starts from studying the implementation of each project according to the approved budget by MTRS based on existing secondary sources.

Second the research purposed to create the one single index that combines the existing indices developed by different units and departments in charge of performance evaluation.

Third we developed index to measure each strategic goal because there is a possibility that some strategic goal under some key strategy will be more successful than others.

Forth the index has been created to measure the effectiveness of the three key strategies.

Fifth in order to pinpoint area where improvements are needed we seek to develop the 3-dimensional analysis by comparing the budget given with their relative importance and the actual delivery of these goals.

The findings from the survey and secondary sources revealed good performance results but where we consider specific strategies goal independently we could pinpoint to where the adjustment and improvement could be made. SWOT analysis has been done to capture the current situation of the tourism strategy.

To manage the competitiveness of the country's tourism one has to pay attention to carving a good strategy and follow through with a successful implementation and control process.

Key words: tourism strategy performance effectiveness index.

INTRODUCTION

Being competitive is crucial to business organisation to survive the global competitors. The same is also true for the public organisation which must also be competent in their products or services.

Tourism is one of the main income-generating industries in many developed as well as developing nations. Therefore to manage the competitiveness of the country's tourism, one has to pay attention to carving a good strategy and follow through with a successful implementation and control process. There are up to three key strategic areas for Albanian Tourism Ministry:

1. enhancing the competitiveness of Albanian tourism
2. the development of product and services related to tourism
3. the development of the integrated tourism management system

In this paper, key performance indicators are developed as tools to drive, monitor and measure the effectiveness of the country's tourism strategy.

The approach is to collect data on performance by asking the tourists how satisfied they are with the performance undertaken to fulfill each strategic goal and further ask them to rank order the importance of each strategic goal to understand the relative importance among the goals itself. Moreover, some specific group of stakeholders were surveyed or interviewed to get the performance score.

This research is an empirical study to establish a complete performance management system for the Albanian Tourism Ministry to manage its tourism strategy.

Our objectives are:

1. To study and design the key performance indicators and indices appropriate to be regularly used to monitor working in progress and evaluate the end result at the end of strategic term (2005-2009)
2. To collect the information in order to develop indices for our newly-designed key performance indicators
3. To access the problems, obstacles, and limitations of work or people responsible for the projects including recommendations of methods to improve upon those conditions and purpose alternatives to resolve those issues.

METHODOLOGY

First, the research starts from studying the implementation of each project according to the approved budget by the MTS (2004-2008) based on existing secondary sources. Next we categorized projects along three key strategies in order to see the distribution of projects and their budgets. The distribution of projects and their budget represents attempt to launch different projects to achieve the three key strategies. It is observed that the number of approved projects was not evenly distributed among the three key strategies. Approved projects deemed to fulfill the second strategy had the highest number. In contrast, the third strategy had the least number of approved projects. Furthermore the distribution of budget doesn't have any correlation with the number of projects, for example, strategic goal number one has only 58 projects but received the total budget of 5.237.312.100 baht.

Second, the research purposed to create the one single index that combines the existing indices developed by different units or departments in charge of performance evaluation. We collect different evaluation forms and measurement techniques and combined them into the only one that reflects the overall effectiveness of the performance. The one single index encompasses 1) number of Albanian and foreign tourists each year and the percentage of change

in the number of tourists 2) average length of stay per tourist 3) amount of money spent per tourist per day and the percentage change of spending 4) revenue from tourism and the percentage of change of revenue from tourism 5) recipient of national or international awards.

Third, we developed index to measure each strategic goal because there is a possibility that some strategic goal under some key strategy will be more successful than others. Three key strategies has quite a broad scope and focus, therefore it is hard to directly evaluate them. We developed key performance indicators based on our interpretation of the 11 key strategic goals by asking ourselves what are the performance objectives of these goals, what are the key results of these goals? The key results expected are called key result areas. Key result areas should represent the critical or essential results that will make a substantial performance difference.

Fourth, the index has been created to measure the effectiveness of the three key strategies. Since the three key strategies have relatively broad scope and focus, therefore it is hard to directly evaluate them. As a result indirect method of evaluation was introduced based on the calculation of the combined score from each strategic goal attached to each respective strategy. In order to assess correctly, there exists a need to understand the relativity of importance of each of the strategic goal as shown in the formula below.

$$KPI_1 = \frac{\sum_{i=1}^n I_i \times KPI_i}{\sum_{i=1}^n I_i}$$

I_i: Relative importance of strategic goal

KPI_i: Average score of all KPIs of the strategic goal

n: number of strategic goals within strategy 1

Fifth, in order to pinpoint area where improvements are needed, we seek to develop the 3-dimensional analysis by comparing the budget given, with the relative importance and the actual delivery of these goals.

SURVEY METHOD

Target population

Target population consists of five main groups: (1) tourists (11,516,936 foreign tourists and 14,037,275 Albanian tourists), (2) 13 ministries, (3) public and private organizations that relates to tourism, (4) entrepreneurs/owners of hotels/resorts, travel agents. There were about 5,431

hotels in the data base in year 2006, whereas there were 854 companies in the list of Tourism Development Office and (5) province – level and local – level offices.

Sampling technique

Yamane sampling technique has been utilized. This method has been used to sampling the tourists groups (foreigners and Albanian), TAOs, and municipalities.

$$n = \frac{N}{1 + Ne^2}$$

Next, we use specific group techniques to specify some other sample groups namely: ministries, travel-related public and private organizations, PAOs, and provinces.

Data collection

We surveyed over 1000 foreign tourists, 1000 Albanian tourists, 7 ministries, 14 travel – related public and private organizations. We sent 1500 questionnaires to the sampling size of 5431 hotels in 7 geographic regions. We sent over 1000 sets of questionnaires to the sampling size of more than 5000 entrepreneurs/owners of hotel resorts, travel agents.

Materials

Up to six different sets of questionnaires have been used to collect data from different respondents group. The questions varied according to the information we seek from those responding groups. Examples are when we asked the tourists, apart from demographics, behavioral and psychographic information; rankings of strategic goals that affect their decision to choose Albanian as traveling destinations were asked along with the satisfaction/success level the tourist's experiences in different activities they are exposed to. The level of satisfaction/success level were measured by a 5 point Likert scale ranging from 1 (not satisfied) to 5 (very satisfied). Table 1 illustrates the example of questions in the questionnaire.

<i>Section</i>	<i>Questions</i>
<i>General information about the respondents</i>	<i>Age</i> <i>Gender</i> <i>Income</i> <i>Nationality</i> <i>Occupation</i> <i>Type of tourism activities</i> <i>Period of travel</i> <i>Frequency of travel</i> <i>Possibility of traveling within three months</i>
<i>Satisfaction level/success level tourists experiences</i>	<i>Strategy no.1 enhancing the competitiveness of tourism</i> <i>Strategy no.2 the development of product and services related to tourism</i>
<i>Execution of tourism strategy development mode (domestic and market)</i>	<i>Strategy no.1- strategic goal no 1 promoting potential to compete in the proactive international</i> <i>Strategy no.2- strategic goal no 1 building, developing, renovating and connecting tourism sites</i>

Table 1 Examples of questions in the questionnaire

Procedure

Data collection from authorities, Tourism Development Office (later called TDO), universities and travel-related associations were done through questionnaire surveys and interviews. Also, questionnaires were sent to municipalities, travel agents and regional travel-related associations through returned mail. Questionnaires surveys were distributed by hand to tourists in cities and suburban areas.

RESULTS

Data analysis

The responses were from 1005 Albanian tourists, 1091 foreign tourists, 220 hotels, 115 related companies, 42 provinces, 30 sports, tourism and entertainment centers, and 8 regional travel-related associations. Additionally, answers from 14 specific study groups were completed for data collection purpose, for example, Tourist Police and so on.

Survey results are classified into 5 parts: (1) the total score received from performance of all three strategies, (2) the score received from each strategic goal, (3) relative importance of each strategic goal within each key strategy, analysis of correlations between the allocation budget and the relative importance of each strategic goal, and performance score, (5) analysis of recommendation from foreign tourists regarding relative importance of each strategic goals and actual score received.

Analysis of the performance of all the strategies

Firstly, as shown in table 2, the study shows the total score received from performance of all three strategies to be 3.4 on the scale of 1 to 5 (where 1.0 – 2.0 = need immediate improvement, 2.0 - 3.0 = need improvement, 3.0 – 3.5 = satisfactory, 3.5 – 4.0 = good, 4.0 – 5.0 = excellent). The overall score of 3.4 reflects performance at satisfactory level. Considering the 5 key performance indicators that reflect the total score item, we found that the key performance indicator of recipient of national or international award obtained the maximum score of 5 (where 1 = receiving none, 2 = receiving less than 5 awards, 3 = receiving less than 20 awards, 4 = receiving less than 40 awards, 5 = receiving more than 40 awards). On the contrary, the result shows score of 1 from revenue from tourism (1 = below target by 15%, 2 = below target by less than 15%, 3 = below target by less than 10%, 4 = below target by less than 5%, 5 = meet or exceed target).

Furthermore, amount of spending per tourist per day and the number of Albanian and foreign tourists per year yielded the score of 3. Due to having low tourists number and the low spending per tourist per day, Albanian tourism industry's revenue from tourism fall so much below target despite the fact that the industry attained the targeted average length of stay per tourist.

<i>Rank</i>	<i>Key performance indicators</i>	<i>Score</i>	<i>Sources</i>
1	<i>Number of foreign tourists (year 2006, targeted tourists = 15.12 million persons, actual = 13.65 million persons, therefore below target by 9.7%)</i>	3.00	<i>TAT website</i>
2	<i>Average length of stay per tourist (year 2005, target length = 8.1 days, actual = 8.2 days, therefore exceed target)</i>	5.00	<i>TAT website</i>
3	<i>Amount of spending per tourist per day (year 2005, target spending = 4,150 baht/day, actual = 3,890 baht/day, therefore below target by 6.26%)</i>	3.00	<i>TAT website</i>
4	<i>Revenue from tourism (year 2005, target revenue (million baht) = 449,768, actual 367,380, therefore below target by 18.3%)</i>	1.00	<i>TAT website</i>
5	<i>Recipient of national or international award (actual = 42 national and international awards)</i>	5.00	<i>TAT</i>
	<i>Average score</i>	3.40	

Table 2: Total score received from performance of all three strategies

Analysis of performance under each strategic goal

Results from score achieved by each strategic goal represent how effectively the goal has been carried out. This renders the opportunity to single out/correct the particular performance that is weak, ineffective or required immediate remedy. Table 3 shows the three key strategies and their 11 strategic goals. Table 4 shows the example of strategy number 1 – strategic goal number 2, its key results areas and its key performance indicators. Whereas Table 5 shows the score received from the execution of strategy 1 – the enhancement of the competitiveness of tourism, with respect to the second strategic goal which is – promoting Albania as gateway to Europe region tourism. Up to 8 key performance indicators are utilized to measure the execution of this strategic goal alone. The result shows that per one single key result area, there are three key performance indicators in this category and the average score is 4.23.

Strategy No.	Strategy description	11 main strategic goals
1	<i>Enhancing the competitiveness of Albanian tourism</i>	<i>Promoting development potential to compete in the proactive mode (domestic and overseas market)</i> <i>Promoting Albania as gateway to Europe region tourism</i> <i>Developing information technology</i> <i>Promoting international tourism</i>
2	<i>The development of product and services related to tourism</i>	<i>Building, developing, renovating and connecting tourism sites</i> <i>Improving goods and services standards</i> <i>Raising standards to provide convenience to tourists</i> <i>Developing standards to provide safety for tourists' lives and property</i>
3	<i>The development of the integrated tourism management system</i>	<i>Improving capability of Ministry of Sports and Tourism to be the main driving force national tourism strategy</i> <i>Promoting efficiency of integrated tourism management encompassing all levels and sectors and countries</i> <i>Adjusting laws, rules and regulations related to tourism</i>

Table 3 Three key tourism strategies and main strategic goals

<i>Strategic goal</i>	<i>Key result areas</i>	<i>Key performance indicators</i>
<i>Promoting Albania as gateway to Europe region tourism</i>	<i>1. Behavior of foreign tourists in choosing Albania as connecting points to neighboring countries</i>	<i>1. Agree that Albania is the focal point for traveling in this region 2. Percentage of foreign tourists who previously used Albania as focal point for their traveling destination 3. Ease of traveling to neighboring countries from Albania</i>
	<i>2. Ease of traveling from Albania to neighboring countries</i>	<i>1. Ease of traveling to neighboring countries from Albania 2. Number of regional airports is enough to cover traveling to different Regions 3. Number of land transportation that connect Albania to neighboring countries and level of convenience of traveling</i>
	<i>3. Convenience on application</i>	<i>1. Ease of applying visa on arrival which renders comfort to travel to other European nations 2. Convenient in applying for visa on arrival</i>

<i>Strategic goal</i>	<i>Key result areas</i>	<i>Key performance indicators</i>	<i>Score</i>	<i>Sources</i>
<i>Promoting Albania as gateway to European region tourism</i>	<i>1. Behavior of foreign tourists in choosing Albania as connecting points to neighboring countries</i>	<i>1. Agree that Albania is the focal point for traveling in this region</i>	4.05	<i>Albanian tourists</i>
			3.86	<i>Foreign Tourists</i>
		<i>2. Percentage of foreign tourists who previously used Albania as focal point for their traveling destination</i>	4.00	<i>Foreign Tourists</i>
		<i>3. Acceptance that Albania is the local point for traveling in this region</i>	5.00	<i>Foreign Tourists</i>
		<i>Average score (key result area no. 1)</i>	4.23	<i>Travel agents</i>

Table 5 Promoting Thailand as gateway to Asian region tourism, key results areas, key performance indicators, score, and sources of score received

Analysis of relative importance of the each strategic goal and average performance

The relative importance of each strategic goal within each key strategy is believed to be different. Therefore such data have been collected from opinions of foreign and Thai tourists, province, PAO and municipalities together with entrepreneurs, travel agents and hotels.

In summary, the first strategy received the total score of 3536, the second strategy got 3534, and the third strategy performed best at 3637. To conclude the three strategies received the total score ranging from 3534 to 3637 indicating performance at above satisfactory level.

<i>Strategy 1: Enhancing the competitiveness of Thailand tourism</i>			
<i>Strategy no.</i>	<i>Strategic goals</i>	<i>Relative importance</i>	<i>Score</i>
1	<i>Enhancing tourism industry's potentials to compete in the proactive mode</i>	0.370	3.79
2	<i>Promoting Albania as a gateway to European region tourism</i>	0.178	3.81
3	<i>Developing information technology</i>	0.213	3.39
4	<i>Promoting international tourism</i>	0.238	3.08
<i>Weighted average score of strategy 1</i>		3.536	
<i>Strategy 2: The development of product and services related to tourism</i>			
1	<i>Building, developing, renovating, and connecting tourism sites</i>	0.254	3.41
2	<i>Improving goods and services standards</i>	0.197	3.79
3	<i>Raising standards to provide convenience to tourists</i>	0.291	3.58
4	<i>Developing standards to provide safety for tourists lives and property</i>	0.258	3.41
<i>Weighted average score of strategy 2</i>		3.534	
<i>Strategy 3: The development of the integrated tourism management system</i>			
1	<i>Improving capability of Ministry of Sports and Tourism to be the main driving force national tourism strategy</i>	0.299	3.67
2	<i>Promoting efficiency of integrated tourism management encompassing all levels and sectors and countries</i>	0.524	3.55
3	<i>Adjusting laws, rules and regulations related to tourism</i>	0.177	3.84
<i>Weighted average score of strategy 3</i>		3.637	

Table 6 Scores of the three key strategies from the key performance indicator

3-dimensional analysis of budget, relative importance and performance score

The intention is to comparatively study the size of the budget received with its relative importance and the actual performance of these strategy in order to analyze whether the budget has been well spent and whether or whether or not it is based on sound economic principles.

Our recommendation is to build more new tourist sites and to increase the budget to meet the tourist demands for these sites to be renovated. Additionally, one noteworthy result from the analysis showed that performance score received has fallen into either good or satisfactory level only across all the 11 strategic goals (table 7). None could achieve the excellent score.

<i>Strategy – strategy goal</i>	<i>Budget size</i>	<i>Relative importance</i>	<i>Category score received</i>
<i>Strategy 1: Enhancing the competitiveness of Thailand tourism</i>			
<i>Enhancing tourism industry's potentials to compete in the proactive mode</i>	<i>High</i>	<i>High</i>	<i>Good</i>
<i>Promoting Albania as a gateway to European region tourism</i>	<i>Low</i>	<i>Medium</i>	<i>Good</i>
<i>Developing information technology</i>	<i>Low</i>	<i>Medium</i>	<i>Satisfactory</i>
<i>Promoting international tourism</i>	<i>Medium</i>	<i>Medium</i>	<i>Satisfactory</i>
<i>Strategy 2: The development of product and services related to tourism</i>			
<i>Building, developing, renovating, and connecting tourism sites</i>	<i>Medium</i>	<i>High</i>	<i>Satisfactory</i>
<i>Improving goods and services standards</i>	<i>Low</i>	<i>Medium</i>	<i>Good</i>
<i>Raising standards to provide convenience to tourists</i>	<i>High</i>	<i>High</i>	<i>Good</i>
<i>Developing standards to provide safety for tourists lives and property</i>	<i>Medium</i>	<i>High</i>	<i>Satisfactory</i>
<i>Strategy 3: The development of the integrated tourism management system</i>			
<i>Improving capability of Ministry of Sports and Tourism to be the main driving force national tourism strategy</i>	<i>Low</i>	<i>Low</i>	<i>Good</i>
<i>Promoting efficiency of integrated tourism management encompassing all levels and sectors and countries</i>	<i>Low</i>	<i>Medium</i>	<i>Good</i>
<i>Adjusting laws, rules and regulations related to tourism</i>	<i>Low</i>	<i>Low</i>	<i>Good</i>

Table 7 Comparison between budget, relative importance and performance score

Analysis of the relationship between relative importance and performance score

Based on the rationale that foreign tourists' through their spending generates capital inflow into Albania foreign tourists' preference affects the revenue and the growth potentials of Albanian tourism. Thus, the analysis of recommendation from foreign tourists regarding the relative importance of each strategic goal has been separately studied. We compare the relative importance foreign tourists gave to each strategic goal with the actual performance score received. From a survey of 1091 foreign tourists, we found that the enhancing tourism industry's potentials to compete in a proactive mode yielded satisfactory score from its performance but received high relative importance in the eyes of the foreign tourists (see table 8). This pinpoints to the immediate improvement in this strategy, particularly, to proactively engage in promoting tourism in foreign countries.

<i>Strategy – strategy goal</i>	<i>Relative importance</i>	<i>Category score received</i>
<i>Strategy 1: Enhancing the competitiveness of Thailand tourism</i>		
<i>Enhancing tourism industry's potentials to compete in the proactive mode</i>	<i>High</i>	<i>Satisfactory</i>
<i>Promoting Albanian as a gateway to European region tourism</i>	<i>High</i>	<i>Good</i>
<i>Developing information technology</i>	<i>Low</i>	<i>Good</i>
<i>Promoting international tourism</i>	<i>Medium</i>	<i>Need improvement</i>
<i>Strategy 2: The development of product and services related to tourism</i>		
<i>Building, developing, renovating, and connecting tourism sites</i>	<i>High</i>	<i>Satisfactory</i>
<i>Improving goods and services standards</i>	<i>High</i>	<i>Good</i>
<i>Raising standards to provide convenience to tourists</i>	<i>High</i>	<i>Good</i>
<i>Developing standards to provide safety for tourists lives and property</i>	<i>High</i>	<i>Satisfactory</i>

Table 8 Relationship between relative importance and performance score

Note: strategy 3 is not studied because there are not directly related to foreign tourists

<i>Internal factors</i>	<p style="text-align: center;"><i>Strengths</i></p> <p style="text-align: center;"><i>Comprehensiveness of the tourism strategy</i></p> <p style="text-align: center;"><i>Importance given to the assessment of results of activities under the tourism strategy</i></p> <p style="text-align: center;"><i>Emphasis on integrated cooperation at all levels both public and private sectors</i></p> <p style="text-align: center;"><i>Clarity of goals</i></p>	<p style="text-align: center;"><i>Weakness</i></p> <p style="text-align: center;"><i>Overemphasis of goals that focus on economic returns</i></p> <p style="text-align: center;"><i>Coordination gap stemming from a large number of different organization characters and levels</i></p> <p style="text-align: center;"><i>Incompatibility of activities: national level activities versus locally launched activities.</i></p>
<i>External factors</i>	<p style="text-align: center;"><i>Opportunities</i></p> <p style="text-align: center;"><i>Tourism strategy plan 2004-2008 could be later utilized as master plan</i></p> <p style="text-align: center;"><i>Growth of tourism industry as each organizations both public and private launch their work to achieve the strategic goals in tourism strategy 2004-2008</i></p>	<p style="text-align: center;"><i>Threats</i></p> <p style="text-align: center;"><i>Redundancy of plan such as tourism development strategic plan 2007-2010 was developed while the tourism strategy 2004-2008 is still in place</i></p> <p style="text-align: center;"><i>Unethical behavior from private organizations and from unethical tourists which exploit natural sources</i></p>

SWOT analysis of Albanian tourism strategy 2004-2008

IMPLICATIONS AND DIRECTIONS FOR FUTURE RESEARCH

This study has given the relevant party whose job is to promote Albanian tourism the valid measurement in the form of concrete feedback on the effectiveness of Albanian tourism strategy 2004-2008, the operations, the marketing along with the problems and obstacles related to all stakeholders. In view of performance management, the research has rendered the appraisal tools (key performance indicators) to monitor and control its strategy and complete the strategic management process. We expect this research to contribute towards improvement of the work of all relevant authorities and offices both public and private whose responsibility is to ensure and promote growth of Albanian tourism industry. Hopefully, this study will contribute towards increasing the income of our people whose earnings come from country's tourism.

PRODUCTIVITY GAINS THROUGH ORGANIZATIONAL CHANGE: A CASE STUDY IN THE CANADIAN FURNITURE INDUSTRY

Beaupré, Daniel¹; Lapointe, Alain²

¹Université du Québec à Montréal, P.O. Box 6192, Centre-Ville Branch, Montréal (Québec)

²Université du Québec à Montréal

Turbulence in the economic environment is being amplified by increased competition from emerging countries, particularly China, forcing organizations to adopt new strategic directions and often change their work organization to obtain more flexibility and thus increase productivity. Two different types of flexibility, usually presented as alternatives, can be developed to do so: external flexibility, typical of the Fordist-Taylorist period, essentially consists in externalizing market adjustment problems by varying remuneration or the volume of the workforce. Internal flexibility, on the other hand, proceeds by investing in workforce training so that workers become more versatile, and thus more productive; this type of flexibility is central in the Toyotist model.

This paper describes the process of transformation in a Canadian manufacturing company and illustrates that the two types of flexibility can coexist. It also answers a fundamental question: on which key elements should we intervene in order to rapidly bring about change and obtain the flexibility needed for productivity gains that will significantly impact a company's profitability? This case study stems from action-research activities conducted within a furniture manufacturing company located in Québec. According to the consultancy mandate agreed upon, the objective was to increase productivity by 30%, despite the reopening of the collective agreement that led to more than 15% wage reductions, within a unionized context. The company's financial situation was so precarious that this productivity objective also had to be achieved within a period of 12 months.

Section: Case study.

Keywords: Change in work organization, flexibility, productivity, furniture manufacturing, Québec.

INTRODUCTION

Turbulence in the economic environment is being amplified by increased competition from emerging countries, particularly China, forcing organizations to adopt new strategic directions and often change their work organization to obtain more flexibility and thus increase productivity. Two different types of flexibility, usually presented as alternatives, can be developed to do so; external flexibility, typical of the Fordist-Taylorist period, essentially consists in externalizing market adjustment problems by varying remuneration or the volume of the workforce. Internal flexibility, on the other hand, proceeds by investing in workforce training so that workers become more versatile, and thus more productive; this type of flexibility is central in the Toyotist model.

This paper describes the process of transformation in a Canadian manufacturing company and illustrates that the two types of flexibility can coexist. It also answers a fundamental question: on which key elements should we intervene in order to rapidly bring about change and obtain the flexibility needed for productivity gains that will significantly impact the company's profitability? This case study stems from action-research activities conducted within

a furniture manufacturing company located in Québec. According to the consultancy mandate agreed upon, the objective was to increase productivity by 30%, despite the reopening of the collective agreement that led to more than 15% wage reductions, within a unionized context. The company's financial situation was so precarious that this productivity objective also had to be achieved within a period of 12 months.

CONTEXT

The company was founded in 1956 and is the largest Canadian manufacturer of top quality leather and fabric upholstered furniture. More than half of the 300 employees have more than 15 years seniority and 225 of them are unionized. The company's 600 customers are distributors throughout North America, mostly in the United States. In 2003 the company's sales were valued at more than \$40 million. But, like all Canadian manufacturing companies, it is now coming to grips with Asian competition, and especially competition from China, which since 2002 has been able to provide furniture with equal quality (in the eyes of consumers) at half the price. Moreover, 50% of the company's production is exported to the United States. With Canadian dollar's appreciation against its US counterpart (when this research was conducted in 2006) its fixed costs have increased by more than 40%. This places the company in a precarious financial situation.

Without studying in depth the complex set of factors operating behind major changes in work organization and production carried out during the past decade in a large number of Québec companies, we consider it is essential to start by identifying the basic economic factors that have forced Canadian manufacturing firms to increase their productivity in order to reposition themselves in the market. Three main interdependent factors can be observed: exchange rate appreciation, increased foreign competition and erosion of competitive advantages.

Exchange rate appreciation²⁴

The depreciation of the Canadian currency against the US dollar during the period preceding 2003 had made it easier to export to the United States, due to relatively lower selling prices.²⁵ During 2003 however the situation changed dramatically, due to the Canadian dollar's rapid appreciation, and this delivered a hard blow to the Canadian manufacturing sector. The real net exports of goods (the difference between exports and imports by volume) fell from a \$72.3 billion annual surplus in January 2002 to a \$6.4 billion deficit in July 2005, after reaching a \$17.5 billion deficit in January 2005.

²⁴ "It must also be understood that an exchange rate appreciation has affected Québec's major producers, since they are the ones who export their goods, while small producers sell their production on the local market. All companies, both large and small are affected in one way or another since it facilitates the entry of new competitors into Canada" (Lalonde, 2005).

²⁵ "Throughout the 1990s, a lower dollar value has increased domestic demand for goods manufactured in Canada through an increase in the price of imported products, while our exports cost more for foreign buyers. As for the weak dollar, which encourages our manufacturers, and the supply gap steadily decreases" (Wang, 2005).

Foreign competition

Foreign competition in the Canadian furniture industry mainly comes from Chinese manufacturers. Between 1993 and 2003, Canadian imports of Chinese products increased by 1,051% (Statistics Canada, 2003).²⁶ Indeed the countries benefiting from cheap labour²⁷ and able to produce inexpensive goods of acceptable quality have succeeded in carving out a sizeable niche for themselves among Western countries, thanks to globalization and the opening up of borders.

Québec's furniture manufacturers must thus deal increasingly with competition from China and its minimal production costs, which are being imposed globally within the industry. This giant is in fact the biggest threat to Québec's furniture industry on its two main geographic markets, representing over 98% of goods delivered: the internal market (Québec and Canada) and the United States (Lalonde 2005). Thus in total Chinese furniture imports increased from \$81.8 million in 1997 to \$230 million in 2000 (Wood Manufacturing Council, 2002), while China became the largest supplier of household furniture to the United States, with exports in this category increasing by 43% between 1997 and 2000.

Table 1 demonstrates the impressive growth of Chinese household furniture imports in Canada. The Chinese are especially threatening in the domestic furniture sub-sector, considered among Québec's manufacturers as a niche market. To counter this threat, several of them have decided to import components and even complete lines of furniture produced in China (subcontracting), and the production delocalization phenomenon has in fact seen significant growth over the last few years.

<i>Origin of Household Furniture Imports</i>	1993	2003
<i>United States</i>	66%	30%
<i>Italy</i>	6%	6%
<i>China</i>	5%	37%
<i>Malaysia</i>	2%	4%
<i>Thailand</i>	1%	4%
<i>Other</i>	20%	19%

Table 1: Origin of Household Furniture Imports (1993 and 2003)

Source: Statistics Canada in Industry Canada

²⁶ Note that Malaysia, Indonesia, Thailand and Mexico have also increased their exports to Canada with growth rates of 457%, 318%, 607% and 505% respectively" (Statistics Canada and Industry Canada. *The Household Furniture Industry in Canada*, 2003).

²⁷ The average hourly wage rate in the manufacturing sector is \$US 21.30 in the United States and \$US 18.35 in Canada yet as low as \$US 0.61 in China (*The China Report*, BMO Nesbitt Burns in Commerce, November 2004 edition). While labour costs represent more than 25% of furniture turnover in Québec, for certain manufacturers this data constitutes a challenge (Pinsonneault, 2004).

Erosion of competitive advantages

Given the context discussed earlier, Québec's furniture manufacturers obviously have to lower production costs, either by lowering workforce charges and by increasing productivity. But even a significant improvement on that score would probably not be sufficient to meet the competition. They should also rebuild competitive advantage by improvements in design, quality and delivery times. Québec manufacturers have the advantage of being close to two major furniture buyers, Canada and the United States. Their challenge however is to take advantage of this proximity by reducing delivery times (meet orders in a matter of days rather than months, like Chinese imports). As underlined by Perreault-Labelle (2006), it takes presently one to two months to receive a piece of furniture from Mao's country; yet Québec manufacturers hardly do better! "Although some companies deliver in ten days, on average they need four to six weeks." (Perreault-Labelle, 2006).

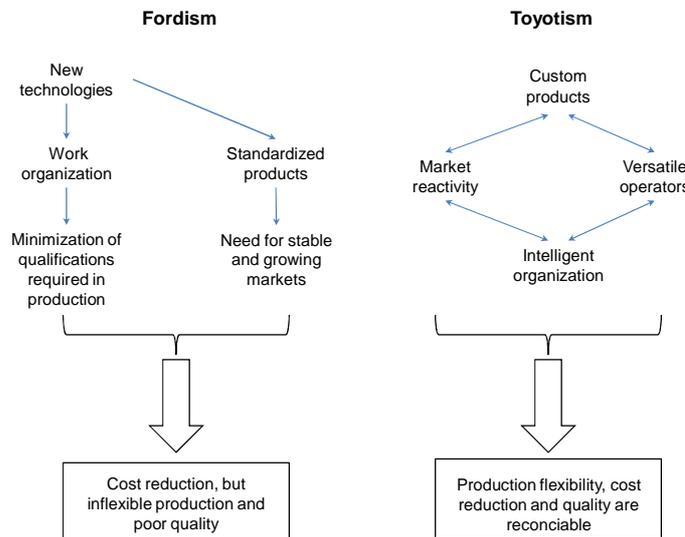

But in order to provide faster delivery, the manufacturing industry needs to move towards value-added production, that is production that eliminates any activities adding no value to the product (like storage or unnecessary worker's moving around). This calls for improvements in internal flexibility (not necessarily excluding external flexibility) and possibly for subcontracting some parts of the production process. We will see shortly that the company object of our case study did in fact adopt a hybrid production system in which large volumes of products are manufactured in China but customized in Québec.

CONCEPTUAL FRAMEWORK: WORK ORGANIZATION FORMATS

The disruptive changes in the production system that we just alluded to inevitably imply major work organization transformations. During recent decades traditional chain-work systems inspired by Taylorism and Fordism have revealed themselves to be ill suited to the organization's new needs for flexibility. Today's production processes are getting more and more complex. While previously production lines consisted of very segregated workstations and workers were required to act somewhat as robots, manufacturers now need to be able to modify their equipment in a few hours, thus quickly adapting to customer demands and producing different parts. This implies more qualified and competent workers. At the same time, thanks to globalization, there is a need to constantly increase productivity and reduce costs in order to remain competitive with other countries. Thus, the very principles of Taylorism and of chain-work production have been questioned.

From a theoretical point of view several authors (Aoki,1998; Boyer,1991; Coriat, 1993) have described the fundamental differences between the traditional system and the new forms of work organization consistent with Toyotism.

Figure 1: The Two Production Models Are Not Equivalent

The type of flexibility sought in the fordist-taylorist model refers to external flexibility, where little training is required and goods are standardized, thus allowing economies of scale. The toyotist model on the other hand calls for internal flexibility, where workers receive intensive training, thus making task rotation possible

This explains the growing interest (from practitioners as well as theoreticians) for new forms of work organization like workcells. Production cells involve the grouping of all items (machinery, manpower and support services) needed to manufacture a product or an entire range of components within an independent unit. Each unit operates as a small factory, so that that production flows are simplified and that products move faster through the various stages of the production process. This method results in the creation of a number of autonomous units, each assuming responsibility for production quality and efficiency. Production-cells allow the production of a range of assemblies or sub-assemblies, while process-cells can produce similar parts for use throughout the entire factory.

This new form of work organization can outright replace conventional production organization. It brings closer together the various production sequences. For this reason the workstations are physically close to each other, facilitating the movement of product components in each stage of the production process. In each workstation tools are also arranged in a manner that facilitates their access. The adoption of this form of work organization can thus increase productivity and reduce operating costs for companies, regardless of their size. Of course, this type of reorganization requires that employees develop a certain degree of versatility that enables them to rotate among workstations involving the same level of complexity; but this can be achieved with minimal investments.

The other arguments most often put forward for converting from line to cell production are: surface gains, improvements in productivity and quality, reductions in stock as well as indirect tasks and supervision. It seems that autonomous cells are better suited to the new requirements and challenges of production:

- a workcell can be easily duplicated if greater speed or quantities are required;
- cell production helps shorten production cycles and avoid work-in-progress stock accumulation. There is no need in fact to expect stoppages between various manufacturing stages, from material and part reception through to the finished product, ready for shipment. Thus, when the worker responsible for one workstation cannot immediately use parts delivered from the previous station, operations would temporarily stop at the latter;
- workcells reduce product manufacturing and delivery times;
- workcell autonomy is determined by manager/operator role combinations, meaning workers are given responsibilities, thus making it possible to convert the indirect (unproductive) into direct (production);
- workcells eliminate the need for storage and thus take up less space;
- worker empowerment results in more motivation and fewer errors;
- teamwork fosters motivation and collaboration.

METHODOLOGY

The previous list of benefits to be expected from cell production might look too nice to be true. Practitioners sometimes wonder if what they read in management literature actually applies to their « real world ». The present case study offers a limited but still quite convincing answer. This case study stems from action-research activities conducted within a furniture manufacturing company located in Québec. Action research implies that research work is carried out on real problems with members of a real organization. The objective is to take action following the researcher's intervention (Eden and Huxham, 1996). According to Arbnor and Bjerke's typology (1997), action-research takes place when there is an optimal balance between the researcher's interest in the company, in science and in the reference framework. These authors stress how difficult it is for action-research to be considered as a true science; for them, some stringent conditions have to be met:

1. The researcher's implication in the will to change the organization;
2. The research must have some involvement beyond the situation at hand;
3. The research must draw upon or develop certain theories;
4. The tools, techniques and methods used must be related to or anchored in existing theories.

These conditions are based on two principles: researcher transparency and integrity. Described below are the different steps in this research, which was undertaken between November 2006 and September 2007.

1. First of all, several meetings were held with a steering committee, composed of the company's president, the plant manager and the human resources director.
2. These meetings were supplemented with an analysis of all the company's documentation, including an analysis of the collective agreement. An informed diagnosis of the situation was then developed.
3. After detailed analysis of the situation, the researcher presented a solution to the steering committee. This proposal included four principal components: a communication plan of the reorganization project, a follow-up of the reorganization of the production layout, the creation of an employer/union committee, and the appropriate training of the supervisors considered as important elements in the changes.
4. This proposal was accepted and a detailed plan including specific objectives, timelines and resources necessary for implementing the plan were made available.
5. Because of the researcher's expertise in work organization interventions, it was possible to rigorously follow-up on the plan's four components. The development of a strong bond of confidence between the management committee and the researcher was developed during the implementation and monitoring of the strategic plan. Accordingly, during a period of 9 months, two days a week, the researcher actually visited the production locations to oversee the plan's implementation.

RESULTS

Transformation of the work organization

The following diagrams (Figure 2 and 3) illustrate the profound transformation of the work organization format that was adopted and implemented in our case study. As can be anticipated from the above discussions, the solution that was finally adopted to try and solve the problems at hand was a transition from linear to workcell organization. In establishing these cells, it was hoped that unproductive time could be reduced, and more specifically less time would be lost in moving equipment. To achieve this, entire departments (seamstresses, foam assembly workers and upholsterers) were reorganized and relocated, thus allowing 8 workcells to be implemented.

Figure-2 Simplified Diagram of Plant Linear “Push” Production System (Before Changes) – Lot system

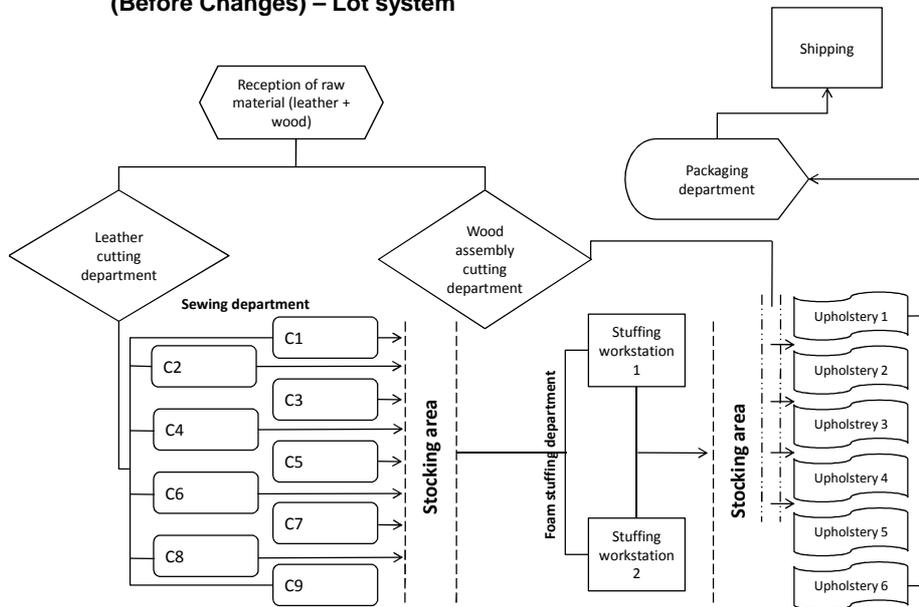

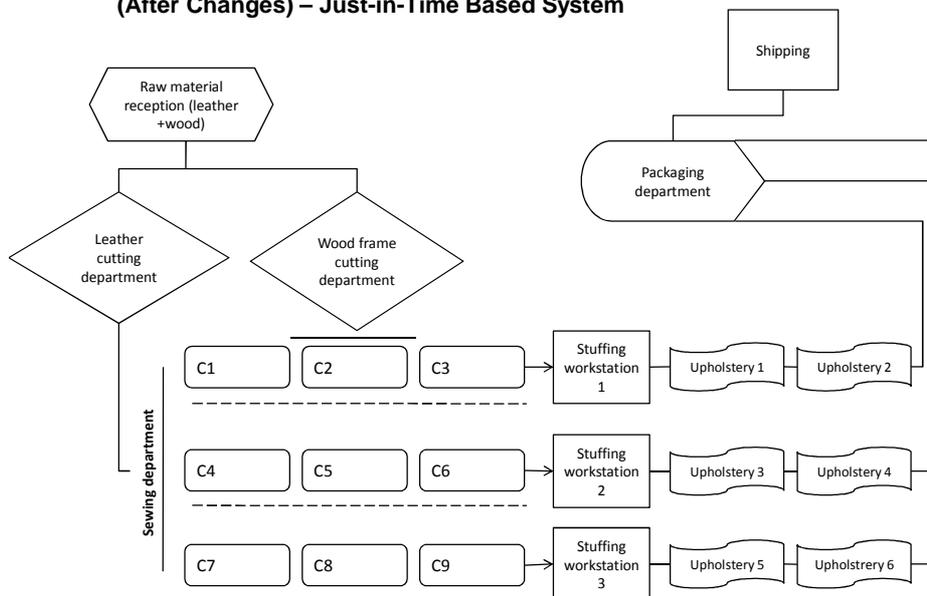

Figure-3 Simplified Diagram of Plant Workcell “Pull” Production System (After Changes) – Just-in-Time Based System

Below is a description of what happened in each one of the company departments following the planning of work reorganization.

1. For the cutting department (commonly known as the Wood Shop), the main objective was to reduce the use of hardwood by 80%, through building furniture frames with specialized plywood and thus reduce cutting time. The two activities planned to achieve this goal included a review of all specifications by the development/design department and the installation of a second digital cutting machine. The director of engineering piloted this project.
2. For the leather department, the objective was to increase quality control for tailors, thus reducing finished product rejects and costs related to poor quality. Note that before packing and shipping furniture, a high level of quality control was carried out. Each reject represented a waste of time and thus the selected activities to that effect were to provide training and increase the awareness for the nine leather tailors. Those responsible included the plant manager and the department supervisor.
3. For the fabric department, the primary objective was to reduce surplus stock. The activity envisaged to achieve this was to train the supervisor on how to plan more efficiently. The person responsible was the plant manager.
4. For the assembly department, priority was placed on the objective of increasing productivity by 40% in Caméléon furniture assembly. The activity retained was to analyze assembly schedule guidelines. Based on the diagnostic findings, a decision was made to set up a workstation to prepare the Caméléon product framing.
5. For the sewing department, the goal was to increase flexibility among the seamstresses, making it easier for them to move from one workcell to another, depending on production needs. This had to do with the company's need to reduce production times. In March/April the production/delivery time was about 14 weeks, but this had to be reduced to 5 or 6 weeks. Each workcell was designed to produce different furniture styles, yet the need for flexibility was a fundamental issue, since seamstresses had to be flexible enough to handle the different orders. A major training investment consequently had to be carried out. The persons responsible were the plant manager and the sewing department supervisor.
6. For the foam department, the objective was to improve workforce planning, due to the bottlenecks often caused by a lack of planning. The selected activity to do so was to train the supervisor. Several coaching follow-ups demonstrated however that the supervisor did not possess the skills needed for this position's new requirements. In the meantime a storekeeper position was created to ensure better management of all the hardware used in the company. The obvious solution was the reassignment of the supervisor to the storekeeper position. As for the supervisor, he was to be replaced by a team leader. It is important to understand that negotiations had been started with the union to promote certain employees as team leaders, and this would improve planning. Given this mutual finding, the company was able to secure the union's support. Team leaders were union employees who received a pay adjustment of two dollars an hour, and while they had no responsibility for discipline, they could help

with planning in their respective departments. Thus the supervisor was replaced by a team leader and not by another supervisor. The plant manager was responsible for naming the team leader, and where applicable for managing discipline.

7. For the upholstery department, two objectives had been identified. It is important to understand that this department serves as a hub in the production system, because the new work organization creates a pull instead of a push, meaning that it applies an upstream pull on production. Thus, if the upholsterers decide to reduce their productivity, the entire plant is affected. Note also that it was the upholsterers who were most affected by the reopening of the collective agreement. They had to undergo the largest drop in pay and as such their lack of motivation could be easily understood. Two goals thus had to be met. The first was to hire new upholsterers to increase production; yet we quickly recognized that external recruitment was not possible, and so a decision was quickly made to train apprentices. Also, an analysis of upholstery tasks was carried out, making it possible to determine which two tasks could be relocated and done by less qualified workers, and this resulted in accelerated production. The second objective was to systematically monitor the productivity of employees who were not producing the minimum expected yield. Meetings were held with about a dozen of them, first to make them aware of the problem and then to warn them of possible disciplinary action. A number of these measures were then administered. Note also that a very high percentage of the workforce responded to the productivity requests explained during the employee meetings that were held in accordance with the communication plan. The person responsible was the plant manager.
8. For the packing and shipping department, the objective was to eliminate the evening shift, implying the supervisor would return to a day schedule. The activity planned was to analyze the actual need of an evening shift. This confirmed that the shift was not really necessary, meaning adding a day supervisor to the department would mean significantly increased efficiency. The person responsible was the plant manager.
9. For the production-planning department (order office clerical staff), the objective was to reduce errors and their repercussions in terms of time, money and frustration. The activities set up for this were to establish a monitoring procedure and to finalize data entry using computer software. The person responsible was the department director.
10. For the stock department itself the objective was to establish better parts management for hardware and to relieve supervisors of this task. This called for the development of a layout plan for the plant's interior. The research and development center had been moved to another factory in Montréal, and this freed up space in which a stockroom could be set up. Moreover, in-house software needed to be developed in order to control the more than 1,000 different parts used to make the various furniture styles. The two persons responsible were the engineering director and the stockroom manager, who was the former supervisor of the foam department.

Challenges encountered during implementation

Of course, these multiple reorganizations required very good planning, especially since the company wanted to make these changes without having to close the factory and thus interfere with production. Between January and May 2007, the supervisors and management successfully modified the plant, according to the predetermined plans. At the beginning of these changes everything seemed to be in the wrong place and several bottlenecks appeared, thus further deteriorating employee productivity. The challenges did not stop there however. While the plant was being reorganized, the company established the different departmental action plans described above, in which productivity targets were identified for each department; a detailed review was carried out in each department and priorities were identified. Following this analysis, the global plant's productivity objective relative to furniture production was increased by 30%. While this may have been an ambitious goal, it was essential if the company was to survive financially. In order to succeed within the required time, the plan would require very rigorous application, strict follow-up, and of course sustained employee participation, despite the 15% wage reduction that preceded the reorganization. When building internal flexibility, teamwork and employee involvement in finding solutions for production problem became a major issue. This is where the HR and communication strategies established upfront proved to be essential.

Managing the change process

- The communication strategy

At the very beginning of the process, a communication plan was proposed to management, according to which all workers would be met in small groups of 20 (the plant currently employed approximately 225 unionized employees). During one day, the general manager and plant director would meet with all groups to explain the business objectives, the vision for this new organization of work and management's expectations regarding employees. The overall response was very good and the presentation highly appreciated. These meetings were planned both in terms of their content and form. They were expected to last approximately 45 minutes and include a 15-minute question period. The message for all employees would be the same, and it was important that the meeting be held without too much delay. For those who would have hoped to ask more questions or obtain more information, the management stated that during the reorganization of each workcell there would be problem-solving meetings in which information exchange would be the leitmotif. The desired impact was attained. More specifically, this approach eliminated rumours about a closure and massive job losses, and clear goals and roles were defined for each employee.

- Employer/union committee

Due to the flexibility required when operating in workcell mode, changes had to be made to the collective agreement. A historical review is needed here to provide a sense of the actual situation with respect to labour relations developments. In June 2005, a steering committee was created to focus on remuneration issues. The president then met with the union explaining that it was imperative that the collective agreement be reopened in order to invest in the factory. After a series of promising meetings, discussions had come to a halt. Then in early autumn 2005,

the management proceeded with two waves of layoffs (affecting 50 employees in total), an extraordinary event in this company. In late November 2005, the union issued statements to the employees and an agreement in principle was drawn up. The new collective agreement was accepted and the old agreement, which was to end in 2006, was replaced. The company could thus invest in the plant. An employer/union committee was then established on a permanent basis and regular meetings were held (once every 2 weeks), to provide all information to union members. These meetings strengthened the bonds of trust and gradually the union became an ally, permitting greater cooperation with employees. Many items were clarified, including the new role of supervisors, changes in the plant, the company's vision in the medium and long term, etc. This was reassuring for the union who had expressed dissatisfaction with certain points and seen the employer act quickly to make the possible rectifications, thus establishing greater flexibility in solving problems with the union.

These transformations also led to changes in the company's governance. As discussed by Bélanger, Lapointe and Lévesque (1998) "a new deal, redefining roles and responsibilities, is substituted to the previous strict division of roles and responsibilities. Unions become concerned with the company's economic performance, feeling that they are partly responsible since they participate in decisions leading to those results. Workers and unions now find themselves performing functions that had formerly belonged exclusively to management."

- Training and coaching

The various changes taking place in the company required that the supervisors' roles be transformed. Before the reorganization, supervisors were somewhat at the service of employees, who in turn were motivated by performance pay, and generally their output was very good. The supervisors' main task was to ensure employees did not lack anything in terms of the equipment and tools needed to obtain the expected productivity. Supervisors thus had excellent technical knowledge but were not necessarily apt as managers, neither in their capacity as personnel managers nor as performance efficiency planners within their workcell. For this reason, and in order to qualify them for their new roles, supervisors were given training sessions in communication, resistance to change and problem-solving skills. The general manager, plant manager and human resources director were required to attend all training sessions with these supervisors, in order to show that the company was taking this approach seriously and to ensure that the same message was being passed down the chain of command. Once this training was given to supervisors, follow-up in the form of real-time coaching was offered for a period of two days as they exercised their duties. It should be stated however that many supervisors, despite good theoretical understanding of the concepts, had difficulty to relinquish their former work habits and become department managers. After 20 years of experience within a different work model, taking on another role represented a major challenge.

CONCLUSION

Following Eden and Huxham (1996), action-research must aim to bring about real change in an organization. The present intervention certainly did so: within 8 months, production had increased by 40% and workforce productivity by 30%; the company was thus able to become profitable once again.

Arbnor and Bjerke's (1997) also insist that the research must have some implications beyond the situation at hand. Our case study highlights the key success factors of radical change in work reorganization. Three critical elements have to be kept in mind when operating a transition from linear production to workcell production. First of all, communication lines have to be opened with the employees: a communication plan in which employees (and union) are regularly informed of the objectives and results of the reorganization is essential. To that effect, the setting up of a management/union committee helps promoting much faster problem resolution than the institutional path, i.e. collective agreement. Finally, supervisors who see their role transformed from one of coordinator to planner, or even to small business manager, definitely need appropriate training and coaching.

The research has also brought contributions on a theoretical level. It showed that two approaches that hitherto seemed difficult to reconcile could indeed be combined to achieve important productivity gains. Authors such as Coriat (1990), Streeck, Meudlers and Wilkin (1987) identified two main types of flexibility: external flexibility and internal flexibility. For these authors external flexibility comes from externalizing market adjustment problems, including salaries and jobs. This form of reactive flexibility (Coriat, 1990) seeks to reopen collective agreements and/or individual employment contracts, creating psychological pressure on employees, and generating fear among them that they could lose their job. «Considering that is aims to make the employees bear the weight of instability and adjustments, external flexibility results in permanent threat and insecurity for the employees » (Coriat, 1990; p. 259). By contrast, internal flexibility means that the organization will to find and satisfy the conditions of its adaptation to the market. Preferring this form of flexibility, the company will strive to provide its workforce with increased training so it can meet the need for diversification and better market/product fit. Requalifying workers, decentralizing management decisions and increasing worker autonomy constitute the main dimensions of this form of flexibility. The two methods are fundamentally different and seem irreconcilable.

But the present case study in the furniture manufacturing industry demonstrates that these two types of flexibility may coexist. The whole set of conditions for such successful combinations has not been identified here, but it appears that the sequence is important. Applying external flexibility measures first apparently helped free the employees from the fear of further pay or job losses, thereby allowing larger and better investment in internal flexibility steps. Of course successful work organization transformation implies that internal flexibility measures have been carefully planned and followed-up, like it seems to have been done here.

A MODEL OF DEVELOPMENT FOR REGIONS TOWARDS A POST CONFLICT PERIOD. THE CASE OF THE DEAD SEA AND THE JORDAN VALLEY

Bijaoui, Ilan¹; Sultan, Suhail²

¹*Ph. D Ashkelon Academic College*

²*Ph.D. UNU-MERIT*

The chief purpose of this paper is to propose the most suitable development model preparing countries to enter in a post conflict period. The FEZ-Cluster hybrid model neutralizes the weaknesses of FEZ and Cluster models and cumulates their advantages, attract investment and generate development based on human capital and knowledge. This hybrid model is able to create new sustainable cross border economic interests between countries in conflict. The researchers checked its feasibility in two regions at the borders of Israel, Palestine, and Jordan; namely, the Dead Sea (chemicals) and the Jordan Valley (agribusiness).

Keywords: Free Economic Zone, cluster, regional development, Israel, Palestine, Jordan

INTRODUCTION

Regional economies have (in recent years/since??) become the core of social life and policy making (Storper,1995). The new regionalism tends to focus on unique, location specific developments (Lagendjik, 1997). Each model of regional development takes advantage of the geographic (Scott, 1988; Storper and Walker, 1989), social (Becattini, 1990), resources (Madani, 1999), technology and market conditions of a region (Porter 1998). The Free Economic Zone (FEZ) creates a new economic entity operating under rules independent of the host country. The main objective is to attract export-oriented foreign manufacturing firms by fiscal and trade incentives. Porter's cluster model (Porter 1990) takes advantage of technology and market conditions and generates a spatial process of vertical and horizontal integration (Porter 1998). Porter places emphasis on market and competition.

The purpose of this research is to determine the most suitable model that is able to generate sustainable economic interests common to the countries of a region in a post conflict period.

The researchers will first discuss the efficiency (examples) of those models in the world. The researchers will check their potential economic impact in two selected regions-sectors, The Dead Sea region (for industry based on raw materials from the Dead Sea) and the Jordan Valley (for out-of- season agricultural products).

REVIEW OF THE LITERATURE ON THE FEZ AND CLUSTER MODELS

Free Economic Zones

The Free Economic Zone (FEZ) is "a geographic economic area in which goods enter duty free for processing and export, and in which investors are offered a variety of incentives (WEPZA)".

FEZs are also called Export Processing Zones (EPZ) or Special Economic Zones (SEZ) in China. They enable less developed countries (LDCs) to benefit from the relocation of the labor-intensive industries (textiles, shoes) and capital intensive industry (steel, petrochemicals) of developed countries that are seeking low cost production and new economies of scale. These changes in the production relations led to the theory of the "New Spatial Division of Labor" (Frober et al, 1977). In the 1950's, many LDCs in Latin America (including Chile, Brazil, Caribbean Islands) established FEZs (Fan Sujie, 1993) while the first FEZs were established in Ireland and Taiwan in the 1960's (McCalla, 1990).

The first four FEZs in China, the Special Economic Zones, were set up in the coastal region of South China, this model spreading from there to the North in the 1980s and to the interior in the 1990s. There are about 125 FEZs on the national level in China today. Product specialization in FEZs is heavily concentrated in labor intensive activities centered on the production of textiles, clothing, electrical and electronic goods, food processing, and metalworking. Such types of activity represent more than 90% of all FEZ output (Burns, 1995). Diversification remains very limited because companies from developed countries adopt de-localization policies for a limited number of manufactured goods.

The ILO (1996) stresses that "a striking feature of FEZs has been their development into mono-cultural industrial estates rather than into well-balanced industrial parks as originally planned."

The creation of induced employment along with the quality of the jobs created constitute the main indicator used to judge the success of an FEZ. Experience shows that even if salaries in FEZs are generally higher than those paid by companies outside the zones, they are generally for jobs requiring low skills and are reserved in the main for a female workforce. Do FEZs generate sustainable economic development in the host region/country?

Empirical studies show the ratio of indirect/direct jobs created varies from 0.25 in the case of Mauritius (ILO 1988a) to 1.4 in Madagascar (Razafindrakoto & Roubaud, 1997) and more than 2 in Honduras. The concept of net exports (exports of finished goods less imports of intermediate goods and materials) provides an indicator of the locally generated value added by an FEZ and of the importance of the backward linkages to the domestic economy. In the Philippines this ratio reached 42% (1994) and only 20% in Bangladesh (1995) (Madani 1999). The Mexican ratio of 22% is similar to Bangladesh (Cling & Letilly, 2001). Kusago and Tzannatos' (1998) study of three Southeast Asian EPZs (Bataan in the Philippines; Masan in Korea; Penang in Malaysia) reaches similar conclusions. The net gain in foreign exchange is significantly reduced by outflows of profits and dividends repatriated by subsidiaries to their parent company; the use of local primary materials remains limited in FEZs; and import duty exemptions on intermediate goods constitute a disincentive to purchases from local suppliers. Countries hosting FEZs expect foreign enterprises to transfer part of their knowledge and technology to local companies, but the transfer of technology is impeded by the following two obstacles:

(1) Most of the employees in the FEZ acquire only the basic skills necessary to perform specific production tasks and in consequence have little value for other sectors of activity, and (2) training is provided to a selected number of employees, and their mobility takes place within the FEZ (ILO, 1998b)

Although developing countries consider FEZs to be a central instrument of development policy, FEZs in the emerging Asian countries have played only a modest role in development. FEZs in Korea and Taiwan were considered as only one element among many adopted in an export-led growth strategy. Export oriented industrial activity has never represented more than 3-4% of manufactured exports in the case of Korea and 8-9% in the case of Taiwan (Basile & Germidis, 1984). FEZs are now declining in the four East Asian "tigers" (Korea, Hong Kong, Singapore and Taiwan).

In Singapore almost all the custom duties were suppressed in 1994, and, moreover, fiscal advantages granted to FEZs have disappeared. Employment in the free zone of Masan (Korea) has fallen since the end of the 1980's from 14000 to 2000.

The Middle East experienced a new kind of FEZ called Qualified Industrial Zones (QIZ). The US-Israel Implementation Act defines QIZ (www.customs.ustreas.gov) as the territory of Israel and Jordan or Israel and Egypt designated locally as an enclave where merchandise may enter without payment of duty or excise taxes. The QIZ program allows the Jordanian kingdoms' business community to export to the US free of duties and restrictions, eliminating tariffs and other commercial barriers, providing the sum of the cost or value of material produced in the West Bank, Gaza Strip, in other QIZs, or in Israel, plus, the direct costs of processing operations is not less than 35% of the price paid by the US buyer.

Job creation was a central objective. In 2001, 70% of the employees in the QIZ enclave were Jordanian. In 2003 only 57% of the 26000 employees were Jordanian (Kardoosh & El Hour, 2004). The official explanation for this situation is the limited number of skilled employees in textiles activities in Jordan. Skilled development is practically nonexistent in QIZs, and consequently, this model does not provide the basis for upward mobility within the enterprise. Also, QIZs have not produced backward linkage to any significant extent. The QIZ sector remains heavily dependent on importing intermediate goods, materials, and accessories. Ninety to ninety-five per cent of fabrics used in QIZ production are imported. Companies operating in a QIZ are labor intensive, low-tech assembly firms, with scant access to advanced technology. Thus, transfer of technology is practically confined to the labor aspect alone.

FEZ model improves the employment situation in developing countries by providing low cost unskilled jobs. But it contributes very little to the economic development of the host region/country. FEZ creates little synergy between firms located in the free zone and the existing business infrastructure in the local community. The conclusion is that FEZ cannot create sustainable common economic interests for a region in a post conflict period.

The Porter cluster model

Firms in the Porter cluster model (1998) gain competitive strength because of better access to specialized and experienced employees, suppliers, specialized information, and public goods, and by the motivating forces of local competition and customer demand (Rosenfeld 1996; Enright 2000; Saxenian 1994).

Christensen, McIntyre, and Pikhoid (2002), in their research on successful cluster development practices in the United States and Italy, emphasize the business generator aspect of Porter's cluster model, describing it as a "geographic concentration of an array of linked,

competitive firms that either have close buy-sell relationships, utilize common technologies, share customers, or share a labor pool that provides them with a competitive advantage.”

The cluster model gains competitive strength due to its better access to trained and experienced employees, suppliers, specialized information and public goods, as well as from motivating forces of local competition and customer demand (Rosenfeld, 1996; Enright, 2000; Saxenian, 1994). In their research on successful cluster development practices in the United States and Italy, Christensen, McIntyre and Pikhoid (2002) emphasize the business generator aspect of the cluster. Lissoni (2001) argues that authorities and institutions should facilitate collaboration and networking, but Porter does not endorse this view on the grounds that such networking would lead to a reduction in competition.

An example of bottom-up development is the Silicon Valley, the first United States cluster model, which was initiated by private parties. Frederick Terman, Professor and Provost of Stanford University, proposed the leasing of Stanford's lands for use as an office park, the Stanford Industrial Park (SIP). Leases were limited to high-tech companies. Its first tenant was Varian Associates, founded by Stanford alumni in the 1930s to build military radar components. Terman also found venture capital for civilian technology startups. One of the major success stories was Hewlett Packard, which was founded by Stanford graduates William Hewlett and David Packard.

Networks were generated autonomously in both regions, Silicon Valley and SIP (Saxenian, 1994; Segel, 1985).

In most European Union (EU) countries, the clustering process was the initiative of governments. The EU Expert Group's final report Enterprise Clusters and Networks surveyed 59 traditional clusters and 25 science-based clusters (European Commission, 2007). According to the report, in the member states, policies towards cluster development are generally issued by national governments with the co-operation of regional or local governments.

National authorities focus on designing and coordinating cluster policies to create the general framework conditions and developing R&D programmes. In certain countries such as Belgium and Spain, cluster policy is strictly a regional government initiative.

In Germany projects such as EXIST or BioRegio are the result of the federal government's cluster policy, a top-down approach. (Colovic-Lamotte & Tayanagi, 2004). Regional governments have been required to share with the federal government the provision of financial support to spinoff companies from universities.

Ireland's Galway software cluster (Green, 2000) is also a top-down initiative of the national government and the regional authorities (Galway). Its origin is in the development of the software industry around multinational company axes such as Digital Electronics Corporation (DEC), Nortel, and Compaq initiated by the government. Those large producers of computers and electronic subsystems are large buyers of electronic components, software and software packaging, and other subcontracting services from local SMEs.

The Japanese government has been implementing new policies such as the Industrial Cluster plan (METI) and the Intellectual Cluster Plan (MEXT) since 2001 (Colovic-Lamotte & Tayanagi, 2004). METI designated nineteen regional cluster projects in metal machine parts and airplane parts (Higashi Osaka), original equipment manufacturing and environment industry (Hitachi-city), and also in ceramics and metal cutleries. MEXT has mainly worked to expand the budget for universities, aimed at improving technology transfer and patent strategy.

Finland's government encourages the development of industrial clusters. The well known cluster in Finland, called "Networking," at Turku and Oulu is in telecommunication and involves companies such as Nokia and ABB (TEKES, 2005).

The cluster model requires strong competitive advantage in one or more of the following inputs or specialization: valuated raw material, dynamic industrial specialization or, the existence of big companies with a strong networking in knowledge and trade. Porter proposed the implementation of those principles in Luxemburg (2005 a), Chile (2005 b) and Ireland (2006). Clusters based on similar principles in a region in conflict may be the economic generator of a future political solution.

The Hybrid FEZ – Cluster private cross border model

FEZ provides not only the required economic conditions required in order to attract foreign investment, but also an economic alternative to a territorial conflict. FEZ is an independent entity, which can neutralize eventual frictions between countries, if it is managed by a third side, according to economic principles approved by all.

The transfer of the geographic location of the FEZ to a neutral independent third economic party is implemented in several regions. Private FEZ, cross border FEZ exist and operate successfully in and between different countries.

Private FEZ:

The FEZ at El Rosario, La Paz, located 42 Km south to Pedegral, San Salvador, is owned by a private partnership , Grupo Artistas (<http://www.elpedregalsal.com>), with 20 years experience in business. In 1992 this partnership initiated the creation of two other FEZ (El Progreso, American Park) <http://www.americanpark.com.sv/elsalvador.asp>

The first private FEZ has been created in Greece by two private companies AEGEK and METON (<http://www.ase.gr>) in the region of Aetolia-Acarmania (Astakos West Greece) (126 Million Euros) In 2003 the Syrian parliament approved a law allowing the creation of private FEZ. (The Syrian Report, 2003 <http://www.ameinfo.com/16199.html>)

This law gives to GOFZ and to the local authorities of the FEZ the right to transfer the responsibility of the FEZ location to private investors.

Cross border FEZ:

Cross border FEZ between countries operate in South East Asia (Tang Min, 1993), Pan Xiaomin, 1997) and Europe (European Commission, 2001). In Asia the most developed cross border FEZ are the industrial triangle between South Korea, Japan China, around Tumen River

(Li Qing, 1997), the Mekong river region between Laos, Cambodia, Thailand and Myanmar and the economic triangle between Taiwan and South China (Xiangming Chen, 1995).

In Europe, The most efficient cross border FEZ is the Maas Rhein triangle between Maastricht region (The Netherlands), Liège region (Belgium) and Aachen region (Germany) (<http://www.euregio-mr.org>).

Different models of private FEZ and cross border industrial and economic zones exist in several regions and countries. It may be feasible also in the Middle East.

The Cluster model developed around a strong local technology based competitive advantage will insure in the framework of a FEZ model the attraction of investment in human capital and knowledge and not only in low cost manpower.

The hybrid FEZ-Cluster private cross border model takes advantage of the positive impact of both models and creates the required conditions for a cross border joint economic development. Its independent economic status neutralizes potential frictions between countries. The potential investors have the benefit of economic incentives and political stability.

HYBRID FEZ-CLUSTER IN THE DEAD SEA REGION AND THE JORDAN VALLEY

The researchers argue that the region at the border between, Israeli, Jordan and the Palestinian Authorities, around the Jordan River and the Dead Sea, meets the relevant conditions for the implementation of a private cross border hybrid FEZ-Cluster model, which, in a post conflict period, can provide for sustainable economic growth. In order to check the feasibility of this model we have selected two locations with a common local distinctive competence from both sides of the border:

- The Dead Sea region: The countries share the raw material from the Dead Sea and have developed parallel and competing chemical and cosmetic industries.
- The Jordan Valley region: On both sides of the Jordan river, the winter climate enables production and export of off-season produce to Europe.

Methodology, Interviews, and Collection of data

The researchers have interviewed representatives of the main “related and supporting industries” manufacturers, growers and providers of services. They were asked to respond to the following questions:

- What are your distinctive competences?
- What products do you produce and for which markets?
- What impact would the establishment of a hybrid FEZ-Cluster have on your activities?
- What impact would the establishment of a hybrid FEZ-Cluster have on the region?

In the Dead Sea region, on the Palestinian-Jordanian side of the border, the researchers interviewed the following main firms:

ACL Arab Chemical Trust Ltd

Crystal for Dead Sea Products (Dead Sea products)

Al Zara (Cosmetics)

Jordan Co for Dead Sea products

Three small cosmetics companies

On the Jordanian side of the Jordan Valley the researchers interviewed the following Palestinian-Jordanian growers:

Large-medium

Walid Al Natour (Fruits)

Fahmi Al-Saify (Fruits)

Zuhail Abdel Rahem (Fruits and Vegetables)

Small

Majed Al Khateeb

On the Israeli and Palestinian side of the Dead Sea Region the researchers interviewed or collected data on the following main firms:

Dead Sea works

Dead Sea Bromine

Periclase

Bromine Compounds

Ahava (the researchers have collected relevant data from secondary sources)

There are no for the moment Palestinian chemical industries

On the Israeli-Palestinian side of the Jordan Valley we interviewed or collected data from the following main companies:

Argaman grapes and dates

Bkaot grapes, dates and citrus

Gilgal: nursery, aquarium ornamental fish.

Gitit dates

Massua dates, citrus, vegetables, flowers

Naama fresh spices

Naaran manufacturers of plastic wrap and PVC

Pazael grapes, dates, vegetables, flowers

Tomer dates, fresh spices, grapes, vegetables

Yitav vegetables, mainly red peppers

The researchers also interviewed national and regional authorities and professional associations in order to answer the following questions:

- What are the distinctive competences of the region?
- What economic sectors exist in the region?
- What impact would the establishment of a hybrid FEZ-Cluster have on the economic activities of the region?

The researchers interviewed the Jordanian Ministry of Planning, the Jordanian Ministry of Industry, Jordanian Investment Promotion Board, and National Resources Authority, the Israeli Jordan Valley Agricultural Commission and Israeli Jordan Valley and the Economic Development Company.

Dead Sea Hybrid FEZ – Cluster

The researchers present below the results of the interviews comparing the situation prior to establishment of the hybrid FEZ-Cluster and the situation expected to result from implementation of the hybrid FEZ-Cluster.

Situation prior to establishment of the Hybrid FEZ-Cluster: (see Figure 1, 2)

- The three basic industries are bromine, potash and magnesium industries produced by two large trusts ICL (Israel Chemical Ltd) and APC (Arab Potash Company). The ICL Group accounts for 11% of the international trade of potash and ACL, for 6%. The ICL group accounts for one third of the world production of bromine.
- The related industries are as follows:
 - Magnesium oxide for refractory applications (bricks) industry Periclase (Israel) and JordMag (Jordan) Both companies have many difficulties competing with the Chinese production which has the benefit of low cost of manpower. Jormag still continues to produce magnesium oxide. Periclase now produces magnesium specialties for food, pharmaceuticals, and fire retardant applications
 - Fertilizers are produced by ICL Fertilizers (Israel) and two Jordanian joint ventures: Jordan-Nippon Fertilizers and Kemira (JV with Kemira, the Finnish partner)

- Bromine Compounds (Israel) produces a flame retardant compound for computers, semiconductors, home appliances, construction and transportation, components of the clear bride fluid used in gas and oil fluids applications, organic bromine compounds as intermediates for the synthesis of pharmaceuticals and biocides. Jordan Bromine company started to produce only in 2003 a smaller range of products. It is a joint venture with the US and world leading company Albermale.
- ICL Metallurgy (Israel) produces magnesium alloys as a joint venture with Volkswagen. Chinese competition cut the prices and limits the expansion of ICL Metallurgy. China has 70% of the market and ICL Metallurgy 7% only. Jordan is not involved in this field.
 - Cosmetics industries based on the Carnallite and the mud from the Dead Sea: 43 Jordanian firms and 33 Israeli firms produce cosmetics based on Dead Sea raw material. Only one firm, Ahava, has succeeded in growing and now exports around 30 million \$US worth of products annually.

Figure 1 - Dead Sea Industry (Israel) prior to the Hybrid FEZ-Cluster

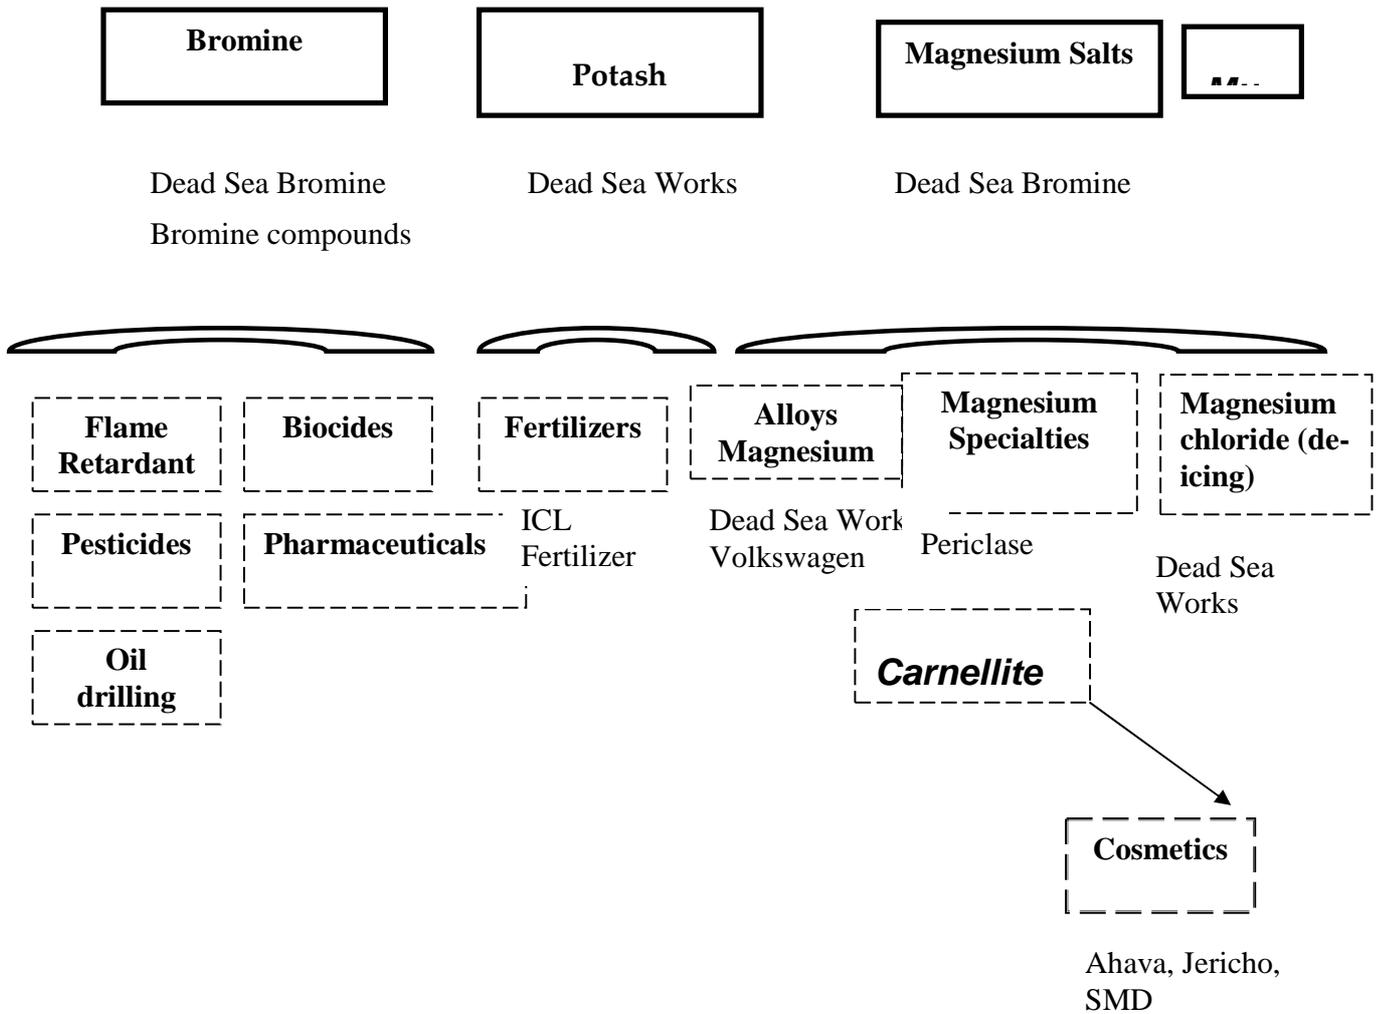

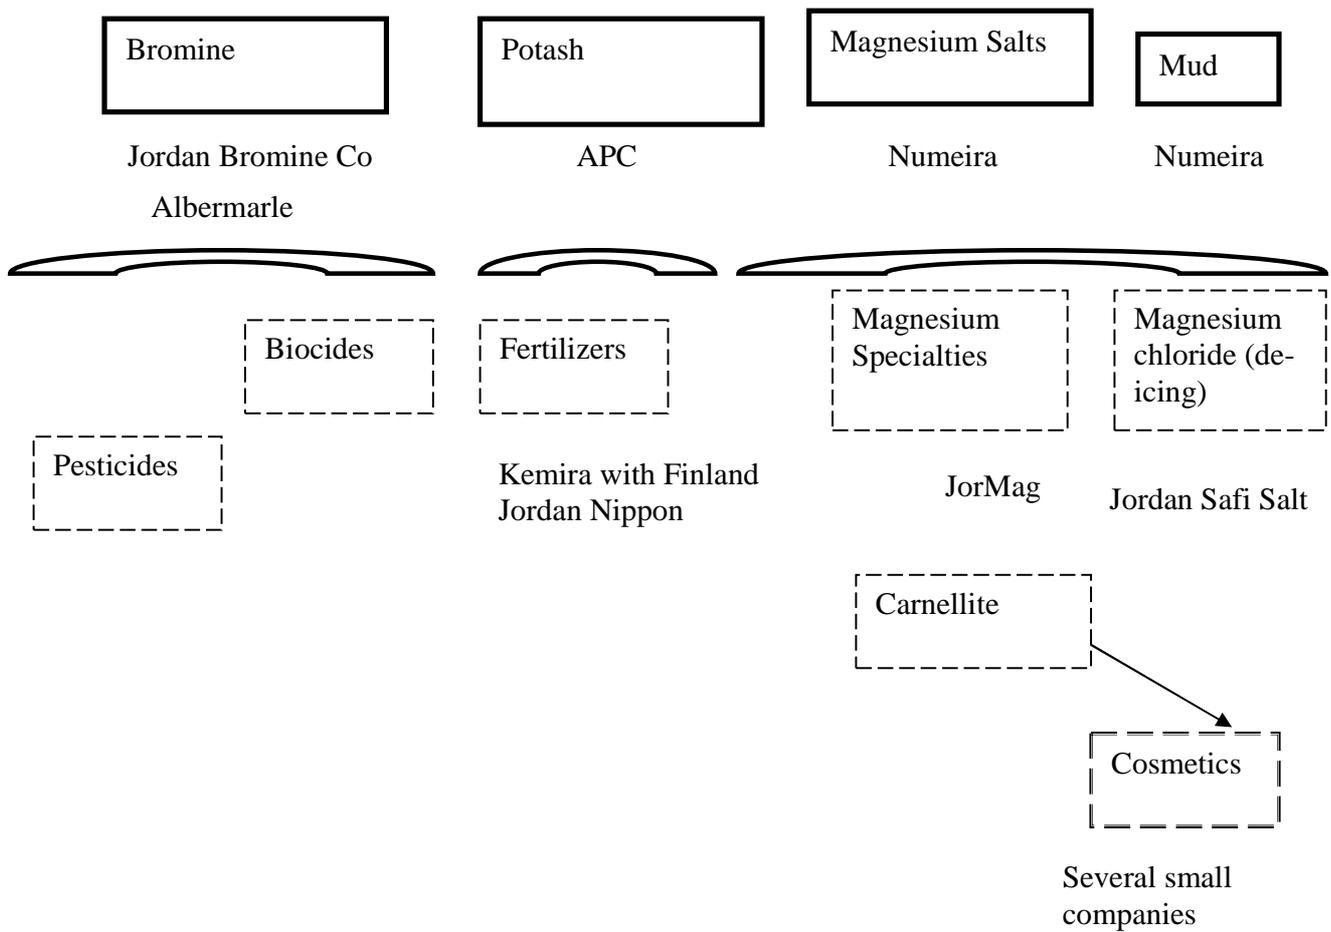

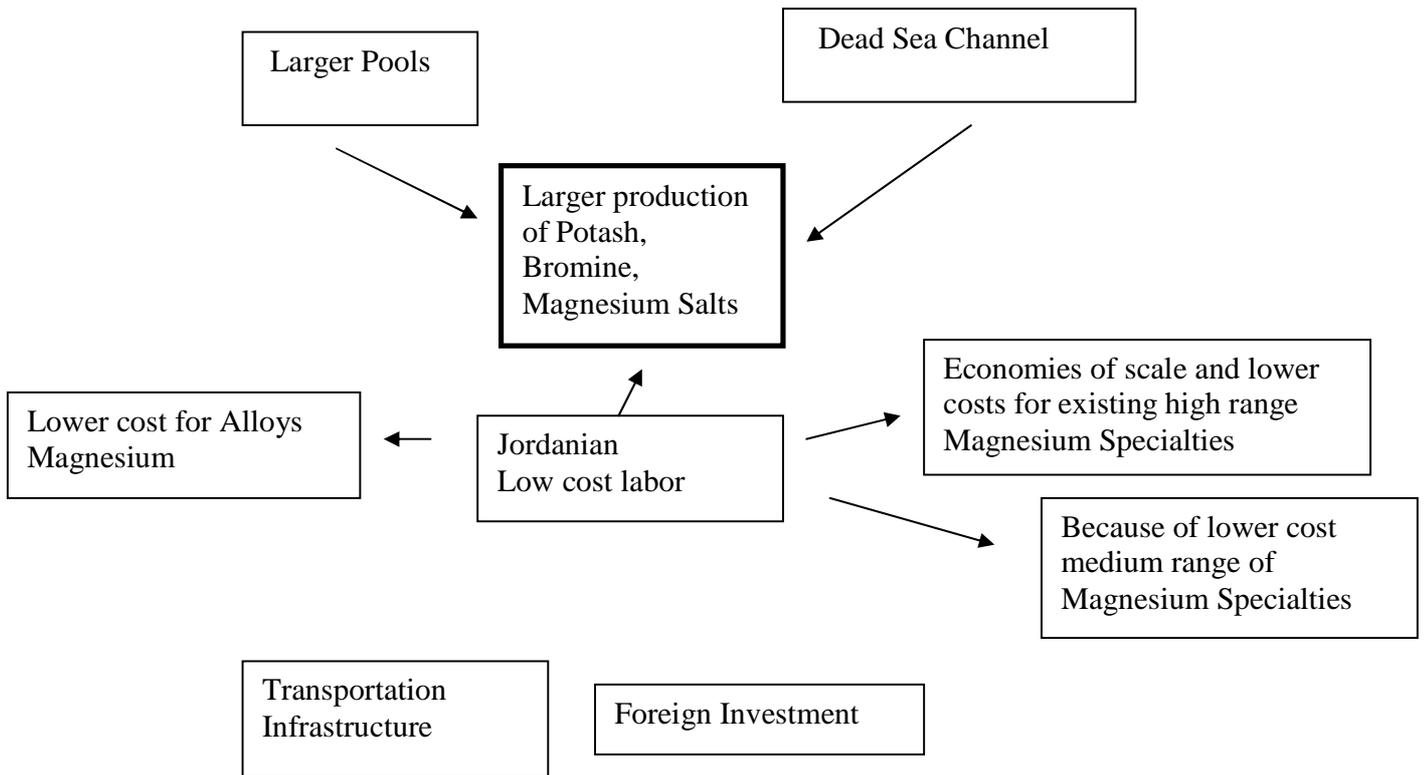

Figure 2 - Dead Sea Industry (Jordan) prior to the Hybrid FEZ-Cluster in the Jordan

Arguments for the Hybrid FEZ-Cluster model (see figure 3).

- The management of the FEZ-Cluster by a third party will help neutralize the effects of the existing embargo of the Jordanian professional associations against Israel.
- The elimination of the physical border will allow the enlargement of the pools and the quantity of raw material produced.
- The basic bottleneck of the industrial development of the Dead Sea region is the low level of the Dead Sea. Only a joint project creating a physical link between the Mediterranean Sea or the Red Sea and the Dead Sea, will improve the capacity of production of raw material from the Dead Sea.
- Lower cost of labor and energy from the Jordanian side will open the middle range of the magnesium specialties market (animal feeding) and will improve the competitive position of the magnesium oxide based industry against Chinese competition.
- Bromine compounds, if produced in larger quantities in autonomous production units, can benefit from economies of scale.
- The production of magnesium alloys (metal magnesium) will have the benefit of lower costs of manpower and energy and will be able to compete with Chinese companies.

Figure 3 - Dead Sea Industry with Hybrid FEZ-Cluster

- Exported raw material and products from the Dead Sea requires efficient transportation infrastructure. Railway infrastructure to the main ports on the Red Sea (Aqaba, Eilat) and on the Mediterranean Sea (mainly Ashdod), and the possibility of using any port will be cost effective.
- The possibility of using any port, train or road in Israel or Jordan, will open new markets to the existing and future firms
- The Hybrid FEZ-Cluster will raise the level of confidence of foreign investors for investing in infrastructure and companies

The Dead Sea Cluster would generate knowledge-based industries dependent upon distinctive local competences of the region.

Jordan Valley: Out of Season Agriculture – Hybrid FEZ-Cluster

Situation prior to the Hybrid FEZ-Cluster (Figure 4, 5, 6)

- Israeli growers produce: 110 ha dates, 90 ha vegetables, field crops and herbs, 40 ha grapes, 10ha fruits. The total Israeli production is valued at 100 Million US\$.
- The Israeli growers use refrigeration services for freezing dates outside the Jordan Valley, close to the ports
- The Israeli growers use the services of agricultural trading companies which have their own transportation services abroad
- Palestinian-Jordanian growers produce: 75 ha citrus, 70 ha vegetables and field crops and 7 ha of other crops in the north and in the south of the Jordan Valley. In the center the authorities plan to build an infrastructure (refrigeration...), supporting the production of agricultural products mainly for exports. The authorities intend to lease land for a price of \$1000 per dunam per year, twice the price of the land in the North and the South.

Figure 4: Israeli Agricultural Cluster in the Jordan Valley

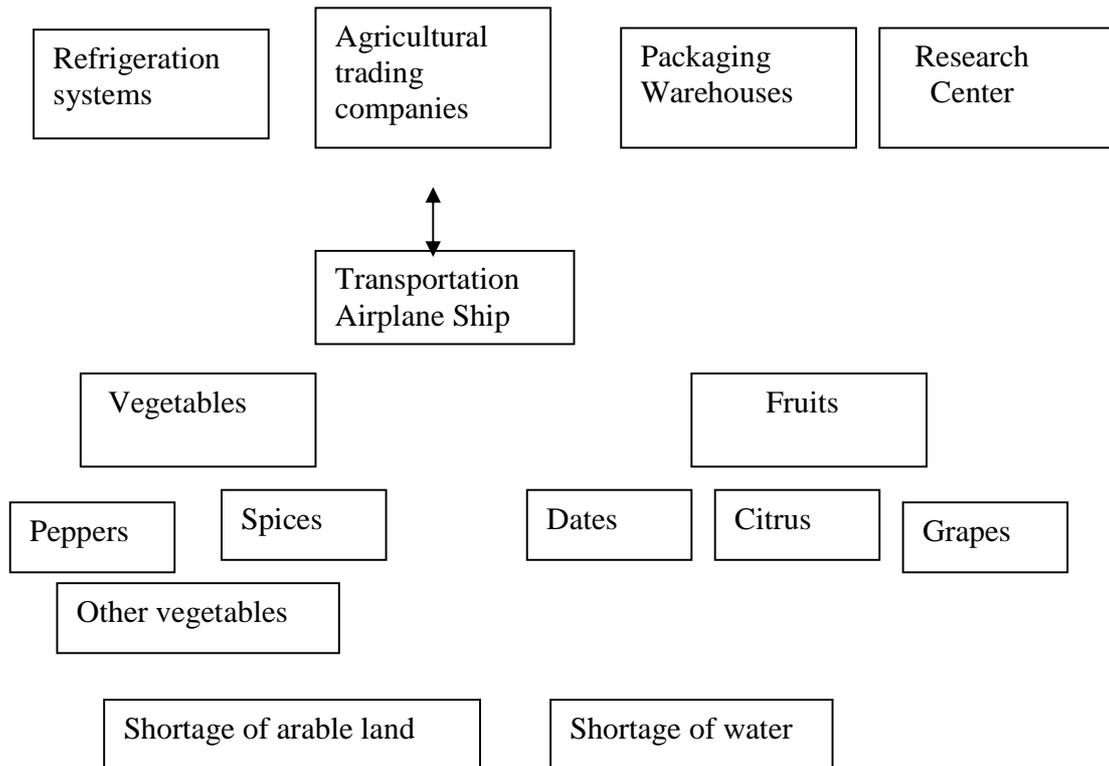

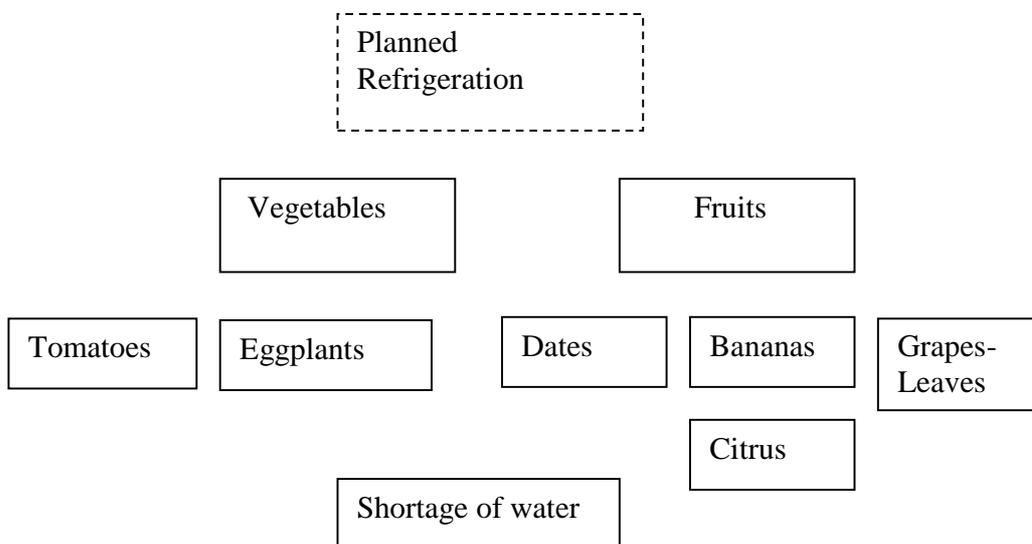

Figure 5 - Jordanian Agricultural Cluster in the Jordan Valley

Palestinian growers produce similar products as Jordanian growers. There are no available statistics about Palestinian production in the region.

- Israel and Jordan, produce a similar quantity of vegetables - around 1250 tons, but in Israel the productivity (quantity/ha) is double and 20 times higher in value (1000 US\$/farmer). Most of the Israeli production (mainly red peppers, dates and spices) is exported to Europe, while the Jordanian production (mainly citrus, banana, tomatoes eggplants, grape leaves) is sold in the local market.

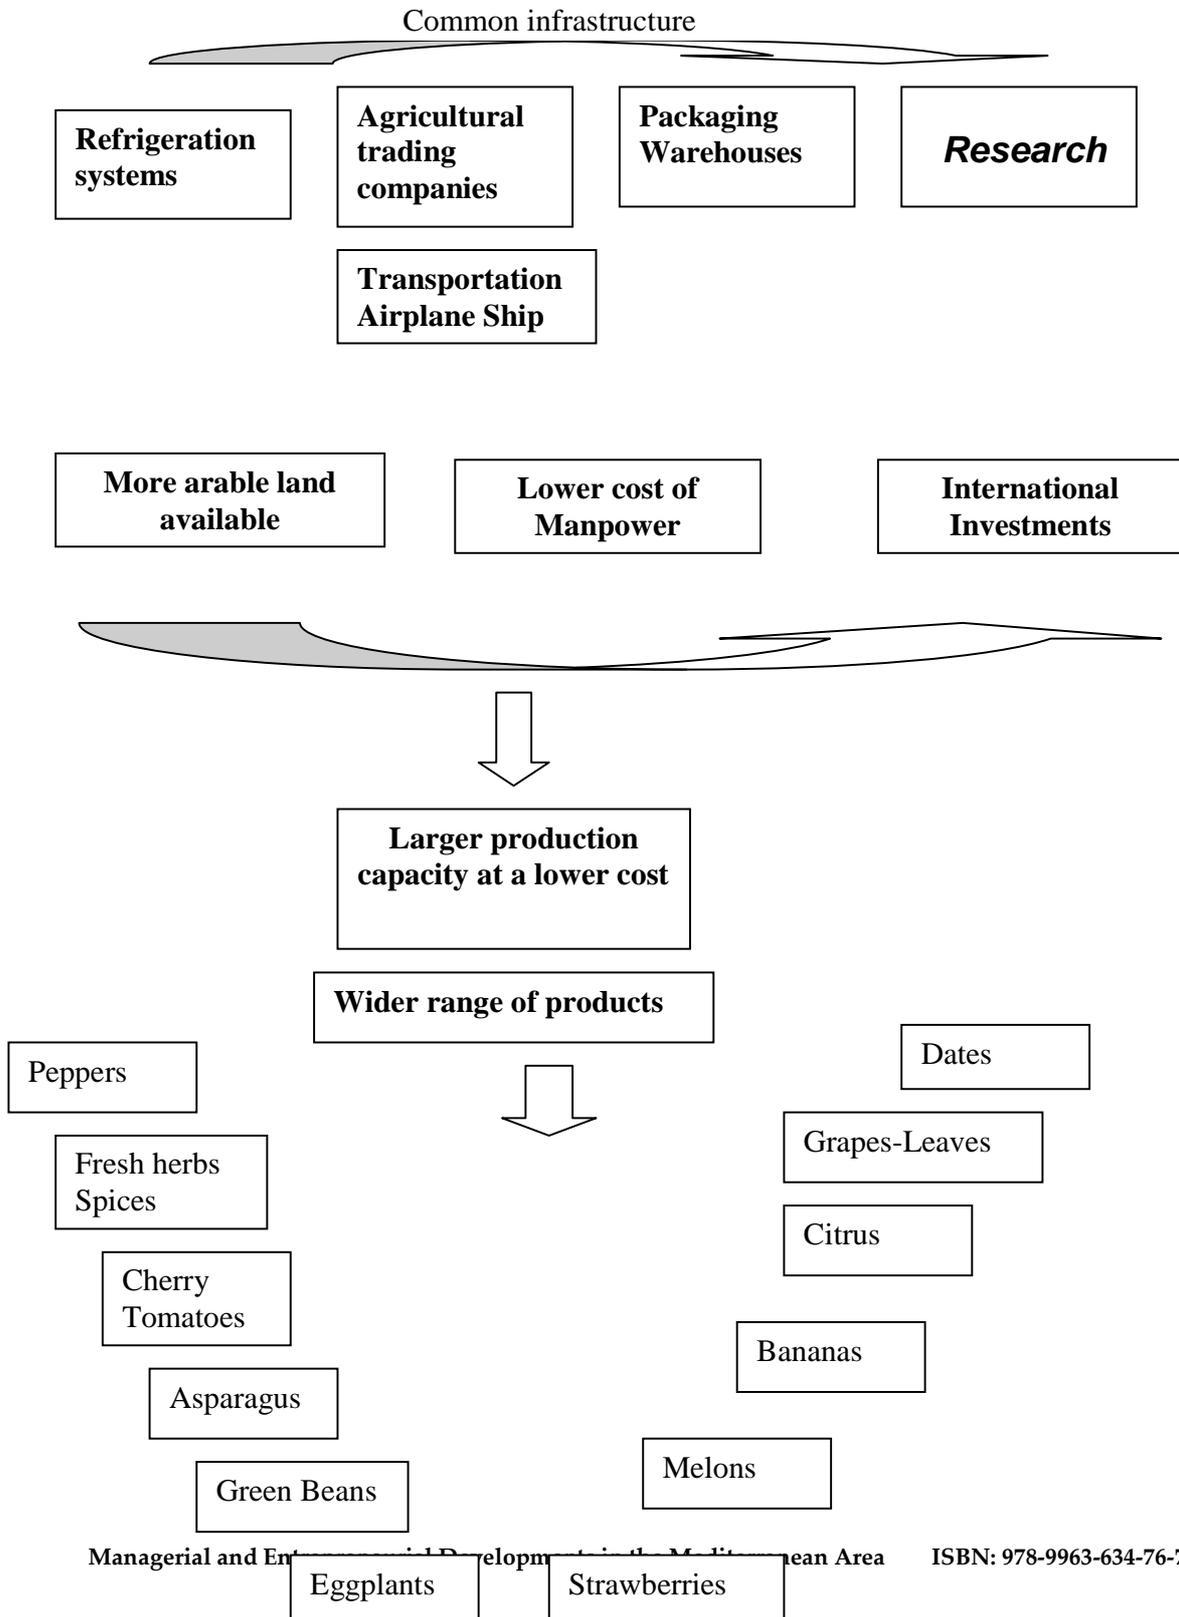

The lack of water is a common disadvantage in Jordan. There is also a lack of capital and technology in inputs, packaging, market channels, and a lack of awareness of prices, demand, and knowledge required to deliver high quality products (Agriculture Cluster in the Jordan Valley, 2000).

Israeli growers benefit from high technologies and updated knowledge from the international markets through several Israeli exports trading companies. The main bottlenecks, beyond water, is a shortage of arable land and of low cost manpower. . Jordan.

Hybrid FEZ-Cluster impact (Figure 6)

- In the framework of the FEZ-Cluster, the Dead Sea-Red Sea channel could be built as proposed by the Jordan Valley Authority in order to solve the problem of the lack of water.

Figure 6 - Hybrid FEZ-Cluster in the Jordan Valley

- The management of the model of a common FEZ-Cluster by a third party solves the problem of the opposition of the Jordanian professional associations to any cooperation with Israeli partners.
- The management of the hybrid FEZ-Cluster a third party and approved by Palestinian, Jordanian and Israelis parties could solve the political problem of the border, which is not recognized by the Palestinians and the Jordanians.
- Jordanian products have access to the Israeli Mediterranean ports
- Jordanian weaknesses in technology, market channels, and related and supporting industries will be compensated by the experience of international and Israeli business units.
- The Jordanian farmers, traders and providers of services emphasize the economies of scale, of scope
- The FEZ – Cluster will attract international investments.
- The production of strawberries, melons, green beans, peas, asparagus, cherry tomatoes, and fresh herbs proposed by the French delegation (MREA, 2002) will be feasible

CONCLUSION

A region in a post conflict period requires the fulfillment of compulsory preliminary conditions in order to be ready to define common economic development involving former enemies as the main objective. The FEZ provides such conditions by neutralizing the concept of political borders: the FEZ location transferred to a neutral economic organization, which does not belong to any side and so any side, anyone, can develop economic activity there. A cluster model inside the FEZ improves the chances of the region to have sustainable growth and to attract international investments. The hybrid FEZ-Cluster is not only based on low cost manpower, but also on local distinctive competences generating horizontal and vertical synergies. The researchers have proved that such hybrid model, implemented in the Dead Sea region and the Jordan Valley is able to generate not only economies of scale and more added value to existing businesses but also to generate new businesses.

THE OPEN INNOVATION STRATEGY IN THE MARKET LIFE CYCLE

Bijaoui, Ilan¹; Tabatchnick, Itshak²

¹*Academic Ashkelon College*

²*Bar Ilan University*

We argue and prove that the intensive use of knowledge from external sources, the origin of open innovation, is positively correlated with business success of high-tech products. We also prove that high-tech products based mainly on the intensive use of knowledge from internal sources, closed innovation, fail. We argue and prove that open innovation in products and in embedded technology in products, is critical in order to succeed in a market at its emerging and growth phase. The empirical research was carried out on a sample of 65 high-tech products, selected from Israeli firms specialized in electronics.

Keywords - Open innovation strategy, competitive advantage, market, technology, manufacturing, innovation, product life cycle, market life cycle, disruptive innovation, discontinuous innovation

INTRODUCTION

Pavitt (2003) argues that business firms remain incapable of accurately predicting the technical and commercial outcome of their own innovative activities. Even if they try to do it, according to Chesbrough (2006), "most innovations fail". Nonetheless, he considers innovation a compulsory activity, because "companies that don't innovate, die" (Chesbrough, 2006). Arthur D. Little (2005) confirms the importance of innovation for the business sector. From 800 companies operating in different business sectors in the United States, Canada, Latin America, Europe and the Asia-Pacific region, the top innovators have 2.5 times higher sales of new products and get more than ten times higher returns from their innovation investments.

The different innovation strategies proposed by academic researches and their business impact are discussed in this paper. We argue that an innovation strategy focused mainly on closed/continuous innovation and in-depth specialization is a high-risk strategy. We prove that business success depends mainly on the intensive use of external sources of knowledge, the origin of open innovation.

INNOVATION STRATEGY IN THE LITERATURE

Schumpeter (1934) was the first researcher to realize that, at the macro-economic level, the development and diffusion of new technologies formed the source of economic progress. Many other researchers followed: Gruber (1967), Gruber and Vernon (1970), Jones (1966), Samuelson (1965), Hirsh and Bijaoui (1985) and Utterback et al (1978) proved the positive correlation between research and development (R&D) and economic growth.

The innovation process has traditionally been viewed as a simple linear sequence process with emphasis on R&D and in which "the market is a recipient of the fruits of R&D" (Rothwell,

2002). The purpose of R&D for the neo-classical school was not new products (Arrow, 1962; Nelson, 1959) but technological innovation. The linear "Technology Push" model, dominated industrial policy after the Second World War until the mid-1960s. In the early 1970s, innovation became linked to customer needs in the market. The source of innovation is no longer the R&D department only, but the marketplace also. Von Hippel (1978) found that the market is the most influential function in the innovation process. In the project NewProd, Cooper and Kleinschmidt (1990) and Cooper (1994, 1999) also found that strong market orientation is one of the basic reasons for success. This led to the second linear model, the "Market-Pull" model. In the "Technology Push" model, the starting point of the innovation process is technology and in the marketing pull model, the market. In the "Simultaneous Coupling Model" of innovation (Galbraith, 1982), neither technology nor the market leads the innovation process. The simultaneous activities of R&D, manufacturing ("Technology Push") and marketing ("Marketing Pull") generate the innovation process. Each side provides its own expertise and the management of the organization leads the whole innovation process.

In the mid-1980s, the novel product organization of Japanese firms led to the "Network" innovation model (Imai *et al.*, 1985). In this model, the different in-house departments interact with each other rather than work sequentially. The objective is to reduce the product "lead-time cycle" and costs. Innovation is the result of the co-operation between the functions (R&D, manufacturing and marketing) and two external flows of knowledge, one linking the external scientific and technological environment to the firm through R&D, and one linking the external marketplace environment to the firm through marketing. (Rothwell, 1992).

In the 1990s, the focus moved from network innovation to "System Innovation" (Lundvall, 1992; Edquist, 1997), a multi-actor process of accumulating know-how, which requires high levels of integration at both intra- and extra-firm levels. The external network is based on current, but also future/potential customers, suppliers, competitors, science and technological infrastructure and service providers. By interacting with the internal sources of knowledge, the external sources of knowledge improve the innovative capabilities of the firm and its capability to enter new markets in order to reach higher returns. (Rothwell, 2002). The key aspects of this model of innovation are integration, flexibility, networking and parallel knowledge processing.

Rothwell underlines the following strategy elements: the time-based strategy, the corporate flexibility and responsiveness, the customer focus, the quality control, the integration with primary suppliers and the horizontal technological and electronic data-processing strategy.

Tidd *et al.* (2001) emphasizes the central role of the strategic approach, the supportive organizational context, the effective implementation mechanisms and the effective external linkages in the successful management of the network innovation model. Any function – R&D, marketing, manufacturing – in this model is able to innovate and lead.

Ritter and Gemunden (2002) use the external environment composition defined by Gemunden *et al.* (1992) – the administration, the suppliers and co suppliers, research and training, the competitors, the consultants, the distributors and buyers – to check if these sources of knowledge can improve the positive impact of technology capability on business results. They find a strong positive correlation with business results. Thomke (2001) and Von Hippel (1978) reach similar conclusions.

Leonard (2002) considers an additional player in the external environment – “other non-competitor companies”. These companies do not compete today, but could be future competitors if the firm decides in the future to enter their market. Leonard refers, in this regard, to Miller’s and Morris’ (1999) “discontinuous innovation” in market knowledge, Christensen’s (1999) and Danneels’ (2004) “disruptive innovation”, and Chesbrough’s (2003, 2006) “open innovation”. These models explain how technological and/or marketing myopia based on continuous/closed innovation, opens business opportunities to newcomers able to generate disruptive/open innovation. Christensen draws attention to cases where market myopia is the effective trigger point, such as Seagate-Conner Peripherals. Seagate, a company specialized in hard disk drivers, decided not to develop and produce a 3½-inch hard disk that was assumed, too small for PCs, not only in size, but also in capacity. In response, employees from Seagate established Conner and created the laptop market, with the 3½-inch disc drive. Christensen concluded that “the track record of existing players to ride both horses is poor, but they face the need to deal with this innovator’s dilemma. Either they surrender the ground to newcomers or they spin off new ventures and become newcomers themselves.”

Open/disruptive innovation changes the bases of competition (Danneels, 2004). Its choice and efficiency depend on “marketing/technological competence”, the ability of a firm to build new technological competences and/or to identify and build relations with new customers.

The growing mobility of highly experienced and skilled people and the wider diffusion of knowledge created new alternatives to firms’ internal knowledge. Open innovation (Chesbrough, 2003, 2006), similar to discontinuous (Miller, 1999) or disruptive innovation (Christensen, 1999), combines internal and external ideas into architecture and systems.

Open Innovation is “the use of purposive inflows and outflows of knowledge to accelerate internal innovation, and to expand the markets for external use of innovation, respectively” (Chesbrough et al, 2006).

De Jong *et al.* (2008) distinguish five types of behaviour that capture most of what enterprises do, when they generate open innovation: networking, collaboration, corporate entrepreneurship, intellectual property management and R&D.

The following external conditions are identified by De Jong (2008), representing the key sources of capital necessary for innovation: large stock of basic knowledge, highly-educated and a mobile labour force, and good access to finance.

Nokia uses an open innovation strategy (Dittrich and Duyesters, 2007) in developing new products and services and in setting technology standards for current and future use of mobile communication applications.

In 1997–2002, it had 48 strategic alliance agreements, of which 25 were joint development agreements, 16 co-production contracts, six joint ventures and one standardization consortium. Nokia refers to as “context”, are usually outsourced. This is the case, for instance, with network elements. Nokia buys them from SCI, Flextronics Finland and Elcoteq Networks Oyj, since they can produce them much more efficiently and there are no economies of scale for Nokia in producing them internally.

Chesbrough classifies industries in three innovation oriented categories:

- industries that have to operate under open innovation such as the Hollywood film industry;
- those in transition between closed/continuous and open innovation, such as Healthcare, banking and computers;
- those that continue to operate under closed/continuous innovation, such as nuclear reactors and mainframe computers.

The trend in many industries towards open innovation processes become more important in recent years, both in large enterprises (OECD, 2008) and in SMEs (De Jong, 2006).

THE INNOVATION MAP – ILLUSTRATIVE CASES

The innovation map presents the different available options of closed (c) or open (o) innovation in the market (Mc, Mo), in embedded technology in products (Tc, To), in the manufacturing process (Mfc, Mfo) and in products (Po, Pc).

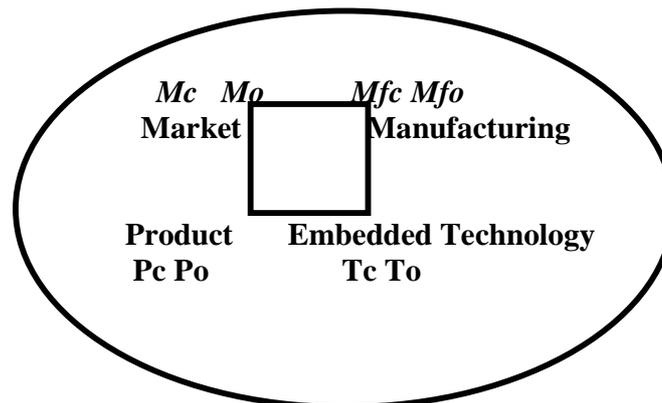

Figure 1 - The Innovation Map

The cases below illustrate the major options of open innovation.

Open Innovation in product and in embedded technology in products; closed innovation in the market – the compact disk and Nike's sport shoes

The compact disk

Improvement of competitive advantage may require open innovation in products, a totally new product concept. In 1982, the CD-DA (compact disk-digital audio) was jointly introduced to the consumer market by Philips and Sony. The open innovation in products – small and portable, based on an open innovation in embedded technology in products, laser technology, stereo audio signals in digital form – responded to the need in the market for improved music quality and quantity, a closed innovation in the market.

Sport shoes – the case of Nike

In 1964, Nike founders Phil Knight and Bill Bowerman detected a need in the United States market for lighter, more resistant athletic shoes for runners (improved added value, a closed innovation in the market, to compete with German brands Adidas and Puma. They decided to develop a running shoe style with a nylon upper and have it manufactured through Japan's Onitsuka Tiger. This new concept of running shoe, open innovation in products, provided the light weight and durability demanded by professional runners.

Nike improved its sports shoes through open innovation in embedded technology in products, including a new patented Air-Sole cushioning technology in "Tailwind". Max Air, engineered to handle impact, Zoom Air, extra light and responsive, and Air Shock, with a slower rate of impact loading, were later embedded technologies in Nike's sport shoes.

Open innovation in products, in embedded technology in products and in the market – the microwave and the laser

The microwave oven

In 1946, Dr. Percy LeBaron Spencer of Raytheon Corporation (www.amana.com) decided to improve radar performance by developing an open innovation in embedded technology in products, microwave technology, and to take advantage of competitors.

Raytheon Corporation decided to embed the microwave technology into the microwave oven, an open innovation in products, provided to an assumed need in the market of quicker cooking process, a closed innovation in the market. In 1947, the first commercial microwave oven hit the market weighting 750 lb, or 340 kg, at a unit cost of US\$5,000. The heavy weight and high price obviously did not suit the needs of private and professional customers (restaurants). Amana, a specialist in electric appliances that was acquired by Raytheon, developed a lighter and cheaper microwave oven and introduced it in the oven market as a quicker cooking oven, a closed innovation in the market. In fact, the microwave oven was not a closed innovation in the oven market, but fulfilled the new need for warming/de freezing/no-cooking pre-prepared food, a new market, an open innovation in the market, The microwave oven is used more often to warm a pizza or a pre-prepared meal than to cook more quickly,

The laser

A powerful tool for identifying the characteristics of a wide variety of molecules emerged from the work of Arthur L. Schawlow and Charles H. Townes in microwave spectroscopy (Luccent Technologies, 1998). Neither of these researchers was planning on inventing a device – the laser – that would revolutionize a number of industries, from communications to medicine. They had something more straightforward in mind: developing a device to help them to analyse molecular structures. Schawlow recalled the unanticipated invention, "We thought it might have some communications and scientific uses, but we had no application in mind."

Schawlow's and Townes' technological innovation aimed at developing an instrument for a small market, the analysis of molecular structures, using a developed product – the laser.

Bell Labs decided to hire them to develop laser technology as an embedded technology in telecommunication systems, an open innovation in embedded technology in products improving the fulfillment of quicker and more intensive telecommunication needs, which is a closed innovation in the market.

Open innovation in manufacturing technology

Benetton used computerized automatic design (CAD), manufacturing (CAM) as an open innovation in manufacturing technology, in order to improve its competitive advantage by reducing cost and time to market.

These new technologies allowed open innovation in products, a wider scope of products, design and colors.

Open Innovation Strategy and the Product/Market Life Cycle

Vernon (1966) is one of the first researchers to hypothesize a natural evolution of industry from innovation in the domestic market to growth in the international market. Based on his product life cycle (PLC) theory, he argued that United States companies would be better placed to develop new innovative products for a relatively high-income consumer market at the "early stage" of the PLC.

Having exhausted its market power domestically, the firms would start exporting the innovation to exploit the competitive advantage of their product in the international market. At this "growth stage" of the PLC, products are highly differentiated.

Finally, as product characteristics become more standardized and a dominant design develops, more firms enter into production and competition, and focus shifts to manufacturing efficiency rather than developing new product characteristics. This is the "mature" stage. Vernon's PLC can be also defined as the Market Life Cycle (MLC). At the early stage, the innovative firms create a new market, the emerging phase. The firms start to export and the market entered its growth phase. More firms enter in production and competition, and the market enters in its mature phase.

Klepper (1996) shows that open innovation in products, and in embedded technology in products, dominates the early stage of the product life cycle, while open innovation in manufacturing enters in the mature stage, when production volume have picked up and competition is strong.

Hirsch (1967) argues that, at the early stage, embedded technology in products, frequently change, Mainly SME's enter the market at that phase. Large firms don't take so high risks. Competitive technologies enter the emerging market and try to propose better solutions. Firms must therefore use new technological knowledge, external sources of knowledge, in order to compete. According to Hirsch, at the growth stage, embedded technology changes a little, but manufacturing technology is the focus of innovation, because large firms enter the market, acquire SME's or their knowledge and improve economies of scale.

At the mature stage, the innovation in manufacturing is expected periodically in order to allow cost improvement and differentiation.

Christensen (1999) argues also that, at the emerging phase of a market, i.e. functionality, disruptive/open innovation in products drives the market. At the growth phase, i.e. reliability, continuous/closed innovation in products, is requested. In the mature phase, the requested convenience, demands capabilities of disruptive/ open innovation in manufacturing technology in order to be able to reach economies of scale and scope. Open innovation in products and in embedded technology in products is, according to Vernon (1966), Hirsch (1967), Klepper (1996) and Christensen (1999) – a compulsory condition in order to succeed at the emerging phase of a market (Figure 2). At the growth phase, they emphasize the importance of differentiation and reliability, closed innovation in products and open innovation in manufacturing technology.

At the mature phase, they agree that convenience, open innovation in manufacturing technology, is the way to improve competitive advantage and succeed.

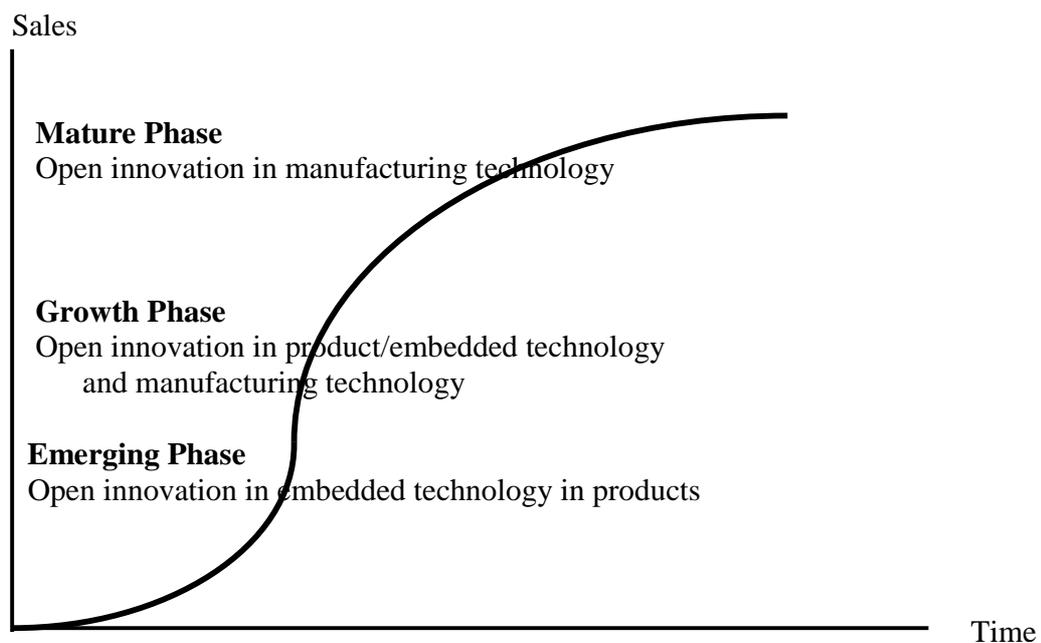

Figure 2 - Product/embedded technology/market life cycle and open innovation

EMPIRICAL ANALYSIS

Methodology

. Many researchers – Ritter and Gemunden (2002), Thomke (2001) and Von Hippel (1978) – proved the positive impact of the use of external sources of knowledge, such as customers, competitors or suppliers, on the correlation between innovation and business success. But no

research has tried to prove the positive impact on the business success of open innovation based on the use of knowledge beyond the current business and technological knowledge of the firm, beyond Miller's (1999) "wall of expectation", (technology knowledge), and "the wall of experience" (market knowledge).

The sample

We contacted 80 high-tech Israeli firms specialized in electronics and telecommunication: 42 were ready to cooperate and able to provide the full historical record of one or two products. Our sample consists of 65 products – 17 from large firms, 28 from medium firms and 20 from small firms. Twenty-one of the selected products enter the market at its emerging phase; 21 at the growth phase and 22 at the mature phase. We made an in depth interview (two hours) for each product of the people involved in it, at the market and technological level.

The questionnaire

The first part presented the innovation strategy of the firm: level of risk, R&D intensity, leadership in technology

The second part presented the profile of the firm, its specialization the selected product and its market (size and maturity).

In the third part, we have collected data at the product level, about the sources of technology, market, product and process innovation from internal and external origin.

The dependent variable:

BS: Business success

For each product, the firms had to evaluate the level of business success on a scale of 1–7 with respect to:

- the entire business;
- the innovative and technological assessment of their competitors;
- the planned business results.

BS= average between the provided scores.

The independent variables are as follows:

In each product, the firms have evaluated – on a scale of 1–5 – the volume of internal and external sources of knowledge for each main embedded technology in products, manufacturing technology and market.

X_m , X_t , X_p volume of internal knowledge from source m- market, t -embedded technology in products and p - manufacturing technology.

P_m , P_t , P_p relative importance of the internal knowledge sources m- market, t-embedded technology in products, p-manufacturing technology compared to the total of internal sources.

$\sum X_i P_i$ = Accumulated internal knowledge $\sum P_i = 100\%$

Similarly, if Y_j are sources of external knowledge,

$\sum Y_j P_j$ = Accumulated external knowledge $\sum P_j = 100\%$;

$\sum X_i P_i + \sum Y_j P_j$ = Total volume of knowledge from the different external sources for a product.

The dependent variables used are:

- EK: Total volume of external sources of knowledge – Closed/Disruptive Innovation
- CI: Total volume of internal sources of knowledge – Open/Continuous Innovation
- OI = EK/CI: Intensity of external sources of knowledge
- ET: Volume of external sources of knowledge for embedded technology – open/disruptive innovation in embedded technology in products.
- EP: Volume of external sources of knowledge for manufacturing technology – open/disruptive innovation in manufacturing technology
- EM: Volume of external sources of knowledge on new markets – open/disruptive innovation in the market.

Size of the firms

Based on total sales in 2007

Hypotheses

Our research aimed to verify the following hypotheses:

H1: Intensive use of external sources of knowledge, the basis of open innovation, is positively correlated with business success.

This hypothesis will confirm that Christensen's (1999) disruptive technology and Chesbrough's (2003, 2006) open innovation generate a positive impact on the business activities of high tech products.

H2: Intensive use of external sources of knowledge (open innovation) is more positively correlated with business success for SMEs than for large firms.

This hypothesis will confirm Hirsch's (1967) assumption that SME's take more risk than large firm and invest in open innovation

H3: Intensive use of external sources of knowledge (open innovation) is more positively correlated with business success in a market at the Growth phase than in a market at the Mature phase.

The reason is that, at the growth stage, large firms develop open innovation in embedded technology in products and manufacturing technology in order to improve efficiency and economies of scale as assumed by Hirsch (1967).

H4: Intensive use of external sources of knowledge for embedded technology in products at the Early phase of a market (open innovation in embedded technology in product) is positively correlated with business success.

This hypothesis will confirm Hirsch's (1967) and Klepper's (1996), assumption that at the Early phase of a market embedded technology in products changes frequently, and so external sources of knowledge (open innovation) are required.

H5: Intensive use of external sources of knowledge for embedded technology in products and for manufacturing technology (open innovation in embedded and manufacturing technology) at the Growth phase of the market is positively correlated with business success.

Our assumption is that at the growth phase, competition is based on the capability of the firm to improve the reliability of each function of the product, as argued by Hirsch (1967) and Christensen (1999).

H6: Intensive use of external sources of knowledge for manufacturing technology and in the market at the Mature phase (open innovation in manufacturing technology and in the market) is positively correlated with business success.

This hypothesis will confirm Vernon's (1966), Klepper's (1996) and Hirsch's (1967) assumption at the mature phase of the PLC new manufacturing technologies are requested in order to improve the competitive advantage of high tech products.

H7: Intensive use of internal sources of knowledge (closed innovation) is negatively correlated with business success.

This hypothesis will confirm that Chesbrough's (2003, 2006) closed innovation generates a lower positive impact on the business activities of high tech products than open innovation .

Results

Regression between the dependent variable, business success (BS), and open innovation (OI) (external knowledge intensity) as an independent variable, by firm size

a: All firms

$$BS = 8.064 + 2.849 OI$$

Sig .000 .006 R² = .10 N=65

b: Small firms

$$BS = 1.694 + .465 \text{ OI}$$

$$\text{Sig} \quad .111 \quad .649 \quad R^2 = .052 \quad N=16$$

c: Medium firms

$$BS = 8.081 + 3.749 \text{ OI}$$

$$\text{Sig} \quad .000 \quad .001 \quad R^2 = .326 \quad N=27$$

d: Large firms

$$BS = 4.086 + 2.128 \text{ OI}$$

$$\text{Sig} \quad .001 \quad .0047 \quad R^2 = .157 \quad N=19 \text{ H1:}$$

We found a strong positive correlation between business success and the use of external knowledge, especially for medium and large firms; R^2 is 0.326 and 0.157, respectively. H1 is confirmed.

H2:

The coefficient for medium firms is higher than for large firms ($\beta = .592$ compared to $\beta = .448$) and more significant (1% compared to 4.7%). H2 is confirmed.

Regression between the dependent variable, business success, and open innovation (OI) (external knowledge intensity) as an independent variable, by market phase

a. Products entering the market at its emerging phase

$$BS = 2.029 + 1.787 \text{ OI}$$

$$\text{Sig} \quad .057 \quad .090 \quad R^2 = .090 \quad N=20$$

b. Products entering the market at its growth phase

$$BS = 8.734 + 4.615 \text{ OI}$$

$$\text{Sig} \quad .000 \quad .000 \quad R^2 = .492 \quad N=21$$

c. Products entering the market at its mature phase

$$BS = 5.435 + 3.762 \text{ OI}$$

$$\text{Sig} \quad .000 \quad .001 \quad R^2 = .385 \quad N=21$$

H3:

The positive correlation between business success and the use of external sources of knowledge is stronger at the growth phase of the market than at the mature phase, with a higher R^2 , 0.492 and 0.385, respectively

H3 is confirmed.

Regression between the dependent variable, business success and open innovation (external knowledge intensity) in embedded technology in products (ET), manufacturing technology (EP) and in the market (EM), as independent variables at the emerging phase of a market

$$BS = -1.104 + 3.135 ET + .390EM + -2.190EP + 1.135OI$$

$$\text{Sig} \quad .519 \quad .025 \quad .639 \quad .038 \quad .038 \quad R^2 = .388 \quad N=20$$

H4:

At the emerging phase of a market, the correlation between business success and the intensive use of external knowledge in embedded technology is positive at a significant level of 2.5%. We also found that intensive use of external sources of knowledge for manufacturing technology is negatively correlated with business success, at a significant level of 3.8%.

Firms entering an emerging market do not need to invest in innovative manufacturing processes, because they will be quickly obsolete due to quick changes in embedded technologies

The R^2 of this regression with the independent variables use of external sources of knowledge in embedded technology (ET), in manufacturing technology (EP) and use intensity of external sources of knowledge (DI) is of 0.388. H4 is confirmed.

H5 and H6 are not confirmed.

Regression between the dependent variable business success, and closed innovation (CI) (internal knowledge) as an independent variable, by firm size

Medium firms

$$BS = 12.667 - 3.967OI$$

$$\text{Sig} \quad .000 \quad .001 \quad R^2 = .353 \quad N=27$$

Large firms

$$BS = 8.119 - 2.446 OI$$

$$\text{Sig} \quad .000 \quad .025 \quad R^2 = .208 \quad N=19$$

H7:

The negative correlation between the intensive use of internal sources of knowledge (Closed Innovation, CI) and business success is confirmed for medium and large firms with a significance of 1% and 2.5% and R^2 of 0.353 and 0.208, respectively.

Regression between the dependent variable, business success, and closed innovation (CI) (internal knowledge) as an independent variable, by market phase

Growth phase

$$BS = 14.907 - 4.478 OI$$

$$\text{Sig} \quad .000 \quad .000 \quad R^2 = .476 \quad N=21$$

Mature phase

$$BS = 10.126 - 3.921 OI$$

$$\text{Sig} \quad .000 \quad .001 \quad R^2 = .406 \quad N=21$$

This is particularly the case when a market is at the growth and the mature phase . R^2 is 0.476 and 0.406, respectively.

DISCUSSION

Open innovation, is required in order to improve competitiveness of tech businesses. Specialization, closed innovation, continues to play a key role in the improvement of the competitive advantage of high-tech products. How can we improve specialization and at the same time enter into open innovation? This is the basic dilemma behind the choice of the relevant innovation strategy. Innovation strategy based mainly on specialization, endangers business success (H 7), especially for medium and large firms operating in markets at the growth and the mature phases.

Open innovation is requested for all sizes of firms (H1), especially for products of medium firms (H2) and for those entering markets at the growth and mature phase (H3).

In fact both strategies are relevant: Specialization strengthens the current competitive advantage and open innovation ensures the evolution of the competitive advantage toward new relevant technologies/markets.

In further research, we propose to explore the following directions:

- differentiation between different kinds of external sources of knowledge, such as research centers, firms and their specializations;
- development of relevant models to analyse the impact of open market innovation;
- development of innovation maps as a framework for selecting the relevant innovation strategy over time .

THE PROGRESSIVE MODEL, AN ECONOMIC RECONCILIATION PROCESS FOR REGIONS IN CONFLICT

Bijaoui, Ilan¹; Sultan, Suhail²

¹*Ph. D, Ashkelon Academic College*

²*Maastricht University*

The main purpose of this paper is to propose a model of economic development able to generate a cross border sustainable economic development, in regions in conflict. The Italian industrial district model implements a community industry synergy process led by the authorities according to a top-down approach. The cluster model implements a clustering specialization process led, in the American version, by a bottom-up approach and in the European version by a top-down approach. The Regional Innovation System (RIS) provides the regional and international innovation networking required for both models in order to confront the global competition. The proposed progressive model creates the industrial specialization (Industrial District) required for the development of the clustering process supported by the RIS. The model is evaluated in the Israeli-Jewish and Arab and the Palestinian olive sector. The results show that the community- industry synergy of the industry district model is supported by the economic actors from both sides of the border but refused by the regional authorities and professional associations. The raw material (olives), the human capital and knowledge required in order to start the clustering process exist. Bottom up decision making process is the only way for the moment in order to activate the cluster and RIS models in the olive sector.

Keywords: Free Economic Zone, industrial district, cluster, progressive model regional development, conflict, Israel, Palestine, olive

INTRODUCTION

Regional economies have become the core of social life and policy making (Storper (1995). The new regionalism tends to focus on various regional conditions: geographic (Lagendjik 1997, Scott 1988, Storper & Walker 1989), social (Becattini 1990), resources (Madani 1999), technology, and market (Porter 1998).

The industrial district model takes advantage of social conditions and generates development based on flexible specializations (Brusco 1986, Piore & Sabel 1984), built around a communicative structure where “community and firms tend to merge” (Becattini 1990).

The cluster model (Porter 1990) takes advantage of technology and market conditions and generates a spatial process of vertical and horizontal integration (Porter 1998). The Regional Innovation System provides the innovation perspective required in order to promote the next generation of industries.

The regional innovation system (RIS) is characterized by good framework conditions, strong capacity among both knowledge generators and users, and public policies that try to strengthen systemic linkages between key actors in the region. Most authors now emphasize that innovation is the result of an interactive learning process that often involves several actors from inside and outside the companies (Simmie, *et al.* 2002).

We first review the main models of industrial development discussed in the academic literature of regional development and industrialization. We analyze the feasibility to use progressively the Industrial District, the Cluster and the Regional Innovation System model in a region in conflict in order to generate a sustained cross border economic development. We explore its feasibility in the olive sector, in Israel and Palestine, analyze and discuss the results and suggest improvements in the proposed progressive model.

REVIEW OF THE LITERATURE

Free Economic Zones

The Free Economic Zone (FEZ) is “a geographic economic area in which goods enter duty-free for processing and export, and in which investors are offered a variety of incentives (WEPZA).” The FEZ is supposed to enable less developed countries to benefit from the relocation of the labor-intensive industries (textiles, shoes) and capital-intensive industries (steel, petrochemicals) of developed countries seeking low-cost production and new economies of scale.

Product specialization in FEZs is heavily concentrated in labor-intensive activities centered on the production of textiles, clothing, electrical and electronic goods, food processing, and metalworking. Such types of activity represent more than 90% of all FEZ output (Burns, 1995). Diversification remains very limited because companies from developed countries adopt delocalization policies for a limited number of manufactured goods.

Do FEZs generate sustainable economic development in the host region/country? Empirical studies show that the ratio of indirect/direct jobs created varies from 0.25 in the case of Mauritius (ILO 1988a) to 1.4 in Madagascar (Razafindrakoto & Roubaud, 1997) and more than 2 in Honduras.

The concept of net exports (exports of finished goods minus imports of intermediate goods and materials) provides an indicator of the locally generated value added by an FEZ and of the importance of the backward linkages to the domestic economy. In the Philippines this ratio reached 42% (1994) but only 20% in Bangladesh (1995) (Madani 1999). The Mexican ratio of 22% is similar to Bangladesh (Cling & Letilly, 2001). Kusago and Tzannato (1998) study three Southeast Asian EPZs (Bataan in the Philippines; Masan in Korea; Penang in Malaysia) and reach similar conclusions. The net gain in foreign exchange is significantly reduced by outflows of profits and dividends repatriated by subsidiaries to their parent company; the use of local primary materials remains limited in FEZs; and import duty exemptions on intermediate goods constitute a disincentive to purchase from local suppliers.

Developing countries consider FEZs to be a central instrument of development policy. But actually FEZs in the emerging Asian countries have played only a modest role in development. FEZs in Korea and Taiwan were considered as only one element among many adopted in an export-led growth strategy. Export-oriented industrial activity has never represented more than 3-4% of manufactured exports in the case of Korea and 8-9% in the case of Taiwan (Basile & Germidis, 1984). FEZs are now declining in the four East Asian “tigers” (Korea, Hong Kong, Singapore, and Taiwan).

The Middle East experienced a new kind of FEZ called Qualified Industrial Zones. The US-Israel Implementation Act defines QIZ (www.customs.ustreas.gov) as the territory of Israel and Jordan or Israel and Egypt designated locally as an enclave where merchandise may enter without payment of duty or excise taxes. The QIZ program allows the Jordanian business community to export to the US free of duties and restrictions, eliminating tariffs and other commercial barriers, provided that the sum of the cost or value of material produced in the West Bank, Gaza Strip, in other QIZs, or in Israel, plus the direct costs of processing operations is not less than 35% of the price paid by the US buyer. Job creation was a central objective. In 2001, 70% of the employees in the QIZ enclave were Jordanian. In 2003 only 57% of the 26,000 employees were Jordanian (Kardoosh & El Hourri, 2004).

QIZs have not produced backward linkage to any significant extent. The QIZ sector remains heavily dependent on importing intermediate goods, materials, and accessories. Ninety to ninety-five per cent of fabrics used in QIZ production are imported. Companies operating in a QIZ are labor-intensive, low-tech assembly firms, with scant access to advanced technology. Thus, transfer of technology is practically confined to the labor aspect alone.

In conclusion, the FEZ model improves the employment situation in developing countries by providing low cost unskilled jobs. But it contributes very little to the economic development of the host region/country.

FEZ creates little synergy between firms located in the free zone and the existing business infrastructure in the local community. FEZ cannot create sustainable economic interests for a region in conflict.

The Cluster Model

Porter's cluster model (1998) is a "geographic concentration of an array of linked, competitive firms that have close buy-sell relationships, utilize common technologies, share customers, or share a labor pool that provides them with a competitive advantage. The cluster model gains competitive strength, because of better access to specialized and experienced employees, suppliers, specialized information, and public goods, and by the motivating forces of local competition and customer demand (Rosenfeld 1996; Enright 2000; Saxenian 1994).

Lissoni (2001) argues that authorities and institutions should facilitate collaboration and networking, but Porter does not endorse this view, on the grounds that such networking would lead to the reduction of competition.

An example of bottom-up development is the Silicon Valley. Silicon Valley, the first US cluster model, was initiated by private parties. Frederick Terman, professor and provost of Stanford University proposed the leasing of Stanford's lands for use as an office park named the Stanford Industrial Park. Leases were limited to high technology companies. One of the major success stories was Hewlett Packard founded by Stanford graduates William Hewlett and David Packard.

In most of the countries of the EU the clustering process was the initiative of governments. The final report of the EU experts group on enterprise clusters and networks surveyed 59 traditional clusters and 25 science-based clusters (European Commission, 2007). According to

this report "in the Member States, policies towards cluster development are generally issued by national governments with the co-operation of regional or local governments".

In Germany projects such as EXIST or BioRegio are the result of the federal government's cluster policy, a top-down approach (Colovic-Lamotte & Tayanagi, 2004). Regional governments have been required to share with the federal government the provision of financial support to spinoff companies from universities.

Finland's government encourages the development of industrial clusters. The best known cluster in Finland, called "Networking," located at Turku and Oulu, is in telecommunication and involves companies such as Nokia and ABB (TEKES, 2005).

The Cluster model requires a critical mass of specialized companies which are the result of private initiative or public initiative. In a region in conflict it will be difficult for economic and political reasons to start with a cluster model: there is a lack of industrial specialization and few private or public organizations are ready to cooperate. A preliminary model is required in order to create this critical mass of specialized companies. The Industrial District is able to play this role.

The Industrial District Model

The industrial district model first appeared in the 1970s in Italy. Industrial districts in the textile industry in Carpi and Prato, the furniture industry in Brianza and Cascina, and the footwear industry in Vigevano opened to Italian industry new markets in Europe and Japan (Brusco, 1982). Today, industrial districts in textiles, ceramic tiles, and machine tools are concentrated in Northern and Central Italy (Panizza, 1998).

The industrial district model requires flexible specialization, deepening division of labor between firms, and differentiation of enterprises by process or products

(Rabellotti 1995; Schmitz 1995; Rabellotti & Schmitz 1999), inter-firm cooperation generated by institutional meaning systems (Bellandi, 1996), geographic proximity facilitating information externalities (Gamsey, 1998), and social embeddedness through collective learning and resource sharing (Dei Ottati, 1994; Harrison, 1992).

Four aspects of Beccatini's definition (Beccatini, 1979) deserve particular attention. These contribute to distinguishing the concept of industrial districts from that of cluster as discussed by Porter (Porter, 1998).

They are: the role of the institutions (Provasi 2002, Di Giacinto V. and Nuzzo G. 2004), the role of local cultures and values (Marini 2000), the role of social capital (Putnam 1993, Scarlato 2001), and the role of human resources (D'Antonio and Scarlato 2000).

The main feature of an industrial district is the role of the institutions (formal and informal), which can be defined as "a set of humanly devised behavioral rules that govern and shape the interaction of human beings, in part by helping them to form expectations of what other people will do" (Nugent and Lin 1996),

By “formal institutions,” we mean a system of codified norms, rules, laws, constitutions, and organizations. By “informal institutions,” we mean “norms and rules which have passed the test of historical time” (Pejovich, 1999).

There are 199 industrial districts in Italy. They employ approximately 2.2 million people and produce over one third of Italian exports. One of the most successful and structured industrial districts is in the Emilia-Romagna Region.

The most important sub-districts in this region are Bologna (automatic machines), Modena-Reggio Emilia (agricultural machines, ceramics), Mirandola (biomedical), Parma (foodstuffs), San Mauro Pascoli-Forli (shoes) and Rimini area (woodworking machines).

ERVET, the region’s managing organization, is held jointly by Emilia-Romagna Region (80%), commercial banks and credit institutions (18%), industrial associations, and the Emilia-Romagna Regional Union of the municipal chambers of commerce. For each main sector, ERVET has established research centres for the textile/apparel sector, the shoe industry, the farm machinery, the construction industry and for the ceramics industry in Bologna;

Morrisson (2004) and Spaventa (2007) have discussed the problematic future of the industrial district model. Morisson (2004) reached the conclusion that the large enterprises do not allow knowledge to freely circulate within and between districts and do not play the role of gatekeepers who facilitate the transmission of information. Similar findings by Lissoni (2001) indicate that privately appropriated knowledge is not transferred to other members of the industrial district. He proposed public intervention supporting the individual leaders who might serve as engines of growth for local systems, in order to counter the destructive aspect of what he calls the leaders’ “creative-destruction mechanism.”

Spaventa (2007) distinguished between the first four (positive) stages of development of the industrial district and the fifth one (problematic), the internationalization process.

The four positive stages of development are as follows:

- 1) Birth: An at-first scattered handicraft presence in the area constitutes one of the preliminary conditions for the development of this organizational model.
- 2) Preconditions for take-off: the progressive development of a network of linkages and of a first process of division of labor.
- 3) Take-off: the development and the strengthening of local institutions
- 4) Drive to maturity: the strengthening of the process of internal and external division of labor.

In the fifth stage the leading firms start to go international to expand their market or to confront increasing international competition by reducing their production costs.

Brioschi, and Cainelli (2001) analyzed the situation of the industrial districts in Italy and concluded that the district model can still operate successfully if there is a “district groupification” process. In the Emilia Romagna’s industrial districts, 52.2% of firms belong to a group and a corresponding 89.9% of employees work in firms belonging to a group.

The industrial district at its first stage merges firm with community and is able to generate economic development based on a common understanding of populations in a region in conflict. Based on this primary common industrial infrastructure, the industrial district model will be able to generate, at its internationalization stage, a clustering process towards the development of industrial specializations in the region.

The Regional Innovation System Model

Initially, the concept of the innovation system was applied to the national level (Lundvall 1992, Nelson 1993, Niosi et al.1993, OECD 1999). The national innovation system (NIS) literature has revealed huge differences between countries in their economic structure, R&D base, institutional set-up, and innovation performance (Edquist 2001). A growing interest in regional innovation systems has emerged (Acs 2000, Bathelt and Depner 2003, Fornahl and Brenner 2003, Mytelka 2000).

Autio (1998) provides a schematic illustration of the structuring of regional innovation systems. A RIS is made up of two subsystems. The knowledge application and exploitation subsystem comprises the companies, their clients, suppliers, competitors, as well as their industrial cooperation partners. The knowledge generation and diffusion subsystem as the second main building block of an RIS consists of various institutions engaged in the production and diffusion of knowledge and skills. Key elements include public research institutions, technology mediating organizations (technology licensing offices, innovation centers, etc.), as well as educational institutions (universities, polytechnics, vocational training institutions, etc.) and workforce mediating organizations.

A strong regional innovation system promotes competitiveness and growth and is characterized by good framework conditions, strong capacity among both knowledge generators and users, and public policies that try to strengthen systemic linkages between key actors in the region." (OECD, 2007)

Innovation is the result of an interactive learning process that often involves several actors from inside and outside the companies (Simmie et al.2002). Innovation is a social and local process.

"Innovation is in general a groping, uncertain, cumulative and path dependent process: knowledge is spatially 'sticky', and tacit knowledge, despite the growth of knowledge management tools, is not easily communicated, other than through personal interaction in a context of shared experiences" (Morgan, quoted in Amin and Cohendet, 2003).

A key dilemma for regions is how to invest in R&D in such a way that at least part of the benefit is captured within the region in some form. At a strategic level, there are initiatives to create regional innovation system institutions that act as a mechanism to maintain links between different actors.

The Brainport initiative in the Eindhoven region has this system-supporting function as one its main missions. The Brainport Programme aims to strengthen the economic development as well as the knowledge infrastructure of the Eindhoven-Leuven-Aachen triangle. It is public-private funded by its triple helix partners and is run in parallel with activities of the regional

economic development agency (REDE). The initiative covers twenty-one municipalities in southeast Brabant, but has a wider geographic scope than the boundaries of its constituent municipalities.

Issues on the agenda are promotion of open innovation (collaboration on an international level between companies and research institutions), creation of centers of excellence, a balanced labor market, attracting venture capital, improvement of manufacturing companies' conditions in order to attract new investment, and strengthening the knowledge exchange between medium-sized and small firms.

The issue for regional policy makers is where their own research efforts, or those of the national level in the region, fit in to their development objectives.

The initiatives of the regions appear to focus mainly on trying to orient publicly funded or managed knowledge assets in such a way that they are better able to engage in joint activities with private firms. These assets are mainly national or regional research institutes or major universities and higher education institutions. The influence of these bodies in practice varies widely from one region to another and also with respect to sector.

The methods used include: 1) promoting co-location of R&D generators alongside private firms in science parks and similar structures; 2) promoting joint R&D and encouraging universities and research labs to emphasize commercial applications; and 3) supporting open innovation platforms and privately managed R&D centers.

RIS provides the conditions required for the continuous and sustainable development of the clusters and industrial districts in a region based on local and international demand.

THE PROGRESSIVE MODEL OF DEVELOPMENT

Figure 1 summarizes the effects of each model of development according to two main processes: community-firm synergy and clustering specialization process.

FEZ generates limited synergy between firms and community. The industrial district creates community-industry synergy but does not generate a process of clustering specialization. The cluster generates the development of vertical and horizontal industrial specialization but does not integrate firms with the community and requires a critical mass of specialized companies. The RIS requires a preliminary infrastructure of clusters/industrial districts in order to generate the innovation networking supporting the development of the industry.

We argue that a progressive model of development, that is, one which starts with an industrial district followed by a process of clustering specialization (Cluster model) based on a regional and innovative perspective (RIS model), is a model able to create gradually sustainable common economic interests in a region in conflict.

The Industrial District creates the critical mass of specialized companies and creates the required trust between population in conflict by merging firms with community.

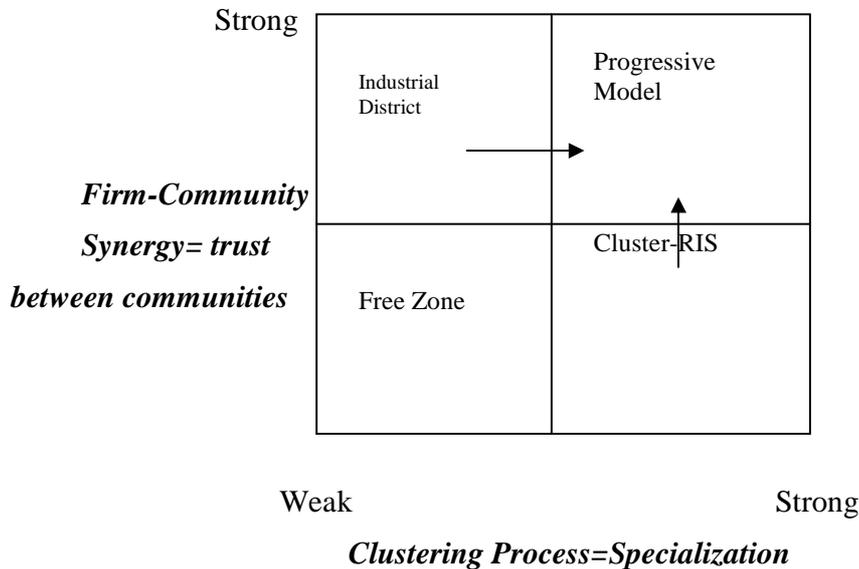

Figure 1 - Positioning of the Industrial Development Models

The Cluster and RIS models generate development based on trust and specialization.

The progressive model requires certain preliminary conditions in order to be implemented with good chances of succeeding and generating sustainable economic development:

1. The populations in the region in conflict have complementary economic interests.
2. The selected domains of specialization are able to generate a clustering process, and the economic forces are able to support it. By economic forces we mean: the units of production (firms, farms), the supporting and related industries and the providers of services .
3. The selected domains of specialization have a regional and innovative perspective, and the economic forces are able to support the development.
4. The local authorities from both sides have a common view of regional economic development and play an active role

The initiative for each model can come from the local authorities (top-down approach) or from the economic actors (bottom-up approach).

The top-down approach led by the local/national is implemented in the Industrial District model. The bottom-up approach led by the economic forces is implemented in the American version of the cluster model. The top-down approach is implemented in the European cluster model and the Regional Innovation System model. A mixed top- down bottom-up approach is required in a region in conflict in order to overcome the political aspect of the conflict and to create a new common economic infrastructure.

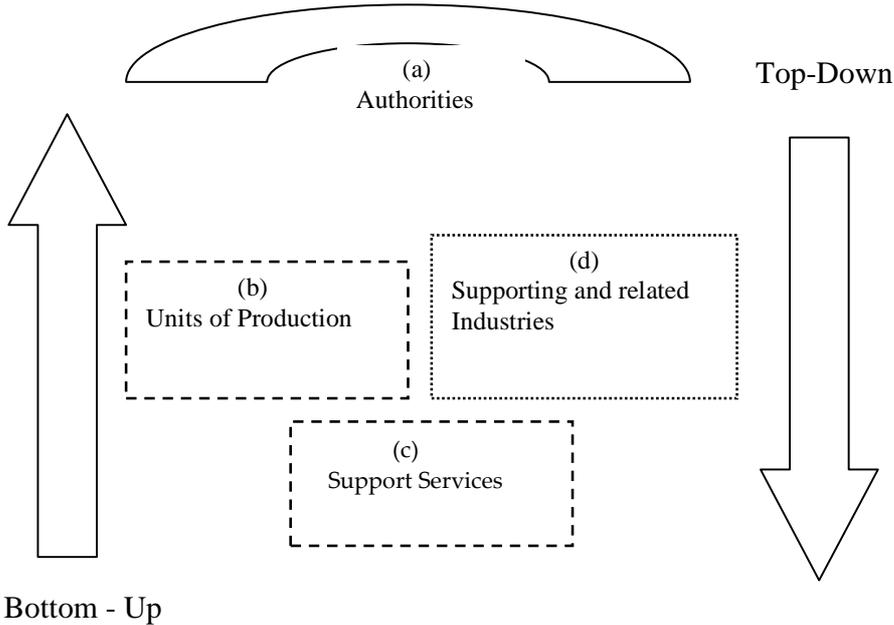

Figure 2 - The Top Down and Bottom Up Approach

EMPIRICAL STUDY

The olive tree has strong roots in the Bible and the Koran as a source of life (energy, food, health, holiness) and a symbol of peace (the olive branch found by Noah's white dove). In good years, this sector provides three million work days and current revenue for thousands of growers and hundreds of olive press owners functioning in the West Bank (PARC, 2004). Olive oil comprises 15% to 19% of Palestinian agricultural output, depending on whether it is the "on-year" or "off-year" of the two-year cycle (United Nations Development Programme (UNDP), World Food Programme (WFP), UN Office for the Coordination of Humanitarian Affairs (OCHA). Olive production constitutes most of the fruit production in the West Bank, making up to 81.1% of the fruit tree area in the Palestinian Territory. The largest olive plantations are concentrated in the northern part of the West Bank (70%)(MOPIC 1998).

In Israel, there are 180,000 dunams of olive trees, with 80 percent concentrated in the north (Upper and Lower Galilee) where the population is composed of a majority of Arabs (around 600,000 Arabs; around 560,000 Jews; CBS 2006).

Hundreds of independent small and medium-sized growers and producers of olive oil, Arabs and Jews, work side by side and provide most of the annual Israeli consumption of 6000 tons of olive oil (Israeli Olive Board 2006).

The Palestinian and the Arab Israeli consumers, without distinction as to income level, use the olive oil as a traditional product. The Jewish Israeli consumer buys olive oil and olive oil-based products (soap, cosmetics) mainly as a premium product having a health impact. Olive oil in the Jewish market is four to six times more expensive than other oil such as sunflower oil.

Thus, the olive oil sector, with the similarities and differences between the populations, fulfils the required preliminary conditions. But, are the economic actors and authorities ready to implement the Industrial District model in the north of Israel and the West Bank, which infrastructure is required and is the bottom up or top down process feasible? Following are the hypotheses we propose to examine in order to answer that question.

Hypotheses

H1: The concept of a cross border Industrial District is expected to have a positive economic impact.

H2: Educational and research support infrastructure are expected to have a positive economic impact in the selected sector

H3: The local authorities and professional associations are ready and able to support the implementation of the Industrial District model.

If the Industrial District model is feasible (H1 accepted), we will interview existing and potential economic actors and authorities, in order to analyze the feasibility of the implementation of the Cluster and RIS models in the selected sector.

Methodology

In order to test the first hypothesis, we interviewed a sample from each category of economic actors We have selected, from the list of producers (growers and producers of olive oil), a random sample of 103 growers of olives and producers of olive oil from both groups from the northern regions (Galilee in Israel and the northern West Bank): 26 Palestinian growers, 25 Palestinian producers, 13 Israeli growers and 39 Israeli producers of olive oil (Table 1).

	<i>Growers</i>	<i>Producers of olive oil</i>	<i>Total</i>
<i>Galilee (Israel)</i>	13	39	52
<i>North of the West Bank (Palestine)</i>	26	25	51
<i>Total</i>	39	64	103

Table 1 – Sample of Israeli and Palestinian Growers and Producers of Olive Oil

We proposed to the interviewed growers and producers two scenarios: Separated economies or implementation of the Industrial District model as the first stage of the progressive model. They were asked which scenario they support and how they evaluate the impact of both scenarios on the following parameters:

- Total Sales
- Total Work Force
- Costs of production
- Prices

We asked the sample which support organizations: local authorities, professional associations, and support services (R&D centers, universities and colleges) will have the strongest impact on the development of common economic interests, responses ranging from 1 (no support expected) to 5 (very strong support expected). In order to test the second, third, and fourth hypotheses, we interviewed the following relevant local/national authorities and professional associations and representatives from the different support organizations:

a) Local/national authorities and professional organizations interviewed: the planning department of the Israeli Ministry of Agriculture; the Palestinian Ministry of Planning and International Cooperation; The Israeli Olive Board; the Palestinian Agricultural Relief Committees (PARC);

(b) Support organizations: Israeli Vulcani Agricultural Research Institute; Agricultural Faculty of the Hebrew University; Technion; Al Arroub Palestinian Agricultural College of Hebron University.

(c) Up stream and down stream olive sector related and supporting industries.

We first asked them which scenario they support and second, if they expect the development of a clustering process and of a Regional Innovation System

Analysis

4.2.1 H1: The economic actors approve a bottom-up approach and expect a positive impact of the progressive model starting with a common industrial district. (Table 2)

Very few Palestinian growers (10%) supported the Separation scenario in comparison with 20% from the Israeli side. Israeli olive growers are afraid of the cheaper Palestinian olives. But Israeli producers of olive oil (who can also be growers) are in favor of the industrial district because of the expected benefit of cheaper manpower and olives for oil production. Under the Separation scenario, the Palestinian growers expect, during the period 2004-2006, a drop of 12% in sales, and the Palestinian producers of olive oil expect a decline of 27% in their sales (Table 3). In the scenario of the common industrial district, the Palestinian growers and the producers respectively expect an average growth of 42% and 145% during the same period.

	<i>Growers</i>	<i>Growers & Owners of Olive Press</i>	<i>Producers of Olive Oil</i>
<i>Separation Palestine Israel</i>	.88	1.07	.73 1.22
<i>Industrial District Palestine Israel</i>	1.42	1.12	2.45 1.19

Table 2 – Expected Sales in 2006 in Relation to 2004 in the Separation and Industrial District Model Scenario *
Significance level <1%

The Israeli producers of olive oil and growers expect some growth of sales in both scenarios: 22% growth in the separation scenario in comparison with 19% in the Industrial District model scenario. The Israeli growers and owners of olive presses expect higher growth in the Industrial District model scenario (12%) than in the separation scenario (7%). According to those results The Industrial District is feasible and H1 is accepted.

The expected sales growth in the Industrial District model scenario for the Palestinians growers is mainly explained by the support of the universities (Table 3). H2 is accepted by the Palestinian side.

The professional associations are expected to play a negative role (Table 3). H3 is rejected by the Palestinian side.

<i>Adjusted R Square: .59 Number of cases: 18</i>	<i>B Coefficient</i>	<i>Standard Error</i>	<i>t</i>	<i>Significance</i>
<i>Constant</i>	2.009	1.704	1.179	.258
<i>Total Manpower</i>	.137	.076	1.796	.094
<i>Expected Support from Educational System</i>	1.463	.384	3.780	.002
<i>Expected Support from Associations</i>	-1.695	.608	-2.790	.014
<i>Expected Improvement of Prices</i>	-.609	.375	-1.625	.126

Table 3 - Ratio Expected Sales 2006/Sales 2004 as a Dependent Variable in the Industrial District Model Scenario for Palestinian Growers

<i>Adjusted R Square: .30 Number of cases: 34</i>	<i>B Coefficient</i>	<i>Standard Error</i>	<i>t</i>	<i>Significance</i>
<i>Constant</i>	7.563	3.539	2.137	.058
<i>Expected Improvement of Prices</i>	4.811	1.835	2.622	.026
<i>Total Manpower 2004</i>	.110	1.291	.085	.934

Table 4 - Expected Sales 2006/Sales 2004 as a Dependent Variable in the Industrial District Model Scenario for Palestinian Growers and Producers

<i>Adjusted R Square: .23 Number of cases: 29</i>	<i>B Coefficient</i>	<i>Standard Error</i>	<i>t</i>	<i>Significance</i>
<i>Constant</i>	16.161	3.150	5.131	.000
<i>Expected Support from the Government</i>	-19.204	7.925	-2.423	.023
<i>Expected Support from the R&D Centers</i>	20.786	9.419	2.207	.037
<i>Expected Improvement of Prices</i>	2.551	1.328	1.921	.067
<i>Expected Improvement of Employment</i>	-5.536	2.365	-2.340	.028
<i>Total Manpower 2004</i>	.427	.350	1.220	.234

Table 5 - Expected Sales 2006/Sales 2004 as a Dependent Variable in the Industrial District Model Scenario for Israeli Growers and Producers of Olive Oil

The high sales growth expected by Palestinian growers and producers is due to the expected higher prices (Table 4).

The Israeli producers expect support from the research centers to have a positive impact on sales. H2 is accepted by the Israeli side.

The impact of the authorities on sales growth is expected to be negative (Table 5). H3 is rejected by the Israeli side. They also expect lower employment with higher sales growth and so higher manpower efficiency.

The Palestinian actors and most of the Israeli actors support the implementation of the Industrial District model and expect a positive impact on their business activities.

Reject of H3: In depth interviews of local authorities and professional associations

The Israeli Ministry of Agriculture supports the Israeli Olive Board (IOB) financially with the aim of improving the quality of the olive oil and guaranteeing a minimum revenue to the growers. The Israeli Ministry does not support the Industrial District scenario, because they believe that Palestinian competition will have a negative impact on the revenue of the Israeli growers and on the quality of the olive oil sold to the Israeli customer.

The Palestinian Ministry of Planning and International Cooperation planned in 1998 to develop the Palestinian "olive oil industry cluster" (MOPIC 1998) by restructuring the flow of international capital and technology, opening international trade, and establishing specialized institutes to develop more sophisticated brands of olive oil. Mainly for political reasons, they do not take into account any cooperation and therefore support the separation scenario only.

The Israeli Olive Board (IOB) and the Palestinian Agricultural Relief Committees (PARC), the dominant professional organizations supporting the olive sector, adopt positions similar to those of the relevant ministries on either side.

Potential clustering process in the olive oil sector- Interviews with related and supporting industries

In Palestine the industrialization process in this sector is quite limited. One factory produces soap based on olive oil, and a few small family firms produce pickled olives or olive wood handicraft products for tourists.

In Israel ten firms produce marinated olives in cans. It is the main olive processing food industry.

But we found several initiatives which could start a clustering process of related and supporting industries in the olive sector. Herewith the initiatives and proposals of the entrepreneurs and researchers we met and interviewed:

- Two Israeli cosmetic firms produce moisture cream for hair and for dry skin based on olive oil. One of them produces a cream against skin diseases and burns.
- One small firm produces a homeopathic drug based on imported olive leaves.
- Organic fertilizers adapted to olive trees are produced locally in Israel by one firm but on a small scale.
- A local Israeli researcher (Eger farm) has developed a solidification process for olive oil. By his patented method he produces margarine based on olive oil in Greece (where the extra virgin oil is 50% less expensive) and exports it to Japan and South Korea as a healthy margarine.
- Shakers for picking olives are produced in Israel and can be used only in new plantations where each tree has one trunk. Old trees develop many trunks and cannot be shaken.

Efficient mechanical harvesting not only cuts costs but increases the quantity and improves the quality of the olive oil (no contact with the ground). It does not impair the olives and, by diminishing the time from harvesting to pressing, it results in lower acidity. The cost of production of the picking system (70% of the production cost of the machinery is labor) will be cheaper if produced in cooperation with a Palestinian partner.

- The small market for new plantings in Israel limits the production of a wider range of varieties by propagation nurseries. Israeli greenhouse owners tried to market trees to Palestinian and Jordanian growers, but their prices were too high. If the progressive model were implemented, it would be possible to build a regional network of nurseries and greenhouses, using the comparative advantage of each group, thus enabling lower seedling supply costs for both Palestinian and Israeli growers and a wider range of trees.
- Ten per cent of the planted area of olive trees in Israel is irrigated and less than 5% in Palestine. The use of recycled water can improve production (Faci et al. 2003), but projects of this kind require economies of scale (enough quantity of waste water), regional authority initiative, and long term loans. Joint installations would be able to provide water economically to olive tree plantations on both sides of the border.
- The natural cycle of olive production (alternating higher and lower yields over a two-year cycle) requires the development of warehousing services in order to limit the fluctuation of prices. Regional warehousing becomes profitable.
- Currently, growers from both sides sell directly to retailers (olives) or producers of olive oil (including olive press units). Olive press units sell directly to olive oil producers or to retailers. Olive oil producers sell directly to retailers and play the role of producer and wholesaler. There is no national or regional business structure supporting growers, olive press units, or olive oil producers in their business activities. Each one acts on his/her own. Only a few large producers of olive oil have their own marketing network (Etz Hazit, Zeita).
- There are no Israeli or Palestinian firms producing medicinal products based on olives. Olive oil and leaves contribute to the treatment of several illnesses such as cardiac disease (Aviram & Eias 1993) and cancer (Kossoy, Madar, Stark 2001, Kossoy et al. 2001). Olive oil prevents loss of the skin's natural moisture, softens the skin, and attracts external moisture to it. Olive oil also cures skin inflammation and burning sensations (Eger 2004) and has antibacterial (Panizzi et al. 1960) and antiviral properties (Renis 1969).
- Olive oil amplifies the effect of drugs in cancer treatments and improves the absorption of nutritional elements such as lycopene in the body (Lee et al. 2000). The interviewed researchers expect that in the Progressive model scenario, the Israeli high-tech industry will find international financing in order to exploit the results of their researches.
- Based on the treatment of waste water and residues of olive processing, regional units will be able to produce energy and fertilizers and raw material for the pharmaceutical and cosmetics industries (Knobloch 2004).

Figure 3 summarizes the potential clustering process which could result if the Progressive model is implemented. H3 is supported.

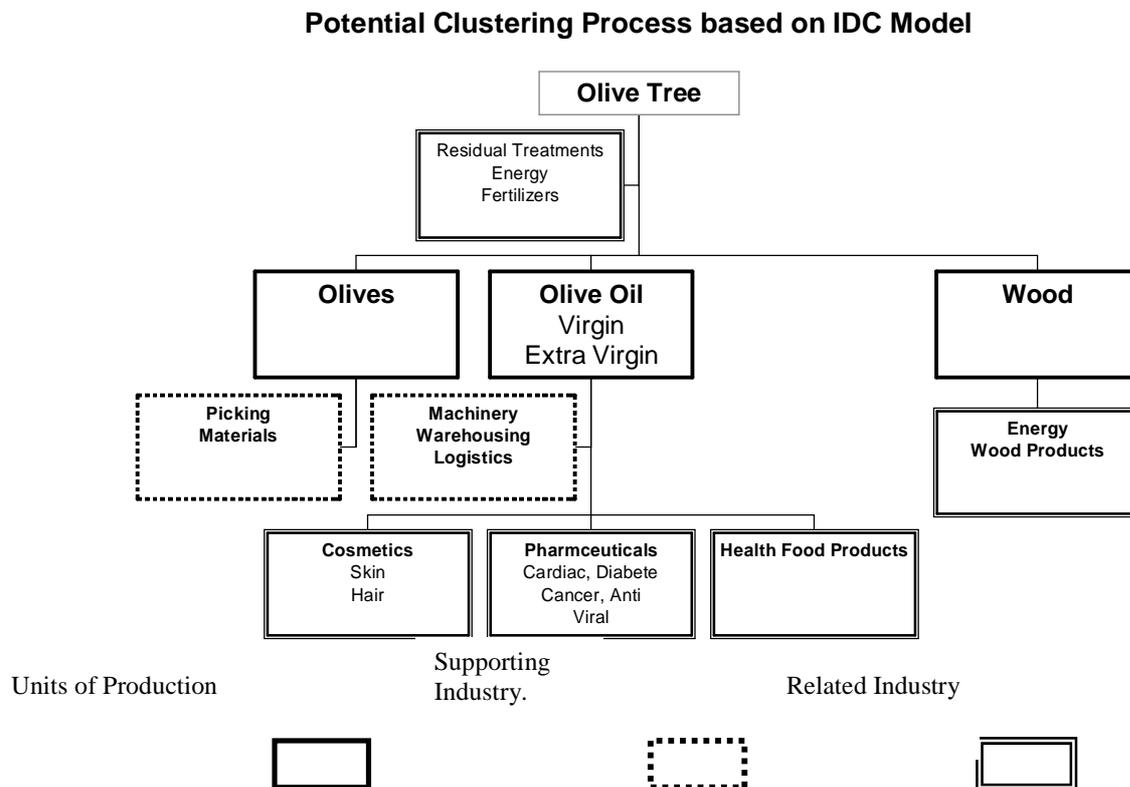

Figure 3 – Potential Clustering Process based on IDC Model

Feasibility of the Regional Innovation System

In Palestine two institutions work on research contributing to the olive sector: Al-Arroub Agricultural College of Hebron University is carrying out research on pest control; and the Department of Animal Husbandry in the Faculty of Agriculture of An-Najah University in Nablus is working on the use of olive pulp to feed chickens.

In Israel, three institutions are active in research: the Division of Oleiculture and Viticulture of the Vulcani Center is carrying out research on improving the efficiency of the growing process such as expanding the use of recycled water and improving fertilizers.

The School of Nutritional Sciences in the Faculty of Agriculture of the Hebrew University has undertaken several studies on medical applications for olive oil and olive leaves (diabetes, cancer).

The Rappaport Institute for Medical Sciences at the Technion has undertaken research, mainly on olive oil, as an antioxidant preventing the development of bad cholesterol (cause of cardiac disease).

In the general policy framework of cutting back government expenditures, the Israeli government has cut down on most of the budgetary allocations for those studies. The research centers, especially the Israeli ones, support the Progressive model scenario, which will stimulate a wider range of research.

The relevant R&D infrastructure exist but the relevant national/ regional policy is missing

DISCUSSION

The process of generating joint economic interest in a region in conflict creates positive conditions towards the future political resolution of the conflict. This process will occur only if both groups are aware of the potential benefit resulting from that process in the short, medium, and long run.

The results of our research show that Israeli and Palestinian growers and producers expect that the Industrial District model will have a strong impact on their sales, due to higher prices. But the local authorities and professional associations on both sides are reluctant to offer any support to the implementation of this model. They have difficulties in internalizing the end of the conflict and changing their attitude. They are not ready, for the time being, to play a role similar to that played by ERVET, the common organization of the local authorities and the economic actors in the Emilia Romagna industrial district (Italy).

According to the bottom-up approach, the common organization has to be initiated by the direct beneficiaries, i.e., the economic actors, growers, and producers of olive oil, research centers and universities. Only their common action will convince the local authorities and professional organizations to play their role.

The cross border Industrial District in the olive sector will create economies of scale in research and development, the production of inputs (fertilizers, pesticides, irrigation and water management), the picking and transportation processes and the production (olive presses, water treatment) and warehousing of olive oil.

It may be expected that the growth in quantity of high quality olive oil, on the one hand, and the wider activities of the research centers, on the other, will generate a bottom-up clustering process, i.e., the development of new industries with a high added value such as cosmetics, health foods, and medical industries, as discussed in this research. It is the second stage of the progressive model.

The required institutions, universities, professional schools, research centers, professional associations, and relevant regional authorities for the creation of a Regional Innovation System already exist, but the networking is weak in training, education, and research and development.

Is the interest of the economic actors strong enough to push to completion the generation of the two missing links: the active involvement of the regional authorities and the innovation networking? This is the subject of a new research, in which we will analyze the efficiency of different approaches to cooperation/organization between economic actors in agriculture and agro-processing domains.

IMPACT OF NUTRITIONAL INFORMATION ON YOUNG MALAYSIAN CHILDREN FOOD PREFERENCE

bin Dahari, Zainurin¹

¹*International Islamic University, MALAYSIA*

Purpose – This study looks into three area of concern i.e. the awareness of nutritional information among the respondents, sources of nutritional information and examining the influences of nutritional information on young Malay children’s preferences. Above all the study tries to analyze whether Young Malay children food preferences are influenced by nutritional information or not.

Design/methodology/approach – An interview was conducted by asking the respondents some questions that relate to nutrition. An experimental study also utilized to examine the influence of nutritional information on young Malay children’s preferences.

Findings – This study has shown that in order to educate children to eat nutritious food, necessary information need to be provided to them accordingly. Parents, teachers and media shall play their roles in providing such information. The findings from the research also revealed that young Malay children have information about nutrition but is not sufficient to them. More nutritional information is highly needed by young Malay children.

Research limitations/implications – It would be useful to conduct the study on a huge number of respondents and perhaps to look at moderating effects of children social background. Thus, the findings of the study might not sufficient to provide information to the industry, government, parents and community at large. Therefore, more extensive study is highly needed in the future. Further research could cover different ethnic and kindergarten.

Originality – The data indicated the primacy of whether nutritional information can shift young children preference. The results of our study may assist the food industry in what they can produce and how they want to promote the product.

Keywords Nutritional Information, Children behavior, Food preference

Paper type Research Paper

INTRODUCTION

Background of the Study

Nutrition plays a key role in the health of individuals. Hence, information or knowledge about nutrition is very crucial to everybody. Getting reliable information about nutrition is a big challenge for everyone especially children. In general, information on nutrition is likely to come from television, radio talk shows or news, daily newspaper, favorite magazines, a variety of nutrition-oriented books and the internet (Rinzler, 2006). Those sources of information can be categorized into three key environments as categorized by Montague (2002) i.e family and home environment, the educational and care environment and the broad community environment.

Many efforts have been taken by much pediatric health to increase children’s knowledge and understanding about food-related of diet-disease relationships (Wardle and Huon, 2000). However, there is no direct evidence that changes in knowledge are necessary or sufficient for

behavior change in children. Some findings, for example, Tinsley (as cited in Wardle and Huon, 2000) has shown that, in general, children are not especially concerned about health outcomes. In fact, the health is not a priority or not an important issue for them especially for those younger than 9 years old (Gochman, as cited in Wardle & Huon, 2000). Thus, it is very crucial to stress on an understanding of the way health-related beliefs with food preferences and choices in order to increase children's intake of nutritious food that might enhance their well being and health (Wardle and Huon, 2000).

There was evidence from a study which was conducted on 9-to 10-year-old on children's food expectations and preferences. Baranowski (as cited in Wardle and Huon, 2000) reported that many children believed 'if a food tastes is good, it must not be good for me; and if a food tastes bad, it is probably good for me'. This finding raises the possibility of the reverse effect (Wardle and Huon, 2000): 'if food is said to be healthy then I probably won't like it'. This tells us that if health information such as labeling does not induce negative expectations in children, then this would have important implications for the way that healthy diet should be promoted to children and how parents might best get their children to eat a healthy diet (Wardle and Huon, 2000).

Objective(s) of the study

This study primarily interested in investigating whether Young Malay children food preferences are influenced by nutritional information or not. Children normally get nutritional information from the environments in which they live i.e family and home environment, the educational and care environment or by the broad community environment.

The objectives of the study are as follows:

1. To determine the awareness among young Malay children knowledge about nutrition.
2. To identify the sources of young Malay children's on nutritional information.
3. To examine the influences of nutritional information on young Malay children's food preferences.

Statement of the Problem

For the purpose of this study, the following research question will be asked:

1. Does young Malay children aware about nutrition?
2. What are the sources of information on young Malay children's nutritional information?
3. Can nutritional information influence young Malay children's preferences?

Significance of the Study

The findings of the study will give new information to the marketers on how they can develop the right strategies before producing their product to consumer especially to young children. Thus, this finding can be used as one of the guideline to all marketers in conducting an effective promotion on the importance of nutritious on children.

They will know the understanding or knowledge on young Malay children about nutritious food and their preferences in food. The sample of the study covers only young Malay children.

Limitation of the Study

There are limitations of the study that include:

1. Difficulties to get information about awareness on young Malay children on nutritional information. Thus, it is hard to collect reliable, accurate and complete information about those objectives.
2. The number of respondents should be large and various to ensure the reliability of result as a whole. However, due to time constraint only a small sample could be chosen.
3. To collect accurate data from children is very challenging and crucial as children can easily lose focus while I was interviewing them.

LITERATURE REVIEW

Introduction

In many part of the world, the amount of scientific evidence on the positive contribution that balanced nutrition and a diet rich in nutrients contribute to the human well being and health have been increased. This scenario is supported by growing interest amongst health professionals and the food industries in raising awareness amongst the people (Asian Food Information Centre, 2006).

It is undeniable that nutrition is very important to human life for all age levels. Awareness on nutritional information promises a better health condition to one's body. Montague (2002) sees nutrition is closely linked to the early growth and development of a child, prevention of disease as well as the lifelong health of the child. The less consumption of nutritious food during childhood is linked to adult disease such cardiovascular and diabetes (Montague, 2002).

A national survey conducted in Australia by National Health and Medical Research Council in 1985 and 1995 (Montague, 2002) shown some worrying facts about children's nutrition and eating habits. The survey in 1995 generally concludes that children consumed higher levels of saturated fats than recommended, more sugar than starch as well as the fall of intake of calcium, fruit and vegetables. Due to this fact, there was a significant increase of rate of both overweight and obesity in 1995 in Australia as compared to 1985 survey (Montague, 2002). More than that, according to Waters and Baur (2003), children in Australia now and in the future are threatened by obesity problem. Overweight and obesity are more likely cause health problems such as diabetes, asthma, cardiovascular disease, cancers, hormone disturbance, joint problem, back pain and psychological problems throughout their lives.

Definition of Nutrition

Nutrition equals life. It is the science of how the body uses food and it is life. Nutrition is about why and what one eats and how the food that one gets affects his body and health (Rinzler, 2006). Rinzler further stresses that if we do not eat and drink nutritious food and beverages, our bones may bend or break (not enough calcium, our gums may bleed (not enough vitamin C) or our blood may not carry oxygen to every cell (not enough iron). Thus, eating and drinking is not just merely eating and drinking. Our bodies actually need good food that means food with the proper nutrients in order to live well. Therefore, consuming good nutrition means having good and healthy life.

The Nutritional Awareness among Young Malay children

It is clear that nutrition education for children in nurturing the culture of healthy eating for the long-term period is very crucial and salient. Children, in their first six years of their life, need proper nutrition safe and nutritious food to grow well and healthy. However, a study that was conducted by Ministry of Health with UNICEF collaboration (Tee E Siong, 2005) showed that the consumption of healthy food among children was still at low level. The result of the survey showed that 19.2% were underweight and 16.7% were stunted. According to the Tee E Siong (2005), in a review of available data showed that 6.0% of school children aged seven (7) to sixteen years old in Kuala Lumpur are overweight while 3.5% were obese.

In Malaysia, the effort to create awareness among Malaysian children has taken place since 1972 through several programmes. In 1972, the Ministry of Education took initiative to include nutrition education into the primary health care system under the Operation Renewal programme (Koon, P.B. et al., 2006). Later on, in July 1983, a joint effort was taken the Ministries of Health and Information by introducing a mass media program using radio and television. In 1997, the Healthy Lifestyle Programme of healthy eating was introduced by the Ministry of Health. Apart from that, all those programmes are supported with several nutrition education programs which were designed for schools have been implemented on an ad-hoc basis, including programs for preschool children, primary school children and adolescents. The Ministry of Education has included basic principles of nutrition in the primary school curriculum. The most significant programme is the Program Sekolah Sihat programme (Koon, P.B. et al., 2006).

The Program Sekolah Sihat was initiated with the objectives of providing nutrition education and promoting healthy lifestyles to Malaysian primary school children programme (Koon, P.B. et al., 2006). It was piloted at 12 primary schools in Kuala Lumpur and Selangor. The goal of nutrition education is to teach children to eat a well-balanced diet that contains a wide variety of foods, and that children learn to make wise food choices independently. The programme involves huge participation of parties who relate to school children inclusive of school-wide policies that support healthful eating; a sequential, comprehensive health education curriculum, inclusive of nutrition, that is active, fun and culturally relevant; coordination between school food service and nutrition education; training for school staff; family and community involvement as well as and program evaluation.

A study and evaluation on the programme conducted by Koon, P.B. (2006) and his team found out that nutrition knowledge improved significantly ($p < 0.001$) from 64.6 ± 19.8 marks during baseline to 69.6 ± 20.8 marks at follow-up. They also found out an encouraging change in

dietary habits among school children by the reduction in snacking practice with a decrease of 23.6% from 95.1% at baseline to 71.5% at follow-up. Besides that, there is also an improvement in the consumption of fast food with a reduction by almost half. Choice of food items and beverages during school breaks also improved in which the percentage of those carbonated drinks decreased by 12.3%. From those findings, they concluded that the programme succeeded in improving children's nutritional status, nutrition knowledge and food choices. This program proved to be an innovative and practical approach to engage and build the capacity of school children and teachers in nutrition.

The Sources of Nutritional Information among Young Malay Children

In most cases, children depend on their environment in which they live to get information about nutritious food. The more nutritious the environment is, the more information about nutritious they can access and *vice versa*. It is generally assumed that children get the information about it within three key environments which shape their eating behaviors and food preferences (Montague, 2002). The key environments are the family, home environment, the educational and care environment and the broad community environment. Besides those three key environments, there are also other factors that which shape children's eating behaviors and food preferences.

Wardle and Huon (2000) suggest that television viewing hours spent by children weekly have a significant correlation with their requests of food advertised on television as well as peer modeling of specific food choices that marked influence on what children eat.

Family and Home Environment

The family and home environment is said to have a critical influence on the establishment of food preferences and eating habits among children, but the extent to which these preferences and habits are carried into adulthood is not well understood (Montague, 2002). The family lifestyles, culture and practices have a large effect on children's purchasing and consumption decisions.

According to Montague (2002), one of the aspects of family and home environment that may influence children's eating behaviour food preferences is parental food preferences (knowledge, values, and beliefs about food) as well as role modeling by parents (particularly the mother), peers or siblings. For an example, mother's dieting behaviour and her perception of her daughter's risk of being overweight have an influence on the daughter's eating habits and relative weight.

Besides that, child-parent interactions around food including, parents restricting food seen as undesirable, using food as a reward, or promoting certain foods as treats for special occasions, and lastly parenting style also have an influence on children's eating behaviour such as strong parental control over eating situations, or pleasant interactions in eating situations. For example, children would choose fewer non-nutritious foods when they were told that their mothers would be monitoring their food choices than without such threat besides parents' exhortation 'eat up because it is good for you' (Wardle and Huon, 2000).

The third factor is television or video watching habits involving long hours of sedentary activity appear to be a component. Television viewing is thought to promote weight gain not only by displacing physical activity, but also by increasing energy intake (Montague, 2002). Children seem to consume excessive amounts of energy dense food while watching television, and their exposure to television advertising (mainly of fast food, soft drinks, sweets and sugar sweetened cereal) appears to affect dietary patterns at other times of the day. Children in recent time have become an important target for marketers (Montague, 2002) due to mainly their purchasing power which is expanding. As the result, children are growing up surrounded by advertising, branding and other forms of promotion (Hastings et al., 2003). Television viewing during mealtimes is inversely associated with consumption of products not typically advertised such as fruits and vegetable (Coon et al., 2001).

The Educational and Care Environment

Preschool and school environment are regarded as the key sites for the acquisition of dietary knowledge and habits and are considered as the place where children consume a significant proportion of their daily food intakes (Montague, 2002). The school food environment can provide nutritional information to children and therefore, can shape the children's food preferences (Kubik et al., 2003). This is due to some factors. One of them is the existence of a specific policy or set of rules within the setting around nutrition education, food service and nutrition resources. Secondly is the formal curriculum based education that the children receive about nutrition and healthy eating. Third is the food that is available in the setting, either provided or available for purchase. Fourth is the availability and promotion of physical education as an integral part of the curriculum. Fifthly, the knowledge, attitudes and practices of the staff involved. Lastly, the role of the parents in the setting and their involvement in food and nutrition issues (Montague, 2002).

The school environment was presented as a "seedbed" for nutritional education to be nurtured (Brown *et al.*, 2000). Interestingly the school was cited as being the prime medium for nutritional education by young consumers from both gender groups (Brown *et al.*, 2000). This is based on the fact that children eat daily at schools where their food preferences are continually modified (Birch, 1993). This is supported by a study in Australia showing that one-third of all children's meals come from outside home and about 52% of the meals are eaten at school (Kubik et al., 2003).

At schools, teachers, peers and canteen operators are the sources of nutritional information and have a greater potential influence on children's food preferences (Kubik et al., 2003). Research shows that children's food preferences are largely influenced by repeated exposure to food, and by the social context in which the food is offered (Hearn et al., 1997). This fact is supported by O'Dea (2003) who states that children eat what is available and allowable at home and schools. For instance, if school provides high-energy fast food to children at school, then children will learn to purchase and eat such food at school, at home, and outside the home and school (Waters and Baur, 2003). Thus, the social context and schools have to create a healthful environment through healthful food policy and canteen that will allow children to access the nutritional information indirectly from the healthful food which are provided to them.

The Broad Community Environment

Children also get information about nutrition from this environment. This type of environment has the potential to influence children's diet and eating habits. Montague (2002) suggests some aspects of this environment may affect the children's food preferences. The first aspect is the massive injections of funds into the marketing of foods and drinks that are generally high fat, high sugar foods on television (Hill & Radimer, 1997). The target groups of such advertising are children and their parents. It is very rare to see on TV advertisements about fresh fruits and vegetable industry and the public health sector to counteract this. Australia is recorded as one of the highest levels of food advertising during children's television viewing times, that is programs rated C or G and shown in the mornings and afternoons (Hill & Radimer, 1997).

The second aspect is the size of the fast food industry. Most industries target children and families as their potential customers. An economic research in Australia, conducted by BIS Shrapnel in 2001 reported that Australians spent \$6.35 billion on fast food and takeaways in the year 2000. The third aspect is the increase of sedentary lifestyles, the dominance of the car, urban design and fears for children's safety. This aspect have set the limits on the extent of children engagement in out of doors physical activity, for example by walking or cycling to school, or playing in the street or the park, (Baur 1998, Baur 2001).

Another aspect of this type environment is the price and availability of fresh fruits and vegetables in some areas (Booth & Smith, 2001). This aspect has become an obstacle to families on low incomes or in rural and remote areas to purchase healthy food at prices they can afford. Lastly is the lack of access to affordable or culturally or socially appropriate food. There are certain groups in the community that may have difficulty to purchase nutritious food. Among them are those who are living in poverty or experiencing homelessness and recent immigrants who cannot afford or find access to familiar foods (Booth & Smith, 2001).

The Influences of Nutritional Information on Young Malay Children Preference

Nutritional information does influence children preference. Many studies show throughout the globe that if children have information about nutrition, they tend to choose food with nutrition and *vice versa*. The Program Sekolah Sihat has proven the improvement in children's nutrition knowledge, attitudes and practices, as well as nutritional status. It was demonstrated by the decrease of overweight and underweight proportion among children; the significant improvement of scores in nutrition knowledge, and positive changes in several dietary habits, such as decreased occurrence of snacking and fast food consumption, as well as improvements in the choices of food and beverages made during school break. The children who had participated in the Program Sekolah Sihat made healthier choices during school break at the canteen as compared to before the program was implemented (Koon, P.B. et al., 2006).

The Integrated Nutrition Project which was conducted in Denver, Colorado, also reported a change in lunchroom dietary behavior of students in which there was increment in fruit consumption and eating of a greater variety of fruits among children as well as improved knowledge of the food guide pyramid, pyramid proportionality, whole grains and 5-A-Day (Koon, P.B. et al., 2006). Similarly, another program in Australia i.e the Outreach School Garden

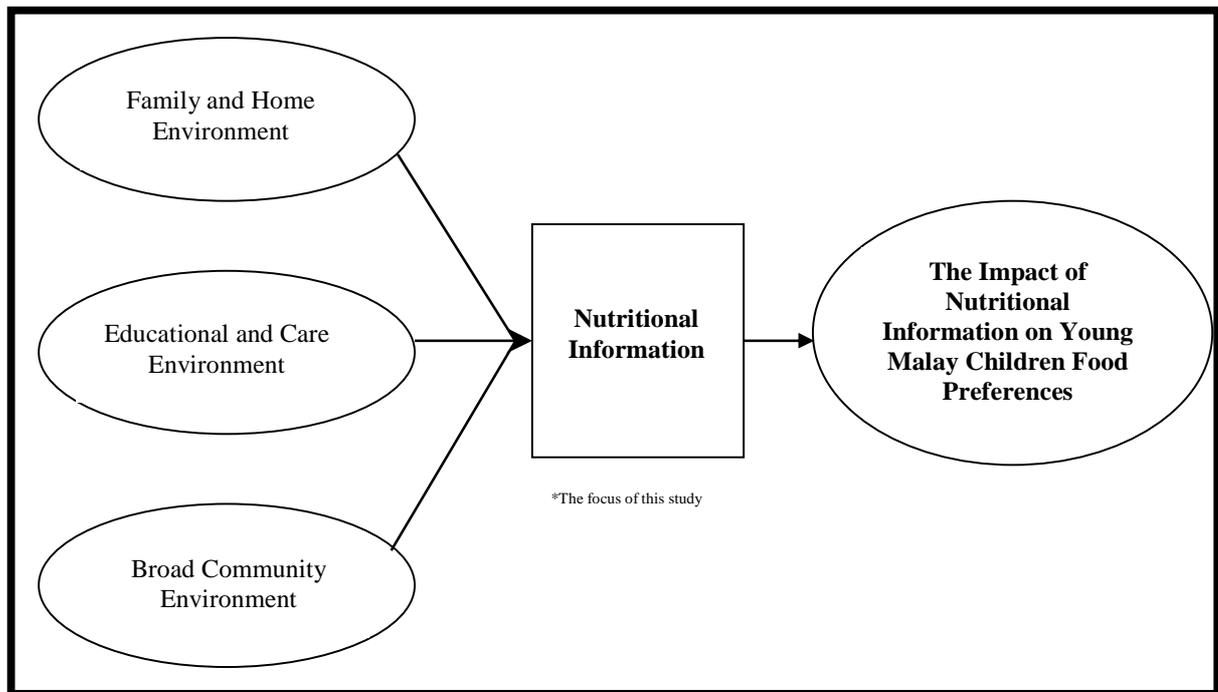

Project which employed the innovative concept of a school-based nutrition garden, proved to be successful in building the capacity of indigenous students and school staff in nutrition (Koon, P.B. et al., 2006).

Although children have access to the nutritional from those key environments, in certain circumstances, such information may not always have a positive effect to some children even though they have information about nutrition (Wardle and Huon, 2000). This happens because they might do not understand the information due to incomplete development of their intellect. Children normally regard healthiness is exclusive characteristic by its nature and alien to them.

Wardle and Huon (2000) state that in general, children are not concerned about health outcomes. Health is not important or a priority for them especially among nine years old children. This is supported by a study of 9- to 10-year-old children's expectations and food preferences. According to Wardle and Huon also, there was evidence that many of children believed that 'if a food tastes good, it must not be good for me; and if a food tastes bad, it is probably good for me'. This expectation raises the possibility of the reverse effect: 'if a food is said to be healthy then I probably won't like it'.

Lacking of nutritional information may have a direct impact on children's eating behavior if the information about food received by children are not being filtered through parents. According to survey in 2002 conducted by the American Dietetic Association Foundation's 2003 Family Nutrition and Physical Activity, many children make food-purchasing decisions for themselves and their parents do not always realize how much or what foods they are buying. In USA, it is reported that children buy about twice food from vending machines, snack bars, convenience stores, restaurants and grocery stores as often as their parents report their children buying.

THEORETICAL FRAMEWORK

Summary

Nutritional information is very crucial for human life long health beginning from their early age. The more nutritional information one acquires the better health condition he gains for his body. The consumption of foods that contains recommended nutrition from childhood will help preventing disease during adulthood, hence; ensure the lifelong of the child.

Environment plays very important role in providing nutritional information to children. The family and home environment, the educational and care environment and the broad community environment are looked as the most influential source of nutritional information to children and subsequently shape the children food preferences. If those environments are nutritious in nature, children consume more nutritious food and *vice versa*.

Beside those three key environments, the amount of hour spent on television viewing also influences children food reference since it has a significant correlation with their requests of food advertised on television. More nutritional information shall be provided to children so that they would better be able to learn healthy behaviors and make healthy choices. Those environments need to be utilized to encourage exercise, healthy choices and moderate portions in food preferences among children. However, in certain circumstances, due to the incomplete development of children's intellect that makes them unable to understand the information, not all nutritional information affects children food preferences.

RESEARCH DESIGN AND METHODOLOGY

This study looks into three areas of concern, i.e. the awareness of nutritional information among the respondents, sources of nutritional information and examining the influences of nutritional information on young Malay children's preferences. An interview session was conducted by asking the respondents some questions that relate to nutrition.

The questions are divided into three different parts. Part One is to determine the awareness among young Malay children on nutritious food. Part Two is to identify sources of nutritional information among young Malay children. Part Three is an experiment to examine the influence of nutritional information on young Malay children's preferences.

The methodologies have been divided as such due to the following reasons:

- Too many number and lengthy of questions may deviate the children's focus from responding to the questions and may discourage them from giving full cooperation during the interview session. Thus, this will cause a failure to the interview session as it will decline the interest of the children to volunteer themselves in giving feedback to this survey.
- A rational number of three parts of questions will motivate children to answer it instinctively, promptly and sincerely from their heart. As a result, it will help researcher to collect full, complete and accurate information which is needed on the spot.

Hence, based on the above reasons, the researcher felt that these three parts of questions are sufficient and most effective to support this study by using the following two methods:

First Method: Interview Session

A random selection of ninety two respondents was chosen by researcher and a brief explanation on the objective of the interview session was described before the children started answering the questions. Children were reminded that the questions needed to be answered sincerely and spontaneously. At the same time, the chosen respondents were requested to give their full support and cooperation during the survey by completing the interview session from the beginning till the end of session.

Instruments consisting of questionnaires with open ended and close questions were developed. The children perceptions and opinions towards nutritional information were measured. The result of this survey would determine the awareness, identify the sources and examine the influences of nutritional information on young Malay children's preferences.

The interview session has been conducted at International Islamic University Malaysia Educare (IIUM Educare) that provides Child Care and Kindergarten services to the university's staff.

Only children who were willing to give their full cooperation to involve in the interview session were selected. As mentioned earlier, all chosen children were requested to give their feedbacks immediately. Most of the children had given their full support and cooperation as small presents were given away to them as a token of appreciation.

The following is the dialogues that were used in the interview session:

1st Objective: To Determine Awareness among Young Malay Children Knowledge about Nutrition.

- Researcher : Good morning children!" How is everyone doing today? My name is Shuhaidah and you can call me teacher Shu. I am here to ask you a few questions about nutrition. If you can answer well, you will get a present from me. Can you do that?
- Children : Wait the reply.
- Researcher : Have you heard about nutrition? Yes/ No. If yes, write down the answer.
- Children : (Wait children response).
- Researcher : Have you heard about vitamin? Yes / No. if yes, researcher will write down the answer.
- Children : (Wait children response).

2nd Objective: To Identify Sources of Young Malay Children's on Nutritional Information

- Researcher : How do you know about nutritional information?
- Children : (Wait children response).
- Researcher : Do you know about it from your Mom, Dad, TV or Teacher?
- Children : (Wait children response).

Second Method: Experiment

The experiment was conducted by giving the children two different scenarios. Scenario 1, the researcher just showed to them two pictures of chicken nugget (Nuggets A and Nuggets B) without providing them any nutritional information. The reason was to know the children preferences without any nutritional information.

In Scenario 2, the researcher gave explanation to the children on what is the different between both of the pictures (Nuggets A and Nuggets B). The picture of Nuggets A showed nuggets and a picture of children who were sleepy and crying. Nuggets B showed nuggets and picture of healthy children who were playing at playground.

After the researcher explained in details and give nutritional information to them, the children were asked to choose which nuggets they preferred. The purpose was to know how the nutritional information influenced their food preferences.

In this experiment, the children gave good responses and feedbacks to the researcher. The researcher found that children need nutritional information before they made a decision to choose their foods.

The following is the dialogue that was used in the experiment session:

3rd Objective : To examine the influences of nutritional information on young Malay children's preferences

Researcher : My young children, are you ready for the next question?

Children : (Wait children response).

Researcher : Do you like chicken nuggets?

Children : (Wait children response).

Researcher : I have two types of chicken nuggets. Chicken Nugget A and B
(Show the A4 size picture)

Scenario 1

Researcher : Which one would you like to buy - chicken nugget A or chicken nugget B?

Children : (Wait for children response).

Scenario 2

Researcher : Let me explain about chicken nuggets A. This nuggets does not contains nutrition. If you eat this you will feel sleepy and tired.

Researcher : But, chicken nuggets B have good nutrition like vitamin. If you eat this you will feel healthy and cheerful. You can go out and play with your friends. Do you understand?

Children : (Wait children response).

Researcher : Which one do you like to buy? Chicken nuggets A or nuggets B?

Children : (Wait children response).

Sample

The sample comprised of ninety two children aged five and six years old. All children were mainly from different family backgrounds.

Time Allocation

The study started in June 2008 and it took six months to complete the data collection and data analysis.

Data Analysis

In this study, the Statistical Package for the Social Science (SPSS Version 12.0) was used to analyze the data. The data were examined using frequency analysis. Frequency analysis was used to achieve the three objectives of the study:

1. Determining awareness among young Malay children knowledge about nutrition.
2. Identifying sources of young Malay children's on nutritional information.
3. Examining the influence of nutritional information on young Malay children's on food preferences

DATA ANALYSIS

There was a 100% response rate from 92 respondents during the interview and experiments session.

<i>Gender</i>	<i>Frequency N=92</i>	<i>Percent (%)</i>
<i>Boy</i>	51	55.4
<i>Girl</i>	41	44.6
<i>Age</i>	<i>Frequency N=92</i>	<i>Percent (%)</i>
<i>5 years</i>	47	51.1
<i>6 years</i>	45	48.9

Table 1: Demographic Profile of Respondents

Table 1 shows the demographics characteristics of respondents according to the age group and gender only. In term of gender, 55.4 percent were boy and 44.6 percent were girls. From the total of 92 respondents, 51.1 percent were five years old respondents while 48.9 percent were 6 years old.

First Objective: To Determine the Awareness among Young Malaysian Children Knowledge about Nutrition

<i>Description</i>	<i>Percent (%)</i>
<i>Aware</i>	28.3
<i>Unaware</i>	71.1

Table 2: Awareness on Nutritional Information

Table 2 shows that 28.3 percent of the respondents were aware about word of nutrition and 71.1 percent were not aware about it.

<i>Description</i>	<i>Percent (%)</i>
<i>Have knowledge about vitamin</i>	<i>59.8</i>
<i>Source of Information</i>	<i>Percent (%)</i>
<i>Own self</i>	<i>61.0</i>
<i>Parents, teacher and media</i>	<i>39.0</i>

Table 3: Having Knowledge about Vitamin and it Sources

Table 3 shows that 59.8 percent of the respondents had knowledge about vitamin. They represented more than half of 92 respondents. In terms of the source information, 61 percent of them know about vitamin by themselves while 39 percent getting the information about vitamin from their parents, teacher, and mass media.

Second Objective: To Identify the Sources of Young Malay Children's on Nutritional Information

<i>Description</i>	<i>Percent (%)</i>
<i>No sources</i>	<i>73.9</i>
<i>Sources (Parents, teacher and media)</i>	<i>26.1</i>

Table 4: Sources of Nutritional Information

Table 4 shows 73.9 percent did not know about nutritional information while 26.1 percent knew about nutritional information from parents, teacher and media, especially television.

Third Objective: To Examine the Influences of Nutritional Information on Young Malay Children's Food Preferences

<i>Scenario 1</i>	<i>Percent (%)</i>
<i>Nuggets A</i>	<i>52.2</i>
<i>Nuggets B</i>	<i>47.8</i>

Table 5: Scenario 1 (Without nutritional information)

Based on the experiment conducted in which nutritional information was not informed to them, 52.2 percent children have chose Nuggets A while 47.8 percent chose Nuggets B.

<i>Scenario 2</i>	<i>Percent (%)</i>
<i>Nuggets A</i>	<i>2.2</i>

<i>(Nutritional information not provided)</i>	
Nuggets B <i>(Nutritional information provided)</i>	97.8

Table 6: Scenario 2 (With nutritional information)

In Scenario 2, 2.2 percent chose Nuggets A (Nutritional information not provided) and 97.8 percent chose Nuggets B (Nutritional information provided). This shows that children would choose nutritious foods if they were provided with nutritional information on foods.

CONCLUSION AND RECOMMENDATIONS

This chapter provides conclusions of the interview session in accordance with all of the objectives for this research as mentioned before. It begins with the summary of the main findings and followed by the limitation of the study, some suggestions for future research in this area and the conclusion of the study.

Major Findings of the Study

This research has investigated awareness among young Malay children on nutritious food, whether children are aware about nutrition and vitamin. Besides, this study also has succeeded in identifying sources of nutritional information among young Malay children's in which the children know about nutritional information from their parents, teachers and media especially television. Apart from that, the study also has successfully examined the influences of nutritional information on young Malay children's preferences.

First Objective: To Determine the Awareness among Young Malay Children Knowledge about Nutrition

From the study, I can see that majority of the young Malay children were not aware of the importance of nutritional information. Only 28.3 percent of children know about it. It might be due to the reason that they come from living environment that give less emphasis on the importance of nutrition.

Second Objective: To Identify the Sources of Young Malay Children's on Nutritional Information

The study showed that majority of the children did not know about nutritional information with the percentage of 73.9 percent. It might be due to the less exposure to the nutritional information at school, home, broad community environment as well as peers. It also tells us that teachers, parents, siblings, community and peers do not play effective roles in disseminating nutritional information to the children.

Third Objective: To Examine the Influences of Nutritional Information on Young Malay Children's Food Preferences

The study was conducted by showing two different pictures (Nuggets A and Nuggets B) to children. Nuggets A without nutritional information while Nuggets B with such information. With the assistance of questionnaires that were developed to predict the young Malay children preferences in choosing the food, children were asked which picture that they preferred. Surprisingly, 97.8 percent chose Nuggets B. This shows that children would choose nutritious foods if they were provided with nutritional information on foods. The result proved that children need information to make good decision in their food preferences.

It is hoped that the findings of this study may assist the food industry in what they can produce and how they want to promote the product. This study will help them to market their products effectively. Besides helping the industry, this study also give beneficial information to parents, teachers, media-mass and government in improving their ways or techniques to create awareness among children. Thus, this nutritional information is really important nowadays for the creation of healthy society.

Limitation of Findings

There is limitation to the findings of the study that should be acknowledged. The limitation is that the study took place in one day in one childcare with small number of respondents. It would be useful to conduct the study on a huge number of respondents and perhaps to look at moderating effects of children social background. Thus, the findings of the study might not sufficient to provide information to the industry, government, parents and community at large. Therefore, more extensive study is highly needed in the future.

Direction of Future Study

Further research could cover different races and kindergarten.

CONCLUSION

This study has shown that in order to educate children to eat nutritious food, necessary information need to be provided to them accordingly. Parents, teachers and media shall play their roles in providing such information. The findings from the survey also reveal that young Malay children have information about nutrition but it is not sufficient to them. More nutritional information is highly needed by young Malay children.

ORGANIZATIONAL, ENVIRONMENTAL AND DEMOGRAPHIC VARIABLES OF EMPLOYEE TURNOVER INTENTION

Bodla, Mahmood A.¹; Hameed, Abdul²

¹*Director, COMSATS Institute of Information Technology, Sahiwal, Pakistan.*

²*Lecturer, COMSATS Institute of Information Technology, Islamabad, Pakistan.*

Purpose - This paper explores the factors and causes responsible for employee turnover. Employee turnover has substantial cost for the organization as it is a loss of social capital.

Methodology - The data has collected from 252 first line managers and supervisors of textile sector of Pakistan for ascertaining the reasons of employee turnover. The statistical tools employed to analyze the data are correlation and regression analyses.

Findings - The determinants of employee turnover intentions have been divided into three factors that are organizational, environmental, and demographic. Organizational (job) related factors are more responsible as compare to other factors of employee turnover

Practical Implications - Paper suggests guidelines for the Human Resource Managers for controlling employee turnover such as job related factors are more important for the managers to control employee turnover intention.

Originality/ Value - Khatri and his colleagues (2001) model adapted, tested and extended the model with job stress variable. Model extended and Empirical evidence received from Textile sector of Pakistan.

Key Words – Employee Turnover Intention, Organizational Factors, Environmental Factors and Demographic Factors

Paper Type – Research Paper

An employee is a valuable resource for the organization. An employee performs tasks and duties for the accomplishment of organizational goals. Turnover can be defined as a voluntary termination of membership of an employee of the organization. (Morrell et al 2001). Turnover is simply defined as the intention of the worker to leave his or her job for another job that meets the workers needs. Turnover intention may be described as “attitudinal (mind process of quitting), decisional (intention to leave), & behavioral (exploring a new job) practices of voluntary turnover” (Khatri, 2000; Sager et al., 1998). Organization runs for the earning profit but may suffer when employees leave the organization. Turnover has a variety of effects on the organization itself, the individual (employee) and wider society who is associated with him (Moblely 1982). Employee turnover encounters major cost, in terms of direct costs (hiring and replacement, and time management), and may be more important in terms of indirect costs (work spirits, costs of learning, work burden on the rest of the employee, work quality, organizational memory) and the loss of social capital (Dess and Shaw, 2001).

Employee quit is a serious issue for many Asian countries for instance Singapore, Malaysia, South Korea, and Hong Kong (Syrett, 1994; Barnet, 1995; Chang, 1996; Khatri 2001). The importance of workforce turnover has been identified as a sustainability issue by the Global

Reporting Initiative (GRI), which has incorporated turnover as a focal point of social performance indicator in its Sustainability Reporting Guidelines (GRI 2002).

Employee turnover is a cause of restless and disturbed nights of the HR managers in the textile sector of Pakistan. The textile sector is selected due to two reasons. First of all, there is a horrifying employee turnover rate i.e. 12% (Majid et al 2000). Second reason is that Textile sector contributes as a Pakistan's largest employer as well as main sector for the economy having round about 68% of total export earning (Bukhari 2005), and represents the largest sector of Pakistan. Therefore, this study has been designed and entitled as "The Determinants of Employee Turnover in Textile Sector". The focus of the study is to find out the reasons of employee turnover. Why employees leave the organization and what are their intentions to leave?

This study has five main objectives. First and foremost objective is to explore the reasons and intentions of employee turnover. Second one is to differentiate between Job Hopping and Turnover intention. Ghiselli (1974) was the 1st one who gave the idea related to job-hopping, and he expressed as 'hobo syndrome'. He described that hobo syndrome as "the periodic itch to move from a job in one place to some other job in some other place". There are almost fifteen hundred investigations in the employee-turnover literature (Shaw et. al, 1998), but job-hopping reported in a few researches in past studies. Third objective is to know about the current pattern of textile turnover. The large numbers of turnover studies were investigated in Western Organization framework (Khatri et. al, 2000) and there is a vast difference in social, economic, and cultural environments. Therefore, second last objective is to find out the implications in the Asian context.

The last objective is to compartment & partitioning the effects of controllable factors (e.g., job satisfaction & organizational commitment), uncontrollable factors (e.g., alternative employment opportunity & job-hopping), and demographic factors (e.g., age & income), on turnover intention. The compartment of the outcomes would diagnosis the turnover issue in a proper way.

THEORETICAL FRAMEWORK & HYPOTHESIS

There are two schools of thoughts on employee turnover research: psychological school and the labor market school. The psychological school involves with those matters basically related to psychological accounts for instance job satisfaction, job stress organizational commitment, & organizational climate. The labor market school explains the issues such as demand & supply, availability of job opportunities or perceived alternatives, and job search. Both schools of thoughts on turnover studies are not able to predict and explain the sufficient reasons and measures for the organization to manage employee turnover effectively (Morrel et al 2001).

The study framework is exhibited in Figure 1. It incorporates 3 groups of independent variables which include organizational factors, demographic factors and environmental factors. Organizational factors are the Job related & psychological factors i.e. job satisfaction, job stress, and organizational commitment. Demographic factors are age, education; job tenure Uncontrollable factors are the environmental or labor market factors i.e. alternative job

opportunities & job hopping. The dependent (study) variable is the Turnover Intention. These relationships incorporated the ideas of Khatri et al, (2001).

Actually I have tested the model of Khatri and his colleagues (2001) as well as extended the model by adding another variable job stress.

This model has been presented in Figure 1.

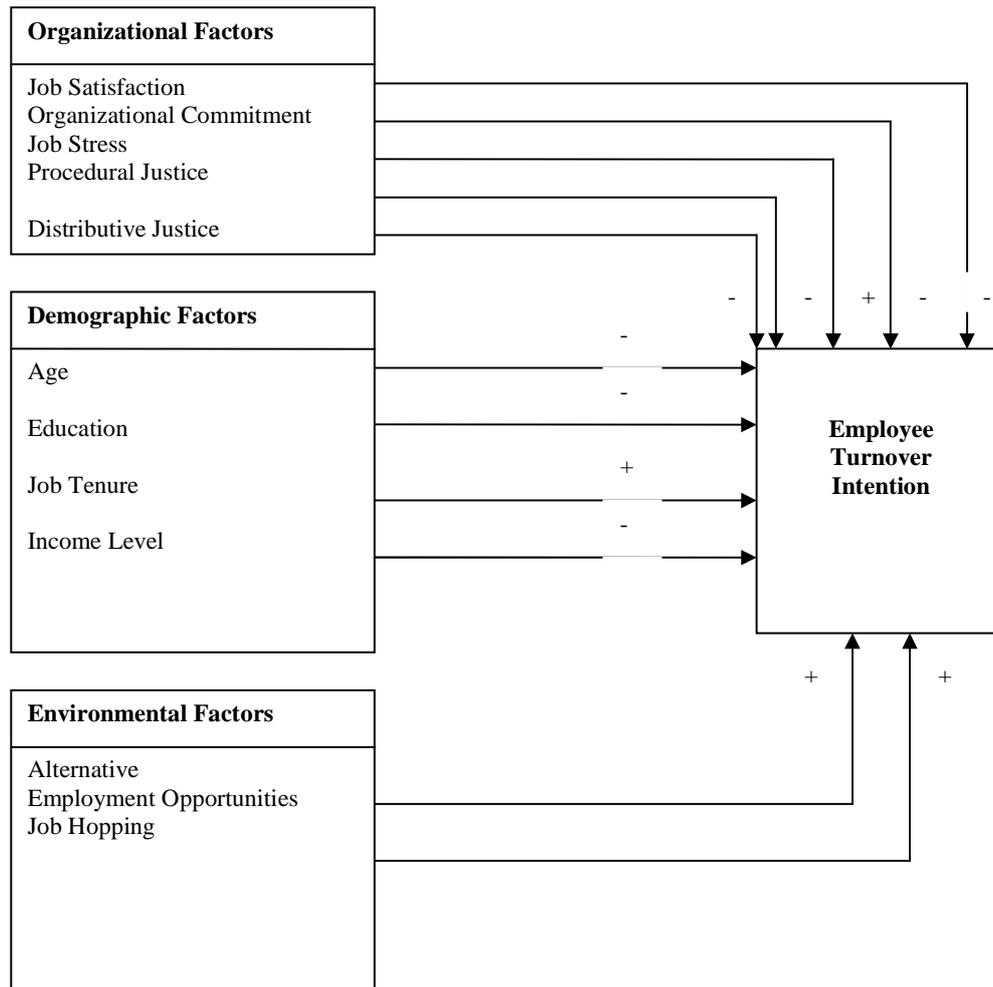

Figure 1: The Determinants of Employee Turnover Intention (Extended model)

REGRESSION MODEL

$$Y = \beta_0 + \beta_1X_1 + \beta_2X_2 + \beta_3X_3 + \beta_4X_4 + \beta_5X_5 + \beta_6X_6 + \beta_7X_7 + \beta_8X_8 + \beta_9X_9 + \beta_{10}X_{10} + \beta_{11}X_{11} + \beta_{12}X_{12} + \beta_{13}X_{13}$$

Y = Turnover Intention

β_0 = Constant

X_1 = Satisfaction with Pay

X_2 = Satisfaction with supervision

X_3 = Satisfaction with working conditions

X_4 = Organizational commitment

X_5 = Job Stress

X_6 = Procedural Justice

X_7 = Distributive Justice

X_8 = Alternative Employment Opportunities

X_9 = Job Hopping

X_{10} = Age

X_{11} = Education

X_{12} = Job Tenure

X_{13} = Income Level

E = Standard Error

$\beta_1, \beta_2, \beta_3, \dots, \beta_{13}$ = Coefficients

Mobley (1982) indicates that there are four primary determinants of turnover: Job satisfaction-dissatisfaction; expected utility of alternative internal work roles; expected utility of external work roles; and non-work values and contingencies.

Job Satisfaction depicts how much happy and comfortable an employee with the job. There are multiple and wide range of causes which may affect an employee's job satisfaction level; for example pay and benefits, quality of the working conditions, the fair perceived promotion practice in an organization, socialization, leadership, & job itself.

Falkenburg and Schyns (2007) describe job satisfaction as a behavioral cycle; as a cause of behavior consists of different aspects of the job and the work related satisfaction. Satisfaction is the level by which workers love their job. There is an inverse association between job satisfaction and withdrawal behavior.

Job satisfaction can be divided into three dimensions: satisfaction with pay, working condition and supervision. The association between job satisfaction and turnover are absolutely investigated variables in literature and research. Several researches report a negative relation between job satisfaction and turnover (such as Khatri et al (2001), Bluedorn (1982), Price (1977), Arnold and Feldman (1982), Mobley (1982), Cotton and Tuttle (1986). Workers have more inclination to leave when they are dissatisfied in an organization.

Koh and Goh (1995) investigate the link between job satisfaction and employee intention to quit in Singapore and classified job satisfaction into eight categories: work load, co-workers,

working conditions, monetary rewards, supervision, company identity, kind of work, and career future.

Khatri et al (2001) have reported job satisfaction into three perspectives; satisfaction with pay, supervision, and working condition. There is a negative relationship among all the three dimensions of job satisfaction in the study of employee turnover intention. Thus:

Hypothesis 1: Job satisfaction is negatively associated with turnover intention.

Hypothesis 1a: Satisfaction with pay is negatively associated with turnover intention.

Hypothesis 1b: Satisfaction with work is negatively associated with turnover intention.

Hypothesis 1c: Satisfaction with supervision is negatively associated with turnover intention.

Organizational Commitment is the worker's emotional affiliation and association to the organization. Organizational commitment can be distinguished with some other job-related attitudes, such as Job Satisfaction, and Organizational Identification.

According to Meyer and Allen's (1991) there are three-constituent commitment model, past studies revealed that employees have three types of "Mind Sets" which may illustrate commitment level of an employee in any type of the organization. Affective commitment has positive emotional affiliation to the organization by an employee; continuance commitment is the someone's commitment with the organization because employee realizes huge costs of loss of organizational membership. Normative commitment is the someone's commitment to stay and remains in an organization due to the sense of feelings of responsibility.

Aryee et al.'s (1991) research on accountancy employees in Singapore also demonstrated an inverse relationship between organizational commitment and intention to quit. In the same way, Wong et al. (1996) uncovered that organizational commitment was a robust turnover predictor in their longitudinal study of almost 400 Hong Kong graduate students in. Numerous other researchers (Kim et al, 1996; Ben-Bakr et al., 1994; Arnold & Feldman, 1982; Tett & Meyer, 1993) also reported organizational commitment as an essential turnover predictor.

Van Breukelen et al (2004) point out that organizational commitment and job satisfaction are negatively associated with intentions to leave (turnover). Therefore

Hypothesis 2: Organizational commitment is negatively associated with turnover intention.

Job stress has gained increasing importance in the recent turnover literature. NIOSH (2008) defines "Job stress is the physical & emotional responses which may reflect when the job requirements do not match with the capabilities, competencies, resources, or needs of the worker. Stress also happens & reflects when the circumstances have high demands and the worker has little control over it. Job stress may lead to harmful poor health and injury".

Lucy et al (2004) investigate the reasons for intentions to quit & findings of the study suggest that intentions to leave is mainly influenced by the feeling of stress, which caused by job stressors, job dissatisfaction, and lack of commitment to the organizational job. Job stressors such as workload, and role ambiguity, which are the causes that stimulate the series of emotional states. Managers should observe employee work burden, and the relationship

between supervisor and subordinate in order to minimize job stress and properly handle job stress.

Price (2001) defines Job stress is a mental and physical situation by which job tasks are not easy to perform. There are four types of stress: workload (burden of work, quantity of work effort expected by a job), role conflict (inconsistent job obligation), role ambiguity (unclear job obligations), and lack of resources to accomplish job tasks).

Janssen Peter et al (1999) suggest that emotional fatigue is basically envisaged by a lack of societal support from coworkers, and may be the work pressure due to work and time constraints. Stress related problems among workers increase high turnover and absenteeism (Mikkelsen et al, 2000). Thus

Hypothesis 5: Job stress is positively associated with turnover intentions.

Folger & Greenberg (1985) describe that there are two types of justice in organizational environment: first one is distributive justice, which explains the fairness of the results an employee obtains; and second one is procedural justice, which explains the transparency in the process used to conclude the results and output. Prior research generally on western samples has revealed that organizational justice negatively related to turnover intention. (Price & Mueller, 1986; Berg, 1991; Dailey & Kirk, 1992; Randall & Mueller, 1995;).

Hypothesis 3: Procedural justice is negatively associated with turnover intention.

Hypothesis 4: Distributive justice is negatively associated with turnover intention.

Environmental factors are the uncontrollable factors which include Job-hopping and Alternative employment opportunities. These factors related to labor market school of thought (Morrel et al 2001). Job hopping and Alternative employment opportunities included in theoretical frame work (Figure 1).

Job-hopping means frequently movement of job from one place to another place without any specific reason. Ghiselli (1974) defines job-hopping, as 'hobo syndrome' which means and includes 'the periodic itch to move from a job in one place to some other job in some other place'. Employees searching alternative jobs even they have secured job (Chew, 1993).

Job hopping is one of the most important factors of employee turnover. Some employees leave due to social influence from peer/colleagues and some employees leave the organization as a fun and no apparent reason. Job hopping is positively related with turnover intention (Khatri et al 2001). Thus:

Hypothesis 6: Job hopping is positively associated with turnover intention.

Alternative employment opportunity is another uncontrollable and labor market variable. Opportunity means of alternative jobs available in the market. The larger alternative employment opportunities exist in the environment, more chances of awareness among the employees, and then they evaluate cost and benefit analysis and have intentions to switch jobs (Price 2001).

Past literature suggests that there is a positive association and link between alternative employment opportunities and employee turnover intention (Khatri et al, 2001; Hulin et al, 1985).

Hypothesis 7: Alternative employment opportunity is positively associated with turnover intention.

Demographic factors have strong and constant relationship with employee intention to quit in previous employee-turnover literature which contains gender, level of income, age, level of education, job tenure, and job category (key post or non-managerial post). Most of the turnover researches have described inverse relationship between intention to quit and demographic variables which include, age, income level and job tenure, (Mobley et. al, 1979; Arnold & Feldman, 1982; Price & Mueller, 1986; Cotton & Tuttle, 1986; Gerhart, 1990; Weil & Kimball, 1995, Wai & Robinson, 1998).

Hypothesis 8: Demographic factors are associated with turnover intention.

Specifically:

H 8a: Age is negatively associated with turnover intention.

H 8b: Level of education is positively associated with turnover intention.

H 8c: Tenure of an employee in a company is negatively associated with his or her

RESEARCH METHODOLOGY

The sample comprised 252 first line managers and supervisors from Textile sector of Pakistan. The textile sector was divided into five broad categories i.e. Ginning, Spinning, Weaving, Finishing, and Garments. The data was collected from first line managers & supervisors of spinning, weaving, and finishing industries on the basis of two stage sampling. In first stage, constructed strata on the basis of spinning, weaving, and finishing organizations of Lahore, Pakistan and then selected 50 organizations by the simple random sampling. In the second stage, first line managers and supervisors selected from the above 50 organizations.

The data was collected by physically and self administered survey (Questionnaire). The questions were asked on five point likert scale from the respondents. The questionnaire consisted of three sections i.e. controllable factors, uncontrollable factors and Turnover intention. Job satisfaction, organizational commitment, job stress, job hopping, and alternative employment opportunities were the independent variables. Turnover intention was the dependent variable.

To increase the response rate, the employees were informed regarding the research objective and confidentiality. The response rate was 84% (252/300) and most of the questionnaires filled by visiting the organization physically and some questionnaires dispatched to the organizations. The respondents were 21% female and 79% male. The participants' ages ranged from 20 to 40 years.

MEASURES

Controllable variables included job satisfaction, organizational commitment, and Job stress. Job satisfaction was measured on five point likert scale and this variable divided into three dimensions i.e. satisfaction with pay, working condition, and supervision. Three items were used for measuring each dimension. These were adapted from the Minnesota Satisfaction Questionnaire (Weiss et al., 1967) and the Index of Organizational Reaction Questionnaire (Smith, 1976). The reliabilities of three scales showed satisfactory with Cronbach alphas of 0.63, 0.84, and 0.65, respectively, for satisfaction with pay, working condition and supervision.

Organizational Commitment Questionnaire (OCQ) was used to measure employee commitment level, developed by Khatri and his colleagues (Khatri et al, 1974). Eight items were used for the measurement of organizational commitment. The scale showed a good reliability i.e. 0.81. Job stress four items were used to measure, developed by Vigoda and Kapun (2005).

The job hopping was measured on three item scale which already developed by Khatri and his colleagues (Khatri et al 2001). The scale showed reliability i.e. Cronbach alpha 0.71. The perceived alternative employment opportunities scale contained six items and was adopted by Michaels and Spector (1982), Arnold and Feldman (1982), Billing and Wemmerus (1983) and Modey et al (1984). The scale showed good reliability i.e. 0.76 and single factor in factor analysis.

The three item turnover intention scale from the Michigan Organizational Assessment Questionnaire (Cummann et al, 1979) and two items from Bluedorn (1982) were used. The Cronbach alpha was 0.84 in the study.

ANALYSES AND RESULTS

The statistical tools employed to analyze the data were Pearson's correlation and regression analyses by using SPSS. Pearson's correlation is a reasonable and familiar means of assessing linear association between variables. The correlation coefficient provides a measure to establish the strength. This study has established a linear relationship between dependent variable (Employee turnover intention) and all other independent variables just like job satisfaction. The relationship and association has been explained in table 1 and 2 at 99% & 95% confidence level. There is a strong relationship exist between the variables at 0.01 or 99% level of confidence.

Table: 2

****** Correlation is significant at the 0.01 level (2-tailed).

***** Correlation is significant at the 0.05 level (2-tailed).

Employee turnover intention is a dependent variable. Job satisfaction, organizational commitment, procedural justice, distributive justice, Job stress, Job hopping, Alternative employment opportunities and demographic factors are the independent variables in the study of 252 first line managers and supervisors of textile sector. Satisfaction with pay, working condition, and supervision, has a strong negative correlation with employee turnover intention i.e. -0.409, -0.378, -0.340 at a $p < 0.01$ level of significance respectively. Procedural justice, distributive justice and organizational commitment also have a negative correlation with employee turnover intention at a $p < 0.01$ level of significance i.e. -0.343, -0.342, & -0.266. There is a positive correlation between job stress and employee turnover intention i.e. 0.266 at a $p < 0.01$. Job hopping and Alternative employment opportunities also have a positive relationship with employee turnover intention i.e. 0.223 and 0.223 respectively at a $p < 0.01$ level of significance. Age and Income have strong negative relationship with turnover intention at a $p < 0.01$ level of significance i.e. -0.158, & -0.188.

So, Pearson's Correlation shows that job satisfaction is negatively associated with turnover intention. It means satisfaction with pay, working condition, and supervision has strong negative association with turnover intention. When job satisfaction increases, employee turnover intention decreases Organizational commitment is also negatively associated with turnover intention. Job satisfaction leads to organizational commitment. Whenever, organizational commitment will increase, employee turnover intention will also decrease. Procedural and distributive justice has strong negative association with turnover intention. Job stress is positively associated with turnover intention. It means that when job stress conditions just like workload increases, employee turnover also increases. Job hopping and alternative employment opportunity are also positively associated with turnover intention. When bad habits develop just like switching job with no apparent reasons or due to friends and colleagues then turnover intention also increases.

Controllable factors (job satisfaction, organizational commitment, and job stress) are highly correlated with turnover intention as compare to uncontrollable factors (job hopping and alternative employment opportunity). It means that controllable (organizational) factors are more dominant and

play very important role in employee turnover intention. When employee dissatisfied, job stress, and has a lack of interest and concern with organization then employee has more intention to switch job.

REGRESSION ANALYSIS

Regression analysis explains the variance and causal relationship between independent and dependent variables.

“B” lists the regression coefficients (Table 3) for the independent variables i.e. satisfaction with pay, nature of work, supervision, procedural justice, distributive justice, organizational commitment, job hopping, job stress, alternative employment opportunities, age, education, job tenure and income at $P < 0.01$ level of significance. These represent the slope and Y-intercept for the regression line. There is one constant in table 3 that is 4.289 while other regression coefficients represent the slope and Y-intercept -0.175, -0.223, -0.067, -0.110, -0.010, -0.098, 0.155, 0.132, 0.197, -0.108, -0.123, -0.014, and 0.059 respectively.

All the independent variables are included in the regression equation except satisfaction with supervision and job tenure. This implies that satisfaction with pay, working condition, organizational commitment; job stress, job hopping, alternative employment opportunities and age have strong impact on employee turnover intention.

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	4.289	.519		8.264	.000
	Satisfaction with Pay	-.175	.066	-.171	-2.642	.009
	Satisfaction with work	-.223	.075	-.196	-2.980	.003
	Satisfaction with supervision	-.067	.068	-.064	-.979	.328
	Procedural Justice	-.110	.068	-.106	-1.617	.001
	Distributive Justice	-.010	.074	-.010	-.136	.002
	Organizational commitment	-.098	.067	-.089	-1.461	.050
	Job Hopping	.155	.051	.171	3.067	.002
	Job Stress	.132	.060	.122	2.180	.030
	Alternative Employment Opportunity	.197	.072	.147	2.746	.006
	Age	-.108	.068	-.103	-1.594	.010
	Education	-.123	.062	-.121	-1.995	.047
	Job Tenure	-.014	.059	-.016	-.242	.809
Income	-.059	.078	-.051	-.750	.004	

Table 3 (Coefficients)

Regression equation explains the variance and factors responsible for employee turnover intention. Satisfaction with pay is responsible in employee turnover intention is – 17.5%, -22.3% satisfaction with work, -6.7% satisfaction with supervision, -11% procedural justice, 1% distributive justice, -9.8% organizational commitment, 15.5% job hopping, 13.2% job stress, 19.7% Alternative employment opportunities, -10.8% age, -12.3% education, 1.4% job tenure and 5.9% income.

The values listed under “Beta” represent an alternative set of coefficients that would be used instead if all variables were first converted to Z-scores.

Satisfaction with pay is negatively associated with turnover intention and regression co-efficient is -0.175. Satisfaction with nature of work, and supervision also negatively associated with turnover intention and regression co-efficient is -0.223, -0.067, respectively. Procedural and distributive justice is negatively associated with turnover intention and has regression co-efficient -0.110, and -0.010 respectively. Organizational commitment is negatively associated with turnover intention and

regression co-efficient is -0.098. Job stress, job hopping and alternative employment opportunities are positively associated with turnover intention and their regression co-efficient are 0.132, 0.155, and 0.197 respectively.

Model	R	R Square	Adjusted R Square
1	.729	.703	.692

Table 4 Model Summary

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	72.126	13	5.548	19.747	.000(a)
	Residual	135.477	238	.569		
	Total	207.603	251			

Table 5 ANOVA

For the purpose of identifying the important variable influencing the dependent variable this research has used the regression analysis. The regression analysis of the used model has employee turnover intention as dependent variable.

It is evident from the results that coefficient of Independent variables and employee turnover are significant. It shows that there are strong relationship exist.

The value of R-squared (R^2) = 70.3 % and Adjusted R^2 is almost 69.2%. This indicates that independent variables bring sufficient variation in the dependent variable i.e. employee turnover intention, only 29.7 % variation is caused by other variables. Larger values of R indicate stronger relationships.

$$0 \leq R^2 \leq 1.00$$

Table 5 summarizes the results of an analysis of variance. F value shows that the overall model is statistically significant and Independent variables predict the variation in the dependent variable employee turnover intention.

	N	Minimum	Maximum	Mean	Std. Deviation
Turnover Intention	200	1	5	3.10	.893
Valid N (list wise)	200				

Table 6-A (Male Turnover Intention)

	N	Minimum	Maximum	Mean	Std. Deviation
Turnover Intention	52	1	5	2.79	.936

Valid N (list wise)	52				
------------------------	----	--	--	--	--

Table 6-B (Female Turnover Intention)

Table 6-A and Table 6-B show that Male has greater intention to leave as compare to female because male turnover has mean value 3.10 and female turnover has mean value 2.79 which shows that male has more intention to switch as compare to female.

All hypotheses have strong support and significant in our study but satisfaction with supervision and Job tenure is not significant due to some differences in economic, social, and cultural environment of Pakistan textile sector.

DISCUSSION AND CONCLUSION

Employee turnover intention is a major issue for the human resource managers and has a significant cost of hiring and replacement. Employee has intention to switch when he is dissatisfied from his pay, supervision and nature of work. A satisfied employee is more committed to the organizational work and has strong loyalty and affiliation with the organization. Job stress is the mental tension caused by the workload, working condition, and lack of means to perform job. So, job stress is another reason for switching job from one to another organization. Job hopping and alternative employment opportunities are the environmental factors who responsible for employee turnover intention. Demographic factors are also one of the reasons of employee turnover intention.

Job satisfaction and organizational commitment are negatively associated with turnover intention. Job stress, job hopping and alternative employment opportunity is positively associated with turnover intention.

Controllable or organizational factors (job satisfaction, organizational commitment, job stress, procedural justice) are more responsible for the intentions of employee turnover as compare to uncontrollable or environmental factors (job hopping, and alternative employment opportunity).

The respondents are 21% female and 79% male. The participants' ages ranged from 20 to 40 years. Average job tenure and income of the respondents are 2-3 years and Rs.10, 000 to 20, 000 respectively. Age and Education are negatively associated with turnover intention. Age, and education increase, employee turnover intention will decrease. Males have more intention to leave as compare to females.

Human resource personnel can manage employee turnover by providing competitive pay package, inspirational supervision, and congenial working condition which ultimately produce committed and loyal employees. Job stress can be managed by proper division of work and counseling service for the solution of stress related problems. Demographic factors should be considered while selection of an employee because they have effect on employee's intention to switch one organization to another organization.

The researchers can extend this research by adding more variables just like organizational change and its impact on employee turnover intentions, managers' leadership style and employee turnover intention. They can compare this study into two dimensions manufacturing vs. service sector employees by increasing sample size which will give broader view and comprehensive frame work of employee turnover intention.

CRISIS RELATED MANAGEMENT ACCOUNTING LITERATURE:

A CONTENT ANALYSIS FOR TURKEY

Bozcuk, Aslihan¹; Demirel Utku, Burcu²

¹Assistant Professor of Accounting and Finance, IIBF, Akdeniz University, Antalya, Turkey

²Assistant Professor of Accounting and Finance, IIBF, Akdeniz University, Antalya, Turkey

Purpose – The purpose of our paper is to review the crisis related management accounting literature in Turkey in order to perform a content analysis. Turkey is no stranger to financial crises; it is not unusual for Turkish firms to be faced with a local or global financial crisis almost every few years. Yet, the firms that manage to survive are those who can sustain their competitiveness amid the financial crisis. Consequently, we see a reflection of this trend in the management accounting research area in Turkey.

Design/methodology/approach – We review three Turkish journals with an accounting focus and a broad readership base made up of academics, practitioners, and regulators. We look for papers on crisis related management accounting topics published during the last decade. We then conduct a detailed content analysis including research areas, keyword/topics, research methods and author affiliations.

Findings – A preliminary analysis reveals that 153 out of a total of 1100 papers focus on crisis related management accounting topics. We find that, papers which have at least one of the keywords ‘competition’, ‘cost’, ‘crisis’ and ‘performance’ comprise 67 per cent of all the relevant papers in our sample.

Originality/value – Our study provides detailed information on the scale and scope of crisis related management accounting literature in Turkey through a content analysis and contributes to the current debate on the global financial crisis by suggesting which issues matter the most when it comes to sustaining competitiveness.

Keywords Financial crisis, Management accounting, Content analysis, Turkey.

Paper type Literature review

INTRODUCTION

Ever since the major liberalization program of the 1980's, the Turkish economy periodically goes through “boom and bust cycles” (Özler et al., 2009) and Turkish firms have learned to cope with the far reaching effects of these cycles. Some of the most recent episodes of crises in Turkey are, the 1994 crisis primarily caused by the growing budget deficit (Yeldan, 1994) and the 2000-2001 crisis largely due to a very fragile banking system (Işık, 2004).

The survivors somehow manage to maintain their competitiveness in the face of not only the domestic but also the numerous global financial crises, The “big five” developed economy crises (Reinhart and Rogoff, 2009) and the recent “panic of 2007” (Gorton, 2009) as well as other emerging market episodes of the 1997-1998 Asian Crisis and the 2001 Argentinean Crisis all hit the Turkish economy at varying intensities and put competitiveness in the spotlight.

In the literature, a number of studies explore the relationship between competitiveness and a variety of firm and economy specific factors, such as exports (Özler, 2009), R&D support programs (Özçelik and Taymaz, 2008) and innovation while controlling for potentially confounding factors of firm size, advertisement intensity, ownership structure and composition of employees (Özçelik and Taymaz, 2004). However, there is another strand of literature that looks at the same issue from the management accounting perspective.

This backdrop provides the motivation for our study. We aim to shed some light on the scale and scope of crisis related management accounting literature in Turkey and to get a feel for the direction it is moving towards. To achieve this objective we perform a content analysis of the research areas,

topics, research methods and author affiliations based on three major Turkish journals with an accounting focus from 2000 onwards. We find that, papers with at least one of the keywords 'competition', 'cost', 'crisis' and 'performance' comprise 67 per cent of all the relevant papers in our sample.

RESEARCH METHODOLOGY

In order to perform a content analysis, we review all the articles in accounting journals published in Turkey from January 2000 to August 2009. Although management accounting papers occasionally appear in journals with a broader business or economics focus, we exclude them from our sample in order to fully understand the position of crisis related research within the wider management accounting literature. The journals included in the study are Muhasebe ve Finansman Dergisi (Journal of Accounting and Finance), Muhasebe ve Denetime Bakış Dergisi ('Glance' at Accounting and Auditing Journal) and Muhasebe Bilim Dünyası Dergisi (World of Accounting Science Journal), denoted in the text and tables that follow as journals A, B and C, respectively. Journals A and C are indexed internationally (EBSCO) and journal B is indexed nationally (ULAKBİM-SBVT).

RESEARCH FINDINGS

Table I, Panel A presents the yearly breakdown of the number of papers in each of the three journals for all subject areas. Table I, Panel B provides the yearly breakdown of the number of issues published for each journal. We review a total of 1100 papers in 89 issues of the three journals for the ten-year period and find 153 relevant papers (14 per cent). In deciding whether a paper is relevant or not, we analyze the content for conceptual links established between the management accounting and crisis subject areas.

Table I. The distribution of the number of papers and number of issues (all subject areas)

Table II provides the yearly distribution of relevant papers by paper type or methodology used for each of the three journals. We find that 42 per cent of the papers are conceptual (65 out of 153), 35 per cent (54 out of 153) are case studies, 20 per cent (30 out of 153) are empirical research papers (including surveys) and 3 per cent are translations.

Table III. Author affiliations

Table IV presents the frequency of the relevant articles based on subject area keywords, published by each journal in each of the ten years included in our study. It is evident that global competition is by far the most popular (31 out of 153 articles) topic of the last decade in crisis related management accounting research. Papers in this area generally talk about global competition in the context of relevant methods such as just-in-time (JIT) production, activity based costing (ABC), and activity based management (ABM) and how they affect managerial decision making at various stages during and after a crisis period.

The second most popular topic is, not surprisingly related with the internal auditing function (20 out of 153 papers). More specifically, papers in this area deal with strategic internal audit and risk focused internal controls. It is unusual for firms to reevaluate their internal control structures to see which areas have room for improvement.

The third most popular topic concerns performance evaluation (14 out of 153 papers) with specific reference to the balanced score card (BSC) and the economic value added (EVA) approaches. These are the more contemporary approaches when compared with the traditional performance evaluation techniques such as budget variance analysis, profit controls and residual income methods.

When we look at Table IV from the point of view of single keywords that appear repeatedly under different subject areas, we find that 35 papers (23 per cent) include 'competition', 28 papers (18 per cent) include 'cost', 21 papers (14 per cent) include 'crisis' and 18 papers (12 per cent) include 'performance' among the keywords. When firms are constantly struggling to survive, it is not

surprising that papers which include at least one of these four keywords comprise 67 per cent of all the papers in our sample.

CONCLUSION

In our content analysis we find that only 14 per cent (153 out of 1100) of the articles that appear in accounting journals during the last 10 years in Turkey are attributable to crisis related management accounting topics. Additionally, we find that 42 per cent of these papers are conceptual. However, the percentage of case studies is higher than conceptual papers for two consecutive years with a two-year lag following crisis. For example, following both the domestic and international crises in 2001, 55 per cent (11 out of 20 papers) of all the crisis related management accounting papers published in 2003 are case studies, while 30 per cent (6 out of 20 papers) are conceptual papers. Similarly, in 2004 47 (9 out of 19 papers) per cent of the papers are case studies while 32 (6 out of 19 papers) per cent are conceptual papers.

The total number of crisis related management accounting papers in 2006 is the highest (23 papers) for our sampling period. This is mainly due to the increase in the number of empirical research papers (including surveys) concerning the consequences of the 2000-2001 crisis in Turkey.

Overall it looks as though the crisis related management accounting literature in Turkey has not quite caught up with what is going on in practice during the last decade. We feel that there is a need to promptly analyze 'what went wrong' immediately following the crisis and to make available a set of recommendations in order to assist firms to better prepare for the next wave. One possible solution to overcome the time-consuming publication process could be to make the working papers available on an internet research network in a user-friendly format that will allow feedback and dialogue between researchers and practitioners. We believe that our study will provide the motivation for future studies in the area of crisis related management accounting.

²Professor of Accounting and Finance, IIBF, Marmara University, Istanbul, Turkey.

³Associate Professor of Accounting and Finance, IIBF, Marmara University, Istanbul, Turkey.

Purpose – The purpose of our paper is to investigate the current state of internet financial reporting in light of the recent regulatory changes in the financial reporting environment of Turkish firms. Although these regulations only cover publicly listed firms, there has also been some usage of the internet as a means of disseminating financial information by large unlisted firms. However, we do not know the scale and scope of such voluntary financial disclosures or how they have changed over time.

Design/methodology/approach – We survey the top 500 Turkish industrial firms on the ‘Istanbul Chamber of Industry 500 list’ (ICI500) to ascertain whether the recent regulatory changes have led to significant changes with respect to their financial reporting on the internet.

Findings – Although we report a statistically significant increase in the number of firms providing financial disclosures on the internet from 2003 to 2007, we highlight a number of problem areas such as the extremely low level of voluntary disclosures (merely 7 per cent of the firms) and the apparent reluctance of listed firms to provide financial information unless it is mandatory to do so (such as financial summaries, financial ratios, share price performance and management reports).

Originality/value – Our study provides detailed information on the state of internet financial reporting in Turkey before and after major regulatory changes and focuses not just on quoted firms but also on large unlisted industrials.

Keywords Internet Financial Reporting (IFR), Turkey, Mandatory disclosures, Voluntary disclosures

Paper type Research paper

INTRODUCTION

The disclosure of corporate financial information on the internet has been in the center of much debate and scrutiny for more than a decade. However, in the aftermath of the current global financial crisis, the issue of internet financial reporting (IFR) has gained new impetus, with an ever-increasing demand for transparency and timeliness of financial and price-sensitive information disclosures. Even in countries with developed securities markets, where IFR has become a fundamental instrument in the dissemination of financial information, there have been calls to look at the whole issue with fresh eyes, especially for disclosures of items such as top management pay and bonuses. In emerging markets, despite the growing use of internet for corporate communication purposes, empirical evidence on IFR (Khadaroo, 2005; Mohamed, 2009) tells us that it is still in its “first-stage” as described by Lymer et al. (1999).

In Turkey, there were no recommendations, guidance, rules or regulations concerning the extent and coverage of IFR until recently. The main switch from local standards to International Financial Reporting Standards (IFRS) came into effect starting with financial statements prepared after January 1st, 2005, as a move towards greater financial integration of Turkey with the European Union. Additionally, also effective as of January 1st, 2005, the Capital Market Board (CMB) Directive Series: XI, No:25, Article: 722, made it mandatory for firms with a web site to make the annual report, annual and interim financial statements and the audit report publicly available in an easily accessible manner for a period of at least 5 years. It is important to point out that these regulations only cover firms listed at the Istanbul Stock Exchange (ISE).

It was hoped that this unprecedented move towards increased transparency and communication between investors and publicly listed firms would pave the way for large unlisted industrials to follow suit. The average total net assets of the top 500 industrial firms with a private or foreign ownership (i.e. excluding large state owned industrials) amounts to 319 million TL as at the end of 2006. Compared to average total net

assets of 432 million TL for publicly listed non-financial firms as at the end of 2006, it is possible to say that the top 500 industrials have considerable influence over the Turkish economy. Hence, from a stakeholder point of view, how these large industrials handle IFR is particularly relevant and necessitates further assessment.

This constitutes the motivation for our study. Our purpose is to find out the precise scale and scope of financial disclosures over the internet for the top 500 industrial firms in Turkey. Additionally we aim to uncover whether the recent regulatory changes that made IFR mandatory for publicly listed firms, had the desired effect of encouraging voluntary disclosures of large industrial firms. For this purpose, we survey the IFR practices of firms on the Istanbul Chamber of Industry 500 (ICI500) list and using data for 2003 and 2007 we conduct a before-and-after analysis to see whether they have changed over time. We would expect that, in an era where the internet becomes a greater part of everyone's lives, more and more firms would increase their voluntary internet disclosures, regardless of certain regulatory changes. At least this is what most empirical evidence tells us²⁸. However, we find that voluntary disclosures of financial statements for unlisted firms are as low as 7 per cent. It is not all bad news though; we do report a modest improvement in the sophistication of general information disclosed, such as video clips and slide shows, as well as a tendency to increase the time periods for which voluntary and mandatory financial information is disclosed.

Our paper's main contribution to the IFR body of literature is that although there is an ever growing use of the internet for financial information disclosures, it would not be safe to assume that the picture is fairly similar in other parts of the world, or that firms are willing and motivated to provide financial disclosures regardless of whether they are obliged to do so.

The remainder of the paper is organized as follows. Section 2 provides a review of relevant literature on IFR, from the regulatory bodies' point of view as well as the country studies to-date. Section 3 provides the details of our research methodology. Section 4 discusses our survey findings and Section 5 concludes.

LITERATURE REVIEW

Regulatory bodies and standards

The rise of voluntary corporate disclosures on the internet can be traced back to the practices of the Securities and Exchange Commission (SEC) in mid-1990s. Lymer (1999) suggests that the SEC's online filing facility for corporate information provided that motivation for firms to include this information on their own web sites. By the beginning of 1998, 91% of the companies in the Standard and Poors (S&P) 500 index were extensively using the Internet for their investor relations function (Deller et al., 1998).

In 1998 the International Accounting Standards Committee (IASC) commissioned a comprehensive a study titled "Business Reporting on the Internet" which surveyed the 30 largest corporations in 22 countries spanning Europe, Asia-Pacific, and North and South America. The IASC report, issued in November 1999, highlighted that most corporations were not making use of the internet's full potential for business reporting purposes. The study also underlined the lack of national and/or international guidance on the technology and content of IFR and proposed a "code of conduct" to improve the efficacy and credibility of online information (Lymer et al., 1999).

Another significant contribution of the IASC study to our understanding of IFR was that it set out a three-stage process in the adoption of the Internet for business reporting. The first stage comprised the use of Internet as just another medium for delivering printed information, such as annual reports in the form of HTML or Adobe Acrobat. The second stage comprised the presentation of the same printed information in a more web-friendly way in the sense that interaction with web browsers and search engines was readily available. Finally, the third stage comprised the inclusion of not only the printed information but also detailed and specific information that may be of interest to third parties, as well as the interactive tools

²⁸ Please refer to Mohamed et al. (2009) for a thorough review of the country studies, presented in a tabular format along with the key issues and findings of each study.

needed in order to analyse such information. This report had a notable impact on both the practice and the academic research in this area by setting out a blueprint and starting the whole debate of IFR.

The Canadian Institute of Accountants (CICA) (Trites, 1999) and the Financial Accounting Standards Board (FASB, 2000) soon followed pursuit in looking into the use of the internet for the dissemination of corporate information. The most recent contribution in the area of professional pronouncements was made by the International Federation of Accountants (IFAC, 2002) who published a “code of conduct” for IFR, based on the recommendations originally proposed by the IASC study. The code was the focus of a joint working party between the IASC (now renamed as IASB) and IFAC, which was later on suspended due to the launch of the new board.

Regulatory bodies are also taking steps in order to protect investors using the internet to access information that could potentially affect their decision-making. In November 2002, the Securities and Exchange Commission (SEC) made it mandatory for firms to disclose the sources that provide access to their SEC filings, such as forms 10-K, 10-Q and 8-K, in their annual reports. Firms were also required to state whether or not this information is provided on their web sites, and if not, the reasons for not doing so (SEC, 2002). In March 2003, the SEC adopted rules which made it mandatory for a public company to either disclose its corporate code of ethics in its annual report (form 10-K or for 20-F) or to post it on its web site provided that they adequately inform users as to the web address of the text (SEC, 2003a). Subsequently, in June 2003, the electronic filing and corporate web page disclosures of beneficial ownership by insiders and majority shareholders became mandatory (SEC, 2003b). These new rules made it possible to implement Sections 406, 407 and 403 of the Sarbanes-Oxley Act of 2002.

International organisations such as the OECD have also voiced their concerns and the prospects regarding IFR. The OECD view can be best summarised by the statement “channels for the dissemination of information can be as important as the content of the information itself” (OECD, 2004, 56). The OECD guidelines also point to the importance of an efficient disclosure regime as the primary tool for investor protection crucial for building confidence in the capital markets.

The Internal Market Directorate-General of the European Union has also adopted a similar view and proposed a course of action in order to enhance corporate transparency. According to the Commission, corporate websites should take on the role of being the fundamental instrument of disclosure for corporations listed on European Exchanges and the national exchanges or regulators should see to it that interested parties can access this information easily (European Commission, 2002).

In Turkey, as a result of the ‘Public Disclosure Platform’ (Kamuyu Aydınlatma Plaformu) of the joint task force between the Capital Market Board (CMB), the Istanbul Stock Exchange (ISE) and the Scientific and Technological Research Council of Turkey (TUBITAK), the CMB Directive Series: XI, No: 25, Article: 722 was issued which, effective as of 01.01.2005, made it mandatory for firms with a web site to make the annual report, annual and interim financial statements and the audit report publicly available in an easily accessible manner for a period of at least 5 years. Additionally, as a consequence of the project, a new web site was developed and maintained by the task force which allows investors to search, prepare reports and download (as text, .csv or .xls file) financial statement items of interest for a specific firm or a number of firms in a specific industry group or index. The web site also allows firms to post price sensitive information, announcements and news items, in a searchable and downloadable format for investors.

From an emerging markets point of view, this project is a success story of how the dialogue and cooperation among practitioners, academics and regulatory bodies can help identify a problem area and take steps to rectify it. However, its coverage is limited strictly to firms quoted at the ISE. Hence, there is still no guidance, recommendations or regulation regarding the scale and scope of financial disclosures for large unlisted industrial firms in Turkey.

Country studies

The literature-to-date on IFR can be grouped into five broad categories as descriptive, exploratory, normative, specific and predictive studies.

The earliest studies in IFR have descriptive intentions and involve a review of the information presented on corporate websites. Studies by Petravick and Gillet (1996) (US), Gowthorpe and Amat (1999) (Spain), Hedlin (1999) (Sweden), Ettredge et al. (2001) (US) and Mohamed et al. (2009) (Oman) provide useful insights into the country-specific IFR practices. International comparisons are also provided in the studies by Lymer and Tallberg (1997) (UK and Finland), Deller et al. (1999) (US, UK, Germany) and Khadaroo (2005) (Malaysia and Singapore).

The second group has exploratory intentions and attempt to shed light on the determinants of IFR. Ashbaugh et al. (1999) (US), Craven and Marston (1999) (UK), Pirchegger and Wagenhofer (1999) (Austria and Germany), Debreceeny et al. (2002), Ettredge et al. (2002), Avallone and Veneziani (2003) (Italy), Marston (2003) (Japan) and Marston and Polei (2004) (Germany) are some of the studies in this category.

The normative studies by Lymer et al. (1999) and FASB (2000) are of particular note since they represent the building blocks for further research in the area.

Additionally, a number of studies explore some of the specific issues related with IFR such as the technical aspects (Bovee et al., 2001; Debreceeny and Gray, 2001; Dulla et al., 2003; Hodge et al., 2004), and the demand-side of IFR (Ettredge et al., 1999; Beattie and Pratt, 2001 and 2003; Gowthorpe, 2004; Quagli and Riva, 2006).

Finally, the predictive studies that talk about the future trends and expectations related with IFR are provided by Lymer (1999), Jones et al. (2001) and Jones and Xiao (2003 and 2004).

Almost all of the above studies report company size as the most significant explanatory variable for IFR. Conflicting result were reported for level of technology, foreign listing, liquidity, industry sector and profitability among different countries and reporting environments. However, leverage and shareholding by institutional investors most commonly do not appear to have predictive power in IFR (Ashbaugh et al., 1999; Brennan and Kelly, 2000). Overall, it is fair to say that larger, more profitable and more technology-oriented firms tend to have higher IFR adoption rates (Ashbaugh et al., 1999; Debreceeny et al., 2002).

It is important to bear in mind that looking at IFR usage rates alone can be misleading, in the sense that, higher adoption of IFR does not always translate into technologically advanced or sophisticated usage. Geerings et al. (2003) report that most web sites in their sample of Euronext zone firms provided simple e-mail links to the investor relations departments rather than the more advanced practices of video/audio recordings and online interactive participation in general meetings which were found to be extremely rare.

In Turkey, there are four studies to-date that focus on IFR. Durukan and Özkan (2003) look at IFR practices of 192 non-financial firms quoted at the Istanbul Stock Exchange (ISE) at the beginning of 2002 and report that 38% of the firms disclose financial information on their websites. Using an identical sampling and data collection approach, Dönmez et al. (2007) survey 217 non-financial firms listed at the ISE in March 2004 and find that only 36% of the firms provide financial information on their websites. This finding is contrary to what we would expect since this level is lower than that reported two years ago by Durukan and Özkan (2003). In other words, from 2002 to 2004 we observe a decline, albeit slightly, in the usage of the internet as a preferred means of corporate financial disclosures of publicly listed firms.

However, the picture is quite different for the top 500 industrial firms in Turkey. Aslan (2004) and Arzova and Aslan (2005) survey firms included in the ICI500 list maintained by the Istanbul Chamber of Industry (ICI). Majority of these firms are not publicly listed. They find a rather bleak picture and report that an appallingly low 10% of the firms provide financial summaries on their web sites. They offer possible explanations for the low IFR adoption rate and suggest that lack of investor pressure and lack of usage of internet as a decision making tool could be driving these results. They conclude that firms prefer to use the internet mainly as a marketing tool.

RESEARCH APPROACH

We investigate the top 500 Turkish industrial firms included in the 'Istanbul Chamber of Industry 500' (ICI500) list to ascertain whether the recent regulatory changes, concerning publicly quoted firms only, have also had an impact on large industrials' financial reporting on the internet. Following Fisher et al. (2004), we

adopt a process of identifying corporate websites, with minor modifications to reflect the Turkish context, as explained below.

We started off by downloading the ICI500 list from the Istanbul Chamber of Industry (ICI) website, on April 15th, 2007. The ranking on this list is based on financial results as at the end of December 2006. In order to find out whether these firms have web sites or not we used the 'member search' facility on the ICI home page to see if a web page address is provided for the firm in question. When this information was not available we conducted a search using google.com and yahoo.com search engines. On the rare occasion where the above steps produced no results, we contacted the firms by telephone and inquired about their web sites.

Where corporate web sites are available, we proceeded to collect information about general web page attributes, financial information and financial statements disclosed. Following Khadaroo (2005), in order to improve the validity of the data collected, for each firm the information was recorded into two separate questionnaires, which were subsequently compared and conflicting items resolved. Due to the dynamic nature of web pages, we ensured that the data collection and validation stages were initiated and completed during the month of May 2007.

We chose this specific month since it allows enough time for the publicly listed firms to have their annual financial statements audited and ready to be included in their annual reports and subsequently disclosed on their web sites, as required by the CMB directive. Additionally, the end of May roughly constitutes a deadline to get all the annual financials, reports and disclosures finalized before the interim financial statements are due.

In order to provide a before-and-after perspective following the regulatory changes that took place, we use comparative data for 2003 from an earlier study by the co-authors (Arzova and Aslan, 2005), which also dictates the specific attributes chosen to be included in the 2007 data. The significant changes between the two years were identified using a Pearson's Chi Square statistical test.

RESULTS AND DISCUSSION

We find evidence that, in Turkey, the top 500 industrial firms are increasingly using the internet as a preferred means of corporate communications. The number of firms that have a web page increased from 415 in 2003 to 438 in 2007 ($p: 0.025$). How the scale and scope of these web pages changed over time will be explored in the following sub-sections.

General attributes

In Table 1, we summarize some general web page attributes and compare how they have changed over time. We find a decrease in the number of firms that prefer to use a web page address same as the firm name, albeit statistically insignificant. Upon further examination we find that this decrease was due to firms preferring to use a 'corporate group' web page to cover all subsidiaries, rather than maintain a separate web page for each subsidiary.

For general corporate information disclosures we find a statistically significant difference between the two years ($p < 0.001$). Although 'html' is still the most popular format by far (95 per cent of the firms in 2003 and 88 per cent of the firms in 2007 prefer this format) its popularity is decreasing over time with the introduction of more advanced media such as video clips and slide shows. While in 2003 only 3 per cent of the firms preferred these formats, in 2007 it increased to 11 per cent, due to decreases in the cost of web-hosting space and the time required for downloading the pages, thanks to widely-available broadband internet.

General Attributes	% of firms with the given attribute		Pearson's Chi-Sq. (P-value)
	2003	2007	
Web address same as firm name	89%	86%	0.189
Format of general information disclosed			0.000
html	95%	88%	
pdf	2%	1%	
other (video clip, slide show)	3%	11%	
Steps from home to financial information page			0.000
0	87%	4%	
1	5%	8%	
2	4%	41%	
3	3%	38%	
4	0%	9%	
Downloadable financial information provided	13%	29%	0.000
Downloadable financial information format			0.000
html	73%	8%	
pdf	27%	89%	
word	0%	3%	
Link to download .pdf reader software	27%	9%	0.000
Link to homepage	92%	82%	0.000
Foreign language support	83%	93%	0.000
Listed at the Istanbul Stock Exchange	34%	24%	0.000

Table 1. General web page attributes

In terms of the financial information disclosed, it is possible to say that in 2007 it has become harder to reach it ($p < 0.001$). While in 2003, 87 per cent of the firms provided a link to financial information page in their home pages, in 2007 only 4 per cent of the firms provided such link. Furthermore, in 2007, for 88 per cent of the firms the number of steps required from home page to financial information page was at least 2 steps. This could be the result of more advanced web page designs or simply greater volume of information included on the corporate web pages making it necessary to use a more structured format.

The percentage of firms providing downloadable financial information increased from 13 per cent in 2003 to 29 per cent in 2007 ($p < 0.001$). For those firms who have provided downloadable financial information, there was a clear shift from the 'html' to the 'pdf' format over time ($p < 0.001$). In 2003, 73 per cent of the firms

preferred 'html' and 27 per cent of the firms preferred 'pdf'. However, in 2007, 8 per cent of the firms preferred 'html' and 89 per cent preferred 'pdf'. Additionally, the link to download '.pdf' reader software was provided by 27 per cent of the firms in 2003 and 9 per cent of the firms in 2007 ($p < 0.001$). The reasons behind these changes could be that the 'pdf' format provides an easily accessible and free-to-use media of information disclosure, especially with respect to tables, graphs and other embedded objects, as well as overcome the problem of distorted layout and formatting encountered when saving the 'html' file. Additionally, with the standard installation of many software today, the .pdf reader is installed automatically for access to user manuals.

Furthermore, it could be that, the firms assume users of financial information disclosed on their websites to be more computer-literate by looking at the statistically significant decrease from 2003 to 2007 in the percentage of firms providing a link to download '.pdf' reader software and a link to homepage from the financial information page.

In 2007, the percentage of publicly quoted firms included in the ICI500 list decreased to 24 per cent from 34 per cent in 2003. This decrease is mainly due to the initiation of an ambitious privatization program in 2005, which during its first year alone generated 208 million dollars (ISO, 2006). The privatization through block sale created not only new subsidiaries of existing conglomerates but also new industrial conglomerates which made it to the ICI500 list but are not publicly quoted. Moreover, during 2005, an impressive \$8.6 billion of foreign direct investment (FDI) came into the Turkish economy (ISO, 2006), creating large firms that do not necessarily need to go public to raise funds.

General financial information

In Table 2, the percentage of firms disclosing general financial information on their web sites in 2003 and 2007 is presented and compared. We find that the percentage of firms providing a financial summary and financial ratios have actually minimally decreased over time. This change is not statistically significant. This is surprising because even the publicly quoted firms did not provide these items. In 2007, 24 per cent of the firms are quoted while only 9 per cent and 8 per cent of the firms provide financial summaries and ratios, respectively.

However when we look at the number of years these items are available for, there is clearly a shift towards longer time periods. For those firms that do disclose financial summaries, in 2003 only one-year financial summaries were available for 90 per cent of the firms, whereas in 2007 two and three-year financial summaries were available for 76 per cent and 12 per cent of the firms, respectively ($p < 0.001$). We see a similar picture for financial ratios, in the sense that, those firms that do make available their financial ratios, frequently do so for one-year (59 per cent) in 2003 and two-year periods (58 per cent) in 2007 ($p: 0.020$).

	% of firms disclosing The respective items		Pearson's Chi-Sq. (P-value)
	2003	2007	
<i>General Financial Information</i>			
<i>Financial summary</i>	10%	9%	0.456
<i>Financial summary available for</i>			0.000
1 year	90%	3%	
2 years	5%	76%	
3 years	2%	12%	
4 years	1%	4%	
≥ 5 years	1%	5%	
<i>Financial ratios</i>	11%	8%	0.225
<i>Financial ratios available for</i>			0.020
1 year	59%	29%	
2 years	30%	58%	
3 years	11%	13%	
<i>Share price performance</i>	3%	16%	0.000
<i>Management reports</i>	3%	17%	0.000

Table 2. General financial information disclosed

One possible explanation could be that, quoted firms do not choose to disclose any more financial information than they are legally required to. The recent regulatory changes do not specifically talk about disclosing financial summaries or ratios on the corporate web sites. Although it does talk about disclosing the annual report, we find, during our review of corporate web sites, that the content and caliber of the annual report varies drastically among quoted firms. Another possible explanation could be that, with the proliferation of investors' web sites that offer real-time on-line financial information for a fee and information with only a few minutes delay for free, the firms might perceive that disclosing this information on corporate web sites is futile from an investors' decision making point of view. After all, investors can easily have free access to the financial highlights and ratios of quoted firms and compare these figures with the industry or any sub-group they choose using one of the many investors' web sites.

As for the disclosure of share price performance and management reports detailing the reasons behind the observed financial results, from 2003 to 2007 the increase from 3 per cent to 16 per cent and from 3 per cent to 17 per cent, respectively, are both statistically significant ($p < 0.001$). However, for 2007 these percentages are still less than the percentage of quoted firms in the sample, which brings us to the above argument of whether the quoted firms are reluctant to provide voluntary disclosures or that they think it is simply not necessary. The latter could be said about share price performance since quite elaborate technical charts can be produced for the real-time share price performance of any listed firm on investors' web sites for as low as €8 per month. However, this does not hold true for management reports explaining why we observe the specific financial results for the past year or what the firm hopes to achieve financially for the year ahead.

Financial Statements

In Table 3, the percentage of firms disclosing their financial statements for 2003 and 2007 is presented, along with time periods these financial statements are available for and the Pearson's Chi-Square statistics to test for the difference between the two years. Financial statements included in the study comprise the balance sheet, the income statement, the statement of cash flows and the statement of shareholders' equity.

We find that, the percentage of firms disclosing each of the above four financial statements is statistically significantly higher in 2007. More specifically, the number of firms that disclosed their balance sheet and income statement increased from 13 per cent and 12 per cent, respectively, in 2003 to 29 per cent in 2007 ($p < 0.001$ for each test). We find a more pronounced increase from 3 per cent to 29 per cent and from 6 per

cent to 29 per cent for statement of cash flows and statement of shareholders equity, respectively ($p < 0.001$ for each test).

	% of firms disclosing the respective items		Pearson's Chi-Sq. (P-value)
	2003	2007	
<i>Financial Statements</i>			
<i>Balance Sheet</i>	13%	29%	0.000

1 year	83%	1%	
2 years	17%	22%	
3 years	0%	2%	
4 years	0%	46%	
≥ 5 years	0%	29%	

Table 3. Financial statements disclosed

When we look into the composition of this 29 per cent for 2007, we find that 22 per cent (111 firms) is due to mandatory disclosures of listed firms and the remainder 7 per cent (34 firms) comprised voluntary disclosures of unlisted firms. We further inquire the reasons behind the percentage of firms providing mandatory disclosures (22 per cent) being lower than the percentage of listed firms in the ICI list (24 per cent). We find that the difference is due to 10 firms' financial statement web pages being temporarily unavailable, under-construction or having a missing link during the data collection period of our study. However, upon subsequent follow up, we verified that the problems were all resolved by the time the interim statements were due in each case. Furthermore, when we examine the voluntary disclosures made by unlisted firms (34 firms), we come across unlisted subsidiaries of large corporate groups which are listed and hence prepare consolidated financial statements in compliance with IFRS.

When we investigate the time periods that the financial statements are made available for, we find an obvious move towards providing financial statements for longer time periods in 2007, as presented in Table 3. Comparing 2003 and 2007, there is a statistically significant ($p < 0.001$) shift in the structure of time periods for all disclosed financial statements. In 2003, for those firms that disclose their financial statements, majority of the disclosures fall into the one and two-year groups. However, this picture changes in 2007 and we find

that, for those firms that disclose their financial statements, majority of the disclosures fall into the four-year and five-or more-years categories. These two categories include the mandatory disclosures by listed firms that are required to make financial statements publicly available for at least five years. This requirement is fulfilled by providing only four IFRS compliant financial statements, since the two-year comparative format allows for a total of five financial years to be disclosed. Hence, the four-year category has the highest percentage of disclosures for all four financial statements in 2007.

Additionally, a closer look at the distribution of time periods for disclosed financial statements in 2007 reveals that there is a clear distinction between mandatory and voluntary disclosures. It is almost as if the three-year category serves as a cut-off point between voluntary and mandatory disclosures. Voluntary disclosures of financial statements most frequently fall into the two-year category; that is, one financial statement with two comparative years. We do not observe such apparent polarity in 2003 for the simple fact that internet financial reporting was not mandatory for listed firms at the time.

Last but not least, the distribution also tells us that in 2007 firms think of financial statements to be disclosed as if they are pairs. Balance sheet and income statement disclosures have exactly the same time period distributions. Although there is a minute difference, statement of cash flows and statement of shareholders' equity disclosures have their own identical time period distributions. We do not observe such apparent grouping in the time periods for 2003.

SUMMARY AND CONCLUSION

We report an increase in internet financial disclosures of the top 500 industrial firms from 2003 to 2007. The only exceptions are the minimal decreases in financial summaries and financial ratios disclosed which are not statistically significant. The documented increase is mostly attributable to the disclosures of publicly listed firms that are mandated to do so from 2005 onwards. We would expect that, in an era where the internet becomes a greater part of everyone's lives, more and more firms would increase their voluntary internet disclosures, regardless of certain regulatory changes. However, we find that just 7 per cent of the top 500 industrials provide voluntary disclosures of financial statements. Additionally, the financial disclosures of publicly listed firms are strictly confined to what is defined as mandatory.

Nonetheless, it is important to point out that, we see a marked improvement in terms of the sophistication of general information disclosed, such as video clips and slide shows, and the tendency to increase the time periods for which voluntary and mandatory financial information is disclosed.

Our study provided a before-and-after picture of the state IFR in Turkey, with specific reference to not just listed firms but also unlisted large industrials included in the top 500. We have highlighted problematic areas as well as areas that have room for improvement, in light of the recent regulatory changes. We feel that our study will offer the motivation for future studies to look into the drivers of such changes and, from a regulators point of view, the possible pitfalls of bringing in regulation as opposed to recommendations.

HUMAN RESOURCE MANAGEMENT PRACTICES AND PERFORMANCE IN THE ITALIAN HOSPITALITY ENTERPRISES

Bresciani, Stefano¹

¹*Researcher of Innovation Management, Faculty of Economics – University of Torino, Corso Unione Sovietica, 218 bis, 10134 Torino*

Purpose The aim of this paper is to investigate the relationship between human resource management (HRM) and performance in the Italian hospitality enterprise. In particular, it analyzes the extent of the adoption of human resource management, the existence of a formal HR strategy, and the development of the HR function in the Italian hotel industry in order to verify whether the effectiveness of HRM is contingent upon the approach to business strategy that has been adopted and whether the hotels which introduce a formal supported package of HRM practices outperform those have HRM practices, but not as a part of the organization strategy.

Design/methodology/approach - Main literature studied this topic focusing the analysis on two framework: internal and external fit. In particular, we are going to use an adapted version of the Hoque's model (1999) in order to compare the Italian hotel industry with Hoque's sample (1999) of hotels in the UK and Alleyene, Doherty and Greenidge survey (2006) in the Barbados hotels. The research was done in two separate phases: in a first phase we selected a sample of 350 hotels; in a second phase we sent a structured questionnaire to the 350 hotels of the sample.

Findings - While HR practices was more prevalent in Barbados hotels than in the UK sample, for the Italian hotels it has been found a result similar to UK.

Then, external fit emerges as a fundamental key. A relationship between HRM and performance exists only among some hotels.

Finally, looking at internal fit, there is evidence that higher performance has been found where HRM is introduced as a strategic part of their own business strategy.

Research limitations/implications - Higher performance was found in situations where the hotel emphasizes quality enhancement and adopted a wide range of HRM practices, but it is impossible to be sure about the causes of this result. In fact, it could be that the use of HRM practices caused high performance or that high performing hotels have a superior propensity to innovate in HRM practices.

Finally, it must be considered that the focus of the analysis was on larger hotels, as it is normal that their interest in HRM is higher than in smaller hotels. So, the results can not be assumed as representative of the hotel industry as a whole.

Practical Implications - Hotels introducing HRM practices as a strategic part of their own business strategy should outperform hotels which introduced HRM practice just in a normal operating way. Then, the results concerning performance outcomes would seem to confirm the importance of introducing HRM practices as part of an institutionally strategic package.

Originality/value - This was the first study focused on the relationship between HRM and performance in the Italian hospitality enterprise. Then, as we use almost the same model by Hoque (1999) and Alleyene, Doherty and Greenidge (2006) it was possible to find interesting comparative analysis.

Finally, the results can be used by hotel decision makers to make their HRM practices more effective.

Keywords: *Human Resource Management (HRM), hotels, HR practice, Organizational performance.*

INTRODUCTION

In order to compete in the actual competitive scenario, corporations have modified their internal organisations, evolving to more lean and flexible structures, which enable them to react quickly and adapt their businesses (Foss-Laursen, 2000; Ham-Kleimer, 2002; Laursen-Mahnke, 2000; Leoni-Cristini-Mazzoni-Labory, 2000; Wilkinson, 2000; Valdani, 2000). This is reflected in the way corporations search for sources of competitive advantage, moving their attention from “hard” elements, such as privileged access to resources (e.g. capital), to “softer” elements, such as the management of human resources, innovation, etc.

The relationship between “human resources” and “performance” is a theme that has been widely discussed over the last twenty years, especially in the US (Arthur 1994; Koch *et al.*, 1996; Lazear 1996; Ichniowski *et al.*, 1999; Osterman, 1994; Huselid, 1995; Macduffie, 1995) and in Great Britain (Guest *et al.*, 1994; McNabb *et al.*, 1997; Guest, 1999; Hiltrop, 1999), where a number of research studies have been published in the most prestigious international journals. The main outcome of such studies has been the recognition that human resource management has an important impact on an organisation’s capacity to be competitive and can be considered a source of competitive advantage (Delery *et al.*, 1996; Guest, 1997; Boselie *et al.*, 2001).

Moreover, many authors describe the impact of “high-commitment management” (Wood *et al.*, 1995; Wood *et al.*, 1998) and “high-performance work practices” (Huselid, 1995) on organizations. Most research, however, focus their attention on manufacturing industry (Arthur, 1994; MacDuffie, 1995); even more recently it is possible to find studies related to services, particularly referring to hospitality sector (Boselie *et al.*, 2003; Lockyer *at al.*, 2004; Maxwell, 2004; Tsaur *et al.*, 2004; Boella *et al.*, 2005; Alleyne *et al.*, 2006a; Alleyne *et al.*, 2006b; Chand *et al.*, 2007; Cho *et al.*, 2006; Davidson *et al.*, 2006; Knox *et al.*, 2006; Namasivayam *et al.*, 2006; Connolly *et al.*, 2007; Nickson, 2007; Urbano *et al.*, 2007; Watson *et al.*, 2007).

Given difficulties related the heterogeneity of the service sector it is very hard for researcher to generalize data from different kind of companies like financial enterprises, retailing operations, transport operations and the hospitality sector. So, this paper presents an industry-by-industry approach, rather than an analysis of the services sector as a whole, investigating the relationship between Human Resource Management (HRC) and performance within Italian hospitality sector.

THEORETICAL BACKGROUND

HRM studies

The study of HRM is concerned with the selections that organisations make from among the myriad of policies, practices and structures for managing employees (Sisson, 1990; Boxall *et al.*, 2003; Boselie *et al.*, 2005); deeply, it is a combinations of such practices geared toward improving organisational effectiveness and hence better performance outcomes, in order to enable the organization to achieve its goals (Wright *et al.*, 1992; Delery *et al.*, 1996).

A few trends have emerged in the field of HRM over the past few years. First, most of studies have analyzed the nature of the interaction between HRM and performance (Arthur, 1994; Guest *et al.*, 1994; Kalleberg *et al.*, 1994; Huselid, 1995; MacDuffie, 1995; Snell *et al.*, 1995; Delery *et al.*, 1996; Boselie *et al.*, 2001; Guthrie, 2001) showing a statistically significant linkage between HRM practices and some measures of organizational performance. In the same direction, Harney and Dundon (2006) studies HRM practices in SMEs finding that HRM was not the coherent set of practices typically identified in the literature but rather was often informal and emergent.

A second trend has been to try to understand the mechanisms through which this relationship takes place. Authors such as Becker and Gerhart (1996), Dyer and Reeves (1995), Guest (1997), Wright and Gardner (2003) and Dowling, Welch, Festing, and Engle (2007), studied some of the mediating relationships that must exist between the HRM practices and organizational performance. Other Authors studied the problem from a

theoretical point of view (e.g. Ferris *et al.*, 1999; Guest, 1997; Wood, 1999; Gerhart, 1999; Gerhart *et al.*, 2000a and 2000b; Rogers *et al.*, 1998; Wright *et al.*, 2001).

A final trend has been the recent interest in taking a multi-level approach. Wright and Boswell (2001) reviewed the HRM literature and categorized this research as being differentiated along one dimension representing whether the focus was on single or multiple practices, and along a second dimension dealing with the unit of analysis, specifically the individual versus the group or organization. Ostroff and Bowen (2000) and more recently Bowen and Ostroff (2004) have developed the most extensive multi-level model of HRM arguing that HR practices serve as communications mechanism signalling employees to engage in certain behaviors.

The main outcome of such studies has been the recognition that human resource management has an important impact on an organisation's capacity to be competitive and can be considered a source of competitive advantage.

Due to the heterogeneity of the service sector most of research, as we stated before, have tried to refer the analysis to the industry sector, while it is difficult to find a huge number of research related to the services. As a result, we can easily find literature about HRM practices. The problem, however, is to understand whether hospitality sector is appropriate to focus an analysis on HRM and performance or not.

HRM and hospitality sector

The hotel industry is renowned for its poor pay and employment conditions and a low take-up of HR practices. It is generally believed that the industry has relied on a lowcost, numerically flexible and disposable workforce. Recently, however, there has been debate concerning the extent to which managers in the hotel industry are embracing high commitment HRM and functionally flexible work practices. So, interest in HRM within hospitality sector has increased a lot just during the 1990s. The first studies, in fact, showed a lack of interest among managers in HRM practices (see Guerrier *et al.*, 1989; Hales, 1987; Lockwood *et al.*, 1989; Price, 1994; Lucas, 1995 and 1996). Later research, however, put in evidence that the interest among managers on HRM practice which could help organizations in improving effectiveness and hence better performance outcomes was raising up (Harrington *et al.*, 1996; Watson *et al.*, 1996; Gilbert *et al.*, 1997; Hoque, 1999).

However, it is only during 2000s that it is possible to find specific evidences of the systematic use of HRM practices within the hospitality sector.

Boselie, Paauwe and Richardson (2003) investigate empirical data on the effectiveness of human resource management in the Netherlands, including tourism industry, finding a lower effect of HRM than in other sectors. In the same direction, Lockyer and Scholarios (2004) consider the nature of "best practice" recruitment and selection in the Scottish hotel sector showing a reliance on informal methods in smaller hotels and structured procedures, including references, application forms and panel interviews in larger and chain hotels. In the same direction Knox and Walsh (2006), studying Australian hotels, put in evidence that while hotel workplaces in general continue to be associated with high levels of numerical and temporal flexibility and greater informality of HR policies, it was apparent that larger luxury hotels were adopting more systematic employee management techniques and strengthening their internal labour markets through functional flexibility initiatives. In the same way, Urbano and Yordanova study the determinants of the adoption of HRM practices moving the attention to tourism SMEs. They find that the adoption of HRM practices is positively associated with the presence of an HRM department. Also, SMEs in which the person responsible for HRM has previous experience in similar positions are greater adopters of HRM practices. Finally, SMEs which cooperate with other organizations are more likely to implement HRM practices.

Tsaur and Chun Lin (2004) empirically explore the relationship among human resource management practices, service behavior and service quality in the tourist hotels discovering that HRM practices had partially a direct effect on customer perceptions of service quality and an indirect effect through employees' service behavior. Also Maxwell, Watson and Quail (2004) investigate the nature of, and relationship between, a quality service initiative and the concept of strategic human resource development, finding that the quality

initiative is acting as a catalyst for a strategic approach to human resource development to emerge in the case organisation.

In 2006 Namasivayam, Miao and Zhao examines the relationships between compensation (direct and indirect) practices in hotel organizations and their performance. The results show that in the case of management employees, direct compensation fully mediated the relationship between indirect compensation and hotel performance.

Cho, Woods, Jang and Erdem (2006) focus the attention on the impact of HRM practices on hospitality firms' performance investigating the relationship between the use of 12 HRM practices and organizational performance measured by turnover rates for managerial and non-managerial employees, labor productivity, and return on assets. The results indicated that companies implementing HRM practices are more likely to experience lower turnover rates for non-managerial employees. In the same direction Watson, Maxwell and Farquharson explore different levels of line manager perspectives, namely strategic and first-line on their role in human resource management (HRM) and human resource development (HRD), and to identify enablers of and barriers to devolving HR to line managers. They found a number of points of divergence in opinions, implying that there is potential for the organisation to secure greater engagement of its first-line managers in HR roles. Focusing on Irish hotels, also Connolly and McGing (2007) show that Dublin-based hotels display some of the human resource practices associated with high performing work practices. There are, however, very low levels of employee participation, which many authors argue are the cornerstone of high performance practices.

Chand and Katou (2007) focus the attention on two linked aspects: to investigate whether some specific characteristics of hotels affect organisational performance in the hotel industry in India; and to investigate whether some HRM systems affect organisational performance in the hotel industry in India. They indicate that hotel performance is positively associated with hotel category and type of hotel (chain or individual). Furthermore, hotel performance is positively related to the HRM systems of recruitment and selection, manpower planning, job design, training and development, quality circle, and pay systems.

HYPOTHESES

As we explained before, the main goal of this paper is to investigate the relationship between HRM and performance in the Italian hospitality sector. Main literature studied this topic focusing the analysis on two framework: internal and external fit. In particular, we are going to measure the extent of the adoption of human resource management (HRM), the existence of a formal HR strategy, and the development of the HR function in the Italian hotel industry compared with Hoque's sample (1999) of hotels in the UK and Alleyene, Doherty and Greenidge survey (2006) in the Barbados hotels.

So, we know that appropriateness, or effectiveness, of HRM will vary depending on organizational life-cycle or the product market within the organization is operating. The first goal of this paper is to verify whether the effectiveness of HRM is contingent upon the approach to business strategy that has been adopted.

Hp. 1: Is External Fit Important Within Hospitality Sector?

Finally, it has been demonstrated that the introduction of HRM as a formal supported package of practices closely linked with the organization strategy improves performance. Here we are going to test whether the hotels which introduce a formal supported package of HRM practices outperform those have HRM practices, but not as a part of the organization strategy.

Hp. 2: Is Internal Fit Important?

EMPIRICAL ANALYSIS AND HYPOTHESIS TESTING

Data

The data we used are taken from “Rapporto sul sistema alberghiero in Italia” edited by Federalberghi in 2007. The research was done in two separate phases: in a first phase we selected a sample of 350 hotels including just those they have 65 bedrooms or more²⁹, representative of region and which have a star rating of 3 or more (on a rising scale of one to five); in a second phase we sent a structured questionnaire to the 350 hotels of the sample. 104 hotels answered the questionnaire, with a response rate of 29.71 per cent.

Method of analysis

In this paper it will be applied the same model of analysis used by Hoque (1999) and by Alleyene, Doherty and Greenidge survey (2006). So, it is possible to synthesize the model as following:

Dependent Variables

To define HRM practices, in the questionnaire it was asked to rate some HR outcomes (the commitment to the organization of lower grades of staff; the level of job satisfaction of lower grades of staff; the flexibility of staff; the ability of staff to move between jobs as the work demands; the quality of work of lower grades of staff; the quality of staff currently employed) on a scale of one (very low) to five (very high).

Then, to define the performance, in the questionnaire it was asked to rate some performance outcomes (How well does labour productivity at your hotel compare with the hotel industry average? How does quality of service at your hotel compare with the hotel industry average? How would you compare the financial performance of your hotel with the hotel industry average?) on a scale of one (very low) to five (very high).

Independent Variables

It is possible to see the measures of HRM used to test the relationship between HRM and the performance measures in Table 1.

<i>HRM practice</i>
<i>Terms and conditions</i>
Harmonized terms and conditions between management and non management staff
Single status for all staff
Internal promotion the norm for appointments above the basic levels
No compulsory redundancy

²⁹ In this way we can compare the our sample with the one reported in Hoque (1999).

<i>Recruitment and selection</i>
Trainability as a major selection criteria
Use of psychological tests as the norm for the selection of all staff
Deliberate use of realistic job previews during recruitment and selection
A formal system for communicating the values and systems in the company to new staff
<i>Training</i>
Deliberate development of a learning organization
An explicit policy requiring all staff to spend a specified minimum period annually in formal training
<i>Job design</i>
Flexible job descriptions that are not linked to one specific task
Deliberate design of jobs to make full use of workers' skills and abilities (i.e. use of job enrichment and/or autonomous work groups)
Work organized around teamworking for the majority of staff
Staff involvement in setting performance targets
<i>Quality issues</i>
Production/service staff responsible for their own quality
A majority of workers currently involved in quality circles or quality improvement teams
<i>Communication and consultation</i>

Regular use of attitude surveys to obtain the views of staff
A system of regular, planned team briefing or cascade of information from senior management to the lower grades/shopfloor during which work stops
All staff are informed about the market position, competitive pressures and establishment and company performance as a matter of course
<i>Pay systems</i>
A merit element in the pay of staff at all levels
Formal appraisal of all staff on a regular basis at least annually

Table 1: HRM Practices Used within the Analysis. Source: Hoque (1999).

Hypotheses testing

Hp. 1: Is External Fit Important Within Hospitality Sector?

According to Schuler and Jackson (1987) and Hoque (1999), HRM should prove effective only within hotels which emphasize a quality-enhancer or innovator approach to business strategy, and should prove ineffective the hotel's business strategy is focused on cost-cutting or price competition. So, according to Hoque's model (1999), respondents are asked to choose the two features that describe in the best way their approach to business strategy. The choices were price, quality, cost control, responsiveness to customer needs, advertising/marketing and providing a distinctive service.

On the base of the answer, it was possible to split the sample into three categories: (a) hotels that focus their business strategy on cost minimization or price competition; (b) hotels that focus their business strategy on quality enhancement (c) hotels that do not have a clear approach to their business strategy.

The measure of HRM which it is used in this analysis is cumulative in order to allow to rank the hotels from the "most HRM practices adopter" to the "least HRM practices adopter" on a rank from 0 to 21 (see Table 1) (0 = no HRM practices; 21 = all HRM practices adopted). By splitting the sample in the three categories described above, and then regressing this aggregate HRM variable on each of the dependent outcome variables, it will be possible to verify the effectiveness of HRM in each categories.

Hp. 2: Is Internal Fit Important?

Of the hotels adopting HRM practices, those introducing HRM practices as a strategic part of their own business strategy (Hoque says '*as a synergistic package of mutually supporting practices... as a coherent, institutionally supported synergistic package*') should outperform hotels which introduced HRM practice just in a normal operating way.

According to Hoque (1999), it was possible to split the sample into three categories: (1) 'strategic HRM' hotels, which are those above-average (14 or more) HRM practices strategically integrated with each other; (2) 'non-strategic HRM' hotels, which are those above-average (14 or more) HRM practices not strategically integrated; (3) 'low-HRM' hotels, which are those below-average (fewer than 14) usage of HRM practices.

If internal fit is important, the "strategic HRM" hotels should outperform the others.

RESULTS

External fit

Table 2 shows the presence of a link between HMR and all of the HR outcome measures. Deeply analyzing the subsamples, it is possible to find more differences. For “Others”, the link is perfectly replicated; for “Quality-enhancer” the link is replicated with the only exception of quality of staff; otherwise, for “Cost-reducers” it is possible to find a link only for the HR outcome organizational commitment, job satisfaction and staff flexibility. So, HRM would seem to be more effective among the quality-enhancer hotels.

<i>Organizational commitment</i>				
	<i>All hotels</i>	<i>Cost-reducers</i>	<i>Quality-enhancer</i>	<i>Others</i>
<i>HRM</i>	<i>0.016 (0.011)</i>	<i>0.028 (0.030)</i>	<i>0.123 (0.021)</i>	<i>0.105 (0.010)</i>
<i>n</i>	<i>104</i>	<i>24</i>	<i>51</i>	<i>29</i>

<i>Job satisfaction</i>				
	<i>All hotels</i>	<i>Cost-reducers</i>	<i>Quality-enhancer</i>	<i>Others</i>
<i>HRM</i>	<i>0.101 (0.033)</i>	<i>0.018 (0.021)</i>	<i>0.014 (0.034)</i>	<i>0.021 (0.042)</i>
<i>n</i>	<i>104</i>	<i>24</i>	<i>51</i>	<i>29</i>

<i>Staff flexibility</i>				
	<i>All hotels</i>	<i>Cost-reducers</i>	<i>Quality-enhancer</i>	<i>Others</i>
<i>HRM</i>	0.04 (0.015)	0.021 (0.046)	0.110 (0.032)	0.135 (0.047)
<i>n</i>	104	24	51	29

<i>Ability to move staff between jobs as required</i>				
	<i>All hotels</i>	<i>Cost-reducers</i>	<i>Quality-enhancer</i>	<i>Others</i>
<i>HRM</i>	0.081(0.012)	0.078 (0.134)	0.089 (0.022)	0.064 (0.043)
<i>n</i>	104	24	51	29

<i>Quality of work</i>				
	<i>All hotels</i>	<i>Cost-reducers</i>	<i>Quality-enhancer</i>	<i>Others</i>
<i>HRM</i>	0.066 (0.018)	0.095 (0.124)	0.043 (0.043)	0.110 (0.032)
<i>n</i>	104	24	51	29

<i>Quality of staff</i>				
	<i>All hotels</i>	<i>Cost-reducers</i>	<i>Quality-enhancer</i>	<i>Others</i>
<i>HRM</i>	0.044 (0.021)	0.044 (0.115)	0.068 (0.118)	0.049 (0.026)
<i>n</i>	104	24	51	29

Table 2: *The Relationship between HR Outcomes and HRM in Italian hotel industry*

Notes: Ordered probit analysis; Coefficients given (sig. in brackets).

Table 3 puts in evidence the relationship between HRM Practices and Organizational Performance in Italian hotel industry. It is possible to find a strong relationship between the extent to which HRM is used and all three performance measures. Analyzing the subsamples, however, it is possible to find a relationship only for quality-enhancer (with the exception of labour productivity) and Others. So, there is no evidence that the adoption of HRM practices improve performance where hotels put a premium on cost control within their business strategy.

Finally, it is possible to assume that the results support the hypotheses 1 that effectiveness of HRM is dependent upon congruence with business strategy. A positive correlation between the cumulative HRM variable and effectiveness exists only within quality-enhancer and 'other' hotels. Where hotels emphasize cost control or price competition, there is no relationship.

<i>Labour productivity</i>				
	<i>All hotels</i>	<i>Cost-reducers</i>	<i>Quality-enhancer</i>	<i>Others</i>
<i>HRM</i>	0.02 (0.021)	0.078 (0.123)	0.054 (0.131)	0.141 (0.042)
<i>n</i>	104	24	51	29

<i>Quality of service</i>				
	<i>All hotels</i>	<i>Cost-reducers</i>	<i>Quality-enhancer</i>	<i>Others</i>
<i>HRM</i>	0.087 (0.011)	0.012 (0.121)	0.134 (0.040)	0.081 (0.021)
<i>n</i>	104	24	51	29

<i>Financial performance</i>				
	<i>All hotels</i>	<i>Cost-reducers</i>	<i>Quality-enhancer</i>	<i>Others</i>
<i>HRM</i>	0.091 (0.019)	0.049 (0.141)	0.081 (0.032)	0.121 (0.030)
<i>n</i>	104	24	51	29

Table 3: *The Relationship between HRM Practices and Organizational Performance in Italian hotel industry*

Notes: Ordered probit analysis; R2 is pseudo; Coefficients given (sig. in brackets).

Internal fit

Here it should be possible to find evidence about the fact that hotels introducing HRM practices as a strategic part of their own business strategy should outperform hotels which introduced HRM practice just in a normal operating way.

Table 4 put in evidence that “strategic HRM” hotels routinely outperform the “low-HRM” hotels across all of the HR outcome measures. At the contrary, the “non-strategic HRM” hotels outperform the “low-HRM” hotels only where organizational commitment is concerned.

The results concerning performance outcomes has been reported in Table 4. It shows the impact of internal fit on performance. Whereas the “strategic HRM” hotels outperform the “low-HRM” hotels in terms of labour productivity, quality of service and financial performance, the “non strategic HRM” hotels outperform the “low-HRM” hotels on only on financial performance. The results here would seem to confirm the importance of introducing HRM practices as part of an institutionally strategic package.

	<i>Organizational commitment</i>	<i>Job satisfaction</i>	<i>Staff flexibility</i>
'Strategic HRM'	0.822 (0.020)	0.788 (0.011)	0.440 (0.024)
'Non strategic HRM'	0.491 (0.012)	0.521 (0.311)	0.320 (0.120)
<i>n</i>	68	68	68

	<i>Ability to move staff between jobs</i>	<i>Quality of work</i>	<i>Quality of staff</i>
'Strategic HRM'	0.610 (0.020)	0.910 (0.030)	0.710 (0.015)
'Non strategic HRM'	0.410 (0.121)	0.010 (0.310)	0.410 (0.210)
<i>n</i>	68	68	68

Table 4: Internal Fit and HR Outcomes

Notes: Ordered probit analysis; Coefficients given (sig. in brackets); 'Strategic HRM' = above-average no. of HR practices used and hotel has formal strategy; 'Non strategic HRM' = above-average no. of HR practices used but hotel does not have formal strategy; Omitted category = below-average no. of HR practices used ('low HRM')

	<i>Labour productivity</i>	<i>Quality of service</i>	<i>Financial performance</i>
'Strategic HRM'	0.590 (0.010)	0.810 (0.032)	0.810 (0.022)
'Non strategic HRM'	0.325 (0.345)	0.224 (0.129)	0.630 (0.010)
<i>n</i>	68	68	68

Table 5: Internal Fit and Performance Outcomes

Notes: Ordered probit analysis; Coefficients given (sig. in brackets); 'Strategic HRM' = above-average no. of HR practices used and hotel has formal strategy; 'Non strategic HRM' = above-average no. of HR practices used but hotel does not have formal strategy; Omitted category = below-average no. of HR practices used ('low HRM')

CONCLUSIONS

The main goal of this paper was to investigate the relationship between HRM and performance in the Italian hospitality sector focusing the analysis on two framework: internal and external fit. The analysis has been done in order to compare the results on the UK hotels by Hoque (2009) and those on Barbados hotels by Alleyne, Doherty and Greenidge (2006) with those of the present survey.

While Alleyne, Doherty and Greenidge found that the adoption of human resource (HR) practices was more prevalent in Barbados hotels than in the UK sample of Hoque work, for the Italian hotels it has been found a result similar to UK. For example, for Barbados, with respect to the existence of a formal HR strategy, the results were mixed and also show that in many respects the Barbados hotels are ahead of their UK counterparts in the development of the HR function.

So, external fit emerges as a fundamental key. A relationship between HRM and performance exists only among hotels emphasizing the importance of quality enhancement and among hotels in the "other" category. HRM proves ineffective where cost control is seen as the key to business strategy.

Looking at internal fit, there is evidence that higher performance has been found where HRM is introduced as a strategic part of their own business strategy.

The results here add to the conclusions reached by Hoque (1999), Ichniowski *et al.* (1994) and MacDuffie (1995).

The research has some limits and could be improved. For example higher performance was found in situations where the hotel emphasizes quality enhancement and adopted a wide range of HRM practices, but it is impossible to be sure about the causes of this result. In fact, it could be that the use of HRM practices caused high performance or that high performing hotels have a superior propensity to innovate in HRM practices.

Finally, it must be considered that the focus of the analysis was on larger hotels, as it is normal that their interest in HRM is higher than in smaller hotels. So, the results can not be assumed as representative of the hotel industry as a whole.

AN INVESTMENT ADVICE AYSSTEM USING THE IMPLICIT KNOWLEDGE

Britzelmaier, Bernd¹; Benz, Andreas²

¹*Professor, Pforzheim University, Tiefenbronner Str. 65, 75175 Pforzheim, Germany*

²*Heldenstrasse 45, 6800 Feldkirch, Austria*

Purpose - The process of investment advice is neither in theory nor in practice very well structured and has a lack of itemisation. Usually based on a customer's risk attitude and his return expectation a portfolio is offered. This paper presents a knowledge based investment advice system that comprises all relevant attributes of the customer and that delivers customer specific investment proposals based on the knowledge of the investment advisers.

Design/methodology/approach - Based on literature review and an observance study in banks a holistic investment advice process is generated. An explorative study has been used to work out a questionnaire that helps to support the investment advice process and that delivers the attributes needed for a case-based reasoning investment advice system. The system will be used to generate a scenario for product proposals in investment advice.

Findings - It is shown that case-based reasoning systems can support the organisational memory in investment advice by generating customer specific investment product proposals.

Research limitations - There are a lot of problem areas with investment advice. The paper shows only selected aspects related to the use of implicit knowledge within investment advice.

Practical implications - The presented investment advice process and the generic investment advice questionnaire are ready to be used in practice. A software prototype could be developed based on the scenarios shown in the paper.

Originality/value - The paper shows deficits of the investment advice process in theory and practice. It shows approaches to solve them. The core of the solution is the use of a case-based reasoning decision support system.

INTRODUCTION

Nowadays the knowledge resource is one of the most important key success factors for financial services companies. The whole knowledge of the investment advice process must be considered as a core competency of a bank. By advising their customers proficiently and individually a bank can gain competitive advantages. That leads to increasing requirements for a qualified investment advice resulting also from globalisation of the markets, changed consumer behaviour and a different competitive environment.

During the investment counselling interview with the customer the bank will be able to sell better if there is a guided structured talk's process. Instead of only focussing on expected return and risk attitude one has to consider also needs, requests, interests and social and financial restrictions. There is a number of attributes and data of the customer to be collected to find out a preferably perfect portfolio for him. A standardised holistic investment advice process is needed which is not really available at the moment in practice.

The *investment advice process* is not very well structured in most financial services' companies, even in literature is not paid very much attention to it (Rehkugler et al 1992, p. 320). During the investment counselling interview the advisers usually collect several parameters with their relevant values to explore goals, needs and desires of the investor. Usually the data is collected based on an *investment advice questionnaire*. The experience and knowledge of the investment advisers are needed to derive certain information. An analysis of 42 questionnaires leaves the strong impression that the questionnaires of different banks vary not very much and that some of them could be improved very much from a quality perspective.

Furthermore it is difficult for the investment advisers to formulate the *investment goals of the investor* in a way that they will match with the suggested investment portfolio (Rehkugler et al 1992, p. 320). Based on the investment goal investment advisers often offer a sample portfolio to the customer based on *the Strategic Asset Allocation* worked out by the portfolio managers. Usually this is the case if the investor will be assigned to one of the standardised customer groups (Gügi 1996, p. 142). That might be the reason that in

practice the *Tactical Asset Allocation* is being regarded as less important. The Tactical Asset Allocation is based on the strategic one and underrates or overrates certain countries, branches or investment categories to align the portfolio ideally to the customer's needs. This process requires very experienced advisers and a lot of implicit knowledge.

There is and there will be always some uncertainty for the adviser when he works out an investment proposal. To find out a portfolio preferably fitting to the customer's needs a 100% lots of investment alternatives and a number of decision relevant attributes have to be considered. IT is needed because the number of relevant attributes is beyond the capabilities of the human being (Rossbach 1994, p. 5).

The paper shows in the first part a holistic and detailed investment advice process that has been generated with experts from banks and based on literature review. Following a generic questionnaire will be shown derived from an explanatory survey in the banking sector of the German speaking countries. At the end a case-based reasoning model is presented that allows making systematically use out of the experiential knowledge. Hence problems arising out of the use of sample portfolios can be avoided. One can submit proposals to the customer based on his individual needs and matching his targets and risk attitude adequately.

INVESTMENT ADVICE PROCESS

The holistic investment advice process can be divided in the sub processes „Customer Acquisition“, „Conduct first talk“, „Survey investment profile“, „Generate asset allocation“, „Buying decision“ and „After sales service“. The whole process has been designed based on interviews with practitioners from banks in Germany, Austria, Switzerland and Liechtenstein. The knowledge of the practitioners – usually investment advisers – has been matched with the literature covering generic advice processes (Spremann 2002, p. 12, Steiner 2002, p. 21) and specific investment processes of banks (Aigner and Vöcking 2002, p. 23). The following exhibit shows the result.

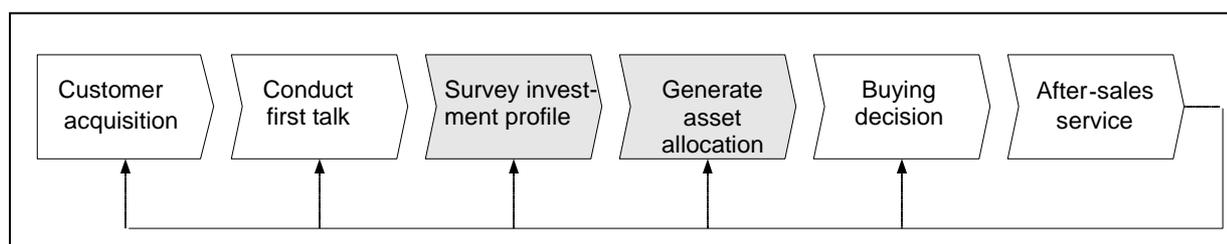

Exhibit 1: Holistic investment process

Before an advice process can start there has to be a customer acquired. During the sub process “Conduct first talk” the focus lies on locating the needs and desires of the customer, collecting customer's attributes, identifying the current financial circumstances (assets and liabilities) and learning about the knowledge and experience of the customer about investment (asset types, risks etc.). The so called “magical triangle of investment” comprising return, security and solvency helps to find out the risk attitude, the return expectations and the period of investment during the sub process “Survey investment profile”. That sub process requires a lot of experiential knowledge. The sub process “Generate asset allocation” refers to strategic and tactical asset allocation. The strategic asset allocation defines the allocation of asset types (e. g. shares, bonds, options) the allocation of countries and the allocation of currencies. Within the tactical asset allocation the whole investment is split into the several asset types. Sometimes according to the current capital market situation an overrating or underrating of assets types takes place leading to a portfolio proposal. Also that sub process requires a lot of experiential knowledge from the investment advisers. The customer finally decides what to buy. The “After sales service” process can be used to sell additional product to the customer.

DEFINITION OF ATTRIBUTES BASED ON A GENERIC INVESTMENT ADVICE QUESTIONNAIRE

An explorative survey has been conducted to design a generic investment advice questionnaire. Therefore questionnaires from 180 banks in the German speaking countries have been collected. 42 of them could be analysed which can be considered as representative. Comparing the questionnaires according to uniformity shows interesting results. There is almost no difference between the single countries in terms of collecting the customer's profile and the investment profile of him. Even the process to gather the data is very similar in all banks. There is a discrepancy if one compares the questionnaire of private banks with the one from universal banks. Private banks target the wealthy customer leading to a more detailed questionnaire and a higher attention to risk attitude and return expectation of the customer.

Universal banks use standardised questionnaires in most cases. Sometimes they even use form sheets with lots of space for notes and only a few standardised questions. As a result of the analysis one can state that a generic questionnaire can support the above shown investment advice process. The detailed results of the questionnaire analysis can be found in Benz (2008).

The generic questionnaire can support the investment advice process especially during those three sub processes:

- conduct first talk (gather customer data)
- survey investment profile and
- generate asset allocation.

During the first part data of the customer, his partner and their children will be collected. Some questionnaires even gather data of the hobbies of the customer. Usually the questionnaires include financial circumstances and investment experience too. To survey the investment profile questions of investment period, risk attitude and return expectation have to be answered. The attribute "Investment period" usually is represented in a fuzzy way, e.g. short-term, mid-term and long-term investment. Short-term, mid-term and long-term are not defined equally for all the banks. Also risk attitude is defined fuzzy in the questionnaires. Often a distinction is made between conservative, risk-averse, risk-happy, speculative and highly speculative. Other questionnaires distinguish between no risk, low risk, medium risk and high risk. The problem for the adviser is to transfer the fuzzy risk attitude into an investment portfolio. Some questionnaire use "what if" questions to state the risk attitude more precisely. No questionnaire in the survey used mathematical models like Bernoulli utility functions. Also the return expectations are not being measured accurately but fuzzy too, e.g. low, medium or high return. Based on the already mentioned "magical triangle" customers are assigned to one investment target, e.g. stability, income, return, growth or chance. For instance the target stability comprises a short term investment period, low return expectation and risk-aversity. During the last sub process the customer usually is asked for his preferences in the tactical asset allocation, e.g. currencies or branches.

KNOWLEDGE BASED INVESTMENT ADVICE SYSTEM FOR THE CREATION OF INVESTMENT PROPOSALS

One promising approach to create investment proposals for customers IT supported is case-based reasoning. Cases of existing customers with similar attributes and positive product experience shall be used for new cases. Empirical studies show that customers with similar attributes have comparable needs and expectations of their investments (Rossbach 1994, p. 13). The following exhibit shows as an example two customers with different attribute values. According to the knowledge of experts both can be regarded as similar to each other. Following the hypothesis of Rossbach there is a high probability that their investment needs and expectations are very similar too. That on the other hand fits perfectly to case-based reasoning.

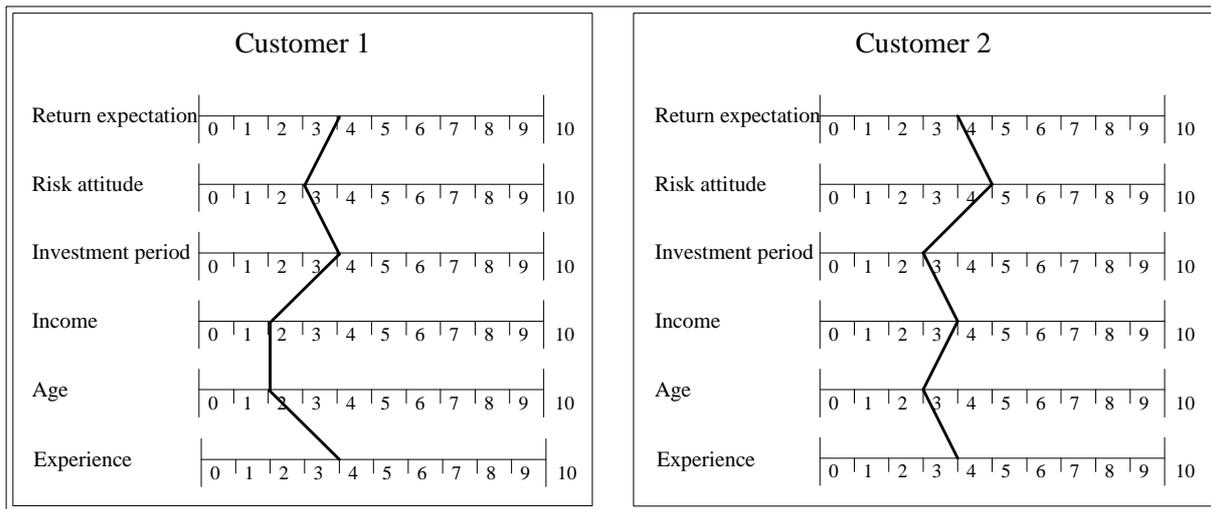

Exhibit 2: Example of a similar target profile

Case based reasoning systems base on a cycle comprising several sub processes. One of the most well known model is the one from Aamodt and Plaza shown in the following exhibit.

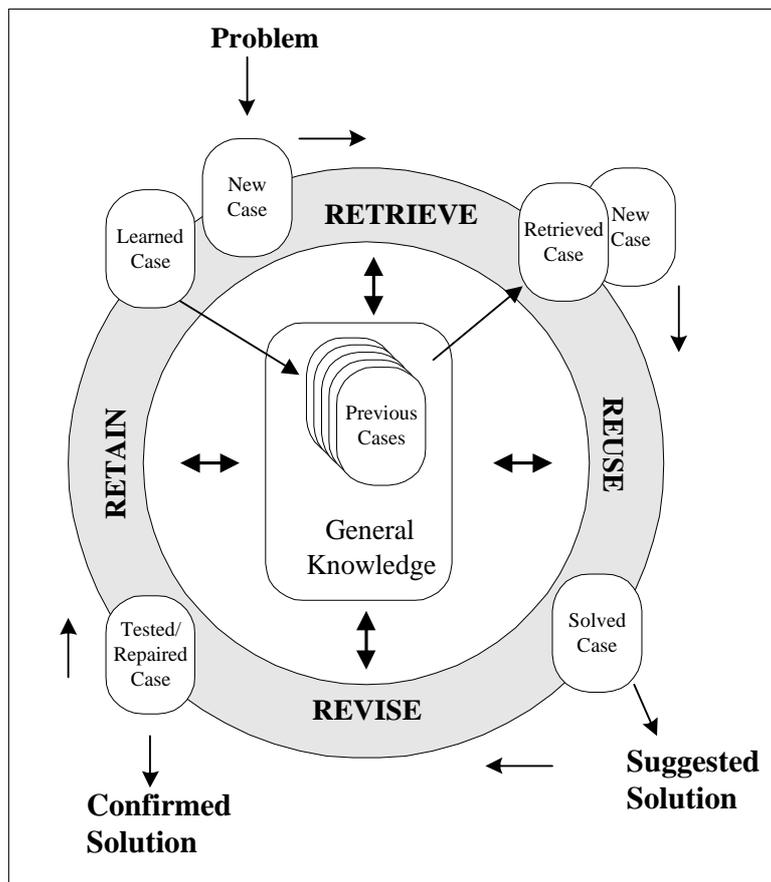

Exhibit 3: The CBR cycle. Source: Aamodt and Plaza 1994, p. 45

Aamodt and Plaza make a distinction between four sub processes: Retrieve, Reuse, Revise and Retain. Essentially for the model is the case base that contains a number of cases. Before discussing the four sub processes some terms will be defined.

A **case** is the description of a problem together with the knowledge gained while solving the problem (Bergmann 1996, p. 36). The cases contain the essential knowledge. A case consists of the problem description and the respective solution (Burkhard 1998, p. 18). Given a problem one tries to find a problem with similar attributes in the case base containing the implicit experiential expert knowledge. Has an experienced investment adviser solved a problem for instance, his solution (investment proposal) will be stored together with the problem in the case base. If another investment adviser is faced by a similar problem he can make use of the problem description of the experienced investment adviser and transfer the solution in the case base to his problem. A case F hence forms a pair (P, L) , where P is a problem and L an experience based solution for the problem. A **case base** is a suitable and organised collection of cases (Bergmann 1996, p. 36). Hence the sum of the cases in a case base can be considered to contain indirectly the experiential knowledge of the investment advisers. That can be used to solve new problems. The organisational memory is reflected in the case base. **Case based reasoning** is an approach to solve problems by using former cases and recycle former experiences (R. Bergmann 1996, p. 36). The case based reasoning cycle comprises the above mentioned sub processes.

The cycle starts with "**Retrieve**", where a similarity query to the case base takes place. First the user formulates a new problem. He gives a description of the problem with its attributes preferably completely. During the retrieve process one or a number of cases is selected, all of them suitable to solve a new existing problem (Bergmann 1996, p. 38). A suitable case can be found while judging similarity. Hence it is assumed that a new problem can be solved by applying successful solutions of former similar cases (Bergmann 1996, p. 38). Richter defines the retrieve-process as follows: „A query to a CBR system presents a problem and retrieves a solution using inexact matches with the problems from the cases in the case base.“ (Richter 1998, p. 9) During the **Reuse** sub process the attempt is made to use the knowledge from the retrieved cases. The information from the new problems is being connected to the one from the retrieved cases (Schaaf 1998, p. 8). While reusing the experience of the retrieved cases a solution for the new problem can be developed. According to Bergmann (1996, p. 40) in the reuse process a solution for the problem is defined by using the experience of the selected former cases. The **Revise** process helps to revise the solution found in the reuse step which can be modified if necessary. Revision can be done using either simulation or validation in the real world (Bergmann 1996, p. 41). If the new problem could be solved the gained experiences can be added to the case base in the **Retain** sub process. A decision has to be made whether each new experience will be added to the case base. Adding each new case to the case base might lead to a huge case base not being suitable for efficient retrieval. In case of not adding each case to the case base criteria have to be defined for the decision which case to add and which not (Bergmann 1996, p. 41). Based on that methodology the system becomes a learning one and the newly acquired knowledge can be used immediately in the next cycle (Schaaf 1998, p. 8).

Applying case-based reasoning to investment advice means customers can be described using the attributes gathered in the generic investment advice questionnaire. Hence data about customer's profile, his risk attitude and his return expectations can be collected during the three sub processes mentioned above: Conduct first talk, survey investment profile and generate asset allocation. This leads to three sub profiles for each customer:

- Customer profile (customer data, e.g. age, income, marital status)
- Investment profile (Risk attitude, return expectation, personal preferences)
- Asset allocation profile (Strategic asset allocation, tactical asset allocation).

Hence similar customers can be retrieved from the case base by searching for similar profiles. Based on similar customers with a good investment performance an investment proposal for the new case can be generated.

That investment proposal can be adjusted by the investment adviser according to the current and expected future capital market situation as well as to specific customer needs. The final solution can be stored in the case base finally. Hence the system is steadily learning and it supports the organisational

memory of investment advice. The following exhibit shows the concept for a case based reasoning system to create investment proposals.

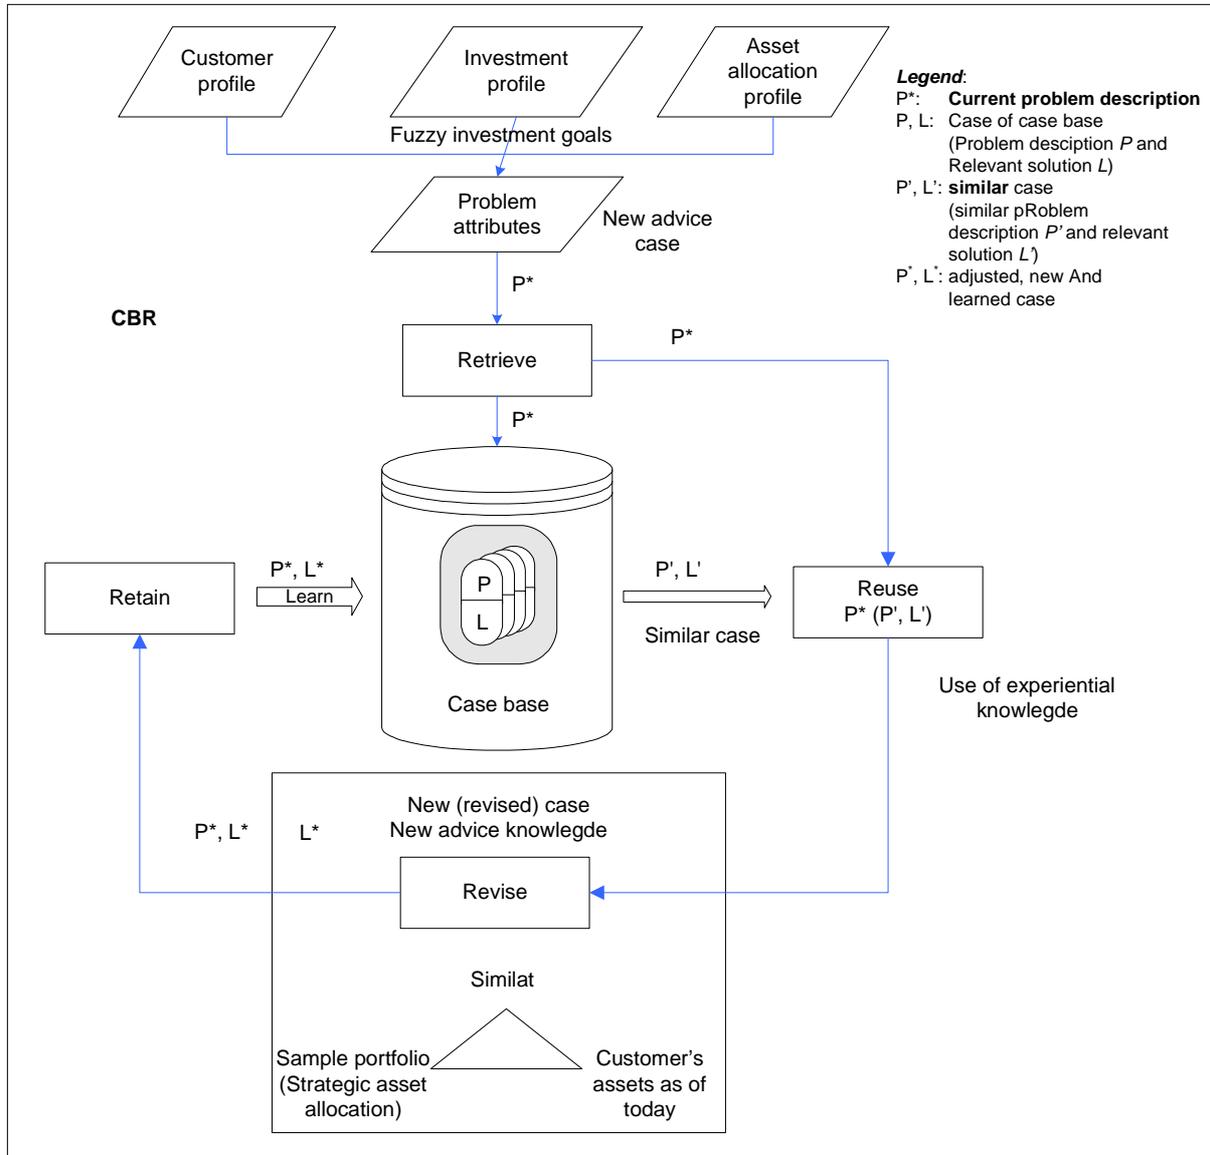

Exhibit 4: Model of a CBR system to create investment proposals

The aim of the case based reasoning system is it based on a new problem P^* (new customer) to retrieve similar already solved problems form a case base and use them to find a solution for the new problem. Hence the experiential knowledge of experienced investment advisers can be used.

The case base consists of a number of advice cases. Cases are being stored with their attributes and attribute's values (problem description P) as well as with their respective investments (Solution description L). Through the continuing addition of solved investment advice cases to the case base the case base itself becomes part of the organisational memory. Organisational investment advice knowledge is acquired, adapted and stored continuously.

During the investment advice process a number of attributes (Problem attributes P^*) of the investor is stored especially during the first sub processes. To retrieve similar cases from the case base similarity algorithms are used.

The similarity of two cases can be expressed by a similarity rate scaling the similarity values within the interval from 0 to 1. A similarity $\text{sim}(x,y) = 1$ means, that the attributes of x and y are equal, whereas a similarity $\text{sim}(x,y) = 0$ shows that there is no similarity between the attributes x and y at all.

The basic idea of case based reasoning is that the whole similarity of two cases can be determined through a comparison of the single attributes (Beierle, Kern-Isberner 2006, p. 185). One can distinguish two phases: First similarity in sense of *local similarity* is determined. This refers to values of single attributes. Then the values of all attributes of two cases are being aggregated to a *global similarity*. The similarity of two cases is determined by the number, the kind and the relevance of the single attributes. For the overall assessment of the global similarity relevance and number of the attributes are being integrated (Meyer 2001, p. 125; Biendarra 1998, p. 155). The following exhibit shows the two phases of similarity determination.

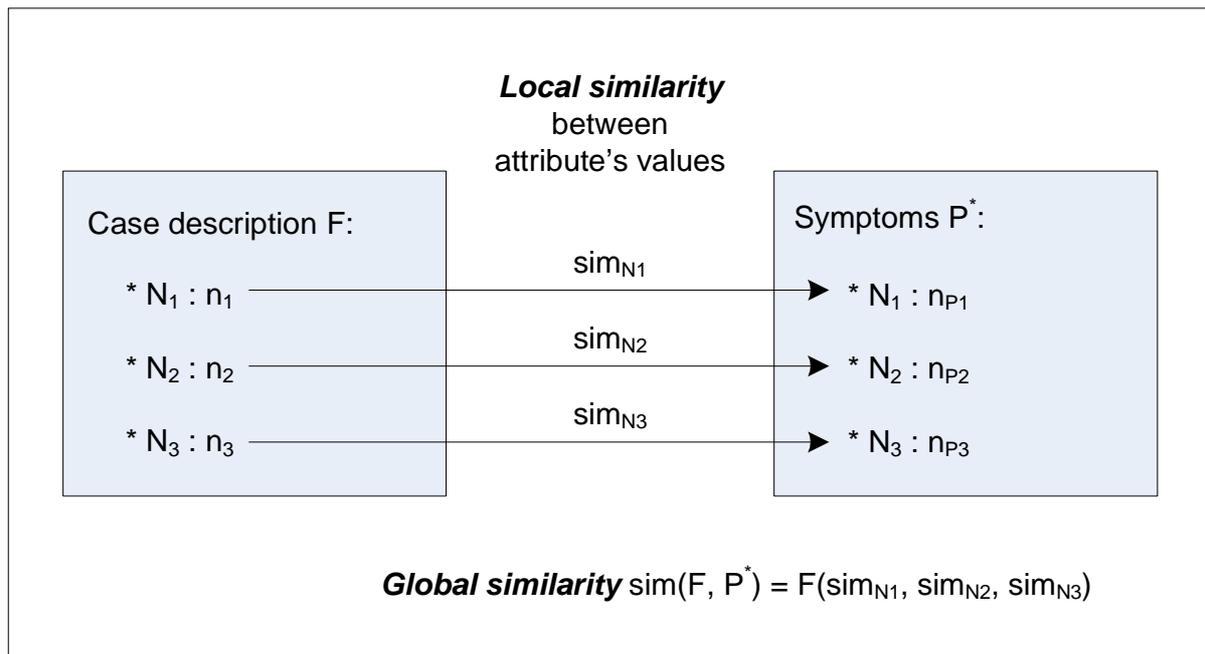

Exhibit 5: Similarity determination

The solution description L' with the problem description P' most similar to the current problem description P^* is considered being a possible solution for the current case. While reusing and revising the investment adviser can adapt the solution approach L' . Hence the most similar case (with the problem description P' and the solution description L') is applied to the current case P^* . The CBR system is a decision support system. At the end the investment adviser has to make a decision what to suggest the customer to buy. Similar customer portfolios can be used to work out investment proposals. The investment adviser is aware of the assets in similar portfolios and can use this knowledge to work out an investment proposal for the current case. The most similar case(s) support(s) his decision. During the whole advice process new knowledge is generated (judgement, adaptation etc.), the solution description L' is being amended with the problem description P^* leading to a new case (P^*, L^*).

The new case represents new advice knowledge. It can be added to the case base and hence enlarges the problem solving competency of the firm. By reuse of existing experiences the productivity of investment advisers can be increased and the organisational memory can be supported for the explicit part of investment advice (Basili, Rombach 1991, p. 303).

OUTLOOK

The paper shows a concept of a CBR system that could be implemented on a prototype basis in a bank. A holistic investment advice process in alignment with a generic investment advice questionnaire delivers all

data needed for the CBR system. Investment advice can be improved significantly by using a CBR system that makes use of the implicit knowledge of investment advisers.

CONTROLLING IN PRACTICE - AN EMPIRICAL STUDY AMONG SMALL AND MEDIUM-SIZED ENTERPRISES IN GERMANY

Britzelmaier, Bernd¹; Thiel, Carsten¹; Kraus, Patrick¹

¹*Pforzheim University, Germany*

Purpose - Small and medium-sized enterprises (SME) are a major economic factor not only in Germany, but also in the European Union. Controlling is meanwhile indispensable for large companies but for SME controlling instruments seem to be applied very heterogeneously.

Design/methodology/approach - Therefore, an online survey especially directed on SME in Germany has been conducted^[1] to find out more about the relevance and the instruments of Controlling in SME. All in all 180 companies took part in the study.

Findings - It seems that in smaller companies operational controlling instruments are still more common than strategic ones and also the organisation of controlling activities is dependent on the company size.

Research limitations/implications - The study shall give a topical, general overview about controlling at SME to create an empirical foundation for further research activities in this domain.

Originality/value - The empirical study in total provides, also for practitioners, useful information about the application and design of controlling at SME in Germany.

Keywords: SME, Management accounting, Controlling instruments, Empirical study, Germany

Paper type: Research paper

INTRODUCTION

The small and medium-sized enterprise sector is considered crucial to European competitive development and represents the vast majority of the companies (Mulhern (1995), p. 83). Hence it is quite astonishing that a big portion of research in business administration focuses exclusively on large companies. Nowadays however a change can be identified. An increasing amount of publications, symposia and media presence about SME can be observed (Becker and Ulrich (2009), p. 2).

On the one hand side SME often confront restricted financial resources and a low equity ratio. On the other side many SME, because of the progressing globalisation and the eastern enlargement of the EU, are in a completely new competitive position. Due to the Basel II framework and the rating procedures which come along with it, SME are facing a further problem area (Müller (2006), p. 237; Rautenstrauch and Müller (2007), p. 1821; Berens and Wüller (2007), p. 393).

Controlling can contribute ensuring the survival of SME in the long run and helping to reduce costs of debt relating to Basel II. Due to the increased transparency the potential of cost cutting can be identified more easily. Furthermore, controlling can help that managerial decisions are determined on a more rational base. Controlling has become a widely used helpful and indispensable tool of the management of large companies. But controlling activities at SME should be beyond pure accounting (Krey and Lorson (2007), p. 1718; Rautenstrauch and Müller (2007), p. 1821; Kadosca (2006), p. 77).

Therefore, the following study focuses on the extension and organisation of controlling at SME. In a first part controlling in general is analysed and in the following the focus moves over to the controlling instruments that are used by the participating companies.

Controlling in Small and Medium-sized Enterprises

Controlling subsumes all instruments which help to coordinate the leading systems planning, surveillance, organisation and human resource management to achieve the company goals in an optimal manner (Wöhe (2002), p. 205). In general there can be observed controlling instruments, also strategic ones, becoming more and more important. Due to shortened Product Life Cycles, fluctuating degrees of capacity utilisation,

increasing overheads, controlling has developed to a crucial factor for small and medium-sized enterprises as well (Hegglin and Kaufmann (2003), p. 359).

In comparison to large-scale enterprises, controlling at small and medium-sized companies is differing regarding organisational issues and the scope of duties. Controlling at a SME typical tasks are broader straightened and the function of a controller can rather be seen as a generalist (Kummert (2005), pp. 155-167).

SME represent more than 90% of the European companies. According to a study in 2007 about 99% of the companies in Germany can be defined as SME. Those companies generate almost half of the German Gross Domestic Product (GDP) and provide almost 70 % of the jobs. Furthermore, SME are a significant resource for innovation and technological change hence they increase prosperity and the competitiveness of economies (Deimel and Kraus (2007) p. 155; Haufe Akademie (2007), p. 3).

There is no consistent generally accepted definition of SME. Definition of size classes based on accounting rules is partly in contradiction to definitions based on an economical base (Krey and Lorson (2007), p. 1717). In Germany mainly three different definitions are relevant given by the code of commercial law, the European Commission and a research institute focusing on SME, called "Institut für Mittelstandsforschung" (IfM).^[2]

EMPIRICAL STUDY

Design/methodology/approach

Main intention of the study is to find out, how SME evaluate the importance of controlling and how widespread controlling instruments in small and medium-sized companies are. The survey focuses at the beginning on SME and controlling at SME in general and later on, the focus switches on controlling instruments in detail which are used in the participating companies.

Therefore, an online-survey was launched in the period of December to the beginning of February under support of the "Internationaler Controller Verein eV" and the software company SBS Software GmbH which was directed especially to small and medium-sized enterprises.

180 companies of different branches answered to the questionnaire. 19 of the 180 completed questionnaires were excluded from the analysis because they had more than 500 employees and hence could not be considered as SME.

The number of employees was used to build size ranges, without considering turnover. All companies up to 500 employees were taken into account in the results of the analysis. For the examination the participating companies are classified into four size-classes. First category is up to 10 employees also defined as micro-sized SME. The next category enfolds companies up to 50 employees. The third category includes companies up to 250 employees and finally the last size-class includes companies up to 500 employees.

The survey was created with help of the Open Source Tool Limesurvey.^[3] In order to get clear analysable results, the authors of the study mostly set aside open answers and used instead well defined multi-choice-questions.

The study shall provide a topical basis and overview about controlling at SME in Germany. Further empirical analyses e.g. multi-factor analyses are not part of the research approach in this paper. Rather the aim of the study is to create an empirical foundation for further research activities in this domain. So further research activities in this area are necessary.

RESULTS

The first question asked for the position of the participants who answered the survey. This information can be used to make a statement concerning the quality of the results and gives a first indication how controlling is organised in the participating companies. The results turned out to be as figure 1 shows:

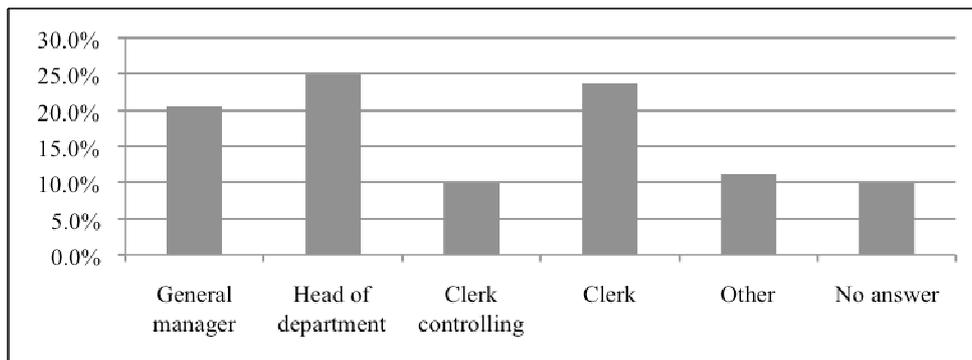

Figure 1: Which position do you hold in the company?

Lion's share constitutes the head of department followed by clerks in general. Noticeable is, that clerks in controlling departments are representing the smallest group participating in the study. This could be an indication for the under representing position controlling clerks still have in SME in comparison to larger companies. The category "Other" comprehends mostly proxy holders, IT-clerks and external controllers.

In the following the amount of employees as central attribute for classifying the companies will be dealt with. Figure 2 illustrates the results:

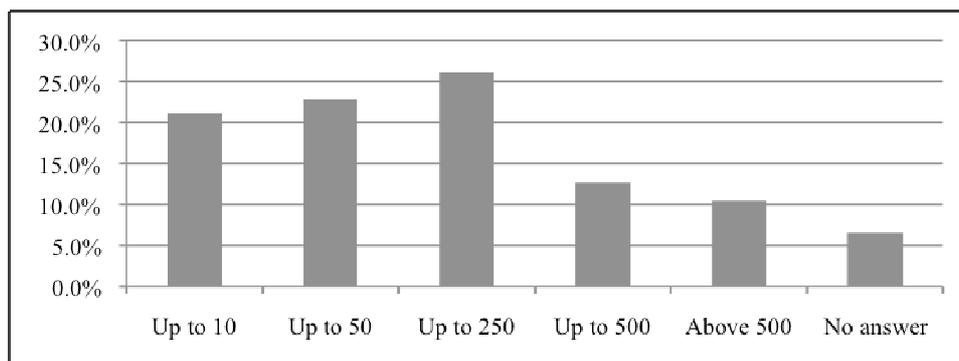

Figure 2: What is the headcount of the company?

Most of the 180 participating companies consist of up to 250 employees. Medium-sized companies up to 500 employees represent about 13 %. Large companies above 500 employees represent 11 %. These 19 companies were not taken into account in the evaluation of the study. Though they conduce as reference to SME concerning e.g. the headcount of clerks in controlling and the success of the company in comparison to competitors.

By taking a look on the measure turnover the results of the study can be shown as follows in figure 3:

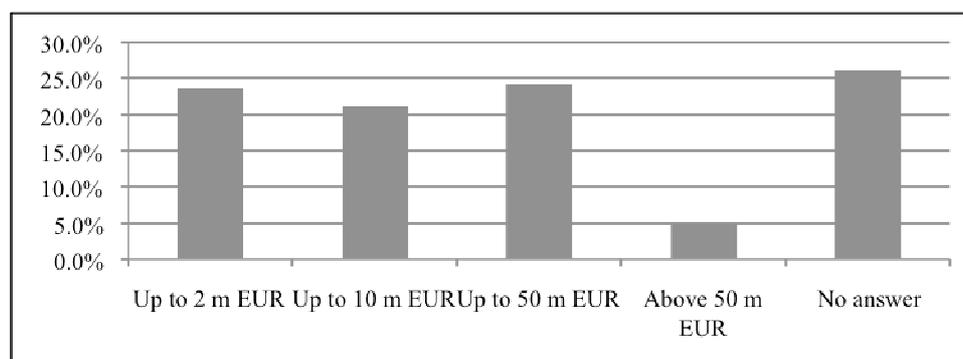

Figure 3: What is the amount of the turnover in the last financial year?

The results regarding the turnover resemble the above shown results concerning the headcount. A turnover up to 50 m EUR appeared most frequently with 24.2 %. In this category mostly companies up to 250 employees can be found. Only companies exceeding 250 employees generate a turnover above 50 m EUR. Micro-companies up to 10 employees fall under the category up to 2 m EUR turnover, with an exception of two companies. Explanation is needed that over 25 % of the companies did not answer the question. Typically in SME measures as turnover, operating result or rate of return are rarely brought into public, in order to avoid giving too much information that can be used by competitors. Often SME are in family property which enforces the unwillingness to share information. Although there is a disclosure requirement for corporate enterprises, often this is not complied with until a registration court asks for disclosure. It is of course to mention that turnovers from different sectors or branches can hardly be compared.

The next question focused on the age of the participating companies. Figure 4 illustrates the empirical results and shows the spreading of the age pattern:

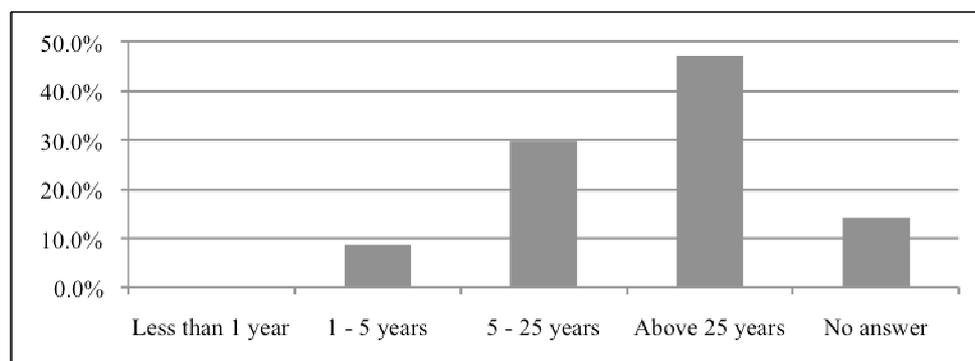

Figure 4: How long is your company respectively organisation already existing?

The figure shows that the majority of the companies is older than 25 years (47 %) and can be described as grown companies which seem to be typical for the SME sector in Germany. In this class almost 70 % of the companies count up to 250 employees. Also the age pattern 5 – 25 years pointed out to be strongly represented with nearly 30 %. Start-up-companies existing of less than 1 year did not attend the study.

An important criterion to find out whether the study is giving a representative profile of the SME sector is the industry classification of the participating companies. The following figure gives an overview in which branches the companies are operating:

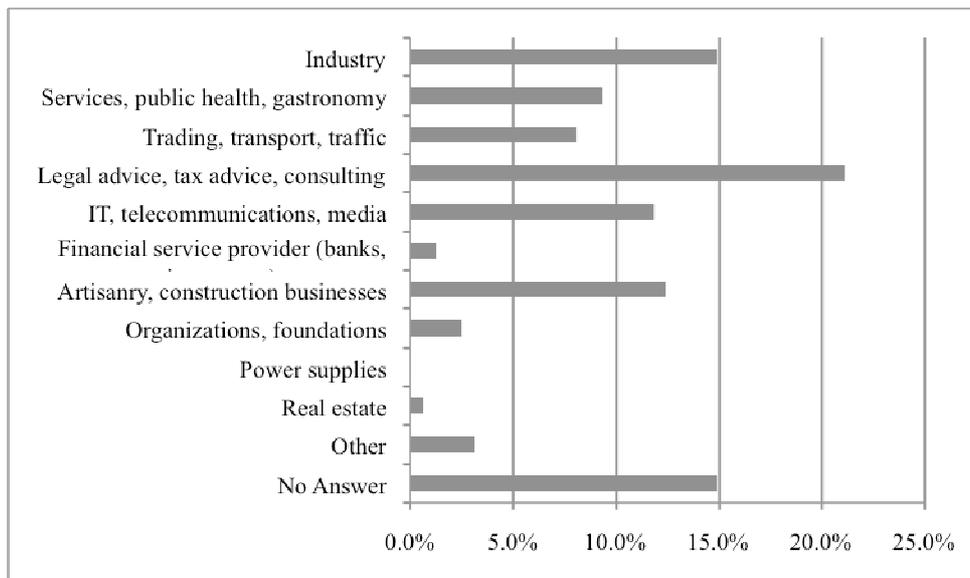

Figure 5: Which is the main sector your company is operating in?

Approximately 21 % of the participating companies have their core business in legal advice, tax advice respectively consulting. Most of them are micro-sized companies with up to 10 employees. The second largest sector represents the industry sector with 14.9 %. Regarding the headcount the companies mostly consist of more than 50 employees. Besides that the artisanry sector represents 12.4 % and telecommunications sector 11.8 %. The artisanry companies mostly consist of less than 50 employees. The tertiary sector service represents almost 9.3 % and is equally allocated between the company sizes. A power supply company was not covered by SME. However, only one single company with more than 500 employees in this sector participated the study (Excluded in the SME -specific part of the study).

In the following, the relationship between the different branches and the company size will be examined more precisely. 12 Companies which did not give information about their headcount were not considered in the following figure:

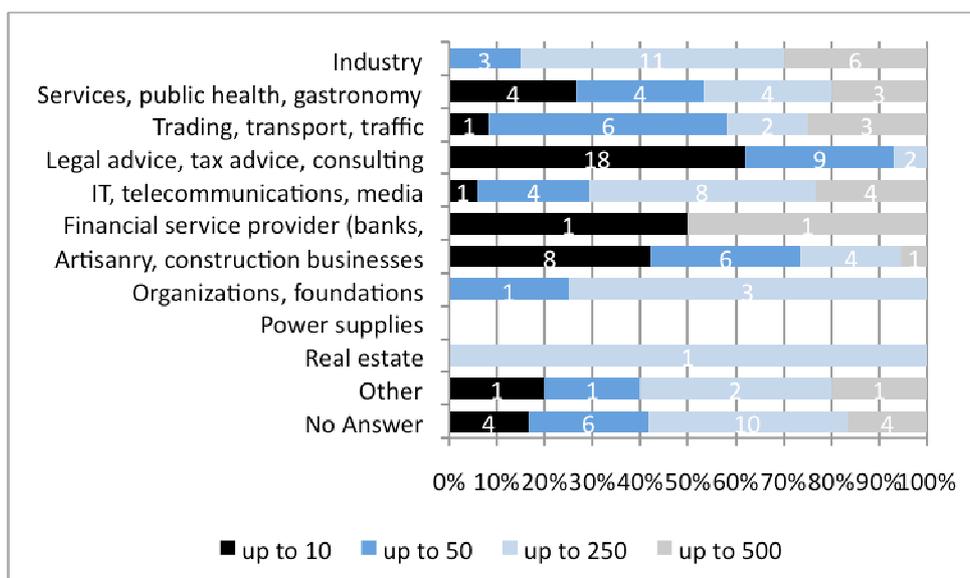

Figure 6: How is the tendency between operating branch and headcount?

The empirical results show in detail that micro-companies up to 10 employees are often operating in the fields legal advice, tax advice, consulting and artisanry. By regarding the companies with up to 50 employees there can be observed a wide variety of different branches. Focusing on companies which have over 50 employees, there is a clear tendency that companies are operating in the industrial sector or in IT-respectively telecommunications sector. In both sectors the part of companies above 50 employees with 6 respectively 4 companies is the highest one.

A very interesting and specific matter concerning SME is, whether companies employ staff specifically for controlling purposes. For this reason the following illustration shows, whether the participating companies have specialised controlling staff or not.

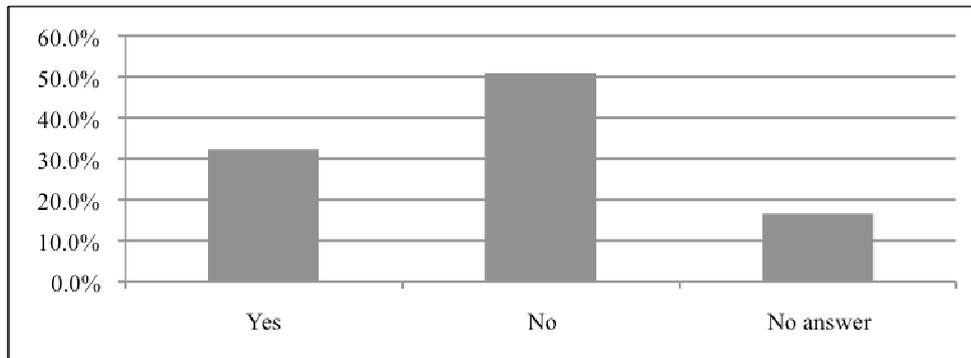

Figure 7: Do you employ staff that is specifically responsible for controlling matters?

The study shows that only 32 % of the SME possesses specialised controlling staff. Among companies up to 10 employees only one company answered the question with a yes. Not a single company up to 50 employees has the availability to benefit from specialised controlling staff. In contrast, 63.6 % of the companies up to 250 employees have at least one position for an employee focusing on controlling matters. On inspection of companies up to 500 employees actually 89.5 % offer at least one controlling position. So there can be observed the strong tendency that with increasing size of the company, controlling as an enterprise function becomes more and more important. In smaller companies the controlling task might be performed by the management itself. Due to the analysis of the headcount mostly the industry sector and the IT respectively telecommunications sector is strongly represented in the size ranges up to 250 and up to 500 employees. This allows the conclusion that specific controlling positions are very common in these classes of business.

In comparison to that an empirical research in 2007 under SME in the northwest of Germany identified 38 % of the companies employing a specific controlling position. Even though most of the attending companies, in total 209, generate a turnover of less than 10 m EUR (38%) and the headcount is up to 50 (43 %), it can be observed that controlling has become more important in comparison to empirical studies in the same area in the past (Wilken (2007), pp. 3-4).

For gathering more information about the importance of controlling among the respondents, the next question deals with the number of controlling employees. The following figure 8 illustrates the results:

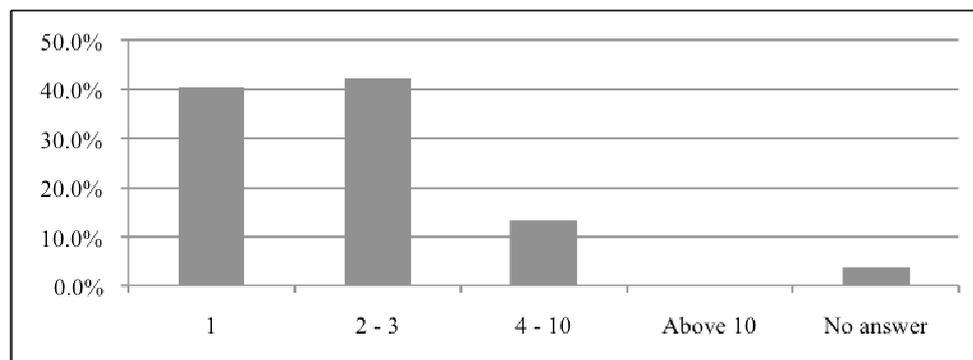

Figure 8: How many employees focused on controlling are working in your company?

Almost 42 % of the companies are employing 2 - 3 employees. These are mostly companies with a size up to 250 and a turnover up to a value of 50 m EUR. The category above 10 refers to large companies with a headcount higher than 500 employees and shall emphasise the importance the company size has with respect to the number of controlling positions. Nearly 26 % of the large companies employ more than 10 controlling employees and merely 10.5 % are having only one position.

Furthermore it is interesting in which department controlling activities are integrated respectively which department is responsible for controlling matters. The results of the question turned out to be as follows:

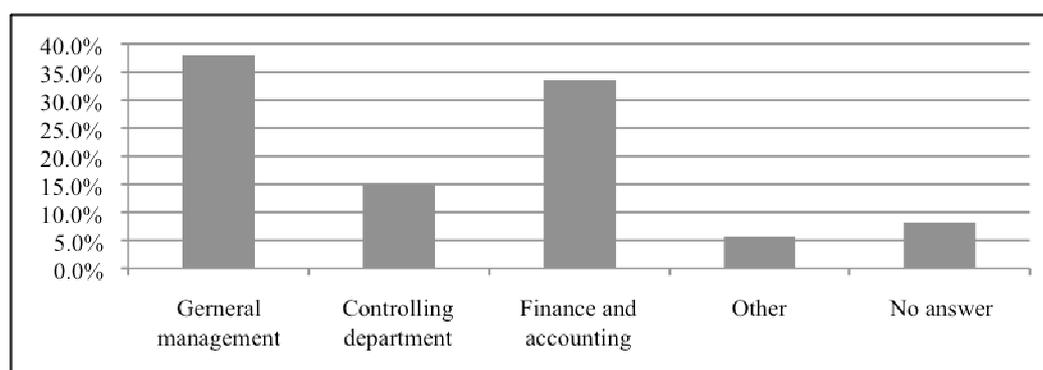

Figure 9: Which department is responsible for controlling activities?

Predominantly, general management is doing controlling activities by itself with approximately 37 %. By splitting up the result among the different size classes, a more differentiated trend can be observed. In micro-sized companies up to 10 employees the controlling function is done by the general management in 68.9 % of the companies. In companies up to 250 employees there can be observed with 42.2 % a declining number of companies in which general management is fulfilling the controlling function. The situation is eminently different when focusing on companies up to 500 employees. If so, in only 26.3 % of the cases general management is doing the controlling. So it can be stated that with increasing size general management is less involved in controlling activities.

However, controlling functions are often taken over by finance and accounting. In almost 34 % of the companies there can be observed this constellation. Solely in 14.9 % of the cases controlling departments are doing controlling activities directly. This occurs with 47.4 % mostly in company sizes above 250 employees.

In approximately 19 % of the interviewed companies controlling activities are provided by two departments that means controlling function is divided between two departments, mostly general management and finance and accounting. In five companies controlling activities are even split among three departments, general management, controlling department and finance and accounting.

After analysing the institutional organisation of controlling it is, furthermore, a matter of particular interest in which time intervals measures of planning and controlling are calculated. Figure 10 illustrates the reporting quantity:

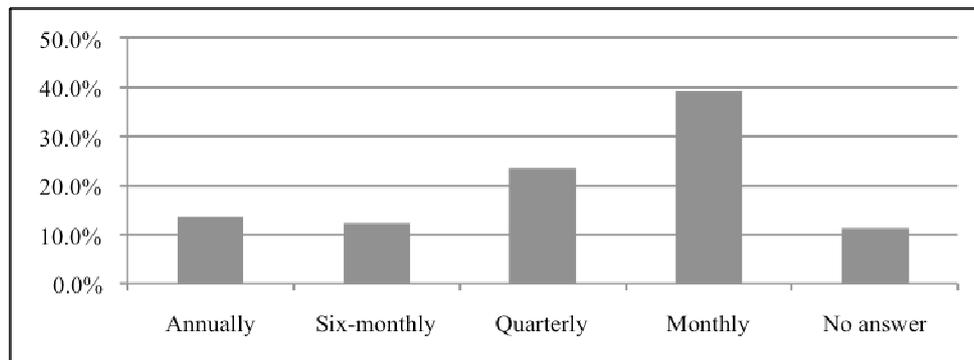

Figure 10: In which time intervals controlling reports are provided?

With approximately 40 %, most of the participating companies are reporting on a monthly base. Foremost, this is the case in companies with more than 50 employees. A quarterly determining of controlling measures mostly occurs in small companies with a headcount up to 50 employees. On the contrary, at micro-sized companies a yearly reporting is quite common, only one company above 250 employees stated to do a yearly calculating of controlling measures. By regarding the cohesion of a six-monthly interval of reporting controlling figures and company size, there is no prevailing tendency towards a single company size.

Also a matter of interest is a statement of the participating companies about the importance of controlling activities in general, and if there appears a divergence of grading the importance of controlling on one side and implementing controlling in the company's routine on the other side. For that reason the next figure shows details about the grading of controlling with regard to the importance:

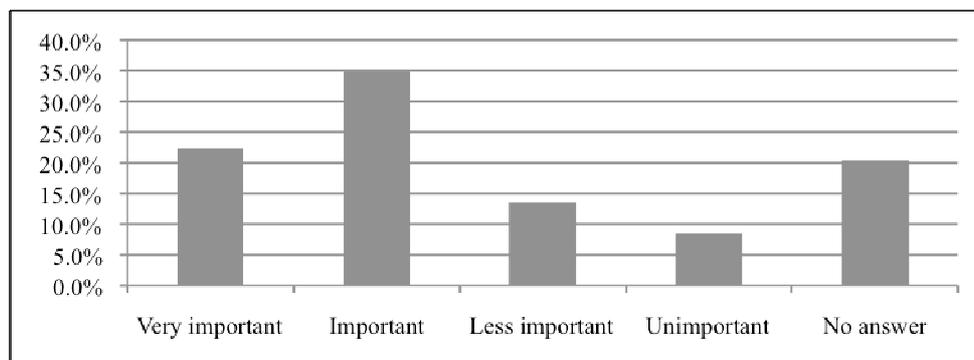

Figure 11: How important is controlling in your company?

For more than 57 % of the participating companies controlling is very important or at least important, predominantly companies with more than 50 employees. About 22 % of the companies grade controlling as less important or unimportant. In general, there can be observed a positive appraisal of the importance of controlling at SME. Only a marginal part of the participating companies attaches unimportance to controlling. This occurs mostly at micro-sized companies up to 10 employees (78.6 %).

The next question was focused on how companies see the future development of the relevance of controlling in the own companies. Figure 12 illustrates the results of the survey:

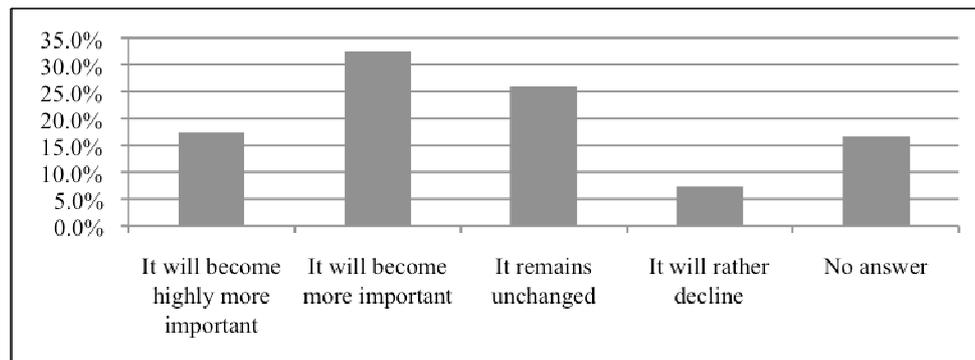

Figure 12: How will the relevance of controlling develop in the next few years?

The chart shows clearly, the estimation of the SME controlling will become more important in the next few years. Less than 8 % advance the view controlling will become less important for them in the future. Over 32 % are of the opinion that the importance of controlling will increase. This statement fits mostly for companies with more than 50 employees. 17.4 % think that controlling will become highly more important in the next few years. For the most part, companies above 250 employees agree with this statement (38.8 %).

After analysing controlling in general at SME, the empirical study is now focusing in specific on the controlling instruments which are used in practice in the participating companies. The results are sorted according commonness of the different controlling instruments. The following figure 13 shows the results in detail:

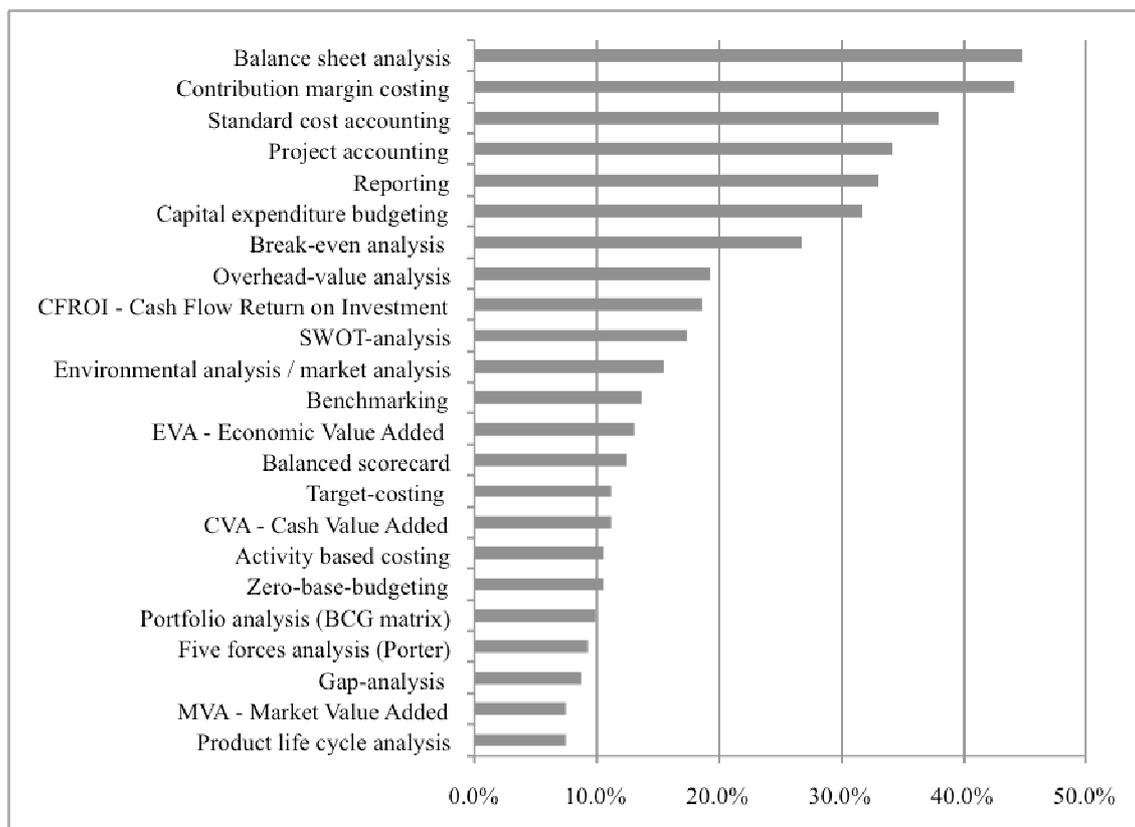

Figure 13: Which of the following controlling instruments are already used in your company?

First of all it is interesting that operational controlling instruments are more widespread than strategic ones. The most common controlling instrument is the balance sheet analysis with 44.7 %. It has to be

mentioned that balance sheet analysis itself does not fully fulfil the needs of controlling by variance analysis. Without a comparison with planned figures it just analyses the past. Balance sheet analysis is used in micro-sized companies in 21.1 % of the cases. In 91.5 % of the companies up to 250 employees and 91.3 % of the companies up to 500 employees the balance sheet analysis is in use very frequently. Concerning the contribution margin costing there is a similar result (44.1 % in total). After differentiating the use of the instruments among the size-classes the results are for companies up to 10 employees a 42.1 %, for companies up to 250 employees a 70.2 % and finally for companies up to 500 employees a 95.7 %. There can be observed a very similar distribution among the different size-classes focusing the controlling instruments reporting and standard cost accounting.

Surprising is the relatively high appliance of the overhead-value analysis (19.3 %). This seems to be overstated and raises the question, if this instrument is known at all in every company which participated the survey.

Strategic controlling instruments are mostly used in companies with more than 250 employees. Environmental analysis respectively market analysis is used in 78.3 % of companies with more than 250 employees and SWOT-analysis is with 87 % also very common in this size-class.

Value based performance measures like EVA[®] are in usage in 52.2 % of the companies up to 500 employees, MVA in 39.7 %, CFROI in 65.2 % and finally CVA in 56.6 % of these companies. But in the smaller size classes value based performance measures are used very rarely.

In general there can be observed the tendency that smaller companies are restricted mostly on operational controlling instruments like balance sheet analysis, contribution margin costing, standard cost accounting, project accounting, reporting, capital expenditure budgeting, break even analysis. The bigger the company, the higher is the potentiality to find also strategic concepts in use.

However, disputable is the number of companies not answering the question. Therefore, figure 14 shows in detail the response behaviour of the participating companies.

	<i>In use</i>	<i>Not in use</i>	<i>Use planned</i>	<i>No answer</i>
<i>Balance sheet analysis</i>	44,7%	10,6%	3,1%	41,6%
<i>Contribution margin costing</i>	44,1%	8,1%	3,7%	44,1%
<i>Standard cost accounting</i>	37,9%	14,9%	1,9%	45,3%
<i>Project accounting</i>	34,2%	16,8%	2,5%	46,6%
<i>Reporting</i>	32,9%	11,2%	3,7%	52,2%
<i>Capital expenditure budgeting</i>	31,7%	14,9%	2,5%	50,9%
<i>Break-even analysis</i>	26,7%	15,5%	5,6%	52,2%
<i>Overhead-value analysis</i>	19,3%	28,0%	2,5%	50,3%
<i>CFROI - Cash Flow Return on Investment</i>	18,6%	23,6%	2,5%	55,3%
<i>SWOT-analysis</i>	17,4%	23,0%	3,1%	56,5%
<i>Environmental analysis / market analysis</i>	15,5%	21,7%	3,7%	59,0%
<i>Benchmarking</i>	13,7%	26,1%	1,9%	58,4%
<i>EVA - Economic Value Added</i>	13,0%	26,1%	1,9%	59,0%
<i>Balanced scorecard</i>	12,4%	24,2%	3,7%	59,6%
<i>Target-costing</i>	11,2%	27,3%	3,1%	58,4%
<i>CVA - Cash Value Added</i>	11,2%	28,0%	1,9%	59,0%
<i>Activity based costing</i>	10,6%	30,4%	3,7%	55,3%
<i>Zero-base-budgeting</i>	10,6%	29,8%	2,5%	57,1%
<i>Portfolio analysis (BCG matrix)</i>	9,9%	28,0%	0,6%	61,5%
<i>Five forces analysis (Porter)</i>	9,3%	28,6%	2,5%	59,6%
<i>Gap-analysis</i>	8,7%	29,8%	1,9%	59,6%
<i>MVA - Market Value Added</i>	7,5%	28,6%	1,9%	62,1%
<i>Product life cycle analysis</i>	7,5%	31,1%	0,6%	60,9%

Figure 14: Which of the following controlling instruments are already used in your company?

There can be discovered a trend not answering the question increases with strategic respectively value based performance measures. Probably a conclusion could be that SME, especially smaller SME, could not deal with this kind of controlling instruments. Furthermore, the statement of SME companies that controlling is very important or at least important, as shown above, raises the question, if there is a lack between appraisal of controlling in general and the implementation of specific controlling instruments in practice. Even the typical traditional controlling instruments like balance sheet analysis or contribution margin costing have with more than 40 % a comparatively high rate of refusal answering the question. Another explanation could be the closeness of SME companies to make public internal information. Despite of that, the basic statement that smaller companies are focusing on operational methods and with increasing size, the instruments are widening towards strategic controlling instruments can be hold.

The next question proceeds with the evaluation of the above mentioned controlling instruments. Therefore, the participating companies were asked after their satisfaction of the instruments which are in action. Figure 15 illustrates the results:

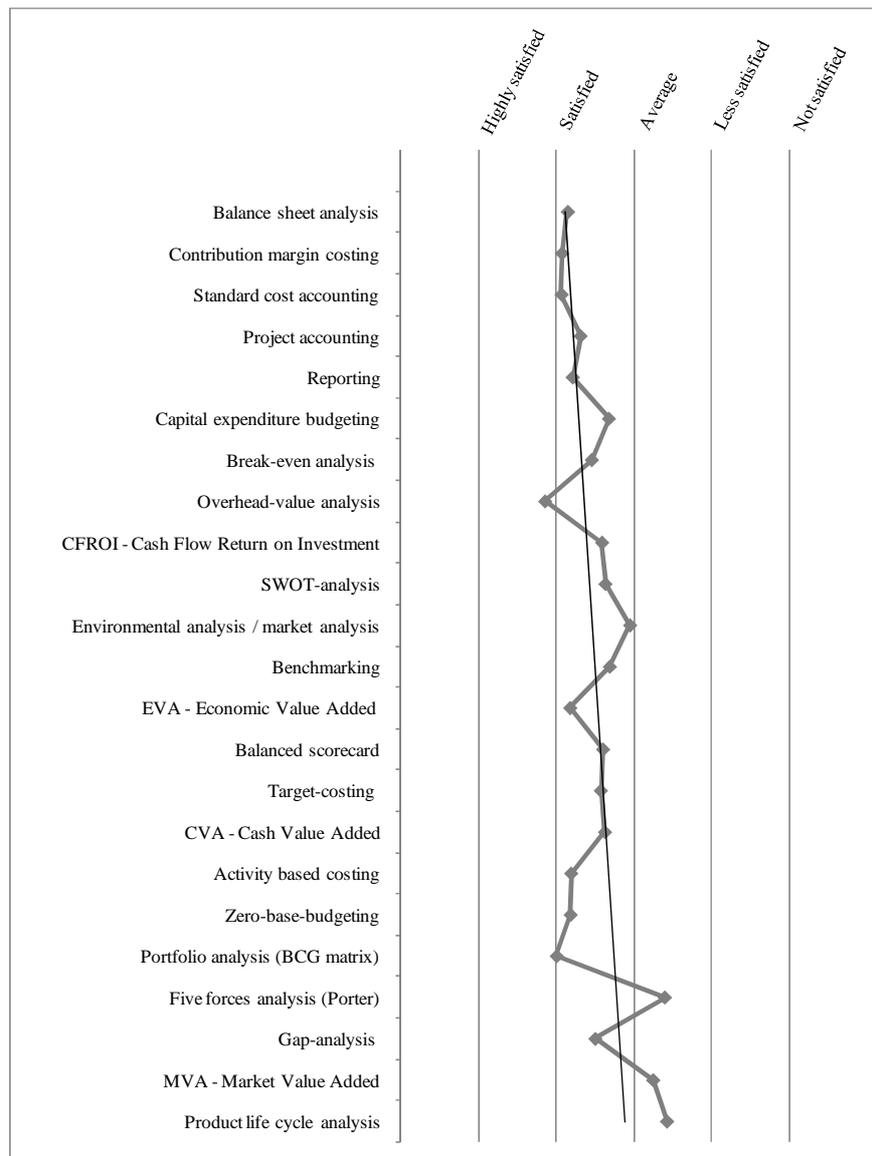

Figure 15: How satisfied are you with the following controlling instruments in your company?

In general there can be observed a trend companies can cope quite well with operational instruments. Satisfaction in this area is in principle existent. Though satisfaction is decreasing with strategic respectively value based instruments. Especially at smaller companies there is noticeable a lower satisfaction in the strategic area in comparison to larger companies.

Closing the study, the participating companies were finally asked after their evaluation of the economic success in comparison to other companies. The results turned out to be as follows:

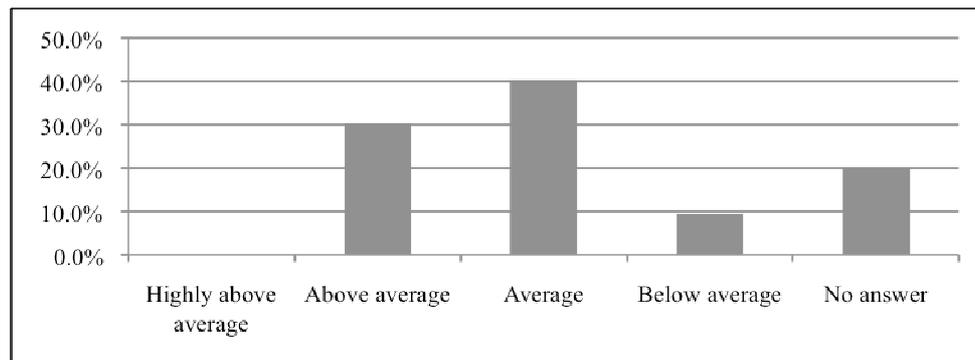

Figure 16: How do you evaluate the economic success of your company in comparison to the other companies?

More than 40 % of the companies estimate their success as average. This applies with 70 % mostly to companies up to 50 employees. Currently 30 % rank their success as above average. Particularly companies up to 250 employees are with 63.3 % of this opinion. Merely 9.3 % rank their success as below average. Hereby mostly micro-sized companies classify themselves as below average (73 %).

None of the SME companies estimate their success as highly above average. But participating companies above 500 employees did so with 42.1 %.

CONCLUSION

Principal objective of this paper was to analyse the results of an empirical study among SME in Germany with respect to controlling in general and the applied controlling instruments in practice.

Concerning the structure of the participating companies there can be assumed that the sample of companies represents a balanced allocation that means no size-range is excessively dominating the other ones. Also the appearing branches seem to be typical for the German SME sector. Therefore, it can be expected that the findings of the study can be characterised as representative for SME in Germany.

In general, there can be observed a positive connection between the company size and the organisation of controlling in respect of employing staff which is especially responsible for controlling matters and also the number of special controlling staff. Also it can be stated that with increasing size of the company general management is less involved in doing controlling.

The reporting quantity is approximately in 40 % of the companies a monthly reporting. Also a quarterly reporting is widely common at SME. For the majority of 57 % of the attendees controlling is very or at least important and most of the companies presume controlling becoming more important in the next few years.

Focusing on the different controlling instruments it can be concluded that operational controlling instruments are more widespread than strategic respectively value based ones. There can be observed the tendency that smaller companies are restricted mostly on operational instruments, however, with increasing size companies are also opening towards strategic instruments. Regarding the satisfaction of companies with the implemented instruments there is a higher satisfaction with operational instruments though the satisfaction is slightly decreasing regarding strategic concepts.

THE CASE STUDY OF AN ITALIAN PUBLIC UNIVERSITY: A NEW APPROACH IN THE ORGANISATION

Broccardo, Laura¹

¹*University of Turin*

Purpose - This research takes into consideration the study of an Italian Public University which has felt the need to reorganize its structure in order to reach its final goal to guarantee a better service all round.

The structure of this educational organization is characterized by nineteen Autonomous Bodies composed by seven Faculties and twelve Departments. The Faculties have an educational output and departments have an output identified by research activity.

The aim was to substitute the "segmentated" running of the Autonomous Bodies (departments and faculties) with one which has common goal for everyone. An overall view is essential to be able to comprehend the complex situation. In order to reach this goal it's important for this university to know and to manage the own processes.

The goal of this project is to identify a method that allows to reduce the bureaucracy caused by the Autonomous Bodies who act as a go-between for the University and the external agencies which represent the welfare system (insurance, pensions).

Design/methodology/approach - The research has been conducted through an empirical analysis of exploratory case study and the results are based on interviews.

In fact we have interviewed the responsible of each Autonomous Bodies; this method of research allows us to map the single activities of the process analyzed.

The choice of a case study is one of the most appropriate method of empirical inquiry because qualitative studies are necessary where organizational processes are involved.

Our analysis concerns an example of educational organizations due to the fact that the public sector is characterized by a radical change.

Findings - In the University W. P. both Faculties and Departments need staff in outsourcing to satisfy teaching and research requirements. This present situation cause a big problem because these subjects are on external contracts. This type of contracts generates relations with a lot of External Agencies for example fiscal and social offices that receive payments from each Autonomous Body, but actually the interlocutor is only one: the University.

Based on evidence, and in particular analyzing this most relevant issue using a processes approach, we pointed out the following inefficiencies:

- duplication of activities concerning the drawing-up and management of a contract;
- duplication of activities concerning relations with External Agencies;
- delay about presentation formal documents and payments.

The mapping and the improvement of the process "Human resource recruitment: not employee" pointed out that is important to broaden this analysis to the mega processes. In fact this could help a better integration between processes and sub-processes in order to reach the strategic targets of the University.

Research limitations/implications - This study take into consideration a single case study, but for future research it's necessary to compare this situation with another.

Originality/value - This study contributes to identify the relevance of processes approach to reduce the bureaucracy both in terms of costs and timing. It also identifies the gap between Autonomous Bodies and processes (relevant topic in the main literature).

The relevance of this research is justified by the fact that the processes approach and the re-engineering are important, especially referring to the Italian public sector. In fact the state-run companies are involved in a radical change which is caused by the following factors:

- the decentralisation of administrative offices
- the increasing of the consumer demand / requirements
- the introduction of competitive mechanisms
- the implementation of new technologies

Keywords: process management, processes organization, university, educational organization.

INTRODUCTION

In the public sector it has become essential to overcome the traditional fragmentation of responsibilities and consequently to revise the administrative processes.

The evolution towards a " process organization " allows to define organizational structures responsible of the whole process, identifying the "process owner".

The adoption of the process approach allows:

- the recomposition of work and professionalism required, overcoming the fragmentation of duties and responsibilities;
- the streamlining of the organization, also through the creation of interfunctional teams with responsibilities on common goals;
- The adoption of quality management and continuous improvement based on the observation of results and bottom-up participation of all actors;
- The establishment of formal management processes with the adoption of reporting systems integrated with the management control system.

The importance of the adoption of process approach is due to the change that is going through the public sector.

The reasons for the change is due to:

- the pressure to the decentralization of administrative functions
- greater needs of end-users (citizens, firms, community), which require services more efficient, without wasting time;
- greater responsabilisation of public manager on expenditure levels, for the effect of policies on financial recovery.

THE METHOD

The research has been conducted through an empirical analysis of exploratory case study and the results are based on interviews.

The choice of a case study is one of the most appropriate method of empirical inquiry because qualitative studies are necessary where organizational processes are involved.

Case study research excels at bringing us to an understanding of a complex issue or object and can extend experience or add strength to what is already known through previous research.

Case studies emphasize detailed contextual analysis of a limited number of events or conditions and their relationships.

Researcher Robert K. Yin defines the case study research method as an empirical inquiry that investigates a contemporary phenomenon within its real-life context; when the boundaries between phenomenon and context are not clearly evident and in which multiple sources of evidence are used (Yin, 1984, p. 23).

Case studies are often criticized for lack of statistical reliability and validity.

Also, it is argued that the risk in using only a few case studies is the loss of external validity.

Still, the insight and relatively deep understanding facilitate analytical generalization so that findings can be generalized to theory (Yin, 1984).

To overcome this dilemma it is increasingly important to select a representative case and validate the result continuously and not simply at the end of the study.

This case study was analyzed through interviews conducted with the Administrative Secretariats of the Faculties and Departments. The main purpose of the interview was to gather information and issues concerning the process "Acquisition of external human resources: personnel not employee" to be devoted

primarily to teaching courses (with particular attention to the category of contract teachers) and research projects.

The interviews were semi-structured to be kept within the main question area but still open the possibility to get the interviewees own ideas and feelings.

The interviews also included some questions to verify the good quality of answers.

Case studies are complex because they generally involve multiple sources of data, and produce large amounts of data for analysis.

Researchers from many disciplines use the case study method to build upon theory, to produce new theory, to dispute or challenge theory, to explain a situation, to provide a basis to apply solutions to situations, to explore, or to describe an object or phenomenon.

In this study we used this tool to explore and describe a phenomenon and its consequences.

The advantages of the case study method are its applicability to real-life, contemporary, human situations and its public accessibility through written reports. Case study results relate directly to the common readers everyday experience and facilitate an understanding of complex real-life situations like this one.

ANALYSIS OF THE PROCESS "PROCUREMENT HUMAN RESOURCES: PERSONNEL NOT OFFICIAL"

Issues

The problem considered at the University W. P. is related to contracts with the non-employee staff of the University which work both in the Departments for the purposes of research, both in the faculties, for teaching (courses, exercises ...).

The problem arises because contracts stipulated by the Autonomous Bodies, Departments and Faculties, they create relationships with other external bodies such as INPS and INAIL (Italian welfare bodies) which receive payments from nineteen Autonomous Bodies, when in reality the interlocutor is one: the University.

Also when it is necessary to prepare certain documents required by tax law is critical. In fact, if the same person has worked for several Autonomous Bodies, all data must be collected and summarized in a single document to avoid duplication. The classic example is related to the redaction of CUD (an Italian document which certified the payed income), where it was found difficulties to coordinate the various offices for the exchange of documentation.

Moreover, at level of data processing system, there are problems related to the database. Every Autonomous Body has its own database, so if a person works with several Autonomous Body, it appears in several database creating problems to the Central Administration.

Consequently, after to have considered the issues highlighted above, the activities executed in the Central Administration, like for example the drawing up of the budget, the balance sheet ect were mapped in order to understand the general working of the University. In a second moment, we moved to observe, through interviews conducted individually with responsible of Administrative Secretaries of Autonomous Bodies, the process currently adopted for the acquisition of human resources as staff not employees.

The final goal was to redesign the process "Acquisition of human resources like personnel not subordinate" both with regard to the Faculties and to the Departments in order to solve the problems recognized.

The critical identified are:

- 1) to define a procedure for Autonomous Bodies described in a clear and comprehensive way;
- 2) to define the duties of the Autonomous Bodies and the duties of Central Administration;
- 3) to determine when it is necessary to centralize or to decentralize;
- 4) to identify how to maintain the autonomy of the Autonomous Bodies;
- 5) to define the paper flow of documents to the Central administration.

The intervention

At this point, speaking of public sector, it is helpful to clarify the link between the concept of process and the concept of administrative procedure. An administrative procedure is defined as the set of documents, identified by laws, connected and tending to a single act with external relevance. The process is composed by activities that are linked together in time and space and they are conducted by the resources of a firm; starting with defined inputs, the activities produce an output used by "clients"³⁰. Administrative procedures and processes have in common the transverseness to administrative structures: a procedure can pass through several administrations and through several offices in the same administration. In the same way a process is transverse to the organizational structures. The main difference is in the level of generality to which they relate. A "process" can also be the set of different procedures.

In the public sector is difficult to identify a process respect the recognition of the procedures.

³⁰ Bracchi-Motta, *Processi aziendali e sistemi informativi*, Franco Angeli Ed, 1997

As regard the main intervention techniques on the processes they are generally identified in the Business Process Reengineering - BPR and Business Process Improvement - BPI.

The business process reengineering (BPR) consists into put the process change at the centre of analysis and design of new firm systems. The essential characteristics of BPR are: the radical redesign, the analysis of the performance discontinuity, the use of information technology, integrated with the organizational interventions. The main feature of reengineering consist to look to the processes as if they were redesign ex novo, imagining alternatives also completely revisited.

For example the execution in parallel of the activities can allow the achievement of significant improvements in terms of total time of execution of the process, because it eliminates waiting times. It also tends to reconstruct fragmented activities, introducing new tasks, which often is called case manager because in the new job are collected all the activities necessities to give a comprehensive reply, timely and customized to the single case.

Traditionally BPR focuses on macro-processes and not on single operating process, even if it is possible to apply techniques of reengineering processes at this level, for example, in the public sector, can be used for the simplification, streamlining , automation and decentralization of administrative proceedings.

The other method of managing the processes, very effective in improving efficiency, is the Business Process Improvement (BPI). The application of this method simplifies the process eliminating waste and unnecessary bureaucratic procedures.

The BPI acts simultaneously on all levels of the organization, involving both management and specialists in activities of medium and long term. The goal is to make the whole process effective and appropriate in manner to avoid the error to improve the sub-processes that compose it without that the process in its entirety will take the necessary benefits.

The process examined "Acquisition of human resources: personnel not subordinate" is an operational process and it is part of a macro-process that could call "Acquisition of human resources." For its review, it was decided to use the technique of BPI and therefore those of improvement, because the technique of BPR could have to cover the re-design of the whole macro-process.

The goal of the intervention: the discontinuity and the duplication of the activities

The technique of BPI, which is used in this case, should not be seen as an isolated activity carried out only once, but rather included in the widespread processes of improvement and, if necessary, replaced with the change introduced in a radical way, with the BPR.

The problems identified in the process analysis can be summarized as follows:

- the duplication of activities of the documents request to the interested subject (for example the personal data of the subject are request not at a time)
- the duplication of loading data on the database of the used software;
- the duplication in the presentation of the models to bodies such as INPS;
- the lack of timeliness in the signing of contracts;
- delays into presentation of documents;
- delays in payments;
- incomplete information provided to comply with all legislative requirements;

In rethinking this operating process, we tried to remedy these problems trying to centralize some activities relating to the signing of the contract and the payment of compensation.

THE INTERVENTION

The phases of intervention

The method of BPI for the review of sub-process object of research is summarized in a few stages which are detailed below.

Step 1: Definition of the intervention

In this first phase of intervention it should be:

- to define as clearly as possible what are the main reasons that lead to an intervention of BPI;
- to identify the context of action and the organizational units involved in the process under consideration;
- to define the organizational constraints that it must comply, or that it is possible to modify in planning the solution.

Consequently it was necessary to interview the seven Administrative Secretaries of the Autonomous Bodies (Faculties and Departments).

It emerges, for homogeneity motivation, the need, for all the Secretaries, of a periodical meeting where it is possible to exchange ideas and information.

Step 2: Diagnosis of weaknesses and priorities

The phase of diagnosis aims to identify critical points of this operating process.

The goals of diagnosis are:

- The thorough examination of the problem, the analysis of its causes and the interpretation of consequences and implications global for the organization;
- the detailed analysis of the constraints, the obstacles and the opportunities for overcoming the problem in a realistic way in the context and with the forces of the organization;

- the presentation of the results and the information geared to the identification and the selection of solutions.
- At this point it's opportune to highlight because it is important to make a diagnosis:
- to analyze the existing process it is necessary because in most of the public administration there is not a precise awareness of what are the processes, and it tends to confuse too easily with the procedures;
- to analyze the existing processes it is useful to understand better the importance of change, because it highlights the gap, the difference between the current situation and the desired situation;
- the understanding of the existing process allows to argue future requests of resources that will be necessary to implement the new design;
- finally, it must remember that only if there are clear the existing problems it is possible to avoid to repeat these in the re-thought processes.

In the specific case under examination, the diagnostic phase was completed with the reconstruction of the real process (see paragraph 4.1).

The "process map" defines the process analysed, the activities, the relations between the various intervention activities, and it describes the process as is, and the main characteristics:

- activities;
- input;
- output;
- players
- rules and constraints.

Step 3: Process Improvement

This phase has the aim of improving the process, through the revision of certain activities in order to:

- delete operations without value (so they do not meet the needs of any actor involved in the process): for example, to eliminate or to limit the transfer between units of intermediate output, the repetition, the remakes, etc;
- recompose fragmented activities or to streamline flows too complex, coherently with the analysis of legal constraints;
- unlock the "bottlenecks" and prevent the depletion of critical resources, through synchronization of operations of the process, the balancing of resources devoted, etc..;
- substitute activities "grouped" with activities "in line": for example, to avoid that it is necessary to accumulate a certain number of practices before to examine these, it is required to intervene in situations of waiting ;
- unify and share the information required for the execution of the process and for the control in order to avoid double data loading inconsistencies, reconciliation of data, etc..

Considering the above it is possible to reach a redesign of the process examined, describing the phases and summarizing the process as outlined in the paragraph 5.

Mapping of the process "Acquisition of human resources: personnel not subordinate "

After the interviews to the staff of the University and the elaboration of the information acquired it was possible to map the process and to highlight the logical sequence of steps and interconnection between the different offices.

Despite the different objects of activity (research and teaching) which are executed at the University and some substantial differences in the types of contracts it is described only the process "Acquisition of human resources: staff not subordinate" related to the Faculty, because it is very similar to the same process in the Department.

- The process begins, on the basis of "educational plan", with the necessity to find external staff for teaching activities and with the verification by the Administrative Office of the availability of funds in the budget to cover the engagement.
- The request is formally made to the Faculty Council that, after examination, it can reject or accept it.
- In the latter case there will be a formal measure of the Board of the Faculty which will express an opinion on the financial side, while the Faculty Council will decide on teaching side.
- Following the decision of the Faculty Council, it is necessary to "reserve" in the balance sheet the sum for the compensation.
- At this point it is necessary to publish the notice of selection, arranged by the Faculty Council and formally drawn up by the Secretary of the Presidency.
- The Faculty Council appoints the Examining Committee, which reviews the applications and prepares the ranking resulting from the selection.
- Publication of the pass-list by the Secretariat of the Presidency.
- Approval of the pass-list by the Faculty Council;
- Against that list or against the subsequent decree of approval by the Faculty Council any recourses may be moved.
- After this step, it may be that no candidate is deemed suitable in this case it is possible to restore the procedure, issuing a new invitation.
- If it is found a the suitable person, the Dean of Faculty will issue the decree of appointment.
- Following this document, the contract, prepared by the Administrative Office, will signed (by the person chosen and the Dean of Faculty).
- From the 1 January 2007 it should also communicate within 24 hours of the day before the establishment of the employment relationship and the beginning of the employment also to the Employment Center territorially competent.

The above is valid to the generality of the contracts concluded in the Faculty, but for the case of "professors with contract" there are some peculiarities which are described below.

- In this case there is an involvement not only of the Administrative Office of the Autonomous Bodies, but also to other central offices. In particular, the Office of Teacher Personnel receives and examines an excerpt of the Faculty Council resolution and the decision approving the pass-list.
- After these documents, the Office of Teacher Personnel issues a Rector Decree authorizing the appointment (the decree, signed by the Rector, is issued after attestation of regularity by the Dean of Faculty).
- This Decree is sent to the Faculty (Secretary's Office) which, after making the final checks, will stipulate the contract. On signing the contract there are also required tax information that will serve for the next payment.
- Following this act, the person will be registered to the Public Registry.

- The last formal act to be done before the start of the activity is called "taking of Service", and the sign is done in the offices of the Secretariat of the Faculty.

The procedure, however, does not end here, because the bureaucratic aspect of contract is only one part, and the other fundamental aspects are referred to the accounting, which regards to all types of contract.

- All the documents are sent to the Administrative Office of the Autonomous Body which will transform the reservation be made in the balance sheet.
- At the end of the service, the Dean of the Faculty, on the basis of the attendance register for teachers under contract or on the basis of a report of the scientific responsible, will attest the effective work of the resource and the Administrative Office of the Autonomous Body, after checking the accuracy of tax information previously collected, will pay the net amount due, with the timeframes specified in the notice and the contract.
- Within the day 16 of the month following the payment, the Autonomous Body will pay the contributions (INPS, IRPEF, IRAP).
- The data of the contracts in question are addressed to the Central Salary Office to drawn up some fiscal documents (CUD and the model 770).

REVISION OF THE PROCESS "ACQUISITION OF HUMAN RESOURCES: PERSONNEL NOT SUBORDINATE"

The phases of the new process "Acquisition of human resources: personnel not subordinate at the Faculty"

- INPUT: The need to find external staff for teaching activities;
- STEP 1: the teacher requires to the Secretary to conduct an administrative check on the availability of funds in the budget for the coverage of any assignment;
- STEP 2: (1) whether there is not coverage, the process ends; (2) if there is coverage, the request is made to the Faculty Council;
- STEP 3: Review by the Faculty Council of the request, which may (1) be rejected and consequently filed or (2) the application begins;
- STEP 4: In case (2) the Board of the Faculty shall deliver an opinion on the financial side;
- STEP 5: Following the advice of the Faculty, the Faculty Council shall act on teaching aspect;
- STEP 6: The Administrative Office conducts the reservation to the balance sheet to cover the engagement.
- STEP 7: publication of the notice by the Department (Secretary's Office);
- STEP 8: appointment of the commission by the Faculty Council;
- STEP 9: collection of applications presented to the Secretariat of the Presidency;
- STEP 10: Review of applications submitted by the Commission;
- STEP 11: The Committee shall establish the pass-list resulting from selection;
- STEP 12: The Secretary's Office publishes the pass-list;
- STEP 13: approval of the pass-list by the Faculty Council;

Some possible claims against the decree of approval of the pass-list;

where there is no suitable candidate (1) it is possible to restart the procedure (by Step 7) or (2) to surrender;

-
- STEP 14: where is located the suitable candidate, the Dean of School will sign the decree of appointment;
 - STEP 15: Secretariat of the Presidency will send within 15 days (from date of issuance of the decree) the decree of appointment both to the person concerned and the Teaching Personnel Office;
 - STEP 16: The contract is drawn up in the Teaching Personnel Office for all types of contract within 30 days from the date of receipt of the decree of appointment;
 - STEP 17: within 5 days of the drafting of the contract, the Teaching Personnel Office sends letter the person concerned inviting him at the Rector's Office (academic staff) to sign the contract and for to take the service which must to be made within 15 days of receipt the letter;
 - From the 1 January 2007 it should also communicate within 24 hours of the day before the establishment of the employment relationship and the beginning of the employment also to the Employment Center territorially competent.
 - STEP 18: sending a copy of the contract, by the Teaching Personnel Office within 2 working days by signing the contract, to the Salaries and the Balance sheet Office;
 - STEP 19: The Balance sheet Office within 5 working days from receipt of the contract communicates to the Public Registry the compensation of the subject;
 - STEP 20: The Balance sheet Office within 30 days from the reception of the contract would make the compensation for the expenditures between the Central Administration and Autonomous Bodies;
 - STEP 21: Communication to the INPS within 30 days from the reception of the signed contract and INAIL communication by the Salaries Office within the day before the start of the activity ,
 - STEP 22 (b): a teachers with contract at the end of the academic year (October 30) sends the register of admissions to the Dean of Faculty;
 - STEP 23 (a): the Dean of Faculty attest is the actual work of the resource and communicate it to the Salaries Office;
 - STEP 23 (b): the Dean of the Faculty announced the implementation of the provision to the Salaries Office by 15 November;
 - STEP 24 (a) The Salaries Office shall pay in accordance with the timetable in the contract;
 - STEP 24 (b) The Salaries Office shall pay by December 15;
 - STEP 25 (ab): the Office Salaries drawn up some fiscal documents (CUD and the model 770)

CONCLUSIONS

On completion of this work, particularly after the intervention aimed at improving the sub-process "Acquisition of human resources: personnel not subordinate" it is clear that it would be appropriate to extend this analysis to the macro-processes of the organisation, also considering the strategic aims of the University, so that all processes, sub-processes and processes operate in an integrated manner.

So that the structure operates in a uniform manner it is necessary to identify the primary processes of the organization, those related to institutional mission of the University, which create "value" outside recognized by customers.

It is on these processes first of all that it is necessary to reconstruct and model the critical areas and possible improvements

The final goal of a more precise analysis is to ensure the quality of service provided by the University. Indeed, in our opinion it is necessary, before starting a BPR and BPI project, to analyze the needs of users of the service of the University. In particular, it is necessary to identify the aspects of quality perceived by the user and relevant to him. The identification of quality factors leads to different results depending on the services analyzed. For administrative services, the qualitative factors as timeliness (speed, punctuality, etc) and reliability (no errors, corrections, etc).. For delivery services, the quality factors are determined by the nature of the benefit. For all services, in addition, there are general factors of quality, such as those pertaining to the relationship with staff.

Not only the qualitative aspect is the most important, but we must also keep under review the efficiency as a ratio between the results achieved (outputs) and resources used (inputs).

But there are also other aspects to monitor and these are the policy and transparency.

In fact, the public administration, unlike most private services, has to combine the satisfaction of user needs with the achievement of policy objectives, which are not always explicitly requested. The improvement of the indicators of efficiency, effectiveness or quality should not be at damage of the adequacy of the service in relation to the overall objectives that come from the institutional mission, which are processes and activities for prevention and control, and which usually not correspond with a specific "user", but with the entire community.

It was underlined the importance of a change within the University, but at the same time, it was revealed that this change to be implemented must take into account many variables, and the human element belonging to the facility.

Rethinking the processes would seem to be of fundamental importance in order to work in a totally new company and to avoid duplication of activities by the various working groups.

³*Local and international development Operator, Campania Region*

Driven by factors like globalization, internet introduction, increased competition and declining customer loyalty the firms are facing a structural transformation. This paper represents a analysis of that aspects of globalization and internet that affects the process of value creation. This is done through the examination of two different model relative to considered concepts and trough a proposition of a dynamic integration of the same ones within the context of Mediterranean competition. The aim of this paper is to highlight the ties between internet, globalization and value creation, through the analysis of how this relations concretize itself in the dissimilar business area. A profile of South Mediterranean Country innovative competencies is developed through the "Italmed" case study. The paper argues that matching globalization and internet in a unique model, with the aim to explain the main theories or arguments of this dimensions and to map them with inter-relational perspective, characterizes the level of competitiveness and represent the basic premises of value creation.

Key words: Internet - Globalization – Value creation – Dynamic - Mediterranean competition

INTRODUCTION

Factors that have contributed to globalization include increasingly sophisticated communications and transportation technologies and services, mass migration and the movement of peoples, a level of economic activity that has outgrown national markets through industrial combinations and commercial groupings that cross national frontiers, and international agreements that reduce the cost of doing business in foreign countries. Globalization offers huge potential profits to companies and nations but has been complicated by widely differing expectations, standards of living, cultures and values, and legal systems as well as unexpected global cause-and-effect linkages. Although many large companies have globalized for decades, the Web, more than any other phenomenon, has enabled the smallest company to have a global presence. While society in general may not yet be living in a world without borders, from a business perspective it's already here (Sengupta et al., 2005). Thanks in large part to the explosive and continuing growth of Internet usage worldwide, having a global strategy is no longer an option for most companies. It is a necessity. The recent trend towards globalization in mass communications has had a drastic effect on the world. With the use of the internet technology there can be seen a great positive force on globalization as it tends to increase the communication processes between people living in different parts of the world and also helps to promote the political, social, economic, and cultural aspects of a country (Streeten, 2001; Sirinivas, 1995). The impact of internet on globalization has both positive and negative aspects (Hay & Marsh, 2000; Held et al. 1999; Fulcher, 2000; Foster-Carter, 1996; Killminster, 1998; Busch, 2000; Bauman, 1998; Robertson, 1992; Holton, 1998). The positive impact of the internet technology on globalization includes the modernization and improvement in the business sector on a world wide basis. Internet have strengthen the information accessibility, in fact, the action of internationalization always derives from an information – internal and external – its result always depends on the size of the information achieved by a firm (Guadagni & De Tommaso, 2007). As there is a positive impact of internet on globalization there can be seen a negative impact of internet on globalization as well. In fact, in less developed countries as in developing countries the internet technology generally does not have a neutral application. So, it causes social costs, as well as costs in the form of urbanization, employment displacement, and the "digital divide".

Globalization has brought on the international scene new actors which differ from the traditional ones. Among these new actors the transnational corporations represent the largest presence. They are private

actors which pursue profitable aims and they have great influence over economic trends (Ansoff, 1980). An aspect which is even more important than their economic influence is their capability of displacement.

The aim of this paper is to highlight the tie between internet, globalization and value creation, through the analysis of how this relations concretize itself in the dissimilar business area. In this perspective, we analyse the literature on the internet role, on the definition of globalization (Busch, 2000; Held et al. 1999; Waters, 1995) and on the drivers of value creation (Guatri, 1991; Porter, 1988) to match those in a unique model. The mean of this essay is to explain the main theories or arguments of this dimensions and to map them with inter-relational perspective. Starting from the considerations introduced, at the aims to underline the changes of factors affecting value creation, occurring after internet introduction, this paper intends to offer a qualitative analysis of business areas testing the factors by which they are affected and leading back them to a prevalent theory.

The research is performed in different steps. It starts from a synthetic review of the literature concerning globalization, internet and value creation. Then, the analysis of "Globalization framework" and Enterprise 4.0 models. Third, the attempt to develop this model in a dynamic perspective. Finally, the proposition of the "Dynamic Internet –Globalization framework" and the analysis of the Campania region's projects in the transport and logistic sector. The research objectives were achieved by analysing the globalization trends, the scope and impact of economic forces and actors, and the capacity of societies to manage their consequences, as well as through the analysis of each area of the "Globalization framework model", the strengths and weakness and the opportunity to develop it in an integrated perspective in order to adapt the model to the new trends of globalization and facilitate the value creation.

The value's creation require time and care from the parts that are involved from Internet, as we clarify into paper, the IT permits to reduce time and costs into process of value creation, it stimulates the co-creation.

In this view, research try to identify, define and refer to the appropriate testing tools the determinants of corporate value, the distinctive contribution of Internet reference to a particular class of companies, or those operating in South Mediterranean area.

The goal of analysis is to propose instruments for the consolidation and expansion of the network of institutional relationships between Campania and Mediterranean countries in order to create conducive conditions to the development of partnership networks among public and private partner of socio-economic, cultural and scientific development of territories involved. The models presented intends to facilitate the management of Campania's institutional cooperation and economic internationalization processes, in a scenario that is being foreshadowed as the most important world market: the Mediterranean.

Into article have been analyzed, amplified and applied two models: the model of Globalization framework model of Manardo (2000) and model of Enterprise 4.0 (Giacomazzi F & Camisani C., 2008). The first maintain the importance of Internet's role into process of acceleration of the Globalization; the second permits to verify the practical application of the instruments of internet into relationship process – internal and external – of the enterprise, in particularly into a complex environmental of globalization.

GLOBALIZATION OUTLINE AND INTERNET

The multi-facets character of globalization makes it difficult to conceive what globalization really is, in fact, globalization means many different things to many different people which renders an attempt to map out the debate on issues around its rather new. So, one of the first issues is attempt to define what one is talking about.

As Dutta (2002) has mentioned "In the absence of economic regionalization, the paradigm of globalization is likely to be operationally dysfunctional...Regionalization can help regional economic unions/ communities enjoy competitive shares of world output and trade and thus become competitive actors in the inter-regional competitive world market, contributing to the success of globalism (Hoecklin, 1996).

Busch (2000) argues that globalization refers to a world in which, after allowing for exchange rate default risk, there is a single international rate of interest. According to Held, McGrew, Goldblatt and Perraton, (1999) globalization implies, first and foremost, a *stretching* of social, political and economic activities across frontier such that events, decisions and activities in one region of the world can come to have significance for individuals and communities in distant regions of the globe.

Griswold (2000) suggests globalization is the growing liberalization of international trade and investment which result in increases in the integration of national economies.

This definition has expanded by Henderson (1999) that comprise five related parts:

- The increasing tendency for firms to think, plan, operate, and invest for the future with reference to markets and opportunities across the world as a whole.
- The growing ease and cheapness of international communications, with the Internet as the leading aspect.
- The trend towards closer international economic integration, resulting in the diminished importance of political boundaries. This trend is fuelled partly the first two trends, but even more powerfully by official policies aimed at trade and investment liberalization.
- The apparently growing significance of issues and problems extending beyond national boundaries and the resulting impetus to deal with them through some form of internationally concerted action.
- The tendency towards uniformity (or harmonization) by which norms, standards, rules and practices are defined and enforced with respect to regions or the world as a whole rather than within the bounds of national states.

The emergence and growth of a single global market render nation-state borders meaningless (Held et al. 1999). In this view the global flow of capital and labour and the integration of markets will accelerate the processes of globalization.

As market shares increase in international scope and corporations become global, the need for information increases. A reliable and competitive telecommunications structure will, in turn, encourage investment by multinational corporations (Hudson, 2000; Sauvant, 1983; Ratliff, 2004), which further encourages global trade and network formation (World Bank, 1998; Kiplagat and Werner, 1994).

The advent and rapid development of information technology, and particularly Internet, have transformed the business mode of information transmission, generating a significant change in the world economy. The key factors of digital society development, in which individuals, businesses, institutions and, generally, the whole country system are moving into permanent/interactive network connections can be identified in (Valdani, 2000):

- The spread of personal computers;
- The process of digitization of information, images, music and communications;
- The development of high-speed communications infrastructure of data transmission.

Each field of business management was affected by the use of the Internet: the management of transactions, online trading, all activities that have contributed to the construction of a square International trade efficient. Through the use of all technologies in common evolution, a growing number of information was exchanged, as a result many barriers to entry to new markets have fallen, costs have been reduced, customer service has expanded to new opportunities and generally improved (Marangione, 2005).

So, ICT could support knowledge management (Rullani, 1994) policies through the socialization, exteriorization, combination and interiorization of knowledge (Nonaka, 1991). Deep in a scenario such as that proposed, a company that builds its environment, through strategies Resources based (Barney, 1991), no longer recognizes national and sector boundaries, but goes beyond them and past them becoming cross border (Singer, 2002). In that sense, the term cross-border vein to put out a set of relationship and business-

like border and inter-sectoral. Therefore, the application of tools and traditional methods are insufficient when applied to the new realities are proving inadequate and also the application of traditional methods that aim to quantify the value, without there being a re-reading that takes into account the unique characteristics emerged, i.e. the characteristic features of digital economy (Metallo & Pencarelli, 1997). Despite the widely held belief that information technology (IT) is fundamental to a firm's survival and growth, scholars are still struggling to specify the underlying mechanisms linking IT to financial performance.

According to Yip (2000) globalization and rise of internet are the two most powerful forces, which interact and its create joint effects.

Internet has permitted a new method of relationship, it move different relationship capabilities, The net can constitute an interesting "space" for enterprise that operate on the global market (Giacomazzi & Camisani, 2008). The relationships between enterprise and surf, the new interaction's methods, the profitability of net are strategic points. The diffusion of Internet involved the human activity at every levels, it is become an instrument of relationship process. the web is indispensable to manage and meet the complex of competition and of demand. The evolution of technology has engrave on the method and on canal of management relationship flow, this change the has involved the enterprise, in fact they use the net for distribution, communication in relation to get to customers, in order to external and internal communication, in relation to management the human resources et cetera. The business strategies find concrete application with instruments of net, it's important the need of firm to create and manage (internal and external) complicate relationship. This revolution involved whole company functions, it's amplified by Web 2.0 (net read and write), terminologies mint in 2004 from Tom O'Reilly. Of point of strategic view the web 2.0 involve a new vision, i. e. a product open source that modify the relation models, it increase the participation, the collaboration and the sharing. From point of view operational/informational it is a platform that permits to user to utilise applications of browser, without the download of software on computer.

DYNAMIC INTERNET – GLOBALIZATION FRAMEWORK

Starting from those consideration we analyze the "*Globalization frame work*", improved by Innovative Leaders in Globalization program (1999)³¹, which provides a structure for the concept of globalization. In this frameworks six capabilities have been individualized. The six capabilities are: governance and responsibility; strategy and finance; marketing; sales and service; operations and technology; research and development; and human resources management (Manardo, 2000). For augmenting the analysis of IT's effects on firm performance we adopte the framework of the resource-based view (RBV) of the firm which links the performance of organizations to resources and skills that are firm-specific, rare, and difficult to imitate or substitute (Barney 1986, 1991). The resource-based view focuses on costly-to-copy attributes of a firm which are seen as the fundamental drivers of performance (Conner 1991; Rumelt 1984, 1987; Schulze 1992). The purpose of this paper is to employ the resource-based view to develop the theoretical links and examine the association between IT capability, globalization processes and value creation. Although this, the model of Manardo does not consider the role of internet in the globalization framework steer towards the value creation processes.

So in our view, it is necessary to develop this model in dynamic perspective which takes in consideration the internet role as an accelerator of globalization and as a vehicle of value creation. Therefore, we explain and qualify the relationship between the business area and the Information and Communication Technologies (ICT) specific of each one that helps to the realization of globalization processes and international expansion. Then we consider the effects of this ties on the value creation processes.

Manardo (2000) argues that "*Globalization is forcing companies to recognize the need to change from creating value for one stakeholder group to an expanded strategy of creating value across the enterprise for four key stakeholder*

³¹ *Innovative Leaders in Globalization program as presented at the World Economic Forum's Annual Meeting in Davos, Switzerland in January 2000.*

entities: providers of capital in the financial markets; customers in the products and services markets; employees in the labor market; and the most complementary business partners. It is only by effectively competing in all four areas that companies can deliver sustainable, superior returns for all stakeholders. This is managing for enterprise value – which is the central concept of the project's globalization framework”.

It is returned to the past but the effects are amplified. In order to characterize the role of Internet in the areas of value creation it must be left from the following task: the New Web (Web 2,0) has widened the possibility and the functionalities of the Web, before limited to the single consultation, in order to become a real “platform”. The read/write transformation in, that is the possibility “to write” and, therefore, to modify the new contents has open possibility (Giacomazzi & Camisani, 2008). If the value creation presupposes the active participation of the enterprise's stakeholders, Internet has allowed on one side to amplify the interaction of the value creators and, on the other side, to be involved new actors (which human resources, city, institutions, and others) strangely enough this instrument has allowed the consumer to recover own role in the value creation (Aiello & Cacia, 2009).

So, in light of the Globalization framework model of Manardo (2000) we propose a new reading of itself in order to draw attention to a map of the “main actions” of Internet in the value creation.

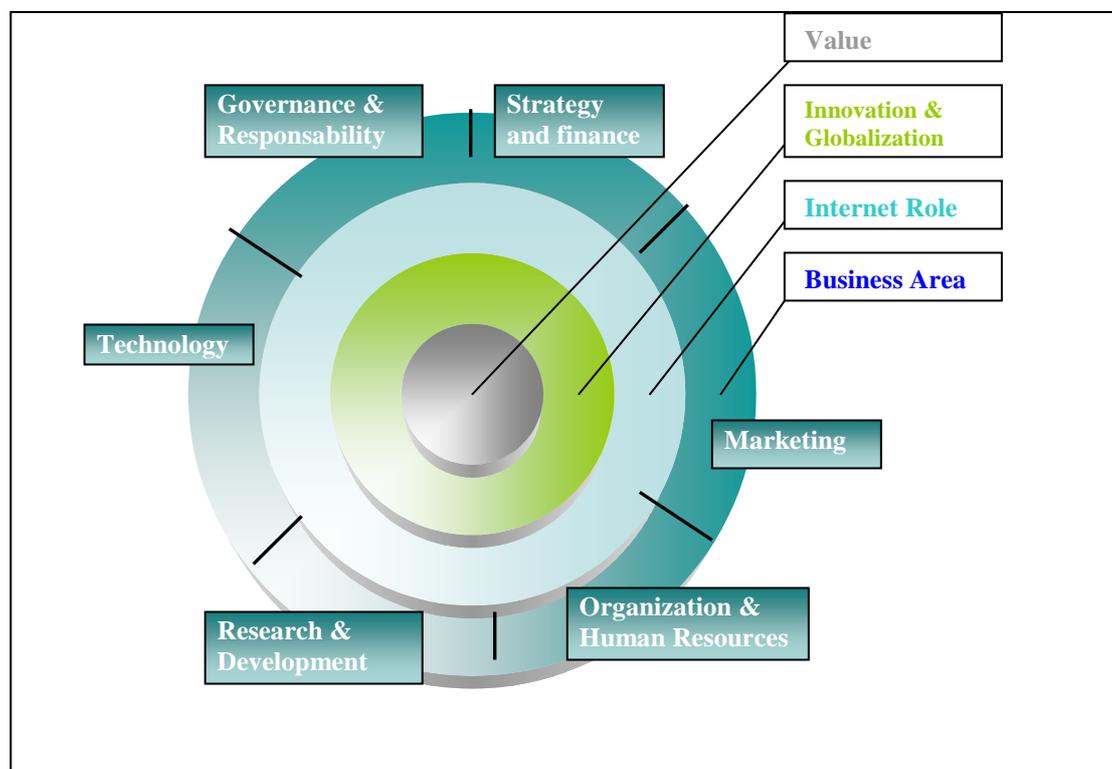

Fig. 1 – Dynamic Internet –Globalization framework. Source: our elaboration

For that reason, it is necessary to identify each areas of the model, that have a discrete and significant role in effecting the ultimate enterprise value, before analyzing enterprise as a whole, and highlights the core competence of the corporation (Prahalad & Hamel, 1990).

The first one is the marketing area; it has the task to plan, to activate and to realize an active action on the market, the marketing is that process face to create, to distribute, to promote and to pricing assets, services and ideas in order to facilitate satisfactory relations of exchange with the stakeholders (as well as customers) in a dynamic atmosphere (Pride & Ferrell, 2005; Kitchen, 2003). To frame the role of Internet in the area marketing is natural the two parts is by now unavoidable, is spoken in fact about and-marketing (Collin, 2000), of e-commerce (Earle & Keen, 2000) and of virtual space, nevertheless there are still enterprises that do not use such instrument the potentialities make or it in reductive way without lend attention to all, in particular in the value creation.

The second one has been individualized in technology. The technology area is the one from which Internet derives and in which that had the most tangible impact. Moreover Internet carries out a fundamental role in the development, spread and sharing of the technological innovation, as we will verify in the study the directions involved in this area. According to Manardo “*Internet-related technologies are enabling unprecedented levels of coordination, both within and across organizational boundaries and around the globe, all the while delivering significant improvements in operational efficiency and flexibility*”. Therefore, internet drive business need to re-examine many other aspects of their strategy.

The third capability have been individualized in the strategy and finance area. Financial resources allow business to carry out investment in activities that create the starting point for future income flow obtaining and for firm economic value development (D’Amato & Cacia, 2008). Therefore, financial system availability to support business requirement cause the opportunity to review firms structural characteristics across innovative process linked on technologies, productive processes and products (Parvani, 2002). To built a relation system capable of maintain and develop the firms growth and change processes is necessary that the information/ valuation process, come from that relation, would be inspired on efficiency and transparency. This is particularly significant for the relation between business system and financial system, that are based on uncertainty and risk conditions, on the basis of which decisions have to be take on; those impose attention on business reputation in order to ensure transparent perception by the stakeholders. In fact, the reputation as uncertainty transformer, could influence business performance and, for that reason, contribute to their success. Still, stakeholders perception doesn’t shape lonely on business information, but also on large context variables. So, firm's difficulty consist on being perceived positively by the public in the course of its natural dynamics and the changing conditions of context. The introduction of *information technology* have generate a considerable transformation on relations between firms and financial system. The web has allowed the construction of a fluid and transparent relationship between company and stakeholders, implemented through the transfer of the undertaking to inform the community as a whole and to bring all stakeholders alike. *The Web* use on financial and strategic processes allowed business to obtain a vast range of information look at context of reference but, above all endorsed to accelerate information sharing and to broaden the public it was designated too (Bollen & Hassink & Bozic, 2006). The introduction of *conference calls, internet, e-mail* either of *social network*, have open to the business the possibility to provide fast and specific information and, at the same time, to achieve a much better informed and sophisticated public. The consequent risk reduction perceived by investor and stakeholders, come from quantity and quality of information increase, generate less costly capital inflow and so, better performance (Bini, 2000). So, the degree of innovation and development of strategic and financial online plans become source of competitive advantage (Porter, 1980 - 1985) because potential capable of conditioning business development and survival. Those elements clarify the growing integration of new communication and information technologies on the value creation processes.

In line of this issue, internet-related technologies are well-suited to facilitating global research and development, that represent the fourth area of the model. Trought internet the companies could be more selective in their core R&D focus –i.e. increases the potential rate of product development cycles - and provide easier access to the complementary competencies of an extended research network, even diverse geographically located. At the same time, internet-related technologies could help advanced global companies to manage the *Human resources*, that represent a mast of the enterprise-value framework. The globally connected business environment facilitate the recruitment of quality employees from around the world and enable increasingly creative work arrangements that balance work demands and family responsibilities. This constitute a positive elements also thanks to the possibility of a better organizational structure of business. Therefore, Internet-related technologies can simultaneously enhance employee loyalty, give employees the confidence to succeed in other jobs (Manardo, 2000) and make enterprise capable to obtain competitive advantage and create value. More, referring to human resources, we need to make a reflection on the fact that globalization doesn’t suppress territorial differences; on the contrary it exalts them. It makes places more complicated, not homogeneous. For this reason an action of internationalization needs a cross-cultural management. The cross-cultural manager must have:

- both personal and professional suitable skills and a cultural literacy;

- a mindset that let him to better manage the cross-cultural situation.

The cross-cultural sensitiveness develop by passing from the stage of ethnocentrism to the one of ethno-relativism. The crucial stage is the adaptation, by which the manager keeps his identity and tries to accept the different culture. If there is a single trait that the domestic leader must demonstrate to be a global leader it is adaptability, which means displaying four distinct and increasingly difficult skills. First, the ability to operate across borders with confidence; second, to rise above the particularities of regions and cultures (Hofstede, 1983, 1984); third, to revel in diversity; fourth and most difficult, to operate in spite of high ambiguity and frustration. Aristotle wrote that the test of a first-class mind is the ability to hold two opposing ideas simultaneously and yet be able to function. How can we accept cultural differences without renouncing to our own identity? To answer at this question it is useful to distinguish the acceptance of different behaviours from the acceptance of different values. In this area Internet, in the last years, has mostly developed, allowing to human resources to share information, tools and “cultures”, contributing to an evolution in the value creation. Globalization represents a permanent change in the way business is conducted, and the Internet is part and parcel of that process.

Further, governance and responsibility area defines the objectives, accountability, and stewardship for a global organization and identify the company’s code of conduct for internal and external relationships as well as for business development around the world. According to Manardo (2000) Internet-related technologies have had the least impact on this capability area of the globalization diagnostic through the “ability to permit collaboration, proxy voting, and more dynamic and transparent financial information. On a human level, effective global boards of directors will increasingly need to be able to evaluate a company’s overall strategic plan, using the wisdom of accumulated industrial experience from across the globe as well as the innovative spirit of the digital economy.” Business is the major source of investment and job creation, and markets can be highly efficient means for allocating scarce resources (Capecchi, 2005; Freeman, 1992). They constitute powerful forces capable of generating economic growth, reducing poverty (Daly, 1997). But the gaps in rules, customs and institutions are often the main cause of the firms’ negative attitude above all in the field of human rights. The new actors, in the global landscape, bring problems which are both qualitative and quantitative. Quantitative problems are to be found not only in the increased number of actors, but, even more, in the impossibility to draw up a complete list of them. The qualitative problems are linked to the unusual characteristics of these actors which are mostly private actors with an institutional identity. They have neither state requisites nor a clear public identity so they are not liable to international laws. After their intervention, the international scene has become more crowded, dynamic and unforeseeable. This has caused the passage from an order marked by the international law to a global order regulated by a global governance where governance appears to signify a form of rule-making and rule-enforcing closer to the society and to the private interests. The international community is still in the early stages of adapting the human rights regime to provide more effective protection to individuals and communities against corporate-related human rights harm. The business and human rights agenda remains hampered because it has not yet been framed in a way that fully reflects the complexities and dynamics of globalization and provides government and other social actors with effective guidance. The focus should be on ways to reduce or compensate for the governance gaps created by globalization. Factors such as these make it exceedingly difficult to hold the extended enterprise accountable for human rights harm. However, the number of initiatives aimed at promoting standards, in this field, increases³², so collaborative models for their grievance mechanisms will likely become more important. This again underlines the strategic role of internet because such mechanisms require a strong collaboration among the members of the different organizations aimed at providing a single avenue for recourse and at achieving solutions.

Finally, even if globalization have contribute to an higher transparent construction, *internet* has made possible an effective reaching of different *stakeholder*. Each field of business management was affected by the

³² An example is represented by multi-stakeholder advisory groups (Nazioni Unite, Protect, Respect and Remedy: a frame work for Business and Human Rights – report of the Special representative of Secretary – General on the issue of human rights and transnational corporations and other business enterprises, 2008

use of the Internet: the management of transactions, online trading, the practice of investor relations, activities that have contributed to the construction of a square International trade efficient (Cacia, 2009).

So, internet and ICT becomes indispensable for all business functions and therefore, the information management move to value driver.

According to this hypothesis, internet have a fundamentals role, because give the possibility of divulge enlarge information compared with traditional vehicles, concern of economic and financial results, organizational structure, governance and behaviour rules, as well as guidance value (Rowbottom & Allam & Lymer A, 2005). Standardization and greater dissemination of information, therefore, can only generate a containment of redundancy of information and the risks of misinterpretation. This will help to generate in long-term, after the natural difficulties of introducing an innovation, benefits in terms of reduced costs of dissemination of information across the enterprise and increase the speed of acquisition and sharing of intelligence for market and, therefore, an increase in value.

Assigned an intense activities to the Internet it is not a simple instrument of information that amplifies and simplifies the interactions of enterprises, in reality, although there is not yet a great literature, the *Net* assumes various "configurations", the main ones can thus be summarized:

- service, simplifies and facilitates the access of the market to the offer;
- service of support, integrating part of the product as an example the reservation;
- half of distribution, e-commerce;
- mass media, e-communication;
- half informative, traditional role.

In this researches, the focus of proposed model is not to define the configurations of Internet but the its role in the value creation processes in a globalization perspective. To such scope we propose a new model given from the synthesis of two models:

- Globalization frame work.
- Enterprise 4.0.

The first one, as explained before, provides a structure for the concept of globalization, the second one is a model that highlight the potential relation flows on the internal side of enterprise and between enterprise and outside, and *vice versa*, that could be activate by the web. The added value of the search could be identified in the application of the 4 directions of Internet model (Giacomazzi & Camisani, 2008) in order to verify the link between directions (one, more or all) and areas; in last analysis, the aim is to identify the strategic directions in relation to each area and the respective sign of the direction.

So, in light of this consideration, internet, pushes the different parts of enterprise and of external environmental in more directions; the principal objective of enterprise, therefore, is that of make attention on each vector possible that New Web can generates.

The Net permits to enterprise of amplify the action of information but also it's make possible to extern public – market and stakeholders – to have more instruments for communicate whether with enterprise or whether between their.

The opportunity is: one multiply the contact point and the powerful of every parts of information process increases. Into figure number 2 – to follow represented – we have analyzed and elaborated the model Enterprise 2.0 of Giacomazzi & Camisani (2008).

"Enterprise 2.0 is a set of organizational approaches and technological support for certification of new organizational models that include the creation of an adaptive architecture, the application of collaborative tools of the Web 2.0 and the use of technology as an enabling platform processes and relations " (Polytechnic of Milano).

The model highlight the possible relationships that the Web can activates and keep, in according to Giacomazzi and Camisani (2208) – authors of model Enterprise 2.0 – the possible direction of relation flow are four.

All direction involved different subject, in fact, the direction *within-outside* start from enterprise to market (i. e. supplier, competitor, potential and/or effective customer) and to stakeholders (media, policy maker, citizen, et. al.); the direction *outside-within* is originated from external environmental (stakeholders and market) to enterprise. the direction *within-within* is originated is turn to internal subject of the enterprise, i. e. idem or different levels of the human resources.

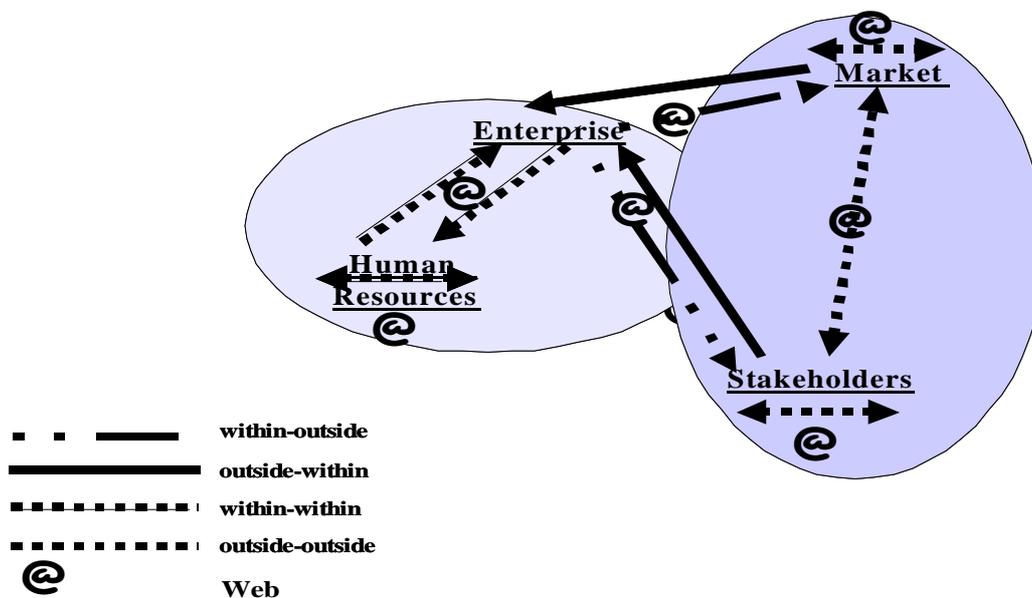

Fig. 2 – Enterprise 4.0: elaboration and role of Internet

Source: ours elaboration of Giacomazzi & Camisani's model (2008).

All direction involved different subject, in fact, the direction *within-outside* start from enterprise to market (i. e. supplier, competitor, potential and/or effective customer) and to stakeholders (media, policy maker, citizen, et. al.); the direction *outside-within* is originated from external environmental (stakeholders and market) to enterprise. the direction *within-within* is originated is turn to internal subject of the enterprise, i. e. idem or different levels of the human resources. The direction *outside-outside* is generated and destined from/to external environmental, i. e. market (customer-customer, competitor-customer), between stakeholders (policy maker-media), between market and stakeholders (policy maker-competitor, consumer association-customer).

For every directions on can to identify one or two different bidirectional flow, its are possibly by Web 2.0 instruments:

1. *within-outside*: e-mailing, the activity of direct marketing – consents an asynchrony communication between the parts, overcome all space-time barrier, the wiki, that is a site web or collect of documents localized on the Web where all parts can to insert different contents. It's an collaboration instrument to share on-line knowledge, the important aspect is that it's possible "recuperates" the inserts and the modifications into database in every time.
2. *outside-within*: the social market sensing, that is the study and the constant monitory of all that the people tell into social network with reference to enterprise-product-brand. Il social bookmarking che permette la condivisione dei link selezionati dall'utente.

3. within-within: instant messaging (Chat) – allows to communicate in real time with a synchronic method; the internal wikis permit the sharing of a “white space” where it’s possible to place and to modify different contents; e-mail, the communication is asynchrony, there isn’t space-temporal barrier.
4. outside-outside: social network – virtual “space” where a groups of people are register, they can interact between them, the OWOMM (Word of Mouth Marketing online) – online pass mouth, the forum – notice board where every subject can to insert a content, it’s share. An important aspect is that the eEnterprise doesn’t part of relationship process but it is the object.

Enterprise 4.0 means to apply of Web 2.0 to enterprise, it include different important instruments to modern firm. It’s a concept derived from that of: enterprise and web 2.0.

The models analysed and elaborated can to be instruments of strategic support for an enterprise or a territory’s policy maker, since its permit a new and dynamic point of view that on founds:

- full vision of business area and role of internet into globalization process,
- amplification of relationship by internet’s instruments.

Into article on apply the models to Campania Region’s Projects – ItalMed and ItalBalk – in order two motif: this projects utilise Internet as strategic point in all business area and its have as crucial point of globalization internet’s instruments.

The second motif is that between parts of project on can amplify the relationship by direction and instruments of web 2.0. The models showed can be for both business strategy and territorial strategy, in this paper the case study is a territorial project.

CASE STUDY: CAMPANIA REGION’S PROJECTS IN THE TRANSPORT AND LOGISTIC SECTORS.

Campania Region, together with other Italian Regions, has increasingly become dynamic in international relations not only in terms of the new constitutional competencies but also because of its growing intention to cooperate with neighbouring countries. These activities are part of various programs and initiatives financed by national funds within the Support Programme for Regional Cooperation and by EU funds through Interreg III which is an initiative of the European Regional Development Fund (ERDF) for cooperation between EU regions. The Campania Region has carried out several interregional projects in the field of logistics and freight transport. Among the most recent are:

<i>ITALMED</i> <i>Integrated Transport and Logistics linking Italy and South Mediterranean Countries (Morocco, Tunisia, Egypt, Algeria) within the line 2.2 (material and immaterial infrastructures) of the Support Programme for Regional Cooperation</i>
<i>General objectives</i>
<ul style="list-style-type: none"> • <i>to increase economic and productive integration, enhancing import/export trade and direct foreign investments of Italian companies,</i> • <i>to support Italian role of Mediterranean logistics platform;</i> • <i>to contribute to logistics' rationalisation to support specific supply chains;</i> • <i>to improve participants skills in managing International cooperation programmes about transport and logistics.</i>
Lead Region: <i>Campania Region</i>
Italian Partners: <i>11 Regions (Abruzzo, Basilicata, Calabria, Emilia-Romagna, Friuli Venezia Giulia, Lazio, Liguria, Puglia, Sicilia, Toscana e Veneto)</i>
Foreign Partners: <i>Maroc, Algerie, Tunisie and Egypt</i>

<i>ITALBALK</i> <i>Integrated Transport and Logistics linking Italy and Balkans countries (Serbia Montenegro) within the line 2.2 (material and immaterial infrastructures) of the Support Programme for Regional Cooperation</i>
<i>General objectives</i>
<ul style="list-style-type: none"> • <i>to increase economic and productive integration, enhancing import/export trade and direct foreign investments of Italian companies,</i> • <i>to contribute to logistics' rationalisation to support specific supply chains;</i> • <i>to improve participants skills in managing International cooperation programmes about transport and logistics.</i>
Lead Region: <i>Campania Region</i>
Italian Partners: <i>11 Regions (Abruzzo, Basilicata, Calabria, Emilia-Romagna, Friuli Venezia Giulia, Lazio, Liguria, Puglia, Sicilia, Toscana e Veneto)</i>
Foreign Partners: <i>Albania, Serbia, Montenegro</i>

The launching Conference of ItalMed/ItalBalk projects, held in Naples at the Maritime Station, on July 14, is the first concrete result which gave to national and foreign partners the opportunity to discuss about transport and logistic issues and about their respective starting points and to bind themselves to the project rules as a prerequisite for a common commitment towards specific projects. ItalMed/ItalBalk projects fall within the APQ (Accordo di Programma Quadro) initiative for Mediterranean and Balkans areas financed by national funds (CIPE). The reference to ItalMed/ItalBalk projects in this paper is explained by the fact that the achievement of the project's objectives confirms internet centrality to enhance actions aimed to create value. Communication is important to make closer people that represent different countries and cultures and the use of internet makes it possible in a clear and direct way. The goals of ItalMed/ItalBalk projects need a correct management of all component of the model showed in this paper which is possible mainly through a good use of internet.

A "good" use of internet doesn't depend only on the knowledge and awareness of the instrument, but also on particular skills and abilities of people who employ it to distribute information or data about the projects themselves among foreign partners that, in most cases don't share the same values and cultures. The main skill, in this kind of projects, is to have a multicultural knowledge aiming to obtain an effective and

emphatic interaction between different players. In the projects' first stage, internet had a central role mainly for the spread of information among the partners and the institutions involved and for the correct management of the relationship between the RUP of the projects – Campania Region – and the implementing board – Logica³³. The first stage of projects ended on July 14 with the Conference ItalBalk/ItalMed at which each partner was represented by both institutional and technical experts. Each of them shared his work with all the participants of Conference through a power point presentation - which emphasized strengths and weakness of the respective areas of competence. The following table (Tab. 1) shows the objectives reached through the use of internet:

<i>Projects' stage</i>	<i>Internet role</i>	<i>Objective</i>
Early step <i>preliminary activities (desk research and analysis, human resources recruitment, partners' spotting, and partnership building)</i>	<ul style="list-style-type: none"> • <i>increase of the chance to recruit effective human resources</i> • <i>survey on logistic and transport systems at different levels: regional; national; European and Mediterranean</i> • <i>collection of data about national and foreign partners and their role in the in field of logistic and transport</i> • <i>communication for the partnership building</i> • <i>information exchange between RUP - Campania Region – and the implementing board aimed at the accomplishment of administration procedures which are necessary to the partnership building (agreement understanding)</i> 	<ul style="list-style-type: none"> • <i>time reduction and costs reduction</i> • <i>increase of the contact opportunities</i> • <i>spread of data emphasized by the survey</i> • <i>increase of the chance to build a program of activities aimed at the cooperation for the development of projects' ideas</i> • <i>built of a table about a description of each partner and the data concerning its competence, potential and prospective</i> • <i>increase of the chance to communicate and transmit data and information</i>
Second step <i>Steering Committee</i>	<ul style="list-style-type: none"> • <i>Elaboration of a short list of experts</i> • <i>send of invitation to experts, institutions representatives</i> • <i>spread of the Steering Committee rules</i> 	<ul style="list-style-type: none"> • <i>Time and costs' reduction</i> • <i>Multicultural barrier reduction (amplified by internet)</i> • <i>Share of projects' objectives</i> • <i>Increase of communication about the projects' ideas and rules</i>
Last stage <i>Conference organization</i>	<ul style="list-style-type: none"> • <i>Organization and coordination of work among</i> 	<ul style="list-style-type: none"> • <i>Time and costs' reduction</i> • <i>Increase of the knowledge</i>

³³ Logica was founded in 2004 on the initiative of the Department for Transport of the Campania Region, which participates in the corporate team through the Ente Autonomo Volturno. It is a mixed public-private consortium also participated by associations of firms in the world of transport and logistics, and from managers of logistic infrastructure of Campania. Its mission is to promote the system of goods field, even through the recognition of Ontario as a territory of excellence in logistics and freight transport. Logica offers its knowledge of the regional context, which is translated into a local marketing activities and analysis of the manufacturing base and business.

Tab. 1 - ItalBalk/ItalMed: The rule of Internet Source: our elaboration

The table above shows the role of internet in the implementation of the integrated projects ItalMed/ItalBalk.

Role amplify into figure n° 3, were one applies the model “Dynamic Internet –Globalization framework”. In relationship every area one analyzed the role of Internet into two project. From the model emerges the strategic importance of Internet in every business area.

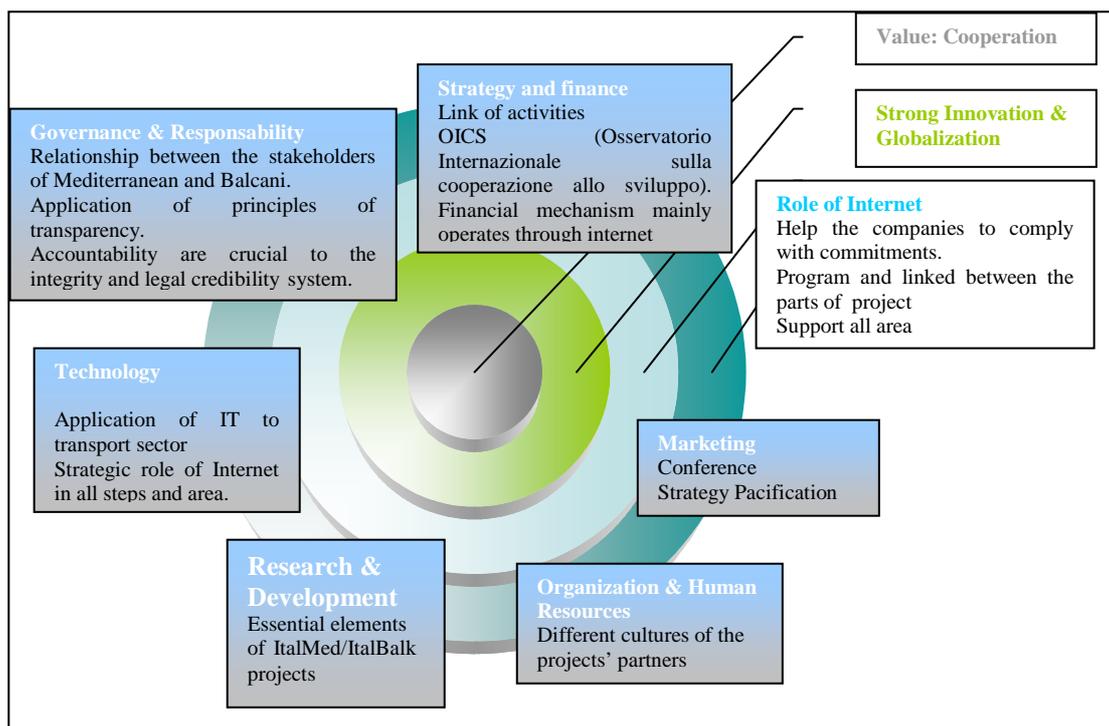

Fig. 3 – Dynamic Internet –Globalization framework: Application to Ital-Med and Ital-Baltik. Source: our elaboration

The different projects' stages need the use of internet for many purposes that correspond to the different parts of our model:

Operations and technology

Internet is a direct response to the ever-increasing need for better project management. In particular it is useful for defining, planning, scheduling, controlling and organizing project activities and transfer them to other project partners. But technology is a very important tool in project management not only because of

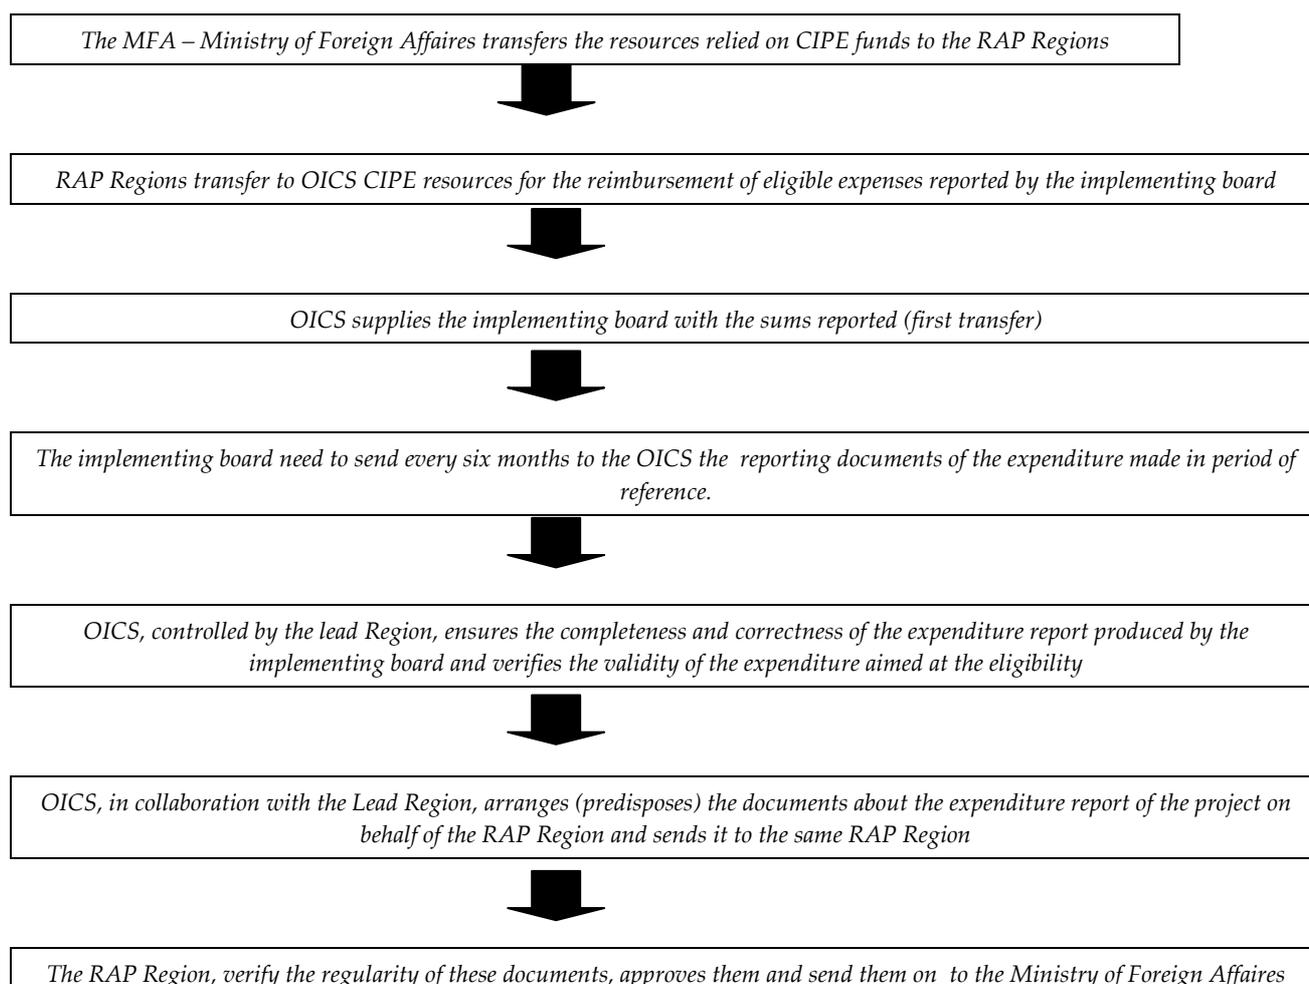

the reduction of time it makes possible in the implementation and realization of the project's activities, but also for its contribution to its main objective that is to create a multimedia platform constructed as a website in which partners can meet and know the results achieved by the others. The purpose is to provide an instrument to improve communication and cooperation among the projects' partners. The importance to know how other partners are working and which results they have reached is clear: it lets partners to compare their conditions with the others' and to share solutions to the same problems, but it mainly stimulates a sound competition among partners and a sort of spirit of emulation. It is also necessary a database to collect and preserve data relating to the projects' issues.

Research and development

Research and development are essential elements of ItalMed/ItalBalk projects mainly because they are aimed at the start of a development process and particularly at the establishment of Italy as main actor of a commercial platform in the Mediterranean area.

Strategy and finance

Internet also gives aid to the activities linked to the expenditure reporting that need to be transferred to the OICS³⁴ (Osservatorio Internazionale sulla cooperazione allo sviluppo). Indeed, the financial mechanism mainly operates through internet. The figure below show the steps of financial mechanism

³⁴ OICS is the actor intended to make direct payments claimed by lead regions, while ensuring the regular reporting on behalf of the RAP (regions responsible for projects) regions.

together with the request for disbursement of the subsequent CIPE contribution

Fig. 3 - Steps of financial mechanism

The transfer of funds from MAE - Ministry of Foreign Affairs and MISE – Ministry of Economic Development to the projects' partners only happens when the agreement with OICS is signed by all partners. This stage is preceded by the financial monitoring of the costs, already realised and to realise in the next stages, carried out by the MISE through the RAP (administrative responsible for process) intermediation. Each partner transfers the financial information to the RAP of project and the RAP collects all this information and transfers it to the MISE. Ministry of Economic Development which lastly send it to the MAE for the disbursement of the CIPE contribution.

Governance and responsibility

The role of good governance and corporate responsibility in helping to assure the well-functioning markets needed for economic growth and development is certain. It requires both private initiatives and strong government action and an effective spread, through internet, of the data about companies which represent examples of good practice.

Good corporate governance – the rules and practices that govern the relationship between the managers and shareholders of corporations, as well as stakeholders like employees, pensioners and local communities – ensures transparency, fairness and accountability. It is a prerequisite for the integrity and credibility of market institutions. By building confidence and trust, good governance allows the corporation to have access to external finance and to make reliable commitments to creditors, employees and shareholders. It is this contract that underpins economic growth in a market economy. Clearly, the importance of good corporate governance goes far beyond the interests of shareholders in an individual company. Indeed, the corporate governance principles of transparency and accountability are crucial to the integrity and legal credibility of our market system. There evidently is a need to provide further guidance, particularly with respect to achieving effective implementation in the dynamic markets of the 21st century. Cooperation agreements aimed at local development, as in the case of ItalMed/ItalBalk contribute to create a global form of governance, at least among the projects' partners, by the establishment of an effective sharing of rules. These rules increase "corporate responsibility". The term "corporate responsibility" refers to the actions taken by businesses in response to society's expectations, increasing in this way, the value of the firm. In fact, the next stage of ItalMed/ItalBalk will be the organization of B2B meetings for the creation of new projects in field of logistic and transport. To reach the main objectives of the projects it is necessary that the business which will be going to operate in the territories of foreign partners adopt a code of conduct that take in consideration also local expectations. Indeed, experience has shown that companies that do so are generally the best performers in the long run. The challenge of meeting these expectations is central in international projects with firms typically operating in a number of legal, regulatory, cultural and business environments. Multinational enterprises sometimes are perceived as taking the money and running, not doing enough to build up local economies, and so on. They are accused of being party – in many cases, inadvertently – to serious problems such as corruption of public officials, human rights and labour rights abuses and environmental damage. Companies have to address such concerns when they arise. In fact, apart from ethical considerations and the law, their host country market valuations would suffer if they ignored them. ItalMed/ItalBalk may contribute to develop codes of conduct and management to help the companies to comply with these commitments. The development of these codes and their application requires an incisive role of internet.

Marketing

Internet has been an important instrument for the implementation of the marketing strategy linked to ItalMed/ItalBalk projects. The first stage of the projects has finished with the organization of the launching Conference held in Naples on July, 14. In this stage internet has helped to inform and invite representatives

of each foreign partner both institutional and technician and to have their power point presentations before the Conference start for translation. The Conference has been followed by a visit of the participants, foreign representatives enclosed, at the Port of Naples and at the Interport of Nola. This part of the program would not be possible without the use of internet which has made possible the collection of the adhesions to the visit and the its organization.

Sales and service

ItalMed/ItalBalk should have to end with the cooperation among institutions and corporations of the different partners involved in the programme aimed to the implementation of the specific projects relating the logistic and transport systems. To reach this aim it is necessary that each partner could sell to the others its services and goods. In the case of an integrated project, in which foreign partners are involved, the only system to reach them, in a first stage, is internet.

Human resources management

The importance of human resources management in the implementation of international projects is explained by the need to succeed in overcoming troubles linked to the different cultures of the projects' partners. The case of ItalMed/ItalBalk shows as an effective management of differences is a condition of the projects' result. It is not sufficient to use internet; it is necessary to transfer information in a language and a form which are the same of the people al which it addressed. In this way, the cooperation may be effective because it relies on the mutual knowledge of the parts.

Remarks

The case study realized has raised remarks which emphasize the importance of internet for the implementation and management of integrated projects as ItalMed/ItalBalk. All initiative which aims at the achievement of a partnership, in whatever sector of activities, entails the use of a tool good for keeping contact among the actors involved. In this prospect, the role of internet is strategic for the various steps of the projects' management which enclose the different parts of the model showed in this paper from Governance and responsibility to Human resources management. Internet can give aid to the various aspect of the implementation of projects not only in the field of internationalization, but also for the implementation of all policy aimed at the achievement of a strong cooperation, In the present scenario, characterized by globalization, cooperation is a need for every action which wants to add value.

CONCLUSION

Detailed diagnostic survey that was used to delve more deeply into how successful companies globalize their operations and to evaluate their processes, experiences, and best practices. The contribution of the research is to supply an evolution of the model, to which the UGC (User Generation Content) has been pointed out previously, that, in concrete terms, considers Internet instruments supporting the business areas in order to allow the companies to Co-create value with the several ones stakeholders (as an example) an instrument of the net that allows the customer of the platform supplied from the company to create content in order to make "to grow" the same one. This process of Co-creation does not invest alone the customer but various actors and different levels. Using our model detailed diagnostic survey that was used to delve more deeply into how successful companies globalize their operations and to evaluate their processes, experiences, and best practices. Concluding remarks focus on this case and the application of the model Enterprise 4.0 to the two projects - ItalMed and ItalBaltik - examined. The following figure shows the application of the model the role of the Internet in creating value for all parties involved in projects, particularly to reduce time and costs and for increased co-relation between the parties.

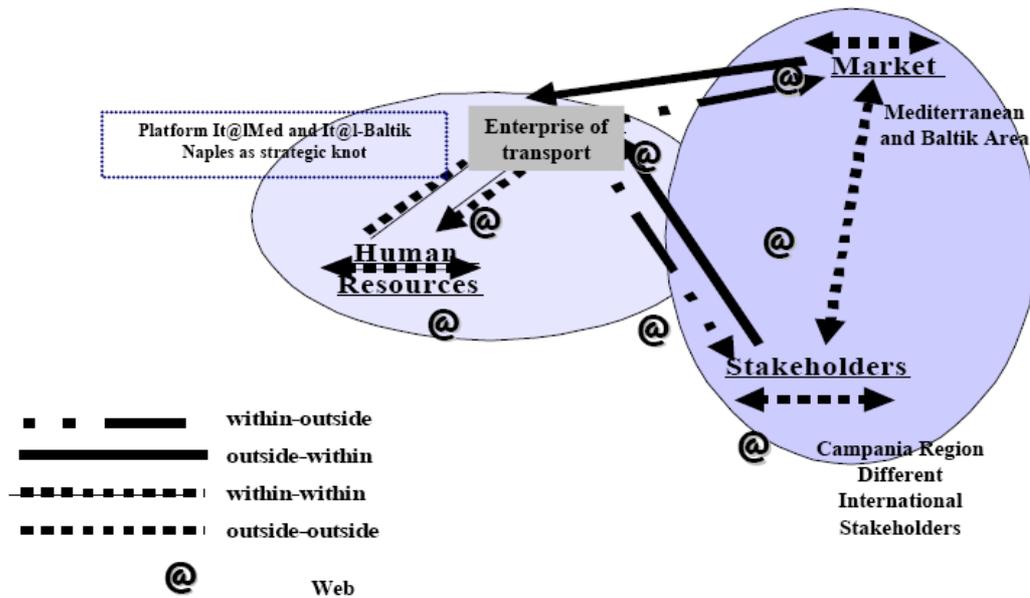

Fig. 4 –

Enterprise 4.0: elaboration and role of Internet: Application to ItalMed and ItalBaltik project. Source: ours elaboration.

The projects Ital-Med and ItalBaltik have stressed the strength of role of Internet in order two reasons:

1. The relationship between stakeholders has been reinforced by instruments of Web, in particularly of Web 2.0; the consequences are a reduction of time and costs and the possibility of a speed cooperation between different geographic areas.
2. The strategic instrument of transport project (Ital-Med and Ital-Baltik) is a information technology platform, that is in phase of realization and implementation.

The limits of research are that the case study is in phase of start-up, but the opportunity of research is that the model proposed could help firms in their process of value creation. However, a more critical concern is that the models are not based on objective evaluations of a firm's resources. Future researches should focus on developing better metrics for evaluating business resources. The limitations listed above suggest avenues for additional research. Anyway, the considerations exposed and the models elaborated can be utilised for different territorial or business activity or project because they are general models.

COMPETITIVENESS AND PERFORMANCE OF THE ITALIAN REGIONAL GOVERNMENTS. THE REFORM OF THE ACCOUNTING SYSTEM

Citro, Francesca¹

¹PhD of Public Management, University of Salerno, Faculty of Economics, Department of Studi e Ricerche Aziendali, Via Ponte Don Melillo, 84084 Fisciano (SA)

LITERATURE REVIEW AND RESEARCH QUESTIONS

The evolution of economic systems, the increase of the competitive boost and the European integration have highlighted a continuous change process in the production of social services managed by public and private companies

As to the Italian public sector, strategies and management policies must be defined to the requirements of the community managed.

More specifically, the public administration has to legitimize its presence by increasing the “production value” through the achievement of results that, in the perception of citizens, should be at least equal to the used resources.

In other words, the Italian public sector should fulfil the performance conditions and the information system should be suitable for supporting the government in its final decisions for the achievement of institutional goals conforming to the strategic effectiveness and the operational efficiency (Cavaliere, 2005; Ferraris – Franceschi, 2005).

The Public Sector Entities (PSE) can be analyzed by using a dual perspective (Borgonovi, 2005):

1. *the political and institutional perspective*, concerning the evolution of the political-institutional structures in the public administration;
2. *the management perspective* concerning the management of resources to complete the objectives and results.

As to the first perspective, the political and the institutional changes depend on (Airoldi, Brunetti and Coda, 2005):

- the evolution of the stakeholders’ needs, the change of the operational areas submitted to the management action and the change of the tools adopted for these specific areas;
- the evolution of the relationship between the different levels of the government;
- new relationship patterns between PSE and stakeholders.

As to the second perspective, management changes are a result of the introduction of tools borrowed from the private sector in order to improve the management of the public activities. These advanced tools are related to the New Public Management³⁵ and the Public Governance³⁶.

The New Public Management (NPM) and the Public Governance (PG) include as follows:

- a redefinition of professional competences and of the role of the intermediate government levels in the social-economic environment (Carmichael, 2002);
- an improvement of accounting-information systems to meet the new requirements of accountability.

³⁵ PUMA-OECD, 1995; PUMA-OECD, 1996; PUMA-OECD, 1999; PUMA-OECD, 2000; PUMA-OECD, 2002; PUMA-OECD, 2005.

³⁶ BEVIR-RHODES-WELLER, 2003a; BEVIR-RHODES-WELLER, 2003b; BOVAIRD-LOFFLER, 2001; CONSIDINE-LEWIS, 2003; KETTL, 2000; MENEGUZZO, 1999.

According to this aspect the New Public Financial Management (NPFM) introduces: new performance measurements, new accounting systems based on the adoption of accrual accounting and, in particular, new structures of financial statements.

Referring to the reforms inspired by the principles of New Public Management and Public Governance, the innovations of the accounting information system in the budgetary accounting should improve the information quality available to the executive-managers and all stakeholders. These innovations should support planning, programming and control processes too.

Furthermore, the adoption of new accounting rules should allow the streamlining and the simplification of the structure in the financial statements. The purpose is to make a more functional budget to the current stakeholders information needs.

In particular, the introduction of accrual based accounting and financial reporting in public sectors of many jurisdictions throughout the world is an essential element of the public sector management reforms.

As matter of fact, the introduction of accrual accounting is an important component of the New Public (Financial) Management reform movement in order to enhance efficiency, effectiveness and accountability. Several studies have shown that the trend towards accrual accounting is likely to continue over the years to come (Lüder and Jones, 2003). Furthermore, international organizations like the International Public Sector Accounting Standards Board (IPSASB) and the OECD Public Management Committee (PUMA) support such a move³⁷.

The supporters of the accrual accounting have emphasized its ability to better meet user needs and its consistency with the overall shift from ex-ante constraints to ex-post accountability.

The aim of the interaction of the dual perspective is to increase the level of efficiency of regional government by creating an accounting system which should help to evaluate public performance.

In addition the regional governments in the European Union are within a governmental level leading to an increasing improvement originated by the fiscal decentralisation.

Following this review during the last fifteen years, the Italian public sector has been involved by a wide reform process (Rebora, 1999) which has changed both perspectives.

Some of these reforms are related to the regional government.

In particular, *as to the political and institutional perspective*:

1. the application of the principle of subsidiarity indicated in the Maastricht Treaty, decentralizes the legislative and administrative functions to the regional and local governments. Consequently, the Italian regions represent the main reference bodies for local governments (Borgonovi, 2001; Longo, 2001) ;
2. the reduction of the financial state transfers and the introduction of the fiscal federalism³⁸ imply a focus on the issues related to the sustainability of some programs.

³⁷ In literature, the introduction of accrual accounting has been the subject of significant debate (Anessi Pessina-Steccolini, 2007). There are a considerable number of papers both in support of and against the adoption of accrual accounting in public sector. For a small sample of papers which support accrual accounting, see (Barrett, 1993; Evans, 1997; Gillibrand and Hilton, 1998; Pendlebury and Karbhari, 1998; Rowles, 1992 and 1993; Talbot, 1998). In contrast, for a small sample of papers which express critical views, see (Guthrie, 1993 and 1998; Jones and Puglisi, 1997; Ma-Matthews, 1993; McCrae-Aiken, 1994; Mellett, 1997). Supporters have emphasised its ability to better meet user needs and its consistency with the overall shift from ex-ante constraints to ex-post accountability. Critics have raised both theoretical and practical objections.

From a theoretical viewpoint, scholars (Montesinos et al., 1995; Monsen and Näsi, 1998) argue that budgetary (or cash accounting) is more consistent with the intrinsic nature of PSE. From a practical viewpoint, scholars argue that the introduction of accrual accounting has raised significant implementation problems (Guthrie, 1998; Stanton and Stanton, 1998; Newberry, 2002; Carlin and Guthrie, 2003; Hodges and Mellett, 2003) and has often produced very limited improvements in the quality of information provided to managers and other stakeholders.

³⁸ The main points of the fiscal federalism are:

3. the direct election of the Regional President by the citizens of the Regions ensures more stability to the regional governments.

On the basis of these considerations, the regional governments will concentrate their attention on legislative functions, planning and monitoring of the outcomes of the administrative activities delegated to the local governments.

The abolition of some financial state transfers to the regions and the introduction of some regional taxes will result in a better focus on the issues for the sustainability of some activities as well as the application of the social and political decisions to the administrative decentralization.

As to the management perspective the adoption of NPM, NPFM and PG implies a general improvement to: the programming and control processes, the resources allocation and the provision of public services.

In this way, the Italian Regions should revise the accounting information system to meet the growing information needs arising from the implementation of the federalism processes.

Indeed, the empowerment of regions in fiscal policy has a strong impact on planning and control functions. The managers should estimate revenue and expenditures dynamics, and subsequently the economic and financial viability of the programs.

The regional accounting information system plays a remarkable role in the accountability field for:

- the assessment of the choices to implement the plans and the programs in terms of congruence between the results and the objectives;
- the economic and financial management of the resources;
- the management of the assets;
- the assessment of performance in all the organization levels;
- the analysis of costs and benefits generated by the government administration.

Under these conditions, the move towards accrual accounting system could satisfy these profiles of accountability.

The paper research focus concerns the Italian regional accounting reform introduced by the Legislative Decree March 2000, No. 76 regarding the fundamental principles and the rules of coordination in the regional accounting and budget system.

This reform tries to establish a relationship between the regional organizational structure and the budget authorization process, by creating new items called «Unità Previsionali di Base» (UPB) representing the different units responsible for managing definite resources and specific objectives within the regional organization. Because of the differentiation in the organizational structures of various Italian regional governments, UPBs don't seem clearly defined.

More specifically, the purpose of this research is to identify one or several models allowing us to understand if the UPBs implemented by different regional governments are in accordance with the aim of the reform process.

The research questions to submit are as follows:

- is the new budget structure coherent with the aim of the reform process?

-
- the abolition of some government transfers to the regions;
 - the introduction of several regional taxes;
 - the establishment of an equalization fund.

Constitutional reform stipulates that the administrative functions of regional authorities are ensured through revenues from local taxation, however the Italian state may take some actions; in fact, sometimes it allocates additional resources to local authorities. The purpose of such government intervention is to ensure the delivery of essential services; for the other regional activities the regions use their own financial resources.

- is the information provided by the accounting systems appropriate to the stakeholders (in particular, managers) requirements?
- is the implementation of the UPBs in different regions coherent with the needs of national and international accounting harmonization?

The hypotheses formulated in this paper are that the implementation of the reform process and the fulfilment of the accounting system are partially inadequate allowing for the informative needs of managers and the national/international accounting harmonization.

I will try to answer to these questions by:

- illustrating the Italian regional accounting reform introduced by the Legislative Decree March 2000, No. 76 and defining the features of UPBs in the new budget structure (see § 2);
- analyzing the different regional models that use the UPBs in the budget (v. § 3).

In the final section, I will discuss the results and draw conclusions (§ 4).

THE ITALIAN REGIONAL ACCOUNTING REFORM: THE NEW BUDGET STRUCTURE

The Italian regional accounting reform took place through the approval of Legislative Decree 28 March 2000, No. 76, regarding the fundamental principles and rules for the regional accounting system and financial reporting. In particular, this Decree replaces the previous legislation and redesigns the regional accounting system. The innovations have been introduced to conform the regional budget structure with the state budget structure, (reformed a few years earlier), as well as to permit the consolidation of public accounts.

This revised regional budget structure reflects the state budget structure, following the criteria issued by the Laws No. 208/1999 and No. 94/1997.

The above said laws introduced the budget as a guidance for the public managers and their administrative decisions (Anselmi, 2001; D'Alessio, 1992; Pitzalis, 2001). The specific law No. 94/1997 suggests two main documents: the "*Decision-making budget*" as a "political document" and the "*Management budget*" as an "administrative budget".

These documents should improve the decision making process and the functioning of the administrative structures.

The "*Decision-making budget*" identifies several budget units called Unità Previsionali di Base (UPB) to which financial resources are allocated through a parliamentary approval. Each UPB is a responsibility unit; then, the budget reflects the organizational structure of the State.

The "*Management budget*" is attached to the decision-making budget and identifies revenue and expenditures by a detailed classification.

As to the regional accounting reform, the apparent trend is to:

- a) simplify any formality relating to "*Planning, Programming, Budgeting System*"³⁹.

More specifically, the regional legislation contains a more general reference on the programming, because the "Regional Development Plan" is no longer required.

E.g. many regions have different medium-term documents, such as sector programs and so on.

- b) strengthen the accounting tools required to demonstrate the achievement of results aiming to the targets set out by the national legislation.

More specifically, the Regional Council approves the budget and decides about the acquisition and the allocation of financial resources proposed in the UPBs by the Executive.

³⁹ For more details concerning the "*Planning, Programming, Budgeting System*" see Jones and Pendlebury, 2000.

The new regional budget structure reproduces the state budget structure and it is divided into two main documents:

- the *Decision-making budget* which is articulated in UPBs and approved by the Regional Council. The expenditures and the revenue chapters are aggregated in the UPBs for a functional destination and institutional or economic nature;
- the *Management budget* which is articulated in more specific items called chapters and referred to revenue and expenditures. The Executive is responsible for the management budget attached to the political budget.

In this way, the financial resources are allocated through the approval voting of the Regional Council on the political annual budget; subsequently, the Executive manages these resources to achieve short-terms programs and projects of each UPB.

Each UPB represents different units of the organization with defined resources to manage, specific goals to achieve and clear responsibilities. The exact definition of these new items tries to establish a relationship between the organizational structure of the regional government and the budget authorization process.

The structure of annual budget follows a criteria of decreasing aggregation.

The Revenue are classified into:

- *Titles* identifying the main revenue sources;
- *Classes* according to the revenue type;
- *UPBs* for the Regional Council approval identified by each Region;
- *Chapters* for the management budget.

The Expenditures are classified into:

- *Target functions* conforming to the regional policies;
- *UPBs* for the Regional Council approval identified by each Region;
- *Chapters*, for the management budget.

A classification of the expenditures in "*Target functions*" and in "*UPBs*", shows the connection between the use of financial resources and the regional strategies; it, also, identifies the allocation of resources to the regional ranges of action.

In this way, the annual budget highlights the political choices for the allocation of financial resources.

According to the new approach, the regional annual budget follows the guidelines as identified in planning and programming documents.

The legislative decree does not regulate some aspects of the regional accounting system. As a consequence, the Regions have the opportunity to make their choices by themselves as listed below:

1. the introduction of further documents for the planning processes;
2. the definition of the UPBs in the annual budget;
3. the identification and the representation of the *Target functions* such as the first level of the expenditures in the annual budget.

This new approach to the budget drafting and the proper definition of *Target functions* and *UPBs* are the key for:

- focusing the attention of the Regional Council on the action priorities and the regional policies;
- identifying the responsibility of managers on the manage of the resources;

- establishing a link between planning, programming and control processes, annual budget and financial statements;
- specifying the link between policy aims and resources;
- identifying the similar areas of activity (UPBs);
- improving the information quality related to the activities pursued, the goals achieved and the resources used.

The exact definition of the UPBs in the annual budget should produce an improvement of accountability and it should meet the changing needs expressed by stakeholders.

In more specific terms, the annual budget divided into UPBs should allow:

- a better manage of the resources, through a clear assignment of the responsibilities in the achievement of the goals;
- a better understanding of the Executive politic choices concerning the community managed.
- In this way, the annual budget should permit to identify “who manages the resources” and “what is done with the resources managed”.

For this, it seems appropriate to:

- analyze the procedures for defining the UPBs and the different regional models which implemented the UPBs in order to verify the presence (or not) of a structured and logical connection between the UPBs and the programs and the targets. This connection ensures a dual role of the annual budget as a tool for programming and planning system and for supervising the financial statements too;
- verify the accountability quality of the different annual budget models to the information needs raising from the reforms inspired by the principles of NPM and PG.

In the third section the empirical analysis tries to identify one or more models which should help to understand if the UPBs implemented by different regional governments are coherent with the aim of the reform process.

THE MODELS OF THE REGIONAL ANNUAL BUDGET

The empirical analysis is based on the contents of the regional laws concerning the accounting rules of all Italian regions with an ordinary statute. This analysis is limited to the definition of revenue and expenditures UPBs in the annual budget.

The empirical analysis identified two different models:

- the first model refers to the organizational structure. This model aggregates the chapters according to the organizational structure; it chooses the same logic of aggregation adopted by the national law up to 2007 for the state budget;
- the second model refers to the institutional competences defined by the regional laws and statutes. This model aggregates the chapters in conforming to regional functions and ranges of action.

The model of the organizational structure

In this model each organizational division corresponds to a single unit of administrative responsibility; so, each manager of the unit manages a set of financial resources.

The organizational structure is based on the national law for the state budget up to 2007; i.e. in the state budget the UPBs represented a set of financial resources allocated and managed by the Ministries in relation to the organization of General Directions ⁴⁰.

As to the regional organizational structure the units of administrative responsibility are the main *Sectors* in a *Department* to which the financial resources are allocated for a particular purpose. More specifically, the UPBs of expenditures and revenue are managed by the first level of direction and defined within the Sector range (see Figure 1 - gray area).

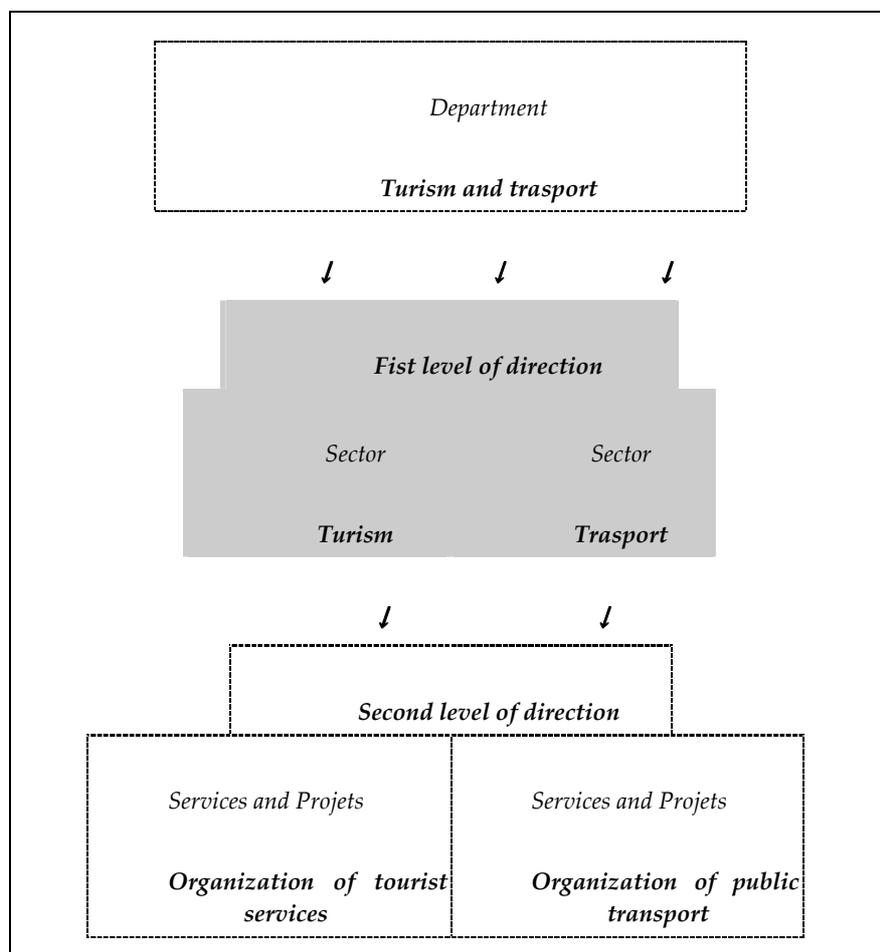

Figure 1 – The UPBs in the model of the organizational structure: the Department of Turism and Trasport

The regions that have defined UPBs by following this model are: Abruzzo, Calabria, Umbria and Piemonte.

This model is not coherent with the aim of said reform process and theoretical framework i.e. NPM and PG; in fact:

1. the organizational division, as units of administrative responsibility reflect the regional one; so, this articulation hardly show evidence of goals prefixed in the planning processes. In other terms, there is no relationship between the unit responsibility levels and the organizational structure.
2. the recognition of a single level of responsibility to the general management implies an unsatisfactory assessment of economic and financial sustainability of the programs. In fact, the second level of

⁴⁰ BORGONOVICANALETTI, 1998, p. 58; CARABBA, 1998, p. 209; CANALETTI, 1998, p. 219; D'ALESSIO, 1998, pp. 231-235

direction, which manages a set of *Services* and *Projects* defined by the first level of direction, is not evaluated.

3. this approach allows to understand “who manages the resources” (through the link between objectives and responsibilities) but not “what is done with the resources managed”;
4. Finally, there is no structural link between “UPBs” and the programs and the goals; then, this approach does not allow a proper vision of each program in-process.

The model of the institutional competences

In this model the regional organizational structure is adapted to the “map of the responsibility units”; this map is defined according to planning, programming and control systems (Brusa and Zamprogna, 2000).

Normally, the effectiveness of the accounting information system requires the coordination between programming processes, map of responsibility units, development of short and medium-term programs and annual budget.

The responsible units and positions are identified by a distribution of managerial and economic responsibilities within the organizational structure.

In these terms, it is necessary to:

- detect the presence of organizational structures undeclared;
- consider the existence of responsibility units to be declared;
- identify the responsible position for each unit;
- formulate the “map of responsibility units”;
- conform the map of responsibility units with the organizational structure.

The map of responsibility units identifies the responsibilities of all organizational units that are involved in the process of performance evaluation and goal setting.

Thus, the distribution of managerial and economic responsibilities appears coherent with the distribution of organizational responsibilities to each level of the structure (Guarini, 1999).

The objectives of strategic effectiveness and operational efficiency are assigned to managers who hold a positions of managerial authority (Brusa and Zamprogna, p. 103, 2000; Nicolò, p. 22, 2005).

The map of responsibility units is divided into two classes of units: a) first level manager, b) second level manager.

The managerial and economic responsibilities of each *Sector* in a *Department* are assigned to the first level of direction. Each *Sector general manager* assigns the *Services and Projects* responsibilities to the second level manager.

More specifically, each manager has several resources to manage, specific objectives to achieve.

In this model the responsibility units are the *Services* and *Projects* in the *Department* to which financial resources are attributed for a particular purpose. In this case, the UPBs of expenditures and revenue are managed by the second level of direction and defined within the *Services and Projects* range (see Figure 2 - gray area).

The objectives of UPBs concern the development of the programs approved by the Regional Council; each UPB may also refer to different responsibility units involved in the management of expenditures and revenue.

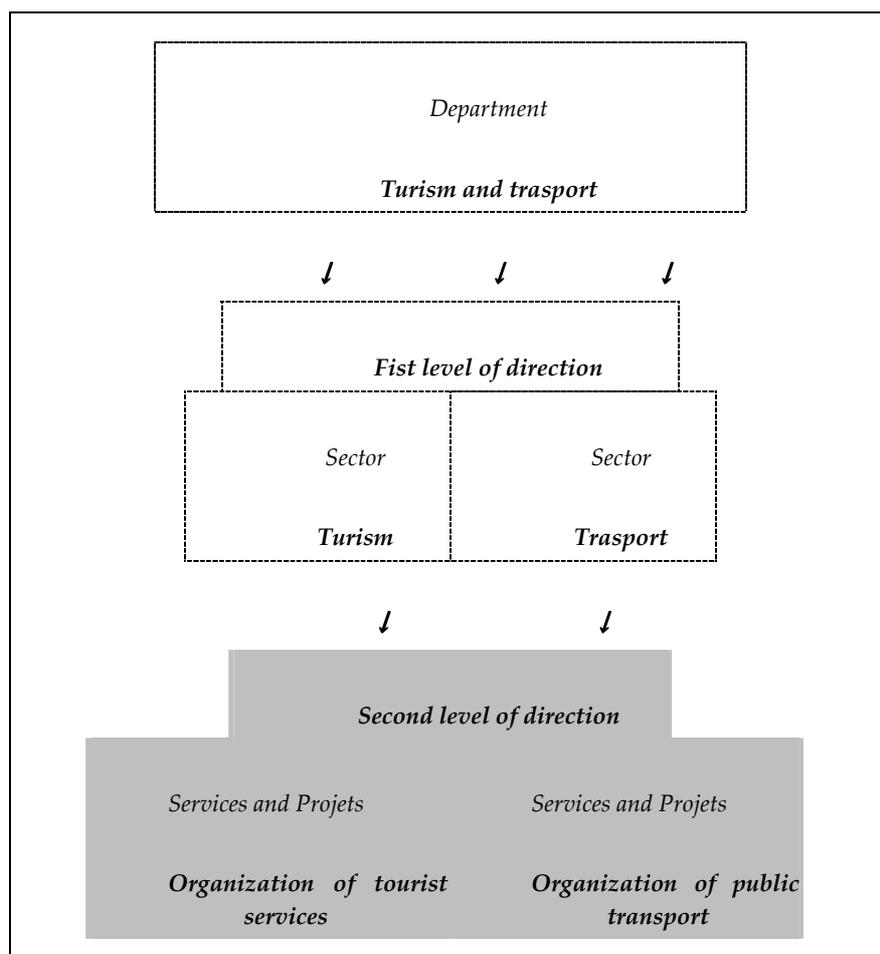

Figure 2 – The UPBs in the model of institutional competences: the Department of Tourism and Transport

In drafting the budget, the second level of the direction establishes the estimates of expenditures for the development of *Services and Projects*. These estimates shall be submitted to the first level approval.

The *Sector general managers* examine all proposals of each manager responsible for *Services and Projects*; in addition, they establish the estimates of expenditures for the development of programs of each *Sector* and their feasibility according to the estimate of revenue.

Finally, the first level managers draw up an overall estimate of expenditures and submit it to the Department Chief. The Department Chief verifies the consistency between programs and projects of each UPB to and objectives to be accomplished on the basis of policy arrangements.

The overall estimate of the expenditures and the revenue shall be submitted to the Regional Council for the final approval.

The regions that have defined the UPB by following this model are: Basilicata, Campania, Emilia Romagna, Lazio, Liguria, Lombardia, Marche, Molise, Puglia, Toscana and Veneto.

This model of the institutional competences is conforming to the theoretical framework i.e. NPM and PG; therefore:

1. this model allows to distinguish the political and strategic role performed by Executive and Regional Council from the managerial and administrative one performed by the first and second level managers.

2. it involves politician officers and first and second level managers to set out objectives and programs. In this way, a participatory approach (or bottom up) to draft different annual budget proposals is adopted by both parts. Each responsibility unit shows its needs and proposals; in this phase, the “top down” approach is neglected ⁴¹.
3. it qualifies the UPBs as a mean of connection between the budget authorization process for the achievement of objectives and programs to achieve and organizational units that carry them out.
4. Finally, it is interesting to consider that in 2008 this model was adopted for drafting the state budget ⁴²; this new budget structure highlights “who manages the resources” and “what is done with the resources managed”.

DISCUSSION AND CONCLUSIONS

The structure of the regional annual budget introduced by the Legislative Decree March 2000, No. 76 along with the decision-making process inspired by the principles of NPM and PG identify some managerial and accounting features.

Please find the key elements as listed below:

2. role of the UPBs in the regional budget system;
3. different criteria for defining UPBs starting from the theoretical framework (see item No 1).

A correct definition of the UPBs in the annual budget leads to an improvement of the accounting information in compliance with the change of informative needs of the stakeholders. It represents the key for:

- focusing the attention of the Regional Council on the priorities of regional policies;
- focusing the responsibility to manage the resources;
- establishing a link between planning, programming and control systems, annual budget and accounting rules;
- making a link between policy objectives and real resources, through the aggregation of chapters into homogeneous ranges of action (UPBs);
- assessing regional policies in terms of economic and financial viability;
- improving the quality of information related to the contents and the relationships between the activities pursued, the objectives achieved and the resources used.

This empirical review has been executed above all on the procedures for determining the UPB of revenues and expenditures within the annual budget.

In particular, it has identified two different models for the definition of the UPBs:

- the first model refers to the organizational structure: it chooses the same logic of aggregation adopted by the national law up to 2007 for the state budget;
- the second model refers to the institutional competences defined by the regional laws and the regional statutes.

The results of this analysis show that the model of the institutional competences seems more coherent within the reforms inspired by the principles of NPM and PG and better responds to the changing needs expressed by the stakeholders. As a matter of fact, the definition of UPBs highlights “who manages the resources” (on the basis of the link between objectives and responsibilities) and “what is done with the resources managed”.

⁴¹ In the “top down” approach the highest organs impose to the lower levels the annual estimates of expenditure and revenue.

⁴² Circolare del Ministero dell'Economia e delle Finanze n. 21 del 2007.

However, it may be also useful to detect of some factors and circumstances which complicate the correct implementation of models ⁴³.

These complex elements can be studied using the both perspectives used in this work: the political - institutional perspective and the management perspective (see item No. 1).

The former perspective is influenced by the federalism reform which involves the replacement of state transfers with regional taxes plus the abolition of equalization mechanisms. In this case the degree of variability of the financial resources available to the regions will increase.

It is difficult to quantify the amount of investments to do and the resources to use for medium-term programs. Moreover, especially in poorer regions, a lot of revenue is absorbed by the ordinary expenditures.

The ability to acquire the empowerment in the field of fiscal decentralization has an important impact on planning, programming and control functions; i.e. the managers have to assess the revenue and expenditures dynamics and may evaluate the economic and financial sustainability of programs to carry out ⁴⁴.

Following these considerations, the regions will focus their actions on legislative functions, planning, coordinating, and monitoring of the outcomes from several administration activities delegated to local governments.

In addition, some specific investment programs have been scaled down because of constraints imposed by the Italian Domestic Stability Pact. At the same time, the operating costs of the bureaucratic-administrative functions and of the institutional bodies have not been changed.

The weight of the operating costs compared to those required for funding programs has increased; therefore, the regional governments have been compelled to control the expenditures within programmed limits; even by underestimating the achievement of programs and objectives.

As to the latter perspective, the reforms introduced by NPM and PG and the new location of the intermediate levels of government in the social-economic context require a revision of the accounting information system.

In Italy the reform processes have produced some improvements related to the quality of information (but some more efforts shall be produced to streamline and simplify the conventional iter). The programming models in the Italian regions are extremely heterogeneous and the UPBs don't appear clearly defined because of the different regional organizational structures. "Accountability" is somehow compromised and the results of the activities of each region are not comparable.

Moreover, the redistribution of the responsibilities and the powers between the several levels of government suggests a revision of the organizational structure.

The PSE characterized by a structural over dimension and a very high complexity of the processes meet serious difficulties in:

- developing and coordinating all activities carried out by different organizational units;
- recognizing the empowerment and the autonomy of these organizational units.

In addition, there has been the failure of the link between the objectives to achieve and the drafting of the annual budget: the managers have often adopted a "bureaucratic" approach for drafting a budget, more oriented to the respect of the authorization process.

In these terms, there has been a scarce interest in the useful of the accounting tools in terms of governance and management of the resources.

⁴³ For example, the presence of inappropriate management practices may cause the failure of the adoption of a model in the public sector.

⁴⁴ In these terms, some regions, with less ability to impose their taxes, could be forced to drastically reduce the supply of essential services.

In some cases, the managers have formulated the general characteristics of the programs but they have not outlined specific and measurable objectives.

In general, some factors do not facilitate the proper implementation of the models are caused by a gap between the long-term of social and economic dynamics and the short-term of political vision.

Politicians often make short-term choices and consider the adoption of new management tools for planning and programming as formal rituals.

There is no heavy interest in the information accounting needs or in the assessment of strategic effectiveness and operational efficiency of the projects.

As a matter of fact to improve any information provided by the regional accounting systems, the role of legislation is important but not sufficient. In my opinion, following steps should be observed:

- change of administrative culture from a predominantly bureaucratic logic to a business logic;
- introduction of new organizational models to meet the users' needs;
- wording of legislative rules for planning, programming and budgeting system must be based on the availability of good accounting standards and good accounting and managerial skills;
- introduction of accrual based accounting, as an important component of the New Public (Financial) Management reform movement, in order to enhance efficiency, effectiveness and accountability.

Now, the introduction of the accrual accounting in the Italian regions (as well as other PSE) needs a gradual approach. This innovation should be realized bearing in mind their characteristics, rather different from those of private organizations.

In addition, the traditional financial accounting seems still useful if you consider the peculiarities of a management within the Regions. The managers are charged to coordinate, plan and monitor the results of administrative actions nowadays delegated to local governments.

A period of transition by adopting a "dual based" accounting system seems to be appropriate:

- *the cash-based accounting system* satisfies the legally adopted budget ;
- *the accrual-based accounting system* could fulfill the function of external and internal information, it should allow to achieve efficiency and effectiveness and proper management of assets. The adoption of this system should facilitate the process of national and international accounting harmonization.

This dual system is satisfactorily applied to PSE, as the Italian regions that are involved in the transfer of expenditures responsibilities and revenue assignments to local governments. For example the European Union and the Swiss Confederation have used a dual system based on the coexistence of traditional cash accounting for the legally adopted budget and the accrual accounting based on the International Public Sector Accounting Standards (IPSASs).

A set of principles developed by a technical unit shall be required in order to:

- regulate the accounting system of public administration;
- harmonize the criteria and the logic in a budget drafting.

However, the situation of our country is not aligned with the international trend as to the adoption of the accrual accounting and the accounting standards issued by a standard setter. To better explain:

1. The accounting system of the Italian PSE is anchored to the traditional accounting (largely cash or commitment based). In particular, some budget reforms in the Italian regions have been introduced, nevertheless, the accounting information system is still linked to traditional accounting introduced for the legally adopted budget only. Now, there is no reference to the

accrual accounting, and, the accounting system produces information concerning the financial aspects of the operations only.

Several regional laws concerning the accounting system have been introduced thanks to the degree of autonomy granted by the Legislatures; but autonomy exercised by single regions not always facilitates the path of harmonization in the structure of regional budget;

2. The adoption of the accounting standards by the Italian PSE is characterized by the presence of "Ragioneria generale dello Stato" (RGS) and "Osservatorio sulla finanza e sulla contabilità degli enti locali" as the accounting standard setters for the state and the local governments, but, there is no standard setter which regulates the regional accounting system.

Furthermore, these Italian standard setters are appointed by the Minister; whereas a technical unit charged to issue accounting matter should be established.

For example, the "Organismo Italiano di Contabilità", as the Italian accounting standard setter in the private sector, could be entrusted to harmonize the accounting systems of different PSE by ensuring the participation of all stakeholders such as the "Ragioneria generale dello Stato" and the "Osservatorio sulla finanza e sulla contabilità degli enti locali". By this way it is ensured the protect of the specific features of several Public Sector Entities.

Finally, the adoption of the IPSASs formulated by the International Public Sector Accounting Standard Board (IPSASB) might facilitate the progress towards accounting harmonization and accrual-based accounting systems and suitable for growing information needs arising from the latest reform process.

LOCAL IDENTITY AND CREATIVE CAPITAL IN TOURISM: SOME EXAMPLES IN ITALY

Simeon, Maria Immacolata¹; Buonincontri, Piera¹; di Trapani, Giovanni¹

¹Institute for Service Industry Research, National Research Council, Italy, Via M. Schipa, 91 – 80122 Naples, Italy

Purpose – The purpose of this paper is to analyze the increasing importance of creativity in the field of tourism, starting from the hypothesis that creativity is able to strengthen the local identity of a destination. Since in literature the analysis of creative capital in tourism is recent and not yet developed, the paper wants to systematize and give additional value to current studies on the subject, identifying the forms of creative experience, the main assets and the contexts in which is possible to develop the tourism based on the creativity.

Design/methodology/approach - Methodologically, the analysis was conducted from a theoretical point of view supported by documentary analysis. In the first part, the paper analyzes the interplay between the local identity and the creative capital in tourism; subsequently it examines the transition from cultural tourism to new forms of creative experience: creative spectacles, creative spaces, creative tourism.

On the basis of features and contexts emerged from the theoretical analysis, the paper examines some examples of creative supplies in Italy analyzing:

- The ways of tourists participation (active and passive), their involvement and the developed skills;
- The interaction between creativity and local identity;
- The different contexts where creativity develops (urban and rural).

Findings – The analysis developed in the paper highlights the importance of creativity in the field of tourism and culture and confirms the hypothesis that creativity is able to strengthen the local identity of a destination. The findings of the theoretical analysis and of the presented examples underline that supply systems based on the creative capital develop synergies between visitors, local identity and creativity. Creative supply systems can also contrast the phenomenon of serial reproduction of culture and stimulate a genuine and direct link between visitors and local identity, with the aim of making them *co-producers* of their travel experiences.

Originality/Value – The paper contributes to broaden the literature and knowledge on creativity in tourism, identifying its forms, features and development contexts.

A next step from this explanatory research could be the development of a new conceptualization which might be later empirically tested.

Paper type: General Review

Key words: Local identity, Creative capital, Creative products in tourism, Italian examples

INTRODUCTION

Tourism based on creativity is an evolution and specialization of traditional cultural tourism and can be defined as “travel directed towards an engaged and authentic experience, with participative learning in the arts, heritage, or special character of a place. It provides a connection with those who reside in this place and create this living culture^[45]”.

In literature the analysis of creative capital in tourism is recent and not yet developed. For this reason, the purpose of this paper is to analyze the increasing importance of creativity in the field of tourism, and to examine how creativity is able to strengthen the local identity of a destination. The paper wants to systematize and give additional value to current studies on the subject, identifying the forms of creative experience, the main assets and the contexts in which is possible to develop the tourism based on the creativity.

Methodologically, the analysis was conducted from a theoretical point of view supported by documentary analysis. In the first part, the paper analyzes the interplay between local identity and creative capital in tourism, and the transition from cultural tourism to new forms of creative experience: creative spectacles, creative spaces, creative tourism. The two main features emerged from the analysis are:

- a) participation in the tourist’s experience of visit;

^[45] The concept is analyzed in works of Greg Richards and Crispin Raymond, and is also in the UNESCO definition of 2006.

- b) the interaction between visitors, the cultural resources of the destination and the local community. The contexts in which creativity as a source of competitive advantage can develop can be both rural and urban.

The paper examines some examples of creative supplies in Italy analyzing:

- The ways of tourists participation (active and passive) and involvement;
- The interaction between tourists, residents and local cultural resources;
- The different contexts where creativity develops.

The studied examples highlights that creativity can be an adequate tool to diversify the destination and exploit the local identity of an area. Supply systems based on the creative capital can also contrast the phenomenon of serial reproduction of culture and stimulate a genuine and direct link between visitors and local identity, with the aim of making them *co-producers* of their travel experiences.

THE INTERPLAY BETWEEN LOCAL IDENTITY AND TOURISM BASED ON CREATIVITY

Creativity in tourism concerns “learning a skill on holiday that is part of the culture of the country or community being visited” (Richards and Crispin, 2008). It’s a tourism that “gives the opportunity to develop the creative potential through active participation in experiences that are characteristic of the destination: the conscious and documented visit of the places and architectural treasures; the discovery of minor routes; the cultural immersion” (Martini, 2005).

In the last years it’s possible to highlight the passage from a cultural tourism based on a *Site&Monument approach* to an *Experience approach*, related to the experiential consumption: visitors want to satisfy their self-development skills need.

The tourism experience is analyzed through the *Economy Experience*^[46]. The economy experience starts from the notion that increased competition forces producers to differentiate products and services, turning them into experiences (Amin and Thrift, 2002, Pine and Gilmore, 2000). Similarly, destinations modify their supply systems to create experiences that can satisfy an increasingly aware cultural demand. Experiences are based on personal sensibility and “... provide sensory, emotional, cognitive, behavioural and social values that replace the functional skills” (Schmitt, 1999).

Cultural tourism is therefore moving towards experiential tourism, which takes the connotation of creative tourism when is present the active participation and involvement by immersion / absorption of the visitor.

Tourism based on creativity faces everyone’s personal need (Figure 1).

(2007), “La gestione degli eventi turistico-culturali nella prospettiva esperienziale”, *Annali della Facoltà di Economia di Benevento*, n. 12, pp. 257-284; Resciniti R. (2004), *Il marketing orientato all’esperienza L’intrattenimento nella relazione con il consumatore*, Napoli, ESI.

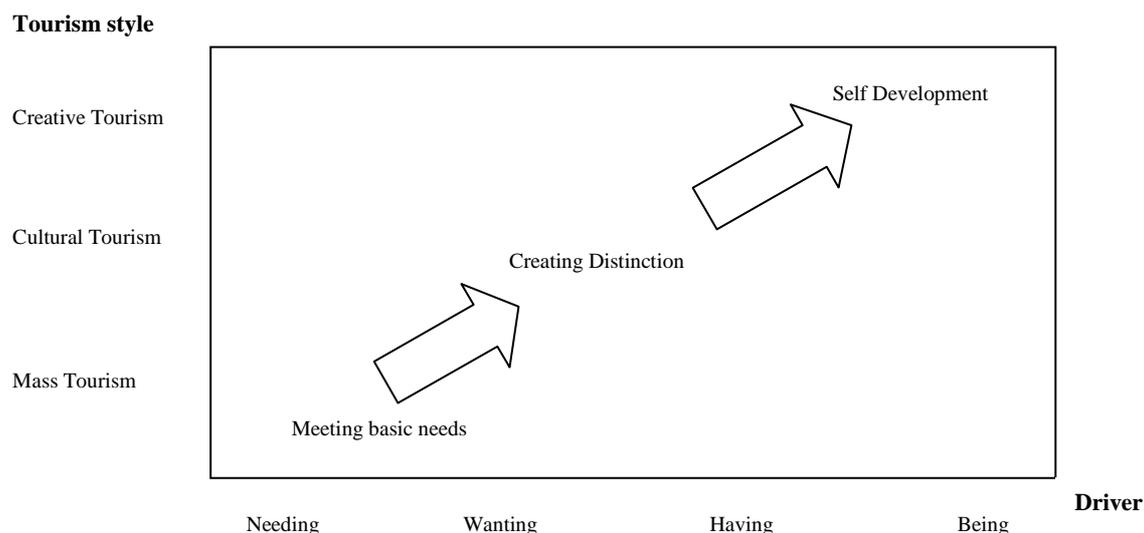

Figure 1 - Development of tourism and its drivers over time

In the past, the mass tourism used to satisfy basic needs, conferring a specific status, and travels could be compared to the purchase of luxury or exclusive goods. Later on, tourism was mainly based on cultural aspects; the tourist became more interested in the local art and cultural resources; in this phase, the destinations have to be able to make unique and distinctive supply systems to reach a competitive advantage. Nowadays, the cultural tourists don't get satisfaction from the observation of the sites or the consumption of similar offers anywhere in the world; they want the destinations pay major attention on what they *are or are becoming*, rather than on what they *have*: tourism is not more related to the consumption of goods and services, but to the consumption of active and dynamic *experiences*.

Studies by Richards and Wilson^[47], Binkhorst^[48], Prentice^[49] and Raymond^[50], have analyzed that creativity can strengthen the cultural identity of the destinations, reducing the risk of serial reproduction and defining a deeper relationship between tourists and local community.

In this perspective, creativity allows the territorial supply systems to achieve competitive advantages to prevent phenomenon concerning (Russo, 2008):

- Cultural homogenization: many destinations have developed artificial attractions not representative of local identity and therefore not really attractive (Richards, 2001). The main risk relating to the serial reproduction is to make the destinations not distinctive and not competitive;
- Strong competition between destinations, which has led to lower costs and prices, rather than to improve the quality of the supply system.

Territories *to maintain, develop and use their creativity as a distinctive instrument*, use different strategies of differentiation (Richards and Wilson, 2006):

- *Iconic structures*: construction of important structures which often aim to become a symbolic shorthand for the territory identity. Iconic structures may therefore begin to lose their distinctive quality, because too many destinations are using this strategy to diversify their own identity, and

^[50] Raymond C. (2003), "Case study – creative tourism New Zealand", published at www.fuel4arts.com

because the signature architects may be better at creating a distinctive image for themselves rather than the places they build for, without consider the local peculiarities.

- *Mega-events*: many cities organize mega-events thanks to their lower cost compared to building physical infrastructures, such as a new museum. The mega-events can also be modified and improved every year. The more known mega-events in the cities are two: The *White Night* and the *Capital of Culture*^[51]. Even this strategy is beginning to fail, since it is used by many cities in competition between them: rather than focusing on a single mega-event, destinations should develop more organic policies and distributed throughout the year, with a timetable of events.
- *Thematisation*: Some territories have tried to make distinctive themselves developing a specific cultural theme, strictly linked to the local heritage.
- *Heritage mining*: Many destinations have attempted to re-develop themselves through the enhancement of their cultural heritage, such as museums or monuments.

The last two strategies are most successful because strongly associated with the distinctive features of each destination; this means that these strategies are not easily reproducible elsewhere.

The growing interest in all forms of culture has led many areas to consider cultural tourism as an important advantage, but those who managed to establish a strong and lasting relationships between tourism and creative sector have a greater chance of success (Gemmiti, 2007). Through creativity, destinations reshape its image and attract tourist flows, financial and human capital (Hall, 2000).

FEATURES AND CONTEXTS OF TOURISM FORMS BASED ON THE CREATIVE CAPITAL

One of the most important features of the tourism forms based on the creative capital is the tourists' participation in the process of creating and enjoying tourism experiences. According to the model developed by Pine and Gilmore about the *Experience Economy* (Figure 2), visitors participate in the tourism experiences in two ways: active and passive.

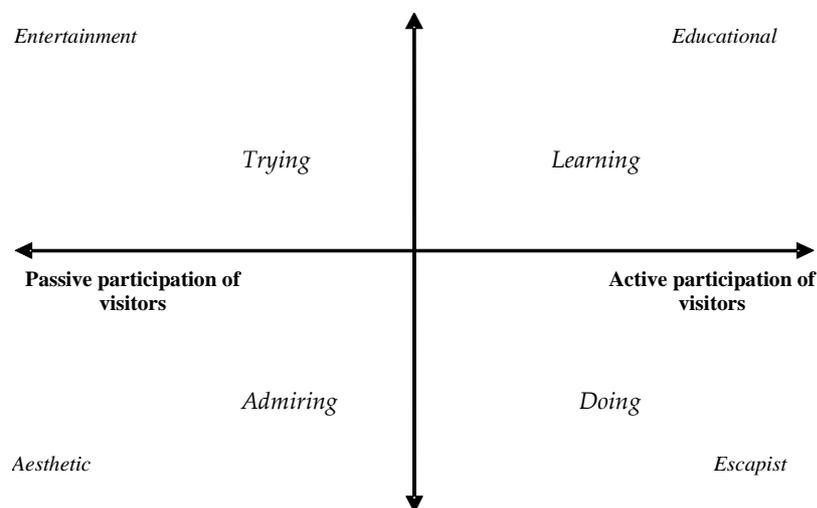

Figure 2 - The experience realms

^[51] During the *White Night* the tourists can visit museums and participate in cultural life of the city all the night, and is performed in Paris, Berlino, Amsterdam, Montreal, Roma, Napoli, Bruxelles, Madrid, Riga, and a lot of other cities in the world. The *European Capital of Culture* is a recognition that allows the European city that has won the title to make known to the world its cultural heritage; Cusimano G., Giannone M. (2007), *op. cit.*

There is *passive participation* when the tourists do not influence the destination's culture through an active involvement, but they simply visit museums, galleries and monuments, or attend at artistic and cultural events. Creativity therefore becomes a fundamental instrument to differentiate the local experiences the visitors don't produce directly. Important examples of passive activities are the *creative spectacles* realized by individuals or creative groups that develop creative activities in the destination. The tourists observe the *creative spectacles* without interfering in the shows. The *creative spectacles* are characteristic of many cultural tourism destinations, and because of their large diffusion, they are losing their competitive strength: Festivals often compete directly with one another and therefore have to introduce innovative elements in order to hold the audience attention.

Creative spaces are another example of creative experience whose tourist's participation is not required; for example, many towns are developing creative areas populated by creative artists to attract visitors (often informally at first) thanks to the lively atmosphere that such areas often exude. In the *creative spaces* the material and the symbolic elements generally intersect; they are spaces multifunctional and that can be flexible to any particular representation. This implies adaptability to different needs (resident, visitor). *Creative spaces* can be also designed to house a core of permanent residents, originating formal creative clusters important not only in the local economy, but also as centres of attraction for the endogenous and creative class as a resource for the development of a creative image for tourists.

The *creative spectacles and spaces* are based on the creative capital the destination can offer, and it is interesting to consider that this creativity is increasingly based on intangible resources - local traditions, culture and territorial identity - that are fundamental for a competitive cultural system. The intangible culture, however, presents some problems in terms of protection; the intellectual property of intangible resources must be protected to establish a strong, unique and distinctive connection in visitors' minds between the manifestations of creativity and the single destination.

In addition to the creation of *creative spectacles and spaces*, the destinations are implementing supply systems in which the tourists must participate actively. These new experiences are based on the development of skills of tourists, who are actively involved and acquire new competences (Richards, 1996). Tourists become *co-producers* of the experiences; the supply systems have to allow visitors to develop their imagination and creativity and create personalized experiences (Pine and Gilmore, 2000). The areas of the active participation are that of *learning and doing* (Figure 3). The participation of tourists to the implementation of creative activities can take place through participation in courses and workshops that teach skills closely linked to the culture of the destination. This type of experiences may also include the participation in *creative spectacles* and the use of *creative spaces*, where the tourists make the spectacles and realize the activities in the spaces, becoming co-producers of the supply system.

Table 1 shows the basic elements and the differences between the traditional cultural tourism and the forms of creative tourism. Traditional cultural tourism is especially linked to the past heritage, while the creative production is oriented to the future and new cultural trends.

	<i>Primary time focus</i>	<i>Primary cultural focus</i>	<i>Primary consumption focus</i>
<i>Cultural tourism</i>	<i>Past and present</i>	<i>High culture, popular culture</i>	<i>Product, process</i>
<i>Creative spectacles</i>	<i>Present</i>	<i>Arts, performance</i>	<i>Performance</i>
<i>Creative spaces</i>	<i>Present and future</i>	<i>Arts, architecture, design</i>	<i>Atmosphere</i>
<i>Creative tourism</i>	<i>Past, present, future</i>	<i>Creative process</i>	<i>Experience, co-makership</i>

Table 1 - The relationships between cultural tourism and creative tourism

A second feature of the supply systems based on creative capital is the interaction among visitors, the cultural resources and the local community.

The visitor wants to be involved in experiences related to the cultural aspects of the sites he visits; wants to enrich his culture acquiring skills, capabilities and information about historical traditions, habits of life and cultural aspects of the destination (Richards and Wilson, 2007): the tourist is no longer a simple consumer of goods and services, but he is engaged in a process of learning, observation and experimentation. The emphasis on intangible resources reduces the production costs and increases the flexibility: destinations are focusing their investments on the local creative capital rather than on making rigid structures, encouraging the creation of *creative spectacles and spaces* that allow the tourist to interact with the specific features. This interaction causes both an increased participation of residents - they become producers of tourist experience - and an increase of creative artists who move in the territory permanently or temporarily. A virtuous circle of benefit for the destination is the result.

Tourists who want to live cultural experiences, want also to have a direct contact with those who live on the site: The resident becomes a vital source of expertises.

Residents, through their skills, teach tourists the local culture, teaching how to cook typical products, to use local techniques, or to build instruments related to the history of the territory. The interaction between residents and tourists not only brings benefits to the visitors, but also allows the community to get closer to different cultures and habits, creating an exchange that can enriches either.

The introduction of creativity in tourism changes the role of local people: the residents are no longer considered as mere sellers of handicraft items, but they become teachers of distinctive skills and abilities, allowing to build a relationship based on exchange of knowledge rather than on economic one.

The growing role of creativity and intangible culture in tourism presents a new challenge for destinations, as the territories have to manage and exploit resources that were previously not considered: to be successful the destinations must invest more in the creative capital of the community (Richards and Wilson, 2006).

Finally, an analysis of the contexts in which creativity can develop as a source of competitive advantage, has highlighted the urban and rural areas. The idea of *adversity* (Richards and Wilson, 2007) joins these territories based on creative capital: to attract creative talent is the starting point for the revitalization of an area and a point of strength for its competitive advantage (Sacco, Tavano Blessi and Vergani, 2006).

Actually, the use of creative factors is being developed especially in the supply systems of rural or remote areas, where the possibility of boosting the traditional cultural tourism is more limited. The rural areas are able to compete with the *urban environment* (Richards and Wilson, 2007) because they are preferred destinations for a growing number of creative people who want to "escape" from the cities. It has allowed the birth of *creative rural clusters*, in which have been made rural museums, rural craft demonstrations

workshops and master classes^[52] focused on the development of creative experiences for tourists. The aim is to enhance the cultural and artistic assets of the rural and peripheral areas.

Creativity appears an important critical factor as key for success also in the cities, and the most global interesting centres - Barcelona, New York, Milan - are developing strategic actions to encourage new creativity and to attract artists and creative people.

The term “creative cities” refers to the cities with a high level of creativity, individual, institutional and widespread which are able to use their resources as tools for competition. Besides financial cities, the so-called “buffer areas” are growing increasingly usually located in peri-urban areas but linked to the city centres, which develop and spread the creative class^[53]. These areas are (Sacco, Tavano Blessi and Vergani, 2006):

- Promoting new ideas and economics related to creativity and innovation especially in the cultural field;
- Areas of experimentation and economic, cultural and social contamination, that stimulates the entire urban system;
- Spaces where the process of cultural diversity among residents leads to renewal and construction of social benefit to the entire urban body.

These urban areas are characterized by a high concentration of creative jobs - artists, musicians, architects, researchers etc.. The creative cities attract a virtuous circle where the *creative class* is attracted by the cities on the basis of the infrastructure they offer, bringing with them economic development and innovation (Florida, 2003).

Even the cities, therefore, are turning into real *creative workshops* where an increasing number of products and cultural activities are developing. Creative spaces are often the result of contamination between traditions and cultures of different populations who coexist on the same territory; these areas, which were born almost by chance, attract more and more tourists interested in a direct access to culture, and they help to draw a new geography of the city (Cusimano and Giannone, 2007).

SOME EXAMPLES OF SUPPLY SYSTEMS BASED ON CREATIVITY

In order to get a competitive advantage through the development and application of creativity it is necessary to reshape and reorganize the process by offering new forms of visitors involvement and participation. Based on the theoretical considerations developed in the preceding paragraph are analyzed here some examples of tourism based on creative capital.

Some initiatives in Table 2 are shown some creative products, with the description of activities offered, the promoter (public or private), methods of co-production of experiences of the website. As shown in the table there are many proposals: these forms of cultural tourism based on the creativity and the enjoyment of experiences, want to involve a more complete participation of visitors, as stated in § 2, and at the same time, they encourage new skills and new capabilities.

^[52] *Ibidem*, p. 28.

^[53] *In the peripheral areas is becoming increasingly important, especially in economic terms, a part of the population called creative class. This definition is because the production of added value is through the use of creativity: through the creative advantage they have, the members of the creative class get more significant results than the other segments of the population. The creative class consists of people working in different fields - science, engineering, computer, education, finance, design, advertising, arts and entertainment - with basic characteristics in common: the value of creativity, talent, distinctiveness. This class is highly educated and is increasingly emerging: its power and its importance is growing as the creativity is recognized as fundamental for the social development. Source: Florida R. (2003), *The Rise of the Creative Class: And How It's Transforming Work, Leisure, Community and Everyday Life*, Basic Books, U.S.A.*

<i>Leggere strutture Factory</i>	<i>Passive</i>	<i>Cultural Events</i>	<i>Taste</i>
<i>Progetto M9</i>	<i>Passive</i>	<i>Social Transformations</i>	<i>Try</i>

Table 3 - Participation, incentives, skills development

Some of the selected examples tend to stimulate the active participation of tourists giving them the opportunity to acquire knowledge and skills (culinary activities, painting techniques and construction of objects), or they offer evasion experiences where visitors perform directly (e.g. to recognize flora and local fauna). Other examples are in the *creative spectacles and spaces* categories, that request passive participation of tourists (Richards, 1996); they have the opportunity to experience live entertainment rather than mere aesthetic experiences. The tourists can *admire* or *feel experience* based on the identity and culture of the area.

The new challenges offered by the growing role of creativity and intangible resources are accepted from the destinations, which are starting to structure the supply systems with creative and cultural courses to encourage the interaction of the visitors (see § 2). In particular, new forms of interaction are developed related with both the cultural resources of the place and the local community. The creative class becomes the primary source of new skills and abilities.

<i>Name</i>	<i>Interplay between visitors and local identity</i>		<i>Context</i>	
	<i>Cultural aspects linked to the territory</i>	<i>Residents and local resources involvement</i>	<i>RURAL</i>	<i>URBAN</i>
<i>Creativa</i>	<i>Items related to local production</i>	YES	X

Table 4 - Interplay between visitors and local contexts

As seen in the Table 4, almost all the selected examples provide a full involvement of residents and the local creative class. The offers are strongly affected by issues of identity and cultural traditions and local production (local products, local flora and artistic traditions are typical). Furthermore, as pointed out in § 2, creativity can be developed in a rural or urban context. Most initiatives are related with rural activities and the urban activities - for example, Venice, Bologna and Maratea – are generally laboratories (M9 Project Read and structures Factory) related with cultural traditions and local history.

CONCLUSIONS

The analysis developed in the paper highlight the importance of creativity in the field of tourism and culture, and confirm the hypothesis that creativity is able to strengthen the local identity of a destination. In the examples analyzed, in fact, is evident a strong coherence between the cultural supplies and the local identity and traditions.

Tourism based on creative capital encourages the interaction between visitors and the local identity of a destination, and promote an involvement with the local community and the distinctive local resources. Creativity is also a very useful tool for developing innovative products, supporting the cultural economy and facing the risk of serial reproduction of culture, and helps to satisfy the tourists who want to live more memorable and genuine experiences.

From the perspective of demand, through the creative tourism “tourists develop their creative potential, and approach to the local community, participating in seminars and workshops related to the local culture^[54]”. On the supply side, creative tourism gives visibility to local assets, making them more interesting and accessible. It can also determine several advantages compared to the traditional cultural tourism (Richards and Wilson, 2006):

- The creative resources are scarce, because creativity is a characteristic possessed by few people. For this reason, the creativity has a very high value added;

^[54] The paper is available at www.creativetourism.co.nz.

- Creativity allows the destinations to create new tourist offers and gain quickly a competitive advantage, as it does not require any special additional infrastructure;
- Creative resources are generally more sustainable than cultural products: while, in fact, the tangible cultural resources may change over time and deteriorate, creativity is likely to be renewed indefinitely.

In tourism based on creativity, then, there is no need to have a significant tangible heritage, or to spend a lot of capital to maintain structures that deteriorate over time; tourists are more satisfied because they are involved in the interaction with the typical local resources. Creativity is an appropriate tool to face the growing competition in the tourist market; the spread of creative tourism is visible in many Italian and European destinations and is developing in several forms: The most promising for the future are the fashion, architecture, design and dance. Intangible culture becomes increasingly attractive (gastronomy, crafts, folklore), and the interest in the smaller towns, villages and local heritage of a territory is increasing.

In the creative experiences, therefore, the success of the supply system does not only depend on external factors but also, and above all, on the ability of management to stimulate the visitors creativity. For this reason, the territories should be more involved in the creative process, not only in terms of product innovation, but also to recognize, stimulate and maintain over time the creative potential.

www.scienzecom.unisa.it/Siano/index.htm

Purpose – The aim of this article is to understand the key factors of success and advantages that Tetra Pak Italy reached thanks to Ingredient Branding (IB) implementation.

Design/Approach – In order to reach the goal of the paper, direct and indirect data were analysed. The primary data are the outcome of an in-deep interview with the Tetra Pak Italy marketing director, while the secondary data comes out from reports made available by the company. The reports present results – codified in tables and figures - of the co-branding campaign.

Findings – The secondary data clearly showed that the IB strategy was successful. The use of primary data allows to identify the existence of several key factors of success of Tetra Pak Italy implementation of IB.

Value of Paper - This paper is a step in a stream of research that analyses IB in the supplier's perspective.

Practical implications - The contribution of the paper should not, however, be overstated. Actually, the analysis presents an initial foray into the realm of IB.

Key words: Tetra Pak Italy, Ingredient Branding, business-to-business, co-marketing

Paper type: Case study

INTRODUCTION

Branding theory has developed mainly in the context of consumer products; yet, most economies are characterised by a preponderance of companies selling B2B or industrial products (Donaldson, 1996; Mudambi, Doyle and Wong, 1997; Mudambi, 2002). Understanding how branding works in industrial markets is consequently a priority (Shipley and Howard, 1993; Rozin and Magnusson, 2003).

The aim of this article is to understand the key factors of success and advantages that Tetra Pak Italy reached thanks to Ingredient Branding (IB) implementation.

In order to allow the rider to understand the Tetra Pak Italy allied campaign some of the distinctive features of ingredient branding (IB) are discussed.

INGREDIENT BRANDING: AN OVERVIEW

IB is a particular kind of promotional alliance (Norris, 1992; Desai and Keller, 2002). A promotional alliance involves a formal partnership characterized by the association of two or more brands and their relative communication (Cegarra and Michel, 2000; Levin and Levin, 2000; Kumar, 2005). The alliance known as co-branding is a marketing strategy for cooperative marketing or, in other words, co-marketing) (Kramer, 1995; Shawn, 2000). Included among the different promotional alliances, IB plays a key role (Figure 1).

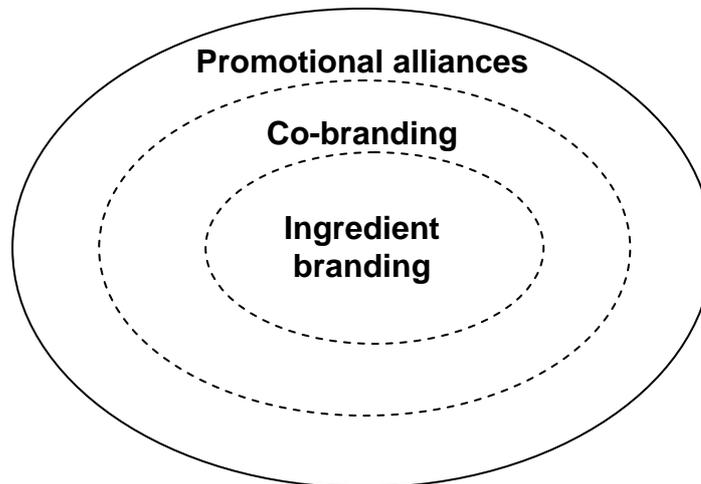

Figure 1: From promotional alliances to ingredient branding (source: authors)

IB is an accepted marketing device (Norris, 1992; Dover, 1997) that has only recently started to emerge (Kotler and Keller, 2006; Kotler and Pfoertsch, 2006). In today's global economy, companies have to establish and maintain competitive advantage, create commercial success in the market and provide criteria to differentiate them from their competitors (Trinquecoste, 1999; Bartlett *et al.*, 2004). Until recently, the focus was on tangible, but has now shifted toward intangible resources, such as brands (Carpenter *et al.*, 1994; Kapferer, 2001; Keller and Webster, 2004) and customer loyalty. For this purpose, companies and organizations favour branding efforts that create value for both consumers and companies. This has also had an impact on industrial marketing such as the B2B market, where the fundamentals of IB apply. For this reason, in today's fast-changing markets scenario, IB is becoming a major marketing strategy as demonstrated by the increasing number of products sold with embedded branded components (Prince and Davies 2002; Cooke and Ryan 2000; Washburn *et al.*, 2004). Thus, the main features of IB are delineated in order to clarify the relative concepts and characteristics linked to IB.

IB is a special form of alliance between two brands (Ohmae, 1989; Lorange and Roos, 1992; Parkhe, 1993), based on the cooperation between firms in designing and delivering the product, with particular emphasis on the recognition and identification of the components used in the end product (Pfoertsch and Mueller, 2006; Luczak *et al.*, 2007). In other words, this alliance is sealed when a component part or service of the end product is promoted to the final user. It is worth noting that IB can be analysed from two perspectives: the manufacturer's or the supplier's— this is the case considered in the present paper (Pfoertsch and Mueller, 2006).

Evidence would appear to indicate that branded ingredients affect consumer product quality perceptions, product evaluations, likelihood of purchase, and reservation prices of host brands of varying quality (Norris, 1992). Certainly, if the customer understands and knows the function, features and benefits of a component (ingredient), he/she will pay more attentions to the offer, and if it creates a unique product offer it can lead to loyal and profitable customer relationships (Desai and Keller, 2002).

DESIGN, APPROACH AND METHODOLOGY

The use of different methods, applied synergically, is almost universally used at the new concept and theory stage (Dean, 2004). In order to reach the goal of the paper, direct and indirect data were consequently analysed. The primary data are the outcome of an in-deep interview with the Tetra Pak Italy marketing director, while the secondary data comes out from reports made available by the company. The reports present results – codified in tables and figures - of the co-branding campaign. Thus, two different approaches were used to ascertain the implementation of IB strategy.

The Marketing Director of Tetra Pak Italy was asked to speak about the main tools and actions the company used to communicate with their partners in this campaign during an in-depth phone interview. This method – the qualitative approach - is almost always used in communication research (Dean, 2004). It has to be considered as a first step of investigation that should be followed by other research.

About the secondary data, they offer results on the Tetra Pak Italy post-campaign effects, measured thanks to a questionnaire submitted to customers. Actually, they present: Tetra Pak Image, intention to buy Tetra Pak packages and awareness of Tetra Pak as a brand. These three items, on which the questionnaire focussed, allow to understand the effects of the campaign.

ANALYSIS/DISCUSSION

As is well known, Tetra Pak is a multinational food processing and packaging company of Swedish origin. An important part of Tetra Pak's mission is to "create profitable growth in harmony with environmental sustainability and good corporate citizenship". As part of corporate values, the company takes a long term life cycle perspective committed to improving environmental performance, to communicating openly with stakeholders and to reporting regularly on corporate performance. These principles are deeply rooted in the Tetra Pak Environmental Policy.

In 2005 the Italian branch of Tetra Pak, Tetra Pak Italy was involved in the ITX emergency - (isopropyl thioxanthone) a substance used to fix ink on packaging. The ink curing agent was found to have seeped through the packaging and into the milk. The packaging was produced by Swedish-based Tetra Pak. It is clear that Tetra Pak, a company that places great importance on sustainable development and social responsibility, has suffered enormous damage in terms of corporate image because of this emergency.

To improve the brand's image and recover the brand's reputation, Tetra Pak Italy decided to put in place IB strategy. This choice of marketing was strictly connected to the ITX crisis, as the marketing director himself confirmed.

Before the campaign that was put into practice from March 2007 to March 2008 (see Table 1), Tetra Pak Italy promoted comakership communication to partners - well-known Italian brands involved in the food sector (Parmalat – phases 1 and 5 of the campaign - Zuegg – phase 2 - Granarolo, Caviro, and Conserve Italia). The comakership communication allowed Tetra Pak Italy to arrange IB strategy with partners. All considered brands made the decision to enable co-branding in order to implement IB strategy.

It was admittedly, the first time that Tetra Pak Italy and partners had highlighted the eco-sustainable value of packaging through a communication plan, using: (1) TV advertising (50" and 15" commercials), in co-branding with Parmalat, Zuegg and Caviro (March 2007-March 2008); (2) Magazine advertising, in co-branding with Granarolo, Conserve Italia and Caviro (April 2007 to October 2007); (3) E-advertising on partners' website and competitions-games for consumers (May 2007-April 2008) (Table 1).

Table 1: Media plan made by Tetra Pak Italy with customers as partners. **Source:** CRC Campaign Update April 2008 (Tetra Pak Italy)

The communication plan required an investment of 30 million Euros used mainly to buy television advertising space; double page spread advertising in newspapers and website space. In addition, many partners dedicated web-space to explain why they chose Tetra Pak Italy. The commercials were broadcast on many Italian networks. The environment was the core theme of the communication plan. “The thickness of a blade of grass, Tetra Pak safeguards taste and the environment”, this was the claim of TV commercials in which the three partners (Parmalat, Zuegg and Caviro) respectively joined Tetra Pak Italy in communicating their common respect for the environment. Several TV commercials were broadcast. Some of them highlighted why Tetra Pak and the other partners were discussing their strategy of sustainable development.

In this way, Tetra Pak Italy implemented IB strategy through co-branding alliances with partners and communicated directly to final customers to attempt to strengthen and improve their joint brand image. The tracking of the campaign, the results of which are shown in a corporate report provided by the company (Figure 2), confirms excellent performance of the main indicators monitored such as: (1) intention to buy Tetra Pak Italy packages (Figure 3), (2) awareness of Tetra Pak Italy as a brand. Many items concerning the company Tetra Pak Italy (as Tetra Pak is a technologically advanced company, Tetra Pak is a company committed keeping food safe in its packages, Tetra Pak is reliable company, Tetra Pak is committed to environment preservation and sustainability) were taken into consideration to measure the effects of the campaign on the company image. All of them are summarized in the following graph (the question proposed to customers was: “For each of the following items concerning the company Tetra Pak Italy, please indicate your level of agreement”). This graph uses these scale of analysis: level of agreement 5 points agree level scale 5 = max agreement 1 = no agreement and the Campaign communication phases.

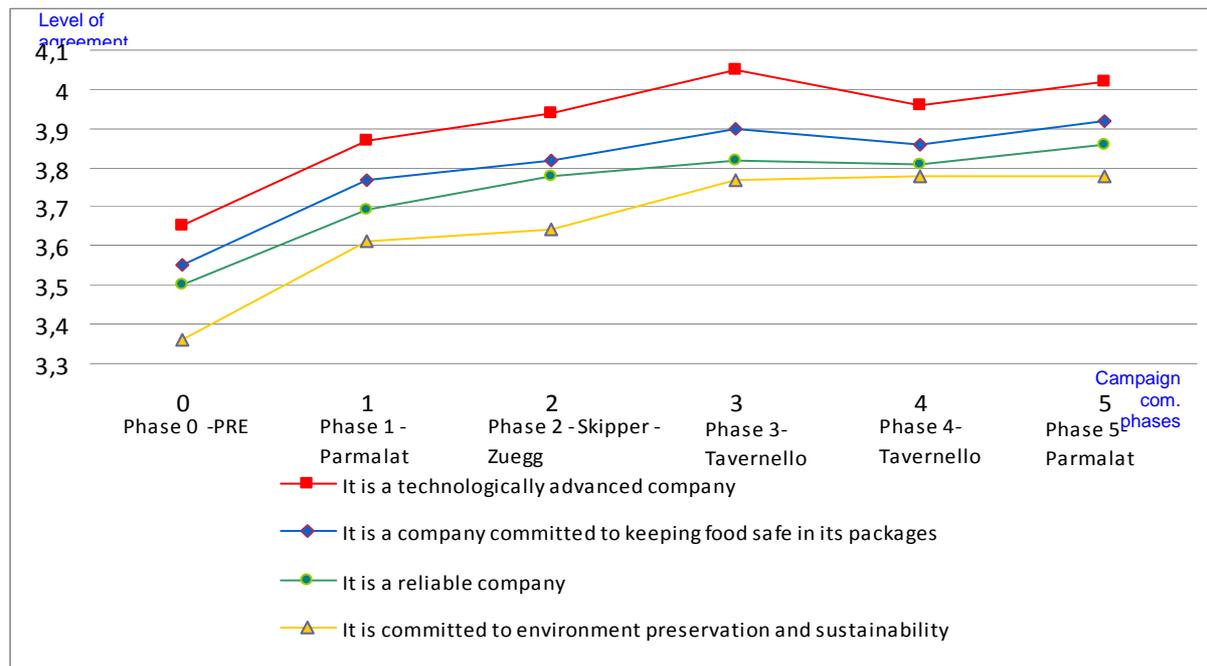

Figure 2: Tetra Pak Image: pre and post IB campaign (2007-2008). Source: CRC Campaign Update April 2008 (Tetra Pak Italy)

Moreover, concerning intention to buy Tetra Pak Italy packages, when this was taken into consideration to measure the effects of the campaign the following question was made to customers (the question proposed to customers was: “Which is your future intention to buy of Tetra Pak packages?”). The outcome of the campaign showed to have caused a positive effect on customers’ intention to buy (Figure 3). Actually the results of each phase of the campaign highlight a growing trends (the answer “for sure I’ll buy them” increases from 28% in phase 0 to 43% in phase 5.

	Phase 0 PRE B :2000	Phase 1 - Parmalat B: 1000	Phase 2 - Skipper - Zuegg B: 1000	Phase 3 - Tavernello B: 1000	Phase 4 - Tavernello B: 1000	Phase 5 - Parmalat B: 1000

For sure I’ll buy them	28	37	37	39	37	43

Figure 3: Intention to buy Tetra Pak packages. Source: CRC Campaign Update April 2008 (Tetra Pak Italy)

In addition, the outcome of the campaign showed a significant improvement in terms of awareness of Tetra Pak Italy as a brand (Figure 4).

In fact, customers answered positively to the question proposed which was: “Do you know Tetra Pak, likewise a name or since you have seen it advertised or on the shelves?”.

The trend of good reached awareness reaches a peak at start of the second flight (phase 2).

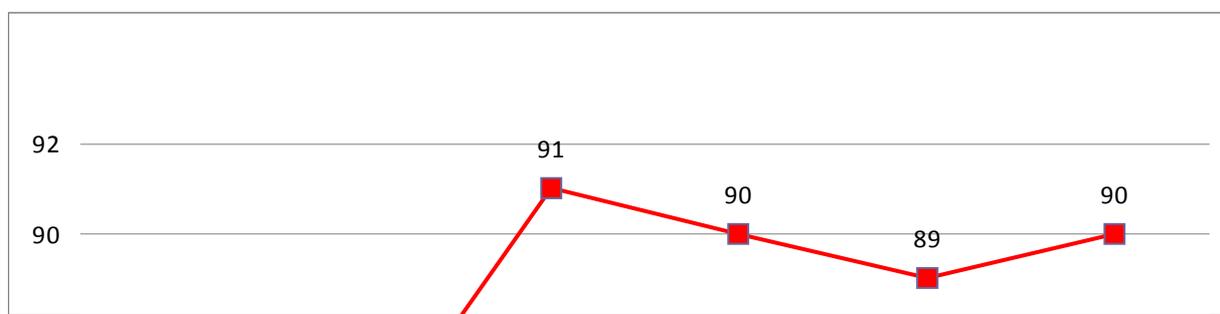

Figure 4: Awareness of Tetra Pak as a brand. Source: CRC Campaign Update April 2008 (Tetra Pak Italy)

In conclusion, the outcome of the campaign showed very positive results on the following items related to Tetra Pak Italy: (1) company and brand built on solid values such as: protection, reliability, environment awareness, and advanced technology; (2) regained consumer trust through marked "intention to buy" based on package and content quality; (3) positive consumer perception towards the partners of the campaign; significant improvement in terms of: visibility; commitment to choosing packages which protect the quality of content; commitment to choosing environment friendly packages and perceived image.

The analysis of Tetra Pak Italy shows that the implementation of the IB strategy enables this company to obtain successful results in terms of brand image. The items identified in the previous section clearly highlight these positive effects. Thus, in the Tetra Pak Italy IB strategy plays a strategic role as a kind of co-branding.

It is important to identify which were the key factors of success of this strategy in the Tetra Pak Italy analysis. In the considered perspective, three factors, emerged from the in-deep interview, have played a very important role to help Tetra Pak to implement successfully that strategy: (1) the previous existing strategic relationships with industrial customers (Parmalat, Zuegg, Granarolo, Caviro, and Conserve Italia); (2) the preliminary comakership communication made to reach these partners in order to involve them into promotional alliances (co-branding); (3) the core theme coherent to Tetra Pak's mission and value system.

About the first factor, it could be highlighted that the main cause which become the basis of this relations is the fact that the comakership was born on the basis of a supply relation between the supplier (Tetra Pak) and manufacturer/producer (Parmalat – phases 1 and 5 of the campaign - Zuegg – phase 2 - Granarolo, Caviro, and Conserve Italia). In actual fact, the well-known Italian manufacturers involved in the food sector chose the innovative Tetra Pak packages for the reason that this product is considered suitable to express their value system too. In fact, the materials which are used by Tetra Pak are eco-sustainable but, at the same time, they are also pioneering in the field of food preservation. The scopes of Tetra Pak packages are shared by all companies involved. This feature is, in fact, an essential requirement of the relationship's origin and persistence. For this reason, it is possible to identify a kind of co-evolution made by the supplier and its partners.

Moreover, those partnerships considered, firstly focussed on corporate strategic aspects, developed on communication collaborations (activities).

On the light of the shared value system, as regard to the second factor, Tetra Pak Italy was able to implement an efficient comakership communication that involved the partners to create promotional alliances and IB strategy. Actually, comakership communication is as important as communication to final consumers. That starting point is fundamental for achieving promotional alliances with partners and co-branding strategies.

Considering the third factor, the values of Tetra Pak brand are also factors which allow the coherence between the core theme of the communication plan and Tetra Pak's mission. In fact, environmental sustainability and good corporate citizenship are corporate values deeply rooted in the Tetra Pak Environmental Policy. Hence, these values make credible the message of the communication plan of Tetra Pak Italy and its partners, based on the core theme of environment safeguard. It is a fact that the core theme recalls values clearly stated in the Tetra Pak's mission and value system which is a strong feature of the communication put into practice in the 2007/2008. This should be an important factor to construct a positive brand image.

SUMMARY

Tetra Pak Italy campaign 2007-2008 analysis shows how to put into practices a successful IB strategy. In order to understand the proposed example, the paper summarised the main characteristics of the considered strategy, presenting several definitions which highlight the fact that it is possible to study the topic from the supplier's perspective.

In fact, Tetra Pak Italy presents an interesting way of involving partners to communicate to final customers. In actual fact, the company firstly implemented a comakership communication with its partners, trying to lever on common value and on long-lasting relationship, and then they decided to plan together a co-branding strategy. This first communicational step strengthened the bonds between Tetra Pak Italy and its partners but at the same time, it puts the bases for a likely IB strategy.

In conclusion, three factors have played a very important role to help Tetra Pak to implement successfully that strategy: (1) the previous existing strategic relationships with industrial customers; (2) the preliminary comakership communication made to reach these partners in order to involve them into promotional alliances (co-branding); (3) the core theme coherent to Tetra Pak's mission and value system.

Moreover, it seems clear that the company made great efforts not only in managing the media and the coherent messages of the IB campaign but also in measuring with a well-shaped questionnaire the effects that the IB campaign had on its final customers.

PROFESSIONAL AND PSYCHOSOCIAL TRAINING FOR SENIOR MANAGERS OF NON-PROFIT ORGANIZATIONS. A QUALITATIVE RESEARCH

Benevene, Paula¹; Cortini, Michela²

¹*Faculty of Sciences of Education, LUMSA University, Roma (Italy)*

²*Faculty of Psychology, G. D'Annunzio University of Chieti – Pescara (Italy)*

Since the early 90s Non-Profit Organizations (NPOs) stand out as crucial actors in politics, economics and welfare systems (Salamon, Sokolowski & List, 2003). Italian NPOs are 35.232. They are mainly young and fast growing: in fact, 55.2% of these organizations started their activities after 1990 and, finally, they increased by 36.8% between 1999 and 2005 (Rinaldi, 2008). Italian Non-Profit Sector also has an economic relevance: it has an income of about 38 million euros and an expenditure of 35 million Euros (Cnel-Istat, 2008) and employs 3,908,118 paid workers (Rinaldi, 2008).

NPOs have to cope with and harmonize different motivations, different working times, different training programmes, different approaches expressed both by the staff and the volunteers. A further element of complexity of the management of Non-Profit Organizations is their being accountable to many and various stakeholders: volunteers, donors, clients/people reached by their services; national and local administrators (with which they often co-operate), state institutions and public services (from which Italian Non-Profit Organizations receive a significant amount of money to fund their activities); just to mention only a few of them (Abzug and Webb, 1999).

Purpose

Following the recent contributions by Kong (2007; 2008), according to whom intellectual capital provides a conceptual framework for non-profit strategic management, NPOs even more required to develop their present human resources and generate new skills and competences in order to create innovative services and survive in a more competitive environment. This explorative research aims at identifying the training needs of senior managers of Italian Non Profit Organizations, with special reference to Human Resource Management.

In particular, we formulated the following research questions:

- Which representations do senior managers have of their training and educational needs?
- Which are the strengths and the weaknesses of senior managers of NPOs on training and Human Resources management?
- Which Priority do Senior Managers of NPOs assign to socio-psychological training?

Methodology

The research was developed through the administration of a **semi-structured interview** to 122 senior managers of as many Italian NPOs. Interviews were audio taped and transcribed and subsequently analysed by trained independent judges. Data analysis has been run using a triangulation of qualitative and quantitative techniques of analysis, namely content and discourse analysis, run through the software T-Lab (analysis of word occurrence and co-word mapping), as well as the statistical analysis of questionnaire's responses.

Findings

Data analysis shows that:

- Senior managers of Italian Non-Profit Organizations assess as very different their training needs from those of for-profit and public organizations. Nonetheless, their representation of training and educational opportunities is far to be well defined and clear;
- Money and time constraints, combined with poor quality of training and educational opportunities as well as the selection procedures adopted, have a negative impact on skills and competencies of senior managers of NPOs on human resources management;
- Senior managers of Italian Non-Profit Organizations assess the development of their skills and competencies in Human Resources management as a priority

Originality

The paper deals with training programmes for NPOs, which is rarely approached by the specialized literature. A further value of the paper is represented by the methodology of analysis, which triangulates different qualitative techniques of analysis.

Key words: Third Sector, Non-profit organizations, Human Resource Management, Training of Senior Management

BACKGROUND

Since the early 90s Non-Profit Organizations (NPOs) stand out as crucial actors in politics, economics and welfare systems (Salamon, Sokolowski and List, 2003). Italian NPOs are 35.232. They are mainly young and fast growing: in fact, 55.2% of them started their activities after 1990 and, finally, they increased by 36.8% between 1999 and 2005 (Rinaldi, 2008). Italian Non-Profit Sector also has an economic relevance: it has an income of about 38 million euros and an expenditure of 35 million Euros (Cnel-Istat, 2008) and employs 3,908,118 paid workers (Rinaldi, 2008). NPOs have to cope with and harmonize different motivations, different working times, different training, different approaches expressed both by the staff and the volunteers. A further element of complexity of the management of Non-Profit Organizations is their being accountable to many and various stakeholders: volunteers, donors, clients/people reached by their services; national and local administrators (with which they often co-operate), state institutions and public services (from which Italian Non-Profit Organizations receive a significant amount of money to fund their activities); just to mention only a few of them (Abzug and Webb, 1999).

AIM AND OBJECTIVES

Following the recent contributions by Kong (2007; 2008), according to whom intellectual capital provides a conceptual framework for non-profit strategic management (See e.g. Kong, 2007, 2008), NPOs are even more required to develop their present human resources and generate new skills and competences in order to create innovative services and survive in a more competitive environment.

This explorative research aims at identifying the training needs of senior managers of Non-Profit Organizations, with special reference to Human Resource Management.

More specific aims are to collect information on:

- Procedures and criteria adopted in order to recruit and select senior managers of Non-Profit Organizations;
- How senior managers are trained in Human Resources management and how they assess their training opportunities in this area;
- How senior managers of Italian Non-Profit Organizations assess their own skills and competences in Human Resources management;
- The relevance and priority assigned to Human Resources management by senior managers of Non-Profit Organizations.

In particular, we formulated the following research questions:

- Which representations do senior managers have of their training and educational needs?
- Which are the strengths and the weaknesses of senior managers of NPOs on training and Human Resources management?

- Which Priority do Senior Managers of NPOs assign to socio-psychological training?

METHODOLOGY

A semi-structured interview and an ad-hoc questionnaire were individually administered by trained researchers to 122 senior managers of as many Italian NPOs.

Interviews were audio taped and transcribed. Interviews have been analyzed using different qualitative techniques, namely content and discourse analysis, run through the software T-Lab (analysis of word occurrence and co-word mapping), as well as discourse analysis carried out by two trained independent judges, who developed the codes deductively, systematically reassessed them during the coding process, and finally adapted them inductively.

MAIN RESULTS

Part 1: Representations of senior managers on their training and educational needs

The interview started with an open-ended question: *“What does the word training remind you of?”* Through this question it was meant to understand participants’ representation of training.

We have decided to approach this open question with a content analysis.

Quantitative analysis has been performed using the software T-Lab, carrying out analysis of word occurrence and co-word mapping, sequence analysis and concept mapping analysis.

We have prepared our text for analysis through *lemmatization*, which gives a reorganization of the T-LAB database, creating different tables used to analyze data; this means grouping together words that have the same meaning root, like for example *“training”* and *“to be trained”*. This operation, obviously, has been performed only for the words (lemmas or categories) considered interesting for the subsequent analyses, like *work-job*, *training*, and so on.

In terms of words occurrence, the most cited word is *“training”*, with 97 occurrences.

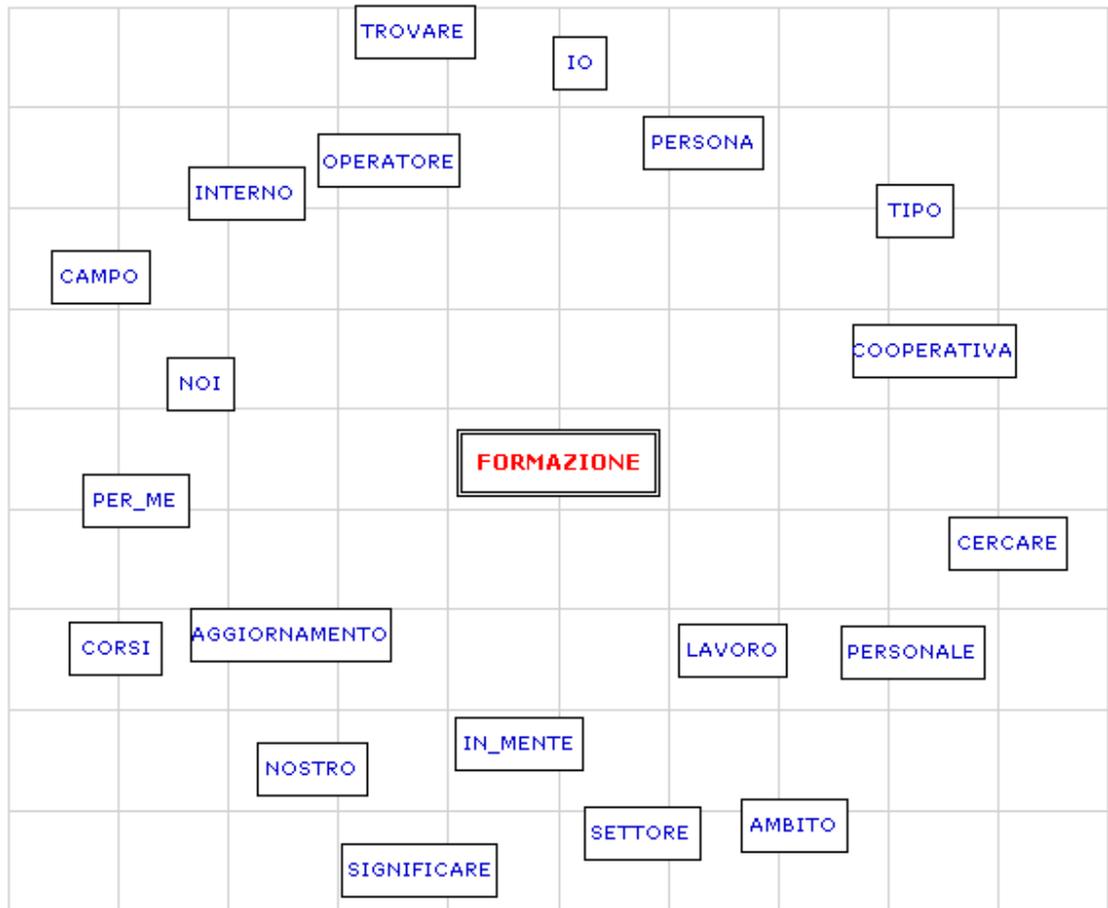

Fig. 1 Graph of word occurrences and co-occurrences on a multidimensional space

WORD	COEFF	OCC	CO-OCC	CHP
Work	0,48	43	28	1,132
In_my_mind	0,419	26	19	2,812
Up-date	0,394	16	14	6,281
People	0,329	30	16	0,427
Organization	0,319	21	13	0,118
Seminars	0,263	9	7	1,474
Experience	0,237	11	7	0,129

Tab. 1 Cosine's Coefficient of word associations for the word "training"

It can be noted that from this analysis (fig. 1, where the more two words co-occur the more they are closed in the dimensional space) training does not seem to be associated with anything like “strategic management”, or “organizational development” or “human resource development”. Training seems to be more considered as a useful way of up-dating professional skills, but not a strategic tool for human resource management

The word “esperienza” (experience) does not compare in the central multidimensional scaling diagram (fig.1), but still shows a quite good index of association (Cosine’s coefficient 0,237), as shown in table 1. Its association with “formazione” suggests that training is strongly associated with direct experience and less with formal or structured occasion of learning.

It is interesting to note too that other words with high association index are related to who benefits from training programmes, namely, “cooperativa” (co-operative organization, one of several types of Italian NPOs) and “persona” (people), with, respectively, a cosine coefficient of 0,319 and 0,329.

This latter result, which considers both the NPO and its workers as subject that receive training, shows how NPO managers have an approach to training which is similar to that of their for-profit counterparts. In these terms, it is evident why for some organizations training programmes are becoming more and more the most powerful tool in terms of *corporate branding*. As an alternative explanation, it is possible to make reference to the fact that NPOs organize training in outsourcing and perhaps for such a reason both the whole organizations as its workers are seen as correlate being the parts that receive training benefits.

In order to go in deeper details of what the words co-occurrence analysis has shown, we have run a [Markovian analysis](#) of the sequences, which are the syntagmatic relationships between the lexical units under analysis. Each lexical unit has a predecessor and a successor that are respectively the lexical unit that comes before it and the lexical unit that comes after it.

Beginning from a matrix in which all the predecessors and all the successors of each lexical unit are recorded, T-LAB calculates the transition probabilities (Markov chains) between the lexical units analyzed (max 1,500).

The following table shows the sorted list of predecessors (the first) and successors (the second) of the lexical unit “training”.

The list is in descending order according to the probability values (“PROB”). For example, in the following table, the probability that “persona” (people) will follow “training” is equal to 0,017, that is 1.0% and the possibility that “work” comes before “training” is 0,43, that is 4%⁵⁵.

⁵⁵ In giving these percentages some meaning, we have to put aside the percentages we usually see in a questionnaire analysis of variance and rather we have to keep in mind that we are discussing about the probability that a word follows another one among millions of words; in this sense 4% is definitely a good percentage.

<i>PROB</i>	<i>PREDECESSORS</i>
0,043	<i>work</i>
0,043	<i>I</i>
0,043	<i>To-my-mind</i>
0,034	<i>In_my_opinion</i>
0,026	<i>up-date</i>
0,017	<i>people</i>
0,017	<i>employees</i>
0,017	<i>professionalism</i>
0,009	<i>we</i>
0,009	<i>study</i>
0,009	<i>social</i>
<i>PROB</i>	<i>SUCCESSORS</i>
0,093	<i>To_my_mind</i>
0,042	<i>In_my_opinion</i>
0,042	<i>To_mean</i>
0,034	<i>internal</i>
0,025	<i>operator</i>
0,017	<i>people</i>
0,017	<i>sector</i>
0,017	<i>task</i>
0,008	<i>professionalism</i>
0,008	<i>employee</i>
0,008	<i>experience</i>
0,008	<i>organization</i>
0,008	<i>Up-date</i>
0,008	<i>we</i>

Tab. 2 *Markovian analysis of the sequences concerning the lexical unit "training"*

Generally in the predecessors list there are the causes of the variable under analysis; significantly, the most probable predecessor, in our case, is "work"; this result may suggest that in participants' opinion, training needs arise in the occupational contexts and that is the work

itself that requires training. In other words, psychosocial training seems to be seen as the professional answer to real organizational needs.

The analysis of successors is not as much clear; among the most associated words there are conversational tools like “in mente” (in my mind), “per me” (in my opinion), “significare” (to mean), which are actually communicative devices to start the response without a real meaningful content.

The rest of the lexical units, “interno” (internal), “persona” (people) and so on in Markovian chains analysis have almost the same probability to be a successor and this stresses the idea that senior managers do not know possible results of training programmes (in fact, in the successors of Markovian sequences there are very often the consequences and results of variables under examination).

Finally, a concept mapping was run, based on a co-occurrence matrix (word x word) and on the mathematical computation of the association indexes (Cosine, in our case), which presents as an output (fig.3) a graphic representation by [multidimensional scaling](#).

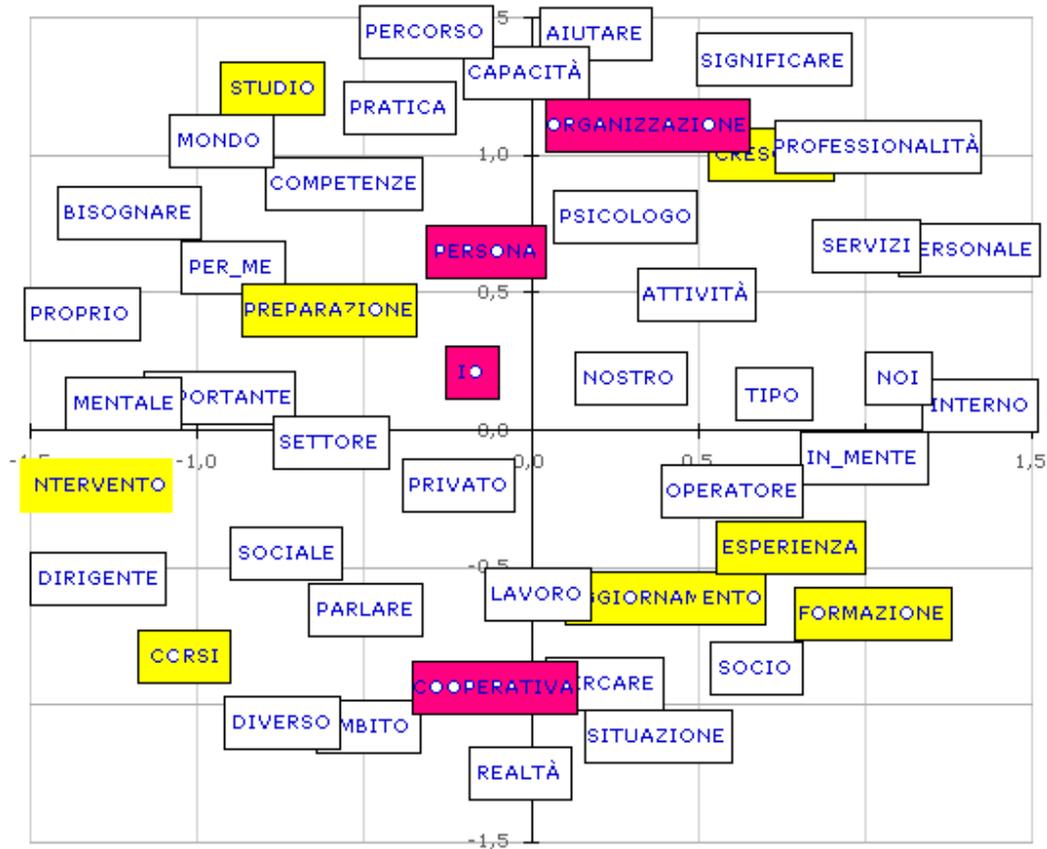

Fig. 3 Multidimensional scaling using a matrix word x word with 7times as cutting level of word occurrence

This analysis was run using as occurrence-point 7 times: this means that the matrix word x word is constituted only by words used at least 7 times in our corpus; this choice has its rationale in terms of facilitating the interpretation of results. Results show two different categorical factors, marked in yellow and pink (fig. 3). The first one refers to the idea of training, going from “study” to “experience”, “update”, “training” and so on; the second factor refers to the entities and people who benefit from training (“persona” - people, “organizzazione” - organization and so on).

The second question of the interview asked whether NPOs have specific training/educational needs.

All participants (N=122; 100.0%) stated clearly that Non-Profit organizations have specific training needs, different from those of Profit Organizations.

The most quoted reasons to explain why NPOs have different training and educational needs from the for-profit and public organizations are mainly related to the kind of intervention they operate: not-profit oriented and people-oriented (N=58; 47.54%) (*“What distinguish us is our attention to society’s needs and weaknesses”; “NPOs need training in order to be able to address people’s needs”; “Our sector is based upon people, relationships; therefore we need motivated and specialized members”; “managing a NPO that offers social services is quite different from managing a public company, dealing for instance with road works”*)

A second group of reason, though less quoted than the first one, deals with the need to improve constantly the services offered, through training (N=21; 17.21%) (*“We need training .. because too often we improvise, we do our work without the proper preparation”; “NPOs are asked to improve constantly their services”; “When you work in the social field you cannot be untrained. Trained members’ work is 100% effective; untrained members’ work is only 25% effective”*)

A third group of reason deals with the need to improve human resource management (N=12; 9.83%) (*“We need specific training to handle our paid staff and volunteers”; “Formal education or a degree doesn’t train enough who wants to work in a NPO”*)

The most quoted training needs of NPO senior managers are: fund raising (N=47; 38.52%) (*“It is vital for us to collect funds”; “Fund raising is fundamental to survive”*); leadership development (N=23; 18.85%) (*we need people able to handle internal dynamics, who’s able to create followers”*); management and organizational skills (N=17; 13.93%) (*“It would be important to get some training opportunities on how to manage and organize the organization” “We should know more on how to develop and value our human resources”*); administrative knowledge (N=18; 14.75%) (*“We need more administration competencies”*); legal and fiscal knowledge (N=15; 12.29%) (*We need to be always updated on laws and rules regarding NPOs”, “We need to know everything about laws and rules as well as fiscal regulations”*)

Part 2: Strengths and the weaknesses of senior managers of NPOs on training and Human Resources management

In terms of training, senior managers are mainly on-the-job trained (N=45; 36.88%); having a specific degree or diploma, related to their job is much less mentioned (N=20; 16.39%); sometimes they also attend informal courses, quite often organized by umbrella organizations (N=16; 13.11%); more often, they take advantage of participating in seminars and meetings (N=36; 29.50%), though those opportunities might lack of continuity and are not part of a broader project.

Knowledge gained from field experiences seems to be highly valued and seniority in the organization or previous experience in its same field appears to play a crucial role in selecting senior managers (*“Senior managers are former field-based workers, who have been given the opportunity to develop their career”; “usually senior managers are already members of their own organization”*).

Seniority in the same organization is regarded by NPOs as a “very important” or “important” criteria in almost 70% of the reached organizations (N=84; 60.85%) (Tab. 2) and a similar percentage (N=82; 67.12%) of current senior managers of participants' own organization were already working in the same Non-Profit Organization before being recruited as such; in add, most recurrent criteria adopted for selecting senior managers are seniority in the same organization (N=49; 40.16 %) and experience gained in the same field of intervention (N=25; 20.49%). Assessment of a candidate through curriculum analysis or job interviews is much less quoted (respectively: N=16; 13.11% and N=11; 9.01%).

	N.	%
<i>Very important</i>	54	4.26
<i>Important</i>	30	24.59
<i>Fairly important</i>	25	20.49
<i>Little important</i>	05	4.09%
<i>Not at all important</i>	06	4.91%
<i>No answer</i>	2	1.63
TOTAL	122	100.00

Table 2. When a Non-Profit Organization recruits a manager, what importance is given to his/her previous field experience in that same organization?

The most quoted obstacle to receive more training is money constraint (N=62; 70.4%), followed by time constraint and poor quality of training and education opportunities (Table 3)

	N.	%
<i>Money constraint</i>	62	70,45
<i>Time constraint</i>	14	15,91
<i>Poor quality of training opportunities</i>	13	14,77
<i>Training is not considered important</i>	11	12,50

Table 3. What are the obstacles to obtaining more training?

It has to be noted that a small group of respondents (N=11; 12.50%) said that sometimes NPOs do not consider training as important as it should be (“NPOs pay little attention to training; it is hard to make people understand how training is important”; “There aren’t many incentives to participate

to training opportunities"; "Training is not a problem, the real problem is NPOs' lack of interest in training"; "Training is under evaluated")

Part 3: Priority assigned by Senior Managers of NPOs to socio-psychological training

Only 12 respondents (N=12; 9.83%) assess as "adequate" the training opportunities offered to senior management by (Table 4). In spite of this such negative assessment as well as the priority assigned to knowledge gained through previous field experiences, the majority of participants (N=63; 71.6%) believe that senior manager of Non-Profit organizations feel they need more training and almost half of them (N=51; 41.80%) believe they feel it quite strongly (Table 5).

	N	%
<i>Adequate</i>	12	9.84
<i>Partially adequate</i>	88	72.13
<i>Fully inadequate</i>	10	8.19
<i>No answer</i>	12	9.84
<i>TOTAL</i>	122	100.00

Table 4. Are training opportunities offered to senior managers adequate?

	N	%
<i>Very much</i>	51	41.80
<i>Fairly</i>	28	22.95
<i>Not at all</i>	31	14.75
<i>No answer</i>	12	9.83
<i>TOTAL</i>	122	100

Table 5. Do Senior Managers of NPOs feel they need training?

Also in the field of human resources management ,according to the majority of respondents (N=84; 68.85%), senior managers develop their competencies and skills mainly on-the-job .

Being asked explicitly to evaluate competencies and skills on human resource management of NPOs' senior managers, more than 70% of participants (N=71; 58.19%) consider them as "inadequate"("Senior managers are poorly, not professionally trained on human resource

management"); a minority (N=21; 17.21%) consider them as "adequate" and about one fourth (N=30; 24.59%) cannot express an opinion on this matter.

About two thirds of respondents (N=92; 75.40%) (fig. 6) believe that training senior managers on Human resources should be considered as a priority among NPOs.

	N	%
<i>Very important</i>	61	50.00
<i>Important</i>	31	25.40
<i>Fairly Important</i>	16	13.11
<i>Little important</i>	7	5.73
<i>Not at all important</i>	7	5.73
TOTAL	122	100

Table 6. What importance should be given to training senior managers on human resource management?

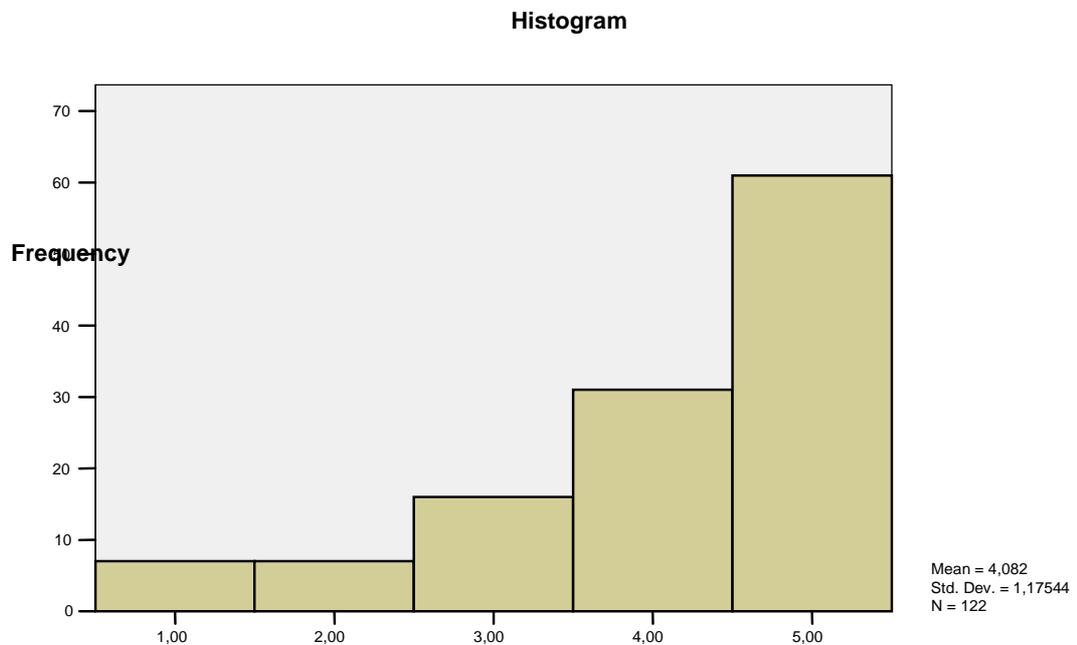

Fig. 4 Training Importance

The data of this single item have been processed for the Kolmogorov-Smirnov statistical test. This is a non-parametric test that measures the discrepancy between the distribution of data and an ideal Gaussian distribution, and is used to test the normal distribution of the numerical data. The Z of 3,121 is significant at $p < 0.001$ (tab. 4), meaning that there is a deep discrepancy in the distribution of responses and namely that training is judged by our sample managers in a very polarized way, and in particular as being definitely important.

CONCLUSIONS

Part 1. Representations of senior managers on their training and educational needs

Senior managers of Italian Non-Profit Organizations assess as very different their training needs from those of for-profit and public organizations. Nonetheless, their representation of training and educational opportunities is far to be well defined and clear. From the analysis carried out with T-lab it emerges that NPOs need to be helped to fully address their training needs. not only because of poor quality of training opportunities, but also because they do not seem to have clear ideas on what training may offer them in terms of organizational development and strategic management.

In addition, it does not seem that training is perceived as a strategic tool for organizational development, but rather a way to update and improve professional skills

Part 2: Strengths and the weaknesses of senior managers of NPOs on training and Human Resources management

Senior managers seem to have a deep knowledge of their own organization's field of intervention and are well aware of their own organization's values, mission and interventions, as it might suggest the priority assigned to previous field experience in the same organization or in a similar organization.

Their knowledge and skills are mainly oriented towards effectively managing the relationship between the organization and its environment; much less developed are competencies and skills on managing the organization in terms of valuing and developing human resources.

NPOs' organizational cultures appear to privilege action and pay less interest in reflecting on action as well as dealing with theories and techniques on organizational management. This approach is obviously to be connected with the reason why a NPO starts its activities: namely to give answer to the specific needs of a targeted group of people. Italian NPOs often struggle with tight budget (Rinaldi, 2008). This might well explain why fund raising is the most mentioned training need. On the other hand, this continuous struggle to survive financially and economically might lead to operate on a day-by-day basis and create some difficulties in shaping a strategic management of the organizations, as it might be suggested by the priority given to previous experience on the organization in selecting senior managers, as well as the relevance assigned to leadership development and training on human resource management.

In add, money and time constraints, combined with poor quality of training and educational opportunities as well as the selection procedures adopted, turn out to have a negative impact on skills and competencies of senior managers of NPOs on human resources management, which are evaluated by respondents both important and insufficiently developed

Part 3 . Priority assigned by Senior Managers of NPOs to socio-psychological training

According to respondents, senior managers of Italian Non-Profit Organizations assess the development of their skills and competencies in Human Resources management as a priority and believe that this opinion is shared among the other senior managers: two thirds of participants consider "important" or "very important" to train senior managers in this field and only a minority evaluate their present knowledge as adequate; in add, they assess as "poor quality" educational and training opportunities offered to them.

It might be interesting, however, to investigate more in depth into the approach adopted by NPOs towards training. From the interviews it emerges that there might be a problem of legitimation of training, as suggested by those who affirmed that "NPOs do not consider training important". As it has already noted, training is limited by the paucity of resources and

the poor quality of opportunities, but maybe further elements to be considered are the culture and values embedded in organizational of NPOs.

Priority assigned to field experiences as well as to knowledge developed on-the-job suggests being in presence of an organizational culture that is strongly action-oriented and not fully able to cope with long-term planning and strategic management.

If this is the case, there is a risk for NPOs of being stuck in a vicious circle, in which money and time constraints, together with lack of opportunities, motivate to reduced interest in training and perpetuate the difficulties in strategic management.

The conceptualization of NPOs being different and their awareness of having different training needs from the for-profit and public organizations might well play a role in this, since they might be leading to underestimate the relevance of applying theories and techniques of strategic management already (successfully) adopted by their counterparts.

Not only for-profit and public organizations, but also NPOs are now more and more under pressure to make the best use of the existing tangible and intangible resources, to survive and develop new opportunities in a competitive environment (Kong, 2007; 2008)

A limit of the present research is the lack of a statistically representative sample of NPOs; the group of NPOs reached is to be considered only a convenience sample. Therefore, it has not been possible to carry out any analysis taking into consideration variables such as age (years of activities), dimension (number of members, financial resources), type of NPOs (voluntary organizations, co-operatives, foundations, associations, and other NPOs), which might have suggested different point of views

This research might be further developed through the administration of a questionnaire, collecting data on a larger group and statistically significant sample of NPOs. It could be interesting, too, to make a cross-cultural comparison, reaching NPOs of other countries.

INTERCORPORATE SOCIAL RESPONSIBILITY AS A NEW WAY TO SOLVE PRODUCTION EXTERNALITIES. A CASE STUDY

Cortini, Michela¹; Giorgio, Riccardo¹

¹*Faculty of Psychology, University G. D'Annunzio of Chieti – Pescara (Italy)*

Purpose - The present paper, based on the concept of intercorporate social responsibility (Tanucci & Cortini, 2008a; 2008b), aims to investigate the role of corporation networks in green management and, in more general terms, in solving production externalities.

In particular, we would like to present the construct of intercorporate social responsibility as a new way of solving production externalities.

Approach - The general theoretical perspective from which we start is that of industrial and organizational psychology, while the peculiar theoretical framework to which we refer is the International literature on externalities and industrial symbiosis, whose basis is business oriented.

The paper, which is theoretical in nature, presents in its final section a case study relating to a project involving a consortium of 60 Italian organizations which exchange production externalities through an electronic platform to which they are all connected 24 hours a day.

Originality - The originality of the paper derives, in theoretical terms, from the application of the principles of industrial symbiosis at a SME level and from its attempt to sustain, theoretically, an important difference in relation to industrial symbiosis: the possibility of conceiving externality exchange in a more flexible way, allowing corporations to exchange different externalities with different parties without always following the same paths of exchange. Such a novel model, presented in the final section of the paper, is possible as a result of an electronic platform that manages the availability of externalities within the network.

Moreover, to our knowledge this is the first time that a psychological perspective has been applied to the theme of industrial symbiosis and externalities.

Key words: Intercorporate Social Responsibility, Industrial Symbiosis, SMEs, Externalities, Case Study.

INTRODUCTION

Generally speaking, in the most recent International literature “Corporate Social Responsibility” (CSR) refers to some virtuous behaviour performed by a single and specific corporation, for example, using a method of production that is sensitive and respectful toward the environment (see, for example, the review proposed by Egri and Ralston, 2008).

The idea of intercorporate social responsibility, instead, stresses the potentiality, in terms of corporate virtuous behaviours, of a network of different organizations. In other words, the core idea of our paper is that together it is possible to perform better and in an even more ethical way.

The idea of intercorporate social responsibility came into being as a result of a project through which we developed a new way to address the issue of production externalities, an approach similar to the one used in industrial symbiosis and eco-industrial parks, that is, the exchange of externalities among corporations. Production externalities, which generally represent a challenge that has to be managed in order to prevent corporations performing in a non-ethical

way, become a source of CSR if they are exchanged (Cohen-Rosenthal, 2003; van Beers et al., 2007; Salmi, 2008; Yang & Feng, 2008).

The paper explores the idea of intercorporate social responsibility within the most recent literature on industrial symbiosis and reflects, in a more general way, on the use of externalities as a way of supporting organizational development and corporate virtuosity.

PRODUCTION EXTERNALITIES AS ORGANIZATIONAL CHALLENGES

In order to clarify the concept of externality we can start by making reference to its etymology. The word comes from the Latin *externum*, derived from *exter* and stresses the fact of being external. In economic terms, the word externality makes reference to involuntary effects of production and consumption, effects for which nobody pays (when they are positive) and for which nobody is compensated (when they are negative). In other words, an externality occurs when a decision or an act causes costs or benefits to third-party stakeholders (Pigou, 1954).

Generally speaking, externalities have been associated with diseconomics and market failure, since they do not have a link with the core business of their producer. As an example, industrial pollution is in some sense necessary to produce cement, though of course this pollution cannot be put on the market. In addition, there has been much discussion in the literature about negative externalities and the way in which it would be possible to confine them, while little attention has been given to positive externalities. With regard to the latter, they demonstrate the subjective nature of externalities, which very often can be seen in both positive and negative terms: what represents a negative externality for one person may be a positive externality for someone else (Hey, 2003). To give an example, the high volume levels of the music from the gymnasium located in front of my house may represent a negative externality for me, since I work at home and my work, being cognitive, requires concentration, while it may represent a positive externality for my husband, who loves listening to the music while painting.

Even if externalities are not wanted by the producer or the receiver, they may nevertheless be so significant as to raise political issues and require correction efforts (Hey, 2003). In addition, the growing scrutiny of corporations by green movements, citizens, employees and other stakeholders in terms of ethical behaviour forces corporations themselves to confront externalities and try to find some solutions.

It is no surprise that production externality attracts most of the research interest and political policy importance, since it may give rise to serious effects for potential victims (Hey, 2003). Within this field of political and academic interest a specific literature has developed regarding solutions to the problem of externalities.

These issues, in response to the threat to Pareto optimum which externalities represent, arise when one of the social actors involved becomes conscious of the role externalities may play. (Paradoxically, if a victim of an externality, for example, pollution, is not aware of the pollution or is not concerned about it, there will be no need for a solution.)

Pigovian taxes and the so-called Coase Theorem are the main solutions, apart from what has been proposed as the internalization of effects (Desrochers, 2004). This latter, as we have already noted, appears to us to be a poor solution, since we live in a specialized economy that does not

allow externalities to be transformed into something internal, at least for the SMEs which we are examining.

Pigovian taxes are concerned with negative externalities, the costs of which they are an attempt to correct. For example, a Pigovian tax may be levied on producers who pollute the environment to encourage them to reduce pollution, and to provide revenue which can be used to counteract the negative effects of the pollution.

The Coase Theorem, on the other hand, is a private negotiation between the parties involved that aims to reach a social equilibrium that maximizes the efficiency of the use of a given resource, on the basis of market bargaining, in turn developed thanks to the property rights. The sole conditions required to allow the model to work are the null cost of the transactions and the existence of a perfect competitive market.

It would be possible and interesting to discuss criticisms of these classical solutions, but our concern here is to present a new way of solving externalities: their mutual exchange, or, in other words, externality recycling.

INTERCORPORATE SOCIAL RESPONSIBILITY

By proposing the concept of *intercorporate social responsibility* (ISR) we wish, on the one hand, in terms of theoretical speculation, to anchor our proposal to the stakeholders' perspective and, on the other, in more pragmatic terms, to invite corporations to think about themselves and to conceive themselves not only as an isolated entity in a never-ending struggle with other competitor corporations, but rather as a part of a network.

The idea of intercorporate social responsibility is not totally new. Some years ago, in fact, Bond and colleagues carried out a series of studies to evaluate the influence of intercorporate networks on social and political corporate behaviours (Bond et al., 2006). They found that corporations and directors involved in corporate networks were more likely to undertake more charitable actions and give donations.

In brief terms, we believe that it will be easier for a network of corporations than for isolated firms to perform Corporate Social Performance activities, and there are at least two different reasons for this. The first relates to the ease with which it is possible, as we will demonstrate, to perform ethical waste management when part of a network (simply because what represents waste or a by-product for Firm A may become an important resource for Firm B). The second reason relates to a psychological factor, namely a deeper consciousness of being in unity with other people, of all of us being citizens of the world who are the receivers of corporate behaviours.

This is the situation in industrial symbiosis and eco-industrial parks, whose principles we will review in the following section. We agree totally with those (Cohen-Rosenthal, 2003; Hewes & Lyons, 2008) who have underlined that, besides the mere technological devices, the most important key for the success of industrial symbiosis projects lies in the relational levels between the parties involved.

POST KALUNDBORG-PROJECT INDUSTRIAL SYMBIOSIS

A review of the concept of industrial symbiosis is not a simple task, and it is not the principal aim of our article. There are several articles and contributions on this issue (see, for example, the two special issues published by the *Journal of Cleaner Production*, in 1997 and 2004) which may serve as a reference point for the reader in this respect. Our concern here is rather to propose a broad definition of industrial symbiosis and to reflect in a critical way on the future of such an economic construct and of the related practical initiatives of eco-industrial parks.

Industrial symbiosis (literally “living together”) refers to the exchange of materials and energy between enterprises for mutual advantage. Other comparable terms have been used: *eco-industrial parks* (Lowe, 2001), *eco-industrial development* (Cohen-Rosenthal, 2003) *regional resource synergies* (van Beers et al., 2007), *complex utilization* (Salmi, 2008), *circular economy* (Yang & Feng, 2008). In all of these models the aim is to achieve ecologically sustainable industrial activities, engaging traditionally separate enterprises in a collective approach involving the physical exchange of materials, energy, water and by-products in order to gain competitive advantages (Chertow, 2000).

The theoretical basis on which industrial symbiosis has developed are those of industrial ecology (Frosch & Galopoulus, 1989⁵⁶) on the one hand and cluster-based economy, developed in turn by Porter (2000, among various studies on the same issue) on the other.

When discussing industrial symbiosis almost all the articles in the specialist literature make reference to the famous project developed in Kalundborg, Denmark, which seems to have been the first attempt to apply the principles of industrial symbiosis.

⁵⁶ Although the term “industrial ecology” was used for the first time by Frosch & Galopoulus in 1989, the idea of industrial ecology dates back to the mid-1950s (for a review, see Erkman, 1997).

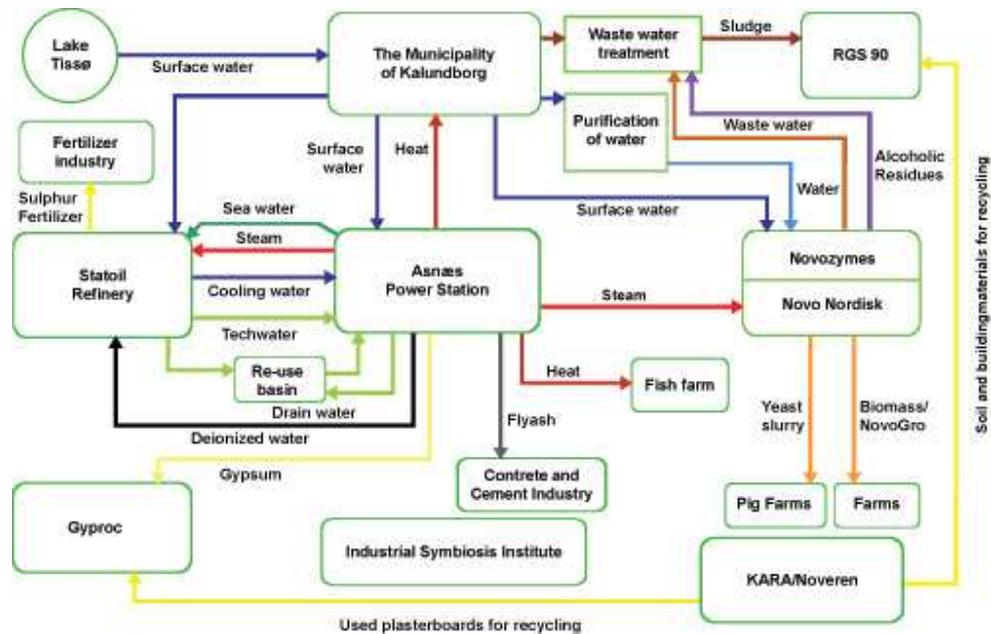

Fig. 1 Schema of exchanges among Kalundborg organizations (<http://www.symbiosis.dk/industrial-symbiosis.aspx>)

The industrial symbiosis project of Kalundborg is a network involving cooperation between seven companies and the Municipality of Kalundborg technical departments.

The philosophy behind the Danish project is that the seven companies (DONG Energy Asnæs Power Station, the plasterboard factory Gyproc A/S, the pharmaceutical plant Novo Nordisk A/S, the enzyme producer Novozymes A/S, the oil refinery Statoil A/S, RGS 90 A/S and the waste company Kara/Noveren I/S) and Kalundborg Municipality exploit each other's residuals or by-products on a commercial basis. One company's by-product becomes an important resource for one or several of the other companies. The outcome is reduced consumption of resources and a significant reduction in environmental strain.

We agree with those authors (Erkman & Ramaswamy, 2005) who have underlined the fact that the case of Kalundborg, although without doubt an excellent benchmark, also includes some misconceptions, since it stresses in an exaggerated way the issue of waste exchange and management, suggesting that industrial symbiosis is this and only this. In fact, industrial symbiosis refers to resource management and not only to waste management, although, as we will see, waste management and in particular the theme of externalities is the core idea of our research agenda.

In addition, and perhaps more importantly for us, in Kalundborg and in similar eco-industrial parks the pathways of resource and waste management among different corporations to support green management are always the same; in other words, the directions of relationships among different corporations and the nature of what is exchanged never change.

In fact, as can clearly be seen in Figure 1, some companies never exchange anything with one another (for example, Gyproc does not exchange anything with RGS 90) and what is exchanged

between two or more organizations is always the same thing (for example, Novo Nordisk always gives pig farms yeast slurry). In addition, since the basis of industrial symbiosis is commercial, it happens that some corporations only give while some only receive by-products from the others (in relation to Kalundborg, consider Kara/Noveren on the one hand and Gyproc and pig farms on the other).

Applying industrial symbiosis at a SME level

Although there is now a consistent body of articles on these themes, some issues related to industrial symbiosis seem to us to be still unclear and in need of further investigation.

As a first step, it is yet to be verified whether industrial symbiosis, which has been demonstrated to function well on an industrial scale, can be applied with ease to small and medium enterprises (SMEs) and family enterprises. In particular, our project aims to verify the conditions under which industrial symbiosis works at a very local level and in family firms.

Some other authors have highlighted the scarcity of both literature on and experience of industrial symbiosis applied at a SME level (Lambert & Boons, 2002), and have called for a new research agenda that includes this type of scenario, which will increasingly characterize our future. An interesting exception is that of Burnside Industrial Park (Coté & Hall, 1995; Lowe, 1997; Coté & Cohen-Rosenthal, 1998), near Dartmouth (Nova Scotia, Canada), an initiative started in 1992 and called “the industrial park as an eco-system”, which, although much work has been carried out on it, has not achieved the desired results (Lambert & Boons, 2002).

According to the literature, the differing interests of the enterprises involved and the lack of cooperation and organization seem to be the primary causes of the slowing down or failure of most of the initiatives of mixed eco-industrial parks, although the lack of enterprises specializing in waste collection, processing and recycling and the lack of opportunity to cluster comparable enterprises can also be put forward (Lambert & Boons, 2002).

However, in our opinion the primary and basic problem with “mixed industrial parks” (the name for eco-industrial parks housing SMEs) relates to the rapid evolution of the parks themselves, with some enterprises leaving and others appearing. In such an ageing process there are closures or relocations of existing industries with differing concerns, features and interests, so that old patterns of symbiosis become obsolete. For this reason, mixed industrial parks need more flexible management and adaptive skills to enable organizations to exchange different externalities with different parties over time. It is exactly in this context that we moved to develop our study, with the additional intention of testing whether this idea of putting together different organizations in an externality exchange system works under the conditions of any commercially based system.

In particular, what we would like to develop is something beyond the core business of the SMEs involved. In fact, in the network we are developing there are no direct financial benefits in giving other enterprises one’s residues and externalities. Rather, firms can develop a reputation as a CSR entity, which, in turn (and in time), may bring financial benefits. The financial benefits emerge when an enterprise receives externalities gratis.

The core idea of the project is to put together a network of organizations so that they can mutually exchange their externalities in the most flexible way, without having in mind a predetermined system of exchanges, as happens in classical industrial symbiosis (as can be seen in Figure 1).

The real benchmark we have followed is perhaps better represented by experiences of time banking⁵⁷ than by industrial symbiosis, although the greening principles are those inspired by industrial symbiosis and industrial ecology. What is valuable in the time banking experience is the idea of strengthening communities through reciprocity. We started with this idea of cooperation among firms and organizations (which was in itself a novelty, since organizations are nowadays increasingly accustomed to a competitive scenario), adding a shared aim: that of preserving the environment with an intelligent waste management system.

As is the case in time banking, proposals and needs are centrally managed to enable the best possible match to be found and, more importantly, to enable the behaviour of all the organizations to be monitored in order to prevent any organization from only receiving externalities from the others without giving anything at any time. Central coordination has also been advocated as a necessity by Desrochers (2004) who, like us, proposes internal market coordination rather than public central planning. The difference between our approach and that of Desrochers is that we would never support the creation of an institution that would force enterprises to internalize their externalities, since we believe that the highly specialized economy in which we live represents a serious obstacle to internalization. It is precisely for such a reason that we have investigated a new way to address the issue of externalities.

In particular, every proposal an enterprise makes, within the network under analysis, is linked to some externalities or by-products. An organization offers an externality and a second organization may take advantage of it. The externalities offered cannot be related to the core business because they are not sold but rather given gratis.

RECYCLING EXTERNALITIES: A CASE PRESENTATION

The idea of recycling externalities as a solution originated as a result of a European project in which we have been involved.

In particular, in collaboration with several colleagues, both academic and professional, we have developed a technological platform by which a consortium of 60 Italian enterprises (named *Costellazione Apulia*⁵⁸) can exchange externalities within a European-funded project called *Avanzare* (Progress).

Consortium *Costellazione Apulia* was established in December 2001 and brings together around 60 family firms with a shared interest in cooperation and innovation. In particular, within *Avanzare*, Consortium *Costellazione Apulia* was intended to test a new way of operating, above and beyond traditional economics, based on the exchange of externalities in order to make the firms' situation more competitive and sustainable. *Avanzare* is a project co-funded by

⁵⁷ For further information, visit the website <http://www.timebanks.org/>

⁵⁸ For further information on the project, visit the following website <http://www.costellazioneapulia.net/>

the European Union (793,000 euro) under the 6.2 del POR Puglia 2000–2006 and realized by Consortium Costellazione Apulia with the aid of the University of Bari and Polytechnic of Bari. Its main aim is to promote the first portal to support inter-organizational exchange of externalities. The idea was to make easier the exchange of production externalities (which usually represent some waste) among different organizations, while observing the development of special interactive and interorganizational social responsibility.

The recycling of externalities is based on the primary characteristic of externalities themselves: the fact that they are subjective. What is judged by Corporation A to be waste (that must be managed, losing time and resources) may be judged by Corporation B to be something useful.

In other words, in our model the externalities are the residues of production and are offered to other firms who may be interested in such remainders. The following is an example.

Imagine that a firm needs to travel from Rome to Milan once a month to allow the human resource manager in Rome to talk with his or her counterpart in Milan, and that this corporation organizes the journey by car. An employee from a second firm may occasionally need to travel from Milan to Rome in order to meet an important client. Imagine that these two firms are in a network that lets them know about the other's needs and externalities. As an output we have the opportunity for the second firm to take advantage, assuming flexibility in terms of the time of travel, of the first firm's travel without additional costs. This second firm could reciprocate in some way by, for example, giving the first firm the opportunity to use a photocopying machine when it is not being used. If the two firms travel together there will not only be a financial saving but also a minor impact on the environment. This last point is worthy of our attention, since many production externalities represent some risks to the environment, and being able to offer someone else one's own externalities may mean they are transformed from residues into something useful. Such a meaning is represented by the Italian word *Avanzare*, the name of the project, which can be translated as both "to develop", "to advance" and "to remain"; a residue, when well recycled, is transformed into money saving and wealth and, in terms of green management, into a reduced impact on the environment.

The result is a network of organizations that can be called sustainable, since they become more and more conscious of the externalities they produce in carrying out their business and, in addition, they are able to correct negative externalities and to develop positive ones.

In this sense, the consortium of firms we have put together acts to develop ISR, since sustainability is guaranteed by the fact of being part of a network.

ICT to support a new way of solving production externalities

The exchange of externalities has nothing to do with Pigovian taxes. In some sense it recalls the principle of Coase Theorem, being based on private negotiations, the only difference being that externalities are not taxed nor paid for: money plays no part in our consortium.

The different corporations exchange among themselves their production externalities, or residues, which would otherwise have become waste products.

To be more precise, a corporation does not always receive externalities from the corporation to which it has given externalities; this would be unusual. More usually – and this is the

philosophy of the project – firms offer their externalities to the whole community of corporations, and take what they require from all the community's externalities, as has already been underlined. This highlights the main difference between a strictly industrial symbiosis and this project.

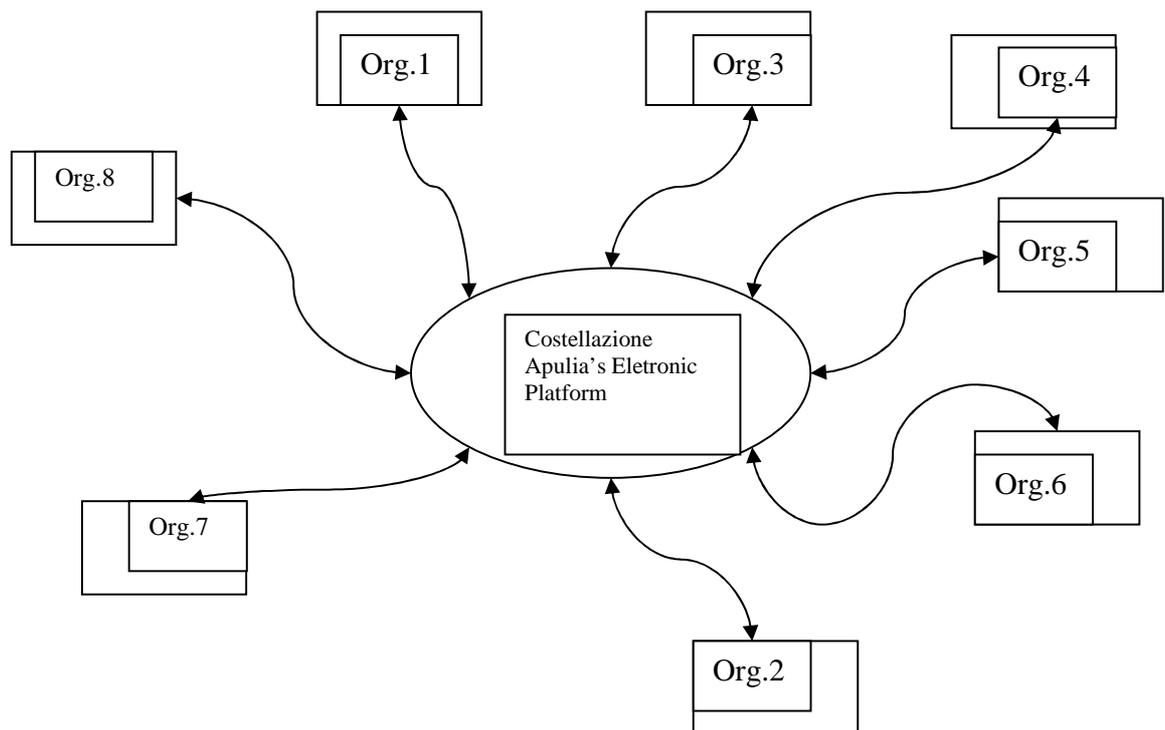

Fig. 2 Costellazione Apulia's Electronic Platform system to support externalities' exchange

As should be clear from Figure 2, the system being developed is more flexible than those generally involved in traditional industrial symbiosis. The enterprises involved exchange their externalities with one another with the help of a central planning system managed by an electronic platform, so that there is an element of central control over the enterprises.

For the externalities they donate, enterprises are given credits that can be used to obtain externalities that others have made available. In this sense there is no commercial agreement but what can be termed an ethical expectancy: if today I give a specific externality to the network I can expect to receive back an externality as soon as the central planning system alerts me that there is an externality that may be useful for my purposes. In fact, no one knows in advance

which enterprises will be connected to one another, and no one knows which externalities will be exchanged.

An important factor, which is similar in some ways to the Coase Theorem, is the null costs of the exchange of externalities. In other words, if there were huge costs involved – either in economic terms or in terms of time – in letting others know about one's own externalities and finding out what externalities were being offered by others, the projects could not work.

For this reason we have developed an electronic platform by which the consortium of enterprises can exchange information on residues and externalities.

The electronic platform, namely an IC technology combining the Internet and the mobile phone, first of all allows a rapid transfer of information. In this sense, if the externality takes the form of some information, the externality exchange can take place straight away. If the externality takes the form of something material, we will become aware of its availability, which is fundamental for the exchange itself. It is important to underline that in this case what allows the exchange of externalities is the proximity of two firms (the idea of the Consortium), otherwise the costs related to the exchange will outweigh the benefits.

The media we have chosen to support the exchange of externalities are the Internet and the mobile phone, because of the ease of sending and receiving messages concerning the different availabilities, value of the items, usability and mobility.

Including a certain number of social actors, namely firms, in a network produces benefits that are proportional and that correspond to the number of social actors involved; these actors would contribute an exponential number of externalities in favour of the network community, as suggested by Metcalfe's Law.

With regard to the main finding, we are still monitoring the organizations involved, so do not have definitive outcomes. An initial examination suggests that the corporate climate is definitely favourable in almost all the firms in the consortium (Tinelli, Pagano, Cortini, 2007). The gains refer to the environmental and social sustainability of the individual firms, and also to the benefits derived from the exchanges of externalities. In other words, there will be lower production costs, higher product quality and less environmental impact for each individual act of corporate social responsibility, and in addition for each externality exchange.

CONCLUSION AND RESEARCH AGENDA

We have presented a European Project, Avanzare, we have developed with the aim of applying a peculiar industrial symbiosis at a SME level.

In particular, the main findings of the above project refer, on the one hand, to a new way of solving production externalities, that is to say recycling and exchanging these externalities among different corporations. On the other one, the project can be seen as a new way of conceiving industrial symbiosis, namely involving flexible exchanging routes among involved corporations (fig. 2).

With regard to the research agenda on industrial symbiosis and externalities from an industrial and organizational psychology point of view, it seems necessary to extend the

methodological tools that are able to measure eco-industrial outcomes, from both a strictly eco-efficiency perspective and a psycho-social perspective.

In addition, it would be useful to understand better what happens in the relationships between enterprises involved in industrial symbiosis or externality exchange projects and the local communities in which the enterprises are located. Some authors have started to consider so-called *urban symbiosis* (van Berkel et al., 2009), stressing the way in which eco-industrial parks are often nested within the urban and social contexts, especially those that involve SMEs. This presents many challenges in terms of *nurtured landscape* (Yang & Lay, 2004), a neologism that underlines the possibility of mediating between the natural eco-system and the urban/industrial environment.

In particular it would be very interesting to study a specific population: that consisting of people who are citizens living in an area which is near or nested within an eco-industrial park and at the same time employees of one of the enterprises involved in the network. In other words, the following would be an interesting research proposition: "Do employees of an enterprise involved in intercorporate social responsibility show higher levels of both organizational and community commitment?"

Finally, industrial symbiosis and related projects, such as externality exchange and recycling, are almost always seen and studied in terms of resource savings. An underexplored dimension of industrial symbiosis and eco-industrial parks such as Costellazione Apulia is their influence on regional innovation activities. Such an issue, which is rarely addressed within the specialized literature (Mirata & Emtairah, 2005), is still not adequately studied and deserves more attention, since it is interesting not only for its own sake but also because it relates to the cited theme of the relationship with the local community and to that of employability and opportunities for employment.

PRIVATE EQUITY FOR DISTRESSED COMPANIES IN ITALY

Danovi, Alessandro¹

¹Associate Professor in "Economics and Management" at the Università degli Studi di Bergamo, via S. Barnaba, 32, Milano

Purpose - The purpose of this paper is to provide a comprehensive overview of turnaround financing in Italy, meaning operations regarding distressed or troubled companies, carried out by professional private equity investors.

Design/methodology/approach - After a short survey on the Italian turnaround financing market (based on sector data), the research tries to investigate whether there has been an improvement in comparison to the situation surveyed in the past, by means of analyzing the answers to a questionnaire submitted to a selected sample of professionals.

Findings - A significant change within the sector was expected in Italy. Although sectorial data show a rise, turnaround is still less than 5% of the Italian private equity market. The new legislative framework will probably cause significant, long-term effects; nonetheless, some delicate issues responsible for the slow development of the market still remain unresolved.

Originality/value - While economic literature about venture capital is very articulated, this is not the case with vulture funds. Works dedicated to the Italian market (Perrini, 1997; Danovi, 2001 and 2003) have shown a general lack of interest for this private equity niche. More recent studies (AIAF 2009) trace the birth of specialized funds. In comparison to the situation surveyed in the past, this study tries to investigate whether there has been an improvement.

Research limitations/implications - Even if linked with the small size of the market, the size of the analyzed sample is obviously a limit in extending the results of the research. However the study provides a starting point for further research in this private equity niche.

Key words: Vulture funds; turnaround investing

Jel classification: G24 - Venture Capital

INTRODUCTION

For several reasons, vulture funds have never been popular either with the layman or academics⁵⁹. While economic literature about venture capital is very articulated⁶⁰, this is not the case with vulture funds. Even in recent years, only a few academic papers have appeared (Hotchkiss and Mooradian, 1997; Rosenberg, 2000; Gilson, 2001; Feder and Lagrange, 2002; Altman, 2004; Altman and Hotchkiss, 2006; Kutcher and Meitner, 2006 about the German market; Krasoff and O' Neill, 2006).

⁵⁹ There is even a novel by the well-known American mystery writer Stephen Frears, *The Vulture Fund*, which tells about an investment bank plotting to set up a speculative fund aimed at investing in depressed real estate stocks and bonds, while financing a terrorist attack on a nuclear plant near Manhattan.

⁶⁰ For a bibliography focused on the Italian market see Gervasoni and Sattin, 2000. On the role of finance in times of crisis see Blatz, et al., 2006.

Some works seem to reflect on the “social” role of operators, often seen in a negative light and called *vulture funds*⁶¹, notwithstanding the effectiveness and value creation entailed in their activity. Gilson (2001, p. 222) observes that the irrational hostility towards the category is not supported by real empirical evidence and underestimates the positive impact of these operators in a crisis situation⁶². In 1997 Hotchkiss and Mooradian (1997) published a study on the US market analyzing the role of *vulture investors* in reorganizations and relating the results with the degree of influence of the *vulture* on the company to be restructured. Evidence showed that company performance improved when the *vulture investor* took control of the target or became the CEO. The study also shed light on abnormal market returns in the two days following the announcement of the intervention of the fund, demonstrating that markets usually appreciate this kind of intervention.

Another interesting element is linked to the taxonomy of the operators, proposed by Gilson (2001) on the basis of investment strategies and the objects of the transactions. The classification, taken up in different variations by most of the authors, divides the *vulture funds* as either *passive* or *proactive* (Gilson, 2001, p. 192.). The former buy shares or bonds of companies in crisis, or which have defaulted on their debts, in order to take advantage of mispricings in the markets⁶³. The latter try to take control and guide the *turnaround* personally⁶⁴ in order to gain from an effective restructuring. Perrini (1997, p. 27) adds a third category: *aggressive vulture funds*, meaning investors that acquire the majority of at least a class of debt with the aim of blocking any undesired restructuring plan⁶⁵. In this case other *stakeholders* often prefer to give something up rather than let the *turnaround* drag on.

Altman (2004 and 2006, p. 188) divides investment strategies in *distressed debt* into *passive* or *active*, where the latter are aimed at seizing control of the company or not. In the second category the difference lies in the expected return (20-25% for the *active/control*, 15-20% for the *non-control*,

⁶¹ The term plays on the similar sounds of the words *vulture* and *venture*. Critics of *vulture funds* sustain that while *venture capitalists* offer sustenance for the growth of companies, *vulture funds* feed on the few means left to companies on the verge of bankruptcy.

⁶² In fact, both banks and creditors can benefit from the chance to get rid of their distressed bonds or shares in a speedy way, despite the subpar price offered, depending on preferences and estimates about time value. Moreover, *vulture funds'* strategy consolidates large portions of debt which would otherwise be held by small bondholders, so easing and accelerating the restructuring and making the overall turnaround process more efficient. The same can also bring capital and business insight to the company and make good gains even if the nominal value is not reimbursed since the purchase was made at a great discount. As the original owners can recover their initial investment only in case of total reimbursement, they are less flexible.

⁶³ Passive strategy also includes the possibility of co-buying where other *vultures* have taken an active role in order to benefit from any improvement brought about by these subjects. The hope of passive funds is for a rapid gain; otherwise the strategy can be changed from passive to proactive.

⁶⁴ The American bankruptcy law allows, once a company has filed for Chapter 11, various alternatives: it can propose a reorganization plan which will need to be approved by the stakeholders assembly, the debt can be placed on a secondary market in the hope that it will be converted into stocks by the post-restructured company (loan to own investments), or it can finance new turnaround plans by underwriting capital increases and loaning capital under the form of debt. For an overview of failure in America see also Sandage, 2005; Skeel 2001

⁶⁵ Gilson (2001) defines this strategy as *bondmail*. He stresses the importance of the division in classes which allows for this kind of operation. Classes of creditors have to be homogeneous, both according to American law as well as in the Italian reforms.

versus the 12-20% for the *passive*), the average investment period (2-3 years as opposed to 1-2) and the degree of influence exercised on the *target* company (control even through a debt to equity swap, versus a moderate influence aimed at monitoring that the restructuring does not take unwanted directions).

The purpose of this paper is to provide a comprehensive overview of turnaround financing in Italy⁶⁶, meaning operations regarding distressed or troubled companies, carried out by professional private equity investors.

Sectorial data show that total investment in turnarounds is on the rise but still amounts to less than 5% of the Italian private equity market. Greater attention, however, seems to be paid by professionals and the media because of the great economic returns expected.

Rare, older works dedicated to the Italian market (Perrini, 1997; Danovi, 2001 and 2003) have shown not only the absence of dedicated operators, but also a general lack of interest for this private equity niche. Greater interest for the niche and the launch of specialized investment funds has been detected by a recent study by AIAF (2009).

This analysis springs from, and is compared to, a similar study carried out a few years ago (Danovi, 2001). In comparison to the situation surveyed in 2001, in the present study we try to investigate whether there has been an improvement by submitting a questionnaire⁶⁷ to a selected sample of professionals.

A significant change within the sector was expected due to both internal and external factors, a more developed private equity market and the reform of the Italian bankruptcy law *in primis*⁶⁸. The wider range of solutions offered by the new set of laws, indeed, aims at easing the successful restructuring of distressed companies.

However in mature markets, especially Anglo-Saxon ones, high segmentation and specialization are normal. For every phase in the life cycle of companies there is a correspondent set of specific investors. Whether in decline or in crisis, it is easy to find investors willing to buy out shares in order to check the chances for a turnaround or to acquire relevant portions of corporate debts in order to carry out arbitrages of value.

Italian empirical data highlight only a modest increase of total investment despite a growing interest toward the topic. Furthermore there is evidence that a few Italian private equity funds, originally set up specifically to turnaround, have now diversified their activity to target also more traditional deals.

⁶⁶ Even though these operations are usually carried out by heterogeneous subjects (private equity funds, single managers, industrial competitors), this study considers only the deals made by professional operators, due to lack of documentation of other deals as well as their episodic nature.

⁶⁷ This analysis was carried out at the end of 2006 through a questionnaire administered to a sample of operators active on the Italian market and covering 4 areas of interest: the degree of participation, opinions on the bankruptcy law reform and its impact on investment choices; risk/return and value/risk drivers and operative modalities.

⁶⁸ "The first part of the reform was enacted by the decree of March 14, 2005, confirmed by the Act of May 14, 2005. The second part was accomplished by the government decree of January 9, 2006, and took force July 16, 2006. The third part was enacted with the decree of September 12, 2007, and has been in force since January 1, 2008" (Panzani, 2009, p. 309).

The new legislative framework will probably cause significant, long-term effects; nonetheless, some delicate issues responsible for the slow development of the Italian market for distressed securities still remain unresolved.

THE SIZE OF THE ITALIAN MARKET

Compared to the international market of turnarounds, the size of the Italian private equity market is modest. Between 2001 and 2005 it never exceeded € 50 million and the number of operations remained between 7 and 14, from a minimum of 1.43% in 2001 to 4.17% in 2003 (AIFI, 2005 and 2006).

The value percentage fluctuated between 0.36% (in 2001) and 2.13% (in 2004).

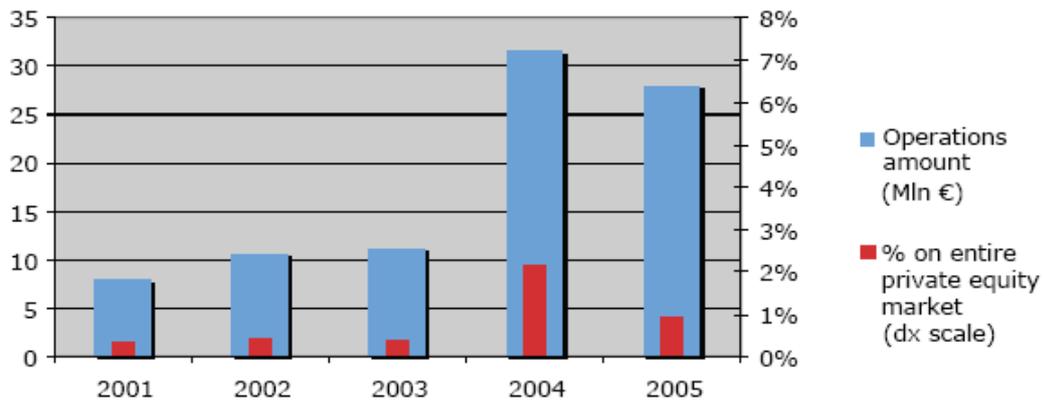

Exhibit 1: Value of turnaround investment Source: Own analysis on AIFI data

We can note that value percentages are consistently lower than deal count percentages; the latter are probably more indicative (3.61% versus 1.99%). It must be considered that the equity investment required to acquire companies in distress is usually very low, given the sheer size of the financial leverage already on the balance sheet of the target⁶⁹.

⁶⁹ EVCA does not offer details regarding the Turnaround-Rescue operations for the European market for 2006. In 2007 the investments for these deals were worth 0,1% of the 74 billion Euro of total investment (but 0.9% of the number of deals). The difference with the Italian market is probably attributable to different reclassification criteria (EVCA 2006 and 2007).

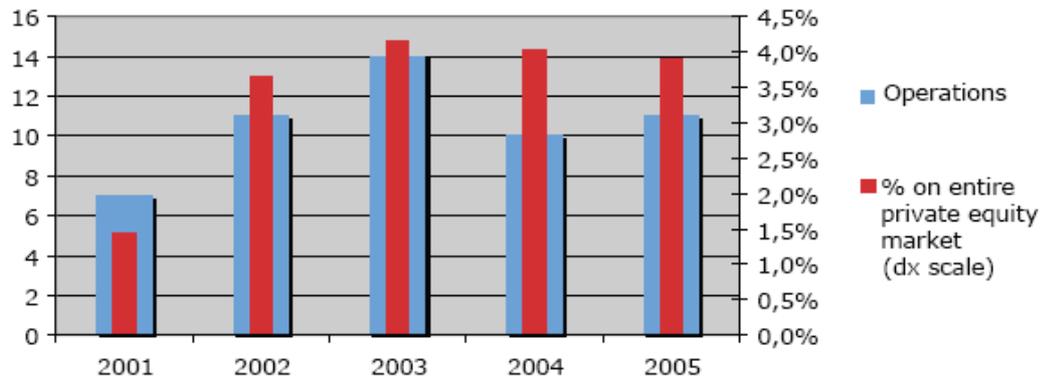

Exhibit 2: Number of transactions, Source: Own analysis on AIFI data

The abovementioned data were supplied by the Associazione Italiana degli Investitori finanziari (AIFI) which gathers the Italian *private equity* operators⁷⁰. During the past years the number of members grew and by the end of 2006, 105 companies were associated; 23 of which (22% of the total) also carried out *turnaround* operations.

Among these, only two were fully dedicated in 2006 to special situations: Atlantis Capital Special Situations and Management & Capitali. The former has been active for a number of years and mostly targets medium-sized companies. The latter was established in 2005 from a spin-off of DCB Web-Tech and listed since mid-2006, and targets medium-large distressed companies. In 2009 M&C announced a change of Mission and a relevant capital reduction. Others are companies, especially Investment Management Companies (SGR according to the Italian regulation), which invest throughout the entire life span of companies and can consider investments in distress, based on certain factors, for example knowledge of the sector, a strongly discounted price or specific interest for the deal.

Foreign funds (Oaktree, Cerberus, EOS Partners, Silverstar and KKR) occasionally carry out large sized operations in Italy; the same do private equity divisions of large investment banks as Goldman Sachs, Deutsche Bank or JPMorgan/One Equity partners.

⁷⁰ Regarding the evolution of private equity activities in Italy, see Gervasoni, 2002, pagg. 338 ss.; Gervasoni, 2005.

Exhibit 3: Funds actively investing in distressed companies. **Source:** Own analysis on AIFI data

The sample is not complete because members of AIFI do not represent all of the operators on the market, but it can be considered an useful estimate since the analysis is aimed at established and systematic investors and not at “informal” ones.

A brief comparison is possible with data from the European Private Equity and Venture Capital Association (EVCA), which represents the diverse players in the private equity and venture capital market in Europe and had 1,151 members in 2006.

In this case, the percentage of operators investing in the turnaround in Europe was 30%. 198 of the 661 full members declared that they were interested in troubled companies, a higher percentage than in the Italian market.

AN EMPIRICAL ANALYSIS

Empirical research was carried out through a questionnaire of 20 questions administered to 84 companies considered to be among the main private equity operators in Italy⁷¹. The sample was chosen from the AIFI member list and integrated with a few foreign turnaround funds active in Italy.

The survey was divided into 4 parts regarding the degree of participation, the impact of the new bankruptcy law, sector opinions and operating technicalities. 21-28 operators answered the questions in the first three sections while the results from the fourth section, which examined more specific characteristics, was completed only by 11-12 operators. These results, even if not statistically significant because of the size of the sample, represent an important part of the universe of Italian *vulture funds* and offer interesting qualitative points of view regarding the operating aspects.

The degree of participation

First we attempted to find out how many operators were interested in financing or acquiring companies in a situation of serious economic-financial imbalance⁷².

This question has a qualitative, rather than statistical, significance: it is in fact very likely that there is a sort of self-selection between those who participated in the survey.

⁷¹ The sample was made up of the following companies: 360 Capital Partners, 3i SGR, ABN AMRO Capital, Advanced Capital SGR, Advent International, Aksia Group, Aletti Private Equity SGR, Alice Ventures, Alto Partners SGR, AME Ventures, Apax Partners, Arca Impresa Gestioni SGR, Argos Sodic SGR, Argy Venture Capital SGR, Arner Advisory, Atlantis Capital Special Situations, BA Capital Advisors, Banca Intesa, BC Partners, Berrier Capital, BNL Gestioni SGR, BPC Investimenti SGR, Bridgepoint Capital, BS Investimenti SGR, Candover, Centrobanca Sviluppo Impresa SGR, CFI, CI Partners, Cinvon, Clessidra SGR, CVC Capital Partners, Deutsche Bank, DGPA SGR, Doughty Hanson, Effusia Investimenti SGR, Efibanca, Euromobiliare PE, Fidi Toscana, Fidia SGR, Filas, Finanziaria senese di sviluppo, Finint & Partners, Finlombarda, Friulia, Gepafin, Impresa & Finanza SGR, Innogest SGR, Interbanca, Investimenti Piccole Imprese, Investitori Associati SGR, Kairos Partners SGR, Livolsi & Partners, Management & Capitali, MCC Sofipa SGR, Mittel, MPS Venture SGR, Natexis-Cape SGR, Nem SGR, PAI Partners, Palladio Finanziaria, Pentar, Permira Associati, Pino SGR, PM & Partners, Private Equity Partners SGR, Quadrivio SGR, Quantica SGR, R&D Advisory, Riello Investimenti, S+R Investimenti e Gestioni, SanPaolo IMI PE, SFIRS, Sigefi Italia PE, State Street Global Investments SGR, Strategia Italia SGR, Sviluppo Imprese Centro Italia SGR, Synergo SGR, Tamburi Investment Partners, The Carlyle Group, Unicredit Banca d'Impresa, Value Partners, VelaCapital, Vestar Capital Partners Italia, Virtus Capital Partners, Wise SGR.

⁷² In reality, comparing the answers with the AIFI data in the paragraph above, there is an overestimation of the number of those claiming to invest in turnaround projects regularly or occasionally. The aggregated percentage is 35.71% against 19% in 2001 and 22% of the data based on spontaneous declarations by AIFI members.

	2001	2006
No	81%	64%
Regularly	3%	7%
Occasionally	16%	29%

Table 1 Interest in conducting turnaround financing deals

It is nonetheless worth noticing that, in respect to the previous survey (Danovi, 2001), the number of those who claimed to engage in these deals occasionally or regularly has significantly increased.

Those who do not carry out turnaround deals explained that they were not part of their investment targets, because they were too risky or not among the kind of targets allowed by their own statute or bylaws. In a few cases, especially for banks, the difficulty has much to do with the unwillingness to contaminate regular activity with turnaround interventions carrying a different profile of risks and responsibilities. Many operators stressed that these deals require specific mentality, approach and know-how, which are different from their own. In a few cases it was highlighted that turnaround deals conflict with subjects who prevalently take minority equity positions and do not have the possibility to intervene directly in the restructuring. The same operators claimed that they do not have sufficient managerial skills to deal personally with these investments.

On the other hand, the dedicated operators declared that they managed 2 to 3 operations every year while others said that they occasionally completed from a minimum of one to a maximum of five. These numbers are in line with the data supplied by AIFI.

The impact of the new bankruptcy law

Empirical data highlighted that the majority of the interviewees did not intend to change investment targets nor plans to change its attitude towards turnarounds because of the reform of Italian bankruptcy law. Those who answered yes had the intention to increase the resources dedicated to these projects or to organize new *ad hoc* initiatives.

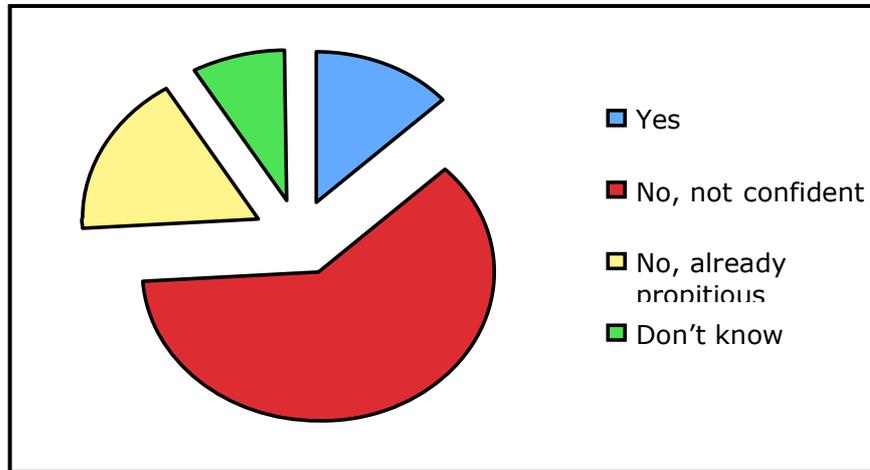

Exhibit 4 Sentiment of investors towards the reform Source: Analysis of survey data

Those uncertain were waiting to assess the actual impact of the new regulations and the way in which Courts would interpret the new tools provided for by the reform; in other words they were waiting to see if the new rules could be of any use to ease the structuring of turnaround investments.

Participants were also asked to indicate the main advantages and disadvantages of the new discipline.

In general, the bankruptcy law reform⁷³ is appreciated for the great flexibility of the Preventive Creditors' Settlement Procedure ("*concordato preventivo*")⁷⁴. A broader range of legal proceedings can be used to solve the crisis and interested parties are granted greater negotiational opportunities without the rigidity of the pre-existing regulations (Stanghellini, 2005; Verna, 2005; Presti, 2006; Proto, 2006).

⁷³ For a complete analysis of the Italian bankruptcy Law reform see Panzani, 2009.

⁷⁴ This is a procedure for resolving crisis situations avoiding bankruptcy, through the execution of an agreement between the debtor and the creditors, under control of the Court (Pajardi, 1986). The debtor submits to the Court a plan that can include:

- the restructuring of the liabilities in ways that can include, among the others, payments in kind or debt/equity swaps;
- the division of creditors into classes that are homogenous as for legal position and economic interest and that accordingly receive differentiated satisfaction;

The debtor usually remains in possession under an administrator and Court monitoring.

Non-guaranteed creditors have to vote on the motion proposed by the debtor, which is approved if accepted by the majority of creditors. In case class disagrees, the Court can impose a cram down and pass the motion.

On the other hand, the weak point of the new discipline is the lack of clarity regarding some regulations which might lead, at least in the initial phase, to excessive freedom of interpretation. It has also been pointed out how the first applications by the Courts were characterized by a certain heterogeneity. There is the hope in any case that these problems will diminish as time passes, thanks to official interpretations supplied by legislators and sentences pronounced⁷⁵.

It has also been noted that the reform has not addressed the penalties associated with bankruptcy crimes, which remain one of the most severe in the entire Italian criminal law. This has historically weighted on investors' willingness to get involved in distressed situations, although it has also been an incentive for the entrepreneurs to address the crisis in a timely fashion not to be later charged with criminally relevant misconduct.

US Chapter 11 has been held up as the example to refer to, even if the sentiment among operators is that the new Italian law is still inadequate at preserving the operating continuity of the debtor firm⁷⁶.

Turnaround: opinions about the market

The questions in this section are aimed at tracing a general picture of the market so as to define its actual and perceived risk-return profile.

First it was asked to state the expected returns deemed adequate for the deals, and the perceived risk. The majority of the operators indicated returns between 30% to 50% or (17% of the answers) lower, even though a third expected an annual IRR of 100%. In this second case the answer is probably due to a lack of experience on turnaround projects or to an overestimation of the actual risk. Those who habitually or occasionally carry out turnaround financing suggested, more reasonably, an average expected return of 40%.

High levels of returns are associated, as in economic theory, with high levels of risk, and in fact the interviewees confirm that turnarounds entail greater risk (81% of the answers) than traditional private equity investments. Only 14% of the interviewees found no appreciable differences in the level of risk⁷⁷.

Analysis of the risk drivers and of the characteristic of restructuring operations appeared to be many-faceted given the variety of answers supplied. Most prominent was the difficulty in: i) evaluating the real amount of debt of the target company; ii) rapidly understanding the industrial and organizational problems; iii) finding managerial capability for the *turnaround*; iv) modelling the behaviour of suppliers and creditors; v) estimating the time required to fix the P&L. Also mentioned were human resources, operational discontinuity, lack of consistency on the part of the Courts, commercial and industrial risks. Many of these problems could be

⁷⁵ See, among others, Arato, 2006. For a brief synthesis of the reform see also Danovi and Quagli, 2008, chap. 11.

⁷⁶ See Marano, 2006; Proto, 2006.

⁷⁷ An investor indicated that the risk is to be considered of a different sort (apparently greater but actually smaller), so meaning that turnarounds can be distinguished from other private equity deals since they bring about the rediscovery of a value that the company had already proven to be able to generate.

anticipated and diminished were it possible to conduct an accurate due diligence before consummating the transaction, but unfortunately in the context of distress investing this option is not always available to potential buyers.

A few elements are characteristic of turnaround operations or of companies in distress: uncertainty regarding the time needed to *break-even*, high indebtedness or financial imbalance, difficulties with other stakeholders.

It is worth considering the arbitrariness of Italian bankruptcy law and human elements. The former point is particularly relevant since it is merely external and cannot be influenced by the parties involved. Indeed the recent reform can be considered useful since it tries to limit the duration of the procedures. The latter is frequently underestimated but is fundamental, given that often the restructuring plans fail due to the conflicts which emerge between the parties involved⁷⁸.

In discussing the value drivers, the interviewees concentrated on three factors: a) the presence of competent managers, b) the characteristics of the target companies and c) the small amounts which, in the most fortunate transactions, one can happen to pay to acquire the business.

In the first place almost all of the operators cited under different aspects the importance of having managerial resources able to conclude operations of this type and often the possibility of finding capable management in the company was appreciated.

As far as the characteristics of the target companies are concerned, the starting point was unanimously deemed crucial. A sustainable competitive position, appealing structure and favorable development of the market, ownership of a recognized brand and the quality of the products were among the most appreciated characteristics.

Finally, a few operators were keen to mention the ability to buy the company at deep discount.

The investment strategy of the turnaround operators seems thus broadly classifiable as "value".

Operative modalities

The last section of the questionnaire surveyed a few operational aspects regarding the origination, management and consummations of deals. Only answers from those who stated that they at least occasionally dealt with investments in distressed companies were considered.

First we tried to understand the origin of the deal flow. All of the operators said that the deal was proposed by a debtor's consultant, who had greater experience rather than the debtor himself (indicated by a third of the sample)⁷⁹.

The percentage of those who think the proposal should originate (or does actually) from the fund itself is still quite low. This is a sign that the market is not yet mature and there is still room for growth.

⁷⁸ In previous articles much has been said on the relevance of the human factor. See Guatri, 1995.

⁷⁹ The decrease in the role of debtor as the originator is due to the greater role played by advisors.

Those who indicated “other” refer to banks, which are normally the largest holders of distressed companies’ debt and which, especially if concentrated, might be interested in a restructuring. In these cases independent advisors are given a specific mandate, or attempts are made to encourage the intervention of private equity funds to minimize the losses.

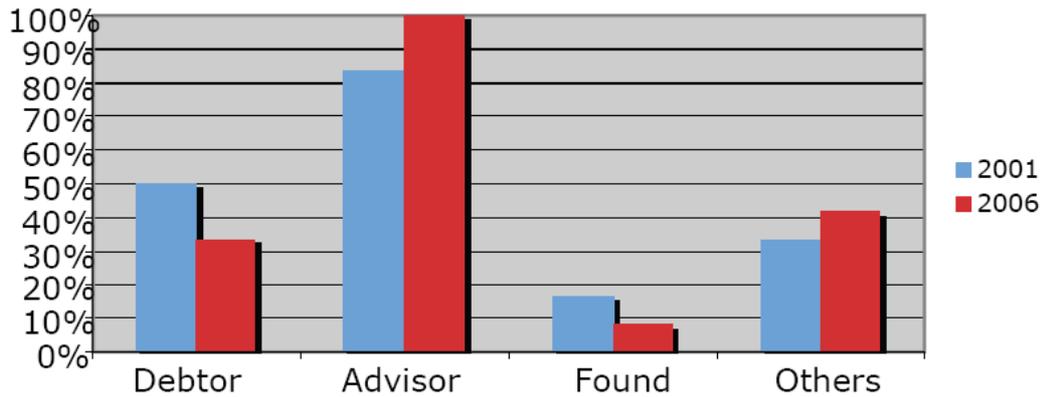

Exhibit 5: Origination of deals. Source: Analysis of survey data

Investors believe that they can manage 3-4 deals at the same time (55% of answers), 2-3 deals (18%), while 27% of the sample indicated 5-10.

Potential targets on scrutiny are less than 10 for 2/3 of the sample, even though many interviewees noted that the deal flow is up to 200 deals per year, 90% of which are discarded.

Given the weak competitive position and lack of strategic view of distressed companies, great attention is paid to strategic analysis.

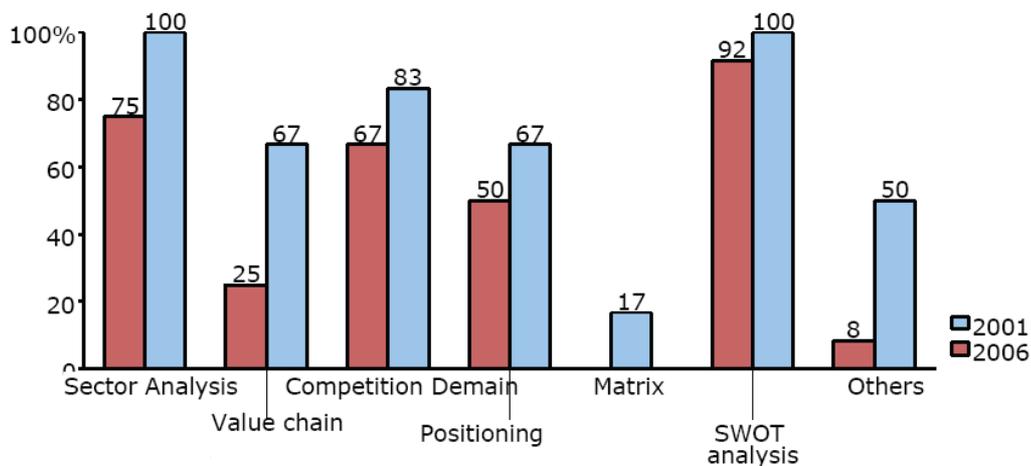

Exhibit 6: Models used for strategic analysis. Source: Analysis of survey data

Preferred methods, as already shown by previous surveys, were SWOT and sectorial analysis, followed by analysis of the competitiveness and positioning within the sector. A few interviewees also reported use of value chain models, but nobody mentioned matrixes. It seems that the attention paid to strategic analysis is somewhat minor.

As already seen in 2001, the proportion of those who believe that strategic analysis should be different from that carried out for healthy companies and those who disagree is roughly 5 to 1. The interviewees stressed that the differences are often minimal and not particularly relevant.

Exhibit 7: Contents of the business plan Source: Analysis of survey data

It is surprising that the business plan hardly considers strategic issues given that they should be of utmost importance in singling out the errors that led to the crisis.

The great relevance attributed to financial contents can be related with the turnaround operations typically carried out in the Italian Market: investors tend to look for companies with good business and bad balance sheets suffering from imbalances in the financial structure. Among investors it is commonly thought that the best operations, if not the only feasible, are those that do not require an actual rethinking of the business but only a financial restructuring.

	2001	2006
Strategic near-sightedness	67%	8%
Financial errors	83%	58%
Company handing down	100%	50%
Neglected company/not part of a core group	nd	75%

Table 2 Optimal causes of the crisis for restructuring

As far as the causes of the crisis are concerned, there is strong contradiction with abovementioned statements: for 58% of the interviewees, financial errors represent one of the causes of crisis on which external intervention can be more effective and are considered "easier" to resolve.

Only 8 % of the interviewees think a profitable investment is possible in case of strategic short-sightedness by a distressed company. There is, indeed, a strong feeling that to have success in this case, specific sectorial competencies are necessary, brought by companies operating in the same or in similar sectors.

The first choice for 75% of the operators are neglected or non-core companies within a diversified, often international, group. In fact, the mother company may decide not to try to recover losses incurred by a foreign, non-core subsidiary, and may therefore prefer to dispose of it, and benefit from its deconsolidation. This answer had not been given in the previous survey.

Given the peculiar structure of Italian capitalism and the problems still present in terms of governance, 50% of the interviewees are interested to troublesome succession.

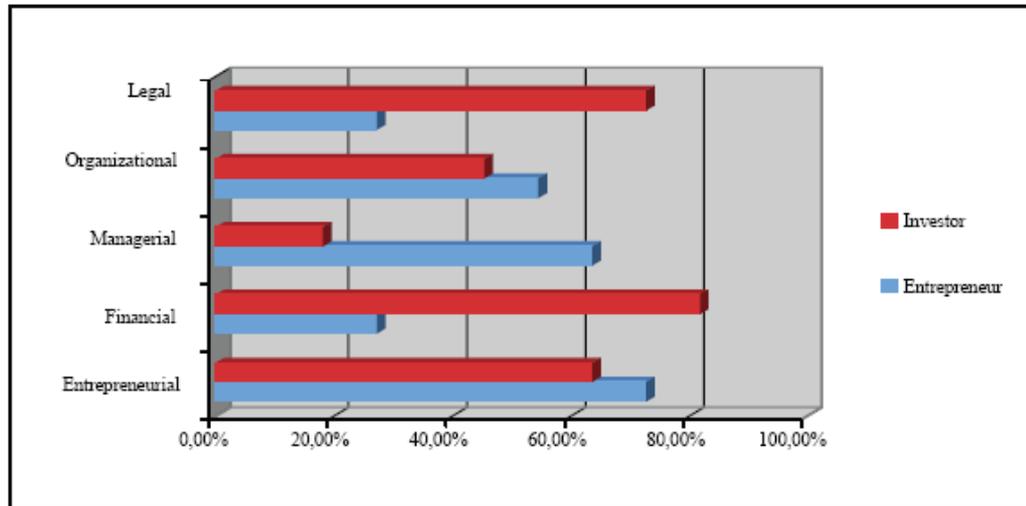

Exhibit 8: Skills required for turnaround, Source: Analysis of survey data

Interesting results are noticeable by comparing the skills an entrepreneur⁸⁰ needs to become an ideal counterpart and those necessary to invest in turnaround projects.

Besides entrepreneurial skill, the entrepreneur needs to have operating and managerial capacities, while investors need financial and legal know how. In an ideal situation, the entrepreneur is still useful for the recovery thanks to his knowledge of the business, while outside investors will manage financial and legal issues.

Finally, it is necessary to track how investors assess the value of the target. This problem is of primary importance given that the price paid for the acquisition or the possible increase in capital is the entry ticket for a vulture fund and it influences the restructuring strategy as well as disinvestment.

This is the question showing the greatest differences in the results compared to the previous survey. Today, in fact, most common methods for analyzing and evaluating troubled companies in crisis are patrimonial methods and multiples of comparables, which were indicated by more than half of the interviewees. A third indicated the DCF and a little more than 20% mentioned revenue based methods⁸¹.

⁸⁰ We have to remember that most of Italian companies (even public ones) are controlled by family or single entrepreneurs.

⁸¹ See Danovi 2000 and Danovi 2003, chap. 1.

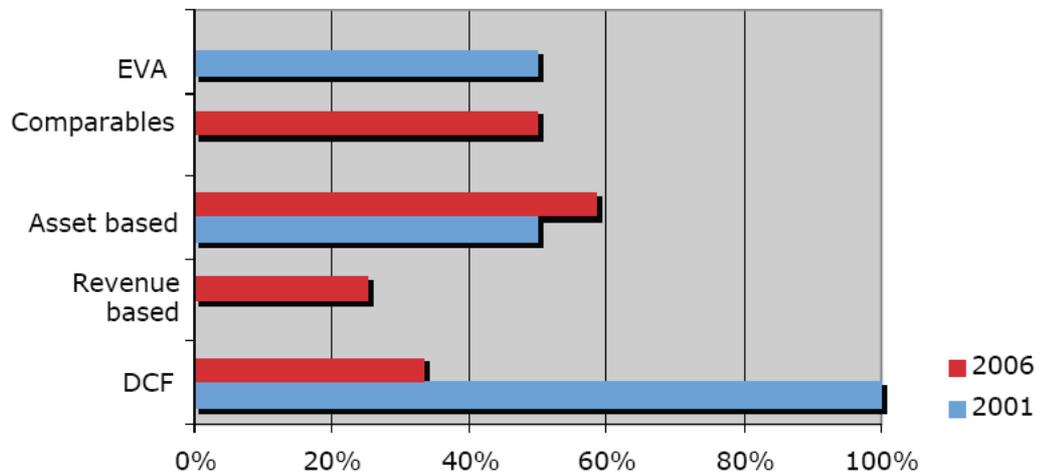

Exhibit 9: Valuation models. Source: Analysis of survey data

Compared to the previous survey, a greater dispersion of results is noticeable, as is the loss of consensus of the two methods like DFC (which was indicated by all of the interviewees) and EVA, today hardly applied by anyone. The great success of multiples of comparables can be explained within its broader application as a control method to be used with others. It is important to mention, in any case, the difficulties in finding a trustworthy sample of homogeneous companies.

There are no significant variations regarding way out channels. The drop of IPOs (17% against 67%) can be imputed to the excessive trust for these strategies back in 2001. Trade sales fell from 100% to 83%, as did secondary buyouts (from 67% to 50%).

CONCLUSIONS

Based on the data presented, it is possible to draw some initial conclusions, keeping in mind that the size of the sample (and of the Italian market) can currently provide more qualitative than statistically significant results. As mentioned, the aim of this study was to picture turnaround financing in Italy, through comparison with a previous survey from 2001, that represents the only comparable study in literature.

A relevant evolution in the sector was expected due to the passing of time and a series of external events (first and foremost the reform of the Italian bankruptcy law).

The data in paragraph 2 show that this market is still a niche: In 2005, it accounted for 0.91% of the total amount invested in private equity, and for 3.91% of the transactions. These numbers are in line with those of the five preceding years, which were slightly above average (0.83% of the resources invested, 3.43% of the total number of transactions).

So it can be affirmed that in 2006 there was no boom; the market remained stable with a slight increase. The number of completed operations is gradually becoming more significant, and experience is one of the necessary components for successful restructuring operations given their complexity.

In the period from 2001 and 2006, there were at least two strong Italian players, exclusively dedicated to special situations: Atlantis Capital, which, with Euro 84 million of committed capital, targets small and medium-sized businesses, and Management & Capitali, listed on the Italian stock exchange, with funds in excess of Euro 500 million and focused on companies with a turnover of more than Euro 100 million. Together these two investors should cover all the segments of the market, guaranteeing constant presence and good operative continuity. There were about 10 other funds which claimed to consider restructuring projects in the context of investments in already known sectors, possibly at discounted prices, and also some foreign funds, both specialized or not, attracted to Italy by private equity mega-deals and assisted by Italian advisors with a track record in large turnarounds. The different characteristics of the Italian market make it difficult to use foreign studies to make meaningful comparisons with the results of the research. What seems to be clear is that the current Italian players seem to prefer an aggressive strategy, as stated in Perrini, 1997 and only foreign investors in a few mega deals acted "passively".

It is clear from these results that a good level of funding is now available in Italy for turnaround investments. It is still a moot point, however, whether investors will shift their focus from simple financial rebalancing to industrial restructuring over a longer period of time

The bankruptcy law reform, whilst useful and necessary, does not seem to have been incisive enough to reshuffle the sector. Some actors stressed that they expected more, especially as far as the judiciary and criminal issues are concerned, and that the legal framework is still inadequate to preserve the going concern. Other problems are still unaddressed because of the labor regulations in Italy which make it difficult to drastically retrench a company. The case of Alitalia (the Italian airline) is a good example of these rigidities.

It is important to recall that the effects of the reform will be fully felt only in a few years' time when Court sentences and doctrinal orientations come to a shared and consistent view.

There are many obstacles to the expansion of the sector. The reforms have concentrated on the risks of these types of deals⁸²: There is, in fact, the widespread idea that *turnaround financing* carries high levels of risk and that it can be handled only by highly specialized investors with past experience and track record. Besides this, as an indirect consequence, many funds have statutes or bylaws which expressly exclude turnarounds or investments in projects deemed too risky⁸³. The landscape looks quite different from the US where even pension funds can invest (directly or indirectly through specialized funds) in distressed companies (Perrini, 1997).

Among other external factors, it is important to recall the market condition of corporate bonds, and that of distressed securities. In Italy, indeed, the market for corporate bonds is almost entirely represented by a few multinational companies (Eni, Enel, Telecom etc.). The situation got worse with the scandals linked to Cirio and Parmalat. Small and medium-sized companies find it is easier to finance themselves through banks rather than selling bonds on financial markets (also due to low ratings held down by the country disadvantage). This is even more

⁸² This problem was also mentioned in Danovi 2001, 896.

⁸³ This also makes a quick reaction to the changes in the market difficult. Before actually consummating turnaround transactions, indeed, an investor would need to set up a new venture expressly dedicated to such projects. At the present day, existing funds are unlikely to change their statutes.

pressing for companies with not-so-solid, or even just imbalanced, balance sheets. Current regulations and Central Bank reforms passed in December 2005 have made it more difficult for bonds to be traded. Therefore no active distressed securities market is available in Italy.

The growth of the turnaround sector is thus dampened by the illiquidity of the secondary market for distressed debt, which forces would be investors to carry out extensive negotiations with banks.

That said, we can try to picture the future evolution of the turnaround market in Italy. The next years are likely to see a growth both in the number of dedicated ventures and in the total amounts invested. The bankruptcy law reform might contribute to the attractiveness of the market for foreign investors. New opportunities are being created by the present recession and by the wave of corporate defaults. Interest by private equity groups is on the rise. The Italian landscape, however, will not easily mirror that of the US and a degree of underdevelopment will persist in the market. But there is the hope that an Italian-style turnaround financing sector can be created, characterized by the strong presence of banks and bearing (not too heavily, hopefully) the bulky weight of the courts. With respect to 2001, 2006 shows renewed and decisive interest for this sector of private equity.

INFORMATION TECHNOLOGY APPLICATIONS AND CUSTOMER SATISFACTION IN BANKING

Datta, Saroj K.¹; Kundu, Sukanya²

¹*Mody Institute of Technology and Science, (Deemed University u/s 3 of the UGC Act, 1956), Lakshmanagarh-332311, Rajasthan, India*

²*Institute of Management Technology, Centre for Distance Learning, 3A, Auckland Place, Kolkata – 700017, India*

Purpose - The paper has tried to identify the factors related to information technology which affects the satisfaction level of the customers of Indian Public Sector Bank. It has further tried to explore the intensity of each of these identified factors in influencing the level of customer satisfaction in the context of Indian PSBs.

Methodology - The research work which is based on primary data, has collected its samples from customers of Indian PSBs from different service segments. This was done following the concept of Convenience Sampling method. Data gathered has been analysed using univariate, bivariate and multivariate analysis.

Findings - It has been found that the performance of e-banking operations are below the customer expectation level for Indian PSBs. Customers are ready to accept information technology in their day-to-day banking activities but still they are not quite confident about the various performance parameters of e-banking.

Research limitations - The research suffers from geographical limitation as the survey has been carried out in and around Kolkata. Again, some of the aspects of electronic banking like the m-banking have been kept out of the scope of the research.

Practical Implications - The research work brings out that Information technology application has a very prospective future in Indian. Accuracy of e-transaction along with the ease of operation is what the customers are seeking for from the operations of Indian PSBs.

Value - The work will have a significant impact on the electronic banking operations of Indian PSBs from the quantitative analysis of the present customers' attitude towards banking.

Key words: E-banking, Customer satisfaction, Indian public sector banks, Customer centric dimension, anywhere anytime dimension

INTRODUCTION

The world is approaching to an era of information as a result of rapid technological advancement. But the life of people is becoming more hectic and they are facing a problem of time constraint for their day-to-day activities. Even for their very personal activities like financial ones (such as account management, bill payment, loan application and approval) they don't want to stand in queue for hours. At the same time when e-banking concept was introduced it revolutionized the whole banking system. Now the customers don't have to wait for hours to withdraw/ deposit money from/to bank, applying for loans, bill payments etc. They are using Internet facilities provided by banks to get their work done in minutes. This is supported by the fact that nearly 13% of world population is now online (showing a growth of 290% in past 7 years) of which 56% uses e-banking. Even in rising economies like India where

total online population is around 4%, 1% is getting benefit from e-banking and the number is rising quickly.

Basic expectations from any IT-enabled system

The highly competitive, complex and uncertain business environment of today is compelling the firms to find out ways to excel at containing cost, improving quality and innovating delivery system. Such emergent compulsions have fostered the growing use of IT by firms as a means to achieve excellence in performance. IT also helps in distribution of informational knowledge enabling the firms to disperse the decision making process down to operational levels. An IT-enabled process helps in gaining strategic advantage over the competitors by way of:

- Compression of time
- Ensuring accuracy
- Assuring ease of use
- Overcoming restrictions of geography / distance

Information technology and banking

E-banking is one of the few emerging areas in banking operations which has started with the rapid advancement of technology and the availability of Internet facility. It is time savvy, reduces the cost of operation (.01\$ to process an internet transaction as compared to 1.07\$ for an in-person transaction) for the banks, customer friendly but with a certain degree of risk attached with it. By going through the recent literatures and surveys it is found that e-banking is attaining mass popularity and it might be possible that one day will come when there will be no physical branch of a bank as all the transactions will be done online. Then the customer can dream of satisfaction to its peak as technology attains great height.

E-banking can be defined as an umbrella term for the process by which traditional banking products and services are directed to customers through electronic, interactive communication channels. E-banking includes the systems that enable its customers or individuals to access accounts, transact business, or obtain information on banking products and services through a public or private network, including the Internet. Customers access e-banking services using an intelligent electronic device, such as a personal computer (PC), personal digital assistant (PDA), automated teller machine (ATM), kiosk, or Touch Tone telephone.

Although Internet banks offer many of the same financial services, as do traditional physical banks, analysts view Internet banking as a means of retaining increasingly sophisticated customers, developing a new type of customer base, and capturing a greater share of depositor assets. Because Internet banks generally have lower operational and transactional costs than do traditional brick-and-mortar banks, they are often able to offer low-cost cheque-facility and high-yield Certificates of deposit. Keeping in mind these unique features, the strategic issues for e-banking are :

- Adequacy of management information systems (MIS) to track e-banking usage and profitability.
- Costs involved in monitoring e-banking activities or costs involved in overseeing e-banking vendors and technology service providers
- Design, delivery, and pricing of services which can generate sufficient customer demand
- Competition from other e-banking providers
- Adequacy of technical, operational, compliance, or marketing support for e-banking products and services.

As e-banking is less time consuming and easily available, it is attracting larger number of customers than traditional banking. But it is also being observed that customers are still reluctant to use e-banking because of the fear of hacking, losing privacy of account related information, technical uncertainty etc. Hence to overcome these drawbacks of e-banking, institutions have to consider the following:

- Security controls for safeguarding customer information
- Authentication processes necessary to initially verify the identity of genuine customers who access e-banking services
- Liability for unauthorized transactions
- Losses from fraud if the institution fails to verify the identity of individuals or businesses applying for new accounts or credit on-line

RESEARCH OBJECTIVES

This research paper is an effort to find the causal relationship between information technology and customer satisfaction in the backdrop of Indian PSBs and also to investigate whether information technology enabled Indian PSBs provide better customer satisfaction. Therefore, the research objectives of the study are:

- To study the usage of Information technology in Indian PSBs
- To identify those factors related to information technology, which are affecting the satisfaction level of the customers of Indian PSBs.
- To cluster the factors under several broad dimensions.
- To find out the relative importance of the factors within each broad dimension.

The observations of the study have been restricted to the IT applications in Indian e-banking scenario. In this study we have gathered data on customer expectation and their level of satisfaction in using the bank's ATM facility, core banking facility, banking website, website accessibility aspect, website design issues, ease of use of the banking website, website transactions, ease of e-transaction, accuracy and security aspect of e-transaction.

LITERATURE REVIEW

Considerable work has been done by Michael Hammer (1990), Thomas H. Davenport (1993), Gerstner (2003) in the area of application of information technology for business process reengineering. Also Jagadish Seth (1969), Oliver (1977-81) and Vavra (1997) have done significant work in the area of consumer behaviour. But not much work has been done in India in the area of e-banking. Nevertheless the works done by i) G.V. Chalam (2002) studied the growth and trend of IT application in banking sector, ii) V. Mehta (2003) researched the impact of IT on banks with productivity reference to J&K Bank Ltd., and iii) Peeru H. Mohamed (2005) carried out a study with six banks (HDFC Bank, ICICI Bank, Indian Overseas Bank, State Bank of India, Standard Chartered / ANZ Grindlays Bank and Citi Bank) from Chennai city to examine CRM in banking industry are worth mentioning.

In their work Avashti and Sharma (2000-2001) describes that advances in technology are set to change the face of banking business. Technology has transformed both the delivery channels used by banks in retails banking.

Bajaj (2000) highlighted e-commerce related issues due to adoption of recent IT. All over the world banks traditional business of taking advances and lending out the proceeds is in terminal decline. IT is also helping in cutting costs by providing cheaper ways to deliver products to customers. He concluded that electronic payment system are emerging and getting accepted in the market place.

Heggade (2000) did his work analyzing the banker-customer relationship in Indian PSBs. It is unique work since it analyses the wide range of customer services provided by the banks and the role of bank staff in its delivery.

Shapiro (2000) studied the effects of cyber space as evolving in ways that threaten privacy and other constitutional rights. It is eroding the liberty. It may end up controlling our lives in ways we have never imagined.

Also Shroff, T. (2004) describes how variety of services can be provided through the electronic channels by banks and financial institutions. According to him, employees are considered as a regular service-provider and they are the one who directly cares for the customers and their needs. The environment in the banking industry is going through rapid changes due to the impact of technology. The concept of 'Brick-and-Mortar' banking is gradually changing into the concept of 'Universal banking'. During the last decade, Internet and the concept of E-commerce, M-commerce, etc. have entered into the scenario of global banking and financial institutions. With the advent of technology in computing, development of Internet and networking technology and advancement of telecommunication facilities, global players like Citi Bank and GE Capital are now able to reach vast number of clientele spread geographically in different areas through limited branches they have set up. The bank employees have turned out to be a knowledge worker with improved productivity (along with higher compensation package), no longer bored with monotonous repetitive figure calculation and duplication of records.

Information technology in banking and customer centric management

Organizational functioning is the result of interactions among four variables: task, structure, technology, and people. (Leavitt, 1965). A change in work technology or task brings about changes in the others. The inter-relatedness of the functioning of the social and technological sub-systems of organizations and the relation of the organization as a whole to its environment have to be considered in this context. (Trist and Bamforth, 1951)

Indian banking is faced with major external challenges, which includes customer lifestyle changes, deregulation, globalisation, the emergence of new competitors, the impact of technology, and convergence in the market place between banks and other service providers such as insurance companies. The cost per transaction has declined as full service branches have been replaced in part by telephone service, ATMs and, increasingly the Internet. But overall transaction volumes have soared, making it more expensive for banks to meet customer demand and giving them more distribution channels to manage. Market research shows that many customers crave a relationship with their bank based on convenience, trust and intelligent proactivity on the part of qualified, accountable staff that know and value the customer.

The banks have adopted a fragmented approach to improving customer service, drawing on everything from psycho-demographics to branch redesign, loyalty schemes, personal banking, segmentation modelling, customer value management, cross selling, data warehouses, data mining, call centres and internet delivery. Customer Centric Management (CCM) is an integrated model for the retail banking industry. In this model the integrated management and use of customer information is the key. CCM focuses on knowledge acquisition (the acquisition and storage of customer data covering static, dynamic, financial and external data feeds), behaviour modelling (managing customer data to acquire new business and influence customer behaviour) and delivery (meeting customer expectations through product service proposition, delivery channel management and relationship management).

The bank must then be reshaped around customer priorities. For top performers, customer service quality is an obsession. Banks need to ask themselves what trapped value they are losing, why they are losing it, how they intend to capture it and how they should set about building a sustainable customer centric organisation. Overall, they should address the key question of the size of the lost opportunity, why the bank is not tapping that lost value and what it must do to get there.

Indian banking – then and now

Computerization of the workplace is beginning to gather momentum in India. Development of a sound and adequate information system has become a necessity to meet the new challenges of growth and diversification of the banking activities. The Banking Commission and the Reserve Bank of India have appointed various committees from time to time to study the situation. The Tandon Committee was appointed in 1974, which gave the guidelines to banks for the follow-up of credit, the Talwar Committee was appointed to look into the customer services in the banks, and the Goipuria Committee reported on accounting procedures and maintenance of records at bank branches. The Talwar Committee on Customer Service in Banks had recommended computerization of some functions to avoid delays in customer service.

To get a holistic picture of how the technology and its public acceptance has evolved over the years, we can refer to what some banking experts in India says. According to N Ravichandran (Professor, IIMA), the economic reforms have generated new and powerful customers (huge Indian middle class) as well as new mix of players (public sector units, private banks, and foreign banks). The emerging competition has generated new expectations from the existing and the new customers. Banks need to find out innovative ways of to deliver the existing products in an innovative and cost-effective way by taking full advantage of emerging technologies beside introduction of new products.

In the opinion of K V Kamath (MD and CEO, ICICI Bank) a combination of developments arising from technological advancements and a liberalized marketplace – disintermediation, blurring of traditional roles and boundaries, emphasis on shareholder value creation – has led to a transformation of the banking sector. The biggest opportunity for the Indian banking system today is the demographic shifts in terms of income levels and cultural shifts in terms of lifestyle aspirations of the Indian consumer. The prerequisite for capitalizing on these opportunities is technology as it is key to servicing all customer segments – offering convenience to the retail customer and operating efficiencies to corporate and government clients.

According to P S Shenoy (CMD, Bank of Baroda) currently in India, there are two types of customers – one who are a multi-channel user and the others who still rely on a branch as the anchor channel. The primary challenge is to give consistent service to customers irrespective of the kind of channel they choose to use. A retail customer selects a bank based on two criteria – convenience and relationship and would continue with a bank if it provides good service. For customers who are multi-channel users, consistent information across all channels is the key requirement of modern retail banking. Although online-only banking has been less successful than was anticipated, with several online-only banks running into difficulties, incumbent banks have started to offer banking services electronically.

P T Kuppuswamy (Chairman and CEO, The Karur Vysya Bank) says that consumers may be broadly categorized into corporate, institutional clients, high net worth individuals, and retail consumers. The challenge is how to service mass-market customers profitably. It should be the business imperative to understand a customer's expectations and appetite for risk. India will shortly become home to the second largest number of elderly persons in the world. The population of our elderly, at present estimated at 76 million, is expected to increase to 100 million in 2013. Therefore, banks should focus on unmet financial needs of the pensioners and senior citizens. Banks may have to go for mobile banking services for a cluster of villages.

The first steps towards mechanisation of banking operation were taken by installing what was known as ICL 40-column punched card equipment in late 50s or early 60s in the Calcutta office of the SBI for the reconciliation of inter-branch transactions. The trend of Non-Branch-Service Delivery in banking started with the growing popularity of electronic payment services in early 1990's with private and foreign banks. It started with Electronic Funds Transfers (EFT). Then, there were credit cards. ATMs and smart cards were next in the evolutionary history. Gradually, with the advance of computing technology, telephone banking and Computer Telephony Integration (CTI) became a powerful medium of delivering banking services. The banks are differentiating their services to the consumers to gain their loyalty. Technology is enabling banks to provide the convenience of anytime-anywhere-banking.

One of the eminent banking service providers the ICICI Bank kicked off online banking in 1996, followed by a host of other banks. But even for the Internet as a whole, 1996 to 1998 marked the adoption phase, while usage increased only in 1999, owing to lower ISP online charges, increased PC penetration and a tech-friendly atmosphere. At ICICI Bank, only 18.3 per cent of total customer transactions are online, says officials. At Standard Chartered, which has a registered base close to six hundred thousands for its Internet banking services-about 20 per cent of its retail customer base-around eight hundred thousands transactions are conducted every month. A survey by Internet and Mobile Association of India (IAMAI) also reveals that only four per cent of the 6,365 respondents approached conducted financial transactions online.

According to IDC (premier global provider of market intelligence, advisory services, and events for the information technology, telecommunications, and consumer technology markets) estimate, there are over two million registered users for Internet banking in India which is 15 per cent of India's Internet user population but just 0.096 per cent of the total population.

Some important statistics regarding the usage of e-banking in India:

- From just nine hundred thousands netizens in 2001, the number is about to reach 100 million in 2007-08. 16 million Indians are already hooked on to e-banking till 2007 according to a recent IAMAI survey.
- 81 per cent use online banking only to view their account balances.
- Net banking is growing at 70 per cent per annum in terms of the number of users.
- 89% of bank consumers use ATMs.

According to the latest IAMAI Report on the online banking trends in India, the Internet population in India is 38.5 million and is set to grow to 100 million by 2007-'08. The number of customers who bank online is expected to grow over 16 million (inclusive of Internet and Mobile Banking) by 2007-'08. Today, their population stands at an estimated 4.6 million (not a complete representation). Interestingly, online banking in tier-two cities and towns – with tremendous growth potential - is reported to be at 26 per cent. The report identifies two trends among Indians for getting hooked onto Internet banking: a) for information transactions such as checking account balances, cheque clearance, and b) for high-end transactions like transfer of funds.

This growing number of Internet users and increase in financial activities online provide an opportunity for the banking industry to get a better understanding of this dynamic channel as an additional and mandatory touch point to serve their customers.

In a competitive market where services command market share, banks are constantly vying for customers. Banking has become a process of choice and convenience; better the service, higher the customer's inclination to a bank, and vice-versa, and Internet Banking is vital for both the industry and the customer. The future of banking would be in terms of integration, as people will have less time for banking. This is already becoming a reality with new-age banks such as YES Bank, and others too adopting a single-PIN, where the customer needs to use a single PIN number for transacting both online, and as well as offline – namely ATMs.

People will want to process more transactions on the Internet. There will be more activity in terms of applications and services on the mobile. Geography will not be an inhibitor any more as everything is executable on the net. In the Internet banking system, information is considered as an asset and so worthy of protection. However, the present system of authentication does not address the security aspect in full. This calls for an urgent need to acclimatize the whole system. According to Online Banking Association, there is a dual requirement to protect customers' privacy and protection against fraud. Another major issue is that of Data Protection and the need for a legal and regulatory framework. Currently, India has no law on data protection. Information security in e-banking presents two main areas of risk: preventing unauthorized transactions and maintaining integrity of customers' transactions. Data protection falls in the latter. Data protection laws primarily aim to safeguard the interest of the individual whose data is handled and processed by others. 'Interests' are usually expressed in terms of privacy, autonomy and/or integrity.

RESEARCH METHODOLOGY

As the intention behind the research paper is to find out the interrelationship of usage of information technology in Indian PSBs and its implication on the satisfaction level of the customers, we have identified the various IT enabled tools that are now being used by the Indian public sector banks and accordingly the expectations and current satisfaction level of the customers related to those IT enabled tools has been captured.

The population for the study can be considered as the customers of those Indian PSBs which are adopting the new technologies in banking. For this purpose customers of Indian PSBs banks which are implementing information technology were chosen and questionnaire was distributed. There were 28 questions altogether divided under two subheadings:

- Customer's expectation from IT enabled banking
- Customer's satisfaction with the present service level of IT enabled banking.

We have used five point Likert-type Scales, consisting of a number of statements which express either a favourable or unfavourable attitude towards the given object to which the respondent is asked to react. The respondent indicated his agreement or disagreement with each statement in the instrument. Each response is given a numerical score, indicating its favourableness or unfavourableness, and the scores are totaled to measure the respondent's attitude. In other words, the overall score represents the respondent's position on the continuum of favourableness-unfavourableness towards an issue.

It was decided that sample would be collected from customers of public sector banks from different service segments such as professionals (doctors, lawyers etc.), businessmen, IT officials, banking professionals etc. located in and around Kolkata. This was done following the concept of Convenience Sampling method. A total of 388 customers were given the questionnaires out of which 265 were usable the average response rate being 68.29%.

One of the prime objectives of this research study was to take direct feedback from the customers through these questionnaires. The customers were selected at random by the interviewer on the basis of judgmental method because the researcher (who is also the

interviewer in this study) felt they have more useful information related to the study. This sort of practice is well accepted in accounts and auditing process and as per the Auditing Practices Board "judgemental sampling is an accepted method of selection provided the auditors are satisfied that the sample is not unrepresentative of the entire population" (APB, 1993)

DATA ANALYSIS & RESEARCH FINDINGS

The data gathered on different aspects of IT enabled banking has been analysed using univariate, bivariate and multivariate analysis. The analysis has been shown under three categories :

1. Analysis on what the customers expects from IT enabled banking
2. Analysis on customer's present level of satisfaction
3. Analysis of the gap between the customer expectation and the present satisfaction level

SPSS ver 13.0 has been used to do the analysis on the data. The variables are identified from the questionnaire and the values against each answer of the questions are recorded against each variable.

The table 1 given below shows the variables and their description on which data has been collected and analyzed.

<i>Sl no.</i>	<i>Variable name</i>	<i>Description</i>
1	EATM	<i>Banks should have ATM facility</i>
2	ECBS	<i>Bank branch should provide core banking facility (i.e., you can access your account from any branch)</i>
3	EWBSTE	<i>Banks should have website</i>
4	EWBESY	<i>Bank website should be easily accessible</i>
5	EWSTRNS	<i>The bank website should support transaction</i>
6	EUSRFND	<i>e-transaction procedures should be user friendly</i>
7	ETNSSCUR	<i>e-transaction should be secured-do you agree?</i>
8	ETNSACRT	<i>e-transaction should be accurate-do you agree?</i>

<i>Sl no.</i>	<i>Variable name</i>	<i>Description</i>
9	HAVATM	Does your bank's branch have ATM facility?
10	SATM	Your satisfaction level with the performance of ATM services
11	HAVCBS	Does your bank's branch provide core-banking facility (i.e., you can access your Account from any branch)?
12	SCBS	Your satisfaction level with the performance of core banking facility
13	HAVWEBS	Does your bank have website?
14	SWEBACC	Your satisfaction level with the accessibility of the website
15	COFWEB	"I find it comfortable to browse the bank website for any product information"
16	TMSVWEBS	"I find it more timesaving (quickness to navigate from one link to another within the banks website) to browse the website than to go to the bank branch for a product information"
17	TOTWBSAT	Overall satisfaction level with the bank website
18	WEBTRANS	Does the bank's website support transaction?
19	TSAVTRAN	"I find it more timesaving to browse the website than to go to the bank branch for any banking transaction"
20	ESYTRANS	"I find the procedure to be difficult to transact over the website"
21	TRASSEC	"I feel the e-transaction to be secured"
22	SACCTRAN	Your satisfaction level with the accuracy in e-transaction
23	SWEBTRAN	Your satisfaction level with e-transaction services

Table 1: Name and description of the variables used in SPSS ver 13.0

Analysis on what the customers expects from IT enabled banking

Univariate analysis

The results of the answer to the questions on customer's expectation from IT enabled banking of public sector banks are shown in the bar chart below:

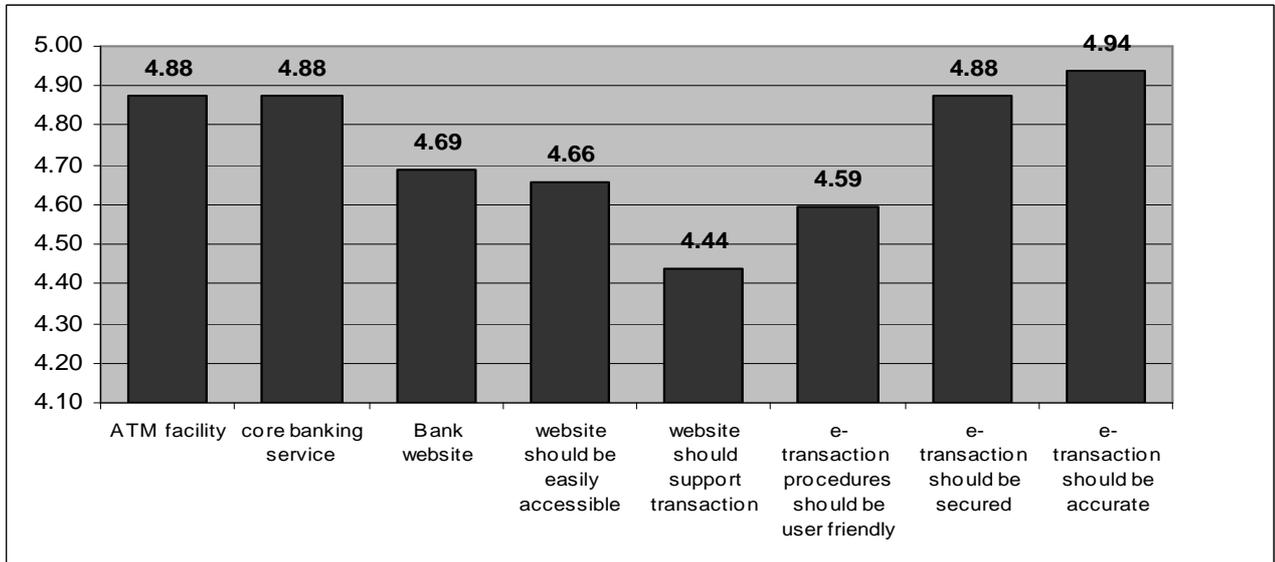

Figure 1: Customers' expectation from IT enabled banking

We can see from the above results that the customer expectation on most of the attributes of e-banking is very high. Whereas the accuracy of the e-transaction (mean value 4.94) gets the highest importance in customer expectation list, the security aspect of e-banking transaction, the availability of core banking facility and ATM facility (all having mean value 4.88) are the attributes of e-banking which customers consider next in terms of their importance.

The availability of bank's website (mean value 4.69) and the accessibility of the website (mean value 4.66) has more or less has the same degree of importance in the customers mind. The customer has attached much lesser importance to the user-friendliness of the e-transaction (mean value 4.59) whereas least importance has been given to the availability of the e-transaction facility (mean value 4.44) of the bank websites.

Bivariate analysis

	<i>EATM</i>	<i>ECBS</i>	<i>EWBSTE</i>	<i>EWBESY</i>	<i>EWSTRNS</i>	<i>EUSRFND</i>	<i>ETNSSCUR</i>	<i>ETNSACRT</i>
<i>EATM</i>	1.000	.143	.357	.522	.271	.175	.429	-.098
<i>ECBS</i>	.143	1.000	-.051	-.075	.116	.175	.143	-.098
<i>EWBSTE</i>	.357	-.051	1.000	.364	.484	.357	.357	.104
<i>EWBESY</i>	.522	-.075	.364	1.000	.304	.577	.522	.357
<i>EWSTRNS</i>	.271	.116	.484	.304	1.000	.323	.427	.185
<i>EUSRFND</i>	.175	.175	.357	.577	.323	1.000	.429	.206
<i>ETNSSCUR</i>	.429	.143	.357	.522	.427	.429	1.000	.293
<i>ETNSACRT</i>	-.098	-.098	.104	.357	.185	.206	.293	1.000

Table 2: Correlation matrix of customer expectation of IT enabled banking

From the above correlation matrix it is observed that none of the variables are very strongly correlated with each other and a moderate correlation exists between some of the variables. Though most of the variables are positively correlated with each other, some negative correlation can also be seen.

The variable *EWBESY* (ease of browsing banking website) and *EUSRFND* (user-friendly e-transaction process) are moderately correlated (correlation coefficient .577) but lesser degree of correlation (correlation coefficient .522) exists between the variables *EATM* (banks should have ATM facility) and *EWBESY* (ease of browsing banking website), which again is similarly correlated (correlation coefficient .522) with *ETNSSCUR* (e-transaction should be secured). This reflects that customer perceives them in terms of their convenience and security. A transaction based website is a part of customer expectation list as the correlation coefficient of .484 exists between the variables *EWBSTE* (Banks should have website) and *EWSTRNS* (The bank website should support transaction).

Analysis on customer's present level of satisfaction

Univariate analysis

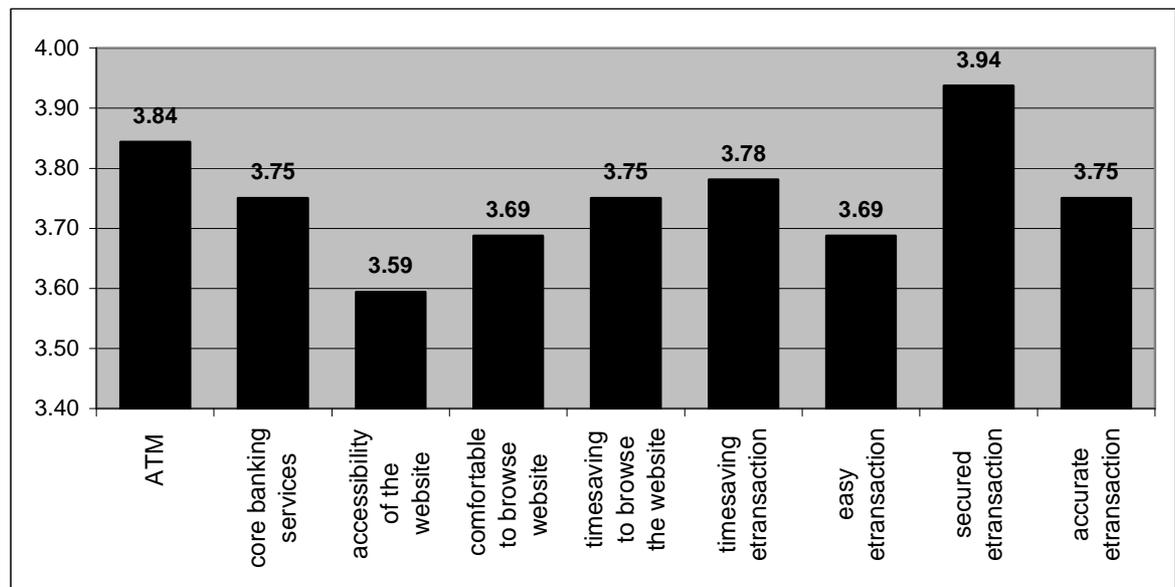

Figure 2: Mean value explaining present level of customer satisfaction

The above result reflects that the present level of customer satisfaction is not too high as the mean varies from 3.59 to 3.94 on different attributes and all values are less than 4 in a 5- point Likert scale. But their satisfaction on the security of e-transaction is highest (mean value of 3.94). Next in order comes their satisfaction from the use of ATM facility and time saving through e-transaction (mean value 3.84 and 3.78 respectively). These two variables are transactional in nature and give convenience to the customer.

Satisfaction level out of the usage of core banking facility, timesavings for using banking website and accuracy of e-transaction have a same mean value of 3.75. All these attributes reflect the operational nature of e-transaction.

But their satisfaction level on both the comfort aspect of browsing bank website and the ease of e-transaction is having the same mean of 3.69. Lastly the customer satisfaction level for accessibility of website is the lowest (mean value 3.59) and can be considered a very moderate one.

Bivariate analysis

Here we shall try to analyze the data from two perspective :

1. From the non-transactional aspect of e-banking as shown in table 3
2. From the transactional aspect of e-banking as shown in table 4

	<i>SWEBACC</i>	<i>COFWEB</i>	<i>TMSVWEB</i>	<i>TOTWBSAT</i>
<i>SWEBACC</i>	1.000	.360	.032	.590
<i>COFWEB</i>	.360	1.000	.673	.481
<i>TMSVWEB</i>	.032	.673	1.000	.375
<i>TOTWBSAT</i>	.590	.481	.375	1.000

Table 3: correlation matrix of customer satisfaction related to banking website (non-transactional)

This correlation matrix reflects how different factors influence the total satisfaction level of customers while using banks' website for other than transactional purpose. Here we find that the variables *COFWEB* (comfortability to browse the bank website) and *TMSVWEB* (timesaving to browse the website) are strongly correlated with a correlation coefficient of .673. The variables *SWEBACC* (accessibility of the website) and *TOTWBSAT* (overall satisfaction level with the bank website) are also sharing a strong correlation (correlation coefficient .590). The correlation coefficient between the variables *COFWEB* (comfortability to browse the bank website) and *TOTWBSAT* (overall satisfaction level with the bank website) being .481 reflects that they are less than moderately correlated.

All other variables are not significantly correlated and can be assumed to be independent of each other. This is important because each independent variable may call for independent banking policies.

	<i>TSAVTRAN</i>	<i>ESYTRANS</i>	<i>TRASSEC</i>	<i>SACCTRAN</i>	<i>SWEBTRAN</i>
<i>TSAVTRAN</i>	1.000	.654	.115	.275	.221
<i>ESYTRANS</i>	.654	1.000	-.016	.543	.441
<i>TRASSEC</i>	.115	-.016	1.000	.071	.243
<i>SACCTRAN</i>	.275	.543	.071	1.000	.723
<i>SWEBTRAN</i>	.221	.441	.243	.723	1.000

Table 4: Correlation matrix of customer satisfaction related to transactional website

The above correlation matrix, related to the transactional aspects of bank's website reflects the following:

- Correlation between the variables *SACCTRAN* (satisfaction with the accuracy of e-banking) and *SWEBTRAN* (satisfaction with e-transaction services) is quite high. The value of the correlation coefficient being .723.

- The variable TSAVTRAN (time saving attribute of web browsing) is moderately correlated to variable ESYTRANS (easiness of transaction through web), the correlation coefficient being .654.
- The variables SACCTRAN (satisfaction with the accuracy of e-banking) are also moderately correlated to the variable ESYTRANS (easiness of transaction through web), the correlation coefficient being .543.
- Security aspect is more or less considered to be an independent factor as this attribute is not showing any considerable correlation with any other variable

The above correlation matrix also brings out the fact that accuracy contributes most to the total satisfaction of e-transaction. Easiness contributes next and security and time saving aspect respectively comes to the last in order.

Multivariate analysis

	<i>Component</i>	
	<i>1</i>	<i>2</i>
<i>TSAVTRAN</i>	.900	
<i>TMSVWEBS</i>	.844	
<i>COFWEBS</i>	.789	
<i>ESYTRANS</i>	.730	
<i>SWEBACC</i>		.831
<i>SCBS</i>		.787
<i>SATM</i>		.701
<i>SACCTRAN</i>		.628

Table 5: Rotated Component Matrix of satisfaction out of IT enabled banking (Considering values above 0.5 only)

Table 5 shows the result of factor analysis. The component matrix was rotated using varimax rotation method with Kaiser Normalization. Two factors were extracted through above method that converged in 3 (three) iterations.

Factor loadings above .25 were considered to be significant.

Factor 1 comprises variables namely TSAVTRAN, TMSVWEBS, ESYTRANS, COFWEBS, indicating *Customer Centric Dimension* of Indian e-banking sector.

Factor 2 comprises variables SWEBACC, SATM, SCBS, SACCTRAN indicating *Anywhere Anytime Dimension* of Indian e-banking sector.

Analysis of the gap between the customer expectation and the present satisfaction level

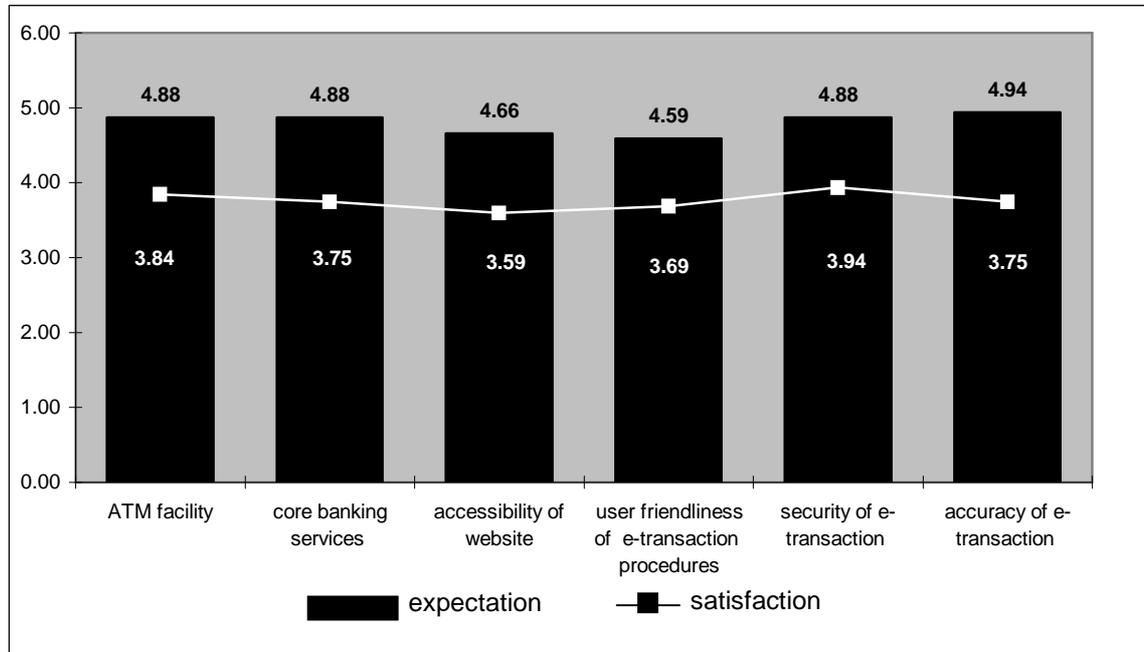

Figure 3: Mean value of customer expectation and present level of customer satisfaction on different attributes of e-banking

In the above bar and line graph, we have plotted the mean values of customer expectation and customer satisfaction level on certain common attributes of IT enabled banking services. The observations from the analysis of above graph are presented below:

- The present satisfaction levels of customers on attributes of e-banking as shown by the line are below their expectation level on the same attribute as shown by the bars.
- The difference between the mean value of the expectation and that of satisfaction related to user-friendliness of e-transaction is the least where as it is highest incase of accuracy of e-transaction.
- The difference between the mean value of the expectation and that of satisfaction in the security attribute of e-transaction is second lowest followed by differences regarding attributes of ATM facility, website accessibility and CBS facility in ascending order.

DISCUSSIONS AND CONCLUSIONS

The univariate, bivariate and multivariate analysis on the gathered data reveals the following facts about the variables related to the usage of information technology in Indian banking:

Significantly high mean values of customer expectation on different attributes of IT-enabled banking reassures that information technology application has a very prospective future in Indian PSBs.

High expectation on accuracy and security aspect of e-transaction and least expectation on the availability of e-transaction reflect that though customers of Indian PSBs are ready to accept information technology in their day-to-day banking activities but still they are not quite confident about the performance of e-transaction.

From the correlation analysis of the e-transactional website it can be seen that a high level of customer satisfaction calls for a very high level of accuracy of e-transaction.

Moderately high correlation between easiness of e-transaction and time saving aspect of e-transaction reveals that easy procedure of transaction ensures less time for transaction. Same is applicable to any non-transactional website where the comfortability to browse the website ensures time saving also.

From the multivariate analysis, we can identify the IT related factors which are affecting the satisfaction level of customers of Indian PSBs and they can be clustered under two major dimensions: *Customer centric dimension* and *Anywhere anytime dimension*.

1. *Customer centric dimension* comprising of variables (in accordance of their comparative weightage within the dimension) such as
 - timesaving to browse the e-transactional website
 - timesaving to navigate through the web site for product information
 - comfortable to browse the bank website for any product information and
 - easy procedure to transact over the website.
2. *Anywhere anytime dimension* comprising of the variables (in accordance of their comparative weightage within the dimension) such as
 - accessibility of the website
 - performance of ATM
 - performance of core banking facility and
 - security aspect of e-transaction

The satisfaction level of the customer on all attributes of e-banking are less than their expectation level reveals that the performance of e-banking operations are below the customer expectation level. Hence the bank has to take steps to improve their performance and also bring new technologies for banking operations.

Hence in the conclusion we can say that though application of information technology in Indian banking has made significant inroads to their customer base, it still lacks in several dimensions of its performance. Therefore this needs to be taken care of by significantly improving the operational efficiency and introduction of innovative technologies. One of the future technologies, which Internet Banking could witness, is of Biometrics approach as against

the password authentication system of individual's claimed identity. It needs to be recognized that such high cost technological initiatives need to be undertaken only after the viability and feasibility of the technology and its associated applications have been thoroughly examined.

The Internet and its underlying technologies will change and transform not just banking, but also all aspects of finance and commerce. It represents much more than a new distribution opportunity. It will enable nimble players to leverage their brick and mortar presence to improve customer satisfaction and gain share. It will force lethargic players who are struck with legacy cost basis, out of business since they are unable to bring to play in the new context.

DECISIONAL MODELS FOR COMMUNICATION-MIX

Di Gregorio, Angelo¹; Zanaboni, Giorgio²

¹*Universita Degli Studi Di Milano – Italy*

²*Universita Degli Studi Di Milano – Italy*

Purpose - This paper's purpose is to outline a taxonomy of different approaches to the company communication and to define the factors on the basis of which a firm can adopt an approach rather than another.

Design/methodology/approach - Analysis of the major existing literature and the following exploration of the most successful case history.

Findings - Although marketing-mix has been studied and analyzed in all its possible aspects and implications, rather less attention has been paid to communication-mix.

Practical implications - The taxonomy of different approaches with which a company can do communication gives an useful support to the management to guide the definition of them through the analysis of the factors that guide the company decisions towards the adoption of an approach rather than another.

Originality/value - In a developed economic system the traditional marketing approach isn't sufficient anymore. New and more updated tools are necessary to better reach consumers.

Keywords: communication mix, taxonomy of communication models, marketing approaches, decisional models, factors of choice.

INTRODUCTION

In the economic systems of the most developed countries, customers always accept with less passivity products, communications and, more generally, business supplies: they are getting more and more aware, informed, demanding, and, ultimately, active, thanks to the dissemination of global information technology and web applications. The "active" behaviours of these consumers appear in at least three separate phases, i.e. during the consumption, the purchase and, often, during the specification of the company's supply.

During the consumption phase, consumer experience cannot be "pre-packaged" and managed solely by the producer and/or distribution channel; in effect, customer experience is an "experiential platform" of benefits that individual consumers aggregate by itself, independently and according to their preferences. In doing so, consumers build their product and their consumption experience (Carù and Cova, 2003, pp. 200-201; Resciniti, 2004, pp. 100-101).

Even when purchasing, the "active" consumer wants experiences, as products or services are not only chosen for the functional benefits they provide, but also for the symbolic values that they communicate. IKEA represents a good example of this situation: in every store each physical element is useful for setting customers at ease and allowing them to experience the chance of being "architects" of their home. Finally, today's consumers can build the offer through the control of elements that belong to the marketing mix that is traditionally managed by firms (Cova, 2007, p. 52). For example, the famous watchmaker Panerai counts among its bestsellers two watches that have been produced thanks to suggestions expressed by potential buyers on

an Internet blog. In this way a new product has been developed in an innovative manner which is far more different from the traditional concept test on the products, in which a company tries to understand the degree of acceptance of a given offer already specified in its essential elements. Conversely, today's consumers have to get involved since the creation of the offer's basic elements.

The consumer's ability to participate at various moments in which take places the relationship between supply and demand - that is in the processes of consumption, purchase and determination of the offer itself - emphasizes the need for companies to provide offers that both in their technology and in the intangible value, allow consumers to feel as an active subject, that participate in the building of the relationship with a particular offer.

The evolution of consumers and the fact that competing products are getting more and more similar from a purely technical point of view, lead to say that creating and maintaining a sustainable and defendable competitive advantage can be realized with an offer strongly characterized by immaterial component.

It becomes therefore crucial to draw attention to the intangible elements of the offer. Only by giving due weight to both tangible and intangible aspects of the offer, it is possible to meet the needs of "new" consumers and, therefore, to achieve a defensible and sustainable competitive advantage.

Brand represent a fair balance of both tangible and intangible assets, if it is not simplistically viewed as the trademark of the company, which is useful to distinguish its products and differentiate them from those of competitors. Instead brand has to be viewed as a specific relationship established with a given market for the achievement of a specific offer.

Brand, thanks to its specific characteristics, is the key factor with which the company can meet the needs of "new" consumers. Indeed, in the most comprehensive meaning, brand has to be regarded as the combination of both the material components (product, packaging, price, etc..) and the intangible value of the company's supply. Among the latter a key role is played by the brand identity, that is the set of associations linked to the brand that a company intends to create and deliver to its consumers. But the existence in the business supply of both tangible elements and intangible value is not a sufficient condition to create the relationship between demand and offer. Alongside these factors, a key role is played by the commercial communication, which is the main tool for guiding this relationship. The aim of this article is twofold: on the one hand to propose a theoretical framework about the different approaches to the company communication and, on the other hand to identify the factors on the basis of which a firm can adopt an approach rather than another.

Given this introduction, this paper will first outline the different forms of communication mix and then the factors through which companies can choose the best approach to be taken.

TAXONOMY OF COMMUNICATION MODELS

Traditionally, in marketing, finding the communication mix consists in a series of sequences: the analysis of the competitive sector, the segmentation of the demand, the choice of the reference target and the positioning. The process ends with the specification of the operative

actions which took places into the decisive variables that compose the marketing mix. Consequently the development of communication follows the same process at the end of which the company decides the different tools to use to achieve the set goals and the reference target as well.

The aforementioned process however, can be developed also in a parallel and not sequential way, thanks to the creation and the use of a database which contains information about customers. In particular, a database allows to study in real time the customer base, to immediately find the subjects to whom address and to define the more suitable actions to satisfy individual needs. In substance a one to one marketing approach takes place. For a company, in order to adopt an advanced marketing model it is fundamental to establish a relation with consumers; in this way the company obtain data that after will merge into a database. It is thus evident that the data collection is a fundamental activity .

Between this two approaches which can be considered "borderline cases", there are "intermediate cases" in which, because there is no customer database, traditional forms of communication are used. For example, advertising can be useful for bringing the consumer to use direct communication tools typical of new media. In this case the main activities are developed through the web, which is not only used to spread messages to the reference target, but it is also an important instrument to create a company database. All other media and communication tools are used to support on-line activities; of fact their duty is to push the communication recipient to visit the company web site and, then, to transfer his data to the company.

In the end is possible to identify another approach to company communication which is defined as "unstructured" because there are no analysis before company decisions. In this approach a major role is played by the set of relations that the businessman has established with his customers. All communication activities are settled to enforce those relations, and a great attention is given to public relations.

Starting from the most "crude" way of communication arriving to the most advanced one, the identified taxonomy consists of four different approaches:

1. unstructured communication
2. traditional communication
3. intermediate cases focus on new media
4. advanced direct marketing

In the following sections each single approach will be examined in more detail.

Unstructured Communication

This approach is called "unstructured" because in this case analysis that precede company decisions are not carried out. In this approach a key role is played by all relations that the businessman has established with individual customers (usually few). All communication activities are aimed at strengthening these relations, therefore public relations act as a preferred tools.

It is easy to think that the unstructured approach characterize only the small entrepreneurial businesses which lack the capital to carry out market analysis or the use advanced CRM would be completely meaningless. This is only partially true; the world of insurance organizations, for instance, is characterized by very big groups acting internationally. It would seem obvious, therefore, to expect the reality of this large-sized organizations to operate under the logic of the most advanced forms of communication, supported by specific analysis; referring to the institutional aspect of communication, this is also true. Examining the functioning of a typical branch of the insurance group though, it is easy to find out that they operate according to unstructured approaches of communication.

Customer management is in fact typically entrusted to the insurance underwriter, which must also be responsible of the seeking for new names. It is in this last phase that the approach is "unstructured." New clients are in fact sought through public relations activities, more or less direct knowledge. If the first contact ends successfully, then the agent will set up an appointment for a subsequent face to face meeting, in which the ability of the single insurance consultant to communicate on an interpersonal level plays a fundamental role.

The recruitment of new customers as well as the activities for retaining those already acquired, is therefore based on the logic of "unstructured" communication, where the key role is played by all the relationships that the consultant has established with its individual customers. Obviously, at the source of all there has to be quality products and a really solid company. This is why on an institutional level traditional communications approaches (with media such as print or television campaigns) are usually used. But the institutional campaigns only allow the insurance companies to be known by the indistinct mass of potential customers, who afterwards will be identified and targeted by single consultants through direct contacts driven by unstructured way of communication.

Traditional Communication

In traditional approaches to marketing, the specification of the communication mix requires a series of preliminary analysis that starting from the analysis of the competitive pressure leads to the definition of the marketing mix.

Specifically, the process consists of a series of sequential steps: the analysis of the competitive sector, the segmentation of demand, the choice of the reference target and the positioning (Kotler and Keller, 2006, p. 310).

The analysis of the competitive pressure of an industry is substantiated in the analysis of the major competitive forces of enlarged competition: existing competitors, potential entrants, substitute products, suppliers and customers. These components determine the nature and intensity of competitive pressure, thus affecting the profitability of the company. According to this analysis the company decides the best strategies to use for dealing with competitors.

Secondly, always based on the traditional approach, there is the analysis of the demand to identify the main needs expressed by it, since consumers increasingly have needs that can hardly be satisfied by a single offer. This means that the company have to segment the market in different groups of consumers with similar needs and identical reactions to the same marketing activities.

After having segmented the market, the company should select the groups of target consumers. Among the possible options, the company offer can be addressed to all the consumers of the market with a segment by segment differentiated offer, to meet the needs of different groups of consumers; or with a standardized offer, thus ignoring the differences between the segments. Alternatively the firm can decide to serve only some of the market segments; or it can just focus on one segment, acquiring a dominant position.

Finally the company defines the positioning of its offering, that is the position which it intends to fill within the individual segment. The objective pursued by the positioning is to be able to occupy a position clearly defined in the minds of the consumers, which is distinct from that held by the competitors' offerings.

The process ends with the specification of the operational actions, which took places into the decisive variables that compose the marketing mix. Therefore the definition of communication follows this same process after which the company chooses different instruments to achieve, effectively and efficiently, whether the set goals or the reference target.

In general, every company defines the set of most appropriate tools to use and identify how best to integrate them in order to convey messages that are consistent with each other. In this way it can maximize the results from the running of communication.

The communication realized according to this approach is traditional, with the aim of reaching the widest possible target. It is therefore a mass communication that uses primarily the most traditional instruments (e.g. advertising), used at the expense of more innovative ones (such as viral and guerrilla marketing).

The process described above is a consolidated business practice for two main reasons. First of all, it is adopted by companies leading their market, thus also the followers follow this approach in an attempt to improve their results. Secondly, it is so accepted by having become an integral part of corporate culture.

This process is not free from limitations : in particular, there are problems from an organizational perspective, in fact the analysis supporting the whole model are performed by members of staff. Consequently, in most cases they are not used neither by those who should decide business strategies, nor by the subject of line functions. This represents a considerable waste of resources that are used in performing analysis useful in the establishment of optimal business strategy and business offers, but which in reality are completely ignored.

Intermediate Cases Focus on New Media

This model is characterized by the central role assumed by the new media linked with the development of information technology. In this case, the main activities are carried out through the web, which is not only used to convey messages to the target audience, but it is also an important tool for creating the company's database. All other media and communication tools are used to support the on-line activities; their objective in fact, is to push the recipient of the communication to visit the corporate website and, subsequently, to transmit their data to the company.

An excellent exemplification of this approach is provided by Pirelli with its new way of communication: Pirelli Film, a series of short film released only through the website www.pirellifilm.com. To publicize the site, Pirelli has advertised them through television, print media, billboards and banners. In them it was clearly indicated the web site address , thus the latter form of communication (that is advertising) playing a supportive role to the first (the web). To create a database of prospects to whom, in future, one to one communication activities could be addressed, on the web site a form has been created. Through this form feedback about the present film can be collected and suggestions for the next ones can be made .

Advanced Direct Marketing

The analysis at the source of the definition of the several operational activities are performed by some companies in a parallel way instead of sequentially. Indeed in the traditional process of marketing, competitive analysis, segmentation, selection of the segment in which to compete, positioning and definition of operational activities are carried out according to a sequential logic: namely, only after having completed a specific analysis is possible to start the following one , until the conclusion of the whole process. There are, however, other companies that perform the same analysis seen before in a parallel way, through the establishment and use of a database containing information about clients. In particular, the database allows the real-time study of the customers, to identify immediately the person to whom the communication have to be addressed to and to define the most suitable actions to optimally meet the needs of each single client. Essentially, it is an implementation of a one to one marketing approach.

The creation of a relationship with final customers in order to acquire data that then have to flow into the database is essential to best ensure that the company could adopt a model of advanced direct marketing. Therefore becomes important to the business the activity of collecting data that must be gathered at every point of contact between the company and its customers. For the company it is then crucial to identify all opportunities for interaction with its customers, which may be helpful in acquiring the information. These contact points may be either "physical", in which there is a direct interaction between customers and company personnel which have to be trained in data collection, or "virtual", in which the customer interact with information systems that have to be designed to collect data and to send them to the database.

When data are collected into the database, it should not only contain information relating to the single settled transactions, but it has also to be able to increase the knowledge about individual customers and their behaviours. It is therefore important that the data contained into the database are correct, without duplication and up-to-dated; only in this way, in fact, the performed query will be as accurate as possible.

When the analysis of data contained into the database is completed, the company can implement targeted communication actions, able to meet each customer's needs. The communication process does not end with the implementation of the operational actions, however. In this particular model it is indeed important that the company establish a long-

lasting relationship with its customers. This is essential to continuously feed the company database, thus providing an increasing amount of information about individual customers. In this way the company can plan activities which are best suited to customer needs, managing consequently loyalty.

In practice, therefore, the process described above is a nonstop one, because once made up the first operational actions it starts again from the interaction with customers to gather further data needed to refine the subsequent actions.

FACTORS OF CHOICE

The analysis of the four approaches outlined in the previous section allows to define a taxonomy of different ways in which a company can carry out the communication activities.

Taxonomy of communication models does not have to be considered a tool that ends in itself but as a useful support for management to guide the communication actions. In order to develop this role, the description of the different marketing approaches adopted by a company is not enough though. It is necessary to find the factors that orientate company's choices towards the adoption of an approach rather than another. In general, these elements can be very different, among which the intensity of competition, number of transactions, data acquisition cost, level of differentiation of the product/service and company dimension.

Intensity of competition

A first factor that may be useful for choosing between different approaches is the intensity of competition in the market where the company competes. If the competition is low, the firm may adopt an unstructured marketing approach, because it knows in depth the needs of customers. The company, moreover, should not act taking into account the actions implemented by competitors.

The more intense the competition becomes, the stronger will be the stimulus to the adoption of innovative approaches, directed to the creation of a database, and then to the analysis of data contained in it. In this case, in fact, the company must try to obtain a competitive advantage that is based on factors not easily imitable by competitors. Among these factors there are the relationships established with individual customers; relationships that, thanks to the high degree of customization, can not be imitated by competitors. Specifically, the adoption of a one to one communication approach in markets characterized by high degree of competition allows companies to take shelter from the actions of competitors.

Number of transactions

The second factor is related to the business target market. Thus, if the company has the chance to conclude a large number of transactions, then the development and maintenance of a customer database are feasible operations. In this way the company can develop targeted actions, likely to meet the needs of each customer: therefore it may take an innovative approach to marketing. In the opposite case, when the number of clients and transactions is small, the creation of the database would be virtually useless because the company would spend considerable resources to support the initial investment, without any consequential adequate

payback. This stems from the fact that to get meaningful information that are useful in decision making, it is often necessary to have a database that contains significant amounts of data. It seems clear therefore that this approach can not be applied in the case in which the company, during an accounting period, performs a small number of transactions concluded with a few customers. In this case it is preferable the adoption of an unstructured approach that, thanks to public relations, enables the company to strengthen relationships with individual customers.

Data acquisition cost

Considering the amount of transactions that have been concluded, the company have also to take into account the cost associated with the acquisition of data. Indeed, it has convenience to create a database when that cost is low. For example, large retailers are using innovative approaches to marketing since the cost of acquiring data about their customers are provided through the use of loyalty cards. If this cost was high instead (because such data should be acquired from outside organizations), the company would be more oriented to traditional marketing approaches with which to carry out mass communications.

Level of differentiation of the product/service

Even the differentiation of product/service plays an important role in the choice of the best communication approach to be adopted. In fact, if the product/service is poorly differentiated (as in the case of mobile telephony provider), the companies should seek to distinguish themselves from their competitors by using intangible values such as brand or relationships with customers. In this case it will be preferable to adopt more innovative approaches.

If instead the product/service is highly differentiated from that of the competitors and if the elements of differentiation are appreciated by customers, the company may opt to more traditional approaches. McDonald's, the world's largest chain of fast food, is a good example in this regard. With its traditional hamburgers, cheeseburgers, fries and soft drinks, McDonald's serves around 47 million customers every day with which it communicates through extensive advertising campaigns : in addition to more traditional media like television, radio and print, the company also uses billboards and sponsorship in sport. However, it is television that has always played a central role within the company's marketing strategy.

Company dimension

A final factor of choice is the size of the company and the level of complexity of its internal structure. In small companies where decisions are all taken by the entrepreneur, it is more likely that the communication approach would be an unstructured one. In this case, it can indeed be assumed that the entrepreneur carries out its activities by developing a direct and personal relationship with its customers; therefore, the unstructured approach will be useful in strengthening these relations. On the contrary, if the firm size is significant, decisions are taken by multiple actors; then it is likely that more complex approaches are adopted. Moreover, it must be taken into account that companies are increasingly multi - product and multi - business and they address themselves to many customers having different needs and requirements.

Consequently it would be more difficult to use public relations to establish a direct and personal relationship with individual customers.

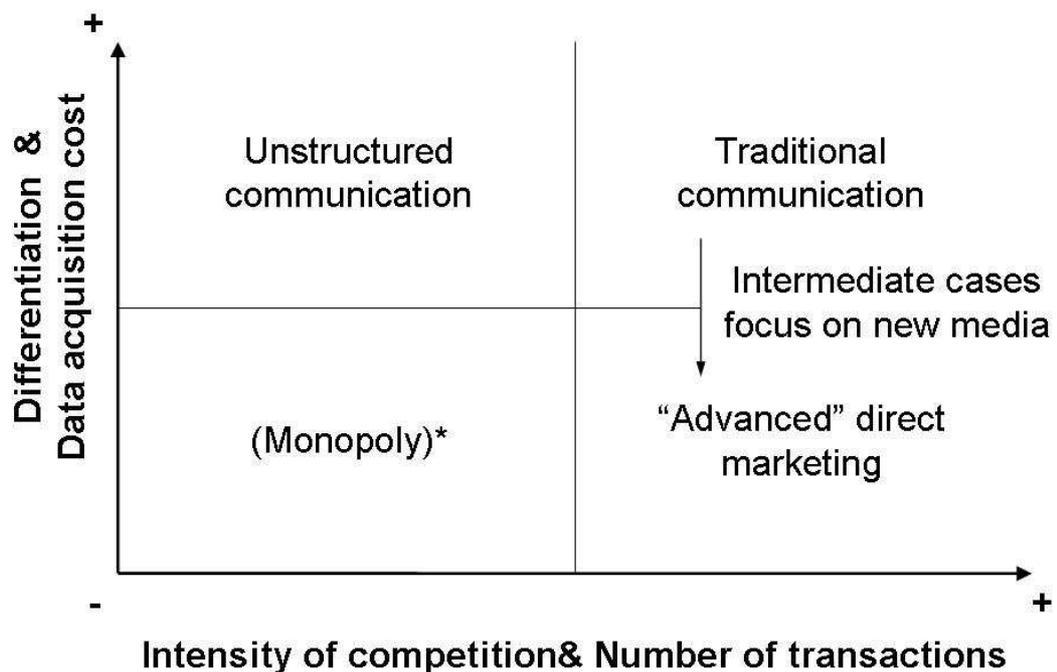

In summary (as shown in Figure 1), a sector characterized by intense competition, a high number of transactions concluded by the company, low cost for the data acquisition, a limited differentiation of products/services, a large-sized company characterized by a complex corporate structure, are all factors that can push a company to adopt innovative communication approaches, based on the creation and analysis of a customers database. This does though not exclude a company having any of the foregoing characteristic from the adoption of more traditional approaches or approaches aimed at the creation of the database itself.

Factors of choice Approach	Intensity of competition	Number of transactions	Data acquisition cost	Differentiation level of the product/service	Company dimension
Unstructured communication	LOW	LOW	HIGH	HIGH	SMALL
Traditional communication	MEDIUM / HIGH	HIGH	HIGH	HIGH	MEDIUM / BIG
Intermediate cases focus on new media	MEDIUM / HIGH	HIGH	MEDIUM / LOW	MEDIUM / LOW	MEDIUM / BIG
“Advanced” direct marketing	HIGH	HIGH	LOW	LOW	BIG

Figure 1 – Approach / factors of choice matrix

Where the analysis of the five factors discussed above leads to prefer a specific approach to communication rather than another, it should be added that these same factors tend to change during the life of an organization: if initially a company were more likely to adopt an unstructured approach, while when its size and transactions settled during a financial year increase, the traditional approach will be better placed to meet the business needs.

A further increasing in size and transactions, as well as an intensification in competition accompanied by a lesser capacity of diversification will then push the organization to adopts an advanced direct marketing approach, passing first through the intermediate forms of communication focused on new media.

* particularly referring to intensity of competition and differentiation

Figure 2 - Evolution of the communication approach

Figure 2 shows the change in the communication approach due to the changing of the main factors of choice.

In the lower left corner of the matrix there are monopolies, which deserve a word apart because in these particular market conditions, companies have no need to attract customers: being the only producers of commodities in the market, the only way to owned one of their products is through them: there is no choice at all. When the monopoly ends, however, companies will find themselves in a condition of traditional communication and then they can think of moving to the advanced direct marketing approach.

DISCUSSION AND CONCLUSIONS

The communication-mix is a set of different approaches that companies can choose from to reach their customers by communicating with them in the best possible way. The taxonomy of different approaches with which a company can communicate represents a useful support for the management to guide the definition of them through the analysis of the factors that guide the company decisions towards the adoption of an approach rather than another.

Studies on the intangible elements of the offer appear to be particularly relevant at a time when competing products are getting more and more similar from a purely technical point of view.

It is, therefore, surprising that theories of communication-mix have received little attention in the marketing literature and, in particular, the factors that guide the company decisions towards the adoption of the best communication approach to be adopted.

This study has attempted, in part, to fill a gap in the literature by proposing a theoretical framework of decisional models for communication-mix. In delineating the communication-mix, it is argued that it is composed by four different approaches: unstructured communication, traditional communication, intermediate cases focus on new media, and advanced direct marketing. It is further proposed that the different factors of choice can be very different, among which the following five: intensity of competition, number of transaction, data acquisition cost, level of differentiation of the product/service and company dimension.

This framework offers important theoretical implications for marketing research as well as a practical support to the management to guide the definition of the communication approach.

Still, concept of communication-mix seems to be worth further elaboration. More research is necessary to empirically validate these considerations and perhaps to extend the concept of communication-mix and, what is more important, the subsequent decisional factors of choice.

The paper examines the criteria for marine tourism development in the small islands of Greece. The study is grounded on the current and potential contribution of yachting development to the local economies of these islands, and proceeds to an analysis of the major factors that can contribute to the evolution of marine tourism in the case of Dodecanese islands.

The methodology that is applied, in order to satisfy the research aims is the Analytic Hierarchy Process (AHP). This is a flexible and functional tool of investigating multi-criteria decision making problems that allows the determination, the evaluation and comparison of major criteria by stakeholders.

The case study is the potential of yachting development in the smaller and least developed islands of the Dodecanese. The selection of this case is based on the characteristics (i.e. size, population, morphology, and geography) and the economic and tourist growth indicators of these islands.

The quantitative research analysis is based on a sample of data that have been collected via a questionnaire that have been answered by a selected sample of key experts and stakeholders. These data help to evaluate the extent that several factors (that in the context of the present paper have taken the form of criteria and sub-criteria) might determine yachting development and influence the achievement of the desirable objective of marine tourism development in small islands.

The article is structured as follows: Section 1 is referring to maritime tourism, Section 2 clarifies the aim of the research, Section 3 presents the methodology used in the study, in order to give priorities to the development of yachting in insular regions involving local experts, Section 4 specifies the case study, Section 5 presents the Criteria for Yachting development, Section 6 exhibits the empirical results obtained from small Dodecanese islands. Finally, Section 7 summarises the main conclusions drawn from this research..

Keywords: Maritime Tourism, Yachting, Analytic Hierarchy Process, Expert Choice, Dodecanese.

MARITIME TOURISM

In the maritime tourism concept, all tourist, recreational and leisure activities which take place in the marine environment of a tourist destination country which offers hospitality to tourists, are included. These activities include stay, restaurants and food shops in general, as well as any kind of infrastructure and upperstructure works such as marinas, enterprises and equipment, which are necessary for tourist development. The strict definition of the term "maritime tourism" directs us to the quest of a more direct and longer lasting contact of the tourist with the sea. The contribution of shipping infrastructures and means to the realization of this relationship is decisive and includes on one hand ports, marinas, and vessel shelters along the sea routes and on the other the vessels themselves, as an integrated system fully incorporated in the activities of cruising, coastal shipping and recreation. With the participation

of shipping, maritime tourism acquires its real content, since it enables the tourist to truly experience the marine environment. In the absence of shipping, the tourist's approach to the coast through other transport systems (by land or air) and his stay in coastal facilities (hotels, etc) weaken his interaction with the sea and hence distort the concept of maritime tourism (Lekakou & Tzannatos, 1998).

According to Miller M., and Auyong (1993 and 1991) Maritime Tourism also includes recreational activities like maritime excursions, coastal and maritime eco-tourism, cruises, swimming, fishing and diving. It is unquestionable that matters concerning the impacts of maritime tourism on island societies, the natural borders of which are determined by the sea surrounding them, constitute a significant field of research (Hall CM, Page S, 1996).

Maritime tourism is widely regarded as one of the world's largest industries of contemporary tourism, with a significant participation in the tourist economies of the countries which have developed it (Hall M., 2001: 601-648) with tendencies of continuous and rapid growth (Webe S. and Mikacic V., 1994: 71-74., Pollard J., 1995: 61-77., Kim S., and Kim Y., 1996: 46-53., Orams M. 1999). Yet, the sector is characterized by a great difficulty in the recording of statistical data for the precise estimation of its real size. Characteristically, the exact number of tourists that select maritime tourism remains unknown (Miller M., 1993:193-199).

The yachting industry faces rapid growth world wide and the demand for marina space is increasing . The development of the industry is also evident by the growth in the production of pleasure crafts and mega-yachts in particular. The benefits of developing the yachting industry seem to outweigh the costs to a great extent and nations around the world are now investing significant amounts in initial or additional infrastructure in an attempt to meet the increasing demand (Caribbean, Croatia or Turkey to name some of them). The islands or the insular regions offer various alternatives to yachting industry mainly, marinas or shelters/ storage and repair, wintering and catering (SCBD, 2005)

A significant factor in the development of yachting is port infrastructure and the possibility of supplying special services to passengers of yachts in leisure.

Leisure ports form a highly dynamic sector whose expansion has knock down direct and indirect effects in numerous economic activities (agriculture, energy, intermediate goods, capital goods, construction, transport, hostelry, sales services, non sales services) (Perez-Labajos, Blanco, 2006).

Leisure crafts can hardly be serviced by the existing harbor installations after establishing harbor zones equipped with all suitable facilities. Only just a few more marinas fully equipped will be necessary. However, the upgrade and modernisation of harbor infrastructure is the most critical factor in order to further enhance the maritime tourism in Greece (Gouloumis *et al*, 2002).

Maritime tourism can be sustainable and converted into a strategy of development for small islands, as long as it is in harmony with their social, economic and cultural dimensions. This means environmental and economic sustainability as well as social cohesion.

Greece is a leader in maritime tourism for a large number of yacht management, chartering and consultant companies giving the country a primary role in the yachting sector worldwide. The Greek market of professional Yachting was created in the 70s, when Greece was pioneer in

the world to establish the legal framework for the operation of companies exploiting recreational vessels. This market began with just 25 vessels which initially flew the Greek flag and in the beginning of the 21st century was the largest in the world with approximately 4,000 vessels and referring to 40,000 charters annually by approximately 80 charter companies offering 7-day charters on the average (Diakomihalis, 2007b)

Nowadays, comparing the western Mediterranean countries, Greece falls short, not so much in the number of mooring spots but in the quality of the services provided (Diakomihalis M., Lagos D., 2008:872). Ports are not only a constituent of national transport systems, they also should be treated as parts of tourism's infrastructure (Miotke-Dziegiel J. 2007:486).

Yachting in Greece is very popular among both Greeks and foreigners and seems to have an upward trend. The 20 marinas in Greece today, offer a capacity of roughly 7,400 mooring posts, while an additional 3,000 boats can be accommodated in ports throughout the country (Diakomihalis 2007b). The existing network of marinas and shelters of tourist vessels, though it needs further development and improvement, provides choices of marine tour which can offer the visitor beyond enjoying the sea routes, the acquaintance with many regions of insular and continental Greece (Diakomihalis, 2007). An important feature of modern ports as maritime tourism centers is a strong pressure on connections with port's city, through railways, roads, parking places, telecommunication etc (Miotke-Dziegiel J. 2007:487).

Polyester boats covered most of the Greek yachting market, 59.6 percent, followed by inflatable boats with 34.8 percent. Sailing boats made up 5.6 percent of the market. Current market trends and conditions show that polyester boats will record an increase as people are increasingly opting for this type of boat. The inflatable boat market will also rise, while the sailing boat market should remain stable or move slightly higher.

The demand of leisure craft is of foreign origin at approximately 95%. The Europeans (mostly the Germans and the French) prefer sail boats while the Americans prefer motor boats. The Greek tourists who are considered demanding clients of high-income salary, usually charter bareboats as well as manned vessels such as motor yachts or motor sailers. According to the data provided by "Kyriakoulis Mediterranean Cruises Shipping S.A" for the year 2004, 29% of the company's clientele originated from Germany, 11% from Italy, 9% from Great Britain, 9% from France, 8% from Holland, 7% from Austria, 5% from the Scandinavian countries, 3% from the Czech Republic, 2% from Switzerland, 2% from Belgium, 1% from the USA and Australia. 12% comes from other countries, while 3% originates from the Greek market (Diakomihalis (2007b).

Yachting's contribution to the main values of the Greek economy is relatively small; it is, however, particularly important to the economy of the islands and to coastal destinations. For many destinations, it constitutes one of the main economic activities of their residents. Local income and employment created constitute the most important effects of maritime tourism activities on the local economy. Yachting contributes to all major values of the local economy of the regions that have developed this specific interest tourism. (Diakomihalis, Lagos, 2008)

AIM OF THE RESEARCH

The study aims at revealing what factors are fundamental in facilitating yachting progress towards a sustainable development. The aim of this research conducted in the summer of 2007 is the identification of the factors- criteria that can contribute to the development of Maritime Tourism, especially of yachting in the small islands.

These factors are determined after the review of the limited literature and experts' and academics brainstorming sessions and are considered as criteria that affect the achievement of the desired goal. The research methodology used is the "Analytic Hierarch Process", a flexible and useful tool of multiple criteria decision-making (MCDM) that allows the determination, the evaluation of criteria as to the degree they participate in the development of the specific tourist product and the hierarchy of criteria by the involving experts. In this case, the involving parties come from the yachting market, the local societies (Organizations of Local Authorities) and professional groups (businessmen, seamen, skippers). An important criterion for the promotion of maritime tourism development is the acceptance by the local stakeholders not only of the manner but of the size of development as well. The two latter elements are tied with the specific area for which maritime tourism development is proposed as well as with its special characteristics.

METHODOLOGY OF THE EMPIRICAL RESEARCH

The methodology followed for the present research includes three levels:

- a) The literature review
- b) The Questionnaire development
- c) The field research and
- d) The data elaboration and the calculation of the importance of each factor.

The first phase was a literature review in order to collect the factors that have been already identified by scholars. The outcome was limited so it was used as an input to the second phase. The latter includes a brainstorming session, in order to decide on: a) which of these or any other additional factors could be used as a decisive factor for the maritime tourism development in island yachting from a small island point of view. The third phase of the research includes the questionnaire development and the field research in the small Dodecanese islands. The final stage was the data elaboration and the calculation of the importance of each factor.

The research endorsed the methodological framework that is portrayed in figure 1.

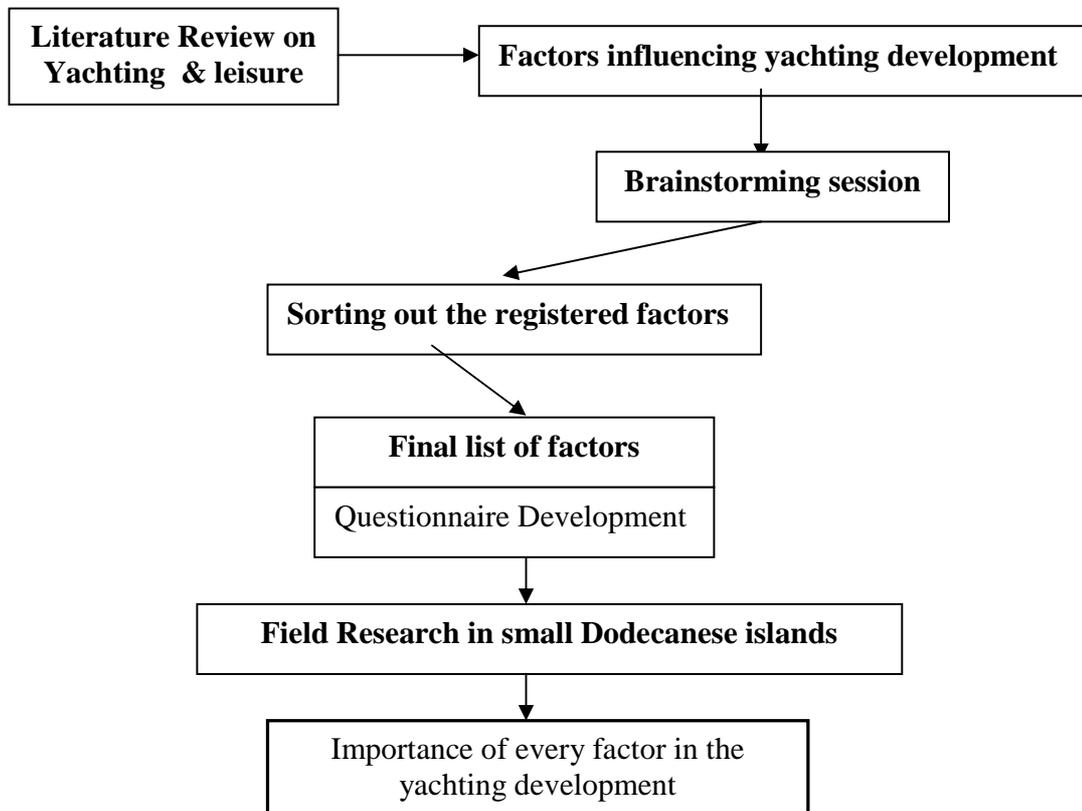

Figure 1. Methodological Framework

AHP method has the ability to structure complex, multi-person, multi-attribute, and multi-period problem hierarchically. Pairwise comparisons of the element (usually, alternatives and attributes) can be established using a scale indicating the strength with which one element dominates another with respect to a higher-level element. This scaling process can then be translated into priority weights - scores (Yusuff R. M. et al., 2001:421).

The Analytic Hierarchy Process- (AHP) uses hierarchical decision models that have a mathematical basis. The meaning of the hierarchical decision model must be defined and subsequently the process for decision making with the use of the model will be explained. The AHP has a successful track record regarding applications in the wider transport area and ports (Lirn et al, 2004) following its introduction as a multiple criteria decision-making (MCDM) methodology in the late 1970s (Saaty, 1977)..

AHP is a multi-criteria method for decision making and priorities ranking (developed by Saaty, 1977, 1980, 1996). This method "combines subjective and objective estimations or perceptions, in an integrated framework which is based on scale ratios from pair comparisons" (Saaty, 1980 (a)). The judgments from the pair comparisons are made by experts or decision makers and in combination with the use of the AHP algorithm are producing the final outcome. In the port

industry the AHP has been used mostly for assessing port selection criteria (Song, Yeo, 2004), (Lirn, Thanopoulou, *et al* 2004), (Guy Urli, 2006), (Ugboma *et al*, 2006), carrier selection criteria (Wong, Yan, Bamford, 2008) and benefits distribution from port services (Vaggelas, Pallis, 2009).

In order to reach reliable results from the application of AHP, the elements of the hierarchy model must be of the same importance (Saaty, 1994) and the judgments in the pair comparisons consistent. An Inconsistency Ratio (IR) allows to trace inconsistency. When $IR < 0.01$ judgements and outcomes stand as reliable (Saaty, T., L., (1980b).

Model: A model is a representative of a phenomenon which helps us solve problems. We can define our model either or a natural or a mathematical model in our effort to discover the significant impacts. Further on, we apply what we have in the real world.

A decision hierarchy: A typical simple decision hierarchy requires an objective, criteria and alternative solutions. We make comparative analysis per couples in hierarchy features, in relation to a feature of a higher level than them, in order to conduct priorities and then depict them as a result of the total.

The method is based on a series of comparisons per couples of the existing data so their relative priority can be determined. The criteria with which the comparisons are made and the final hierarchy deriving from them, are not necessarily determined. It is possible and acceptable to be based on non-measurable factors such as experience and subjective judgment. After the completion of the process, the most important factors have the highest gravity coefficients (Saaty 1999a).

Aiming to identify the experts' opinions, questionnaires are completed in which the criteria and sub-criteria of each criterion in couples are prioritised. These can determine the impact of the choice of each separate activity for the development of yachting in the Dodecanese islands.

CASE STUDY: SAILING TO SMALL DODECANESE ISLANDS

The area of this research includes the analysis of the factors that contribute to the development of yachting in small islands. This paper presents the results of an empirical research that aims to (a) identify the criteria for the development of yachting and (b) conclude on the hierarchy that each of these criteria has. These factors become the criteria and sub-criteria in order to reveal and analyze the development of maritime tourism and their impact upon it.

The case study is the development of maritime tourism of small islands in the Dodecanese Archipelagos. Maritime tourism (by tourist boats and yachts) in the Aegean is concentrated on a relatively small number of ports, which simultaneously constitute the main poles of attraction for tourists. The Argosaronic Gulf, the Cyclades and the Dodecanese show the largest concentration. However, it should be noted that the Argosaronic Gulf shows signs of a saturated market (Piraeus – Hydra) with the ports of Southern Dodecanese (Rhodes – Kos) following.

Even though the Dodecanese is one of the most developed tourist regions of the country (Rhodes, Kos belong to this region), significant disparities and differentiations are observed among the islands as to welfare level and to the indices of tourist development. At the same time, due to the distinctiveness of maritime tourism on one hand and the distance from large mainland urban centers on the other, we can observe numerous differences in the manner and

type of tourist development of the Dodecanese compared to those of e.g. the Caribbean or the Saronic Gulf islands. For these reasons, the selection of the small islands of the Dodecanese, based on their characteristics (area, population, land morphology) and the indices of economic and tourist development constitutes an interesting case study of the development of maritime tourism.

These Dodecanese islands face serious problems, for reasons of their geographical nature (spatial discontinuity, small size and the long distance from urban complexes) and diachronic absence of sustainable model of economic and social development. A special characteristic is the fact that even though the whole region has significant natural and cultural resources, significant economic, social and cultural particularities per island are presented.

The Greek islands constitute important tourist destinations. For these island societies, the role of tourism as a source of income and development is especially significant. However, a number of small islands is exposed to the negative impacts of mass tourism while some islands present difficulties at call, due to the existing coastal shipping network on one hand and due to limitations presented by the small size and the existing port infrastructure (e.g pertaining to the possibility of cruise calls) (Lekakou, Tzannatos, 2000). In most cases a limited substantial involvement of the local communities is observed in the production or in the formation of the production of tourist products. Therefore, we observe the passivity of the inhabitants and the prevalence of identical conditions in the tourist product and finally the loss of the comparative advantage of each island. Another critical point is the carrying capacity of island communities and destinations that should not be exceeded, and external effects should be controlled and measured, enhancing the positive ones and diminishing the negative. It is important to reduce seasonality of tourism by diversifying activities and changing traditional "sun and sand" tourism into a wider coastal and marine tourism model, which would involve more activities traditionally developed in the seafront (Spilanis, 1999).

The present study analyzes the factors that may influence the development of Yachting in the small islands of Dodecanese.

For the completion of the research the following islands were selected: Astypalea, Kastelorizo, Lipsi, Leros, Nisyros, Patmos, Symi, Tilos and Chalki. A common feature of these islands is that they are the smallest in size and the least developed ones. Karpathos and Kasos were not included in the research only due to their geographical position that is far from the archipelagos of the rest of the islands and near Creta.

The selection of the 9 islands of the Dodecanese was on the grounds that they are destinations of significant demand by the tourists of maritime tourism. Specifically Rhodes and Patmos are included in the 10 largest ports of the country in the preference of cruisers and the number of passengers that visit them (Rhodes 3rd, Patmos 5th). Occasional cruise calls 1 to 2 or 3 per year take place on other smaller islands as well. From the total of 954,791 cruise tourists (NSSG, 2006) who visited Greece in 2004, 213,300 22,34% have passed by the Dodecanese (almost all of them by Rhodes and Patmos, while less than 1,000 in total have passed by Nisyros, Symi and Chalki).

A significant activity for the small islands is the visits of one-day tourists on Daily cruises on small passengers boats coming from the larger and more developed tourist islands. The

percentage of 18% of the total tourists (approximately 700,000) is especially high since it shows that approximately 1/5 of the day tours takes place in the Dodecanese.

The islands included in the field research are the destinations selected by leisure boats charterers who choose the Dodecanese for their vacations. Simultaneously, it has been estimated that 18% of the leisure boat charters taking place in the country, are in the Dodecanese (mainly in Rhodes and secondarily in Kos). Consequently, from the total of approximately 235,000 tourists who bought Yachting services in Greece in 2005, 42,300 had preferred the Dodecanese.

A significant Yachting activity is observed in the Dodecanese. The number of leisure boats chartered in Greece in 2005 has been estimated to 41,900. According to estimates by experts and members of the professional unions, a ratio of 18% of the charters took place in the Dodecanese. The total of the leisure crafts charters in the Dodecanese for 2005 was consequently 7,542. The majority of these charters took place in Rhodes to a very high percentage, and in Kos.

The visitors of the islands however witnessed great deficiencies in the mooring infrastructure and in the offered services (for the vessels) at the ports and on the mainland.

It is concluded from the above that these 9 islands of the study constitute the "ideal field" for the identification and the hierarchy of factors influencing the yachting development in small islands

The empirical research took place from June to August of 2007. The questionnaires were completed by a large number of experts such as: a) members of the Local Authorities, b) of the Coastguard and c) businessmen. The AHP designed questionnaire survey (containing an explanation of the major criteria and a clear example of how to answer the questionnaire) was distributed to 30 and was completed by 29, which covered almost 65% of the total (estimated maximum) of 45 experts (port operators /coastguard officers /local authorities /maritime tourism businessmen, yachtsmen).

YACHTING DEVELOPMENT CRITERIA

The results of the AHP reveal different views and priorities among the experts. Various approaches were given not only from questionees among different islands but from questionees on the same island itself. This is due to the difference of the morphology and the features of natural or built ports or marinas among islands and on the other hand due to the different approach and priorities given by the experts. The latter differentiation has to do with the status, the job position and the knowledge and the experience of the area each respondent has.

As it has been recognized, infrastructure in ports is a predominant condition for Yachting development in Greece. The condition of port infrastructure in the coastal regions of the Dodecanese is considered insufficient.

Two marinas in the Dodecanese (in Rhodes and Kos) offer 365 mooring posts in total, out of the approximately 7,400 posts in the country. Additionally, only 6 out of 61 ports that can offer supply services to leisure boats are located in the Dodecanese. The lack of infrastructure on the one hand and the effort of private initiative in order to satisfy the demand on the other, are demonstrated by the fact that two of the four private marinas of the country are located in the

Dodecanese. The improvement of the offered services at every type of tourist port is what is needed.

The groups of criteria and the criteria, which are estimated to have an impact on Yachting development, are afterwards elaborated on.

Criteria groups

A prerequisite for the prioritisation of the activities for the development of yachting services provision in small islands is the identification of the yachting service offered.

Based on the previous review and the expertise, port infrastructure (at tourist ports and marinas) is a primary precondition for Yachting development and consequently all the factors characterizing it will become criteria groups or will be integrated into a group.

Another significant feature (inseparable from port infrastructure) for Yachting development is the port equipment and the services offered there. The connection of the port with the land zone, where the facilities offered to the users are concerned, is another category of preconditions for Yachting development. Finally, the competition observed in the Yachting market, on a global scale as well as in the wider region of the Mediterranean, is affected by the level of infrastructures and services and also by the costs for them. Consequently, a group of criteria pertaining to the major costs paid by leisure level charterers is necessarily included in the criteria.

The determination of groups was done with the cooperation of the field's experts. For their final selection the opinions of business officials and local authorities and organizations were co-evaluated because they are aware of the particular characteristics of the region under research.

The hierarchic structure of the levels of criteria as well as the number of criteria on each level are quite significant in the implementation of AHP. For this reason, the structure of the present research is relatively simple, with data present of two levels and a total number of 39 questions (comparisons per couples).

The groups of criteria selected are the following:

1st: Mooring availability for yachts, sailers & tourist vessels

2nd: Port basin characteristics

3rd: Mooring positions' characteristics

4th: Facilitations on the land zone

5th: Port equipment

6th: Port costs

Criteria characteristics

The selection of the characteristics for each criteria group was also a result of synthesis of opinions and estimations by field experts and by individuals who apart from their knowledge and experience are well aware of the special conditions prevailing in the specific area. The 19 sub-criteria selected for the total of criteria are presented below per couple.

The 1st criteria group "Mooring availability for yachts, sailers & tourist vessels" includes 2 sub-criteria:

1. The natural position of the port (Entrance, weather conditions)
2. Non existence of fishing and commercial vessels in the port

The 2nd criteria group "Port basin characteristics" also includes 2 sub-criteria:

1. Sufficient room for maneuvers
2. Type of sea bottom (Muddy, rocky, etc)

The 3rd criteria group "Mooring positions' characteristics" includes 3 sub-criteria:

1. Sufficient draught
2. Sufficient quay length for simultaneous and safe vessel mooring
3. Infrastructure for speed and mega yachts (availability of a proper ramp, etc)

The 4th criteria group "Facilitations on the land zone" includes 4 sub-criteria:

1. Availability of utility and hygiene areas
2. Availability of car parking space
3. Interconnection with transportation means
4. Availability of areas for maintenance and wintering

The 5th criteria group "Port equipment" includes 5 sub-criteria:

1. Supply infrastructure (water-fuel)
2. Availability of launches
3. Fire fighting means
4. Vessel lift for repairs and maintenance
5. Port approach and Safety control

The 6th criteria group "Port costs" includes 3 sub-criteria:

1. Mooring dues
2. Dues for astern/alongside mooring
3. Wintering dues

Table 1 presents in which levels of the objective, the criteria, the sub-criteria and the alternative solutions are depicted.

Table 1: The diagram of the model

THE SIGNIFICANCE OF THE CRITERIA AND SUB-CRITERIA

The degree of participation of each criterion and sub-criterion, which depicts its gravity for the achievement of the objective as well, will formulate the results for the procedures and the actions required so that Maritime Tourism can essentially contribute to the development of these islands.

It should be mentioned that the structure of the questionnaire was such, that the respondents were asked to compare each sub-criterion included in the Criterion, with the remaining sub-criteria of the Criterion. Therefore there is no comparison of all the sub-criteria separately with the remaining belonging to other criteria. This was done for purposes of abridging the number of the questions. Despite all these, with the Expert Choice software that was used, the gravity coefficients were calculated without the aid of such a comparison. The most significant sub-criteria are depicted afterwards.

The results (gravities) from the AHP analysis of the research with the questionnaires clearly demonstrate the significance of the "Characteristics of the port basin" with 0,248 or 24,8%. The significance of this coefficient is rather high and is proven by two data.

Firstly, by their difference from the first criterion "Mooring availability for yachts, sailers & tourist vessels" (0,194 or 19,4%), which follows the first in gravity with a difference of 0,054 or 5,4%.

Secondly, comparing the criteria of the first level we discover that the greatest significance difference between the successive criteria in significance is that of the fifth, "Facilitations on the land zone" (0,134), with the sixth, "Port costs" (0,079), which is 5,5%.

Comparing in the same way the differences in significance between criteria successive in significance, we ascertain that the difference between the first Criteria "Mooring availability for yachts, sailers & tourist vessels" (0,194) and the fifth "Port equipment" (0,186) is just 0,8%. At the same time, the difference between the fifth and the third criterion "Mooring positions' characteristics" (0,158), is 2,8% and finally difference between the third and the fourth, "Facilitations on the land zone" (0,134) is 2,4%.

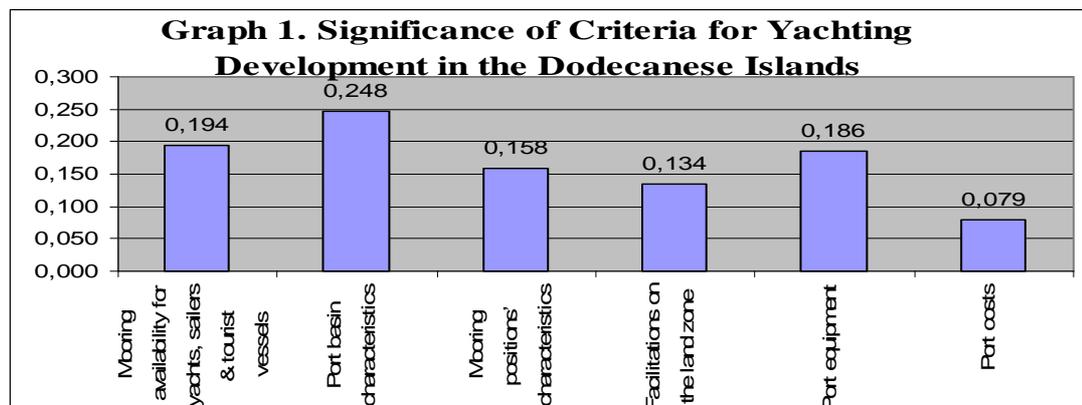

According to the above, it is concluded that despite the greatest significance of the second criterion "Port basin characteristics", it is not considered that the experts in the field are indifferent to the remaining 4 criteria which are to a lesser extent significant. On the contrary, their opinion is that the sixth Criterion "Port costs" is rather negligible. This shows to an extent the deficiencies depicted and pertain to the Criteria of infrastructure and services, deficiencies that are judged as more significant than port costs.

<i>Criteria</i>	<i>Significance (%)</i>
1 <i>Port basin characteristics</i>	24,8 %
2 <i>Mooring availability for yachts, sailers & tourist vessels</i>	19,4%
3 <i>Port equipment</i>	18,6%
4 <i>Mooring positions' characteristics</i>	15,8%
5 <i>Facilitations on the land zone</i>	13,4%
6 <i>Port costs</i>	7,9%

Table 2: The significance of the criteria in priority order, as perceived by local experts in an AHP survey

Starting the analysis of the results concerning the significance of the Sub-criteria, it is useful to make some notes.

At this point it is useful to clarify that the gravity coefficients for each sub-criterion have been estimated as for their Local significance (the Criterion they belong to) as well as for their Total significance (as to the Objective). Their Total significance firstly has to do with the significance of the Criterion they belong to, and secondly, with their own significance. That is, one sub-criterion may have a high (Local) significance for the Criterion it belongs to, its Total significance however may be low due to the low significance of the Criterion it belongs to as to the Objective. One sub-criterion belonging to a Criterion of medium significance, may sometimes have a higher significance as to the objective even than the most significant sub-criterion of the most significant Criterion. This can happen due to the existence of many almost equally significant sub-criteria in the most significant Criterion in which case the significance is divided among them, while at the same time one sub-criterion of a medium significance Criterion may be particularly significant and the rest of a less significance.

Graph 1- Significance of Criteria for Yachting Development in the Dodecanese Islands.

Table 3 which follows allows us to observe the five (5) most significant sub-criteria, while Table 4 presents the five (5) least significant sub-criteria.

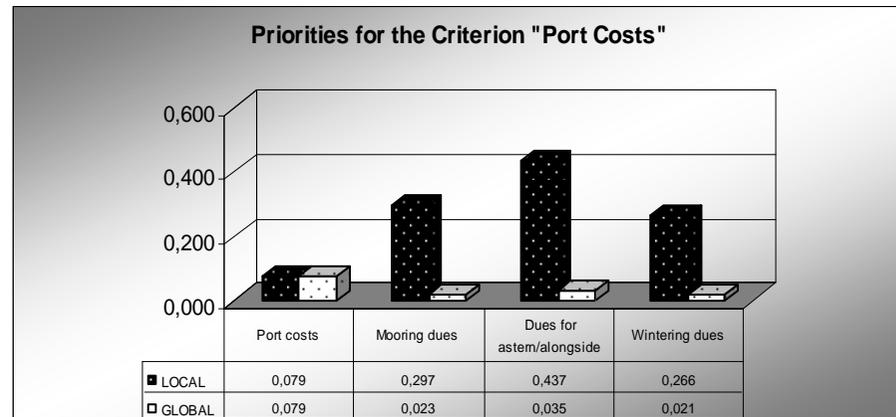

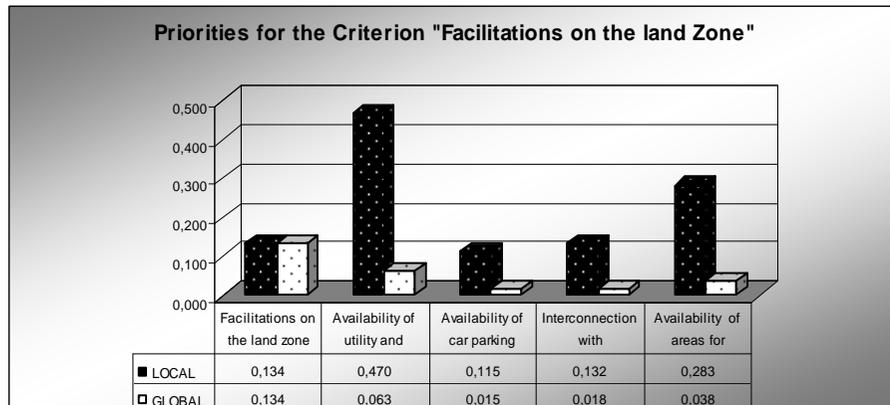

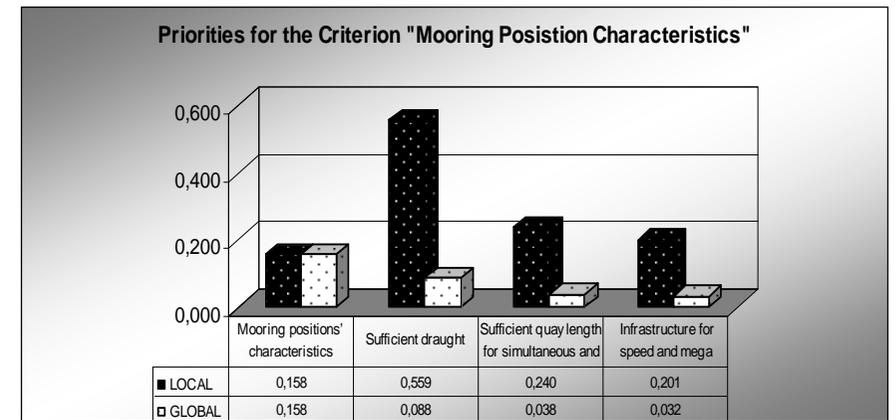

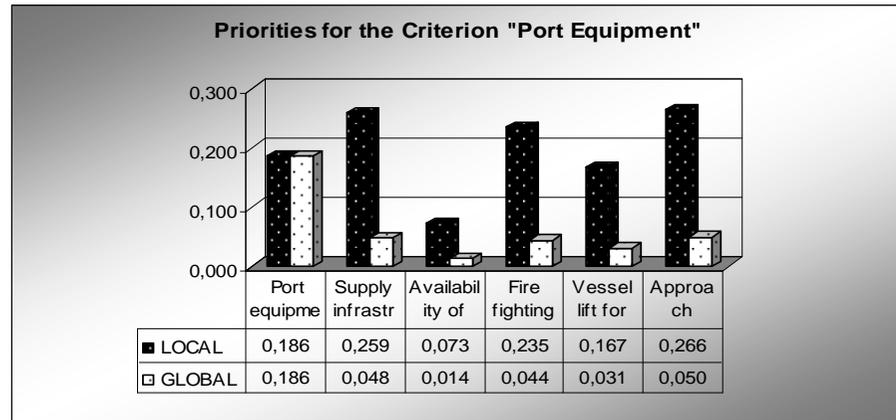

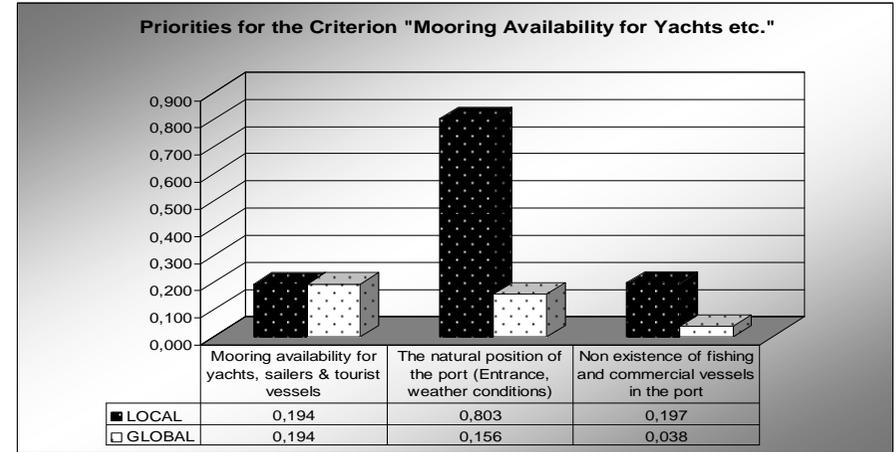

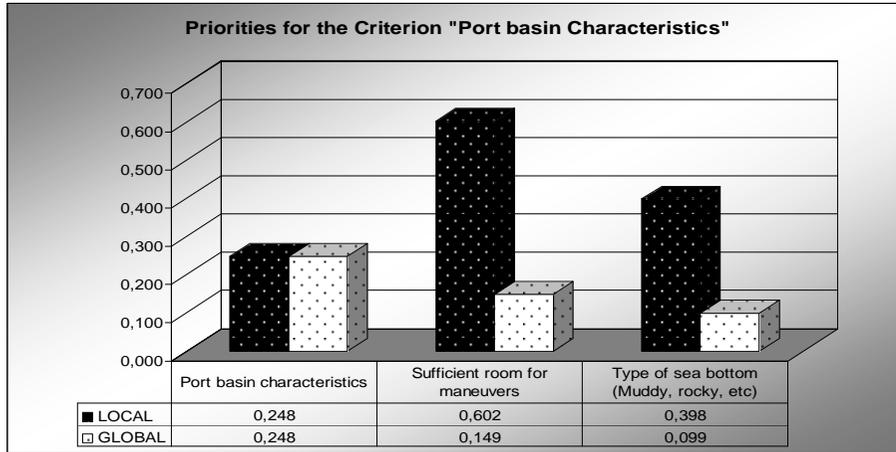

<i>The natural position of the port</i>	<i>0,156</i>
<i>Sufficient room for maneuvers</i>	<i>0,149</i>
<i>Type of sea bottom</i>	<i>0,099</i>
<i>Sufficient draught</i>	<i>0,088</i>
<i>Availability of utility and hygiene areas</i>	<i>0,063</i>

Table 3: The five most significant sub-criteria as perceived by local experts in an AHP survey

<i>Availability of launches</i>	<i>0,014</i>
<i>Availability of car parking space</i>	<i>0,015</i>
<i>Interconnection with transportation means</i>	<i>0,018</i>
<i>Winter shelter dues</i>	<i>0,021</i>
<i>Mooring dues</i>	<i>0,023</i>

Table 4: The five least significant sub-criteria as perceived by local experts in an AHP survey

In the following 6 diagrams the sub-criteria of each Criterion are presented indicating their degree of importance for the Criterion they belong.

CONCLUSIONS

The development possibility of Yachting in small Dodecanese islands was studied in the present research. After the notional approach of Maritime Tourism and the activities it includes, its impact in the Greek market and its degree of participation in the economic development of the country was determined. The factors which can contribute to the Maritime Tourism development in Dodecanese islands were determined after the recording of the opinions of the field experts, while it was questioned how possible the realization of an investment program is, which could lead to the development of the specific tourist activity.

Based on the results, useful conclusions arise as to the existing infrastructure and the Yachting services provided in the small islands of Dodecanese. The significance of the criteria and sub-criteria which was recorded, depicts simultaneously the degree to which these factors are lacking and the necessity for their acquisition or improvement.

The conclusions pertain totally to all 9 islands, which present even to a large degree Maritime Tourism activities and, which were the case study. During the research significant differences in the answers of the respondents were observed. The results of the AHP analysis of the questionnaire surveys showed definitely that there is a strong subjective importance as in other cases too (Lyrn, 2004). In spite of this, the lack in basic infrastructures, equipment and services for the development of yachting arises in these islands.

According to Table 1 depicting the gravity of each criterion as to the degree of its significance at the desired objective, it is observed that the highest rank in the hierarchy is the criterion "Port basin characteristics" followed by "Mooring availability for yachts, sailers and tourist vessels" and "Port equipment", are the most significant criteria for Yachting development, with a total of 62,8%. A relative significance was presented by the criteria "Mooring positions' characteristics" and "Facilitations on the land zone" with total significance 29,2%.

In comparison with the rest of the criteria, "Port costs" got 7,9%, a quite low percentage, a fact stating the very low degree of significance of this criterion in the development of Yachting.

Summarizing, we consider as a general conclusion the lack of serious infrastructure for the development of Maritime Tourism in these small islands. At the same time, a satisfactory tourist activity is observed despite the lack of proper infrastructure, a fact depicting the attractiveness of the areas offering maritime tourism. It is concluded therefore, that the promotion of maritime tourism may possibly bring significant benefits to the development of these islands.

We should not overlook the fact that the development of tourist ports may bring environmental (to the sea, land and air) and social effects. Maritime Tourism development can also adversely impact other economic activities, such as agriculture, fishing, aquaculture, forestry and tourism, all of which can directly effect the living conditions and welfare of local people and communities (Dong P.T., Chapman D. M., 2006:179-179). The promotion of Maritime Tourism in the small islands, provided that it constitutes common resultant of state and local societies, can turn out to be the central axis of developmental process that will ensure both the social and cultural harmony of insular regions. Research, education of stakeholders and spatial planning will be the first steps. Actions in local and national level should be coherent. Yachting should be given equal importance compared to Coastal Shipping and Cruising, which for certain islands may function complementary to Yachting, while for others they might constitute their main field of Maritime Tourism development.

EVENT SPONSORSHIP – A CORPORATE TOOL FOR BRAND POSITIONING. THE RELATIONSHIP BETWEEN SPONSORSHIP ACTIVITIES AND BRAND BUILDING STRATEGIES. THE CASE OF ALBANIA

Elmazi, Ilir¹; Bazini, Evelina²; Elmazi-Billa, Liljana³

¹MBA, Director of Economy and Finance, International Insurance Company, SIGMA, Albanai

²Ph.D, Tourism Department, Faculty of Economy, University of Vlora, Albania

³Ph.D, Chair of Marketing Department, Director of Advanced Marketing School, Faculty of Economics and Business, University of Tirana, Albania

The use of event sponsorship has increased greatly in the recent years, and the proportion of event sponsorship in companies' marketing budgets has increased. A major contributor to this development is the increasing difficulty of differentiating from competing brands through mass-media advertising. Events offer an opportunity to focus on a smaller, but more select number of people in an appealing environment, which can bring forth positive associations to the brand and thus give it a competitive advantage.

The study made evident that event sponsorship was still a rather minor component in most companies' marketing mixes, and that it was not explicitly included in most companies' marketing strategies. The role of event sponsorship in building brand image and identity was thus a minor one.

The purpose of this study is to shed light on how companies relate their sponsorship activities with their overall brand building strategies. The increasing use of event sponsorship as a marketing medium can be said to make the study more interesting in a general sense.

The study is related to brand positioning and spans the whole event sponsorship process, from the sponsorship bid to the sponsorship evaluation.

The aim is to try to find out how companies relate event sponsorship to marketing strategy, how they communicate their brand identity at events, and how they monitor the effects of the sponsorship activities, and how these activities relate to the event lifecycle.

Keywords: Event sponsorship, brand, brand building, brand image, brand identity, brand positioning, project lifecycle.

EVENT SPONSORSHIP

Jiffer and Roos (1999) explain sponsorship as *"purchasing the right to create an association with the event"*. Sponsoring is about marketing a company and its products and services in order to sell more. With event sponsorship, a company aims to make itself visible through a popular activity and be associated with that activity. In event sponsorship a company can choose to reach either a narrow or a wide audience, depending on what they want from the promotion. (Jiffer & Roos, 1999). Event sponsorship allows organizations to reach their target market with less confusion than other communication methods. It also exposes the product directly to the market and provides an excellent mechanism for the organization to give back to the community by which it is supported. (Walker Mack, 1999) There are many advantages and disadvantages in event sponsorship. Jiffer and Roos (1999) have mentioned such advantages as the possibility to reach a large audience and combine many different media with event sponsorship. Many times possible customers can see advertisements placed on a sport stadium through television broadcastings and newspaper pictures, which increases the effectiveness of event sponsorship. Another advantage is that event sponsorship

can increase awareness of other advertising and marketing acts of the company, such as radio and television campaigns. Event sponsorship seems also less commercial than other types of advertising. Furthermore, the sponsor is seen in the context of and associated with a positive leisure time activity. Event sponsorships provide relatively unobtrusive but high-impact name exposure coupled with positive associations (Aaker, 1996). Jiffer and Roos (1999) have claimed that event sponsorship also has many disadvantages. They mention, for instance, that it is very time consuming because of the preparations,

planning, and functions during the event. To be effective and successful in the events, a considerable amount of work has to be done, objectives have to be clearly defined, and knowledge has to be gathered. Wragg (1994) suggests that before planning any form of sponsorship, one should be clear about the objectives of the sponsorship, i.e. the expectations that should be fulfilled. This is important because careful analysis might suggest that sponsorship is not necessarily the best way forward. The audience of each event must be researched, as well, to be sure of the breakdown of the people present. This should be done by demographics such as sex, age, region, social group, disposable income, and occupation. (Wragg, 1994). However, the most crucial fact is that sponsorship is a weak message carrier for unknown brands. Wragg (1994) argued that sponsorship can only succeed if the brand has a sound reputation. In other words, if the brand is not known by the public, sponsorship will only waste time and money. No one will notice an unknown brand name in an event. Competition for attention in events is hard, especially for newcomers. Moreover, in outside events the successfulness can also be dependent on the weather.

MEASUREMENT OF THE IMPACT OF EVENT SPONSORSHIP

Visibility is important, and can provide value for money. It is not easy to compare one sponsorship agreement to another. However, looking at competitors and their sponsorship programs and evaluating if they are making an impact might help making one's own decisions. This basically means taking a wide look at what other are doing in the field, what they are paying directly and indirectly for the sponsorship agreement, and what are the results. One should also judge whether what you will pay for the sponsorship and whether the cost and effort of promoting the sponsorship will provide value for money (Wragg, 1994). Tuori (1995) argues that the impact of event sponsorship should be evaluated when planning the sponsorship, during the sponsorship, and after the event:

- Before committing to sponsorship one should research how well the brand is known and what the interest groups' attitudes are towards the brand. Furthermore, it is important to know how the brand image is perceived.
- During sponsorship, it is crucial to evaluate that the company is on the right path with its communications and whether the environment gives a reason to change or adjust the direction of communications.
- After the sponsored event has ended, the company has to research the impact of the sponsorship and how well the company has reached the targets. (Tuori, 1995). Measurement of the value of event sponsorship is very hard. Presented below are ways to estimate how feasible the sponsorship agreement has been.
- Explanations will be given on how to evaluate media exposure, how to evaluate the impact on image, how to measure effects on event visitors, and how to evaluate the impact of event sponsorship to different segments.

BUILDING STRONG BRANDS

As Aaker (1996) stated, brands offer marketers a way of differentiating their products or services, which otherwise would easily copied by the competition. Branding can thus be argued to build barriers for competitors, which become harder to breach as the brand grows in power. Branding is also one of the most important tools for creating a good position on the market. A strong brand can create a high degree of loyalty and thus build a solid sales base. (Kapferer, 1997). As a result of that, a strong brand can benefit a firm by adding protection against competitive marketing actions or marketing crises, providing larger margins, and more gaining more favorable customer response. One can therefore argue that gathering knowledge and doing research on how to create a powerful brand is essential. (Aaker 1991, 1996). Kotler et al. (1999) gave examples of different tools to use for strengthening a brand and projecting its image and identity. Strong brands often show an owned word, a slogan, a color, a symbol or a collection of stories. An owned word refers to the triggering of a certain word in people's minds when presented with a brand; ideally, this word is a positive one. A slogan is a brief message that companies add to their corporate or

brand name, which is repeated in all advertising. The effect of the repetition of a slogan nearly is hypnotic and it helps the brand be more memorable. Colors, too, can be related to a certain brand; for instance, a certain shade of blue that is characteristic to Fazer chocolate has been branded, and thus legally protected, in Finland (M&M, 35/2004). Symbols are often related to brands, as are certain logotypes. Two good examples of well known symbols are Mickey Mouse's ears and the Nike swoosh. Another kind of symbol is a spokesperson, e.g. an athlete or a movie star, who promotes and endorses a brand; this can be seen as an attempt to lure consumers by connecting the brand with someone they trust and can relate to. Pepsi, for instance, has sponsored a great number of pop stars, while Nike has at some point been directly personified by Michael Jordan. Some brands and companies are associated with stories. The stories can be related e.g. to the founder and the struggle of creating the company. The story can also revolve around the founder alone, who gives the company a face. Such stories can deepen the consumer's perception of the brand and give more value for their money. It is important that the stories that are put forth are in line with the brand's and company's image, as that gives more power to the stories. A good example of a story related to a brand is that of Levi Strauss jeans, which allegedly have a past in the gold rush of the 19th in Western USA, where they were used by miners. Examples of founders of companies that have become "larger than life" could include Bill Gates of Microsoft and Richard Branson, the man behind Virgin. (Kotler et al., 1999).

Customers' needs and wants are ideally the cornerstone of all marketing in modern business procedure. The AIDA model gives insight into the thought processes of the consumer.

THE AIDA -MODEL

In order to be successful in brand building, a company must learn to understand the wants and needs of its consumers and their motivation and decision-making processes. A great number of models are usually based on concepts from psychology, which purport to show how people reach decisions. (ft.com, 2001). Advertisers view the market as an active group, purposefully seeking information from mass media, which requires considerable participation from audience members. These conditions created the AIDA model (awareness, interest, desire, action) which suggests that when considering making purchases, human thought processes go through four stages. The model states that the advertising message must first gain the audience's awareness then its interest, next its desire for the product, and finally action (purchase) will occur. (Smith and Swinyard, 1982; ft.com, 2001).

Before a customer will make a purchase decision, he or she needs to be aware that the product exists, what it is, what it does, and perhaps also where and when it is available. Next, consumers need to be stimulated to take some interest in the product. What special features does the product have? What benefits does it offer to consumers? How might it satisfy any one of a variety of needs and wants that the consumer might have? During this stage the consumer develops a reaction to the product, usually either favorable or unfavorable. (ft.com). If the response is favorable and the advertisement is successful in awakening interest, it then attempts to create a desire to purchase in the consumer's mind. It does this by successfully connecting the benefits of the product with the consumer's needs and wants. This phase of advertising has to both show consumers that there is a product available which will satisfy their needs, and show them that they can satisfy that need by purchasing the product in question. This leads to the final stage, action, where consumers actually get up, go out, actively seek the product and buy it. (ft.com).

BRAND LEADERSHIP

Aaker and Joachimsthaler (2000) have introduced a theory of "brand leadership" which proposes a model for building strong brands. They propose that brand building faces four fundamental challenges that an organization must tackle in order to thrive in the market.

The organizational challenge

The first challenge is to build an organization that supports the construction of strong brands. Brands must have solid management teams that are devoted to building them on a long-term scale, and the organization must adapt a culture that is focused on nurturing and maintaining brands. (Aaker and Joachimsthaler, 2000).

The brand architecture challenge

Brand architecture involves identifying the brands and sub-brands that are most valuable to the company and acknowledging their relationship with one another. The aim of brand architecture is to clarify customer offerings, create

A key element in brand architecture is knowing when to stretch an existing brand, when to create a new brand, when to use an endorsed brand, or when to launch a sub-brand. These decisions are instrumental when stretching to new markets; e.g. sub-brands or endorsed brands can be used for vertical stretches when seeking access to upscale or downscale markets. (Aaker and Joachimsthaler, 2000).

The brand-building program challenge

Communication and other brand-building programs are needed to realize the brand identity. In fact, brand-building programs not only implement the brand identity but also help define it. An advertising execution or a sponsorship can bring clarity and focus to a brand identity that would otherwise appear sterile and ambiguous. As previously stated by Kotler et al. (1999), a symbol or a story can help people relate to a brand, as they give something tangible to which people can feel a connection to. In Finland, for instance, Coca-Cola is forever tied to the Summer Olympics of 1952 in Helsinki, when the first cases of the soft drink arrived to the country. Coca-Cola has in a sense made itself a part of the Olympics by constantly sponsoring the event since 1928 (Athens 2004), and as such included itself in the Olympic story. (Aaker and Joachimsthaler, 2000). The key to most strong brands is brilliant execution that bursts out of the clutter, provides boost to the brand, and creates a cumulative impact over time. The difference between good and brilliant cannot be overstated. Brilliant execution requires the right communication tools. These tools are often more than just advertising – in fact, sometimes advertising plays a small role or even no role. One key is to access alternative media. The strong brands of tomorrow are going to understand and use interactive media, direct response, promotions, and other devices that provide relationship-building experiences. Another key element is to learn to manage the resulting communication program so that it is synergetic and consistent on strategy. (Aaker and Joachimsthaler, 2000). Successful management involves measurement. Without measurement, budgets become arbitrary and programs cannot be evaluated. However, measurement should encompass all aspects of the brand; relying on short-term financial indicators alone is a recipe for brand erosion rather than brand building. (Aaker and Joachimsthaler, 2000).

The brand identity and position challenge

Each actively managed brand needs a brand identity – a vision of how the brand should be perceived by its target audience. The brand identity is at the heart of the brand leadership program, because it is the vehicle that guides and inspires the brand-building program. If the brand identity is confused or ambiguous, there is little chance of brand building occurring. (Aaker and Joachimsthaler, 2000).

Brand Positioning

When the brand identity and value proposition have been specified, implementation begins. Objectives for communication need to be set, and execution planned and implemented. The starting point for all this is a brand position statement – the cornerstone of the communications program. A brand position can be defined as follows: “Brand position is the part of the brand identity and value proposition that is to be actively communicated to the target audience and that demonstrates an advantage over competing brands”. The four salient characteristics of a brand position as reflected by the phrases are “part”, “target audience”, “actively communicated”, and “demonstrates advantage”. (Aaker, 1996). One key point to consider when positioning a brand is whether it is similar or not with existing brands on the market. If differences are

apparent, the marketer has several choices. First, the brand can be positioned as a “differentiated” product. This way, the brand’s superiority to competitors in respect of the common characteristics can be stressed. (Sujan and Bettman, 1989; Dickson and Ginter, 1987). Another approach, also involving differentiation, is to create a separate submarket or niche for the new brand. This strategy strives to gain advantage from setting the brand apart from the general market and thus seeking a more individual status. (Sujan and Bettman, 1989; Srivastava et. al, 1984).

The existence of a brand position allows the brand identity and value proposition to be developed freely, with texture and depth. They need not be limited to short, concise statements, because the brand position takes that role. The brand position can be shifted according to current needs without interfering with the integrity of the brand; thus, a brand could respond to competition and trends without changing the essence of the brand. (Aaker, 1996). Positioning is thus like the image, but it is adjusted according to the target audiences needs, lifestyle and image. The best strategy of positioning in the communication process is achieved when the message is made simple and easy to understand while still kept appealing. Furthermore, positioning should make the recipient appreciate the offered image. (Kapferer, 1997).

RESEARCH QUESTIONS

The preceding discussion has led to the formulation the following questions:

Main question: “How do companies use event sponsorship to position their brands at different stages of the event sponsorship process?”

This study seeks the answers to how consumer product companies that operate in the Albanian market use the medium to their advantage.

Moreover, as event sponsorship can be seen as a process, the study will give separate focus to its different phases to bring more depth and clarity to the issue.

To underline the differences between the different brands that were studied, a research problem was added:

Research Problem 1: Which elements of brand identity can be expressed through event sponsorship?

There seemed to be differences in how brands benefited from event sponsorship at its differences. To gain understanding on this issue, scrutiny was given on which brand identity elements each brand could best portray at each stage of event sponsorship.

Design approach

From an experimental design perspective, theory is a large body of interconnected propositions about how some portion of a certain phenomenon operates. Theory underpins the development of hypotheses about relationships.

As such, hypotheses are smaller versions of theories. Experimental research is primarily a hypostudy-testing method and can thus be called a deductive method. Researchers derive a hypostudy from theory, design an experiment, and gather data to test the hypo study. There are situations when researchers will use causal design procedures to generate hypotheses in order to create new theories or extend existing theories about a phenomenon; these are referred to as inductive research.

Our study is based on both theories and hypotheses founded by other people as well material gathered by ourselves, making it a mixture of both the inductive and deductive approach. This design approach is referred to as “abductive”, which implies that the researcher tries to extend the existing theory and alternates between the empirical and theoretical level.

Research approach

The choice of the research approach will affect the outcome and character of the research. A determined approach will affect the following research process and it therefore sets the guidelines for the following research approaches.

Empirical Approach

When choosing the method of research, the researcher has two rough-cut options: quantitative or qualitative methods. The choice, however, needs not be limited to one, but a mixture of the two can be employed.

Quantitative methods, as the name implies, seek to quantify research data. The data, which is reduced to a basically numeric form, can then be processed and analyzed into statistics. The quantitative method is usually associated with conclusive research and its purpose is to measure a problem as accurately as possible.

For the purposes of our study, the quantitative method was not suitable. First of all, the information we were looking for was rather broad. Moreover, we had only established the "broad picture" of what we wanted to ask from our respondents by the time we started the interviews.

In-depth interviews

The study for this paper was made by interviewing people in expert positions, using the in-depth interviewing technique. This form of research is rather loosely structured; still, some rules apply to it.

The questions that we posed to the respondents were based on the literature we read. Although we strove to conduct the interviews in a uniform manner, they were affected by willingness of the interviewee to cooperate and the experience we had gained from previous interviews. Therefore, the length of the interviews varied from half an hour to a full hour. Moreover, although we tried to remain neutral towards the respondents' answers and not affect them in any way, the manner in which the questions were presented might have affected the answers.

Therefore, other researchers would not necessarily be presented with the same answers by the respondents.

Analytical approach

As the study was qualitative and performed by conducting in-depth interviews, the results were all in non-numeric form. After each interview, we compared notes, or conducted a debriefing analysis. Later on, we also prepared the data for analysis by looking for significant differences along with significant similarities. Gustavsson (2004) had stated that the key to conducting qualitative research by interview is to look for the same answers; if the respondents start repeating themselves, the topic has been "saturated".

Having accomplished this, we broke the interviews down to their major points and compared them with each other. Using this technique, content analysis, allowed us to group our respondents' answers to recurring themes. When analyzing the responses, we paid close attention to the intensity of the comments, the context in which they were given, their wording, their specificity, and the "big picture", i.e. the general message the respondent gave out. (Hair et al., 2003). Having grouped the answers, we were able to reflect upon them in comparison with the literature we had gathered and the research question and draw our own conclusions.

Quality improvements

To look upon quality in research in an objective manner, consideration must be taken on some key factors. The main points of inspection are sources of error, validity and reliability, criticism towards sources, and finally the ethics. (Silverman, 2001; Kinnear and Taylor, 1996).

Sources of error

Various kinds of errors may occur during the research process. Serious misinterpretation of results may result from those errors, which should thus therefore not be neglected. In the early stages of the research, it is common that problems occur in relation to perspective and setting the research problem. Unless the problem at hand is studied and interpreted in the correct fashion, the study will have no scientific value. Therefore, it is important that enough time is spent in the beginning of the project to set the right question; otherwise, the answers found will be wrong by default. To find the right questions, the researcher sometimes has to challenge the prevailing views over the topic. (Wiedersheim-Paul and Eriksson, 1991). Vested interest relates to the researcher having an interest in viewing reality in a certain manner. Improper reference occurs when the researcher applies results gained from a small sample to the whole population without paying attention to the sampling frame: the sampling frame may be poorly built up. Measurement errors may occur for many reasons, e.g. due to mistakes made by the researcher. Non-response errors occur when the respondents refuse to join the sample or are unavailable for some reason. Respondent error, in turn, occurs when the respondent fails to answer a question correctly, willingly or unwillingly. Unclear questions either in a questionnaire or in an interview can affect the outcome negatively; the interviewer can also affect the outcome by leading the respondent to certain answers. (Wiedersheim-Paul and Eriksson, 2001). Errors in analysis and processing can take place when processing the raw data. Finally, when presenting the findings, the effect of the presentation may be affected by many factors. Unclear disposition of the findings can make the results hard to understand, while selective presentation can distort the message given out by the findings. The effect of the presentation can also be diluted by poor command of language or terminology that is too technical, laden with industry jargon, or colloquial. Finally, a poor layout can diminish the value of the report by making it look unprofessional. (Wiedersheim-Paul and Eriksson, 2001). We are aware of the problems related to the aforementioned sources of error. However, we have tried to minimize their effect, especially by focusing on the correct formulation of the research question. The largest sources of error are arguably related to the sampling, as we draw from a small study population even a smaller sample. The generalizability of our results is hence questionable; however, we seek to increase the relevancy of the study by applying it to a strictly limited population. Furthermore, we feel that being aware of the sources of error makes one less vulnerable to them.

VALIDITY AND RELIABILITY

The terms validity and reliability are used to measure the quality of research. The resources available to the researchers affect the quality of study greatly; moreover, the research methods used must be valid and reliable to gain results of scientific value. Validity and reliability are sometimes ambiguous in the sense that they overlap each other; this may cause some confusion as to their meaning. (Kinnear and Taylor, 1996).

Validity

Validity measures the suitability of the research methods to the purpose. It refers basically to whether the researcher knows what he or she is doing; are the right tools of measurement used for the right purposes? Wiedersheim-Paul and Eriksson (1991) divided validity into two categories: internal and external validation. Internal validity refers to the conformity of the models used in the research and their measurable definitions. Internal validity can thus be judged without gathering empirical data. This we tried to achieve by presenting only literature and models that were used in the analysis. External validity refers to the extent to which specific research results could be generalized to other research situations. This, we think, is harder to measure, but we tried to perform well in this respect too, by interviewing experts in event sponsorship and people who have direct responsibility over the use of it. External validity does not correlate directly to internal validity. (Wiedersheim-Paul and Eriksson, 1991). Kinnear and Taylor (1996) added that high validity can also be achieved through avoiding systematic or random errors.

Reliability

Reliability refers to the stability and consistency of results derived from research, i.e. would the results be the same if another researcher performed the same study, or if the study were conducted at a later date or with a different sample? Reliability is essentially concerned with the consistency, accuracy, and

predictability of the research findings. (Wiedersheim-Paul and Eriksson, 1991). We tried to achieve the best reliability by consistently asking the questions from all respondents and keeping the interview settings as similar as possible. However, we cannot be certain that all respondents answered truthfully to our questions, or spoke their whole minds. To minimize the risk of such, we used probing questions to follow up on the respondents' answers and gain "deeper" responses. Had the interviews been conducted by other people, the results might have been slightly different. Moreover, in no way are we able to be sure that the interviews were not biased on our part. However, as there were two of us present at each interview, we were able to make a synstudy of our personal interpretations of the interviews, or a debriefing analysis (Hair et al., 2003), which made them more reliable than if we had conducted them alone.

How is event sponsorship used to position brands?

As we expected, the main motivator for investing in event sponsorship was to gain access to the correct consumer segment and incorporate the goodwill created by the event into the brand image. As consumers may have emotional ties to events, sponsoring the right events can give an advantage that could not be gained through other media. Moreover, event sponsorship was stated to offer an opportunity to exhibit products in an appealing environment. The main drivers for success in event sponsorship were stated to be selecting the right type of event and working with the "right" partners. One can argue that the target group to which the event appeals is always the main factor when selecting the event, but beyond that, the type of event and the partners are the most important. Working with different events and partners can give a different image of the brand, and in essence exhibit different elements of the brand identity, but the connection needs to be clear enough for the consumers to see. If not, the investment in event sponsorship can turn worthless. At the time of the event, the most value was seen to be gained from the event personnel, the increased visibility of the brand and the opportunity to bring products to the consumer in a positive environment. The event personnel was seen to give a face to the brand and reflect the brand personality with their own personality. Using event personnel that is motivated and has high expertise was seen as key point in achieving good results from the investment in sponsorship, as they can improve the perceived quality of the brand. Moreover, expert personnel can exhibit the products' different uses and functions to their full extent, thus enhancing the quality of brand experiences given to consumers. The visibility can be increased on spot at the event grounds and through media exposure. Visibility in non-commercial media was seen as beneficial for the brand, because consumers tend to find non-commercial sources more reliable. Hence, the value of advertorials was seen to be much higher than commercials of equal size or duration.

CONCLUSIONS

The study began with a general interest in sponsorship and brand building. Although the research question was influenced by literature around the subject, it also set a focus on the literature that would further be needed for the study. An abductive approach was chosen, as we felt a need to mix existing theories and our own research. Furthermore, the research approach came out as conclusive, as the necessary theories were rather clear to us. The choice of the qualitative research method was also clear to us, as it provided a chance to gather richly detailed data. Moreover, we feel that a quantitative study would have required a preliminary round of interviews to build a good questionnaire. Interviews were conducted using the in-depth interview technique as proposed by Kinnear and Taylor (1996) and Hair et al. (2003), among others. Debriefing analysis was conducted after each interview, as Hair et al. (2003) have suggested. Interviews were conducted until a point of "saturation" was reached, as Gustavsson (2004) had advised. Analysis of the interviews was then done by content analysis (Hair et al, 2003), and further on by judging the results by the theoretical framework and the research question. We are aware that along the course of the study, there were numerous opportunities for sources of error. However, we feel that being aware of those sources reduces the risks set by them. As companies' investments in event sponsorship continue to grow, the need for further research increases, as well. Our study covered a small number companies and can thus only be considered a snapshot of how consumer product companies use event sponsorship to gain an advantage over the competition. Still, our study shows that the benefits sought from event sponsorship are much in line with what literature states. Out of our sample, the group that seemed to gain the most apparent benefit from

event sponsorship was the **food and drink brands**. The main reason for this is that they are able to produce **high-quality brand experiences** for a great number of event visitors, as they can hand out product samples very quickly and still exhibit brand personality through their event personnel. Moreover, the food products can easily be given out in such a way that they must be imbibed on location, whereas e.g. cosmetics samples are rarely used on location. Cosmetics brands can arguably produce more memorable brand experiences on location by offering the services of e.g. professional make-up artists or hair stylists, but as these services take much more time than giving out food samples, the benefit gained by food brands can be argued to be greater. The most apparent flaw in our respondents' use of event sponsorship, as we noted, was the lack of proper measurement of effects. As large-scale event sponsorship can involve huge investments, the benefits gained through it should be very clear and apparent.

RECOMMENDATIONS

Based on our findings, we would have to recommend that food brands focus heavily on event sponsorship as a form of marketing communication. The apparent ease of producing brand experiences coupled with the opportunity to prove the product's taste advantage offers food brand marketers great opportunities to diversify their marketing mix and bring their brand closer to consumers. However, we think that event sponsorship is a suitable marketing channel for most consumer products and other types of products as well, as it offers the possibility of giving a "face" to the brand and positioning the brand as a one that is interested enough about the consumers to meet them face-to-face.

THE IMPACT OF MASS MEDIA ON ESTABLISHMENT OF DESTINATION IMAGE IN GLOBAL RECESSION CONDITIONS: THE CASE OF BALCAN THEATRE FESTIVAL

Elmazi-Billa, Liljana¹; Gega, Elsa²

¹*Ph.D, Head of Marketing and Tourism Department, Director of Advanced Marketing post graduate School, Faculty of Economics, University of Tirana, Albania*

²*Ph.D Student, Faculty of Economy, University of Elbasan, Albania*

The media has become a major tool of awareness and it has brought the wonders of the world and the excitement of various natural environments to millions of people.

The aim of our paper is to investigate the effects of the products of mass media on tourism through locations induced by movies and commercial advertisements. More specially this study examined the relationships between the perceptions of movies or television- induced affective response; the perceptions of movies or television- induced attributes and movies or television – induced destination images on tourism.

Self- administrative questionnaires developed to achieve the purpose of this research were disseminated and collected during Balcan Theatre Festival held in Albania. Descriptive analysis were employed to overview the general outcomes of results.

The our hypothesis were as following:

H1: *recognition of television induced affective response shall have some meaningful relations with images of the sightseeing place.*

H2: *recognition of television induced attributes shall have some meaningful relations with the images of the sightseeing place.*

18 attributes from the emotional stimulus and the adjectives of the emotional reactions were selected that can be effectively applicable to this study and presented 18 various images and measured the relevant data by Likert Scale of 5 points.

The empirical analysis indicate that movie or television induced affective response factors such as refreshment romanticism freshness have a positive impact on the destination image factors such as uniqueness and cleanliness. This relevance suggests that tourists who have perceived the feeling of joy or excitement at the movies or television movies will have a tendency to be more exciting fanatastic about the filming destinations.

This paper has demonstrated that movie or television movies location attracts visitors. The main implication is the media could renew the image of filming destination through the attributes of the media perception. And it also attracts a great number of visitors to screened locations and make them more satisfied with their personal experience. Thus television related travel package should be a good marketing tool for the filming destinations.

INTRODUCTION

Regarding the people' choice of movies, past experience of individual would be considered to be the basis of their choices. Consumption of movies depends upon private experiential judgment of consumers differently from the television and internet. Considering the previous study on the perception of movies or television- induced images, Neelamegham and Jain (1999) said that goods that cannot be recognised without practical experience like movies shall be chosen by the basis of expectation and that the expectation of the goods shall have much influence on the choice of the goods. The expectations that they have presented can be classified into three categories:

At the first the expectation for core attributes (story, performance, and casting) , second the expectation for neighboring attributes (set, costumes and background music) , third the expectation for emotional attributes. Especially, they have shown that the expectation for emotional stimulus can magnificently influence on the choice of movies and the information parts of advertisement, comments and oral spread also can influence on the choice.

Images

An image can be expressed in intrinsic concepts through the relevant objects and the expression can be differently treated, which is caused by the language that are visible in the expression. These are the

aggregates of signal customs understandable by the audiences. the signals can be applied to the various media that produce the meaning of movies, the signifying practices. That is emotional perception will be the practical experience that can be obtained through the movies that the main contents that can be passed through the purchase of the movies.

Destination images

Images of tourism destinations have been rooted as very important marketing concept and various studies of the images of sightseeing places have been performed so far. Kotler (1993) said that marketers of a tour place should promote the image of a sightseeing place in the largest scale within the possible limit and they should strengthen the relevant images with the possible changes. There are some benefits that can be obtained by attraction of tourists through movies. First of all movies can advertise the photographed sites for much longer than common advertisements and the identity of the places can be secured through the development of the plot with strengthening of the photographing images by using of special effect and stars and complete camera technical dimensions.

Methodology of our study

Self-administrative questionnaires developed to achieve the purpose of this research were disseminated and collected during the event of the Balcan Theatre Festival held in Albania. Total of 600 questionnaires were collected, however 550 questionnaires of them were used for this study because some of them were insincere responses. Descriptive analysis were employed to overview the general outcomes of results.

Our hypothesis are:

H1: *recognition of television induced affective response shall have some meaningful relations with images of the sightseeing place.*

H2: *recognition of television induced attributes shall have some meaningful relations with the images of the sightseeing place.*

18 attributes from the emotional stimulus and the adjectives of the emotional reactions were selected that can be effectively applicable to this study and presented 18 various images and measured the relevant data by Likert Scale of 5 points.

STUDY FINDINGS

The table 1 provides a demographic profile of the survey participants. Of the total respondents, 65 % were female and 35 % male. The majority of the respondents (75%) were 20-29 years of age groups. The visitor survey found that over half of respondents were from Albania which tells us that residents have shown more interests for this event.

<i>Gender</i>	<i>Female</i> <i>Male</i>	65% 35%
<i>Age</i>	<i>Under 19 years</i> <i>20-29</i> <i>30-39</i> <i>40-49</i> <i>Over 50 years</i>	2% 75% 15% 5% 3%

<i>FACTOR 2 UNIQUENESS</i> <i>Unique</i> <i>New</i> <i>Unusal</i> <i>Fantastic</i> <i>Interesting</i> <i>FACTOR 3 CLEANLINESS</i> <i>Pure</i> <i>Clean</i> <i>Pretty</i>	<i>0.82</i> <i>0.74</i> <i>0.74</i> <i>0.66</i> <i>0.64</i> <i>0.884</i> <i>0.87</i> <i>0.70</i>	<i>0.82</i> <i>0.86</i>
<i>FACTOR 4 TRADITION</i> <i>Traditional</i> <i>Antique</i> <i>Affectionate</i>	<i>0.88</i> <i>0.77</i> <i>0.45</i>	<i>0.66</i>

Table 4. Factor analysis of destination images. A cummulative totalvariance percentage ewplained 67.0 %.

Canonical analysis was employed to examine the relationship between the recognition of movie or television induced affective response and images of the destination which was seen at the movies. The findings show that movie or TV induced affective response factors such as REFRESHMENT (0.590); ROMANTIISM(0.67); FRESHNESS (0.40); have a relatively significant impact on th destination image factors such as UNIQUENESS (0.74) and CLEANLINESS

(0.60)

CONCUSIONS AND RECOMMENDATIONS

The media have become a major vehicle of awareness and they have brought the wonders of the world and excitement ov various remote natural environments to millions of people.

The empirical analysis indicate that movie or television induced affective response factors such as refreshment romanticism freshness have a positive impact on the destination image factors such as uniqueness and cleanliness. This relevance suggests that tourists who have perceived the feeling of joy or excitment at the movies or television movies will have a tendency to be more exciting fanatastic about the filming destinations.

This paper has demonstrated that movies or TV location attracts visitors. the main implications in the media could renew the image of the filming destinations through the attributess of the media perception. Movie or television related travel package should be a good marketing tool for the filming destinations.

DOES MARKETING RESEARCH REALLY “HAVE A SEAT AT THE MARKETING STRATEGY TABLE”? AN EXPLORATORY RESEARCH

Er, Iclem¹; Odabasi, Yavuz²

Purpose – One of the major functions of marketing research is to provide relevant and necessary information to marketing decision making process. In other words, marketing research should bring the “voice of the customer” to the strategic marketing decision making “table”. In addition, marketing research provide information to managers to be used in specific marketing actions as well as in a general manner that would allow them to understand their customers and environment in a better way for future strategic planning. However, it is a significant question whether marketing research really has a critical position in strategic marketing decision making in most of the firms, particularly in Turkey. Thus, the purpose of this study is to explore marketing research’s position in marketing decision making process in Turkish firms.

Design/methodology/approach – An exploratory in-depth interview method was used. Five professional marketing researchers and four marketing research/consumer insight managers were interviewed in Istanbul. Through in-depth interviews with the participants, marketing research’s position in strategic marketing decision making was discussed. Based on the analysis of these in-depth interviews, the role of marketing research in marketing decision making and its changing position are explored.

Findings – Marketing research surely has an important role in marketing decision making. As bringing the “voice of the market” to strategic marketing decision making process gets more and more important, marketing research managers in firms evolve to consumer insight managers. Marketing research’s role in strategic decision making is essential in especially multinational firms. That is, any marketing related decision or innovation decision needs to be based on marketing research findings. Furthermore, findings of any marketing research project could be used in scenario development for future strategic directions and for a general enlightenment in firms’ management.

Research limitations/implications – Because of its exploratory nature, this research should be considered to be a starting-point for further research. Marketing research’s actual role in determining firms’ strategic options and the extent to which the findings of marketing research projects are used for specific marketing actions should be investigated in further research, possibly through some kind of quantitative research.

Originality/value – In marketing literature, basic assumptions about marketing research show that research should be used in the marketing decision making process, and the more the marketing research inputs the more healthier would be the decision making process. However, it poses a significant question whether these assumptions about marketing research holds in reality, especially in Turkey. This study explores the validity of these assumptions and discusses the changing role of marketing research function in firms.

Keywords: Marketing Research, Consumer Insight, Strategic Marketing Decision Making

INTRODUCTION

The American Marketing Association approved the definition of marketing research in 2004:

“Marketing research is the function that links the consumer, customer, and public to the marketer through information--information used to identify and define marketing opportunities and problems; generate, refine, and evaluate marketing actions; monitor marketing performance; and improve understanding of marketing as a process. Marketing research specifies the information required to address these issues, designs the method for collecting information, manages and implements the data collection process, analyzes the results, and communicates the findings and their implications.” (AMA, 2004)

This definition positions marketing research as a fundamental business function, since the objectives mentioned in the definition are core business concerns, crucial to the success of the business and requiring management support. The definition also shows that one of the major functions of marketing research is to provide necessary information to marketing decision making process by linking the customer to the marketer through information. In other words, marketing research brings the *“voice of the customer”* to the strategic marketing decision making *“table”*. Furthermore, marketing research provide information to managers that could be used in specific marketing actions in a way that allows them to understand customers and the environment to shape future strategic planning.

However, according to Honomichl (2007), the world’s 25 largest commercial marketing/advertising/public opinion research conglomerates had revenue of \$15.5 billion in 2006, up 5.1% over 2005. The Top 25 as a group had a total revenue that is quite below in the rankings of Fortune 500 list of global firms. In Turkey the situation is more dramatic in terms of revenue of the marketing/public opinion research firms. ESOMAR’s 2008 Industry Study shows that the annual revenue of 22 participating marketing research agencies in Turkey is \$161 million in 2008 with a 16% growth rate compared to 2007 (ESOMAR, 2009).

Despite its vital importance for the success of organizations, the figures above depicts that marketing research might be underutilized in organizations. Malhotra *et al.*, (2006) think that the reason for this underutilization might be that researchers are not frequently involved in decision making process by managers. Dubof and Spaeth (2000) believe that marketing research *“can and should contribute to setting strategy for businesses, however marketing researchers or the whole industry have been rarely invited to the table of decision making where they should earn their place”* (p. v).

Huppertz (2003) claims that we are living in a world where an organization's success increasingly depends on the quality of information and analysis, and thus marketing research as a function is crucial for decision making and strategy formulation processes. On the other hand, marketing research has still does not really have its place at the decision making table to *“give voice to the data”*. Accordingly, the significant question whether marketing research really has an essential position in strategic marketing decision making in most of the firms, especially in Turkey still remain not answered. Thus, the purpose of this study is to explore marketing research’s position in marketing decision making process in Turkish firms.

THEORETICAL BACKGROUND

Managers today should make decisions in highly complex, intensely competitive and dynamic environments. This situation makes decision making process more complicated and at the same time more important compared to the past. Under these circumstances, marketing managers frequently make decisions about problems or opportunities based upon imperfect and sometimes inaccurate information. At the worst scenario, this may result in severe consequences for their firms or a big failure. At best, this can cause making less favorable decisions, and placing the firm in a less competitive or a less successful position than it would otherwise be. Samli (1996) asserts that in the era of information society neither the firms nor the world itself have not been the same, and knowing all decisions are based on some form of information, decision makers now have a better chance of making more efficient decisions. Deshpandé (2001, p. 1) notes that knowledge is the lifeblood of any organization and commonsense, experience and intuition-based

knowledge has an impact on all business decisions. Scientific research will continue to play a crucial role in affecting management's assumptions and subsequent actions. In this regard, knowledge about customers, competitors and markets coming from marketing research is most critical for marketing management.

Marketing research, of course, does not replace management experience or management skills in making decisions, but it reinforces marketing decision makers' performance by questioning commonsense and traditional marketing assumptions. In other words, marketing research provides marketing decision makers new perspectives in marketing management. Malhotra and Peterson (2001) argue that marketing research in the new millennium has becoming more crucial for firms, which are already operating in an intense competitive environment. The authors note two major reasons for increasing importance of marketing research. First, due to the development of digital and telecommunication technologies and the diffusion of related tools, the speed of business world has changed dramatically. These developments make it possible for firms to be more responsive to markets, customers and competitors through innovations, flexible systems and new channel operations. Accordingly, marketing's role in firms gained importance, since the cost of misinterpreting the trends and changes in the markets becomes more exorbitant than ever. Being one of the most important interpreter of changes in the markets marketing research's role became even more crucial in terms of bringing "*the voice of the market*" to management (Barabba and Zaltman, 1991). The second reason Malhotra and Peterson (2001) put for increasing importance of marketing research is the globalization of business operations with the end of Cold War. With more open markets, multinational firms moved into newly developing markets, and making competition more global and changing the rules of the business in almost every part of the world. Marketing research once more started to play its crucial role by providing the necessary international marketing information to the multinational firms that penetrate developing and newly developed world markets.

Blakenship *et al.* (1998) characterize the traditional roles of marketing research as measuring the potential of new products, solving marketing problems, providing inputs sometimes for marketing planning and occasionally showing the outcomes of the flawed decisions. In other words, most of what marketing research is supposed to look backward performance or present time performance. It is as a part of marketing function seldom asked to look into the future and work in the same team with other functions to plan for the future, to provide efficient inputs for really important business and marketing decisions (Blakenship *et al.*, 1998).

What Dubof and Spaeth (2000) assert about the role of marketing research in firms support this status of it. According to Dubof and Spaeth (2000), most of the marketing strategies of actual firms depend on traditional assumptions about "*the outside world of*" markets, customers and competitors, and when it is time prepare the corporate strategy for the future marketing research is rarely "*at the table for the discussions*". The authors claim that

"... marketing research (should) not be used only as a lamppost to support already agreed-upon business arguments instead of as a beacon to define future direction..." (Dubof and Spaeth, 2000, p.3)

Dubof and Spaeth (2000) point out an important reality that there are even some managers who do not use marketing research in order to understand their markets, customers, competitors and their shareholders. This reality was tried to be understood with a series of research studies beginning from 1980's. At the end of 1970's use of marketing research had been identified as an particularly important issue to be investigated formally which was also supported by AMA and Marketing Research Institute. Upon these discussions,

Deshpandé (1982), Deshpandé and Zaltman (1982, 1984, 1987 and 2001) initiated to explore the issue of marketing research use with a series of researches on the topic. Their main findings in these research studies could be summarized as follows:

- Managers and researchers clearly have a different perspective on the objectives and value of the marketing research efforts. Understanding the other's point of view would probably lead to greater use of the marketing research.
- Managers do not like surprises. So researchers who prefer to undertake a more exploratory style of research should be careful about its possible effect on managers. The manager's "*comfort zone*" for results of exploratory research should be discussed up front.

- Sheer quality of a research report is usually not enough. If the results are going to make a positive impact, the manager and researcher should be developing relationship throughout the project.
- Trust between the parties is a key factor affecting the use of marketing research, and the perception of that trust will have a great effect on how the report's quality is ultimately read.
- If a product is already at a mature stage of its life cycle, or especially if it is in decline, managers should be open to more exploratory kinds of research.

Again during 1980's Krum *et al.* (1987-1988) analyzed how researchers and users of research in Fortune 500 manufacturing firms perceive the importance of marketing research at each stage of marketing research process. They explored many aspects of the research process and the degree of similarity between the researcher and the research user. According to this study some significant areas of conflict occur in the perception of the role of marketing research. The first key area of conflict is in the area of whether the researcher should be involved in marketing strategy development for the firm. The results of the study could be interpreted in such a way that the researchers should be involved in strategic planning and implementation only to the extent that they provide information as to what the research objectives should be and what kind of data should be gathered. This perception somehow accepts the involvement of the research in the strategy process in restricted form. The second disagreement occurs in the area of whether researchers should restrict their activities and offer advice when asked. Research users are more keen on this alternative that they would like to see the researchers in a more limited role. Whether the researchers should be able to translate marketing research findings into courses of action for management to follow is the third important area of conflict. While the researchers agreed on this task of researchers in the firm, research users were believing at that time it is research users' responsibility to develop the courses of action from the research findings (Krum *et al.*, 1987-1988).

However, authors like Huppertz (2003) points out that at the 2002 Annual Marketing Research Conference of AMA, industry leaders suggested that researchers have been too wrapped up in executing the requests they receive from their brand marketing colleagues – in other words, taking and filling orders which is quite a upsetting stance. In addition, as stated by Huppertz (2003), industry leaders called on researchers to “*move beyond the task of simply crunching numbers and churning out results; they need to understand the underlying business issues at stake and adjust the information they gather and how they analyze it.*” They encouraged researchers to build stronger relationships with other disciplines and departments of their companies to demonstrate day-to-day value. Marketing researchers should follow these suggestions to gain wider respect within their organizations.

Similarly Malhotra *et al.* (2006) indicate that presenting only data as findings of the research will overwhelm managers with detail, which would only reinforce the negative perception that the researcher wants to gratuitously add complexity to the issues facing the firm. Instead, marketing researchers should desire to provide high-impact research and strive to synthesize or grasp larger meanings emerging from their analyses. The implication here is that the researcher needs to understand the current context for decision makers.

Everett (1997) thinks that marketing researchers should reinforce their role in the marketing decision-making process through establishing an important link between customer knowledge and business strategy. In today's turbulent business environment, firms should continuously tune their marketing strategies to keep abreast of increasingly sophisticated customers and products. To do that, strategists need a continuous flow of relevant customer intelligence. In this regard, research's role has always been to speak for the customer and customer understanding needs to be integrated into a strategic context (Everett, 1997).

In summary, marketing research surely has an important role in marketing decision making. Since bringing the “voice of the market” to strategic marketing decision making is becoming more crucial than the past, it is possible to say that marketing managers would appreciate the significance of marketing research more in the near future.

METHOD

Purpose of the Study

The purpose of this study was to explore the position of marketing research in a general manner and its role in marketing decision making process in Turkey. In other words, it is really an important question whether the basic assumptions about role of marketing research in marketing decision making process hold or not in Turkey. We also aim to explore whether there is a change in role of marketing research function in Turkish firms. Accordingly, we decided to start with two basic questions:

1. What is the position/perception and use of marketing research in Turkey in a general manner? Are there any differences in the perception or practices of marketing research in Turkey compared to developed countries in terms of marketing research use?
2. Does marketing research have an effective role in strategic marketing decision making process in Turkey? Are there any significant differences between marketing research users (client firms) according to origin or industry, etc?

Data Collection

Since our research follows an exploratory approach, we decided to conduct a qualitative research with in-depth interviews that would provide the best technique to uncover the issues addressed here. Marshall and Rossman (1999) suggest that in-depth interviews enable participants to tell the researchers what is important to them in their own words, not in terms of some predefined responses, or not just in terms of what is expected to be important by the researchers.

Five commercial marketing researchers and four marketing research/consumer insight managers were interviewed in Istanbul in March 2009. The interviews lasted from one hour to two hours in length, and were audio taped during the interview. We followed the accepted interview procedure of working from general to specific questions during the interviews. We prepared a semi-structured flow of questions to be asked during interviews, which starts with some general questions on the issue and continues with other questions that probes the general issues deeper. After conducting the interviews, we transcribed the audio tapings, and then analyzed the data systematically.

Sample

Because of the exploratory nature of our research, our primary goal was to investigate the position of marketing research in Turkey through the eyes of professionals of the field. To serve this goal, we interviewed marketing research professionals, either working as a marketing research executive/manager in a firm or working as researcher/research executive in commercial marketing research firms. Thus, we chose the participants according to *Maximum Variation Sampling* strategy to ensure variation among respondents. As Patton (2002) states this strategy of purposeful sampling aims at capturing and describing the central themes that cut across a great deal of variation (Patton, 2002, p. 235).

For maximizing the variation in the sample, we tried to include marketing research managers both from multinational and national firms, and researchers from commercial marketing research firms. In choosing the researchers from commercial marketing research firms, we decided to go to the largest marketing research firms in Turkey with the assumption that they would have much more information about the industry as a whole and the client firms' perceptions. Participant characteristics are summarized in Table 1.

<i>Participant</i>	<i>Gender</i>	<i>Age</i>	<i>Marketing Research Related Experience</i>	<i>Profession</i>
--------------------	---------------	------------	--	-------------------

Arzu	F	39	15	Freelance marketing researcher, former marketing research manager of a multinational firm
Burcu	F	38	14	Associate director of a multinational marketing research firm
Hasan	M	45	20	International branch director of a multinational marketing research firm
Dilara	F	36	13	Marketing research executive of a domestic firm
Hande	F	40	20	Managing director of a multinational marketing research firm
Ceyda	F	35	12	Marketing research manager of a multinational firm
Ahmet	M	49	24	CEO of a multinational marketing research firm
Oya	F	32	10	Marketing research manager of a domestic firm
Irem	F	39	15	Consumer insight manager of a multinational firm

Table 1. Participants' Characteristics

Findings

Increasing globalization, stronger competition worldwide and the mergers of large marketing research groups affect the position and use of marketing research in Turkey, like any other country in the world. Another important determinant that improves position and use of marketing research is the changing consumers and customers in the last two decades. Consumers and customers, who are equipped with more information and provided with more opportunities than ever, seem to be more alert and conscious compared to the past. In this regard, they force firms to know more about them and understand them better. As a result, marketing research's role stiffens in the world as well as in Turkey.

"Competition is now stronger, more intense, not competition but Competition with capital C. Firms do not just compete with firms in the same industry, competition is now supra-industrial... At any point you touch the consumer, you need to benchmark yourself with best practices in all industries... Thus, marketing research is gaining more importance since it is the tool that measures performance through the eyes of consumers and that brings what customers think to the firm..." (Hasan)

The position and use of marketing research

Despite its strengthened position in the world, the situation in Turkey is somehow different than the developed countries mostly due to relatively short history of the industry. According to Hande;

"We live stone age and space age at the same time in terms of marketing research use here...(Hande)"

However, marketing research is a dynamic industry growing rapidly in Turkey, except the times of financial downturns, and its rules are changing with globalization.

"The position of marketing research is changing rapidly, like everything else in the business world..." (Ahmet)

Though the importance of marketing research has been approved by large manufacturing and services firms, there are some doubts about its benefits versus its costs as expressed like;

"I haven't heard anyone saying 'research is useless'. Everyone is very well aware of the fact (its benefits). 'Marketing research is an important input of the marketing management process' is a connotation that everyone approves but some people could not even decide whether research is a spending or an investment and they could not predict the return of marketing research..." (Hande)

Interviews showed that all participants pointed out the very significant distinction between multinational firms and domestic firms in terms of marketing research's position and use. Ahmet asserted three categories of firms according to marketing research use;

“One of the categories is institutionalized multinational firms. They have standard procedures for marketing research. It moved beyond the preferences of managers. For example, when they are developing a new product they have to do this, this and this kinds of research and make this as an intrinsic process... Marketing research departments in these firms are now started to be called as ‘Consumer Insight Groups’ or ‘Consumer Knowledge Departments’. Conducting research in these firms became a standard protocol long time ago and it is step that must be taken before relevant decisions made. Managers of these kind of firms do not have the chance to say ‘I like this ad, let’s air it’. Any decision of this kind is taken after the standardized researches are conducted..... The second category consists of domestic firms which are more institutionalized. They are established firms and get in marketing research like multinational firms, but not at the same degree yet. They are more like ‘in middle of the road’. I mean, they already established marketing research departments, but trying to are establish them ad consumer insight departments like the multinationals. But, since they are in the middle of the road and could not standardized marketing research procedures as an input in decision making process, manager preferences or manager decisions still plays a more important role. Large but less institutionalized domestic firms fall into the third category. These firms experienced a rapid growth but mostly due to their entrepreneurial nature and they are at the beginning of the road. Occasionally they might conduct one or a few researches one year, but the next year no one knows. They usually do not have a marketing research department in house, a marketing manager or one of the marketing managers is held responsible for marketing research...” (Ahmet)

Hasan suggested a similar categorization of firms in terms of marketing research’s position and use, but detailed it with two more categories and being more optimistic about the large domestic firms;

One position for marketing research is to exactly what the research findings discovered. For example, developing a product just as the research results show. This is a rare case, since here you put all the risk on research. Besides not every research project tells you what to do exactly by nature. The second position for marketing research is being considered as a supportive tool for decision making. We are talking about making decision depending on research results, which I myself highly recommend. Research is a product that is effective decision making, but not the thing that makes the decision. Large firms which incorporated a thorough marketing research culture – what I meant here by large firms is the large multinationals plus large domestic firms – lies in this category. They do not conduct research occasionally. They have marketing research programs, they assign a budget for research at the beginning of the year, and they use their research budget properly. Some of the domestic firms in this category even conduct research in foreign markets. The position or the third kind of usage comes out of curiosity. They are the ‘oh, let’s see what has happened’ type of firms. They are quite far from implementing research results with commitment. Their only motivation in conducting research is to satisfy their curiosity. The fourth position or use for marketing research is the misuse of it. Some firms or managers use marketing research only when the results of the research support their decisions, otherwise they don’t use research. They sometimes might be large domestic firms that are far away from any kind of research notion, or sometimes middle scaled firms, but in short we can say that these are firms that do not yet institutionalized. The fifth position is to use no research in any decision which another fact in Turkey...” (Hasan)

Other participants also have similar views on the position or use of marketing research in Turkey:

“ For example, beyond the existing facts, people in the world are trying to predict the future (of the markets). On the other hand, here there people saying as shallow as ‘I aired an advertisement, is it heard, is it known?’ or ‘I am going to develop an ad but there is no need for research’... ” (Hande)

“We do not make decisions without marketing research in our company. Every gut feeling must be tested with an appropriate research. We have a very important and strong brand. No one can dare to harm it just upon gut feeling. Everything must be checked first, ‘what would the consumers think’, ‘would this ad reinforce or harm our brand image’, etc... We have strict guidelines about which research should be done at each stage of the decision making process. Other than this, we conduct long term researches to see what could be the future trends among our consumers or customers... Marketing research is strategically used in every aspect of decision making in our company...” (Ceyda)

“When I was working in Company X (large and established multinational FMCG firm), everything, every decision about every step of, for example, new product development went through a marketing research process. We had an innovation funnel where any idea went into, then tested by stepwise marketing research projects till the end of the funnel... Multinationals are really different. There are written procedures showing what research to do in the next step, which all the marketing managers follow strictly... Now I am serving to domestic firms mostly in FMCG industry. They are conceiving the notion of marketing research better every day, but they are still not at the same grade with multinationals. Some of them take marketing research seriously but I had to work on them. I had to teach them how to do research, how take action on research...” (Arzu)

“So much has changed since I began working in this company. We are, as you know, a large domestic firm, and we are different than the multinationals. We are, for example, still a family firm, but we are improving rapidly in terms of using marketing research in our decisions. The best indicator of this is the significantly increasing research budget from year to year... We are using marketing research results in our critical decisions, like developing new product lines, which could otherwise be very much costly for the firm...” (Oya)

“Multinationals are of course different, especially the ones in FMCG industry. I myself mostly work with business-to-business firms which have totally different concerns and different competition rules. They are much more hungry for bits and pieces of information. They use research results but not as much as the multinationals or FMCG firms, and they do not have standardized research use principles yet, so they might not use all the research result in their decisions...” (Burcu)

“We are strictly using marketing research results in our company for making decisions. We have solid guidelines showing us what to do at every stage of marketing decisions. It is something like a corporate culture...” (Irem)

Marketing research’s role in strategic decision making

Our study showed that marketing research has an important role in strategic decision making is at multinational firms. Some of the domestic firms are in the same direction with the multinationals, but most of them still following from behind or even not on the same road. As mentioned by Ahmet, Ceyda, Hasan and Oya, multinational firms strict guidelines for using marketing research in their strategic decision making processes, and also in their daily tactical decisions too.

“No one can say that ‘I will invest on this without checking it with a research’... If you are to change, let’s say, something about the packaging you need to first test it with consumers, you need to learn what they would think, and then you can do it. You do not have the chance to do any changes in any part of the product just by feeling... We have forecast meetings at the end of the year where all functions, like even finance are invited. They come to the meetings, listen to the forecasts for the future and then they prepare their projections accordingly...” (Ceyda)

“Any innovation idea should be tested through pre-determined marketing research projects before any kind of implimatation...” (Irem)

However, domestic firms present a more fragmented picture about the role of marketing research in strategic decision making. On the one hand, there are quite a large number of domestic firms which do not even conduct marketing research;

“Construction industry is one of the locomotive industries for the past several years in Turkey. But do any of the large construction and real estate firms conduct marketing research? Do you know any? I don’t know. If any one of them had conducted I would have known... Marketing research, as supportive function, does not at the place compared to where it should be...” (Ahmet)

“We are much better than the past in marketing research use. But we are a domestic firm and not the leading company in terms of the marketing research’s role. On the other hand, depending on the competition we started to use more and more research in our decisions, I other words, marketing research is becoming more important year by year...” (Dilara)

“Some of the domestic firms, which are not small in number, are conducting research occasionally only of curiosity, or even sometimes in a feeling like ‘Oh company A did it, then I should do it as well’... We need to go a long way to explain them the real importance of marketing research...” (Hasan)

Mostly it is hard for researchers to know whether their research results are used in decision making, especially for the ones working at commercial marketing research firms. They deliver their research reports, they discuss on the research results, sometimes come to a mutual understanding about the actions to be taken upon research results. But then they do not have the chance most of the time to track whether the formerly agreed-upon actions have taken or not, or they do not hear any feedback about results or use of the marketing research project.

“After finishing the project we usually hear nothing about the research from client. They do not give us any feedback on project basis, but only with performance measurement tests we conduct with our clients at the end of the year... On the other hand, if you have long and sincere relationship with the client sometimes in between the lines you hear something but nothing formally...” (Burcu)

“I feel happy when the client says in a meeting ‘after that research you said so, we did so, then the result was so as you estimated’. It is a good thing to hear some feedback about what you do...” (Arzu)

For in house marketing researchers, it is some kind of a routine to attend to the strategy meetings, especially for the ones who are working in multinationals.

“We have to attend strategy meetings with marketing research results with us. Because all managers, from marketing to product and sales, want to hear our actual situation and forecasts about the future...” (Irem)

however, for researchers from commercial marketing research firms attending any client’s strategy meeting is or being asked to comment on strategic issues at any kind meeting is some kind of new perspective which they feel they are being taken seriously with what they do. Some of them feel like they are achieving the privileges of advertising agencies.

“Sometimes they (the clients) invite us to strategy meetings or important meetings along with ad agencies. I like to be there, because it makes me feel like they consider me and what I do important... A few months ago one of our clients invited me to their strategy meeting saying that ‘what you showed us about our firm was really useful and helpful. We would like to see you in the meeting where we discuss these issues with our management’...” (Burcu)

In addition to being invited to important meetings of client firms, some significant developments make marketing researchers feel more optimistic about the future of the industry;

“One of our biggest clients, which is large domestic firm with a real research notion, established some kind of a communication committee for her brand a few years ago. The committee was consisting of the CEO of the firm, marketing managers, sales managers, advertising agency, public relations agency, in house marketing research manager, and yes our general manager. Someone outside firm along with ad and PR agency was on that committee. I think this is one of the best examples where our job is now being considered an important function of the decision making process...” (Hasan)

DISCUSSION AND CONCLUDING REMARKS

When we start our study in order to explore the position and use of marketing research in Turkish firms, we did not expect to see such a fragmented picture about the whole industry. However, at the same time, it is not too much surprising in an emerging country like Turkey. Increasing globalization, stiff competition and rapidly changing expectations and behaviors of consumers are changing the face of marketing research profession in Turkey perhaps not rapidly as it should be. As one of our participants said, we are “living the stone age and the space age at once” in terms of the position and use of marketing research. On the one hand, there are the multinational firms, which are very strict in using marketing research as a supportive tool in every decision with great proficiency and the same time teaching the whole industry what marketing research really is. On the other hand, there are large or medium sized domestic firms, which never consider

marketing research as a management tool for decision making. It is possible to say that important role of marketing research is not fully appreciated in Turkey yet.

Although the scenery does not seem so bright for the industry or the profession, it is not all too dark, as well. Marketing research surely has an important role in marketing decision making in multinational firms, and in some large domestic firms as well in Turkey. Even in some firms, particularly in multinationals, marketing research managers in firms evolve to consumer insight managers or consumer knowledge managers, who have two primary tasks: The first task is to transform marketing research results into action routes that the firm should take in marketing decisions. The second task is to draw consumer/customer insights for innovation ideas or future scenarios from research results as well. These changes in the profession or the industry create more optimistic expectations about marketing research for the future.

Furthermore, recent developments about efforts of marketing research “to earn a seat at the strategy table” seems to have a real potential to be realized. Malhotra and Peterson (1999) suggested some trends in marketing research for the future at the dawn of the new millennium. Marketing research’s position in Turkey seems to be affected by these emerging trends:

- Marketing researchers will participate more and more in marketing decision making
- Managers will participate more and more in marketing research
- More and more marketing research will be undertaken as an on-going business operation
- The marketing research industry will become more aggressive in positioning itself as distinct from selling (Malhotra and Peterson, 1999, p. 217).

As a result, we can speak of marketing research as an established and growing industry in Turkey with a great potential of growth and progress. However, there some steps to be taken to realize this potential:

- Practices of multinational firms should be considered and exemplified as best practices
- Marketing research industry or marketing researchers should play the role of a tutor to make Turkish firms understand the importance and benefits of marketing research
- Marketing research industry as a whole should turn their focus to be consumer insight providers and consultants rather than mere data providers and catch up with the pace of the multinational firms
- While doing this, marketing research industry should try to position itself as supportive tool for decision making process instead of back office workers
- At the same time, spending more time to train the research personnel in accordance with the needs and expectations of their client firms seems crucial.

This study also poses some limitations as well. Our goal was to discover the position and use of marketing research in Turkey with a qualitative research and in-depth interview technique. Therefore, it is conducted with varied, but small sample from the profession that would not allow the findings to be generalized to the whole marketing research industry. However, the results of this study may provide useful guidance for designing a more structured research on marketing research’s position and use in the future. Besides, other qualitative and quantitative researches with marketing managers or marketing research users would be of great help to understand the scenery of marketing research thoroughly in Turkey.

EFFECTS OF ETHNOCENTRIC TENDENCY ON CONSUMERS' PERCEPTION OF PRODUCT ATTITUDES FOR FOREIGN AND DOMESTIC PRODUCTS

Erdogan, B. Zafer¹; Uz Kurt, Cevahir²

¹Head of Department, Bilecik University, Iktisadi ve Idari Bilimler Fakultesi Dekanligi, Bilecik 11010, Turkey

²Associate Professor, Eskisehir Osmangazi University, Iktisadi ve Idari Bilimler Fakultesi, Isletme Bolumu, Eskisehir - Turkey

Purpose – The first aim of the study is to determine the relationship between consumer ethnocentrism and product attitudes including country of origin. Investigating whether ethnocentric tendencies and product attitudes vary by demographic variables is the second aim.

Design/methodology/approach – Data for the study were collected through a face-to-face survey of consumers in Turkey. Of the 300 questionnaires distributed, 283 were accepted as usable for the study. Consumer ethnocentrism was measured by CETSCALE.

Findings – The findings show that shoppers with high levels of ethnocentricity are more likely to be less educated and to earn lower monthly income than those with low levels of ethnocentric tendency. As expected, those with low ethnocentricity levels perceive foreign products more favorably than their high-ethnocentricity counterparts.

Research limitations/implications – The study has two limitations. First of them is the fact that the research sample was located in only one Turkish city is a clear constraint on the generalizability of the results. Second, consumers were asked to evaluate the attributes of foreign-origin products without reference to a specific product group.

Practical implications – These findings provide useful market intelligence for marketing strategists targeting Turkey, but must be generalized with caution.

Originality/value – This study both supports and contributes to the existing literature by examining consumer ethnocentrism and country of origin together.

Keywords Consumer ethnocentrism, country of origin effects, attitudes, Turkey

Paper type Research paper

INTRODUCTION

Knowing consumers' buying motivations, and developing close relationships with them, are critical means of competition for firms in today's increasingly crowded marketplaces. Of special significance in the case of economies relying significantly on imported goods are consumer attitudes towards foreign and domestic products, and the ethnocentricity that affects them. There are two general streams of research in the area: Consumer Ethnocentrism and Country of Origin Effects. As the literature review will show below, a number of studies have analyzed the effect of the behaviors and attitudes of highly ethnocentric consumers on foreign products. These studies have provided insights in understanding individual and organizational attitudes towards domestic and foreign products, which in turn assists managers to form effective marketing strategies in given markets.

Other studies have focused on the country-of-origin effect, sometimes called the 'made in' effect, under the influence of which consumer perceptions about products are influenced by the image of producer country (Huddleston *et al.*, 2001; Kaynak and Kara, 2002). These studies have attempted to measure consumers' country of origin perceptions on various product groups produced in different countries (Beverland and Lindgreen, 2002; Elliott and Cameron, 1994; Garland and Coy, 1993; Han and Terpstra, 1988; Kaynak and Cavusgil, 1983; Lawrence *et al.*, 1992; Monrai and Monrai, 1995; Watson and Wright, 2000).

Country of origin effects have also been attributed to consumer buying behavior (Ettensen, 1993), product image (Peris *et al.*, 1993) and consumer perception of domestic and foreign product/service attributes (Kaynak *et al.* 1994; Stratton *et al.*, 1995). The findings from these studies indicate that many consumers tend to buy products from their own countries in preference to foreign products (Bilkey and Nes, 1982; Samiee, 1994). When they have to choose among foreign country products, they tend to prefer those from countries

with similar cultures to their own over those from culturally distant countries (Heslop *et al.*, 1998; Wang and Lamb, 1983; Watson and Wright, 1999).

Country of origin studies presuppose that consumers use intrinsic cues, such as style or design as well as extrinsic ones such as price or branding, as indicators of quality in product evaluation. Such studies must be differentiated in some respects from consumer ethnocentrism studies, which assume a social acceptability, since the customer's product decision process of customers focuses on the producer country as a product attribute rather than as an indicator of social acceptability (Huddleston *et al.*, 2001).

Reported studies have found the presence and strength of relationships among the consumer ethnocentrism, product attitude and demographic variables to vary in different countries. Therefore, there is a need to do more research into different cultures, and this paper accordingly aims to explore the relationship between consumer ethnocentrism and product attitudes including those relating to country of origin. It also investigates whether or not ethnocentric tendencies and product attitudes vary with demographic variables.

The focus is on Turkey, which has been transformed since the economic reforms begun in 1981 by economic growth and relative political stability into an important commercial center with a vibrant and lucrative consumer market. In recent years, the growing size of that market, its increasing disposable income and the greater sophistication of its members and its Turkish consumer market in size as well as consumer wealth and sophistication has attracted significant attention from multinational companies (Kaynak and Kara, 2002). The study reported here offers market intelligence about Turkish consumers' ethnocentric tendencies and their evaluation of the attributes of foreign and domestic products attributes to marketing strategists operating in Turkey.

This study is structured as follows. First, the literature of product attitude, country of origin effects and consumer ethnocentrism is reviewed and summarized. Second, research hypotheses are presented and tested. Finally, the findings are analyzed and discussed, conclusions are presented, and limitations identified.

LITERATURE REVIEW

Product attitude and country-of-origin effect

Product attitude is commonly defined as consumers' overall evaluative judgment of a product's attributes, such as style, brand, and quality. In general, country of origin affects consumers' product evaluation because they assess a product on the basis of information cues available (Kaynak and Kara, 2002). Country-of-origin research assumes that, when evaluating products, consumers use intrinsic cues, such as style or material, and extrinsic cues, such as price or brand, as indicators of quality (Huddleston *et al.*, 2001). Country of origin effects is used as an important cue in forming positive and negative influences of a product's country of manufacture, and hence affecting decisions and purchases (Elliott and Cameron, 1994; Mitchell and Greatorex, 1990; Watson and Wright, 1999). Furthermore, a product's country of manufacture can be more important in shaping customer attitudes and purchasing decisions than brand name, price and quality (Lanz and Loeb, 1996; Okechuku, 1994). Evidence from some studies suggest that consumers favor products from countries that they find culturally, politically or economically closer (Crawford and Lamb, 1981; Kaynak and Cavusgil, 1983; Lanz and Loeb, 1996) to their own country. According to Huddleston *et al.* (2001), there is a linear relationship between a country's image and consumer perceptions for the quality of goods produced in the country. Consumers may assume that more developed countries produce better quality products (Huddleston *et al.*, 2001).

However, a positive relationship between country image and consumer perception of foreign products cannot always be assumed (Ozsomer and Cavusgil, 1991). Bilkey and Nes (1982), have identified studies where a negative correlation between these two variables was found. Al-Sulaiti and Baker (1998) assert that knowledge of the country of origin is especially very influential when there is insufficient knowledge on other variables. However, it is difficult to generalize on how this influence occurs.

The effect of country of origin on product evaluation has been studied in four main ways (Kaynak *et al.*, 2000): single-cue studies, multi-cue studies, conjoint (trade-off) analysis, and environmental analysis. In the first of these, consumers are required to base their evaluation decisions on both intrinsic cues (e.g. design and tastes,) and extrinsic cues (e.g. warranty, brand name and price) (Bilkey and Nes, 1982; Han, 1990; Kaynak and Cavusgil, 1983). In the second group of studies, country of origin is among a variety of factors that a consumer considers when selecting eligible products and making ultimate purchasing decisions (Johanson, 1989; Johanson *et al.*, 1985; Wall *et al.*, 1992). In the third group, researchers attempt to provide a measurement standard for how much consumers value respective attributes of foreign products compared to the domestic alternatives. (Akaah and Yaprak, 1993; Klenosky *et al.*, 1996; Okechuku, 1994). In last group of studies, the main emphasis is on the effect of various environmental factors on consumers and company decision makers (Cordell. 1992; Papadopoulos *et al.*, 1990).

The focus of country-of-origin studies can further be classified by four main areas of comparison. These areas include region (Schweiger *et al.*, 1995), country (Barret, 1996), product type (Han and Terpstra, 1988), and consumer types (Kaynak and Küçükemiroğlu, 1992).

CONSUMER ETHNOCENTRISM

'Ethnocentrism' refers to the tendency of individuals to see their cultural group as proving the norms for acceptable behaviors and preferences. Highly ethnocentric individuals are intolerant and judgmental with respect to cultures different from their own (Booth, 1979; Martinez *et al.*, 2000). They perceive ethnic and national symbols and values as a source of pride, while often despising the values of others (Martinez *et al.*, 2000).

Analyzing ethnocentrism together with consumer behavior from the perspective of consumer economic behavior results in "Consumer Ethnocentrism". "Consumer ethnocentrism" expresses the effects of buying intentions with regard to products from the home country and from countries that are perceived to resemble or differ from it (Kaynak and Kara, 2002). Consumer ethnocentrism calls into question the appropriateness of preferring foreign-made products over domestic products (Shimp and Sharma, 1987). Consumers who have a high tendency to ethnocentrism will perceive the quality of local products to be higher than foreign equivalents (Kasper, 1999; Sharma *et al.*, 1995). Cultural closeness between countries also plays an important role in ethnocentric buying behavior (Watson and Wright, 2000).

According to Huddleston *et al.* (2001), consumer ethnocentrism is expressed by economic behavior such as purchases and boycotts, based on the fear that foreign-made products harm individuals and national economies. It gains moral and social dimensions when a consumer avoids or prevents others from buying imported products because of this concern (Myers, 1995; Ozsomer and Cavusgil, 1991).

Positive relationships between consumer ethnocentrism and buying behavior have been found by some researchers (Herche, 1992). However, the same relationship is not apparent in all studies of these concepts (Good and Huddleston, 1995). According to McIntyre and Meric (1994) highly ethnocentric consumers are more likely than the less ethnocentric to accord more importance to the place of manufacture of goods and to prefer local products. The importance of a product to the consumer also influences ethnocentric perceptions. Consumers tend to be less ethnocentric for the products that they perceive as necessary in their daily lives (Sharma *et al.*, 1995). Kucukemiroglu (1999) found that consumers who are non-ethnocentric tend to have more favorable beliefs, attitudes and intentions for import products than do ethnocentric consumers in Turkey.

Shankarmahesh (2006) has reviewed the antecedents of consumer ethnocentrism and classified them in to four main categories; socio-psychological, economic, political and demographic. Recently, Altintas and Tokol (2007) have identified three main constructs of antecedents of consumer ethnocentrism; xenophobia, negative attitudes towards foreigners and conservatism. Their results show that xenophobia and conservative values influence ethnocentrism, but not negative attitudes towards foreigners in the Turkish market.

Studies that analyze the relationship between demographic variables and consumer ethnocentrism have found that consumer ethnocentrism correlates with age positively, but education level negatively (McLain and Sternquist, 1991; Caruana and Magri, 1996). However, there is not a relationship with gender and marital status (Shimp and Sharma, 1987; Caruana and Magri, 1996). In addition to such demographic factors, others such as beliefs, intentions, attitudes and consciousness level may determine customer ethnocentrism (Martinez *et al.*, 2000).

HYPOTHESES OF THE STUDY

Demographic variables and consumer ethnocentrism

Watson and Wright (2000), Good and Huddleston (1995), Shimp and Sharma (1987), and Sharma *et al.*, (1995) examined relationships between demographic variables and consumer ethnocentrism and found significant differences among them. For example, Watson and Wright (2000) found that high ethnocentric consumers were more likely to be female, older, less educated, and less wealthy, than low ethnocentric consumers. Therefore it is hypothesized that:

H1. There is a significant relationship between Turkish consumers' ethnocentrism scores and their demographic characteristics

Consumer ethnocentrism and product attitudes/country of origin

The impact of consumer ethnocentrism on attitudes towards foreign products has been extensively researched and significant relationships among them found (Sharma *et al.*, 1995; Ozsomer and Cavusgil, 1991; Myers, 1995; Kaynak and Kara, 2002; Wang *et al.*, 2004; Watson and Wright 2000; Lantz and Loeb, 1996; Huddleston *et al.*, 2001). Sharma *et al.*, (1995), Lantz and Loeb (1996), and Watson and Wright (2000) found that cultural similarity is one factor that may influence the effect of consumer ethnocentrism on attitudes towards products made in foreign countries. Shimp and Sharma (1987) found that highly ethnocentric consumers evaluated imported products according to their perceived effect on the economy. Most of these studies have established that the higher the ethnocentric tendency, the more negative the attitudes towards foreign or imported products, and thus the more positive they are towards domestic products. Accordingly, it is hypothesized that:

H2. Turkish consumers exhibiting high levels of ethnocentrism will have less favorable attitudes towards foreign products than those with low levels of ethnocentrism.

H3. Turkish consumers exhibiting high levels of ethnocentrism will have more favorable attitudes towards domestic products than towards foreign products.

Demographic variables and product attitudes/country of origin, and consumer ethnocentrism

Evanschitzky *et al.*, (2008) found that consumer buying behaviour towards foreign versus domestic products can be explained by a combination of demographic variables and country-of-origin effects. Also, some studies reveal significant relationships between demographic variables and attitudes towards products. For instance, Schooler (1971), Wall *et al.*, (1988), and Good and Huddleston, (1995) found that older consumers were more negative towards foreign products than younger consumers. Significant differences between education and perceptions of foreign product attributes have been found in other studies (Good and Huddleston, 1995; Schooler, 1971; Wall and Heslop, 1986). The findings suggest that the higher the educational level of consumers, the more positive their attitudes towards foreign products. Studies have also found that the higher the income level, the more positive the attitudes towards products made in foreign countries. Schooler (1971), Wang (1978), Han (1988), and Good and Huddleston (1995) found significant differences between sex and attitude towards foreign products. The results of these studies, except Han (1988), show that females have more positive attitudes towards foreign products than men. Hence, it is finally hypothesized that:

H4. There is a significant relationship between consumers' attitudes towards foreign products and their demographic characteristics

METHODOLOGY

Sample selection and data collection

Data for this study were collected via a survey of consumers living in the city of Eskisehir, one of the largest in Turkey and one of the most cosmopolitan in respect of its demographic, social-economic and cultural characteristics. It was chosen on the strength of its consequent potential to yield a demographically diverse sample. Interviews were conducted by 20 graduate students, all of whom had been trained and given instructions about their responsibilities during the data collection process. They conducted the survey at the entrances to the largest five supermarkets in the city. Shoppers were invited to take part in the survey and, if willing, given a questionnaire to complete on the spot.

Data collection occurred over a two-week period, daily between the hours of 10 a.m. and 8 p.m. Of the 300 questionnaires distributed, 283 were accepted as usable for the study.

Measures

Questionnaires used for the research consisted of three parts. The first uses the familiar CETSCALE (Shimp and Sharma, 1987) to measure the respondents' ethnocentric tendency, modified to fit the Turkish context. This scale assumes that a positive attitude towards domestic products is a matter of national responsibility and loyalty. It has been tested by different studies in different (the USA, France, Japan, West Germany, Korea and Poland, all of which achieved a Cronbach's Alpha value of over 0.90 as an indicator of its reliability (Netemeyer *et al.*, 1991; Sharma *et al.*, 1995; Good and Huddleston, 1995; Huddleston *et al.*, 2001). As Netemeyer *et al.* observe, the scale thus demonstrates both the discriminant and nomological validity. In Turkey specifically, the Cronbach Alpha coefficient has been measured at 0.93 (Kaynak and Kara, 2001).

A member of faculty educated in the USA translated the items to which the scale was applied into Turkish. Back-translation from Turkish to English was also performed by another, also educated in the USA and in the UK, to check for translation errors.

The second part of the questionnaire contained questions relating to 'product attitudes' including country of origin. Countries chosen for the study are main trade partners of Turkey from the "triangle". They are namely; Japan and China from the Asia Pacific, the USA from the America, and France, Germany and Italy from the EU. Respondents rated products from Turkey and six foreign countries in terms of quality, performance, robustness, brand image, style, design, diversity, and price: dimensions were selected from previous studies (Kaynak and Kara 2002; Watson and Wright. 2000; Han and Terpstra. 1988). The responses for the six factors were aggregated to create a total product attitude mean value for the products of each country, which was used in the statistical analyses.

Seven countries were chosen to be the sources of foreign products, for the questionnaire. Germany, France and Italy are the European Union member countries from which Turkey imports the most products. The other four selected for the study were Japan, China and the USA. Five-point Likert scales, anchored by 1 = very good and 5 = very bad, measured respondents' evaluation of the attributes of products originating in each country.

The questionnaire also collected demographic data, specifically age, gender, monthly income, and educational level.

Data analysis

The collected data were analyzed using SPSS v12.0 software. Descriptive statistics such as frequency, percentage, mean and standard deviations were calculated. ANOVA was used to test the impact of demographic variables on consumer ethnocentrism. The independent-samples *t*-test compared perceptions of the attributes of foreign and domestic products among respondents exhibiting high and low ethnocentricity. MANOVA was employed to test relationships between demographic variables and product

attitudes including country of origin. In addition, paired sample *t*-test is used to compare highly ethnocentric consumers' perceptions about foreign and domestic product attributes.

RESULTS

Profile of the respondents

The demographic profile of the 283 respondents is shown in Table 1. More than half are male. Over two thirds had completed either high-school or university study. More than half are between 21 and 40 years old, and two thirds were classified in the two lowest income brackets out of four.

Reliability and mean values of the perceptions

Mean values, standard deviations and Cronbach's Alpha reliability are presented in Table 2. They suggest that respondent's ethnocentric tendencies were generally moderate. The reliability of these measures is good, as confirmed by an overall Alpha of 0.92.

Hypothesis testing

To understand relationships between demographic variables—and ethnocentrism, one-way analysis of variance was carried out, with the results are displayed in Table 3. These show significant differences across gender, education, age, and income. In this sample, females are more ethnocentric than males ($F = 11.969$, $p < 0.01$), consumers with low income and education level are more ethnocentric than those with the opposite characteristics ($F = 14.257$, $p < 0.001$) and education level ($F = 3.451$, $p < 0.001$), and age is a predictor of ethnocentricity ($F = 17.882$, $p < 0.001$). Therefore, *H1* was accepted.

To distinguish high and low-ethnocentricity respondents' perceptions of foreign products, the independent sample *t*-test was applied, separately for each country presented in the questionnaire. The results are shown in Table 4, showing that consumers with high levels of consumer ethnocentrism have more negative perceptions of foreign products and more positive perceptions of domestic products than do consumers with low levels. There is no statistically significant difference between the two sub-samples' perceptions of Chinese products. The results provide strong support for *H2*.

H3 asserts that high-ethnocentricity consumers will have more favorable perceptions of domestic products than of foreign products. It was tested by paired sample *t*-tests, comparing their scores relating to Turkish products with those for foreign products. The results in Table 5 show significant differences in six comparisons of attitudes to Turkish and foreign products, supporting *H3*.

To test *H4*, multivariate analysis of variance was employed. The results in Table 6 show no significant difference between demographic variables and product attitudes including country of origin; product attitudes cannot be differentiated according to gender, education, age or income. *H4* is therefore rejected.

CONCLUSIONS

Discussion or Findings

The objective of this study was to investigate relationships among Turkish consumers' ethnocentric tendencies and their product attitudes, and demographics. The research findings suggest that ethnocentric tendencies are strongly associated with demographic characteristics. For example, as education level increases, ethnocentric tendency decreases. In addition, younger and higher-income consumers are less ethnocentric than their older and lower-income counterparts, and men are less so than women. The study also found that high levels of consumer ethnocentrism were significantly associated with strongly negative perceptions of foreign products and very positive perceptions of domestic products.

The findings that gender, income and educational level are directly related to levels of ethnocentrism (*H1*) are consistent with those described by Watson and Wright (2000), Good and Huddleston (1995), and Sharma

et al., (1995). The significant relationship of high levels of consumer ethnocentrism to relative perceptions of Turkish and foreign products (H2) are also consistent with much of the literature, though the lack of significance in the case of products of Chinese origin is noteworthy. The specific connection between ethnocentrism and preference for domestic products (H3) is consistent with the findings of Watson and Wright (2000), who further found that consumers extended their approval to those originating in countries perceived to be culturally similar to one's own.

On the other hand, whereas Good and Huddleston (1995), Schooler (1971), and Wall and Heslop (1986) found a significant relationship between demographic variables and product evaluation, the results of the MANOVA tests related to H4 did not.

Managerial implications

The findings of this study potentially provide useful market intelligence for marketing strategists in both international and national firms operating in Turkey, which is a candidate to join the European Union. With countries in the Caucasus region that have similar cultures, this amounts to a fast-developing total market of more than 100 million consumers.

The overall conclusion is that companies targeting their products at market segments that include women or low-income or less educated consumers should emphasize product quality, price and product attributes, rather than country of origin.

In addition to this, foreign companies in cooperative arrangements with domestic partners could advantageously deploy brand names and the domestic images, or might support domestic values by, for example, sponsoring a major-league football team. They could at the same time deliberately select market segments that are known to be characterized by relatively low ethnocentrism.

By contrast, domestic companies can derive a real competitive advantage from inherent ethnocentricity in the marketplace by stressing their domestic image as well as the specification of their product ranges. As a case in point, a newly marketed domestic soft-drink company (Cola Turka) has built all its marketing communications strategies on its domestic brand name and image, and has captured an important market share.

Given that Turkish consumers have relatively undeveloped perceptions of Italian, German, French and American products. Thus, firms of those nationalities operating in Turkey should emphasize the quality of their products in their marketing strategies. Since Japanese origin evokes positive perceptions, the appropriate route to competitive advantage in that case would be both to emphasize the country of origin and to cooperate with Turkish companies.

Chinese products, on the other hand, are negatively perceived, probably due to low quality and low price. The only strategy obviously open to Chinese marketing planners will be to focus on price-sensitive segments of the market.

Methodological limitations

The fact that the research sample was located in one Turkish city only is a clear constraint on the generalizability of the results. Further, consumers were asked to evaluate the attributes of foreign-origin products without reference to a specific product group. Studies of broader samples from other nationalities and cultures are required to further validate the findings of this study. Future research can also enrich understanding of consumer ethnocentricity by focusing on cultural values, varied product groups, and different product features.

Despite these limitations, any study that casts light on the relationship between personal values and ethnocentric tendencies can offer important insights into effective segmentation of challenging target markets based on a clearer understanding of the life styles of local customers.

ANTI-CORRUPTION MANAGEMENT, STATE CAPTURE, GOVERNANCE AND ACCOUNTABILITY IN THE LOCAL PUBLIC ADMINISTRATIONS

Esposito, Paolo¹; Cillo, Valentina²; Landi, Tiziana²

¹PhD Student, University of Roma Due, Roma

²PhD Student, University of Sannio, Benevento

²PhD Student, University of Sannio, Benevento

The main purpose of this paper is to test an innovative reporting and organizational model in local Italian Public Administration governance (Borgonovi, 2002; Meneguzzo, 2006) in order to monitor and prevent, control and account the occurrences of corruption, deformation and capture of the Regulatory State (Rawls, 1971; Mintzberg, 1996; Bresser Perreira, 1999; Scott, 2000; Moran, 2002; Schick, 2003). Today, the public administrations have a particular government system that is beyond the effective application of law, and they are also accountable just to people predominating through the use of corruption and bribery (Klitgaard, 1988; World Bank, 1997; Broadman H. G., Recanatini F., 2001; OECD/PUMA, 2002), ruling out the citizen's power.

Consequently, the paper aims to identify not chameleon-like political tools in order to improve political accountability and citizens' participation, switching from a government system to a responsibility governance system (Cepiku, 2005).

Keywords: Public Administration, legality, corruption, bribery, State capture, accountability, government, governance, model, dependability, policy, political consensus.

INTRODUCTION

A well-functioning public sector is critical for poverty alleviation. It must deliver quality public services that match the needs of its citizens, foster private market-led growth while managing fiscal resources prudently, and be accountable to its citizens for all actions (World Bank, 2007).

This paper facilitates learning from others experiences with ideas and practices that promote responsive, responsible and accountable public governance in Mediterranean area and in Italy in special way. Performance-based accountability is appealing because of its potential to improve government service delivery performance and to ensure the integrity of public operations, empowering citizens to demand accountability for results from their governments. But implementation of such an accountability system represents a major challenge for any public sector organization; most such reforms fail as a result of difficulties in design and implementation.

This paper provides advice on how to institutionalize performance-based accountability, especially in countries that lack good accountability systems. The paper is divided into two parts: the first part argues about public management reforms (NPM) to ensure the integrity and improve the efficiency of government operations. It outlines that in Italy more than talk of NPM should be better to speak of *Public Governance* considering a much calmer approach to reform compared to Anglo-Saxon countries (i.e., UK with *common law system*).

On the other hand, the paper highlights the causes of corruption and the cost of corruption for the society and government. It provides advice on how to tailor anticorruption programs

and how to use of both internal and external accountability system and other mechanisms of control to fight it with the aim of ensuring sustainability⁸⁴.

NPM VS PUBLIC GOVERNANCE FOR ITALIAN GOVERNMENT

The past decade has been characterized by a strong innovation legislation aimed at radically change the mode of governance and management of public administration (PA). Objective of innovation was, and still is, to create government strongly oriented towards economic and corporate culture so steeped in the principles, rules and methods that underlie the government units that have significant economic and social impact . This process of change, defined as "corporatization" of the PA, is discernible in the need to change the management and organization of individual institutions in response to new tasks and the increasingly central role they have assumed.

The local authority becomes engine of regional development, even the question "politics" that has taken place in recent years, is the daughter still the same process of change: the principles of "subsidiarity", "federalism" and others to them are accompanied by the need to derive a competitive economic and social, relations with PA more "open", that is more sensitive to the needs of the community. It is considered therefore concluded the phase of self-reference and static of PA, which is now required "to account" of what was planned, what results have been achieved and what benefits actually produced.

All this requires a new approach "to customer", new information tools, a different organization and different management criteria marked by the new principles, borrowed from private companies, of economy, efficiency and effectiveness. For example, about the separation between politics and management, however, this has been undermined at the roots attribution to the appointing political bodies. This measure, theoretically aimed at revitalizing the principle of political accountability and to combine the pair autonomy - responsibility of the manager in public, in practice it has become a tool for strengthening political control over bureaucracy, based on a misuse of power of appointment. In essence, compared to formal transfer of duties and responsibilities, control and supervision and central policy has been substantially strengthened through subtle mechanisms of control and interference.

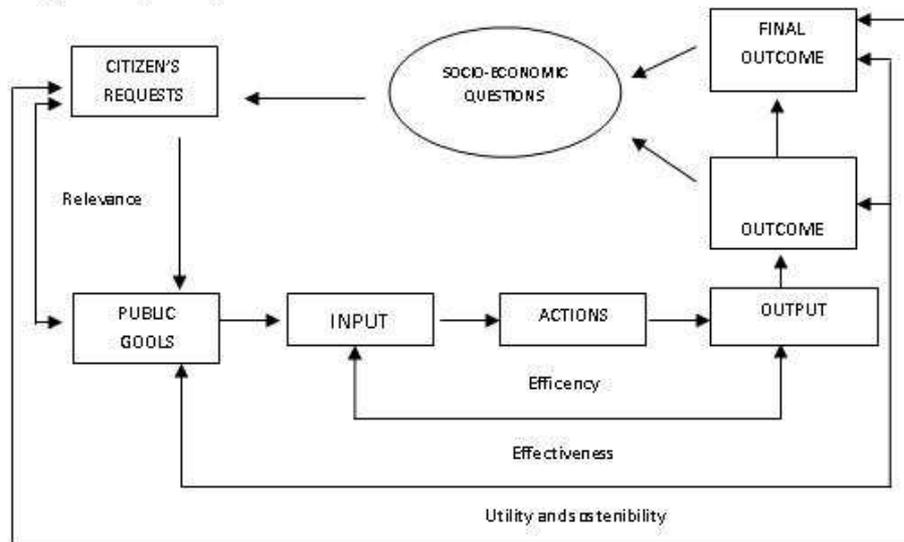

Such modernization programs have been particularly influenced by the New Public Management (NPM) approach (Aucoin 1990; Pollitt 1990; Hood 1991; Minogue 1998; Barzelay 2001), which objectives have been mainly on reshaping the boundaries and responsibilities of States, on introducing accountability and performance measures, promoting citizen-centred public services and favouring competition in the public sector. The English scholar Hood, for example, raised the issue that often the successes in the public sector, with its emphasis on so-called sigma-type values (efficiency, effectiveness, targeted investments) have been at the cost of ' honesty and fairness (theta values) or the safety and elasticity (lambda values).

As defined by Perry and Kraemer (James, Kenneth, 1983), however, one can speak of public management only when there is a *harmonious fusion* and thus a perfect balance between the general management and more traditional concerns of PA while maintaining the "values of the State and placing greater emphasis on flexibility, performance measurement and the achievement of results. Pierre, the French scholar, consider a division of society into two areas, the State and civil society in which the government represents a junction between the two. He described the government as a *output linkage* because it allows the State to send its output to the

⁸⁴ Anwar S., *Performance accountability and combating corruption*, World Bank, Washington DC, 2007, p. XVII

civil society, i.e. information and resources, and civil society to provide input or requests and questions to the State in the following format (Pollitt, Bouckaert, 2002):

Figure 1 *Input/output model*

They must behave like selfless trustees, putting the welfare of their beneficiaries (society, clients) before any personal interest⁸⁵.

But real-life public management is completely opposed, looking at the ways in which public managers and management can detract from public value. This mechanism should work through the detailed observation of the rules and principles of NPM, also addressed Italian PA to sound management in order to satisfy the needs and requests of the entire community. Indeed, when between public interests and political authority of the mechanisms involved perverse corruption and undue abuse of power, the delicate equilibrium, where public functions operate at the service of civil society, is destroyed.

One of the commonest types of this failure comes when those managing or producing a service put their own interests first and the interests of their clients or customers second – or nowhere. The sort of failures that are likely to arise will come about through disdain for any collective restraint on the ability of individuals to shape their jobs as they choose, turn public affairs into private-market transaction, and public organizations into personal property. From time to time politicians have recruited without considering the need to recruit Politicians consider that government exists to provide jobs for their supporters (McCourt, 2006).

Where that happens, public service organizations have become part of the crime problem rather than the solution, and it is particularly likely to occur in law enforcement: politicians had a vested interest in maintaining a patronage system (Anwar, 2007).

Alterations and distortions caused by an unbalanced relationship between autonomy and accountability in the management of PAs have produced in recent years dystonia and

⁸⁵ According to authoritative doctrine (Moore, 1995) public managers and their organizations play a leading role as “creating public value”, in the sense of producing services and outcomes that “add value” to society.

lacerations logical chains of meaning between the phases of administrative planning, management and control.

Some of these commonest failings are bribery and corruption .

The worthy organization Transparency International defines corruption as the abuse of entrusted power for private gain, material or not, linked to political ambitions and/or professional, a notion of exchange as a mesh network in which to insert very large number, perhaps as early too many cases of improper trade, illicit, illegal, sometimes enforced with the use or threat of violence (Borgonovi, 2009). what they have in some form: i.e. by private appropriation of public property, by accepting money from willing hands (bribery) or extracting it from unwilling ones (extortion) for performance, non-performance or prompt performance of their duties. Transforming public assets into private property can range from petty pilfering to massive illegal privatization operation or even outright sale of public office.

There is a relevant gaps between rules and conducts and then between elements of delegitimation and contradiction in PAs (Reichard, Wegener, 1988; Kooiman, Van Vliet 1993; Cassese, 2002, 2004; Frey, Benz, 2004).

This brief outline, ignoring many other aspects of the studies on public, they understand the general trend of our country to focus on the legal paradigm - administrative rather than practical.

Faced with the abstract rational measures, in contrast to the specificity of the system to which they relate, actors tend to put in place strategies for applying the provision already in the formulation stage and then, especially in the implementation of a vicious circle that see the various attempts at reform, corporatization, dispersed in many streams, which coexist in a thousand pieces as pieces of an unfinished monument to the PA (Anselmi, 2001).

Since any reform in PA must also consider the wider institutional environment where each organization operates, it is necessary to properly change the system of rules according to which political representatives operate. The design of theoretically perfect systems, on the PU organizations or institutional viewpoint, could not be practically implemented, due to its inconsistency with the characteristics of the political system where different actors operate. For instance, a political system where people culture and dominant values are oriented to the search of personnel favor and influence peddling will provide a substantial obstacle towards the implementation of even the best change-oriented programs.

The above remarks suggest the need of a system – rather than a bureaucratic – approach in outlining PA performance improvement programs. A bureaucratic approach, in fact, does not guarantee the satisfaction of citizens' needs (Kernaghan et al., 2000). On the contrary, it is here suggested an “open system” view of the PA. Such a view is opposite to that of the PA, as a self-referential system. This implies a shift of focus, from a formal compliance to norms and other input factors (such as, those related to the execution of tasks), towards a results-oriented approach. This perspective focus on issues such as:

- ensure greater autonomy to public managers in an optic of political devolution to promote *accountability* in the local authorities;
- clear identification of responsibilities and resources assigned to decision makers;
- transition from management by rules to ones by outcomes;
- putting the citizen at the centre as a customer or client of Public services.

In order to effectively achieve the above goals, it has been remarked by the literature (Borgonovi, 1996) the need to provide public managers with a sufficient level of autonomy, to identify (on the basis of their knowledge, skills and experiences, and resources available) alternative ways to better satisfy citizen' needs, in compliance with the current legislation. This also implies the clear definition of autonomy and responsibility of:

1. the political-institutional function;
2. the managerial function;
3. the operational function.

According to such a "post-bureaucratic" perspective (Osborne D., and Gaebler T. 1992; Kernaghan *et al.*, 2000), the *political-institutional function* must be focused on assuring the general conditions to implement public policies (i.e., citizens perception of politicians' reliability and trust, citizens wiliness to pay the current level of taxes for the services received) and sharing with citizens future development plans. Any account of public management that ignores the right rules and downplays such phenomena is a case of Hamlet without the prince of Denmark (Hood, 2004).

CORRUPTION AND STATE CAPTURE: AN INTRODUCTION

Studies on the activities of offenders and capturing the state, take on great significance in an analysis and diagnostic analysis of the PA, as they constitute a kind of magnetic resonance PA's ability to display weakness, symptoms of institutional weakness and democratic thickening, hypertrophy ligament between the different levels of governance and accountability models adopted.

In the sixties and seventies of last century, theories of some political economists have succeeded to capture a real need, irrepressible, even "functional" in the short term is to condone certain manifestations of corruption in developing countries were oiled the wheels of bureaucracy and would allow appropriate decisions, implementations and quick.

However, in the long term, corruption is not only a price to pay for a development that otherwise would not occur. In contrast, many studies are now documenting how corruption is a cost to be borne by the negative development and that spills over the weaker sectors of society. Corruption corrupts not only all the protagonists, but especially in the spheres of economy, society, politics and makes them less susceptible to any development. To give a particular form of development that often tends to underestimate the moral and ethical, the only one capable of promoting, if not a functioning democracy and of acceptable quality, at least not based on coexistence civil extortion and blackmail.

Here comes the first problem, which affects not merely a question of definition: what is really, concretely, the corruption? How to configure it? Somehow, corruption is a trade-off between people who are benefiting at the expense of others, many or few. An exchange of favors that in some societies is often considered inevitable (has always done so), and acceptable, even somewhat positive, if not fundamentally due. Of course, where this trade-off is constitutive of interpersonal traditional "normal", the one that most Westerners would consider a corrupt practice is, in a society usually based on such behavior, merely an expression of its classical rules of operation . The risk of ethnocentrism in the definition of corruption, warn some anthropologists and sociologists, is therefore very high. To escape it seems absolutely necessary to define with great precision what are the cases that deserve to be placed in the category "corruption". According to authoritative doctrine (Borgonovi Fattore, Longo, 2009), the distinction more effectively applicable to the situations of "trade" has been taken by the two

terms improper corruption and extortion. In the first case, the decision makers, political or bureaucratic, which extorts resources, for the most money, in exchange for a decision, due or not due, which would benefit a person, family, group, company or a party to the detriment and to the detriment of all others. In the second case, however, to take the initiative and offer something to decision-makers placed at any level in exchange for a favorable decision is a person, family, group, company or party, and so on. If and when requests and offers, or the circuit of exchange corrupt, must be accompanied by threats and violence remains a moot point.

Indeed, using a cultural-theory perspective (Mars, 1982) it has been show how different people tend to generete different characteristic “fiddles” and different views about where the line is to be drawn between “honest graft” and “unacceptable cheating”. Moreover, for some, the cure to the corruption problem may be deemed worse than the disease.

The corruption and the growth of anti-corruption bureaucracy contribuites heavily to a paralysis of public management while having no significant impact on the corruption rate (Hood, 2004). In many cases, unfortunately, the exchange of favors becomes a perverse sort of *routine institutionalized* where no one (or almost) knows or puts in questions these procedures; is for these reasons that we usually call that *State capture*.

As highlighting Della Porta and Vannucci the spiral systemic corruption is difficult to escape for individuals and for the system as a whole. Indeed, there is sinking like in quicksand. *The more corruption is widespread and practiced, the less the risk of being reported or discovered, and the higher the cost of choosing to stay honest* (Della Porta, Vannucci, 2006). That, of course, the opposite, namely, the lower the systemic corruption so the higher the political cost of using them⁸⁶.

COSTS OF CORRUPTION IN PUBLIC CONTRACTING

Practical experience shows that the costs of corruption and mis-governance are enormous in terms of political stability, as well as on social and economic development. Meanwhile an efficient and transparent governance promotes growth and well-being. In fact, corruption in both public and private sector, seriously harms the society in its socio-economic right. However, government authorities, political leaders, civil society representatives and private sector leaders seldom have the opportunity to meet and join efforts to analyze and deeply discuss the multiple

⁸⁶ Borgonovi E., *La tutela della salute è il fine, il funzionamento delle aziende e dei sistemi è il mezzo*, Egea, Milano, 2008.

dimensions and determinants that cultivate a strong and transparent governance with no corruption.

The governance and anti-corruption program, uses a novel approach, putting together knowledge and practical experience. It takes into account national requirements in the fight against corruption and looks for consensus building processes to design public policies tailored to the country's specificities.

This study uses a cross-country panel to examine the determinants of corruption, paying particular attention to political institutions that increase accountability. Even though the theoretical literature has stressed the importance of political institutions in determining corruption, the empirical literature is relatively scarce. Our results confirm the role of political institutions in determining the prevalence of corruption (Kickert 1995, Meneguzzo 1996). Democracies, parliamentary systems, political stability, and freedom of press are all associated with lower corruption. Additionally, common results of the previous empirical literature, related to openness and legal tradition, do not hold once political variables are taken into account.

Successful anti-corruption programs depend on publicly available information, political leadership, and collective action. By stressing these components and through its integrative logic, this program has been able to respond to client-country demand and to provide innovative, action-oriented, non-lending activities illustrating a new way of doing business in which the client is in the driver's seat (demand-driven).

An avoidable misuse and abuse of public funds results from corruption. Corruption in public contracting leads to a distortion of fair competition, the waste of scarce resources and the neglect of basic needs, perpetuating poverty.

Massive market inefficiencies can also arise from corruption and, in the extreme, lead to the destruction of development opportunities. If corruption in public contracting is not contained, it will grow. It is estimated that systemic corruption can add 20-25% to the costs of government procurement, and frequently results in inferior quality goods and services and unnecessary purchases. It is argued that, on average, approximately 70% of central government expenditure turns in one way or another into contracts. Contracts are sources of power to those who give them out, and targets of ambition for those who may receive them, making public contracts particularly prone to abuse at the expense of public need.

The risk of corruption in public contracting exists even before the contracting process has started, perhaps even at the moment when public budgets are allocated, and it perpetuates beyond the awarding of a contract to its implementation. The cost of corruption is four-fold: political, economic, social, and environmental. On the political front, corruption constitutes a major obstacle to democracy and the rule of law. In a democratic system, offices and institutions lose their legitimacy when they are misused for private advantage. Though this is harmful in the established democracies, it is even more so in newly emerging ones. Accountable political leadership can not develop in a corrupt climate. Economically, corruption leads to the depletion of national wealth. It is often responsible for the funnelling of scarce public resources to uneconomic high-profile projects, such as dams, power plants, pipelines and refineries, at the expense of less spectacular but fundamental infrastructure projects such as schools, hospitals and roads, or the supply of power and water to rural areas. Furthermore, it hinders the development of fair market structures and distorts competition, thereby deterring investment. The effect of corruption on the social fabric of society is the most damaging of all. It undermines people's trust in the political system, in its institutions and its leadership. Frustration and general apathy among a disillusioned public result in a weak civil society. That in turn clears

the way for despots as well as democratically elected yet unscrupulous leaders to turn national assets into personal wealth. Demanding and paying bribes become the norm. Those unwilling to comply often emigrate, leaving the country drained of its most able and most honest citizens.

Environmental degradation is yet another consequence of corrupt systems. The lack of, or non-enforcement of, environmental regulations and legislation has historically allowed the North to export its polluting industry to the South. At the same time, careless exploitation of natural resources, from timber and minerals to elephants, by both domestic and international agents has led to ravaged natural environments. Environmentally devastating projects are given preference in funding, because they are easy targets for siphoning off public money into private pockets. The Global Corruption Barometer is a survey that assesses general public attitudes toward and experience of corruption in dozens of countries around the world.

Transparency International

Transparency International (TI) is a non-governmental, non-profit organization, founded in May 1993 headquartered in Berlin. It proposes to develop a global approach against corruption, with a focus on international business transactions and developing countries, promoting international cooperation, forcing governments to promote and implement effective laws, policies and anti-corruption programmes. The main purpose of TI is to increase the level of transparency, integrity and accountability in economic relations and administration, consolidate public support for anti-corruption, strengthen the rules and procedures to conduct more accurate and transparent in a global system. TI has played and still plays an important role in promoting international anti-corruption agreements, from the negotiation phase until the conversion into law the cartel agreement and its practical application: in particular, TI has actively contributed to the negotiation of the United Nations Convention against Corruption (UNCAC), the OECD Convention against Corruption, the African Union Convention on combating and preventing corruption. Finally, TI has put in place a work of governmental cooperation to reduce the levels of internal corruption (eg, we consider that in Pakistan after the fall of Prime Minister Benazir Bhutto, the national section of IT controls the granting of public procurement). In the ranking of "perceived corruption", prepared annually by Transparency International, which measures the "perceived corruption", Italy went from 44th place in 2007 to 55th place in 2008. The first ten countries in the ranking of "perceived corruption" are: Denmark, New Zealand, Sweden, Singapore, Finland, Switzerland, Iceland, Holland, Australia and Canada (see Table 1).

The Corruption Perception Index (CPI)

The Corruption Perception Index (CPI) is an indicator ordering the countries of the world on the basis of *level according to which the existence of corruption is perceived among public offices and politicians*. The index of perceived corruption in the public sector and defines this unlawful behavior such as *abuse of institutional power for personal ends*. Therefore considers the corruption of public officials, bribes for public office, the misuse of public funds and includes the administrative and political corruption.

The ranking of 180 countries considered this year, 17 more than in 2006. The views are collected and then weighted and translated into an overall score for each country, which can range from a maximum of 10 (high accuracy) to a minimum of 0 (high corruption).

As shown in the table below, 8 countries had a score from 9.4 to 9.0, close to the maximum and 7 from 8.7 to 8.1. 15 are placed in the bottom of the standings with scores ranging from a minimum of 1.4 to 2.0.

Order	Virtuous Countries	Points	Order	Corrupt Countries	Points
1	Denmark	9,4	179	Somalia	1,4
2	Finland	9,4	178	Myanmar	1,4
3	New Zealand	9,4	177	Irak	1,5
4	Singapore	9,3	176	Haiti	1,6
5	Sweden	9,3	175	Uzbekistan	1,7
6	Iceland	9,2	174	Tonga	1,7
7	Netherlands	9,0	173	Sudan	1,8
8	Swiss	9,0	172	Ciad	1,8
9	Canada	8,7	171	Afghanistan	1,8
10	Norway	8,7	170	Laos	1,9
11	Australia	8,6	169	Guinea	1,9
12	Luxembourg	8,4	168	Equatorial Guinea	1,9
13	Unite kingdom	8,4	167	Congo	1,9
14	Hong Kong	8,3	166	Venezuela	2,0
15	Austria	8,1	165	Turkmenistan	2,0

Table 1 - Ranking IPC 2007: The 15 countries most virtuous and the 15 most corrupt⁸⁷

Italy is 42nd, with 5.2 points behind the front of the Czech Republic and Malaysia. Was 45th in 2006. Among the G8, the United Kingdom is 12th with 8.4 points, Germany is 16th with 7.5, Japan is 18th with the same score, France is 19th with 7.3, the U.S. is in 20th place with 7.2, Spain is 25th with 6.7, Russia is 143rd with a 2.3.

In 2003 the survey included 133 countries in 2007. A higher score means less corruption (perceived). The results show that seven in ten (nine out of ten developing countries) have an index of less than 5 points out of 10. The ranking has no real meaning as up or down position may depend on improvements in other countries. What counts for each country is the score achieved. Using sophisticated statistical tools, the CPI is an estimate of great importance for the economic and social sciences.

Table 2 – Ranking CPI (2002 – 2007) in the Word⁸⁸

The data for the aforementioned report, are a clear sign of market failure and state reform and modernization of that failure of the PA Italian place with strong regulatory action of our legislators, who need instead of a more bottom-up development, governance at local.

THE THEORY OF SOCIETY'S PARTICIPATION IN STRENGTHENING GOVERNMENT ACCOUNTABILITY

An emphasis on accountability in government is one aspect of the growing emphasis on eliminating corruption and promoting transparency in government (Kaufman 2005). According to some authoritative doctrine (Ricci, 2005) the term accountability, widely used in recent years, is the firm ability to permit stakeholders to assess firms performances, in order to adequately

⁸⁸ www.transparency.org

empower business decision makers. Accountability evokes a set of ideas closely related to each other (Molteni, 2000):

- Autonomy and freedom of government and company management operating in a market economy;
- Firm responsibility towards their stakeholders;
- Firm responsibility and accountability towards results achieved.

Transparency and openness are necessary, but perhaps not sufficient, to produce accountability in the public sector. If the public sector can maintain secrecy about its actions, there is little chance that political officials or the public will be able to impose effective control over government. Accountability is a fundamental value for any political system. Citizens should have the right to know what actions have been taken in their name, and they should have the means to force corrective actions when government acts in an illegal, immoral, or unjust manner. Individual citizens should have the ability to have some redress when their rights are abused by government or they do not receive the public benefits to which they are entitled. Accountability is also important for government itself.

It provides government with a means of understanding how programs may fail and finding mechanisms that can make programs perform better. Therefore, accountability and transparency are essential to a democratic form of government. As matter of fact, if public sector can maintain secrecy about its actions, there is little chance that political officials or the public will be able to impose effective control over government.

Throughout the developing world, citizens are demanding greater government accountability and responsiveness as well as better delivery of public services. Economic inequalities accentuated by globalization, lagging public sector reform efforts, entrenched corruption, and persistent concerns about the overall legitimacy of government decision making at all levels have fueled such demands, creating a deeper sense of urgency about budgeting and service delivery shortcomings.

The analysis of all aspects linked with globalization brings an obvious statement (of fact) concerning the complexity of the outside environment and its repercussion also on Public Administration strategies and management. Therefore a "complex planning" is needed to go beyond these criticalities. This complexity, then, needs to go beyond the traditional terms of the organisation operative ways that have just faced the problems sequentially in turn until now. Generally speaking, as it was predicted by outstanding scholars (H. Mintzberg, P. Drucker, J. Galbraith among others), the organizational machine is becoming less and less "machine" and more and more "organizational system".

The best way to tap into the energy of society is through "co-governance," which involves inviting social actors to participate in the core activities of the state. During the past two decades, two prominent influences – globalization and the information revolution – have brought about profound changes in the division of powers within nations as well as beyond nation-states. As a result, the world has gradually but steadily moved from closed-economy centralized governance to open-economy globalized and localized governance – sometimes called "glocalized" governance. International security concerns in recent years have somewhat dampened this change process. Nevertheless, these rearrangements have had profound implications for the roles of and relations among various orders of government. They also have implications for democratic choice and citizen voice and exit.

A government, therefore, needs to exercise caution in designing a system of accountability and control in order to take into account all the contingencies that may arise from its choice. The simplest form of accountability is the requirement for an administrative organization to render an account of what it has done, as a mean of assessing just what government has produced for its citizens. Are the programs adopted by government actually delivering goods and services, or are there major failures in delivery? If there are failures, what is the cause and how can it be corrected? These questions may identify malfeasance and corruption. In this case, punishments may be deserved.

The report should be made to some external, independent organization—a legislature, an auditor, even the public at large—through a published report, so that the assessment can be reasonably public and objective. The accounting may be financial, or it may be expressed in terms of the services provided and the successes and failures of the program. In either case it involves making public what has been done in the public name. This form of accountability highlights the notion that at the most basic level, accountability is about transparency, about making it possible for actors outside a public organization to identify, and question, what has happened. The conditions in which assessments are produced depend on the quality of the firm's accountability system. Factors which contribute to determine the degree of accountability in a company are⁸⁹:

1. a clear and thorough programming process;
2. a clear definition of internal and external duties;
3. a suitable accounting system;
4. an effective internal system for control and evaluation;
5. a periodic informative activity about company management;
6. the use of benchmarking procedures;
7. the use of up-to-date technology in the communication process.

Thinking of an extended accountability system it includes all tools and documents that provides information and comments about company performance in different ways and with a different degree of insight and detail (Terzani, 2002), such as balance sheet, period analysis, periodic reports, budgets over one or more years, financial and economic programmes, strategic and executive plans social balance.

Moreover, accountability has been conceptualized in terms of responsibility – ensuring that the behavior of officials corresponds to (is responsible to) the law or a code of ethics in office (Bovens 1999). While the conceptualization of accountability described above emphasizes the role of external actors in enforcing accountability, the concept of responsibility relies more on the internalized values of public servants and their understanding of the law and appropriate behavior in office. Such a standard of personal responsibility may be acceptable and enforceable in countries with well-institutionalized public service systems; it may be risky to rely on such an approach when there is less agreement on standards of behavior. On the other hand, in terms of responsiveness, accountability system is closely related to the willingness of civil servants to respond to demands from their political masters and perhaps from clients and the public at large. The idea of responsiveness is that the good civil servant is one who is willing to take direction from above, to attempt to serve the public, and, insofar as possible, to provide the

⁸⁹ Ricci P. *Enti strumentali regionali e loro accountability. Il caso caso Campania*, Franco Angeli, Milano, 2005, p.

public with what it wants. This conception points to the numerous pressures that impinge on the behavior of the public servant and the attendant difficulties he or she may face in determining an appropriate course of behavior.

Synthetically we see that the Public Administration is more and more repeatedly expected to follow socially qualified aims and to contribute to society's sustainable development. The social function can be considered as the presumption bringing to life the public sector itself and, at the same time, as the quality assuring its survival. Seeing that the legitimation of existence comes from the ability to satisfy citizens needs and that the legitimation of persistence as vital structure is linked to the requirement of performances carried out, it's correct let be the future of every kind of Public Administration based on efficiency, integrity and capacity criteria.

A consensus among development specialists favors the creation of more effective and participatory policy-making mechanisms to exert greater control over service delivery design and operation, but implementing such mechanisms has proven difficult. Stronger citizen "voice" – demand-side pressures for reform – should result in better incentives for public officials to budget and deliver services of the type and amount desired by the public.

Appropriate legal and institutional frameworks can create significant participatory "spaces" and opportunities often grounded in individual and collective rights – for the public to exert such agency and make meaningful choices about service delivery quality, access, accountability, efficiency, and equity. A wide range of contextual factors, however, complicates straightforward emphasis on these formal interactive organizational arrangements – factors that include background politics and power relations, socio-cultural norms, and government and civil society organization (CSO) capacity.

Reformers need to both incorporate the influence of such factors into legal and institutional designs and acknowledge important limitations – at least in the short run – in the ability to mitigate many of these conditions.

The public function is naturally depositary of the public trust, which is indispensable for improving the quality of life, the civil life, the social cohesion, the mutual respect, the economy of decisions making. The cost of the lack of trust in Institutions is a huge cost for the whole society both from a moral and economic perspective. Negligence, delays, non executions, as well as unfair behaviours, corruption, nepotism are claimed by citizens sound reactions by Institutions, which sometimes seems to tolerate privileges and illegal conditions.

Three issues seem of critical relevance in the years to come, particularly in view of the challenges posed by the achievement of the Millennium Development Goals (MDG) and by recent events of great impact. These include: (1) Improving Economic and Social Decision Making Institutions and Processes; (2) Strengthening Integrity, Transparency and Accountability; (3) Reconciling Security Requirements with Demands for Social Service Delivery.

Integrity, transparency and accountability in government are also critical in ensuring that the principles contained in the MDGs are translated into daily action, i.e. in ensuring that government officials act in open, transparent, and accountable ways in managing scarce resources and that they take decisions in the public interest. The second major challenge for public administration is therefore that of building and strengthening management and accountability systems, promoting integrity in the public sector, fighting corrupt practices; developing transparent and fair public procurement systems; introducing financial and management control and evaluation mechanisms, maximizing the utilization of ICT, for efficiency and transparency.

By addressing these challenges, countries will not only facilitate the flow of additional resources for development, but will also ensure that these resources be used efficiently, effectively and thus maximize their impact on the development process.

CONCLUSION

One of the central tasks for an adequate theory of PA is to give an account of collapse and failure. Each type of failure discussed above (corruption and bribery) represents a recognizable and frequently encountered family of shortcomings, regularly appears in different guises and contexts and serves to trigger-off ideas about how to organize to correct or avoid such failings. The sort of organization that remains passive, sunk in inappropriate routines, and unable to plan or take initiative even in the face of palpable disaster is not likely to be the same sort of organization that makes large-scale of corrective policies taking into account the whole range of citizen's interests. Corruption, in which individual interests are placed before anything else, as widely argued above, can often contribute dramatically to disaster. An unrecognized clash of opposing interests or mixture of different interests biases seems to be one of the major triggers for several well-known mechanisms which produce reverse effects in policy and organization.

Despite the advent of the NPM, the new rules and laws have not yet started the desired effect, as the downsizing public sector, increasing transparency about the actions taken by public managers, the limitations of behavior that isn't consistent with the general aims of the reference community. The old bureaucratic model of PA, was based on the *ex-ante* compliance rules, but the growth of complexity and relative abundance of public functions and services has created market failures and, in particular, the emergence of opportunistic behaviors and corrupt practices. Corruption, if continued over time, can weaken the whole system, so is fair to add to a simple *ex-ante* control an alongside *ex-post* evaluation of results achievements. At the same time, increase the stringency of controls, increase the powers of administrative authorities, could lead to increase complexity and to create longer and less clear decision-making processes. According to our hypothesis it's necessary to take some important and timely interventions explained below.

- a) Implement a social control and not just a bureaucratic control. That means to create some tools of communication (social balance, budget office, report) to grant citizens participation to political choices in the planning, managing and control phases.
- b) Implement new models of accountability, dependability and governance because the damage connected to phenomena of irregularity and corruption leads to serious negative consequences (Court of Auditors, 2009):
 - Economic, when resources diverted to other purposes and unlawful failure to achieve the objective of determining the development or support the economy;
 - Public safety, as these resources end up financing criminals circuits
 - Social, since these phenomena undermine the credibility of national and international public institutions.
- c) Redefine the models of spoils system to ensure independence and accountability in the selection and appoint public managers.
- d) Review the pattern of recruitment and evaluation of public employees and directors to provide award fees or penalties commensurate with the results achieved or not achieved.

- e) Create inter-institutional task force to support collaboration and transfer of data (databases). It's necessary to allow citizens and all other stakeholders to assess the actions taken from planning to implementation of strategies.
- f) Create anti-corruption networks between Institutions and specific Authority ("watch dog").

Obviously no one of these levers alone is able to resolve the problem of corruption, particularly when deposited on a long time and widespread and socially accepted. It must take coordinated measures to involve and raise awareness among citizens and authorities to a widespread public culture and highlight benefits and collective well-being that a less corrupt society may generate, increasing confidence and transparency toward its citizens.

THE EFFECT OF INVESTING IN HIRING, HUMAN RESOURCE PLANNING, AND EMPLOYEE DEVELOPMENT ON LABOR PRODUCTIVITY: CASE OF LEBANON

Fahed-Sreih, Josiane¹

¹Associate Professor of Management, Department of Economics and Management, School of Business, Lebanese American University, P.O. Box 36, Byblos, Lebanon

This paper examines the factors that contribute towards enhancing Labor productivity. Three main areas are studied, namely investing in human resources hiring, human resource planning, and employee development. Responses were received from 527 human resource managers or small businesses managers. Results showed that there is a positive relationship between formal HR planning, formal evaluation of hiring policies, succession plans and labor productivity. However, results showed a negative relationship between formal planning, career path and labor productivity. On the other hand, there seems to be a negative relationship between skills selection test and aptitude selection test with labor productivity. Moreover, the number of candidates interviewed in a hiring process, is the most significant variable, whereas search firms are the least significant. The study found a positive relationship between promotion from within and labor productivity. On the other hand, there seems to be a negative relationship between training of employees and labor productivity. Moreover, the only significant result among the above three variables is promotion from within.

After testing for each variable alone, testing for the overall significance proved that there is a positive relationship between some of the independent variables in the model with labor productivity.

Keywords: Labor Productivity, Human Resources, Hiring, Planning, Employee Development, Capital Intensity, Lebanon

INTRODUCTION

The organizational factor that is most likely to provide potential competitive advantage is human resources and how these resources are managed. The most effective organizations find unique ways to attract retain and motivate employees, a strategy that is hard to imitate. The success of an organization comes from managing people effectively and providing them with a safe working environment, the best opportunities and paths to advance. Human resource management is the utilization of individuals to achieve organizational objectives. Consequently, managers at every level must concern themselves with the human resource management. Five functional areas are associated with effective human resource management: Staffing, human resource development, compensation and benefits, safety and health, and employee and labor relations.

Staffing is the process through which an organization insures that it always has the proper number of employees with appropriate skills in the right jobs at the right time to achieve the organization's objectives. Staffing involves job analysis, human resource planning, recruitment and selection. All areas of staffing would be haphazard if the recruiter did not know the qualifications needed to perform the various jobs. Lacking up-to-date job descriptions and specifications, a firm would have to recruit and select employees for jobs without having clear guidelines; this practice could have disastrous consequences. Job analysis is conducted after the job has been designed, the worker has been trained and the job is being performed. Human resource planning involves matching the internal and external supply of people with job openings anticipated in the organization over a specified period of time. Because conditions in the external and internal environments can change quickly, the human resource planning

process must be continuous. Changing conditions could affect the entire organization, thereby requiring extensive modification of forecasts. Planning, in general, enables managers to anticipate and prepare for changing conditions and human resource planning, in particular allows flexibility in the area of human resource management. Human Resource development is a major human resource management function that consists not only of training and development but also of individual career planning and development activities, organization development, and performance appraisal, an activity that emphasizes training and development needs. Training is designed to provide learners with the knowledge and skills needed for their present jobs. Development involves learning that goes beyond today's job; it has a more long term focus. Career planning is an ongoing process whereby an individual sets career goals and identifies the means to achieve them. This is a continuing and difficult process because the average person graduating from college today may face five to seven career changes in his working years. Career development: is a formal approach used by the organization to ensure that people with the proper qualifications and experiences are available when needed. Individual careers and organizational needs are not separate and distinct. Organizations should assist employees in career planning so the needs of both can be satisfied. Organization development is the planned process of improving an organization by developing its structures systems and processes to improve effectiveness and achieving desired goals. Organizational development applies to an entire system such as a company or plant. Performance appraisal is a formal system or review and an evaluation of individual or team task performance. It affords employees the opportunity to capitalize on their strengths and overcome identified deficiencies, thereby helping them to become more satisfied and productive employees. Job specification information often proves beneficial in identifying training & development needs. If the specification suggests that the job requires a particular knowledge, skill or ability and the person filling the position does not possess all the qualifications required, training and development are probably in order. They should be directed at assisting workers in performing duties specified in their present job descriptions or preparing them for broader responsibilities. With regard to performance appraisal, employees should be evaluated in terms of how well they accomplish the duties specified in their job descriptions and any specific goals that may have been established. A manager who evaluated an employee on factors not clearly predetermined is left wide open to allegations of discrimination.

The question of what constitutes a fair days pay has plagued management, unions, and workers for a long time. A well-thought-out compensation system provides employees with adequate and equitable rewards for their contributions to meeting organizational goals. In the area of compensation, it is helpful to know the relative value of a particular job to the company before a dollar value is placed on it. From an internal perspective, the more significant its duties and responsibilities, the more the job is worth. Jobs that require greater knowledge, skills, and abilities should be worth more to the firm. For example, the relative value of a job calling for a master's degree normally would be higher than that of a job that requires a high school diploma.

Safety involves protecting employees from injuries caused by work-related accidents. Health refers to the employee's freedom from physical or emotional illness. These aspects of the job are important because employees who work in a safe environment and enjoy good health are more likely to be productive and yield long-term benefits to the organization. Information derived from job analysis is also valuable in identifying safety and health considerations. For example, employers are required to state whether a job is hazardous. The job description should reflect this condition. In addition, in certain hazardous jobs, workers may need specific information about the hazards in order to perform the jobs safely.

A business firm is required by law to recognize a union and bargain with it in a good faith if the firm's employees want the union to represent them. In the past, this relationship was an accepted way of life for many employers. But most firms today would like to have a union-free environment. When a labor union represents firm's employees, the human resource activity is often referred to as industrial relations which handle the job of collective bargaining.

Job analysis information is also important in employee and labor relations. When employees are considered for promotion, transfer, or demotion, the job description provides a standard for evaluation and comparison of talent. Regardless of whether the firm is unionized, information obtained through job analysis can often lead to more objectives human resource decisions.

LITERATURE REVIEW

This paper tackles the way in which human resources function in organizational setting, and the effect of human resource functions on labor productivity. It is important to note that the study of the impact of human resource management on organizational performance contributed to a better understanding of human resource decisions in creating and sustaining organizational performance and a competitive advantage in order to demonstrate to senior managers that their human resource systems represent a largely untapped opportunity to improve firm performance. (Becker, Gerhart, 1996). The study was built upon a review of the cumulative literature of acute point estimates of the HR- firm performance. In studying the literature on this subject, it was noticed that HR decisions influence organizational performance in a way that they must either improve efficiency or contribute to revenue growth. However, the new interest in HR as a strategic lever that can have economically significant effects on a firm's bottom line aimed to shift the focus more toward value creation, which suggests that HR contributes directly to the implementation of firms' objectives. Still, the mechanisms by which HR decisions create and sustain value are not understood and complicated. In this respect, most studies suggest that an HR system can be a unique source of sustained competitive advantage especially when its components have high internal and external fit. These papers look directly at the impact of HR decisions on performance outcomes that have clear meaning and relevance to managers such as stock performance, productivity, profits, quality, and organizational survival. Finally, emphasis was placed on the fact that HR strategies that are deeply embedded in an organization are hard to imitate due to casual ambiguity and/or path dependency, policies are developed over time.

The study suggests that further work must be done regarding the relationship between a firm's HR system and the bottom line, since none of the studies thus far used business-unit-level outcomes indicating the difficulty of measuring performance at this level. It was also noted that a major disconnect exists between the literature review suggestions on what firms must do and what firms actually do. This can be explained by the fact that there should be a better communication between the academic and management communities so that research findings can have a greater influence on actual policy. Hence, since the choice of HR systems can have an economically significant effect on firm performance, HR managers must not ignore the importance of the strategic role of the HR function so that the function won't be left with traditional transaction and compliance activities and be forced to justify itself on a cost basis rather than being assessed based on value creation measurements, as the study concludes. Another study examined the role of strategic reference points in explaining the nature and consequences of human resource strategy (Bamberger, Fiegenbaum, 1996). This study examined how managers use strategic reference points or benchmarks to guide their strategic decision making with regard to human resource issues and how these benchmarks can affect the performance-based consequences of such decisions. The study developed propositions

regarding the likely configuration of such reference points and their impact on the nature of HR policies and practices, to explain how the management of strategic reference points fit and consensus can reduce the likelihood that HR policies and practices will have a negative effect on a firm's performance, and the implications of this issue organization wide. In this article, the theoretical underpinnings of benchmarking are explored by examining strategic reference points at both the organizational and sub organizational or system levels. Strategic reference points are the targets or benchmarks that managers use to evaluate choices, to make strategic decisions, and to signal to other key personnel their system wide or organizational priorities. The goal in this article is to show how the strategic reference point construct might allow researchers to integrate each of these elements into a comprehensive theory explaining managerial behavior and decision making in the development of HR systems and to use strategic reference point theory to enhance researchers' understanding of the occasionally contradictory findings regarding the link between HR policies and practices and a firm's performance. The paper begins by presenting a brief review of strategic reference points theory. Then, applying the concept at the system level, it discusses the nature and determination of the reference points relevant to the HR system, and it examines how the configuration of strategic reference points may influence HR managers' decisions to select more daring HR policies and practices over more conservative strategies, to finally describe how the management of strategic reference points fit and consensus can affect the likelihood that such strategies will have a negative effect on firm performance. The study found that in the context of strategic reference points theory, benchmarking in the HR system may be seen as much more than a new managerial tool. From an strategic reference point perspective, benchmarking is not so much an innovative managerial practice as it is a cognitive process underlying much of what researchers know about managerial strategic decision making, thus, managers are likely to adopt policies and practices that may be more daring or less daring in nature based on these benchmarks results; these policies and practices may, in turn, have a direct effect on a firm's overall performance. Under conditions of limited strategic reference points fit and consensus, the potential for the HR system to have a negative effect on a firm's performance may be heightened. Thus, by showing how managers establish system-level policies and practices on the basis of comparisons with internally, externally, and temporally based targets, the model provides a much needed link between strategy and policy at the firm level and implementation and practice at the system or sub organizational level. The study concludes that the HR strategic reference point model provides an additional means by which to move away from the more traditional, rational-economic foundations of HR management and toward a body of theory more solidly grounded on notions of cognition and micro-politics, and that a movement in this direction may help reduce the gap between HR theory and managerial practice. This article also reinforces recent efforts to move HR strategy research away from its prescriptive roots and toward description and analysis. Other studies showed the effect of human resource management systems on economic performance and compared US and Japanese plants (Ichniowski, Shaw, 1999). The study elaborated on the effects of Japanese and U.S. human resource management practices on worker productivity, using personally collected data from 41 steel production lines, to develop models of the productivity of these lines; each line was toured by the experimenters with either an experienced engineer, area operations manager or superintendent. The study found that Japanese production lines employ a common system of HRM practices including: problem-solving teams, extensive orientation, training throughout employees' careers, extensive information sharing, rotation across jobs, employment security, and profit sharing. On the other hand, a majority of U.S. plants now have one or two features of this system of HRM practices, but only a minority has a comprehensive system of innovative work practices that parallels the full system of practices found among the Japanese

manufacturers. In fact, the results revealed that the Japanese lines are significantly more productive than the U.S. lines. However, U.S. manufacturers that have adopted a full system of innovative HRM practices patterned after the Japanese system, achieve levels of productivity and quality equal to the performance of the Japanese manufacturers. This study's evidence helps reconcile conflicting views about the effectiveness of adopting Japanese-style worker involvement schemes in the United States. United States manufacturers that have adopted a definition of employee participation that extends only to problem-solving teams or information sharing do not see large improvements in productivity. However, U.S. manufacturers that adopt a broader definition of participation that mimics the full Japanese HRM system see substantial performance gains. Other studies examined two alternative views, universal and contingency views, of the human resources-performance relationship in manufacturing settings (Youndt, Snell, Dean, 1996). According to the contingency approach to strategic human resource management, if a firm's approach to competition depends on the talents or capabilities of employees, then HR practices would affect performance or else the connection between HR and performance would be minimal. On the other hand, the universal approach to strategic human resource management stated that human resource activities should have a high degree of internal consistency, such as having training and selection activities correlated with both productivity and firm performance. However, there are notable differences across the studies, as to what constitutes a "best practice". The study was based on data collected from a survey of 97 plants, the information was processed using regression analysis, studying the relationship between HR systems, manufacturing strategy, and multiple dimensions of operational performance such as customer alignment, machine efficiency and employee productivity. The analysis of results showed that the apparent main effect of human-capital-enhancing human resources on performance is a function of the performance obtained when firms link of human-capital-enhancing human resource systems with a quality manufacturing strategy as well as other manufacturing strategies that altogether moderated the HR-performance relationship.

However, the study could not conclude that there are strong universal or "best practice" approaches to human resource management. Instead, results were more supportive of a contingency approach to human resource management. Further research examined the impact of workplace practices, information technology, and human capital investments on productivity, to get a better understanding of the effects of those variables on productivity (Black, Lynch, 2001). Using data from a unique nationally representative sample of businesses, they estimated an augmented Cobb-Douglas production function with both cross section and panel data covering the period of 1987-1993, using both within and GMM estimators. The study was able to examine these factors on a broader cross section of employees, unlike previous studies that have focused on one particular industry, product, or even firm. The study found that it is not whether an employer adopts a particular work practice or a TQM system per se that raises productivity, but rather how that work practice is actually implemented within the establishment that is associated with higher productivity. Results showed that unionized establishments that have adopted human resource practices that promote joint decision making coupled with incentive-based compensation have higher productivity than other similar nonunion plants, whereas unionized businesses that maintain more traditional labor management relations have lower productivity. Thus, allowing greater employee voice in decision making raises labor productivity. The results also showed that plant productivity is higher in businesses with more-educated workers or greater computer usage by non managerial employees and that having a profit sharing system also has a positive effect on productivity.

SAMPLING AND METHODOLOGY

The sample

The sample consisted of 527 questionnaires which were circulated to different organizations in Lebanon across various regions, mainly to human resource managers or managers of small-sized firms that do not have a human resource department.

The questionnaire aimed at obtaining data related to year of establishment, legal form of the company, industry type, whether the business is a family business or not, job title of the person filling out the questionnaire, net sales, number of employees, employee productivity relative to competition, formal planning of the number and skills of employees, formal evaluation of hiring policies, existence of succession plans and career paths, number of candidates interviewed per position, sources of employment, selection tests used in recruitment, whether training programs exist and the number of trainings per year, whether the company invests in R&D, and the amount of the R&D expense, and the amount of total assets in the company.

Out of the 527 data sampled 280 (53 %) were family businesses, whereas 47 % were non-family businesses. Moreover, the legal forms of the companies are distributed as follows:

<i>Legal Form</i>	<i>Number of Companies</i>	<i>% out of Total</i>
<i>Family Limited Partnership</i>	35	6.64%
<i>Holding</i>	8	1.52%
<i>No Answer</i>	1	0.19%
<i>Off-shore Company</i>	7	1.33%
<i>Other</i>	26	4.93%
<i>Partnership</i>	25	4.74%
<i>S.A.L.</i>	149	28.27%
<i>S.A.R.L.</i>	174	33.02%
<i>Sole Proprietorship</i>	102	19.35%
TOTAL	527	100.00 %

The companies that were sampled ranged from very old to very recent. The following table gives a view of the years of establishment:

<i>Year Established</i>	<i>Number of Companies</i>	<i>% out of Total</i>
<i>Before 1900</i>	11	2.09%
<i>Between 1901 and 1974</i>	83	15.75%
<i>Between 1975 and 1990</i>	116	22.01%
<i>Between 1991 and 2000</i>	164	31.12%
<i>2001 Until Current</i>	126	23.91%
<i>Not mentioned in the Survey</i>	27	5.12%
TOTAL	527	100.00 %

As for the size of the companies in terms of the number of employees, the following table gives an insight about the data collected:

<i>Range</i>	<i>Number of Employees</i>	<i>% out of Total</i>
<i>Less than 10</i>	161	30.55%
<i>Between 10 and 50</i>	225	42.69%
<i>Between 51 and 100</i>	44	8.35%
<i>Between 101 and 500</i>	65	12.33%
<i>Between 501 and 1000</i>	16	3.04%
<i>Above 1001</i>	16	3.04%
TOTAL	527	100.00 %

The main aim of the study is to examine the factors that affect labor productivity. Investments in planning, hiring, and employee development are tested to measure their influence on labor productivity. The study was conducted by circulating questionnaires to firms in Lebanon. The data was collected by a team of graduate students at the Lebanese American University. The data was collected from different companies and firms belonging to diverse sectors in the Lebanese economy. According to the Lebanese Ministry of Economics and Trade, the breakdown of the GDP by sector is:

SECTOR	% of GDP
<i>Agriculture</i>	6.3
<i>Energy and Water</i>	1.5
<i>Manufacturing</i>	13.5
<i>Construction</i>	9.4
<i>Transport and Communication</i>	5.3
<i>Housing</i>	8.5
<i>Market Services</i>	22.6
<i>Trade</i>	21.3

<i>Non-Market Services</i>	11.6
TOTAL	100

In the questionnaire used in this study, the industry types were the following:

SECTOR
<i>Agriculture</i>
<i>Construction</i>
<i>Finance</i>
<i>Insurance</i>
<i>Real estate</i>
<i>Manufacturing</i>
<i>Transportation and Communications</i>
<i>Wholesale and retail</i>
<i>Services</i>
<i>Other</i>

In order to measure whether the sample of companies is a valid representation of the Lebanese Economy, the percentage per industry was measured and compared to the data provided by the Lebanese Ministry of Economy and Trade. However, the division of sectors was not all the same, therefore, a re-categorization of the sectors used in the questionnaire took place, in order to make them compatible with the data provided by the Lebanese Ministry of Economy and Trade. The re-categorizing is as follows:

SECTOR (AS PER QUESTIONNAIRE)	SECTOR (AS PER MINISTRY OF ECONOMY AND TRADE)
<i>Agriculture</i>	<i>Agriculture</i>
<i>Construction</i>	<i>Construction</i>
<i>Finance</i>	<i>Trade</i>
<i>Services</i>	<i>Market Services</i>
<i>Real estate</i>	<i>Housing</i>
<i>Manufacturing</i>	<i>Manufacturing</i>
<i>Transportation and Communications</i>	<i>Transportation and Communications</i>
<i>Wholesale and retail</i>	<i>Trade</i>
<i>Insurance</i>	<i>Market Services</i>
<i>Other</i>	<i>Other</i>

Accordingly, the following table shows the percentage distribution of the different sectors that the data collected represents versus the percentage of GDP:

<i>SECTOR</i>	<i>DISTRIBUTION OF SAMPLE DATA</i>	<i>% DISTRIBUTION OF SAMPLE DATA</i>	<i>% of GDP</i>
<i>Agriculture</i>	6	1.14	6.3
<i>Energy and Water</i>	0	0.00	1.5
<i>Manufacturing</i>	63	11.95	13.5
<i>Construction</i>	20	3.80	9.4
<i>Transport and Communication</i>	14	2.66	5.3
<i>Housing</i>	8	1.52	8.5
<i>Market Services</i>	194	36.81	22.6
<i>Trade</i>	195	37.00	21.3
<i>Non-Market Services</i>	0	0	11.6
<i>Other</i>	18	3.42	0
<i>No Answer</i>	9	1.71	0
TOTAL	527	100	100

First, the Agriculture sector of the data constitutes 1.14 % of the total sample collected. Whereby, the Lebanese Agriculture represents 6.3 % out of the total economy. This could be due to the fact that the data collection covered mainly the geographical areas of Mount Lebanon and few areas of Beirut; while the main agricultural firms are in the Bekaa region. Second, the energy and water sector is not represented at all in this study. However, this is a relatively minor sector, only 1.5 % of the GDP. Third, manufacturing is very well represented in the data sample since it comprises 11.95 % of the data collected, whereby it also represents 13.5 % of the Lebanese Economy. Fourth, both construction and transportation and communication sectors were represented in the sample data, with a percentage almost half of that of the Lebanese Economy. Fifth, the housing sector represents 1.52 % of the data versus 8.5 % of the GDP. So, this sector is not very well represented in the sample. Sixth, both market services and trade form the heart of the sample data collected since they accumulate to 74 % of the total firms that filled out the questionnaire. These sectors are considerably the largest as well in the Lebanese Economy, with a cumulative percentage of 44 % out of the total GDP.

In general, the allocation of the data collected in the Lebanese Sectors of Economy are well distributed and not clustered in specific industry types

Statistical Model and Definition of the Variables

The statistical tool used in this study is the SPSS version 15.0, based on the 95% confidence interval with $\alpha = 5\%$ being our tolerance level of type I error. A linear regression model is constructed whereby the dependent variable is Labor Productivity (measured by the total output "average net sales" divided by the total input "number of employees"), and the main explanatory variables in the model are: HR investment in planning, hiring, and development.

However, each of these three independent variables is explained by more than one variable, as in the following table:

	<i>Independent Variable</i>	<i>Label</i>
<i>Investment in Planning</i>	<i>Formal planning for number of employees</i>	<i>A.1</i>
	<i>Formal planning of skills</i>	<i>A.2</i>
	<i>Formal Evaluation of hiring policies</i>	<i>A.3</i>
	<i>Succession plans</i>	<i>A.4</i>
	<i>Career path</i>	<i>A.5</i>
<i>Investment in Hiring</i>	<i>Number of candidates interviewed</i>	<i>B.1</i>
	<i>Recruitment Source: Employee Referrals (Labeled as S1)</i>	<i>B.2</i>
	<i>Recruitment Source: Graduate and undergraduate institutions (Labeled as S2)</i>	<i>B.3</i>
	<i>Recruitment Source: Search firms (Labeled as S3)</i>	<i>B.4</i>
	<i>Recruitment Source: Private and governmental employment agencies (Labeled as S4)</i>	<i>B.5</i>
	<i>Recruitment Source: Walk-ins (Labeled as S5)</i>	<i>B.6</i>
	<i>Recruitment Source: Newspaper advertisements (Labeled as S6)</i>	<i>B.7</i>
	<i>Recruitment Source: Internet advertisements (Labeled as S7)</i>	<i>B.8</i>
	<i>Selection Test: Skills</i>	<i>B.9</i>
	<i>Selection Test: Aptitude</i>	<i>B.10</i>
	<i>Selection Test: Behavioral</i>	<i>B.11</i>
	<i>Selection Test: Medical</i>	<i>B.12</i>
<i>Investment in Employee Development</i>	<i>Offer training for employees</i>	<i>C.1</i>
	<i>Promotion from within</i>	<i>C.2</i>
	<i>Number of annual formal training programs</i>	<i>C.3</i>

The main equation of the model constructed in the study is:

$$\text{Labor Productivity} = \beta_0 + \beta_i(\text{Investment in Planning}) + \beta_j(\text{Investment in Hiring}) + \beta_k(\text{Investment in Employee Development})$$

Substituting the labels of the above table in the model equation would yield:

$$\text{Labor Productivity} = \beta_0 + \beta_1 * A.1 + \beta_2 * A.2 + \beta_3 * A.3 + \beta_4 * A.4 + \beta_5 * A.5 + \beta_6 * B.1 + \beta_7 * B.2 + \beta_8 * B.3 + \beta_9 * B.4 + \beta_{10} * B.5 + \beta_{11} * B.6 + \beta_{12} * B.7 + \beta_{13} * B.8 + \beta_{14} * B.9 + \beta_{15} * B.10 + \beta_{16} * B.11 + \beta_{17} * B.12 + \beta_{18} * C.1 + \beta_{19} * C.2 + \beta_{20} * C.3$$

Three different regression models are tested:

- 1) In the first model, the objective is to test the individual effect of **investment in planning** on **labor productivity**.
- 2) In the second model, the objective is to test the individual effect of **investment in hiring** on **labor productivity**.
- 3) In the second model, the objective is to test the individual effect of **investment in employee development** on **labor productivity**.

Measurements and Estimation Technique

Measurements for each of Labor Productivity, Investment in Planning, Investment in Hiring, and Investment in Employee Development are based on a number of factors. For instance concerning labor productivity, the measurement was done based on the company's net sales and the company's number of employees and whether the company's employee rate high as compared to competition. Concerning investment in planning, five distinct bases of investment in planning were used in this study. Whether the business unit formally plans for the number of workers needed to run the business in the future, or whether the business formally plans for the skills needed to run the business in the future, or whether the human resource department formally evaluates its hiring policies on a regular basis and whether the company has succession plans, and is able to replace any individual worker when necessary, and whether the company provides its employees with a clear career path. Concerning investment in hiring, three distinct bases of investment in hiring were used in this study. The number of candidates interviewed on average for every employee hired, the recruitment source, and the selection tests. Three distinct bases show the indicators that measured Investment in Employee Development, and they are whether the company offers training to its employees, whether the company utilizes promotion from within as a primary method for filling vacancies, and whether the company offers formal training to employees.

This study uses a linear regression model to analyze the data. The data were transformed from the questionnaire to the SPSS by substituting the value "1" for "YES" and "2" for "NO", whereby "0" was used to indicate "No answer".

RESULTS

Descriptive Statistics

The following tables give the descriptive statistics of the following variables:

- Highly productive relative to competition
- Investment in R&D
- Expense of R&D
- Personal Opinion on whether investment in planning, hiring and employee development, affect labor productivity.

Statistics

		<i>Highly.Productive.Relat ive.to.Competition</i>	<i>Invest .RnD</i>	<i>Expense.RnD</i>	<i>HR.Invest.Effect .on.Labor.Produc tivity</i>
<i>N</i>	<i>Valid</i>	527	527	527	527
	<i>Missing</i>	0	0	0	0
<i>Mean</i>		1.08	1.59	.63	1.20
<i>Std. Error of Mean</i>		.012	.022	.040	.027
<i>Median</i>		1.00	2.00	.00	1.00
<i>Mode</i>		1	2	0	1
<i>Std. Deviation</i>		.277	.504	.917	.629

Variance	.077	.254	.841	.395
Range	1	2	4	3
Minimum	1	0	0	0
Maximum	2	2	4	3

Highly.Productive.Relative.to.Competition

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	YES	483	91.7	91.7	91.7
	NO	44	8.3	8.3	100.0
Total		527	100.0	100.0	

Highly.Productive.Relative.to.Competition

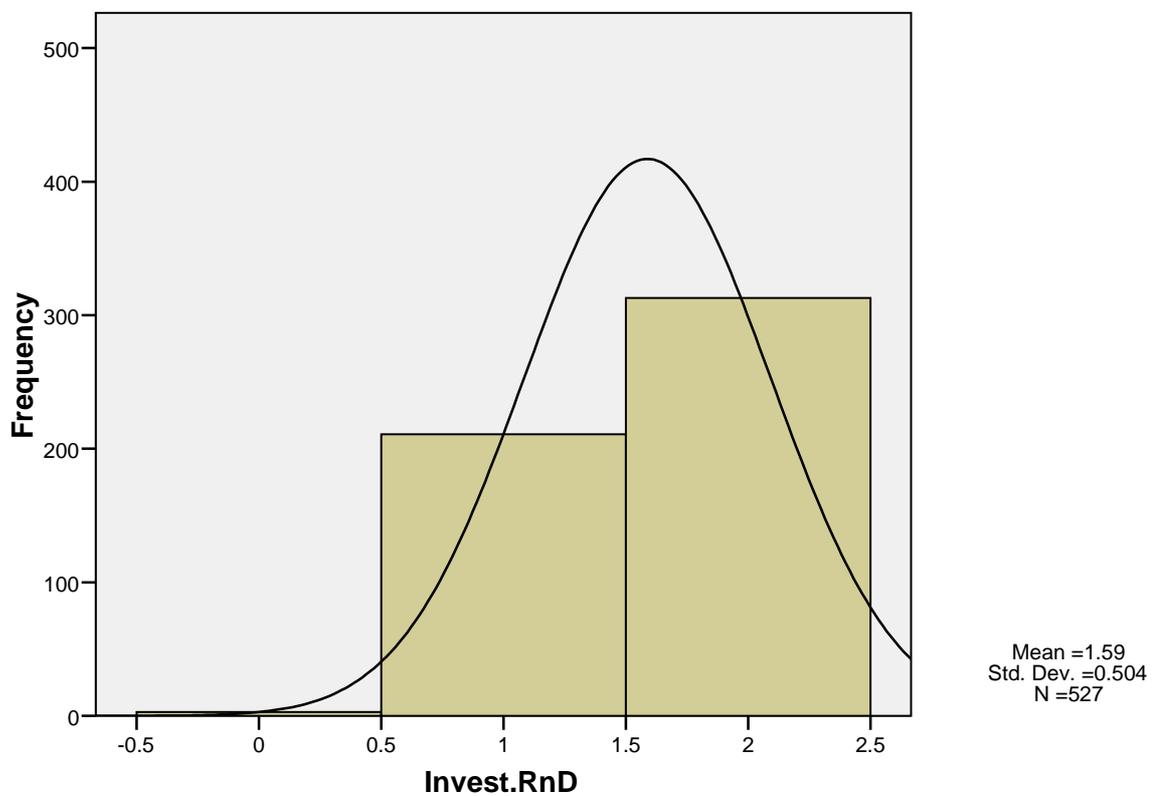

The above statistics show that 91.7 % of the survey answered that their employees are highly productive relative to competition, which is a very good indication.

Invest.RnD

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	0	3	.6	.6	.6
	YES	211	40.0	40.0	40.6
	NO	313	59.4	59.4	100.0
	Total	527	100.0	100.0	

Invest.RnD

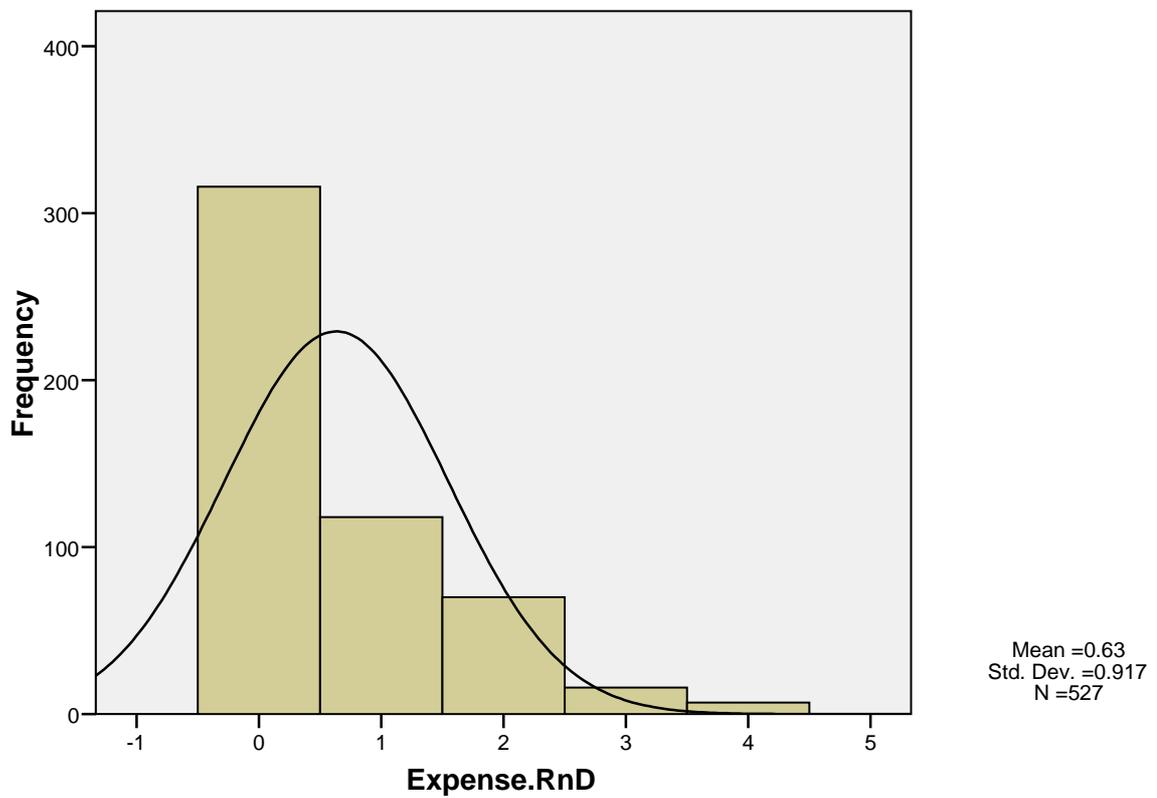

The above statistics show that only 40 % of the survey answered that their companies invest in Research and Development, whereby more than half of the firms affirmed that they do not invest in R&D at all. These results were expected since very few sectors of the Lebanese Economy consider investment in R&D.

Expense.RnD

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	No Answer	316	60.0	60.0	60.0
	Less than 5 %	118	22.4	22.4	82.4
	Between 5.1 % & 10 %	70	13.3	13.3	95.6
	Between 10.1 % & 20 %	16	3.0	3.0	98.7
	More than 20.1 %	7	1.3	1.3	100.0
	Total	527	100.0	100.0	

Expense.RnD

The above statistics show that out of the 40 % that invest in R&D, the majority spend an amount equivalent to 5 % or less of their total assets on R&D.

HR.Invest.Effect.on.Labor.Productivity

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	0	7	1.3	1.3	1.3
	Positively	459	87.1	87.1	88.4
	Negatively	7	1.3	1.3	89.8
	No Effect	54	10.2	10.2	100.0
	Total	527	100.0	100.0	

HR.Invest.Effect.on.Labor.Productivity

The above statistics give the results of the last question in the survey which indicates that 87.1 % affirm that there is a positive relationship between investing in human resource planning, hiring, employee development and labor productivity. Whereby, 1.3 % actually believes that there is a negative relationship between the variables stated and almost 10 % consider that there is no effect between investment in human resource and labor productivity.

Regression Results

The following two tables show the results for model 1:

Model 1 Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	.129 ^a	.017	.006	248853.236	.017	1.584	5	467	.163

Coefficients of Model 1:

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	38240.471	51770.337		.739	.460
	Formal.Planning.No. of.Employees	10746.134	31628.553	.019	.340	.734
	Formal.Planning.Skills	-46486.5	35176.170	-.075	-1.322	.187
	Formal.Evaluation. Hiring.Policies	45938.510	26778.006	.090	1.716	.087
	Succession.Plans	41155.095	26456.556	.077	1.556	.120
	Career.Path	-30289.2	25309.273	-.060	-1.197	.232

a. Dependent Variable: Labor.Productivity

Model 1 shows that there is a positive relationship between formal planning of number of employees, to formal evaluation of hiring policies and succession plans with labor productivity. On the other hand, there seems to be a negative relationship between formal planning of skills and career path with labor productivity. Moreover, formal evaluation of hiring policies, formal planning of skills and succession plans are more significant than career path and formal planning of number of employees.

$R^2 = 1.7\%$ and the adjusted $R^2 = 0.6\% \Rightarrow$ which means that 0.6% of variation in Labor Productivity is explained by the regression model (Investment in Planning) after taking into consideration the degrees of freedom and the number of independent variables.

The following two tables show the results for model 2:

Model 2 Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	.129 ^a	.017	-.010	253091.365	.017	.636	12	451	.811

Coefficients of Model 2

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-150592	218878.7		-.688	.492
	No.Candidates. Interviewed	863.092	683.118	.060	1.263	.207
	S1	15370.878	25547.107	.031	.602	.548
	S2	26592.430	28978.300	.048	.918	.359
	S3	1348.065	47808.626	.001	.028	.978
	S4	13268.511	58344.400	.011	.227	.820
	S5	29918.882	29116.190	.052	1.028	.305
	S6	-29099.8	27292.991	-.055	-1.066	.287
	S7	41721.372	52681.889	.038	.792	.429
	Selection.Test.Skills.Test	-8372.291	26321.612	-.016	-.318	.751
	Selection.Test.Aptitude. Test	-1194.310	32191.006	-.002	-.037	.970
	Selection.Test. Behavioral.Test	7820.584	25694.718	.015	.304	.761
	Selection.Test.Medical. Exam.Test	19733.744	38597.675	.026	.511	.609

a. Dependent Variable: Labor.Productivity

Model 2 shows that there is a positive relationship between the number of candidates interviewed, employee referrals (labeled as S1), graduate and undergraduate institutions (labeled as S2), search firms (labeled as S3), private and governmental employment agencies (labeled as S4), walk-ins (labeled as S5), internet advertisements (labeled as S7), behavioral selection test and medical selection test with labor productivity. On the other hand, there seems be a negative relationship between newspaper advertisement (labeled as S6), skills selection test and aptitude selection test with labor productivity. Moreover, number of candidates interviewed is the most significant variable, whereas search firms (labeled as S3), is the least significant.

$R^2= 1.7\%$ and the adjusted $R^2=1 \%$ => which means that 1% of variation in Labor Productivity is explained by the regression model (Investment in Hiring), after taking into consideration, the degrees of freedom and the number of independent variables.

The following two tables show the results for model 3:

Model 3 Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	.093 ^a	.009	.002	252843.574	.009	1.328	3	453	.265

Coefficients of Model 3

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	12257.358	44469.364		.276	.783
	Training.Employees	-1038.418	27577.693	-.002	-.038	.970
	Promotion.From.Within	46698.696	24179.628	.092	1.931	.054
	No.Formal.Trainings	-118.670	385.833	-.014	-.308	.759

a. Dependent Variable: Labor.Productivity

Model 3 shows that there is a positive relationship between promotions from within and labor productivity. On the other hand, there seems be a negative relationship between training of employees and number of formal trainings with labor productivity. Moreover, the only significant result among the above three variables is promotion from within.

$R^2= 0.9\%$ and the adjusted $R^2 = 0.2 \%$ => which means that 0.2% of variation in Labor Productivity is explained by the regression model (Investment in Employee Development), after taking into consideration the degrees of freedom and the number of independent variables.

Contribution

This study is based on previous research by Koch and McGrath in the year 1996 that is conducted in the United States of America. However, the contribution of this study will be its implementation to the Lebanese market across various sectors. This is the only study conducted in Lebanon on the topic and considering the variables studied in the paper.

Significance

Today, Human Resource management is becoming more and more an imperative contemporary issue. The field of HR in Lebanon is relatively understudied. The importance of this study is that it covers a significant number of Lebanese Economical sectors with multiple explanatory variables.

DISCUSSION AND CONCLUSION

The study was conducted using a sample of 527 which is considered a good sample representing the Lebanese population; had the study covered a bigger sample size (population), it would have yielded better results. Moreover, the lack of statistical data in Lebanon made this study solely rely on questionnaires that might not be taken seriously by some respondents, and might have eventually led to biased results.

The study shows that there is a positive relationship between promotions from within and labor productivity. On the other hand, there seems to be a negative relationship between training of employees and number of formal trainings with labor productivity. Moreover, the only significant result among the above three variables is promotion from within.

This study contributes to considering the effect of participative leadership (which involves delegation, empowerment, and joint decision making) on employee motivation, loyalty, self-esteem, work attitudes (hence, on employee behavior as a whole), in organizations in Lebanon. The results that this paper came up with, clarify the nature of these relationships. In light of these results, and after testing for each variable alone, testing for the overall significance proved that there is a positive relationship between delegation, empowerment, joint decision making and employee behavior (measured by employee motivation, loyalty, self-esteem, and work attitudes). Delegation was the most statistically significant variable in this study.

In short, it can be clearly shown that participative leadership (particularly delegation) plays a crucial role in positively affecting the overall behavior of the employee in an organization in Lebanon.

Limitation of the study

As previously discussed, some of the Lebanese Economic sectors were either not represented or poorly represented (example, Energy and water). In addition, when computing the Labor productivity in terms of the average net sales, quantitative figures were missing on the questionnaire. Instead, they were substituted by ranges and the average per range was computed when inputting the data to the SPSS. However, both the upper and the lowest brackets were not represented in terms of averages, but in terms of upper or lower boundaries correspondingly.

Recommendations

It is of great importance that thorough future research is conducted to reinforce Human Resource Management in Lebanon in particular and the Middle East in general. Moreover, the belief in the effect of investing in Human Resource that would lead to increase in Labor productivity should be more elaborated and examined. Thorough research is needed so that the study comes up with better, more accurate and more significant results.

A MODEL OF DEVELOPMENT FOR “TERRITORY” AS A TOURISM PRODUCT AND THE ROLE OF BRANDS IN THE POSITIONING MAP. APPLICATION TO A MEDITERRANEAN AREA IN THE GLOBAL ECONOMY

Ferri, Maria Antonella¹; Aiello, Lucia²

¹Associate Professor: Strategy, Web Communication and Marketing, University of Rome “Mercatorum”

²Marketing and Communication PHD student, University of Salerno in Italy, Tutor in Marketing and Web Communication, University of Rome “Mercatorum”

In the new scenario dominated by globalization the transnational mobility of capital and people and re-localization of economic activity have strategic importance in different areas and regions. At the same time, external effects of the single territories have a fundamental role in economic development. As a result of these processes, government bodies responsible for local development need to improve how they operate with new function that respond to the need to equip the territory. They also need to organize a development plan capable of stimulating and facilitating productive investment and tourist flows.

The research starts from reflection on tourism through an operational research methodology in order to offer suggestions for tourism development in the Mediterranean.

The **phases of research** are:

- To define the main characteristics of a territory as a tourism product.
- To propose a modality of tourist development based on model “AS-IS TO-BE”.
- To present the positioning map of the tourism territory in the perspective of the proposed model.
- To reflect on the role of Quality Brands in positioning of tourist destination in the Mediterranean.
- Case study: Naples – historic district.

Objective of the present work is to explain and apply a model of development for territory marketing.

The general model is applied to a case study and can be adapted to any territory. The research shows the points of strength that “Mediterranean” area tourism has to offer.

The methodology is based in an innovative approach used in the interpretation of the statistical pointers and compares the present situation (As Is) with the ideal one (To Be), in relation to strategies and policies with levels of sustainable performance (Ferri M. F., Aiello L., 2009).

The objective is to connect the different elements of tourism system, to eliminate negative and to promote positive impact and in finally to improve efficiency.

In this context a policy of step-by-step development can guarantee stable improvement. In the light of the complexity of the object of the survey, a “bottom-up” approach has been applied.

The **final part** of the research explains the application of position maps for territory tourism product “to map” a Quality Brand of Naples as a core city of the Mediterranean.

Research limitation: the model proposed is inserted in a broader field of research of territory marketing that merely connected to the territory.

Keywords: Tourist destination – Position map – “AS-IS TO-BE” model.

METHODOLOGY NOTE

The concept of tourism⁹⁰ product is involved two perspectives: *business*, like product of the single *territorial* operator and like product "territory" (Martellotti, 2008).

Both must be coherent, in such optical it is necessary that the resources of the territory (economic, acclimatizes them, associate-cultural) come invested in the tourist product of the same one and is in this optical that speaks about tourist destination⁹¹ (Ejarque J., 2003).

The tourist destination is the fruit of the system management of the territory⁹², to aim to make available it to the tourist flows. From the tourism they derive, therefore, the following impacts: it generates wealth for the local actors, orients local the economic activities, it addresses the political activities and social, "it consumes" resources, it demands infrastructures, it produces to refusals and requirements of consumption (energy, water, transports).

The tourist product of a destination is given from the "sum" of the single products offers from the tourist companies presents on the territory.

In order to considerations proposed a model of tourist development, than part from the following requirements:

- to plan the participations aimed at the territorial development in a strategic optical of development;
- to pass from activation to performance of the process face to define a development model;
- to concert the local actors private publics and, being involved all the local, city actors comprised
- to support policies of territorial development in advantage of the tourist development;

⁹⁰ *The tourism's definition accepted to international level is "the term tourism is the activity carried out in humans - for fun, business or other reason - during travels and stays in a place outside their usual environment for a period less than one year" Definition of United Nations Statistical Commission (1993), session XXVII of ONU. In order this definition is the consumer that with his behaviour, when he buys and uses goods and services (commercial and non-commercial) such qualifying activities as tourism products.*

⁹¹ *Mussner, Pechlaner, Schoenhuber (1999) define the destination as "territorial space geographical defined, it is capable of expressing one or more tourism products, thanks to the presence of factors of attractiveness of natural and artificial, controlled and operated by an articulated set of actors among their coordinates with the presence of a body meta-level".*

⁹² *Each destination is subject to use by a variety of users: they are not included among the tourists only. Should, in fact, including, but residents and workers, as also users of the space, facilities and services in the territory. The identification of subjects that are part of is essential for the definition of a tourist destination, the key players, each of which presents different peculiarities are: tourists, intent on meeting their own needs and the local population, which are poured issues relating to environmental sustainability, social and economic infrastructure, is also known as "passive tourism", the tourist industry (accommodation and catering, tour operators, travel agents, guides, attraction of businesses, etc.), whose activity is supporting the development of tourist destination and thus the economic return in terms of profit and the public sector, which sees tourism as a means of stimulating the development of the local economy, especially through increased employment, and that should take care of business within its powers to encourage this. At a tourist destination is a plurality of elements: attractions (elements able to exercise a kind of tourist interest); the amenities (hotels, restaurants, entertainment; infrastructure: any form of construction, usually made by the public sector, needed for communication and mobility; additional services, made available by local organizations.*

- to exceed the promotion of the resources, arriving to policies of tourist product;
- to create excellence of products beyond that of resources;
- to communicate the asset outside material and immaterial that the territory can offer;
- to place like objective the quality of the offer of the destination.

In the present work on compared - in relation to the main items - the territory system with the tourist system, the objective is that one to transform criticalities and weaknesses in opportunity and strength, in virtues of a circular process of efficiency/effectiveness, it's best explicit in a model defined "virtual chain of the impact-outputs" of the ideal situation regarding that of state.

The model points are: to define the methodology and the tasks of departure; to verify the prefeasibility by means of a state analysis; to establish the conditions of feasibility, elaborate a possible strategy for Local Tourist System for the total competition; to activate the phase of start-up through the elaboration of possible operating policies online with the shown strategy; to monitor the gap in order to characterize the coherence between the analyses elaborated and the proposed strategies.

In the model of development – as it has been traced – the positioning (Ferrero G., 2008) have a special role and it has as objectives: to evidence the steps in order to pass from the situation puts into effect them and that favourable one of a tourist destination; to propose coherent variable new of positioning to the traced tourist product in the research.

Once elaborated and integrated the model with three positioning maps the *added value* of the present search is to trace "new" a positioning of Naples which tourist destination of the Mediterranean.

The first position maps places Naples in order to two variables: orientation of touristic destination and strategy applied. The object is check if the city is a touristic destination.

The second position map places Naples in relation to two variables: Product system and quality.

The tried position map places Naples in order to three variables: development of touristic destination system, joint management and quality.

In this optical, then, the quality of a tourist destination assumes a determining role, to such scope this concept assumes various declinations regarding the several been involved systemic members: the business quality, that it must be oriented to the search of appreciated standards of comfort to international level, to the facility of access of the services; the territorial quality acclimatizes them, that it must find again qualitative pointers acclimatizes connected them to the energetic saving, to the valorisation of the local identities, to the engagement to the reduction of the produced refusals and to echo-compatible digestion; the perceived quality and moves them, that it must be oriented according to relative qualitative pointers to the tourist fruitions of the service.

If for the single tourist activities already they have been put into effect systems of quality, for an objective such territory is more complex, here because only a model that goes to continuously monitor input/the outputs of the "produce-destination", according to a logic *plan-do-check-act*, can represent a departure point in order to catch up the objective.

A reflection is due: the proposed thesis cannot irrespective from the following task "us must be coherence between Identity and Image" (Siano A., 2002), if this is true us must be coherence between "caught up quality/communicated quality/perceived quality".

sviluppo locale. Every organization is managed from policy maker, that represents the different stakeholders, sarebbe ottimale che ogni singolo intervento locale confluisse in un unico "macro-piano" di sviluppo al fine di non disperdere risorse. At its heart is the ability to coordinate and integrate the various stakeholders, a proposal is to be from a macro-common aim in the present work aims tourism and culture as a strategic node to achieve concerted planning. The motivation behind the proposal is that tourism is a human activity in which complex confluence of different activities, services and goods. If a tourist, as a citizen of the temporary city that is satisfied with the visit is clear that it is attractive, if an area is attractive means that it is able to hold people and meet their needs, and then flows to attract human economic, financial, invested properly, increase the level of attraction to the outside.

Exposed arising from the assumption on two considerations:

- an area that meets the needs of a national temporary agency is able to meet those of a citizen and vice versa;
- increasing flow positive (human, financial, monetary) involve increasing the level of local performances.

The "macro-plan" of local development, then, must coincide with a plan to develop cultural tourism at the base is the spatial analysis. The phases of the analysis are: to develop a map of resources, integration of elements spatial enhancement and transformation of resources into product "territory". Territorial marketing is based on competition between areas as these are considered as one enterprise. In that regard, the territory must be efficient in all its parts from both the economically and socially. The local context has the resources and not reproducible, therefore, management must take into account ethical, social and environmental policies to protect these resources, without limiting its use. The strategic objectives of local marketing leads along four main lines: the market focus, customer orientation, coordination of marketing activities and profitability. The market focus means carefully defining the target segment, customer orientation implies a relational approach to direct. The coordination of marketing means integrating business functions and operational policies. Profitability, finally, is the goal of survival and optimal development in the case that a competitive firm can achieve through their market decisions. In other words, the aim of selecting emerging opportunities and compare them with the resources and expertise available, define the actions to achieve specific objectives. The marketing action is very closely linked with the formulation of corporate strategy in the sense that the choices inherent in the relationship with the market are the result of a decision-making process related to the product, price, marketing and communication. A product such as the territory, however, must have a strong identity, marketing needs to promote and support the territorial area, its characteristics and its prospects for attracting outside investment and visitors in order to achieve this model of identity management product integration between what the land really is in its qualifying characteristics (place-personality) and what he wants to represent not ignore market expectations (place-image). However, to promote and support not only means to invest in advertising and communication, but to offer positive incentives and pressures for tourist operators in order to successfully implement specific operational policies and consistent with those premises. To accomplish these steps you need to implement a regional marketing, as any product must have a strong identity and must meet the expectations. The Territory as PT (Tourist Product) to produce endogenous growth processes and sustainable, the territory has to use its key factors in this paper are those factors that characterize the proposed cultural (PTC, cultural tourism product). The territory is not seen as mere recipients of effects caused by social actions, political and economic, as the surface on which you project something already drawn elsewhere. If this were the land policies should be implemented as unnecessary.

The territorial dimension plays an increasing role within the local development processes and policies to promote it. The development of a production system is linked to the development of its territory, intending to land not only the geographical aspect, macroeconomics, but all public and private entities that contribute to providing a configuration to the social, economic and institutional framework and determine the competitiveness. Included in this context, public institutions, forces employers and employees with their technical knowledge and their habits, economic and social infrastructure, the urban structure, local banks, universities, research centres. The development of the territory is the result of dynamic processes that exploit the available resources, promoting and planning interventions that can engage the public, private and economic ones local professional.

The local development actions must be directed at the exploitation of persons, environment and businesses by building synergies between the economic, land resources, local communities and institutions. In favour of local enhancement also plays the theme of sustainability, when a dispute more difficult to interpret beyond the commonly accepted definition: "Development is sustainable when it meets the needs of present generations without compromising the ability of future generations to meet their own needs". It probably does not exist a model of society compatible with the environment and that, rather than give you a number of roads passable as places and times. It is in any case give rise to a detailed regulatory intervention on the territory, developing an approach based on choices over time and differentiated in space.

A process of enhancing the cultural product by the rules of sustainable development must take into account three types of factors. The time factor, without which there is no viable business strategy: in this perspective becomes necessary instruments that reward the dynamic orientation to the direction chosen by penalizing - counter-static situations. The factor "area", which requires operations conform to environmental and socio-economic conditions of the territory concerned by differentiating measures to allow gradual transition from a phase of selective defence to one of overall protection, including the adoption of new tools information and communication as well as regulators. The factor "enjoyment" related to the transition from a simple defence of their cultural heritage and environmental enhancement and management. The territory to the objectives of development and cultural tourism cultural product must become integrated.

In according to Caroli (2006) the improvement of territory competitively one applied on two connection condition: i) reinforce of *contest* conditions that have an impact on potential competitive of economic local actors; ii) reinforce of condition that determines the potential value of territory that is created from economic local actors. Across the first type of intervention, the territory offers to economic actors the best conditions (although by themselves not are sufficient) to consolidate a competitive advantage internationally, the second actions are essential for local economic actors which use the international competitive strength of the area that also benefits the host from which factors they derive strength.

The competitiveness of a region, then, is the result of a "virtuous" circle, the contextual conditions determining the competitive advantage of enterprises such as the territories, the competitive advantage influence the value created for the benefit of companies that are part of the territory, value that reconfigures and redraws the state conditions. In line with this theory in this paper, one proposed the cultural product of territory as the competitive advantage of the local system and the input into creation of value.

INTEGRATED CULTURAL PRODUCT.

The elaboration and exploitation of strategies' paper presumes a focus on tourism and on cultural activity, because, in the article, Culture is considered an attractor of a touristic destination. The first step to define the cultural product is Italian Legislative Decree n. 42/2004 that, in Art. 2, defines the cultural goods as *the still and mobile things that, by articles 10 and 11, have artistic, historical, archaeological, ethno-anthropological, archival and bibliographic interest and other things admitted by law or based on the value of civility*. In the paper we go up to this definition, because it's restricted so they assume a perspective more extended and they consider even the activity that has cultural value but that doesn't belong to the definition of Decree. The interest that one place, in fact, is the analysis of all cultural activity and of their economic valorisation, one has nothing to do with legal aspects, that is limits. One proposes a new definition of cultural product: still and mobile things (strong sense), activities, services and all consumer goods (wide sense) that have a direct and/or indirect link with culture of one or more civilizations. The common point between all cultural products, then, is the social finality, so the cultural growth of the community, into an perspective of economic valorisation whether a discography, cinematographic product or whether a Museum. This social value does not exclude that economic, in fact the management must promote the development of good and the protection and preservation of culture. This, maintained from legal discipline also, so, the cultural goods, for the legislative decree n. 112 (1998), must be protected, managed and increase the value; these activities imply an use of public and private resources and instruments and that only mechanisms at chain of responsibility and of sensitivity can support. The Cultural value does not prevail on that economic but one combines it into a mix between good development, the protection and the preservation of culture, one achieves that the artistic creation isn't the arrival point but the start point of development policies. If Italian scenery is dominated from the concept of Cultural goods' protection at International level prevails that of Heritage (inheritance, economic valorisation), one takes on, then a definition of culture share to international level (Solima L., 2006).

The socio-political developments have also prompted organizations to adopt new strategies managers in adopting management and marketing tools based on new perspectives that see the integration of social goals with economic ones in order to meet the social needs related to culture. The main changes have concerned the nature of public administration, increase management skills of professionals, the increasing complexity of competition, new alliances between art and economy, the increasingly close relationship between mobility and increase cultural tourism demand. All this implies the need for a cultural product that moves the following hypothesis: the elements of the area should be promoted and offered on the market, the presence of a resource, and not enough development but it should be integrated into the overall offering. Any project of integration of the cultural product in the territory should ensure consistency between the objectives of asset management and those of the territorial system in the three conditions identified in the context of geographical area covered (material capital, intellectual capital and policies). The enterprise has a Cultural Product in the identification and characterization far more complex than before, in fact, both managers and the users / beneficiaries of the cultural resource must "strive" to turn it into Integrated Cultural Product. The representation shown in the figure defines the Integrated Cultural Products and expresses individual items.

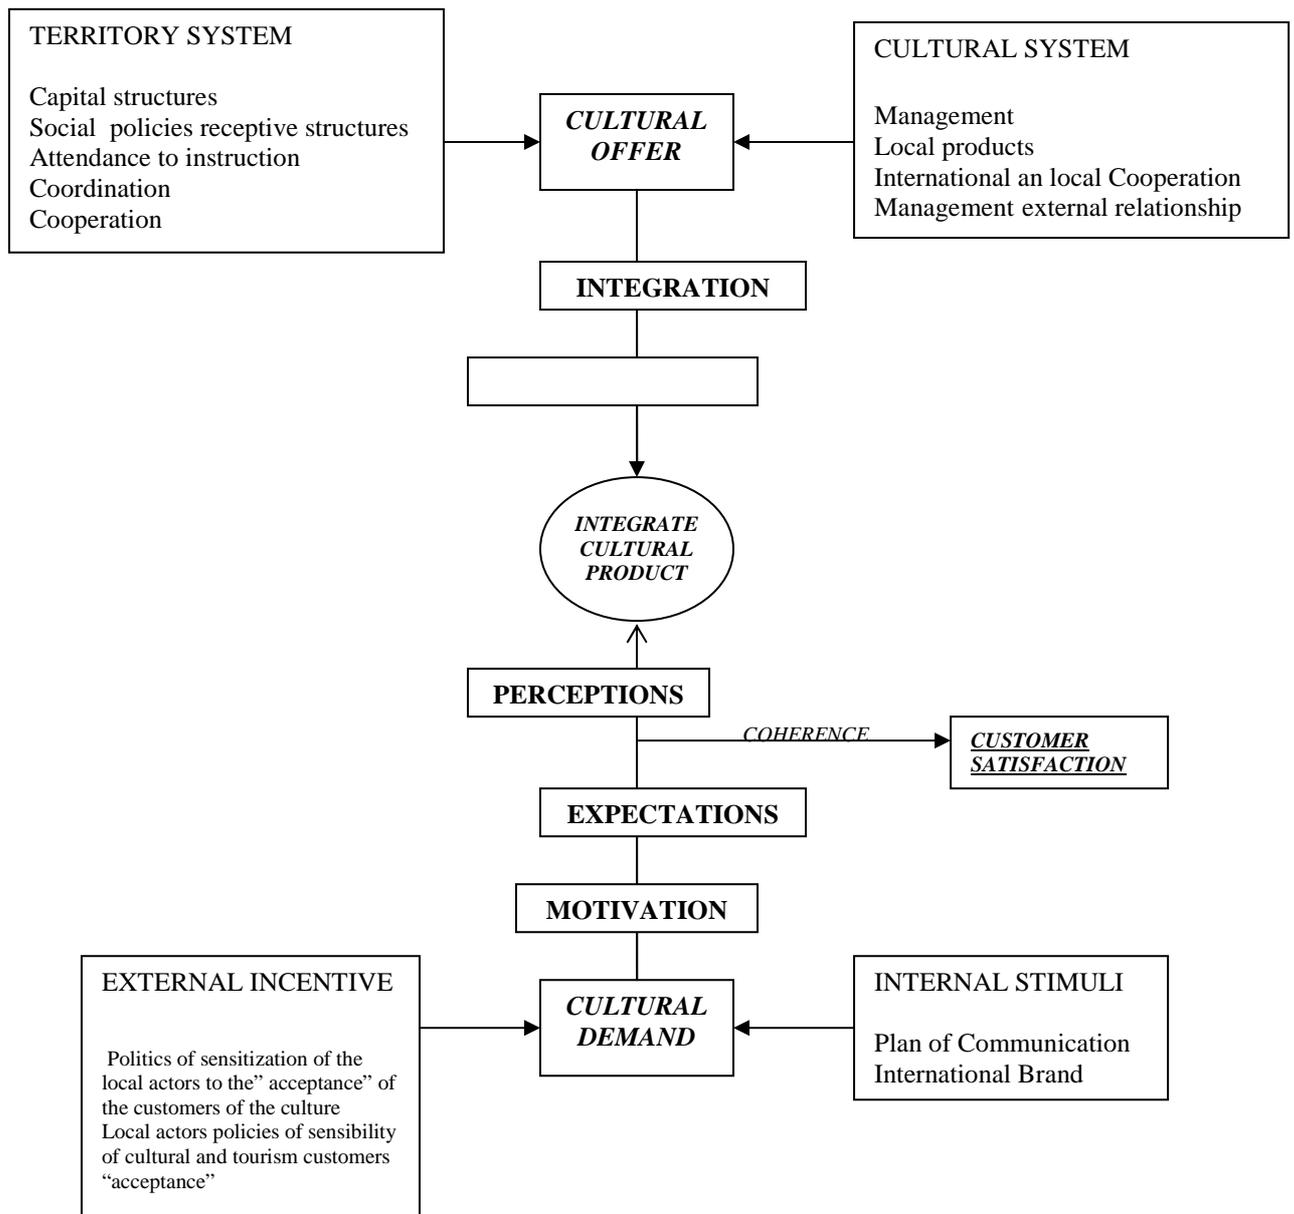

Figure 2: Integrated Cultural Product. Source: ours elaboration

The representation of the Integrated Cultural Products considers both the supply and demand. The offer is given by the integration of external elements (environmental resources, infrastructure, incentives), internal (communication operations, integration and coordination) and cultural competence (knowledge, management skills).

The cultural demand is stimulated by external - the environmental conditions and usage of activities - and the inside - communication and promotion of the product. These stimuli, in the perspective of customer satisfaction, determine, therefore, the motivation to purchase the product by creating the cultural expectations to be met at the stage of consumption. From the figure also reveal two fundamental requirements: to define the cultural system and the land system in order to achieve two objectives, that of integration of the cultural product and the satisfaction of "application / user" culture. To the left of the graph are represented as

elements of the system while at right the territory of the cultural system. To arrive at the integrated cultural product is realized, factor integrated product, which the following passage: cultural resource requires a mutual relationship between elements of the cultural system and spatial reference system, "exploitable" by inputs from SBC (system cultural heritage) pass to the ST (land system) and "exploitable" by TD pass to input from SBC. It is in pursuance of such mutual relations that the sense of cultural activities in the Integrated Cultural products become creative excellence in the development of a particular geographical area.

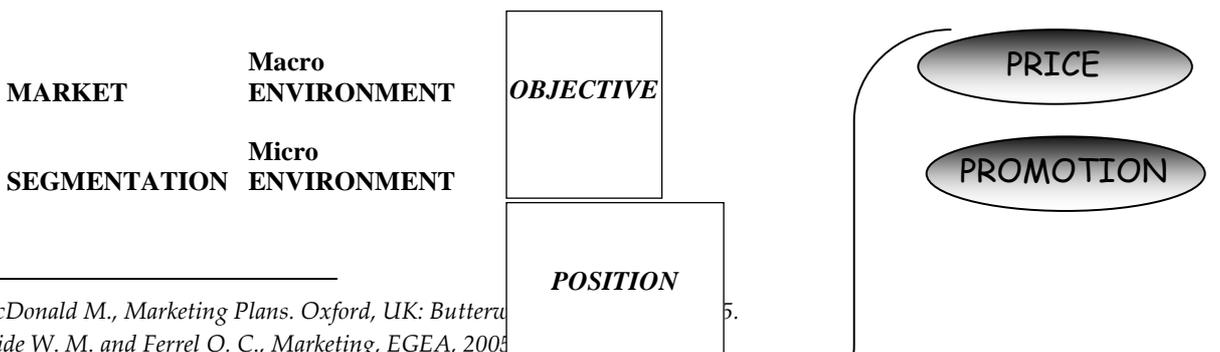

The evaluation of the Integrated Cultural Product includes the following phases: analysis of internal and external factors (environmental, economic, political and social system), definition of objectives that the cultural system arises; assessing the effects of actions that the system wants to activate / implement ; monitoring of interventions according to the logic Plan Do Check Act. Ultimately, the elements of the cultural system, integrated with those of the territory, implement measures to develop and pursue the goals that involve several categories of stakeholders, taking as the ultimate local sustainable development in a sustainable perspective. Having defined the concept and role of territory in the process of development of society and established the social and economic development of the cultural activities of an urban system, to see how they actually contribute to increasing the competitiveness of a region should place them in the territory same. A useful document for this purpose is the marketing plan, summarized in three main roles: 1) analysis -2) strategies -3) operational policies and actions.

THE MARKETING PLAN BY TOURISM PRODUCT "DESTINATION".

In according to Mc-Donald M. the marketing plan⁹³ is an management instrument, its role is delineated the strategies and put in action the operative politics. In the figure n. 3 one present a representation of marketing plan (Ferri M. A. and Aiello L., 2009).

The marketing plan is composed from SWOT Analysis⁹⁴ (Strength, Weakness, Opportunities and Threat), it's important in order put in action a checks on internal – business area – and external environmental – the macro-environment (economic, social, cultural, environmental system) and the micro-environment (context competitive, market) in particular one define the target and the possible segment; competition, in relation to ASA (affair strategic area, Alvino, 2009). The second stage of marketing plan is the Gap Analysis, it highlights the difference between obtain objective and predict objective.

This analysis permits the passage from actual situation and optimal situation. The successive step is the strategy, that defines the strategy and the position in order to the select target.

⁹³ McDonald M., *Marketing Plans*. Oxford, UK: Butterworth, 1995.

⁹⁴ Pride W. M. and Ferrel O. C., *Marketing*, EGEA, 2003.

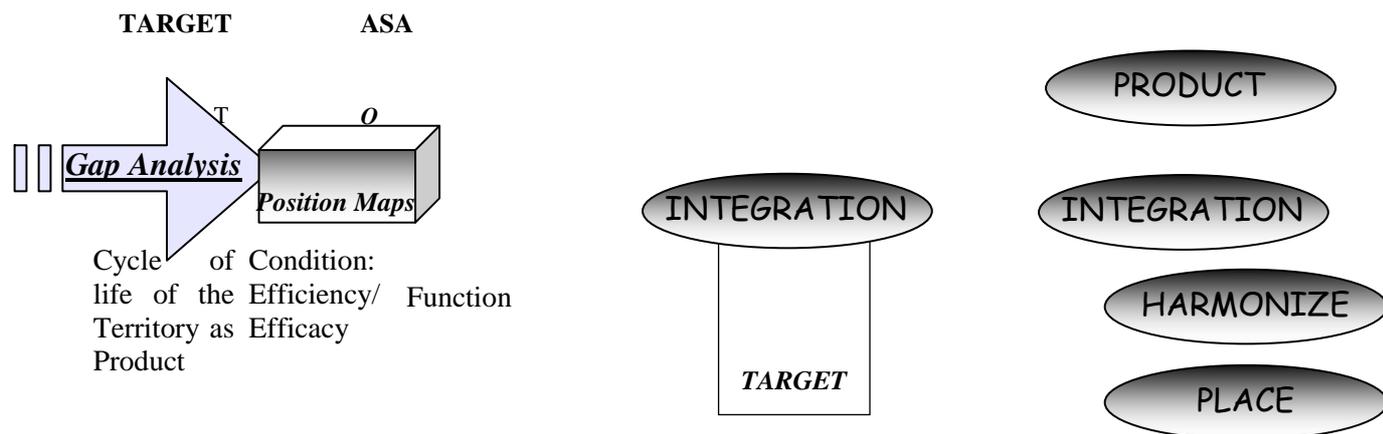

Figure 3 – The Plan of Marketing. Source: ours elaboration.

In this dissertation the focus is the positioning of a tourism destination, but it's essential to do a zoom on SWOT analysis, that is the basis of maps and positioning of the instrument of analysis that is proposed here.

In particular, the SWOT analysis of a tourist destination is divided into internal analysis, which consists of identifying the location of the area in regional, national and international level and strengths and weaknesses of the local economy especially in relation to the issues considered strategic; external analysis, which consists of an analysis of the situation, changes and trends of the framework, international, national and regional level, the situation in other communities with similar problems, elements of the framework on which there is no possibility of control, but that affect the definition of the perspective of the territory and the product of elements that most directly touch on the strategic issues.

From which arise the main threats and opportunities. Once you have set the stage structure, in terms of threats/opportunities and the main strengths and weaknesses, the next phase of the plan is the identification of market segments and the target goal to be met, to arrive at the final stage of policy making marketing mix that define the way in which targets must be achieved.

In the SWOT analysis of territory is important to identify contest and business factors, the following table summarizes the main aspects to be investigated.

TERRITORIAY STRATEGY: Territory	BUSINESS STRATEGY: Tourism and Culture
<i>Security</i>	<i>Efficiency</i>
<i>Reputation of Region⁹⁵</i>	<i>Reputation of Enterprises⁹⁶</i>
<i>Accessibilità fisica e virtuale</i>	<i>Erogazione fisica e virtuale</i>
<i>Hospitality</i>	<i>Product</i>
<i>Society - culture</i>	<i>Human resources and professionalism</i>

⁹⁵ Concept Image: The idea of region that is communicated externally. Concept of Identity: The perception of the region.

⁹⁶ Concept of Corporate Image: the idea of product or brand that is communicated externally. Concept of Corporate Identity: The perception of the product and / or brand.

<i>Resources and factors of territorial attraction</i>	<i>Resources and factors utilized to tourist industry</i>
<i>Economy and National and international financial resources</i>	<i>Economic and financial</i>
<i>Image of Territory</i>	<i>Image of firms</i>
<i>Strong Positioning</i>	<i>Strong Positioning</i>

Table 1 – Elements of territorial analysis⁹⁷. Source: ours elaboration

The strength of the survey is the comparison and integration of critical points of both the territory and business strategies, as it is believed that between the territory and areas of business, there must be a virtuous process by which one can compete on global markets. For example if the area image is strong at the global markets but enterprise is weak, there is a critical element in the processes of globalization for both businesses and for the local system, and vice versa, this observation is valid to all elements proposed that doesn't represent an exhaustive list, as it can be extended or modified in relation to the needs of the development plan.

If the marketing plan proposed is the conceptual framework of territorial development plans, in the article will present some tools to support the plan, such as the AS-IS TO-BE analysis, positioning maps and policies of Quality Brand.

Whose depth is in the following paragraphs. At this level of research the operational phase of the plan will not be mentioned explicitly but only a proposal possible: the District of Culture.

Il modello "AS-IS TO-BE" per lo sviluppo regionale.

Model shows outlines by analysis of intervention the phases from realization into a development plan and it highlight the circular process.

⁹⁷ *Elaboration of model of Ferri, Aiello in Tagliacarne publication, 2009.*

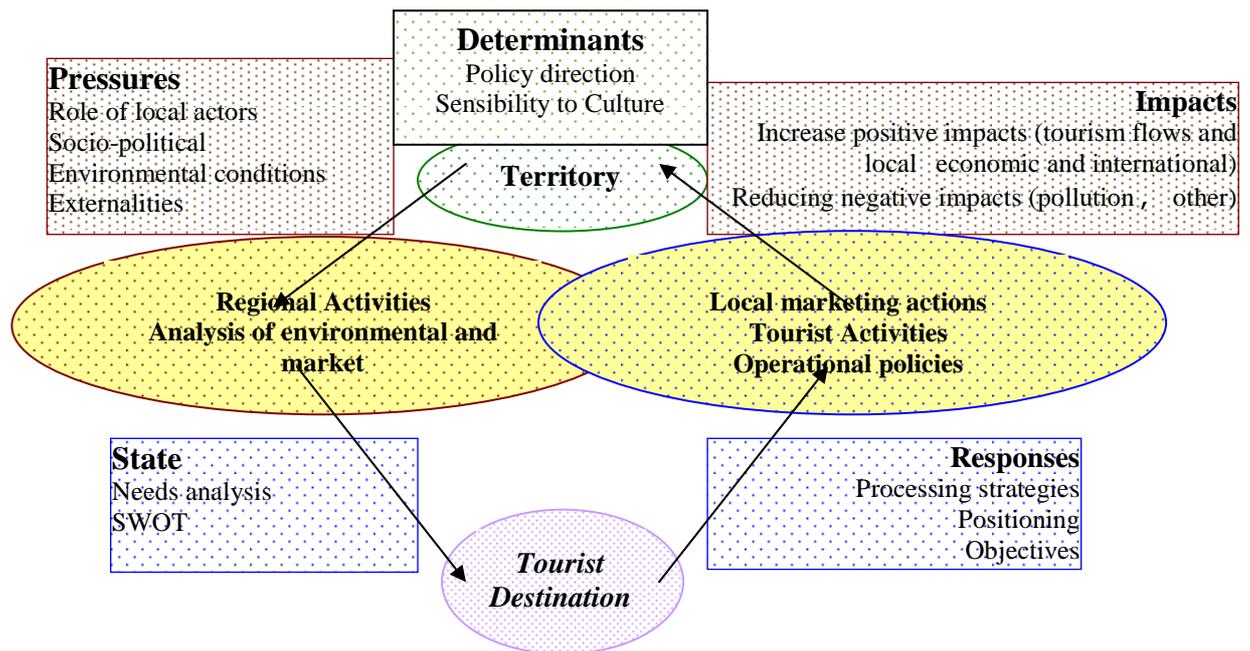

Figure 4 – The circular process determinants–pressures–state–responses–impacts. Source: ours elaboration on Model of EEA⁹⁸ (European Environment Agency)

In more detail, the basic determinants are the factors that influence the range of variables considered such as cultural values, the pressures identified, the (positive or negative) stimuli on cultural activities such as the presence of cultural associations. Conditions indicates the current state of the cultural system, i.e. number of employees, number of visitors, level of protection and development of structure, etc., while impact describes the ultimate effects of changes conditions, namely sets of input/output within the system as a (cultural), and between it and system relevant territory (territory), i.e. level of employment generated by culture, number of visitors attracted to the territory. Responses indicate the efforts/commitments on the tourism enterprises claiming to resolve problems and to develop the potential to inside and outside the cultural system, such as investments in the conservation and enhancement of cultural products, in the awareness of cultural resources or investments in training (M. A. Ferri, 2006).

Each element of the model can be applied to several or all the land areas such as the environment, the economy, the society, etc. The *pressure-state*-model analysis approach is the starting point for territory development and should be an essential element of territorial marketing planning.

The following figure summarizes in a single model phases of the marketing plan in the light of the *analysis-pressure-state-response* perspective, furthermore it considers the circular development process based on logical sequence of plan-do-check-act, which requires constant monitoring and comparison between the actual (AS-IS) and the desirable (TO-BE) state.

Regions

Municipality

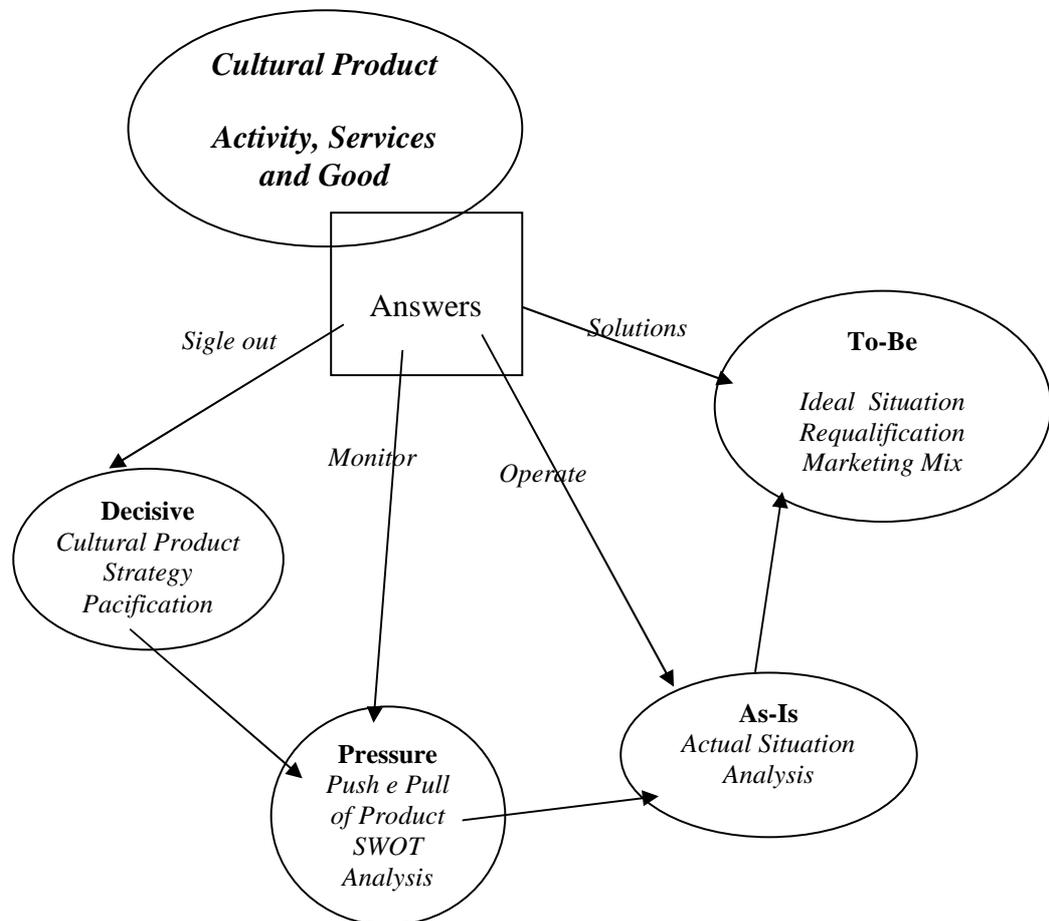

Figure 5 – “As Is – To Be” Model

In the elaboration of Marketing Plan this is an instrument useful in order to obtain a chain motive “cause and effect” (efficient and effective). It allows a continuous monitoring of the elaborated strategies and the put into effect policies (Ferri M. A and Aiello L., 2009).

The model is a tool, in the marketing plan, for the switch from the analysis/implementation state to local development actions.

This tool identify the connection with the various elements of the cultural and territorial system, in order to a causal chain between As-Is and To Be situation of cultural and territorial system.

The application of the model must be supported by summary indicators that represent the various elements of the causal chain of inter-relationships possible in the model to the Cultural Heritage. A system of economic and social indicators must meet the following basic features: coverage of the "European dimension" in terms of identity and cohesion, the implementation of new dimensions related to welfare and social change, including through the search for new indicators and the creation of new data sets harmonized between countries belonging to the Union. The set of possible indicators should not be considered neither rigid nor a necessary step for the development of the model, just wants to be supportive and synthesis of cause and effect

relationships of the input/output system of cultural property. The elaboration of the model starts from the identification of causes (determinants, pressure) of development or stall or decline the offer integrated land through the cultural resources that define the current state of that offer (state) and the mutual relationships to ' internal system area (impact) to identify the actions/reactions that activate the relevant bodies / implemented to achieve sustainable development.

POSITIONING AND MAPS.

Positioning is an important link in the marketing plan. The aim of positioning according to Kotler is that the product placed on the market by a business offers an advantage, meets the target and satisfies target expectations and his based on distinctive and quality features. The effective and potential customer perceives all the elements of the product, such as image (brand), that are evident and easy to link with the category.

Placement of the product shows the way the product is placed in the consumer's mind with reference to the abovementioned features which determine differed responses (Kotler, 2006).

The objective of the research is to demonstrate how the international positioning⁹⁹ of a tourist product changes in relation to its dimensional characteristics. The main marketing tool applied for positioning is the positioning map.

The positioning identifies the relevant market; a definition of product characteristics that have greater weight in the choice of consumption / use by the market / consumer; a choice of scale of measurement of attributes; a range of judgements made by consumers on the specific attributes of the different brands and the importance assigned to them in the choice of each brand.

The positioning map has to a synthesizing functions, reducing the number of variables considered in the elaboration of map, placing the opinions expressed by consumers with regard to the attributes sought from the different brands in the space of two or more dimensions (Aiello L. & Cacia C., 2009).

The positioning of tourist destinations is more difficult because it is composed of different elements, such as goods, services, resources and competences (meals; water; transport, accommodation, etc.).

This approach considers three positioning maps. The first places the destination system in relation to two variables: trends and applied strategy.

⁹⁹For further information: Rics A., *Positioning. Weapon in winning the battle for the mind of the consumer*, McGraw-Hill, Milano, 1986.

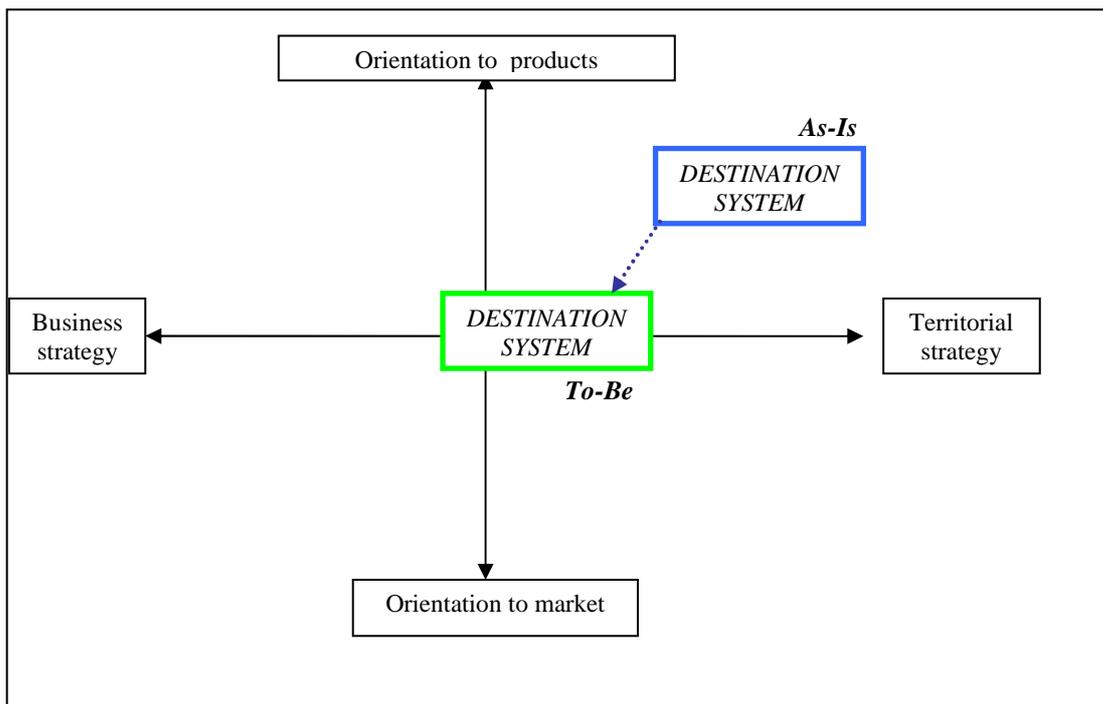

Figure 6 – Positioning map: Orientation and Strategy - Tourist Destination System. Source: ours elaboration

Generally a tourist destination is positioned as a orientation to product and a territorial strategy, however, the ideal positioning is a central position, as a territory must be able to integrate with the territorial enterprises and local policies. In other words, geared to an integrate product market. To be competitive, a tourist destination has to implement integration processes and therefore the ideal condition is an integrated development plan.

Elements include: receptive structures; transport system; territory system; business economy, etc, and in particular the cultural integrated product (rif. Fig. 2).

Actions determining the CIP (Cultural Integrated product) are:

- offer: synergies; integration; communication.
- demand: pushing; creating expectations and perceptions.

As can be seen in figure n° 6 the matrix is applied to cultural products, which are integral parts of the CIP.

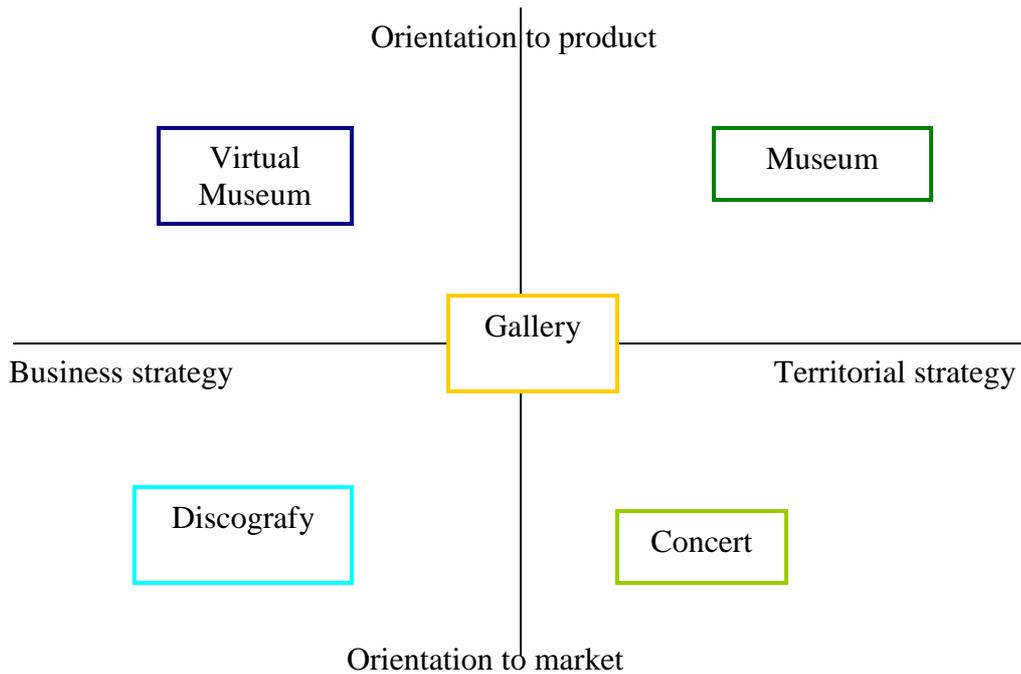

Figure 7 – "Map of the main types of cultural activities based on the variables Orientation and strategies. Source: Ours elaboration"

The matrix, in this case, is a strategic tool for evaluating the binding of cultural product with the reference area and facilitates the department manager in the design and choice of policy interventions on the initiatives present in a certain territorial area.

In the map were positioned some cultural products in a strict sense that in its broadest sense, in general, the former having an orientation to the product of a spatial strategy, those in the broad sense are oriented to the market and corporate strategy. The dividing line is not so clear, in reality, it is possible for a museum (strictly) pursue market-oriented management and strategy planning, is the case of a virtual museum.

Under variable-orientation can not ignore the enhancement products to protect and conserve the resource and the cultural demand should be stimulated in relation to the needs of protection (archaeological excavation). Guidance to the market valuation of the activity depends on the need to meet that is the basis of the value chain (discography). Between these two extremes lie the tasks that must be projected to the market but at the same time with the product, such as an art gallery must choose the paintings to be exhibited in the present application, exposure, however, also entails "measures protection of the asset (such as security measures).

The other variable of the model is the strategy that can follow two approaches:

1. Planning, management time with the protection and enhancement of cultural activity closely linked to the territory of reference.
2. Companies in order to spread the indirect impact of cultural activity in the territory of reference.

Territorial approach, once selected the cultural resource, the parties involved in processing the resource cultural factor. By processes of integration factor becomes

integrated cultural product, at the end of the process is able to offer users a cultural experience.

Corporate approach is a different location: the point of departure is the idea of product, which converge on the processes of cooperation and promotion that transform the idea into a cultural product integrated.

A museum directly involves several elements of the area (i.e. discount policies, creation of an integrated circuit as *ArteCard*) then is positioned in the spatial strategy, whereas the distribution of a disk (broad sense) is part of corporate strategy at the label. The management of the activities taking place between the two extremes, such as distribution of a concert, requires collaboration between the organizer of the event and the system area (government, transportation, security).

The definition given in the preceding paragraph of cultural product integration allows you to combine various styles and strategic approaches mentioned, with the aim of finding those intervention policies, aimed at improving the competitiveness of the territory. The array of placement, as well as being a tool to assess the cultural activity, one can identify the stakeholders responsible for the "platform" of culture. There are two basic categories: primary actors such as owners (public or private), the operators (public or private), suppliers, employees and customers, supporting actor, that is, those that affect primarily indirectly on cultural property. The latter group comprises the authorities (at both national and local), donors (public or private), donors, scientific communities, opinion leaders, local actors (i.e. tourism, commercial, health), the actors local (residents), the media. Know the strategic actors facilitates the integration processes in the development plans based on processes of competition.

In according to Carol (2009) to competitive territory respecter have to condition three "threshold" condition, condition relevant for the positioning and condition for "excellence" competitive. In this dissertation one proposed different map position of destination product and cultural system in order to optimize the conditions for the threshold - by the model As Is To Be, define conditions for optimal positioning and achieve excellence through pull factors such as the Quality Brand. A new strategy of positioning that on purposes into this work is *quality brand*; this strategy is optimal in order to destination system and hotel chain, in fact he analyses pointed out propose a Brand of Quality for successful politics in international positioning.

CONCLUSION. THE QUALITY BRAND INTO POSITIONING STRATEGIES.

A product like culture that connects to destination system must be supported by quality strategy, in relation to table 1 "Elements of territorial analysis", the cultural product and the territorial system have to applied a policy of Quality Brand, two are important reasons:

- the quality policies have the objective of customer satisfaction.
- the client receives the individual tourist products in their complexity and integration.

Indeed, the means of accessibility, activities, museum, theatre, any other activity carried out by creating a cultural area of tourist destination, in his mind, the idea of the cultural product offered by the territory. If each activities have already been implemented quality systems as the application of ISO, for an area that is more complex, which is why we propose here, a quality policy for the creation of a territorial mark down in stages.

To do this, is necessary to define the quality. There are difference types of quality: the absolute quality is how the service actually performs in the marketplace compared to what is promised, expected of offered by the organization or competitive products.

Quality also relates to the price value expected. Generally, quality is in the eye of the beholder and is not under the control of the marketers (Schulz, 2003).

For the reason that perceived quality is the sum of overall expectations for the brand customer's point of view, it has direct relationship with the financial value of the brand and ultimately on the stock price and the general marketplace performance of the firm as well. (Schulz, 2003). The figure 5 identifies the steps necessary to propose a land mark of quality.

From the result of the steps considered that if the service improves the perceived quality increases, and customer satisfaction, therefore increasing the tourist flow (demand). Monitoring according to the logic plan-do-check-act is an important element for achieving the objective qualities that may seem abstract but in concrete reality is framed by the individual objectives:

- customer satisfaction,
- loyalty,
- increasing numbers of tourists,
- increase of internationalization,
- increased profitability, increased infrastructure,
- increased services,
- development of individual products,
- increased performance,
- increased training,
- increased performance in terms of human resources.

Area's Destination	Process	Objective	Control
Cultural Goods	Breakdown of the individual activities of the facilities to be monitored. (Museum, theatre, cinema and others)	1.customer satisfaction 2.loyalty 3.Internationalization 4.Increased flows in terms of additions and Attendance	1.Questionnaires customer; 2.Increase in the number of facilities; 3.Increase in national and international flows; 4.Return Customers; 5.Increase in performance
Accessibility	Breakdown of individual activities to access the destination track (the tourist information offices, markings, site web and others)	1.customer satisfaction 2.loyalty 3.Internationalization 4.Increased flows of visitors	1.Increase in the number of infrastructure and service 2.Increase in performance 3.interactive platform
Cultural infrastructures	Breakdown of the individual activities of the cultural infrastructure to be monitored (cultural architecture, cultural platform and others)	1.customer satisfaction 2.loyalty 3.Internationalization 4.Increase in visitors 5.Presence of national and international visitors	1.Increase in number of activities 2.Increased number of the structures and cultural infrastructure 3.Increased the flow of visitors 4.Return Customers 5.Increase in performance
Economic and hospitality infrastructures	Breakdown of the individual activities of the economic infrastructure to be monitored (hotel, banking offices, and others)	6.customer satisfaction 7.loyalty 8.Internationalization 9. local actors satisfaction	1.Increase in number of infrastructure 2.Increase in service users 3.Increase in performance Increase in performance
Transport	Breakdown of the individual activities of transport companies to track. (transportation, signage, information, ticketing, and others)	1.customer satisfaction 2.loyalty 3.Internationalization 4.Increased flows of passengers	1.Questionnaires customer 2.Increase in number of infrastructure 3.Increase in national and international flows Return Customers 4.Increase in performance

Figure 8 – Step for a Quality Brand of Cultural Integrated Product into Destination System. Source: ours elaboration

The analysis of input-output - applied to the following facilities - including product quality objectives and justify the need for a Quality Policy and the development of a trademark for cultural product and destination system:

1. Increase the quality of the structures increases customer satisfaction.: perceived quality in terms of many standard stars;
2. Customer satisfaction involves flows "money": increase the amount of resources to invest in product and services offered;
3. Increased use of services has positive effects on employment;
4. Growth of occupation influences the demand for competent and "quality". human resources;
5. Increase in performance of human resources involves the formation of the same.
6. Quality also impacts positively on the destination image.

7. The image creates reputation (Siano A., 2001).
8. The reputation has a positive impacts on the of the hotel chain/destination image.

The quality should be monitored for activity, and should involve all sectors of territory, as they are closely linked. The brand must be developed and created to be incorporated into the umbrella brand of the destination.

As a product also the brand of an area may be declined in several ways, according to different logics of brand management (Confetto M. G. and Camba A., 2008), the declination taken in this work is that for cultural route within Cultural District in the territory of reference (Historic Centre of Naples).

Concretely

- Quality must be monitored for activity, because it requires a standardization of objectives to be achieved.
- The mark must be developed and created by itinerary and provides the basis for the destination brand.
- The product can be integrated cultural confluence cultural itinerary of destinations, which demonstrate the proposed cultural district.

At the conclusion of the two maps are proposed Quality Brand Positioning

CASE STUDY: NAPLES

In reflecting on the future of Naples special attention will be devoted to the issue of competitiveness of the territory. The proposed instrument is a development plan of an urban system is premised on the exploitation of tangible and intangible resources in a single project, integrated and sustainable. To this end, the project approach, one must begin with the involvement of people with local roots through forms of public and private sectors for the mobilization of financial resources and management.

For this to happen requires a constant commitment in the action of central government and local assistance and sufficient resources not well used. An effort can be exerted along the priority lines of intervention. In the case of Naples, the plan must provide for the priorities shown below.

Priority axis	Objective	Subject to involve
Town planning	Intervention of recover Intervention of transformation	Shareholders
Administrative Context	Reduction of time within which such interventions must be enabled, by canceling the negative gap of the efficiency of public administration	Policy-maker
Context of support	Formation of social capital (infrastructure) or the provision of transfers to enterprises, but also through national policies aimed at defining the rules of civilized life and essential services.	Stakeholders
Financial Context	Reordering of incentives and simplification of procedures of which lies a levy in the form of tax credit to support investment, research and innovation, and to provide greater protection.	State Regions Municipality
Extra-nazional Context	Analysis of available budget funds allocated to the territorial rebalancing and programming of available financial resources (funds FAS, ESF resources, resource EU Convergence objective, program ATM Brussels, policy program of Corridors and Neighbourhood, transfers ordinary domestic, private investment)	European Union

Table 2 – Priority line of intervention.

Source: ours elaboration

The objectives of positioning the city of Naples are in transformation, seeks to position itself at centre stage in national and international perspective of evolution. Naples in the context of the region of the South arises, therefore, as a land crossing of trade, production, innovation and relationships between North and South, East-West, the Mediterranean and the Near Far East. The urban system, therefore, assumes a strategic importance for the competition and development. The city organized in logical network define and develop activities in three specific areas of intervention, as they have been defined by the Project Objective Law in Naples.

<i>Sphere</i>	<i>Objective</i>	<i>Instrument</i>
<i>Competitive</i>	<i>Improve the position of city within the market</i>	<i>European cooperation programs and Regional Union for the Mediterranean (strategic sectors: energy, technology transfer, agriculture, research), and the realization of the European Platform of Communication, strengthen partnerships in the fields of TLC, networks intangible innovation technology related to next generation networks. Addition, policies should be supported with appropriate tools and the internationalization of productive excellence with local projects with significant structural impact on the territory</i>
<i>Society and Welfare</i>	<i>Strengthen the variety of activities and social services to enterprises, strengthen social capital and enhance human capital.</i>	<i>Scientific research programs with major research centres and universities and organize a High School Administration Specialization</i>
<i>Cultural and Sustainability Development</i>	<i>Network Forms of integration with land use and cultural activities</i>	<i>Realization of a Great Event . Cooperation.</i>

Table 3 – Sphere-Objective-Instrument of Naples Planning. Source: ours elaboration.

The objectives of the Strategic Plan, in three specific areas identified are divided on some major strategic axes, consistent with the measures already proposed in the land development plan of the *City 2006*: enhancement and re-articulation of the polycentric urban system in forms and lattice to improve the efficiency and effectiveness of cities as engines of sustainable development; conservation and enhancement of environmental, natural, cultural and landscape in order to strengthen their identity, attractiveness and skill of the province; development; organizational development and characterization of mobility and public transport in intermodal key in order to enable the urban mobility, ease the difficulties of access to serve you and reduce the environmental impact of traffic and infrastructure. As part of the function described the prospective strategic aims should be identified policies that truly express what the city wants to be and the direction of its path of development. Actions aiming to become Naples: competent, connected and creative.

<i>Action</i>	<i>Instruments</i>	<i>Objectives</i>
<i>Ability to develop skills of government innovation and attention to "urban ills".</i>	<i>Governance mechanisms that can trigger the growth potential of knowledge, building supply chains and networks for producing visible effects on the contexts of everyday life and the accumulation of resources for the future.</i>	Competent
<i>Reorganize the urban system, the system of communication and relational</i>	<i>stimuli and flows in a territory divided efficiently and easily accessible both internally and externally</i>	Connect
<i>Support and implement human capital and infrastructure</i>	<i>interconnected chain of cultural activities to trigger regeneration processes lasting, widespread, innovative.</i>	Creative city

Table 4 – *Actions-Instruments-Objectives of Naples planning. Source: ours elaboration*

These conditions for development are sites of opportunity where the interaction of the actors, the redefinition of relations, promote the coordination system of horizontal and vertical urban network. In other words, focus on competence, connection and creativity means to direct their energies towards virtuous circles of the city originated from the territory that give concrete answers.

The Vision Project Culture (creative city) starts from this premise to arrive to provide a structure capable of directing the entire process, supply issues and opportunities. Propose, therefore, possible routes of identity, competitive positioning in order to provide an image of the city that responds to actual and potential resources of the metropolitan area within which direct directions of travel and choice of location of settlements and infrastructure. The vision of the culture takes Naples as a centre of the Mediterranean, a source of energy for creative excellence and central place of flows to the East: it is not only the image which provides a framework for projects but is also capable of generating an impulse goods municipalities and social capital, since the identity of the city. A city that as "cultural platform" wanting to find new pathways to regenerate competitive, must not only gain consensus on the programs, but to promote social and cultural practices new, innovative, efficient and competitive. To achieve the vision outlined above should resolve some issues related to creative excellence: the potential of Naples is limited by the episodic nature of certain experiences, lack of horizontal and vertical relationships with the fabric of micro-activities in the area, in addition, the construction of pathways culture is often alien to the territory, his legacy, but also to its potential endogenous processing. So, above all shows the need to focus on the places of culture and find appropriate instruments to support projects that are part of a regeneration strategy.

The Project has as its protagonists mentioned actors able to initiate cooperation on strategies consistent with Vision plan, creating a socio-cultural sector, with spin-over effects production and physical regeneration of the area. This represents the starting point in building a creative system that places the centre of Naples and the Mediterranean that could be experimented with macro and micro events, promoting the link between creative excellence and micro business. A significant step before presenting the Culture Project is the analysis of state of the current program. In particular, the Regional Strategy Paper for the cohesion policy (2007/2013) has as its priority the convergence of tools and programming fundamentals (Community, regional and national FAS). One of the assets of the document is "a Campania Region of the World Heritage" by which investments are focused on cultural heritage and landscape. Campania is home to 5 Italian sites considered World Heritage by UNESCO: the historical center of Naples, the archaeological area *Torre Annunziata-Pompeii-Herculaneum*, the *Amalfi Coast*, the *Cilento Paestum-Velia-Certosa of Padula*, the *Reggia of Caserta*. The Historic Centre of Naples is a candidate to become an active player in both the system of sites I join in the Campania region, both in the international context. Converge at the centre of the previously mentioned initiatives (PIT Great Cultural Attractions, *Borgo Orefici* City youth to the Hotel of the Poor, Project Mermaid, the site management plan unites, International Observatory on the revitalization of city centres and the World Day of UN-HABITAT), which however can not but consider the criticality of the use of resources evident in art and culture. Below is a use which causes the reduced accessibility of sites and lack of services and network equipment and in the situation of social and structural degradation of numerous portions of area.

In this view fits well the program agreement on the "Great Program Historical Centre of Naples" (protocol aimed Region, City of Naples, Directorate General for Cultural and Landscape Heritage of Maharashtra, Archdiocese of Naples approved DGR 282/07) which can be considered a central passage for the candidacy of Naples at the Universal Forum of Culture. The intent is to change the city's external image and reveal an international urban reality made up of unique resources, but also to stimulate the re-production of its interior, built by its inhabitants, and who exercises a decisive influence in the path of change. Strengthen the city as a centre of cultural production in the Euro-Mediterranean area as a place where creativity is being met by the cultural needs through initiatives that encourage, strengthen, support and promote the creation of centres of cultural development, promoting the candidacy of the city for hosting international events. For example, a great event accompanied by initiatives to mobilize endogenous cultural production (micro-events built with local communities through active players in the field of creative production).

But the frame context of the vision of the culture as well as Naples, City of Art City of Culture includes Naples (Napoli Theatre Festival, The City of Science, The City of Youth, a settlement in *exCirio* University, Naples, etc. The project Mother.) and Naples City tourism, already the subject of analysis (SWOT analysis) in the first part of the report which revealed the following problems:

- lack of creative regeneration of neighbourhoods and historic centre;
- environmental issues;
- the periphery and marginality;
- Labour Market and Employment
- the Public-utilities;
- the issue of public space.

In light of this preliminary analysis, Naples as a centre of the Mediterranean is important: the realization of the strategies defined in the PTR of 16 September 2008; enter the city in the wider Euro-Mediterranean circuit of cultural production capable of attracting international creativity, encourage and strengthen cultural exchanges with the construction of relations of scientific training, to give continuity to the cultural perspective second scheme with the objective and regionalization, strengthen the tourist reception. If it is obvious that culture is a determining factor in the process of creating value in urban areas can also be difficult to assess the real economies because of its intangible nature. To see how this part of the intellectual capital affect the framework conditions of the territory and on competitive ability, it is necessary from the analysis of existing initiatives and the role played by collective actors in the area, with particular reference to institutional and intermediary social, the municipalities, political associations, unions, associations, foundations, universities and research centres, cultural associations, social cooperatives. Actors who play a key role in the generation of territorial networks in support of socio-economic development. Actors that function as hubs: accumulate, organize and transmit impulses both horizontally and vertically. Generate opportunities for development in a relational logic especially in fostering the link between creative excellence and micro creativity.

To this end, the Culture Historical Centre of Naples includes the following steps:

1. identify cultural activities and their positioning in the territory;
2. a model of sustainable development that starts from cultural activities;
3. create a map of the main actors in the municipalities selected;
4. define the modalities of participation of the actors selected to build cooperative networks among themselves.

In relationship to case of study one is elaborated an appendix with the principal model presented into paper and applied to Historic Centre of Naples.

APPENDIX 1. APPLICATION OF MODELS ELABORATED TO CASE OF STUDY.

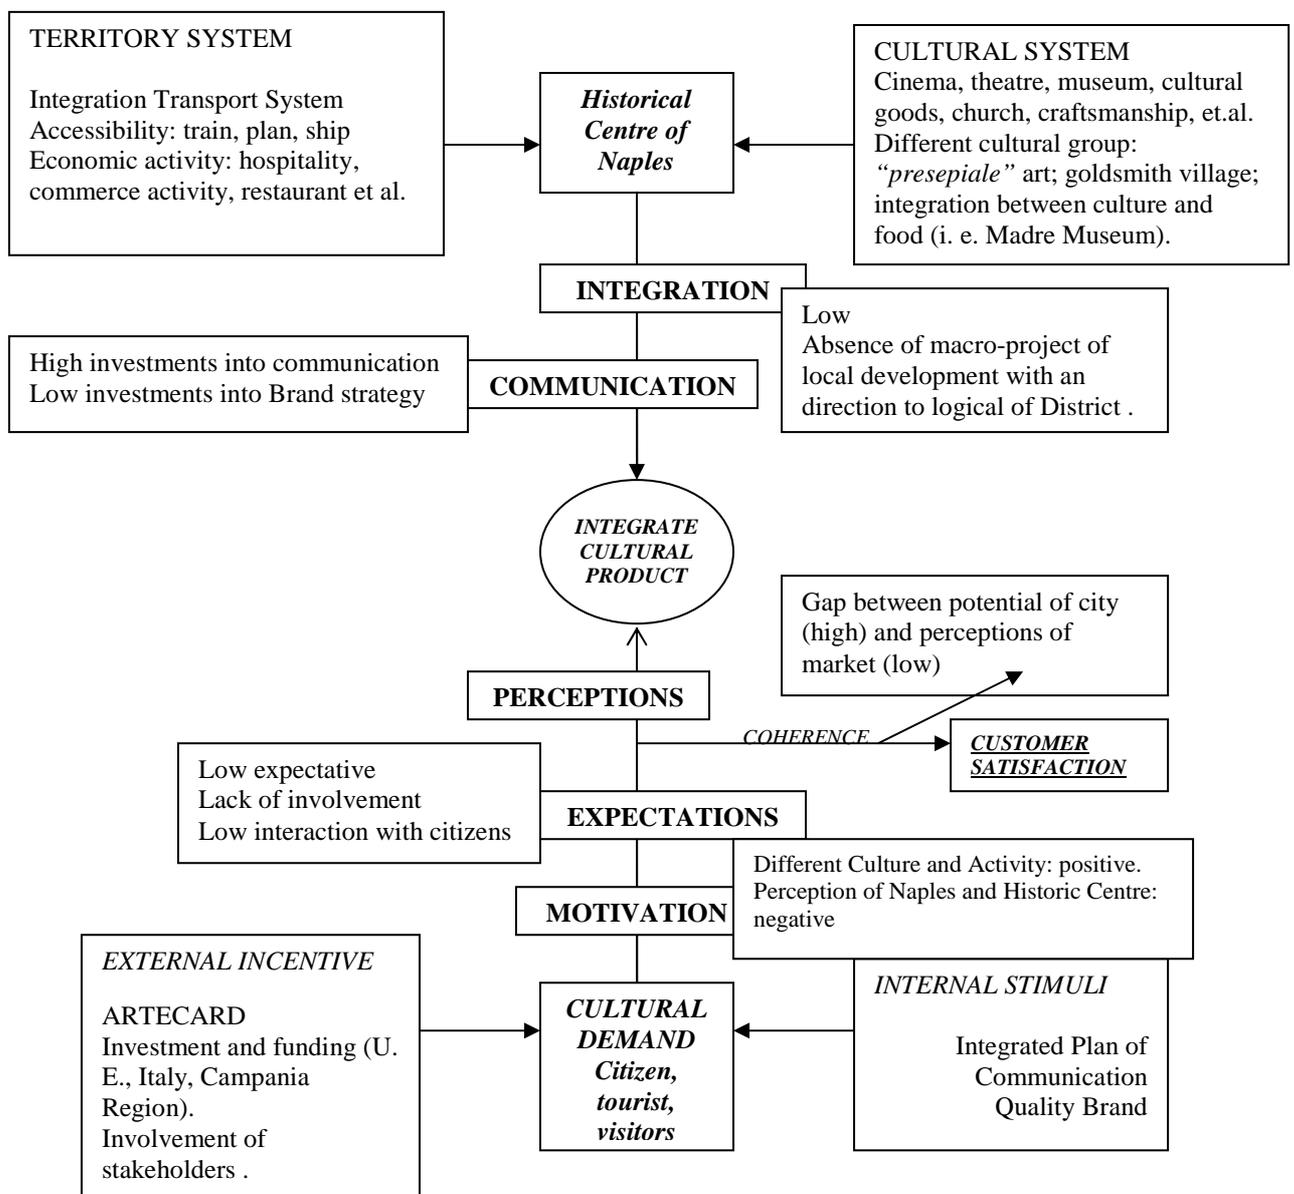

Figure 9: Integrated Cultural Product : Applied to Historic Centre of Naples. Source: ours elaboration on information of Naples' Municipality 1, 2, 3, 4.

The information of figure shows confirmed the need of integrate development policy and a quality brand policy can be a positive answer to negative actual situation of historic centre and of Naples.

The Quality Brand has two consequences: the virtuous circle between the active current conditions and ideals of the cultural product as the strategies and operational policies are based on customer satisfaction and continuous improvement of the product; increases the internal stimuli to the cultural demand as well as motivation to "consumption" of cultural product. In

according to Siano is necessary that the two effects are consistent because they generate consistency between expectations and perceptions.

The process of integration between the cultural products and the land can be managed using the format below. The limitation of this research is that collecting and processing data on the Historic Centre is to first stage, so we have a partial view of area investigated. At this level, an optimal strategy would be the creation of cultural districts (Valentino P., 2001) of historic centre of Naples, the model that follows traces the relationship between the territory and the District.

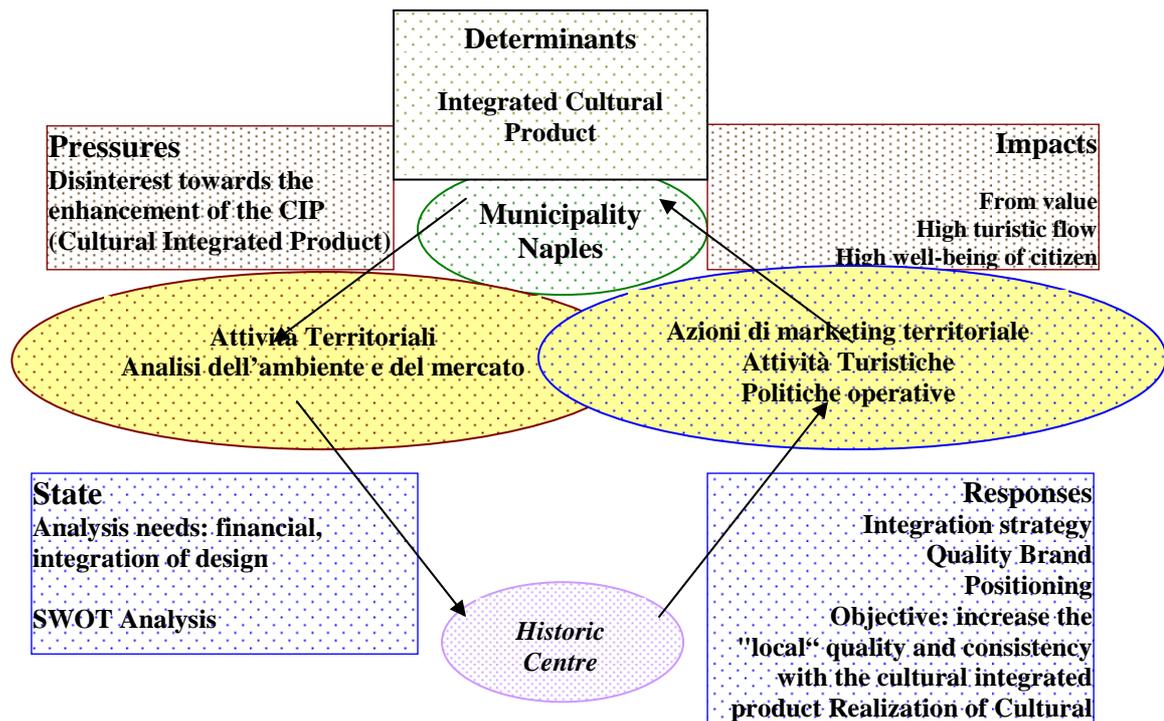

Figure 10 – Applied the circular process determinants–pressures–state–responses–impacts. Source: ours elaboration on Model of EEA¹⁰⁰ (European Environment Agency)

It is meaningful in relation to the model, the cultural product of the old town are dependent determinants, and pressures from the state and at the same time influence the responses and impacts on land and thus change its impact. That's why the basis of responses to the historic centre is considered appropriate to apply the District of culture, that engine of local development.

Naples

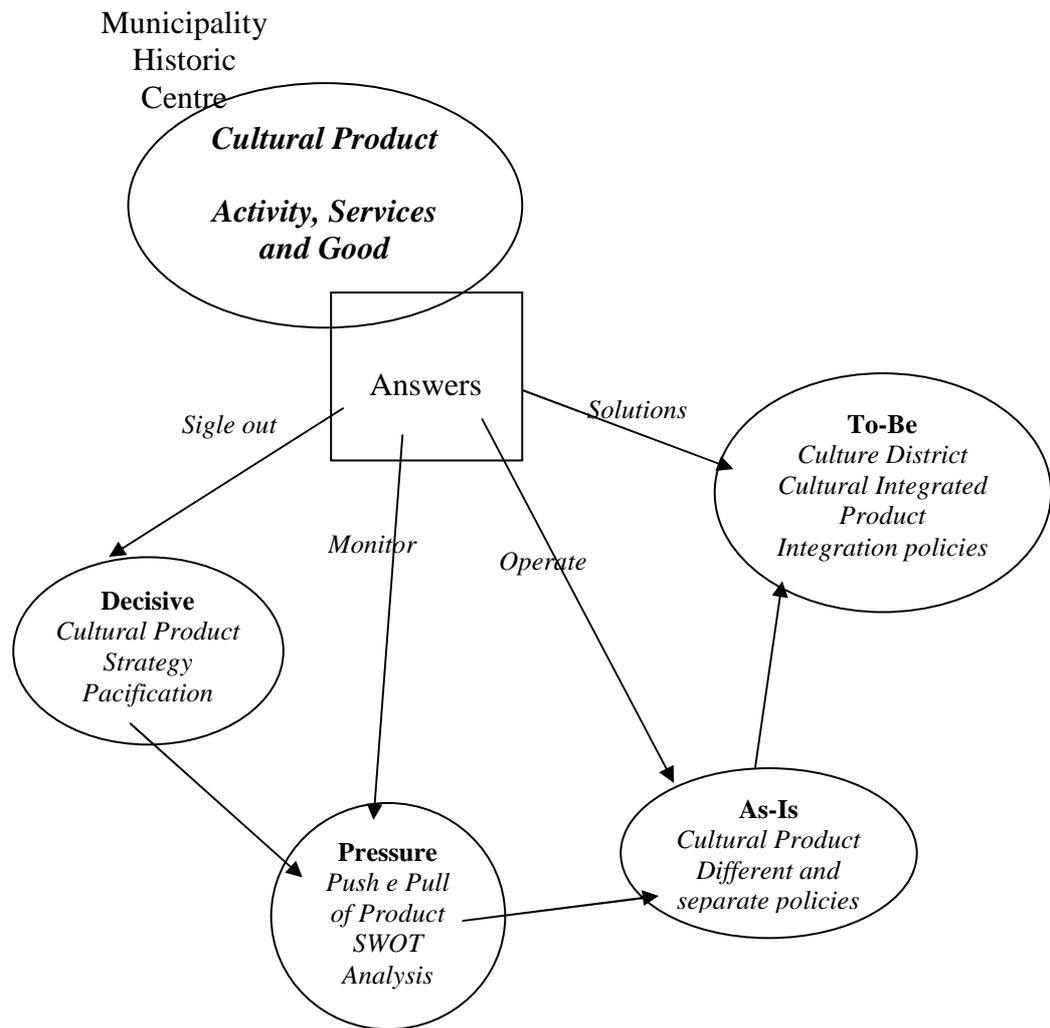

Figure 11 – “As Is – To Be” Model. Source: ours application

The model summarizes the main phases of the local development plan of the historical centre of Naples. Once defined the planning have been applied to the historical centre of Naples, three maps of positioning.

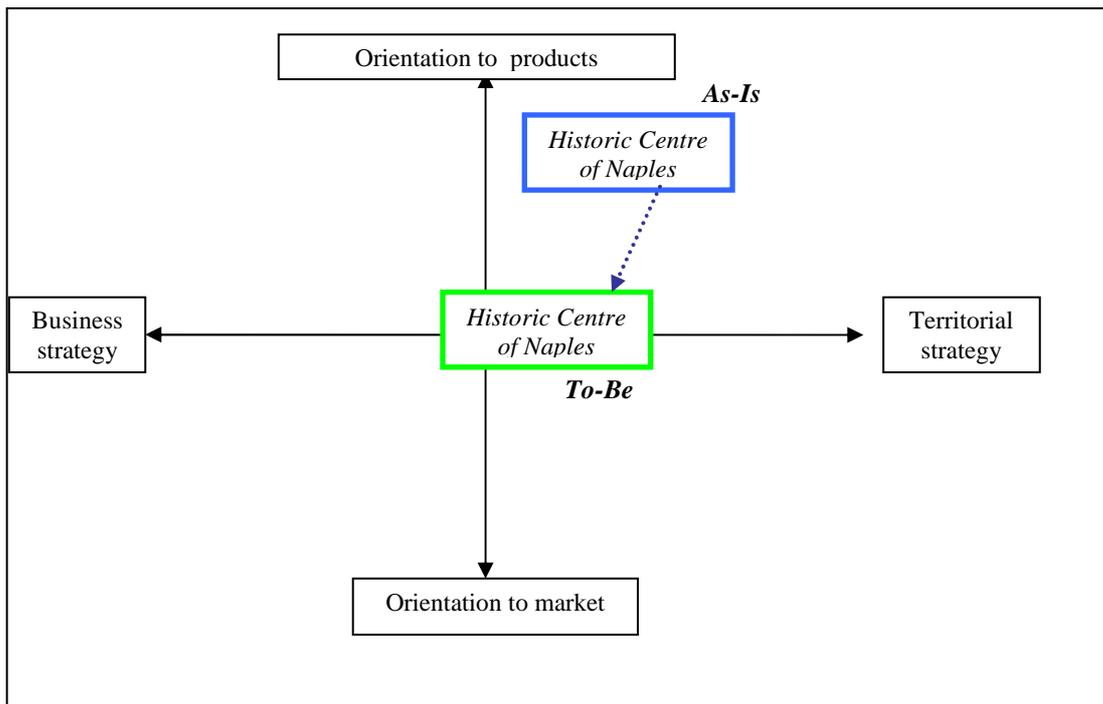

Figure 12 – Positioning map: Orientation and Strategy of Historic Centre of Naples. Source: ours application.

The logic of cultural district offer an integrated view of cultural activities in the territory, so in the district policy-makers need to take a developmental perspective is oriented to the preservation of cultural products to the enhancement and development (market orientation), for example the case of the museum "Mother" - is a museum but also organizes events and musical evenings and culinary. At the same time, the district must pursue both a business strategy - to every cultural activity, and related support - is a regional strategy with a broader view and sort - with macro-areas of intervention and goals shared by all stakeholders of the territory.

In the figure below, have been placed on the grounds of the main-strategy and characterizing the cultural products of the historical centre of Naples.

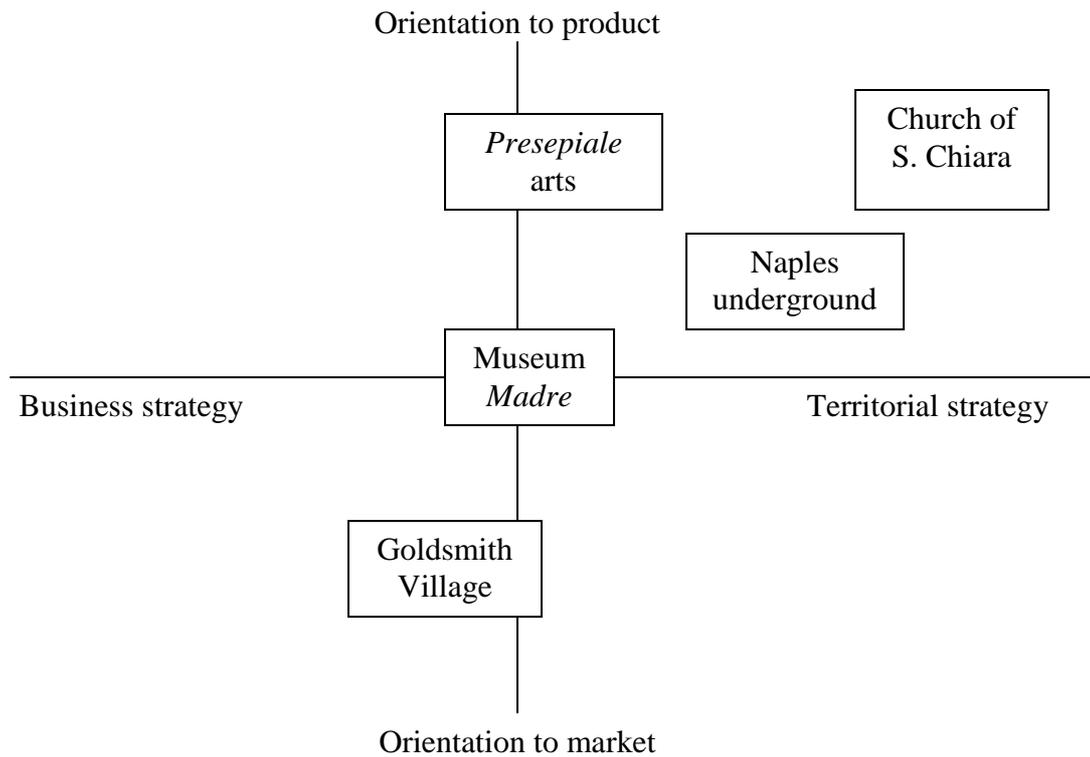

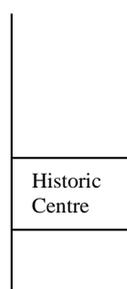

Figure 13 – Positioning map: Orientation and Strategy of Principal cultural product of Historic Centre.

The art *presepiale*: orientation to the handicraft, the shepherds are creations of the artisans of "Spaccanapoli", the strategy is business as artistic creations are sold to visitors and lovers of art nativity scene, but also because each local store could be Visits to admire the artistic creations of the Neapolitan territory, also in part a symbol of the city of Naples. Naples underground: orientation to the product which is made up of the underground excavations of the foundations of the city of Naples, the strategy is territorial. The Church of St. Clear guidance to the preservation of the product, strategy planning. Goldsmith Village: market orientation, strategy, integrated business because the village consists of several shops and a goldsmith, territorial because the village is proposed, is promoted and perceived externally as a single cluster of local craft products.

Last two maps are represented into figures that follow. The first position map places Historic Centre of Naples in relation two variables: Product system and quality; the second position map places Centre of Naples in order to three variables: development of touristic destination system, joint management and quality.

Product System

 Quality

Figure 14 – Product System and Quality level of Historic Centre of Naples. Source: ours elaboration

This positioning is clear that the historic centre of Naples can not be perceived as a cultural system and the quality is low, since in many areas must implement a recovery policy.

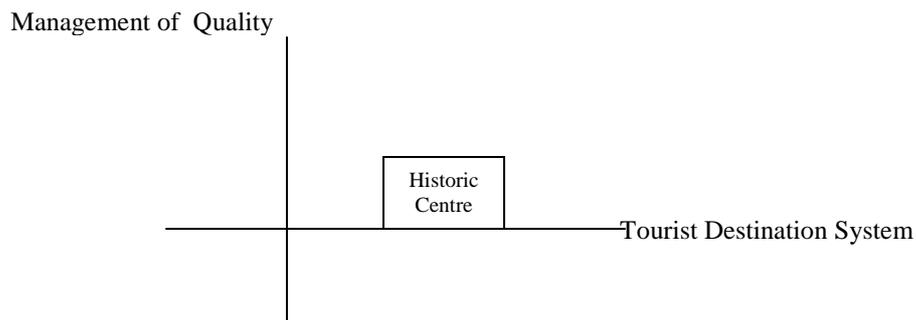

Figure 15 – Management of Quality and Tourist Destination System. Source: ours elaboration

The historic centre of Naples is characterized by an average development of the tourist destination and a quality management absent or negative.

In conclusion, The analysis and application of developed models applied to historic centre, confirming the need for a Quality Brand strategy on the basis of implementation of the Cultural District.

FROM STATE OWNED OPERA COMPANIES TO FOUNDATIONS UNDER PRIVATE LAW: THE INFLUENCES OVER GOVERNANCE

Finessi, Elena¹

¹*Business Administration Department, University of Turin, Turin, Italy*

Purpose - This paper aims to analyse the composition of the opera foundations' administrative organs, with the intention to check how much and in what way the entrance of private parties has modified the guide lines in the management of the individual foundations.

Design/Methodology/Approach - The research was carried out on thirteen opera foundations recognised by the Ministry of Cultural Goods and Activities to which the Accademia Nazionale di Santa Cecilia must be added.

The method adopted concerns an empirical analysis of the 2007 financial statements and the charters of each foundation.

Findings - From the research carried out it is seen that the privatisation of the opera foundations is still in embryonic form. The only exception is the Teatro alla Scala di Milano where private parties contribute in a significant way to the operations of the foundation and they nominate all their representatives on the board of directors, which total three.

Research limitations - The study was carried out only on ten foundations because financial data for the others foundations was not available.

Originality/value - The study focused on the role played by private components over foundation' governance.

Keywords State owned opera companies, opera foundations under private law , corporate governance, donations, private components.

Paper Type Research Paper

INTRODUCTION

Opera houses have been faced with great change as they have passed from being autonomous companies to private law. This passage has entailed a rethinking of the theatre as such, from a corporate point of view.

Speaking of companies in the context of opera foundations, means first and foremost contextualising the term with what is the defining activity carried on by the said foundations.

Generally speaking, the company is an economic activity the aim of which is to satisfy the needs of people through the creation of certain "economic assets" available for consumption.

In this respect, the opera house just like any other company can be conceived of as a system consisting of a set of elements interrelated with each other oriented towards the satisfaction of a very precise requirement. In particular, opera foundations are born with a clearly defined objective: "pursue the spreading of musical art and, as far as it concerns them, the training of artistic managers and the musical education of society at large, as a non-profit making concern."¹⁰¹

Elements making up the theatre company are the same as any other company and find their expression in: the human element and the material element, in other words the "capital".

In this regard, the human element plays a determining role within the theatre.

In fact, the product offered by the theatre company cannot be created without the presence of the human factor. Every element necessary for producing a show is a human element.

Just think for example of the orchestra with its conductor, the playwright, the actors, the corps de ballet, the choreographer etc. All these individuals, coordinated with each other make up the product offered by the theatre.

In this regard, from the analysis of the financial statements of the different opera foundations, it emerges that around fifty percent of the production costs are labour costs.

Also the second element, or the material element, be it monetary or already invested in means of production, has a considerable weight in the situation being analysed. In fact, as far as monetary capital is concerned public or private contributions allocated by the foundation to carry on its activities are extraordinarily important. In particular these foundations are unlikely to be able to have an "economic" management and it is unlikely that they operate in conditions of equilibrium.

Actually, these "companies", survive thanks to the contributions of private parties, the state (through the disbursements of the One Performing Arts Fund and other funds of various natures), the regional authority, town and city councils and other public bodies.

The objective of the contributions received is not that of covering the losses but that of helping the foundations in their management, since in a great many cases income flows are not able to meet the cost flows. In fact, most of the theatres' revenues come from ticket sales and season-ticket holders. The critical point in this imbalance comes with the setting of ticket prices.

Opera foundations cannot in fact determine the price of the ticket with the same dynamics with which companies determine the prices of their products. The reason lies in the fact that each theatre has a limited number of seats in the building and each show involves the incurring of variable costs linked mainly to the performers. The coverage of these costs would require high prices to be fixed with a heavy selection of the demand. This selection would not be in line with the statutory aims anyway. These provide for the provision of a cultural service to a large number of spectators. It is not therefore possible to fix the price of the ticket by following the conditions dictated by the market because doing that would determine a price that is too high which only a limited number of individuals would be prepared to pay.

They are therefore required to maintain a price level that is within the reach of the greatest number of people. In this regard, some of the contributions received have the aim of being used to cover differential between what the sales price would be determined a market conditions and the sales price actually charged so as not to go against the provisions of the charters.

A further particularity is that regarding the capital already invested in production resources.

When this concept is adapted to the reality of the opera house it can be seen that each foundation is able to carry out its own activities on premises made available by the town or city council.

In fact, the regulations establish that in carrying out their activities, the foundations manage opera houses they have been given, conserving their historical and cultural heritage. This feature is encountered in the individual financial statements. As a matter of fact, the non-current intangible assets include the amount of the free granting of the premises including the theatre, for the performance of the artistic activity.

A further detail that can be seen in the financial statements and linked to the theatrical activity, has to do with the historical and artistic heritage which, whilst being part of the non-current tangible assets, is often indicated in a separate item.

The historical and artistic heritage is created following the conservation of historical assets, sometimes not used currently and whose economic utility is not used up, over time precisely because of the strong cultural value. This include in particular, sketches, historical costumes, figurines, models of sets and, for example, the musical archive.

Drafting the financial statements in the same way as in the case of commercial undertakings has been one of the obstacles that the foundations have had to overcome, but following their transformation, there have been many changes to tackle within the organisational, management and administrative structure. In particular, as mentioned previously, these changes have taken the path of "privatisation"¹⁰². For this reason, all those elements that permit the achievement of the purpose in the charters, following criteria of efficiency and effectiveness. In this sense it is possible to speak of the theatrical company since this is understood as a unitary¹⁰³, organised system of people and assets that creates a variegated and changeable complex of operations oriented towards the achievement of the institute's aims.¹⁰⁴

The aim of the transformation of the state-owned opera companies into foundations, was that of making them more autonomous than they were when owned by the state. In particular, the foundations:

- passed from financial accounting to economic accounting with records and books of account as well as the drafting of the year's financial statements as required by the Civil Code and by the national accounting standards, in the same way as other companies. The accounting standards and the provisions of the Civil Code are applied wherever possible because it should not be forgotten that the opera foundations, although taking on a private nature retain their non-profit making company features;
- they have privatised industrial relations, regulating them through a national collective contract;
- they have modified their management by adopting the models used at companies, in particular a functional type of structure has been adopted;
- they have introduced modifications from the point of view of governance, for the purpose of bringing in members designated by the private founders to their boards of directors.

In particular, this last aspect has meant a lot from both the financial and the management points of view.

Through their financial contribution, the private parties, are entitled to be present institutionally in the organisation's managerial organ.

Pursuant to Legislative Decree 367/96, art. 10, paragraph 3: "founders who as individuals or together as well as contributing to the equity ensure a contribution of not less than 8¹⁰⁵ per cent of the total state financing disbursed for the management of the foundation's activities for at

least two consecutive years verified with reference to the year in which they become part of the foundation can appoint a representative on the board of directors subject to the provisions regarding the composition of the board of directors.

The private individual can then join the foundation's steering and administration organ. This organ has among its powers also that of nominating and revoking the superintendent.

The entrance of private parties can mean a lot in terms of company growth, since the contributions available to the foundations will be greater, as well as in terms of a managerial shake up. In this regard, it should be emphasised that members designated by private founders have the same powers as the other members of the board of directors and therefore have the possibility of contributing to the management of the theatre by providing a more company-like configuration.

This paper therefore aims to analyse the composition of the opera foundations' administrative organs, with the intention to check how much and in what way the entrance of private parties has modified the guide lines in the management of the individual foundations.

BACKGROUND TO THE RESEARCH

The journey from autonomous companies to private law foundations has taken around thirty years and it is shown in brief below.

In the period leading up to the Nineties, the state owned opera companies were regulated by Law 800 dated August 14, 1967 (the Corona law), which for the first time stated that opera and concerts were of great National interest and that the state would undertake to intervene with concrete provisions.

The autonomous state-owned opera companies and concert institutions have a legal personality under public law and are organised into a number of thirteen autonomous companies clearly distinct from traditional theatres.

The abovementioned law also provides for the introduction of a certain funding to the state-owned opera companies, but does not provide for their financial recovery.

The problem of the double funding channel was tackled with the promulgation of law no. 291 on May 10 1970, pursuant to which two "reserves" were set up: one of them earmarked for the financing of the productive activity, and the other to rectify operating losses.

The first great step towards actual funding to the state-owned opera companies, was taken in 1985. In that same year, law 163 was passed on April 30, 1985, that instituted a "reserve" allocated to the financing of entities belonging to the world of show business including the state owned opera companies. This reserve was the One Performing Arts Fund(OPAF).

Before the introduction of OPAF, financing of the performing arts was by means of :

- income from a numbers lottery;
- from lotteries of other types;
- from taxes on shows and on casinos;
- from the so-called RAI provisions.

Law 163 dated April 30, 1985, " New laws governing the intervention of the state in favour of the performing arts" it was the first real legislative intervention aimed at regulating all the sectors of the performing arts.

The One Performing Arts Fund thus represents an instrument aimed at providing financial support to the state-owned bodies, institutions, associations, other bodies and companies operating in cinema, musical, theatrical dance, circus and travelling show sectors. The allocation to the performing arts was inserted in the finance act of the state and became a truly ongoing cost heading on a three-yearly basis.

Thanks to the introduction of this permanent type of financing those involved in the performing arts were able to programme long term and in greater detail.

Nevertheless, to have a real reorganisation of the theatre sector it is necessary to wait until 1996. That in fact was the year in which Law 367 of June 29, 1996, was passed.

The object of this law was to transform the state-owned opera and symphony companies from autonomous state-owned bodies under public law into foundations under private law of priority national interest governed by a board of directors.

The origin of the passing of this started from the La Scala opera house that had the aim of finding an alternative to the financing of the opera houses.

The La Scala opera house project was to introduce private parties into the financing of state owned opera companies and placing them alongside the public financing.

To put this project into practice the Foundation was chosen as the legal entity.

The reasons for choosing the foundation as the legal entity was not so much for its suitability but because other forms of legal entity were ruled out . The main considerations are the following:

- the corporation form was not suitable because the state-owned opera companies are not-for-profit companies;
- the association form was not suitable because the objective of the association is pursuing the benefit of its members, this would mean making the entire public members and excluding those who were not associated.

Legislative Decree 367/96 provided for the transformation occurring at the discretion of the state owned opera companies. In this period, the only state-owned opera company to be transformed was the La Scala opera house. All the others awaited the extension granted with the passing of Legislative Decree no. 134 dated April 23,1998 which provided for the transformation occurring "ope legis".

Starting from the passing of the abovementioned decree, in the space of just a few years, all the state owned opera companies took steps to transform themselves into foundations under private law.

Among the various consequences deriving from the transformation into foundations under private law, shown above, an analysis was done on the implications of these on the composition of the governance of the individual opera foundations. In particular, the changes deriving from the entrance of private parties into the governance of the foundations and on the impact that this had in terms of corporate growth, were focussed on.

After this, a general presentation was made of administrative organs of an opera foundation before entering into the merits of analysing their composition.

THE ADMINISTRATIVE ORGANS OF AN OPERA FOUNDATION.

Legislative decree 367/96 art. 10 paragraph 2, provides that it is for the charter of the foundation to determine the composition, the competencies and the power of its organs. Nevertheless the same decree establishes the minimum structure of the internal organisation of the foundations. In particular, the organisation is structured into four organs:

1. The Chairperson,
2. The Board of Directors;
3. The Superintendent¹⁰⁶;
4. The Board of Auditors.

The charter can however provide for other organs alongside those listed above, like for example the Founders' Meeting.

The research was concentrated on the second point, i.e. the composition of the board of directors. The aim, in particular, is that of establishing the presence of private parties at the board meetings.

Nevertheless, during the research there was an investigation into which organs made up the internal organisation of the foundations. In this specific case, it turned out that, some cases, as well as the minimum organisations established by law, other ones were constituted. In the table shown below, the results of the research deriving from the analysis of the charters of the individual foundations are highlighted.

Table 1 – organs of the foundations

As can be seen from the table above, in four cases the constitution of an additional organ called "Founders' Meeting" was provided for.

The meeting of the founders is usually made up of all the founder members,¹⁰⁷ be they public or private, entitled to one vote in the meeting. Nevertheless in some cases participation in the

meeting restricted dependent on the monetary contribution made. The charters of the individual opera houses that institute the founders' meetings provided that :

- for the La Scala opera house all the founder members take part who have the right to one vote for every contribution of € 520,000. The Ministry, the Province, the City Council and the Chamber of Commerce have the right to two votes and the members of the board of directors can be present.
- for the Civic Opera House in Bologna all the founder member participate and they are entitled to one vote each;
- for the Regio opera house, all the founder members participate and are entitled to one vote each. The Ministry of Cultural Assets and Activities is entitled to two votes and the members of the board of directors may be present.

The founders' meeting has an important role among the organs as it is responsible for different tasks.

Generally speaking, this organ mainly deals with: seeing to the appointment and the revocation of members of the board of directors; assessing whether any subsequent candidatures for founder membership have all the requisites; expressing its opinions regarding different issues such as, for example, any modifications to be made to the charter, to the financial statements for the year and other possible issues, submitting them to the board of directors; proposing that the board of directors take action against directors when the presuppositions for said action exists and indicting the reasons for it at the time.

The chairperson

The chair of the opera foundation is given to the mayor of the municipality where the foundation itself is located (art. 11), irrespective of the contribution the council makes to the foundation's equity.

The only exception was made for the Accademia Nazionale di Santa Cecilia, where the chair is not given to the mayor but to the chairperson of the Academy itself who also acts as superintendant.

Among the various duties, the Chairperson calls and presides over the board meetings and ensures that the resolutions taken therein are implemented.

Alongside the figure of the chairperson a deputy chairperson is also envisaged who is elected from among the members of the board of directors and is required to take the place of the chairperson should he or she be absent or indisposed. Nothing is said about whether the termination of the mayor's term of office falls within the cases of absence or indisposedness.

The board of directors

The foundation is managed by a board of directors consisting of a minimum of seven and a maximum of nine members¹⁰⁸, including the chairperson. The only exception is the one

provided for for the Accademia di Santa Cecilia, for which the size of the board of directors has been increased from nine to thirteen members.¹⁰⁹

The appointment of the members of the board of directors is in part restricted by law. In this regard three members must be elected:

- the Chairperson whose function must be covered by the mayor of the city where the foundation is located¹¹⁰;
- one representing the Government authority responsible for the performing arts that in this case is the Ministry for Cultural Assets and Activities;
- one representing the Region where the foundation is based.

The last two organs have the respective right to at least one representative, independent of what their contribution to the equity of the foundation has been. Furthermore, following the passing of Law Decree no. 4 art. 29 dated January 10 2006 converted into Law 80 dated March 9, 2006, if the Board of Directors consists of nine rather than seven members the charter must provide for the Government Authority to be attributed two representatives on issues regarding the performing arts.

As for the remaining components, these can be appointed from the private parties.

The conditions for the participation of private parties in the management of the foundations have been modified by reducing the lower limit of the annual contribution to operation costs from twelve to eight percent. This percentage is calculated on the total of the state funding disbursed for the management of the activities of the foundation.

In the case in which the private parties singularly or together reach the minimum limit established by law and assure it for at least two consecutive years, they can appoint their own representative on the board of directors.

The components of the board of directors, with the exception of the chairperson remain in office for four years and can be reconfirmed.

The law, furthermore, attributes different powers to the board of directors among which:

- the approval of the year's financial statements;
- the appointment and the revocation of the superintendent;
- the approval of changes to the charter;
- the approval of the programmes of artistic activity;
- the establishment of guidelines for the foundation's economic and financial management.

The board of directors has powers relative to the ordinary and extraordinary administration of the foundation that are not attributed by law or by charter to another organ.

In addition to the duties attributed to them by law, there are others that are established by charter, such as for example:

- the appointment of the deputy chairperson, the auditor and the secretary to the board;

- resolutions regarding the acceptance of contributions;
- the confirmation of offices and powers to the individual members;
- promotion for the raising money abroad.

RESEARCH METHODOLOGY

On the basis of what was said in the previous paragraphs, research was carried out on thirteen opera foundations recognised by the Ministry of Cultural Goods and Activities to which the Accademia Nazionale di Santa Cecilia must be added.

The method adopted concerns an empirical analysis of the 2007 financial statements¹¹¹ and the charters of each foundation.

When the opera foundation world is observed, it is deduced that the objective of the competent Government Authority is that of providing an incentive for the entrance of private parties so that these can replace in part the contributions made by the public institutions. For this purpose the Ministry has moved in two directions. On the one hand we have seen a considerable cut in the last few years in the One Performing Arts Fund, probably also with the aim of providing the foundations with incentives to find subsidies from private parties. On the other hand the percentage has been reduced that represents the entrance threshold for private parties, with the aim of allowing entrance thereto to a greater number.

The purpose of the research is that of analysing the composition of the Board of Directors for the purpose of checking whether the objective of the entrance to private parties in the management of the opera foundations has been reduced or otherwise.

THE RESULTS OF THE RESEARCH

The research had as a starting point the analysis of the charters of the opera foundations, for the purpose of checking the composition of the board of directors that they provide for. The following table shows the relevant data.

NAME	NO. OF MEMEBERS	CHAIR PERSON	MINISTRY FOR CULTURAL ASSETS AND ACTIVITIES	REGION	COUNCIL	OTHERS (%)	PRIVATE FOUNDERS
FONDAZIONE ACCADEMIA SANTA CECILIA DI ROMA	13	1	2	1		6	4
FONDAZIONE TEATRO ALLA SCALA DI MILANO	9	1	2	1		2	3
FONDAZIONE TEATRO ARENA DI VERONA	7	1	1	1		1	3
FONDAZIONE TEATRO CARLO FELICE DI GENOVA	9	1	2	1	1		4
FONDAZIONE TEATRO COMUNALE DI BOLOGNA	7	1	1	1			4
FONDAZIONE TEATRO LIRICO DI CAGLIARI	9	1	2	1		1	4
FONDAZIONE TEATRO LIRICO GIUSEPPE VERDI DI TRIESTE	7	1	1	1			4
FONDAZIONE TEATRO MASSIMO DI PALERMO	7	1	1	1		3	1
FONDAZIONE TEATRO REGIO DI TORINO	7	1	1	1			4
FONDAZIONE TEATRO SAN CARLO DI NAPOLI	7	1	1	1			4

Table 2 – composition of the board of directors as provided for in the charters– () Hereafter the “other electors” are shown for the individual foundations : - The Teatro Arena di Verona: Chairperson of the Accademia Filarmonica; - Teatro alla Scala di Milano: Province, Chamber of Commerce; - Teatro Lirico di Cagliari: Mayor; - Teatro Massimo di Palermo: Board of Directors; - Accademia di Santa Cecilia: Mayor since, non president is part of the Board of Directors, the Academic Corps has the right to five appointments. .*

From the table shown above, it emerges that, in most of the foundations, the private founders have a great importance in the composition of the board of directors with the exception of the Fondazione Teatro Massimo di Palermo. This in fact gives private parties the right to appoint a single member of the seven envisaged in the charter for the composition of the board of directors.

It is necessary to point out that the right of appointment granted to founder members can only be exercised if a legally-required minimum contribution is guaranteed. As stated previously, the current regulations have reduced the percentage of the private contributions in relation to the state contributions from twelve to eight percent. The aim of this reduction is to give an incentive for the entrance of private parties to the support of the opera foundations.

Irrespective of the percentage, once it is reached it is possible to appoint a member of the board of directors. This reasoning is valid for every eight or twelve percent. If, for example, a foundation has a minimum threshold of eight percent and the total of private party contributions reaches sixteen percent, then said private parties can elect a maximum of two members to the board of directors, always taking into account any restrictions expressly provided for in the charter. In this regard, the size of the contribution of the private founders as a proportion of the state contribution total was checked. The a comparison was made between the percentage determined in the way indicated above with the minimum percentage provided for by the statute. By doing this it has been possible to determine the number of members who the private founders can elect to take part in the make-up of the board of directors.

The table that follows shows the data reworked in accordance with the analysis made.

NAME	% PRIVATE CONTR./STATE CONTRIB.		MINIMUM THRESHOLD APPOINTMENT TO B.O.D	NUMBER OF ELIGIBLE MEMBERS ON B.O.D.
	2006	2007		
FONDAZIONE ACCADEMIA SANTA CECILIA DI ROMA	31%	32%	8%	3
FONDAZIONE TEATRO ALLA SCALA DI MILANO	44%	43%	8%	3
FONDAZIONE TEATRO ARENA DI VERONA	0%	12%	8%	0
FONDAZIONE TEATRO CARLO FELICE DI GENOVA	17%	14%	8%	1
FONDAZIONE TEATRO COMUNALE DI BOLOGNA	15%	10%	8%	1
FONDAZIONE TEATRO LIRICO DI CAGLIARI	8%	4%	8%	0
FONDAZIONE TEATRO LIRICO GIUSEPPE VERDI DI TRIESTE	0%	0%	8%	0
FONDAZIONE TEATRO MASSIMO DI PALERMO	0%	4%	8%	0
FONDAZIONE TEATRO REGIO DI TORINO	8%	9%	8%	1
FONDAZIONE TEATRO SAN CARLO DI NAPOLI	5%	0%	8%	0

Table 3 – power of appointment attributed to the private founders in proportion to the contributions disbursed

The analysis was done over two years (2006-2007), since the Legislative Decree D.Lgs 367/96 art 10 paragraph 3, explicitly provides that in order to be able to have the right to nominate at least one member of the board of directors, the founders must guarantee an annual contribution to operations of not less than 8% (or 12%), for at least two consecutive years.

It therefore follows, on the basis of the data shown in the table, that in the two years considered, no fewer than five foundations fail to meet the above mentioned minimum threshold. These in detail are: the foundations of the Teatro Arena di Verona, Lirico di Cagliari, Giuseppe Verdi di Trieste, Massimo di Palermo and San Carlo di Napoli.

If we compare the results of table 3 with those of table 2 and focus on the contributions of the private founders, it can be seen how, it is only in the Fondazione Teatro alla Scala, Milan that the private founders are entitled to elect the total of two members attributed to them by the charter. The charter in fact provides for a maximum of three members that can be elected by private parties. By having a minimum threshold of eight percent and obtaining a total of contributions from private parties totalling 44% in 2006 and 43% in 2007, this foundation has three members of the board of directors elected by private founders.

Given the limited contribution of private founders for the operations of the foundations, in order to anyway guarantee the regular make up of administrative organs, substitute members are elected in accordance with what is provided for by the individual charters. These members are provisional as they remain in office until the contributions donated permit the private founders to appoint the remaining members.

Consequently the actual composition of the boards of directors of the individual foundations, on the basis of the analyses made, should be those shown in table 4. The formulation of the composition of the board of directors is only hypothetical because at the moment the documents that would allow public and private parties who appointed the members to be identified, cannot be consulted. For this reason, on the basis of data extrapolated from the analyses and the checks made it is deduced that the board of directors of each opera foundation, are probably composed as follows:

NAME	NO. OF MEMBERS	CHAIR PERSON	MINISTRY OF CULTURAL ASSETS AND ACTIVITIES	REGION	COUNCIL	OTHERS (%)	PRIVATE FOUNDERS	FOUNDERS MEETING	B.O.D
FONDAZIONE ACCADEMIA SANTA CECILIA DI ROMA	13	1	1+1	1		6	3		
FONDAZIONE TEATRO ALLA SCALA DI MILANO	9	1	2	1		2	3		
FONDAZIONE TEATRO ARENA DI VERONA	7	1	1+1	1+1		1+1	0		
FONDAZIONE TEATRO CARLO FELICE DI GENOVA	9	1	2+1	1+1	1+1		1		
FONDAZIONE TEATRO COMUNALE DI BOLOGNA	7	1	1+1	1	1		1	1	
FONDAZIONE TEATRO LIRICO DI CAGLIARI	9	1	2	1+1		1+1	0		2
FONDAZIONE TEATRO LIRICO GIUSEPPE VERDI DI TRIESTE	7	1	1+1	1+1		1	0		1
FONDAZIONE TEATRO MASSIMO DI PALERMO	7	1	1	1		3	0		1
FONDAZIONE TEATRO REGIO DI TORINO	7	1	1	1			1	3	
FONDAZIONE TEATRO SAN CARLO DI NAPOLI	7	1	1+1	1+1	1		0		1

Table 4 – forecast make up of boards of directors. () In the Fondazione Teatro alla Scala di Milano, as indicated above, the private founders have the right to elect all three members attributed to them.*

The provisional members appointed by the organs instead of the private founders are shown in the above table.

In most of the cases, the institutional organs that exercise the power to appoint as substitutes of the private founders are the Ministry and the Region in which the individual foundation is located. .

In the Fondazioni Teatro Comunale di Bologna and Teatro Regio di Torino foundations, this power of appointment is also attributed to the Foundation Meeting.

In conclusion, in the Fondazioni Teatro Lirico di Cagliari, Teatro Lirico Giuseppe Verdi di Trieste, Teatro Massimo di Palermo and Teatro San Carlo di Napoli foundations, it is the Board of Directors made up of the members in office that appoints one of the missing directors. .

CONCLUSIONS

From the research carried out it is seen that the privatisation of the opera foundations is still in embryonic form. In this regard it has been seen that some years after their transformation into foundations the size of the contributions by private parties for operations has not been very big.

Actually if we compare the make-up of the board of directors provided for by the charter with the contributions actually disbursed, it can be seen that the founder members are not able to exercise the power to appoint the members they are entitled to either at all or in part. The only exception is the Teatro alla Scala di Milano where, as said previously, private parties contribute in a significant way to the operations of the foundation and they nominate all their representatives on the board of directors, which total three.

Hence it emerges that the private participation in the management of opera foundations, which was intended to replace the public presence has been very slow in taking off. Furthermore this situation still exists even after the reduction of the investment requested of private parties whereby it fell from twelve to eight percent.

From what has been seen it would seem that the aims of the reform of the state-owned opera companies, have not been pursued in part. The opera foundations, still depend a lot on the

OPAF contribution. Nevertheless the continual cuts being made to the OPAF are forcing opera houses to face up to difficult decisions and placing the albeit delicate equilibriums they have been able to create, under considerable strain.

Since, at present, the public component¹¹² is much larger than the private one it is deduced that the guidelines of the governance are still a long way from those typical of a corporation. For this reason, even if the opera foundations are in their infancy, because of the part the regulations have played, it is nonetheless necessary that this direction continues to be followed with greater intensity by private parties.

The charters actually provide for private founders being given wide decision-making capacity within the board of directors, since they can appoint more than half the members of said board.

This power however derives from the size of the contributions they have donated which are hardly increasing at all.

Thus, given the difficult economic and financial situation in which the opera foundations find themselves and in the light of the considerations made, it clearly emerges how, to complete this corporate growth process, greater investment on the part of private founders is necessary.

NOTES

(1) Art. 3 “aims of foundations” paragraph 1 Legislative Decree 367/96.

(2) According to the author, privatisation means that process that tends to apply standards of business economics in the functioning of the various institutes.

(3) M. Nova, *L'azienda teatro, assetti istituzionali e politiche di gestione*, Egea, 2002.

(4) The law establishes that the overall contribution disbursed by private parties, for the purpose of being described as founder members must not exceed 40% of the net worth of the foundation itself. This donated fund is in part used also to contribute to the operations of the same foundation.

(5) Paragraph 3 has been modified by art 3-ter, of law decree 7 dated January 31, 2005, n. 7, in the overall test by the relative conversion law. Before the modification the annual percentage of the private individuals was equal to twelve percent

(6) The figure of the superintendant is characteristic of opera foundations. Legislative decree 367/96 requires him or her to be chosen from among people with specific experience and a sound track record in the musical organisation field and the management of similar bodies. He or she is given the job of co-ordinating the artistic concert production activities with the artistic director, in compliance at all times with budgetary restraints.

(7) The qualification of founder member is bestowed dependent on compliance with certain criteria required expressly by the individual charters.

(8) The number of members of the board of directors was modified with the passing of law 51 dated February 23, 2006.

(9) Art.1-decies of law decree December 5, 2005 converted by law no. 27 dated February 2, 2006, provides for the members of the Board of Directors of the Accademia di Santa Cecilia be raised from thirteen of whom five are to be elected by the academic body.

(10) With the exception of the Accademia di Santa Cecilia for whom it is provided that the chairperson is not the Mayor of Rome but rather the chairperson of the Academy itself. Nevertheless, the mayor of Rome is a member of the board..

(11) Foundations, for which no financial statement data or charter is available , have been excluded from the research. These in particular are : Fondazione Maggio Musicale Fiorentino, Fondazione la Fenice, Venice, Fondazione Teatro Petruzzelli,Bari and Fondazione Opera di Roma.

(12) Most members are elected from public bodies such as the Ministry, Region and City Council.

GOVERNANCE MECHANISM FOR ENVIRONMENTAL LOGISTICS CHANNEL

Fujimoto, Hisao¹

¹*Osaka University of Economics, Japan*

The recycle problem has become the domestic and world-wide issue in many countries. For considering this issue, the traditional view of marketing channel, which only considers the one-way process from production to consumption, has become insufficient. This paper develops the concept of circulated logistics channel and also suggests the important role of trust and cooperation as a governance mechanism for the successful circulated logistics channel.

After discussing basic framework of circulated logistics channel and three governance mechanisms (market, network, and hierarchy), three types of the circulated logistics channels are discussed. The first is the closed circulated logistics channel, where an actor (a firm) can govern total channel and its flow. In this channel, an actor bears the role of entrance and exit, and processes goods, resources, and waste. The second is the open circulated logistics channel, which is governed by plural actors, such as firms, consumers, and governments, based on trust and cooperation. The last is the intermediate circulated logistics channel, which is intermediated by traders and retailers. It also needs trust and cooperation based on the price/market mechanism.

In the real world, there is no society which works only one pure mechanism. However it is important that we ascertain which mechanism is dominant and how other mechanisms support the dominant mechanism.

INTRODUCTION

It has been becoming a serious social and economic issue that the enormous abandonment of products, materials, and wastes from the mass production and consumption has been bringing the destruction and contamination of the earth environment. The recycling and reuse of these enormous wastes can economize the social useful resources. It can also solve the problems of facility shortages and the increasing cost for processing wastes. In developed countries, the recycling has been the serious issues after the mass production and consumption.

In Japan, the Law for Establishing the Recycling-based Society has been enacted in May, 2000. Before and after this Law, related laws in several products categories, packages, home electronics, foods, automobiles, are enacted. Along with these laws, companies and local governments have been working to promote the recycling. However, the recycling system still has not performed the enough achievement.

For supporting and promoting the recycle and reuse of wastes and materials, the conventional distribution channel concept, which only considers the one-way process from production to consumption, is not sufficient. The backward or reverse channel, which includes the collecting and recycling process of resources and wastes after consumption, has to be considered. It is important that two types of channels are not only recognized respectively, but that they are tied up effectively. If this combined channel is called as environmental circulated logistics channel, it has some different features from the conventional channel.

The new circulated logistics channel (CLC after this) will include various members and need the long-range perspective for the efficient and effective operation. It will also need the governance mechanism for interorganizational factors.

This paper explores the importance of trust and cooperation as the governance mechanism and fundamental features of CLC from the several examples in Japan. As Japan has been learning from European countries, this experience of Japan will be a lesson for Asian countries.

BASIC MEASURE FOR RECYCLING-BASED SOCIETY

In Japan, under the Basic Law for Establishing the Recycling-based Society, the Master Plan for Establishing the Recycling-based Society was enacted in 2003. At a simultaneous period, Law on Promoting Green Purchasing (2001), Law for Promotion of Effective Utilization of Resources (Recycle Law) (2001), Waste Management and Public Cleansing Law (2003), Container and Packaging Recycling Law (2000), Electric Household Appliance Recycling Law (2001), Food Recycling Law (2001), Contraction Recycling Law (2002), and Automobile Recycling Law (2005) has been enacted. (see Fig.1 and Fig.2 in detail)

In Container and Packaging Recycling Law, renewing a past idea that only local governments completely bear the responsibility of the processing of the waste of container and packages, it tries to promote recycling under new roles that consumers bear the discretion exhaust, local governments bear the separate collection and traders bear the re-commercialization of waste respectively. The re-commercialization of four items of glass container, pet bottle, plastic container and paper container was obligated. Traders can select one method from three alternatives: (1) voluntary recall rout, (2) Designated corporation rout, (3) original rout.

Almost of used discarded home electronic appliances product exhausted by ordinary family is partly returned as metals after processing of crushing so far. Electric Household Appliance Recycling Law enacted in 2001 obligates retailers to receive discarded home electronic appliances, manufacturers to recycle them, and consumers to pay the fee for collection, delivery and recycle for air conditioner, TV, refrigerator and washing machine. It also obligates manufacturers to clear the recycle level of 50-60% and collect fluorocarbon. To secure the appropriate delivery of the specific discarded home electronic appliances from consumers to retailers and to manufacturers, the manifesto system is settled.

In Food Recycling Law, a large amount of food waste as unsold stuff and half-eaten is brought in the process of manufacturing, distribution and consumption. Whereas it occupies around 30% of municipal waste, the recycle ratio is still around 10%.

The basic idea in the Master Plan for Establishing the Recycling-based Society suggested that this society can be attained only by the role allotment and mutual cooperation of stakeholders. However, the attainment of effective recycling is still not sufficient.

Not limiting to Japan, the management of the recycling flow of such resources is becoming an indispensable part in the corporate strategy in a lot of worldwide global businesses. The main following factors exist in its background.

The first is the rise of consideration and responsible concern for the environment of business enterprises. The enterprise cannot disregard a public concern about its environmental friendliness for its continued development any longer. The public concern for the environment becomes a pressure that it is necessary to consider the environment for the enterprise. In addition, as people can use the various means of information gathering including the Internet and access to various information sources about environmental problems, understanding people's concerns for environmental problems becomes more important for the enterprise. Moreover, these people demand the positive result for e enterprises by settling on and executing construction of the management system and circulating logistics channel that achieve

the recovery of the resource after the abandons it. The company that works on such environmental problems and maintains the environmental compliance will produce the image "Green company" as Environment friendly enterprise" in its corporate strategy.

Secondly, in some countries, the law and the policy concerning the recycling of products and resources come to be executed. Several laws have been reacted in some countries of Europe in 1990's. For instance, the collection of packages of all package commodities has been imposed on companies by "Packaging Ordinance Act" in Germany. In addition, "German Recycling and Waste Control Act" requests for manufacturing companies to work on the technique and the technology to promote the reduction of wastes and the collection of inevitable wastes positively.

The Commission of European Communities adopted the request for the promotion of recycling, the reduction of hazardous articles, and the appropriate abandonment of wastes of electric and electronic appliances in 1998.

As mentioned above, also in Japan, various laws and ordinances are enforced under "Basic Law for Establishing the Recycling-based Society". The law and ordinance by such a national and local authority come to influence the corporate strategy that centers on the environment. To improve the environmental performance, companies in such a situation have to advance the environmental tie-up and green alliance with related companies and consumers in logistics channels.

Thirdly, not only important the reduction of the abandonment and its processing cost of wastes, collecting resources for recycling and its re-use can become the profits for companies. For instance, in Europe, Xerox is reporting the saving of 3.5 million dollars a year, which have been brought by a reverse logistics activity. (Maslennikova and Foley 2000) Such a case is reported also in the fields such as auto parts, computers, and airlines products. (Ayres et al 1997; Giude and Srivastava 1998) Therefore, it is clear that a holism aspect concerning the logistics channel including both the forward and backward channels flow is necessary.

FRAMEWORK OF CLC

After reviewing many literatures, Carter and Ellram (1998) concluded that most of literatures was descriptive and exploratory, and examined only relatively narrow aspect of reverse logistics, such as recycling. They also examined the internal and external constraints and drivers as critical factors in the reverse logistics process (also see Carter and Carter, 1998). The reverse logistics is also attracting attentions from the business strategy. Tibben-Lembke (1998) approached from the viewpoint of the total cost of ownership. Blumberg (1999), Inman (1999), Mayer (1999) and Schwartz (2000) stress that the managing, handling, and disposition of materials and returned goods can bring business opportunities and/or strengthen the market position. According to Caldwell (1999), not only in the conventional commodity flow channel, the reverse logistics is becoming the important part of the business in the online sales and direct marketing of digital contents like as music CD. The free return strategy and the environmental concerned disposal of materials can increase the customer satisfaction (DiMaggio, 2000).

Zikmund and Stanton (1971) is the first consideration of the distribution of wastes on the concept of the backward channel (BWC). They defined BWC as the return channel of reusable packages and materials from consumer to producer. They finally pointed out the four concrete forms of return channel; (1) direct backward channel, (2) backward channel with an atypical intermediary, (3) backward channel with traditional middlemen, (4) indirect backward channel using trash-collection specialists.

Fuller et al. (1996) describes a typology of reverse channel networks as the following: (1) corporate-integrated networks, (2) waste hauler-public recovery networks, (3) specialized reverse dealer-processor networks, (4) traditional "forward" wholesaler-retailer networks, and (5) temporary-facilitator networks. They also suggest the concepts of the closed-loop and open-loop application.

There is an only difference from the conventional forward channel (FWC) in that the typical consumer does not emulate the proactive role of the commercial channel member in spite of his role to sell and distribute waste materials to the market (see Fuller et al., 1996). From the antecedent researches, several features of BWC and CLC can be pointed out.

First, consumers are not only a consuming actor, but also the producer of resources after consuming and the promoter of its recycling. Whereas consumers have not been considered as the proactive member in FWC, they are considered as the proactive members in BWC and CLC. Consumers are expected to be aggressive participants in BWC and CLC. Their judgments and behaviors will determine whether wastes will be the useless garbage or the recyclable and useful resources.

Second, BWC and CLC will include public organizations, such as national and local governments and various non-profit organizations. Third, BWC and CLC are not for the narrow profit of specific organization. They are operated for the sustainable economic and social development of our ecosystem.

Last, the channel consisted of such a constituent needs to have the governance mechanism, which function based on not the conventional authority nor the market-price mechanism, but the long-range trust.

In this paper, three types of the circulated logistics channels are discussed. The first is the recycle channel, where an actor (a firm) can govern total channel and its flow. In this channel, an actor bears the role of entrance and exit, and processes goods, resources, and wastes. It can be called as the closed CLC. The second is the recycle channel of kitchen garbage, which is governed by plural actors, such as firms, consumers, and governments, based on trust. This channel can be called as the open CLC. The third is positioned between closed CLC and open CLC. In this logistics channel, actors are restricted, and middlemen and/or intermediate special traders perform an important role. This channel can be called as the intermediate CLC.

TPOLOGY OF GOVERNANCE MECHANISMS

After the Williamson's transaction cost economics, the third mechanism has been recognized between markets and hierarchies. Arndt (1981) described three types of economic control systems as markets, politics, and hierarchies, and coordinating mechanism as price, bargaining, and direct assignment (command). Powell (1991) suggested three systems as markets, networks, and hierarchies, and methods of resolution as price, reciprocity, and administrative fiat. In Bradach and Eccles (1991), coordinating mechanisms are described as price, trust and authority. Whereas these three coordinating mechanism seem to be independent and mutually exclusive, they can be related each other in various ways as pointed out. For example, the price mechanism can only be operated with trust for prices, products, and members' behaviors. Among of three coordinating mechanisms, trust occupies the important position especially in the open network. Whether it is operated in success or not is depend on the degree of trusts of network members. The importance role of trust as a governance mechanism for CLC will be discussed with introducing several cases.

CASES OF CLOSED CLC

In the closed CLC, an actor can control the entrance, process, and exit of goods and materials. In the convenience store in Japan, unsold lunch baskets and daily dishes are collected and processed into manure or feed. Vegetables and meats, which are produced using these manure and feed, become raw materials of lunches and daily dishes again. In this recycling system, a convenience store and /or its group operate the circulation of production, distribution, selling, abandonment, and reuse. It can avoid the difficulty of collection, sorting, assortment and disposition from the aspect of health administration. The other example is CLC for disposal cameras. Consumers bring their disposal cameras to DPE stores for development. Manufacturers of disposal cameras can certainly collect finished disposal cameras through DPE stores. In Fuji Film Company, the re-use and recycle automation system, which was developed along with the product development of the disposal camera "*Utsurunndesu*", was operated in 1992. In 1998, new circulated production factory, which has renewed the past concept of production and introduced the new production system with collection, resolution, inspection and reproduction, was born. This disposal camera is designed to use the minimum parts and be easy for resolution in recycling without screw and adhesive. The company also monitors the bootlegs of the own CLC, which will bring inferior reproduction goods and ruin customers' trust. These two cases are relatively successful, because wastes and materials are restricted and members of CLC are strongly tied up.

Another example is the closed CLC based on the Specific Home Electronics Re-commercialization Law, the so-called Home Electronics Recycling Law, which has been enforced since April 2001 in Japan. This law has imposed a duty of recycling of main four items of home electronics, air-conditioner, television, washing machine, and refrigerator, to the manufacturer or importer. It is based on the consideration that those who have the specialized knowledge about the contents of products can accomplish the recycling properly and efficiently. The fact that about 80 percent of retailers already had been taking over used home electronics at the time of consumer's replacement could act favorable to impose retailers to collect and convey used home electronics. Consumers, on the other hand, are responsible to use their home electronics longer for restraining product abandonment, hand over their used home electronics to proper retailers, and respond to a claim for payment of predetermined charge required for recycling.

The last CLC has several different characteristics from the former two CLC. First, consumers have to bear costs for recycling used home electronics, which used to be collected by local government or specialized dealer-processor without costs for consumers. It means that manufacturer and retailer can claim a payment for consumers to abandon their home electronics. It can bring the consumers' illegal abandonment and the increasing monitoring cost for local government. It is depending on the moral and self-consciousness of consumers. Second, there is the problem that products from the recycled materials can obtain sufficient demands and markets in the competition with products from new virgin materials. It cannot be denied that recycled products tend to be in the disadvantage position in price and quality compared to new products. Third, the last CLC is difficult to be controlled by one actor. Manufacturers and retailers will not cooperate without economic incentives, such as reservation of the technical innovation and competitive advantage by recycling activities. Consumers will have no tangible profit. They only have the psychological factor of duty and solidarity. Whereas the local government can enforce its mandatory control power, there is a limit for its effective enforcement.

CASES OF OPEN CLC

Wastes and materials, which cannot be circulated in the closed CLC, have to be disposed by the local government. While most of wastes have been disposed as the incineration and/or reclamation disposal, the open CLC is a trial for recycling reusable wastes. In the open CLC, manufacturers and retailers have no strong commitments. Local government also has no strong enforcement based on the institutional law. Consumers have no economic incentives and legitimate duty to cooperate with the open CLC. In this situation, trust seems to be important role for the open CLC. Price, which has its base on economic incentives, and command, which has its base on authority and legitimacy, cannot be expected to be an effective governance mechanism for the open CLC. Trust can support other two mechanisms in their base and operate the open CLC effectively. For exploring it, several cases are discussed.

The first case is the plan of waste processing promotion in Fukuoka prefecture. It was enacted in 2002, and declared the following four basic policies.

1. Decreasing exhaust and promoting recycle
2. Clearing and strengthening the responsibility of exhaust and proper processing
3. Securing of proper processing , uplifting the consciousness and improvement of processing technology
4. Enhancement and enforcement of monitoring and guidance system
5. Promotion of public participation business

As strengthening the cooperation of residents, company and local government, manufacturers work to collect and re-use their own products, reduce container and package, and convert materials into more recyclable materials. Local government makes plans for recycling and monitors it. It can use the restricted measures and economic measures for improving the effect.

The second case is the Environmental Master Plan of Shinjo City. After the first plan had been passed ten years, Shinjo city has enacted the second Environmental master Plan in 2006. This plan has four basic frames.

1. Formation of fine environment based on recycling society

2. Preservation and utilization of natural environment and cultural heritage
3. Improvement of environmental learning and action
4. Promotion of environmental industry

The plan also points out the roles of citizen, company and local government, and preaches their collaboration. The role of citizens is to learn the relationship with environment, to review their life, and to participate in the environmental preservation and action. The role of company is to prevent the environmental pollution, to build the recycling system, to participate in the environmental preservation and action, and to work at the eco-business. The role of local government is to collaborate with citizens and companies for promoting actions, to exercise leadership in promoting steady actions, to release the proceeding situation, and to lead regions and districts.

CASES OF INTERMEDIATE CLC

The intermediate CLC emphasizes the important role of intermediaries and/or middlemen. In this channel, waste will be returned on the re-use base. However, waste is only returned as it is which is different from the open CLC where waste is returned as materials or resources for the reproduction. It is because intermediaries/ middlemen are positioned the next of consumers and have the important role in this channel. The other significant difference from open CLC is that in open CLC costs derivative from return channel can not be covered and they are covered by the public subsidy and/or finance because of the insufficient market for this channel. In this sense, the intermediate CLC is considered as an amalgamation of market and non-market.

The Shiromi Shopping Street in Kumamoto city is a case of the intermediate CLC. The ecological action of Shiromi has been activated from 1999 with the corporate identity (CI) of "the eco-station shopping street". In 2000, Shiromi made its original certificate of KSO14001. The purpose of this certificate is (1) formation of the eco-shopping street, (2) environmental education and learning, (3) formation of local community. The development of Shiromi has three aspects.

The first aspect is the internal network for the collaboration of component members. This internal network has the role of integrating members on the concept or slogan of "the environmental shopping street". The key for success is that this integral concept can be agreed by members with its fun and profitability. Without them, members and its organization can not be operated. In this sense, the internal network needs the price/market governance mechanism. It can be a system of economy and ecology.

The second aspect is the community network taking in consumers and townspeople and getting their collaboration. This collaboration can be supported by their voluntary consciousness and solidarity. The functioning of Shiromi as the eco-station is based on the loose network with the reciprocity and trust. However, this loose network based on the reciprocity and trust has no coercion power and economic incentives. It will need a rule as a control mechanism and an economic incentive mechanism.

The third and last aspect is the external network including local government, collection and recycle dealers, and manufacturers. Dealers and manufacturers will participate and act as economic concerns. This part of network consists of economic network on the price/market mechanism. The other part of network consisting from political network subsuming local government will basically depend on reciprocity and trust. However, it also can not ignore the price/market mechanism that can cover costs.

CONCLUDING REMARKS

The discussion of cases with the framework of the closed, open, and intermediate CLC can suggest us to consider and explore the importance and problems of CLC.

First, although the locus of responsibility is clear in the closed CLC, it is not clear in the open and intermediate CLC. In the cases of the open CLC, townspeople, company, and local government have their role respectively. However there is no clear responsibility for the successful recycling system. Whereas local government has the responsibility to operate the recycling system and bear most costs of the system, the enforcement power of local government is weak, and the successful operation of the open and unstable CLC depends on voluntary wills and trusts of participants. In the intermediate CLC, there lies the basic price/market mechanism which is controlled by the reciprocity/trust mechanism.

In conventional FWC and closed CLC, firms and public governments have been controlling channels with coordination mechanisms as price and/or authority as a proactive actor. In contrast, consumers will be expected as a proactive actor to participate in and operate CLC. Coordinating mechanisms of price and authority cannot be denied and excluded as CLC includes economic activities of participants. However, it is also clear that CLC cannot be successfully operated only with price and authority. Cases may suggest the importance of trust for operating CLC and combining markets and authorities as the economic and social embedded bond.

Points in Laws Enacted and Revised Based on the Basic Law.

Revision of the Waste Management and Public Cleansing Law

- Establishment of a framework for prefectures to establish facilities for safe and appropriate waste disposal
- Strengthening of responsibility of a discharging business party (business party that discharges wastes)
- Prohibition of outdoor incineration, etc.

Law for Promotion of Effective Utilization of Resources (revision of the Law for the Promotion of Utilization of Recycled Resources)

- Introduction of measures for restricting (reducing) the generation of wastes through saving product resources and prolonging the use life of products
- Introduction of measures for reuse of parts, etc.
- Making it obligatory for business parties themselves to systematically take measures to reduce and recycle by-products.
- Making product collection and recycling obligatory of business parties, etc.

Construction Material Recycling Act

- Making it obligatory for a party that placed an order for dismantling of a building, to report to the prefectural governor.
- Making the following obligatory of a party who received an order for dismantling of a building, etc.
 - ① Sorted dismantling of specific construction materials (concrete, wood, etc.), etc.
 - ② Reuse of specific construction materials as resources
- A prefectural governor's advice, warning, or order to a party who received an order for dismantling, etc.
- Registration of building dismantling business parties with a prefectural governor, etc.

Food Recycling Law (law concerning promotion of reuse of food recyclable resources, etc.)

- The National Government establishes judgment standards related to efforts by food-related business parties (business parties that produce/sell foods, restaurants, etc.) , regarding restriction of the generation of leftover foods and their recycling.
- Food-related business parties will promote recycling, etc., according to the judgment standards.
- A registration system of reuse business parties will be established, and use of foods as fertilizer and feed will be promoted.

Law on Promoting Green Purchasing

- The National Government, etc., takes initiative in promoting the procurement of environmentally friendly products (eco-products), such as reproduced products, based on the procurement plan.
- Promotion of providing information helpful for "green purchasing," etc.

MEDIATION AND INTERNATIONAL NETWORKS. THE CASE OF INTERTRADE SALERNO

**Fumai, Carmine¹; Rusticale, Giovanni²; Orlando, Innocenzo³; Fumai, Carmine⁴; Siniscalchi,
Antonio⁵**

¹*University of Salerno, ITALY*

²*Secretary General, Chamber of Commerce Salerno*

³*Deputy Director, Intertrade – Special Agency of Chamber of Commerce Salerno*

⁴*PHD Candidate in Marketing and Communication, University of Salerno*

⁵*External Consultant, Intertrade – Special Agency of Chamber of Commerce Salerno*

Purpose: The study focuses on the role of mediation, knowledge diffusion and creation of international channels by public and private organisations operating in the sector of services to favour internationalism. Findings from an analysis carried out on Intertrade suggests that its role be expanded to guarantee support to local enterprises during the international relation life cycle of SMEs in Salerno.

Design/Methodology/Approach: the Network Theory (NT), the Resource Based View (RBV), and the Viable Systems Approach (VSA).

Findings: the analysis shows that the presence of Intertrade in the life cycle of relations, is limited only to the start-up stage and potentially to the development stage in terms of preparation of contracts.

Practical Implications: The future assumption of a role of *prominence* by Intertade depends not only on its ability to create initial harmonious conditions between local and international operators, but also on its capacity to build and consolidate a relational network. The outcome would be improvements in the operative structure of Intertrade by means of organisms such as a Permanent Observatory as systemic support for internationalism in SMEs.

Originality value: The hypothesis of growth and a greater role of cohesion played by Intertrade in international networks, leads to a variety of considerations. Above all, the opportunity for Intertrade to penetrate a “market” niche in the varied context of services for internationalism.

Keywords: *international network, gatekeeper, broker, international relations.*

Type of paper: Research paper

INTRODUCTION

The study focuses on the role of mediation, the diffusion of knowledge and the creation of international networks by public and private organisms operating in the sector of services for internationalism; in particular with regard to enterprise in the province of Salerno. The main constraints hindering international development are the outcome of principally of late development processes in the area, and by the inadequacy of enterprises to manage processes of internationalism independently. The paper analyses the role played by Intertrade, an associate Company of the Salerno Chamber of Commerce in coordinating internationalism projects put in place by SMEs in the area. Intertrade evaluates local entrepreneurial potential for competition and value creation both in a regional context and in the Mediterranean basin scenario. An in-depth analysis of current reports and international networks triggers considerations on the opportunity of extending the role of Intertrade from that of gatekeeper to broker (Piciocchi, 2007) to guarantee support during their life cycles, to local enterprises with an international interest. The study was inspired/starts from a review of the literature on options for creating

international networks; the value of relations and how to obtain relevant competitive advantages. The hypothesis on which the study is based derives from the representation of the network of international relations between Intertrade and its context of reference. At a later stage, a new reticular configuration using a Network Analysis software such as UCINET, is proposed, to envisage the potential actions and strategies that Intertrade could put in place to improve and strengthen its role in international terms. The conclusive phase of the study defines the potential opportunities arising from changes in international relations, by virtue of a favourable new configuration of the network where Intertrade would play a core strategic link role, that of qualified star of international networks.

LITERATURE REVIEW. THE ROLE OF THE LINKS IN A NETWORK AND THE VALUE OF RELATIONS. FROM NETWORK THEORY (NT) TO THE VIABLE SYSTEMS APPROACH (VSA).

Globalization requires an innovative approach to problem solving and decision making relative to the internationalism of enterprises. In this respect, relevant theories such as; the Network Theory (NT) the Resource Based View (RBV) and the Viable Systems Approach (VSA) can be applied in the formulating and implementing of projects of internationalism. The merit of NT (Granovetter, 1985; Killworth, 1990) lies in the observation and controlling of eventual conditions which might penalize the functioning of the network. Besides, such surveys enable the roles and strategic weight of organizations offering services to enterprises (such as Intertrade) in international networks to be verified, with a view to developing cooperative synergies. In this respect, with RBV (Moigeon, 1998; Siano, 2001) effective knowledge sharing in networks and spatial diffusion is underlined, as it guarantees competitive, cooperative and sustainable advantage. RBV enables better understanding of the dynamic relations in cognitive systems (Vicari, Troilo, 1999) the result of a combination of resources, skills, routines and individual capacities. From a RBV perspective Intertrade is a strategic link of the *star* type for the entire lifecycle of the international network, capable of coordinating and guiding the network in its creation and sharing of competitive advantage. The recourse to VSA (Golinelli, 2000-2005) enables the requalification of the systemic connective tissue binding the various international partners with a view to achieving consonance and resonance in the system and the identification of strategic roles within the network. Bearing in mind the structural composition of the context in which the network develops, ASV provides interpretative schemes to analyze governing dynamics, through the identification of three structural levels (Barile, 2008):

- the *Organizing Subject* (O.S.) appointed to identify action lines coherent with the context within which the different international networks will function;
- the *Coordinating Subject* (C.S.) to develop relevant proposals in line with the context individualized by the O.S and adequate to diverse business needs;
- the *Proposing Subject* (P.S.) to carry out projects linked to the proposals formulated by the C.S. In conformity with acknowledged guidelines (O.S. and C.S.) transposing them to the context, highlighting specific instances of the context and referring them to the Organizing and Coordinating Subjects.

Such governing levels linked to the resource-capacity-competence cycle qualify systemic governance as per the scheme below;

LOGICAL LEVELS OF GOVERNMENT	SPECIFIC DOTATION ELEMENTS	STRUCTURE CATEGORY
------------------------------	----------------------------	--------------------

ORGANIZING SUBJECT (O.S.)	RESOURCES: <i>Identification and classification of the territorial resources for consideration</i>	Logical structure <i>(Design of the potential structure of the network)</i>
COORDINATING SUBJECT (C.S.)	CAPACITIES: <i>Identification of components and internal/external and local/International conditions</i>	Amplified Structure <i>(Prediction of internal/external and local/International conditions)</i>
PROPOSING SUBJECT (P.S.)	COMPETENCES: <i>Identification of interactive opportunities for the components to carry out activities and processes</i>	Specific Structure <i>(Operative structure of implemented network)</i>

Table 1 - Structural pattern of roles in networks. Source: Adapted from Barile, S. (2008) *L'impresa come sistema. Contributi sull'approccio sistemico vitale, II ed., Giappichelli, Torino.*

Qualifying governance levels enables the effective role and weight of Intertrade in international relations to be measured and strategies and roles to be modified where necessary.

THE PRESENT POSITIONING OF INTERTRADE IN INTERNATIONAL RELATIONS BETWEEN SMES IN SALERNO AND FOREIGN PARTNERS.

A scientific approach qualifies Intertrade as a "mediator" in internationalism processes and ostensibly in the future, as a core link of the star type in international networks. Through Intertrade, the Chamber of Commerce of Salerno ranks economic, social and institutional power points in the Salerno territory, projecting an integrated system on foreign markets. Intertrade's activities are characterized by a series of initiatives in which potentially interested enterprises are invited to take part. This is the outcome of specific and random requests on the part of enterprises and recommendations on the part of the Ministry of Foreign Affairs and the Ministry of Economic Development, regarding programmes stipulated between the Ministry, the Institute for International Trade (IIE), Unioncamere and Assocamerestero, the Campania Region, the Board Chamber and the Province of Salerno. Intertrade cooperates with leading sectors of the economy in the province of Salerno and is always open to collaboration in any economic area in the world. Intertrade's mission is to guide the global approach relative to the economic system and local productivity from a merely casual to a rational and synergistic procedure. Through its services, this Special Agency takes care of organization and market development, reduces operative difficulties encountered by local enterprises intending to take up international activities. In this context, Intertrade's priorities are:

1. to operate in conformity with the policies of the Chamber of Commerce, Salerno;
2. to set up management policies to guarantee continuation in terms of support activities for internationalism and community integration;
3. to develop innovative promotional services for small or medium-sized enterprises, in particular for sectors where structural crises render it imperative that the province of Salerno have access to European Union funding, taking into account that local firms are operating in an economically disadvantaged area.

THE AREAS IN WHICH INTERTRADE OPERATES

Intertrade promotes a series of informational initiatives or technical assistance to facilitate internationalism procedures for SMEs in Salerno. Intertrade's programme for foreign development is illustrated below. see Table 2:

<p style="text-align: center;">ECONOMIC INFORMATION Enterprise Europe Network-relais BridgEconomics South Italy- UE,European Commission ,D.G.Enterprises</p>	<p><i>Intertrade offers customised information concerning community and national regulations, technical aspects regarding customs and tax, national, international and community, programmes and financing, public contracts.</i></p>
<p style="text-align: center;">UPDATING AND TRAINING FOR INTERNATIONAL TRADE Extender – MAE, Programme Agreement Unioncamere and Assocarestero</p>	<p><i>Intertrade organizes specialist seminars and workshops; courses in international management and trade missions for improving both performance of local enterprises and the image of Made in Salerno</i></p>
<p style="text-align: center;">SPECIALIST COMMUNICATION Globus</p>	<p><i>Intertrade’s integrated communication system known as Globus, promotes services and initiatives in support of internationalism; it supports and evaluates business activities, those of the board holding and those of the Salerno business community; it provides enterprises with updated informative tools, and enables foreign users to obtain information on the economic situation in Salerno , advising and assisting them when in search of local partners</i></p>
<p style="text-align: center;">TECHNICAL ASSISTANCE BridgEconomies - B2Europe</p>	<p><i>Intertrade offers specialist services regarding contractual issues in the negotiating phase; lists of exporters, importers, buyers, distributors and agents; inspections to ascertain the reliability of new partners or clients and makes ad hoc enquiries relative to foreign markets or sectors</i></p>
<p style="text-align: center;">PROMOTION Promoexport</p>	<p><i>To increase business opportunities abroad, Intertrade offers enterprises assistance regarding market regulation; economic information; entrepreneurial training and promotes infrastructure and the diffusion of quality</i></p>

Table 2 – Intertrade activities

In short, in conformity with these guidelines, Intertrade operates in territory areas of the province of Salerno in order to:

- provide a wide range of information on international conditions and opportunities;
- promote local products and services focusing on flexibility, innovation, local/typical production and quality;
- organize managerial and technical training to update local professionalism to European standards in marketing and managing productive and commercial areas.

WHERE INTERTRADE OPERATES

On an international scale, the main places of interest for Intertrade, the Special Agency for the Chamber of Commerce of Salerno are:

- Western Europe (France, Spain, Germany, the United Kingdom);
- Central Western Europe (Serbia, Croatia, Bosnia Herzegovina, Hungary, the Czech Republic, Slovakia);
- New Independent States;
- The Mediterranean Area, Africa, the Middle East (Tunisia, Turkey, The Arab States, Qatar);
- Asia (Singapore, Hong Kong, Japan, India);
- the NAFTA Area (USA, Canada, Mexico);
- the MERCOSUR Area (Brasile, Argentina, Perù).

Two sectors have been tested in our research (Cosmetics and the clothing/manufacture sectors) with mediation by Intertrade achieving successful results.

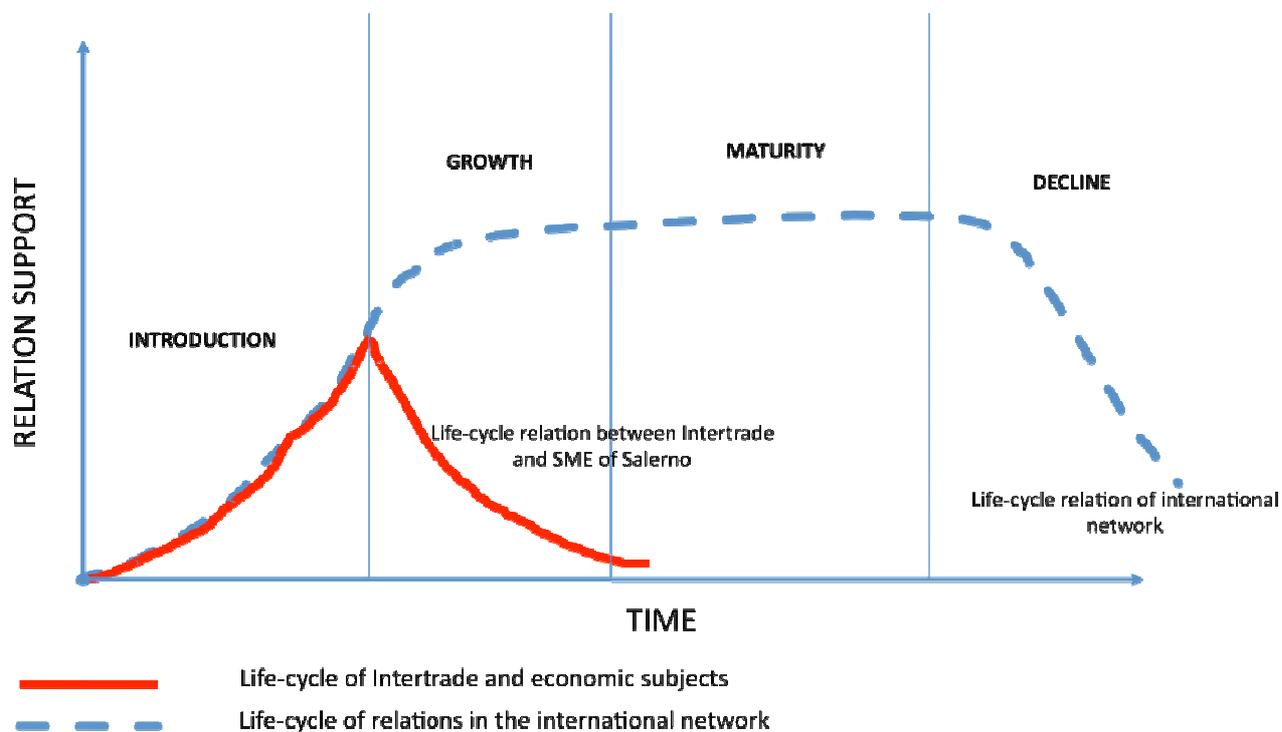

The enterprise X, owners of enterprise Z, is a company operating in the sector of natural cosmetics. The company already has dealings abroad, in particular in the United States. In 2008 it requested Intertrade to provide a list of oil and extraction producing enterprises in the Middle East. Intertrade's BridgeEconomics area, Intertrade tracked down the necessary economic information, communicated the results of their research and provided the user with the names of a series of SME's operating in the Middle East. The main contact was made with the enterprise W, one of the major oil and extractions company in the Lebanon. A report was requested on their reliability prior to the user establishing eventual business relations. Using the information obtained from an external borker, Intertrade issued an exhaustive picture of the W, which in turn, allowed the managers of Z to peruse a draft agreement with the W. In July 2008 Z and the Lebanese company stipulated an agreement. The W was appointed sole agent for 11 Middle Eastern states on behalf of Z, and were appointed distributors of the products in and outside Europe. Qatar was the first Middle Eastern state to trade Z products.

File 1. Information and Consulting support on internationalism

The enterprise Y is a company operating in the clothes manufacturing sector. The company requested Intertrade to draft them a model contract, which authorized the hiring of machinery and industrial equipment out to a third party operating abroad to decentralize production without having to sustain factory costs. The B2Europe area, appointed to deal with finding and formulating contractual information, defined a series of clauses in the contract which stipulated the transfer not only of instumental goods linked to the manufacturing process, but also that of all the necessary knowhow and expertise to train human resource capital for the company. This met with Y agreement. In 2009 the company based in Salerno, set up a partnership with an Albanese SME, which, at its own expense, manufactures the commissioned products, subject to the transfer of the goods instrumental for production and to the training of internal personnel under the commitment of Y.

File 2. Contractual Information and Consulting support on internationalism

The analysis of the two sectors and the cases illustrated, confirms Intertrade as a “channel intermediate” and not a proposing and coordinating subject of the international network. The presence of Intertrade in terms of the life-cycle of relations, is limited only to the start-up phase, and, potentially, to the development phase regarding the drafting of contracts .Accordingly, the life-cycle of relations is that of the modular type (Kotler, 2006), as can be evinced from Fig.1.

Figure 1 - The current presence of Intertrade in the international relations life-cycle

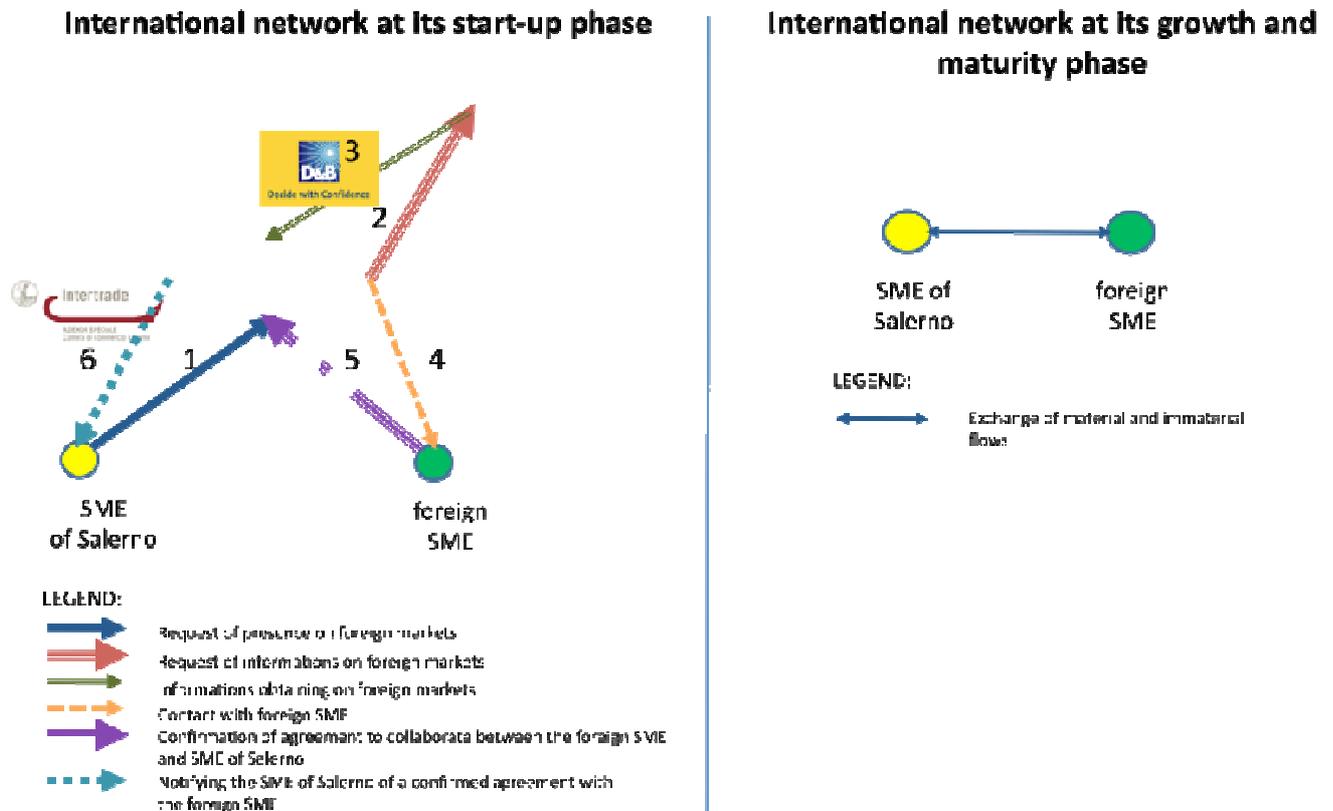

Source: Our adapment from Kotler P., *Marketing Management 12th edition*, Pearson Prentice Hall, 2006

However, the Special Agency's role in terms of current support action penalizes its strategic role and weight; Intertrade merely collects information and plays a limited role in procedural support, not providing administrative action in conformity with a prominent role in the network which would be characterized by two fundamental elements:

- *powership*: capacity to direct and transmit relations within a network;
- *prestige*: legitimacy and recognition by the related links within the system.

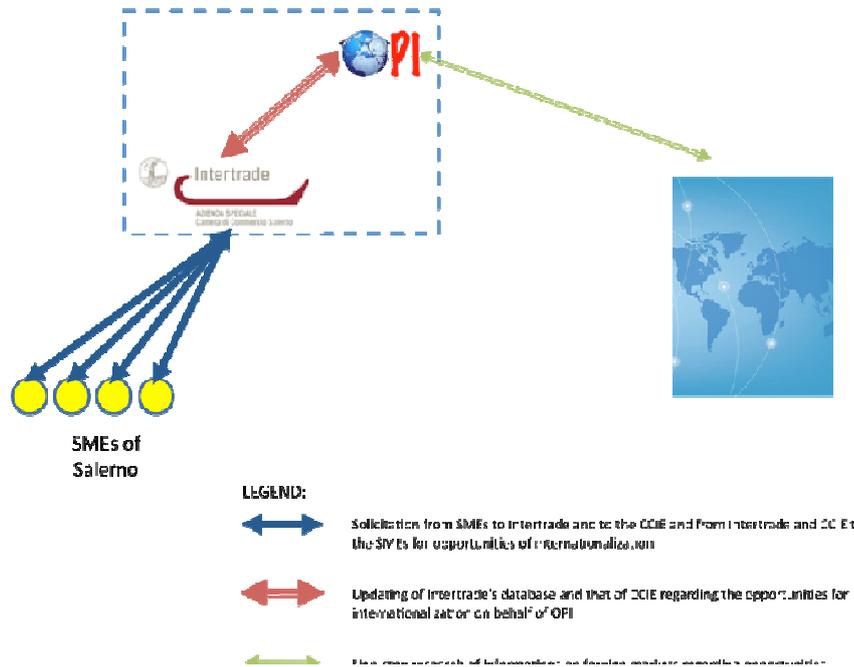

On this basis, a prominent role would be attributed to Intertrade of guarantor of *governance*, shared and acknowledged at both a local and international level, not only in terms of dissemination of information to the links in the network, but also in operational terms and in supervising relations, as well as in terms of a catalysing function of stimulus for new initiatives deriving from both the local and foreign context.

Figure 2 - The current role of Intertrade's relations of the spot type

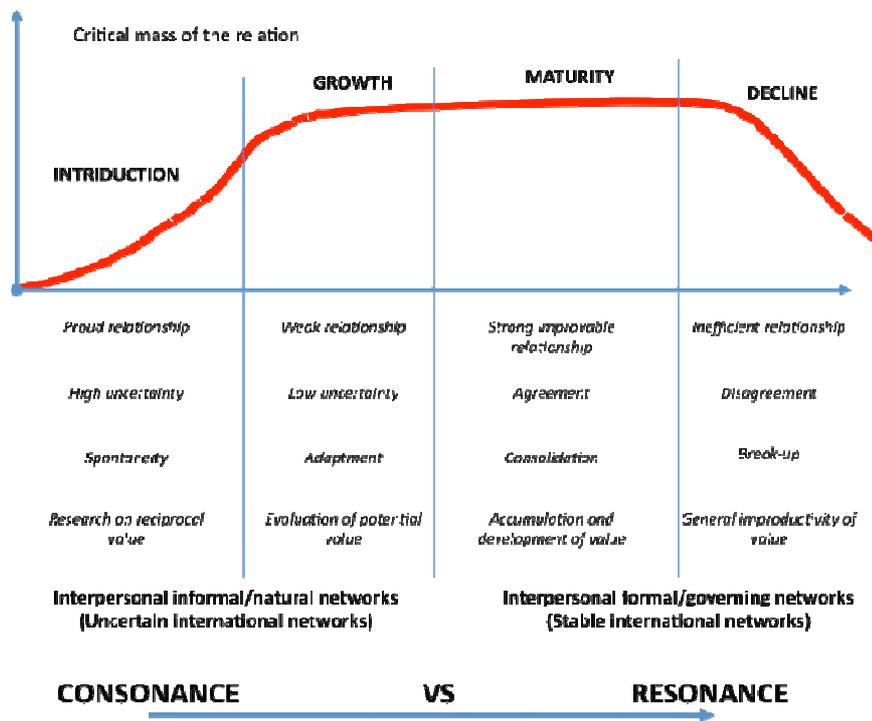

REDEFINING INTERTRADE'S ROLE AND INTERNATIONAL RELATIONS

The projection of Intertrade to a role of *prominence* and long-term widespread action in the international network, would not only depend on its ability for creating the initial conditions of consonance between local and international operators, but also in its capacity for establishing and consolidating a relational, resonant tissue, to guarantee, long-term synergies, syntropy and trust in the network.

Figure 3 - Intertrade's new role in international relations

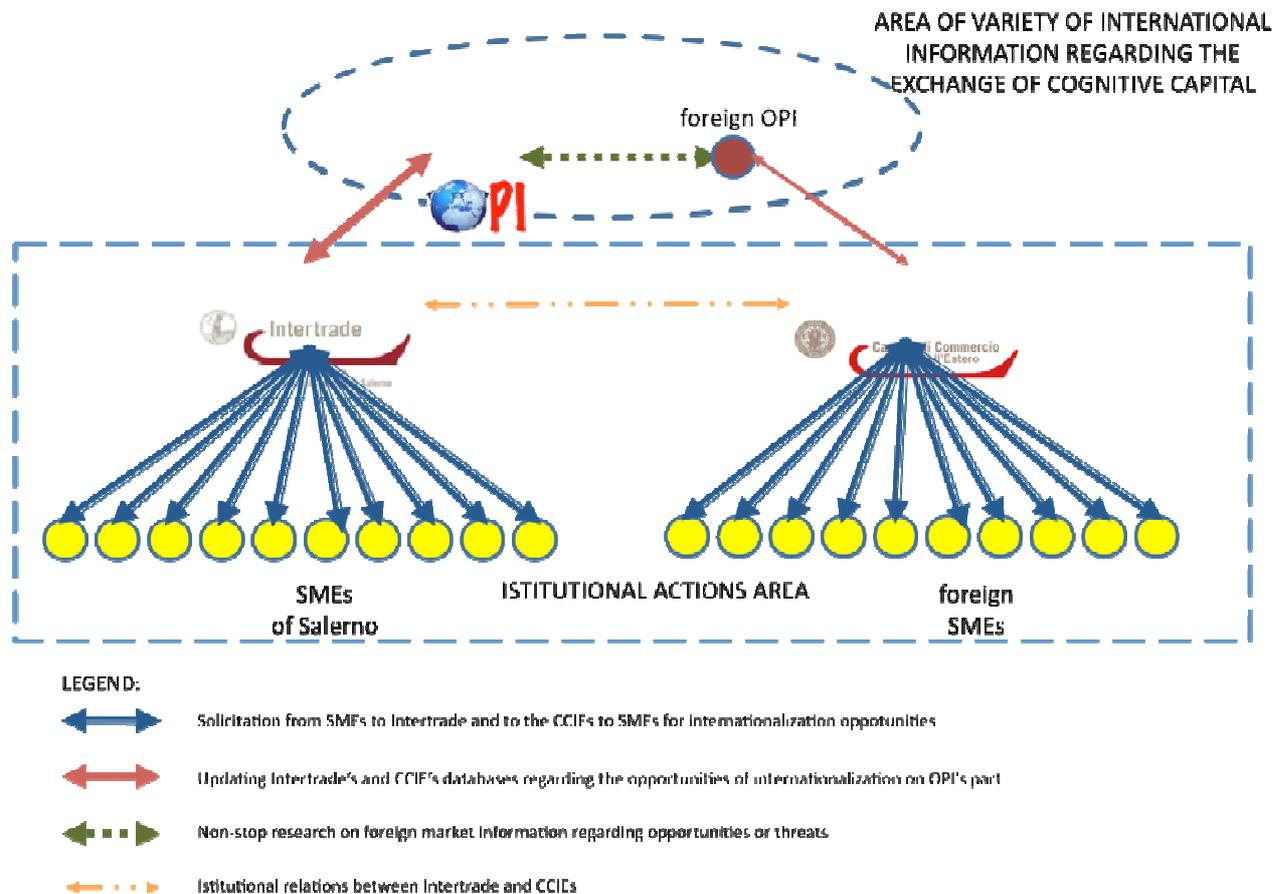

To achieve this aim, a transformation in Intertrade's operative structure would be advisable. Creating a Permanent Observatory for Internationalization (OPI) for example, through its support systems would be a case in point, capable of securing systemic support in terms of the globalization of local SMEs. The Observatory would guarantee constant assistance throughout the working lifecycle of the international network in terms of creation, implementation, monitoring and control.

Figure 4 - Logical, relational flows governed by Intertrade

Source: Adapted from Barile, S. (2008) *L'impresa come sistema. Contributi sull'approccio sistemico vitale* II ed. Giannichelli Torino

Intertrade would consequently be qualified as an influential subject, the retainer of fundamental resources, in terms of cognitive capital, expertise and guarantee and whereby Intertrade could provide a virtuous circuit of internationalism. The stability and growth of relations with organisations abroad such as the Italian Chambers of Commerce would be a logical trend in improving the operative and informative efficiency of networks relative to foreign markets.

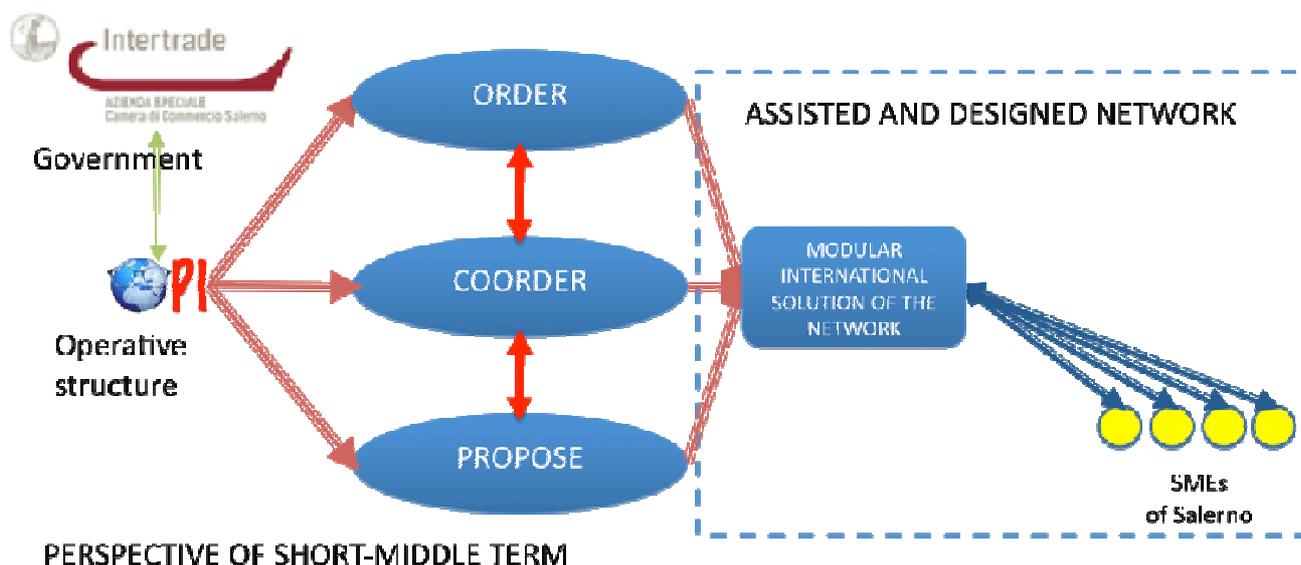

Figure 5 - The new reticular configuration based on Intertrade's star role.

This would produce positive implications of a strategic-operative nature and consequently, international networks would be structured and controlled, capable of guaranteeing low risk performance deriving from knowledge and other significant elements connected to international experience.

SUMMARY AND CONCLUSION

The hypothesis of Intertrade developing a major role of cohesion in international networks, suggests a series of reflections. Above all, the opportunity for Intertrade to place itself in a "market" niche of effective services for internationalism. This would enable the Service Agency to improve its services qualitatively and quantitatively by means of a virtuous cognitive circuit. In effect, Intertrade, would shift from covering an active to a pro-active role, generating momentum inside the service market and would represent a model of *best practices*, not only for local organisms, but also for all the international *strategic-relational intermediation* operators.

Through the Observatory, Intertrade, and as a consequence, the CCIAA of Salerno, render even more concrete and consonant support action and collaboration with local SMEs in the pursuit of opportunities linked to industrial, international and communicative development and to implementing processes of internationalism. In establishing its target, the Observatory is attributed different functional roles for strengthening the international competitiveness of the economy of the province of Salerno.

Figure 6 - Formal network for the service of Internationalization of the SME's of Salerno.

The definition of the role of the Observatory is detailed below:

1. Organizing: identification and classification of territorial enterprises, elaboration of information collected, monitoring and analysis of expansion trends abroad concerning local enterprises and foreign investment trends in the Salerno region;
2. Coordinating: creation of an adequate functional, logical-strategic bond, for the development of international procedures;
3. Proposing: planning and implementation of operative actions in support of direct and indirect internationalism of the Salerno economy.

In the long term, the expansion and evolution of the initial network can be envisaged. This is predictable as like all SMEs in Salerno, any enterprise, worldwide, needs institutional partners who are able to guarantee a facilitated approach to foreign markets, especially if reference is made to firms of small-medium dimensions that do not have a sector dedicated to internationalism. The presence of an Intertrade counterpart in the 74 countries in which the Italian Chamber of Commerce is present or vice versa the presence of an internal sector in the foreign Chamber of Commerce board to deal with internationalism issues concerning local enterprises, would result in the creation of a global network where the exchange of information would be in real time and ongoing. In real time seeing that each link of the network relative to the countries in which the Italian Chamber of Commerce is situated, would be connected to Intertrade who would make the required information available in a speedy, continual two-way process.

DOES INTERNATIONALISATION EMERGE FROM ACCOUNTING DOCUMENTS? A SURVEY AMONG PIEDMONT FIRMS

Gamba, Valter¹; Montanaro, Luca²

¹Researcher of Business Administration, Faculty of Economics – University of Torino, Corso Unione Sovietica 218 bis, 10134 Torino

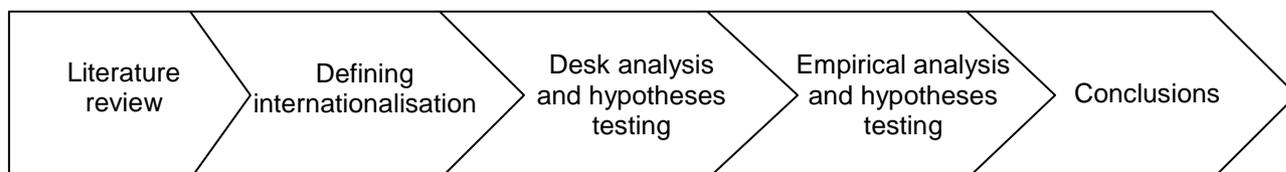

²PhD (corresponding author) – Lecturer of Business Administration, Faculty of Economics – University of Torino, Corso Unione Sovietica 218 bis, 10134 Torino

The topic - The internationalisation of firms has been one of the key topics in International Business research in the last years. Researchers' efforts have been mostly addressed to explain and to describe the development process of firms' international activities. This mission generated a large number of theories attempting to clarify the firms' internationalisation process as a result of the economic globalisation process taking place worldwide.

Moreover, one of the bigger challenges that enterprises have to face today is how to be more competitive, as the economy changes with incredible rapidity and becomes more and more a "knowledge economy". In order to act and not merely react, every enterprise has to adopt, through its managers, strategists and decision makers, the best tools available to reach the goal of being more competitive and efficient. Several firms are trying to reach these objectives through the internationalisation of their activity.

In the Italian context, the small and medium enterprises (SMEs) represent a relevant part of total enterprises and show a high international commitment, not rarely from their inception, thanks to the adoption of global niche strategies.

The research method - The paper examines the relationship between internationalisation and the financial structure of a sample of Italian firms from an economically important Italian region, Piedmont, as it emerges from the accounting documents. The research is to be developed according to a logical-chronological process that follows the steps shown below:

Literature review - The goal of this step is to contextualise the research topic. Several scholars studied internationalisation. The literature review has the objective to find the links among different theories.

Defining internationalization - It is difficult to define what is called "internationalisation" and, especially, what is "the internationalisation of a firm". Many Authors studied the topic from different points of view. As such, we must look to the literature to reach a unique definition best suited for this research. Anyway, a unique definition is necessary to better set a clear paradigm for the next phases of the research.

Desk analysis and hypotheses testing - In this phase we are going to make a classical desk analysis in order to find some key factors for internationalisation from balance sheets, budgets and accounting documents. We perform an analysis on a sample of 250 SMEs from the Piedmont area; Piedmont is one of the 20 Regions of Italy, in the north-west. Its territory presents a widespread industrialisation, featuring mostly SMEs. It has an area of 25,399 km² and a population of about 4,4 million. The capital is Turin.

We will investigate the following factors: 1) the amount of revenues deriving from exports toward foreign countries, 2) the participation to international EU programs, 3) the relationship with foreign

suppliers, 4) the kind of international activity (if present), 5) the amount and geographical destination of investments, 6) the involvement of foreign shareholder and/or foreign managers.

Empirical analysis and hypotheses testing - In this phase we will direct an interview to every firm that in the desk analysis obtained the highest score, i.e. the most internationalised firms of the sample. The main goal of this phase is highlighting – in a deeper way than the simple analysis of their balance sheets, budgets and accounting documents – if SMEs from Piedmont have followed or are currently following an internationalisation path.

Conclusions - Conclusions have the following objectives:

- to explain the results through the interpretation of data;
- to explain which factors are relevant for the results and, thus, which factors inside firms can determine a change in the results.

The contribution of the research - The most original elements of the survey concern the following aspects:

- an empirical test of the presence of different internationalisation paths, through the analysis of data coming both from balance sheets, budgets and accounting documents, both from a questionnaire for a sample of firms from Piedmont;
- an explanation about factors relevant for the results which, inside firms, can determine a change in the results;
- a comparison between the results from the desk analysis and the data from questionnaire. It is interesting to verify if the growth path emerging from balance sheets and accounting documents matches the survey results.

Keywords: internationalisation, SME, balance sheet.

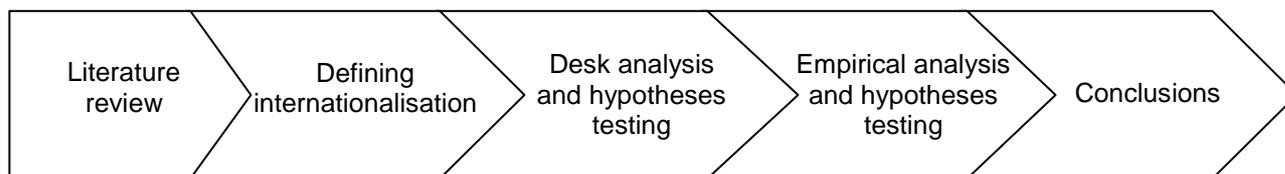

INTRODUCTION

The internationalisation of firms has been one of the key topics in International Business research in the last years. Researchers' efforts have been mostly addressed to explain and to describe the development process of firms' international activities. This mission generated a large number of theories attempting to clarify the firms' internationalisation process as a result of the economic globalisation process taking place worldwide.

Moreover, one of the bigger challenges that enterprises have to face today is how to be more competitive, as the economy changes with incredible rapidity and becomes more and more a "knowledge economy". In order to act and not merely react, every enterprise has to adopt, through its managers, strategists and decision makers, the best tools available to reach the goal of being more competitive and efficient. Several firms are trying to reach these objectives through the internationalisation of their activity.

The increasing importance of SMEs (small and medium-sized enterprises) in international markets has led to substantial research on the internationalisation of SMEs (Lu and Beamish, 2006). The debate on factors affecting the international development of SMEs is very lively and research in this field is attracting growing interest (Cerrato and Piva, 2007). In the Italian context, SMEs represent a relevant part of total enterprises and show a high international commitment, not rarely from their inception, thanks to the adoption of global niche strategies. A recent survey by UNCTAD (2002) has shown clearly how Italian firms have vigorously pursued internationalisation strategies: in 2001 Italy has been the country with the largest increase in the world of foreign direct investments outflows. This result is not isolated, but comes at the end of a ten years period of steady international growth of the Italian outward investments.

The paper examines the relationship between internationalisation and the financial structure (Singh and Nejadmalayeri, 2004) of a sample of Italian firms from an economically important Italian region, Piedmont, as it emerges from the accounting documents. The research is to be developed according to a logical-chronological process that follows the steps shown below:

The literature review will contextualise the research topic; it is in fact necessary to look at the literature to reach a unique definition best suited for the research. In the next phase, a classical desk analysis will be carried out in order to find some key factors for internationalisation from balance sheets, firm budgets and accounting documents, and to test some of the hypotheses. An empirical analysis will complete the hypotheses testing through interviews to every firm which has had a consolidated and constant international activity in the last 3 years according to the desk analysis.

LITERATURE REVIEW

The goal of this step is to contextualise the research topic. The literature review has the objective to find the links among different theories. Many authors have studied internationalisation paths and strategies within their own field of study. As a result, different research approaches have been used to investigate this phenomenon. The main difficulty is to find a horizontal link between these different approaches.

Defining internationalisation

It is difficult to define what is called “internationalisation” and, especially, what is “the internationalisation of a firm”. Internationalisation is a phenomenon researched intensively over the last few decades from a variety of viewpoints, including: organisation theory, marketing, strategic management, international management, and small business management. Issues such as international decision-making and management, the development of international activities, and factors favoring or disfavoring internationalization have been studied for both large as well as small businesses (Ruzzier *et al.*, 2006). As such, we must look to the literature to reach a unique definition best suited for this research. Anyway, a unique definition is necessary to better set a clear paradigm for the next phases of the research.

Given the heterogeneity of small firms and their operating environment, fundamental difficulties arise when seeking to identify and define the critical resources needed for internationalisation (Ruzzier *et al.*, 2006). Drawing on different perspectives of analysis, international business literature stresses the role of factors both internal and external to the business as drivers of firm internationalisation. Economic studies, such as those based on Dunning's eclectic paradigm (1981) and internalization theory (Rugman, 1981), have contributed, in particular, to explaining decisions related to Foreign Direct Investments (FDI) by large multinational enterprises, already at an advanced stage of the process of international development. The eclectic paradigm, also known as the OLI Paradigm, is based on internalization theory and tries to explain the different forms of international production as well as the selection of a country for FDI. According to [Dunning \(1988\)](#), the internationalization of economic activity is determined by the realization of three types of advantages. First, ownership advantages which are specific to the company and related to the accumulation of intangible

assets, technological capacities or product innovations. Second, the internalization advantages stemming from the capacity of the firm to manage and coordinate activities internally in the value-added chain. These are related to the integration of transactions into multinational hierarchies through FDI. Third, location advantages referring to the institutional and productive factors present in a particular geographical area. These arise when it is better to combine products manufactured in the home country with irremovable factors and intermediate products of another location.

Another stream of literature focuses on the internationalization process. In this field, the *stage theory*, which is the dominant paradigm, suggests that the international activity of a firm increases gradually as it acquires knowledge and experience (Johanson and Wiedersheim-Paul, 1975; Johanson and Vahlne, 1977). A firm evolves from a low level of international activities and commitment to higher levels, through stages which are assumedly one-way.

The incremental nature of the process is considered not only as a shift from “soft” internationalisation (indirect exports) to more committed, riskier modes, also in terms of choice of foreign markets: the firm gradually expands from nearer markets to those further away. According to the stage theory, market knowledge is the key factor that influences the time and direction of international development. Only experience can reduce the uncertainty associated with international expansion and, therefore, remove the principal obstacle to it (Leonidou and Katsikeas, 1996). Internationalisation is perceived, here, as an incremental process based on learning. The *incremental internationalisation models* wants to explain how firms generally evolve in their international markets. Knowledge and experience play an important role in firms’ international expansion process. The conceptualisation is based on different theories (Leonidou and Kasikeas, 1996) and examples were progressively spread in the literature (Cavusgil, 1982; Czinkota, 1982; Lim, Sharkey and Kim, 1991; Crick, 1995). From an empirical point of view, some studies have complementarily supported the incremental internationalisation approach (Cavusgil, 1982; Jull and Walters, 1987). However, it must also be acknowledged that others have arrived to opposite conclusions (Sullivan and Bauerschmidt, 1990; Millington and Bayliss, 1990).

Several contributions to internationalisation studies are based on *network theory* (Coviello, 2006). The *network approach* (Johanson and Mattsson, 1988; Welch and Welch, 1996; Andersson, 2002; Hadley and Wilson, 2003) predicts that internationalisation process is affected by influence of external actors or organisations. It is built on the degree of internationalisation of the firm and the degree of internationalisation of the market. Models framed in this approach consider business to be interconnected and within a network. The relationships play a key role in the process of international development, providing access to technological, productive or market resources (Johanson and Vahlne, 2003). Therefore, relational capital (Caroli and Lipparini, 2002), that is the resources and mutual benefits incorporated in a relationship between two or more parties (Dyer and Singh, 1998; Hitt *et al.*, 2006), constitute important factors which guide international expansion. Small businesses, in particular, can leverage on relations to overcome limitations deriving from their size or lack of experience.

The *contingency or business strategy approach* (Welford and Prescott, 1994; Robertson and Chetty, 2000) considers that internationalisation process is contingency based and is the result of the selection of an expansion strategy among a set of competing strategies that are directed by the characteristics of market opportunity, firm resources and managerial philosophy.

Internationalisation paths

It is helpful to fall back on theories of internationalisation from the field of international management.

One of the most influential theories is the internationalisation process model developed by Johanson and Vahlne (1977, 1990). They regard internationalisation as a gradual process in which firms incrementally increase their commitment in foreign markets. A commitment is always associated with uncertainty. The firm extends its international business activities until its particular maximum tolerable risk is reached. This is a function of the degree of the firm's risk aversion and the firm's resource position. The commitment of resources to a foreign market increases knowledge of that market and thus reduces any existing uncertainty about the foreign environment. The internationalisation process is therefore combined with a dynamic learning process over time. An initial involvement in a foreign market reduces uncertainty, which in turn induces an additional commitment to this market. As a consequence, firms start their international activities with relatively few resources because the commitment of these resources is associated with a relatively high amount of risk. Improved knowledge acquired over time through additional commitment to the market leads to more resource-intensive international activities, since the latter become associated with less risk than the firm's initial foreign activities.

The internationalisation process model is the basis of the so-called "stage" models of internationalisation (e.g., Bilkey and Tesar 1977, Bilkey 1978). In these theories the internationalisation behaviour of a firm is linked with different stages of the firm's life cycle, starting from no foreign sales and expanding its international activities incrementally to a more resource-intensive commitment to foreign markets until a final stage of foreign direct investment is reached. Hence, the stage models not only try to explain the entry into a foreign market per se, but also the choice of the optimal market entry mode used at different stages of the firm's international involvement.

The most important criticism of the internationalisation process model and especially of stage theories is the quasi-deterministic character of the models (Reid 1983). The argument is that firms can and will decide on an optimal entry mode and on expansion of their international activities contingent on market conditions. There is no need to proceed in the incremental way described by the model. Johanson and Vahlne have themselves already listed three exceptions where firms are likely to deviate from the gradually expanding commitment predicted by their model. Firstly, large firms may have enough resources to take larger steps in their internationalisation process. Secondly, relevant knowledge that reduces uncertainty about a foreign market can be acquired by other means than own experience, for example by employing an internationally experienced manager.

Finally, if market conditions in different foreign markets are homogenous, firms may generalize experience gained in one market to make larger internationalisation steps in another.

Andersen (1993), however, has criticised the model and pointed to studies that have shown that SMEs do not select foreign markets as methodically as presumed by the model. Andersson et al (2004) argue that the stages model does not explain why some small firms internationalise while others do not. Some firms are international from their birth and have been called: international new ventures (McDougall, 1994; Oviatt and McDougall, 1994, 1995), born global (Madsen and Servais, 1997), and global start-ups (Oviatt and McDougall, 1995). Oviatt and McDougall (1994) and Knight and Cavusgil (1996) as well criticise the stages model as lacking explanations for the internationalisation of small born global firms, which lack both resources and experience.

In a network context, Johanson and Mattsson (1993, p. 306) described internationalization as a "cumulative process, in which relationships are continually established, maintained, developed, broken and dissolved in order to achieve the objectives of the firm". This view, however, seems somewhat fragmented as it focuses exclusively on relationships. Assuming that SMEs operate within their natural context, the view of Johanson and Vahlne (1990, p. 20) developed from Johanson and Mattsson (1993) appears more promising. They define internationalization as the "process of developing networks of business relationships in other countries through extension, penetration, and integration".

In their definition, Lehtinen and Penttinen (1999) try to summarise the fundamental characteristics of the internationalization process based on the Nordic research findings. Their definition also covers two concepts occasionally applied in the context of internationalization, namely international orientation and international commitment. International orientation refers to a firm's general attitude towards internationalization, thus representing an evaluative dimension. Reid (1981) defined it as a measure of the perceived difference between foreign markets and the home market space along economic, cultural, political, and market-strategic dimensions. International commitment is basically associated with the requirements of the operation modes chosen and the size of international business. The latter seeks to position firms somewhere between the extremes of no involvement (domestic firm) and full commitment (a firm with a realized foreign direct investment).

Inter-firm and interpersonal relationships also appear to be influential in other internationalization issues: foreign market selection (Andersen and Buvik, 2002); market servicing (Welch and Welch, 1996); dynamics of entry (Meyer and Skak, 2002); international market development and marketing-related activities (Coviello and Munro, 1995); time of internationalization (Oviatt and McDougall, 1994); propensity to export (Westhead et al., 2001); strategic choices and performance (Peng, 2001); and degree of internationalization (Brush et al., 2002).

Cavusgil and Godiwalla (1982) described the internationalisation process as a process of decisions, which may be categorised along a continuum from clearly strategic decisions, in which firms actively search for opportunities and alternatives, to reactive decisions, in which no clear goals are set and the firm's phases of activity are not determined in advance. In the early stages of internationalisation, the behavior of firms is reactive and incremental, whereas in later stages, this evolves into a proactive decision-making process (Cavusgil and Godiwalla, 1982).

Most of the empirical studies, however, have been focused on large, well-internationalised firms, not on SMEs (McDougall and Oviatt, 1996; Dana et al., 1999). Very few papers focus on the first steps of small and medium-sized firms toward intermediate forms of internationalisation (Wagner and Schnabel, 1994). Only recently has the theoretical debate on internationalization focused more deeply on the specific features of small firms in an attempt to establish a general theory (Julien, 1994). The "classical" literature on the subject had an abstract, general firm model as its reference point and implicitly considered the large firm as its object of analysis. However, a series of studies has underlined that size is no restraint in the international competitiveness of small firms, both because of their important contribution to the trade balance of their respective countries (Hardy, 1986; Beamish and Munro, 1986) and because sales abroad have been shown to be unaffected by firm size (Cavusgil and Tamer, 1980; Edmunds and Khoury, 1986; Ali and Swiercz, 1991; Julien et al., 1994). Not surprisingly however, the results of these studies have produced mixed results. It has also been shown that under certain circumstances, an entrepreneurial culture resistant to change, an increasingly centralized behavior and other country-specific factors can hinder the international development of small firms (Calof and Viviers, 1995; Caruana, Morris, and Vella, 1998; Minguzzi and Passaro 1997,

2001). There is also divergence in the theoretical considerations of the advantages and limitations of SMEs in the literature. Basically, the empirical findings on the relationships between internationalisation and firm performance based on samples of large firms do not necessarily apply to SMEs because it has been well argued and documented that smaller business and larger business are different species (Shuman and Seeger, 1986).

International expansion is an especially important decision for small and medium-sized enterprises (SMEs) who traditionally have a small financial base, a domestic focus and a limited geographic scope (Barringer and Greening, 1998). Two of the most common goals attributed to international expansion are achieving firm growth and improving a firm's profitability (Oviatt and McDougall, 1994; McDougall and Oviatt, 1996). Differences in the scale and scope of SMEs' international operations are often attributed to their home market and industry conditions or the attractiveness of foreign markets (Dunning, 1988). From a theoretical point of view, SMEs have certain advantages over large enterprises, in fact they are able to more easily overcome governance problems (McIntyre, 2002). Some researchers (e.g. Liesch and Knight, 1999) argue that SMEs have the advantage of flexibility and are able to internalise market information to the same degree or better than large firms. However, SMEs also face certain disadvantages to large enterprises, which may inhibit their success in the local market as well as discourage them from pursuing international opportunities. Obviously, a major impediment to SMEs' expansion, in comparison to large firms, is lack of resources (Berkema and Vermeulen, 1998; Calof, 1993, 1994). So, it is possible to analyse the relationship between firm's internationalisation and firm's size in the Piedmont region.

Hypothesis 1: Piedmont's SMEs internationalisation grows with firms' size.

Moreover, the impact of ownership structure on corporate strategy and firm performance has been largely investigated by management literature (e.g. Amihud and Lev, 1981; Lane *et al.*, 1998; Thomsen and Pedersen, 2000). Ownership structure has been analysed in terms of both concentration and identity of the owners (companies, banks, institutional investors, executives). For example, Tihanyi *et al.* (2003) find a significant relationship between institutional ownership by professional investment funds and pension funds and international diversification in a sample of large US firms. George *et al.* (2005) show that shareholders such as venture capitalists, bank and institutional investors, in general, positively affect the scale of international activities of SMEs. Similarly Fernandez and Nieto (2006) provide empirical support to the hypothesis that a corporate blockholder encourages an SME to expand internationally.

We are interested in exploring the effect of a specific ownership characteristic – the presence of foreign shareholders – on the internationalisation of Piedmont's SMEs.

The internationalisation of a firm does not only take place in *real* terms - sales, production and resources located abroad - but it can take place also on the *financial* side, or rather, from the point of view of the type of investor to which a firm is addressed. It has been shown that the two aspects respond to different logics and do not necessarily correlate (Hassel *et al.*, 2003). However, financial internationalisation indicates wider knowledge of the international environment and may be emblematic of a greater opening up also in the way a firm perceives its market (Fernandez and Nieto, 2006). Then, it is possible to study the link between firm's internationalisation and the presence of foreign shareholders and managers within it, in the Piedmont region.

Hypothesis 2: Piedmont's SMEs with foreign shareholders and/or managers are "more internationalised".

By the way, much of the literature on internationalisation of SMEs focuses on the export activities of these firms and the differences between successful and unsuccessful exporters (Leonidou and Katsikeas, 1996). This comes as no surprise, given the aforementioned obstacles to internationalisation. Bilkey and Tesar (1977) describe the export activities of small firms as incidental, whereby firms passively fulfill international orders instead of proactively seeking opportunities. As such, because of lack of resources, SMEs do not approach internationalisation in a systematic fashion and do not possess formal strategies (Bell et al, 2004).

It has been proposed that SMEs follow a model of incremental internationalisation (Katsikeas and Lenidou, 1996; Pedersen and Petersen, 1998; Ellis and Pecotich, 2001). In this view, SMEs start with those internationalisation activities implying the lowest barriers (i.e. exporting goods) and accumulate experience used to develop other forms of international business such as alliances, sales branches, production, and R&D. This model has been challenged by the literature on so-called “born globals” (see Zucchella *et al.*, 2009; Zucchella *et al.*, 2008; Knight and Cavusgil, 2004; McDougall *et al.*, 1994; Madsen *et al.*, 2000; Fryges, 2004). In this view, to take advantage of unique selling propositions they were able to obtain through innovation, some SMEs seem to follow an international business strategy and adopt a global focus from their very beginning.

Hypothesis 3: in Piedmont, there are SMEs which are “internationalised” since their birth.

However, lack of resources, firm size and market opportunity are not the only determinants of the internationalisation success of SMEs. Small firms depend much on the abilities, knowledge and attitudes of those individuals in the firm responsible for international decisions. Some researchers (Moini, 1995; Cooper et al, 1994), for example, have found that the success of exporting firms and new ventures depends on the demographics, while others (Knight and Cavusgil, 1997; Reuber and Fischer, 1997) point to the importance of the international orientation of decision-makers. Cavusgil and Naor (1987) have proposed that the former are less important than factors related to behaviour. Manolova et al (2002) studied the impact of international business skills, international orientation, environmental perceptions and demographics of SME managers and found that skills and environmental perceptions are among the most important criteria for successful internationalisation. Thus, lack of resources in the form of physical capital, might not be such a hindrance if decision-makers of SMEs have a proactive view toward internationalisation. More important are the knowledge, skills, experience and networks of firms and the external environment, which form the strategic foundations of the firm (Welch and Welch, 1996). Jaklic (1998) suggested that networks can be especially useful for SMEs in catching-up economies since it is possible to overcome some of the problems of knowledge and technology as well as capital accumulation. Because large firms often have the resources to easily enter foreign networks, the establishment of network relationships will be even more important for SMEs, especially those which do not yet have clearly defined internationalisation goals. The development and coordination of knowledge inside the firm must be viewed as integral to its internationalisation processes (Knudsen and Madsen, 2001).

The most prominent avenues of internationalisation are: export; FDI; international strategic alliances (Lu and Beamish, 2006).

Exporting is the most common form of internationalisation. In the case of Italy, exporting is not necessarily the most important or most fundamental internationalisation way: Italian firms have recently begun to develop other, more advanced forms of foreign expansion, mainly of non-equity type (Basile *et al.*, 2003).

FDI represents the main tool of internationalisation for medium - and large - sized firms and multinationals. FDI is an investment realised abroad ('active' or 'outward' investment) or from abroad ('passive' or 'inward' investment) in plants, and can take place either through the opening of branch plants ('green-field' investment), or through the acquisition of or financial participation in existing firms ('brown - field' investment). By contrast, small and medium size firms extend their supply chains abroad through international strategic alliances that can come in various forms (Dunning, 2001). The first type is the *non-equity* strategic alliance that is formed through sub-contracting agreements between a firm and one (or more) of its suppliers to supply, produce, or distribute a firm's goods or services without equity sharing. They include, e.g., licensing, franchising, subcontracting. Because they do not involve the forming of a separate venture or equity investments, non-equity alliances are less formal and demand fewer commitments from partners than joint-ventures and strategic alliances (Hitt *et al.*, 2001; Gemser *et al.*, 2004). The second type is *equity* strategic alliance which is an alliance in which partners own different percentage of equity in a new venture or project, or an existing firm. The third type is the *joint venture* where two or more firms create a separate corporation whose stock is shared by the partners. Considering all of the mentioned options, we can propose one more hypothesis.

Hypothesis 4: Piedmont's SMEs realise internationalisation processes which guarantee the physical presence in a foreign country through co-operative strategies rather than any other way.

DESK ANALYSIS AND HYPOTHESES TESTING

In this phase we make a classical desk analysis in order to find some key factors for internationalisation from balance sheets, firm budgets and accounting documents.

The Italian law, like other nations, demands companies to issue a budget each year in order to give information about economic and financial results.

Analysing the minimum information a budget must have, it is possible to determine some relevant "information areas" to understand the degree of internationalisation of the firms.

Among the documents composing Italian budgets (Stato Patrimoniale, Conto Economico and Nota Integrativa), there is a descriptive one, called "Nota integrativa", made of 27 points. It is possible to divide this document in 4 parts:

1. evaluation criteria;
2. analysis of Stato Patrimoniale;
3. analysis of Conto Economico;
4. other data.

Focusing on parts b), c) and d), it is possible to obtain the following information:

- the investments made by the firm, through the analysis of fixed assets, in particular of R&D costs;
- the possibility that a holding group is present, through the analysis of the shares owned by the firm; by the way, there is currently a lack of information in Nota Integrativa about the commercial and financial relationships among the companies of a holding group;
- the classification of sales and revenues concerning sector and geographical area;

- the presence of asset addressed to particular business.

Thus, through a theoretical analysis of Italian balance sheets, we can see how it is not always possible to determine the degree of internationalisation of a firm. In fact, Italian budgets' criteria have always been addressed to creditors and, only secondly, to other stakeholders. Moreover, the Italian law allows many Italian SMEs to make shorter and less complex budgets (called "bilanci abbreviati"), basically lacking almost the information described above.

There is one more document attached to Italian budgets, called "Relazione sulla Gestione", featuring some information about management. In particular, some parts of that document could represent an important tool to determine relevant information and indicators about the internationalisation of Italian SMEs. Anyway, the Relazione sulla Gestione is not very used by the firms we studied, since it is requested only above some financial amounts. The firms must exceed for two following years the following limits: total assets more than 4.400.000 €; total revenues more than 8.800.000 €; more than 50 employees (average per year).

The Relazione sulla Gestione must even supply information concerning R&D costs, though not only about their nature, but about their destination as well. The vision and the relationships among companies of holding groups are also thoroughly described, because, beyond shares and guarantees, the document budgets the flows of costs and revenues, the presence and the exchange of licenses, royalties and know how. The Relazione sulla Gestione features moreover a forecast on the evolution of the firm's management, that can be significant for this research to understand what is the direction of the future business of firms.

We use a panel of manufacturing firms from the Piedmont area; Piedmont is one of the 20 Regions of Italy, in the north-west. Its territory presents a widespread industrialisation, featuring mostly SMEs. It has an area of 25,399 km² and a population of about 4,4 million. The capital is Turin.

We perform an analysis on a sample of 250 SMEs. Consistent with parallel studies on American small and medium sized firms in the entrepreneurship literature (Baird *et al.*, 1994; Hodgetts and Kuratko, 1998; Beamish 1999; Wolff and Pett, 2000), this study employs the definition of SMEs provided by the following European Community standard (Recommendation of the European Commission, May 6th 2003): a small enterprise has fewer than 50 employees, less than 7 million Euro in revenue and less than 5 million Euro in assets. The upper ceiling for a medium enterprise is fewer than 250 employees, less than 40 million Euro in revenue, and less than 27 million Euro in assets. The sample is stratified and randomly selected (it reflects sector's geographical and dimensional distribution of firms from Piedmont) for firms up to 250 employees. We use the database of AIDA (Analisi informatizzata delle aziende), in particular Piedmont SMEs' annual budgets. Additional balance sheet information has been derived from *Centrale dei Bilanci*, a well-known and reliable source of balance sheet data for Italy. The dataset provides information about who controls the firm. We consider budgets of last three years (2006, 2007, 2008), so both qualitative and quantitative data are collected. Qualitative data provide, among other things, information on ownership structure and entitlement to state subsidies. The analysis on the sample is meant to test Hypothesis 1 and Hypothesis 2.

Further analyses in particular include the following: *i*) analyses on structure of enterprise according to size, number of employees and economic activity; *ii*) analysis of SMEs according to number of companies, number of employees and industry.

The empirical analysis draws on a sample which includes small and medium-sized firms in an economy where the market for corporate control is not fully developed. This reduces the

impact of two types of selection bias. The first (Steer and Cable, 1978) occurs when only large firms are included in the sample, since only the most efficient ownership-controlled firms maintain this status when they grow in size. The second occurs in samples containing only small firms when, under an effective market for corporate control, less efficient firms are taken over and excluded from the sample.

According to the Ateco 2007 code (used by Istat, the Italian Statistical Institute), the 250 firms have been classified within six industrial sectors.

<i>Description</i>	<i>Nr. of firms</i>	<i>%</i>
<i>Chemical, rubber and plastic industries</i>	29	11.6
<i>Manufacture of electrical machinery and apparatus, optical instruments</i>	66	26.4
<i>Manufacture of fabricated metal products, except machinery and equipment</i>	49	19.6
<i>Manufacture of mechanical machinery and apparatus</i>	54	21.6
<i>Services</i>	24	9.6
<i>Transports</i>	28	11.2
<i>Total</i>	250	100

Table 1: Division of the sample according to performed activity. Source: AIDA and Centrale dei Bilanci.

Table 1 highlights that the firms of the sample are distributed within all of the economic activities described in the table, with a good number coming from the electrical, electronic and optical industries, from metal products industries and from the mechanical industry.

Table 2 divides the firms analysed according to total sales and number of employees.

<i>Revenue (ml of €)</i>	<i>Number of employees</i>	<i>Number of firms</i>	<i>%</i>
<i>< 0.5</i>	<i>< 10</i>	70	28.0
<i>0.5-1</i>	<i>10-50</i>	147	58.8
<i>1-50</i>	<i>50-250</i>	33	13.2
	<i>Total</i>	250	100

Table 2: Division of the sample by company size. Source: AIDA and Centrale dei Bilanci..

Descriptive features of this sample illustrate some important characteristics of Piedmont's economy in the three years considered: the relative specialisation in traditional sectors and the underspecialisation in high-tech sectors, and the relevant weight of small firms (no more than 50 employees), which account for more than 86 percent of the sample.

No matter which of the definitions of internationalisation described above we adopt, the question is how to measure the level of it for the purposes of this study. We assessed that a broadly accepted indicator of internationalisation is the size of FDI. Alternatively, FDI can also be observed as the capital or equity invested in foreign companies and businesses. Anyway,

SMEs sometimes cannot compete in all international markets, so FDI is probably not the only measure of internationalisation to be adopted. The level of exports is a valid parameter for internationalisation, in fact. Exports are not so challenging for the company in terms of investment and they also show the international orientation of the company. Considering that, we have determined a number of factors, emerging from accounting documents, that can mean a SME is following the internationalisation path: 1) the amount of revenues deriving from exports toward foreign countries, 2) the participation to international EU programs, 3) the relationship with foreign suppliers, 4) the kind of international activity (if present), 5) the amount and geographical destination of investments, 6) the involvement of foreign shareholder and/or foreign managers. Then, following the theories about the influence of internationalisation on SMEs' balance sheets and accounting documents, we analyse the firms' budgets searching for these six factors. In particular, we got some hints from Buttignon, Vedovato and Bortoluzzi's model (2005) about the performances after private equity investments and their impact on growth and profitability, from Haynes, Onochie and Lee's model (2008) about the origin of loans of internationalised SMEs and their debt structure, from Bopaiah's model (1998) about the availability of credit for internationalised SMEs, from Gallo's analysis (2005) about the state of origin of board directors and from Pilotti *et al.*'s definition of the internationalisation index (2007).

Thus, we obtain an *Internationalisation Index*¹¹³ that allows us to rank the firms from the "most internationalised" to the "least internationalised"¹¹⁴. The most internationalised firms obtained a score of 1 (or 6/6), meaning that they fulfil all 6 criteria being researched; the least internationalised firms scored 0,16 (or 1/6), and fulfil only one criteria. In sum, the level of internationalisation of the firms being considered corresponds to the number of satisfied requisites. The results of the classification are summarised in table 3.

¹¹³ *Internationalisation index from 0 to 1 (0 = no requisites; 1 = full requisites).*

¹¹⁴ *For example, in the hypothesis of 6 requisites: group A: firms with an index equal to 1; group B: firms with an index equal to 0.83; group C: firms with an index equal to 0.66, etc.*

<i>Internationalisation Index</i>	<i>Number of firms</i>	<i>%</i>
0.16	67	26.8
0.33	53	21.2
0.50	48	19.2
0.66	38	15.2
0.83	26	10.4
1	18	7.2
Total	250	100

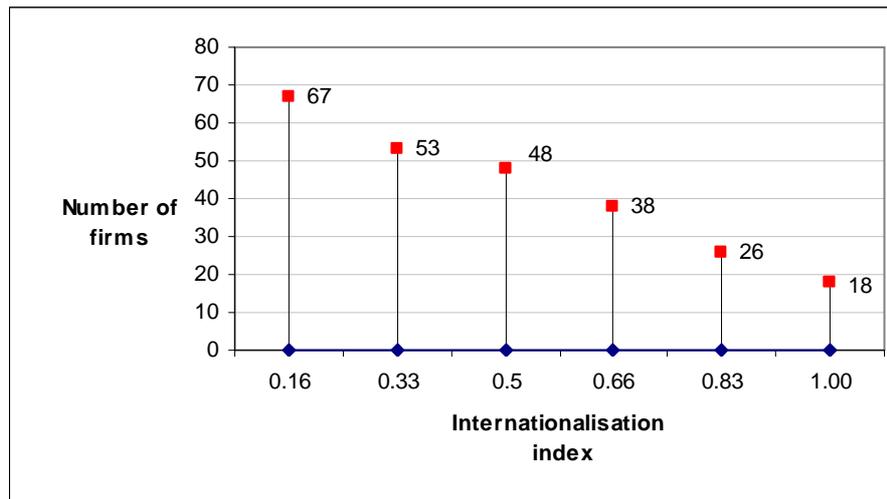

Table 3: Results of the classification. Source: personal research.

Table 4 shows what happens if the *Internationalisation Index* is compared to the main economic activity of the firm.

<i>Description</i>	<i>Nr. of firms</i>	<i>I.I. (average)</i>
<i>Chemical, rubber and plastic industries</i>	29	0.4
<i>Manufacture of electrical machinery and apparatus, optical instruments</i>	66	0.4
<i>Manufacture of fabricated metal products, except machinery and equipment</i>	49	0.2
<i>Manufacture of mechanical machinery and apparatus</i>	54	0.3
<i>Services</i>	24	0.3
<i>Transports</i>	28	0.2
<i>Total</i>	250	

Table 4: *Internationalisation Index (I.I.) and main economic activity. Source: personal research.*

From the data analysis no significant relationship between the predominant economic activity and the *Internationalisation Index* emerges. Nonetheless, the highest average *Internationalisation Index* is found in the electrical, electronic and optical industries, and in the chemical industries. The firms of the sample therefore have levels of internationalisation that are not related to the sector they belong.

Table 5 shows what happens if the *Internationalisation Index* is compared to the size of the firm.

<i>Revenue (ml €)</i>	<i>Number of employees</i>	<i>Number of firms</i>	<i>I.I. (average)</i>
< 0.5	< 10	70	0.3
0.5-1	10-50	147	0.5
1-50	50-250	33	0.6
	<i>Total</i>	250	

Table 5: *Internationalisation Index (I.I.) and firm size. Source: personal research.*

The data analysis reveals that the average *Internationalisation Index* grows as the size of the firm within the sample grows. So, referring to Hypothesis 1 “Piedmont’s SMEs internationalisation grows with firms’ size”, the desk analysis shows that the size of a firm and its level of internationalisation are linked.

Table 6, instead, shows the comparison between *Internationalisation Index* and presence of foreign shareholders and/or managers within the firm.

<i>Internationalisation Index</i>	<i>Number of firms</i>	<i>Firms with foreign shareholders and/or managers</i>	<i>%</i>
0.16	67	4	5,9

0.33	53	3	5,7
0.50	48	3	6,3
0.66	38	3	7,9
0.83	26	2	7,7
1	18	2	11,1
Total	250	17	

Table 6: *Internationalisation Index (I.I.) and presence of foreign shareholders and/or managers. Source: personal research.*

The data analysis is consistent with Hypothesis 2 “Piedmont’s SMEs with foreign shareholders and/or managers are more internationalised”. Firms with a higher *Internationalisation Index*, in fact, show at the same time a higher presence of foreign shareholders and/or managers.

EMPIRICAL ANALYSIS AND HYPOTHESES TESTING

The main goal of this phase is to deeply understand the internationalisation process of these SMEs investigating, in particular, the following hypotheses:

Hypothesis 3: in Piedmont, there are SMEs which are “internationalised” since their birth;

Hypothesis 4: Piedmont’s SMEs realise internationalisation processes which guarantee the physical presence in a foreign country through co-operative strategies rather than any other way.

The testing of these hypotheses highlights – in a deeper way than the simple analysis of their balance sheets, budget, and accounting documents – if SMEs from Piedmont have followed or are currently following an internationalisation path.

Moreover, it is possible to have an accurate framework of the state of art of the internationalisation of the SMEs from Piedmont.

We directed an interview to every firm that in the desk analysis obtained the highest score (1), i.e. the most internationalised firms of the sample. The structured interviews concern the 7.2% of the sample (18 firms) that had obtained a score of 1 on the *Internationalisation Index*. The objective here is to verify if the results of the desk analysis – based on accounting documents – were confirmed by a *vis-à-vis* confrontation with the management.

The interviews to the managers of the 18 firms features questions about the six factors concerning internationalisation path already used to build the index.

Results of the interviewing process

The interviewing process to the managers of the most internationalised firms of the sample from Piedmont area basically confirms the results of the desk analysis carried out on balance sheets, budgets and accounting documents.

Direct interviews show that the percentage of “fully internationalised” firms (*Internationalisation Index* = 1), beginning an internationalisation path since their first year of activity, is 77% (14 on 18). This result is consistent with Hypothesis 3 “in Piedmont, there are SMEs which are internationalised since their birth”.

The interviewing process, on the other hand, highlights that every firm followed different strategies to approach internationalisation: export; FDI; international strategic alliances. In particular, in the case of Piedmont area, exporting is not the most important or most

fundamental internationalisation way; Italian firms sometimes choose to open branch plants ('greenfield' investment), or to acquire or participate in existing companies ('brown - field' investment). Another option emerging from interviews is the *non-equity* strategic alliance, formed through sub-contracting agreements between a firm and one (or more) of its suppliers to supply, produce, or distribute a firm's goods or services without equity sharing. They include, e.g., licensing, franchising, subcontracting. *Joint ventures* represent a further option. Table 7 shows which strategies were chosen by the eighteen "fully internationalised" firms to approach internationalisation.

<i>Strategy</i>	<i>Number of firms adopting the strategy</i>	<i>% (on total number of 18 firms)</i>
<i>Licensing</i>	14	77.8
<i>Joint venture</i>	13	72.2
<i>Export</i>	18	100.0
<i>"Greenfield" investment</i>	3	16.7
<i>Other</i>	4	22.2

Table 7: Strategies chosen by firms to approach internationalisation. Source: personal research.

Referring to Hypothesis 4 "Piedmont's SMEs realise internationalisation processes which guarantee the physical presence in a foreign country through co-operative strategies rather than any other way", the evidence from Table 7 indicates that all of the most internationalised SMEs in the sample adopted at least one co-operative strategy; moreover, co-operative strategies prevail on other approaches, such as "greenfield" investment. Thus, the hypothesis is demonstrated.

CONCLUSIONS

The internationalisation of Italian firms is a phenomenon of growing interest. It is very interesting to verify how the growth path emerging from balance sheets and accounting documents matches the results of the research.

In this paper we have focused on SMEs that have begun to tread on the internationalisation path. We analysed the evidence concerning the link between firms' budgets and accounting documents and their involvement in international operations. That is to say, the main question was whether the first could be an efficient way to investigate the internationalisation path.

To this end, a review of the literature on this topic has been presented (sections 1 and 2). Then a sample of 250 SMEs from Piedmont area was selected, on which the desk analysis was performed. The 250 target firms were studied focusing mainly on accounting data, to appraise the evolution of their internationalisation performances over a period of three years. We then determined an *Internationalisation Index* for all the studied target firms (section 3). The *Index* showed that only the 7.2% (18 on 250) of the sample firms fulfil the six parameters requested to indicate a full internationalisation process. Finally, we carried out an interviewing process on

the eighteen most internationalised firms of the sample for confirming the results obtained from the desk analysis.

In this phase, some evidence emerged. Accounting data can be a valuable tool to highlight the presence of an internationalisation process over the years, since they provide information about revenues from exports to foreign countries, international funds being pursued, presence of foreign suppliers and customers, international investments, involvement of foreign shareholder and so on. Anyway, only SMEs have been investigated, no large companies. It is not clear if the presented empirical findings also hold true for larger enterprises. Yet the study pointed out that this kind of information cannot fully substitute direct interviews to the firms' management or other research tools about internationalisation already used in previous studies.

The road is open for new analyses and elaborations of accounting data, to assess the internationalisation path of SMEs, that may represent a remarkable target for future researches.

²*Department of Innovation and Entrepreneurship Tsinghua University, Beijing, China,100084*

Organizational ambidexterity has become an emerging research trend when it adapt to the environment dynamism in the organization science and strategy research. Previous research focused on the organization-level or unit-level analysis like structural, context and TMT attributes within the organizational boundary, especially focused on the MNCs. However, small and medium firms also need to balance the exploration and exploitation to adapt to the environment dynamism with limited resource engagement in the context of China that the distribution of organizational technology and market resource is uneven. From the open innovation research advancement, inter-organizational ambidexterity that organizations balance the exploration and exploitation simultaneously across the organizational boundary through the co-specialization is more realistic pattern. Through the analysis of interaction of the inter-organizational and intra-organizational ambidexterity, we introduce network capability as the antecedent in the network context and suggest an integrated model.

Keyword-- Inter-organizational ambidexterity, Intra-organizational ambidexterity, Network capability, Open innovation

INTRODUCTION

In the dynamic environment, organizational competitive advantage is temporal and erodes fast. Sustainable competitive advantage requires the balance of the short-term and long-term performance, which means that organization needs to be aligned and efficient in its management of today's business demands while simultaneously being adaptive to changes in the environment. Organizational ambidexterity has gained increasing interest in recent years (Duncan, 1976; Gibson & Birkinshaw, 2004; Tushman & O'Reilly, 1996; Raisch & Birkinshaw, 2008; Simsek, 2009;). From the temporal dimension (Simultaneous vs. sequential) and a structural dimension (independent vs. interdependent), a two-by two typology of organizational ambidexterity is identified as harmonic, cyclical, partitional, and reciprocal ambidexterity (Simsek et a., 2009). However, it seems that temporal separation couldn't promise the dynamic oscillation (Thomas, C., Kaminska-Labbê, R., Mckelvey, B., 2005) and structural separation seems more applicable through organizational design and context, top management teams. Based on the structural separation across the organizational boundary, ambidexterity could be classified as intra-organizational ambidexterity (e.g., harmonic and cyclical model) and inter-organizational ambidexterity (partitional and reciprocal model).

According to prior Chinese scholars' empirical results, we will find that firms in the VCD, Mobile phone, TV and automobile industry gain temporal competitive advantage through open innovation and inter-organizational ambidexterity (Chesbrough, 2003, 2006). There also some firms are successful with the industry evolution like ZTE in the ICT industry and Chery in the automobile industry but most of these firms fall into the exploitation trap and lost the innovation capability. Therefore, the question is that in these industries why firms performance differently in long-term and short-term performance both possessing inter-organizational ambidexterity? Obviously, inter-organizational ambidexterity is not the unique origin of the

difference. “ShanZhai” phenomenon may give us some lessons about interaction of the intra- and inter-organizational ambidexterity for sustainable competitive advantages.

On the other hand, strategic scholars emphasize that external resource (such as social capital, partners’ resources) is important source of the competitive advantage and Open innovation is a new paradigm (Chesbrough, 2006). Organizational partners’ resources and inter-organizational relationship and structure characters have important influence on both the organizational short-term and long-term performance, especially for small- and medium- high-tech firms without enough internal complementary resource, product development or commercial competence et al in the Chinese context with unequally distribution of technology resource. In order to access the external resource embedded in the organizational ego-network to gain the inter-organizational ambidexterity, organizations also need the network capability to orchestrate the innovation network (Dhanaraj & Parkhe, 2006).

Therefore, there are two questions are important for gaining and maintaining sustainable competitive advantages in the open innovation context. The first is organizational network capability, which changes the organizational network to adapt to the network dynamics and to meet the requirements of inter-organizational ambidexterity, and the second is the interaction between inter-organizational ambidexterity and intra-organizational ambidexterity. We suggest that these two research clues could be integrated by extension of the ambidexterity concept.

In this paper, based on the literature review and empirical results, we put forward an integrated framework to analyze the above question. We conclude that future empirical research on the inter-organizational ambidexterity and performance need to take the network capability and intra-organizational ambidexterity into account in the open context, substitution of intra-organizational ambidexterity is related to organizational network capability and constrained by the minimum threshold of the intra-organizational ambidexterity. We begin by reviewing previous discussions on ambidexterity and typology and then focus on the interdependent ambidexterity in the innovation network and we introduce the concept of network capability and suggest an integrated concept model to discuss this problem.

LITERATURE REVIEW

Exploration and Exploitation

There has been a burgeoning literature about exploitation and exploration since March (1991) introduction of the explorative and exploitative learning (Ying Li & Vanhaverbeke, V. & Schoenmakers, W., 2008). Exploration includes things captured by terms such as search, variation, risk taking, experimentation, flexibility, discovery, and innovation. Exploitation includes such things as refinement, choice, production, efficiency, selection, implementation, and execution. Exploration is variation-seeking, risk-taking and experimentation oriented. Exploitation is variety-reducing and efficiency oriented (March, 1991). These two concepts require different structures, processes, strategies, capabilities and cultures, and may have different impacts on an organization’s performance. Following the seminal work, researchers and practitioners are using the concept of trade-off or balance of the two organizational learning behaviors, such as the ambidexterity and punctuated equilibrium, for sustainable competitive advantages. Researchers have used this notion in their discussion of numerous significant and complex organizational phenomena (Tushman & O’Reilly, 1996; Gibson & Birkinshaw, 2004; He & Wong, 2004; Smith & Tushman, 2005; Lubatkin et al., 2006;). Additionally, the importance of ambidexterity for practice is discussed in the many prescriptions offered for firm performance improvement and survival (e.g. Gibson & Birkinshaw, 2004; He & Wong, 2004). As a

consequence, organizational ambidexterity is viewed as an emerging research paradigm in organizational theory (Raisch & Birkinshaw, 2008). Traditionally, balance of the explorative and exploitative learning has been discussed through the structure and temporal dimension.

Temporal dimension: Ambidexterity vs. punctuated equilibrium

The punctuated equilibrium concept, which states the advantageousness of a sequential alignment of exploration and exploitation activities, has a trend of organizations to get trapped by chaos or inertial patterns (e.g., explorative trap or exploitative trap, Thomas & Kaminska-Labbe & Mckelvey, 2005). According to the concept this inertia can only be broken (if a fundamental change is needed due to drastic internal or external changes) by sudden and revolutionary bursts of innovation and organizational change. However, it is highly questionable whether radical innovations and change can be developed "on demand" or in very short development periods (and sometimes coincidentally). Today's world does not only ask for refinements or extensions of established products but mostly for radical new concepts that optimally provide at least a temporary possibility for the inventing firm to escape of highly mature markets. In addition it seems like a long top management team's tenure and a long firm history make it even more difficult for a company to break out of the equilibrium (Puhan, 2008).

Ambidexterity tries simultaneous exploration and exploitation efforts inside a specific organizational structure to balance these activities in an organization and through this to avoid the inertia trap. Ambidexterity therefore follows the concept of March and several other scholars. The tension of the coexistent learning behaviors that need and consist of differing organizational cultures and forms, management styles and reward systems is a critical feature of an ambidextrous organizational concept. It should by design buffer the two conflict activities (Vinekar, Slinkman & Nerur, 2006). However, it appears to be very difficult and especially questionable if the senior management is able to adequately fulfill the integration function of a governing node. Internalizing concerns for the needs of explorative and the frequently conflict needs of exploitative activities is a very tough task (Katz, 2005; Tushman & O'Reilly, 1996). In addition, several studies find that exploratory activities seem to be rather unattractive due to the risky averse and successful trap.

Finally, punctuated equilibrium and ambidexterity were interpreted as two ends of a continuum of the alignment of explorative and exploitative activities (Gupta et al., 2006). However, the sequential alignment of exploration and exploitation at a single organization level could possibly be interpreted as an effort to separate the diametric activities in an effective way without giving up the idea that both activities have to be carried out in order to assure the long-term survival of an organization. The possibility of a concentration on one of the activities and the clearer distance between the two activities is actually a very charming aspect of the concept of sequential alignment. Punctuated equilibrium is also just another kind of ambidexterity but dominated by exploration or exploitation in some region (Thomas, et.al, 2005: P241), see figure 1. Hence the design of inter-organizational ambidexterity is to implement explorative and exploitative activities in a certain structural distance of each other (albeit the design still assures a high level of interconnectedness).

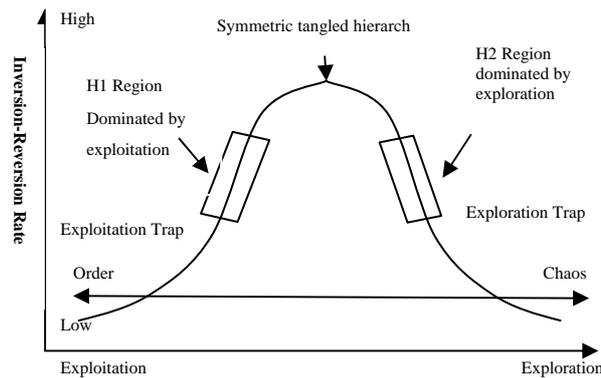

Figure 1- Exploration vs. Exploitation

Structural dimension: Independent Vs. interdependent

From the structural dimension, Simsek (2009) argues that organizational ambidexterity could be classified into inter- and intra-organizational ambidexterity. Inter-organizational ambidexterity includes partitional and reciprocal model. Partitional ambidexterity can be pursued across, as well as within, organizations (Lavie and Rosenkopf, 2006; Lin et al., 2007; Tiwana, 2008). According to the social network theory, this emerging line of research suggests that ambidexterity can be achieved by pursuing exploitation and exploration across network or alliance partners (e.g. Rothaermel and Deeds, 2004), thus relying on market relationship or social relationship.

		Structural dimension Where is ambidexterity pursued?	
		Independent	Interdependent
Temporal dimension How is ambidexterity pursued?	Simultaneous	Harmonic	Partitional
	Sequential	Cyclical	Reciprocal

Figure 2. A typology of organizational ambidexterity

Reciprocal ambidexterity assumes a reciprocal interdependence in which the outputs of exploitation from unit A become the inputs for exploration by unit B and the outputs of unit B cycle back to become the inputs of unit A (Simsek et al., 2009). Reciprocal ambidexterity is best delineated as being a synergistic fusion of complementary streams of exploitation and exploration that occur across time and units such as the ‘discovery cycle’ (Nooteboom et al., 2007). From social network perspective, ambidexterity is achieved through the efficient specialization of exploitation and exploration across an inter-organizational network. Thus, exploitation and exploration can be pursued sequentially across different domains of strategic alliances (Lavie & Rosenkopf, 2006; Ying L, et al., 2008).

However, previous research focused on the organization-level or unit-level analysis like structural, context and TMT attributes within the organizational boundary, especially focused

on the MNCs. After Simsek et al. (2009) introduced the inter-organizational ambidexterity that organizations balance the exploration and exploitation simultaneously or sequential across the organizational boundary through the co-specialization, we can discuss the ambidexterity under the network and open innovation context and the interaction of the inter- and intra-organizational ambidexterity.

Definition of Ambidexterity: Inter- and intra-organizational ambidexterity

Although Duncan, Tushman and O'Reilly, and Gibson and Birkinshaw have delineated ambidexterity from the different context and analysis level, they viewed ambidexterity as the intra-organizational ability to adapt to the innovation evolvement of single or portfolios innovation processes for multifarious objectives. However, ambidexterity need not necessarily be implemented at intra-organization level but can combine its network partners' complementary exploration or exploitation (Gupta, Smith & Shally, 2006; Filiou & Windrum, 2008). This approach termed inter-organizational ambidexterity is based on co-specialization: one organization is devoted to exploration, while associated organizations focus on their core competences in exploitation. Therefore, innovation process could be open-up and enormous part of these activities is carried out cooperatively with organizations and individuals through outside-in process, joint process and inside-out process (Chesbrugh, 2003, 2006).

We agree with Simsek's (2009) typology, Ying's (2008) reframing the interpretation of ambidexterity and Gupta et al. (2006) findings about the multi-level of organizational ambidexterity, here we disaggregate the organizational ambidexterity into intra-organizational and inter-organizational level to emphasis the open context and organizational network and don't think about the temporal dimension which is also another kind of structural dimension. We definite that intra-organizational ambidexterity as the organizational ability to create, modify and extend its internal resource to balance its exploration and exploitation, inter-organizational ambidexterity as the organizational ability to create, modify and extend its network partners' exploration or exploitation to complement its exploitation or exploration. Intra-organizational ambidexterity enables the organization to balance explorative and exploitative activity internally, which prerequisite internal munificence resource base, organizational structure and culture. Inter-organizational ambidexterity enables the organization to balance exploration and exploitation across organizational boundary, which prerequisite network partner's exploration or exploitation through partners' selection and network ties and structure. Simultaneously, the performance of the inter-organizational ambidexterity is moderated by absorptive capability and combinative capability to effectively access to and efficiently leverage network partner's complementary exploration or exploitation.

Network capability

Recent scholars stress that organizations which consist of portfolios of heterogeneous assets and competencies could achieve competitive advantage. However, in fast moving business environments open to global competition, and characterized by dispersion in the geographical and organizational sources of innovation (von Hippel, 1997; Chesbrough, 2003, 2005) and manufacturing, sustainable competitive advantage needs unique and difficult-to-replicate dynamic capabilities (Helfat, et al., 2007). In a networked environment, firms can obtain the benefits of resources from partners without owning or controlling the resources themselves and so can other firms for the same resources, which make the inimitability and imperfect substitutability conditions of the traditional RBV less applicable (Lavie, 2006). At the same time, the effects of network properties on performance suggests that certain network characters and strength of tie can confer at least a temporary competitive advantage, especially due to its

complex, causally ambiguous nature. Furthermore, empirical observation shows that networks change, not just through exogenous events, but also endogenously as a result of purposeful firm action to change their position and strength of tie to achieve a competitive advantage (Liere et al., 2008). According to the network dynamics, the nature of the network capability is dynamic capability.

Based on the prior alliance capability and alliance portfolios management research, we introduce the network capability concept. This article would not like to expand this discussion about the network capability detailed. Network capability could be disaggregated into three parts including (1) network horizons capability; (2) network exploitative capability; (3) network explorative capability. Liere and Koppius (2008) argued that recognizing advantageous network positions is key for organizations to obtain and sustain competitive advantage and they introduced a construct named network horizon as the percentage of the information about the network structure. Their simulation results indicate that organization with high network horizon will occupy a strong bridging position. Network vision is about the network strategy and couldn't reveal the network cognition capability. However, both of them are about the cognition of network which will enable network related actions. Here we refer the network horizons construct and suggest that network horizon capability is the organization sensing opportunity and threats for exploration and exploitation through realized and potential network tie, structure and partner's attribute. Network exploitative capability means that organizational ability to exploit its prior network tie, structure position and partners' new resource to seize the opportunity. Network explorative capability means that organizational ability to explore new partners to extend or modify its current network to seize the opportunity.

CONCEPT MODEL AND PROPOSITIONS

Interaction of the Intra- and inter-organizational ambidexterity and performance

'The interplay between exploitation and exploration takes place both within and between organizations' (Holmqvist, 2004, p. 72). Consequently, the reciprocal relationship between exploitation and exploration may involve an extension process in which an organization 'extends its experience to others, for example, in a formal strategic alliance' or a process of internalization, wherein an organization 'internalizes experiences as retrieved in inter-organizational rules' (Holmqvist, 2004, p. 73). As with extension, internalization can be classified as opening-up, in which inter-organizational exploitation leads to intra-organizational exploration, or focusing, wherein inter-organizational exploration leads to intra-organizational exploitation (Holmqvist, 2004). It seems that inter-organizational ambidexterity is the substitution of the intra-organizational ambidexterity. In fact, there is an important difference that is the separation of value creation and value appropriation, which is related with service and ownership of exploration and exploitation. In the traditional RBV views, due to the potential hypothesis of the ownership of the resource, we needn't think about this problem because of the combination of value creation and value appropriation. The inter-organizational ambidexterity, which could achieve the balance across organizational boundary through network partners' exploration or exploitation, is challenged by this problem. Therefore, intra- and inter-organizational ambidexterity can not simply be viewed as substitution of each other and should consider other factors which moderate the relationship between organizational ambidexterity and performance. In this paper, we would like to focus on the interaction of intra- and inter-level.

Intra-organizational ambidexterity will enhance the inter-organizational ambidexterity, because internal sensing the internal opportunity and threat for exploration and exploitation will enhance its cognition base which enhances the sensing capability of inter-organizational ambidexterity. Conversely, inter-organizational ambidexterity will reinforce internal exploration or exploitation oriented because of the prior success and co-evolution lock-in with overembeddedness. We think inter-organizational ambidexterity could not foster intra-organizational ambidexterity for the organization dominated by exploitation or exploration; inter-organizational ambidexterity will reinforce the co-evolution lock-in and even hinder intra-organizational ambidexterity development due to the internal and external inertia. In the organization with intra-organizational ambidexterity, inter-organizational ambidexterity will make the organization change its internal balance of exploration and exploitation and focus on exploitation or exploration to enhance efficiency and keep adaptation at the same time. Intra-organizational ambidexterity also moderates the relationship between the inter-organizational ambidexterity and performance, because intra-organizational ability provides the common knowledge and capability base for communication that enhances the synchronous attainment and adaptation by breaking the co-evolution lock-in potentially.

Proposition 1: High organizational ambidexterity is positively related to organizational performance, especially for dynamic environment relative to stable environment.

Proposition 2: High intra-organizational ambidexterity is positively related to organizational performance, especially for long-term performance relative to inter-organizational ambidexterity.

Proposition 3: High inter-organizational ambidexterity is positively related to organizational performance, especially for short-term performance relative to relative to intra-organizational ambidexterity.

Proposition 4: High intra-organizational ambidexterity is positively related to inter-organizational ambidexterity and moderates the relationship between the inter-organizational ambidexterity and organizational performance.

Proposition 5: Intra-organizational ambidexterity positively moderates the relationship between inter-organizational ambidexterity and organizational performance, especially for long-term performance relative to short-term performance.

Network capability and Ambidexterity

Exploitation and exploration has different requirements in orchestrating network (Sigvald J.Harryson et.al, 2008). As Lavie and Rosenkopf (2006) disaggregated the exploration and exploitation into function, structure and attribute domains. And Ying Li et al. (2008) disaggregated that into science, technology and product-market function and cognitive, temporal and spatial dimensions, exploration requires knowledge-generating, prior partner with new resource investment and new partners with heterogeneous knowledge. Exploitation requires knowledge-leveraging, prior partners and new partners with similar knowledge to prior partners. Thus, inter-organizational ambidexterity is conditioned by organizational network capability through different domains. Some scholars reveal that exploration and exploitation benefits from organization's network characters, such as centrality and diversity. However, organization embedded network is dynamic and network requirement for intra- and inter-organizational ambidexterity is different. Therefore, organizational network capability influences the resource base of the ambidexterity through changing the network characters. Within network, dyadic relationships could be classified into four types in the light of content of collaboration as explorative, exponential, exploitative and experiential collaboration (Scott Motty et al., 2008). Therefore, organizations could orchestrate network ties portfolios to achieve inter-organizational ambidexterity.

Proposition 6: High network capability is positively related to organizational inter-organizational ambidexterity and intra-organization ambidexterity.

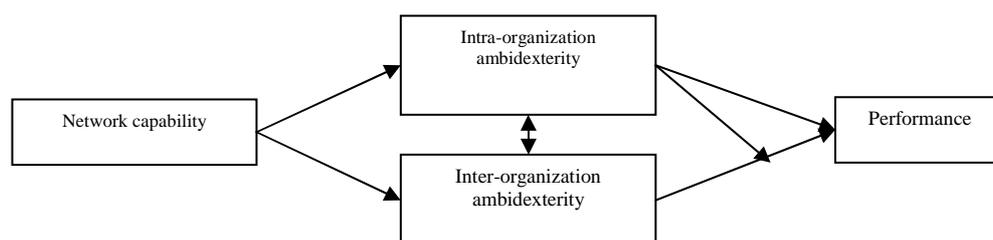

Figure 3 The integrated conceptual framework

DISCUSSION AND FUTURE RESEARCH IMPLICATIONS

The challenge of organizational ambidexterity is a crucial capability for management and research. Prior organizational ambidexterity research focuses on the MNCs and the antecedents, on the one hand. Ambidexterity still remains an under-theorized, under-conceptualized, and therefore, poorly understood phenomenon (Simsek, 2009). On the other hand, various disciplines about network dynamics and open innovation could be integrated and extend

current understanding about organizational ambidexterity. Therefore, further research could test the inter- and intra-level respective and joint effect on organizational performance and moderator such like absorptive capability and combinative capability. Also, we can introduce other factors, like network capability, which will influence organizational ambidexterity, and how to design the organization and capability evolutionary path.

ACKNOWLEDGEMENTS

We would like to thank the Chinese NSFC funding project 70672006.

**CHALLENGES OF CULTURE TOURISM IN ALBANIA ECONOMIC RECESSION
CONDITION: CHALLENGES AND ADVANTAGES. A STRATEGIC MARKETING PLAN
AS IMPORTANT TOOL**

Gega, Elsa¹; Elmazi, Liliana²

¹Phd/STUDENT Faculty of Economy, University of Elbasan, Albania

²(Billa), University of Tirana/ Faculty of Economics and Business, Tirana, Albania

Albania is a beautiful and fascinating country. It has a wide range of historic, cultural and natural attractions that are of the great interest to international tourist. The main aim of the paper is the assessment of the implementation of a Strategic Marketing Plan prepared for the WHS of Butrint as a Albanian 's major heritage attraction. I have structured the interviews conducted with the management of Butrint as well as other experts in the field, in order to collect the required information. Information required will be of qualitative nature. Two of the tools chosen to obtain the data required are the investigation of the secondary resources and the conduction of in depth interviews with management representatives of the attraction that I'm analyzing.

Key words: Cultural tourism, cultural attractions , Butrint destination

INTRODUCTION

Cultural Tourism is the most important part of the Albanian tourism product and successful element of the national economy. Albania is considered as a new cultural destination in the tourism marketplace, as a Balkan country of dramatic natural beauty, with a wealth of historic buildings and ancient archaeological sites that can compare, for interest and variety with any in the Mediterranean world. Analyzing Albania as a new destination in the tourism marketplace one can easily bring into light a series of disadvantages (i.e. poor quality of service such as electricity, water supply, and the perception of the country as an unstable and potentially dangerous destination). These, were a result of the historical and political circumstances. Albania has been through during the last century characterized by increased isolation, limited access to the country, economic and technological inertia, making it Europe's least-developed country. There are however many advantages (i.e. undiscovered natural beauty, proximity to established or growing markets) that increase the chances for Albania to attract visitors interested in a new destination and a new cultural experience. Attempts to project the country to the outside world began in the 1970s using classical heritage as an element of national identify. Thus heritage is represented today in Greek, Roman and later Byzantine archaeological wealth generated by Albanian lands due to its favorable geographical position in the Balkan in classical times as a key area for trade, agriculture and minerals. After a long period of instability, Albanian heritage is again being projected as an integral component of the country's reconstruction.

The country is safe, and its people are welcoming and friendly. Most importantly, is still "authentic". It remains largely unspoiled by foreign influence, people live and work in traditional ways in much of the country, and local culture expresses itself in every possible way on a regional basis- even town to town. The combination of these factors makes the country unique, and its potential value to international tourism markets very high.

WHY ALBANIAN CULTURAL TOURISM?

Albania has excellent tourism development potential. Many cultural resource attractions are of very high quality and would likely receive high levels of visitation if they were more widely publicized within target populations. More important for Albania, however, are the trends in tourism preferences. Culture is considered to be the fastest growing tourism markets worldwide. Tourism focused on independent tourists visiting local communities and participating actively in nature and culture activities has been shown to yield 5-10 times more development benefit than large-scale sun and sand tourism per dollar of tourist spending.

CASE STUDY OF BUTRINT – ALBANIAN’S MAJOR HERITAGE VISITOR ATTRACTION

Albania comprises an important amount of splendid archeological sites. Ottoman heritage, as well as a number of national parks bearing an outstanding natural beauty. Among others, it is worth mentioning the archaeological site a museum of Apollonia, which together with *Dyrrachium* makes two most important ancient Greek settlements in Albania. The citadels of Gjirokastra and Berat, characteristic of which are the beautiful mosques and churches that can be seen, whereas the domestic architecture of these two town are considered the best preserved examples of Ottoman towns of their period that have survived anywhere in the ex-imperial territories.

The national parks (Divjaka National Park, Lura National Park, Llogara National Park, etc.) established mainly after the World War II are in remote forest areas and comprise a remarkable variety of plants and some of the last refugees of rare animals and birds that have disappeared from other regions of Balkans.

Sitting in the south of Albania within region of Saranda, just across the straits of Corfu, the WHS of Butrint of Butrint National Park, is Albania’s main cultural and natural heritage site.

The importance of the site was recognized both nationally and internationally. This has been proved by the fact that the at times the site has received several designations which have significantly built up its image and attracted more visitors and specialists in the area. A collage of several evaluations made by the academia and public media prove not only the perception of the place by the people and the impression that the site leaves, but of the grandiose dimensions of the values that the site carries. Of the great classical sites of the Mediterranean, Butrint is the least known, the least frequented and the least spoiled. Visiting it today must be like visiting Ephesus or Baalbek a hundred years ago: nor car parks, no souvenir stalls, no sound but the sound of birds and the ever-buxy crickets. If you yearn to lose yourself in romantic meditation, alone among the ruins of a once-great city, then Butrint in the place for “Butrint is a magical place. In special atmosphere is created by a combination of archaeology and nature not found elsewhere in the Mediterranean. This is one of the great, largely unknown archaeological sites of Albania and of the whole Balkan Peninsula.

The Park is now the single most important tourist asset for the Saranda region and arguably for Albania as a whole. It has been recognized as a site of international and national importance for its wetlands, as an historic landscape important for the caliber of the archeology and as a focus for national and regional cultural identify. In addition, the Park has been identified as a place of national importance for education (over 25,000-school children visit the site each year) and an important local resource for farming and fishing activities”.

1948	“Cultural Monument”, designed under the first Albanian Cultural Monuments Act.
------	--

1981	<i>“Protected woodland”, designated under the first Albanian Law on the “Protection of sites of environment importance”.</i>
1992	<i>UNESCO WHS, inscription by the WH Committee based on the cultural criterion .</i>
1997	<i>Inscription on the List of World Heritage in Danger by the World Heritage Committee.</i>
1999	<i>Butrint National Park was established by the Ministry of Culture</i>
2000	<i>Confirmation of the enlargement of the WHS site to 29 km2.</i>
2001	<i>An application for RAMSAR status was prepared in winter 2001.</i>

Table 1 Chronological list of national and international designation for Butrint.

An observation of the above “trophyies” shows that international recognition has increased significantly during the last decade. That is certainly a result of the opening of the country.

RESEARCH METHODOLOGY

The collection of the information for the research begins with defining the main aim and the objectives. The methods and tools chosen are going to be strongly depend on the aim and objectives. The research topic is presented in the form: “How is the implementation of A strategic Marketing Plan prepared for the WHS of Butrint evaluated from a management perspective?” This is lending to descriptive and inductive research. The next step of the research is related to the identification of the information needed, which includes management issues on heritage attractions, more specifically related to WHS-s. This information is about the strategic marketing plan that the attractions adopt and the assessment of the implementation of this plan. After concluding on the list of information and the sources, the next step is to decide on the techniques that will be used. So apart fro the existing data about Butrint, the primary information coolected through the opinion and knowledge of a group of experts in the field will be of large amounts which will then be interpreted by the researcher. Therefore, the methodology relies on secondary and primary information. Where qualitative data is to be collected, (the information collected using in –depth interviews) special interest must be given to how the results of the interviews will be analyzed. This remains the final stage of the research. The sample chosen by me to conduct the interviews includes mainly representatives of the site management of the as well as stakeholders that would be involved in the implementation, such as:

- Foreign consultants that have contributed in the field.
- Representatives of the Institute of Monuments and the Institute of the Archaeology.
- Local travel agent.

THE WHS OF BUTRINT, RESOURCES, GEOGRAPHIC LOCATION AND ACCESS

The WHS of Butrint or the Butrint National Park comprises an area of 29 km2 lying slightly inland from the east shore of the Straits of Corfu. It is Albania’s main cultural and natural heritage site lying in the Southern part of the country within the Saranda region about the 15 miles to the South of Saranda Port. It is located in a relatively unpopulated area close to the borders with Greece with less that 100 people living within its boundaries. Its closest villages are Shen Delli, Vrina Xarra and Ksamili with an estimated population of 5600 inhabitants. Its assets consist of mainly archaeological and natural resources bearing unique international

values. Encompassing a constellation of at least 10 archaeological sites within its boundaries the site illustrates a history of human occupation which dates back to the Middle Paleolithic period with intensive settlement from the 8th century BC onwards. Despite the significant changes and transformations of the landscape, low intensity of land use has preserved a wide range of species-rich habitats. The remarkable diversity of habitats Butrint National Park supports consists of woodland and scrub, dry habitats and wetland.

Main access to the site is made possible by the road that links Saranda with Butrint along the Ksamili thus making the Port of Saranda a main gateway for the majority of foreign visitors coming via Corfu (GR) is the main provider of visitors which come to the park remains whether a new road is constructed between Konispoli (the nearest border crossing point with the port of Igoumenitsa, inland Greece) and Saranda. That will probably shift the orientation of the park with the majority of the visitors entering from the south. That would avoid the major constraint of the cooperation with other similar sites in the region and improve communication with potential markets.

VISITORS AT BUTRINT

It is fact that Butrint makes Albania's major visitor attraction. Since late 1980s, day visitors from Corfu were taken to the site and soon made half of all Albania's foreign tourists in numerical terms.

The upward trend in visitor numbers dates back to early 90s when the fall of communism, the visitor numbers started to increase steadily. In 1996 the site attracted 20.000 visitors. Apart from a serious drop in numbers as a result of the civil unrest and the turbulent events in Albania and Balkans during 1997 and 1998, the visitor numbers built up again 23.000 by September 2001. In 2002 visitorship has surpassed 40.000, an increase of about 50% over 2001 and in 2005 visitorship has surpassed 100.000. It has only the last two years that data on the different types of visitor group using the Park has been gathered at its ticket office. Five visitor groups have been identified:

- Independent visitors (domestic)
- School and college groups (domestic),
- Coach parties (domestic),
- Day-trip groups from Corfu (foreign) and
- Independent visitors (foreign).

Each group has different visiting patterns and demands different things from the Park. (Martin 2002). From a careful observation of the percentage of each group against the total number of visitors one noticed that although the visitor number doubled from 2001 to 2002, the rapport of each group with the total number of visitors changed too. It is obvious that the school groups' number increased by less 5% of the total in relation to last year whereas the domestic visitors have increased by 2% more. There is a drop in foreign groups by 2% while, independent foreign visitors as well as undetermined (free) have increased by respectively (1+2) from 2001 to 2002 it still remains the dominating part of the market share. The identification of visitor's types for the WHS of Butrint is an important step towards the shaping and implementation of a strategic marketing plan and a marketing strategy option that the site might adopt in the future. It specifically relates to the process of market research as an initial operation undertaken by the marketing sector of every attraction organization.

<i>Nr.</i>	<i>Visitor Types</i>	<i>% of total visitors (2004)</i>	<i>% of total visitors (2005)</i>
1.	<i>School groups</i>	9	14
2.	<i>Domestic Groups</i>	48	46
3.	<i>Foreign Groups</i>	27	29
4.	<i>Foreign independent</i>	3	2
5.	<i>Undetermined (free)</i>	13	9

Table 2 Visitor types (percentage against the total number of visitors 2004, 2005)

CRITERIA THAT PLACED BUTRINT IN THE WH LIST

Based on the set of criteria provided earlier, the inscription of Butrint in the WH List was made after evaluating the site's assets from an international viewpoint. Therefore, Butrint was inscribed based on cultural criterion that bear a unique or at least exceptional testimony to a cultural tradition or to a civilization which is living or which has disappeared. Butrint has met the second set of criteria too. The archeological and natural resources have met the authenticity and integrity test. Such combination of archaeology and nature has given Butrint "a special spirit of place and authenticity". Although the natural resources have a great value due the remarkable diversity of habitats, the site is not recognized as a priority for conservation action or legislative protection. In response to the requirements of WHC, the preparation of the management plan for Butrint has been the last criterion to be met by the site. It has been written with the assistance of different interest groups and it aims to:

- Preserve the character and qualities of Butrint for future generations.
- Promote sustainable forms of agriculture, educational use and thereby contribute to the regional economy and country.
- Unite the local communities and interest groups involved with the park behind a single program of action.

It would be very narrow to say that Butrint Management Plan was prepared merely as a response to the requirements of the WHC. Its preparation was a necessity dictated by:

- The location of the site in a developing country that during the last decade had been through dramatic changes, and
- The increase of the threats defined as potentially endangering for the long-term survival of the site (and its designation)

These threats are clearly defined in the plan and include the collapse of management and funding structures, regional economic pressure, limited visitor capacity, uncontrolled development and theft. (Martin 2001)

STRATEGIC MARKETING PLAN FOR THE WHS OF BUTRINT

The following part of this section consists of the preparation of a long-term strategic marketing plan for the WHS of Butrint based on the information available. The whole process goes through the stages explained earlier in the research. The plan prepared is used as the subject around which in-depth interviews are developed and the primary information is collected.

IDENTIFYING THE NEEDS FOR THE ADOPTION OF A STRATEGIC MARKETING PLAN FOR THE WHS OF BUTRINT – AN ENVIRONMENTAL ANALYSIS

Among fifteen important objectives that the site management has identified in its Management Plan it is important to distinguish those of the Regional Development. A prior short-term action for the regional development objectives is the devising of a Marketing Strategy for the region. In fact, a marketing strategy is a tool that helps attractions achieve their goals and objectives set in a long-term strategic marketing plan therefore, the process of devising the marketing strategy remains a crucial phase of this plan and depends on the preparation of such a plan for the WHS of Butrint. However, this should not be considered as the only reason. Observing the site's situation carefully or, conducting an environmental analysis provides a more complete answer that justifies the adoption of the plan for Butrint.

The SWOT analysis prepared for the site helps to identify the main needs for the adoption of a strategic marketing plan for Butrint. Beginning with the analysis of the *external environment*, we must say that the site should not be considered as an isolated unit (attraction) within the region, the external environment has always influenced the developments in the site. During the 10 years, political instability has reigned in the country and the region of Saranda. This has been major generator of threats for the site. While the site itself is being developed slowly, cautiously and sensitively not the same can be said about the southern region of Saranda. There has been an absence of planned and managed urban development and uncontrolled tourism development especially in Ksamili and Saranda region. The development policy for the region intends to generate revenue based on tourism, which increases the dependency of the region on tourism.

There are in fact more opportunities for parallel development of other resources in the region. Under communism, Saranda encompassed a rich agricultural land that gave it district advantages over other districts. State-owned farms and agricultural cooperatives accounted for above 80% of the district's total production and that was heavily supported by the agro processing of the fish, canned food, a salt mine and a manufacturing base consisting primarily on handcrafts and carpet production. This uncontrolled development has brought uncontrolled demographic movements. The situation in Ksamili has been exacerbated by a further unflux of economic refugees from the north of Albania. This has been perceived as a major threat to the preservation of the ecological and archaeological resources of the area. The long isolation of the country from the rest of Europe and the World has cut the site off mass tourism and its negative impacts. At the same time, improvement of infrastructure and communication can bring this threat forward (see app.2).

At the same time the fact that Saranda, therefore Butrint too, is adjacent to well established regional markets, especially. Northern Greek destination such as Corfu and Epirus (inland Greece) with a mixed tourism product contributes to increased competition for the site as an attraction. In long-term a broader development of the Heritage Trail concept as part of a Partnership Programme will reduce this threat. At an organizational level, or else in the internal environment analysis it is important to consider that despite the wealthy resources that the site encompasses within its borders, only a limited number of products are sold for the moment. The valuable contribution of the foreign and national experts in management and marketing issues of the site accompanied by a lack in local capacity building. More specifically, although a local office, responsible for the safeguarding of the Park was created there is still a lack in visitor management skills and tools. This threat has become more evident since the increase in visitor numbers. Despite of the "soft" promoting policy adapted by the Butrint Foundation members at an international level, little has been done at regional and local level. The increase in foreign visitorship emphasizes the high dependency on foreign (mainly Greek) intermediaries

indicating at the same time the lack of local tour operators and of a marketing strategy. Consequently, there is a lack encouraging direct selling or control over the intermediaries.

SETTING THE AIM, GOALS AND OBJECTIVES OF THE STRATEGIC MARKETING PLAN

Prior to setting the aim, goals and objectives it is necessary to stress that they have to be turned in with the principal aims of the site development and management. Butrint Management Plan aims

- To preserve the character and qualities of Butrint for future generations.
- To promote sustainable forms of agricultural, educational use and tourism in and around the Park and thereby contribute to the regional economy and the community.
- To unite the local communities and interest groups involved with the park behind a single programme of action.
- To meet the needs of the existing visitors to the Park and bring the local communities into the process of development, by focusing facilities in their villages.

From the viewpoint of modern (societal) marketing the strategic marketing plan will contribute to a sustainable use of the resources, increased capacity, healthy local economy and happy visitors. Relying on the above aims the mission for the proposed plan can be: Support the development of cultural tourism as a form of sustainable tourism in order to assist in building a socially harmonious local economy.

Main goals that derive from this mission range as follows:

- Increase numbers of cultural visitors in the site.
- Minimize marketing costs by increasing the numbers of repeated visitors.
- Generate income from for the WHS of Butrint and the region.
- Regenerate culture and arts a crucial element that provide competitive advantage.
- Support local initiatives that provide authentic cultural products/experiences.
- Improve the set of communication tools especially interpretation and education.

The above goals can be converted into more detailed objectives that may be:

- Set up a regular daily basis inventory of the site visitors based on ticket counting.
- Involve staff at the entrance (a visitor information unit) aiming to identify the visitor types on basic of motivation, their requirements, their impressions and suggestions.
- Undertake a regional market research in order to identify potential cultural visitors and the product offered by other regional attractions.
- Identify authentic cultural assets (resources) in the surrounding area of Butrint.
- Formulate new products by allocating these assets in culturally unique experiences/products.
- Apply for financial support that would help start any local initiative for the creation of Park's exclusive products or services (i.e. souvenir productions with Park's logo, etc).
- Design a variety of locally based tours that would include a night stay in local houses.

- Increase the number of cultural tourists at the site through the promotion of these cultural experiences/products (i.e. local events celebrated in the area) within and out of the park area especially to potential domestic market.
- Improve the use of communication tools that could reach targeted cultural customers (i.e. marketing, education, interpretation).
- Use communication tools for the locals, looking at them as important recipient and transmitters of these messages.
- Increase the awareness of the locals about the cultural and natural wealth and uniqueness of the area.

The reasons of choosing cultural tourism for Butrint are many however, among the most important we can mention:

1. Cultural tourism is experiencing an upward trend worldwide. Of all tourist trips 37% accounts for cultural tourism and the demand is growing by 15% tourist trips per annum. So about 70% of all Americans traveling to Europe seek a cultural heritage experience.
2. The WHS of Butrint would prove successful in this market due to its cultural wealth varying from well-presented archaeological remains proving that the site has been alive for over 2000 years with a history that stretches from Hellenistic and Roman periods through Byzantine and Venetian to the time of Ali Pasha. The area encompasses Ancient, Ottoman, Communist history, transition to democracy as well as historical figures and travelers (i.e. lord Byron, Edward Lear, Ali Pasha etc) to traditional culture of the villages in the surrounding area of the site especially villages along the south and eastern border of the WHS of Butrint, which are older and distinguish on basis of authenticity and cultural identify. These villages are considered a potential support for a traditional village-based cultural tourism (i.e. producing handicrafts, offering traditional lodging, developing mini folkloric festivals etc).

However, the possession of the assets is not enough. It requires organized efforts made by professional people to recognize the cultural visitors and their requirements, design the appropriate products (experiences) that meet these requirements and approach them using the most efficient communication tools.

DEVISING THE MARKETING STRATEGY MODEL

In a customer led marketing area knowing more about the customers (visitors) helps market sites more efficiently.

The above aim, goals and objectives chosen in harmony with the wider goals and objectives of Butrint dictate at the same time the adoption of this strategic option. The marketing strategy option proposed will not aim at selling the site products (activities) but will try to approach 'niche' markets proactively by using special products that will meet demands of global tourists search for the authentic experience.

Therefore, this strategy will develop in three main directions:

- Identify market segments among the existing visitors at Butrint that are motivated by culture in their traveling decisions.

- Create unique cultural experiences by integrating products and services based on local resources that would provide Butrint a competitive advantage as a cultural destination in the Mediterranean.
- Prepare an educational and interpretative set of communication tools that would help the site promote its activities towards the targeted visitors and at the same time improve awareness of the locals.

It is clear that the strategic option selected involved the locals in the implementation process not only by appreciating the products they offer but, considering them an important target where to the management can send its messages, be they of conservational or promoting nature in relation to Butrint properties. Therefore, a major conclusion drawn at this point is that the implementation of the strategy will heavily depend on two very important elements of the mix, promotion and people.

WHY A VISITOR-LED STRATEGY?

The changing nature of customers has placed increased demand upon destinations. The new tourist is no longer satisfied with a passive experience. He is seeking instead authenticity at destinations with a view to understanding the indigenous culture, history and environment, how local people live and work. Such a strategic option for the WHS of Butrint not only considers the trends in the successful management of the site but also encourages the involvement of visitors and locals in the process of product formulation and delivery.

As said above the marketing strategy chosen does not aim primarily at selling Butrint or its products/experiences to visitors but formulate a product after having discovered what visitors would like to experience through it.

Cultural tourists defined as people that intend to visit a cultural tourism attraction; art gallery; museum or historic site; attend a performance or festival; or participate in a wide range of other activities at any time during the trip; regardless of their main reason of traveling (Mc Kercher 2002), has nowadays become the focal segment for many attractions. Although the WHS of Butrint may attract culturally motivated visitors due to the possession of the necessary resources, this is not enough to develop cultural tourism at the site successfully.

The reasons of adopting a proactive visitors led strategy are many however, it is worth mentioning the fact that:

- The development of high prestige cultural tourism can be only achieved by maintaining a highly satisfactory visitor experience.
- The competition in the marketplace is won only after choosing the right ways of approaching the visitors.
- Less price sensitive segment require a special experience and this is initially achieved by the adoption of a visitors led strategic approach which if successful provides high income levels; increased awareness about preservation and conservation; repeated visits and once defined this visitors are easily targeted therefore the marketing cost for this market reduces.

Concentration of the management efforts in the specific strategic direction will certainly prove more productive and will help coordinate their actions.

THE CRITERIA OF EVALUATING THE IMPLEMENTATION OF THE STRATEGIC MARKETING PLAN FOR THE MANAGEMENT OF THE WHS OF BUTRINT

It is important to understand that the implementation of the long-term plan will be made only after converting it in short tactical one-year plans each of them will fulfill some of the goals and objectives set earlier. However, management should not start immediately implementing it. Even in cases when the management is convinced that the plan provides the way to success, there is still a very important phase to be considered, that of the evaluation of the implementation of this plan. Within this frame, a set of criteria on basis of which each attraction makes the evaluation is set. In the case of Butrint it would be recommendable to make this assessment by looking at main constraints and implications that derive from the resources needed to implement the strategic marketing plan.

As with any other organization, these resources are divided in financial, human and physical and are related to the organizational performance of Butrint. However, the management considers other criteria related to the external environment. One of them is the flexibility of the plan to adapt to sudden changes in the business environment.

Taking the above-motioned criteria separately we can convert

- The financial resources into the budget available to implement the plan.
- The human resources into the strength and weaknesses of the marketing staff including their training, experience and attitude. It is important to understand that this criterion encompasses staff from all the levels of the managerial hierarchy, marketing managers dealing managers dealing with decision-making and those that deal with day-to-day marketing.
- The physical resources usually consist of the equipment and building required (i.e. visitor information units set in and out of the park area, office, souvenir display units within the site, etc).

The set of criteria is wider than what we offer so as additional ones we can mention:

- The size of WHS of Butrint as an attraction organization.
- The time of the implementation of this plan.
- The actions of competitors.
- Elements of the mix used to implement the strategy selected.

We can explain that the size of the attraction reflects its marketing organization and consequently the performance in terms of implementing e plan. Strategic marketing plans cover a long-term period stretching in a time length of 5 years. These plans usually apply for large attraction organizations. A long-term plan for the management; therefore, the size of the organization and the timescale of the plan are important for the evaluation of the implementation of this plan.

External environment criteria are also the actions of competitors as a source of benefits or implications for this plan.

Other elements of the mix such as price, product, promotion etc, are considered in the evaluation process.

CONCLUSIONS

Albania as a country that has recently opened to the world is considering tourism an important activity that will contribute to the country's reconstruction. In this frame, Albanian heritage has been projected as an integral part of the country's reconstruction. Butrint is considered the most important among other attractions of Albania and its values have been recognized in a national and international level.

Apart from the political instability that the country has experienced during the last decade, Butrint has attracted a dominant number of visitors compared to the total of visitors that have entered Albania. This was dedicated to the cultural and natural resources that gave the site a series of designations, its favorable geographic location and the job done to project it in the marketplace.

The designations mentioned carry as many responsibilities for the management of Butrint, as prestige for the site. One of the primary needs that derive from this point is the formulation of a management plan that will guide the sustainable development of the Butrint. Consequently, the preparation of strategic plans for all the management aspects will be the next step toward success for the site. The Strategic Marketing Plan presented in our case carries the mission, goals and objectives for the marketing management of Butrint.

Although the plan may be well prepared, that is, its mission goals and objectives may be chosen in harmony with the main objectives of the site, an environmental analysis may have been conducted, a marketing strategy may have been selected, a monitoring system may have been installed, there is still a very important phase that the management always considers. This phase is the assessment of the implementation of this plan made by the management of attractions prior to adopting it. This paper provides the assessment criteria that are used in these cases usually divided in criteria related to the sites as organizations and criteria related to their external environment.

On basis of these criteria, I have structured the interviews conducted with the management of Butrint as well as other experts in the field, in order to collect the required information.

Albania must be sold on international markets as Albania. Albania does not have strong enough assets for its central marketing position to be either geographically – based (South versus North coast) or thematically –based alone (cultural monuments, etc).

Albania's core (primary) tourism product must be a general one that encourages visitors to discover the many facets of Albania's culture.

A RESOURCE-BASED VIEW THEORY OF THE NATION BASED ON THE RESOURCE SEEKING ACTIVITIES IN THE OIL INDUSTRY

George, Suresh¹; Gomes, Emanuel¹; Donnelly, Tom¹; Blanas, George²

¹Coventry University, UK

²TEI Larissa, Greece

INTRODUCTION

This is a work in progress and part of a research that attempts to evaluate the resource seeking activities of oil consumer nations in targeted oil producer nations and correlate these activities into a broader theme of a resource based view of the nation.

We attempt to view these activities of nations from three different lenses: the first is from the traditional views on International Business and the national competitiveness; the second is from the resource-based view theory of strategic management and thirdly, we look at the geopolitical strategies of nations seeking energy security. By integrating these three theoretical strands, we intend to provide an integrated approach that will help businesses understand how the political strategies of a few nations seeking to control and manage the supply and deployment of resources either as 'resource owners, or 'resource seekers', affects the wider world of politics and global business.

History has shown that nations have for ages competed to control 'resources'. This can be done through the process of creating colonies as in the case of Britain and other western European powers or by the more recent and subtle form of 'neo-globalisation'. Nations like the US have used military capabilities to control resources as seen in Iraq while others like the oil producer nations have used reserves of sovereign funds to buy into assets in other countries. A common strand among these nations is the need to secure resources or to ensure that existing resources or capabilities remain sustainable sources of advantage for the future as well.

The oil industry on which this research focuses has been the scene in the recent past for several of these nation specific and resource driven strategic tactics. A survey of media reports has yielded support for this perspective, showing energy hungry countries seeking to parley with pariah nations like Sudan and Iran in return for supply of Crude oil, leading the researchers to assume that there was potential in exploring this aspect of Business. A very recent occurrence has been the use of Military force by Russia to ensure that control of the Caspian Sea pipeline remained within Russia as well as the well documented War in Iraq. Another addition has been the release of a Libyan national to serve the wider interests of British business interests in Libya.

The research aims to demonstrate how nations aim to expand their national competitive advantage by actively and selectively building their national resource base, using sovereign funds and heavy subsidies to motivate and facilitate the international expansion of their domestic firms at the expense of other competitors. Our findings are expected to be integrated into a new integrative framework that will help to understand why some nations behave as firms or a 'resource based view of the nation' as an extension to the 'resource based view of the firm'

This paper specifically looks at the energy seeking activities of India and China, two of the world biggest consumers as well as its largest economies. The focus on the oil industry is meant to narrow down the scope of the study as well to be able to collect sufficient data since oil has emerged as one of the most valuable resources, nations are trying to secure in order to strengthen their economic and geopolitical sphere of influence

We feel that with nations like India and China emerging as large consumers of Oil and rivalling the demand of historical consuming economies like western Europe, the US and Japan, it seems quite logical to study the resource driven business strategies of oil consuming nations and the investment by Oil producers in strategic economies of which some are effectively net oil consumers.

THE OIL INDUSTRY AS A FOCAL POINT FOR THE RESEARCH

The Oil industry is taken as a central focus as it sustains global economy, supplies over 35% of the total energy demand of the world and is also heavily globalised with over 60% of the production being traded in International markets (Gupta, 2008). It is also a fertile ground to test the propositions as producer nations earn sufficient budget surplus that are deployed in other nations as 'resource seeking' FDI as most producer nations lack economies that can support infusions of these budget surplus.

We use here the argument of Barney(1997) 'Do a firm's resources and capabilities add value by enabling it exploit opportunities and/or neutralize threats', to the oil industry and substitute the unit of consideration as the 'nation' instead of the 'firm'. Considering oil price fluctuations and the clamour for alternative fuels, Oil producer nations would need to be looking at creating a more sustained value for their resources in the event that it becomes price sensitive in the future and loses value. One way would be to deploy this monetary advantage of their resource into new emerging economies or by diversifying their investment portfolio across existing nations or diversifying their asset base. In the case of the oil producers, all nations have the same competitive advantage of possessing oil resources and cannot claim an exclusive or an inimitable advantage except perhaps for Saudi Arabia in terms of the sheer volumes of production it controls. In this scenario, we then suggest that these producer nations compete across a wide spectrum of International activities and invest in other nations in a bid to differentiate themselves. Some of this take the form of sovereign fund investments in other oil consumer nations.

Another aspect of our interest in the Oil industry is the unequal distribution of oil resources. North America, Asia-Pacific, and Europe, have only 10% of world's reserves but account for about 78.6% of the demand. Similarly, other producer nations in Middle East, Russia and other former soviet republics and Africa consume only 15.5% of the total world demand, but possess over 81.3% of the total world reserves(Gupta, 2008), making this nations a scene for political and strategic tactics by nations that seek to access their resources. India and China as a result of their growing demand for oil have been seen to engage in a resource driven international trade strategy.

INDIA AND CHINA AS MAJOR 'RESOURCES SEEKERS'

The research attempts to explore the specific actions of India and China within the oil industry as they engage in capability building and developing national competitive advantage. In this approach, the analysis of the data gathered is expected to lead to the formulation of a theory based on the observations of the relationships between the patterns of the activities in specific nations by these nations. A correlation to the geopolitical strategies provide an insight

into understanding the rationale of nations seeking to invest in specific economies apart from the pure economical reasons of FDI in existing literature Dellios (2003).

India and China are amongst the world's biggest consumers of oil and yet are heavily dependent on other nations. China imports about 50% of its requirements and India about 70% making a search for oil resource, of utmost concern to this nations (Khanna, 2007). This has led to energy companies of both countries investing in several nations. Khanna (2007) substantiates his argument that India and China are resource rivals with the following evidences.

- China's economic rise threatens India, which trails its neighbor on almost every conventional socioeconomic indicator.
- Both nations have a growing appetite for natural resources such as oil, coal, and iron ore, for which they compete fiercely.
- Both nations fight for capital, especially for investments by multinational companies from North America, Europe, and Japan
- Between January and October 2005, China's Sinopec and China National Petroleum Corporation (CNPC) and India's Oil and Natural Gas Corporation (ONGC) clashed over purchases of oil assets in other producer nations like Angola, Ecuador, Kazakhstan, Myanmar, Nigeria, and Russia
- China won many contracts in these nations but at a higher price due to India's aggressive bidding wars over the same assets.

Apart from being rivals, India and China are also collaborators in sharing their capabilities in seeking oil resources as the following evidences from Khanna (2007) will show.

- In December 2005, China's CNPC and India ONGC won a bid for a joint 37% stake in Syria's Al Furat Petroleum
- A Joint venture between Sinopec(China) and ONGC(India) won a 50% stake in the Colombian oil company Omimex de Colombia in August 2006.
- In April 2007, ONGC and CNPC agreed to team up to acquire oil assets in Angola and Venezuela

Khanna(2007) suggests a possible reason for this collaboration in Oil procurement was that China was hoping to get preferential bidding rights for infrastructure projects in India leading to the argument that we are witnessing a new era of international business driven by resource seeking.

RESEARCH OBJECTIVES

The specific objectives of the study are as follows:

- To critically analyze the current international strategic business environment in relation to oil production and consumption using information available in the public domain as well as from primary data from key respondents.
- To seek patterns of flow of foreign direct investment and sovereign funds deployment by oil producing countries in selected and targeted oil consuming countries and vice versa.
- To investigate the development of strategic groupings of firms in certain industries in these countries that are related to the oil production and consumption that create or influence entry barriers for other countries into growth areas of world trade.

- To analyse the extent to which a large percentage of the global FDI is politically motivated by oil producer countries seeking to invest in strategic economies to secure their future from threats related to anticipated changes and that recipients of FDI are consuming countries seeking to secure energy security for their needs.

REVIEW OF EXISTING LITERATURE

The Initial review of the existing literature has showed that IB (International Business) and Strategic Management research activities are mostly based on the assumption that firms compete within market conditions where the nature of the industry as well as resource bundles or capabilities of firms create a sustainable advantage. According to Lippman and Rumelt (2003), many theoretical researchers in competitive strategy have remained in standard neoclassical microeconomics. However, Mehra (1996) argues that analysis of competition remains one of the most important aspects of Strategic Management and IB. The market based research focus of strategic management seem to be centred along the industrial economics approach (McWilliams and Smart, 1993), the resources based approach (Penrose, 1959; Barney, 1991; Teece et al., 1997; Armstrong and Shimizu, 2007; Newbert, 2007; Connell, 2008) or the fairly new institutional view (Peng et al., 2008). In the bulk of literature reviewed on the non-market environment, we find that apart from occasional articles in strategy and IB, the majority of most recent research is in the sphere of political or political economic studies (Buckley, 1991; Dahan, 2005; Connell, 2008).

This leads us to infer that existing research has focused on the nature of the firm, the associated industry conditions and the effect of market forces affecting the 'firm'. There has been limited research on the whole 'nation' as a unit of analysis although we have seen studies partly addressing the topic like the work of Porter on the competitive advantages of nations (Porter, 1981), the notion of locational advantage of Dunning (1988), several studies on the competitiveness of industry clusters within nations or the competitive advantage of nations, (Rugman and Verbeke, 2002). In addition, an integrated approach using the schools of thought from both strategic management and political studies seem relevant and this found resonance in the work of Yamakawa et al. (2008) who have called for an integrated view of industry view of firms, the resource based view as well as the role of institutions. The need for further research in this direction has been reiterated by John Dunning at the AIB 2008 Annual Conference in Milan, where he made a call for more research on resource seeking strategies of Nations.

This justifies the rationale for this study, where we attempt to follow an integrative approach to the notion of nations selectively creating and deploying resource-capabilities bundles across borders in order to improve national competitive advantages. We would argue on the lines of Önsel et al. (2008) that the capability of firms to survive in the global markets with a competitive advantage is partly dependent of the role of national institutions and its political and economic actions. In addition, we also consider the Institution based view of Peng et al. (2008) who argue that institutional environments are the focal point for firms seeking sources of competitive advantage. This view is also supported by Connell (2008) who views the government as a major source of firm level competitive advantage.

PROPOSED METHODOLOGY

As mentioned before this is a research in progress. For the scope of this paper we will make use of existing secondary data from media reports, journals and several databases like Lexis Nexis, Reuters and JODI, with the objective to demonstrate that the actions of both India and China in their quest for Energy Security has sufficient elements to prove that nations are

moving towards a resource based approach in building up national competitiveness. Such an approach seems appropriate given that nations are now seen as competitors in international business (Dunning, 1997).

The intended methodology for the overall research is as follows: The underlying idea of the research is to identify whether FDI by oil exporting countries and by oil importing countries are influenced by their resource endowment. From quantitative analysis perspective, this involves first of all clustering the oil exporting countries into different groups that exhibit similar properties. A multivariate cluster analysis technique is deployed in order to identify different clusters. Under the assumption that number of groups is unknown, the researcher proposes clustering using hierarchical method with agglomerative steps. In other words, as a first step each sample point is considered as single cluster and then these clusters are grouped according to the proximity of these clusters.

Once different groups of oil exporting countries are identified, then the next step would entail reducing the number of factors to those that significantly influence the FDI pattern of each cluster. This essentially means using Principal Component Analysis (PCA) to reduce the dimension without compromising much on the variability of the data. The choice over here is whether the researcher uses neural networking technique (NN) for PCA or not. Whilst the NN has advantage of better out of sample performance, the restriction of larger sample size in order to ensure that the networks are well trained and therefore results are not biased would influence the decision of deploying NN or not. Finally, after having identified the variables that significantly influence the behaviour of Oil Exporting countries, the researcher finally would perform the regression analysis to verify the hypothesis that a large percentage of global FDI is motivated by oil producer countries to secure their future from threats related to anticipated changes. However, since the researcher hypothesises that the recipients of FDI are consuming countries seeking to secure energy security needs, it would be worthwhile to verify the factors influencing the oil importing countries simultaneously. Consequently, the researcher at this stage is in favour of deploying Simultaneous Equation Model as opposed to Single Equation Model. Further, in order to check the sanctity of clustering technique, the researcher proposes to first run the simultaneous equation models for different clusters and then run for the pooled data. Alternatively the researcher could run a single set of simultaneous equation model with further dummy variables in order to distinguish between different clusters of countries.

THE POTENTIAL CONTRIBUTION TO KNOWLEDGE FROM THIS RESEARCH

The thesis aims to provide an insight into the body of knowledge within the the resources driven approach of nations. It is hoped that this focus would conceptualise and develop an academic view of a global business environment driven by the market influencing mechanisms of resource seeking nations along with that of resource owning nations within the confines of two broad areas of management research; International Business and Strategy.

There are differing views on how to view each of the aspects that affect a firm. The industry based view of the firm based on the Industrial Economics (IO) approach, (Porter, 1981) which argues that Industry conditions acts upon the performance of a firm. The Industry view looks at more external aspects of the factors that affects a firm while or the Resource Based view that argues that it is the resources bundles or combinations of resources that create competitive advantage (Barney, 1991, Teece et al., 1997). In addition, there is a growing momentum for the Institution based view that looks at institutional environments as the focal point for firms sources of competitive advantage. A significant contribution here is the work of (Peng et al., 2008) who argue that an institution based view of International Business has arrived and calls it,

the third leg of the tripod of strategy, the first being Industry View and the second resources based view. To this can be added, the views of (Connell, 2008) who views the Government as a major source of firm level advantage.

International Business with its emphasis on international trade, patterns of FDI flow, the role of MNCs and Transnational Companies as well as the role of the Business Environment has also concentrated in using the firm as the unit of analysis instead of the nation although there are sufficient studies on the factor endowments of a nation as well as the role FDI plays on country competitiveness

In International Business, a review of the literature has shown a dearth of information on the Empirical support for the notion that International Business Strategies are affected by political resource driven strategies of nations and there is the perception that most of the knowledge available has been compartmentalised with individual silos from where there is a lack of cross pollination which is necessary for an integrated approach to global business strategies. Politics and its effects on International Business still suffer from being under researched although Politics has generated vast amounts of information form Political Scientists. Given that in today's world, we are closer to understanding and acting upon information of the effects of this kind information on Global Business Environment, It is felt that we need to integrate both stream of knowledge. Figure 1 below is an attempt to illustrate that.

Although Research in international business has more focus on the political aspects than Strategic Management with some studies explaining the role of Government as a variable that influences International business strategies, it still considered to be a growing body of research(Boddewyn and Brewer, 1994).The interest in the External Political environment has been of little interest to academics when compared to that of internal organizational politics. These authors also quote the fact that other social sciences have well researched politics and its effects especially the works of (Epstein, 1980, Keim, 1988) and that the application of this information to IB theory is limited.

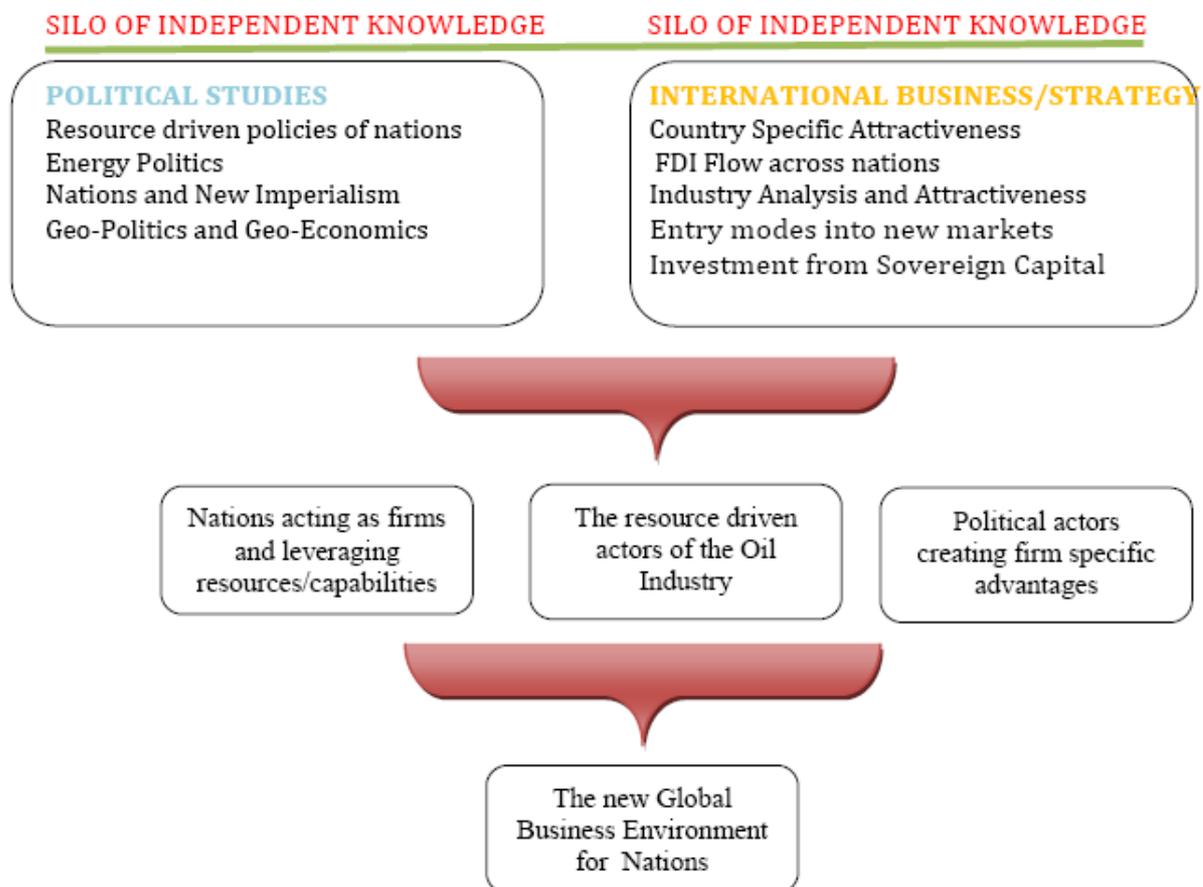

Figure 1. Showing the Compartmentalisation of Knowledge in relation to the Political Strategies of Nations

CONCLUSIONS

In this view, we hope that our results will help in better understanding government and policy decisions in the areas of International Trade and Business. The analysis from the findings would be useful to MNCs or TNCs that seek to understand the implications of institutional actors on international expansion as well as market entry strategies into specific countries and industries where a resource based political alignment is seen to play an important role.

This paper¹¹⁵ focuses on integrating theories of individual differences in information processing within the context of eCommerce Web-sites. Accordingly, a design of a human factors' ontology has been proposed, called UPPC (User Perceptual Preference Characteristics), and could be used in any Web-based application for returning an optimized adaptive result to the user. An existing commercial Web-site was filtered through an adaptive mechanism based on that ontology. This mechanism is described by a proposed Web browser extension set of custom xml tags for the imminent automatic transformation and enhancement of the Web-based content. The expected impact of the content reconstruction lies in the increase of users' satisfaction and efficiency of information processing (both in terms of accuracy and task completion time), while users navigating in the personalized condition rather than the original one.

INTRODUCTION

Advances in Web-based oriented technologies and services are taking place with a considerable speed around the world. As communications and IT usage become an integral part of many people's lives and the available products and services become more varied and sophisticated, users expect to be able to personalize a service to meet their individual needs and preferences.

Due to the heterogeneous users' needs and requirements, user profiling could be considered as a successful step towards the identification and collection of users' preferences. However, there are some crucial issues that should be further investigated and analyzed, such as whether user profiles could nowadays be considered complete, and more extensively whether all the vital parameters of users' characteristics are taken into account in order for the Web-based systems to provide users with the most user-centric result.

In recent years, there has been a rapid growth in research and experiments that work on personalizing computer-mediated platforms, according to user needs and indeed, the challenges ranging in this area are not few. In this respect, an objective is to design an expressive ontology that is composed of human factors that can be used in any hypertext

¹¹⁵ *The project is co-funded by the EU project CONET (INFSO-ICT-224053) and by the Cyprus Research Foundation under the project MELCO (TPE/OP120/0308 (BIE)/14).*

computer-mediated application. Based on that ontology, engineers will design and develop personalized and adaptive interfaces. This will enable easy access to any content while being sufficiently flexible to handle changes in users' context, perception and available resources, optimizing the content delivery while increasing their comprehension capabilities and satisfaction.

Therefore, this paper describes a human factors' ontology, called UPPC (User Perceptual Preference Characteristics) that could be used in any hypertext computer-mediated application for returning an optimized adaptive result to the user. It further analyzes the main intrinsic users' characteristics like visual and cognitive processing parameters that together tend to give the most optimized, adapted and personalized result. In the remainder of the paper an adaptation paradigm of an existing commercial Web-site is presented. The Web-site's content was filtered through an adaptive mechanism based on the UPPC Ontology. This mechanism is described by a proposed Web browser extension set of custom xml tags for the imminent dynamic transformation and enhancement of the Web-based content. An evaluation of the expected impact of the content reconstruction concludes the paper.

PROPOSING A HUMAN FACTORS ONTOLOGY

The proposed human factors ontology is based on the theoretical conceptualization of a comprehensive model in the field of Web personalization and adaptation, which integrates cognitive parameters and attempts to apply them on a Web-based environment. The particular cognitive concepts have already been proposed by the authors and positively evaluated in the information space (Germanakos et al., 2007, Germanakos et al., 2008). This ontology consists of an optimized series of these parameters and tends to further enhance the current user profiles (considered the main filtering elements for Web personalization systems), that could be used in any hypertext computer-mediated platform in order to return a more enhanced user-centric result by reconstructing (adapting) any content coming from the provider.

Our purpose is to improve learning performance in terms of information assimilation and comprehension capabilities and, most importantly, to personalize Web content to users' needs and preferences, eradicating known difficulties that occur in traditional methods. Such an approach may be proved to be very useful in assisting and facilitating a user to understand better Web content and therefore increase his / her satisfaction and navigation performance.

Theoretical Implications of the UPPC Ontology

The theoretical implications of the proposed ontology constitute an enhancement / component of the user profile, called User Perceptual Preference Characteristics (UPPC). The UPPC theoretical model formulates a three-dimensional approach to the problem of building a user profile determining these mental, cognitive and emotional factors that take place throughout the whole process of accepting an object of perception (stimulus) until the comprehensive response to it (Germanakos et al., 2008). The first dimension investigates users' cognitive style, the second their visual and cognitive processing efficiency, while the third captures their emotional processing during the interaction process with the information space (Germanakos et al., 2007).

For the scope of this paper, only the cognitive styles and the working memory span of the UPPC model are considered. Our primary objective is to identify the main impact of these characteristics in the information space, and specific content meta-characteristics, and to give a semantic description of these dimensions in the UPPC theoretical model utilized by the proposed ontology.

Cognitive styles represent an individual's typical or habitual mode of problem solving, thinking, perceiving or remembering, and "are considered to be trait-like, relatively stable characteristics of individuals, whereas learning strategies are more state-driven..." (McKay, 2003). Among the proposed cognitive style typologies (Cassidy, 2004) we favor Riding's Cognitive Style Analysis (Riding, 2001), because we consider that its implications can be mapped on the information space more precisely, since it is consisted of two distinct scales that respond to different aspects of the Web. The Imager / Verbalizer axis affects the way information is presented, whilst the Wholist / Analyst dimension is relevant to the structure of the information and the navigational path of the user. Moreover, it is a very inclusive theory that is derived from a number of pre-existing theories that were recapitulated into these two axes.

Working memory span refers to the processes that enable a person to hold information in an active state while integrating it with other information until the current problem is solved.

We measure each individual's ability to perform working memory tasks based on the Visio spatial sketch pad sub-component (Baddeley, 1992), since all information in the Web is mainly visual.

The UPPC Ontology

Based on the abovementioned considerations, findings and the described cognitive characteristics we hereafter depict (Fig. 1) at a high level point of view the UPPC ontology that uses the main elements of the human factors conceptualization.

The main uses of this ontology are: 1) to enable consistent implementation (and interoperation) of all hypertext computer-mediated systems that use human factors as their main filtering element, based on a shared background vocabulary, and 2) to play the role of a domain ontology that encompasses the core human factors elements for hypertext computer-mediated systems and that can be extended by any other individual or group.

The semantics behind the ontology (Fig. 1) are depicted in Table 1. The user entity in the ontology (Fig. 1) is the main entity. Specializations of the user are the Cognitive Styles and the Working Memory.

<i>Ontology figures</i>	<i>Semantics</i>
	<i>Entity / Class</i>
	<i>Specialization</i>
	<i>Binary relation</i>
	<i>Total constraint (at least one)</i>
	<i>Mandatory constraint</i>
<i>{ n }</i>	<i>Value constraint</i>

Table 1. Semantics of the Ontology

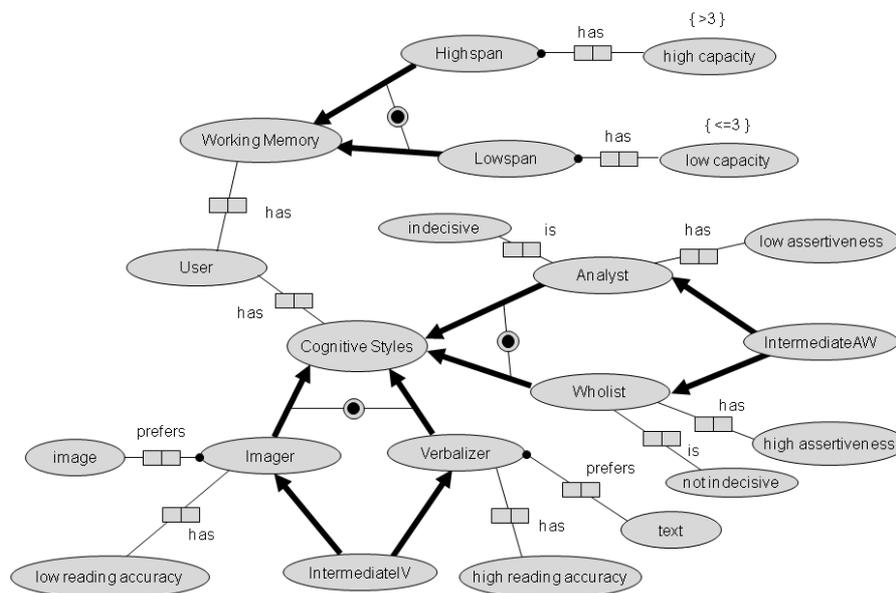

Fig. 1. User Perceptual Preference Characteristics Ontology (represented using the ORM graphical notation (Lukichev and Jarrar, 2009))

Cognitive Styles is distinguished between Imager, Verbalizer, Wholist and Analyst. The Imager prefers image and has low reading accuracy. On the other hand, the Verbalizer prefers text and has high reading accuracy. The Analyst has low assertiveness and is indecisive. The Wholist has high assertiveness and is not indecisive.

Working Memory is distinguished between Highspan and Lowspan. The Highspan and the Lowspan entity have high and low working memory span capacity, respectively.

Even though the evaluation of the UPPC ontology's concept in the eCommerce domain, described in section 5, is really encouraging for the validity and integrity of the relation within and between these cognitive dimensions and their effective impact in the information space, this ontology can only be considered as a proposal. Main goal is to initiate and drive this research to a concrete human factors ontology that can be used in any hypertext computer-mediated system enhancing one-to-one services delivery based on an efficient user-centric dynamic content reconstruction (adaptation).

WEB CONTENT TRANSFORMATION BASED ON THE UPPC ONTOLOGY

As mentioned in previous sections the given UPPC ontology's cognitive dimensions have a specific influence into the information space and to specific structural content meta-characteristics. Based on this impact, we hereafter introduce a method of transforming and adapting Web-based content into users' unique characteristics. The validation and accuracy of the content transformation based in this ontology has been achieved with the use of an innovative Adaptation and Personalization Web-based System, namely, AdaptiveWeb¹¹⁶ that has been developed and positively evaluated in the Web domain (Germanakos et al., 2009).

    <p>250 GB Hard Disk (7200 rpm)</p>
  </csl>
</csl>
```

Fig. 2. Sample code extension with the new <csl> tag

The proposed methodological approach is related to the mapping process mechanism (that is, rules responsible for the content's transformation based on the correlation of the cognitive implications and the actual raw (provider's) data) and the imminent adaptation of any content based on the specific human factors, that is in the particular case the cognitive styles and working memory.

Web Browser Extension

A suggested precondition for the mapping process to work properly at this stage is to extend the well known html model with a new set of tags; <csl> (cognitive style list) and <cslitem> (cognitive style list item). A Web Browser (Mozilla Firefox) Extension has been therefore developed in order for the browser to recognize and implement the set of tags. Fig 2 shows a sample code that is extended with the new set of tags.

This set of custom xml tags is interpreted by the Web browser extension for reconstructing a given Web content when mapped with a user's cognitive factors.

¹¹⁶ See <http://www3.cs.ucy.ac.cy/adaptiveWeb>

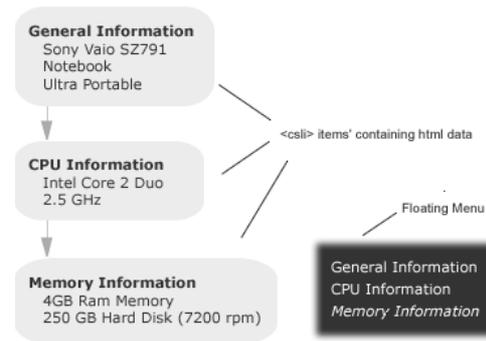

Fig. 3a. Browser content interpretation based on user's profile (Wholist / Imager)

Based on the sample code depicted in Fig. 2, the corresponding browser's extension interpretation and content presentation is shown in Fig. 3a and 3b.

In case a user is a Wholist / Imager (with regards to his cognitive style – see Fig. 3a), the browser will enhance each `<csli>` item, along with its containing data, with a diagram box (Imager) and will also create a floating menu (Wholist) that contains each `<csli>` item's name so to help the user navigate through the items by clicking on the corresponding link.

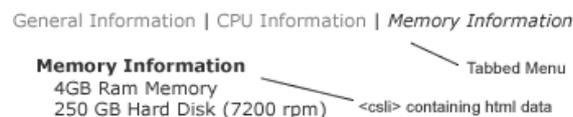

Fig. 3b. Browser content interpretation based on user's profile (Analyst / Verbalizer)

In Figure 3b, the user happens to be an Analyst / Verbalizer. In this case, the browser shows the `<csli>` item's containing data in a textual form (Verbalizer) and will also enhance the Web-page with a tabbed menu for each `<csli>` item (Analyst). Each time the user clicks on a link of the tabbed menu, the corresponding data of the `<csli>` item is shown on the Web-page.

Mapping the `<csli>` tag with the User's Cognitive Characteristics

Our main goal in this section is to show in a more detail how the web browser extension interprets the `<csli>` tag and adapts the containing information based on the user's profile and consequently the abovementioned cognitive factors. The adaptation process involves the transformation and / or enhancement of a given raw Web-based content (provider's original content) based on the impact the specific human factors have on the information space (Germanakos et al., 2009, Germanakos et al., 2008) (i.e., show a more diagrammatical representation of the content in case of an Imager user, as well as provide the user with extra navigation support tools). Fig. 4 shows the possible Web content transformations / enhancements based on the mapping process that take place during adaptation process, the influence of the human factors and the theory of individual differences.

According to Fig. 4, the meta-characteristics of a user profile are deterministic (at most 3); Imager or Verbalizer, Analyst or Wholist and Working Memory level (considered only when low).

For a better understanding, a user that happens to be an Imager gets as mentioned above a diagrammatical representation of the containing information of the `<csli>` tag. The `<csli>` tag is used by the web browser extension to distinguish the logical meaning of a sentence when

creating the diagrammatical representation. In other words, the <csl> tag is used for a new paragraph sentence in the <csl> division. As we will see later, the <csl> tag is interpreted differently by the browser when the user types change. On the other hand, when a user is a Verbalizer (prefers text instead of diagrammatical representations), no changes are made to the containing custom xml tags of <csl>.

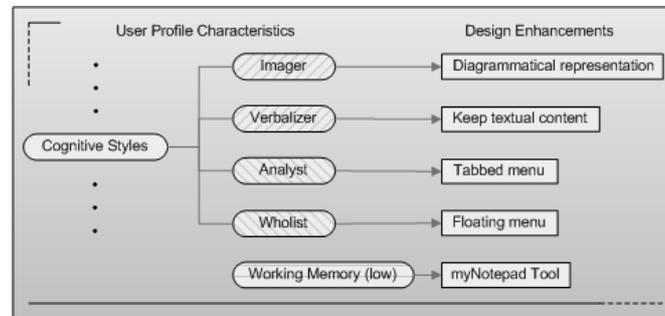

Fig. 4. Web design enhancements / transformations

Furthermore, if a user is an Analyst, the information will be enriched with a tabbed menu to be easier accessible. The menu will consist of the <csl> element's containing <csl> tags. The <csl> tags along with the "name" attribute (see Fig. 2) are used in this case to create the tabbed menu with the name of each <csl> element comprising an item of the menu. Each <csl> element is added to the tabbed menu and is used as a dynamic link to the containing information of the particular tag. The same logic of transformation is used when mapping the <csl> with a Wholist user. In this case, a dynamic floating menu with anchors is created so to guide the users on specific parts into the content while interacting. Again, the <csl> elements comprise the menu's items.

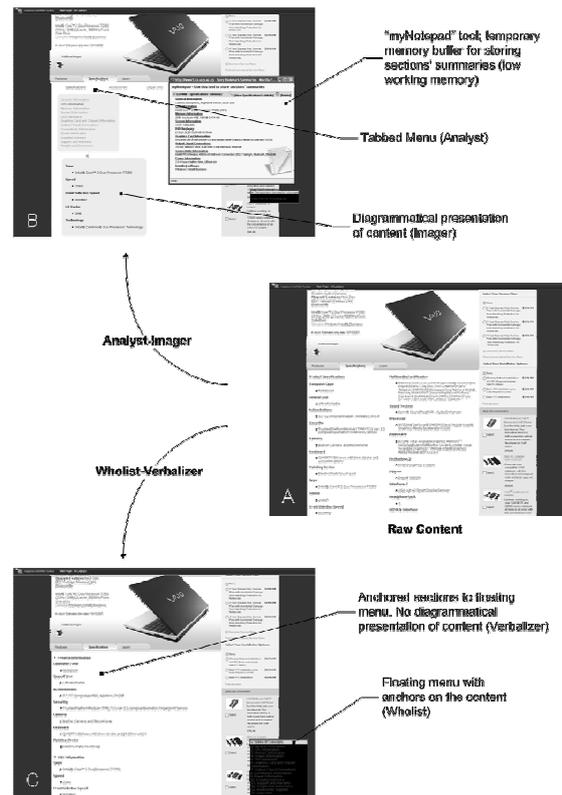

Fig. 5. Content adaptation according to user's comprehensive profile

Finally, when users happen to have a low working memory level, the browser will provide them with the "myNotepad" tool (temporary memory buffer) for storing a section (<csli> element content) of the page and keep active information that is interested in until the completion of a cognitive task at hand.

An eCommerce Adaptation Paradigm

We have designed and authored an experimental environment in the application field of eCommerce using the <csl> tags. The eCommerce (Web) environment that has been developed used the design and information content of an existing commercial Web-site of Sony¹¹⁷. This Web-site provides products' specifications of the Sony Company. We have developed an exact replica of the Sony Notebooks' section in sonystyle.com using the <csl> tags. Fig. 5a depicts the Sony Web-site without any personalization made, while Fig. 5b and Fig. 5c shows the same Web-site after the personalization and adaptation process has been initiated, with the content to be adapted according to the user's comprehensive profile and consequently the UPPC ontology.

As we can easily observe, the original environment has been altered based on rules that define the typologies of the users in terms of content reconstruction and supportive tools. For example, a user might be identified as an "Analyst-Imager" with low working memory and therefore the Web environment during interaction time would be as in Fig. 5b. The information will be presented in a diagrammatic form (imager), will be enriched with menu tabs (analyst) to be easier accessible and with the "myNotepad" tool (temporary memory buffer) for storing sections' summaries (low working memory). In case that a user is identified as "Wholist-Verbalizer" the content will be automatically reconstructed as in Fig.5c, where a floating menu

¹¹⁷ See <http://www.sonystyle.com> (date extracted: September 19, 2007)

with anchors Wholist) have been added so to guide the users on specific parts into the content while interacting. In this case no diagrammatical presentation will be used because the user is a Verbalizer.

EXPERIMENTAL EVALUATION USING AN ECOMMERCE SETTING

The following section overviews the experimental design of Sony and the results that support the notion of personalization in Web-sites using the UPPC ontology as the main influential factor irrespective of the reconstruction mechanism (automatic or predefined).

Methodology and Design Implications

In order to evaluate such an approach a within participants experiment was conducted, seeking out to explore if the personalized condition based on the UPPC ontology serves users better at finding information more accurately and fast.

The number of participants was 89; they all were students from the Universities of Cyprus and Athens and their age varied from 18 to 21, with a mean age of 19. They accessed the Web environments using personal computers located at the laboratories of both universities, divided in groups of approximately 12 participants. Each session lasted about 40 minutes; 20 minutes were required for the user-profiling process, while the remaining time was devoted to navigating in both environments, which were presented sequentially (as soon as they were done with the first environment, the second one was presented).

The content was about a series of Sony Notebooks: general description, technical specifications and additional information were available for each model. We considered that the original (raw) version of the environment was designed without any consideration towards cognitive style preferences, and the amount of information was so high and randomly allocated that could increase the possibility of cognitive overload. The personalized condition addressed these issues by introducing as personalization factors both cognitive style and working memory span. The psychometric materials that were used are the following: i) Cognitive Style: Riding's Cognitive Style Analysis, ii) Working Memory Span: Visuospatial working memory test (Demetriou et al., 1993, Demetriou and Kazi, 2001).

In each condition, users were asked to fulfill three tasks: they actually had to find the necessary information to answer three sequential multiple choice questions that were given to them while navigating. All six questions (three per condition) were about determining which laptop excelled with respect to the prerequisites that were set by each question. There was certainly only one correct answer that was possible to be found relatively easy, in the sense that users were not required to have hardware related knowledge or understanding.

As soon as users finished answering all questions in both conditions, they were presented with a comparative satisfaction questionnaire; users were asked to choose which environment was better (1-5 scale, where 1 means strong preference for environment A and 5 for environment B), regarding usability and user friendliness factors.

The dependent variables that were considered as indicators of differences between the two environments were:

- a) Task accuracy (number of correct answers)
- b) Task completion time
- c) User satisfaction

The within participants design allowed the control of differences and confounding variables amongst users.

Regarding the design implications in this eCommerce setting, the content enhancements and transformation considerations discussed in previous sections regarding users' particular typologies were followed. More specifically, users with low working memory received a "myNotepad" tool that allowed them to make entries of goal-related information

Results

The most robust and interesting finding (Germanakos et al., 2009) was the fact that users in the personalized condition were more accurate in providing the correct answer for each task. The same user in the raw condition had a mean of 1 correct answer, while in the personalized condition the mean rose to 1.9.

Since the distribution was not normal and the paired samples t-test assumptions were not met, Wilcoxon Signed Ranks Test was performed, showing that this difference is statistically significant at zero level of confidence ($Z = -4.755$, $p = 0.000$). This is probably a very encouraging finding, implying that personalization on the basis of these factors (cognitive style and working memory span) benefits users within an eCommerce environment, as long as there are some cognitive functions involved of course (such as information seeking).

Equally interesting is the fact that users in the personalized condition were significantly faster at task completion. The mean aggregated time of answering all three questions was 541 seconds in the raw condition, and 412 in the personalized. A paired samples t-test was performed ($t(88) = 4.668$, $p = 0.000$) demonstrating significance at zero level of confidence. Again, this second dependent variable (time) shows that the personalized environment is more efficient.

As it concerns the satisfaction questionnaire, 31 users leaned towards the personalized environment, 38 had no preference while 20 preferred the raw. This descriptive statistic is merely indicative of whether participants would consciously observe any positive or negative effects of the personalized condition. A considerable percentage leaned towards that condition (or at least users did not seem somehow annoyed by such a restructuring), but overall it cannot be supported that they were fully aware of their increase in performance, as shown by the abovementioned findings.

In sum, the specific experiment shows in a rather clear way that users performed better within the personalized environment, and these findings are statistically very robust. It could be argued of course that there is no way to be fully aware if information processing was more efficient at a deeper level, or users simply found the personalized condition more of their (perhaps unconscious) liking, thus devoting more conscious cognitive effort.

Nevertheless, such an increase in performance, which is consistent to the findings of previously conducted experiments in the field of eLearning (Germanakos et al., 2008), provides support for the further development and application of our UPPC ontology in different Web-based application environments.

CONCLUSIONS

The basic objective of this paper was to present a conceptualization of a human factors ontology, namely UPPC, for hypertext computer-mediated systems. It has been attempted to approach the theoretical considerations and technological parameters that can provide the most

comprehensive user profiling and further supporting the provision of the most apt and optimized user-centered Web-based result.

We further proposed a Web-based content adaptation design methodology according to the ontology's impact into the information space, and described the mechanism that is based on a proposed Web browser extension set of custom xml tags for the imminent automatic transformation and enhancement of the Web-based content. The specific influence and the Web design enhancements and content transformations have been overviewed and positively evaluated in the eCommerce domain.

It was clearly demonstrated that users' information finding was more accurate and efficient, both in terms of providing correct answers to the task questions and in task completion time. These findings reveal that our approach turned out to be initially successful, with a significant impact of the UPPC ontology and the given human factors in the personalization and adaptation procedure of Web-based environments.

Future and emerging trends include a more extensive study on the structure of the metadata coming from the providers' side as well as a fully detailed technical description of the UPPC ontology, implemented and tested in different domains and contexts.

THE ROLE OF PORTFOLIO DIVERSIFICATION IN THE HOTEL INDUSTRY: EVIDENCE FROM THE ITALIAN MARKET

Giannotti, Claudio¹; Mattarocci, Gianluca²; Spinelli, Luca³

¹University LUM Jean Monnet of Casamassima, Ph.D. in Banking and Finance – Laboratory of Real Estate Finance

²(corresponding author), University of Rome “Tor Vergata”, Ph.D. in Banking and Finance – Laboratory of Real Estate Finance

³University of Rome “Tor Vergata”, Ph.D. in Banking and Finance – Laboratory of Real Estate Finance

Keywords: Hotel, GOPPAR, portfolio diversification, efficient frontier, persistence analysis

INTRODUCTION

During the last years, the hotel sector has been interested by an important development mainly in certain Countries, such as Italy, demonstrating a growing ability in obtaining positive results (Jones Lang Lasalle Hotels, 2009).

Studies proposed in literature carried out significant differences in management policies of single hotel investments according to the presence or not of institutional investors (Mooradian and Yang, 2001) and identified different trend in securities issued by hotel chains respect to the overall market (Kim, Gu and Mattila, 2002).

With regards to the portfolio analysis, authors looked prevalently at the advantages for an institutional investor related to the inclusion of hotels in a diversified multi-asset portfolio (Quan, Li and Sehgal, 2002), stressing the main differences of hotels compared to the other real estate investments (Firstenberg, Ross and Zisler, 1988) and highlighting the distinctive features of property cycles for this specific market (Corgel, 2005). Researches on different hotel types were restricted to the performance correlation (Jang and Yu, 2002) and it lacks studies defining some guidelines about the minimum/maximum number of hotels to include in a portfolio and/or criteria to adopt for its composition.

Starting from several studies using the Markowitz's model to identify the best property portfolio composition (Friedman, 1971 among the others), the paper evaluates the advantages and limits deriving from the risk diversification in the hotel investments on the basis of an efficient frontier approach. Therefore, results obtained may complete the performance analysis of an institutional investor in the hotel sector, providing some interesting empirical results useful for the identification of a diversification criterion that allows to maximize the return and/or to minimize the risk exposure.

The paper presents a literature review about the sector/geographic diversification strategies in the hotel investments, analysing the main explanations that can justify the different results achieved by properties with a different destination of use and/or located in different geographical area (section 2). The empirical analysis presents the sample feature in respect to the overall Italian market (section 3.1), determines the methodology on the basis of the characteristics and limits of the available data (section 3.2) and evaluates the results concerning the portfolio with and without minimal diversification constraints (respectively sections 3.3.1 and 3.3.2). The last section summarizes some brief conclusions and implications for hotel chains and institutional investors specialized in this sector (section 4).

The results achieved with the empirical analysis of Italy, one of the most important world market ^[1], prove how the composition of an optimal hotels portfolio is strongly different according to the presence or not of diversification constraints. Unconstrained portfolios are significantly concentrated in some asset classes but, in the time horizon considered, the composition of more efficient portfolios varies significantly. The lower yield for unit of risk assumed of constrained portfolios respect to unconstrained ones could be considered acceptable because results obtained are more persistent over time.

LITERATURE REVIEW

The purpose of a diversification criteria is to select investments that presents dynamics that are not strictly correlated (or better that are negatively correlated) in order to reduce the overall risk of a portfolio. Sectoral and geographic segmentation represents the general principle in diversifying an investment portfolio also in the property market because of the relation between the dynamics of property with same use-destination and located in similar area (McMahan, 1981).

Differences among hotel located in different geographical area are related to (Strano, 2006):

- weather;
- country;
- fashion trend;
- economic trend;
- seasonality.

Mainly with reference to some retail segments and to several kinds of hotel, the demand could be strongly influenced by climatic variable because the serviceability for the customer is partially linked to the coherence of weather conditions in respect of his expectations (Aall and Hsyer, 2005).

The characteristics of the country where the real estate unit is located can influence both risks and results derived from the hotel management: political instability and social problems can make more complex the investment management (Poirer, 1997) while policies adopted to support the hotel industry can reduce the investment risk and/or will lift up profit margins of activity (Hall, 1998).

The demand of hotels located in a specific area may be influenced by irrational components, fashion trend, that modify customers choices (Seaton, 1996) causing anomalous and unexpected changes in investment profitability (Crouch, 1995).

The demand of service provided to customer base is strictly related to the general economic trend and to the trend of the specific are where the hotel is located and profits prospects connected to the hotel activity appear susceptible to the contest conditions change (Canina and Carvell, 2005).

The seasonality is chiefly related to retail customer for which the service demand, for climatic or institutional matters, may vary in times of year. The weather aspect depends, above all, on atmospheric/meteorological conditions (temperature, degree and nature of precipitations, etc...) whereas the institutional component depends on several social rules involving potential clients and able to influence the service demand (religious festivals, holidays, etc...) (Butler, 2001).

The sectoral diversification consider the structure of costs an revenues of different type of hotel assuming that there will be significant differences on the basis of quality of service offered or the type of customers served.

Differentiation on the basis of service quality is important for what concerns cost structure because charges linked to the customers' satisfaction are different in accordance with the complexity of demand satisfied (Younes and Kett, 2007). Standardized models (i.e. star rating) widely spread at international level settle guidelines in classifying various hotels accordingly to the kind of services provided and useful to communicate the target customer of service. (Wang, 2003).

Hotel classifications based on service quality are realized considering general guidelines in the assignment of stars rating but there is not a specific rule to establish the relationship between the characteristics of each service and the final opinion on the hotel (Parrilla, Font and Nadal, 2007).

Classification upon the typology of served customers is based on differences existing in employment rate dynamics, in occupation period, in pricing policies e in overbooking risk between the business customer and the retail one (Baker and Collier, 1999).

Business customer charges service costs to the firm and, therefore, he is more interested in the quality of the service in respect of the price (Vinod, 2004). Other recurring features are the booking for a reduced number of successive nights (usually one) mainly concentrated during midweek days (Wheaterford, 1995) and an heterogeneous pricing dynamics for groups in relation with the nature of the relationship between the hotel manager and the company promoting the event (Steed and Gu, 2005).

For retail customers, instead, the coincidence between the payer of service and the user is preserved and the right management of customers implies the evaluation of satisfaction level related to price and provided services ratio (Noone, Kimes, Renaghan, 2003). Most recurrent features are identifiable in the demand focused above all during week ends, often implying successive nights of stay in the same hotel (Choi and Mattila, 2004) and, even in case of groups, the remarkable sensitivity to price may determine the inability to appreciate service provided (Lewis and Shoemaker, 1997) and/or incentive to use internet in order to compare available offers in similar hotels partly reducing the profit margins of structure (O'Connor, 2003).

Customer classification related to the served segment is very useful estimating income dynamics connected to the hotel even if is not easy to apply such type of classification. In fact notwithstanding the possibility to identify, mainly in the Italian market, certain hotel typologies (B&B and small hotels of low-quality standard) uniquely designed to private customer (Monente, Pozzana and Ballanti, 2007), medium-high standard hotels, located in important cities from an economic view, provide services able to satisfy both business customer and retail ones, so, the classification of hotel for type f classification served is not easy.

EMPIRICAL ANALYSIS

Sample

The analysis considers the Italian market collecting information from Associazione Italiana Catene Alberghiere (AICA) ^[2]. Comparing the available sample with data referred to the entire Italian market, the coverage of available data in terms of number of structures is moderate (mainly for what concerns hotels with a 3 stars quality standard or less) but the sample seems to be enough representative on the basis of revenues of hotels considered (Table 1) .

		AICA	Italy	Ratio between AICA and Italy
Number of Hotels	Overall	265	33,768	0.80%
	*****	25	254	9.84%
	****	204	3950	5.16%
	***	36	17038	0.21%
	**	0	7718	0.00%
	*	0	4808	0.00%
Total Revenues		1,462,728,638.63	22,638,470,580.00	6.46%
Mean revenues for each hotel		5,519,730.71	686,014.26	804.61%
Mean revenues for room available		35,271.97	22,549.02	156.42%

Table 1. Sample characteristics. Source: AICA e Databank data processed by authors (2007)

The size of sample varies over time because the availability on information for AICA linked to the choice of members to provide or not their information to AICA in order to elaborate sector statistics.

For what concerns qualitative characteristics, the sample includes just hotel structures (structures like B&B and holiday camps are excluded) but present a good geographical coverage of main Italian regions and provinces (Figure 1).

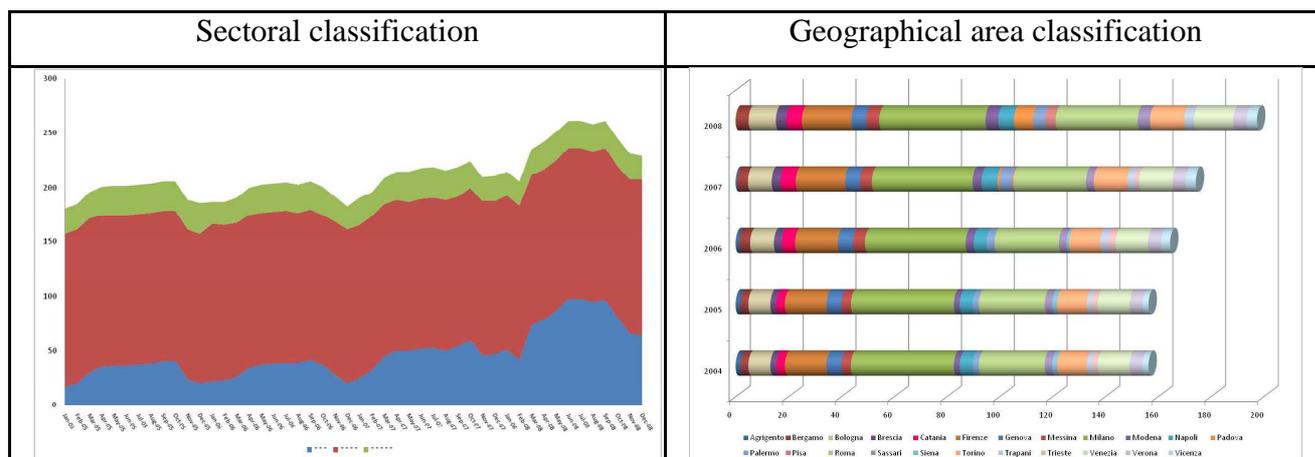

Figure 1. Sample composition classified for sector and geographical area. Source: AICA data processed by authors

In order to estimate benefits due to the investment portfolio diversification, single structures have been combined in homogeneous groups in function of their reference province and of the quality of provided service.

Data referred to mean daily revenue per available room and to mean daily occupation rate for each month have been provided by AICA preserving the anonymity of hotel to whom data were related. Internal accounting of each hotel structure is not available for AICA and data related to costs incurred for the service supply have been, then, taken from the aggregate balance periodically edited by the association (Table 2).

Cost in the balance sheet	Type	Information available				
		2004*	2005	2006	2007	2008**

Notes:
 *Data about “Expenses for leased assets to third parties” and “Other managing expenses” for the 2004 are included in the macro-category “Service expenses”
 ** Data for the 2008 are not available now because the balance sheet are not published. These information are substituted using forecasts realised on the basis of the trend of the last 4 years

Table 2 . Available information on cost structure. Source: AICA data processed by authors

In order to make coherent available cost items and profit items, the equivalent of costs incurred by the hotel per day during each year has been examined. Every cost item has been,

then, classified into fixed or variable category on the basis of their sensitivity to service demand (Graham and Harris, 1999).

On the basis of available data it has been defined the segmentation of costs into fixed and variable by imputing fixed costs to different hotel categories in relation to their structure dimension while variable costs have been imputed just in relation to the rooms occupancy rate. The hypothesis behind to such attribution criterion is that variable component could be managed by establishing the service quality in accordance with the room demand. For what concerns staff cost it was useful to considered it as a semi fixed cost because even if staff cannot be modified during the season, hotel can use seasonal work to minimize such item cost if for a certain period a closing period has been settled (Ball, 1989).

Methodology

The choice of best investment opportunities in hotel sector has been analyzed using a standard financial approach to evaluate financial investments, the efficient frontier (Markowitz, 1952).

On the basis of the literature review, the performance measure for hotel investments is identified as the Gross Operating Profit for Available Room (GOPPAR) (Brown e Dev, 1999), considering only the hotel core-business and excluding from the analysis the profit coming from optional services provided to customer (restaurant, SPA resort, etc..) (Ganchev, 2000). In formulae:

$${}_{t_0} GOPPAR_{t_1} = \frac{1}{n} \sum_{i=0}^n \sum_{t=t_0}^{t_1} (Revenues_{it} - Costs_{it}) \quad (1)$$

where:

${}_{t_0} GOPPAR_{t_1}$ = Gross operating profit per available room during the period between t_0 and t_1 ;

n = total of available rooms;

$Revenues_{it}$ = Revenues from the occupancy of i -th room during the t -th period

$Costs_{it}$ = costs (fixed, semi fixed and variable) referred to the i -th room available in the t -th period.

Data about revenues related to each room are normally available and the estimate is quite objective meanwhile there are some degrees of arbitrariness linked to the evaluation of costs to be considered in the formula.

Literature about the balance analysis of hotels underlined how, due to the strong variability of services demand, the evaluation of economic result could be made only if a detailed internal accounting is available enabling the determination of each type of cost and its relationship with the occupancy room rate (Gigli, 2003).

Disaggregating costs into fixed and variable costs, the evaluator has to presuppose several hypothesis for what concerns some items of cost (staff e.g.) for those who have not a single

literary interpretation of their nature (Modica, 2004). The main problem related to the definition of performance measures also involves the availability of information dataset complete enough to attribute to the single room not only variable costs but fixed costs too and, usually, the choices are strongly bound by data availability (Pellinen, 2003).

To preserve the measure usefulness in comparing different investments it has to be calculated always on the same time period (usually Year-to-Date or Month-to-Date) not excepting closing period of the structure (Ismail, Dalbor and Mills, 2002) and taking into account the total amount of rooms regardless of any possible maintenances responsible of the temporary unavailability of some rooms (Slattery, 2002).

On the basis of the quality of available information, a measure of GOPPAR has been monthly calculated using the following formula:

$$GOPPAR_j^{rs} = \frac{1}{n} \sum_{i=0}^n \sum_{t=t_0}^{t_1} (Revenues_{it}^{rs} - Costs_{it}^{rs}) = {}_{t_0}REVPAR_{t_1}^{rs} - {}_{t_0}\overline{FCPAR}_{t_1}^s - {}_{t_0}\overline{PFCPAR}_{t_1}^s \times {}_{t_0}Season_{t_1} - {}_{t_0}\overline{VCPOR}_{t_1}^s \quad (2)$$

where:

$GOPPAR_j$ = net profit per available room per month j (month starting from t_0 date till t_1 date)

n = total of available rooms;

$Revenues_{it}$ = Revenues from the occupancy of i -th room during the t -th period;

$Costs_{it}$ = costs referred to the i -th room available in the t -th period;

${}_{t_0}REVPAR_{t_1}^{rs}$ = average revenues per day per available room during the t_0 - t_1 month for hotels of a specific category in a specific province;

${}_{t_0}\overline{FCPAR}_{t_1}^s$ = average fixed costs per available room per day of s category hotels from annual aggregate balance of AICA partners;

${}_{t_0}\overline{PFCPAR}_{t_1}^s$ = average semi fixed costs per available room per day of s category hotels from annual aggregate balance of AICA partners;

${}_{t_0}\overline{VCPOR}_{t_1}^s$ = average variable cost per available room per day of s category hotels from annual aggregate balance of AICA partners;

${}_{t_0}Season_{t_1}^{rs}$ = dummy variable embodying value as 1 just in the event that in t_0 - t_1 month the hotel carried out its activity.

Once identified a measure of net profit for each month, the average GOPPAR on a year time period and the standard deviation of monthly GOPPAR for hotels of a certain category located in a specific province have been calculated. In formulae:

$$E(GOPPAR)_{yearly}^{rs} = \frac{1}{12} \sum_{j=1}^{12} GOPPAR_j^{rs} \quad (3)$$

$$\sigma(GOPPAR)_{yearly}^{rs} = \frac{1}{12} \sqrt{\sum_{j=1}^{12} [GOPPAR_j^{rs} - E(GOPPAR)_{yearly}^{rs}]^2} \quad (4)$$

Measures of mean yield and risk metrics are used in order to construct yearly efficient frontiers in order to estimate benefits in terms of risk-return of trade-off deriving from the construction of diversified portfolios compared to the investment focused on a single asset class and to evaluate the relative weight of each investment.

The analysis has been repeated every year to control if characteristics of different asset classes have changed during the 5 years taken into account (2004-2008) and to estimate, using a persistence analysis, if investment strategies realized during the t-n year are the best solution of investment just referred to an annual period or are a good solution also for wider periods where is not possible to rebalance the portfolio at the end of the year. Persistence is an especially aimed feature for hotel investments, and in general for any direct property investment, since the assumption regarding the possibility of modifying the investment strategy during the brief period is strongly less acceptable compared with the same hypothesis made for financial investments (Seiler, Webb and Myer, 1999). In order to study the persistence of performance over the time, have been computed those results which should have been achieved by portfolios on frontiers for years subsequent to the estimated year and it has been calculated the differential between the yield and the risk of new portfolios and portfolios entered in the efficient frontiers built on the basis of estimated year. In formulae for each portfolio the distance is computed as follows:

$$d_i(P_t^*, P_{t-i}^*) = \sqrt{\left(E(GOPPAR)_t^{P_t^*} - E(GOPPAR)_t^{P_{t-i}^*}\right)^2 + \left(\sigma(GOPPAR)_t^{P_t^*} - \sigma(GOPPAR)_t^{P_{t-i}^*}\right)^2} \quad (5)$$

where:

$d_i(P_t^*, P_{t-i}^*)$ = distance between frontier portfolios identified at t and t-i time ;

$E(GOPPAR)_t^{P_{t-i}^*}$ = mean GOPPAR over t year of efficient portfolios identified on time t-i with $i \in [0,4]$;

$\sigma(GOPPAR)_t^{P_{t-i}^*}$ = standard deviation of GOPPAR over t year of efficient portfolios identified on time t-i with $i \in [0,4]$.

Such data have then been summarized by several descriptive statistics to estimate the average, maximum and minimum persistence of every considered portfolios.

The last research took into account the possibility to impose maximum concentration limits on portfolio in order to evaluate if increasing the diversification level through an ex-ante determination of limits will significantly influence the investment risk and revenue profile and if eventually benefits/losses coming from limits of diversification will be more or less balanced

by a major/minor performance persistence. Data on Italian institutional investors specialized in hotel sector exhibit the concentration level, estimated as the inverse of the number of assets in the portfolio, is never higher than 50%^[3]. The analysis of the limits of diversification effect has been realized considering efficient frontiers with different concentration limits (between 0% and 50%) and using integral calculus to measure the lower risk-return trade-off related to the definition of limits with a wide range of diversification. In formulae:

$$\int_{\min \sigma(GOPPAR)}^{\max \sigma(GOPPAR)} EF_{constrained} \partial(\sigma(GOPPAR)) \quad (6)$$

Once having established the area for the different levels of imposed limit, the sacrifice has been estimated through a comparison between areas under different curves by the study of single hotel investments not dominated anymore further to the imposition of maximum concentration limit. The study of constrained frontiers characteristics has been completed by replicating the analysis of persistence proposed for unconstrained frontier in order to valuate if the imposition of limits may determine effects not only for what concerns revenue/risk of efficient portfolio but also on performance persistence over the time.

Results

Unconstrained efficient frontier

Through a standard optimization form it has been constructed the efficient frontier referred to property investment starting from data related to the mean and standard deviation of GOPPAR during observed years. For the optimizer the efficient frontier was traced identifying 100 representative portfolios (Figure 2).

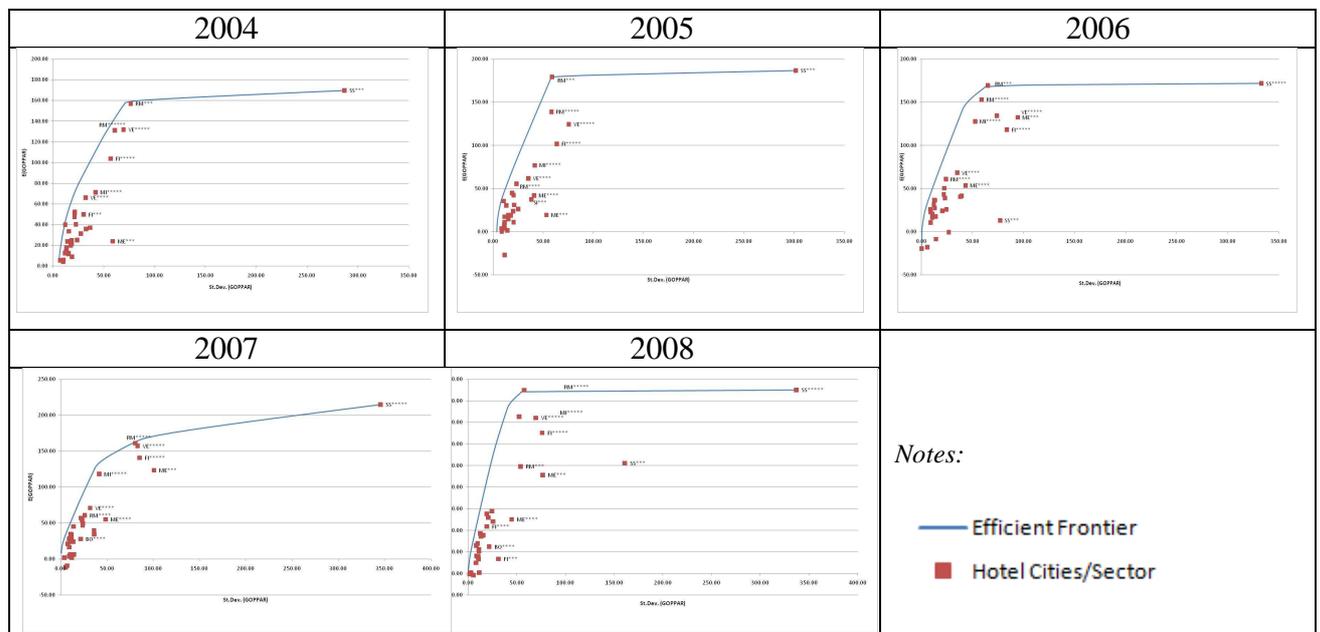

Figure 2. Unconstrained efficient frontiers of hotel investments. Source: AICA data processed by authors

The analysis of frontiers over the 5 years taken into account underlines the presence of an asset characterized by the maximum mean level and standard deviation and placed itself, thereby, at the extreme point of frontier. Over 2004-2005 this investment is represented by 3 stars hotel structure in Sassari while over 2006-2008 it describes 5 stars hotel structure in Sassari. Sassari province represents, then, the province granting wider profit margins within the sample even if the structure seasonality determines a high risk investment [4].

Hotels with a more balanced trade-off revenue-risk and however near to the efficient frontier have for the first years lower quality standard hotel structures but located in important cities (Rome - 3 stars and Milan/Turin - 4 stars) while over following years hotels near the efficient frontiers present high standing hotels (almost all 5 stars hotels) in major Italian cities (Rome, Milan, Venice, Florence).

The analysis of efficient frontier examined the composition of the 100 portfolios on the frontier in order to identify the role of single asset classes assigned by the optimizer to select the best combination of available investments (Figure 3).

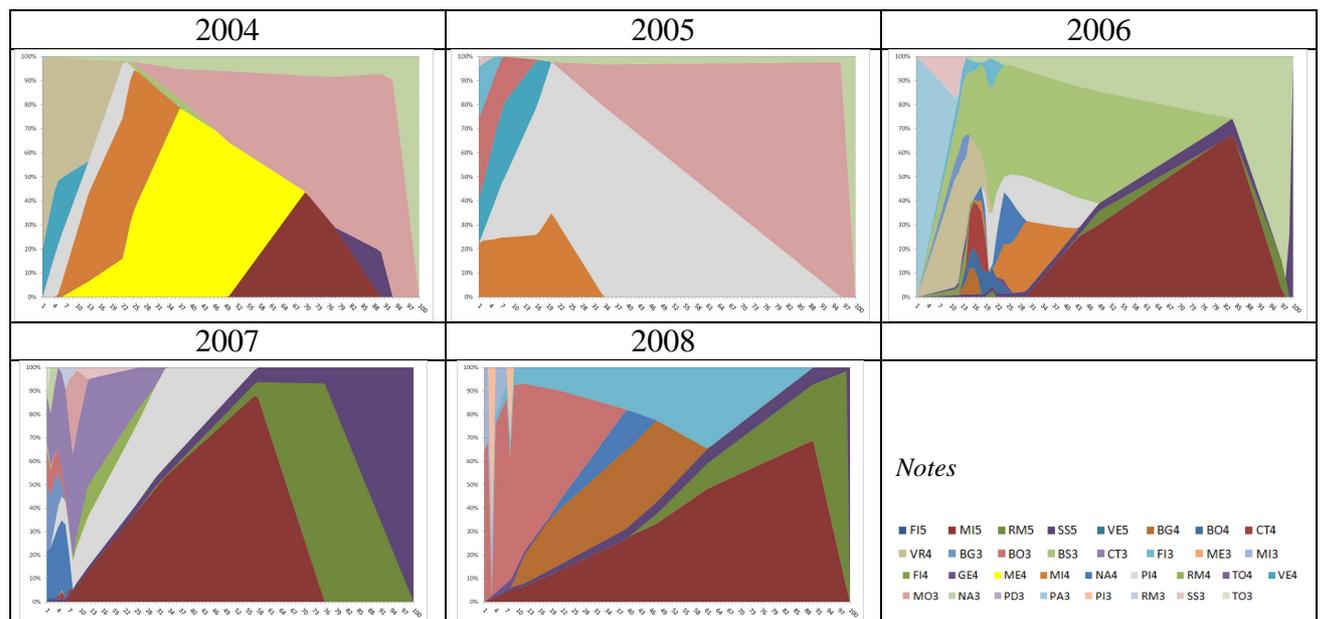

Figure 3. Portfolio composition of efficient portfolios. Source: AICA data processed by authors

Among years considered, portfolios presents very heterogeneous characteristics both in terms of average number of assets included in portfolio and also in terms of characteristics of hotel selected.

During the first two year period (2004-2005) portfolio are characterized by a low number of assets (less than 10 typologies of hotels) while during other years (mainly on 2006) created portfolios present a higher diversification level.

For what concerns real estate typologies we can generally state that 3 stars hotels do not operate at a marginal level on portfolios frontier most of all in specific cities (Rome, Milan and Naples) and in some areas with a strongly seasonal tourism (Sassari and Catania).

The characteristics of 3 stars hotels on efficient portfolios are not stable within the time because, for example, on 2004-2005 period 3 stars hotel categories are mainly located in Sassari and Rome while during following years such categories aim to disappear.

The role of some 5 stars hotels placed in more touristic cities as Venice and Florence is extremely interesting. Evidence obtained is partially related to the hypothesis made in the attribution of fixed and variable costs for 5 stars hotels which by assigning to cities proportional costs to the rooms number and to the occupancy rate it probably overvalue the extent of incurred costs by structure that may be considered lower compared to the costs of other cities with 5 stars hotels as Rome and Milan.

Performances for efficient frontier's portfolios have not a short-run persistence over time because of the impossibility to compare the revenue and risk levels resulting from t by efficient portfolios estimated on $t-n$ with revenues related to portfolios on the frontier set on t year (Table 3)

Mean distance					Distance standard deviation				
	2005	2006	2007	2008		2005	2006	2007	2008
2004	7.96	27.00	90.14	20.79	2004	15.74	33.28	97.72	25.86
2005	-	25.80	105.28	30.68	2005	-	31.04	94.24	26.05
2006	-	-	79.64	13.34	2006	-	-	76.84	12.98
2007	-	-	-	65.03	2007	-	-	-	59.10
Maximum distance					Minimum distance				
	2005	2006	2007	2008		2005	2006	2007	2008
2004	97.54	301.32	406.82	188.82	2004	0.00	8.12	4.06	3.82
2005	-	301.32	406.82	188.82	2005	-	4.92	2.96	5.51
2006	-	-	328.29	62.17	2006	-	-	0.00	0.00
2007	-	-	-	268.83	2007	-	-	-	0.00

Table 3. Summary statistics of distance measure for efficient portfolios identified in the previous year respect to the new efficient frontier. Source: AICA data processed by authors

Summary statistics reveal that during 2005 and 2006, in terms of average values, the choice to use portfolios created over previous years in order to build an investment portfolio was a fair solution while concerning to 2007 there is no coherence between the earnings and risk dynamics of hotels and what was previously estimated. However the analysis of the range of variation (the difference between maximum and minimum distance) and standard deviation highlights the strong variability in such a distance measure within the sample and underlines, thereby, the severe limits of the portfolio optimization approach that embodies the persistence of hotel sector performances.

Constrained efficient frontier

The analysis of the effect of limits on diversification about the construction of frontier has been carried out considering limits on the rate of available resources invested in each hotel typology, considered as the sum of hotels placed in the same geographical area and providing comparable service quality (number of stars), varying from 5% to 50% of total amount (Figure 4).

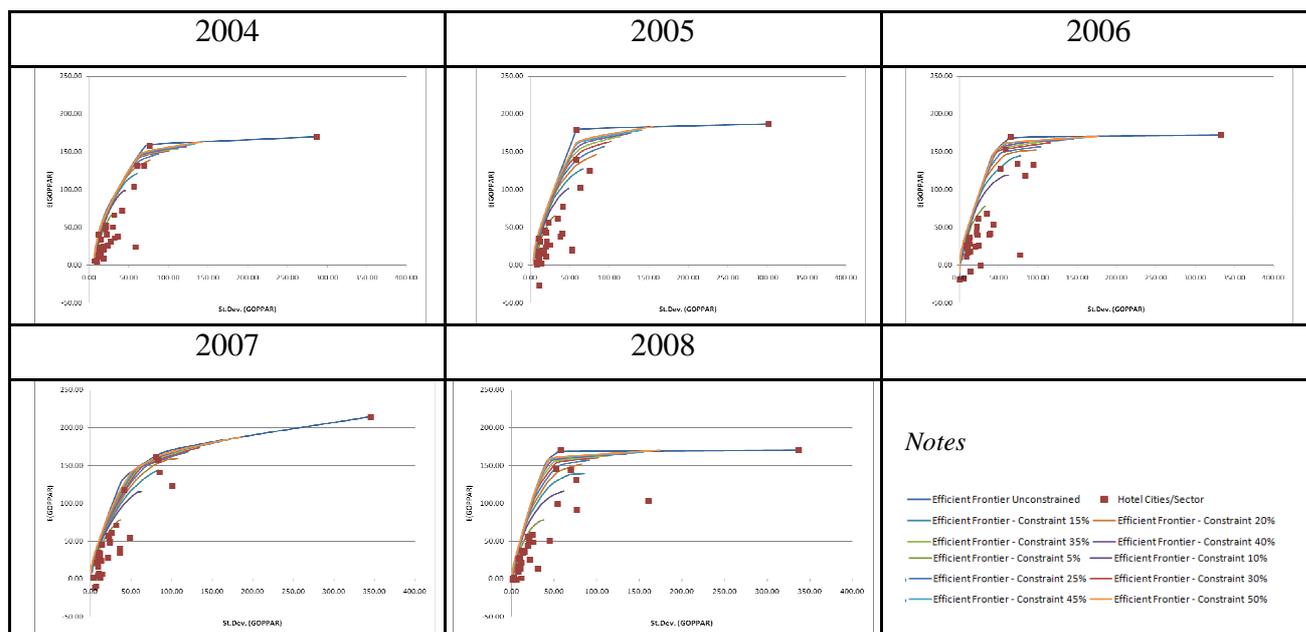

Figure 4. The impact of limits concentration on the efficient frontier. Source: AICA data processed by authors

A simple analysis of plots referred to several efficient frontiers revealed meaningful differences among results attainable with and without limits mainly for portfolios created with a maximum concentration limit of 15%-20% of total value. In considered frameworks, the solution without limits on portfolio composition rules over constrained frontiers and, in some cases, the choice of imposing strictly constraints determines a risk- return trade-off worst than the portfolios construction strategy focused on a single province or structure quality (Table 4).

Table 4. Summary statistics on the impact of concentration constraint on the efficient frontier. Source: AICA data processed by authors

Sacrifice due to the imposition of limits on balance is estimable through the study of the area underlying the efficient frontier that significantly declines following to the establishment of every kind of limit to the portfolio construction. Over every year are registered, indeed, reductions higher than 54% in the case of imposition of portfolio concentration limits at 50% and reduction higher than 97% regarding the imposition of limits on maximum diversification (portfolio concentration at 5%).

Limits on efficient frontier construction determines the impossibility to establish optimally portfolio compositions always governing compared to the alternative choice investing in only one hotel typology. The analysis, in detail, underlines as the limits imposition may establish the construction of a theoretical set of favourable concurrences which appears dominated by a significant number of single investment opportunities (fluctuating among 3.03% for portfolios created on 2004 with a limit of 50% and 44.12% for portfolios created on 2006 with a limit of 5%).

Such performance sacrifice is partially regulated by the wider persistence of frontier portfolios whom composition does not aim to change over the years in a significant way mainly for portfolios with pressing diversification limits. The analysis of mean distance among portfolios on considered frontiers over t moment in respect of the results achieved by favourable portfolios created over past years is a sustainment to this thesis (Table 5).

<i>Unconstrained frontier</i>					<i>Frontier – Max concentration 50%</i>					<i>Frontier – Max concentration 45%</i>

Table 5. Mean distance for efficient portfolios identified in the previous year respect to the new efficient frontier constructed using different concentration constraints Source: AICA data processed by author

The choice of imposing a wider diversification limit determines a relevant reduction in the distance between the efficient frontier calculated over the t moment and the result in terms of return and risk at the time of identified portfolios over $t-i$ time. Constraints not too much penalizing (max concentration 50%) cause a decrease in the mean distance of more than 35% while the choice of highest diversification constraints (like 5%) could cause a reduction in the mean distance from the frontier of more than 90% for some of the years analysed^[5].

CONCLUSIONS

Hotel investments have heterogeneous characteristics in the respect of other kind of properties, which may significantly affect the extent and the variability of the performance.

The proposed analysis demonstrates the utility of criteria on sector/geographic diversification in order to create efficient portfolios, even if the best portfolios have inner investments with different characteristics but a not too high diversification level. Constraints on the maximum concentration level towards certain typologies of hotels determine a lower efficiency of the constructed portfolios, even if the performances of new portfolios result more persistent over time.

The importance of the phenomenon is particularly relevant in relation with the increasing presence in Europe (Peters and Frehse, 2005) and in Italy (Jones Lang Lasalle Hotel, 2009) of hotel chains that can decide to purchase or to realize an hotel, on equal terms, also in function of the characteristics of the portfolio already invested.

The European development expected by institutional investors, specialized in the hotel sector (Bader, Geierregger and Balekjian, 2008), which consider the investment, unlike the hotel chains, only on the basis of project cash flows, makes the proposed approach valid. Results from the Italian market also help to understand the reasons under the strategy of low sector/geographic diversification of several funds currently active in this country.

As in other researches, the main limit of this work is due to the unavailability of detailed information about the structure costs of each hotel. Hypothesis on structure costs, taken into consideration in this paper, have been supported by references on national and international literature and may be considered acceptable. Nonetheless, the availability of internal data about costs (fixed, semi fixed and variable costs) incurred by hotels will enable to obtain more objective evaluations of the benefits coming from the diversification.
