Additionally, market factors are those market characteristics that determine the level of potential demand in a market (Rau and Preble, 1987) and account for "... changes in customer composition, customer needs, customer base, customer preferences and market demand growth" (Powers and Loyka, 2007, p. 682). For example, the market size has an impact on standardization decisions as the larger the market, the more adaptation is generally required or even preferred. This is because the potential for higher sales volume in a large market will cover the higher costs of adaptation (Chhabra, 1996). This observation is particularly relevant for a tourism-oriented, Euro-Mediterranean market such as Malta or Cyprus, which are significantly enlarged each year because of incoming tourism flows. Therefore, this study, which deals with such unexplored markets, is interested in their contextual characteristics (e.g. seasonality of tourism or length of stay of tourists). The focus on the contextual characteristics is critical since the tourism-oriented market is the platform that annually and temporarily generates new forms of customer composition, customer needs, customer base, customer preferences and market demand growth (Powers and Loyka, 2007) with attendant consequences for SA.

Competition-related factors include the structure (monopolistic vs. oligopolistic), nature (price vs. nonprice) and intensity (mild vs. fierce) of competition in foreign markets (Theodosiou and Leonidou, 2003; Rosen, 1990; Jain, 1989). Contrary to the view that marketers should consider the origin, number and position of competitors in each market (Buzzell, 1968, Jain, 1989) the structure and nature of competition does not have a serious impact on the decision to standardize or adapt in most studies (Theodosiou and Leonidou, 2003). The intensity of competition though is positively associated with promotion adaptation (Cavusgil, Zou and Naidu, 1993) whereas the intensity of competition and the competitive hostility in a market affect the inducements for responsiveness by firms (Slater and Narver, 1994; Kohli and Jaworski, 1990). In any case, many researchers have identified the correlation between competition and SA making it an omnipresent factor in every SA attempt (Sorenson and Wiechmann, 1975; Theodosiou and Katsikeas, 2001; Michell et al., 1998; Ozsomer et al., 1991; Jain, 1989; Buzzell, 1968; Boddedwyn et al., 1986). Even since the 70s, Sorenson and Weichmann (1975) stated that competition among MNEs leads to greater standardization while competition against purely

local firms leads to higher adaptation. Cavusgil and Zou (1994) also argued that the presence of foreign competitors across foreign markets and the intensity of competition in the field of pricing are correlated with adaptation. In other words, intensive local competition is expected to lead to higher adaptation as such pressures may necessitate a better fit with local needs that only modifications on promotional aspects can bring.

Product and industry factors refer to the type of the product (consumer or industrial), the role of technology in the industry and the stage of product life-cycle (Boddewyn et al., 1986). Despite the ubiquitous belief that industrial products receive more standardization due to the rational rather than emotional buying process that underlines purchasing of such products, the literature only partially confirms such views empirically. For example, in Michell et al.'s (1998) research, the type of product was not associated with the degree of standardization with industrial firms having similar levels of standardization with consumer firms. The analysis indicated that the degree of standardization related more to within-firm variables than industry type while the degree of adaptation was connected more with country variables (customs, consumer characteristics, culture, legal system, channels structure etc.). However, the desirability of culture-bound products' adaptation is well manifested, at least theoretically, in the literature (O'Donnell and Jeong, 2000; Cavusgil and Zou 1994; Samiee and Roth, 1992; Whitelock, 1987; Rau and Preble, 1987).

Organizational/managerial factors often intermingle and refer to internal characteristics or processes of the firm (Whitelock and Pimblett, 1997; Cavusgil et al., 2003). They more or less coincide with the field of research that deals with the resource-based view of the firm (Barney et al., 2001) i.e. company-specific actions and facts as opposed to industrial organization theory (Porter, 1980). Items in this category can include the nationality of the parent company, the nature of company ownership, firm's international experience or the attitude toward international operations including the centralization of decision-making and corporate openness towards foreign approaches (Cadogan et al., 2002; Solberg, 2002; Ozsomer et al., 1991; Rau and Preble, 1987).

The implications for companies vary according to the status of the firm (MNE vs. local firm and even further an MNE with a geocentric vs. a polycentric approach; Perlmutter, 1969) and one can expect different influences on each firm. As shown in Ozsomer et al. (1991), the influencing role of nationality of the parent company was important. For example, American firms tend to standardize more than most of their European counterparts whereas findings also supported the view that MNEs tend to desire more globally integrated marketing programs through higher control over subsidiaries. This is mostly reflected on product design decisions, brand name, packaging and advertising message. Yip (1997) also found that parent firm's characteristics such as nationality and size define in a way a polycentric, ethnocentric or geocentric orientation while Cavusgil and Zou (1994) stated that firms' skills and constraints profoundly influence firms' strategies.

Therefore, we see that the literature has offered a vast array of themes of factors that may influence the strategy of firms towards standardization or adaptation. This study, through an inductive, exploratory mode of investigation aims to identify which factors indeed come into play when FMCG firms choose their promotional channel strategy in a typical Mediterranean country such as Greece. Building on Eisenhardt and Graebner (2007), we aim to develop a model

and generate a posteriori propositions that reflect the way FMCG firms deal with the contextual idiosyncrasy of a tourism-oriented market. However, before presenting findings and the emerging model, the methodology we adopted is explained.

METHODOLOGY

A qualitative approach was deemed as more appropriate because of the non-typical, under-studied context of the project. Indeed, culturally idiosyncratic markets such as those identified in Euro-Mediterranean countries are rarely investigated through a multicultural lens (with exceptions such as Poulis and Yamin, 2009). The decision to embark on a case-based methodology matches with the fundamental objective of qualitative research (Hyde, 2000; Silverman, 2000), which is to uncover and illuminate contextual particularities i.e. in this case, to gain a deeper understanding of the interrelationships that shape practices of FMCG firms in a typical 'international' environment. Therefore, at this point, we would like to note that the purpose of this research is not to measure causal relationships but rather to explore an unknown phenomenon through the integration of in-depth views as expressed by respondents. In this respect, we adopt a qualitative, case study-based methodology, which is the preferred methodology when currently unexplored and/or complex phenomena need to be studied, and especially when questions of how and why need to be asked (Eisenhardt and Graebner, 2007; Yin, 2003; Miles and Huberman, 1994).

We followed a literal replication logic i.e. each case was selected because it predicts similar results (Alam, 2005; Johnston et al., 1999). These similar results refer to FMCG organizations which acknowledge the effect of inward tourism on their operations. This focus resulted to the selection of 14 firms operating in Greece, for which the influence of tourism on their promotional strategy is clearly manifested (Patton, 1990). In order to have an as maximum variation of sample as possible, we included packaged food (F), fast-food (FR) firms, cosmetics (C) and beverages (B) firms i.e. a wide range of FMCG firms. The focus is on these cases because the main consideration was to use a sample that was purposefully suited to explore the questions through information-rich cases (Eisenhardt and Graebner, 2007; Yin, 2003).

In order to enhance the robustness of our sampling framework and consequently our arguments, we had to focus on firms which are explicitly influenced by tourism-induced heterogeneity but at the same time, they are also active in the market throughout the year. In other words, opportunistic or temporary, sporadic players which tailor their offering to tourists 'by default' cannot be relevant for this study. Relevant firms were identified by a mixture of techniques (corporate databases, corporate websites, four pilot studies) but the most concrete channels to identify them was through direct observation in diverse retailing outlets of tourism and non-tourism related areas of Greece. Three major types of outlets that can be found in both areas (mini-markets, convenience stores and kiosks) were visited twice a year by the researchers and a structured recording of brands that were identified in both areas took place. This allowed a comparison between brands i) sold by firms to locals only and ii) brands sold to both locals and foreigners and informed us on which are the firms that are affected by both consumer groups. This method resulted to a relevant list of 157 firms, which are influenced sales-wise by the idiosyncratic character of the market and by both consumer groups.

Out of these firms, our sampled firms were chosen based on a maximum variation (Patton, 1990) logic with the effort to have firms across major FMCG industries. Firms offered 43 in-depth interviews of almost one hour and a half each and respondents included Trade and Marketing directors, Senior Brand managers, Group Product managers, Regional Sales

managers and similar staff from the sales or marketing departments of firms. This managerial diversity of respondents stems from our request to firms to 'nominate' the respondents themselves. After explaining the nature and scope of our investigation, firms decided on which are the most suitable managers to answer our questions.

Individual in-depth interviews were conducted, which are credited as being a largely valid method of data collection especially, in the international business field (Marschan-Piekkari et al., 2004; Yeung, 1995). The richness of information they provided, the much-needed empathy and direct communication that the interviewer developed with respondents, the control over the data collection procedure and the chance for dissolving ambiguity or probing further analysis in the view of the present researcher have compensated for the drawbacks of cost and time that this approach usually entails (Hall and Rist, 1999). Interviews started with unstructured questions and allowed respondents to freely express their knowledge and experience regarding the topic of investigation. The questions didn't reduce the flexibility that is required in a qualitative study and were susceptible to changes during the interview that allowed expansion and better illustration of responses.

Data analysis commenced with the transcription of interviews and then, data reduction took place with the purpose of 'selecting, focusing, simplifying, abstracting and transforming the data' (Miles and Huberman, 1994, p.10). The selection of the relevant parts of the interviews was a cyclical process that sharpened the analysis and organized data in such a way that meaningful excerpts were immediately evident to the author. Analysis of each case followed and the responses to our questions reflected a clear reference to the way tourism influences promotional channels selection.

FINDINGS

The focus is on the promotional channels firms utilize in order to address to incoming tourists as opposed to locals. There is a dominant indication that most firms utilize adapted channels of promotion tailored to the tourism-specific idiosyncrasy of the market. These idiosyncrasies lend themselves to a new mix of below-the-line and above-the-line activities where 'traditional' channels of communication are not fitting. Table 2 shows that ten out of fourteen firms use adapted channels to promote their brands across tourists since channels used for the local, permanent population do not suffice.

Table 2: Channels of promotion by sampled firms

Promotional channels are thus, heavily adapted with a strong geographical focus and intensification of the promotional activity during summer. Whereas during winter, the firm utilizes promotional channels such as television or radio, during summer, a large part of promotional activity takes place through non-conventional channels that are never used during winter. The following quotes are characteristic:

- *We cant use, radio, television etc. So, the channels are usually outdoor advertising or collaborations with tour operators such as TUI, which brings masses of tourists into the country. We also have collaborations with e.g. rent-a-car offices; we have a joint promotion where we both win. These are tactics that 'run' regularly in areas like these (Marketing Supervisor in a food retailing company)*
- *There was a leaflet distributed in X,Y,Z (airline firms) that had a map of Greece at the back. On it, there were the spots where FR2 is located; and at the front, it was written what FR2 is all about. We estimate that through this medium, the message of what FR2 is reached 2,5 million people. (Marketing Supervisor in a food retailing company)*

- *During summer, we focus on below-the-line activities. It is difficult to reach the consumer with above-the-line activities during summer... they don't stay home like the Greeks for which we almost exclusively use above-the-line activities (Group Product Manager in a packaged food company)*
- *In tourist areas... we have special promotions with samples, gifts etc. For example, we have more promo-packs, which means 'when buying two brands you get two miniatures as gifts'... Within outlets in tourist areas, we also pay attention to the aesthetic part. We have placed e.g. a beautician in the outlets for three months -in Santorini and Mykonos- constantly promoting brands. So, we had a more specialised promotional strategy in areas with high tourism activity (Group Product Manager in a cosmetics firm)*

Therefore, firms have exercised innovative ways to exploit promotional opportunities among tourists under conditions of limited time, non-traditional uses of channels and clustered target groups. Empirically grounded data have identified channels such as the following:

- in-store promotion is heavily used as it is one of the few instances where firms have the time to come into contact with prospective consumers
- road signage is especially utilized by fast food chains who need to showcase their location within a limited time
- gates of entrance are used for their enhanced visibility among foreign consumers
- tourism firms/organizations such as airlines, passenger ships or tour operators are seen as prime channels of promotion since they are part of the tourists' trail.

The few firms that followed a standardized approach and kept using the same channels of promotion did so because they believe that promotion adaptation is not as effective as distribution adaptation. Thus, they preferred to standardize their promotional channels and invest the relevant budget on tailoring their distribution channels to the specificities of the tourist market (e.g. tailoring the choice of middlemen).

The effort is to reach the trade and not promote among consumers. Thus, we standardize our promotional strategy and we prefer to invest the amount that we save on expanding our distribution base. (Group Product Manager in a cosmetics company)

At this point, the following propositions can be suggested:

P1: FMCG firms operating in a tourism-oriented environment adapt the promotional channels they use in order to promote their brands among tourists

P2: FMCG firms operating in a tourism-oriented environment use a new mix of above and below-the-line activities to promote their brands among tourists as opposed to an exclusive use of above-the-line activities that is used for the permanent population

P3: FMCG firms operating in a tourism-oriented environment will use the same, standardized promotional channels as with the permanent population whenever other marketing mix elements are considered more critical for the effectiveness of marketing strategy

Proposition 3 introduces us to the second research question i.e. the reasons behind the choice of primarily adapted promotional channels by FMCG firms operating in Greece. As far as the

channels of promotion are concerned, structural elements of the tourism industry/tourist modes of behavior necessitate a focused approach with adapted channels. These elements/modes, which are seen as forces pushing towards adaptation, are:

- the distinct travel path of tourists

The tourist's spatial behavior is very specific. Most of them move in specific locations and follow specific itineraries. If we do not adapt to these, we lose our chance to communicate (Marketing Manager in a beverages company)

- high seasonality of the tourism phenomenon in Greece

The selection of the channels through which we will communicate our brands to incoming tourists is largely dictated by seasonality. As you probably know, the vast majority of incoming tourists in the country come during summer. This, by default, means that we must adapt our promotional strategy to meet the peculiarities stemming from this seasonality. This is the first factor we consider in conjunction with the geographical allocation of tourists.

- the limited length of stay of tourists in the country

Each tourist stays here for approximately ten days. If we do not tailor our channels to this length of stay, then we have no chance to establish any kind of promotional contact with them (tourists) (Group Product Manager in a packaged food company).

Due to these forces, channels reflect geographical and time considerations firms have when promoting among non-permanent, mobile consumers of their product. For example, the distinct travel path of tourists and their limited spatial behavior actually means that firms that want to communicate their brands to these tourists must follow the latter's 'trail'. Such observations are in line with the need for fit between deployed strategies and environmental contingencies that several studies have pointed out in the strategic management (Venkatraman and Prescott, 1990) and international marketing literatures (Okazaki et al., 2006; Katsikeas et al., 2006). If firms, especially those operating in Mediterranean resorts, ignore the local peculiarities and the unique environmental characteristics of a tourism-oriented environment, they will fail to communicate what they need across the millions of tourists who visit their markets of operation. At this point, therefore, the following propositions can be put forward:

P4: The travel path of tourists dictates adaptation of promotional channels for a FMCG firm operating in a tourism-oriented environment

P5: The length of stay of tourists dictates adaptation of promotional channels for a FMCG firm operating in a tourism-oriented environment

P6: The seasonality of tourism dictates adaptation of promotional channels for a FMCG firm operating in a tourism-oriented environment

As a result of the heavy influence of contextual factors on promotional strategy, traditional factors that can be found in the international promotional literature such as company/organizational (e.g. firm's international experience) or industry/product characteristics (e.g. product uniqueness) (Cheon et al., 2007; Cavusgil et al., 1993, Sandler and Shani, 1992) are either not relevant or must be re-interpreted in a tourism-oriented context. Therefore, promotional channels adaptation primarily reflects context-specific considerations but serves

typical purposes such as brand awareness, location awareness, acknowledgement of product offers etc. However, the latter purposes go beyond the scope of this study since they refer to performance consequences of SA. Therefore, the contribution of the paper lies in the following emergent model (Figure 1) which, for the first time, aims to portray the simple, yet unexplored reality in a tourism-oriented Mediterranean country.

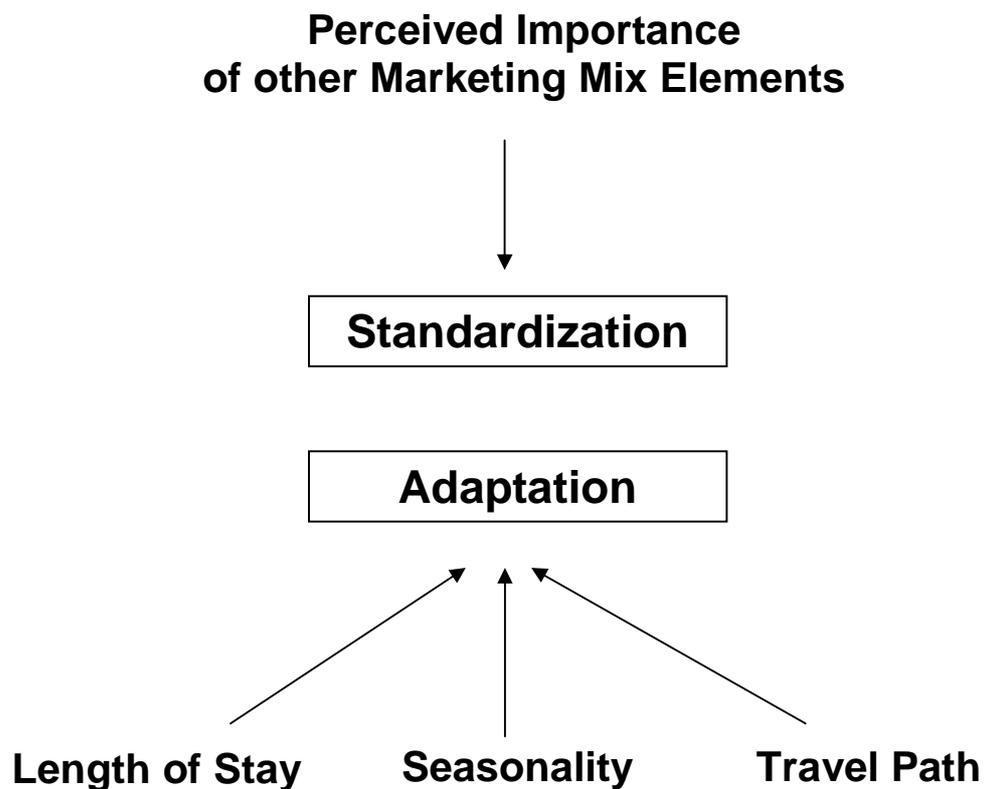

Figure 1: Standardization/Adaptation of promotional channels for FMCGs in a tourism-oriented market

On the one hand, FMCG firms in such contexts primarily standardize their promotional channels because they put more emphasis on adapting other elements such as distribution channels. On the other hand, firms choose to adapt their promotional channels to the idiosyncrasies of the tourist market because structural elements of the tourism reality in the country such as length of stay of tourists, seasonality of the tourism phenomenon and the distinct travel path of tourists necessitate such an approach.

CONTRIBUTION

We can say that the literature has identified many families of variables that affect SA promotional strategies by firms (e.g. product, competitive, organizational, infrastructure influences) with cultural forces being omnipresent (Okazaki et al., 2006; Harvey, 1993). Despite the prevalence of national heterogeneity in the context of this paper, though, cultural factors haven't influenced the decisions of firms towards promotional strategy-making. This is not to claim that cultural inducements do not influence promotional decisions towards either standardization or adaptation. The literature (e.g. Singh et al., 2005; Vrontis, 2003; Koudelova and Whitelock, 2001; Whitelock and Rey, 1998) has manifested this in a robust way across different product categories but it seems that, paradoxically, culture's influence becomes less relevant in a multicultural market as a result of international tourism. Instead, the collective identity of 'tourist' and his/her unique characteristics (as opposed to distinguishing between e.g. British, German, Scandinavians) are perceived by firms as more influential for the selection of promotional channels. These characteristics led to primarily adapted promotional strategies, an observation which agrees with prior findings in the literature that promotion is one of the most adapted elements of the marketing mix (e.g. Vrontis, 2003).

Therefore, what this study stresses is the strong relevance of local, context-specific variables for channel strategies in a tourism-oriented market. Authors such as Kanso and Nelson (2007) or Papavassiliou and Stathakopoulos (1997) have also stressed the influence of context on promotional decisions. Therefore, the co-alignment between promotional channels selection and an idiosyncratic environment seems to be a fundamental pursuit by firms in a market such as Greece's. Such an environmental isomorphism (Okazaki et al., 2007) posits that the external market environment is a principal driver of firms' conduct when it comes to the decision between standardization and adaptation. Indeed, the peculiarities of the Greek context support this isomorphism view, which is reflected in the previously presented model.

To the best of the authors' knowledge, this is the first paper which explains how and why FMCG firms deploy their promotional strategies in a tourism-induced market. This is particularly important for, at least, the following two reasons:

- on the one hand, annual global number of tourists is expected to reach 1.6 billion by 2020 (<http://www.unwto.org/facts/eng/vision.htm>, retrieved 8th of June 2009), making tourism one of the largest industries in the world
- on the other hand, the Euro-Mediterranean region is the largest recipient of these tourist inflows with countries such as France and Spain featuring as the most popular destinations on earth.

Therefore, any study that provides a deeper insight on how this consumer mobility affects the operations of firms that seemingly have nothing to do with the tourism industry per se are of increasing importance.

CONCLUSION, LIMITATIONS AND FURTHER RESEARCH

Apparently, the exploratory nature of our investigation does not allow any generalizations to be made. More research is needed across similar contexts and only by this way we will be able to draw some generalized conclusions on the causal relationships between factors and strategies

that work out in such a contextually idiosyncratic environment. For the time being, the outcomes of the current paper can be only utilized as a generic guideline for firms/researchers operating/investigating similar contexts and should not be seen in a prescriptive fashion. This is a serious limitation of the current study that must be taken into consideration by readers.

In this respect, a future study could investigate the developed propositions and measure causal relationships between SA strategies and factors informing them. Even more specifically, a large-scale survey conducted across countries with similar characteristics could yield more grounded insights that will counterbalance the inherent limitations of this effort. Contexts such as France, Spain, Portugal, Cyprus, Malta and even Mexico, Thailand and Malaysia are popular tourist destinations and several non-tourism-related firms are interested in how tourism affects their operations. Therefore, a cross-country investigation with a quantitative research design is a meaningful research path for the future.

Moreover, a future study could focus on other elements of the promotional mix such as the message that is used to position the FMCG firm in foreign consumers' minds. Perhaps, with regards to this element, the cultural heterogeneity of a tourism-oriented environment is more influential and dictates the positioning strategy of the firm. Additionally, the focus could be extended to other marketing mix elements such as price and distribution. It must be noted therefore, that the exclusion of product, price and distribution does not deny their significance in the marketing program of a firm. Actually, implications for the entire marketing mix were discussed during interviews with selected firms but the analytical focus of this study was on promotional media for reasons of conceptual clarity and because the SA debate is mostly associated with the more controllable elements of the marketing mix, namely product and promotion (e.g. Fastoso and Whitelock, 2007; Calantone et. al., 2006).

The vast majority of studies in the field of SA deal with these two elements whereas the focus on price and distribution SA strategies is still in its infancy (Waheeduzzaman and Dube, 2004; Theodosiou and Katsikeas, 2001). A reason for this literature focus is that product and promotional aspects are more easily prone to manipulation by firms and 'subject to greater modification' than the other elements (Cavusgil et al., 1993, p.485). On the other hand, pricing and distribution are mostly a result of the existing marketing, distribution and retailing infrastructure, over which firms have little or no influence (Terpstra and Sarathy, 1994). Thus, this study focuses on promotion strategies of firms in order to gain greater depth on established constructs which are, moreover, directly associated with the contextual idiosyncrasy of the market we described.

When such additional studies are conducted, and through a synthesis of different insights, we will be able to obtain a more holistic view on the unique characteristics of tourism-oriented markets. Especially for Mediterranean countries where these markets are dominant, such a synthesis promises managerially relevant and research-wise thoughtful results. We hope that the present effort opens an initial path for the better appreciation of the unique forces that come into play in these countries.

THE IMPACT OF GREEK SKI CENTERS PRODUCT DIMENSIONS ON VISITORS' SATISFACTION LEVELS: A PRELIMINARY ANALYSIS.

Priporas, Constantinos-Vasilios¹; Vassiliadis, Christos; Andronikidis, Andreas

¹University of Macedonia, Department of Marketing and Operations Management, Edessa, Greece

²Assistant Professor of Marketing at the University Macedonia

³Lecturer in International Marketing at the University of Macedonia, Greece

Purpose The aim of the current paper is to explore the impact of ski centers product dimensions on visitors' satisfaction levels.

Design/methodology/approach A total of 1608 usable questionnaires were selected in 11 ski resorts in Greece. The questionnaire used 50 ski center product attributes (variables) which influence visitors' satisfaction levels. These variables were the product of previous qualitative research which determined the product attributes of an ideal ski resort.

Findings Exploratory factor analysis revealed 7 significant product dimensions influencing visitors' satisfaction and intention to revisit.

Research limitations Results from this study may not be generalized in other countries ski centers such as Alpine or US centers.

Practical Implications Improvements to product attributes will help the marketing managers of ski centers increase customer satisfaction and intention to revisit.

Originality/Value The study provides insights from visitors in ski centers from a well known summer destination in the Mediterranean region where studies are limited.

Keywords Visitors satisfaction, Ski center product characteristics, Ski center, PCA, Greece

Paper Type Research Paper

INTRODUCTION

Satisfaction or dissatisfaction with a place, tourist destination or hospitality firm and the tourist product/service they offer are two of the possible outcomes of the tourist experience and have significant influence on tourists decision making for future vacations. In addition, visitors' satisfaction with a tourist destination has an impact on their intention to revisit them or recommend them to others (Alegre and Cladera, 2009, 2006; Um et al., 2006; Yoon and Uysal, 2005; Kozak, 2001; Baker and Crompton, 2000). If tourists are not fully satisfied with the quality of the services and products provided, it is highly unlikely that they will visit the same destination again. Pizam et al. (1978) in their pioneering study define tourist satisfaction as:

“the result of the interaction between a tourist's experience at the destination area and the expectation he had about that destination. When the weighted sum total of experiences compared to the expectations results in feelings of gratification, the tourist is satisfied; when the tourist's actual experience compared with his expectations result in feelings of displeasure, he is dissatisfied”.

The measurement of tourist satisfaction has become a major research topic in the tourism marketing field over the last forty years. This is because, firstly tourism has become an important economic sector for many regions or countries, secondly their is considerable

complexity in the differences in tourist perceptions and experiences of destinations, and, thirdly, because the measurement of tourist satisfaction can allow the those marketing a destination area, i.e., a ski resort, to monitor and improve its effectiveness and performance based on the needs of the tourist. (Piercy and Morgan, 1995). Thus tourist satisfaction with a destination has become a key indicator for the competitiveness and survival of regional tourist industries (Kozak, 2001; Kozak and Rimmington, 2000).

The main goal of the current study is to explore the impact of ski center product attributes on visitors' satisfaction. In particular, we have looked at the product attributes that most influence visitors' satisfaction level and have studied their implications for the management of ski centers. The Greek ski industry is in the early stages of development and is basically concerned with domestic tourism (Boniface and Cooper, 2005), since Greece is considered a popular destination for mass summer vacationing, especially the popular tourist destinations, (i.e., the islands). In addition, tourism policy issues were not prioritised by the local authorities of the less developed tourist destinations, (i.e., mountain areas) as well as by the government (Priporas and Kamenidou, 2003). However, ski centers could be the vehicle for economic development and prosperity for these regions (Andronikidis et al, 2006). A limited number of studies with reference to Greek ski centers have been made. Previous works have focused on visitor loyalty (Alexandris et al, 2005), visitors segmentation (Siomkos et al, 2006; Tsiotsou, 2006), visitors profiling and intention to re-visit (Drakou et al, 2005), and evaluation of ski center services (Masmanidis et al, 2006).

The rest of the paper is organised as follows. In the next section we review the literature regarding visitors' satisfaction with ski resorts. Subsequently, we describe the research methodology and discuss our findings. Finally, we conclude our paper with a summary, a discussion of the limitations of our approach and some directions for future research.

COMPONENTS OF ATTRIBUTE SATISFACTION

Destinations are mosaics comprising of inter-dependant components of attractions and support services such as natural scenery, accommodation, food, shopping, transport, events and many other features that are vital for the destination. Therefore, visitors' overall satisfaction with the destination experience may be a multidimensional, multi-attribute function of satisfactions with individual attributes of all the products/services that make up the experience (Hsu, 2003; Pizam & Ellis, 1999). Previous studies in various destinations (Wand and Qu, 2006; Deng et al, 2002, Laws, 1995) emphasized that satisfaction with several destination factors have the greatest impact on tourists' overall satisfaction, such as accommodation, tourist facilities, accessibility, the cost of vacation, etc.

Ski resorts, through their service infrastructure and destination environments, influence their visitors' perceptions, satisfaction and loyalty (Matzler et al., 2008). More particularly, in a ski resort the visitors' experience is influenced by:

- service infrastructure such as shopping services, recreational services και amusements, food, transportation, and lodging.
- destination environments, such as natural, political, technological, economical, environment, and socio-cultural environments

Usually the visitors' activities in the ski resorts referred to the following product characteristics in winter destinations (Weiermair and Fuchs, 1999, p.1005):

1. Food and Accommodation
2. Sports activities (other than skiing)
3. Animation and Culture
4. Transportation Aspects to and within the Resort
5. Skiing and Related Activities
6. Enjoyment of Nature and the Landscape (e.g., hiking)
7. Shopping Activities

Matzler et al (2007, p. 412) found that "seven factors (parties and fun, information, price-quality ratio, kids' slopes, well-being, slopes and accessibility) influence overall visitor satisfaction" and "overall satisfaction, in turn, is a strong predictor of loyalty". In another study of Clark and Maher (2007) the authors found that, "trust, commitment, *satisfaction*, past behavior, and value predict 60 percent of the variance in attitudinal visitor loyalty".

Matzler et al. (2005a) showed that customer satisfaction with a ski area varies between lifestyle segments. In this study, this stream of research on moderators in the attribute performance–overall satisfaction–loyalty chain is extended by three factors that are considered to be primarily important in winter sports tourism: lifestyle, spending levels and customers' skiing skills.

Weiermair and Fuchs (1999) adopted a multi-attribute model in exploring tourist satisfaction in Alpine ski resorts. They measured a range of quality dimensions such as aesthetics/appearance, security/safety, service orientation, variety/fun, and accessibility of service, in several domains of tourist activities; including food and accommodation, attractions, activities, shopping, and transportation. According to Faullant et al. (2008, p. 163): "ski resorts with the highest satisfaction ratings and the highest image ratings have the highest loyalty scores".

RESEARCH METHODOLOGY

Qualitative research

Qualitative research was utilized in 11 ski resorts. For the data collection an open-ended questionnaire was used with the assistance of trained interviewers who recorded the visitors' perceptions regarding an ideal ski center. Eventually 219 comments observations were recorded, where were categorized initially into 50 important product characteristics (variables). Afterwards the 50 variables were grouped in 7 product dimensions. Figure 1 gives a synopsis of the qualitative findings. Adequacy of facilities, visitors security and cleanliness, concentrated the majority of the observations. The qualitative research findings were used as a theoretical model for the quantitative research.

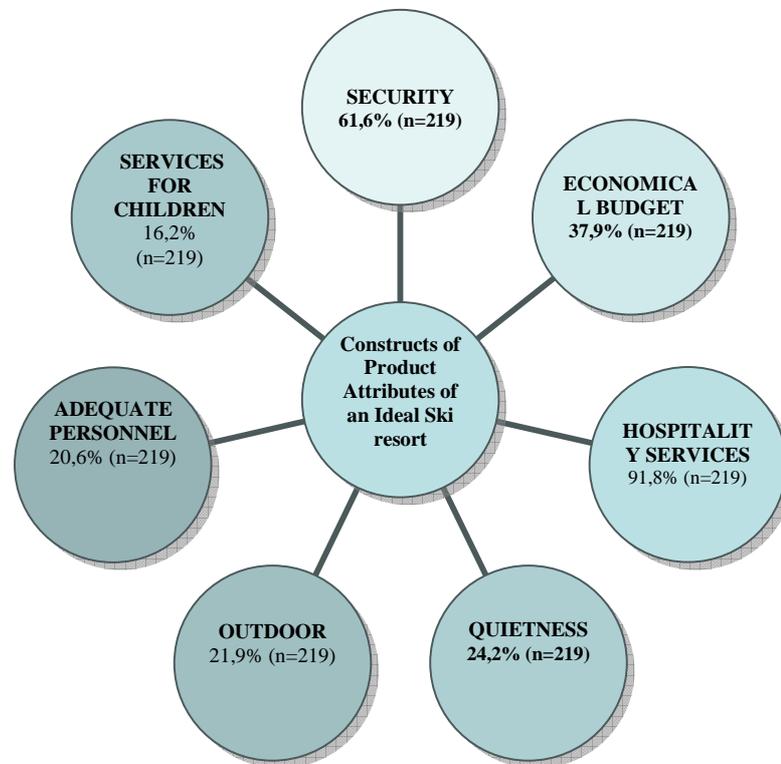

Figure 1. Theoretical Framework based on qualitative research findings. Source: Vassiliadis and Masmanidis, 2004. The figure was formulated by the current authors

Quantitative research

The data was collected by employing the convenience sampling technique at eleven ski resorts by using a self administered questionnaire from 8 to 18 March of 2009 by trained business administration undergraduate students. 1680 questionnaires were collected while 1608 were usable. Visitors were asked in a scale from 0% to 100% to grade the seven product dimensions. The findings are presented in Figure 2. “Economical Budget”, η “Security” και ο “Hospitality Services” are the most important dimensions.

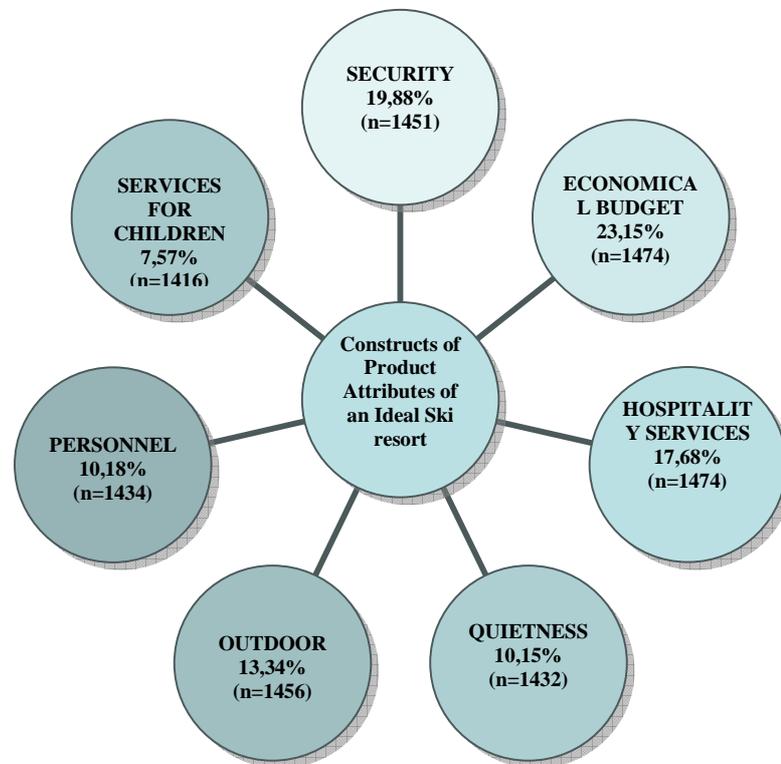

Figure 2. Quantitative analysis of the theoretical model of the 7 product dimensions

Next, the structure of the product characteristics through the fifty variables influencing the level of visitors' satisfaction and intention to revisit was explored. The variables were the result of the qualitative research. The main question in the questionnaire regarding the above variables was 'the level of my satisfaction and my intention to re-visit the ski resort are influenced by...'. The respondents expressed their level of agreement on a seven point scale from 1= 'disagree completely' to 7= 'agree completely'. Data analysis was undertaken in two steps: first we conducted an exploratory factor analysis and secondly we performed a parallel analysis. SPSS statistical software version 15 was used to analyze the findings.

DATA ANALYSIS

Sample demographics

The gender distribution of participant respondents was 51.5% males and 48.5% females. The mean age of the respondents was 31 years old. Regarding the education level, the majority of the respondents had a university degree (54.4%), 29% had a high school diploma, and 12.3% had a graduate degree. Referring to profession, 23.5.2% of respondents were students, 21.8% private employees, 17.8% freelance professionals and 16.8% public servants. Lastly, 368 respondents (24.9%) had monthly net income in their families of 1001-1500€, 21.7.9% of more than 2600€, 18.4% of 1501-2000€. and 14.3% had an income of 601-1000€. The majority of the participants

(45%) visited the ski resorts for the first time during the period 2001-2009 and 35.5% during the period 1991-2000. Finally, 866 participants (53.9%) visited the ski centres with friends, 478 (29.7%) with other members of their families, 13.8% with their girlfriend/boyfriend, and only 2.7% went alone.

<i>Demographic Variables (n=1608)</i>	<i>Frequencies</i>	<i>Ποσοστά</i>

Table 1. Samples demographic profile

Exploratory Factor Analysis

The method of Principal Component Analysis (Pallant, 2005; Tabachnick and Fidell, 2001) was used to define the underlying components of product attributes. Bartlett's test of sphericity was statistically significant ($p=.001<.05$) (Bartlett, 1954) while the Kaiser Meyer Olkin (KMO) test ($.962>.6$), showed that the data was highly qualified for this procedure (Kaiser, 1970; 1974). Both indices give us the capability to perform a good factor analysis (Tabachnick and Fidell, 2001).

Parallel Analysis

In order to get a more accurate definition of component number, parallel analysis was performed (Horn, 1965; Watkins, 2000). The comparison of PCA eigenvalues with the average eigenvalues of 100 random samples showed that the component number is equal to seven (components where the PCA eigenvalues exceed those of the random samples). Table 2 presents the parallel analysis outcome.

<i>Component number</i>	<i>PCA eigenvalue</i>	<i>Criterion value from parallel analysis</i>	<i>Decision</i>
1	18.043	1.3885	Accepted
2	2.784	1.3529	Accepted
3	2.198	1.3242	Accepted
4	1.811	1.3006	Accepted

6	1.434	1.2609	Accepted
7	1.342	1.2435	Accepted
8	1.120	1.2256	Rejected [..]

Table 2. Parallel Analysis results

The seven components from this comparison agree with the number of components in the theoretical model of the qualitative research. Next, by performing a factor analysis of the seven

components with oblimin direct and with deletion of factor loadings of less than .55, the results showed that the components are independent since the correlation index is less than .498 with minimum value the .011 (Table 4). The components can be named based on the variables with the highest loadings (Table 3).

The first component interprets 36.09% of the total variance and is composed of five items: "existence of experienced and specialized personnel" (PER5), την "possibility of fast and suitable service in the ski resorts facilities" (PER6), "fast service at the lifts" (PER7), "existence of friendly and pleasant personnel (PER4), and "existence of personnel for ski slopes check" (PER 3). This component could be named "*Adequate Personnel*".

The second component interprets 5.57% of the total variance and is composed of five variables: «economical prices for equipment rental" (ECONI3), «lift tickets in affordable prices" (ECONI5), «Low cost and affordable prices in the ski center. (ECON11), "existence of low budget packages for special groups (i.e., students) (ECONI2), and "lunch available at affordable prices" (ECONI4). The second component could be labeled "*Economical (Affordable) Budget*".

The third component interprets 4.39% of the total variance and is composed of four items which referred mainly to children's services: "existence of ski slopes for children" (SKSL6), "existence of sufficient and suitable lifts in the children ski slopes (LIFT3), "existence of playgrounds for children" (FACIL4), and "existence of personnel for children's activities (PERS1). This component could be named "*Services for Children*".

The fourth component interprets 3.62% of the total variance and is composed by services variables regarding lodging, entertainment, and relaxation> More particular: "possibility of overnight stay (ACOM1), "entertainment possibilities in open areas and closed halls" (ENT1), "existence of accommodation facilities in near by distance" (ACOM3), "existence of sufficient available chalets to cover various needs"(ACOM2), and "existence of spa facilities for relaxation" (FACIL3), "existence of food courts" (FACIL1), "shopping opportunities (retailing stores) (FACIL2). This component is named "*Hospitality Services*".

The fifth component interprets 3.13% of the total variance and is composed of three items: "safe facilities for visitors in the ski slopes" (SECUR2), "existence of first aid center for medical care in the ski center (SECUR1) and "cleanliness and hygiene in the accommodation and food courts" (SECUR3). This component was labeled "*Security*".

The sixth component interprets 2.87% of the total variance is composed by two spatial items "near by parking" (P2), "variety of ski slopes"(SKSL4). This component could be labeled "*Suitable Outdoors* ».

Finally, the seventh component interprets 2.68% of the total variance and is composed by one item, "Existence of Quietness".

<i>Variables</i>	<i>COMPONENT†</i>

CONCLUSIONS

It is vital to identify and measure tourists' satisfaction with individual components since visitors' satisfaction with the components leads to their overall satisfaction with the destination (Pizam et al., 1978). An exploration of each attribute's impact on visitor satisfaction and their intention to re-visit helps identify the strengths and weaknesses of a destination at individual levels. Satisfied tourists are more likely to return and become loyal, which leads to the destination's long-term economic success (Kozak, 2001; Kozak and Rimmington).

According to the participants in this study, the most significant product attributes that influence their level of satisfaction and their intention to re-visit can be organised into seven different categories. These are: "Adequate Personnel", "Economical Budget", "Services for Children", "Hospitality Services", "Security", "Suitable Outdoor" and "Quietness". Specifically the product dimensions, "Economical Budget", "Security" and "Services for Children",

“Hospitality Services”, and «Outdoor” were considered to be more important as shown in Figure 2. Because of their significance the ski resorts management should pay attention to these components in improving their product in order to remain competitive and to attract new visitors, as well as to increase re-visitation.

Although our findings extend our knowledge about satisfaction and intention to re-visit ski resorts, there are some unavoidable limitations. The instrument was validated by collecting data from ski resorts in Greece. Further research from different ski resorts in other countries should confirm the relevance of the current findings. Also, future research should include a factor analysis to confirm the adequacy of these seven components of product attributes in influencing visitors’ satisfaction and intention to re-visit. Finally, person-related factors (i.e., gender) can be used in investigating the similarities and differences of the product dimension and their impact on satisfaction and re-visitation.

TRADITIONAL VALUES AND POSTMODERN CHALLENGES OF CULTURAL TOURISM- THE EXAMPLE OF THE DALMATIAN COUNTY IN CROATIA

Razovic, Mili¹; Rotar, Nada Zgrabljic¹; Vidakovic, Josip¹

¹*University Of Zadar, Department for Communication Science and Tourism*

The Subject of this study is cultural tourism and cultural tourism experience in Dalmatian area in Croatia, in the context of postmodern philosophy of adventure/ experience travel. Cultural tourism has traditionally been a powerful motive in trips because of visiting historical cities, monuments, museums or kinds of festivals. More than a third of all international travel includes a kind of cultural activities which is why it is important to attract the attention of tourists in the areas that have many cultural attraction such as cities of Dalmatia County. The aim of this paper is a presentation of scientific the results of empirical research conducted in July and August 2007, in Zadar, Šibensko-Krinska and Splitsko-dalmatinska Counties by a method on a sample survey of 1346 tourists. The questionnaire consisted of 48 questions, open and closed, and some of the questions were set in order to explore the offer of cultural resources. The results showed that the cultural tourist offer should be accessed an insufficiently used possibility for the developing of Croatian tourism and that it is necessary to create a new strategy with regard to today's modern tourism. It is important to take into account generational, educational and material differences as determinants in defining the guidelines and initiatives of cultural tourism and that the targeted offers are not limited element. The conclusion is that there is a large and under used opportunity for the development of cultural tourism in the entire tourist offer of Dalmatian counties.

Keywords: tradition, cultural tourism, Croatia, Dalmatian Counties, strategy for tourism development

INTRODUCTION

Groups of tourists motivated by the need to meet and understand more thoroughly the tradition and culture, cultural heritage and the places they visit, are synonymous with the term used for the phenomena of cultural tourism.

According to the World Tourist Organization, 37 percent of all international travels include some sort of cultural activity, while according to other sources it is considered that up to 70 percent of international travels may be included in this category (Richards 1996; McKercher and du Cros 2002, in Antolović, 1999).

Cultural tourism is a growing sector in Croatia (Jelinčić, 2009). The media's as well as the state's interest in this area is growing. Development of cultural tourism is mentioned in a strategic document of the Ministry of Tourism (2003) „From Tourism and Culture to Cultural Tourism: Cultural Development Strategy“. However, according to some conducted scientific research, the cooperation with the state institutions is still not sufficiently developed and there is a recorded lack of coordination between the sectors of culture and tourism.

Cultural tourism is hard to define given that both culture and tourism are complex and dynamic terms. The prevailing opinion is that there is no particular, specific definition of cultural tourism. In the terminological sense both expressions „heritage tourism“ and „tourism of cultural heritage“ are used. All terms nevertheless share the same responsibility, which is introducing the tourist to what makes the city, region or state different and interesting, regardless of whether it is art, culture, history or all together.

Cultural tourism is a practice that involves intersectoral collaboration of culture and tourism and in contemporary trends it includes other development practices that are functionally integrated (Ljumović, 2009 in: Jelinčić, 2009: 93).

Cultural tourism is therefore, unlike other types of special interest tourisms, complex given that it implies collaboration of multiple sectors and a wide range of activities. Quality cultural-touristic offer demands a successful collaboration of experts in the area of culture and those in the area of tourism, although these two areas are often presented as very different and the former directed towards profit, and the latter towards common good of protection and promotion of traditional values.

The concept of cultural tourism is based on the basic presumption according to which there is no involvement in culture as a process but culture is used as a product. Culture as a product makes a large supply of touristic offer. The authors suggest that such supplies may include: monuments (sacred monuments, public, historical buildings, castles and palaces, parks and gardens, forts, archeological areas, industrial-archaeological buildings), museums (historical, folklore, art museums, industrial), routes (culture-historical routes, art routes), entertainment centers (culture-historical centers, archeological, architectonic, musical), cultural-historical events (religious celebrations and pilgrimages, secular festivals, folklore festivals), artistic events and art exhibitions (Pančić Kombol, 2000: 32)

Some areas and events are considered especially interesting and attractive for the development of cultural tourism, for example archaeological areas, architecture (ruins, well-known buildings, whole cities), museums, art, sculptures, crafts, galleries, festivals, various events, music and dance (classical, folklore and contemporary), drama, theater, film, language and literary studies (tours and events), religious celebrations and pilgrimages, overall (folk and primitive) culture and subculture and in this sense in the world there is a number of cultural touristic offers such as archaeological sites, sacred monuments, museum spaces, galleries and preserved urban units.

CULTURE AND CULTURAL TOURISM

Culture

The development of new communication possibilities, new technologies and informatization and various processes of globalization in tourism create specific characteristics of contemporary tourism of the postmodern era, specific values and way of life, specific culture of travelling and specific customs.

Culture is a complex entity based on the organizational concept of broad-spectrum “way of life” believes Richards (1996: 226) which includes the behavior, production and beliefs of people. Culture does that what people think (attitudes, belief, ideas and values), make (art works, artifacts, cultural products) (Littrell, 1997: 107, in Jelinčić 2008: 31). Culture is achieved in processes (ideas and life styles of people) and products of those processes (buildings, artifacts, art, customs, “atmosphere”)

Culture is therefore characterized by the entirety of knowledge, standards and values which the community feels as its way of life and uses to introduce itself to another community with which it comes in contact. It includes and represents the behavior of the community members and the spiritual and material products created by their actions. It is a process and is subject to change in circumstances when different groups are confronted, and then try to reconcile their own standards of meaning and values with standards of the other group (Jelinčić 2008: 30).

According to the above mentioned, culture is seen as the way of life of certain people or social group and has distinctive characteristics and systems of meaning. It can be said that culture includes all forms of social activity as well as artistic and intellectual activity.

Culture is made by processes, ideas and ways of life, as well as the products of those processes, believes Richards (2001: 32). Kilday (2000: 56) defines culture as: 1. All inherited ideas, beliefs, values and knowledge which provide the basis for the development and actions of the community; 2. Specific ideas, interests and activities of people; 3. particular civilization at a certain period; 4. Artistic and social activities, expressions and preferences of society; 5. Education and refinement arising from the previously said.

Culture refers to the set of values, beliefs, behavior, symbols, (e.g. tradition, customs, clothing and arts) and forms of learned behavior of the local community. It can also be defined as the “way of life” that the society shares, which is transferred from generation to generation and for which it is considered to be typical for a certain social group (Jelinčić, 2008: 26). It includes unique natural, historical and cultural accomplishments of a certain area and the people living in it, which are remembered or preserved so that the present and future generations could experience them (Mak prema Metelka, 1999: 2)

If culture is studied and defined in the context of tourism, it is necessary to set the focus on socio-cultural aspects. Therefore, all participants who appear in cultural tourism should be considered.

Touristic culture

Several social categories are included in the cultural contact of touristic space. We can emphasize the local population and its culture, tourists and touristic culture (shared by most tourists), residual culture (unique for each tourist market), tourism workers (that provide services to tourists and work as individuals between the local and visiting population), their managerial and business culture etc. (Brown 1990: 80).

In tourism people and cultures intertwine with forms and forces characteristic to each individual local community, and a better understanding of these cultures will lead us to understanding tourism as a factor of change in the community itself, but also beyond it.

Discussions about the local culture are often conducted over which one of these two are winning or how they are affecting one another. However, both local and touristic culture are best observed regarding the residual culture, which can, in that case, explain how tourists from different cultures behave in different ways (Jafari, 1987: 152).

The behavior of all participants in the touristic process is what literature often denotes with the term touristic culture. A tourist will before, during and after a trip behave in accordance with touristic culture.

Culture can therefore, in relation to the term "tourism", be defined as the totality of material and spiritual values in the area of tourism and the level of man's knowledge of these results, which includes in itself views, relations, risks, behavior of people, whether tourist, whether holders of tourist services of all kinds (Vizjak, prema Ravkin, 1999: 292).

Tourism with its multiple opportunities for contact provides huge possibilities for enactment of cultural processes and for the invention of new forms of cultural expression (Chambers, 1997: 3). Culture-related tourism, accordingly, can't mean only tour of the material forms of culture, but also includes exploring ways of life in a certain destination.

Cultural tourism

In general, cultural tourism is a form of tourism which is dominated by interest and demand for objects and activities of cultural value (Vukonić and Čavlek, 2001: 167).

However, there are multiple definitions of cultural tourism, and the difficulties in defining that term arise from the difficulties and the complexity of defining the term culture.

The World Tourist Organization (UNWTO, 1985) defined cultural tourism as travels motivated by culture such as study, theatrical and cultural tours, trips to festival and similar events, visits to historic sites and monuments, trips in order to study nature, folklore or art and pilgrimages.

Spilberbeg (1995: 362) defines cultural tourism as persons travelling outside their permanent place of residence, motivated entirely or partly by their interest for the historical, artistic or scientific heritage of a social community, region or institution. These definitions indicate that the basic element that distinguishes cultural from other tourists is motivation.

Another group of authors suggested a definition from the standpoint of visitors during their stay in a destination.

Thus Stebbins (1996: 949) defines cultural tourism as tourism based on the demand for participation in new and deep cultural experiences that can be of aesthetic, emotional, intellectual or psychological nature. Brokensha and Guldberg (1992:24) defined cultural tourism as trips of individuals who want to meet the local population, learn about their culture and life, who go on trips in order to get education and spread their horizons, visit cultural events, intensively travel to experience the richness of cultural and natural attractions, and are in search of authentic, informed, quality experiences in which they actively engage. However, these definitions are criticized as so comprehensive that almost everything everywhere becomes a

cultural product, and almost all tourists become cultural tourists (Craik 1995: 92; Hugens 1996: 708).

According to The International Council on Monuments and Sites –ICOMOS (1996) “cultural tourism is a broad term for many people and in it lies its strengths and weaknesses.”

Numerous definitions of cultural tourism can be grouped in four categories: definition derived from tourism as a concept, definition that proceeds from the travel motif, from experience and organization. “Cultural tourism involves four elements: 1. Tourism; 2. Use of cultural heritage assets; 3. Consumption of experiences and products; 4. The tourist.” as considered by McKercher and Du Cros (2002: 7-9).

The definition of cultural tourism is derived from the term of tourism. Through it, cultural tourism is recognized as a form of special interest of tourists, where culture is the basis for attracting tourists or a motivating element for people to travel (McIntosh and Goeldner 1990; Zeppel 1992; Ap 1999).

Some theorists contextualize cultural tourism from a business perspective, as involvement of development and marketing of different cities or attractions for foreign as well as domestic tourists (Goodrich 1997).

For better research and planning of the development of cultural tourism a technical definition of cultural tourism is introduced (Tomljenović 2006: 124). With a technical definition, the activities considered as a part of cultural tourism, and which are a reflection of the cultural resources of a particular area, are specified. So, for example, for the purposes of planning cultural tourism in Canada (Lord 1993: 37) institutions (museums, galleries, historical sites, theaters, concert halls etc.) are differed from heritage and way of life (historical towns and quarters, monuments, customs, language, gastronomy) as well as from events (festivals, fairs, exhibitions, competitions).

In Europe, the double definition of the European Association for Tourism and Leisure Education (ATLAS), which conducts researches of cultural tourism in Europe for the European Union, usually applies.

The conceptual definition includes motivational and elements of experience so it defines cultural tourism as all travel that includes visiting cultural attractions outside the permanent place of residence with the aim of acquiring new knowledge and experiences which meet the cultural needs of an individual.

According to the technical definition “cultural tourist travel is all travel which includes visiting specific cultural attractions, from historic sites to art and cultural manifestations, to visiting museums and theaters, outside the permanent place of residence” (Tomljenović 2006: 128).

In Strategy Development in Cultural Tourism of Croatia cultural tourism is defined from the motivational point of view and within the framework of existing legislation, which defines culture as tangible culture (museums, galleries, concerts, theatres, monuments and historic sites) and intangible culture such as customs and tradition (Tomljenović et. al., 2003: 18).

According to the same source, the technical approach defines cultural tourism through visits to cultural-historical sites, museums, galleries, art exhibitions and exhibitions of applied arts, operas, musicals, ballet and contemporary dance, theaters, festivals (of music and film) and concerts of popular music.

According to Nuryanti, tourism related to culture and cultural heritage allow describing the past in the present. Today, the developed world countries have taken almost the maximum advantage of their cultural heritage in the tourism industry and have invested great effort in its understanding.

Less developed countries, that still live in a world of tradition, religion, superstition, in a world far from modern, possess great potential to be discovered as a source of symbols and new interpretations" (Nuryanti 1996: 251).

In its beginning cultural tourism was considered a market niche, therefore an offer that completes the basic offer. Today it still often has this role, in terms of offering additional content to extend the stay of tourist in a particular destination, or to enrich their stay with a quality program. However, except being a market niche, cultural tourism can also be the basic offering of a destination.

"Certain destinations often have no large tourist resources that could serve as a basis for the development of mass tourism, so they resorted to the creation of a small but authentic tourism product connected to the culture and thus create the image and identity of destinations." (Jenkins & Jones, 2002: 160).

Croatia, following the European trends, has a possibility of developing cultural tourism in two ways: in addition to mass tourism in coastal destinations, where cultural tourism has the role of a market niche, and also as a basic offer, especially in continental destinations and coastal hinterland.

In the context of Croatia the Dalmatian region, with respect to their resource base of cultural tourism, has special possibilities in the evaluation of cultural tourism in the total tourist offer and its efficiency on the tourism of Dalmatia.

The Offer of Cultural Tourism

Culture is one of the main elements of tourism products and the basis of tourist offers. Considering that tourism has always attracted visitors with a unique atmosphere, cultural-historical monuments, dynamic scenes of life on the streets, festivals and carnivals (Boissevain, 1996: 25), and tourist have always been interested in gaining insight into material and immaterial (norms, values, ideology) forms of culture (Kelly and Dixon, 1991; 26), cultural tourism is increasingly becoming a more important element of the tourist offers of a particular area.

After the competition intensified the development of new tourist areas that have, in order to revitalize its economic recession, and in the absence of natural attractions, those destinations have also turned towards the development of cultural tourism (Tomljenović 2003: 16).

In the process of planning cultural tourism the characteristics of the offers regarding cultural tourism should be taken into account, Tomljenović highlights (2006) and adds that the increase in offers is caused by the simultaneous actions of several factors: a) an accelerated process of reconstruction and creating the image of cities where culture is used as the main mechanism of revitalization and improvement of image; b) changes in the financing system of the cultural sector where funding from the budget is reduced and is expected from institutions in culture to increase self-financing c) The more intensive competition on the tourism market where cultural offers of sites is used as means of creating an unique image of the destination and is competitive advantage (2006: 133).

Cities have since the beginning of the 1990ies embraced tourism as means of economical development, supporting the thesis that the effects of tourism are much wider than the economic effects generated by the tourist demand. By investing in the tourist infrastructure and converting districts in attractive areas they not only attract visitors but also create a positive image of the city with which they retain the existing and attract new economic entities and improve the service sector on which their economy is based.

The development of tourism inevitably includes the development of cultural offering, as considered by Law (2002) and Cameron (1991). Seeing the cultural sector is faced with the increasingly modest financing from the state budget and is forced to turn to alternative funding sources - the sponsorships of the private sector and attracting a larger number of visitors, so culture and art are more frequently interpreted as generators of economic activity or means of economic development (Cameron 1991; Garrod and Fyall 2000).

A large number of traditional vacation travels also include culture in a wider sense. Forms of offers in cultural tourism are different. Cultural resources and activities are elements of the offering and products in cultural tourism, offered on the market in the travel arrangements of tour-operators or directly from those who create the cultural offering.

As considered by Vukonić and Čavlek (2001: 167), cultural-historical tourism resources are preserved remains of past civilizations and their technological achievements, monuments and certain objects, urban integrities, artistic achievements in sculpture, painting and other fields of art visited by tourists.

According to the classification above, the resource base of cultural tourism in the areas of Zadar, Šibenik-Knin and Split-Dalmatian is rich and diverse. For the purpose of illustration: the Church of St. Donat, the collection of gold and silver of the city of Zadar, the Archeological Museum of Zadar, the Cathedral in Šibenik (UNESCO), the city of Trogir (UNESCO), Salona, the Diocletian palace (UNESCO), Hvarski ager (UNESCO), Sinjska alka, the Meštrović gallery and numerous other sites, attractions and events present exceptional potential and make an element of the cultural offering in tourism of these areas.

The diversity of the resource base of cultural tourism with its numerous variations and possibilities to transform into and offering of cultural tourism give significant possibility to become and even more important element of the offers in tourism on the areas of Zadar, Šibenik-Knin and Split-Dalmatian County.

PHYSICAL AND TOURIST MEANING OF RESEARCH AREAS IN CROATIA

A relevant research has been conducted in the area of Zadar, Šibensko-Knin and Split-Dalmatia counties. For a better insight into the physical and tourist meaning of these three counties, basic information regarding space, accommodation and tourist traffic is presented.

Zadar County

The county of Zadar stretches on the surface of 3.638 kilometres and makes 14% of the total surface of the Republic of Croatia. The length of the coast is 1300 km, in which the coasts of 365 islands are included. 162.045 habitants live in the county's area. The accommodation capacities of the County of Zadar are: hotels and tourist resorts 11,476 beds, camps 21,524 places, private accommodation 52,893 beds and 3,402 moorings in nautical tourism.

In the year 2007, 1,114,454 tourists have visited the Zadar County (10 % of Croatia), of which 876,159 were foreign. In the same period a total of 6,789,053 overnight stays were realized (11% of Croatia) of which 5,031,302 were realized by foreign tourists.

Šibenik-Knin County

The Šibenik-Knin County comprises a total surface of 5,670 square kilometres, of which 2.994 square kilometres is land surface. In the county area there are 112,891 habitants. The accommodation capacities of the county are: 8,200 beds in hotels, 48,000 beds in private accommodation, 12,400 places in camps and 300 moorings in nautical tourism.

In 2007 the county was visited by a total of 820,002 tourists (8% of Croatia), of which 682,758 were foreign tourists. In the same period there were 4,022,697 overnight stays (8% of Croatia), of which 3,453,556 were realized by foreign tourists.

Split-Dalmatia County

The Split-Dalmatia County is the largest Croatian county with a total surface of 14,045 square kilometres, of which 4.572 square kilometres is land. On the surface of the county there are 463,676 residents. The accommodation capacities of the county are: hotels and tourist resorts 24,820 beds, 12,926 camp places, 97,119 beds in private accommodation and 1250 moorings in nautical tourism.

In 2007 the Split-Dalmatia County was visited by a total of 1,656,343 tourists (16% of Croatia) of which 1,441,497 were foreign tourists. In the same period a total of 9,144,594 overnight stays were realized (17% of Croatia) of which 8,213,470 were realized by foreign tourists.

RESEARCH METHODOLOGY

The research was conducted through field testing surveys during May-September of 2007 in the areas of Zadar, Šibenik-Knin and Split-Dalmatia counties. For research purposes a survey of 48 questions (closed and open type) was used. The survey was translated into English, Italian and German.

In the first part of the survey socio-demographic data were requested (sex, age, education, marital status, number and age of children on vacation, average monthly income of the family in Euros, frequency of visits to Croatia, season in which they spend their holidays, planned duration of vacation and whether the vacation was in individual or organized form).

Other questions were grouped according to the following topics: arrival and accommodation, way of informing on the tourist destination, motivation, tradition and culture, gastronomy, friendship and hospitality, personal evaluation, the destination in general.

The research was conducted on the sample of 1346 interviewed tourists. Foreign tourists constitute 93% of the sample or 1249 persons and 93 or 7% of tourists were domestic. 636 (47%) tourists were male, and 710 (53%) were female.

37% of the total sample was tourists interviewed on the area of the Zadar County, 25 % in the area of the Šibenik-Knin County and 38 % in the area of the Split-Dalmatia County.

43% of the interviewed tourists were in the age of 18-30, 33% were in the age of 31-45, 20% in the age of 46-60 and 4% were above the age of 60.

41% of the interviewed tourists have a secondary education and 48% have a higher education. 52% were not married and 61% were without children.

24% of the interviewed tourists had the average monthly income less than 2000 Euros, and 22% more than 2000 Euros. 39% have visited the destination for the first time, but 22% of the interviewed tourists visit the same destination every year. 78% of tourists visit solely during the summer and 60% of the participants in the survey spend an average of 8-15 days on the destination. 66% of the interviewed tourists come in their personal (individual) arrangement.

RESULTS

According to the questions given in the survey, quantified results based on the answers of the participants in the survey are listed.

Motif of the visit

The strongest motif for visiting Zadarska, Šibensko-kninska and Splitsko-dalmatinska counties is the absence of pollution of the environment and the clear sea with an average rating of 4.3. The motif of visit-friendship with a local is rated with 3,7; proximity of the destination with 3.6; cost of stay with 3.5 and the possibility of doing sports and healthy living with 3.4.

Art and cultural contents as a motif of visiting have been rated with an average rating of 3.5; which is almost one value unit less than the strongest motif of visiting the area where the survey was conducted.

According to the structure of the sample, when the motif of visit is in question, artistic and cultural content is especially important to the tourists with completed postgraduate studies (24.2%) and unimportant to tourists with finished elementary school (16.6%).

There is also a difference in the average monthly incomes: the tourists with larger incomes, more specifically those with incomes larger than 6000 Euros (27%) consider artistic and cultural contents an important motif of their visit in contrary to the tourists whose incomes are less than 2000 Euros (11.8%) and consider that contents of these types are not a motif of their visit.

Visiting cultural sights and monuments during summer vacation

<i>How many cultural sights and monuments did you visit during your stay?</i>								
	<i>n=</i>	<i>s %</i>	<i>All I heard of</i>	<i>Most I heard of</i>	<i>A few I heard of</i>	<i>none, not interested</i>	<i>DK/NA</i>	<i>sig.hk</i>
<i>Country</i>	1346	100	13.2	28.4	43.3	14.7	.2	,01
<i>Croatian tourists</i>	97	7.2	16.4	25.7	32.9	23.7	1	
<i>All other tourists</i>	1249	92.7	12.9	28.6	44.1	14	.1	

Table 1. How many cultural sights and monuments did you visit during your stay

According to the results of the survey the number of those who are very satisfied and those who consider that it could be a little bit better is equal. In the group of foreigners 80% of tourists fall into this category, and those much more critical make 10%.

Men and women differ when visiting cultural monuments during summer vacation; women visit most monuments they have heard of (32.3 %), while men visit a few of those they have heard of (46.6%). Furthermore, tourists with high education (17.7%) above average more frequently visit monuments they have heard of, while tourists with secondary education do not visit any monuments because they are not interested in this area of tourism. An interesting fact is that divorced tourists (22.5%) are significantly more frequent in visiting monuments, all they have heard of, in contrary to the unmarried tourists (18.8%) that do not visit monuments because they are not interested.

Information on the traditions and culture of Croatia

<i>Were you informed enough about culture and tradition of Croatia during your stay?</i>							
	<i>n=</i>	<i>s %</i>	<i>I'm very satisfied with provided information</i>	<i>it's good, but it could have been better</i>	<i>I feel deprived because I wasn't informed enough about it during my stay</i>	<i>not interested in it when on holiday</i>	<i>sig .hk</i>
<i>Country</i>	1344	100	40.5	36	9	14.2	,06
<i>Croatian tourists</i>	96	7.1	32.2	37.5	7.2	.9	
<i>all other tourists</i>	1248	92.8	41.1	35.9	9.2	13.6	

Table 2. *Were you informed enough about culture and tradition of Croatia during your stay*

During their stay in Croatia, gaining information on the tradition and culture of Croatia was not in the field of interest of the younger (18-30) respondents (16.8%), while older tourists, over 60 years of age, 55% of them, are very satisfied with the received information. Furthermore, when it comes to education, it has proved to be statistically significant that tourists with elementary (23.8%) and high-school education (18.7) are not interested in the tradition and culture of Croatia while on vacation. Also, when it comes to the marital status of tourists, those who are married (44.2%) are very satisfied with the received information, in contrary to those that are not married (16.8%) who are not interested in that kind of information.

Description of monuments and cultural sights in brochures and guides

<i>. Are historical monuments and cultural sights well described in leaflets and guide-books, and appropriately marked on respective buildings?</i>							
	<i>n=</i>	<i>s %</i>	<i>well and interesting</i>	<i>. well enough, but it could be better</i>	<i>not attractive enough for anyone interested</i>	<i>don't know; not interested in monuments and cultural sights</i>	<i>sig.h k</i>
<i>Country</i>	1345	100	38.3	36.9	7.3	17.3	,00
<i>Croatian tourists</i>	97	7.2	22.6	36	11.3	.8	
<i>all other tourists</i>	1248	92.7	39.5	37	7	16.3	

Table 3. Are historical monuments and cultural sights well described in leaflets and guide-books, and appropriately marked on respective buildings

There is a significant difference between men and women when it comes to the description of monuments and cultural objects in brochures and guides. Women (41.3%) consider that they are adequately described, while men (19.4%) are not interested in these matters on vacation. Furthermore, there is also a considerable difference in age. Older tourist, over 60 years of age, consider that they are adequately described, as well as tourists in the age of 31-45 (42.1%). Younger tourists, 18-30 years of age, 21.5% of them, say that monuments and cultural sights are not in their field of interest while on vacation. When it comes to education, it has been proved statistically significant that tourists with elementary school education (34.1%) and high-school education (22%) are not interested in monuments and cultural sights, in contrary to tourists with higher education (39.5%) and are of opinion that they are adequately described, although they could be described better.

Also, when marital status is in question, those who are married (41.7%) consider that they are adequately described, in contrary to those who are not married (21%) who are not interested in this type of information while on vacation.

Availability of cultural sights in the city

<i>Were historical monuments and cultural sights accessible enough for seeing and visiting?</i>							
	<i>n=</i>	<i>s %</i>	<i>accessible in proper time</i>	<i>. accessible but always in improper time</i>	<i>not accessible enough</i>	<i>don't know; not interested in seeing historical monuments and cultural sights</i>	<i>sig.hk</i>
<i>Country</i>	1346	100	58.2	14.2	8.4	19	,00
<i>Croatian tourists</i>	97	7.2	43.2	12.3	.5	25.7	
<i>all other tourists</i>	1249	92.7	59.4	14.4	7.6	18.4	<i>w1</i>

Table 4. Were historical monuments and cultural sights accessible enough for seeing and visiting

The results show that a relatively high number (22%) of tourists considers that monuments are available in the wrong time or are not available enough.

Men are not interested in cultural sightseeing (21,8%). Age has shown to be a significant indicator; younger (18-30) tourists (22, 7%) do not show interest in cultural sightseeing while older tourists (46-60, 63% of them) consider them to be available in the right time. When it comes to education, it was proven statistically significant that tourists with elementary (28,5%) and high-school education (23,3%) are not interested in monuments and cultural sights, in contrary to tourists with high education who find that the monuments are available in the right time. When it comes to the marital status of the tourists, those who are married (62,4%) consider the monuments to be available in the right time, in contrary to the divorced tourists (18,7%) who consider them to be available, but always in the wrong time, and 22% of tourists, who are not married, are not interested in cultural sightseeing.

Cultural sightseeing in the city

	During cultural sightseeing did you feel lack of:							sig.h k
	n=	s %	. expert guidance and interpretatio n	. information possibilities about cultural monuments through leaflets, brochures and books	. information possibilities about cultural monuments through CDs, films and other types of multimedia presentations.	don't know; not interested in cultural monuments and information about them	DK/N A	
Country	1346	10 0	21.3	28.6	17.4	32	.4	,34
Croatian tourists	97	7.2	14.4	27.8	21.6	35	1	
all other tourists	1249	92. 7	21.9	28.6	17.1	31.8	.4	

Table 5. During cultural sightseeing did you feel lack of

The research shows that both foreign and local guests equally felt the lack of flyers, brochures and books on cultural monuments. The tourists have shown a special interest for CDs, film and multimedia on the cultural monuments of the city, which is in accordance with the high percentage of Internet usage.

When it comes to this issue, women (31.5%) missed the possibility of informing through flyers, brochures and books for the purposes of cultural sightseeing, in contrary to the 35% of men who are not interested in sightseeing. The age of tourists has shown to be interesting; older tourists (over 60 years of age, 35%) missed during cultural sightseeing professional guidance and explanation, and 32.7% (age 40-60) missed the possibility of informing through flyers, brochures and books. Those tourists whose monthly income is between 4000-6000 Euros missed professional guidance and explanation, in contrary to those tourists with incomes bigger than 6000 Euros, who missed the possibility of informing through CDs, film and other multimedia.

Organizing workshops for tourists on cultural history, monuments and painting

<i>Do you think tourists would be interested in organized workshops about cultural history, monuments and art</i>								
<i>Country</i>	<i>n=</i>	<i>s %</i>	<i>. yes, I think it would be very interesting</i>	<i>yes, but in low season</i>	<i>. no, I think it would be boring</i>	<i>don't know; not interested in that kind of offer</i>	<i>DK/NA</i>	<i>sig.hk</i>
<i>Country</i>	1346	100	39.8	21	10.4	28.2	.3	,74
<i>Croatian tourists</i>	97	7.2	44.3	22.6	8.2	24.7	0	
<i>all other tourists</i>	1249	92.7	39.5	20.8	10.6	28.5	.4	

Table 6. *Do you think tourists would be interested in organized workshops about cultural history, monuments and art*

The interviewed tourists have shown great interest (40%) for workshops on cultural history, monuments and painting. What is interesting is that 20% of them would prefer them to be off season.

There are significant differences between men and women; women (43.6%) find it would be interesting to organize professional workshops for tourists on cultural history, monuments and painting, while 33% of men are not interested in this type of offering. Education has also showed significant differences; those participants with finished postgraduate studies (47.6%) find that it would be interesting to organize such workshops, in opposite to 24.6% of participants with high education who are also interested, but off season, and tourists with finished high-school who are not interested in this type of offering (32.6%).

Services of a cultural guide

	<i>. Did you use the service of a tour guide?</i>						
	<i>n=</i>	<i>s %</i>	<i>yes, every time</i>	<i>sometimes</i>	<i>never</i>	<i>no, because I didn't go sightseeing</i>	<i>sig.hk</i>
<i>Country</i>	1346	100	10.5	26.4	46.8	16.1	,00
<i>Croatian tourists</i>	97	7.2	0	20.6	55.6	23.7	
<i>all other tourists</i>	1249	92.7	11.3	26.9	46.1	15.5	

Table 7. *Did you use the service of a tour guide*

According to the results of the survey a smaller number of tourists used the services of a tourist guide. There are differences between sexes as 49.7% of women never use the services above, while 28.9% of men sometime use the same services. Furthermore, the marital status has also shown as a significant indicator because 28.1% of divorced participants use the services of a tourist guide every time, in opposite to 18.7% of tourists that are not married who do not use the services of a tour guide because they do not engage in sightseeing. As far as monthly incomes go, the tourists with the average monthly income between 2001 and 4000 Euros (15.2%) use the services of a guide every time, the tourists with incomes between 4001 and 6000 Euros (37.2%) sometimes and the tourists with incomes lower than 2000 never use the same services.

Satisfaction with the level of service of a tourist guide for cultural monuments

Were you satisfied with the level of service offered by the cultural tour-guide?								
	n=	s %	yes, he/she was educative and communicative	partly yes, because I didn't find out enough	not satisfied at all with his/her knowledge	don't know, I didn't use the services of a tour guide	DK/NA	sig.hk
Country	1346	100	24.5	12.2	2.3	60.5	.2	,01
Croatian tourists	97	7.2	3	11.3	2	76.2	0	

Table 8. Were you satisfied with the level of service offered by the cultural tour-guide

Satisfaction with the service of tourist guides is bigger with older tourists (46-60 years of age, 27.8%), who find that their guide was educated and communicative, in contrary to the younger tourists (18-30, 3.4%) who are not at all satisfied with his knowledge. The tourists who are divorced (38%) find that their guide was educated and communicative, in contrary to the tourists who are not married; they are partially satisfied because they have not learned enough (13.8%). When it comes to monthly incomes, the most satisfied tourists are those with incomes between 40001 an 6000 Euros (37.2%) because they consider that their guide was educated and communicative.

Prices of cultural contents

Prices of cultural contents									
	n=	s %	too high	average	favourable	never used it	don't know / cannot say	DK/NA	sig.hk
Country	1345	100	3.7	32.2	35.7	9.6	.1	18.3	,51
Croatian tourists	97	7.2	3	39.1	34	11.3	0	12.3	
all other tourists	1248	92.7	3.8	31.7	35.8	9.5	.1	18.8	

Table 9. Prices of cultural contents

A third of the interviewed tourists have stated that prices of cultural contents is average and 36% have stated that the prices are affordable, and only 4% consider the prices to be too high.

DISCUSSION AND RECOMMENDATIONS

Based on the stands and opinions expressed by tourists, participants of the research, it is possible to give a certain analysis of the research results. We also find it useful to propose, based on this, certain measures and activities that would improve the offer of cultural tourism on the areas of Zadar, Šibenik-Knin and Dubrovnik-Neretva counties.

1. Art and cultural contents as a motif of visiting has been evaluated by tourists with an average rate of 3.5. The value of this motif is in the centre of the value scale.

When the motif of the visit is in question, the artistic and cultural contents are especially important for tourists with the highest level of education - completed postgraduate studies and monthly incomes larger than 6000 Euros.

Hence, the high educated tourist with above average monthly income is the market segment that is especially turned towards the offers of cultural tourism.

2. The number of those who are very satisfied and those who consider it could be a little bit better when it comes to information on the tradition and culture of Croatia, is equal.

During their stay in Croatia, the younger tourists are not interested in obtaining information on the tradition and culture of Croatia, while the older tourists, over 60 years of age, are very interested and satisfied with the obtained information.

Regardless of the achieved level of being informed about the tradition and culture of Croatia the research shows the need for even more intensive activities and the use of various media for the purpose of better informing the tourists on the offers of cultural tourism.

3. The interviewed tourists with high education, who are particularly relevant, find the description of monuments and cultural sights in the leaflets and guides to be good enough although it could be better. This "although it could be better" means that the interpretation of the offers of cultural tourism still is not on the level it belongs to, given the quality and variety of this type of offering in the areas of Zadar, Šibenik-Knin and Split-Dalmatia counties.

Therefore, regardless of the media through which information and description of the monuments and cultural objects is transmitted, it is necessary to do this in a more adequate manner with a bigger level of professionalism in forming information, where structure of the tourist boards and subjects of the offering of cultural tourism hold a special role and responsibility.

4. A relatively large number of tourists gave their opinion that the offering of cultural tourism is available in the wrong time or is not available enough. This indicates a necessity of a serious reconsideration of working hours and organization of work in cultural tourism, especially during the main tourist season.

5. The research shows that both foreign and local guests equally felt the lack of flyers, brochures and books on cultural monuments. Tourists have also shown a special interest for CDs, books and multimedia on city cultural monuments, which is in accordance with the high percentage of Internet usage. This indicates a much more intense engagement of local tourist boards but also economic entities engaged in publishing activities, on the creation and publication of new informative media.

6. The interviewed tourists have shown a great interest in the organization of a workshop on cultural history, monuments and painting. It is interesting that about 20% of them would prefer these workshops to take place off season. This is an extremely valuable indicator of the possibility to prolong the tourist season and organize new forms of offers in cultural tourism.

7. The satisfaction with the services of tourist guides is greater with older tourists, who consider their guide to be educated and communicative, unlike the younger tourists, who were not at all satisfied with their guides' knowledge. In the program and process of educating new generations of tourist guides this should be considered since it is obvious that new generations of tourists have different needs in guiding and presenting the offers of cultural tourism than the older generations of tourists.

8. Results of the research have shown that the prices of cultural content are average and affordable. This means that the existing offering of cultural tourism is cost-wise competitive but with a constant improvement of its quality and availability. In order to achieve that, the local government, subjects of the offers in cultural tourism and the tourist board structures must be included on all levels.

CONCLUSION

The offering of cultural tourism has realistic basis for a larger proportion and meaning in the whole tourist offering of Zadar, Šibenik-Knin and Split-Dalmatia counties.

However, the researches in this paper prove that it is necessary to take a number of actions to improve the existing level of presenting and valorising the offers of cultural tourism, where the culture, given the resource base, take the more significant role in the whole tourist offering of the three Dalmatian counties.

It was shown that there is a significantly greater need of tourists for a more detailed and more information in general, in various media, on the tradition and culture of Croatia.

Organization of work and working hours, cultural institutions, sights and all subjects of cultural tourism has shown to be inadequate to the needs and demands of tourists. If a "harmonious relationship" of tourists and the offers of cultural tourism are wanted, these differences need to be coordinated.

The need of tourists to participate, even off season, in the workshops on cultural history, monuments and painting, have shown to be a significant fact in creating and organizing special forms of offers in cultural tourism in the future.

Education of new generations of tourist guides need to be adjusted to the needs of new generations of tourists.

The research proved that the offering of cultural tourism, regarding prices, is competitive and that prices are not a limiting factor of the wholesome tourist spending that takes place in cultural tourism.

Cultural tourism in the areas of Zadar, Šibenik-Knin and Split-Dalmatia has a large and valuable resource base, attractive locations, monuments and events - an excellent offering.

With a better organizational form and with the inclusion of all subjects in the field of tourism in its evaluation, it is possible to expect greater effects on cultural tourism in the entire process of development in these areas.

NEURAL NETWORKS AND PRICING STRATEGIES

Reitano, Antonella¹; Pasqua, Francesco¹

¹University of Calabria, ITALY

This paper aims at answering the following question: “what price should be set for the products a company wants to market?”. This decision is very critical because price can directly influence sale proceeds and marginal revenues.

In this paper we propose a new method for the prediction of market price, that is analytic and can consider intangible variables at the same time. In particular, we used neural networks, able to be trained on the basis of a definite topology, in order to have an output with the expected characteristics.

Regarding the predictability of market prices, results have been positive and characterized by a low mean square error. Therefore, neural networks can be used in order to output a prediction of the market price of the analyzed products.

This method for the price setting has been used here for the first time and, because of its efficacy, can be also used in different fields (i.e. as a support to the investment decision). Moreover, it can be compared to other methods present in literature, which are cost, competition, or customer-oriented.

Keywords: Neural Networks, Pricing, Data Mining, Simulation.

INTRODUCTION

Pricing policy is an essential component of a company commercial strategy, and price making often becomes a critical decision in the bringing out new products. Companies aim at foreseeing both sales at a certain price level and the average unit cost of production. Their management set a price that has the maximum difference between the price level and the average unit cost of production, in order to maximize profits. When the expected demand is overvalued, costs are higher and companies could have a loss. However, if the expected demand is correctly foreseen, but customers believe that the price of the product is too high, sales will be low: this will happen mainly because the competitors' product has a lower price (Bolton *et. al*, 2003). Thus, price setting is a critical decision, determining the company profit margins, its earning power, products and brands replacement, market and competitive advantage (Kotler and Keller, 2008). In this study we analyzed the importance of money in the buying process in a competitive environment based on the life cycle of a product. This research highlights the chance of using price as a strategic variable, and it analyzes pricing policies and objectives. Several methods of price determining have been analyzed. Each method is characterized by advantages and disadvantages: some of them are too based on costs, others are too subjective or complicated to use.

This paper introduces a new method for price setting, which employs a *neural networks* approach. This involves the construction of a mathematical model which, depending on input variables, simulates a value corresponding to the market price of product. The case study presented in this paper is based on a high-definition televisions market. The aim behind this case study is the determination of the neural networks contribution to the modelling price

settings, as well as its practical relevance in opposition to the theoretical relevance. Our experiment uses neural networks with regard to price setting and marketing decision support. In order to achieve this objective the HD television industry has been examined. A representative database modelled on this industry was re-created, and, basing it on a neural network approach, it was applied to determine the market price of a new product. Then the method here used has been compared to that used in academic literature. A *two layers networks* approach has been put forward, as it allows the acquisition of important information. Finally, the results have been analysed with regard to their relevance to the examined industry and some future development of this research has been suggested.

NEURAL NETWORKS AND PRICE SETTING

The methodological approach used in science-engineering to deal with the outside world is based on the construction of a formal model or an abstract representation that characterizes a real-world phenomena (Reitano, 2003). Formal models may simplify external behaviour by allowing the prediction of responses to particular input without operating on the real system (Reitano, 2006).

This conclusion justifies the wide engineering efforts in this direction, since the management and control of complex systems behaviour have always been considered a strong challenge. The implementation of models, or the whole activity performed in a computational analysis of models, is called simulation.

Simulation

Simulation is the result of the development of the information technology, that make possible a series of calculations necessary for the mathematical representation of a complex system. High Performance allows the highlighting of physical, economic or social aspects, becoming a very important tool for corporate management (Lehnard *et al.* 2006). In fact, simulation is applied to problems such as:

- Prediction of climate change;
- Design of new materials or new products;
- Simulation of crash tests and endurance tests of finished products;
- Design of plant layouts through the simulation of people movements inside the building;
- Credit-Risk Evaluation (Baesens *et al.*, 2003)
- Predicting performance stocks, forecasting investment, business games, analysis and forecasting consumer behaviour.
- Identification of households that are interested in a particular product or service (Kim *et al.*, 2005)

Simulation is often the only technique applicable in order to study complex systems. This occurs when it is not possible to obtain results through an analytical approach. Since this

situation happens very often, simulation is one of the most used approach for solving scientific and engineering problems. An alternative could be to realize simulation experiments on real systems, but this is often impossible or very inconvenient. Using tools and techniques based on simulation algorithms, it is important to not confuse the model system with the real one, because the model system works only under certain conditions. Moreover, if the experimental conditions are not present, the model loses its validity in terms of prediction. In other words, results could be completely different from those the real system returns applying the same input (Haykin, 2008).

Symbolic approach vs connectionist approach

Mathematical modelling is a part of an industry based on the representation of reality through symbols and operations performed on them, designed to solve problems or to define models with precise mathematical formalism. This approach is called symbolic. It is based on a chain of deductions and it is suitable for processes of conscious intelligence, typical reasoning of experts or demonstration of theorems. However, many other intellectual processes, such as the recognition of images, as well as audio or sensory-motor coordination, do not seem to be based on the logic characteristic of a symbolic approach. In fact, it's more probable that the recognition of images can be performed using an associative memory or a self-association that in correspondence to an input $X + \text{noise}$ returns a purified input X . Thus, when listening to the voice of someone, we sense information such as sex, age or humour, or when riding a bicycle we can avoid obstacles and or maintaining balance, it is impossible to explain such things using a symbolic approach, because of both the quickness in decision making process and the impossibility to explain how and why. Regarding the identification of what turns inputs into outputs reproducing them artificially, the Connectionist approach draws its inspiration directly from brain neurophysiology (Haykin, 2008). This approach involves the creation of an artificial neurons network, connecting non-linear elements with multiple inputs, and having only one exit. The elements receive input data and they return an output, that can be directed to the external, or can be directed to another neuron. This network is able to learn: learning takes place by an auto configuration in which the changes to the network topology are realized on the basis of an analysis of a predefined set of input-output pairs. Therefore neural networks are able to compare new situations, overcoming the limitations of a symbolic approach. Moreover, according to their ability to evolve, neural networks are very important in the field of simulation, and they are used in various fields as financial analysis, process control and marketing (Cui and Wong, 2004).

Neural calculation

Calculation is based on the construction of a neural network composed of a wide number of elementary components such as neurons. This architecture is directly inspired by the whole of nerve cells that make up the human brain (Werbos, 2009). The number of neurons constituting brain is around one hundred billion, and each neuron is connected by synapses with tens of thousands neurons, for a total of millions of billions of connections (Hopfield, 1982). A neuron is formed from a body cell (the soma), which branches out in order to form multiple nerve fibres connected to other neurons. The kind of contact between two neurons can be excitatory or

inhibitory. Therefore each neuron is characterized by a state of arousal or quiescence: the neuron is excited when the total stimulation caused by other neurons exceeds a certain threshold (this threshold can be variable and depends on many factors). When stimulated, the neuron gives an electrical signal that spreads along the nerve fibres and comes into a synaptic contact with other neurons. However, neurons can also stimulate muscles, as in the case of motor neurons. Therefore human brain can be defined as a system receiving input information from outside by senses (i.e. taste, smell, touch). The neurons propagate the signal to the sensor, which in turn stimulates the muscle to act the desired action. It is important to note that no individual neuron is characterized by a great performance, and thus the complex operations that human brain is able to play are due to the large number of neurons and connections between them rather than the intrinsic capacity of each neuron. Thus, the characteristics of the connectionist paradigm are the following:

- High number of elementary particles;
- Interconnection of each component with many other components;
- A simple basis structure which is not able to perform complex tasks or operations
- Changeable connections

It is important to underline that, if the network can change its structure, then it can learn. This happens through a feedback mechanism, where the minimization of an error is measured as the difference between the real system output and the model output. This kind of architecture has inspired the development and construction of the artificial neural networks. Moreover, neural networks can reproduce decision-making operations, typical of human logical reasoning (Terna *et al.* 2006), and can solve problems such as the forecasting of stock prices, the prevention of fraud, the development of activities, the routing and scheduling in manufacturing and transport, financial analysis, character recognition, and the prediction of consumer behaviour (Shaw *et al.*, 2001). However, these topics will be widely discussed in the following chapters.

Operation of a generic neural network and methodological application

A generic neural network can consist of several layers, including an input layer (which relates to the data input), some layers in between (usually not more than two), and an output layer that provides the results calculated by the network. Network connections are characterized by weights, usually expressed as a number between 0 and 1. These weights are determined through a process of training based on a data set (called training set) and a learning algorithm. The neural network evolves dynamically toward a final state of equilibrium that represents the ability to solve a problem (Bishop, 1995). Learning process may be very long and, in the case of an inadequate architecture of a network or algorithm, the system could not converge or manifest behaviour oscillations. However, when learning process works, synaptic weights are blocked, and the network works only by the law of activation. Thus, starting from an initial state representing the initial data of the problem, the network evolves towards a final solution of the problem (Hornik *et. al.*, 1989). Furthermore, in the case of an ineffective learning, the final status could be both non-significant and far from the absolute best level.

In conclusion, the first step is represented by data acquisition problem. Each neural network works only if it is trained on a set of examples from reality, used as a reference. This phase is usually the most difficult because data are not immediately available. After the acquisition of data, they are pre-treated in order to arrange a proper functioning of network. Then, data are adapted in order to generate an appropriate input for the network, and then appropriately scaled in order to have the same range and standard deviation. Regarding scalar data, it is necessary to add or subtract a constant, and subsequently divide and multiply by a constant. Scaling is used when, for example, it is necessary to change an unit for measurement data. Other operations are normalization and standardization. Normalization means to divide the elements of the vector for their rule so that they are in a range between 0 and 1. Moreover, regarding the standardization of the elements of a vector, it is necessary to subtract the mean and divide by the standard deviation. In this way the elements correspond to the instances of a random variable with mean 0 and standard deviation 1. These operations are necessary because they greatly influence the convergence speed of the back propagation algorithm. After the building of the database, it is necessary to divide the examples in sets of Training, Validation and Test. The training set is used to train the network, the validation one is mainly utilized in order to understand when it is necessary to stop the training, and the Test one is used for the network final test (in order to assess its performance before an use application). It is not necessary to use all the patterns for training, because a selection of them is sufficient to cover the whole range of output. Furthermore, it is important to identify:

- Network Topology
- Input unit number
- Output unit number
- Intermediate unit number
- Kind of activation function
- Kind of output function
- Learning Algorithm
- Starting weight value (random assignment mode)
- Weight update modality

After that, the true training can start, ending when the error on the validation set is minimum. For each considered network and cycle of training, all the training set patterns are put in the network and the output value, calculated by the network, is compared with the prefixed value. The calculated error is used to modify the weights of the connections as well as to control learning network using the Mean Square Error (MSE). MSE is calculated on the validation and test set: if these values are close, the network properly works and it is possible to implement and use it; if it does not work, it is necessary to correct the training, the validation and the test sets, as well as the pre-treatment of the data, the network architecture, or the choice of variables (Bishop, 2006).

THE IMPORTANCE OF PRICE

Price strategies have a great importance in economic and financial relations. They govern companies and exchange processes with consumers. In fact, in company's economy, "price is a key variable of a Profit equation", and it affects immediately the result (Valdani, 1989).

Buyers react to sale price with purchase options that determine the competitive positions of enterprises and their income trends from the medium to the long term (Vanhuele *et al.*, 2006).

This implicates that pricing is a critical decision, and it depends on the margins of contribution, economic business, perceptual positioning of products and brand (Schindler, 2006), and the competitive relations with other competitors. In addition, price is a Marketing variable characterized by a great flexibility, because it is quicker and easier to manipulate if compared to any other conventional action. Moreover, it is the only lever that immediately generates revenues (Rao, 1984), rather than others that generate only short-costs. Historically, price is one of the most discussed variables; in the past, products were very standardized and the only factor of distinction was price, expressed in quantitative terms that allowed the application of quantitative methods in order to study the economic indicators in the medium-long-term period. Pricing mainly consists in the quantitative monetary transposition of the value of the product offered by the company to customers (East *et al.*, 2009). Therefore, sale price has a dual meaning: on one hand it is the sacrifice that the customer bears for purchasing the property, and on the other hand it is the return of the efforts sustained for its production and marketing. Using a concise representation (Valdani, 1989):

$$\text{Price} = \frac{\text{Goods and services offered by the seller}}{\text{Money or products and services provided to the buyer}}$$

The concept of money is wide, and it means more than the simple combination of objective and quantitative. From the customer point of view, price can be defined as (Lambin, 2008):

$$\text{Price} = \frac{\text{Collection of monetary and non-monetary sacrifice}}{\text{Collection of satisfaction}}$$

For a long time price has been considered the only tool available for a company's competition. In fact, it is essential for the establishment of competitive business strategy, and it is important in order to correlate the degree of concentration in the sector and level of differentiation in demand (Kotler and Keller, 2007). Thus the importance of choosing an appropriate price is the result of both the companies number in a sector and their possibility to differentiate the offer on other parameters of action (Mazumdar *et al.*, 2005). If the market is highly standardised, price becomes the primary competitive variable, while in competitive situations, characterized by high heterogeneity of the application, the relevance of price is definitely the most contained. Although, in areas where market power is based on the ability to satisfy an heterogeneous demand through strong qualitative differentiation of offer, price can still strongly affect perceptions of value for consumers and market dynamics (Busacca *et al.* 2004).

THE OBJECTIVES OF THE RESEARCH

Experiments with neural networks have the objective to demonstrate their own validity in terms of market price predictions.

There are many methods in literature that allow a prediction of price, but each has some weaknesses that make them not reliable in some goods sectors. The proposed method does not aim at substituting the current ones, but it can be considered an effective alternative to be used

in the opportune contexts, such as those where it is possible to quantify a great part of products value parameters.

In order to declare the efficacy of this methodology we realized an experiment on a real case, observed the medium square error obtained by the network, and measured it as a difference between the prices calculated by the network and real prices.

THE EXPERIMENT

Neural networks can be used as a support for testing laboratory in economic field. With this new implementation, economic research comes into possession of completely new instruments, which could lead analysis to the theoretical boundaries of traditional schemes (Fabbri, Orsini, 1993). Neural networks, by their nature, bring into question the formal approach based on perfect rationality economic operators and the formulation and solution of problems of constrained optimization. This phenomenon is considered a methodological revolution: in fact, in the past, traditional methods were completely set on a logical-deductive approach and suffered, therefore, its characteristic limits. The use of neural networks allows to emulate the functioning of human brain, and, therefore, to analyze human behavioural processes such as, for example, given by consumer during purchase process. It can be said that functioning of neural networks in economic field is governed by the rationalistic and evolutionary processes that are a way of formalizing conditions of limited rationality, in which traders do not have any information on which to base their decisions, and any capacity to provide to future outcome of their actions (Kohl and Miikkulainen, 2009).

In this study, neural networks have been used as a methodology to determine price and to support marketing decisions. Neural networks approach has been applied to the LCD/plasma television industry. This market was selected because of data availability in numeric format, which simplifies the data collection and facilitates stringent and accurate simulation process. Each aspect of the product, which was used as model input, has been analysed with particular reference to: dimensions, contrast ratio, brightness, response time, 100hz technology, view angle, presence of digital tuner and power consumption. All variables mentioned above were normalised in order to adopt value between 0 and 1. This study was based on companies which are in competitions, and their products and services were perceived by consumers to be substitutes. The HD televisions industry is dominated by a few big companies, which often also partner to produce LCD panels together. Our study was based on consumers' perceptions about brands and product quality of eight leading companies. The target of the investigation was composed by men aged from 25 until 65 years old that were about to buy a hd television. The survey has been analyzed as input to the neural network and in order to realize a perceptive map.

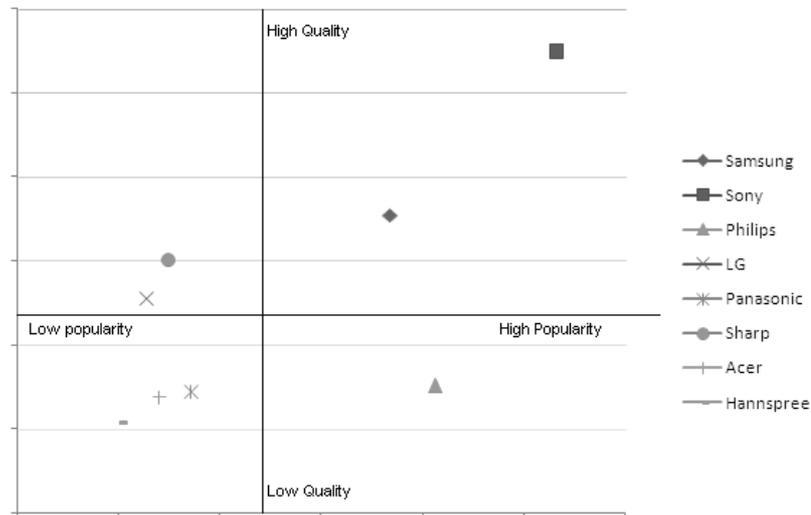

Figure 3 – Brand Perceptive Map

Results were calculated by associating a numerical value from 1 to 8 brand based on the location data of interviewees (thus a low value would be paid an high popularity/Quality). Later it has been calculated an index and a reverse rate that allows you to have an immediate vision of results. From Figure 1 it is immediately observed that SONY is the brand that enjoys the greatest popularity and greater confidence to customers, on the contrary the Hannspree company is almost unknown and, probably for this reason, the interviewees have also associated a low quality. Some products, one for each brand, having very similar characteristics, were observed focusing on prices charged by different companies. Through this survey it has been possible to develop another perceptual map on a board with the economical aspect and qualitative aspect.

It can be seen that companies that offer a low quality (in the view of respondents) engaged in a price better than their competitors. Sony is without doubt the company with the higher rank, and it could still keep the price competitive position in the quadrant of excellence, together with Samsung.

The Final Result

This simulation has been developed using a database divided in the following percentages for the different wholes:

- 79 % training set
- 12 % validation set
- 9% test set

Networks, that are different for the hidden units number, have been prepared with the joint use of JavaNNS and batchman, choosing, finally, the one that could guarantee the lower mean-square error on the validation set. Different experiments have been made, modifying, from time to time, some of the parameter values as the learning rate of the EBP algorithm.

The best network is BOT_9.net

Test set results: SSE=0.00772077 MSE=0.000857863

Validation set results: SSE=0.0076609

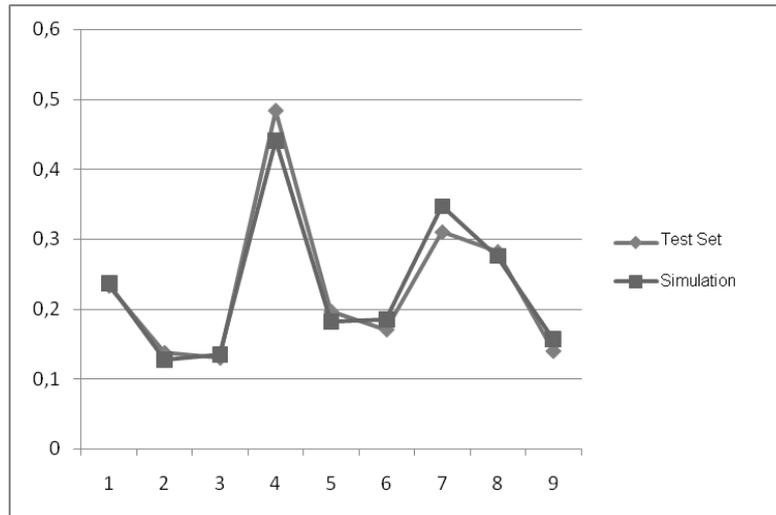

Figure 4 – Network Behaviour on Test Set

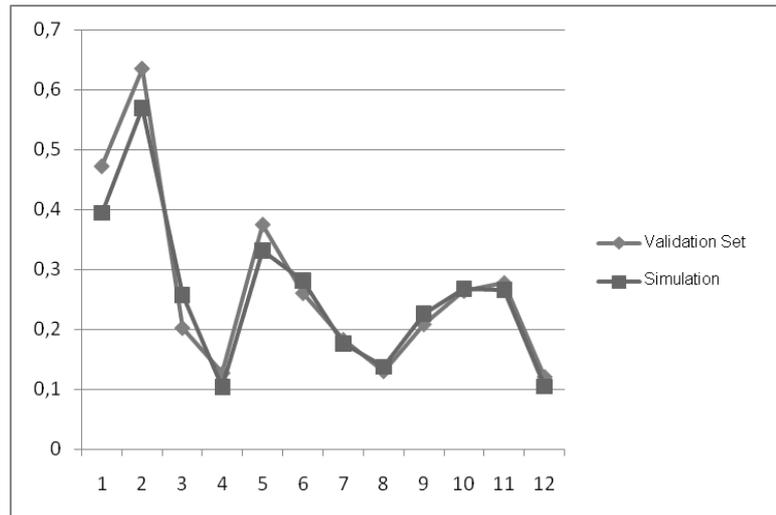

Figure 5 – Network Behaviour on Validation Set

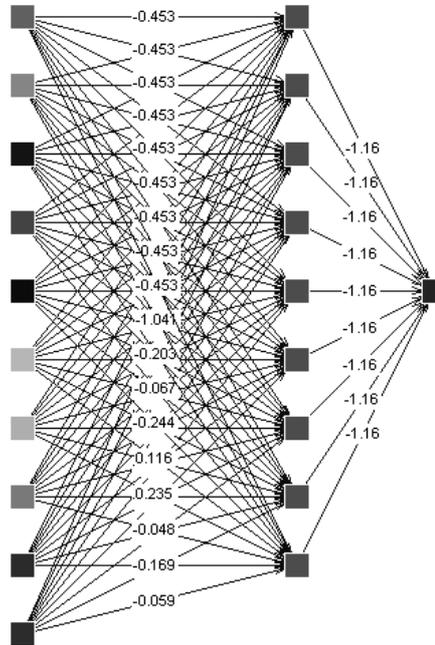

Figure 6 – Network Topology

Investigations have proved that trained networks with a learning rate equal to 0,2 give better results referred to its lower error level on the validation test and on the test set. The result proves that the network is able to determinate the price of a television that wasn't absolutely considered during the learning process and, thus, it is equipped of generalization characteristics. Consequently, it is possible to affirm that an approach based on neural networks can be used to solve the problem of the price making and it turns out being very effective and analytically precise as well. At the same time, the approach to neural networks takes into account also intangible characteristics (popularity and quality). A table has been elaborated to compare neural networks approach to the more used price making methods, and it has been possible to ascertain that the neural networks method gives an excellent precision/effectiveness and complexity/cost ratio. Subsequently, an experiment with a perceptron has been realized, in order to have the possibility to infer information about the relative importance of the performance characteristics used to set the final product's price. Calculating the potential as the sum of the inputs weighted with the connection weights, setting the threshold value to zero and using the identity function as output function, it is reasonable to presume that weights could give information about the incidence on price making of correlated characteristic.

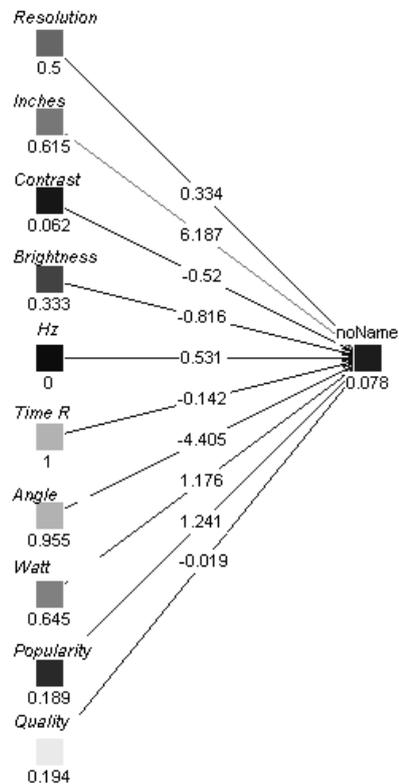

Figure 7 - Perception 10 neurons

The experiment has immediately shown, as it was reasonable to expect, that the most important characteristic is the panel dimension in inches, that determines almost proportionately the television price. In fact, the network sets a very high value to the weight correlated with it. A second experiment has been made isolating the inches characteristic and building a training set with televisions with the same dimensions. From this second experiment it is clear to understand that if all circumstances are equal, the panel resolution is the parameter that influences the price, immediately followed by the contrast. In addition, it is clearly visible that both in the first and the second experiment, parameters (i.e. the view angle) do not minimally influence price, as it has been foreseen during the study of the product characteristics. Thanks to this approach it is possible to obtain the relative importance of each characteristic and this could be useful in many applications. For example, during a business game study and realization, one of the biggest difficulties is very often represented by the individuation of the values that the system parameters have. In fact, these parameters define the weight of each state variable in the determination of other state variables. In this view, the potentialities of neural networks are very interesting, because numerous applications are possible. In fact, information elicited by these experiments can be used to take decisions about hypothetical investments on the characteristic of a value instead of another one. In our example television makers tend to disregard parameters as brightness or view angle, taking advantage of others, as for example dimension and resolution, that guarantee a bigger return rate. In conclusion, the experiment

about two layers networks has spotlighted some of the offered peculiar characteristics of HD television industry and has shown that neural networks can be a useful tool in the business decisional processes.

CONCLUSIONS AND FUTURE RESEARCH

This study suggests that neural networks can be a powerful tool in decision making in economics, and in particular regarding price setting. This is confirmed by the little mean square error obtained in the simulation on the test set. It has to be specified that error entity can be influenced by inaccuracies during data-gathering. In fact, some of the information obtained on the internet could be obsolete, and can not correspond to the current selling price (Zettermeyer *et al.*, 2006). This temporal incongruity between current dates and those that are not updated could influence the simulation process, with a peculiar error that cannot be linked to the network nature, but connected to the inaccuracies of patterns used during the training. Therefore it can be concluded that, in further more precise and expensive market researches, the neural network tool could have a very low error value, improving its effectiveness and precision. Consequently the neural networks method can be considered together with the methods that are already present in literature.

The capacity of understanding the information as the perceived value of the product is very important for the companies of new economy. It is necessary to consider the possibility of a company to compare internal costs with market price (the maximum applicable price) and to draw conclusions about profit margins or disinvestment decisions. Fabbri and Orsini affirm that the chaotic phenomena emerging in non-linear dynamic systems can be completely understood only with math tools or with simulative tools. In fact, these tools are able to reproduce faithfully the complexity of the phenomena. It seems that neural models can meet these requirements and it is possible to affirm that they are going to be used in many researches and applications for the investigation and the comprehension of economic system complex structure.

A NOVEL APPROACH FOR SIMULATING ENTERPRISE NETWORKS AND CLUSTERS

Remondino, Marco¹; Pironti, Marco²

¹University of Turin, Italy

²University of Turin, Italy

Purpose - The goal is to study the formation of clusters of enterprises and to verify how competencies spread over and modify the network, in order to supply a tool for managing inter-firm joints and collaborations.

Design/methodology/approach – The work deals with an agent based model used to simulate and analyze the dynamics behind networks districts and clusters creation and modification. This tool can be used to show the effect of a different managerial strategy (internally Vs externally focused) on a network of enterprises. The enterprises are endowed with a certain number of internal competencies and can decide to carry on a cooperative managerial strategy , in order to fill their gaps; a metaphor is used, in the form of “heat”, representing how much the enterprises are rewarded for the competences they can use, with a different weight for external or internal ones. The enterprises can explore the territory to find complementary competences (thus forming links) or exploit their current competencies to form new ones internally (internal exploration).

Findings – The model is comprehensive and its scope is wide. Qualitative results are described, reflecting current state-of-the art theories.

Originality/value – The presented framework help studying the dynamics of network formations among enterprises. It constitutes for Social Sciences the equivalent of lab experiments for such discipline as Physics or Chemistry.

Paper type Research paper

INTRODUCTION

Firm’s productive opportunity is defined as possibilities for deploying resources that its entrepreneurs and managers can see and which they are willing and able to act on (Penrose, 1959). These conditions take firms face an important strategic dilemma. On one hand, exploiting existing competencies may provide short-term success, although competence exploration can become a hindrance to the firm’s long term viability by stifling the exploration of new competencies and the development new resources (Levinthal and March, 1993). On the other hand, deploying resource combinations as a form of external exploration search inherently mitigates the risk of failure by making the new combination perform in ways that firms in the mainstream market already value, while deploying resource combination as a form of internal exploration may dramatically enlarge the set of all possible deployments that are within someone’s ability and means to execute, increase the number of productive possibilities, and enable new market application to emerge (Hult, David, Ketchen and Slater, 2005).

The growth and development of a firm depend, therefore, on its ability to develop new capabilities and resources and introduce them in the market (Dougherty and Hardy, 1996). Thus, two different types of exploratory behaviours are involved in deploying new resources combination (Nerkar and Roberts, 2004). The first one is internally focused, when firms can

explore new resource combinations by using their research and development activities (Treece, 1982). On the other hand, externally focused firms can search along the value chain, using the range of complementary assets that results from participation in the competitive arena (Day, 1999). The effects extend, through network externalities, to others with whom the learning organization interacts (Katz and Shapiro, 1986). Reason inhibits foolishness; learning and imitation inhibit experimentation. During external exploration, each firm can reshape its communication and learning ego-network of relationships as result of the decisions to acquire new competencies. Network change consists of changes in the number of actors (exit and entry), and changes in number and patterns of link information. The network can expand, churn, strengthen or shrink. Each network change is brought about by specific combination of changes in tie creation, tie deletion, and by changes in an actor's portfolio size (number of link) and portfolio range (numbers of partners). Philippen and Riccaboni in their work on "radical innovation and network evolution" focus on the importance of local link formation and the process of distant link formation. Regarding the formation of new links, Gulati (1995) finds the process of new tie creation to be heavily embedded in an actors' existing network. This means that new ties are often formed with prior partners or with partners of prior partners, indicating network growth to be a local process. Particularly when considering inter-firm alliances, new link formation is considered risky and actors prefer alliances that are embedded in a dense clique where norms are more likely to be enforceable and opportunistic behaviour to be punished. Distant link formation implies that new linkages are created with partners who are not known to the existing partners of an actor. At the level of the firm, Burt (1982) shows that distant linkages that serve as a bridge between dense local clique of firms, can provide access to new source of information and favourable strategic negotiation position, which improve the firms' position in the network and industry.

The main goal of this paper is to introduce a computational model to be used as a tool for studying and analyzing the effects of different managerial behaviour (externally or internally focused) on enterprise clusters and, at the same time, to explore the effects of innovations on the network itself. The internally or externally focused behaviours have a very different impact on the clusters formation, along with a series of parameters included in the model.

ENTERPRISE AND BUSINESS CLUSTERS

Clustering is definable as the tendency of vertically and/or horizontally integrated firms in related lines of business to concentrate geographically, or, to a more general extent, virtually.

Cluster policies are an example of pro-active industrial policy with shared responsibilities among actors; besides, the agglomeration of firms and their suppliers can confer competitive advantage to the enterprises involved.

There are many social and economic reasons leading to clusters creation. The main economic drivers of cluster formation in particular industries include: proximity to markets. Despite low-cost international transportation, being near to markets can be important in cluster development (products that are not easy to transport, that require continuous interaction with customers). Supplies of specialised labour.

The existence of specialised pools of labour, such as occur around many universities.

The presence of input and equipment suppliers. A high frequency of exchanges between co-located capital goods producers and users.

The availability of specific natural resources; economies of scale in production. Such economies may allow only a small number of efficient-scale plants in a given market. The availability of infrastructure. Some types of infrastructure may also be quite specific, such as with certain transport or tourist facilities, further encouraging agglomeration. Low transaction costs. When firms and their suppliers operate near to each other, and the frequency of interaction is high, the costs of negotiation and contract enforcement may be reduced.

Superior access to information. This is straightforward: when many enterprises are integrated, than the information system is usually shared or, if individually managed, it allows an easier communication among them. Enterprises, when aggregated in clusters, can share, for example: product and market information, product design, marketing policies, training, recruitment services, human resources, skills, purchasing (lower prices for raw material and supplies), transportation and delivery (for geographical clusters), quality control, testing facilities, financing (credit guarantees at collective level), sponsorships. Many of the mentioned can be considered as "competences". That's why the model takes as its basic unit for link creation the generic "competence exchange" among two enterprises. Of course this is true during the external exploration phase, where an enterprise is looking for the best partner to create a new link, or to strengthen an existing one. Though, also the internal exploration is very important since it can allow an enterprise to develop a new competence, that will be used later on to be exchanged, thus constituting a new link with another firm.

The price-independent preferences of both the market and its participants are based on each one's perception of the other rather than the market simply being the sum of all its participants actions as is usually the case. So, the cluster effect is a usually cited example of emergence.

In order to study these dynamics, as long as the optimal balancing among different strategies and the importance of exogenous parameters in cluster creation, a model is presented. It follows the agent based paradigm, particularly suited for describing complex social systems in which many parts interact among them. This allows to create simulations of the studied system, and to test different hypotheses. Besides, it's the only paradigm in which the emergent features of complex systems can arise spontaneously, thanks to the bottom-up design.

AGENT BASED SIMULATION

Why do enterprises team up? There can be many reasons for this strategy, leading, in its widest extent, to the creation of joint-ventures, i.e.: a new economical subject formed by two or more enterprises with the goal of new projects, or of clusters and networks of enterprises. The leading cause for these phenomena is the optimization of the production, by resources and competences sharing. Agent based simulation is an effective paradigm for studying complex systems. It allows the creation of virtual societies, in which each agent can interact with others basing on certain rules. The agents are basic entities, endowed with the capacity of performing certain actions, and with certain variables defining their state. In the model presented here, the agents are reactive, meaning that they simply react to the stimuli coming from the environment and from other agents, without elaborating their own strategies. When the model is formally

built and implemented, it can be run by changing a parameter at a time, and emergence of a complex behaviour occurs.

Agent based Modelling is thus one of most interesting and advanced approaches for simulating a complex system: in a social context, the single parts and the whole are often very hard to describe in detail. Besides, there are agent-based formalisms which allow studying the emergence of social behaviour through the creation and study of models, known as artificial societies. Thanks to the ever increasing computational power, it has been possible to use such models to create software, based on intelligent agents, whose aggregate behaviour is complex and difficult to predict, and which can be used in open and distributed systems.

In Franklin and Graesser (1997) we read that: *“An autonomous agent is a system situated within and a part of an environment that senses that environment and acts on it, over time, in pursuit of its own agenda and so as to effect what it senses in the future”*.

Another very general, yet comprehensive definition is provided by Jennings (1996): *“...the term [agent] is usually applied to describe self-contained programs which can control their own actions based on their perceptions of their operating environment”*.

Agents have traditionally been categorized as one of the following types (Woolridge and Jennings, 1995):

- Reactive
- Collaborative/Deliberative
- Hybrid

When designing any agent-based system, it is important to determine how sophisticated the agents' reasoning will be. Reactive agents simply retrieve pre-set behaviours similar to reflexes, without maintaining any internal state. On the other hand, deliberative agents behave more like they are thinking, by searching through a space of behaviours, maintaining internal state, and predicting the effect of actions. Although the line between reactive and deliberative agents can be somewhat blurry, an agent with no internal state is certainly reactive, and one that bases its actions on the predicted actions of other agents is deliberative.

The agents used in this paper are reactive, but organized in the form of a MAS (Multi Agent System), which can be thought of as a group of interacting agents working together or communicating among each other. To maximize the efficiency of the system, each agent must be able to reason about other agents' actions in addition to its own. A dynamic and unpredictable environment creates a need for an agent to employ flexible strategies. The more flexible the strategies however, the more difficult it becomes to predict what the other agents are going to do. For this reason, coordination mechanisms have been developed to help the agents interact when performing complex actions requiring teamwork. These mechanisms must ensure that the plans of individual agents do not conflict, while guiding the agents in pursuit of the system goals. Many simulation paradigms exist; agent-based simulation is probably the one that best captures the human factor behind decisions. This is because the model is not organized with explicit equations, but is made up of many different entities with their own behaviour. The macro results emerge naturally through the interaction of these micro behaviours and are often more than the algebraic sum of them. This is why this paradigm is optimal for the purposes of

modelling complex systems and of capturing the human factor. The model presented in this paper strictly follows the agent based paradigm and employs reactive agents, as detailed in the following paragraph.

THE MODEL

The model is built in Java, thus following the Object Oriented philosophy and has been engineered and built at the *e-business L@B*, University of Turin. This is suitable for agent based modelling, since the individual agents can be seen as objects coming from a prototypal class, interacting among them basing on the internal rules (methods). While the reactive nature of the agents may seem a limitation, it's indeed a way to keep track of the aggregate behaviour of a large number of entities acting in the same system at the same time. All the numerical parameters can be decided at the beginning of each simulation (e.g.: number of enterprises, and so on). Everything in the model is seen as an agent; thus we have three kinds of agents: Environment, Enterprises and Emissaries (E³). This is done since each of them, even the environment, is endowed with some actions to perform.

Heat Metaphor

In order to represent the advantage of an enterprise in owning different competences, the "heat" metaphor is introduced. In agent based models for Economics, the metaphor based approach (Remondino, 2003) is an established way of representing real phenomena through computational and physical metaphors. In this case, a quantum of heat is assigned for each competence at each simulation turn. If the competence is internal (i.e.: developed by the enterprise) this value is higher. If the competence is external (i.e.: borrowed from another enterprise) this value is lower. This is realistic, since in the model we don't have any form of variable cost for competencies, and thus an internal competence is rewarded more. Heat is thus a metaphor not only for the profit that an enterprise can derive from owning many competences, but also for the managing and synergic part (e.g.: economy of scale).

Heat is also expendable in the process of creating new internal competences (exploitation) and of looking for partner with whom to share them in exchange of external competences (exploration). At each time-step, a part of the heat is scattered (this can be regarded as a set of costs for the enterprise). If the individual heat gets under a threshold, the enterprise ceases its activity and disappears from the environment.

At an aggregate level, average environmental heat is a good and synthetic measure to monitor the state of the system.

Environment

This is a meta-agent, representing the environment in which the proper agents act. It's considered an agent itself, since it can perform some actions on the others and on the heat. It features the following properties: a grid (X,Y), i.e.: a lattice in the form of a matrix, containing cells; a dispersion value, i.e.: a real number used to calculate the dissipated heat at each step; the heat threshold under which an enterprise ceases; a value defining the infrastructure level and quality; a threshold over which new enterprises are introduced; a function polling the average

heat (of the whole grid). The environment affects the heat dispersion over the grid and, based on the parameter described above, allows new enterprises to join the world.

Enterprise

This is the most important and central type of agent in the model. Its behaviour is based on the reactive paradigm, i.e.: stimulus-reaction. The goal for these agents is that of surviving in the environment (i.e.: never go under the minimum allowed heat threshold). They are endowed with a heat level (energy) that will be consumed when performing actions. They feature a unique ID, a coordinate system (to track their position on the lattice), and a real number identifying the heat they own. The most important feature of the enterprise agent is a matrix identifying which competences (processes) it can dispose of. In the first row, each position of the vector identifies a specific competence, and is equal to 1, if disposed of, or to 0 if lacking. A second row is used to identify internal competences or outsourced ones (in that case, the ID of the lender is memorized). A third row is used to store a value to identify the owned competences developed after a phase of internal exploration, to distinguish them from those possessed from the beginning. Besides, an enterprise can be "settled", or "not settled", meaning that it joined the world, but is still looking for the best position on the territory through its emissary. The enterprise features a wired original behaviour: internally or externally explorative. This is the default behaviour, the one with which an enterprise is born, but it can be changed under certain circumstances. This means that an enterprise can be naturally oriented to internal explorative strategy (preferring to develop new processes internally), but can act the opposite way, if it considers it can be more convenient. Of course, the externally explorative enterprises have a different bias from internally explorative ones, when deciding what strategy to actually take.

Finally, the enterprise keeps track of its collaborators (i.e.: the list of enterprise with whom it is exchanging competencies and making synergies) and has a parameters defining the minimum number of competencies it expects to find, in order to form a joint. The main goal for each enterprise is that of acquiring competences, both through internal (e.g.: research and development) and external exploration (e.g.: forming new links with other enterprises). The enterprises are rewarded with heat based on the number of competences they possess (different, parameterized weights for internal or external ones), that is spread in the surrounding territory, thus slowly evaporating, and is used for internal and external exploration tasks.

Emissary

These are agents that strictly belong to the enterprises, and are to be seen as probes able to move on the territory and detect information about it. They are used in two different situation: 1) if the enterprise is not settled yet (just appeared on the territory) it's sent out to find the best place where to settle. 2) if the enterprise is settled and chooses to explore externally, an emissary is sent out to find the best possible partners. In both cases, the emissary, that has a field of vision limited to the surrounding 8 cells, probes the territory for heat and moves following the hottest cells. When it finds an enterprise in a cell, it probes its competencies and compares them to those possessed by its chief enterprise verifying if these are a good complement (according to the parameter described in the previous section). In the first case, the enterprise is settled in a cell

which is near the best enterprise found during the movement. In the second case, the enterprise asks the best found for collaboration).

While moving, the emissary consumes a quantum of heat, that is directly dependant on the quality of infrastructures of the environment.

The movement of the emissaries is detailed within the following paragraph (5.3).

In the following paragraph a formal insight of the model is given through a set of defining equations, for the agents and the general rules.

MODEL EQUATIONS AND ITERATIONS

Model Equations

In order to formally describe the model, a set of equations is described in the following.

The multi agent system at time \mathbf{T} is defined as:

$$\mathbf{MAS}_T = \langle \bar{\mathbf{E}}, \bar{\mathbf{e}}, \bar{\mathbf{e}}, \overline{\mathbf{link}} \rangle . \quad (1)$$

Where $\bar{\mathbf{E}}$ represents the environment and is formed by a grid $\mathbf{n} * \mathbf{m}$, and a set $\bar{\mathbf{k}}$:

$$\left\{ \begin{array}{l} \bar{\mathbf{E}} = \langle \mathbf{n} * \mathbf{m}, \bar{\mathbf{k}} \rangle \\ \mathbf{n}, \mathbf{m} > \mathbf{0} \end{array} \right. . \quad (2)$$

Where the set $\bar{\mathbf{k}}$ defines the heat for each cell, $\bar{\mathbf{e}}$ is the set of enterprises with coordinates on the grid, and $\bar{\mathbf{e}}$ is the set of the emissaries, also scattered on the grid:

$$\left\{ \begin{array}{l} \bar{\mathbf{k}} = \langle \mathbf{k}_{i,j} \rangle \\ \bar{\mathbf{e}} = \langle \mathbf{e}_{i',j'} \rangle \\ \bar{\mathbf{e}} = \langle \mathbf{e}_{i'',j''} \rangle \\ \mathbf{0} < i, i', i'' \leq \mathbf{n} \\ \mathbf{0} < j, j', j'' \leq \mathbf{m} \end{array} \right. . \quad (3)$$

Each enterprise is composed by a vector $\bar{\mathbf{c}}$, and an emissary (\mathbf{e}_e). The vector $\bar{\mathbf{c}}$ defines the owned competences, with a length \mathbf{L} and competences \mathbf{C}_i represented by a boolean variable (where 1 means that the i^{th} competence is owned, while 0 means that it's lacking):

$$\begin{cases} e_{ij} \ni \vec{c}_e, \varepsilon_e \\ \vec{c}_e = (L, C_1) \\ 0 \leq l \leq L \\ C_1 = \text{Boolean} \end{cases} \quad (4)$$

In $T = t > 0$, k_{ij} that's the heat of each cell on the grid, depends on the heat produced by the enterprises (K_e) and the dispersion effect (d). The heat of each enterprise is function of the competences it possesses and of the behavior it carried on in the last turns (b_e).

$$\begin{cases} k_{ij} = [f(K)_e, d] \\ K_e = f(\vec{c}_e, b_e) \\ b \in \bar{b} \\ \bar{b} = \langle \text{set of behaviors} \rangle \end{cases} \quad (5)$$

In particular, a certain behavior can be successful, meaning that at the end of a phase of internal or external exploration, a new competence (internal or outsourced, respectively) will be possessed. Otherwise, a it's unsuccessful when, after some steps of research and development (internal exploration) or external market research to find a partner, nothing new is found, and thus the l^{th} competence remains zero.

$$\begin{cases} \{ \text{if } (b = \text{success}) \text{ then } C_1 = 1 \\ \text{else } C_1 = 0 \\ b \in \bar{b} \end{cases} \quad (6)$$

At each time-step the set of links (connecting two enterprises together) is updated basing on the competences of the enterprises.

$$\begin{cases} \overline{\text{link}} = \langle \text{link}(e_{ij}, e_{i'j'}) \rangle \\ \text{link}(e_{ij}, e_{i'j'}) = f(\overline{c_{e_{ij}}}, \overline{c_{e_{i'j'}}}) \end{cases} \quad (7)$$

Specifically, when an enterprise does external exploration, it looks for a good partner, i.e.: an enterprise with a number of competences to share. So, if an enterprise with a vector like **10001** meets one with a vector like **01110** then there is a perfect match and the two enterprises will create a link among them, to share the reciprocally missing competences. This is the perfect situation, but not the only one in which two enterprise can create a link; in fact, it's enough that there is at least one competence to reciprocally share. The strength of the link is directly proportional to the exchanged competences. This set of equations and rules is enough to explore the effects on the network of the behaviors of the enterprises, namely the way in which

the firms are managed (externally or internally focused). Though the model allows also to explore the effects on innovation (i.e.: a competence that's possessed only by one enterprise).

In $\mathbf{T} = \mathbf{t}' > \mathbf{t}$ a radical innovation can be metaphorically introduced in the system (this is called "shock mode", since this is decided by the user, at an arbitrary step) by means of increasing the length of the vector of competences of a specific enterprise:

$$\begin{cases} \mathbf{L} \leftarrow \mathbf{L} + 1 \\ \mathbf{C}_{i+1}(\mathbf{E}) = 1 \\ \mathbf{C}_{i+1}(\mathbf{E} - \mathbf{E}) = 0 \end{cases} \quad (8)$$

Meaning that the competence \mathbf{C}_{i+1} will be possessed by only one enterprise, at that time, while the same competence will be lacking to all the others; though, all the enterprises' vectors will increase in length, meaning that potentially all of them will be able to internally develop that new competence through R&D, from then on.

The vector length metaphorically represents the complexity of the sector (industry) in which the enterprises operate; an highly technological sector has many more potential competences than a non-technological one. So, another kind of "shock effect" to the system is that of increasing the length of the vector by more than one component, and by leaving all the new components to zero for all the enterprises. In this way, they'll have to develop themselves the new competences by means of internal exploration. The analysis phase is carried on after several steps after \mathbf{t}' , in order to see how the introduction of the innovation impacted the network and the enterprise in which the innovation was first introduced. So we have an analysis phase in $\mathbf{T} = \mathbf{t}'' > \mathbf{t}'$ defined as:

$$\begin{cases} \text{MAS}'_i \text{ vs } \text{MAS}''_i \\ \mathbf{L} \leftarrow \mathbf{L} + \mathbf{d}\mathbf{L}; \mathbf{d}\mathbf{E}; \mathbf{d}\mathbf{K} \end{cases} \quad (9)$$

Namely, the comparison among the system at time \mathbf{t}' and the same system at time \mathbf{t}'' , since the innovation has differential effects on the number (and nature) of the links, on the number of enterprises and the heat of the cells composing the environment, always depending on the managerial behavior of the involved enterprises. At the beginning of a simulation, the user can change the core parameters, in order to create a particular scenario to study and analyze.

Synthetic model iterations

At step 0, a lattice is created (n, m). A number of enterprises (X) are created (according to the proper parameter set by the user), x of them internally explorative (IE) and X-x of them externally explorative (EE). X, x, n, and m are set by the user, before the simulation starts.

At step 1, the environment checks if some enterprise reached the minimum heat threshold; if so, removes it from the world. After that, each enterprise, if idle (not doing anything) decides what behavior to follow.

At step 2, all the enterprises that selected to be EE move their emissary by one cell. All the IE ones work on the R&D cycle (one step at a time). At step 3, the EE enterprises check if the emissary finished its energy and, in that case, ask the best found enterprise for collaboration (they can receive a positive or negative reply, basing on the needs of the other enterprise). The IE enterprises check if R&D process is finished and, in that case, get a competence in a random position (that can be already occupied by an owned competences, thus wasting the work done).

At step 4, the environment scatters the heat according to its parameters. Loop from step 1.

While the internal exploration behaviour is technically simply represented by some idle steps, after which an enterprise develops a new competence in a random position ^{1th} (based on a uniform distribution), the external exploration is a bit more complicated, and is metaphorically represented by the movement of a "probe", called "emissary", that searches the territory for the best possible match with other enterprises. The iterations behind the movement of the emissary are deterministic: it can move on the grid to follow the hottest cells. When an enterprise is found, its competence vector is analyzed, to see how many competences are possessed, that are missing to the parent enterprise. A quantum of heat is consumed at each step by the emissary, and when the heat is over, the enterprise with the best found vector is asked for collaboration and competence exchange.

PARAMETERS IN THE MODEL

At the beginning of a simulation, the user can change the core parameters, in order to create a particular scenario to study. In figure 1, the section of the control panel containing the parameters is shown.

Some of the parameters are constituted by a scalar value, others are in percentage, others are used to define stochastic (normal) distributions, given their mean value and their variance. Here follows a synthetic explanation for the individual parameters: *Maximum number of steps*: is the number of iterations in the model. 0 sets the unbounded mode

Initial number of enterprises: is the number of enterprise agents present at start-up (0 is random)

Initial heat for enterprise: a normal distribution setting the initial energy for each enterprise, given the mean and the variance

Number of competences: the length of the vector, equal for all the enterprises (metaphorically representing the complexity of the sector in which they operate)

Competences possessed at start-up: a normal distribution referring to how many processes an enterprise owns internally, given the mean and the variance

Threshold for new enterprise to enter the market: a delta in the average heat of the world, after which a new enterprise is attracted in the market

Infrastructure quality: affects the cost of external exploration

Minimum heat threshold: level under which an enterprise cease

Minimum percentage of competences to share for link creation: when asked for a competences exchange, the other enterprise looks at this value to decide whether to create a link or not

Emissary step cost: percentage of the heat possessed by the enterprise spent for each step of its emissary, during external exploration task

Internal exploration duration: quantity of steps for internally developing a new competence

Internal exploration cost: percentage of the heat possessed by the enterprise spent for each step of internal exploration

Environment control cycles: quantity of steps for sampling the average heat of the environment

Heat dispersion index: percentage of heat evaporated at each step

Lattice dimension: the dimension of the grid hosting the enterprise (i.e.: the whole environment)

Internal Exploration cost: una tantum cost for setting up an emissary for external exploration

Propensity to External Exploration for new enterprises: when a new enterprise enters the market, it looks at the average number of links in the network. If more than this value, it behaves as externally explorative, otherwise internally explorative

Number of initial enterprises doing external exploration: variable to divide the initial behaviour

Value of internal/external competence: reward (heat) given for each internal/external competence possessed

QUALITATIVE RESULTS

While the main object of this paper is to present the model itself as a tool for studying the effects of different managerial behaviour (externally or internally focused) on enterprise networks, in this paragraph some insights will be given about preliminary results obtained from the model itself. The presented ones will be mainly qualitative results, although the model can give many quantitative individual and aggregate results. In particular, a “computational only” mode is present in the model, allowing it to perform a multi-run batch execution. This is done according to the theory presented in Remondino and Correndo (2006): the model is executed a defined number of times (chosen by the user) and the different outputs are sampled and collected at every n steps (again, n decidable by the user) with the same parameters (in order to overcome sampling effects that could be caused by stochastic distributions) or by changing one parameter at a time by a discrete step, in order to carry on a *coeteris paribus* analysis on the model. While this kind of analysis will be discussed in detail in future works, here some qualitative and semi-quantitative outputs will be discussed, obtained from the model. The model can give the following different kinds of outputs, when running in “normal” mode: 1) a real-time graph, depicting the social network, in which the nodes are the enterprises, whose colour represent the behaviour they are following at a given step, and the links are the ties indicating two or more enterprises mutually exchanging one or more competences. 2) A set of charts, showing in real time some core parameters, namely: average heat in the environment, number of links (in the network), number of links (average), number of enterprises doing internal exploration, number of ceased enterprises since the beginning, number of born enterprises since the beginning, number of available competences (overall), total number of skills possessed at the beginning, obtained by external exploration, obtained by internal exploration.

In fig. 1, 2 and 3, the output graph is depicted at times 0 (no links), 100 and 500. These pictures belong to the same simulation, so the parameters are the same for all of them, with the only variation of time, giving a hint about the development of the enterprise network. In fig. 1 the initial state of the network is shown, where no ties have been created, yet. A total of 20 enterprises is on the territory, 10 of which have an internally explorative behaviour and the other 10 have an externally explorative mood. Internal competences are rewarded 10% more than external ones, but internal exploration strategy (e.g.: research & development) is 30% more expensive.

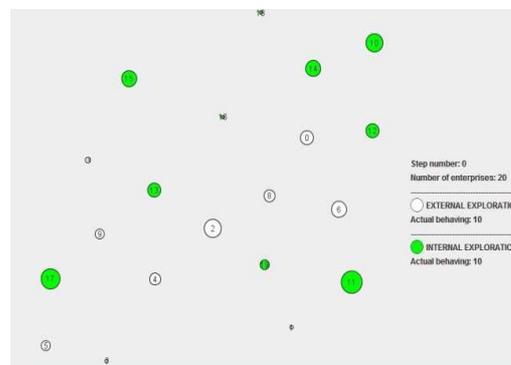

Fig. 1. The network at time 0

After 100 steps (fig. 2) some new players have entered the market (an average of 1 new enterprise each 10 steps), meaning that the average heat of the system increased significantly; this can be thought as a starting network, attracting new players thanks to a good overall balance. Some ties have formed and many new competences (the dimension of enterprises) have been internally produced.

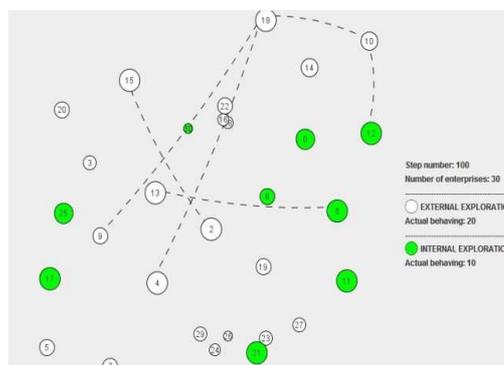

Fig. 2. The network at time 100

After the initial steps in which 50% of the enterprise was doing internal exploration, now at the 100th step, only one third (i.e.: 33%) is doing that, since almost all the smaller players are trying to outsource them from the bigger ones, in order to gain some energy. Unfortunately, many of these small enterprises have no competence to give to the bigger one in exchange for theirs. They will eventually die (ceased enterprises) or try to change strategy, by starting an internal exploration. That's why at time 500 (fig. 3) the total number of players increased again, but at a lower rate (1 every 15 steps, as an average) and now, in percentage, most of the survived enterprises are doing external exploration (62% circa) and have become quite big (many internal competences possessed).

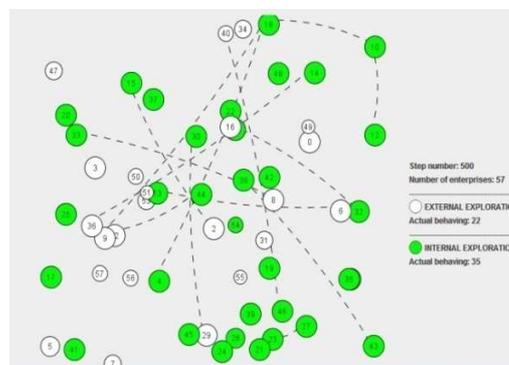

Fig. 3. The network at time 500

Notice that in this experiment the threshold under which an enterprise must cease is a low value, meaning that few of them have to leave the market. This was done intentionally to show how enterprises can react and adapt their behaviour even if they are modelled as reactive agents.

CONCLUSION AND FUTURE WORKS

An agent based model is introduced, aiming at capturing the dynamics behind the creation and the following modifications of enterprise clusters for competences exchange, i.e.: networks in which enterprises can internally develop and/or share processes with other players. This is, by the way, one of the focal points behind the creation of industrial districts and clusters and is mainly dependent on the strategic management of the individual enterprises, namely externally or internally focused, and the optimal balance among these policies. A well established network of this kind can attract new players, that will probably bring new knowledge and competences in it. The model is formally discussed, and so the agents composing it and its iterations. While studying quantitative results is beyond the purpose of this work, a qualitative analysis is given, and the network graph, one of the graphical outputs supplied by the model, is analyzed in order to show how network dynamics emerge from the model and its parameters, settable by the user. At the beginning, when the enterprises have few competences and high perception of how can be difficult develop and innovation process, they try to link with the enterprises that have already developed innovative processes. That's why, in an initial phase, the number of enterprises doing external exploration tends to increase. After some steps, the number of

enterprises choosing external exploration is lower and lower and limited to the smallest players, or the newly arrived ones. The reason is that at the beginning, the enterprise's capability are low and the perception of the effort for developing a process innovation is high. The enterprise at this phase typically try to share and exchange competences with others that already developed an innovative process, not having to face the risk of inside developing, even if this can be more gainful in the long run. As time passes by, the enterprises start to become bigger and be more conscious about their capabilities and knowledge, thus reducing the perception of the effort to develop innovative processes internally.

The model is comprehensive and its scope is wide. In future works other features will be introduced, and quantitative analysis will be carried on in order to study real-world cases (e.g.: existing industrial districts and so on) and the underlying dynamics that lead to their creations. Besides, a new feature will be implemented in the model, referred to as "shock mode", allowing the user to stop the model at a given step, and change some inner parameter, thus introducing innovations as explained at the end of paragraph 5.1. Also, agents' behaviour will be much more articulated; while in the present model agents simply react to some predefined rules, in order to choose which action to perform, in future works two new agent categories will be introduced: stochastic agents and cognitive agents. The former will base their behaviour on a uniform probability distribution, while the latter will adapt themselves, based on the payoff they get from their previous actions (trial and error learning technique). This will allow to capture even at a higher detail the effects on an enterprise network of a given management policy, adding realism to the behavioural choice.

ACKNOWLEDGMENT

The authors would like to gratefully acknowledge the key support of Anna Maria Bruno, and Gianpiero Bussolin, Full Professors of "Economia e Gestione delle Imprese" at the University of Turin. The authors would also like to thank Fondazione CRT for supporting their research.

CORPORATE SOCIAL RESPONSIBILITY IN THE CROATIAN RETAILING

Renko, Sanda¹; Rašić, Sanda²; Knežević, Blaženka³

¹Ph.D., Assistant Professor, University of Zagreb, Faculty of Economics & Business Zagreb, J. F. Kennedy 6, 10000 Zagreb, Croatia

²Ph.D., Assistant Professor, University of Zagreb, Faculty of Economics & Business Zagreb, J. F. Kennedy 6, 10000 Zagreb, Croatia

³Ph.D., Assistant Professor, University of Zagreb, Faculty of Economics & Business Zagreb, J. F. Kennedy 6, 10000 Zagreb, Croatia

Purpose: The main purpose of the paper is to explore three aspects of corporate social responsibility in the Croatian retail industry: responsibility to the community, employee rights and working conditions and environmental protection. Moreover, the goals of the paper are: to present an overview of the CSR issues being addressed within the Croatian retailing, to give an outline of the structure of the Croatian retailing and to investigate the level of the commitment of Croatian retailers to CSR.

Design/methodology/approach: The research is based on secondary (desk) and primary (field) research. Within the framework of secondary research, the relevant domestic and foreign literature with the topic of corporate social responsibility was used. Within the framework of primary research, the study on the sample of 60 retailing managers was conducted. Statistical data analysis was done using SPSS 13.0.

Findings: The findings reveal that the process of retailing internationalization and media coverage increased efforts of retail companies operating on the Croatian market to demonstrate socially responsible behaviours. The results indicate that retailers are concerned about all investigated aspects of corporate social responsibility: responsibility to the community, employee rights and working conditions and environmental protection.

Research limitations/implications: CSR in the retailing has received little attention from Croatian academics. This study was based on a small sample retail companies. Therefore, future studies are required to ensure representativeness.

Originality/value: The provides an review of the CSR issues being reported by some of the Croatian retailer and as such it could be useful to Croatian academics and practitioners which deal with the investigated area.

Key words: corporate social responsibility, retailing, Croatia

INTRODUCTION

In recent years, increasing number of companies have experienced crisis because of environmental accidents, social ills, customer boycott, activists' threats, strikes, negative publicity, damage of image, investors' losses, legal penalties etc. Hence, corporate social responsibility (CSR) has become more important component of corporate strategy at the domestic and global level. Concept of corporate social responsibility means ethical treat and responsibility to various stakeholders who have interest in the business: investors, workers, customers, business partners and contractors, government, society and community, environment, activists etc. World Bank noted that "CSR is the commitment of business to behave ethically and to contribute to sustainable economic development by working with all relevant

stakeholders to improve their lives in way that are good for business, the sustainable development agenda, and society at large". The Hoskins (2005) stated that the aim of social responsibility is to create higher standards of living, while preserving profitability of the corporation, for peoples within and outside of corporation. CSR incorporate undertaking the responsible activities that goes beyond the legal, market and economic requirements. CRS promote values such as freedom and human rights, democracy, diversity, minority protection, reduction of poverty and inequality between rich and poor, health and quality of life. The main purpose of the paper is to identify key areas of corporate social responsibility concerning Croatian retailers and the impact of corporate social responsibility on the performance effectiveness. The basic hypothesis of this paper are: (H1) there is significant relationship between CSR and the size of the retailer and (H2) there is significant relationship between CSR and the years of retailer's existence on the market.

As CSR has increased its importance within the Croatian retailing during the past few years, this paper will contribute to the understanding of the ways in which retailers are using CSR to communicate with community, their employees, stakeholders and customers as well. The paper begins with the short theoretical background where relevant work on CSR is briefly discussed. The short discussion about the Croatian retailing situation is given to provide a background for the study. Then a research study examining three dimensions is of CSR in Croatian retailing industry: (1) responsibility to the community and society, (2) employee rights and working conditions, and (3) environmental protection is presented. After that, results of the study are given. Finally, the results are discussed with an emphasis on the impact of CSR on the Croatian retail companies' performance and the ability for some improvements in this sector.

THEORETICAL BACKGROUND OF THE PROBLEM

CSR may be motivated by altruistic motives, and/or economic motives (avoiding the threats or profit maximization). Many researchers qualify CSR as a part of improving corporate performance. Freeman (1984) stated that CSR might be an optimal choice to minimize transaction costs and potential conflict with stakeholders. Stakeholders are extrinsically and intrinsically motivated and intrinsic stimulus can be substitute for extrinsic motives and thus affects the level of sales, resource availability, productivity, reputation etc. There are numerous empirical studies that find positive link between CSR and corporate performance. Considering 127 published empirical studies between 1972 and 2002, Margolis and Walsh (2003) found that the majority of these studies found a statistical significant and positive correlation between CSR and corporate financial performance (CFP) in both directions (causality in running from CSR and CFP and vice versa). In some regressions coefficient was not statistically significant, and a small number of studies showed negative relationship. Stanwick and Stanwick (1998) and Verschoor (1998) established positive relationship between corporate performance and good relationship with stakeholders. Soleman and Hansen (1985) findings show that costs of having a high level of CSR are more than compensated by benefits in employee morale and productivity. Ruf and others' (2001) study shows that there is positive relationship between change in CSR and increase in sales and returns on sales for three financial periods. Pava and Krausz (1996) and Preston and O'Bannon found that CSR is positively connected with financial performance (1997).

Hence, engaging in CSR, the company might achieve benefits that are supposed to offset costs of CSR activities. These benefits might be customer satisfaction and higher sales, better image and brand, friendly oriented activists, availability of investors, bargaining power, better adjustment to future regulation and protection from legal actions and penalties, intrinsic motivation of employees that can increase productivity and competitiveness, free advertising, etc.

The company rating the social performance of firms "Kynder, Lynderberg and Domini Research & Analytics" divides CSR criteria into eight main categories: 1) community, 2) corporate governance, 3) diversity, 4) employee relations, 5) environment, 6) human rights, 7) product quality, and 8) controversial business issues. Kitzmuller (2008) identifies six frameworks of strategic CSR: 1) labour market, 2) products market, 3) financial markets, 4) private activism, 5) public policy, 6) isomorphism. Pavić-Rogošić (www.mreza-lokalni-razvoj.net) divided CSR dimensions into two main groups: 1) internal (human resources, health and safety, responsible flexibility to change, natural resources and environmental process management); and 2) external (local community, relationship with suppliers, customers and partners, human rights, global environmental management). Scott (2007) analyse and group CSR criteria into five main areas: 1) responsibility to the community and society, 2) promoting democracy and citizenship, 3) reducing poverty and the inequality between rich and poor, 4) employee rights and working conditions, 5) ethical behaviour.

As a transitional country burdened by a post-war problems, Croatia has various difficulties in joining international economic and political flows. During 1990s Croatia initiated development of democracy and privatisation process that includes: reform of state-owned companies, stimulus for private companies, and attractiveness of Croatia to foreign investors and creation of national stock market. Even though CSR has become more important strategic issue, it is still insufficiently spread in developing countries. The first national conference "Promotion of social responsible business in Croatia: Agenda for 2005" attracted attention of economic, political and social subjects, but it took several years to initiate their concrete steps toward CSR.

One empirical economic analysis (Tipurić, Omazić, Hruška, 2004) explores the social awareness in business practice of Croatian managers and concludes: 1) larger proportion of Croatian managers that have affirmative attitude towards CSR think how CSR is part of their daily job and how CSR influence workers' motivation and devotion in comparison to proportion of managers that have neutral or aversive attitude toward CSR; 2) larger proportion of managers that have affirmative attitude towards CSR emphasize influence of external organizational factors while larger proportion of managers with neutral attitude emphasize internal organizational factors as stimulus for CSR.

Omazić (2008) analyzed CSR in Croatia and stated that stakeholders' activities in Croatia were mostly reactive and focus to media which resulted in situation where companies thought of CSR as public relations and donations. He stated that legal system was reactive in nature and didn't demand special efforts and concluded that there was no clear evidence in strategic sense that Croatian companies pay enough attention to CSR, even though growing number of companies thought of CSR as a business opportunity.

Škrabalo, Bagić and Miošić-Lisjak (2008) published the paper that was part of comprehensive research "Accelerating CSR practices in the new EU member states and candidate countries as a vehicle for harmonizing, competitiveness, and social cohesion in the EU" which was conducted by UNDP for the need of EU Commission. They assessed that in Croatia there were about 200 companies that accepted CSR as a part of their strategic orientation. These companies were mostly large, leading companies, with significant share of foreign ownership, listed at stock market and export oriented. Authors concluded that CSR could be found mostly in production and processing industry, financial sector and telecommunications. The areas of CSR are mostly: quality and safety of work, customer satisfaction, environmental protection, and partnership in community. Some information about CSR elements can be found on several web pages, in manuals, education courses, or collected from business associations and expert organizations, which was not the case several years ago in Croatia. Beside that, CSR is promoted by Government, NGO, National competitiveness council, and media.

OUTLINE STRUCTURE OF THE CROATIAN RETAILING

In order to get the clear picture of the importance of retail industry in Croatia, it is necessary to explain the significance of the overall sector in the national economy and to give current data on retail industry.

Distributive trade sector is a significant part of the Croatian national economy. Distributive trade (statistical NACE field G) generates 10,96% of gross domestic product (own calculation according to data in RCCBS First release, 27.02.2009). This sector currently employs 17,6% of total active workforce (own calculation according to data in Croatian Statistical Yearbook, 2008, p. 124). More than 36% registered legal entities are registered as companies in distributive trade sector (own calculation according to data in Croatian Statistical Yearbook, 2008, p. 73).

At the moment, distributive trade generates 4.697 mil. EUR of Gross Value Added (RCCBS First release, 27.02.2009). It is the second largest employer in Croatia (after the processing industry) as there were 273.825 employed persons. Detailed analysis of the structure of distributive trade shows that retail trade has the largest number of employed i.e. 46,1%; wholesale trade 29,95% and motor vehicles and motorcycles trade 7,6%. The non-commercial activities have 16,35% of employment.

The importance of retail industry is even more obvious if we analyze data in Table 1. Out of 38410 business entities in the sector, 55 % are registered for retail. Out of 48980 outlets of various formats, 60,3% are retail outlets. Almost half employees in the sector are employed in retail industry (45,74% of 273.825).

	<i>No. of business entities</i>	<i>No. of outlets/service points</i>	<i>Persons in employment</i>
<i>Motor vehicles & motorcycles trade</i>	4516	4951	20841
<i>Wholesale trade</i>	9351	8484	81984
<i>Retail trade</i>	21151	29521	125260
<i>Non-trading activities</i>	3372	6024	44740
<i>Total</i>	38410	48980	273825

Table 1 *The structure of distributive trade in Croatia.* Source: RCCBS First release, no. 12.1.4, Republic of Croatia Central Bureau of Statistics, 27th February 2009

Croatian retail network is still very fragmented and being dominated by small stores (34% of market consists of stores with an area under 100sq m). However, changes in the global retail market and customers' way of life caused the decreasing in the number of small stores. According to data in Table 2, hypermarkets and supermarkets are steadily increasing their market share. Nowadays, main characteristics of Croatian retailing are concentration, internationalization and consolidation with 71,4% of the market held by 15 retailers (comparing to 16.6% of the market held by 10 retailers in 2002).

	<i>2001</i>	<i>2002</i>	<i>2003</i>	<i>2004</i>	<i>2005</i>	<i>2006</i>	<i>2007</i>	<i>2008</i>

METHODOLOGY

The data

A survey method was used for collecting data from the target population comprising the retailing sector operating in Croatia. In order to achieve as high response rate as possible, retailing managers that are participating 15 Postgraduate studies on the Faculty of Economics and Business of Zagreb were selected. In the initial phase, fully structured questionnaires were distributed to a sample of 600 postgraduate students. In such a way, 120 completed questionnaires were returned. Among them, questionnaires filled up by retail managers were

deemed usable for analysis. Thus, the respondents of the survey consisted of 60 retail managers of different retail companies in Croatia.

The questionnaire design

The questionnaire consisted of three sections.

Section I of the questionnaire was devoted to 22 statements relating to three categories of CSR in retailing: (1) employee rights and working conditions (2), responsibility to the community and society, (3) environmental protection.

Employee rights and working conditions are presented by following elements: exposure to temperature and sound extremes, air quality in work place, sick and maternity leave policy, preventive systematic health check-up, employee education, employee wages, compensation program for good business results, developed communication system within the company and internal meetings..

Responsibility to the community and society are presented by: organization of sponsor and humanitarian campaigns, act in compatibility with needs of local community, sponsoring development of sport, culture, education and environmental projects, support employee freedom in joining associations and right to collective agreement and publishing company newspapers.

Environmental protection is presented by several following elements: generations of noise, smell of waste, existence and maintenance of fire-devices, of emergency procedures and familiarity of staff with them, existence of safety certificate, encouraging and supporting employee responsible environmental behaviour taking care about plants in offices.

Statements were adopted from *A Guidelines Manual for Retailers towards Sustainable Consumption & Production* (2008). A five-point Likert format was used to assess the level of commitments of managers to the various CSR statements used in this section. The five-point scale ranged from 1= strongly disagree to 5= strongly agree.

Section II of the questionnaire consisted of 13 statements relating performance of the company. Statements were adopted from studies of Krohmer et al. (2002), Ruckert et al. (1985) and Quazi (2003). A five-point Likert format was used to assess the level of commitments of managers to the statements relating to the situation in the business comparing to competition.

Section III of the questionnaire consisted of characteristics of the company: the size of our company and the years of its existence on the market.

Analysis

The collected data were analyzed using SPSS. Except from descriptive statistics calculations, significance of the findings was explored using Spearman correlation coefficient and chi-square tests, depending on the various types of combination of variable that occurred. The p values were calculated to examine the level of statistical relationship between pair of variables. The hypotheses were tested using the conventional significance level of 0,05.

RESULTS

Characteristics of the sample are given in the Table 3.

<i>Item</i>	<i>Frequency</i>	<i>Percent</i>
<i>The size of the company</i>		
<i>less than 50 employees</i>	28	46,7
<i>50-250 employees</i>	11	18,3
<i>more than 250 employees</i>	21	35,0
<i>The years of the companies existence on the market</i>		
<i>less than 5 years</i>	7	11,7
<i>5-12 years</i>	22	36,7
<i>more than 12 years</i>	31	51,7

Table 3. Characteristics of the sample Source: authors

Table 4 present average perceptions of different CSR aspects. As table 4 reveals, respondents, i.e. retail companies, perceive that their companies are involved in environmental protection very much. Neighbours perception of the noise levels is very good (average grade = 4,39) and there are small problems with waste storage odours (average grade = 1,68). Also, relatively small number of retailers have native plant and/or low water consumption landscaping in their offices (average grade = 3,60) and reinforce environmentally responsible behaviours among staff (average grade = 3,03).

Companies are taking care of safety and emergency procedures because fire extinguishers are in place and properly maintained (average grade = 4,27). However, lower average grade of commitment with staff trained (average grade = 3,61) with emergency procedures and staff training in general (average grade = 3,14) are disturbing. Although there is increasing awareness of the importance of employees' knowledge and skills as the most important source of the company and essential for the companies' success (Jones et al., 2007), on average there are grade lower than 3,00 assigned to rewards programme for good employees performances and internal communication. As in the context of the CSR dimension, employees and subcontract labour must be given the necessary and appropriate education and training and should have opportunity to improve their working conditions (Rainey, 2006, p. 232), we can conclude that Croatian retailers do not spend sufficiently on employees' development activities.

Those findings can be supported by average grades of satisfaction with policies on sick leave and/or maternity leave, wages and preventive health security of employees. On the scale from 1 to 5, they are just above 3,00 which signifies that even managers are moderately satisfied with analyzed CSR elements.

<i>Item</i>	<i>Mean</i>	<i>St.dev.</i>
-------------	-------------	----------------

<i>Neighbours perception of noise levels</i>	4,39	0,910
<i>Problems with waste storage odours</i>	1,68	1,121
<i>Maintenance of fire extinguishers</i>	4,27	1,219
<i>Emergency procedures</i>	3,61	1,543
<i>Native plant and/or low water consumption landscaping</i>	3,60	1,280
<i>Staff exposure to temperature or noise extremes</i>	2,15	1,350
<i>Offices air quality & dust/vapours</i>	2,56	1,277
<i>Policies on sick leave and/or maternity leave</i>	3,66	1,308
<i>Employees' satisfaction with policies on sick leave and/or maternity leave</i>	3,75	1,212
<i>Staff training and updating of training</i>	3,14	1,224
<i>Environmentally responsible behaviours among staff</i>	3,03	1,221
<i>Rewards programme for good performances</i>	2,87	1,432
<i>Internal communication system</i>	3,45	1,227
<i>The certification of safety</i>	3,11	1,520
<i>Internal meetings</i>	3,62	1,451
<i>Employees' wages</i>	3,47	1,096
<i>Freedom of association and right to collective bargain</i>	3,53	1,308
<i>Internal newspapers</i>	2,52	1,799
<i>Preventive health security of employees</i>	3,50	1,750
<i>Sponsorships and humanitarian campaigns</i>	2,95	1,517
<i>Relationship to local communities</i>	3,08	1,430
<i>The development of sports, culture, education, and environmental projects</i>	2,93	1,518

Table 4. Average perceptions of different CSR aspects. Source: authors

According to the results in table 4, retailers do not adequately recognise the range of impact they have on the communities within which they operate, because average grades for the development of various sponsorships and humanitarian campaigns, the respond to the needs of local communities and the broad social environment in which retailers operate and funding the development of sports, culture, education, and environmental projects are 2,95; 3,08 and 2,93 respectively.

Out of 22 CSR elements, companies' internal meetings organization and the size of the company showed statistically significant relationships ($\chi^2= 17,765$; $df=8$, $p=0,023$). 52 per cent of large companies (companies with more than 250 employees) have internal meetings very often. Also, a significant relationship ($\chi^2 = 18,570$, $df=8$, $p=0,017$) between the company's support of freedom of employees' association and right to collective bargain and the size of the company was found. 47,4 per cent of large companies support the freedom of employees association and right to collective bargain. Chi-square test show significant relationship between the fact that companies publish their internal newspapers and the size of those companies ($\chi^2 = 16,880$, $df=8$, $p=0,031$). 70,6 per cent of large companies have their internal news. Statistically significant relationship between sponsorships and humanitarian campaigns of retailers and their size was found ($\chi^2 = 28,012$, $df=8$, $p=0,000$). Among those who developed various sponsorships and humanitarian campaigns 73,7 per cent of respondents were from large companies. On the other side, the largest percent (85,7) of those who do not invest in sponsorships and humanitarian campaigns are small retail companies (less than 50 employees). Moreover, retailers' involvement

in the development of sports, culture, education, and environmental projects are significantly related with their size ($\chi^2 = 21,301$, $df=8$, $p=0,006$).

To determine the direction of relationship and the strength of the relationship between CSR items and characteristics of retailers, correlation analysis was done (Table 5). Table 5 shows that significant relationships exist between the size of the retailer and some other CSR aspects, too. For example, there is a moderate positive association between the retailer's reinforcement of environmentally responsible behaviours among staff and its size. Also, correlation analysis suggests: more larger the retailer, higher the level of its commitment to emergency procedures, and the certification of safety and preventive health security of employees, as well.

<i>Item</i>	<i>Spearman correlation coefficient</i>
<i>Emergency procedures</i>	<i>0,365**</i>
<i>Environmentally responsible behaviours among staff</i>	<i>0,270*</i>
<i>The certification of safety</i>	<i>0,377**</i>
<i>Internal meetings</i>	<i>0,317*</i>
<i>Preventive health security of employees</i>	<i>0,367**</i>
<i>Sponsorships and humanitarian campaigns</i>	<i>0,500**</i>
<i>Relationship to local communities</i>	<i>0,457**</i>
<i>The development of sports, culture, education, and environmental projects</i>	<i>0,459**</i>

Table 5. Correlation coefficients (significant relationships). ** Correlation is significant at the 0.01 level (2-tailed). * Correlation is significant at the 0.05 level (2-tailed). Source: authors

In order to know whether CSR and the Croatian retail companies' performance are related, correlation analysis was used. As Krohmer et al. (2002) we used and adapted perceptual measures of outcomes that assessed effectiveness, and adaptiveness to measure performance specifically focused on the research domain. We asked respondents to rate the performance of their business in relation to that of its competitors. Table 6 shows only moderate ($\pm 0,6 \leq r \leq \pm 0,4$) and strong associations ($\pm 0,7 \leq r \leq \pm 0,9$) (Dancey & Reidy, 2002, pp. 166).

<i>CSR Item</i>	<i>Performance Item</i>	<i>Spearman correlation coefficient</i>
<i>Employees' satisfaction with policies on sick leave and/or maternity leave</i>	<i>Greater contribution to the local job market Company's social responsible standing is its effective basis for competing</i>	<i>0,462** 0,496**</i>
<i>Environmentally responsible behaviours among staff</i>	<i>Greater contribution to the local job market</i>	<i>0,403**</i>
<i>Internal meetings</i>	<i>Effectively adaptation to changes in the market environment</i>	<i>0,423**</i>
<i>Employees' wages</i>	<i>Effectively adaptation to changes in the market environment</i>	<i>0,450**</i>
<i>Preventive health security of employees</i>	<i>Greater contribution to the local job market Responsibility towards employees Opportunities for personal development</i>	<i>0,427** 0,534** 0,518**</i>

Table 6. Correlation coefficients (relationships between CSR elements and the Croatian retail companies performance).

** Correlation is significant at the 0.01 level (2-tailed). Source: authors

As we can see, there is a moderate positive association between the satisfaction of companies' employees with the policies on sick leave and/or maternity leave and the companies' contribution to the local job market in comparison to their competitors. In other words, more satisfied employees result in greater contribution to the local job market. Additionally, table 6 suggests that there is a moderate positive association between the satisfaction of companies' employees with the policies on sick leave and/or maternity leave and the companies' social responsible standing as its effective basis for competing. Thus, increases in the quality of policies on sick leave and/or maternity leave also enhance company's effective basis for competing.

There is a moderate positive relationship between companies' reinforcement of environmentally responsible behaviours among staff and the companies' contribution to the local job market in comparison to their competitors. Therefore, retailers' stronger involvement in environmentally responsible behaviours among staff will result in a much greater contribution to the local job market.

Additionally, internal meetings and employees' wages are moderate positive related to companies' adaptation to changes in the market environment. Companies that have internal meeting very often and whose employees have got adequate wages are companies better adapt to changes in the market environment.

Table 6 shows that companies' organization of preventive health security of employees is moderate positive related to its contribution to the local job market, responsibility towards employees and opportunities for personal development. Thus, companies that more organize preventive health security of employees increase their contribution to the local job market,

increase their responsibility towards employees and offer more opportunities for personal development of their employees than their competition.

LIMITATIONS

A number of potential limitations of this study need to be acknowledged. Firstly, direct distribution of the questionnaire to only retail managers might have compromised the representativeness of the sample. Also, limitation of the study lies in its relatively small sample size. This was mainly attributable to the limited time and resources available for the study. Therefore, the findings of this research should not be generalized across the entire Croatian retailing sector. The methodology followed and the statistical methods employed in the study were also subject to limitations.

Future studies may be directed to the whole retailing sector to develop a broad based understanding of the linkages between company's characteristics and CSR issues. A number of company's profiles such as region, size of residence, etc. can be explored as the determinants of CSR because the Croatian retail market is not homogenous in its structure.

CONCLUSION

This paper is an attempt to reveal what is the level of CSR of Croatian retail companies. The study suggests that an explicit and sustained focus on health and safety and human resources is common to most of investigated retail companies. However, retail companies report their recognition of the importance of CSR and their commitment to integrate it within their business but they invest relatively limited resources in their employees. Also, there is limited participation in the local community's activities. Only small number of respondents recognized the importance of improving environmental performance that can be translated into increased staff commitment.

The majority of Croatian retailers are making use of CSR themes in their communication with their customers, community, stakeholders, etc. but the survey revealed that on average their commitment was very low. According to the findings, there is a relationship between the size of the company and CSR because large companies accepted CSR as a part of their strategic orientation. Thus, the first hypothesis was approved. However, companies' years of existence on market were not related to CSR in any investigated item and therefore second hypothesis was rejected. The study points out significant relationships between some CSR elements and business performance (i.e. adaptiveness and effectiveness).

As competition for market share in the retail sector is intense, these findings have important implications for Croatian retail sector because retailers are facing significant pressures to offer high level of service, knowledge and skills of their employees and to reduce cost as well. The findings could give them directions which strategy to apply in order to improve conditions for workers and in return win greater loyalty and dedication from the staff. Taking into considerations above mentioned limitations of the study, future research should be conducted on the sample of Croatian consumers to find out their perception of retailers' CSR.

THE ITALIAN SMES IN THE GLOBAL CONTEXT:
THE ACCOUNTABILITY SYSTEM ROLE

Ricci, Paolo¹; Cillo, Valentina²; Landi, Tiziana³

¹Full Professor of Business Administration, University of Sannio – Benevento

²PhD Student, University of Sannio – Benevento

³PhD Student, University of Sannio – Benevento

The main purpose of this paper is to analyze critical and economic-financial tools of communication and social reporting such as driver of society development process in order to allow Small and Medium Size Italian Enterprises (SMEs) to become large and considerable in the national and international business system. The research work explores accountability system role making Italian SMEs considerable on national and international scale. To define a SME as global, the paper will compare internationalization indicators with the levels of accountability that a company can reach reporting and highlighting any correlations. The main purpose is to suggest a definition of small, medium and large company closely connected to their competitiveness capability, not necessary through quantitative parameters. From this point of view, large companies - not necessary great - are those which play a decisive role on a national and international scale.

Keywords: Complexity, external environment, communication, responsibility, accountability, corporate governance, global context, stakeholder, network, social reporting, company size.

ITALIAN SMES IN THE MEDITERRANEAN AREA

In the Italian economic system the small and medium size enterprises (SMEs) and “micro-firm” represent 90% of the total Italian economic entities with a medium number of 50 employs for each one²⁰³. Even so, the national wealth of “*made in Italy*” is increased by this small entities and by their manufactured products. Over the last decades the issue about SMEs, and in particular, SMEs in going global, has gained the attention of scholars and business experts as a key factor to improve competitiveness and lead the “*made in Italy*” all over the word. In the Mediterranean area “*the vast majority (of European companies) ... are small or medium sized entities*”²⁰⁴, so the goal of European Authorities is to create a network in a free and global market (Med Forum, 2009).

While big enterprises may enjoy of the advantages of their large dimension, SMEs don’t have so easy access to global market.

²⁰³ ISTAT Annual Report, 2008

²⁰⁴ IASB, *Accounting Standard for Small and Medium-sized Entities, Topic Summary*, October, 30th 2003, www.iasb.org

In the traditional business literature, SMEs are identified through some specific quantitative factors (see Table 1)²⁰⁵: turnover, number of employees and total assets.

PARAMETERS	MICRO-FIRM	SMALL BUSINESS	MEDIUM FIRMS
Workforce	≤10 unit	≤50 unit	≤250 unit
Maximum annual turnover	2 million	10 million	50 million
Total assets	≤2 million	≤10 million	≤43 million

Table 4: dimensional principles for enterprise classification

On the other hand, according to some Italian scholars (Bertini, 1969, Aureli, Cesaroni, Demartini, 2004), definition of small, medium and large company results from the role the companies play in a society development process and not only from quantitative parameters. From this point of view, *large companies* are those which are able to lead global competitiveness while, on the other hand, small ones are those which are not able to affect economic and living conditions on a large scale. In other words there are some SMEs which may be “*large*” in the market thanks to their capabilities, competences and some financial and economic reporting tools that make them able to play a leading role in the development process in national and international scenario. In this way, and through specific tools of communication that increase confidence and transparency in small firms in coming *large*, they may gain the same or more advantages of big companies.

Up against the change a first trend is what Di Bernardo and Rullani have called widening of “reference horizons”. About this we can talk of “interdependent globalization” that is a radically brand new situation where economical, productive, social, cultural specificities interact, mutually communicate and become – thanks to computer technologies and informatics know-how – interconnected parts of wider systems. Interdependence doesn’t avoid power, capacity and resources deep inequalities. In the meantime the rate is different from time to time according to different globalization processes: faster at a financial level, slower at a cultural and civil level. From this asymmetrical integration patterns follow implicating imbalances relating to relative positions of all the subjects involved. Globalization is a good opportunity for some of them, while for some others it’s a threat to which they answer activating defence and protection mechanisms.

But what is good in this macroeconomic scenario is also good for SMEs?

Small and Medium Enterprises have an economic and social value: this kind of enterprises may, in fact, also be conceived as a model for social stability thanks to its ability to develop employment opportunities and social mobility in the Mediterranean area. Therefore, to develop and implement an economic strategy, it’s necessary to be aware of this social impact and search

²⁰⁵ UE Recommendation n°. 316/2003, adapted by P.Ricci, *Introduzione all’economia aziendale*, Giuffrè, Milano, 2007, p. 25.

for the right way to communicate it to stakeholders. Indeed, to become global it is necessary to create:

- a wide entrepreneurial culture, enlarged and open to the external environment;
- a common language to disseminate and share goals and values throughout the Mediterranean area in order to converge different individual actions towards a great strategic development goal;
- a network of relationship and partnership to increase confidence and believableness to each other.

Measures of corporate internationalisation have gained crucial importance in the recent debate on globalisation, since many scholars link globalisation to a quantitative increase in the international activities of firms. Opinions on the extent of this increase differ widely, however, depending on what measurement concept is used. As there is no universally applicable measurement concept, researchers face the difficult task of bringing research questions, measurement concepts and data availability into line.

Various obstacles have prevented the growth and modernisation of the SME sector in transition countries, although they did not inhibit the foundation of great numbers of traditional, mostly micro-enterprises fighting for survival. These obstacles require that proper policies are addressed to the SME sector, both involving the general context or SME specific issues. The situation varies greatly through countries due to pre-transition features and different transition strategies.

It is necessary to understand what are the obstacles to this role of SMEs as a first step to remove them. As it turns out, obstacles to SMEs establishment, growth and modernisation vary largely through countries, as the nature and present role of SMEs do. Countries in transition are remarkably different also under this aspect. In general, the problem is not necessarily that SMEs did not grow in numbers. True, in some cases, such as that of Russia, there are too few SMEs compared to the size of the country and to the numbers existing in comparable market economies. However, in some other cases the problem has been labelled as “too many, too small”. This label stresses that SMEs size is too small to make them viable in modern and competitive market economies. A corollary of the latter is that most small businesses are concentrated in the traditional consumers trade (including shuttle trade) and some traditional handicraft. Scarce examples of vertical integration with large firms exist, and barely any horizontal networks. In the case of SMEs all this has meant that institutions and infrastructure, including those necessary to SMEs, were missing or undeveloped. SMEs themselves – their owners and entrepreneurs in particular – missed the necessary experience and expertise to successfully operate in a competitive market economy. To these one should add that transition as it was implemented also meant liberalisation of foreign competition, often excessively abrupt for new SMEs to survive.

Obstacles SMEs in transition apparently change during their life cycle. Credit is an important issue in point. While observers and scholars often quote the lack of credit as a major obstacle to SMEs foundation. The lack of credit (including bank credit, trade credit, and leasing) becomes a major obstacle that prevents or slows down the growth and modernisation particularly of domestic firms.

SMEs that want become global and competitive in the Mediterranean area are looking forwards to implement a specific system of accounting and reporting and change their entrepreneurial culture.

Competitiveness means to enable customers to choose, under the same conditions, the company which offers greater economic benefits without incurring any sacrifice or with minimal effort.

Providing themselves with adequate accounting and non-accounting information system for transmitting outside their results and achievements, SMEs may become visible at the same level of a large company.

GLOBALISATION AND INTERNATIONALISATION: LITERATURE REVIEW

The process of globalisation is of course very complex and multifaceted. In this study we are bound to restrict the focus only to some limited aspects that have strict implications for SMEs competitiveness. However, to this end, we need some background on a few issues and problems raised by the global evolution of markets.

The modern process of globalisation of the world economy had been, and is, in its essence a process of globalisation of markets. Certainly the pace is rapid and has quickened in recent years but the process of greater international economic integration has been underway for decades. In the last 20 years more open economic policies and trade liberalisation worldwide and technical advances, notably in transport and communication have combined to lower costs and accelerated globalisation. Global trade in products and services has been growing at an average 6% since 1990. The most notable elements of the current wave of globalisation are:

1. An unprecedented lowering of trade barriers worldwide.
2. Vastly improved logistics and communications systems available to all companies.
3. The information technology revolution which has opened the way for greater technology and knowledge exchanges and the advent of new types of economic transactions such as e-commerce.

This means that trade can be conducted cheaper, faster, easier and over larger distances and the advent of previously no-available services. But globalisation is not only trade. It also involves foreign direct investments including off shoring and relocation and an increase of all forms of technology transfer and a larger access to markets and suppliers.

Globalisation has effectively “shrunk” the world. Through globalisation national borders are constantly losing their significance as limitations for human interaction in general and for economic collaboration in particular. This means that the natural spheres of activity of all the economic actors expand from national into multinational or even global²⁰⁶.

However, how European SMEs may transform this factors in advantages?

For SMEs globalisation means that the natural or “local” environment grows constantly and brings greater opportunities in the form of larger markets and new suppliers but also threats in the form of wider competition, complexity and shorter product life cycles. Greater integration and reduced barriers mean that international competition starts at home. Even businesses that focus primarily, or even exclusively, on the domestic market have to be competitive internationally in order to secure long-term survival and growth.

²⁰⁶ Karagozoglou, N., and M. Lindell (1998). “Internationalization and Small and Medium-Sized Technology-Based Firms: An Exploratory Study,” *Journal of Small Business Management* 36, 44–59.

Internationalisation is a phenomenon researched intensively over the last few decades from a different viewpoints, including: organization theory, marketing, strategic management, international management, and small business management. Issues such as international decision-making and management, development of international activities, and factors favoring or disfavoring internationalisation have been studied for large as well as small businesses.

Given the nature of today marketplace, SMEs are increasingly facing similar international problems as those of larger firms. For many SMEs, especially those operating in high-technology and manufacturing sectors, it is no longer possible to act in the marketplace not taking into account the risks and opportunities presented by foreign and/or global competition. As a result, discussion about internationalisation in this study needs to cover to some extent, aspects of general internationalisation of both large and small firms, while focusing on the internationalisation of SMEs.

This new, ever changing scenario that is globalisation will require and reward inventiveness, agility and flexibility: the very qualities commonly used to define SMEs. Embracing these qualities means that competitive SMEs will not only be in a position to tackle globalisation but will be able also to gain the benefits from it.

Therefore, a pro-active attitude to global competition and markets is increasingly becoming not a choice but a matter of necessity. Each company must adopt internationalisation as part of the strategic search for the company's competitiveness and not just as a reaction to times of reduced national demand. This implies that continuous technological, managerial and operational innovation inside SMEs will be one of the key tools for their sustainability and growth.

It is reasonable to suppose that benefits of internationalisation do not refer exclusively to exports. Exporting, as the traditional way to internationalise, is still very important, and so importing is not just a source of improved performances through the acquisition of new technology and abilities, because importers tend to be keener/faster exporters²⁰⁷. Other forms of internationalisation such as foreign direct investment (relocation or outsourcing), technology transfers, participation in international value chains, and other forms of inter SME co-operation are gaining ground. In all cases the quest for greater competitive advantage is even more direct: access to other markets is only one motivation usually shared or outweighed by access to technology.

Currently there is no agreed definition of internationalization (Bell and Young, 1998) or international entrepreneurship (Young et al., 2003). Internationalisation has been viewed as the process of increasing involvement in international markets (Welch and Luostarinen, 1988). A distinction can be made between inward and outward activities. Inward processes relating to internationalisation (that is, importers, licensees and franchisees) have received relatively

²⁰⁷ On the direct impact of imports on increased productivity and growth "Imports of services and economic growth: a dynamic panel approach", Xiaoying, L., Greenaway, D. and Hine, R.C., SETI project, May 2003. "Small and medium enterprises internationalization and the influence of importing on exporting" Holmlund, M.; Kock, S. and Vanyuhin, V., International small business journal 2007, Vol. 25, pp.459. Also "Born Globals internationalization in the creative industries", a paper by Professor Staffan Gullandern remarks the crucial causations effects between inward and outward activities

limited attention, despite the belief that many firms begin their first international activity on the inward side (Karhonen et al., 1996; Welch, 2004).

As matter of fact, according to some authorities (Dunning, 1992) *a multinational or transnational enterprise is an enterprise that engages in foreign direct investment and owns and controls value adding activities in more than one country.*

There are strong differences of opinion about what indicators are suitable for measuring corporate internationalisation (Caroli, Fratocchi, 2000). Some authors have sought to develop composite indices of internationalisation that combine several hitherto separate indicators. Ietto Gilles (1998), for example, proposed a composite index that combined the ratio of foreign to total assets, sales and employments with a measure of how many countries the company could be present in if it so wished. UNCTAD (United Nation Conference on Trade and Development, 2007) uses these measures, but in two separate indices of internationalisation: a trans-nationality index (TNI) and an internationalisation index. The former is the average of the ratio of foreign to total assets, sales and employment while the latter is calculated by dividing the number of foreign affiliates by the number of all affiliates. The literature does provide a wide array of possible ways through which internationalization could be measured, some are easier to implement than others. A key factor that determines which measures can and which ones cannot be used is the availability of data.

Following a well established framework in international business literature (Perlmutter, Heenan, 1979: 16; Sullivan, 1994: 331; Bäurle, 1996: 9), we can distinguish structural indicators, performance indicators and attitudinal indicators.

Structural indicators try to give a picture of the international involvement of a company at a certain time. Here we find several indicators that are related to the foreign activities of SMEs such as:

- the number of countries where a company is active
- the number/proportion of foreign affiliates
- the number/proportion of non-capital involvements abroad (e.g. strategic alliances, franchised operations etc.)
- the amount/proportion of foreign assets
- the amount/proportion of value added abroad²⁰⁸
- the amount/proportion of sourcing abroad
- the number/proportion of foreign employees

A second group of indicators describes the internationalisation of the governance structures of a corporation. Relevant indicators here are:

²⁰⁸ Following Schmidt (1991: 57) and Dunning (1992: 7) the value added abroad is the best measure to indicate the economic significance of the foreign activities of an MNC. The amount of value added abroad is calculated as the revenues made by foreign affiliates minus all inputs.

- the number of stock markets on which a company is listed
- the amount/proportion of shares owned by foreigners
- the number/proportion of non-nationals on the board of directors

On the other hand, performance indicators measure the degree of success or failure of corporate activity abroad during a certain period of time (usually one year). The two main indicators are *turnover* and *operating income*. Two issues have to be addressed when considering turnover:

- The first issue is demand. The main question here is, to what extent turnover is generated in foreign countries. The relevant indicator - amount of foreign sales by customer location - is calculated as exports from the home country plus revenues of the foreign affiliates (except those revenues that come from exports to the home country of the parent company).
- The second issue is supply. The main question here is, to what extent business activity is transacted by subsidiaries located in foreign countries. The relevant indicator - amount of sales of foreign subsidiaries - is calculated as the sum of turnover of foreign subsidiaries as a proportion of the sum of turnover of the parent company and its national subsidiaries.

A second important performance indicator is the amount of operating income earned abroad.

This indicator is usually calculated as the sum of operating income generated by all foreign affiliates.

<i>Structural indicators</i>	<i>Performance indicators</i>
<p><u>1. Relating to foreign activities</u></p> <p><i>number of countries a company is active in</i> <i>number or proportion of foreign affiliates</i> <i>number or proportion of non-capital involvements abroad (i.e. strategic alliance, franchised operation, joint venture)</i> <i>amount or proportion of foreign assets</i> <i>amount or proportion of value added abroad</i> <i>amount or proportion of sourcing abroad</i> <i>number or proportion of foreign employees</i></p> <p><u>2. Table 5: individual internationalisation indicators

Source: Our illustration based on Dörrenbächer 2000

Traditionally, small enterprises are characterized by lack of transparency in relation to their audience and, moreover, they seem unwilling to account any economic-financial information outward. The accounts are prepared primarily for tax purposes or for purposes of internal control but never to provide information outside, except for what established by the existing regulatory obligations.

Globalisation and its increasing competitiveness, together with socio-cultural changes occurring in the environment, requiring the company a growing ability to communicate with their business partners, as the fulfilment of their information needs; moreover their decision depends on the ability of the company to secure a lasting success.

The importance of corporate communication for managing the external environment is crucial especially for companies that want to grow internationally, where there is a greater competitive challenge and a lack of information on market participants.

Regarding the reasons why SMEs decide to initiate internationalisation processes, many authors (Campebell, 2003; Bonaccorsi, 1994) agreed to support the prevalence of reactive motivations, as the fruit of the awareness of being able to use resources and expertise for international expansion implementation.

Concerning the way through which SMEs realize their presence in the international context, several studies highlight that internationalisation with low levels of involvement forms is prevalent, especially indirect exports made through a commercial intermediary managing exports flow, placement in foreign markets and customers relationships. In this case SMEs involvement abroad is highly limited, experiencing a situation of passive internationalisation because it lacks direct contact with foreign market.

On the other hand, more complex internationalisation forms such as strategic alliance, franchised operations and joint venture are less common among SMEs.

This analysis is a necessary step to establish the relationship between accountability degree and degree of internationalisation (DOI). Indeed, as firms increase the share of their operations abroad, they experience higher levels of performance increasing their DOI.

In order to analyse the tendency to give economical-financial information to foreign interlocutors there are two objectives to pursue:

- a more general objective, concerning the examination of the ways through which SMEs are present in the markets abroad and the reasons bringing those enterprises to widen their range geographically;
- a more specific objective, concerning the possibility to identify relations between level of involvement abroad and economical-financial communication processes towards foreign interlocutors.

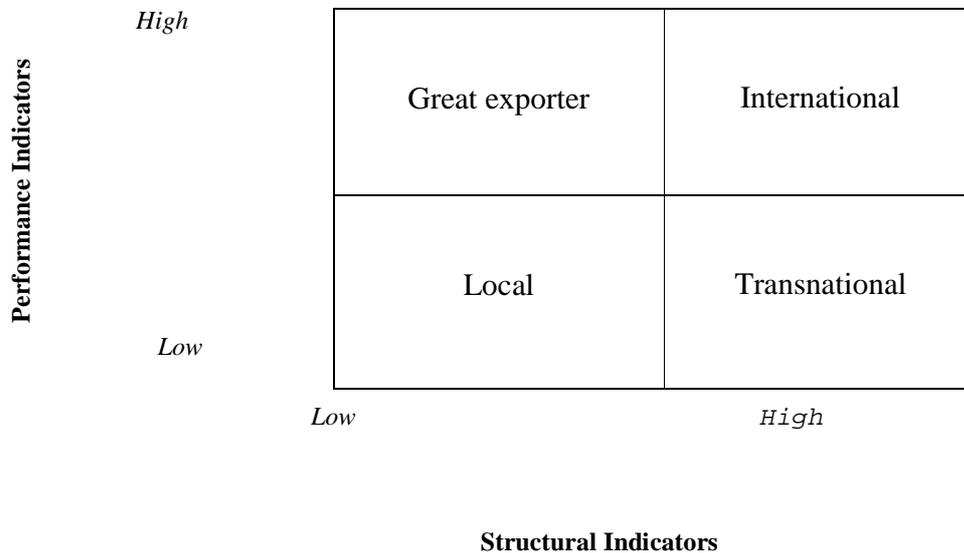

Figure 1 – Foreign sales/Involvement abroad matrix

Reference: Our illustration

It is important to recognize that research relating the SMEs internationalisation is associated with several methodological problems. Some studies are not keyed into debated relating to the internationalisation of private smaller firms as opposed to larger multinational firms. There are also a number of concerns surrounding the size and representativeness of sample, the techniques used, and the validity and reliability of measures operationalized in SMEs studies. Particular problems relate to establishing whether there is a causal link between internationalization and firm performance.

However, it reasonable to suppose that SMEs that having an high propensity to export and establish a widespread presence in the international context should be considerate such as international. This shows a good ability to overcome barriers of access to different international markets and manage the complexity associated with the plurality of relations with countries culturally very different.

THE ECONOMIC-FINANCIAL REPORTING IN SMEs: THE ACCOUNTABILITY SYSTEM ROLE

Financial and economic reporting is a key component of the relationship between the firm and the environment in which it operates (Branciarri, 1988, Adamo, 2006). Therefore, this process become an indispensable resource for any company (regardless of size, legal form or business) which wants to operate in a global context.

Until some times ago, financial reporting for small Italian firms was restricted to strike a balance sheet according to civil and tax laws requirements (Capaldo, 1981, Capodaglio, Ricci, 2008).

In the study about balance, it was considered just a means to measure income and it had a prevailing internal function without considering its public role for external and internal stakeholders.

The low level of financial reporting and economic information are often considered one of the main causes of the financial problems for smaller firms, especially to obtain long-medium-term loan by bank and private or public financiers. For this and other types of reasons, SMEs which would become *large* and relevant in the local and international market have to create and implement an adequate accountability system composed of all kinds of economic-financial tools of reporting and communication. In fact, an approach to a reporting model that is not restricted to only economic and financial indicators, allows SMEs to demonstrate the wealth and value created for the entire network of internal and internal stakeholders. A suitable accountability system may improve managers social responsibility and responsiveness toward their stakeholders allow them able to evaluate the actions taken and results achieved.

According to some authoritative doctrine (Ricci, 2005, Buccellato, 2004, Pulejo, 2001) the term accountability, widely used in recent years, draws the firm ability to permit stakeholders to assess firms performances, in order to adequately empower business decision makers. Accountability evokes a set of ideas closely related to each other (Molteni, 2000):

- Autonomy and freedom of government and company management operating in a market economy;
- Firm responsibility towards its stakeholders;
- Firm responsibility and accountability towards achieved results.

The conditions in which assessments are produced depend on the quality of the firm accountability system. Factors which contribute to determine the accountability of a company are²⁰⁹:

1. a clear and thorough programming process;
2. a clear definition of internal and external duties;
3. a suitable accounting system;
4. an effective internal system for control and evaluation;
5. a periodic informative activity about company management;
6. the use of benchmarking procedures;
7. the use of up-to-date technology in the communication process.

²⁰⁹ Ricci P. *Enti strumentali regionali e loro accountability. Il caso Campania*, Franco Angeli, Milano, 2005, p. 14

Thinking of an extended accountability system it includes all tools and documents that provide information and comments about company performance in different ways and with a different degree of insight and detail (Terzani, 2002), such as balance sheet, period analysis, periodic reports, budgets over one or more years, financial and economic programmes, strategic and executive plans, social balance. Only an intense stimulus towards a suitable accountability system may actually improve the company's network of relations and to boost its reputation and credibility.

Given this brief introduction, and considered needs and market characteristics of the Mediterranean area, SMEs must focus on the relationship between the degree of accountability and their capability to influence the development processes on national and international scale, and look forward to becoming *large* through appropriate skills and competencies. To evaluate the degree of accountability, it's possible to use a scale of values for the factors described above.

1. A clear and thorough programming process

Using a scale from 1 to 5, we can assign 1 to enterprises with the lowest planning ability and the smaller communication tools and 5 to enterprises with the highest planning ability and the larger communication tools (Book keeping, Financial Program):

2. A clear definition of internal and external duties

Using the same scale from 1 to 5, we can assign 1 to enterprises with short system of duties definition and lack credibility in their own actions, while we can assign 5 to enterprises which develop and enforce their specific duties at all levels of the hierarchical organizational structure.

3. A suitable accounting system

Using the same scale from 1 to 5, we can assign 1 to enterprises with a poor accounting system and few financial reporting document addressed primarily towards internal communication, while we can assign 5 to enterprises which have an advanced reporting system with innovative tools of social and economic communication (Social Report, Budget, Environmental Balance, Cost Accounting)

4. An effective internal system for control and evaluation

Using the same scale from 1 to 5, we can assign 1 to enterprises without any degree of control and internal evaluation system, while we can assign 5 to enterprises with dedicated internal audit function through tools and specialized staff (controller role).

5. A periodic informative activity about company management

In a scale from 1 to 5 we can assign 1 to enterprises where any form of communication and comparison between operational and management is provided, while we can assign 5 to enterprises which have an extraordinary commitment to management information and check the actions implemented.

6. The use of benchmarking procedures

In a scale from 1 to 5 we can assign 1 to enterprises which haven't any responsibility about their performance and don't measure their results, while we can assign 5 to enterprise which

consider performance measurement a necessary priority and compare their own performance with the best practices of other leading companies in the relevant market.

7. The use of up-to-date technology in the communication process

Using the usual scale from 1 to 5 we can assign 1 to enterprises which have only few instruments of communication and we can assign 5 to enterprises which have sophisticated and appropriate tools and technological systems to communicate information to internal and external stakeholder.

Enterprises with higher rating on these factors should match the best processes of assessment and accountability, increasing internal levels of trust and cooperation and implementing a network of relationship with their own stakeholder. An accountable enterprise is therefore an enterprise responsible and transparent towards its stakeholder about undertaken actions and achieved goals.

Accountability is a strategic action to promote market development and growth of the environment in which the company operates. To measure the degree of accountability is possible to identify several socio-economic reporting tools (see Table 3).

	1	2	3	4	5

Table 6 – Tools measuring accountability degree

Reference: Our illustration

It should be stressed that, given the complexity of the topic, the analysis will be carried out not on the measurement of quality of these instruments, but on their presence and on the activation of some processes of accountability due to the seven factors described above.

TO BE GLOBAL FOR ITALIAN SMES IN THE MEDITERRANEAN AREA: GENERAL IMPLICATIONS

An enterprise that is really internationalised according to the indicators set out before (paragraph 2) cannot be defined global without implementing any accountability process. SMEs with their small size may become *large* only if they will be able to impact on national or international context in which they operate. To be global it's not enough fostering high profit increasing output on the international market, but is necessary to create positive outcomes on

the environment where they decide to live through, for example, strategic alliance and joint venture with foreign partners.

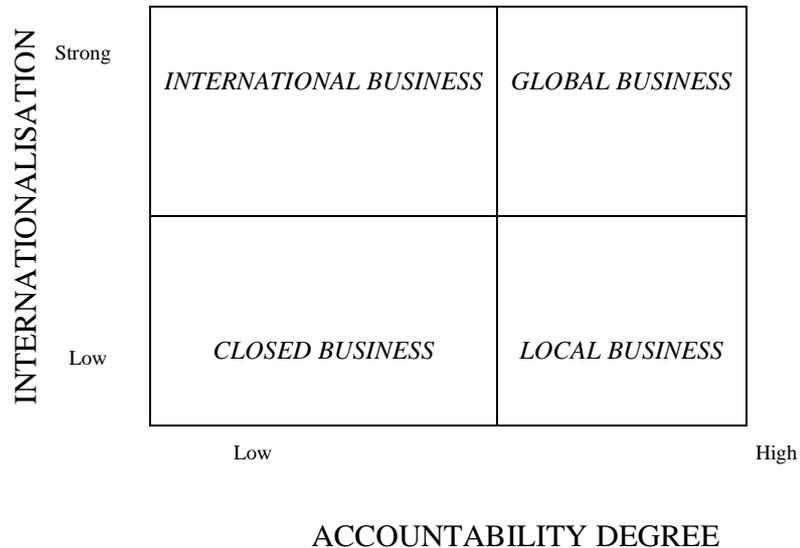

Figure 2 – Internationalisation/accountability degree matrix

Reference: Our illustration

According with our hypothesis, international SMEs are those which have an high propensity to export and establish a widespread presence in the international context, a good ability to overcome barriers of access to different international markets and manage the complexity. The internationalisation process is therefore, at the same time, effect and cause of SMEs development.

The ability to create collaborative relationships with foreign partners, in the case of small companies is even more important because they require an external network that can make up for limited financial resources and structural deficiencies in staffing.

The communicative behaviour of small businesses, necessary to obtain the consent of the principal foreign partners (primarily lenders and potential customers), urges SMEs to conform to communicative standard far higher than those provided by the law.

Furthermore, Italian SMEs able to obtain accreditation in the foreign market and earn the trust and cooperation from foreign partners may enjoy several economic and financial benefits, such as:

- easier access to credit and smaller price of money;
- lower operational costs;
- better business reputation and credibility;
- full stakeholders confidence;

- established relations with local authorities (partnerships).

Concluding, we can see that the legitimacy of the company in the foreign market facilitates the creation and distribution of value created but, at the same time, it must be the company able to create his new identity becoming activated part of the reference context, adapting its culture and its values, establishing and strengthening positive relationships with old and new stakeholders.

COMPETITIVE STRATEGY AND PERFORMANCE OF CAMPANIA WINE FIRMS

Rossi, Matteo¹

¹University of Sannio

Purpose - The aim is to analyze the corporate performances to verify the success (or not) of strategic process of Campania wine firms. The study focuses on competitive strategies realized to achieve a sustainable and durable competitive advantage (Porter, 1985). During the last few years the wine world is interested to a process of accelerated change due to different configuration that the wine geography has had either from the demand side or the supply side.

Methodology - The study is an exploratory survey (Selltitz, Wrightsman, Cook, 1976) with deductive method. The contents of survey should be exposed in specific questions:

what are the criticality of Campania wine system?

what are the strategies adopted and the performance obtained from regional firms?

which actions can be implemented to compete with the biggest national and international companies?

After the problem definition and development of research questions, the second phase of the research involves the critical choice of research hypothesis. The strategic management process is measured with the following issue:

sales growth rate,

profitability,

leverage.

On these paper are developed the following hypothesis:

H1. International listed wine firms and leading Italian wine makers achieve a higher growth rate in sales than Campania wine enterprises,

H2a. International and Italian wine firms achieve a higher growth rate in Return On Investment rate (ROI) than Campania wine firms,

H2b. International and Italian wine firms achieve a higher Return On Equity rate (ROE) than Campania wine makers,

H3. Campania wine firms use debt more than international listed wine firms and leading Italian wine makers.

Findings - In the new competitive environment Italian and Campania wine industry has showed structural weaknesses: a lot of wine enterprises are incapable to realize an optimal strategic process and this has negative reflex on performance. However in the regional context there are also successful firms able to develop and implement competitive and marketing strategies adapted to sector change.

Research Limitations - This is an exploratory study and the results represent a base for further analysis.

Managerial Implications and Originality

The principal managerial implications are the following:

the key of good performance is a correct and formalized strategic process,

Campania wine makers should continue to valorize their autochthones wines,

Campania wine firms should review their investments (investment in tangible assets should be supported with investments in R&D that are important to realize product and process innovations),

it's important the involvement of public institutions to realize merger and acquisition (M&A) processes and to create and support social capital nets,

the ultimate goal should be to have a systematic view, where the system is the territory in which there is confluence of grapes, land and human and social factors.

This survey has tried to make a minimal innovative contribution and could be represent a starting point for strategic planning firms responsible and for policy makers that are interested to develop the regional wine sector.

Key Words: competitive strategy, performance, wine firms, marketing, financial structure

THE NATIONAL AND INTERNATIONAL SCENARIO

During the last few years the wine world is interested to a process of accelerated change due to different configuration that the wine geography has had either from the demand side or the supply side. These considerations are confirmed by Organisation Internationale de la Vigne et du Vin (OIV), which, for 2007, has calculated global wine production in 266.1 million hectoliters, down 6.6% on the 284.8 million hectoliters recorded in 2006 and down 10% on the 296.8 million hectoliters produced in 2004. The 61% of production is realized by European Union countries with a predominant role of three countries: France, Italy and Spain. Italy, along with France and ahead of Spain, is the leading world producer with a market share of 17.5% of world production and 29% of European production.

However in the last years wine production has interested countries that do not have a winemaking tradition. They are all those countries named New World Countries (Australia, New Zealand, South Africa, Argentina, United States and Chile) where there are lots of large size firms that have obtained good performance and high market shares using intensive production techniques and targeted marketing policies.

For these reasons the main non European producers could be considered the United States, which recorded growth of 3% in 2007 (estimates for 2008 suggest further growth of 2%), followed by Argentina, which reported volumes virtually flat from 2004 to 2007 (a slight reduction of just 2.5% is expected in 2008), and Australia, which, with volumes flat from 2004 to 2006 and following a 33% decline in 2007 due to the drought conditions, posted 22% growth in 2008; whereas South Africa was stable, and in the last year should approach 10 million hectoliters of produce.

The international scenario shows EU production falling in 2007 (from 176.8 million hectoliters in 2006 to 161.3 million), with a further contraction of around 1% estimated in 2008 to reach approximately 160.1 million hectoliters. Italian wine production in 2007 totaled 46.6 million hectoliters, around 10% less than in 2006. The output for 2008 is estimated by the OIV to be more or less stable, with an increase of just 1% compared with the previous year's vintage. The value of Italian wine production in 2007 may be estimated at €8.3bn (production prices) and apparent consumption at €5.2bn. The *Denominazione di Origine Controllata e Denominazione di Origine Controllata e Garantita* (DOC-DOCG²¹⁰) wine production share has declined (-3.7%) and the estimates of ISTAT²¹¹ indicate that it represent only 33% of total production in 2007 (but in 80s DOC-DOCG wine represented only 10% of total production). Another 28% of production is

²¹⁰ Italian wines which are grown in certain specified areas and which conform to certain regulations may be styled DOC (*Denominazione di Origine Controllata*). The classification DOCG (*Denominazione di Origine controllata e Garantita*) is awarded to DOC wines of particular quality. Wine must conform to the DOC criteria for at least five years before they can be classified as DOCG.

²¹¹ ISTAT is the Italian national statistical institute.

represented by *Indicazione Geografica Tipica* (IGT²¹²) wines (also decreased of 4.5% compared to 2006).

A significant part of country's production is exported, with a surplus of 3.2 billion in 2007 (in 1990 the surplus was only 760 million euros). The reasons of positive performance of Italian foreign trade are the reduction of prices and the augmentation of volumes.

In 2007 sparkling wines, DOC and DOCG wines accounted for some 54% of the income from exports (compared with 55% in 2006, 59% in 2004 and 63% in 2003). For 2008 ISTAT's provisional data suggest that in terms of value exports should increase by 1,7% while falling by 7% in terms of quantity.

In this new competitive environment there are many changes in firms structures and competitive strategies; with these changes it's possible to recognize three groups of wine firms:

- global enterprises, active in all segments of the beverage industry;
- large national wine enterprises, focused on wine production and that operate in an international context;
- SMEs with niche strategies.

The Italian wine industry has structural weaknesses that need a solution. These considerations are true also for Campania wine sector, characterized by a presence of a high number of micro-enterprises²¹³.

In this research are emerged difficulties of Campania wine firms: most regional wine enterprises are incapable to realize an efficient strategic process adapted to changed context and this has also negative reflex on performance. However in the regional context there are also successful firms able to develop and implement competitive strategies adapted to sector change and so capable to obtain significant performance.

THEORY, RESEARCH HYPOTHESES AND METHODOLOGY

Increasing worldwide competition emphasizes the importance of strategic management process in modern organizations. According to Harrison, strategic management is a "process through which organizations analyze and learn from their internal and external environments, establish strategic direction, and implement those strategies, all in effort to satisfy key stakeholders" (Harrison, 2003: 4). After formulation and implementation of strategies it's important to develop a system of controls. For this reason it's important to start by considering basic financial planning and, over time, develop methods more closely aligned with the strategic management process.

The paper aim is to analyze the strategic choices of Campania wine firms, through the analysis of strategic management process and performance. The study focuses on competitive

²¹² IGT is the second of four classifications of wine recognized by Italian government. IGT wines are labeled with the locality of their creation, but do not meet the requirements of the stricter DOC or DOCG designations. In wine terms, it is considered the rough Italian equivalent of the French *vin de pays* designation.

²¹³ Micro-enterprises are all enterprises with less than 10 employees and turnover less than 2 million euros.

strategies because in SMEs, that characterize Campania wine sector, there isn't difference between corporate and competitive strategy because in many cases they are mono-product firms. Besides the decision to investigate competitive level is that competitive analysis is productive not so much at corporate level, but at business level (Rispoli, 1992).

In this paper strategic analysis of Campania wine firms is followed by a performance and capital structure analysis. Since the Modigliani and Miller seminal article (1958), researchers have tried to explain how firms choose their capital structure. The interest exist because if an optimal structure can be identified a firm could maximize its value maintaining that financial mix. Analysis and review of different approaches in literature confirm an optimal composition of financial sources. This must be compatible with the strategic profile of the firm in order to take part in the value creation process.

On these statements we have defined alternative research questions:

- what are the criticality of the Campania wine system?
- what are the strategies adopted and the performance obtained from regional firms?
- what is the capital structure of Campania wine firms?
- what actions can be implemented to compete with the biggest national and international companies?

The answer to research questions has needed:

- the strategic analysis of the sector (to identify strengths, weaknesses, opportunities and threats),
- the performance analysis of major International listed wine companies and leading Italian wine-makers,
- the performance and capital structure analysis of Campania wine firms,
- the identification of critical factors of regional wine firms.

After the problem definition and development of research questions, the second phase of the research involves the critical choice of research hypothesis.

Studies in the management field recognize the existence of several performance measures, such as market share, growth, profitability, customer satisfaction (Hitt et al., 1998; Lumpkin and Dess, 1996). In this paper strategic management process is measured with the following issue:

a) *sales growth rate*: in today's rapidly changing environment, companies often have to grow quickly in order to survive and one method of achieving rapid growth is through acquisitions. Often the most effective way to deal with a competitor, or prospective competitor, is to buy it. Public companies can use their shares as a currency to make acquisitions. This leads to the following hypothesis:

H1. International listed wine firms and leading Italian wine makers achieve a higher growth rate in sales than Campania wine enterprises,

b) *profitability*: the prediction here is less straightforward. If from a side managerial efficiency could be improved by more appropriate compensation package with stock options or other remunerations linked to share price, from another side too much emphasis on the stock price could result in misleading attention to short-term performances. Furthermore, the managerial incentives could be higher in SMEs, where most of potential pay-off through to the controlling shareholders (DeAngelo et al., 1984). Therefore the following hypothesis are somewhat unpredictable:

H2a. International and Italian wine firms achieve a higher growth rate in Return On Investment rate (ROI) than Campania wine firms,

H2b. International and Italian wine firms achieve a higher Return On Equity rate (ROE) than Campania wine makers,

c) *leverage*: as private firms face significant constraints in raising outside equity, it is very likely that their financial structure were unbalanced toward the debt. SMEs, especially during growth periods, usually stretch their debt capacity to the limit. Thus it can be assumed that leverage is higher for Campania SMEs. Therefore:

H3. Campania wine firms use debt more than international listed wine firms and leading Italian wine makers.

This research is an exploratory research (Selltitz et al., 1976; Tsetsekos, 1993) because the aim is to explore the strategic management process, performance and capital structure of Campania wine firms. One of attractive features of this research is to identifies isolates variables and relationship for further analysis and research.

One of the first step was the collection of secondary data of the major wine companies present in AIDA (Bureau Van Dijk), Mediobanca²¹⁴, ISTAT, INEA²¹⁵, ISMEA²¹⁶ and Campania Region databases. The acquired data has helped to define the context of research: number of firms, size, capital structure, performance.

The primary data were collected through two instruments:

- survey analysis;
- case study analysis.

The dual level of analysis – sample and single firm - has made possible to obtain valuable information for entrepreneurs and policy makers that would like to revitalize the territorial context. Finally there are developed innovations hypothesis that can guide the firms to implement development processes appropriate with available resources.

This study uses both methods to collect data: qualitative and quantitative. Specifically, the quantitative analysis, that is a mono-variable and bi-variable statistical analysis of data, has had the objective to transform the information into variables, while the qualitative analysis was an

²¹⁴ Mediobanca is the leading investment bank in Italy.

²¹⁵ INEA is the Italian national agriculture institute.

²¹⁶ ISMEA is the Italian national agriculture and food services institute.

analysis of content, realized with the documentation acquired on field and organized with a thematic criteria related to the initial research hypothesis.

THE INTERNATIONAL AND NATIONAL ANALYSIS

To verify the competition in the wine sector, is useful to determine the sector attractiveness level and then analyze the performance of the leading international and Italian wine firms. For these reasons are very useful data produced by Mediobanca in Wine industry survey 2009 (data processed at 2007).

The attractiveness sector

Strategy is based on competition because without it strategy doesn't mean nothing. Before making decisions is important to think the reactions of competitors, for each action. The basic premise of sector analysis is that industry profitability level isn't an historical accident or the result of specific influences into a sector, but is determined by the characteristics of the sector structure. According to Porter the sector attractiveness, is determined by the profitability that firms can achieve in the sector (Figure 1) and usually this is measured with return on capital invested (ROI) (Grant, 1994).

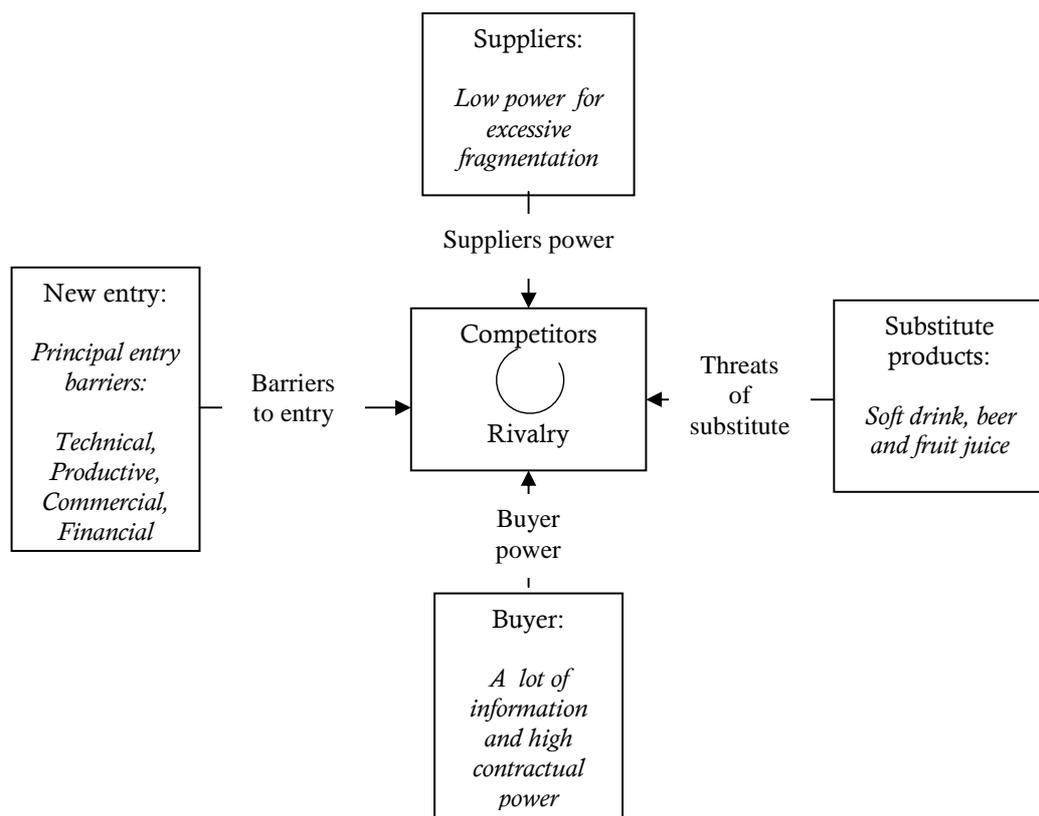

Figure 1 Diagram of Porter's Five Forces applied to wine sector. Source: data processed by Porter, 1980

In fact a sector has a catalytic role on the firms where there is the possibility to achieve a ROI greater than the capital cost. The Italian wine industry has a good rate of return on investment (6.3%) however it's lower than the beverages firms (9.2%) and than the Italian industrial firms (13.0%) (Mediobanca, 2009). This gap may be explained by the hyper-competition that characterizes this sector at national and global levels. If we consider the effect of entry and exit barriers it is possible to determine the competitive pressure degree in wine sector. Those barriers are different mechanisms that have correlations: the conjoint presence gives different combinations of risk/profitability.

The wine sector presents a low and risky profitability (Figure 2) because there are low entry barriers (the new entry, called New World Producers, are a demonstration) that don't protect firms present in the sector and ensuring only a satisfactory profitability (not high), and high exit barriers which don't allow disinvestment (the wine sector requires specific investments) and that don't allow elimination of marginal producers.

		<i>Exit barriers</i>	
		<i>Low</i>	<i>High</i>
<i>Entry barriers</i>	<i>Low</i>		<i>Low and risky profitability</i>
	<i>High</i>

International Listed Wine Companies

The Wine industry survey 2009 has realized a performance analysis of aggregate accounts of a panel of nine international groups with turnover above €200m, all of which make and/or sell wine and are listed on global stock markets. The results cover the period from 2001 to 2007 (Table 1).

It should be noted that there was a reduction in turnover, which declined by 10.3% from €8.6bn in 2006 to €7.7bn in 2007²¹⁷. The most dynamic sales growth shown was by Chinese group Yantai, which delivered a 36% increase on the back of strong growth in domestic demand (with the Chinese market accounting for over 90% of the company's total sales), followed by Chilean wine-maker Vina Concha y Toro which reported a 23.3% increase, and for which exports, which represented 81% of turnover, were up 28% in terms of volumes (with sales to Europe and Asian in particular)²¹⁸.

<i>Company</i>	<i>Country</i>	<i>Financial year ends</i>	<i>Turnover (in € '000)</i>	<i>Wine as % of turnover</i>	<i>Export as % of turnover</i>
<i>Foster's Group</i>	<i>Australia</i>	<i>30 June 2007</i>	<i>2.718.864</i>	<i>51,5</i>	<i>(1)36,8</i>

²¹⁷ This contraction was entirely attributable to Constellation which deconsolidated some of its activities in 2007 which reported 2006 sales amounting to €1.3bn.

²¹⁸ This information is important to understand how different strategic choices are possible to pursue a sustainable competitive advantage. In fact the success is related to analysis of internal and external factors, of market trends and opportunities in the new competitive environment.

<i>Constellation Brands</i>	<i>U.S.</i>	<i>28 February 2008</i>	<i>2.563.005</i>	<i>89,0</i>	<i>46,2</i>
<i>Distell Group</i>	<i>S. Africa</i>	<i>30 June 2007</i>	<i>621.273</i>	<i>n.d.</i>	<i>18,9</i>
<i>Vina Conchay Toro</i>	<i>Chile</i>	<i>31 December 2007</i>	<i>389.874</i>	<i>100,0</i>	<i>80,5</i>
<i>Boizel Chanoine Champagne</i>	<i>France</i>	<i>31 December 2007</i>	<i>359.420</i>	<i>100,0</i>	<i>39,0</i>
<i>Vrnaken Pommery</i>	<i>France</i>	<i>31 December 2007</i>	<i>286.830</i>	<i>100,0</i>	<i>43,7</i>
<i>Sektkelleri Schloss</i>	<i>Germany</i>	<i>30 June 2007</i>	<i>281.327</i>	<i>79,9</i>	<i>61,3</i>
<i>Yanatai Changyu Pionner Wine</i>	<i>China</i>	<i>31 December 2007</i>	<i>253.912</i>	<i>78,8</i>	<i><10</i>
<i>Laurent Terrier</i>	<i>France</i>	<i>31 March 2008</i>	<i>249.430</i>	<i>100,0</i>	<i>67,2</i>
TOTAL			7.723.935	69,8	42,0
<i>(1) Does not include Asia and the Pacific, which are considered as home country</i>					

Table 1. International listed wine companies Source: data processed by Mediobanca, 2009

In 2007 the main earnings margins (expressed as a percentage of turnover), were systematically higher than those for the previous year. Net profit halved as a percentage of sales, however, from 12.9% in 2006 to 5.9% in 2007. The most profitable company in 2007 measured by net profit as a percentage of turnover was Yantai with 23.3%, followed by Foster's at similar levels (21.2%). The Return On Equity for the aggregate in 2007 was 7.5%, down sharply from the 21.3% posted in 2006 due to the one-off charges taken by Constellation; Yantai stood out also in terms of average of ROE with 19%, behind only Foster's (21%) and ahead of Distell (17%) and Vina Concha y Toro (14.3%). Net equity proved to be smaller than borrowings, with the net worth/borrowings ratio standing at 88.9%, the lowest in the entire 2001-2007 period and far from the high of 126% reached in 2002. Still in 2007, net equity stripped of intangible assets did not even reach one-seventh of total outstanding borrowings, representing just 13.3% of them in percentage terms, down 24 points from 2001, and here again recording a low for the 2001-2007 period²¹⁹.

Leading Italian wine-makers

For the ISTAT analysis methods and for particular structure of domestic wine sector isn't possible to have accurate data on Italian wine-makers. However interesting data emerge from a Mediobanca's Wine industry survey 2009, carried out on 97 main Italian companies (Figure 3) operating in the wine sector that represent 48% of national wine production and 53% of total exports²²⁰.

The top five Italian wine-makers by turnover includes four co-operatives (Table 2).

	Registered Office	Turnover 2008 (€ M)	Ownership Structure
GIV – Gruppo Italiano Vini	Calmasino (VR)	288,0	Co-operative
CAVIRO	Faenza (RA)	281,3	Co-operative
CAVIT (*)	Ravina (TN)	154,8	Co-operative
Mezzacorona (*)	Mezzacorona (TN)	142,5	Co-operative
P. Antinori	Firenze	138,3	Family-owned ²²¹

(*)Cavit's financial year ends on 31 May and Mezzacorona's on 31 August.

Table 2. Top five Italian wine-makers by turnover (2008) Source: data processed by Mediobanca, 2009

The first important indicator is sales growth rate, which in 2007 is increased by 6.6%: the co-operative companies were slightly less dynamic, registering an increase of 4.7%, whereas the other Italian companies were more so, with growth of 6.9%; the four non-Italian companies reported a strong increase, of 23%. In 2007 the 97 companies under review here posted average turnover of €41.6m with an average headcount of just over one hundred staff. The Return On Investment came in at 6.3%, down 0.7 percentage points versus 2006 and returning to 2004-2005 levels, whereas ROE diminished from 6.0% to 4.1% (2.5 points below the high recorded in 2005). These indicators' performance was driven by trends in operating costs and taxation: ROI suffered from the decrease in margins and was hit by the new increase in capital invested, driven by substantial capital spending (€242m, near to the 2004-2005 average figure following

²²¹ A family-owned firm is a firm in which one or more members of one or more families have a significant ownership interest and significant commitments toward the business' overall well-being.

the high recorded in 2006); whereas ROE was reduced by higher labor costs and interest expense, as well as by the higher incidence of tax rate.

The breakdown of the companies covered in this survey by ownership structure shows that the cooperatives and non-Italian-owned companies were the least profitable in terms of Return On Equity: the former, for obvious reasons, do not offer many of the upstream phases in the production filière (shareholders produce grapes and wine which transfer to co-operative firms for further processing and sale), whereas the latter have limited commercial operations, being structured mainly suppliers to non-Italian sales networks controlled by their parent companies. The financial structure is also uneven: given that net equity chiefly consists of those fixed assets which are typical of the upstream phases of the wine-making filière (i.e. land and property), the co-operatives appear to be relatively under-capitalized: the net worth/borrowing ratio standing at about 59%.

The 97 companies at end-2007 had capital invested of approximately €4.4bn on their book, but the survey shows that the companies' relationship with financial markets continues to be negligible; only six out of the companies included in this survey have an interest in the stock market, but indirectly.

This analysis shows that the competitive success isn't linked to size structure. In fact specialization and flexibility represent the right way to obtain significant profitability: the success is linked to the entrepreneurs ability able to find unexplored market opportunities, realizing strategies able to exploit the Italian typical wines.

THE CAMPANIA WINE SECTOR

Campania is a region with a wine tradition of ancient origin and it's one of the first and most important centers of settlement, cultivation and study of the wine in the world.

The most dedicated area in Campania is Avellino's province, but Benevento's province is the area that has the largest extension of wine grape with 11.226 hectares, followed by Avellino (7.519 hectares), Salerno (6.079), Caserta (5.135) and Naples (2.557) (ISTAT, 2003).

The productive structure is composed by less than 2.000 transformation firms that are concentrated in Avellino and Benevento (90%) (Pomarici et al., 2006). The enterprises that produce wine only for auto-consumption, with a production capacity less than 100 hectoliters, representing the majority of Campania wine firms (84%). The artisan enterprises (that produce between 100 and 500 hl) are about 370 (9% of total), while medium and large enterprises (that produce more than 500 hl) are only 140 (7%) (Pomarici et al., 2006).

The 61% of medium-large firms are agricultural, for 35% industrial and only 4% are co-operative. In Benevento's province there are four of the six regional co-operative firms, the other two are located in Avellino and Salerno's provinces.

In Campania there are 325 firms with commercial orientation but a significant number sells its wine to other firms. However there is a contraction of this phenomenon: actually the enterprises that commercialize wine with their own brand are 236 (with a growth of 34.09% between 2003 and 2006). This is sign of a dynamic situation and Campania is the only region of South of Italy that have an increase so remarkable.

The territorial distribution of firms that produce with own brand see at the first place Avellino (28%), followed by Naples (25%), Benevento (23%), Caserta (14%) and Salerno (10%). Most of these firms have a production between 100,000 and 1,000,000 bottles (Pomarici et al., 2006). The regional classification for productive capacity see in the first five places four co-operatives firms, three of these are located in Benevento's province (Table 3).

These firms express 40% of Benevento's province production capacity while Avellino's province presents the three largest private enterprises.

Table 3 Top fifteen Campania wine-makers by productive capacity Source: data processed by Pomarici et al., 2006

THE MAIN RESULTS OF SURVEY

The survey was conducted on a population of 180 companies that include all companies that:

1. commercialize wine with own brand,
2. at least have 100 hl of production capacity.

The 94.44% are production firms and only the 5.56% are transformation firms. The territorial distribution of firms shows a predominance of Avellino, followed by Napoli, Benevento, Salerno and Caserta (Figure 3).

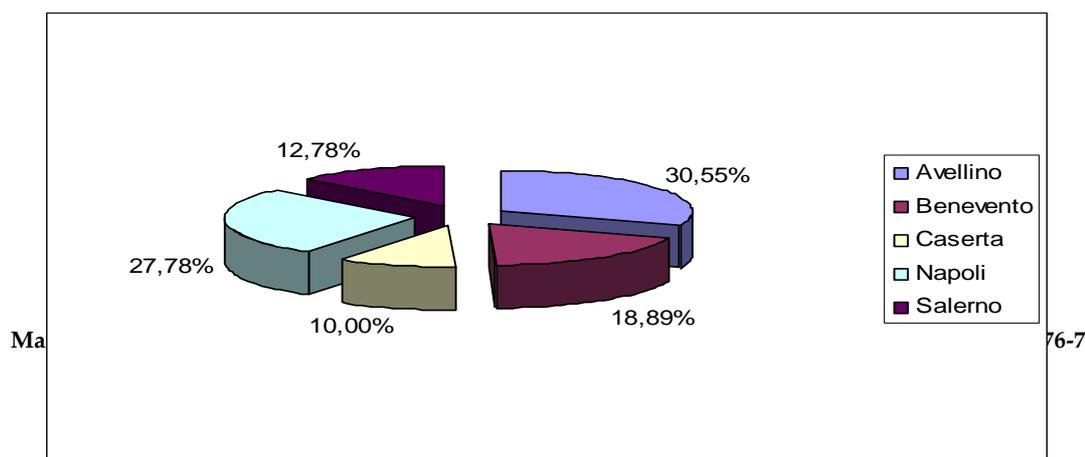

Figure 3 Territorial distribution of population firms. Source: data processed by www.vinocampania.it

Avellino's province presents the largest number of transformation firms (60%), followed by Naples' province (30%) and Benevento's province (10%).

One of the first structural characteristic of regional wine industry is the strong integration with the primary sector (Rossi, 2008). In fact almost all enterprises have own acres, however, those are insufficient to the realization of production and so the external contributions become very important.

The survey has interested 30% of population enterprises. Regarding the ownership structure it's possible to recognize two categories:

- family owned firms (88.89%),
- co-operative firms (11.11%).

Into family owned firms there are three different legal status:

- company (48.15%),
- sole trader (25.92%),
- partnership (14.82%).

One of the first results is the small size of wine firms. The 70.37% of enterprises have a turnover less than one million euros. The small size is confirmed also by number of employees who, in 79.63% of cases, is less than 10 units: Caserta, Salerno and Naples' province have highest number of micro-enterprises while Avellino and Benevento's province are characterized by the presence of bigger firms of sample (Rossi, 2008). A confirmation of average small size is also evident from the firms' net equity. In fact the balance sheets of 2006 show that the average capital is about 430,000 euros, with strong differences into the sample (the range is from a minimum of 10,000 euros to a maximum of about 11,000,000 euros). However the balance sheets of 2007 show an equity growth: actually the average equity is about 540,000 euros. In spite of an increase of 23.33%, the average net equity remains low. This data demonstrate that the Campania wine firms are under-capitalized: this is a problem because it means that large part of investments are covered with an excessive use of debt. Almost all the sample firms don't respect uniformity temporal criterion among finance sources and invest capital. The low capitalization could influence growth processes of firms and the under-capitalized enterprises could be merged from international firms. Few differences exist between different provinces of region. Only in Avellino's province, that is characterized by the presence of larger companies, the average net equity is more than 600,000 euros. However in this area there are the top three Campania wine-maker for turnover but also many microenterprises. Biggest firms have an equity very close to the values of the largest national firms. This data confirm the existence in Campania of some important wineries firms.

The preliminary considerations are that the regional wine system is based, with few exceptions, on micro-enterprises incapable to have a pro-active attitude towards the competitive

environment. This is the principal weakness of regional wine sector. Campania wine firms are family enterprises, strongly linked with territory and its traditions, and this have reflections on competitive strategy and on the decision-making processes.

The survey shows that a large part of regional wine firms pursue differentiation strategies (59%), a minor part (about 25%) pursues niche strategies and some residual choose cost leadership strategy (Figure 4).

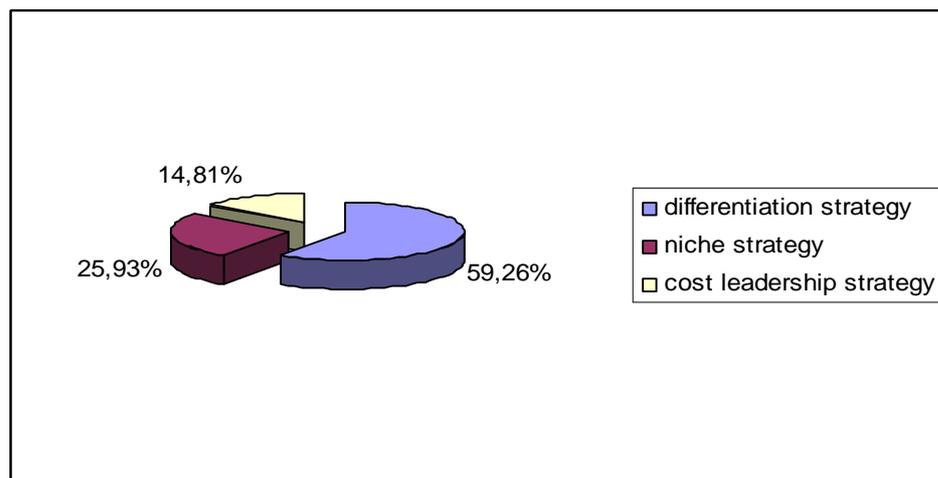

Figure 4 Competitive strategy of Campania wine firms. Source: author calculation

It is not easy to determine if competitive strategies are carried out: sometimes, it seems more a statement of principle, that the expression of a real behavior. Often entrepreneurs are unable to verbalize the key elements of their strategy and there is confusion between size and strategy because the term niche is used as synonym of small. In many cases entrepreneurs do not write strategic planning, only 37% of sample realizes a written plan, index of lack attention to the formulating strategies process. Often this process is realized and knew by a few people. The few firms that formalize their planning often make a one year plan: only 20% of them make multi-annual plans.

The analysis of organizational structure, shows that 74.07% of enterprises have a "simple structure" (Mintzberg, 1983) characterized by a simple architecture, a minimum of organizational units, the absence of staff organism and where the use of strategic planning is minimal. In this organizational structure there are fundamental gaps in commercial function (particularly for commercial actions in foreign markets) and in financial function. In large part of sample (83.33%) the financial decisions are taken by people without appropriate training and involved in administrative activities.

Important considerations are possible with bi-variable analysis. The combination of organization structure, net equity and strategic planning give important results: an organization structure more complex is linked with an evolved legal status; an organization structure complex is linked also with an high net equity and these enterprises present also a strategic

planning more formalized. This means that firms with an high turnover, with an higher number of employees have an higher net equity and have more attention to strategic processes.

To verify the effectiveness of strategic choices and their success is important a corporate performance analysis. Strategic choices have some reflections on the corporate performance indicators (Hitt et al., 1998; Lumpkin and Dess, 1996). The first indicator to consider is the average turnover that in 2007 was above 1.5 million. A comparison with data of 2006 shows a growth of 2%. However this data is influenced by the excessive heterogeneity of sample.

The co-operative firms have the highest turnover (about 3.5 million euros), but this group present a greater uniformity. Company group has an average turnover over 2.5 million. In this group is possible to find the two firms of sample that have the highest turnover (22 million euros and 14.65 million euros). This group is characterized from an high heterogeneity.

We assumed in H1 that International listed wine firms and leading Italian wine makers would exhibit an higher operating revenue growth rate than Campania wine firms. Results from empirical analysis, support H1: Italian companies growth at a faster pace and it's true also for international wine makers. In fact if listed international firms had have a major reduction in turnover, which declined by 10.3% from €8.6bn in 2006 to €7.7bn in 2007, this contraction was entirely attributable to Constellation. Net of this effect, aggregate turnover would have increased by 4.5%.

This is consistent with the findings of Mayer and Alexander (1991). A plausible justification for this result may be found both in the enhanced financing capacity and in the share liquidity advantage (Capasso et al, 2007).

The average ROI in 2007 is 4.13%, with an increase of 2.28% compared with 2006, but ROI value is far from the value of the major Italian wine enterprises (about two percentage points). Between the four groups there aren't strong differences. ROE is stable: from 2.97% in 2006 to 3.14% in 2007. Actually the difference with the major national wine enterprises is about 1%, but the difference with the international enterprises is still high (-4.6%). The value of these indicators has a double significance: from one side indicate a corporate grow up, from another side represents a structural weakness of Campania wine firms. In particular companies present high value of ROI and ROE. Co-operative enterprises present a low value (4.01% ROI and 2.69% ROE), but the individual enterprises are the firms that present lowest profitability (2.67% ROI and 2.15% ROE). The low profitability of these groups have two different reasons. The co-operatives societies aren't integrate up the chain, while the other groups have a commercial operative very limited because their choices are often subject to decisions of national or international distributors, not rarely, in fact, they represents a suppliers of commercial nets.

Empirical analysis on company profitability (H2) show that there are significant differences regard ROI and ROE. International and Italian companies achieve a higher profitability than Campania firms. Also these results are consistent with Mayer and Alexander (1991), but it is in contrast with the result of Rondi et al. (1994). The low value of these indicators, for Campania wine firms, is due to low capital turnover for ROI and high impact of interest expenses for ROE. In fact low operating revenue is eroded by financial costs.

These data show the weakness of strategic choices of a large part of the enterprises of sample. The problem is more relevant for those enterprises that don't use written planning. For those firms there is a problem of effective implementation strategies. The micro-enterprises are incapable to realize a strategic process adequate to changing market and this problem is relevant also for co-operatives firms because they have difficulties to apply the just strategy for new competitive environment. This means that these firms have a tendency to strategic management, but very often are distracted by difficulties of an hypercompetitive sector and so are incapable to distinguish difference between strategic and operative decisions.

The analysis of financial structure shows that all firms of sample use excessive debt, in particular bank debt. In fact the capitalization index is less than 55%, with some small differences within the four groups. In this case sole trader and partnership groups have very similar values, with a very low level of net worth/borrowing ratio (about 51%), followed by co-operatives firm which net worth/borrowing ratio is 56% and companies (61%). All firms present an elevated level of debt with reflection on investment choices.

The data also show that Campania wine makers use more financial leverage compared with other firms. This result indeed support H3. This finding confirms the conclusions of Rondi et al. (1994) and Pagano et al. (1998). Campania wine firms are very small companies and for this reasons they are more exposed to the information asymmetries; therefore the use of high proportions of debt in their financial structure can be explained by the pecking order theory (Myers and Majulf, 1984)

Finally empirical analysis to investment policies show an increase of materials immobilization (+18,5%), between 2006 and 2007, and a low growth of intangible immobilization (+1.93%) for Campania wine firms. However the increase of fixed assets has not interested in the same way all companies of sample: co-operatives firms show a little grow up of immobilization (+2.74%) because do not control the upstream phases of transformation process.

Also Italian wine firms show this tendency. In fact in the wine sector only few international firms have increased budget on intangible assets (research and development, brands, expansion costs), but they are a little percentage of leading companies.

CONCLUSIONS

The survey has shown strategic problems of Campania wine firms. However in Campania there are also firms capable to implement winning strategies, as demonstrated by performance. In fact in decision-making process these entrepreneurs have been able to understand market trends and changes in consumer tastes. For these firms (Table 4), such as for Italian companies, the success isn't linked to companies size but to correct formulation of strategic process.

<i>Company</i>	<i>Competitive strategy</i>	<i>Sales growth rate</i>	<i>ROI</i>	<i>Net worth/borrowings ratio</i>
<i>Feudi di San Gregorio</i>	<i>Differentiation</i>	5,53%	4,60%	78,0%
<i>Mastroberardino</i>	<i>Differentiation</i>	2,89%	7,57%	110,0%
<i>Terredora</i>	<i>Niche</i>	6,88%	6,05%	83,4%
<i>Vinicola del Titerno</i>	<i>Niche</i>	11,25%	4,27%	111,5%

<i>Agricola del Monte</i>	<i>Niche</i>	<i>10,85%</i>	<i>5,25%</i>	<i>71,2%</i>
---------------------------	--------------	---------------	--------------	--------------

Table 4 The top five Campania wine-makers by performance indicators Source: author calculation

In Campania is possible to divide successful enterprises in three categories:

- big firms with formalized structure that pursuing differentiation strategies;
- co-operatives firms that have their strength in partnership;
- micro-enterprises with niche strategy based exclusively on typical or organic products.

These considerations show how different firms with different sizes and different strategies can have success. The key of good performance is strategic planning that is important to know market trends. These best practices, symbol of wine-makers capable to merge tradition and innovation, are the strength of regional wine sector and represent the base to realize the regional wine sector growth process. The Campania's Achilles heel remains firms' structure which isn't measured by company size, but with the ability (or inability) to solve financial and strategic problems.

The first intervention that should be encouraged are merger and acquisition (M&A) processes: in fact in this context would be necessary facilitate M&A processes between regional companies in order to promote growth dimension. These processes could be important to realize cost economies (scale and scope economies) fundamental key in a mature sector. The low enterprises capital and high financial exposure produces a double negative effect:

- the first one is high interest expenses that have a negative impact on performance because erodes the low operating revenue,
- the second one is to make vulnerable many local enterprises who may be acquired from international wine-makers that are interested to acquire small producers of high quality wine.

It is important also a review of investments: investment in tangible assets should be supported with investments in research and development that are important to realize product and process innovations. These investments should ensure a repositioning process on higher (perceived) quality. In fact from many parts is recognized that one problem of Campania wine industries is the lack of marketing policies in support of strategic decisions. The regional wine firms should invest more on development of ideas, creativity, originality and realize products with high emotional content that are recognized and appreciated from new consumers.

Campania wine makers should continue to valorize their autochthones vines because they are appreciated wines with a strong link with territory. For these reasons it's important understand the values that identify the area, understanding the interactions between grapes and regions of origin. The rediscovery of grape-region link could be an instrument for exploitation of unknown resources and represent an opportunity to create interest and economic value.

Also collective interventions are important: wines could be an important element for socio-economy development, but these interventions require the involvement of public institutions. A major cohesion between firms is important, in particular it is necessary a common action to increase cooperation between different actors in the sector. One solution could be creation of relationship networks, formal and informal, that facilitate action to create value in terms of social capital. The growth of the system and the possibility of its development requires ability to learn and to work together to achieve common objectives. The creation and support of social

capital nets, goal of local development, require support of all local institutions (Vespasiano and Martini, 2008). The ultimate goal should be to become the territorial model one of the pillars of regional model, linking the identity of wines to the Campania territory. It would be necessary to have a systematic view, where the system is the territory in which there is confluence of grapes, land and human factors. The international competitiveness can not be won without a deal between productive institutions forces.

The success of this strategy could allow to practice high prices because the consumer appreciate those products that have a strong link between wine and territory. This link is an invaluable source because is the only inimitable value.

Summarizing for regional wine sector development is fundamental:

- to valorize autochthons grapes,
- to change communication underlined regional specificity,
- to realize common action between firms and public institution to create social capital nets that are essential for research and development.

LIMITATIONS AND DIRECTIONS FOR FUTURE RESEARCH

The survey revealed some problems that have underlined managerial lack, low performance and important problem in strategic planning.

However the analysis is an exploratory research and these aren't final results but represent only a base for further analysis. For this reason the empirical results should be interpreted with some limitations:

- the sample of firms is totally random and does not follow the criteria of statistical representatives;
- the number of companies could be expanded and could be involved also the firms of other region of Southern Italy;
- it will be important to realize a many years corporate performance analysis.

Therefore in this phase it's impossible to give an universality character to the results. To achieve this objective will be important to realize small corrections in future phases:

- to expand the number of companies in the sample;
- to respect the percentage importance of different categories of firms.

For these reasons this study has tried to make a minimal innovative contribution and could be represent a starting point for strategic planning firms responsible and for policy makers that are interested to develop the regional wine sector.

ORGANIZATIONAL DETERMINANTS OF KEY ACCOUNT-RELATED KNOWLEDGE DISSEMINATION

Salojärvi, Hanna¹; Saarenketo, Sami²; Puumalainen, Kaisu²

¹*Lappeenranta University of Technology, School of Business, Finland*

²*Lappeenranta University of Technology, School of Business, Finland*

Purpose – This study aims at identifying the organizational antecedents of intra-organizational customer knowledge dissemination in the context of key account management.

Design/methodology/approach – The data was collected from large industrial companies in Finland by means of a structured survey. Linear hierarchical regression analysis was used to test the hypotheses.

Findings – The findings of the study show that esprit de corps among employees and the formalization of key account management facilitate customer knowledge dissemination in industrial key account organizations. Moreover, the intra-organizational dissemination of customer knowledge is positively related to the supplier's KAM performance.

Research limitations/ implications – The study contributes to the research on key account management in providing quantitative empirical evidence about the antecedents and consequences of the intra-organizational dissemination of key account-related knowledge.

Originality/value – In building on previous research on customer knowledge management, market orientation and key account management the study identifies customer-specific knowledge dissemination as an intra-organizational determinant of the successful management of industrial key account relationships.

Keywords: Customer knowledge, knowledge dissemination, key account management

Paper type Research paper

INTRODUCTION

Customer knowledge has been recognized as a fundamental organizational resource by several authors (e.g., Campbell, 2003; Day, 2000; García-Murillo and Annabi, 2002; Gebert et al., 2003; Gibbert et al., 2002). In the competitive marketplace of today it is imperative that firms develop organization-wide customer knowledge, and use it in a proactive manner in order to foster and enhance long-term customer relationships (Campbell, 2003; Jayachandran et al., 2005; Sisodia and Wolfe, 2000).

Although several researchers have acknowledged the significance of customer knowledge management, there is still a lack of empirical research into the supplier's intra-organizational processes in this regard (e.g., Campbell, 2003). These processes would appear to be of crucial importance in the management of large, strategically important industrial customers, also known as key accounts (e.g., Abratt and Kelly, 2002; Workman et al., 2003). The management of these relationships requires efficient knowledge processes because communication occurs at many levels across different functions both inside the supplier firm and between the supplier and the customer (Bennett and Gabriel, 1999; Day, 1994). Moreover, compared to the management of non-key account customers, the knowledge flows are often more substantial due

to the strategically important nature of key accounts (McDonald et al., 2003; Nätti, 2005). However, a large proportion of customer-related knowledge may be tacit in nature, and thus difficult to share and communicate (Day, 2000). This creates pressures on supplier firms because if customer knowledge is not freely disseminated in the organization, the supplier's actions may seem fragmented from the perspective of the customer (Nätti et al., 2006). Moreover, unless effective knowledge sharing mechanisms are in place, firms may not be able to fully realize the true value of their knowledge assets (Gupta et al., 2000). They should therefore have the capacity for organization-wide dissemination of customer knowledge in order to ensure that the right people have access to the appropriate knowledge at the right time. This, in turn, is likely to improve the quality of customer-specific decision-making and thus create added value for the customer.

The aim of this paper is two-fold. Firstly, it examines how managerial practices and structural factors such as top management involvement, sales team use, esprit de corps among employees, and the formalization of key account management (KAM) affect the dissemination of customer knowledge. Although the importance of these factors has been acknowledged in previous research on key account management (e.g., Workman et al., 2003), their link to intra-organizational processes of customer knowledge management still requires empirical research. Secondly, the performance consequences of customer knowledge dissemination are considered from the perspective of the supplier. The study thereby responds to a call for more research on the intra-organizational determinants of successful key account management (Workman et al., 2003).

The rest of the paper is organized as follows. The specific features of customer knowledge management and dissemination are discussed next, and then the hypotheses are presented and justified. The focus then shifts to the research design and data collection. The results of the hierarchical regression analysis are presented and the paper ends with a discussion of the findings, the managerial implications and the limitations.

CUSTOMER KNOWLEDGE MANAGEMENT AND DISSEMINATION

In recent years several researchers (e.g., Campbell, 2003; García-Murillo and Annabi, 2002; Gebert et al., 2003; Gibbert et al., 2002; Salomann et al., 2005) have been fostering a field of study referred to as "customer knowledge management", which represents a confluence between two streams of research - the management of customer relationships and knowledge management. The driving force behind the emergence of this line of research was the recognition that the management and cultivation of customer relationships enable firms to leverage their customer-specific knowledge assets (Campbell, 2003; Jayachandran et al., 2005; Salomann et al., 2005). Customer knowledge may help in the creation of competitive advantage because its development enhances new product performance (Joshi and Sharma, 2004). It also facilitates the cultivation of customer relationships, which are increasingly recognized as competitive assets that are equal in value to the other financial assets of the company (Galbreth, 2002).

Drawing on theories of knowledge management, the literature on the management of customer knowledge emphasizes that companies should generate information not only *about* their customers but also *from* them (e.g., García-Murillo and Annabi, 2002; Gibbert et al., 2002; Rowley, 2002). Thus, in addition to recognizing customers as a source of information, as in

traditional knowledge management, there is a deeper and explicit focus on the generation of customer knowledge, and particularly in interaction with the customer. The emphasis is not only on generating explicit knowledge about customers (e.g., customer-specific data on sales records and past purchases, and written customer-visit reports) that is objective and rational, and can be communicated and shared easily (Gupta et al., 2000), but also on the tacit customer relationship-specific knowledge that builds on prior experience with the customer and is difficult for competitors to imitate (Wernerfelt, 1984). According to Gibbert et al. (2002), the ability to manage customer knowledge is likely to result in the identification of new market opportunities and new ways of doing things, and thus to benefit the company, its shareholders and the customer.

To date, research on customer knowledge management has mainly focused on the inter-organizational flow of knowledge between the buyer and the seller (e.g., García-Murillo and Annabi, 2002), and it is still unclear what actually constitutes the organization-wide 'management of customer knowledge' from the perspective of the supplier. In accordance with Darroch's (2003) definition of knowledge management, the management of customer knowledge is understood in this study in terms of its acquisition, dissemination, and utilization. This approach has conceptual similarities to the market orientation construct, which Kohli and Jaworski (1990) define as behavior related to the generation and dissemination of, and responsiveness to market intelligence. The difference, however, is that in this study the object of the knowledge processing is a specific key account customer. Thus the contents of the knowledge generated in the management of customer knowledge are also different from market-oriented knowledge in which the processing behaviors are focused on generating knowledge about aggregated markets (see e.g., Campbell, 2003; Jayachandran et al., 2005; Helfert et al., 2002).

This research builds on different theoretical backgrounds, and therefore there is great variety in the use of terms describing the intra-organizational flow of knowledge. For example, among marketing academics the most often used term has been dissemination (e.g. Darroch, 2003; Jaworski and Kohli, 1993; Kohli and Jaworski, 1990; Li and Calantone, 1998), but also other terms such as transmission (Moorman, 1995), sharing (Slater and Narver, 2000) and transfer (Nätti, 2005) have been used. In the realm of knowledge management the terms most frequently applied include sharing (e.g., Gupta et al., 2000) and transfer (Goh, 2002). In general these terms are used rather interchangeably, although Liyanage et al. (2009) make a distinction between sharing and transfer, suggesting that sharing refers to two-way knowledge exchange between individuals whereas transfer refers to a higher-level process that includes knowledge transfer in groups, departments or divisions. The term dissemination is used in this study to refer to the intra-organizational flow of customer knowledge. It involves the extent of key account-related knowledge sharing and transfer within a given key account organization. Dissemination occurs both formally (e.g., via intranets or other knowledge-sharing platforms) and informally (e.g., via hall-way discussions and over lunch). In general it refers to the extent to which those involved in the management of a single key account relationship share and transfer the related knowledge organization-wide. It also has a direction in that it may be vertical or horizontal (Kohli and Jaworski, 1990). Dissemination is an important phase in the processing of customer knowledge because it provides the basis for managing customer relationships as complete entities organization-wide.

THE CONCEPTUAL MODEL AND HYPOTHESES

Lin (2007) identified individual (e.g., motivation, values, beliefs), organizational (e.g., top management support, structure) and technology (ICT to support knowledge processing) factors affecting the intra-organizational sharing and dissemination of knowledge. The focus in this study is on organizational and individual factors. The study conducted by Workman et al. (2003) is used as a basis for examining how top management involvement, esprit de corps, the use of teams, and the formalization of KAM affect the dissemination of customer knowledge. The hypotheses are set out and justified, and the conceptual model presented, in the following paragraphs.

Top management involvement

Top management has a special role to play in shaping the values and behavioral activities in organizations (Deshpande et al., 1993; Kohli and Jaworski, 1990). The importance of top management involvement has been discussed in previous research on key account management (e.g., McDonald et al., 2003; Napolitano, 1997; Workman et al., 2003). Napolitano (1997, 5), for instance, argued that *“top management involvement is the most important indicator of success”* in KAM. It is also emphasized in the literature on knowledge management: Gupta et al. (2000), for example, state that top management support is crucial in the development of a true knowledge-sharing and learning-oriented culture. If top managers show a willingness to share knowledge they might expect others in the organization to follow their lead (Goh, 2002). Jaworski and Kohli (1993) found in their study on market orientation that top management involvement was positively related to the generation and dissemination of, and responsiveness to market knowledge. It is thus assumed in this study that top management involvement has an impact on the dissemination of customer knowledge, and the following hypothesis is posited:

H1: Top management involvement is positively related to the dissemination of customer knowledge.

Esprit de corps

Esprit de corps reflects the degree to which employees are committed to common goals and to each other (Workman et al., 2003). These values are deeply rooted in the organizational culture, which according to previous studies may affect knowledge sharing in organizations. According to Nahapiet and Ghoshal (1998) and Nätti et al. (2006), this kind of knowledge-sharing tendency is likely to occur in organizations with co-operative and collaborative cultures and collaborative methods of working. According to Workman et al. (2003), a lack of esprit de corps among employees may inhibit them from sharing customer-related knowledge with each other. Thus the following hypothesis is proposed:

H2: Esprit de corps is positively related to the dissemination of customer knowledge.

The use of teams

Several authors refer to the need for cross-functional coordination in the management of diversified key account customers (e.g. Workman et al., 2003). The most frequently used intra-organizational coordination mechanism in the KAM context is a specific sales team with the

following functions: coordinating the activities of team members across the organization in line with its overall goals, maintaining knowledge about the customer and the customer's market and industry, and coordinating the day-to-day selling activities (Deeter-Schmeltz and Ramsey, 1995).

Teamwork in general is often seen in today's changing business environment as a critical success factor and as a tool for increasing horizontal knowledge flows (Goh, 2002). Teams allow access to "pooled intelligence", and they are needed especially in converting tacit knowledge into the overall pool of organizational knowledge (Nonaka and Takeuchi, 1995). They constitute a breeding-ground for new ideas and enhanced knowledge as the members have the opportunity to share dispersed knowledge, argue, challenge, and create new knowledge to be further utilized in terms of new products, processes, and services (Sapsed et al., 2002). Although research on the relationship between team use and customer knowledge processing is mainly qualitative in nature, a positive relationship has been proposed in several studies. For example, it has been argued that the use of sales teams enables the more efficient integration of customer knowledge (Katzenbach and Smith, 2005) and improves the degree of knowledge sharing between team members (Geiger and Turley, 2005; Nätti et al., 2006). Teams thus have a 'linking-pin' role in providing a forum for the cross-functional communication of customer relationship-specific matters. Hence the following hypothesis is posited:

H3: The use of sales teams is positively related to the dissemination of customer knowledge.

The formalization of KAM

Formalization reflects the degree to which formal rules, procedures, and standard policies govern the decision-making, roles, and responsibilities in organizations (e.g., Argouslidis and Baltas, 2007). Although it has been found to have a negative impact on the ability to adapt to external changes (Jaworski and Kohli, 1993), and to decrease flexibility in information use (Deshpande and Zaltman, 1984), a positive influence on knowledge-processing behaviors has also been reported. For example, Green et al. (2005) found that it had a positive influence on the generation and dissemination of and responsiveness to market knowledge, whereas Low and Mohr (2001) noted that it enhanced the use of market knowledge. According to Jaworski and Kohli (1993, 63), "*if properly designed, rules may facilitate rather than hinder market orientation*". Formalization could be regarded as an impersonal coordinating mechanism (Homburg et al., 2002), which by its mere existence communicates the special status of key accounts to employees. It is assumed here that it is likely to encourage the firm to disseminate customer-specific knowledge more actively, hence the following hypothesis:

H4: The formalization of KAM is positively related to the dissemination of customer knowledge.

Supplier's KAM performance

The organization-wide dissemination of customer knowledge facilitates the management of the key account relationship as a complete entity. Dissemination enables the shared interpretation of knowledge among employees (Slater and Narver, 1995), and thus is likely to result in customer-specific innovative products and services when people across functional

borders are exposed to the new knowledge. Moreover, the free dissemination of customer knowledge supports customer-specific financial reporting, and the development of customer-specific profiles and strategies organization-wide. Arnold, Birkinshaw and Toulan (2000) found in their study on global-account management that intra-organizational communication inside the supplier firm was even more important in terms of account performance than external communication between the supplier and the account. The crucial role of the intra-organizational dissemination of knowledge is also widely referred to in the market-orientation stream of research, and a positive relationship between market-knowledge dissemination and organizational performance has been reported in several studies (e.g., Baker and Sinkula, 1999; Jaworski and Kohli, 1993; Kara et al., 2005). This leads to the following hypothesis:

H5: Customer-knowledge dissemination is positively related to supplier's KAM performance.

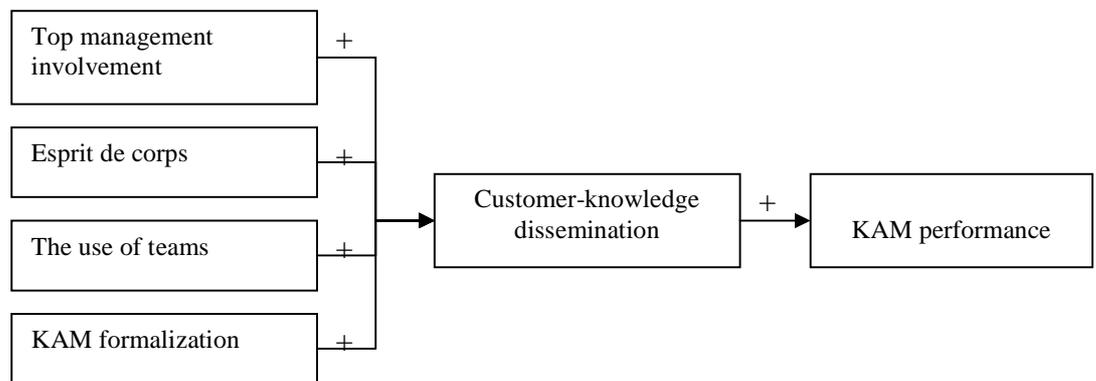

Figure 1. The conceptual model. Research design and data collection

The data was collected during the spring of 2007. A structured print questionnaire was sent to a sample of Finnish industrial firms with over 200 employees, drawn from the Amadeus database. The key-informant technique was used in collecting the data. Higher-level managers were first contacted by telephone in order to ensure the eligibility of the firm to take part in the study, and to elicit their cooperation. They were then asked to recommend between one and five knowledgeable respondents who were responsible for managing different key account relationships. The final respondents were mainly key account managers or persons with corresponding positions. When completing the questionnaire they were asked to refer to a relationship with the most significant key account customer in terms of annual sales. Of the 361 firms identified from the database, 171 were found eligible to take part in the study, and 13 refused to do so. A total of 395 questionnaires (with a pre-paid return envelope and a cover letter) were then mailed to the 158 firms that had agreed to participate. A total of 169 responses were received from 97 firms, thus yielding a satisfactory effective response rate of 56.7 per cent (97/171) on the company level, and 42.8 per cent (169/395) in terms of the total number of questionnaires sent and received.

The suggestions put forward by Armstrong and Overton (1977) were followed in order to check for possible non-response bias. The early and late respondents were compared on a

number of variables, and no significant differences between the groups were found. Thus, non-response bias was not considered a problem. As single informants were used in the data collection, Harman's single-factor test (Podsakoff and Organ, 1986) was performed to check for possible common-method bias. No single factor emerged, and the first factor accounted for only 21 per cent of the variance. Thus, common-method bias was not expected to have an effect on the results of the study either.

MEASURES

Principal component analysis with varimax rotation was used to create composite measures for each construct. The dissemination of customer knowledge was measured on a seven-point Likert-type scale ranging from "strongly disagree" to "strongly agree". Five items were used, adapted from Kohli et al. (1993), Jayachandran et al. (2005), and Cadogan et al. (1999), and modified to fit the context of the present study. They assessed, for example, the degree to which people involved in the management of the key account relationship shared key account-related matters, and the extent to which the key account-related knowledge was disseminated to those who needed it. The Cronbach's alpha for the aggregated measure was 0.73, which according to Nunnally (1978) indicates acceptable reliability. Top management involvement was measured on a seven-point Likert-type scale, using four items adapted from Workman et al. (2003) and Jayachandran et al. (2005). These items assessed the degree to which top management was involved in the management of key account relationships and also the degree to which they supported the key account managers in their work. The Cronbach's alpha for the scale was 0.74. Esprit de corps was assessed on four items taken from Workman et al. (2003), which measured the extent to which the people involved in the management of the key account relationship 'pulled together', in other words were committed to the common goals and to each other. The reliability of the scale was 0.74. A dummy yes/no variable measured the use of teams. Finally, KAM formalization was measured on four items taken from Workman et al. (2003), which assessed the existence of formal rules and procedures in the organization covering communication and the identification of key accounts, for example. The reliability of the scale was strong, with a Cronbach's alpha of 0.80. In order to assess KAM performance the respondents were asked to rate on a 10-point Likert scale their overall performance in the management of the key account relationship during the previous three years.

Control variables

The dynamism of the key account, measured on a seven-point Likert scale comprising items adapted from Jaworski and Kohli (1993) and Jantunen (2005), was controlled for in the analyses of the relationships between the proposed antecedent factors and customer-knowledge dissemination. Six items assessed the rapidness of technological change in the key account's industry ($\alpha=0.82$), four items measured the unpredictability of the key account's preferences ($\alpha=0.71$), and four items measured the competitive intensity in its business ($\alpha=0.71$). The effect of the geographical scope of the key account was also controlled for by means of a dummy variable with a value of zero for a national key account and one for an international account. Control measures were also used in the analyses of the relationship between customer knowledge dissemination and KAM performance. Firstly, the status of the key account's business (how its

own business had developed during the previous three years) was measured on four items assessing for example development in terms of price level and profitability ($\alpha = 0.81$). Secondly, the geographical scope of the key account was controlled in a similar manner as in the first regression analysis.

RESULTS

The means, standard deviations and correlations among the variables used in the study are reported in Table 1. The correlation matrix reveals that 67 per cent of the respondents filled in the questionnaire from the perspective of an international key account relationship, and approximately 50 per cent of the supplier organizations had established a specific team for managing the relationship. It is also evident that the competitive intensity in the key account's field of business in general was held in higher regard than the technological turbulence. Moreover, competitive intensity in the key account's field of business is positively associated with unpredictability in terms of the key account's preferences. Finally, there is a strong correlation between the development of the key account's business and the supplier's KAM performance.

Table 1. The means, standard deviations and correlations

Linear hierarchical regression analysis was used to test the hypotheses. The control variables were entered into the regression model in the first step, and the independent variables, namely top management involvement, the use of teams, esprit de corps, and formalization, in the second step. The possible risk of multicollinearity was assessed by checking the values of the variable inflation factor (VIF) scores. They were below the cut-off value of 10 suggested by Hair et al. (1998), the highest being 2.08 in the first regression analysis and 1.007 in the second. Thus, multicollinearity was not considered a problem. Graphical examination of the residuals, skewness and kurtosis statistics revealed no violations of the basic assumptions of regression analysis. Table 2 presents the results of the first hierarchical analysis.

<i>Dependent variable: Customer knowledge dissemination</i>		
<i>Variable</i>	<i>Step 1 Standardized Coefficients</i>	<i>Step 2 Standardized Coefficients</i>
<i>nat_int</i>	-.040	-.028
<i>ka_techtrub</i>	.030	-.039
<i>ka_pref</i>	-.162	-.087
<i>ka_comp</i>	.236*	.161
<i>Use of teams</i>		.064
<i>Top management involvement</i>		-.066
<i>Esprit de corps</i>		.306***
<i>KAM formalization</i>		.191*
<i>R2</i>	.047	.198***
<i>Adjusted R2</i>	.024	.157
<i>Change in R2</i>		.151***
* $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$ ($n=167$)		

Table 2. Regression results (customer knowledge dissemination)

The results of the first regression indicate that none of the control variables had a significant effect on the dissemination of customer knowledge. As far as the second step is concerned, firstly, top management involvement was not significantly related, thus hypothesis 1 was not supported. On the other hand, there was a strong positive relationship on the one-per-cent level between KAM team esprit de corps and customer-knowledge dissemination, thus supporting H2. There was no significant positive relationship between the use of teams and the dissemination of customer knowledge, thus failing to support hypothesis 3, but there was a positive relationship with KAM formalization on the five-per-cent level, thus supporting H4.

Another hierarchical regression was then run in order to assess the effect of customer knowledge dissemination on KAM performance (Table 3). The results indicate that of the proposed control variables the status of the key account's business was positively related, suggesting that suppliers perform better when the status of the key account's business is higher. The dissemination of customer knowledge was also found to have a significant and positive effect on the supplier's KAM performance, thus supporting H5.

<i>Dependent variable: KAM performance</i>		
<i>Variable</i>	<i>Model 1 Standardized Coefficients</i>	<i>Model 2 Standardized Coefficients</i>

DISCUSSION

The findings reported in this paper contribute to the existing research on key account management in providing empirical evidence of the antecedents and consequences of intra-organizational customer knowledge dissemination in this context. Although the importance of the organization-wide dissemination of customer-specific knowledge has been addressed by several authors, so far academic research from this perspective has remained sparse. In that sense, this study is explorative in nature and calls for more research on various issues.

The first hypothesis posited that top management involvement would be positively related to the dissemination of customer knowledge. Contrary to expectations, there was no support for H1. However, it is clear from the correlation matrix (Table 1) that top-management involvement has a significant and positive correlation with esprit de corps and KAM formalization, both of which according to these findings are positively related to customer knowledge dissemination (H2 and H4). It appears, therefore, that top management involvement may have an indirect effect on dissemination by shaping the organizational values, increasing the level of esprit de corps among the employees, and establishing rules and norms covering the management of key account relationships.

The third hypothesis, suggesting that the use of teams would be positively related to the dissemination of customer knowledge, was not supported either, which implies that the team itself is not a guarantee of efficient knowledge flow in key account organizations. It rather seems that, as previous research (e.g., Goh, 2002; Lee and Choi, 2003) suggests, what matters more is the esprit de corps, and thus the willingness of employees to share knowledge.

The results also suggest that formalization has a positive impact on the dissemination of customer knowledge. Although it has been reported in previous studies that formalization may decrease flexibility (e.g., Deshpande and Zaltman, 1984) and make organizations too stiff in their attempts to adapt to external changes, it appears from this study that in the KAM context a certain degree of formalization is necessary, at least in terms of customer knowledge dissemination. It communicates the importance of key accounts and therefore enables employees to distinguish key account-specific knowledge from the overall knowledge flow in firms. It also helps in assigning roles and responsibilities among employees.

Finally, it was confirmed in the study that the dissemination of customer knowledge has a positive influence on the KAM performance of the supplier. This finding implies that when customer-related knowledge flows freely within the supplier organization, the relationship can be managed in a coordinated manner and relationship-specific decisions can be made based on accurate and updated information. Contradictory service offerings that would not look good in the eyes of the customer can therefore be avoided.

Although the study makes a contribution to the research on key account management by bringing customer knowledge dissemination into the discussion on its intra-organizational

determinants (Workman et al., 2003), it also has some limitations that should be addressed in future research. Firstly, although it was recognized that knowledge is either codified or explicit, its nature was not taken into consideration. Thus, future studies should examine in more detail the effect of the nature of knowledge on the dissemination of customer knowledge and its relationship with KAM performance. Moreover, the use of the key-informant technique in the study means that the possibility of common-method bias cannot be ruled out. Moreover, as the respondents were mainly key account managers, one must recognize that managerial perceptions of knowledge dissemination may differ from the perceptions of team members.

INTERNATIONAL STRATEGIES IN ITALIAN ENTERPRISES: THE NEW ENERGY MARKET SCENARIO

Sanguigni, Vincenzo¹

¹Full Professor of Business Management, Department of Business Studies, University "Parthenope" of Naples, Via Medina, 40 - 80133 Napoli, Italy

Purpose - The aim of the research is to describe widely the European and the Italian energy market scenarios of the last decade, analyzing specific topics (such as the European energy dependence, the liberalization of the electricity and gas sectors and the obstacles to the competition in the emerging markets) and the strategic approach of Italian enterprises.

Design/methodology/approach - The research was developed through a five month study of the Energy sector, using sources of information as Eurostat, AEEG and GME data. The present research is a qualitative and quantitative description of the scenario, reporting numerical data and trends of the sectors and describing the possible evolution of the gas and electricity markets in the near future.

Findings - The main finding of the research is that there will not be a real competitive energy market until some obstacles are removed: the trend toward market concentration and the residual market power of incumbents (such as ENI or ENEL in Italian markets) are just few of these obstacles. Moreover the European energy market players must aim at diversifying energy sources and suppliers. Depending on countries like those of the FSU or Middle East is the main reason why prices of energy are still high in European countries.

Originality/value - The research's value is that it aims at being an easy but exhaustive description of the dynamics of the new energy markets and of the strategic behaviour of Italian enterprises.

Keywords: Energy, Liberalization, Electricity and Gas Markets, Italian Energy Market.

Article Type: Research paper

THE ENERGY MARKETS: TRENDS AND OBSTACLES TO THE DEVELOPMENT IN EUROPE AND ITALY

During the last 15 years the energy sector underwent a deep mutation. This market slowly moved from a monopolistic toward a liberalized system, though this passage didn't had the expected success because of a series of obstacles.

Infrastructures problems and trend toward market concentration make the transition to competitive markets extremely hard and slow, moreover energy market's operators are facing many difficulties due to oil's price oscillation and geopolitical instability in supply countries.

We will try to show the dynamics that make this transition to the new energy markets so complex in an approachable way, deeply analyzing all the events and the peculiarities of the contemporary gas and electricity sectors.

European Scenario

Worldwide energy demand is growing with a very fast rate mostly because of the Asian and developing countries' needs.

In recent years the exploitation of almost every energy source (renewable, natural gas, coal) has grown rapidly, except for nuclear energy. Natural gas seems to be the main energy source for electricity generation, while oil remains the major one in the transport sector. Anyway oil's exploitation seems to be slowing down, while natural gas and coal's utilization is growing fast.

On the supply side, combustibles stocks seems to be able to satisfy worldwide demand for the next few decades although the exploitation of existing ones is hardly hindered by geopolitical obstacles: being almost 56% of oil stocks located in Middle East and 40% of gas ones in FSU and ME, it is clear that energy sources supply is still concentrated in a few areas around the world.

So the energy consuming countries, including the European ones, have to face a difficult situation also due to the elusive behavior of suppliers: OPEC is reluctant to invest in new oil production capacity as exporters find it easier to keep higher prices thanks to growing demand. Empowering production capacity would lead to a rise in the supply of oil and this would also force Middle East suppliers to reduce prices.

AEEG (Italian Gas and Electricity Authority) believes that, through proper investments, Iraq could raise its production from 2,3 millions oil drums a day to more than 5 millions in the next five years and this could be a way to gain enough wealth to restore the whole country's uneasy conditions.

It is also important to notice that the OCSE countries' oil stocks are diminishing day by day and this strengthens the OPEC supplier position. Moreover Brent²²² is produced only in a few areas of the planet and it is very rare. Otherwise heavy oils are easier to be found and they are overproduced but they are not used for gasoline production.

It also seems quite clear that every energy source stock has grown very slowly in the last few years, while on the contrary, the consumption of the exporters has grown very fast (this trend has been observed in countries like Iran and Russia).

For what concerns renewable energy sources, only the 18,6% of total electricity generation has been produced through the use of these sources, but in 2006 hydroelectric generation still counts for 90% of total RES generation.

The three main European trends to be considered to deeply understand the energy sector situation are Dependency, Production and Consumption.

Eurostat Data (2005-2007) show that European consumption remained almost constant while production diminished: the result of these two trends is that dependency has grown.

For example 2006 data show that EU25 energy production dropped by 4,2% implicitly causing a 4,5% rise in import energy. This brought European energy dependency from 54 to 56% (EU 25). In particular, in the period 2004-2006, oil net imports raised by 2,9% while gas net imports raised by 9,2%.

2008 data uphold these findings as EU27 data consumption remained stable while production slowed down augmenting European dependency from 53 to 54% (EU27).

²²² Brent is a light crude oil. Being good for making gasoline and middle distillates, it is the most demanded.

In other words the general trend shows that in between 1997 and 2006 European energy production was reduced by 9%, consumption raised by 7% while dependency raised by 29%.

Almost every country raised its net imports like Italy and UK. Only Denmark could reduce its own with a 22% net imports reduction.

It is easy to understand that Europe, as the rest of the world, is almost completely dependent from those export areas like FSU and Middle East for what concerns oil and gas exports and to completely understand the energy market scenario it is important to consider that oil and gas prices deeply affect electricity production and gasoline prices.

For example oil's price oscillation bias electricity prices on the European markets (like Italian IPEX or French Powernext). The impact of these variations on the electricity markets usually happens after a short period of time and the size of this impact also depends on the amount of oil (or gas²²³) used for electricity generation (for example the Italian market, which depends almost completely on oil and gas, suffers most these oscillations).

So as oil and gas prices recently suffered numerous turbulent variations, caused by speculative and opportunistic behavior of suppliers, the energy prices consequently underwent strong rises and downturns.

This is one of the main reasons why Europe is aiming at diversifying its own energy sources and its own suppliers. Excessive dependency on supply countries like Russia and Middle East's ones brings Europe to deeply suffer combustible prices oscillations caused by strong players in the markets.

One of these players is the Russian colossus Gazprom. First of all this company recently suffered strong political influences that caused unbalances throughout all Europe that led to the "gas war" between Russia and Ucraina in 2006. Moreover Gazprom is expanding its control upstream and downstream over other minor companies. The aim of the player is to strengthen its export capacity over Europe in the next future: through M&As operations Gazprom is trying to acquire control over Asian stocks as internal ones are going to exhaust oneself. This way the Russian player is going to rule the gas market for a long time.

²²³ Gas prices are index linked to oil prices.

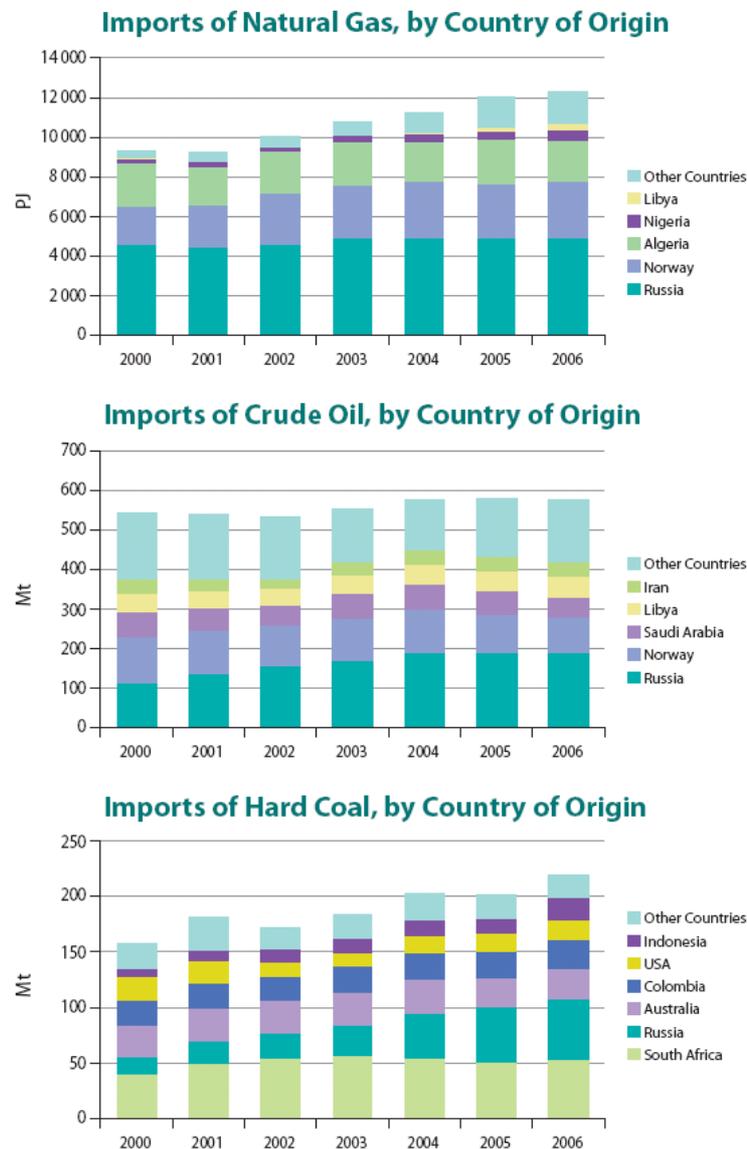

Figure 8 Source: Eurostat (2008)

One way to avoid this situation could be the development of LNG (liquefied natural gas) Terminals, but this technology needs huge investments in special infrastructures (Italy is investing and developing this kind of technology thanks to the efforts of ENI). The creation of a LNG market with all the necessary transportation, storage and terminals infrastructures could lead to a deep reduction of concentration in the field of gas import.

In light of these considerations Europe is aiming at two main purposes by 2020: secured procurements and climate sustainability. To face these two hinders EU is trying to strengthen

market liberalization, sources diversification, RES exploitation and Energy Efficiency programs development although many studies state that Energy efficiency and renewable energy sources will not be the real answer to procurements reliability until at least a 50 years time.

The European Commission believes that in the mid term the only solution will be nuclear energy. First of all this technology is the cheapest to consent CO2 reduction nowadays and at the same time it could guarantee procurements reliability for a long time. The only obstacle to the development of this technology is the necessity to invest in plants security.

Market Liberalization

Liberalization throughout the European national markets began almost 10 years ago and it has reached a fairly good result but the path toward a completely competitive market seems not over yet.

At the beginning of the 80's many European countries experienced a progressive opening toward liberalization of their markets. One of these was the energetic one. This kind of market is characterized by the presence of a transport net which was usually managed by the monopoly that also offered the electricity generation and production so that the same operator could offer the distribution service too²²⁴.

As the realization of a second transport net could cost huge investments to any potential new entrant, the electricity generation and distribution services remained State owned for a long time.

Many operators anyway amortized the costs of the transport net during the 80's and the 90's and let new entrants join the net exploitation. After a few years, with the liberalization of the market the transport net management has been transferred to a new independent company (in Italy this new company is called Terna). Although many countries started the liberalization process very early in the 80's (as it happened during Thatcher's mandate in England), the real European process started in the mid 90's with directive 96/92/EC.

This directive let new entrants in the market access the transport net. The main aims of EU to be reached by the tool of liberalization were the security of procurements and competitive prices. Moreover every country had to institute an authority whose main task is to lookout the market operators and their behavior.

In 2001 new measures have been introduced to reinforce the liberalization process and in 2003 the European Council and the European Parliament approved two new directives (2003/54 and 2003/55) to complete the realization of a European market and a Regulation (1228/2003) to enforce crossborder energy exchanges.

The directives anyway were also meant to safeguard obligations as the "universal service" and procurements security, consumerism, market transparency, information diffusion and competition. The antitrust authorities tried also to avoid abusive behavior by the incumbent (as ENEL in Italy) which often maintain a dominating role in the market.

²²⁴ In Italy this "double service" was offered by ENEL.

The last and maybe the most important passage in the path toward market liberalization is the introduction of complete liberalization which happened in many countries the first of July 2007.

Looking forward to 2020, liberalization safeguard is one of the main aim of EU, together with climate sustainability. To assure energy service quality to citizens and companies in fact are just two of the achievements to be reached in a perfectly reinforced and integrated market.

Anyway many scholars think that the liberalization process isn't to be considered over yet: the market opening in EU hasn't been an easy task for many reasons. First of all every European country has had an heterogeneous energy policy due to the consequences of the oil crisis of the 70's. This led to a very low crossborder competition as incumbents mainly acted in their own country.

Moreover the energy market structure is highly complex. The electric market, for example, is structured in this way: generation, transmission, distribution, selling and not only it is easy to find fragmentations inside it but it is also very usual to find vertical integrations among players²²⁵.

Another feature of the market liberalization is that incumbent players often maintained high market shares thanks to perceived switching costs: in the British market for example, customers rarely changed supplier because they did not have access to information about the new services offered by new entrants. This is one of the reason why there are only six major players in the British market and British Gas is still the market leader. Something very similar happened in France, Italy and many other European countries too.

All these features slowed down the liberalization process in recent years.

Eurostat data also confirm a concentration trend in the electric sector: in Italy only five companies produce 70% of the whole country's electric generation. In Germany four companies produce over 75% of the whole production.

BCG studies sustain that the energy market future is going to be dominated by a strong concentration although it is more than a decade since the liberalization process has been started. Among the drivers of this consolidation process (and so, on the opposite, among the obstacles to new entrants) we can find in first place the high investments requested which are necessary to join the market.

REF studies on concentration in the energy markets show the importance of mergers and acquisitions too: in between 2003 and 2006 M&As operations trebled compared to the 1998-2002 period, with over 100 operations in between 2003 and 2004. Back to 2006 a deep rise in the crossborder operations has been observed.

In the 2003-2006 period the M&As operations in the electric market raised from 55 to 64, while in the gas market they raised from 17 to 42 (this was mainly caused by the aggressive behavior of the Russian gas operator Gazprom).

²²⁵ *This also happens in the Gas market.*

Moreover in the electric market the majority of M&As operations involve players in the generation phase, while in the gas sector the players involved mainly act in the distribution and selling phases but many M&As were also developed in the procurement stage.

Scholars believe that these trends show a particular evolution of the entire market toward an European oligopoly: big players as Russian Gazprom, Italian ENI, French GDF, exploited the market opening to expand their operations crossborder. This is going to lead to a new arrangement of the European market in which a few big players will be the competing leaders while all the other companies will only have a residual market share. So major companies will be able to benefit from their incumbent position in their own market, stronger contractual power in the procurement phase and solid economies of scale thanks to the presence in other countries.

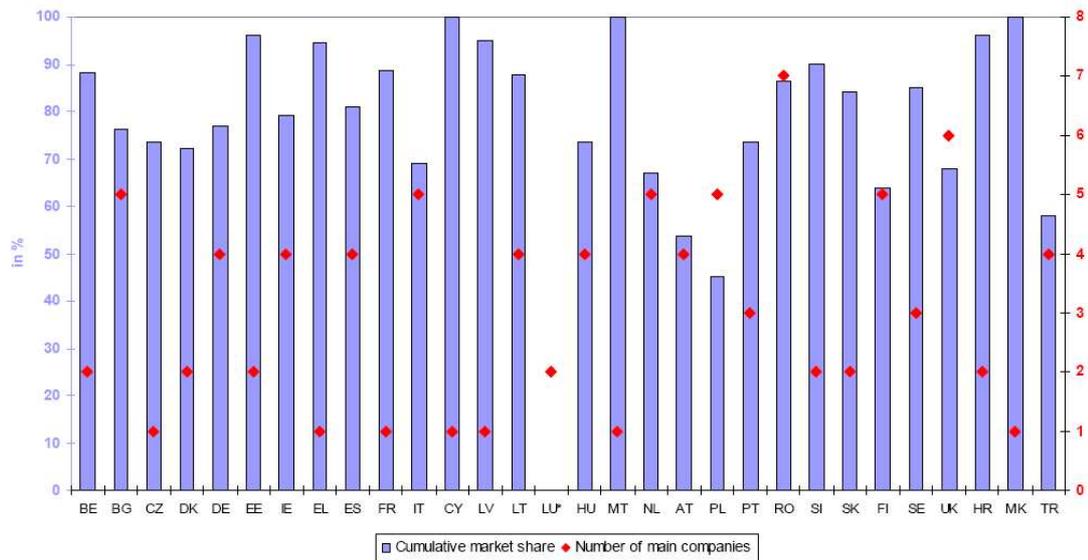

In the first period of concentration (1998-2002) the main driver of M&As operations was horizontal integration. On the contrary, since 2005, new drivers brought to a new wave of mergers and acquisitions:

- **Vertical Integration:** major players aim to enlarge their own business but not only. They also aim at diversifying their own procurement strategies, in particular for what concerns natural gas supply.
- **Gas/Electricity Business Joint:** the constitution of an integrated Gas/Electricity business portfolio gives major players the opportunity to reinforce their own market position (through final customer “dual offers” and CCGT plants better exploitation). Nowadays it seems quite clear that to be competitive in the electricity generation is fundamental to have a low cost access to gas supply and that is why players which act in both the markets are favoured.
- **Financial Resources availability:** bigger players own huge financial resources thanks to high gas and electricity prices that bring substantial cash flows. This boosts companies’ investments.
- **Diversification of regulatory risk:** various EU members adopted different laws and regulations to rule their own internal market and this leads, for example, companies interested in nuclear power plants to expand themselves in countries where this kind of plants are not banned.

Anyway the new wave of European M&As in the field of energy markets has to face the strengthening of European Commission controls over merging operations that could damage competition increasing the opposite effect of concentration. This means that the role of European Commission is going to be relevant in the future shaping of the entire energy market.

The oligopolistic structure reinforcement also poses a problem about final consumers protection and market efficiency. Transnational groups presence could slow down the competition development and the increasing conditions for an internationally competitive market. Moreover though gas/electricity business joint is a tool to increase the companies wealth and power, this could lead to a limitation of the number of new entrants in both the markets. In the end we can assert that even though the electricity and gas markets are formally liberalized, these still suffer huge limitations to competition as a few big groups dominate the European scenario.

Figure 9 Source: Eurostat (2006)

ITALIAN DEPENDENCY

Various sources (AEEG, ENEA, Eurostat, Acea Electrabel) argue that Italy relied on natural gas and oil more heavily than other EU27 countries in recent years. Almost 70% of electric generation has been produced exploiting these sources, even if in Italy the exploitation of oil is progressively diminishing being substituted by gas as in almost every European country.

Interesting and encouraging data on Italy are the use of geothermic source that, even if very low, is almost completely absent in every other European country and the great exploitation of hydroelectric sources (almost 13% of the whole electricity generation) that is superior to the European average.

Anyway Italy still suffers a negative pay off (12,5% of energy is imported from foreign countries): Italy imported almost 48000 GWh in the last years and exported only 3000 GWh. The country in particular experienced a rise in the Swiss import rate.

The general condition is characterized by a huge energy dependency on combustibles like oil and gas (86,8 % Eurostat 2008).

Moreover Italy is facing the gradual reduction of the monopolistic power of its main incumbent operator (ENEL) as many other European countries after the beginning of the liberalization process, but ENEL anyway still remains the main player in the market²²⁶.

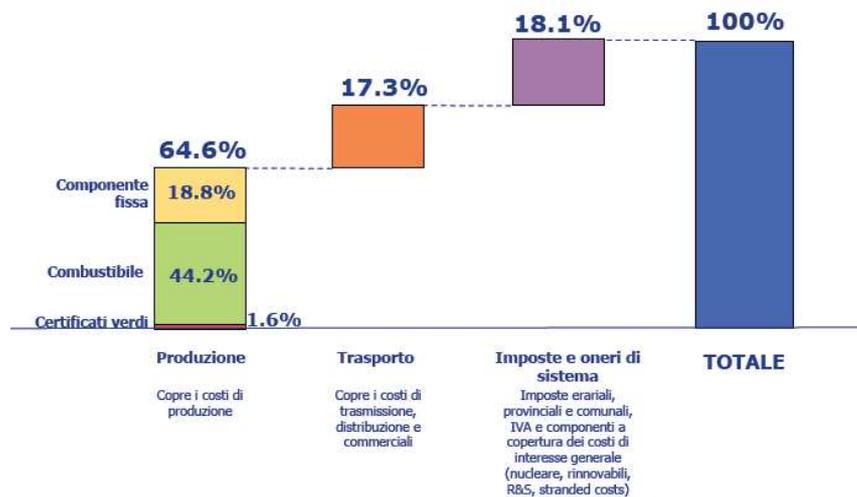

Figure 10 Electricity price structure in Italy (Source: Acea Electrabel 2008)

In 2007 new electric generation capacity has been installed, in particular numerous thermoelectric plants have been realized by the main market operators like ENEL and Edison.

The first one is also the main RES exploiter although other companies are investing in the fields of fotovoltaic, biomass (A2A S.p.A.) and eolic (International Power).

An important feature of Italian market is the electricity price: the average price to consumers in Italy is around 74€/Mwh (January 2009 GME), that is higher than the average European price due to the high Italian dependency.

The price of electric energy can be divided as follows:

- 64,6% Production costs;
- 18,1% Taxes;
- 17,3% Transportation costs.

²²⁶ We will broaden this topic in the paper.

Figure 12 Source: Eurostat (2008)

For what concerns natural gas, Italy drastically diminished its production in recent years; the main producer and importer is ENI with an 80% market share, followed by Edison. Our country import this combustible mainly from Algeria and Russia.

Companies' Strategies in the New Energy Market: Effects of Liberalization in Italy

Liberalization in Italy hasn't had the expected success yet and the same discreet result has been experienced by other countries in Europe. The main reasons for this unsuccessful development are to be searched in the birth of a "hybrid system".

We can define hybrid system the one in which, although the numerous efforts made by EU through laws and other interventions to introduce a competitive mechanism in the energy markets, both the Gas and Electricity sectors stay dominated by a leading player (ENEL in the electricity market, ENI in the gas Market), on which the political influence has still a big impact.

Furthermore is quite curious to notice that many companies, also the smallest ones, remain State owned or controlled by local government and consequently suffer political pressure.

The two main players were involved in many M&As operations upstream but also downstream (in the distribution and selling sectors) making it hard in particular to potential new entrants to join the market.

That's one of the reason why the Italian market (and not only the Italian one) remains an oligopoly. The space that was given to competition is only a "formal" space. In other words the market has been regulated with new interventions and laws with the intent of opening it to competition, but remains still dominated by a few operators whose control is in great part in the hands of the State and the main consequence is that the price often depends on the behavior of these incumbent companies which do not seem to care that much about market efficiency.

An interesting feature in fact is that bigger players under State control don't seem to pursue public wealth, of course not as the main purpose. The Italian Antitrust authority already acted against ENI in particular for suspected abuse of market power.

So although the numerous laws introduced since the Bersani decree, it doesn't look like the transparency has grown in the energy sector.

These features damage the final costumers who find themselves paying energy prices which are not the result of a competitive and efficient market structure.

REF scholars claim that in Italy we can find competitions elements put side by side with residual monopolistic characteristics and privately owned enterprises whose control is still mainly in the hands of the State (Saraceno, Scarpa 2006). One reason why it is easy to find hybrid structures in many European countries could be the States' behaviors which aim at

enlarging their energy companies international presence²²⁷. This could be one of the reason why the Italian government too did not completely gave up its control over ENI and ENEL.

An AGICI 2007 research claims that Italy was characterized by many concentration operations in between 2005 and 2006: the M&As in the country raised from 76 to 93. The main actors of this phenomenon were, on the one hand, bigger players as ENI, ENEL and Edison which reinforced their crossborder expansion and, on the other hand, local utilities which aimed, on the contrary, at reinforcing their local position. AGICI research sustains that the strategic driver which brought to these numerous M&As operations is the horizontal integration intent. Vertical integrations, which are often pursued by bigger players, were not particularly frequent even if local utilities too exploited this tool to obtain access to generation capacity. Many scholars believe that V.I. upstream could increase companies' efficiency and this enables them to face stronger competitors.

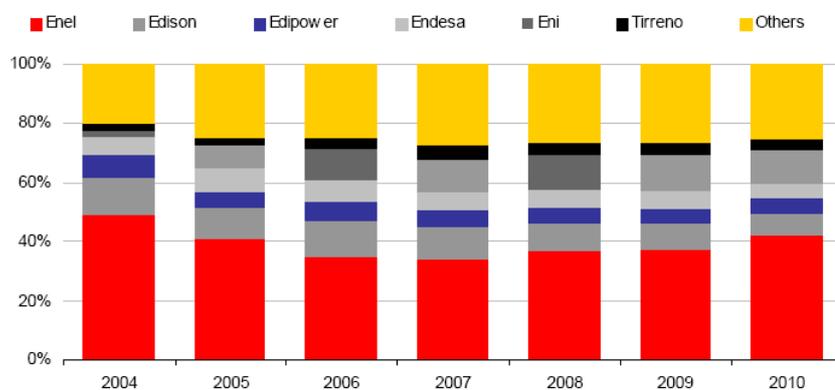

More than 60% of the operations involved utilities in the north of the country. Moreover ENEL expansion activity seemed very interesting as it recently acquired Slovenske Elektrarne, reopening its way toward nuclear power.

Foreign companies are pursuing Italian market penetration too: E.ON extended its influence with the acquisition of a utility in Veneto, while British Gas joined the electric business acquiring thermoelectric plants from Edison.

So the national trend doesn't seem so different from the general one: concentration and aggregation are going to increase in a market where ENEL, that remains the main operator, seems more interested in expanding itself abroad.

Anyway it looks like Italy is one of the countries that most reduced (at least in the electric sector) its main operator power over the market thanks to the breaking down of 3 Generation Companies (Gen. Co.).

On a strategic basis, the market liberalization brought companies to pursue two main aims: production mix optimization and cost reduction.

²²⁷ It is exactly what we showed in the market liberalization paragraph.

Figure 13 Electricity Generation Market Share Scenario (Source: REF 2006)

All the companies went through an increase of their electricity generation with a contemporary cost reduction thanks to a better generation mix and a better cost management (in particular HR costs). The electricity sector in fact is the one in which the employment rate has grown less.

ENEL was subjected to a market power reduction but it remained the main market player thanks to a series of expedients. First of all ENEL is the company which most reduced its personnel. Moreover it increased its own generation capacity thanks to the investments in new plants and improved its generation mix (increasing in particular the hydroelectric quota) reducing the average cost of combustibles exploited to produce electricity.

This success had a great impact on stockholders: the pay out ratio in fact has been very high in recent years and the State gained two billion euro dividends while at the end of the 90's, when it owned 30% more stocks, it gained "only" 990 millions euro.

Other companies did not benefit as much as ENEL from the generation mix change as they could not exploit the same economies of scale. All the companies anyway reduced their personnel and increased their production thanks to increased production efficiency and installed capacity.

Edison has been involved in many M&As operations and capacity increasing projects. ENEL on the contrary reduced its efforts in expanding the installed capacity (also not to exceed the generation limit imposed by the Antitrust authority²²⁸) but invested in repowering projects.

New entrants and local utilities were less involved in this kind of operations.

Anyway, in conclusion, the huge gains of the companies enabled them to increase their investment in capacity increase. We should keep in mind that Italy suffer of a big negative import-export imbalance and investments in generation plants are the main tools against dependency.

ENI is similar to ENEL. The two companies share many features but the main difference is the sector in which the two lead. Although in fact both are involved in the gas and in the electricity markets, while ENEL is leader in the electricity one, ENI is leader in the gas field.

ENI gained huge profits during the last decade that brought it to pay substantial dividends to all of its stockholders, including the State that at the end of the 90's started selling 60% of ENI's stocks.

The selling of these stocks reduced the Debt/PIL rate by 2,2%.

Anyway, ENI dividend policy was definitely less overstated than ENEL's, but it is to be noticed that in the gas field ENI has had the highest pay out ratio compared to every other European player.

²²⁸ *Players must not produce more than 50% of the whole Italian electricity generation.*

ENI's organization is structured in Divisions and the profits increase is to be attributed to two of these in particular: Exploration & Production and Gas & Power. The first one works in the field of research and production of hydrocarbon internationally, while the second works in the field of procurement, transport, distribution and selling of gas. The contribution of E&P business has grown exponentially in the last decade while the G&P suffered some changes among which the new entrants joining the market.

ENI group enacted many measures to face the increasing competition since 2000, almost like ENEL did in its own market. First of all, ENI too began expanding itself abroad. This strategic choice brought ENI to raise its gas selling market share and its involvement in the international transports of gas. To achieve this success ENI reinforced its relations with many foreign companies and started acquiring many other players. These choices allowed ENI to strengthen its upstream position. Nowadays it controls prices and international infrastructures access.

The strengthening of the main gas player was also accomplished by strategic choices made inside the Italian borders as the acquisition of Italgas.

Moreover although this put ENI in big difficulty with the Italian Antitrust Authority, ENI started an "innovative selling policy": this means that ENI started selling gas to other importers at the Italian borders, tricking the generation and procurement limits imposed in our country. This strategic choice damaged seriously the development of competition in the sector, but it is also important to consider that the ENI group developed the best commercial and marketing initiatives toward companies clients after the market opening.

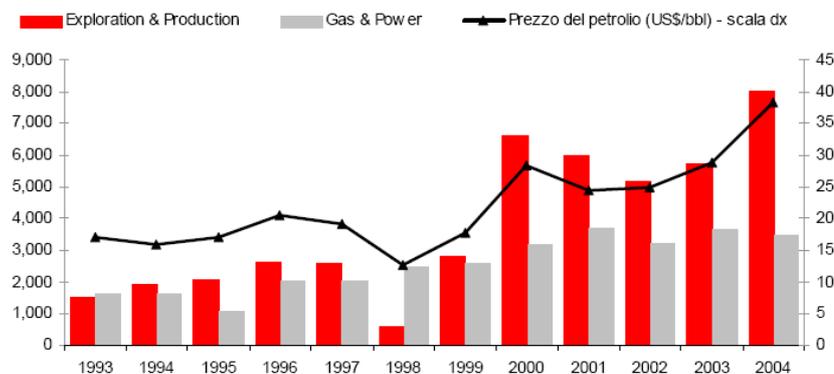

Figura 14 Evolution of G&P and E&P Profits (Source REF 2006)

Diversification was another tool through which the company increased its competitiveness and its profits. ENI in fact expanded itself in the electricity generation market through the creation of a new unit: Enipower.

In conclusion we can say that ENI exploiting its dominant position and its superior profitability to reinvest in new opportunities, didn't suffer the market liberalization effects.

So a final overview of the whole energy markets makes it possible to say that in Italy, as in many other European countries, new entrants and minor companies suffer the vertical integration of incumbents and their market power.

In the gas market different laws and interventions make it even harder to pursue a competitive market structure. For example the authority did not decide to separate the control of the transport net from the supply of gas with dangerous consequences on the development of infrastructures and procurement security.

Experiences like this are the perfect example of an hybrid structure like the one we can observe in Italy: imposing limits to the gas selling and imports was not a concrete choice and didn't have the wished effects being the vertical integration of ENI left untouched.

Another demotivating feature for new entrants is the longevity of procurement contracts in the gas sector. These contracts last for 15 years or more making it harder to new players to join the upstream. So it is enough clear that the procurement stage in the gas sector is very difficult to join for new entrants.

Only the downstream stage seems easier to access for new entrants.

What we can say about the future of the market is that the critical phase of procurement shortage should be over at the end of the decade if there won't be delays in the realization of new infrastructures like le TAG and TTPC. Enlarging the infrastructure capacity could bring to an effective competitive structure in the gas market with good effects on the price. Moreover it could reduce ENI's market share increasing Edison's and ENEL's ones and it could reduce de geopolitical risk including new supply countries like Egypt and Qatar.

In conclusion the gas market could become a competitive market only if ENI will reduce its control over the transport infrastructures. The Italian geographic position could also represent an enormous opportunity for the gas market. Increasing its infrastructures could allow the players in the market to work as European Hubs for gas supply.

HUMAN RELATIONS AND COMMUNICATIONS IN A GLOBAL ENVIRONMENT: STRATEGIES AND SOLUTION IN PERFORMANCE MANAGEMENT

Santonino III, Michael D.¹; Spanò, Isabella²

WITH A SPECIAL ITALIAN EXCERPT ON THE “PRACTICAL IMPLICATIONS- MANAGEMENT OF PEOPLE
IN THE PUBLIC ADMINISTRATION”

¹*Bethune-Cookman University, School of Business, Daytona Beach, Florida, USA*

²*Università degli Studi di Modena e Reggio Emilia, Modena, Italia, ITALY*

Purpose - This paper examines global strategies to improve the individual performance of managers in organizations. The authors present a methodology to establish outcomes driven performance appraisal criteria for managers, plus systems accountability and evidence to support goals and objectives in a global environment. The article concludes with an action plan for a manager's role in the performance management process.

Design/methodology/approach - Performance management systems need fixing (Brown, 2005) and based on research findings an attempt to provide solutions for practicing managers are outlined in this paper. Employees find the performance appraisal process useless, while managers acknowledge that the performance management systems have failed to add much value in the organization are examined.

Findings - By using a systematic approach, human resource executives can offset many challenges and problems dealing with performance management.

Originality/value – The paper contributes to performance management literature and provides value for practitioners searching for methodologies that are driven by accountability measures and outcomes that have interwoven benefactors.

Practical implications – Executives to front-line managers will find the challenges and solutions outlined in this paper realizable in their performance management process. Key linkages in the accountability and outcomes will immediately impact an organization's approach to effectively measure the performance of managers with outcome driven criteria.

Keywords Performance management, Performance appraisal process, Managers, Organizational behavior, HR Development, Process methodology, Accountability

Paper type: General Review/Case Study/Literature Review

INTRODUCTION

Challenges facing organizations in a global environment

Today, many organizations use the term performance management to include many activities to ensure the success of the organization. An organization's success can be defined by measurable outcomes specific to the organization's goals, the role of the managers, performance metrics at the department level, and process models built around products, services, or employers. Organizations with strong performance management systems will build an

environment in which the organization's actions reflect value creation, and therefore, are likely to outperform their competitors.

Organizational effectiveness is the lifeblood to many organizations today that use performance management as part of their value creation within the organization. Value creation manifests itself throughout the business when executive leadership builds an environment that defines the heart and soul of the organization (Mintzberg, 1973;1975). In order to accept a process, methodology, or procedure that often is mechanistic in nature during the performance review, organizations must demonstrate that behavior and decisions have interwoven benefactors. These include; managers, executive leadership management, human resources management, and individual employees. Secondary factors are built around dealing with customers, partners, suppliers, and local communities. This paper focuses on the challenges and solutions for effectively measuring the performance of managers.

Managers are on the front-line to establish individual performance and development objectives that are action driven. The most effective performance review processes occur year-round. A survey of more than 48,000 employees, managers and CEOs from 126 organizations in the United States found that just 13 percent of employees and managers, and only six percent of CEOs say their organization's performance appraisal system is useful (Brown, 2005). Employees find the process useless, while managers find that the performance management systems have failed to add much value in the organization. Many employees believe the flaw in performance management lies with the managers while the managers believe the flaws lie with the human resources department and the CEOs. Problems in communications, trust and knowledge continue to plague organizations during economic "boom's" or "bust's". Researcher today are still asking the same questions postulated by H. Likert in his 1967 book "The Human Organizations: Its Management and Value" about trust between managers and employees (Mishra, Mishra & Speitzer, 2009). Mishra, Mishra & Speitzer (2009) findings have not added much value to the body of knowledge in ways to improve or change what Likert asked over 40 years ago, that is "Are top managers doing enough to empower their employee's?". The three authors brainpower together write at the end of their prominent MIT Sloan publication that " Business schools and academics have their roles to play in helping organizations and individuals adapt – not only in assessing the effectiveness of different approaches but also in advancing hands-on solutions" (Mishra, Mishra & Speitzer. 2009). Indeed, advancing hands-on solutions is an excellent methodology to implement in education, again, thoughts from the authors not adding much value to the body of knowledge of specific changes need to the "practice" of management in education. The advancement of hands-on solutions had already been articulated by Mintzberg (2004; 2005) for new approaches in education that business schools needed to teach. The authors (Mishra, ed.) keep a database of former students (over 1,000) to help leverage jobs opportunities is a noble service, but if the database exist with managers not educated in the "practice" of management that business schools have taught them, they you have not advanced the inherited problems found with managers that Likert asked in organizations or what Mintzberg has asked in business education!

MEASUREMENT OF VALUE CREATION DIMENSIONS

O'Sullivan (2009) points out the importance to measure the observed performance of an employee in a reliable and valid manner because such quantification can be helpful for reward allocation (distributive justice) and for feedback provision (preserving a sense of procedural justice while assisting employee development). The performance management literature outlines several key attributes that should be measured for technical or contextual dimension. But with much of quantitative construct measures it becomes a function of the measurement techniques used, as stated by O'Sullivan (2009) that can usually be measured in a variety of ways: the measure can be trait-oriented, behavior-oriented, or outcome-oriented. By combining the technical "hard" and contextual "soft" with accountability measures that are based on outcomes, can provide managers with a framework for supportive implementation practices. The relationship between individual and organizational values and the contributions to organizational productivity is evident (Preziosi, 1997). Preziosi (1997, p.2) emphasized: "Organizations that are well led will be productive organizations." Key linkage between the individual and organization's values can be found with the following value creation and leadership dimensions:

Value Creation Dimension:

The Value Creation dimension defines the behavior and the decisions of the organization using a multi-faceted approach dealing with customers, partners, suppliers, and the local communities that surround it. Examples that reflect value creation of the organization include:

<i>1. A focus on serving customers;</i>
<i>2. A commitment to meeting business objectives;</i>
<i>3. A sincere respect for individual or team contributions;</i>
<i>4. An awareness of social responsibility with the decision to be good corporate citizens;</i>
<i>5. A commitment to ensure that the organization is a fun place to work.</i>

Table 1.0 – Example of Value Creation

Leadership Dimension

Organizational leadership is driven from the supervisors or line managers that are responsible for creating value within the functioning unit. Human relations (HR) factors can impede success with problems that occur when people work together no matter the industry. For example, likes/dislikes, dissatisfactions, grievances, jealousies, misunderstandings, and even opposition to the common cause by employees can be impediments for sustainability within the organization. Managers should integrate many of the HR functions into their work, working in partnership and holding HR more accountable in delivering organizational dominance (Ulrich, 1998; Legge, 1995). Jackson and Schuler (2002, 2003) called this the "HR Traid" with such accountability found across hierarchy of control (HR, line managers and employees). Caligiuri and Tarique (2009) preferred to focus on global leaders as high-level professionals such as executives, vice presidents, directors, and managers who are in jobs with some global leadership activities such as global integration responsibilities. Whichever level within the command of control defined for the organization's assessment needs, it does not alter the overall

accountability requirements for performance management. The leadership dimensions plan an important role in developing and sustaining the organizations competitive advantage over time.

Effective leaders with the organization are those who can establish an environment in which people can advance and build an environment in which the organization's actions reflect value creation activities, by:

<i>1. Demonstrating the organization's values in behaviors, actions, and relationships that align to decisions;</i>
<i>2. Creating a sense of shared ownership and account-ability among team members;</i>
<i>3. Inspiring and aligning human resources by communicating a compelling vision;</i>
<i>4. Encouraging people to perform at their full potential by providing development, coaching, and rewards and consequences for all levels of performance;</i>
<i>5. Genuinely encourage people to embrace change and quickly adapt to new ways of doing business.</i>

Table 2.0 – Example of Effective Leadership

Knowledge workers

In today's knowledge economy, knowledge management is increasingly essential for organizational success. Creating knowledge workers who exemplify the knowledge required to lead or contribute to the viability of the company. Key attributes in knowledge management are cooperation, networking and collaboration. Two major workplace shifts make knowledge management both essential and challenging--the changing nature of work itself and the changing nature of the work environment becoming increasingly global and virtual (Tetrick & Da Silva, 2003)

The knowledge worker has 1.) Product or Service knowledge, 2.) Business and finance knowledge, 3.) Market/Industry knowledge and 4.) Multinational knowledge

The knowledge worker can:

<i>1. Evaluate and integrate information to create critical action items;</i>
<i>2. Engage in decision-making that is based on an understanding of the core competencies of the organization;</i>
<i>3. Determine and balance short and long-term goals that align with all stakeholders;</i>
<i>4. Identify opportunities and threats;</i>
<i>5. Encourage new ideas and reward risk versus rewards relevant to performance and development objectives;</i>
<i>6. Be action oriented and support decision-making in a dynamic environment;</i>
<i>7. Be accountable and take personal responsibility for decisions regardless of outcome;</i>
<i>8. Make timely decisions and take corrective action if things do not go as planned.</i>

Table 3.0 Example of Knowledge Worker

Build and Sustain Partnerships by Delivering Customer Value. This can be done by:

<i>1. Creating, developing and maintaining strategic alliances, partnerships and relationships that result in cross-organizational cooperation.</i>
<i>2. Cooperating internally in order to compete externally</i>
<i>3. Aligning work with that of related teams</i>
<i>4. Utilizing all resources available across the organization</i>

Table 4.0 Example of Partnerships

Accountability

Gwynne (2002) cited research work that revealed three basic criteria that managers commonly rely on in their performance review of employees: Task performance -- carrying out the responsibilities of the job; citizenship performance -- willingness to help colleagues and volunteer at corporate events and, in general, how they contribute to a positive image of the company; and counterproductive performance -- indulging in negative behaviors such as drug taking or arguing with coworkers and, in general, whether they harm the organization's image.

Effective management will coordinate the roles and responsibilities of employees through criteria determinants that must be an interwoven part in the performance management process weekly, quarterly or annually. Gwynne's cited research work suggested that mini-appraisal every three or four months and even daily diary keeping by managers would be an effective management approach to proactively demonstrate to the employee that the manager cares about their work. Employee's appreciate people, especially their manager who shows through their deeds and actions that they really care about them (Nelson & Economy, 2005).

Key linkage between the individual performance and development objectives/expectations can be found with the following accountability and outcomes driven criteria:

ACCOUNTABILITY AND OUTCOMES DRIVEN CRITERIA

Establish Individual Performance and Development

Objectives/Expectations

The individual's performance and development objectives should reflect his or her responsibilities throughout the year (accountability). They should be comprised of evidence to support their performance (outcomes) and must be aligned to the organization's mission, unit goals and business objectives.

Criteria for Stated Objectives (Accountability)

Individuals should state objectives in terms of what is to be accomplished and provide active verbs to describe such activities. For example:

1. Design and develop a process used for a call center manager to monitor incoming customer calls wait time.
2. Create a new business unit to consolidate product and services.
3. Analyze budgets and provide quarterly reports to investors.
4. Utilize information that best meets the organization's strategic plan.
5. Conduct customer surveys for each business unit.
6. Demonstrate capability to electronically locate, retrieve, and integrate human resources strategic plans.

Criteria for Stated Evidence (Outcomes)

Individuals should provide evidence (outcomes) that supports individual and/or team objective(s), the organization's mission, the unit goals, and the business objectives. For example:

2. Designed and completed a new flow to monitor incoming calls on 4/15/09. Reduced customer wait times 50 percent by developing a new decision making tree for help desk staff. The new tree was implemented in the existing application software and provides staff with improved
 1. decision making capabilities at one-half the time.
 2. Re-organized two business units (wireless products and computer products) into a fully functional product and service division on 6/11/09. Reduced staff by fifteen employees by using the company's voluntary retirement policy. Redesigned operational and service policies to assure a seamless customer transition and the rating of employee satisfaction on 4/8/09.
 3. Published investor quarterly report on 7/7/09.
 4. Obtained primary and secondary research data on competitors' market placement to help align the organization's strategic plan for future business opportunities in the southeastern division. Completed data analysis on September 12, 2009.
 5. Customer Satisfaction surveys completed on July 7th, 2009. A 75 percent response rate for each business unit was met. Results showed that each business unit met or exceeded customer expectations for product quality, service and reliability.
 6. Obtained secondary research data to benchmark existing human resource outsourcing strategies in three industries: transportation, health care and telecommunications. Completed data collection on August 9, 2005 using a shared database and provided a complete report analysis to management at the strategic initiative meeting.

Additional criteria for individual's performance and development objectives should also reflect his or her Affirmative Action/Diversity objectives and evidence throughout the year. Affirmative Action means taking positive steps towards creating a work environment free from

all forms of discrimination. Specifically for managers, it means providing all employees with opportunities to make the most of their talents and aspirations.

Manager's roles in performance management

The manager's role in performance management is to share an equal part of the employee's performance process. Training and development needs must align with the employee's interests and development plan. For example:

1. What specific skills, knowledge, behaviors, or capabilities need to be developed to enhance the individual's ability?
2. How does the individual's ability align with performance objectives and/or job requirement?
3. Can each development objective demonstrate, specific outcomes relevant to each performance objectives and/or job requirements.

Developing An Action Driven Development Plan

Manager's in today's organizations are still accountable for each employee. Certainly, the knowledge worker has transformed many organizations to be more effective and efficient in aligning the mission with individual goals. But, manager's have the responsibility to the individual to provide an environment that is safe, efficient, positive, and action driven. Some items to be considered to when formulating the development plan are:

<i>1. identification of action steps.</i>
<i>2. identification of resources needed.</i>
<i>3. identification of roadblocks and anticipated barriers.</i>
<i>4. determine of how results will be measured and the completion date.</i>

Table 5.0 Plan of Action

Specific action steps may include: job assignments, coaching, training and education and organizational/work redesign. Manager's must articulate and encourage specific actions necessary to help the individual achieve each objective in the development plan. Such actions reflect the qualities of leadership and part the human relations function of performance management. Specific steps taken by a supervisor or manager are:

<i>1. Develop or update job descriptions for employees.</i>
<i>2. Actively participate in training and demonstrate competency-based on training received.</i>
<i>3. Know and implement compliance requirements in the work area.</i>
<i>4. Know and follow established job specific and facility wide policies and procedures and rules.</i>

*Table 6.0 Example of Specific Action Steps***Interim Review(s)**

Discussions between the manager and the employee should be documented and reviewed. Periodic reviews throughout the year are encouraged.

Overall Annual Performance

There should be a summary of the overall Annual Performance Plan showing the extent to which the employee has achieved each performance and development objective. An additional challenge is to align the Value Creation and Leadership Dimensions with the individual objectives.

Employee Comments

Employee comments are always a challenge for open, honest and sincere thoughts for managers and employees. The fallacy that has challenged the overall annual performance plan is when managers lack a sincere and genuine insight for relationship building with subordinates. This undermines the entire process when employee trust is lost and they feel part of a mechanistic process rather than benefactors that is part of the organization's performance management process. Killian (1978) identified communications with employees and empathy as basic behaviors that effective leaders must have to understanding the central tendencies in employee behavior. Appreciation for good work listed number one and feeling "in" on things listed number two. Managers can create an environment with employee when these two components are met with genuine sincerity in the performance management process.

CONCLUSION

An important strategy of the performance management process is development of managers and employees that are able to communicate openly to improve or build on the performance management process. Managers and employees are faced with challenges and problems when dealing with performance management. When more solutions as presented in this article are offered to human resource executives, then more managers will be able to meet the challenges in performance management for their organization.

SPECIAL ITALIAN EXCERPT ON THE "PRACTICAL IMPLICATIONS- MANAGEMENT OF PEOPLE IN THE PUBLIC ADMINISTRATION"**La Gestione delle Persone nella Pubblica Amministrazione**

A differenza che nel settore privato, la gestione delle risorse umane, o ~ meglio ~ la "gestione delle persone", nell'ambito dell'amministrazione pubblica presenta un ostacolo di fondo: non esiste il fine della massimizzazione del profitto (Giannini, 1986). La mission dell'organizzazione, così, non comporta risultati quantitativamente misurabili, ma si situa su di un piano ideale. Ciò la rende meno identificabile con chiarezza e meno percepibile dagli attori

coinvolti. L'efficienza organizzativa e la produttività individuale rischiano quindi di risentirne in modo pesante.

Gli attuali orientamenti della ricerca scientifica in materia danno particolare valore a concetti quali quelli di "empowerment" e di "commitment". In effetti proprio l'enfasi su tali aspetti in ambito organizzativo pubblico può consentire di uscire dall'impasse di cui si è detto (Alberoni, F., 2002).

Le persone, in qualunque contesto di lavoro, hanno necessità di significato e di valorizzazione. Si rivela fondamentale, dunque, fare leva sui bisogni esistenziali di crescita e di sviluppo personale e professionale, così come su quelli di empatia/armonia, senso d'appartenenza, comunicazione interpersonale, soddisfazione per le realizzazioni ottenute. Nel settore pubblico ancor più che nel privato, un buon leader deve riuscire ad implementare tutti gli aspetti indicati ed a portarli, per così dire, "a piena maturità" (Rifkin, J., 2002). La fidelizzazione nei confronti del servizio d'appartenenza assume peculiare importanza: occorre conferire un ruolo-chiave all'eterodirezione verso i clienti/cittadini, rafforzando il commitment dei team organizzativi. Al posto del ruolo di potere, il leader deve rivestire un ruolo di servizio (Amovilli, L. 1995). Al posto del movimento con forza centripeta verso l'interno dell'organizzazione burocratica, il leader deve dare impulso ad un moto centrifugo positivo di operatività verso la popolazione. Il vertice del sistema non è più, in tal modo, quello della piramide gerarchica, ma diviene esterno, posto nel cliente/cittadino, al quale è fornito il servizio.

Il leader assume una funzione di coaching, vale a dire di sostegno e di accompagnamento del cliente interno verso il raggiungimento degli obiettivi dell'ente.

In questo quadro operativo, la formazione rappresenta una preconditione-chiave: è necessario che i "capi" per primi e poi, a cascata, via via il restante personale siano interessati da un processo di formazione continua atto ad aumentare consapevolezza e responsabilità. Proprio in forza dell'importanza di quella che in senso lato può definirsi istruzione permanente, i percorsi di carriera vanno costruiti incentrandoli su di essa (Robinson, D., 1990).

Si tratta, a ben vedere, di una rivoluzione copernicana rispetto alla concezione corrente del lavoro nella pubblica amministrazione. Solo così, peraltro, la produttività può essere portata ad un livello considerevole e nel medesimo tempo può realizzarsi il benessere organizzativo che chiunque auspica.

DECISION-MAKING UNDER COMPLEXITY: THE CASE OF DISTRICT SME^{*}

Saviano, Marialuisa¹; Berardi, Massimiliano²

¹Associate Professor of Business Management, University of Salerno, Department of Business Studies, Via Ponte Don Melillo, 84084 Fisciano (SA), Italy

²PhD of Business Management, University of Foggia, Department of Business Studies, Via Gramsci, Foggia, Italy

Purpose – This study aims at examining the district SMEs decision-making under complexity. The purpose of the paper is to confirm the idea of industrial district as a source of opportunities which fosters consonance and cooperation among district firms and hence supports the decision-making of individual entrepreneurs, in the perspective of value creation and long term survival.

Design/methodology/approach – Complexity Theory, Viable System Approach and Informative Variety Model have been used for the analysis of the district firms decision-making process.

Findings – The findings suggest that the different degree of development of a district influences the decision-making of a district firm. Indeed, by comparing the performance of two Italian industrial districts, specialized in the industry of tanning, that is Santa Croce sull'Arno – configurable as complete viable system – and Solofra – definable as embryonic system –, it emerges the lower degree of development of the latter and the less competitiveness of its companies which tend to compete in individual way also within the international markets.

Research limitations/implications – The discussion stresses a series of research propositions for future researches aimed at improving the understanding of the problem. As for limitation, only two cases in a single sector have been analyzed and there is a lack of concrete outcomes concerning the decision process of district SMEs.

Practical implication – The findings suggested some managerial implications to govern and simplify complex decisions for district SMEs.

Originality/value – The paper provides a new methodology to examine the decision-making of district SMEs.

Keywords – Complexity, Knowledge, SME, Industrial District, Viable System Approach (vSa), Informative Variety Model.

Paper type – Conceptual/Research paper

INTRODUCTION

This paper aims at examining the competitiveness of district SMEs facing with the challenge of complexity, by assuming the district, they belong to, as a solution for government which induces to consider complexity as an opportunity rather than a managerial constraint (Vicari, 1998, 2008).

The analysis moves from the essential literature about complexity, useful to analyse and interpret the firms' decision-making contexts, and then, considering the most recent

^{*} Also if the paper is the result of common reflections, the paragraphs 1, 2.2, 2.3, 3.3 e 4 are attributable to Marialuisa Saviano, while the paragraphs 2.1, 3.1 e 3.2 are attributable to Massimiliano Berardi.

contributions concerning the systemic thought (Golinelli, 2000, 2005; Barile, 2005, 2009), applies the subjective perspective to the complexity and its systemic interpretation.

By assuming the point of view of district SMEs and considering the Viable Systems Approach (VSA) (Golinelli, 2005) and the model of Informative Variety of viable system (Barile, 2008, 2009), the paper aims at understanding the decision-making under complexity.

In particular, while it is difficult, or sometimes even impossible, for an individual firm to manage the environmental complexity, the district system, as a network which supports firms to develop creative and innovative networking capacities, represents an opportunity for SMEs to share a multitude of informative varieties.

In such a view, by adopting the (VSA) methodology and making comparisons among different Italian production systems, we would verify the conditions under which the district represents an opportunity for SMEs to manage the complexity.

THEORETICAL BACKGROUND, METHODOLOGY AND PRELIMINARY INSIGHT

The complexity theory

The Complexity Approach is not a scientific theory, rather we can speak of epistemology of complexity as interdisciplinary study of complex adaptive systems and emerging phenomena. Although this concept has deep historical roots (the first insights on chaotic systems date back to the years between 1910 and 1930 - Poincarè, Birkhoff and Smale emphasised that non linear physical systems can show very complex evolutionary trajectories, whose dynamic depends on initial conditions), the movement of complexity gained ground in the course of the 1980s, with the foundation of the Santa Fe Institute by the work of the scholar Murray Gell-Mann (Lorenz, 1963; Pascale, 1999). Some scholars consider this "new science" as a paradigm shift from previous sciences (see Cybernetic Theory and the General Theory of Systems); differently, others imply that it is a new paradigm, by associating previous science with Modernism, and Complexity Theory with Post-Modernism or Anti-Positivism (Lee, 1997).

The different approaches to the complexity have in common the study of the systems, assumed as sets of elements and components that are organized and react to the structures and models they contribute to co-create: "[...] complex systems are systems in process, systems that constantly evolve and unfold over time" (Arthur, 1999, 107).

The complexity studies are focused on the problems linked to order creation and, particularly, on the effects caused by non-linear discontinuities, rapid transaction phases and co-evolution processes determined by events that are apparently disjointed and unforeseeable (McKelvey, 2004).

In this way, by adopting a systemic perspective, the complexity theory is focused both on the effects of the components' behaviour on the overall system which they belong to, and on the intra and inter-systems relationships (Carrol and Burton, 2000). Evidently, we are referring to the complexity of open systems, according to Prigogine, and not to that defined as computational complexity (Hilbert) which concerns closed systems (Prigogine, 1990). Business organizations are highly interdependent with external environment and, unlike the logic and

mathematics, they incur problems which are not clearly defined and evolve continuously because of internal and external constraints. Therefore, these problems are unlikely to be solved within the framework of traditional schemes.

A system cannot be examined and understood as a single phenomenon, but it should be contextualised within the framework of interconnections and interdependences with external environment, from which the same system derives the degree of complication or complexity of its representation (Siano, 1997). It follows a vision of the complexity as a science of contextualised mechanisms and interactions; the mechanisms may be described as the dynamic behaviours within the system (Hernes defines mechanisms as “a set of interacting parts – an assembly of elements producing an effect not inherent in any of them”. Hernes, 1998, 74); while the context may be configured as the set of structural, organizational and behavioural features affecting and regulating the nature and type of systemic dynamics. In other words, the context can be assumed as the complex of relationships and interactions among people, ideas, traditions, organizations, etc.

Not all the systems have, however, the same capacity for evolving and developing; in particular, this capacity is influenced by the degree of stability or instability of the system. While chaotic systems manifest a widespread inability for evolving and adapting because they are not able to organize and coordinate their behaviour; ordered systems are likely to be conditioned by excessive rigidity and static nature.

Indeed, a system may evolve towards the order, where it remains despite the disruption deriving from outside; towards the chaos, where it moves in an irregular and unstable way; towards the edge of chaos, where, while it converges towards certain attractors, sudden events may destabilize and remove it. Some system patterns that emerge over time have been distinguished: fixed or static, periodic or cyclical, chaotic or strange, coloured noise and random (Dooley and Van de Ven, 1999).

Kauffman (1991) theorizes that four variables (N, K, P and C) in non-linear dynamic systems affect the level of stability of the system and hence its evolutionary capacity, thereby also helping to define the relative degree of complexity:

1. “N” represents the system or organization’s number of components;
2. “K” is the level of inter-relatedness or interaction of the components, measured by inputs to each “N”, which introduces non-linearity into the system (Morel and Ramanujam, 1999);
3. “P” is the common schemata the components share and it is a measure of internal homogeneity;
4. “C” is an inter-system variable. Indeed, it represents the level of inter-relatedness or interaction of “N” across system (this is the second source of non-linearity – Schneider and Somers, 2006).

Nevertheless, the “traditional approach”, which focuses on the objective and implicit characteristic of the systems or phenomena, is not enough to fully understand the complexity of firms decision-making. Really, it is also necessary to adopt a subjective view of the complexity as the feature of the available representation of the same system. In this vein, phenomena are

neither simple nor complex, but they become simple or complex because of the cognitive process of the observer (La Moine, 1995).

The Viable System Approach to the complexity

The previous citation leads back under the systemic thought and highlights that although each theory uses its own specific approaches, definitions and images, the theory of general systems and the complexity theory are essential to comprehend and explain complex systems, and hence they make us able to examine the decision-making process and the strategic management of district SME in the context of complexity.

Starting from the concept of *viable system*, as a system that survives, is both internally and externally balanced, and has mechanisms and opportunities to grow and learn, to develop and adapt, and hence to become more and more efficient within its environment (Beer, 1991), the (VSA) methodology supplies a complete conceptual framework for firm government. The firm as viable system is an entrepreneurial organization that, on the basis of interconnections and interdependence among its internal components and some of these and the components of other systems, interacts with external entities (supra-systems), hence extracting from the environment its specific context of action – configurable as articulated set of constraints and rules – to learn, evolve, develop and improve over time its conditions of survival.

For this, Viable Systems Approach and Complexity Theory make us able to investigate the capacity of entrepreneur, as firm administrator, for making decisions necessary for long term survival under uncertainty and complexity (Saraceno, 1973; Golinelli, 2005).

By using the viable system approach to the complexity, it emerges the opportunity for adopting the paradigmatic dualism *structure-system* (Barile and Saviano, 2008) to stress the fundamental distinction between the structural and the systemic dimension of the observed phenomenon. On the basis of a static-descriptive structural reading, as well as in the most widespread proposals for an objective measurement of the complexity, it is relevant the analysis of components and relationships (*structure*) which characterise the observed phenomenon; but the true nature of the complexity emerges from the dynamic dimension (*system*) of the phenomenon, whose understanding and interpretation inevitably escape from any attempt of definition and classification (Figure 1).

The growth of the number of relations and interactions increases the complication of the phenomenon, because it enlarges the number of information and variables that must be considered and interpreted. Differently, the complexity expresses the incapacity for reading and managing the system of multiple and non linear interdependencies and interconnections which involve the system and its components, and of the system sensitivity to the change of initial conditions, considered that an event, even if small sized, can lead to disorder and chaos.

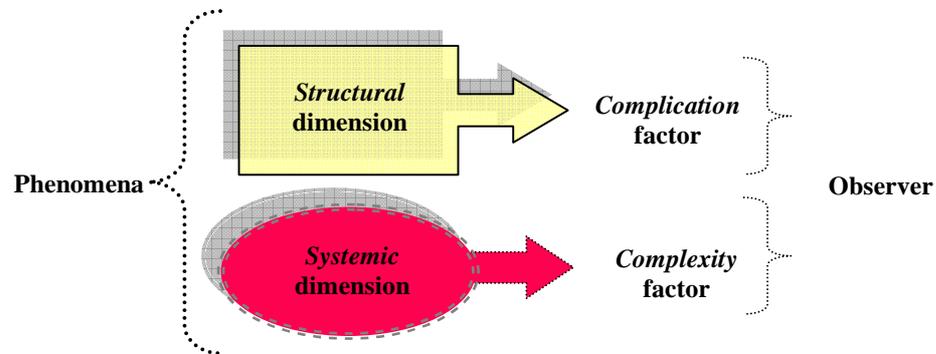

Figure 1 – The structural and systemic dimensions of complexity, Source: Our elaboration.

Obviously, the level of complexity is also conditioned by both the structure and the genesis of the system. On one hand, it depends on the degree of autonomy of its components or, in other terms, on the capacity of top management for coordinating and controlling the components. In particular, the more is the degree of autonomy, the more will be the complexity. On the other hand, it depends on the origin of the system: this can be top-down or bottom-up. It is clear that emerging systems (those that have a bottom-up origin – such as the consumption system) usually have a higher degree of complexity, especially if they lack common government, purpose and rules. For this, they are difficult to manage and control. The only way to partly regulate these kinds of systems is by imposing constraints and rules from outside.

The difficulty in managing such systems appears to be due to their nature of “systems of systems”: in other words, they are not individual systems, but assemblies of systems that are far from each other, but at the same time they are strictly interconnected and interdependent each other. In this way, small initial events can lead to complexity cascades of avalanche proportions, because of latent forces. Moreover, the borders and the relations of these systems are informal and unstable: this produces a further increase of complexity.

By using the systemic view, at the same time, a phenomenon could be complex for a person, but complicated or even simple for another. In such a way, the subjective interpretation of the phenomenon becomes relevant: the complexity does not concern the phenomenon or the system itself, rather the interpretative capacity of the observer. In such view, the complexity, that is a systemic phenomenon, as well as the systems, is not as such, but can only be observed (Mella, 1997).

Complexity and knowledge from the Viable System Approach

Bringing the complexity to the systemic field of the individual capacity for reading and interpreting a problem, we can emphasise the nature of the cognitive process, by defining the links among decision-making, complexity and knowledge.

In this sense, the decision-maker operates under complexity when he/she is not able to build an interpretative model of the problem (Barile, 2009): and even by acquiring more information, he/she just increases the entropy without finding any resolutive solution (Figure 2).

In this perspective, the complexity arises from the incapacity of the observer to build an interpretative model; on the contrary, the complication is linked to the difficulty to define such an interpretative model. In this sense, at the same time, low complex problems may be very complicated because the model that describes them may result difficult to be interpreted (Baccarani and Golinelli, 2008).

Hence, the knowledge capacity of the decider switches the problem from the indeterminateness of complexity to the certainty. The abductive hypothesis or the induction, which enable to build a resolutive interpretative model of the problem, depend on the perceptive and interpretative efforts of the observer and on its own informative variety.

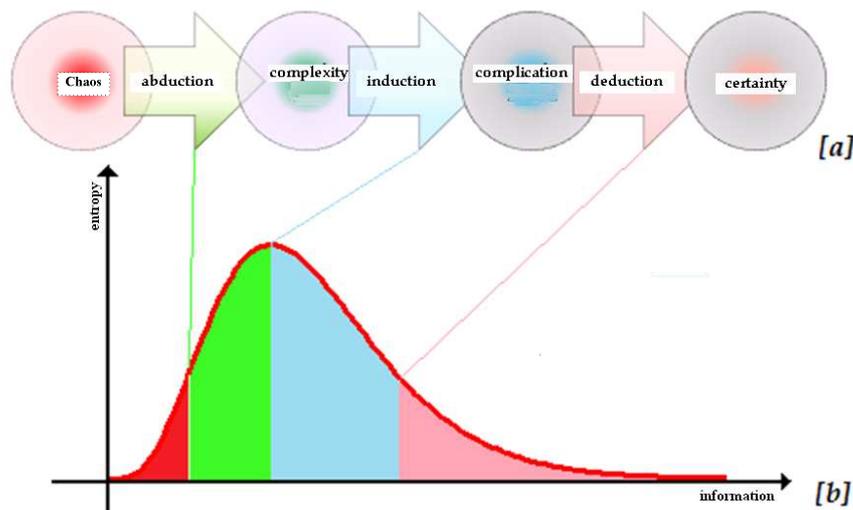

Figure 2 – The “four C” of knowledge, *Source: Barile, 2009, p. 53.*

Furthermore, the complexity refers to the functioning of the system that may be more or less understandable and predictable because of the variety and variability of internal components and of external relations; differently, the complication appears to be a feature of the model or of the representation of the phenomenon.

In order to govern the uncertainty and complexity, the decision-maker must increase his/her variety, by continually upgrading his/her cognitive background. For this reason, SMEs need to develop more stable and structured forms of collaboration and cooperation also outside of the traditional borders of their communicative network, by entering into organizational networks which enable them to increase their innovative capacity and the creativity that is necessary to operate in highly dynamic environments. In other words, in order to reduce the complexity and play the decision-making in a more aware way, the entrepreneur, as SME government, must increase his/her Informative Variety within a dialogical and collaborative framework with other entrepreneurs.

Following the methodology of *Informative Variety* of viable systems (Barile, 2009), the assumption of this paper is that individuals make decisions on the basis of three levels of knowledge, that is *informative units*, *interpretative schemes* (general and of synthesis) and *categoric values*, with regard to different levels of complexity and to the time. Categoric values and interpretative schemes act in reducing and simplifying the huge variety of the context, which would otherwise be perceived as a chaotic flux of informative units.

In particular, while under certainty decisions are easy to take by means of information units, under complicated circumstances, and particularly under complexity, the decision-maker must hold and use adequate interpretative schemes (both general and of synthesis); nevertheless, under chaos, managers are forced to make decisions by instinct, flair and categoric values and they are unable to foresee what will happen (Figure 3).

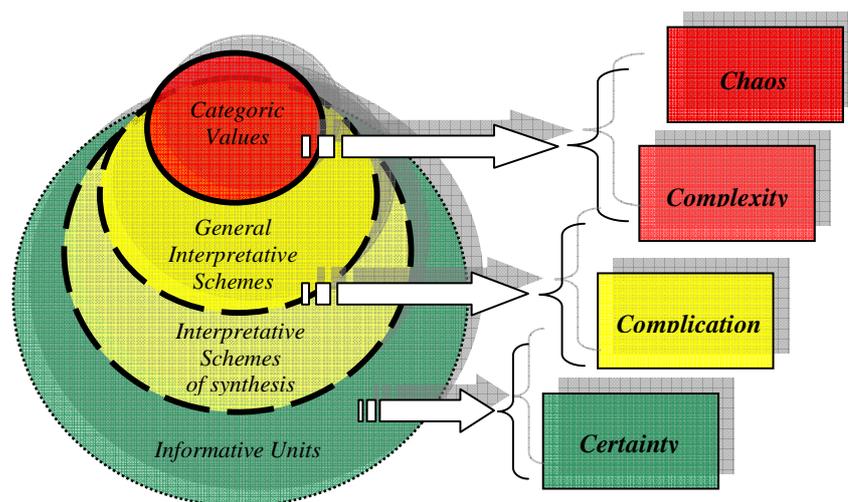

Figure 3 – *Informative Variety of viable systems and decision making contexts.* Source: Our elaboration from Barile, 2009.

Obviously, in order to avoid to persist and act under conditions of complexity or chaos, individuals and firms have to increase their own *Informative Variety* by improving and enhancing their cognitive resources and developing adequate interpretative schemes, through interpersonal and inter-systemic networks which, starting from specific relational conditions defined as consonance by the (*vSA*), foster the development of knowledge synergies.

However, not all the environmental changes are understandable and foreseeable: indeed, complexity usually means uncertainty and ungovernability especially in the case of systems with not well-defined borders and characterized by latent forces and high sensitivity to internal and external changes. In other words, the dynamic complexity of internal and external contexts makes unforeseeable and ungovernable for firms the most of future changes and of their effects

on market and competition as well as on the nature and typology of the resources of competitive advantage.

It follows that complexity increases uncertainty and causal ambiguity with regard to the resources, capacities and competences the firm should have in order to get and exploit the opportunities that emerge over time.

To increase his/her Information Variety through the creation of new knowledge, decision-maker can follow two approaches or paths, based on two main elements that are relevant for firm competitiveness: firstly, the awareness of its own background of knowledge and competences and the capacity for managing it in order to provide flexible and innovative solutions to emerging problems (furthermore, the continuous combination and re-combination of knowledge supports value creation through the multiplication of its intended uses – Sherif and Xing, 2006); secondly, the continuous exploration of complexity and the learning of new knowledge (Figure 4).

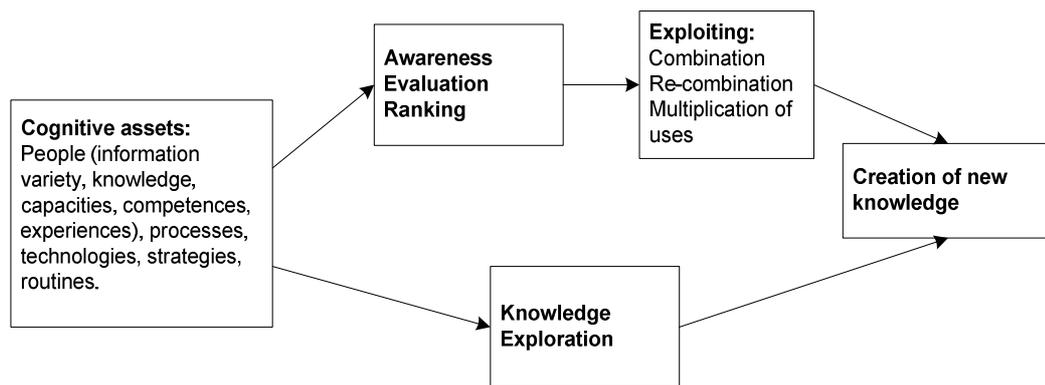

Figure 4 – The process of knowledge creation within a CAS, Source: Our elaboration.

In other words, beginning from an initial cognitive background (that is people, processes, products, technologies, routines, strategies, etc.) the firm government should be aware about it in order to adequately exploit it through the multiplication of its uses but, at the same time, must increase and improve it by exploring the environment and starting a process of combination and re-combination of new and old knowledge; in this way, he/she will be able to create new knowledge and implement innovative solutions to contingent problems.

Therefore, the firm government has to explore the variety and variability of the competitive context by learning information and knowledge, in order to improve his/her capacity for understanding and managing the complexity and induce the evolution of the system by means of adequate organizational, strategic and operative solutions. By increasing internal variety, the system becomes also able to improve its creativity and the capacity for learning and elaborating information and knowledge, in the way of changing decision-making problems (Barile, 2009) in problem solving (Carley, 2001).

Hence, the main function of entrepreneurship is not only the re-combination of previous knowledge (Poincarè, 1905), but also the creation of new knowledge through the exploration of the unknown.

In such a view, the entrepreneur, as firm government, must make a cognitive effort of monitoring and exploring the environment in order to foresee and define the knowledge, competences and capacities necessary to achieve the entrepreneurial goals.

Nevertheless, the context complexity and dynamism, together with limited rationality and asymmetric information, make difficult for deciders to identify only one set of resources and capacities to achieve long term competitive advantages.

For these reasons, competition is taken as a continuous developing process, based on different cognitive schemes, which are strictly interconnected and interdependent each other, and on different evaluations of phenomena, which allow to implement structural and systemic solutions and to develop new strategic logics for increasing firm evolutionary capacity (Sanchez, 1997).

For firm survival and development under complexity, the entrepreneur must create an “*open-system design*” in order to ensure strategic flexibility. The flexibility enables firms to access and coordinate continuous flows of endogenous and exogenous knowledge, useful to implement the innovative solutions necessary for the satisfactions of supra-systems expectations. Such an evolution must follow the widespread of a culture of networking: the network has to be seen as a tool to garrison the value chain.

FINDINGS

Decision-making of district SMEs under complexity: the case studies of the districts of Santa Croce sull'Arno and Solofra

For a long time, many studies have tried to identify an appropriate definition of industrial district, capable of enclosing all the elements and the main features of this new organizing paradigm (Iannuzzi, 2007). The most complete one appears to be that of Becattini – considered the Italian precursor of the Theory of Industrial Districts – who, following the Marshall's line of thought, defined a district as a socio-territorial entity, characterized by the contemporary presence of both a people community and a population of industrial enterprises, within the same territorial area (Becattini, 2000).

In such a way, the scholar brings the local context out, as the place where external economies arise. According to Marshall, external economies have been the main success factors of this form of industrial organization of production, which come from values, tacit knowledge, background, traditions and culture which are embedded in the territory (Marshall, 1920). For these reasons, they are uneasy to imitate and reproduce by competitors in other contexts (Soubeyran and Thisse, 1999).

However, the traditional view, focusing on historical, institutional, economic and socio-territorial components, considers the district as a whole, without examining the nature and the

behaviour of its companies and of its internal-external relationship system (Becattini, 1979, 1987, 2000; Brusco, 1986; Pike *et al.*, 1991).

Differently, we adopt the Viable System Approach to emphasise the relevance of single entrepreneurs, of their companies (even if small sized) and of their social and economic relationships (Emery, 1969; Golinelli, 2000, 2005; Golinelli, C. M., 2002; Barile, 2006). In other words, we cannot focus our analysis only on the “forest” as a whole, but on the coming up and growing of its “trees” (Baccarani and Golinelli, 1993, 22-23; Iannuzzi and Berardi, 2008).

The (VSA) enables us to observe and examine the structure and the dynamics of a district as an ordered system, whose components are analysed with regard to the whole system and to its internal and external interactions, bringing the focus from the parts to the whole system (Mastroberardino, 2002; Saviano, 2003; Barile and Saviano, 2008).

Such elements contribute also to define the degree of completion of the district, which therefore may be (Barile *et al.*, 2008):

1. *embryonic district system*: when there are neither cooperation among firms nor any collective government, rather there are several decision-making centres, as many as the systemic entities within the district;
2. *ending district system*, when there is a collective government – usually a consortium of firms or an institutional actor –, yet it is not able to address the entrepreneurial decisions of all district firms;
3. *complete district system*, when there are both a common finality among firms and a collective government – usually a leading firm – which manages the competitive dynamics of the whole system

However, only few of them can be considered as complete systems (it is the case of Prato, Varese, Montebelluna, Sassuolo, Santa Croce sull’Arno, etc.) or ending systems (for instance, Manzano, specialized in the production of chairs; Grandinetti, 1999), able to compete successfully in global markets, thanks to their SMEs which are able to achieve higher efficiency, as well as bigger companies, still keeping strategic and operative flexibility; differently, the most are embryonic districts, that is systems without a common head capable of promoting and managing change and innovativeness (for instance, the district of Solofra – Iannuzzi, 2007).

Furthermore, empirical evidences demonstrate that in many Italian district systems there are small firms governed by different kinds of entrepreneurs: on one hand, there are *production-oriented entrepreneurs*, focused on internal management and concerned in product innovation; on the other hand, there are *flexible entrepreneurs*, able to adjust themselves and therefore to introduce external innovations, who aim at surviving by developing financial, market and marketing competences (Iannuzzi and Berardi, 2008a).

Usually, both the entrepreneurs are also the administrators of their own companies. This often determines negative consequences in terms of contrasts between personal and organizational interests, “whereby what is expected from individuals, in terms of family principles, often violates what is expected from them according to business principles” (Lansberg, 1983, 40). Indeed, a family business is characterized, not only by strong cohesion, tradition, good reputation, joint liability and trust, but also by self-centredness, self-opinion,

conventionality, undervaluation of critical signs, favouritisms, disagreements, low internal competition, lack of a strategic planning, short run perspective and incapacity to analyse and comprehend the environment and context complexity (Tagiuri and Davis, 1996).

In fact, the comparison of performance of two Italian industrial districts, specialized in the industry of tanning, that is Santa Croce sull'Arno configurable as complete viable system, and Solofra, definable as embryonic system, it emerges the lower degree of development of the latter and the less competitiveness of its companies which tend to compete individually also within the international markets.

Var. % 2006/08	Observations	Average Value
Sales	184	+12%
Added value	184	+6%
Export	182	+11%
Earnings Before Interest, Taxes, Depreciation and Amortization (Ebitda)	184	6,0%
ROI	184	6,9%
ROE	184	3,0%

Table 1 – The district of Santa Croce sull'Arno. Source: Our elaboration.

Var. % 2006/08	Observations	Average Value
Sales	41	-4,%
Added value	41	+10,%
Export	41	-20%
Earnings Before Interest, Taxes, Depreciation and Amortization (Ebitda)	41	3,8%
ROI	41	2,9%
ROE	41	0,6%

Table 2 – The district of Solofra. Source: Our elaboration.

The greatest concerns are represented by the value of exports, that, however, is offset by the increase of domestic sales, and particularly by the low level of ROI that, compared with the average of sector and with the cost of financial debts (average rate of passive interest), is a significant measure of firms profitability: for the average of analysed firms, the ROI is less than 3% and confirms an unstable condition.

This weakness is also confirmed by the low level of ROE (0,6% on average - Metallo, 2007).

For supporting the competitiveness of Solofra district SMEs, it is necessary the awareness of their entrepreneurs that the real competitors are located not within the local territorial system, but outside the district and in particular in the international context where Chinese companies are becoming more and more strong. In this perspective, district SMEs should build more stable

and structured networks in order to benefit from economies of scales (for example they could create a consortium to acquire raw materials), brand advantages (with a common brand); financial resources; and knowledge economies to simplify the decision-making. Moreover, the competition among firms is centred on the access to the critical resources of information, knowledge, skills and creativity, and not merely on the acquisition of positions of leadership on the markets. In fact, the firms which incorporate the "best" cognitive resources will be able to compete successfully on final markets and act under conditions of certainty or complication: in such a way, they will be able to prevent irrational and instinctive decisions which could prove to be wrong.

Furthermore, if, on one hand, multi entrepreneurial systems are very widespread on the national territory and have proved to be able to compete in the traditional industries focusing on the tacit-aesthetic component of the production (fashion, creativity, design, etc.), on the other, this kind of entrepreneurship does not appear to be able to develop knowledge-based assets and functions, such as R&D, patents, training, learning, intellectual capital. This has led district SMEs on an inertial path of growth that, because it is based on the vain confidence that firms can survive and evolve without undertaking investments and risks, has proved to be not sufficient to face with the international competition effectively.

Italian district SMEs should become able to exploit their own distinctive capacities through the creation of stable networks.

The role of knowledge in the decision-making of district SMEs

The hypothesis of complexity of the economic system and of many entrepreneurial decisions requires greater attention by literature and decision-makers on the importance of decision process, and on the cognitive components of entrepreneurial resources (Gatti, 2005).

In this context, the *Knowledge-based View of the firm*, which takes the knowledge as the most critical resource that allows the firms to create value, and to survive and develop in global competition, acquires relevance (Spender and Grant, 2008; Tardivo, 2008). The firm loses its materiality to turn itself into a complex of personal and collective skills and knowledge, which grow along the channels of networks and are necessary to uphold the competition (Prahalad and Hamel, 1990). This consideration applies even more in the case of district SMEs that, generally, manifest a low budget of tangible assets and whose the individual knowledge is the main resource of the entrepreneur, deriving from his/her experience and work-practice (Lorenzoni, 2003).

This is also a contextualized resource which is not easy to imitate and replicate in other contexts and, rarely, the mediation with the language is full and effective (Kakkonen, 2008). Usually, people and firms operate under complexity and use implicit and informal forms of knowledge. This kind of knowledge cannot be easily separated from the context where it has been generated and socialized, rather usually it remains an intuitive and unconscious ability of people. The difficulty to codify the most of tacit knowledge is due to its nature of embedded resource (Lundvall, 1996).

The two different but strictly related way to learn and develop new knowledge, that is individual learning and collective (or relational) learning, to be effective require specific relational conditions (these will be analysed forward).

In particular, individual learning derives from past experience, competences and capacities of individuals, who take part to the firm production, and it is made by trial and error or through forms of *learning by doing* and *by using*. It follows that district tacit knowledge can be transferred only jointly to the person who holds it and through socialization processes (Nonaka, 1995).

Also the relational learning is supported by the sharing of embedded values, interpretative schemes, codes, language and culture which support information flows and tacit knowledge socialization, but it derives from the relationships among district firms (*learning by interfirm relationship*), which allow *cross fertilization* processes and the creation of new knowledge. In this case, learning depends on face-to-face interactions: each firm component, by experience and practice, tends to develop specific competences and knowledge, which are specialized and complementary to those of other district firms, in the way of starting a continuous and intense relational activity; district firms can also interact each other to create conditions of inter-systemic resonance for the sequential conjunction of processes, or to the achievement of economies of scale.

This entails exchanges of information, experience and, therefore, the production of new knowledge. However, we can also observe various forms of integration with the social system, which induce the formation of a cognitive relational space and facilitate the movement of knowledge and forms of *learning by interacting*, *collective learning* and the building of an innovative context.

Referring to the relationships with district supra-systems: various and relevant researches emphasize the difficulty for several district SMEs to develop stable relationships with external contexts, because they are unable to codify the most of their own tacit knowledge, to decode external knowledge, and to manage formal mechanisms of interactions (Grandinetti and Rullani, 1994). Therefore, the relations with external systems are generally trading and concern the exchange of market information. However, if on one hand, district SMEs are able to perceive and meet the demand in a flexible way, on the other hand, they are often unable to create new markets and usually adopt strategies of benchmarking and of learning by external adapting. It follows that district learning is not the mere summation of district individual learnings, rather it is the result of the synergic interactions among district actors, territory and external entities.

Hence, district firms share a common background of tacit knowledge, that is unconsciously socialized through two main cognitive networks: the entrepreneurial network and the institutional network (Geroski, 1995; Bell, 2005). In the first, firms share tacit knowledge through informal and confidential relationships (Nonaka and Takeuchi, 1997); in the second, they exchange formal and codified knowledge concerning trade and market standings. (Rullani, 2004).

In such a way, individuals, firms and networks are connected by social mechanisms, and circular and continuous flows of learning which are influenced by the contexts and concur to the creation of new knowledge (Figure 5).

The learning, internalization and combination of external knowledge with its own tacit knowledge support firm creativity and innovation.

In such a way, the firm assumes an evolutionary nature and bases its competitiveness on its cognitive resources and on the capacity to create new knowledge (Zaheer and Bell, 2005, Belussi and Pilotti, 2000).

In such a perspective, the real engine of the economy is the reproducible knowledge, which can be transferred and spread among the different systems of firms and enables firms to achieve economies of knowledge and to create value and generate profits.

Either the pre-modern economy, and the fordism, and the current networking capitalism have placed their bases on such a knowledge, but they have used different approaches to the environmental complexity that is necessary to create new knowledge (Rullani, 2008).

Indeed, the pre-modern economy tried to eliminate complexity through the standardization of processes and products, and the deterministic prevision of events.

Differently, the fordism, giving attention to contingencies, contexts, people and firms – these latest taken as unique, different and path-dependent systems (according to the *resource-based view*) – aims at monitoring and adjusting the complexity by means of the market power and negotiations with the various supra-systems.

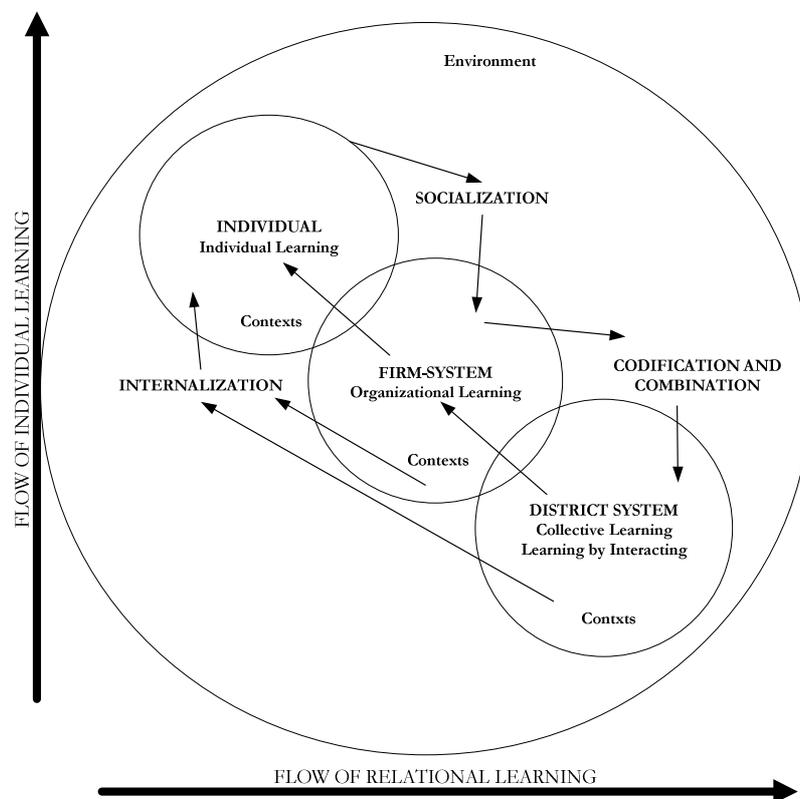

Figure 5 – Individual and relational learning within the district system. Source: Our elaboration.

Nevertheless, the systematic restraint of complexity in terms of demand prevision, vertical integration, etc., is not easy to support within the modern competition, based on new technologies, characterised by deep change, variety and variability, and where the time is fundamental for competition and for exploiting worthy innovation and knowledge. In other words, the fordism leads the company in a position of relative immobility.

Vice versa, there is a need for a different approach to the complexity that must not be controlled and reduced by the mere exploitation of the known, rather it must be considered as an endless source of new knowledge and must be explored and managed through a co-evolutionary path (Rullani, 1997).

The challenge is to create a context where firms can learn, socialize, share and use knowledge, that is worthy and difficult to imitate, quickly and costless (Nonaka and Nishiguchi, 2001). In particular, the district SMEs, assumed as *Complex Adaptive Systems* embedded in complex contexts, must acquire specialized knowledge and combine the same knowledge in a synergic and innovative way, through *cross-fertilization* processes with previous knowledge. In other words, such an evolutionary competitive context, the globalization and the technology revolution make the firm knowledge and learning as the main competitive factors in order to survive and evolve over time.

District SMEs must evolve from *path dependent* systems, which use and exploit the knowledge they already hold by means of mechanisms of elaboration of previous experiences and of *conceptual combination*, to innovative systems which, recovering their history and tradition and exploiting the uniqueness, explore the new opportunities and knowledge through collaborative interaction with other systemic entities.

In such a view, the patterns of knowledge that are relevant for district SMEs competitiveness are both, individual knowledge and collective knowledge.

The district system as a context to govern the complexity by means of knowledge

The idea of the environmental complexity and turbulence emphasises the relevance of the firm decision-making, especially for SMEs which are usually characterised by an individual government, where the entrepreneur plays the roles of owner and administrator even if he/she does not have enough ability and specialised capacities. Differently, strategic and operational decisions for long term survival of SMEs require adequate cognitive capacities.

The complexity and the rapid evolution of the competitive context, and the scarcity of human, financial and cognitive resources emphasize the necessity for SMEs to join network systems, typified by forms of vertical and horizontal cooperation among firms, in accordance with the general interpretative scheme of cooperation and competition (Barile, 2009).

The complexity imposes the continuous environmental monitoring because not only the supra-systems expectations, but also the structure of the firm context can change significantly, and requires continuous structural and behavioural adjustments.

In such a view, also the small district entrepreneurs must change their strategies and organizational models and finally their entrepreneurial mentality.

Indeed, the complexity and interaction among several subjective and systemic components make difficult for firms to anticipate context evolutions and to identify the opportunities and threats which can emerge over time. This entails the necessity for a continuous monitoring of external dynamics in order to perceive and interpret potential change signs. Hence, with the definition and implementation of planned strategies, there is a need for creative and emerging decisions and actions.

Furthermore, usually an individual entrepreneur does not hold the knowledge, competences and experience to face with the complexity of government and management. Therefore, he/she can undervalue critical elements and makes decisions by instinct, insight and personal value, rather than by a real knowledge of problems. An effective decisional process requires the active and direct participation of all the organizational members and the recruitment of qualified workers with specific and specialised competences: in such way, the system will govern the complexity and will survive and evolve through self-organization, learning, creativity and flexibility.

Because of the hyper-competition and continuous environmental change, entrepreneurs need to have the access to cooperative inter-systemic networks, in order to induce the completion of the district system and foster its effectiveness in exploring the complexity and learning new knowledge. Differently, the firms and the district risk to not survive.

The needed cultural change is linked to the access to network systems: the knowledge inter-systemic relationships allow small firms to implement processes of research and development and of complexity exploration (Lindsay, 2005). They also allow to achieve flexibility and the capacity for adjusting to environmental change through processes of knowledge socialization (Volberda, 1996).

Indeed, the network can be defined as the tool whereby also small firms can explore and govern the complexity in the perspective of knowledge and value creation, and opportunity exploitation.

By taking the point of view of the single firm, the district system can be represented as a structured and dynamic *supra-systemic context*, where routine procedures and rules are clearly defined thanks to a long sedimentation process of inter-systemic relationships. In this sense, a district SME has to be able to exploit the district as an opportunity to profit by common structures, relations and embedded knowledge.

Hence, it is necessary to implement a knowledge approach for the government of district firms. At the moment they compete within the so called Knowledge Era, but their government and managerial systems are typical of the Industrial Economy. Moreover, they are facing with growing uncertainty and complexity, which often go beyond the information assets and the consolidated interpretative schemes, even until the chaos. In these cases, entrepreneurs are forced to make decisions by instinct and values, that, for this, may be wrong.

In this perspective, learning and knowledge can be assumed as firm responses to the complexity and environmental change: in fact, the firm competitiveness depends on its capacity for developing new knowledge by means of the combination and re-combination of network variety.

In such a view, the district becomes a chance for SMEs to govern the complexity in order to simplify the cognitive process for understanding complicated problems and to support the decision-making under complexity also thanks to strong and embedded categoric values which help to orient the choices even when there is a lack of both informative units and interpretative schemes.

But when do such opportunities emerge?

According to the (VSA), the case studies stress that the *degree of completion* of the district system is essential to exploit the economic-structural potentialities linked to the development of synergic and worthy interactions. Indeed, for exploiting district opportunities it is necessary to develop conditions of *consonance* and *resonance* among the firms and the other district entities. The consonance is conceived as the degree of integration among structures, i.e. their potential structural compatibility for exchange. It is the ability to relate with the external world in order to bring about the exchange of resources. The resonance is the realisation of such a potential compatibility among parts (consonance) through operative collaboration in order to reach a common goal. It is a sort of syntony and coinciding of aims, and configures the capacity of the system for creating synergies with the other systems with the same goal (Golinelli, 2005).

Therefore, the network needs to achieve consonance at several levels: the consonance between the district firm and the district as supra-system; and the consonance between the complete district system and the external context (Figure 6).

In the figure 6, we can emphasise the *recursion* (a VSA key concept) of the connections among the different levels of the district system. Within the recursive scheme, the district context is perceived as an external entity, by taking the view point of the district firms, or as an internal one, by assuming the view point of the whole district system. In such a perspective, what represents a form of external *exploration* of new knowledge for a district firm, becomes a sort of internal *exploitation* of knowledge for the district (March, 1991). A recursive relation between internal and external context, and hence between exploration and exploitation of knowledge, arises by means of the district.

The structure and the systemic functioning of the district configure its degree of completion, as *embryonic*, *ending* or *complete* system. In particular, the consonance of the relationships will define the degree of completion of the district that will work as a whole system and will mediate the relationships between the district firm and the environment by developing synergies of complexity government.

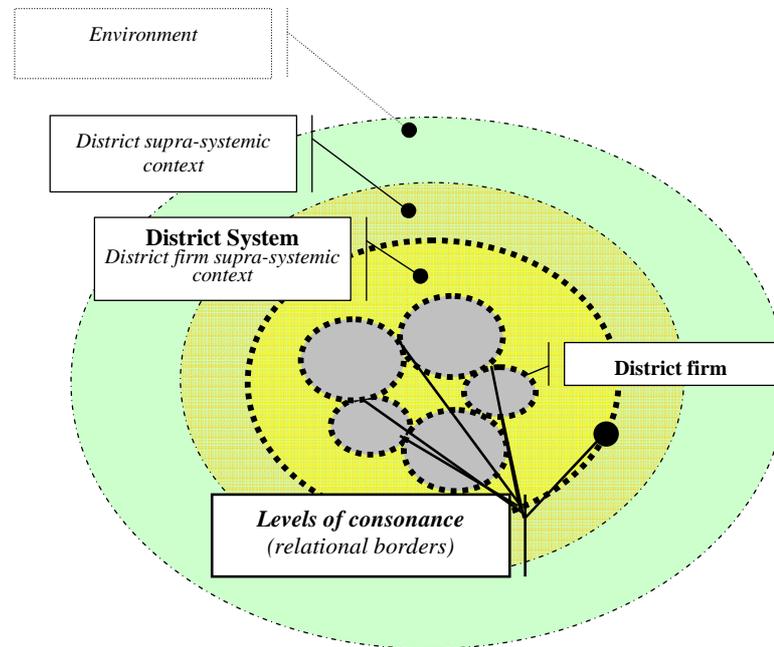

Figure 6 – The levels of consonance among district systemic entities. Source: Our elaboration.

The degree of completion of the district influences the opportunities to govern the complexity. By competing *through* the district system, individual firms will reduce their degree of autonomy on final markets, but they will gain the capacity and the power as a complete network system, which can face with the challenges of global competition effectively.

The district system with growing inter-systemic consonance and resonance enables firms to focus on *core business* and achieve economies of specialization, flexibility and adaptability, by sharing information and knowledge and avoiding the negative effects of both excessive integration and standardization (which block innovation), and a limited coordination (which leads to chaos). In fact, cooperation supports informal exchanges of information and tacit knowledge which in turn foster the creation of new knowledge and innovation.

How do the conditions necessary for the completion of a district arise?

As observed before, according to the Information Variety model, viable systems take decisions and act within their own context on the basis of their knowledge background which is composed by information units, interpretative schemes, general and of synthesis, and categoric values. These three variables can influence the dynamics of the cognitive processes which characterize the interaction among the viable systemic entities. During the interactive processes the informative units can be easily transferred and socialized, the interpretative schemes (of synthesis or general) are fundamental to give an order and a meaning to information, and the categoric values are more difficult to influence and change over time because they resist change.

Determining the level of consonance, the action of the categoric values is more significant in comparison to rational interpretative schemes and informative units. The greatest level of consonance between the related entities derives from shared categoric values (Figure 7).

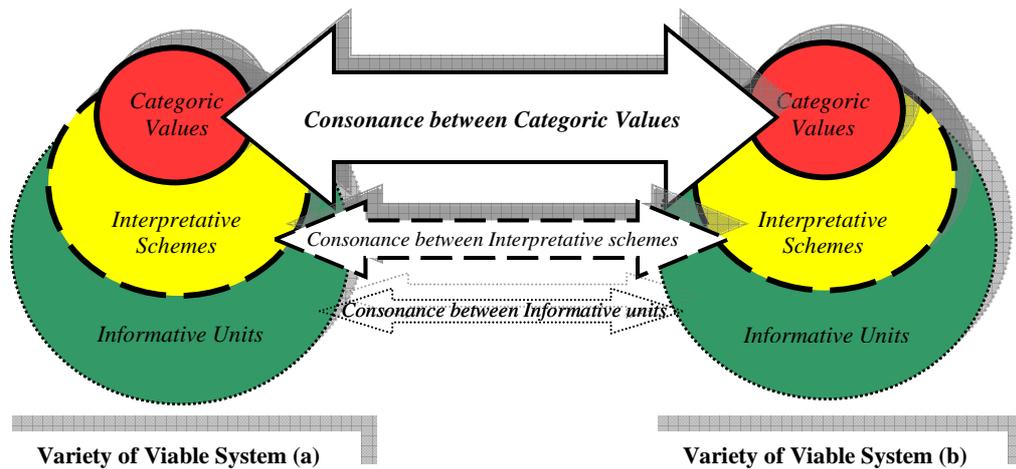

Figure 7 – The Informative Variety Consonance Model. Source: Our elaboration from Barile, 2009.

Hence, the consonance depends firstly on the categoric values and interpretative schemes. The consonance and resonance act as factors of change of the informative varieties that interact. In particular, when two informative varieties interact each other, firstly they perceive the information units, then they see them through the interpretative schemes and finally they accept or refuse them depending on the resistance action of the categoric values (Figure 8).

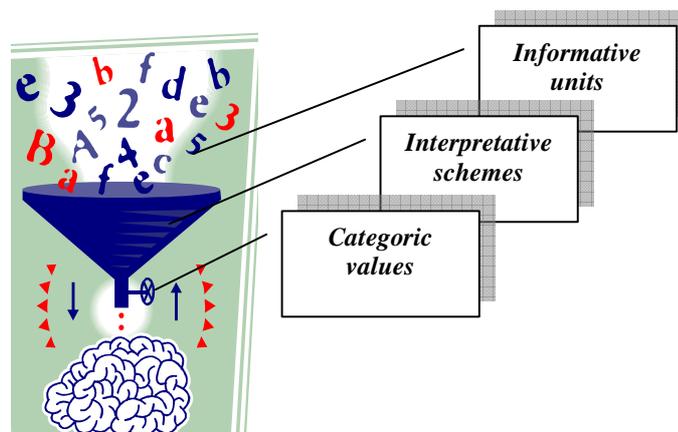

Figure 8 – The action of the Informative Variety factors in the cognitive process. Source: Our elaboration.

The level of consonance among the district systemic entities defines the degree of completion of the district. *Complete district systems*, characterized by strong inter-systemic consonance and intense and profitable relationships, enable firms to manage complexity and support their trading and internationalization through the socialization of tacit and codified knowledge with the main supra-systems (institutional supra-system, financial supra-systems, consumption supra-system etc.). Differently, in the case of *embryonic district systems* there is a prevalence of occasional relationships and speculation purposes (in this case, the speculation is usually the main categoric value, for instance for the access to public financing).

The case of the embryonic district system of Solofra shows that the main problem for many SMEs concerns the categoric values and the self reference of the entrepreneur, owner and government, who tends to control the firm directly and to use informal forms of communication. While informality can be considered a key factor for SMEs competitiveness, the lack of formal systems and procedures makes difficult the learning and spreading of new knowledge, and the access to wide network systems. In fact, small firms base their competitiveness on experience, empirical knowledge and know-how. This, on one hand, can be a source of competitive advantages in terms of entrepreneurship and creativity, on the other, can produce rigidity and decline.

Many small entrepreneurs miss skills and knowledge to face with the new challenge of competition and to adopt the most modern models and technologies to manage and govern their firms. Furthermore, they have developed a concept of high quality which is too costly: to reduce cost they should industrialize the quality, moving from the empirical knowledge to the scientific production (Varaldo, 1990).

The centralization of decision-making shapes a government based on the cognitive background (the Informative Variety) of the entrepreneur, limited to his/her scarce information and interpretative schemes and conditioned by his/her categoric values.

However, the district system, assumed as a socio-territorial entity, characterized by the contemporary presence of both a people community and a population of industrial enterprises into the same territorial area, which fosters continuous and intense economic, human, social, religious, institutional and technical relationships, supports the spreading of a common and homogeneous system of values which both can expunge opportunistic behaviour and encourages inter-systemic convergence, and simplifies and improves the firms' government by means of more intense and lasting information flows and worthy knowledge exchanges. In such a way, district firms become able to compete effectively also under condition of complexity.

In the case of embryonic systems, such as the district system of Solofra, the prevalence of the categoric values of speculation, short-term profit, self reference, individualism and maximization of self-interest leads to undervalue the opportunities of the district system and to sub-optimize performance.

For long-period survival of district SMEs, entrepreneurs must change mentality and develop adequate mechanisms to explore, share and exploit complexity and new knowledge (Jones and Macpherson, 2006).

The cultural change must involve the entrepreneurs and the other systemic actors (Golinelli, 2005) who must foster the spread of categoric values, such as cooperation, ethics, socialization of knowledge etc.

The common values, finalities and objectives induce a widespread sense of belonging to the district system and foster the homogeneity of categoric values which will merge each other and resist to external change which undermines the viable survival of the system through eventual opportunist and speculative behaviours. Complete systems can expunge dissonant entities.

Obviously, the high consonance within the district supports also the research of external consonance with the relevant supra-systems.

CONCLUSIONS AND PRACTICAL IMPLICATIONS

Assuming the point of view of the district SMEs, the pursuit of self interest and profit, which has always characterized every firm, should be achieved by developing consonant relationships with other district SMEs in order to ensure long term survival and performance for all the district system and its firms.

In other words, the lack of cognitive, managerial and financial resources imposes to small firms the access to more resonant, stable and wide network systems. In such a way, they could benefit from common knowledge assets and develop more specialised and innovative capacities and competences (for example, by establishing or participating in collective training programmes, recruiting qualified workers and strengthening the links with local universities and research centres).

District entrepreneurs must overcome the traditional family management which gives priority to the personal involvement and commitment in pursuit of specific objectives, and assume a government focused on strategic flexibility and complexity exploration, giving attention to the strength of environmental weak signs (Sanchez, 1993).

Hence, not all the relations generate value for firms and the network: there is a need for consonance among the systemic entities, in terms of common finality and objectives, codes and interpretative schemes, and language and values. Moreover, the resources and competences they hold must be heterogeneous and complementary, and there is a need for mutual trust to stabilise the relation (Piciocchi *et al.*, 2003). Nevertheless, each relation has to be embodied and contextualised into a wider network system which creates new opportunities and amplifies benefits and advantages for firms, starting a strategy of creative and synergic combination of Informative Varieties (Piciocchi *et al.*, 2009).

In particular, for surviving under complexity and developing capacities and competences to enhance learning, creativity and flexibility, district SMEs, firstly, must increase their internal informative variety through the acquisition of heterogeneous knowledge and competences, without trying to simplify and rationalise their structures and strategies. Secondly, they should homogenize also their own informative variety, in order to share the same interpretative schemes and categoric values.

The categoric values are very effective in the case of complete district systems where the consonance among firms emerges spontaneously thanks to the homogeneity of social and entrepreneurial values.

In this way, we can understand and explain the deep meaning of industrial atmosphere (Marshall, 1919) that can be shared only within the complete district systems.

The district government plays the essential role of guiding the evolution of the whole system and ensure its survival.

Furthermore, the nature of the district as emerging system, generated by spontaneous bottom-up processes of sedimentation and interaction among the territory, the social network and the population of firms, makes the district a significant example of complete system, even when it apparently misses a common government. Indeed, it is characterised by advanced forms of self-organization and self-government, based on consonance and resonance, and on the spontaneous sharing of categoric values and interpretative schemes.

COMMUNICATIVE IDENTITIES AND BRAND PLACEMENT

Saxena, Rajan¹; Ravi, K.²

¹Vice Chancellor and Distinguished Professor, SVKM's NMIMS University, Mumbai, India

²Student, Ph.D., NMIMS University, Managing Director, Pinnacle Advertising Pvt. Ltd., 308, 3rd Floor, Neelkant Commercial Centre, Sahar Road, Ville Parle East, Mumbai - 400 099, India

This research paper, examines the adequacy of understanding of the definition, perceptions, theoretical foundations of Brand Placement (BP) and establishes the need for a new definition; concludes that Brand Placement is an innovation with distinct values; identifies the communicative identities as used in Indian Movies-one of the largest creative industries in the world; introduces a new classification of inclusion of identities in creative content; identifies linkage to certain dominant product categories and brand placement and proposes a definition with 2 intensities, four superstructure, an outcome and two perspectives:

Brand Placement, an innovation in marketing communication with distinct values, is the paid inclusion of communicative brand identities, via management of intensities, in creative content of any media and is an audience driven strategic communication process, managed by stakeholders for an outcome.

Methodology - The methodology employed was field research to find out the general perspectives of practitioners in India on the comparative merits and demerits of brand placement versus TV Commercial and data collected by personal interview from randomly selected 31 practitioners with a structured questionnaire on a 7 point scale. A content analysis of 100 brand placements from randomly chosen movies which served as reliable secondary source of data was carried out to study the type of brand identities used in Indian movies using the model of four communicative identities namely visual, verbal, audio and thematic

Findings - The empirical research rejected the null hypothesis "there is no difference between brand placement and TV commercial"; found 11 Distinct Values of Brand Placement based on 't' results and concluded that BP is an innovation with the salient distinct values as 4 Cs – Captive Audience, Clutter Free, Celebrity Cost Advantage and Cost Effectiveness based on factor analysis and ranking on average score. Through content analysis classified placement of brand identities into two intensities of inclusion namely Silent Visual Placement and Interactive Inclusion and identified the most popular intensity types as interactive inclusion. This paper revealed that five brands were placed per movie and found 4 dominant product categories in BP namely food and beverage, fashion, media and entertainment, and automobile and two wheelers.

Limitation - The limitation of the study was however the small sample yet significant considering that BP in India is in its nascent stage.

Originality Value - This paper will give both the practitioners and academia a comprehensive understanding of BP in India and enable them to take well-informed decisions to promote practice and research.

RESEARCH ISSUES

- Is the current understanding of definitions of Brand Placement adequate?
- Is Brand Placement an innovation? What type?
- What brand identities are used in movies? How?

- Are there any dominant product categories in BP?

RESEARCH ON BRAND PLACEMENT (BP) 1982 – 2009

In the year 1982, a movie titled ET: “The Extra Terrestrial” was launched.

In this movie, a brand Reese’s Pieces was included.

This inclusion caused the sale of the Candy to jump 65% (Karrh, 1998).

The global advertising industry recognized this as the birth of Product Placement.

Researchers observed a number of product placements. James Bond making secret call on Ericsson mobile phone (1987) in the movie Tomorrow Never Dies, made Ericsson brand benefit by enhanced visibility and gain in market share (Ziemme 1988).

Researchers also recognized the value of product placement as “clutter and ads of competitors are cut off when you integrate the brand story with the main story (Gay, 1988). The scope of product placement as a promising advertising way was confirmed (Buss 1998, Farhi 1998 and Reed 1989). Since then Product Placement has grown in application and has become an industry attracting researchers, academia and practitioners. Product placements in Movies and TVs maximized the interests for both film producers and advertisers.

By 1991 in USA, a group of west coast based placement agents formed an American industry group-the Entertainment Resources and Marketing Association (ERMA) to highlight the practice. UK followed in 1996, with the formation of Entertainment Marketing Association (Curtis 1996).

Nebenzahl and Seunda (1993), brought to the collection of knowledge that consumer beliefs towards product placement activities have been found to influence their acceptance in general and product placement has been more organized to enhance product communications.

In 1999 BMW invested \$20 million for Z3 roadster in James Bond Film Golden Eye and the brand had prominent exposures in film, trailers and TV ads. This attracted the attention from academics (Einstein 1997, Babin & Carder 1996, Decorme and Reid 1999, Gupta and Goud 1997, Karrh 1998, Ong and Meri 1994, Goud Gupta and Grabner and Krauter 2000). Brands, Mokie and Lexus, were placed in Spielberg’s film Minority Report and promoted through interactive bill boards. The advertiser reportedly paid \$5 million to \$7 million each for the placement (Friedman 2002). It was predicted that Advertising Agencies and Public Relations firms may become involved in negotiations for their clients (Pardun and Mckee 2000) and product placement will become an important revenue source for broadcast television network (Schneider 2002). The practitioners sought more prominent roles for their brands in films (Dorio 1999, McCarthy 2000) and in TV shows (Elliott 2002, Friedman 2001, Avoni 2007). In the beginning of 2000 Coca-Cola, BMW and Ford adopted a role of programme producers themselves to protect the brand interests and to give themselves more opportunity to present the brand. They gained control of the entire programme (Brown 2002 and Wells 2001). The concept of product placement began to be practiced worldwide.

RESEARCH ON CLASSIFICATION OF BRAND PLACEMENT (BP)

A number of researchers studied the effectiveness of product placement and in the process classified the levels of product placements in movies and TV programmes

Shapiro (1993) classified the product placement in movies in to three types:

1. Product placement that provides **clear visibility** with product and brand name shown.
2. Product placement that has a **spoken reference**
3. Product placement that provides **hands on use and mentioned by a main character**.

D'Astous and Seguin (1998) identified three types:

1. **Implicit** product placement: The brand name is not referred to in the movie.
2. **Integrated Explicit:** The brand is within the context of the story and is expressed in a way that its attributes are explicitly demonstrated.
3. **Nonintegrated Explicit:** The brand is explicitly expressed outside the context of the story.

Russel (1998) saw product placement in three dimensions:

1. **Visual:** Brand appears as a silent visual at the background
2. **Auditory:** Brand is referred to only in the audio
3. **Plot Connection:** Brand is a part of the plot

Yang and Roskos (2005) used three levels of placements in the research conducted by them.

1. **In the background:** The product shown with one of the main characters but the product not used in situation.
2. **Used by the character:** Was used by one of the main characters but not central to the story.
3. **Used as an enabler in the story:** Product played a role in the story line.

Thus different types of classifications emerged during the period 1993 to 2005 based on visibility, spoken reference, hands on use by main character, product attributes and demonstration, context and plot connection.

However we have seen from various movies in India that product placement does not come into strict classifications as mentioned above. Especially Indian movies which have a combination of story, comedy, dream-sequence, song and dance, and, fighting sequence, it is difficult to classify in the above mentioned manner. In many Indian films most of the time the song and dance, comedy, and fighting sequence may or may not be relevant to the story; but are seen as an important part of the entertainment mix. Unique to Indian Movies dream sequence and fantasy in movies are used as devices to include song and dance. Song and dance and comedy can be stand alone and television channels in India telecast song and dance, and

comedy scenes from movies in separate programmes without reference to the movie story. A simple, broad and comprehensive classification to cover all possible usages of product placements will be useful to the practitioners for ease of implementation and decide the value pricing. This will also provide for creative freedom. A new classification keeping this in mind is needed.

RESEARCH ON PRODUCT PLACEMENT DEFINITIONS

During the period of 1994 to 2005 researchers came up with various definitions. "Product placement has been defined as a paid product message aimed at influence of movie or TV audience via the planned and unobtrusive entry of a branded product" (Balasubramanian 1994). Further refinement came as "product placement or more precisely brand placement is the inclusion of a brand name, product package, merchandise within a motion picture, television show or music video"(Babin Och Carder, 1996). "Product or brand placement is the paid inclusion of branded products or brand identifiers, through audio or visual means within mass media programming" (Karrh, 1998). "Product placement of a brand or a firm in an entertainment vehicle by different means and for promotional purposes" (Prof.Tapan Panda, 2005). "Product placement is the inclusion of products – branded and/or unbranded – in mass media programmes to support content"(Scott and Craig-Lees2005). "Product placement is a co-operative effort of advertisers and creator of entertainment products in which trade marked goods are embedded into popular entertainment products in order to encourage their consumption over riding entertainment and artistic concerns (Schejeter, 2005)." "It's a form of advertisement, without disclosing it to the receiving party" said the Centre for Media and Democracy (Source Watch 2005).

INADEQUACY OF THE DEFINITIONS

Researchers and practitioners agree that brand placement is a paid inclusion. Even though in cases of barter, often used by the media brands, the same can be considered as a value transaction. But transaction alone does not provide a complete perspective especially in terms of the values of BP and its communication process.

Specific definitions like "TV", "Movie", "Entertainment Vehicle", "Mass Media Programmes" give an understanding of BP but such specificity may not be comprehensive considering the fact that BP is also noticed in internet and information media, fictions, plays and thematic environmental simulacra.

An expression like "Via planned" indicates the nature of the process. But "Unobtrusive Entry" is susceptible to perceptions of the audience and advertiser. A need for understanding the levels of implementation in a manner that practitioners will appreciate is noticed here.

In these definitions the purpose of BP is indicated to "influence the audience", "for promotional purposes" and "support content". Thus the benefits of both advertisers and producers were noticed. A broader terminology with respect to brand perspective will be better suited for a powerful concept like BP, considering that BP is a professional practice. The need for a new contemporary and comprehensive definition with a new perspective that will encapsulate the concept of BP as it is practiced to day is yet to be seen.

In summary the definitions seen so far are inadequate in terms of current brand practice and strategic perspectives, levels of brand inclusion, drivers and managers of the concept, the legs on which the idea rests and the framework that encapsulate the idea.

In order to compare the freshness and enrichment of the proposed definition of BP the researcher has identified various elements of the proposed definition and presented along with the definitions of other researchers.

	CURRENT DEFINITION ELEMENTS	PROPOSED
WHAT	Product placement, a paid product message (Balasubramanian, Tapan Panda and Scott & Craig, Lees) Brand placement, a paid inclusion (Babbin Och Carder and Karrh)	Brand Placement, an innovation in marketing communication with distinct values, a paid inclusion, an audience driven strategic communication process
WHERE	In Movie or TV programme (Balasubramanian) In Entertainment Vehicle (Tapan Panda) In Mass Media Programmes (Scott & Craig)	In content of any media
HOW	Via Planned and Unobtrusive Entry (Balasubramanian)	Via intensities of Visible Placement or Interactive Inclusion
WHO	In the understanding of BP as a concept the "by who" factor is missing	Managed by stake holders
WHY	In order to influence audience (Balasubramanian) For promotional purposes (Tapan Panda) To support content (Scott & Craig)	For an outcome

Chart 1 – Comparison of the Definitions

Is Brand Placement (BP) an innovation?

Innovation is a new approach and can be related to product, service, production process, organizational structure, people or policy.

Brand Placement is a new approach for achieving the objective of reaching the brand story to the audience through a new system. It's a change in the strategy and process. In order to understand whether BP is an innovation the researcher viewed the concept through models offered by researchers like Rogers (1993), Rafii (2002), Elaine Dundo (2002), Rebecca M. Henderson & Kim B. Clark (1990) and Clayton M. Christensen (1997)

Rogers (1983) identified relative advantage, compatibility, simplicity, trial ability, observability and involvement as attributes of an innovation. A comparison of these attributes to brand placement, identifies it as an innovation. Avoidance of clutter, entertainment, information, celebrity value, audience reach, shelf life, novelty and positioning context can be seen as relative advantages. When brand is in Internet content, interactivity is a relative advantage. Compatibility of brand placement and entertainment/information content is found to be high by research and as indicated by the growing acceptability of this concept worldwide. The simplicity of BP enables easy adoption of the idea. The possibilities of inclusion of a brand in content at different levels reduces the cognitive complexities, removes uncertainty, gives a choice of format and increases trial ability. It is possible for an advertiser to participate in the process and arrive at a richer solution through pre and postproduction discussions.

Of the three types of innovations namely radical, incremental and disruptive, BP has similarities with radical innovation as it changes the game instead of changing the rules of the game. BP enables avoidance of clutter instead of managing clutter. The director, and scriptwriter of the entertainment content express the brand story instead of the advertising professionals. Unlike the ad spot which treats every second and every frame as premium, the movie format flows with the story and dialogue without hurry for the delivery of the brand. As the benefits of BP are not just marginal or incremental, BP may not be an incremental innovation.

The growth in the practice of BP and its acceptance by audience worldwide indicates that BP may have certain unique values and may enable disruption, partly or fully, of other options like TV commercials. Disruptive innovation, a subset of innovation, is driven by multiple perspectives and distinct values and is disruptive because one cannot differentiate "signal from noise" (Christensen 1997). The real disruptions are not taken seriously until they become obvious- when it is often too late for competition. Its simple, economical and revolutionary. The disruptive innovation takes place in the space of overshot market solutions and under demanding customers.

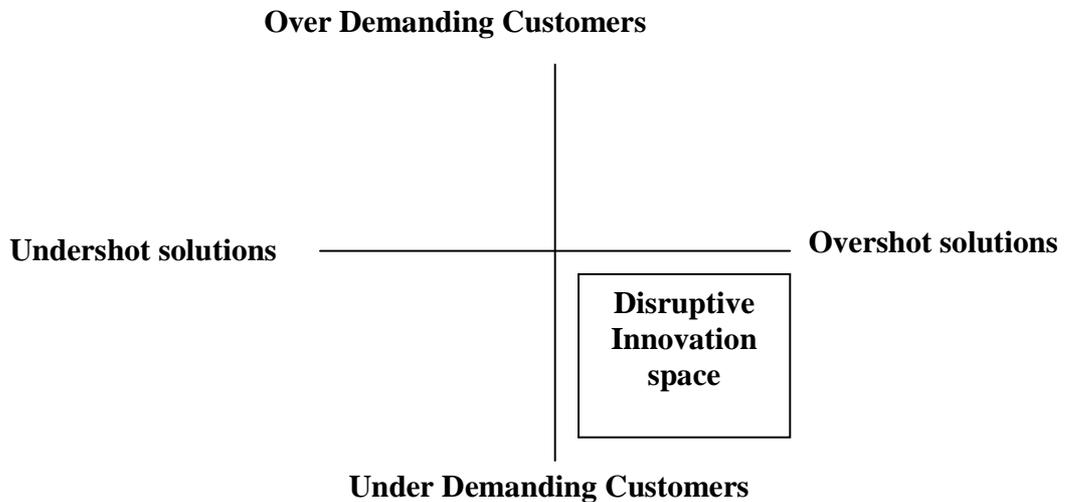

Chart II - BP in the innovation map - What is available Vs Customer Demand

In the chase for ad effectiveness in terms of reach and recall, often lead options like TV commercials may become expensive and overshot. Research also has shown that high persuasion effectiveness without effective ad recall is sub-optimal to high recall and high persuasion. Even though an objective like ad recall may sound basic, it is prime. Disruptive innovation principle is based on “good is great” and “step, don’t leap”. (Christensen 1997). Advertisers may also feel that reach and recall are good enough. Simplicity of solution can also be a convenient one as BP gives both uninterrupted entertainment to audience by removal of barriers to consumption namely ad clutter and multi level choice for placement of brand for the practitioners. BP gives access to all those customers who are locked out of market due to avoidance of ads, interruptions and information overload.

Is BP disruptive, can be studied from the perspective of lowest benefit range and the easiest point of implementation. The benefit of simple reach and visibility can be achieved from the lowest level of implementation namely silent visible placement of the product or by placement of visual and verbal brand identities in creative content. Current advertisers may not always value the high performance of TV commercial and may prefer a combination solution for greater brand recall. The ever increasing cost of TV commercial production and media, competitors not looking at the lower end solutions, inability of agencies to respond as they are locked up in their own value net work catering to their existing customers’ needs and expectations (Christensen 1997) and there by missing out on the untapped low end market needs, new trends and new customers, are potential situations for the birth and growth of disruptive innovation like BP.

With this theoretical background and clear understanding and inspired by the model developed by Rafi (2002), a hypothesis and a questionnaire was developed for examining the disruptive potential of BP against TV commercial.

Null Hypothesis: *There is no difference between brand placement and TV Commercial with respect to certain parameters.*

METHODOLOGY

I) Field research on general perspectives of practitioners in India on the comparative merits and demerits of brand placement versus TV Commercial was conducted and data collected by personal interview from randomly selected 31 practitioners (from advertising agencies, TV channels and Production House and Advertisers). A minimum of five sample per group was taken to represent all the segments of practitioners. The sample was drawn random from member list of Advertising Agencies Association of India, Indian Broadcasters Federation. The advertisers were drawn randomly from the list of organizations/ brand owners who practice BP in movies. Since the industry is in nascent stage in India it was not possible to get a larger sample for this study.

A structured questionnaire with 21 statements was used. Of 21 statements two were general perceptions and nineteen were disruptive statements. For each statement respondents indicated as to what extent one agreed or disagreed, using 7point Likert's scale. There were also two questions pertaining to the extent of current practice and growth of future practice.

The data collection with direct personal interview with a structured questionnaire was chosen to be the best method since the sample size has been only 31 cases and the industry being in the nascent stage. If the sample was larger and if the industry a mature one, one would have considered other options like telephonic interview or email questionnaire. The respondents had direct experience in brand placement, contributing to the validity and the reliability of information collected.

Testing of hypothesis

Two tail test

Alpha 0.05 default value

Test Statistic

t with $df = n-1 =$ thirty

Decision Rule

If calculated $t \geq 2.040$ reject the null hypothesis; otherwise accept

CONTENT ANALYSIS

II) The methodology of content analysis was chosen to understand the type of **communicative brand identities used in Indian movies**. The advantage of content analysis from movies is that it is a secondary source of data and rechecking is possible. Inter coder reliability was included and discrepancy if any was resolved through immediate discussion between the coders. The accuracy of the coding was 98% indicating coding clarity, training of coders and reliability of data. The movies were viewed, coded and data recorded for the type of brand identities. The model of **four Communicative identities** – Visual/Verbal/Audio/ Thematic was used

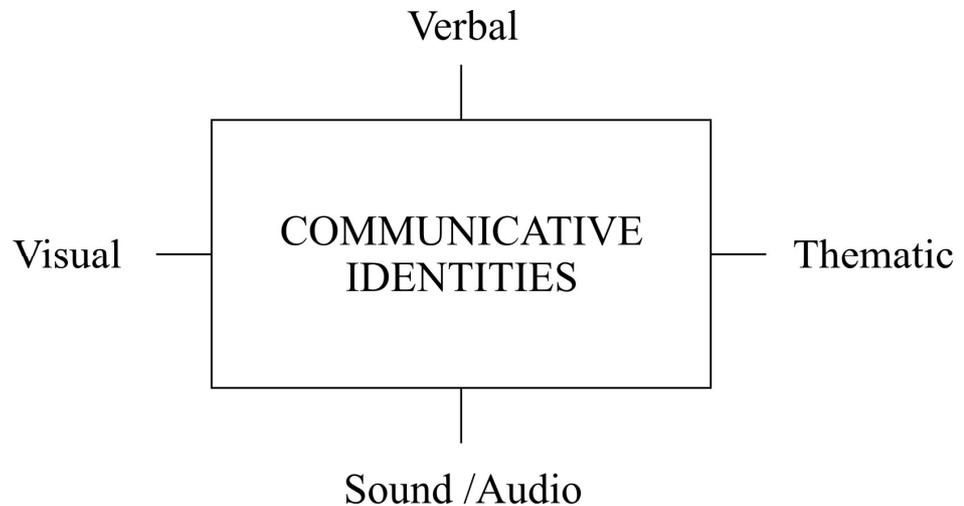

Chart III - The Four Communicative Identities

Initial pilot review indicated that there were two levels of placements namely silent visual placements and interactive placements. The silent visual placements are those where the product or brand is placed in a silent manner in the background of content. Interactive placements are those where the brand and the character or theme interacted in content. Interactive placements included four categories: interactive visual placement, verbal mention, audio and thematic. Both the levels, silent visual placements and interactive placement, were further coded to enable observation and data capture. These two levels namely silent visual placement and interactive inclusion together is labeled as **intensities** as they represent two different levels of engagements of brand. Further disruptive innovation has been explained by “signal Vs noise” by Christensen and therefore the usage of intensity to denote two different levels of strength is apt.

While doing the content analysis for the identities, the product and its category also were coded and recorded to identify linkage of BP to any dominant product category.

Sampling

Considering that brand placement is a new practice in India, a sample size of 100 was thought to be reasonable. The sample size added up to hundred from eighteen **randomly** chosen and reviewed movies out of thirty five movies randomly selected from a collection of fifty movies with brand placement.

FINDINGS AND CONCLUSIONS

This Paper

1. **Rejected the null hypothesis** “there is no difference between brand placement and TV commercial”

2. The calculated 't' 7.584 was higher than the critical value 2.040 indicating that BP is a disruptive innovation.
3. **Found eleven disruptive distinct values of Brand Placement** of the nineteen factors based on 't' results: Captive Audience, Clutter Free, Shelf Life, Celebrity Value, Cost Effective, Audience Connect, Brand Recall, Brand Recognition and beyond, Celebrity Cost Advantage, Multiple Positioning and Usage Opportunities, Promotion of Brand Values and Properties and Credibility
4. **Ranked the distinct values based on average score:** 1. Captive Audience 2. Clutter Free 3. Celebrity Cost Advantage 4. Shelf Life 5. Cost Effective 6. Brand Recall 7. Brand Recognition and beyond 7. Multiple positioning and Usage Opportunities 8. Promotion of Brand Values and Brand Properties 9. Credibility 10. Celebrity Value

<i>RANKING</i>	<i>AVERAGE SCORE</i>	<i>DISTINCT VALUE</i>
1	6.40	<i>Captive Audience</i>
2	6.19	<i>Clutter Free</i>
3	6.00	<i>Celebrity cost Advantage</i>
4	5.84	<i>Shelf life</i>
5	5.30	<i>Cost Effective</i>
6	5.26	<i>Brand Recall, Brand Recognition, beyond</i>
7	5.00	<i>Audience Connect</i>
7	5.00	<i>Multiple Positioning & Usage Opportunities</i>
8	4.94	<i>Promotion of Brand Values & Properties</i>
9	4.71	<i>Celebrity Value</i>
10	4.70	<i>Credibility</i>

Chart IV –Ranking of Distinct Values Based on Average Score

Infers (Refer Factor analysis Chart V) that the six most important salience distinct values of BP in the perception of practitioners are:

1. Captive Audience
2. Clutter Free
3. Celebrity Cost Advantage
4. Cost Effective
5. Shelf Life
6. Brand Recall, Brand Recognition & beyond.

By Factor Analysis: Through SPSS, using the Principal Component analysis, four components were extracted accounting for maximum variance of 76.583%. Fixing the factor score as minimum of 0.5 the summary component matrix was evolved as follows:

<i>Component 1 Variance 35%</i>	<i>Component 2 Variance 20%</i>	<i>Component 3 Variance 12%</i>	<i>Component 4 Variance 9%</i>
<i>Multiple Positioning & Usage Opportunities 0.752</i>	<i>Cost Effective 0.684</i>	<i>Celebrity Cost Advantage 0.584</i>	<i>Celebrity Value 0.492</i>
<i>Shelf Life 0.717</i>	<i>Clutter Free 0.569</i>	<i>Audience Connect 0.557</i>	<i>Promotion of Brand Value & Properties 0.482</i>
<i>Brand Recall, Brand Positioning & Beyond 0.680</i>	<i>Captive Audience 0.537</i>		
<i>Credibility 0.659</i>			
<i>Variance 35%</i>	<i>20%</i>	<i>12%</i>	<i>9%</i>
<i>The two items in component 4 are included even though the items have a score of less than 0.5, because they are leading in component four.</i>			

Chart V – Summary Component Matrix

The four “C”s Captive Audience, Clutter Free, Celebrity Cost Advantage and Cost Effective enjoys both high average scoring and also relatively less variance demonstrating high conviction and consensus.

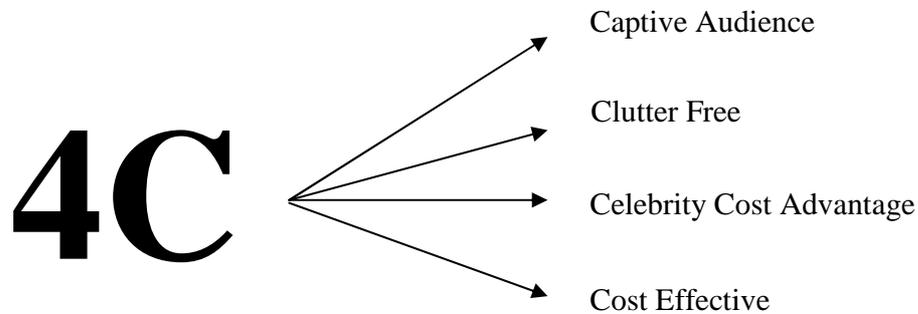

Chart VI - The 4 'C's of BP

Classified placement of brand identities in content into **two intensities** of inclusion namely

Silent Visual Placement

Interactive Inclusion

1. In the Silent Visual Placement the most dominant device to place a brand was “outdoor signage and POP”. Surprisingly “silent display of product” and “package and label” emerged as the least frequently used device. “Logos & Symbols” was found to be a distant no.2 in usage frequency.

Silent visual placement

Frequency of usage of silent visual placement in 100 Brand Placements

	1.1	1.2	1.3	1.4	Total
Frequency	13	19	13	40	85
%	15.3	22.4	15.3	47	100

1.1	Silent display of product
1.2	Logos & Symbols
1.3	Package and Label
1.4	Outdoor/Signage/POP

Chart VII – Table 1, Intensity Analysis

2. Identified interactive inclusion as the most popular intensity type of BP. In interactive inclusion, using **combinations** of its devices was seen as a dominant practice.

In the interactive visual placement “usage situation” was found to be the most dominant (53%) followed by “product/logo/symbol pointed at, product touched or offered by character”. “Brand name on body or accessories of character was third popular pattern and “product

demonstration” route to BP was the least popular. In 100 BP studied, 32 have been in combinations of various ways of using interactive visual placement. Combining “product usage” situation with the device of “product logo/symbol/pointed at, product touched or offered by character” is the most popular pattern. Combination of “usage situation” and ‘brand name on body or accessories of characters’ is the second most popular pattern. “Product usage” emerged as the most popular device for interactive visual placement and served as an anchor for combinations within.

Identified linkage between 4 dominant product categories and BP

- a) Food & Beverage

- b) Fashion
 - c) Media & Entertainment
 - d) Automobile & Two wheelers
6. Found that five brands were placed per movie.
 7. **Proposes** a new definition

This study revealed new perspectives and new elements that encapsulate the concept of BP:

1. Innovation in marketing communication with Distinct Values
2. Audience Driven strategic communication process with choices of intensities and management through frequency and duration.
3. Outcome: Brand Recall, Brand Recognition, Promotion of Brand Value and Brand Property and Audience Connect.

<i>Formation of definition: 2 Intensities, 4 Superstructures and Outcome</i>		
<i>New Perspective: BP is an Innovation in marketing communication. BP is an Audience driven strategic communication process.</i>		
<i>Intensities of inclusion</i>	<i>Super Structures</i>	<i>Outcome</i>
<ol style="list-style-type: none"> 1. Visible Placement 2. Interactive Inclusion 	<ol style="list-style-type: none"> 1. Content 2. Media 4. Stakeholders 3. Distinct Values 	<i>Brand Outcome & Professional goals</i>

PROPOSED DEFINITION:

Brand Placement, an innovation in marketing communication with distinct values, is the paid inclusion of communicative brand identities, via management of intensities, in creative content of any media and is an audience driven strategic communication process, managed by stakeholders for an outcome.

Interplay of Communicative Identities in Creative Content

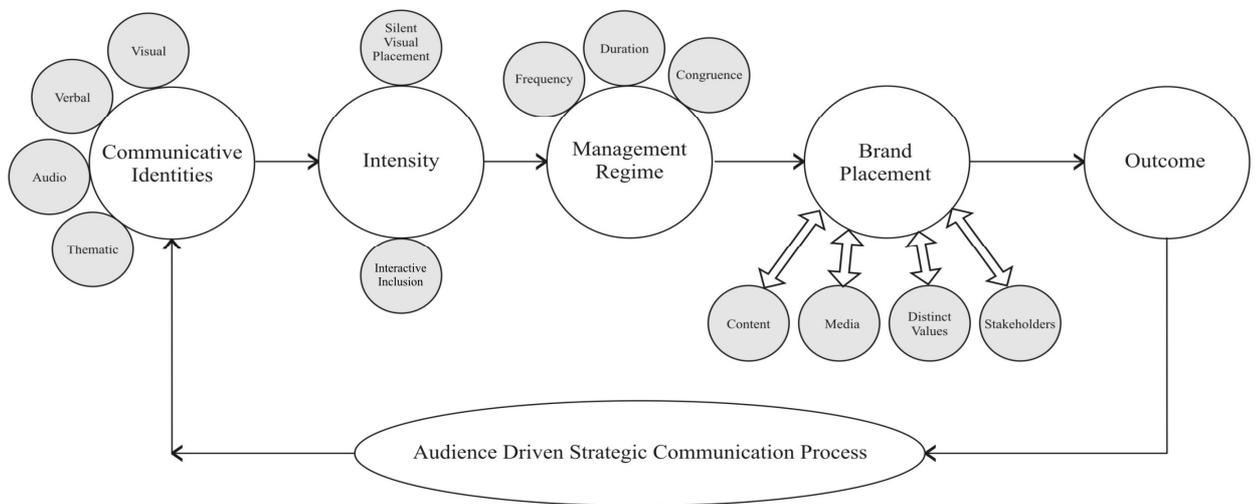

Chart VIII - Concept Chart

DISCUSSION

This model encapsulates the concept of BP and its process. Understanding the DNA of BP is to understand firstly the two perspectives that BP is an innovation in marketing communication and that it is an audience driven strategic communication process. BP is an Innovation because the brand is in content and not in an ad capsule appearing in the ad breaks. It has distinct values.

The process of BP begins with setting up of professional goals and an understanding and selection of Communicative Identities whether Visual, Verbal, Audio or Thematic. At the second stage one makes a choice of the Silent Visual Placement or Interactive Visual Placement. The placement of brand message in content is done through a strategic management process. The choice of intensities and the management of intensities through frequency and duration, the choice of context, characters and celebrities and the choice of media for brand congruency makes it an audience driven strategic communication process.

Secondly, there are 4 superstructures namely Content, Media, Distinct Values and Stakeholders on which the concept of BP rests. Thirdly BP is a professional practice with professional goals and has outcome. The Outcome of a BP exercise is assessed, discussed and the learning is used in reformulating the strategy beginning with the objectives, selection of the

communicative identities and brand messages. The four superstructures that encapsulate the concept and principles of BP are discussed here in detail.

CONTENT

BP is brand in content, entertaining or informative. It's the first requirement for BP and is the system in which it is included. Entertainment contents like Movie, TV programmes, Video Games and Music Albums are contents that attract BP.

The content can be compelling if the story line is richer in entertainment. If the content is richer with personalities, situations, contexts, celebrities, reflecting the society both real and aspirational, it will attract BP. The situations in content, movies, soaps or infotainment, offer positioning contexts. These contexts enable execution of brand differentiation. In a conventional advertising format an advertising specialist will be otherwise crafting the product context. Globally, soaps are media vehicles of choice of a majority of viewing audiences wherever they are aired (Allen 1995) and depict reality through the lens of the particular culture where it is produced and consumed. "Soaps have a common feature – product placements in consumption scenarios. The placement also reflect the economic realities of production, the society in which characters and consumers live and the nature of the products shown."

The entertainment plots also present a number of personalities like traditional or modern, ambitious, educated, leaders in village or metros, society or industry, extrovert or introvert, simple or show off and product usage situation like kitchen, home, outdoor, party, marriage, picnic, travel, hangout, college, hospital and others. Such opportunities provide scope for a personality fit between brand and content. **Contexts give congruence of brand positioning and viewers. BP being an audience driven communication process examines the context fit, character fit and celebrity fit to ensure congruence.**

In the information content how ever the audience can also be active and interactive. "Participatory media" or "citizen media" (Economist 2006) has revolutionized the content creation and the audiences are no more just the receivers of messages but also the creators of their own content with pictures, video, text and audio.

The emergence of "The new interactive paradigm of content creation enables **audiences to be both creators and receivers of content** at the same time, leaving out the exclusivity of content creation from conventional media firms and marketers (Jerry Kliatchko, 2008). Thus the audience has evolved into a stakeholder and plays a role in the content creation and consumption.

MEDIA

The media channels with good reach are likely to be the chosen media for BP practice. Movies, TVs, Radio, Internet, Video Games, Music Album Seminars and Fiction are potential media for BP due to rich entertainment and informative content and media consumption habits. Fragmentation of channels, simultaneous media exposure and usage, and altered media consumption habits of audience (Schultz et al 2005) offer new challenges and opportunities to BP. The media exposure and usage habits of audiences may either come in the form of "**foreground**" media (the main medium at any given time) or "**background Media**" (secondary

medium) used. Being audience driven strategic communication process BP may be more frequent in the foreground media like Movies, TV programmes. Media is a reach enhancer for BP.

STAKEHOLDERS

The **interaction network** of BP will include the (1) Creative industry – Production House, Celebrities, Directors of movies, (2) Brand Owners - Advertiser, Agency, (3) Audience and Consumers and (4) Government. The objective of their interaction is to meet their **professional goals, accountability and responsibility** for their roles and jointly upholding of **moral and ethical standards** of brand inclusion. The stake holders are the drivers of the concept and also have the responsibility to uphold the dignity and respect of the viewers and consumers at all times and they have to be sensitive to the moral issues that surround their practice. This demands the use of persuasive means of communication that are respectful, and shunning all forms of manipulation, exploitation and corruption at all costs (Pontifical Council for Social Communications on Ethics in Advertising 1997).

DISTINCT VALUES

The distinct values are the unique merits of brand placement that characterizes it as an innovation. Distinct values have the power potential to disrupt and substitute partly or fully. This paper identified 11 such disruptive values of BP:

1. Captive Audience: In BP brand message is consumed with the programme. The ad cannot be avoided. In conventional advertising ad appears in the ad breaks. Hence the viewers rating points for the programme need not be equal that of advertising due to ad avoidance. In other words the programme reach can be equal to the reach of brand message.
2. Clutter Free: When brand is in content, there is no interruption or irritation due to ad breaks. The brand enjoys a 'solus' advantage and doesn't have to compete for noticeability, work hard for cutting through clutter and rise above the noise level of competition.
3. Celebrity Cost Advantage: Celebrity advertising is increasingly practiced for cutting through clutter, noticeability and favorable perception. The celebrities charge a hefty fee to do endorsement ads. In brand placement since the advertiser is paying for the brand in content, even though the celebrity may be interacting with the brand, the costs may be lower in comparison.
4. Shelf Life: The entertainment products have a shelf life. They can be repeat viewed. A movie can come on TV or one can watch a DVD. While you pay for an ad insertion every time.
5. Cost Effective: This pertains to the cost of brand placement Vs the cost of production of TV commercial and release cost in TV.

6. Brand Recall, Brand Recognition and beyond: A perception that BP can deliver more than just Brand Recall and Recognition.
7. Audience Connect: BP has the power-potential to connect because of Celebrities Contexts and Consumption habit
8. Multiple Positioning and Usage Opportunities: Entertainment products like movies and TV programmes and also offer multiple contexts and situations, multiple characters, multiple celebrities offer a number of opportunities to position a brand or bridge the gap between intended brand positioning and market positioning. BP also gives a number of usage situations for products.
9. Credibility: The credibility of the message is multiplied by the credibility of the characters, programme and that of the celebrity. While viewers know an ad and that its purpose is to sell. The realism in BP contexts enhances the credibility.
10. Celebrity Value: In BP the star and super star value of the Celebrity works in favour of the brand. When the brand is interacting with the main character the brand value is enhanced.
11. Promotion of Brand Values and Brand Properties: BP is a compatible medium where one can promote brand values and brand properties.

OUTCOME

BP as a professional practice will be expected to perform in the area of brand recall, brand recognition, positioning opportunities, usage situation and behavioural changes. Reach and Connect will demand outcome metrics that can be practice. The process of growth of BP will be defined by the achievement of pre set objectives and audience acceptance of the content. Given the fact that celebrities promote the brand in entertainment content the potential for audience-connect-persuasion exists.

ORIGINALITY VALUE

1. Indian Entertainment and Information industry is one of the largest in the world. There is a growing usage of BP. But very little research is done on this nascent subject. This paper will give both the practitioners and the academia a comprehensive understanding of BP.
2. An understanding of Intensities and its management, distinct values and disruptive qualities, importance of contexts, celebrities, characters and congruence, and the possible out come of brand recall, brand recognition and audience connect will enable the practitioners to take a well informed decision.
3. The creative industry now has with it, the practitioners' perspective on the distinct values and 4 Cs and will be effectively able to position BP against other options of marketing communication and promote it.
4. Practitioners also will know that they have to build consensus in the areas of Principal components with high variation like multiple positioning and usage

opportunities, shelf life, brand recall, recognition & beyond, and credibility, in order to ensure that BP is practiced extensively in the future.

5. This along with the new model of BP gives researchers new areas to work on.

THE MIDDLE EAST PEACE PROCESS AND THE ISRAELI SHEKEL, 1999:2008

Schein, Andrew¹

¹*Netanya Academic College*

Keywords: exchange rates, news, peace process, interest rates, Oslo peace index

INTRODUCTION

On September 13, 1993, Israel and the PLO signed a Declaration of Principles based discussions that had begun in Oslo, and this signaled the beginning of the peace process between Israel and the Palestinians. Initially, there were great hopes that a final agreement would be concluded relatively quickly, but this has not yet occurred. Instead, the peace process has experienced an almost continuous series of ebbs and flows from 1993 until the present.

A peace agreement is expected to generate a peace dividend that there would be greater foreign investment, tourism, a substitution of military spending for more productive spending, greater regional trade and a general increase in consumer confidence in the region.²²⁹ This peace dividend should also lead to an appreciation of the Israeli shekel due to the greater demand for the currency. The peace dividend can be partially realized even before a final agreement if there are expectations for peace. Accordingly, one would expect the Israel shekel to appreciate if there are increases in expectations for peace between Israel and the Palestinians, and decrease if expectations for peace declined.

This paper will test the hypothesis that changes in expectations for peace between Israel and the Palestinians influence the value of the Israeli shekel. We incorporate a monthly survey of expectations regarding the peace process in Israel in a regression analysis of the changes in the value of the Israeli shekel, and we find that increase in expectations for peace lead to an appreciation of the Israeli shekel.

Our result accords with several findings of the importance of news, and specifically non-economic news, on the foreign exchange market. Blomberg and Hess (1997) found a connection between political ratings and the value of the US dollar, and that a political model of exchange rates outperforms random walk models of the exchange rate. Kauffman and Weerapana (2006, p.366) have shown "that 'bad' news about AIDS has a detrimental impact on the value of the South African Rand." Zussman, Zussman and Nielsen (2008) in a study of the foreign exchange market from 2000-2005 have found that several turning points in the value of the Israeli shekel during the period were associated with both positive and negative changes in the peace process.

Other studies have found a relationship between the Middle East peace process and other economic and financial variables. Schein (2003) in a study of the period 1994-2001 found a positive relationship between expectations for peace in the Israel and Israel's GDP. Eckstein and

²²⁹ See Ben Bassat (2002) pp.33,34.

Tsiddon (2004) in a study of the period 1980-2003 found that high level of terrorism decreased per capita consumption in Israel. Levy (2009) in a study of the period 1994-2007 found a positive relationship between expectations for peace in Israel and stock returns in the Israeli and Palestinian stock markets.

The remainder of the paper is as follows. We begin with a brief review of the peace process, the movement of the shekel, inflation and interest rates in Israel for the period 1999-2008. Afterwards we will explain the variables in the regression, and then present the regression results. The paper concludes with a discussion of the significance of the results.

REVIEW OF THE PEACE PROCESS, INTEREST RATES, EXCHANGE RATE REGIMES AND EXCHANGE RATES IN ISRAEL 1994-2008

After the signing of the Declaration of Principles in 1993, in July 1994, Israel ceded control of most of Gaza to the Palestinians, and in September 1995, an interim agreement (Oslo II) was signed. In 1996, there was a wave of terrorism in Israel, a "right-wing" government was established in Israel, and progress on the peace process stalled. In May 1999, Ehud Barak was elected Prime Minister of Israel, and immediately set about to complete the peace process. However, negotiations in Camp David in July 2000 failed, and in October 2000, the second *intifada* erupted. The *intifada* peaked in its intensity in the beginning of 2002, and slowly died down after Operation Defense Shield that began on March 29, 2002. In 2001, 207 Israelis were killed, in 2002, 452 Israelis were killed, in 2003 214 Israelis were killed and in 2004 107 Israelis were killed due to terrorism.²³⁰ In 2005, Israel unilaterally disengaged from Gaza removing all Israeli citizens and the Israeli army from Gaza. In January 2006, Hamas won the Palestinian parliamentary elections and in June 2007, Hamas wrested all control of Gaza from its political rival Fatah. During this period, there were numerous rocket attacks on Israel rising to 1,750 rockets and 1,528 mortar bombs fired from Gaza into Southern Israel in 2008,²³¹ and on December 27, 2008 Israel attacked Hamas for three weeks.

During this period from 1994-2008, there was a change in the trend rate of Israel's inflation.²³² In 1994, Israel's yearly inflation rate was 14.45%, and from 1994-1998, the average yearly inflation rate was 9.75%. However, in 1999, the inflation rate declined to 1.34%, in 2000 there as zero inflation, and in 2001, the inflation rate was 1.41%. In 2002, the rate jumped to 6.5%, but then there was 1.89% deflation in 2003. In the ensuing years, 2004-2008, the average inflation rate was 2.14% with the highest level being 3.8% in 2008. This change in the trend rate means that starting from 1999 Israel's inflation rate was comparable to inflation rates in the developed world, while previously Israel had been a high inflation country.

²³⁰ Data from www.mfa.gov.il, the website of Israel's foreign ministry.

²³¹ Data from www.mfa.gov.il.

²³² Information concerning Israel's rate, exchange rates inflation and interest rates of the Bank of Israel are available from the Bank of Israel's website, www.boi.gov.il.

The change in the inflation rate was due to the contractionary monetary policy of the Bank of Israel. In 2004, the Bank of Israel raised its interest rates from 10.5% in the beginning of the year to 17% by the end of the year. In 1995, 1996, the Bank slightly lowered its interest rate but then raised it back again to 17% in July 1996. From July 1996 to August 1998, the bank lowered its rate very slowly to 9.5% but then after the Russian debt crises in August 1998 and the collapse of LTCM in September 1998, the bank raised its rates 400 basis points to 13.5%. Afterwards the bank again began to lower its rates slowly, reaching a rate of 3.8% in January 2002. With the rise in inflation in 2002, the bank sharply raised its interest rate to 9.1% in July 2002, and then as inflation subsided, the bank slowly lowered the rate to 4.1% in April 2004. From April 2004 through September 2004, the interest rate fluctuated between 5.5% and 3.5%, and after the Lehman Brothers fallout, the bank lowered its rate to 2.5% in December 2008.

In addition, the Bank of Israel also changed its exchange rate policies several times during the period 1994-2008.²³³ In 1991, Israel adopted a diagonal upward sloping trading band, which allowed the shekel to depreciate at a regular rate. With this regime and its high interest rates, the bank regularly intervened in the market in order to keep the exchange rate near the midpoint of the band. In June 1997, the bank widened the trading band, and then with the exception of several days in January 2008, the bank stopped intervening in the market. In addition, the band was continuously widened and in 2003, the upper limit was 70 percent above the lower limit. In June 2005, Israel officially abolished its trading band and the shekel was allowed to float freely, though this had already been the effective reality since 1998. In March 2008 the Bank of Israel began again to intervene on a daily basis by selling shekels and buying dollars and this policy continued until August 2009.

Concurrent with these changes in inflation and Bank of Israel's exchange rate regimes, the shekel has also had various changes from 1994-2008. In Israel, the most important exchange rate is the shekel (ILS) with regard to the US dollar, as numerous contracts in Israel are denominated in dollars due to the history of very high inflation in the 1970s and 1980s. Every business day, the bank of Israel announces the representative USD/ILS exchange rate, and this determines how many shekels a person is obligated to pay according to the contract. On January 3, 1994, the exchange rate was 2.98 USD/ILS, and from 1994 -1998, the shekel depreciated every year, 1.07% in 1994, 3.88% in 1995, 3,7% in 1996, the shekel depreciated another 8.77 in 1997 and 17.65% in 1998. This trend of yearly depreciations corresponds to the relatively high inflation of the period. With the change in the trend of the inflation rate, the trend rate of the shekel also changed. In 1999, the shekel appreciated slightly, 0.17%, and again in 2000 the shekel appreciated 2.7%. In 2001 and 2002, the shekel resumed its rate of depreciation declining respectively, 9.28% and 7.27%. However, from 2003-2008, with the exception of 2005 when it depreciated by 6.85%, the shekel appreciated all the other years, on average 5.5%, ending on last day of trading in 2008 at the rate of 3.80 USD/ILS. Overall the shekel appreciated 9% from its value on the last day of 2008 in comparison to its value at the end of the year in 1998.

With this brief review of the peace process, inflation, interest rates, exchange rate regimes and the value of the shekel from 1994-2008, we can proceed to the regression.

²³³ This review until 2003 is based on Elyakam (2003).

ECONOMETRIC TEST

The hypothesis that we are testing is whether the changes in the peace process impact on the value of the shekel. More specifically, as discussed in the introduction, we expect that there when there are an increase in expectations for peace, the shekel will appreciate, while when expectation for peace decline, the shekel will depreciate.

The test is for the period 1999 through February 2008. The starting date is because, as mentioned above, starting from 1999 inflation in Israel was similar to levels in the developed world and from 1999 onwards the inflation rate was no longer the significant factor in determining the short run nominal exchange rate in Israel. The ending date was because in March 2009, the Bank of Israel began to intervene on a daily basis in the foreign exchange market, and hence in the period under study there was no direct intervention by the Bank of Israel in the foreign exchange market.

The independent variable is the percentage change in the end of month shekel dollar exchange rate, s , as stated by the Bank of Israel when it announces the representative exchange rate on the last day in the month when the foreign exchange market is open. The dependent variables are the percentage change in the Oslo peace index, (Oslo), the spread between US and Israel's interest rates (spread) and the percentage change in the number of incoming tourists to Israel (tourists).

The Oslo peace index is calculated every month by the Tami Steinmetz Center for Peace Research of Tel Aviv University. The index is based on a monthly survey at the end of the month of 500-600 people in Israel about their views concerning the peace process. In the 1999, the index was at its highest level in our study, at 52.3 in January 1999 and rising to 56.8 in April 1999. Its lowest value was in May 2002 at 29.1, and on February 2008, the last date in our study its value was 30.1. Overall the average value of the index for the period was 38.25.

The surveys were conducted every month except for two months, July and August 2006 during the war between Israel and Lebanon. In order to solve this problem of missing data, we smoothed the data for these months based on the values prior and after the gap. Accordingly, as in June 2006, the value of the index was 33.6 and in September the value of the index was 33, we used a value of 33.4 in July and 33.2 in August. The data for the Oslo index is available at the website of the Tami Steinmetz center, www.tau.ac.il/peace.

The second dependent variable was the spread between the Bank of Israel's interest rate and the Federal Funds rate. This variable tests the theory of uncovered interest rate parity that the interest rate differential between deposits in two different countries forecast changes in the corresponding currencies that will offset the interest rate differential. For example, if shekel denominated interest rates are higher than dollar denominated interest rates, then one would expect the shekel to depreciate with respect to the dollar in order to equalize returns from holding either shekels or dollars. Yet, studies show that the currency with the higher interest rate tends to appreciate, contradicting the theory of uncovered interest rate parity.²³⁴ This data is available at the website of the Federal Reserve and the Bank of Israel.

²³⁴ For surveys of this literature see Froot and Thaler (1990), Engel (1996) and Lewis (1989, 1995).

The test was also run with just the Bank of Israel's interest rate (BOI) as the dependent variable. Kahn, Kandel and Sarig (2002, p.1517) found that "a monetary shock, which is defined as change of 1.05% of the Bank of Israel's interest rates, causes a 0.1 percentage point change in the exchange rate of the shekel." However, Zussman, Zussman and Nielsen (2008) found that when the Bank of Israel reduced its interest rate from 5.8% to 3.8% (a fall of 34%) in December 2001, the largest reduction during the period, this did not cause a turning point in the value of the shekel.

The third variable was the percentage change in the number of incoming tourists. This value was calculated as the percentage change year over year per month. For example, the data for January 2002 was the percentage change in the number of tourists in January 2000 with respect to the number of tourists in January 1999. This variable was included in an attempt to capture foreign expectations for peace. The rationale is that when foreign expectations for peace are higher then more tourists will come to Israel. For example, when the second *intifada* began in the fourth quarter of 2000, there was a 44% decline in the number of incoming tourists. Schein (2003) found that this variable had a significant effect on Israel's GDP. Eckstein and Tsiddon (2004, p.994) write, "the elasticity of foreign visits to Israel with respect to threat of terror or war seems to be so high that no regression is needed to verify it." Yet, the question remains whether this variable can help explain movement in the value of the shekel?

The estimated regression equations are:

$$(1) s_t = \alpha + \beta_1(\text{Oslo}_t) + \beta_2(\text{spread}_t) + \beta_3(\text{tourists}_t) + \varepsilon_t$$

$$(2) s_t = \alpha + \beta_1(\text{Oslo}_t) + \beta_2(\text{BOI}_t) + \beta_3(\text{tourists}_t) + \varepsilon_t$$

The regression results are:

<i>Dependent variable:</i> <i>spot exchange rate</i>	<i>R Squared: 0.068</i>	<i>Adjusted R Squared: 0.042</i>

Table 2. Regression Results: Equation Two

REGRESSION RESULTS

The results from the regression are nearly identical. One, in both regressions, the coefficient for the Oslo index had both the correct sign and was significant at a 97% percent confidence level. The negative sign means that as expectations for peace increase, the shekel dollar exchange rate falls, which is an appreciation of the shekel. On the other hand, the second variable which measured foreign expectations for peace, the percentage change in the number of incoming tourists, had the correct sign, but was not significant at a 10 percent significance level. This lack of significance might be because the change in incoming tourists while relatively quick in the goods market still occurs with a lag in the foreign exchange market. In any event, the results for the Oslo index demonstrate that expectations for peace have a significant impact on the value of the shekel.

On the other hand, the regression results show that changes in the interest rates do not have a significant impact on the value of the shekel. In the first equation, the coefficient on the spread between Israeli and US interest rates not only had the wrong sign but was insignificant. This result would be another rejection of the theory of uncovered interest rate parity. In the second regression the sign of the coefficient on the parameter BOI is negative which implies that an increase in the Bank of Israel's interest rates causes an appreciation of the shekel but again the coefficient is insignificant.

The results again highlight the importance of incorporating non-economic news into forecasts of the exchange rates. Of course it is tricky to predict these events and for each country one would have to investigate what particular news impacts on the exchange rates, as clearly not all news have an impact. In many cases, the news would be specific to the particular country, as for example the peace process in Israel, the peace process, and the spread of AIDS in South Africa. Thus, this forecasting would need to go beyond the usual macroeconomic factors that are relevant to all countries and to incorporate country specific non-economic factors that impact on the exchange rate.

In addition to helping with forecasting, the results also suggest a new perspective on understanding the "crisis" of the Israeli economy in the first half of 2002, see Table 3.²³⁵ The crisis was that there was a depreciation of the shekel from 4.233 shekels/ dollar in the end of November 2001 to 4.893 in the end of April and 4.916 in the end of May. In June, it appeared that the shekel was on the verge of passing the threshold level of five shekels/\$ and in response the Bank of Israel raised its interest rates to 7.1 percent in the middle of June and then to 9.1 percent in July. These interest rate hikes appear to have caused the shekel to appreciate, as at the end of June the shekel/\$ rate was 4.769 and by the end of July the rate had dropped further to 4.689. Also, the shekel began to fall in the end of December when the Bank of Israel lowered its interest rate by 2% to 3.8%. However, as noted above, Zussman, Zussman and Nilesen did not find that the reduction in interest rates was not associated with a turning point in the value of the shekel and this corresponds with the results here that the interest rates did not significantly impact on the value of the shekel.

²³⁵ See discussion in *Bank of Israel, Recent Developments, August 5, 2002* and a brief recollection of the crises in newspaper article by Nehemia Shtrasler, *Haaretz, April 14, 2007*.

The explanation for the crises from the regression results here is that the initial fall of the shekel was due to a lowering of expectations for peace in December 2001 and January 2002. In April when the shekel lost almost 5 percent of its value, the biggest one month reduction for the period, there was a 20 percent decline in expectations for peace. This trend from April continued in May, as Oslo peace index fell to its lowest level, 29.1. In June through August there was a reversal of the trend, as expectations for peace rose 15 percent, with the index rising to 33.5 in August. If this explanation is correct, then the shekel would have strengthened without the increase interest rates, and the Bank of Israel might have over-reacted by raising interest rates which most likely exacerbated the recession that was occurring at that time.

A third implication of the results here is that paradoxically if positive developments in the peace process lead to an appreciation of the shekel, then this appreciation might temper some of the peace dividend that is predicted in the event of a final agreement. A strong shekel could cause Israeli exports to decline and might reduce the amount of tourists and foreign investors. Yet, this effect would only reduce the peace dividend, but still overall one would expect a peace agreement to not only save lives but also to increase the GDP of all the countries in the region.

<i>Month</i>	<i>End of month spot rate</i>	<i>Interest rate of Bank of Israel</i>	<i>Interest rate spread (basis points)</i>	<i>Expectations for peace</i>

This paper explores some of the key factors that determine the wine decision making process and explores the personal values and emotions of the Portuguese wine consumers. In addition, reports the results of the personal value based consumer segmentation. The empirical insights of this exploratory research suggest (1) the structure of perceived attributes and motivations that shape different degrees of involvement, (2) the interaction between different situations of wine use with different price bands, (3) the psychological dimensions that the consumer projects, recognizes and uses on wine purchase decisions. The findings of this study suggest that Portuguese wine consumer use a small range of buying decision intrinsic/extrinsic factors. The product information gap demands Portuguese wineries to improve value perceptions and wine usages.

Main aim, findings and conclusions of this research- The aim of the paper is to provide an overview about key factors that determine the wine decision making process and explores the personal values and emotions of the Portuguese wine consumers. The results enable the essential features of a consumer profile of purchase and consumption with respect to the structure of attributes - intrinsic and extrinsic - that Portuguese wine consumers best recognize and value in determining its quality; the motivational structures that encourage and guide them in their wine decision-making process; the interaction between different situations of consumption and different price bands. These findings led us to the following conclusions about the Portuguese wine industry profile: (1) must to adjust to huge competitive marketplace because it is still production and sales-based; (2) more market oriented.

Keywords: Anthropomorphic Perception; Involvement; Perceived quality; Price by usage situations;

INTRODUCTION

Wine is Portugal's most important agricultural export with still wine representing 0.6% of all exported products and services. Wine companies have been working against a downward trend in the volume and value of wine consumed in Portugal, which have been annually contracting in real terms by -2.0% and -1.6% respectively over the last decade. Portuguese winemakers still focused on the short-term opportunity in the domestic market. There are few 'brand leaders' that gain a reputation for excellence in export markets and simplify Portuguese wines for a potential consumer (Monitor Group, 2003).

There is still a considerable lack of knowledge in Portugal concerning wine consumers attitudes, perceptions and behavior. Hence, our main objective has been to obtain structured and generalisable information to clarify the perceptions, expectations and motivations that Portuguese consumers place on the essential dimensions and attributes when purchasing and

consuming still wine. Moreover, the results obtained from the heads of major companies in the sector by means of interviews suggest that their orientation to the dominant product and its distribution is subtly related to, or absent from the necessary guidance of the market.

REVISION LITERATURE

The traditional theory of wine marketing defines this product as a set of attributes that attempt to meet the needs of its consumers (Spawton, 1991). Furthermore, the dynamics of the market changed the behavior of consumers. This had a significant impact on the discourse of new consumers as quality has been increasingly assumed to be a multidimensional concept. Quester and Smart (1998) suggest that quality is a characteristic of the wine that is both difficult to define and to communicate. The level of quality required may vary upon a variety of circumstances including the consumption occasion. The quality of wine, however, is difficult to evaluate objectively or precisely measured (Oczkowski, 2001).

The complexity and perceived risk associated with the decision to purchase and consume wine justifies the concept of perceived total quality: the intrinsic and extrinsic attributes, and the extent to which these are recognized as causes of value. Lockshin & Rhodus (1993) found that quality perceptions of wine were based on *intrinsic cues*, such as grape variety, alcohol content and wine style, which relate to the product itself and the processing method as well as on *extrinsic cues*, including price, packaging, labeling and brand name, which can be altered without actually changing the product. In spite, Gluckman (1990) postulates that consumers do not have a clear understanding of branding in the wine market, while Lockshin, Rasmussen & Cleary (2000) highlights the fact that brand name acts a surrogate for a number of attributes including quality and acts as a short cut, in dealing with risk and providing product cues. When a product has a high proportion of attributes that can only be assessed during consumption (experience attributes) as with wine, then the ability of consumers to assess quality prior to purchase is severely impaired, and consumers will fall back on extrinsic cues in the assessment of quality (Speed 1998; Salaun & Flores, 2001; Antonelli, 2004). Price is an important cue for quality when few other cues are available, when the product cannot be evaluated, or when the perceived risk of making a wrong choice is high (Dodds & Monroe, 1985). According Spawton (1991) in the purchase of wine, price is also used to overcome perceived risk. The wine perceived price-quality relationship (umbra and market potential) enables the reasons for, and magnitude of, the decision to purchase to be determined; by measuring the gap between different price ranges (minimum / maximum) depending on the levels of perceived quality that consumers associate with it; setting up a relevant indicator of potential demand (Keown & Casey, 1995). Recent research by Jarvis, Rungie, & Lockshin, (2003a) shows that consumers seem most loyal to price bands. Furthermore, Hall & Lockshin (1999) found a relationship between price and the situation where the consumer intends to drink the wine. These 'attributes' are related in consumer's minds to the "consequences' they produce. The literature review (Aurifeille, Quester, Lockshin, & Spawton, 2002; Lockshin, Quester, & Spawton, 2001; Rodriguez, Blanco, & Fernandez, 2006) further highlights involvement as one of the most important variables of segmentation in wine marketing. In this sense Barber, Ismail & Dodd (2008, pp. 72) consider that "involvement is a goal oriented and emotional state of interest, enthusiasm and excitement consumers exhibit towards a product category, which ultimately influences purchase or consumption of the product". If high involvement wine consumers use complex information

cues to inform their decision-making (Tustin & Lockshin, 2001; Yuan, So, Si & Chakravarty, 2005), wine novices (low involvement) use risk reducing strategies based on choosing known brands, recommendations from friends, advice from sales assistants, low prices, wine packaging, labels, grape varietal, evidence and samples (Barber et al, 2008). Analysis of the perceived structure that consumers place on the product image and brands seeks to identify a reflection of their own identity within them. The use in this paper of a range of anthropomorphic measures supports its aim to identify the psychological dimensions that the customary wine consumer projects and recognizes on the images of the brand(s) in this product group. This combination with other variables allows the design of a profile of segments capable of directly explaining the motivations behind purchasing certain brands and the way in which its products are used.

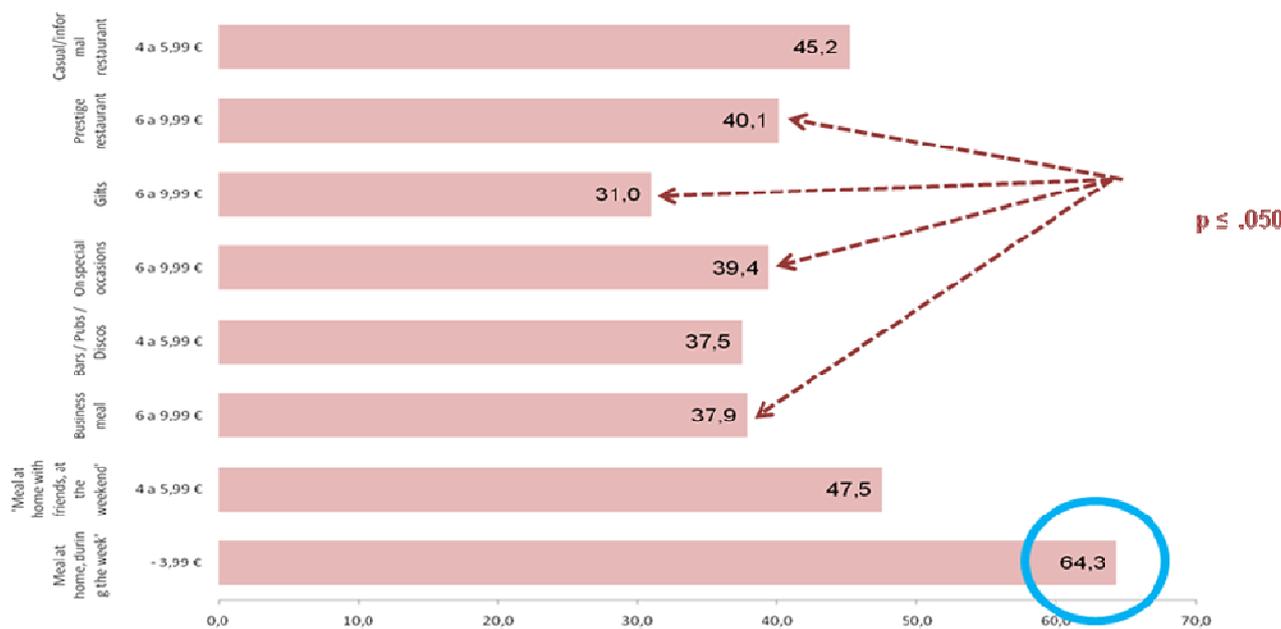

METHODOLOGY

Method of Data Collection - Population: Portuguese (men/women) over 18 to 65+ years old, who drinks wine at least once a month. All profile characteristics are defined as being statistically significant at 95% confidence, unless otherwise stated. The data has been weighted to represent the profile of Portuguese market. A Phone (CAPI) survey (N=2044) was used to assess socio-demographic characteristics, consumer behavior activities (e.g., frequency of use, type of information sources, involvement and perceived quality) and psychographic information (motivations and attitudes). With each question, a respondent profile was created - 1203 valid responses, gathered in September 2008 (95% confidence interval; 2,8% margin of error). The questionnaire used closed-ended and five-point Likert scale responses - demographic and consumption questions, followed 70 attitudinal statements, each question being rated with 5 strongly agree and 1 strongly disagree. Before data collection procedures began, the questionnaire was pilot-tested at local hypermarkets in Porto to assess content validity. All the modifications were made accordingly. Method of Data Analysis - most of the sequence data were subjected to statistical treatments concerning the attitudes and behaviors of the respondents. In a subsequent second phase, the information was further subject to a sequence of multivariate statistical techniques: Exploratory PCA (SPSS, v.17.0) and CFA (EQS, V.6.1), Oneway ANOVA, Cluster analysis and Logistic Regression to describe the perceptually implicit substructures and to clarify theoretically relevant relationships.

RESULTS AND DISCUSSION

For habitual wine consumers the data show that Portuguese men consume still wine more frequently: 45% claim to drink wine daily. The emergence of female consumption is concentrated in a less intense level of wine use: 21% claim to drink wine 2-3 times per month or less. When questioned about the most likely circumstances in which still wine would be consumed, the results of a Oneway ANOVA showed that Portuguese consumers in the age bracket of 45 years or older, drank wine with their daily meals (*at regular meals*) ($F = 7.518, p = 0.000$). If wine consumption *alone without food* is not expressed among Portuguese consumers, its social consumption - *in groups, in special occasions and at restaurant meals* - is an area of growth among the younger age bracket (18-34 years). Globally, Portuguese consumer's decision of buying still wine depends on their latest *consumption experience* ($\bar{x} = 3,97, SD = ,891$), *wanting to drink it with friends* ($\bar{x} = 3,90, SD = ,824$), the *type of food one will eat* ($\bar{x} = 3,87, SD = ,890$) and its

brand being well known and awarded ($\bar{x} = 3,83$, $SD = ,837$). Portuguese wine consumers underline some intrinsic key quality factors like the *harvest year* ($\bar{x} = 4,07$, $SD = ,719$), the *age of the wine* ($\bar{x} = 4,00$, $SD = ,860$), the *color* ($\bar{x} = 3,96$, $SD = ,792$), the *aroma* ($\bar{x} = 3,76$, $SD = ,748$) and *full body* ($\bar{x} = 3,71$, $SD = ,805$). The most valued extrinsic cues are *wine bottle design* ($\bar{x} = 3,79$, $SD = ,882$), *brand awareness* ($\bar{x} = 3,51$, $SD = ,966$) and *the price* ($\bar{x} = 3,50$, $SD = ,835$). In this work, the price is analyzed according to perceived brand/product quality and contextualized by various scenarios in which wine may be used. Graph 1. shows that in situations of wine use with a "meal at home during the week", Portuguese consumers claim to buy bottled still wine from a price range between 2 € - 3.99 €. At the weekend "with friends in bars, pub's and clubs" and from consumption during "informal occasions at restaurants", the value increases up to 4€ - 5.99 €. In the case of wine use for "special occasions", "gifts", "business meals" or when dining in "prestigious restaurants" the price consumers are disposed to pay is positioned in a price band between 6€ - 9.99 €. The results also suggest that the majority of Portuguese consumers are not predisposed to pay more than €10 in any situation of wine consumption. The data indicates that a lack of knowledge concerning strong intrinsic and extrinsic attributes makes it difficult for higher prices to be accepted, blocking the implementation of strategies to differentiate by price. Any improvement, revision and reorientation of the general pricing strategy implies an effort to educate and raise awareness of the qualities and attributes of still wine amongst final consumers, as well as professionals and advisors.

Graph 1 – Price Level by Consumption Occasion

LOGISTIC REGRESSION: BEST PREDICTORS OF WINE INVOLVEMENT LEVELS

Data were analyzed using SPSS V. 17.0 statistical procedures such as descriptive statistics, exploratory factor analysis and logistic regression. The descriptive statistics provide a slight description of the Portuguese wine consumer habits. Exploratory factor analysis and Logistic

Regression were utilized to identify underlying factors set that best discern between Portuguese wine enthusiasts (high involvement) and novices consumers (low involvement).

Portuguese low involved individuals, or wine novices, do not relate to wine as part of their lifestyle and seldom spend much time on reading specialty magazines, lingering in retail stores, talking to sales people or discussing wine with their" friends.

Buying Motivations (Cronbach's Alpha = ,837)		Exp(B)	S.E.	Sig.

Table 1. Variables in the Equation – Binary Logistic Regression

Usually these wine novices simplify their choice by utilizing *price, label design, grape variety, brand, wine menus, restaurant wine stewards* and risk reduction strategies to assist in wine purchase decisions. By contrast, high involvement wine consumers are more inclined to use complex information cues and buy more wine and spend more per bottle. To measure the involvement dimensions – *product involvement, brand involvement and purchase involvement* -, we used the overall mean and distribution derived from data and classified (*tow step cluster analysis*) the respondents into low or high involvement clusters. The overall mean was $\bar{x} = 26.89$ (SD = 4.564) with a Cronbach's Alpha of 0.751, indicating good internal consistency of the items. This dichotomous variable - wine consumer's personal involvement - acted as the dependent variable in 3 separate logistic regression analysis, taking the value 0 when subjects have low level of personal involvement with wine, and 1 when they have high level of personal involvement. The factor scores of wine *buying motivations, intrinsic/extrinsic cues and anthropomorphic wine perceptual structure* acted as the independent variables (*iv*). Of the 1203 respondents, 57,2% were wine enthusiasts and 42,8 % were wine novices. The results of binary logistic regressions suggest that different levels of wine purchase / consumption involvement can be explain by multiple factors – expectations, intrinsic/extrinsic cues and psychological ones. Nevertheless, only 6 of those 16 original motivational describers can discriminate between high/low wine involvement – “feeling enough informed to buy wine”, “the type of food one will eat”, “having visited the DOC Region”, “knowing the DOC Region historical tradition”, “trust on the person who sells it” and “the information on the label” (see Table 1), while only 4 of those original intrinsic perceived quality factor can also discriminate between high/low wine involvement – “wine aroma is diverse and intense”, “the best wine comes from just one grape variety”, “the best wine comes from the grape variety mixture” and “the best wine comes from an excellent grape variety”. Differently, 6 of those 6 original extrinsic cues can discriminate between high/low wine involvement. Portuguese wine novice consumers use brands awareness, labels, price, bottle design, label/back label information to chose, but they claim they need more information. Additionally, analysis of the perceptual structure that consumers place on the product and brand image seeks to find within them the reflection of their own identity. The use in this study of a scale of anthropomorphic perception measure aims to identify the psychological dimensions that the Portuguese consumer recognize and projects on to the brand image(s) of still wine. Despite a general association of various personality traits of Doc Douro, and as shown in Table 1., the results of Binary Logistic Regression by involvement high/low levels show that the degree of involvement with DOC Douro is only determined by the traits *sociable, fun and young*. This positioning may facilitate individual brands' in the adoption of "price premium" strategies, which reinforce among these segments an image of quality and exclusivity to attract younger and more dynamic market segments. Our results suggest that specific consumer knowledge components (*subjective/objective*) lead wine consumers to employ specific expectations, quality perceptions and psychological traits on their buying decision making process.

LIMITATIONS

Instead this ongoing research focus on the Portuguese consumer's involvement with wine, the results of this study can't be generalized. Next step research must be amplified to multicultural/multimarket to capture different knowledge structures and win involvement framework.

MARKETING STRATEGIES FOR THE ECONOMIC CRISIS

Shuv-Ami, Avichai¹

¹*The Business School of the College of Management, 7 Yizhak Rabin Blvd. Rishon Lezion 75190 ISRAEL*

This paper examines ten different marketing strategies that may help businesses cope with the current economic and financial crisis. The suggested strategies are based on three basic principles: they do not require much capital, they cater toward the needs of the supply chain and they build the reputation of the brand. These ten strategies include: increasing supply chain confidence; plan flexibly for changing needs; use the marketing budget wisely, understand customers and re-segment the market; implement data base marketing to increase share of customer and market share; build brand value; improve marketing relationships and human interaction; re-evaluate product offerings and revenue management; develop better pricing strategies and use efficient marketing communication.

INTRODUCTION

“According to the head of the International Monetary Fund, the world currently faces its worst economic crisis in 70 years” (Macleod 2009). Richard L. Clarke (2008, p. 176) described the current financial crisis as “unsettled, challenging, and often harsh and unpleasant”. Most financial analysts suggest that this crisis is far from ending.

As credit dries up, many businesses and individuals have been caught with a cash flow problem and devaluated assets that are hard to sell. To cope, businesses are reducing marketing costs, especially advertising. While some businesses may need to cut costs, the current crisis also offers opportunities to improve marketing performance (Matei, Matei and Dinu 2009). As Hudak notes (2009, p. 3) “wise companies view a recession as an opportunity to gain an advantage over weaker competitors who remain on the sidelines waiting for the recession to end”.

All the strategies below are based on three basic principles: they do not require much capital; they cater toward the needs of the supply chain; and they are focused on building brand reputation.

TEN MARKETING STRATEGIES

The strategies suggested below may fit both end users (Business to Consumer - B to C) and business clients (Business to Business - B to B).

Be confident

Panic never helps the marketer in the marketplace; indeed, the opposite is true. Confidence conveys to customers that the business has plans, that it is stable and can be trusted. In times of crisis, consumers are looking for someone to rely on. A good supplier (B to B and B to C) provides customers with confidence. In order to create confidence, a business must plan flexibly,

changing offerings in accordance with the changing needs of customers. Suppliers should invest in their brands and seek to continue to preserve good relationships with customers.

Plan with flexibility

Smith (2008) correctly suggested that “An economic slowdown demands careful planning”. Consumers still buy in a weaker economy, but it depends on their condition and state of mind (see below – segment), their needs and wants, the perception of the brand and product value and their financial constraints. Change and flexibility in our plans are the keys to planning at such times (Court 2009). Thus, planning should be dynamic, careful and flexible. Such flexibility may also prepare businesses for the post-crisis period. For example, Lee, Beamish, Lee and Park (2008) found that in the Asian economic crisis, inflexible management in the home market has had a negative effect on their performance in the export market.

Use your marketing budget wisely

Wise revenue management may help a business survive (Garrow, and Ferguson 2008). Costs that do not build brands or create sales should be reduced. A business should invest in its brand and use creative advertisements but costs for media and raw materials should be cut. Inefficient distributors should be dropped along with less productive personnel and sales staff. Suppliers should be pressed for better prices and businesses should strive to lower their brand's break-even points to new lows.

Understand your customer

In order to successfully weather this economic crisis, businesses should better understand the “recession psychology” of the market (Quelch and Jocz 2009). It is possible to segment the behavior of end-consumers and business customers based on their reaction to the current crisis or their “state of mind”. There are five possible types of behavior. Those whose financial state has been affected by the current crisis and who are barely making ends meet are the “Survivals”. The “Unaffected” are those who were not affected either financially or emotionally. The “Emotionally Affected” were not affected financially but are worried that they are going to be affected. The “Optimistic” are those that suffer some financial difficulties, but feel that “it is going to be ok” and they can still maintain their current lifestyle. The “Long-term Affected” are those whose current income was not affected but the value of their assets has declined.

The “Survivors” and the “Emotionally Affected” will probably reduce their consumption. The “Not –Affected”, the “Optimistic” and the “Long-Term Affected” are probably not going to change their consumption behavior. While each segment may need some different marketing solutions, all will probably appreciate businesses that help them reduce risks. Cavender and Rein (2009) suggest that in China, consumer optimism (the “Optimistic”), a growing middle class, the superrich (the “Not –Affected” or the “Long-Term Affected”) who are still willing to spend, and government efforts to boost the economy will all contribute to a growing demand for luxury goods.

Quelch and Jocz (2009) suggested another way to segment the market. They offer four segments base on the consumers’ response to the current crisis. The “slam-on-the-brakes”

segment feels most vulnerable and reduces all types of spending. The “pained-but-patient” consumers tend to be optimistic about the future but are now worried and have cut their spending. The “comfortably well-off” segment feels secure about their ability pass this current crisis and they continue to consume but more selectively and less conspicuously. The fourth segment is “live-for-today” and unconcerned about savings.

Use data base marketing

Data base marketing will help a business increase the amount of its product it sells to its customers. Through analyzing relevant data, a business can find its best customers and understand the reasons for their purchasing preferences. Similarly, "look-alike" customers can be found and approached in the same way (Chapman 2009). Once their characteristics have been examined, new products and solutions may be offered that will better satisfy changing needs. This strategy will be more useful for B to B than B to C, unless, the business has inexpensive ways of communicating with end-users such as is the case with credit card companies, banks etc. that communicate with their consumers on a regular basis.

Build the value of your brand

Consumers are buying brands not just products. They are asking themselves “What can this brand do for me? Will others view me using the brand?” Businesses that invest in brand awareness and recognition will gain the most rewards in this crisis. Customers do not stop buying; they only look for the best value for their money. Also, less willing to take risks associated with unknown or new brands, they prefer known and established brands. West (2008) suggested that businesses focusing on bigger brands will gain the most return for their investment.

In contrast to Crane's suggestion to (2008) “Re-brand Yourself” it is not recommended for businesses that have solid reputation to launch a new brand name and logo. It is, however, recommended that businesses renew and update their brand, but with relatively minor changes. Creative marketing communication can be used to make the brand more relevant and exiting.

The importance of the brand reputation in the economical crisis may be seen in Kim, Lado and Torres' (2009) research in the Uruguayan market. Their research shows that compared to the pre-crisis period, during the financial crisis the credence attributes of the brand are more important than the search attributes. They also found that the post-period analysis indicates a reversal and greater importance of the search attributes that were important in the pre-crisis period. These results suggest that the value of the brand is important and strong brands that provide greater credence may survive and even grow during the crisis at the expense of weaker brands.

Improve marketing relationships and human interaction

While marketing relationship is important in normal times it is crucially important during times of crisis (Weiss 2009). Consumers (current clients and prospects), suppliers, employees need support and the human touch in a crisis. Marketing relationships mean continuous communication, contacts, listening and providing support. As noted by Crane (2008) “In

troubled times, you can't have too much communication". All have insatiable appetites for information about how to cope with the crisis, personally and in the marketplace and also what are the prospects for the future. Businesses should partner with suppliers, customers and employees in a variety of ways to get their trust, confidence, cooperation and loyalty. The effort to be invested in such activities should be related to the "life-time value" of the customer/supplier/employee to the business. Relationships at the business level should be planned and managed.

Re-evaluate product offerings and revenue management

Identifying revenue and profitability sources within products lines and businesses may provide an opportunity to increase profit (Garrow and Ferguson 2008). Leveraging such opportunities with additional offerings may increase a business' share of the customer purchase but also the market share. In addition, "back to basic" products and services (Weiss 2009) will fit the needs of the "Survivals" and the "Emotionally Affected" segments which want inexpensive, private brands. In the United States and Europe, private brands are growing and research shows that consumers switch more extensively to store brands during bad economic times and then switch back to national brands in a subsequent recovery (Lamey, Deleersnyder, Dekimpe and Steenkamp 2007). Other may continue to buy the same products but will be happy to get a better price.

Better pricing strategies

Pricing strategies in an economic downturn are different and should deliver value (sometime different values) to different segments of the market (Garrow and Ferguson 2008). Pricing strategies involve the price of the product but also associate costs (like handling, delivery and supplementary products that must be purchased), terms and method of payments. While sales promotion may be good strategy for all segments, the "Survivals", the "Emotionally Affected" may need lower prices and better credit even for somewhat less valued products. Smith (2008) argue that "Convenience, novelty, and indulgence are cut right away. But quality and service are more precious. These are the last things consumers are willing to trade off on to economize". While these may be correct for the "Emotionally Affected" it may not be correct for "Survivals" who now need now inexpensive products with less service and which may be not as convenient to purchase.

Other segments may want to feel that the seller is doing something for them by providing higher value for the same price, supplementary products for a discount or a bigger "package deal" for a better price. Seifert and Seifert (2008) suggested three strategies in extending credit to customers. The first, "Win-win", uses trade credit to broker advantageous capital access to supply chain partners or reduce outstanding days to eliminate unnecessary costs. The second strategy, termed "Followed", offers industry-standard terms to attract customers and uses trade credit to attract additional customers' once sales slowdown. The third strategy, "Squeeze", requires asking customers for direct payment or uses discount schemes to speed up payments and to negotiate long payment delays with suppliers.

Use efficient marketing communication

Hudak (2009) argues that ideally, companies should increase their marketing budgets during an economic downturn to obtain an advantage over their competitors in both brand awareness and market share by expanding, or at least maintaining advertising levels. As suggested before, businesses should cut cost but continue to invest in their brands. Nevertheless, investing in brand awareness and promise require advertising. If a business advertises, proactive ads may derive more benefits and better response than regular ads during times of recession (Srinivasan, Rangaswamy and Lilien 2005).

In crisis times, this investment should be shifted from television ads to more measurable and direct channels (West 2008) such as on-traditional media (Web sites), online social networking and the sales forces (Court 2009) with an emphasis on public relation (Pannunzio 2008) and guerilla marketing.

The Web is powerful and relatively inexpensive marketing tool. It can be very advantageous to marketing efforts in times of crisis in many ways. A **Website** that provides information about the business and its offerings, may sell online. **Search engine optimization** can improve search rankings and generate more site traffic. **Online Research** can be used for regular customer feedback, customer satisfaction surveys, and other marketing research projects. **Online ads** enhance brand awareness, perception and recognition. An interactive ad is a powerful ad that provides "two-way communications". **Blogs** can be used to post product updates, to publish press releases and other information and to answer customer queries and complaints. **Online video and picture libraries** using YouTube.com and Flickr.com are some of many sites that can be used for posting products/projects videos and pictures to promote a business brand.

Public relation using press releases and other activities are more credible than ads. And they get published free of cost. They are the best and most effective way to announce new product launches, business achievements, and other announcements. In recession people tend to stay at home, spend more time watching television, reading newspapers and magazines, and surfing the net. To capitalize on this opportunity, businesses should remain proactive and continue their public relation activities (Pannunzio 2008). However, press releases must be made newsworthy and interesting to the general public or else no one will publish or read them.

One of the expenses that should not be cut is the **sales force**. It is not easy to find experience sales personnel. The investment is too high to let the good ones go. Create new sales programs and use the sales force in to improve marketing relationships and for new tasks such as telemarketing, Web communications and sales can lead to more sales and for guerrilla marketing (Court 2009).

Guerilla marketing is one of the most suitable marketing tools in time of financial crisis. The goal of guerrilla marketing is to engage consumers in order to create memorable and exciting brand experience. "Guerrilla marketing is an unconventional system of promotions that relies on time, energy and imagination rather than a big marketing budget. Typically, guerrilla marketing campaigns are unexpected and unconventional; potentially interactive; and consumers are targeted in unexpected places. The objective of guerrilla marketing is to create a unique, engaging and thought-provoking concept to generate buzz, and consequently turn viral." (From Wikipedia).

CONCLUSION

Cutting marketing budgets may not be the best solution to cross and the current financial crisis successfully. As this paper demonstrates, marketing strategies may prove more helpful. The ten strategies suggested here are based on three basic principles. They do not require much capital (such as using the Web, public relation or guerilla marketing); they cater towards the needs of the supply chain (segmentation, product and price strategies, marketing relationships or data base marketing); and they build the reputation of the brand (planning with flexibility, wise marketing budget or building the value of the brand). Using these and similar principles may help generate more marketing strategies for the unstable, challenging, and often difficult times that we are now experiencing.

THE EVOLUTION OF NEW CONSUMER ROLES IN BRANDING

Siano, Alfonso¹; Kaufmann, Hans Ruediger²; Basile, Gianpaolo³; Kitsios, Alexis⁴

¹*Professor of Corporate Communication, University of Salerno, Department of Communication Sciences*

²*Associate Professor, University of Nicosia, Cyprus*

³*PhD, Lecturer in Marketing, University of Salerno, Department of Sociology*

⁴*MBA, School of Business, University of Nicosia*

Purpose: This paper provides a contribution to the subject of the relationship between brand and consumer, with the particular objective to develop understanding of the social trends that determine the brand behavior of consumers, and the increasing role that brand plays in the socialization system.

Design/methodology/approach: Based on an interdisciplinary literature review a number of conceptual frameworks depicting the chronological evolution of the brand- consumer relationship have been developed. Due to a perceived very high level of compatibility of research objectives the frameworks have been validated by a qualitative research conducted in Cyprus. The research presents the results of interviews and focus groups with marketing management of Cypriot companies and with potential Cypriot brand consumers. The research aim was to investigate and conceptualize the relationship between brand-, consumer behavior and the socialization system in Cyprus, which might influence corporate branding strategies.

Findings: The research provides an adaptation of a conceptual framework proposed in order to demonstrate that the relationship between brand and consumer, overall to island populations, cannot be separated from socio-demographic (age, gender, income, education) and cultural categorization (collectivistic and/or individualistic) factors.

Practical implications: The precedents arising from the study carried out in this paper provide academic and practical suggestions for segmentation, targeting and positioning in order to develop and strengthen the relationship between brand and consumer.

Originality/value: The paper sensitizes readers to develop careful considerations about the difficulty to identify the social and cultural factors (individualistic and/or collectivistic culture, sense of belonging, etc.) influencing the postmodern consumer. Based on the description of the chronological evolution of the relationship between consumer and brand/firm an innovative conceptual framework is provided differentiating consumer roles by the strength of the relationship to the brand. The elicited strongly normative implications of the socialization system suggest differentiating brand and consumer behaviour related theory as to island populations.

Key words: Branding, social identity, symbolic consumption, Cyprus

RELATIONSHIP DYAD: ATTRACTIVENESS

In recent years many consumer behavior researchers and practitioners have elaborated on the relationship between the "self" and consumption, seeking to study the trend of the individual to consume products not only in accordance with functional utility consumption but also, above all, driven by symbolic significance. According to these studies, individuals actually employ consumption both to take advantage of the technical function of the product and to create and support the "self", understood as a connotation of self-esteem and image towards other individuals (Turker, 1957; Turner, 1982; Schlenker, 1986; Brewer and Gardner, 1996).

Managerial and Entrepreneurial Developments in the Mediterranean Area ISBN: 978-9963-634-76-7

To this end, scholars of the theory of *self*-concept in the middle of the last century sustained that a definition of consumers should entail a reference to the meaning the products have for them and the implicit consumer attitudes towards the products (Tucker, 1957). Later on Grubb and Grathwohl (1967) expanded on the self-concept in that:

1. Self-concept is of value to the individual, and behavior will be directed toward the protection and enhancement of self-concept.
2. The purchase, display, and use of goods communicate symbolic meaning to the individual and to others.
3. The consuming behavior of an individual will be directed toward enhancing self-concept through the consumption of goods as symbols.

Following this thread of study, in particular from the perspective of self-esteem, the school of symbolic interaction also sustains that the consumer will be motivated to look for a positively valued product to maintain a positive self-image. Therefore, they argued that once an individual decides which image to express in the social situation, she looks for ways of expressing it. Hence,

the product is one means by which an individual can express the self-image (attitudes, perceptions, feelings) that she/he wishes others to associate with her/him.

These studies, contextualized in the study of marketing, have revealed the importance for consumers to create relationships with the firm/brand in order to building the self-concept (Rosenberg, 1979).

In the ambit of the sources cited above, the individual, by means of the informative, symbolic and emotive characteristics of the brand, develops a cognitive/perceptive system by which to choose the product/brand most useful for her/his own self-concept. In consequence, businesses use their product/brand to achieve a competitive advantage.

On the basis of these observations the consumer evolves, due to the role of the brand, from being a passive subject in marketing, resulting in stimulation of mere commercial transactions, to being an active subject in the context of relations with the firm. In the context of this evolving process in terms of the relationship between firm and consumer, the brand no longer represents a simple "name, term, sign, symbol or design or a combination of them, intended to identify the goods or services of one seller or group of sellers and to differentiate them from those of competitors" (American Marketing Association in Kotler and Keller 2006, p. 274), but rather, a partner of the relationship with the consumer, to the extent of playing an essential role in the dyadic condition of the relationship (Keller, 1993; Fournier, 1998).

The need for the creation of relationships, to the detriment of 'dry' transactional links, is the fruit of continued search on the part of the individual for a semiotic feature which first defines the identity and then the values to be communicated to others. These consumer needs have stimulated businesses towards humanization of the brand, evolving it so as to invoke values, cognitive characteristics and social emotions with the result of allowing the individual/consumer to recognize these in themselves and to perceive themselves as a partner due to the employment of a series of social dynamics (Granovetter, 1985; Rao, et al., 2000).

On this subject, one is reminded of Apple, a company that has always produced products which express their potential in their interaction with the individual. In fact, Apple computers were the first to overcome the pure logic of their function, expressing instead an aesthetic and sensory role so strongly that they became a 'cult' in modern interior design, passing from being a grey box to an object of design, even when switched off. Beyond this, the Apple product has been established as being a part of the life style of the individual/consumer, and has always centred its production on the individual, favouring the expression of 'I'. It is not by chance that Apple has used the 'I' prefix when naming its products – the I-pod and I-phone.

The evolution described above has led researchers and practitioners to develop a dual consideration on the meaning of brand and on the concept of relationship. Consequently, brand can be seen as a combination of perceptions regarding information, values, and emotions collocated in a consumer's mind. The concept of relationships is, on the contrary, the expression of reciprocal changes and social adaptation both for the firm and for the consumer (Sirgy, 1982; Holt, 1995).

So we can argue that the concept of relational reciprocity, described above, is useful to reveal the dyadic nature of the consumer-brand relationship.

The consumer therefore, via the brand, achieves social aims such as self-esteem and consensus in the context of reference. To create value, the firm on the other hand plans, modifies and adapts its tactics and marketing and communication strategies on the basis of the attitudes and needs of the individual who recognizes the brand as a social partner reflected in the case of Apple.

The relationship between the consumer and the brand, therefore, is the expression of a systematic relationship whereby the business and the consumer, to reach their respective aims, use a general symbolic communication media (Luhmann 1988, p. 68).

On the basis of these trends, businesses no longer produce products and/or services to satisfy consumer needs but to generate the social consequences which individuals are searching for.

The dyadic consumer-brand relationship, as is depicted in Figure 1, expresses the conditions in which the consumer, in the phase of observation and valuation, perceives the brand as a transducer – a transmitter and transducer – not only of information, values and emotions but also of the capacity to withstand evolution and social roles.

In this phase the consumer, in the constant search for personal identity, assumes the status of evaluator and *browser* of the brands that compose the market, in order to identify the brand or brands capable of expressing a language in line with the benefits sought by the individual.

The meeting point between the research of the individual and the brand characterizes the phase of compatibility, in effect a common language which signals reaching a condition of consonance of identity, thanks to a state of attractiveness between the consumer and the business.

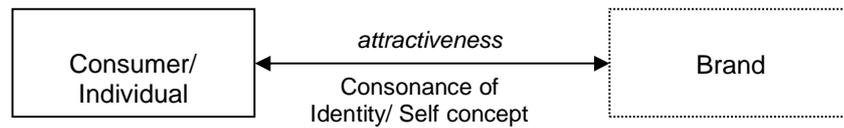

Figure 1: Conditions of Consonance of Identity

As we will see from the results of the research, this condition reveals the role of the brand as a vector of the identity of the individual/consumer in the context of reference.

RELATIONSHIP TRIAD: IDENTIFICATION

The individual, by means of the state of attractiveness developed in their dealings with the brand, identifies this as the means to develop not only their own self-concept but also their identification within the group, tribe or community, created on the basis of a shared passion and/or emotion (Maffesoli, 2004).

Both, researchers and practitioners on this subject sustain that the individual/consumer is no longer in search of the value of using the product or service but of the linking value of that product or service (Cova, 2002).

This trend signals the culmination of the evolution which began as the brand being understood as a distinctive sign of the product, and has reached the point where the brand is seen as a means of achieving strong social links. This contribution from firms towards the creation of a social system has caused a provocative re-evaluation of the traditional terms used in disciplines from marketing to society (Fabris, 2008; Visconti, 2006).

The product/brand, therefore, contributes to realize relationships through the attractive components which surround it (Bauman, 2001; Fabris, 2008; Maffesoli, 2004).

In this phase the brand widens its function, evolving from being a partner to the individual/consumer in the identity/self-concept phase, into being the marketplace around which and by means of which groups are created and evolve, concluding in social identification for the individual (Bhattacharya and Sen, 2003).

The identification of the individual with a group expresses, therefore, the degree of perception of self both as an individual and as a member of the group, in relationship with other group members and with the firm/brand. This further level of perception is developed on the basis of sharing the relevance – functional or symbolic – of specific aspects of the product/brand with other members, based on the process of emulation of individuals considered to be opinion leaders (Dutton and Celia, 1994).

This condition, therefore, satisfies the double need of the individuals to develop their self-concept and their identification with the social group to which they belong (Mael and Ashforth, 1992).

Reaching this condition is demonstrated by means of creation of the sense of belonging on the part of the member in their dealings with both the group/community and with the firm/brand.

On this subject, researchers and practitioners are circulating the definition of brands as love marks, based on the concept of brand as an expression of emotional ties between members of groups, no longer irreplaceable but irresistible. Examples are provided by the numerous communities which arouse around specific models of cars or motorbikes, such as Mini, Harley Davidson and others (Robertson, 2007).

The phenomenon of identification belonging to the theory of social identity represents the evolution of consumer-brand relationship from dyadic to triadic individual/consumer-brand-individual/consumer/ member of a social group that is shown in Figure 2.

In this context the social group or brand community can be interpreted as a social aggregation of members, the expression of a specific cultural capital and their relationships based on the brand considered a warehouse of meaning (Maffesoli, 2004).

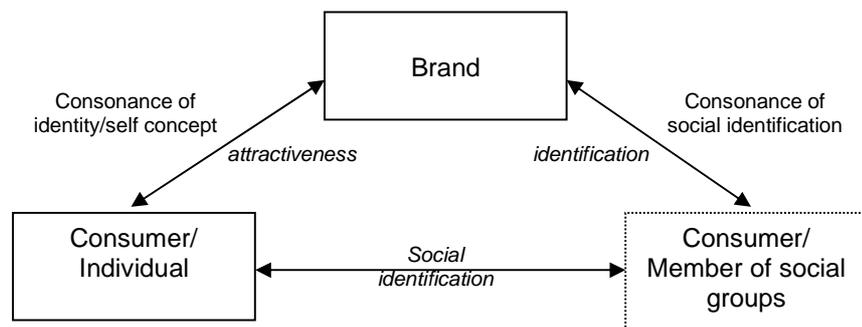

Figure 2: Conditions of Consonance of Identity and Identification

In support of the above, scholars of the theory of social identification (Turner, 1982; Mael and Ashforth, 1992) maintain that identification, in the sense of the aim of an individual/ consumer/ is, above all, a perceptive and cognitive construct. They further sustain that, identification being a condition in which the individual brings into being relational attitudes and comparatives with other individuals, in this phase the individual prevalently tends to contextualize this identity in the environment of social reference.

To achieve identification the individual needs to perceive herself/himself as psychologically linked to the destiny of the group, but above all to perceive a state of distinctive values (evoked by the firm by means of symbols and behaviour) and group practice differing from that of other groups.

In confirmation of the above, it usually happens that the individual identifies with the group either by way of emulation of an opinion leader (a famous person who evokes the distinctiveness of the brand, or an individual attractive to a social group) or by attraction towards the brand (one thinks of the frequent cases of retro-marketing, in which products re-evoked a deeply rooted background, as is the case with the Fiat 500, the Mini Cooper, the VW

Beetle, Chuck Taylor All Star sneakers, and others) (Brown, Kozinets and Sherry, 2003). In both cases the individual expresses the characteristics of an emulator or mingler.

RESONANCE THROUGH COMMITMENT

The dynamics described above, other than the state of attractiveness and the sense of belonging (identification) to the group, cause the individual to feel a state of obligation or commitment, a rooted interest and a sharing of objectives, as much with the group as with the business, and in this way to seek to contribute to success: this condition of relationship can be defined as resonance.

The condition of resonance represents the evolution of the triadic relationship, in which, by way of the commitment factor, the individual in the ambit of the group in which they have found social identification develops a strong awareness of belonging and a respective sense of moral responsibility in their dealings with the group and with single members, so much so that they put into place suitable behaviour towards reaching the objectives of the group and/or the business (see Fig. 3).

The condition of resonance is verified, if the conditions of consonance, identity and identification are protracted in time, due to the frequency of the relationships and the quality of exchange of information, both emotive and cognitive. Further, on reaching this condition a progressive development is put into practice which allows, in its turn, the gradual blurring of boundaries between firm and consumer, as shown in Figure 3. Consequently, achieving this state of resonance is the expression of reaching ever greater levels of sharing and trust on trends and perspectives (McAlexander, et al., 2002; Ahearne, et al., 2005).

From the point of view of marketing studies, such display by consumers represents a net change in the role of firm/brand which, from the pole of the relationship with the consumer evolves into support for the links/relationship between consumers.

The consumer/member, being aware that the firm/brand can help in the building of a social identity, shares the aims of the firm to the extent that he/she participates in decision making concerning products and communication.

The case of Ducati, for instance, saw the firm propose a model of motorcycle with a single disc brake. However, the members of the community opposed the plan and had the entire braking system changed to dual disc brakes.

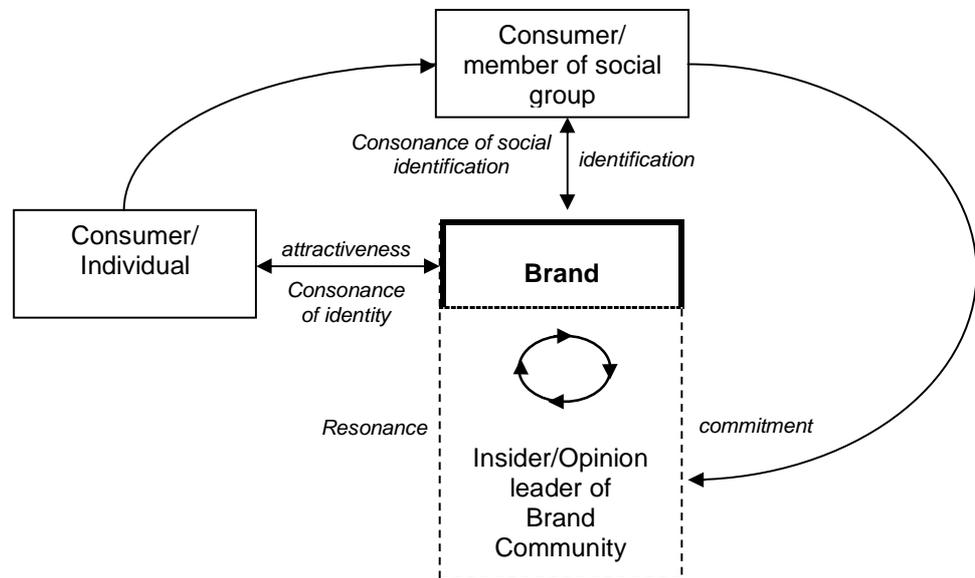

Figure 3: Conditions of Resonance

This participation, which often materializes as extreme loyalty on the part of the consumer towards the entire business organization, finds effective representation in the willingness not only to accept new products or a brand extension, but also to involve new members in the community and, furthermore, to support and sustain the firm in moments of crisis.

From the moment in which the consumer becomes an active member/insider of the brand community, the latter, by effect of the two step flow theory, becomes an efficacious sounding board of the firm/brand. In other words, it becomes a spontaneous communication tool activating word of mouth, both on and offline, encouraging new "fans" or, even, defending the reputation of the brand from judgement on the part of members of communities of brand competitors.

In this situation the consumer sees his position evolve from simple member, joined in the social group, that we called mingler to molecular opinion leader to insider (Katz and Lazarsfeld, 1955; Kingdon, 1970; Confetto, 2005).

The social evolution of the consumer /individual, from browser to opinion leader, is illustrated by means a conceptual framework in Figure 4.

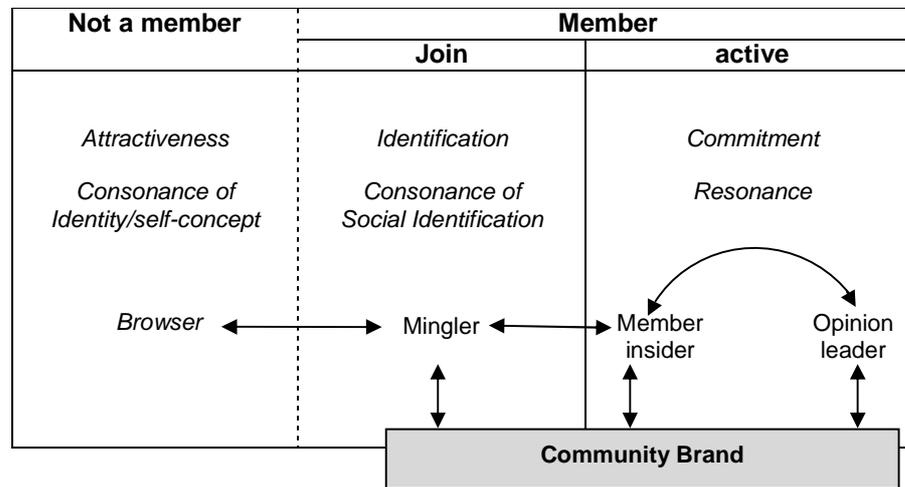

Figure 4: Conceptual Framework of Social Consumer Evolution

New technologies also contribute to the proliferating of the community brand. A tool initially blamed for causing the alienation/isolation of the individual, is proving itself as the “territory” on which to create the community (Algesheimer, et al, 2005).

The social aspect of the consumers in their relationship with the brand, the spontaneous growth of social groups and the role of the consumer within these groups are always the centre of attention for researchers and practitioners, who seek to adjust the planning of marketing and communication towards a less traditional, “murk” or “non conventional” approach (Muniz and O’ Guinn, 2001; Bagozzi and Dholakia, 2006).

RESEARCH METHODOLOGY

This paper resulted from a research co-operation with the intention of cross-validating the mutual research findings. Due to a perceived very high level of compatibility of research objectives the developed frameworks (see also Siano and Basile, 2009) have been validated by a Cyprus case study conducted in 2008 (Kitsios and Kaufmann, 2009).

Due to its idiosyncratic political and economic development, Cyprus might be considered a unique case. Cyprus was conquered by a variety of international powers who wanted to capitalize on the strategic position of the island being ideally strategically located at the crossroads of the three continents of Europe, Asia and Africa. The Turkish invasion in 1974 divided the country, and the economy had to shift to new industries, mainly tourism to survive (Maital and Pierides, 2003). However, after this tragic event an impressive increase in GDP occurred and the Cyprus economy boomed by double digit growth rates between 1976 until 1995 and more moderate, by single digit growth rates thereafter up to a level of 14.317,57 mio Euro in 2006.

This unique political, economic and cultural background might imply unique aspects of consumer behavior be it consciously or unconsciously (De Mooij, 2003). The research aim was to investigate the underlying reasons governing consumer behavior of Cypriot consumers as to branding applying a qualitative research approach focusing on the why and how of decision making. A need was perceived for smaller but focused samples (Denzin and Lincoln, 2000).

The research objective was to investigate the concrete factors of brand related consumer behavior of Cypriots which might inform corporate branding strategies. The derived research question was if symbolic consumption and the other notions on identity and self-concept described in the literature review above might be determining factors of consumer behavior as to branding in the age group 25 and 40. Purposive sample was chosen as the sampling technique as it is regarded as useful for situations where the researcher needs to reach a targeted sample quickly and where sampling for proportionality is not the primary concern (Trochim, 2006). As to subcategories of purposive sampling, expert sampling and quota sampling were applied.

Expert sampling was used for two reasons: first, the specific strategic and operational knowledge of experts representing a variety of categories of status revealing products, such as technology, fashion, cars, mobile phones or cosmetics; second, expert sampling might provide evidence for the validity of another sampling approach chosen. Hence, 8 interviews with marketing managers were conducted on their perception and capitalization of symbolic consumption.

As a second sampling method for two focus groups with respectively 7 potential brand consumers aged between 25 and 40, proportional quota sampling was applied to assure a proportion of respectively 50% female and male participants.

Due to the perceived uniqueness of the Cypriot setting the research method of a case study was chosen where a focus on a limited number of cases (direct observation and systematic interviewing) allows for a holistic, in-depth investigation eliciting rich information (Feagin, Orum and Sjoberg, 1991; McNamara, 1997). As a qualitative research technique the focus group was applied to uncover, possibly surprising, information by an interactive group setting where participants are free to talk with other group members (Rushkoff and Douglas, 2005).

Moreover, focus groups are a powerful means to test new ideas or assumptions. As a structural guideline for conducting the focus groups McNamara's (1997) suggestions were applied. The qualitative data were analyzed to elicit meaning and symbolic content (Seidel, 1998) and to specify the presence of certain words or concepts using content analysis (Neuendorf, 2002).

CYPRIOTS AS EMULATORS/MINGLERS (SEE FIGURE 4) BASED ON THE DESIRE OF SOCIAL ADVANCEMENT AND THE PREFERRED LIFESTYLE ATTACHED TO IT

Five of the marketing managers (KCT, PAM, XST, DGM, and LFT) confirmed the influence of the group, where the consumers want to become members of, on brand consumer behavior. One possible reason was provided in that people have the need to belong to a social group and to advance socially. Therefore, they are more likely to modify their behavior according to the preferred group conditions compared to that group they are already belonging to.

PAM said, "Indeed, people may change their buying behavior so as it is the same as the one of the members of the group that they want to join in order to be accepted". Similarly, LFT said that "people whose goal is to move socially upward believe that, by exhibiting the behavior they believe their target group has, the transition to that group will be easier and smoother since they will be accepted faster".

The statements of the marketing managers were confirmed by ten out of the fourteen members of the focus groups. XPM, confirmed by the majority of the focus group members, stated that he copies the extravagant consumption patterns of his colleagues at work in order to be accepted by them. He said: "I had to start behaving as they did and buying the same expensive things as they did, so that I could join the group and be part of the team".

Accordingly, the preferred group's influence is regarded as a dominant factor that influences symbolic consumption, but there were some variations in their answers. EJJ, APF and ATF, three women in their 30s, as well as PPM, a man in his early 30s, who have very similar demographic characteristics since they currently belong to the middle class differentiate according to age. They said that when they were younger, at school and at college, the most influential group for them was the group that they wanted to join. Now, this group is still influential but not to the same extent.

That is probably because young people always want to be in the group with the most popular people and, thus, conform to their buying behavior in order to be accepted into the popular group. Concordantly, EJJ said: "I remember when I was in school and at college that I used to buy the same things as a specific group of popular girls so that they would accept me as a friend, but this reduced as I got older". APF agreed by stating: "Something similar has happened to me, too. I can also say that this happens more when you are younger".

Thus, it is obvious that age plays an important role as to the extent of adaptive status orientation.

THE RESONANCE STAGE (SEE FIGURE 4) IS NOT YET ACHIEVED

These and the following findings imply that the brand related consumer behavior seems to be exclusively based on the desire for social advancement and the preferred lifestyle attached to it rather than on an underlying common passion for the brand and its embodied values as Maffesoli (2004) or Cova (2002) stated in the literature review. All marketing managers who were interviewed unanimously agreed that lifestyle and, to be more precise, the lifestyle which people would like to have is a very important determinant of the buying behavior of Cypriots. PPT said that "if we want to achieve a certain status that has a certain lifestyle attached to it we start modifying our behavior, especially our buying behavior in order to suit that lifestyle and the people who have already achieved that lifestyle". In their opinion, Cypriots tend to buy products that represent the lifestyle that they would like to emulate. Thus, the symbolic meaning of these brands is the lucrative lifestyle, social position and status.

To be more precise, six marketing managers said that lifestyle is one of the greatest determinant factors, because people seek membership into these groups in order to achieve their goal of moving socially upwards and enjoy the lifestyle that these people are enjoying.

Interestingly, the responses of six members from both focus groups were very similar to the answers given by the marketing managers.

The focus group members said that lifestyle is one of the most important determinants and provided a similar justification: "Most times, people do not want to join a group because of the group members but because of the social position of the group members. Sometimes, the lifestyle of these people is what attracts us to them rather than the group members themselves" (OKM, IPF and AIF).

These latter statements strongly imply that Cypriot consumers can be perceived as emulators/minglers but that the stage of resonance is not achieved due to a lack of psychological link with the desired social group which would be based on common values. This is confirmed by IPF who said: "I think that we all have the need to socially advance. Some people in Cyprus, however, overdo it. I know many people who have no credentials or education but act and buy things like millionaires in order to be accepted in a higher status group". It might be concluded that Cypriots want to change their identity by their brand purchases in an attempt to either advance socially or to join a group with a higher status.

However, the sustainability of this newly created identity might be questioned as it is not based on the change of a value system or moral growth. Four of the marketing managers confirmed this view: "They are people who achieve their identity without having the actual qualifications for that identity through their wealth that is visible from the products that they buy" (KCT). Similarly LFT said: "You can see more extreme symbolic purchases from them rather than from those who are already members of the target group since they are trying to adopt the identity of that group without really deserving it most of the times".

Ten out of the fourteen participants in the focus groups agreed with the statements of the marketing managers: "We try to impress the group's members by adopting an identity that might not really be our own, so that this group's members will accept us" (IPF). Similarly AIF said "Many times we try to advance socially by adopting an identity that other people who belong in an upper class have, so that we can be friends with them. We usually do that by buying the same things that they buy".

POSSIBLE IDIOSYNCRATIC REASONS FOR NOT ACHIEVING THE RESONANCE STAGE: NORMATIVE REFERENCE GROUPS, SHOW OFF BEHAVIOR, SIZE OF THE COUNTRY, GENDER, WORK ROLE, MEDIA

The following findings reflect a very strong normative character of comparative and/or identification reference groups not referred to so far which consumers perceive as a pressure to conform. Seven out of the eight marketing managers interviewed (PAM, PPT, KCT, DAS, PAP, DGM, XST) held that Cypriots like to show off their wealth to an extreme. This would make them engage in symbolic consumption and buy branded goods that signify wealth. PPT, in this context, said: "In my opinion, everybody shows off in Cyprus. Sometimes it goes beyond the limits as it becomes some kind of a competition between neighbors, for example". Similarly, half of the participants in the focus groups agreed with this statement. This is reflected in statements as: "we are all show-off maniacs in Cyprus and this is the main reason that we buy branded things" (PPM); or: "In my opinion it is a kind of competition between most Cypriots. The winner

is the one who shows off the most expensive and luxurious material goods" (IPF). It is very interesting that this informal "competition" was mentioned by both, the marketing managers and the consumers. A possible reason for this might be the small size of the society, population and geographic area of Cyprus as almost all marketing managers mentioned it. XST is quoted: "Because we live in a very small society and everybody wants to show off their wealth and social position". This is confirmed by another interviewee: "When you live on a small island like Cyprus where everybody knows everybody's business you feel you are under pressure to look your best and because women in Cyprus tend to talk and to show off a lot, you feel you are not performing well if you are not dressed in designer clothes". This is confirmed by a manager of a boutique stating: "if you look at the Cypriot women's magazines there is a huge difference. Women are pressurized into buying expensive clothes; if you don't then you are cheap" (Cyprus Mail, 2006, p. 2).

Some of the participants in this research linked the preferred life style and normative group influence to the job role. Summarizing, they said that Cypriots adopt an identity which is in accordance with their job or work environment and work group. One of the marketing managers mentioned: "There is a group of people who consider their jobs to be managerial; they buy a mobile that suits their position" (XST)

Four participants in the focus groups gave a similar explanation. XPM said that groups are influential but for him the most influential group is the group of people with whom he works since he had to modify his behavior and buying behavior in order to fit his new work environment and be accepted by his new colleagues as a member of the team. OKM echoes this view: "an equally important factor that influences our buying behavior is our job and work environment. If you are an accountant, a doctor, a lawyer or a bank employee, you are expected to wear a nice suit and drive a nice car".

In addition, the media were regarded to exert a normative influence. Two of the marketing managers said that television is a very influential factor since it sets standards with which people must comply: "In my opinion what influences Cypriots is television, the stupid box, which dictates certain standards of behavior to the society that if someone does not comply with, he becomes alienated from the rest" (PAM).

Ten out of the fourteen participants in the focus groups agreed on the normative role of the media: "I think that actually we are influenced by TV and other media that expose these famous people" (EJF).

The previous findings suggest a low quality of exchange of emotive and cognitive information between the groups which, according to the literature review is regarded a precondition for the development of resonance based on enhanced levels of commitment, sharing and trust.

CULTURE AS THE REASON TO EXPLAIN THE GROUP NORM AND TO DIFFERENTIATE BRAND RELATED CONSUMER BEHAVIOR

When trying to explain the underlying reason for the brand related behavior reflected in the last paragraph the concept of culture seemed to be necessary to be included in the discussion. The following definitions imply a certain extent of unanimous and patterned reactions of members of a given culture to marketing stimuli. Culture has been defined as the “interactive aggregate of common characteristics that influence a group's response to its environment” (Hofstede, 1980), or as the “collective programming of the mind which distinguishes the members of one group or category of people from another”(Hofstede, 1997). Referring to cultural dimensions (Hofstede and Hofstede, 2005) governing the respective people’s behavior (individualism vs. collectivism, masculinity vs. femininity, power distance, uncertainty avoidance, long-term vs. short-term orientation), Lustig and Koester (1999) reason cultural differences primarily by the individualism vs. collectivism category which emphasizes conflicting views on the nature of humans and society and the underpinning relationships. The following more detailed description by Samovar and Porter (2001) referring to Hofstede points to the applicability of branding in both, individualistic and collectivistic cultures. Whereas, in an individualistic culture, people are symbolized by numerous features believing that they are unique in society and, hence, emphasizing personal preference and competition rather than a co-operative social setting, the needs, views, objectives and, even emotions of the people in a collectivistic culture are conditioned by the group.

Conclusively, in individualistic cultures, branding might account for individual preferences by segment specific life style positioning and, in collectivistic cultures the consumption of well known brands might be regarded as constituting a group norm.

Even though most Western societies are considered to be individualistic societies, there seems to be a high degree of collectivism regarding the consumer behavior of Cypriots which is in line with the emphasis on the personalization aspect and the strong normative character of comparative and/or identification groups. People seem to feel conditioned in their brand consumer behavior in order not to be considered to be different.

The statements imply that Cyprus might be considered to emphasize personalization as a reflection of a being orientated culture rather than de-personalization as a characteristic of a doing orientated culture (Usunier and Lee, 2005).

Four of the marketing managers agreed on the significance of collectivism influencing the consumer behavior of Cypriots. Thus, since most are status oriented, the rest tend to copy this behavior: “We know that people are watching us and making comments. The issue is not the personal mentality but the collective mentality. We are expected to behave in this way and so we do” (LFT). In the same vein, PAM stresses: “They don’t want others to consider them different or think less of them if they see them using inferior or unbranded products”.

The participants in the focus groups were more explicit in their comments confirming the findings of the interviews. Most of the 11 out of 14 who gave this as a reason said that they do what everybody else is doing so that they are not considered to be different and also to avoid negative comments. ATF said: “We buy the brands so that we are not different from the rest”.

PHM said: "Trying to avoid comments by trying to be the same with others is a reality in Cyprus. People tend to buy the same brands, go to the same restaurants, clubs or cafes and generally behave like a flock in order not to be different and to avoid becoming a target due to their difference".

CONCLUSIONS AND RECOMMENDATIONS

The study carried out in this paper supplies points for reflection on the evolution of marketing, from both strategic and operational points of view, following the identification of the three conditions of the relationship between individual and brand (attractiveness, identification and resonance) and the corresponding figure of the consumer which corresponds to different states of evolution and therefore to different targets (browser, mingler and insider/opinion leader).

From a strategic point of view, the work has revealed the social and community role of the firm which, to identify adequate marketing behaviour, brings into being an *interaction-based* approach, favouring social dynamics evaluation techniques such as network analysis and n-ethnography in the segmentation phase (Kozinets, 1999).

Brand related consumer behavior of Cypriots seems to be embedded in a national culture characterized by collectivism and personalization. Whereas culture refers more to formal role organization, the applicability of the identity concept epitomizing the spiritual and behavioral repertoire of people was confirmed by this research. A preferred social identity is regarded as the underlying driving force of brand related consumer behavior. This preferred social identity, however, is not only reflected in a sense of voluntarily belonging to the aspired group or social class, but also in a perception of a strong normative character or even pressure by the comparative and/or identification group and even the media. This normative perception, however, decreases with achieving and establishing the accepted membership in the desired group and/or social class. The preferred social identity, in line with Laverie (1995) creates the salient identity expressed by preferred identity or desired identity change, preferred lifestyle and the job role by symbolic consumption.

Finally, in a more collectivistic culture, the brand related consumer behavior seems to be characterized by an excessive 'show off' behavior and a brand selection which has to be further differentiated by gender.

Summarizing, due to the findings of the empirical research the initially conceptualized framework is suggested to be further differentiated by culture, age and gender, as is shown in Figure 5.

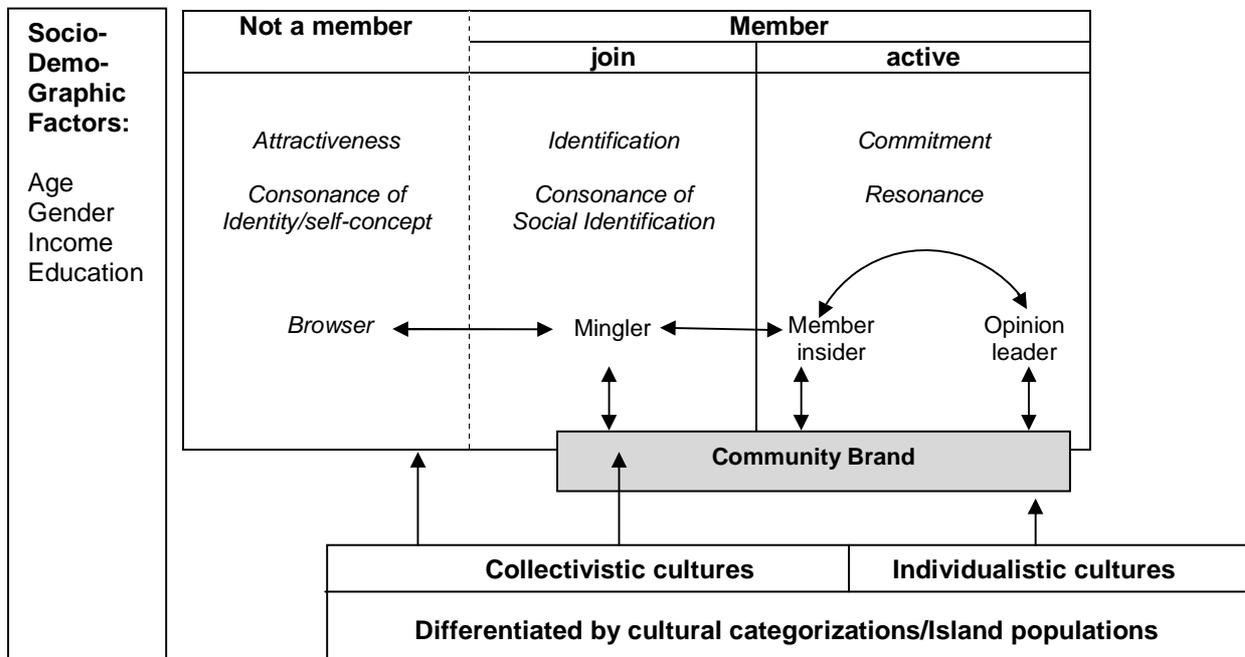

Figure 5: Adaptation of Conceptual Framework

From the marketing operative point of view, the constant research into the self and social relationships on the part of the individual, as it emerged in this research, modify the application of traditional variables to the marketing mix, specifically with regard to communication, driving the firm to modify its approach to the consumer, passing from “from-to” communication to “between” communication.

Due to this evolution, firms should aim their conduct in marketing towards the creation and stimulation of interaction, both informative and emotive, with the individual/consumer and members of the community, developing networking-based behaviour in this way. This operative approach evokes the need of the firm to assimilate and to reflect the system of values of a society, in the continued interaction with the individual.

Suggestions for corporate brand strategies refer primarily to position the family and/or individual brand highly based on image, status and, in tendency, highly priced. TV advertising is recommended due to its high level of intimacy penetration and status perception. Another preferable promotional mix element to be suggested refers to event marketing, as fashion shows, executive parties and, most importantly, charity events. The use of testimonials representing the desired social identity is also recommended.

The empirical findings also imply that the brand epitomizing the linking identity value does not suffice to create a new sustainable consumer identity. This identity creation process should

be accompanied by developing new value systems and moral growth provided by educational institutions.

The limitations of the research refer to its exploratory nature. Explanatory research based on inferential statistics is suggested to validate the qualitative research and to provide for weight and direction of the factors and to more clearly differentiate brand related consumer behavior as to socio-demographic aspects, especially age.

A further limitation refers to the lack of differentiation between national and international brands. Last but not least, it is suggested to investigate possible contributions of retailing (i.e. in the sense of conative retailing), preferably in concerted strategies with academic education providers, to strike the balance towards a more individualistic, voluntary and self-determined identity development of the brand consumers considering seemingly neglected elements of identity such as character or existential identity. This would be in accordance with the underlying mission of the micro sociological/micro psychological concept of identity in the sense that the consumers should draw other social or emotional benefits from its application rather than only economic ones (Arnett et al, 2003).

This aspect coupled with the finding of normatively perceived influence of the comparative and/or identification group might be used as a starting point for research to develop brand consumer behavior conceptualizations differentiated as to small world (island populations).

³*University of Manchester, UK*

⁴*PhD, Lecturer in Marketing, University of Salerno, Italy, Department of Sociology*

Purpose – The objective of this conceptual paper is to study the relationship between company and consumer, focusing on the role of social actor that companies have to create, maintain or strengthen the links between the brand and consumers. In the ambit of this topic, the study aims to explore in greater depth the role played by new forms of retailing in the relationship between brand-consumers.

Design/methodology/approach -The present study *takes its starting point* from evolutionary dynamics developed from sociological and psycho-sociological literature in postmodern society: the constant search by the consumer for self-concept and social identity/identification. Subsequently, the literature analyses different new ways of retailing that support the social dimension of consumer behavior.

Findings - The focus on the social dimension of buying allows identification of the vertical branding strategy and the characterization of two different strategic options: corporate vertical branding and cooperative vertical branding. The study offers arguments in support of the function carried out by various forms of retailing and their importance both in communicating corporate values and in creating/consolidating the link between brands and consumers.

Practical implications - The precedents arising from the study carried out in this paper provide suggestions for practitioners (managers and professionals) who use retailing in order to develop and strengthen the relationship between brand and consumer.

Originality/value - The paper offers readers the possibility to understand how evolutionary dynamics of postmodern society combine with new forms of retailing in order to develop relationships between brand and consumer.

Key words: Postmodern Consumer Behavior, Vertical branding, Concept Stores, Temporary Store, Flagship stores, Franchising

POSTMODERNISM: VARIOUS SCHOOLS OF THOUGHT

This paper aims to provide a conceptual contribution with regard to the evolution of marketing and consumer behaviour, and to the relationship between brand and consumer. The study focuses particular attention on the role of social actor which brands increasingly have to impose in order to create, maintain or strengthen their links with the individual/consumer.

In the second section, the study focuses on the opportunities of new retailing forms to involve the vertical branding strategy, thanks to the evolution of marketing and consumer behaviour. In particular, lastly the study highlights the temporary store effects. It has to be considered the

most recent and innovative retailing format within those useful for the vertical branding strategy.

To this end the work is based on a presupposed concept borrowed from a social psychology principle, according to which the individual, by nature, tends to develop both their own "self" (concept, image, identity) and their "social identification" in the ambit of social groups (Turker, 1957; Turner, 1982; Schlenker, 1986; Brewer and Gardner, 1996).

Social psychology studies have contributed a great deal to clarifying the changing social processes recorded throughout the last fifty years, caused by the passage from industrialised society by way of modernism to postmodernism (Brown, 1995; Lyotard, 1982). These changes have involved every form of society, from political to philosophical, from sociological to marketing, evolving the role in society both of the individual and of institutions in general, and in particular of the business. From a social point of view the individual has evolved its role, passing from the constant search for individual differentiation and extreme utilitarian relationships, elements which characterise modernistic society, to the search for rational and unconditional individualism – that is, to a condition of constant search for the self with the outcome of making oneself noticed and distinguishing oneself from others. The postmodern individual seeks to behave towards activating a large number of autonomous choices, with the result of producing and demonstrating their own existence and their differences in respect to others. This trend, in the last twenty years, has become the basis of an important reference point on the part of marketing researchers and practitioners, relative to concepts such as extreme individualism, social mobility of the individual, the difficulty in homologation of the individual into clusters, the fragmentation of ever more ephemeral consumerism and social links chosen rather than imposed, based on the sharing of emotions derived from the symbol/brand.

The evolutionary cycle between individualism and social links has revealed the emergence of two different streams of study in the phenomenon of postmodern consumerism, one North European and the other Latin/Mediterranean.

The North European School is characterised by the definition of consuming as an act of self-definition by the consumer (Firat and Venkatesh, 1993; Firat and Shultz II, 1997). This stream of study sustains that postmodernism is the era in which the individual can and must put personal actions in place to customize and demonstrate themselves (their own existence) and their differences (Elliott, 1997). The North European School considers tribes, specific social groups, as alternative social enclaves on the outskirts of society (Firat and Dholakia, 1998). These considerations have caused two important aspects to emerge from postmodernism: (1) the individual evolves as sovereign subject at the centre of marketing activities, participating in the personalization of its world, of its image (its symbolic system), providing input, living direct experiences and expressing fragmented modes of being; (2) consuming, from a natural economic transaction, becomes the principle form of language by which the individual communicates their own identity to themselves and to others. In this respect Firat sustains that:

"The postmodern consumer recognizes that they are not just a consumer, but a customizer and a producer of (self-)images at each consumptive moment" (Firat et al., 1995).

These aspects clearly show the emergence of the new figure of the consumer which no longer represents a segment/destined target of products and services, fruit of an un-natural correspondence with the firm/brand, but evolves and becomes a co-producer of experiences, of symbolic significance in the creation of fragmented and fluid self-image (Bauman, 2005). These changes weaken the validity of traditional marketing concepts and tools, such as segmentation and analysis of positioning (Blattberg and Deighton, 1991). They make it necessary to carry out more active/participative analysis (interaction based), conducted with tools like ethno-sociology and/or network analysis.

The new trends favour marketing behaviour that offers contexts to the consumer in which the individual can live out experiences and experiment with their own self-image diverse from their role in society. Lately businesses, aware of these social trends of the individual, tend towards stimulation of search for the "self", seeking to suggest their own products/brands as ideal partners in reaching the individual's social objective. Businesses actually seek to stimulate this dyadic relationship with the individual, in support of the expression of "I", by means of communication activities. One is reminded of the claim "Just do it" by Nike, or Apple's insertion of the "I" prefix in their products such as the I-pod and the I-phone.

In contrast to the North European School, the Latin/Mediterranean School considers the phase of individualism as the conclusive part of the modern period, marked by the freedom of the individual from socially-imposed links (for example, social class). For scholars following this thought, consumerism represents an inversion of social trends, so as to allow creation or maintenance of links between individuals (Maffesoli, 1996; Bauman, 1990). From this perspective new technologies, which have always been considered a cause of social isolation, have become the means and the places in which re-socialization of the individual can be fulfilled. One thinks of the spreading of social networks and themed blogs, or of the stimulus given to customers and web-site visitors by businesses in order to create communities. These social dynamics are often represented by a multitude of experiences and emotions which are born from the behaviour of the individual and culminate in a demonstration of tribalism, or spontaneous social aggregation founded on the sharing of experiences, emotions and passions between individuals (Cova, 2003; Cova, Kozinets et al, 2007).

The Latin/Mediterranean School pays particular attention to the role of the tribe, and sustains that every individual, however socially mobile, is a component of tribes and plays a different role in each tribe.

This train of thought emphasises the constant search for multisensory experiences both as spectator and protagonist, which lead the individual towards new forms of social aggregation in tribes and in neo-communities, characterised by increased involvement but resulting in being provided with links. The tribe, understood as the dynamic and flexible positioning of the individual, tends in this way to substitute concepts of social class and segmentation which are themselves representative of socially static positioning (Cova and Cova, 2002).

The view of the Latin/Mediterranean School changes the outcome of marketing, which functions as a "vector of tribal and social links" by which products and services permit and support social interaction between individuals. This evolution, induced both by new trends and

by the constant search for the self and for social relationships on the part of the individual, is modifying the application of traditional marketing mix variables, especially in respect to communications and distribution. These effects drive businesses to radically modify their behaviour in marketing, passing from a general broadcasting approach aimed at a mass of predefined individuals to a narrow or net-casting approach as a result of which businesses express awareness of the constant search for individuality, even within groups, on the part of the consumer. This evolutionary trend drives businesses to modify their approach to the consumer, moving from a unidirectional *"from-to"* relationship to *"between"*-type networking.

The identification of the individual in a group, therefore, expresses the degree of self-perception, both individually and as a member of a group in relationship with other members and with the business/brand (Semprini, 2006). This level of perception is developed based on sharing specific attributes of the product/brand – functional and above all symbolic - with other members (Dutton and Celia, 1994). The condition of identification by the individual satisfies the double need for developing the concept of self and identification with belonging to social groups (Mael and Ashforth, 1992). The achievement of this condition is demonstrated by the creation of a sense of belonging by the member both towards the group/community and the business/brand (McAlexander, Schouten, and Koenig, 2002; Muniz, O'Guinn, 2001).

Individuals do not seek out new products and/or services or places from which to buy in order to be more free, but rather to experience emotions which can link them to other individuals (Roberts, 2006). Businesses emerge from this effect with a new social role, first through the products and/or services/brands and then through the creation of links. The places for consuming and acquiring, therefore, transform into places for actual self-concept and social identification – actual *"containers"* which, by effect of their spaces and variety, transform into places of identity, for socialization and aggregation (Cardinali, 2009; Codeluppi, 2000).

Businesses do not limit themselves to creation of products ad hoc, but they often stimulate or ask for commitment from the individual in co-production of products. This redefinition of boundaries, on the part of businesses, has been nourished recently by the multiplication of retailing channels, places and moments of contact, fruit of an ever-clearer consumer connection strategy. Businesses increasingly target their actions in order to co-involve the stimulated individual to immerse themselves in the value element of the brand.

Outlined trends are confirmed in a recent survey conducted in 2007 by *"Osservatorio Innovazione nel Retailing Università di Parma"*. This survey shows that, in the last five years, the primary information source for retailing strategy in the fashion sector are, now, psico-social variables of consumption model at the expense of purchasing and demographic and socio-cultural patterns (Figure 1).

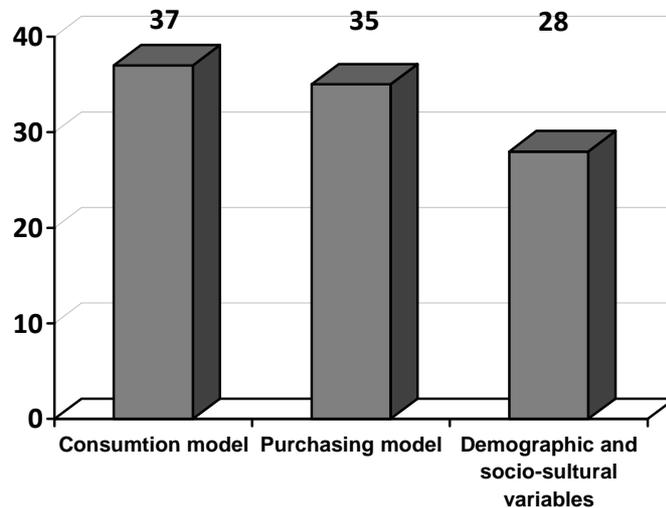

Figure 1: Importance of variables that affect consumers behaviour for retailing innovation in Italy

Outlined trend encourages the increasing retailing formats innovation, in Italy and in the rest of the world, overall speaking of setting and communication tactics in store (for instance the stores that evoke the value systems like Sainsbury's ecological store in Greenwich), changing the traditional store in socio-cultural setting in which consumer and brand meet (Fabris, 2008).

DISTRIBUTIVE FORMATS FAVOURABLE TO VERTICAL BRANDING STRATEGY

The most significant efforts made towards creation of a strong relation between brand and consumer are found in retailing, a place of value and perception in which the individual can express their own identity and their social identification. The sales point thus becomes the place of realisation, of experience and emotions, as much as possible unique and unrepeatable. Management of the customer experience (Berry *et. al.*, 2002; Haeckel *et. al.*, 2003; Schmitt, 2003) becomes the key managerial function.

Not only franchising but also, and above all, the recent concept stores, flagship stores and temporary shops, represent distribution formats in which the individual can immerse themselves in the value of the brand and create relationships with other consumers attracted to the brand value.

These formats allow companies to activate vertical branding strategies (Richardson, 1996; Ravazzoni and Petruzzellis, 2004), fruit of the integration between production and retail. The focus on the social dimension of buying allows identification of vertical branding strategy and the characterization of two different strategic options: corporate vertical branding and cooperative vertical branding. Cooperative vertical branding brings about creation of contractual vertical marketing systems (Kotler, 1991), through affiliation, of which franchising is the most significant expression. Corporate vertical branding, however, the system of vertical

branding by companies (Kotler, 1991), is realised in the opening of single-brand stores managed directly by the producers.

This is also the case with concept stores, flagship stores and temporary shops.

Franchising

In order to examine the franchising concept, it is necessary to investigate what is meant by the term franchising and how this method of doing business came about, the variations that exist, and the advantages and disadvantages to both the franchiser and the franchisee.

The Dictionary of Retailing defines the term, "franchise," as:

"An authorisation granted to one person (the franchisee) to use the franchiser's trade name, trade marks and business system in return for an initial payment and further regular payments."

The term franchise covers a wide variety of arrangements under which the owner of a product, a process, a service or even just a name having a certain significance, for example that of a sportsman, permits another to make or use something in exchange for some form of payment. This can either be direct, for example a fee and/or royalty, or indirect in the form of an obligation to buy a service or product in which the license holder has some kind of business interest. It is unclear when franchising as a business concept, started, but its origins can be traced back at least to the 19th century. The first recognizable franchises were launched by Coca-Cola and the US car industry about a century ago.

Many variations exist today. Some franchisers sell their products and techniques as a combination whereas other franchisers supply only the *modus operandi* and ancillary services of the business system. A classic example of the first type is Coca-Cola, which franchises bottlers in nearly every part of the world. The parent company sells its syrup, which is made to a secret formula. It provides franchisees or bottlers with manuals that define (and demand compliance with) the size and shape of bottles, advertising programmes, marketing techniques, and standardized systems of every aspect of the business.

The combination of one central organisation developing the entire, "package," and leasing it out to the franchisees is so effective that billions of dollars in profit have been generated for companies like Coca-Cola and Benetton, and billions of satisfied customers have been created world-wide.

Those franchisers that supply the *modus operandi* and subsidiary services of the business system sell only their knowledge, operation manuals, and marketing methods. This is paid for in various ways such as a franchise fee, and often includes an on-going percentage of profit or turnover as royalties, or a fixed-fee royalty.

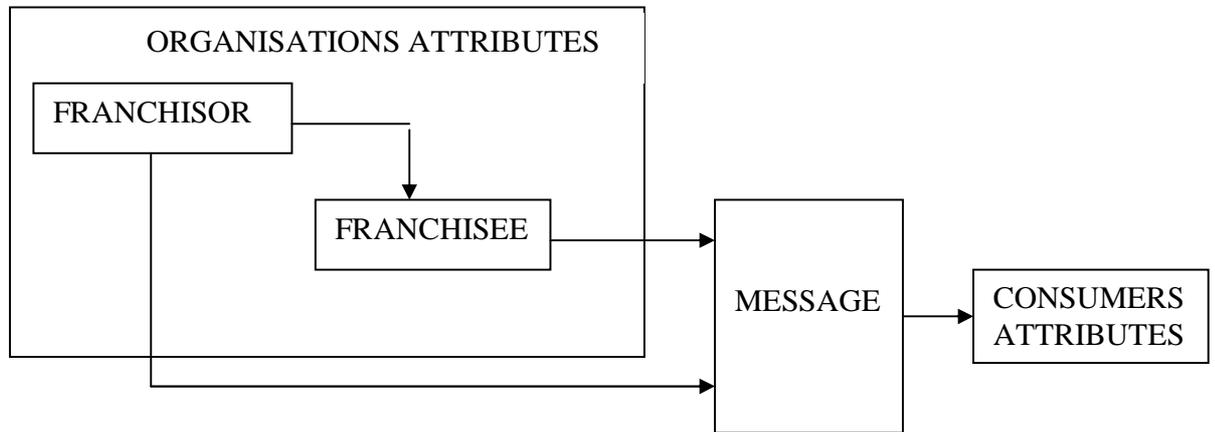

The business format franchising has been responsible for the rapid growth in the franchised marketing method. It involves the use not only of goods and services identified by trademarks, and/or service marks, but also the preparation of a, "blueprint," of a successful way of operating all aspects of a business.

The seller of the, "blueprint," (the franchiser) will have prepared and smoothed the way for the franchisee to open up a business of his or her own in the predetermined established format. The franchisee will also have the backing of the franchiser organisation.

Analysis of the work of Hall and Dixon (1989) and Golzen, Barrow and Severn (1985) and sustained by others, indicates that the main features of business format franchising are as follows:

1. It is a licence for a special period of time to trade in a defined geographic area under the franchiser's name and to use any associated trade mark or logo.
2. What is franchised is an activity, usually some form of service, which has already been tried and tested to produce a formula of operating that has been found to work elsewhere.
3. The franchiser provides the entire business concept of that formula (the blueprint) for the conduct of operations which the franchisee must follow.
4. The franchiser educates the franchisee in how to conduct the business according to the method laid down in the blueprint.
5. The franchiser provides back-up services in order to ensure that he franchise operates successfully.
6. In the exchange for the business blueprint and the services that the franchiser provides, the franchisee is expected to make an initial investment in the business and to pay a royalty to the franchiser thereafter, based on turnover or profits. There may also be an obligation on the franchisee to buy some or all goods and equipment from sources nominated by the franchiser.
7. The participation of the franchiser in setting up the business does not mean that s/he owns it. It belongs to the franchisee and s/he is free to dispose of it, though s/he will probably have to give the franchiser first refusal. Benetton is a good example of a company using business format franchising. It operates in the clothing market world-wide from its base in Italy.

In Field 1 of Nicosia's Model the company's attributes lead to a message which in turn tempers the consumer's attributes. In our case and especially as Business Format Franchising is the key, the company's attributes become the organisation's attributes and can thus be further explained by the diagram below:-

The Nicosia model focuses not on the act of purchasing itself, but the processes which proceed and follow the act. "The act of purchasing is only one component of a complex ongoing process – a process of many interactions amongst many variables." The firms attribute leads to a message being sent out to the consumer who in turn translates the message based on their own attributes and needs.

Hence the company's behaviour affects the consumer and the consumer's reaction in turn affects the behaviour of the company. Nicosia conceptualises consumer behaviour itself as a decision process, rather than as a result of a decision process. Nicosia's emphasis on decision making as an ongoing process is paramount. When a buyer is beginning to purchase a product, s/he lacks experience. S/he lacks knowledge of choice criteria, as such elements of the retail marketing mix, or knowledge of the brand and its potential.

The general models of consumer behaviour do not provide a basis for predicting outcomes as they stand. They do not provide a clear picture of the types of factors that may be said to impinge on such behaviour, though in each case such a picture is partial. Broadly, each model contains variables that may be connected with the individual consumer's characteristics, purchase situation characteristics and product characteristics. Each model includes a number of characteristics in each variable group, which militates against their straightforward extension (as flow models, inclusion of partly additional factors requires considerable revision). However, the Nicosia model offers greater scope for amendment/extension for two chief reasons: -

- The group of variables associated with, "company," impacts on consumer is not fleshed out.
- The model groups together variables within sub-fields, thus allowing modification/extension without compromising its original integrity.

For these reasons the Nicosia model appears to allow for as great a scope for proactive behaviour.

Concept stores and temporary shops

The function of thematic sales points renders the concept store the place where the consumer can not only buy products but also come into close contact with the “world” proposed by the brand, immersing themselves into the “business philosophy”, into the spirit and history of the brand, into a memorable shopping experience. One of the first examples of concept store took place in 1986 in New York, where the stylist Ralph Lauren inaugurated his first concept store. He chose “American-style” as his theme, the store was constructed as a film set that suggested an American atmosphere, an ideal and luxurious style of life. In Italy in the 1980s, the stylist Elio Fiorucci united the sale of fashion, technology and articles for the home in one unique space, paying great attention to atmosphere and to the shopping experience. Recently the well-known car producer Ferrari has inaugurated its own concept store in Regent Street, London’s famous shopping street.

The temporary shop, which appeared early in the 2000s, expressed a new retail concept, strongly innovative with respect to the traditional distributive formula. It was an attempt to transform the shop into an event and, therefore, as a branding instrument, to get near to consumers, to promote an active dialogue with them and to develop a relationship with them through the customer experience. There are many diverse cases of temporary store (Nivea, Lagostina, Saeco, Barilla, Breil, Chanel, Durex, Fiat, Gabetti, Lancôme, Levi’s, L’Oreal, Nike, Philips, Veuve Clicquot) both in Italy and abroad.

This new format aims: (1) to arouse curiosity, to attract attention and to give visitors unique experiences and to feed their emotions by way of being an unrepeatable happening, destined to be exhausted in a short space of time; (2) to experiment with the effectiveness of brand extension projects (Aaker e Keller, 1990; Park et. al., 1991, 1996; Smith, 1992; Keller e Aaker, 1992, 1998; Sullivan, 1992; Rao e Ruckert, 1994; Choi, 1998) with reference to new segments of consumerism in contrast to those which traditionally presided. Durex implemented this strategy in their clothing line, and Nivea in their hair care category; (3) to launch new exclusive product lines (for limited periods), destined to personalize goods on offer; (4) to test new products (exploration of customers’ tastes) before definite launch on a large scale; (5) to develop the relationship with the client and to acquire immediate informative feedback (awareness of the target, with respect to their needs, orientation and behaviour).

Temporary shops are located in large urban metropolitan centres, in zones which are particularly representative, in famous and prestigious streets and squares, in places exclusive to fashion and dedicated to shopping.

The search for locations attractive to visitors can also present the choice of places linked to culture (museums and art galleries). For example, Louis Vuitton designed an exclusive temporary shop inside the Brooklyn Museum in New York. Previously unknown places can also become the location of temporary shops, by way of the fact that these can feed curiosity and be spread by word of mouth by the public. Target has opened a temporary shop on a boat that sails along the Hudson River in New York.

The setting up of temporary shops and concept stores (Kotler, 1973; Donovan e Rossiter, 1982) plays a fundamental role in their success, these spaces being perceived in a strongly innovative and attractive manner. Visitors are offered spaces in which to relax, with multisensory visual

marketing stimuli and experiences (Langrehr, 1991; Botti e Castaldo, 2001). Inside these spaces, visitors can take advantage of experiential shopping or, if they like, emotional shopping and hedonistic consumption (Hirschman e Holbrook, 1982; Holbrook e Hirshmann, 1982; Botti et. al., 1999; Pine e Gilmore, 1999; Schmitt, 1999; Codeluppi, 2001; Vescovi e Checchinato, 2004; Carpenter et. al., 2005). The uniqueness of the acquisition experience is often combined with the uniqueness of the products on offer (exclusive product lines, produced in limited edition, not on sale in the general market). The temporary shop avails itself of promotional support and information by various means of communication, above all by digital technology (company web-sites, mini-sites and blogs created for the occasion) in order to activate the process of viral marketing (Godin, 2000).

The temporary store and the concept store converge in the thematic temporary store, which can respond to diverse needs. Primarily, temporary shops can be dedicated to a target aimed for by consumers, as was done by United Colors of Benetton when they inaugurated their first temporary store in Milan, dedicated exclusively to children, in June 2008. The thematic temporary store can also provide the emblem of a specific theme that recalls the concept of basic brand positioning, expressed through the company claim/slogan. This in theory aims on focussing competitive positioning on starting points (van Riel, 1995), that is to say, on the distinctive value of the elements on which the difference of the brand is founded and the promise it makes to the customer (Keller, 1998; Aaker, 2004). For example, Philips dedicated a temporary shop to the theme of "simplicity". In fact, the claim/slogan was "Sense and Simplicity", through which Philips expressed its brand promise. This included the intention of the company to create advanced easy-to-use products and solutions to satisfy the needs of consumers all over the world. Philips opened the thematic temporary store in mid-December 2008 (closing in mid-January 2009) in Milan, which offered visitors the opportunity to personally experiment with Philips' "simple technology". Fiat also opened a themed temporary store in Milan, entirely dedicated to the new Fiat 500, to its values and to all those passionate about this model which made history for the Turin company.

Flagship stores

The flagship store has for many years represented an important opportunity to add value to strong brands (Kozinets et. al., 2002; Moore e Doherty, 2007). This particular distributive format is considered above all as a channel of communication. The pre-requisite for a single-brand flagship store is the possession of an already well-established brand (Aaker e Joachimsthaler, 2000). The "Epicentro" flagship stores, opened by Prada in New York and Tokyo, represent examples emblematic of the communicative force of these distributive formats supported by the existence of a previously well-established brand identity.

The communicative value, more than the distributive value, attributes particular relevance to the elements of entertainment in the flagship store, most of all in the ambit of the fashion system and the luxury sector – so much as to induce various authors to speak of making sales points into "theaters" (Pine e Gilmore, 1999; Wolf, 1999), and of the "show" of merchandise (Codeluppi, 2000). In consequence, the furnishings and structure exposed in this type of sales point are considered scenic elements of a theatre (Grove e Fisk, 1992). The various theatrical elements in a flagship store (symbols, colours, music etc) represent by definition the many elements expressed

in the world of the brand (Semprini, 2003), elements to make the acquiring experience unforgettable and always new (Aaker e Joachimsthaler, 2000).

To give an idea of the complex function carried out by the flagship store, the metaphor "laboratory" has also been suggested. The term "laboratory" indicates a place in which certain activities are carried out, the participants being actively involved and interacting both between themselves and with the equipment put at their disposition. From this perspective, the flagship store can be seen as a container that allows experimentation with new solutions, the discovery of solutions appreciated by customers and the reapplication of these solutions (Aaker e Joachimsthaler, 2000). Experimentation is linked in this way to the idea of the laboratory, which expresses a platform for relationships and the durable links of learning between the company (brand) and the consumer (Pellegrini, 2001). The idea of the sales point which goes beyond being the mere traditional meeting point between production and consumer to becoming transformed into a laboratory allows us to recognize it as a space where the company-customer relationship becomes a point for mutual learning (Pine e Gilmore, 1999).

The metaphor of the theatre, and more accurately, that of the laboratory, allows us to understand the reason why the flagship store is associated with the phenomenon of the shopping experience and the brand, and has also been attributed with the function of experience provider (Schmitt, 1999) inside the store.

Although the temporary store and the flagship store share the elements of theatre and experiential shopping, they present differences that can be taken back to a fundamental factor: time, or rather the use which is made of it. For the temporary store, the brevity of the life cycle makes this distributive formula a store-event; in the case of the flagship store the duration of the structure allows it to be stationed in specific places, so as to permit it to carry out its activities until its function is fulfilled. As a matter of fact, once created, the space that represents the best expression and the symbol of excellence of a company's brand cannot be seen to cease to exist but, on the contrary, must last through the course of time to confirm and consolidate its presence and to give its customers the possibility to visit at any time and to find there the valued stimuli of the brand. On closer inspection the duration, for which the flagship store is naturally suitable, also justifies the heavy investment in material and technology that companies sustain in order to guarantee a strong sense of theatre and experience for the customer.

This diverse use of the time factor, which constitutes one of the major differences between temporary stores and flagship stores, does not exclude the possibility that there could be a complementary relationship between the two formats. For example, Nike has experimented with the opening of a temporary shop even though it was one of the first brands to have opened flagship stores (Nike Town). Inside their flagship stores, besides promoting new product lines Nike also offers a series of activities and experiential and emotional spaces: personalization of products, fitness, music clubs and multimedia parks. To be excluded, therefore, is an alternate use to these two formats that appear, above all, as complementary elements, insofar as they pursue the same ends of branding, even though using different methods.

CONCLUSION

The concept store, the temporary store and the flagship store represent, through their characteristics, the latest expression of the evolution of vertical branding and branded retail. In particular, the advent of the temporary store is overturning the traditional way of understanding the point of sale, anchored to the idea of a store for which limited duration in time is the qualifying element.

This idea is compared to the approach of vertical branding. Actually, it contemplates a long-lasting and stable structure of retailing, as the franchising networks in cooperative vertical branding (contractual vertical marketing systems) and the others retailing formats that are in the corporate vertical branding category (the concept store and the flagship store).

Franchising envisages the creation of a network of retailer, which by its nature is intended to last over time to justify the investment for the creation and maintenance.

The classic ideas linked to the sales point are being emptied of meaning and importance: the geographic catchment area, spatial proximity, customer fidelity and commercial goodwill. Similarly, the concept store and the flagship store involve the creation of setting intended to last over time although with geographic catchment areas more extensive.

The short or very short duration of the temporary shop sweeps away these old ideas, substituting them with the concept of the spatial event and the place of unique and unrepeatable experiences under the symbol of the brand of the producer.

The most direct and immediate consequence from this evolution in the understanding and management of the store is the loss of, or major reorganization of, the connotations of a selling space in favour of those of a place temporary for experiential shopping and hedonistic consumption, in which the brand displays and speaks for itself and its values in order to develop a strong relationship with the consumer. The latter, constantly searching his/her self and social identification, can discover the world of the brand and its system of values.

In the meantime, branding opportunities on the part of the company are considerably increased with the spread of this new format, with respect to the flagship store which, in its most significant expression, seems to be in reach of only the strongest firm/brands that have much financial resources. The temporary store also assures a branding function - that is, allowing the direct management of the brand and its relationship with the consumer. The temporary store, nevertheless, does not require fixed costs for the amortization of its selling space in a building or for the renting of this space for many years, as is required for the flagship store. Besides, for symbolic significance, dimension and duration, the flagship store renders onerous investment necessary for the setting up of its internal spaces (using multisensory stimulation tools and solutions of visual merchandising in order to heighten the excitement of the show).

If the temporary store truly constitutes a more accessible distributive formula for branding, we can conclude that its arrival could generate similar effects to those that the internet has been producing for some time, allowing small and medium-sized businesses to bring and add value to their own brands, in order to increase their visibility and fame.

The results of this study provide very important information for consumer behavior scholars and for managers and practitioners interested in formulating branding strategies. The study also provides considerations about how to create and/or manage the relations between brand and consumer allowing the psico-social satisfaction of this latter.

WILL HIGH GROWTH ECONOMIES HAVE ENERGY-INTENSIVE GROWTH?

Singh, Bharti¹; Gupta, Pallavi²

¹Faculty- Economics, Institute of Management Technology, Centre for Distance Learning, Ghaziabad, Uttar Pradesh, India

²Faculty- Finance, Institute of Management Technology, Centre for Distance Learning, Ghaziabad, Uttar Pradesh, India

Purpose - The study puts forward the viewpoint that India and China may achieve a high growth rate with lesser consumption of energy per capita in comparison to the developed countries of the world.

Literature /Theory - The International Energy Agency has made projections that since in the next two decades India and China would be growing rapidly they will have an average annual growth rate of demand for primary energy higher than the world average .

The study puts forward the viewpoint that though the demand for primary energy, by the two economies will be growing rapidly, the primary energy demand per capita will still be lower in comparison to the developed countries of the world. Observations reveal that in the past two and a half decades (1980 -2005) India and China had a phenomenal growth rate but the energy consumption per capita of the two countries did not increase at the same rate. Even though India and China are high growth economies the energy intensity of both the countries has declined due to energy efficiency measures adopted by them. In fact, a comparison between the growth rate of gross domestic product and per capita energy consumption of India and China (since 1990 to 2005), does not reveal any specific correlation between the two.

Methodology - A theoretical framework is developed by taking into consideration a projection period of twenty-five years (2005-2030) for demand of primary energy, in context of three scenarios namely reference scenario, alternative scenario and high growth scenario, based on the estimates made by International Energy Agency. Data has been compiled from international publications and national reports to support the hypothesis. A number of indicators and policy measures have been assessed to ascertain the per capita use of energy by India and China in relation to the developed countries of the world.

Findings - A high positive correlation between energy consumption per capita and high growth rate may reduce as developing nations are using energy more efficiently that will result in a decline in energy intensity.

Limitations - There are some important differences between IEA energy statistics for India and China and official national data, because of methodological differences and statistical discrepancies.

Practical Implications - The developing countries can adopt energy-light model of growth like India and China. Energy – light development strategies of urbanization and industrialization can be framed by late developing countries of Asia and Africa.

Promotion of energy efficient appliances, green infrastructure and energy friendly lifestyle can reduce excessive dependence on energy for urbanization.

Encouragement of clean energy projects and emphasis on industrial energy efficiency can minimize the use of energy for industrialization.

Energy conservation policy measures initiated by India and China may be adopted by developing countries.

Adoption of energy efficiency measures and energy management practices can help in reducing the energy intensity and thereby result in energy security.

Originality/Value - India and China are likely to achieve high growth rate with lesser consumption of energy per capita.

Conference Theme Addressed:- Energy Security- The Global Challenge

INTRODUCTION

Since times immemorial it has been regarded that food, clothing and shelter are basic necessities essential for the survival of an individual. With the advancement in science and technology it is now realized that access to a dependable, sustainable and environment friendly source of energy is an essential requirement of a civilized modern society. India and China are the emerging players of world economy and international energy markets. Rapid economic development in both the countries is keeping their energy demand growing. As these countries would become richer they would demand more energy for urbanization and industrialization.

This is because it is generally regarded that with rapid economic development the per capita energy consumption is also high. The study aims to answer the question whether India and China will also register energy – intensive growth as they grow rapidly in the next two decades. The objective of the study is to highlight the fact that in the last two decades the two economies experienced a high growth rate with lesser per capita energy consumption and due to initiation of energy conservation measures by both India and China, the energy intensity is likely to reduce in future. A high growth rate in the two economies may not be accompanied with higher consumption of energy per capita as experienced by the developed countries of the world. In such a scenario the high positive correlation between per capita energy consumption and growth rate may not be applicable for countries like India and China.

PROJECTIONS OF TOTAL PRIMARY ENERGY DEMAND: AN OVERVIEW

The International Energy Agency (IEA) has made projections that India and China would have greater demand for energy as they would be growing steadily in the next two-and-a-half decades (2005-2030). As economic development would take place in these countries there would be greater demand of energy for industrialization, urbanization and electronic gadgets.

Projections have been made by IEA in context of three scenarios – Reference, Alternative and High Growth. The Reference Scenario is a baseline scenario that makes projections on the basis of existing policies to conserve energy in a country. On the other hand the projections of Alternative Scenario are based on the new policies initiated by India and China for energy efficiency and energy management. The High Growth Scenario assumes that the gross domestic product growth in both the countries rises by 1.5 percentage points higher than the Reference Scenario. On this basis the average growth rate in High Growth Scenario for India is projected at 7.8% per annum and for China at 7.5% per annum. The average growth rate of primary energy demand per year in India and China in the next two decades will be higher than the world average in all the three scenarios.

Table no. 1 shows that the primary energy demand for India in the Reference Scenario is projected to grow at an average of 3.6% per annum, and for China at 3.2% per annum, while the

world average is projected to grow at 1.8% per annum. The total primary energy demand in India is projected to increase by two-and-a-half times from 537 mtoe in 2005 to 1299 mtoe in 2030 and in China to almost double from 1742 mtoe in 2005 to 3819 mtoe in 2030. The demand for primary energy by the two countries in the Reference Scenario grows at a higher rate compared to the Alternative Scenario, as it makes projections on the assumption that the government does not undertake new policies to conserve energy.

In the Alternative Scenario, the primary energy demand by India will grow at an average of 2.8% per annum (17% lower than Reference Scenario) and in China it is projected to rise at 2.5% per annum, while the demand in the world will increase at an average of 1.3% per annum. The total primary energy demand in India will double from 537 mtoe in 2005 to 1082 mtoe in 2030 and in China it is projected to rise by a little less than double from 1742 mtoe in 2005 to 3819 mtoe in 2030.

	<i>Average Annual Growth Rate (2005 – 30)(%)</i>			2005		2030	
	<i>India</i>	<i>China</i>	<i>World</i>	<i>India (Mtoe)</i>	<i>China (Mtoe)</i>	<i>India (Mtoe)</i>	<i>China (Mtoe)</i>
<i>Reference Scenario</i>	3.6	3.2	1.8	537	1742	1299	3819
<i>Alternative Scenario</i>	2.8	2.5	1.3	537	1742	1082	3256
<i>High Growth Scenario</i>	4.2	4.0	2.1	537	1742	1508	4691

Table No.1 Total Primary Energy Demand: Projections Source: World Energy Outlook, 2007, International Energy Agency

In case of High Growth Scenario the primary energy demand in India is projected to grow at 4.2% per annum and in China at 4.0% per annum. On the other hand the demand in the world will be at an average of 2.1% per annum. There will be almost threefold rise in total primary energy demand in India and China in the high growth scenario. In India the total primary demand will increase from 537mtoe in 2005 to 1508 mtoe in 2030 while in China from 1742 mtoe in 2005 to 4691 mtoe in 2030. In comparison with the Reference Scenario the demand by India and China, in the High Growth Scenario, would be higher by 16% and 23% respectively. But at the world level the demand for primary energy is only 6% higher than the projections made in the Reference Scenario.

The projections of total primary energy demand for India and China in all the three scenarios show that in the next two-and-a-half decades the total primary energy demand will be high. But if we take into consideration the total population of the two economies the per capita energy consumption turns out to be quite low. The total primary energy demand is higher because the two economies are home to one-third of world population. How much is the energy consumption per head rather than the total energy consumption should be cause of concern. The next section undertakes inter temporal and international comparison to exemplify this viewpoint.

TOTAL PRIMARY ENERGY DEMAND AND PER CAPITA ENERGY CONSUMPTION: TREND AND PROJECTIONS

A trend analysis of previous two decades of high growth, in India and China, has been done to study the relationship between the total primary energy demand and per capita energy consumption. To assess whether the two economies had a high level of energy consumption a comparison has been made with the developed economies of Japan, United Kingdom and United States. Projections for total primary energy demand and per capita energy consumption for India and China are also compared with Japan, United Kingdom and United States to assess the dependence of the two economies on energy in future.

	<i>India</i>	<i>China</i>	<i>Japan</i>	<i>United Kingdom</i>	<i>United States</i>
1980	209	604	346*	201	1811*
1990	320	874	444	212	1924
2000	459	1121	527*	234	2302*
2005	537	1742	530	235	2336
2015	719	2743	576	N.A.	2574
2030	1082	3256	567	N.A.	2712

Table No. 2 Total Primary Energy Demand (Mtoe) Table Notes and Sources:

1. Total Primary Energy Demand for India, China, Japan and United States is based on estimates of WEO, 2007, IEA.
2. Total Primary Energy Demand for United Kingdom is calculated from World Development Reports, World Bank.
3. Projections are based on annual growth rates of Total Primary Energy Demand for Alternative Scenario, WEO, IEA.
4. * World Development Report, World Bank,

India

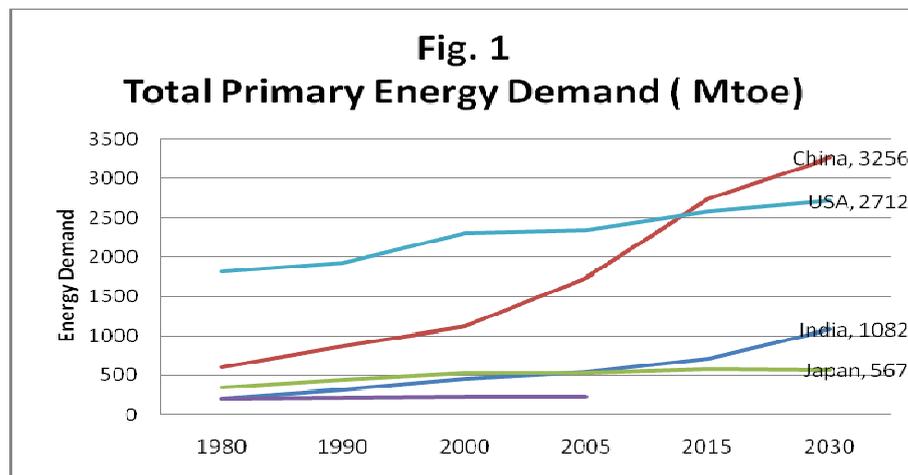

Although, in the past two-and-a-half decades the total primary energy demand in India, more than doubled from 209 mtoe in 1980 to 537 mtoe in 2005 (Table no. 2) in the next twenty-five years it is projected to just double from 537 mtoe in 2005 to 1082 mtoe in 2030. In 2005, the total primary energy demand in India was one-fourth of United States, one-third of China and almost equal to that of Japan. Even in 2030 the total primary energy demand in India will be one-third of United States and China.

As shown in Table No. 3 the per capita energy consumption in India has also increased marginally from 0.3 toe per capita in 1980 to 0.4 toe per capita in 1990 and further to 0.5 toe per capita in 2005, but compared to the other countries of the world, it is extremely low. One in every six people in the world resides in India while they account for only 5% of energy demand. The per capita energy consumption in India is about one-sixteenth of United States, one-eighth of Japan and United Kingdom and one-third of China. Projections of per capita energy consumption, for the country, for the next two decades also show a marginal increase. Energy use is projected to increase to 0.6 toe per capita in 2015 and in the next one-and-a-half decade it again rises marginally to 0.7 toe per capita. Incidentally, even in 2030 the consumption of energy

per head by India is projected to be one-third of China one-seventh of Japan, one-eleventh of United States.

China

The total primary energy demand in China in 2005 was more than Japan, United Kingdom but less than United States. Although the total primary energy demand in China almost trebled from 604 mtoe in 1980 to 1742 mtoe in 2005, it is projected to only double to 3256 mtoe in 2030. Since one-fifth of the total world population resides in China the projected total primary energy demand is also higher than Japan and United States but the projected per capita energy consumption is low.

The per capita energy consumption in China increased from 0.6 toe per capita in 1980 to 0.8 toe per capita in 1990 and further to 1.3 toe per capita in 2005. This was about one-third of Japan and United Kingdom and one-sixth of United States. The projections for China show a consistent increase in the next two decades. The per capita energy consumption is projected to increase to 1.5 toe per capita in 2010 and further to 2.2 toe per capita in 2030. Despite a rise, the projected per capita energy consumption in China will be 2.5 times less than Japan and 3.5 times less than United States.

Japan

Although, the total primary energy demand in Japan in 2005 was lower than India and China the per capita energy consumption was 8 times more than India and 3.3 times more than China. The per capita energy consumption in Japan has increased from 3.0 toe per capita in 1980 to 3.6 toe per capita in 1990 and further to 4.2 toe per capita in 2000 but decreased marginally to 4.1 toe in 2005. Though, the total primary energy demand is projected remain almost the same in 2030 the per capita energy consumption is estimated to rise from 4.1toe per capita to 4.9 toe per capita.

	India	China	Japan	United Kingdom	United States
1980	0.3	0.6	3.0	3.6	8.0
1990	0.4	0.8	3.6	3.7	7.7
2000	0.5	0.9	4.2	4.0	8.2
2005	0.5	1.3	4.1	3.9	7.9
2010*	0.5	1.5	4.2	N.A.	7.8
2015*	0.6	1.6	4.3	N.A.	7.8
2020*	0.6	1.8	4.5	N.A.	7.8
2025*	0.7	2.0	4.7	N.A.	7.8
2030*	0.7	2.2	4.9	N.A.	7.8

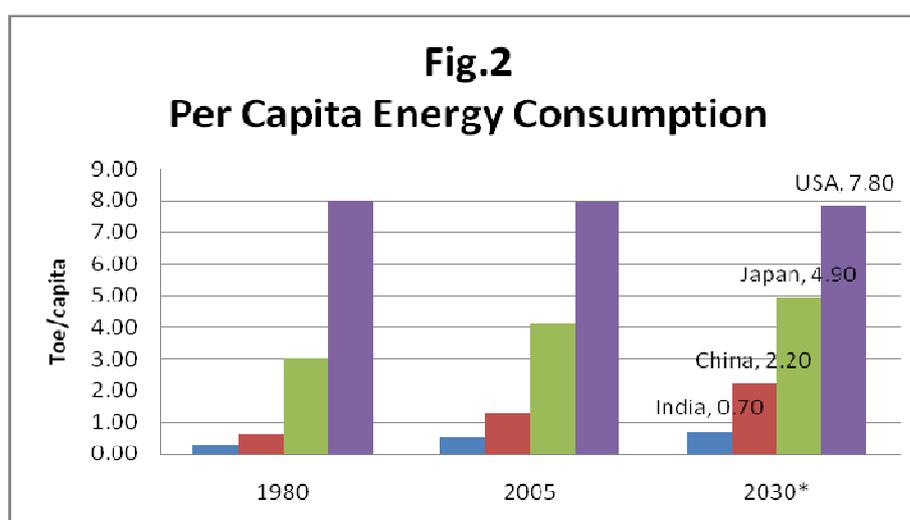

Table No. 3 Per Capita Energy Consumption (toe/capita)

Table Notes and Sources:

1. Total Energy Consumption is calculated as product of per capita energy consumption and total population by taking details of the two variables from World Development Reports, World Bank.
2. Projections of total population are based on population growth rate projections made by World Energy Outlook, 2007, IEA.
3. Projected Per Capita Energy Consumption is based on annual growth rate of energy demand projected for the Alternative Scenario in World Energy Outlook, 2007, IEA.

United Kingdom

United Kingdom has registered a marginal rise in total primary energy demand from 201 mtoe in 1980 to 235 mtoe in 2005. While the per capita energy consumption increased consistently from 3.6 toe per capita in 1980 to 4.0 toe per capita in 2000, and then decreased marginally to 3.9 toe per capita in 2005. The country had a lower total primary energy demand compared to India, China, Japan and United States.

United States

The total primary energy demand in United States has been rising consistently from 1811 mtoe in 1980 to 2336 mtoe in 2030. In the next two decades it is projected to grow at a rate of 0.6% per annum and will be 2712 mtoe in 2030.

The per capita energy consumption in United States is 15 times more than India and 6 times higher than China. Since 1980, a fluctuating trend is observed in per capita energy consumption in United States. The energy consumption in United States has decreased from 8.0 toe per capita in 1980 to 7.7 toe per capita in 1990 and rose to 8.2 toe per capita in 2000, but decreased to 7.9 toe in 2005. It is projected to decrease to 7.8 toe per capita in 2010 and remain constant at this rate till 2030.

A country may have a low total primary energy demand like Japan and United Kingdom but the per capita energy consumption may be high. The per capita energy consumption of India and China is low in comparison to Japan, United Kingdom and United States. Projections show that even though the two economies would be developed by 2030 (as assumed) the per capita energy consumption will still remain significantly low compared to Japan and United States.

RELATIONSHIP BETWEEN GROSS DOMESTIC PRODUCT AND PER CAPITA ENERGY CONSUMPTION

To ascertain the generally acceptable high positive correlation between the growth rate of gross domestic product and per capita energy consumption a trend analysis of previous two-and-a-half decades is undertaken.

	(1981-1990)		(1991-2000)		(2001-2005)	
	GDP	Per capita Energy Consumption	GDP	Per capita Energy Consumption	GDP	Per capita Energy Consumption
India	5.60	2.18	5.50	1.86	6.80	1.68
China	9.40	2.24	10.40	1.46	9.40	8.68
Japan	4.00	2.01	1.30	1.47	1.20	-0.06
UK	2.90	0.39	2.40	0.70	2.40	-0.38

Table No. 4 GDP and Per Capita Energy Consumption

Average Annual Growth Rate (%)

Table Notes and Sources:

1. Annual growth rate of GDP has been taken from World Development Reports, World Bank. Thereafter the average annual growth rate for the three time periods has been calculated.
2. Per capita energy consumption data has been taken from World Development Reports, World Bank to calculate the annual growth rate year wise $((1981-1980)/1980)*100$. Thereafter the average annual growth rate for the three time periods has been calculated.

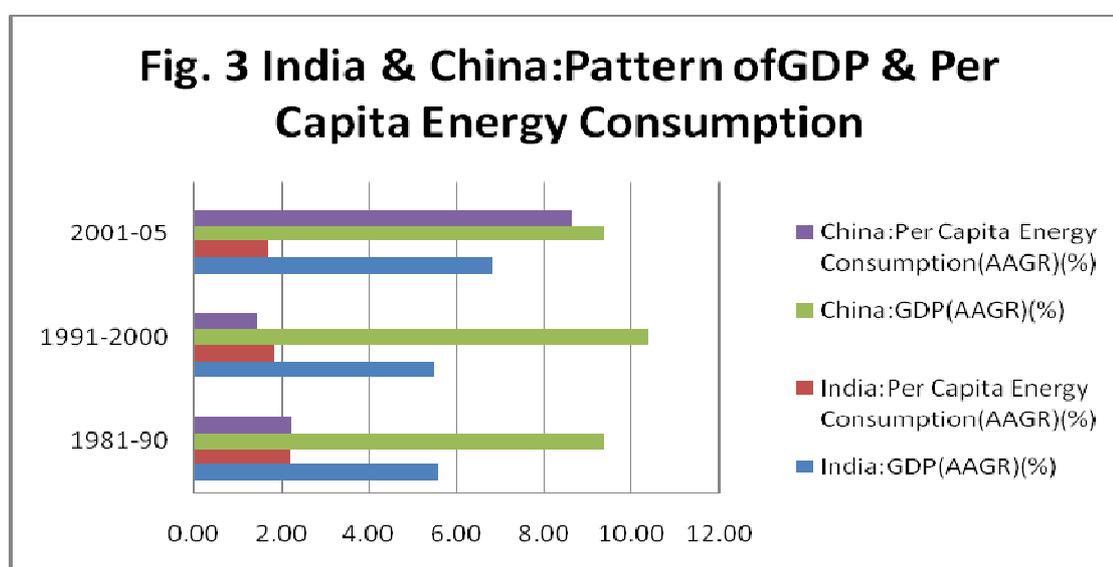

India

Though India has registered a rise in absolute per capita energy consumption since 1980 the average annual growth rate shows a consistent decline over the years. The per capita energy consumption has declined from an average of 2.18% per annum in the decade of 1980s to 1.86% per annum in 1990s and further to 1.68% per annum in the first half of current decade. This decrease has been observed despite an increase in the average growth rate of gross domestic product in the corresponding time periods from 5.6% per annum to 5.5% per annum to 6.8%.

Between 2001 and 2005 the Indian economy has grown at a rate of 6.8% per year, supported by an energy growth rate of 1.7% per year. In the previous two decades also the consumption of energy has been low despite an average growth rate of 5.6% per year.

China

In China the per capita energy consumption declined from 2.24% per annum in the decade of 1980s to 1.46% per annum in 1990s but increased in early 2000s to 8.68% per annum. This increase is due to greater investment by China in heavy industry in the early part of the current decade. The growth rate of gross domestic product increased from 9.4% per annum to 10.4% per annum but declined to 9.4% per annum in the corresponding time periods. In the decade of 1990s, China also had a phenomenal average growth rate of 10.4% per year supported by growth in energy consumption by 1.5% per year. Fig. 3 depicts an inverse relationship between growth rate of GDP and per capita energy consumption for India and China observed since 1980 with exception for 2000-05 for China.

Japan has registered a continuous decline in average annual growth rate in both per capita energy consumption and gross domestic product over the past two-and-a-half decades. United Kingdom and United States do not reveal any specific pattern between the two.

A comparison between the growth of per capita energy consumption and gross domestic product in the last two decades for the developing economies India and China does not depict a positive correlation between the two. Despite a rise in growth rate of gross domestic product the growth rate of per capita energy consumption, especially in India, has declined consistently. So also, in China excluding the 2000s decade similar relationship is discernable. Therefore, it can be stated that, as India and China would grow rapidly in the next two decades the per capita energy consumption may still be low.

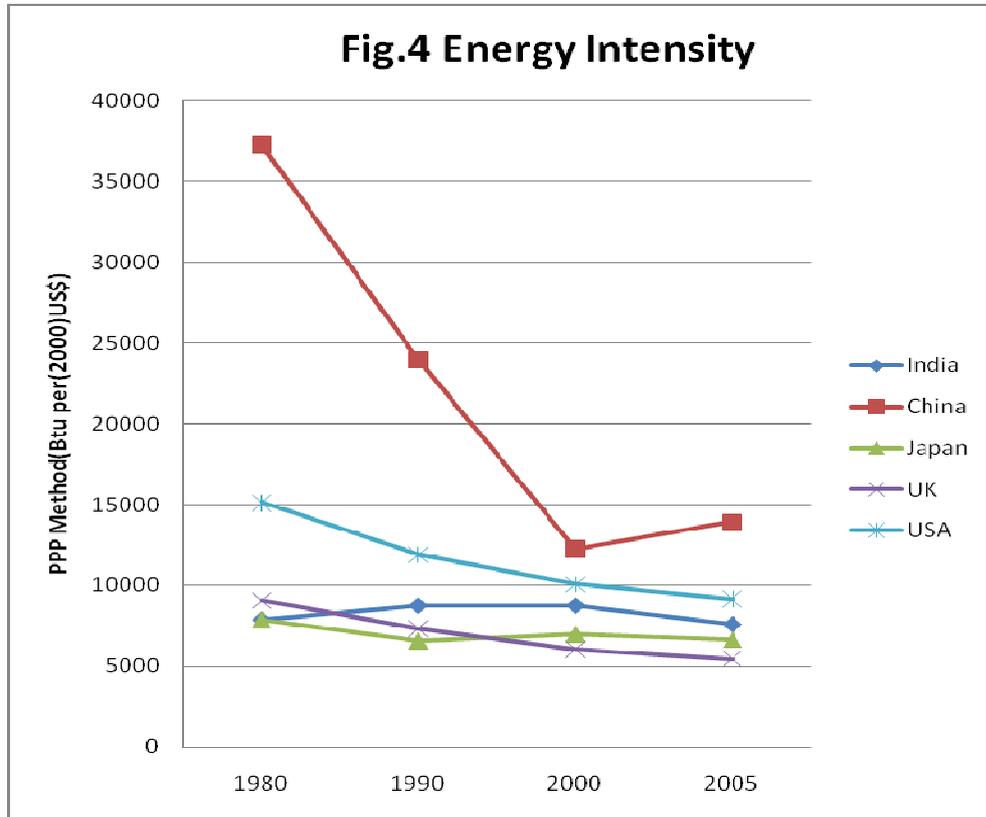

ENERGY INTENSITY

A trend analysis of requirement of energy to produce a dollar worth of GDP is the most important indicator to adjudge whether an economy of a country is energy-intensive.

Energy intensity in India has declined phenomenally in the first-half of the current decade after remaining almost constant in 1990s as shown in Table No. 5. Although China registered an increase in energy intensity between 2000 to 2005 it registered a continuous decline since 1980. This is a remarkable achievement for the two rapidly developing economies. A similar pattern of reducing energy intensity is also observed by Japan, United Kingdom and United States but they are developed countries. Fig. 4 depicts a decrease in energy intensity for both, the high growth developing economies and developed economies.

MEASURES TO REDUCE ENERGY INTENSITY

Energy friendly consumption pattern, emphasis on recycling ratios, and initiatives for industrial efficiency are some of the major factors that can help in a reduction in energy intensity in the short run. Measures to improve energy efficiency and conserve energy play a significant role in reducing energy intensity in the long run.

	<i>India</i>	<i>China</i>	<i>Japan</i>	<i>UK</i>	<i>USA</i>
<i>1980</i>	7870	37279	7863	9053	15135
<i>1990</i>	8738	23956	6567	7319	11902
<i>2000</i>	8741	12238	6983	6027	10082
<i>2005</i>	7582	13919	6636	5451	9146

Table No. 5 Energy Intensity-PPP Method(Btu per (2000) US\$) Source: International Energy Annual 2006, Energy Information Administration-Table posted on December 19,2008

(A) **Short Run Measures** - Major factors that have led to reduction in energy intensity in India and China are discussed below.

(a) **Patterns of Consumption** - The lifestyle of Indian and Chinese consumers is regarded as energy friendly. Consumers in India and China are amongst the three top scoring countries on Green index score as shown in Fig 5. "In spite of fears that their (India and China) Greendex scores could drop with economic development, most of these countries have improved their scores" (Greendex, 2009)¹. Greendex measures the discretionary and nondiscretionary consumption patterns to save energy in a country. It is a comprehensive measure of consumer behavior in 65 areas relating to housing, transportation, food and consumer goods. A brief

discussion of the sub-indices is undertaken to highlight the lifestyle habits that help in saving energy.

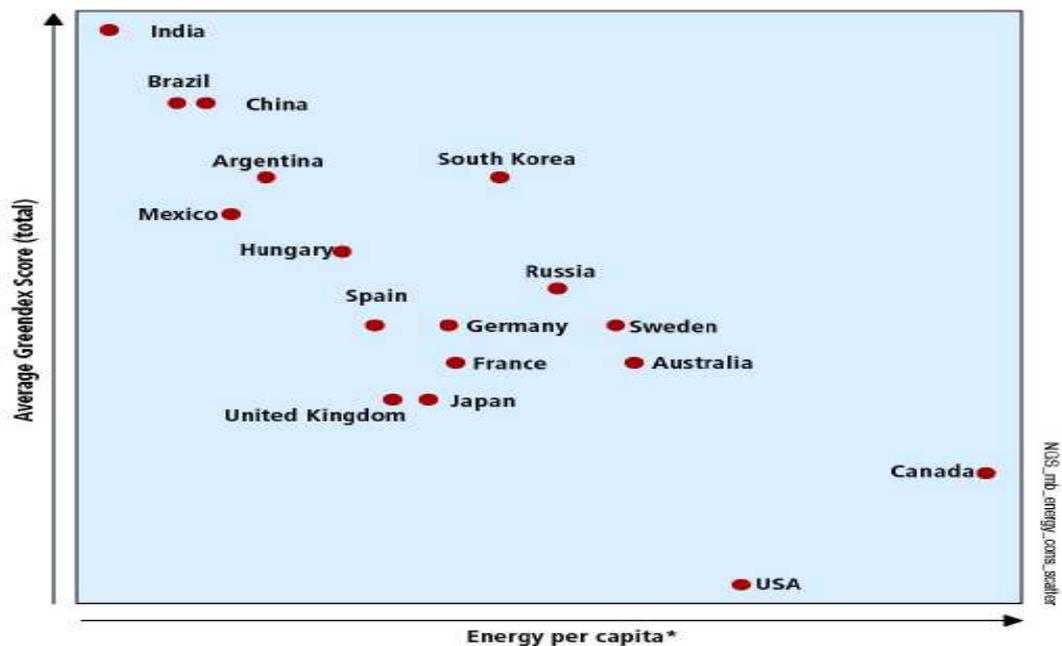

Fig 5 Greendex Score Source: Market Basket Report May 2009 Pg.15 *kg of equivalent oil

- 1) **Housing** - People in India and China score higher in this sub - index partly because they generally have smaller residences and use less energy in their homes. Consumers in the two economies engage in energy – saving activities, such as thermostat settings, minimizing their use of fresh water, and washing laundry in cold water.
- 2) **Transportation** - India and China registered a drop in transportation index perhaps as a result of peak prosperity in early to mid-2008, but the consumers in these economies tend more than others to walk, cycle or use public transportation.
- 3) **Food** - Though the scores of Indians in this sub-index dropped by 4.5 point since last year, they still top this index. This is so because they eat least amount of meat and seafood, while consumers in other countries tend to consume both meat and seafood at least once a week.
- 4) **Goods** - India and China topped this index. Indians recorded the highest year-on-year improvement in this index. Indian and Chinese consumers are more likely to buy environmentally friendly products, buy second-hand items and recycle goods frequently.

(b) **Recycling Processes** - Recycling processes have led to a reduction in energy demand. The high ratio of recycling in India (70%), compared to that of other major economies like Japan (53%) and United States (30%) has also limited the growth in energy use, because of the lower demand for virgin material such as steel, aluminum and copper.²

(c) **Industrial Efficiency**

Over the past decade, energy efficiency in Indian industry has increased steadily. In the major energy-consuming industrial sectors, such as cement, steel, aluminum and fertilizers, average specific energy consumption has been declining because of energy conservation in existing units, and (much more) due to new capacity addition with state-of-the-art technology. The specific energy consumption of Indian cement plants and of Indian iron & steel plants has been declining rapidly. In the cement sector, the specific energy consumption of the most efficient plants is now comparable to that of the most efficient plants in the world.³

(B) **Long Run Measures** - Policies for energy efficiency have been initiated in India and China. These policy measures will help in reduction of energy use in the long run.

India - One of the basic objectives of policy initiatives in India has been to increase energy efficiency that would help in a reduction in energy intensity. These measures have been undertaken in all the four energy consuming sectors of the economy. Some of the major policy initiatives are listed below.

(i) Policy measures in the **Power Generation Sector**

1. India has taken a step forward towards replacing more than 25 years old and smaller units with the ultra mega power projects.

2. Since 2002 India is engaged in the research and development of integrated gasification combined cycle (IGCC) technology programme which is expected to give results by 2020.

3. Integrated Energy Policy was implemented in 2005 to increase the coal plant efficiency from 30% to 39% which will result in two percentage points higher efficiency for new plant compared to reference scenario.

(ii) Policy measures in the **Industrial Sector**

1. Government of India is encouraging use of more combined heat and power (CHP) technology with increased use of biomass potential in the pulp and paper, textiles, chemical and fertilizer industries.

2. The National Steel Policy aims to reduce cost and improve efficiency and productivity of iron and steel sector. The Steel Authority of India has taken various steps to improve the operational efficiency and deployment of technologies to reduce energy consumption.

3. The Energy Conservation Act 2001 which stipulates the mandatory audit requirement in 15 energy intensive industries will reveal the potential for energy savings if the recommended energy efficiency measures are implemented.

4. Cement production will be less energy-intensive due to reduced energy intensity because of reduction in clinker/cement ratio.

(iii) Policy measures in the **Transport Sector**

1. India has introduced vehicle emission standards based on European Vehicle Emission Standards which has primarily impacted CO₂ emissions but has made a significant impact on fuel consumption.

2. India is stressing more on public transport and infrastructure development by introduction of rapid transit bus system and underground rail system.

3. India is moving towards vehicle fuel efficiency resulting from increased co operation with foreign manufactures and deployment of more advanced technology.

4. Indian Government has taken a decision for mandatory rating of vehicles by 2011 based on fuel consumption per kilometer and BEE will be responsible for administration of the programme and label vehicles as per their energy efficiency.

(iv) Policy measures in the **Residential Sector**

1. Bureau of Energy Efficiency has released a National Building Code for commercial and large residential buildings, with provisions for better building orientation, roof and wall insulation and the adoption of energy efficient lighting and air conditioning system.

2. Bureau of Energy Efficiency has launched National Energy Labeling Programme in 2006 which requires mandatory energy efficiency labeling of various electronic gadgets like CFL, refrigerator, air conditioners, electric motors and ceiling fans. BEE tends to achieve the target of average appliance efficiency improvement being 30% higher in 2030.

3. Bureau of Energy Efficiency has launched Bachat Lamp Yozana in 2008 to encourage the use of CFL in place of incandescent lamps.

China –Realising the need to reduce energy intensity several policy measures have been initiated in China.

(i) Policy measures in the **Power Generation Sector**

1. China has taken various policy measures to improve the efficiency of electricity use which will reduce the electricity generation by 12% as compared to Reference Scenario.

2. After 2015 China will be able to achieve increased efficiency of new coal fired power plants, the efficiency level of these plants are expected to be 39% in 2030 which is quite closer to the efficiency level of OECD countries (42%).

3. China has taken several steps for the faster deployment of cleaner technologies which includes super critical, ultra supercritical and integrated gasification combined cycle plants. Faster deployment of these technologies will increase the efficiency of new power plants.

(ii) Policy measures in the **Industrial Sector**

1. China has increased export tax by 5-10% in energy intensive product like steel & non metallic minerals and also decrease or elimination of export credits for energy intensive products like steel.

2. China has initiated Top 1000 Enterprise Energy Conversation Programme with the objective of managing the energy use at the top consuming 1008 industrial firms and utilities through energy auditing, reporting, formulating goals, incentives & investments.

3. In 2005 China took steps to promote industrial energy efficiency by closing inefficient small scale plants in energy intensive industries. Under this policy China has identified 250 million tonnes of small capacity will be eliminated and for iron ore production 100 million tonnes of outdated capacity will be eliminated by 2010.

4. China has taken policy measures for increasing the efficiency of energy use in iron and steel sector by increased use of scrap steel recycling.

5. The 11th five year plan has taken steps to increase the share of service sector in the GDP of country, so that by 2020 value added services would account for more than 50% of GDP.

6. China has the potential of implementing gas based ammonia production, if this process is introduced energy intensity improvement of more than 20% could be achieved.

(iii) Policy measures in the **Transport Sector**

1. China is giving several incentives to promote the use of public transport system like Bus Rapid Transit Development in major cities, providing subsidies to students for using public transport.

2. China has enacted a policy for early scrappage of vehicles , not for revenue passenger vehicles to be scrapped after 10/15 years, for revenue passenger vehicles to be scrapped after 8/10 years & trucks to be scrapped when they reach 10 years.

3. China intends to implements fuel tax on gasoline & diesel.

4. In April 2006 China implemented sales tax on vehicles.

5. In July 2006 China has implemented fuel economy standards for light-duty vehicles (LDVs). LDV are expected to be 40% more efficient than 2005 models, new trucks are expected to be 36% more efficient.

(iv) Policy measures in the **Residential Sector**

1. China Energy Label has been introduced for energy efficiency labeling for refrigerators, air conditioners and washing machines.

2. China has already introduced different building codes for three regional zones. In 2007 China has passed National Standard for Residential Buildings. It targets to reduce energy consumption in new buildings by 50% by 2010 compared to efficiency of 1980 buildings.

3. China has taken several steps for mandatory and voluntary certification and more stringent penalties to ensure the phase out of inefficient products.

4. China intends to provide fiscal incentives such as reduction of value added tax to make more energy efficient appliances cheaper for consumers and manufacturers.

5. China has taken various measures for the speedy deployment of advanced energy insulation for building and of conservation measures such as combined space heating and cooling systems.

A host of short run and long run measures have led to a reduction in energy intensity in India and China. If the consumers of the two economies pursue energy friendly lifestyle and the energy efficiency and energy conservation policies are implemented timely, the energy intensity in both the economies may remain constant or reduce further.

CONCLUSION

Even though India and China have been growing rapidly since 1980s their high growth rates have not been supported by high per capita energy consumption. If a similar growth pattern of reducing energy intensity is followed by them, then the two economies would experience energy-light growth. Reducing dependence on energy requirement and an increase in energy efficiency will help in achieving energy security.

This conclusion would also help in mitigating the thought that, since India and China have a large population as these economies would grow rapidly their demand for energy will be very high, that will lead to rapid depletion of energy resources of the world (Anup Shah).⁴

Energy-light model of growth can be emulated by the developing countries of Africa and Asia. Energy saving practices like, use of energy efficient appliances and public transport, and recycling of goods can help in reducing the demand of energy for urbanization. Demand of energy for industrialization can be decreased by conservation of energy in energy-intensive industries like, iron and steel, cement aluminum and fertilizers. Energy conservation and energy management policies can be framed specifically for power generation sector, industrial sector, transport sector and residential sector to reduce energy intensity. The lower the energy intensity, the more will a country have energy security. Growth rate of an economy can be increased rapidly with lesser dependence on energy.

WHAT THE ESSENTIAL COMPETENCIES FOR INTERNATIONAL MARKETEERS? AN EXPLORATORY STUDY

Soares, Ana Maria¹

¹*School of Economics and Management, Gab 3.02, University of Minho, 4710-057 – Braga, Portugal*

The globalization of economies poses considerable challenges to companies. Firms are no longer protected by local governments nor can they afford to ignore non-domestic competitors. This context calls for an understanding of the important competencies required for the success of international marketing activities.

An exploratory study was conducted in Portugal to identify the competencies that managers perceive as more important for dealing with the complexities of export, international and global marketing. Respondents recognized the challenges specific to marketing at the international level and the need for specialised knowledge in international marketing environments and in operational techniques, as well as the importance of specific competencies for international marketers.

INTRODUCTION

The globalization of economies poses considerable challenges to companies. This painful reality has been felt increasingly by Portuguese companies, who now realise that the small-scale of the Portuguese internal market can compromise their firms' future. In such a context, going international is vital for companies, including Small and Medium enterprises (SMEs), even for those which traditionally would not consider marketing opportunities abroad.

Becoming active and successful in international markets, however, poses substantial hurdles to marketing managers. Indeed, understanding international markets and competitors and defining marketing strategies is arguably more complex than those deployed in domestic markets.

This raises the question of what kind of expertise (competencies and knowledge bases) do international marketing managers need to help companies compete internationally. Identifying such competencies required for international marketing operations may greatly contribute to understand success requirements in international markets. Such an understanding may offer important insights for promoting internationalisation efforts at different levels: policy making, industry boards' activities and companies recruiting and training activities. Additionally, it may have important consequences for universities, contributing for designing adequate graduate and post-graduate international marketing (Beamish and Calof, 1989; White and Griffith, 1998; Yenyurt et al. 2005; Gray et al 2007).

In addition, a general concern in business-related subjects' teaching concerns whether formal university education is relevant from the companies' perspective, i. e. whether university education is effectively capable of developing the capabilities required by companies (Beamish and Calof, 1989; Gray et al, 2007). Beamish and Calof (1989) contended that the content of international programs should be set in consultation with industry so as to assure its relevance.

Thus, several studies surveyed practitioners' in order to identify the knowledge base and capabilities perceived as important for different management functions. Such studies may prove useful in highlighting areas and methods of training which are relevant for inclusion in academic curricula and training programs. In what concerns International Marketing, however, there is a dearth of research addressing the development of global knowledge competencies (Yeniyurt et al, 2005) and to the best of our knowledge no such study has been conducted in Portugal.

This paper describes the result of an exploratory study carried out to identify the competencies deemed most important for marketers and managers dealing with international markets and consumers, as well as their educational background. The paper is organized as follows: first, literature regarding development of international competencies is reviewed, then the study methodology findings are presented. Conclusions and implications follow.

LITERATURE REVIEW

Markets have become global for most industries and services. Firms are no longer protected by local governments nor can they afford to ignore non-domestic competitors (Cavusgil, 1991; Yeniyurt et al, 2005). Thus, the importance of internationalisation for companies' long term survival has been emphasised, for example Yeniyurt et al (2005, 2) contends that "having a global orientation is no longer a luxury, but a necessity for economic survival in a large number of industries".

Becoming active and successful in international marketing (IM), however, poses considerable challenges to international marketing managers (IMM). Among these, are questions related to international marketers' competences and expertise. In fact, international marketing presents specific challenges: "International marketing managers have a role that differs substantially from that of the national marketing managers with whom they deal. It is not the same function just for a larger, or global market" (Ambler et al, 1992, 47). In a similar vein, Harvey (1996, 103). contended that "The quality of managers in foreign assignments appears to be even more critical than in domestic operations"

Thus, it has been argued that IM requires specific competencies and knowledge base (Johanson and Vahle, 1977, Ambler et al, 1992, Beamish and Calof, 1989, Monye, 1995, Gorchels et al, 1999; Yeniyurt et al, 2005).

The process model of internationalisation highlighted the impact of knowledge, both objective and experiential, in the degree of internationalisation of the firm (Johanson and Vahle, 1977). Objective knowledge refers to issues such as market methods, statistical tools and can generalised across markets while experiential knowledge pertains to culture, distribution systems and market characteristics. Experiential knowledge influences perceived market uncertainty and therefore impacts on commitment to internationalisation (Hadley and Wilson, 2003). The knowledge base required for firm's internationalization includes "foreign institutional knowledge, or knowledge of governments, institutional frameworks, norms and

culture, (and) is significantly related to the degree to which firms have invested in foreign assets and, marginally to the foreign earnings achieved" (Hadley and Wilson, 2004, 712).

De Toni and Nassimbeni (2001) emphasised the role of characteristics of the entrepreneur (decision maker's export expectations, level of education and amount of experience, attitudes towards risk, etc) as variables explaining firm's propensity for exporting and level of success abroad.

Consequently, although the barriers faced by companies when going international are numerous, the fact that competencies-related barriers constitute an important constraint especially for SMEs in accessing international markets has been acknowledged by academics, practitioners and policy-makers alike.

Policy-makers have highlighted the need for developing specific capabilities for international marketing. OECD-APEC listed a number of barriers to SME's internationalization (OECD-APEC, 2006) which included identifying international business opportunities, locating and analyzing suitable markets, contacting potential overseas customers, obtaining reliable foreign representation, accessing finance for internationalization, Engaging specialist staff to assist with the management of international markets, etc. According to the "Final Report of the Expert Group on Supporting the internationalisation of SMEs" (EU, 2007), these problems can be grouped into three groups of concern: Insufficient managerial time and/or skills required for internationalization; lack of financial resources and lack of knowledge of foreign markets.

Concern for the need for specific competencies in international marketing has been expressed by managers as well. For example, an empirical study conducted in UK managers concluded that "75% of the sample felt there was need for specialized knowledge of international marketing management for companies to succeed in their international operation" (Monye, 1995: 8). However, the lack of qualified human resources has been acknowledged: "the shortage of qualified international managers to expatriate is considered to be one of the most significant constraints on the expansion of multinational corporations" (Harvey, 1996: 103).

Concurrently, several studies documented the importance of an internationally oriented education system as a means to enhance companies' and countries' competitiveness at the international level (Beamish and Calof, 1989; Gniewosz, 1996; White & Griffith, 1998). A comparative study of the 21 top US graduate programs in international business and found that the majority of the programs had internationalised the curriculum to only a small extent while experts emphasised "the need for international managers to understand the interdisciplinary nature of problems in a culturally diverse manner" (White & Griffith, 1998, 110). In general, these studies expressed their concern for the fact that course content had not achieved the practical content orientation to cultivate high-caliber global managers" (White & Griffith, 1998, 110-11).

Ball and McCulloch (1993) studied the views of American multinational CEOs on the importance of international business education and courses such as Principles of International business, International Marketing and International Finance were valued. Nevertheless, 80% of the respondents agreed that the international aspects of the business were learned by employees on the job.

In fact, the suitability of academic programs to meet practitioners requirements is a recurrent concern among business disciplines and the question whether IM curricula are responsive to corporate needs has also been addressed (Beamish & Calof, 1989; White & Griffith, 1998). In general, these studies pointed to the conclusion that training for IMM calls for collaboration between Universities and the practitioners' (Beamish & Calof, 1989, Monye, 1995).

This brief literature review identified a gap regarding the understanding of IMM' competencies. We carried out an exploratory study in order to identify the competencies that managers perceive as more important for dealing with the complexities of marketing at the international level.

METHODOLOGY

As a preliminary step, a content analysis of recruitment ads for IMM published by a major national weekly newspaper during a 30 day period was conducted. These were analyzed in terms of required education, experience, and competencies.

Personal interviews with IMM and Human Resources managers of exporting companies were conducted. The list of exporting companies of the official Portuguese Export Agency (ICEP – Instituto das Empresas para os Mercados Externos – www.icep.pt/www.portugalinbusiness.com) was used to identify potential companies for the interviews. A convenience group of companies from diverse industries were identified and their international marketing managers were contacted; Notably, textile companies are predominant reflecting the structure of the industry in the northern region of Portugal, where interviews were held.

Nine in-depth interviews of about 60 minutes were conducted. Most of the interviews were conducted by two researchers. Interviews were transcribed and content analyzed. All companies were strongly orientated to international marketing with sales in international markets of up to 99% of total sales. Although none had an international marketing department, interviewees were mostly top managers, either marketing managers or CEOs, directly involved in setting international activity strategies.

RESULTS

The content analysis of recruitment ads revealed that employers typically seek for higher-education individuals, with previous experience in international markets preferably in the same industry. Fluency in English was required, and in some cases other languages were valued. Interpersonal, organization and marketing management capabilities such as negotiation and information technologies were strongly emphasized.

In what concerns the interviews, in spite of the importance of international sales and/or international activities, none of the companies had managers with specific educational background in IM. In general, respondents highlighted the specificity of IM activities, the need of specific theoretical training and experience, the importance of strong technical knowledge of the value chain, the need for considerable investments in time and financial resources in order to obtain results in international markets, and the lack of reliance on the government as a source of export knowledge and information.

Additionally, respondents agreed that training in marketing, and specifically in IM, could help solve some of the problems related to their international activity and sales. These include the difficulty to identify and deal with differences between domestic and international markets; handling the bureaucratic/red tape in foreign markets; difficulty in establishing and maintaining relationships with international partners, including communication and cultural problems; difficulties in launching brands internationally; international segmentation and positioning; and the high level of resources needed for marketing internationally, difficult to obtain for individual companies.

Identifying required competencies for IM was a key driver of this research. Several competencies deemed important for IM were pointed by respondents. These can be grouped under three types: Personal and interpersonal competencies, Supporting competencies and specific competencies.

Personal and interpersonal competencies

Respondents highlighted the importance of personal and interpersonal competencies as well as personality-related traits needed to be successful in this area. Specifically, organization, communication, and cross-cultural skills such as adaptability and flexibility and curiosity and openness to new cultures and behaviours.

Supporting competencies

Issues covered were the importance of quantitative methods, information technologies, and foreign languages. English was obviously required, but other languages such as Spanish, Russian or Chinese were also highly valued.

Specific competencies

Specific competencies required for international marketers were grouped into two major groups:

Technical and substantive knowledge

Included here were knowledge of the international system, international economy, and international commerce needed to understand the dynamics of international negotiations and cooperation, namely questions such as international agreements and organizations; international law and contracts; negotiations and alliances; logistics; custom formalities; and exchange rate fluctuations.

Strategic and operational marketing skills

These competencies pertain to the need to fully understand the value chain of the business and the technical aspects of the product and process, including sourcing decisions and outbound logistics;

DISCUSSION AND CONCLUSIONS

This exploratory study sought to evaluate the requirements for success in international marketing, including the identification of main problems in international marketing and the needs of employers in this area.

The specificity of international marketing was recognized by respondents, who acknowledged that international marketing activities requires specific theoretical training, experience, as well as a strong technical knowledge of the business value chain.

The lack of qualified human resources to work in this area was highlighted by several respondents. Companies rely on experience and in-job training to develop expertise in international markets. Experience, preferably in the same industry, was also evident in the recruitment ads and interviewees highlighted the importance of recruitment within the industry.

However "learning 'on-the-job' is often not an optimal mode for acquiring exporting knowledge" (Samiee and Walters, 2000: 89). Offering executive training seminars in international marketing and international business may, thus, represent an opportunity for universities. It has been suggested that, in times of economic constraints which constraint companies to recur to expatriate, "the education process assumes even greater significance in creating international knowledge" (Cavusgil, 1991: 93). This type of offering presents specific requirements. For example, a study on the perceptions of export education revealed sporadic and regular exporting firms have different requirements of regarding this type of training programs (Samiee and Walters, 2000).

Improving course curricula in order to allow students to develop and train these competencies will certainly provide companies with more qualified human resources for successful international marketing. Although experience, by definition, cannot be taught, different pedagogical methods provide hands-on-reality learning environments. Active learning such as project-led education-based methodologies and case studies can be used as experience-based approaches allowing enriching students' problem solving capabilities.

The identification of essential competencies for IM constitutes an important contribution of this study. The importance of cross-cultural competencies has been highlighted. Cross-cultural competence has been defined as "an individual's effectiveness in drawing upon a set of knowledge, skills, and personal attributes in order to work successfully with people from different national cultural backgrounds at home or abroad", (Johnson et al, 2006, 530). This is, thus, a particularly relevant requirement for engaging in mutually satisfying inter-cultural encounters which requires further attention from an international business perspective (Johnson et al, 2006).

Cross-cultural competencies can be improved through experience and cross-cultural sensitivity training. Thus, it is important to provide students with opportunities for cross-cultural environments and contacts. Exchange programs such as EU Erasmus can contribute towards this end however more systematic approaches towards this end may be implemented. Kayes et al (2005) identified the following competencies for cross-cultural knowledge absorption: Valuing different cultures; building relationships within the host culture; listening and observing; coping with ambiguity; translating complex ideas; taking action and managing others.

The importance of foreign languages is another question which can be stressed. This finding is in accordance with the results of different studies which have acknowledged the need to include foreign languages in international business programs curricula (Grahm and Van Bloomen, 1995; Shanahan, 1996). The importance of language as a condition for developing cross-cultural competencies cannot be understated: "The importance of multi-lingual competence in the contemporary business environment is so palpable and so universally recognized as to be a cliché" (Shanahan, 1996). Foreign language knowledge is not only required for effective communication in foreign countries, as it constitutes a means to understand culture (Kayes et al, 2005).

Although the study has limited generability, these results provide implications which can contribute to improve graduate and executive education course design in the area of International marketing and business.

AN EVALUATION OF THE USE OF COMPETENCIES IN HUMAN RESOURCE DEVELOPMENT – A HISTORICAL AND CONTEMPORARY RECONTEXTUALISATION

Stokes, Peter¹

¹*Lancashire Business School, University of Central Lancashire, PRESTON, PR1 2HE, United Kingdom*

Competencies have come to play a central role in a wide range of settings in United Kingdom public and private sector contexts. In many regards, these developments reflect wider international and global discussions and movements concerned with competency and how to assess, nurture and develop it.

The paper provides a historical contextualisation of competencies in the United Kingdom. In particular it outlines a brief history of the evolution of competencies in this context underlining the recent and rapid emergence and implementation of competencies in a wide range of organizational and human resource development situations. The paper examines the nature of competencies and the epistemological and ontological paradigms on which these approaches are couched in a British historical socio-cultural context. Within that context, many of these approaches (herein the paper pays particular attention to the British National Vocational Qualification System – NVQs) are underpinned by an empirical, pragmatic and ultimately modernistic, positivistic predilection. In an attempt to reappraise this rigid and highly structured representation of competencies, the paper draws on the resources of Critical Management approaches and notions of 'lived experience'. In this way, it aims to contribute to the small number of marginal revisionist voices in the mainstream competencies literature. This is supported by a qualitative methodology built on an in-depth two-year ethnographic study (employing participant-observer methods) of a consultancy delivered training programme for customer service competency based vocational qualification in a water utilities company based in the north of England.

Overall, the paper provides an assessment and a critique of the experience of competencies and vocational training in a United Kingdom and finds that, in the context examined vocational qualification competencies frameworks do provide a structure framework with which to catalogue employees' work and roles. However, they are weak at capturing and portraying the rich panoply of multifarious emotions and social interactions that take place in the workplace and everyday job life.

Key words: competencies, positivism, critical, lived experience.

INTRODUCTION

Competencies have come to play a central role in a wide range of settings in United Kingdom public and private sector contexts. In many regards, these developments reflect wider international and global discussions and movements concerned with competency and how to assess, nurture and develop it. The paper provides a historical contextualisation of competencies in the United Kingdom. In particular it outlines a brief history of the evolution of competencies in this context underlining the recent and rapid emergence and implementation of competencies in a wide range of organizational and human resource development situations. The discussion examines the nature of competencies and the epistemological and ontological paradigms on which these approaches are frequently couched in a British historical socio-cultural context. In an attempt to reappraise competencies, the paper draws on the resources of Critical

Management approaches and perspectives and, in particular, embraces notions of 'lived experience'. In so doing, it combines with the small number of marginal revisionist voices in the mainstream competencies literature. This is supported by an in-depth two-year ethnographic study (employing participant-observer methods) of a consultancy delivered training programme for customer service competency based vocational qualification in a water utilities company. Overall, the paper provides an assessment and a critique of the experience of competencies and vocational training in a United Kingdom.

A Historical Contextualisation of Competences in the United Kingdom

The last three decades in the United Kingdom have witnessed a widening role for competencies and related terminology in the workplace and increasing attempts to classify behaviours and attributes required for varying job situations. Indeed, talking about the growth of competencies in the 1980s and 1990s, Hirsh and Strebler (1994, p.81) suggested that the development of competency based training for organizations emerged as a '... a veritable industry in the late 1980s and ...into the 1990s...' and Sparrow and Bognanno (1994, p.57) that 'Competency based approaches [have] been a rising star'. In turn Garavan (2001, p.144) notes 'The increased usage of competencies is also reflected in the burgeoning academic literature on the topic'. In the intervening period, vocational and competency based training have witnessed a range of transformations and remains prevalent.

Competencies grew out of a response to increasing concerns and a recognition in the 1980s that the United Kingdom was falling behind other national economies with regard to skills and qualification levels in the labour force and notional competitiveness (Edwards-Zara, 2005, p.420). They were also viewed as a more individually focused and non-elitist qualification in comparison, for example, with traditional classroom, theory-intensive further and higher qualifications (Pate, Martin, Robertson, 2003, p.172). These concerns were manifested in government reports such as the (now defunct) Manpower Service's Commission *New Training Initiative: an Agenda for Action* (Manpower Services Commission, 1981) and the government white paper *Working Together, Education and Training* (Department of Education, 1986). The central tenet of these policies was the initiation of an employer-based system of training predicted on consolidation and formalisation of job roles and competencies across a range of industrial and business sectors. The Management Charter Initiative (MCI) played an early central role in established the occupational standards for management that would link into the creation of vocational qualifications.

Identified competencies are typically constructed into competency frameworks. These frameworks may be developed within a given company or, alternatively, the framework might be adopted from an existing national qualification system developed, supported and administrated by a network of government departments, quasi-government and private organizations. One of the difficulties with generic frameworks is that they may apply only generally to a specific company situation. This has drawn charges against them with regard to their relevance (Hirsh and Strebler, 1994, p.90)

In the academic domain, a key early commentator on commentators was Boyatzis (1982) following the work of McClelland (1973). His central contribution was the need to achieve performance through the identification of the underlying personality traits, skills and abilities

within the job. In particular, what attracted the attention of organizations and governments was the possibility of a systematic way of managing superior performance of individuals in a given population and of measuring the associated training inputs and achievement outputs (Gibb and Megginson, 2001,p.152). In particular, Boyatzis research identifies important managerial competences in notional 'soft skill' domains such as, among others, 'efficiency orientation' 'concern with impact', 'proactivity', 'self-confidence', 'conceptualization' 'use of socialized power'. As the academic discussion gathered pace in the 1980s a not always useful series of arguments concerning appropriateness of nomenclature were perhaps unavoidable. Not least of all was the debate about the important and difference of 'competences' and 'competencies' which does not need to be rehearsed here. Suffice to say, nevertheless, that 'competencies' emerged as the term in common usage in the contemporary era (Sparrow and Bognanno, 1994, p.58)

The attention given to competencies stems from a long post-war malaise and transition in the United Kingdom economy concerning performance, efficiency and effectiveness. This was largely the residue and impact of movements and discussion taking place in North America and this was perhaps an inevitable part of a well rehearsed dialectic between the United States of America and the United Kingdom. Indeed, in analysing the influence of American management thought and practices on a range of European countries, Engwall and Zamagni (1998) characterise the United Kingdom as a 'late adopter'. This is certainly the case in the area of competencies where the movement followed on from the work in the United States by McClelland (1973) and Boyatzis (1982).

The development and adoption of competencies has been carried out based on a number of assumptions and desired outcomes. These include the establishment and attainment of an *objective* measure of being able to do all, or part, of a given task. There are many different kinds of competency discussed in the various areas of business and management literature. For example, it is possible to talk about individual or organizational competencies. Murray (2003, p306) describes these as:

- (1) *Personal (or management competencies)*. Those competencies that comprise personal attributes, skills and behaviours to perform a function or task of a job in a designated ...way
- (2) *Organisation competencies*. Those competencies defined by processes, systems and practices (e.g. training methods, performance appraisal reviews, motivation techniques, change programs, technical processes) that enable any firm to turn personal competencies into organisation-wide competencies...'

In turn, strategic management discourse has dedicated time to analysing the concept of core competencies of the firm (Prahalad and Hamel, 1990). This particular approach reviews what abilities and skills the firm possesses at present, and may possess in the future, and how these might be configured in order to achieve competitive advantage. Such resource-based competencies may be knowledge based 'they are not solely human but rather composed of human capital, social capital (important relationships that exist) and organizational capital (i.e. processes, technologies, databases) (Snell et al in Wright et al (2001)) It is frequently the case, to

discuss organizational competencies in terms of tangible (financial, technological, physical, human) or intangible (brand name, reputation, know-how) (Bratton and Gold, 2007, p.55)

In relation to personal competencies Woodruffe (1992, p.17) states that competencies are 'the set of behaviour patterns that the incumbent needs to bring to a position in order to perform its task and functions with competence'. Whereas, Bratton and Gold propose that 'competencies' are the:

'Underlying characteristics of a person which result in competent or effective performance taking into consideration the nature of the task and the organization context' (Bratton and Gold, 2007, p.580).

In essence, both definitions point at what the person concerned brings to a given role. At the level of the individual, competencies have been stated as typically comprising 'three recurrent features:

- a competence is seen in the context of a particular job or job role and the organization in which that job exists
- Competences are positively associated with superior performance
- Competences can be described in terms of specific behaviours which can be observed in the job' (Hirsh and Strebler, 1994, p.83)

The Income Data Services (2008) argued that competencies usually define behaviours that an employer values and believes will play a role in the organization's long-term goals and that competencies can usually be seen as either behavioural or technical.

There is an interesting and important nexus to be made between organizational and individual competences in that they are both focused on with the shared, ultimate, objective of achieving competitive advantage at a range of levels leading up to advantage for the entity of the firm as a whole. Competencies, whether, organizational (tangible or intangible) or individual are intended to align, marry and support larger organizational goals, objectives and strategies (Hafeez and Essmail, 2007). Margerison (2001) has also pointed up that there is too much time dedicated to discussing individual competencies when in fact it is team competencies that are as, if not more, important.

A number of advantages and disadvantages became apparent in the early period of the introduction of competencies to British work settings. On the positive side, competency approaches underpinning a wide range of vocational awards have been credited *inter alia*, with clearly identifying needs for employees and potential managers, facilitating and improving selection and recruitment, allowing a basis of comparison between employee performance, engendering a common language and scheme for assessing ability and skills, providing a basis for people to self-assess and monitor progress, and systematising job role and content, and identifying the skills and competencies that will ultimately lead into overall better corporate performance and competitive advantage.

On the less positive side, competencies and vocational approaches can be seen as creating difficulties because: they are susceptible to being applied a range of varied and un-uniform manners, assessors may assess in variable and unreliable manners, there is a danger that the

development of competencies at the individual level will not result in an improvement in organizational performance. Assessment of competences tends to be backward, rather than forward, looking (i.e. concentrate on what the person can already do rather than their potential), standardised competency frameworks may seem inflexible or rigid when applied to different organizational settings and contexts, it may be more orientated towards a UK/USA derived approach to development and therefore have limited international transferability ((Sparrow and Bognanno, 1994, p.61) Thorpe and Holman (1994), in examining a case study of the MCI competency framework as applied to higher education settings, identified that the 'knowledge' aspects of skills and situations tend to be weakly addressed due to an over focus on behaviour and outcomes. Their insight may have implications across many vocational qualification experiences.

Most importantly, yet frequently overlooked in the commentary on competencies in the United Kingdom context is the epistemological and ontological provenance of the approach. There are two points to make here, one pertaining to a Western general epistemological orientation and the second underscoring a particular set of embedded values in the United Kingdom. As indicated above, the United Kingdom has been marked as a 'late-adopter' of management ideas, techniques and philosophies from the North American model (Engwall and Zamagni, 1998). In the post-WWII era, management and organization thinking, teaching, research and practice in the North American sphere has been strongly informed by modernistic and positivistic concepts and constructs (Lyotard, 1984, Bratton et al. 2007). The normative 'late-adoption' pattern has meant that the United Kingdom emulates and assimilates much of hegemonic American practice. It is therefore no surprise to learn that over the last sixty years modernism and positivism – with their reification of linearity, notional objectivity, scientific experimentalist method, representational and reductionist categorisation and typologies have become the dominant frame of reference in British Business Education and much wider organizational life.

This broad cultural infusion has been sown on an accommodating ground of longstanding British sensemaking (Weick, 1995) through the philosophical traditions empiricism and pragmatism. (McEwan, 2001, pp73-75 drawing on the work and legacy of Bentham (1748-1832) and Mill (1806 – 1873). It can be readily seen that many of the philosophical commitments of this amalgam of modernistic positivism and empiricism and pragmatism dovetail extremely well with the delineated, categorised, experienced-based (cusp anti-intellectual) framework that has come to represent the British National Vocational Qualification system.

In particular, a charge that may be levelled at a number of competency approaches is that, due to the limitations of the paradigm(s) in which they are rooted, competencies are less predisposed to represent or capture 'soft-skill' competencies pertaining to, for example, relational, personality, behavioural areas (i.e. as opposed to supposed hard skills areas – accounting, planning, budgeting). This is not to say that such dimensions are not sought to be addressed by competency frameworks. Moreover, it is precisely this sort of competency that has been discussed in relation to manager and senior manager work. It is, however, the case that the human behavioural dimensions are often addressed in a mechanical, unproblematised and weakly situationalised contextualised manner. This has been alluded to some extent above however in order to illustrate the form and impact of this issue it will be useful to begin to focus

attention on a particular approach to competencies, namely, the British National Vocational Qualifications Framework.

Competencies in the United Kingdom - Contemporary Context and Issues

Competencies continue as very much part of the *modern* business setting being used in many sectors: education, health, public management, supply chain management, food and wine, library services, facilities management, leisure and hospitality among many others (Ashton, 1996, Clark and Hinxman, 1999, Brophy and Kiely, 2002, Ashcroft, 2004, Bouzdine-Chameeva, 2006, Barth, Godemann, Rieckmann and Stoltenberg, 2007, Institute of Physics, 2009, Department of Health, 2009, Halley and Beaulieu, 2009). Equally, competencies for various types of employee: directors, managers, other employees and spheres, for example, leadership, and careers have been a focal area in the literature (Margerison, 2001, Thach and Thompson, 2007, Spendlove, 2007, Cappellan and Janssens, 2008). Competencies have therefore infused and imbued every aspect of organizational life. As such they have become a normative way to attempt to address and account for thought, action and behaviour in the contemporary British organization. Watson (2002, p.428) points up issues of commodification and marketisation that intertwine with competencies. He discusses the notion of 'portfolio or boundaryless careers' and suggests that the development by individuals of 'marketable competencies' has emerged as an important element of such pathways.

As has been discussed above, the term 'competencies' is employed in a range of ways and contexts, organizational and individual competencies, competencies relating to a particular role or business sector as in vocational qualification frameworks, and also, manager competencies – the skills, traits and attributes that managers might need to apply to be able to perform their jobs effectively. The evolution of ideas relating to organizational competencies and individual (employee, manager) competencies have been introduced earlier and it is now to individual vocational qualifications within an organizational context that the discussion turns as this is particularly germane to the case study used to gather field data.

The United Kingdom National Vocational Qualifications Framework

The key body in the United Kingdom context for developing, structuring and controlling competency based vocational qualifications is the National Vocational Qualifications Authority (NVQA) and the Scottish Vocational Qualifications Authority. This is aligned with the Qualifications and Curriculum Authority (QCA). Vocational awards can be attained at five different levels, identified as Level, 1, Level, 2 and so on up to Level 5. One of the key roles of the Authority is to establish the 'Standards'. The Standards map out all the competencies and skills that a prospective candidate must fulfil to be able to achieve the units of a given vocational award. All vocational qualifications are made up of 'units'. Units cluster together particular typical situations likely to be encountered in a given business role and area. For example, in the case of the Customer Service Award (discussed further below in relation to the field research) the Level 3 Award is comprised of units (in turn comprised of sub-units termed 'elements'). The Units/elements are entitled, for example:

'Unit 205, Making Customer Service Personal/Element 205.1 Identifying opportunities for making customer service personal'

'Unit 205, Making Customer Service Personal/Element 205.2 Treat your customer as an individual'

'Unit 211 Delivering Customer Service on Your customer's Premises/Element 211.1 Establish a rapport with the customer,

And, so on and so forth, depending on the unit that are identified as necessary for coverage. An award typically would be constituted of a number of such units to be completed. Candidates undertaking vocational qualifications are assessed by qualified Assessors. To be able to undertake this role, assessors need to have undertaken the vocational award for assessing candidates to ensure that they have the competencies and that they are competent to do this. Importantly, Units often point at behavioural or attitudinal dimensions of employee candidates. It is, in fact very much at the discretion of the assessor concerning the degree to which these have taken place and been witnessed.

Assessment of candidate competencies can take place through a number of methods. These include *observation* by the assessor of the candidate carrying out their role. In some awards candidates are allowed to simulate or show the role in action however, quite often, the demonstration has to be live and real. Also, it is possible for candidates to write *personal statements* of experiences and roles supported by evidential documentation like a report of notes. Alternatively, the candidate can ask someone for a *witness testimony* reporting on what they have done to demonstrate particular competencies against the standards. In addition, it might be that there is a document, such as the minutes of meetings, reports and so on and so forth that can be used as *document* evidence.

Operating in relation to the NVQA are a number of awarding bodies, such as the City and Guilds. In addition, there also exists the Learning and Skills Council, a quasi government department responsible for disbursing funds for the further education sector (relating to ages 14-19) and a range of ongoing supporting publications and materials (see Whiddett and Hollyforde, 2003, 2007 as illustrative of the repetitive nature of the work produced).

Typically the landscape of competencies in contemporary United Kingdom focuses on a number of recurrent concerns and approaches. Central to these is the notion of developing competency frameworks. The aim of a competency framework is to ensure fairness of comparison across job roles and staff. (Whiddett and Hollyforde, 2007, pp.7-36) In 2007 sixty per cent of organizations in the United Kingdom were reported as employing a competency framework for their staff and half of the organizations who didn't have one were planning to introduce one (CIPD, 2007, p.18). The primary uses these were used for was to underpin performance reviews and appraisals. Fifty-two per cent of competency frameworks were created in-house. A further thirty-three per cent were created in house with the assistance of consultants. A mere eight per cent claimed to use a framework developed by an external organization (CIPD, 2007, p.20).

In 2005 the United Kingdom government set up the UK Vocational Qualifications Reform Programme (Learning and Skills Council, 2009) This revisiting of vocational qualifications recognised and aimed to begin addressing a number of long commented concerns with competency based vocational qualifications. It sought to improve support from employers for the qualification. Hitherto it had been difficult to secure consistent and ongoing commitment

from employers to vocational qualifications. Employing organizations typically felt that the available competency based qualifications were too paper-bound, and bureaucratic and did not always seem to respond to and develop organizational aims. In tandem with this, the homogenous, and perhaps sometimes inflexible, standards that had been drawn up by qualification awarding bodies did not always seem to respond to individual learning needs. Finally, the government wished to see vocational competency based qualifications rolled out into additional business sectors and be able to recognise a wider range of achievement so as to support slipping government targets for further and higher education achievement. Moreover, there has been an attempt to make links to other grading systems. Overall, the review is to ensure that competency framework's are fit for purpose and meet organizational needs.

METHODOLOGICAL APPROACH

The study used an ethnographic approach (Van Maanen, 1978, Bryman and Bell, 2007, pp439-470, Eriksson and Kovalainen, 2008, pp.137- 153) Ethnography enables the researcher to use an array of qualitative techniques to examine a community in action in its natural, usual and everyday environment. In relation to Gold's (1958) well-cited classification of observer roles which embrace towards one end of the continuum 'complete participant', 'participant as observer' to, at the opposing end of the spectrum 'observer as participant' and 'complete observer', the research worked as a participant observer. This meant that he was totally implanted in the milieu of the CLO. Ethnography, as methodological approach was ideally suited to the study. The participant as observer also permitted unstructured and semi-structured interviews to be conducted (Maylor and Blackmon, 2005, pp.225-233). All data were recorded in the form of notes. It was deemed an unnatural intrusion to try to use recording devices because the respondents were not used to such an experience. Also recording would not have been easy in the day-to-day client calls. Moreover, many respondents would be worried what would happen to the tapes and feared they risked ending up in the hands of senior management.

In a study such as this it is important to underline the role of reflexivity of the researcher towards the individuals and groups researched and reciprocally by the people researched to the researcher (Alvesson and Skoldberg, 2000). The researcher spent many hours in the company of individual company employees, travelling many miles, visiting many clients together over many months. This provided an opportunity to socialise and get to know each other reasonably well on a personal level. The research embraced this subjectivity at the heart of the ethnographic approach of the research. Within the reflexive tradition of inductive research it is important to signal that for some respondents the researcher felt great empathy whereas with others no strong relationship developed. A couple of the employees become personal friends. Others were rude, unfriendly, aggressive or obnoxious towards the researcher and this never abated during the two years. Some were not unfriendly but were guarded and remote. One of the more extreme instances involved one elderly male worker who insisted on urinating into a bucket in secluded locations rather than find a public toilet. Clearly there was a gamut of behaviour and personalities. The researcher's background as someone with personal experience of a working class life and factory floor working meant that while alarming when they occurred none of the experiences were necessarily shocking.

The data analysis followed an inductive crystallisation process whereby the data were constantly reviewed in the light of repeat data capture. This form of review allow emergent themes in the data to be identified and analysed.

REFLECTIONS OF LIVED EXPERIENCE OF COMPETENCIES IN THE FIELD

The Field Research Organization

The field research was conducted in a large water utilities company employing approximately 5000 people located in the north of England. The author was part of a team of some ten assessors who were delivering a National Vocational Training, Level 3 qualification. He gained his A1/A2 Assessor Award during the process. The programme was targeted at ninety three Customer Liaison Officers (CLOs) who interacted on a daily basis with customers in the field. Each assessor was responsible for assessing approximately fourteen CLOs. The CLO role was the result of a change management programme and restructuring in the company. This had seen the creation of the new CLO role and the counterpart to this the Network Controller (NC) role. It was intended that the NC would look after the technical aspects of the network and would not have contact with customers. On the other hand, the CLO would be entirely customer facing and would no longer be involved with any technical aspects of the water supply network. Prior to the change the CLO and the NC role had not existed and both roles had been carried out by each member of the field team. CLOs used company white vans to travel around their designated area. Because half the original staff were now undertaking NC roles this meant that the CLOs were covering a territory surface area that was double what they had previously had to cover. On occasion, due to the scheduling at the central headquarters this could mean that CLOs would leave a customer visit and have to travel fifty miles to another visit and then return back to the area where they were previously for the subsequent visit resulting in very long journeys. The issue of poor scheduling was a recurrent issue and, together with the changing job role, was a source of great discontent and tension. The company was concerned about improving its ratings on customer feedback. It was assumed, without any major research, more on management intuition that it would be necessary to improve customer interaction with the newly formed CLOs. Overall, the changes were far from popular and had witnessed considerable discussion with unions and some acrimony over what was considered by the front-line staff to be an the ill-thought plan by management.

A Day in the Life of a CLO.

Typically this involved spending whole days with the CLO at a few weeks' interval. The day would include telephoning the CLO to arrange the visit arriving at the works depot or the CLOs home address to meet up and drive off together in the van. The day would comprise visiting customers houses and premises and entering customers' houses to discuss water supply and quality problems. Lunch and breaks times would be spent with CLOs in 'greasy spoon' basic workers' cafes. As the researcher became more friendly with and trusted by CLOs he would find himself doing their shopping, visiting family and friends and doing little errands as the CLOs fitted these 'unofficial' personal and domestic jobs into their planned and prescribed work routine. As such he witnessed and experienced a breadth of rich experiences with the CLOs.

INITIAL AND EMERGENT FINDINGS AND PRELIMINARY DISCUSSION.

The experiences from assessing and journeying with the CLOs produced a wide range of data. These data are still in process of being analysed and important themes and findings identified. For the purposes of presentation at conference the findings and accompanying discussion below provide indicative rather than a comprehensive discussion of what is planned in the final paper. Nevertheless, it is intended and hoped that this will facilitate the reader to obtain an impression of the relationship of the competencies experience to the employee/student CLOs, the assessor and other organizational actors. As indicated above, the data analysis is ongoing and themes are emerging and being consolidated. Four of these themes are presented below centred around competencies and resistance, competency frameworks as bureaucracy and anti-intellectualism, competencies as a device in a battle between managerialist and craft cultures, private and professional lives lived out in a competency framework.

A Theme of Competencies as Eroding Resistance

One of the key themes that came out of the research was the issue of resistance by CLOs to undertaking the qualification in the first place. The lead assessor on the programme suggested that in her experience this was not however typical. By way of illustration, on the first visit to a CLO the assessor got in the van and greeted the CLO. The CLO shouted:

‘So what the f*****g hell is all this NVQ competencies b*****ks about!’

(CLO ‘A’, 2007)

The assessor gradually built up a very friendly relationship with CLO A however the cynicism never really went away completely.

Many assessors on the programme reported various obstruction tactics to impede and delay their visits to CLOs. These tactics included cancelling appointments at the last minute, calling in sick on a given day. All of this was resonant of the forms ‘organizational behaviour’ characterised by Thompson and Ackroyd (1999). There was little doubt that the introduction of the competency framework was seen and used as a device to categorise and evaluate the CLO job. This afforded the opportunity for managers to have greater apparent say and control over CLO operatives. This was indeed true to some extent since what the job should consist of had now been made very explicit. Nevertheless, on a wide range of occasions older more experienced CLOs devised ways and loopholes to counter-manager the new job construction. This would involve exchanging jobs on work schedules with other CLOs unofficially to overcome the illogical allocation of jobs from the call centre. Equally many CLOs would go beyond the role of the CLO and assist clients, particularly elderly clients in ways that were not permitted. As an assessor the researcher was of course automatically complicit in these deviations – he was present at the time they occurred and had no power (or necessarily desire) to block them. In essence both respondent and researcher were engaged in a process of creating new sense of the job role. The competency framework assessing the workers actually had very little relationship to this. Rather it was the case that opportunities were looked for to tick any boxes possible. This was often a collaborative process between the researcher-assessor and the respondent-employee.

A Theme of Competency Frameworks as Bureaucracy and Anti-Intellectualism

A further emergent issue concerned the paperwork involved in the competency assessment process for the NVQ award. Many of the CLOs did not like the assessment documentation and needed considerable assistance with it. This was not always helped by the labelling of the documentation. The main form was called the 'MAD' form which stood for Multiple Assessment Document. Naturally this caused many amusing and witty remarks. It was clear that in some of the case of problems with documentation it was a matter of further resistance on the part of the CLO. However, in other instances, there seemed to be issues relating to levels of education. Nearly all of the CLOS were semi-skilled /skilled manual labour. The world of written qualifications was not a world in which they were automatically comfortable. Although it was not stated three CLOS left the role and returned to become Network Controllers (NCs) on the technical side because this group of employees were not at that time completing the NVQ. But the manner in which these few employees baulked at and postponed written tasks also alluded to a deeper problem of potential illiteracy or semi illiteracy. These workers had thrived well in a world that valued the empirical, the pragmatic, indeed the much admired British saying 'the university of life'. The paper based assessment in competencies proved a serious challenge.

With regard to the issues of skills, many of the CLOS (and especially the older longer serving ones who has a depth of technical knowledge and experience) felt and often stated that the NVQ and competency approach was actually part of a process of further deskilling of their role. Already they believed that the restructuring of their role was problematic and the competency based assessment was yet a further part of that. Moreover, they stated that the assessment was belittling and demeaning of their technical skills and craftsmanship.

'This NVQ is a load of cobblers isn't it, admit it, go on. All they want is a monkey to do this job – when the managers get that then they will be happy'.

(CLO 'D', 2008)

The temporal retrospective aspect of the award was a further difficulty. Many CLOs felt that they were getting an award for something that they already knew how to do and were doing. The sentiment of many was what was the point? As the process went on what become increasingly important and informative was the interaction and exchanges between the author as assessor and the CLOs. In many cases friendships struck up and it was the wider discussions over mugs of tea in 'greasy spoon' cafes they pointed up some of the lessons to be learned. These discussions were not couched in the dry language of NVQs but rather in an everyday vernacular drawing on common wisdoms.

A Theme of Competencies in a Conflict Between Managerialist and Craftmanship Cultures.

It is important also to draw attention to the wider context of the organization and the CLOs managers. There were many managers and a great number of 'special task forces' of contingent manager groupings. There was very little respect between CLOs and any of the managers. In truth, there was not a great deal of respect in reality for the managers by the assessor team. The assessor team had met the managers before and during the initiative in a range of meetings. The corporate culture typically produced highly political 'yes' (wo)men behaviour. Managers were

regularly moved between roles every two to three years. Therefore no manager would take a risk of making a mistake so as not to jeopardise his or her chances of a promotion in the long-term. As one CLO put it succinctly:

‘They’re all f*****g greasy pole climbers and arse lickers – no f*****g use at all’ (CLO ‘G’, 2007)

Concerning longer-term impacts and effects of the programme it is difficult to determine long-term sustainable consequences. For the organization senior management were able to say in corporate reports that 93 of their CLO operatives has attained NVQ level 3. This had considerable political capital in national competitor league tables. For the CLOs the consequence was varied. Older CLOs were often not interested in the vocational qualification process at all. A substantial number were concerned with their chances of retirement. Unfortunately, and perhaps linked to the socio-cultural characteristics of the group to some extent, many has experienced earlier divorces which had resulted in their pension being reduced and given to the divorced partner. This was a major topic of conversation for some of the CLOs. The younger CLOS were very different. These were typically not technically very experienced (the long route of many technical jobs no longer available in the contemporary structures of the organization) and so the NVQ in Customer Experience ‘legitimised’ them in the light of the new company ethos. For the older CLOs customer service was not a question of competencies. They viewed it more a matter of behaving in a decent human way to deserving customers. This could lead some older CLOs to mending broken taps and pipes for elderly people and doing them favours. All of this was in strict contravention to the new company rule book but they did it in any case. Matlay (2001) has suggested that in the case of small to medium sized enterprises competency approaches may not be as effective as large organizations. The present data indicates that this can also be the case in a very large company employing thousands of people.

The older workers in particular saw themselves as fighting against the competency framework on two linked fronts. Firstly, they felt that ‘management speak’ had taken over all parts of the company and that the competency programme was a part of that. At the same time they remembered nostalgically a period when they operate using a wide range of skills and exercised a great deal of judgement and independence. Managers were seen as increasingly impinging on this and the competency programme associated with the restructuring of the job was deemed to be a diminishing of their ‘craft’ role. They often reported that they were becoming mere cogs in a (modernistic) machine.

‘They knocked the passion out of me a long time ago. I still love the idea of this job but they keep bl**dy wrecking it. This NVQ id the latest in a string of bullshit with had thrown our way. They’ll end up getting rid of us and employing bl**dy robots!’.

(CLO ‘H’, 2007)

A Theme of Private Identity Lived Through the Competency Framework.

During the research project many events both professional and private happened to the employees. Partners become ill and were taken into hospital, children took important exams, some of the respondents separated and divorced, other respondents married (some for the second or third time), some respondents operated secondary businesses during their day job –

school visiting parties, jobs 'on the side' for extra money, a number were deeply involved in interest such as semi-professional motor-bike racing, hunting with hounds, shooting, taking several cruiseship holidays a year and so on and so forth. What role did the competency framework play in relation to these activities. There is no doubt that many of these activities made many of the respondents more rounded, mature, knowledgeable and even wise. The competency framework wrestled to try to respect and represent the talents that were being brought to the job.

Equally, there were the 'bad' days. The days when one man's ex-wife's solicitor had just written him a letter claiming a large proportion of his pension resulting in the fact that his retirement plans were now destroyed. The day when one of the CLO's announced to the author that his marriage was over and that by the time the competency project was over he would have left her. On those days, it was better 'not to talk too much about the competency work. The researcher assessor would sit in the van or a café and talk. The competency framework never officially acknowledge these many realities of the CLO operatives. Reflexively, the researcher worked hard with the competency framework to see what could be done for the CLO on such days and this might very well 'not noticing' failure to follow procedure exactly or a more grumpy approach.

The public too were not homogenous automatons. The competency framework offers some variation descriptors to not 'confused', 'very please', or 'angry' customers contexts. Clearly, these are limited descriptions of the rich panoply of behaviour that might be experienced on a given day. Therefore the competency frameworks not only weakly represent the experience as lived by the employee but equally it portrays weakly the client or customer also.

As stated above these comments provide the introductory analysis of the data for the purposes of discussion at conference. The evaluation and analysis of the data is an ongoing process and the intention is to develop and consolidate a range of emergent themes. Nevertheless, there is little doubt that there is considerable scope to apply in a more concerted way critical, social constructive and lived experiences lenses to these situations to be able to bring a critical realism to the study of competencies in the United Kingdom context.

COMPETENCIES – A CRITICAL PERSPECTIVE ALTERNATIVE INSIGHT

While competencies' approaches and the debate surrounding these has made some progress in trying to distil and categorise the skills that delineate and identify what an employee or manager need in their work role, it is equally important to say that this approach has not been without its limitations (Watson, 200, p.43). The key limitations revolve around whether or not to accomplish such a project – in a highly complex world of human interaction is it possible to isolate human skills employed in the world of work? This points at the limitations in the modernistic and positivistic paradigm in which competencies are rooted. Equally, while competency assessment frameworks try to take account of contextual and situational factors, again, this is often achieved only in a limited manner whereby, for example, the assessor of the competency has to observe the competency in a range of different settings. For example, this might be offering customer care to (a) a customer who is angry (b) a customer who is confused and so on and so forth.

As the world of management and organizational theory has evolved so have the demands on competencies frameworks in relation to it. There is no doubt that in some instances, competencies and especially rigid or prescribed competency frameworks may seem artificial or even counter-intuitive to common sense. For example, in order to achieve a given vocational qualification it might be stated in the competency standards for the award that the participant/student needs to do or demonstrate skill or personality attribute 'X'. In the 'real-life' circumstance this might seem illogical or even ridiculous. For instance, in a door-to-door customer service context – showing somebody in extreme distress your company ID-card and introducing yourself formally before controlling the immediate situation! McKenna (2004) raises this point and calls for a role for 'common sense' in applying and working with competencies. Rather than slavishly following only a 'tick box', he suggests, there is a need to apply a more everyday sense-making. But as Weick (1995) as pointed up 'common sense' itself is not always that easily defined or shared between individuals.

Watson (2002, pp.446-447) underlines the dangers of the way consultants adopting and rolling out such techniques simply do little more than 'commodify' the concept and reduce it to a series of emotional traits that managers must adopt. As a response Watson suggests:

'The danger here is that we are taken back to the type of thinking about managerial competence ... that which saw competencies as inbuilt characteristics or 'traits' of human individuals existing in isolation from their organisational context. It is much more helpful to see competencies, instead, as emergent predispositions of people to act in certain ways in the context of relationships, cultural assumptions and ongoing learning and adaptive processes. The concept of emotional intelligence, for example, is likely to be more useful for understanding manager effectiveness if we do not focus on the extent to which managers are emotionally intelligent but focus on the extent to which, in particular organisational contexts, managers act in an emotionally intelligent way' (Watson, 2002, p.447)

In the edifice and structures that have grown up around discussions on competencies it is easy to overlook that a key question associated with the entire competency debate is what makes some managers [or employees] more competent than others. (Watson, 2002, p.292)

In so many regards competencies approaches epitomise modernism and managerialism. Here perceptions of managers revolve around preoccupations of measurable performance and output at the expense of a genuine concern and insight on the social dimensions. This is derived from a long-standing hegemonic tradition of positivism in management and organization studies in the post-WWII period (Watson, 2002, Linstead, Fulop and Lilley, 2009) Aligned and compounded with this, the United Kingdom has a tradition of empiricism, pragmatism. Even anti-intellectualism. As indicated above, these traditions are long established (McEwan, 2001, pp73-75 drawing on the work and legacy of Bentham (1748-1832) and Mill (1806 – 1873). Based on the above characterisation it is possible to say that competencies fit very well within these traditions.

A drawback of the modernistic and positivistic conceptualisation and epistemological grounding of competencies is that they can be charged as reductionist in the way in which they confine and constrain a rich human experience or interaction into a ticked box of 'action achieved. The boundaries drawn around NVQ elements and units are artificial boundaries.

Although not capitalised on, such observations are long standing. Canning (1997) has suggested that vocational and competency based approaches cannot fully assess aspects such as interpersonal relationships and social contexts. In this vein, Pate, Martin and Robertson (2003, pp.169-171) have pointed up the possibility for viewing competencies through a subjectivist or constructivist approach whereby the person doing the work and undertaking the qualification constructs the *meaning* of their work.

Given these reflections, it seems therefore there is scope to revisit and reconsider competencies and competency training in an alternative way. This would involve drawing on more interpretive, constructionist and critical ways of making sense of competencies. In tandem with this, it is possible to draw on the dynamic notion of 'lived experience' to try to draw out a richer representation of human experience rather than the constrained and limited representation offered by competencies. The paper seeks to surface tensions between these prevalent "normative" or representationalist presentations (Chia, 1996; Watson and Harris, 1999) and a more marginalised commentary in extant accounts. This paper simultaneously surfaces and develops a more emotive and "lived experience"-type exploration of competency based processes (Knights and Willmott, 1999; Fineman, 1993; Fineman and Gabriel, 1996; Gabriel, Fineman, and Sims, 2005). The *a priori* contention of the argument is that representationalist assumptions, in competency approaches are limiting or constraining in the way they portray the experience. The intention of this paper is not an attempt to usurp existing competency approaches, but rather to complement them with a rich and overt adjustment and acknowledgement of the emotional and human dimensions of competency.

In order to construct a reply to normative representation in many competency frameworks and approaches paper proposes an enhanced role for increased narrative and social construction within them. A helpful comparison for this process is to be found within the critical perspective field of management and organisation studies (Linstead, Fulop and Lilley, 2009) The commitments of writers within this area have drawn attention to the mechanistic and rationalistic nature of writing in the management arena pointing up a lack of commentary on inter alia emotion, spirituality, gender, values and beliefs, identity, power and resistance. Knights and Willmott, (1995, 1999) have proposed this as the absence of a sense of "lived experience" in areas of that literature. They argue that organizational life and management "entails the common experience, challenges and disappointments and pleasures of being human... students and practitioners of management are, first and last, human beings." (1995:3) Commenting on many management texts, they point out that readers "are presented with an endless stream of theories, typologies, bloodless descriptions and often patronising prescriptions" (1999:2). They summarise the purpose of the 'lived experience' approach as "less concerned with the specific and the detailed 'technical' functions of management, as described in most textbooks than with the ways in which technical activities effect the lives of managers."(1999:ix) Many aspects of competency approaches and much of the writing and literature on competencies are prone to similar effects in relation to the lives of participants, employees and managers. However, Knights and Willmott are keen to emphasise that they "are not quite so arrogant as to deny [for example] the value of a good textbook in providing an introductory guide to a particular field of knowledge" (*ibid*, p.1) The present paper shares this sentiment with regard to competency frameworks and writings. However, it does underline

scope for, in a first instance, surfacing the limited “lived experience” style accounts extant in these approaches.

“Lived experience” approaches draw their inspiration from a socially constructed perspective of human interaction. This offers alternative appreciation of the emergence and patterning of competency experience. For Berger and Luckmann (1971) the objectification (i.e. representationalist) form of knowledge building is a consequence of intertwined processes of typification (classifying and “agreeing” knowledge) and subsequent habitualization (repeated usage and reinforcement) which give rise to the “externalization” and “objectification” (the rendering as fact) of human and social experience. In turn, this permits a process of consequent internalization of a created “reality” in that: “A world so regarded attains a firmness in consciousness.” (*ibid*:p.78) And, as such, everyday human experiences become seen as ‘legitimated’ (*ibid*:p.111) or ‘representations’ (Chia, 1996) rather than being “humanly produced”. (Berger and Luckmann, 1971:78) It should not be assumed that “these moments” occur in a progressive linear or strict “temporal sequence” (*ibid*: p.149) but rather through an iterative and relational manner (See also Watson and Harris 1999:18 and Chia, 1996:581).

It is thus useful to view a programme of competencies as much as a socialisation experience as a project to inculcate and record technical skills and the progressive pursuit of process and outcomes. These seemingly less tangible aspects have the power and poignancy to dictate and to dominate the process and in many cases are more likely to constitute the usual (or normative) rather than the marginal. It is through alternative frames of reference that wider and richer appreciation of competencies can be generated drawing out the social, psychological and emotional dimensions.

CONCLUSION

The argument in this paper has been able to provide a historical contextualisation of competencies. As indicated, they have been a number of comments in the literature in this regard. However, there is a case and scope to provide a more concerted and rich appreciation of the socio-cultural and socio-economic in which competencies in the United Kingdom environment have emerged.

Moreover, the discussion of competencies in their contemporary context has carried forward a modernistic and positivistic framing of the domain. This has provided guidelines and assistance to organizations in a range of ways. However, there is clearly the potential to bring to bear alternative perspectives and paradigms through a critical gaze to be able to glean a wider and richer picture of competencies and vocational training and qualifications.

In much of the commentary of competency training the full human nature of the participants is not addressed. By gathering and analysing data in relation in a way that shows individuals replete with all the human emotions and characteristics they possess there is a potent opportunity to recast competency approaches and understand them in a deeper manner.

CHANGE READINESS: AN ALTERNATIVE CONCEPTUALIZATION AND AN EXPLORATORY INVESTIGATION

Timmor, Yaron¹; Zif, Jehiel²

¹*Interdisciplinary Center Herzliya (I.D.C), P.O.B 167 Herzliya 46150 Israel*

²*Center for Academic Studies, Israel and Hult International Business School– Boston*

* Tel-Aviv University supplied partial funding for this research.

The study's main contribution is proposing and testing an alternative conceptualization for change readiness (CR). In this conceptualization, change readiness is viewed as a multidimensional Behavior that reflects the firm's competencies to do three things in response to environmental opportunities and threats in its industry: *trigger identification*; gearing up to take action (*preparation*); and the action's *degree of novelty*. An empirical study of 217 organizations and strategic units in the U.S., Europe, and Asia is presented. It was hypothesized and supported that CR is influenced by both internal and external variables, including management orientation (entrepreneurial, centralization), environmental barriers, and technology and innovation roles in firms' business strategies. It is argued and supported that a higher degree of change readiness leads to better performance and to higher management evaluation of success in coping with environmental triggers. Theoretical discussion and managerial implications are addressed.

Keywords: business strategy; change readiness; environmental barriers management orientation

INTRODUCTION

The concept of change readiness has been largely discussed in the management literature mainly in the Organizational Behavior domain (Alas 2007; Chonko et al. 2002; Eby et al. 2000; Jones et al 2005). These studies focus on organizations' structures, learning, and personnel's (managers, employees) attitudes toward organizational changes (Alas 2007; Armenakis and Bedeian 1999; Barr et al. 1992; Newman 2000; Rajagopalan and Spreitzer 1996). Most studies have associated change readiness with flexibility, and note its importance to achieving a strategic advantage in an increasingly turbulent business environment. However, though change readiness is strongly related to business and marketing strategy (i.e., how and when to respond to marketing opportunities or threats), studies of this aspect are limited.

This paper explores the concepts of inertia and change from the aspects of business and management strategy. As such, it concentrates on the concept of change readiness (CR) and addresses the following questions: 1. What does it mean to be ready for strategic change in response to environmental triggers? 2. What distinguishes organizations that are good at it? In an attempt to answer these questions, the study's main contribution lies in proposing and testing an alternative conceptualization for CR. In this conceptualization, change readiness is viewed as a multidimensional construct that reflects the firm's competencies to do three things in response to environmental opportunities and threat in its industry: *trigger identification*; gearing up to take action (*preparation*); and the action's *degree of novelty*.

We propose that CR is influenced by a set of both internal and external variables, including management orientation (entrepreneurial, centralization), environmental barriers, the firm's resources, and the roles that technology and innovation play in the firm's business strategy. We argue that a higher degree of change readiness leads to better performance—both financial and operational—and to higher management evaluation of success in coping with environmental triggers.

In theory, the proposed CR concept draws on the resource-based perspective, which finds firms' distinguishing competencies to be important in successfully dealing with their environments (Barney 1991; Saini and Johnson 2005; Shrama and Vredenburg 1998; Timmor and Zif 2005). In addition, the CR concept draws upon the industrial organization's viewing the firm's competitive strategy to be industry-dependent (Conner 1990; Grandy and Mills 2004; Porter 1985). Lastly, it largely considers management perspectives and typologies regarding how firms handle their environments, i.e., being proactive and flexible (Dreyer and Gronhaug 2004; Mintzberg 1990; Rudd et al. 2007; Segev and Gray 1990).

The study takes the point of view of an independent organization, or a strategic business unit within a conglomerate. It begins with discussing the meaning of CR, reviewing the major perspectives of CR and their related influence on organizations' strategies. The CR concept is then presented by discussing its various dimensions and their nature in the organization behavior. The set of hypotheses is based on the factors that are expected to affect the CR facet of an organization, and the expected correlations between CR and business performance. The paper continues by presenting an empirical study of 217 organizations in the U.S., Europe, and Asia that includes methodology and findings, theoretical aspects, and managerial implications.

THE MEANING OF CHANGE READINESS

Two related concepts of organizational responsiveness have been discussed in the literature: *inertia* and *flexibility* (Aaker and Mascarenhas 1984; Hannan and Freeman 1984; Huff et al. 1992; Kelly and Amburgey 1991; Rajagopalan and Spreitzer 1996; Rudd et al. 2007; Zhang 2006). Although both concepts characterize the speed of an organization's response to environmental change, they reflect different theoretical heritages." (Ginsberg 1990 ; Huff et al. 1992)

The concept of inertia centers on structural and bureaucratic elements that organizations develop over time that tend to limit change and are hence considered "weaknesses" (Rajagopalan and Spreitzer 1996). Flexibility, on the other hand, may be defined as the extent to which new and alternative decisions are considered in strategic planning and execution, enabling positive changes and adaptations to the turbulent environment (Combe and Greenley 2004; Feigenbaum and Karnani 1991; Grewal and Tansuhai 2001; Ireland and Hitt 1999; Rudd et al. 2007). Flexibility focuses on managerial and organizational abilities to quickly respond to environmental forces, traits that are considered "strengths" (Hitt et al. 1998; Rajagopalan and Spreitzer 1996).

With the acceleration of globalization and environmental dynamism, numerous studies have discussed the relationships between flexibility, strategic changes, and organizations' performance (Dreyer and Gronhaug 2004; Ebben and Johnson 2005; Kessler and Chakrabarti 1996; Rajagopalan and Spreitzer 1996; Rudd et al. 2007; Thoumrungrole and Tansuhaj 2007).

Scholars have addressed various types of flexibility such as operational, technological-financial, manufacturing, and structural (Harris 2002; Harris and Ruefli 2000; Lei et al. 1996; Mensah and Werner 2003; Zhang 2006). Most studies have found strategic changes and flexibility to have a positive effect on firms' financial (i.e., profitability, costs) and organizational (i.e., efficiency, productivity) outcomes (Goldhar and Lei 1995; Hitt et al. 1998; Li 2000; Li et al. 2005; Rudd et al. 2007; Tan and Peng 2003).

Readiness for change has been identified with a "cognitive precursor to behaviors of either resistance or support for change efforts" (Armenakis, Harris, and Mossholder 1993; Chonko et al. 2002). Moreover, CR has been highly associated with the individual's attitude towards change as well as her perceptions, feelings, and beliefs surrounding her organization's change readiness (Alas 2007; Armenakis et al. 1999; Chonko et al. 2002; Freiberg 1988; Ogbanna and Wilkinson 2003; Rangarajan et al. 2003). In addition, it has been argued that readiness for change reflects an individual's unique interpretation (Eby et al. 2000; Spreitzer 1995; Thomas and Velthouse 1990).

Despite the extensive literature of organization flexibility, inertia, and change readiness, empirical studies have tended to use flexibility and change readiness intuitively as a clear-cut, universally understood notion (Aranda 2003; Billet and Garfinkel 2004). Hence they do not specify or measure this notion's attributes, but rather examine individuals' assessments and change's apparent effects on individuals and organizations' outcomes (Alas 2007; Jones et al. 2005; Miller et al. 1994; Santhanam et al. 2000). Somewhat of an exception is Zhang's (2006) study focusing on IS support for a few proposed parameters of strategic flexibility and firm performance. However, it did not measure these parameters directly, but rather studied its perceived affect thereon, and it also used the term *flexibility* itself in some of the parameters, i.e., "increased flexibility of business process".

Two major approaches were proposed in studying Change theories: the variance and the process. The former focuses on fixed entities with variable attributes and the later on entities that participate in events and may change over time. (Poole and Van de Van 2004; Langley 1999, Mohr 1982). Our research follows the line of the variance rather than the process approach.

In this paper, CR is perceived as strategy, oriented and is used in a more specific sense to express *the demonstrated capacity of an organization to respond effectively to important new developments in its business environment*. The proposed CR concept is therefore based on specific behavior rather than on attitude.

CR: A BUSINESS - STRATEGY CONCEPTUALIZATION

According to this conceptualization, CR is a multidimensional construct consisting of three related activities: 1. Trigger identification 2. Gearing up to take action (*preparation*) 3. Action's *degree of novelty*. These elements identify the firm's competency to cope with opportunities and threats, that evolve in its specific business environment.

Business strategy can be viewed as all activities that involve the monitoring, planning, and implementing of actions to strengthen the position of the firm relative to its competitors (Alvesson and Wilmott 1995; Grandy and Mills 2004); whereas *strategic change* refers to differences in these activities, i.e., the form, quality, and state over time of an organization's alignment with its external environment (Chonko et al. 2002; Rajagopalan and Spreitzer 1996;

Van de Ven and Poole 1995). Business and marketing scholars have commonly used Porter's (1985) SWOT (Strengths, Weaknesses, Opportunities and Threats) to analyze firms' environmental opportunities and threats and how the firm is facing them with its strengths and weaknesses (Hill and Westbrook 1997; Grandy and Mills 2004; Lin and Hsu 2006). It has been argued that amidst the globalization process, firms are more affected by *changes* in market opportunities and threats (Frenkel and Peetz 1998; Kulmala et al. 2002). Furthermore, how a firm copes with these external changes affects its competitive position and performance (Hitt et al. 1998; Thoumrungrole and Tansuhaj 2007; Zhang 2006).

Opportunities and threats are both considered external triggers; however, they are highly distinct from one another. The former is a highly favorable situation in a firm's environment, and is indication of a chance to substantially improve performance. The latter, on the other hand, is a highly unfavorable situation in a firm's environment, and indication of pending deterioration in organizational performance if some action is not taken (Hill and Westbrook 1997; Kotler 2006; Lin and Hsu 2006; Porter 1985). While it is true that in many cases a threat can be viewed as an opportunity and vice versa, most organizations tend to identify environmental signals either as threats or as opportunities, and the strategic literature frequently classifies outside events into threats or opportunities (Ansoff 1984; Urban 1991). Another view of triggers that call for strategic change is their origin:

- A shift in consumer demand toward or away from the organization's products / services (cultural pressure, economic shift, or other causes)
- A technological development that creates either a threat or an opportunity
- A change in governmental regulations or policies
- A major decline / increase in competitive activity
- An adverse / favorable change in financial sources

We propose that the first element in a firm's readiness to cope is *trigger identification*. Identification of an environmental trigger with a likely strategic impact on the firm is considered a key signal for change action (Chonko et al. 2002; Segev 1977; Struckman and Yammarino 2003; Tichy 1983). In dynamic environments, it is important to quickly respond to external triggers (Jack and Raturi 2002; Li et al. 2005; Zhang 2006;). It has been argued that with rapid environmental changes (i.e., technology, markets, regulations) and globalization, leadership is highly associated with pioneering, and thus requires early identification and quick decision-making in the face of external changes (Alas 2007; Golder and Tellis 1993; Kessler and Chakrabarti 1996; Mittal and Swami 2004).

An effective identification mechanism requires certain organizational and managerial properties. First is the need to properly monitor the environment and intercept signals for trigger sources. Second, this information should be processed to separate a meaningful development from random noise, the latter which is common "fallout" from a special event. There is also a need to assess expected likelihood of occurrence, impact, and timing. The third stage requires substantial attention on the part of higher management to translate the findings into a managerial conclusion that some response is necessary or desirable (Bar et al. 1992;

Gersick 1994; Huff et al. 1992; Lant and Mezias 1992; Li et al. 2005; Struckman and Yammarino 2003; Yetton et al. 1994).

The second element in the firm's readiness for a change is *gearing up to take action (preparation)*. Recognizing a need, or an opportunity, is a necessary but insufficient condition for undertaking strategic change. The second variable therefore deals with the time it takes to respond (Grimm et al. 1993; Kessler and Chakrabarti 1996; Mittal and Swami 2004; Zhang 2006). The time response variable, however, is not detached from the environment-monitoring variable: If the organization is slow in identifying an environmental threat, then the time available for preparing action might be quite short (Ansoff 1984). Response time can be assessed by two parameters: 1. Time to start; and 2. Preparation time. The first refers to the lag between the recognition of the need to change and the start of active preparation. This lag reflects the organization's readiness for taking change action, i.e., being overly occupied with current projects or crises, or finding it difficult to put aside existing activities, or organizations that tend to postpone making key decisions are likely to have a long lag prior to the start of action preparation (Leana and Barry 2000; Leonard-Barton 1992).

Preparation time can be seen as encompassing two discrete components: the time it takes for the change, and *prioritization policy*. The former is content-related, i.e., if a new technology requires an extensive adaptation process, then a long preparation time is inevitable (Alas 2007; Laar 1994; Yetton et al. 1994). The latter component reflects the organization's priority for dealing with the specific strategic changes needed.

The third element of the CR construct is the *action* of response, or more specifically, the degree to which the firm's response to the environmental triggers is *novel or innovative*. In turbulent environments, effective strategic change is highly associated with renewal of competencies, product innovations, and diversified and innovative response to external triggers (Huff et al. 1992; Ireland and Hitt 1999; Raymond and St-Pierre 2005; Rudd et al. 2007; Teece et al. 1997; Vatdarajan and Jayachandran 1999). Firms may defend their market positions with incremental and limited responses such as reducing prices or launching a "me too" product. However such activity reflects tactical flexibility, and may be less effective for the long haul, particularly for organizations looking to lead dynamic markets (Cannon and St. John 2004; Ireland and Hitt 1999; O'Regan and Ghobadian 2005; Timmor and Zif 2005).

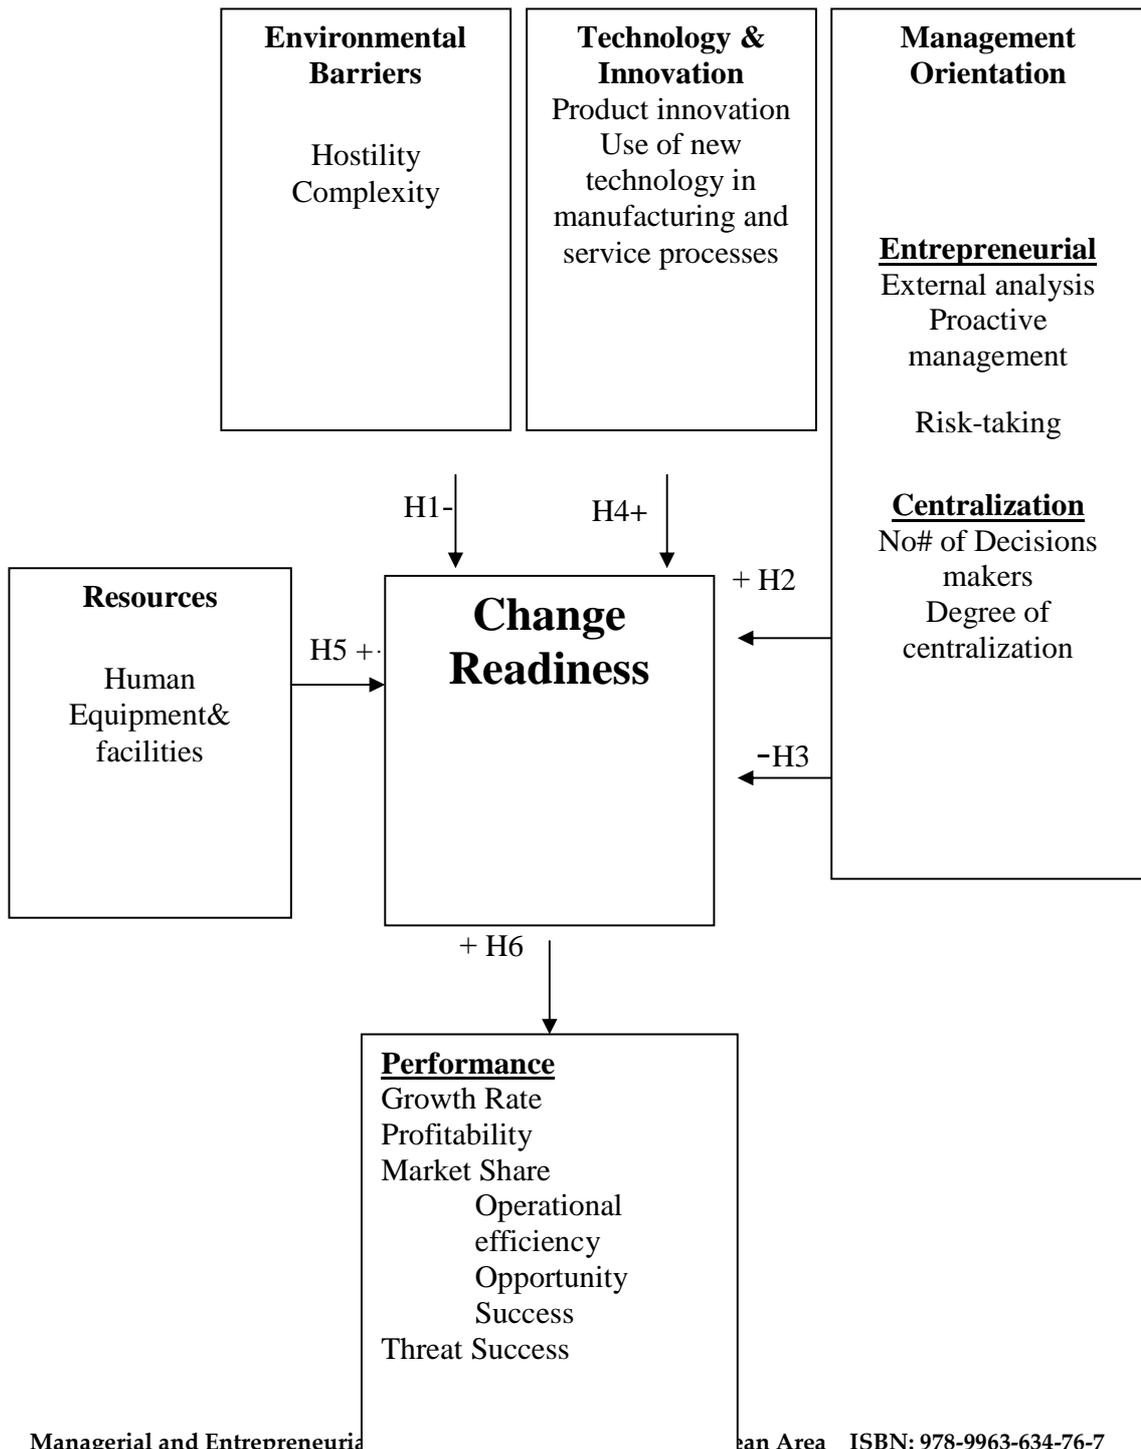

A strategy's novelty can be measured by its *evolutionary vs. revolutionary* scope. Evolutionary changes have a low degree of innovation: They do not require changes in paradigm or a major shift in managerial behavior; they have been tried before and are therefore familiar to the organization; they require limited deviation from organizational inertia. Revolutionary changes, on the other hand, are based on a new pattern of response. Such changes have to overcome natural resistance both inside and outside the organization (Boccardelli and Magnusson 2006; Hannan and Freeman 1984). A strong, committed leadership is usually needed to implement action that is completely new to the organization and its affiliates. There are of course intermediate situations, wherein the organization has been experimenting with an innovative approach on a small scale prior to its adoption on a large scale.

An organization capable of executing a response that is somewhat more innovative is assumed to have a high degree of change readiness. This of course does not mean that a

revolutionary response is always desirable (Boccardelli and Magnusson 2006; Eisenhardt and Martin 2000): A major deviation from past behavior is more likely to be needed when the outside threat or opportunity has a high potential impact on the firm and when the environment is dynamic and turbulent. In this study, respondents were asked to select strategic threats and opportunities that have potentially high impact on their firms.

What are the factors that affect a firm's CR? In this study, based on the literature review, we explored five major factors related to the environment, management orientation, use of technology, and available resources.(Poole and Van de Van 2004; Langley 1999, Mohr 1982) Figure 1 exhibits the research chart with the expected influence of the various factors on the firm's readiness for strategic change and CR on the firm's performance.

Figure 1: Research chart and hypotheses

Environmental barriers – the rapid growth of external turbulence and market dynamism have increased the importance of organizations' readiness for strategic change (Choko et al. 2002; Han et al. 1998; Ireland and Hitt 1999; Li et al. 2005; O'Regan and Ghobadian 2005; Zhang 2006). However, the environment has a dual influence on change readiness: On the one hand, as it is dynamic and changing, there is a greater need for the organization to prepare itself for strategic changes and be flexible in responding to external triggers (Alas 2007; Hitt et al. 1998; Eby et al. 2000; Li 2000; Rudd et al. 2007). On the other hand, as the environment can be hostile, complex, and unpredictable, and change readiness becomes a greater challenge and more difficult to achieve, firms' capabilities of adapting their strategies thereto are deteriorated (Kapasuwan et al. 2007; McKee et al. 1989; O'Regan and Ghobadian 2005), and the likelihood of change in corporate strategy is reduced (Kelly and Amburgey 1991; Rajagopalan and Spreitzer 1996). Under volatile circumstances, when uncertainty is high, the consequences of strategic changes are hard to predict. Therefore firms can be expected to respond with greater caution in regard to new and innovative actions. Moreover, hostile and constantly changing markets may induce tactical flexibility within a short interval—such as price-chopping or increasing supply—rather than long-term strategic changes (Cannon and St. John 2004; Evans 1991; Johnson et al. 2003). This paper views change readiness as a strategic property, and hence considers environmental hostility and complexity to be barriers to organizations' CR. We therefore hypothesize that:

H1. Environmental barriers have a negative effect on a firm's change readiness: The higher the barriers, the lower the firm's CR.

Management Orientation – An entrepreneurial mindset and decentralized strategic decisions appear to be integral parts of the organizational culture and climate that have a meaningful influence on an organization's CR (Nakahara et al. 1997; Naman and Slevin 1993; Ranjarajan et al. 2003; Zahara et al. 1999). Entrepreneurship has been reported to have a positive correlation to a firm's superior performance and innovative response to dynamic environments (Lumpkin and Dess 1996; Stopford and Baden-Fuller 1994). In addition, entrepreneurship can help a firm acquire new capabilities, enter new business ventures, and create new products ahead of its competition (Hamel and Prahalad 1991; Ranjarajan et al. 2003; Zahra 1993). Proactive management trying to shape its environment and managerial willingness to assume risk are two entrepreneurial variables (Chonko et al. 2002; Gersick 1994). They are also two dominant properties of Miles and Snow's (1978) Prospectors strategic category, whose members look for opportunities to innovate, develop, and enter new markets. Part of an entrepreneurial orientation is the commitment to scanning the environment for opportunities and for threats that might be converted into opportunities. As such, it is not surprising to find that a high score on these variables points to an organization's CR. It is important to understand, however, that CR as defined in this paper refers to responses to environmental triggers rather than the initiation of entrepreneurial action. The argument here is that an organization committed to initiating change is more likely to respond quickly and effectively to environmental triggers generated by outside causes, than is an organization characterized by a purely defensive posture.

H2. Management's entrepreneurial orientation has a positive effect on a firm's change readiness: The stronger management's entrepreneurial orientation, the greater the firm's CR.

Is centralized decision-making a help or a hindrance in responding to environmental triggers? There are occasions, particularly emergencies, when a single decision-maker or a small group

responds faster and possibly better. However, under normal conditions, a small decision-making group could, over time, be a hindrance to the acceptance of new trends and ideas. A small group has less chance of viewing external developments, and may have a tendency to lock out “disturbing” signals delivered by “non-members”. Kanter (1983, p. 281) argued that a company with a diverse group in the “dominant coalition” at the top is more likely to pick up on more external cues. Decentralized strategic planning and decision-making is associated with diversity and organizational flexibility in responding to environments (Chonko et al. 2003; Jones et al. 2005; Mintzberg 1994). In a turbulent environment, quick response to external triggers is required (Dickson et al. 2001; Ireland and Hitt 1999; Zhang 2006). In certain cases, there is a need for learning by doing and improvisation (Dickson et al. 2001; Moorman and Miner 1998; Teece et al. 1997). Learning strategies are most effectively created through a somewhat structured process guided by the top managers, yet also take place at the grassroots level (Rangarajan et al. 2003). When decision-making is centralized, i.e., only a few people located in the head office make decisions, response may take longer, hence losing both timing and pioneering advantage. In many cases, centralization is concerned with bureaucracy, or formal and rigid procedures that force inertia and hence decrease capability of change and adaptation to the environment (Rajagopalan and Spreitzer 1996; Rudd et al. 2007; Zeira and Avedisian 1989).

H3. Management centralization has a negative effect on firms’ change readiness: The greater the centralization orientation, the lower the firm’s CR.

Technology and Innovation - The importance of technology use and innovations, in both manufacturing and processing of products and services in dynamic environments, has been largely discussed in the management literature (Andersen 2005; Borch et al. 1999; Drennan and Kennedy 2003; Miller 2002; Morgan 2004; Raymond and St-Pierre 2005; Timmor and Rymon 2007; Zahra 1996). The use of technology is key in meeting the requirements of changing markets and new competitive situations (Boccardelli and Magnusson 2006; Timmor and Rymon 2007). Technology contributes to organizational dynamic capabilities (Teece et al. 1997) by facilitating product adaptation as well as new product or service offerings and variations (Karagozoglu and Lindel 1998; Lei et al. 1996; Meredith 1987).

The ability to assess and to respond to new threats and opportunities depends on the current state of knowledge and practice: If a firm maintains updated technological capability in a variety of technical fields, it enhances its ability to read customers’ preferences and activate the necessary resources to act. It has strategic flexibility and is in a strong position to respond to serious environmental shifts (Aaker and Mascarenhas 1984; Byrd 2001; Harris 2002; Rudd et al. 2007). Use of technology can also speed the firm’s response to changing environmental triggers, by better monitoring the environment, identifying new opportunities and threats, and accelerating new product developments within reduced costs (Lei et al. 1996; Raymond and St-Pierre 2005; Zahara 1996; Zhang 2006;). We therefore hypothesize:

H4. Technology and innovation have a positive effect on firms’ change readiness: The greater the use of new and innovative technologies in the product manufacturing and service processes, the greater the firm’s CR.

Resources – Change Readiness is a business capability that we suggest gives a firm a competitive advantage and enhances its performance in turbulent environments. However, in

order to develop this capability, a firm needs to invest in its resources. (Boccardelli and Magnusson 2006; Grandy and Mills 2004; Helfat and Peteraf 2003). Moreover, organizations wishing to benefit financially from operational flexibility (Aranda 2003; Jack and Raturi 2002) need to plan their resources (Greenley and Oktemgil 1998; Mensah and Werner 2003; Rudd et al. 2007; Tang and Peng 2003). These resources can be identified by two major factors: facilities and human capital. *Facilities*, reflects the availability of equipment and infrastructure such as information systems (IS), computer-aided design (CAD), and flexible manufacturing systems (FMS) (Hitt et al. 1998; Lei et al. 1996; Zhang 2006) that can contribute to better monitoring markets, greater flexibility in production at lower cost, and increasing a firm's speed in introducing new and innovative products. *Human capital* is a critical resource upon which many core competencies rest, and through which competitive advantages are exploited successfully (Ireland and Hitt 1999). Availability of new technologies is not sufficient for strategic changes; personnel need to embrace these technologies and implement them in the manufacturing process (Jones et al. 2005; Powell and Dean-Micaleff 1997; Vankatesh and Davis 2000). We therefore hypothesize:

H5. Resource availabilities have a positive effect on firms; change readiness: The greater the availability of facilities and human capital the greater the firm's CR.

Performance – Strategic change by itself does not necessarily lead to better performance (Kelly and Amburgey 1991; Rajagopalan and Spreitzer 1996; Zajac and Shortell 1989). Especially in stable markets, using a proven strategy with slight modifications can be more effective in maintaining market positioning than can rapid and / or continuous changes. However, CR in this paper relates to a firm's capability of quickly identifying and adapting its strategy to environmental triggers in turbulent environments, and to its response in the event of new and significant triggers (opportunities or threats). Hence recent studies arguing for the positive effect of flexibility and organizational readiness for changes on financial and organization outcomes (Ebben and Johnson 2005; Goldhar and Lei 1995; Hitt et al. 1998; Li 2000; Li et al. 2005; Rudd et al. 2007; Tan and Peng 2003; Thourmrungrule and Tansuhaj 2007; Zhang 2006). We therefore hypothesize:

H6. Change Readiness has a positive effect on a firm's performance: The greater the firm's CR, the better its financial and organizational outcomes.

METHODOLOGY

Research procedure and data collection

The empirical study is based on data collected from 217 organizations in 14 countries. Nearly half of the organizations are headquartered in the USA, 68% of the firms engage in some export activity, and 46% make at least half of their sales away from home. Service organizations account for 36% of the firms, and manufacturers accounts for 26%, with strong R&D.

The research respondents filled out structured questionnaires during their studies in enterprise, executive workshops, and executive MBA programs. 60% attended such programs at leading academic institutions in the USA, and 40% in their home countries (if not US-based). All respondents were key informants (i.e., in charge of or involved with their firms' strategic

decisions and implementations thereof (Thoumrungrule and Tansuhaj 2007; Timmor and Zif 2005)), and 36% are senior managers. 30% of the respondents are employed by state-owned enterprises, and 36% by publicly traded enterprises (for a detailed sample profile, see the appendix).

Self-reported data for firms' strategy tactics and performance are quite common in business and marketing research (Cavusgil and Zou 1994; Grewal and Tansuhaj 2001; Morgan and Strong 2003; Thoumrungrule and Tansuhaj 2007). Studies report a high degree of correlation between perceptual and objective measures of organizational performance as reported by questionnaires, suggesting high confidence in the latter's use (Diamantopoulos et al. 1994; Hart and Banbury 1994; Murray 2005; Rudd et al. 2007). However, it is important to point out some potential concerns regarding self-reporting questionnaires; the danger of biased responses is always present in a study of this kind: Are respondents likely to admit poor management policies? The response bias in this study seems to work against finding significant correlations. Systematic errors would have been likely to conceal rather than amplify the hypothesized behavior. If managers felt that they should not disclose their organization's lag in responding to threats and opportunities, it would have been difficult to find confirmation of key hypotheses. The respondents did not have prior knowledge of the hypotheses of the study. On the other hand, non-systematic errors of perception would have likely increased variability and made it more difficult to find statistical significance.

In two organizations, the same questionnaires were administered to a number of managers in order to explore consistency of response by various managers from the same firm. The comparison supports the assumption that variability in the content of response from the same firm is much more limited than that between managers in differing firms.

The Study Questionnaire

The questionnaire contained three parts. In part one, respondents were asked to think of two separate, recent strategic triggers: one an opportunity, and one a threat. This part had six questions: three about the organization's response and success in dealing with the specific threat, and three parallel questions about the specific opportunity. Various examples of threats and opportunities were provided.

Part two of the questionnaire was adapted with minor modifications from Segev and Gray's (1990) Business Success Expert System (BSES). This part contained questions dealing with the environment, strategy content and the strategy-crafting process, and organizations' structure, performance, age, and size. Inclusion of this set of variables made it possible to provide each respondent with a separate, confidential, printed diagnostic assessment of the strategy of her organization based on BSES. As a result, there was an incentive not only to respond, but to provide truthful answers in order to receive meaningful interpretation. The promise of quick feedback, which was kept, ensured that all responses were 100% complete. Part three contained classification questions about the respondents, their organizations, and their international activities.

Measurements

The measurements were adopted from Segev and Gray (1990) and based on recent studies whenever possible (i.e., Cadogan et al. 2002; Li et al. 2005; Rudd et al. 2007; Timmor and Zif 2005; Zhang 2006). The responses to all questions, with the exception of the respondent classification data, were rankings on a scale from 0 to 100. Most questions were based on a comparison with the industry average of the respondent's organization, i.e., a score of 50 (see appendix for specific items).

Change Readiness – The CR dimension contains three variables: 1) Speed of identification of an environmental trigger for change; 2) Response time to start preparing for implementing a change; and 3) Innovation in the nature of the response. Each variable was used twice in every questionnaire: once for measuring the firm's competencies to cope with opportunity, and once for coping with threats. Thus the CR dimension is constructed of six parameters ($\alpha = 0.75$) and reflects the calculated mean of each. Since identification of a trigger may depend on interpretation of an evolving trend, exact identification time might be vague in many cases. In this paper, the variable selected to represent the trigger identification time is expressed by a position on a continuum of early versus late identification of an environmental trigger for change. This measure was considered clearer for assessment purposes than were alternative formulations.

For statistical comparisons across companies, preparation time is a difficult variable for two reasons: first because it is content-related, and second because preparation could be regarded as an ongoing, continuing activity. A continuous measure of "early versus late start of action preparation" might better represent response time for preparing to implement a change. An early start would mean practically no lag in starting to prepare for action; while a late start would mean starting action when there was no other choice.

Management Orientation – Two factors were examined: entrepreneurship and centralization. Entrepreneurship is measured by three items ($\alpha = 0.80$): 1) Willingness to commit a high proportion of the organizational resources to risky projects; 2) Extent to which the organization is proactive in trying to shape its environment, as opposed to merely reacting to trends in the environment; and 3) Degree of tracking opportunities and threats in the environment in order to craft strategy. For measuring centralization in decision-making, two items were used: the number of personnel that make decisions in the organization, and the degree of centralization in strategic decision-making ($\alpha = 0.60$). Note that for the analysis, the number of decision-makers was reverse-scaled, i.e., the more personnel making decisions, the lower the degree of centralization. The second item was important, since it is possible that while a considerable number of personnel are involved in decision-making, decisions are authorized strictly at the top vs. at the lowest managerial level.

Technology and Innovation – Three items were measured: 1) Extent of use of new technology in manufacturing; 2) Product innovation, i.e., number and novelty of new products introduced; and 3) Extent of use of various technologies in the service process ($\alpha = 0.74$). The first item reflects the organization's *capability* of producing and launching new products, whereas the second item reflects the firm's *actual launching* of new and innovative products. The third item is important because the service sector is rapidly growing, with its role increasing in the manufacturing sector (Brady and Cronin 2002; Timmor and Rymon 2007).

Environmental Barriers – Following the literature review, we distinguished between environmental dynamism that can encourage CR, and environmental barriers that can inhibit and decrease an organization's motivation to invest in changing its strategies. Such barriers were measured by two items: the assessment of environmental hostility, and the assessment of complexity ($\alpha = 0.62$). *Hostility* relates to factors such as nationalization and aggressive competition; while complexity relates to regulation and procedures that hinder new initiatives and actions.

Resources – Two items were used to measure the organization's availability of resources: investment in production equipment and facilities, and availability of human capital ($\alpha = 0.65$). While these items differ somewhat content-wise, one—human capital—is in many cases essential to the use of the other (Jones et al. 2005; Powell and Dean-Micallef 1997; Vankatesh and Davis 2000).

Performance – To test respondent assessments of their organizations' performance, (Cavusgil and Zou 1994; Diamantopoulos et al. 1994; Hart and Banbury 1994; Murray 2005; Rudd et al. 2007), six parameters were measured. In two of them, the respondents were asked to rate the success of their organizations in dealing with the threat / opportunity on which they reported earlier in the questionnaire. Three parameters were used for financial and market performance: growth rate; profitability and market share; while the sixth parameter examined operational efficiency. For all four parameters, respondents were asked to rate their organizations' performance relative to its specific industry (Segev and Gray 1990).

Organizations' ages and sizes have been discussed in the strategic literature as affecting inertia as well as firms' flexibility and readiness for strategic changes (Autio et al. 2000; Feigenbaum and Karnani 1991; Fombrun and Ginsberg 1990; Kapasuwan et al. 2007; Kelly and Amburgey 1991; Rajagopalan and Spreitzer 1996; Zajac and Kraatz 1993). While age and size are not of main interest in this study, they were measured by asking the respondents for their evaluation of their organization's characteristics relative to their industry.

FINDINGS

We applied a logistic regression analysis to examine the differences between firms perceived to have high vs. low CR. Firms in the high CR category received a score above 50 on the CR factor, while those in the low category got a CR score ≤ 50 . This categorization was made for two reasons: 1. The scale is from 1-100; hence, the score of 50 indicates the mid level. 2 Following Segev and Gray's (1990) scaling and the questions' phrasing, the score of 50 reflects the average industry rating. Following this processing of data, the low CR category counts for 77 cases, and the high CR category accounts for 140 cases. The five factors in the research chart that we hypothesized would affect the firm's CR were used as independent variables. Table 1 presents the logistic regression analysis results.

<i>Predictor Factor</i>	<i>B Coefficient (S.E.)</i>
<i>Environmental barriers</i>	-0.027* (0.009)

<i>Technology & Innovation</i>	0.035* (0.012)
<i>Management Orientation - Entrepreneurial</i>	0.038* (0.012)
<i>Management Orientation - Centralization</i>	-0.020* (0.012)
<i>Resources</i>	0.035 (0.012)
* - $p < 0.01$	
Model Statistics	
-2 log likelihood = 210.501	
Chi square (5 d f.) 88.325 ($P < 0.01$)	
Correct classification = 77.4%	

Table 1: Logistic Regression Results Categorical Dependent Variable = Change Readiness

The model is significant and has a relatively high predictive ability (77.4% of the observations were correctly classified). Consistent with the environmental barriers factor and supporting H1: a significant negative association was found between environmental barriers and CR. Looking at the variables means and correlations (Table 1 in the appendix) it can be seen that while environmental barriers correlate with environmental dynamism, the coefficient is only 0.31 and the mean difference is significant ($p < 0.01$). This means that these two variables do not reflect the same content.

Supporting H2 and H3, management entrepreneurship and centralization were found to have a positive effect on CR. H4 was supported as well: Firms rated high in the technology and innovation factor were likewise rated high in CR. Firms with greater availability of facilities and personnel were expected to have a higher CR score. However, in this study no such significant correlations were found, hence H5 was not supported.

Table 2 shows the performance results of the firms with high and low CR respectively. The comparative analysis indicates that for all tested parameters, the firms with high CR significantly outperformed the firms with low CR, thus H6 is supported.

<i>Firms' Classification</i>	<i>High Change-Readiness</i>	<i>Low Change-Readiness</i>
<i>Performance variables</i>	N=140	N=77
<i>Growth rate *</i>	67.92 (18.80)	60.78 (22.36)
<i>Market share**</i>	62.36 (29.45)	49.39 (29.88)
<i>Profitability**</i>	58.52 (24.69)	48.96 (24.79)
<i>Operational efficiency**</i>	61.24 (18.183)	51.17 (22.07)
<i>Success of opportunity handling**</i>	69.03 (20.37)	46.97 (26.728)
<i>Success of threat handling**</i>	63.63 (20.63)	40.45 (21.82)

Table 2: Performance of Firms with High vs. Low Change Readiness Means (Std). * $p < 0.05$, ** $p < 0.01$

Table 3 presents the age and the size means of the tested firms in the high and low CR groups respectively. In this study, firms with a high CR score were found to be significantly bigger than those with low CR scores. No significant differences were found regarding firms' relative ages.

<i>Firms' Classification</i>	<i>High Change-Readiness N = 140</i> <i>Means (Std)</i>	<i>Low Change-Readiness N = 77</i> <i>Means (Std)</i>
<i>Firm relative size*</i>	60.68 (22.34)	54.68 (22.74)
<i>Firm relative age</i>	65.27 (28.18)	68.77 (26.97)

DISCUSSION

The paper proposes an alternative business strategy concept of Change Readiness regarding a firm's behavioral response to environmental triggers. To explore this concept, the following tasks were attempted: 1. To explain and define the concept as a multidimensional construct. 2. To show that this concept has predictive value for a given organization's performance (Hypotheses 6) 3. To examine how CR can be predicted based on a set of organizational and environmental variables (Hypotheses 1 - 5).

"The secret of success in life is to be ready for opportunity when it comes" (Benjamin Disraeli): The idea of being ready for change, which is easy to grasp, can be operationalized for possible use.

The viability of Change Readiness as a defined and measurable concept is supported by the findings of this study. Supporting the research hypothesis, firm performance was found to be strongly associated with the multidimensional construct of three related CR activities: early identification of an environmental trigger for change; rapid response by starting preparing for implementing a change; and novelty in the content of response (for both opportunities and for threats).

In this study, firms' performance was measured by six different parameters: growth rate; profitability; market share; operational efficiency, opportunity handling; and threat handling. For all six parameters, the firms with high CR scores outperformed those with low CR scores. Previous studies have argued for the positive effect of an organization's flexibility on its

financial (profitability; growth rate) and operational outcomes (Hitt et al. 1998; Rudd et al. 2007; Thourmrungrone and Tansuhaj 2007; Zhang 2006). Flexibility, however, is commonly defined as the extent to which new and alternative decisions are considered and made (Ebben and Johnson 2005; Ireland and Hitt 1999; Rajagopalan and Spreitzer 1996; Rudd et al. 2007). In light of this study's findings, it can be argued that while novelty of action is one component of a firm's CR, early identification of environmental triggers and speed of preparation for response are integral parts of the CR construct that affect the firm's performance.

In measuring their firms' perceived performance, respondents were also asked for their assessments of their organizations' success in dealing with the environmental triggers that were presented as specific major opportunities and threats. It was found that the greater the firm's CR, the greater its success in handling these triggers. These findings, which support the research hypothesis, are not obvious, since it might be that speed and novelty of action could lead to inferior outcomes—or even failure—in handling the triggers.

This study suggests five factors that are hypothesized as affecting firms' CR, and hence aid in distinguishing between firms with high vs. low CR. Hostility and complexity were identified as environmental barriers, and have been found, as hypothesized, to have a negative effect on CR. These findings differ from those of other studies, which have viewed dynamism as an environmental motive for organizations to increase their readiness for strategic change (Choko et al. 2002; Han et al. 1998; Ireland and Hitt 1999; Li et al. 2005; O'Regan and Ghobadian 2005; Zhang 2006). One explanation for this might be related to the differing conceptualization that this study presents of CR: Most studies have approached CR as an attitude toward making strategic changes under turbulent conditions, whereas this study addresses firms' actual behavior to environmental triggers. The concept of CR implies the consideration of the required effort in making strategic changes, rendering making strategic changes under hostile and complex conditions riskier.

Another explanation might lie in the differing meanings of environmental dynamism and barriers. The former may reflect rapid changes in consumer tastes, technology, and liberalization (Chonko et al. 2002; Han, Kim, and Stivastava 1998; Harvey and Novicevic 2002); while the latter may be more expressed in regulations and state action (i.e., nationalization) and political constructs that render the business environment complex and hostile. In this study, we asked for respondent assessment to environmental dynamism as reflected by the quantity and speed of changes and uncertainty. Partial correlation was found between environmental dynamism and barrier constructs, and their mean scores were found to differ significantly.

Following the research hypotheses, the study identified key factors that correlate with CR: Entrepreneurship (risk-taking, proactive management, and constant external analysis) and Centralization (no. of decision-makers and degree of centralization) are related to management orientation in process and structure of decision-making. While CR variables are defined in terms of response to external triggers, the research findings support the notion that high change readiness implies a managerial conviction that the organization has the internal strength to shape and influence the outside, rather than merely react thereto. CR is also manifested in willingness to commit a high proportion of an organization's resources to risky projects, and systematically tracking opportunities and threats in the environment in order to craft long-term strategy. In addition, it was found that organizations that are positioned defensively to react to

external triggers are less successful in responding to those triggers than are organizations that are positioned offensively to initiate change.

The study supports the hypothesis that decentralized decision-making is associated with greater change readiness. A small top-management team is more likely to reject external signals that lie outside its comfort zone than is a wider, diversified team that is capable of raising doubt. Disturbing questions aid learning through improved interpretation of unexpected external signals. A broader managerial team might aid in promoting innovative solutions by rendering deviating from inertia an acceptable activity.

Consistent with the extensive literature and supporting this study's hypothesis, technology and innovations, both in the manufacturing / service process and the final product, were found to have a positive effect on CR. The concept of CR in this study is identified with speed and innovativeness of organizations' responses. Hence, it is not surprising that as firms integrate technology into their operations, they improve their capability of introducing new product and services within a shorter time.

In order to develop its competencies, an organization needs to invest in its resources. It has been hypothesized that firms' CR is positively affected by availability of both equipment and facilities, and human capital. Surprisingly, no significant effect on CR was found for resources. This might be explained by the relatively high correlation found between resources and technology. In addition, the findings may support the notion that entrepreneurial orientation is more critical to CR than are resources.

Finally, the two fundamental properties of age and size, considered to be indicators of organizational inertia (and therefore possibly related to CR): Age was not found to significantly differ between the high- and low-CR groups. On the other hand, the mean size of the firms with high CR scores was significantly greater than those with low CR scores. Advocates of small-size firms' strategic advantage have argued for greater flexibility and innovativeness due to less bureaucracy (Fombrun and Ginsberg 1990; Kapasuwan et al. 2007), while other scholars found no or positive effects of firms' size and age on strategic changes (Kelly and Amburgey 1991; Rajagopalan and Spreitzer 1996; Zajac and Kraatz 1993). It may be that these two parameters by themselves do not substantially affect strategic changes, and need to be mediated by other variables. Their effects however, are yet to be conclusively found.

MANAGERIAL IMPLICATIONS

In *McKinsey Quarterly* (April 2008), executives surveyed worldwide reported that, though most executives recognize the importance of global environmental trends and changes for corporate strategy, they feel that few companies address these successfully. Under globalization and increasingly turbulent environments, organizations need to prepare to make strategic changes. However, the right attitude is not enough: To be successful in responding to outside events, an organization needs certain capabilities in order to act.

This study suggests that firms' readiness for change should be examined based on three related elements: their capability to continuously scan the opportunities and threats evolving their environments; their timing; and their innovative / varied response. Our empirical research revealed that managers who ranked their organizations high on this multidimensional construct

reported significantly better performance than did those who ranked their organizations low. We therefore propose that change readiness can be improved. This study found that management's entrepreneurial orientation and decentralized decision-making contribute to CR. Technology and innovativeness, both in the production and service processes, also have positive effects on firms' CR. Environmental hostility and difficulties, on the other hand, were found to deteriorate firms' CR, yet managers can find ways to overcome these barriers.

LIMITATIONS AND FUTURE RESEARCH

There are a number of limitations to the study. For most firms, there was only one responding manager from each organization, and the threats and opportunities were self-selected. Though self-reported data for firms' strategic tactics and performance are quite common in business and marketing research, it may raise concerns regarding potential biases. The size and selection of the sample may pose limits in generalizing the study findings. Future studies should attempt to include a larger sample of organizations with more respondents from each, and to perform separate analyses by type of industry, with more specific information about environmental threats and opportunities. It would also be useful if survey data could be supported by observation of actual behavior in field studies. Yet in spite of its shortcomings, the study has explained interesting variations in response patterns and in the successful handling of environmental changes.

This paper is part of a continuing effort to study patterns of organizational response to environmental threats and opportunities. Additional planned studies include cross-cultural comparisons of response patterns based on a larger multinational sample. Further research into the distinction between responses to threats and to opportunities and an examination of the relationship between CR variables and existing typologies is also planned.

APPENDIX - THE MEASURES**CHANGE READINESS**

Think of a relatively recent specific strategic OPPORTUNITY faced by your organization (i.e., an increase in demand, decline in competition, new course of capital, a new regulation that has a positive affect for your organization, a new potential product or service for your organization).

1. Did your organization identify this opportunity at the earliest possible time (score 100), or very late after the opportunity was quite obvious? (score 0) _____

2. Did your organization start preparing to deal with this opportunity immediately (score 100), or when it was almost too late? (score 0) _____

3. Did your organization take an incremental and familiar action in response to this opportunity (score 0), or did it take a totally innovative response that differed from past behavior? (score 100) _____

Think of a relatively recent specific strategic THREAT faced by your organization (i.e., a decrease in demand, incline of competition, an adverse change in financial resource, a new regulation that has a negative affect for your organization, a new potential product or service which competes with your own).

4. Did your organization identify this threat at the earliest possible time (score 100), or very late after the threat was quite obvious? (score 0) _____

5. Did your organization start preparing to deal with this threat immediately (score 100), or when it was almost too late? (score 0) _____

6. Did your organization take an incremental and familiar action in response to this threat (score 0), or did it take a totally innovative response that differed from past behavior? (score 100) _____

MANAGEMENT ORIENTATION**Entrepreneurial**

1. How would you rate the extent to which top management is willing to make commitments that involve a high proportion of your organization's resources to risky projects (business, marketing, financial, or political risk)? A low score indicates a highly conservative approach; 50 is average across all industries, and 100 indicates a risk-preferring approach _____

2. How would you rate your organization's ability and resource commitment to systematically track opportunities and threats in the environment in order to craft long-term strategy? An organization with a highly external environmental analysis and forecasting abilities is scored 100. The average across all industries is 50. _____

3. How would you assess the extent to which your organization is proactive in trying to shape its environment, as opposed to merely reacting to trends in the environment? A proactive

organization continually trying to shape its environment should receive a score of 100; a business that merely reacts to trends in the environment should receive a score of 0. _____

Centralization

1. How would you rate the number of main strategic players or decision-makers in your organization? An exclusively one-person show is scored 0, three to five strategic players is scored 50, a highly dispersed decision-making team (about 30 persons, or in smaller units, 30% of the staff) is scored 100. _____

2. How would you rate the degree of centralization in your organization? When decision-making authority is strictly at the top (score 100), the organization is centralized; when decisions are delegated to the lowest managerial level (score 0) the organization is decentralized. 50 is the average level of decentralization. _____

Technology & Innovation

1. How would you rate the progress of your organization in terms of the number and novelty of new techniques used in producing existing products? A score of 100 indicates the highest possible progress in your industry; 50 would be an average, and 0 is the lowest. _____

2. How would you rate the product innovations of your organization in terms of the number and novelty of new products introduced? The industry score level is 50. _____

3. How would you rate the relative number of core technologies employed in service processes? A score of 100 indicates the highest possible use of different technologies; 50 would be an average; and 0 is the lowest. _____

Environmental Barriers

1. How would you rate the extent of hostile environmental factors negative to your organization? A score of 100 indicates a completely hostile environment; a score of 0 indicates a highly benevolent environment; 50 is for a neutral one. _____

2. How would you rate the number and complexity of external elements with which your business has to contend? A score of 100 indicates the most complex environment; 50 an environment of average complexity; a score of 0 indicates a very simple environment. _____

Resources

1. How would you rate the availability of human resources in your organization? An organization with abundant resources is scored 100; an organization with depleted resources is scored 0; an average resource level is 50. _____

2. How would you rate the amount and frequency of investment in production equipment and facilities? A score of 100 is given to with the most equipment- and facility-rich organization in the industry; an organization with the least equipment and facilities ranks 0; 50 is average in the industry. _____

Performance

1. The average profitability on the return of equity of your industry is 50. How would you rate the profitability of your organization relative to your industry? _____

2. The average operational efficiency of your industry is 50. How would you rate the operational efficiency of your organization relative to the industry? _____

3. The average rate of growth of your industry is 50. How would you rate the growth rate of your organization relative to the industry? _____

4. How would you rate the relevant market share held by your organization? Monopoly or an industry leader is scored 100. Other business units' scores are their sales as a percentage of the leading competitor's sales.

5. How would you rate the success of your organization in dealing with this opportunity? A score of 100 would mean the highest rate of success; a score of 0 would represent a failure. _____

6. How would you rate the success of your organization in dealing with this threat? A score of 100 would mean the highest rate of success; a score of 0 would represent a failure. _____

Note: Questions 5 and 6 above appeared in the questionnaire after the Change Readiness section, questions 3 and 6 respectively.

Environmental Dynamism

1. How would you rate your environmental uncertainty? Complete uncertainty about the environment is 100; an average uncertainty level is 50; if there is no uncertainty (a rare situation), assign a value of 0. _____

2. How would you rate the rapidity and the amount of change in your environment? A score of 100 indicates a quick and total change in the wider environment as well as in your industry; 50 is the long-term average across all industries. _____

Firm's Characteristics

1. How would you rate the size of your organization relative to your industry? Size could be assessed by sales, assets, and personnel in the organization. An average for your industry will rate 50. _____

2. How would you rate the age of your organization relative to your industry? The oldest organization in the industry is given a score of 100; the newest 0; and the industry median is 50. _____.

MANAGING IT OUTSOURCING RELATIONSHIP IN THE PUBLIC ADMINISTRATION

Tommasetti, Aurelio¹; Vaia, Giovanni²

¹*Università degli Studi di Salerno, Dipartimento Studi e Ricerche Aziendali, Via Ponte Don Melillo, 80084 Fisciano (SA) – Italy*

²*PhD, Università degli Studi di Salerno, Dipartimento Studi e Ricerche Aziendali, Via Ponte Don Melillo, 80084 Fisciano (SA) – Italy*

The outsourcing business in the public administration is increasing mostly in Europe through different contracting models and governance structures, where public entities and providers set up a market relationships regulated within public administration regulation frameworks.

This paper presents a qualitative study based on a Italian Region that has outsourced its Information Systems.

This study, at a very early stage, tries to contribute to the debate on Outsourcing in the Public Administration in Italy underling the characteristics of outsourcing models and how outsourcing processes are governed.

Key words: Outsourcing in Public Administration, outsourcing governance, IT outsourcing

INTRODUCTION

Nowadays strategical change and research of flexibility seem to be obligatory objectives for public entities, due to the fact that they are conditioned by high turbulence and complexity (internal and external).

Last decade has been characterized by modernization processes from a managerial and organisational point of view (Rebora, 1999), this resulting in public entities (which are becoming more decentralised) being pushed to focus on outputs and service levels provided to end users. Public entities actually operate in a new competitive scenario which is (re)defined by deregulation and technology pervasiveness.

This change, supported by a deep acceleration due to regulations prodding, has led to a redefinition of internal trims and the adoption of new organisational models that focus on strengthening outsourcing strategies, gaining external competencies and functions, improving tools for performance evaluation and strategic control. The main objective is to maintain control capabilities on activities and processes that have been externalised to product and service providers.

The outsourcing business in the Public Administration is increasing mostly in Europe through different contracting models and governance structures, where public entities and providers set up a market relationships regulated within public administration regulation frameworks.

In Italy the first stage of outsourcing processes has been mainly about non-strategic functions or functions which are instrumental to the delivery of the standard PA activities. The main objective was cost reduction. Now the focus is moving from reducing costs to improving the performance of the organization, this resulting in the presence of strategic purposes when it comes to take decisions about outsourcing (Meneguzzo, 1990).

The main benefits for public entities can be summarized as follows:

- cost reduction and economies of scale due to better specialization of suppliers;
- engagement of continual service improvement activities;
- access to resources, knowledge and capabilities of other actors in the competitive context (suppliers, competitors, etc.);
- reduction of the level of bureaucracy and better flexibility of the whole organisation;
- focusing of investments on the resources, knowledge and skills that differentiate the organization;
- the possibility to get complex and real-time information about costs, quality and results;
- the possibility to tie service costs to the results defined in the contract;
- the possibility to develop benchmarks for public entities with the objective to get good suggestions for the future;

Outsourcing is becoming the tool to encourage and support changes in public entities by pointing them towards better and more efficient management options.

This study, at a very early stage, tries to contribute to the debate on outsourcing in the Public Administration in Italy underling how outsourcing processes are governed and if accounting and financial tools in use are able to support public entities in evaluating the effectiveness of outsourcing choices, the ongoing management, the control of outcomes and performances.

This paper presents a qualitative study based on a Italian Region that has outsourced its Information Systems.

The objective is to understand which structural and relational structures allow to reach innovation and strategic development goals, and within which limits.

IT OUTSOURCING IN THE ITALIAN PUBLIC ADMINISTRATION: CHARACTERISTICS AND MODELS

Throughout the last years the public sector has shown a great interest for some contractual agreements as sources of flexibility in order to obtain the same functioning within the public companies like the private one. Types of decentralization have been analysed particularly from both the strategic point of view and the contractual one.

At the beginning of the eighty's, particularly in the USA and in the UK, lively grows a trend of decentralization favouring first of all the privatization of the activities and services, instead of the externalization. In the case of privatization, considered as a strengthening of the private role both from the strategic and operative point of view, the public management renounces the choices of the services and the definition of the strategy.

Types of externalization *in strictu sensu*, instead, are summarized as follow (Meneguzzo, 1990):

- contracting out, when a public or a private entrepreneurs manages services and/or activities;
- contracting in, when the management of the services is given to other public institutes;

- partnership, considered as a process of cooperation between public and private sector like in the case of the joint venture.

In Italy there are many outsourcing examples in the public sector, especially within the IT services.

In 1969 the Ministry of Finance began a project of full outsourcing; but after that It decided to internalise IT systems and to create Consip SpA. The Ministry decided to maintain a control over the integration and the cooperation between systems on the one hand, and the normative dynamic and the evolution of the staff competences on the other. Consip became the main interface for all the technical problems and the new projects of the Ministry, assuring the integration of the systems.

Another example of outsourcing concerns the Ministry of Agriculture. In 1980 It gave to Auselda only a part of the information systems, and this experience developed in a full outsourcing in 1985 when it gave to Finsiel the management of all systems, in order to obtain economies of scale and integration. In fact the Ministry managed a software complexity, due to a normative framework, which quickly developed, and to an administrative system decentralized on the territory.

Both the examples show, as many other cases (ACI, Alitalia), how the choice of partnership relations as consortium or public-private venture represented and represent nowadays a prevalent strategy. The easier management of the relation, in terms of free decisional processes, becomes an important factor of choice that affects strategies. Actually the trade off works between the difficulty of the management of the relationships among the institutions, as the case of the contracting in, and the difficulty of governance of the private subjects, as the case of the contracting out, because of the incompleteness of the contracts and the lack of specific competences.

More, the difficulty to empower the skills and the inner competencies has driven to constitute private enterprises with public sharing, aiming to manage the outsourcing contracts.

The choice of these intermediate relations of collaboration between hierarchy and market, thanks to an exercise more or less direct of the governance of the relation, solves at the source a series of problems and bonds primarily tied to the responsibility on the collective systems, to the respect of the policy determined at different levels.

The public sector, moreover, prefers the choices of insourcing or contracting in order to avoid a loss of control. The risk to create a situation of almost a monopoly, with great players of the market is high. This case would increase the risks of a failure of the relation and rise of the switching costs.

In the private sector, on the contrary, the choices of internalization or adoption of intermediate relation as the joint venture are tied to the increase of the costs of transaction related to the selection of the supplier with high frequency of the use of the resources (Wildener, Selto, 1999), with high level of technological uncertainty and asset specificity (Robertson, Gatignon, 1998; Poppo, Zenger, 1998), with high risks of opportunism (Steensma, Corle, 2002). Other independent variables correlated to the outsourcing decisions include: the risk of failure negatively correlated to the probability of internalization (Steensma, Corle, 2002); the costs of

monitoring, where the difficulty of growing measurement, referred to innovative factors, is positively linked to an inner governance (Robertson, Gatignon, 1998).

The need of more flexibility and the innovative high boosts, contrary to the typical rigidities of the public employment, drive to reconsider the utility to operate through the different contractual agreements provided for the Public Administration, creating with the final supplier a market relation more daring but regulated within the public administrative services (Willcocks, Currie, 1997). According with Meneguzzo, the competitive management «represents the solution that allows to give importance to the substantial contents of the service supply»(Meneguzzo, 1990).

Nevertheless, the trend to the outsourcing processes *in strictu sensu* and the lack of experience and managerial models consolidated for the PA, open to a series of research questions :

- a. Which are the roles, the activities and the useful tools to manage the supply relation successfully?
- b. How do the ruling factors drive on the governance of the outsourcing relations?
- c. Which are the controlling measures available that can be considered as effective management tools of the outsourcing contracts?

The first problem is linked to the difficulty to detect appropriate technical and strategic skills and roles able to support the correct execution and monitoring of the contractual agreements. This scenario drives the public companies to reconsider the organizational and operative requirements in terms of process of coordination and integration between the different units, together with the needs of professional and technical retraining of people involved in the outsourcing process, in terms both of direction and execution of the contract.

The management of the decision process only represents the first stage of the outsourcing processes, which careful management guarantees their success only partially. But it is decisive to start up processes of continuous reassessment to estimate both the quantitative aspects (levels of service), and qualitative aspects (perception of the quality) of delivered services.

The crucial point becomes, so, to manage the complexity and the dynamism of the outsourcing processes through activities of codification and standardization of processes and measurement units, definition of the interfaces of communication, allocation of decision power, definition of the processes of penalties and rewards.

The second problem , linked generally to the re-definition of the limits of the public, concerns the ruling factors which reduce within the public companies the possibilities of management, typically linked to the contract, of the different outsourcing solutions.

The third problem concerns the economic and financial methods of management of the contract. These conditions assume a crucial role because they have to reconcile the need of respect of the agreed budget and the need of more flexibility linked to the introduction of new technological solutions and changes of the service request. Moreover, the traditional account systems of the public companies, focused on the cash accounting, do not allow, ex ante, to estimate the convenience of the different proposals taking care of financial expenditures, and ex post to verify and evaluate the performance of the supplier.

In general, the effectiveness of the management of the outsourcing process needs weighed strategic choices and a consequent organizational development characterized by high level of integration and a consequent coordinated development of competencies. The adoption of the outsourcing models like the contracting out is linked to the capability of the public companies to reconvert their own purchase and management structures in order to avoid the growth of the costs of the transaction contracts, because of the distortion effects of the opportunism and the power (competencies) of the supplier of the outsourcing services.

This development and change of course is not simple and quick in bureaucratic structures like those of the public sector. Often the reduction of the risk of the loss of control on the outsourcing contracts, and the removal from the real needs of the inner users, carries out through a path of inner growth and development of managerial competencies that is not trivial at all.

An exploratory case study

The empirical material on which this paper is built has been collected in an Italian Region.

Two collecting methods has been utilised. The first one concerns the analysis of archival sources. Internal official documents have been analysed and data from bids. The second is based on semi-structured interviews. Interviews have been involved individuals, both strategic decision makers and people involved in operational activities, directly involved in outsourcing processes (both IT and financial side). Roughly 10 hours of interviews were carried out by the authors. For confidentiality reasons no more information on the buyers can be provided.

The nature of the research questions made the choice of the exploratory case study method the most appropriate (Eisenhardt, 1989, Yin, 1994), both to explore and to get a deeper understanding of particular issues.

In addition to the intrinsic limitations of case study research, the study could be partially biased by the fact that we observed only customer side. As a consequence, further investigation on vendors can be useful to validate the existing findings.

Management service of the network infrastructures, hardware goods, ICT services systems used by the structures of the Region and ICT services offered by the authority itself, are the object analysed.

Actually the Region has drawn up a contract in 2007 of about 9.000.000.000 euros given to a group of companies.

The actual lead company on January 2004 won a competition which provided a contract of 5 years for the amount of 6.600.000,00 euros, amount extended to 9.600.00,00 because of a new re-modulation on June 2004. On June 2006 the Region resolved the former contract and gave again to the same company similar services for the amount of 4.800.000,00 euros until the end of December 2007.

The services in the procurement contract are:

1. institution of a on-site call centre/help desk;
2. network maintenance services, network development and security;

3. system integration, system development, system maintenance;
4. hardware maintenance and workstations maintenance;
5. monitoring, support and control of third parties contracts.

The collaboration with the external supplier is included in the strategies of the Region which has set up a developing process of the network verged to guarantee interoperable standards and software cooperation between computer systems of its own offices, distributed in the territory.

Other objective concerns the adjustment of the current structure of the network to changing needs and to the confidential nature of the information. The prospect is the migration towards the Public System Network and to guarantee, at the same time, of the continuity of the services offered and the greatest cohesion among Public Administrations in the region.

With this structure it is possible to realize a net of reliable interconnections which guarantees alternative paths among different offices.

The model adopted for the project guarantees a distributed environment in which all the authorities can interact between themselves, setting aside all the platforms used. The distributed system assures the integration and interoperable applications, safety mechanisms and the measurements of the quality of services, the access to applications from different devices.

The Region expects from the outsourcing relation first of all the raising of the levels of the services, the access to new competencies and skills, the improvement of the flexibility and support to the change. In order to gain these objectives the Region considers to maintain in house three main functions/competencies:

1. Design of solutions and definition of requirements;
2. Definition of models for semantic interoperability in service;
3. Management of the information.

DISCUSSION

In the paper major focus has been concentrated on IT supply services for which is requested a particular level of integration between user and supplier for the complexity of the object of outsourcing. The IT services under analysis, in fact, are closely bound to core processes of analyzed organization, both inner and outer (dedicated to final user).

Given the analyzed case it is clear that turning to outsourcing is the result of a deep analysis of internal organization and of its possibilities compared to needs and resources, of a study of internal processes (we lack of a specification of their cost). Administration chose to concentrate its energies on arguments that are more critical for its life and for services offered to citizens as the definition of requirements and the design of services, definition of semantics, and management of information. This is essentially done to avoid loss of internal knowledge and professional skills, necessary also to the verification of the validity of the committed service and to avoid a dangerous subjection.

The concentration of resources on the main mission that constitutes the essence of the organizational structure and the external commitment of other activities and services must

prove to be favourable, economically too, and can be accepted only if suitable selection procedures have been arranged in advance, as much as suitable contractual tools in which, as well as a detailed definition of the committed service, warranty controls for the level of the furniture and transparency on operational procedure should be forecast. Research highlighted, on the other hand, a substantial inconsistency between features of the object of the supply and tools of relationship management.

Empirical evidences derived from the explorative case show as management tools usually prompted by literature aren't always consistently applied in the observed case.

Contract and technical measures detailing it revealed themselves as the main governance tool of the relation. Nevertheless is really on its features on the capability to reflect the real features of relation that we met the biggest differences in governance systems adopted in the private system.

An approach is marked by a static management of the contract, and a regulation too restricted. This one tries to respect predefined levels of service, trying to increase sales proceeds through the management of a bigger amount of activities, and on the other hand trying to avoid penalties, often left unpaid for lack of a continuous monitoring activity. This approach limits the capability for the supplier to understand the needs of the user and to translate them in dynamic and performing services.

Management of uncertainty and technology dynamics and business processes depends on a good contract rafting, on the definition of goals and management and control processes (Willcocks, Fitzgerald, 1994), on modalities of operational modalities review, but also on the capability to stimulate *in itinere* actions and reactions of counterpart towards common goals. In complex cases, in fact, as the one analyzed, a contract as governance tool results effective only if it is posed in a dynamic shape, that is able to comprehend internally incentive tools, of recurrent review, of possibility of review and improvement of needed services during the relationship, that are controlled from time to time, considering the whole development of the relationship itself.

The case shows as in environmental internal and external uncertainty situations, as if in the case of technology, contractual forms defined first by community policy and then by national policy represent an area of vulnerability from the point of view of governance. Risk is that a growing dissatisfaction of users both external and internal and a difference between the expectations on the quality of service and the quality of service actually given, a lack of incentives to improvement, a bureaucratic selection of needs, the missed updating of available services. To the law, in effect, is given the task to identify the most suitable solution for the management of services, and to give coherent and effective solutions in situations of certainty (Pini, 2005).

Again, accounting systems based on cash accounting impact negatively on outsourcing governance. They do not allow, *ex ante*, to evaluate the value of different proposals, focusing mostly on cash outflows, *ex post* to control and evaluate provider performances.

Putting the accent on the relevance of financial aspect of management disregarding the economic one (accrual accounting) doesn't create the basis for accountability, that is making

responsible on performance, of the right use of the resources, on the decisions to activate commercial partnerships, on the financial supportability of the desired services, to plan future investments (Tommasetti, 2008). It would be appropriate to use an analytical distribution of cost, that should consider the various stages in which is divided the life of the information system. A structure of cost isn't present, in fact, articulated in supplied services or in activities, clearly linked to the use of a well determined factor. It seems impossible to follow a recovery of efficiency for activities that present a contained added value and a recovery of flexibility in the management of costs. The single entries that make the cost of the service managed internally by administration should be related to the effects of externalization on the same costs in terms of savings, for economic convenience; evaluations at the same time should be done in political terms and considering the strategic direction of the administration, the features of product as well of the service, constraints tied to the resources allocation.

CONCLUSIONS

Outsourcing isn't simply a commitment to an external supplier on activity phases of service delivery, but expresses a logic of redesigning and it's supposed to focus on the main mission, defending some of the main activities e focusing the attention on the needs that tries to fulfill.

It's necessary to keep a power of continuous control on externalized processes, on quality of service, on planning, on development of services. It would be appropriate for public authorities to adopt control tools able to affect the behavior of outsourcer as budget, report, rules and procedures, dynamic contracts, relational trust.

As for the relational aspects, administrations show an interest limited to management of relations of endowment as a kind of partnership. It's an inheritance of a vision strongly tied to bureaucratic formalisms. Governance of social relations informally developed seems to determine success of outsourcing processes and of capability of innovation of organizations.

Lack of recognition and management of these informal relations tends to under estimate the role of knowledge. A poor sharing of knowledge and information in the supply chain, could produce cost benefits for users and supplier in the short period. Risks of losing long time benefits deriving by the tight collaboration, nevertheless, are high.

These considerations induce to deepen the explorative analysis of the relations between user and supplier, widening it also to the cases that weren't studied in this paper, to build a complete outline of the current management practices. In particular, starting from the limitations of the research considered, next steps will be in the direction to widen the surveying on the field.

THE ECONOMIC EFFICIENCY OF THE INNOVATION SYSTEM IN THE WOOD AND FURNITURE ENTERPRISES BRANCH IN THE REGION OF THESSALY – GREECE

Trigkas, Marios¹; Papadopoulos, Ioannis²; Karagkouni, Glykeria³

¹Laboratory of Forest Economics – Faculty of Forestry & Natural Environment, Post Code 54124 Thessaloniki, Department of Wood & Furniture Technology and Design, TEI of Larissa, Karditsa Branch, Post Code 43100, Center for Research Technology and Development Thessaly (CE.RE.TE.TH.) – Institute of Technology and Management of Agricultural Ecosystems (I.TE.M.A.), Karditsa, Post Code 43100

²Department of Wood & Furniture Technology and Design, TEI of Larissa, Karditsa Branch, Post Code 43100

³Department of Wood & Furniture Technology and Design, TEI of Larissa, Karditsa Branch, Post Code 43100

In the present study, which focuses to the branches of wood and furniture enterprises in the Region of Thessaly, there is an attempt to register the main problems of the enterprises, the best practice applied concerning their operation and the analysis of the economic dimension and efficiency of their innovative activity as well. For the production of new, innovative and quality products, it is necessary to have relative high expenditures for the procurement of modern technological equipment, as long with other production factors, which have to be incorporated into the total production cost. The enterprises of the branch of wood and furniture, seems that they don't produce innovation by their own and they come behind to the extraversion that they have to show for successful innovations they may apply. The efficiency of the enterprises innovation system is judged as adequate, as long as the majority of the firms are using in a satisfactory way the inputs of innovation. However, there are significant margins of improvement, mainly to the sales of products that are a result of some kind of innovative action of the enterprises, along with issues dealing with training of the staff, dissemination activities of innovation and development and application of R&D. The alteration of efficiency shows fluctuations pointing the absence of a clearly specified strategy of the enterprises of the branch in issues dealing with adequate use of production factors of innovative activity and the expenditures that are made for that reason. Finally, there are enterprises that come significant behind related to other firms of the branch and they have to try much harder in order to improve their efficiency and to decrease their expenditures to achieve the best efficiency of their business activity.

Purpose - The study provides important implications for managers and researchers who explore the efficiency among innovation inputs and outputs along with the registration of economics of innovation variables in company performance.

Design / methodology/ approach - A 2005 - 2007 empirical study registers economics of innovation of 38 wood and furniture enterprises in the region of Thessaly - Greece. The data collection methodology was based to the guidelines of the Oslo manual. The data analysis techniques are descriptive statistics, frequencies and correlation, using the SPSS package.

Based upon the Data Envelopment Analysis technique, a benchmarking analysis of 17 decision making units was applied measuring simultaneously the efficiency of innovation's system of the branch in the region.

Findings - Wood and furniture enterprises in the region adopt and improve already existing methods of production and products distribution. The proper attention towards the direction of developing and producing of new products and methods of products distribution should be given.

Significant efforts still have to be made for importing innovation in the production process. It is required a relative high cost of modern technological equipment, as long as of several production elements, for the production of new, innovative and quality products, a cost that has been embodied

into total production cost of the study's firms. As a result it is accenting the fundamental contribution of innovation in entrepreneurial activity and the meaning that step – by – step the firms of the branch are giving in innovative products and processes. Generally, increment of innovation performance incurs increment of sales. The firms themselves of wood and furniture branch, do not produce innovation by their own and they clearly come behind concerning to the extraversion that have to show for whichever successful innovations they apply.

The efficiency of the enterprises innovation system is evaluated as adequate while the majority of the firms are using in a satisfactory way innovation's inputs and outputs. However, there are significant improvement margins. The variation of efficiency shows fluctuations accenting the absence of a clearly stated strategy of the branch concerning issues of effective use of innovation factors and of the expenditures that are made for that specific reason.

Practical Implications - Industries, struggle to strength their competitive position in the new globalized markets, using innovation activities as their strategic ally for producing products and services of added value. The study provides useful information and data concerning the financial aspect of innovative activity and quantifies this activity in the wood and furniture branch. Furthermore, proves that, the use of innovation inputs and outputs is efficient and benchmarking analysis provides margins for business operation improvements in the branch.

Originality / value - This was the first study focused to the registration of financial data of innovative activity of Greek wood and furniture enterprises. This study expands previous similar studies, using more detailed innovation inputs and outputs and can be used as a guide to the decision makers and to the enterprises, for conducted similar benchmarking studies, offering more insight on the effects and improvements of innovative activity.

Keywords: innovation, economics of innovation, Data Envelopment Analysis, efficiency, wood and furniture enterprises

INTRODUCTION

Although it is difficult to isolate the nature, the sources and the results of innovation, there is a congruency of opinions concerning to the elements that constitute innovation (Gordon and McCann 2005). Innovation is related, beside to the technological evolution, with an expanded system of procedures for knowledge management (Komninos 2001). Scientific research approaches the meaning of innovation as a system and not with the classic linear approach that constrains innovation in specific frameworks and procedures. Enterprises do not innovate by their own but they are in continuous reaction with the rest members of the system, which along with the relations that are developing among them, determine innovative action of enterprises (Komninos et al 2001, Feinson et al. 2002). Meanings and practises, such as the adoption of new technologies and the reduction of total production cost, seem inadequate for the survival of the enterprises, which have to aim in reinvestment of information and applications of benchmarking (Papadopoulos 2005, Karagkouni 2006, Karagkouni and Papadopoulos 2006). Focusing to the branch of wood and furniture enterprises in this study, through the application of specially constructed questionnaires for the study and delineation of the existing innovation system of the branch, it is attempted a registration of enterprises problems, the approach of best practice concerning their operation and the analysis of economic dimension and efficiency of innovative action of these enterprises.

LITERATURE REVIEW

Innovation Systems

Innovation in general, but also business innovation more specifically, constitutes a non linear meaning according to the existing scientific perception and it is examined as a system. It constitutes a complex, interactive system where science, technology and society are interacting in such way that it is often difficult to discriminate the causes from the results of this system's operation (Smits 2002). As till today the linear approach of innovation was focusing to the capability of the enterprises for producing innovative activities, the approach of innovation system sets as a main role, the demand of innovation from the consumers and generally from the final recipients and users of it (Edquist and Hommen 1999, Oudshoorn and Pinch 2003). The significance of dealing innovation as a system can be easily understood if we consider that enterprises are not producing innovation by their own but always through complex relations of reciprocity and feedback (Komninos et al. 2001), specified by the elements of the system and by the relations that are developing among them (Edquist 1997, Edquist and Hommen 1999). The key of success in an innovation system is the way that the above mentioned organizations and enterprises are interacting in such a network (Pittaway et al. 2004) as long as other factors of the system (Klein Woolthuis et al. 2005).

The examination of National Innovation Systems embodies three levels of analysis (Parastakos 2003):

The *macro level* in which economy is comprehensible as a sum of acting and reacting mechanisms that involve enterprises, universities and public and private research organizations along with intermediate supporting organizations. In this level it is with a quite importance the knowledge flows inside the system.

The *mid level* examines the interrelations between enterprises with common characteristics. This is about the meaning of enterprises networks (*clusters*) which deal with alike or interconnected activities, or geographical proximity, or both.

The *micro level*, which is focusing to the individual interior characteristics and capabilities of the firm that are positively related to it's ability to innovate.

The present study is dealing with the analysis of the efficiency of the innovation system in the branch of wood and furniture enterprises in the region of Thessaly, focusing to economic efficiency of this system in mid and micro level.

Measuring efficiency in wood and furniture branch with the use of D.E.A.

Recent approaches concerning the measurement of business performance in innovation have a multidimensional character (Danneels and Kleinschmidt, 2001) without neglecting the fact that, technological evolution plays one of the most fundamental roles in the way that business innovative action is developing (Green et al. 1995, Talke 2007). Fenkel et al. (2000) mention that, «*quantification, evaluation and benchmarking of business innovation is a complex procedure for them, having simultaneously a fundamental role and meaning for academic research*». In this point it has to

be highlighted the fact that, measurement of business innovation must not be confused with the measurement of products performance in the market. The first one constitutes a fundamental criterion for the second one (Richardson and Gordon 1980, Sink 1983).

The first application of *Data Envelopment Analysis (DEA)* in the sector of forest industries was made by Rhodes (1986). However, studies for measuring efficiency in the specific branch are still limited. Most of them are focusing to the measurement of economic efficiency of the specific enterprises as long as to the efficiency of forest holdings management (Yin 1998, 1999 and 2000). Fotiou (1997) estimated the efficiency of Greek sawmills using a DEA model with two variables for inputs and one variable for outputs. Respectively, Nyrud and Bergseng (2002) have applied the same methodology for measuring productivity of approximately 200 sawmills in Norway. Similar studies have been published by Carter and Siry (2003). Specifically, considering DEA application for measuring innovation efficiency of wood enterprises, Diaz – Balteiro et al. (2006) are using only two variables for inputs and two for outputs of innovation respectively, considering total expenditures for R&D and number innovation collaborations (inputs) and number of innovative products and processes (outputs).

MATERIALS AND METHODS

The methodology that has been followed in this study, considering registration of innovation of wood and furniture enterprises in the region of Thessaly, is focusing to economic dimension of their innovative activity through the registration of the expenditures that enterprises have made related to procedures of *Technological Innovation of Products and Processes (T.I.P.P.)*. The questionnaire which has been used, was based to the internationally recognized manual of registering business innovation that O.E.C.D. has constructed in 1995, known as *OSLO manual*, of the *Frascati manuals* line. For the purposes of the present study the *subject approach* was selected which deals with the studying of innovative behavior of enterprises and the procedures of the firm as a sum.

For the construction of wood and furniture business innovation budget in the basis of subject approach, another way of approach was used in order to register innovation expenditures, known as *bottom-up approach* (O.E.C.D. 1995). Innovation outputs are dealing with incomes that came through sales of products as a result of some kind of innovative activity and they constitute an estimation of annual incomes as a percentage of annual turnovers of the enterprises, which flows from innovative products and processes, based also to published balance sheets of the enterprises of the study. The target – population of the study are the 42 firms of the branch in the region with more than 5 employees which are dealing with wood processing and furniture manufacturing. The questionnaire was addressed to all 27 enterprises for which their financial data are published in financial directories of ICAP of 2007 also. Finally, from the sum of enterprises, 38 questionnaires were gathered, namely a percentage of 90,5% of the total population of the study.

For the measurement of wood and furniture enterprises innovation system efficiency in the region of Thessaly, *Data Envelopment Analysis* was used (Charnes et al. 1978). It is a non parametric technique based to linear programming (Cooper et al. 1999). The knowledge of efficiency of a firm and as a result of a system constitutes a fundamental factor for the evaluation of the existing situation as long as for the decision making in micro and micro economic level

(Fotiou 1997). The subjects of Data Envelopment Analysis for which the efficiency is estimated, are mentioned as *Decision Making Units (D.M.U.)*. Data Envelopment Analysis considers Decision Making Unit – enterprise as a productive unit that consumes resources in the form of inputs and produces a total of outputs. In the present study, was used the occasion which the presentation of efficiency frontier is based to the hypothesis for standardized efficiency scale (*constant returns to scale*).

The philosophy of DEA relies to the estimation of efficiency according to the ratio:

Efficiency = Weighted outputs sum/weighted inputs sum

In our research, the efficiency is estimated for a sum of D.M.U's, for that reason the meaning of weights is used, since each firm uses a number of different inputs to produce several outputs. The above mentioned ratio can be presented as:

$$E_{ij} = \frac{\sum W_r Y_{rj}}{\sum V_i X_{ij}}$$

Where: W_r the weighted output r

V_i the weighted input i

Y_{ij} the output i

X_{ij} the input i

with $0 \leq E_{ij} \leq 1$

Each firm has to choose different weights of inputs-outputs of their innovative activity because of the fact that operates in a different way from the rest ones. According to this, maximum input oriented efficiency can be estimated by maximizing the above ratio, with the constraint that it can take values between 0 and 1. This leads to the ratio:

$$\max Eij_0(w, v) = \frac{\sum_{r=1}^s W_r Y_{rj_0}}{\sum_{i=1}^m V_i X_{ij_0}}$$

with $Eij \leq 1$ and $W_r, V_i \geq 0, j=1 \dots n, r=1 \dots s$ και $i=1 \dots m$.

According to this, the efficiency of wood and furniture enterprises innovative activity was estimated, through the estimation of general relative efficiency, the percentage of improvement in using inputs and outputs of innovation (*slacks*), the weighting coefficients of inputs and outputs (*weights*), *cross efficiency* estimation, *lambda* coefficients and through several indicators describing innovative activity of the study's enterprises.

RESULTS

The economic – innovative profile of the enterprises of the study

The major percentage of the study's enterprises, states as main activity furniture manufacturing (42,1%). Wood and wood products trading enterprises follow (21,1%) and with lower percentage the rest of the activities such as wooden products production, wood processing and furniture trading. The major percentage (59,5%) of the study's enterprises has a total invested capital less than 2.000.000€ and those which the invested capital is among 2 till 10 billion € follow (32,4%). Firms with invested capital that exceeds 10.000.000€ constitute the 8,1% of the sum. Similar is the distribution of percentages regarding the total value of fixed investments, showing some small differences.

Regarding annual turnover, the mean for the period 2005-2007 is in major percentage (40,5%) among 1.000.000-2.000.000€ and enterprises with annual turnover less than 1.000.000€ follow with a percentage of 32,4%. These which their annual turnover is among 2.000.000-5.000.000€ and over 10.000.000€ constitute the 24,3% and 2,7% o the sum respectively. The distribution of basic financial data for the period 2005-2007 is presented in the next Table 1.

BASIC FINANCIAL DATA	MEAN IN €
Net profits (before taxes) during 2005	189.112,76
Net profits (before taxes) during 2007	214.024,48
Salaries and social security contributions during 2005	256.475,96
Salaries and social security contributions during 2007	330.609,41
Raw materials cost during 2005	770.906,04
Raw materials cost during 2007	925.923,77

Table 1: Means of basic financial data of the enterprises for the period 2005 – 2007

To the question if they are familiar to the meaning of innovation, the major percentage (86,8%) of the businessmen, have stated that they are familiar with. Similar are the percentages concerning the use or not of innovative products and processes by the enterprises of the study, while the 76,3% stated that are users of innovative products and processes.

Concerning the ways with which the enterprises are embodying innovative action into their economic – entrepreneurial operation, it is remarked that the major percentage (51,5%), adopts and improves already existing methods of production and distribution and enterprises that innovate through the improvement of already existing products and the production of new products, follow with a percentage 39,4%. Enterprises developing new methods of production and distribution follow with relative lower percentage.

As major objectives of innovative action of the firms have been accented the following four: a) the increment of market share that is operated by the firms, b) lower production costs, c) opening of new markets abroad or towards domestic market groups – targets, d) improvement of products quality. Technologically improved products that have been commercialized by the firms during the period 2005-2007, constitute a percentage up to 16,4% of the total sales of the firms and sales of products that are new or technologically improved in relation to market under exploitation by the enterprises and commercializing of products, during the same period, that are technologically unchanged, follow with percentages 12,8% and 12,3% respectively. Technologically new products stands at the last position as a percentage of total sales up to 7,8%, while the participation of processes comes up to a percentage of 10,7%. A characteristic fact is that, the percentage of products sales that are technologically unchanged and they have been produced through unchanged production methods, constitute only a 8,3% of the total sales, a fact that indicates the effort of importing innovation in production process.

PRODUCTS SALES	PERCENTAGE % OF TOTAL SALES
1. <i>Technologically improved products which were commercialized during 2005 – 2007.</i>	16,3
2. <i>Sales of products that are new or technologically improved in relation to operation market by the enterprises</i>	12,8
3. <i>Products technologically unchanged or simply modified, that have been produced with unchanged production methods and were commercialized during 2005-2007</i>	12,3
4. <i>Sales of products that are new or technologically improved exclusively in relation to the firm</i>	10,9
5. <i>Processes technologically unchanged or simply modified that have been applied during 2005-2007</i>	10,7
6. <i>Products technologically unchanged or simply modified, that have been produced with unchanged production methods during 2005-2007</i>	8,3
7. <i>Technologically new products which were commercialized during 2005 – 2007</i>	7,8

Table 2: Percentage % of sales that are caused by innovative products or processes.

Evaluating the impact of products or processes innovation to the use of basic production factors, it is accented that innovation affects in a quite significant way the consuming of materials and the use of fixed capitals, while labor and energy consumption follow. A significant percentage (32,4%), stated that technological innovations have reduced the average total production cost during 2005-2007. Analyzing the previous question, from the enterprises that have answered positively and in relation to the reduction of average total cost, the major percentage (58,3%) showed a reduction into a range from 5-10% and a percentage of 16,7% into a range from 10-15% (Figure 1).

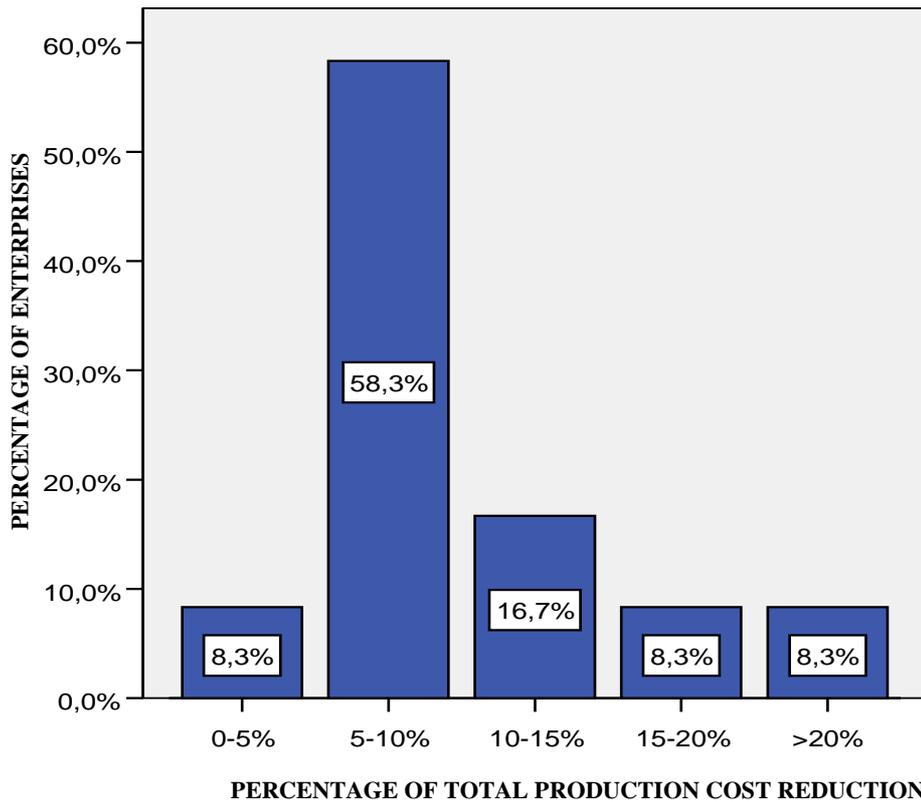

Figure 1: Percentage impact of innovation to the reduction of average total production cost of the study's enterprises.

An encouraging fact is that, the percentage of annual turnover of the firms which is related to innovative products and processes during 2005-2007, has increased significantly. Thus it is accented that, as the rate of innovation increases the percentage of sales increment shows fluctuations. Generally, it is a fact that increment of innovation rate bears sales increment also, as long as the correlation between these two variables is positive (coefficients Kendall's tau-b=0,620 and Kendall's tau-c=0,582).

In Figure 2 it is presented that the major percentage of the enterprises (31,4%), has spent in total more than 50.000€ for developing innovative activities during 2007. Enterprises with total expenditures amount less than 10.000€ follow with a percentage 22,9% and the lower percentage of enterprises (11,4%) has spent from 20.000 – 30.000€.

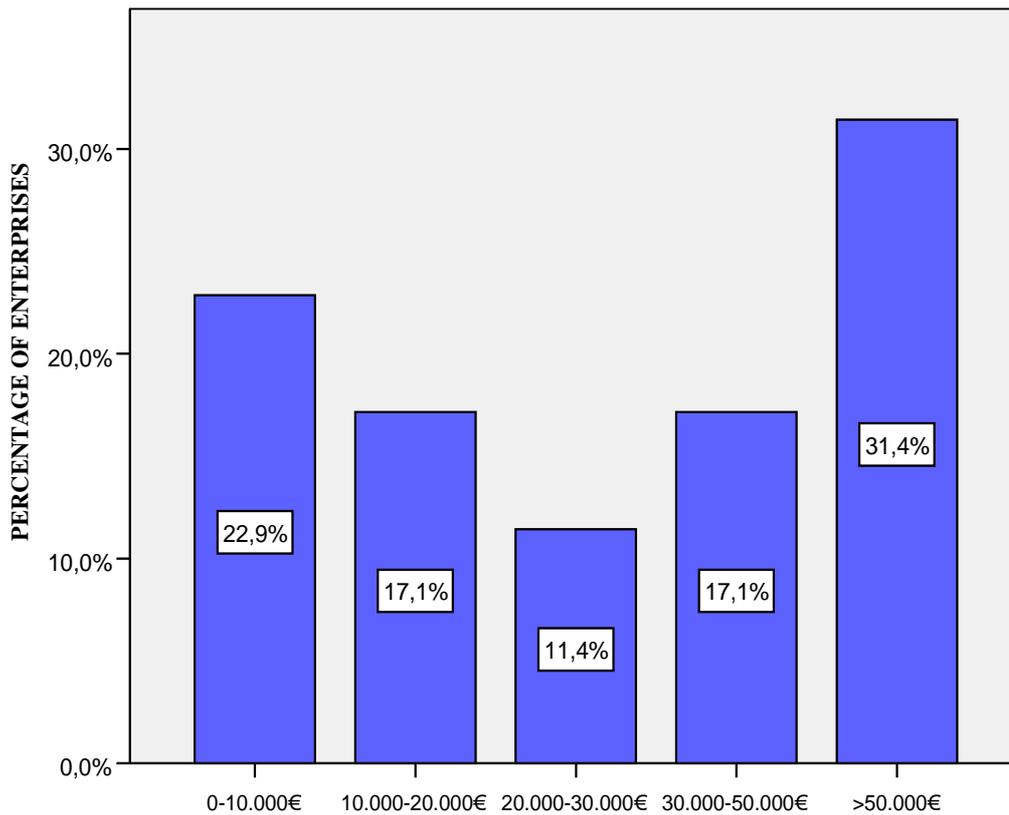

Figure 2: Innovation expenditures distribution during 2007 of the study's enterprises.

The analysis of the unified budget of the enterprises of the study, concerning innovative activities which may have been undertaken by them during the last closed financial period, follows (Table 3). The major percentage of the enterprises (85,7%) has acquired machinery and equipment and the average expenditure was approximately 56.000€. Concerning the percentage of enterprises that were involved in these specific activities, dissemination of innovation (45,7%), innovation's imports into the market (31,4%) and the acquisition of R&D (25,7%) follow, with an average amount of expenditures approximately up to 4.000€, 3.000€ and 9.500€ respectively. In the last position is the participation in procedures concerning training and acquisition of other external knowledge with a percentage of 14,3% of the enterprises and only 1.500€ of average expenditure.

From the total expenditure's amount, the major percentage (95,3%), has to do with expenditures concerning innovation flows towards the firms. The enterprises of wood and furniture branch, are not producing innovation by their own. In relation to the several positions of cost of the enterprises where these expenditure are made, the major amount concerns the acquisition of land and buildings related to innovation's development, the purchase and establishment of machinery and equipment for improving business procedures, while in the last position stand the expenditures concerning salaries such as day wages, other labor costs, financial prizes, financial bonus e.t.c

INNOVATION ACTIVITIES	INVOLVEMENT IN ACTIVITY (PERCENTAGE OF ENTERPRISES %)		ACTIVITY EXPENDITURES (€)
	YES	NO	
R&D expenditures	20,0	80,0	5.142,86
R&D acquisition expenditures	25,7	74,3	9.558,82
Machinery and equipment acquisition expenditures	85,7	14,3	55.728,57
Other external knowledge acquisition expenditures	11,4	88,6	3.228,57
Training expenditures	14,3	85,7	1.571,43
Importing innovation to the market expenditures	31,4	68,6	2.868,57
Design expenditures	17,1	82,9	3.657,14
Total innovation flows expenditures			81.482,86
Innovation dissemination activities expenditures	45,7	54,3	4.000,00
Other expenditures			0
Total innovation expenditures			85.397,14
COST POSITIONS			MEAN IN €
Day wages			156,67
Annual salaries			3.056,67
Extra financial contributions expenditures			280,00
Labor costs not involving in TIPP activities			666,67
Procurement of materials			8.466,67
Buying of procurements			766,67
Innovative products marketing			3.658,06
Supporting TIPP activities expenditures			5.645,16
Total of current innovation expenditures			22.219,35
Acquisition of land and buildings for use in TIPP			28.870,97
Acquisition of basic organs and equipment			7.000,00
Hardware and software supporting activities of TIPP			1.766,67
Establishment of machinery for improving existing products			23.140,63
Establishment of machinery for producing new products			3.533,33
Total of capital innovation expenditures			60.742,42

Table 3: Involvement in innovative activities and distribution of total innovation expenditures of the enterprises during the last financial period into positions of cost.

In the next Table 4, innovation inputs and outputs are presented, concerning the enterprises of the study for one financial year, as they were registered according to the used questionnaires (inputs) and were estimated based to the percentages of annual turnover dealing with sales of innovative products and services during 2005-2007 (outputs). In total, available data have to do with 17 from the enterprises of the study. Eight innovation inputs and seven outputs are being used. The results are being used next in order to analyze the efficiency of innovation system with the use of Data Envelopment Analysis technique. As it is presented, the major amount of inputs has to do with the acquisition of machinery and equipment for producing innovative products while from the scope of outputs sales of technologically unchanged or simply modified products that have been produced with the same methods and been commercialized within a year, constitute the majority.

S/N	INNOVATION INPUTS							
	INNER BUSINESS R&D	ACQUISITION OF R&D	ACQUISITION OF MACHINERY & EQUIPMENT	ACQUISITION OF OTHER EXTERNAL KNOWLEDGE	TRAINING	IMPORTING INNOVATION INTO MARKET	DESIGNING/OTHER PREPARATIONS	INNOVATION DISSEMINATION
1	0 €	0 €	30.000 €	0 €	0 €	5.000 €	10.000 €	0 €

Table 4: Innovation inputs and outputs of the study's enterprises during 2007

The efficiency of the study's enterprises system of innovation

Wood and furniture enterprises of the study for which efficiency was estimated, are referenced as *Decision Making Units* – DMU. The Data Envelopment Analysis model that was applied concerns the delimitation of reference units according to inputs decrease of non – efficient units (*input oriented*) and the representing of efficiency frontier based to the scale of constant efficiencies (*constant returns to scale*).

In next Table 5, it is presented the estimation of the efficiency for the total of 17 enterprises which are participating into the analysis. Generally, we can say that enterprises are judged as efficient concerning the ratio inputs/outputs of innovation. Nevertheless non – efficient enterprises have to improve significantly this ratio.

	EFFICIENCY	GRAPHIC ESTIMATION	✓

DMU17	100 %	100%	✓

Table 5: Estimation of the wood and furniture enterprises efficiency according to inputs and outputs off innovative action.

Using the results of Table 5, it is estimated that the average efficiency of the sum of the study's enterprises reaches approximately a percentage of 81%, which can be considered as a quite adequate percentage of using innovation inputs in relation to the produced outputs.

In the following tables (Tables 6 – 9), the above mentioned estimation is more deeply analyzed.

In Table 6, it is presented the margin for improving the use of the inputs and outputs of innovation by the firms of the branch, as a percentage that expresses the margin of usage improvement of the mentioned variables by the non – efficient enterprises in relation to the efficient ones. As it is presented, these margins are wider concerning outputs of innovation in relation to inputs. Specifically, the margins are wider for the sales of products that are unchanged or simply modified and were commercialized during the last three years and for the sales of technologically improved products which were also commercialized during the same period. Of course this has to do with non – efficient enterprises in relation to efficient ones. However, a fact

with interest is the estimation of the margin that enterprises could improve the decrease of inputs use. This is more intense concerning expenditures for innovation dissemination, meaning expenditures related the acquisition of innovation through commercial and other channels by the enterprises and use it for the first time. In general, we could say that enterprises use the rest of the inputs quite efficiently showing small exceptions in staff training and the development and application of internal business R&D.

In Table 7, the weighted means of innovation inputs and outputs of the enterprises are presented and have to do with the way that the firms will select to weight these specific factors in order to accent their efficiency in the most extended way. In other words, Table 7 presents the best practice for the enterprises. As it is presented this weighting deals mainly with the inputs of innovation, showing several improvement alternatives in relation to the acquisition of extra-firm R&D and of other basic knowledge, with the acquisition of machinery and technological equipment to follow. However, expanding the analysis and applying cross – efficiency, aiming to the limitation of the subjectivity that is enclosed to the weighted means analysis, new values of the efficiency index are calculated (Table 8). In this way we can estimate the benchmark position of non – efficient units in relation to efficient ones, based to the results of the table's lines, as long as and the variation of efficiency based to the results of the table's columns. As it is observed this variation shows great fluctuations, confirming the above mentioned results.

Finally, in Table 9 lambda (λ) coefficients were estimated, according to which innovation's outputs of the enterprises will alter if inputs decrease by the same coefficient, in order to achieve best practice by the non – efficient firms in relation to the use of innovation's variables. This combination shows also, a significant variance as a percentage (from 1% to 524%) pointing the existing margins of improvement in the use of innovation activity between the enterprises of the study in the region.

Table 9 Lambda Coefficients

In order to have more specific results in relation to the efficiency of innovation, the *Efficiency Variance Coefficient* was estimated, through the estimation of the average, standard deviation and interval of cross efficiency of the reference units (Table 10, Figures 3 and 4). Based to the variance of this coefficient we can conclude about the “health” of the enterprises and the variance of their efficiency. As we can see there are significant margins of improvements, confirming the above mentioned results. At a single firm level, these that keep the efficiency variance near to 1, show a better behavior regardless the weights that has to use for the inputs and outputs of innovation.

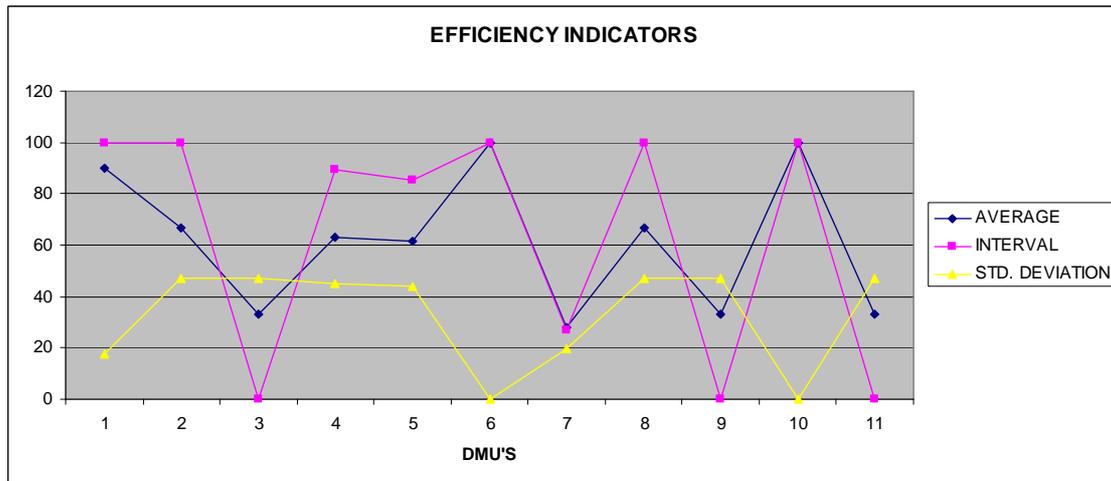

Figure 3: Indicators of Efficiency Variance of the study's enterprises.

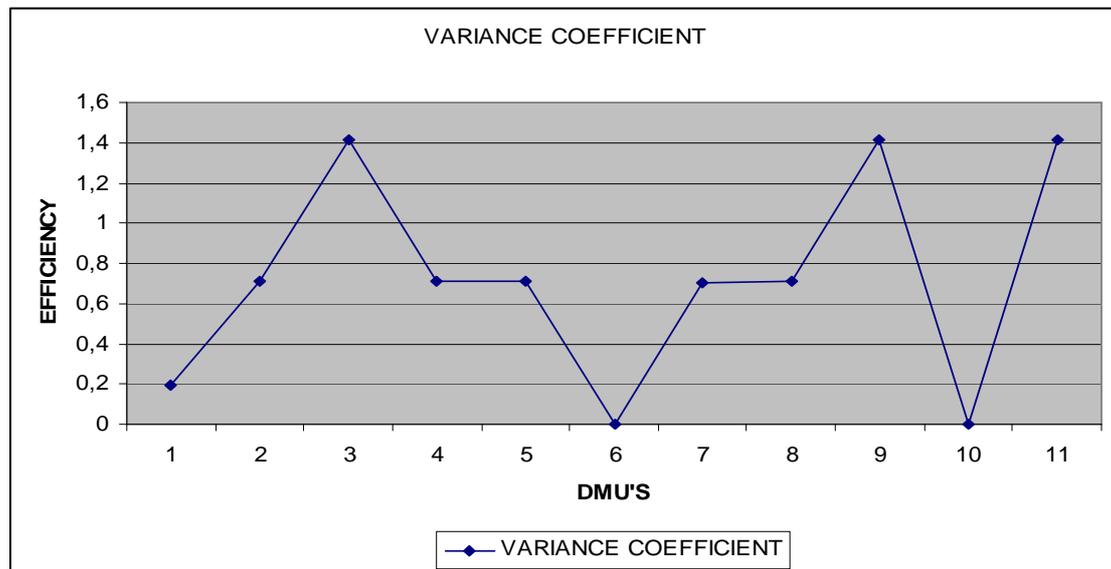

Figure 4: Efficiency Variance Coefficient of the study's enterprises.

CONCLUSIONS

The major percentage of the branch's enterprises adopts and improves already existing methods of production and products distribution while the enterprises which innovate through the improvement of already existing products and the production of new products, follow. Relative fewer is the number of the firms which develop new methods of production and products distribution. For that reason, it should be given the proper attention towards the direction of developing and producing of new products and methods of products distribution.

The major percentage of innovative products sales of the branch's enterprises comes from sales of products which are technologically improved and embody new methods of production and distribution, a fact that accents the effort for importing innovation in the production process. It is required a relative high cost of modern technological equipment, as long as of several production elements, for the production of new, innovative and

quality products, a cost that has been embodied into total production cost. The positive results of applying innovation require a reasonable time in order to be represented to the financial data of production process.

It is quite encouraging the fact that the amount of annual turnover of the enterprises which comes from innovative products and services during the period 2005 – 2007, has been significantly raised. As a result it accents the fundamental contribution of innovation in entrepreneurial activity and the meaning that step – by – step the firms of the branch are giving in innovative products and processes, in the framework of improving their competitive position in domestic and international market. It is a matter of course that generally, increment of innovation performance incurs increment of sales while the correlation between these two variables is positive. Furthermore, a significant number of enterprises don't have the capability to invest significant amounts in activities of developing and applying innovation.

From the sum of the innovation expenditures, the majority (95,3%) concerns expenditures of innovation flows towards the firms. This fact accents the existing need for acquiring know how from the enterprises of the branch and the innovation gap, which exists in relation to the rest of the business activity of several other professional branches. The firms themselves of wood and furniture branch, do not produce innovation by their own and they clearly come behind concerning to the extraversion that have to show for whichever successful innovations they apply.

The efficiency of the enterprises innovation system is evaluated as adequate while the majority of the firms are using in a satisfactory way innovation's inputs and outputs. However, there are significant improvement margins, mainly concerning sales of products which are a result of some kind of business innovative activity, along with issues of training, innovation dissemination activities and developing and applying R&D mainly through the acquisition of external R&D and technological equipment.

The variation of efficiency shows fluctuations accenting the absence of a clearly stated strategy of the branch concerning issues of effective use of innovation factors and of the expenditures that are made for that specific reason. Finally, enterprises exist which come far behind in relation to the rest of the firms of the branch and they should make intense efforts for improving the reduction of expenditures and the best possible effectiveness of their business activity.

SUSTAINABILITY MANAGEMENT: A BUSINESS MODEL APPLIED TO PUBLICLY-OWNED ENTERPRISES IN THE WASTE SECTOR

Truant, Elisa¹

¹*University of Turin, Italy*

Purpose: Over the last few years, the laws concerning the waste sector have changed considerably. The European and national laws provide strict rules for companies so as to protect the environment and the citizens' quality of life. At the same time Italian laws are pushing in order to open up the market in the utility sector. So, by changing the rules of game, companies need to implement monitoring performance systems in order to align the organizational units to the strategy and to control the sustainability-related issues. This paper aims at analyzing the diffusion of strategic planning tools in Italian companies. More specifically it identifies the success key factors for a sample of publicly – owned enterprises operating in the waste sector in Italy and the related key performance indicators necessary to reach the sustainability goals.

Design/Methodology/Approach: The research method is empirically based: the analysis has been conducted through interviews with managers of strategic and technical areas as well as C.F.Os in ten Italian companies, and internal documents analysis.

Findings: According to Kaplan and Norton theories (2004) and basing my findings on the companies' similarities identified, a Business Model containing the cause and effect relations necessary to implement and communicate strategic goals successfully was drawn up. In addition, a set of indicators and key actions that were tailor-made better for the sample companies were proposed. The results obtained confirmed the need of a control system based on a comprehensive framework that translates companies' strategies into a coherent set of performance drivers and measures, according to social and environmental patterns.

Research limitations/implications: The possible development of the research is oriented towards a comparison between the publicly-owned companies and the private companies operating in the waste sector, in this way it is possible to see if there is a change in the strategic goals, in the perspectives and in the success key factors analyzed in the strategic map.

Originality/value: Over the last years, the theme of sustainability has received increasing attention and many organizations have implemented environmental and social management systems in order to manage and control sustainability-related issues (Bieker 2002).

The paper contributes to integrate the existing literature on strategic map and sustainability performances. In addition the research analyzes, through a multiple case – studies, the Italian waste sector, the relations among the key variables in order to create long – term values.

Keywords: waste sector, sustainability, key success factors, performances, multiple case - studies.

Article Type: Research paper

INTRODUCTION AND PURPOSE OF THE RESEARCH

Over the last few years, the rules of law concerning the waste sector have changed. The European and Italian laws provide strict rules for companies so as to protect the environment and the citizens' quality of life. In particular, national and regional laws define the objectives regarding collection, separating and recycling of wastes that have to be respected in order to avoid heavy sanctions. Companies must therefore understand the distinctiveness of the sector and the role of the internal competitive forces in order to define a winning strategy. Porter (1996: 68) defines strategy as 'the creation of a unique and valuable position, involving a different set of activities'.

The strategic analysis of the internal aspect of organizations and the external context in which companies operate seem propedeutic to the definition of their strategies and expected results.

The companies analyzed in this paper are publicly-owned and operate in the Italian waste sector in different activities: they are involved in the urban waste collection; in the transport and delivery to disposal centres; in urban hygiene and in the management of some disposal centres.

Following the classification of Kaplan and Norton (2001), in the sample analyzed, the most common strategy is *be a good corporate citizen* which takes into consideration the existing relations with external stakeholders. It is a sustainability-oriented strategy which also considers environmental and social aspects.

However, if companies want to be aligned to the requirements stated by the rules of law, the strategy formulation is not sufficient: they need to adopt management systems which are able to guide and involve whole the organization structure working towards the long-term goals.

The strategic map could be a good management tool to deal with the demand of relevant stakeholders and to translate strategies into action. However, the traditional model theorized by Kaplan and Norton should be adapted to companies operating in the waste sector in order to include the social and environmental spheres. Therefore, the purpose of this study is to design a business model for the companies analyzed, identifying the relevant strategic goals, key success factors and a set of indicators that are tailor-made better for the waste sector taking into consideration the sustainability issue. The business model has built following the logics of strategy map (Kaplan and Norton, 2004) because, better than other strategic planning tools, it highlights the existing cause and effect relations among key success variables.

The paper starts with a conceptual background concerning the sustainability issue and how it should be integrated within management systems to implement the strategy.

The following sections include the research method, that is empirically based; the survey instruments; the characteristics of the sample analyzed and of the waste sector.

In addition, the paper contains:

- the design of the business model, according to the logics of strategic map, showing the success key factors and the cause and effect relations for the companies which operate in the waste sector;
- the proposal of financial and non financial indicators (e.g. current and future performance measures regarding the different perspectives).

THEORETICAL BACKGROUND

Sustainability management has recently experienced a resurgence of interest both in the private sector (Line et al. 2002) and in the public sector (Boyce 2000; Frost and Seamer 2002; Vagnoni 2001) this is partially in response to the present crisis of unsustainability and recent scandals caused by socially and environmentally irresponsible behavior (Hawken et al 2002).

In fact, in the last years, the theme of sustainability has received increasing attention and many organizations have implemented environmental and social management systems in order to manage and control sustainability-related issues (Bieker 2002).

The sustainability highlights the interdependence of three spheres: the economic, the social and the environmental spheres (Elkington 1997). Such an approach to sustainability management aims at simultaneous achievement of ecological, social and economic goals (Figgie et al., 2001, Schaltegger and Burrit, 2000, O' Connor, 2006).

The analysis of sustainability must also focus on the interactions and interdependencies among these three spheres and on the characterization of performance and quality in each sphere. According to O'Connor (2006), who introduces a fourth sphere, the role played by the system of regulation becomes relevant, especially in

companies operating in the waste sector, because it arbitrates the claims made by the actors of the social, economic and environmental spheres. In addition, the systems of European and national laws set strict rules for companies which offer urban waste collection, transport and disposal services. So, the increasing attention on sustainability seems to be partially influenced by the ongoing process of reform. This process is aimed at closing the current performance gap of the Italian public sector by promoting its efficiency, effectiveness and accountability (Maruccio and Steccolini 2005).

Many authors have stressed the importance of linking performance measurement to environmental strategic objectives of organizations (Dias-Sardinha and Reijnders, 2001).

For this reason it becomes more and more important to adopt management guide systems which are able to involve all the organization structure working towards the sustainability goals.

This research aims at studying how the economic, social and environmental aspects are considered and related to each other in the company's management in order to guarantee a service of high level and quality as well as being environmentally friendly and respectful of the local community's needs. The strategic map, theorized by Kaplan and Norton (2004), plays a key-role in translating strategy into action because it forces managers to identify the success key factors and their cause and effect relations. After designing the strategic map, it's helpful to trace a set of performance measures that provide the framework for a strategic measurement and management system (Kaplan and Norton, 1996). The framework, that is Balanced Scorecard, which contains the set of indicators allows making a balance between past and future, quantitative and qualitative, financial and non - financial information.

Kaplan and Norton (1996: 34) say that 'the four perspective, learning and growth, internal processes, customer and financial, should be considered as a template, not a strait jacket'. Each perspective consists of relevant strategic goals, indicators and measures to achieve them. Objectives of the learning perspective, for instance, serve as enablers for the achievement of goals of the other overarching perspectives (e.g. customer, finance).

Concerning the companies of the sample analyzed, it could be more useful to adapt the classical perspectives in order to detect strategic environmental and social objectives. The majority of the companies analyzed have a monitoring system only for economic and financial performances, but nowadays they aren't sufficient: the increasing prescriptive attention on environmental and social issues necessitates the introduction of sustainability performances of the internal process perspective (Epstein and Roy 2001). In particular, starting from the strategic map, Epstein and Wisner (2001) suggested the introduction of a new perspective and Bieker (2001) proposed the conception of a sustainability balanced scorecard.

This research analyses how sustainability goals can be expressed and communicated through a business model.

RESEARCH METHOD AND SURVEY INSTRUMENT

The aim of the paper is to gain a better understanding of management tools for companies which operate in the waste sector, through the adaption of the strategy map. The research analyzes how the four perspectives theorized by Kaplan and Norton (2004) can be adapted in order to better align the organisational units to the sustainability strategy. The identification of the operative tools needed to translate the model into practice are therefore necessary. One of the main difficulties connected to the control activities is the lack of a comprehensive set of indicators which enables companies to measure the different performances.

The set of indicators proposed in this paper aims at being an example, not an inflexible framework, which has to be adapted on the basis of the specific organizational structure and distinctive key variables.

The research has been conducted through an empirical analysis of ten exploratory case studies and the results are based on interviews with managers of strategic, financial and technical areas. In the smallest companies the interviews have been conducted also with the C.E.Os.

The choice of a multiple case-study approach is an appropriate method of empirical inquiry when organizational and managerial processes are involved.

The researcher Yin (1984: 23) defines the case-study method as 'an empirical inquiry that investigates a contemporary phenomenon within its real-life context; when the boundaries between phenomenon and context are not clearly evident and in which multiple sources of evidence are used'.

At the same time the numerousness of the sample analyzed don't allow a statistical generalization. Still, the insight and relatively deep understanding can facilitate analytical generalization so that findings can be generalized to theory (Yin 1984).

The choice of the waste sector is due to the increasing prescriptive attention to the safeguard of the environment and the health of citizens. In addition, the increase in waste production brings about an environmental and social problem and companies are partially responsible. Therefore, companies must keep this phenomenon under control through the creation of partnership relations with the local community and by involving the whole organization working towards common sustainability goals.

The case studies were based on multiple sources of evidence: the internal document analysis and interviews.

The interviews were semi-structured to be kept within the main question area, at the same time the interviewees were allowed to express their own ideas and feelings. According to Yin (1984), the open-ended interviews are relevant to expand the depth of data gathering and to increase the number of sources of information.

The questions asked were on general topics such as the peculiarity of the business and other specific topics, which is the strategy orientation and the role covered by the sustainability, how is the strategic planning process organized and managed, which are the critical aspects of the process, which are the indicators constantly monitored, who are the main stakeholders, which is the role of the environment in the company's management and how is the external communication process organized.

The interviews in case studies lasted between five and seven and a half hours and also included some questions to verify the quality of the answers.

A draft of results was sent to those interviewed for their comments and to ensure that the technical details were interpreted correctly. According to Yin (1984), this ensures construct validity.

The goal of these interviews was to identify the success key factors of the companies and their cause and effect relation in order to design a common strategic map for companies operating in the sector analyzed.

The following exhibit gives some information about the characteristics of interviews, such as the length and the role covered by the interviewed within the organization .

<i>Companies</i>	<i>Interviewed</i>	<i>Timing of interviews</i>
<i>Company 1</i>	<i>Technical director; C.F.O.</i>	<i>5 hours</i>
<i>Company 2</i>	<i>C.E.O., C.F.O.</i>	<i>5 hours</i>
<i>Company 3</i>	<i>C.F.O., Technical director</i>	<i>5,30 hours</i>
<i>Company 4</i>	<i>Strategic planning staff, Technical director</i>	<i>6,30 hours</i>
<i>Company 5</i>	<i>Strategic planning staff, Technical director</i>	<i>6,30 hours</i>
<i>Company 6</i>	<i>Strategic planning staff, Technical director</i>	<i>7 hours</i>
<i>Company 7</i>	<i>Strategic planning staff, Technical director</i>	<i>7 hours</i>
<i>Company 8</i>	<i>C.E.O., Technical director</i>	<i>7,30 hours</i>
<i>Company 9</i>	<i>C.F.O., Strategic planning staff, Technical director</i>	<i>7,30 hours</i>
<i>Company 10</i>	<i>C.F.O., Strategic planning staff, Technical director</i>	<i>7,30 hours</i>

Exhibit 1: the sample analyzed: characteristics of interviews

The sample analyzed includes ten publicly – owned enterprises operating in the North –West of Italy, especially in Piedmont and Lombardy regions. From this point of view, Piedmont and Lombardy are some of the most virtuous regions in Italy regarding the waste prevention, the attention paid to environmental impacts and separated collection²³⁶.

The sample chosen is in efficient regions in order to investigate the distinctive competencies able to better investigate the drivers for successful performances.

The dimension of the companies has been considered as a discriminating factor in choosing the sample. I selected only companies which offer services to more than 35.000 citizens²³⁷.

In addition, the companies analyzed were chosen on the basis of specific characteristics: the sustainability strategic orientation, the public nature and the characteristics of services offered. These companies offer primary services regarding the collection of wastes, both recyclable and non, transport to disposal centres, and management of the same. The collection is made by collecting from bins on the road or in buildings, depending on instructions given by the municipalities, but in some areas there is a mix of the two techniques. In some neighborhoods in Turin, for example, an experimental project to collect wastes in separate containers in buildings has begun, but in the remaining part of the city collection is only done on the streets where bins for the undifferentiated and differentiated wastes are present.

The sample analyzed offers also secondary services of urban hygiene in the municipalities where they operate.

²³⁶ ANTA Ranking 2009; National observatory on wastes, year 2008.

²³⁷ The selection has been conducted analyzing information shown in the Register of environmental operators.

Eight companies out of ten have a documentation called card of services which contains some indicators, especially concerning the quality of the service constantly monitored, but only one has an elementary formalization of key performance indicators.

Therefore, the interviews conducted have revealed that companies constantly monitor the efficiency and the effectiveness of the service through a simple set of indicators, mostly financial indicators and concerning the quality of the service. In a sector such as the one analyzed, which is now opening up to liberalization, involving the whole organisation in working towards common goals becomes relevant and acquires a greater awareness at all levels in order to lay the foundations for future competitiveness. The interviews have allowed me to identify the critical success factors of the business and their cause and effect relations. In the following section of the paper I have drawn up the strategic map, according to the model of Kaplan and Norton and I have proposed a set of financial and non financial indicators for the perspectives analyzed.

Designing a strategic map is a way of providing a language in which companies can describe their strategy. After designing a strategic map, a set of key performance indicators is necessary to guarantee the alignment of the organization to a common direction (Kaplan and Norton 1996; Brusa, 2007).

For the purpose of the research, a quantitative approach might not be sufficient to acquire information concerning the implementing methodologies of the strategy; a practical insight concerning the possibilities and problems within this area is needed in qualitative terms.

THE ITALIAN WASTE SECTOR

The companies operating in the waste sector can offer one or more of the following services: the collection of undifferentiated and recyclable wastes, the transportation services to disposal centres, the management of disposal centres and services of urban hygiene (i.e. cleanness of roads and parks).

The waste production is still increasing and it is partially caused by the high-volume packaging which still exists to guarantee the respect of sanitary laws and to attract consumers through a marketing policy which uses packaging to promote goods.

The waste production per head highlights that the highest values have been reached in the regions in the centre of Italy, followed by the northern regions²³⁸.

Italian laws define percentages of recycling wastes that have to be reached by the Regions: 40% before 2007, 50% before 2009 and 60% before 2011.

The data concerning the waste separation highlight a broad gap between the north and the south of Italy: the northern regions with a 40 per cent of recycling wastes in 2007, is aligned to the Italian goals while the southern regions have reached a percentage of eleven.

In addition, Italian laws are oriented towards the liberalization of this sector. Nowadays the services linked to the management of wastes can be offered both by private companies and publicly-owned enterprises. The publicly-owned enterprises are not subjected to rules of competition. Therefore, by opening up the market, for this type of companies it becomes increasingly important to adopt managerial tools able to improve their performances and competitiveness.

FINDINGS

²³⁸ In 2007, the production of wastes per head in the regions of the centre of Italy is equal to 638 Kilos. In the Northern regions the production per head is equal to 544 Kilos while in the Southern regions is equal to 509 kilos.

The strategic map

From interviews it emerged that companies analyzed haven't formalized management tools which are able to align the organizational units to strategy. A useful framework to describe and communicate a strategic plan is represented by the strategic map which can bridge the existing gap between strategies and action plans. Therefore, it is evident how the ability to execute a strategy becomes as relevant as the same strategy (Kaplan and Norton 2000).

There are two fundamental elements that have to be considered in developing a strategic map: the framework which defines the order of the perspectives and the existing cause and effect relations which link the goals within the framework chosen.

A key factor in designing the strategic map concerns the analysis of cause and effect relations which link the key success factors. These key factors are organized within perspectives. The perspectives identified by Kaplan and Norton were: learning and growth, internal process, customer and financial. The intangible assets strongly influence the achievement of objectives by other perspectives and seem vital for the future competitiveness.

In this research, the four perspectives have been adapted to the peculiarities of the sector. In particular I have identified the following perspectives:

- Value creation for consumers (end users): contains the key success factors necessary to maximize the public utility;
- Internal processes: identify the critical internal process in which companies excel;
- Learning and growth: considers the employees' skills, the companies' communication campaigns and the investments in research and innovation;
- Economic and financial balance: considers the economic and financial goals, necessary to contain costs, reduce the financial intervention by public administrations and banks, and apply the fairest price to final users.

The following exhibit 2 contains the linkage among the three perspectives.

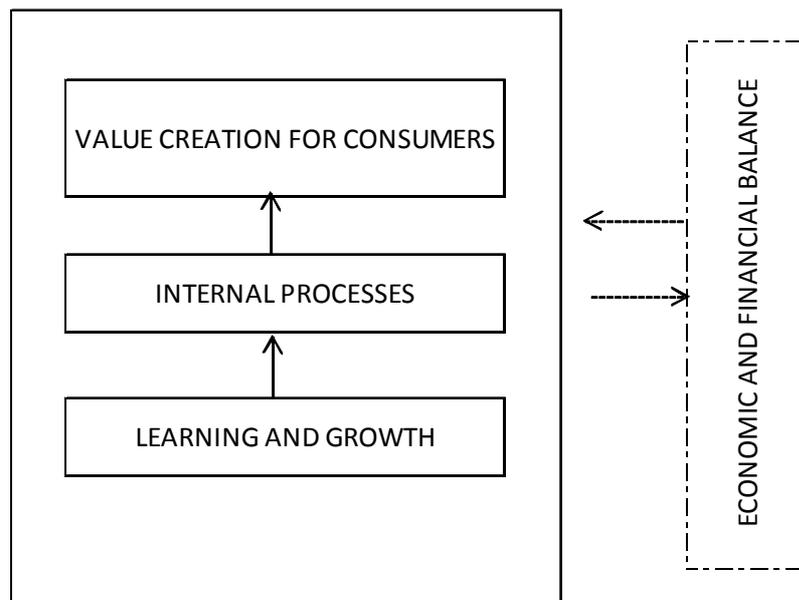

Exhibit 2: Linkages among perspectives Source: elaboration from Brusa L. (2007:100)

The previous exhibit shows that the economic and financial perspective has an influence on the other perspectives and, at the same time, it is influenced by the same. The economic and financial aspect are very important also in publicly-owned enterprises; therefore they represents a constraint, and not a final goal because companies management have to be focused on creating public utility, rather than profitability. Companies have to deal with the scarcity of resources and have to manage the available resources in an efficient and effectiveness way in order to achieve the processes excellence (Brusa, 2007).

We start off by looking at the highest perspective to identify what companies need. Then I will analyze the work which needs to be done at the lower perspectives in order to achieve the higher goals.

The strategic map identifies the key success factors, resulting from interviews, that could be considered in common for all companies analyzed. Each company should adapt the model depending on the specific needs and activities.

In exhibit 3, the arrows of effects are from lower perspectives to higher perspectives, but the arrows of strategic interference (that are not explicitly drawn in the strategic map) are from the higher perspective to the lower ones. The different perspectives are logically and not mathematically related.

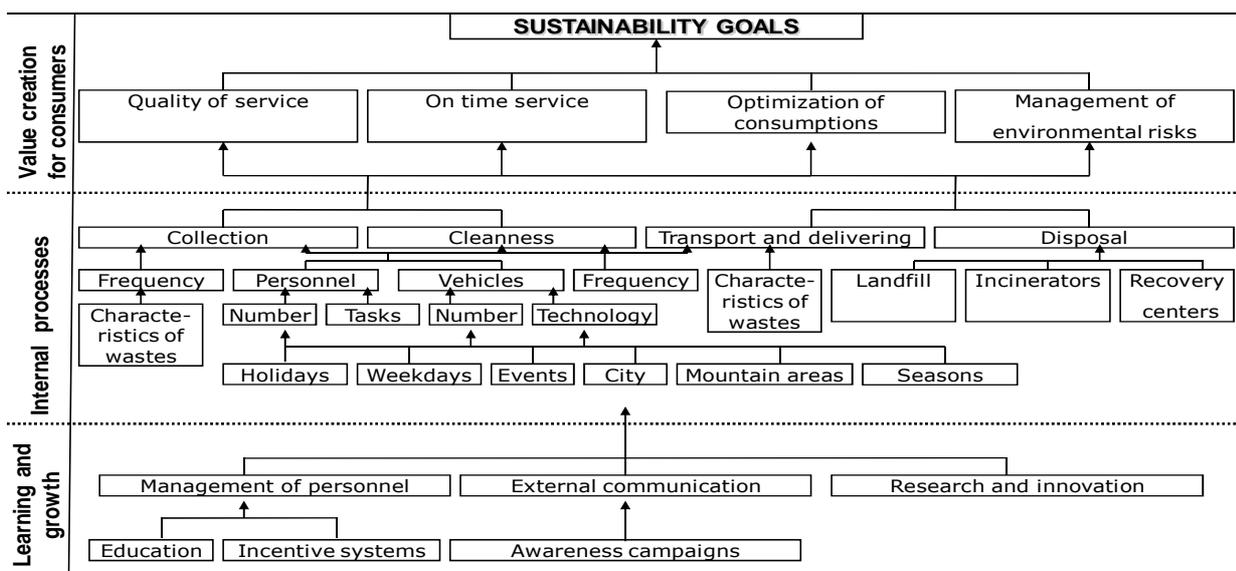

Exhibit 3: Strategic map for companies operating in waste sector Source: personal elaboration

The model proposed should help companies to detect strategic environmental and social objectives and illustrate causal relationships between qualitative soft facts and financial performances (Bieker et al. 2001).

As described before, the basic objectives of management are orientated towards the creation of value for final users (citizens). The value creation is a different concept compared to consumers’ satisfaction: for example, the waste separation can be in contrast with users’ needs because it requires more efforts in terms of time and comforts, but it allows to protect the environment and improve the citizens’ quality of life.

The creation of value for consumers can be reached towards an on time service with high level quality standards. Therefore, the value creation can derive also from an optimization of resource consumptions, trying to

reduce the environmental impacts generated by the company activities, and a properly management of environmental risks, in order to safeguard the territory and the health of citizens. These key success factors enable companies to reach the environmental goals, and to increase the wellbeing (quality of life) of local communities.

The second perspective concerns the internal processes in which the organization must excel. The map proposed highlights the critical processes which, if managed in an efficient and effective way, enable the organization to reach in time, the goals of the previous perspective.

The critical processes for the companies analyzed concern the collection (on public property or in private buildings), the transport and delivery, the management of disposal centres and urban cleaning.

As highlighted in exhibit 3, the process excellence can be achieved through an adequate planning of the frequency of the service; skilled employees in terms of numbers, tasks and hours of work; vehicles in terms of numbers and technology used, and finally a proper management of disposal centres (landfill and recovery-waste plan). Defining the frequency of the service is relevant because it influences the efficiency (costs) and effectiveness (quality of service) of cleaning and collection processes. In addition it depends on, but can also be influenced, by the number of vehicles and employees.

The third perspective identifies the infrastructure that companies must build to create long-term growth and learning. The process must be supported by continuous improvement of technologies and capabilities. This perspective takes into consideration the intangible assets as employee management and external communication. For the companies operating in the waste sector the role of employees is crucial in order to obtain a high performance. In fact, in the majority of the companies analyzed a system of suggestions in order to create a communication bottom-up that is present and this has resulted in an improvement in internal process performance. In addition, the personnel who is involved in the waste collection, especially regarding the collection in buildings, acts as mediator between the company and the final users and hence can understand the level of satisfaction and propose new solutions to increase the process efficiency and the perception of service quality to companies' managers.

The key role of employees, especially of those working in the operating line, is recognized by company's managers, so employees are involved in regular educational meetings in order to improve their skills and consequently the process performances.

Another aspect of the perspective concerns the communication campaigns organized by companies.

The campaigns are promoted in order to communicate the new initiatives carried out in the territory and engage citizens in companies' goals and policies. These are a powerful tools that, when properly used, enable the companies to build reliance and partnership relationships with the local community; but communication campaigns allow companies to modify citizen's behavior and consequently companies' performance as well. The last intangible asset is the research of technological innovation which requires a cooperation with suppliers and research centers in order to find the best technological solutions at the lowest environmental impact. The internal technologies can strongly influence the process execution and the final performance of companies.

Performance measures: a suggestion

After designing the strategic map it is important to identify what should be done to make the strategy effective: the map does not show the key actions to be carried out and the key performance indicators to be monitored.

In the following exhibit a scheme that shows the success key factors included in the strategic map, the connected key actions and key performance indicators are presented.

STRATEGIC GOALS	SUCCESS KEY FACTORS	KEY PERFORMANCE INDICATORS	FORMULA	KEY ACTIONS
<i>Value creation for consumers</i>	<i>Quality of service</i>	<i>Quality of waste separation</i>	<i>Tons of separated wastes not accepted in recovery centers / total wastes differentiated</i>	<ul style="list-style-type: none"> • <i>Compliance with quality procedures</i> • <i>International qualifications</i>
		<i>Perception of service quality</i>	<i>Vote obtained in the questionnaires (scale 1-10) distributed to a statistically significant sample</i>

Exhibit 4: suggestion of performance indicators Source: personal elaboration

Looking at exhibit 4 it is possible to identify in the perspectives of the strategic map, the main key success factors, the key performance indicators and the key actions. The framework has been built following the logics of balanced scorecard (Kaplan and Norton, 1996) and highlights the steps necessary to translate the strategic themes

into actions. Through the balanced scorecard it is possible to include financial measures and other kinds of measures regarding customer satisfaction, internal processes, employees and capabilities which are linked to a system performance that should lead to long-term success. This characteristic makes the balanced scorecard different from other managerial tools, such as Tableau de Bord (Epstein and Manzoni 1998).

The environmental indicators which enable the compliance with environmental standards, and social indicators enabling companies to improve the relationships between the companies and the community and reach high standards of service in order to improve the quality of life perceived. The social indicators are present in the quality of service; on time service; the process collection; the urban hygiene processes and communication campaigns. The environmental indicators concerning the optimization of consumptions; management of environmental risks; disposal, delivery and transport processes; communication campaigns and research and development, monitor the companies' performance in order to minimize the environmental impact.

For each process described in the exhibit above, companies should identify the revenues and the costs in order to evaluate where they generate inefficiencies and schedule the appropriate corrective actions.

The number of indicators must be adequate for the different levels of the organization and adapted on the basis of the strategic goals, the activities developed and the peculiarity of the local territory.

The definition of key performance indicators is a delicate stage which requires the involvement of those who are responsible for the achievement of the goals and the detection of a fair compromise between accessibility and commitment. In other words, to obtain the maximum benefits from the system it's necessary to share strategy with the whole organization. By communicating the strategy and by linking it to personal goals the system creates a shared understanding and commitment among all organization employees (Vola et al. 2007).

The following step concerns the translation of each strategic initiative into action plans which are assigned to a leader, a program or project team and a budget (Kaplan and Norton 2000).

So, the identification of strategic initiatives, and their translation into operational terms towards the program or project management tools, is just the last step in strategic planning (Brusa 2007). First of all, companies must identify the key success factors and their cause and effect linkages and then search for the key performance indicators necessary to monitor them adequately.

CONCLUSIONS

This analysis aims at studying a particular strategy implementation tool in publicly-owned enterprises which operate in the waste and urban hygiene sector. The reference model is the one theorized by Kaplan and Norton (2001, 2004): the strategy map.

The publicly-owned enterprises operating in the utilities sector are now facing radical changes in market systems, especially due to liberalization.

In addition, the changes in rules of law also pay attention to the company's environmental and social performances. In fact, it is increasingly the case that, in order to survive and thrive, organizations must make decisions which serve the interest of the environmental and the society (Adams and Frost 2008: 289). So, by transforming the competitive arena, companies need to implement monitoring performance systems in order to align the organizational units to the strategy and to control the sustainability-related issues.

In this framework, a comprehensive measure system to control success key factors occurs; the system must directly reflect the companies' strategy and must consider the crucial problem of the alignment of the different organizational units. In order to formalize the strategic process for the companies analyzed, the first step is represented by the design of the strategy map, in which all success key factors are included and linked by cause

and effect relations. The map presented has been adapted from the model of Kaplan and Norton in order to highlight the success key factors necessary to reach the economic, social and environmental strategic goals.

This map could be a valid framework for companies which operates in the waste sector , but it must be personalized on the basis of the specific company's needs, mission, culture and goals.

The strategy map is the starting point to trace the indicators necessary to monitor the performances. The companies of the sample analyzed only monitor some indicators without a specific reference to the strategy map thus risking missing the link between the success key factors and the indicators. The consequence is that the strategy risks remaining an abstract concept and not being translated into operating actions. For this reason when drawing up the set of indicators, I have identified a proposal of key actions necessary to reach the strategic sustainability goals.

The possible development of the research is oriented towards a comparison between the publicly-owned companies and the private companies operating in the waste sector, so as to study if there is a change in the strategic goals, in the perspectives and in the success key factors analyzed in the strategy map.

FINANCIAL REPORTING: QUO VADIS?

Turner, Geoff¹; Fiedler, Brenton²

¹*University of Nicosia, Nicosia, Cyprus and University of South Australia, Adelaide, South Australia*

²*University of South Australia, Adelaide, South Australia*

This paper reflects on the confusion and indecision that the march of globalisation has inflicted on the accounting profession. It identifies the winners and losers in an accelerating harmonisation process that initially progressed with some degree of lethargy following the inception of the International Accounting Standards Committee (IASC) in 1973. The current financial crisis engulfing the world has led some to demand an increase in regulation to avoid, in future, the exploitation that predicated the present contagion. Continued harmonisation of accounting and financial reporting standards is considered essential to this ideal although it would require a change, globally, to the present inadequate enforcement authority.

Rather than simply accept this one-dimensional view, the paper examines the probable situation that would exist in the absence of any form of guidelines to manage the changes facing the profession as a result of the increasing globalisation of business. Using deductive reasoning, the conclusions drawn in this paper are that the financial markets could easily circumvent the absence of harmonised accounting standards, as it has done quite well in the past, but business generally is likely to experience fraud on a significant scale.

Even so, the paper introduces the possibility of an alternative, market-driven approach that may resolve the ongoing difficulties inherent in the bureaucratic, top-down process currently being undertaken. The authors acknowledge that it is not possible to fully assess the potential of this, or indeed any other alternative, without considerable research and questions the reluctance of the profession to actually carry that out.

Keywords Accounting standards, fraud, globalisation, regulation

INTRODUCTION

Accounting is the system an organisation uses to measure its financial performance by recording and classifying transactions of value. Accounting also provides ways to present this information that make it possible to evaluate an organisation's past performance, present condition and future prospects for decision making by a range of users. Interested external readers may use this information in an attempt to evaluate the organisation while managers may try to use it to plan and control the organisation's operations. Because these two audiences use accounting information in different ways, accounting has two distinct facets, both of which embrace an extensive range of practical techniques which may be used at various times in the course of evaluating or managing any organisation (Jones, 1995). While not wishing to ignore or trivialise the impact of globalisation on the needs of internal users, it is the implications to the external users that are the locus of this discussion.

Financial accounting is concerned with preparing information for the outside world. Those interested parties, external to the organisation, use this accounting information to satisfy a variety of interests. Suppliers, banks and other lenders want to know whether the organisation is creditworthy. Investors and owners are concerned with the organisation's profitability and growth. Government agencies are mainly interested in regulating the organisation and the collection of taxes (Perks, 1993) however the nation-state based operation and regulation of organisations is increasingly being affected, and in many cases influenced, by the impact of non-domestic competition and regulatory requirements. These influences notwithstanding, all users need financial information that is relevant, objective, consistent over time and comparable to that supplied by other organisations.

Once the financial statements are prepared it is necessary for many organisations to have those statements, as well as the nature of the underlying transactions and the recording of those transactions in the accounting system, reviewed by a competent, independent professional. It is acknowledged that this review, or audit, is not required

for all business entities, yet it is often mandated under legislation, or employed to give assurance in one form or another to users of the financial statements. As part of the process of ensuring relevance, consistency and comparability, for these business entities it would be expected that the professional undertaking the review, the auditor, would employ an assiduous approach in line with some approved guidelines.

Such a requirement would suggest that financial accounting statements ought generally to conform to certain standard formats and ought to be prepared in accordance with uniform generally accepted accounting principles. Furthermore, the audit review and attestation would be conducted in accordance with a set of defined guidelines. In a purely domestic setting this has certainly been the case for many years. Internationally, however, it has been a different proposition for, until the latter part of the last century, diversity of national legislation, tradition and culture resulted in a disparity of accounting and auditing practices throughout the countries of the world (Harris, 1998).

On planet Earth it would seem that accounting is not, as Morgan (1965) appears to have believed, an exact science. Using identical financial and other data, accountants may legitimately derive a wide variety of results depending on the assumptions they make, the way they interpret the accounting rules, and the areas of accounting or reporting that are not yet covered by accounting standards or that involve subjective estimates. Indeed, when considering the financial reporting requirements of an organisation that operates in many parts of our global village, this presents significant difficulties for preparers, auditors and users of these financial reports.

To some extent then, accounting numbers represent human judgement. They do indeed provide a picture of the organisation as Hines (1988, p.257) suggested, but that picture has been constructed with the artist's concept of reality or purpose. Users of the information generated in this way think and act on the basis of that picture, "and by responding to that picture of reality, they make it so". This is a concern shared by Miller (1994, p.1) who suggests that accounting is "an attempt to intervene, to act upon individuals, entities and processes to transform them and to achieve specific ends". So, a view that holds some currency is that the underlying purpose of accounting is to persuade through presentation; in short, communicate. What seems less clear at this juncture is what it is that accountants are communicating and to whom.

This dilemma arises because of the vast constituency with whom accountants are trying to communicate. As with any group of reasonable size, the needs of its members are disparate. Consequently, for many years the accounting profession has struggled with a 'one size fits all' approach to the determination of accounting and auditing standards. Indeed, the on-going transfer from national to international development of accounting regulation is perhaps the clearest example of this way of thinking.

Many would say that this transfer, the harmonisation project, continues to progress at too slow a pace, continuing to get in the way of efficiency and incurring significant additional costs for multinational preparers of financial statements and their auditors. As a consequence both groups continue to champion the need for a single, universally accepted conceptual framework and operating principles. These professionals are no longer alone at the forefront of the drive for change. Oliverio and Newman (1997) indicate that users of the financial information being disseminated around the global village have also added their rallying cry to the cause. Now, world leaders, as a result of the current global financial crisis, are calling for stronger global regulation of accounting and auditing standards with the G-20, at its April 2009 meeting, concluding that standard-setters should "make significant progress towards a single set of high quality global accounting standards" (2009, p.6). The global impact of the financial crisis clearly supports this.

It is against this background that the accountancy profession continues to be bombarded by an ever-increasing number of laws, regulations and other kinds of standards and guidance. This trend will only continue, if not escalate, following the final report of the joint International Accounting Standards Board (IASB) – Financial Accounting Standards Board (FASB) Financial Crisis Advisory Group (FCAG), which made it quite clear that "it is critically important to achieve a single set of high quality, globally converged financial reporting standards that

provide consistent, unbiased, transparent and relevant information, regardless of the geographical location of the reporting entity" (2009, p.2).

Yet it should be remembered that this is only one side of the debate, being promoted, in the main, by those with a vested interest and supported by panicking politicians whose policies arguably led to the present contagion. As with all debates, there is another side and that is the incessant demand for financial information to be presented in such a way that it may be put to use as a functional decision-making and compliance instrument by stakeholders and the community. Needless to say the current underlying dogma is that *being local is bad, going global is good*. The result of such a doctrine is that traditions, customs, and local accounting dialects are considered antiquated barriers that a truly modern accounting community is expected to overcome. Lehman (2001, p.4) asked: "who benefits the most from the harmonisation project"? In a global context, let's see if there is a reasonable answer to that question.

FACT OR FICTION?

Over time, many 'must have' products or ideas have been important only in the minds of their inventors. Is it possible that this may be said of the concept of a single, universally accepted set of accounting and auditing principles? For, despite continuing and strong international interest in the harmonisation debate, major problems of definition and confusion over ambiguous terminology remain to seemingly confront all attempts at objective inquiry.

There is, however, a reasonable degree of consensus that the economic activities of national economies are following a path of increasing global integration. The primary drivers as suggested by Ohmae's (1995, 1999) initial perception of the forces that are shaping these changes are: the new information technologies and knowledge-based industries; major shifts within the international division of labour; the development of strategic alliances and joint ventures by transnational organisations; and the global movement of financial capital of which over 75 per cent is in private hands. It is the last of these that is crucial to the debate for it is the providers of financial capital who are most interested in financial statements (FCAG, 2009). Their importance acknowledged, one must question whether this financial globalisation is as unprecedented as cheerleaders of the 'new economy', such as Friedman (1999), would have us believe.

International capital flows are not a new phenomenon. They have always occurred when there have been large-scale international movements of goods and people. For most of modern history, capital export has been motivated by a mixture of economics and politics. Concentrating on the economic perspective, the rationale for capital export is to secure higher returns than would be possible from a domestic investment. Even short-term credits would not have been granted to foreign merchants in medieval times if there had not been the prospect of better profits than from internal trade. So, if financial globalisation has been developing since Pacioli 'came down from the mountain with the professional tablets', why is it only now that cross-border variety in accounting and auditing standards has become a problem? A fair question considering that, without the benefit of uniform financial reporting statements, investors of all kinds have been able to separate the important information from the unimportant with sufficient acumen to allow the capital markets to experience the explosive growth that they have been able to achieve (Goeltz, 1991).

For much of the more than five centuries that the present accounting model has been in existence it was hardly possible to distinguish between private, profit motivated overseas investment and public, strategically motivated overseas investment. It was often the case that private overseas investment had been officially sanctioned and therefore usually came with political strings attached. Such backing by government, real or implicit, had the attraction of reducing the risk of default by the foreign borrower. This not only made the investment attractive to private interests but also, in many respects, removed the need to make a reasonable assessment of the capacity of

the borrower to repay both principal and interest. Indeed it has been said of the bankers, Rothschilds, that they would hardly take up anything that did not have the British Government 'guarantee' about it (Kynaston, 1994).

For such circumstances to prevail, it required there to be one or more capital-exporting powers with a political or strategic agenda. For much of the last century or two this has usually been the case with Britain being the principal hegemonic power, politically underwriting international financial stability through formal and informal imperialism (Davis and Huttenback, 1986). What makes the end of the twentieth and start of the twenty-first centuries unusual is the absence of such a financially hegemonic power, yet the process of financial globalisation has continued apace.

The international component of banking activities has increased dramatically in this time. Between 1977 and 2006, the international claims of banks in the world's major economies rose at an average annual rate of 11.5% growing five-fold to represent approximately 50% of world gross domestic product (GDP). This progressive internationalisation of banking activity has been driven to a large extent by the general globalisation of business and trade (Bank for International Settlements, 2007).

Global markets for goods and for capital are more open today than ever before. At the turn of the century, international trade amounted to little more than one per cent of world GDP. The figure for 1990 was 13 per cent and this had doubled to 26 per cent by 2006. This reflects the fact that international tariff barriers are currently lower than they were at the start of the twentieth century. In addition, foreign direct investment has increased similarly in the same period of time, due to an increasing number of multinational organisations, to stand at 26 per cent of world GDP in 2006. This comes about because information flows are both faster and greater in volume, greatly facilitating cross-border investment decisions. What is more, this process should go further. According to the International Monetary Fund (IMF), 144 countries still had capital controls on foreign direct investment in 1997, while 128 countries still regulated all international financial transactions (Micklethwait and Wooldridge, 2000). As such controls are progressively dismantled cross-border capital movements would get even bigger.

Clearly the activities and interests of investors, lenders and companies are becoming increasingly global. If we accept that accounting, or more particularly the generation of financial statements from the accounting records, is the way to present information that makes it possible to evaluate an organisation's past performance, present condition and future prospects, it seems imperative that the profession develops a globally accepted, high quality financial reporting framework. This means expropriating all the best ideas of the different national standard-setters and doing away with those accounting principles that unduly burden the preparers of financial statements and increase the cost of an organisation's capital. This approach should provide a framework to produce relevant, unbiased, transparent and reliable financial information that is useful for investors, lenders, creditors and others who make capital allocation decisions. Providing users with such information would seem to be the most sensible way of achieving fair, liquid and efficient capital markets worldwide. If such a coherent framework evolves, then it is logical to believe that a framework auditing will follow on the same path.

ACCOUNTING HARMONISATION

The means of achieving this objective has been the *raison d'être* of the IASB and its predecessor, the IASC, since its inception in June 1973. Since then, after extended consultations with academics, auditors, preparers, users and other interested parties, some twenty-nine international accounting standards (IAS) and eight international financial reporting standards (IFRS) have been promulgated. As the effects of the financial crisis are felt around the globe, more than 100 countries now require or permit the use of international standards or, where they have their own sovereign powers, have national standards that converge or are converging with the international standards currently in place. Clearly, convergence is now seen as being in the best interests of all concerned.

Even the attitude of the lead actors, the United States of America (US) and the European Union (EU), has mellowed as they accede to the wishes of the 'trade union' and accept the inevitability of convergence. While

there is still some way to go before a single, universally accepted set of accounting principles for recording the financial effect of business transactions and reporting for global entities becomes a reality, there is strong hope for the future as the number of countries accepting harmonisation shows.

Continuing along this path of change should not be difficult considering that, even in times of economic difficulty, global business is on the minds of senior management in countries throughout the world. Organisations of all sizes are increasingly taking their expertise to many and varied destinations on planet Earth. The optimism of these global business leaders will be a key driver in the establishment, introduction and acceptance of a single, universally accepted set of accounting principles. Why? There are two reasons. First, there are compelling strategic business considerations, rather than accounting issues, for promoting the change. Second, they and their staff are the ones who have to manage any disparity in rules governing accounting in the different countries in which they operate. Understanding each is crucial in agreeing the final solution.

What are these compelling strategic business considerations for promoting change? They include organisational marketability, cross-border mergers and acquisitions, finance raising and shareholder dialogue. In each of these situations decision-makers rely on information provided by financial reports. Until recently these reports, upon which investors and regulators depend, were based on accounting practices that varied widely by country. As such, there was a distinct lack of comparability and reliability in financial disclosures that contributed to the current financial distress. An inability to quickly detect and prevent financial problems allowed them to reach global proportions. Little attention was paid to Oxley (2001) who made it very clear that, at a time of growing interdependence in world financial markets, economic crises are not deterred by national borders. In his view, the sensible way forward is to harmonise accounting standards. This will allow investors to be better able to make informed investment decisions and also benefits will accrue to preparers and users of financial statements, costs will be reduced and growth in international trade and investment will continue.

Even in the shadow of the financial crisis, investors around the world continue to embrace the opportunity to partake in investment strategies that are no longer subject to geographical constraints or the lack of a global information network. Global investment on this scale is of concern to the auditing profession as reliance on financial reports is no longer limited to domestic investors. Further, the complexity and diversity of multinational business entities adds exponentially to the risk of auditing global enterprises. The need for a global auditing framework is thereby just as critical. Oxley's (*ibid.*) proposition, therefore, has another dimension – auditing. It is now well established that economic crises and business failure are not constrained by national and international borders and accordingly investors will have an ever-increasing focus on assurance about the reliability of financial reports, irrespective of whether the basis of their preparation is in accordance with a harmonised accounting framework.

Furthermore, the incessant growth of business globalisation is also responsible for the pressure to bring some form of homogeneity to the financial reporting process, which reflects the growing unease of auditors who are now subject to the prospect of worldwide liability to global investors. Their concern, now well and truly justified, about the ability of history to repeat itself, in the form of financial disasters, business failures and fraud of enormous proportion, manifests itself in the profession's support for the harmonisation of not only accounting standards but auditing standards and practice as well.

Even so, there remain issues to be overcome and the future is less than certain. Certainly there exists a set of standards promulgated by the IASB yet they have no force of law and unless national authorities enact appropriate legislation they will remain unenforceable. Individual countries have found it a relatively simple exercise to undertake but in others the disparity between harmonised standards and local associated business laws, languages, customs and practice make enforcement problematic. It is possible that IASs and IFRSs will be accorded worldwide authoritative support at some future time. However, this will continue to be an evolutionary process and will require continuing changes in jurisdictional accounting and reporting standards, fiscal practices

and capital market regulations. Doomsayers believe fundamental cultural and political differences will forever prevent that from happening. Certainly, in the immediate future and despite the present political will, a global mandate for international standards may not be a realistic solution but, while dealing with a disparate set of national accounting and auditing standards is a real cost of doing business, it must surely be the 'only game in town'.

REGULATION OR MARKET FORCES?

The issue of globalisation reflects a deeper question: one that involves the role of knowledge and of knowledge producers in a changing world. In this changing world it appears increasingly difficult to draw a line and separate those issues that have to be understood as technical and scientific, from the debates belonging to the realm of socio-cultural and anthropological analysis. Yet the process of harmonising accounting and auditing standards is developing a world of generalised financial communication where these seemingly unattached sets are brought together in a jumbled combination. Accounting harmonisation will almost certainly put the seemingly comfortable certainties of accounting 'as it is' into confrontation with those social and institutional contexts existing in the global environment. Far from providing a solid, unitary and coherent approach to the provision of financial information, such a mixing is likely to reflect a variety of different ways in which accounting becomes 'what it is not' (Hopwood, 1987).

One problem inherent in any top-down approach to the harmonisation of anything, accounting included, is that forced harmonisation requires compromise. If there are three ways to report a certain item, for example, and if each of the three ways is in widespread use, it must be because a substantial segment of the financial reporting community thinks that each of the methods is 'the best' way to report that item. If accounting harmonisation requires two of the three methods to be discarded in the interests of uniformity, it is fair to say that a substantial segment of that community will have to be content with a method that they deem less than best. Otherwise they all would have adopted the method voluntarily without the need for forced harmonisation. In other words, sub-optimisation will often be the result if substantial segments of the financial reporting community have to settle for less than their first choice.

With regard to the auditing community, the problem is perhaps less demanding, but still critical. Given that fundamental auditing procedures and techniques, *per se*, are universal, (acknowledging that the application in some geographical areas lacks the support of regulation and oversight), the defining variable that causes concern to auditors is largely the accounting crisis discussed above. If global accounting harmonisation was to materialise, then the accounting dilemmas facing decision makers would diminish as would the same dilemmas that challenge auditors. In essence, '*auditors are accountants looking backwards*' and as such, are directly responsible for, yet subject to, their own inability to properly harmonise the global business community. The procedures for gathering evidence are fairly universal, however if the accounting processes and standards are disparate and flawed, the auditing evidence gathering procedures will also be challenged. Until the issue of harmonisation of accounting standards is resolved, auditing standards will retain the existing current global problem.

Forced harmonisation of the accounting and auditing standards that underpin the financial reporting process involves all the dangers that are inherent in any 'one size fits all' system. One of the very real dangers is that those charged with overseeing the harmonisation process will make the wrong decision. Indeed, if decisions are made by a political process rather than by an economic process, there is a substantial probability that the decision made will be the wrong one. Even if the decision-makers always choose the method that the majority prefers, which is often not the case, a harmonised system must necessarily ignore or discount the views of the minority. If harmonisation is desirable, it does not logically follow that the government or some private group should be the impetus.

Several other arguments have also been made against regulating accounting standards. Hendriksen and van Breda (1992) mention three: regulations are conceived in crises, regulators are captured by regulatees, and regulators are reactive rather than proactive. The 'Public Choice School of Economics' would probably add a fourth reason: regulators are motivated by their own interests, not those of the public (Miller, 1997). Furthermore, top-down, centrally planned systems have proven to be suboptimal because they are structured in such a way that makes it impossible to respond to changing consumer demands. The regulators do not fully understand what all the users need, so how can they possibly give them what they want? As a consequence, decisions are often made for political rather than economic reasons.

The literature on development economics and economic systems (see, for example, von Mises, 1922; Hayek, 1935; Hoff, 1938; Boettke, 1994) has been addressing the relationship of central planning to efficiency, innovation and growth for considerably longer than the accounting profession has been pursuing harmonised accounting and auditing standards. The continuing push toward accounting harmonisation can only suggest that the accounting profession has chosen to ignore the lessons that have already been learned in other disciplines. A centralised financial reporting system adheres to the same hard rules of economics as do centrally planned economic systems. A top-down approach to standard setting is structurally inferior to a system that is consumer-driven (Yoon, 1998). In other words, there is an alternative and that is to provide a series of guidelines defining acceptable accounting practice and allow the market to determine whether the preparer is providing good quality, relevant financial information.

The market – the unregulated, invisible hand of Adam Smith – has proven more than capable of solving many important problems over the centuries without any central direction. It solved the question of railway gauge, computer operating systems, VCR v. Beta, language and numerous other important problems without top-down intervention. The possibility that the market could solve relatively minor problems, like the problems of financial reporting to an international audience has, inexplicably, not been adequately explored in the finance or accounting literature. Over a period of time, if the market were allowed to operate unhindered and if investors and potential investors were allowed to voice their opinions as to their preferences, certain methods would emerge as being better than others. If no reasonable and informative method is prohibited, new methods, not now existing, might well emerge to resolve financial reporting issues that the present day regulators choose to ignore or cannot yet imagine.

In a perfect world we would not need an IASB because accounting standards would be developed through direct negotiation between corporate management and shareholders (or analysts serving as their proxies). All elements of financial reporting from recognition and measurement through to disclosure, the extent of which probably matters the most, would therefore be investor focused, responsive to specific investor needs and delivered at a cost that preparers, in their role as agents for investors, would be willing to bear. This is a market based proposition that begins with the premise that markets are efficient and that corporate management has an incentive to provide the information that their constituency wants. If they do a good job of providing it, they are rewarded in the market place. If they do an inferior job, they are punished (Holthausen and Leftwich, 1983; Scott, 1997; Wolk and Tearney, 1997). The market is a stern overseer and will swiftly and severely punish those who don't perform in the expected manner.

Yet this is not always the case and so when, from time to time, markets do not work perfectly, governments feel obliged to intervene to correct for market failure, as they have done in the current financial crisis, by introducing new or strengthening existing regulations. Without doubt such an approach involves a *non-sequitur*. Just because the market does not always work perfectly, it does not logically follow that government intervention is needed to make things better. In actual fact, government intervention may even make things worse but it is acknowledged that accounting policies do sometimes make a difference (see, for example, Lev, 1979).

And so the question is not so much whether to regulate but rather who regulates: some quasi-governmental agency or the market? We leave this dilemma unresolved for the time being for it is an issue over which there will be no early compromise. Yet it does not make sense to abandon the work that has been carried out so far. While practical problems in implementing a global financial reporting framework remain, there is at the present time considerable pressure on the accounting profession to progress the harmonisation project. Harmonisation of the auditing profession will then follow.

SUMMARY

Throughout this paper the notion of 'transparency' has been omnipresent. In the sense of financial reporting it has been used to imply better quality information. That is the objective of harmonised standards but mere uniformity in accounting and auditing rules will not guarantee better quality information. Based on the preceding discussion it should be admitted that internationally accepted standards will help global flows of capital, but creating international standards alone is not enough to result in meaningful or sustained improvement in the functional decision-making instrument used by stakeholders and the community. There needs to be an adequate compliance mechanism in place but whether that should be regulatory or market based is a matter of conjecture. Maybe if an answer is provided to Lehman's (2001) question it ought to be possible to assess how the overall reform may be packaged. It is easier to answer if the question is addressed from the opposite perspective. In other words, who wins and who loses in an environment of diversity?

Winners from worldwide diversity in financial accounting and reporting practices include, first of all, the financial analysts who profit from their interpretation of these divergent reports from country to country on behalf of brokerage firms, investment newsletters and portfolio investors themselves. National accounting regulators also gain because they have complete authority over national GAAP in their respective jurisdictions. This is a source of administrative and political power for them. Accounting professionals are also potential winners because diversity generates fees when clients set up new business units in different GAAP territories or when cross-border auditing has to be performed. Finally, business consultants gain from rendering advice on the basis of financial information differentiated by different GAAP applications.

Portfolio investors stand to lose the most because misunderstandings stemming from diverse reporting practices are likely to reduce their investment returns. Businesses operating in several jurisdictions lose because complying with different GAAP sets is costly and often misleading. Consumers and other general markets participants are also likely losers since financial inefficiencies tend to increase consumer prices and also tend to make markets less efficient. Finally, economic policy makers are negatively affected since they do not have comparable information from country to country and therefore they must spend time and effort to adjust economic data of all sorts to a homogeneous or at least comparable basis.

Auditors are similarly challenged. From a slightly different perspective, we must recognise that there has been abundant litigation against auditors to compensate shareholders and sometimes third parties for losses and unmet expectations (O'Malley, 1993). The public perception is that auditors have an unmistakable responsibility for the detection of fraud and prevention of mismanagement. Yet this is not so, and the failure of the accounting profession worldwide to address the public's unrealistic expectations regarding the independent auditor's role in preventing business fraud and reporting mismanagement has exacerbated the situation. For many years professional accounting bodies in most countries have been agonising over how to deal with the expectation gap problem with limited success. As globalisation increases, the growth of fraud and opportunistic mismanagement also increases and this has a knock-on effect in all countries. Investment by local investors and financial institutions in foreign companies and by foreign investors and financial institutions in local companies is only provided at a higher cost as the providers of funds seek to mitigate their exposure to the global risk.

How bizarre that those who least benefit from the harmonisation of diverse national accounting and auditing standards are the very people who have been managing the process. No wonder they have been dithering over a project that in most other circumstances would have been effectively completed, or trashed if that course of action was deemed to be in the best interests of those for whom financial information is prepared, many years ago. But this may be unkind. As a result of the continually changing global business environment there are difficult conceptual and practical issues facing the accounting profession and those producing and using financial statements. There are deep-seated differences of opinion coloured by established national approaches and contrasting regulatory philosophies and in some instances short-term opportunism.

Perhaps the most fundamental of differences lies in the question of the degree of detail appropriate in setting out the standards. Central to the debate is whether a standard should attempt to describe precisely the application of principle in almost all conceivable cases or simply be clear on the overall principle and provide more general guidance on its application. The latter, supported by precedents determined on a case by case basis as a result of actual audits, would seem to be the preference of those charged with interpreting the standards in the preparation of financial statements and accounting reports. This approach to harmonisation focuses on the strategic rather than the technical merit of the process and seems capable of providing uniformity and comparability of information.

Finally, it has to be said that impeccable international accounting and auditing standards are one thing, enforcement is another. This is a most critical aspect that will ultimately determine the success or failure of the harmonisation process. Neither the IASB nor the IFAC has a mandate or the authority to enforce their standards. That essential role is for the national regulators and for the audit firms themselves. Does not this, and earlier arguments, suggest that the most appropriate way to provide investors of all kinds with the information they need would be to replace the present coercive, authoritarian, top-down model with a set of market-driven rules or guidelines supported by case studies?

IMPLICATIONS FOR BUSINESS

For many commentators (see, for example, Micklethwait and Wooldridge, 2000 and Giddens, 1999) globalisation is a force for good, promising nothing less than a perfect future as it subverts the nation state, but also 'traditional' cultures. The present process of harmonisation represents nothing less than the globalisation of accounting and auditing standards. As such, and in this respect the IASB and others have been quite open, IASs, IFRSs and ISAs that have replaced the national standards of many countries are built on a possibly unstable foundation of compromise. In so doing they will quite possibly erase any socio-cultural influence on the principles and practice of both accounting and auditing in sovereign states. Those who think this a touch extreme should ponder only for a moment on the European Commission's autocratic dictates across an infinitely wide spectrum of business regulation.

But such behaviour will not only apply in the EU. The tentacles of the harmonisation process stretch across planet Earth. Business organisations, particularly those based in capitalist societies, support the process because it will reduce their cost burden and allow them to make even greater profits. It is difficult to complain too much about this because that is their fundamental charter. Yet as a profession, how can accountants reconcile the conflict that may arise in Muslim based jurisdictions over a simple reporting item such as interest expense (for a discussion on the impact of Islam on accounting practice see Lewis, 2001)? And how will they be able to honestly attest that a set of consolidated financial statements prepared in accordance with IASs and containing information from Russia, with an inflation rate of 12.7%, and Cyprus, with an inflation rate of 2.6%, represent a true and fair view of both financial performance and financial position of the consolidated entity?

Regulated harmonisation of accounting and auditing standards is a juggernaut on the global field of change and in this respect Friedman's (1999, p.12) imaginary conversation between the former US Treasury Secretary,

Robert Rubin, and the Malaysian Prime Minister, Mahathir bin Mohamad, reflects the views of many within the profession:

"Ah, excuse me, Mahathir, but what planet are you living on? You talk about participating in globalization as if it were a choice you had. Globalization isn't a choice. It's a reality. There is just one global market today and the only way you can grow at the speed your people want to grow is by tapping into the global stock and bond markets, by seeking out multinationals to invest in your country and by selling into the global trading system what your factories produce. And the most basic truth about globalization is this: No one is in charge, not George Soros, not 'Great Powers' and not I. I didn't start globalization, I can't stop it and neither can you..."

It is, of course, profoundly true. All businesses will be required to 'follow the leader' and so, unless there are some imminent changes of heart, a set of financial statements prepared in accordance with international GAAP, and audited in accordance with ISAs, will be commonplace in the not too distant future. Staff will be needed who are capable of working with the new regime. So, forewarned is forearmed, management of both business entities and professional firms will need to ensure that resources are available within their organisations, or at the very least can be bought in, to accommodate the impending change.

There is, of course, an alternative for those not committed to the notion that financial statements prepared in accordance with international GAAP present a sensible financial picture of an organisation to its stakeholders. Follow the conviction of Hines (1988) and provide them with something that does. Exactly how that may be done and what is entailed is beyond the scope of this paper. However, by taking a strategic view of the situation it should be possible, with the help of some committed professionals, to develop accounting concepts and a reporting mechanism that not only meets the needs of stakeholders but of the market in general. Of course, this is only one half of the problem. If the stakeholders continue to require the comfort of an independent review of the financial statements then a similar approach needs to be taken in the determination of acceptable audit practices. It must be said, however, that audit practices cannot reasonably be addressed until the accounting dilemma is solved.

EVALUATION OF REGIONAL TRADE FLOWS, TRADE COEFFICIENTS AND MULTIPLICATIVE EFFECTS ON PRODUCTION AND EMPLOYMENT

Valma, Erasmia¹

¹*University of Piraeus*

The main purpose of this study is to construct a complete three region interregional input – output model and to indicate how this model can be applied as a tool for regional analysis. We focus on the issue of applying the model in order to estimate trade flows, trade coefficients and multiplicative effects on production and employment. The methodology used is the application of input – output analysis to interregional relationships based on Chenery - Moses interregional model.

The results of the study accomplished by the construction of an interregional – interindustry input – output model which provides a description of interregional flows between the three regions as well as the trade coefficients of the Greek economy. On the basis of the model implementation production and employment multipliers were estimated from 2000 data for three regional systems.

With respect to the research limitations, the input – output analysis presupposes a rigid production and consumption technology that assumes away and adaptability to a changing environment. This limitation is well known and unavoidable if we use an input – output model.

The interregional model is the first effort for the regional delineation of the Greek economy. We also note that the practical implication of the construction of an applicable and reliable model was needed to bridge the existing statistical gap.

INTRODUCTION

The use of input – output techniques in economic analysis has been and still is extensive. Researchers are able to obtain under assumptions, multipliers that guide them in the understanding of the productive structure of an economy and are useful to approximate the underlying effects.

The point of departure for an interregional input – output study, is an accounting framework comprising estimated intersectoral and interregional trade flows and the economic processes determining these flows. Here we also attempt to capture the implied effects on production and employment of an exogenous change in final demand within an interregional model.

The purpose of this study is the construction of an interregional model for Greece and the estimation of multiplier effects on production and employment for the regional economies.

Specific objectives that fall within the major objective are :

To formulate a precise interregional model with regional technical coefficients for the Greek nation.

To apply the model to evaluate production and employment multipliers for the three regions using impact analysis.

To identify the sectors which have major influence in terms of generation output and employment within the regions.

Finally to suggest solutions about the empirical implementation of the results.

Our empirical application tries to exploit the structure of a recent 2000 interregional input – output matrix of three regions to study the impact upon the productive sectors of exogenous changes in demand.

Application of the model to regions other than the three treated here could be accomplished by some additional information. The data and procedures upon which this analysis is constructed when combined with some additional information could be applied to a different system of regions from that in this study.

The paper will be divided in five parts. Section 2 refers on a review of literature. Section 3 describes the research methodology of the interregional model and the data base used. In section 4 we introduce the impact indicators and we present the empirical results. We close the paper with a section that summarises the results and limitations of the analysis, and the contribution of the field.

LITERATURE REVIEW

The fundamental purpose of the input – output model is to analyse the interdependence of industries in monetary units in an economy (Miller and Blair, 1985). Input – output analysis was developed by W. Leontief in the late 1930s, and for his contribution in the area he received the Nobel Prize in Economics Science in 1973. The input – output model based on a system of linear equations, which represent for the distribution of an industry's output throughout the economy. Leontief applied this technique in the U.S. tables for 1919 and 1929 in 1936.

The regional input – output models may deal with a single region or with two or more regions and their interconnections. The several – region case is termed interregional input – output models (IRIO) (In one version) or multiregional (MRIO) input – output analysis (in another version).

Such classical interregional or multiregional models associate with authors as Isard et al (1960), Chenery (1953), Moses (1955), Leontief and Strout (1963), Hartwick (1971) and Polenske (1980).

The U.S. M.R.I.O model suggested (independently) by Chenery (1953) and Moses (1955). For this reason is classified as the "Chenery – Moses" model.

Duchin (2005) designed the World Trade Model and its predecessor, the world input – output model of Leontief, Carter and Petri (1977).

METHODOLOGY

The model applied in this study follows the Chenery – Moses type formulations. The interregional input – output matrix provides a complete description of the intra and interregional relations between a region with its productive sectors and the other regions comprising the matrix.

The data requirements of the interregional model are:

- (1) Technical input requirement for each industry in each region a_{ij}^k and
- (2) Trade flows for commodities between regions,

$$t_i^{k1} \left(t_i^{k1} = r_i^{k1} / R_i^1 \right)$$

or the ratio of commodity i shipped from region k to region 1 to the total receipts of commodity i in region 1 from all regions including itself).

The model consists of the following basic equations:

$$(1) D^s = A^s X^s + Y^s$$

$$s=1,2,\dots,m$$

$$k=1,2,\dots,m$$

$$(2) X_K = T_K D_K$$

Equation (1) states that the total demand of a region for each good, D^s , is the sum of its final demand, Y^s , and its intermediate demand, $A^s X^s$, (A is the input coefficients matrix). Equation (2) the innovation of Leon Moses, states the equality of commodity demand, $T_K D_K$ and supply, X_K . Thus, if the total demand for each commodity in each region is known, and if regions acquire each good according to a fixed regional purchasing pattern, the impact on each region of any change in the level of activities can be determined.

When final demands Y^s are given, this system can be solved for outputs, X^s by eliminating the variables D^s and D_K from (1) and (2).

So, we write

$$(1) D_C = AX_C + Y_C$$

$$(2) X_m = TD_m$$

Where D_C and Y_C are $mn \times 1$ column vectors of total demands and final demands for all goods by regions. X_m and D_m are $mn \times 1$ column vectors of total and final demands for all regions by commodity. A is $mn \times m$ diagonal block matrix composed of $M \times M$ square submatrices, with all non – diagonal blocks being zero submatrices.

Thus,

$$(1) A = \text{diagonal } (A^1, A^2, \dots, A^n)$$

Where $A^s = a_{ij}^s$ or the $m \times m$ technical coefficients matrix for each region. T is an $mn \times mn$ matrix consisting of $n \times n$ square submatrices with all blocks off the main diagonal being zero submatrices.

Thus,

$$(2) T = \text{diagonal } (T_1, T_2, \dots, T_m)$$

Where $T_K = T_K^{r,q}$ or the $n \times n$ trade coefficients matrix for the k^{th} commodity. Define E as a $mn \times mn$ permutation matrix which converts a commodity arrangement into a regional arrangement.

So that

$$(3) Y_C = EY_m, D_C = ED_m, X_C = EX_m.$$

Equation (4) can be written as $X_m = TE^{-1}ED_m$ and premultiplying by E , we have by (7).

$$(4) X_C = ETE^{-1}D_C.$$

Letting $T^* = ETE^{-1}$, we have $X_C = ETE^{-1}D_C = T^*D_C$.

Thus, a commodity arrangement has been converted into a regional ordering (8). Premultiplying (3) by T^* ,

$$(5) T^*D_C = T^*AC_C + T^*Y_C.$$

Substituting from (8), we have:

$$(6) X_C = T^*AX_C + T^*Y_C \text{ and}$$

$$(7) X_C = (I - T^*A)^{-1} T^*Y_C$$

When demands by the final demand sectors in each region are given, the system converts these demands, into a set of shipments on final demand, account, T^*Y_C , by region and determines all regional outputs, X_C .

RESULTS

Estimation of the trade flows, trade coefficients and interregional input – output matrix.

The results of estimating the interregional model for Greece are based on a statistical implementation of the Chenery – Moses model.

Studies attempting to measure the impact on a particular region of exogenous changes in the demand for products of that region have frequently used a regional input – output framework.

In this study we attempt to treat three regions with equal detail specifying a complete input – output matrix for each region, which contains a total of nine submatrices, three intraregional and six interregional and sixteen industries. We start deriving the technical coefficients for the industries of each region, dividing each element of the regional input – output flow tables by the total of flows.

The crucial contribution of this study is that the above information is used to derive regional technical coefficients. On the other hand the empirical implementation of Moses interregional model was accomplished by using national coefficients as approximation to those of each region.

The procedure whereby estimates the data pertaining to regional trade, are embodied to regional trade coefficients. Trade coefficients are defined by Mose's as $t_i = r_i^{k1}/R_i^1$, where r_i^{k1} is the shipment of commodity i from region K to region 1, and R_i^1 is the total shipments of i received in region 1, Tables 1 and 2. For example for sector A, Agriculture the trade coefficients are obtained by division of the shipment of this commodity to the total receipts received in region I, that is $t^{11} = 0.4768$.

According to the regional technical coefficients and trade coefficients, a new matrix TA derived which embodies the structure of production in each region and the structure of regional trade. This is referred to as regional input - output coefficient matrix, Table A – 1 (Appendix).

The solution of the interregional input – output matrix TA , is of the form $(I - TA)^{-1}$, and incorporates the direct plus all the indirect input requirements that would result from a unit change in the activities of any sector, Table A-2 (Appendix).

The impact upon production

The interdependence matrix, can be translated into multiplier coefficients to evaluate the ultimate effect, Table A – 2 (Appendix). Each column of the above matrix indicates the amount of each industry's produce directly and indirectly required as a result of an increase in output of one monetary unit in the industry associated with that column. So, the effects on all industries in all regions of an increase in any industry's production in any region can be calculated by multiplying that change by the appropriate coefficients.

Thus, each unit worth in manufacturing production in region I, generates 1.3469, 0.5197 and 0.1117 worth of manufacturing production in regions I, II and III respectively. Summing each of these sets of numbers give the total value of production from industry of manufacturing in the nation as a whole. Thus a unit of manufacturing production generates 1.9783 worth of activity in that industry, in the nation as a whole. The fact that national amount of activity generated varies with the location of initial activity can be attributed to a) regional differences in the proportion of imports obtained from foreign sources and b) regional differences in intermediate product mix.

The results also showed that the intra - regional impacts were always higher than any inter- regional impacts.

The results provide the importance of given sectors to initiate growth process as a response of an increase in final demand. These sectors are Financial Intermediation, Manufacturing and Constructions. Another characteristic of the Greek regional economy is the production relative homogeneity in the industrial structure.

The impact upon employment

This study presents a measure of employment generation potential or precisely a measure of the employment content in the regions studied. To this end three vectors of employment coefficients were constructed by sector and by region. Each element of a vector may be presented by the following equation :

$$I_j = L_j / X_j$$

which is the ratio between the number of employees of sector j in each region and the value of production of sector j, in the same region. Performing this operation for each sector of the three regions, we obtain the direct employment coefficients.

The direct and indirect or simple employment multiplier for an individual sector is given as

$$\sum_{i=1}^j l_j b_{ij}$$

where b_{ij} is the typical element of the interdependence matrix $(I - TA)^{-1}$ which is called simply B^{-1} .

Furthermore the type I employment multiplier of Moore and Petersen for the sector j, is derived from the ratio of simple multiplier to the direct employment coefficient of the same sector.

$$\sum \frac{l_i b_{ij}}{l_j} \quad i = 1 \dots n$$

The generation of employment in the regionalized Greek economy will be analysed on the basis of the above referred employment coefficients and multipliers. The capacity of individual region in generating

employment it appears from the findings of this section. Table 4, 5 and 6 column (1) shows the direct employment coefficients measure the additional number of workers directly employed for a unit increase in the demand per million euro. In the case of manufacturing in region I the employment will be rising by 15.59 workers in response of an increase in final demand by one million euro. While the corresponding figure in region II is 12.74 workers and for region III is 20.94 workers.

However, a unit increase in output demand for a specific industry induces demand for employment in other sectors because of the interdependence of industries. So, the number of workers required to produce the additional output can be calculated by multiplying the direct input coefficient by each component of the inverse input - output matrix.

Table 4, 5 and 6 column (2) summarises the effects caused by industrial interdependence. For example the total employment coefficient for hotels and restaurants in Region III is 17,06, while the corresponding figure in region II is 19.04.

Type I employment multipliers indicate the change of the total economy in persons employed, when the employment of the sector j changes by one person. The highest effects upon employment occurred in the following sector, Financial Intermediation Services, Manufacturing and Constructions in region I and II and Financial Intermediation in region III.

Thus an industry with a high employment multiplier means that stimulates a greater amount of employment indirectly due to its linkages with other industries than an industry with a low employment multiplier.

It is important to point out that the results must be interpreted as an indication of the sensitivity of each region in face of a possible demand increase.

Table 6 IMPACT ON EMPLOYMENT, REGION III

CONCLUSIONS

The estimation of interregional input – output tables with greater regional specification can proportionate many benefits to regional studies. In this way, the present work proposes and evaluates a method to accomplish this task.

The contribution of the interregional input - output model is that provides the best framework for statistically articulating a static general equilibrium model of interconnected regional structures. Its most useful role is in predicting comparative multiplier results from changes in exogenous data.

The interregional model presented, indicate what is apparently the first for the regionalised Greek economy. In addition the most important contribution in the field in the estimating procedures is the use of regional technical interindustry coefficients.

So, the analysis was conducted to obtain estimates of the impacts upon employment and production, using interregional input – output matrix.

This kind of analysis was helpful in order to achieve the results.

1. Reliable estimates of trade flows and regional trade coefficients were obtained.
2. The sectors that are mainly responsible for growth of overall output and GDP, in the regions, were determined.

With respect to regional production structure a relative homogeneity between regions was indicated.

Finally the intraregional production multiplier effects of activity were greater than the interregional effects.

3. As regards the employment effect is observed the same sectors when the impacts upon employment level is evaluated. The results therefore showed the same sectors generated a great number of jobs, as in the case of production. The major limitation of input – output analysis is the assumption of constant technical coefficients. Technological advances and relative price change bring about substitution of inputs, causing the technical coefficients to change overtime. Because of this, the model lose the accuracy overtime.

The policy implications of these regions must be further investigated, given the practical concern and importance of the regional policy in the context of regional analysis.

WHAT MAKES PIEDMONT CATCHING UP?

Viassone, Milena¹

¹Ph.D., Department of Business Management-Faculty of Economics- University of Turin, C.so Unione Sovietica, 218/bis-10100 Turin (ITALY)

Purpose— The purpose of this paper is to create a composite provincial index which, via macro categories of factors, reflects the weight of competitive drivers for each Piedmont province and allows to rank them according to their level of competitiveness, expressing their contribution to regional performances.

Design/methodology/approach—The individuation of drivers and measures of local competitiveness are examined basing on the existing literature and throughout three different focus groups involving 30 local stakeholders of different origin (Builders of competitive indices, Bodies, Academics and Entrepreneurs) (Delphi methodology) while the index was then applied to Piedmont interrogating provincial databases.

Findings—The research findings show how regional performances depend on a few highly-competitive provinces able to train - throughout their good results- less performing ones. Furthermore, this paper highlights how competitiveness of a province is mostly based on immaterial drivers and may be modified with no change in the factors that describe that province but only with changes in factors of other provinces.

Research limitations/implications—Main limits of this research involve the level of exhaustiveness of drivers and relative indices, chosen throughout subjective (and not objective) criteria. The paper offers scope for further research into the application, with some small adjustments, of this provincial index to other province and, after some more adaptations, also to district and urban levels.

Originality/value—The paper contributes to the literature on “provincial/regional competitiveness measure” not limiting to supply a measure but also explaining how provincial performances and characteristics can contribute to regional competitiveness and outlining relative strategies.

Keywords: Regional competitiveness, Delphi methodology, Provincial Competitiveness Index, Local Strategies.

Article Type: Research paper

INTRODUCTION AND METHODOLOGY

The global importance of the concept of territorial competitiveness has increased rapidly in recent years. Most papers try to answer two important questions: “*How to define competitiveness and which indicators measure it?*” and “*How can competitiveness be improved?*”. In this paragraph we try to supply a definition of local competitiveness while a more exhaustive literature on drivers of regional/provincial competitiveness will be introduced in paragraph 3.

There are numerous attempts to define regional competitiveness. The European Union (EC, 1999) defines it as “*the ability of companies, industries, regions, nations and supra-national regions to generate relatively high incomes and employment levels*”.

Very similar is the concept expressed by the Second Cohesion Report of the EU (EC, 2001):

“...*(it) has begun to emerge, which relates to the achievement of high and rising standards of living and high rates of employment on sustainable basis*”.

A very common definition is provided by Storper (Storper, 1997), who defines regional competitiveness as “*the capability of a sub-national economy to attract and maintain firms with stable or rising market shares in an activity while maintaining stable or increasing standards of living for those who participate in it*”.

One of the most important phases in strategic planning consists of measuring present competitive position and potential of a region (Snieska and Burneckiene, 2009). Despite the increasing number of papers on regional competitiveness issues, the research concerning measure and indices or regional competitiveness are still a few and,

when existing, they are built especially for developing areas, which show different characteristics if compared to regions of Western Europe.

Furthermore, even more rare are studies on measure of regional performance that reflect the contribution of single provinces to determinate its competitiveness.

In particular, the lack of a model of complex measure of competitiveness is becoming one of the obstacles which prevents from measuring the competitive potential of a region and assessing how to increase competitiveness.

The aim of this paper is to analyze main problems affecting regional and provincial competitiveness and to supply a method of analysis of Piedmont competitiveness able to reflect different levels of performances of each province. Consequently the objective of this research is not to determine the exact level of competitiveness of Piedmont but to understand which its provincial forces and weaknesses are.

The methodology used in this paper consists both of a systematic and comparative analysis of the concepts and methodologies published in literature and of testing these results by means of three focus groups (the first for the determination of drivers and indices, the second for the repartition of scores among indices and the last for individuating paths of action) composed by 30 Piedmont stakeholders of different origin (Builders of competitive indices, Bodies, Academics and Entrepreneurs). They allow us to validate the framework of provincial drivers affecting regional competitiveness found in literature and to build a global provincial index, consisting of a weighting index provided with 7 partial indices (Financial, Economic, Innovation, Environmental, Demographic, Labour Market and Physic Indices); while each index reflects the importance of the group of sub-indices on regional performances for each province, the global provincial competitiveness index (equal to the sum of the 7 partial indices) ranges from 1 to 100: the higher the score, the better the competitive performances. This paper is structured in five main parts:

- main problems in measuring local competitiveness;
- individuation of sources and relative indices of provincial competitiveness;
- the analysis of provincial drivers and measure of Piedmont performances and the identification of a sort of benchmarking among provinces with reference to single groups of drivers;
- the building of a global provincial ranking and the definition of paths of action to further increase the regional level of competitiveness;
- conclusions, limits and possibility of application of the model.

PROBLEMS IN MEASURING LOCAL COMPETITIVENESS

An analysis of different problems affecting local competitiveness measurement shows how it cannot be completely defined by one or more economic and social competitiveness (Kitson *et al.*, 2004; Huggins, 2003).

In particular, many regional/provincial competitiveness indices have been created, with different composition:

- *DTI's business competitive indicators*, including business formation and survival rates, employment levels, GVA and employee in manufacturing, average earnings and GDP;
- *The World Knowledge Competitiveness Index*, which seeks to benchmark the globe's regions leader in knowledge-based economy and a European Competitiveness Index which covers regions both within the UK as well as Europe and reveals a major competitiveness gap between the best and poorest performing regions;

- A group of indices dealing with particular aspects of competitiveness that don't develop a single composite index but include Massachusetts Technology Collaborative's, Index of Massachusetts Innovation Economy and the OECD's (1999), Science, Technology and Industrial Scoreboard: Benchmarking-Knowledge-based Economies;
- A system of evaluation and monitoring of a large set of quantitative variables is designed in the *Community Support Framework (CSF) 2000-2006* for Southern Italian Regions as a fundamental instrument to plan, select projects and monitor the impact of the interventions;
- *Regional Attractiveness Index* developed by Price Waterhouse Coopers in 2001 for Rumanian regions, using socio-economic indices;
- *The WEF (World Economic Forum) (1999)*, a composite competitiveness index that represents an attempt to establish an appropriate weighting for sub-indices;
- *The Regional Competitiveness Index Croatia, (2007)*, based on 176 indicators derived from statistical and survey data, which enables a more comprehensive comparison of regions;
- *UK competitiveness Index, (2003)*, an index reflecting 3 factor models consisting of a framework of competitiveness based on inputs, outputs and outcomes;
- *Creativity index*, a proxy for an area's openness to different kinds of people and ideas, built by Richard Florida;
- *The competitiveness Index for Turkish Regions, (2009)*, which measures regional and provincial competitiveness through different socio-economical factors;
- *The Regional competitiveness framework in Hungary, (2006)*, a set of indices aiming at measuring Hungarian sub-regions alongside development phase.

These important attempts to measure local competitiveness lack completeness, do not supply a global vision in constructing provincial index but, most of all, they do not reflect the contribution of a single province to regional level of competitiveness.

SOURCES AND INDICES OF PROVINCIAL COMPETITIVENESS

Provincial competitiveness is affected by several components of different nature and it cannot be reduced to a single factor, regardless how many papers try to do it. After Porter's contribution in 1990, more and more experts have dealt with local competitiveness and examined its factors (Viassone, 2008; Lukovics and Lengyel, 2006; Bud-Hirmis, 2004; Gardiner *et al.*, 2004; Huggins, 2003; Camagni, 2002; Malecki, 2002; Huovari, 2001). This study starts with seven different categories of indices coming from literature and validated by Piedmont stakeholders and arrives at a final one expressing the weight of each province in the Piedmont context. The seven-factor model of provincial competitiveness consists of a framework of competitiveness based on:

Economic factors - The competitiveness of a province, i.e. its ability in competing on international markets, is determined by its trade performance, the activities of foreign-owned affiliates and the investments of its MNEs overseas. Therefore it is important to argue that local competitiveness occurs only when a territory owns a critical stock of firms that are able to generate new entrepreneurs and innovations in developing sectors and markets and, in addition, new jobs. Porter already argued that business density has an important role only since firm concentration and competitive performance are related (Porter, 2003; 1990).

Financial factors - Starting from the fact that competitiveness is intimately bound up with successful economic development and with reference to the definition previously given by EC (1999), we can remember how "relatively high income" could be measured by means of GDP and VA pro capita (Lengyel, 2004). GDP is often

considered the most important measure of economic activity of a province, indicating the historical impact of competitiveness (Huggins, 2003). Furthermore in today's new economy the credit market has an important place and its analysis involves the equipment of banking branches which is positive related to the growth rates of real variables (King and Levine, 1993) and must be suitable to the needs of a territory (Low, 2005).

Social factors - Population of a particular territory is one of the main variables of local development. The demographic profile of a region is usually seen as a slowly-changing background phenomenon in the analysis of regional competitiveness and regional growth. However, provincial demographic change may have a significant impact on its competitiveness and such a change is often more rapid and profound than at the national level. In turn, provincial/regional population size, growth, composition and distribution are endogenous to regional economic development (Poot, 2007).

Labour factors - It is a common opinion among business researchers that local competitiveness occurs only when sustainable growth is achieved at labour rates that enhance overall standards of living (Huggins, 2003). In order to be competitive a region must be able to ensure both quantity and quality of employment. Labour factors and employment rates also play an important role in determining a province's overall living standards. The HM Treasury asserted that differences in regional/provincial income levels are a function of variations in regional/provincial employment rate.

Innovation factors - The great importance of innovation-based competition (Andersen, 2006) was already stressed by Schumpeter in 1930s and 40s: he maintained that innovation results in qualitatively new products, processes, markets, inputs or organizational forms, which lead to a process of "creative destruction" whereby the old is displaced by the new. According to Perroux (1970), innovation well-executed by certain agents serves as a valuable example for others and gives rise to imitations, which are themselves creative (Alexiadis and Tsagdis's work, 2005; Perroux, 1970). The necessary ideas for innovation are embodied in individuals with creativity, know-how and skills to engage in technological advance (Knudsen *et al.*, 2008), real driving forces force in regional economic growth and prosperity (Florida, 2002; Vrontis, 2001).

Environmental factors - Environmental processes and parameters - the so-called 'success determinants' with an indirect, long-term impact on competitiveness (Jensen-Butler, 1999)- are also taken into account.

Physical factors - Initiatives concerning the building up of infrastructures and social overhead capital are important tools for local development (Gosso, 2005). Local infrastructures influence in a sensible way the competitive capacity of the territory and the firms settled on it; they are not replaceable by other forms of capital, so their localization and quality determine their potential of development. Literature on competitiveness of modern productive systems agrees on the even higher importance of the level and diffusion of infrastructures (Rohm *et al.*, 2004). In the new competitive context the simple framework of infrastructures continues to play a very important role but they assume a different relevance depending on whether they are connected with immaterial factors (i.e. the offer of adding services, the baggage of local knowledge).

Table 1 shows the framework of economic, financial, social, labour, innovation, physical and environmental indices obtained from both the review of literature and opinions of provincial stakeholders. The group of local stakeholders evaluated, out of 100 scores, the repartition weighting of each of the drivers basing themselves on their personal experience, allowing us to calculate the average weight for each driver. Given that their sum must correspond to 100, we got the personal contribution of each driver to the level of regional competitiveness. Then, the total score assigned to each driver needs to be shared by interviewees among each single sub-driver. So, using SPSS, the original variables (our sub-drivers) are segmented in 4 classes that contain the same part of population (25%). In this way it is assigned a different weight and different scores to the sub-drivers according to whether their value belongs to class 1, 2, 3 or 4 (the major number of scores is assigned to class 4). By summing single sub-indices (Table 2) for each province, we obtain 7 partial indices (min = least competitive province in that particular

factor; max = most competitive province in that particular factor), and a global indicator (i.e. the sum of the 7 indices), which varies between 0 and 100 (0 - least attractive province; 100 - most attractive province).

<i>Indices</i>	<i>Scores</i>	<i>Driver</i>	<i>Scores</i>
Economic Index	25	Financial Index	15
Entrepreneurship	10	Financial factors	10
- Total number of firms - Female firms (%) - Cooperative societies - Immigrants' firms		- Total Value Add - GDP per capita	
Foreign affairs	5	Banking factors	5
- Imports - Exports		- Investments/counters - Deposits/counters - N.of banks - N. of counters	
Sectorial composition	10	Index of Innovation	20
- Firms in agriculture - Firms in manufacture - Building firms - Commercial firms - Transport firms - Services firms - Touristic firms N. of accomodations N. of beds N. of foreign travellers Foreigners' Expenditure Travellers presences in accomodations		- Deposits of innovations - Brand deposits - Patents - R&D firms - N. of participation at projects - Firms participating to events	
Demographic Index	10	Environmental Index	7
-population -%foreigner population out of total population		- N. of implants alimented by renewable sources - separate refuse collection	
Physical Factors	8	Labour Index	15
- Road network - Railways network - Airport - Health structures - Energy network - Telephonic network		- Total Labour forces - Activity rate - Employment rate - Employees in agriculture - Employees in industry - Employees in services

PIEDMONT PERFORMANCES: AN 8-PROVINCE COMPARISON

Piedmont is constituted of 8 provinces with very different characteristics. Throughout the methodology over explained, in this paragraph we try to calculate a single index for each of the 7 categories of factors affecting their level of competitiveness individuating their contribution to high performance of Piedmont.

Economic index

The first sub-index is related to economic factors, which are usually taken as the first sign of competitiveness. This index shows at the top of the list Turin - with its well-known industrial reputation and home of [FIAT](#) automobile group - followed by Cuneo with 74.836 firms, 33% of which with agricultural nature. Alessandria, Novara and Vercelli place themselves at the same position both with reference to import and export data, but the first two present a more favorable entrepreneurial situation. Finally, Asti, Biella and Verbania cover the lowest investments, the first with a prevalent agricultural nature contrary to the commercial one typical of the latter two provinces.

	<i>Economic Index</i> (msa[*]=25)	<i>Financial Index</i> (msa=15)	<i>Index of Innovation</i> (msa=20)	<i>Environmental Index</i> (msa=7)	<i>Demographic Index</i> (msa=10)	<i>Labour Market Index</i> (msa=15)	<i>Physical Index</i> (msa=8)
AL	10	5	5	1,75	5	3,75	8
AT	7,5	3,75	5	1,75	6,25	5,25	4
BI	8,75	5	5	1,75	2,5	6	2
CN	15	6,25	10	7	5	6	2
NO	10	6,25	5	3,5	5	5,25	8
TO	25	15	20	7	8,75	14,25	6
VB	6,25	5	5	5,25	2,5	5,25	2
VC	10	3,75	5	1,75	3,75	4,5	4

Table 2. Values assigned at provincial level for each single index. Source: personal elaboration on UnionCamere data, 2008

Financial index

With reference to financial indices we can notice how the geographical distribution of banking headquarters is not very homogeneous with a concentration of them on the provinces of Cuneo (41,94%) and Turin (35,48%) and an absence of them in the province of Vercelli. The lowest value of investments and deposits is for the province of Verbania. Cuneo predominates also when referring to GDP pro capita (30414,4), followed by Novara (29354,2) and Turin (29223,3); Turin is at the first position with reference to Value Add; Alessandria covers the fifth position par GDP and the third par value add. Asti shows low data with reference to every financial factors.

Index of innovation

The index of innovation shows a repartition of Piedmont in three parts: Turin comes at the top of the classification with the 65% of regional patents and 50% of regional brands and Cuneo follows it after a considerable gap. The totality of remaining provinces takes the lowest rank in this index.

Environmental factors

Environmental policies cover a prior importance in the main strategic political, social and economical choices, both referring to safeguard of our planet and the quality of life of present and future generations. With reference to these topics the most careful provinces are Cuneo and Turin, also if the primate for the separate refuse collection is held by the province of Novara, while Turin has the highest number of implants alimeted by renewable sources, closely followed by the province of Cuneo.

*msa= maximum scores assigned

Demographic index

Demographic factors and their trends interact each another creating complex relationships which must be suitably considered in the current socio-economical context. Turin covers the first position, with a very high density that has its roots in a fairly complex historic context (its influence in the period from its proclamation as capital of Italy to the beginning of '900 and the intense increase of the density of population in 1899, year of foundation of FIAT). This index presents high values in the province of Asti (8,41%) and Alessandria (7,38%), while the lowest presence of foreigners is registered in the provinces of Verbania (7379) and Biella (9341).

Labour market index

The labour market index complements in many ways the economic one. As an indicator of the labour market flexibility and efficiency, it is a key to analyze sub-regional employment and activity level. Turin is at the top of the list while Alessandria comes last. In particular we can underline how Turin shows the highest value of labour force (1.030.000) and total number of employees (972.000) while Cuneo has the primate with reference both to the activity (71,4%) and employment rate (68,9%). A "middle" position is covered by Asti, Novara and Verbania while Vercelli and Alessandria have very low level.

Physical index

The importance of physical infrastructures is undisputable for economic growth. The physical index does not consecrate Turin in the first position because of its unsuitable railways network. Alessandria and Novara are at the top of the classification thanks to their roadways, railways and energetic network. It is to notice the lowest position of the province of Cuneo, in particular in the energetic and telephonic networks.

A GLOBAL PROVINCIAL COMPETITIVENESS INDEX

After this particular description of single provincial indices, we summed them getting a global provincial competitiveness index (GPCI) and a regional competitiveness ranking (Table 3). In order to better understand its composition, each single indicator can be split into the scores assigned to their sub-indices. Finally the global index can be computed in the following way:

$$(1) \quad \text{GPCI scores} = [\text{ECI scores} + \text{FI scores} + \text{II scores} + \text{EI scores} + \text{SI scores} + \text{LI scores} + \text{PI scores}]$$

Where:

ECI= Economic Index;

FI = Financial Index;

II = Index of Innovation

EI = Environmental Index

SI = Social Index

LI = Labour market Index

PI = Physical Index

In a second round, we organize the eight provinces in 5 groups according to their level of competitiveness (GPCI) (0-20= the lowest class; 81-100 scores: the highest class) (Table 4). It is curious to notice two important aspects:

- provinces in the same class have often very different characteristics;

- the (relative) competitiveness of a province may be modified with no change of the factors describing that province, but only with changes in other provinces factors.

Furthermore, it is important to notice that none of the 8 provinces is included in the “High competitiveness” and “Low competitiveness” classes.

Rank	Provinces	Max Scores assignable	Scores assigned
1	TO	100	96
2	CN		51,25
3	NO		43
4	AL		38,5
5	AT		33,50
6	VC		32,75
7	VB		31,25
8	BI		31

Table 3. Global provincial competitiveness index Source: personal elaboration

Scores	Level of competitiveness
0-20	Low
21-40	Moderate
42-60	Quite high
61-80	High
81-100	Very high

Table 4. Levels of competitiveness. Source: personal elaboration

Province with a very high competitiveness

Turin

Turin's economy, with 235.912 registered firms in 2008 (3,9% of the Italian datum) (at the fourth position only after Rome, Milan and Naples), is based prevalently on commercial and service sector. Despite its industrial nature, it shows a very high environmental index, with the highest number of implants alimented by renewable energy (80) and a quota of separate refuse collection by 45,9%. A great strength of Turin is represented by foreign trade, with an import which represents 53,3% of the regional total and an export corresponding to 49,8% of the regional datum. It also boasts a strong superiority in innovation, supported by an excellent physical and financial capital (with a value add by 17184,9 millions of euros, a GDP per capita higher than the regional average value and a high ratio deposits and investments out of counters). The only weak points are the social and – partially - the labour market indices (with an employment rate (64,7%) even lower than the regional average one (65,2%)).

Provinces with a quite high competitiveness

Cuneo

The province of Cuneo is strongly characterized by the presence of agricultural enterprises. Very positive is the datum referring to the territorial female firms' density, with 6 firms every 100 women. Foreign trade represents a relevant element for provincial economies with the most of exports coming from food and drinks (26,2% of the provincial exports) and imports heavily affected by agricultural goods. It covers the second position at provincial level with reference to the value add and the first with the reference to GDP per capita (30.414,4 euros, which sets it at the seventieth place in the national ranking). It shows a large number of banking counters (511) but they are not homogeneously spread, with the total absence of them in many mountain towns. Labour market represents a point of force of this province, with an employment rate that gives Cuneo the eighth position at national level. It is also an innovative province, with a number of registered brands of 290 (10 brands par 1000 firms) and it is also very careful as for environmental aspects (Tardivo, 2008): it owns one third of regional implants alimented by renewable sources and in 2008 it registers a major propensity for separate refuse collection (40,9%) if compared with 2007 (37,8%). The only two points of weakness are its ageing population (100 young people par 163 ageing people) and its performances in infrastructural network, much lower than regional data.

Novara

Novara has its points of force in a strong network of infrastructures, that places it at the top of the classification both with reference to railways (with Alessandria and Asti) and to roadways (with Vercelli and Alessandria) and in energetic and banking networks. With reference to economic situation, in 2008 both its imports and exports decreased. The first, involving mainly mechanical (48% of provincial exports), chemical, rubber and plastic (30,8%) and fashion sector (12,3%), are prevalently destined to EU. With reference to entrepreneurship, it gets good performances, registering the major increase. Novara distinguishes itself for the value add created by industrial sector (32,9% of the total value add) and it holds the second position par GDP. Furthermore it presents one of the major values in investments/counters and deposits/counters ratios and excels in the separate refuse collection (61,1%) but it has a low number of implants alimented by renewable sources. It is in a middle position with reference to activity and employment rate and labour conditions.

Province with a moderate competitiveness

Alessandria

Alessandria's economy is based on agriculture and commerce and the comparison with other provinces sets it at the fourth place both for imports and for exports, after Turin, Cuneo and Novara. Four sectors characterize its export: food, chemical, mechanical and fashion and one in particular that of imports (mechanic: 68,4%). It has a high value add (10.602,3 millions of euros), prevalently created by services (67,8%) and it is the second province for number of patents (56) (after Turin); its real point of force is the physical index, which gives it the top of the classification in any kind of infrastructure. It shows one of the regional highest incidence of foreigner population out of the total (7,38%), second only to the province of Asti. The only two weak points are environment (with a low number of implants alimented by renewable sources and an also lower quota of separate refuse collection) and labour market (with the lowest value with reference to the activity (65%) and employment rate (61,8%)).

Asti

This province presents several points of weakness with reference to economic, financial and environmental indices. In fact it counts only 26.312 enterprises, the most of which based on agriculture (8.531) and very low values with reference to imports (965.228.222) and exports (1.300.609.026). In addition it presents one of the lowest regional GDP per capita (25.170,8), higher only than the province of Verbania. The same situation is shown in the credit sector, with a scarce efficiency of counters. Not so positive is the environmental situation of the province where it is registered the total absence of implants alimanted by renewable sources but a quite high quota of separate refuse collection (50,7%). It is placed in a "middle" position with reference to innovation, social, labour and physical indices, with a point of excellence in railways network, quite good values concerning activity (69,8%) and employment rate (66,8%) and very low datum concerning innovations (22).

Verbania, Vercelli and Biella

are at the bottom of the classification. In particular, the first shows the lowest values in economic and social field (the lowest population (162.333) and percentage of foreigners (4,55%)). The only very good result is reached for the environmental index thanks to the number of hydraulic implants alimanted by renewable sources (39) and to the high percentage of separate refuse collection (55,5%), besides the creation of a pole of innovation for renewable energies on Lago Maggiore.

Vercelli is not in a very positive competitive situation with very low values in financial, innovation, environmental and physic indices. It presents a value add by 4492,3 (millions of Euros) prevalently based on services (64,2%) and a scarce attention to environment (the separate refuse collection covers only 25,5%). Also social, labour and physical indices do not register good performances: Vercelli shows an activity rate lower than the regional one by 2 percentage points and one of the less numerous population (second only to the province of Verbania). Finally, Biella closes the classification and results the province with the worst competitive performances, apart for labour market where it has one of the highest regional activity (71,1%) and employment rate (67,6%).

Figure 1 shows important suggestions for Bodies supplied by territorial stakeholders during the third focus group.

<i>Provinces</i>	<i>Paths of action</i>
TO	<p><i>Development of transport infrastructures (Lisbona-Kiev and Genoa-Rotterdam).</i></p> <p><i>Increase in relationships among Centres of research, University and firms</i></p> <p><i>Promotion of growth and valorisation of Turin's excellences (design, food and drink)</i></p> <p><i>Make Turin an international educational centre</i></p> <p><i>Support entrepreneurship start-up</i></p> <p><i>Valorisation of human capital</i></p> <p><i>Improve relationships among banks, enterprises, assurances</i></p> <p><i>Major attention to energetic and environmental subjects</i></p>
CN	<p><i>Need of a dimensional growth of enterprises</i></p> <p><i>Promotion and investments in R&D</i></p> <p><i>A major support at the commercial internationalisation</i></p> <p><i>Major investment and better organisation of infrastructures (railways "Asti-Cuneo", doubling of the tunnel of Tenda)</i></p> <p><i>Improvement in the road Cuneo-Maddalena's pass, roadways link towards Liguria and in the railways towards Fossano-Torino, service infrastructure for Levaldigi airport, ICT networks</i></p>

Figure 1. Suggestions for Piedmont provinces Source: personal elaboration

CONCLUSIONS

Looking at the different tables and sub-indices we can notice that:

- provincial and regional competitiveness cannot be totally defined by one or a few economic social indicators and almost the total of sources of local competitiveness has an immaterial nature;
- the paper proved that the measurement by a global index of provincial competitiveness solves the problem of a complex measurement of local competitiveness;
- GPCI allows to measure provincial competitiveness in a single value (also if reflecting the contribution of each single driver) and to compare provinces one with another;
- GPCI allows an analysis of provincial competitiveness, according to groups of competitive drivers;
- the ranking of the provinces in different sub-indices largely differ;
- GPCI is an important tool to suggest paths of action to provincial/regional Bodies;
- the application of GPCI to Piedmont provinces showed how regional competitiveness is based on good results of three provinces able to train the regional competitiveness: Turin, Cuneo and Novara.

This index shows also several limits, in particular with reference to exhaustiveness of sub-indices, chosen according to criteria of accessibility, relevance and transferability; in addition the set of drivers and indices has been chosen throughout subjective and not objective criteria.

GPCI actually supplies a picture of provinces in terms of competitiveness capacity; from now on, we could track changes in competitiveness drivers with subsequent studies and apply it to different levels of analysis (i.e. urban level).

LAYOUT AND AESTHETICS OF SELECTED SOUTH AFRICAN CASINOS

Wannenburg, Elizma¹; Drotsky, Tonie¹; de Jager, Johan¹

¹*Tshwane University of Technology, South Africa*

This South African based research focuses on the gamers' perceptions of the layout, accessibility and aesthetics of the gaming areas of four selected Sun International casinos. The purpose of this research is to provide relevant information to casino managers on how gamers perceive the layout, accessibility and aesthetics of the servicescape. Four hundred and forty gamers at four selected casinos were interviewed in order to obtain a synopsis of the target population. A focus group discussion was held to assist the authors in constructing the questionnaire. Fieldworkers used a structured questionnaire to collect the final data for the research. All variables related to the questionnaire were statistically analysed. The results of this study indicated that no significant differences exist between male and female gamers in the way they perceived the layout, accessibility and aesthetics of the gaming areas. This research assists the management of the Sun International group in identifying new opportunities in order to grow and expand in a competitive environment. Key words: Casino, Servicescape, gamers, layout, aesthetics,

INTRODUCTION

As the previous South African government did not allowed casino gambling within its borders, the South African hotel magnate Sol Kerzner opened the first luxury casino in December 1979, namely Sun City, located in the North West Province of South Africa. This was by then the semi-independent state of Bophuthatswana which is currently still one of the most popular destinations in South Africa (Gauteng Happenings, 2009:1).

The Sun City casino forms part of the Sun International group and was placed on the international map by hosting the million-dollar golf tournament that is still running (Wiesenberg, 2005:156). Currently, there are 34 legal casinos in all nine provinces of South Africa. The Sun International group is the largest license-holder in the South-African casino industry, with 13 casinos nation wide.

According to the Casino Association of South Africa (2007:3), casinos in South Africa have extensively funded public infrastructure, tourism, such as convention centres and more than 5000 hotel beds. The South African casino industry is still young in relation to international casino standards and local research is still in its formative years (Casino Association of South Africa, 2007:1).

According to Wikipedia (2007:1), a casino is a facility that offers different types of gambling activities and is placed near major attractions in a city such as hotels and shopping centres. The gaming area of a casino, also known as the servicescape, is the place where gaming activities take place. A servicescape, according to Bitner (1992:57), is where the service is generally produced simultaneously; the consumer is in the facility experiencing the total service delivery. French (2006:18) believes that every single aspect of a casino: the location, the décor, the choice of games, the layout, and the staff is designed for one purpose only, to part customers from their money. According to the Casino Association of South Africa, all casinos applying for a new casino licence must present a detailed floor plan of the gaming area to the South African casino board. The casino board then decides if the applicant's floor plan complies with the regulations set by the casino board. Blackwood (2006:27) states that when visitors enter a casino they may find themselves in the lobby or foyer of the casino. Familiar sights like the helpdesk will help the visitors find their way to the different games that the casino offers. The gamers can choose between table games and slot machines for entertainment. Casino employees all have one goal in common: to provide the visitor with opportunities to try their luck against the uneven odds of the casino.

A structured questionnaire was used to collect the final data for this the research on which this article is reporting. The aim of this research is provide Sun International casino management as well as other casinos with

a better understanding on how gamers perceive the casino layout, its accessibility and aesthetics. By understanding the gamers' perceptions, management can implement the findings of this research in their future planning strategies. The question can be asked, 'What remedial actions if any, should be deployed by management within the gaming area of a casino that would improve the gamers' perceptions regarding the casino layout, accessibility and aesthetics?' To answer this question the authors determined the perceptions of gamers with regard to the casino layout, accessibility and aesthetics of the gaming areas of four selected South African casinos. In the following section relevant literature to the research will be discussed.

LITERATURE REVIEW

A **servicescape** according to Palmer (2001:70) is the environment in which the service is assembled and in which the seller and customer interact, combined with tangible commodities that facilitate the performance or communication of the service. Nankervis (2005:227) states that the term **servicescape** describes the physical and psychological design of service layouts. The service delivery environment, and that the efficient operation of a business has significant implications for the design of the physical layout, or setting of the business. Bitner (1992:57-71), as cited by Wakefield and Blodgen, (1996:45) refers to the physical settings in an organisation as the **servicescape**. This includes the environmental dimensions, holistic environment, internal responses and behaviour of the occupants in the area. The casino has a physical setting where the slot machines and tables are installed for gaming, and this is also referred to as the gaming area. The operational factors that influence the servicescape will be discussed next.

Operational factors that influence the servicescape

The casino floor plan

The floor plan of South African casinos is basically the same as those in other countries. Blackwood (2006:27) researched and found that most casinos in the world are laid out on a similar floor plan. The aesthetic and functional characteristics one finds at mega casinos can also be found at smaller casinos. Blackwood (2006:27) states that casino owners have intimate knowledge of the gamers' mind, the interior design, and the layout of a casino that will lead to impulse gaming. Russell and Taylor (2006:271) identified four types of services layouts. Firstly, **free flow layouts** encourage browsing, increase impulsive use or purchasing and are flexible and visually appealing. Secondly, **grid layouts** encourage customer familiarity and are low cost, easy to clean and good for repeat customers.

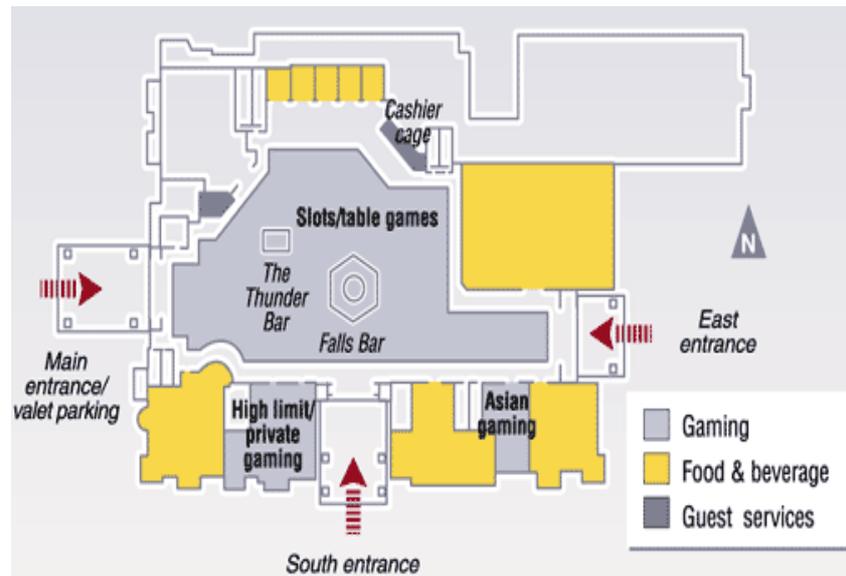

Figure I. The casino floor plan Source: The Pennsylvania code (2007:1)

The service environment has a strong impact on the customers' perceptions of the service experience. Before entering the service facility, consumers commonly look for clues about the firm's capabilities and quality. Since services are so intangible, the physical environment outside and inside is very influential in communicating an image and in shaping gamers' expectations, (Van Looy, Gemmel and van Dierdonck (2003:333)). The last two types of layout are **loop layouts** and **spine layouts**. These two increase customers' sightlines and their exposure to products, while encouraging the customer to circulate throughout the entire store. To increase impulsive gaming most casinos use the free-flow layout.

According to the Pennsylvania code (2007:2) as illustrated in **Figure I** each casino-licensed applicant must provide a floor plan of the gaming area to the casino board when applying for a casino license. The proposed floor plan should include the proposed total square meters, the perimeter of the gaming floor and the alternative route for underage persons to cross the gaming floor. The Pennsylvania code (2007:2) further states that no slot machine licensee can commence slot operations until the casino board has approved the floor plan. According to Van Looy et al. (2003:334), when designing a servicescape, organisations have to take a more analytical point of view.

The three dimensions identified by Van Looy et al. (2003:334) that need to be considered when designing a servicescape are:

- **Ambient conditions:** The background characteristics, such as noise, temperature, scent, lighting, aesthetics and colour.
- **Spatial layout:** The elements of the environment that are closely related to the core element of the service. These include items such as machinery, equipment and furniture that are necessary for delivery of the service.
- **Signs, symbols and artefacts:** The items in the physical environment that serve as explicit or implicit communications to its users and tell about the place. Signs such as labels on doors or instructions on how to proceed are used for directional purposes.

Navigating the casino floor

Burton (2005:2) suggests that when entering a casino one should find a landmark to help find the exit. Casinos are designed to confuse guests and to keep them wandering around and playing on the machines along the way. Blackwood (2006:27) points out that the bottleneck entrance of a casino is part of the casinos marketing strategy to lure the visitor closer to the games. The colourful lights, sounds and energy on the gaming floor influence all the visitors' senses. Burton (2005:2) states that casino carpets are designed to keep visitors from looking down. The carpet patterns are meant to cause visitors to turn their eyes away from the carpet and keep looking ahead at the machines and tables. According to Burton (2005:2), casinos want visitors to lose track of time and that is why there are no clocks or windows in the gaming areas.

Blackwood (2006:28) observed that the slot machines and video poker stations are positioned near the casino entrance. The reason for positioning the slot machines and video poker machines at the entrance of the casino is to tempt the visitor to "test the waters" and to feel the rush the casino offers. Blackwood (2006:28) found that casinos place the most profitable slot machines near the main aisles, such as the guest elevators, bathrooms and restaurants. Friedman (2000:47) explains the never-ending layout of the slot machines by referring to a sea layout. The sea layout consists of endless rows of slot banks; where the tops of the machines all blend together at about the same height. The space between the machines and the ceiling of the casino is empty and extends to the far end of the casino. Nestor (1999:41) points out that playing a slot machine is like having a personal gambling party with no impatient dealers or unhappy players to dampen the atmosphere.

Bar and restaurant facilities

According to Burton (2005:2), the guest elevators, bathrooms and restaurants are all located near the gaming area of a casino. Blackwood (2006:29) supports Burton's point of view by indicating that most casinos have a bar central to the main action. Large casinos may offer numerous bars interspersed throughout the casino floor, each bar being decorated in a unique theme. Some of the casino bars offer live music, while others offers only bar services to take a quick pit stop.

There is no escaping the games the casino offers, seeing that casino bars are located in the midst of all the action. If the gamers don't feel like leaving the table or slot machines, cocktail waiters are available to take drink orders. According to the International Gaming Institute (1996:128), most casinos seek to achieve three major food-and-beverage department objectives. The first objective is to enhance the gaming revenue of the casino. The second is to provide maximum guest convenience. The last objective is to attract a large number of gaming guests to the casino. From the above discussions it may be concluded that the servicescape has many factors that can influence the perceptions of gamers regarding the layout of the casino gaming area. For the purpose of this research the access to the food services, slot and table games, restrooms as well as the adequacy of the directions found in the casino were investigated.

Interior design of casinos

Important to this research is the interior design and aesthetics of the gambling area of a casino. Wakefield and Blodgett (1996:45-61) point out that the quality of the interior design of the gaming area may play an important role because it influences the gamers in their desire to stay longer in the servicescape, and as a result how much money they will spend. Friedman (2000:5) found that interior design is more important in determining potential player counts than management, marketing and operations combined. The interior design of a casino is the reason why some casinos perform better than other casinos.

Blackwood (2006:10) states that every element in a casino, from the design of the wall paper, floral arrangements, glittering lights, slot machines, table games to the thickness of the carpet, draws visitors and keep them gambling as long as possible. According to Bitner (1992:57), the effect of atmospherics, or physical design

and décor elements, on consumers and workers is recognised by managers and mentioned in approximately all marketing texts. Friedman (2000:5) states that effectively designed casinos have higher player counts, even when weak marketing, management and poor operations exist. Blackwood (2006:10) points out that the colours, sights, sounds and sensations that gamers experience while visiting a casino all serve one purpose only, and that is to make the customer cheerful. According to Bitner (1992:57), individuals react to places with two general, opposite forms of behaviour: approach and avoidance. Approach behaviours include all positive behaviours that might be directed at a particular place, such as a desire to stay and explore. Avoidance behaviours reflect the opposite, in other words not to stay and not to explore. According to research done by Friedman (2000:608), cut-throat situations exist regarding the interior design of a casino. Casinos that do remodelling on a regular basis often attract higher player counts than those casinos that stay the same over the years.

According to Bitner (1992:57), individuals visit particular service organisations with a goal or purpose, and they may be aided or hindered by the setting. Friedman (2000:609) states that casinos with distinctively more appealing interiors attract more players than casinos with less appealing interiors. When two casinos launch similar marketing programmes, the one with the more attractive interior will attract more business than the other casino. According to Bitner (1992:57), environments that elicit feelings of pleasure are likely to be the ones where people want to spend time and money, whereas unpleasant environments are avoided. In the following section the research methodology used in this research will be discussed. In this paper the following interior design elements were investigated: the lighting in the gaming area of the casino, the interior wall and colour schemes of the casino, the noise levels on the gaming area and finally the décor of the casino.

RESEARCH METHODOLOGY

According to Wrenn, Stevens and Loudon, (2002:2) marketing research is the function which links the customer and public to the marketer through information used to identify and define marketing opportunities and problems, and to generate, refine, and evaluate marketing actions. According to McDaniel and Gates (2005a:6), marketing research performs three functional roles, namely a descriptive function, a diagnostic function and a predictive function. The descriptive function, according to McDaniel (2005b:6), includes gathering and presenting statements or facts. The diagnostic function explains the research data or actions; and lastly the predictive function specifies how to use the descriptive and diagnostic research to predict the results of a planned marketing action. For the purpose of this paper, marketing research is defined as systematically collecting, recording, analysing and interpreting data to arrive at conclusions and make significant recommendations to unravel the problem and accomplish the objectives.

Problem formulation and research objectives

The problem identified was how gamers perceive the layout, accessibility and aesthetics of the servicescape and what influences their desire to stay longer at the servicescape. The first objective of this research was to determine the gamer's perceptions concerning the layout and accessibility of the casino; this includes the food services, slots and table games, directions and restrooms. The second objective of this research was to determine how the gamers perceive the aesthetics of the casino, which include the lighting, wall and floor colour schemes, noise levels inside the casino and the décor.

Sources of data

McDaniel and Gates (2005:323) identify two decisions that have to be made by the researcher, namely the establishing of the data source and the data-collection method that is most effective for the investigation. A literature review was conducted by using secondary sources to establish if any related research had been done previously. External secondary data like the internet, libraries, newspapers articles and international gaming

magazines, which reach the limelight in the entertainment industry, were applied. The data-collection process of primary data takes much longer than that of secondary data. With primary data the researcher develops a questionnaire, sends it out to different respondents, and then waits for feedback. Secondary data are freely available to the researcher at any time, (Malhotra, 2007:103). In this study a combination of primary and secondary data was utilised.

Sampling

A decision on sampling procedure must be preceded by a decision on who will provide one with the required information. Larger samples are preferred, since they yield more reliable data. According to Wrenn et al. (2002:158), sampling consists of obtaining information from a portion of a larger group or population. In this research it was decided to make use of convenience sampling seeing that gamers will not stop gaming while sitting at the slots machines or tables while they are being interviewed. The sample size was calculated as 375 gamers to be interviewed. Webb (2002:60) states that the accuracy of the sample, the degree to which it is an accurate re-presentation of the population against some chosen characteristic, is not related to the size of that population but to the size of the sample. The target population consists of gamers gaming at selected Sun International casinos with 700 and more slot machines, and casinos with less than 700 slot machines in three South African provinces. In this research a focus group discussion was held to assist the researcher in constructing the questionnaire.

Data collection

Data collecting can be done by means of a telephone survey, mail surveys, personal interviews or internet surveys (Kotler & Keller; 2006:111). The primary data-collection method selected for this research is the personal interview method. The interviewers approached gamers' who was sitting around not gaming; those who take a break in between gaming; or those finish gaming and are on their way to another place. According to Aaker, Kumar and Day (2003:233), the interviewer interviews the respondents in person when using the personal interviewing survey method. McDaniel and Gates (2005:125) define personal interviews as a form of direct communication in which an interviewer asks respondents questions face to face in order to obtain specialized forms of information. In this research the field workers approached gamers in the gaming area of the casino.

For the purpose of this research the Likert scale was utilized to determine gamers' perceptions regarding the casino Layout, accesibility and aesthetics. The Likert scale is easy to understand, construct and administer by a researcher, although it can be time consuming at times. A total of 440 questionnaires were completed at the end of the data collection, due to an even number of 110 respondents interviewed at each of the four selected casinos.

Coding and Validation

According to Zikmund and Babin (2007:485), coding is the process of identifying and classifying each answer with a numerical score or other character symbol. Churchill and Iacobucci (2002:575) define coding as the technical procedure by which raw data are transformed into symbols. These symbols are numerals and can be tabulated and counted more easily. A variable was assigned to each statement in the questionnaire. Each statement had a numerical score: (1) strongly agree, (2) agree, (3) neither agree nor disagree, (4) disagree and (5) strongly disagree. For the purposes of this research the raw data obtained from the questionnaires underwent preliminary preparation before they were analysed statistically.

Editing and data capturing

The raw data obtained from the questionnaires was edited by the authors before they were analysed statistically. The researcher evaluated the questionnaires and eliminated one questionnaire that was inadequately

completed. After the raw data were edited, the data were converted into a suitable form for statistical analysis. The data were captured on the Excel computer program and analyzed on the SPSS statistical program. According to Zikmund and Babin (2007:272), experiments are judged by two measures of validity. The first one is internal validity that determines whether the independent variable was the sole cause of the change in the dependent variable. The second type of validity is external validity, which determines whether the results are applicable to the real world. Field experiments are lower than laboratory experiments in internal validity, but higher in external validity. A Cronbach's Alpha coefficient of 0.876 was obtained that confirmed the reliability of the measuring instrument. The results of the research will be discussed in the following section.

RESULTS AND DISCUSSION

According to Zikmund and Babin (2007:546), researchers commonly test hypotheses stating that two groups differ. In marketing research, differences in behaviour, characteristics, beliefs, opinions, emotions or perceptions are commonly examined. For the purpose of this research the levels of agreement and disagreement between male and female gamers' were analysed, seeing that these two groups might differ in opinion. Two hundred and seven of the respondent's interviewed in this research were male and 232 were female. Data tables were constructed to analyse the levels of agreement and disagreement of variables concerning the layout and accessibility of the gaming areas in casinos with 700 and more slot machines, and casinos with less than 700 slot machines. A total number of 440 respondents were interviewed at four selected casinos. From the total respondents interviewed, 220 of the respondents were interviewed at casinos with 700 and more slot machines, and 220 at casinos at casinos with less than 700 slot machines. Only one questionnaire was rejected during the editing process due to incompleteness, making a total of 439 correctly completed questionnaires that were used in analysing the data. According to Aaker, Kumar and Day (2003:434), many adjustments can be made to the data in order to enhance their quality for data analysis The final number of correctly completed questionnaires was 219 from casinos with 700 and more slot machines, and 220 from casinos with less than 700 slot machines.

In **Table 1**, the levels of agreement and disagreement between independent variables (male and female) and the dependent variables of layout and accessibility (V1, V2, V3, V4, V5 and V6) were analysed. The mean statistics and the significant difference results that were obtained from the independent t-test were used to analyse **Hypothesis 1** and **Hypothesis 2**, and then to either accept or reject the hypotheses.

Hypothesis 1

Ho₁ – No significant differences exist between the perceptions of male and female gamers regarding the way gamers perceive the layout and accessibility of the casino.

Ha₁ – Significant differences exist between the perceptions of male and female gamers regarding the way gamers perceive the layout and accessibility of the casino.

Variable description	Mean / (Standard Deviation) Casinos with 700 and more slot machines		700 and more slot machines results of hypothesis test	Mean/ (Standard Deviation) Casinos with less than 700 slot machines		Less than 700 slot machines results of hypothesis test
	Male	Female		Male	Female	
V1 – The casino layout makes it easy to find the kind of food service you want.	1.71 (.942)	1.65 (.762)	MD = .058 t = .498 df = 217 Sig = .619 p-value =>0.05 Ho A Mean (1+2) =1.68 Strongly agree to Agree	2.08 (1.152)	2.15 (1.069)	MD = -.064 t = -.425 df = 218 Sig = .671 p-value =>0.05 Ho A Mean (1+2)=2.12 Agree to Neither Agree nor Disagree

Ho - Hypothesis		A - Accepted		R - Rejected		

Table 1. Levels of agreement or disagreement between male and female respondents regarding the layout and accessibility of the four selected casinos

Table 1 gives an overall picture of the perceptions of male and female gamers in both of the two categories (casinos with more than 700 slot machines and casinos with less than 700 slot machines); regarding the way gamers perceive the layout and accessibility of the casino. Male and female gamers at selected casinos with 700 and more slot machines and at casinos with less than 700 slot machines indicated that:

- Gamers experience that the casinos are designed in such a manner that one can easily find the slot machines.
- Gamers at casinos with 700 and more slot machines are more acquainted with the casino layout to find the tables than gamers at casinos with less than 700 slot machines.
- Gamers experience that the casinos have adequate directions.
- Gamers agree that the casinos layout makes it easy to get to the restrooms.
- Overall gamers perceive that the casinos' layout makes it easy to get to where gamers want to go.

A brief synopsis is that both male and female gamers at selected casinos with 700 and more slot machines and casinos with less than 700 slot machines perceived the layout and accessibility of the different casinos as easy to go where you want to be, and that adequate directions exist. H_{01} is therefore accepted and H_{a1} is rejected. The only statistically significant difference existed with V2 (only for casinos with less than 700 slot machines) and H_{01} ($p > 0.05$) is therefore rejected and H_{a1} ($p < 0.05$) is accepted for the variable.

Table 2 reflects the levels of agreement and disagreement between independent variables (male and female) and the dependent variables on the aesthetics of the gaming area (V7, V8, V9, V10, V11 and V12) were analysed. The mean statistics were used to analyse **hypothesis 2** and the significant difference to either accept or reject the hypothesis.

Hypothesis 2

Ho₂ - No significant differences exist between the perceptions of male and female gamers regarding the way gamers perceive the facility aesthetics of the casino.

Ha₂ - Significant differences exist between the perceptions of male and female gamers regarding the way gamers perceive the facility aesthetics of the casino.

Variable description	Mean / (Standard Deviation) Casinos with 700 and more slot machines		700 and more slot machines results of hypothesis test	Mean/ (Standard Deviation) Casinos with less than 700 slot machines		Less than 700 slot machines results of hypothesis test
	Male	Female		Male	Female	
V7 – The lighting in the casino is too bright.	4.27 (1.124)	4.42 (.975)	MD = -.149 t = -1.049 df = 217 Sig = .295 p-value =<0.05 Ho A Mean (1+2)=4.35 Disagree	3.44 (1.299)	3.49 (1.210)	MD = -.045 t = -.262 df = 218 Sig = .793 p-value =>0.05 Ho A Mean (1+2)=3.47 Neither agree nor Disagree

Table 2 Levels of agreement or disagreement between male and female respondents regarding facility aesthetics of the four selected casinos

Table 2 gives an overall picture of the perceptions of male and female gamers in both the two categories regarding the way gamers perceive the facility aesthetics of the casino. Statistically, no significant difference exists between male and female gamers in both of the two categories at the selected casinos, according to the hypothesis tests for the variables (V7, V8, V9, V10, V11 and V12).

Both two categories (casinos with more than 700 slot machines and casinos with less than 700 slot machines); agreed that the lighting in the casino is not too bright, but acceptable, and the interior wall schemes of the casinos are attractive, as well as the casino floor colour schemes. Sometimes the noise levels inside the casinos distract the gamers. This could be due to the regular announcements on the floor regarding promotions or events. All the casinos used in this study were decorated in an attractive fashion according to the gamers.

In conclusion both male and female gamers at casinos with 700 and more slot machines and casinos with less than 700 slot machines perceived the facility aesthetics of the different casinos to be attractive. Ho₂ is therefore accepted and Ha₂ is rejected.

CONCLUSION AND RECOMMENDATIONS

The casino has a physical setting where gaming activities are installed for entertainment and pleasure of the gamers'; this is also referred to as the gaming area. All casinos must provide a detailed floor plan to the casino board when applying for a casino license. The interior design and floor plan of a casino can influence gamers' perceptions in a positive or negative way.

In general the male and female gamers at the four selected Sun International casinos perceive the layout and accessibility of the casinos as acceptable and it is easy to get where they want to go. The wall and floor colour schemes of the four casinos were described as eye-catching. The authors found that although the gamers' were overall satisfied with the layout, accessibility and casino aesthetics. Additional recommendations came to light after interviewing the gamers'. Information display boards can be placed near *MVG (Most Valued Guest)* desk or casino entrances to guide gamers to their destination of choice.

A small leaflet indicating the layout of the casino plus the tables and slot machine denominations could be provided to the gamers at the main entrance of the casino or at the *MVG* desk. A quiet booth where gamers can answer their cell phones must be set up inside the casino gaming area, so that no need exists for the gamers to leave the gaming area. The number of announcements on gaming areas must be limited to a minimum to avoid any disturbance of the active gamers. Electronic notice boards should be placed at strategic points in the casino. Reflection of casino lights on some slot machines might upset some gamers while gaming; maintenance must regularly check for lights that might reflect on the slot machines. The investigation into gamers' perceptions of the layout, accessibility and aesthetics of the gaming area will provide casino management with insight, on how to improve the layout, accessibility and aesthetics of the gaming area if needed. The management of casinos can also use the findings of this research for future casino developments and decision making. "Quality begins on the inside... and then works its way out" - Bob Moawad.

CAN THE LESSONS BE LEARNED FROM ORGANIZATIONAL MARRIAGES? THE CASE OF MADGE & LANNET MERGER

Weber, Yaakov¹; Tarba, Shlomo²

¹*Chair, Department of Strategy and Entrepreneurship, School of Business Administration, College of Management, Rishon Lezion, Israel*

²*School of Business Administration, College of Management, Israel*

On October 1998, Lannet Data Communication Ltd. (Hereinafter: "Lannet") was sold to Lucent technologies Inc. (Hereafter "Lucent") for a total price of US\$117M. This sale marked the end of a merger destined to provide Lannet with the much-needed strategic breakthrough. The said merger started in 1995.

In July 1995, the multinational manufacturer of data communication and networking products, Madge Networks N.V. (Hereinafter: "Madge"), purchased the share capital of the Israeli company, Lannet, at US\$27.5 per share, even though its then current market price was only US\$19. The total value of the acquisition was US\$330.

However, this friendly and promising merger between two similar enterprises turned out, upon its implementation, to be problematic. A large number of problems were encountered during the process of attempting to integrate the respective operations, with the result that the value of the Madge stock declined by more than 90% over the course of less than three years.

The case describes two high technology, international companies, prior to the merger, the negotiation process, the manner in which the merger was implemented and the events leading to the sale of Lannet to Lucent.

"Does the name Robert Madge mean anything to you? It probably rings a bell, if a distant one. Madge was the founder of Madge Networks, which in the late '90s was the market leader in Token Ring networking technology. The once high-flying company has since met the same fate as that of Token Ring itself: near oblivion" (Tennant, 2008).

INTRODUCTION

According to KPMG's Corporate Finance Dealwatch 1999, the total value of cross-border transactions has increased fourfold from \$196.4 billion in 1994 to \$798 billion in 1999. Cross-border takeovers are the largest component of Foreign Direct Investment (FDI) in the U.S., and an increasingly large component of total U.S. acquisitions. European companies do more cross-border than domestic activity, with more than half of total cross-border volume targeted at non-European Community countries. U.S. companies continue to be largest net sellers on the global cross-border M&A balance sheet. For example, non-U.S. firms acquired nearly \$200 billion worth of assets in technology acquisitions alone in the U.S. over a period of a year and a half starting in January 1998 (Inkpen et al., 2000).

Most of the research about M&A "has not been systematic and linked to any other comprehensive theory" (Schweiger & Goulet). Research about M&A is still fragmented, leaving gaps waiting to be addressed (Shimizu et al., 2004). For example, many studies were conducted

under the assumption that M&A are homogeneous, but in reality not all M&A are alike (Bower, 2001). A major omission in this respect has been the absence of comparative studies between M&A in various countries.

The M&A aspect is especially important in Israel, a country poor in natural resources but rich in human capital. Israel has a high proportion of scientists and engineers in the population, with approximately 130 scientists and engineers for every 10,000 workers (Chorev & Anderson, 2006), compared with 80 in the U.S. and 75 in Japan. Israel has the highest number of start-ups in the world relative to population size. More than 130 high-tech Israeli firms are listed on the US stock exchange, the largest number of any nation outside North America (Lashinski, 2000; Yeheskel, Shenkar, Fiegenbaum, Cohen & Geffen, 2001).

The number of mergers involving Israeli companies, including the high-tech industry, is continually growing (see Figure 1 below, 2008 Israeli Venture Capital Association report).

For example, M&A activity involving Israeli companies that were either acquired or merged totaled \$3.2 billion in 2007 in 75 deals – the second highest number of M&A deals in any one year to date.

Mergers and acquisitions of VC-backed Israeli companies in 2007 totaled \$1.9 billion and consisted of 32 deals. According to Israeli Venture Capital Association General Manager Guy Holtzman, “In times of uncertainty in capital markets, exits generally take place through M&A transactions rather than IPOs. Global technology firms with operations in Israel may well take advantage of the current economic situation and expand their local activities through acquisitions.” Israeli companies were also on the acquiring side in some 60 deals in 2007, including about 20 where one Israeli company acquired another Israeli company, and nearly 40 acquisitions of foreign companies. Israeli companies spent \$2.15 billion on mergers and acquisitions in 2007, of which \$1.96 billion was for acquisitions of foreign companies.

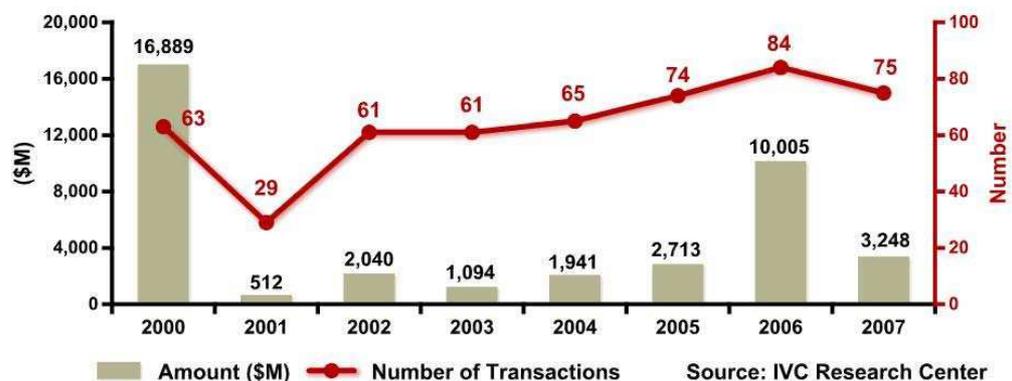

Figure 1- Mergers & Acquisitions of Israeli High-Tech Companies

There can be various motives for foreign acquisitions, including synergism, managerialism, and hubris (Seth, Song and Richardson, 2000; 2002). M&As are an important globalization strategy because they have a high potential to meet strategic goals by exploiting synergy through different sources of competitive advantage. In Europe, the strategic rationale for many M&As was clearly a desire by many European companies, free of the political barriers that had fragmented their markets, to consolidate their efforts in order to match the economic scale advantages of their U.S. and Japanese competitors (Calori and Lubatkin, 1993). Similarly to their U.S. counterparts, many of the buying firms found it less difficult to determine what merger strategies to pursue than how to implement them. Indeed, a survey of more than 200 European chief executives found that the challenge of integrating the newly acquired companies was viewed as more important to the success of the merger than the more traditional strategic considerations (Booz Allen and Hamilton, 2001). There are repeated reports in the literature about M&As that have not lived up to expectations. The failure rate is above 50% (e.g., Cartwright and Cooper, 1993). Despite all this, the challenge of making international acquisitions succeed has been relatively ignored by the international management literature.

M&As have traditionally attracted strong academic interest in the fields of industrial economics, financial economics, strategic management, and more recently, organizational behavior. The vast majority of research in these domains has focused on combinations of firms with the same national background. This is also true for organizational research typically concerned with decision-making issues and implementation processes in M&As. Generally, there has been little systematic research in the field, although this situation has been slowly changing. Moreover, the significance of national culture differences and their effect on behavior and management systems is widely acknowledged in the international management literature with respect to cooperative ventures (e.g., Black, Mendenhall, and Oddou, 1991; Hofstede, 1980; Lane and Beamish, 1990), and specifically to M&As (e.g., Kogut and Singh, 1988; Rosenzweig and Singh, 1991; Weber, Shenkar, and Raveh, 1996). Nevertheless, conventional theories on internationalization have paid little attention to M&As as a major route to internationalization, and have barely addressed the cross-cultural integration process that follows every cross-border acquisition (Melin, 1992).

Most of the academic research on domestic acquisitions (DM&A) illustrates the high failure rate of M&As by focusing on issues other than those associated with the post-merger consolidation processes of the buying and acquired firms. Much of the past literature focuses on pre-acquisition decision making (Haspeslagh and Jemison 1991; Jemison and Sitkin 1986) or the financial impact of acquisition transactions (e.g., Datta, Narayanan, and Pinches, 1992). Recently, more attention has been paid to difficulties arising during post-merger integration owing to a lack of organizational fit (Datta 1991; Weber, Shenkar, and Raveh, 1996; Lubatkin, Schweiger, and Weber, 1999).

The literature in the M&A area of DM&As is richer and has been focusing increasingly on comprehending the consequences of culture clash on individuals, groups, and organizations during the integration process (e.g., Nahavandi and Malekzadeh, 1988; Datta, 1991; Weber, 1996; Weber et al., 1996). It is now possible to utilize the DM&A literature to formulate theories and

models that would assist researchers and practitioners in understanding the human resource issues involved in international M&As.

MADGE & LANNET - A TALE OF CROSSBORDER MERGER THAT FAILED

The handful of reporters covering the class action suit against Madge Networks NV, known as Madge, slipped into the back seats of the crowded room, hoping to hear more details of the alleged federal securities violations. The breakneck pace of international M&A in the computer network industry caused one more casualty. An officer and director of Madge were charged with violations of federal securities laws. While Madge, which manufactures and sells data and communication networking products, was in the process of acquiring Lannet Data Communications Ltd. (Lannet) and Teleos Communications Inc. (Teleos), in exchange for millions of shares of Madge stock, the defendants allegedly participated in inflating the price of Madge's stock from \$28-7/8 on October 12 1995 to a high of \$48-5/8 on June 16, 1996. Robert Madge, founder and chairman, had envisioned a global network of acquired corporations in North America, Europe, the Far East, and the Middle East, and now his dream was tainted with the sour taste of failure. His dream came up against the harsh realities and complexity of international mergers. Was the high flying, risk taking Robert "Bobby" Madge considering only strategic and financial fit? Was he oblivious to the impact of corporate and national cultural fit on the success of an international merger?

MADGE AND LANNET PRIOR TO THE MERGER

Madge

Madge Networks, NV a Dutch company, is a supplier of computer network solutions based on the Token Ring Smart Ringswitch standard. The Token Ring was developed and marketed in the early 1980s by IBM. Founded in 1986, Madge functioned as a British corporation named Madge Networks Limited.

In June 1993, all of its shares were bought by Madge Networks NV and was listed on NASDAQ with a market valuation of \$300M. On the eve of the merger, towards the end of 1995, the company had 1,500 employees worldwide. In 1987, the company launched its Token Ring line of products. The product line was expanded to include a complete mix of adapter cards, which are hardware components installed in the computer that enable it to connect to a network; switchboards called Stackable Hubs, which control and manage the network; general software; and network management software. Just before the merger, Madge had developed a Token Ring switch and announced its plan to offer new products that allow Token Ring network users to integrate ATM architecture. ATM technology, the upcoming computer networking standard, is suitable for Local Area Networks and Wide Area Networks and is used for data, voice and video transmissions.

Most of the company's revenues are generated through the sale of products and a smaller portion of sales are generated through licensing technology. The products are used mainly by large organizations that have replaced central, main frame computer systems with distributed networks using client/server configurations. In the main, the company's customers include large

corporations and government organizations with critical, centralized applications that operate in an IBM environment.

Madge's centers of marketing, after-sale service and technical support are located in 40 sites in 20 countries. Generally, the company markets its products directly to end customers. However, a significant number of its worldwide sales are generated by a network of distributors, retailers, large systems installers and OEM's (Original Equipment Manufacturers).

Madge has incorporated subsidiaries in countries where there is a need for local representation of marketing and sales departments and also when local financing and production confers a business advantage. Overall, the Madge group includes approximately 16 subsidiaries with various operational and legal relationships. The R&D centers of the company are located in England and the USA. The company has invested approximately 9% of revenues in R&D.

The product strategy of the company is to help its customers gain a competitive advantage through the development of a wide selection of products and services for use in computer networks. Since Madge works closely with its customers on current communication and network installations, it gains insight into the communication needs of its customers, which it incorporates into its next generation of products. The R&D programs include further development of Token Ring technology in order to maintain market presence, while also investing in a new line of products for ATM networks. Subcontractors carry out production according to Madge's specifications and design. The company is presently constructing a plant in Ireland and plans to employ a production strategy based on integrating its own production with production outsourcing in order to maximize flexibility, reduce time to market and facilitate quick response to customer requirements.

<i>Year</i>	<i>Sales (\$M)</i>	<i>Profit (\$)</i>
1990	19.6	
1991	33.4	
1992	78.8	7.4
1993	145.4	25.6
1994	213.3	37.5
1995 (3 rd . quarter)	209.6	25.5

Table 1 - Madge's Sales Prior to Merger

Madge's major competitors are IBM, OLICOM, 3Com, and Bay Networks. Madge is expected to compete with these companies in the ATM market, which also attracts new entrants.

Madge's success is highly dependent on the contribution and leadership of its principal founder and CEO, Mr. Robert H. Madge. Without his expertise, the company's operations and competitive advantage would be materially affected. The success of Madge is also dependent on a small number of key employees and senior managers. Madge is confident of its future market prospects and believes that its success is directly related to its ability to attract and employ highly skilled technical, managerial and marketing personnel. The competition for this kind of personnel is very intense and there is no guarantee of success.

Lannet

Lannet was founded in Israel in 1985. It is a wholly owned subsidiary of the Rad Binat group of companies. Lannet develops, produces and markets the following: Local Area Network (LAN) solutions for business systems, ethernet switching, and internet products for ATM technology. The ethernet technology was a tested technology and was more widespread than the Token Ring technology. It is suited to large organizations with relatively low network loads. Lannet switchboards are world-renowned for their technologically superior performance.

The founders of Lannet hold approximately 30% of its outstanding shares and are actively involved in the company's day to day management. R&D and production are based in Israel, a country well known for its highly educated, highly skilled employees. Lannet invests about 10% of revenues in R&D. The company employs 320 workers.

Marketing and after-sale service and support are executed through subsidiaries in the US, Far East and South America. These subsidiaries support Lannet's distributors and customers. Lannet is dependent on an international network of distributors and agents that frequently install, service and maintain customer networks. Among the large customers that have acquired Lannet switchboards are Airbus, BMW, and Swiss Bank.

Lannet has international cooperation agreements with AT&T and Olivetti. Lannet was listed on NASDAQ in 1991 with a valuation of \$54M. Lannet was granted tax-exempt status in Israel and continued growing while maintaining its position among the top three companies in its field. While the first two years showed poor financial results, the 1993 results indicate growth and expansion.

The company did not reinvest the funds accrued through the NASDAQ listing. Following the lack of investment in 1993, sales plummeted and the stock price took a beating. In 1995 sales topped \$100M, 95% of it overseas, with \$15M profit. The company has 350 employees and utilizes subcontractors based in rural Israel.

Lannet, which focuses on Ethernet technology, shares with Madge its main competitors: Cisco, 3Com, and Bay Networks.

<i>Year</i>	<i>Sales (\$M)</i>	<i>Profit (\$M)</i>
1993	100	15
1994	70.2	5.6
1995 (3 rd Quarter)	74	9.2

Table 2 - Lannet's Sales Prior to the Merger

Lannet: The Quest for a Strategic Partner

During the period in question, Lannet competed against Cisco, the American giant, in bidding on a major contract with the Republic Bank. Prior to this bid, Lannet had sold its products to one of the Republic Bank's Brazilian branches as well as to several Swiss banks. At the time, it seemed that Lannet's competitive advantage was as follows:

- Lannet had a proven record in the banking industry
- The Republic Bank requested an existing, proven, product which was not custom designed. Lannet was the only company offering such a proven product.
- Lannet asked a lower price for the product than Cisco.
- Lannet had a \$10M deposit with the Republic Bank.

However, there were also some apparent weaknesses:

- Lannet had a poor geographic distribution of technical support staff
- To compensate for Lannet's distance from its customer, it was suggested that an employee of Lannet would work for one year at the Republic Bank.

After due consideration, Lannet lost the bid on the basis of "...Lack of viability..." Lannet's executives identified the need for a major shakeup including operational turnaround, a new management philosophy, such as TQM, and strategic cooperation, or a possible merger. A preliminary benchmark study indicated that Lannet was lagging behind the industry. The Cumulative Average Growth Rate (CAGR) of Lannet was less than 100%, while American companies with comparable products were reaching sales of over a billion dollars. This did not bode well in an industry which believes that, "growth rate and size is essential for survival." The company applied a Total Quality Management (TQM) process and found it to be irrelevant. The company tried a detailed costing and focused on efficiencies from the bottom up and found the process to be of no help.

Lannet's Board of Directors considered, but rejected, the idea of a merger with a large corporation. It considered acquiring a smaller company, using the \$40M cash in its coffers. However, preliminary screening for acquisition candidates showed that the smaller firms would not strengthen Lannet substantially. It became apparent that Lannet's best choice was to be acquired by a large international corporation and risk losing identity and control. At this point

Lannet turned discreetly to an investment bank, worrying about the impact of a possible sale of the company on customers and suppliers alike, and wondering about competitors taking advantage of the situation. Only the board and senior managers, who are shareholders, were briefed on the merger options. At this point several opportunities presented themselves. One of the customers offered to buy 20% of the outstanding shares (legally, a holder of more than 20% of a company's shares is required to submit consolidated statements.) Lannet rejected this offer. Lannet was pursuing actively an American OEM, however the pursued company was hesitant about Lannet's potential, share value and negative impact of acquisition on the value of its own shares. (It is interesting to note that the same OEM which was offered Lannet shares for a mere \$200M, ended up buying an inferior company for \$700M. Six months after the merger²³⁹ it was declared a failure. Many workers have left and those that remained were dealt with unfairly).

THE MERGER PROCESS

The Madge's team arrived in Israel for an initial audit of Lannet. Robert Madge, the founder and CEO of Madge landed shortly thereafter, on the way from Australia to England. He offered to buy Lannet for \$330M, at \$27.5 per share, higher than the price suggested by the Madge team (\$24 per share). Lannet's value, according to this offer, was higher than the \$200M offered by the American OEM.

Even though the Lannet managers were concerned about the incompatibility of Madge and Lannet distribution channels, they sealed the deal, conditional upon due diligence and a visit to Madge's facilities in England. In August 1995, the merger was consummated. Lannet's shareholders received shares of Madge at \$27.5 (based on a valuation of \$330M), in return for Lannet's shares, valued at \$19. This represented an immediate profit of 45%.

Although this was an outright acquisition, the announcement described the deal as a merger, to make the Lannet people feel good. The name "Lannet" was eliminated from all documents and products and was replaced with "Madge-Israel."

A feeling of a strong financial backing caused an immediate increase of inventory, despite a reduction of cash reserves. The number of employees increased from 1,200 to 1,700, and in two years reached 2,400. Sales commenced through the sales force, and Lannet's network of local distributors ceased to exist. The image of Lannet as a small, flexible and dynamic firm had been lost.

Employees at Madge-Israel got a brief workshop on bridging the national and corporate cultural gap between the two organizations. While the general impression was that it was easier to work with the British than with the Americans, there were differences that were obvious. Lannet management worked on an informal basis. All employees could approach the senior management at any time in order to present problems and suggest possible solutions. Decisions were made quickly and informally. On the other hand, Robert Madge was always referred to in a formal manner, the hierarchy was always respected and decision making was centralized.

FORESEEING DIFFICULTIES: MADGE'S CONCERNS ABOUT THE MERGER

The shareholders' prospectus directed by Madge to Lannet shareholders prior to the merger, lists the following risk factors:

- Operating efficiencies not realized
- Coordination difficulties due to geographic distance
- Integrating efficient production lines
- Integrating different reporting systems
- Integrating employees with different business background
- Integrating processes and business cultures
- Interruptions due to the integration of activities
- Difficulties due to the sudden increase of employees, managers, geographic coverage, operating and financial systems
- Higher than expected expenses related to the merger (Layoffs, reassignment of workers, elimination of duplication and distribution channels)
- Negative impact on operating efficiencies and bottom line results due to the merger
- Negative impact of Madge's practice of selling Lannet's products directly and not through Lannet's agents
- A complete shutdown of all Lannet's activity in Israel.

MERGER RESULTS

During 1996, many difficulties presented themselves. Sales stagnated. Disagreements with headquarters were developed. Lannet, now called Madge-Israel, was required to adopt the marketing and distribution practices of Madge International. As a result, Lannet's best distributors started to work with the competition. Former Lannet founder and CEO, Ben Hanigal, left Madge-Israel. Arik Ben-Hamou, CEO of 3Com, a competitor, said "Despite the merger, Madge did not achieve the size required to invest in R&D of new products as well as increasing market share and sales." In 1997, the merged company let 400 employees go and started a major reorganization. For the first nine months of the year, the company reported losses of \$74M, a sales reduction of 18%, and \$48.7M of reorganization expenses.

In July 1997, the company announced "...organizational changes that help the company to focus on its technological skills in order to return to solid profitability." The changes included return to the pre-merger distribution and sales network. However, the fourth quarter ended with a significant loss and further reduction in share values.

The third quarter of 1997 shows a loss of \$62.7M on revenues of \$83.2M compared to a loss of \$67M during the comparable quarter in 1996. Revenues were down by 26% compared to 1996. The gross profit margin was 46.6%. After allowing for reduced sales and administration expenses and excluding the non-recurrent reorganization costs, the company reported a loss of \$9.4M. Madge shares traded at \$5.75, significantly below their value at the time of the merger.

Table 3 - Madge's Stock Prices for the Period 1994 - 1999

In order to get the cash required for continuity, the company raised, through a private offering, deferred convertible bonds in the amount of \$30M. The declared use of the funds was for "...helping in the implementation of a customer focused strategy and developing communication solutions for data, video and voice..."

Typical comments by the acquired Israeli firm employees were:

- "... We were required to fill in forms and get authorization for every action..."
- "... We have lost our autonomy, every new recruit had to be approved by head office in England..."
- "... The British disregarded many reports that were generated in Israel..."
- "... The project presentations were always made by the British manager, and little credit was given to the Israeli teams..."
- "... The reports went only one way..."
- "... We were required to work Fridays, which are considered to be part of the Israeli weekend..."
- "... Joint R&D teams did not manage to bridge the gap between former Lannet and Madge employees..."
- "... Excessive bureaucracy contributed to the incapacity of the Israeli management team to make decisions..."
- "... Senior management consisted of only Madge personnel except for Lannet's founder and CEO, Benny Hanigal..."

- "... Madge forced its methods and business practices on former Lannet employees..."
- "...The corporate cultures of the two corporations were very different. The head office in England requested a certain focus on R&D, while we were busy doing exactly the opposite in order to show that our ideas were correct and not theirs..."
- "...The general feeling was that there is no leadership and no short or long term plans..."
- "...The right hand did not know what the left hand was doing, no coordination, no focus, no sense of direction..."

The VP for Finance of Madge-Israel left for "personal reasons" and was replaced by Dennis Palmary, a member of the management team. Most board members of Lannet left and sold their shares, causing the employees a great degree of concern and disappointment.

THE MERGER BREAK-UP

Madge management concluded that it was best to allow Madge-Israel to become independent in all its decisions. This included R&D, production, marketing and sales. The CEO got complete authority to make his own decisions. In addition, a company called "Lannet-Israel" would be registered in the Netherlands just like Madge.

The sales and distribution network would be based on distributors and they would market Lannet's products independently. Lannet is now operating under its original name and is recognizable for its Ethernet solutions for computer networking.

The CEO of Lannet, Mr. Levy, says that the break-up of the two corporate entities would allow customers to identify Lannet's products with the reliability and technological breakthroughs commanded by Lannet. He mentioned a joint venture with the Japanese communication giant NEC. The joint venture includes:

- Integration of both companies' production of organizational computer communication
- Lannet will represent NEC
- NEC America will sell Lannet's Ethernet products in the USA.

The above should serve to boost current revenues of \$100M. This is the same level of sales as on the eve of the merger, but with lower profitability. Furthermore, a new manufacturing facility with 300 employees has just started operations at a technological park in Jerusalem with a \$3M investment. Expected production volume is \$100M, of which 95% is earmarked for overseas sales.

Table 5 - Madge Networks N.V. Condensed Consolidated Balance Sheet(in \$ 000's)

ANALYSIS OF THE CASE

Effective mergers and acquisitions has been a widespread corporate strategy for a considerable time, but few case studies in the area of strategic management or international management detailed the M&A process in general and failed ones in particular. The strategy of using M&As has become an increasingly common phenomenon, attaining new highs in recent

years. Many research studies, though, have indicated that in at least 50% of all instances, the strategy ends with failure. Despite this statistic, it is uncommon to find a case that treats failed M&A.

It is noteworthy to underscore the point that, of the two entities, Madge has the larger marketing setup, and that they engage in distinctly different technologies. This point is exemplified mainly by Madge's "Token Ring" product line, as opposed to Lannet's "Ethernet" line of switching products.

It would be worthwhile to elaborate on this issue more fully at this time and to stress that Madge and Lannet employ different marketing techniques. Madge markets its products principally to final customers, via its own sales force, whereas Lannet uses outside distributors. In addition, Madge's customers are mainly large organizations and governmental agencies, whereas Lannet sells mainly to small and medium-sized firms whose network loads are relatively low. Furthermore, Madge continued to rely on relatively old-fashioned technologies, while Lannet has managed to achieve more considerable progress in the upcoming area of ATM. Moreover, financial analysis indicates that there have been increases in sales turnover and profitability at Lannet, but not at Madge (see tables 4 and 5).

POSSIBLE ADVANTAGES OF THE MERGER

The marriage between Madge and Lannet was consummated at the end of 1995, when both companies were at their peak. Madge, the younger of the two companies, then specialised in the Token Ring network market, and Lannet contributed on its part the competence in Ethernet networks. The aim of merger between two companies was to enable them to develop a new communications switch based on ATM technology, which was considered at the time to be the last word in fast data communications. In addition, Lannet was supposed to become integrated into Madge's international marketing infrastructure, and, with its help, enter new market segments (Ginzburg, 1998).

The anticipated advantages of the merger at the time were:

- 2) The ability to cooperate in the utilization of operating resources and to produce efficiencies in such functions as manpower, finance, manufacturing and marketing. Reduction of inventories, reduction of R&D expenses, and gaining economies of scale.
- 3) Being able to transfer professional know-how from one company to the other. Lannet is regarded as the better of the two companies in R&D, while Madge holds an advantage in the area of marketing.
- 4) Decreasing competition
- 5) Increasing the range of products offered – expanding the variety of communications solutions
- 6) Obtaining a larger market share (Chiefly for Lannet line of products), which will establish the "Viability" desired by Lannet's international customers.

ASSESSMENT OF THE QUALITY OF THE STRATEGIC PLANNING OF THE MERGER/ACQUISITION

- 1) The acquisition process was carried out extremely rapidly, and this did not provide sufficient time for any in-depth examination. For better planning companies need to "Date", to feel each other, for some time before the merger.
- 2) The Madge team therefore was satisfied with a cursory inspection. Furthermore, Madge agreed to effect a thorough due diligence process only *after* the agreement had first been signed.
- 3) The per share price paid appears to be very high compared with both the market price and the recommended by the Madge team. It looks as though hubris (In the form of the over confidence displayed by the Madge managing director) may have caused the speed with which the purchase decision was made. In any event, the total consideration paid (US\$330M) was considerably more than the sum (About \$200M) that Lannet expected to receive (See also the class action brought in the USA on behalf of purchasers of Madge common stock, against Madge and its principals. The class action alleges the artificial inflation of Madge's stock prior to the Lannet acquisition).

It should be noted that where an acquisition is effected via an exchange of shares, irrespective of whether or not the buying company undertakes a proper process of due diligence, the company being acquired should itself undertake a due diligence of the buyer. However, Lannet did not do this.

- 4) No assessment was made of the difficulties that could be expected in implementing the merger. In particular, no examination was effected of the differences in Corporate or organizational culture or the need of the acquired company to retain elements of autonomy. This is essential in order to plan the integration process and choose the integration approach.
- 5) No dynamic evaluation was made of the likely reactions of competitors in the market or of the moves likely to be effected by customers, suppliers or distributors.

ANTICIPATED DIFFICULTIES – DIFFERENCES IN NATIONAL AND ORGANIZATIONAL CULTURE**Corporate culture issues**

Although Madge refers in its prospectus to anticipated difficulties, it conducted no fundamental investigation into two key matters: The differences between the two companies' organizational cultures and the need (Which was exceptionally strong at Lannet) of the acquired company and its principals to retain its autonomy. It has to be remembered that Lannet was not a losing money enterprise and that the management of that company had proven its ability to develop new products and run a successful business. An analysis of the differences in corporate/organizational culture has been made for the purposes of this case, based on the seven dimensions of culture that have been identified and found valid in several research studies conducted by Chatterjee, Lubatkin, Schweiger & Weber (1992) and Weber (1996) . The table 6 provides a summary of each dimension, grades the two companies in terms of these dimensions and assesses the degree of the differences between them.

<i>Cultural Dimensions</i>	<i>Lannet</i>	<i>Madge</i>	<i>Cultural Differences</i>
<i>Innovation & Action Orientation</i>	<i>High</i>	<i>High</i>	<i>Low</i>
<i>Risk Taking Attitude</i>	<i>High</i>	<i>Medium</i>	<i>Medium</i>
<i>Integration and Lateral Interdependence</i>	<i>Low</i>	<i>High</i>	<i>High</i>
<i>Top Management Contact</i>	<i>High</i>	<i>Low</i>	<i>High</i>
<i>Autonomy in Decision Making</i>	<i>High</i>	<i>Low</i>	<i>High</i>
<i>Performance Orientation</i>	<i>High</i>	<i>High</i>	<i>Low</i>
<i>Reward Orientation</i>	<i>No Data</i>	<i>No Data</i>	<i>No Data</i>

Table 6 - An Analysis of Corporate Culture Differences: Madge and Lannet

To summarize, significant differences in corporate culture exist between Madge and Lannet. Taken with the need for retained autonomy on the part of the acquired company, this suggests that difficulties could certainly be anticipated during the process of effecting the desired synergy.

National Culture Issues

National culture differences play a significant role in the merger of Madge and Lannet. The cultural differences between the British and Israeli culture may be assessed using the four dimensions of Hofstede (1980): power distance, uncertainty avoidance, individualism and masculinity.

	<i>Power Distance</i>	<i>Uncertainty Avoidance</i>	<i>Individualism</i>	<i>Masculinity</i>
<i>Great Britain</i>	35	35	89	66
<i>Israel</i>	13	81	54	47

Table 7 - Hofstede's National Cultural Differences Between England (Madge) and Israel (Lannet)

These findings, drawn from international management literature indicate large national cultural distance on all dimensions. Thus, problems should have been expected in the case of the merger between the two firms. This is contrary to the opinion of Lannet's managers that there are not too many national cultural differences. For example, if one examines the dimension of power distance, the large gap in the case of international mergers may contribute to behavioral problems of acquired firm managers. These behavioral problems lead to: reduced commitment to the success of the merger, and a lower degree of cooperation between the acquired and purchaser management teams. It has been shown, that stress and negative attitudes are caused by national cultural differences. In this case, the British expected a higher degree of obedience by subordinates than the Israelis did.

In summary, there are significant cultural differences that inhibit the impact of the synergies expected to evolve.

INTEGRATION APPROACH, RECOMMENDED STAGES AND THE IMPLEMENTATION PROCESS

It has been demonstrated that, where there is high potential for synergy accompanied by anticipated difficulties in implementation, the "symbiosis approach" is the preferred method for achieving integration. According to this approach, one should move forward cautiously, with progress and changes affected in accordance with developments occurring. During the initial stages, one has to preserve the character and identity of the acquired company and proceed only with essential minimal changes. Following the initial period the two firms become acquainted with each other, enabling the acquired firm (e.g. Lannet) to develop self-confidence.

The stages for the symbiosis approach are:

- 1) Creating a gate keeping structure to protect the distinct identity of the acquired firm.
- 2) Nurturing the acquired firm.
- 3) Implementing adjustments needed in both firms.
- 4) Starting voluntary interactions gradually.
- 5) Trading operating responsibility for strategic control.
- 6) Amalgamating the firms.

THE INTEGRATION PROCESS AND ITS CONSEQUENCES

The students are asked to compare the aforementioned stages to the actual activities taken in the merger of Madge and Lannet. Very quickly they will discover that there were some major deviations. The culture and operating procedures of Lannet were not kept. There was no gate keeping structure. Madge's managers did not wait or encourage the initiation of voluntary interactions by the acquired firm.

As a matter of fact, Madge has moved directly to step 6, in the hopes of absorbing Lannet completely. Only after the merger was pronounced a failure, did Madge separate between the two organizations – a separation that should have been part of step 1. The results of this shortcut

are outlined in the case and the students are asked to give several examples of violations of the process by Madge. Furthermore, this shortcut brought about the resignation of key senior managers of Lannet, including the founder and CEO. The Lannet people started to fight for autonomy undermined Madge's initiatives and hurt the R&D capability of Lannet. This capability was one of the main reasons that Madge acquired Lannet in the first place.

As Robert Madge confessed in an interview "... Lannet was a large company comparable to ourselves with nearly as many people. After about six months it became clear that our sales were not reacting well as a joint company. We had a lot of problems in putting the company together. We couldn't get a clear, focused strategy that everybody bought into. Most acquisitions fail. If you can't get positive momentum fairly soon, you're much more likely to fail, especially when the two companies are fairly similar in size. Because we couldn't get positive market momentum, all the differences in opinion broke out, and it became that much harder to make it work together" (Tennant, 2008).

CONCLUSION AND FUTURE IMPLICATIONS

Although Morosini et al. (1994) reached the conclusion that national cultural differences are always beneficial to an acquisition's performance, we argue based on the findings of our study that each M&A requires a "tailor-made" post-acquisition integration approach as well as its appropriate implementation. This is because an inappropriate post-acquisition integration approach and/or an inadequate degree of implementation can negatively affect acquirer performance.

In addition, according to Pablo (1994) if the acquiring firm imposes all its practices on the acquired company, many of these practices are likely to be incompatible and undermine post-acquisition integration efforts, and can eventually result in negative performance on the acquiring company's part. Conversely, if the acquired firm is granted an excessive degree of autonomy, it can take several years until the underlying synergies are realized, which can have a negative effect of acquirer performance. Based on the results of our case study of Madge & Lannet merger, we assume that it is insufficient to consider the corporate (organizational) culture differences between the acquirer and the acquired company in isolation from the national culture dimensions when examining how these differences affect acquisition performance.

Furthermore, Tarba (2009, Unpublished dissertation) found that there is a significant difference in the extent of the fit between the integration approaches that should be and were actually adopted by the acquirers according to the Haspeslagh and Jemison's model (1991) and based on a large sample data regarding M&A deals in Israeli hightech industry between 1990 - 2006: only 42% of M&A transactions in the sample show fit, whereas 58% M&As did not. This may be the reason for the poor performance of acquiring companies which did not adopt the integration approach required in each merger or acquisition according to the model of Haspeslagh and Jemison (1991), based on corporate culture differences and the synergy potential between the combining entities.

Another issue raised in the present research pertains to the relationship between national and corporate culture and the way in which it may affect M&A performance. Although sharing some

definitions and terms, authors writing about national and corporate cultures refrain from stepping on each other's turf, thereby overlooking opportunities for cross-fertilization. The in-depth examination of the Madge & Lannet merger case study presented here provides ample opportunities for systematic research on the similarities and differences between national and corporate cultures, their interrelationship, and their similar and different impacts on conflict in international M&As.

Finally, the case results suggest that executives of the acquiring firm should pay as much attention to the choice of level of integration and cultural dimensions during the pre-merger search process and post-merger integration as they do to the effects of national and corporate culture differences. The challenges associated with the ideal integration type, and the ability to successfully implement the intended integration approach should be considered during all stages of the M&A, including screening, planning, negotiation, and the interventions that take place during the post-merger integration period.

DESIGN AND DEVELOPMENT OF AN INFORMATION SYSTEM TO SUPPORT DECISION MAKING IN PERENNIAL CROP PLANTING

Yuryeva, Diana¹; Kokkinaki, Angelika I.²

1University of Nicosia, Russia, Nizhny Novgorod, Karl Marx St 20-123

2University of Nicosia, 46 Makedonitissas Ave., 1700 Nicosia Cyprus

Purpose: This paper reports on the design and development of an information system to support decision processes related to perennial crop planting.

Design/methodology/approach: Secondary data have been collected through literature review. Users' requirements were elicited through interviews. Entity Relationship Diagrams (ERD) and Data Flow Diagrams (DFD) were used for design and modeling of the system. A relational database management system (Microsoft Access ©) was used for implementing the system. Interviews and questionnaires were used for end-users' evaluation of the developed system.

Findings: Domain knowledge has been elicited including theoretical concepts of economics of agriculture and perennial planting specifics. The system keeps data about soil, crops sowed in different years, as well as financial data concerning costs and crop sales. Moreover, a module supports decision making in perennial planning. The system is also capable of producing a number of reports which can significantly enhance decision making.

Practical implications: The developed system support operational and strategic processes in perennial crop planting including improved planning, control mechanisms and decision making support in perennial planting.

Originality/value: The described information system is the first information system described in the literature to combine agronomic and financial decision making in perennial crop planting.

Keywords: agriculture, information systems, agribusiness software

INTRODUCTION

In recent years a number of projects using ICT have been initiated to enable rural populations to access information on agricultural related issues (Gordon and Dakshinamoorthy, 2006; Paul et al. 2004; Scornavacca, 2006). However, it seems that research and development of IS that support decision processes in agriculture (Kuflik et al., 2007; Rydahl et al., 2003) is under-represented compared to the economic impact of this sector. In the European Union, the utilized agricultural area in 2007 amounted to more than 182 million hectares; more than 12 millions of people were employed in agriculture; in 2007, the output of the agricultural industry equaled 355 810 million euros (European Commission, 2009). Agriculture is estimated to supply 4% of the world GDP in 2008 whereas in 2007, 40% of the labor force was estimated to be occupied in agriculture (CIA, 2009).

Agriculture is one of the main branches of the agricultural sector which produces foodstuff for the population as well as raw materials for manufacturing processing industries (Minakov, 2005). Agriculture comprises of the crop sector and the livestock sector. The focus of this paper lies on the businesses in the crop sector, and more specifically with regards to perennial cultivation. This business sector is characterized by high capital intensity and low turnover of

capital, which makes it a less attractive option for investment compared to other industries and frequently requires state intervention for development (Minakov, 2005). Furthermore, the climate, a highly uncontrollable and unpredictable factor, is very influential to yields formation. In general, there may be many exogenous factors which could severely affect the production (Ternovih, 2006).

The traditionalism, unpredictability and low profitability of agricultural enterprises may be the hindering factors in the development of IS applications in agriculture. However, the complexity of running an agricultural business calls for software tools that can support aspects of operational processes. "Decision making and analysis in a modern agribusiness firm is multifaceted, complicated, sophisticated, and dependent on operational, financial, marketing, and planning activities" (Litzenberg, 1992). Furthermore, for a business so risky and unpredictable, it is especially beneficial to rely on an information system which would endorse decision-making and assist the enterprise management. Agricultural businesses rely on large data sets concerning the crops sowed, their utilization and sales. Better record-keeping and improved control on company operations are potential sources of significant money savings.

This research describes a system solution which addresses the decision support processes in the crop sector. It investigates into the range of possible information that can be helpful for decision-making in agriculture. It outlines the main data needed to be stored in such a system, as well as the information which can be produced using the data accumulated. Furthermore, this research draws conclusions as to the effects on the decision-making practices which the properly implemented system should create.

The research aims to study the information needs of agricultural enterprises in the crop sector and to outline possible solutions and lines of development in this area. Towards this aim, four objectives have been set. These include:

1. To review the nature and particularities of the businesses in question
2. To determine the useful data, which is feasible to be stored and processed
3. To propose possible output that the system would be capable to produce out of the data collected
4. To examine the system's potentials on decision making.

The value of the research relates primarily to its knowledge contribution to the field of information systems in agriculture. The research can be of further practical value since it may serve as a starting point for a comprehensive agricultural information system. Finally, it offers immediate practical value since the system proposed in the research can be implemented in an agricultural enterprise and bring instant positive impacts onto its functioning.

DOMAIN FUNDAMENTALS

In principle, an agricultural enterprise shares common features with other businesses; however, it has some distinct differences in the way it operates. Therefore, in order to gain insight into the nature of the business in question, as well as to interpret the developed system

and the information it requires and produces, it is important to understand this subtle, yet crucial particularities of the way agricultural businesses function.

In agriculture, land is one of the main assets and resources for production. The land of the enterprise is typically divided into fields, although it may be subject to further divisions. Compared with other resources, given proper usage, land does not depreciate, but in fact preserves its qualities. Results of agricultural production are dependent on the soil and climatic conditions. In other words, the quality of land and the content of nutrients can influence the harvest greatly (Minakov, 2005). Special care needs to be taken in order to sow the suitable crops on the land available. Thus, the described system has a module devoted to soils which would be helpful to the agronomist, as well as all other users in the sense that it would help to identify better fields in terms of nutrients.

The production cycle for agriculture is seasonal and not continuous, but rather intermittent. The seasonality has a significant effect on the way production processes are organized. Understanding of the crops production processes allows gaining insight into the type of information required at different stages.

The typical agricultural year starts with fields being ploughed and seeds being sowed (UK Agriculture). Although fields may have a variety of uses such as being rented out, their primary utilization is for planting crops. Crops sowed can be either annual or perennial. Annual reproduction means that a crop completes its life cycle in less than one year. Annual crops give gross yield every year, but need to be sowed every year, too. Perennial reproduction means that once sowed, the crop will reproduce itself for the next years (New Mexico State University). The exact timeframe is individual for different plants and depends on the weather conditions. Perennial crops stay on the same field for many years and are typically more profitable, but they do not give any harvest in their first years. Due to this fact, part of cultivated land is usually planted with annuals such as wheat or rye in order to yield income balancing current expenses.

Moreover, there is a widely used practice known as intercropping which should be taken under consideration when designing an information system in this domain. Intercropping is the agricultural practice of cultivating two or more crops in the same space at the same time (Wikipedia, 2008). Since the perennial crop doesn't yield anything for at least one year, it is recommended to combine it with an annual crop so that to leverage expenses. This way, there will be some gross yield from the annual crop while the perennial crop is not ready to give harvest, and later on the perennial crop will take over. Intercropping is economically effective since it makes possible to use the fields and get some return from them each year rather than sowing a perennial and waiting for a few years until it starts giving a return.

For this stage, the objective of the system is to provide comprehensive information about the utilization of all fields in a given year: it must show in a clear way what crops are cultivated on all the fields belonging to the enterprise. The database associates fields with crops sown in a many-to-many relationship, contains information whether a specific plant is annual or perennial, as well as provides for practice of intercropping and distinguishes field areas which are used for purposes other than growing crops.

Keeping this information allows to associate land and its uses and thus to improve clarity and permit unambiguous record-keeping. It is worth noting that even such straightforward

information as the location and amount of crops sowed on each field is often not available to the decision maker. Access to such data promotes better accountability and control, whereas lack of such fundamental data inhibits further analysis.

Seeds grow throughout a long period, with irrigation, pesticides or fertilizers applied if necessary (UK Agriculture). At this stage it becomes obvious which seeds have sprouted and the management starts making the first forecasts. In order to help them, the proposed system provides assistance in planning of revenue.

At the end of planting season, the crops are ready to be harvested: they are collected, dried, sorted and have weed admixtures removed (UK Agriculture). At this point it becomes possible to calculate the gross yield: the total amount of seeds that is collected from a crop in harvesting in a certain year. The actual gross yield is not the same as the sum of gross yields of the crop from all fields where it has been harvested. After drying, there is always shrinkage of total seed weight. By comparing the weights before and after drying, the manager can see if the loss is typical (e.g. he/she knows that the seeds were wet and thus the actual gross yield is much smaller) or if there is a discrepancy which needs further investigation. Additionally, in order to account for deviations between crops from fields of different sizes, yield capacity is computed by dividing the gross yield by the total area. Yield capacity is the amount of crop produced by a unit of area (Hlebutin E.B., 1978).

In relation to this stage, the system in focus is capable of storing data about gross yields and computing yield capacity. Gross yield is one the most basic indicators of the efficiency of any agricultural enterprise in the crop sector (Minakov, 2005). The value of gross yield in decision-making is that the user immediately can estimate what crops have had the greatest volumes and what crops have given poor harvests. High-yielding crops are more predictable and provide guaranteed yield and thus revenue assuming that they are not produced at a loss. To summarize, knowledge and comparison of crops in terms of yields promotes better planning for the next sowing season.

Finally, it is important to underline the fact that an agricultural business, contrary to self-sustained home farming, is a profit making organization; that is, crops ought to be sold at prices yielding higher profits, even though a portion of the crop may be used as input to the production process (seeds, forage, organic fertilizers etc). Although gross yields and yield capacity should be taken into consideration, financial information should be of primary importance to the upper management of such an enterprise. For this reason, the developed system contains a special module devoted to financial part of the business.

The data stored in the module is related to costs and prices of the crops, that is, financial information which affects the profitability of the enterprise. In other words, availability of data about costs and sales (primarily the selling prices and corresponding quantities) would enable the management to rank crops on their profit-making potentials. Based on the data, the system produces a number of reports which would permit the higher management to distinguish between crops based on a variety of characteristics with the main aim of identifying profitable and unprofitable lines of development.

DESIGN AND IMPLEMENTATION OF THE SYSTEM

Mainly, the system solution is based on the economic measures proposed by the research made into the economics of agriculture and strives to incorporate the ideas and economic indicators into an information system. Domain knowledge has been retrieved based on theory of economics of agriculture. In order to understand the nature of the business, its activities and information requirements, a number of information gathering techniques such as interviews, existing documents analysis and personal observation had to be used. A number of small agribusinesses have been observed, and employees ranging from agronomists to upper management have contributed their knowledge and judgment. Due to low availability of theoretic information on this subject, to a large extent implementation decisions were adopted based on personal observations of the functioning of the businesses in question.

Following is the description of the system divided into modules.

Fields and their uses (main module)

The main module of the system is concerned with keeping records about the main operations of the enterprise. It provides a graphical interface in order to enter the data into the database and performs the necessary checks to ensure that the data is complete and correct. The core of the system consists of two database tables: one for fields and the other for crops. The former consists of information about fields which does not change from year to year: field number, area, and cost of field. The Crops table is another fundamental table of the database which stores information about the "product line": different crops which are cultivated in the enterprise. It specifies the name of the crop, its genus and species in Latin, and the reproduction of the crop (whether it is annual or perennial).

Furthermore, for each year the system is capable of storing the following information: crops and intercrops cultivated on each field, together with the area occupied and the gross yield. Any other utilizations of the field are also stored. On the whole, the system represents comprehensive information on the uses of all fields in all years in an orderly way. Furthermore, total used and unused areas for the year are calculated so that the user can immediately see without any further computations whether the field has been fully used. Provided the concrete gross yields have been supplied, the module computes the yield capacity of each crop at each field. This feature makes it possible to identify fields which are not suitable for the crop, if the user notices that yield capacity on a specific field is much lower than on the others.

From the system, it is possible to obtain the total list of fields, including their cumulative area, total cost and total area occupied under crops. From this report, the user can get a perception of the land available for the enterprise. In addition to this, the list of crops can also be generated so that the user can get an idea of the "product mix" of the enterprise.

The module can also produce lists of unoccupied areas or fields which are not used in a given year. This information can be of interest for the managers and the agronomist. Having free areas is inefficient, especially if significant plots are left unattended. Moreover, this information can be useful in the sowing period when certain fields have already been sowed with some early crops, and decisions about the rest have to be made. Likewise, it can be helpful to see the fields not used in the worst case scenario, when there would not be enough capital to sow all the fields. In

such pessimistic case, it is at least advisable to change crops locations and make sure that no fields remain uncultivated for more than 3 years.

Soils

Whereas it is difficult to predict the climate, the information about soils, another significant external factor, is possible to be obtained in the course of scientific expertise. Soil samples should be taken from fields and results should be stored in a system. Based on the findings, the quality of soil can be estimated. Information about the acidity (pH), content of humus, potassium, phosphorus and texture of soil enables quicker, more thoughtful judgment and decision-maker's insight when deciding which crops to grow on a field. Knowing the physical characteristics of each field, an agronomist can make better decisions about the crops which should be cultivated on a certain field: certain crops would not grow on highly acidic soils; others give better yields on soils rich with phosphorous etc. Such information would also permit to identify crops which are not appropriate for sowing on a field. Moreover, it would be possible to identify better fields and sow them with crops which yield highest profits. At the same time, if someone wants to rent a field from the enterprise, other things being equal, perhaps it would be wiser to rent out a worse field. Obviously, an information system presents the accumulated data in a way which facilitates further analysis of soil and speeds up interpretation of data- for instance, by using color codes or by computing average values.

Forecasting

This module is helpful to estimate sales and revenues early in the summer when the actual data is unavailable for analysis. It contains the minimum data which can be forecasted in order to make the estimates. Using this module allows the managers playing with the data. Working with this module happens in the following way: in a certain year, the estimates are made for each crop cultivated by the enterprise. For estimates it is easier to predict yield capacity based on historical data. Although the fields are not homogenous, generally they should not vary much in yield capacity in a single enterprise, and estimates are usually made in this manner. Therefore, the user only has to enter the estimated yield capacity of the crop and the price the crop is expected to be sold. The module then computes the total area occupied by the crop and displays expected gross yield and expected sales. It also shows the cumulative expected sales. Working with this module, the user can immediately see effects of various prices or yields on the total expected revenue.

Another feature of this module is that it can compare the projected data with the actual outcomes thus permitting to assess the accuracy of forecasts and hopefully assist the forecaster in future planning. The report produced compares actual yield capacity with the planned, and the resulting gross yields. It also compares the planned price with the average price at which the crops have been sold in the chosen year. Moreover, it compares the maximum expected sales with the maximum possible sales under these conditions. Naturally, the maximum sales may not be achieved, but they indicate the maximum possible revenue from the crop. Performing such comparisons is necessary for any forecaster who would like to improve and upgrade his skills; analysis of previous deviations becomes the basis for future planning (Ternovix, 2006).

Finance

This module is devoted to the economic data and is most useful for assessing enterprise's financial performance. For each year, the data stored per crop includes the actual gross yield and the cost. At the present time, it is envisioned that the cost is imported from the accountants' data. The factual cost is calculated at the end of the year based on the results of accounting. While it is not available yet, it is acceptable to enter the planned or estimated cost. Besides, the module contains information concerning the sales of a crop in a particular season: dates, prices and quantities. The sale may not happen at the year when the crop was harvested; price is determined by the market conditions and may vary, especially if the crop is sold over a long period of time.

This module also records usage of crops other than sale. As it was discussed in the overview of agriculture, the seeds as the final product can be further used as an input. For instance, they can be used for sowing in the next season. The enterprise does not receive a profit on these seeds, yet it can not be said that it is a loss or these seeds are unsold and thus available.

On the whole, from this module the user can find comprehensive information on the uses of all harvested crops in all years. In order to minimize risk of theft, the module is also capable of comparing the cumulative gross yield (that is, the sum of gross yields of a crop from all the fields at the time of harvesting, before they were sent into drying) versus the gross yield retained after drying. Another feature is that it shows the amounts of crops which are still available.

Rankings

Rankings module uses data collected by other modules, primarily the financial module, and computes various indicators with the aim of comparing and analyzing crops in great detail. The module would definitely be indispensable in the process of planning since it gives a complete picture of all the crops. It is possible either to rank all the crops according to various factors, or to see complete information for each crop, or to see the information for the enterprise in general. Following is a list of indicators which are computed and permit comparison per crop.

- Actual yield capacity is computed by dividing actual gross yield by the total area occupied by crop. It shows how much quintals one hectare of land sowed with this crop has produced. Ranking crops according to yield capacity permits the user to see what crops are promising because they grow best and yield highly on the soils of the enterprise and what crops yield poorly and hence should be considered to be replaced. Although some crops may not be too profitable, a stable high yield capacity diminishes the risk of being affected by poor harvest. The enterprise should always consider sowing some of its fields with high-yielding crops provided they are at least breaking even. Actual yield capacity is one of the fundamental ratios in relation to crop planning.
- Cost: obviously, crops that are the cheapest to produce may not bring high profits, yet given the limited resources of the enterprise, investment in too many expensive crops may not be feasible and subsequently it would have to diversify with some cheap crops in order to occupy all its area.

- Total revenue is the total amount of money received by selling the crops. Crops yielding high total revenues bring in more cash to the enterprise. A stable revenue growth, even if the profits are stagnant, is attractive for investors and may facilitate obtaining loans.
- The level of saleability is an important ratio showing what percentage of actual gross yield has been sold. Enterprises should strive for a high level of saleability as it is the sold crops which bring in profit. There is no sense to sow a crop with enormous gross yield but which nobody wants to buy. Seeds are not perishable: they can be stored for a number of years, yet waiting too long for sales may negatively affect the cash flows. The agribusiness, especially if it has undertaken a loan, may not afford to wait for payback on its investments for long periods. Main factors affecting saleability are the demand for the seeds, the amount of seeds used internally, losses in the course of production, storage and transportation. In order to maximize and improve saleability, enterprises should improve production efficiencies and produce higher-quality seeds so that a smaller quantity would be set aside. The level of saleability normally does not reach 100% as there are always some seeds used internally (Minakov, 2005). Although consuming own production is necessary, it may probably not make sense to sow crops which would yield just enough to be sowed next year. On the other hand, highly demanded seeds should be focused at.
- Profit is definitely an important indicator which shows how much money is left after costs are deducted from revenues. In other words, profit is how much money the crops bring to the enterprise. Logically, the enterprise should identify and focus on the crops which bring consistently high profits. It must be mentioned that seeds set aside for further use etc should not be counted as a loss together with seeds which have not been sold yet. They are investments, and it can be viewed that the enterprise paid for them at their cost because otherwise, it would have to buy seeds from somewhere else.
- Profit per hectare facilitates the comparison between different crops. One crop may have a higher profit because it simply occupies a much bigger area. This ratio smoothes the differences in profit caused by different areas occupied, and permit a more unbiased comparison of them. When deciding which crops to sow, it is advisable to cover larger areas with crops capable of bringing more profit per hectare.
- Payback on expenses is a ratio generally used for enterprises which trade at a loss which is not uncommon for agricultural businesses (Minakov, 2005). This ratio is computed by dividing the total revenue by the total cost. It shows what percent of expenses is covered by the revenues. In other words, the amount of revenue per unit of resources consumed becomes evident from this ratio. The ratio higher than 100% indicates that the crop is profitable. The enterprise should only choose cultivate crops which pay off their expenses. In some cases, there government may subsidize production.
- Gross production per hectare of land is the indicator which assesses the economic efficiency of land. It is computed by dividing the total cost of the crop by the total area occupied by it and therefore shows cost of crop per hectare occupied. It is considered that the land is used effectively if it produces high-cost crops. Sowing with cheap crops is considered to be not good in the term of land resources because the same resources could have been used to produce more costly and usually profitable crops. Nevertheless, the

enterprise may not have the financial resources to sow all its land with the most profitable crops. Comparing the cost and profit of a crop per hectare, it would be possible to distinguish certain "best value" crops and maximize the profit received from the land available.

- Yield on land investment helps to assess the economic effectiveness of land. It is expressed as a ratio of cost of gross production to the cost of land occupied by the crop and shows to what extent the land is used to produce costs in monetary value (Klimentova E.A., Dubovitsky A.A., 2008).

Implementation and User Acceptance

There are no off-the-shelf software products in the market satisfying the required functionality for the system, as described above. Existing software packages support crop-related data, crops yield capacities and other agronomic characteristic. There also exists certain accounting software which facilitates creating invoices, calculating payroll and keeping the ledger. However, there are no applications tailored for agriculture which would deal with the financial part, and more specifically, which would permit comparison of crops based on financial indicators. For these reasons, in-house development was chosen which is not surprising as the business in question is so specific that it would be difficult to tailor an existing application for its purposes.

Design and modeling for data and processes have been addressed by an Entity Relationship Diagram (ERD) and a Data Flow Diagram (DFD), respectively. Figure 1 presents the Entity Relationship Diagram and Figure 2 presents the Data Flow Diagram. Based on user requirements, it was decided that the system should be implemented through database management software (DBMS). After examining some packages, the final alternatives singled out were Microsoft Access and Apache Derby. Advantages and limitations of both packages were examined thoroughly. In conclusion, Microsoft Access has been selected as it is a more appropriate tool for the task at hand. The system has been implemented and tested. For practical purposes, a detailed technical analysis is omitted although a demonstration is available. The system has been evaluated by end users. Some of the resulting improvements on business processes are listed in Table 1.

CONCLUSION

The described information system has introduced positive effects on a number of aspects. At the operational level, it provides effortless ad hoc retrieval of complete data, prompt distribution and sharing of data, as well as the benefits which most effective information systems should enable: automatic calculations and means of effective input and functional and appealing output.

Moreover, the developed system contributes towards many corporate objectives. This is even more important since the system was developed to assist higher management and the enterprise as a whole. It was not developed simply to automate processes and make them more effective or keep records. The impacts of the new system reach far beyond that.

In fact, the most challenging task in the sowing season is selecting the suitable crops so that to maximize the profit using the limited resources available. From the agricultural point of view, the structure of the sown area should provide for stable yields of high quality production and

better soil fertility, from the organizational point of view – for compliance with the specialization of the business and effective usage of the productive resources, and from the economic point of view – for maximization of profit from the unit of land (Ternovih, 2006). The rankings generated by the system permit the upper management to analyze crops from different perspectives: in terms of yield capacity, cost and profit. The developed system creates the information which can help the decision-makers to use the available resources to the best possible extent. Through analyzing the records kept through the years, it becomes feasible to choose best fits between the fields and the crops.

The system contributes to improved control mechanisms: availability of records about the gross yields reduces risk of theft going unnoticed, be that in the time of harvest, or later, when the seeds are stored in the warehouse. Any inconsistencies in the gross yields of the same crop in different fields would also be observed.

In general, the presence of factual records improves control and supports the operations of any enterprise. By analyzing yearly data concerning individual crops and the enterprise in general, it becomes possible to identify trends, threats and opportunities early in time and act accordingly. The availability of timely, up-to-date information is a source of time savings and definitely enhances cooperation with partners and clients. Besides, the system provides invaluable assistance when it comes to financial planning with the help of the forecasting module.

Finally, the positive extent of improved decision making can be incessantly speculated; the system developed provides a decision-making framework which can potentially contribute to better profits and cost savings.

³Swinburne University of Technology, Australian Graduate School of Entrepreneurship

Case synopsis: In February 2002, two fresh University of New South Wales IT graduates, Mike Cannon-Brookes and Scott Farquhar, founded Atlassian (after the Greek Titan Atlas), one of the fastest-growing technology ventures in Australia specialising in collaboration and development tools. Starting as a consulting business with total start-up costs of \$10,000, the founders realised that they needed an issue tracking tool enabling them to manage their own consulting projects effectively. This is how the idea of JIRA, Atlassian's first product, was born, soon to be followed by other products. By 2009, Atlassian had revenues of \$35 million (nearly all of them outside Australia), in excess of 15,000 customers in some 110 countries and nearly 200 employees worldwide, with offices in Sydney, San Francisco, Amsterdam, Kuala Lumpur and Poland. Throughout the years Atlassian remained highly profitable and privately owned with no institutional or venture capital investment and spent 40% of its revenues on R&D. The founders' ambition is to make Atlassian a \$100 million company with 50,000 customers worldwide. The main discussion points in the case are whether Atlassian's business model and entrepreneurial culture are further scalable in international markets and whether Atlassian should become more aggressive in its growth strategy.

Teaching objectives: The case allows the instructor to discuss a number of issues in entrepreneurship, strategy and general management in the context of a fast-growing global venture. Specifically, the instructor may wish to consider the following issues:

- The challenges of building a 'born global' IT company from Australia, where the broader industry and economic context is not conducive to international entrepreneurship;
- The process of entrepreneurship and venture success as a function of 'fit' between three drivers: the entrepreneurial founders, the opportunity and the resources they bring to bear on the venture;
- Atlassian's business model, its genesis, sustainability and scalability in international markets;
- Atlassian's strategic positioning and the strategic choices they made; and
- Maintaining a distinctive culture in a fast-growing company beyond the start-up stage.

INTRODUCTION

In late February 2009, Mike Cannon-Brookes and Scott Farquhar, co-founders of Atlassian Software, a global technology company, were sipping beer on the deck of their office in downtown Sydney. Only days ago Mike was chosen by the World Economic Forum from a world-wide pool of 5,000 candidates as one of the 230 Young Global Leaders for his professional accomplishments, commitment to society and potential to contribute to shaping the future of the world. Mike and Scott, both in their late 20s, had all the reasons to feel proud that their efforts had been validated. Starting in 2002 as a consulting business, the founders, then fresh IT graduates, soon realised that they needed an issue and task tracking tool enabling them to

manage their own consulting projects effectively. JIRA, Atlassian's first product, was soon to be followed by several other team collaboration products. By 2009, Atlassian had become one of Australia's fastest growing technology ventures, had revenues of \$35 million (nearly all of them outside Australia), in excess of 15,000 customers in some 110 countries and nearly 200 employees worldwide, with offices in Sydney, San Francisco, Amsterdam, Kuala Lumpur and Poland. Throughout the years Atlassian remained highly profitable and privately owned with no institutional or venture capital investment and spent 40% of its revenues on R&D. The company was equally well known for its transparent, vibrant and informal, yet highly professional culture. It received a sweep of industry and business awards (see *Exhibit 1* – Atlassian's awards), and in 2006, Mike and Scott became the youngest entrepreneurs to ever win the prestigious Ernst & Young's Entrepreneur of the Year Award for Australia.

Nevertheless, the current revenues and customer base were still a far cry from the founders' intent to grow a \$100 million company with 50,000 customers worldwide. As Mike and Scott pondered the future of Atlassian, they wondered whether they could scale the business in a way that did not diminish the creative vitality, enthusiasm, and customer focus that had got them so far.

ATLASSIAN'S EARLY YEARS

The Founders

Mike and Scott met in 1998 as recipients of the prestigious Business IT Co-op Scholarship at the University of New South Wales (UNSW). The program was set up by industry and the UNSW to provide financial reward and industrial training for undergraduate students in the disciplines of Commerce, Science and Engineering. UNSW Co-op Program scholarship holders received a tax-free scholarship of \$53,600 for a four-year degree and \$67,000 for a five-year degree as well as structured industrial training (between nine and eighteen months), gaining valuable work experience with up to four different sponsor companies. In addition to exceptionally high entry requirements based on scores from high school, Mike and Scott were selected on the basis of their motivation, leadership potential, involvement in extra-curriculum activities and excellent communication skills. Mike commented on the program²⁴⁰:

There were a very small number of places, \$15,000 a year tax free, which when you're at University is a lot of beer. And it requires a more American-style large application for that they cull down with interviews to get in. ...Everyone who gets in is very smart, very ambitious. You have to do computer science subjects and information systems subjects as well as finance and accounting, and commerce. It is really supposed to be business IT, technical and non-technical. ...It was an amazing bunch of people, a really good environment and a really good time to do it. We started in 1998/1999.

Like many of the scholarship holders, Mike and Scott came from different backgrounds. Mike's father was a successful British banker whose career took him and the family around the world. Mike was born in the U.S. and attended an elite private school in Sydney. Scott came

²⁴⁰ Interview with Mike Cannon-Brookes and Scott Farquhar, 6 September, 2006.

from an Australian family of more modest means and went through a prestigious public school in Sydney before joining the Business IT program. Avid readers, both were influenced by high-tech entrepreneurial success stories of the likes of Microsoft and HP and the rhetoric of magazines encouraging young people to ride on the Internet boom and embark on entrepreneurial careers.

Soon after a positive start in the program Mike became bored and restless, largely due to one of his first internships with an industry sponsor who had given very little thought to how they would utilise the bright student more effectively. Mike began spending a lot of time working on an online book-marking start-up with another scholarship student. They realised that people used different PCs to store their bookmarks (at home, university and work), which in the end could become a nuisance. Once the founders had collected all of their favorite sites, they flipped the service around to provide an efficient search engine of user-contributed links.

Firmly believing in the idea's potential, Mike and his partner, still only in their late teens, made the controversial decision to drop out of the prestigious program. The founders turned the start-up (called Bookmark Box) into a "mild success" and contemplated raising additional funds to grow the business, but were eventually outcompeted by cash-rich and aggressive American start-ups. After nine months of operation the founders sold their company to an American dot.com, staying on for three months.

Following this initial foray into business venturing, Mike went on to work for another NASDAQ-listed research firm while enrolled in night classes, and Scott took the more traditional BIT route which provided job placements of three to six months with established companies. A key element of Mike's job was to evaluate the business prospects and viability of other Internet start-ups, during which time he learnt "a lot of lessons about how not to run a business"²⁴¹. His 18-months stint at the company proved to be an exciting time: he earned a decent salary for a twenty-one year old and traveled extensively to Singapore, Hong Kong, Malaysia and China, where the Internet was just exploding. The good life came to an end in 2001 with the dot.com crash, when the company started shutting down its Asian offices. As Scott still had six months to graduate, Mike resigned and went back to the university full-time to finish off the loose ends and "get a piece of paper".

The Opportunity

In late 2001, Mike and Scott sat down to flesh out the foundations of their venture. Unimpressed by what they had seen in the corporate world and pre-revenue dot.com start-ups, who appeared to be interested more in quickly gaining market share than having a sustainable business model, they hatched the idea of a venture underpinned by an entirely different philosophy²⁴²:

Australians definitely build real businesses. We don't have this build and flip mentality that the [Silicon] Valley has. Australians are typically very good managers because we are used to dealing with scarce resources in the true sense of the word.

²⁴¹ Interview with Mike Cannon-Brookes and Scott Farquhar, 6 September, 2006.

²⁴² Interview with Mike Cannon-Brookes and Scott Farquhar, 6 September, 2006.

Business is pretty simple. At some point we've got to have a product that people like and buy, and we've got to get more money when we sell it than it costs to make it. There are businesses that don't operate that way. There are some that need to lose money to grow, but we didn't have the resources to build one of those businesses, so we didn't.

We didn't have a formal business plan...we knew what we wanted to do, and we had a massive dose of common sense and reality.

By the New Year they were generating some cash flow with software service and consulting for a small Swedish company. Although the application server the company developed was, in Mike and Scott's judgment, 'excellent', the company had no real interest in customers resulting in poor support. So Mike and Scott set themselves up as third-party support experts for the server selling annual subscriptions and trying to make some money until they could carve their own niche.

In February 2002, the entrepreneurs moved into a simple office in downtown Sydney. They named their company Atlassian, after the ancient Greek Titan Atlas, the first person to fulfill the new venture's mission to provide legendary service while supporting the world²⁴³. With a modest initial start-up cost, total expenses of around \$5,000 per month and a steady average monthly consultancy income of \$18,000, they had enough funds and time to work on improving their own business processes, such as managing the flow of various leads and commitments. Once the entrepreneurs had the program – named JIRA – up and running, they quickly realised they found their niche and their first product. JIRA helped project managers monitor the progression and completion of individual tasks. It was by no means a novel concept – in fact, JIRA was addressing a problem that had been solved a thousand times over the years, with plentiful solutions already available. The first few copies of JIRA were sold to clients Mike and Scott knew personally.

At the time of JIRA's launch, enterprise software companies sold software that was 'heavy' – expensive (frequently costing over \$200,000), difficult to use and taking months or even years to deploy. On the technical side, industry analysts were becoming increasingly critical of enterprise software in large organisations, which largely failed to fully integrate and intelligently control complex business processes while remaining adaptive to changing business needs. Enterprise systems, they argued, brought high risks, uncertainty and a high level of complexity, and the way forward was to emphasise simplicity and efficiency in software development and implementation²⁴⁴. Purchasing in large user organisations was centralised with the IT department, who strived to ensure new software compatibility with the overall corporate network, and typically involved a protracted decision-making process. Customisation, service contracts and staff training added on thousands of dollars, and a trailing fee of 18% of the license fee for regular software updates was the industry norm. A significant proportion of these costs were built in from the sales model. A typical software company would have a worldwide network of distributors, and a direct sales force who sold in the vicinity of one in every one

²⁴³ Atlassian company website, www.atlassian.com/about accessed on 15 May 2009.

²⁴⁴ See Cynthia Rettig (2007), 'The Trouble with Enterprise Software', MIT Sloan Management Review, Fall, pp. 21-27.

hundred leads. Needless to say, such software was out of reach of small and medium-sized businesses or individual consumers.

With JIRA Mike and Scott broke away from the mold, creating a new market niche between free open source software and expensive commercial software ²⁴⁵:

We sold copies to a couple of our clients for \$800. The clients got back to us saying "It sort of does what we need, but it could use one or two other components". Being small, being keen, we fixed it up in a week and shipped them out a new version. They said "Great, now it does what we want". We sold ten or more versions to people we already knew. We were not looking at what competitors were offering; unless somebody asked for a change – or we identified a need for something among ourselves – it didn't get built in.

Committed to providing legendary service, the entrepreneurs strived to respond to customer queries within an hour. Not having any sales experience probably helped: they simply tried to answer their customers' queries intelligently and as quickly as possible. In an effort to break further away from competition, Atlassian adopted an open-pricing model. While the usual industry practice for enterprise software firms was to have an online form to fill in or a number to call for price quotes, the entrepreneurs did not believe in discounting, having differentiated pricing or giving credit terms to customers. They did, however, provide JIRA (and all subsequently developed programs) free of charge to non-profits and half price to academia.

As project management software was usually sold on a per user basis, enterprise software firms designed their systems with limited features and number of users. Atlassian, however, made very different choices. Atlassian's products could be bought by the actual user using a credit card and put onto a workgroup's machine. While in the early days configurability and scalability proved problematic, with further software development these issues were partially resolved, and a customer could run multiple projects on one higher-end version. Nevertheless, because Atlassian's software was so keenly priced, large users preferred to buy multiple copies for different functional departments or different cities around the world.

The entrepreneurs acknowledged their customers saw considerable value in their products, many of them admitting that Atlassian's sold their software so inexpensively that they would gladly pay ten times more for it. Mike and Scott reasoned²⁴⁶:

That's good to know. But in reality, this is probably classic supply and demand, because as long as we are at a price that is cheaper than what most people regard the value to be, we'll keep on selling heaps of copies and upgrades. If we can get 100 customers at \$5,000, that's much better than five customers using us at \$100,000. If one of them leaves, you're in big trouble.

Our pricing also lowers the cost of selling upgrades. If we talk to them from time to time, they'll buy it. A thousand bucks? No problem, here you go. But thousands of dollars – thousands of times – means than we have lots of cash coming in the door every year for free.

Atlassian's business model and funding

²⁴⁵ Interview with Mike Cannon-Brookes and Scott Farquhar, 6 September, 2006.

²⁴⁶ Interview with Mike Cannon-Brookes and Scott Farquhar, 6 September, 2006.

Atlassian's business model was based on a few simple principles. Mike explained the early thinking behind their venture²⁴⁷:

Our business is based on a few premises. One is that we foresaw – foresaw seems a bit glamorous, doesn't it – but we guessed that basically the price of software was going to keep coming down for a number of reasons. One, the price of producing software – although producing scalable software is still quite high – the cost of some componentry, tooling and building it has come down, maybe it's halved in the past ten years. So we could build stuff a lot more cheaply.

The second linchpin was related to Atlassian's choice of the global distribution platform, the Internet. Despite their young age, both founders were well-versed in the web-based tools and had the confidence that their fairly sophisticated customers would have little problem downloading software from the Internet. In addition, Mike and Scott figured out that they did not need salespeople to sell their inexpensive software, nor could they afford them²⁴⁸:

This has always been a common sense business. We couldn't afford to have huge spikes in sales, or pay commissions and huge annual bonuses to a rep in the hope of making the big sales during the year. To keep our cash flow going, we had to have small, incremental sales that came without big marketing expenses.

The entrepreneurs were also trying to leverage the trend to "software as a service" (or usage-based) business models to essentially convert the 18% maintenance trailing fee (the industry standard) into an ongoing 50% support fee.

As a result of its positioning, JIRA quickly gained a strong word-of-mouth following that spread across the IT community, enabling the entrepreneurs to raise its price to \$1,200. Mike and Scott's ultimate ambition was to create a mass-market enterprise software firm – a notion which, by their own admission, seemed almost oxymoronic:²⁴⁹

One of our goals from day one has been to build a \$100 million business with 50,000 customers. Why? Because that's a big number. Doing the math, we figured an average price of \$2,000. This fits with our concept of selling high-quality enterprise software, with high-quality service, at very low price. To build that sort of business, we had to go to the mass market.

The broader business environment's conditions in the early 2000s, particularly the dot.com bubble and the 9/11 terrorist attacks in the U.S., helped to define Atlassian's funding and growth strategies. In addition, the Australian context in general and a lack of venture funding in particular was not conducive to entrepreneurship (see *Exhibit 2* – the Australian Entrepreneurial Environment in 2001)²⁵⁰:

For IT purposes, we started the company right in the perfect storm. In 2002, everything was tight, budgets had been cut, and no one was buying much of anything. If we had gone to [potential investors] saying we have no experience in the industry but we're going to start a mass-volume

²⁴⁷ Interview with Mike Cannon-Brookes, 8 December, 2008.

²⁴⁸ Interview with Mike Cannon-Brookes and Scott Farquhar, 6 September, 2006.

software company and we're going to go into markets where there are already 10 to 20 other products, they would have shown us the door in 30 seconds – and probably rightly so from their understanding of how things should work.

We knew we weren't going to raise any money, so we focused on making cheap stuff that was really good. We were talking with a lot of people who still didn't have budgets. They'd say "I don't have the bucks right now, I'll have to wait until next month". It may sound insane, but we were like - great, sounds like they're going to buy!

RAPID GROWTH

Innovation and customer service

Fuelled by JIRA's success, by 2004 Atlassian had grown to six developers. Unhappy with the bevy of wikis on the market, the team created Confluence, an enterprise wiki, Atlassian's second biggest product after JIRA. By 2006, Atlassian's customers ranged from very small two-person start-ups to very big enterprises like Cisco, Oracle and The World Bank, with half of *Fortune 500* companies reportedly using an Atlassian product²⁵¹. In January 2007, the company doubled the number of products when it released Bamboo and Crowd. The acquisition, in August 2007, of Cenqua, a US-based supplier of market-leading software engineering tools FishEye, Crucible and Clover, further expanded Atlassian's portfolio of products (see *Exhibit 3* – Description of Atlassian's Products). Early in 2008 Atlassian released JIRA Studio, a hosted version of its product suite²⁵². All Mike and Scott's ideas were developed into products to address their own 'pain point' following essentially the same pattern²⁵³:

We haven't really built anything without having the fundamental problem ourselves and actually trying to solve it, which makes what we're trying to do a lot easier. If you're solving your own problems, it's a lot easier to build something good.

Originally chalking up customer wins one at a time on a whiteboard, Atlassian started to gain hundreds of new customers per month. Its customer base and revenue quadrupled and tripled during the first few years (see *Exhibit 4* – Atlassian's customers and *Exhibit 5* – Atlassian's Milestones). One of the best customer testimonials was posted on the company's website: "We now have a pretty simple rule for products from Atlassian – if they've built it, we'll buy it"²⁵⁴.

Atlassian's transparent approach extended beyond its original pricing model to the software development process. Customers could raise feature requests as well as see what bugs had been reported. All customers received full source code, allowing them to customize Atlassian's products to suit their own environment. Atlassian worked closely with the open source software community in an admittedly 'symbiotic' relationship. All products were built using open source

components many of which had been developed by Atlassian and donated back to the community, enabling much faster product development at a lower cost²⁵⁵.

As the company grew, answering customer queries within an hour of the initial call became a difficult goal, but the entrepreneurs had not pulled back from their service commitments. All incoming communications were answered within 24 hours, and customers could call and speak directly to the person who could help, from a customer service representative through to senior software developers. By late 2008, Atlassian had several dedicated people in support, and a pre-sales team responded to the many hundreds of email queries on a daily basis. This side of business was difficult to scale fast enough. The entrepreneurs believed that their ability to scale up was related to their proven talent for pro-active problem-solving²⁵⁶:

Perfect support means if someone asks a question, we take time to ensure that no one ever has to ask that same question again – whether through improvements to the system, or with better documentation. This is because by the time we have 50,000 customers, we want to eliminate the need for support. Okay, in reality, this is never going to happen, but the support team needs to have that sort of mindset...We ought to be able to handle support for 50,000 customers with a dedicated team of around 100. That would represent an efficiency gain, but we have been getting efficiency gains in support all along. That's because our products continue to get better, and because we do more than just answer the query, we really extend the effort.

Mike and Scott considered Atlassian a product- and service-driven company, with the creation of new and innovative products being Atlassian's utmost business objective²⁵⁷:

If you divide companies into single categories you'd have product companies, marketing companies, sales-oriented companies, and we're without doubt a product-oriented company. You'd probably also have engineering companies, and I would say we're an engineering company. Product is our main strength due to the founders, the way we set up the business and also largely due to the business model that we have.

The company did not practice marketing in a conventional sense (as anyone in the world could order the product off the web) and spent very little on advertising or sales support, relying mostly on word of mouth. While in the early years marketing was everybody's job – particularly that of the founders, the Sales Director and developers – in 2006 Mike and Scott realised that hiring a Marketing Director could help to professionalise the business and propel further growth. An experienced VP Marketing joined Atlassian a year later, and by 2008 the marketing team had grown to well above 20 people.

HR practices

Finding technical talent had proved to be a major constraint on Atlassian's long-term growth, despite it being Atlassian's priority. Atlassian spent very little money on recruiters, with the majority of new hires coming from staff referrals or from the website. The website openly

²⁵⁵ Atlassian company website, www.atlassian.com/about accessed on 15 May 2009.

²⁵⁶ Interview with Mike Cannon-Brookes and Scott Farquhar, 6 September, 2006.

²⁵⁷ Interview with Mike Cannon-Brookes, 8 December, 2008.

declared: “HELP WANTED! Check out our current openings, we’re always hiring!”²⁵⁸ On occasions, Mike and Scott had to source talent outside Australia and closely followed Andrew Bassat’s advice (the co-founder of the highly successful Australian online recruitment company Seek) that it is better to wait for good staff than hire the wrong ones out of desperation²⁵⁹. The founders explained how they tried to keep top talent:²⁶⁰:

We pay people very well. We spend a lot of money on offices – internal offices, not external. Our reception area isn’t very flashy, our meeting rooms are basic, but we make sure everyone has a large flat screen on their desk. We spend a lot of money on filling the fridge with anything they might need. We take people out to nice parties, and work on maintaining a good office culture. I’m sure we could certainly save heaps by moving out of the central business district, but I know of at least three good people that would quit immediately if we did...We are very aware of not cutting costs where we actually make money from spending.

The choice of the head office premises in downtown Sydney reinforced Atlassian’s commitment to attracting talented people. The leased 1877 heritage-listed building was extensively renovated and cleverly refurbished to give it a quirky and modern but not over-designed look. It was one of the few office buildings in the area that had a large deck to hold staff functions.

In 2005-2006, Atlassian appointed an HR director to improve recruitment, leadership development and training systems. The founders hoped that the number of customers would increase faster than the number of staff, as each employee developed multiple skills across operations, invoicing or sales. Atlassian’s staff turnover was generally small and close to zero in some years.

Despite its exponential growth, Atlassian managed to retain an entrepreneurial spirit and create an organisation with distinctive culture. The founders were mindful of not stifling the early start-up stage excitement with excessive structures and processes so as not to lose the best people. As one of the elements of the organisational culture that did not scale were the founders themselves, in 2007-2008 Atlassian’s founders and employees worked hard on codifying Atlassian’s corporate values (see *Exhibit 6* – Atlassian’s values). These values became enshrined on the glass wall in the front office. Other ways of preserving the organisational fabric included founders’ lunches (where Mike and Scott took every new employee out for lunch), various corporate parties and events, and ‘FedEx Day’ and ‘lab days’ aimed to promote creativity. For example, during FedEx Day (introduced in 2006) Atlassian developers would create something of their choice and ‘ship’ it in 24 hours. This concept was subsequently copied by other companies, including Yahoo!²⁶¹

Global Reach

By their own admission, Atlassian’s founders had global orientation from day one, as their business could not survive if it focused solely on the Australian market. In 2009, Atlassian had

²⁵⁸ Atlassian company website, www.atalssian.com/about accessed on 15 May 2009.

²⁵⁹ Tim Treadgold (2006) ‘The Best of the Fast’, 12 October, *Business Review Weekly*.

²⁶⁰ Interview with Mike Cannon-Brookes and Scott Farquhar, 6 September, 2006.

²⁶¹ Atlassian company website, www.atalssian.com/about accessed on 2 June 2009.

about 200 employees worldwide in Sydney, San Francisco, Amsterdam, Kuala Lumpur and Poland. While most of the engineering, R&D, customer support and corporate functions were centralized in Sydney, other overseas offices had a number of different functions (see *Exhibit 7 – Offices’ functions*). The San Francisco office (in effect, Atlassian’s second main office) provided Atlassian with access to marketing talent not available in Australia, and other offices were established mainly for ‘time zone reasons’ to ensure 24/7 support. Atlassian aimed at four hours response for every interaction with the customers around the globe, be it by email, online, phone or chat.

Most of Atlassian’s senior management team had some international experience: for example, Head of Engineering started in the Silicon Valley, and the CFO had worked in Hong Kong and the U.S. The founders traveled extensively between Australia, the U.S. and Europe, sometimes spending as much as a fortnight per month away from the Sydney office. Ensuring coordination in what was quickly becoming a medium-sized multinational enterprise proved a continuing challenge.

Social Contribution²⁶²

Since it opened its doors, Atlassian had donated over 2,500 licenses to charities and not-for-profits. Some well-known charities that used Atlassian software included World Vision, The United Nations, The Fox Chase Cancer Center, The Sierra Club, The MS Society, The National Breast Cancer Foundation, The Red Cross, UNICEF and Amnesty International. In late 2006, Atlassian created a non-profit foundation to focus the charitable giving that had previously been ad-hoc by the founders. The Foundation adopted a ‘1%’ model: 1% of staff time (up to six days per employee per year), 1% of revenue and 1% of equity was donated to its Foundation. While some employees chose to work in soup kitchens for their six days a year, many opted to put their technical skills to good use, helping charities build the websites or internal systems.

Recognising the importance of education in its success, Atlassian annually sponsored \$USD60,000 worth of scholarships at the University of NSW. These scholarships encouraged students to enter the IT profession, and were often awarded to country students who otherwise could not afford to move to the city for university.

NEW CHALLENGES

Throughout the years, Mike and Scott shared the same mentality of growing their business conservatively and hedging their bets carefully. They ever only funded out of retained earnings, and hired people when they could afford them. Atlassian still did not have a Board, because in the past Mike and Scott would not have attracted the people of the caliber needed to grow Atlassian to a \$100 million company. The founders continued to eschew the typical sales, consulting and professional services revenue streams that diverted focus away from customers, maintaining their focus instead on creating innovative software. While in the relatively short span of seven years of its existence Atlassian had become very successful by Australian standards, its achievements looked modest when compared to U.S. start-ups: Google, for

²⁶² Atlassian company website, www.atlassian.com/about/press/background.jsp accessed on 18 June 2009.

example, turned over US\$6 billion at the end of its seventh year (2005). The founders wondered whether time finally came for Atlassian to become more aggressive in its growth strategy.

EXHIBITS

EXHIBIT 1 – ATLISSIAN’S AWARDS

Read Write Web's Top 10 Enterprise Web Products (2008)

Part of its series of top products for 2008, ReadWriteWeb named Confluence to its list of Top 10 Enterprise Web Products. We are honored to be part of this year's list which includes the likes of Amazon, Google and SalesForce.com. As RWW says: "We are seeing major wiki adoption in the enterprise. It is simply a much easier way to collaborate than by putting lots of complex technology under the general umbrella of the Intranet...Atlassian seems a safe bet for enterprise, having traction and a good breadth of products."

EContent 100 (2008)

Atlassian Confluence was selected for the EContent 100 awards in the Collaboration category. EContent writes, "Everyone knows they should play well with others. But frankly, that's tough enough for a lot of folks. When those others span the globe and never meet, things get a whole lot more complicated. Collaboration tools enable teamwork, web-style, which emphasizes shared knowledge and member contribution, regardless of proximity."

Deloitte Technology Fast 50 (2008, 2007, 2006, 2005)

For the fourth year in a row, Atlassian was named as one of the winners of the 2008 Deloitte Technology Fast 50. The Fast 50 ranks the fifty fastest growing technology companies, public or private, based on percentage revenue growth over three years (2006-2008). Atlassian achieved a staggering 255% growth in revenue over this period and was accordingly ranked #20 among the Fast 50.

City of Sydney Business Awards (2008)

Atlassian took home two awards from the City of Sydney Business Awards including being named winner of the City of Sydney's Business of the Year. The ceremony took place at Doltone House and was presided over by Lord Mayor Clover Moore MP. Atlassian competed with 260 other Sydney-based businesses to win the Information and Communication award, recognising Atlassian as a leader in business technology, as well as the overall honour of Business of the Year.

NSW Pearcey Award (2008)

The Pearcey Awards is an Australian State Award that is given to an individual early in their career. Atlassian's founders Mike Cannon-Brookes and Scott Farquhar were jointly awarded this honour for their demonstrated innovative and pioneering achievements, and their contributions to research and development within the ICT industry.

SDTimes 100 (2008, 2006)

Atlassian was once again named to the prestigious SDTimes 100 list, which recognizes those companies, organizations and individuals that most broadly 'set the agenda' in the software industry. Atlassian won in the Application Lifecycle Management category which recognized solutions that supported the spectrum of collaboration workflow from start to finish.

SmartCompany Award (2007, 2008)

For the second year in a row Atlassian was named one of the Smart50 companies in Australia. SmartCompany spent months combing through hundreds of applications, from start-ups to companies with up to \$200 million revenue, to reach this final 50, which are ranked on revenue growth over three years. Atlassian was ranked 17th on the Smart50 List and took out the Top Exporter award which is judged based on the company's profitability, growth & innovation.

BRW Fast 100 (2005, 2006, 2007)

For the third year in a row, Atlassian was selected for the BRW Fast 100. The BRW Fast 100 is a list of Australia's fastest-growing small and medium-sized businesses, ranking companies with up to 200 staff according to their average annual turnover growth over three years. Atlassian achieved 168% growth in the last year, ranking it the ninth fastest growing company in Australia.

Ernst & Young's Australian Entrepreneur of the Year (2006)

Atlassian's founders Mike Cannon-Brookes and Scott Farquhar were named Ernst & Young's Entrepreneur of the Year for Australia. After being named Young Entrepreneur of the Year, they qualified to be in the running for the top honours. At just 26 years of age each, Mike and Scott were the youngest winners of the overall category award which honours entrepreneurs who are building and leading successful, growing and dynamic businesses.

In addition, Atlassian's products won a number of industry awards.

EXHIBIT 3 – DESCRIPTION OF ATlassian'S PRODUCTS

**JIRA**

JIRA lets you prioritise, assign, track, report and audit your 'issues,' whatever they may be — from software bugs and help-desk tickets to project tasks and change requests.

Confluence

Confluence is a simple, powerful wiki that lets you create and share pages, documents and rich content with your teammates.

**FishEye**

FishEye opens your source code repository and helps development teams keep tabs on what's going on using a web interface.

Bamboo

Bamboo automates the process of compiling and testing source code, saving time and instantly alerting you of build problems.

Clover

Clover measures code coverage generated by system tests, functional tests or unit tests, allowing you to improve test quality and find bugs sooner.

**Crowd**

Crowd is a single sign-on (SSO) application for as many users, web applications and directory servers as needed — all through a single, intuitive web interface.

**Crucible**

Crucible is a peer code review tool that allows teams to review, edit, comment and record outcomes.

JIRA Studio

JIRA Studio combines Atlassian's bug tracker, wiki, and development tools with Subversion source control to deliver an integrated development suite.

EXHIBIT 6 – ATLISSIAN’S CORPORATE VALUES**“Open company, no bullshit**

Atlassian embraces transparency wherever at all practical, and sometimes where impractical. All information, both internal and external, is public by default. We are not afraid of being honest with ourselves, our staff and our customers.

Build with heart and balance

Everyday we try to build products that are useful and that people lust after. Building with heart means really caring about what we're making and doing — it's a mission, not just a job. When we build with balance we take into account how initiatives and decisions will affect our colleagues, our customers and our stakeholders.

Don't #@!% the customer

When we make internal decisions we ask ourselves “how will this affect our customers?” If the answer is that it would 'screw' them, or make life more difficult, then we need to find a better way. We want the customer to respect us in the morning.

Play, as a team

We want all Atlassians to feel like they work with Atlassian, not for Atlassian. We think it's important to have fun with your workmates while working and contributing to the Atlassian team.

Be the change you seek

We think Gandhi had it pretty right when he said “We need to be the change we wish to see in the world”. At Atlassian we encourage everyone to create positive change — we're constantly looking for ways to improve our company, our products and our environment.

Disclaimer:

We realise that some people might find our values offensive, please be assured that we are not out to offend/shock/irritate you. Atlassian got where it is today by being openly and publicly ourselves. All these values have evolved from phrases and principles that we use and live everyday.”

THE ECONOMIC ANALYSIS OF INTELLECTUAL PROPERTY RIGHTS STRATEGY

Zaninovic, Jasenka¹; Majic, Helena²

¹Department for Law, Zagreb School of Economics and Management, Jordanovac 110, 10 000, Zagreb, Croatia

²Department for Law, Zagreb School of Economics and Management, Jordanovac 110, 10 000, Zagreb, Croatia

Modern economy is driven by ideas, informations and innovations. Companies, no matter if they are supported by governments or not, invest in research and development continuously.

These investments include costs of human resources, technologies, industrial goods, lasting development period combined with financial risks in development period and financial risks in market-positioning period. Cost and risks of R&D are most likely to exceed investor's real economic potential. Contrary to this, investors and firms tend to find the way to finance expensive and risky R&D projects because of the perceived gains and advantages they expect in terms of their market position, profit and social and business respectability. However, there is always a need to use some form of assurance instruments that will cover at least partially potential risks and costs. The most common and probably one of the most used instruments (beside various forms of insurance) are Intellectual Property Rights (IPR). Industrial sector and scientific community emphasizes the importance of patent and other IPR. Investors and companies, in order to use benefits of this instruments must develop adaptable business strategy based on the legal protection of intellectual property rights and other specific factors, such as culture, environment, tradition, proper marketing strategy etc.

The paper confronts two concepts: a concept of private IPR strategies and government support programs, but also emphasizes a need and some results of their cooperation.

Key words: Marketing in Public Services, Communication Strategy, Public Perception

INTRODUCTION

Advantages and disadvantages of private IPR strategies and their benefits and shortcomings for investors and firms derived from a national strategy. Legal framework and government support programs for R&D. The most important benefit of Patent Law and other IPR is assurance of further R&D activities. This paper investigates if IPR strategies assure investors and companies to take profit from protected innovation that will exceed the costs of project and also allow them self-financing of further R&D activities. If an investor expects profit, he will be more encouraged to invest even more and overtake the risk of new projects and innovation. IPR strategies also encourage industrial and scientific development which is not only in interest of private corporations, but also in interest of government and social community. Its main benefit and protection for innovators and investors – exclusiveness – may also result in one of its main shortcomings – monopol. Monopol that Patent Laws may create manifests in three different directions – monopol over informations, monopol over invention representing specific new technology or product potentially of a wider interest for social welfare and monopol on markets in respect of profit. Although IPR strategies may create an incentive for further research, it may also result into strict control of new, valuable informations for scientific community creating

profit for innovators and investors, but excluding others. We have to be aware of the fact that any future research or innovation is based on knowledge and research results we accomplished in past or accomplish now. The incentive is strong, but not optimal, especially if combined with lengthy patent life span. As much patent life exceeds, profit is higher, but control over information becomes stronger and prices higher with more negative effects. We find examples of this statement in transfer of new technologies to the developing countries encountering high prices, high costs of implementation or sometimes even failure of implementation due to lack of specific knowledge and know-how. Patent also affects market – it denies an opportunity to other competitors to grow or pushes them into a race with inventors producing higher costs and uncertainty in their future business activities. We find many examples of companies swept away from the markets by competition and their costs of investment were merely returned by profit in sales. However, some of the negative effects of patent protection may be tendered by government involvement if certain innovation is of a public interest. This system compared to one in USA is being preferred in EU and Japan. It relies on government support programs for R&D projects and cooperation with scientific community and innovators. Optimal patent protection is obtained by prerequisites of these programs: shorter patent life span, contractual obligations of licencing, shares in profit and disclosure of informations applicable to other R&D projects.

LEGAL BACKGROUND

The roots of the intellectual property system in Croatia date back to the second part of the 19th century, since the common Croatian and Hungarian Parliament passed two important laws concerning intellectual property: the Copyright Law²⁶³ and the Patent Law²⁶⁴.

The intellectual property protection has been continually present and developed from those time and up to the present day in accordance with the highest international legal criteria²⁶⁵ and the needs of the growing industrialization and international trade.

First, the Constitution of the Republic of Croatia guarantees²⁶⁶:

“... The State shall stimulate and assist the development of science, culture and the arts. The State shall protect scientific, cultural and artistic goods as national spiritual values. Protection of moral and material rights deriving from scientific, cultural, artistic, intellectual and other creative activities shall be guaranteed ...”.

Second, adopted laws²⁶⁷ and regulations primarily protect the interests of right holders and market competition. Only exceptionally is protecting a public interest, when and if for the legislator is more important a social well-being.

²⁶³ On 4 May 1884

²⁶⁴ On 7 July 1895

²⁶⁵ Paris Convention for the Protection of Industrial Property of 1883 and Berne Convention for the Protection of Literary and Artistic Works of 1886.

²⁶⁶ Article 68 of the Constitution of the Republic of Croatia

²⁶⁷ Patent Act (OG No. 173/2003, 87/2005, 76/2007), Trademarks Act (OG No. 173/2003, 76/2007), Industrial Design Act (OG No. 173/2003, 76/2007), Act on Geographical Indications and Designations of

Incorporated the latest normative standards in the field of copyright and industrial property²⁶⁸ in the national system, Croatia provided the highest criteria of protection of intellectual properties with regard to the manner of acquisition of protection, duration of protection, the exercise of rights as well as enforcement of the rights.

But to this range of the rights should be add other institutes as eg: trade secrets²⁶⁹, know-how, firm²⁷⁰. This instruments could achieve a similar effect as listed instruments, but in the most cases they are using as additional instruments of protection of industrial property rights in order to control over the information and the exclusion of third party business information firm.

NATIONAL IPR STRATEGY – PRIVATE IPR STRATEGY

Importance of intellectual property rights for Croatian economy effected a creation of a national strategy for development of intellectual property²⁷¹. This strategy created for the period of time from 2005 untill 2010 the basic conditions for a) ensuring the level of protection of IPR similar to that existing in the EU, b)harmonizing the level of protectiona in accordance with all international obligations and agreements binding Croatia, c) improvement of the enforcement of intellectual property rights, d) improvement of institutional framework such as inspectorates, custom, administration, police, justice, e) the improvement of intellectual property as a power tool for economic growth and the originator of the scientific, cultural and overall social progres in order to reach the aerge level of such use in the leadign EU countries, f) establishing incentives for the right owners.

In the area of research and development that contribute to the general public interest or community, and, or where a particular industry in which research and development carried out is marked as a strategic industry of the national economy, the costs are often covered by state through the scientific community support programs or programs of public-private partnerships.

Therefore, but not only because of that, the national strategy is or could be a base for private IPR strategy.

As it was mentioned, intellectual property rights could be the power tool for economic growth of any company with a vision of effective exploitation of intangible goods. And vision has to be a basis for creating of private IPR strategy of the company.

Of course, in creating the IPR strategy should not be taken in account only the appropriate forms of intellectual property – incorporated in the appropriate laws - but also the technical properties or aspects of products, design, quality, function and price of the products to attract consumers, as well as the necessary financial means for process of protection of the rights on domestic or/and on international level, for product development and producing, marketing

Origin of Products and Services Act (OG No. 173/2003, 76/2007), Act on the Protection of Topographies of Semiconductor Products Act (OG No. 173/2003, 76/2007)

²⁶⁸ Instruments of protection of intellectual property rights includes now: patent, consensual patent, trademark, industrial design, geographical indications and appellations of origin, topographies of semiconductor products

²⁶⁹ Steven Shavell, *Temelji ekonomske analize prava*, Mate d.o.o., Zagreb, 2009, p.137

²⁷⁰ The provisions of the laws on Trade Secret, Unfair Competition, Corporationame

²⁷¹ In the year 2004

strategies, including product price compared to competing or similar products in order to get a realistic value of the good.

But the appropriate form of intellectual property should insure the owner an exclusive rights and that could be a primary factor in a decision making process.

Considering all mentioned – or depending on the circumstances some other facts not mentioned yet – it is very important to decide which instruments of protection will be used.

ECONOMIC JUSTIFICATION FOR THE INTEGRITY AND EXCLUSIVITY RIGHTS OF THE PATENT OWNER

Subject of protection

Intangible goods as a products of the human mind have certain value for their owners and for society. The value certainly is not the same for the individual - owner of the goods, and for the society, but the emphasis is always on protection of human creativity, which ultimately contributes to the general social development.

Intangible goods are the object of the protection. They could be protected by one or more various instruments of intellectual property, which could be mutually complement. So, patent protects a new solution of technical problem, industrial design protects a new external features or shape of product and trademark protects a sign used to label or name product and/or service.

This instruments, named as industrial property rights²⁷² allows their holders protecting of their intellectual creations. Therefore, it is essential a standard of the protection, which authorized the right holders to prohibit the third party a credit of the creation of intellectual creations, or to exploit them without his approval, or in case of violation or misuse of the rights by ensuring the appropriate administrative, civil and criminal legal protection. So, it is secured the control over the acts of third party - the control over the information in the process of creating the work, the control over the distribution of the work, the control over the terms of use of the work or economic terms, and, in the economic sense very important issue, the control over income from the intellectual rights. Of all instruments of the intellectual property rights, these characteristics are considered to be the most prominent in the field of patent protection, because, it seems that patents are very much related to technological progress than other industrial properties instruments. But it looks quite different in the real world because the sale of goods, as well as the sale of firm, really means the sale of trademark or industrial design, although it is in the same time the sale of technology too. Only in cases of buying very technical sophisticated goods or equipments the emphasis is on patents.

From the economic point of view can not be regarded trademark or industrial design or other industrial properties as less valuable instrument of the patent.

Therefore, for the purposes of this work will be analyzed the characteristics of the patent, trademark and industrial design and their effects.

Arguments for exclusivity and monopolisation

²⁷² For the industry this rights are more important than copyright

Patent

Croatian law defined as a patent an invention in the field of technology that is new, have an inventive step and is industrially applicability. Therefore, it is an original intellectual creation of the inventor, which is a novelty in the current state of science and technology and represents an advance over existing knowledge, and can be applied in the production process. Why did the inventor need protection?

First, a moral right of the inventor. Inventor, who has with own knowledge and own work achieved the result – invention – and because of that should be always recognized as the creator of the invention. The patent owner has the exclusive right to create, use, placing on the market or sell his invention/patent and in the same time he has the exclusive right to require from third parties to respect his invention, forbidding them the use of the results of his work, or allowin them the use of the results of his work, but under conditions which he determines (usually giving a licensee or through other agreement transferring the patent). The patent owner not only exclude third parties from unauthorized use, but also he exclude them from information and facts that were an integral part of the process of invention, at least before the registration becomes publicly available or longer in the case that same facts are keeping as trade secret or know how.

Other exclusive rights of the patent owner are linked on economic or business function of patent. Objects of the patent protection are industrial applicable inventions and the patent owner expects that he will obtain a profit exploiting the invention and distributing it as a product, but in the same time he monopolizes the profit of the patent. This right is the result of high costs in the proces of creating of invention.

Second, profitability of financing of R & D projects. Research, regardless of the investment, does not necessarily result in a favorable outcome, ie invention, and especially not patentibility invention. But, there is no guarantee that the invention could be industrial applicable. Then, even if it is industrial applicable, there is a risk in the period of market placement of the product. No one guarantees that the invention / patent would be able to win the corresponding market share or not to be squeezed from the market of competitive products. Market research on the needs of consumers as well as the existing competition for sales of new products with simultaneous selection of trademark attractive for consumers are the tools necessary for further market penetration.

Third, a risk of competition. The entire period of research requires protection from industrial espionage, while in the process of making business decisions is important to know if, and or a competitor does research and investment in identical or similar products. The same could be in the phase of market placement and positioning²⁷³. The increasing of the cost – particulary activities of advertising and marketing - could be caused in both cases.

Therefore, the patent provides the owner exclusive rights to create, use, placing on the market or sell the invention protected by patent. Therefore, the patent is property whose owner can expected an income from the patent. The sence of the patent and patent exploitation is to

²⁷³ Unsuccessful example of this investment is Sony's MiniDisc, which is at the phase of market placement and positioning was suppressed of competitive manufacturers of MP3Player

recover the actual cost of investment plus planned investment costs and risks to ensure that the research and development exposed. After the return of initial investment, the patent will enable to achieve the profit in the phase of market distribution. After the stagnation and, or decline in the phase of market placement, by transferring the patent to third could be made further profit. Profit and return on assets achieved in all three phases in particular will depend on the duration of patent protection, so it is understandable that the longer life is in the interest of inventors and investors .

Appropriate patent protection, which provides more rights to the owner will motivate the business community to continue with further research and development of projects which may have a beneficial to the whole society.

Trademark and design

Undoubtedly is that consumers perceive the trademark and design of goods first, and then the technical characteristics. Generally, it can be argued that trademark and design sell goods more than patent. What makes so attractive this distinctive features?

If the trademark is defined as an instrument that protects a sign which serves to distinguish the goods and, or services of one person from other persons in the market, it is clear that the attraction lies in the possibility that the same or similar goods and, or services could be distinguished by marked sign.

If the design is defined as an instrument that protects external appearance of a product in whole or in part, it is clear that the attraction lies in the possibility that the same or similar goods could be distinguished by its spatial or blade characteristics visible at ist normal use.

In both cases just mentioned characteristics provide the owner exclusive rights. Which one?

Trademark provides the owner exclusive right to put in the products and, or services market by it, and design provides the owner exclusive right to use or produce, supply, putting into circulation, import or export products in which the design contained in or by design applied.

Exclusive rights, just as in the patent case, is the magic word that gives the owner the right to prohibit the third person to use his rights and that gives him the right to authorize the use of other people in a certain time for a certain royalty.

The market power can arise from the recognition od trademark or disagn of the product, as they represent of the first symbol, which is linked to our experiences.²⁷⁴

The result of great potencial of recognizable marks and, or designe is that has less space to create new features. Therefore, it is not suprising frequent violations of owners rights and his goodwill, which leads to damage to both parties: the owners, because they have to protected their rights in court proceeding and the consumers, because they do not get the right information about the source, quality and other characteristics of the goods and, or services.

²⁷⁴ Cornish underline that in the case when you would not have been available means to distinguish the goods according to the source would prevail over the lowest common denominator quality ine would be any incentive for competitors to be better, W. Cornish, : *Intelektualno vlasništvo - Sveprisutno, ometajuće, nebitno?*, Omnilex, Zagreb, 2008, p.115.

Arguments against exclusivity and monopolization

Patent

Exclusive rights of the patent owner, despite of a protective function, could have some negative effects. Although, a monopoly is precisely that what gives meaning to patent protection, there are some negative effect of the monopoly for further research as well as negative effects on the market.

First, the patent creates the monopoly on information and invention, at least during the period before the publication of the patent application. Namely, an integral part of the patenting is publication of the patent application, after which the information about the invention became publicity available, regardless of whether the proceeding in the patent to be granted or not. The other solution is to keep the invention as trade secret in which case the inventor bear the risk of possible foreign knowledge and use of invention not having any effective remedy to prevent such use.

The monopoly of information may be understandable and justified due to the nature of products and competition, however, but what is with the information that are potentially of general public interest and use and, or are necessary for further research. In this case, strict patent protection, particularly a long-term protection is against the public interest. Such effects could be avoided by co-financing research projects of social interest of the state or by legislation.

Second, the monopoly on the invention and the product can be unfavorable too. Namely, the monopolisation of products through the prohibition of exploitation without compensation of the inventor or manufacturer, or monopolisation of distribution through specific distribution channels is negatively reflected particularly in the areas of technology patents and technology transfer. Although certainly is not the only reason, and perhaps not even crucial, we can conclude that the monopoly of technology contributed to the gap between developed and underdeveloped countries and developing countries have done economically dependent on technology transfer from developed countries. The developed countries have transferred new technologies to developing countries according to their high prices, often only after the patent protection period has elapsed (do not be surprised but it actually happens even in Croatia) or when the protected technology in terms of technological development becomes obsolete. This situation perpetuating the technological underdevelopment of developing countries and their technology due to high price makes it inaccessible²⁷⁵.

²⁷⁵ Even when the patent protected technology makes available to developing countries, they are faced with serious problems in their implementation. First, the transferred technology for the degree of complexity can be implemented in the existing level of technology of countries, because it is not compatible with existing technology, or the country has not the production capacity. Second, due to lack of educated staff can use to schedule due to lack of skills and knowledge required for the use and maintenance of technology.

Third, the monopoly of the patent-protected product can adversely affect the market conditions and the allocation of resources, creating the market in favor of a particular manufacturer or distributor and disturbing the market balance and competition²⁷⁶.

Fourth, the monopoly price policy may be conditioned by the protected products to the detriment of consumers as an option for the formation of too high (monopoly) prices. Although the current conditions, increased competition in the global market on one side and the financial disturbances and because of that reducing of a purchasing power of consumers on the other side, there is no many companies that can lead long-term policy of high prices without suffering damage in thje same time.

Croatian Patent Law contains some regulations that attempt to avoid the adverse effects of monopoly patent protection.

Thus, art. 63 of Patent Law specifies exclusion from patent protection in the cases when the subject of patent protection are procedures and tests on an object protected by patent applied for registration or the discovery of new drugs or medical products in order to protect the public interest that is social, giving him previlage in relation to the interests of the patent owners.

Even more important is the institute of compulsory license regulated by art. 68 of Patent Law excluding the inviolability of the rights of patent owners in order to protect the national and or public interest, the competitors in the market and market competition itself (in the last two cases in particular suppressing the monopoly of the patent owner).

Must be emphasized that our Patent Law permits a granting of compulsory license in the case of non-exploation of the patent, although this institut does not limit the monopoly. The compulsory licence could be given at the request of any person, but after a grace period of four years of filing the patent application or three years of patent granting. As the compulsory licenses can be issued to protect and, or to improve certain industries, then we can conclude that the law limits the patent owner, however extensive, and motivated not only because of the public interest, but also because of economic and macroeconomic considerations.

Trademark and design

Considerations about the benefits and negative aspects of exclusive rights of the patent owner could be in large part related to the trademark or design owner, respecting the specifics of each right. But not only that there are limitations in obtaining first registration – the basic condition that the sign has to meet in order to became a trademark are that it should be distinguished and not like as earlier trademark, or news and individual character of shape in order to became design - there are provisions about duration of the rights paying appropriate fees and, setting requirements for genuinely use of the trademark by the owner. Otherwise exclusive rights chease.

However, we believe that the fascination of trademark and design caused not only high prices which are often not followed by the appropriate quality of goods - mutatis mutandis of service - but it is one of the causes of the present recession. In fact, the market pays more attention to the

²⁷⁶ Ig: Microsoft which is recognized by the largest ever amount of fines for violation of the rules of competition in the European Union

successful design and markings as the basic values of the company, which comes due to the unduly high price of shares

PRIVATE IPR STRATEGY AND NATIONAL RECOGNATION

An excellent example of good private IPR strategy and state upgrading is a project „Croata,, based on the historical fact that the tie is Croatian invention.

„Did you know that the cravat originates from the Croats,, is a slogan that began the project. The project was not only limited to product design - a tie (Croatian: kravata) as the symbols of the Croatian national and historical identity - which is protected as design - but also the product is conditioned series of moves that led to one of a strong Croatian brand as bellow:

Graphic-Verbal Brand

Verbal Brand

Of course, this brands are protected by trademarks.

Function of the marks – and design too - is not only to familiar consumers with the product - a tie - but also to discover the historical truth about the ingenuity of a small nation – Croats - recognized by the major nations and its contribution to the development of this product. This piece of cloths round a neck, was wearing by Croatian soldiers in the Thirty Years War (1618.-1648.), and recognized as a nice decoration by the French people, who developed it and improved it, and than by the English people, who contributed to the development of a cravat too.

The result ist that the „Cravat,, (tie) became not only the symbol of Croatia that the symbol of Europe or a world, depends on who is talking on, or better who is wearing on²⁷⁷.

What is the symbolism of the tie? According to the authors of mentioned project „the cravat is a universal symbol of elegance and the culture of dressing, but its powerful symbolic potential contains many other values. The vertical cravat symbolizes the human vertical – human dignity and self-awareness, moments of solemnity and ceremony, success and a business spirit... With its lightness on the one hand and the knot on the other, the cravat “binds” together freedom and responsibility. It encourages us to be more aware in our communication of our dignity and the dignity of others - our freedom, but also our responsibility.,,²⁷⁸

²⁷⁷ Kravata (tie) is common custom in male elegance, especially specific professions or specific events or elderer generation

²⁷⁸ <http://academia-cravatica.hr/>

Idea „ Cravat,, led to other projects as²⁷⁹:

- Academia Cravatica which was founded in the year 1997 with „ the mission of promoting the tie or cravat as part of the Croatian, European, and world cultural heritage, and as a special medium of communication. The cravat is the only Croatian symbol which is universally known and appreciated, and at the same time is recognized and acknowledged as a Croatian symbol,
- the installation “The Cravat around the Arena” in Pula on 18th October 2003 - and later in some other countries - as a major world performance,
- Museum of Cravats (in establishing
- Development of special stand for cravats, protected as patent.

The project have received a state support in a terms of promulgation of Cravat Day on 18th October²⁸⁰. The important thing is that the Cravat Day is not only marked in Croatia, the homeland of the tie, than even in some other countries as Japan, Egypt, Italy and Germany.

This project from product to project shows all possibilities of IPR strategy and IPR instruments used to development the brand of company²⁸¹ as well as the brand of Croatia, recognize as the national brand power value for Croatia by the Croatian state.

CASE STUDY: MARKETING IN PUBLIC SERVICES – MARKETING STRATEGY OF CROATIAN MINISTRY OF JUSTICE IN THE PROCESS OF REFORMING THE SYSTEM OF JUSTICE

Zaninovic, Jasenka¹;Hodak, Ljerka Mintas²; Majic, Helena³

¹Department for Law, Zagreb School of Economics and Management, Jordanovac 110, 10 000, Zagreb, Croatia

²Department for Law, Zagreb School of Economics and Management, Jordanovac 110, 10 000, Zagreb, Croatia

³Department for Law, Zagreb School of Economics and Management, Jordanovac 110, 10 000, Zagreb, Croatia

According to Kotler, public institutions providing services to citizens use marketing in public services as an instrument of managing their relationships with public and instrument of influencing their perception on public institution's purpose and advancement. They also apply different communication strategies if they want to affect the citizen's behaviour, especially in terms of his cooperation and confidence to public institutions. However, public sector also encounters boundaries and limitation in their marketing and communication strategies due to specific services they provide and different social objectives they are trying to achieve, so we can not compare them entirely to marketing in profit-oriented private sector, neither they use same strategies. Public institutions always keep in mind their role in social community and a need to appeal to as wider audience they can, creating strong ties of cooperation and civil initiative. Despite all of the limitations, they could also benefit from their specific position due to accessibility to public and media on many communication levels and channels and public sources of financing. When a public institution faces a challenge of structural reform that has to be presented to public and requires an engagement of whole community, an issue of proper marketing and communication strategy arises. The Republic of Croatia is currently in the accession process to the European Union and one of the most significant reforms conducted by government is reform of the system of justice. It requires a comprehensive and prudent communication strategy on various levels and directed to various social subjects. By using various communication channels and adapting communication and marketing strategy, Croatian Ministry of Justice and government address to the three target groups: European Union and its public institutions, Croatian community of lawyers and law experts and Croatian citizens. The goals of marketing strategy are to engage experts in reform process and to present the objectives and results of judiciary reform to public. This reform also requires high participation of Croatian citizens and successful presentation of its results to European Institutions and European public. One of the key components of success is also redefining reputation and respectability of Croatian judicial institutions in international community, but also in order to influence the confidence and loyalty of Croatian citizens to public institutions. Despite all of the legal criteria, the advancement in this process highly depends on perception of individuals and public. In this paper we analyze who are the most significant carriers in marketing strategy of judicial reform (key communicators), what are the objectives of this strategy and what are the instruments of its realization, who are the target public groups that communication strategy addresses to and how it adapts to each one, which communication channels key communicators choose and how the communication style adapts to these channels. The paper also discusses how successful this strategy has been in past time and what obstacles arise in its realization. Some of the obstacles are very specific and not related to the communication process at all, but rather related to the specificities of services that judiciary system provides, current regulation and social phenomena such as corruption.

Key words: Marketing in Public Services, Communication Strategy, Public Perception, the Process of Reforming the System of Justice

INTRODUCTION

Ever since the closure of Stabilization and Accession Agreement, the Republic of Croatia has taken over a demanding obligation to reform its System of Justice. This is not only an obligation towards international community, but also a legal, political, ethical and moral obligation towards Croatian community and our citizens. The reform of System Justice is now a process exceeding to long-term period and it is conducted under the rule of law, the rules of political reforms and the rules of adapting to the European Acquis Communautaire.

A key prerequisite to the success of reform process is a high quality communication strategy on many levels and oriented to many different target groups. One of the target groups is Croatian legal profession or the public of professionals. Without their cooperation and high participation, it would be almost impossible to conduct the reform successfully. If they were reluctant to accept and exercise the novelties introduced by the reform process into our System of Justice, or if they were not informed enough of them, they would represent a major obstacle to the process. However, if they decided to contribute to the process by offering their professional skills and experiences or the knowledge in specific legal areas, the reform process would be less complicated and short-run.

However, despite all of the professional and legal standards, the succes depends on how the reform is presented to Croatian citizens with reference to what is the concept of communication strategy like. The communication strategy includes these issues: 1. why are the outcomes of this process important to each indivudal or citizen ; 2. how the public and the media percieve the process and the results it has given; 3. how the public and the media percieve the conduct of state institutions which are responsible of planning and excercising the reform. Croatian state institutions note the importance of these issues from the expierence they had with various media and non-governmental organizations research on public perception (e.g. Transparency International annual reports on public perception of corruption).

The state institutions aknowledge the significance of reputation and image they create among Croatian citizens. The most disputed issues are the perception of institutional and political determination to conduct the reform and the perception of institutional achievements and their presentation to the public.

MARKETING IN PUBLIC SERVICES

At first sight, the economic notion of marketing and the public sector functions do not have much in common. Departments for marketing and public relations remind us of multinational corporations, advertising and commercial breaks, either annoying or funny advertisements, retailers and products of mass-consumption such as beer, mobile phones, detergents etc. It is logical to question where is a connection between this type of marketing and public sector and if there is one, what is it like? However, there is the most significant connection from the manner in which a corporation communicates with consumers and the manner in which public sector

communicates with the citizens – the both of them supply consumers / citizens with goods and services, they are concerned with how to fulfill consumer's / citizen's needs and how to influence their perception on success of their performance.

The public institutions function in order to satisfy the needs of citizens and members of their social community. Usually, these needs are the most essential, private human needs such as health, education, the right to be informed or having the sense of justice being served... Public institutions also ensure the stability and prosperity in its community and affirmation of moral and legal principles. Despite all of the differences between public and private sector, public sector can not afford to act irrationally in the economic sense of this word.

As well as corporations, public institutions supply citizens with goods and services. It is logical to imply which target groups are in need of this goods or services, what is the quality of our goods or services like, how big is the gap between citizens' expectation and the perception of what it was given to them. We have to question the costs and the price under which public sector supplies citizens with goods and services, in which manner it supplies them and how it affects state budget and tax payers. Of course, the quality of goods and services given also depend on the quality of human resources in public institutions. These are important incentives to development of marketing in public sector.

However, it is more probable that marketing was introduced to public sector by politicians, and not by the new economic concept of management in public services. Political structures develop specific communication strategies while lobbying or promoting their programmes during election campaigns. Soon after they become official authorities, they take over some of the communication strategies they applied in political marketing and adapt them to official institutional communication strategy. Modern public institutions use marketing and promotion almost to the same extent as corporations, but they adapt them to the role and functions they perform in a specific social community. The most common causes are: 1. getting the public acquainted with novelties and reforms in the system ; 2. motivating the citizens to cooperate with public institutions and increasing the level of participation when required ; 3. influencing the citizens to act and behave in an eligible manner ; 4. creating a desirable image and reputation for the institution.

Who are the key communicators or carriers of marketing strategy in the process of reforming the Croatian System of Justice?

The Republic of Croatia has taken over a political and legal obligation to reform and rebuild its System of Justice. This obligation has risen from the Stabilization and Accession Process, but also from the process of accessing to the European Union and becoming a Member State. There are two institutions who are perceived as the most responsible to conduct the reform with success: the Government of Croatia and Croatian Ministry of Justice. These two institutions have an interesting interrelation in respect of public perception. The Government has taken over a role of political communicator. Its communication strategy is comprehensive and more general because it refers to the widest target group. However, the desirable effects of Government's marketing might be very limited given the circumstances. The Government points out the reform process as an issue of political determination and political success or failure. This is the

crucial reason why the efficiency of its communication strategy depends on political affiliation and preferences of each individual.

Opposite to the perception on Government, the Ministry of Justice is perceived as professional communicator. This perception resulted into domination of Ministry over the Government since the Ministry enjoys different type of reputation and credibility. The citizens are more likely to trust the Ministry than the Government because of the persuasion that the Ministry devotes more attention to professional and legal standard than political one. The Ministry of Justice is not keen to aggressive political marketing and does not compete with political parties and opposition – it appeals to citizens with demand for their participation and cooperation based on the relationship of mutual trust, common facts, legal knowledge, professional experience and professional competence. According to public perception, if there is a difficult problem in public sector which requires reforms or even radical measures, the best solution is to appoint an expert and not a politician. Subsequently, the carriers of communication strategy were separated to the Government taking part as a „political communicator“ and the Ministry of Justice taking part and leading in the communication strategy as a „professional communicator“.

Eventhough the marketing strategy is created by the state institutions mentioned above, at same time the strategy is extremely personalized and embodied in the functions of Prime Minister and the Minister of Justice. The individualization of strategy is more interesting in case of the Minister of Justice. When judging if the reform process is successful or not, the citizens and other target groups do not take into account the political affiliation of the Minister of Justice. They are more interested in personality characteristics, e.g. professional experience and education of the Minister, his prior work and personal ethics and integrity. From the experience with formerly appointed Ministers, we may conclude if the Minister was perceived as a well educated and professional person with strong ethics and values, the reform process was perceived as more successful, and the media were more reluctant to criticize keeping their impartiality. We can support this statement by background of the present Croatian Minister of Justice – who is a former diplomat, a professor at Zagreb Law School and has never been a member of any political party.

THE PROBLEM OF „INCIDENTAL COMMUNICATORS“

The „incidental communicators“ are not official authorities encharged to communicate and present the results of reform process. However, the „incidental communicators“, media, non-government organizations, the judges presiding the courts, court spokesmen etc. have the opportunity and capability to influence public perception on the reform process and „key communicators“ reputation and credibility.

The „incidental communicators“ frequently give opinion on the reform of System of Justice and therefore judge the Government and the Ministry of Justice. Contrary to „key communicators“, they do not have a communication strategy. Their communication activities are random and not characterized by objectives, planning and target groups they wish to appeal to. If they have an objective, it is not the one of promoting the reform. However, their indirect communication activities might have collateral effects on the institutional efforts to promote

changes in the System of Justice. These collateral effects might be both desirable and undesirable from „key communicator's“ point of view.

The most interesting „incidental communicator“ is a court's spokesman. A spokesman is a formal position in the System of Justice. However, his function is not to promote the goals of reform, but to inform impartially the public on many various matters of interest. This institute is rather new to Croatian System of Justice and spokesman's functions are yet to be clearly defined in respect of new, more managerial approach to the organization of courts. Some courts did not appoint a spokesman at all. The results of those who are appointed vary from court to court. A spokesman is not under direct authority of „key communicators“, he is liable only to the Presiding Judge of a Court. Therefore, the deficiency in communication and cooperation between spokesmen and „key communicators“ might be harmful and leaves a possibility to rethink the position of a spokesman and all of the modalities of their integration into formal communication strategy.

Even more harmful might be the communication activities of other „incidental communicators“ such as media and NGO's. The media and civil society analyze and research the functions of public sector as a whole, and therefore they are very interested in proper functioning of the System of Justice. The influence they have on public perception is immense since they have various communication channels at their disposal and easy access to the media and public. Also, their reputation is almost flawless in the perception of public because they are not insiders in the System of Justice, they operate independently and fight for humane causes. The independence and impartiality of the media and NGO's are substantial principles of democracy and therefore „key communicators“ are not allowed to influence their work and communication with the public. Also, influencing them might be meaningless even to the „key communicators“ themselves because eventually these „incidental communicators“ support the goals of reform process by detecting and stressing all of the problems and difficulties in the System of Justice. However, the undesirable collateral effects of their communication activities are surmounted by integrating them into official communication strategy as one of the target groups in marketing strategy. The „key communicators“ are making a lot of effort to build the relationship of trust and partnership with the media and NGO's. Their goal is to make them a proactive participant in the reform process. The media and NGO's mostly cooperate with „key communicators“ in the field of protecting the human rights and suppressing the corruption.

Who are the target groups of marketing strategy in the process of reforming the System of Justice?

The basic target groups of this strategy are: 1. the public – citizens who represent the widest target group ; 2. the public of professional – legal experts, practitioners and scientists ; 3. the media and non-government organizations – civil society ; 4. the media and political structures in the European Union. The communication strategy must adapt to each target group.

THE COMMUNICATION STRATEGY WITH THE PUBLIC

The communication strategy with the public is designed to attain two principal objectives: 1. building citizen's trust and confidence in the System of Justice : 2. increasing public support and participation, not only in the reform process, but continuously in various areas which require

citizen's cooperation (e.g. suppressing the corruption, witness protection, suppressing drug abuse, juvenile delinquency etc.). In this target group, a unique marketing concept is based on the mutual trust and partnership with the citizens.

The public perception on the System of Justice is being formed from their personal opinion of the System as a whole, as well as from private, personal experiences of each individual with the System. The effects of marketing activities in individual cases are very limited since every individual case is being resolved strictly by law. E.g. judge's attitude towards the counsels in individual case proceedings is out of «key communicators» control. The communication strategy can not affect this aspect of judicial system.

Subsequently, the communication strategy with the public is general, comprehensive and appeals to the widest group of citizens as possible. The «key communicators» take advantage of as many communication channels and mediums they can. The fundamental communication channels in this target group are the media: television, radio, Internet, newspaper and direct communication with the citizens. The communication mediums being used are public conferences, discussion panels, interviews, advertisements, promotional video-clips, billboards, brochures, web pages designs, informative material etc.

The communication strategy with the public is of a planned and continuous character. However, depending on occasion, the communication becomes more intense. This usually happens when „the key communicators“ are introducing a novelty in the System, or they want to react and respond to a certain development or information coming outside the System.

THE COMMUNICATION STRATEGY WITH THE MEDIA AND NON-GOVERNMENT ORGANIZATIONS

The communication strategy with the media and NGO's is very similar to the strategy with the public since „key communicators“ apply the same principles of partnership and cooperation in this target group as well. But, „the key communicators“ have to adapt to their role of „incidental communicators“. Being an incidental communicator in this case creates a potential zone of conflict with „key communicators“ in matters of disagreement about the reform process. In order to neutralize the harmful effects of this conflict and undesirable collateral effects of „incidental communicator's“ activities, the „key communicators“ try to involve them in the process inviting them to cooperate and assist when needed. However, there are still enough opportunities to improve the relationship with the media and non-government organizations, both on formal and informal level. The „key communicators“ should develop specialized departments and personnel in charge of the communication and keeping contacts with members of this target group. Throughout the institutional cooperation, it might be possible to create informal network of contacts with this target group. The best solution here is to avoid conflicts on one side, and encourage partnership and cooperation on the other.

THE COMMUNICATION STRATEGY WITH LEGAL PROFESSIONALS

This target group is very specific and traditional attractive forms of marketing are not appropriate for members of legal profession. However, the target group is essential to the success of reform process. Legal professionals must be motivated and educated enough to enforce new laws and novelties introduced. They also need time to adapt to new rules in the System. On the

other side, some of them are already experts who can contribute to the process. If they did not perceive personally the reform as a common purpose, it would be a complete failure.

Traditional communication channels and mediums such as television, Internet, advertisements etc. are not appropriate for this target group since legal professionals in the System of Justice are very formal and pay attention only to professional and scientific standards. The traditional activities of promotional and aggressive marketing might have even the opposite effects from what is considered to be eligible. The best way to approach them is through educational and professional meetings, seminars, discussion panels etc. where legal professionals have an opportunity to exchange experience and knowledge as peers do. Taking into account these circumstances, the Ministry of Justice have founded the Judicial Academy – a place for legal professional to educate and improve themselves exchanging ideas, even with their colleagues abroad.

THE COMMUNICATION STRATEGY WITH THE EUROPEAN UNION POLITICAL STRUCTURES

This target group is the least influenced by the «key communicators» marketing strategy. This is a result of natural determinants of accession process to the European Union. The communication strategy can not be comprehensive and unique since there is a big interference with the Ministry of Foreign Affairs, diplomatic services and many other informal contacts and networks of politicians throughout the EU. This target group is also not very tolerant of traditional promotional marketing as we have noticed in the target group of legal professionals. Traditional marketing might be also inappropriate if it tends to exaggeration because the European Union has many operative services with the capacity to screen and monitor any developments in the System of Justice and the reform process itself, providing a clear insight.

The most appropriate way to promote the reform among EU political structures is a subtle diplomacy and informal political contacts. Any kind of formal contacts and relations should be conducted by the domestic services who are highly professional and specialized exclusively for this matter.

The communication strategy should always be governed by the principles of partnership and cooperation with EU institutions. The final objective in this target group must be a correct and honest presentation of all the achievements, results and fulfilled duties in the reform process with reference to the accession.

THE GIVEN DETERMINANTS AND LIMITATIONS IN MARKETING OF THE SYSTEM OF JUSTICE

Despite all of the efforts to promote the goals and objectives of the reform, to encourage citizen's confidence in institutions, to present what was achieved and what is yet to be accomplished, there are some communication channels and mediums out of the «key communicators» area of influence. The lack of control on this area is a result of the System's specific characteristics or given determinants. Some of them might be eliminated in the future, and other are here to stay as System's unavoidable circumstances.

The first and common given limitation is a necessity to adapt the marketing strategy to the nature of services provided by the public sector with the distinction from corporate marketing.

Second limitation are the effects of given statements on individual case proceedings which can not be included by the communication strategy as mentioned before. Possible interventions in this area would represent an unlawful conduct.

Third group of limitations, and the most criticized one, comes out of the Croatian positive regulation – Penal Code and Law on Criminal Procedure which prohibit public commentaries on unvalidated court rulings and disclosure of information collected during the criminal investigation. These provisions are highly disputed even among the legal professionals and especially by the media. The provisions actually allow total absence of any kind of communication outside the System of Justice whenever the official authorities decide it.

CONCLUSION

The principal goal of this paper was to explain the necessity of marketing in public sector. This case study has shown in what way the marketing strategy might be adapted to public sector successfully and what obstacles might show up while enforcing it. For us it was essential to point out that marketing strategies in public sector can be very inspirative, rich with variety and a smart support remedy for public institutions to achieve their goals. Thereby, at the end of our paper, we enclose a typical example of marketing in public sector appealing to the members of our society to work together in order to accomplish a common purpose for all of us.

HOW ETHNOCENTRIC TENDENCIES INFLUENCE THE ADAPTABILITY OF MARKETING STRATEGIES IN INTERNATIONAL TRADE

Zaninovic, Jasenka¹; Majic, Olivera Jurkovic²; Sonje, Amina Ahec²; Majic, Helena³

International trade liberalization focuses on similarities in consumer's behaviour, while the local paradigm points out the variety of different and specific consumer's needs. International marketing is being challenged by the struggle between two opposite concepts of international trade – liberalization and protectionism. Both concepts impose a necessary choice between global and local marketing strategies which represents only a rude simplification of what is ought to be a holistic, profound, thorough and adaptable marketing strategy which takes into account all the differences and variety on the global market.

In global economy, the variety of modern world is manifested by rising ethnocentric tendencies. Ethnocentrism is justified by political and cultural factors, as well as determined by the consumer's behaviour and one's private needs.

This paper analyzes the effect of cultural factors in consumer's behaviour on international trade, especially in respect of the religious tendencies, and all the means of adapting the marketing strategy accordingly. The paper is based on the authors' authentic research conducted among the Croatian managers with a view to their opinion on consumer's ethnocentrism.

Key words: international trade and international marketing, consumer's ethnocentrism, adaptable marketing strategies

INTRODUCTION

The orthodox theories of international trade are focused on national economies and intersectoral trade of homogenous, undifferentiated goods. However, the modern, so called firm theories are focused on the role and influence of companies in international trade. Globalization and liberalization represent a convenient environment to the companies. However, companies more often do business with companies and countries in their nearby as well as with traditional trade partners. Therefore, regionalism in international trade rises simultaneous to the globalization and liberalization processes. The international paradigm assumes that all consumers behave alike, opposite to the local paradigm which points out all the differences and variety in consumer's behaviour. Despite that, local paradigm does not confront with globalization and the concept of international market. If companies acknowledge the basic assumptions of regionalism and local paradigm, they would be able to turn them into comparative advantage. Consideration given to the cultural variety of modern world makes further incentive to better understanding of consumer's behaviour. Religious factors influence, no matter if varies from negative to positive, corresponds to the system of values of each individual affecting the consumer's purchase decision.

CONSUMER'S ETHNOCENTRISM

Consumer's ethnocentrism develops from differing individual attitudes, values and personal persuasions among consumers encouraged by paradox processes of political disintegration and regionalism which accompany the globalization process. Ethnocentrism reflects tradition, culture, religion, historical heritage, political situation context, social values, as well as individual predispositions. Accordingly, it influences consumer's decision on individual purchase of goods and services. Research on this matter indicates that ethnocentrism encourages self-imposed social isolation and perception of national superiority.²⁸² However, ethnocentrism became a rising tendency as an inevitable result of global integration and liberalization since it can not develop in isolated social communities.

However, modern theories do not presuppose a relation between ethnocentrism and hostile attitude towards other nationalities or cultures. Hostility, either reluctance to buy certain products motivated by ethnocentrism, depends on the context of social situation and motivational functions such as social relationships and inter-group self-identification.²⁸³

Many research and surveys have shown that consumer's ethnocentrism corresponds to religious beliefs and attitudes taking part in a higher, more general system of values.²⁸⁴ Religion has a continuous ethnocentric effect, on occasion either positive or negative.

In order to keep their present market position and gain access to new markets, companies have put consumer's needs in center of marketing strategies. Delivering a certain product or service to a satisfied customer, now represents a final step in a long process that starts with research on consumer behaviour, perception and needs. In order to understand what determines consumer behaviour, almost every company on global market takes care of consumer's preferences in respect of one's attitudes, beliefs, aspirations, needs and perception.

A consumer acts with economic rationality, but his actions are also determined by many other factors. Philip Kotler classifies factors which influence consumer behaviour into personal, social and cultural factors, especially emphasizing culture²⁸⁵. This statement does not lead companies to target consumers who are perceived as „desirable“ to their products or services, but motivates companies to deliver desirable goods or services to many various consumers.

Consumer's ethnocentric behaviour started to intrigue economists in respect of deregulation and liberalization of international trade. While many administrative and tariff barriers were

successfully removed, ethnocentric tendencies have become the most important non-tariff barrier reflecting consumer's attitude toward foreign (or specific) products and revealing government protectionism. The notion of consumer's ethnocentrism was first introduced by Terence A. Shimp and Subhash Sharma in 1987 in order to illustrate American consumer's attitude toward foreign products²⁸⁶. They have also developed a measurement instrument on consumer's ethnocentrism called CETSCALE – Consumer Ethnocentric Tendency Scale. In order to differentiate ethnocentric consumers from non-ethnocentric, scientists have also developed the so called EP-SCALE.²⁸⁷

Research have shown that ethnocentric consumers are more reluctant to purchase foreign products, while non-ethnocentric ones are more pragmatic when deciding. Ethnocentric consumers give a higher meaning to their decision. Example given, by buying domestic products, they give support to their national economy. Multinational companies at first identified ethnocentrism as potential obstacle to successful business abroad. However, research conducted on given matter has soon persuaded them otherwise. Adapting marketing strategies and access policies to new markets enables a company to turn ethnocentric barriers into a competitive advantage adding new value to company's both image and brand. Even if companies do not recognize the importance of ethnocentrism, eventually they will have to

confront it when accessing traditional markets. These markets institutionalize ethnocentric tendencies enforcing them as obligatory import requirements.

It is advisable for companies to adapt to ethnocentric consumer behaviour, but ethnocentrism is sometimes very questionable if it transforms to governmental, institutionalized ethnocentrism. Many of such public actions, example given «Buy American» were criticized as a new form of state protectionism. Very similar Irish campaign in 80's was condemned by European Union authorities and argued from position of free market.

RELIGIOUS INFLUENCES ON CONSUMER'S ETHNOCENTRISM

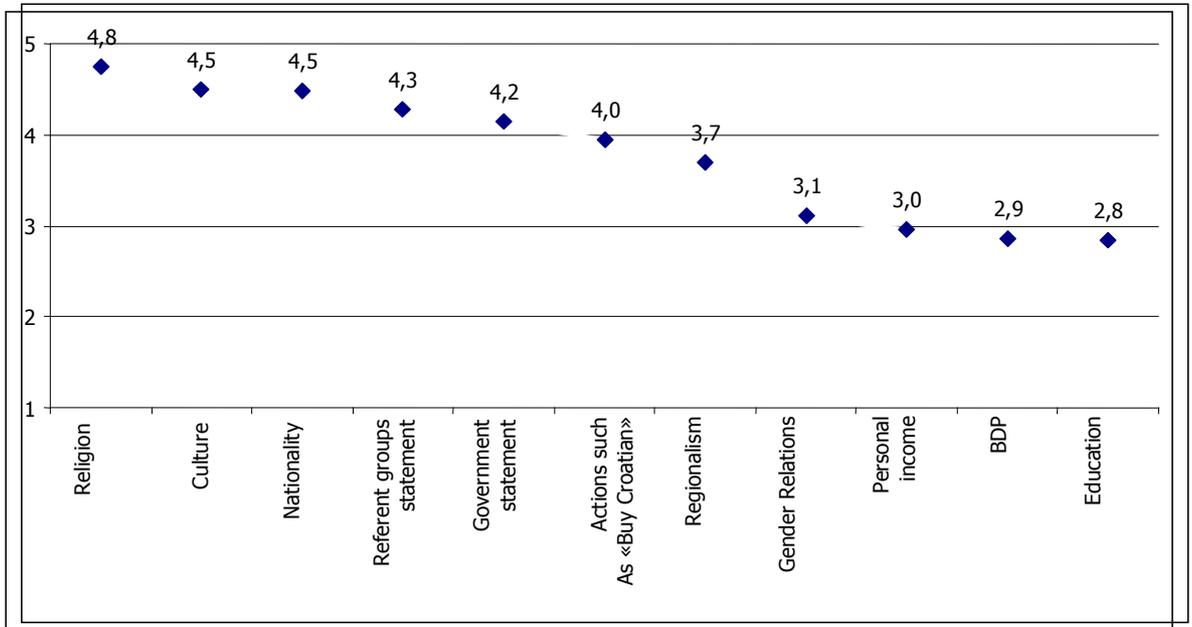

Consumer's preferences and habits are influenced by interference of various factors so consumers ought to be perceived as complexed beings. Accordingly, new microeconomics theories are trying to analyze some phenomenons that even can not be measured in terms of mathematics or statistics. However, consumer's satisfaction and perception can be analyzed and measured introducing questions about the effects of culture, religion or some other element on their behaviour. Example given, an important study on attitude toward modern marketing and advertising conducted within a group of Muslim consumers and a group of Christians gave interesting results – both groups have very similar attitudes about modern marketing strategies that companies enforce, but have shown differing attitudes toward exploitation of religion in marketing²⁸⁸.

The assumption that economic progress and new technologies would make religion irrelevant was disputed since Muslim population worldwide has kept ethnocentric tendencies under influence of religion, even regardless to age, sex, income class, geographical position and state of development. Therefore, religion influences purchase decision on a daily basis, as well as companies adapt bussines activites and strategies to majority Muslim markets. Religious consumers pay attention to every aspect of producer's bussines – from advertising, image, approved certificates, packaging, distribution et cetera. If not approved by religious authorities, these producers might be ignored by ethnocentric consumers.

Therefore, multinational companies, especially food producers, adapt brands to local environment. Religious ethnocentrism prohibits consumption of specific food and products which are not in accordance to religious standards. Companies have adapted to this kind of ethnocentrism introducing certificates (such as Halal and Kosher) which guarantee that a product complies to religious requirements. Many Croatian companies have certificated their products since Croatian primary export market is Bosnia and Herzegovina, a country with significant Muslim population.

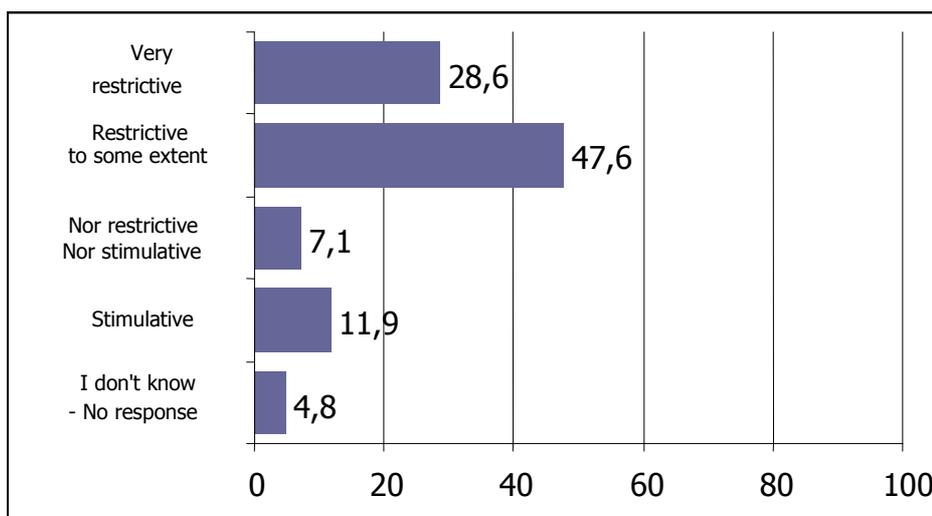

With a view to how many Croatian companies have aknowledged adjustment to potentially ethnocentric markets, we have researched what kind of attitude Croatian managers have on consumer's ethnocentrism. The research was conducted on a focus group of 50 Croatian managers who were randomly selected from the Croatian Export Directory to answer specially designed questionnaire.

²⁸⁸ Gibbs, P., Ilkan, M., Pouloukas, S.: *The ethics of marketing in Muslim and Christian communities: Insights for global marketing*, Equal opportunities international, Vol. 26, No. 7, 2007., p. 678-692.

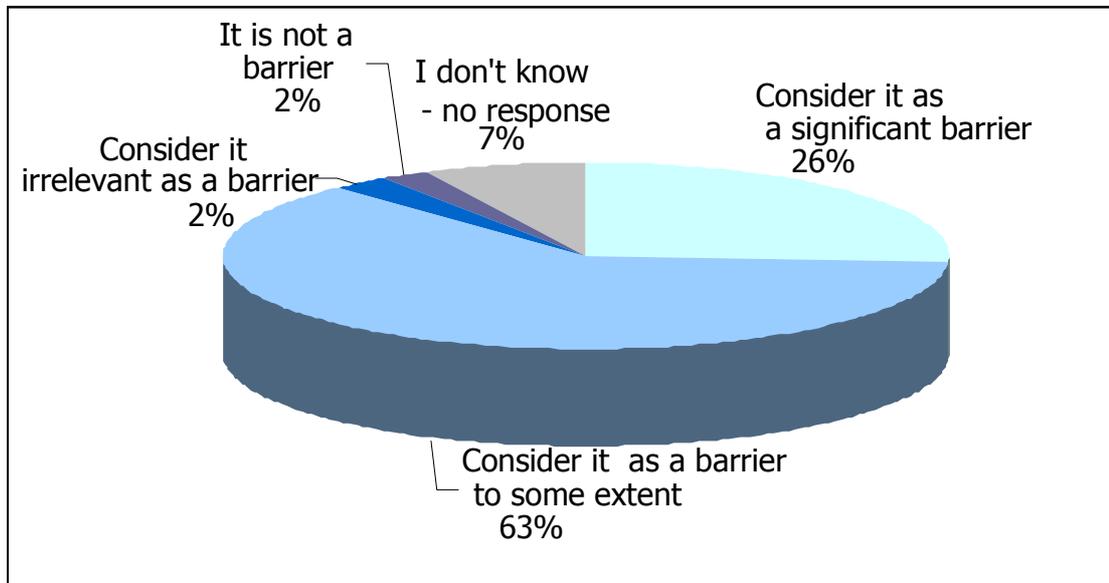

Graph 1: Q – In Your opinion, what factors influence ethnocentric tendencies in international trade?

From the graph, we can easily conclude that in manager's opinion, religion, culture, nationality, referent groups and forms of government protectionism influence the most rising ethnocentric tendencies.

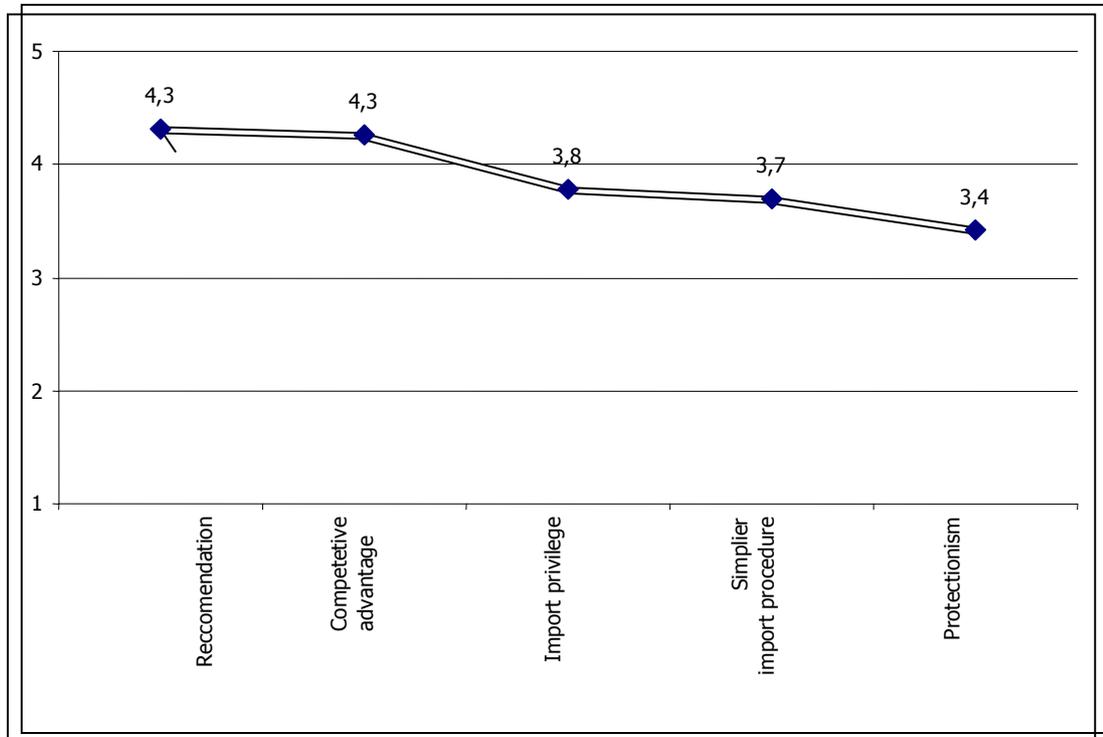

Graph 2: Q – How do You percieve religious ethnocentrism?

Graph 3: Q – Do You percieve religious ethnocentrism as a barrier in international trade

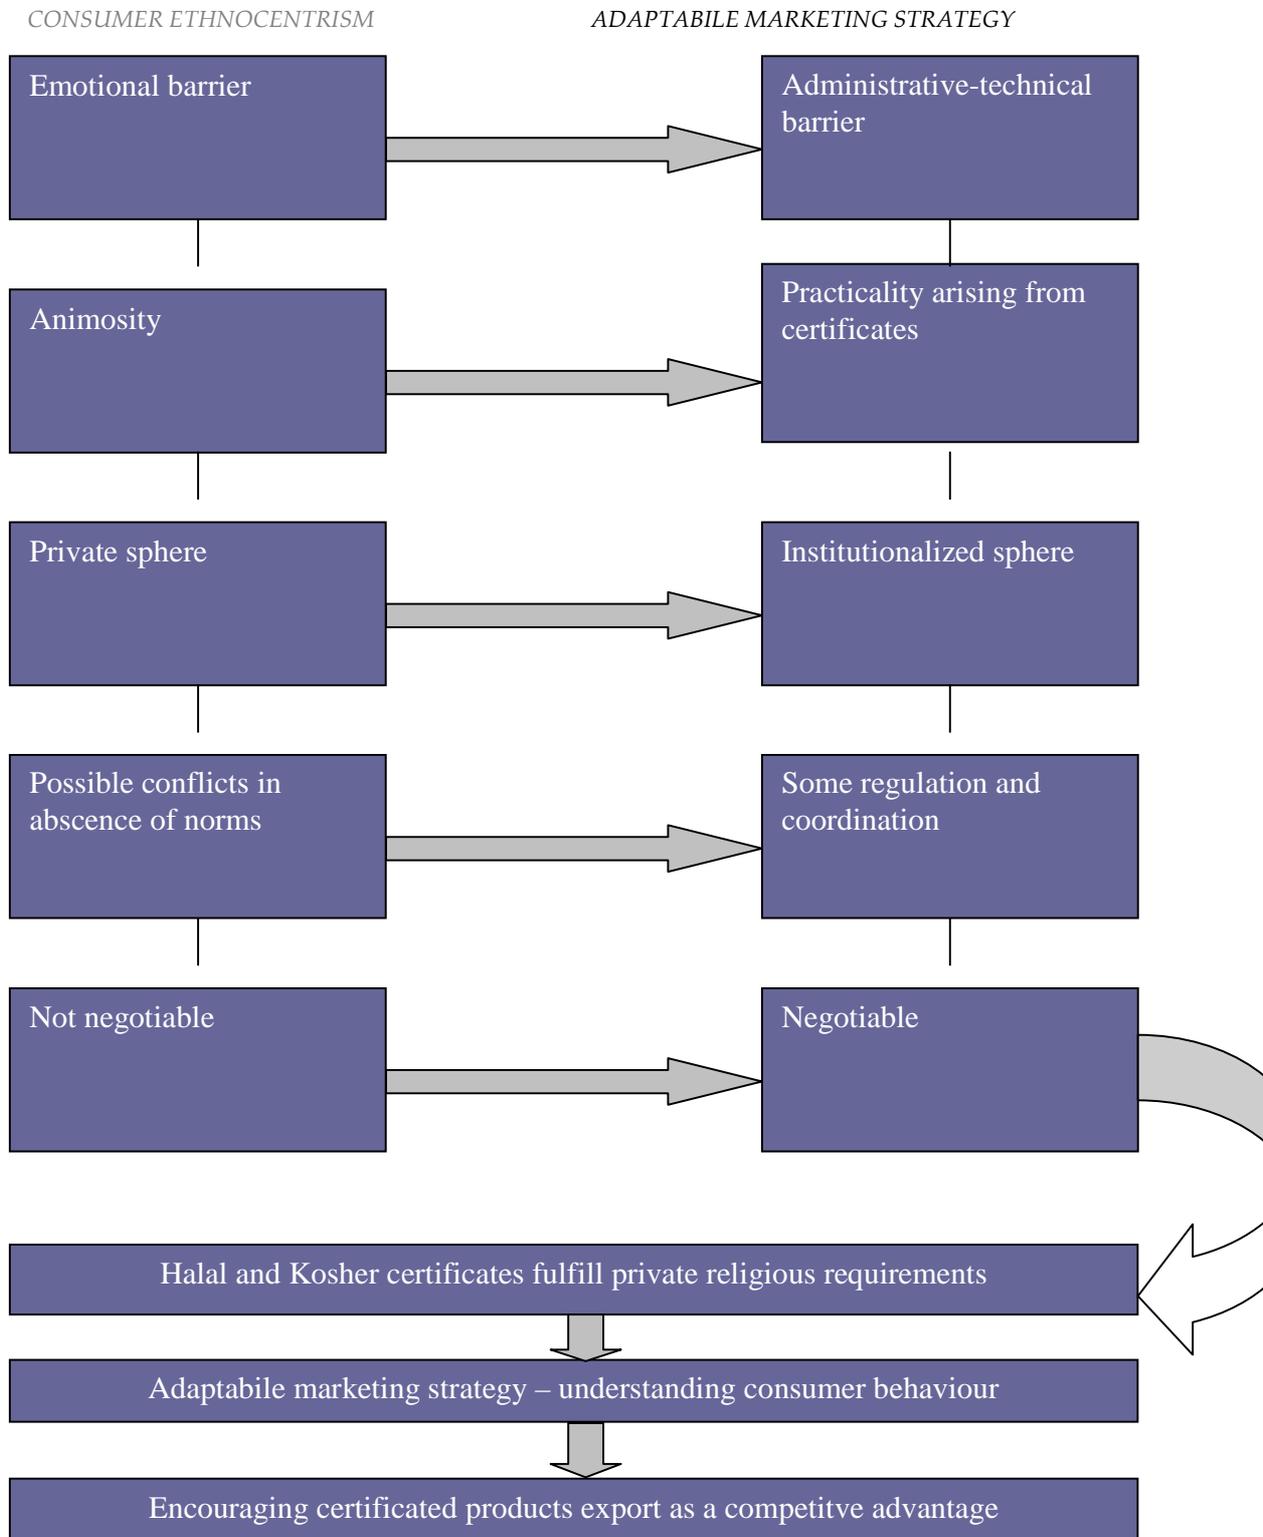

From Graph 2 and 3 we have concluded that the most of Croatian managers percieve religious ethnocentrism as a restrictive barrier in international trade.

Graph 4: Q – How do You percieve Halal and Kosher certificates in respect of adaptable marketing strategies

CONCLUSION

International market is extremely competitive environments. In order to gain competitive advantages on this market, companies ought to understand what motivates and determines customer's actions and consumer behaviour. We emphasize that it is very important to adapt marketing strategies in terms of consumer's local environment determined by religion, culture and other important social factors. This statement refers to the new, holistic and adaptable marketing that respects the variety of modern consumer body on what is most frequently referred to as a deregulated international market.

DEVELOPMENT MODELS OF CATHOLIC SANCTUARY-TOWNS

Ambrósio, Vítor¹

¹*Escola Superior de Hotelaria e Turismo do Estoril*

My paper will cover the impact of visitors/religious tourists on four Catholic international towns in Western Europe.

In this paper, four Catholic sanctuary-towns, founded after the apparitions of the Virgin Mary, Banneux in Belgium (1933), Fatima in Portugal (1917), Knock in Ireland (1879), and Lourdes in France (1858), will be compared in terms of urban development. I will argue that these sanctuary-towns represent two different evolutionary situations: one associated with successful development and marketing and the other with weaknesses in planning and marketing.

Looking at the development and marketing strategies of these four sanctuary-towns, one may notice that the larger they became, as better known they are abroad.

In fact, as in most tourism destinies, there is a simple rule – services are created in order to answer the needs of the pilgrims/tourists going to the sanctuary-towns.

A systematized information interpretation allowed to build a model concerning the stage of development of a sanctuary-town.

To confirm the success of the previous model, a second model was built based on Butler's model (1980); the main goal of this adaptation is to visualize the evolution curve of the four sanctuary-towns simultaneously.

The variables considered in this second model are: millions of visitors; time; temples; accommodation and shopping.

After the presentation of both models, I'll be able to argue that in Banneux and in Knock (not Mediterranean sanctuary-towns), after the exploration stage and some involvement of the local population, a set of conditions did not occur, so neither Banneux nor Knock moved on to the development stage.

In Fatima and Lourdes (Mediterranean sanctuary-towns), there was a natural progression, without any kind of serious interruptions, confirming the Butler's Model from the exploration until the stabilisation stage. For these reasons, it is possible to say that these two towns represent successful cases both in the tourism and evangelization fields.

**EXPLORING CREATIVELY THE HUMAN RESOURCE MANAGEMENT – AS AN
INTELLIGENT SOLUTION IN IMPROVING THE LOGISTICS SERVICE PROVIDERS IN
CRISIS**

Angheluta, Andrei¹; Costea, Carmen²

¹*ASE Bucharest, Romania*

²*ASE Bucharest, Romania*

The 2008 and 2009 financial crisis is hitting systemically hard in all companies' budgets: revenues, expenses, and sales. These are difficult times for all market participants and innovation may play the role of the main engine differentiating companies.

This paper is focused on the state-of-art of logistics by creatively exploring the Human Resources Management, in order to reduce labor costs, increase work efficiency, boost human productivity, find new work practices, such as problem-solving teams, enhanced communication with workers, employment security, flexibility in job assignments, training workers for multiple jobs, and greater reliance on incentive pay.

To study it, we constructed a data base for 2 multinational companies in the logistics sector; we collected data with precise measures on productivity, work practices in the warehouses and production lines.

The empirical results consistently support the following conclusion: the adoption of a coherent system of these new work practices, including work teams, flexible job assignments, employment security, training in multiple jobs, and extensive reliance on incentive pay, produces substantially higher levels of productivity than the 'traditional' approaches involving narrow job definitions, strict work rules, and hourly pay with close supervision. By contrast, adopting individual work practice innovations in isolation has no effect on productivity.

This evidence can be interpreted as a revolutionary alternative towards creative logistics within the Human Resources Management.

ETHNOCENTRISM, THE VILLAIN FOR CROSS-CULTURAL KNOWLEDGE TRANSFER IN EASTERN-WESTERN EUROPEAN CO-OPERATIONS

Bengoa, Med. Dolores Sanchez¹

¹*Research Coordinator, Intercollege, Larnaca*

The paramount importance of knowledge for companies in the 21st century related to innovation, development and growth was highlighted, for example, by the World Economic Forum in Davos, Switzerland 2001 (Holden and Tansley, 2007). Therefore, successful knowledge transfer between international business co-operations has become the focus of attention.

In this context, knowledge transfer (KT) refers "to the cross-cultural, cross-border and cross-organizational processes whereby information, ideas and practices move between two different business systems" (Clark & Geppert, 2002, p.264). The way the knowledge is transferred conditions or facilitates not only the understanding, but also the acceptance, the efficiency and its cognitive legitimation. Semantically, transfer refers merely to a process of direction, where the origin and destination is known, however, with holistic influential factors and effective methodology remaining unknown and often insufficiently considered.

Western knowledge transmitters often show a lack of cultural sensitivity who apply ethnocentric one way processes underestimating the understanding of the structural influences of cultural variants and being unprepared for international missions (Marcic, 1995; Darby, 1995; Tsang, 1999; Clark & Geppert, 2002; Hoecklin, 1994; Lang & Steger, 2002;). This ethnocentric behaviour lacking cultural awareness and preparation leads to a knowledge structuralist perspective defined as "a formal, uncontested process whereby ideas move directly from Western source to post-socialist destination" (Clark & Geppert, 2002 p.268). Implicitly, knowledge senders assume that knowledge receiving companies have to integrate Western best practice unquestioned. The reasons for that are provided in that Eastern companies lack managerial knowledge as a consequence of their political past.

However, if the learning process is done by imitation and performed solely to please the formal requirements implying at best the adoption of new practice, a behavioural change achieved by single loop learning, without any reflection, criticism, appreciation and, most importantly, application of new knowledge, no real cognitive learning can flourish. Compounding the matter, it might undermine the willingness to learn as suggested by Child and Czegledy (1996). Criticism as to this ethnocentrism is addressed by Hutchings and Michailova (2004) implying the lack of research on reciprocal learning and reciprocal exchange of knowledge. They argue that knowledge can also flow from Eastern partners to Western partners. Concordantly, Holden (2002) calls this lack of research the literature grand lacunae. Finally, Riege (2007) complains about the shortcomings in empirical evidence providing guidance of how to dismantle Eastern- Western knowledge transfer barriers. Interestingly, Wolf and Vollmer (2007) suggest communities of practice towards a more integrative creation of knowledge in this context.

Methodology - Qualitative research following a phenomenological approach was applied in order to understand social realities based on people's experiences and the meaning attached to them. Grounded theory was used to generate and analyse data for theory creation (Strauss and Corbin, 1998) due to the lack of existing literature. This requires the emersion of the researcher into the field for gaining insight and a depth of understanding of the problem's complexity (Charmaz, 2000; Bryant, 2003). For the data collection theoretical sampling was chosen, with all the participants being

involved in intercultural KT. 23 in-depth interviews, participant and non participant observation and 4 focus groups were conducted in Russia and Austria.

Eastern Findings - This abstract presents secondary and primary research findings which shed light on the negative effects of ethnocentrism in KT between Eastern and Western European business co-operations and how those can be overcome. Eastern interviewees showed negative reactions as well as negative facial expressions related to their Western knowledge transmitter. They stressed feelings of depreciation created by Western partners who come to them with a superiority complex. This superiority, coupled with underestimation of the partners leads only to a bad end. In some cases criticism relates to the authoritarian depreciation of Russian knowledge hurting their pride. Furthermore, lacking cultural sympathy, interest and understanding of Russian realities could be identified. Finally, high expectations difficult to be fulfilled by Eastern Europeans explain why people in Eastern Europe develop manifest reluctant attitudes in accepting and/or integrating Western knowledge and processes.

Western findings - The imperialistic attitude, as several respondents named it, was intensively discussed with Westerners. The many different comments, attitudes and experiences ranged from admitting this still existing attitude, reflection on it, self criticism and to a final rejection of it.

The human behaviour and the attitude towards the way of transferring knowledge have to be very carefully observed. Especially, certain attitudes like displaying arrogance, imposing behaviour or not allowing for the receivers' own space of action were seen as having detrimental consequences. Analogies referring to the 'master and the servant', or you the 'Goliath and the David' were used by respondents to express self explanatory feelings during the KT co-operation. Westerners identified a low absorptive capacity, lack of motivation and resistance to learn as negative attitudes from the Eastern partners hampering the KT process.

Finally, most of the respondents called for an urgent change towards a more reciprocal and integrative KT and developing skills like emotional intelligence which will entail better and quicker learning outcomes leading to better economic success.

ORGANIZATIONAL FACTORS AND ABSENTEEISM OR INTENT TO LEAVE: A COMPARISON BETWEEN YOUNG AND OLD AGE WORKERS

Bouville, Gregor¹

¹Lecturer in Economy and Management at University of Haute Bretagne Rennes 2. PhD student – CREM UMR CNRS 6211 – University of Rennes 1, IGR-IAE

Purpose - In a previous paper (Bouville, 2008), we analyzed the relationships between organizational factors and absenteeism-intent to leave for old age workers (seniors). In this paper, we will compare our previous results on old age workers with a population of young age workers (under thirty years old). Indeed, this type of empirical research based on a comparison between different workers population has seldom been done before in the absenteeism literature (Johns, 2003) and is even rarer in the intent to leave literature. *The goal of the research is to understand what the relationships are for young age workers between organizational factors in one hand and absenteeism and intent to leave in the other hand, and to compare these results with those on old age workers. The other goal of the study is to examine the degree to which health at work and job satisfaction mediates the relationship between organizational factors in one hand and absenteeism and intent to leave in the other hand, for young age workers.*

Design/methodology/approach - This research analyzed both work organization and working conditions factors relative to sickness absence and intent to leave. The organizational variables are as follows:

<p>Work organization Time pressure, skill variety, monotonous work, hierarchical control, support from colleagues and supervisor, post rotation, shift work, flexible schedule, working hours</p>	<p>Working conditions Painful postures, noise and thermal nuisances, tension with the public, aggression from the public, bullying</p>
<p>Confounding variables Size of the organization, work sector, gender, age, tenure, work status, social and occupation group, position</p>	

The approach taken is a quantitative analysis on a total of 5239 young age workers (under thirty years old) with a multinomial Logit model. Absenteeism was measured by the number of self-reported sickness absence days within the previous 12 months. This variable was divided in five categories: 0 day, temporary absence: 1-3 days, short sickness absence: 4-7 days, middle sickness absence: 8-15 days, long sickness absence: +16 days. To test the effects of mediators (job satisfaction and health at work), we use the Baron and Kenny (1986) procedure.

Findings – Compared to old age workers, some organizational factors (monotony, autonomy, post rotation, shift work, working hours, time pressure, and thermal pollutions) have a strong impact on absenteeism and intent to leave of young age workers. Furthermore, the links between some of this organizational factors and absenteeism-intent to leave is mediated by job satisfaction and health at work.

Practical implications – We emphasize the importance of Human Resources Practices differentiated for old age and young age workers. A way to increase fidelity of young workers is to improve work

organization: development of autonomy, skill variety, and supervisor support, alleviation of time pressure, and shift work. For seniors, implementation of flexible schedule and alleviation of hierarchical control can lead to a decrease of absenteeism. For both young and old age workers, managers have to strongly tackle workplace bullying and violence at work from the public.

Originality/value – The interest of the study is to examine the relations between a large set of organizational factors (including bullying, tension with the public, aggression from the public) and absenteeism or intent to leave after controlling for many variables (size of the organization, work sector, gender, age, tenure, work status, social and occupation group, and position) and to compare the results on young age workers with those on old age workers. Also, we compare the explicative power of two mediators (job satisfaction and health at work) in the relationships between organizational factors and different lengths of sickness absence or intent to leave. Further research could focus on examining in more details differences the impact of organizational factors on absenteeism or intent to leave between young and old age workers.

SHOULD THE ITALIAN WINE SECTOR BE WORRIED ABOUT THE NEW COMMON MARKET ORGANIZATION?

Casini, Leonardo¹; Corsi, Armando Maria²

¹University of Florence, Piazzale delle Cascine 18, 50144 Florence, Italy

²University of Florence, Piazzale delle Cascine 18, 50144 Florence, Italy

Purpose: In order to face the increasing competition in the global wine sector, the European Union is bringing into action a new Common Market Organization (CMO), which will be applied for the first time in its entirety only since the productive campaign 2009/2010. Therefore, it is fundamental to predict how the different markets will react to these changes, analysing, among other elements, the factors, which have been recently influencing consumers' loyalty towards wine attributes. In particular, the purpose of the present work is to understand how the new CMO will impact preferences of Italian wine consumers, by observing loyalty levels to the purchases of wine made by a representative sample of the population in the retail sector (35% of sales by volume and 60% by value in 2008). The purchases have been recorded for six years (2003-2008), but they have been split in two three-year periods: 2003-2005 and 2006-2008. Loyalty levels towards three product attributes (prices, formats and quality designations) for the two three-year periods are separately calculated and subsequently confronted.

Design/Methodology/Approach: Loyalty analysis is conducted through the *polarization index* (ϕ). Due to space limitations, it is not possible to go into the details of the model – see Jarvis *et al.* (2006) for further information. It is, however, important to say that the index is derived from the application of the Beta Binomial Distribution (BBD) model to the actual purchases made by consumers of certain brands and/or product attributes and levels over a defined interval time. The analysis can then focus on the deviations of the loyalty for each brand (or level of the attribute) from the average or benchmark loyalty level – also called *category polarization index* (ϕ_c) or *DMD value*. The name *DMD value* derives from the fact that latter can be estimated by fitting a Dirichlet Multinomial Distribution (DMD), which represents the multivariate counterpart of the BBD, to the data. Both the BBD and the DMD values range from 0 (maximum disloyalty) to 1 (maximum loyalty).

Findings: The observation of loyalty levels shows that the format in which the wine is purchased continues to represent the attribute to which Italian consumers devote the highest loyalty, followed by the quality designation that appears on the label and by price tiers. However, it is interesting to observe that while loyalty to price tiers has increased between the two interval times, loyalty to quality designations and formats has decreased. The Bag-in-Box format has almost disappeared from the market, the purchases of 0.75litres bottles have increased in terms of loyalty and market shares, while >0.75litres & ≤1.5litres formats have only lost few percentage points in volume terms. The consumption of table wines has decreased, substituted by DOC-DOCG and GI wines. However, instead of observing an increase in the price tiers theoretically associated with higher quality attribute levels (e.g. 0.75litres bottles, DOC-DOCG or GI wines), we have noted that the €5-€7 tiers has been partly cannibalized by the popular premium segment and partly substituted by the basic price tier.

Research Limitations: The polarization index operates with the certainty that all the levels for the 3 attributes under analysis were present when consumers made their purchases given the wide offer that the majority of modern distribution points of sales have for the wine sector. However, this cannot be proved.

Managerial Implications: From a managerial perspective, the analysis suggest that 319 DOC&DOCG are not sustainable over time, as several of them cannot count on a background and a mass critical enough to justify the costs necessary to maintain and/or modify the current codes of production. Unless a producer is in an area eligible for the production of a DOC/DOCG able to create, deliver and communicate a high value to customers (e.g. Amarone della Valpolicella, Brunello di Montalcino, Fiano di Avellino, etc.), he/she would make a better choice by deciding to product a varietal wine or one with a geographical indication (GI). In doing so, a producer can reduce production costs and more easily adapt wine styles to the ever changing tastes of consumers. Moreover, it would be a strategic mistake to let only New World (NW) Countries make wines with Italian grape varieties (e.g. Sangiovese, Nebbiolo, Sagrantino, etc.) and indicate them on labels, given that these varieties belong to the Italian wine tradition and, as such, should generate a competitive advantage to Italy at first.

Originality/Value: To the best of our knowledge the polarization index has never been applied in a dynamic perspective, but it has always been used as a way to analyse the behavioural loyalty of customers in a defined interval time. Moreover, the observation of actual habits over a long time period offers a powerful means to the actors of the whole supply chain to consistently predict future market trends.

Abstract Category: Research Paper

Key Words: Evolution of Behavioural Loyalty, Beta Binomial Distribution, Common Market Organization (CMO), Polarization Index, Retail Sector.

**SUSTAINABLE DEVELOPMENT:
FROM AN ABSOLUTE POINT OF VIEW TO A RELATIVE ONE**

Ceruti, Francesca¹

¹*Università degli Studi Milano-Bicocca*

Purpose - the aim is to present a concept of relative sustainable development that is linked to a specific environment; this concept refers to the Italian mining sector. The need for a new conceptualisation derives from the fact that an absolute value to the sustainable development forces to lose sight of the specific environment in which it was inserted.

Design/Methodology/Approach - on the basis on meetings conducted with professionals of the mining sector, a model that describes the economic environment has been developed. In addition, specific problems that characterise the Italian case (e.g. the drop in mining production, the poor professional training, the anachronistic set of rules, the syndrome NIMBY, the poor dissemination of mining culture) have been considered.

Findings - it has been demonstrated that the sustainable development is a relative concept which is inevitably linked to the context. In other words, an unequivocal definition of the concept does not exist. In fact, different definitions are possible on the basis of the importance that is given to economic, environmental and social principles.

Originality/Value - differently than before, sustainable development is examined considering the linked environment, not only as a set of natural resources but as a system composed by actors involved in the economic environment which includes a stated political order, a level of technology, and stakeholders. Furthermore, a solution to the problems affecting the Italian mining sector is suggested: i.e. an independent and permanent comparison table with a Scientific Committee that gives support to policymaker, disseminate culture in the local communities and harmonize the set of rules etc. would be useful.

Keywords - Sustainable development, economic environment model, mining activity.

Classification - Conceptual paper

THE RELATIONSHIP BETWEEN EUROPEAN TOURISTS' LOYALTY AND THE PERCEIVED IMAGE OF TUNISIA: APPLIED LOGIT MODEL

Chemli, Samiha¹; Mzali, Hassen²

¹*Tourism Lecturer and PhD student at the Ecole Supérieure de Commerce de Tunis, 34 Rue 7225 El Menzah 9, 2013 Tunis, Tunisia*

²*Ecole Supérieure de Commerce de Tunis, University of La Manouba*

Over the past three decades, considerable research has dealt with destination choice issues (Park et al., 2004; Hosany et al., 2006; Gallanza et al., 2002; Lee et al., 2005 and MacKay et al., 2006). However literature on the subject of loyalty to destinations by tourists is limited and the extent to which frequently visiting tourists can be perceived as loyal has not been clearly identified (Kozak, 2001).

Scholars have adopted a variety of approaches to address the problems and issues surrounding customer loyalty. Chen et al. (2001) study the relationship between tourists' destination loyalty and their preferences to destinations. In addressing issues surrounding customer loyalty, one of the main challenges for tourism managers lies in understanding the patterns of tourists' behaviour (Castro et al., 2005, Hallowell et al., 1996 and Crompton, 2000).

Alegre et al. (2006)'s research study indicate the explanatory power of repeat visitation, knowledge, and quality of a place as a motivation for tourist expenditure. Murphy et al. (2000), identify that quality as measured by overall satisfaction, is a key predictor of visitor intention to return within two years. Bosque et al. (2006), Baker et al. (2000), and Castro et al. (2007), claim that managers should understand satisfaction as an essential determinant of loyalty.

This research study aims to identify the relationship between European perceived image of Tunisia and their loyalty to the country, by means of questionnaires.

The sample size was identified according to the statistics collected from the Tunisian Tourism Board in 2007 (Le Tourisme Tunisien en Chiffre 2005: the last published when starting the research), and according to which 65 percent of the total number of European arrivals to Tunisia in 2005 were tourists from the UK, Germany, Italy and France. Therefore, in assuming a sampling percentage of 0.05 percent with a response rate of 100 percent (asking people to fill in the questionnaires till we get into the right number) the sample size for the questionnaires was 585 French, 236 Italian, 286 German, and 163 British tourists.

Furthermore, the empirical research consists of the application of a binary Logit model, used to estimate the relationship between the dependent variable (loyalty) and one or more independent and explanatory variables (personal characteristics, perceived elements of Tunisia, and push and pull factors).

the findings suggest that the Logit model was statistically validated for French, Italian, and British respondents, with values of the Mc Fadden R-squared tend to 0.4, respectively R^2 French= 0.17, R^2 Italian= 0.15, and R^2 British = 0.12.

The results of the Logit model, estimating respondents' loyalty to Tunisia, conclude that the perception of Tunisia as a 'luxurious, health and spa' tourism destination, leads to French respondents being loyal to the country. In addition, a 'hot climate' explains the loyalty of British respondents, whilst for Italian respondents, the perception of Tunisia as a 'luxurious, health spa and cultural' tourism destination explains their loyalty to the country.

Key words: Tourists' Loyalty, European tourists, perception, tourism destination, Logit model

DIET AT WORK. AN EXPLORATIVE STUDY ON FOOD CONSUMPTION AT WORK

Cortini, Michela¹

¹*Faculty of Psychology, University G. D'Annunzio of Chieti – Pescara (Italy)*

Purpose - We start from the idea that food consumption and diet are important elements of human health and wellbeing. In such a sense, it is not surprising that eating and drinking have long been recognised as being of sociological and psychological significance. What still lacks is a serious and scientific investigation on food uses and values, and in particular of food consumption and diets within the working and organizational contexts.

Food at work is an interesting object of research since it allows not only to better know organizational and working contexts but also to do a real action research, planning interventions on nourishment problems and preventing them.

Food and nourishment related problems at work concern, among others, good nutrition (which is, in addition, indispensable for productive working), religion related diets, good work practices.

Our research aims at analysing food consumptions and values within working contexts, starting with the hypothesis that a lot of food and nourishment problems derive from nowadays occupational contexts, with the purpose of suggesting changes in the working contexts in order to prevent diet's problems.

In addition, standing the difficulties at a diet workers have to face, we would like to reflect about the conditions under which diet at work may work; or, in other words, we want to reflect about what are the working and organizational features that may help or damage a diet programme, in order to better intervene in nourishment diseases.

Methodology - After a critical review of the International literature on food at work (which is actually quite scarce), we interviewed a sample of both employers and dieticians. The transcripts have been analysed in qualitative terms. In particular, we did a narrative-metaphoric analysis of transcripts.

Findings - Perhaps the most important result concerns the possibility to cluster jobs and working contexts as being or not at risk in terms of healthy food consumption.

Of particular importance are the organizational facilities in terms of food consumption, which may play a crucial role for an healthy food consumption. In addition, we have found out that also some psychological variables (for example, self efficacy) may have a deep influence on food and diet's problems. Last but not least occupational stress seem to lead to diet problems.

For what concerns interviews, both employers and dieticians seem to recognize how crucial is the working context in terms of an healthy food consumption and diet, even if they are not always capable to foresee practical guidelines to reinforce occupational setting in this sense

Practical Implications - The present study, even if explorative in nature, is full of potential suggestions in terms of institutions' guidelines. We have provided a sort of map of food uses in Italian organizations which may serve as a basis to organize specific training for specific occupational contexts. For example, as it has happen for the Italian Education and university Ministry, also the Work Ministry could start a pilot project on fruit machines/dispensers.

Originality - Food at work is an emerging and original topic per se and, in addition, it may help in planning guidelines for an healthier occupational environment.

OPPOSING POSITIONS IN M&A RESEARCH: CULTURE, INTEGRATION AND PERFORMANCE

Dauber, Daniel¹

¹*Research and Teaching Assistant, Europainstitut | WU, Vienna University of Economics and Business Althanstraße 39-45, UZA III Staircase 2, 3rd Floor, A-1090 Vienna, Austria*

Purpose - Although mergers and acquisitions are still very popular to internationalize quickly, more than 50% are not successful. Strategic fit was found to be an important factor for positive M&A outcomes, however, many scholars highlight the importance of cultural fit and post-M&A integration in recent years. Therefore this paper aims at summarizing findings in this field of research during the last decade and their limitations.

Design/Methodology/Approach - The findings are based on an extensive literature review including 58 papers from 20 learned international journals. Main selection criteria were keywords (merger/acquisitions and integration/culture) applied to the database "EBSCO Business Source Premier" and the h-index calculated with the help of Harzing's Publish or Perish. Each article was coded and categorized by several characteristics. In contrast to classic literature reviews, this procedure allowed for quantitative analysis as well, e.g. frequency of certain variables studied, number of papers published each year, trends in methodology, etc.

Findings - Based on the papers selected for the literature review, opposing positions in M&A research were found. While some papers recommend early integration of the target company, other research findings favor late integration. Also conclusions on cultural effects are manifold: First, the question whether national culture, organizational culture or even lower levels of culture play a role seems unclear. Second, cultural diversity is seen by some scholars as a barrier to M&A success, whereas those who follow a resource-based view, argue in favor of cultural differences. Finally, performance as a variable was mainly applied to quantitative studies. However, its operationalization is different among studies and mainly refers to financial performance.

These opposing positions are mainly due to different definitions of culture, integration and performance and, to some extent, bias in methods. On the one hand, qualitative studies either used one case or investigated in many cases with view interviews. This seems not in line with leading literature in qualitative studies that highlights theoretical sampling at different levels (selection of cases, selection of interview partners, etc.) as a crucial factor for valid findings. Quantitative studies, on the other hand, produced contradictory findings due to the numerous moderating and mediating effects that might have distorted results.

Originality/Value - This literature review clearly outlines four major recommendations for future research: First, it seems important to consider the different facets of culture, integration and performance. Defining clearly the variables under investigation seems necessary in order to clarify to which extent findings can be generalized. Second, use methods appropriately. A crucial factor is the way methods are implemented to answer research questions. Especially findings from qualitative studies are strongly limited to only one case or replicate the perception of a certain group involved in such an operation. Third, consider both sides of the deal. Many studies focused on the acquirer only and excluded the role of the target organization and its members. Fourth, the paper closes with a call for research on management practices. The author suggests that culture and integration may not be the main source of failing M&As, but the way culture and integration are managed.

Keywords: Mergers, acquisitions, culture, integration, performance

RESTRUCTURATION AND ITS IMPACTS ON PSYCHOLOGICAL AND NARCISSISTIC CONTRACTS

de Chatillon, Emmanuel Abord¹; Desmarais, Celine¹; Dubouloy, Maryse²

¹IREGE, Université de Savoie

²ESSEC Business School

More than ever during the reorganizations we can hear the following remarks: "this person is having difficulties", "this person is in difficulty". The same words are taken up by the executives themselves: "I am having difficulties.

The objective of this communication is to improve the understanding to these remarks. The definition of the manager in difficulty is the following he (she) is a person does not succeed to fulfill his (her) responsibilities according his (her) hierarchy's expectation or his(her) other prescribers' ones. The consequences of these difficulties are multiple. The costs are more or less hidden : the decrease of effectiveness and performance of the managers, the destabilization of the surrounding people. But there are also social costs which are difficult to measure.

This communication proposes to identify

- The nature of these difficulties: techniques, relational, personal or managerial;
- The origin of these difficulties;
- the circumstances and contexts which generates these difficulties
- if it is possible to detect these difficulties as soon as possible?
- Is it possible to settle "tools" in order to anticipate and to prevent the risk?
- How the company can to do with the managers in difficulty : training, coaching, assessments, professional mobility, dismissals, etc?

Methodology - We carried out 15 interviews in depths with managers in various companies, of different sizes, in various sectors.

We made the analysis of the contents according to the methods recommended by Luce Bardin (Bardin, 1977).

The question of the executives in difficulty is with the striping crossing of questions milked with the individual and questions having milked to the organization. The difficulties are linked to the individual (competences, its personality, behaviors) and to the organization (requirements, its expectation, strategies, management...).

In fact the manager is bound to the company with contract. So we will mobilize the theory of the psychological contract (Rousseau, 1995, 2001) as well as the theory of the narcissistic contract (Kaës, 2009) to explain certain aspects of the situations of managers in difficulty. The hypothesis is that there are breaches in the psychological contract where there is restructuration. These breaches have consequences on narcissistic contract.

The mobilization of the concepts of Psychological Contract to analyze these situations triple interest presents.

- First of all it makes it possible to apprehend the situation of the manager in a global way; the difficulties of the executives as integrated in a disturbance of the relation of employment.
- The second interest is in the particular context of the executives' employment. Indeed, the roles of the executives are characterized by a prevalence of tacit obligations and the importance of political and relational dimensions. The use of the psychological contract enables us to apprehend these "tacit" dimensions sources of ambiguities, conflicts and difficulties. This

concept is adapted to the analysis of the difficulties being able to occur in the relation of use of the executives, because it puts forward socio-cognitive and emotional dimensions of the existing tacit bond between employer and employee.

- Lastly, the third interest lies in the fact that the psychological contract is the subject of a processual modeling within an organizational context, which will enable us to be based on this modeling to analyze and propose methods of management of the situations of managers in difficulty.

The concept of contract narcissistic borrowed from the psychoanalysis facilitates the understanding of the unconscious dimensions of representations, illusions, fantasies, identifications. It gives us a deeper knowledge of ambivalent and conflictual attachment to the company.

CSR STRATEGY: A TOOL TO ENHANCE THE REPUTATION OF INSTITUTIONS OF TERTIARY EDUCATION

Demetriou, Marlen Martoudi¹; Efremoglou, Cynthia²

¹Assistant Professor, University of Nicosia

²MBA Graduate, University of Nicosia

Every corporation strives to enhance its reputation and brand image by adopting a societal approach to all its stakeholders. In the recent years many companies choose to invest on strategies of CSR as an expression of their Societal Marketing Orientation. CSR is the concept whereby businesses integrate social and environmental concerns in their corporate operations and in their interaction with their stakeholders on a voluntary basis. As each profit making company builds a successful brand image in the community, the CSR approach allows it to give back to the community and the environment by taking the responsibility of preserving the rights of all its stakeholders, our environment and our planet. "It has become a band of critics and an image to produce a license to operate for business that has a proper CSR program". (Lodge, Wilson 2006). Good CSR efforts can help improve brand positioning and brand name as a company increases their care for the environment and community. CSR efforts can help transform businesses and develop their corporate citizenship, as a tool for development and competitive economic advantage by facilitating and developing these efforts in the world. (Carter. C. 2007)

According to the European Competitiveness Report 2008 of the EC indicates that the stakeholders are the major criteria to ensure good CSR efforts. Ongoing support for the CSR approach from the non market stakeholders, for example, allows better and more effective results. 'Effective CSR requires dialogue and partnership with stakeholders such as trade unions, public authorities, non-governmental organisations and business representative organisations.' (EC website 2009)

The CSR approach is also an opportunity for tertiary education to implement and take responsibility to influence and set an example to their students, employees, community and government bodies. Various objectives were identified from the research to establish and increase CSR awareness, CSR advantages and efforts and increase brand positioning and image for tertiary education.

In this research paper the researchers aimed to identify the market opportunities for the University of Nicosia, in order to enhance its brand image as a Responsible Organization in the Cyprus and the International Market of Private Institutions of Tertiary Education.

The research was divided in three phases and it combined a variety of research methods in order to help the researchers to collect valid and reliable data. The first phase of the research was a survey with a sample of 506 Cypriot Citizens who were asked to express their expectations from an Institution of Tertiary Education in Cyprus in terms of Social Activities. The respondents were positive for the advantages the CSR efforts could bring to both the community and environment and the majority of them agreed that CSR behaviour and philosophy to care for our plant and community is important and needs the collaboration of the educators to help persuade and influence our world. They have also listed areas/ social problems in which they expect the Institutions of Tertiary Education in Cyprus to become actively involved.

The second phase of the research was a survey among a sample group of 60 persons who interact with the University of Nicosia (students, faculty and staff) who agreed on the need of an Institution of Tertiary Education to adopt a dynamic CSR strategy. Furthermore a 86.7% of responders agreed

that a successful CSR strategy will increase awareness and 81.6% also agreed that CSR could increase brand positioning and image for the University of Nicosia.

The third phase of the research used the focus group approach. A focus group was formed with the participation of the Campus director and members of the administration and the student affairs of the University of Nicosia. They all agreed on the need, the Institutions of the Tertiary Education to get more involved in the environmental and other social problems named by the participants of the first and the second phase of this research process. The members of the focus group emphasised the need for the University of Nicosia to increase CSR awareness by taking the responsibility to show the community how important is to recycle and preserve the environment and to save energy by adopting "solar energy" technology. On a social aspect the members of the focus group agreed to undertake "smoke free" campaigns since lung cancer is the number one reason for mortality among young adults. The intention of the focus group to examine other measures and campaigns related to other social problems of our community was also expressed.

The main conclusions from the research highlight the need for Institutions of Tertiary Education to adopt a comprehensive CSR campaign which will enhance their brand image and reputation, contributing to the minimization of social and environmental problems- a role that is expected from ITE's as the research indicated.

Key words: Corporate Social Responsibility (CSR), Institutions of Tertiary Education (ITEs), brand image and reputation.

ALLIANCE DECISION-MAKING OF SME: PHASES AND INFLUENCE FACTORS

Diaz, Karla¹

¹*Candidate Ph-D SEPT Programm, Universität Leipzig, Deutschland*

Managing alliances is no more difficult than deciding to enter into such a cooperative relationship. Many researchers, particularly in the advanced countries have studied strategic alliances with special emphasis on large enterprises and focused as a way of internationalization but there is still a gap of references to understand how this decision is taken from the point of view of SME: what makes SME to be engaged in alliances?, which factors are playing an important role into this decision?.

The innovation of this research is to provide a framework of alliance decision-making process based on five phases as well as the identification of key factors that make SME to be engaged on alliances. The proposal is based on the incorporation of different perspectives from the social capital, mainly social exchange, and economic development into the alliances decision making particularly in SME. This research could be especially attractive to the different actors involved with SMEs in order to focus their effort on those phases or factors that are weak and that may be potentially developed in a new way of joint working.

The empirical data comes from a sample of 130 small and medium enterprises in Mexico that is a good example to find not only enterprises with structural and cultural limitations that are obstacles to decide to be engagement but it is also possible to find successful experiences of inter-organizations. These two paradoxes provide relevant data to try to answer the question of this study. 11 variables are measured through two questionnaires (one for enterprises with alliances experiences and one for enterprises without alliances experiences), using a liker type ordinal scale of 3 and 5 options. The answers of this questionnaire are being collected through personal and phone interviews.

The preliminary results show significant difference between these two groups that provide a lot of potential to develop alliances strategies among SMEs. The perception of the enterprise competence phase and the alliances proposal phase are critical phases into the alliance decision-making process. Although most of the entrepreneurs desire to be involved in alliance, the lack of possession of information about alliances issues as well as the lack of trust is key factors that are limiting this decision.

Key Words: Alliances, decision-making, phases, influence factors.

JEL Classification: D01

CASE STUDY: INTERNAL FACTORS IN THE PLANT AND THE KIBBUTZ HELPING PLANTS TO INTEGRATE IN THE GLOBAL ECONOMY

Edom, Sara¹

¹*Ashkelon Academic College*

General background - In Israel, there are some 250 kibbutzim. Kibbutz members comprise 1.7% of the population of Israel. The kibbutz is a collective society, whose core values are: cooperation and equality. The guiding principles of kibbutz organization and management are:

1. Joint ownership of production and consumption assets.
2. General and mutual help.
3. Democratic management, decision-making by vote of all the kibbutz members, each member having one vote regardless of their role in the system and their seniority as a member of the kibbutz.

In the past, the kibbutzim supported themselves through agriculture, and in the 1960s they underwent a process of industrialization. Today there are around 300 industrial plants on kibbutzim.

In 2007 income from industry represented 67% of the income of the kibbutzim, and income from agriculture was 15%. According to the breakdown of income from kibbutz industry in 2007, 45% of the plants are in the field of plastics, 17% are in the food and beverages branch, and 12% are metal and machinery-based.

Economic characteristics of kibbutz industry in 2007:

Total sales NIS 36,854,000

Export and overseas activities NIS 18,568,000

Total employees 45,970

These figures indicate that the kibbutz industry is export-oriented, and many of its plants have found the way to growth by joining the global economy.

The position of kibbutz industry in the Israeli industrial sector (2007 data): 7.8% of total sales in the sector, 9.4% of the total workforce, 10.2% of total exports. Kibbutz industries as a group contribute more to the Israeli economy than the proportion of kibbutz members relative to the country's population.

<i>2007 sales in NIS m</i>	<i>No. plants</i>
<i>Over 250</i>	<i>25</i>
<i>100 - 205</i>	<i>50</i>
<i>50 - 100</i>	<i>54</i>
<i>30 - 50</i>	<i>43</i>
<i>Up to 30</i>	<i>93</i>

Breakdown of sales by size of plant (2007)

More than half the sales from kibbutz industry come from the 25 largest plants. This figure indicates a process of polarization in the kibbutz industry, with the largest plants growing at a faster rate than

the medium and small plants. The big plants are becoming bigger, and the small ones are becoming smaller.

Characteristics of the kibbutz plant - The kibbutz plant is a combination of cooperative and family firm. When factories were first established on the kibbutzim, only the kibbutz members worked there, and, as in a cooperative, they were also the plant owners. The members of the kibbutz, like the family of the owner of the firm, had the right to manage and work in the plant. The growth of the plants necessitated the intake of a workforce beyond that which the kibbutz could provide, and the industrial plants were forced to employ people who were not kibbutz members. Over the years, the second and third generation of the kibbutz became members and joined the plants as laborers and managers. The kibbutzim and their plants are managed today by second and third generation kibbutz members and non-member salaried employees.

The core values of the kibbutz society, cooperation and equality, had an impact on the management culture of the plants, especially in their early years. In the 1960s and 70s, when the kibbutzim were undergoing massive industrialization, the socio-technical approach was adopted by the kibbutz industrial plants.

As noted, the kibbutz industries are managed today by second and third generation members of the kibbutz. The critical element in the success of a business firm is the quality of its human capital, the quality of its managers. If there are no suitable managers among the kibbutz members, managers are hired from outside the kibbutz. However, those who decide who will be hired as managers are the kibbutz members, and so it is their skill and ability to choose the right manager that influences the quality of the managers who are hired. Hence the quality of management of a kibbutz plant is always affected by the management ability of the kibbutz members.

Research question - What are the internal factors in the kibbutz and the plant that help the plant cope successfully with the global economy?

Method - From the data regarding kibbutz industry, it appears that in the past decade there has been a process of polarization, in which the big plants have shown greater growth. It can be assumed that internal factors in the plant and the kibbutz have affected the plant management in responding differently to changes in the environment.

In order to learn what factors affect the response of the management of the kibbutz and the plant owned by the kibbutz to changes in the business environment, three cases were examined, three industrial plants owned by kibbutzim whose financial situation is strong. The plants were from the three main branches of kibbutz industry: plastics, food and machinery,

The three plants have been in existence for around 50 years, and until around a decade ago the income and profits of the three plants grew steadily. In the past decade, one plant has stopped growing, another grows some of the time, and the third has continued to grow consistently. The business environment is similar in all cases, a high level of competition and exposure to imports; the results of the way the plants have dealt with this environment are different.

The research examined factors such as organizational culture, management style, adherence to the core values of the kibbutz, personal motives and attitudes of the kibbutz members, the percentage of plant workers out of the total kibbutz workforce, reciprocal relations between the plant and the kibbutz and so on.

The research was carried out using quantitative and qualitative methods.

The presentation at the conference will include details regarding the internal factors in the plant and the kibbutz relating to the quality of management of the plant.

DEVELOPMENT OF SYSTEM THINKING IN THE CONTEXT OF BUSINESS EDUCATION

Frank, Moti¹; Kordova, Sigal²

¹HIT, Holon Institute of Technology, Israel

²Technion, Israel Institute of Technology, Israel

This paper deals with a development of system thinking of students who study Industrial Engineering and Management according to new curriculum. Project Based Learning (PBL) becomes an integral part of the new curriculum. During two semesters, the students conduct a project in a business organization where each project is related to a different aspect the business environment. The students should demonstrate the appropriate use of critical thinking, written and communication skills, decision-making skills, and problem solving skills needed for the high quality of their project. The participants of this research included 42 college students and 111 high school students, all of them took part in a team project in the area of industrial engineering and management. One of the research tools was a questionnaire for assessing students' tendency for system thinking. The original questionnaire was developed by Frank (2007) and was upgraded for the current research. To successfully integrate different issues into an integrated project, the student needs a system view or, in other words, a high capacity for engineering system thinking (CEST). CEST is a combination of knowledge, professional skills, and behavioral competencies. The main characteristic of CEST is the ability to see the "whole picture" and all relevant aspects without getting stuck on details (Frank, 2007).

The upgraded questionnaire was repeatedly used to track the development of the students system thinking. First, we ran the questionnaire in the beginning of the process while the students had to find a suitable organization for performing their projects. Finally, we ran the questionnaire in the end of the academic year, after the students submitted their final reports. The tool's reliability test was measured by calculating the Alpha coefficient (The result was 0.706). In addition, three types of validity were investigated - content validity, contrasted group validity and construct validity.

In the statistical analysis of the respondent's replies to the above questionnaire, a significant difference was found between the score received at the beginning of the final project's work process, and that which was received at the end of the process, after the final project had been completed ($p < 0.01$).

According to the division of four components which defined CEST (cognitive characteristics, abilities, personal traits, knowledge) we used the paired t test in order to compare those components before and after the final project had been completed. We found a significant difference between the pre mark and the post mark in these components: cognitive characteristics, personal traits and knowledge. There was no evidence of a significant difference between the component of abilities in the two points of time ($p = 0.743$).

These findings emphasize the notion that CEST may be improved and acquired through learning. The only component that may not be improved is the student's abilities of CEST. This component includes analyzing the needs, requirements and preferences of the customers, and conceptualizing benefits against costs considerations. We will discuss the difference between this component to the others components of CEST, regarding the research's results.

In this research we used a confirmatory factor analysis, regression analysis and general structural equation model with latent variables. The model that we present is a confirmatory factor model for data of the 153 students' scores. Using Analysis of Moment Structures (AMOS software) we implemented the general approach of data analysis known as Structural Equation Modeling (SEM).

The study findings allow us to conclude that the final project contributed to the development of system thinking among learners. Perhaps this is evidence that supports the notion that system thinking may be improved and acquired through learning. This conclusion should be verified and validated by additional future studies.

And finally, both industrial engineering curriculum and business administration programs curriculum combine different complementary learning experiences.

The graduate in both areas must understand different issues from various disciplines (such as finance, marketing, leadership, negotiation, operations, strategy, and more) and has to combine them together. He doesn't have to understand all the internal processes in the organization. The main advantage of the graduate in both areas is the ability to integrate all the system's parts.

A practicable contribution of this research can be the planning of an effective outline for business administration curriculum so that the graduate will acquire system thinking skills and integrated understanding of contents and processes.

Keywords – Capacity for Engineering System Thinking (CEST), Project based Learning (PBL).

A CROSS CULTURAL COMPARATIVE STUDY ON VENDOR CHARACTERISTICS, SUBJECTIVE NORMS AND ONLINE TRUST

Ganguly, Boudhayan¹; Dash, Satyabhusan²

¹*Indian Institute of Management Lucknow, Prabandh Nagar Off Sitapur Road*

²*Indian Institute of Management Lucknow Prabandh Nagar Off Sitapur Road*

Purpose: The purpose of this study is to examine the moderator effect of culture on the relationship between vendor characteristics, subjective norms and online trust.

Design/Methodology: Student sample was used in the study. A total of 596 students from various Bschoools in India, Canada and USA participated in the study. Moderator regression analysis has been used in the study for testing the moderator effects of cultural variables.

Findings: Our results indicate that vendor reputa and communication with vendor positively affect trust. Internal norms also have a positive effect on online trust. External norms have a negative effect on trust. Uncertainty avoidance positively moderates the relation between internal norms and trust. Power distance negatively moderates the relation between external norm and trust and also between communication and trust. However, there were no moderator effects of collectivism on the relation between internal norm and trust.

Research Implications: The results have several interesting managerial implications. First it shows that customers who are high on uncertainty avoidance would prefer to trust vendors with a lot of reputa. Customers who are low on power distance give more importance to communication to build trust. Further, it was found that external norms may have negative impact on trust and the customers who are high on power distance gave less importance to external norms to build trust. Thus celebrity endorsement and use of other mass media need not necessarily generate online trust. Online stores should build reputa, provide more efficient communication, and use the positive word-of-mouth of its existing customers for building trust.

Limitations: The students were used in the sample to get sample equivalence and also because students belong to younger age groups who are heavy users of online shopping. However, other segments were not considered.

Originality: Findings from the study indicates that culture moderates at the individual level and country should not be used as a surrogate for culture. The study differs from the previous works as it uses individuals' cultural values and tests its moderator effect on the relationship between vendor characteristics and trust and also between subjective norms and trust.

Keywords: Vendor Characteristics, Subjective Norms, Online Trust, Moderator, Culture.

THE IMPORTANCE OF ACCOUNTING INFORMATION ON STRATEGY MAKING FORMULATION OF SMEs IN GREECE

Germanos, Georgios¹; Tsamenyi, Mathew²; Tourna, Eleni³

¹*PhD Candidate at Birmingham University*

²*Professor, University of Birmingham*

³*Technological Institute of Athens (TEI of Athens)*

The purpose of this study is to examine the role of accounting information in the strategy formulation process of small and medium size enterprises (SMEs) in Greece. The study will analyse how owner managers of SMEs utilize the information they receive from internal and external sources for strategic purposes. The study is motivated by the dearth of literature on how SMEs make strategic decisions and the role that accounting information plays in this. The thesis will examine whether integrating accounting information into the formulation of strategy leads to greater financial success.

SMEs play a crucial role in the economic development of a country. SMEs contribute to outputs and employment and can also affect the competitive ability of the large organizations (Husband and Mandal, 1999). SMEs influence the competitiveness of large organizations by providing high quality inputs (Van der Weile and Brown, 1998). According to Ghobadian and Gallear, (1996) SMEs are the "life-blood" of modern economies. The importance of SMEs for future economic development has also been reflected in a number of policy papers which have focused attention on the role of entrepreneurship, owner-managers and the small firm sector (Deakins et al., 2002). Examples include EU policy on sustainability and the Competitiveness White Paper (DTI, 1998).

Despite this fact, most empirical studies in the area of strategy formulation have been focused on large organizations. Only a few researchers have addressed the strategy-making process of SME's (O'Regan and Ghobadian, 2000) or the importance of information in strategy development and implementation (Bhimani and Langfield-Smith, 2007). There is little empirical research that has sought to critically evaluate the strategic decision process and how this impacts on the performance of SMEs (French et al., 2004).

Prior research on the relationship between strategy and firm performance has produced mixed results. There is therefore no conclusive evidence on the effect that a particular strategy orientation has on firm performance. This study argues that the failure of prior studies to include accounting information in their analysis might have contributed to these mixed results. The present study contributes to our understanding of the relationship between strategy and firm performance by exploring the role of accounting information in the strategy decision process. In particular, it examines whether firms perform better by integrating accounting information into their strategy formulation process. The study will address two main research questions: (i) To what extent do Greek SMEs use the accounting information available to them when formulating their strategy, and (ii) what is the impact of strategy and accounting information on the performance of the SMEs? To accomplish the aims of the study several issues will be examined including the process of strategy making in the Greek SMEs, factors influencing strategy formulation, and the role of accounting information in the strategy process. In terms of the role of accounting information, the study will investigate what are essential accounting and financial information that owner managers of SMEs seek to receive and what accounting and financial information are being used for strategy formulation.

The thesis adopts a contingency model that posits that financial performance will depend on the fit between strategy formulation with the use of accounting information and the contingent factors of organizational size, managerial characteristics, technology employed, financial and human resources available and the external environment.

In order to achieve the study's aim, this study adopts a triangulation research as the methodological approach. Using a mixed approach to research will permit a wider and richer understanding of strategy formulation practices than a singular methodologically approach. Specifically the research design of the study will consist of two main research stages. The first stage, that has already been conducted, is an exploratory pilot study and consists of the analysis of interviews to prepare the questionnaire. The second stage is the explanatory study and consists of conducting the large scale survey and testing the study hypotheses.

The research approach used at the first stage can be characterized as qualitative. This is due to (1) the limited literature investigating the strategy formulation in SMEs in Greece and (2) the fact that some research objectives and questions that are stated above are on an exploratory basis. The research approach that will be used in the second stage can be characterized as quantitative. The specific design of this stage can be identified as cross-sectional. The specific method of data collection will be questionnaires that will be sent via mail to the SMEs. The rationale for choosing this method of data collection is that it can be used to generate quantitative data on a large number of companies who are known to be representative of a wider population in order to test theories or hypotheses.

Preliminary results from the pilot study confirm that the process of strategy formulation in Greek SMEs is an emergent procedure and individualistic in nature. Results also reveal that organizational size, technology, the external environment and the owner manager characteristics are important variables in understanding the relationship between strategy formulation and financial performance. In addition, it appears that owner-managers use accounting information when making strategic decisions and the most reliable source are the accountants they employ. The preliminary findings will be used as a basis for the development of the main instrument of the study.

This study will make several contributions to theory and practice. For example, it will fill a gap in the literature on the importance of accounting information in the process of strategy formulation of SMEs. In addition, the study will provide owner managers and policy makers with a better understanding of how to improve the performance of their businesses.

BOARD ATTRIBUTES AND ORGANISATIONAL DEMOGRAPHY- EVIDENCE FROM COMPANIES LISTED IN THE ATHENS STOCK EXCHANGE

Purpose of the study - Due to the recent scandals on the headquarters of the world's leading organizations, corporate governance (CG) practices and board of directors' functions have attracted considerable attention. A range of CG guidelines have been developed, aiming to enhance investors' confidence and reduce the risk of collapse (Demirag and Solomon, 2003). Although a plethora of studies have already assessed the association between board attributes, board performance and organizational performance (Payne et al., 2009; Nicholson and Kiel, 2007), a limited amount of studies have focused on the association between board attributes (Ruigrok et al., 2007) and organizational demographics. The present study attempts to fill this gap by collecting data from 293 companies listed in the Athens Stock Exchange (ATHEX) for the year 2008.

Literature Review - Board Characteristics - Board Size: Larger organisations have more complex structures and managerial processes (Godfrey, Merrill and Hansen, 2009); thus we theorise that there is a necessity for a bigger board size that allows monitoring and servicing the organisation more efficiently.

External Independent Directors: Agency theorists believe that the presence of external directors can minimise agency cost. A remarkable number of studies argue that the presence of non-executives protect shareholders' interests (Hillman and Dalziel, 2003; Pearce and Zhara, 1992). Larger organisations involve greater number of stakeholders than smaller ones (Rindova, Pollock, and Hayward 2006). This may result to the need of more external directors, so as to protect the interests of those stakeholders.

Board Committees: OECD (1999) recommends that companies should establish internal control committees, so that to protect shareholders' interests and to engage efficient internal control systems. Larger organizations are more complex to be monitored and controlled than their smaller counterparts (Godfrey et al., 2009), and thus may have a greatest necessity for the presence of established board committees (Ruigrok et al., 2006).

Organizational Demographics - Type of Industry - Different industries need to adopt dissimilar organizational strategies and corporate governance approaches depending on their competitive environments (Pearce and Zahra 1992; Kang et al., 2007). Due to that, they may develop board attributes that fit best to their strategies and respective environments.

Organizational Size: Agency theorists argue that larger firms require a greater number of directors to monitor the management of the organization (Kiel and Nicholson, 2005; Hillman and Dalziel, 2003). Similarly, "Resource dependency" theory suggests that large organizations need more directors to attract valuable and diverse resources (Allen, 1974; Dooley, 1969). Large organisations involve greater

number of stakeholders than smaller ones (Rindova, Pollock, and Hayward 2006). This may result to the need of more external directors that will protect the interests of those stakeholders.

Organizational Age: Institutional theory of action implies that as an organisation ages, reliance on rules increases (Zhou, 1993). The reason of this phenomenon is the increased pressures for “internal consistency” and managerial stability (Aldrich, 1972). Therefore, we may assume that boards in older organisations employ greater proportion of external and independent directors that will be responsible for the consistent internal function and protection of shareholders’ interests.

Methodology - The current study consists of all Greek companies found listed in the Athens Stock Exchange (ATHEX) on 31st December 2008. Secondary data of 293 companies were collected from December 2008 to January 2009, while the main sources of data collection were the ATHEX website (www.athex.gr) and the companies’ Annual Reports. T-test and One Way ANOVA were used to examine any significant differences in the means of the four dependent variables (board size, number of internal/external directors, independent members), based on the groups formed for each independent variable (Industry Classification, Organisational Age, Organisational Size and Years listed in the ATHEX) and grouped as explained in the relevant variables in the methodology.

Findings - T-test was employed and significance of difference was found between the two industries in the means of board size and the means of external and independent directors, while the means internal board members did not show any significant difference.

Analysis of Variance technique shows that larger organizations tend to have bigger boards and greater proportions of external internal and independent directors. This may be explained by the fact that large organizations require large number of directors.

Furthermore, older organizations have larger boards, more external directors and a higher mean of independent members. Companies that are listed in the ATHEX for longer period of time seem to have larger boards and greater proportion of external members. This may be explained by the fact that the longer an organization is listed, the higher it appears to rely with the CG rules and procedures.

Originality - This paper extends our understanding regarding corporate governance practices in Greece and focuses on the association between board attributes and organizational demographics.

**THE FORMS OF POWER IN THE COMPANY AND THE HEALTH OF THE EMPLOYEES :
CROSSED INFLUENCE OF THE MANAGEMENT AND THE GENDER**

Guiol, Patrick¹; Hess-Miglioretti, Aurelie; Mériot, Pascale; Muñoz, Jorge

¹*Researcher in political science at the CNRS*

Purpose - The presence of participative practices in the company and the opening of the board in the labor-management dialog generate a climate at work having an impact on the health of the workers ? Do these effects vary according to the gender ?

Design/methodology/approach - Two samples of companies opposing by their management (in total 128 companies and over 30 000 employees) are compared. The criterion of effective governance has been preferred to the legal status of the company (capitalist / cooperative). Occupational physicians of these companies have been interviewed through a questionnaire. The medical statistics of the employees were also analyzed.

Findings - An authoritarian management of human resources and a bad social climate have effectively an impact on the health of the workers, particularly in the register of the pathologies with anxio-depressive constituent. But the impact is also very sensitive about the accident, which suggests two kinds of explanatory tracks: sociological and psychological. The question of the gratitude(recognition) - to literally and figuratively - is once more central. The gender distinction is very significant. Women shows an highest level in health spending, but men are four times more sensitive than women in relation to the type of power exercised on them.

Research limitations/implications - The study covers 16 sectors of industrial activity. The identification of companies per pairs similar but enough contrasted by the nature of their management is a challenge.

Practical Implications - The socioeconomic translation of the sanitary overconsumption resulting from an environment which privileges the authority rather than the animation in the management is not negligible in public spending. The rate of absenteeism in the company is concerned.

Originality/value - We know through many studies on stress, including the contributions of Karasek and Desjourns that climate relationship in the company, the degree of autonomy and recognition to the employee are majors psychosocial determinants of health at work. For its part, this paper show that such effects may find an upstream explanation nature of collective and not individual, at the level of the institutional logics.

CUSTOMER RELATIONSHIPS IN HIGHER EDUCATION: A CONCEPTUAL FRAMEWORK

Ioannou, Myria¹; Melanthiou, Yioula²

¹Lecturer, Ioannis Gregoriou School of Business Administration, European University of Cyprus

²Lecturer, School of Business, University of Nicosia

Purpose - Academic interest and research on exchange relationships dates back to the 1970s. Nevertheless, research pertaining to student-university relationships is scarce. Such an omission, however, may seem surprising given the assertions of an array of academics, such as Berry (1983) and Gronroos (2000), who suggest that services are inherently relational.

Specifically, education is a service which necessitates the personal involvement of the student, and according to Pressey and Mathews (2000) this enhances relationship development. Moreover, a substantial investment is required on behalf of the student in terms of time, effort and financial resources as well as substantial adaptation of his/her behaviour and lifestyle, increasing even further the relevance of exchange relationships in the education industry. In addition, education is continuous in nature but normally for a specific duration. That is, even though the ongoing nature of education makes it conducive to relationship development (cf. Berry, 1983; Lovelock et al, 1999), the delivery of the service would normally not last for a lifetime, but instead for a limited time period.

In fact, a number of benefits may accrue from a potential student-university relationship for both parties of the dyad. In particular, students benefit from an enhanced service delivery process and as such, an improved outcome, i.e. more knowledge and capabilities which can result in better job opportunities, earning prospects and contribution to society (cf. Melanthiou, 2009). On the university side, relationship benefits pertain to improved levels of service quality, increased student retention and loyalty, positive word-of-mouth and reputation enhancement (Reichheld and Sasser, 1990; Buttle, 1996; Seeman and O'Hara, 2006; Helaesen and Nettet, 2007). Consequently, investigating student-university relationships seems particularly intriguing.

To reiterate, however, little work has been undertaken which investigates the relevance, applicability and implementation of student-university relationships. This lack of research may be partly accounted for by the lack of consensus as to whether students can truly be considered as customers. In fact, the student-as-customer concept has attracted the interest of various academics, but perspectives have polarised (cf. Eagle and Brennan, 2007; Svensson and Wood, 2007).

Consequently, in view of the above, this paper discusses the relevance of the relationship concept in the higher education industry and proposes a conceptual framework which maps the development of student-university relationships, from an input-output perspective. In so doing, it utilises concepts from relational theories but, in line with Eagle and Brennan's (2007) suggestion, it is acknowledged that higher education is largely a private good and this essentially "makes the student the customer in the higher education process" (p. 48).

Findings - The conceptual framework models the wider environment within which the student-university relationship develops, maps the dual effect of the interacting parties and presents the relationship dimensions which influence the success or failure of the relationship (cf. Anderson and Narus, 1984; Wilson and Moller, 1991; Morgan and Hunt, 1994). To this end, it is recognised that student-university relationships develop through multiple service encounters at different levels with different service personnel.

In particular, the conceptual framework views student-university relationships to unfold within a wider environment (cf. Hakansson, 1982), which includes such aspects as culture, the legal and regulatory framework, the economic environment, and the technological environment (cf. Ioannou

and Zolkiewski, 2007) and affects relationship development. Further, the significant effect of each of the parties on the interaction pattern and the resulting student- university relationship is modelled, by incorporating their profiles.

Finally, the relationship variables which influence the dyad in pursuing and maintaining the relationship are presented. These are conceptualised to include the courses offered, comparison level of alternatives, communication, consultation/advising, fairness, service quality, satisfaction, bonds as well as trust and commitment (Anderson and Narus, 1984; Dwyer et al, 1987; Ioannou, 2009; Morgan and Hunt, 1994; Parasuraman et al, 1988).

THE ECONOMIC EFFECTS OF A SINGLE NATIONALITY ON A NICHE TOURISM DESTINATION: THE BRITS WEEK IN LAAX

Jenkins, Ian¹; Rios-Morales, Ruth¹; Horrigan, David¹

¹STAR, Swiss Tourism Applied Research, Les Roches Gruyère University Applied Sciences, Bulle, Switzerland,

Purpose: This paper explores the perceived economic expenditure that a single nationality makes at an Alpine niche tourist destination (Hudson 2008, Hall 2005). A number of strategies are used to promote new forms of income during a tourism shoulder period. One such strategy is encouraging a destination to attract a single nationality for a niche event (Hudson 2008, Novelli, 2007). This is the case of Laax, Switzerland. The destination has developed a niche tourism image, with supporting niche products (Novelli 2007). Laax focuses upon the sport of snowboarding and encourages specialised events connected with this image (Getz 2007). This paper explores the perceived expenditure (of British snowboarders and freestyle skiers) during a one week stay. Primary data was collected on perceived expenditure and also peripheral variables; such as marketing of the Brits Week and antecedents of the participants (Hudson 2008). Two companies organise and manage the event, Souls Sports and Weisse Arena; both companies were extremely interested in the expenditure profiles and other consumer information (Getz 2007) relating to the British tourist.

Design/methodology/approach: A mixed methods approach was taken to collect data on a qualitative and quantitative basis. The intention was to complement the perceived expenditure of the British tourists with the qualitative perceptions of tourism actors in the surrounding environs of Laax. The study collected 204 self completion questionnaires from British tourist that attended this event. In addition, some 9 qualitative interviews with relevant tourist actors from the surrounding locality were undertaken. The data were explored and analysed using descriptive statistics linked to non parametric statistical tests. The main focus of this paper is upon quantitative data.

Findings: Most participants at the event plan to come well in advance (sometimes up to a year). Awareness of the event is dominated by 'word of mouth' information (Hudson 2008), which given that this event is part of the British Ski Events calendar, is not surprising; this 'week' is the culmination of the whole season's events.

It is evident that the Brits Week in Laax provides an important economic boost at a shoulder period in the year. The economic spend is an estimate, but its range may well be in the region of £600,000 to £1,000,000 for some 800 to 1000 tourists. It was noted that perceptions of economic spend differed when individual spending categories were compared to total spend.

Furthermore, the economic spend on primary items, tended to mirror the profile of a normal tourist, with accommodation and transport consisting of the largest expenditure segments (Hall 2005). Secondary spend, too, was predictable, with ski lifts and food being the largest categories.

The antecedents (Getz 2007) of the participants in Laax were clearly linked to snowboarding and its depiction. In essence most visitors at the event were young, between 16-35, with a bias towards males. Given the risky image of snowboarding and freestyle skiing, one may have conceptualised this (Getz 2007, Hudson 2008, Wheaton 2004).

In addition, the expenditure profile of this week is similar to that of an annual holiday. In fact the estimate spend is higher than the visitors' annual holiday spend.

Finally, the economic spend at Laax has little leakage; facilities used by the Brits are nearly wholly owned by Wiese Arena. Consequently, the majority of the expenditure is derived from the

accommodation, lift operations and retail outlets, located around the Ski Area of Laax. Little, if any, money circulates to the village as a whole.

Practical implications: This study provides a new perspective on expenditure by a single nationality at a niche event. The research was primarily designed as an applied venture to assist in understanding expenditure and consumer behaviour of a particular nationality at a niche tourism destination. Before being able to actually engage in the research, it was necessary to gain the consent of both companies who were involved in hosting the Brits Week. Both companies were anxious to ascertain what the perceived expenditure was for the week, where the economic spend was being made, together with understanding antecedent factors of the attendees.

CONCEPT OF BUSINESS PERFORMANCE MANAGEMENT (BPM)

Klaas, Olga O.¹; Gorskova, Yu. O.²

¹Associate Professor, PhD in Economic, Gubkin Russian State Oil and Gas University

²Postgraduate Student, Gubkin Russian State Oil and Gas University

Abstract: The article is the authors' view and attempt to consolidate general vision (including development of BPM Architecture Chart) of new managerial concept BPM (Business Performance Management) and analysis of how it can allow to integrate all managerial systems and tools, used in a company, to focus internal operational business processes on achieving strategic goals and targets. All managerial systems used in any corporation (Strategic management, Value based management, Risk management, ERP etc.) usually are focused on some specific areas and ignore some processes which are apart of those systems control, but make rather significant impact on results. So it's very important to have some approach or tool which can integrate all systems which are used in managerial process and account any interinfluence between them in focusing the whole scope of activity on achieving strategic goals. Implementing BPM allows to solve this task with maximum efficiency.

Key words: Business Performance Management (BPM), Integration, Efficiency, Strategy, Enterprise Resource Planning systems (ERP), Information system.

Creation of Enterprise Resource Planning systems (ERP) in the middle of the 1980-s became an apogee of the human desire to know and understand the processes ongoing in the organization. These systems were based on planning of necessary material (Manufacturing Resource Planning (MRP)) and manufacturing resources (Manufacturing Resource Planning (MRP II)), management of customer relations (Customer Relations Management (CRM)) and supply chains (Supply Chain Management (SCM)). On the one hand, this helped to put all processes in the company in order, bring them to the single reference point, but, on the other hand, such systems often proved to be not only user-unfriendly but also inefficient because of their complexity. In addition, they allow managing the company on a day-to-day level only, while the tactical and strategic levels were not covered by ERP systems. Therefore, there was an evident need for an integrated management system that could offer concrete solutions for business performance improvement.

Separate solutions that allowed covering all three levels of management (i.e. operational, tactical and strategic) existed but were used by companies separately from each other. Attempts to consolidate them by IDC analytical company specializing in computer market monitoring led to the emergence of a new term - BPM (Business Performance Management).

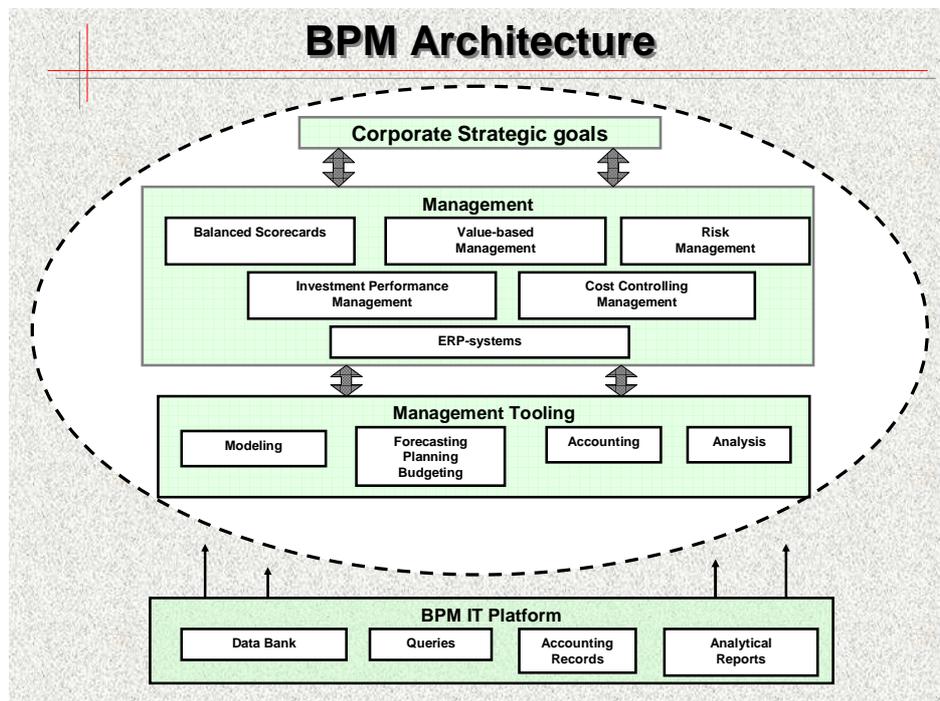

Along with BPM, other abbreviations can be found in the literature, such as CPM (Corporate Performance Management), EPM (Enterprise Performance Management), etc. It is interesting to note that the above-mentioned term, CPM, was concurrently formulated by Gartner Group. This gives another evidence of the logic development of management systems which reached its culmination in BPM concept being a universal system applicable to any company.

The BPM management system is a new integrated method that allows aiming all business processes existing in the Company at achievement of strategic goals and timely making of effective decisions. The following features make this system unique:

- it makes achievement of the strategic goal a priority of decision-making at all levels of management;
- it takes into account not only internal factors that determine activities of the company but also external environment that is often beyond the control of the company and, as a rule, is not accounted for by conventional management systems;

- it is not a new methodology to manage development of the company, instead it integrates and structures logically all management systems applied in the company.

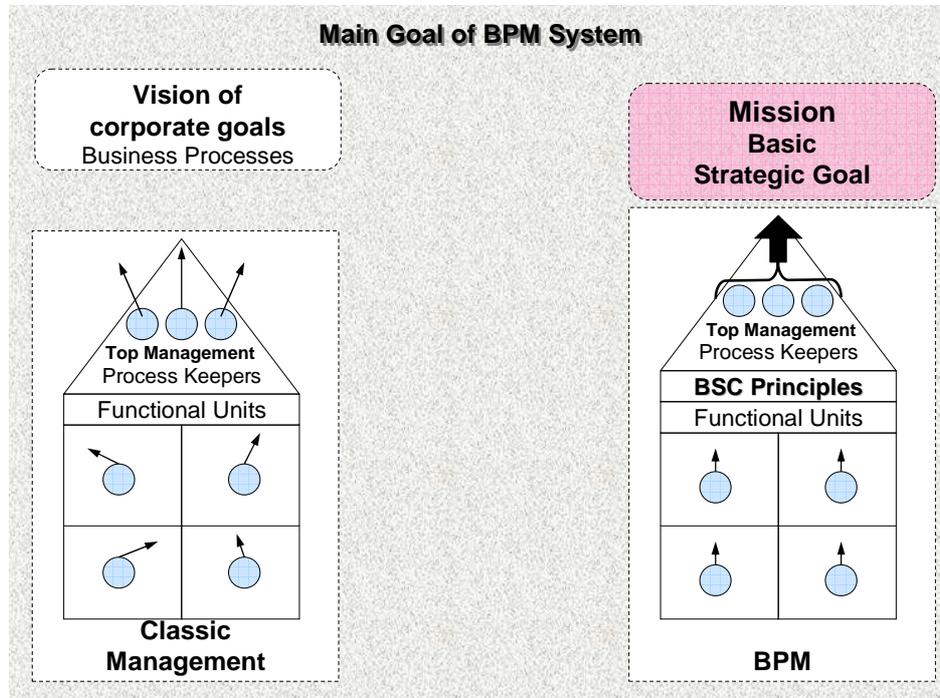

Today the majority of companies use sophisticated management systems in their activities, such as purpose-oriented management, budgeting, different forms of reporting and analytical tools. The concept of the BPM system does not contradict them but regards them from its point of view as components that should be properly connected instead of being operated separately. However, it is very seldom that BPM systems are fully implemented. And the main reason for that is primarily the fact that the concept itself is very young. On the figure below is placed the architecture of BPM.

Goals, objectives and solutions of the concept. In a practical sense, term "BPM concept" has two meanings:

1. As a management concept – a certain approach to making and implementation of managerial decisions;
2. As an information system – a complex of software supporting the BPM ideology and enabling its practical implementation.

But in the first place BPM is a management concept and only after that an information system that supports the management process. Its main advantage is its universality. It is provided by the application of the integrated approach of the system to activities of the company. This is expressed in the ability of the system to provide for implementation of all processes and solutions to arising problems from the point of view of the strategy implementation, by using existing means, methods and systems of management.

Focus of the company on the strategy implementation. Sometimes in the course of operations the strategic goal can recede into the background in light of continuously arising problems. This leads to a situation when at the level of a business unit, subsidiary or even a corporate center day-to-day managerial decisions are aimed not at the gradual achievement of the pre-set strategic goal, but elimination of daily problems. In this case the BPM system constantly “reminds” managers at all levels of the main objective of the company by focusing their attention on the strategy of the company and fulfillment of the strategic Key Performance Indicators (KPI). To achieve this, priorities of development should be identified for each business unit from the point of view of the company as a whole. Being an integral method, the BPM concept suggests using existing systems that perform the functions of purpose-oriented management. One of the most famous of them is Balanced Scorecard created by R. Kaplan and D. Norton. The essence of the system lies in setting KPI for each business unit and building a balanced system for the company aimed at achievement of strategic goals. It also makes sense to have the policy of personnel incentives based on the created system of balanced of indicators and analysis of KPI fulfillment. Thus, with implementation of this system, the company can arrange work of all business units by setting achievement of strategic goals as common priorities in all areas of activities, both production and sales, as well as for development of the in-house growth of technology and qualification potential. At the same time, this system allows to link compensation of personnel to business performance (see the Figure above). Therefore, local goals of business units are linked to the high-level goals of the company, i.e. day-to-day activities match the strategy.

Improving interaction between business units. The system allows building relations between business units in such a way that prevents the situation when one business unit achieves its goals and, in particular, fulfills its individual KPI, at the expense of another business unit. This can happen independently from personnel of the business unit. The proposed regulation of interaction is called the method of *collaborative management*. It makes collaborating with colleagues not only profitable but also effective for the company as a whole.

Distribution of responsibility for decision making. In order to focus the attention of personnel on operational and quality management, BPM offers improvement of the process of managerial decision-making through distribution of the levels of management, i.e. delegation of authority and enhancing the responsibility of an employee of the previous level, which allows to avoid excessive bureaucracy and stimulate employees' initiative. This approach is very appropriate to the modern Russian reality because even in the leading Russian companies bureaucracy exists as a legacy of the centralized planning system significantly preventing efficient managerial decision making, which slows down performance improvement and adds to lost profits of companies.

Modeling at the corporate level. To support innovations, effective use of available resources and opportunities, the concept provides for the application of "what if" situation analysis not only at the level of business units but primarily at the corporate level. It is assumed that various business units take part in such modeling effort. Their interaction is based on the above-mentioned collaborative management.

Budgeting. Budgeting is one of the most universal tools of the management system and, in particular, strategic planning. The BPM system allows using the budget process to support implementation of strategic decisions on a day-to-day basis.

Information. Being a management system of higher level, BPM uses ERP systems as its basic elements. The issues of effective use of resources are always of great importance. Besides, it is not only about material resources, but also about information, in particular. Availability of quality operational information is a key to having a successful business, therefore, BPM provides for documenting, cataloguing, storing and analysis of informational resources.

Today this management concept is not only "in vogue". It significantly helps in managing large companies having multidivisional structure. Firstly, BPM builds relations between all levels of management providing for implementation of the strategy and directing all its components to achievement of strategic goals. In practice this means that every day, performing their standards job duties employees contribute to the fulfillment of long-term plans. Secondly, the concept structures business units/subsidiaries and their functions in a logical and understandable manner. It becomes clear what and how each business unit/subsidiary is doing and how it affects the performance of the company as a whole, which allows to optimize management costs as much as possible, reduce the probability of the overlapping of functions between divisions and provides for their well-coordinated team work.

Therefore, the BPM system that has at its command various interrelated tools of management provides for the timely, flexible and comprehensive performance management of any business.

ASSESSING E-GOVERNMENT DEVELOPMENTS IN CYPRUS

Kokkinaki, Angelika I.¹; Koukounidou, Vasiliki V.²; Michaelides, Stefanos

¹University of Nicosia, 46 Makedonitissas Ave., 1700 Nicosia Cyprus

²Digitisation Dpt. Library, University of Cyprus

Purpose - This paper reports on e-government developments in Cyprus and the assessment frameworks used to evaluate the progress. The paper examines to what extent the UN evaluation framework (e-government readiness index) and the EU benchmarking mechanisms reflect improvements regarding e-government initiatives in Cyprus. Also it addresses whether the issue of e-participation that becomes central in the latest strategic plans on e-government is reflected in the assessment process.

Design/methodology/approach - Secondary data have been collected through literature review. The two primary frameworks for evaluation of e-government initiatives are analyzed. A comparison of published results on Cyprus e-government initiatives is performed and an improvement is outlined.

Findings - E-government initiatives face unique challenges with respect to efficient and effective implementations, primarily related to e-participation services that require increased interaction with the public. It has been observed that there is a misalignment between the new e-government services, which in principle aim to promote e-participation and a number of implementation problems. In order to clarify this, it was deemed important to take a more detailed look into the assessment mechanisms that track down improvements related to e-government. For the purposes of this study, the case study of e-government improvements in Cyprus has been examined. From an administrative point of view, Cyprus is divided into six districts: Lefkosia (capital), Ammochostos, Larnaka, Lemesos, Keryneia and Pafos. Each district is headed by the District Officer who is essentially the local representative of the central government. The District Officer acts as the chief coordinator and liaison officer for the activities of all Ministries. The administrative power in Cyprus is a two-tier system, but the structure is rather centralized, delegating limited power to the local authorities. There are two types of local authorities: Municipalities and Community Councils. Municipalities have more financial capabilities power and more population than the Community Councils which are also stipulated by the Cyprus Municipalities Law. Cyprus consists of thirty-three Municipalities and 486 Community Boards of which nine Municipalities and 131 Communities are in the Turkey occupied north part. Community Councils in Cyprus govern 31% of the inhabitants (Ministry of Finance, 2002) and 85% of the territory of Cyprus. Some works, especially development works, are carried out with substantial contribution by the Government. Cyprus e-government initiatives has been following steady improvements over the last few years. In a series of studies conducted by the United Nations, regarding e-government readiness index, Cyprus has been steadily improving both its readiness index and its global rating; In 2003 Cyprus e-government readiness index was found to be 0.474, while in global rating Cyprus was in the 51st position. In 2004, Cyprus readiness index was found to be 0.519 and Cyprus was placed in the 49th position in a global rating, that is, it has moved up two places ahead from its global ranking in 2003. In 2005, Cyprus e-government readiness index has increased to 0.5872 and was ranked 37th, that is, 12 points ahead the previous year ranking. This was due primarily to the addition of a new Cyprus Ministry of Health site (<http://www.moh.gov.cy>). In 2008, Cyprus e-government readiness index is 0.6019 and Cyprus was ranked 35th. This is attributed to the launch of a one-stop e-government portal. These improvements are also consistent with the benchmarking index used in EU. However, as it is outlined in this report, an area that is of prime

importance to strategic aims of e-government, that is e-participation, is not reflected in existing assessment mechanisms. A proposal on evaluating e-participation is presented.

Practical implications - The proposed paper demonstrates strengths and weaknesses of existing evaluating frameworks for e-government initiatives. More specifically, the paper identifies that the UN evaluation framework (e-government readiness index) and the EU benchmarking mechanisms reflect improvements regarding e-government initiatives in Cyprus but they both fail to detect the level of e-participation. A preliminary framework for assessing e-participation is proposed.

Originality/value - The paper identifies a lack in existing evaluation systems for e-government and describes a preliminary attempt to address it.

Keywords: e-government, e-participation, Cyprus, UN e-government readiness index, EU evaluation index.

AIMING HIGH? THE CAREER TRAJECTORIES OF BRITISH-EDUCATED GREEK BUSINESS GRADUATES

Kyriakidou, Niki¹

¹Senior Lecturer in HRM/OB, Leeds Business School, UK

One of the most debated issues within the European labour markets, especially during the last decade, has been the value of higher education (CIPD, 2006, Kyriakidou, 2006; Holden and Harte, 2004). To promote UK Higher Education to overseas students, the British government has established the Prime minister's Initiative for International Education (PMI2), a 5 years' strategy aiming to attract an additional 100,000 overseas students to study in the UK (<http://www.britishcouncil.org/eumd-pmi2.htm>, accessed in 12/01/2009). That translates into about 10 to 15 per cent of all students coming from overseas. One of the main European student cohorts studying in the UK are Greeks and Cypriots (Eurydice, 2008, 2000). The aim of this project to explore the career trajectories of Greek business students following their graduation from British Higher Education Institutions. Of particular importance in Greece, is the weak links between educational institutions and organisations operating in the economic field. This phenomenon is attributed to the gap between the increasing number of people entering higher education and the limited demand in the domestic economy for highly educated personnel.

In the light of the above, this study investigates the extent to which graduates' career expectations, decisions and outcomes are shaped by specific educational institutions and courses, the national environment, structures and culture (Kyriakidou, 2005; Kyriakidou and Zhang, 2005). The contribution of my project is to explore the linkages between higher education and employment and therefore, investigate the *actual* value of British academic studies within the Greek labour market.

A unique aspect of the study lays in its attempt to directly examine graduates' perceptions of their studies and graduate career trajectories through countries specific cases (UK and Greece). Its empirical base draws from a graduate questionnaire survey, and semi-structured interviews with graduates, course directors, HE careers advisers, and recruitment consultants.

The study undertakes a multi-level analysis in order to assess the subtle interactions between higher education structure and policies, organisations' recruitment strategies, and the country's culture and tradition. In this regard, the study highlights the importance of socio-economic influences on students' degree choice and their career activities after graduation. Main findings focus on factors impacting on the initial degree decisions and students' aspirations; the impact of British education on the career trajectories of Greek business graduates and the barriers, perceived or real, to graduates entering employment and receiving promotion in terms of different national labour markets for graduates, the increasingly diverse recruitment base and career opportunities to different range of business professions and roles. In general terms key findings revealed the difficulties respondent graduates have experienced in finding desirable jobs. It could be argued that, in many respects, the Greek labour market structure is relatively uncondusive (and perhaps non-responsive) to graduate employment. There are still weak links between academic establishments and the operation of the labour market in Greece, as most small and family-owned Greek businesses are unable to absorb the increasing number of graduates. Evidence from this study, also showed that there are doubts about whether the skills graduates acquired on HE programmes are those that employers required or were prepared to pay for. Overall, the main issue that emerged from our findings was that, graduates'

employment opportunities did not only depend on the nature of their degree studies per se, but also on the extent to which the Greek labour market was able to absorb them.

This study challenges the assumptions, so dominant in the European educational policy discourse, concerning the supposed merits of expanding higher education.

**ACCOUNTING FOR HERITAGE ASSETS: FINDING A NEW RESOURCE FOR
DEVELOPMENT. THE ITALIAN PERSPECTIVE**

Lacerra, Annamaria¹

¹PhD Student in "Economia e Direzione delle aziende Pubbliche", Dipartimento di Studi e Ricerche Aziendali, Facoltà di Economia, Università degli Studi di Salerno, Via Ponte Don Melillo, 84084 Fisciano (Salerno)

Purpose: After a brief examination of the main management issues of the assets in the public sector, this paper aims to investigate the problems of recognition, valuation and disclosure of Heritage Assets (as a fundamental part of the global Capital assets of the public entities) in the Italian context, highlighting the criteria defined by the Italian legislator for local authorities.

Methodology: An exploratory case study is carried out in order to highlight the peculiarities of the problem related to the adoption of particular procedure for the accounting treatment of heritage assets. In particular, this work intends to analyze the accounting procedures adopted by the main Italian municipalities that held the most part of heritage assets of the world: Rome and Florence.

Findings: Based on the reading and analysis of financial statements and other relevant documents, the analysis of these two case studies (Rome and Florence) is carried out in order to define (in a first step) the current situation of the accounting treatment of heritage assets in Italy.

Originality/value: The analysis of the accounting problems encountered by these two municipalities represents a starting point for future investigations regarding the accounting treatment of heritage assets in the Italian context. It represents also a useful investigation for future comparisons at international level.

Keywords: heritage assets, public sector accounting, recognition, valuation, disclosure.

Classification: Case study

EXAMINING THE IMPACT OF MENTORING AND LEADER-MEMBER EXCHANGE IN ORGANISATIONS

Loong, Leow Kah¹; Wei, Khong Kok¹

¹*Sunway University College*

Purpose of this paper: The purpose of this study was to examine the relationship and to test the interaction effects of mentoring (psychosocial and career) and four dimensions of Leader-Member Exchange (LMX) (affect, contribution, professional respect, and loyalty) on organizational commitment.

Design/methodology/approach: Three broadly hypothesized relationships were tested in a field study among auditors serving in audit firms across Malaysia who were registered with the Malaysian Institute of Accountant (MIA). Out of 1100 questionnaires posted out to MIA's firms located in the state of Penang, Selangor, and Wilayah Persekutuan, 318 completed questionnaires were returned of which only 266 were usable (24.2% return rate). The unit of analysis was the individual auditors and participation was voluntary.

Findings: By and large, the results from hierarchical regression provided moderate support for the hypotheses. Auditors regardless of their sex experienced higher organizational commitment with the presence of mentoring and LMX. The findings on direct effects revealed that predictor variables have a positive relationship with affective-normative commitment and only partial support for continuance commitment. Psychosocial of mentoring, reciprocity and contribution of LMX were found to be positively related to affective-normative commitment. Continuance commitment was significantly predicted by contribution of LMX. The results provided partial support for the interaction effects of affective-normative and continuance commitment. One implication of the study's findings is that human resources department has to take a serious view of mentoring and LMX when implementing human resource policies in order to encourage employees to manifest high levels of commitment.

Research limitations/implications (if applicable): One limitation was the size of the sample due to resources constraints. Although the sample size was relatively small compared to the population, the model has a good fit. Future research can include; other indicators to organizational commitment like organizational justice and moderating variables like gender. The inclusion of these factors or variables may change the R square and how independent factors can impact organizational commitment.

What is original/value of paper: The paper empirically measured the impact of Mentoring and LMX on organizational commitment. Practitioners may find this paper useful as supervision, coaching and mentoring can be empirically substantiated using a series of statistical techniques.

Keywords: Mentoring, Leader-Member Exchange (LMX), Organizational Commitment, hierarchical Regression, Malaysia.

Paper Type: Empirical Study.

THE TERROR EFFECT ON TEL AVIV STOCK MARKET

Malul, Miki¹; Rosenboim, Mosi²; Shoham, Amir³

¹Department of Public Policy and Administration, School of Management, Ben-Gurion University, P.O. Box 653, Beer-Sheva 84105, Israel

²Sapir Academic College, Ben-Gurion University of the Negev, Guilford Glazer School of Business and Management, P.O.Box 653, Beer-Sheva 84105, Israel

³The College of Management, School of Business Administration, Rishon le Zion, and Sapir Academic College, Israel

Since the beginning of this decade, Israel had suffered from terror attacks. These attacks had many kinds: bombs in busses, terrorist suicide, car inferno and ect.

Although studies investigating the impact of terrorism on economic activity are relatively new, they are quickly gaining popularity following the events of September 11, 2001.²⁸⁹ The research estimating the impact of terror on the economy is in its first stages. There are a few works about terror but it primarily focuses on the impact of terror and tourism (Enders and Sandler,1991; Downes-Le Guin and Hoffman, 1993; Sloboda, 2003; Ito and Lee, 2005). Frey, Luechinger and Stutzer (2004) claim that terrorism's impact on various aspects of the economy including tourism, FDI, savings and consumption, investment, stock markets, foreign trade, urban economy and national income and growth. Blomberg, Hess and Orphanides (2004) and Abadie and Gardeazabal (2003) discovered that terrorist attack in a country reduces its GDP growth. A study by the World Bank (2002) on the Palestinian-Israeli conflict estimates that its cost on the Israeli economy is about 4 percent of GDP. Furthermore, Gupta, Clements, Bhattacharya and Chakravarti (2004) find that terrorism has a significant positive effect on the government budget this additional fiscal cost effect GDP growth. Tavares (2003) terrorism study found to have a negative and significant impact on growth in real GDP per capita. However, when taking into account other determinants of growth, such as exports, size of government, and spending on education, terrorism is no longer significant. There are also some studies that claim that terror has a small direct cost on capital stock in the U.S (Navarro and Spencer, 2001). Nitsch and Schumacher (2004) find that a 100 percent increase in the number of terrorist incidents is found to reduce bilateral trade by about 4 percent.

Even on Israeli terrorism there are just a few articles from the economic perspective and even they deal mostly with the local effect and not with a bilateral affect (Eldor and Melnick 2004; Levy and Galili, 2006). Fleischer and Buccola (2002) found that the Israeli hotel industry was negatively impacted by terrorism between 1992 and 1998 because revenues from foreign visitors dropped. The net loss increased with the deterioration of the situation in 1996. Drakos and Kutan (2003) used monthly data from 1991 to 2000 to investigate the effect of terrorism on tourism in Greece, Israel and Turkey. They found significant negative effects. Fielding (2003) focused on the impact of terror on aggregate savings in Israel. He calculated terror by the number of deaths in Israel during 1989-1999. He estimates that if the number of fatalities in Israel decreased by its average level, consumption would fall by over 7%. The savings ratio in Israel would double if a complete cessation of violence occurs. Eckstein and Tsiddon (2004) using VAR methodology estimate with quarterly data for the Israeli economy from 1950-2003, that there is a significant effect of terrorism on consumption. Berrebi and Klor (2005) find that terrorism has no significant impact on the average stock-market valuation of

²⁸⁹ See Barth et.al. (2006) for a literature review.

Israeli firms. This is due to a positive effect on defense stocks that offsets a negative effect on non-defense stocks.

Terrorism affects FDI flows because foreigners can choose among many countries and projects, some of which are not subject to terrorism. Enders and Sander (1996) research on Spain find that terrorism has been estimated to have reduced annual FDI inflow by 13.5% on average for the period 1975-1991. They also estimated that terror in Greece reduced FDI on average by 11.9% annually. This translates into a loss in FDI amounting to almost \$400 million. Because FDI is an important source of savings, investment and economic growth are negatively affected in countries on the receiving end of terror. Moreover, the transfer of technological know-how into the country is reduced. Abadie and Gardeazabal (2005) examine the impact of terrorism on FDI which, they hypothesize, may be greater than its impact on economic growth. In most cases their 'terrorism index' is found to be negatively related to net FDI. Moreover, a one standard deviation increases in terrorism leads – on average – to a decrease in the ratio of net FDI to GDP of between 4.16 and 6.54 percentage points. Investigating the effects of terror on economic variables is clearly an important issue of research that more studies and resources have to be devoted to (Brück and Wickström, 2004).

In this paper, we collected 308 data of terror attacks since September 2000 until January 2006 (151 of them in the green line) and we use event study methodology (Campbell et al. (1997)) to find whether the terror attack influence the stock market in Tel-Aviv. When we analysis all of the 151 terror attacks, it seems that they has weak influence on investor behavior at Tel-Aviv stock exchange.

There are a few characterize of the Israeli economy and stock exchange that should minimize the impact of terror on the markets. First we suggest that the influence fade out along the years since the investors get used to the terror attacks in Israel. Second, the Israeli industry is biased and based on exports. Due to this fact terror should have even a lower effect then expected when you invest in an open small economy like Israel. Global effects should have a bigger effect.

PROCESS LED TRANSFORMATION – A PRACTICAL FRAMEWORK AND CASE STUDY IN THE FINANCIAL SERVICES SECTOR

Massa, Pier M.¹

¹M2 – Business Frameworks Limited, MALTA

Purpose - The presentation will share a pragmatic methodology used to drive effective enterprise wide process change in complex service businesses. This approach, which we call the Process Management Framework (PMF), has been applied in the Financial Services Sector and the case study of a Mid Sized European Bank will be shared to provide clear and tangible illustration of its usage.

The primary objectives behind the PMF initiative are to:

- significantly impact the customer experience to deliver on a Customer Brand Promise – addressing customer issues and irritants directly;
- concurrently, optimize internal operational efficiencies to drive substantial cost reduction;
- actively address enterprise and operational risk and audit considerations.

The PMF process seeks to transform all aspects of service delivery with primary focus on effective operational processes and supporting technology. It also seeks to embed optimal people practices and effective structures so as to maximise performance.

Design / Methodology / Approach - This methodology enables organizations to fully reap the benefits of process change through implementation by ensuring full organizational alignment across the core business disciplines. In addition, through effectively embedding metrics directly into the operational processes, these processes can be effectively monitored and managed throughout their lifecycle.

Findings - This approach and methodology has been applied extensively at a Mid Sized European Retail Bank across multiple business lines and process areas including Cards, Investments and Payments.

In all of these areas, significant changes to both process and technology were required and this process ensures that technology is effectively deployed and that processes are first optimized prior to their automation. This is a critical step since experience indicates that often this is not the case.

Through the use of this methodology the bank is in the process of completely transforming these business areas and reaping material business benefits through these changes. In particular, despite significant capital investments required for technology changes, the bank will reap material savings relative to the status quo while, concurrently, significantly improving its customer service delivery.

Originality / value - While the core PMF builds upon process re-engineering methodologies, the approach encompasses unique innovations that have made it exceptionally effective. These include:

An “End-to-End, Outside In” View of Process that starts with the customer and ends with the customer – with the customer touch-points, internal operations and back office processes being the engine to deliver differentiated products and services to the customer efficiently and effectively. This requires a horizontal view of processes as seen through the customers’ eyes. Cross-functional working teams spanning all areas that touch the process are fully empowered to work together to improve the overall process.

A Methodology that Integrates Across Multiple Disciplines - the PMF process spans three business disciplines, specifically, customer service delivery, internal operations and risk management. Each constitutes an expert area that traditionally operates independently and views the business through a unique lens. The PMF effectively balances the tensions, issues and opportunities that each of these lenses needs to legitimately address. Representatives from these disciplines actively co-create the 'Options' and develop the final 'Recommendations'.

The engagement of a “Challenger Team” to explicitly Challenge the Status Quo – a team of senior thought leaders with a horizontal orientation whose role is to test the conclusions of the working teams and truly break the paradigm, often challenging issues that have remained unresolved for years. The challengers add robustness, open up the options and break the mould in terms of assumptions and expectations. These are not process experts and are not from the process area being addressed – rather, they have a sound understanding of the way the bank actually works and the issues faced across multiple facets of the business.

An Emphasis on Creating Options – Traditional process re-engineering methodologies focus on two stages – i) mapping AS IS processes and ii) designing the TO BE world. The PMF approach is unique in that it adds an explicit phase that requires the teams to broadly explore all Options before landing on recommendations. These Options are reviewed by the Challengers - invariably, the breakthrough ideas that create large scale impact are generated in this stage and are often the overlay of the options generated by the working teams.

THE CONTRIBUTION OF EXPERIMENTAL LABORATORIES TO THE ECONOMIC GROWTH**Matricano, Diego¹**¹*Second University of Naples, ITALY*

The issue of new venture creation has always attracted considerable attention by scholars even if there is still so much to inquire. This study starts from Curley and Formica's proposal [2008] to implement experimental laboratories (exp labs, from now on) which are business simulators in which skilled partners test high-expectations business ideas proposed by would-be entrepreneurs. The main purposes of this paper consist of determining if exp labs are really able to influence high expectations start-ups (technology-based and aiming to grow significantly) and, soon afterwards, of inquiring about the way it could happen.

Because of several changes happened in economic, social and political field, the process, through which would-be entrepreneurs try to introduce innovation into the market, has totally changed. It was based on the "technology – business – funding" paradigm and now it seems to be based on a new one characterized by four phases: technology/idea – idea test – simplest solution – marketing/sales [Matricano, 2009]. Exp labs, born with the main purpose of reducing risk and uncertainty in the new economic environment, seem to drive economic growth because of the way they work.

Would-be entrepreneurs, in fact, before launching high expectations start-ups could decide to test their business ideas in exp labs. They are a sort a cross boundaries network since they involve several partners like universities, research centers, governments, non-governmental organizations, capitalists, fund-raisers, suppliers, customers, experienced-entrepreneurs, of exploiting their different backgrounds and of making tested business ideas more fitting to the market [Matricano, 2009]. The main contribution to the launching of new start-ups is due to the partners' previous experiences and it has two main consequences.

The first is strictly depending on the way exp labs work. In fact, all the partners involved in the process help to test business ideas by bringing their experience in the simulation. It causes a range of new possibilities which can be redefined, up to several times, and eventually launched into the market. Each partner contributes to improve the business idea by adding something new, not evaluated until that moment and going across knowledge boundaries. The continuous exchange between partners in the network increases creativity. The business idea becomes more fitting to consumers' needs and, at the same time, its implementation is much easier. The second consequence is connected to the first one. Innovation and greater creativity, in fact, encourages high-expectation start-ups and constitutes the premise for launching them as international or for making them grow internationally. Exp labs can create the right conditions to make high-expectations ventures evolve into global businesses, which is entrepreneurship without borders [Formica, 2005]. The right conditions derive from the fact that partners have different backgrounds in reference to both their work experiences and their origins (countries). It increases the possibility that a new business idea can be exploited in as many countries as possible. The most important aspect to think of is that the new business idea does not need to be changed to meet consumers' needs, according to the "glocal theory", because it is supposed to be thought and tested according to many different perspectives.

In conclusion, this paper introduces and emphasizes the relevance and importance of high expectation entrepreneurship as a driver of economic growth which depends on three factors: innovation, creativity and international environment.

The contribution given to economic research deals with the different goals would-be entrepreneurs aim to pursue for their ventures. According to Sorrentino [2003], in fact, learning, survival and consolidation coexist although the predominance of one of them. When talking about high-expectations start-ups, the three different aims seem to describe the whole creation process starting from innovation (based on learning), passing through the redefinition of the business idea (necessary to improve the level of fitness with market needs or, at a wider extent, to survive) and ending with the consolidation (the achievement of important results through internationalization).

THE GREEK BANKING SYSTEM AND SOCIAL PROSPERITY

Mavridis, Savvas¹; Kotzaivazoglou, Iordanis²

¹*Lehovu 10, Sykies*

²*Spartis 41, 54640, Thessaloniki, Greece*

The transition from the drachma to the euro has been a gradual process, and is not even yet entirely complete. The Greek banks have retained several particularities from the old regime that they exploit in the new era, guided primarily by their own corporate interests. The Greek state's control mechanisms are weak, thanks to high levels of corruption. Greek banks have happily slashed their deposit rates to Eurozone levels, but have not adjusted their lending rates, which remain high.

This paper attempts to determine whether and to what extent the Greek banks have helped the country's social development in the past ten years. It presents tables charting the differences between lending and deposit rates, rates of household borrowing and seizures of customer assets, as well as related court decisions imposing penalties on banks. It shows that the top priority of the Greek banks is their own short-term profit, and that the result has been to drive Greek society deep into debt rather than to foster long-term prosperity.

THE SYNERGIES OF DIVERSITY WITHIN THE HOTEL INDUSTRY: THE IMPACT AND VIEWS OF HOSPITALITY STAKEHOLDERS

Michael, Costas¹; Kaufmann, Hans Ruediger²; Vrontis, Demetris³

¹*Dept. of Hospitality & Tourism, Intercollege Limassol Programme Coordinator, School of Business, 92 Ayias Phylaxeos Str., P.O. Box 51604, CY-3507 Limassol, Cyprus*

²*School of Business, University of Nicosia*

³*Dean of School of Business, University of Nicosia*

Purpose – The purpose of this paper is to explore the perceptions of hospitality industry stakeholders regarding diversity management initiatives and policies adopted by many hotel organisations and investigate their role and within the discourse of diversity.

Design/methodology/approach – This paper focuses on workforce diversity and stakeholder involvement investigated by both management theorists and hospitality researchers.

Findings – Taken together, the paper reveals the perceptions and main concerns of hospitality stakeholders regarding the business case of diversity despite the little research into how key stakeholders such as trade unions and government agencies have responded to diversity management initiatives and policies. In conclusion, the discussion around diversity and the debate around its benefits has urged many stakeholders to further examine the discourse of diversity in order to achieve their own goals and objectives.

Practical implications – This paper suggests the importance of cooperation among stakeholders to create the synergies and ideal conditions for diversity to flourish.

Originality/value – This study identifies the uniqueness of cultural diversity and demonstrates new insights in regards to the stakeholders cooperation and the concept of diversity.

A STUDY OF JOB SATISFACTION OF EMPLOYEES IN THE RESTAURANT INDUSTRY: THE CASE STUDY OF CYPRUS

Michailidis, Maria P.¹

¹*Peter Kkolos School of Business, MBA program, University of Nicosia, Nicosia Cyprus*

Purpose - The objective of this study is to examine the levels of job satisfaction of employees in the restaurant industry in Cyprus.

Design/methodology/approach - To identify the levels of job satisfaction, questionnaires were formulated and distributed to 130 randomly selected restaurant employees of purposely selected restaurants in Nicosia, Cyprus. Participation in the study was on a voluntary basis, responses to the questionnaires were anonymous and the participants were assured about the strict confidential treatment of their responses. There was a 73% response rate, in total 95 questionnaires were returned completed.

Job satisfaction was investigated in ten key areas namely: Salaries and Benefits, Performance Appraisal system, Job Security, Work Recognition, Social Satisfaction, Job Advancement, Working Conditions, Internal Service, Internal Communication and Work Allocation and Responsibilities.

The questionnaires consisted of 23 statements on a five point Likert Type scale, of an open ended question asking for remarks or comments, and of 5 statements based on demographical information. Statistical analysis was conducted using descriptive statistics with the SPSS program.

Findings - Literature indicates that job satisfaction, according to Kepler (1994), is the fulfilment and gratification that comes from work. Robbins (2003), referred to job satisfaction as an individual's general attitude toward his or her job. A person with a high level of job satisfaction holds positive attitudes about the job, while a person who is dissatisfied with his or her job holds negative attitudes about the job.

The importance of this study is for restaurant employers and employees to become aware of the current levels of job satisfaction experienced by their employees. As this research goes to show, many restaurant employees in Cyprus have rather low levels of job satisfaction. As seen by the ten factors investigated in the research, most of them fall under the fifty percent satisfactory level mark. The main reason for these relatively low levels of job satisfaction is due to a combination of factors that are discussed in the following paragraphs.

The study has shown that over a third, 36%, of the employees working in restaurants are not satisfied with their salaries. It is worth noting that 23% remained neutral. As far as benefits are concerned, 48% remained neutral, and only 10% appeared to be satisfied. This in turn has negative consequences for the restaurants concerned. It was found that many restaurants pay their employees relatively low wages.

Furthermore, low levels to no work recognition were reported, as 58% stated that they do not receive any praise or recognition for work done in the restaurant. This translates into frustration and lower morale amongst employees. Many employees feel that they never know their value to the restaurant, as they would never get any feedback on their performance.

Also, due to the lack of job advancement opportunities in the restaurants, 55% felt that there is no career prospects for them in their restaurants. They believe that there is no clear and specific career path for them to follow. It was also noted that 56% of employees believed that the performance appraisal schemes at their restaurants are not satisfactory. It was found that many restaurants do

very little or nothing with respect to performance appraisals, which in many instances, as reported by the employees, lowers employee morale and self-esteem.

Furthermore, 20% of the respondents reported not being satisfied with their place of employment and their job itself, and a high of 41% remained neutral. This was found to be mainly due to reasons such as stress (as 60% reported as being stressed out with their jobs), management (as 50% tend to disagree that management encourages suggestions and feedback towards the improvement of the restaurant), and 54% reported not being satisfied with the allocation of workload and responsibilities. Many felt that management has their favorites when it comes to work allocation and responsibilities. Although over half of the employees (56%) felt secure with their jobs, 21% reported that they did not feel secure with their jobs, while 23% reported neither comfortable nor uncomfortable with their job security. It was found that people working for franchised restaurants tend to feel more secure with their jobs than privately owned restaurants.

Of the participants, 60% reported that they enjoy a good working relationship with their peers and co-workers. It is evident more so with people working on the same level than with supervisors and managers. However, 40% appeared not to be satisfied with their working relationships. It has also come to light that 36% of employees felt that the training that they received is relevant to their present duties and responsibilities. 54% of employees tend neither to agree nor disagree with that statement while a minority group felt that the training that they received is firstly not entirely relevant to their present duties and responsibilities and secondly not sufficient enough.

Lastly, there appeared to be a communication problem in many restaurants. Employees are not finding out information that they need to know on a timely basis for them to do their job better. 23% of employees felt that there is not a satisfactory communication flow in the restaurant and that information is not brought to them in a timely and efficient manner, and 41% remained neutral.

Many studies suggest that by the year 2010, many people will have never cooked a meal from basic ingredients. Changes in demographics and lifestyles will combine to produce the greatest decade of growth the food service industry has ever known.

For this reason, it will be beneficial for all restaurant employers to take this issue of job satisfaction into consideration in order to be prepared and take full advantage of this growth the food industry is experiencing.

Research Limitations/implications - The topic of job satisfaction is one with many dimensions. Through this study, specific issues were addressed which could form the basis for further research in the restaurant industry in a country where the tourism industry is one of the main sources of income, but where similar research is scarce.

Originality/Value - The information gained from the study provides valuable and constructive insights into the factors contributing to employee satisfaction of individuals working in an industry where related research is sporadic.

Key Words: Job satisfaction, restaurant industry, Cyprus

**FINANCIAL STATEMENTS FOR GLOCAL COMPANIES? SOCIO-ECONOMIC AND
FINANCIAL COMMUNICATION ISSUES FOR FIRMS AND AGENCIES WITH A GLOBAL
VOCATION AND STRONG TIES WITH LOCAL CONTEXTS**

Migliaccio, Guido¹

¹Lecturer of Management and Business Administration, Sannio University (Benevento - Italy), University: Università degli studi del Sannio, Dases – Dipartimento di Analisi dei Sistemi Economici e Sociali, Università degli Studi del Sannio, Via delle Puglie, 82, 82100 Benevento (Bn)

In an economic scenario, current global competition classifies the actors involved in three main categories: 1. operators on an International scale; 2. local operators and 3. those who, although operating on a multinational scale, maintain significant ties with local contexts.

The latter category, firms that can be defined as “glocal enterprises” seem destined to characterize productive scenarios, above all because they succeed in mediating domestic needs by eliminating international trade barriers/ frontiers.

The aim of the study is to debate/discuss potential new demands in terms of communication and the compiling of financial statements, analysing the costs and benefits that could derive from methodologies of accounting systems best able to favour relations between competitors.

Following a brief but concise analysis of the relevant literature (both national and international) requirements are formulated deriving from the need to identify the predominant economic, financial and patrimonial elements distinguishing individual operators involved in international competitiveness, in order to evaluate standing and consequently, reliability. Primary sources of information are undoubtedly the “traditional” (i.e. patrimonial and income) systems of compiling financial statements/account rendering as are more recent systems characterized by a marked “ethic-social ethos”.

Both systems are easily identified in terms of typically global productive realities or on the contrary, local productive scenarios: the former reflecting the wide panorama of international accountancy principles rapidly becoming widespread and the significant practice/experience of “social statements” present in specific Nations, at time regulated by the legislation in force.

Small local firms, on the contrary, can still anchor themselves to domestic book-keeping/accounting traditions and to the standards of compiling social statements frequent in a national context.

Certainly the communication relative to “glocal” firms is more problematic, considering the foreseeable difficulty of mediating between inside information reserved for the public present in geographical contexts where the productive system is deep-rooted and information intended for international stakeholders.

Predictably, problematic issues emerge with respect to the potential connivance between often very different modalities of expression that often hinder interpretation, albeit in praiseworthy attempts to respond to different demands.

With reference to specific experiences drawing up statements, some critical reflections are moved concerning the hypotheses described above.

Some areas deserve special attention .

In particular, “the prism effect” of the financial statement. Can a single flow of accounting information in the meanwhile, satisfy the different requirements stakeholders express, above all, in different local and international contexts?

Furthermore, can it be assumed that the solution to this complex issue is to be found in the contribution each stakeholder can make to firm communication - becoming the "prosumer" – in other words, at one and the same time, actor-producer of the information and consumer?

And again: what must be the role of the public powers in this respect? Would it be preferable to have legally binding regulations even in a local context, imposed by supra-national legislative bodies, or alternatively, sufficient to rely prevalently on the impulse of professional organisms in the context of a fundamental regulatory framework?

The solutions to queries of this kind naturally could radically influence the schema, structure and content of economic-patrimonial, financial and social statements with predictably "revolutionary" effects in accountancy terms and on the interpretative skills of the public involved.

Public institutions are not strangers to such issues: ranging from State financial statements, to those of local institutions, all submerged in these broader contexts of operations requiring modalities of interlocution which are certainly different compared to those typical of a homogeneous economy circumscribed within a confined space.

Keywords: Glocal firms, Financial Statement, Socio-economic Communication.

BANK EFFICIENCY DURING CREDIT CRUNCH- EUROPEAN PERSPECTIVE

Mihai-Yiannaki, Simona¹; Evripidou, Loukia Ch²

¹Ph.D., M.B.A., Affiliation : European University Cyprus- Laureate International Universities (EUC), 6 Diogenes, Street, Engomi, Nicosia,1516, P.O. Box: 22006, Cyprus

²Ph.D., European University Cyprus- Laureate International Universities (EUC), 6 Diogenes, Street, Engomi, Nicosia,1516, P.O. Box: 22006, Cyprus

Purpose - In the aftermath of the 2007/08 financial crises, the biggest financial crisis since the Great Depression, many questions have been raised for both market participants and policy makers. Firstly, what are the causes of this global financial crisis and what have been the consequences, both for the global economy and the financial system itself. Additionally, are there any antidotes that governments and other policy-makers can take, to reduce the costs of the current crisis, and most importantly how we can prevent its repetition?

The aims of the current paper are to firstly to examine the primal reasons of this global financial crisis. It is generally accepted that the reasoning behind the crisis is twofold, low interest rates that led in an abundance of liquidity and securitization which enabled banks to grow earnings while at the same time sparing on capital by gaming the Basel requirements. Securitization permitted banks to move assets off their balance sheets, freeing up capital and spreading the risk among many different players.

The current decade has been one with low interest rates on a global level, averaging in some cases the short term real interest rate zero. Those low rates have motivated the increases in financing and this in turn led to an increase in assets pricing, from real estate to stocks. During the same period stimulated by improved risk management techniques financial innovation led to an unexpected growth in the market for credit risk transfer instruments. With securitization banks extend loans and then allocate much of the underlying credit risk to end-investors. Further low interest rate generated the need for yield enhancement. For that reason, there was a demand for high yielding assets to place into the collateral pools in order to increase the profitability of securitization.

Eventually, the real estate market collapse, and the first consequence of this was the failure of a number of US mortgage lenders. This caused enormous losses in mortgage backed securities and many banks and investment firms began searching for liquidity. Furthermore, depressed housing prices caused additional problems as it made many homes worth much less than the mortgage value and some owners preferred to simply walk away instead of pay their mortgage. As a result, the asset-backed commercial paper market stopped in several countries. The rates at which banks would lend to each other in overnight and term money markets started to narrow. Lenders that had depended on short-term money markets or securitization therefore started to find it very difficult to get hold of funding. Ultimately, the banks in an attempt to preserve their regulatory capital ratios, banks cut off the flow of credit, causing a decline in lending to companies and consumers. Governments globally, in an attempt to avoid market failure and bank run bailout a number of banks.

Having establishing the reasoning behind the crisis, the second aim of the current paper is to compare the financial performance of a set of failing banks with a set of financially sound ones and try to evaluate the difference, if any.

Design / Methodology/ Approach - This is an empirical study aiming to examine the performance of a number of banks so as to identify any problematic areas in terms of risk and efficiency leading banks to fail. The attempt is to evaluate prior to fail financial position of banks and compare the result with those of sound banks. The data would be based on financial statements and share prices, where

available. The methodology is based on two different approaches. In the first approach we examine the X-efficiency of the banks in the sample by estimating an efficient frontier and by measuring the average differences between observed banks and banks at the frontier. Specifically, X-efficiency is defined as the effect of differences in managerial ability to maximise revenue or minimise cost, and accounts for differences in costs that cannot be explained by differences in scale or other observable characteristics (Leibenstein, 1966). A number of papers on bank performance follow these concepts (Berger and Humphrey (1997), Berger and Mester (1997), and Berger (2007)).

The second one is a nonstructural approach to bank performance measurement analysis achieved performance and is based on a set of financial ratios, e.g., return-on-asset, return-on-equity, or the ratio of fixed costs to total costs. The nonstructural approach then explores the relationship of performance to various bank and environmental characteristics, including the bank's overall strategy, corporate governance and control, location, and environment.

Findings - The study findings are expected to substantiate the credit crunch impact on both healthy and bailed out banks in terms of ex-ante and ex-post regulation. Moreover, the presented methodology can provide strong evidence of the differences in the financial and structural strength of this study's banks undergoing the recent financial crisis. Additionally, our research will provide key structural and nonstructural evidences that helps investors differentiate between bailed out and non-bailed out banks. Eventually, findings can provide policy makers with new areas of importance in terms of stability of financial institutions.

Research limitations/implications - The study's implications are significant for both academia and practice. In regards to the academia this paper addresses the issue of efficiency performance and financial distress of banking institution. The bulk of literature concentrated on the relationship between risk and bank failure. There is generally thought that there is a need for a larger time-span analysis period from the time the credit crunch started, yet the study wants to identify early stage signs of financial distress or strength/ potential recovery.

Practical implications - The question whether banks are efficient is of interest to managers and shareholders, as well as to customers and regulators. If these institutions become more efficient, then profitability will improve, greater amounts of intermediated funds will be available and better prices and service quality for consumers will be obtained. Thus, banks become more viable, therefore, the possibility of failure or being subject to take-over, decreases substantially. On the other hand, inefficient banks face the risk of default and that in turn generate the possibility of a bank run. Any early identification of efficiency impairment could help stakeholders fix the cause.

Originality/value - In the authors' best knowledge, there is no published research in the literature that addresses the specific subject matter. The study is original in the notion that aims to compare the performance of financially sound and bailing banks, in an attempt to identify key differences.

BRANDING LOCAL HERITAGE-TRADITIONAL FOOD-AS A FORM OF SUSTAINABLE TOURISM- THE CASE STUDY OF CYPRUS

Orphanidou, Yianna¹; Gronau, Werner²; Kaufmann, Rudi³

¹*School of Business, University of Nicosia, Cyprus*

²*School of Business, University of Nicosia, Cyprus*

³*School of Business, University of Nicosia, Cyprus*

Purpose- The objective of this paper is to examine how specialized industry agrotourism establishment managers/owners, Vakhis taverns managers/owners and Cyprus Tourism Organization officers interpret food culture and locality in branding traditional food utilizing the Vakhis (traditional food related) project of CTO.

Design/methodology/approach - The research method of a case study is chosen to allow for an in-depth comparison of macro (CTO) and micro decision makers. As to the research technique interview data will be collected from eight to ten agrotourism managers or owners, CTO officers and Vakhis registered taverns managers or owners. Semi structured interviews will be conducted during the period of May-June 2009. The research questions are as to what extent food culture is seen as an attractive way to interest the tourist consumer and to what extent branding food culture as local heritage can be regarded as a sustainable factor for the destination of Cyprus. The data will be analyzed applying content analysis.

Findings - Literature indicates that food products of a country can be among its most important cultural expressions (Handszuh, 2000; Bernard & Zaragoza, 1999). Cyprus as a Mediterranean country has always associated with the sunny weather and the lovely beaches as any other Mediterranean country. This strong but limited identity based on the 3S (Sun, Sea, Sand) that positioned the Cyprus tourism industry compared to traditional European destinations quite successfully for more than three decades might be regarded as a current weakness in the current saturation stage as it does not allow Cyprus to differentiate its tourism product. In the last decade the Cyprus Tourism Organization (CTO) established a theme-oriented marketing campaign related to Cyprus' traditional cuisine, a project named Vakhis leading to a CTO certified taverns. However, the "discussion of the trioka of tourism, food and identity is surprisingly limited in the extent to which food is used in destination and place promotion" (Hall and Mitchell 2000:34). This paper suggests the Branding of Local heritage as traditional food as a revitalizing solution to overcome the current maturity stage of the Cyprus tourism life cycle. The trend of the recent years shows that tourists prefer individually-planned holidays rather than package tours. People want to decide for themselves what to do and not to be limited to the plans made by the tour operators experiencing the authentic Cyprus, rather than the artificial mass tourist experience. Many tourists no longer seek just sunbathing and nightlife but are demanding complementary activities such as excursions, cultural visits and experiences. Despite the very scarce publication of food-tourism related texts in the last couple of years, few have weaved together the concepts of food, identity, sustainability and cultural heritage into any coherent and tangible structure (Gronau and Kaufmann, 2009). In this light, the paper interprets the level of success of the Vakhis project and the role of food culture in branding local heritage.

Research Limitation - The present study provides a starting-point for further research in the area of Branding Local Heritage as a form of Sustainable Tourism for Cyprus based on the existing literature and author's area expertise.

Originality/Value - The paper illustrates a bundling product of agrotourism and traditional local cuisine which can be a differentiating prospect for Cyprus differentiating from any other 3S destination..

Key words: Branding, local food culture, tourism, Cyprus

TRANSFORMATION OF HOSPITALITY CURRICULA AND ITS IMPLICATIONS FOR FUTURE MANAGERS

Orphanidou, Yianna¹; Vrontis, Demetris²; Kaufmann, Rudi³

¹*School of Business, University of Nicosia*

²*School of Business, University of Nicosia*

³*School of Business, University of Nicosia*

The objective of this paper is to address the current deficiencies of hospitality curricula and the implications to the Future Managers. Although the development of hospitality management education has been evolutionary the last decades (Morrison and O'Mahony, 2003) according to Lewis (2005) curricula are tailored to what the industry had needed in the past, not what it actually needs today, or what it may need in the future. Consequently, many educators are out of touch with the business world and unaware of its revolving needs. Based on the literature of the recent years, there is an agreement regarding the educational benefits of incorporating a more liberal approach into the hospitality curricula (for example, Airey and Tribe, 2000; Lam and Ziao, 2000; Tribe, 2000; Brotherton and Wood, 2000; Lashley, 2000; O'Mahony et al., 2001; Morrison and O'Mahony, 2002). Hence, an inconsistency gap exists between the practical application capabilities needs of hospitality managers and the knowledge provision by the hospitality curricula.

A capable manager in a broad sense is an executive who has a hands-on understanding of international business, an ability to work across cultural, organizational and functional boundaries. Unfortunately, however, many of the existing hospitality curricula have been designed by educators with few or limited exposure to the international market leading to programs with a 'local character'. Traditionally, hospitality education provides students with a good breadth of knowledge, which were based on "an amalgam of craft, ritual and inherited practices" (Lynch and Murray, 2009:56).

For many years, hospitality education has been criticised as not preparing graduates with all of the skills required to operate effectively in industry (Johns and McKechnie, 1995). For example, Ladkin (2000) and Coleman et al. (2002) suggests that traditionally hospitality management focus on the development of technical operational skills and competences, but the academic scope of the hospitality higher education is enduringly problematic (Morrison and O'Mahony, 2003). Consequently, in the last decade the design of hospitality curricula can be characterized by a tendency to merely add the term 'international' as a marketing tool to attract students rather than, as would have been required, radically changing the structure and competencies needed by an international manager. Furthermore, hospitality education was born out of a need to supply the hospitality industry with competent managers and is often driven by industry standards (Nelson and Dopson, 2001). Rather than focussing on competencies being perceived as insufficient learning outcomes, a current strong debate points to the need of restructuring hospitality education towards a hospitality curricula based on liberal study (for example, Airey and Tribe, 2000; Lam and Ziao, 2000; Brotherton and Wood, 2000; Lashley, 2000; O'Mahony et al., 2001; Morrison and O'Mahony, 2002).

Based on a wide ranging literature review this paper synthesizes the required factors for the development of hospitality managers derived from liberal study. Moreover, implications for the hospitality curricula are provided. The paper finishes with suggesting a qualitative research design to explore the implications of the transformation of the hospitality curriculum from its traditional vocational orientation to a liberal one for future managers using in-depth semi-structured interviews from a sample purposefully selected from hospitality educators and hospitality professionals in an

attempt to provide a holistic explanation of this new phenomenon and, by doing so, contributing to new knowledge on hospitality curriculum development.

Key Words: Capability, Hospitality education, hospitality managers, hospitality curriculum

CONFUSION AND/OR EMPOWERMENT: THE IMPACT OF ONLINE PRODUCT REVIEWS AND RECOMMENDATIONS ON CONSUMER DECISION MAKING

Ozata, F.Zeynep¹

¹Anadolu University, Porsuk Vocational School, Osmangazi District, Basım Şehitleri Street, 26140 Eskisehir, Turkey

Purpose – The Internet empowers consumers to create and share product information based on their personal experiences. The importance of these product reviews and recommendations are increasing as more and more consumers tend to appeal and rely on this kind of sources. In a survey of 5.500 web consumers conducted by BizRate, 59% of respondents said they consider consumer generated reviews more valuable than expert reviews. The purpose of this study is to understand the uses of online product reviews and recommendations by the consumers and to explore their influence (if any) on decision making.

Design/methodology/approach – An exploratory case study method was used. A participant who is an expert consumer on using online information sources is preferred as unit of analysis in this study, since this kind of expert consumers are thought to be heavy and effective users of online product reviews and recommendations. Through semi-structured interviews with the participant, three different product choice experiences which reflect different uses of online product reviews were identified. The experiences were about the use of the online information sources for the purchase of a camera, a screen card and a lens for camera. Based on the analysis of these experiences and participant's decision making framework, the possible influences of online product reviews and recommendations on purchase decisions are explored.

Findings – Online product reviews and recommendations themselves are paradoxical. On the one hand, they help consumers overcoming barriers during the external information search by enabling access to information that cannot be found elsewhere, providing personalized information, offering the ratings/votes of other consumers and delivering cues for elimination of the alternatives. They also empower consumers as the control of market knowledge shifts from suppliers to consumers. However, because of the deficient, conflicting and disorganized nature of online reviews and recommendations, they also create consumer confusion, information overload and consumer misjudgment. Further, the time needed for information search and decision making also increases when consumers use online reviews and recommendations. In brief the paradoxical nature of online product reviews and recommendations produce both positive and negative consequences concurrently. Besides specific influences on purchase decision, online product reviews and recommendations may facilitate subsequent information search process for future purchase decisions with the accumulated knowledge and expertise in using online information sources.

Research limitations/implications – Because of its exploratory nature, this study provides a starting-point for further research. Since this study has focused on the experiences of an expert consumer, further research should consider consumers with different expertise levels and demographic characteristics. Furthermore, other attributes such as tolerance for ambiguity/complexity, consumer decision and learning styles may also help making the paradoxes of online product reviews and recommendations more explicit, and understanding the uses and problems in-depth.

Practical implications – Companies and website designers should find ways of organizing the information that could decrease consumer confusion and information overload. On the other hand, to enhance the consumer decision making, the marketing websites should add more detailed and

objective content on their websites. For example, by including the links of popular forums/blogs, websites may increase their trustworthiness.

Originality/value – In most studies, either positive or negative consequences of online product reviews and recommendations are analyzed. Rather than a one-sided approach this study provides an extended understanding of the influences of these information sources on the decision process by displaying their paradoxical nature.

Keywords: Online Consumer Review, Word-of-Mouth, Online Information Search, Consumer Confusion, Information Overload.

**INTRA-ARAB, ARAB MENA-US AND ARAB MENA-EU TRADE: IS IT TOO LITTLE,
TOO LATE? THE COMPETITIVE CONSEQUENCES OF ARAB NON-OIL PARTICIPATION
IN THE GLOBAL ECONOMY TO THE US**

Pelzman, Joseph¹; Shoham, Amir²

¹Department of Economics, George Washington University, Washington, DC 20052

²School of Business Administration, College of Management, Rishon L'Tzion, ISRAEL and Sapir Academic College, Sderot, ISRAEL

Apart from oil, international trade for the Arab states of Middle East and North Africa (MENA) has been a trivial element in their economic development program. A relatively small portion of total (non-oil) Arab trade, both in absolute terms and relative to other regions is devoted to intra-Arab trade. Likewise MENA-EU and MENA-US trade is insignificant, despite the enormous political pressure for a MENA free trade area by the US Administration and the EU. Various reasons have been offered to explain why Arab trade is relatively small. Some of these are policy related and, in theory, could be overcome -such as the high level of tariffs (and other) trade impediments in some of the Arab countries as well as political disputes-while others are not easily reversible such as the lack of product complementarity and the differences in per capita income which may encourage greater protectionism. There is also the issue of trade paranoia and fear of political infection.

The Arab countries have many similarities, including common religion, culture, and language. However, they also have several differences. They are diverse in terms of size, natural resource endowments, and standard of living. Some are primarily agricultural countries (e. g., Mauritania and Sudan), others are primarily energy producers (Gulf Cooperation Council (GCC)), and others have an emerging industrial base (Egypt and Morocco). Total exports by the Arab countries were about US\$130 billion in 1998. Over one-half of total exports were to industrial countries and another one-third was to Asia. Imports totaled US\$170 billion, of which about two-thirds were from industrial countries and another 15 percent from Asia. Very little has changed in the decade that has passed. Despite numerous attempts by the US and EU to promote regional and extra-regional integration, Arab MENA trade remains a small portion of world trade. Intraregional trade in countries with similar factor endowment-such as the EU-and with different factor endowment-such as NAFTA-is higher than trade among the Arab countries and across Arab MENA and the EU and the US.

In order to assess the competitiveness impact on the US of whether intra-Arab trade is indeed too little or too late, one would need to make a judgment on the "normal" or "expected" level of trade in the absence of policy related barriers to trade. While most observers believe that Arab trade is below what it could be, there is currently a gap in the empirical literature on estimating the potential for bilateral trade between Arab countries, MENA-US and MENA-EU. There is also a lack of understanding of the impact of this low trade profile on the US economy. Despite US dependence on oil from the region there is a limited reliance on the US for manufacturing products or services, other than defense oriented products.

This paper intends to start with a basic gravity model to measure the "expected" level of intra- and inter- regional trade for the Arab MENA region. The question that I seek to answer is the following: compared with a sample of other countries, with the same endowment and income, do Arab countries trade less with EU, US and intra-regionally with each other? While gravity models have been extensively used to measure bilateral trade among countries, they have not been used to

measure inter – and intra-Arab trade. The reasons for this shortcoming in the empirical literature on intra-Arab trade probably have to do with the demanding data requirements for estimating a gravity model and the dominant role of oil in trade which could bias the estimated ‘normal’ trade levels.

The MENA region is a ‘critical country’ group for the US. Despite this fact, we know very little about the institutional and cultural biases affecting these countries trade policies and ultimately US trade competitiveness. As the US expands millions of USAID dollars on building Trade Capacity, the MENA region stands unaffected. This study will go a long way in answering the very basic competitiveness question concerning Arab MENA trade – is it too little and too late or has the US policy community missed the proper institutional lever?

POSITIONING AND BRANDING – DEFINITIONS AND INTER-RELATIONS

Perry, Michael¹

¹College of Management, Rishon LeZion, Israel

Purpose - The two concepts - Positioning and Branding - have become synonyms in marketing thinking (see, for example, “Positioning and branding your organization”, Simon Knox, Journal of Product and Brand Management, Mar 2004, Volume 13, Issue2, PP 105-115). This paper will explore the origin and the meaning of the two concepts and the distinction between them. It will discuss the importance of distinguishing between the two concepts and the implications for Strategic and Marketing Planning.

Design/methodology/approach - Both concepts are traced to when, where and by whom they were introduced to the realm of business and marketing thoughts and what their original meaning was. The literature in which these concepts appear, and the applications of these concepts, are tracked since their introduction. Changes in these interpretations and applications are analyzed and discussed as are the implications for Strategic and Marketing Planning.

Findings - It was found that there is a confusion and misinterpretation of the concepts, and as a result the planning process of implementing them is not optimal: Logical order of planning steps, the cause and effect relations, identification of target segments and discovering what will influence the consumer most – are all blended together without the correct model to set them in the logical place.

Practical implications (if applicable). - The paper proposes clear definitions of the various concepts, the relation between them and an effective order of implementation.

Originality/value - The concepts of Positioning and Branding are being used very often by marketers and strategy planner while their meaning and their generated implications are not clear, and therefore are not being used in the most effective way. The paper attempts to clarify them and to suggest how they should be applied by marketers, advertisers and strategic planners.

Conceptual Paper.

QUALITY ORIENTATION AND ORGANISATIONAL PERFORMANCE IN THE PUBLIC HEALTH SECTOR: AN EXPLORATORY STUDY

Pinho, José Carlos¹; Macedo, Isabel Maria²

¹*School of Economics and Management, University of Minho, Campus de Gualtar, 4710-057 Braga, Portugal*

²*School of Economics and Management, University of Minho, Campus de Gualtar, 4710-057 Braga, Portugal*

Purpose - In the light of the deep changes occurring in the Health Care Systems in the majority of countries, there has been an intense political involvement in encouraging the introduction of more rational management systems in the NHS with the objective of improving the quality of management of these organisations. With regard to the public sector, the financial problems surrounding the management of health care organisations have almost exclusively emphasised the need to reduce public expenditure which has been used as the main rationale to introduce measures to raise both efficiency and quality. This has been pursued through the implementation of concepts and management frameworks mainly derived from the private sector, which have to varying degrees, embraced aspects of Total Quality Management (TQM) (Hanson, 2000; Ovreteit, 2000). Although there have been numerous attempts to empirically demonstrate a positive relationship between quality orientation and performance (Easton and Jarrel, 1998; Hendricks and Singhal, 1997), concerns have been raised about whether quality programmes have effectively generated economic gains and/or improvements in organisational performance. While in previous studies the concepts of quality orientation and market orientation have been independently related to performance, few efforts have been made to build an integrative model that incorporates both orientations to examine its impact on organisational performance. A rough attempt to integrate both constructs was taken by Raju and Lonial (2002) who analysed the impact of quality and marketing functions on financial performance in the hospital setting. Nevertheless, these authors have only examined the market oriented-performance relationship focused on a sample of quality-oriented organisations. We believe that the conflicting results in prior literature between quality and performance are due in part to the fact that existing studies have focused mainly on the direct relationship between quality and organisational performance, and have ignored the indirect mediated effect of market orientation on the previous relationship (Agus and Abdullah, 2000).

As an attempt to fill this gap, this research goes further by addressing the following research questions:

To what extent and in which ways does quality orientation impacts on organisational performance?

To what extent does marketing orientation plays a mediating role in the quality orientation-organisational performance relationship?

To what extent does innovation plays a mediating role in the quality orientation-organisational performance relationship?

By attempting to answer these questions, the purpose of this study is to examine the synergistic relationships between quality orientation, organisational performance, market orientation and innovation. Moreover, it seems also worth noting that existing research is mostly focused on the American context, where the health sector is much more competitive contrasting with the European setting, in which health care needs to be examined in the realm of the public sector.

Design / Methodology / approach - The present study employs mainly a quantitative approach, which is traditionally associated with logical positivism (Gill and Johnson, 1991), as it accomplishes the research aims more adequately. Following this approach, the different constructs are measured

precisely and the data are collected under standardised conditions. Before the actual questionnaire was mailed, a small scale pre-testing procedure was conducted. This pre-test was conducted to six academics and four practitioners that helped to ensure content validity and to clarify ambiguous questions. Subsequently, in order to test the proposed hypotheses, a survey method was implemented. The questionnaire was sent to the CEO of a national-wide population of 355 health care organisations yielding a sample of 102 organisations, which corresponds to a 28% response rate. A structural equation modelling technique called Partial Least Squares (PLS) was chosen to conduct data analysis.

Findings - This study empirically validates that quality orientation has a major influence on performance. It also suggests that market orientation and innovation are important mediators to enhance the relationship between quality orientation and performance in the health care context.

Research limitations /implications - This study was conducted in the health care context, and may not be generalised in other industries. Moreover, as the sample used for this study was drawn from Portugal, the generalisability of the results to other countries remains to be tested.

Practical implications - The findings of the present may assist health care managers as well as public policy makers in the design of policies to achieve quality goals and organisational performance in this specific sector.

Originally/Value - The major contribution stemming from this research is to conceive an integrative model that incorporates the indirect mediated effect of market orientation and innovation on the quality-organisational performance relationship.

Acknowledgements - The authors wish to thank the Portuguese Ministry of Science, Technology and Higher Education – FCT - Fundação para a Ciência e a Tecnologia (PTDC/GES/76347/2006) for funding this research.

AN EFFICIENT VALUE CHAIN, OR A SERVICE VALUE NETWORK? BEST PRACTICES DERIVING FROM ZARA

Polese, Francesco¹; Tartaglione, Andrea Moretta²; Sarno, Sandra³; Carrubbo, Luca⁴

¹*Associate Professor of Business Management, Cassino University, Via S- Angelo Loc. Folcara, 03043, Cassino (FR), Italia*

²*Researcher in Business Management, Cassino University, Via S- Angelo Loc. Folcara, 03043, Cassino (FR), Italia*

³*PhD, CNR-IRAT (Service Research Institute within Italian National Research Council), via Trinità, 13, 84081 Baronissi (SA), Italia*

⁴*Doctoral Student in Business Management, Cassino University, Via G. Capaldo, n° 26, 80128, Napoli (NA), Italia*

Purpose: Today Service Economy allows to the development of new value processes inside firms. Perspective changes recently have led to a models evolution in terms of value creation and service provision. Then we want to investigate the influence of this changes in real business activities, in order to show the (eventual) link existing between new service, network theories and current business world.

Design/methodology/approach: The methodology used for this contribution is a field study, in order to analyze the industrial databases and specific internal information grouped in a set period in Zara , a multinational enterprise successfully operating in fashion sector.

Implications and Practical inferences: Investigating best practices deriving from Zara, we could deepen business processes management for successful retail, in the attempt to highlight service solutions and best performances in fashion world and in nowadays service economy.

Findings: Paper final goals can be summarized in the attempt to identify foundational service leverage solutions and logics involved in best case studies, referring to new firms governance and strategies, also for internationalization, and to a new concept of Service Value Chain.

Originality/value: Following the international literature movement focusing on service dominant logic, our contribution refers to nourish new paradigm trends and to favour the representation of a confident case for their main foundational premises.

Keywords: Service Value Networks, Service Economy, Retailing, Service Value Chain, Service Dominant Logic.

Name Session Proposal: N° 46. Supply Chain Management: Supplier-buyer and customer-seller relationships, purchasing, logistics, and distribution.

Type of paper: Case Study

THE CONTRIBUTE OF VIABLE SYSTEM APPROACH IN DIRECTING AND MANAGING INTER-FIRM RELATIONSHIPS

Polese, Francesco¹; Russo, Giuseppe²; Carrubbo, Luca³

¹Associate Professor of Business Management, Cassino University, Via S- Angelo Loc. Folcara, 03043, Cassino (FR), Italia

²Researcher in Business Management, Cassino University, Via S- Angelo Loc. Folcara, 03043, Cassino (FR), Italia

³Doctoral Student in Business Management, Cassino University, Via G. Capaldo, n° 26, 80128, Napoli (NA), Italia

Purpose: This paper aims to enforce interpretations about Business Systems and their interactions inside networked context and environmental relationships. They will be highlighted emerging interpretations of inter-firm co-operations following nowadays foundations of System Thinking and Service Logics, considering new related reflections about service value networks and service systems, verifying possible contributes deriving from Viable System Approach (VSA).

Design/methodology/approach: Studying several foundations of new dominant logics in international literature, it will be interesting to deepen inter-firm relationships in networked context following a theoretical comparison of system framework foundations, analyzing main significant features of VSA.

Implications and Practical inferences: Considering nowadays service economy (dense, articulated and interconnected), the study of relationships existing between related companies and how they evolve could be useful to direct and manage business networks allowing to their development and systemic survival.

Findings: Today complex service systems represent an emerging model for business experiences and competition, strengthening inter-firms relationships for competitive advantage and long run survival. The work leads to identify the specific contributes of VSA to inter-firms relationships directing and managing.

Originality/value: In a logic of continuing up-grading *open source* project for International multidisciplinary Paradigm enriching, it seems to be useful to contribute to deepen the effects of multi parts influences on business processes, operations and interconnected activities, in the context of network. Verified the compatibility of system visions and service logics for new interpretations of business behaviour, the inter-firms relationships and the contribute of VSA to their understanding surely deserve to be further investigated.

Keywords: Viable Systems Approach, Inter-firm Relationships, Service Systems, Networked Interactions.

Type of paper: Theoretical paper.

TAPPING THE MANAGER'S MIND THE USE OF DIARY STUDIES IN INTERNATIONAL MANAGEMENT

Prange, Christiane¹; Götze, Elisabeth²

¹EM Lyon Business School, 23 Avenue Guy de Collongue, F-69134 Écully cedex

²Vienna University (WU-Wien), Augasse 2-6, A-1090 Wien

Purpose - This paper points out the necessity for more qualitative research in international management. It especially suggests the diary method as a tool to elicit tacit knowledge that may not be detected by traditional research approaches. As a large part of our knowledge is deeply anchored in the personal mind, is tacit and unconscious, it defies easy articulation and communication as depicted in the observation that 'we can know more than we can tell' (Polanyi, 1966, p. 4). This poses a particular challenge to international management research as managers' decision-making capabilities largely rely on tacit knowledge (Stubbart, 1989). By identifying these tacit parts of knowledge, new insights in managerial decision making are expected which is of mayor relevance to theory and practice.

Design/methodology/approach - A review on the literature in international business research shows that quantitative methods dominate it, without being able to give full answers to all research questions. One promising qualitative method is the diary method. For further details on the diary method see Bolger, Davis and Rafaeli (2003). A thorough analysis of diary studies in other disciplines shows its potential and ability to create knowledge.

Findings - A tacit knowledge perspective has been widely used to investigate the link between the multinational company's (MNC) internationalization and the behaviors of managers (Athanassiou and Nigh, 2000), knowledge transfer processes in MNCs (Kogut and Zander, 1993, 1995; Kotabe *et al.*, 2007; Lam, 2008), types of internationalization processes (Gassmann and Keupp, 2007; Nordman and Melén, 2008), or knowledge acquisition strategies from foreign joint venture partner firms (Dhanaraj *et al.*, 2004). A review of the literature of the international management literature back until 1985 illustrates the dominance of quantitative methods in investigating tacit knowledge. It has been assumed that knowledge can be traced by asking people to fill in questionnaires, i.e. that tacit knowledge can be easily transferred into explicit knowledge. However, a closer look into the psychological literature provides for more succinct insight. Tacit knowledge resides outside our consciousness (Gioia and Ford, 1996); it is ultimately related to actions such that it reflects knowing *how* rather than knowing *what* (Brockmann and Anthony, 2002).

In the last few years, a growing number of studies in international management have reminded us of the cognitive capabilities of key decision-makers as a critical success factor for organizational performance (Murtha *et al.*, 1998; Harveston *et al.*, 2000; Gupta and Govindarajan, 2002). Labels, such as *global mindset* (Perlmutter, 1969; Maznevski and Lane, 2004; Bouquet, 2005; Levy *et al.*, 2007), *global orientation* (van Bulck, 1979; Moen and Servais, 2002), or *international outlook* (Wiedersheim *et al.*, 1978; Reid, 1981), have been used to illustrate discrepancies between the foreign and the home market as perceived by the manager. Researchers have investigated miscellaneous knowledge dimensions and structures, but to date, only a handful of studies have explicitly and precisely identified the type of knowledge under investigation and related it to the associated layers of access (Brockmann and Anthony, 2002). These distinctions as well as the respective research methods deserve more attention. As mentioned previously, there is a dominance of quantitative methods when researching tacit knowledge in international management empirically. While various qualitative research methods

have been suggested, most notably from disciplines other than international management, e.g. repertory grid technique (Kelly, 1955; Fransella and Bannister, 1977), causal and cognitive maps (Eden, 1992; Hodgkinson, 2004), story-telling (Hansen and Kahnweiler, 1983; Kaye and Jacobson, 1999), one particular method has largely eluded the attention of international management researchers. The diary method as an unstructured journal emerged in disciplines such as medicine, sociology, psychology, and market research, and studies illustrate its usefulness in detecting largely unconscious knowledge. Indeed, the diary method is an excellent instrument for studying activities, events, behaviour and other phenomena *in situ*, i.e. within the context of a given situation (Bolger *et al.*, 2003).

We discuss the application of the diary method in international management with reference to three areas of research. First, conflicting headquarter-subsidiary relations in the MNC (Hedlund, 1980; Martinez and Jarillo, 1989) have been a prominent research topic. Using the diary method may help to reveal underlying emotions, perceived barriers to strategy implementation, coping mechanisms, and potential changes in power distribution over time. Second, international marketing researchers may focus on the balance between standardization and adaptation, possibly by redefining headquarters' directions or mediating the tension between thinking globally and acting locally (Kotabe and Helsen, 2001). Finally, in international human resource management, diaries may more precisely illustrate existing challenges for expatriates and how they deal with them (Boyacigiller, 1990).

Originality/value - Taken collectively, we suggest the diary method as an ideal tool for researchers in international management when tapping into managers' largely unconscious tacit knowledge. By suggesting areas of application, we prepare the field for an empirical study. This will provide new insights to international management research and practice.

FOSTERING TYPICAL PRODUCTIONS THROUGH STRATEGIC COLLABORATION: TRUFFLES MARKET IN CAMPANIA

Ranucci, Stefano¹

¹Ph.D., University of Salerno, Italy

Purpose: This paper aims to describe truffles market in Campania highlighting the actors and their interactions and drawing the market structure. Market analysis is finalized to detect development opportunities and limits to grow expansion. The goal is to suggest managerial solutions in order to promote market development.

Type of paper: Viewpoint This paper illustrates the author's viewpoint about truffles market peculiarities and compares the case of Campania to the best practices realized in other territories in order to increase the value of typical productions and achieve local development.

Design/methodology/approach: The research work starts with a preliminary examination of the industry features through the use strategic management approach. The industry has been studied using the Porter's five forces model defining its attractiveness for all business actors.

The demand analysis has been accomplished using information and statistical data provided by national and local official agencies (ISTAT and Regione Campania).

Moreover the paper refers to relevant literature about typical products. A relevant source of information and ideas has been the web. The web site information has been helpful to define who the main actors are and to outline their roles and their expectations.

A benchmarking analysis has been useful in order to select the best practices adopted in other territories or in different industries that can be coherently adapted to the truffle industry in Campania.

Findings: The main findings of this research are:

Truffles market in Campania has relevant growth opportunities as shown by economic data (such as annual total sales; growth in selling prices and export sales).

The productive chain shows several inefficiencies related to the presence of information asymmetries among the actors involved. The inefficiencies verified in products distribution represent the principal factor delaying market development.

Consumer behaviour and needs for typical products corroborate findings in economic data analysis highlighting a good market potential.

Benchmarking analysis shows several useful ways and tools to remove inefficiencies through collaboration among principal actors of productive chain. In order to encourage this way of collaboration has been suggested the consortium answer among producers, local agencies, and other relevant actors in productive chain.

Research limitations: Principal research limitations refer to data collected. Advances in this analysis may use several tools (i.e., questionnaires or focus groups) investigating specific features, roles and expectations of actors involved.

Originality/Value: This work belongs to studies and literature analyzing typical productions effects for development of territories through marketing and strategic management tools.

In this point of view, typical products like truffles represent important factors of development for a territory. In this literature, truffles market analysis in Campania represents a first original contribution of this paper.

Solutions suggested in this paper may be considered a helpful methodological guideline for all industry actors in order to foster typical productions through strategic collaboration.

Keywords: truffle; improving typical productions; agricultural market development; strategic collaboration; consortium; Campania.

ENVIRONMENTAL PERFORMANCE OF CROATIAN COMPANIES REGARDING OWNERSHIP

Rašić, Sanda¹

¹Ph.D., Assistant Professor, University of Zagreb, Faculty of Economics & Business Zagreb, J. F. Kennedy 6, 10000 Zagreb, Croatia

Purpose: The main purpose of the paper is: to examine differences in environmental performance among companies of different ownership-type in Croatia, to determine main obstacles in achieving better environmental performance, and to explore influence of environmentally friendly products/services to certain company' characteristics.

Design/methodology/approach: Within the secondary research, the relevant literature about environmental performance of companies of different ownership type was consulted. Within the primary research, the study was conducted at the sample of 350 Croatian companies and 63 questionnaires were received. Statistical data analysis was done using SPSS 13.0.

Findings: There are no differences among companies of different ownership types in the majority of environmental dimensions. Statistically significant differences can be established in only two dimensions: product/services features and device/equipment features regarding prescribed environmental protection standards. The highest obstacles in achieving better environmental impact are: the lack of new clean technologies, company's orientation to other goals, and high purchasing costs of clean technologies. Among all companies, the highest is influence of environmentally friendly products/services on image.

Research limitations/implications: There are not many studies that examine connection between company ownership and environmental performance. Therefore, future studies are required to broaden knowledge in this area.

Originality/value: The paper shows comparison of environmental performance among companies of different ownership-type in Croatia, the main obstacles in achieving better environmental protection and influence of environmentally friendly products on certain company' characteristics. Hence, it could be useful to Croatian academics and practitioners that manage environmental performance.

Key words: environmental performance, ownership-type, Croatia

FOREIGN DIRECT INVESTMENT FROM EMERGING COUNTRIES INTO EUROPE

Rios-Morales, Ruth¹; Brennan, Louis²

¹(PhD), Lecturer at GIHE- Laureate International Universities, CH 1630 Bulle, Switzerland

²(PhD), Associate Professor at the School of Business, Trinity College, Dublin 2, Ireland

Purpose - This paper analyses the prominent features of recent trends in FDI flows from Emerging countries into Europe. Emerging countries are surging as important contributors of outward FDI in both developing and developed markets around the world. The paper focuses on Chinese investment into Europe with a particular consideration given to the manufacturing sector. The purpose of this paper is to analyse this new phenomenon in the context of the Eclectic Paradigm.

Design/methodology/approach - The analysis incorporates aspects related to drivers and motivators, elements of difference, and includes considerations of the institutional role in influencing the competitiveness of firms and the strategies of countries.

Findings - From this analysis emerges a contribution to theory development. A holistic model which incorporates government's role in influencing FDI is developed to advance understanding of Chinese OFDI.

Practical implications - This paper addresses the rapid increase in outward foreign direct investment from the Emerging markets. In particular focuses on Chinese investment into Europe. A model incorporating governmental influences on FDI has been developed to explain this phenomenon. The issues that arise for the new entrants in terms of strengths and weaknesses and for incumbents in terms of threats and opportunities will be discussed. While the new entrants retain strengths from their home country base, they also face considerable challenges that require major improvements in their capabilities and changes in their modes of operating. Likewise while incumbents face threats from the new entrants, there are opportunities for them to respond to these threats in a proactive fashion.

Originality/value - Data and scholarly research on the topic of FDI from emerging countries and on the emergence of China as a potential investor in Europe are limited. Since emerging markets are playing a growing role as sources of FDI there is a need for scholarly research in this area. This should include studies at the firm level. Longitudinal case studies of the new entrants and of incumbents might be a useful means of assessing the evolution of these players in terms of their strategies, building of capabilities and their commitment to innovation.

IS TIME ORIENTATION CAUSED BY CULTURE AND INFLUENCING URBAN CONSUMPTION?

Rodríguez-Santos, Carmen¹; Laaksonen, Martti²; Laaksonen, Pirjo²; Huuka, Ari²

¹University of León,

²University of Vaasa

Purpose – Perception of time is a crucial topic in consumer behavior. The main purpose of this research is to identify the patterns of time orientation in different countries: Finland, Spain, Japan and Italy, looking for the possible relation with culture as a second aim. Finally, in this research, we explain the effect of the different patterns of time orientation on diverse consumer behaviors, focusing specifically on café consumption behavior.

Design/Methodology/Approach - After conceptualizing time orientation in this research it is followed the six-dimension frame by Usunier and Valette-Florence. For these six dimensions we selected three of the four items they developed in their work to measure each dimension, and we added the present dimension, measured also through three items. A semistructured questionnaire was used, considering six parts in order to measure: general time orientation; time orientation at cafés; preferences and main evaluative elements when selecting a café; first impression and expectations at cafés; behaviour at cafés; and personal characteristics (values and socio-demographic characteristics). This questionnaire was administered to eight hundred consumers from Finland, Spain, Japan and Italy. A stratified multi-stage random sample with fixed proportions for sex, age, time and place was used.

Findings - We ran a factor analysis, achieving very good results in all the dimensions but not in the items composing the preference for non-linear/unorganized time. This fact can be explained because we had already measured the opposite dimension through other items in the same measurement. Having deleted these three items the loading and the composition of each dimension were appropriate and these six dimensions explain 63.770 of the variance. At a second step Pearson correlation was used to analyse the relation of these factors with the Hofstede's dimensions. Finally multiple correspondence analysis was used to explain the relation between these factors and different consumer behaviours described by the consumer in different countries when selecting and going to cafés.

Research implications – When choosing and enjoying time at cafés different causes can be described, being the time orientation pattern shown in different countries, one of these determinants. Through this knowledge more efficient marketing strategies can be developed and implemented. Thus, the success of certain types of café, the relative importance of certain attributes, the location, the perceived image and the perceived price are different for the different clusters following diverse perceptual time patterns.

Originality/value – Urban consumption and how time orientation determinates it, is very important, both academically and professionally. This paper tries to contribute in this field describing consumption at cafés through time orientation patterns in different countries.

Key words: time orientation, culture, urban consumption, cross-cultural research.

Research paper

THE EVOLUTION OF INTERNATIONALIZATION PROCESS OF ITALIAN SMEs

Rossi, Matteo¹; Martini, Elvira²

¹University of Sannio

²University of Sannio

The aim of this paper is to analyze the consequences of globalization on the internationalization processes of Italian SMEs, underlining the importance of social capital as competitiveness factor.

An increased number of enterprises deciding to operate on foreign markets are faced with a very complex competitive and institutional environment which is based on a large net of commercial, productive, financial and communicational relationships (Rispoli, 2002). This process start from the unifying force of technology that has made affordable for all communications, transport and travel (Levitt, 1983). The ultimate consequence of this process was the creation of supranational market that require a rethinking of strategic conduct by firms. While in the past, enterprises that operate in a geographical area weren't interested at strategy of foreign enterprises, today the distance is no longer a factor for protection against competition. The tariff barriers fall and the free capital circulation have created strategic opportunities which have changed the attitude of many sectors and increased the competitive pressure. However the global vision of economy and culture has also raised the importance of localism and the social, economic and cultural development of territories. For these reasons the *glocalism* phenomenon has emerged in recent years (Bauman, 2005); the places have begun to interact with the flow that passed through them, determined by global players.

All these changes imply for enterprises the need to learn to govern competitiveness (Bertoli, 2004), making critical choices of internationalization, especially for small and medium enterprises (SMEs) that need to expand their activities beyond the market home.

Internationalization, which in the past was a way followed exclusively by major enterprises of industrialized countries, has been transformed by the elites phenomenon in mass phenomenon, regarding all businesses and all activities (Grandinetti and Rullani, 1996). The classic international models (based on costs advantages) are not generalized and applicable to all enterprises system, because the *glocalism* has favored new internationalization forms, complementary to the traditional ones. These new forms are based on relationship advantages (Figure 1), understandings, not like a generic availability of cooperation and confidence, but as the development of real forms of social capital of reciprocity (Pizzorno, 1999).

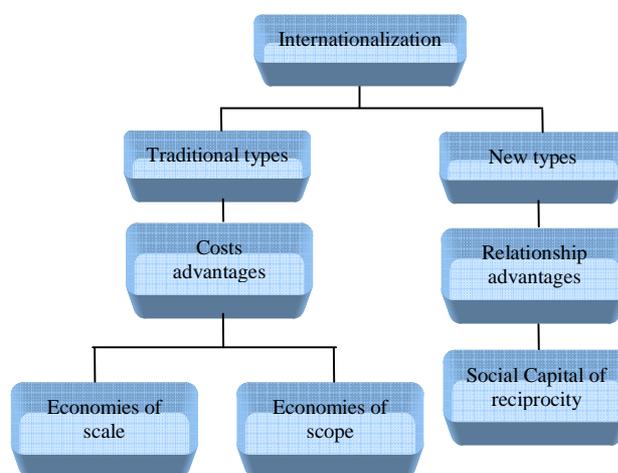

Figure 1 Internationalization models. Source: Martini and Rossi, 2009

For productive systems characterized by a large presence of SMEs, such as the Italian system, international development can't be based on codified and standardized production rules. The internationalization of small firms, in fact, requires an analysis of their traditional limitations and a focus on their specific characteristics²⁹⁰. For this reason in the new scenery are favorites new international processes with different dynamics from the traditional one. Particularly the Italian SMEs have had to rethinking their strategies linking the international development with the valorization of local resources.

In complexity economy (Rullani, 2004) the territories of origin, in fact, have become fundamental to the international success of enterprises, engraving on competitive advantage: the added value for Italian enterprises is linked to specify their identity, valuing intangible resources, first of all social capital²⁹¹, which may constitute important elements, conditioning the territorial and productive perception that have internal and external customers. Particularly are advantaged those enterprises systems able to create products capable to balancing the technical-economic and territorial-cultural components.

However, not all productive experience have successful, because someone are linked to competitive strategies incapable to be open to new forms of "radicalized internationalization", and incapable to making the territory an opening relational system for the production and spread of social capital, the unique differential component for a territory area and for the entrepreneurship that insists on itself (Martini and Rossi, 2009). In this way, the international success is based on an interactive process that involves not only possible agreements among entrepreneurs, but also the ability to rely on other players in the same territory, other stakeholders, interested to develop, not only the enterprises system but all the (actors of a) territory. Social capital, particularly the bridging type (that is composed by weak ties and it allows the opening toward the outside), allows to direct, to inform, to support and to lead to new territories and markets not easy to achieve, which can be explored

²⁹⁰ These limits are linked to distinctive characteristic of Italian firms: presence of a strong family that supports the business, insufficient use of external skills, undercapitalising, aversion to debt, limited availability of capital to make foreign investments, absence of human resources for develop international processes.

²⁹¹ Social capital is rooted in social relationships of specific territory. In this sense, the social capital is not a component transferable from an area to another one, that is possible with financial, physical and human capital.

through the support of the local community, where mature the intention to improve their ability to share a path international growth.

SEGMENTING PATIENT MARKET IN POLISH HEALTHCARE THROUGH THE USE OF CONJOINT MEASUREMENT TECHNIQUE

Rudawska, Iga¹

¹Ph.D., University of Szczecin, Faculty of Economics and Management, Department of Marketing, Mickiewicza 64, 71-101 Szczecin, Poland

Purpose - The principal purpose of this paper is to present the applications of conjoint measurement in the recognition of differentiated patient preferences in the healthcare market in Poland. As for the mainstream analysis, it aims firstly to determine the relative importance of attributes associated with healthcare providers in Poland. In the next step 4 patient segments have been identified and described. Finally, the paper demonstrates the application of research findings in the marketing practice of healthcare providers.

Design/methodology/approach - Borrowing from the literature on theory of consumer segmentation, especially consumer-based segmentation, supports a research hypothesis that patient preferences and choices are multi-dimensional constructs. They are determined by patient age, income, gender, work status, education and place of life.

Subsequently, an empirical research has been conducted through the use of conjoint measurement technique. A set of five attributes (i.e. cost of the service, service availability, market image of the healthcare provider, peer-group recommendations, and comprehensiveness of the healthcare offer) was used with the corresponding levels set on the basis of a pre-test. Finally, nine healthcare provider profiles has been selected for presentation during the interviews with patients.

When designing a research sample, for lack of an updated list identifying all the elements of the defined population, the selection was based on the *random route technique* (Gallup Poll sample). Finally, the sample group amounted 506 patients who met the following prerequisite: „At least one encounter with a healthcare provider within a year preceding the survey” and conformed to the quota assigned for the state (age, sex). The market research has been carried out using face-to-face interviews.

The research employed the traditional additive measurement, which makes it possible to determine the total utility, and consequently, to understand patient preferences when it comes to selecting a healthcare provider.

Findings - The obtained results clearly demonstrate the dominant role of availability and perceived quality of healthcare (based on recommendations and market image) as advantages in the process of choosing and consuming of medical services, against the drawback in the form of direct payment (upon receiving the service) rather than anticipated payment (health insurance contributions).

Furthermore, the study suggests that there are four distinct segments in the Polish healthcare, significant demographic differences among these groups, and substantial differences in sales potential among the segments. “*The Price Insensitive Segment*” and “*The Recommendations Segment*” were found to have the greatest sales potential. First one consumes relatively much healthcare services, and the second one is interested in complex healthcare and puts little importance to the price of service.

Practical implications - Healthcare managers could use the information from this study to make more informed marketing decisions. The above presented findings provide the basis upon which health care managers could design effective marketing strategies. It is possible to put the results to further use, especially in designing:

the locations of the new service-provider network and its marketing strategy;
the positioning strategy in predefined segments of the patient market;
the communication policy of the healthcare institutions which want to maximize the efficiency of their messages in their target groups;
the healthcare offers addressed to the predefined patients segments;

The research findings let draw the conclusion that in the newly created competitive environment in which healthcare providers now operate understanding patient expectations and evaluation is essential, not only to protect existing patient lists, but also to attract prospective customers who may be motivated to look for an alternative service provider.

Research limitations/implications - The present study provides a starting-point for further research in the health sector. Firstly, there is a need for further methodological research to assess the predictive validity of conjoint measurement in healthcare market. To date, published research in the area is scarce and it covers other areas but not health sector. Second, there is a need for more empirical work to describe and identify major patient segments. There is also a need for studies in different geographic regions of the common European market to determine if major patient segments are similar across geographic locations, or if certain segments are found only in certain regions. Further, additional demographic variables should be included in future studies.

Originality/value - The paper contributes to the discussion referring methodology of patient preferences measurement. The application of conjoint technique made it possible to observe the multi-dimensional character of choices made by the patients. This approach is a promising direction for studying customer preferences also in other markets. It offers companies a chance to get to know the customers' behaviour in a more precise manner, seen as their choices are rarely a function with a single variable.

CULTURAL HERITAGE INTERPRETATION , AUTHENTICITY AND THE VISITOR EXPERIENCE: A CONCEPTUAL PAPER

Sakkadas, Savvas¹; Kaufmann, Hans Ruediger²

¹Senior Lecturer, Hospitality and Tourism Cyprus University of Technology – Limassol, Dpt of Administration and Economics, Archbishop Kyprianou 31, P.O. Box 50329, CY-3603 Limassol, Cyprus

²Associate Professor, School of Business, University of Nicosia

Purpose – This paper researches the influence of interpretation on cultural heritage visitors' experience in general and on the perception of authentic experience in particular. The paper explores the concept of authenticity and also suggests that visitors can experience different forms of authenticity.

Design/methodology/approach – Integrating the innovative aspect of cultural heritage interpretation the paper, concluding from a wide ranging literature review encompassing the main areas and concepts such as cultural heritage tourism, visitor experience and authenticity and develops an initial conceptualization on visitors' authentic experience so far not existing in literature. The approach is based on qualitative methods, in-depth and semi-structured interviews and participant observation. The paper aims to critically assess the factors of cultural heritage site interpretation strategies in order to enhance visitors' authentic experience. Specifically, this research is guided by the objectives of identifying and analyzing the factors of cultural heritage interpretation methods in tourism, the role of interpretation in enhancing visitors' authentic experience and to add to the body of knowledge on how authenticity is presented and perceived by contributing to better understanding the visitors' perceptions on the various factors of experience when visiting heritage sites with respect to authenticity.

Findings –Practical implications – A distinction is drawn between existential authenticity and authentic experience. This paper provides the factors of interpretation related to cultural heritage sites and ways to experience authenticity. The paper examines the current level of knowledge and addresses the current gap in practice of not sufficiently addressing the need to enhance visitors' authentic experience and provides pragmatic suggestions.

Originality/value – This study calls for differentiating authentic experience as to cultural heritage sites. The hypothesized factors of experiencing authenticity at cultural heritage sites are provided.

CHINESE ENTREPRENEURIAL MODEL: AN EMPIRICAL INVESTIGATION ON PRATO INDUSTRIAL DISTRICT

Santini, Cristina¹; Rabino, Samuel²; Zanni, Lorenzo³

¹PHD, School of Business Administration, University of Florence, Via delle Pandette, 9, 50127 Firenze

²Full Professor, Northeastern University, College of Business Administration, 202 Hayden Hall, Boston, MA 02115-5000

³Full Professor (Prof. Lorenzo Zanni is the corresponding author), Università degli Studi di Siena, Facoltà di Economia "R. Goodwin", P.za S. Francesco, 7 (53100) Siena (Italy)

In the field of study of Ethnic Entrepreneurship a strong attention has been paid in the last years to Chinese migrant Entrepreneurs by describing their role both in China and in foreign countries (Levie, 2001; Holt, 1997).

Previous researches have outlined some traits that can be defined as typical of Chinese Entrepreneurship, such as: a strong family orientation (Collins, 1998, 2002); the importance of Chinese cultural heritage (Krug and Laszlo, 2000; Zapalska & Edwards, 2001); self achievement (Lee & Chan, 1988); and networking dynamics (Lee and Tsang, 2001; Butler, *et al.*, 2000). An interesting issue in ethnic entrepreneurship is the one of *mixed embeddedness* (Kloosterman, *et al.*, 1999, Kloosterman and Rath 2003) that helps in describing how two different cultures mix up in specific contexts. On the other hand, Chinese communities have shown a very high degree of independency from hosting cities services and communities and have revealed a specific network organization that is able to support migrant Chinese entrepreneurs' needs.

How the Chinese Entrepreneurial model is affected by mixed embeddedness? In order to answer to this research question, this paper examines the dynamics of Chinese Entrepreneurship in the Industrial district of Prato, in Tuscany (Italy) a city that is specialised in garment and textile production, and hosts the biggest Chinese community in Italy. Data from a questionnaire submitted to 50 Chinese Entrepreneurs based in Prato will be analysed and findings will be supported by a selected case study. In order to support hypothesis an extensive literature review will be carried out and will focus on Chinese Entrepreneurship and Prato Industrial District Entrepreneurial model.

Keywords: Chinese Immigrant, Industrial District, Mixed Embeddedness, Entrepreneurship.

Type of Paper: Research Paper

CRISIS COMMUNICATION IN THE CATALAN HOSPITALITY INDUSTRY

Saumell, Ramon Palau i¹

¹Business Organization Department, ONIT Research Group CRIIT –Research and Innovation Centre for the Tourism Industries, University of Girona

Purpose: the 21st century is characterized by the facility and the speed in which any information circulates throughout the world. The mass media provide the public opinion, with political, cultural, social and economic information in such way that the news, interviews and reportages about the performance of companies usually play the lead in the media sections of economy. But not everything are good news, there is also a presence of news that the media bring to the public opinion related with the entrepreneurial crises (Berno T.; King, B. 2001), such as the difficulties of companies in economic crisis, the processes of work restructurings, the fusions, accidents, pollution, etc. In this sense, the media adopt an essential role as mediators between the companies and their targets in transmitting positive or negative information. This situation has a special significance in a sector like tourism, which involves millions of persons and their movements every year. Destinations, hotels, tour operators, and air companies work in the delivery of services to persons in a weak context, because it is in touch with the environment, the cultural heritage - the sea, mountains, cities- and it is highly sensitive. Therefore, the management and planning of crisis communication becomes fundamental in order to act with planned communicative criteria in front of media, in case any situation of crisis happens.

For this reason our research goals are:

1) To identify if a set of Catalan relevant hotel chains has planned the communication of crisis and which typologies of crisis has considered. 2) If the size of the companies has a significant influence in the crisis communication planning.

Design/methodology/approach: a qualitative research has been developed, based on a theoretical frame with the conceptualization of the main contributions of the academic literature to the entrepreneurial crises (Faulkner 2001, Henderson 2003) and the most usual case studies of situations of entrepreneurial crisis as physical environment, human or social environment and management failure (Tse, So & Sin 2006) and more detailed: terrorism (Evans & Elphick 2005) industrial accidents, work conflicts, external accidents in the hotels provoked by the company, hotels pollution, severe operating errors in the provision of the service (Coobms 1999), economic crisis (Prideaux & Witt 2000, Okumus & Altiney 2005), negative information on the Internet, disasters and catastrophes (Blake & Sinclair 2003). 38 hotel chains with 4 or more hotels were identified, of which only 24 wanted to take part in the research. The qualitative research was carried out through depth interviews to managers of those 24 hotel chains, which in total represent an amount of 495 hotels in Catalonia (Spain). In order to achieve the most reliable information the international chains were not selected because their decision centre is located abroad. Instead, in order to collect information from the first managerial levels that can take decisions, those chains that were selected had a majority of the property in Spain, and the decision centre was located in Catalonia.

Findings: The results of the eight crisis typologies analyzed reveal that the majority of the hotel chains that have been analyzed don't have eventual situations of crisis planned.

Among those few companies that do have plans of communication to face crises, they had planed a sort of typologies related to labour accidents, disasters, the internal work conflicts and mistakes in the delivery of services processes. It has also been observed that the size of the companies measured by the number of employees or by total income is a relevant variable that conditions the forecast in the

planning. The bigger are hotel chains, the more they plan the communication of crises, except when crises happen due to a mistake in the delivery of a service. In this last case, as the service is the most important part in the contact with the customer, the size of the companies is not significant.

Research limitations/implications: This research is a first approach to the matter and its purpose is not to extrapolate the results to the rest of the Spanish hotel chains.

However the results show some trends that could be approached in future researches, as it is shown that the analyzed hotel chains have not planned crises and should have instruments of planning that could allow them to react in front of any kind of crisis and not having to face these crises when they have turned up in the media, with negative consequences for the company.

Originality/value: the traditional research in crisis communication has put the emphasis in evaluating the information that media have published after crisis, through content analysis techniques. The originality of this research is that company managers have been interviewed in order to identify their motivation towards the crisis communication planning.

THE NECESSARY OF RATIONAL SOCIOLOGICAL APPROACH TO INDUSTRIAL CHANGES

Sozou, Elias¹

¹*KEO Group, Nicosia CYPRUS*

Purpose - KEO Organization has its own brewery producing the leader local beer, (KEO beer) the leader range of wines (KEO wines, brands such as Othello, Aphrodite and Thisbe), KEO juices (a full range of flavours of fruit juices), St. Nicholas mineral water (the leader more than 50% market share) representing Teacher's, Langs, Laurent Perrier, Disaronno and many other world wines known brands in Cyprus.

In the medium term plans of KEO, we are planning to build our new brewery in which we intend to produce beers other from ours such as Heineken family beers and InBev family beers (Beck's, Stella Artois, etc) while we are in the process of finishing our second plant for bottling mineral water.

The idea of a doctoral reset project, in my case, is to analyze and develop a methodology of communication management along with project management and documentation of this huge project that is expected to be fully materialized in the next five years.

Taking under consideration that KEO plc is an eighty year old Company, with many obsolete mentalities and having the average employment of its employees to succeed 27 years, a key success factor in the efficient application of the middle term plans will be the effective change management and communication to the people that they have been doing things in a certain way for so many years.

Additionally, the modernization of the plans and the sales structures will create redundancies that will need to be handling in such a way not to disturb the operation of the Company. The whole project involves a lot of construction, engineering projects, finance, transitory period, human recourse status and of course a lot of unexpected situations that the management of the Company will have to face during changes along with day to day matters.

In all these operations, it's very important taking under consideration that the organization and structure of KEO plc it is consisted by three Top Managers out of which one the Production Director is expected to retire the next fifteen months.

Methodology - The research will be based a lot on cultural analyses of the outstanding human resource of the Organization, aiming to create a SWOT analysis leading to a SWOT matrix in view of the coming radical changes in the Organization.

Taking under consideration the major Principles of project management and all the aspects being involved in the triple constrain of big projects, the research will aim to minimize risks and unpredictable issues that we raise during the materialization of the project. In the research I will try to determine the role and the importance of the different stake holders and categorize them in such a way, in which communication and documentation during the project will be done in the best possible way with the highest efficiency and speed. These are elements that will be critically needed for the materialization for such great changes taking under consideration that business will still run as normal. Taking under consideration that no additional managerial recourse will be hired in order to materialize this project it is important that in this research I will be able to determine which of the outstanding resources will be able to help in which part of the project and which extent.

In this project my personal interaction will be very determine and crucial, taking under consideration the fact that the project will be materialized at the same time that business will still be running as

normal. Due its complexity, the project will need skills, expertise and knowledge from many different sectors, such as business, marketing, communication, project management and of course human resource management.

My extensive backgrounds in labour intensive industries were going through changes while running business as normal, renders me as an ideal project manager for the materialization of such project. Apart of being the one who will monitor on computerized (MS Project) methodology the project and in triple constrains (time-quality-cost) at the same time I will be the person who will be liable for the day to day performance of the Organization.

The fact that I am also the person in charge of the product development obviously makes my role even more determining due to the fact the reengineering of the Organization will deeply look into the advancement and the modernization of the products, especially the packaging.

Summarizing my intended contribution in the project, I will obviously be the one to monitor, measure and designing the project along with managing the changes and the communication regarding the project, taking care at the same time of the business.

The doctoral project under suggestion it is expected to contribute a lot in the development of the Organization and working mainly from the point of view that will restrict me in processing these major and critical changes of the Organization, in the most scientific possible way, documenting and communicating all the steps of the project management in an audited way that will be reported regularly to my academic advisor.

The entire project will be in this way computerized documented and most of the performance factors will be term in such a way to be measurable.

This project will help a lot into the development of the human resources involved in it.

It will create another interesting approach in project management for organizations that they are still doing business as normal.

This project if will be documented as a doctorate research, it will create a very interesting case study of the project and change management of one of the biggest and oldest industries in Cyprus.

It will establish me as an academically correct management applied director.

Documenting this project in a research study, that will be done in such a way that academically will be useful, will contribute in a theoretical level in management in many levels. Firstly, and more important will be an excellent study, to prove how important is to apply scientific approaches into reality, especially in project management but also in showing the importance of the mutual feedback during changes in an Organization. Secondly, I will try to examine in detail the full potentials of application of technology of the computerized project management by calculating and revising a project along its whole materialization.

Additionally to the two previous issues in this project I will aim to give alternatives, or solutions to certain incompatibility issues on the theory and the practical application when it comes to multiple labour intensive needs that usually conclude to only one person who can not be specialized in many fields like legal, construction, financial, operational, commercial etc.

The research study in this case will fully exploited the project management theory along with the communication and change management necessities of a major changes project (both organizational and physical) at the same time with product and human resource reengineering. The idea is to elaborate and design theoretically an academical approach that after and during its application will need to tackle practical problems that will mainly arise from the fact that all these changes will take place at the same time with as a usual business. Basically, I will look into a theoretical outline that will be fully compared at the end, with all the problems of applying theory into reality.

Findings - Academically this project will contribute in the science of project management, especially at the sector of the communication management (of a project) by taking theory into actual application and materialization.

Taking under consideration that it is going to be a project that will be a turning point of the beverage industry of Cyprus the documentation through out this research will obvious consist a case study it self in the business and academic world of Cyprus.

Taking under consideration that I have been provided with the promise of full support from the University of Nicosia especially from the Marketing Dean Dr Vrontis, I am sure that I will have enough support to materialize the research through out its requirements.

THE FILM AND AUDIOVISUAL CLUSTER IN MONTREAL: CHALLENGES FOR THE DEVELOPMENT OF DISTRICT FIRMS

Tremblay, Diane-Gabrielle¹; Cecilli, Elisa²

¹Université du Québec à Montréal – TÉLUQ, 100, Sherbrooke Ouest, Montréal, Québec, Canada H2X 3P2

²Université du Québec à Montréal – TÉLUQ, 100, Sherbrooke Ouest, Montréal, Québec, Canada H2X 3P2

Film and audiovisual production have been evolving over recent years and are now often seen as part of the New media sector, one of the main sectors of the Creative industries sectors. The sector has evolved from purely audiovisual techniques to various creative services used in television, advertising as well as film. Montreal has long been known as an important North American hub for Film and Audiovisual production, especially with the presence of the French and English production of the CBC (Canadian Broadcasting Corporation) and the National Film Board of Canada. This reputation has continued over recent years with important developments in Visual Effects, often related as well to the important developments in the multimedia sector and the Multimedia City of Montreal, which has attracted important firms such as Ubisoft, Electronic Arts and others. However, the protectionist attitude of the Hollywood filmmakers at times, as well as the negative effects of the long screenwriters' strike in Hollywood on the Montreal production, have been amongst the factors that have spurred important preoccupations for the future of the Montreal Film and Audiovisual production. In this context, the City of Montreal has decided to develop a strategy to protect and develop the future of this creative industry in Montreal, in the context of increased competition in the sector, from the US, but also from other Canadian provinces. It is in this context that efforts have been made since 2004 to try to develop a district or cluster strategy in this sector and ensure this industry's future. We chose the Film and Audiovisual production district or cluster, to investigate the birth of a creative cluster and identify its challenges and difficulties, as well as the sources of success for the development of such a district or cluster.

Our paper will thus highlight the challenges and difficulties in developing cooperation between businesses of a very competitive creative sector, something which seems important to us since writings on clusters too often present fully mature clusters, without showing the difficulties and challenges often related to cluster creation and development. It thus appears useful to look into emerging clusters to identify these challenges, not only to have a more realistic picture of cluster development, but also to help governance bodies and firms in other sectors better understand the fact that cluster development is a lengthy process, maybe all the more so in sectors that are less concentrated and count more small and medium-sized businesses than large firms, and thus many more independent actors.

In this paper, we will begin by defining the concept of industrial districts and clusters in more detail since it is often taken for granted, but we consider it important to develop on our precise view and highlight the recent debates on this concept. Once this done, we will then define the cluster policy of the City of Montreal, especially as concerns the Film and Audiovisual production sectors, and finally analyze the process of cluster development in this sector, highlighting difficulties and challenges encountered in this process of cluster or district creation. Our paper will thus center on the process of cluster creation, as well as on the conditions which appear to facilitate or to impede the development. To refer to our theoretical elements, we could say that social capital, as defined in Bourdieu's work as the set of resources that are related to a durable network of relations, with "interconnexions" and

“interexchanges’, is only beginning to develop in this sector, but many actors have seen enough common interests to start moving in the direction of cooperation and exchanges.

We conclude that the Film and Audiovisual cluster is at the start-up or development stage, that it has accelerated the circulation of information between members of the sector, and has contributed to some learning and innovation (innovation usually coming later, when clusters are more established and connexions between actors more developed). There are still efforts to be made to ensure cooperation of many actors that are not directly in the cluster (tourism and film location actors such as real estate firms), as well as to ensure the transformation of competitive relations into cooperative relations throughout the cluster.

ANTECEDENTS OF SMALL INVESTORS' RISK TAKING PROFILES: AN EMPIRICAL STUDY**Tsoukatos, Evangelos¹**¹*TEI of Crete, Department of Finance and Insurance, P.O.B 128, 72100, Agios Nikolaos, Greece*

Purpose - During the last few decades the world has witnessed the integration of different types of financial institutions into a single, globally operating, system. Products and services delivered to corporate and private customers offer a very low-degree of differentiation and it is often a matter of just a few hours before a new financial product or service is copied by the competition and possibly distributed at a bargain price. In this extremely complex environment the term "private depositor" has been replaced by the term "private investor" or "small investor. This change is tied with the drastic transformation of the global financial environment and the dramatic decrease of deposit interests to the extent that depositors will actually have to pay a fee to the bank that accepts to keep their money. So, small capital holders who in the preceding financial era deposited their savings in a bank and enjoyed a handsome interest, in the present era have to invest their money and accept the risks associated with their investment decisions. However, "small investors", mostly private citizens, find it difficult to appraise the uproar of investment – related information they receive. Furthermore, the risk-taking decisions of small investors are rarely completely rational and are mostly based on their personality profile which in turn is influenced by their demographic, cultural or other characteristics.

Most financial institutions have developed instruments to assess the risk profile of their prospective private customers but only after customers have crossed institutions' thresholds seeking advice and assistance. Yet, little is known on the drivers and antecedents of small-investors' risk profiles. There is no published research in the literature although such knowledge would be mutually beneficial for both financial services firms and small investors. Should they were able to associate demographic and cultural characteristics of prospective investors with their respective risk-profiles, financial institutions would be able to appropriately segment their markets and design investment packages especially fit for specific market segments. On the other hand small-investors would choose between investment opportunities designed before-hand to fit their own needs and preferences.

Design/methodology/approach - This is an empirical study designed to examine the drivers and antecedents of the risk profiles of "small-investors" considering factors such as respondents' demographic characteristics (gender, age, occupation, marital status, family income etc.) and cultural values. A specially designed research instrument is used to collect data, including measurements of the risk and cultural profiles of respondents, that is statistically analysed to produce valuable results on the extent to which respondents' demographic and cultural characteristics are related to their respective cultural profiles. The study draws evidence from the Greek "small-investors" market.

Findings - The study provides evidence that respondents' risk profiles is closely associated with their demographic characteristics and personal cultural values and, therefore, it is possible for financial services firms to accordingly segment their small-investors markets.

Research limitations/implications (if applicable) - The study's implications are significant for both academia and practice. With respect to academia the study addresses a wide-open literature gap and initiates a new research stream that is expected to be followed by other researchers and produce new knowledge on small-investors' risk taking profiles that we do not have at the present time.

Practical implications (if applicable) - The study provides to financial services firms' management useful insight on how to segment their investors' markets and design investment proposals meeting the needs and preferences of particular segments. Furthermore, if properly disseminated, the study's

findings will also be beneficial to “small-investors” desperately seeking advice on how to create a small return on their savings or even safeguard the present value of their small capital.

Originality/value - There is no published research in the literature with respect to the drivers and antecedents of small-investors risk taking profiles. The study is original in that it is perhaps the first attempt to address the specific research subject under the light of demographic characteristics and personal cultural values. In this respect the value of this study will prove significant.

AN ANALYSIS OF COLLABORATIVE KNOW-HOW THROUGH THE I-SPACE FRAMEWORK

Turi, Claudio¹; Castaldi, Laura²

¹*Second University of Naples, ITALY*

²*Second University of Naples, ITALY*

Purpose - The research sets out to combine the issue of knowledge management, fundamental to achieve and sustain competitive advantage, with the one of strategic alliances, analyzing one of the most important organizational knowledge assets, the ability to manage each phase of interorganizational collaboration cycles (from the identification and selection of potential partners to the ongoing management and the eventual termination of the relation), named collaborative know-how (Simonin, 1997). Indeed, despite the relevance of strategic alliances for value creation, collaborations often fail because of the difficulty inherent in their management (Simonin, 1997; Anand, Khanna, 2000; Ireland, Hitt, Vaidyanath, 2002; Kale, Dyer, Singh, 2002). The aim of the paper is therefore to make a contribution towards the understanding of those dynamics which lead to the generation and development of collaborative know-how and to highlight related problems of value generation and appropriation.

Design/Methodology/Approach - Even though the accumulation of experience across different partnerships is important in developing collaborative know-how, it is deemed to be a necessary but not sufficient condition for alliance success: it is important to invest in deliberate cognitive activities in order to leverage previous alliance experience (Simonin, 1997; Kale, Singh, 1999; Kale, Dyer, Singh, 2001, 2002; Zollo, Winter, 2002; Draulans, deMan, Volberda, 2003; Heimeriks, Duysters, 2007). Several mechanisms can be used to interpret, learn from, and share previous experience: creation of codified tools (databases containing firm alliance history, manuals, guidelines), formal and informal debriefings of alliance managers, alliance training systems, problem-tracking and problem-solving procedures, rotation across different partnerships of experienced alliance managers, alliance committees and task forces, dedicated alliance functions (Kale, Singh, 1999; Kale, Dyer, Singh, 2001, 2002; Draulans, deMan, Volberda, 2003; Heimeriks, Duysters, 2007). These organizational mechanisms foster the conversion of the tacit knowledge of people involved in collaborative activities into more explicit knowledge assets (words and/or written documents), thus making alliance management knowledge assets easier to get diffused within the firm and used in future partnerships. In order to analyze the characteristics, evolution and value dynamics of collaborative know-how, we use Boisot's (1998) I-Space theoretical framework, which absorbing and enlarging Nonaka and Takeuchi's (1995) distinction between tacit and explicit types of knowledge assets, analyzes knowledge through the joint use of three dimensions - abstraction, codification and diffusion. Abstraction points out the width of the range of applications of a knowledge asset: while abstract knowledge has several potential applications, concrete knowledge can only have specific uses in space and time. Codification captures the degree to which knowledge is articulated in written documents, figures, formulae, etc. Finally, the diffusion dimension represents the proportion of a given population which could get access to a knowledge asset. The three dimensions of Boisot's I-Space are linked together: the more codified and abstract a knowledge asset, the easier its diffusion over a given population.

The development of collaborative know-how is achieved through the structuring (abstraction and codification processes) of individuals' alliance experience. Indeed, through the use of the aforesaid

deliberate learning mechanisms, individual alliance management knowledge, which is concrete (confined to one or few similar collaborations), uncodified and hardly diffusible, is converted into a knowledge asset – i.e., collaborative know-how – which is, on the contrary, abstract (it can be used in several alliances, with different partners and governance structures), codified (it is often articulated in written documents, manuals, etc.), and therefore more useful and diffusible within the firm.

However, the structuring of alliance experience makes it diffusible not only inside the organizational structure but also outside it, thus making it more difficult for firms to preserve its scarcity and extract value from. Therefore, firms aiming at extracting value from collaborative know-how will also have to adopt those mechanisms avoiding its uncontrolled external diffusion: secrecy measures, contractual agreements, relational mechanisms (Liebeskind, 1996; Rullani, 2004; Castaldi, 2007).

Therefore, basing on Boisot's I-Space framework, we develop hypotheses on the effects on alliance performance of the adoption of mechanisms for the creation of collaborative know-how, on the one hand, and for its protection, on the other hand, to be tested through a quantitative analysis.

Findings - The research fosters a better comprehension of the role of the different mechanisms for the structuring and the protection of alliance management knowledge (and their balance) in improving alliance performance.

Originality/Value - This paper investigates a fundamental knowledge asset, i.e., collaborative know-how, identifying those processes leading to its creation as well as the problems of generated value appropriation.

Keywords: Collaborative know-how, I-Space, Knowledge assets

DO INTENSIVE RELATIONSHIPS WITH BUSINESS PARTNERS HELP TO INTERNATIONALIZE LITHUANIAN TEXTILE AND APPAREL COMPANIES?

Vaiginiene, Erika¹

¹*Vilnius University, Faculty of Economics, Sauletekio ave. 9 - II, room 807, LT-10222 Vilnius, Lithuania*

Purpose - Companies work in an environment, where activities of governments, competitors, customers, suppliers and other stakeholders are unpredictable. Changes in business environment can cause revolutionary changes in the main strategy of company, it can change international expansion decisions of business partners and competitors, which makes a process of company's international expansion chaotic. Thus, nowadays businessman has to care about his business future activities and has to forecast business activities of his business partners as well. Such forecasts are possible only when having close and active relations with business partners which ensure an active interchange of information between all parties.

Investigations show, that relationships with business partners are important for the internationalization of companies in Eastern Europe, and especially in the Post Soviet countries. So the main purpose of the paper is to show how intensity of relationships with business partners effects internationalization of Lithuanian textile and apparel companies.

Design/methodology/approach - Empirical data were collected by performing a questionnaire survey of managers responsible for company's international activities. 119 Lithuanian textile and apparel companies which already carry out international activities were selected for a survey. They were selected from the exporter/importer directory of the Lithuanian Development Agency and from a member list of the Lithuanian Apparel and Textile Association. This target group was chosen assuming, that if a company advertises in mentioned catalogs, it means that it is looking for international expansion opportunities. Questionnaire survey was carried out in July – August of 2007. 38 completed questionnaires were received, thus the response rate was 32%.

Bogardus scale and 6 points Likert scale was used for evaluation of managers attitudes about intensity of relationships with business partners.

The survey data were encoded and entered to SPSS file. After the verification and evaluation of data, factor analysis, Cronbach Alpha coefficient and inter-correlation matrix was used in order to calculate derivative variables. Taking in to account a small sample for further analysis of data I used Spearman Rho correlation coefficient, one-way analysis of variance and regression.

Derivative variables for the evaluation of relationships with business partners and of company's engagement to international activities are used in this paper.

Findings - It was found that Lithuanian textile and apparel companies' managers are very open for relationship and are ready for split of information with business partners. However data do not demonstrate a high involvement to international activities. Regression analysis showed, that even higher intensity with business partners wouldn't effect noticeable changes in the degree of internationalization form which is used by a company.

Research limitations/implications - A small sample and analysis only of one of the business sectors (textile and apparel industry) limits the generalization of results.

Practical implications - A paper demonstrates how intensity of relationships with business partners and level of company internationalization can be measured. It shows that active and open relationships with business partners do not ensure high international involvement.

Originality/value - A paper is valuable to researchers who investigate business partnership and measurements of company internationalization level. Paper findings can be interesting to the managers of textile and apparel companies in Lithuania and other developing countries.

Keywords Company internationalization, relationships with business partners.

Paper type Research paper

NETWORKS FOR LOCAL DEVELOPMENT. PLANNING A LOCAL FESTIVAL (CAL-ITER) FOR THE AVELLINO'S CHEESE INDUSTRY

Vollero, Agostino¹; Palazzo, Maria²; Carmine, Fumai³; Marianna, Iodice⁴; Ilaria,
Pietropaolo⁵; Daniela, Florio⁶

¹Research Fellow in Marketing, University of Salerno (Italy), Department of Communication Science

²PhD candidate in Marketing and Communication, University of Salerno (Italy), Department of Communication Science

³Phd Candidate in Marketing and Communication, University of Salerno, Department of Business Studies

⁴Temporary teaching assistant, University of Salerno

⁵Temporary teaching assistant, University of Salerno

⁶Temporary teaching assistant, University of Salerno

Purpose - This paper proposes a project for local development that adopts a systemic approach (from an economic-political point of view), which goes beyond a traditional place marketing approach. This perspective presents a geographic area as an integrated system of different values and resources. The proposed study refers to the planning of a "wine and food" festival network in the Province of Avellino (milk-cheese industry of Calitri), in which the network configuration is not spontaneous.

Design/Approach/Methodology - The approach followed in this contribution starts from a literature review of two different strands of study (the sociological-anthropological and economic-managerial perspectives) that have offered insights with regard to land management.

The sociological-anthropological approach, in particular the Landscape Architecture (Brinckerhoff Jackson, 1984), while suggesting an integrated human-environment view, doesn't recognize a geographic area as an integrated system as is the case with the Landscape Ecology (Dramstad *et al.*, 1996). In fact, this perspective focuses on a dynamic balance between the internal components which corresponds to a dynamic external balance, and interprets the natural ecosystem as a living system.

From an economic-managerial perspective, a territory is gradually interpreted as an integrated system made up of collaborative components, designed to enhance the local system. In this field of study, the Viable Systems Approach (Golinelli, 2000-2008) regards an area as a complex entity more than as a simple product. Thus, a territory becomes a entity endowed with systemic subjectivity and governance, characterized by collaborative relationships between the components to ensure broad and lasting benefits.

In addition, the identification of resources - more or less explicit - as a basic element of local competitive advantage, is supported by the Resource Based View (e.g. Moingeon *et al.*, 1995; Siano, 2001) which highlights the importance of re-combination and integration of local resources (e.g. cultural heritage), by means of shared beliefs and values between the different actors involved.

Finally, the proposed project of the Cal-Iter festival is developed by means of Network Analysis, which supports the identification, analysis and description of relationships and roles of partners in the network. The capabilities of the network nodes/partners have been detected and linked by a strategic local development framework, for the enhancement of Avellino's area in terms of increasing tourist flows and attracting inward investments.

Findings - The analysis of the *status quo* found that the implementation of integrated projects require local participation of Towns/Cities (Submitting Subjects), Regional and Provincial Authorities (Coordinating Subjects) and the State and the EU (Regulating Subjects) (Golinelli C.M., 2002).

Furthermore, the analysis of existing projects reveals the need to redefine the guidelines of Avellino's local development, by adopting a systemic approach. In particular, the City of Calitri, known for its gastronomic traditions, has promoted communication actions (festivals, trade fairs, etc.) of this kind that were not always consistent with a systemic approach. The main result of the analysis of the various initiatives implemented has been the planning of a festival network (Cal-Iter) for the promotion of the cheese industry, which should be an experience free from the "speculative" marketing approach.

Practical Implications - The proposed project may be an important factor both to support the "food and wine" tourism and to attract investments for the entire province of Avellino. Under the project, the consolidation of the "place identity" is further enhanced through the integration of "place communication", according to a systemic perspective (Siano *et al.*, 2008). This approach allows the festival network of the cheese industry to improve the results of the communication, in terms of place image and place reputation, and to enhance the tourism competitiveness of this location.

Originality/value - The study represents a first step in the planning of local networks for the enhancement of local areas. This has dual value: on the one hand, to stimulate tourism demand and on the other, to attract investments capable of generating, in turn, further demand for goods/services in the area.

Keywords: local development, local system, networks, festivals, "wine and food" tourism.

**CORPORATE GOVERNANCE AND FIRM PERFORMANCE: AN EMPIRICAL ANALYSIS OF
THE RELATIONSHIP BETWEEN PERFORMANCE AND OWNERSHIP CONCENTRATION
IN THE ATHENS STOCK EXCHANGE**

Voulgaris, Fotini¹; Sfakianakis, Nikolaos²

¹Technological Educational Institute of Crete, P.O. Box 128, GR_72100 Agios Nikolaos, Crete, Greece

²MSc, University of Portsmouth Business School, GR-72100 Agios Nikolaos, Crete, Greece

Purpose - Firm value maximization is the target for every firm. According to theory, Corporate Governance is associated with firm performance measured in stock price appreciation, depending on the level of the agency cost problem between managers and stockholders. The higher the diffusion of ownership, the higher is the separation of ownership and control and consequently the higher the agency cost problem.

In this study, we investigate the impact of corporate governance on the performance of Greek publicly-traded large capitalization firms. We approach corporate governance by the degree of concentration of stockholdings, in a firm. The question we try to answer is if dispersion of ownership, size and public shareholding, affect firm performance measured by profitability.

Empirical studies suggest that higher firm profitability is correlated to a concentration in ownership structure (Demsetz and Lehn, 1985, Demsetz and Villalonga, 2001). Our hypothesis testing is that ownership diffusion is negatively correlated to stock value.

In Greece, there is limited research on this area (Kapopoulos and Lazaretou, 2006), with a limited number of studies focusing on the effect of insider ownership on firm performance (Karathanassis and Drakos, 2004).

Design and Methodology - The study uses OLS models on cross sectional data, on a sample of 81 publicly traded firms of the large capitalization category of the Athens Stock Exchange (ASE). The dependent variable is profitability, measured with the Tobin's Q ratio, with explanatory variables Majority Holders (i.e. % of stocks of largest stockholders) and Block Holders (i.e. % of stocks of stockholders with >5% of shares), used to measure the dispersion of ownership. The models are controlled for size of firms. Datastream database is used for the market related variables and Bloomberg for financial statement data. Descriptive statistics are also given on the ownership structure and profitability profile of the sample population.

The period covered is limited to years 2006 and 2007, because of the new regulations imposed in 2006 on trading stocks in the large capitalization category of ASE.

Findings - Descriptive statistics show that the Greek Stock market presents phenomena of extreme ownership concentration, even among the largest listed companies. Tobin's Q ratio presents an average of 1,95 showing that the market values the majority of stocks with a premium in their equity value. The regression results show that both ownership diffusion variables and size, are negatively and significantly correlated with the dependent variable, indicating that, in the large capitalization category of the ASE, given the size of the firms, the lower the dispersion, the better the performance.

Practical Implications - Greek firms should practice good governance as it is of value to shareholder and investors. Prospective investors should prefer smaller firms with low ownership dispersion in the ASE.

Originality/Value - The study covers the large capitalization sector of the ASE, for the period after the enactment of the new law on corporate governance. The methodology, variables and sample used

are different from the ones used in other studies on Greek publicly traded firms. The findings verify that low ownership dispersion contributes to higher firm value, thus helping to solve the ambiguity on this matter, for Greek firms.

Further research - Given constraints on data availability, further research should take also into account the fraction of shares owned by shareholders with at least 1% of shares and a panel data analysis for a more extended time period after 2006, to avoid the impact of business cycle.

EXPORT CHOICES AND MANAGEMENT OF COMMERCIAL RISKS IN TUNISIA

Wilhelm, Sabine¹

¹CEREFIGE, Nancy Université, France

This paper deals with the links between trade, liberalization and GDP growth in Tunisia. In this country, exports, as well as imports represent 50 % of the GDP. Tunisia is also strongly encouraged to liberalize its trade, which may not be compatible with its intention to intensify growth. Besides, with the negotiations on the Union for Mediterranean Sea, the consequences of trade liberalization are regarded as current matters once again.

The issue of the impact of trade liberalization on Tunisian growth also led to question the nature of what products are likely to promote GDP growth. We debate therefore whether the development scheme introduced by PALMA (2006), resting on exports of manufactured products that are in high demand in OECD countries, works for Tunisia, especially in times of liberalization set by treaties.

Our research has therefore two objects : the first is to analyse if agreements on commercial liberalization have had an impact on Tunisian trade and GDP growth. The second is to verify whether the scheme of development and economic growth based on the industrial sector can work for Tunisia.

Nevertheless, the bulk of the analysis remains dedicated to the case of the exports of goods towards the European Union (EU).

We use an approach which has the originality to take into account all the trade restrictions affecting Tunisian exports. The liberalization of trade does not exclusively encompass the elimination of tariff or quantitative barriers regulated by the International Agreements. The multitude of trade barriers makes it difficult to aggregate and tally them up. For the purposes of this paper, we have used year 1995 as the temporal benchmark to compare Tunisian trade before and after the signing of the Euro-Tunisian Agreement.

Moreover, other analyses dedicated to Tunisia (HOEKMAN et al., 2002 ; LORCA et VICENS, 2004 ; BACHTA et BEN MIMOUN, 2003 ; CHEIKZAOUALI, 2002) are essentially based on the transversal or punctual aspects of trade liberalization, and neglect the longitudinal dimension²⁹². The latter is based on how the country evolved and allows to take into account numerous events that have affected the country. To obtain equations in spite of these various events means that there is a strong interaction between some variables.

To obtain these equations, we use an econometric approach²⁹³, based on NEAR VAR models. These models are dynamic, because explicative variables have a lag. According to KRUEGER (1997), this approach is the best in order to test the impacts of trade liberalization.

Our results show that the scheme of economic development introduced by PALMA, which is an essential factor of growth noticed in East-Asian countries, is only partly proved in Tunisia. In this country, the uncertainty affecting exports towards the EU²⁹⁴ gives little room to argue that the demand coming from the OECD countries justifies the industrialisation of product exports. This uncertainty has another consequence : if Tunisia decides to renegotiate its trade conditions with the

292 « Longitudinal » applies to the study of a phenomenon in a country over a long period. Transversal approaches consider several countries but in a shorter perspective.

293 The method to carry out a totally longitudinal analysis and to use a temporal benchmark was not, in our opinion, previously used when dealing with liberalization in Tunisia.

294 The obtained \bar{R}^2 show that trade uncertainty is strong.

European Union, and chooses to increase its exports towards the European Union, it runs the risk of significant fluctuations of the GDP.

To intensify liberalization between Tunisia and the European Union is therefore a risky strategy for Tunisia because a significant part of growth would rest on extremely unforeseeable exports. Moreover, exports' fluctuations, either in increase or in decrease, are more accentuated following the Euro-Tunisian Agreement (1995). Nevertheless, this high risk strategy proved to be favourable to Tunisian growth, having considered the period of 1995-2007 globally²⁹⁵.

The strategy of intensifying exports towards the UE can therefore be adopted by Tunisia, provided that two conditions are fulfilled. According to our results, it is necessary that Tunisian industrial exports increase more than agricultural exports. The relative indicator of agricultural opening equaling the share of agricultural exports in the exports of goods, explains growth negatively. As a consequence, the fall of relative agricultural opening can benefit GDP growth. So, when agricultural exports increase, their increase must be smaller than that of other goods, in order to favour growth in Tunisia.

The second condition that must be met in order to annihilate possible risks linked to an intensification of liberalization is more of a political nature. We showed that the intent to intensify liberalization resulted in bigger fluctuations of exports towards the EU. These fluctuations turned out to be favourable to Tunisian growth. Nevertheless, it remains possible that such fluctuations hinder growth, for instance if production that is intended to the Tunisian market went towards the exports markets. To diminish this risk, Tunisia can request during the negotiations on the Union for Mediterranean Sea the introduction of a social clause, inspired for instance by article 14 of the Euro-Tunisian Agreement (1995)²⁹⁶.

296 This article envisages that measures of limited periods of time can apply to sectors confronted to serious difficulties when these difficulties cause serious social consequences.

INTERNATIONAL TRADE: GOVERNANCE NOT REGULATION THROUGH A META-MODEL :HINTS FOR AN EUROMEDITERRANEAN AREA

Zoccoli, Paola¹

¹Phd, Dipartimento di Studi e Ricerche Aziendali – Facoltà di Economia – Università degli Studi di Salerno

Definition and purposes - The international trade is constituted by a set of shared and steady activities stabled by practice and customs with widespread among dealers. In this wise, this process institutionalize the correspondent phenomenology. The reality so bounded is the source for behavioural rules that are described in the market laws, but is also in rules of a multilateral agreement system. The knowledge of the process that carried to international agreements and to the international system is possible only by a systemic approach that allows to know the parts of the system and their teleological links.

In this way we will be able to point out the physiognomy of a structure that is characterized by social, political and economical processes that have the capacity to shape and continue the international trade. This approach is able also to highlight as rules are not able ever to maintain the system, it needs a governance.

The paper has the aim to highlight the nature of ultra-complex system of international trade system and that it needs a governance. In a deeper manner, our hypothesis is that in the analysis of the viable system, as the international trade is, that pointing out the analysis of need to relate and dialoguing among entities that are part of the system is necessary to define the “consonance level” and relevance of each entity for another. Then we maintain the hypothesis that by this analysis we can draw out a modelling for governance as a meta modelling that has the ability to have a tool for governability of the international or regional trade.

Approach and Methodology - Developing a conceptual work we think to join the static view of structuralism and the dynamic view; the latter is to recover the knowledge of the development and the influence/impact of dynamics and details of the phenomenology of the process.

The International trade flows point out that it is a web of relations and interactions that is an ordering interactive force and that has a need of steering and rules. The latter ones are in other words “the whole of actions that wish to determine the behaviour of the system” (Saraceno, 1972).

In the ultra complex systems is not a sufficient way to define positions and their relations, but is has main importance to settle the way and the intensity what in the viable systems approach is named “relevance”.

The Viable Systems Approach applied to International trade explains its productivity bounding main characteristics of the considered system and having hints to define steering and action schemes, anyway for governance.

Findings and practical implications - When the DG of WTO says that the international trade system has to be and maintain multilateral and open and when he says that it needs steering, control and cohesion among relevant parts of the system this is a pinpoint to affirm our first finding: the analysis of relations, their impacts (influences) is a main step to find qualitative factors (and information) to set steer and manage the system. Adopting this view international agreement or regional trade areas (RTAs) are tools to operate in this setting; they get possible the government.

By a meta model we have the base for a system of adaptive or proactive governance (flexible as the chance to choice and change set and tools). A meta model allows to give governance setting in coherence with objectives and ways of development.

Practical implications - Giving a model setting of governance recognizing a governance is representative of a viable system accomplished or quasi-accomplished. Having a government body expressing this set and coordinating and steering sub system of open trade flows in RTAs or free trade areas make the accomplishment and unitarity of the system real. It would be a great support to the harmonization of the international economic order.

Originality and value - The viable system approach gives the hints to catch the dynamism that underline and characterizes the evolving of every process of creation. The application of the approach furnish the way to formalize a flexible scheme to figure governance and governability of the system we investigate: the international trade.

The value is in designing not only rules (they will be the result) but shaping a non static scheme, but dynamic that will be able to give response (reaction, adaptation and evolution) to evolutionary system to give it the way to develop and mantain its existence.
