In order to complete the diversification analysis in the Italian hotel sector, next developments on research could take into account, as already carried out for properties in general (Cacciamani, 2003; Giannotti and Mattarocci, 2008), the possibility to itemize the criteria for the classification of the investments. The chance to realize such approach presumes the availability of a wider database in terms of registered information and noticed hotels.

COMMERCIAL VALUE CREATION FOR SERVICE COMPANIES IN FACEBOOK (AND THE OTHER ONLINE SOCIAL NETWORKS)

Gil-Or, Oren¹

¹*University of Pécs, The Faculty of Business and Economics, International Ph.D. Program in Business Administration*

This paper is describing an ongoing research that intends to analyze the best routes that companies should take in order to get into consumers' conversations within Facebook (and the other social networks) in a way that will benefit both sides. Encouraging and influencing this electronic World of Mouth can generate substantial commercial value.

The commonly-used "push" approaches that are currently used by most of the vendors in the online social networks are creating negative responses and this research is looking for the expeditors that will make the social networkers willing to participate in a commercial electronic Word of Mouth. This research is focused around service companies, since eWOM is much more critical for these companies.

Keywords - Social networks, Facebook, eWOM, Services companies

INTRODUCTION

Online Social Networks have become the most popular online destinations in recent years. Facebook, as the largest social networking site in the world, is the 10th most popular website in the US (ComScore, 2009). It has 250 million active users (users who were active within the last month) with 70% growth in the last year and more than 100 million out of them that are accessing it at least once a day (Facebook statistics, 2009). If it was a country, it would be the 4th largest in the world (Based on the number of inhabitants). The majority of the consumers' community, for most companies, is now accessible in Facebook.

With the latest technological developments, Facebook is now accessible via smart-phones, has open interface to other sites and applications (Facebook-Connect) and is supported by monetary applications (Facebook Payments and others).

The popularity of Facebook and its recent enhancements have created a very attractive commercial infrastructure. In a recent survey (Stelzner, 2009), an overwhelming majority (88%) of marketers said that they are now using some form of social media to market their business (72% of those have just started to do it in the last few months). Still, the majority of these companies are using traditional mass-market push strategies for advertising and selling their goods and services (using the Facebook Advertisement mechanism and opening a "Group" for the company) while others are trying more advanced approaches, such as viral spread of their brand awareness, guerrilla marketing and others. All these approaches have not yet yielded the desired ROI for the majority of the companies.

From the users' perspective, this "push" approach creates a negative attitude towards the social network, and users that perceive the social network to become "vendor polluted", leave or switch to another network.

Marketing within a social network should be very different than traditional approaches and should become much more conversational, bi-directional or even multidirectional. It should be based on building relationships, rapport and trust between the company and the consumers and as a result much more transparent (from the company perspective). The reason traditional

marketing and advertisement approaches are becoming less and less effective is exactly because consumers lost their trust in what companies are telling them.

In order to develop a better approach for both companies and the Facebook users, this research is going to analyze the routes of getting into consumers' conversations in a way that will benefit both sides. Getting into these conversations is very important today in order to get into the consumers' consideration set, because of the shrinking effect of traditional advertisement.

Looking at it from a different perspective, most of the Facebook users (and the other social networks) are connecting to each other in order to share ideas, thoughts and content (mainly photos and music). Making this sharing process, the Electronic Word-of-mouth (e-WOM), valuable for commercial use, is the heart of this research.

Word of Mouth (both traditional and electronic) is very critical in the decision making of consumers. According to Nielsen (2007), "consumer recommendations are the most credible form of advertising among 78% of the study's respondents". In another survey that was done by the Kelsey Group (comScore /The Kelsey Group, October 2007) "review users noted that reviews generated by fellow consumers had a greater influence than those generated by professionals". To add to that, the concept of influencers is becoming much wider in the online social network. It's no longer just the "expert" that is influencing but it's also other influencers such as the best networker (with a large social network), the most attractive blogger and others.

This research is analyzing the main factors that expedite commercial e-WOM in Facebook and figure out the real possible commercial value for companies. The research focuses on service companies, since WOM is more critical for these companies, compared with product companies (Friedman, Margaret, Smith, 1993). The research intends to find out what the online networkers' desires and needs are (in a segmented way) in order to realize what it is that they want in return for sharing commercial information with their peers.

LITERATURE REVIEW

The description and history of Facebook and the competitors

Facebook was founded in February 2004 as a social network for Harvard students, opened to the public in 2006 and is today the biggest online social network in the world. One of Facebook's main differentiators are the 52,000 applications currently available that are developed by a community of more than 660,000 developers and entrepreneurs from more than 180 countries (Facebook Statistics, 2009). Facebook's biggest competitor, MySpace, was founded in 2003 and launched in January 2004.

In addition to the biggest networks, there are hundreds of other networks, some of them are targeting specific segments, such as LinkedIn that is a professional network, and others. In addition to those, there are new social network applications that are becoming trendy, the latest is Twitter, a micro blog application that enables users to send and read other users' updates (Wikipedia Twitter, 2009).

The business model of all social networks today is based on revenues generated by advertising, beside Facebook that launched Facebook Gifts, which enables networker to exchange virtual gifts they're buying. Facebook is making around 30M\$-40M\$ a year from selling these gifts (InsideFacebook, 2008).

There is not much academic research that has been done on the marketing and business aspects of the online social networks. Facebook and the other social networks became very popular only in the last couple of years, and the interest around them grew hand in hand with their popularity. The majority of the research that took place on Facebook (or the other online networks) was focused on the social aspects of this new and unique phenomenon.

Also, with the rapid development of the electronic social networks in the past few years, some of the research that exists, was done on “networks” that are different than Facebook (such as: company forums, blogs and messaging platforms) which makes the direct concluding into the Facebook world questionable.

Participants: individuals and companies

In order to look into possible segmentation of social networkers, one needs to analyze the Social network users' characteristics and their participation habits within the online conversation. Although Facebook is a global tool and as a result represents a global social network, there are differences in usage between experienced-advanced networkers, usually from developed countries/areas, and beginners-basic networkers, usually from developing countries/areas (Majharul Talukder & Paul H P Yeow, 2007). There are other demographic parameters (such as gender, race, ethnicity and parental educational background) that are correlated with the level of participation in social networks (Hargittai, 2008) and as a result might influence the “needs” that each of these segments is trying to fill.

Although Facebook is considered to be a tool for young people, more than two-thirds (and growing) of its users are outside of college and the fastest growing demographic among its users is those 35 years old and older. The average user has 120 friends and spends 35 minutes a day on Facebook. More than 20 million users update their statuses at least once each day and more than 850 million photos and 8 million videos are uploaded to the site each month (Facebook Statistics, 2009).

Analysis of the participants' motivation

The reasons that drove hundreds of millions of people to register to the social networks and are still driving the majority of them to access and interact with others on a daily basis is an important building block in understanding the social network consumer behavior.

Recent research shows that using the internet for social purposes (such as the online social networks) reduces people's feeling of loneliness and depression, feeling that the modern world and specifically non-social internet usage amplifies (Kraut, R., Patterson, M., Lundmark, V., Kiesler, S., Mukopadhyay, T., & Scherlis, W., 1998), as well as helping people's self-esteem and their perceived social support (Bessière, K., Kiesler, S., Kraut, R., & Boneva, B.S., 2008; Lindsay H. Shaw, Larry M. Gant, 2002).

Facebook specifically was found to benefit people with low self-esteem and low life satisfaction, but moreover is creating and maintaining social capital for the larger population (Nicole B. Ellison, Charles Steinfield. Cliff Lampe, 2007). This sociologic phenomenon can be partly explained by the fact that many traditional social networks disappeared over the last few decades as a result of the existence of the internet since people prefers to spend time online instead of interacting with their families and friends (Kraut, R., Patterson, M., Lundmark, V., Kiesler, S., Mukopadhyay, T., & Scherlis, W., 1998). According to Nick Couldry and James Curran's findings (2003, p.279) some of the traditional physical social networks (such as

meeting with friends in the food market) got “replaced” by online appearances of these networks.

Despite the fact that we might look at different sets of needs within the social networks, there seem to be one main desire and this is that people would like to feel a part of a group and have social interactions with individuals within the group. These interactions are huge in volume. There are more than 1 billion pieces of content (mainly web links, news stories, blog posts, notes and photos) that are shared each week in Facebook (Facebook statistics, 2009).

The parts of the conversation that has commercial implications are:

- The “conversation” between consumers and companies/brands
- The “conversation” between consumers about companies/brands

Despite what one can think, there seem to be a mutual interest in having conversations between the companies and the consumers. This interest is as a way of transferring information and reducing the risk/cost of future business transactions. Brand-related information can also be entertaining.

Electronic Word of Mouth

World of mouth was always a critical factor in success of products, specifically in the diffusion stage of new products (Czepiel, 1974) and it's been discovered that the participation and drivers of the traditional WOM (in pre-internet world) were replicated into the electronic WOM (Hennig-Thurau, Gwinner, Walsh & Dwayne, 2004). The WOM is even much more critical for services companies, compared to Product companies (Friedman, Margaret and Smith, 1993) which might be a result of the non-tangibility of services that is making the experience reporting very important.

Facebook as a social network is relatively a weak and static network. The relationships between the “friends” are not very strong (in terms of the amount of information that they exchange or other “relationship strength” characteristics) in average and the network of a specific member is not changing much. In addition to that, Facebook is a “public” network, where information that can be treated as private is published around the network (Skinstad, 2008). The publicity as well as the weakness of Facebook as a network have probably an effect on the level and depth of the WOM that is happening there.

In general, social networkers have different eWOM habits and behavior as a result of their social network structure (can be classified by how strong their ties are, what their position in the network is or other classification). For instance, eWOM participants will be more willing to share information in a dense network, compared to a sparse network (Dongyoung Sohn, 2009).

The importance of e-WOM, as a replication of the traditional WOM, is something that was researched in the last years, and was proven to be significantly positive related to consumers' attitude, trustworthiness and loyalty towards a firm, a brand and/or a product (Gruen, Osmonbekov & Czaplewski, 2006; Mathwick, 2006). From the other side, although online communities are an important part of eMarketing for companies (Armstrong and Hagel 1996; Young and Levine 2000), companies have almost no control over the conversation. The conversation can involve any part of the marketing functions (e.g. product or price), and as a result it is more of a situational function rather than a basic one (Kalyanam & McIntyre, 2002; David Godes & Dina Mayzlin, 2004).

Despite its complexities, companies are interested in participating in the eWOM conversation in order to be aware of the conversation topics, influence this conversation, provide information

and knowledge to this conversation and also address negative eWOM that might hurt the company. eWOM is a self-feeding process where positive experience in “talking” with a company will increase the trust and loyalty of the participants, which will result in a higher willingness to “talk” with and about the company (Mathwick, 2006). Although trust is a key issue in social networks, it’s not as important in building new relationships in the online networks as it is in face to face relationships (Dwyer, Hiltz & Passerini, 2007).

In addition to that, there are other factors that assist in creating more interactive conversation and as a result better commercial interactions between companies and consumers, such as the personalization of the messages, its relevancy to the consumer and the company’s response time to consumers’ requests (Ji Hee Song & George M. Zinkhan, 2008). Other research indicated that consumers would like to be entertained and feel confident in the online commercial environment in order to be more active (Goldsmith, Bridges & Freiden, 2001). It’s reasonable to assume that these factors will also have an influence on the willingness to share commercial information.

Marketing tools used in social network

The majority of the “marketing” within the social networks today is invested in advertisement. Still, there are other ways that are currently used in order to get better results.

One of the things that have started to be researched is the efficiency of monetary encouragement on commercial conversations (and specifically on references by people that used a product/service). The monetary benefits can be provided to either the recommender, the receiver of the recommendation or both, and it looks like the strength of the existing brand is influencing the most efficient compensation mix (Gangseog Ryu & Lawrence Feick, 2007). The addition of financial benefits (and benefits in general) into the social network conversation is tricky since it can make the whole conversation be less genuine (at least by perception). Providing too many incentives for encouraging product recommendations can weaken the credibility of the information sources (Leskovec J., Adamic L. A., Huberman, B. A., 2007).

Despite this possible backfire effect, some companies (Facebook Chase, 2009) already started to provide credit points that can be redeemed for presents. Facebook-Gifts is also a mechanism that has started to be used for providing “tokens of appreciation” between networkers or between companies and consumers.

There are other creative ideas for increasing online consumers’ confidence, ideas that have been used and researched in the last few years. One of these is the use of Avatars (graphical representation of the company’s representative) for influencing the online surfers’ behavior. Since a company is an entity that is difficult to “feel” or create relationships with, the use of a human-representation of the company has proven to increase the satisfaction, positive attitude and purchase intention of the online shoppers.

The type of avatar that made the most influence (attractive or expert) was found to be correlated with the consumer involvement level with the specific product (Holzwarth, Janiszewski, & Neumann, 2006). These findings are reasonable and are similar to traditional advertisement source decisions. The consumer involvement level is a factor that is probably influencing the amount and type of information that networkers will be willing to share or receive in the commercial eWOM.

Commercial participation in social network conversation also brings to the front the area of Relationship Marketing, a long-term well-maintained relationships between a company and its customers.

In order to build the level of trust and transparency that is needed for the consumers to feel comfortable with companies participating in what is considered a not commercial environment (such as Facebook), companies should invest in doing Relationship marketing right. Relationship marketing is an area that was discussed a lot but is not always implemented in a way that benefits both sides. In recent research it was confirmed that the quality and strength of the relationships were the most influencing factors on the commercial results from this customer. This research also found that Relationship Marketing's effectiveness also increases when the relationships are critical to the customer (in service offerings and business markets, for instance) and when there is an individual (from the company side) that is managing the relationships, rather than "a company" (Palmatier, Dant, Grewal & Evans, 2006). This can also be related with the efficiency of Avatars that I've discussed before.

Another method that is relevant for transferring commercial information in social networks is Viral marketing. In Viral marketing, the company is creating an attractive content that is being published within the network from one member to another (like a virus). The positive effect of Viral marketing in social networks on the adoption of products (mainly new products) was proven in research that was done last decade (Rogers, 1995; Strang & Soule, 1998) but the exact "formula" of what kind of message should be transferred to which "entry point" within the network was still not found.

One of the aspects of Viral marketing that was researched was a result of the fact that not all the members of the network have the same "value" for a company. Companies should analyze the optimal amount of marketing that should be invested in each of the members (Richardson & Domingos, 2002), since marketing has a cost and there is also a negative effect to transfer "too-much" of viral marketing through the network. Viral marketing was a big hope for companies that believed that it can be used in order to "manipulate" the consumers' market, but recently research shows that it's not that epidemic and that efficient as was previously presented, especially in promoting product sales (Leskovec J., Adamic L. A., Huberman, B. A., 2007). As a result, learning the real "needs" of the social networkers and provide more transparent and honest "conversations" is the best way.

Additional traditional approach that is being used in the social networks is Guerilla marketing, a concept that involves creative and not predictable sets of marketing activities. This "tool" can generate an interest for smaller companies with low marketing budgets since it's usually pretty cheap (Dalgic & Leeuw, 1994). Using Guerilla marketing in social networks can generate one-time success but is against the fundamentals I've discussed before that involves persistent, honest and transparent approach of both the social networkers and the companies.

Key success factors influencing the effectiveness of used marketing tools

Although Social marketing can be very beneficial, effective online marketing campaign should be a coordinated effort of different "marketing tools" (one of them would be social marketing), both online and traditional (physical advertisement, for instance). Innovation and support from the company's management are both affecting the ability of companies to create an appealing online campaign (Youcheng Wang Daniel R. Fesenmaier, 2006). Still, the marketing activities in the Internet world have to be different than the traditional sales and marketing approaches in order to create an appealing offer for the customers (Schubert P., Selz, D., 1999). Since the internet is such a virtual and non-personal medium, almost all the research is indicating the importance of trust as a main success factor to participation of people in the internet world (mainly for socializing or participating in commercial activities).

Measurement of online marketing activities in social network WOM

Doing marketing in Facebook (and in the other social networks) is a very trendy thing, but companies have to make sure that they can measure the effectiveness of the marketing investment they're doing in this "media". The marketing effectiveness should be measured against the goals of the marketing campaign/program, since these marketing efforts should, in the end of the day, generate better financial results for the company (Doyle, 2000). Defining the goals in campaigns like that, especially talking about long-term relationships-building is something that its marketing effectiveness measurement can be challenging (Gordon, McKeage & Fox, 1998).

DESCRIPTION OF THE METHODOLOGY

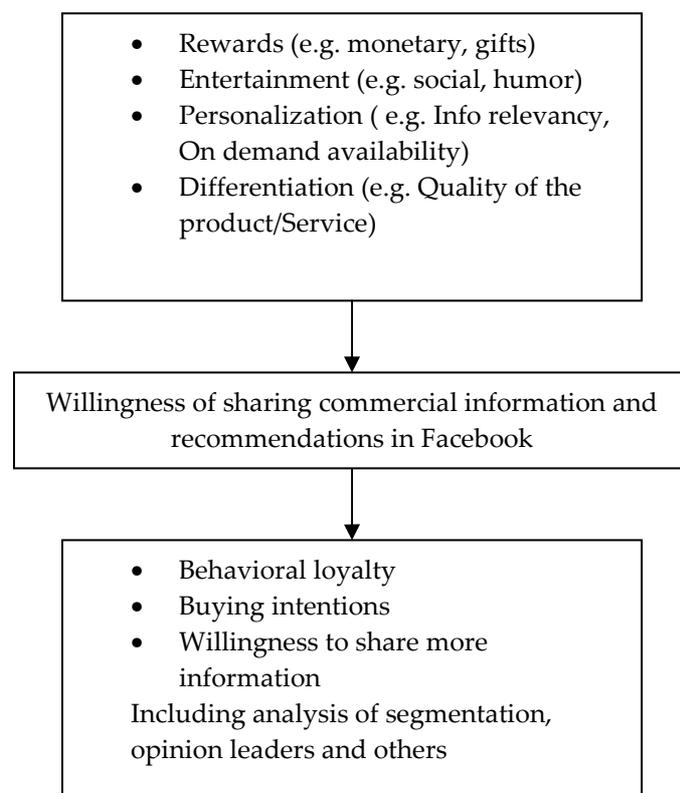

This ongoing research is divided into three main stages:

1) Depth interviews and focus groups with marketing executives from the social network vendors, executives from companies that are doing marketing in Facebook (both successfully and unsuccessfully) and heavy users of Facebook.

The input of these interviews is used in order to figure out the main goals of companies when marketing to the social networks and the methods that were used already, both successfully and not successfully. In addition in the first phase provides first understanding of possible factors that influence networkers when participating in WOM.

The rationale behind the first stage is figuring out things that we don't even know that we don't know, mainly since this area of research is so new. For instance, visual representation of the company "icon" in Facebook might be found as influencing the trust of the company (something that was hard to predict in the pre-Facebook era).

2) Quantitative research that is conducted by submitting online questionnaires within Facebook. The Facebook users' are asked about their usage habits of Facebook, eWOM habits, level of interest in relationships with the vendors within Facebook, the benefits that they want to get in order to share their "buying" recommendations/experience, eWOM recommendations/references as a driver in their buying decisions and the effectiveness of eWOM with services companies

The conceptual model of this research is:

In order to normalize the answers of the responders from different countries and cultures, the Anchoring Vignettes technique (King, Murray, Salomon & Tandon, 2003) is used in this research. For instance, measuring Loyalty to a company might result in different scales by people from a "long-term oriented" Confucian dynamism culture (Geert Hofstede, 2001), such as Japan that will be much more trustworthy compared to people from a "short-term oriented" culture, such as the USA.

3) A post-questionnaire Focus group is going to be conducted in order to verify the results of the research (Powe, Garrod & McMahon, 2005).

FINDINGS OF THE RESEARCH

The research is still ongoing and based on the initial feedback from the first phase of the research it's clear that Facebook users are still very negative with regards to "push" commercial use of the social network. They use Facebook much more than any other social network and use it mainly for social use. A phenomenon that seems to be interesting for further research is the fact that many users are claiming that Facebook is wasting their time and has no value, but still use it on a weekly basis.

Facebook users are exposed to advertisement but are ignoring its content. From the other end, users see value in recommendations from their peers (mainly their close "friends" within the network) and also from connection with the vendors. Still, users are not willing to share information unless they get something in return. Monetary rewards or gifts have been identified as possible rewards side by side with other less-monetary rewards, such as: information and content.

The same phenomenon that I mentioned above seem to exist also when asked about information sharing and its value. When asked in general about the concept, users are relatively negative, but when asked specifically about possible benefits and awards, users seem to see the value and are willing to share information in return to various awards (not necessarily monetary).

The quality of the actual service/product seem to also influence the willingness of the Facebook users to share information, as well as the attractiveness of the commercial information that is being published to them. This indication shows the connection of the social media to the marketing mix and also suggesting that activities in the social network can't be disconnected from activities done in other types of media.

First indications of the research seem to show the willingness to share information with both services and products. The effectiveness of this information in both areas has not yet been analyzed.

SUMMARY

Facebook and the other social networks are representing an incredible potential for companies. These would like to encourage electronic word of mouth between users and also conversations between the users and the companies.

The users of the social networks are very sensitive to any commercial intervention but from the other end can see the value in information sharing between users and companies and among users.

This research is looking for the expeditors that can make the commercial communication valuable for both companies and users for long term by researching the users and trying to understand their underline needs and desires.

From the initial stages of the research it seems that real value creation and minimal or no “pushiness” from the vendors’ perspective can make a difference. In addition, long-term view and honesty in addition to consistency in the various marketing mix components increases the attractiveness of the social media information to its users.

EXAMINING UNIVERSITY EFFICIENCY: THE CASE OF GREEK ENGINEERING DEPARTMENTS

Goletsis, Yorgos¹; Brahou, Vassiliki²

¹*Department of Economics, University of Ioannina, GR 45110, Ioannina, Greece*

²*Department of Economics, University of Ioannina, GR 45110, Ioannina, Greece*

Purpose - A long discussion exists on the measurement of university efficiency. As universities are non-profit organisations the usual purely financial measures of efficiency are not applicable nor a typical production function is available. A non-parametric method that combines multiple inputs with multiple outputs seems to be fitting the problem. Data Envelopment Analysis (DEA) is such a linear programming technique that can be used for the calculation of relative efficiencies and best practice cases.

Design/Methodology/approach- The study is based on the analysis of 30 Engineering Departments in Greece. DEA is used to calculate efficiency scores for each department and to identify the best performing cases. For each non efficient department the method indicates improvements that could be set (targets) based on the similar efficient departments (reference set).

Findings - Results indicate high technical efficiency for many departments. Some departments seem to be continuously on the efficient frontier, i.e. 100% efficient. Scale effect does not seem to be present. Average efficiency seems to be falling in 2004 and rising in 2005. Specific improvements are proposed for the non efficient departments.

Practical Implications - The approach followed allows for the identification of the less efficient departments and the elaboration of an improvement plan for each of them. It can therefore contribute to the overall efficiency increase of the higher education.

Keywords: efficiency, data envelopment analysis, university performance

INTRODUCTION

A long discussion exists on the measurement of university efficiency. Universities are complex institutions aiming at producing both, knowledge and research and are mostly public financed. Due to the impact of the operation of universities to the economy and society of a country and the need of the universities for public funds, there is a public and governmental pressure for efficiency evaluation, improvement and efficient use of public funds.

As universities are non-profit organisations the usual purely financial measures of efficiency are not applicable nor a typical production function is available (Abbot and Doucouliagos, 2003). Several index or ratio based approaches exist but in general it is not easy to determine the overall efficiency since it is not possible to combine the entire set of ratios into a single numeric judgment. Moreover, although several indexing approaches exist, there is not a widely acceptable composite index approach (Arcelus and Coleman, 1997). On the other hand, the simultaneous analysis of such ratios may give ambiguous results and such ambiguity makes ratio analysis ineffective in efficiency evaluations (Sexton, 1986). Additionally, these approaches can hardly be used as a means for the identification of improvement potential for each specific university, as they can not distinguish inefficiency from environmental factors.

Statistical approaches, such as regression analysis, although applied in literature (e.g. Lovell, 1993, Førsund et al., 1980, see also Brinkman and Leslie, 1986) impose the knowledge of the function and are beset of possible misspecification (Johnes, 2006). Additionally, they can hardly be applied in the case of multiple outputs, as in higher education. Finally, regression analysis

based estimation provides estimates according to the “central tendency” behaviors of the observations and not according to the best performance (Cooper et al., 2007).

As a consequence, a non-parametric method that combines multiple inputs with multiple outputs seems to be fitting the problem. Data Envelopment Analysis (DEA) (Charnes et al., 1978) is such a linear programming technique that can be used for the calculation of relative efficiencies and best practice cases. DEA does not make any assumptions regarding the distributions of efficiencies or the functional form of the production function.

Data envelopment analysis is an estimation method, which since its appearance in 1978, has been widely applied due to the satisfactory measurement of efficiency that provides and the advantages that has vis-u-vis the other estimation techniques. Since then, many organizations (both non-profit and profit making) have used DEA to measure their efficiency since this method can indicate solutions to improve efficiency. The literature review shows that DEA has been applied for efficiency measurement of banks (Halkos & Salamouris, 2004), academic libraries (Reichmann, 2004), insurance companies (Tantan et al., 2000) and health sector (Hofmarcher et al., 2002) (see Cook and Seiford (2009) for a comprehensive review of applications).

In the domain of higher education DEA has been applied mainly in two directions (a) efficiency estimation at university level (Agasisti & Dal Bianco, 2006; Taylor & Harris, 2004; Sinuary-Stern et al., 1994) and (b) efficiency estimation at department level (either departments of the same universities or similar departments of different universities) (Kao & Hung, 2008; Martin, 2006; Beasley, 1990). As it shown in Table 1, different inputs and outputs have been applied per case aiming at capturing the multiple input / multiple output characteristics of the higher education.

This study applies Data Envelopment Analysis to the Greek universities over a three year period (2003-2005). Literature review reveals limited application of DEA to Greek education cases with only two studies dealing with secondary education. Maragos and Despotis (2004) used DEA to measure the efficiency of 60 public high schools out of 219 operating in the Greater Athens Area. Smirlis et al. (2006) introduced an approach based on interval DEA, developed for the case of missing values of inputs and outputs. They applied this methodology to 29 public secondary schools of Athens. According to our knowledge there exists no similar evaluation of Greek higher education institutions.

The following part of this paper is structured as follows: In Section 2 the DEA framework is shortly presented and the application to the Greek university departments is analysed. The data set and the research design are described and model building issues are dealt with. The results of the application are given in Section 3. Some discussion on the application of DEA for efficiency follows in Section 4.

<i>Author(s)</i>	<i>Sample</i>	<i>Input measures</i>	<i>Output measures</i>
<i>Beasley (1990)</i>	<i>Chemistry and physics departments, United Kingdom</i>	<i>General expenditure, equipment expenditure and research income.</i>	<i>Undergraduate and postgraduate students and research ratings.</i>

<i>Köksal. & Nalçacı (2006)</i>	14 departments of a Turkish engineering college.	Academic staff salaries, potential of the department, entering students.	Research and education activities and quality, other activities, graduates.
<i>Kao & Hung (2008)</i>	41 academic departments at National Cheng University, Taiwan.	Personnel, expenses and floor area.	Teaching loads, publications and external grants.

Table 1. DEA applications in higher education

METHOD AND DATA

Efficiency measurement through Data Envelopment Analysis

Charnes and Cooper (1985) gave the following definition of efficiency: "100% efficiency is attained for a unit only when: a) none of its outputs can be increased without either increasing one or more of its inputs, or decreasing some of its other outputs, b) none of its inputs can be decreased without either decreasing some of its outputs, or increasing some of its other inputs." Farrell (1957), who is considered to be a pioneer at the measurement of productive efficiency, defines technical efficiency as the success of a firm in producing maximum output from a given set of inputs or alternatively, producing a given output with minimum quantities of inputs. Allocative efficiency measures the ability of a firm to use the best combination of inputs which minimizes cost given input prices. The combination of technical and allocative efficiency provides economic or "overall" efficiency.

Initially, efficiency was studied only through conceptual approaches without giving any attention at the identification of inefficiency. DEA originated from Farrell's work (1957), in which he introduced an alternative approach and showed how efficiency could be measured using empirical data and without making any assumptions about the functional form of the technology. Charnes et al. (1978) extended Farrell's work and succeeded in using multiple inputs and outputs and providing a single measure of efficiency.

Data Envelopment Analysis is a linear programming technique used in measuring the relative efficiency of similar units when multiple inputs and outputs are present. Since it is a non-parametric technique, it is not necessary to specify the production functional form in advance. DEA is applied to a set of homogenous Decision Making Units (DMUs) which aim at producing the maximum quantity of outputs for any given quantity of inputs or alternatively, producing a given quantity of output given a minimum quantity of inputs. For each of the examined DMUs is calculated the following equation:

$$\text{efficiency} = \frac{\text{weighted sum of outputs}}{\text{weighted sum of inputs}} \quad (1).$$

The efficiency score is on a scale of zero to one, meaning that the higher the score, the more efficiently the unit operates. The units with an efficiency score equal to one are considered to be the "best practices" and form the efficient frontier which 'envelops' the inefficient DMUs. The 100% efficient units form the so called 'reference set' which sets the targets for the inefficient units. Each inefficient DMU has its own reference set and is compared against all its 100% efficient DMUs.

DEA is a very useful tool for policy-makers or administrators because it can identify the units with best performance and provide an understanding of the reasons that the others units were less efficient. Furthermore DEA provides direction for improving efficiency and achieving excellence through input reduction or output rise.

There are different types of models and the choice of which one to use depends on the character of the data and the process which is being analyzed. On the basis of the envelopment surface, the models are classified into CCR (Charnes et al., 1978) which is built on the assumption of constant returns to scale (CRS) and BCC (Banker et al., 1984) which is an extension of the former and assumes variable returns to scale (VRS). The CCR model measures technical efficiency which represents inefficiencies due to the configuration of the inputs and outputs (pure technical efficiency) as well as to the size of operations (scale efficiency), while the BCC model measures pure technical efficiency only. The orientation of the model is another matter for selection and shows the movements towards the efficient frontier, or in other words

how improvements can be done. Accordingly to the orientation, the inefficient DMUs can improve their efficiency either by reducing their inputs without changing the outputs (input-oriented) or by raising the outputs without changing the inputs (output-oriented).

In its original version (CCR model), technical efficiency was measured by solving the following fractional programming problem:

$$\max h_0 = \frac{\sum_{r=1}^s u_r y_{ro}}{\sum_{i=1}^m v_i x_{io}} \quad (2)$$

$$\text{subject to: } \frac{\sum_{r=1}^s u_r y_{rj}}{\sum_{i=1}^m v_i x_{ij}} \leq 1 \quad \text{for each DMU in the sample}$$

$$u_r, v_i \geq 0$$

where: u_r, v_i are the weights given to outputs and inputs, respectively, y_{rj} is the level of the r -th output from unit j , x_{ij} is the level of the i -th input from unit j , $r = 1, \dots, s$ is the number of outputs, $i = 1, \dots, m$ is the number of inputs, $j = 1, \dots, n$ number of DMUs.

The weights for inputs and outputs are v_i and u_r respectively and their values are unknown. DEA sets these values during the procedure of optimisation, however, if needed, the analyst can impose weight restrictions on inputs and outputs. Several extensions of the model exist. For more details the reader can refer to (Cooper et al., 2007).

Application of DEA to the Departments of Greek Technical Universities

Data set and research design

The study is based on the analysis of 30 Engineering departments¹¹⁸ of Universities and Technical Universities in Greece, each of them considered to be a DMU. These DMUs are listed in Table A1 in the Appendix. The study focuses only to the engineering departments due to the requirement that cases/units are homogeneous in the sense that they are undertaking similar activities and producing comparable products or services so that a common set of outputs can be defined (Dyson et al., 2001). The period of analysis is for three consecutive academic years (2003-2005).

The selection of inputs and outputs used in a DEA study is an important step. They must be congruent with the objectives of the educational institutions while data availability and reliability should also be considered. Table 1 reveals that there is not consensus on the employed variables. In this study, the selection of variables considers that the two missions of a university are to explore and transmit knowledge and are achieved through research and

¹¹⁸ The departments which started their operation after 1999 are not included in the data set because their 'production' of graduates began after 2004, whilst the period of analysis of this study begins from 2003.

teaching (Kao & Hung, 2008). Therefore, the outputs have been selected so as to measure the results of teaching and research:

A research indicator used in this study is the number of publications in scientific journals. It reflects the research activity of the departments and is considered to be the most important output of research activity (Kao & Hung, 2008; Johnes & Johnes, 1995). We accounted the articles that have been published in journals appearing in the Scopus database¹¹⁹. Considering that there is a lag between the research activity and the publication we estimated as an average this lag to be one year. Search was performed according to institution name (official name and variations due to translation of name from Greek to English). A total of 3518 papers has been identified for years 2004 – 2006.

Another indicator that provides information about the quality of research activities is the measurement of the citations. We measured the number of citations of the publications of each department. Scopus database was again our source. A lag of one year was also taken, since the citations consist an indicator closely related to the publications. A total of 15009 citations has been identified for years 2004 – 2006.

Publications and citations reflect research results. In order to capture teaching results we employed the number of graduates and the number of postgraduate (PhD and MSc) certificates offered. The data were collected from the National Statistical Service of Greece.

The selection of the inputs has been based on the idea that the two main necessary factors for the operation of the educational institutions are staff and funding. Two of the inputs used are the academic and non-academic staff. Contrary to some approaches, like the one of Martin (2006), which do not take into account the non-academic staff because it does not participate in the teaching process, in this study, non-academic staff is used as an input measure as it is considered to participate indirectly in the teaching process through its supplementary role. A third input employed is the number of students (both undergraduate and postgraduate ones). These data were also collected from the National Statistical Service of Greece.

Another type of input are the financial resources. We use budget funds as input to represent financial resources. This variable does not include the staff salaries since they depend on the academic rank of faculty members and is highly correlated to the number of the personnel. The research grants is the fifth input used in this study even though there are researchers that who consider it as an output (in the sense that a more efficient department attracts more grants). There is a great controversy in literature between those who use research grants as an output (Sinuary-Stern et al., 1994; Abbott & Doucouliagos, 2003) and those who use it as an input (Johnes & Johnes, 1995). In this paper, research grants are considered to be an input in the research process because it is a resource used to produce outputs like publications. If publications and research grants are both used as outputs then we double-count (Johnes & Johnes, 1995). Budget and research related data were provided by the financial offices of the Universities.

Finally, following what appears as a 'rule of thumb' in literature, we ensure that the number of DMUs is at least as twice as large as the sum of number of inputs and outputs (Dyson et al., 2001, Yang and Chang, 2009). This rule assures sufficient degrees of freedom and a great discriminating power for DEA, so that the efficiency scores are meaningful. In general, the more inputs and outputs are included in the model, the higher will be the number of DMUs with an efficiency score equal to unity (Nunamaker, 1985).

¹¹⁹ www.scopus.com

Model and variable selection

Before applying DEA a correlation analysis was performed in order to ensure that we do not employ correlated variables and, in this way, that we avoid double counting. Correlation analysis shows that publications are highly correlated to the citations. This result is not strange, since the two outputs represent the same phenomenon: the research production. As a consequence, we chose to drop out of the variable set the citations because publications are considered to be a better indicator for research.

Research grant data was not available for all departments. More specifically research grant data was missing for the departments of University of Thessaly, the Aristotle University of Thessaloniki and the Technical University of Crete. As a result, we decided to perform our analysis in two parts: (i) Examine only the departments where we have all the information (we called this Mix 1) and (ii) Examine all the departments but use only the available information (Mix 2). Consequently, Mix 1 was composed by 17 departments. Due to the above mentioned 'rule of thumb', the number of variables used as inputs-outputs should be adjusted. After correlation analysis, non-academic staff seemed to be the most appropriate to be excluded, since they were the most correlated to other variables. Mix 2, includes all the 30 DMUs and all variables excluding research grants. Table 2 presents the inputs and outputs used per Mix.

<i>Mix 1</i>	<i>Mix 2</i>
<i>N = 17 DMUs</i>	<i>N = 30 DMUs</i>
<i>Output 1: Graduates</i>	<i>Output 1: Graduates</i>
<i>Output 2: Publications</i>	<i>Output 2: Publications</i>
<i>Input 1: Academic staff</i>	<i>Input 1: Academic staff</i>
<i>Input 2: Students</i>	<i>Input 2: Non-academic staff</i>
<i>Input 3: Budget funds</i>	<i>Input 3: Students</i>
<i>Input 4: Research grants</i>	<i>Input 4: Budget funds</i>

Table 2: Mixes of inputs-outputs

The choice of the right model to use is the next step when applying DEA. The fundamental ones are the CCR, which assumes constant returns to scale, and the BCC (or VRS) which assumes variable returns to scale. According to some authors, the BCC model is suitable for the university sector because the returns to scale of universities activities are unlike to be constant (Koshal & Koshal, 1999). On the other side, according to other studies (Johnes & Johnes (1995), Celik & Ecer (2009)), the CCR model is considered to be the most appropriate.

In this study, we performed two tests so as to choose the most appropriate model. Firstly, we carried out the analysis under each model type and most of the efficiency scores proved to be similar. As a second test, we used the correlation analysis and the results showed that there is no high correlation between the efficiency scores and the size of the departments (we used as a proxy for this the number of the academic staff). These two results indicate that it is safe to assume constant returns to scale and thus the CCR model is proved to be the most appropriate for the present analysis. In other words, scale effects are not operating and large departments are just as efficient as small ones when they transform multiple inputs into multiple outputs.

The next issue to be decided is the orientation of the selected model. For the present study, we chose the input-oriented model, which focuses on reducing inputs without changing the level of the outputs. As all the inputs used are considered to be controllable, if necessary, by the university administrations this orientation better suits the problem and the planning needs.

ANALYSIS AND INTERPRETATION OF THE RESULTS

We calculated technical and pure efficiency of all the departments since we should select between the CCR and the BCC model. After having chosen the CCR model as the most appropriate, in the following paragraphs we present only the measurements of technical efficiency. Table A2 in the Appendix shows the efficiency scores of the assessed departments for all the three years and for the two mixes of inputs and outputs. Generally, it is obvious that the Greek engineering departments perform well as they present high mean scores. The average technical efficiency for the first year (mix 1) is 0.925 which means that 7.5% of the inefficiency is due to pure technical inefficiency.

The departments showing an efficiency measurement equal to 1 are those which construct the efficient frontier. Some of the departments demonstrated 100% efficiency during all the years. More specifically, if we consider Mix 1, NTUA_ARC, UP_CHE, DUTH_CE, DUTH_ECE are efficient during all the three years, while considering Mix 2, NTUA_ECE, UP_CHE, DUTH_CE, UTH_ME are continuously efficient. As one can observe, the Department of Civil Engineering of the Democritus University of Thrace and the Department of Chemical Engineering of the University of Patras are 100% efficient for both of the mixes.

An examination of the DEA results over time shows that 2004 could be characterized as the most "inefficient" year. The average overall efficiency declines from 92.5% in 2003 to 74.6% in 2004 for the first mix. Even for the second mix we can also observe such a decrease, while efficiency improved for both mixes in 2005. A deeper look at our data, reveals increase in research grants for 2004, which is not associated with output increase.

It is worth having a look at the departments which consist the reference set of each DMU. For each of the inefficient departments, DEA identifies a group of efficient units which diagrammatically are positioned more closely to the examined unit. As an example, we refer to the NTUA_NAME which is an inefficient department and its reference set consists of the UP_CHE, DUTH_CEI and the DUTH_CE. These three units are used as benchmarks for the improvement of the inefficient department and compose the ideal environment for this purpose. Following this path, we found it interesting to examine the frequency of the presence of the efficient units in the reference sets. We calculated how many times each of the 100% efficient departments are present in the reference sets of the inefficient ones. We found, for example considering the worst year, i.e. 2004, that the NTUA_CEI appears to be the most frequent benchmark for both mixes. Probably its composition of inputs and outputs and its performance is closer to the inefficient units and thus, it is considered to be a benchmark for them.

An application of Data Envelopment Analysis also involves the suggestion of potential improvements in the examined sample. DEA sets targets for the inefficient departments to work towards and suggests improvements that can be done to become efficient. It also provides measures for the contribution of the peer units at the configurations of the efficiency scores. In general, the higher the inefficiency is the biggest will be the changes suggested by DEA. However, it should be noted that sometimes the targets set are not realistic and achievable, e.g. it is not possible for a department to reduce its staff by 90%. Tables A3a and A3b present potential improvements according to 2005 data.

It is also worth mentioning that we found slacks in outputs when applying DEA. Having selected an input-oriented model, we expected DEA to suggest only decline of the inputs. However, the potential improvements included even rise of the outputs in some cases, along with the inputs decline. These are the so called slacks and show that those outputs are under-produced.

An indicative short analysis for one inefficient department follows: In 2005 and using Mix 1, when we consider the NTUA_NAME (Department of Naval Architecture and Marine Engineering of NTUA), we see that it demonstrates technical efficiency of 59,5% (see Table A2). The respective reference set is composed by three departments of the same university (NTUA_ARC, NTUA_CE, NTUA_ME) with NTUA_ME being the closest efficient department (and therefore contributing mostly to the definition of improvement potential for NTUA_NAME). When compared with its peers (the reference set) it seems that the number of Academic staff is relatively high (Table A3a). A slack appears in publications, indicating that the number of publication is quite low. Combined with the fact that an improvement of -40% is indicated for undergraduate students, this forms a clear indication for strengthening the research output of the department. Research grants seem to be less effective here, as well. The department expenses are high compared to reference departments. This analysis can be further extended in other departments.

DISCUSSION

In the current work we worked on the estimation of technical efficiency in higher education. We concentrated on Greek engineering departments. Efficiency was estimated through a non parametric method, namely the Data Envelopment Analysis (DEA). DEA can simultaneously handle multiple inputs and outputs with the only requirement to have information on inputs and outputs quantities. Thus, it is suitable for assessing the efficiency of educational institutions where it is impossible to assign prices to many of the outputs. Moreover, no assumptions for the functional form of technology are required, since it is a non-parametric method. An advantage against the statistical techniques is that DEA compares the inefficient DMUs with the 'best practices', not the central tendency. Additionally DEA provides with improvement plans for each non efficient department. However, DEA has some limitations which should be taken into account when applying it. DEA measures relative efficiency, but not absolute efficiency. In other words, each unit is compared to a subset of peers and not to a theoretical maximum performance (Colbert et al., 2000). Sometimes DMUs achieve 100% efficiency simply because no one else is competing in that niche (Johnes & Johnes, 1993). Additionally DEA does not perform statistical tests on the inputs and outputs applied. In general there is not an agreement on the researchers on the inputs and outputs to be employed. Quantitative variables are strongly preferred. Ideally, qualitative evaluation should also be included. However as it is usually produced out of questionnaires (Higgins (1989), subjectivity issues arise. Moreover ,such reliable indicators are not available for Greek higher education yet (early attempts for this started in 2008-2009). Finally, DEA performs static evaluations for each year. This can be misleading since dynamic settings may give rise to seemingly excessive use of resources which are intended to produce beneficial results in future periods. Incorporation of the time dimension through the application of specific techniques (Malmquist index, window analysis) is a future step for the authors.

CONCLUSIONS

Data Envelopment Analysis has been applied for the estimation of the technical efficiency of the engineering departments in Greece. DEA seems an appropriate method since it does not

require any knowledge of the production function nor the existence of prices. Additionally, it provides with improvement plans for each non efficient department. In this sense it can become a valuable tool for university management. In terms of results, analysis indicates high technical efficiency for many departments. Some departments seem to be continuously on the efficient frontier, i.e. 100% efficient. Scale effect does not seem to be present. Average efficiency seems to be falling in 2004 and rising in 2005. Specific improvements are proposed for the non efficient departments.

A MODEL OF LOCAL DEVELOPMENT: THE CASERTA FACTOR

Graziano, Domenico¹

¹Assigned Researcher – Faculty of Economy at II University of Naples

INTRODUCTION

The object of the dissertation herewith is to draw attention to a possible course/guide for local development in the district of Caserta. The matrix idea is of a problematic nature. What are the crux, the problems, the criticality inhibiting the attraction/procurement of capital for future investments in some areas of the country? The main thesis is that the social-economic context in which the already existent companies operate and the one pertaining to potential future companies constitutes the main lever in explaining territorial competitiveness. What is territorial competitiveness today? The question is subjected to an analysis of the present environment.

Globalisation, market integrations, opening of national/home economies, increases the mobility of enterprises and investments. Why do companies prefer, so much so as to favour, a specific territory as opposed to another? Can a territory become object of an enterprises' choice of investment and have a value and importance equal to or above the other production factors that constituted and in some way still constitute the elements on which its production function may be based? For an enterprise/company wishing to invest and operate nowadays in a given sector or activity the question to be asked is "which territory?"

Two conflicting ideas but nevertheless coexistent can be traced in the territory in question and they refer to economy globalisation; the idea that economic activities are incoherent with the territory, from "one" place of reference and thus essentially mobile both with respect to productive process and market outlets/openings and the idea that enterprises/companies are more dependent on the territorial context¹. This second perspective does not represent a backward step, a congenital involution of the existent globalisation process, nor does it generate any localising closure. This is the idea of local development. To speak about local development is to discuss a new relationship between economy and territory. If one takes a look at the transformation that has invested the production organisation in its historical-temporal context, the Ford approach, the enterprise/concern becomes autonomous from the environmental context and from its influence. In this perspective, territory is a passive element and development is decided upon and organised by the policies of the central State. On the contrary the anti-Ford production model links enterprises to the territorial context which they are established in; the Logics under the new model and the existence of possibilities and favourable operative conditions, already existent in a context or promoted by particular policies, become the fundamental motivations that establish interest in locating its activity in one place, in preference to another. The influence of the environment on company decisions, is evident in the post Ford production model and has been enhanced by globalisation - and the same may be said for the possibility of territorial choice. In such a picture territory may constitute interest and future investment choices for the enterprises/companies/concerns. The choice of location, spatial organisation to operate in, now holds a key role as a factor of competitiveness.

The role of institutions in the construction of this course/guide is fundamental/decisive. Globalisation increases competition between territories and pushes local governments and regions to expedite development processes, in order to enhance the territorial context as a

competitive resource. To attract external business a territory can use internal resources – for example fiscal, financial resources, benefits, provision of services, cost factors. To do so, it may adopt territorial marketing structures, specialised agencies to contract and attract interest in eventual external investments. This tool in its function and outcome will probably bring out evident criticality that influences the actual return. They could therefore use different tools that, although absolving the same function of drawing in/procuring external resources, consider the attraction/procurement of external investments not just a scope in itself, to be considered satisfied once the operation has been concluded, but, within a logic of local development, a means for yet another scope i.e. evaluating internal/home supply. These resources are not only material or economical, also immaterial resources or extra economy resources constitute development factors, and in this sense social capital is determining, as a network of personal social relations amongst individual, joint, public or private subjects/participants. But then a continually “relational” economy is conditioned by market factors and is based, above all, on the capacity of subjects to interject amongst themselves and co-operate.

Within this relational logic, the fate of these courses/guides is entrusted to the roles of enterprises and the local government. Once again, the transformation of the productive organisation model contributes to explain the reasons thereof. In the passage from a Ford-like order/disposition to a post-Ford disposition the productive organisation model took on flexibility and quality as terms of company research as decisive factors in their “objective function”. Flexibility, as adaptation to a voluble and variable market and product quality require a formal and informal collaboration amongst the formally autonomous public and private subjects.. A well structured contract between enterprise and local government does not suffice to assure that the development process functions and proceeds. Even technical assistance may prove insufficient. Delegating the formulation and the realisation of efficient development projects to technical structures does not always guarantee good results. The availability, firstly, of orientation and coordination mechanisms and, then, control on the part of the local government of the development process and the availability of the company’s full efficacy to act on that process is necessary. The agreed logic thus outlined refers to the capacity of local institutional subjects to implement efficient cooperation processes aimed at obtaining a territorial quality context that results attractive for the private investor. The leading role of the local government becomes a new form of territorial regulation of the economy and the society, in a kind of governance that improves the territory through a development strategy of same. To manage this change, the local ability to plan avails itself of efficient and known competition amongst territories.

COMPETITIVENESS AS A SUCCESS FACTOR FOR ENTERPRISES WITHIN A GLOBAL MARKET

The existing phenomena of globalisation increases national/home and international growth. Indissolubly this is connected to the process of internationalisation of the production sector and markets. The dynamics of such a process are the reason why enterprises/concerns decide to leave their habitual dimension and throw themselves into a different, presumably or allegedly better, global market reality. This change towards different places of interest, considered both with respect to the productive process, and with respect to market opportunities, refers to an image of the mobile economy in the area, disconnected from individual single places. With this in mind, territory is an implicit element of what may appear to be a kind of indifference versus the territory seems to be an effect of globalisation. The de-territorialisation effect annuls the geographical distance, normally an obstacle to business². This prospective is certainly not denied if innovation and quality research induce enterprise to look at the territory and local context as an important reference, as a favourable environment. This means that the

competitiveness that takes place between the economic operators 'accompanies a new local rooting of economic activities'³. It is the bond with a determined territory and with its social and institutional context to make a name for itself and hence local development. In this way two different tendencies can be profiled, or rather opposing tendencies that have their reference centre within a territory.

The enterprises'/concerns' approach, especially in the production stage, considers the external territory as a base for further development; whilst, in the project and organisation phases of the production process, the local territory is the one to boast attention. As will be stated, this dual consideration is not only within business logic; it invests more complex dynamics. In particular, after thorough consideration the effect might also apparently seem paradoxical/bizarre with respect to the globalisation phenomena; at further analysis the effects considered on the whole could seem compatible if global dimension and local dimension of development do not remain exclusive courses and reciprocally excludable, but, rather, combinable.

The globalisation process is evidently accompanied by renewed processes to the regionalisation of economic organisation. A vision and entrepreneurial/business approach destined to introduce new goods onto the market, new productive methods, new economic organisation models, and to discover/pinpoint openings to new markets, demand identification of which conditions in a determined territorial context can produce investment opportunity. It is not so much, or necessarily, seeking defined conditions in a physical space, but rather a context of specific chosen conditions in a specific situation, of interest to numerous participants/subjects. In the interpretation conducted around the industrial district phenomena, the general conditions that resulted regarded the Ford Industry crisis, and also the opening of international markets, conditions which, together with others, have brought about a totally new consideration of space, or rather, territory. Observing the local context one has come to locate a local territorial structure of opportunity, favourable for business, covering resources to be used with unexplored modalities and in unexplored directions. What is the consequent result? The result is that there is a renewed return of the territory, to be considered resource, added value/net output, that an enterprise cannot neglect. This change in prospective is content enriched.

The identification of a local development course/guide, the analysis of development modalities for territorial entities, brings us to reflect on the social capital that has its most significant feature in the given territory. The contents of the social capital are expressed in what a person possesses and may exploit. It is a resource deposited within the relation structure the person is part of, deriving from potentiality that the self-same relationships are able to convey, it is a component of social organisation. The relational data that thus emerges allows us to identify two types of network and related social capital " it is social capital that reinforces the bonding barriers – and a capital that allows bridging. When looking at social capital we again find that dual observation, within and without, that explains its effects when discussing/viewing local development. Locally speaking, we may find particular territorial features, environmental, physical and natural and particular findings deriving from inter-relations with features of a territorial, social, economic and political nature. A consideration of social capital cannot be left out of connections between social relations and territorial resources, nor even from its own features, of whatever context. It is not only and simply a correctly premised specification, but it is above all a consideration of methodology. The differentiation between economy and society operated by the Ford organisation methods has depreciated the importance of enterprising, as a local institutional context, marginalising the role of social capital in local economic development; regarding an autonomous environment-based company,

the non-economic factors able to weigh upon O&M capacity (Logistics) and the central Keynes policies have an approach from the demand side and the policies relating to external investment attraction/procurement, using suitable incentives. The Ford structure crisis re-launches social capital. Production flexibility and capacity to adapt towards the market and its conditions, product quality, become new keywords. This ideal, and at the same time operative, change concerns the small and intermediate highly skilled/specialised companies, like the large companies who, availing themselves of the collaboration of small and average-sized external firms, in order to reduce time frames and costs for innovation and production processes, delocalise certain product lines at decentred specialised and autonomous production units. The importance of social capital can be seen in local development processes: autonomy of structures within the enterprises/companies, opening up to external collaboration thus increasing relational data resulting from networks of companies in production and innovation processes, and from rooted social relation networks within a territory.

Relationships amongst subjects, which are potentially productive of economic, social and political opportunities and stimuli, have as a fundamental reference, ties with physical, environmental and natural resources of the local context. Only if we assume that territorial resources may weigh upon the economic activities of an area, and thus influence them, and that the local development policies may benefit from this, can one affirm with greater effectiveness, that social capital potentiality within territorial dimension relationships, can but result strengthened and exploited. In this sense, economic, political and social dimensions are not the only ones to be reductively included in the social capital; territorial dimension is the determining component of a local development course. One should stress how social capital cannot escape the territorial features to which it belongs, similarly, as territorial social capital is "the place of inter-relations between territorial resources and social cultural resources, functional to their reciprocal exploitation, to identity growth and to local development". In this particular sense, social territorial capital, deriving from a reciprocal interactive process of its own components and territorial peculiarities, expresses potentiality that may be exploited by local subjects so as to promote local development.

Notwithstanding the fact that growth/expansion courses/guides of local development are not simultaneous to its activation, the risk at this point that might occur, with respect to the possible consequence of social capital on an economic scale, is to consider social capital availability as the sufficient condition, even automatic, for it to become a resource for local development. The outcome of an interactive co-operation process, of personal resources and territorial resources, as an expression of potentiality of a determined territory, territorial social capital must be subjected to recognition in order to play an important role in promotion policies for local development, in order to be a development resource – discovered by local subjects, without which those potentialities, although existent, would be hidden, latent. Therefore, if identification can contribute to eliminating the evident risk, translating the transformation of social capital into development resource, may a supply of identified/acknowledged low social capital be an obstacle for its functioning in terms of local development? This question is the result of a consequential logic concerning identification/recognition. Thus, the extent of initial supply of the social capital is not so much in question. Supply, potentiality, are whatever the case existent, and provided they are recognised, may more often than not be urged from the outside, for example through the possibility to access tools, financial loans by means of joint ventures on the part of institutional participants and businesses and, attaching territorial resources in a determined area, they may generate local development if translated into concrete and feasible ventures, into interventions, projects with which interaction between resources determines something more than a simple territorial valorisation/exploitation. Nonetheless, not

bearing in mind the local and territorial specifics expressing the identity content of a determined area, might undermine development and renewal policy significance. In any case, to pursue development means to develop the capacity to seize occasions, possibilities, external stimuli. In this respect, social capital may become a point of reference for the outside but also an evaluation parameter for the territory and may also contribute to the popularity index rating and, therefore, to the construction of its identity. Such phenomena, in their complexity, clearly show the notion whereby if we obtain origin from processes of change imposed by economic evolution, this creates an open and propositional territory with respect to the external contribution. The attachment between local resources and external networks generates knowledge/know-how, ideas and people circulate, know-how within in the territory develops, new possibilities and opportunities arise which, together with market evolution and tendencies, nurtures local development and increases territorial added value/net output. On the other hand, this opening, this receptiveness must be interwoven with local territorial resources and allow regeneration thus avoiding the loss of identity rooting of territorial social capital. Social capital thus enhances/exploits territorial dimension development. Globalisation and research of advantageous conditions beyond the localised networks in a determined area, might even alter/corrupt the convenience within a given territory. Therefore the data one should pay attention to is not so much de-territorialisation of the productive process, but rather competition between territories, in which social capital emerges as a resource, as a localisation catalyst for external investments, as an tool with which the possibilities of local subjects increase and weigh upon territory development.

For this to become an tool for local development, interventions are necessary, social capital promotion policies favourable for development. The experience of negotiated programming, involving public and private parties, represents progress with respect to the idea of an intervention to support development connected to individual incentives to attract/procure external companies/business, or to the idea of operations that, by acting on costs, might respond to low production levels. The activation of social capital passes through the exploitation of territorial implementation policies on the part of local, business and institutional subjects. In the new economic framework, in a market that tends to globalise and faced with news forms of economic and productive organisation, social capital interacts with human capital, know-how/familiarity, physical capital, infrastructures, financial capital. Local development calls for learning capacities, specialised know-how development that increase productivity, social relations between local subjects. " From this point of view, they become relevant sustainment participations, both on a financial and organisation level, in integrated local development projects that stimulate the formation of co-operative networks both between individual subjects and collective participants, and that attach external companies more closely to this objective/target. Nonetheless, " central institutions are not to infer upon the contents of local development projects, are not to limit their autonomy, are only to help local participants to define projects and then demonstrate capacity and transparency in choosing the better ones to generate competition within territories and push them to draw up projects more prone to the features of social capital and that bring about a knowledgeable use of local resources in development". Hence an invasive institutional approach that does not preserve enough autonomous margins for the local participants, and risks to generate dependency, localism, levelling on the requirements expressed by the territory, harmful to territorial social capital and, therefore, development. The realisation of development conditions, exploitations of local social capital characteristics occur, on the other hand, strengthening autonomous capacities of the area involved, local resources being the differentiation factor of the offer of each area. These tasks are referred to development policies and their role in territorial dynamics. Faced with a territory with few territorial resources, or where recognition/acknowledgement of the resources and

potentiality has not been carried out within or that has not projected re-launching strategies, in similar occasions, task of local development politics is to reconnect territorial, physical, environmental and social components and stimulate local identity factors. It is not about dealing with these components separately, the intervention aims at favouring complementary inter-relations, all functional to their reciprocal enhancement/exploitation. The promotion of local development qualifies as a means to rediscover the territory, but differently. In development, promotional approach refers to local context of a determined area, without forgetting the local reality, nor altering the relationships between territory and participants. Tools to be used to face critical times of a territory should involve local subjects within a shared project. The features of the territorial social capital of an area are the co-ordinations of the development policies of the projects. The problem of economic development is not therefore just a simple and reductive matter of cost but has a social dimension that emerges from the social capital. In mobile and globalised economy conditions, social capital expresses the systemic tie between economy and social organisation. The local systems look even more like social organisation resources for economic development. Two ideas contribute: "territorial politics do not concern only and so much so redistribution of resources and the amount of given data enrichment, but may be addressed to free the potential of local initiatives, the enhancement of economic and cultural resources of local societies, often latent and unrecognised, establishing institutional orders able to favour decisions and decentred aggregations. The second idea concerns the fact that local development is triggered off with strategies of more participants/subjects, public and private, able to develop coordinated projects" In other words, not a return to already experimented economic forms of policy but "the start of new forms of process governance in which public and private participants, entities and associations, enterprises, universities, research centres all compete; the game consists in convincing different participants to take part in converging investments. – that remain independent and that may also orientate their relations elsewhere, or go elsewhere- so that the varied development conditions are guaranteed, and arrive at the appointment at the same time ". The local development paradigm needs to be equipped with approach address methods in function of social interaction development.

The territorial approach of development policies is re-determined according to the new conditions connected to market evolution. It does not correspond to a merely endogenous concept of development ; contacts with the outside/exterior are essential to define territorial development strategies. Nor does it accompany a welfare type of development concept, implemented by means of support policies. The local territorial approach is based on the definition of a territory seen as a project on which re-launching steps can be effected, on a dynamic extent, economic, social, environmental, institutional and cultural . The significant conceptual change over the territory no longer regarded it as space, interpreted as simple geographical environment, but for its social consideration. In this perspective, the territory characterises the concerns' actions, existing for them a localized preference and a market differentiation on the part of the other participants because of their geographical position. Territory is the place that the enterprises/concerns choose depending on the possibility of active establishment/settlement there. Thence his competitive position with respect to others derives. Choosing "where" to establish productive activity is part of the requirement of the production system. The relational data that emerged from interpretation of territory, as a host for relations of the subjects/parties therein, grants an importance to the territory in the measure in which this influences the nature of relations. The advantage of a localising choice derives from the differentiation of the relations that the enterprise establishes with the other participants/subjects and with the environment in which he operates. The territorial dimension of his choice has the fundamental function of determining the competitive advantage for the enterprise/concern.

This territorial approach, integrating an prominent economic space/area, economic operators, market and support policies, suggests a territorial development strategy.

A POSSIBLE STRATEGY: THE CASERTA FACTOR

When giving a response to the query on how to define a territorial development strategy does not claim to explain in a strategy approach a kind of general theory on development nor does it claim that the territorial policies expressed in it are the sole privileged tool of economic policy. It does however stress the potentialities of a local economy for the development of the area – the province of Caserta – in line with the competitive capacity/skill of the territories. These local economy potentialities may be enhanced/exploited with specific interventions.

Studying the characteristics of territorial social capital and analysing what occurs in other territories it is possible to delineate a developing course of a determined territory. This course leads to the formulation of hypothesis on which ones may have the chance of success in the initiative, which economic sectors may be developed, what reactions there may be, how the social-cultural characteristics can interact with territorial resources. The external reference is again important for a non self-sufficient local system, nor self-referential, within a more ample system and within a global vision of economy, but on which re-launching strategies may be built. The operative choice to avail oneself of national and international local development models has not been dictated by the conviction that, to implement development policies, one must passively follow predefined courses, but if anything, from the need to learn from the experience of some models in order to try and draw one's own. As concerns the case under discussion, it would be pointless to try and find the same social, economic, political and cultural conditions as in other places. The histories of local development differ. There is no model to be followed or to be repeated. Local development is not exported, nor inherited, reproducing in territorial contexts different models from elsewhere, but it is constructed taking advantage of the unexpressed potential, intrinsic, of the territory and on its capacity to attract resources from outside/beyond.

The phenomena to be investigated is activation of development in the particular area of the province of Caserta. Pinpointing the general structural characteristics that define and condition the situation in which the subjects live, one may observe how they define the situation in which they operate and interact. The elaboration of a strategy aimed at explaining the initial phenomena: how the province of Caserta can be the laboratory of a territorial marketing strategy. The prospect taken on is of a business nature, founded on the approach of the enterprises/concerns

The proposition of a territorial marketing operation that is able to consolidate the existing activities/concerns, enhancing the present resources but also responding to the requirements of potential investors and attracting outside companies/enterprises entails as a precondition the definition of the area product, of the "offer", i.e. the territory product. The territory, observed from the point of view of productive establishment, represents a varied and significant offer, the offer of localisation product to be assessed for future investment choices on the part of the business concerns. For a territory which wishes to be qualified as a factor of competitiveness, it need no longer be a point of arrival for entrepreneurial action, a reflection on the localised choice made in an introspective manner, in a self-referential manner, within the company and dictated by purely economic reasons which keep the territory far away, considered as the obvious outcome of a reasoning extraneous to its contribution. The territory is the starting point from which one must direct subsequent development. From a quantitative point of view , the

enterprise/concern may count on a significant offer of territory, more or less of interest as concerns investments, i.e. the predisposition of truly appetising conditions.

The presupposed dynamics for globalisation economy processes of and the transmission and speed of innovation and know-how speed such as to evidently have an effect on factors such as capital, technology, know-how, professionalism, once considered priorities or even exclusive in the determination of the degree of competitiveness of an area, of the success of the industrialisation processes of a territory. The availability of the concern to delocalise the production of goods/assets or services or part of a productive process is rendered evident as a market condition.: the attempt to lower production costs in contexts with favourable external economies and qualifying resources constitutes the element for a dynamic competition between territories. This dynamism, this territorial attention is realised in terms of supply, trusting in its visibilities in the eyes of potential investors. Competition regards establishing factors and conditions which in turn concern not only material elements

but also immaterial ones, extra-economic ones. The difference in territories is qualified in terms of area product supply, an alternative to be evaluated when the concern makes choices of investment.. The development of area products, and also the definition of a local development course depend on the individuation of coherent financial activity typologies with the features and criticality of the area and the creation within this area of appetising and attractive conditions for the relative investors. Territorial marketing initiatives also play a role in this picture. The local development course that we herewith try to outline is founded on a strategy promoted with tools typical of company management activities. Territorial marketing strategy centred on the company approach registers a territory that is no longer passive, within which investment opportunities may be sought for final choices, but active, within which the persons responsible for territory development stimulate the demand of the investing enterprise/concern, or better still proactive, as the territory itself is , with its interest potential, an investment opportunity. To organise the supply, the territorial characteristics are to be analysed, from an environmental, population, economic, infrastructural point of view and to pinpoint the weak and strong points of the area concerned, so as to be able to define any operations that may improve the interest of the territory and consolidate existing activities. The territory supply, as a economic and social context in which the enterprise/concern can be inserted and can operate, is the result of collective approach of local subjects operating therein, that permits distinctive characteristics of the area to be seen on the outside and that contribute to the investment interest.

The definition of a territorial marketing strategy that aims at interesting new productive investments for the area, on the part of national and international companies, is to depend on prior know-how of competitive factors of the territorial context under reference. For this, an indispensable prerequisite is the analysis of the territory in its physical, morphological, population, social and economic structure. The object of the precautionary analysis is to bring the strong and weak points of the area into evidence. Thus, it is also interesting to learn what the outside opinion is of the territory under question, how it is viewed from the outside. Hence, our country - Italy, from a point of

view of investment interest, still suffers from high fiscal pressure, from a heavy going public administration, a credit system barely adequate and hardened versus offering credit to enterprises/concerns, from a weak labour market. In particular, investment interest and productivity are scarce, dynamics are scarce: although there has been a growth in this sense, it is still barely strong enough, inferior to other European countries. The difference in productivity of the Italian concerns with respect to European enterprises may be explained in the different dimensional structure, in specialisation, in external conditions connected to diffusion and to infrastructural quality and the working order of the public administration. The transfer channel of technology and organisation models, represented by direct foreign investments – DFI – has grown but the productivity of the country has benefited to a lesser extent than those of the remaining European countries; the portion of foreign direct incoming investments, index of the interest capacity of a country, tends to diminish. On a regional scale, development policies have partially missed their targets; the actual cost has at times been lower than the estimated one; the subsidies to enterprises have often been inefficient or bias; above all, little has been done to change those aspects of social-economic and institutional context that best stand out for development, such as legality, instruction, the actual concept of public service.” The difficulties in business activities in Italy, with respect to other countries, are worse in the south (Mezzogiorno). In that productive system environment , the difficulty of handcraft workmanship production and especially industrial production emerges, difficulty in sustaining lowest labour cost competition, in shifting to advanced or innovative market segments. The

effects of the crisis in course are only others to be added to the chronic economy financing: delays in payments on the part of clients and public administration, difficulties in recovering credits, and difficulty in accessing credit and cost of finances/loans reflect structural factors, of context, that regard/concern also high risk state of companies/enterprises. Similar conditions reflect negatively on company profitability and, in particular, complicate the expansion strategies of the sound ones. The analysis referred to the provincial level feels the competition disadvantages that concern national and regional territory.

Finding Demand. Potential Investors.

The development process for the province of Caserta in its outcome and duration, is undermined by structural limitations prevailing ; the productive system is fragmented, exposed to international competition. The de-industrialisation process concerns enterprises operating in innovative and relevant sectors for the territorial economy, such as electronics, telecommunications, machinery and chemical sectors. The difficulties encountered by exposing production costs to competition also felt by small and medium-sized of textile districts and shoe factories and divisions.

The critical points of Caserta production reality do not only concern international competition but also the production model, linked to a family approach which barely renews itself. Although there are positive effects for the economy of Caserta deriving from international demand growth/expansion, registering an increase in exports for 2006-2008 and since, therefore, there is interest in the territory on the part of international markets, some of the difficulties in expanding internationally lie in the company structures which are mainly individual. Nevertheless, the strategic position of the province of Caserta, a strong link between north and south of the country, its good infrastructural supply - to be strengthened, considering the strategic and priority character of works such as Marcianise airport, the Interport of Maddaloni-Marcianise and the Matese tunnel, and their positive impact on the territory and on the local business system in terms of added value/net output and of logistic cost reduction – offer the province of Caserta the chance to relaunch vocation and prospective development for the entire territory, even over the region of Campania.

Investment availability of the enterprises in the province of Caserta and the more general aim to increase the interest possibilities of the territory also require positive signs for future production of the companies. In identifying target reference, i.e. the enterprises/businesses that are potentially interested in investing in the area, said signs consist in preferring investments that are compatible with socio-economical vocations, cultural and environmental vocations of the actual area. Re-launching economy strategy not only concerns high-tech companies, but also mature-sectored companies such as textiles (the silk from San Leucio) and shoe factories, whose offer, in terms of known patrimonial and productive tradition, constitutes the prerequisites for remarkable development potential and for products of high level. The province also registers a strong weight in agriculture and foodstuffs of high quality. In this sense steps may be taken to strengthen the local produce spinneret, in particular typical territorial products such as mozzarella DOP made with buffalo cow, Annurc apples, Roccamonfina chestnuts. The Caserta productive system also has a high service supply sector. Commercial activities represent an important portion of the economic system; tourism, although high provincially, does not boast an index in line with artistic and environmental resources of the territory. Tourism represents a potential underutilisation one should aim at re-launching, with its heavy economical and occupational relapses. Environmental resources and countryside resources (areas destined as national parks and coastal areas), artistic, historical and cultural patrimony (the Reggia of

Caserta, the historical centre of Sessa Aurunca, Capua amphitheatre, the medieval castle of Letino) can also be other points of touristic interest within a development course in such a sense.

The meeting point of demand and supply in the territory. Strategy and promotional and communication policies of the area product. The participants involved.

The definition and implementation of a territorial marketing strategy involve the application of marketing logics and techniques in the territory. Users of the territorial marketing tools and programmes are, in their capacity of investing participants, both companies already present and operative in the territory, and also those potentially active as they are interested in setting up business there. For both kinds, territory is an area product.

Actions to be taken concerning the existing consumers in the territory aim at maintaining and rooting territory in the existing economic web in order to counter abandonment and to draw/procure additional expansion investments and, at the same time renewing favourable considerations manifested at the time of establishment as regards localised opportunity of the territory under consideration, hence avoiding that the operating company may find more convenience disinvesting out of the area chosen, in favour of others, and mostly helping modification projects that express better use of the territory for the localisation of companies in the area. That is, the companies already operating there in the area are able to influence convenience factors and the capacity to draw/procure subjects and their presence strengthens development opportunities of the self-same area.

From the economic dynamics specification and from analysis of the dimensions and characteristics of the productive structure of Caserta one may observe that forms of production aggregation/integration should be looked over so that provincial companies may offer their skills on an international prospective and that there is a better organisational and productive outcome. Interventions would lead the product towards market segments where competition regards product quality, where new relational models between production agents may be promoted and adopted, through co-operation that allow sharing of the cycle phases of production. The competitive advantages for the company result evident in terms of better negotiation with distributors and suppliers, a decrease in purchase costs for services and procurement/supplies, an increase in commercial and promotional impact on the reference markets, realisation of trade marks and product improvement, strengthening of external credibility, with participants to the internationalisation process, exchange of connections/know-how and information, an increase in managerial skills within the single companies. In the light of the specificity of the Caserta economy, local agricultural and food produce, textile goods and tourism, maintaining the local level of added value/net output from the transformation and the commercialisation of products, represent strong points in the Caserta territorial scenario. The productive vocation is linked to historical traditions, to environmental and climatic conditions, to local productive tradition and to its entrepreneurial/business dynamism, to cultural tourism traditions of some towns. The integrated development model, which we outline, is of a territorial marketing project type that weds production enhancement ad cultural asset enhancement/exploitation. The promotion of this model takes its approach from ambitious attempts to separate, without dividing, institutional participants from entrepreneurial ones, to determine a table and a climate of permanent consultation around development policies. What are the effects? The model may represent both large companies that show strong signs of productive and commercial vitality and the small ones, weaker from a market point of view, but nonetheless equally competitive with regard to the quality of its products, an tool of growth/expansion and a distinctive sign of territorial quality, recognisable also on an international level. The combination of territorial characteristics and competitive conditions in

production sectors is such as to obtain self-propulsion territorial growth. Should a determined productive sector have specialised characteristics and a certain degree of integration between the production phase and the supported territorial area, thanks to the degree of the local participant's involvement and the level of the services offered, the productive activity, one may retain that the integrated development model may commence. The production vocation of the area is necessary to guarantee a positive outcome of the territories' development policies; the extent of competition of the sectors is influenced by the company's choice of strategy, with differentiable products, and it is as higher as the more local companies are orientated versus the external market; at his point innovation urges for organisational change ad territorial integration becomes important to differentiate the products and to exploit their peculiarity also beyond the local market. The development model brings into evidence the role of economic agents that, for their role or their service, are able to have an effect on development processes and on local production offer. Its achievement is also thanks to the high degree of the local operators involvement, public and private, from which the propulsive effect of economic growth/expansion depends; the entrepreneurial, social and institutional context weigh positively upon the competitive advantage from production localisation. The governance model is articulated on more levels. The integration level amongst the companies is realised in terms of operative management according to market logic. Common interests aim at realising agglomeration outside of the company, but within the local area of reference, in terms of production costs, flexibility, creation and development of new companies to respect product quality regulations, the realisation of common policies for procurement and for product commercialisation, improvement of their quality through research and technology innovation policies, extension of sales expected and also to face global market competition and obstacles to important distribution channel access. The relational component does not only concern the local productive system but also involves the institutional system. At integration level between companies and local institutions, the role of intermediate public and private subjects – category associations, syndicates, Chambers of Commerce, local bodies, financing banks, research bodies, the academic world – is to address and support company policies, thus the interests of a private nature followed by the companies, towards common targets of professional, economic and productive growth/expansion of the territory and technological innovation through the assessment of a table of comparison with governance tasks and coordination of development policies. The third level contemplates integration of all the components involved in the central programme operation, reference bodies for the economic, institutional and technical co-ordination, beyond the area of reference, with guidelines and controls of the intermediate subjects, of relations between companies and local bodies/entities and the implementation of regional development policies, to overcome particular strategies. And the effects on economy and production? As a result of sharing objectives/targets for territorial expansion/growth, governance modalities, the network of co-operation, produce a multiple effect on the territory, having a positive influence on the quality of productive localisation/establishment, increasing territorial interest in the eyes of new companies, both from a productive and touristic point of view. Equally positive are the effects of development expansion in the territory where, in virtue of interaction and diffusion processes of connections among companies, and support action and service action to the companies on the part of the local institutional system and central and regional intervention policies, may benefit in the lengthy period of a social capital that, to be specific, makes the local products unique and of quality. As concerns the local business system, the advantages involve the development of local competitive factors, better use of production factors, strengthening of local specialisation of productive supply and the conquering of new quotas on the market, of specialised segments of demand, synergic strengthening of business, relation inter-productive intensification with suppliers and industries involved, the founding of

new companies/businesses. The development potentialities of the model are such that the acknowledgment of the strategic importance of organizational and relational changes deriving therefrom, may contribute to the development of the local productive system and its competitiveness.

Product promotion comes from territorial marketing strategy that calls for participants and practices/performance. Managerial skills of local public and private subjects who have previously, in their development processes, qualified their approach in locating the necessary tools for the growth of the local economic system and in organizing resources destined to stimulate the interest of potential investors. Such an action has characterised itself in preparing a passive or "wait and see" type strategy that left the investing concern the task of finding establishment opportunities, choosing the location sites on the basis of convenience variables and factors, and thus make a decision from the chosen alternatives. Territorial marketing implies, on the other hand, an active performance substantially different. The subjects/persons responsible for local development are involved in planning and the implementation of predisposition if an area product/output and this entails recognising the actual requirements of the productive investment, removal of any obstacles to development, communications to the market advising of the established offer so as to urge/stimulate a demand of the investing companies. Visibility is about the territory as a competitive advantage distinguishable from others. As a matter of fact, the choice of locations is among the objective factors that, together with the subjective factors, determine, as a whole, the competitive advantage of the company on the market in question. The area product/output, since made up of physical elements, economy operations, institutions, gives rise to management problems. This complexity comes from the fact that only part of these elements is at the disposal of territorial marketing approach, in the sense of being planned, modified and controlled. With a view to investment realisation, the parties responsible for territorial management are given the task of defining some industrial policy choices that specifically concern a synergic vision of economic benefits from potential investors; the development of product dies/spinnerets in particularly important sectors on a territorial level and through these, the diffusion of the productive process innovations; the establishment and diffusion of highly skilled technology and research centres that facilitate collaboration in universities, research, an efficient territorial planning approach, the removal of obstacles to development, acting on safety conditions, bureaucratic efficiency, the functionality of public services and the adequacy of infrastructures the company requires; improvement of the quality of life.

Territorial marketing operations

In relation to economic entrepreneurs/businessmen and operators to the territory, beyond the strategic approach concerns drawing in/procuring new and additional external investments and as such it is subjected to pre-arrangement of an area product/output offer that may qualify the territory as a possible location for new businesses and therefore improve the interest in the territory, using approaches similar to those used to preserve those companies already present on the market in question/of reference, and aimed at finding investors who have potential interest therein.

What beneficial effects can be had in the territory and in the companies from the development of territorial marketing programmes? The benefit for the established choice of investing business becomes evident thanks to a series of factors that are not always foreseeable or assessable beforehand, but whose impact is noticeable after establishment therein. The companies already operative within a territory may be seen both as area product/output components and therefore potential interest for new investors, and also as users of the territory

and therefore interested in specific marketing operations. To promote development of the area concerned, the favourable conditions and relevance for locating productive investments are to be presented as true rooting prospects for potential investors in the territory. Such prospects depend from the possibility for the business to attain a level of profitability in line with expectations. Consequently, a prior analysis of market expectations for the product or the service concerned in the investment, also in terms of cost and potentiality of revenue development, a prior analysis as to the presence or otherwise of adequate infrastructures for the company requirements, a control as to the presence or otherwise of an environment with high external effects that translate into cultural, contextual and economic conditions favourable to the development of productive activities/assets. The attainment of territory visibility, obtained locally by formulating and articulating territorial market strategies, involves, on one side, negative external effects, in the sense that the objective is to promote local to remove the weak points and points that hinder the realisation/attainment of positive performance on the part of the internal and external investors of the area and, on the other hand, favourable conditions and establishment opportunities in the area, by promotion that is able to communicate to the outside/exterior their presence so as to attain investments.

The realisation of these operations and the difficulty of local political and economic participants, such as public administrators that do not operate according to management logic, to carry out territorial activity and to accept a new manner to administer the territory induces to provide itself with a streamline development Agency able to act as collector with all the stakeholders, whose institutional order is able to refer to a combination between public and private, appointed to exercise similar functions. Its main objectives are to promote the territory and to have its potential and its characteristics known, to supply assistance and consultation to investors, both in the choice stage of the area where the investment is to be made, to be the only representative for potential investors, with roles of brokerage and articulator between the company and the local social-economic context. The Agency is, furthermore, to carry out the task of implementing development policies of the existing activities/concerns and the task of management of the connections between the external investment and the territory; in this way one aims at maximising the impact that an external investment can produce on the territory, in terms of potential connections with the existent concerns/activities. The dual role is on one hand to activate, exploit and promote an intense network of relations within the local system and on the other hand to create a link with the outside, promoting economic specificity and territory development potentiality, establishing contacts with international business. Its procurement/brokerage concerns improving local-global relationships in order to guarantee its correct competitiveness within the territorial system.

Promoting local territorial context and in particular investment opportunities in the area cannot exclude service connections/know-how and utility within the territory, to be seen qualitatively differently in the eyes of external potential investors, thus stimulating demand; nor can it exclude the request for external investments on the basis of the sole consideration of minor costs adopted by the companies, as a reason for their nomination; but if anything the choice should fall on companies that compete on the basis of parameters such as process innovation, product innovation, environment friendly, technologic innovation. The established choice should cover comprehensively element-opportunity investment, conditions and convenience of a serviceable area for productive induction, services placed at disposal for the planning and realisation of the investment, present productive activity, collaboration with local investors.

Financial methods/procedures and tools

For the Agency to operate, tools are required that indirectly but positively contribute to its approach, although they may not be within its full availability. Hence attention must be paid to tools of a financial nature. However, relatively reduced distinctive importance and their interest as a competitive advantage may be, having a different extent of intensity over the entire national overview, and though said tools do not sufficiently favour company localisation, requiring other approaches to exploit social and economic conditions in the area, nonetheless the preparation tools of a financial nature conditions the choice of the place of induction/establishment of the productive concern and is therefore necessary for a territory which does not contemplate it.

On the capital market the lack of actual capital negatively affects small and medium sized companies, in particular high-tech companies and new companies with high growth/expansion potential, also companies with reduced expansion potential that cannot find finance/loans for their expansion projects without outside risk or venture capital. Furthermore, finance systems based on loans, and therefore debt capital (borrowed capital), and not enough on the risk capital, hinder the creation of small and average sized companies/businesses, as the companies cannot sustain the costs/expenses of the guarantees requested by the credit institutes. In similar conditions, public aid concessions to support the supply of venture capital may represent, in some cases, a means to encourage private capital. In this sense risk capital emerges intended as equity loan (equity stakes in the company and shares issued for investors) and quasi-equity (investment whose return is based on profits and on losses of the destined company and are unguaranteed should the company go badly) to companies in the initial stage of their growth/expansion.

The need of the companies to increase their own capital, to diversify finance sources, to substitute short term debts with mid-term or long-term debts and to increase contractual power with the banks, refer to further investments. A greater contribution of its own capital is required to attain investments in innovation, to sustain and support internationalisation processes, to amend/adjust an organisation process; furthermore, the supply of an adequate patrimony allows the company to procure capital, to have at its disposal a better rating and to obtain less onerous financing. The requirement of the small and middle-sized companies to increase its own capital, with an interesting industrial project and with potential expansion, may be satisfied through private equity operations on the part of public or private subjects: closed-end funds promoted by banks or private companies, finance participation company, public holding companies, regional financing. This type of operation consents acquisition of holdings in the companies of mid and long term, with the main objective being to sustain the expansion of the company through strengthening of capital, support of industrial projects, partner substitution, solutions to problems to do with generational transition, to internationalisation, objective..... aimed at reaching a capital gain on share sales. It is an unquoted investment concern/activity in company risk capital, aimed at exploiting the company concerned in the investment in order to divest within a mid-long term. In particular, venture capital activity regarding investments in the initial and delicate phases of the business/company cycle, is a moment of private equity directed at private equity funds specialised for small and intermediate sized companies fulfil the fund-company alliance through acquisition of a minority stake/holding in the companies. As minority partners, the funds work together with the entrepreneur for the growth of the company, and in turn the holding value, to be resold to the entrepreneur himself or herself earning on the capital gain. The advantages for the company deriving from the entry of the fund are realised in terms of development initiatives, such as acquisition of new firms, de-

location, export increase, power versus the banks and suppliers, procurement of expert managers, synergies and partnerships with other firms, easier generational transition.

As concerns the company's choice of investor, the role of institutional investors in the risk capital is not limited to the capital contribution, but is a strategic and organizational type of contribution: strategic support in the choice of investment, contribution of managerial competence and consequent reorganisation of human resources, fiscal planning, management contribution especially in family businesses, acquisitions, international agreements and contacts, improvement of the company's image on the market and banks, improvement of management control systems. Alternatively, participative financial tools/tools are mixed tools/tools associating share and bond characteristics, giving the right to capital redemption and payment of interests, depending on the performance of the company. The unitholders are allowed a holding in the financial results of the company; for the company the tools/tools are a further source of financing, being able to command debts whose interests are paid in function of profits obtained.

Participative loans are for example average and long term, supplied by banks without guarantees, but on condition that the company undertakes to recapitalise through partner contributions or reinvestment of profits. The advantages consist in obtaining, against a financial effort of the partners, more financing without guarantees, at concessionary rates and partly variable in function of the profits, and also an improvement in rating consequent of the increase in wealth/assets.

Through portfolio guaranteed loans, the financiers create average term credit portfolio, made up of homogeneous financing in duration, finality, technical characteristics and guaranteed by CONFIDI. The role of CONFIDI is also to be seen in concessional finance as an alternative to traditional finance sources. In this sense, since organisms have a cooperative and syndicated structure and exercise a mutual form of collective guarantee of loans in favour of partnerships or associations, they carry out the task of sorting/choosing the concessional finance opportunities, guaranteeing operative assistance and assistance in the preliminary phase. Locally, the sector associations, the Chambers of Commerce, the provinces, regions and other bodies/entities promote constitution of guarantee funds with partial or total coverage of eventual insolvencies on the part of the partnership companies versus the agreed credit institutes.

The main objective of the CONFIDI are to increase the dimension by means of bundling and amalgamations, to offer quality service at competitive prices, to offer financial services converging with requirements of small and middle-sized companies. The Agency is able to command such tools/tools and therefore candidate itself to act as collector in those mechanisms in promotional function of the territory.

²School of Business Management, Faculty of Economics and Business, National University of Malaysia, 43600 Bangi, Malaysia

³School of Economics Study, Faculty of Economics and Business, National University of Malaysia, 43600 Bangi, Malaysia

⁴Graduate School of Business, National University of Malaysia, 43600 Bangi, Malaysia

Purpose – The purpose of this paper is to investigate the effect of changes in oil price on the share prices of public listed companies in Bursa Malaysia Securities Berhad and Philippine Stock Exchange (PSE).

Design/methodology/approach – The issue of stock price sensitivities towards changes in oil price are examined based on the past literature. Using time series data from January 1986 through December 2006, the study employs Engle-Granger Cointegration test and Error Correction Model.

Findings – The study reveals that there is a significant long-term relationship between oil price movements and the performances of the two stock markets. The movements of oil price and the market indexes in both stock markets are found to be positively correlated. However, the statistical results from Granger Causality test show an absence of dynamic relationship between oil price movements and the performance of both stock markets.

Research limitations/implications – An understanding in the direction of the oil price movements or the trend movements is important for stock traders and international fund managers in formulating their investment strategies in the future. The paper offers scope for further research into the application of out-of-sample forecasting via impulse response functions and variance decomposition techniques.

Originality/value – The paper contributes to the finance literature on investment strategies and efficient market theory.

Keywords – Kuala Lumpur Composite Index, PSE Composite Index, Oil Price, Engle-Granger Cointegration Test, Error Correction Model, Cusum Test for Structural Break, Granger Causality Test
Paper type – Empirical research

INTRODUCTION

Changes in commodity prices certainly have some impacts on a country's economy. This is true with regard to the crude oil prices. Oil is a major commodity which is used in almost every aspect of an economy. The upward movement of oil price would put heavy burden on an economy as it is one of the important cost components in the production of goods and services. This has been observed recently when the crude oil price shot to almost USD140 per barrel sometime in June 2008. Numerous studies have been done on investigating the interrelationship between movement in crude oil prices and local economy (Hamilton, 1983, Gisser and Goodwin, 1986; Ferderer 1996). Most of the studies concentrate on the relationship between changes in oil price and the reaction of the economic activity that ensues.

Sadorsky (1999) and Lee (1992) examine the interrelation between energy prices, economic activity and employment. Basher and Sadorsky (2006) elucidate the strong link between energy

sector and financial markets in generating economic growth. They explain that rising oil prices will trigger an increase in production cost, which in turn dampen cash flows. The net result is a fall in stock prices. This explanation is valid in the case of manufacturing companies in which majority of them consume oil as factor input. Basher and Sadorsky (2006) further explain that as there are more companies in the world consume oil as a factor of production rather than produce oil as revenue, the overall impact of an increase in oil price on the stock markets is likely to be negative. Their research reveals strong evidence that oil price risk exerts significant impact on stock price return in the stock markets. Their findings are consistent with the results from earlier study undertaken by Ferson and Harvey in 1995.

Public listed companies in Bursa Malaysia have been the engine room for economic growth in Malaysia. These companies have a big role in the country's 'entrepreneurialization' program as they create a platform for small and medium size entrepreneurs to penetrate into new markets locally, as well as, overseas. A poor performance of these public listed companies would imply a slowdown in economic activities for the smaller size entrepreneurs. Besides being viewed as pillars in the economy, these listed companies also have a crucial role in strengthening and widening the national economic activities as a whole. These listed companies play an important role in increasing Malaysia's export value and reducing the nation's dependency on imported goods.

Due to the huge contributions of public listed companies in the nation's industrial development and economic growth, the government has taken actions to design a strategic plan for both public listed companies and small and medium size industries. In the case of Malaysia, the Ministry of International Trade and Industry (MITI) has formed Small and Medium Industries Development Corporation (SMIDEC) to help establish synergic drive between public listed companies and small and medium size industries. Nonetheless, these public listed companies are still vulnerable to the external macroeconomic factors, such as the Asian Debt Crisis in 1997 and the recent hike in oil prices in 2008.

This study tries to investigate the impact of fluctuations in crude oil price on the stock market performance in Malaysia and Philippines. The recent hike in oil price has left tremendous impact on the local economy, particularly on general price levels. As such, respective government has put up a lot of effort to curb the expectation of inflation. One of the measures involves the central bank decision to raise interest rates. Subsequent to this, consumer credit becomes more expensive and economic activities are expected to contract. Burbridge and Harrison (1984) find that oil price shocks, during the 1973 – 1974 oil embargo, result in some negative impact on USA, Canada, UK, Japan and Germany's national GNP and unemployment rate.

This study is regarded as a preliminary research with the objective to determine the effect of changes in oil price on the performance of stock markets in Malaysia and Philippines (proxied by Kuala Lumpur Composite Index (KLCI) and Philippine Stock Exchange Index (PSEi)). Haung *et.al.* (1996) examine the relationship between daily oil future returns and stock returns in the United States. They find that oil futures do lead some oil company stock returns but do not have much impact on the market indices in general. Chen *et.al.* (1986) examine the impact of oil price changes on asset pricing. They argue that asset pricing should be influenced more by "systematic" risk or the market risk.¹²⁰ They find no overall effect by oil price on stock prices. Nonetheless, oil price will continue to have impact on the economy as suggested by an OECD

¹²⁰ This is in line with the asset-pricing theories of (Ross 1976) and Cox *et.al.* (1985)

study¹²¹. It suggests that the global dependence for oil will continue, especially in the transportation sector.

Specifically, this study tries to answer the following research questions:

1. Does the fluctuation in the oil price affect the performance of listed companies in the short-run, as well as in the long-run?
2. What type of relationship can be established between the two stock market indices and the oil price?
3. What is the lead-lag relationship between the two stock market indices and the oil price?

DESIGN/METHODOLOGY/APPROACH

The research instruments used in this study involve normality test, unit root test, Engle-Granger cointegration test, ARIMA, error correction modeling, vector auto-regressive modeling, and Granger causality test to investigate the relationship between the two stock market indices (KLCI & PSEi) and crude oil price (OP). The movements of these three variables against the time line are shown in Chart 1, Chart 2, and Chart 3 respectively. The KLCI and PSEi are broad-market indices and they are used as proxies for measuring the performance of stock market in Malaysia and Indonesia respectively. In the pursuit to investigate the effect of oil price changes on the performance of public listed companies, the Engle-Granger cointegration procedure (1992) is strictly followed.

Basically, this study will perform stationary tests on the time series variables, followed by Engle-Granger cointegration test as well as Granger's causality test in Vector Error Correction Model (VECM). This study takes 17 years monthly observation on changes in the level of oil price. The study period spans from January 1986 through December 2006 involving 252 data points. In evaluating the statistical relationship between the OP and the performances of the two stock markets, a procedure in Engle-Granger Co-integration test (1992) is observed. Statistical analyses will be performed to provide empirical linkage between the two stock market performances and OP. This cointegration test is a statistical concept introduced by Granger (1981), Granger (1986), Granger and Weiss (1983) and Engle and Granger (1987). This modeling technique has received wide attention among academics and is beginning to be applied to test the validity of various theories and models in Economics and Finance. Cointegration is an econometric technique for testing the correlation between non-stationary time series variables. Two variables are said to be cointegrated when a linear combination of the two is stationary, even though each variable is non-stationary on its own (at level). Take X_t and Y_t as time series variables. Usually when X_t and Y_t variables are non-stationary, it is expected that a linear combination of the two variables would also be non-stationary. However, this notion has been proven wrong by Engle and Granger (1987). According to Granger (1981) and Engle Granger (1987), components in vector X_t is cointegrated at d, b degree if:

1. All components of X_t is $I(d)$
2. There is a nonzero vector $\beta = (\beta_1, \beta_2, \dots, \beta_n)$ so that the linear combination of $\beta X_t = \beta_1 X_{1t} + \beta_2 X_{2t} + \dots + \beta_n X_{nt}$ will be cointegrated at $(d-b)$ degree where $b > 0$. The vector β is the cointegration vector.

¹²¹ Organization for Economic Co-operation and Development (OECD Economic Outlook no. 76)

In order to avoid the problem of non-stationarity, it is necessary to make use of first (or higher) differentiated data. Such differencing, however, may result in a loss of precious data points on long-run characteristics of the time-series data. However, Engle and Granger (1987) show that, if there is an equilibrium relationship between such variables, then the disequilibrium error should fluctuate about zero *i.e.* error terms should be stationary. The unit root test is important in determining the stationarity of time series data. Whether the variables tested has the tendency to return to its long term trend after a shock (*i.e.* it is stationary) or exhibits a random walk pattern (*i.e.* it has a unit root), it is an important question to be answered prior to any further data analysis as the latter would suggest spurious regression relationship. This study uses the Augmented Dickey Fuller (ADF) technique to perform unit root test. The ADF model is expressed as follows:

$$\Delta X_t = \lambda_0 + \lambda_1 T + \lambda_2 X_{t-1} + \sum_{i=1}^n \lambda_i \Delta X_{t-i} + \varepsilon_t \text{ where } i = 1, 2, 3 \quad (1)$$

The hypotheses being tested are:

H₀: $\lambda_2 = 0$ (the data is not stationary, it contains unit root)

H₁: $\lambda_2 < 0$ (data is stationary, it does not contain unit root)

Once this requirement is met, X_t and Y_t variables are said to be cointegrated and a method of Error Correction Model (ECM) can be pursued. Vector Error Correction Model (VECM) is a restricted Vector Autoregressive (VAR) method which involves Johansen-Juselius' multivariate cointegration. VECM restricts the long run behaviour of endogeneous variables to converge to their cointegrating relationship while allowing for short run adjustments. The VECM would allow us to separate short-term from long-term relationships. The VECM model is shown below:

$$\Delta X_t = \mu_i + \sum_{i=1}^n A_i \Delta X_{t-i} + \sum_{i=1}^n \xi_i \Theta_{t-i} + v_t \quad (2)$$

where: X_t is in the form of $n \times 1$ vector, A_i and ξ_i are the estimated parameters, Δ is the difference operator, v_t is the reactional vector which explains unanticipated movements in Y_t and Θ (error correction term)

The study also applies Ordinary Least Square Method (OLS), which is subjected to Classical Normal Linear Regression assumptions. Those critical assumptions are: a) time-series data must be stationary, b) residual or error term must be homoscedastic, c) residuals are independent of one another or there is no autocorrelation between residuals, d) residual distribution is normal, and e) independent variables are not related to one another or there is an absence of multicollinearity. In order to ensure all statistical findings are valid, the assumptions must be observed. For this reason, diagnostic tests consisting of Augmented-Dickey Fuller unit root test, Moments of Specification Test/White test, Durbin-Watson test, Anderson-Darling test and Variance Inflation Technique are carried out. In investigating the relationship between stock market performances and movements in oil prices, the study assumes one causal direction: changes in oil price affect stock market performances in Malaysia and Philippines. Specifically, the model of the study is developed as follows:

$$SMI_t = \beta_0 + \beta_1 OP_t + \varepsilon_t \quad (3)$$

where: SMI = Stock market Index, OP = Oil price Movements, β_0 = Intercept, β_1 = Slope Coefficient, ε_t = Error Terms

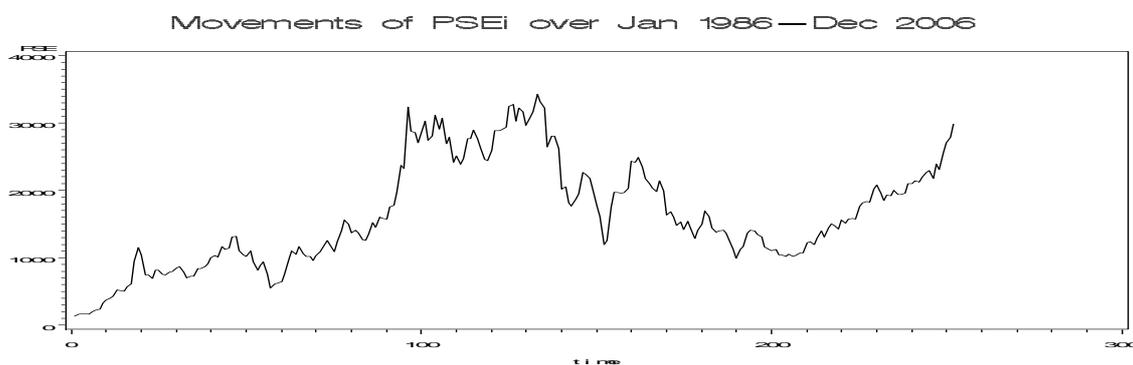

Chart 2: Movements of PSEi

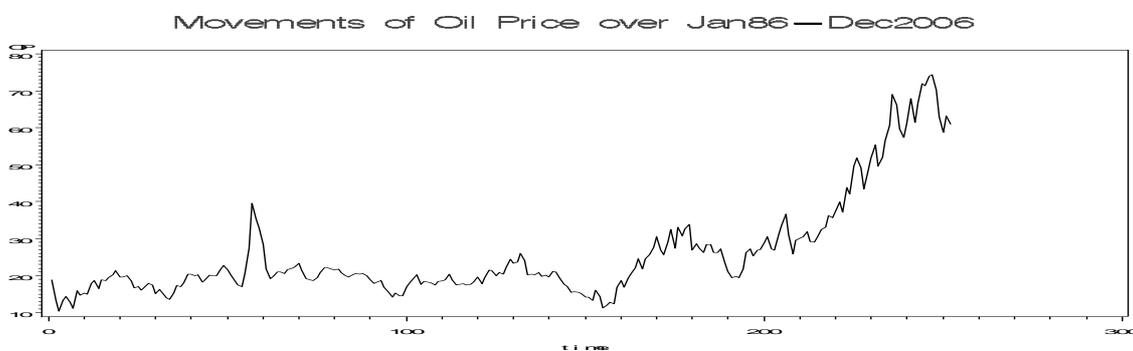

Chart 3: Movements of Oil Price (OP)

FINDINGS

To demonstrate the effect of changes in crude oil price (OP) on the performance of stock market, the procedures in time-series econometric modeling are followed. Specifically, these procedures involve OLS regression, ARIMA, cointegration test and VECM. To examine the data stationarity, Augmented Dickey-Fuller (ADF) unit root test is used and the results are shown in tables below.

Table 1 shows the results from the unit root tests performed on KLCI and PSEi. A hypothesis testing is carried out to determine the significance level of the stationarity test. P-values are reported, indicating the level of significance. The test statistics presented in Table 1 clearly show with all five different values of lags, it is noticeable that both KLCI and PSEi are non-

stationary at all lags. Similarly, the test statistics presented in Table 2 also show crude oil prices (OP) are non-stationary at all lags. On the other hand, Table 3 shows the first-differenced KLCI and PSEi are stationary and the same goes to the first-differenced OP as shown in Table 4. This implies that the two stock market indices and OP are integrated at first difference and this fulfills the primary requirement set forth in Enger-Granger Cointegration test.

H₁: Data series have no unit root (stationary)

The test result presented in Table 5 clearly shows an acceptance of alternative hypothesis for both stock markets. This statistical result suggests that there is a significant positive relationship between the individual stock market and OP. However, for OLS estimation in general to be statistically valid, Engle-Granger (1992) suggests that the error terms from a model must be time-invariant, that is, stationary. For this reason, the test for error terms stationarity is warranted. The results from Dickey Fuller test and Augmented Dickey Fuller test presented in Table 6 and Table 7 show that the long-term residual (r) is stationary at one of the lags. This finding indicates two important implications. First, having the long-term residuals stationary implies that there is a significant long-term relationship between the individual market and OP.

Secondly, having proven the long-term error terms are stationary, the individual stock market index and OP are said to be co-integrated. Therefore, Vector Error Correction Model can be mobilized for further analysis.

Vector Error Correction Model (VECM)

Vector Error Correction Model is deployed to investigate both long-term and short-term responses between the two tested variables. Based on the regression results, the optimum lag-length for the VECM lies at lag 2 (as indicated by its lower AIC). Specifically, the test results are shown in Table 8 below.

Dependent Variable : dKLCI				
Variables	Parameter	Standard Error	t-Value	P-Value
Intercept	3.0702	3.4155	0.90	0.3696

<i>l2dpsei</i>	0.0874	0.0638	1.37	0.1725

Table 9: Error Correction Model at Lag 2 or ECM(2)

The *lr* is the error correction term at lag 1 and it measures the statistical long-term relationship between oil price (OP) and the two stock markets performances. Its significance test is reported by the p-value. The p-value in Table 8 ($0.0105/2 = 0.0052$) indicates that there is a significant long-term relationship between OP and *dklci*. Meanwhile, the p-value in Table 9 ($0.0407/2 = 0.0203$) shows the same inference and both are significant at 5% level. In these two instances, the individual p-value is divided by two because VECM lies on the premise of one-tail residuals distribution. The coefficient on the error term at lag 1 is called *speed of adjustment* and it measures the discrepancy rate between short-run disequilibrium to the long-run equilibrium. Notice that the speeds of adjustment for KLCI model and PSEi model are 0.0364 and 0.0267 (ignore -ve sign) respectively. These two figures indicate that KLCI and PSEi adjust from their state of short-run disequilibrium to long-run equilibrium at the rate of 3.64% and 2.67% respectively.

Given the presence of long-term relationship between the two individual stock markets and OP, there is a potential short-term relationship between them as well. To investigate if such a relationship exists, a Granger Causality test is performed and its test statistic is reported in Table 10 below (via Simultaneous Wald F-test). The F-value reported in Table 10 indicates the acceptance of null hypothesis, which suggests an absence of short-term relation between KLCI and OP. Similarly, the F-value reported in Table 11 also indicates an absence of short-term relation between PSEi and OP. These two findings clearly show that the two models have been handicapped by their inability to demonstrate the lead-lag relationship between OP and the two individual stock markets. To ensure that the Ordinary Least Square (OLS) assumptions are in tact, diagnostic tests are performed on the two vector error correction models.

Source	DF	Mean Square	F-Value	Pr>F

Numerator	2	14635	0.61	0.5464 ns
Denominator	243	24153		
<i>ns = not significant</i>				

Table 11: Short-term Relationship Between PSEi and OP

Moments of Specification Test or White Test

To see whether the error terms have constant variance, moments of specification test or White test is performed. The test results are shown in Table 12. From the test statistic in the tables above, the study fails to reject H_0 at 5% significance level. This indicates that the residuals are homoscedastic or having constant variance for both models.

Dependent Variable (y):	dKLCI	dPSEi
White Test	<u>Pr > ChiSq</u>	<u>Pr > ChiSq</u>
	0.0794	0.1341

Table 12: Moment of Specification Test

H_0 : Homoscedastic (Constant variance in ϵt)

H_1 : Heteroscedastic (Inconstant variance in ϵt)

Test for Normality

Before any statistical inference can be made, the error terms distribution must be checked for normality. The test statistics for normality are based on the empirical distribution function, which involves Shapiro-Wilk, Kolmogorov-Smirnov, Cramer-von Mises, and Anderson-Darling statistics.

Variable: r3

Test		P-Value (KLCI Model)	P-Value (PSEi Model)
Shapiro-Wilk	W	<0.0001	0.0001
Kolmogorov-Smirnov	D	<0.0100	0.0100
Cramer-von Mises	W-Sq	<0.0050	0.0050
Anderson-Darling	A-Sq	<0.0050	0.0050

Table 13: Test for Normality

H₀: ECM residuals are normally distributed

H₁: ECM residuals are not normally distributed

The results from all the normality tests as shown in Table 13 (see p-value) indicate the rejection of null hypothesis at 5% significance level. This means that the error terms from the two ECM(2) are not normally distributed. However, given large sample size (n=252), this result is not considered to be a major shortcoming in the financial modeling.

Autocorrelation Test (via Durbin-Watson Tests)

Autocorrelation Test is performed in order to examine whether the residual are independent of one another. The test result is presented in Table 14. From the p-values reported, it is evident that the residuals are independent of one another in the two models.

	Dependent Variable: dKLCI	Dependent Variable: dPSEi
<i>Pr < DW (Positive Autocorrelation)</i>	0.2811	0.3971
<i>Pr > DW (Negative Autocorrelation)</i>	0.7189	0.6029
Number of Observation	249	249

Table 14: Autocorrelation Test

H₀: ECM residuals are independent of one another

H₁: ECM residuals are not independent of one another

Variance Inflation Test (VI)

To examine whether the independent variable are not related to one another, Variance Inflation test (VI) is carried out and the result is as shown in Table 15.

Variable	DF	Variance Inflation (dKLCI)	Variance Inflation (dPSEi)
Intercept	1	0	0
ldop	1	1.00379	1.0102
L2dop	1	1.00434	1.0102
lr	1	1.01884	1.0143
ldKLCI	1	1.00939	1.0128
l2dKLCI	1	1.01039	1.0138

Table 15: Variance Inflation Test

The test results from the above show that all independent variables in the two models are not subject to multicollinearity problem as their variance inflation values lie below 10. As a whole, the overall diagnostic tests show that the two models possess credible econometric properties and are considered statistically valid.

Test of Model Stability

Last but not least, the Cumulated Sum of Residuals test or CUSUM test is performed to test the constancy of the coefficients in the two VECM models. As shown in chart 4 and 5, the individual CUSUM analysis indicates the presence of parameter (short-run and long-run parameters) stability in the two VECM models over the sample period. This suggests that the two VECM models are stable over time or in other words, the model parameters are constant across the full 21 years (January 1986 through December 2006).

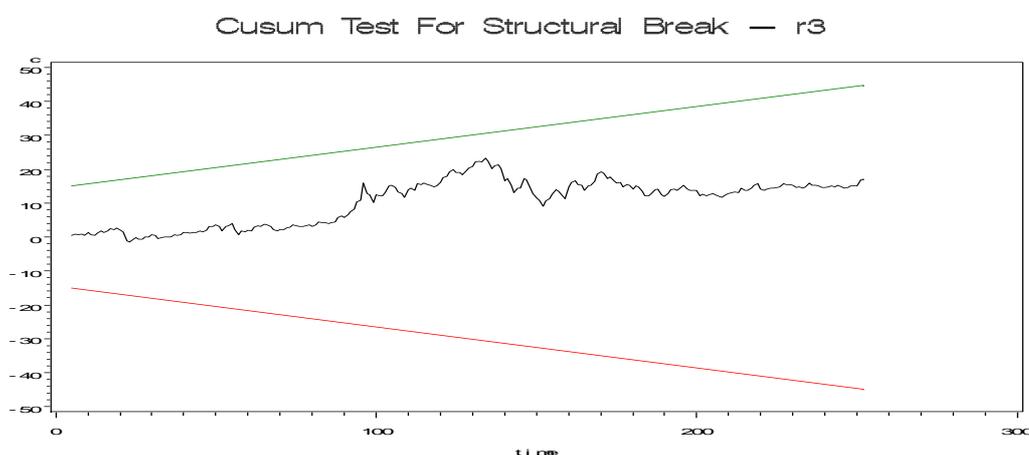

Chart 4: Plot of CUSUM in Estimated ECM(2) involving KLCI

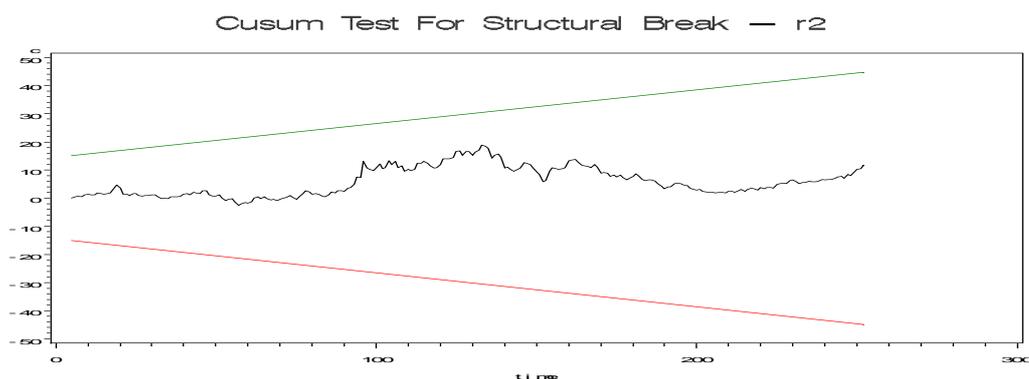

Chart 5: Plot of CUSUM in Estimated ECM(2) involving PSEi

CONCLUSION

From the evidence presented, there is a statistically significant long-term relationship between the performance of the two stock markets (KLCI & PSEi) and the movements of crude

oil price (OP). However, the empirical results from Granger causality test show no significant short-term or dynamic relationship between the two individual stock markets and OP as indicated by the statistical results in the Simultaneous Wald F-test. As such, no lead-lag relationship can be established between the two observed variables. Even though the study fails to support the presence of dynamic relation between OP and the two stock markets in South East Asia, the majority of its findings are still beneficial for stock traders and international fund managers in formulating their investment strategies in the future. For instance, a steady increase in oil price can be regarded as an early warning that the stock market is about to make a correction in its course. Although there are many other relevant factors that can influence stock market performance, the oil price movement seems to be one of the credible factors. As a whole, the empirical findings are consistent in both stock markets and therefore this study has achieved its primary objectives.

JOURNEY TOWARDS CULTURAL COMPETENCE: DEVELOPING UNIVERSITY TEACHERS

Higson, Helen E.¹

¹*Pro Vice Chancellor, Aston University, Aston Triangle, Birmingham, B4 7ET*

Purpose - This paper examines the importance of intercultural training for lecturers; describes innovative training to address this, based on a new theoretical framework; and evaluates training and framework.

Background - UK HE is becoming increasingly internationally diverse. The UK HEI population is also very multicultural. The proportion of lecturers who come from outside the UK has risen. It is, therefore, important that students develop intercultural awareness. One way of doing this is to work with students. A more sustainable approach focusses training on lecturers who will embed cultural awareness into their practice.

Method - This paper sets out a theoretical framework which underpins training developed for lecturers as part of a Postgraduate Certificate.

The paper describes the training and evaluates the effectiveness of this.

Findings and results - Findings show that participants were apprehensive about the training. Afterwards they expressed surprise at the participative approach, but were pleased with outcomes. They enjoyed the exercises and the training appeared to have opened up their outlook. They praised the freedom to share thoughts with others.

Conclusions - Findings show that participants learnt intercultural skills to use in class. This was due to the design. The nature of the training encouraged reflection on cultural diversity and participants attested to the effects this would have on their teaching. These results replicate other studies

Implications - The implications are immediate in the design of intercultural training in different contexts. It has already been used to design innovative training for students and managers. In both cases the same far-reaching results were achieved.

Keywords: Intercultural, learning, higher education, lecturers, diversity

INTRODUCTION

UK higher education is increasingly becoming diverse. In 1996/7 the total number of non-EU students at UK HEIs was 109,940, whereas ten years later this more than doubled to 239,210. The UK HEI population is also very multicultural (see HESA, 1998 and 2008). Similarly, the proportion of lecturing staff from outside the UK in British higher education institutions has risen.

At the same time, the world of work has become more global and developments in travel, technological communication and mobility have led to change in the global employment market (Ready, 2008 and Foster, 2008). It is, therefore, important that students are helped to develop an awareness of cultural differences and an outlook which will help them manage this constructively, both in their studies and when they graduate (Butt, 2007, Holmes, 2005). Kilpatrick et. al. published their frame of reference for intercultural education in 1949, but it is only in recent decades that its full implications have been apparent in the UK HE context.

One way of addressing this need is to work with students on intercultural training programmes. Previous work by this author (Higson, 2008 and Higson, 2010 in preparation) examines the effectiveness of offering intercultural training to students, using a similar intervention to that analysed in this paper. This work, however, indicates that such approaches

are not as sustainable as focussing training on teaching staff who would then embed their newly gained cultural awareness into practice, and amongst their students (Volet and Tan-Quigley, 1999; McAllister and Irvine, 2000). Teekens (2003) highlights the need for such approaches and the lack of previous attention to teacher training for the intercultural classroom. Harman (2005) goes further and in his review of the Australian literature on internationalisation and higher education notes that 'there is almost a complete absence of material on the active involvement of academics in internationalization...' (p.131). This view emphasises the importance of initiatives, such as those which are the topic of this paper.

It is important that such work is research informed. This paper sets out a theoretical framework which underpins training developed for new teaching staff as part of a compulsory Postgraduate Certificate in Professional Practice. The framework seeks firstly to encompass the needs of home (UK students) and staff, whose cultural experience is often not great (Herzfeldt, 2007); secondly, the needs of overseas students and staff who bring a mixture of learning approaches which can enhance the cultural experiences of their home colleagues and should not merely be regarded in 'deficit' to UK learning approaches (Ippolito, 2007); and finally, the needs of a very complex complete learning community which should not be stereotyped, but bring a range of 'stories' with them (Welikala and Watkins, 2008).

This paper describes the training intervention which was developed on the basis of this framework, and evaluates the effectiveness of this training.

LITERATURE REVIEW

As mentioned earlier, until recent years there has been little concentration in the literature or in practice on the training of academic staff as a method of preparing students in an intercultural classroom (Ismail and Hull, 2001; Tamkin et. al., 2002; Bodycott and Walker, 2000). There has, however, been much work on approaches to training students. The underlying principles on intercultural learning approaches are the same for both constituencies and this is why the author of this paper uses the theoretical framework set out below as the premise to all such interventions. This literature review will, therefore, concentrate on the literature that focuses on preparing academic staff for intercultural training and the section on the theoretical framework will look more on intercultural awareness generally.

For Rogers-Sirin and Sirin (2009) the need to ensure that teachers are culturally competent is 'a professional requirement, not a personal choice' (p.19). In order to test their view they devised a training intervention and, as with this study, carried out pre- and post-tests to find out how effective the training had been. The result, as with this research, was very positive. Participants showed more cultural competence after completing the workshop. This study used both a self-report methodology and a behaviour-based measure. Badley's (2000) work explores just what global competence is in university teaching. He follows this up by asserting that discipline knowledge and teaching skills are not enough for globally competent teachers. In addition you need a 'transformatory' approach to education.

Amongst those realising the importance of training staff, Teekens is a front-runner, particularly in her 'Profile of the Ideal Lecturer for the International Classroom' (2000 and the development of this in 2003). She has been followed, for example, by Butt (2007) within leisure and tourism, Traversi and Fabi (1998) within Italian schools and Stone (2006) more widely within universities. These authors present projects to help teachers build up their ability to teach intercultural groups. Nash (2007) asserts that cultural competence training should be an integral part of the curriculum for staff and students.

Like Teekens, Resnick (2006) and Olson & Kroeger (2001) aim to develop very specific sets of competencies to guide teachers in teaching multinational student groups. The latter's approach uses research which comes to the same conclusions as Herzfeldt (2007) (part of the underpinnings of the theoretical framework in this paper). Olson and Kroeger (2001) found that the number of cultural experiences which teachers had had (including a second language and experience teaching overseas) increased their ability to teach to mixed international groups. A similar finding is expressed in Walker et. al. (2007), in a study which puts forward the need to develop 'moral literacy' in schools and colleges, and by Abdullahi et. al. (2007) in their study of library staff. Ziegler (2007) takes Herzfeldt and colleagues' approach one step further. She agrees that the more direct encounter with different cultures, the better, but also thinks that reflection on these experiences is essential. The implication of this is that true intercultural learning is only achieved via a solid strategy and programme, one which facilitates deep reflection. Conway (2008) concurs that effective intercultural competence training for staff must be highly interactive and Monthienvichienchai et. al (2002) adds that communication competence is essential. This is another reason why the innovative training intervention used in this research was developed.

A feature of the new approaches to teaching and learning mentioned above, and one which is central to the current study, is the need to break away from traditional learning and teaching methods, and to find new approaches and new means of expression. It was for this reason that the research in this paper is based on interventions using the arts. Bar-Shalom et. al. (2008) also identify the need to abandon old methodologies in order to develop new models and discourse. They identify the ramifications and discomfort which such approaches can bring, many of which are mirrored by the reactions of the teacher-participants in this study. Critical self-assessment and re-evaluation is clearly a necessity and a pre-cursor to effective change (Hurtado et. al., 2008; He and Cooper, 2009).

THEORETICAL FRAMEWORK

The theoretical framework which underpins this paper is based on three previous studies described below (see Table 1).

Herzfeldt (2007) investigated cultural competence amongst undergraduate students. Her research showed that the effectiveness of an individual to work in international group situations increased incrementally with the number of international or intercultural experiences that person engaged in. In summary, anyone who has studied foreign languages or has spent time studying or working abroad will be a more effective international learner than those who have never been abroad or studied another's culture. According to these criteria many students, from the UK in particular, lack cultural experience. This low cultural competency has a negative impact on group and collaborative work, and on the student and staff experience. At the very least, it is not maximizing students' learning experience. For this reason it is important to increase the opportunities for cultural experiences. This may be by making extra-curricula language tuition available, arranging study trips abroad or ensuring that students have the opportunity of experiencing the kind of innovative intervention which is the subject of this paper.

The theories underpinning Herzfeldt's study, and thus this research, is the theoretical model of cultural learning developed by Yamazaki and Kayes (2004) and based on Kolb's (1984) experiential learning. Such developmental learning increments over time, as the participants gradually learn about different cultures; getting used to varying norms and building up new forms of behaviour. This links with the second set of theories underpinning Herzfeldt's work;

that of personality (Van Oudenhoven and Van der Zee, 2002). Her research suggests that those who have more cultural experiences not only operate more effectively in intercultural situations, but also develop a greater 'multicultural personality' (specifically open mindedness and social initiative). Their ability to reflect on life in general is increased.

Importantly for this research, Herzfeldt found that UK home students showed a lower cultural competence than international students. This was due to their lower number of cultural experiences and to the UK's individualistic learning culture as compared to the communalism experienced by many overseas students (Waistell, 2009). This led to the first strand of the framework underpinning this research: the need to increase the cultural experiences of UK students.

The second strand of the theoretical framework is encapsulated in the work of Ippolito (2007), who asserts that 'deficit' models are often used to frame international students' assimilation into UK education, as identified also by Cadman (2000). There is much research on how overseas students can be 'enabled' to succeed academically in the HE environment, rather than acknowledging what such students can bring to the UK learning experience. In order to ensure that overseas students can achieve in the same way as home students we need to make our learning more inclusive. The theory which underpins Ippolito's work is that linking critical pedagogy with intercultural communications (Helmundt, 2003), which challenges assumptions that international students should merely adjust to with how learning is oriented in the UK. Furthermore, the cultural experiences of overseas students can be used to increase the cultural experience of their home-based peers in the classroom (Ward, 2001).

The natural corollary of the framework which is being built up is that, as well as finding ways which increase the intercultural capital of both home and overseas students and staff, in their separate ways, one needs to build intercultural training that is much more flexible than has traditionally been the case. (see Kember and Gow, 1991). This must be training which avoids stereotyping and which a range of participants can respond to. This is where the work of Welikala and Watkins (2008) is particularly relevant. The premise of their book is 'the concept of cultural script' (p.2), and the importance of taking into account the varying cultural scripts which learners have. Rather than the traditional view of the lecturer as the 'respected guru' (p.16), these authors suggest that peer interaction is important (p.48). Learning should be based on a set of interactions between participants who will all bring different cultural scripts. Welikala and Watkins suggest that these scripts are important learning resources rather than barriers and they use the discourse approach to intercultural learning espoused by Scollon and Scollon (1995).

Welikala and Watkins suggest that all participants can be helped to benefit each other to develop intercultural competence. This third strand of the theoretical framework brings the first and second strands together, as set out in the table below.

<i>Home students</i>	<i>Overseas students</i>	<i>All students</i>
<i>The effectiveness of an individual to work across cultural boundaries increases with the number of their international/intercultural experiences</i>	<i>It is important to challenge the deficit model of intercultural training where the UK approach is seen as the best</i>	<i>Building training on individual stories rather than stereotypes</i>

<i>Developmental learning theories</i>	<i>International communication theories</i>	<i>Discourse theories</i>

Table 1: Framework for developing Intercultural Awareness training

METHODOLOGY

Training intervention

Based on this theoretical framework, an innovative intervention was designed and run in 2007 in our Business School. The School looked for a practical way in which it could use the theoretical framework to increase the international/intercultural experience of its home students, help the international students to combine their learning approaches with UK-centric approaches, and ultimately devise an interactive intercultural awareness workshop which benefited everyone. Students could thus leave the University able to make a greater contribution to the international community as more effective international managers. At the same time School managers wanted to do this in a way which was innovative and inspiring because the framework suggested that reflective approaches were more effective. They wanted to follow Sanderson's (2009) advice: 'Be bold to take calculated risks in your teaching' (p.70).

The School linked with an organisation called Arts and Business that seeks to bring businesses together with the artistic community to their mutual benefit. Building from the original theoretical framework, Arts and Business and the MAP Consortium devised an intervention which would inspire and develop the intercultural team-working skills of the business school final year students. Similar work in other contexts is reviewed by Darse (2005).

Having used this approach with students, in 2008 the author integrated the same intervention into staff training. The assumption being that it would have similar effect in increasing intercultural competence and be more sustainable in the HEI's learning community.

The relationship between arts practice as a means of reaching out across cultures is well analysed in the literature (for example, Bailey and Desai, 2005; Thomas and Mulvey, 2008; Liddicoat, A.J. and Diaz, 2008). Wolf (2008) analyses the effectiveness of moving away from traditional teaching methods towards more student-centred and expressive methods of addressing culture in the classroom. She shows that such a method will help students to be evaluative and act in a culturally inclusive way. The reasons for such results are explained by Wesley (2007), and further analysed by Crichton and Scarino (2007), who emphasise the importance of interaction as the key principle in the practice and development of intercultural awareness (p.15). A theme of much of this literature is that greater cultural competence comes from active learning. Through the arts, people can learn more holistically, they have a great chance of interacting with different nationalities and cultures and are able to form connections with others more easily. 'Participating in the arts gives adults experiences, contexts, and tools to help them reexperience, revise and reconceptualize multicultural diversity in their lives and communities' (Wesley, p.13). Wright (2006 and 2007) follows this up by exploring how meaning can be recreated by engaging in creative activities with diverse cultures through individuals responding to an art form.

Surveys

The research for this paper was carried out via two mixed methodology on-line surveys with the participants on the programme; first before they undertook the training and then afterwards. Each survey incorporated some quantitative background data and some reflective qualitative responses to the intervention. This methodology was adapted as it was similar to that used by Herzfeldt (2007) and Ippolito (2007) (and also Rogers-Sirin and Sirin (2009), described in the literature review above).

The purpose of the surveys was to find out attitudes to the intercultural competence training sessions held as part of the Postgraduate Certificate. The surveys were web-based and consisted of two parts; Part One conducted before and Part Two after the residential during which the intercultural training took place. The respondents represented all disciplines of the University. Half were British, the others from three other European countries.

FINDINGS AND RESULTS

Part One: Pre-training

Eight respondents (out of a possible 12) completed the initial questionnaire prior to the training. One of the respondents chose not to answer seven open-ended questions. Four respondents described their ethnicity as White-British; three as White-Other; and one as Mixed-Other. Five respondents stated their native (first) language was English; and one each gave it as: French; Russian; and Spanish. Two respondents reported fluency in English and competence in another European language. Four respondents reported no competence in any other language and one did not answer this question. Five individuals responded affirmatively to the question as to whether they had studied or worked abroad. Two of them had student experience and one respondent reported both student and working experience. The remaining two described their international work experience.

The survey dealt with the respondents' expectations of the intercultural training part of the Postgraduate Certificate. It is worth summarising their responses in some detail:

- 'I'd hope some very specific examples - I prefer to learn from situational items, preferring to hear how another person dealt with it. I'm hoping it won't be a lot of hand waving and generalising statements.'
- 'I am hoping this training will help provide me some guidance to deal with issues as part of my teaching as home students often report difficulties to work with international students.'
- 'Not sure. I'm firmly against communalism and believe individuals should be treated as individuals. They should not be treated as part of some larger block or community, and be assumed to hold to certain ideals that other may ascribe/or push on their "group" or "community". On the other hand, it is clear that there are different cultural backgrounds, and that responses to students should take account of these differences.'
- 'To broaden my research into other cultural areas, to find new sources of materials for my teaching and research, to enrich my personal view of the Higher Education environment.'
- 'Fuller understanding of cultural differences and their effect on the learning process.'
- 'Improved understanding of and communication with people from different cultures. An ability to bridge cultural differences between students, help them feel fully included in the study group regardless of ethnic background and learn with equal effectiveness within the same environment.'
- 'An understanding of where different cultures require different teaching approaches'.

In summary, the findings of the pre-training survey show that the participants were apprehensive at the kind of intercultural training they might be going to experience. Many of them were looking for some very specific examples of situations where intercultural awareness

was important and practical suggestions on how to handle these situations. All of them hoped that there would not be a lot of "hand waving and generalising statements".

After the training session the same eight participants completed a questionnaire giving their opinions on their experience

Part Two: Post-training

Participants were asked what they had been expecting to get out of the intercultural training. Again, it is worth quoting some responses to show the degree to which the intervention had moved them from their original position. It is noted that the language used here is highly reflective of the training which had been delivered.

- 'Ability to bridge cultural gaps between the students, enabling them to learn with equal effectiveness.'
- 'Some ideas as to how to avoid any cultural difficulties when teaching.'
- 'I was expecting to improve my ability to deal with diverse groups of students (i.e. international students, EU students, diversity within UK students).'
- 'Post-modern all cultures are equal multiculturalism that tries to force people into stereotypical cultural boxes, rather than respecting their individuality and right not be confined by the culture they grew up in.'
- 'Improved teaching and learning skills.'
- 'Understanding of how to work better with students of different nationalities. Is there a difference in the way they learn?'
- 'Better ability to interact with international students and colleagues both with respect to relational outcomes and professional achievements.'

When asked what they thought was the best aspect of the intercultural training, the participants offered the following. Again, to give a flavour of the actual responses some are quoted in full.

- 'Demonstration that culture had so many aspects, increase in confidence.'
- 'The perception exercise forced me to consider how my background and experience moulded the way I see things.'
- Meeting others on the course.'
- 'I think the best aspect of the training was the way we were all involved in exercises which highlighted intercultural differences within the group. I also believe that the fact that the training was held off site helped build a close community of learning.'
- 'The fact it did not live up to what I was expecting, and instead focused on people as individuals and how one could adapt one's responses to an individual. The challenging nature of the training. The introspection it led to.'
- 'Meeting new members of staff. New ideas on delivering high quality teaching.'
- 'The freedom with which we could express and share our thoughts with other participants.'

The answers to the question on the worst aspect of the training varied from the physical: ('Sitting on the floor'; 'The human sculpture exercise took me way outside my comfort zone') to

content-related ones ('I think some aspects of the training may not be applicable in some situations i.e. they may be easier to apply with small groups than in very large groups i.e. 200 students').

All respondents felt they learnt skills they will use in the future, and then described why:

- 'The training encouraged deep reflection on the nature of cultural diversity and its effects on learning and teaching experience.'
- 'I will always question what I think I am seeing in future'.
- 'I believe that the training will help me communicate with intercultural students and will also help me realize the variety of student needs.'
- 'I just think it made me more open to empathising with others and examining my own views.'
- 'New engaging and dynamic teaching approach.'
- 'I started thinking about questions discussed within the session.'
- 'One for all, being better able to understand how the same notion of cultural issue is perceived by people from different cultures.'

When asked in what way the training made them rethink their approach to teaching, the following replies were forthcoming.

- 'It demonstrated importance and fun of group work, divergent teaching and learning expectations (often dependant on cultural perspective). I was more determined to find out about my students and was more convinced in importance of feedback.'
- 'The training helped me think 'outside the box' and consider innovative methods of teaching.'
- 'Take note of the intercultural diversity among the group.'

Next, the survey focused on what aspects of the training respondents thought would be useful in their careers. Whilst two respondents thought there would be no useful aspects, a further two valued the newly-established peer links ('Bonds with colleagues established during the training. Increased confidence in interaction'; 'I've met new colleagues and happy to collaborate with them in the future'.) Two respondents thought their teaching was to benefit: ('Anything related to improving my teaching skills will certainly help in my future academic career'; 'Awareness of the importance of culture for teaching'). One respondent stated the useful aspect was introspection.

Two questions dealt with the possible applications of the training in the future. The first one was concerned with how the training will be used in teaching. Two respondents were not sure. Two respondents were planning to focus on visual aids. The remaining four offered following answers:

- 'Ask for and give feedback, introduce more interaction and debate.'
- 'I will consider introducing new learning and teaching styles in my future teaching.'
- 'will help me to find a way how to encourage/persuade students to work in groups'.
- 'include reflections on cultural issues when preparing materials and lectures, and when designing evaluations.'

When asked to make suggestions for the future with regards to intercultural training, the following was reported:

- 'Undertake case studies illustrating where cultural issues have caused problems in the classroom, and how these could have been avoided or overcome.'
- 'More relevant subjects, experience and dealing with problems due to cultural differences.'
- 'Don't turn it into training about race and religion Keep it about responding to individuals and their needs, and respecting them as people not stereotypes.'
- 'More practical suggestions so to give to students.'
- 'State the objectives better. Make people more aware of what they are doing and why: self-reflection is ok but takes time to be effective.'

All participants expressed surprise at the highly participative manner of the training, but many of them were pleased with the outcome. The most strongly expressed view was that they had enjoyed the involvement in the exercises (although they expressed discomfort at the physicality of the event), and that it helped build up a close shared community between the participants. (This was evidence that the participants were living the theoretical framework.) Most importantly, the training appeared to have opened up the participants' minds and outlook and they praised 'the freedom with which we could express and share our thoughts with other participants.'

CONCLUSIONS

This paper successfully brings together for the first time a research-informed model for intercultural learning for home and overseas students with sustainable proposals to embed this in the curriculum via teacher training. The findings show that participants had learnt important intercultural skills which they will be able to use in the classroom. This effectiveness was due to the design of the training which took account of the differing, complex but inclusive, learning styles identified in the theoretical framework. The nature of the training via artist practitioners appears to have encouraged reflection on the nature of cultural diversity, and participants attested to the effects that this was going to have on their learning and teaching practice. It could be suggested, as it has been by Ladson-Billings (1995), that these approaches share the features you would expect from any good teacher – active learning which seeks to maximise and respect the approaches of all learners and which encourages them to be reflective, taking responsibility of their own learning and that of their colleagues (individually and communally).

The findings clearly replicate a number of key features of effective intercultural learning identified as important in other studies referred to both in the literature review and theoretical framework. These include the discomfort which is likely to be experienced by the participants (He and Cooper, 2009) and the need to help participants over this on the basis that it leads to greater learning. They also include the ability to create a learning space where connections can be formed (Wesley, 2007), peer interactions increased and cultural experiences incremented. The openness clearly created by the training reflects the ethnographic approaches to cultural learning which Bradley (2000) advocates, which creates openness and allows participants not just to call upon the intellect but to absorb themselves in until the familiar is strange and the strange is familiar (p.248).

IMPLICATIONS AND FURTHER WORK

The implications of this work are most immediate in the design of intercultural training and the framework developed could be used in a number of different pedagogic and work-based contexts. Indeed, the author has already used it to design innovative training for students and board room level managers. In both cases the same far-reaching results have been achieved.

Despite the findings clearly replicating much of the literature. There are many limitations to this study, particularly arising from the methodology. The sample was small and the surveys did not use a recognised instrument of measurable items. It would be useful to reproduce the work, this time using both a self-report tool and behaviour-based measure, for example that of Rogers-Sirin and Sirin (2009). This would make the findings more generalisable. In spite of this, the robustness of the theoretical framework and its effect on practice is clear.

As Harman (2005) said, this area is very under-developed and is in need of investment. The implications are also important for policy makers and senior university managers, whose support, as Dunne says 'in the form of budgetary resources to fund staff training, is imperative if meaningful curricular transformation is to be realised' (2009, p.33). Having seen the results, the institution has decided to continue to include the training in its Postgraduate Certificate. This is a notable commitment to embedding intercultural learning across the institution which others should follow.

KNOWLEDGE CONSTRUCTION WITHIN THE AEROSPACE CONTEXT

Holford, David¹

¹*University of Quebec at Montreal (UQAM), CANADA*

This paper attempts to examine how knowledge is constructed within the workgroup environment of a large North American aerospace company.

Group member interactions within the firm had been evaluated across an ethnographic case study approach involving direct observations and interviews, whereby qualitative empirical results were interpreted and analysed across discourse analysis for emergent categories.

A dialogical model is proposed describing both verbal and non-verbal interactions between group members leading towards knowledge complexification.

This single case study prevents us from generalising the findings across the entire firm in question; and by extension, any manner of external validity outside of the firm's context. Additional workgroups/teams within the firm need to be evaluated; while similar studies in other institutions within the knowledge economy are to be envisaged.

The practical implications to this work suggests that workgroup managers must nurture an environment conducive towards mutual trust and respect, where individuals are given the time and freedom to express themselves all the while being open to differing viewpoints and experiences.

This paper presents the 'how' and 'why' of an effective knowledge complexifying dialogical process occurring at the interpersonal level.

Keywords: Knowledge construction, ambiguity, boundary constructions, risk induction

INTRODUCTION

Organisations can be fertile grounds for the knowledge they possess as well as create. Furthermore, knowledge creation leading towards enriched or complexified knowledge can be viewed as having both a 'defensive' and 'offensive' role within organizations: 'defensive' in that it is primordial in terms of trouble-shooting, problem solving and avoiding deleterious consequences (for example, Weick (2001) speaks of "simplications produce blind spots..." and "...with more differentiation comes a richer and more varied picture of potential consequences"); and 'offensive' in that it is essential for product and service innovation (Nonaka and Takeuchi, 2004).

Our own simplistic starting point begins with the individual within the workgroup environment on the basis that: a) organizational knowledge creation and organisational sense-making begins with the individual (Nonaka and Takeuchi, 2004; Weick, 1995); and b) the workgroup is a constitutive and fundamental entity within the organization for understanding social phenomena (Enriquez, 1992). More specifically, this paper, across an ethnographic case study, proposes a dialogical model describing both verbal and non-verbal interactions between group members leading towards knowledge complexification.

A FEW WORDS ON KNOWLEDGE

Knowledge is seen as occupying a central place in contemporary modern societies. Yet numerous equivocal concepts have resulted in a range of definitions. Some have come to see it as being divisible into two broad categories: namely, representational and anti-representational knowledge (Kakihara and Sørensen, 2002; Von Krogh and Roos, 1996). The representational view sees knowledge as being a representation of a pre-given world with these representations resulting from human cognition (Kakihara and Sørensen, 2002), where cognition in this case

consists of purely 'rational'/logical dimensions. Such knowledge, being universal and codifiable, is seen as being storable and easily transferable in a controlled manner between individuals and organizations in formal and systematic manners (Szulanski, 2000).

The anti-representational view sees knowledge as interpretation, as relationship and as process (Kakihara, and Sørensen, 2002):

1. Knowledge as interpretation emphasises the tacit and personal subjective aspects of knowledge that is hard to formalise and hard to communicate, share or transfer.
2. Knowledge as relationships emphasises that knowledge is intrinsically relational to its surrounding world. Knowledge is a result of human mental acts, be it individual, group or social, and those acts are interdependent on various socio-cultural contexts.
3. Knowledge as process emphasises the dynamic and fluid aspects of knowledge, emerging from the interaction between subjectivity (e.g. beliefs, emotions, etc.) and objectivity ('truth'). Furthermore, knowledge is seen as a non-static entity resulting from the process of 'knowing' by which human beings make sense of the world.

Furthermore, the knowledge taxonomy of non-representational vs representational can be transposed into an alternative taxonomy of tacit vs explicit knowledge (Nonaka and Takeuchi, 2004). Explicit knowledge covers all of the representational view of knowledge, but also overlaps onto anti-representational dimensions. These latter dimensions cover the very nature of the interpretative/contextual semantic aspect of language such as interpretative ethnographic texts (Geertz, 1998), text as discourse and fiction (Van Mannen, 1988), etc. Tacit knowledge on the other hand is solely non-representational in nature, which Takeuchi (2001: 319) divides into 'technical' and 'cognitive' aspects: the former being related to "informal and hard-to-pin-down skills and crafts" as well as "subjective and personal insights, intuitions, hunches and inspirations derived from bodily experience"; and the latter being related to "beliefs, perceptions, ideals, values, emotions and mental models so ingrained in us that we take them for granted...yet shapes the way we perceive the world around us".

Beyond the tacit/explicit categorisation, other authors have proposed additional 'types', such as Scharmer's (2001) 'self-transcending' knowledge typically associated with artists with their "ability to sense the presence of potential; to see what does not yet exist" (2001: 68).

Our 'knowledge of knowledge' is a continuously emerging field integrating various contrapositions (e.g. representational vs anti-representational knowledge (Kakihara and Sørensen, 2002); or tacit vs explicit knowledge (Nonaka *et al*, 2004)), where "knowledge is created in the spiral that goes through pairs of seemingly antithetical concepts such as order and chaos, micro and macro, part and whole...tacit and explicit, self and other, deduction and induction..." (Nonaka *et al*, 2001: 14). In essence, knowledge and its creation have an infinite range of ambiguous¹²² or antithetical concepts to tap from as knowledge expands ontologically from the individual to Society (Nonaka and Takeuchi, 2004). Hence knowledge can be seen as a *synthesis of constantly emerging polysemic antithetical concepts*. This position is also congruent with Weick's (2001: 60 and 167) argument that with "diverse views", "ambivalence" and "...more differentiation comes a richer and more varied picture of potential consequences"; and that constancy of ambivalence ensures required organizational flexibility and resilience, since it

¹²² Here we adhere to Weick's (1995) definition of ambiguity as being actions, ideas or concepts that are contradictory or "capable of being understood in two or more possible senses..." as opposed to a second definition of ambiguity which often refers to "obscurity" (Webster's Collegiate).

generates necessary re-adjustments to preceding actions, which if left unchecked can lead to significant consequences.

The Individual and the Workgroup as an Ontological 'Starting Point'

Our own starting point as to which ontological level ambiguity, contradiction or equivocal points of views are first integrated is at the level of the individual (Nonaka and Takeuchi, 2004; Weick, 1995). Furthermore, we are also interested in examining the individual within the context of a workgroup environment. According to Enriquez (1992: 97 and 101), "the group constitutes the privileged location for the comprehension of collective phenomena", in which the "group only establishes itself around an action to accomplish, a project to work on or a task to complete". Group members interact with one another whereby "communication is often viewed as the central process of the group" (Levi, 2007: 4). Keeping in mind that communication across dialogue is, according to Nonaka et al (2004), a prime mechanism for the sharing, conversion and creation of organisational knowledge, it is therefore at the level of the workgroup that we first ask ourselves how and to what degree ambiguity is integrated.

RESEARCH AIM AND METHODOLOGY

This research sought to determine how knowledge is constructed within a large North American high-tech firm. Towards this end, our intent was to study one or more work groups within a given firm. More specifically, we wanted to observe the interactions and dynamics both within a given group and across its boundaries.

Field site

The research site, given the pseudonym, NorAm Aircraft Engines, is an aircraft engine manufacturer which employs over 4000 people world-wide. Preliminary discussions with a first workgroup (the Engine Operability Development or EOD group) not only confirmed their interest and acceptance to participate, but were involved in regular bi-weekly meetings with another work group that had not been initially identified (the Engine Component Rig Testing or ECRT group). This second workgroup was also approached, and accepted to participate in the study.

The EOD and ECRT Workgroups

The EOD group is responsible for ensuring the development of adequate engine operability *envelopes* throughout all phases of engine development programs. The proper establishment of the engine operability envelope is of critical importance, in that it delimits the boundaries beyond which the aircraft risks running into critical compressor surges or other types of catastrophic engine failures. EOD group members have a good general understanding of the various engineering disciplines involved in engine design and development. A principal objective of the EOD group is to ensure meaningful engine component test data is generated. Establishing the type of engine test data to be generated is negotiated between the EOD group, the various engineering specialty groups, and the ECRT group; the latter being responsible for the generating and integrity of the required engine component test data. In turn, the ECRT group's responsibilities include the development and preparation of component test rigs (required for each new engine development program), their subsequent test runs, and the

proper collection of the test data. Both groups interact with each other daily (informal) and also meet bi-weekly.

Data collection

A qualitative ethnographic case study approach was adopted using direct non-participatory observations and interviews. Observation notes were complemented with digital recordings of on-going interactions between individuals. Interviews were either semi-structured or ad hoc in nature.

Within this perspective, it was especially important to be vigilant for 'emergent' categories, and hence borrowed from Schwartzmann's (1993:47-72) ethnographic studies in organisations involving a dialogical inductive-deductive process between empirical evidence and theoretical elaboration across thick descriptive writing. Although ethnography is typically reserved for larger cultural systems, and case studies to bounded systems or "units" (Cresswell, 1998: 66), the synthesis of the two approaches has often been adopted across *ethnographic case studies* (Prosser, 1995; Beaulieu, Scharnhorst and Wouters, 2007).

The primary unit of analysis for our study consisted of the bi-weekly inter-group meetings between the EOD and ECRT workgroups. The period of time investigated was from early February 2007 till early May 2007.

The research design criteria were based on *trustworthiness* (Lincoln and Guba, 1985) and *reliability* (Yin, 2003) across rigorous data collection as per Spradley (1980).

Data Analysis

Descriptive data from observations and interviews were manually analysed and interpreted in a separate journal as per Spradley (1980). The nature of the data that was collected (digital recordings and hand-written observations) allowed us in many cases to analyze for *cues*. These cues being both verbal and non-verbal in nature, were essentially in-line with the more recent streams of discourse analysis, whereby non-verbal aspects (e.g. voice tonality, facial expressions, body language, etc.) bring forth important contextual information (Dickey *et al*, 2007).

RESULTS: THE BI-WEEKLY INTER-GROUP MEETINGS

My first and lasting impression upon assisting the bi-weekly inter-group meetings between EOD and ECRT was of a high degree of camaraderie within each group as well as between both groups; extending itself between the two group managers (Gerry and Frank).

The meetings themselves lasted anywhere between 40 to 60 minutes. With time, we were able to confirm within each meeting the existence of three chronological periods which seemed to naturally flow from one to the other; namely, the pre-agenda, the 'formal' agenda and the post-agenda meeting periods.

The pre-agenda period consisted of the initial 5-10 minutes of each meeting. During this period members would either joke and cajole one another; informally discuss technical issues that were not necessarily part of the formal agenda; or simply converse on various social topics (little league hockey, house renovations, car problems, etc.). On other occasions, members discussed specific technical issues related to joint project activities. This was often accompanied by the act of sketching a particular view of a rig or engine component that one member was trying to describe, justify or clarify. Throughout such conversations sketches were often drawn and modified in successive superimposing steps by each of the interacting members before

finally converging towards a mutually agreed 'version'. During this process, active sense-making was observed, whereby various cues indicating understanding, questioning or disagreement were easily discerned across words such as "Yep", "Oh really? I thought the chamfer had a smoother profile than that..." and "No, the airfoil cooling hole needs to be drilled at 45 degrees...". Similar types of sense-making also occurred with the use of pre-existing 2D drawing cross-sections. Here, existing blue-prints were typically modified (via successive iterations between interacting members) with pen/pencil to explain one's existing perspective (perspective-giving), understand someone else's perspective (perspective-taking) or construct new perspectives (perspective-making).

The 'formal' agenda period was always initiated by Gerry's (the EOD manager) calling out the first agenda item on the agenda sheet. The agenda sheet consisted of a series of one or two-line descriptions identifying the development engine model/test rig combination in question, the principle tasks being monitored, a completion target date for each of these tasks, and the current status of the task in question. Most members had a copy of the status sheet, while those who had forgotten it were familiar with the tasks they needed to report on (while occasionally looking at their neighbour's copy). Gerry's kick-off words such as "QA510/Gas Generator?" would prompt a response by one of the attending members. Such responses, rather than simply 'closing' the agenda item often triggered comments, inputs or questions from other members. The following example shows how such an item called out by Gerry triggers an initial status description, which is then followed by subsequent discursive dialogue amongst the various meeting members:

Gerry: "Ok. QA 720/inlet distortion test?"

Jon: "The plenum is now at the Manufacturing Development Shop and they should be able to have a look at it by this Friday – they said they'll be able to install new pads for the two new additional 'rakes'; and they'll be able to respect the distances...Its just that with those walls the spaces aren't the same anymore...we get a larger gap (uses hand/arm movement to represent the distance)

Lloyd: "Yep. One is like this and the other is like that (uses hand and arm movement to show two different space distances)"

Jon: "Ya, that's it...I managed to get some measurements on the shrouds this morning, so now we'll be able to re-assemble everything. When they disassembled the shroud section they saw that the capacity probe filters were broken; but we don't think we'll need them for the upcoming tests..."

Ian (who is not involved in the project): "That's what they figure we don't need anymore".

Jon: "And they didn't need to bolt anything down..."

Frank: "So that means it's been passing by the holes"

Despite the 'formal' agenda listing and monitoring of various items of activities related to various rig testing projects, discussions were more often than not discursive/digressive in nature and involved a good dose of humour and socialisation.

And finally, the subsequent post-agenda period of discussions seemed like an organic or blurry extension to this 'formal' period, typically involving a discursive continuation of the final agenda topic. These periods varied anywhere between 5-10 minutes within the meeting room, but could go as much as 20 minutes or more as people often decided to 'airlift' the meeting towards the nearby ECRT workgroup area.

ANALYSIS AND INTERPRETATION OF RESULTS

Various categories were discerned within the inter-group meeting context. The following subsections discuss the five main categories identified.

Narratives

Very often perspectives that were transmitted between members across all three periods of the morning inter-group meetings, were done so in the form of narratives. Here, we define the narrative form as being concerned with the temporal ordering of events, ideas and actions with a focus on “their sequential patterning, their duration and pace, their context and the role of actors” (Holman, 2000: 965). Moreover, narratives were discerned across *all* of the inter-group meetings which had been digitally recorded (10 meetings). Narrations were used as part of overall descriptive explanations given by various members to either assure others that actions had been taken, justify one’s own position, report on progress in relation to a specific activity, provide background information to the meeting audience in general or simply to present old knowledge in an entertaining fashion.

The following is an example of story-telling by Ian as he describes the status of an activity:

Ian: *“Helen came to see me yesterday and mentioned ‘This’ll be way too complicated to try and make an evaluation, and so on’...And then the union got involved by saying ‘No. The noise level is way too high. It’s out of the question people work under these conditions.’ I was a bit pissed-off in that ‘Hey! What’s the big deal? Everyone’s using earmuff’s no?’...”*

The numerous examples of narratives bring up the notion of a more general category of *perspective-giving*. But it does bring up the notion of a more general category of *perspective-giving*. Boland and Tenkasi (1995: 357) speak of narratives as being inherent to the process they refer to as “perspective-making”; but this is in relation to the individual actually generating the narrative. Yet, as Dickey *et al* (2007: 50) recently remind us in their own literature review, perspective-making, when articulated towards another individual, involves “the objective...to induce a perspective” towards this very individual known as “perspective giving or perspective setting”.

Perspective-Giving

All the above examples of narration or story-telling can be included within the more general category of perspective-giving. But many more examples of non-narrative forms of perspective-giving were observed; and constituted a major form of exchange in perspectives between the meeting members throughout all of the meetings that were attended. Here we define the non-narrative form as “being concerned with non-temporal patterns such as relationships between propositions, argumentation, descriptions, ideas and evaluations” (Holman, 2000: 965).

One example of non-narrative perspective-giving shows Gerry giving a pedagogical-like explanation to Frank and the rest of the members as to why the company takes four repeated test measurements:

Gerry: *“The reason why we take four measurements is because if ever there’s a problem you’ll see it right away...”*

Frank (interjects in agreement): *“Oh, ok ya...”*

René (agrees): *“Yep.”*

Perspective-Taking

All examples of perspective-giving would have us ask whether or not these perspectives were actually being 'taken in' by the listening members. When we refer to perspective-taking, we are not speaking of agreement on the part of the listening interlocutor but simply that he has taken the other's point of view into account before making up or readjusting his own perspective (Boland and Tenkasi, 1995; Holman, 2000).

Sufficient cues were seen and/or heard to indicate that perspective-taking was predominant across all of the inter-group meetings attended.

One example is during a technical discussion between Lloyd and Jon, in which we see Lloyd's perspective being given, and in turn, Jon taking in this perspective as seen across explicit verbal cues:

Lloyd: *"There's one part missing that's still at Assembly; it's just that Daniel Filion wants to have two inspection points taken"*

Jon (following Lloyd's words): *"...Ok..."*

Lloyd: *"The part left on the 170 truck instead of returning back to me..."*

Jon (in surprised empathy): *"Oh !"*

Revision of Perspectives

Dialogue between members within the inter-group meeting environment, where perspective-giving and perspective-taking were in constant interaction, led to perspectives being continually revised; thus echoing Dickey *et al's* (2007: 49) words, that "the ability to change perspective allows individuals to communicate with a multiplicity of partners who hold a wide variety of perspectives". It often appeared in the form of partial discreditations whereby an individual's assumption, belief or practice could be self-perceived to contain both a certain degree of pertinence while also needing to be modified in the face of another's input. At other times, we could discern an individual's *tentative* self-discreditation in the face of the other's input, reminding us of Weick's (2001) 'healthy doubt'. On occasion, a 'full' or 'complete' self-discreditation of an individual's retained assumption seemed to occur in parallel to the formation of a new perspective as a result of someone else's input.

Examples of revisions observed throughout the inter-group meetings, were easily discerned across cues such as "Oh ok, now I see what you mean" and "All along I was thinking it was doing...Now I get it."

The following example between Ian and Frank in regards to Frank's proposed idea of conducting a physical polishing in lieu of a chemical treatment (on Ian's plexiglass component) shows Ian gradually (and tentatively) revising his own prior belief that doing a physical polishing would take too much time:

Ian: *"I'm not sure if we can dip it in acid or something...just to 'melt' the surface"*

Frank: *"But you can polish it physically. It goes pretty fast..."*

Ian: *"Really?"*

Frank (turns to Lloyd): *"When you do the polishing it goes pretty fast, no?"*

Lloyd (agrees with Frank): *"Yep, it's pretty fast"*

Frank: *"They start by rubbing it ..."*

Lloyd: *"After the wet scrub"*

Ian (in a pondering tone as he parrots Lloyd): “*After the wet scrub...*”

‘Dynamic/Static Boundary Objects’ as Boundary Constructions

The different types of mediums used in *helping* to transmit perspectives within the various intergroup meeting interactions that went beyond verbal articulation included the agenda sheet, active sketching from scratch, sketching to modify existing 2-D drawings and existing 2-D drawings themselves. Some of these ‘objects’ in their static forms such as the existing 2-D drawings could be classified as repositories (Star and Griesemer, 1989). And although Bødker (1998) acknowledges the activity or mediation that occurs around most of these ‘objects’, they are nevertheless viewed as static representations. Yet in our case, all of the listed ‘objects’ were not only accompanied with some form of visible action on the part of actors, but that it was *during* the dynamic yet transient modifications of these ‘objects’ by these very same actions that perspectives were both given and taken. In our case study, the agenda sheet was actively modified across Gerry’s handwriting, as the discussions advanced from one item to the next. And in conjunction to this dynamic re-construction of the ‘object’ was the updating of everyone’s perspective of the topic at hand – i.e. we are looking at both imaginary/mental as well as physical de-constructions and re-constructions occurring in tandem.

The active process of sketching and re-sketching was found (across ad hoc interviews) to be a much more meaningful process for the participants as opposed to simply looking at the end-resultant sketch or construct. For example, in portraying gas flows within an engine combustion chamber, if the same explanatory words were used in the absence of specific motions and line drawing movements, one would have a less clear sense of the phenomena being articulated.

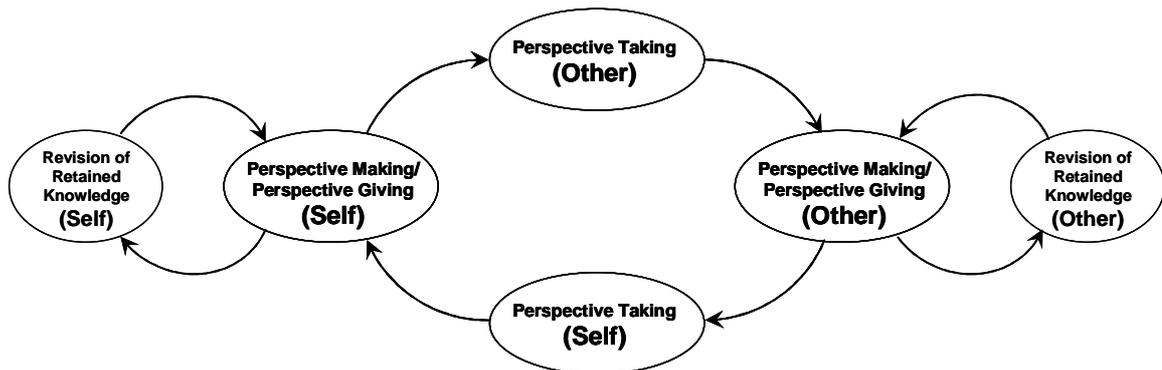

In all of these cases, we are looking at physical boundary objects being continually constructed and re-constructed by the subject-actors. Hence, we can speak of *boundary constructions*. Even 2D drawings without any visible line markings or modifications added to them, were always accompanied by finger movements across various features and physical phenomena the interlocutor wanted to bring a mental attention to (e.g. gas flows, stress distributions, a hole diameter, etc.). This created new mental bracketings (Weick, 1995), necessary for constructing new mental representations within the minds of the various interacting members.

KNOWLEDGE CONSTRUCTION ACROSS DIALOGUE

Based on the five categories observed within the inter-group meeting context, we now propose a dialogical model on how knowledge seemed to be constructed. Firstly, our analysis showed the two strong emergent categories of perspective-giving and perspective-taking to be complementary processes allowing interlocutors attain a “shared understandings” (Boland and Tenkasi, 1995; Dickey *et al*, 2007). A relatively clear transmission of a perspective not only clarifies a perspective in the sender’s mind (hence perspective-giving = perspective-making (Boland and Tenkasi, 1995; Dickey *et al*, 2007)), but is also the first step towards providing the *potential* for the receiver to take in the sender’s perspective. That is not to say perspective-taking is an automatic process as a result of the sender’s perspective-giving. Taking in the other’s point of view, as Mead (1934) explained, involves “taking the attitude of the other” and of being fully human by maintaining “an inner conversation with a generalised other”. Furthermore, “communication is unsuccessful when neither party manages to mentally ‘step into the other’s shoes’, to be non-ego-centric” (Schober, 1998: 142). Seen within the inter-group meeting environment was a continuous cycle of immediate reciprocity between the listener-become-speaker and the speaker-become-listener. Perspective-giving was received by perspective

taking, or in a more layman’s term, ‘active listening’. This leads us towards a basic ‘perspective coordination’ between two interlocutors named ‘Self’ and ‘Other’ (central ‘loop’ in figure 1).

Closely associated to the perspective giving/perspective taking process was what appeared to be the revision of perspectives in line with Krauss and Fussell (1991: 2), whereby each member’s perspective within the inter-group meeting was periodically being revised in terms of retained knowledge (as beliefs, opinions, practice, etc.). This revision of retained knowledge occurs as a result of the perspective-making process (reciprocal loop seen on both the left and right hand side of figure 1). In turn, a newly revised perspective retained by a member will also have an

influence on the subsequent incoming perspective being taken in by this same member.

Figure 1: Perspective coordination process between Self and Other.

Finally, figure 2 shows the incorporation of boundary constructions into our previous figure. Perspective-making/giving by the Self can involve the aid of a boundary construction, which in turn is taken in (perspective-taking) by the Other. On the other hand, it is quite possible that it may not involve the aid of a boundary construction (for example, communication purely via verbal articulation) in which case perspective-making/giving bypasses the boundary construction step and is directly taken in (perspective-taking) by the Other. In turn, the Other changes roles from a perspective-taker to a perspective-maker/giver and once again begins the same process.

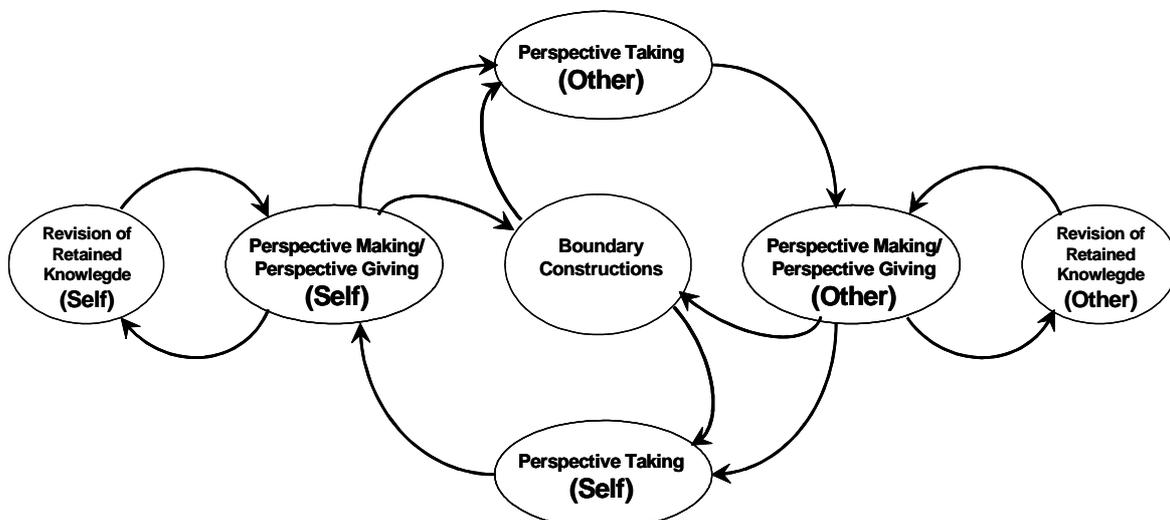

Figure 2: Perspective coordination process between Self and Other incorporating the revision of retained knowledge and boundary constructions.

Knowledge Complexification as Openness to Antithetical Concepts

As argued throughout section 2, dynamic interaction between complementary oppositions, ambiguities or antithetical concepts is an essential 'feedstock' towards knowledge complexification. In this sense, numerous dynamic contradictions were seen at work leading towards the expression and transmission of enriched individual perspectives.

One antithetical dyad at work was the co-existence, interaction and conversion of tacit and explicit knowledge. Explicit knowledge was articulated verbally (as perspective-giving) often in the form of metaphors, analogies and stories, thereby confirming Nonaka et al's (1995: 64) externalisation (tacit to explicit conversion) at work, whereby individuals use their discursive consciousness towards articulating interactive dialogue. Furthermore, perspective-taking involved the taking in of others' perspectives which often implied the beginning of learning-by-listening to others' narratives, whereby members feel the realism and essence of the story that took place so as to convert it into a tacit mental model (Nonaka *et al*, 2004: 64). And finally, when we look closer at the boundary construction aspect of the perspective coordination process, again we can see both explicit codified aspects (existing 2-D drawings, agenda sheet, etc.) as well as more tacit ephemeral aspects, such as hand drawing movements in themselves (which impart a film-like quality); and in this sense transmits a certain degree of tacit knowledge to the perspective-taker. The exact manner in which explicit and tacit knowledge fit into the dialogical model shown in Figure 3 will be the subject of further studies and analysis.

Other antithetical dyads at work included dialogue vs action as seen across the perspective making complemented by the boundary construction process. In this way, as per Nonaka, Toyama and Konno (2001: 14 and 16), it provides the basis (in dialectical fashion) for further ambiguities or complementary oppositions to interact together, which in turn, further reinforces the tacit/explicit dyad and its respective conversions.

One interesting antithetical dyad within the inter-group meeting was seen across the complementary strengths of both groups. The Special Test group seemed more centred towards technical and practical hands-on knowledge of the test rig's capabilities and running. Hence, between the two groups we have a strong combination of practical-technical 'how to' and theoretical 'why' knowledge which interacted, transformed, entrained and complexified one another.

Another antithetical dyad could be seen across the relative knowledge balance between younger and older members within the meeting room. Often, the older members provided ways in which to solve problems (or avoid them altogether) based on their experience and/or the network of contacts they had amassed over the years. The younger members, on the other hand, tended to be stronger within the realms of information technologies as well as having stronger competencies for numerical modelling activities.

Finally, there was a more basic and primary ambiguity or contradiction at work within the inter-group dynamics which can be directly attributed to the predominance of perspective-taking on the one hand, and perspective-giving on the other: namely the ontological dyad of the individual (as seen across emancipation of self via self-expression (or perspective-giving)) vs the more collective desire of identity towards the other (as seen across genuine listening that attempts to 'put oneself in another's shoes' (or perspective-taking)). Here we can speak of balanced or, as Enriquez (1992) terms it, "differentiated" group dynamics. In turn, this allowed for secondary knowledge-rich antithetical dyads described above (e.g. tacit vs explicit

knowledge, older vs newer knowledge, practical vs theoretical knowledge) to be actively integrated so as to continuously complexify the knowledge being exchanged.

Figure 3 shows a schematic of the numerous specific secondary knowledge rich ambiguities specified in previous paragraphs, in a dialectical relationship of mutual reinforcement with the primary ontological ambiguity. The primary ambiguity of 'emancipation of self' vs 'identity towards the other' allows for specific knowledge-rich secondary ambiguities to be expressed and integrated within the dialogical perspective coordination process (shown in detail in previous figure 2); The expression or integration of these secondary ambiguities also reinforces the primary ontological ambiguity; and in turn, results in an open dialogue results whereby, individuals are open to others' viewpoints as well as towards revision of their own retained knowledge; all of this resulting in knowledge being continuously complexified and shared.

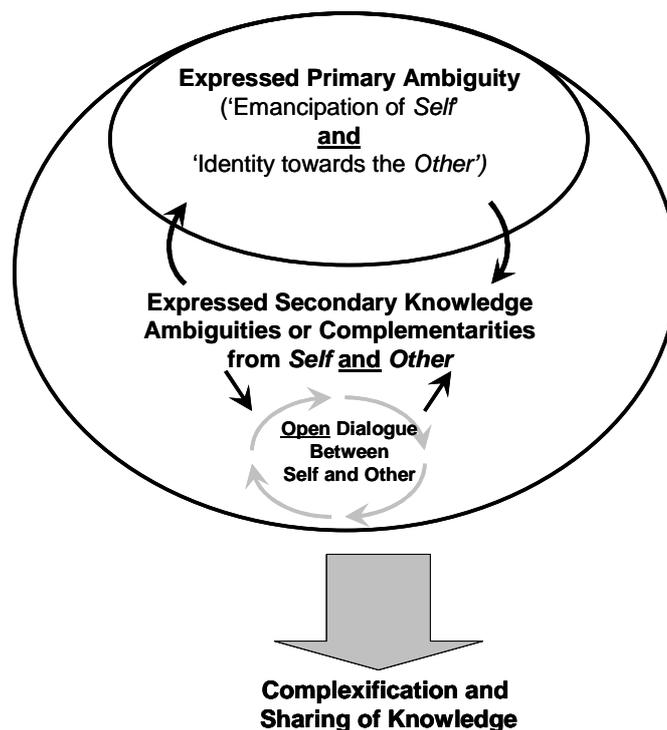

Figure 3: Expression of the primary ontological and secondary knowledge ambiguities (in dialectical reinforcement) within the dialogue process; leading to knowledge complexification.

POSSIBLE IMPLICATIONS FOR MANAGEMENT

What is the role of management in all of this? We realise that further studies across many more workgroups are required in order to fully answer this question. Nevertheless, certain preliminary indications detected across the actions and words of the managers from both workgroups seemed to point towards the importance of developing a sense of self-confidence amongst the members. Furthermore, as one manager explained (Frank), this self-confidence can be gradually developed with time by providing a psychological "safety net", whereby people feel comfortable in learning and trying new ideas. This seems to be in agreement with Edmonson's (1999: 351) and Bogenrieder and Nooteboom's (2004: 293-294) arguments that psychological safety nets provide a shared belief amongst the members that the group "is safe for interpersonal risk-taking" and thereby encourages the willingness to learn, share and create new knowledge; and that the lack of such a "safety net" can often drive members towards an

individualistic survival mode, whereby members hold back critical knowledge from one another.

Another (yet related) possible management implication towards achieving a knowledge-complexifying dialogue is *patience*. Enriched and authentic dialogue is a fragile human endeavour which requires time. In many ways, it involves, as one manager puts it (Frank), “the art of losing time to save time”. This is not to say that the two groups we studied were sheltered from the daily organisational pressures and objectives to ‘meet the schedule’. Yet, as Chanlat and Bédard (1990) argue, the lack of an authentic will in taking the time to listen and be open towards another can provoke feelings of mistrust. Furthermore, as we shift more and more towards managerial ideologies based on short term efficiency (where we adhere to the mantra of ‘be brief’ across the sole and systemic use of conduit type communication methods), we may risk inducing various consequences (technical, financial, etc.) due to mis-communications.

CONCLUSIONS

Our research first proposes, across discourse analysis, a dialogical knowledge construction process, which on the one hand, across emergent categories brings forth the notions of perspective-making/giving and perspective-taking at the interpersonal level whereby it describes the micro-interactions between individuals (as represented across *Self* and *Other*). In addition, we discerned and integrated into the dialogical process the concept of boundary constructions: here, rather than seeing objects as distinct end-resultant or static instruments being fully separate from the actor-subject, the dynamic and transient nature of the ‘object’ is more fully captured across an acknowledgement of the actor-object interaction, which in the end, is what vivifies and renders perspectives more easily understandable across the *Others’* lenses.

In terms of ‘why-it-occurs’ as such was seen across our observations of how knowledge complexification involves a primary ambiguity or antithetical dyad at an ontological level whereby the *Self* and *Other* fully acknowledge and appreciate one another across ‘individual *Self*-emancipation’ vs ‘identity towards the *Other*’. This in turn is nurtured across feelings of mutual trust, mutual respect, mutual support and empathy – all very human traits, which we tend to forget and take for granted as we get caught up in the ‘mechanics’ of the process itself. It is across the presence of these two ontological yet antithetical elements that the *Self* attempts to place himself in the *Other’s* ‘shoes’ and vice-versa; and where individual learning and creation of new knowledge by both the *Self* and the *Other* can potentially occur. It is also a reminder for management that effective knowledge creation, sharing and learning is first and foremost a very human process. It is this ontological relationship between the *Self* and the *Other* which allows for specific secondary antithetical, yet complementary, knowledge to be expressed, integrated and synthesized within the dialogical process.

Although much more work is still required before we can make any firm statements on management implications, preliminary indications seem to imply that management can play a key role towards achieving such an enriching dialogical process by providing a psychological ‘safety net’ to its workgroup members, whereby individuals are given the time and freedom to express themselves all the while being open to differing viewpoints and experiences.

We realize that within the scope of this paper many outstanding questions still remain and are the subject of further studies: such as how exactly does explicit and tacit knowledge fit into the dialogical model that has been proposed; or what characteristics (or breakdowns) does the dialogical process exhibit when dialogue becomes more coercive or conflictual in nature.

Furthermore, this single case study prevents us from generalising our findings across the entire firm in question; and by extension, any manner of external validity outside of the firm's context. Additional workgroups/teams within the firm need to be evaluated; while similar studies in other institutions within the knowledge economy are to be envisaged.

GLOBAL FINANCIAL CRISIS: CAUSES AND PERSPECTIVES ^{*}

Iannuzzi, Elio¹; Berardi, Massimiliano²

¹Associate Professor of Business Management, Department of Business Studies University of Salerno, Via Ponte Don Melillo, 84084 Fisciano (SA), Italy

²PhD of Business Management, University of Foggia, Department of Business Studies, Via Gramsci, Foggia, Italy

Purpose – This study aims at examining the current global financial crisis, and in particular its main causes and perspectives, in order to define the way they can be avoided in the future. We think that there is a need for a new International Financial System with the function of coordinating and guiding the different national and supranational institutions.

Design/methodology/approach – Complexity Theory and Viable System Approach have been used for the analysis of the global financial system.

Findings – The findings suggest that they are implicit features of these kinds of markets, due to their high uncertainty and hyper-competitiveness, rather than temporary deviation from normal equilibrium. In this way, financial markets can be thought as Complex Adaptive Systems (CAS), that are systems on the edge of chaos, so, while tending toward certain attractors, they may precipitate in disorder and chaos because of a seemingly mild event which activates latent forces and leads to emerging and unpredictable consequences. Furthermore, as it has emerged from the last G-08 and G-20 meetings, the orientation of international partners is to move towards a new order, a real new international financial system, where the stabilisation of financial system does not pass only through the bodies created in Bretton Woods, but through the endowment of new rules and new structures.

Research limitations/implications – The discussion stresses a series of research propositions for future researches aimed at improving the understanding of the problem.

Practical implication – The findings suggested some measures to limit future instability and crises, and to reduce their negative consequences.

Originality/value – The paper provides a new methodology to examine the financial crises and the way to limit them.

Keywords – Financial crisis, Complexity, Viable System Approach, International Financial System.

Paper type – Conceptual and Research paper

INTRODUCTION

The Traditional Theory of markets considers financial crises and speculative bubbles as temporary deviations from efficient logic of markets, due to the irrational behaviour of operators.

The high frequency of these events (such as the Great Depression of 1929, the crisis of the international banking system of 1982, the Asian financial crisis of 1997-1998, the technology bubble of 2000-2001, and the current global financial crisis) demonstrates that they are implicit features of these types of markets, due to their high uncertainty and hyper-competitiveness, rather than temporary deviation from normal equilibrium (Reinhart and Rogoff, 2008a). Moreover, a direct consequence of these crises is both dramatic currency devaluation and a crippling decline of the banking system, such as those witnessed recently in East Asia, Latin America and Russia.

** Also if the research paper is the result of common reflections, the paragraphs 1., 3., 3.1 and 4.1 are attributable to Elio Iannuzzi, while the paragraphs 2., 3.2 and 4 are attributable to Massimiliano Berardi.*

In this way, we can overcome the dominant paradigm, which has favoured the current systemic crisis by inspiring several wrong decisions – such as the deregulation of investment banks, the monetary policy of Greenspan (In various speeches as the head of the Federal Reserve System, Alan Greenspan concluded that credit derivatives and other complex financial instruments have contributed “to the development of a far more flexible, efficient, and hence resilient financial system than existed just a quarter-century ago”, and that “The new instruments of risk dispersion have enabled the largest and most sophisticated banks in their credit-granting role to divest themselves of much credit risk by passing it to institutions with far less leverage”) (Greenspan, 2004), the wide spread of financial innovations, etc. – because based on the wrong assumption that markets are efficient self-organizing systems, able to allocate financial sources in a rational way, and we can adopt an approach which considers markets as systems far from equilibrium, because of different elements and, in particular, because of human behaviour that, usually, is oriented to the pursuit of personal interest (Pitelis, 2002).

Therefore, financial markets can be thought as Complex Adaptive Systems (CAS), that are systems on the edge of chaos, so, while tending towards certain attractors, they may precipitate in disorder and chaos because of a seemingly mild event which activates latent forces and leads to emerging and unpredictable consequences. For these reasons, they “can only be grasped locally, hence partially and inadequately” (Van de Vijver G., 1998, 250).

Furthermore, they act on the basis of decisions and dealer activities founded on partial information and foresight, instinct, previous experiences, emotions which influence and, at the same time, are strongly conditioned by those of other irrational operators. Hence, the evolution of the system is extremely uncertain and unstable.

In other words, global financial system is very complex and sensitive to the change of initial and external conditions.

THE COMPLEXITY APPROACH

The Complexity Approach is not a scientific theory, rather we can speak of *epistemology of complexity* as interdisciplinary study of complex adaptive systems and emerging phenomena. Although this concept has deep historical roots, the movement of complexity gained ground in the course of the 1980s, with the foundation of the Santa Fe Institute by the work of the scholar Murray Gell-Mann (Lorenz, 1963; Pascale, 1999).

Some scholars consider this “new science” as a paradigm shift from previous sciences (see Cybernetic Theory and the General Theory of Systems); conversely, others imply that it is a new paradigm, by associating previous science with Modernism, and Complexity Theory with Post-Modernism or Anti-Positivism (Lee, 1997).

The different approaches to complexity theory have the study of systems in common, assumed as sets of elements and components that are organized and react to the structures and models they contribute to co-create: “[...] complex systems are systems in process, systems that constantly evolve and unfold over time” (Arthur, 1999, 107).

These complexity theory studies are focused on the problems linked to order creation and, particularly, on the effects caused by non-linear discontinuities, rapid transaction phases and co-evolution processes determined by events that are apparently disjointed and unforeseeable (McKelvey, 2004).

In this way, by adopting a systemic perspective, complexity theory is focused both on the effects of the behaviour of components on the overall system which they belong to, and on the intra and inter systemic relationships (Carrol and Burton, 2000). Evidently, we are referring to

the complexity of open systems, according to Prigogine, and not to that defined as *computational complexity* (Hilbert) which concerns closed systems (Prigogine, 1990). Furthermore, business organizations are highly interdependent with external environment and, unlike logic and mathematics, they incur problems that are not clearly defined and evolve continuously because of internal and external constraints. Therefore, these problems are unlikely to be solved within the framework of traditional schemes.

A system cannot be examined and understood as a single phenomenon, but it should be contextualised within the framework of interconnections and interdependences with external environment, from which the same system derives the degree of complication or complexity of its representation (Siano, 1997). It follows a vision of the complexity as the science of contextualised mechanisms and interactions; the mechanisms may be described as the dynamic behaviours within the system (Hernes defines mechanisms as “a set of interacting parts – an assembly of elements producing an effect not inherent in any of them”. Hernes, 1998, 74); while the context may be configured as the set of structural, organizational and behavioural features affecting and regulating the nature and type of systemic dynamics. In other words, the context can be assumed as the complex of relationships and interactions among people, ideas, traditions, organizations, etc.

Nevertheless, the complexity must not be understood as an objective and implicit characteristic of certain systems or phenomena, but also as the feature of the available representation of the same system. In this vein, phenomena are neither simple nor complex, but they become simple or complex because of the cognitive process of the observer (La Moine, 1995).

The degree of knowledge determines the level of complication or complexity of the phenomenon. In a specific way, complexity arises from the incapacity of the observer to build an interpretative model; on the contrary, the complication is linked to the difficulty to understand such an interpretative model. In this sense, at the same time, low complex systems may be very complicated because the model that describes them may result difficult to be interpreted (Baccarani and Golinelli, 2008). Furthermore, the complexity refers to the functioning of the system that may be more or less understandable and predictable because of the variety and variability of internal components and of external relations; differently, the complication appears to be a feature of the model or of the representation of the phenomenon.

The growth of the number of relations and interaction increases also the complication and the complexity of the phenomenon, because it increases the amount of information and number of variables that must be considered and interpreted. Therefore, the complexity appears to be the result of both the interdependencies and interconnections which involve the system and its components, and of the system sensitivity to the change of initial conditions (Rullani, 1989).

The complexity acquires also a historical dimension, because what today is considered as complex, may not be the same in the future. For this, the problem is not the complexity itself, but the dynamism of the phenomena. In such a way, we could speak of *evolutionary complexity*.

The complexity theory investigates CAS, i.e. dynamic systems, characterized by multiple and overlapped hierarchies, which, like the individuals that are members, tend to create interactive and evolutionary networks with other systems. The behaviour of the interconnected agents of a CAS generates, also, emerging creativity and learning, where emergency refers to the non-linear and unpredictable changes of complex systems and it is due to the so-called *latent forces* (Plowman *et al.*, 2007).

In particular, “complex systems consist of a large number of elements”; “the elements in a complex system interact dynamically”; “the level of interaction is fairly rich”; “interactions are non linear”; “the interactions are fairly short range”; “there are loops in the interconnections”; “complex systems are open systems”; “complex systems operate under conditions far from equilibrium”; “complex systems have histories”; “individual elements are ignorant of the behavior of the whole system in which they are embedded” (Cilliers, 1998, 37).

Nevertheless, the complementarity and interdependence of the structures, activities, formal and informal relations of its agents support the self-coordination and the flexibility of the system. For this, the system is defined as adaptive and the more numerous are the factors that influence its adaptation to the environmental change (for example, random factors, learning, etc.), the more are the complexity and the unpredictability of its behaviour.

“A path-dependent process is *non-ergodic*: systems possessing this property cannot shake off the effects of past events, and do not have a limiting, invariant probability distribution that is continuous over the entire state space [...] small events of a random character, especially those occurring early on the path, are likely to figure significantly in selecting one or another among a set of stable equilibria for such a system. Under those conditions, *ex ante* predictions of outcomes may not be possible.” (David, 1992, 208). During the evolution of the system, its components co-change through the development of co-adaptation strategies (cooperation, communication, etc.).

However, the firms environment and context are eminently dynamic and complex: the laws that regulate market and competition change; the preferences and expectations of stakeholder change; the technology and techniques of production and the information systems change; the strategies and the behaviour of competitors change. In this scenario, the entrepreneur is called to constantly monitor the evolution of the context and to take continuous structural, organizational, strategic, managerial and operational adjustments.

Moreover, not all the environmental changes are understandable and predictable: in fact, the complexity often means uncertainty and ungovernability, especially in the case of systems characterized by no fully definable borders and by latent energies and high sensitivity to internal and external changes. In other words, the evolutionary complexity of both internal and external contexts makes the great part of future changes and of their implications on markets and competition unpredictable and uncontrollable.

It follows that the complexity increases the uncertainty and the casual ambiguity related to the resources and to the skills and competences the firm must have in order to exploit effectively the opportunities that emerge over time.

Not all the systems have, however, the same capacity for evolving and developing; in particular, this capacity is influenced by the degree of stability or instability of the system. While chaotic systems manifest a widespread inability for evolving and adapting because they are not able to organize and coordinate their behaviour; ordered systems are likely to be conditioned by excessive rigidity and static nature.

Indeed, a system may evolve towards the order, where it remains despite the disruption deriving from outside; towards the chaos, where it moves in an irregular and unstable way; towards the edge of chaos, where, while it converges towards certain attractors, sudden events may destabilize and remove it. Some system patterns that emerge over time have been distinguished: fixed or static, periodic or cyclical, chaotic or strange, colored noise and random (Dooley and Van de Ven, 1999).

The hypothesis is that complex adaptive systems exist at a poised state between too much and too little connection, the so-called edge of chaos, which gives them flexibility and adaptability. These systems “may have special relevance to evolution because they seem to have optimal capacity for evolving” (Kauffman, 1991, 82). Indeed, systems that are only sparsely connected are too static, while those that are overly connected are inherently unstable (Carroll and Burton, 2000).

Kauffman theorizes that four variables (N, K, P and C) in non-linear dynamic systems affect the level of stability of the system and hence its evolutionary capacity, thereby also helping to define the relative degree of complexity:

1. “N” represents the system or organization’s number of components;
2. “K” is the level of inter-relatedness or interaction of the components, measured by inputs to each “N”, which introduces non-linearity into the system (Morel and Ramanujam, 1999);
3. “P” is the common schemata the components share and it is a measure of internal homogeneity;
4. “C” is an inter-system variable. Indeed, it represents the level of inter-relatedness or interaction of “N” across system (this is the second source of non-linearity – Schneider and Somers, 2006).

Furthermore, the level of complexity is also conditioned by both the structure and the genesis of the system.

On one hand, it depends on the degree of autonomy of its components or, in other terms, on the capacity of top management for coordinating and controlling the components. In particular, the more is the degree of autonomy, the more will be the complexity.

On the other hand, it depends on the origin of the system: this can be top-down or bottom-up. It is clear that emerging systems (those that have a bottom-up origin – such as the financial system) usually have a higher level of complexity, especially if they lack a common management. For this, they are difficult to manage and control. The only way to partly regulate these kinds of systems is by imposing constraints and rules from outside (this is confirmed by the current financial crisis).

What is more, the difficulty in managing the financial system appears to be due to its nature of “system of systems”: in other words, it is not a single system, but an assembly of systems that are far from each other, but at the same time they are strictly interconnected and interdependent each other. In this way, small initial events can lead to complexity cascades of avalanche proportions, because of latent forces. Moreover, the borders and the relations of these systems are informal and unstable: this produces a further increase of complexity.

In this view, financial system like CAS appears to be in unstable equilibrium at a poised state between order and chaos, creation and destruction, that is the edge of chaos.

Such considerations explain why we use the Systemic Approach to the Complexity in order to analyse, interpret and describe the functioning of the global financial system, giving particular attention on the examination of causes, circumstances and prospects of the current financial crisis.

THE COMPLEXITY APPROACH FOR THE ANALYSIS OF GLOBAL FINANCIAL SYSTEM

Our hypothesis is that market operators and, in general terms, people tend to decide by instinct and perception, rather than by real knowledge of things (Akerlof and Shiller, 2009).

Especially within financial markets, decisions can influence significantly the evolution of events. From they own, changes modify perceptions and decisions of participants and determine new unpredictable evolutions of system.

These dynamics are not always sequential, but they can act simultaneously too, and for this they further increase indetermination and uncertainty (Soros, 2008).

For instance, within financial markets, prices depend on prevalent expectations which can be wrong and replaced by other dominant expectations. However, rarely these inaccurate understandings of events start a boom-bust process. Moreover, if simultaneously similar and interconnected processes take roots, they can cause the crash of the system as a whole.

In this view, we can analyse the current financial crisis which, differently from other past crises, does not concern a single segment of market, rather, starting from a sector of market (that of mortgage loans) it has activated series of hidden forces which have made global financial system strongly unstable and have caused high, strong and long-lasting consequences on real economy (Hasman and Samartín, 2008). Furthermore, it has spread from the United States to the global financial system through the insurance companies, investment funds, investment banks, derivatives and especially through the new information and communication technologies (Tremonti, 2008; Rullani, 2004).

For this, we can observe that financial markets do not tend to a natural equilibrium, but it is necessary an adequate regulation which does not limit innovation and must be continuously adapted to system changes.

However, although empirical evidences demonstrate the fallibility of regulators, they should not be eliminated because sometimes market is not able to self-organize (see for instances the Big Crash of 1929 and the current financial crisis).

Really, it is not easy to find causes, evolutions and future consequences of the current crisis, but we need to analyse and understand monetary and economic policies implemented in different Countries and, firstly, in the United States.

The mortgage bubble and the way the crisis has developed – from *subprime* loans until to crashes on the stock exchange, banks and insurance companies bankruptcies, and recession, – prove the inadequacy of some institutional measures.

The Big Crash of 1929: the basis for the current financial crisis

Although we have to consider that there are no significant similarities between the current crisis and that of 1929, as they occurred in different historical contexts (for instance, in 1929, there was a fragmented banking system, currently, a more concentrated one), because of opposed factors and conditions (see the balance of payment), and with different implications as a result of unequal policies (in 1929, a protectionist and deflationary policy, in 2008, one oriented to provide liquidity), we have to emphasize homogeneity in the underlying dynamics:

1. an initial favourable event that has given widespread expectations of profit (in both cases we note the reduction in the interest rate);
2. a phase of liquidity growth, characterized by a boom of loans and by a large use of leverage;
3. a phase of increasing profits;

4. a breaking point followed by a systemic collapse (in 1929, there was the crash of the stock market; in 2007-2008, the collapse of real estate – see figures 1 and 2);
5. a phase of instability and depression (in 1929) or recession (nowadays) characterized by panic, deleveraging and lack of liquidity.

Therefore, the understanding of the current financial crisis requires the analysis of the Big Depression of 1929 which started with the slump on the stock exchange and the following bank run and liquidity drop which struck banks in the world as a consequence of both the credit expansion policy of the Federal Reserve System (between 1927 and 1928, the discount rate was lowered to 3, 5%) and the phase of speculation and growth in share prices between 1928 and 1929 (see the following figure).

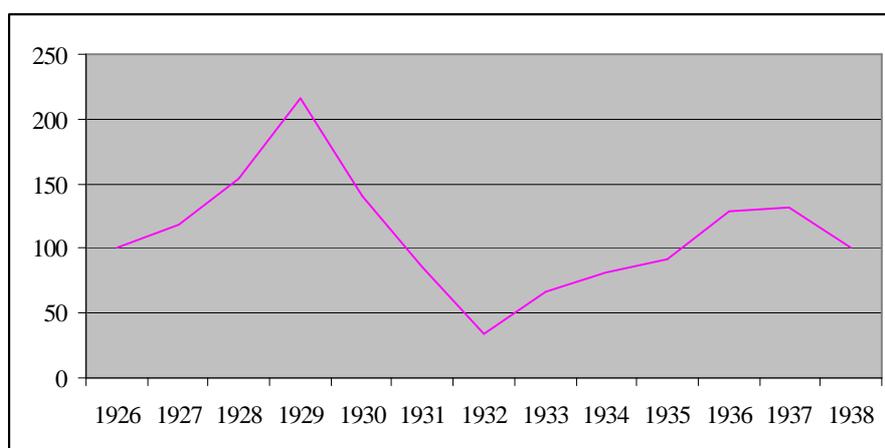

Figure 1: Trend in share price according to the Standard Statistics index, between 1926 and 1938

Source: Our elaboration from Kindleberger, 1993, 91.

This was not an occasional and unpredictable event within the natural course of financial activities; rather, like current financial crisis, it was the obvious outcome of a long lasting phase of bad governance of banks, which worsened credit quality and amplified negative effects on the global financial system and real economy.

Between 1929 and 1933, the high opacity and riskiness of management was the main cause of the failure of more than 5,000 banks in the world, with more than 3,000 billion dollars in deposits. Really, the high number of banking failures was due to the structural weakness of past financial system too, which was characterized by a multitude of small independent units.

In this view, the sharp decline of the currency quantitative that followed the collapse of the stock market, and the inability of the banking system to gain sufficient liquidity to meet the large and pressing demands of currencies by depositors played an essential role in the expansion of the crisis at global level.

Moreover, there was another factor that made the situation even more volatile: several countries (such as Germany and Latin America) were running massive current account deficits financed by the United States. This unbalanced condition was worsened by surplus of export over imports – between 1924 and 1929 the United States hold an amount of credits to other countries equal to 6,400 million dollars (Kindleberger, 1993, 42). When the debtor countries

became insolvent and it occurred a substantial fall in exports, this special condition of the balance of payments aggravated further the internal crisis (Galbraith, 1972).

Between 1929 and 1933, central banks, the Treasury and the Federal Reserve System adopted a passive, uncertain and protective policy because of both the evaluations of the economists – many of them considered depression as a desirable economic event, necessary to overcome the system inefficiency and weakness – and the misunderstandings of governors (Friedman and Schwartz, 1972).

Nevertheless, in the most industrialized countries, the forces of continuity (central banks, Government, Federal Reserve System), faithful to the validity of the Orthodox remedies, reacted to the crisis on the basis of restrictive and deflationary policies, oriented to prevent speculation and to the attainment of a balanced budget, by increasing taxes and reducing public expenditure. This started a vicious circle, characterized by liquidity and consumption drops, which consolidated the downward spiral and aggravated the recession in a real long depression (Pollard, 2004).

Furthermore, we think that the premise for the current financial crisis has been made in the days after the Great Depression, when it was issued a regulatory system for savers (the so called *Glass-Steagall Act*), that distinguished financial institutions in *commercial banks* – which could accept bank deposits and therefore were subject to strong restrictions on the risks in order to have easier access to credit granted by the Federal Reserve (FED) – and *investment banks* – which were not authorized to accept bank deposits and their activities were much less regulated because they were not exposed to bank runs (Federal Deposit Insurance Corporation, 1933).

In fact, if on one hand, this regulation has helped to keep a certain stability of the financial system for almost seventy years – at least until it was repealed in 1999 (by the Gramm-Leach-Bliley Law), during the so called *deregulation* phase willed by Greenspan and based on the assumption that markets would subsequently self-organize – on the other hand, it has allowed an uncontrolled development of investment banks. In such a way, investment banks have gained more and more relevance, even to overcome the traditional bank system, by developing the same activities and offering similar services as commercial banks, but under no regulation and control of risk. What is more, in 2004, the Securities and Exchange Commission (S. E. C.) gave to the investment banks an exemption from a regulation that limited the amount of debt – known as the net capital rule. By increasing the level of debt, they were able to invest in the opaque market of mortgage-backed securities and credit default swap. Indeed, “prior to 2004 broker dealers were supervised by stringent rules allowing a 15:1 debt to net equity ratio. Under the new scheme investment bank could agree voluntarily to SEC consolidated oversight (not just broker dealer activities), but with less stringent rules that allowed them to increase their leverage ratio towards 40:1 in some cases” (Blundell-Wignall *et al.*, 2008, 4). For instances, in a few months the leverage ratio at Bear Stearns rose to 33:1; this made the bank very risky since it held only \$1 of equity for \$33 of debt (Labaton, 2008). It has definitely “allowed the growth of highly risky and fraudulent mortgages without recognizing the ‘self-destructive power’ of this type of mortgage lending with virtually no regulation (Skidelsky, 2008). The Fed could have put a stop to it by using its power under a 1994 law (Home Owner Equity Protection Act) to prevent fraudulent lending practices. It was obvious that the mortgage industry was out of control and was allowing individuals with very little money to borrow huge sums of money. Greenspan could also have used the monetary powers of the Fed to raise interest rates which would have ended the housing bubble.” (Friedman and Friedman, 2009, 9).

This has recreated the conditions of such a financial vulnerability that made possible the Great Depression (Krugman, 2009).

The global financial crisis of 2007-2008

Although the reasons are many and distant in the years, the root cause of the global financial crisis of 2007-2008 is the growth of the bubble of real estate loans, as an effect of too much liquidity placed on the market by strongly expansive monetary policy of the Fed of Greenspan. Between 2001 and the 2004, in order to strengthen the labour market and the economic system, it lowered the interest rate to 1%. This, together with the propensity for speculation and over-indebtedness expressed by American peoples and fostered by generous ratings and widely optimistic evaluations of risk, led to a dilation of mortgage loans. Moreover, a high percentage of the these loans were *subprime* and *Alt-A* mortgages, namely loans of low quality. A subprime mortgage can be simply defined as a mortgage that is issued to a borrower who has a weaker credit profile than a prime borrower. The innovation here is that the borrower has a weak credit profile when the mortgage is made. Differently, *Alt-A* mortgages are mortgages that are between prime and subprime in terms of credit quality, and are generally underwritten with less than the complete documentation required of prime mortgages (Udell, 2009).

However, consumers have used debt also to finance banal purchases and durable goods, as cars, appliances, clothes, holidays, education, etc., with the result of increasing considerably the risk of insolvency.

Such trends, supported by increasingly pushed and risky practices and encouraged by the use of sophisticated tools of mobilization of loans, have unbalanced and destabilized the finance of families and intermediaries which have started to get into crisis with the growth of the interest rates, imposed by Fed between 2004 and 2006 (1.5% to 5, 25%), and with the reduction in house prices in 2007 (- 9, 7%) and 2008 (- 15, 3%) (Partnoy and Skeel, 2006).

In fact, the widespread conception of the real utility of innovative finance, as a tool through which banks could reduce and transfer some or all of the credit risk to another party once incorporated into new financial products, has lead both the banks to grant more loans, and the families to get into more debts (the so-called *irrational exuberance* – Shiller, 2008).

Year	Subprime			Alt-A			Jumbo			Agency			Total		
	Disb.	Secu.	%	Disb.	Sec.	%	Disb.	Sec.	%	Disb.	Sec.	%	Disb.	Sec.	%
2001	190	87	46	60	11	19	430	142	33	1433	1087	76	2113	1327	63
2002	231	123	53	68	54	79	576	172	30	1898	1422	76	2773	1771	64
2003	335	195	58	85	74	87	655	238	36	2690	2130	79	3765	2637	70
2004	540	362	67	200	159	79	515	233	45	1345	1018	76	2600	1772	64

Table 1: Value of mortgages disbursed and securitized in the United States between 2001 and 2007 (\$ mln). **Source:** Inside Mortgage Finance, 2008.

We can observe that the securitisation, even if potentially effective to reduce the risk of credit, has been used inappropriately, under no regulation and control, to finance high volatility

mortgage loans. Moreover, an analysis on the Federal Reserve Bank of Chicago Bank Holding Company Database emphasises that “the net notional amount of credit derivatives used for hedging of loans in 2005 represents less than 2% of the total notional amount of credit derivatives held by banks and less than 2% of their loans.” (Minton et al., 2009). It means that the remaining part (that is more than 98%) was used for speculative activities.

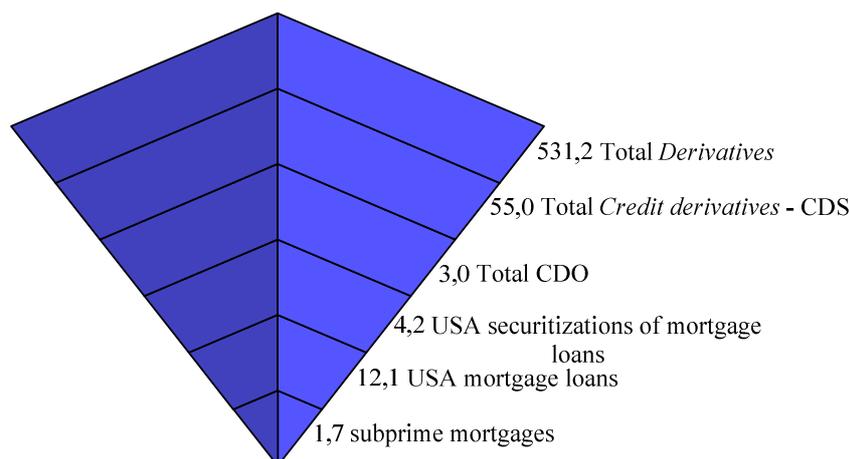

Figure 2: Securitizations of mortgage loans (thousand of \$ billions). Source: Our elaboration from Sole 24 Ore Data

In this way, the only relevant outcome for banks and insurance companies from using credit derivatives has been the multiplication and exchange of risks that are impossible to evaluate. Indeed, pools of mortgages and, particularly, subprime mortgages have been securitised in obligations, the so called Asset-Backed Securities (ABS), which in turn have been incorporated in new debt securities (the so called Collateralised Debt Obligation – CDO) by other banks, insurance companies or other intermediaries, and so on up to be transferred to the investment of savers (Onado, 2005). There has been a process of production of “finance by the means of finance”, due to the orientation of financial institutions to maximise the amount of lending and, therefore, the charges, regardless the possibility of repayment. Indeed, they have been concerned to transfer as soon as possible the risk to a wider audience of investors (Onado, 2009). Hence the most of the risk has been transferred on investors who, often unwittingly, have been pushed to buy from banks and other intermediaries portfolios of public and private shares, credit derivatives and other risky products (The Economist, 2005).

Of course, this mechanism was got in crisis by the strong rise in mortgage loans and the fall in prices of houses (which have reduced the value of the buildings in guarantee): for this reason, a large part of the indebted families became insolvent. “The impact of these defaults on the financial sector has been greatly magnified due to the complex bundling of obligations that was thought to spread risk efficiently. Unfortunately, that innovation also made the resulting instruments extremely non-transparent and illiquid in the face of falling house prices” (Reinhart and Rogoff, 2008, 4).

In such a way, it has been refuted the basic principle on which the expansion of mortgage loans was founded: indeed, as long as the house prices have continued to rise, the borrowers in

financial straits have been able to renegotiate the loans or sell property; but when prices have fallen, the system has gone into crisis and the percentage of insolvency has grown to 40.28% for loans granted in 2006 (Reuters).

In other words, such an event, that in a condition of less leverage would have generated, obviously, less significant consequences, in this case has started a process of chaotic deleveraging that has expanded the negative effects of the crisis to the global financial system (Iannuzzi and Berardi, 2006).

The fall in housing prices and the consequent impoverishment of the families have led to a sharp reduction of consumption; this has plunged the sales, and the production system has gone into a difficult stage, that has become even worse because of the credit crunch, which has not only reduced the investment but also caused a series of bankruptcies.

In fact, financial institutions, to cope with losses and because of their inability for recapitalising their finances, have been forced both to reduce the value of assets and to ration the credit to companies and families (Spaventa, 2008). The following figure shows the sharp increase in housing price inflation from mid 2003 to early 2006 and the subsequent decline. We can observe that delinquency rates and foreclosure rates were inversely related to housing price inflation during this period. While, “during the years of the rapidly rising housing prices, delinquency and foreclosure rates declined rapidly. When prices are falling, the incentives to do so are much less and turn negative if the price of the house falls below the value of the mortgage. Hence, delinquencies and foreclosures rise.” (Taylor, 2008, 11).

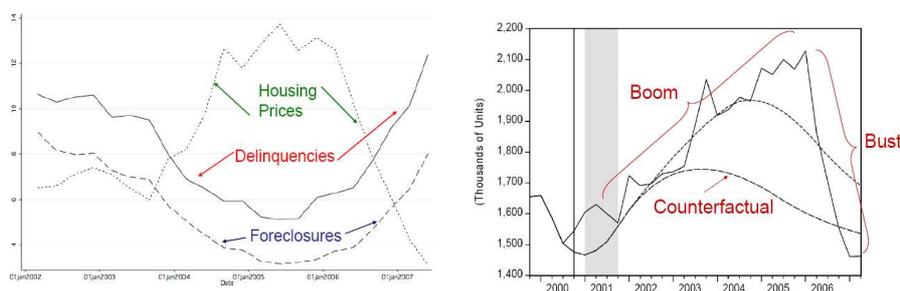

Figure 3: Housing price inflation and subprime ARM delinquencies and foreclosures – the boom-bust in housing starts compared with the counterfactual. Source: Our elaboration from Taylor, 2009, 5-11.

In this view, it is clear the inadequate understanding of the issues by the Fed and by the U.S.A. Treasury, and as a consequence the ineffectiveness of their policies. For example, the same further reduction in the discount rate on federal funds has not produced significant effects because we are facing with a difficult moment, that is far from normality (Krugman, 2009).

Obviously, since the beginning of the crisis, the investment banks were the most affected and suffered heavy losses. Moreover, the same losses have been increased by their vehicles, that is off-balance sheet companies used by investment banks to buy further securitized obligations (Iannuzzi, 2004).

This has led to concern and crisis of confidence, not only from investors, but also among the banks which have significantly reduced the interbank loans in the face of a substantial increase in the interbank rate. This has increased the fear of a credit crunch and has worsened the expectations in terms of fall in consumption, production, investment and employment. In this context, it was not enough the significant liquidity introduced into the system by the central

banks (this solution would have been more effective in 1929 when the main problems were not the crisis of confidence and the counterpart risk, rather the strong monetary contraction – Taylor, 2009).

Asymmetric information in the context of financial system has accelerated the process of feedback among contraction in asset value, reduction in financing, liquidity crisis, losses and lack of capital. In short, the expansion of the crisis has been induced, on one hand, by the close interdependence and interconnection among the financial markets and, on the other hand, by the high degree of opacity and uncertainty about the effective level of losses and the size and distribution of the risks (Impenna, 2009).

For these reasons, in the days after the collapse of the real estate market, investment banks were the first businesses to go into crisis, disappearing from international financial scenario and suffering bankruptcies, mergers, acquisitions and nationalization. “In the US, events began with the unrest around the sale of the so-called sub-prime mortgage packages and, when things started to go horribly wrong, the rescue of the bank Bear Stearns with the Federal Government pumping large amounts of money into that bank to keep it alive. Shortly thereafter, the much larger merchant bank, Lehman Brothers, went into trouble and was not ‘helped’ by the US authorities with the direct result that it had to go into receivership. Subsequently, Merrill Lynch, another merchant bank, was taken over by and found shelter with Bank of America and escaped a similar fate” (The WTO Doha Round and Regionalism, Kluwer Law International, 2009).

Moreover, the opacity and ambiguity of their balance sheets, together with the inadequate rules, show the personal responsibility of managers, focused primarily on their own short-run profits, rather than on the creation of the stakeholders’ value in the long term.

Nevertheless, it appears difficult to recruit the thesis of unawareness of the Fed and central banks in what was happening. In fact, they hold the information, quantitative surveys and, above all, the experience to provide the destabilising effects resulting from high inflation, widespread financial speculation and continued expansion of liquidity and credit (Pavlov, 2009). Already in 2003, the Bank for International Settlements did not exclude acute phases of weakness caused by the growth of debt (Bank for International Settlements, 2003). Also Rajan emphasized weighty responsibility of asset managers of banks, investment funds, hedge and private equity funds, who oriented themselves to high-risk investment (Ryan, 2006).

For these reasons, no one could deny that on the markets there was optimism, but it was clear that such an optimism was increased by the irresponsible expansive monetary policies (Bruni, 2008).

In addition, markets became extremely sensitive and widely exposed to systemic risk, that is a potential source of insolvencies and bankruptcies, because of the so-called policies of deregulation. Indeed, the real criticality has been expressed in the existence of an asymmetry between highly regulated areas, such as the Europe, and other without clear and structured rules, such as the United States. This, combined with the globalisation and the interdependence and integration of financial markets, has created a paradoxical mechanism, a real vicious circle: hence, developing forms of financial activity has been possible in a context with no rules (Tremonti, 2009). In this sense, although the crash occurred under no regulated segments of the U.S. financial system, its impact has been amplified by the heightened level of leverage and by the structured products and the currency crisis.

This has contributed to spread the speculation, guided by short-termism of managers, who have contributed to make the markets extremely volatile, unstable and inefficient (Jensen, 2002).

Moreover, decisions were based on mathematical and statistical models that, although realized on the basis of a wide range of variables, were always approximations of the reality, and therefore they should have been interpreted and framed (Friedman and Friedman, 2009).

Furthermore, the orientation, which induces increasing bargaining in order to achieve capital gains – even with high risky practices and insider trading –, was promoted by the pay system of managers and other financial operators, which is still linked to short term performance compared with those of competitors (Smith, 2003).

Market instability was also accentuated by the international imbalance that was created after the Bretton Woods agreements, among the oil exporting countries and emerging countries, in significant structural surplus, and the United States that, contrary to what happened in 1929, were heavily indebted and exposed to risk (Blanchard, 2007).

IMPLICATIONS AND PERSPECTIVES

There are two main points of view concerning the causes of the current crisis and the way to overcome it: on one side, statisticians – many of them are politicians – support the decline of the American capitalism, based on deregulation which has fostered the degeneration of finance and globalization (Tremonti, 2008); on the other side, liberalists still assume markets as fully efficient and accuse politics as the only guilty of the crisis (Alesina and Giavazzi, 2008).

Really, the succession of stages of expansion interrupted by moments of great uncertainty and recession proves the substantial imperfection of markets and their incapacity for self-organization.

Nevertheless, globalization, increasing complexity and rapid change make many regulatory mechanisms ineffective in facing with the formation of speculative bubbles which generally precede more or less intense crises. In this sense, the current systemic crisis has highlighted the insufficiency of regulatory standards and the failure both of the system of control of intermediaries, and of the financial markets.

Even if it is not obvious that the strengthening of stability of financial system would prevent the formation of speculative bubbles and new systemic crises, as the Great Depression showed, we must not adopt passive policies; the same failure of institutional systems and rules of jurisdiction and control requires their review and the implementation of a careful policy in order to prevent the spread of the negative effects of the crises. In other words, if it appears impossible to avoid the formation of future financial crises, as features of modern capitalism resulting from the interactions between hardwired human behaviour and the unfettered ability to innovate, compete and evolve, “their disruptive effects can be reduced significantly by ensuring that the appropriate parties are bearing the appropriate risks, and this is best achieved through greater transparency, particularly in the so-called ‘shadow banking system’” (Lo, 2008, 1). Moreover, it is impossible to foresee how future financial crises will occur; for this reason, the system requires openness, flexibility and adaptability to contingencies (Schwarcz, 2008).

The growth of financial activities and its detachment from the real economy require a real change of attitude and a review of the financial system in order to better satisfy the expectations of relevant stakeholders, such as savers, consumers and firms, by promoting sustainable development and by supporting productive investment and innovation. This measure derives from the necessity to reduce the short-term orientation, in the awareness that, in the long term, capital gains depend on the expectations from real economy. In fact, the propensity to short term profits through increasing share prices and share-out, rather than the orientation to long term value by improving employment, innovation and productivity have caused a division

between financial system and real economy. The same logic of business has led to be based on financial leverage that has supported debt during the expansion, while it has accentuated the collapse during the unfavourable phase of the economic cycle (Sapelli, 2008).

However, the concept of corporate governance, as complex of various forms of self-regulation based on ethical codes of best practices, and characterized by independent managers is marking the moment of its decline (Gordon, 2007). The presence of powerful independent directors who act in the context of several committees – e.g. for the internal control, for the stock option plans and for the control of the external auditors – in a condition of substantial “collective irresponsibility”, does not appear sustainable by the modern financial capitalism (Rossi, 2008, 78). It appears difficult to imagine and achieve satisfactory results in terms of pursuit social interest and satisfaction of stakeholders expectations by basing on mere ethical codes of self-discipline, when directors are induced to undertake high-risk investment in order to increase their own profits. Differently, the variable part of their remuneration should be linked eminently to the long term performance of company and the directors should be made more responsible by sharing not only profits, but also losses.

In this view, also the function of balance sheet has been changed: from information tool useful for the board of directors, the shareholders and the investors in order to evaluate the performance of managers and the stability of the company, it has been degraded to a tool for transferring to the market a continuous flow of announcements to push the share price up. In this sense, the morphology of modern financial capitalism is focused excessively on the short term, neglecting the logic of intangible assets and of the statement of assets and liabilities which highlights the structure, history, competences and values of the company.

Despite the innovations in the instruments of risk analysis, a significant evidence from the crisis are the mistakes made by banks and rating agencies in evaluating the risks (Metallo, 2007). This is due to the failure of the models of corporate governance, with particular concern to the relationship between management and control of risk. For instance, a common measure of risk that was very popular with the financial engineers was VaR (Value at Risk). It is a short-term measure of risk (daily, weekly, or for a few weeks) is one number and is based on the normal distribution. For example, a “weekly VaR of \$100 million indicates that, for the week, there is a 99% probability that portfolio will not lose more than \$100 million. Of course, this is based on what has happened in the past. [...] The problem with VaR and similar measures is that it ignores what can happen 1% of the time.” (Friedman and Friedman, 2009, 26). Moreover, the evolution of bank models, from Buy and Hold (B&H) to Originate to Distribute (OTD), has removed the fundamental role of monitoring also because of the conflict of interest expressed by rating agencies. This new model – expression of the new equity culture of banks – together with the securitization process have been not about risk spreading, rather they have been a key part of the process to drive revenue, the return on capital and the share price higher. In other words, they have been more about increased risk taking and up-front revenue recognition (Blundell-Wignall *et al.*, 2008).

In such a way, the model of corporate governance has marked the strategic and managerial weakness of big corporation that is heavily exposed to the bankruptcy risk. This is confirmed by the following table:

	<i>Write-downs</i>	<i>Capital Infusions</i>	<i>Leverage</i>	<i>CDS Ago 2007</i>	<i>CDS dic 2008</i>
<i>Merry Lynch</i>	-40,5	20,8	31,9	225	439

For the future, before we can hope to be able to manage the risks of financial crises more effectively, we have to be able to define and measure those risks explicitly. "Therefore, the first order of business for designing new regulations is to develop a formal definition of systemic risk and to construct specific measures that are sufficiently practical and encompassing to be used by policymakers and the public. [...] The complexity of financial markets is straining the capacity of regulators to keep up with its innovations, many of which were not contemplated when the existing regulatory bodies were first formed. New regulations should be adaptive and focused on financial functions rather than institutions, making them more flexible and dynamic" (Lo, 2008, 1-2).

Toward an International Financial System

The crash of U.S. real estate market was only the spark of the crisis, freeing the pervasive elements of instability that permeated the global financial system. In this context, short term debt played a critical role in amplifying the effects of the crisis, leading financial institutions to settle and devalue the most of their assets in order to satisfy creditors, with the effect of increasing the likelihood of insolvency (Zingales, 2009).

It is clear that the Government must avoid to focus on short term policies, limited to prevent financial institutions from failing and depositors from losing their funds, which often are very expensive for the balance of the State; rather, they should aim at identifying the real causes of problems in order to implement effective and long lasting remedies (Yeoh, 2009; U.S. Government Accounting Office, 2008).

In this vein, we do not have to underestimate the effects of the rescue operations of the financial institutions by governments in term of uncertainty, instability and moral hazard. In many cases, governments have been forced into the role becoming new owners of distressed financial institutions, guarantors of loans and making regulatory adjustment on the run; this condition inspires a series of concerns and doubts, such as: further irresponsibility of the top managers, who could be induced to undertake high-risk investment in the perspective of socializing and transferring the risks of potential losses on tax-payers; uncertainty about the weight of the State in making strategic and managerial decisions (Barucci and Messori, 2009); conflicts of interest arising from the illogical admixture of the roles of controller and controlled.

It follows the necessity to restructure the financial system in order to serve the needs of ordinary people and families (workers, homeowners, tax-payers) and to avoid the pursuit of personal interests. It is not a case that, in the United States, while “the Federal Reserve and the Treasury Department have spent, promised and guaranteed up to several trillions of dollars to try to prevent financial institution from failing [...], the financial system has not restored the flow of credit to the economy where it is most needed.” (Schwartz Center for Economic Policy Analysis, 2009, 12).

At the moment, the financial system in most developed Countries has become bloated and it is too big relative to the size of the real economy. For these reasons, it is necessary to: 1) increase transparency in operations and financial innovations to avoid fraud and other forms of financial malpractice; 2) reduce asymmetric information, conflicts of interest and perverse incentives which led financial actors to take on excessive risk (Crotty and Epstein, 2008); 3) restrict or even eliminate off-balance sheet vehicles – indeed, all risky investment should be moved back onto bank balance sheets and adequate level of capital should be required to support them; 4) limit the level of lending by increasing capital requirements in order to protect bank solvency even during the liquidity crises; 5) encourage the flow of credit to SMEs; 5) reduce pro-cyclicality; these policies must be implemented in the context of greater coordination and cooperation among the countries at global level (Griffith-Jones et al., 2008).

In other words, it is necessary to evolve from the logic of the maximization of profit and of the shareholder's value, to the policy of long term strategies, investment, productivity and profitability. This is possible only as part of a clearer and more structured system, in order to overcome market failures. Furthermore, globalisation needs to harmonize the rule of individual States and to reinvigorate a global discussion of financial regulation (Obadan, 2006).

Therefore, the interdependence and interconnection of markets at international level impose a greater coordination among different countries in order to counter the formation of the so-called shadow banking system (Saccomanni, 2009).

Moreover, we must underline the needs for a reduction of the concentration and for a greater diversification in the bank system. In fact, it is necessary the existence of: specialised institute of venture capital to finance the economy effectively; smaller banks focused on the needs of SMEs; big financial institutions that operate at international level, but under much more significant and harmonic regulation. Another problem is that these big banks have become too big too fail and this creates perverse incentives for excessive risk taking. "The taxpayer bears the loss, while the bondholders, shareholders, and managers get the reward. It also distorts the marketplace in another way: as we have noted, there are hidden subsidies (which have been increased in the current crisis), for instance in deposit insurance, in the government-provided explicit guarantees to newly issued bonds, and in the implicit guarantees to bondholders and shareholders associated with the bail-outs." Furthermore, "preventing banks from becoming too big to fail, and intense regulation of these too big to fail institutions, is not the only thing that is needed. We need a Financial Product Safety Commission to assess which financial products are safe for use by consumers – and for what purposes. But this Commission will help in addressing the problems of the too big to fail banks as well. It will take risk out of the system; these banks will not be able to buy up big packages of financial products that have a high risk of non-payment. We need strong regulation at the bottom of the pyramid to complement the strong regulation at the top." (Stiglitz, 2009, 1-4).

The systemic nature of the crisis emphasises the needs for a process leading to the creation of both a System of international governance (may be the Global Legal Standard) through the definition of common principles and regulation, and national and supranational institutions with the role and the power of control and intervention on the international players of markets (Federico et al., 2009).

As it has emerged from the last G-08 and G-20 meetings, the orientation of international partners is to move towards a new order, a real new international financial system, where the stabilisation of financial system does not pass only through the bodies created in Bretton Woods, but through the endowment of new rules and new structures. In particular, the Government of this system should aim at stabilizing the factors which have been at the basis of the current crisis and guiding the different national and supranational institutions; supranational institutions should play the function of coordinating the actors of financial markets and preventing systemic instability; national institutions should play the role of supervision and monitoring the activities carried out in the different countries. It is also necessary to establish concrete procedures for an effective international cooperation which enables the application of this regulation (Attali, 2009).

In this perspective, for instance, the European Council urges the introduction of a new supervisory framework, with the creation of a European Committee for systemic risks, that will monitor and evaluate the potential threats to financial stability and, if necessary, will issue reports of risk and recommendations for action. Then, the European Council has suggested the creation of an European System of Financial Supervisory Authorities, including three new surveillance authority communities (ESA), in order to improve the quality and consistency of national surveillance, strengthen the monitoring of transnational groups through the establishment of colleges of supervisors, and spread a single European code for all financial institutions (Gazzettino Europeo, 2005).

We must underline also the role of central banks as lenders of last resort, in order to counter the crisis and stabilize the markets when this occurs. As the Great Depression and the current financial crisis demonstrate, the monetary policy of the central banks influence duration and depth of crises: while in 1929, central banks did not play an active role, today they "have arguably more flexible monetary policy frameworks, thanks particularly to a less rigid global

exchange rate regime. Some central banks have already shown an aggressiveness to act that was notably absent in the 1930s" (Reinhart and Rogoff, 2009).

Financial innovations have spread the vain illusion of being able to diversify and reallocate every form of risk and, hence, to support ever-increasing financial activities with a small capital (D'Arista and Griffith-Jones, 2008). Differently, there is a need for adequate capital requirements to support all risky investment, and financial institutions, especially those that operate within the shadow banking system, must be brought under adequate regulatory control that limits the level of leverage and demands absolute transparency in operations (Apanard, 2009).

On the other hand, these measures must be defined and introduced in order to avoid to block innovation and tighten up the financial system (Shiller, 2005).

However, for any serious regulation reform to work at least two conditions must be met. "First, financial institutions must come under much more significant regulatory oversight that demands absolute transparency in operations to avoid fraud and other forms of financial malpractice. Second, the financial regulatory institutions" or the Government of the New International Financial System "must have the capacity, authority and desire to implement and enforce these regulations. They need to be insulated from political money and special interest interference; this requires further reforms in election finance." (Schwartz Center for Economic Policy Analysis, 2009, 15).

Moreover, as the current crisis has amply demonstrated, the aim of achieving a trade-off between efficiency and stability within the financial system does not appear easy to get without the harmonization of the regulatory framework at least among the most industrialised countries.

Finally, for any global regulatory reform to work, it must be consonant with the culture and values of the international community (Golinelli, 2005). In other words, to achieve greater efficiency and stability of global financial system, the rules should be adapted to the specific contexts of markets and products in order to reduce the emergence of opportunistic behaviours and other destabilising factors.

CONCLUSION

The current crisis of modern financial capitalism concerns both the system, that despite the experience of 1929, has proved to be not capable for creating transparent and precise rules, and the individuals and their system of categoric values, culture and expectations (Barile, 2008; Barile, 2009).

The morality of managers is a critical aspect to understand the formation of speculative bubbles and crises. Also Adam Smith, in *The Theory of Moral Sentiments*, made it clear that he believed that economic growth depended on morality (Alvey, 1999). In fact, while it is impossible to support the idea of financial markets tending to the equilibrium, it also true that this is mainly due to the orientation to the self-interest, for long time theorized and taught in the main schools of management of the world (Ghoshal, 2005). In this perspective, Howard speaks of tragedy of maximization to define the adverse effects caused by the spread of the culture of maximization of self-interest that in economic and managerial terms means maximization of profit and of the shareholders' value, neglecting the long-term prospects of the company (Howard, 1997).

Finally, the crisis 2007-2008 has clearly emphasized, together with the fragility of global economic system, a crisis of social, personal and political values. Furthermore, the widespread philosophy of the pursuit of self-interest, contrary to the past when it was based on mere ethical and behavioural codes and on various forms of incentives for managers, such as the stock options, requires the translation of the ethical principles into laws, which must be clear and shared at international level.

Moreover, according to the “twelve table” of the OCSE the global nature of the crisis imposes to the Governments the adoption of a systemic approach. In particular, the stability of financial and economic system requires to re-introduce the values of property, integrity and transparency by Governments, firms and other systemic entities which must activate consonant relationships based on the principles of equilibrium, transparency and fairness (OECD, 2009).

However, more regulation is not enough by itself, indeed it is also necessary a change of perspective, that is a change of culture by decision makers who, inspired by the categories of ethics and morality, should find the balance among entrepreneurial and personal interest, on one hand, and collective interest, on the other.

FINANCIAL CRISIS: ITS EFFECT ON EXISTING BANK-SME RELATIONSHIPS

Ioannou, Myria¹; Mihai-Yiannaki, Simona²

¹European University Cyprus- Laureate International Universities (EUC), 6 Diogenes, Street, Engomi, Nicosia, 1516, P.O. Box: 22006, Cyprus

²Ph.D., M.B.A., Affiliation : European University Cyprus- Laureate International Universities (EUC), 6 Diogenes, Street, Engomi, Nicosia, 1516, P.O. Box: 22006, Cyprus

Purpose: The value of relationship building is well documented in the literature, where a number of benefits seem to accrue for both interacting parties. This is also the case for Bank-SME relationships. However, the recent financial crisis is expected to have a significant impact on the underlying dynamics of such relationships and as such, this paper models the expected effect and proposes a number of recommendations to reduce the crisis potential effect.

Approach: The paper utilises literature from both banking and finance and relational studies, on the basis of which a conceptual framework is developed and recommendations are proposed.

Findings: Some particular recommendations are discussed relating to various aspects of the relationship itself, including changes in the communication mode as well as changes relating to strategic aspects such as reformulating facets of HRM to enhance the relationship.

Originality/value: The paper addresses a hot topic, in both academic and managerial circles, and offers insights on both the expected effect of the recent crisis on Bank-SME relationships and on actual ways of dealing with the problem. To this end, it integrates different cross-functional management aspects and is therefore expected to be of interest to both academics and practitioners.

Keywords: Bank-SME Relationship, Financial crisis, Retention, Multipurpose teams

Paper classification: Conceptual Paper

INTRODUCTION

Business-to-business relationships unfold within a wider environment and from the interaction of two active parties (Hakansson, 1982; Moller and Halinen, 2000). Consequently, any change in this wider environment, such as the recent financial crisis, is expected to influence the underlying dynamics of existing relationships.

In particular, the banking crisis started by weak and un-uniformly spread regulation in risk management in the derivatives and housing markets. At the same time the lack of liquidity in refinancing deals and the default fear pushed towards a chain reaction in the system creating thus a global scale economic deterioration.

In order to redress the situation most banks looked for capital injection, bailouts or restructuring or selling off part of their units together with complementary redundancy schemes. But very few banks looked also inside their relationship with their customers to boost support to households and SMEs. Many banks reacted in different ways, some wanting to keep corporate customers and get rid of the subprime portfolio.

Hence, how has the recent financial crisis affected the market? There is a possible threefold approach:

1. It affected banks first, through both bankruptcy and liquidations
2. It made many industrial facilities bankrupt
3. It made a large number of SMEs and individuals bankrupt or redundant

Therefore, instead of increasing attention on SMEs as a means of coping with the crisis, the above changes resulted in increased pressure for both the financial institutions and their SME customers, which at many instances, endangered existing relationships. Given, however, the considerable value that exchange relationships can yield for the interacting parties, such an approach can be seen as detrimental to their long-term success.

Consequently, this paper aims to model the impact of the recent financial crisis on the relationship between banks and SMEs, with application to Cyprus and other Euro-Mediterranean countries and to propose a number of recommendations to reduce the potentially adverse effect of the crisis on the exchange relationship. This is largely driven by the acknowledgement of the centrality of exchange relationships on the long-term success of the interacting parties (Wilson, 1995; Christopher *et al.*, 2002), where a plethora of benefits accrue for the dyad. In fact, banking is considered conducive to relationship development (Lovelock *et al.*, 1999), and relationship banking can yield considerable benefits for both the financial institution and the SME; benefits which are exemplified in the case of a financial crisis.

Specifically, on the bank's side, relationships ease the collection of customer information, help in understanding customers better and facilitate loyalty building. That is, reliable information on small and medium-sized enterprises (SMEs) is rare and costly for banks. To compensate for this, relationship banking is often considered as the appropriate lending technique (Baas and Schrooten, 2005). As such, holding a strong portfolio of SMEs can help in achieving scale and scope economies, ultimately enhancing long-term profitability (Reichheld and Sasser, 1990). This is why banks perceive SMEs as a core and strategic business and seem well positioned to expand their involvement with SMEs (de la Torre *et al.*, 2008).

On the other hand, for the SME which is more financially constrained than large firms (Schiffer and Weder, 2001; IADB, 2004; Beck *et al.*, 2005; Beck *et al.*, 2006) and hence, in a worse position to ask for financing during a financial crisis, a positive relationship with their financial institution can reduce perceived risk and uncertainty (Sheth and Parvartiyar, 1995) because the Bank-SME relationship will provide greater assurance that funding will be available even in times of duress (Holland, 1994).

As such, the objective of this paper is to identify the crisis' impact on the Bank-SME relationship and to propose ways to redress the crisis' negative effects - with application to Cyprus and other Euro-Mediterranean countries. To this end, the paper reviews and utilizes literature from two research areas: relational studies and banking theory and finance, and draws a conceptual framework which maps the effect of the recent financial crisis on existing Bank-SME relationships. In conclusion, the paper discusses a number of recommendations, which can potentially reduce the crisis' adverse effect on existing Bank-SME relationships.

LITERATURE REVIEW - CONCEPTUAL FRAMEWORK

The recent financial crisis is postulated to have a profound effect on the interaction pattern of existing Bank-SME relationships, and as such, our conceptual framework models this effect.

The present section discusses the literature employed in designing the conceptual framework. It is divided in three areas: the first explains the potential effect of the crisis on the interaction environment and on each of the interaction parties in isolation, the second maps the effect that the financial crisis creates for the interacting dyad and the section concludes with a discussion of the effect on existing Bank-SME relationships.

Exchange relationships are seen to develop within a wider **environment** (Hakansson, 1982, Kumar and Nti, 1998). In the proposed framework, the environment is conceptualised to

include such aspects as Culture, the Economic environment, the Legal and Regulatory framework (e.g. Central Bank regulations) and the Technological environment (Ioannou and Zolkiewski, 2007). As such, the recent financial crisis has reshaped the environment within which Bank-SME relationships develop and is, therefore, expected to have influenced the underlying dynamics of the particular relationships. Specifically, it is suggested that environmental changes have affected both parties of the dyad. The extent that the crisis has affected each party is as follows:

The crisis' influence on the **bank** is subject to a number of parameters, such as the philosophy and strategy of the bank, the structure of the institution as well as its financial position. In particular, the underlying strategy of the financial institution and hence, the extent of its customer-orientation affect the pattern of interaction (Hakansson, 1982; Odekerken-Schroder *et al.*, 2003) and in periods of economic crisis they are expected to assume a vital role in reformulating the bank's policies.

Put differently, a *bank's philosophy and strategic planning* should grasp the relational concept and debate its medium to long-term strategies as well as the short-term tactics in applying it. This results in an improved relationship which leads to better financial positions and reputation, one of the most important traits in the service. Supporting this strategy, the new Relationship Management (RM) concept should be released towards all stakeholders, with strong emphasis to the employees. Such apprehension is an essential part of building personnel's knowledge and bank behaviour as well as strengthening the bank's mission and vision. In this line of thought, the so-called opaqueness of SMEs^[123], becomes virtually redundant.

Within the umbrella of the bank's philosophy, one needs to also consider the Corporate Social Responsibility (CSR) of the financial institution. Some may look at CSR as "the policy and practice of a corporation's social involvement over and beyond its legal obligations for the benefit of the society at large" (Enderle and Tavis, 1998), while others (Lerner and Fryxell, 1988) suggest that CSR describes the extent to which organizational outcomes are consistent with societal values and expectations. But for simpler people and for the retail business, as an extension, being socially responsible identifies very much with the rationale that businesses are more likely to do well in a prosperous society rather than in a crisis affected one (McIntosh *et al.*, 1998).

There are so many words associated to or replacing CSR, such as: corporate philanthropy, social disclosure, company's environmental record, workforce diversity, financial health and tendency to grow, community involvement, ethical lending, all depending on cross-cultural differences. What it is interesting is that when defining CSR as 'financial health and tendency to grow', Stanwick and Stanwick (1998) provide evidence that profitability of the firm encourages managers to implement programs that enhance the level of CSR.

Apart from the value-significance perspective, the financial perspective is not sufficient to evaluate the level of neither CSR nor any other perspective individually. A company may have outstanding employee benefits but if they go into financial distress, those benefits become null. Instead, strong banks are alleged as more pro-social as they can offer employees more advancement chances (Fombrun, 1998). Considering this normative facet of CSR, it becomes obvious that this concept is of 'no single value state' (Frederick, 1991) in bank RM as well. Moreover, it becomes redundant to consider it a cause or an effect of failing relationship management within financial crises. It could, however, be suggested that during a financial

¹²³ *i.e. unstable economic feasibility – capacity to pay as well as un-appraisable willingness to pay- due to moral hazard.*

crisis banks have a 'moral and social obligation' to support SMEs, since SMEs provide the highest employment level and uphold economic well-being. Therefore, under times of duress, an important aspect of their CSR is the need to nurture Bank-SME relationships.

Further, the crisis effect on the bank is conditioned by its shareholder base. Mergers and Acquisitions have played an active role within the banking market during the past years. For instance, in the Cypriot banking market most banks have a large business exposure to CEE and SEE, hence they work with these markets' local SMEs, and the cultural factor becomes an important ingredient to success. At SME level in Cyprus, there is still a high involvement of RM instead of an arm's length finance or of firm-like organization by market exchange.

Hughes et al. (2003) studying financial consolidation found elements of managerial entrenchment among banks with higher levels of insider ownership, more valuable growth opportunities, poorer financial performance, and smaller asset size. When managers are entrenched, acquisitions are associated with greater inefficiency. For example, following the M&A of Marfin Popular Bank (MPB), it is relocating post-merger its headquarters, downsizing and rethinking its strategies in Cyprus to escape merger diversification (De Long, 2001) to compensate for efficiency loss. Thus teams' combinations do play a key role in keeping RM optimum with their clients, by allocating time and people to service.

Another efficiency model is the one of managerial utility maximization (Koetter, 2006) and the associated measure of risk-return efficiency developed in Hughes et al. (1996, 1999, 2000) of the measure of return efficiency with cost and profit efficiency and found that efficient banks using a low-risk investment strategy are less profitable, since they also expect lower profit. Then, would the adventuring into higher risk bearing relationships with the SMEs, trigger higher risks-higher profit profile of the bank during financial crises?

On the other hand, the crisis' effect on the SME is seen as a function of the nature of the SME's business, its market share and customer composition, its financial position as well as its shareholder's base. Specifically, the economic crisis had a greater impact on certain industries (e.g. automotive, food and beverage, tourism, manufacturing, trading, chemicals & pharmaceuticals) and hence, those SMEs operating in the said markets may encounter bigger financial problems and may require more support from their financial institution. In turn, this affects their interaction with the banks, since on the one hand, they become riskier customers^[124] but on the other, the SMEs expectations vis-à-vis bank performance may rise. In fact, existing literature suggests that small business customers are more relationship-focused than corporate customers (Istock, 1996 in Colgate and Lang, 2005) and hence, are more likely to expect the financial institution to reciprocate in periods of duress.

In addition, the economic crisis has had an effect on consumer behaviour, where a number of retail customers have either withdrawn from the usage of certain products or have switched to lower-priced alternatives. That is, the crisis' impact is distinct for different customers and thus, the profile of the *SMEs customers*, manifested in such ways as who the target market(s) is/are and the degree of customer loyalty (cf. Reichheld and Sasser, 1990) become critical variables. Consequently, coupled with the SMEs nature of business (i.e. type of products traded), the SMEs customer composition and market share have a significant effect on its operational performance and interaction pattern with the bank.

The factors outlined above, will ultimate shape the *financial position of the SME*. That is, the above parameters have a direct impact on the SMEs' operational performance and are likely to

¹²⁴Where the risk level of customers is a determinant attribute when the Cypriot banks assess SME customers (Ioannou and Zolkiewski, 2007).

cause cash flow shortages. This would essentially translate into increased pressure on behalf of the SME for working capital on the one hand, and on the other, a higher perceived risk and uncertainty level for the bank.

Further, if the market is mature or emerging and if the bank went through M&A (e.g. MPB in Cyprus), then the RM can affect both the SMEs activity as well as the bank's structure and efficiency. In such a case, though, it proves interesting to deal with the following factors at the same time:

<i>Factor/Connotation</i>	<i>Local SMEs</i>	<i>Foreign SMEs</i>	<i>Mature Markets vs. Emerging Markets</i>
<i>Fears of default</i>	<i>Strong</i>	<i>Strong</i>	
<i>Reactions to hard (financial) information</i>	<i>Weak</i>	<i>Strong</i>	
<i>Reactions to and soft (managerial or informal) information</i>	<i>Strong</i>	<i>Weak</i>	
<i>Industry independence degree</i>	<i>Weak</i>	<i>Strong</i>	
<i>Attitude change</i>	<i>Strong</i>	<i>Strong</i>	
<i>Opportunities and Threats impact</i>	<i>Medium</i>	<i>Medium</i>	
<i>What is the level of cultural compatibility/match?</i>	<i>Strong</i>	<i>Strong</i>	
<i>What is the level of adaptability?</i>	<i>Strong</i>	<i>Weak</i>	
<i>What is the response during financial crisis?</i>	<i>Strong</i>	<i>Strong</i>	

TABLE 1. Factors and Connotations in RM approach to SMEs (authors' evaluation)

Consequently, at a first level, the financial crisis affects each of the interacting parties and, in turn, the above factors determine the effect that the crisis has on the dyadic interaction. Specifically, the Bank fears that the customer might not be in a position to promptly and consistently meet its financial obligations and may even eventually default; as such, the bank aims to secure itself. Therefore, the extent of pressure that may be exerted by the bank to the SME will depend upon:

- The buying centre of the SME and the Bank employees

The interaction pattern of the dyad is conditioned by their characteristics (Hakansson, 1982). Specifically, the SME's management team and in particular the SME's buying centre on the one hand, and the capabilities and experience of the bank employee(s), on the other, influence the exchange procedure and the communication mode. That is, the profiles of the dyad affect both the content and the quality of the information exchanged (Wilson and Moller, 1998). This is a particularly important consideration since in turbulent periods communication assumes an even more important role in RM.

- Interdependence and Power balance

These are also important elements in relationship development (Dwyer et al, 1987; Wilson, 1995). The conceptual framework postulates that the resulting power balance and interdependence amongst the interacting parties will be conditioned by (a) how important a particular SME is to the bank and (b) whether the bank is the sole financier of the particular SME. These parameters become especially important in periods of duress, where financial institutions could reassess the value of their customers.

In other words, the SME's *profile*, including such aspects as soft elements, cash flow, risk assessment/credit scoring and group affiliation, determine, to a great extent, the attractiveness of the particular customer to the bank (Gronroos, 2000) and hence, the latter's willingness to maintain the relationship.

Specifically, customer creditworthiness is key in any kind of transaction with SMEs. Most of the time, the credit scoring becomes a strong instrument in assessing it. Yet, there are many pitfalls that can show in many mature markets, even companies that look great on paper, but which are a “nightmare” in reality, due to their group affiliation or else. Much information does not reside in the shareholding structure, but in the “supply-side” partners. Other deficiencies often relate to rating SMEs as per Basel II Accord when calculating the bank’s capital adequacy ratio as per the Standardised Approach. This method, mostly used by smaller banks, allows the bank have their customers rated by international rating agencies. These agencies cannot yet mark to market their clients while having different valuation methods for default probability. Here is when the banks start the “rating shopping”, should the SME be a strategic target of the bank (Mihai-Yiannaki, 2009).

Moreover, the attractiveness of the SME to the bank is influenced by the *industry* in which the *SME operates*. In terms of risk diversification, the bank may try to get customers outside its areas of concentrated exposure (either geographical or industrial or transaction related). Yet, there are cases where concentration on temporary healthy business is recommended rather than on diversified losers, even it contradicts some local legislations.

The power balance and interdependence level is also affected by whether the *bank is the sole financier* of the SME or not. Where the SME patronises more than one bank, its comparison level of alternatives^[125], CLalt, (cf. Hakansson, 1982; Anderson and Narus, 1984) may be higher than that of other SMEs which bank only with one institution. Consequently, perceived switching and termination costs (cf. Jackson, 1985) may be greater for SMEs that have a single financier. Thus, on the whole, as Anderson and Narus (1984) suggest, the CLalt has an impact on Power/Dependence.

Conversely, the bank may value more an SME which patronises it on an exclusive basis, and the bank would be more committed in maintaining the particular relationship. Therefore, in periods of duress the bank’s attitude and behaviour may be more favourable for its exclusive SMEs customers.

1. The type of the existing relationship

Blois (1998) stresses that what matters is not whether an exchange relationship exists, but what form that relationship takes. In fact, a number of academics (see for example Turnbull *et al.*, 1996; Wilkinson and Young, 1998), argue that there are different relationships in different situations and thus, it is important to understand the form that the relationship assumes in each situation. The conceptual framework postulates that the financial crisis can affect the existing form of the relationship; in effect, existing Bank-SME relationships may reshape as a consequence of changes in their underlying dynamics. Specifically, changes in the adaptation level and in the increasing need for communication between the dyad, affect relationship variables^[126].

The effect on the existing Bank-SME relationship may emanate from the bank’s fears of customer default and the pressing need to further secure itself. As such, the bank may engage in one or a combination of the following:

- (a) The bank may either impose more rigorous lending terms and conditions or may impose lending restrictions; either way making it more difficult for

¹²⁵ Defined as a standard which represents the quality of outcomes available from the best available relationship partner (Thibault and Kelley, 1959).

¹²⁶ Relationship variables influence success or failure of relationships (Anderson and Narus, 1984; Anderson and Weitz, 1990; Wilson and Moller, 1991; Morgan and Hunt, 1994).

the SME to borrow funds. However, given the possible liquidity problems of SMEs during such periods, this may undermine relational efforts.

- (b) The bank may require more securities, so as to further decrease its exposure. This may be perceived by the SME as a sign of lack of trust on behalf of the bank, which adversely influences their relationship.
- (c) The bank may also pressurise SMEs for savings, which may serve both in improving the bank's liquidity and in reducing its exposure. Again, such an action may negatively impact the existing relationship.
- (d) Increased pricing at periods of duress: Financial deterioration has had an impact on the asset quality of many European Banks, while their interest income has been hurt by falling interest rates set off by the European Central Bank.

Specifically, Baas and Schrooten (2005) show that lack of reliable information leads to comparably high interest rates even in the long-term relationship between borrower and bank. This is also one of the short-term tactics utilized by Cypriot banks during the financial crisis. The reason is retaining larger, more important corporate clients in the detriment of potentially financially distressed SMEs. Here, the banks will reduce their dependencies to potential losses in favour of getting exposure to corporations. At their turn, those corporations depend on SME's activities, yet the latter's bargaining power diminishes during financial crises. What we experience then, is a negative chain reaction at the liquidity level: banks reduce SMEs financing, but keep financing corporations, which ousts from the market many SMEs putting them in financial distress, while themselves cannot cope with the demand drop in the market. The outcome is twofold: either both the banks and corporations get bailout by government, or everyone is drifting away.

Consequently, communication becomes integral, where the bank needs to clearly and sincerely explain to the SME the underlying changes in their relationship. Hence, a further relationship dimension, i.e. openness, becomes critical. In fact the importance of openness in a business-to-business banking context has been revealed by the work of Moriarty *et al.* (1983) and its importance is enhanced in periods of duress.

Moreover, the outlined changes may essentially alter the adaptation level in the relationship. Adaptation is an instrumental factor in relationship building (Axelsson and Easton, 1992 cited in Zineldin and Jonsson, 2000), since "adaptations are the way in which a company shows that it can be trusted to respond to a counterpart's requirements" (Ford *et al.*, 1998) and signal that a supplier is willing to co-operate and make sacrifices. Even though there is as yet no generally accepted definition for adaptation (Brennan *et al.*, 2003), adaptation encompasses investment of tangible and intangible resources by both parties. Investment may be in the form of human resources, development of or alterations in goods/services, production processes and procedures or even investing in transaction-specific investments (Anderson and Narus, 1991). More specifically, in the present context, adaptations refer to such dimensions as flexibility, speed and understanding.

Ultimately, as Ford *et al.* (1998) and Zineldin and Jonsson (2000) suggest, adaptation affects trust and commitment. Trust is a gateway to a successful relationship (Wilson and Jantrania, 1996); it is the building block of a business-to-business relationship (Wilson, 1995) and it creates

the conditions under which commitment develops (Wilson, 1995). Commitment, which is the most commonly used relationship determinant, is the enduring desire to maintain a valued relationship (Moorman *et al.*, 1992). Therefore, in view of the overriding role of trust and commitment in RM (Morgan and Hunt, 1994), it becomes vital to safeguard them, even in periods of economic distress. Failure to do so may prove detrimental to any relational efforts.

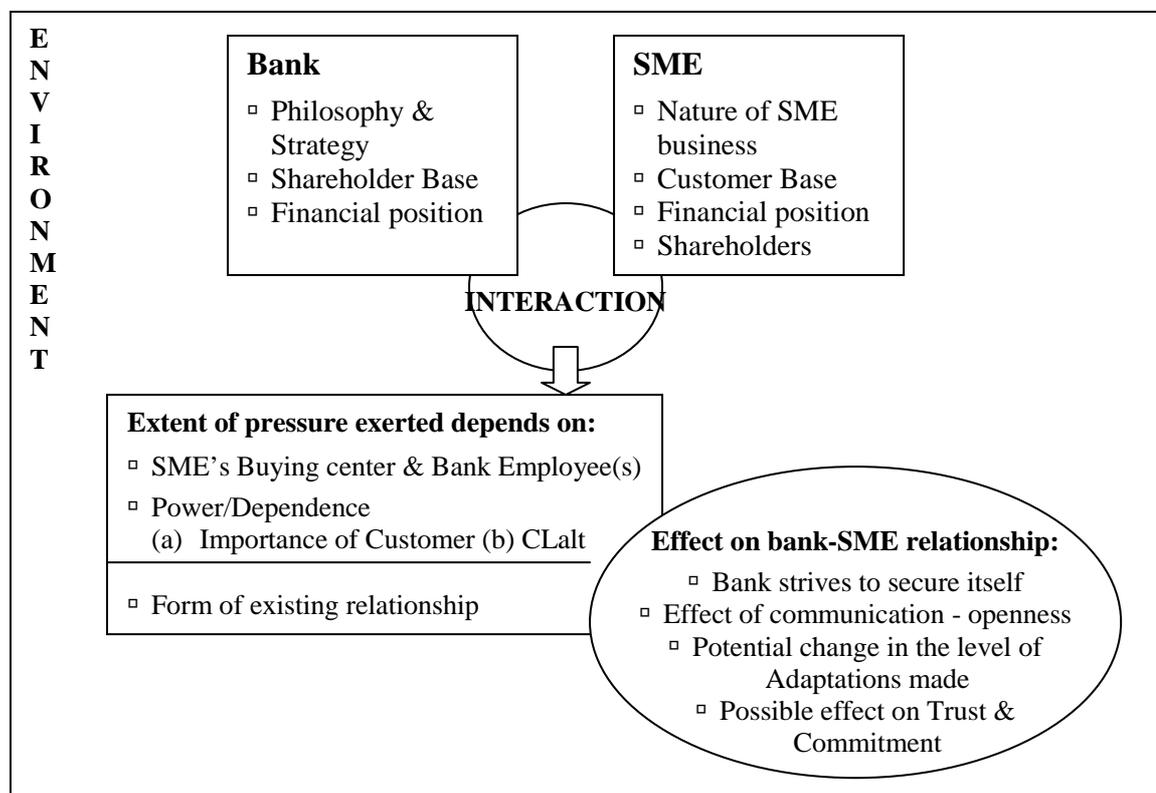

FIGURE 1: Conceptual Framework

RECOMMENDATIONS

The proposed conceptual framework suggests that the financial crisis can alter the underlying dynamics of the Bank-SME relationship. As such, a number of recommendations are discussed below, so as to ensure that the crisis' effect on the said relationships will be the lowest possible.

Firstly, upon specialized knowledge and job description it is possible to see the level of integration of the RM concept within the bank's top-down strategy and identify team and individual motivational tools for driving responsibility and sustainability in relationships with SMEs during the financial crisis. Then utilising HRM concepts, certain tools become key in improving RM:

- Maintain a professional attitude in line with the bank's strategy, i.e. keep the SME connected to the bank, recognize the SME's efforts during the financial crisis, put value to RM. This can be obtained through:
 - i. Bonuses, LTI (long-term incentive) and pay-to-performance
 - ii. Build dedicated teams

iii. Budget reorientation and constraints (creating the best team combination and allocating time in this respect)

- Client retention (through superior employee performance)

Bank Relationship matrix on PAY (employee)-PRICE (product) affects the relationship with the SMEs by improving the selection of companies according to optimum risk-taking appraisal. In such cases, inputs from teams can better evaluate not only risk but also the bank's behaviour towards the SME. In terms of compensation, during financial crisis, it is necessary to fit a more exceptional case rather than a threshold case:

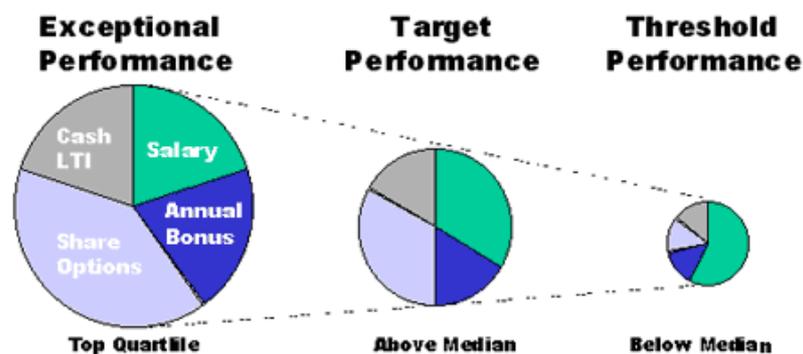

FIGURE 2: Market value measure Trends in shape, size and scope (Cornish and Dell, 2009)

We could analyze base salary; total cash compensation (TCC); total long-term incentive (LTI) values as well as a breakdown by vehicle; total direct compensation (TDC); LTI mix; and TDC mix. In the relationship with SMEs it becomes very difficult to extract the cost/income components in team works though. Such quantifications have improved results on the SME-bank relationship, profitability and durability. Yet, on a whole, the participating team must match the need for calibrating pay to performance, aiming at the top right quadrant.

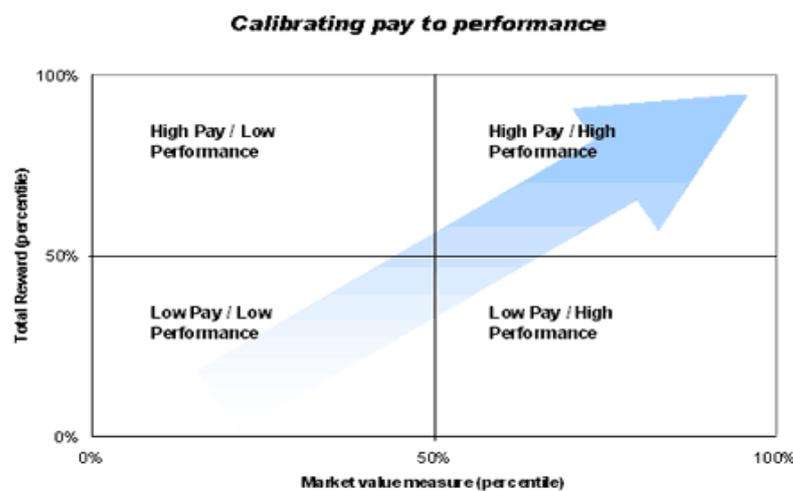

FIGURE 3: Calibrating pay to performance on RM objectives (Cornish and Dell, 2009)

The link between them is the high individual and team motivation. Hence, choice of performance measure is critical. If not thought through carefully, and "audited" regularly, an organisation may be paying the bonus but not rewarding the right business performance.

When considering risk taking as part of the pricing-efficiency model in the context of Bank-SME relationships, building a visible dedicated team to serve SMEs asks for a set of requirements.

<i>Requirements for team assembly</i>	<i>Team key competences</i>	<i>Team minimum composition</i>
<i>Cross-knowledge of culture/language</i>	<i>Language development, behaviour analysis, case studies</i>	<i>Customer Service Desk Loan Officer Treasurer Risk Manger Legal Officer Relationship Manager IT specialist</i>
<i>Information identification</i>	<i>Explore various information sources/channels</i>	
<i>Inside information exchange</i>	<i>Build up trust</i>	
<i>Information processing/ synthesis</i>	<i>Staff training</i>	
<i>Information adaptation</i>	<i>HRM& IT departments involvement</i>	
<i>Information selling to decision makers</i>	<i>Build up dedicated teams</i>	
<i>Price- related information reflection</i>	<i>Standardisation vs. customization in pricing</i>	

TABLE 2. Multipurpose teams serving SMEs

It is important to observe that having good clients makes getting much easier. Yet, clients that are not good enough can improve anytime, yet during financial crisis the chances for "bad" clients to get worse are higher, despite the fact that the market can bounce back.

Using confidential regulatory data on small, closely- held commercial banks, DeYoung et al. (2001) find that banks that hire a manager from outside the group of controlling shareholders perform better than those with owner-managers; however, this result depends on motivating the hired managers with sufficient holdings of stock. Higher levels of insider holdings lead to entrenchment and lower profitability.

Therefore, the bank needs to be proactive: it should educate the SMEs, understand their current situation, including analysing their zone of tolerance (Zeithaml and Bitner, 1996) as well as determining their propensity to default. That is, through the enhanced communication channels, the bank should establish whether, under the new regime, the SME has a positive, cooperative behaviour towards finding mutually beneficial solutions to enhance the relationship (Wilkinson and Young, 1998), or whether it is likely to behave in an opportunistic way (Williamson, 1985 in Zineldin, and Jonsson, 2000),

Put differently, for an RM success strategy in times of financial crisis, there are seven fundamentals of RM development: LEARNER

Leverage: leverage current SME clients to get new ones

Expand: Expand the products and services each client uses, but add and drop products and services in line with the portfolio strategy and keep reassessing clients constantly (client reshuffling).

Assets: Get all of your clients' assets

Retain: Retain your clients by providing extraordinary service

Niche: Develop your niche and natural markets and build a marketing process around them (an RM Tool)

Educate: Educate your client to work with you and the financial products and

Regulate: regulate at both an internal and external level your SME, i.e. create a control and supervision system within the SME department and share your experience with the regulators, the Central Banks.

Out of these fundamentals, one is key in times of financial crisis: Retention. Some general factors affecting customer retention are:

- Portfolio performance consistent with client goals and expectations - a certain degree of satisfaction that can be immediately measured and data stocked and interpreted in time. A combination of client education by the bank on such factors as performance and contact frequency or required level of relationship. Understanding goals and risk tolerance levels come prior to expectations and are key in a long-term RM. Then performance satisfaction depends on the allocation, diversification and a disciplined investment process. In the long run, a conservative approach will outperform a less-disciplined, aggressive investment approach.
- Frequent, proactive contact - not only the clients want to hear from you during this time, but they need your help in the sense of caring, appreciation and actual support. A minimum of two proactive contacts per month is recommended: one for information exchange and another for problem solution.
- Crisis communication tips: plan ahead, constant contact, consistency and engagement in each issue, fast response time, no rumours, total coordination.
- Effective problem resolution-based mainly on communication becomes the most important trait of RM. Any solution should be immediately be released to the client, while any delay should be regularly explained and followed through.
- A broad relationship - the higher the number of products held with the customer the higher the technical probability of client retention as a vote of confidence from the customer.
- Ensuring that the new relationship experience is positive - first impression always counts, not only in new client relationships about also in terms of new products offered to existing clients.
- Team work (specialized on product types, inside and outside from contact-communication and administrative issues, vertical or superstar structure (Mullen, 2008), junior and senior for a succession plan or a mixed team) or reach through someone else system.
- Final step to Client Associate Programmes - the SMEs can participate to the Bank client retention programmes. In this case, the SMEs benefit from large fee and interest rates reduction (based on their participation level to the Bank's client retention), while at the same time the bank can suggest possible clients/suppliers or partners to the SME in strengthening each others' business.
- Build-up upon the Bank's strategy, a RM Control and Supervision system (why, by whom, how often, where)

From the bank's view point, hard information (financial and market ratios analysis) offers a level of probability subsequent to default. For the bank, credit scoring plays an important role

in predicting default. Nowadays, many banks incorporate in the internal credit rating, soft information that usually contributes 40-50% to assessing credit quality (Kornai 1980). Therefore, in many industries and cultures the soft information component prevails to hard information.

Most of the time these areas are associated to emerging markets, but touch mature markets due to globalization. Then, soft information is associated to default especially when the environment allows room for figures manipulations, the timing data procession or delaying procedures, technology or systems, hidden data and attitudes in payment, when there is no repeated relationship or transactions (exception Herstatt Bank case). Hence, often soft information substitutes rather than complements hard information, depending on the depth of the lending relationship.

Further, employees directly involved in RM, can benefit from rotational audit and supervision which could be utilised during financial crisis for reducing person dependency. At the same time the cultural aspect should be kept in mind. Change during financial crisis triggers insecurity, yet a frequent presence of a well-known figure could improve a sustainable rhythm of work.

These, as an outcome of the relational philosophy of the bank, can have a positive effect on key employee performance when dealing with grievances and difficulties that arise from the financial crisis.

In a nutshell, the measures suggested rely on strong commitment on behalf of the bank in nurturing its existing relationships as well as on behalf of the SME. In other words, it is the attitudes of the interacting parties that will determine the future course of their relationship.

CONCLUSION AND FUTURE RESEARCH

It is well documented in the literature that fostering customer relationships can result in the long-term success of an organisation (Wilson, 1995; Christopher et al, 2002). Nevertheless, the conceptual framework presented here, suggests that the recent financial crisis can adversely affect the existing bank-SME relationships: it undermines adaptation and may eventually hinder trust and commitment, two fundamental pillars of relationship building.

Consequently, in view of the above, the present paper discusses a number of recommendations so as to undermine the crisis's effect on the long-term success of such relationships. To this end, it is suggested that special emphasis is placed on the communication mode between the interacting dyad, i.e. communication channels should be improved. In addition, the recommendations draw from the very nature of services, where their unique characteristics (and especially inseparability) make employee performances critical. As such, in periods of crisis HRM becomes even more important, where employees are motivated to enhance performance and retain SMEs. Further, employees are expected to open the eyes and the ears so as to gather soft information on SMEs; this is key in evaluating SME viability. Moreover, the bank's structure and the design and availability of special programmes to help SMEs are important parameters, but it is recognised that existing bank regulation does not necessarily help SMEs.

On the whole, it can be argued that both the conceptual model and the recommendations may be used as a reference point for potentially any European bank involved in RM with SMEs.

MANDATORY OBLIGATIONS AND VOLUNTARY DISCLOSURE OF ITALY'S LISTED COMPANIES

Iuliano, Giuseppe¹; Sessa, Lucia²

¹Research Professor of Management Accounting, Università degli Studi di Salerno – Italy

²PhD Student of Public Management, Università degli Studi di Salerno – Italy

INTRODUCTION

Voluntary disclosure is defined as the discretionary release of financial and non-financial information through annual reports over and above the mandatory requirements; it is a term that encompasses the process by which the social and environmental impacts of corporate actions are communicated to stakeholders.

Providing social and environmental information also represents a commitment to accountability, transparency and stakeholder engagement. However, without laws and regulations, the provision of this information is primarily voluntary and dependent on individual corporate determination of what should be reported, how it should be provided and to whom it should be directed.

The social implications of the activities carried out by companies also seem to receive more attention from stakeholders and several countries government.

Recent legislation by the European Commission reflects the mentioned scenario.

This is consistent also with Commission Recommendation 2001/453/EC of 30 May 2001 on the recognition, measurement and disclosure of environmental issues in the annual accounts and annual reports of companies. However, taking into account the evolving nature of this area of financial reporting and having regard to the potential burden placed on undertakings below certain sizes, Member States may choose to waive the obligation to provide non-financial information in the case of the annual report of such undertakings.

As a result of the process of accounting harmonization brought about by Regulation no. 1606/2002, the Commission has reconsidered the contents of its Accounting Directives (*Modernisation of the Accounting Directives*). One of the most significant amendments concerns the minimum content of the Management Report, which, in its updated version, allows for disclosure of information also of “*non-economic or financial nature*”. With reference to the process of accounting harmonization involving the mandatory use of IAS/IFRS, the IASB project certainly deserves mentioning. In collaboration with some international standard setters, the IASB project has released a discussion paper entitled “*Management Commentary*” (MC) with the purpose of working out an archetype, similar to a Management Report, for the disclosure of corporate information, particularly qualitative¹²⁷.

Directive no. 2003/51/EC of the European Parliament has established that the information should not be restricted to the financial aspects of the company's business. It is expected that, where appropriate, this should lead to an analysis of environmental and social aspects

¹²⁷ The IASB Framework for the Preparation and Presentation of Financial Statements acknowledges that financial statements are not, of themselves, sufficient to meet the objectives of financial reporting. To bridge the gap between what financial statements are able to achieve and the objectives of financial reporting it may be necessary for the financial reports to include additional information (*las 1, Framework*, paragraph 13).

necessary for an understanding of the company's development, performance or position; hence, the level of disclosure depends on the legal framework.

Each Member State, however, would be responsible for drafting the specific procedures to incorporate the new requirement into national legislation; hence, implementation of Directive no. 2003/51/EC has been occurring across Europe and is a strong case study for how future governance and disclosure legislation will be implemented. In European countries there has been much progress as well.

After the "modernization" of European accounting directives, the Italian Government has adopted Legislative Decree no. 32, 2nd February 2007, which requires to include in the Management Report, where appropriate, non-financial information relating to environmental and employee matters.

Social and environmental issues have become a major concern for accounting research over the past two decades. Social and Environmental Accounting has attracted the attention of a number of researchers attempting to understand, explain and predict the disclosure of information on the social and environmental implications of business activities.

Empirical research has hypothesized that size, profitability and the potential environmental impact of the firm are the main factors explaining the amount of information disclosed, both mandatory and voluntary. On the other hand, several studies have focused on the motivations for disclosing environmental information, hypothesizing that disclosures are aimed at making or sustaining corporate legitimacy.

The purpose of this paper is to examine the impact of legal framework on extent of voluntary disclosure practices of listed companies in Italy.

Hence, this paper provides an empirical analysis of the influence of Legislative Decree 32/2007 on Italian listed firms' disclosure, based on a sample of companies listed on *Italian Stock Exchange*.

CONCEPTUAL FRAMEWORK

This section deals with the empirical studies so far conducted by different researchers on the extent of disclosure of information in the annual reports.

Some studies look at only mandatory information, some look only at voluntary information, and yet others have looked at both mandatory and voluntary information.

On the subject, some Italian scholars (Quagli, Teodori, 2005) make a distinction among *required*, *voluntary* and *mandatory information*, considering the different degrees of discretion (about format, way of explanation and contents) adopted by a company when disclosing.

Hence, disclosure could be classified as follows:

- **mandatory;**
- **required:**
 - discretionary in content, format and communication conditions;
 - discretionary in content and format, but regulated in communication conditions;
 - discretionary in content but regulated in format and communication conditions;

- **voluntary**, defined as the discretionary release of financial and non-financial information through annual reports over and above the mandatory requirements. (Allini, Manes Rossi, 2007).

To determine the extent to which specific items of information are disclosed in corporate annual reports, various approaches have been used by different researchers.

Ahmed and Nichols (1994), Wallace, Naser and Mora (1994) and Wallace and Naser (1995) used mandatory information items while Firth (1979), Chow-Boren (1987), Spero (1979) and Hossain et al. (1994) used only voluntary information items in their studies. Singhvi (1967), Singhvi and Desai (1971), Choi (1973), Barret (1976), Cooke (1989), Karim (1996), Hossain (1998), included both mandatory and voluntary information items in their studies (Ahmed, 2006).

The number of items included in a disclosure index varies from study to study. In most of the studies, a disclosure index has been prepared in order to measure the extent and level of disclosure in the annual reports based either on a user's survey or on a search of corporate reporting literature.

In some studies, the disclosure index has been prepared by surveying a sample of users to determine the user's perception of the important items of information to be reported in the annual report, as well as the weight to be assigned to the items of information incorporated in the disclosure index, while in other studies, the weight has been given based on the researcher's own subjective assessment (Barret 1976 and 1977, and Marston, 1986).

On the other hand, some researchers like Kahl and Belkai (1981), Cooke (1992), Alam (1989), Ahmed and Nicholls (1994) and Karim and Chowdhury (1998) have used the unweighted index and a dichotomous procedure in which an item score is one if disclosed and zero if not disclosed.

Some studies stress the adequacy of total disclosure based on a checklist consisting of mandatory and voluntary disclosure items.

The number of items included in various disclosure indices generally range from 10 to 289. It means that the concept of adequate disclosure varies across researchers.

There are researchers who have measured the extent of disclosure longitudinally to determine whether the quality of disclosure has improved over time, whereas, most of the studies have focused on only one year. The number of companies included in the samples in those studies varied from 14 to 527.

Moreover, a variety of studies concerning voluntary disclosure (e.g. Atkinson, 1997; Eccles et al., 2001; Epstein and Birchard, 2000; Gray, 2002; Healy and Palepu, 2000; Jaggi and Low, 2000) and institutional guidelines (GBS, 2001; GRI, 2002; ISEA, 1999, OECD, 2001) can be used to classify, record and evaluate the information contained in the voluntary disclosures made by a listed firm as a part of its stakeholder management effort. Listed companies have real strategies to compete for attract potential investors interested in choosing convenient investment model. In determining the most convenient investment opportunities, investors are essentially driven by performance indicators, risk management, transparency and level of disclosure (Galeotti, 2008; Azzali, 1996; Stone, 2007).

Mainstream literature on voluntary disclosure has focused on quantity and then used that aspect as a sound proxy for the quality dimension of disclosure. Some researchers (Beretta, Bozzolan, 2006) propose simple quantity-quality indices based mainly on a dichotomous score

(Marston & Shrivies, 1991; Sinhvi & Desai, 1971; Zarzeski, 1996). Others hoping to differentiate quality, adopt weighted indices of disclosure, subjectively assessing the weight to be attributed to each item disclosed (Botosan, 1997; Wallace, 1988; Wallace & Naser, 1995) or to the type of measure associated with the information disclosed (Guthrie, Petty, Ferrier, & Wells, 1999).

Many empirical studies have demonstrated that the level of disclosure is highly influenced by *size* and *industry* (Ahmed & Courtis, 1999; Belkaoui & Kapik, 1989; Cooke, 1992; Firth, 1979; Healy & Palepu, 1994; Richardson & Welker, 2001; Robb et al., 2001). For this reason we contend that an absolute index (e.g., the number of phrases containing voluntary disclosure) is not adequate to appreciate the relative quantity of disclosure made by any company. Instead, to investigate the overall amount of disclosure made by any single firm we computed a *relative index* of disclosure for each company. The relative index quantifies the increment in the level of information each firm disclosed in its management report before and after the date of the Decree. Appendix 1 presents the classification scheme proposed.

RESEARCH METHODOLOGY

The research has been designed to test the impact of a legal framework (legislative Decree 32/2007) on the level of environmental, social and risk management informations disclosed by Italian companies, but recognises that many other factors may play a part. Instead of engaging in either a longitudinal study or an in-depth study of a large number of companies, the approach is one of using a small sample as a pilot to provide indicators of further research. Hence the empirical evidence is exploratory rather than definitive.

In this study, content analysis was employed to collect the necessary data. Content analysis is defined as “the method of a research technique for the objective, systematic, and quantitative description of the manifest content of communication” (Berelson, 1971). It is usefully defined by Abbot and Monsen (1979), as: “A technique for gathering data that consists of codifying qualitative information in anecdotal and literary form into categories in order to derive quantitative scales of varying levels of complexity”.

The content analysis approach employed assumed that the content categories identified in the written messages of annual reports had manifest meanings (e.g. environment) that could, therefore, be categorized. (Krippendorff, 1980) (Guthrie and Parker, 1990). Hence, content analysis has been widely employed in studies on annual reports in the areas of corporate social and environmental reporting (for example, see Guthrie and Mathews (1985), Guthrie and parker (1990) and Hackson and Milne (1996)) although it is less common in the more conventional areas of accounting research (Gray et al., 1995a).

Prior studies have measured the disclosure in different units, i.e. number of sentences, words and pages (Hackson and Milne, 1996; Zeghal and Ahmad, 1990). We have adopted number of sentences in our analysis as it is adopted in the Hackson and Milne (1996) study and supported by Milne and Adler (1999). They considered number of sentences both as the most appropriate measure of disclosure, and also as the most appropriate basis for coding and analysis. Variability in sentence length was not considered a factor affecting the analysis of content from a coding perspective (ibid). The use of ‘word’ as a unit of measurement is difficult because interpretation of individual words out of context may result in differences of meaning (Unerman, 2000). Use of sentences overcomes this and removes some of the judgement required. They will also provide the means of determining whether there appears to be any variations in disclosure practices.

The use of page size also has some difficulties because of differences arising from font size, margins, graphics etc. and even with the use of a grid presents problems of comparability (Wilmshurst and Frost, 2000).

We used a disclosure index based on number of items disclosed by a sample of listed companies.

DEVELOPMENT OF HYPOTHESES

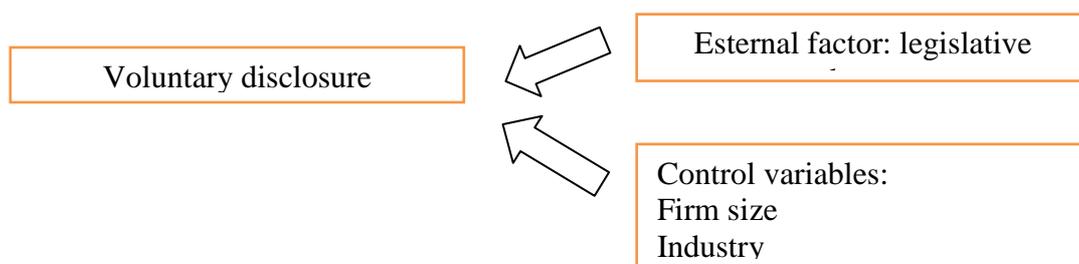

The improvement of mandatory disclosure may have a relationship with the size and the industry type of the listed companies. Moreover, the listed company may disclose more information than the smaller one for a variety of reasons. We test if the level of compliance influences the level of voluntary disclosure. Hence, we tested the following hypotheses:

Hp1: regardless of size or industry type, the listed companies provide more information in their annual reports than the regulations require.

Most of the literature on voluntary disclosure considers it as the only available disclosure, and ignores the existence of mandatory disclosure.

However, unless there is no correlation between mandatory and voluntary disclosures, mandatory disclosure may influence the incremental informational content for investors of voluntary disclosure. Hence, mandatory disclosure might be a key determinant for discretionary disclosure strategies of managers, as well as for the total level of disclosure in capital markets.

Research Model

DATA SOURCES

This assurance to stakeholders requires that corporations communicate their activities. Environmental, social and risk management informations may be disclosed in a variety of ways: reporting media, such as newsletters, bulletins, media releases, annual reports, management commentary reports and Internet homepages as well as stand-alone environmental reports. This makes the identification of a complete set of information (both for researchers and for stakeholders) very difficult.

The annual report is widely recognised as the principal means for corporate communications of activities and intentions and has been the source for virtually all previous corporate research (Wiseman, 1982).

In addition, the corporate annual report is seen as an important device for financial communication between management and shareholders (Barlett and Chandler, 1997), it's an important channel by which corporations can communicate with interested stakeholders and it's considered to be a logical medium for communicating corporate attempts at legitimization of environmental activities (Savage, 1998). Gray et al. (1995b) also suggested that the annual report is the major medium for a company to promote itself and the inclusion of other information with the financial information may indicate its relative importance.

Wilmshurst and Frost (2000) argue that the annual report is a statutory report incorporating both statutory and voluntary disclosure, which is produced regularly and can be easily accessed. Tilt (1998) also argued that an annual report is produced on a regular basis by all companies, thus making comparisons relatively easy. Finally, it is found that corporations are increasingly using their annual reports to disclose information about their social actions, particularly those relating to the natural environment (Savage, 1998; Savage and Cataldo, 1999).

This study will focus on the disclosures in management commentary reports.

SAMPLE SELECTION

The research took the form of a pilot study to investigate the effect of the regulatory framework on disclosure practices. The sample selection is drawn from firms listed on the Italian Stock Exchange (*Borsa Italiana Spa*) which organises and manages the Italian stock market. Main responsibilities of *Borsa Italiana* are to:

- oversee transaction activities;
- define the rules and procedures for admission and listing on the market for issuing companies;
- define the rules and procedures for admission for intermediaries;
- supervise listed companies' disclosure.

A sample of 30 listed companies was randomly selected from the population of companies listed on. The sample comprises only industrial and commercial firms; listed financial companies (e.g., bank and insurance companies) were excluded because of their specific disclosure requirements, specialized nature of operations and financial characteristics. This is based on the argument that the nature of a company's industry has been identified as a factor potentially affecting corporate social disclosure practices (Gray et al., 1995a). Companies whose economic activities directly modify the environment are more likely to disclose information about their environmental impacts than are companies in other industries (Hackston and Milne, 1996; Adams et al., 1998). In addition, the environmental sensitivity of the industry has been argued to influence the level of environmental reporting (Deegan and Gordon, 1996). The control variables (firm's size and industry type) used in this study will help to test the influence of decree on level of voluntary disclosure. Consequently, the industry groups selected in our study are: consumer goods and services; light and industrial manufacturing; water, energy, chemicals and drugs; food and beverages; high technology; heavy industry. The survey of

annual reports covers companies, which published their annual reports during the period ending between December 31, 2007 and December 31, 2008; two consecutive years immediately before and after the introduction of Legislative Decree no. 32, 2nd February 2007.

It is recognised that a small sample size and an analysis of two year's information has a risk of aberrance, but the results were to be indicative, and further studies would reveal whether this study could be replicated.

EXPERIMENTAL VARIABLES

We classify voluntary disclosures into three groups: strategic, nonfinancial and financial information. Most of the previous (theoretical and empirical) literature has tended to treat voluntary disclosures as somewhat amorphous. However, it is likely that the decision-relevance of information varies by type. Strategic and financial types of information have obvious decision relevance to investors and are widely discussed in the literature. Nonfinancial information is directed more toward a company's social accountability and is aimed at a broader group of stakeholders than the owners/investors. Thus, the variables affecting disclosure choices by companies probably vary by type as well. We view this refinement as a major improvement over prior studies.

Voluntary disclosure is an abstract concept that cannot be measured directly. Nevertheless, we concede that a suitable proxy such as an index of disclosure can be used to gain insight into the level of information disclosed by companies.

Three steps were taken to develop the index of discretionary items.

SCORING THE DISCLOSURE ITEMS

There are two main approaches to developing a scoring scheme to capture levels of disclosure. The approach advocated by Copeiand and Fredericks (1968) is to use a criterion based on the presentation of information. They cite the number of words used to describe an item disclosed. Such an approach leads to a scale of disclosure which varies between zero and one.

However, the allocation of scores along the continuum is somewhat subjective.

The alternative approach, and that adopted in this study, is to use a dichotomous procedure in which an item scores one if it is disclosed and zero if it is not disclosed. We based on the disclosure index used in earlier studies (Gray, Meek and Roberts 1995; Cooke, 1989; Chow and Wong-Boren, 1987; McNally, et al. 1982; Firth 1979) a preliminary list of 110 items was generated. The list was then updated by referring to the Italian regulatory in order to derive an index of discretionary items. Some items were dropped from the list because, after the Decree, they were found to be mandatory disclosure requirements.

After the index was subject to these revisions, a final list comprising of 95 discretionary items was compiled. Approximately 70% (67) of the discretionary items are similar to those selected by Gray et al. (1992). After establishing the disclosure index, a scoring sheet was developed to value the extent of voluntary disclosure. If a company disclosed an item of information included in the index it received a score of 1, and 0 if it is not disclosed (see Cooke, 1989, p. 182).

Both weighted and unweighted disclosure indices have been used. The disclosure indices constructed to measure the quality and extent of disclosure vary considerably from study to study.

The disclosure index created by this means is unweighted and assumes that each item of disclosure is equally significant. We consider that unweighted indices are a suitable research instrument in disclosure studies.

Furthermore, the weighted indices are subject to general criticism in the literature. Chow and Wong- Boren (1987, p. 536), argue that a great deal of subjectivity exists in the assignment of weights because it reflects the perceptions rather than actual information needs of the users of financial reports. For this reason, an unweighted index was considered to be appropriate for the aim of this paper.

The final checklist consists of eighty-five items of information (see appendix A). They are categorized into three major groups of information types and, further, into twelve subgroups:

(a) Strategic information:

- (1) general corporate characteristics,
- (2) corporate strategy,
- (3) acquisitions and disposals,
- (4) research and development,
- (5) future prospects information;

(b) Nonfinancial information:

- (6) information about directors,
- (7) employee information,
- (8) social responsibility and value added disclosures;

(c) Financial information:

- (9) segment information,
- (10) financial review information,
- (11) foreign currency information,
- (12) stock price information.

The increase of voluntary disclosure items, except those becoming mandatory immediately following the introduction of the decree, has been indicated using 0-1 dummy variables, respectively, depending upon whether or not the item "state" was changed during the analysis period.

Finally, for each item in the disclosure index, a firm receives a score of "1" if it voluntarily discloses information on the item and "0" otherwise.

For each company, the disclosure index (ID) is calculated as the difference between the number of items disclosed by company x in its management report in year 2008 and the number

of items that the company x has disclosed in its management report in year 2007, divided by the total number of items disclosed by company x in its 2007 report.

Disclosure index was computed by using the following formula:

$$(DI) = (a - b)/b$$

where:

a = number of information items disclosed by each listed company in 2008 management report;

b = number of information items disclosed by each listed company in 2007 management report.

CONTROL VARIABLES

Firstly, we assessed whether the introduction of Legislative Decree 32/2007 produced an increase in the level of disclosures contained in the management commentary report. Control group method was used to test for association between the improvement in corporate disclosure levels and decree implementation. This method compares to an experimental group in a test of a causal hypothesis. If the suspected causal agent is actually a causal factor of some event, then logic dictates that event should manifest itself more significantly in the experimental than in the control group. For example, if "A" causes "B", when we introduce "A" into the experimental group but not into the control group, we should find "B" occurring in the experimental group at a significantly greater mean than in the control group. Significance is measured by relation to chance: if an event is not likely due to chance, then its occurrence is significant.

Two variables are introduced as control variables in the analysis:

1. firm size
2. industry type

These variables are used to test the hypothesis *HP1*. Two subsamples are drawn from the initial sample on the basis of the control variables. In other words, subsamples were selected in two steps:

- the first step consisted of constructing two subsamples of companies selected on the basis of *firm size*; the first one includes small size firms, the other one includes large size firms;
- in the second step of the selection procedure, six subsamples of firms are selected from our sample on the basis of *industry type*.

To test the hypothesis *HP1*, in our analysis, the main samples mean is compared to control variables subsets mean.

The improvement of mandatory disclosure may have a relationship with the size of the companies. Moreover, the larger company may disclose more information than the smaller one for a variety of reasons. Again, the size of a company may be measured in different ways such as through sales turnover, total assets, capital employed, number of employees. In this study,

to better examine the effect of legal framework on voluntary segment disclosure, our analyses control for other factors that may affect the levels of voluntary disclosures:

In almost all disclosure studies, company size has featured as an important determinant of disclosure levels (Belkaoui-Riahi, 2001; Chow and Wong-Boren, 1987; Lang and Lundholm, 1993; Owusu-Ansah, 1998; Singhvi and Desai, 1971; Wallace and Naser, 1995; Wallace et al., 1994; Watson et al., 2002).

For this study, number of employees was used as a proxy for size. Number of employees was preferred over other proxy measures because the focus of this study was on stakeholder management efforts of a company, and for a company having larger number of employees it would be more important to manage the relationship with employees as a stakeholder group.

Revenue or total sales, one can argue may not be an appropriate measure since many companies (especially high technology companies) with relatively few employees could have large sales and revenue. Data for number of employees was obtained from annual reports.

Industry type also affects disclosure choices particularly when the reported information is specific to the firm itself and not common to the industry. Haven et al. (2002) show that high-tech firms voluntarily disclose information because, investors might not expect their future earnings easily. Consequently, firm value is subject to large price fluctuations. Furthermore, Wallace et al. (1994) and Kasznik and Lev (1995) suggest that industry effects could explain the different levels of disclosure among firms. Industry dummy variable is therefore included in this study to control for the industry effects.

EMPIRICAL EVIDENCE

This paper examines the patterns in voluntary environmental disclosures made by a sample of around 30 listed firms drawn from a diverse range of industrial sectors. The results show an average increment of 33,98% in voluntary disclosure level. The three major groups of information types showed in the table n. 1 are:

- (a) Strategic information
- (b) Nonfinancial information
- (c) Financial information

listed companies	2007				2008				delta 2008-2007

Table 1: The disclosure index

The results in Table 1 provide that voluntary disclosure items concerning non-financial information (b) improved after the introduction of Decree; this improvement appears to be a particularly interesting. In fact, increment rate of voluntary disclosure items concerning non-financial information (b) is 32%, the highest increase recorded in the study period. Although a significant increase in the number of items recognizing compliance with environmental regulations is reported, many firms simply stated that they were in compliance before the new regulation.

To test the hypothesis Hp1, we compared the main samples mean to subsample mean.

Scanning Table 2, listed firms size is not important in explaining the voluntary disclosures of different types of information. The table reports two subsamples. selected on the basis of firm size; the first one includes small size firms with number of employee under 1200, the other one includes large size firms.

Listed firms size doesn't appear to be significant in explaining the variability in the extent of voluntary disclosure for our samples of firms.

Size			
<1200	disclosure increment rate	>1200	disclosure increment rate
2	5,56%	1	25,00%
3	10,53%	4	22,22%
6	42,86%	5	75,00%
7	7,69%	8	62,50%
11	20,00%	9	0,00%
15	83,33%	10	100,00%
17	-7,14%	12	33,33%
19	33,33%	13	0,00%
21	-25,00%	14	16,67%
22	125,00%	16	25,00%
23	25,00%	18	11,11%
24	12,50%	20	-47,83%
26	75,00%	25	166,67%
27	50,00%	28	57,14%
30	25,00%	29	-11,11%
Min	-25,00%	Min	-47,83%
Max	125,00%	Max	166,67%
subsample mean	32,24%	subsample mean	35,71%
sample mean	33,98%	sample mean	33,98%
standard deviation	0,4475	standard deviation	0,5148

Table 2

In effect, the difference between the disclosure average of main sample and the disclosure average of subsample is not significant.

Industry doesn't appear to be influential in this study. Although Companies in the oil, chemicals and mining industry seem particularly inclined to provide non-financial information, such as those related to the environment, perhaps reflecting greater sensitivity toward social accountability issues. Industry is also related to disclosures of financial information. However, seem there is little variation in the increment of voluntary across industry sub groups.

The industry influence is more pronounced than it is for nonfinancial information in that two industry categories are significant (heavy industry and high technology).

It is possible that voluntary disclosure in one sector of the economy may be higher than in another sector. The increment rate in disclosure recorded in heavy industry subsample, for example, may be due to the existence of a dominant firm with high levels of voluntary disclosure leading to a bandwagon effect and to an industry characteristic that impacts on environmental.

The amount of variability in disclosure explained by the size and industry type measures, although statistically significant, is not large; the difference between main sample disclosure average and subsample disclosure average is not significant. This result suggests that other explanatory factors, such as legal framework, which is the variable included in this initial analysis may have an important role to play in improving the explanatory power of the model.

Industry											
Heavy industry	disclosure increment rate	Water, energy, chemicals and drugs	disclosure increment rate	Consumer goods and services	disclosure increment rate	Light and industrial manufacturing	disclosure increment rate	High technology	disclosure increment rate	Food and beverages	disclosure increment rate
5	75,00%	6	42,86%	1	25,00%	10	100,00%	2	5,56%	15	83,33%
14	16,67%	13	0,00%	3	10,53%	12	33,33%	4	22,22%	16	25,00%
18	11,11%	17	-7,14%	9	0,00%	20	-47,83%	7	7,69%	19	33,33%
21	-25,00%	26	75,00%	11	20,00%	27	50,00%	8	62,50%	23	25,00%
25	166,67%	28	57,14%	22	125,00%	30	25,00%	24	12,50%	29	-11,11%

CONCLUSION, LIMITATIONS AND IMPLICATIONS OF THE RESEARCH

This study investigates whether the introduction of Legislative Decree no. 32, 2nd February 2007, had increased the level of voluntary disclosure. We derive some preliminary conclusions from the analysis made by using the proposed framework.

Our results suggest the following implications.

First, listed Italian companies, regardless of size or industry type, provide more information in their management commentary reports than the regulation requires in the two-year period of study.

In conclusion, it could be said that the improvement in the quantity of mandatory items disclosed by listed Italian firms may influence their level of voluntary disclosure.

However, whatever may be the variables and method of analysis, the disclosure index can provide a useful tool for measuring disclosure adequacy and practices if the results obtained from it are balanced by qualitative analysis. Little attention has been paid in the extent literature to the semantic properties of information. We contend that, in the analysis of the disclosure made by listed companies, attention has to be paid not only to how much is disclosed but also to what is disclosed and how. This is the purpose of our future studies.

Moreover, the study is based on the voluntary and mandatory disclosures before and after the legislative decree n. 32, which makes this study restrict to two-year period. The size of the sample used in this study is relatively small. Given these limitation, future research should attempt to revisit these aspects of this study.

Moreover, the study is based on the voluntary and mandatory disclosures before and after the legislative decree n. 32; hence, it has used a short observation window—only a two-year period which may lead to deceptive results. The size of the sample used in this paper is relatively small. Given these limitations, future research should attempt to revisit these aspects of this study and may focus too much attention on the quality of the additional information disclosed by the companies as a result of the implementation of legislative decree n. 32.

APPENDIX A

[Voluntary Disclosure Checklist](#)

Strategic information

1. General Corporate Information
 - 1 Brief history of company
 - 2 Organizational structure

2. Corporate Strategy
 - 3 Statement of strategy and objectives - general
 - 4 Statement of strategy and objectives - financial
 - 5 Statement of strategy and objectives - marketing
 - 6 Statement of strategy and objectives - social
 - 7 Impact of strategy on current results
 - 8 Impact of strategy on future results

3. Acquisitions and Disposals

9 Reasons for the acquisitions

10 Reasons for the disposals

4. Research and Development

11 Corporate policy on research and development

12 Location of research and development activities

13 Number employed in research and development

5. Future Prospects

14 Qualitative forecast of sales

15 Quantitative forecast of sales

16 Qualitative forecast of profits

17 Quantitative forecast of profits

18 Qualitative forecast of cash flows

19 Quantitative forecast of cash flows

20 Assumptions underlying the forecasts

21 Current period trading results - qualitative

22 Current period trading results - quantitative

23 Order book or backlog information

Nonfinancial information

6. Information About Directors

24 Age of the directors

25 Educational qualifications (academic and professional)

26 Commercial experience of the executive directors

27 Other directorships held by executive directors

7. Employee Information

28 Geographical distribution of employees

29 Line-of-business distribution of employees

30 Categories of employees by gender

31 Identification of senior management and their functions

32 Employees' picture

33 Reasons for changes in employee numbers or categories

34 Amount spent on training

- 35 Nature of training
- 36 Categories of employees trained
- 37 Number of employees trained
- 38 Data on accidents
- 39 Cost of safety measures
- 40 Redundancy information (general)
- 41 Equal opportunity policy statement
- 42 Recruitment problems and related policy

8. Social Policy and Value Added Information

- 43 Safety of products (general)
- 44 Environmental protection programs - quantitative
- 45 Charitable donations (amount)
- 46 Community programs (general)
- 47 Value added statement
- 48 Value added data
- 49 Value added ratios
- 50 Qualitative value added information

Financial information

9. Segmental Information

- 51 Geographical capital expenditure - quantitative
- 52 Geographical production - quantitative
- 53 Line-of-business production - quantitative
- 54 Competitor analysis - qualitative
- 55 Competitor analysis - quantitative
- 56 Market share analysis - qualitative
- 57 Market share analysis - quantitative

10. Financial Review

- 58 Profitability ratios
- 59 Cash flow ratios
- 60 Liquidity ratios
- 61 Gearing ratios
- 62 Disclosure of intangible valuations (except goodwill and brands)

- 63 Dividend payout policy
- 64 Financial history or summary - six or more years
- 65 Restatement of financial information to non-U.S./U.K. GAAP
- 66 Off balance sheet financing information
- 67 Advertising information - qualitative
- 68 Advertising expenditure - quantitative
- 69 Effects of inflation on future operations - qualitative
- 70 Effects of inflation on results - qualitative
- 71 Effects of inflation on results - quantitative
- 72 Effects of inflation on assets - qualitative
- 73 Effects of inflation on assets - quantitative
- 74 Effects of interest rates on results
- 75 Effects of interest rates on future operations

11. Foreign Currency Information

- 76 Effects of foreign currency fluctuations on future operations - qualitative
- 77 Effects of foreign currency fluctuations on current results - qualitative
- 78 Major exchange rates used in the accounts
- 79 Long-term debt by currency
- 80 Short-term debt by currency
- 81 Foreign currency exposure management description

12. Stock Price Information

- 82 Market capitalization at year end
- 83 Market capitalization trend
- 84 Size of shareholdings
- 85 Type of shareholder

ENHANCING AND ESTABLISHING STRONG RELATIONSHIPS WITH CUSTOMERS: THE CASE OF THE BANKING SECTOR IN FYROM

Kapoulas, Alexandros¹; Cvetanovski, Ilija²

¹*CITY College – International faculty of the University of Sheffield*

The financial services industry in FYROM and the banking sector in particular is relatively young though is growing immensely and becoming highly competitive after foreign investments in the past several years were conducted by groups of foreign investors. At present 19 FSI operate in a market of 2.000.000 customers. Why is this imminent? For the reason that today the customer is more important than ever.

The purpose of this research paper is to provide insight about how behavioral and affective commitment could be enhanced in the banking sector in FYROM and in what way does it affect the established customer base.

Findings in our research indicate that at present even conservative banks not being positioned as customer-oriented, are forced to become customer-centric in order to survive or progress. Banks that realize the necessity of becoming customer-centric and of establishment of strong relationships with its customers based on affective commitment will prosper and grow while those who will follow the opposite route will lose ground to its competitors and will struggle for survival. Consequently all participants in our focus groups both from the B2C and B2B segment stated that they would prefer to build affective commitment with their FSI.

The particular research was conducted through inductive approach using semi-structured in-depth interviews with "elite participants", comparative case studies and focus groups.

Considering the fact that research for behavioral and affective commitment has not been conducted in the specific industry, substantial space for further research is assured.

Keywords: behavioral, affective, commitment, banking, FYROM, CRM

PURPOSE

The purpose of this research paper is to provide insight about how behavioral and affective commitment could be enhanced in the banking sector in FYROM and in what way does it affect the established customer base. The primary aims of this paper are to provide understanding about the current relationships between the subjects operating in the banking sector in FYROM and their customers and uncover the type of relationship whether behavioral or affective commitment exists, discover customers' perceptions in regard to the type of the relationships and their attitudes towards customer care before and after the implementation of a CRM program or complementary customer care integration system at the financial institutions. Moreover, this research paper will uncover the perceptions and expectations of the management of the particular bank towards increasing the behavioral or affective commitment with their clients and understanding of how these relationships could be established and maintained. Consequently, this research paper will explore and provide understanding of findings for future research on the particular topic. The particular research will be conducted through inductive approach using semi-structured in-depth interviews with "elite participants", comparative case studies and focus groups that will be discussed in greater detail in this research paper.

For the purpose of the particular research paper two different types of banks were selected with different mentality and business focus. Consequently, one bank owned by domestic investors, being attributed as conservative, albeit undertaking strategic moves incorporated in its mid-term business strategy to become more customer-centric and another bank being transformed from conservative to customer-centric as a result of a take-over of a major multinational banking Group. The findings in our research indicate that today even conservative banks not being focused towards the customer previously are forced to become customer-centric in order to survive and consequently be able to report positive financial figures in their balance sheets.

DESIGN/METHODOLOGY/APPROACH

Considering the nature and the specifics of the particular research and by taking into consideration past exam suggestions such as Fitzgibbon and White (2005), Menon and O'Connor (2007) and Kapoulas, et al (2002), it appeared that most suitable research approach for the particular research in behavioral and affective commitment was qualitative. Moreover the authors Carson, et al (2001) imply that qualitative studies are crucial and extremely valuable in the study of managerial performance and marketing activities within and by organizations, as these cannot be adequately studied in neatly arranged compartments in isolated and artificial settings. Creswell (1994) believes that by following an interpretative research through an inductive theory- that generates "mode of inquiry" can uncover a production of substantial and valuable knowledge for the business and the academic environment as well. In seeking understanding, qualitative research methods based on the "ethos" of an interpretative philosophy serve marketing management decision making in better manner than many other research methods that provide information without guidance (Carson et al, 2001). Through interpretative comparative case studies it will seek to reflect the manager's understanding and perception of behavioral and affective commitment and CRM. Moreover interpretative qualitative research methods are valuable for in-depth understanding of phenomena in the marketing domain, in managerial and consumer contexts (Carson et al, 2001). The purpose of this study is exploratory since it investigated and tried to uncover and understand an emerging phenomenon. This argument is supported and implied in the qualitative research by Kapoulas, et al (2002).

The particular research was being conducted through an inductive approach using semi-structured in-depth interviews with "elite participants", comparative case studies and focus groups. In-depth interviews, focus groups and case studies are comprehensive methodologies, that allow wide range for gathering of data, allow for observation what people say, written materials, documentary evidence and time specific approach that are clear benefits of its utilization as research techniques/methods (Carson et al, 2001). Primary data were collected from interviews that provided detailed insight about the understanding of the organization and its clients, the benefits of building strong and long term relationships with them and the drawbacks of having established relationships based on high switching costs. Moreover the authors Carson, et al (2001) state that qualitative research is suitable where the research emphasis is on in-depth understanding of how, why and in what connotation certain given phenomena occur and what impacts upon or influences such phenomena.

In -depth interviews with "elite participants" as stated by Egan, J. (2007) and Carson, et al (2001) is considered to be a methodology that is most likely to accomplish results in a qualitative research. Moreover the authors Carson, et al (2001) state that in-depth interviewing is a powerful research technique for interpretative research for the fact that it is a useful method for exploring new and under-researched topics including those that are new only to the researcher while its overall strength is its ability to gather rich and meaningful data and analysis of which will lead to significant depth of understanding that would be difficult to achieve by using any other method alone. Semi-structured interviews of different sessions of 45 minutes and of an hour was conducted and recorded on a digital recorder for further help and documentation of data for future revisit, as it is implied in the qualitative study by Fitzgibbon and White, (2005). Participants in the interviews were managers of the banks on a complementary position with our research area. This practice was being followed since these people are considered to be individuals that are highly influent, prominent, well informed about the organizations' operations and are selected based on their level of expertise (Marshall and Rossman, 1995:83).

In addition two case studies from different multi-channel banks were being conducted for further and more explicit comparison between different banks. Moreover, Carson, et al (2001) state that qualitative research is most relevant and provides useful and quality data when the emphasis is on comparison between different companies and industries. As argued by Patton (1990) that the design of a multi case uses combination of data sources in regards to secondary surveys, and company documentation to cross check data, increasing the credibility of the findings. This has provided an insight about the different perceptions of the management of the banks towards building affective commitment with their customers without disregarding behavioral commitment and facing negative implications on their established customer base in

terms of volume. Considering the different mentality of the management of the two banks that were part of our research, it is evident that the method of case-study was an optimal tool for comparison between these financial institutions that has albeit provided us with findings that are applicable for the whole banking sector in FYROM. Given the fact that qualitative methods are an array of interpretative techniques, they allow flexibility and variety in the study of complex phenomena in dynamic and changing environments (Carson et al, 2001). Secondary data was collected from various electronic sources, such as web sites from the participative banks in our research, publications, relevant articles, competitors' web sites and previous research done in the Balkan region since in FYROM previous research on the particular topic and in the specific industry has not been conducted at all.

For the purpose of the research, focus groups were being conducted as a tool that well supported the findings that were gathered in the process of our research. Focus groups are an extremely useful and often cost-effective method of gathering insightful aspects about a research topic (Carson et al, 2001). Focus groups were consisted of bank's customers that possesses the necessary expertise and have established relationships with the bank on a long term bases (Marshall and Rossman, 1995:83). Each focus group was consisted of 8 participants as it is suggested by Carson, et al (2001) in their work "Qualitative Marketing Research" that the optimal and most suitable number of participants for a particular focus group is ranging from 5 to 8. The focus groups were being conducted in two sessions, each of them enduring between 45 minutes and one hour as suggested by Carson, et al (2001) that this particular time interval for duration of the focus groups' sessions is providing optimal and quality findings. The method of triangulation was being applied in order to cross-check managers' and customers' perception towards behavioral and affective commitment, suggested in the qualitative study by Kapoulas, et al (2002).

LITERATURE REVIEW

The authors, Menon and O'Connor (2007) state that the term "behavioral commitment", also referred to as "calculative" or "continuance" commitment refers to customer- marketer relationship that is maintained by the perception of the customer of high switching costs, lack of market alternatives or also referred to as "customer inertia". On the other hand, the authors Sharma, et al (2006) think that this definition has to be broadened and for this reason, state that the behavioral dimensions of a commitment refer to "the overt of manifestations of relationship continuation and associated investments", in a form that is the allocation and development of resources, including different perspectives in terms of human, financial and physical aspect in a particular relationship in the form of a dedicated relationship-specific assets. The authors refer to this specific type of commitment as "behavioral commitment" or "resource commitment".

However the authors Menon and O'Connor (2007) and Sharma, et al (2006) agree that the term "affective commitment" refers to a customer-marketer relationship that is maintained on the pillars of reciprocity and mutual trust. It further implies "emotional attachment" between the two sides based on shared values. Moreover the authors, Menon and O'Connor (2007) emphasize that an essential prerequisite in order to achieve a successful CRM strategy, it is vital that companies establish behavioral or preferably affective commitment with their customers. In this connotation, the authors Reynolds and Phillips (2005) emphasize the importance of establishments of relationships based on loyal customers by stating that it is evident that market share that results from an activity from loyal customers is understood to be more sustainable and profitable. Moreover Yue and Xie (2008) based on the findings in their research on the "antecedents and consequences of customer loyalty: an empirical synthesis and reexamination" prove that the findings indicate stronger effect sizes for trust, perceived value, perceived fairness, and product/service quality rather than in the case of high switching costs, psychological commitment, brand reputation and general customer satisfaction. Hence, the authors state that the magnitude of customer loyalty did not seem to reflect any major differences in the case of tangible products in complementary industries and economic segments operating with intangible services. The previously stated fact is extremely important considering that this finding additionally contributes to data validity in different geographic and economic segments regardless of the business subjects' core operations.

The author Breur, (2006) defines the term “customer value” as representation of either the benefit/value that a customer gets from using a product, or the profit that the company gets from a customer. In this connotation the author states that there are two approaches soft and hard. The soft approach is directed to only how to satisfy the customer. On the other hand, the hard approach that is recommended by authors Breur (2006) and Kapoulas, et al (2004) deals with creation of shareholder value for the customer. Moreover, the author Kapferer (2006) states that there is a dramatic gap existing between the latest definitions of marketing by Kotler that emphasize “the soft notions of a balanced exchange relationship” and the hard mantra of the modern marketing strategy that is directed into reduction of people’s choices. Hence, the author elaborates and clarifies what loyalty really means today in the market and how best it can be achieved from the perspective of semantics. Kapferer (2006) states that the issue of the global phenomenon of decrease in brand loyalty is motivated by the disparity in the core meaning of the term “loyalty” in different languages and cultures in the first place. The term “loyalty”, as the author implies when translated into French becomes “fidelite”, derived from the Latin word “faith” and when translated into German it becomes “marktrauen”, based on the verb “trauen” that has religious connotation! However, the author states that regardless of the culture and language being examined the term “loyalty” refers to a unique type of relationship, based on reciprocity and at its extreme exclusivity. Consequently, the author Kapferer (2006) makes a parallel between the relationship of a business subject and its customer and the marriage between a man and women. The author states that the word “fidelite” in French that means “faith” in English implies exclusivity demanded from a long lasting relationship. But for the reason that people divorce and remarry with the evolution of the modern society, as stated by the author this perception is not applicable to the core definition. Because of this issue, the author states that brand cannot seek for exclusivity based on long-term relationships but rather seek for relationship that is based on mutual knowledge and values that could be defined as friendship for the reason that friendship unlikely like marriage demands no exclusivity and is always open to others as long as they largely share the same ideals, behaviors and views. The author believes that the path to this outcome of building relationship based on mutual trust is the companies to realize that the key is not to limit the customers` choices but paradoxically allow the customer to choose from more versatile choices.

The authors Sarel and Marmorstein (2007), Fitzgibbon and White (2005) and Reynolds and Phillips (2005) agree that not all customers contribute equally to the revenues and profits of a particular company. Consequently, the authors Reynolds and Phillips (2005) state that if a company is seen as an organism, the caloric contribution of the loyal customers could be seen as “nutrient rich”, while those of the less loyal customers could be seen as “empty”. Moreover, the authors Sarel and Marmorstein (2007) and Fitzgibbon and White (2005) initially agree with this statement, they think that companies should focus on identification of profitable customers and their life cycle considering that fact that an increase in number of new clients does not by itself imply positive implications on the financial performance of the particular company.

The author Yildiz (2007) and the authors Heath, et al (2006) agree that in their research they found that “trust” was the key variable that stimulates commercial trade and communication. Moreover Riivari, J. (2005) emphasizes the future and potential of mobile banking as an emerging trend in the financial services industry because there are three times more mobile phone users than online PC users. According to the author mobile devices become preferred route of communication by customers that opens opportunity for financial institutions through mobile banking applications to “put its brand into customer’s pocket”. However, considering the findings by the authors, Heath, et al (2006) that reveal that behavioral research conducted by Watzlawick, Bavelas and Jackson (1967) suggests that is the emotional and not the rational content in communication that drives relationships, the author Riivari (2005) states that there is an enormous limitation in the context of mobile banking in terms of communication having in mind that the switching costs for customers are extremely low. For this reason the author, Sjödin (2006) states that the recent developments in new technologies and channels of communication provide important tools for better monitoring and management of the relationship being established between the company (brand) and its customers and the communication between these two subjects. The author pinpoints e-mails, companies` websites as important emerging platforms for communication between the company and its customers that present the foundation for blogs and podcasts as evolving elements of the previously mentioned pillars

representing the foundation for more intensive interaction between the company and its customers that are rising in popularity and most important are contributing to interaction not just between the customer and company but among the customers themselves as well. The authors Yildiz (2008) and Godin (2000) agree that e-mailing has proved to be an effective route of increasing customer loyalty among the established customer base of the particular business subject and on the other hand has proved to be a powerful weapon in "conquest of new customers". This argument has also been supported by the findings from the focus groups in our research. Moreover, the author Sjödin (2006) emphasizes that even though all these channels accelerate and facilitate the diffusion of word of mouth, more importantly on behalf of the companies, it puts them in a strong position to monitor these relationships. In order this relationship to work, the authors recommend that the business subjects practice the principle of permission marketing in their operations that means that in order e-mailing to be effective, the customer must first accept the invitation for the business subject to send its e-mails to his/her address. The author Godin (2000) believes that the permission marketing empowers the customer of controlling the frequency and number of messages it does not affect the development of exchange but rather stimulates it by increasing the frequency of communication, increases the trust in the seller and enables preservation of the powerful and strong long-term relationship between the business subject and its customer. However, the author Sjödin (2006) warns about the possibility of diffusion and emergence of negative word of mouth that today in the market when the customer is most important and to a large extent is influenced by statements and experiences of other customers is the most dangerous weapon against any company operating in the market. In this connotation, Berry, J. (2006) presents the following formula for calculating economic benefit of each potential communication: $\text{propensity to respond} \times \text{value of the response} \div \text{cost of communication}$.

Challenges for bankers in the future will be to introduce larger number points of interaction with the customer without "compromising the convenience factors that customers have now come to expect". (p.167) Companies should be careful when relying on technology since technology should be used for routine, non complex services and in others conduct personal contact in order to achieve high level of customer satisfaction (Menon and O'Connor, 2007). In order companies to maximize its performances, increase customer satisfaction that by the fact itself would have positive implications on building strong long term relationships with their customers, they will have to maximize its employee motivation. In order to achieve the particular objective, companies should focus on selection and adjustment of the working conditions, identify applicants with the relevant needs and dispositions in order to best respond to the demands of the complementary position, design jobs and tasks to provide variation and challenge to be in a position to achieve intrinsic motivation, permanent training and sporadic revision for a timely and relevant feedback and continuous supervision on the workload of employees in order to avoid extreme stress and pressure on the employees. By no doubt, organizations will have to give incentives to its employees, but doing so the positive effects that will follow will be inevitable and will not only contribute to establishment of better internal relationships in the organization but will result in improvement of the established relationships with the existing customers that will stimulate establishment of better relationships with prospective customers and increase of customers volume. Considering the fact that personnel practices are not imitable and applicable to various types of organizations it will provide the particular organization with a sustainable and powerful competitive advantage. (Benkhoff, 1996) Moreover, companies should focus more increasingly on post-sale communication since this is the main reason that determines whether a certain relationship between a business subject and its client will be made or broken. (Heath, et al, 2006) Consequently, the authors Reynolds and Phillips (2005) state that gained market share through loyal customers is proven to be significantly more sustainable and profitable. In this respect, organizations from the banking sector should direct its focus on identification and recognition of profitable customers and their life cycle and build strong relations with them, considering the fact that increase in volume does not necessarily imply increase in company revenue and profits. (Sarel and Marmorstein, 2007, Fitzgibbon and White, 2005). As stated by Reynolds and Phillips (2005) that just as calories are not equally nutritious, not all share points contribute equally to the health of the brand, in a way that the caloric contribution of loyal customers is seen to be "nutrient rich" while those of less loyal customers can be thought as "empty". Moreover, understanding how a brand is nourished provides useful and helpful information for evaluation of the company's health and if necessary prescribing the company a diet. (Reynolds and Phillips, 2005)

FINDINGS

For the purpose of our research we have selected two multi channel banks, representatives of the middle banking sector of FYROM for the reason that these two banks had different mentality and culture. Bank A is owned by domestic investors while its business style of management and operations could be attributed as conservative though as findings will later on indicate, shifting towards more customer-centric orientation. Bank B on the other side is a bank that was taken over by one eminent multinational Group several years ago and since then the bank has become customer centric and incorporated customer care and the customer itself in the focus of its business strategy and core operations.

Findings in our research indicate that none of the banks that participated in our research have implemented a CRM program to aid them in better uncovering, understanding and management of the relationships with their customers. However in both cases, the managers have stated that their banks utilize various mechanisms and techniques for uncovering, management and improvement of the relationships they have established with their customers. In the case of bank A the reason for not having implemented a CRM system was that the eventual implementation of it would not make any financial sense considering the fact that the cumulative customer base of the bank is ca. 80.000 customers, albeit having various mechanisms such as procedures, planed actions, analysis of the customer base...that can be attributed as CRM activities. In the case of bank B, although the bank had not implemented a CRM program yet, the perceptions of the management of the company regarding the importance of the client and building strong and long lasting relationships with him/her have significantly changed after the entrance of the multinational Group in bank B that had moreover contributed the bank to be attributed and positioned as customer centric.

While the manager of bank A stated that they have build different relationships with different clients and that their focus is on building and maintenance of the affective commitment with their bigger clients, those who could be attributed as community leaders that according to the manager greatly influence new customers, the manager of bank B stated that the formulated business strategy of the new management is that every client should be treated as VIP person and none of the clients should receive more beneficial treatment than other regardless of his/her importance to the bank and hence targeted establishment of affective commitment with all subjects that its customer base was comprised of. However the manger of bank B stated that albeit there are some exceptions in the practice, the bank remains focused onto offering a unified approach towards customer care to all of its customers.

Findings in our research from the focus groups indicate that larger number of customers from bank B had established affective commitment with their bank and perceived their bank (bank B) as "carrying", "trustworthy", and "supportive" although certain clients expressed their opinion that there is still room for improvement. Moreover customers stated that after the take-over of bank B by the multinational Group their trust in the bank had significantly increased as a result of the improvement of the bank in various fields and most importantly in the customer care towards them. Considering the fact that bank B before the entrance of the multinational Group had focused its business operations narrowly in terms of geographic to two major cities in FYROM, the new management had changed this drawback by establishment of new branch offices in other cities in FYROM and improved the assortment of products and services of the bank. Moreover while improving the internal relations with engagement of new young and qualified labor force and providing training to the existing employees of the bank that represented important steps in improvement of the image of the bank on the market. As stated by the bank's manager: *"I can say that the perceptions of how the customer service should be conducted have changed and we have made significant steps in the context of training of our personnel. I have to mention that this is not something that can be changed over night, I said that last year we had 112 new employees, large portion of which did not have a working experience or they had different perceptions about customer service, if they came from different banks or financial institutions and over training of our employees, we try to bring our employees to a unified approach towards good customer service"*.

As one customer commented: *"As a client of that specific bank for 13 years, in the last years, after the bank became bigger, I think that the young personnel that was engaged in this bank greatly contributed to the performance of the bank because of its efficiency and friendliness"*. The level of satisfaction and perception about the relationship they have built with their bank in all cases of the respondents in the focus groups regarding bank B was that

it was professional, based on mutual trust and that both sides benefited from this relationship regardless of the type of the customer whether it is B2C or B2B. As one customer commented: *"I am extremely satisfied with my bank, more accurately 100% because if this was not the case, I would have changed it by now"*.

Another customer defined her relationship with the bank in the following way: *"If I have to define my relation with the bank in few words those would be: perfect, trustworthy relationship with benefits for both sides"*. Moreover another customer commented: *"I feel that the bank is practicing the motto: "Think global, act local". It is like there is special treatment for everyone but in fact all customers receive the same beneficial treatment"*. In the case of B2B customers the level of satisfaction was nearly the same as in the B2C segment with responses from the participants that indicate relationship based on affective commitment. However some of the respondents have complained about the complex administrative procedures although they stated that they realize that these are standardized procedures practiced by the whole banking sector in FYROM, but implied that if the bank could find a way to lower the paper work, guarantees demanded and time intervals for credit approvals it would enable companies to be even more efficient and effective in their business operations.

On the other hand, there was a dramatic gap in the responses of the participants of the focus group in terms of B2B and B2C customers regarding the customer care and established relationships with them from the perspective of bank A. B2C customers were evidently much more dissatisfied with the relationships that they have established with their bank that could be defined as behavioral commitment. As one customer commented: *"The relationship that the bank has towards me is not professional... There isn't any change in the customer care towards B2C customers, there isn't any service available, there isn't any possibility to talk with someone, in order to gain certain information you should make efforts by yourself via internet, and the bank thinks that if they upload certain information on their website it is enough to inform their customers about any changes or notifications"*. All respondents from the B2C segment had complaint on their relationship with the bank and emphasized the components of "confidentiality" and "professionalism" as key issues for having not established affective commitment with their bank.

On the other hand, B2B customers were explicitly much more satisfied from the support and attention they receive from their bank (bank A), from the collaboration with it and consequently stated that their relationship is based solely on affective commitment, as long-term clients of the bank. As one customer commented: *"In general I am highly satisfied of my bank for the reason that in our long-years of operations I have not experienced any problem. Every time when certain obstacle had occurred was being resolved promptly and effectively. As a client that is with the bank for many years, I could say that we have a relationship built on mutual trust. I receive great beneficial treatment from the bank probably because I am loyal customer of the bank for years ... What really overwhelms me is the fact that the bank's employees always have a solution for a given problem in the shortest time period regardless of its complexity and believe me, sometimes I really had complex issues that had to be resolved"* However one B2B respondent stated that they have built affective commitment with the particular bank and not with any other because of his close relationships with the management of the bank. *"We are clients of the bank because the vice director of the bank is my friend for many years. Our relationship is solid above all because we are friends and not because the bank offers some kind of extra benefits to my company"*.

All of the B2B respondents stated that they have trust in the bank and that they are satisfied from the care they receive albeit some B2B customers that have collaborated with foreign banks stated that they would like the communication with the bank to be more intensive via different channels such as telephone, face-to-face, Internet, although all B2B respondents pinpointed e-mailing as most desired and effective form of communication with their bank. As one customer provided his insight and expectations of his future interaction with the bank: *"My expectation is that in a near future I will communicate with my bank electronically. I doubt that in near future someone will communicate with his/her bank physically"*. Moreover another customer commented: *"I would like to have a relationship that is based electronically for the very basic fact that it saves money, and today more than ever, time is money. The reasons for this are that I have access to my bank 24/7, regardless of my location"*. In this connotation one customer made an interesting remark: *"I think that the bank has to pay greater attention in the communication with its clients in terms of customer care. What do I mean by this? The bank should send a postcard for a birthday of its customer, an e-mail for the same purpose or as an informative mail because I believe that such gesture means a lot. For some people it is a mean to feed their ego, for some it is a more emotional issue, but*

the fact is that all people appreciate special attention. In any case such care had always resulted in positive effects and in greater faith or loyalty to someone”.

The implementation of the strategic steps discussed in greater detail at an earlier stage of this paper by bank B have put them into position to bring the bank closer to the customer, increase the components of satisfaction and trust among their customers that enabled them to convert the relationships with their customers based on behavioral commitment into affective relationships based on mutual trust and benefits, improve and strengthen the already established affective commitment with their clients, that has put them in strong position to have high rate of customer retention and through the active recommendations of their current customer base via positive word of mouth be able to positively impact their customer base in terms of volume. As stated by the bank manager: *“I have to emphasize that our goal is not to have these customers only as loyal clients. The ultimate sales goal is not to only make these clients loyal, but to be clients that will give active recommendations for our bank. That is our ultimate goal I can say, in the context of sales and customer service, to have clients that will permanently collaborate with us, to be satisfied of our service and clients that will further spread positive word-of-mouth for our bank”.* This issue is extremely important considering the fact that enormous 69 percent of clients shift from one bank to another because of having not established affective commitment with their bank or have established behavioral commitment with it but stay with the bank only because of the issue of high switching costs and plan to leave the bank the first time they will have the possibility for it. As stated by the manager of bank B: *“1 percent of the clients leave the bank because of death, simply biological process. 3 percent of the clients leave because of migration or immigration issues...5 percent of the customers leave because of friends` suggestions...7-9 percent leave because of competitive issues...But significant 69 percent of the clients leave because of negative customer service or experience at a bank. So, all these parameters listed before, do not give this percentage cumulatively. This parameter indicates the importance of the customer...”.* Moreover all participants in our focus groups with the exception of two that were neutral towards the issue of building affective or behavioral commitment with the bank because of personal resistant perceptions towards the banking sector in general, stated that building of affective commitment between a bank and its clients in FYROM is vital, considering the low switching costs in the banking sector. If banks do not focus on establishment of affective commitment with their clients and transformation of its relationships with its customers from behavioral into affective commitment banks will struggle for survival. As one customer commented: *“Today in FYROM the switching costs in the banking sector are minimal. Today almost every loyal customer to its bank in FYROM is because of the mutual trust and nothing else”.* On the other hand, the establishment of affective commitment with their existing customer base will enable them to be in a strong position to have high rate of customer retention and hence be able to build affective commitment with new customers and better manage already existing relationships based on behavioral commitment and transform them into affective commitment enabling banks in FYROM to have positive implications on their customer base in terms of volume. Consequently the findings of our research in regard to the focus groups in which all customers have stated that they would like to build relationship with their bank based on affective commitment indicates the necessity of its establishment and permanent maintenance.

CONCLUSION

Findings from our research indicated that even conservative banks like bank A start to undertake strategic steps to become more customer-centric realizing that it is the winning business route, as the case with bank B indicated. Consequently this research paper highlighted the importance of establishment of affective commitment with customers, and investing extensive efforts as a company to convert the relationships based on behavioral into affective commitment considering the fact that behavioral commitment has to be seen as an initial and temporary base on which affective commitment should be build. Moreover this research provided an indication that establishment of affective commitment with customer as a customer-centric company will have positive implications on the respective company`s customer base in terms of volume. Consequently this will enable the particular business subject to have high customer retention rate while tracing the route to customer acquisition more easily. Banks that realize the necessity of becoming customer-centric and of establishment of strong relationships with its customers based on affective commitment will prosper and grow while those who will follow the opposite route will struggle for survival.

RESEARCH LIMITATIONS/IMPLICATIONS

In the particular research, the focus was on the process of building behavioral and affective commitment between the financial institutions (banks) in the middle segment of the banking sector in FYROM and its clients and did not focus on how technological advancements` influence the particular process.

Considering the fact that the banking sector in FYROM is highly competitive considering the extensive number of rival banks operating in it in correlation with the market size of 2.000.000 residents, future research would be necessary to a different geographical setting and analysis of different industrial sectors as to assure relevance of the findings for different geographical areas and industrial segments as it has been suggested by authors Menon and O`Connor (2007) and Fitzgibbon and White (2005) in their research on behavioral and affective commitment as well.

PRACTICAL IMPLICATIONS

This research paper will aid the banks operating in FYROM to easier identify the type of relationship they have established with their clients, moreover provide them with understanding from academic perspective how these relationships can be better managed and improved. Moreover, this paper will provide managers with direction of how relationships with their clients based on behavioral commitment could be managed and transformed into long term strong relationships based on affective commitment that will positively reflect on the customer base of the respective bank in terms of volume. Consequently, customer care, better management of customer relationships, increase in trust in the respective bank and positive implications on the customer base are expected outcomes of the eventual implementation of the recommendations this paper provides on behalf of the banks.

SOCIAL IMPLICATIONS

This research will provide customers with better understanding of the banks as financial institutions that do not only care about their own interest and financial results but are open and supportive institutions that care about the customer and their relationship with him/her to be based on mutual trust and benefits. Moreover, it will provide indication to the banks about the level of fit between the perception they think the customers have about the type of the established relationship with them and the actual perception of the customer towards the respective relationship.

ORIGINALITY/VALUE

Considering the fact that the banking industry in FYROM is relatively young albeit highly competitive and the fact that research in particular for behavioral and affective commitment has not yet been conducted in any sector in FYROM, the value of this research paper in providing an insight about the enhancement of behavioral and affective commitment in the banking sector, its influence on the established banks` customer base and uncovering of the type of relationships that exist between the banks and its customers, while providing an insight about the understanding of the banks` managements towards the importance of establishment of affective commitment and conversion of the relationships they have with their customers based on behavioral commitment onto affective commitment is significant .

Consequently, all managers that participated in our research were extremely optimistic that this paper will positively contribute to improvement and better management of customer relationships and building strong and long term relationships based on mutual trust and benefits and try to improve the relationships with the customers that have build behavioral commitment with the bank considering the fact that today the customer is most expensive. As one manager commented: *“This research will provide us with an aid from the academic perspective in better management of our relationships with the customers, how to keep our satisfied customers that trust our bank and how to change perceptions of those customers that feel they are obliged to stay with our bank out of different reasons”* .

Another manager commented: *“Considering the fierce competition in the banking sector in FYROM and the fact that it may cost up to 5 times more to acquire new customer than to keep an already existing one, such research was necessary and will surely provide us with an indication of our relationship with the customers and the type of relationships that we have established with them. This will help us to better manage the relationships with our customers and enable us to provide them with better customer care that will eventually result in an increase of customer satisfaction and trust in our bank from a customer perspective”*.

Moreover, the managers stated that the particular research will immensely aid them in their operations and stated that they will present the findings to the Board of Directors that may utilize them in the formulation or customization of their banks' business and operating strategy.

COMPETITIVE SOURCES & PERFORMANCE OF CYPRIOT FURNITURE MANUFACTURERS

Karagouni, Glykeria¹; Papadopoulos, Ioannis²; Tringas, Marios³

¹Department of Wood & Furniture Design and Technology, Technological & Educational Institute of Larissa, Greece

²Department of Wood & Furniture Design and Technology, Technological & Educational Institute of Larissa, Greece

³Department of Wood & Furniture Design and Technology, Technological & Educational Institute of Larissa, Greece

Purpose - The study provides important implications for managers and researchers who explore the relationships among competitive sources and company performance.

Design / methodology/ approach - A 2007 empirical study explores the competitiveness of 145 furniture enterprises in Cyprus. Based upon the relevant literature, a comprehensive list of 47 competitive items was developed which were viewed as potential strategic abilities supporting competitiveness. The data analysis techniques are descriptive statistics, correlation and regression analysis, using the SPSS package.

Findings - Cypriot furniture manufacturing follows the principles of manufacturing strategy. Competitive advantage is limited in price and quality. Price-competitive companies are stressing delivery/time issues with a leading role of the marketing area, whereas quality – competitive ones are building on marketing and new products, with quality being the strongest predictor for market share.

Time is seen as a possible winning criterion. On – time delivery strongly correlates to human resources, but not to quality processes. Yet, Quality Management starts gaining some attention with ISO 9001:2000 being the main concern.

The Cypriot furniture sector is still lagging behind in technology and manufacturing. This, however, does not mean that advanced technologies are neglected in Cyprus with a steady growth of CNC machinery.

Practical Implications - Mature, industries, struggle to survive in the new globalized markets. The study provides useful information first and most of all for Cypriot managers and all responsables for the survival and development of the Cypriot furniture industry. It also proves that companies need more than one competitive priorities and advantages to prosper, while focusing on a single competitive component is rather dangerous.

Originality / value - This was the first study devoted to the analysis of manufacturing, product development, marketing, quality, human resources and overall management decisions adopted by Cypriot furniture manufacturers.

This study expands previous similar studies, offering more insight on the effects of the several functional areas and arising questions on the differences among the same industry sector across different nations.

Keywords: Competitive Sources, Performance, Cyprus, Furniture industry, Manufacturing, Empirical Research

INTRODUCTION

This paper presents the results of a survey about the competitive sources and performance of 145 furniture manufacturers located in Cyprus. The survey was conducted in late 2007 and combines competitive strategy and performance in order to draw results and suggestions for the Cypriot furniture industry. There are currently some 800 factories and workshops throughout the country, employing a total of 2,500 people (CSIL, 2008).

There are practically no studies that have been devoted to the analysis of manufacturing, product development, marketing, quality, human resources and overall management decisions adopted by Cypriot furniture manufacturers. Responding to the specific industry need for survival and development, this research aims at investigating sources of competitive advantage that could lead to superior performance.

The aim of this paper is to establish the framework in which the Cyprus wood and furniture industry is operating with emphasis given to the competitive priorities and manufacturing parameters. The level of existence of various characteristics of the companies is investigated and correlated in order to examine their relationship. The level of importance given to each competitive priority and manufacturing parameter is established.

This paper is organized as follows. First, the strategic operations literature is reviewed to develop a theoretically relevant list of competitive priorities. The methodology is described next, including the sampling procedure and measurement process. The set of competitive priorities is then analyzed to identify core dimensions of manufacturing strength in the furniture industry. Next, predictive validity is established by examining relationships between these generic dimensions of manufacturing performance and overall business performance. Finally, the managerial implications of this study are presented along with suggestions for future research.

Following a discussion of the survey, the results which focus on competitive objectives and performance are discussed, as well as their relationship to the above mentioned competencies and their practice.

LITERATURE REVIEW

Porter (1980) developed the idea that all competitive strategies are variants of generic strategies involving a choice between differentiation and delivered cost (price), with degrees of focus, i.e., serving niche or broad markets, providing a second competitive dimension. The term "competitive advantage" has at least two distinct but interrelated meanings. The first focuses on superiority in skills and/or resources and the second are concerned with superiority in performance outcomes (Vickery, 1994). Still, both meanings rely on companies' distinctive competencies such as New Product Development, Quality and Marketing.

Traditionally competition was static with production factors being the key responsables for success or failure. Modern competition is global and unexpectedly dynamic. The industrial competitive advantage is changing rapidly due to new and innovative technology, shorter product life cycles and new dynamic players such as China. Li (2000) claims that there is a cross-functional effort between marketing and operations to follow the market needs and translate them into capabilities.

Numerous studies conducted during the past two decades demonstrate the importance of strategy in relation to firm performance (Demeter, 2003). This stream of research includes work highlighting the connection between performance and manufacturing technology (Beaumont and Schroeder, 1997; Das and Narasimhan, 2001), quality management practices (related to both people and systems/assets) (Dow *et al.*, 1999) and overall strategy (Robb and Xie, 2005; Li, 2000). We first argue that competencies in marketing, innovation, quality, human resources, overall management and manufacturing are sources of advantage for a firm. We focus on these six functional areas because they have long been hypothesized to be crucial to corporate survival and progress.

The marketing, innovation, and manufacturing competencies are defined in terms of the weighted performance on a comprehensive set of competitive elements. The set of elements is derived from the strategy, innovation, marketing, and manufacturing literature. Such items have also been referred to as capabilities and order-winning criteria. The literature also suggests that competitive performance relative to such items contributes to business performance, and hence, to overall competitive advantage. The literature reduces an exhaustive list of competitive priorities to five to six core dimensions: price (cost), quality, delivery performance, dependability, innovativeness and flexibility (Hayes and Wheelwright, 1984; Ferdows and De Meyer, 1990; Ward *et al.*, 1990; Roth and Van Der Velde, 1991).

Previous research has shown that only when a firm can concert its functional area competencies, can it enhance competitiveness (Li, 2000; Evans and Lindsay, 1996; Hill and Jones, 1989; Porter, 1990). In 1966, Skinner described the heightened competitive pressures placed upon U.S. manufacturers for improvement in a variety of performance categories. The areas that were marked as the most important were: more frequent product changes and new product introductions; price advantage; lower production costs; quality which encompassed appearance, style, function, and tighter design tolerances; longer, trouble-free product life; special purpose or customer-designated products; shorter lead times; and delivery speed (in Vickery *et al.*, 1997). Several years later (in 1974) Skinner described some common standards for measuring manufacturing performance. These performance criteria included short delivery cycles; superior product quality and reliability; dependable delivery promises; the ability to produce new products quickly; flexibility in adjusting to volume changes; low investment leading to high return on investment and low costs.

Since then several authors have described in an analytical way the most important general criteria for enhancing and evaluating manufacturing performance : Wheelwright (1978) (in Robb and Xie, 2003); Schmenner, (1981) who grouped them in product - , delivery – and cost – related “competitive demands”; Hayes and Wheelwright (1984) who introduced the term 'competitive priorities'; Krajewski and Ritzman (1987) with a more definitive list of manufacturing competitive priorities; Hill (1994) who outlined a set of 'order-winning criteria' and Schroeder and Lahr (1990). Each author expanded the criteria from price, product and process quality (conformance to specifications) and reliability to delivery speed, delivery reliability, and the ability to respond to increases in demand as well as after-sales service, product design, product customization, process technology (Vickery et al, 1997).

Around the same time, empirical studies focusing on competitive priorities began to stress the need for consistent quality, high performance products, dependable delivery promises such as delivery on due date, fast deliveries, design changes/introduction of new products, rapid volume changes, offer low prices, broad distribution, advertise effectively, broad product line, and after-sales service (Cleveland et al., 1989; Wood et al., 1990; Ferdows and De Meyer, 1990 in Vickery et al, 1997).

A common theme in operations strategy research has been the manufacturers' choices of emphasis among key capabilities or competitive priorities. Schroeder et al. (1986) found the first- and second- ranked objectives to be quality and delivery performance, respectively. Single-industry US studies include Vickery et al. (1997) on 65 furniture manufacturers, finding significant relationships between company financial performance and the degree to which manufacturing performance supported the business strategy.

Other studies concentrated on *infrastructure* (human resources, management policies, and procedures) such as Upton (1995, in Robb and Xie, 2001), who entered the importance of the workforce and management communication and Bates et al. (1997) who show a significant relationship between manufacturing strategy and management, and Evans and Lindsey (1996) and Simerly (1997) who discussed on the effect of human resources.

Based on the above literature and using the studies of Vickery et al. (1996) and Li (2000) as guidelines, a comprehensive list of 47 items was developed, which were categorized to the six categories that were found to be crucial functional areas for firm survival and development: marketing, product design and development, quality, human resources, overall management and manufacturing.

More specifically and in order to clarify their role, the above functional areas are briefly discussed below:

Marketing: Literature concerning marketing and its linkage to production shows that one key to success is the understanding of customers and expected wishes and their satisfaction (Krajewski and Ritzman 1996; Li, 2000). Therefore, the existence of a separate marketing department, with modern approaches and tools and a formed strategy emphasizes responsiveness, meeting customer's needs.

Product design and development: They are considered as innovation capabilities and thus cover the area of innovation. Furthermore, furniture industry belongs to the mature ones. So, one cannot expect radical innovations or exceptional R&D. Many studies have suggested that they have a significant impact on a firm's overall performance (Ettlie, 1997; Porter, 1990).

Quality: Garvin (1987) points out that quality is multidimensional and that each of its dimensions can be used strategically to gain competitive advantage. The quality scale used here includes items related to the important quality aspect of process control and process management (Flynn et al., 1994). Quality cycles and employee contribution have been recalled from the classical quality theory.

Human Resources: Evaluation and training combined to a good communication with the top management empowers employee satisfaction and leads to superior performance. Human resources management is one of the non replicable and most valuable competences in a prospering organization. Its importance has been highlighted by numerous authors (Forrester and Hassard, 2000; Sun *et al.*, 2001; Porter, 1990; Hil, 1994; Simerly, 1997).

Overall Management: Studies dealing with the connection between business management and business performance have played an important role (e.g. Pearce et al., 1987; Cool and Schendel, 1987; Banker et al.,

1996) in the development of the production strategy of successful organizations. They refer to business characteristics and strategies, such as communication and collaboration, information diffusion and company programs. Benchmarking is introduced as an indicative practice, in order to specify the general meaning of "new practices" (where the answer is usually *yes*).

Manufacturing: Recent management theories stress the need for the manufacturing strategy of the business to be compatible with the firm's competitive strategy (Efstathiades et al., 1999). Success in the global market place requires companies to employ technology strategically by linking it to a firm's competitive strategy. Such a link ensures that technology and strategy support one another, enabling a company to better achieve its goals (Zahra, 1994). The target customer needs determine the manufacturing capabilities the firm must possess, in order to offer a competitive customer service. Therefore, the development and use of technology must be guided explicitly by the business strategy of the firm. Technology is then considered as a tool that has to be used in the strategy of an enterprise (Haan and Peters, 1993; Erickson et al., 1991).

Using a rather big pool of manufacturing parameters, a set was made of the ones that have been identified as major contributors to the competitive priorities of the furniture industry (Efstathiades et al., 1999; Li, 2000).

Performance

Concerning business performance, it is obviously very difficult to create a single measure for business success. Still, the overall research hypothesis that the six above mentioned and discussed functional areas individually and/or jointly determine performance is strongly supported by the literature in a variety of fields. Fitzsimmons, Kouvelis, and Mallick (in Vickery, 1994) argue that the successful performance of design, manufacturing and marketing functions, as well as the performance of the whole, is required for competitive advantage.

Craig and Douglas (1982) investigated the effects of several marketing mix and industry structure variables on firm performance to find product quality to be significantly related to ROI and market share in every year of a six-year time horizon. Many studies in the innovation literature have identified innovation as a key determinant of firm performance, especially of growth. While the measurement of new product success or failure is multi-dimensional, researchers have historically focused on overall firm impacts (e.g., profitability, revenue growth, ROI) and have connected the number of new products to firm performance (Griffin, A. & Page, 1993).

In the manufacturing literature, several studies have attempted to link business performance with one or more manufacturing-related constructs. Wood et al. (1990) examined several competitive items (e.g., high product reliability, high durability, product customization, short delivery time, quality consistency, and cost) in their study of the effects of intended and achieved performance on firm performance. They found that above average financial performance was associated with above average emphasis on a wide variety of competitive items, highlighting quality and delivery accuracy among them. In a similar vein, Giffi et al. (1990) argued that the achievement of superior manufacturing capability requires emphasis on many priorities such as quality, dependability, cost, and flexibility (in Vickery et al., 1994).

CYPRUS

Cyprus, a small island in the eastern Mediterranean, has traditionally relied on agriculture and tourism for economic growth. The introduction of Cyprus to EU and market globalization have led to the opening up of the Cyprus market to manufacturers from the EU and other countries with products of higher quality and higher design content (e.g. Italy and Spain), or lower price (China) than locally manufactured goods. The challenge arises from the need to compete with European and other manufacturers in terms of cost and quality in the local market (Efstathiades et al., 1999) in an ever changing competitive environment. Success in this endeavour, however, requires new approaches to technology, human resource development, company structure, and management philosophy.

Cyprus is classified as a 'high income' economy in the World Development Report 1997 (Anon, 1998). Cypriot firms are generally very small with many micro-businesses: 88% of firms have less than 10

employees, while only 1.4% of firms have more than 50. Furthermore, industrial research in Cyprus is virtually absent and, probably, due to its size only some industrial development work is realistically feasible (Hadjimanolis & Dickson, 2001).

THE FURNITURE INDUSTRY

There are a remarkable number of studies of the furniture industry in the United Kingdom (Deeks, 1976 in Robb and Xie, 2003), the United States (Skinner and Rogers, 1968; Moorman and Montgomery, 1998 in Robb and Xie, 2003), and China (Robb and Xie, 2003). All of them show an industry comprised largely of small, privately- owned firms (the majority employing less than 100), with many operating in a 'craft' production mode and very labour intensive. Raw materials have a great impact on costs, plant locations, design and innovation.

With processes such as assembly and finishing notoriously difficult to automate, the furniture industry in general is not known for highly advanced manufacturing technology – the level is 'reasonable but not overwhelming' (Vickery *et al.*, 1994 in Robb and Xie, 2003). Generally only the largest firms target more than one segment of the market. A 1990 study of 65 US furniture firms with sales above 10 million US\$ showed that manufacturing strategy, expressed in terms of 'production competence', was strongly associated with business strategy and firm performance (Vickery *et al.*, 1993).

FURNITURE MANUFACTURING IN CYPRUS

The destruction of the island's infrastructure by the Turkish invasion in 1974 and the rapid reconstruction programme that followed, led to the rapid development of the furniture industry which was initially geared to serve the local construction industry. There are practically no studies about the specific industry and its main characteristics of its manufacturing and business strategy.

Furniture production in Cyprus is mainly based on wood, with a marginal share of plastic and metal furniture. Cyprus has limited forest resources but has large areas of woodland with typical Mediterranean flora. As could be expected Cyprus is completely dependent on imports of semi-finished wood products. It therefore shows a large deficit in the trade balance. The country is completely dependent on imports for its woodworking machinery needs (mainly from Italy).

In recent years (2002 – 2007) furniture production has slowly yet constantly decreased. In contrast, consumption has been increasing over the same period (about 50%). Actually, between 1998 and 2007 per capita private consumption showed average annual growth of about 5%. The Cyprus manufacturing sector is very active, also due to the country's great tourist attraction (around 2 million tourists every year). Demand is particularly high for hotels and other kinds of accommodation as well as houses used as a second home. The increased share of furniture imports on the domestic market should be noted (CSIL, 2008)

Most of the companies produce total furniture excluding parts, while the rest concentrate mainly on kitchen and frame production and installation. According to the Cyprus Furniture and Woodworking Industry Association, there are around 2,500 people working in almost 800 factories and workshops throughout the country. The number of employees in the sector has been stable since 1999 (CSIL, 2008).

RESEARCH METHODOLOGY

Furniture industry is in general highly competitive with a moderate level of technology. Globalization has changed the demand rules even for furniture; that is bulky products with expensive transfer. The purpose of the present study is to identify the competitive sources that affect the performance of Cypriot furniture firms, under the hypothesis that the whole organization is responsible for its economic growth and the ability to compete globally.

The methodology adopted in this study is based on the findings of the literature review outlined above. Based upon the strategy, innovation, manufacturing, and marketing literature, a comprehensive list of 47 competitive items was developed which were viewed as potential strategic abilities a firm acquired,

sustained, or improved upon with the goal of competitiveness. Most of the competitive priorities that were frequently cited in the various literatures, as important ones, were included, in order to be comprehensive. Following Li (2000) who formed four groups of competitive advantages (marketing, product design and development, manufacturing and human resources), the sources of competitiveness are explored in six separate groups of questions, which represent six functional areas (FA): overall management, human resources, quality, manufacturing, new product development and marketing.

Business performance is operationalized as a composite of four measures, market share (BP1); number of new product introductions (BP2); Quality conformance (BP3) responding to the percentage of not delivered /accepted products due to defects and On-time delivery (BP4) (Source: 1988 European Manufacturing Futures Survey (De Meyer and Ferdows, 1988)). It is important to have different performance measures, since firms competitive priorities are quite different (Droge et al. 1994). These four parameters refer to data of the last three years.

With a well known negative attitude towards mailed questionnaires in Cyprus (most companies do not even have an e-mail) we opted to phone companies directly requesting an interview with the manufacturing/ plant manager, who was usually the company's owner. The face-to-face contact provided a forum for the respondent to complete the questionnaire, as well as opportunities to discuss items in more detail and obtain anecdotal evidence.

The response rates was approximately 60%, while the final sample consisting of 145 firms, was a quite satisfactory one, based upon the total number of firms in the relevant population frame (around 800 in CSIL, 2008). There were 140 companies producing total furniture excluding parts, confirming the CSIL study, with a mean number of employees around 5.

The data analysis techniques employed are descriptive statistics, correlation analysis and regression analysis. Descriptive statistics were used to indicate the level of significance of each parameter. The current implementation status was assessed using 1 = none / no (which could mean "we don't have / use it" or "not at all"), 2 = in progress or under consideration or partly used, 3 = yes, fully used and similar expressions) and future investment plans (1 = no plans, 2 = considering, and 3 corresponding to yes (we use / have it, we fully believe and support it)). The same model was used for the performance parameters with 1 indicating declination, 2 for no change and 3 for increase in the last three years. Further questions were used to cross check these answers (the percentage of returns due to imperfections, or the percentage of delayed deliveries etc.). This was the promptest way to find out the real situation instead of wish and personal believes.

Correlation and regression analysis was used to examine and analyse the results obtained. The coefficient of correlation is a measure of the degree of linear association between two variables. Factors with a correlation coefficient greater than 0.3 and level of significance below or equal to 0.01 were considered as highly correlated.

All computations were done using the SPSS package (Norusis, 1997). The qualitative responses are used to provide context for the statistical results obtained.

RESULTS AND DISCUSSION

Demographics

The majority (128) are micro firms with a mean of 5.3 employees, which is rather representative of the Cypriot furniture sector. Practically all of them (140 out of 145) produce total furniture excluding parts and are Ltds (132, with the rest of them being SAs).

Competitive objectives

Respondents were asked to indicate their company situation on various "competitive objectives". They are described in six functional areas. The means and rank orders for the usage rating of the 47 items are given in Table 1 (overall ranking) and in Table 2 (ranking by functional area). In soliciting these competitive

priorities we were seeking to establish what the competitive advantage (if any) was that led to a satisfactory performance and could support the long wellbeing of the company.

The first important notice is that only five out of 47 globally established important competitive priorities (in both theoretical and empirical studies) are almost or above 2, indicating a rather poor and raw way of company management. Three of these items belong to the overall management area responding to the dependence from suppliers and the high degree of communication with both customers and suppliers. ‘Communicating with customers’ usually refers to the mouth-to mouth promotion and the tailor made products which enclose almost all customer wishes. Second and third ranked items are due to the micro - and rather family – type of the Cypriot furniture companies. Nevertheless, a fade commitment to quality appears with 3 items on quality to follow with means above 1.85 (1.86, 1.93, 1.99). ISO9001 and a quality strategy are some of the objectives that are enclosed in direct future plans (Table 1).

The last positions with a “no” answer by almost all respondents hold three marketing competencies. Cypriot firms neither regard the existence of a marketing department as a need, nor want to spend on market research. This can be satisfactorily explained by the combination of the steady demand increase (from 146 million € at 2002 to 216 million € at 2007 (CSIL, 2008)) and the reluctance of the Cypriot furniture manufacturers to export (although there are very good prospects for exporting due to Cyprus’s proximity to Lebanon and Arabic Emirates. Group targeting has gained the biggest mean of the particular functional area, which in any case is only 1.49, indicating a rather subconscious tendency to group their markets than really doing it.

Safety and Health seem not to interest Cypriot companies with a mean of 1.06. That can be explained because of the small size of the companies, but it will be a problem in conforming to EU laws.

Table 1: Means and rank order for the competitive items

Human resources are regarded as an important competitive source, but training is neglected (mean = 1.31), although it is considered to be important. Free discussion proved training started to be part of their plans the last three years.

New technology in order to develop new products is under consideration (mean = 1,63), since Cypriot consumers are well informed and rather hard to please (Papadopoulos et al. 2007) and imported new products are very close to them. On the other hand, they do not manage the life cycle of their products but let customers decide about that (mean = 1.02).

Table 2: Means and rank order for the competitive items per functional area

In our survey, several firms had positioned themselves as high quality providers and have stressed quality to be one of their strong competitive advantages. Although their products are recognized for their quality by Cypriot consumers (Papadopoulos et al. 2007), they do not follow known quality strategies. They consider ISO 9001 to be important and have already started to enter into its concept (mean=1.99) and they encourage employee contribution to quality (mean = 1.93), without applying (or indenting to do so) any methods to systemize it. They seem indifferent to any environmental certification (means 1.14, 1.35).

Advance Manufacturing Technology is out of the plans of most companies, although there appears to be a growing number of CNC purchases the three last years. Waste management, with a mean of 1.85, starts playing an important role. At the time of the survey, a new law about waste management brought new troubles to furniture companies (new waste installations according to EU specifications and plant relocation in some cases). The low mean of CAD – CAM (1.29) was rather a surprise, since in free discussion everybody seemed to care about CAD but they did not even consider entering it in their early future plans.

SOURCES OF COMPETITIVENESS

Concentrating on the functional areas and exploring relationships *between them*, Pearson correlation coefficients were generated (non-parametric Spearman rank correlation coefficients generated very similar results).

Table 3 identifies high positive correlations between marketing and manufacturing competitive areas and Human Resources, indicating a strong dependence of the employees' characteristics and skills in order to

manufacture and promote. There are also clear linkages *between* the two above areas and quality, which confirm the managers' claims that quality is the focal point of their products and their strong competitive advantage.

Competencies	Mean	St Dev.	Correlations					
			FA1	FA2	FA3	FA4	FA5	FA6

* Correlation is significant at the 0.01 level (2-tailed).

Table 3: Descriptive statistics and correlations for the functional areas

On the other hand, there appears to be only a weak connection between on – time delivery and market share (cor. coef = 0.179) which is rather surprising, since in free discussion, most managers admit that one of the weaknesses is the delayed deliveries and mention it among the reasons that loose customers. Nevertheless, it does affect quality performance with a coefficient around 0.30 and a sig. value of 0.000, which further confirms the managers' aspects.

The performance means are all slightly above the mid point of 1.5, with Quality performance and on-time delivery to be well above 2. This indicates a positive growth of Cypriot manufacturers. Furthermore, the quite low prices of St. Deviations confirm the homogeneity of the sample.

Of note is the only high positive correlation between Human Relations and on-time delivery (0.324 at sig. = 0.000), which again denotes the importance that is paid to personnel skills and competencies (Table 5). There are no significant correlations between the functional areas of New Product Development and Quality with any performance parameter. While the first is rather expected, the second surprises and calls for further investigation. A not negligible correlation (0.270 and 0.287 respectively with a sig. value of 0.000) shows that overall management and marketing are closely linked to the market share.

Performance	Mean	St Dev.	Correlations			
			BP1	BP2	BP3	BP4
BP1	1,96	,686	1			
BP2	1,54	,746	,017	1

BP4	2,19	,725	,179	-,083	,288*	1

* Correlation is significant at the 0.01 level (2-tailed).

Table 4: Descriptive statistics and correlations for the performance parameters

Two negative results with correlations of medium significance indicate the manufacturing area to be reversely associated with both quality and delivery performance. This can be explained because of the very early use of advanced machinery. Employees as well as management are not familiar with AMT and its

culture. There are delays, malfunctions, defective products etc. The direct results are on quality and delivery time. Yet, table 1 and 2 show CAD to be the most popular manufacturing technology, with the rest playing only very limited roles. This result is consistent with findings that CAD is among the most common and often the first technology implemented (Boyer, 1998, Robb and Xie, 2003).

<i>* Correlation is significant at the 0.05 level (2-tailed).</i>				

Table 5: Correlation between functional areas and performance

No functional area correlates to New Product Introduction. This supports the above mention note that this area is of no interest for Cypriot manufacturers and does not constitute a competitive advantage. Table 5 shows in a most definite way how important the on-time delivery is for the respondents, with 4 out of 6 functional areas having strong or medium relationships to this performance parameter. Finally, table 5 presents a remarkably wide range of correlations (from -0.268 to 0.324) supporting the use of multiple performance measures.

The survey asked the respondents to place themselves in one of the four performance groups according to their opinion. New product development was expanded to “competitiveness on innovation” and on-time delivery to “competitiveness on time – criteria”. The other two groups were named competitiveness on price and quality. All companies placed themselves in either price or quality group, which was rather predictable.

<i>Competencies</i>	<i>Correlations (N=52)</i>					
	<i>FA1</i>	<i>FA2</i>	<i>FA3</i>	<i>FA4</i>	<i>FA5</i>	<i>FA6</i>

<i>** Correlation is significant at the 0.01 level (2-tailed).</i>						
<i>* Correlation is significant at the 0.05 level (2-tailed).</i>						

Table 6.1: Correlations for the functional areas for quality - competitive companies

Almost one third of the survey sample (52 out of 145 companies) belonged to the quality group. While there appeared to be some strong correlations among the functional areas (Table 6.1), the performance parameters seemed to have no relationship (Table 6.2), except for on-time delivery which is modestly connected to quality. Although this relationship appears feebler in the case of price – sensitive companies, it leads to the promising conclusion that time starts bothering furniture manufacturers and is seen as a possible winning criterion.

The strong relationship between Marketing and new product releases (Table 6.1) indicates that in Cyprus quality is highly connected to faster changes and new materials or techniques in order to satisfy customer needs. It should though be mentioned that managers referred to new design as well. On the contrary, the negative relationship between an emphasis on the functional area of quality and the one of human resources is somewhat disturbing. This is further stressed by the fact that quality appears not to relate, or to relate to a

negative way to the other functional areas, although the group is the quality competitive one. An explanation could possibly be that Cypriot furniture manufacturers focus on product quality and not on process quality. As seen in Table 2, the questions concentrated in certifications, quality techniques and controls, which fall out of the scope of the questioned small and micro furniture Cypriot firms.

	<i>Competencies</i>		<i>Correlations (N=52)</i>	
	<i>BP1</i>	<i>BP2</i>	<i>BP3</i>	<i>BP4</i>
<i>BP1</i>	1			
<i>BP2</i>	,084	1		
<i>BP3</i>	,165	,090	1	
<i>BP4</i>	,262	-,157	,313 *	1

* Correlation is significant at the 0.05 level (2-tailed).

Table 6.2: Correlations for the performance parameters for quality - competitive companies

Yet, this group shows strong relationships among three out of five functional areas and overall strategy, leaving out manufacturing (besides quality) for similar reasons. Marketing appears to play an important role in overall strategy, human resources and new products (cor. Coef. 0.398, 0.408 and 0.375 at sig. values of 0.002, 0.004, 0.003), revealing its importance for the specific industry.

Marketing and new products correlate modestly to market share (Table 6.3), since they are the media to appeal to customers. The results can surprise anyone who is not familiar to Cypriot mentality of the specific industry. Quality is connected to artisanship, tailor – made products by new materials and fresh design that are promoted in a quality way. These were the advantages that came to light by the free discussion and are verified by the statistical analysis too. Managers do not believe that quality comes through systems and methods and declare that the size and the type of the companies do not permit the competitive items of the manufacturing area.

<i>Correlation with</i>

* Correlation is significant at the 0.05 level (2-tailed).

Table 6.3: Correlation between functional areas and performance for quality - competitive companies

The majority of the companies (93 out of the 145 ones) considered themselves as price – competitive. The strongest relationship appeared to be between marketing and overall management (Table 7.1; 0.411 at 0.01 level), indicating that marketing is a competitive priority in this group too. There is also a quite interesting relationship between human resources and new product development, which is rather normal.

<i>Competencies</i>	<i>Correlations (N=93)</i>

* Correlation is significant at the 0.05 level (2-tailed).
** Correlation is significant at the 0.01 level (2-tailed).

Table 7.1: Correlations for the functional areas for price - competitive companies

There is some interesting insight when considering the results of Table 7.3. Quality is negatively related to market share, while the manufacturing competitive area has a negative relationship to quality and on – time delivery. The last result confirms previous remarks on the introduction of AMT and time and quality problems. The notion that quality costs leads to the first result. Manufacturers confront this functional area with scepticism since according to their opinion, quality actions are money and time consuming and because of the companies' size and capability could probably reduce the number of customers ("drive them away if I tell them I will deliver their furniture too late.."). It seems that on – time delivery is a strong winning criterion for this group and it strongly correlates to human resources, a competitive priority of special interest in Cypriot furniture manufacturing.

Table 7.3 Correlation between functional areas and performance for price - competitive companies

The most outstanding feature of these results is that price-competitive companies are stressing delivery/time issues, whereas quality – competitive ones are building a foundation on marketing and new products (mostly of design) and reveal their interest on market share. It is interesting to note how Table 5 (for all companies) encompasses the views of both groups.

To examine the relationship between performance and the importance of the various competitive Functional areas, a multiple regression analysis with the current emphasis of the four performance factors as the dependent variables (see Table 8).

Variable	P-value	Model R2	FA1		FA2		FA3		FA4		FA5		FA6	
			B	Sig	B	Sig	B	Sig	B	Sig	B	Sig	B	Sig
BP1	.000	0.275	0.453	0.093	-.076	0.657	0.091	0.659	-.770	0.006	0.679	0.012	0.421	0.018
BP2	.618	0.284	0.502	0.076	0.450	0.013	0.113	0.603	0.269	0.035	0.211	0.454	-.546	0.004

Table 8: Multiple Regression Analysis

Quality makes the strongest unique contribution ($p=0.006$, $\beta=-0.770$) to market share, while the marketing and manufacturing areas seem to contribute also strongly (but certainly less) to this performance parameter. Quality performance is strongly and uniquely affected by manufacturing ($p=0.001$, $\beta=-0.658$) and less by the quality functional area ($p=0.006$, $\beta=0.289$). There are no other important relationships among the other two performance parameters (new product introduction and on-time delivery).

Variable	P-value	Model R2	FA1		FA2		FA3		FA4		FA5		FA6	
			B	Sig	B	Sig	B	Sig	B	Sig	B	Sig	B	Sig

Table 9.1: Multiple Regression Analysis for price - competitive companies

The results indicate that emphasizing quality, marketing and manufacturing, Cypriot furniture manufacturers enhance their quality performance and market share. Strangely and contrary to other similar studies (Li, 2000) there does not appear any kind of HR's contribution, although correlations proved its importance.

Variable	P-value	Model R2 Adjust	FA1		FA2		FA3		FA4		FA5		FA6	
			B	Sig	B	Sig	B	Sig	B	Sig	B	Sig	B	Sig
BP1	,042	,205	,000	,999	-,185	,241	,213	,229	-,082	-,593	,337	,033	,271	,048

Table 9.2: Multiple Regression Analysis for quality - competitive companies

Considering the two groups, overall management appears the only functional area that contributes to market share for price competitive furniture companies. Marketing plays a rather important role, since it has a unique strong contribution to quality performance and on – time delivery ($p=0.014$, $\beta=-0.266$ and $p=0.000$, $\beta=-0.354$ respectively). On-time delivery is of vital importance for this group and also strongly affected by human resources and overall management.

Quality makes the strongest contributor to high market share for the quality – focus group ($p=0.033$, $\beta=0.337$), followed by manufacturing. Overall management and the process of new product development affect the new product performance, while quality performance is only affected in a strong and unique way by manufacturing, revealing again the dislike of Cypriot manufacturers for quality processes.

It is quite notable that on – time delivery appears of little interest for this second group, contrary to the first one. No functional area contributes to its prediction. This is due to a common belief in Cyprus that “good things take time”.

CONCLUSIONS

This was the first study devoted to the analysis of manufacturing, product development, marketing, quality, human resources and overall management decisions adopted by Cypriot furniture manufacturers. Responding to the specific industry need for survival and development, this research investigated sources of competitive advantage that could lead to superior performance.

In general, Cypriot furniture manufacturing appears to follow the principles of manufacturing strategy. Competitive advantage seems to be limited in price and quality. The most outstanding feature of the results of this survey is that price-competitive companies are stressing delivery/time issues, whereas quality – competitive ones are building a foundation on marketing and new products (mostly of design) and reveal their interest on market share. Meanwhile quality is the strongest predictor for market share when referring to quality competitive firms. The strong relationship between Marketing and new product releases indicates that in Cyprus quality is highly connected to faster changes and new materials or techniques in order to satisfy customer needs.

Time also starts bothering furniture manufacturers and is seen as a possible winning criterion. On – time delivery strongly correlates to human resources, but not to quality processes. Furthermore, managers do not believe that quality comes through systems and methods and declare that the size and the type of the companies do not permit the competitive items of the manufacturing area. Yet, Quality management starts gaining some attention with ISO 9001:200 being the main concern.

Although four out of the five less important competitive items (with the lowest means) in the 47- item ranking belong to the marketing area, the functional area itself appears to play an important role, especially for the price competitive furniture companies.

The Cypriot furniture sector is still lagging behind in technology and manufacturing. CAD is the only new technology to be implemented mostly by micro firms and it is quite normal: it facilitates designing, stands alone, its costs are coming down rapidly and the benefits are quite clear. This, however, does not mean that advanced technologies are neglected in Cyprus. The number of CNC machinery is constantly growing, but there is still a misuse of them due to lack of proper training and culture and management change, which cause troubles for the time being.

Mature, labour - intensive industries, such as the furniture industry, struggle to survive in the new globalized markets. The present study provides several important implications first and most of all for Cypriot managers and all responsible for the survival and development of the Cypriot furniture industry. The results offer a better understanding of the competitive sources and underscore the strengths and weaknesses of furniture companies in an ever changing business environment. It is also proved that companies need more than one competitive priorities and advantages in order to prosper. Especially for micro and small companies, focusing on a single competitive component is rather dangerous.

The six functional areas with their 47 competitive items, as sources of advantage, are hypothesized to lead to outcomes across a variety of business performance measures. Considering relationships among sources and outcomes of advantage, this study expands previous similar studies, conducted in both industrialized and developing countries, offering more insight on the effects of the several functional areas and arising questions on the differences among the same industry sector across different nations. The last issue could start a new direction of research. Another direction could be the study of the environmental parameters that favour the development of different competitive areas and / or items within the same industry sector in a nation or across nations and industries.

Another possible direction could be a more general specification of competitive items and areas that lead to different desirable competitive advantages (e.g. price, quality and innovation) although there appear to arise several questions to answer, such as whether this list would be general or industry specific, international or nationally dependant. In this direction, the present study encourages further empirical research on the relationships between competitive sources and performance and how these are shaped due to the special economic, legal, and cultural environment in various countries and industries.

MEASURING THE SEASONALITY WITH THE COMPARISON OF DIFFERENT METHODS IN THE CASE OF TURKISH TOURISM

Karamustafa, Kurtulus¹; Ulama, Sevki²

¹PhD, Associate Professor, Erciyes University, Tourism and Hotel Management School, Kayseri/Turkey

²PhD, Assistant Professor, Erciyes University, Tourism and Hotel Management School, Kayseri/Turkey

Purpose - The Turkish tourism industry is suffering from the seasonality and the problems caused by it. By applying different methods, this study proposes to measure the seasonality in the case Turkish tourism. Studying seasonality and its measurement with the comparison of different methods might first provide useful guidelines for the countries which may have the similar problems and might also broaden the current view in the related literature since the focus is also on the comparison of the widely used methods in the literature.

Design/methodology/approach - This study depends on the current literature and makes evaluations based on the secondary data acquired from the statistical publications of The Turkish Ministry of Culture and Tourism.

Findings - The findings reveal that none of the methods is superior to one another. They complete the weaknesses of one another. Therefore, it is suggested that destinations when measuring the seasonality should make their evaluations on the seasonality by applying different methods in order to make a proper evaluation.

Originality/value - The contribution of the current study to the measurement of the seasonality literature is to employ different methods in an holistic way and reveal the differences and similarities with the comparison of different methods in the case of the Turkish tourist industry.

Keywords: Seasonality, seasonality measurement, Turkish tourism.

Paper type: Conceptual paper.

INTRODUCTION

International tourism is of great importance to the Turkish economy with its creation of foreign exchange earnings, employment, generation of income and regional development effects. For this reason, international tourism has been perceived as a locomotive sector of the Turkish economy since the 1980s and has been supported with generous investment incentives by the Turkish governments (Karamustafa, 2000). This governmental support has helped to increase the bed capacity of the Turkish tourism industry more than 10 folds (TURSAB, 2009a). Parallel to the increase of the bed capacity, the number of visitors visiting the Turkish coastal tourist destinations increased with the creation of considerable net foreign exchange earnings. However, the uncontrolled increase of the bed capacity and its uncontrolled concentration on the coastal regions has emerged the seasonality problem in the Turkish tourist industry. This is to say that despite to the increased numbers of accommodation establishments and tourists, the distribution of tourist numbers to the months of year is chaotic. The number of tourists visiting Turkey is very large particularly during the summer months; however, it goes down during the rest of the year resulting disequilibrium between the bed supply and the tourist demand (Unluonen, Kara and Tokmak, 2008). This creates problem particularly for the accommodation establishments which suffers from the idle capacity problem for most of the year, particularly on the coastal areas which consist of approximately 75% of the licensed bed capacity (TURSAB, 2009b). For this reason, within the framework of Turkish tourism, studying the seasonality is of importance for the accommodation establishments in general (Koc and Altinay, 2007).

There are number of studies focusing on the affects of the seasonality on employment (Ball, 1988; Lee-Ross, 1999; Hinch and Jackson, 2000; Flognfeldt, 2001; Nesheim, 2003; Getz and Nilsson, 2004). Krakover (2000) has studied the relationship between the factors causing changes on the number of employees working in Israeli hotels and the tourism demand. The variables has been investigated can be categorized as international and domestic tourist demand, occupancy rates, seasonality indices and long term trends. The study of Krakover indicates that there is a negative correlation between the changes in employee numbers and the occupancy rates. To sum up, it has been revealed that when the occupancy rates decrease as a result of the seasonality, the number of employees fired increases. Ashworth and Thomas (1999) analyzed the employment strategies

developed against the seasonality in the UK between 1982 and 1996. According to the results, an improvement occurred in the number of tourist stays during the above mentioned period; hence, the negative affect of seasonality on tourism employment decreased by 30% for the summer term and 24% for the winter term. One of the most important problems related to the seasonal employment is to hire and keep the full-time skilled human resources. This results with the direction of low-educated, unskilled and semi-skilled workforce to the industry. This causes to the unsustainability of the service quality (Koenig and Bischoff, 2004; Koenig and Bischoff, 2005; Jolliffe and Farnsworth, 2006). From this argument, it can be concluded that the seasonality in tourism is of great importance to examine since it creates economic and social problems as well as with the negative effects on service quality in the tourism industry. Hence, the importance of measuring the seasonality in tourism.

By using various statistical methods, seasonality can be measured (Sutcliffe and Sinclair, 1980; Drakatos, 1987; Donatos and Zairis, 1991; Uysal, Fesenmaier and O'Leary, 1994; Grainger and Judge, 1996; BarOn, 1999; Coenders, Espinet and Saez, 2001; Bender, Schumacher and Stein, 2005) and seasonal demand can be forecasted (Kulendran and King, 1997; Chen and Fomby, 1999; Grubb and Mason, 2001; Lim and McAleer, 2001a; Lim and McAleer, 2001b; Goh and Law, 2002; Ahas, Aasa, Mark, Pae and Kull, 2007). Depending upon the number of foreign tourist arrivals, as the demand can be forecasted for the whole destination, it can also be done for the accommodation establishments in the same way. Hence, measuring the seasonality and forecasting the seasonal tourist demand have been paid attention widely in the above given literature. This kind of studies conducted mostly by focusing on the number of foreign tourist arrivals. Though studies measuring the seasonality has generally focused on only one method. The current study aims to contribute to the measurement of the seasonality literature by employing different methods in an holistic way and reveal the differences and similarities with the comparison of different methods in the case of the Turkish tourist industry.

WHAT IS TOURISM DEMAND?

Tourism demand can be defined as the number of people who are willing to travel and have the amount of money that meets their travel willingness. Characteristics of tourism demand can be summarized as follows (Olali and Timur, 1988):

(a) Tourism demand is heterogeneous, meaning that the needs and wants of those vary from one person to another depending upon the travel aim as well as their social, cultural, economic and demographic features.

(b) Tourism demand requires to be used personal disposable income.

(c) There is a very high competition between the demand for luxury products and tourism; in other words, tourism demand can easily be substituted by various luxury and other recreational products.

(d) Its substitutability and impacts of economic, social, political and financial factors increase the elasticity of demand for tourism.

(e) There is a fierce competition even among the tourism products themselves. This happens actually depending upon the individual preferences of those who are willing to travel. The competition between the length of stay and the travel distance affects the amount allocated to the accommodation and to the transportation; hence results with the competition between the accommodation and the transportation. In other words, tourist generating countries and the tourist destinations compete with each other since the travel distance increases, the length of stay decreases.

(f) It is seasonal and concentrates on specific seasons.

Tourism demand is affected by several factors such as (Bozok, 1996): (a) economic (level of disposable income, cost of travel, travel distance, availability and the quality of tourist facilities in destinations); (b) socio-demographic (population structure, age, urbanization, professions, educational level, leisure time); (c) politics and legislation (restrictions on tourist movements, politic relations between the origin and the destination); (d) psychological (travel motivation, tourist needs and typologies).

Correct demand forecast is one of the most important duties of the marketers. Demand forecast requires to indicate the level of demand concentrated on specific time periods. Demand forecast is required: (a) to provide data for decision makings; (b) to be precise; (c) not to be at high costs; and (d) to be able to be updated easily. Many firms can forecast demand for various purposes. Demand forecast can guide a firm in applying strategies; with the evaluation of demand forecast, it can be detected which market to enter. In this respect, demand forecast carries out two main functions (Lumsdon, 1997): (a) the first is to contribute to the allocation of the resources effectively to the marketing efforts and applications; and (b) the second is to reduce the risk of the strategies for the future.

Demand for the accommodation establishments varies daily, weekly and monthly from time to time. In this study, the focus will be on the monthly basis. Tourist demand change occurs depending upon the economic, social and political variables. Forecasting future requires planning in order to take decisions. Accommodation establishments can forecast the room and the bad occupancy rates depending upon the estimated number of tourist arrivals (Koenig and Bischoff, 2004). Widely used demand forecasting methods can be grouped into two (Cuhadar and Kayacan, 2005): (1) the qualitative ones; and (2) the quantitative ones. Qualitative methods include (a) traditional questionnaire technique, (b) Delphi technique and (c) multi-decisional supported model. Quantitative methods consist of (a) time series and trend analysis, (b) computer systems and simulation techniques, (c) demand creative techniques and (d) multivariable regression analysis.

As being one of the widely used quantitative demand forecasting methods, the time series and trend analysis takes into account the seasonal variations, hence it is one of the most suitable techniques to forecast the seasonal demand. Time series occur with the statistical data observed and recorded periodically. These series are the data derived from observations regarding the areas such as tourism revenues, number of tourists, number of nights stayed, tourist expenses and tourism employment. Decision making bodies of a destination country may require information on the variability of tourist movements by years. Depending upon the number of tourist arrived in the previous years, the number of tourist arrivals in the future can be estimated. This method is used with the assumption that the future events will occur as heretofore. The basics of time series depend upon finding out the reasons for any irregular movements and fluctuations in the series (Icoz and Kozak, 1998; Halpern, 2007).

In general time series consist of four parts as being trend (T), seasonal variation (S), cyclical variation (C) and irregular variation (I). A trend can be either a linear or a curve which can either rise or fall in a given time period. All values in a time series cannot be expected to be on the trend linear or curve. Some values can be on the trend linear or its under. Cyclical variations consist of the values which are clearly on or under the trend linear in years. Trend and cyclical variations can be determined by analyzing the variations in number of years; seasonal variations can be determined by analyzing the stable variations observed regularly in a period of the year or seasonal. Irregular variations in time series consist of the fluctuations outside the trend, cyclical variations and seasonal variations (Anderson *et al.*, 1993). According to traditional time series model, number of tourist arrived can be formulized as $T \times S \times C \times I$ (Mansfield, 1994).

However, in order to forecast the seasonal demand it may be necessary to measure the seasonality. By measuring the seasonality, dimensions of the seasonality can be determined and later seasonal demand can be forecasted. In this respect, since the seasonality is an important issue for the accommodation establishments, measuring the seasonality is also gaining importance (Allcock, 1989). Efforts to extent the peak tourist season can be successful depending upon the determinations of seasonal demand structures which can be used to make regional comparisons (Donatos and Zairis, 1991; Hingham and Hinch, 2002). Seasonal demand structure can be determined by calculating the seasonality ratio derived from the number of tourist arrivals and occupancy rates and by also drawing the graphics of the seasonal fluctuations (Goulding and Gunn, 2000). Hence, the months of the year can be determined as being *the peak season*, *the shoulder season* and *the off-peak season* (Yacoumis, 1980).

MEASURING THE SEASONALITY

As Butler and Mao (1997) classify, there are three different types seasonality: (a) one-peak, (b) two-peak, and (c) non-peak. Mediterranean countries whose tourism demand is primarily driven by the sun and warm weather follow a one-peak pattern characterized by a pronounced peak season in the summer months. Two-peak seasonality occurs when there are two seasons. Non-peak seasonality means the tourism is not seasonal indicating that tourism activities occur whole year around. In order to calculate the peak season a simple method can be proposed. If some months of the year are systematically above the trend and seasonal index is greater than one, the mentioned term can be called as the peak season (Fernández-Morales, 2003). Seasonal index is an indicator to indicate the degree of seasonal variations. Seasonal index shows increases and decreases of the demand comparing to the average during the season (Celikcapa, 1999; Nadal, Font and Rosselló, 2004; Lim and McAleer, 2008). Main indicators which can be used to measure seasonality are; (a) Seasonality Ratio, (b) Seasonality Indicator, (c) The Gini Coefficient and (d) Seasonality Index.

Seasonality Ratio

Yacoumis (1980) calculated the seasonality ratio in the study of seasonality in the tourism industry of Sri Lanka. He established a graphic depending upon these ratios, hence determined the seasonal demand structure which can be benefited to understand whether the seasonality shows schematic similarities among the years or not. Seasonality ratios and graphics can be used to compare either seasonal demand or regional demand or among the tourist markets themselves.

Determining the peak-, shoulder- and off-peak seasonal months for the whole country is important to indicate which strategies to apply in which months of the year. Determination of the peak-, shoulder- and off-peak seasons by months at regional level is important to the accommodation establishments in order to decide which strategies to apply. This can also be beneficial for the benchmarking both for the similar regions and the similar type of accommodation establishments.

Depending upon the Yacoumis' calculations, Turkey's tourism seasonality ratios are calculated in Table 2 for the years between 1995 and 2007. First, monthly seasonal indices have been found by dividing the number of tourists arrived in a given year by months to the monthly average number of tourist arrivals in the given year.

<i>Months</i> <i>Years</i>	1	2	3	4	5	6	7	8	9	10	11	12	Total	Average
1995	275	302	368	535	732	810	1,009	1,070	1,055	836	393	340	7,727	644
1996	284	325	537	556	875	902	1,106	1,154	1,117	909	452	396	8,614	718
1997	301	314	555	640	1,021	1,046	1,206	1,405	1,297	947	538	418	9,689	807
1998	346	372	477	642	986	1,063	1,288	1,460	1,209	1,035	503	371	9,753	813
1999	359	372	409	427	691	785	932	1,079	876	801	436	321	7,487	624
2000	334	354	435	721	986	1,079	1,526	1,419	1,369	1,178	602	424	10,428	869
2001	359	405	547	885	1,232	1,388	1,777	1,601	1,440	1,066	521	398	11,619	968
2002	307	426	676	853	1,326	1,458	1,897	1,900	1,771	1,420	663	560	13,256	1,105
2003	364	481	500	669	1,146	1,511	2,131	2,275	1,874	1,658	776	644	14,030	1,169
2004	534	608	784	1,104	1,799	1,898	2,591	2,493	2,125	1,842	949	789	17,517	1,460
2005	700	697	1,107	1,348	2,302	2,403	3,181	2,861	2,502	2,108	1,053	862	21,125	1,760
2006	667	627	922	1,373	1,919	2,369	3,110	2,906	2,267	1,714	1,020	927	19,820	1,652
2007	714	787	1,100	1,521	2,288	2,774	3,624	3,384	2,799	2,153	1,177	1,019	23,341	1,945

Table 1. Number of Turkish Tourist Arrivals by Months (,000 in persons). **Source:** Derived from <http://www.kultur.gov.tr/TR/BelgeGoster.aspx?F6E10F8892433CFF2B81939FD5B60AFAFFDE13C621852F44>

Secondly, by dividing the highest seasonal index in the given year has been divided by the average seasonal index, hence the seasonality ratio has been calculated. For example, seasonality ratio for the year 2007 has been calculated as follows;

- a) Determination of the seasonal index by months: the number of tourist arrivals in January 2007 has been divided by the average number of tourist arrivals in that year. $714.425 / 1.945.076 = 37\%$. For the rest of the months of the year seasonality indices can be calculated in the same way.
- b) The highest seasonal index for the year 2007 (July) has been divided by the average seasonal index (the average index value is 100) ($186 / 100$), hence the seasonality ratio for the year 2007 is 1.86.

Months \ Years	1	2	3	4	5	6	7	8	9	10	11	12	Seasonality Ratios
1995	43	47	57	83	114	126	157	166	164	130	61	53	1.66
1996	40	45	75	77	122	126	154	161	156	127	63	55	1.61
1997	37	39	69	79	126	130	149	174	161	117	67	52	1.74
1998	43	46	59	79	121	131	159	180	149	127	62	46	1.80
1999	58	60	66	68	111	126	149	173	140	128	70	51	1.73
2000	38	41	50	83	114	124	176	163	157	136	69	49	1.76
2001	37	42	57	91	127	143	184	165	149	110	54	41	1.84
2002	28	39	61	77	120	132	172	172	160	129	60	51	1.72
2003	31	41	43	57	98	129	182	195	160	142	66	55	1.95
2004	37	42	54	76	123	130	178	171	146	126	65	54	1.78
2005	40	40	63	77	131	136	181	163	142	120	60	49	1.80
2006	40	38	56	83	116	143	188	176	137	104	62	56	1.88
2007	37	40	57	78	118	143	186	174	144	111	61	52	1.86

Table 2. Seasonality Ratio (1995–2007).

It is possible to show seasonality ratios of two different years on a graphic. Seasonality ratios of 1998 and 2007 are given in Figure 1. Those two years, in which seasonality ratios are different, indicate a similar seasonal demand structure on the graph.

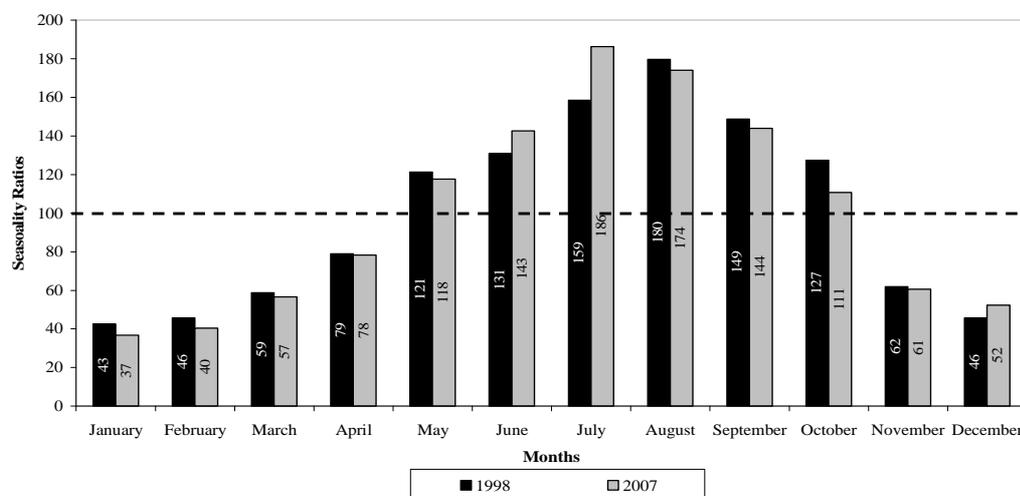

Figure 1. Seasonal Ratios by Months (1998 and 2007).

As can be noticed from Figure 1, seasonality indices for some months are higher than the average (the peak season months), for some months are close to the average (the shoulder season months) and for some months are below the average (the off-peak season months). According to this, July-August-September are the peak-season months, May-June-October are the shoulder season months, November-December-January-February-March-April are the off-peak season months for Turkey.

Theoretically, seasonality ratio can vary from 1 to 12. If the number of visitors arriving is constant for every month then the seasonality ratio will be 1. If the number of visitors arriving concentrate on a month then the seasonality ratio will be 12. In this respect, it can be said that when the seasonality increases seasonality ratio will increase.

Seasonality Indicator

Since the occupancy rates are accepted as the indicator of accommodation establishments' performances, the seasonality ratio cannot be satisfactory in making comparisons (Jeffrey and Barden, 2000). For this reason, seasonality indicator (ω : omega), which is the reverse version of the seasonality ratio, can be used. Seasonality indicator can be calculated by dividing the average seasonality index to the highest seasonal index which can be interpreted easily. As during the peak season, when the accommodation establishments are fully occupied, the highest accommodation number refers to the capacity of the accommodation establishments (Koenig and Bischoff, 2004). Since the seasonality indicator refers to the accommodation number depending upon the capacity, it indicates the average occupancy rate. In this respect, seasonality indicator can be seen as a capacity use measure. For instance, if the seasonality indicator is 0.5, this means that only 50% of the accommodation capacity is used. If the highest accommodation number is smaller than the capacity, seasonality indicator refers to the relative capacity use for the given year (Lundtorp, 2001). Theoretically, seasonality indicator can vary from 1/12 to 1. If the number of visitors arriving is constant for every month then the seasonality indicator will be 1. If the number of visitors arriving concentrate on a month then the seasonality ratio will be 1/12. In this respect, it can be said that when the seasonality increases seasonality ratio will decrease.

As mentioned above, the calculation of the seasonality indicator is reverse to the calculation of the seasonality ratio, therefore, the average index value (100) is divided by the highest seasonal index. In Table 3, by taking into account the calculated seasonal index values, seasonality indicators have been calculated for the year 2007: the average index value (100) has been divided by the highest seasonal index value for the year 2007 (seasonal index for July = 186) ($100 / 186$), hence the seasonality indicator for the year 2007 is 0.54. In Table 3, seasonality indicators, calculated depending upon the values in Table 2, are given.

Months Years	1	2	3	4	5	6	7	8	9	10	11	12	Seasonality Indicator
1995	43	47	57	83	114	126	157	166	164	130	61	53	0.60
1996	40	45	75	77	122	126	154	161	156	127	63	55	0.62
1997	37	39	69	79	126	130	149	174	161	117	67	52	0.57
1998	43	46	59	79	121	131	159	180	149	127	62	46	0.56
1999	58	60	66	68	111	126	149	173	140	128	70	51	0.58
2000	38	41	50	83	114	124	176	163	157	136	69	49	0.57
2001	37	42	57	91	127	143	184	165	149	110	54	41	0.54
2002	28	39	61	77	120	132	172	172	160	129	60	51	0.58
2003	31	41	43	57	98	129	182	195	160	142	66	55	0.51
2004	37	42	54	76	123	130	178	171	146	126	65	54	0.56
2005	40	40	63	77	131	136	181	163	142	120	60	49	0.55
2006	40	38	56	83	116	143	188	176	137	104	62	56	0.53
2007	37	40	57	78	118	143	186	174	144	111	61	52	0.54

Table 3. Seasonality Indicators (1995-2007).

Seasonality ratio and seasonality indicator can be criticized as being affected by the highest monthly value. This means that while the number of arrivals or the occupancy rates are close to the average in most of the months, in some months of the year they can be very high and causing to the high seasonality rates and seasonality indicators. Because of this, the Gini coefficient can be suggested to measure the seasonality.

The Gini Coefficient

This is the most commonly used measure of inequality. The coefficient varies between zero, which reflects complete equality, and 1, which indicates complete inequality. Graphically, the Gini coefficient can easily be represented by the area between the Lorenz curve and the line of equality (Lundtorp, 2001). In Table 4, the numbers of tourist arrivals by months are given. The Lorenz curve has been provided in Figure 2 from the figures in Table 4. The numbers of monthly tourist arrivals have been divided by the total number of tourist arrivals within the given year, hence the monthly tourist arrival ratios have been calculated. These ratios have been ranked from low value to high value and the cumulative values of these ratios have been calculated. The Lorenz curve in Figure 2 has been drawn depending upon these ratios.

<i>Months</i>	<i>Years</i>	<i>1998</i>	<i>2007</i>
<i>January</i>		346,183	714,425
<i>February</i>		371,526	787,048
<i>March</i>		476,756	1,099,960
<i>April</i>		642,332	1,520,954
<i>May</i>		986,237	2,287,645
<i>June</i>		1,062,961	2,774,076
<i>July</i>		1,288,439	3,624,156
<i>August</i>		1,460,075	3,384,065
<i>September</i>		1,209,256	2,799,276
<i>October</i>		1,035,237	2,152,908
<i>November</i>		502,638	1,177,475
<i>December</i>		371,057	1,018,923
<i>Total</i>		9,754,695	23,342,914

Table 4. *Tourist Arrivals by Months (1998 and 2007). Source: Derived from*

<http://www.kultur.gov.tr/TR/BelgeGoster.aspx?F6E10F8892433CFF2B81939FD5B60AFAFFDE13C621852F44>

The Lorenz curve in Figure 2 shows the distribution of tourist numbers against the months of years. If the distribution of tourist numbers were equal, the plot would show as a straight, 45° line. For instance, during the first three quarter of a year (corresponding to the first nine months), 75% of the total tourist arrivals would occur. However, unequal distributions has yielded a curve. The gap between this curve and the 45° line is the inequality gap, this is because the number of tourist arriving each month is not equal. In some months of the year the number of tourist arrivals is low (for instance, in the case of Turkey, the winter months), while in some months it is high (for instance, in the case of Turkey, the summer months) and hence an unequal distribution of tourist arrivals among the months of the year. As can be seen from the Figure 2, the number of tourist arrivals in the first three quarter of 1998 (the first nine months of 1998) consisted of 61% of the total tourist arrivals. However, the number of tourist arrivals in the first three quarter of 2007 (the first nine months of 2007) consisted of 58% of the total tourist arrivals. Depending upon these results, it can be said that the inequality of tourist arrivals among the months is higher in 2007 comparing to 1998.

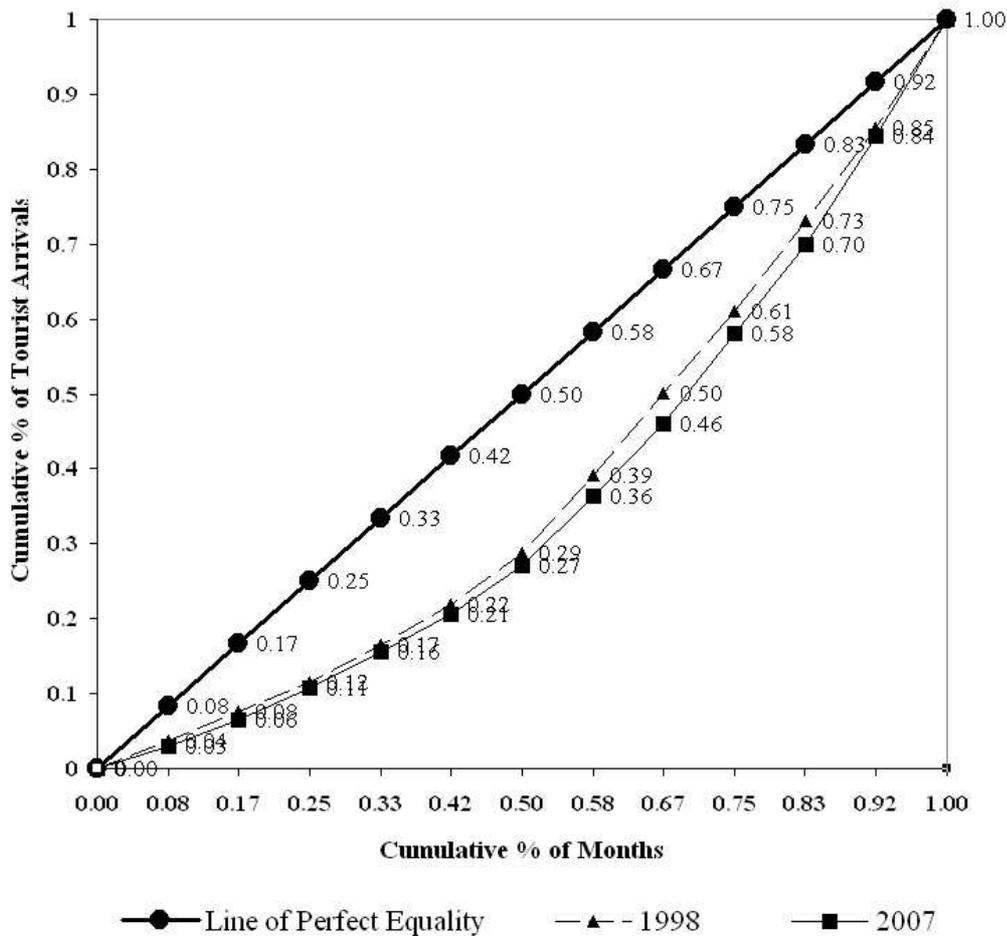

Figure 2. Lorenz Curves – 1998 and 2007 Tourist Arrival Ratios

The unequal distribution of the number of tourist arrivals can be understood from the distance of the curve from the 45° straight line in Figure 2. How much distribution of actual number of tourist arrivals yields a curve, it means that distribution of number of tourist arrivals shows that much inequality (Dinler, 2003). As can be seen from Figure 2, the curve of 2007 has yielded more that the curve of 1998.

Another way to evaluate the unequal distribution of tourist arrivals depends on the Gini coefficient, which also benefits from the Lorenz curve. In this respect, the Gini coefficient (G) is the proportion of the area left between the 45° straight line and the curve to the total area of above (the area left between the 45° straight line and the curve) and below the curve. As shown in Figure 3, the Gini coefficient is the proportion of area A to the total of areas A and B; can be formulized as $G = A / [A+B]$ (Unsal, 2003).

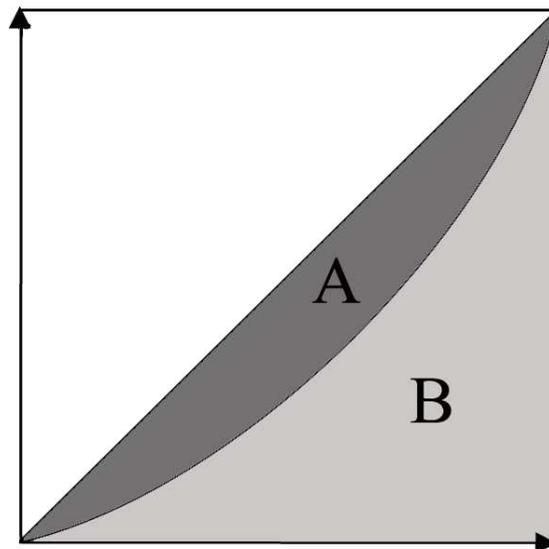

Figure 3. Calculation of the Gini Coefficient in the Lorenz Curve

The Gini coefficient implies the inequality as a ratio. Greater the ratio, greater the unequal monthly distribution of tourist arrivals. A zero ratio indicates an perfect equality. The value of 1 for the Gini coefficient means that there is a full unequal distribution of number of tourist arrivals by months. As the coefficient gets closer to 1, the inequality increases (Unay, 1997). The formula used in the calculation of the Gini coefficient is explained below (Lundtorp, 2001).

$$G = \frac{2}{n} \sum_{i=1}^n (x_i - y_i)$$

n = ratio value (in the case of this study, number of months = 12).

x_i = ratio order (i.e. 1/12, 2/12, , 12/12).

y_i = cumulative actual ratios in the Lorenz curve.

By using this formula, the Gini coefficients for 1998 and 2007 have been calculated as 0.25 and 0.29, respectively. It has been indicated that the inequality of the monthly distribution of number of tourist arrivals is higher in 2007 comparing to that of 1998. In other words, what is clear here is that as the Gini coefficient increases, the level of seasonal concentration increases (Fernández-Morales, 2003).

As the Gini coefficient can be calculated for each year, it can also be calculated for the different nationalities staying in the accommodation establishments. In this respect, the Gini coefficient may help the accommodation establishments to apply appropriate marketing strategies on seasonality for various markets (Fernández-Morales, 2008). The nationalities given in Table 5 indicate the first twelve nationalities stayed in the Turkish accommodation establishments between the years of 2000 and 2006. The nationalities ranked in descending order by the number of visitors stayed in the accommodation establishments.

NATIONALITY	2000	2001	2002	2003	2004	2005	2006
German	0.28	0.22	0.23	0.20	0.16	0.14	0.19
Citizens of the Commonwealth of Independent States	0.29	0.24	0.33	0.35	0.33	0.34	0.37
French	0.34	0.33	0.33	0.33	0.29	0.26	0.29
Dutch	0.51	0.51	0.36	0.31	0.35	0.36	0.33

British	0.36	0.41	0.33	0.34	0.38	0.40	0.36
American	0.25	0.24	0.22	0.21	0.22	0.19	0.17
Japanese	0.22	0.25	0.17	0.34	0.21	0.10	0.05
Italian	0.38	0.43	0.38	0.36	0.30	0.27	0.26
Belgian	0.58	0.43	0.33	0.37	0.38	0.35	0.30
Australian	0.42	0.42	0.39	0.45	0.30	0.32	0.35
Israeli	0.48	0.27	0.33	0.42	0.29	0.26	0.27
Spanish	0.35	0.42	0.44	0.51	0.42	0.31	0.39

Table 5. The Gini Coefficients by Nationality (2000-2006)* **Source:** Derived from <http://www.kultur.gov.tr/TR/BelgeGoster.aspx?F6E10F8892433CFF2B81939FD5B60AFAEF224863CBA28A8C> *. Calculations are based on the number of foreign tourist arrivals by nationalities.

According to the figures in Table 5, Germans are ranked first in terms of tourists staying in the accommodation establishments and the Gini coefficient for German tourists staying in the accommodation establishments showed a diminishing trend between 2000 and 2006. In this respect, it can be said that German tourists staying in the accommodation establishments have not concentrated on some months of the years; comparing to other nationalities, their stays have showed a trend of an equal distribution among the months of the years. However, on the other hand, the citizens of the Commonwealth of Independent States are ranked second in terms of tourists staying in the accommodation establishments and the Gini coefficient for those staying in the accommodation establishments showed an increasing trend between 2000 and 2006. In this respect, it can be said that tourists from the Commonwealth of Independent States staying in the accommodation establishments have concentrated on some months. This kind of analyses may produce useful guidelines for the accommodation establishments in determining the right marketing strategies on seasonality when deciding to choose which tourist market to enter.

Seasonality indicator is mostly affected by the time period of the highest tourist arrivals. However, although the Gini coefficient is affected by the time period of the highest tourist arrivals, this affect is not significant. It is worth noting that neither the Gini coefficient nor the seasonality indicator values show the lowness of the seasonal fluctuations. For this reason, it is appropriate to examine the seasonal fluctuations on a figure (Lundtorp, 2001). The ratios of monthly tourist arrivals in 1998 and 2007 in Figure 4 derived from the figures in Table 1 and assumed as the number of stays in the accommodation establishments. The highest monthly tourist arrival ratio has been assumed as the capacity of the accommodation supply. This is because, as mentioned previously, the highest monthly tourist arrival ratio can be accepted as the maximum use of the accommodation capacity.

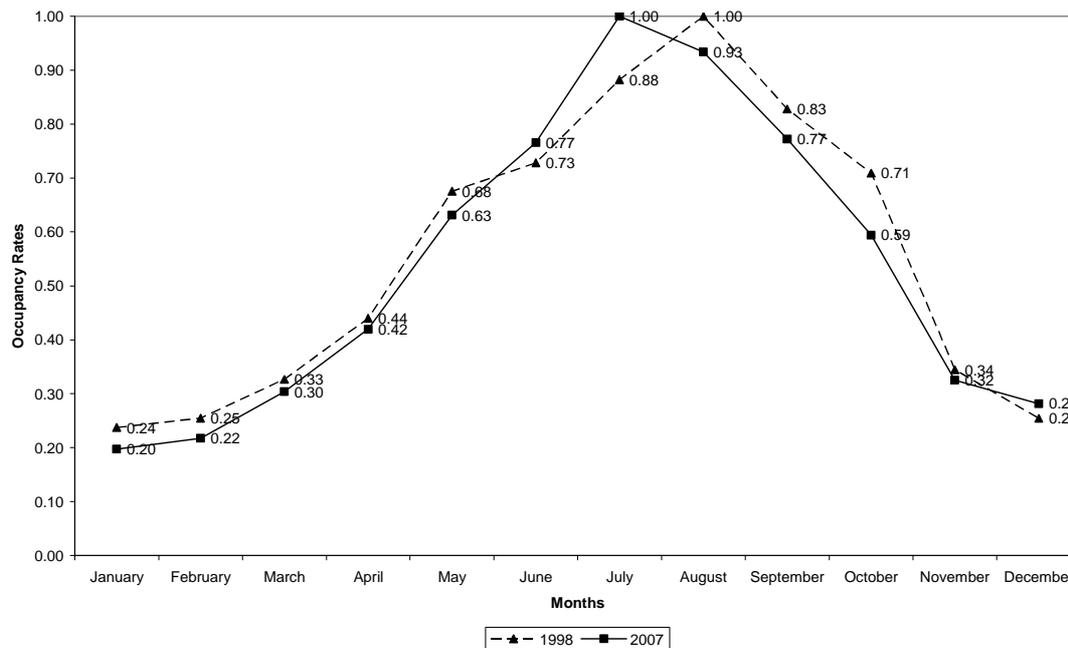

Figure 4. Seasonal Distribution of Tourist Numbers (1998 – 2007)

Seasonal fluctuations among the months in 1998 and 2007 have similarities. As can be seen from Figure 4, the months of January-February-March-April, both in 1998 and 2007, are *the first off-peak seasonal months*. May and June show a trend of increase in the accommodation ratio. These months can be called as *the first shoulder-seasonal months*. July-August-September are the months in which the accommodation establishments reach to full capacity use or very close to it. Hence, these months can be called as *the peak-season months*. However, October is the month in which the accommodation ratio decreases, therefore, it can be called as *the second shoulder-seasonal month*. November and December are the months in which the accommodation ratio reaches its lowest value and these months can be called as *the second off-peak seasonal months*. In Figure 4, the seasonal fluctuation of 1998 shows lowness comparing to the seasonal fluctuation of 2007. The seasonality indicator is 0.56 in 1998 and 0.54 in 2007. The Gini coefficient was calculated 0.25 for 1998 and 0.29 for 2007. Reduction of the inequality among the months can be possible as the Gini coefficient closes to zero or the seasonality indicator closes to 1. Depending upon the Gini coefficients, the seasonality indicators and Figure 4, it can be said that the unequal distribution of number of tourist arrivals in 1998 is less comparing to that of 2007. In this respect, it can be asserted that seasonality fluctuations during this 10-year period has increased to some extent.

The Gini coefficient is an useful tool indicating the inequality in the distribution of number of tourist arrivals. However, the distribution of number of tourist arrivals occurs together with trend (T), seasonal (S), cyclical (C) and irregular (I) fluctuations. In this respect, the Gini coefficient can be criticized as being insufficient in determining the monthly distribution of tourist arrivals since it takes into account only seasonal fluctuations. Therefore, distribution of monthly tourist arrivals are needed to be decomposed from the affecting factors such as trend (T), seasonal (S), cyclical (C) and irregular (I) fluctuations. This kind of decomposition can be done by the seasonality index which is calculated through the method moving averages.

Seasonality Index (Time Series Model)

By applying the method of moving averages, monthly seasonality index can be calculated. When this method is applied, it is possible to decompose distribution of monthly tourist arrivals from trend (T), seasonal (S), cyclical (C) and irregular (I) fluctuations (DeLurgio, 1998). It can be useful to explain this

method with an example which is given in Table 6 depending upon the number of monthly tourist arrivals between 2003 and 2007.

Calculation of the seasonality index:

- First, the moving average tourist arrival for the first 12 months is calculated [$(363.983 + 481.252 + 499.663 + 669.288 + 1.146.309 + 1.510.951 + 2.130.949 + 2.275.055 + 1.874.329 + 1.657.726 + 776.181 + 643.872) / 12 = 1.169.130$]. The same calculation continues for the next 12 months until the last 12 months.
- Subsequently, the central moving averages are calculated; i.e. [$(1.169.130 + 1.183.272) / 2 = 1.176.201$].
- In order to calculate the seasonality index the number of tourist arrivals is divided by the central moving averages.

According to the traditional time series model, real value of the tourist arrivals equals to the values of the formula of $(T \times S \times C \times I)$. Moving average approximates to the value of $(T \times C)$. Ratio of number of tourist arrivals to the central moving average is an estimation of the value of $(S \times I)$ (see column 6 in Table 6). Since the ratios in column 6 in Table 6 consist of seasonal and the irregular fluctuations, it requires to be decomposed from the irregular fluctuations. In order to do that, median value of ratios for each month is calculated. In Table 7, calculated monthly seasonal indices are arranged in order and median values are calculated. Monthly median values are needed to be rearranged by multiplying with the 12 month average ($1200=12 \times 100$). These rearranged values are accepted as monthly seasonal indices. This calculation can be summarized as follows (Mansfield, 1994);

- median values are calculated,
- calculated median values of each month is multiplied with the number of 1200 (12×100) and the result is divided by the total of median values,
- and the result is the monthly seasonal index.

Year	Months	Number of Tourist Arrivals	12 Months Moving Average ^a	Central Moving Average ^b	Ratio of Number of Tourist Arrivals to The Central Moving Average ^c

Table 7. Calculation of the Season Index (2003 – 2007)

According to the calculated seasonal indices, while July has the highest seasonal index (180) for the time period of 2003 and 2007, January has the lowest value (39). From the figures in Table 7, it is possible to examine the seasonal fluctuations among the months in Figure 5.

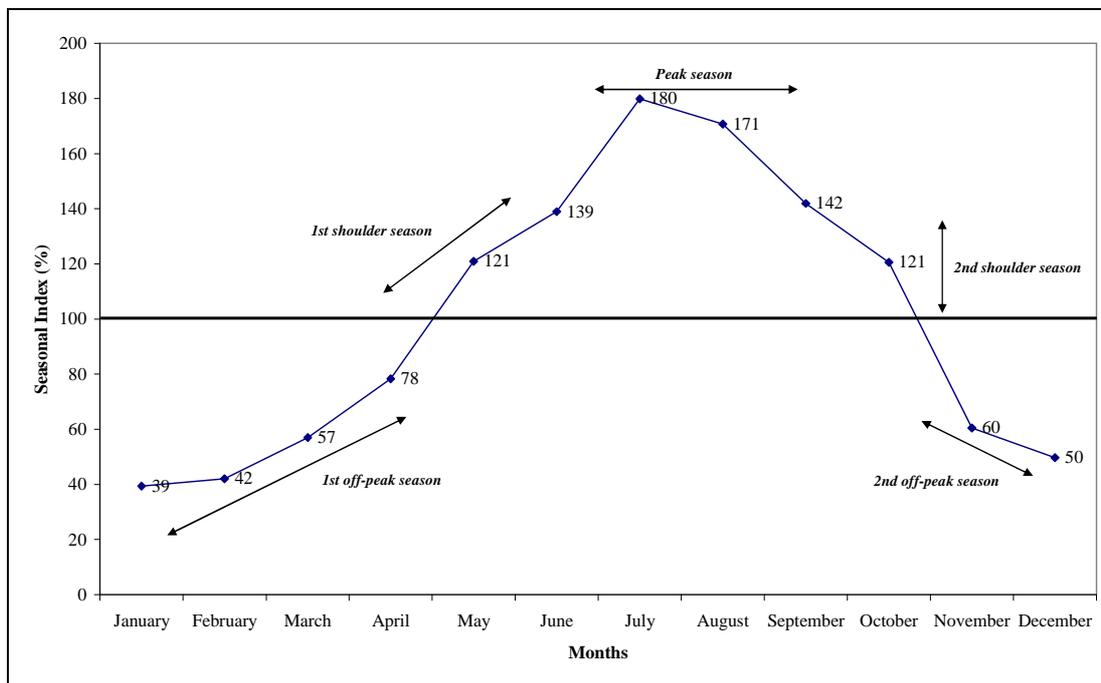

Figure 5. Seasonal Indices of the Turkish Tourist Arrivals between 2003-2007 by the Method of A Ratio to Moving Averages.

As can be noticed from Figure 5, the months of January-February-March-April are the first off-peak seasonal months; May and June are the first shoulder-seasonal months; October is the second-shoulder season; and November and December are the second off-peak seasonal months. Based on this, it can be judged that the Turkish tourism consists of a time period of six months low season, a time period of three months mid-season and a time period of three months peak season between 2003 and 2007. The methods discussed above are summarized with their strengths and weaknesses comparatively in Table 8.

SEASONALITY MEASUREMENT METHODS	STRENGTHS	WEAKNESSES
<i>Seasonality Ratio</i>	<ul style="list-style-type: none"> Measures the seasonal intensity. 	<ul style="list-style-type: none"> Affected by extreme values. Focuses only on one year data.
<i>Seasonality Indicator</i>	<ul style="list-style-type: none"> Indicates the seasonal capacity of the accommodation establishments. 	<ul style="list-style-type: none"> Affected by extreme values. Focuses only on one year data.
<i>The Gini Coefficient</i>	<ul style="list-style-type: none"> Evaluates the whole year and can make comparisons among the years. Is a practical measure in various comparisons. 	<ul style="list-style-type: none"> Makes calculations and comparisons depending upon only a selected year.
<i>Seasonality Index</i>	<ul style="list-style-type: none"> Constructs a base for the demand forecast since it takes into account the previous several years. Its calculation is based on moving averages which takes smooth fluctuations other than seasonality into consideration. 	<ul style="list-style-type: none"> Cannot be applicable to new destinations since it requires previous data. Requires a large amount of data.

Table 8. Comparison of the Seasonality Measurement Methods.

CONCLUSION

This study has examined the seasonality problem in Turkish tourism by applying the widely known seasonality measurement techniques in the literature: (a) Seasonality Ratio; (b) Seasonality Indicator; (c) The Gini Coefficient; and (d) Seasonality Index. As the results indicate, Turkish tourism is highly seasonal with the concentration of tourist arrivals on the summer months. The seasonal concentration of the nationalities of tourist arrivals can also be measured by the Gini coefficient. For instance, in the case of Turkey, to some extent, arrivals of German tourists are not seasonal as much as the tourists arriving from the Commonwealth of Independent States. It is generally recognized that seasonality tends to have more negative effects, particularly from a socio-economic viewpoint. Therefore, necessary attempts should be taken into account in order to eliminate the negative effects of the seasonality. In this respect, to overcome seasonality and hence reduce its negative effects, followings can be done: (a) efforts should be done to lengthen the main season; (b) with various attractions and events additional seasons can be established; (c) target tourist markets should be diversified; (d) price differentiation and tax incentives on a temporal basis can be applied; (e) the staggering of holidays can be encouraged; and (f) domestic tourism in off-seasons can be encouraged.

Our comparative assessment and categorization of the seasonality measurement methods reveal that although none of the seasonality measurement methods are superior to one another, the seasonality indices calculated through the use of moving averages may produce more objective analysis regarding to understand the structure of seasonality in a tourism industry. Every method has its strengths and weaknesses as presented in Table 8. Therefore, it is the suggestion that these methods should be used together in order to have a broader understanding on the structure and the type of the seasonality.

More studies can be conducted in various regions and destinations in a comparative way. The seasonality measurement methods used in this study can use the actual number of stays in the accommodation establishments other than using the number of tourist arrivals. Studies of these kinds may give much more understanding on the seasonality.

ACKNOWLEDGEMENT

The authors would like to thank to Professor Bayram Zafer Erdogan for his feedbacks and the encouragements. We also appreciate the constructive comments of the double blind referees.

MEASURING THE IMPACT OF BRAND EQUITY ON COMPANY PERFORMANCE: A STUDY ON THE MOBILE PHONE BRANDS IN THE KLANG VALLEY, MALAYSIA

Khong, Kok Wei¹; Hong, Amelia Woon Ai¹

¹*Nottingham University Malaysia, Nottingham University Business School, Jalan Broga, 43500 Semenyi, Selangor*

Purpose of this paper: The aim of this paper is to measure the impact of brand equity on company performance. The study was based on a study on mobile phone in the Klang Valley.

Design/methodology/approach: This is empirical study involving a survey. Of the 500 questionnaires sent out, 317 were returned. The dataset from the sample underwent series of statistical analyses, ie reliability test, factor analysis and multivariate regression.

Findings: Cronbach's alphas were between 0.900 – 0.924 among the 3 constructs, ie Brand Loyalty, Perceived Quality and Brand Image. These results indicated internal consistency among variables measuring the predefined concepts from the literature. Factor analyses also extracted 3 dimensions, ie Brand Loyalty, Perceived Quality and Brand Image. The findings revealed that Brand Loyalty and Brand Image have significant association with company performance.

Research limitations/implications (if applicable): One limitation was the size of the sample due to resources constraints. Although the sample size was small, the model has a good fit. Future research can include; other indicators to performances like ROI or ROE and other brands besides the 4 mentioned the paper.

What is original/value of paper: The paper empirically measured the impact of brand equity on company performance like sales in units. Mobile phone makers may find this paper useful as brand equity can be empirically substantiated using a series of statistical techniques.

Keywords: Brand Equity, Regression, Mobile Phone Companies, Malaysia.

Paper Type: Empirical Study.

INTRODUCTION

The telecommunications sector in Malaysia has undergone significant physical and structural transformation in the past twenty years (Lee, 2002). From the 2006 report by the Malaysian Communication and Multimedia Commission (MCMC), it is shown that between 1985 and 2005, fixed line subscribers grew more than 460% and the mobile phone subscribers grew a whopping 422,138% (see Table 1). The figures are simply staggering. In fact, the mobile phone subscribers exceeded the fixed line subscribers somewhere between 1995 and 2000. This happened during the privatisation and liberalisation of the sector in the 1980s in an era of dynamic regulatory reforms and competition.

The following years, the fixed line penetration ratio remained relatively low and even suggested a slight fall from 2000 to 2005 with merely 16.6 per 100 population in 2005 (see Table 1). In contrast, the mobile phone subscriptions have soared tremendously and there are more than 19 million subscribers- most of its grown from the year 2000-2005. This growth can be attributed to the significant growth in the prepaid services launched by the service providers (in the late 1990s) which appealed to younger people mainly those 15-24 years old (Chong, 2007). Also handset prices have dropped tremendously due to growing market sizes, which permit economies of scale, technological enhancements and, in some cases, cross-subsidisations of handset prices (ITU, 1999).

Sector	1970	1980	1985	1990	1995	2000	2005
Population size ('000)	8,118	13,879	15,883	18,102	20,689	23,254	26,380
Fixed Line Subscribers	107,000	395,640	948,598	1,585,744	3,332,447	4,628,000	4,366,000
Mobile Phones Subscribers	-	-	4,630	84,557	872,790	5,122,000	19,545,000
Fixed Line Penetration*	1.3	2.9	6.0	8.8	16.1	19.9	16.6
Mobile Phone Penetration*	-	-	0.0	0.5	4.2	22.0	74.1

* per 100 population

Table 1:

Malaysia Telecommunications Indicators 1970-2005

Source: Adapted from Lee (2002), *Telecommunication Reforms In Malaysia*, p 523 and SKMM (2006), *Komunikasi & Multimedia: Fakta & Angka Terpilih* pp 16,26,28

The mobile phone penetration rate changes from year 1998 to 2006 can be seen in Figure 1. Out of the 19 million subscribers of mobile services, 15% is post paid and the rest is from the prepaid sector.

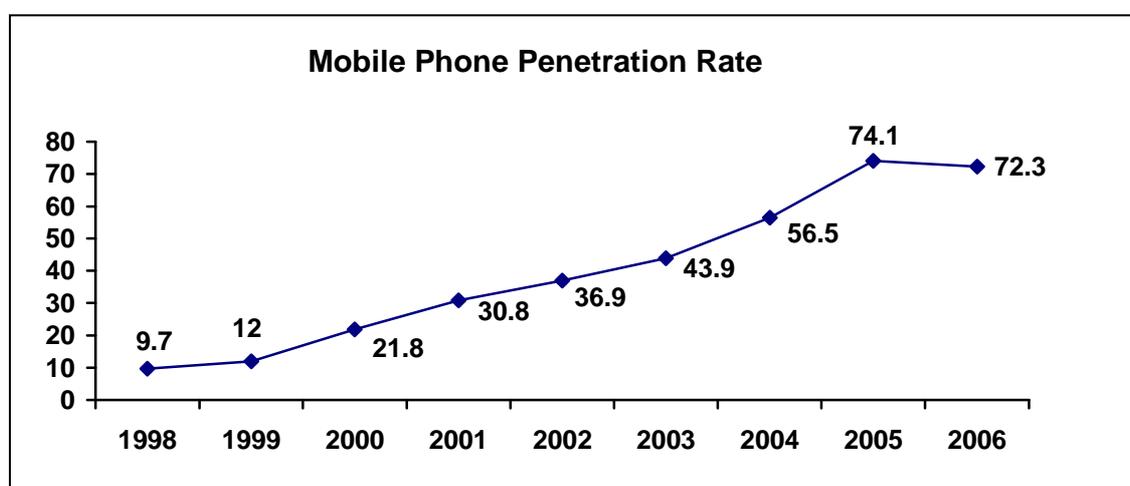

Figure 1: Mobile Phones Penetration Rate

Source: MCMC (2006), *Komunikasi & Multimedia: Fakta & Angka Terpilih*, p 28.

There are 3 players in the mobile telecommunication service provider market, ie Maxis Communications Bhd (using the 012 and 017 prefix), Celcom (M) Bhd (using the 019 and 013 prefix) and DiGi Telecommunications Sdn Bhd (using the 016 and 014 prefix). Their respective market shares from year 2004 to 2006 are shown in Table 2.

Service Providers	2004 (%)	2005 (%)	2006 (%)
Maxis Communications Bhd	41.2	40.3	40.1
Celcom (M) Bhd	36.6	35.2	33.4
DiGi Telecommunications Sdn Bhd	22.2	24.6	26.4

Table 2: Service Provider Market Share

Source : Chong, (2007), *Maxis Internal Report, Internal Competitive Analysis Training*, 4-5 April 2007

In Malaysia, the market for mobile phones is dominated by 4 major brands (Nokia, Motorola, Samsung and Sony Ericsson). Together, in 2006, these four companies hold 96% of the market share. Of these manufacturers, Nokia is by far the most popular with 49% of the market (in terms of units); Samsung falls in 2nd place with 18%, Motorola at 3rd place with 16% and finally Sony Ericsson with 13%. (see Figure 2). The

other 4% are mostly saturated by brands like LG, Panasonic, Siemens, Sagem, Alcatel, Phillips, Toshiba and other PDA phones such as Palm, Dopod, O2, Mitac, iKoMo and Xplore.

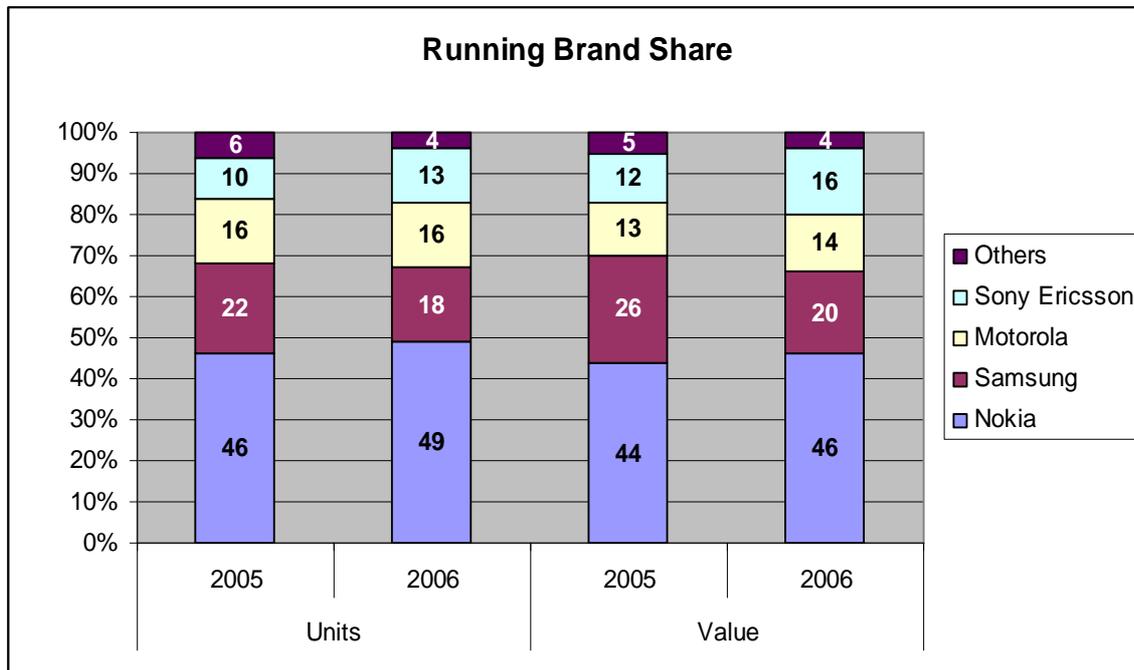

Figure 2: Running Brand Share of Mobile Phones

Source: GFK (2006), Mobile Phone- Retail Audit Results-Total Malaysia-Dec 06

In more recent times, the government of Malaysia has put forth the National Telecommunication Policy (1994-2020) as a catalyst towards the growth and development of this sector. Its objective is to make Malaysian telecommunication a modern, sophisticated and dynamic sector. The strategies that are to be carried out include expansion of services in a systematic and comprehensive manner, encouraging competitiveness, research and development, upgrading of rural facilities and etc. All this will definitely further increase the mobile phone penetration and provide ample opportunities for both mobile phone manufacturers and service providers to grow. Despite the continuing dominance of the major manufacturers in the handset market, there has been evidence of establishment of newer players, partly as a result of the widening of the network market by newer providers. In Malaysia, there are no new service providers but the establishment of newer players is true nonetheless as seen in the proliferation of unknown phone brands like Mitac, Gigabyte, VK Mobile, HUM, i-mobile and Xplore. These smaller players are racing to introduce the technologically latest game phones and handsets with the most sophisticated interactive capabilities, as well as scalability in sheer range of models.

Due to the intense competition, mobile phone brands tend to compete on three important platforms; technology, design and branding (Chong, 2007). Due to the depth of these three areas, branding is the focal point of this paper. In describing good branding strategies, one often relates the positive results of the strategies as brand equity. Brand equity plays a prominent role in evaluating the brand health because it increases the firms':

- Competitive Advantage
- Sales Revenue / Margin
- Shareholders' Value
- Growth Opportunities

The following reflects the impact of brand equity on the firms' performance and development. Therefore brand equity is an important asset of a firm. With such rapid changes within the mobile phone industry, it is the aim of this paper to examine the impact of brand equity, which consists of brand loyalty, brand image and perceived quality, on company performance of mobile phone companies in the Klang Valley, Malaysia. For the purpose of this research, only the top 4 mobile phone brands are chosen, ie Nokia, Motorola, Samsung and Sony Ericsson.

LITERATURE REVIEW

There are various definitions of 'brand' that one can get from the scholarly journals, web and dictionaries. It has been long recognized that brands are valuable to companies. Brands often provide the primary points of differentiation between competitive offerings and therefore are critical to the success of a company. Brands are considered intangible corporate assets (de Mortanges and van Riel, 2003). It is often suggested that they possess economic value and create wealth for the company's shareholders (Aaker, 1996; Doyle, 2001; Kerin and Sethuraman, 1998). Due to the many definitions, the perception of brand is diversified and assorted (see Table 3). However, brand seemed an esoteric concept as the measurement of this intangible asset is complicated and problematic. In the midst of this complication, brand equity provides the avenue to quantify the value of the brand.

Authors	Definitions
Sherry (2005)	Tripartite meaning- 1) Burning, 2) Marking, 3) Delivery from danger. Also embodies the transformative heat of passion. A differentiator, a promise, a license to charge a premium,...a mental shortcut that discourages rational thought,a performance, a gathering, and inspiration,.. a semiotic enterprise of the firm, the companion spirit of the firm, . a contract, a relationship, a guarantee,... a non-zero-sum game; improvisational theatre at best, guerrilla theatre at worst
American Marketing Association	a name, term, sign, symbol, or design, or a combination of them, intended to identify the goods or services of one seller or groups of sellers and to differentiate them from those of competitors
Berthon et al. (2007)	Symbols around which companies, suppliers, supplementary organizations, the public and, indeed, customers construct identities
Watkins (1986), Aaker (1991), Stanton et al. (1991), Doyle (2001) & Kotler et al. (1996)	Variations but similar in context to the above definition by Berthon et al. (2007)
Dibb et al. (1997)	A name, term, design, symbol or any other feature that identifies one seller's good or service as distinct from those of other sellers
Murphy (1992)	A complex thing. Not only is it the actual product, but it is also the unique property of a specific owner and has been developed over time so as to embrace a set of values and attributes, both tangible and intangible, which meaningfully and appropriately differentiate products which are otherwise very similar
Prasad & Dev (2000)	Embraces all tangible and intangible attributes that the business stands for
Ambler (1997), Arnold (1992)	The promise of the bundles of attributes that someone buys and provide satisfaction... the attributes that make up a brand may be real or illusory, rational or emotional, tangible or invisible
Martineau (1959)	An image in the consumers' minds
Alt & Griggs (1988) & Goodyear (1993)	Brand Personality
Sheth et al. (1991)	Value Systems
Levitt (1962), de Chernatony & McDonald (1992), Murphy (1992) & Wolfe (1993)	Added Value
Brown (1992) and Noble (2006)	... nothing more or less than the sum of all the mental connections people have around it.
De Chernatony (2001)	Complex offerings that are conceived in brand plans but ultimately reside in consumer's mind

Table 3: Summarises of the authors and their respective definitions of 'brand'

Overview of Brand Equity

"Brand equity" is considered as an attempt to define the relationship between customers and brands in the marketing literature (Wood, 2000). The issue of brand equity has emerged as one of the most crucial topics for marketing management in 1990s (Leuthesser et al., 1995; Keller, 1993; Cobb-Walgren et al., 1995; Lassar et al., 1995; Aaker, 1996; Dyson et al., 1996, Kim & Kim, 2005). The content and meaning of brand equity have been debated in a number of different ways and for a number of purposes, but so far no congruent and common viewpoints have emerged (Vazquez et al., 2002; Keller, 2003a; Keller, 2003b; Washburn & Plank, 2002; Atilgan et al., 2005).

At the simplest level, brand equity assesses the value of a brand. At a conceptual level, most of the authors agree to some extent on its meaning but brand equity can still be considered in many different contexts; the added value endowed by the brand to the product (Farquhar, 1989); brand loyalty, brand awareness,

perceived quality, brand associations, and other proprietary brand assets (Aaker, 1991); brand value (Kamakura & Russell 1993); differential effects of brand knowledge on consumer response to the marketing of the brand (Keller, 1993); the set of associations and behaviour that permits the brand to earn greater, Volume or greater margins (Leuthesser et al., 1995); incremental utility (Simon & Sullivan, 1993); total utility (Swait et al., 1993), the difference between overall brand preference and multi-attributed preference based on objectively measure attribute levels (Park & Srinivasan 1994); subsumes brand strength and brand value...which permits sustainable and differentiated competitive advantages, superior current and future profits, and lowered risks (Srivastava & Shocker, 1991); brand value, brand strength and brand description (Feldwick, 1996). These many definitions imply that brand equity is the incremental value of a product due to the brand name (Srivastava & Shocker, 1991).

Brand equity can be discussed from the perspective of the investor, manufacturer, retailer, the consumer (Cobb-Walgren et al. 1995; Atilgan et al., 2005). Manufacturers and retailers are more interested in the strategic implications of the brand while investors are more sympathetic for a financially defined concept (Cobb-Walgren & Ruble, 1995). In simple terms, manufacturers and retailers are more interested in the relationship between customers and the brand. This relationship can be called customer brand equity. Investors however, are more likely to be interested in what brand equity means in terms of the asset valuation (Wood, 2000)

Intangible brand properties came to be known as brand equity in marketing literature (Kerin & Sethuraman, 1998). Brand equity arose from customer brand-name awareness, brand loyalty, perceived brand quality, and favourable brand symbolism and associations that provide a platform for a competitive advantage and future earnings streams (Aaker, 1991). If a company's brand name represent both an asset as well as its future earnings, then is quite important to be able to put a valuation on the brand itself to see what economic value it brings to the company. Claiming that successful brands are an asset to the company is one thing, assigning the value to the brand is quite another. There has been much work for the last 15 years that seek to find a way of measuring brand equity. Most of the work on brand equity centres on three perspectives: customer-based, financial-based and the combined/balanced view (Kim & Kim, 2005) – see table 4. The combined/balanced view is preferred due to its overall emphasis on customer and financial based perspective.

A balanced view of Quantifying Brand Equity

A key requirement for managing brand equity is the availability of good measures (Aaker & Joachimsthaler 2000). Wood (2000) holds that accountants tend to see brand equity differently from marketers, with the concept being defined both in terms of the relationship between customer and brand (consumer-oriented definitions) or as something that accrued to the brand owner (company oriented definitions). As such different perspectives on brand equity were contrived.

CUSTOMER-BASED PERSPECTIVE

The customer based brand equity perspective is approached by taking the view of the customer- be it an individual in the business-to-consumer (B2C) market or an organization in the business-to-business (B2B) market. Keller (2003b) coins the term *customer-based brand equity* (CBBE) and defines it as "the differential effect of brand knowledge on customer response to the marketing of the brand". The premise of the CBBE approach is that the power of the brand lies in what customers have learned, felt, seen, and heard about it over time. Simply put, the power of a brand is what resides in the minds of customers, ie consumer franchise (Keller, 2003a; Kotler, 1996).

Srivastava & Shocker (1991) state that brand equity subsumes two multi-dimensional concepts, ie brand strength and brand value. Here, it is explained that brand strength is based on perception and behaviours of customer that allow the brand to enjoy sustainable and differentiated competitive advantages. Brand value is the financial outcome of the management's ability to leverage brand strength via strategic actions to provide superior current and future profits (Srivastava & Shocker, 1991).

David Aaker (1991, p 16), defined brand equity as 'a set of brand assets and liabilities linked to a brand, its name and symbol that add to or subtract from the value provided by product or service to a firm and/or to that firm's consumers'. Blackston (1995) on the other hand, has referred to brand equity as brand value and meaning, where brand meaning implies brand saliency, brand associations, brand personality and where brand value is the outcome of managing the brand meaning. Winters (1991) related brand equity to added value by suggesting that brand equity involves the value added to a product by consumers' association and perceptions of a particular brand name.

For the brand to have value (measured by brand equity), it must first of all be valued by the consumers. If the brand has no meaning to the consumer, none of the other definitions is meaningful (Farquhar, 1989; Crimmins, 1992; Keller, 1993; Cobb-Walgren & Ruble, 1995; Rio et al., 2001). Within the marketing literature, operationalisations of customer-based brand equity usually fall into two groups (Cobb-Walgren et al., 1995; Yoo et al., 2000) which are

1. Consumer perception (brand awareness, brand associations, perceived quality)
2. Consumer Behaviour (brand loyalty, willingness to pay a high price).

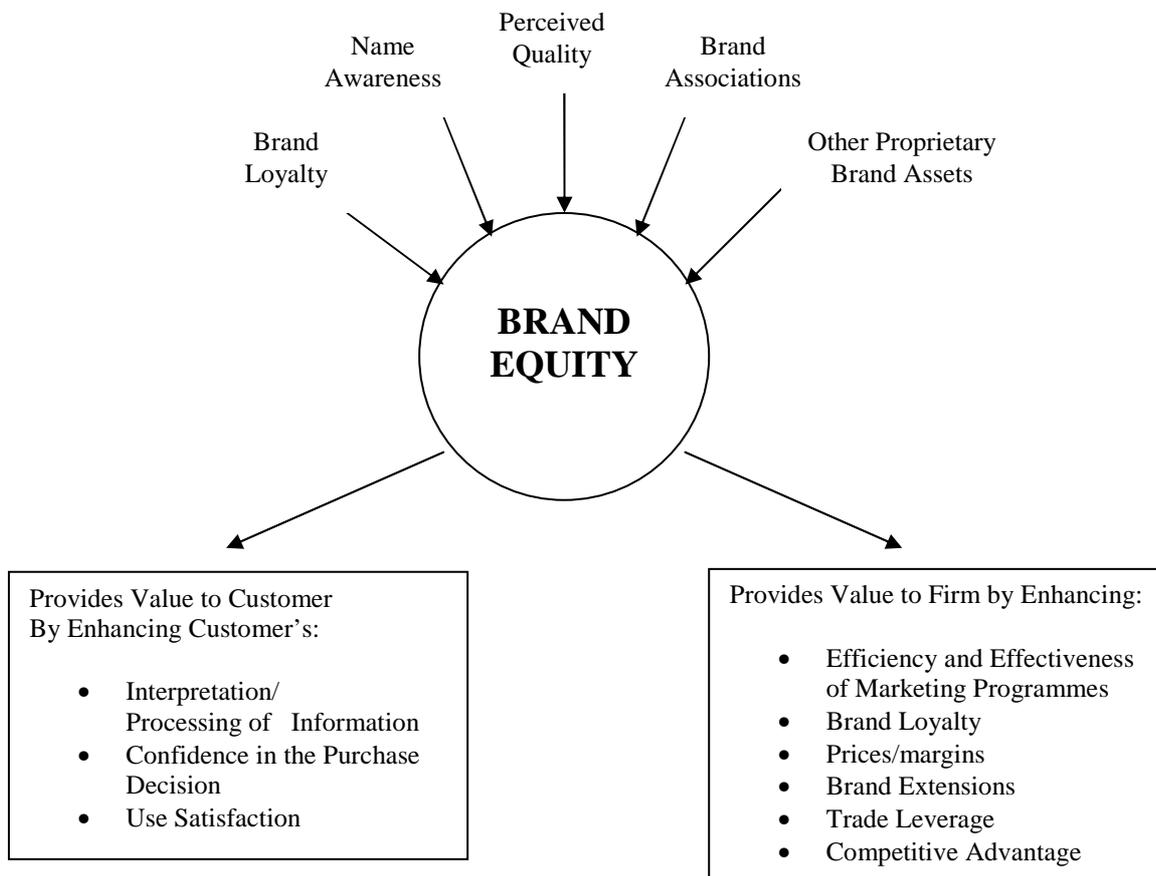

Brand equity has been operationalised by Lassar et al. (1995) as an enhancement in the perceived utility and desirability a brand name conferred on a product. It is the consumers' perception of the overall superiority of a product carrying that brand name when compared to other brands. Lassar et al. (1995) offer that the customer-based brand equity indicates only the perceptual dimensions rather than behavioural dimensions (such as loyalty or usage intentions) which differ from Aaker's earlier work in 1991(which incorporated the behavioural dimensions). The dimensions of brand equity – brand loyalty, brand awareness, perceived quality and brand image which was offered by Aaker (1991, 1996) have been broadly accepted and employed by many researchers and authors (Keller, 1993; Motameni & Shahrokh, 1998; Low & Lamb Jr., 2000; Prasad & Dev, 2000; Yoo et al., 2000; Washburn & Plank, 2002, Kim & Kim, 2004, 2005, Altılgan et al., 2005).

Quantifying Brand Equity using Aaker's Brand Equity Model

Aaker (1991) examined brand equity and explained that a brand's assets and liabilities contribute to its equity. In order for assets or liabilities to underlie brand equity they must be linked to the name and/or symbol of the brand. The assets and liabilities on which brand equity is based on will differ from context to context. However, they can be usefully grouped into 5 categories:

1. Brand Loyalty
2. Name Awareness
3. Perceived Quality
4. Brand Associations in addition to perceived quality
5. Other proprietary brand assets- patents, trademarks, channel relationships, etc

The concept of brand equity by Aaker (1991) is summarized in Figure 3. The 5 categories of assets that underpin brand equity are shown as being the basis of brand equity. The figure also shows that brand equity

creates value for both the customer and the firm.

Figure 3: Aaker's Brand Equity Model

Source : Aaker (1991), "Managing Brand Equity: Capitalizing on the value of a brand name", p17

This measure is not only valid and reliable but also parsimonious (Aaker, 1991; Yoo et al., 2000), which helps practitioners track brand equity of individual brands on a regular basis. Regular checking is advised as consumers are fickle and any changes (negative) in brand equity needs to be identified so that the right measures can be taken to counteract the reasons of such changes. While this method is useful in making relative comparisons of brands, it is not easy to translate preference measures into financial measures for use in cost benefit analyses (Randall *et al.*, 1998). This makes the method, whilst very popular with marketers, unfavorable to accountants who need to sink their teeth into something more 'substantiated' and "tangible".

Linking Brand Equity and Company Performance

According to Rubinson & Pfeiffer (2005), if a brand is creating brand equity, it is succeeding in creating loyalty based on uniquely favourable customer beliefs. They affirm that such brands enjoy greater market share, margins and resulting profits than a generic product or poorly marketed brand. They continued to explain that loyalty provides the mechanism by which increased profit margins arise. As a group, loyal customers do not require marketing stimuli to the same degree as less loyal customers to stay with the brand, nor are they as switchable in the face of competitive promotions. An observation by the authors suggested that the average price paid for a given brand, among a range of packaged goods, by consumer scanner panel data seemed to be higher among more loyal buyers (as measured by share of requirements). This is presumably due to loyal users who are much more likely to buy the brand whether it is on sale or not. This implies that brand equity can positively affect company performance.

Even though the brand is an asset, its intangibility is one key reason why it is not included as an asset in accounting. Therefore there is this plethora of ways in valuing a brand from the 3 perspectives, previously mentioned, to other methods which are not discussed here for parsimony sake. In the end, any measurement of brand equity can never be a conclusive attempt. There are many elements within the brand itself that would prove to be elusive for a person who is empirically quantifying it. Therefore researchers need to acknowledge this setback that can influence brand valuation.

RESEARCH FRAMEWORK

The framework of this paper is based on Aaker (1991) which was discussed previously. Aaker (1991) expounded that brand equity is a multidimensional concept that consists of brand loyalty, brand awareness, perceived quality, brand associations and other proprietary assets. The study was exploratory in nature. Later, Yoo et al. (2000) adopted four of Aaker's five categories, namely brand loyalty, brand awareness, perceived quality and brand associations. Aaker (1991) described the five dimensions as representing customer perceptions and reactions to the brand. These dimensions are readily understood by consumers. Aaker (1991) further expounded that the 5th brand asset consists of other proprietary brand assets such as patents, trademarks, and channel relationships. However, this dimension is not relevant to the consumers, hence removed in the model. In the context of this paper, the brand awareness construct was excluded in the analysis because data was not collected from survey. However a study shows that the 4 brands constituted 96% market share in Malaysia (Chong, 2007). As such, the variance among the 4 brands in the context of brand awareness is marginal. Thus, only three constructs are used in the CBBE (see Figure 4). Hence an adapted model of Aaker (1991) was adopted.

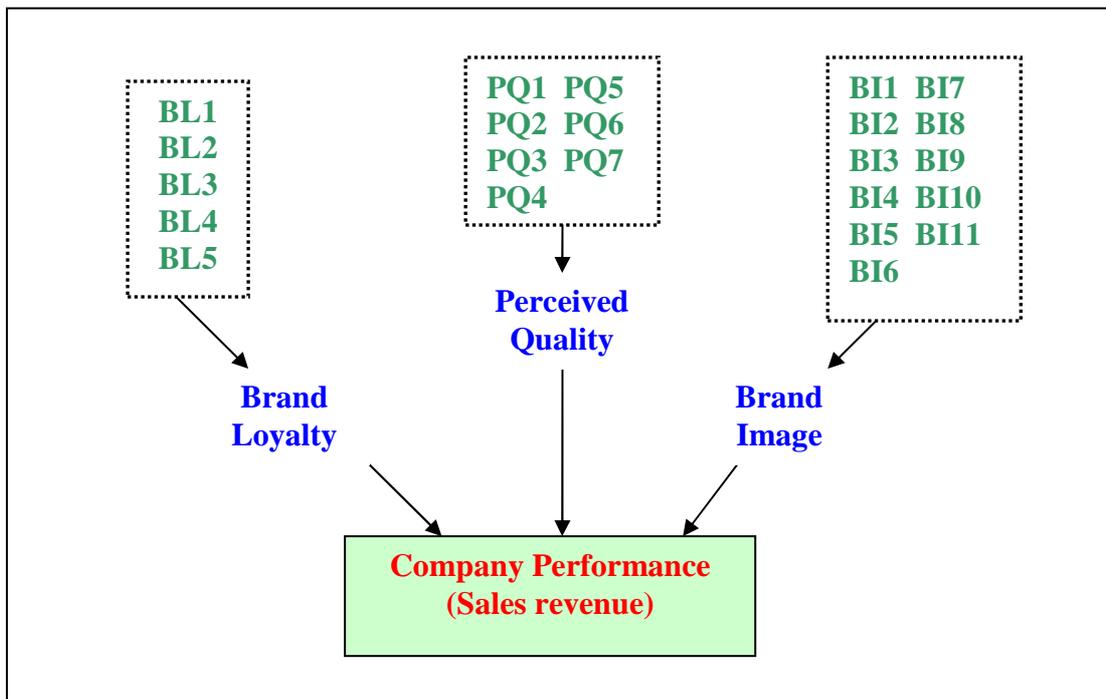

Figure 4: The Framework for this research (adapted from Aaker, 1991)

Source: Adapted from Aaker (1991), *Managing Brand Equity*, p17

Figure 4 suggested that brand loyalty, perceived quality and brand image have associations with the company performance. Therefore in this study, brand equity consists of 3 dimensions; ie Brand Loyalty, Perceived Quality and Brand Image, are manifested by 5, 7 and 10 variables (see Table 5).

<i>Dimension</i>	<i>Measures</i>	<i>Abbreviation</i>	<i>Author</i>
Brand Loyalty	<i>Behaviour Measures</i>	BL1	Aaker (1991)
	<i>Switching Costs</i>	BL2	
	<i>Satisfaction Measures</i>	BL3	
	<i>Liking the brand</i>	BL4

	<i>Competitors</i>	BI10	

Table 5: Brand Equity Dimensions and its manifesting variables

Company Performance

Although profit related financial ratios may be more appropriate to represent company performance, sales in units is chosen as the indicator for company performance. This indicator is the dependent variable. The sales in units were chosen instead of sales revenue because the price of a particular phone model will decline throughout its lifecycle. Hence it is not a very accurate representation of company performance relative to brand equity. Sales in units will give a better regression on the constructs in Figure 4. From the survey, respondents were asked the approximate number of phones (of specific brands) they have bought in the past 5 years. This indicates the performance of the brand in terms of performance.

METHODOLOGY AND FINDINGS

A series of statistical tests were conducted to examine the impact of brand equity on company performance. These statistical tests were as follow:

1. Reliability Analysis,
2. Factor Analysis, and
3. Logistic Regression

Survey Results

Of the 500 questionnaires sent out in Klang Valley, a total of 317 were completed and returned. The number of questionnaires sent (500) was based on the funding and resources available to the researchers. Nevertheless, a minimum of 200 sample size is considered adequate to conduct a series of statistical tests (Hair et al., 1998). However 9 questionnaires response were rejected due to incompleteness with most of them having only 4 replies out of the 35 questions (23 were measuring independent variables via a 7 interval scaled questions while 12 were non parametric scales on background and other information). Of the

remaining 308 responses, 141 were males (46%) and 167 were females (54%). In terms of age, majority of them were in the 21-30 years old age group (47%) and 31-40 year old age group (41%). In terms of the education level, more than half the respondents held a bachelors degree (58.6%), closely followed by a Master's degree (18%) and Diploma (15%). Looking at the gross annual income, more than half of the respondents fell into the wide scale of annual income between RM30,000 and less than RM99,000. Around 6% would spend above RM2000 for a mobile phone, 37% RM1001-RM2000, another 37% RM501-RM1000, 12.5% between RM301 –RM500 and about 7% less than RM300. On average, the amount spent on mobile phones was approximately RM1300 per unit. The average number of the same mobile phone brand purchased by the respondents in the last five years was 2.6 phones.

Reliability Analysis

Reliability analysis was performed using SPSS to calculate Cronbach's alpha. This analysis was to test the degree of consistency of variables when measuring the brand equity dimensions for the four mobile phone brands. The factors examined were brand loyalty, perceived quality and brand image. From the results in Table 6, Cronbach's alpha for brand loyalty, perceived quality and brand image were 0.910, 0.900 and 0.923 respectively. This showed how well each individual items in a scale correlates with the sum of the remaining items. The results implied that the questionnaire was measuring brand loyalty, perceived quality and brand image in a consistent way.

<i>Scale Item</i>	<i>Mean of each indicator (on a scale 1=strongly disagree to 7=strongly agree)</i>
Brand Loyalty: Cronbach's Alpha = 0.910	
1) <i>I have been buying this brand regularly</i>	5.15
2) <i>I will buy this brand again</i>	5.40
3) <i>I am satisfied with this brand</i>	5.61
4) <i>I will recommend this phone brand to my friends</i>	5.37
5) <i>I will not switch to another phone brand if current phone is damaged</i>	4.19
Perceived Quality: Cronbach's Alpha = 0.900	
1) <i>The phone's function works well ie voice/music quality is good, camera photos are clear, etc</i>	5.44
2) <i>The phone is user friendly and has convenient features</i>	5.78
3) <i>The phone hardly has any defects</i>	5.07
4) <i>The phone is reliable, it works properly each time it is used</i>	5.46
5) <i>The phone is not easily damaged</i>	5.35
6) <i>There is good after care customer service</i>	4.76
7) <i>The phone looks and feels like it is of good quality</i>	5.71
Brand Image: Cronbach's Alpha = 0.923	
1) <i>This phone fits my personality</i>	5.43
2) <i>It has a good reputation</i>	5.88
3) <i>This brand stresses on innovation</i>	5.60
4) <i>This phone is good value for money</i>	5.36
5) <i>Owned by a lot of people who are hip and happening</i>	4.93
6) <i>I feel proud owning the phone</i>	5.11
7) <i>It's like a companion</i>	5.03
8) <i>It's a fashion accessory</i>	4.46
9) <i>It's like my personal organizer</i>	4.46
10) <i>The brand is familiar to me</i>	5.87
11) <i>It has a differentiated image from other phone brands</i>	5.26

Table 6: Scale Items for Mobile Phone Brands Survey

Exploratory Factor Analysis

Exploratory factor analysis using SPSS was employed to summarise the essential information contained in the variables and to summarise a set of variables (Coakes, 2005, p 154). Results revealed that the Bartlett test of sphericity is significant (p value = 0.000) and that the Kaiser-Meyer-Olkin (KMO) measure of sampling adequacy is 0.947 which is greater than the 0.6 threshold. This indicated correlation among indicators within the factors structure. In short, the factors extracted are consistent and clearly manifested by the variables.

The factors were then rotated with varimax rotation to achieve simpler and theoretically more meaningful factor solutions (Hair et al., 1998, p 106). The factor loadings that were below 0.30 are considered not significant for a sample size of 350 and therefore were suppressed (Hair et al., 1998, p 112). Factor loadings, which explained the correlation, now the factor loadings, of each variable and the factor, showed that these variables have influence over the factor. The results in Table 7 show that 3 factors were extracted, ie, 'brand image' (Component 1), 'brand loyalty (Component 2) and 'perceived quality' (Component 3).

	Components		
	1	2	3
<i>Been buying this brand</i>		<i>.784</i>	
<i>Will buy again</i>		<i>.820</i>	
<i>Satisfied</i>		<i>.743</i>	<i>.497</i>
<i>Recommend</i>	<i>.322</i>	<i>.739</i>	<i>.411</i>
<i>Will not switch</i>	<i>.395</i>	<i>.581</i>	
<i>Performance</i>	<i>.433</i>	<i>.448</i>	<i>.471</i>
<i>Features</i>		<i>.669</i>	<i>.452</i>
<i>Conformance</i>			<i>.862</i>
<i>Reliability</i>		<i>.308</i>	<i>.794</i>
<i>Durability</i>			<i>.824</i>
<i>Serviceability</i>	<i>.360</i>		<i>.503</i>
<i>Fit and Finish</i>	<i>.418</i>	<i>.362</i>	<i>.535</i>
<i>Fits personality</i>	<i>.701</i>	<i>.395</i>	
<i>Good reputation</i>	<i>.437</i>	<i>.571</i>	<i>.433</i>
<i>Innovation</i>	<i>.570</i>	<i>.440</i>	<i>.338</i>
<i>Value for money</i>	<i>.527</i>	<i>.319</i>	<i>.477</i>
<i>Owned by hip people</i>	<i>.789</i>		
<i>Proud owning phone</i>	<i>.828</i>		
<i>Companion</i>	<i>.739</i>	<i>.326</i>	
<i>Fashion accessory</i>	<i>.797</i>		
<i>Organiser</i>	<i>.651</i>		
<i>Familiar brand</i>		<i>.645</i>	<i>.355</i>
<i>Differentiated image</i>	<i>.515</i>	<i>.374</i>	<i>.337</i>

Table 7: Rotated Component Matrix

Extraction Method: Principal Component Analysis.

Rotation Method: Varimax with Kaiser Normalization.

Regression Analysis

Regression analysis using SPSS was employed to represent the best prediction of a dependent variable from several independent variables. The dependent variable that was chosen to represent company performance was “company sales in units”. Results showed that the 3 factors (brand loyalty, perceived quality and brand image) explained approximately 47.7% of the total variance of sales in units (see Table 8).

Model Summary^b

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.690 ^a	.477	.467	5.172

a. Predictors: (Constant), Brand Awareness Regr Factor Score, Perceived Quality Regr Factor Score, Brand Loyalty Regr Factor Score, Brand Image Regr Factor Score

b. Dependent Variable: Company Sales

ANOVA^a

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	5457.302	3	1364.326	51.006	.000 ^a
	Residual	5991.650	224	26.748		
	Total	11448.952	228			

a. Predictors: (Constant), Brand Awareness Regr Factor Score, Perceived Quality Regr Factor Score, Brand Loyalty Regr Factor Score, Brand Image Regr Factor Score

b. Dependent Variable: Company Sales

Table 8: Results of Regression and ANOVA

An examination of the t-values in Table 9 indicated that brand loyalty and brand image were linearly related to the company sales, but there is no evidence of a linear relationship between perceived quality and company sales. Of the two significant factors, brand loyalty had a higher standardised regression coefficient ($\beta=0.311$) compared to brand image ($\beta=0.136$). Perceived quality had a low significance level of 0.123 ($\beta=0.075$) which meant that perceived quality was not statistically significant. In short, there was insufficient evidence to imply that there was linearity between perceived quality and company sales in units.

Coefficients^a

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	12.852	.342		37.603	.000

DISCUSSION

Brand Equity Rating (BER)

Referring to Table 10, the ratings show that Nokia ranked no 1 in total brand equity (BE = 22.92), followed closely by Sony Ericsson (21.41). Motorola was rather distant from the first two (18.76) while Samsung (18.43) ranked last. Nokia has the highest brand equity at 22.92 and it surpasses all the other brands in terms of the dimensions of brand equity except for brand image where Sony Ericsson has the upper hand. This means that Nokia has consumer franchise in terms of loyalty and perceive quality compared to other brands. The brand equity measurement is a good tool for marketers. Marketers are able to monitor the performance of individual components of brand equity and take corrective actions.

Brands	Brand Loyalty ^a		Perceived Quality ^a		Brand Image ^a		Total Brand Equity
Nokia	5.47	(n=148)	5.56	(n=144)	5.20	(n=143)	16.23
Samsung	4.40	(n=31)	5.09	(n=31)	4.82	(n=31)	14.31
Sony Ericsson	5.21	(n=85)	5.33	(n=83)	5.43	(n=81)	15.97
Motorola	4.46	(n=44)	4.99	(n=43)	5.14	(n=443)	14.59

Table 10: Overall Brand Equity Rating based on the dataset

a. On a scale of 1 to 7, where 1= strongly disagree and 7 = strongly agree on positive meanings

b. Scale where 4,5 and 6 = unaided recall, and 7= top of mind brand recall

All values are Mean value of responses from respondents

Based on Table 11, Nokia is also the no 1 mobile phone brand with US\$30,131M of brand value globally (according to Interbrand 2006). Interbrand ranks Samsung (Samsung Electronics) at 2nd, followed by Sony Ericsson and Motorola. This reflected some consistency between the dataset and global perception in brand equity. However it is pertinent to state that the BER in Table 10 is tabulated based on mean score. Consequently generalisation cannot be imposed unless longitudinal studies are conducted.

Mobile Phone Brands	Brand Value Globally	Global Brand Value Ranking	Local Sales (Units)	Brand Value & Sales Ranking	Total Brand Equity	Brand Equity Ranking
Nokia	US\$30,131M	6	1,911,288	1	16.23	1
Samsung	US\$16,169M	20	830,995	2	14.31	4
Sony Ericsson	US\$11,695M	26	664,796	3	15.97	2
Motorola	US\$4,569M	69	581,696	4	14.59	3

Table 11: Global Brand Equity, Sales and Brand Value

Brand Equity as a whole

The R squared figure of 0.477 means that 47.7% of the 3 underlying components of brand equity, ie brand loyalty, perceived quality and brand image, explain the variation of the company's sales in units. The other 53% which can impact company's sales in units were not examined. In short, besides brand equity there are other reasons why people purchase a particular mobile phone. However, a strong brand that represents a mark of trust gives the buyer permission to make a decision (Farr, 2007).

Brand Loyalty

Brand loyalty has the second highest impact on company performance (see Table 9). Survey questions/statements such as "will buy this brand again", "satisfied with this brand", "been buying this brand" and "will recommend to others" were highly loaded (see Table 7). This is probably due to the fact that customers have used and are satisfied with the products. In short they have good perception of the brand. Loyalty can also stem from habitual buying behaviour. Once consumers have good experienced of a product, they may be reluctant to switch brands. This is supported in the literature that loyal customers will not be swayed by marketing stimuli like discounts and heavy promotions. Also, consumers with high brand loyalty tend to be zealous in recommending the brand to others as explained by Aaker (1991). Keller (1993) suggests that brand loyalty actually 'insulates the brand from a measure of competitive threats' and "provide competitive advantage and opportunities for brand extension". Atilgan et al. (2005) explains that brand loyalty is the most influential dimension of brand equity. This can describe why brand loyalty has such a high impact on company performance like sales.

Perceived Quality

From Table 9, there was insufficient evidence to conclude that perceived quality has an association with mobile phone companies' performance. One explanation is customers assumed equality of variance in quality in the 4 major brands; hence it is not something that will really move them to buying the brand. This is depicted in Table 10 as perceived quality rating of the 4 brands are quite close to each other (the mod is only 0.57). Similar study by Kayaman and Arasli (2007), show that perceived quality did not have any direct relationship with brand equity and therefore did not really impact the company performance.

Brand Image

Brand image appeared to have a small effect on the performance of mobile phone companies. Referring to Table 10, the researchers opine that the reason for Sony Ericsson's higher brand image rating compared to Nokia is because Sony Ericsson is well known for its mobile music, software and accessories. Sony's very strong brand equity in the consumer electronics market has definitely complemented the brand image for Sony Ericsson with regards to both its music and camera capability. In the last two years Sony Ericsson has become an industry leader in both mobile imaging and music phones thanks to the outstanding success of the Walkman and Cyber-Shot branded handsets (Sony Ericsson Celebrates, 2006). Nokia's image has always been consistent with its simple-to-navigate user interface (UI) and its stylish design (Kevi, 2007). Samsung created a sleek appeal and great design image (Samsung Launches Slim, 2007). Motorola's image is about fashion and form which earned its reputation while it still falls behind in terms of functionalities (Hughlett, 2007).

When it comes to brand image, the survey questions which were loaded highly were 'proud owning the phone', "owned by hip and happening people", "it's a companion" and "fashion accessory" (see Table 7). These questions clearly show that brand image matter to the consumer psychological constructs. In fact, Westbrook (1987) suggests that consumers will be more inclined to recommend the brand when they associate this brand with highly relevant emotional experience. This may mean that the more affinity and personal identification the customers have with the brand, the chances of them recommending it (thus increasing company performance) increases. This argument is also supported by Rio et al. (2001), Pappu et al. (2005), Kim et al (2003) and Kim & Kim (2004). They concluded that brand image is important to increasing word of mouth recommendation hence company performance.

CONCLUSION

Researches in the past have demonstrated that brand equity can be looked into from the financial perspective, the customer perspective and the combined perspective. In the opinion of the researchers, the combined perspective of brand equity measures is particularly popular as it is able to record current consumer trends and perceptions, to oversee attitudes which changes over time and to meet the customers' needs and wants. This study used the combined perspective of brand equity measures to investigate the impact of the three underlying brand equity dimensions on company performance in the mobile phone industry. The dimensions that were examined were brand loyalty, perceived quality and brand image.

The scale comprising of 27 variables manifested the 3 dimensions of brand loyalty, perceived quality and brand image. Due to limited resources, the dataset was restricted to a small sample in the Klang Valley. However the dataset provided some insightful information on brand equity. Sales figures in units, as the indicator for company performance, used in this study were not presented due to the non-disclosure agreement with the companies involved. Results concluded that the customer-based brand equity measurement is a reliable tool to measure the impact of brand equity dimensions on company sales performance. Findings revealed that brand loyalty and image have a positive effect on the company's performance manifested by sales in units. Brand loyalty is considered the most important construct due to its stronger β coefficient between the two. Perceived quality is not a significant component to affect firms' performance due to insufficient evidence from the dataset. The results of this study imply that strong brand equity is an important construct in consumer buying behaviour.

Future research can attempt to examine brand equity across other brands besides the major 4 brands. If smaller competitors are included into the study, there is a possibility that the R square can improve implying that brand equity may play a more significant role in company performance. Further research may include brand awareness as an important construct as indicated in Aaker's Model. It is important that the results can confirm its impact on performance; whether the impact is significant or marginal.

THE ROLE OF LGD IN CREDIT RISK MITIGATION: THE REMUNERATION ENHANCEMENT DILEMMA

Kosmidis, Kosmas¹; Stavropoulos, Antonios²; Terzidis, Konstantinos³

Purpose – The objective of this paper is to contribute to the debate about the current financial crisis and highlight the ambiguous role of Loss Given Default (LGD) in credit risk mitigation. Our motivation is to stress that both lenders and borrowers are partners in the alleged U.S. sub prime mortgage market crime with the misuse of the LGD mechanism as a Trojan Horse. In over-liquidity times, bank management faces more imperatively the dilemma to mitigate or not the *ex ante* credit risk of sub prime mortgage customers in order to enhance the reported performance of their organisations and their remuneration respectively. Surprisingly, the preceding considerations were neglected by the Basel Committee on Banking Supervision in its proposed enhancements to the Basel II framework. The paper argues that there is an incentive for synergy among bank management, property appraisers and mortgage customers as long as their decisions are based on short term criteria.

Design/methodology/approach – In this paper an advanced IRB retail credit scoring system is constructed in accordance with the Basel II framework and the current literature. The impact of the real estate bubble on LGD and the manipulation of that system are studied. The gap between *ex ante* and *ex post* Expected Loss (EL) is also explored.

Findings – The paper shows how the LGD mechanism can be used in the manipulation of an advanced IRB retail credit scoring system. Through such practice a sub prime mortgage customer is presented as a highly attractive prime bank customer.

Practical implications – The regulatory authorities should take into consideration such misuses and bank practices that bend the Basel II framework in order to prevent retail banks from becoming real estate companies.

Originality/value – The contribution of the paper is embedded in the unveiling of the ambiguous role of LGD in credit risk mitigation and the propositions made to the Basel Committee on Banking Supervision in order to enhance the Basel II framework.

Keywords Credit risk mitigation, LGD, Basel II, A-IRB credit scoring

Paper type Case study

INTRODUCTION

It is almost two years since the current economic crisis has broken out and the modern world is still experiencing its consequences in multiple levels. According to many analysts, professionals and politicians, the western economies are still in the eye of the economic cyclone and they express their concerns that we have only seen the peak of the iceberg. Moreover, a debate is in progress about the origin of the crisis, the rampant spread of uncertainty in financial markets and the responsibilities of each stakeholder. Unfortunately, the information asymmetry that prevails in credit markets enforced uncertainty while the gap between *ex ante* and *ex post* expected loss of financial institutions prolongs that uncertainty. In an effort to mitigate the effects of the current crisis and prevent the repetition of similar phenomena in the future, the Basel Committee on Banking Supervision published a consultative document with its proposed enhancements to the Basel II framework (BCBS, 2009). However, it is extremely difficult to assess the adequacy and efficiency of the preceding proposals due to the complexity of the contemporary financial markets and products.

Our main concern and objective of this paper is to contribute to the current debate about the economic crisis and highlight the ambiguous role of Loss Given Default (LGD) in credit risk mitigation. Our motivation is to stress that both lenders and borrowers are partners in the alleged U.S. sub prime mortgage

market crime with the misuse of the LGD mechanism as a Trojan Horse. Although securitisation is immensely important in the expansion of the crisis, the birth cause of the crisis is associated with the information asymmetry that characterises credit markets. The role of LGD is crucial in credit risk mitigation since LGD is one of the three variables that influence the Expected Loss (EL) of financial institutions which choose an Advanced Internal Ratings Based (A-IRB) approach for the determination of their capital requirements against credit risk. Nevertheless, it seems that the current debate is focused only on the expansion of risk and uncertainty while the role of LGD is obviously neglected. In addition, some aspects of the crisis concerning the recovery rate of loans can be viewed within an agency theory framework. Thirty years ago Jensen and Meckling (1976) mentioned the difficulties in maintaining the goal congruence of shareholders with agents and creditors and still their arguments seem to be even more contemporary.

The remainder of this paper is organised as follows: In the second part, we present a review of related literature concerning the role of LGD in credit risk mitigation. In the third part, we construct an A-IRB retail credit scoring system in accordance with the Basel II framework and the current literature. Our argument that an agency problem may arise out of the appraisal process of the collateral and how such a problem can be used in the manipulation of credit scoring systems is documented in the fourth part of this paper. The fifth part summarises the practical implications of our study. Our concluding remarks are reported in the last part of this paper.

LITERATURE REVIEW

Although there are numerous studies concerning the financial distress signalling and the prediction of corporate failure, there are less studies concerning the prediction of the probability to default for retail borrowers and virtually only few numbered papers investigate the role of LGD and the recovery rates of bank loans especially in the retail – mortgage market. The effort to discriminate the financially distressed from the financially viable corporations was enhanced by the use of financial ratios. Initially, academics were consumed in the prediction of corporate failure by using discriminant and logistic analysis and by finding the appropriate financial ratios that maximised the predictive power of their models (Altman, 1968; Altman et al., 1977; Altman, 1984; Johnsen and Melicher, 1994). Later, artificial neural network approaches were employed and their results were intensively compared with those of the discriminant and logit models (Altman et al., 1994; Lin and McClean, 2001; Alfaro et al., 2008; Yim and Mitchell, 2007; Etemadi et al., 2008). In any case, this comparison unveiled not only the superiority of artificial neural network approaches over the discriminant and logit models but also the instability of financial patterns of distressed corporations (Martikainen and Ankelo, 1991).

Simultaneously, similar methodologies were used to identify the factors that influence retail loan delinquency. Gabriel and Rosenthal (1991) found that wealth, employment, house location, house price appreciation and race are significant factors for the default of a mortgage and the eligibility of a mortgage customer. They concluded that minority households are less likely to obtain conventional financing than are white households, even after controlling for various proxies of the probability and the cost of default which indicates racial discrimination in mortgage markets as well. The research about the relevance of the initial loan-to-value (LTV) ratio on the probability of mortgage default had conflicting results. Although Deng et al. (1996) found association among default sensitivity and LTV ratio, unemployment and divorce, Lambrecht et al. (1997) supported that cash flow variables, such as salary and interest rate paid are significant parameters while LTV ratios are insignificant in the U.K. mortgage market. On the other hand, Liu and Lee (1997) argued that besides LTV ratio, borrower's family status and education level are significantly correlated with the risk of default. In his eight EU countries' survey, Diaz-Serrano (2005) supported that income volatility and savings showed a statistically significant effect on the probability of mortgage default; positive for income volatility and negative for savings.

In this context, the Basel Committee on Banking Supervision introduced in 1988 a capital measurement system referred to as Basel Capital Accord in order to provide a global framework for credit risk measurement with a minimum capital requirement of 8%. Later in 2004, the framework was revised, improved and became a guide for international banking legislation, known as Basel II. According to the

revised framework of Basel II financial institutions are allowed to choose between the Standardised Approach (SA) and the IRB Approach for the assessment of their credit risk and the calculation of their regulatory capital charges (BCBS, 2004). The SA allows small and less sophisticated financial institutions to classify their customers by using external credit ratings while big and more sophisticated financial institutions can determine their credit risk based on internal default experience. The main advantage of the IRB approach is that it offers greater credit risk sensitivity and consequently, big financial institutions have an incentive to adopt the IRB Approach for their credit risk measurement leaving the small banks to benefit from the adoption of the SA. Ruthenberg and Landskroner (2008) found evidence that bank customers with lower probability of default enjoy lower loan interest rates in big financial institutions while bank customers with higher probability of default enjoy relatively lower loan interest rates in small banks. This is consistent with the prior study of Altman et al. (2002) who investigated the relative accuracy of the Standardised model's risk weights under Basel II framework. They found that the risk of the three highest rating classes (AAA to AA-, A+ to A- and BBB+ to BB-) of the Standardised model is "over-priced" under Basel II while the pricing of the below BB- category is justified. They computed a capital requirement for the preceding rating classes of 0%, 1% and 2.5% in contrast to the respective Basel II 1.6%, 4% and 8%.

According to Basel II framework we define the Expected Loss (EL) as a percentage figure of the Exposure At Default (EAD) as

$$EL = PD \times LGD \quad \text{where}$$

PD is the Probability of Default of the counterparty and

LGD is the Loss Given Default or,

$$\text{as an amount} \quad EL = PD \times EAD \times LGD \quad (\text{BCBS, 2005}).$$

Furthermore, PD estimation can be based on internal default experience or/and mapping to external data or/and statistical default models (BCBS, 2004, par.461) while LGD estimation should not be based only on collateral's market value but on historical recovery rates as well (BCBS, 2004, par.470). Finally, EAD estimation for on-balance sheet items, such as loans, can be no less than the current drawn amount (BCBS, 2004, par.473). Unfortunately, the preceding formula used for the computation of EL implies that PD and LGD are independent and thus uncorrelated variables while there is evidence that this is not the case. In fact, there is an inverse relation between PD and LGD (De Laurentis and Mattei, 2009). Apparently, as borrower risk increases collateralisation increases as well in order to improve the recovery rate. There is a strong indication that financial institutions have an incentive to mitigate their credit risk exposure by using collaterals to balance the poor quality of their customers since the weighted average of LGD as a percentage of EAD can be computed as follows:

$$LGD \% = 1 - (\text{Recovery value}/EAD)$$

The preceding argument is consistent with the Basel II framework that requires banks to deduct from their Tier 1 & 2 capital any EL amount in case EL exceeds provisions made.

Subsequently, prospective retail bank customers can become eligible for loan granting and enjoy lower interest rates by decreasing their EL, achieving that by decreasing their LGD. This is feasible with the following two ways: a) if the prospective customer provides more collateral to the bank and b) if the appraiser manipulates (overstates) the market value of the existing collateral. Undoubtedly, bank management has an incentive to manipulate the market value of the collateral and hence, LGD in order to minimise capital charges, increase reported profits and thus enhance their remuneration. There is evidence to support the notion that property appraisers are not independent of their clients (banks), indicating that a

moral hazard problem can arise if bank management rewards the property appraiser with future business for “successful” appraisals. Gwin and Maxam (2002) showed that an appraiser may have the incentive to overstate the value of the property if the lender wants him to do so. Having in mind that credit markets are characterised with information asymmetry and in the case of Enron, information asymmetry and opportunistic behaviour of executives, auditors and legal firms made the collapse even more catastrophic (Arnold and de Lange, 2004), it is self-evident that the agency relationship exists in business corporations as well as banks and since agents (bank managers) do not always act in the best interest of their employers (shareholders) (Jensen and Meckling, 1976), they have an incentive to manipulate their reported profits, through LGD in order to enhance their remuneration. The manipulation of EL is feasible not only in retail customers but also in corporate customers. Kosmidis and Terzidis (2010) showed that the EL of corporate customers can be manipulated in many ways as well due to creative accounting practices that allow the manipulation not only of the LGD but also of the PD. The issue of appraisers’ conflicts of interest becomes more distinctive than ever before.

CONSTRUCTING AN A-IRB RETAIL CREDIT SCORING SYSTEM

One of the main objectives of this paper is to support that there is a goal congruence of bank management and property appraisers as long as their remuneration schemes are based on short-term criteria (e.g. accounting profits). Unfortunately, there is always space for manipulation when personal greed guides managerial action. In fact, when there is a synergy among bank management, retail customers and property appraisers the results are even more disastrous. In this section, we will try to construct an A-IRB retail credit scoring system in accordance with the Basel II framework and the current literature. The choice of variables is based on the results of Finlay’s (2009) and Liu and Lee’s (1997) studies. We will then attempt to show how the property appraisal can be used in the manipulation of that system.

<i>Criteria</i>			<i>Notes</i>
1	MS	MARITAL STATUS	<i>married with x children, single, widow(er), divorced</i>
2	OC	OCCUPATION	<i>civil servises, full and part-time employee, employer, unemployed</i>
3	TCA	TIME IN CURRENT OCCUPATION	<i>unemployed, retired, x years</i>
4	AG	AGE	<i>x years old</i>
5	AS	ACCOMODATION STATUS	<i>tenant, guest, owner of x flats, x houses</i>
6	EL	EDUCATION LEVEL	<i>elementary, junior-high, senior-high, university, post-graduate</i>
7	PP	PURCHASE PURPOSE	<i>private use, investment</i>
8	IPCR	INTEREST & PRINCIPAL COVERAGE RATIO	<i>ratio of annual payment of interest and principal to annual gross income</i>
9	SR	SOLVENCY RATIO	<i>ratio of total debts to total assets</i>
10	LVR	LOAN TO VALUE RATIO	<i>ratio of the loan amount to the appraised value of the property</i>
11	DB	DEBT BALANCE	<i>ratio of other annual debt payments to annual gross income</i>
12	PC	PREVIOUS TRANSACTIONS	<i>(loans well paid, delayed months, default, no transactions)</i>

Table 1 Criteria

In this context, we set four quantitative criteria (income related and LTV ratios, No8-11) and eight qualitative criteria (No1-7 and No12, see Table 1) and rank the score into six scoring classes or buckets from A to F. All borrowers who fall in the same bucket are assigned with the same PD that can be considered as the mean of individual PDs (Krink et al., 2008). As we can see in Table 2, there are twelve criteria in total, six PD buckets and the weights for each criterion and bucket. It is easy to understand that the more scoring classes an A-IRB system has, the more risk sensitive is. The most important criteria are No 8 the interest and principal coverage ratio and No 12 previous transactions (weight 10 credits or 13.33%) while the least important criterion is the purchase purpose of the property (weight 3 credits or 4%). The buckets from A to F multiply their credits for each criterion by a number that varies from 4 to -1 respectively. The lowest

possible scoring a retail customer can achieve is -54 credits and the highest possible scoring is 300 credits. According to Ruthenberg and Landskroner (2008), the turning point for retail customers is PD=13.4% meaning that retail borrowers with PD>13.4% can be considered as high-risk customers while retail borrowers with PD<13.4% can be considered as low-risk customers. In our model, low-risk retail customers can be considered those who achieve scorings from C and upwards (A-C) while scorings from D and downwards (D-F) characterise high-risk retail customers.

Table 2 PD Scoring

The retail borrower's performance in each criterion and the assignment to a PD bucket can be viewed in Table 3. For instance, a thirty six years old, civil servant retail customer who is married and has two children, with IPC ratio=0.12, LTV ratio=0.18, solvency ratio=0.05, debt balance=0.04 and a history of three well paid loans etc. is assigned to A PD bucket and considered to be a retail borrower with the lowest possible risk. However, in most cases the performance of a retail customer varies in each criterion. Hence, it is possible for a retail customer to have IPC ratio=0.10 and LTV ratio=0.70. That corresponds to A bucket for the former ratio (the weight of the ratio 10 credits is multiplied by 4) and to D bucket for the latter (the weight of the ratio 7 credits is multiplied by 1). The overall performance of a retail customer and its assignment to a PD bucket depends solely on the total number of credits accumulated.

Table 3 Criteria Scoring

As far as the LGD estimation is concerned, it is based on the market value of the collateral and historic recovery rates as presented in Table 4. From the exhibited types of collateral, bank deposits in domestic currency and government bonds are considered to be of the lowest risk, LGD=0% indicating 100% recovery rate and machinery, equipment and commodities (e.g. cars) are considered to be of the highest risk, LGD=60% indicating only 40% recovery rate. Nevertheless, it is not unusual for a retail customer to provide more than one assets as collateral for his/her bank borrowings.

Table 4 Historic Rates of Collateral LGD

PROPERTY APPRAISAL AND MANIPULATION OF AN A-IRB CREDIT SCORING SYSTEM

In our case analysis, let us consider Mr. John Smith, a thirty six years old man, full-time employed for the last three years who is married and has one child. He is a university graduate, rents a flat and wishes to buy a new flat to live in for 160,000€. His annual family gross income is 27,000€ and he bought a new car for 20,000€ last year which it was 100% financed by a five year loan with 8% interest rate from C Bank (5 annual instalments). He is willing to offer 10,000€ downpayment and applies to C Bank for a residential mortgage of 150,000€ in order to cover the full price of the flat. The mortgage will be paid back with 6% fixed interest rate in twenty annual instalments. Unfortunately, the first instalment of the 20,000€ loan is overdue three months. As we can see in Appendix A and B, the annual instalment for the 20,000€ loan is 5,009€ and for the applied 150,000€ mortgage is 13,078€.

In Table 3, we can see the scoring of Mr. John Smith (grey boxes) to the above twelve criteria and in Table 5 his performance, his total credits and the PD bucket that is assigned to. The computation of the ratios is based on the notes of Table 1. Obviously, Mr. John Smith accumulates 113 out of 300 credits which is the maximum score and that corresponds to D scoring class with 20% probability of default. According to the preceding analysis, PD 20% is much higher than the threshold of 13.4% making Mr. John Smith a high-risk retail borrower.

Table 5 PD Scoring of Mr. John Smith

As far as LGD estimation is concerned, Mr. John Smith offers his car and the flat he is willing to buy as collateral for the applied mortgage of 150,000€. The weighted average of LGD as a percentage of EAD is 24.71% (see computations in Table 6). Further, the EL's absolute value is 8,400€, 4.94% of the EAD, which is forbiddingly high and should lead C Bank to the rejection of the application. Although the collateral decreased the EL from 20% to 4.94%, it is still extremely risky for C Bank to grant that mortgage. In that case, Mr. John Smith would not be able to buy the flat he wishes and C Bank could not increase its reported profits because of lower interests earned. Since bank managers' remuneration is based on reported profits, it would probably be decreased although they acted in the best long-term interest of their employers (bank shareholders).

<i>COLLATERAL</i>	<i>MARKET VALUE</i>	<i>LGD%</i>	<i>RECOVERY VALUE</i>
<i>URBAN RESIDENCES AND OFFICES</i>	<i>160,000</i>	<i>25.00%</i>	<i>120,000</i>
<i>COMMODITIES (CARS)</i>	<i>20,000</i>	<i>60.00%</i>	<i>8,000</i>
<i>TOTAL</i>	<i>180,000</i>		<i>128,000</i>
<i>EAD / WA LGD</i>	<i>170,000</i>	<i>24.71%</i>	

<i>EXPECTED LOSS in EUR</i>	<i>8,400</i>
<i>EXPECTED LOSS %</i>	<i>4.94%</i>

Table 6 Expected Loss of Mr. John Smith

Let us assume that Mr. John Smith is desperate to buy that flat in any circumstances, the bank manager of C Bank is determined to get that Christmas bonus and the property appraiser is not a virtuous person. In such case, every stakeholder has an obvious incentive for C Bank to grant that mortgage except for bank shareholders. Mr. John Smith will acquire a new flat, the bank manager will probably get his/her bonus and the property appraiser will be rewarded at least with future business. In the preceding process the main stakeholder (bank shareholder) is excluded. The only barrier that prevents the bank manager from granting that mortgage is the EL of 4.94%. In order to overcome that obstacle, the property appraiser is convinced by the joint efforts of Mr. John Smith and the bank manager to overstate the market value of the flat at 240,000€ (+80,000€).

The overstated appraisal modifies the solvency ratio and the loan to value ratio. The former ratio decreases from 0.94 to 0.65 while the latter ratio decreases from 0.94 to 0.63. In Table 3, we can see the deviation from the initial scoring of Mr. John Smith (red boxes) to the above twelve criteria and in Table 7, we can see his performance, his total credits and the PD bucket that is assigned to. Again, the computation of the ratios is based on the notes of Table 1. Mr. John Smith achieves 137 out of 300 credits that correspond to C scoring class with 8% probability of default. According to the preceding analysis, Mr. John Smith is a retail customer with acceptable risk level since his PD is much lower than 13.4%. Furthermore, the recovery value as a percentage of EAD is 100% and the weighted average of LGD as a percentage of EAD is 0% due to the overstatement of the flat's market value. The EL as an amount is 0€ and as a percentage figure of the EAD is 0% as well (see Table 8). Since the recovery value of collateral is bigger than the EAD, LGD as a percentage of EAD and EL% are always 0%. In this case, C Bank will probably satisfy Mr. John Smith's application and grant a mortgage of 150,000€, considering him as a counterparty of relatively low risk (highly attractive retail customer).

IMPLICATIONS

One of the main objectives of this paper is to investigate the role of LGD in credit risk mitigation especially in the retail – mortgage market which was, surprisingly overlooked by the Basel Committee on Banking Supervision in its proposed enhancements to the Basel II framework (BCBS, 2009). Under Basel II framework, financial institutions were forced to adopt empirically-based methodologies for the assessment of their credit risk exposure although they do not ignore the subjective judgement of their experts. There is evidence that borrowers with an intense client relationship with the bank exhibit higher recovery rate (Grunert and Weber, 2009). Moreover, Qi and Yang (2009) studied LGD of high LTV residential mortgages and found LTV is statistically and economically related to LGD and higher LTV is associated with higher LGD. In fact, they observed current LTV (CLTV) has a much higher correlation with LGD than LTV and not surprisingly, regression with CLTV has much better explanatory power than that without CLTV. The actual average LTV at origination is around 90% whereas at time of default the average CLTV increases to 104%. This is also consistent with our analysis and an indication that the market value of property is more likely to be overstated at origination when bank managers face the remuneration enhancement dilemma than at the time of default. Since the expected life of a residence is much longer than the period of the respective mortgage and in times of low interest rates, the annual decrease of the principal is probably bigger than the

decrease of the collateral's market value as long as it is fairly appraised. This is a reason that justifies the periodical appraisal of the collateral's market value.

Although resecuritisation is mainly responsible for the expansion of risk and uncertainty, it is vital to understand that the so-called "domino-effect" would not have started in the U.S. sub-prime mortgage market if the original borrowers a) had the ability to pay back their debts or b) did not consider to default as an optimal decision of rational consumers according to the options-based mortgage default theory. In the case of Qi and Yang (2009) study, the latter choice was the 51.7% of their sample. In addition, the 24.71% LGD computed in Table 6 indicates a recovery rate of 75.29% that is close to the 74.03% recovery rate of Grunert and Weber, (2009) and the 71% of Dermine and Neto de Carvalho (2006). If we consider the recovery rate of Table 6 (75.29%) as fair and hence ex post and the manipulated recovery rate of Table 8 as optimistic and hence ex ante, we can define the gap in their respective EL as agency costs. In our case, this costs are 8,400€ or 4.94% which are probably much bigger than the remuneration of the bank manager. In that sense, it would be wise for the shareholders to motivate the bank manager with a bonus scheme that is not based on short term criteria (e.g. reported profits) but on medium and long term criteria (e.g. delinquency rates of mortgages granted for the last x years).

From the preceding analysis, there is an indication that the "triangle of opportunism" exists not only in corporate markets (Kosmidis and Terzidis, 2010) but also in retail and mortgage markets. The main difference here is that the incentive for synergy exists among bank management, property appraisers and mortgage customers. Consequently, the manipulation (overstatement) of the market value of the collateral can lead to zero LGD and respectively to zero EL since $EL \% = PD \times LGD$. In this way a bank, which grants extremely high-risk mortgages, can be presented at least for a short period of time, as a low-risk bank through the manipulation of the market value of its collaterals, the reduction of its expected losses and the appropriate provisions and the increase of its earnings, reserves and capital ratio. In order to moderate the impact of LGD on the EL and prevent retail banks from becoming real estate companies, a lower limit of EL as a percentage of PD could be imposed. Thus, $EL \% \geq Y \times PD$ where $0 < Y < 1$. Furthermore, the greater the Y the greater the impact of PD on the EL while the less the Y the greater the impact of LGD on the EL.

CONCLUSIONS

The motivation of this paper is the consultative document with the proposed enhancements to the Basel II framework that was released on January 2009 by the Basel Committee on Banking Supervision. We constructed an A-IRB retail credit scoring system in accordance with the Basel II framework. We supported our argument that there is an incentive for synergy among bank management, property appraisers and mortgage customers while the LGD mechanism can be used as a Trojan Horse in the manipulation of such systems. A practical illustration of the above manipulation was provided in a case study analysis. The Basel II framework about the formula of EL implies that PD and LGD are independent and thus uncorrelated variables while there is evidence that this is not the case. The prior work of De Laurentis and Mattei, (2009) about the inverse relation between PD and LGD is consistent with our analysis which indicates that financial institutions have an incentive to mitigate their credit risk exposure by using collaterals to balance the poor quality of their customers. Although, Mr. John Smith was a fictitious person with fictitious credit scorings, the practical implications of our case study and the current credit crisis are very real.

The contribution of the paper is the propositions made to the following stakeholders: a) the Basel Committee on Banking Supervision in order to impose the periodical appraisal of the collateral's market value, b) the Basel Committee on Banking Supervision in order to mitigate the impact of LGD on the EL and c) the bank shareholders in order to motivate their managers with remuneration schemes that are based on long term criteria. Thus, the weight of PD will be enforced and the financial institutions will be motivated to attract lower-risk customers than high-risk customers with overstated property. Further research is necessary for the validation of the proposed formula of the EL.

SIX SIGMA APPLICABILITY IN SMES: IN SMALL ECONOMIES

Krambia-Kapardis, M.¹; Ioannou, A.²; Chakka, E.³

¹Associate Professor of Accounting, Cyprus University of Technology.

²PricewaterhouseCoopers, Nicosia, Cyprus.

³Cyprus University of Technology.

Purpose: Nowadays companies irrespective of industry and legal status are facing serious business pressures, not just to continuously streamline their operations and cut costs, but also to grow, nurture innovation, gain a competitive edge, as well as, survive. Quality can no longer be just about processes, products, services or people. Whilst there are a number of qualified methodologies, the researchers have opted to utilise the tools available through Six Sigma. The principal purpose of this paper is to identify if this methodology can be applied in small economies and more specifically to SMEs.

Design/methodology/approach: Five service industries were selected, namely Hospitality and Tourism, Banking and Finance, Construction and Real Estate, Automotive and Transport, and Healthcare. These industry sectors were identified as the ones to be surveyed using quantitative and qualitative methods.

Research limitations/implications: Since this is a relative new methodology to the Cypriot entrepreneur and regrettably at the time of carrying out the study an international financial crisis caused a lot of financial problems to many respondents and as such could not see the immediate effects or benefits of Six Sigma and were reluctant to co-operate or participate. However, once they were convinced to join the focus group meetings and realized what Six Sigma is all about they became enthusiastic in being involved and some organizations came forward immediately requesting to be considered for the pilot programs.

Practical implications. The Six Sigma methodology can be customized to industrial sectors and a tailored version of the methodology can be developed for a particular process or problem. The paper illustrates the problem areas identified from both the qualitative and quantitative research per industry.

Originality/value. This is the first study carried out on Six Sigma in a small economy like Cyprus and tested on five industry sectors using both qualitative and quantitative methods.

Keywords: Six Sigma, Sigma, Lean, EFQM, TQM, SME, Industry Sectors, Cyprus.

Classification: Research Paper.

An earlier version of the paper was presented at the 2nd Annual EuroMed Conference held in Salerno, Italy 26-28 October 2009 for track 56 on Quality Control for the Service Industry.

INTRODUCTION:

The global financial crisis started to show its effects in the middle of 2007 and into 2008. The world stock markets have fallen, large financial institutions have collapsed or have been bought out, and governments in even the wealthiest nations have had to come up with rescue packages to bail out their financial systems. Six Sigma is a methodology for minimising mistakes and maximising operational significance. Ultimately mistakes have a cost, a lost customer, the need to repeat in undertaking an activity, a part that has to be replaced, time or material wasted, efficiency lost, or productivity squandered. In fact, waste and mistakes cost many organisations as much as 20 to 30 percent of their revenue. In other words it has been defined as a measure of the quality of products and services, a philosophy and a process. Higher product quality is measured by higher “ σ ” ratings and Six Sigma uses a range of tools to achieve quality. It is disciplined, data-driven approach and methodology for eliminating defects in any process. Defects and lost customers have serious repercussions for a company particularly during economic crisis. The question however is how acceptable would such a methodology be in a small economy by SMEs?

LITERATURE REVIEW

During the 1990s Total Quality Management (TQM) was the dominant theoretical and empirical paradigm for quality management and included many elements advocated by leading quality thinkers such as Deming (1986, 1994), Juran (1989) and Crosby (1979). Some argued that Six Sigma is the latest banner of

TQM (McManus, 1999), others disagree claiming it is something new (Pande et al. 2000). Schroeder et al. 2007 has carried out an extensive comparison of Six Sigma and TQM. They conclude their comparison by saying that “ what is being done in Six Sigma is not entirely new with respect to prior quality tools or principles, but the deployment approach and emergent structure of Six Sigma are new” (p.548) . “The management practices and principle” offer a new structure for improvement. “The structural differences simultaneously promote both more control and exploration in improvement efforts” (p.549). Anbari (2002) went a step further and stated:

“Six Sigma = TQM + Stronger Customer Focus + Additional Data Analysis Tools + Financial Results + Project Management.”

WHAT IS SIGMA?

Sigma is the Greek letter that is a statistical unit of measurement used to define the standard deviation of a population. It measures the variability or spread of the data.

In the world of Six Sigma companies (Ioannou, 2007), the term Sigma has to come to signify how well a business process, product, or service is meeting the requirements of the marketplace. Six Sigma has come to mean failing to meet customer requirement only 3.4 times out of a million opportunities.

WHAT IS SIX SIGMA?

Six Sigma is a data-driven method focusing on the customer and the quality of the product or services provided (Islam, 2004). It is a “very basic and systematic approach based on statistical data, which provides companies with a way to reduce these uncertainties” (Lee and Choi, 2006:893). It is a business strategy that focuses on “improving customer requirements understanding, business systems, productivity and financial performance” (Kwak and Anbari, 2006:708). It is a “systematic, data-driven approach using the Define, Measure, Analysis, Improve, and Control (DMAIC) process” (Kwak and Anbari, 2006:709).

The definitions of Six Sigma vary from “it is a business strategy used to improve business profitability, to improve the effectiveness and efficiency of all operations to meet or exceed customer needs and expectations” (Kwak and Anbari, 2006, p. 709) to being a disciplined method of rigorous data gathering and robust statistical analysis to identify sources of error and ways of eliminating them (Harry and Schroeder, 1999).

Benefits derived from the use of Six Sigma have ranged from : (a) Financial outcomes resulted from cost reduction (Lee and Choi, 2006), (b) customer and employee satisfaction (Elliott, 2003), (c) business operations being more successful, with strategies being set faster and more effectively than competitors (Lee and Choi, 2006),(d) giving priority to preventive measures that remove the root cause of the defects rather than searching for defects after they occur (Rowlands, 2003), (e) standardization measurement process common (Xagoraris, 2003), (f) driving out waste and raising levels of quality (Cua, 2001), (g) no Six Sigma project will be approved unless the team determines the savings generated from it (Antony et al. 2005), (h) Six Sigma integrates human aspects and process (Antony et al. 2005), (i) Six Sigma methodology links the tools and techniques in a sequential manner (Antony et al. 2005) and (J) Six Sigma creates a powerful infrastructure for training of champions, master black belts, black, green and yellow belts (Adams et al., 2003).

Motorola developed Six Sigma in 1987 in an effort to reduce defects (Barney, 2002). Companies which have used the Six Sigma methodology ranged from Ford, Honeywell, American Express, (Hahn et al. 2000). Companies have estimated the financial benefit of implementing Six Sigma. An example of this is General Electric which estimated in 1999 that the impact on net income derived from the implementation of Six Sigma after allowing for the cost of implementation exceeded \$2 billion (General Electric Company, 1999). Kwak and Anbari 2006:711 provide a list of the benefits/savings derived from the implementation of Six Sigma on 15 companies.

<i>Company</i>	<i>Project Metric</i>	<i>Measures Benefit /savings</i>
Motorola (1992)	In-process defect levels	150 times reduction
Raytheon/aircraft integration systems	Depot maintenance inspection time	Reduced 88% as measured in days
GE/Railcar leasing business	Turnaround time at repair shops	62% reduction
Allied signal (Honeywell)/laminates plant in South Carolina	Capacity Cycle time Inventory On-time delivery	Up 50% Down 50% Down 50% Increased to near 100%
Allied signal (Honeywell)/bendix IQ brake pads	Concept-to-shipment cycle time	Reduced from 18 months to 8 months
Hughes aircraft's missiles systems group/wave soldering operations	Quality/productivity	Improved 1,000%/improved 500%
General electric	Financial	\$2 billion in 1999
Motorola (1999)	Financial	\$15 billion over 11 years
Dow chemical/rail delivery project	Financial	Savings of \$2.45 million in capital expenditures
DuPont/Yerkes plant in New York (2000)	Financial	Savings of more than \$25 million
Telefonica de espana (2001)	Financial	Savings and increases in revenue 30 million euro in the first 10 months
Texas instruments	Financial	\$ 600 million
Johnson and Johnson	Financial	\$ 500 million
Honeywell	Financial	\$1.2 billion
Bank of America (BOA)		10.4% increase in customer satisfaction and 24% decrease in customer problems
American Express		Improve external vendor processes, and eliminate non-received renewal credit cards
The radiology film library at the University of Texas MD Anderson Cancer Center		improved service activities greatly
University of Texas MD Anderson Cancer Center outpatient CT exam lab		Patient preparation times were reduced from 45 min to less than 5 min in many cases and there was a 45% increase in examinations with no additional machines or shifts

Table 1 – Reported Benefits and Savings from the Implementation of Six Sigma (source: Kwak, Y.H. and Anbari, F.T. (2006))

Lean Six Sigma and Six Sigma are classified as process improvement programmes, which include “process re-engineering, theory constraints and total productive maintenance” (Shah, et al. 2008:6680). This concept dates back to the beginning of the 20th century (Taylor, 1911) and the decisive work of Ohno (1978), Shingo (1981), Deming (1986) and Shah (2006). Thus it can be used in all the industries

Lean Six Sigma and Six Sigma have been tested in manufacturing (Shah et al. 2008; Schroeder et al. 2007; Kumar et al. 2006; Kwak and Anbari 2006; Lee and Choi 2006; Mahesh et al. 2006; Antony et al. 2005; Linderman et al. 2005); Construction (Heon et al. 2008; Kwak and Anbari 2006; Pheng et al. 2004); Service industry (Chakrabarty and Tan 2007; Oke 2007; Schroeder et al. 2007; Antony et al. 2006); Automotive (Antony et al. 2005); Healthcare (Kwak and Anbari 2006); Public Sector (Furterer and Elshennawy 2005)

Whilst Six Sigma has been implemented in large and multinational organizations SMEs have experienced some resistance to implement it perhaps due to the costs involved. It appears however, and as stated by Antony et al. (2005) large organizations have left no choice on the SMEs to consider the introduction of Six Sigma strategy in order to provide high quality products and highly capable businesses processes. Harry and Crawford (2004) demonstrated the benefits of implementing white belts on SMES and creating value for customers with a savings of about \$300,000 per year. Wilson (2004) identified the following advantages for small-businesses embarking on Six Sigma initiative: (a) stronger, more intimate relationships with customers, (b) fewer number of sites; (c) fewer layers in the management hierarchy; (d) faster and effective internal communication; and (e) strong owner influence.

Lean production, evolved from the Toyota Production System (TPS) and its purpose was to improve firm performance through elimination of waste. Lean production can be defined as a “philosophy, as a set of principles and as bundles of practices” (Shan et al. 2008:6681). Womack et al. (1996) defined lean production in terms of production philosophy that eliminates waste from a product’s value-stream and shortens the time between order placement and product delivery.

Six Sigma range from “a business philosophy for improvement to a collection of statistical tools and metrics” (Shan et al. 2008:6681). Schroeder et al. 2007 identified six concepts which relate to Six Sigma: (a) top management leadership, (b) customer requirements, (c) focus on financial and non-financial results, (d) structured method of process improvement, (e) strategic process selection and (f) full-time specialist. Six Sigma concentrates on performance target of operating within 3.4 defects per million opportunities.

THE DIFFERENCE BETWEEN LEAN AND SIX SIGMA

“Lean practices and techniques focus on streamlining processes, whereas Six Sigma practices and techniques help identify and eliminate root causes of problems” (Evans and Lindsay, 2005:498). Thus lean places emphasis on process flow while Six Sigma concentrates on process defects (George, 2003:6). Lean is a bottom up approach whereas Six Sigma plays a “more active role by selecting improvement projects based on financial and strategic goals” (Shan, et al. 2008:6683).

Obstacles and challenges of the Six Sigma methodology have varied from simply repackaging traditional principles and techniques (Catherwood, 2002), to not being the panacea to answer to all business issues (Kwak and Anbari, 2006). Of course the cost to implement such a process whilst they are less than the savings in harsh economic times it is difficult to convince that it is worth spending a few hundred thousand to save a million.

Whilst Six Sigma appears to be winning ground in developed economies and academic literature is steadily increasing on the topic non existent research appears on its use in small economies. The researchers decided to select and test the use of Six Sigma in Cyprus for the following reasons.

Firstly, Cyprus based on the World Bank Report (2007) is one of 45 small economies. Secondly it has a large percentage of SMEs (99.9% of its businesses are SMEs) [www.mof.gov.cy/mof/cystat/statistics.nsf]. Cypriot Micro enterprises within SMEs (those employing less than 10 persons) are 94.1%, whilst Medium size enterprises (those employing between 10-49 people) account for 5% and only .8% are Large SMEs (those employing 50-249) [source: www.mof.gov.cy]. Thirdly according to the Minister of Finance on the 9th of July 2009 Cyprus is one of two countries in the EU 27 with a positive economic growth in the first half of 2009 (Minister of Finance on 9 July 2009)

Having therefore identified the country the research was to be carried out, the authors decided to concentrate on SMEs and on the main industries the country’s economy relied upon which are: Hospitality and Tourism, Construction, Banking and Finance, Healthcare and Automotive and Transport.

METHODOLOGY

Given the size of the country and of the companies as well as the economic crisis being faced at the time of the research it was decided that the research questions are as follows:

1. In what process areas can Six Sigma be implemented in a small economy?

Is there a difference in the processes identified depending on the industry?

To enable the researchers to carry out the present study, an academic and a Six Sigma Black Belt were involved throughout the research, funding was provided by the Research Promotion Foundation of Cyprus. Having conducted an extensive literature review a generic questionnaire was developed. The researchers decided to use the Common Assessment Framework (CAF) (2006) as a basis to identify the problematic process areas. The reason CAF and not another model was used was because this particular framework is widely used by many quality officers in Cyprus. Having therefore adapted the CAF model on the needs and characteristics of a small economy the questionnaire was pilot tested on five quality managers within each of the industries. Once the questionnaire was approved by the team, it was mailed to 1000 Cypriot companies selected from the Cyprus Chamber of Commerce database. The questionnaires were mailed to the quality officer within each organisation. As the database included all the members of the Cyprus Chamber of Commerce, there was no way of knowing which one of them were SMEs or not. Therefore, respondents were asked to state the number of employees and turnover or to only reply if they fulfilled the SME criteria. Over one hundred respondents replied that due to the economic crisis and that there were concerns of survivorship or staff redundancies, they were not interested in participating in this research. Additionally, many questionnaires were returned back to us because the companies had closed down.

The useful responses (ignoring incomplete questionnaires, as well as, respondents that did not qualify under the European Commission's SME definition) were 50. Following the low response rate, it was decided to have a follow up action to the quantitative study and carry out a qualitative study as well. In the qualitative study we invited CEOs/MDs and Quality Managers of leading organizations and Government Regulators who have an influence on the market of SMEs from the five industry sectors running five different focus group meetings. This gave us an opportunity, to obtain tangible information from these individuals by operating outside the box.

Table 2 – Demographics of Quantitative Research

B1 Leadership	1 %	2 %	3 %
1. We provide direction for the organization in developing its mission, vision and value, by:			
a. Formulating and developing the mission (what our goals are) and the vision (where we want to go) of the organization by involving relevant stakeholders and employees.	75	15	10
b. Translating the mission and vision into strategic (long-and medium-term) and operational (real and short-term) objectives and actions.	78	10	12
c. Creating conditions for effective communication of its mission and vision by ensuring a wider communication of their values, strategic and operational objectives in the organization and to other stakeholders.	76	12	12
d. Periodically reviewing the mission, vision and values to reflect changes in the organization's external environment.	64	19	17
2. We develop and implement a system for the management of our organization's, performance and change, by:			
a. Developing processes and organizational structures in accordance with strategy, planning, needs and expectations of stakeholders, using available technologies.	75	10	15
b. Defining appropriate management forms (levels, functions, responsibilities and competencies) and ensuring a system exists for managing such processes.	76	7	17
c. Giving direction on output and outcome targets balancing the needs and expectations of different stakeholders.	49	29	22
d. Communicating initiatives and reasons for changes to employees and relevant stakeholders.	73	15	12
3. We motivate and support people in the organization and act as role model, by:			
a. Leading by example, thus acting in accordance with established objectives and values.	80	10	10
b. Demonstrating personal willingness of leaders/managers to accept change through constructive feedback.	83	10	7
c. Promoting a culture of innovation and improvement by encouraging and supporting employees to make suggestions and be proactive in their daily work.	81	7	12
d. Respecting and addressing employees' individual needs and personal circumstances.	93	2	5
4. We manage the relations with politicians and other stakeholders in order to ensure shared responsibility, by:			
a. Developing and maintaining partnerships and networks with important stakeholders (Non-Government Organizations (NGOs), interest groups, industry and other public authorities).	56	22	22
b. Seeking public awareness, reputation and recognition of the organization and its services.	73	17	10
c. Developing a concept of marketing (product and service targeted) and its communication in relation to stakeholders.	68	22	10
B2 Strategy and Planning	1 %	2 %	3 %
1. We gather information relating to the present and future needs of stakeholders, by:			
a. Identifying all relevant stakeholders.	71	17	12
b. Systematically gathering and analyzing information about stakeholders, their needs and expectations.	54	34	12
c. Systematically analyzing internal strengths and weaknesses (e.g. using methodologies such as, Total Quality Management (TQM), Common Assessment Framework (CAF), European Foundation of Quality Management (EFQM) and Strengths, Weaknesses, Opportunities and Threats (SWOT) analysis).	39	27	34
2. We develop review and update strategy and planning, taking into account the needs of stakeholders and available resources, by:			
a. Developing and applying methods to monitor, measure and/or evaluate the performance of the organization at all levels ensuring the monitoring of the strategy's implementation.	70	15	15
b. Systematically reviewing risks and opportunities (e.g. SWOT analysis) and identifying critical success factors by regularly assessing these factors in the organization's environment (including political changes).	58	17	25
c. Balancing tasks and resources, long and short term pressures and stakeholder requirements.	51	29	20
d. Assessing the need to reorganize and improve strategies and methods of planning.	61	22	17

3. We implement strategy and planning in the whole organization, by:			
a. Translating strategic and operational objectives of the organization into relevant plans and tasks for departmental units and individuals within the organization.	53	32	15
4. We plan, implement and review modernization and innovation, by:			
a. Integrating tools and measures (e.g. input → process → output measurement or the use of TQM principles).	48	22	30
b. Ensuring the availability of the necessary resources to implement the planned changes.	70	13	17
B3 People			
1. We plan, manage and improve human resources transparently with regard to strategy and planning, by:			
a. Regularly analyzing current and future human resource needs, taking into account the needs and expectations of stakeholders.	73	12	15
b. Ensuring HR capability (recruitment, allocation, and development) is available to achieve and balance tasks and responsibilities.	73	10	17
c. Ensuring good environmental working conditions throughout the organization including taking care of health and safety requirements.	98	0	2
d. Ensuring that conditions are conducive towards achieving a reasonable work-life balance for employees.	90	5	5
2. We identify, develop and use competencies of employees, aligning individual and organizational goals, by:			
a. Identifying current competencies at the individual and organizational level in terms of knowledge, skills and attitudes.	86	12	2
b. Developing and agreeing on personal training and development plans for all employees with a special emphasis on managerial, leadership, and abilities to deal with diverse customers and partners.	75	15	10
c. Planning of training activities and developing communication techniques in the areas of risk and conflict of interest management.	63	15	22
3. We involve employees in open dialogue and empowerment, by:			
a. Promoting a culture of open communication and dialogue and encouraging team work.	80	12	8
b. Involving employees and their representatives in the development of plans, strategies, goals the design of processes and in the identification and implementation of improvement activities.	61	22	17
c. Regularly conducting staff surveys including publishing results/summaries/interpretations.	35	27	38
B4 Partnerships and Resources			
1. We develop and implement key partnership relations, by:			
Identifying potential strategic partners (e.g. purchaser-provider, co-production) and establishing an appropriate partnership agreement taking into account the nature of the relationship.	69	22	9
2. We develop and implement partnerships with customers, by:			
a. Ensuring transparency of the organization as well as its decisions and development.	51	15	34
b. Being open to ideas, suggestions and complaints by customers, and developing as well as using appropriate mechanisms to collect them (e.g. by means of surveys, consultation groups, questionnaires, complaints boxes, opinion polls, etc.).	76	12	12
3. We manage finances, by:			
a. Ensuring the cost efficient management of financial resources.	90	5	5
b. Introducing innovative systems for budgetary and cost planning (e.g. multi-annual budgets, programme of project budgets).	63	15	22
c. Ensuring investment decisions and financial controls are based on cost/benefit-analysis.	78	15	7
4. We manage information and knowledge, by:			
a. Developing systems for managing, storing and assessing information and knowledge within the organization in accordance with strategic and operational objectives.	83	12	5
b. Developing internal channels to cascade such information throughout the organization to ensure that all employees have access to the information and knowledge relevant to their tasks and objectives.	63	27	10
5. We manage technology, by:			
Implementing an integrated policy of technology management in accordance with the strategic and operational objectives of the organization	76	12	12
6. We manage amenities, by:			
a. Ensuring a safe, cost efficient and ergonomically suitable use of office facilities based on strategic and operational objectives; accessibility by public transport; needs of the employees; local culture and	81	7	12

physical constraints (e.g. open plan offices vs. individual offices, mobile offices) and technical equipment (e.g. number of computers, photocopiers and internet access by service type).			
b. Ensuring an efficient, cost effective and sustainable use of transport and energy resources.	66	15	19
c. Ensuring an efficient, cost effective, planned and sustainable maintenance of buildings, offices and equipment.	87	8	5
B5 Processes	<u>1</u> %	<u>2</u> %	<u>3</u> %
1. We identify, design, manage and improve processes on an ongoing basis, by:			
a. Identifying, describing and documenting key processes on an ongoing basis.	76	17	7
b. Identifying process owners and assigning responsibilities to them.	78	12	10
c. Allocating resources to processes based on the relative importance of their contribution to the strategic aims of the organization.	68	27	5
d. Improving processes on the basis of their measured efficiency, effectiveness and results (outputs), in conjunction with relevant stakeholders.	68	20	12
e. Analyzing and evaluating key processes, risks and critical success factors taking the objectives of the organization and its changing environment into consideration.	71	17	12
f. Identifying, designing and implementing process changes leading to one-stop-principle services.	48	40	12
g. Measuring and reviewing the effectiveness of process changes and carrying out benchmarking to drive improvement.	63	27	10
2. We develop and deliver customer-oriented services and products, by:			
a. Involving customers and other stakeholders in the development of quality standards for services, products and information for customers.	61	17	22
b. Developing clear guidelines and regulations using plain language.	75	15	10
c. Developing sound response query handling and complaint management systems and procedures.	66	19	15
3. We innovate processes involving customers, by:			
a. Providing the resources necessary for process innovations.	49	24	27
b. Actively identifying, analyzing and overcoming obstacles to innovation.	61	27	12
4. Our products and services are produced, delivered and serviced, by:			
Communicating, marketing and selling products and services to existing and potential customers.	83	10	7
5. Our customer relationships are managed and enhanced, by:			
a. Handling feedback received from day-to-day contacts, including complaints.	83	12	5
b. Following up on sales, servicing and other contacts in order to determine levels of satisfaction with products, services and other customer sales and servicing processes.	83	12	5
c. Using regular surveys, other forms of structured data gathering and data gathered during day-to-day customer contact in order to determine and enhance customer relationship satisfaction levels.	54	22	24
B6 Customer-oriented results			
1. Customer satisfaction measurements are carried out on:			
Products and services (e.g. quality, reliability, compliance with standards, processing time, value of advice given to customers).	73	12	15
2. Customer-oriented indicators are measured through:			
Employee training in relation to the effective handling of customer relationships (e.g. professionalism and friendly communication with, and treatment of customers).	66	17	17
B7 People results			
1. People's satisfaction and motivation is measured by:			
The level of employees' involvement in the organization and its mission.	63	20	17
2. Indicators are utilized to:			
a. Measure satisfaction level of employees (e.g. levels of absenteeism or sickness, rates of staff turnover, number of complaints).	54	24	22
b. Measure level of performance by employees (e.g. measures of productivity, results of evaluations).	63	15	22
B8 Society results			
1. We measure our stakeholders' perceptions by:			
General public's awareness of the impact of how the organization's performance affects the quality of our customers' lives.	52	27	21
2. We identify society's perceptions on how our organisation's			

<i>Programmes protect customers and employees from exposure to possible health risks and accidents.</i>	68	15	17
B9 Key performance results			
1.External results: outputs and outcomes of goals are measured in terms of:			
<i>a. The extent to which the goals are achieved in terms of output (delivery of products or services).</i>	86	12	2
<i>b. Cost efficiency (outputs achieved at the lowest possible cost).</i>	81	7	12
<i>c. Cost effectiveness (outputs achieved at the lowest possible cost).</i>	72	13	15
2.Internal results ,are measured in terms of:			
<i>The degree of involvement of all stakeholders in the organisations.</i>	49	22	29
<i>Process performance.</i>	76	14	10

Table 3 – Areas of Primary Concern - (1=agree; 2=do not know; 3=disagree)

Utilising the information gathered from the qualitative and quantitative study, the major problem areas identified per industry sector are listed in Table 4. For instance as indicated in Table 3 above, leadership issues appear to be of less importance to the Banking and Automotive and Transport Industries. It was found in the focus groups that there are some issues in the leadership field that need to be addressed unlike the other three industries. Putting therefore the findings of both studies the research team has identified the problem areas needing to be addressed per industry.

Table 4 – Problem Areas Validation

DISCUSSION ON FINDINGS

Responding to the two research questions posed earlier, i.e.

1. In what process areas can Six Sigma be implemented in a small economy?
2. Is there a difference in the processes identified depending on the industry?

The participants of the focus groups and respondents of the questionnaire have been hesitant to agree that six sigma can be used during economic crisis period and more importantly the benefits to be derived if used in a small economy, like Cyprus. There was however, an interest for some to take up the free of charge six month pilot period offered since it will not have a financial burden on them.

More specifically, regarding the two research questions the findings from both the qualitative and quantitative study do illustrate that problem areas identified by industry vary. Having therefore identified the problem

Hospitality and Tourism

As a holiday resort, Cyprus depends heavily on tourism and other related services. However in the last two to three years due to exogenous factors this industry has been affected adversely. These exogenous factors are: cheap near by destinations, the international economic crisis, the swine flu and finally due to its geographical location it is frequently found to be close to political unrests. Six sigma can help to sooth out some of these issues now that the problem areas have been identified. In most cases, the areas which are often highlighted are poor service delivery, high costs, customer dissatisfaction, staff training etc. From the present study only the following issues (see Table 4) were identified by the organisations: (a) Strategy and Planning; (b) Processes; and (c) Customer-Oriented Results.

Banking and Insurance

Over the past couple of years, this sector is pressured to reduce costs, improve their operational cycle, reduce risks, and be competitive. This industry has been heavily affected from the local conditions due to international interest roles, the downturn of the construction industry, the effects that tourism had on the island and the spending habits of people on luxury items such as cars, etc. The present research identified the following issues (Table 4) which need to be addressed by Six Sigma in the banking and insurance industry:

(a) Leadership; (b) Strategy and Planning; (c) People; (d) Partnerships and Resources; (e) Processes; (f) Customer-Oriented Results; (g) People Results and (h) Society Results.

Construction and Real Estate

Very little research has been conducted on setting definite quantitative goals for performance improvement while considering the defect rate involved in construction operations or external influences which affect their project performance or operational integrity. Whilst the construction industry in Cyprus has been booming, during the international economic crisis the same industry has been affected the most after the hospitality and tourism sector. Only three problem areas have been identified needing the attention of six Sigma. These are (a) Strategy and Planning; (b) Processes; and (c) Key Performance Results.

Automotive and Transport

For years, Six Sigma was viewed simply as a process improvement tool (like TQM) to help companies improve their processes and operations, reduce product defects and a methodology applicable to the manufacturing industry. In small economies for this particular industry we can generalise by saying that it does not including the manufacturing of automobiles but only the retail and maintenance component. The automotive industry has been affected very much because of the global crisis and local SMEs were not immune to those effects. Even so, the number of respondents were surprisingly better than anticipated and the following problem areas (Table 4) were identified: (a) Leadership; (b) Strategy and Planning; (c) People; (d) Partnerships and Resources; (e) Processes; (f) Customer-Oriented Results; (g) People Results and (h) Key Performance Results.

Healthcare

Despite the fact that generally Six Sigma principles and the healthcare sector are very well matched because of the healthcare nature of zero tolerance for mistakes and potential for reducing medical errors, the present research has shown that these organizations would like to use Six Sigma to address the following areas of concern (Table 3): (a) Strategy and Planning; (b) Partnerships and Resources; (c) Processes.

CONCLUSION

Despite the limitations of the study, ie that only 50 companies participated in the study, the fact that results were rechecked with the aid of qualitative research it is argued that this exploratory study will provide room for further research in the field in small economies. As illustrated above the type of industries which participated in this study included Hospitality and Tourism (40%), Banking and Finance (12%), Construction and Real Estate (20%), Automotive and Transport (10%) and Healthcare (18%). Out of the 50 companies that responded, 7 were micro (<10 employees), 19 were medium (10-49 employees) and 24 were Big SMEs (50-249). Thus far only three organisations within the sample of SMEs got involved in a Six Sigma programme, two of them undertaking such assignment under the auspices and assistance of their international principals or Head Office, the third organisation trained their top management in the Six Sigma concept and techniques.

However, in implementing Six Sigma in SMEs, its penetration into the workforce and the task of gaining commitment by management and employees would depend on whether the organisation had prior experience with quality management systems, namely ISO 9000, Balanced Scorecard, Total Quality Management (TQM), European Foundation for Quality Management (EFQM) or other quality initiatives. In addition, it must be emphasized that the commitment of the top management is essential to progress and goal to attain Six Sigma projects.

In conclusion it can be said that whilst Six Sigma can be implemented by SMEs in a small economy there will be lack of commitment to do so during harsh economic crisis since immediate benefits cannot be achieved. Six sigma is a long term investment that needs to be made. Regarding the second research question whilst it was found that each industry has its own problem areas, strategy and planning is a

problem area identified for all five sectors. In fact in small economies, where most businesses are not only SMEs but family businesses it is hard to have the vision and appropriate people to form strategic plans. Further research is suggested in this field.

AN EXPLORATION OF LOYALTY DETERMINANTS IN GREEK WINE VARIETIES

Krystallis, Athanasios¹; Chrysochou, Polymeros²

¹(Corresponding author), MAPP, Aarhus School of Business, Aarhus University, Haslegaardsvej 10, DK-8210 Aarhus V, Denmark

²MAPP, Aarhus School of Business, Aarhus University, Haslegaardsvej 10, DK-8210 Aarhus V, Denmark

Purpose: This paper aims to provide a deeper understanding of the market structure of red and white wines from Greek wine varieties and measure loyalty behaviour of frequent wine buyers in Greece.

Design/methodology: The study concerned measuring brand performance and loyalty of 4 different Greek wine varieties. Based on stated preference data, basic brand performance measures are estimated through Juster purchase probabilities of brand choice. To measure loyalty behaviour, the polarisation index ϕ (phi) is used as a measure to model loyalty both at the brand name and specific wine attributes and attribute-levels.

Findings: The findings of the present study point to the conclusion that each one of the four Greek wine varieties under examination exhibits its own market structure and loyalty profile, whereas price, quality certification and winemaker's size seem to function as loyalty stimulators more effectively for white wines. Moreover, it is also clear that the origin or type of the wine variety *per se* does not constitute a particularly important loyalty component in the wines' marketing mix.

Research limitations/implications: The wine category has always been one of the most challenging product categories to investigate. Many attributes contribute to building loyalty that is often hard to delineate and take into account each. Moreover, the present methodology is based on stated preference data, whereas revealed preference data could be the ideal for applying the specific methodology.

Originality/value: Few studies, if any, have explored the issue of loyalty using the present methodological approach in the case of wine.

INTRODUCTION

Wine is often characterised as a difficult and confusing product for consumers. In addition, the wine market is much diverse and competitive, with an enormous number of niche brands, making consumer choice even more complex. When consumers are overloaded with information that exceeds their processing limits, they tend to simplify their decision-making based on heuristics (Bettman et al., 1998). In the case of wine, such heuristics can often be extrinsic quality cues (e.g. brand, price, variety, VQPRD certification, etc.). Certain past studies have explored the importance of such cues on consumers' wine choice (e.g. Fotopoulos et al., 2003; Jarvis et al., 2007).

However, less is known on whether consumers remain loyal within a specific wine category, and moreover what influences their loyalty behaviour mostly. Loyalty has mostly been viewed from the brand level. However, there is the possibility to account for loyalty broken down into product attributes, but such an approach has rarely been measured, analysed or discussed, apart from a few recent exceptions (Jarvis et al., 2007; Singh et al., 2008). Singh et al. (2008) suggested that measuring loyalty to product attributes is urgently needed, since manufacturers, retailers and marketers generally seem to have little empirical knowledge on this issue. Furthermore, a better understanding of which attributes are drivers of loyalty will provide further input for the design and implementation of loyalty strategies.

On this basis, the aim of this paper is to provide a deeper understanding of the market structure of red and white wines from Greek wine varieties and measure loyalty behaviour of frequent wine buyers. Basic brand performance measures are estimated through Juster-scale purchase probabilities of brand choice. The Dirichlet-NBD model and the polarisation index ϕ (phi) are used to model loyalty both at the a) brand name; and b) wine attributes level. The wine attributes and their respective levels used for the purposes of this study are: a) price (low, medium, high tiers), b) winemaker (small, medium, large corporate size), and c) quality certification (VQPRD wine or not).

The paper develops as follows: in the Material and Method section a brief description of the concept of behavioural loyalty and its measurement, as well as a detailed description of the research design, the data collection procedure and the sample(s) are included; in the Results section the main empirical outcomes of the research explained in relation to its aims; finally, in the Discussion and Conclusion section the practical implications of the current research findings are highlighted.

MATERIAL AND METHOD

Measuring loyalty

Brand loyalty is nowadays a well established concept. Copeland (1923) first defined loyalty as “an extreme attitude towards a product which might have a special effect on buyer behaviour”. This definition is considered as one of the most cogent descriptions of loyalty ever proposed. It took 50 years of research until researchers suggested that loyalty is a composite measure, comprising behavioural and attitudinal loyalty (Day, 1969; Dick and Basu, 1994; Jacoby and Chestnut, 1978).

Behavioural loyalty has been suggested to be measured at a product’s brand level with the use of various parameters commonly known as Brand Performance Measures (BPMs). Typical BPMs are market share, penetration, and purchase frequency. Certain BPMs can be used as inputs in fitting the Dirichlet model (Fader and Schmittlein, 1993; Bhattacharya, 1997). Models like this are often called zero-order models due to their assumption that each purchase is unrelated to the previous one (“as if random”). The Dirichlet model has been shown to provide useful benchmarks and offer a natural baseline for the repeat-purchase loyalty each brand enjoys (Ehrenberg et al., 2004; Goodhardt et al., 1984). Empirical regularities associated with the Dirichlet model have been widely tested and supported in marketing, and observed for over 30 years in a large number of product categories and across different countries in Europe, the USA, Asia and Australia (Ehrenberg et al., 2004; Uncles et al., 1995).

Brand performance measures are usually obtained from revealed preference data (e.g. scanner data, panel data). However, such data can be expensive and time-consuming to acquire and process and may not be readily available for certain product categories and markets (Uncles and Lee, 2006). An alternative approach for empirically estimating similar measures is by using the Juster-scale, according to which respondents are asked to rate the probability of purchasing selected brands within a product category in a future time purchasing period (“What are the chances that you, personally, will buy/purchase <brand j> in the next <period>?”). Answers to the previous question are provided in an 11-point probability scale ranging from 0 to 10, where 0 denotes “no chance, almost no chance (1 in 100)” and 10 denotes “certain, almost practically certain (99 in 100)”. The attraction of the Juster-scale is its use to develop observed estimators for a set of various brand performance measures which can further be used as inputs to fit the Dirichlet model (Wright et al., 2002). The Juster scale is preferred over other purchasing intention measures, since it has been proven to be more reliable and precise, constituting a direct means to estimate real purchasing behaviour (Wright and MacRae, 2007).

A measure stemming from the Dirichlet model used to model loyalty is the polarisation index ϕ that was initially proposed by Sabavala and Morisson (1977). Polarisation ϕ is estimated by the following equation: $\phi = 1/(1+S)$, where S is a parameter of the Dirichlet model (see Ehrenberg, 1988). Both indices (ϕ and S) capture changes in heterogeneity of consumer choice as purchase incidence changes. The primary benefit of ϕ is that it is easier to interpret, since it varies from zero to one, whereas S varies from zero to infinity. Values of ϕ close to zero indicate pure homogeneity in consumer choice, denoting high switching levels within a product category, where all buyers have the same propensity to buy individual brands. Values of ϕ close to one signify the existence of maximum heterogeneity, indicating high levels of loyalty in a product category within which each consumer buys only his/her favourite brand (Fader and Schmittlein, 1993; Stern and Hammond, 2004).

Study design

For the purposes of the study, brand performance on a set of 40 wine brands was investigated using the Juster-scale. The period for measuring the probability of purchase was set to four weeks. Four Greek wine varieties were chosen (two white varieties: "Asyrtiko" and "Mosxofilero"; and two red varieties: "Agiorgitiko" and "Xinomavro") and 10 known brand names were selected from each variety according to their retail sales and the attributes under examination (price, winemaker and certification), so to include a reasonable number of brands for each attribute. Thus, 12, 15 and 13 brands belonged to the low, medium and high price tiers respectively, 35 brands were VQPRD wines, and 12, 6 and 22 brands were produced by big, medium and large winemakers respectively. In order to simplify the selection of brands, no reference to vintage was made.

Each brand was presented as pictures to the participants to further stimulate brand recognition and increase realism. In addition, for each variety brands were shown to participants randomly to avoid any order bias effects. Finally, apart from the section with the Juster-scale, the questionnaire included:

a) Questions about wine purchasing frequency of respondents (replies varied from "once a week" to "at least once a month");

b) A measurement of attitudinal loyalty towards Greek wine varieties (2 items per variety: "I am committed to this <wine variety>" and "I am willing to pay a higher price for this <wine variety> over other <red/white wine varieties>", adapted from Chaudhuri and Holbrook, 2001). Answers were measured on 7-point, Likert agreement scales with end-points 1 = "totally disagree" to 7 = "totally agree";

c) A measurement of the importance of 10 wine purchasing criteria (e.g. "How important are the following criteria for your wine purchasing selection?"). Answers were measured on a 7-point, Likert importance scale with end-points 1 = "completely unimportant" to 7 = "absolutely important". The 10 criteria were: grape variety, price, winemaker's fame, vintage, prize won, quality certification, region of origin, brand name, label, and fermentation in barrel; and

d) A part aiming to describe participants' socio-demographic profile.

Sample

A web-based administered survey was undertaken in Greece during March 2009. Participants were selected according to their purchase of wine (at least one purchase a month), in order to ensure a minimum level of respondents' knowledge and involvement in wine purchasing. In total, 408 respondents participated in the survey, from which 205 answered questions referring to white varieties (N_W) and 203 to red varieties (N_R).

Table 1 presents descriptive and group comparison tests between the two samples. Both white and red wine samples are skewed towards relatively younger age groups, higher educational levels and higher income tiers, although the participation of male and female consumers is almost equal between the two samples. Moreover, the majority of consumers in both samples are married, with one or two children, live in large cities across the country and work in paid types of employment. Regarding the statistically significant differences between the two samples, more red wine consumers belong to the tertiary educational level and live in smaller cities, while less are in a paid type of employment compared to white wine consumers.

Table 3. Socio-demographics of wine type segments

The sample was further segmented to frequent and non-frequent buyers according to their stated frequency of buying (red or white) wine. Frequent buyers are those reporting buying wine at least once a week, whereas non-frequent those at least once a month. Frequent buyers of red wine were 61 (NRF) and of white wine 59 (NWF). The socio-demographic profile of the frequent buyers and the statistically significant differences from the overall samples for white and red wines appear in Table 2. No statistically significant differences emerge between the two pairs of groups per wine category (white or red), apart from gender (i.e. more male consumers belonging to the frequent group) for both varieties and age groups for white wine buyers' sample (more frequent buyers in the 25-34 and above 55 age groups).

Table 2 Socio-demographics of the frequent buyer group per wine type Note: Chi-squares report differences from the non-frequent buyer groups Procedure

Answers to the Juster-scale were used for the estimation of BPMs, such as penetration and purchase frequency at the brand level, as well as at the product category level, and market shares at the category level. Theoretical BPMs are relatively easy to estimate and are analytically described by Wright, Sharp and Sharp (2002). The above mentioned BPMs are those necessary to fit the Dirichlet model, from which additional measures of loyalty can be estimated. In addition, each brand was categorized based on the following attributes: a) price tier (low, medium, high); b) winemaker (small, medium, large corporate size); and c) certification (VQPRD wine or not) allowing analyses to be performed on an attribute level as well. Finally, the polarization index ϕ was estimated from the Dirichlet model allowing for modelling loyalty both at a

brand and attribute level. All analyses were performed in MATLAB and the DIRICHLET software (Kearns, 2000).

All analyses were conducted on the frequent buyer group. The main reasoning behind this decision was twofold. First, wine is by default a less frequent bought product thus exhibits low loyalty levels. Therefore, from a technical point of view, it is not sure, and not aim of the present paper, whether this was due to low purchase frequencies or variety seeking behaviour. Thus, the frequent buyer group was selected instead. Second, from a marketing point frequent buyers comprise the main target segment for wine companies. Therefore, it is interesting to explore loyalty behaviour of such buyers.

RESULTS

In relation to the criteria for wine purchasing included in the questionnaire, the five most important ones are region of origin, variety, price, winemaker's fame and quality certification (Table 3). Brand name did not receive high score indicating its low importance in the choice of wine. No significant differences were found between different types of wine apart from vintage and label on which the red wine consumers consider as more important.

	<i>All sample (N = 408)</i>	<i>White wine (N₁=205)</i>	<i>Red wine (N₂=203)</i>	<i>F (p-value)*</i>
<i>Region of origin</i>	5.31	5.26	5.36	0.56 (0.456)
<i>Variety</i>	5.30	5.18	5.42	3.23 (0.073)
<i>Price</i>	5.18	5.22	5.15	0.22 (0.641)

<i>Medal</i>	4.13	4.03	4.23	1.44 (0.231)

Table 3 Importance of criteria in wine purchasing for whole sample and wine type segments* Differences between two groups of wine segments.

For the frequent buyer group the total penetration (% of category buyers) is 89% for Asyrtiko, 92% for Moshofilero, 87% for Xinomavro and 89% for Agiorgitiko (Table 4). Furthermore, the average purchasing frequency during the 4-week period under examination is 7.1 times for Asyrtiko, 6.3 times for Moshofilero, 5.8 times for Xinomavro and 6.8 times for Agiorgitiko. In other words, more than 90% of the frequent wine buyers purchase one of the 20 white wine brands at least once a month, while a frequent wine buyer buys any of the 20 white wine brands around 7 times a month. The relevant figures for the red wines are penetration 88% at average and average purchasing frequency around 6 times a month (4 weeks).

	<i>Penetration</i>	<i>Purchase Frequency</i>	ϕ	<i>Mean loyalty (attitudinal)</i> ^{1,2}
White wine				
<i>Asyrtiko</i>	0.89	7.1	0.05	3.23
<i>Moshofilero</i>	0.92	6.3	0.05	3.85
Red wine				
<i>Xinomavro</i>	0.87	5.8	0.04	3.26
<i>Agiorgitiko</i>	0.89	6.8	0.04	3.50

Table 4 Brand performance measures and polarisation indices for Greek varieties, frequent buyers. ¹ Likert agreement scales with end-points 1 = "totally disagree" to 7 = "totally agree". ² Cronbach alpha coefficients: *Asyrtiko* = 0.878; *Moshofilero* = 0.831; *Xinomavro* = 0.859; and *Agiorgitiko* = 0.781.

The third column of Table 4 indicates the polarisation indices ϕ for the four Greek wine varieties under investigation. It is clear that loyalty towards all varieties is very low, where as there are no differences between the two white and the two red wine varieties. The same low loyalty to all the wine varieties under examination is exhibited by the rather neutral attitudinal loyalty measures shown in the last column of Table 4.

Basic brand performance measures per wine variety for each wine attribute under examination are shown in Table 5. In terms of price, larger market shares appear in relation to the medium tier across all wine varieties, whereas comparably high market shares appear for the high price tier in the *Asyrtiko* variety (white wine) and the low price tier in the *Xinomavro* variety (red wine). Accordingly, higher penetrations and purchase frequencies appear in relation to the medium price tier across all wine varieties, but equally high measures appear for the high price tier in the white wine varieties and for the low price tier in the red wine varieties.

<i>Small</i>	0.32	0.52	0.24	0.34	0.69	0.79	0.58	0.66	2.97	3.82	2.09	3.07	0.02	0.20	0.02	0.10

Table 5 Brand performance measures and polarisation indices for wine attributes, frequent buyers. Note: Key to wine varieties: *As*=*Asyrtiko*, *M*=*Moshofilero*, *X*=*Xinomavro*, *Ag*=*Agiorgitiko*. * All brands in the *Xinomavro* variety are *VQPRD* wines

In terms of certification, much larger market shares, penetrations and purchase frequencies emerge for the *VQPRD* wines than the non-certified ones, across all white or red varieties. Furthermore, in relation to the corporate size of the winemaker the results seem to be variety-specific, since market share, penetration and purchase frequency are usually higher for the big winemakers in relation to *Xinomavro* (red) wine, where as the relevant measures for *Moshofilero* (white) and *Agiorgitiko* (red) wines are usually higher for small winemakers. For *Asyrtiko* (white) wines, both big and small winemakers seem to acquire equally large market shares and penetrations. However, the differences among varieties in market share, penetration and

purchase frequency in relation to the size of the winemaker are not usually too large, especially in relation to the comparison between big and small winemakers.

The fourth column of Table 5 indicates the polarisation indices ϕ for the wine varieties under investigation per attribute and attribute-level. It is clear that loyalty to price, as well as to all price tiers is very low, especially for red varieties. Moreover, loyalty to certification is considerably higher for VQPRD wines in white wines and especially the Asyrtiko variety. Finally, loyalty to the size of the winemaker is also considerably higher for the white wine varieties; in particular, loyalty to big winemakers is high for Asyrtiko wines, and loyalty to small winemakers is high for Moshofilero wines. However, substantial loyalty appears in relation to small winemakers also for Agiorgitiko (red) wines.

DISCUSSION

Although the nature of the data collection procedure followed in the present survey does not allow for wide generalisations, the socio-demographic profile of the two samples indicates that younger, more educated, urban consumers constitute the most typical wine buyers. Moreover, it is worth noting that the main discriminating characteristic between white and red wine buyers is the educational level, with red wine being a more preferable choice of the more educated consumers than white wine.

However, the general convergence of the socio-demographic profiles of both white and red wine buyers possibly indicates that the same consumers are purchasers of both wine categories, usually substituting the one for the other according to criteria that prevail under different contextual conditions (e.g. occasion a bottle of wine is purchased for, availability of wide range of wines in relevant outlets and convenience of accessing them, etc.). Also striking is the finding that the heavy frequency of wine purchasing does not seem to be depended on socio-demographic characteristics of the buyers. Again, more customised, personality-related characteristics (e.g. consumers' attitudes and beliefs) or even purchasing context-specific factors as above might offer more valuable explanatory insights than socio-demographics as to the reasons that make a consumer to be a frequent wine buyer.

The importance ranking of the wine selection criteria included in the present survey points out to the accuracy of the wine attributes selected as potential drivers of consumer loyalty to a wine brand, and offers face validity to the study. In this respect, it is shown that Greek consumers select wines based on region of origin, wine variety, price and winemaker's fame. The fact that variety/region combinations are more important criteria than brand name constitutes both a reason for and an indication of the large fragmentation of the wine market at the brand level. This fragmentation justifies to a substantial extent the low loyalty levels exhibited in the present survey, as it will be discussed further in this section.

One of the most interesting parts of the findings is what concerns consumer loyalty towards the Greek varieties under examination. Following the indications about large fragmentation of the wine market at the brand level, loyalty towards all varieties is found very low, with no differences between white and red wine varieties. This implies that the consumers of the survey are not fond of any (Greek) variety in particular, thus substitution of one wine brand from one variety (red or white) for another wine brand of another variety can usually happen, especially since the same consumer can equally well buy red or white wine, as shown before. Hence, the (Greek) variety of wine does not constitute an extrinsic cue that can create loyalty to the category. In this respect, the high market shares, penetrations and purchase frequencies found at the variety level do not seem to owe their existence to the origin or type of the varieties. Moreover, the neutral level of attitudinal loyalty to the varieties under examination further justifies the above finding and offers additional face validity to the research. Nevertheless, regarding in particular the comparison between attitudinal and behavioural loyalty, the high reliability coefficients of the attitudinal loyalty scales for each variety indicate that the specific loyalty measurements can function as a robust basis to compare polarisation-type of loyalties steaming from Juster estimates.

On the other hand, the results regarding the VQPRD quality certification are more straightforward. Quality certification seems to constitute a very powerful attribute irrespective of wine category (white or red) or variety. However, results in this respect should be interpreted with caution, since the representation in the

research design of non-certified wines, or of wines with other types of quality certification (e.g. regional wines) is particularly small, meaning that the results are dominated by VQPRD wine brands across categories and varieties.

The importance of the winemaker's corporate size is hard to grasp through the present findings. A certain trend that can be supported is the fact that the (consumer inferred) average corporate size of the winemaker is the less successful winemaker-related characteristic of a wine product across categories and varieties. This might again relate to a perception trade-off consumers engage in during the wine selection process, since both small- and large winemaker size might be perceived as a positive heuristic that is associated with a certain expertise or fame on behalf of the wine producer (e.g. big size might imply a successful, experienced producer with accumulated market expertise; and small size might indicate technical/oenological expertise, specialisation in specific production methods and low volume-high quality market orientation). In general, however, it needs to become clear that the results in respect to winemakers' corporate size are proven to be variant and too much variety-dependent. It is also possible that the winemaker's fame, which is also found to be among the most important self-reported wine selection criteria as explained above, is not represented well by the winemakers' corporate size (in other words, the mental distance in consumers' associations between corporate size and market value is too large). Finally, the underrepresentation of medium-sized winemakers can also be a limitation that changes brand performance measures in favour of the small- and (mainly) large-sized winemakers.

Focusing on the price attribute, the preference for usually average price tiers across all wine varieties analysed may indicate a type of value-cost trade-off resulting to low and high prices' aversion; low prices may indicate lack of product quality in the eyes of the customers leading to a high-risk buying decision; and high-price aversion may be the outcome of the widely held perception among Greek consumers that wine is often a low value-for-money product. After all, price is found to be one of the most important self-reported criteria of wine selection, as described above. Nevertheless, the present results in relation to price imply a certain positioning of the Greek white wine brands at a more premium market level compared to the Greek red wine brands examined here (i.e. higher price tiers in Asyrtiko white wine acquire higher market share, penetration and purchase frequency, where as for Xinomauro red wines the case is the opposite). It thus seems that although medium prices are usually preferred, the importance of price is overall category-dependent, closely mirroring value-cost considerations.

In terms of loyalty, price is an important factor primarily for the white wine category; additionally, not only the high-price tier in Asyrtiko and Moshofilero wines, but also the low-price tier in the former and the medium-price tier in the latter can also stimulate consumer loyalty. As regards red wines, the medium-price tier creates more loyalty, especially in the Xinomauro variety, which is in accordance with the above-described findings about medium-priced red wines usually achieving higher market shares, penetrations and purchasing frequencies. All in all, although there is a certain variation at the variety level, price considerations follow the red-white wine category differentiation, with red wines being better positioned at medium price levels and white wines at both medium and high price levels.

CONCLUSIONS

Wine marketers have always been eager in building strong bonds with their customers. Therefore, identifying which wine attributes make consumers loyal and increase their chances of repeat purchase is always of high importance. Moreover, delineating the issue of loyalty to a wine brand and to the cues (i.e. extrinsic attributes) that are found on the label (e.g. variety, winemaker, VQPRD sign, etc.) can further help wine practitioners to determine which product attributes "stimulate" loyalty and consequently create tailor-made products that fit the market better and increase market shares. In this respect, the findings of the present study point to the conclusion that each one of the four Greek wine varieties under examination exhibits its own market structure and loyalty profile, whereas price, quality certification and winemaker's size seem to function as loyalty stimulators more effectively for white wines. Moreover, it is also clear that the origin or type of the wine variety *per se* does not constitute a particularly important loyalty component in the wines' marketing mix.

CONCEPTUAL DESIGN OF A FINANCIAL APPROACH TO DEVELOPING COMPETITIVE ADVANTAGE THROUGH RESPONSIBLE TOURISM

Kuokkanen, Henri¹; Rios-Morales, Ruth²

¹*Glion Institute of Higher Education, Glion-sur-Montreux, CH 1823 Switzerland*

²*LRG, University of Applied Sciences, CH-1630 Bulle, Switzerland*

The purpose of this conceptual paper is to structure a model explaining how businesses operating within the field of tourism could gain competitive advantage and improve their financial performance through Corporate Social Responsibility (CSR). The link between financial performance and CSR has been widely studied, and evidence for positive correlation exists. The concepts of sustainability and responsibility in tourism are on the other hand not clearly defined, leaving room for various interpretations. This may provide an explanation of why currently there are few tourism operators pursuing financial gains through CSR, even if studies indicate demand for responsibility. This paper argues that currently no operator/service provider really understands the demand for responsibility and a customer is not able to ask for something of which he has no previous experience. By determining what the real demand for responsibility in tourism means, a company could - by meeting this demand - gain a competitive advantage through a responsible brand and thus improve financial performance. The performance would be measured by revenue, as this is what the consumer choice changes, as well as net income, in order to include the cost of responsible actions. Based on the findings of the literature study on CSR, sustainability in tourism and consumer behaviour this paper presents a conceptual framework through which the perceived demand for responsibility in tourism could be translated into increased sales and profits.

INTRODUCTION

Currently, sustainability and corporate social responsibility (CSR) are widely accepted concepts in the world of business. The approach of combining financial and societal goals under CSR has been extensively studied. A number of studies have linked the social and financial performance of a company, finding a positive correlation between these two (Orlitzky *et al.*, 2003; Porter and Kramer, 2006); other research has found no evidence of companies being able to perform better in economic terms when using social strategies in their financial planning (Husted and Allen, 2007). However, research has also shown that companies embrace the concept of sustainability and CSR when there is market demand for responsibility in business (Vogel, 2005). Although sustainability is one of the most common axioms in the field of tourism (WTO, 2004), scholarly research that links social and financial performance is limited. The purpose of this conceptual paper is to structure a model that can explain how businesses operating within the field of tourism could gain competitive advantage through CSR and improve their financial performance. The paper argues that the reason behind this is that no operator/service provider really understands the existing demand for social responsibility and a customer cannot demand something of which he has no previous experience. By determining the true demand for social responsibility in tourism and meeting it, a company could gain a competitive advantage for its business (responsible brand) and thus improve financial performance measured mainly by revenue (as this is what the consumer choice affects) as well as net income (to include the cost of being responsible).

The remainder of this paper is organized as follows: Section 2 presents an overview of related CSR literature. Terminology related to sustainability within the tourism sector is summarized in Section 3. Section 4 covers existing research of indicators for sustainable tourism. Section 5 develops hypotheses on how responsibility could benefit tourism operators and what are the requirements for improved financial performance through responsibility. Section 6 discusses the core of our study and presents a model on gaining competitive advantage and improved financial results through responsible tourism. Section 7 summarises this study.

RELATED CSR LITERATURE

Covering CSR literature involves combining two areas of study: research on CSR as theory and the link between responsibility and financial performance. Most of the research on these two areas is not concentrated on any specific field of business and this literature review actually revealed the minimal amount studies combining tourism, CSR and financial performance. This part of the review is divided in two subsections; the general CSR-theory and research into the link between CSR and the financial performance of a company. Some tourism related specific studies are discussed as part of the following two sections on tourism terminology and indicators.

Corporate Social Responsibility as a Theory

Corporate Social Responsibility has been the topic of numerous studies ever since Friedman (1970) argued that companies should not engage in such activities. The purpose of this review is not to summarize decades of CSR research exhaustively, but to cover a few key points which are fundamental to the link between the financial and social performance of companies discussed later. Carroll (1979) presented a model of different dimensions of corporate responsibility that was an acknowledged effort to create a tool for managers to respond to questions and challenges arising in this emerging field. This is an opposite view from that of Friedman as it assumes that managers should react to such questions.

Research in this area has subsequently widened significantly. Garriga (2004) divided theories related to CSR into four main categories based on how they define the relationship between a company and the surrounding society. In some respects this division could be argued to be too general, but it provides some interesting starting points for this study. He combines theories which emphasize performance improvement through responsibility under “instrumental theories”; this study will also adopt this approach. It is important to note that the question of how a company could create competitive advantage and thus improve its financial performance does not exclude other drivers for responsible behaviour, such as a genuine desire to be a good corporate citizen. It rather combines these two potential positive outcomes. As noted by Bondy (2008), any positive outcomes might be limited if responsibility becomes an instrument in a struggle for power within an organization and people start using it to pursue personal goals.

The approach of combining financial and societal goals in CSR has been widely studied. Examining corporate strategy and the importance of CSR, Porter and Kramer (2006) look at different justifications for CSR activities, and suggest that implementing responsible activities may benefit both the company as well as society as a whole. They call for strategic CSR decisions through which organizations can differentiate themselves from their competitors. Their arguments were challenged by Husted and Allen (2007), who studied the value created through CSR in a multinational company. They found some correlation between the social and economic performance of companies but could not show evidence of a direct causality. However, here the question can be returned to the starting point: is there no value that can be created through these strategies or have the strategies simply been wrong?

The difference between the papers mentioned above and many other CSR studies is that other researchers focus primarily on dealing with the demands that companies face, instead of proactively developing responsibility with the ultimate goal of improving performance. An example is a study by Waddock *et al.* (2002), which examines the pressures set by society, NGOs and other stakeholders, to which companies must respond. A more fundamental questioning of current practices grouped under the umbrella of corporate social responsibility is posed by Margolis and Walsh (2003); they raise the question of when do corporate actions actually benefit the surrounding society. Brammer and Pavelin (2006) took the next step and examined the “fit” of CSR activities; that is, how well the activities are suited to the actual business of the company. Their findings supported the claim that not only must the CSR activities be beneficial, it is also critical that they are perceived to be part of the business in the eyes of the stakeholders.

Link between CSR and financial performance

A natural next step from theoretical studies of CSR to examining potential applications for gaining competitive advantage is research into the link between the social and financial performance of a company. A plethora of studies of this type have been made (e.g. Cochran and Wood, 1984; Waddock and Graves, 1997;

Griffin and Mahon, 1997; Roberts and Dowling, 2002; Goll and Rasheed, 2002) and these have been further examined through meta-analyses of the results of individual studies (Margolis and Walsh, 2003; Orlitzky *et al.*, 2003; Wu, 2006). The next paragraphs discuss these studies, their results and some limitations of these studies.

The link between corporate social and financial performance is often measured as a correlation between indicators of each aspect. The selection of these indicators thus becomes the key factor of such a study. Margolis and Walsh (2003) included 127 studies in their meta-analysis and listed the indicators used. A variety of methods were used to measure corporate social performance (CSP) but the most common were rankings of Fortune magazine, KLD Social index and CEP as well as mutual fund screens and company disclosures. For corporate financial performance (CFP) the differences were less obvious, with most studies using either market or accounting performance, or both, as indicators. The initial results coincide with the results of another important study in the same area: both Margolis and Walsh (2003) and Orlitzky *et al.* (2003) found a clear positive correlation between CSP and CFP and very little evidence of any negative impact of CSP.

Orlitzky *et al.* (2003) emphasize the correlation between CSP and CFP and discuss the importance of reputation for companies. They use their findings in order to disagree and agree simultaneously with Friedman; they disagree with the aspect of CSP activities being controversial to the concept of shareholder value but agree with his comments related to minimizing the role of governments. They conclude by hailing the role of responsibility as a tool for improving financial performance. Margolis and Walsh (2003) on the other hand take a much more pessimistic view and question the basis of CSP and when it is beneficial to the society as a whole.

The first limitation, as pointed out by Goll and Rasheed (2002) is the lack of objective measures for social performance. As explained previously, a multitude of different indices, rankings and ratings are used for this purpose, but it is not clear if any one of them really measures the positive impact that a corporation can have on its stakeholders. This lack of objective measurement can severely impair the results obtained. Some of these measures are very likely to be relevant, but as Porter and Kramer (2006) point out, the popularity of the topic has led into what they call "the Ratings Game", a confusion caused by all the different providers of responsibility data. An example of this is provided by Waddock *et al.* (2002); they list examples of corporate reputation and responsibility related standards - both of these lists contain more than 10 different items. Hamann (2007) notes that the motives for assessing the social performance of a company and the organization conducting the assessment should be carefully evaluated and questioned before using the results. The need for clear definition and measurement of what responsibility means is evident; whether this can be done on a general level or on a company basis remains unclear so far.

Continuing with the scepticism towards the correlation analysis between CSP and CFP, Pelozo and Papania (2008) emphasize the need to consider which stakeholders are in a position to reward or punish the corporation financially through their actions. According to their study this could be an important factor in explaining the correlation between CSP and CFP. They ask how financial performance should be measured. The method of using market valuation fully or partly for this purpose as explained earlier is controversial, as the stakeholders benefiting or suffering from the company activities may not have any means to affect the market valuation. Bird *et al.* (2007) conclude that management might be misguided in their actions if they blindly follow market valuation as a guideline for CSR activities to pursue.

TERMINOLOGY RELATED TO CSR WITHIN THE TOURISM SECTOR

The initiatives for responsible business have made their mark within tourism and there exists overlapping terminology describing them. The most important terms used are sustainable tourism, ecotourism, green tourism, environmentally friendly tourism and nature-conserving tourism. The purpose of this section is to clarify these concepts and discuss their differences, strengths and weaknesses.

Sustainable Tourism

Perhaps the most common definition used for sustainable tourism is the one established by World Tourism Organisation (WTO). The current definition (WTO, 2004) concentrates on optimizing the use of resources to conserve the environment, respecting the local communities and sharing the benefits of tourism with all stakeholders. In addition, they also emphasize the satisfaction of the tourists – a highly important point when NGOs and businesses meet. This view of including all the stakeholders was also promoted by Byrd *et al.* (2007).

A recent initiative to define sustainable tourism more practically is the “Global Sustainable Tourism Criteria” launched in late 2008 by the Partnership for Global Sustainable Tourism Criteria (GSTC). Their mission is to build “a set of baseline criteria organized around the four pillars of sustainable tourism: effective sustainability planning; maximizing social and economic benefits to the local community; reduction of negative impacts to cultural heritage; and reduction of negative impacts to environmental heritage.” (GSTC, 2008: *About the Partnership*). These criteria should serve as a guideline for businesses, consumers, media and other users for recognizing sustainable practises in tourism.

Some academics however criticise the concept of sustainable tourism itself. McKercher (1993) doubts that the combination of sustainability and tourism is feasible, as tourism is a consuming activity by nature. This extreme view would deny the existence of responsible tourism. However, the tourism industry continues to expand and there is a strong case for minimising the resulting negative impacts. On a more conceptual level of what sustainable development means Sharpley (2000) agreed with McKercher’s view and concluded that sustainable tourism cannot exist. He argues that while many of the principles related to the area are important and tourism can be important in development, tourism should be developed further “without hiding behind the politically acceptable yet – in the context of tourism – inappropriate banner of sustainable development” (Sharpley, 2000: 15).

Despite this fundamental critique, some form of sustainable tourism exists. This discussion is closely related to the debate about “greenwashing”, making unjustified claims about the environmental consciousness of a business. Lansing and De Vries (2007) studied the arguments between those claiming sustainable tourism as a real ethical alternative and those seeing it as a marketing ploy, and concluded that at the time there did not seem to be enough evidence for using sustainability as a basis of marketing. In another critique to the concept of sustainable tourism Liu (2003) suggests several weak points in the research but calls for less idealistic and more practical studies in order to avoid the risk of research becoming irrelevant to the real world. This clearly advocates the positive opportunities that can be provided by research.

The development and use of clearly defined sustainability standards in tourism is called for by several authors, for example Lansing and De Vries (2007) and Liu (2000). McCool *et al.* (2001) defined some possible indicators for sustainable tourism in Montana, but at the same time emphasized the importance of first clarifying what is meant by sustainability before trying to measure it. Finally, Sharpley (2000) raises the question of whether sustainable tourism refers to the qualities linked with sustainable development or actually the sustainability of the industry itself. The definition of sustainable tourism remains controversial and unclear as pointed out by a mapping of different definitions for sustainable tourism made by Dolnicar (2006). Despite all the controversy, the “real world” development with the launch of GSTC seems to go hand in hand with what the research is suggesting.

Ecotourism

Another important concept linked with sustainable tourism is ecotourism, a term closely related with nature-conserving tourists and environmentally friendly tourists. Although the goal of this paper is not to look into all the definitions of the area, ecotourism requires a brief discussion.

Dolnicar (2006) pointed out that there is no common agreement on the meaning of these terms, but several authors have tried to list qualifying criteria. Credited in some texts as the originator of the term ecotourism,

Ceballos-Lascurain (1996), along with Ballantine and Eagles (1994) include enjoying undisturbed nature in their definitions of ecotourism. This clearly differentiates ecotourism from sustainable tourism as nature itself becomes the product offered. As the aspect of conserving nature is strongly incorporated in the term, ecotourism could be claimed to be a subdivision of sustainable tourism. However, Dolnicar (2006) points out that ecotourism is largely demand-oriented whereas sustainable tourism appears to be the opposite and driven by supply. This distinction will be used later when discussing the shortcomings of what is currently known as sustainable tourism.

Page and Dowling (2002) collected results of studies on the characteristics of ecotourists, but much criticism is directed at categorisations based on income or level of education. As Dolnicar *et al.* (2008) point out, there is no firm knowledge of who these environmentally friendly tourists really are and whether their ecological footprint is any smaller than that of a mainstream tourist. The study raises the interesting question of whether there is any link between the everyday behaviour of individuals and their behaviour as tourists. Sharpley (2006) agrees on the lack of “ecotourists” as individuals by asking whether the increased demand for ecotourism actually means increased amount of ecologically friendly tourists. In his view it is not possible to separate these from mainstream tourists.

The credibility of ecotourism itself is another major concern expressed by researchers. In a critique Liu (2003) points out that there are often marketing related factors behind ecotourism and the risk of “greenwashing” is always present. Sharpley (2006) continues that ecotourism is a form of consumption; he questions whether a real ecologically friendly approach can ever be achieved, but at the same time he recognizes the significant contribution that ecotourism can have on conservation and local communities.

RESEARCH ON INDICATORS FOR MEASURING SUSTAINABILITY

Karmani (2007) argues that tourism is a sector that can provide low-skilled jobs in developing countries and thus help alleviating poverty. The lack of concrete evidence however prevents tourism operators from using this statement further in their business. Less encouraging results for sustainability in tourism were found by Clavier-Cortes *et al.* (2007), whose case study made in Spain concluded that no link between environmental strategies and profit could be established. This study was however concentrating only on the natural environment and none of the other aspects of sustainability.

For the moment, the most noteworthy effort to create a set of indicators for sustainable tourism may be the ISO 14001 standards, and there is evidence that hotels are adopting them (Bambrook, 2008). However, general standards like ISO can never fully meet the business specific needs of different tourism operators. Furthermore, the risk of having several competing ratings, as discussed in the CSR section, exists. CSR reporting in the tourism industry, more specifically in hotels, was studied by Holcomb *et al.* (2005), who claim that at the time of the study the tourism industry was still lagging behind in CSR; for example, charitable donations were still the most common form of CSR. Further evidence of this was provided by Ashley and Haysom (2006), who studied the popularity of tourism-related philanthropy in South-Africa. The obvious appeal of this approach is the easy measurement of funds donated. Holcomb *et al.* (2005) also drew attention not only to the tourism industry lagging behind in CSR but also on the minimal research in the field.

Byrd (2007) drew attention to the relationship between stakeholder theory and the development of sustainable tourism. This approach touches on one of the fundamental questions when assessing the external impacts of a business: who is affected? The stakeholder approach can offer some basis for developing indicators. Baros and David (2007) emphasize the importance of selecting the right set of indicators, but their study does not offer concrete examples of how to do this. Also Gurney and Humphreys (2006), in their theoretical paper based on a holiday resort, emphasized the need for indicators.

A practical approach to indicators was made by McCool *et al.* (2001), who first asked about the goals of sustainable tourism and then used the answers to evaluate different indicators. This is still, however, a supply-oriented approach and does not discuss the demand side of responsibility in tourism. Skinner *et al.* (2004) study the possibility of starting a Sustainable Tourism Stewardship Council based on the model of

certification organisations. This initiative is again based on creating a one-size-fits-all set of principles that might prove to be difficult to apply in the tourism industry with all its small operators. So far the concrete result of that study has been the launch of Sustainable Tourism Certification Network of the Americas but no standards have been created (Rainforest Alliance, 2009).

Kasim (2004) gets closest to the question of whether sustainable tourism is financially worthwhile with his case study of the customers of resorts in Penang Island, Malaysia. His findings confirm that tourists understand the issues related to sustainability, but do not really act based on this criteria, for example by switching hotels. Furthermore his survey suggests that people care less about responsibility when they are on holiday. These findings are closely related to the main theme of this study, which is whether offering demand-based responsibility could make the difference to customer response.

IMPROVED FINANCIAL PERFORMANCE THROUGH RESPONSIBLE TOURISM

The objective of this section is to discuss in theory how businesses operating in the field of tourism could gain a competitive advantage through CSR with the goal of improving their financial performance. This theoretical discussion can later be used as the basis for an in-depth analysis including practical testing with suitable set(s) of data. The first step is a set of hypotheses about the mechanism of how responsibility could lead to improved financial performance. In practise this means determining the requirements and defining the major hurdles stopping businesses from pursuing this strategy.

Studies made by consultancies confirm that companies believe in the demand for CSR when conducting their business (Vogel, 2005). Therefore this study makes the assumption that some of the customers also within the field of tourism would be willing to choose a responsible provider for their holiday activities, provided they perceive the responsibility offered meaningful. This preference would translate into increased demand for these businesses, but only when the supply meets the demand for responsibility. In terms of business this would mean a competitive advantage through responsibility and thus improved financial performance.

In this study financial performance is defined solely as increased sales and profitability. This is different from many of the CSR studies which also consider share price performance as a measure of financial performance (Orlitzky *et al.*, 2003). The reason for excluding share price is that as the driver for responsibility in business is obtaining a competitive advantage in the eyes of existing and potential customers, a successful strategy will result in more sales. Share price increase should be regarded merely as a result of this improvement in performance (or an anticipation of it) but not a direct result of implementing responsibility. Thus, in order to study the effects of CSR on performance only the customer-induced change in financial performance should be measured.

Transferring a perceived demand for responsibility into a purchase criteria and an actual decision can be challenging. One reason, specifically in the area of tourism, might be the different ways of defining responsibility and sustainability. Therefore, this study will use the term responsible tourism as a balanced and fair approach towards all stakeholders. Furthermore, the study also follows the instrumental school of thought about CSR, believing that the prime purpose for a company to conduct business in a responsible manner is to improve profitability. Selecting this approach increases the number of companies for which the results are applicable to any for-profit organization. Companies that could have mixed motivation behind responsibility, for example some combination of profit and general "good citizenship", are not excluded as long as profitability is one of the drivers. Additional philanthropic goals of the company will not contradict this approach either. Therefore the widest possible range of companies for the study is available without any need for subjective evaluations on their underlying motives.

The first question is: why does the perceived willingness to prefer responsible products (e.g. Cowe and Williams, 2001) not transfer itself into a purchase decision in tourism, where the funds consumed for travelling are not used for basic needs but are "extra"? This study takes a customer-oriented approach and suggests that the reason is a fundamental question of demand and supply: the supply of responsibility

offered by companies does not meet with the demand and thus efforts on improving performance through responsibility have produced weak results at best.

Another important concept for the hypotheses made in this paper is the concept of latent demand. According to Fuller *et al.* (2007: 85)

“Latent demand may be defined as an activity not demanded by consumers at a particular time and at a particular location because the cost of supplying the activity is regarded as too high, but if supplied, would be demanded by consumers.”

Hypothesis 1: If operators in the field of tourism were able meet their customers’ real demand for responsibility, as opposed to offering a supply of what they perceive as responsibility, they could enjoy a competitive advantage.

This hypothesis assumes that tourists as consumers are not able to ask the right questions themselves, i.e. their demand is latent as defined above. They simply reject what is being offered by the industry as irrelevant. The reason behind this is that the customers do not have the experience in this field to state clearly what the operators should offer to satisfy their needs. To be able to evaluate fully whether this hypothesis is correct, a broad analysis of what tourists mean by responsibility needs to be conducted. However, some small companies have been able, at least partially, to answer the responsibility demand of their own small customer groups.

An example of this is the Pacific Whale Foundation, a combined research organisation and tourism operator. The company offers whale and dolphin tours, an activity that falls within the domain of ecotourism, but at the same time they strive to do this in a responsible and eco-friendly manner and try to involve their customers in activities that help to preserve nature (Pacific Whale Foundation, 2009). Whether they have chosen this approach through focused and formalized research, good understanding of the customers or a primary interest in conservation is unclear. The responsibility statements of successful responsible operators and those of the mainstream could be analyzed to see how they differ. The existence of such a differentiation would support this hypothesis and suggest the need for further research. These potential operators will be referred to as “CSR-branded companies”.

Being able to create a “CSR-brand” in tourism could be an effective way to increase sales and profit. Fuller *et al.* (2007) argue that leading companies can deliver products exceeding expectations and thus achieve market leadership while maintaining profitability. Jamrozny (2007) discusses marketing of sustainable tourism and suggests that the area could change profoundly. In his study of the hospitality industry, Tepeci (1999) emphasizes the importance of brand loyalty, which is keeping customers once they have been attracted, in running a profitable operation. Some efforts have been made in researching sustainable branding. Woodland (2007) studied this in the South Downs of the UK and suggested that the approach could boost business in the region. However, apart from local experiments, responsibility branding remains a largely untapped opportunity in tourism and could prove to be the next winning proposition.

The use of indicators in demonstrating responsible behaviour is acknowledged and there are several different ways of measuring (Waddock *et al.*, 2003). Tourism research emphasizes the importance of measurement with correct indicators (e.g. Gurney and Humphreys, 2006 and Baros and David (2007). However, Porter (2006) points out the dangers of confusion created by the number of different agencies and ratings systems as well as the potential inaccuracies in their data. The statement of “too much of a good thing” seems to be true related to measuring CSR performance and this could be one factor preventing businesses from pursuing competitive advantage through responsibility. Hypothesis 2 addresses the role of measurement and indicators.

Hypothesis 2: Successful indicators used to measure responsibility in tourism have to be industry specific, understandable, concrete and meaningful for the customer.

However, measuring variables where positive development also means immediate financial benefit for the company risks being considered greenwashing. Furthermore, the hypothesis could mean just adding to

the chaos of measurement mentioned earlier and therefore it has to be explained further. Instead of one common set of industry-wide measures – like GSTC - we believe that within tourism the best results could be achieved when a company's responsibility objectives arise from the business and location itself, not from a definite set of global standards. The key for a successful indicator is the customer. If the customer does not feel that the indicator is relevant, there is little chance of creating a preference for that particular company. Where some areas of tourism are more similar around the world, e.g. luxury hotels, the business in general is tied to the location in which it operates. Trying to fit these local differences into a global mould is likely to result in indicators that are not satisfying for the customer, as implied by Kasim (2004). This does little good for the company itself – apart from possibly getting expert recognition that does not turn into increased profits.

What kind of indicators then fill the criteria hypothesized above? As with the first hypothesis, it is unfortunately not possible to answer this question without extensive research far beyond the scope of this paper. The purpose of hypothesis two is, for now, to cast a doubt on blind reliance on global measurement systems and indicators in tourism, despite the obvious appeal and the compelling logic behind initiatives like the GSTC.

The last step in the model is to form a link between financial performance of a business and its perceived responsibility. As discussed earlier, only growth in sales and profitability should be used as these are a result of the customers' actions. More customers choosing the CSR-brand company will mean faster-than-average growth in sales. This alone, however, is not enough. Responsible ways of operating may in some cases generate substantially more expenses and therefore profitability is at risk. According to the CSR approach chosen, the driver for a company to be responsible is profitability and therefore it must be also measured.

Hypothesis 3: A CSR-brand operator in tourism can achieve a competitive advantage which translates into higher-than-average growth in revenue and profits.

A full study of this hypothesis would require the validation of the two first hypotheses since it assumes the existence of a CSR-brand company, but could also provide a key for future success within the industry. In this conceptual paper, it was not possible to look at financial data. As there are few, if any, examples of companies fulfilling the criteria discussed above, the validation will not be exhaustive before enough operators have adopted the principles discussed.

Another difficulty is to assess the impact of responsible business versus other factors ranging from new trends in tourism to the global economy and their individual effects on financial performance. Further study should also cover existing responsible tourism and whether any financial improvement can be shown there even if the population size would be small for significant results.

A DESIGN FOR A FINANCIAL APPROACH TO DEVELOPING COMPETITIVE ADVANTAGE THROUGH RESPONSIBLE TOURISM

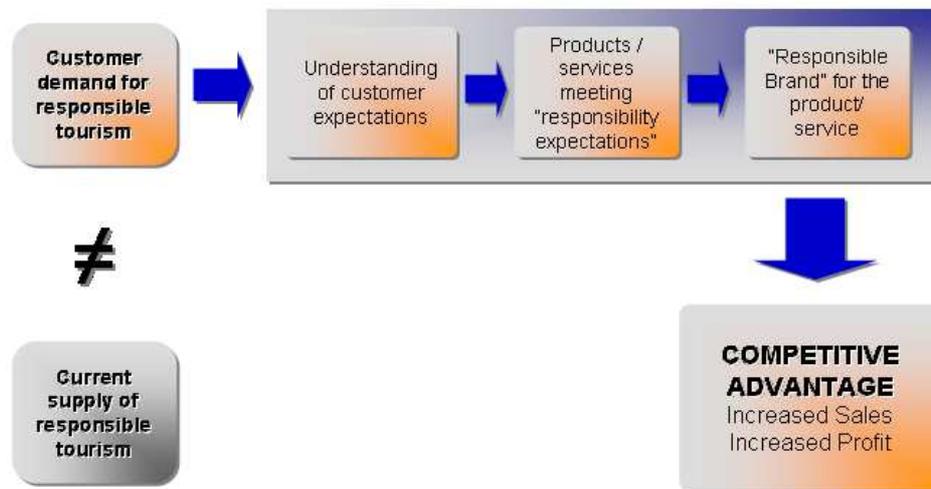

The lack of universal definitions for terms like sustainable tourism, ecotourism, green tourism and environmentally friendly tourism has partly led to a distrust of the whole domain, especially when there has been suspicion of greenwashing as part of these efforts. However, the recent launch of “The Green Directory”, a website dedicated to responsible travel by a U.S. online travel agency Travelocity, proves that there exists confidence in the opportunities provided by responsibility in tourism.

The focus of this study is finding a new way to gain competitive advantage, and instead of using any of the above discussed terminology this research will use the term “responsible tourism”. This will include the tourism operator’s behaviour towards the environment as well as all other stakeholders of the business from employees to suppliers and from local communities to investors and the government. All of these relationships, when handled responsibly, should be balanced and mutually beneficial. Defining responsibility this way liberates the research from concentrating too much on the environmental impact of the business and enlarges the potential customer base from eco/environmentally aware individuals to anyone interested in the well-being of society as a whole. As this study takes a customer-oriented approach to the demand of responsibility in tourism, this framework provides a good starting point for formulating a general theory on the topic and later gathering data in order to test it.

To avoid misguidance, this study will concentrate on the indicators of financial performance that can be affected by a potential customer of a tourism business. Revenue and net income of a company should be the only financial measures considered when making a customer-oriented study. The purchase decision – negative or positive – is the moment when each individual can “vote with their feet”; a customer can choose to support or reject the CSR-activities taken by the company. For example, a market valuation-based measurement does not reflect the customers’ immediate decisions, but the anticipation of the decisions by the financial market participants.

Figure 1 presents the structure of a model that can explain how businesses operating within the tourism sector could gain competitive advantage through CSR, improving their financial performance. As we have argued above, there is dislocation in the market for products and services that connote responsible tourism. In Figure 1 we observe that the supply for ‘real’ responsible tourism must be based on two pillars: customers’ expectations of responsibility and the provision of product/services that meet those expectations. By responding to such demand, tourism providers can gain a competitive advantage for their businesses. This demand must carry a “responsible brand”; thus by attracting such demand, improvement of financial performance measured mainly by revenue (as this is what consumer choice affects) as well as net income (to include the cost of being responsible) should occur.

Demand and Supply of Responsible Tourism: a Conceptual Model of Competitive Advantage

Kuokkanen & Rios-Morales (2009)

Figure 1

CONCLUSIONS

This paper maintains that the “sustainable” or “responsible” tourism offered today does not attract demand due to the dislocation between supply and demand. We argue that the underlying reason is that the tourism operators and service providers have little or limited knowledge of the real demand for responsibility. Providers select their responsible actions without studying the demand by the customers. Therefore the demand for the existing supply of responsibility remains weak. Tourism operators will need to determine their customers’ expectations; meeting this demand is a key to competitive advantage. We also argue that businesses would need to develop “responsible brands” supported by a tailored set of indicators in order to create this competitive advantage. The new demand from customers seeking responsibility will improve financial performance through increased volume and revenue.

THE FINANCIAL DERIVATES IN THE ITALIAN LOCAL AUTHORITIES

Lanza, Mario¹

¹*Seconda Università Degli Studi di Napoli, Dipartimento di Strategie Aziendali e Metodologie Quantitative*

Purpose. The main aim of this paper is to emphasize the potentially dangerous effects on the finances of the local authorities that utilize derivative instruments. Especially it stresses the opacity of the contractual mechanisms, the lack of information, the different purposes that have induced local representatives to subscribe such contracts, the potential difficulties that economic operators shall deal with, in coming years, and the possible solutions to a problem that is going to assume huge dimensions, in the future.

Design/methodology/approach. The present situation of Italian local authorities, both municipalities and provinces and in particular of Pozzuoli has been analysed, through the processing of the data furnished by the "Corte dei Conti" and the results of the survey have been emphasized.

Findings. This survey has shown that in spite of the bad practices, such as most derivatives have proved themselves, perhaps also because of the crisis on financial markets, the innovative finance has produced typologies of instruments that have given a strong input to local development and growing.

Originality/value. The following step after this survey would be the developing of a different approach to prevent an improper utilization of derivatives in the future and to permit local authorities to exploit the benefits that come from a careful use of the financial risk management.

Keywords local authorities, derivative, innovative finance, dangerous effects.

Paper type Case study

INTRODUCTION

The acknowledgment, brought about with the constitutional reform in 2001, of the financial autonomy of the public territorial entities, with the subsequent marginalization of the financial resources from the centre to the outskirts, has had, as is known, as an important consequence, the matter of the indebtedness of the local authorities.

The course which has brought the local authorities to an administrative and financial autonomy, in Italy, has been long and characterized by a succession of insurmountable difficulties, especially regarding the problem of the local finance which, to this day, has yet to find a radical solution able to conciliate autonomy, transparency and rapid methods of retrieval of the economical-financial resources.

In other terms, with the reform, the problem of finding external sources of financing of the investment expenses of the local authorities, has intensified. These, together with the divestment of their own disposable assets and the processes of privatization, have taken out passive loans and issued debenture loans.

In sum, the changeover from a "derivative" public financial system to a regime of autonomous finance has brought about the running out of numerous resources previously transferred from the central Government.

Such reduction has come about contemporarily with the increase of the demand for services by citizens, to which, at least initially, a guaranteed financial coverage, was not assured.

Together with this, the restrictions on the demand for credit of the local authorities have increased, derived both from reconstructive actions of the public finance and from the entrance of Italy into the European union first, and subsequently into Euroworld.

This context which has just been described, of scarce resources, timid tax autonomy and growing restrictions on indebtedness, has given rise to the need to turn to financial instruments which allow for the search of sources without having to readjust local taxation excessively and without further burdening the budget with the expense of passive interest rates.

Financial instruments created for use in private enterprise have been adapted to the needs of the local authorities, instruments for the active management of debt and liquidity have been created, the debt has been restructured, private subjects have been involved in the management of these instruments.

This phenomenon which has been defined by many observers as the “innovative finance” has been proposed as an alternative to traditional finance.

The financial innovation has produced types of derivative instruments with levels of complexities and structural characteristics diverse amongst themselves. From the first forward contracts one has moved, with modern finance, to swaps and to option contracts, up to instruments of a complex structure.

When one speaks of derivative instruments, therefore, one refers to a very heterogeneous whole of instruments with characteristics and mechanisms with different functions.

In principle, derivative instruments carry out a positive function for the financial system, as they allow for an optimal allocation of the risks. As a matter of fact, derivatives allow for the transfer of risks towards those subjects who are better capable of bearing or managing them.

The evolution of the market has brought about the affirmation of more and more complex instruments, the comprehension and evaluation of which requires sophisticated financial capabilities. Such capabilities, however tend inevitably to remain concentrated among the brokers.

For those functions, therefore, the derivative contracts and markets have been recognized by the economical-financial theory as elements of fundamental importance for the overall efficiency of the financial system.

The most complex problem of the derivatives, has always been that of the assessment of their value, or rather, of their estimated value. The estimate of the value of the derivative products, at a certain moment, requires the capacity to simulate the possible future scenarios of the underlying with the aim of determining, for each scenario, the subsequent value of the pay-off.

Their trend “derives” from other financial products. From here the risk level implicit in the “derivatives”. These are confirmed, however, as an important opportunity for those administrations short of resources, involved in operations of debt restructuring or research of funds for new investments.

The recent developments of the international economy have seen to it that terms such as derivatives, futures and options are pointed out as “instruments of the devil”. In particular the operations of derived finance are placed on the defendant’s stand, together with the so-called sub-prime loans.

In reality, this is not totally true. The financial crisis is making its effects heard even in the delicate public Italian finance, with repercussions on the entire sector of the public local administrations.

This paper comprises two ideal parts.

The first part supplies an analysis of the benefits that the use of such instruments can bring to the budget of the local authorities, the problems which they cause the moment they are not used in an appropriate manner and the abuse that the administrators of the authorities accomplish the moment in which they persist in using a very complex instrument with the aim of solving today’s problems by simply putting them off to the future, probably amplifying their negative effects.

Before examining the critical points of the use of financial instruments, the various interventions that the legislator has conducted with the aim of limiting their use to the maximum, have been analysed. As a matter of fact, at the moment, the legislator has prohibited the local authorities with the possibility of undersigning such a type of contract.

Once the regulation has been analysed, the critical points and the advantages that such an instrument can generate, the research has concentrated on a national survey which offers a complete picture of the activities of the authorities.

The survey, which is based on the processing of the data supplied by the “Corte dei Conti” supplies a complete picture of the situation of the authorities which through the years have undersigned such a

contract, and classified according to the number of inhabitants and region, thereby supplying a picture of the possible losses that the authorities expect to endure in the years to come.

In the end, the survey also concentrates on the use of derivatives in the Campania region, analysing in particular the situation which at the moment concerns the municipality of Pozzuoli and which represents an obvious case on the national territory.

THE LOCAL FINANCE AND DERIVATIVES IN THE ITALIAN LOCAL AUTHORITIES

The deep evolution of the financial function of the public authorities has significantly changed the demand for banking and financial services from the public subjects (especially provinces, municipalities and regions) which have felt the need to adopt politics of dynamic and managerial management of the financial activities and liabilities.

A typical and characteristic object of this changing process is the use of derivative instruments for coverage and remodulation of the contracted debts. As a matter of fact, the authorities have started to perceive the need to adopt restructuring techniques of the passed debt, which has long been used among the private subjects, thereby realizing an active management of the debt verged towards diminishing the financial charges of the indebteding operations and to pursue a balanced and dynamic portfolio structure.

The need, from the sub-governmental government authorities, to turn to the drawing up of derivatives can be dated back to 1994.

As a matter of fact, in terms of access to the credit on behalf of the regions, provinces and municipalities, in eliminating the monopoly of the "Cassa Depositi e Prestiti" and reactivating their right to be admitted to the capital market in issuing debenture loans, has inevitably increased the exposure to risk in the fluctuation of exchanges and rates.

The subsequent, strong process of decentralization of the administrative functions and the contextual dynamics of the Italian public finance have determined a trend in the heavily rising debt of the territorial authorities.

It deals with an effect which is totally physiological, and which on its own does not represent a source of concern, but an index of the maturity of the local institutions.

The substantial lack of rules (and the subsequent lack of exercise of ministerial power of coordination) has brought about the development of debatable strategies of "financial survival" on behalf of the administrators of some authorities (often of small dimensions); these, overwhelmed by a growth (of the costs) of the traditional debt at times unbearable and faced with the huge cuts to revenue reassignment, the block of the local taxation system, of the continuous dilation of the uncontrollable expenses and of the severity of the restrictions imposed by the Internal Stability Pact, have often used the derivative instruments not to cover exchange or rate risks, but to pursue goals of a (near) speculative nature, or rather, more mundanely, to "make cash"¹²⁸.

That of the limits for the use of derivative financial instruments on behalf of the local public administrations constitutes a topic of undoubted importance, not only in Italy.

In particular, two possible abnormal aspects in the use of financial derivatives by the territorial authorities, have been adumbrated: on one hand, some may have been coerced into purchasing protective measures against the market risks, whereas in reality they have burdened themselves with heavy future charges, all in favour of the counterpart (or rather, of the bank and broker); on the other hand, other entities would have used the derivative operations to elude the limits of the indebtedness or rather to surreptitiously transfer the charges of their own debts to the future generations.

¹²⁸ Atelli, M. (2008), *Gli strumenti derivati negli enti locali*, Il Sole 24 ore Libri, Milan.

In both cases, it has to do with time bombs that, in the years to come, will not fail to determine a detrimental effect on the finances of the entities themselves.

In synthesis, the principle benefits¹²⁹ that the entities can achieve from a careful application of the *financial risk management* and from the use of the instruments of derivative finance consist in:

- the overcoming of a static vision of the residual debt represented by loans and debenture loans;
- the possibility to intervene on the characteristics of the liabilities, by not eroding the available margins of the plafond of maximum indebtedness;
- the possibility to redefine the financial fluxes which derive from a determined structure of the liability;
- the exploitation to their own advantage, of any trend in the curve of the interest rates futures;
- the stabilisation of the conditions of financial balance, thanks to the possibility to optimise the cost of indebtedness in relation to the trend of the market interest rates;
- the creation of wider margins of financial manoeuvres to destine towards investment expenses;
- the possibility to improve one's own rating by effect of the restructuring of passed debts.

Territorial entities and derivative financial instruments: opportunities and risks

In the past months the debate on the nature and function of derivative financial instruments in relation to the territorial entities and to their activity, has been particularly lively both because some negative financial effects caused by the contracts stipulated in the passed years, have surfaced, and because public attention has been attracted by the more general question of the derivative finance and by the negative consequences that have resulted, even in relation to the trend in the financial markets. In reality, the effects which have appeared in these months are the mere consequence of a conduct carried through in the passed years, and have not been comprehended in all their possible negative implications, neither by the operators of the entities nor by the legislator.

In the financial world, for many years, a lively debate regarding the nature and the potential danger of these types of contracts has been going on, so much so that in 2001 the famous investor Warren Buffet defined them as "financial weapons of mass destruction".

The potentially dangerous effects for the finances of the territorial entities were brought to light by television shows and by numerous journalistic surveys which highlighted, especially, the opacity of the contractual mechanisms and the scarce information of numerous operators of the territorial entities who gave course to these relations.

Moreover, the same legislator, after having allowed the use of this type of financial instrument to the local entities, intervened with a series of regulatory interventions directed, progressively, towards placing some restrictions to their use and to schedule a specific control entrusted to the "Corte dei Conti".

The development of such a financial instrument, can be explained with the possibility of reducing some risks, as well as with the reduction of the coverage costs, with the increase which they entail in the liquidity and therefore in the functioning of the financial markets, with the recent progresses in the field of financial theory, which allow for a more precise assessment of the risks and of the value of the various instruments, as well as with the large possibility of arbitration offered by the differences in regulation at an international level.

It must be remembered that the creation of such instruments has not only had positive effects. As a matter of fact, while their basic goal should be that of reducing the risks for the entities, this cannot always be done completely with single operations; on the other hand, the use of such instruments tends to swell the

² 129 Loris, M. and Nadotti N. (2009), *I derivati nelle PA locali. Origine, dimensione e criticità.*, Franco Angeli, pp 29 -38.

budget, both of the entities and of the banks, and therefore, paradoxically, tends to increase the need for an efficient management of the overall risk, while the data of the budget itself are not easily comprehended.

The emergence of these new instruments contributes to increase the instability of the markets, moving the attention of the operators contemporarily from the basic savings and investment market in the direction of speculation, as well as, in general, towards the yields and short-term perspectives. Whereas, in actual fact the initial aim of the derivatives is to act as protective instruments against risks, they can also be used for speculative purposes, as a matter of fact they are now used a lot more for speculative purposes than for protection purposes.

In recent years these have also been used to hide budget losses, to forward an indebtedness which has been difficult to confront at the moment.

The truth being, as mentioned, it has to do with instruments often of difficult comprehension in all their implications and this explains why they can paradoxically bring to huge losses and, in the case of an economic crisis, can accentuate the systemic instability, via the tight connection they implement, between the various financial markets.

The difficulty in fully comprehending such instruments on behalf of the operators has brought about in that time, when the formers started being imported into Italy by the large Anglo-Saxon banks, the consequence that the Italian banks have paid heavy costs to their foreign counterparts before being able to somehow possess the instruments; many of them, now, together with the foreign banks, are apparently trying to carry out the same operation with the Italian public entities, after having done so with the enterprises, especially the small and middle-sized ones.

One of the problems that can emerge is that, at least in the eyes of a not-so-expert entity on the matter, the true cost of a contract can be masked by a price offered by the counterpart bank which is substantially different, and often higher than that of the market. One speaks of "implicit" costs even with regards to this.

The derivatives have often been improperly finalized towards ensuring alternative sources of liquidity of other financial advantages to the detriment of future managements: this has posed and continued to pose the need for more controls and attention, as these are products which are frequently characterized by elements of a complex and high risk.

The active debt management is a positive fact if it does not become an instrument to elude the regulation on the indebtedness of the local authorities, as it often occurs. A solution to this improper use could be that of prohibiting the use of the active debt management for the financing of current expenses.

In the case of swaps, instead, one should prohibit their use by local entities, as has been done in England and in Germany for the past 20 years as they are considered substantially speculative: the swap require decision times that are too rapid for the deliberative processes of a public entity. The example of England is emblematic as even if, it has prohibited the derivatives for local entities since 1991, and therefore not able to "play at home", the English banks have motivated the young financial promoters, through prizes, to conclude contracts on derivatives with the local Italian entities.

If one considers that many of the financial instruments have been activated by foreign banks, which obviously are not subject to controls by the Bank of Italy and sell to the Italians what cannot be sold in their own country, one can comprehend how important a government intervention is, even in this sense. In these cases, obvious problems arise regarding the contractual relation regulated by a law and by a jurisdiction different to the Italian one. As a matter of fact, the provision that the entire operation is regulated by a foreign law, implies a specific knowledge on behalf of the public body, of that particular legislation, as well as of the jurisprudence of that country, of which the rights and obligations of the contracting party can be asserted, and the contents of the clauses of the contractual regulation can actually be interpreted. Furthermore, there are obvious problems with the applicability of the safeguarding measures envisaged by the Italian legislature in favour of the financial investors to obligations borne by the brokers, as anticipated by the Consolidation Act regarding financial matters. Without neglecting that if should arise a litigation

among the parties, the public body could not resort to the Italian justice, but to the judges of another country, with subsequent heavier charges, besides the difficulty of knowledge of the relevant legislation.

The absence of market rules is not a civil fact: public budgets, like the company ones, must be clear and transparent. It is necessary to supply the local authorities with the possibility of getting out of the debt circle without resorting to new contracts, even if it means adopting deterrent methods.

The problem at the source of the derivative issue is the debt of the local authorities: the debts from investments are blocked by the cut in the transfers, one must then understand how the authorities are able to finance the investments, considering the use of the derivatives as a last resort. On the other hand, the banks have not always reacted positively towards the local authorities, who do not have expert civil employees capable of evaluating the adequacy of certain operations and who now find themselves in grave difficulty.

On the other hand, it must be clear that the derivatives, for the contractors, generate proceeds (positive fluxes) or expenditures (negative fluxes). However, it is equally appropriate to clarify that the possible expenditures on behalf of the entity which has concluded the derivative, do not constitute the "profit" for the bank, but a positive flux that compensates, in turn, similar transactions that the bank has set up to cover in turn, in being the bank, typically, a risk manager.

From 2000, for at least five years, the derivative contracts have allowed the banks to regain those margins that the traditional treasury management of the public administrations no longer offered in a period when the rates dropped. It was the swaps themselves that for the renegotiation of the interest rates opened the "hunting grounds" constituted by the debt in local entities, for the private operators. A debt always more difficult to manage for the public administrators, struggling with the progressive clampdown on central transfers and with the further restrictions to the budgets due to the Stability Pact. The proposal of the banks sounded like the classic squaring the circle, to the ears of mayors and city council members: with the swap interest rates, it appeared possible to restructure the debt, postpone the deadline (after the end of the mandate), lower the rates and, often, obtain an initial cash flow from the banks.

In synthesis, the implied critical points in the derivative contracts, and in general, in the financial operations connected to them, and which hide the cause of the heavy losses highlighted by some entities, are:

Distorted purpose. Many derivative contracts were proposed and subsequently sold to entities as coverage instruments against the risk of increase of interest rates.

These instruments should have annihilated the negative effects on the cash flows and therefore render the financial management of the debt immune to the variations of the rates. In reality, in many cases the contracts turned out to be speculative, or rather, downright bets without any aim of coverage.

Complexity of the contracts. The complexity of the formulas that defined the payments was such that it made comprehension of the contract and evaluation of its suitability in favour of the objectives of the entities, absolutely unfeasible for those not involved.

Such complexity has made both the comparison of the contractual conditions with alternative forms, and the calculus of the risk profile in terms of future cash flows, practically impossible

Lack of liquidity. The swap contracts, once stipulated, cannot generally be transferred to other subjects and can be closed and/or renegotiated only with the initial bank. The banks have taken advantage of this situation by imposing the companies with particularly penalizing closing costs and/or conditions.

Due to the high competitiveness reached in the field, the banks make most of their profits in the closing (unwinding) phase of swap rather than in the subscription phase. The entity is generally not totally aware of the unwinding conditions at the moment of the drawing up of the contract.

Absence of reference prices. The fact that the contracts are not exchanged in liquid markets implies the impossibility for the entity to have reference prices with which to evaluate the convenience in the drawing up phase and subsequently the market value during their life-span. The "structured rate", paid by the entity to the bank and often resulting from complex mathematical formulae, makes the evaluation of the value of the contract furthermore possible (fair value) only to specialized operators.

Renegotiation and coverage of the losses. The banks tend to hide from the entities the losses which derive from the contracts, in terms both of the market value (Mark to Market) and in the expected cash flows. Most of the times they propose to close the original contracts (unwinding) and to substitute them with new contracts which appropriate the negative mark-to-market. Such contracts have, however, a probability of generating negative cash flows for the entity which are higher than the previous ones. Furthermore, they are often based on a higher notional value, thereby increasing the risk exposure for the entity.

Problems subsist even with regards to the discipline of a financial character inherent to the recording and the representation of the budget of the entity. Even in relation to this profile each entity should check the procedures followed and eventually, place in being the necessary corrective interventions with the aim of rendering the effective financial situation transparent and evident, even in relation to the risks taken on with the derivative contracts.

In conclusion, it can affirm that the entities must use the swap contract carefully and in such a manner as to minimize risks and take on the advantages relative to the managerial flexibility of the debt. In particular, it is necessary to:

- a) carry out a careful examination of the reference scenario (both internal to the local authority, and relevant to the exterior, especially with regards to the expectation of the current interest rates on the capital markets);
- b) a careful structuring of the operation in coherence with the characteristics detected during the preliminary analysis;
- c) assistance/consultancy of a selected advisor (with the procedures for the choice of contractor as expected by the regulation), which does not correspond to the broker with which the operation is carried out;
- d) operate in full respect of the current regulation thereby avoiding interferences on behalf of the press or public opinion who can jeopardize a correct and orderly management of the operations.

USE AND DIFFUSION OF DERIVATIVE INSTRUMENTS

From the second half of the nineties local authorities have been resourcing to financial derivative instruments to manage their liabilities. Starting from the years 2001 and afterwards, legislators tried to avoid the assumption of excessive risks and the improper use of such instruments through a series of regulatory interventions. Hereafter the management of derivate instruments is analyzed .

At the end of the years 2000, according to official sources, the value of financial bonds, subject-matter of derivative contracts, was around 0,1 billions Euros, while at the end of 2008 the value was around 26 billions Euros.

If the existing transactions should be closed the corresponding amount that the local authorities should pay to the brokers went from about 2 millions Euros at the end of 2000, to 1,1 billions Euros approximately, at the end of the year 2008. The high level of those values and the poor connection with the course of the market rates reflects an utilization of the derivative instruments to satisfy liquidity needs, as well.

Considering the relationship between borrowing and utilization of derivative instruments, some results are mentioned with the aim to give a general idea of the actual situation of the local authorities that have utilized derivative financial instruments in Italy.

Municipalities and provinces in the grip of the derivates: the case of Pozzuoli.

The combined debt of the municipalities and the provinces, according to the survey of the "Corte dei Conti", adds up to 55,4 billions of Euros, the 57,5% (31,9 billions) of these are derivative products.

Referring to the municipalities, the combined debt adds up to 46,6 billions, of which 27,3 billions are constituted by derivate products, referring to the provinces against a debt of 8.8 billions, the derivates add up to 4.6 billions.

The following table (tab. 1) indicates the number of municipalities that have made derivative financial transitions.

In Italy on the total of 6.482 municipalities¹³⁰, around the 11,4 % of them uses derivative instruments. At the end of 2007 municipalities charged by derivatives added up to 497, with a change in percentage of 48,3 % compared to 2008. The comparison is alarming because the data of the year 2007 refer to all the region of Italy, while those one of 2008 do not include the regions of Piemonte, Trentino Alto Adige and Valle d'Aosta; the conclusion is that in one years the Italian municipalities that have subscribed derivative instruments are doubled.

At the end of last years, the local authorities that had subscribed derivative contracts with resident counterparties, were beyond 450, 32 provinces and 400 municipalities, according to official sources. It must be emphasize that the biggest local authorities frequently contact nonresident counterparties, too, whose operativeness is not registered by the head committee of risks and of vigilance.

¹³⁰ Referring to the data in this table and in following ones it must be specify that they are related to nearly all regions of Italy. Only the data of Piemonte and Trentino Alto Adige are missing, because they are to be elaborated, while in the autonomous region of Valle d'Aosta is not yet constituted the regional Section of vigilance.

	<i>Dimension of authority (resident)</i>					<i>Totale</i>
	<i>fino a 2000</i>	<i>2001 - 5000</i>	<i>5001 - 10000</i>	<i>10001 - 50000</i>	<i>oltre 50000</i>	
<i>Lombardia</i>	14	23	25	28	3	93
<i>Veneto</i>	1	12	16	30	3	62
<i>Friuli</i>	8	10	5	4	1	28
<i>Liguria</i>	1	1	3	3	3	11
<i>Emilia</i>	8	15	8	17	8	56
<i>Tuscany</i>	13	17	13	15	8	66
<i>Umbria</i>	10	9	5	8	3	35
<i>Marche</i>	3	13	8	11	1	36
<i>Lazio</i>	1	3	11	23	5	43
<i>Abruzzo</i>	10	7	4	7	3	31
<i>Molise</i>	1	3	1			5
<i>Campania</i>	1	16	15	28	6	66
<i>Puglia</i>	2	11	19	30	5	67
<i>Basilicata</i>		5	5	2		12
<i>Calabria</i>	6	10	13	13	4	46
<i>Sicily</i>	3	15	14	20	6	58
<i>Sardinia</i>		11	3	7	1	22
<i>Total</i>	82	181	168	246	60	737

Table 1 – Municipalities with existing derivative instruments (number of authorities according to the regions and the dimensions)

The above-mentioned data prove that most municipalities that use derivative instruments are in the regions Lombardia (93 authorities), Puglia (69), Campania and Toscana (66), however the phenomenon of derivatives is diffused everywhere in the country on an average beyond 43 authorities for every region.

In eighty-two local communities the population is smaller than 2000 inhabitants while in 181 ones it is between 2001 - 5000, nevertheless it must be underline that derivative instruments are concentrated for the 70 % in the municipalities with a population above 50.000 inhabitants (44,1 % of the authorities) and between 10.001 - 50.000 inhabitants (25,9 % of the authorities).

The use of so complex products by small authorities generates some perplexity; besides it is noticed the utilization of very complex types of contracts looking like exotic derivatives. These contracts connect the payments to the authority with variables as the slope of the rate curve (Steepeners), its convexity (Butterflies), the share index or commodities.

Exotic contracts often give the impression to obtain good saving on the loan rates, through several devices in the contract structure, this caused huge losses by local authorities, that payed small rates during the first years and prohibitive amounts in the following years.

Here (tab. 2) are the data referred to the municipalities of the province of Naples.

	<i>Dimension of authority (resident)</i>					<i>total</i>
	<i>till 2000</i>	<i>2001 - 5000</i>	<i>5001 - 10000</i>	<i>10001 - 50000</i>	<i>above 50000</i>	
<i>Naples</i>		2	3	13	2	20

Table 2 – Municipalities with editing derivative instruments in the province of Naples.

In the province of Naples the 21,7 % of ninety-two municipalities utilized derivatives, a higher data than the national average; particularly the 65 % of them is constituted by municipalities with the population from 10.001 to 50.000 inhabitants.

The city of Pozzuoli stipulated three contracts of interest rate swap¹³¹. The first contract, subscribed in 2005, had a national amount beyond 40 billions Euros, equal to the residual debt of the local authority towards the "Cassa Depositi e Prestiti".

In that contract, the city of Pozzuoli had "bet" that the Euribor, during the contract (for a period of six months), would have kept in a prefixed corridor. It did not happen and the loss amounted beyond 8 millions of Euros. In the 2006 this contract was substituted by a new one which aimed to avoid the losses caused by the unfavourable rate trend. This new contract would have permitted to obtain more favorable conditions referring both to the debt rate and the financial advantage by the city during the whole operation (till 2026), it would have permitted, too, to reduce the risk. In 2007, the city, to find new financial resources immediately, subscribed a third contract and postponed the problem to the following accounting periods. The contract wanted to mitigate the impact on the interest shares of the years 2007 and modified the sinking plan of the debt through a reshaping of the amortization quotas of the capital. This reshaping permitted the city to reduce the amortization quotas till the year 2023 but on the other hand these ones would become higher in the following years. Through this operation the contract would have matured in 2032, extending the average time of payment of the debt, produced higher rates on that one caused by an increase of the capital on which they are calculated.

In the first swap contract subscribed by the city of Pozzuoli there were some digital options or generally some clauses that showed its speculative nature. All that was in contradiction with the principle to hold down the financial risks of the authority and it would be an unhelped way of salvation for the city; infact administrative cases could produce the abolition of the contract not in keeping with the laws in force. Such a judgment would resolve the problems of a lot of Italian municipalities.

Digital options, having a speculative nature produce a jump in payments, when reference rate exceeds the established limit, near the strike the value of the options has high variations against low variations of the underlying.

The huge, real and potential, losses are explainable by the presence of such options, that can defeat a favourable progress of the market.

The situation of the municipalities in the province of Salerno (tab. 3) is not different from that of Naples.

	<i>Dimension of authority (resident)</i>					<i>total</i>
	<i>till 2000</i>	<i>2001 - 5000</i>	<i>5001 - 10000</i>	<i>10001 - 50000</i>	<i>above 50000</i>	
<i>Salerno</i>	1	4	5	8	2	20

Table 3 – Municipalities with editing derivative instruments in the province of Salerno.

In the province of Salerno on a total of 158 municipalities only 12,5 % has subscribed derivative instruments, in average with national data, with a peak of 40 % in the municipalities with a population between 10.001–50.000 inhabitants.

Referring to the provinces, the data (tab. 4) put in evidence that on a total of 99 authorities, in the regions like Umbria and Friuli, all the provinces are utilizing such instruments, while lower percentages can be found in the Sardinia, Tuscany and Sicily regions.

Table 4 - Provinces with existing derivatives (number of authorities for every region)

From the table that follows (tab. 5) it appears that, in the annual budget of 2008, the municipalities that foresaw losses related to derivative operations, are 52,5 %, that is 387 on 737, while 36,8 % of them is still considering positive the situation, another 10,7 % did not give any information. The data would show that most operations could be negative. Most authorities, that suppose some losses are in the Sardinia (72,7 %), Friuli Venezia Giulia and Umbria regions (both to 71,4 %).

Table 5 – The number of municipalities that are supposing a loss for a derivate instrument

The highest negative incidence (tab. 6) can be found in operations concluded by authorities with a population below 2000 inhabitants (56,1 %), followed by those with a population between 10.001 and 50000 (54,1%). The most virtuous municipalities are those one with a population between 5001 – 10000 inhabitants.

Table 8 – The losses of the authorities caused by derivate instruments: supposed sums

The losses of some local authorities as a consequence of having stipulated swap contracts, come from a series of natural criticalities implied in the same authorities:

Specific competences. The pricing of the swap and the derivatives, requires highly specialized competences and the considerable investments in the technology, possible only by specialized subjects. That caused an objective difficulty the advantage to subscribe derivate contracts;

The conflict of interest. The coexistence, in the same seller bank, of the roles of the advisory and the apposite party, creates an evident conflict of interest; the bank is stimulated to suggest exotic swaps with a high margin of gain, often opposite to the specific needs of the authority.

Risk management. It is necessary for the authorities the monitoring and the managing of the risk associated with their liabilities, accounting the potential losses conditionally to the worst settings, even more when they subscribe derivatives, wing to the leverage effect associated with them. An appropriate monitoring of the positions would have prevented most losses by the authorities.

Lack of control. The operations with derivatives are difficult to the check by citizens both in their nature and in their sums. This gives a lot of freedom to the local representatives, who are not aware of the loss. An independent specialized advisor could assume this purpose of control.

About that Edmund S. Phelps¹³² tells that most economists are persuaded that economy is foreseeable and understandable. But today we are seeing that this is a presumption, the financial engineering has considered subject of sure knowledge what cannot be. Phelps picks on the scholarship of the last 40 years, the so-called

¹³² Margiocco, M.(2008), "Azzerare i rischi, l'illusione di una formula magica", *Il Sole 24 ore*, March 18, 2008. It contains an accurate analysis of the questions related to the mathematics formulas and their reliability and the contrast of these latest years among the different schools of economics.

“rational expectations” full of employments in financial field and he concludes that the formula that had to spread and cancel the risks of all the investments has diffused the risk with an unstoppable series of engineering and derivate sales. The guaranteed safety has become a guaranteed loss.

In this period when the interest rates are having a high reduction and the volatility of rate curve is increasing calculating the losses that the local authorities foresee the power of renegotiation of the contracts could be exploited by the same authorities with the purpose to reduce the possible potential losses related to the contracts.

With relation to the financial structure of each derivative operation, and particularly to the variable rate borrowing, the situation of the local authorities is changed and has become more favourable to the same authorities.

The population resident in the municipalities that foresee to have losses in equal to 6.312.984 inhabitants. It can be calculated approximately the average amount of the loss for each inhabitant in the interested municipalities, that is of 11 Euros, as the following table shows.

	<i>til 2000</i>	<i>2001 - 5000</i>	<i>5001 - 10000</i>	<i>10001 - 50000</i>	<i>beyond 50000</i>	<i>total</i>
<i>North west</i>	9,4	36,8	10,3	13,6	4,4	6,8
<i>North east</i>	13,2	26,8	4,6	6,8	10,8	9,9
<i>Centre</i>	10,6	9,7	5,7	21,5	3,8	11,4
<i>South</i>	11,7	8,3	5,1	4,7	26	13,5
Total	11,1	14,5	5,9	10,5	11,9	11

Table 9 – The losses of the municipalities caused by derivates: supposed seems. (The distribution for territorial area and the dimension of the municipality)

The highest medium sum is in the municipalities between 2001 and 5000 inhabitants (14,5 Euros), the lowest a population between 5001 and 10000 inhabitants (5,9 Euros).

With relation to the provinces the exam of the data (tab. 10) shows that only the 20% of local authorities (8 among 40) supposes to suffer losses while the 65% thinks that the operation is positive and a 15% did not provide any indications.

Table 10 – The number of the provinces that suppose a loss for the instrument

In substance, the local authorities which have ended up in the quick-sands of the derivatives during the years of reckless finance, see their long-term financial position seriously degenerated, therefore, even if in June the disbursements are less or zero thanks to the drop of the BCE and Euribor rates to which the contracts are linked, in prospective the entities will have mountains of debts.

As a matter of fact, next to an immediate benefit for the entities, brought about by the drop in short-term rates, an increase in the future feasible payments from the entity has occurred. An increase that could result absolutely current the moment in which the entity decides to extinguish the contract in advance.

A last consideration regards the sensibility of the mark to market of the swap contracts with long-term rates: it depends on the so-called duration, or rather the average financial duration of the contracts. The higher it is, the heavier the impact of the variation of the long-term rates on the mark to market.

The administrations shouldn't commit the error of being content to have a credit balance on the half-yearly coupon, thanks to the favourable trend of the reference rates, which have nothing to do with the expenditure costs, the market to market, but should proceed towards a meticulous exam of the products with the aim of closing or selling the position.

The confirmation arrives from a few concrete cases such as Telese Terme (BN), Valledoria (SS) and Recanati (MC) that closed their position at no cost or at bearable costs taking advantage of momentary drops of the forward curves and therefore of the improvement of the mark-to-market.

In all the contracts related to derivative financial operations, the choice to recede in advance, prior payment of a "substitution cost", is attributed to the public entities, the determination of which is entrusted to the intermediary, without the specification of precise parameters, except for a generic reference to objective criteria.

The clause, considered to be the nature of the contract, its long duration and the particular quality of the public entity that is administered by subjects that manage public resources presents profiles of a particular criticality since it should be formulated envisaging precise parameters.

It is true that it deals with the application of discounting-back of the expected financial fluxes in relation to the variation of the rates, but on account of the uncertainty of the financial markets and the nature of the public entity, both the minimum and the maximum limits of the possible cost that the entity is taken to bear in the case of anticipated dissolution of the contract, are clearly determined at the signing of the contract.

The public entity that intends to proceed with the termination of the contract cannot limit itself to taking into consideration the overall gain possibly achieved or the heaviest loss possibly envisaged, but must carefully evaluate with full knowledge of the facts, which were the elements taken into consideration by the intermediary to determine the cost of substitution, or similar, and where there is a dispute in the calculation of the parties, it will be necessary to turn to the judiciary authority with the aim of determining the sum effectively given from one party to the other.

CONCLUSIONS

Use of derivative contracts can offer local authorities a guarantee against some financial risks (especially fluctuations of interest rates) and facilitate debt management.

In the first place, they produce immediate benefits to which, however, correspond strong risks of future heavier charges; such risks, moreover, are often of a difficult quantification, due to the frequent complexity of the derivatives, which makes the management on behalf of the (not always qualified) local civil employees, arduous; furthermore, the destination of the liquidity prizes, which are nearly always used to meet operation expenses, is problematic.

However, as dealing with complex financial instruments, assessable with difficulty especially by the smaller entities, their use can determine a significant increase of the financial charges and a reduction in the transparency of the public accounts.

But the worrying factor is, also, the distorted use of the derivative instruments: many local authorities which have carried out operations on the derivatives, of many local authorities that have carried out operations on the derivatives, only a very limited number has turned to them according to the original functions, tied exclusively to forms of tax risk coverage, whereas the remaining part utilizes the derivatives to remodulate the debt with the aim of reducing costs, or as a form of financing, via use of up-front, thereby ending up, as a matter of fact, bearing all the risks of these instruments.

The budget restrictions imposed by the regulations, the continuous limitations to the transferrals of government finance to local finance, constitute the entirety of the causes which have induced many local administrations to search for solutions as innovative as they are risky, to face their own financial necessities.

A careful analysis has highlighted various critical points which have been analysed under different points of view and to retain that the main cause that pushed the administrators to subscribe to such contracts was the possibility of recovering resources to reinvest and to postpone to the future possible problems connected to the excessive RICORSO to indebtedness.

At this point, it is admissible to ask oneself if the administrators have an administrative responsibility and must answer for their conduct not only to the citizens but especially to the competent bodies and if in their regards such actions are taken that make administrators in the future, in general, more careful towards the budget and squandering.

The administrators, especially the mayors, from their part, have the extenuating circumstance, that in the past years the decrease of the income and the restrictions of the Stability Pact have induced them to search for new sources.

The derivative instruments suited their purposes, in so much that on one hand they should have had to guarantee them from an increase of the interest rates and on the other find new resources essential for the smooth-running of the public administrations.

The current difficult situation is due to, firstly, the absence on behalf of the public administrations of adequate professionalism to carry out sophisticated financial operations; the evaluation of the structure of an operation, the calculus of the swap mark to market, the analysis of the contractual clauses, of the possible implicit costs and of the associated risks, require competences which are difficult to find in the local authorities.

Furthermore, the civil employees tend to think that the operation terminates with the signing of the contract, neglecting the importance of a continuous monitoring of the trend of the rates and the opportunity of renegotiating the same operations.

Considering that the swap is a zero-sum contract, or rather, the loss for a contracting party is compensated by the gain for the other, in the relation with the Credit Institutions a public administration finds itself in an unfavourable position.

Facing these difficulties, the local authorities tend to turn to an advisor, typically a broker. This phenomenon amplifies the risks of the operation, as often the advisor takes on directly, or more often, via a controlled institute, even the position of counterpart with which the body stipulates the contract, thereby generating a dangerous situation of conflict of interests.

It has been found, that in the local authorities there is an excessive trust in the Credit Institutes, some of which have adopted an opportunist behaviour, exploiting the asymmetry of competences to their own advantage.

The current situation is not to be attributed solely to the administrators but also to the Government who has done nothing but push the territorial authorities towards more complex instruments with the conviction that they are capable of managing them in an autonomous manner, and without arranging an inspection at

the source of the undertaken operations, especially the financial ones, and above all their continuous supervision.

Furthermore, the tightening of the rules has brought more disadvantages than reasons for optimism for the local finances: externalization in strong growth, distorted use of the derivatives and excessive recourse to urbanisation charges and project finance instruments.

It is not sufficient to verify if the instrument is conformable to the law, but it is necessary to understand which is the connected underlying, the implicit costs and the possible probabilities of substitution or extinction in the case of a negative trend.

The intervention of the administrator in such a mined territory should have been quicker. We must not forget that the first big bankruptcy case due to an incautious use of derivatives regarded a local American authority, Orange County, who due to the derivative financial products in 1994, lost 1,6 billion dollars.

There is a common fear that many horses have already bolted and that some problems are about to arise. Even a swap from fixed to variable rate is an operation that should be surrounded by the same caution and by the same checks with which one looks at the assumption of a debt.

Many of these operations have produced more advantages for the counterpart than for the entity. The only criteria used has been that of hedging, in the shortest time, the interest charges, totally disregarding the encumbrance or how much risk would be left for the future managements and above all without remembering a hard and fast law of the market.

In trying to free oneself from the situation by closing the contract at the current market conditions, one must be cautious as this approach could turn out to be counterproductive. As a matter of fact, one risks paying other implicit commissions to the banks, probably even higher than those already paid on the date of signature.

In the first place, before taking decisions, it is appropriate to evaluate which are the effective risks of the contract, or rather, which exposure it gives with respect to possible disbursements in the future, until expiry. Here it is appropriate to carry out an analysis to identify and evaluate the consequences of the worst case scenario, or rather, understanding what is the maximum loss that one can reach under the scenario of the most unfavourable rates evolution for the entity. If the worst case scenario is financially sustainable, it would be better to maintain the derivative in portfolio. Otherwise, it is necessary to bring about some changes to make the risk "sustainable".

Some "solutions" can be assumed.

In the first place, the necessary ex-ante evaluation of the risk of the derivative is to be hoped for, so as to know the loss towards which the entity is going and not only to establish the effects ex-post. Therefore, proceed however possible towards discounting back the losses or the proceeds. Naturally, seeing the uncertainty of the rates, one needs to establish a maximum acceptable loss (or threshold) before which the contract can be extinguished without costs. In the financial practice, there exists the so-called mutual terminal clause according to which both parties can establish to extinguish the derivative, at any time, whatever its mark to market is.

Secondly, it may be useful to envisage that the negotiation of such instruments is connected to a predefined period of time: at the most two legislatures, or rather the temporal period within which the administrators are responsible for the "internal" management and have effective "responsibilities" (even electoral) towards the administrative community. Besides this, , as influential experts suggest, the constitution of a purchasing centre of the financial resources could be surmised: the legislator could constitute a centre in which the local authorities are obliged to request consultancies and evaluation in resorting to financial instruments. A less binding alternative, could be represented by the voluntary consortium (envisaged by the Consolidation Act on the local authorities: Legislative decree n. 267 dated 2000, article 31) to carry out a consultancy in the exclusive interest of the local authorities themselves.

Lastly, it is necessary to further involve both the board and the district council of the authority, and not only the person responsible for the financial services, thereby creating a virtuous circle of responsibility and transparency. It is necessary, therefore, that the council resolution contains an indication of the main obligations and financial restrictions that the authority intends to take on, both because the chosen operative method can condition, for a long time, the possibility of use of the resources of the body, and therefore of the administrated community. If then, there are changes that have as an object elements of a substantial type, as it so happens, for example, where the curves of the rates applied in the contract are changed, the decision cannot be only of the person responsible for the financial services, but of the council or the board.

However, we cannot forget, when dealing with local finance, the hurdles still to overcome, regarding the separation between politics and administration, or neglect the delay in implementation of the system of internal controls: all details of the fragility and instability of the local administrative apparatus, that is not capable of responding and elaborating the complex phenomenon of derivatives.

It would be more logical, then, to bear in mind the "transalpine" experiences, which are orientated, in one way (in a jurisprudential manner in the UK) or another (with an administrative circular in France) to exclude the use of the derivative instruments, because "speculative". Of little worth, therefore, all the relative regulation dispositions, when it is of common knowledge that such instruments are risky and therefore not adaptable to an already "vacillating" context.

Furthermore one could proceed and entrust the present and future management to an only subject, such as the "Cassa Depositi e Prestiti", that has all the competences to provide consultancy for the present as well.

The "Corte dei Conti" seems to be the only institutional organism to have the power to put a stop to this improper use of the resources, however, the problem of the derivatives of the local authorities is accompanied by a public debt of the Government among the highest of the western countries.

A centralized negotiation on behalf of the MEF (Ministry of Economics and Finances) would be necessary with the intermediary institutes of the derivatives undersigned by the local authorities, (avoiding that an asymmetrical briefing among the intermediaries and the weaker entities comes about) for a payment of the debts on the derivatives extended in time, even by creating a fund on the model of the "bad bank" in which these "toxic" assets are moved, thereby avoiding that the accounts of the local authorities are bound by these debts for years.

Considering that the near totality of the financial instruments collocated to local authorities, came about on behalf of 8-9 intermediaries, the Government could negotiate an only solution to the derivative problem for all entities, maybe by extending the debt (in 50-70 years), thereby avoiding market rates, and that these local authorities are obliged to declare the default.

The government should, also, impose by law the ban of subscription to high-risk financial instruments on behalf of the local authorities (including the corporate bond), imposing the subscription to fixed-rate loans.

The point is that the increase in the demand for services and the decrease of the transfers are confronted with managerial innovations.

These, to be so, necessitate structural reforms of the public administration (such as the possibility to fire, transparency, accountability, etc.).

Not confronting these issues is an incentive for creative finance.

Today it is possible to ban derivatives, but tomorrow, without reforms, other creative and costly solutions will be found.

Now, faced with these derivative instruments which have been created to cover risks, and which have ended up amplifying them, one must not discriminate in attributing to other financial instruments the same negative value of the derivatives.

As a matter of fact, it is necessary to bear in mind that, in facing bad practices, represented in most cases by derivatives, which have not always provided the results hoped for by the local authorities (partner,

maybe, also the current crisis on the financial markets), regulatory speaking, other categories of instruments have been created, and that have given a strong contribution to the development and growth of competitiveness at a local level such as: bonds, project finance, the securitization of credits and assets and the different lease-back operations.

Practically, not everything that has to do with finance is negative; the contrary is true: the finance instruments, if managed in an attentive manner, enclose immense possibilities for the entities and for the territory of reference.

THE OPTION EFFECT OF ECONOMIC DEVELOPMENT IN NORTH CYPRUS

Li, Eric A. L.¹

¹*Department of Economics, Eastern Mediterranean University, North Cyprus*

Purpose: To explain the wide-spread under-investment in north Cyprus, especially infrastructure such as electricity and water supply.

Methodology: Considering the real option effect in business investment under the conventional cost-benefit analysis.

Findings: Due to the uncertain nature of north Cyprus' future geo-political status, any foreign investment must not only pass the conventional cost-benefit analysis, but also overcome a significant mark-up in net benefit before it can profitably go ahead. This is because potential investors could stand to lose a large amount of initial capital outlay if political situation were to deteriorate. The ability to avoid this has an intrinsic value (option value). This must be overcome by any profitable investment. Hence, the presence of wide-spread under-investment in the small-island economy. This is especially so in infrastructure such as electricity and water supply.

Originality: A first attempt to explain the lack of investment in north Cyprus using real option analysis.

Key words: Cyprus, option, investment, uncertainty.

INTRODUCTION.

Foreign direct investment (FDI) is crucial to the economic development of a region. Not only will the business participants of the direct project investment benefit, but also the supply chains and the economy as a whole. This is the multiplier (trickle down) effect (Parkin, 2005). In north Cyprus, economic development faces a number of significant hurdles. These are largely related to the uncertain nature of its future geo-political status regarding a Cyprus reunification. There are prominent cases around the world where a political settlement could quickly remove this uncertainty. The idea is that once the uncertainty is removed, businesses spring up. Jobs are created and FDI follows. The resulting economic development is the so-called peace dividend (Dunne and Coulomb, 2008). For example, following its re-unification, Germany recorded a jump in FDI from 0.079% of GDP in 1988 to 0.518% of GDP in 1989. The German GDP growth increased to 5.255% in the following year (from 3.896% in 1989). The Czech and Slovak Republics, following their decoupling (happy divorce), turned their GDP growth around from -11.612% and -14.574% in 1991 respectively to a stunning 5.945% and 5.843% respectively in 1995. Slovenia, after its independence from the ruins of the Balkan conflict, saw their GDP growth increase from -8.900% in 1991 to 5.327% in 1994. Its FDI doubled to 1.650% of GDP in 1997 and further increased to 7.193% in 2002. (World Development Indicators, 2007).

For Cyprus, The Peace Research Institute of Oslo (PRIO) calculated that the annual peace dividend in terms of boost to business would amount to EUR 1.8 billion euros (10% GDP by 2015). This translates to EUR 5,500 per household per year (20% of salary in the south and 40% in the north). This peace bonus could double if we added the potential benefits of the implementation of the Ankara Protocol and business generated from the Baku-Ceyhan oil pipeline. (Mullen, Oguz and Kyriacou, 2008)

However, before this peace dividend can be enjoyed, uncertainty must be removed. It is this uncertainty that hinders business investment. This had led to the wide-spread under-development in north Cyprus. The reason is the following. Under pervasive uncertainty, real option theory suggests that any foreign investment in north Cyprus must not only pass the conventional cost-benefit analysis. It must also overcome a significant mark-up (option value) in net benefit before it can profitably go ahead (Dixit *et al*, 1999)

This wide-spread under-investment in the small-island economy is especially acute in infrastructure such as electricity and water supply. As long as foreign investors are holding the development option, they will adopt a wait-and-see attitude towards north Cyprus. Potential investors could stand to lose a large amount of initial capital outlay if political situation were to deteriorate. The ability to avoid this has an intrinsic value (McDonald and Siegel, 1986). This must be overcome by any profitable investment. On the other hand, by

not investing today, potential investors lose the immediate benefits of investment projects (periodic cash inflows from sales, etc.). They will also forgo the upside in their investment value should there be a satisfactory political resolution.

As with financial call options, an increase in the volatility of the underlying instrument (i.e., political situation) raises the value of the option (Baily, 1995). This makes foreign investors more reluctant. On the contrary, an increase in the rate of return of the underlying instrument (i.e., business profits) suppresses the value of the option. This entices investors who fear missing out on profitable business ventures. It partially explains the "property boom" in north Cyprus over the past few years.

In the next section, we explore the theoretical aspects of the real option in investment and its application to north Cyprus. Note that the option here does not mean various investment options such as a hotel project or sea water desalination plant. Rather the option here refers to whether investment should go ahead or not. The paper then examines policy implications due to the presence of this investment option. We conclude with a few remarks.

THE OPTION TO INVEST AND ITS EFFECTS

We begin with a simplistic investment project. It generates cash flow R in each time period after implementation at an initial cost of C . Then the total net present value (NPV) of the project is:

$$NPV = \frac{R(Y)}{r} - C \quad (1)$$

r is the discount rate. R is a function of Y – north Cyprus's economic output. It is natural to assume $R'(Y) > 0$. When NPV exceeds a certain threshold NPV^* (to be determined later), the investor will go ahead with the project. In the traditional cost-benefit analysis, $NPV^* = 0$. Before the investor invests, he retains the option of doing so. Suppose the cash flow stream R depends on the economic output Y of north Cyprus. Assuming Y evolves stochastically over time with a steady rate of change of α . However, Y is also subject to an instantaneous standard deviation σ . This can be due to, say, unforeseen developments in the Cyprus settlement solution. In other words,

$$dY = \alpha Y dt + \sigma Y dz \quad (2)$$

dz follows a standard Wiener stochastic process. Equation (2) is a geometric Brownian motion (Harrison, 1985) in Y . It enters into the individual's investment calculus in the following way. When the economic output $Y > Y^*$, the project's NPV hits the threshold level NPV^* . The individual decides to invest. Otherwise he stays put. By doing so, he gives up the cash flow stream R which is growing in tandem with the economy's growth rate α . However, he retains the option to invest should a settlement solution be satisfactorily found as a result of some unexpected events σ . On the other hand, suppose he invests and the settlement process suffers as a result of future deteriorating political climate. Then his cash flow stream R will drop precipitously on account of the ensuing economic recession. The ability to avoid this and retain his investment option has an intrinsic value. This should enter his NPV in equation (1). As with financial options, the larger the volatility σ (or growth rate α) in economic output Y , the higher the value of this option. Then it will be less likely for this individual to invest. Algebraically, we can represent the value of this investment option by $F(Y)$. Its behavior follows the differential equation:

$$\frac{1}{2} \sigma^2 Y^2 F_{YY} + \alpha Y F_Y - r F = 0 \quad (3)$$

r is the no-arbitrage equilibrium discount rate (Harrison and Kreps, 1979). Equation (3) can be derived as follows. A small random change in Y , dY , over dt results in a small expected NPV change of $E[F(Y + dY)]$. This can be discounted back to t using the discount rate r , i.e., $F = e^{-r dt} E[F(Y + dY)]$. Note that $e^{-r dt}$ is approximately $1 - r dt$. $F(Y + dY)$ can be expanded by Ito's lemma (Dixit et al, 1999). On re-arranging, we have (3). (3) can be solved by the method of undetermined coefficients:

$$F(Y) = AY^\beta \quad (4)$$

A is a positive undetermined coefficient. β is the root of the characteristic function:

$$\frac{1}{2} \sigma^2 \beta (\beta - 1) + \alpha \beta - r = 0 \quad (5)$$

β has a bigger-than-1 root and a negative root. The latter is discarded since the value of investment option $F(Y)$ should increase with economic output Y . Now, the project's NPV before investment consists entirely of the value of the investment option, AY^β . Suppose the economic output Y hits the threshold Y^* . That is, when the project's NPV hits NPV^* , the investor invests (exercises option). We have

$$AY^\beta = \frac{R(Y)}{r} - C \quad (6)$$

This is the *value-matching condition* (Dixit and Pindyck, 1994). The *smooth-pasting condition* dictates that the derivatives with respect to economic output Y on both sides of equation (6) must be equalized:

$$A\beta Y^{\beta-1} = \frac{R'(Y)}{r}$$

This gives, on re-arranging,

$$AY^\beta = \frac{YR'(Y)}{r\beta} \quad (7)$$

Note that Y^* must be big enough so that the threshold NPV^* covers the investment option value before the individual invests:

$$\begin{aligned} NPV^* &= \\ &= \frac{R(Y^*)}{r} - C - AY^{*\beta} \end{aligned} \quad (\text{using (7)})$$

$$= \left\{ \frac{R(Y^*)}{r} - \frac{Y^* R'(Y^*)}{r\beta} \right\} - C \quad (8)$$

To simplify our analysis, let us assume $R(Y) = k Y$. That is, the project's cash flow stream is a direct proportion of economic output (Silberberg and Suen, 2001). Then (8) can be simplified to:

$$NPV^* = \frac{kY^*}{r} \left(\frac{\beta - 1}{\beta} \right) - C \quad (9)$$

The factor $(\beta - 1)/\beta < 1$ is called the option value multiple. As a result, the original cash flow stream $k Y$ must be scaled up to $k Y \beta / (\beta - 1) = k Y^*$ before the project can go ahead. Suppose the individual would consider investing when economic output was Y in the absence of this option. With the option, Y will have to be larger at Y^* to induce investment (since β is larger than 1). Moreover, the characteristic equation (5) indicates that the β solution is decreasing in σ^2 or α but increasing in r . Thus, the threshold Y^* or NPV^* is increasing in σ^2 or α but decreasing in r . For example, a high σ^2 means more volatile economic conditions. The investor will do well by holding his investment option or requiring a higher threshold Y^* . This is because he could stay put should politics deteriorate, or invest *vice versa*. In other words, he suffers no loss if he does not exercise his investment option (option out of money). On the other hand, he stands to gain big if he does exercise his option (option deep in the money).

When the rate of return on investment (the discount rate r) is high, the project's cash flow will increase fast. The investor will do well by executing the project right away. Hence, the option to invest loses its value. Y^* or NPV^* decreases accordingly. This is a partial explanation of the recent property boom in north Cyprus. When the property sector is doing well, investors do not want to lose out and participate in construction and development projects. The option to wait on these projects has diminished value. Hence, the propensity to hold on to this option vanishes.

POLICY IMPLICATIONS FOR NORTH CYPRUS

It is often said that little can be done by Turkish Cypriot authority about lessening the political uncertainty. However, there are functions within north Cyprus's internal control that can be made less uncertain. For example, underground water can be prevented from being contaminated by septic tanks. Potable water is largely supplied by water trucks and underground water pipes. However, underground water is often used additionally. Although not for drinking purposes, it can often be used for cleaning and washing, e.g., vegetables. Underground water is often found next to septic tanks of houses. Due to seepage, it is very often contaminated, resulting in diarrhea or more serious health problems. Immediate possible solutions can include purification, underground water table survey, or building instructions regarding location of septic tanks.

Electricity supply should also be made more reliable to reduce blackouts or brownouts, or shorten outage period. Better-quality roads and streets, e.g., road signs, street lamps, asphalt, traffic lights, etc. can also be considered. Telecommunications technology can be upgraded through broadband, wireless connection, etc. Perhaps investment in a business exhibition and convention centre may entice potential investors. Better healthcare provision can also be considered. The recently completed new state hospital in the Famagusta district is a step in the right direction. Funding from Turkey and the EU ought to be directed towards these activities.

Financial services provision can play a significant role in removing much uncertainty. For example, loan approval can be speeded up by the north Cyprus central bank or commercial banks for investment projects. These can include roadwork, bridges, sanitation, garbage tip sites, parks, children's playgrounds, sports amenities, etc. At the same time, bureaucratic red tape for new business registration or renewal should also be reduced. All of these activities are conducive to a better foreign investment climate.

CONCLUDING REMARKS

The whole island of Cyprus is considered by the European Union to be a member. However, the economic development of north Cyprus is hindered by the uncertain nature of its future geo-political status. As a result, any foreign investment must not only pass the conventional cost-benefit analysis. It must also overcome a significant mark-up (option value) in net benefit before it can profitably go ahead.

The reason for this is because foreign investors (apart from Turkey and EU funding) are largely holding the development option. They will adopt a wait and see attitude towards north Cyprus. Potential investors could stand to lose a large amount of initial capital outlay if political situation were to deteriorate. The ability to avoid this has an intrinsic value (option value). This must be overcome by any profitable investment. Consequently, there is wide-spread chronic under-investment in the small-island economy. This is especially problematic in infrastructure such as electricity and water supply.

An increase in the volatility of the political situation raises the value of the investment option. This makes foreign investors more reluctant. On the contrary, an increase in the rate of return of potential business profits suppresses the value of the option. This entices investors who fear missing out on profitable business ventures. By not investing today, potential investors could lose the immediate benefits of investment projects (periodic cash inflows from sales, etc.). They might also miss the upside in their investment value should there be a satisfactory political resolution. This, together with a rising population and the Cypriots' propensity toward home ownership, partially explains the recent "property boom" in north Cyprus.

There are immediate policy implications drawn from the theoretical discussions. Foreign direct investment abhors uncertainty. Political uncertainty regarding Cyprus reunification cannot be easily removed. However, there are functions within the Turkish-Cypriot authority's control that can be made less uncertain. For example, prevention of underground water contamination, reliable electricity supply, quality roads and streets, upgrading telecommunications technology, a business exhibition and convention center, better healthcare and financial services provision, and removing bureaucratic red tape. All of these activities are conducive to a better foreign investment climate in north Cyprus.

Ultimately, removing the political uncertainty regarding a Cyprus reunification is the best enticement to FDI. Mullen *et al* (2008) estimated that the peace dividend in the form of investment in construction and real estate, tourism, tertiary education, accounting and legal services, and exports such as pharmaceuticals would amount to 1.8 billion euros annually (10% Cyprus GDP by 2015). This figure would double if we added the Ankara Protocol and Baku-Ceyhan oil pipeline business.

DETERMINANTS OF SOCIALLY RESPONSIBLE MARKETING DECISIONS

Lončarić, Dina¹

¹PhD, Polytechnics of Rijeka, Vukovarska 58, 51 000 Rijeka, Croatia

Purpose – Marketing as a social and management process can improve the well-being of consumers and other stakeholders. In order to improve consumer well-being, it is necessary that managers make decisions in a way that each of them is viewed through the prism of ethics and social responsibility. However, the question arises: what are the factors that influence the implementation of ethics and social responsibility in marketing decision-making process. The aim of this work is to determine the factors that affect marketing decisions that are consistent with the principles of ethics and social responsibility.

Design/methodology/approach – Based on the theoretical background several hypotheses that assume the impact of individual and organizational factors on the adoption of marketing decisions are set. They are tested on a sample of the most successful Croatian companies. The survey instrument included the original scale „Socially responsible marketing decisions“.

Findings – It was found that the socially responsible marketing decisions are determined by individual and organizational factors. A positive relationship between the perceived role of ethics and social responsibility in achieving business performance and socially responsible marketing decisions is established. In addition, there is a connection between stakeholder orientation of the company and socially responsible marketing decisions. The impact of the code of ethics and foreign ownership on ethical marketing decisions was established.

Practical implications - Based on the research results it can be concluded that the application of ethics and social responsibility in marketing is under the influence of different factors. Some can be controlled, but some are out of the control of managers.

Originality/value – The study whose results are presented is based on the application of the original scale “Socially responsible marketing decisions”. The correlation between the perception of the importance of ethics and social responsibility in achieving business performance and application of ethics in making marketing decisions is established.

Keywords – Social responsibility, marketing ethics, consumer well-being, QOL marketing, Croatia, economy in transition

Paper type - Research paper

INTRODUCTION

Marketing is traditionally considered to be a business orientation which meets the consumers' needs and also accomplishes the company's goals. By implementing the marketing concept positive effects are achieved at both micro and macro level. Positive effects on the micro level are seen in satisfying the needs of the target market and the company's goals, while the effects of marketing on the macro level can be seen in the transfer of goods, services, capital and knowledge, so that we can consider marketing to be an important economic process. Yet, in recent decades marketing experts are faced with numerous challenges from the environment. Occurrences in the environment manifested as exhaustion of non-renewable energy resources or environment pollution, or social occurrences such as illiteracy, materialism and socially unacceptable behaviour such as inclination towards alcohol and drug abuse, represent additional challenges for marketing experts. They are becoming more and more aware of the responsibility they have towards the consumers and the society on the whole. That is the reason why there is more talk in the marketing theory and practice about implementing the principles of ethics and social responsibility in doing business.

Social responsibility and ethics in doing business can be manifested in many different ways; moreover they should be seen in everyday work. Marketing experts in the strategic marketing management and deciding on products, prices, promotion and distribution should make decisions taking the principles of ethics and social responsibility into consideration and avoid activities which encourage undesirable behaviour. In such a way one can enhance the consumer well-being and the quality of life of other stakeholders.

Yet, the research question is raised: what does the socially responsible decisions in marketing depend on? In order to find the answer to this question an analysis of the literature and a field research has been done. The results are represented in the following parts. In the first part of the paper there is a brief presentation of the theoretical background from which the research hypotheses are developed. Second part refers to the methodology, followed by the results of research and conclusions. In the end the limitations of the research are stated, as well as recommendations for further research.

THEORETICAL BACKGROUND AND HYPOTHESES

During the last decades the fact that the consequences of marketing activities of a company cross its boundaries and reflect upon the environment where its work has been more and more stressed in the developed market economies. In the conditions when the company's activity is under scrutiny of the internal and external stakeholders a manager is expected to have sensitivity for the social processes in the environment, as well as a high level of social responsibility in decision-making process. Business goals can be realized in many different ways, but nowadays is necessary to respect the principles of ethics and social responsibility in doing business, as well as to satisfy the interests of different stakeholders. Implementation of ethics and social responsibility in marketing is realized by accepting the philosophy of Quality-of-life marketing. Sirgy defined the Quality-of-life as a "business mechanism that plans, prices, promotes, and distributes economic consumer goods to consumers in ways to maximize consumer well being" (Sirgy, 2001, p. 8). According to the contemporary view the Quality-of-life marketing refers to any good (economic or non-economic, consumer or industrial) service or program (Sirgy, 2001, pp.10 – 11). That is why the Quality-of-life marketing can be regarded as a specific form of thinking and doing business connected to production, delivery and consuming of products, services, ideas and programmes, their promotion and setting the prices which contributes to the improvement of living conditions in a certain environment on the long term and at the same time meets the needs of the target markets and other stakeholders with minimizing the unwanted side-effects. This is a specific business philosophy and strategic orientation which is based on the principles of ethics, social responsibility and stakeholder theory. The Quality-of-life marketing as a philosophical but also a strategic approach is put into practice by making decisions based on ethical principles. The task of the company is the development of products, services and programmes which can improve the consumers' well-being and to deliver these products in the way which would minimize the negative side effects to target consumers, as well as to other public with simultaneous generating of a long-term profit (Sirgy and Lee, 1996).

In order to achieve positive effects on the consumer well-being marketing managers should make decisions having in mind the possible negative consequences. These marketing decisions refer to setting goals and formulating strategies and tactics. The starting point is determining the dimension of consumer well-being on which the organization is likely to have impact (Sirgy and Lee, 1996). After that, the marketing experts make a series of decisions regarding the marketing mix. All decisions should be considered from the stakeholders' point of view as well. It should be analysed whether a certain decision improves the consumers' well-being and whether it has negative effects on the consumers and other stakeholders.

Yet, the question is raised which factors influence the socially responsible decision making in marketing? According to Robbins ethical or unethical behaviour is under the influence of individual characteristics, structural variables and organizational culture (Robbins, 1991, p.134). Ford and Richardson (1994) divided the factors which influence moral behaviour into two groups: individual and situational factors. Individual factors refer to those given by birth such as gender and age, and factors which are the result of experience and socialization such as education, personality and attitudes. Lee and Sirgy (2004) consider the implementation of the Quality-of-life philosophy, which represents the implementation of ethical principles in marketing, to be possible with three groups of assumptions which reflect the factors from the environment, organizational and individual factors. The factors from the environment are social sensitivity regarding the consumer well-being and predominant ethical climate in business. Organizational factors which influence the implementation of the Quality-of-life marketing are the level of organizational ethics and the long-term orientation of the company. Individual factors are connected to moral idealism, a caring

relationship to the environment and autotelic personality characterized by enthusiasm and intrinsic motivation.

So, a larger number of authors consider that the guidelines of ethical and socially responsible behaviour in doing business, which refers to marketing as well, are connected to the managers' characteristics and conditions from the environment. Making the marketing decisions is in the managers' domain, so it depends on their system of values and moral principles. This is confirmed by Pini and Carolli (2004) who established that the managers' moral characteristics influence the accepting of social responsibility. Frederick, Post and Davies (1992) also stress personal values and the managers' moral as an important guideline of ethical behaviour in doing business. When the behaviour in certain business situations is not determined by the rules or procedures, the critical factors which the decision-making depends on, refer to the managers' individual characteristics. Singhapakdi et al. (1996) claim that "marketers must first perceive ethics and social responsibility to be important before their behaviours are likely to become more ethical and reflect greater social responsibility." This perception depends on a number of factors such as cultural differences, economic and legal/political environment, organizational ethical climate and gender (Singhapakdi et al., 2001). Taking that into consideration we can conclude that the manager's attitude regarding the importance of ethics and social responsibility in doing business is important for moral behaviour in marketing decision-making. Those managers who consider ethics and social responsibility important for business success in the long term will probably make such marketing decisions which will improve the consumer well-being, as well as the well-being of other stakeholders. Therefore we can set the hypothesis **H1: The perception of the importance of ethics and social responsibility in achieving company's effectiveness has a positive impact on socially responsible marketing decisions.**

Social responsibility is under the influence of different organizational factors, especially organizational culture, which should support the stakeholder orientation; not only owners and consumers, but also employees, creditors, suppliers and the population in the community. Those companies that tend to socially responsible doing of business set such goals, implement strategies and make marketing decisions by which they can increase the consumer well-being and minimize the negative effects upon other stakeholders. According to the above, we can set the hypothesis **H2: Respecting the interests of a larger number of stakeholders is in a positive interaction with socially responsible marketing decisions.**

Formal rules and regulations also influence the role of ethics in decision making. They help managers and employees to clear the ambiguities in decision making process. Although the existence of the code of ethics in doing business is not a guarantee that it would influence the marketing decisions, it confirms that there is a positive attitude in the company which supports socially responsible decision-making. That is the reason why the hypothesis **H3 is set: Those companies which have a code of ethics achieve better results on the scale of socially responsible marketing decisions.**

According to the research of Singhapakdi et al. (2001) the perception of the importance of ethics and social responsibility in achieving organizational efficiency depends on cultural, economic and legal/political environment. Bagić, Škrabalo and Narančić (2006) did a research on social responsibility in companies in the Republic of Croatia; a country in the process of transition from planned to market economy. It was established that the factors which influence the social responsibility in Croatian companies are the ownership structure, the leadership abilities, the size of the company and the economy sector. Companies in private ownership tend to a speedy introducing of efficient management systems because they are more market oriented and have a simpler procedure of decision-making process. Foreign ownership has also a positive influence, whereas companies in domestic ownership show a greater interest in cooperating with domestic suppliers. The managers' leadership abilities which cause the employees' confidence, such as personal engagement, interests and charisma, have a great importance for introducing changes in the management processes, as well as for promotion and spreading of the information about the social responsibility of the company. The authors established that implementing a socially responsibility is most widespread in larger companies, and small and medium-size companies regularly invest into the well-being of the local community. Although dominant fields of social responsibility, such as human resources development, investing into the community and environment protection are present in all economy sectors,

it was noticed that the services' sector, especially banks, use more often the social responsibility with the purpose of public promotion. On the other hand, companies from the industrial sector invest more into managing the waste material, ecologically efficient technologies and collective negotiation. According to the above, two hypotheses have been set:

H4: Socially responsible marketing decisions depends on the ownership structure; Managers employed in companies in predominantly foreign ownership achieve better results on the scale of socially responsible marketing decisions.

H5: Socially responsible marketing decisions depend on the size of the company; Managers employed in large companies achieve better results on the scale of socially responsible marketing decisions.

The hypotheses set are verified on the sample of Croatian companies and the results are represented in the following part.

RESEARCH METHODOLOGY

Sample

The research was done on the sample of companies in the Republic of Croatia. The companies were chosen from the list of 500 largest Croatian companies according to the amount of added value in 2006, reported by the Financial Agency (FINA, 2006). The respondents were persons who do the marketing tasks regardless whether they are employed in the marketing department or other departments in case there is no marketing department. During the research preparation it was established that in some companies there had been some organizational changes, so the final number of companies included in the sample was 481. The data gathering was done by e-mail in the period from 20th July to 20th December 2007. After two waves of telephone follow-up 109 questionnaires were gathered, which gives 22.66%

Among the respondents those from large companies prevailed (77.8%), then came those from medium-sized (19.4%) and from small companies (2.8%) according to the criteria of the number of employees. 50.9% of respondents were female and 49.15% were male. More than two thirds of the respondents had a university education (68.5%), 21,3 % had master's degree or Ph.D., and only 10.2% of the respondents had finished high school. More than half of the respondents were employed at a middle level of management, there were 29.6% of marketing managers, 27.8% of managers in other departments in the company, 5.6% of top managers, 18.5% of managers on lower levels in the company and 18.5% of the employees. In the sample 25.2% of respondents were under the age of 30, 34.6% were from 30 to 39 and 40.2% were people over 40.

Measures

The data were gathered by a questionnaire which had one measurement scale known from the literature and the original measurement scales. The basis of the research is the scale of socially responsible marketing decisions. As there was no reference to an appropriate scale by which one could establish in which measure the decision makers implement the principles of social responsibility with the goal of developing the consumers' well-being, and in accordance with the paradigm of Quality-of-life marketing, a new measurement scale was developed (Lončarić, 2009). In the first phase 16 statements were generated; they refer to the socially responsible marketing decisions, and are connected to certain elements of marketing mix. The respondents determined the level of agreeing with the statements given on a five-point Likert scale, whereby 1 indicated "I do not agree at all, the statement does not refer to our company.", whereas 5 indicated total agreement, that is the following attitude: "I completely agree, the statement refers completely to our company."

After pre-testing on a sample of 78 managers and postgraduate students with working experience two statements were excluded, so that the testing of the scale consisting of 14 statements on the sample of Croatian companies was done. The dimensionality of the scale were checked by exploratory factor analysis. A three component structure was gained which explained 66,32 % of the variance.

After the exploratory factor analysis, confirmative factor analysis was done as well, which represents a more rigorous test of the scale dimensionality. Taking the recommendation of Hair et al. (2006, p.786) into consideration according to which every construct should be represented with at least three indicators, and the fact that the reliability coefficient Cronbach alfa for the third component was only .694, it was decided that the third component represented by only two items was to be excluded, so that the measurement model which includes two components which explain 60,39% of variance was tested by the confirmative factor analysis. By this analysis the following indicators were gained: Goodness-of-fit Index (GFI) .932, Comparative Fit Index (CFI) .951, Normed Fit Index (NFI) .893 and Root Mean Square Error of Approximation (RMSEA) .082. The results gained are within the acceptability limits according to Byrne (2001), so it was concluded that the two-dimensional measurement scale constructed from eight manifest variables has satisfactory measurement characteristics. The results of the explorative factor analysis are represented in Table 1. The calculated coefficients can be considered as satisfactory according to the recommendation of Nunnally and Bernstein (1994, p. 265). The cumulative percentage of the explained variance is 60.39, which is on the lower limit of acceptability in social sciences according to recommendations given by Hair et al (2006, p. 120).

“The Perceived Role of Ethics and Social Responsibility” (PRESOR) scale by the author Singhapakdi A. et al (1996) which consists of 13 statements was implemented in order to explore the perception of the role of ethics and social responsibility in achieving business performance. The respondents on the nine-point Likert scale express their opinions on the importance of ethics and social responsibility in achieving the organizational effectiveness. A two-component structure, which is different from the original results, was gained by the component analysis. The results of the implemented analysis are represented in the paper Grbac and Lončarić (2009). A subscale named “Long-term gains” which consists of 6 statements referring to the perception of the importance of ethics and social responsibility for business performance in the long term (Table 1) was implemented for the needs of this research.

Orientation towards stakeholders was measured by the scale which consists of eight statements. The respondents marked on the five-level Likert scale their agreement with the statements which referred to fulfilling certain interests of the stakeholders. Two components were extracted by the explorative factor analysis and they explain the 53.84% of the variance. The results of the explorative factor analysis are represented in Table 1.

<i>The overall effectiveness of a business can be determined to a great extent by the degree to which it is ethical and socially responsible.</i>	.838	
<i>Business ethics and social responsibility are critical to the survival of a business enterprise.</i>	.805	
<i>Being ethical and socially responsible is the most important thing a firm can do.</i>	.766	
<i>Business has a social responsibility beyond making a profit.</i>	.698	
<i>Social responsibility and profitability can be compatible.</i>	.599	
STAKEHOLDER ORIENTATION		
Main stakeholders		.763
<i>We take care of the employees' interests when we make important business decisions.</i>	.775	
<i>We always satisfy the requirements of creditors completely.</i>	.759	
<i>We take care that our business does not have any harmful consequences for the local inhabitants.</i>	.741	
<i>In making business decisions we take the demands of our suppliers into consideration.</i>	.639	
<i>The interests of consumers (clients) are of top priority for us when we make business decisions.</i>	.592	
Other stakeholders		.560
<i>We try to satisfy the expectations of political parties and the government completely.</i>	.746	
<i>In decision-making we mostly take care of the owners' interests.</i>	.726	
<i>Competitors are our partners with whom we meet the needs of the target market.</i>	.691	

RESEARCH RESULTS

The research hypotheses assume the influence of different factors on the implementation of socially responsible marketing decisions. The mentioned hypotheses were tested by implementing different statistical methods.

In order to verify hypothesis H1 a correlation analysis among the variables "Long-term gains" which reflects the managers' perception of the importance of ethics and social responsibility for the success in the

long term and the variables "Satisfying consumers' needs" and "Ethics in promotion and sales". Taking the fact into consideration that the Kolmogorov-Smirnov test of the distribution normality was significant for the variables "Satisfying consumers' needs" ($z = 2.160, p = .000$) and "Ethics in promotion and sales" ($z = 1.739, p = .005$), the correlation coefficient Spearman's rho was implemented. A statistically significant correlation was determined between the variables "Long-term gains" and "Satisfying consumers' needs" ($r_s = 0,482, p < .001$), as well as between the variables "Long-term gains" and "Ethics in promotion and sales" ($r_s = 0,297, p = .002$), which confirms hypothesis H1. So, we can conclude that there is a connection between the perceived role of ethics and social responsibility in achieving organizational performance and socially responsible marketing decisions.

Hypothesis H2 states that there is a connection between the orientation towards stakeholders and socially responsible marketing decisions. By implementing correlation analysis it was established that there is a positive correlation between regarding the main stakeholders interests and satisfying consumers' needs ($r_s = .475, p < .001$) and ethics in promotion and sales ($r_s = .506, p < .001$). A statistically important connection of the orientation to the other stakeholders and ethics in promotion and sales ($r_s = .217, p = .030$) was also established, whereas the connection of the orientation to other stakeholders and satisfying consumers' needs was not established ($r_s = .064, p = .525$). These results confirm hypothesis H2, so we can conclude that those companies that take into consideration the interests of a larger number of stakeholders, such as consumers, suppliers, creditors, employees and local inhabitants also achieve a higher level on the scale of socially responsible marketing decisions.

In order to establish whether the existence of the code of ethics has any influence on decision making in marketing the Mann-Whitney U test was done. It was established that those companies which have a code of ethics achieve higher average values regarding the variables satisfying consumers' needs (MR = 56.05) and ethics in promotion and sales (MR = 56.21) compared to the companies that do not have the code of ethics (MR = 44.73 for satisfying consumers' needs and MR = 44.20 for ethics in promotion and sales). The difference between groups is statistically significant for the variable ethics in promotion and sales ($z = 2.025, p = .043$), whereas it is on the verge of statistical significance for the variable satisfying consumers' needs ($z = 1.925, p = .050$). The mentioned results show us that the hypothesis H3 can be confirmed, that the existence of the code of ethics in doing of business has an influence on the decision making in marketing.

Hypothesis H4 states that there is a difference in implementation of socially important marketing decisions taking the ownership structure into consideration. The hypothesis is checked by the Mann-Whitney U test for independent samples. A statistically significant difference has been established between the companies in domestic and foreign ownership regarding the ethics in promotion and sales ($z = 2.073, p = .038$). Managers employed in companies in foreign ownership achieve higher results on the scale (M = 43.20) than the managers employed in domestic companies (M = 32.91). The difference between companies regarding the variable satisfying consumers' needs was not established ($z = .392, p = .696$), so that the hypothesis H4 can be partially accepted.

Hypothesis H5 assumes that higher values on the scale of socially responsible marketing decisions are achieved by managers in large companies. Mann-Whitney U test for independent sample was done. The results for two groups of companies were compared. One group consisted of small and medium-sized companies, and the other consisted of large companies. A statistically significant difference between two groups of companies was not established by the test ($z = .345, p = .730$ for satisfying consumers' needs and $z = .709, p = .478$ for ethics in promotion and sales). The hypothesis H5 is therefore rejected and it is concluded that the size of the company does not have a more significant role in implementation of socially responsible marketing decisions.

CONCLUSIONS

Ethics and social responsibility in marketing can be manifested in avoiding morally questionable decisions by which the consumers are encouraged to behave unacceptably. In accordance with the Quality-of-life marketing philosophy the starting point in developing products and services is the need of the market which should be satisfied without negative effects upon the actors in the environment. It is also important to

encourage socially acceptable behaviour and declare truthful statements about products and services, as well as choose those distributors who offer the best possible service to the consumers.

In order to implement all the above mentioned, the presence of certain assumptions is needed. One of the conditions for ethical decision making in marketing is the perception of the importance of ethics and social responsibility in achieving business performance. As the research results showed, the managers who consider ethics to be important for the success of the company achieve higher values on the scale of socially responsible marketing decisions. Thereby is the attitude by Singhapakdi et al. (1996), that the perception of the importance of ethics in doing business is a precondition for moral conduct, confirmed.

Furthermore, it was established that one of the determinants of responsible decision making is the companies' orientation for satisfying the interests of a larger number of stakeholders. In those companies where they pay more attention to the interests of clients, creditors, suppliers, employees and inhabitants in the local community managers make decisions in accordance with the Quality-of-life marketing philosophy. The existence of the code of ethics contributes to this as well; the code shows that an understanding of the importance of ethics in doing business is present in the company, although the code itself does not necessarily prescribe the marketing managers' conduct regarding specific problems about which they have to decide. Foreign owners who entered the ownership structure during the process of privatization of Croatian companies also contributed to the implementation of ethical principles in communicating with the market, which is in accordance to the results by Bagić, Škrabalo and Narančić (2006) according to which the ownership structure has an influence on social responsibility. The reason for that is probably that privatized companies in mainly domestic ownership are still in the transition phase and in the process of adjusting to the rules of the game of the developed market economy and in creating organizational culture which stresses social responsibility as one of the crucial values of a company. The influence of the size of the company on social responsibility in marketing in Croatian companies was not established, probably because of the fact that there were mostly large companies in the sample.

On grounds of given results we can conclude that the determinants of socially responsible marketing decisions are both individual and organizational. The precondition for ethical decision making in marketing is the perception of the importance of ethics and social responsibility in doing business which is under the influence of different factors. Apart from the individual, the organizational factors that may be affected to a greater extent, are also important. In those companies which have clear rules of the game edited by the code of ethics and in which the organizational culture which takes the interests of a larger number of stakeholders into consideration prevails, marketing managers make decisions in accordance with the Quality-of-life marketing philosophy and thereby contribute more to the consumer well-being.

LIMITATIONS AND SUGGESTIONS FOR FURTHER RESEARCH

It is also necessary to point out, because of the scientific truth, the limitations of the research done which had an impact on the research results. One of the limitations was a small sample in which those companies took part which gave the greatest contribution to added value. Further research should be done on a representative sample and, if possible, in different cultures, in both transition and developed market economies. Taking the fact of a small sample into consideration it was not possible to do an analysis of industries which should be done in future research.

The next limitation is the respondents' category. Managers from the field of marketing, independently of the fact in which department they are formally employed, answered the questions. One has to ask the question in which measure they were able to be objective or they fell into the trap of giving socially desirable answers. In future research a detailed analysis of a few companies could be done and their behaviour regarding social responsibility would be estimated by the stakeholders. In this case a further, more detailed analysis of different aspects of the implementation of ethics and social responsibility in marketing would be necessary.

The disadvantage of the research done is also the measurement scale by which the implementation of ethics and social responsibility in marketing should have been established. Many statements which belong to

the construct and should have been included were not included in the scale because of the possibility of the respondent's abstinence or avoiding to answer some questions, such as questions about non-ethical conduct in advertising or setting the prices. Therefore, the scale should be enlarged by generating new items and tested on a larger number of samples. It should also be differently formulated, so that it can be applied to the sample of consumers, business partners and other stakeholders.

The limitations mentioned lead us to the conclusion that the research results and conclusions drawn from them should not be taken for granted, but also represent a basis and challenge for further research.

CONNECTING THE MEDITERRANEAN SYSTEM OF INNOVATION: A FUNCTIONAL PERSPECTIVE

López-Vega, Henry¹; Pujol, Juan Ramis²¹ESADE, Ramon Llull University, Barcelona, Spain²ESADE, Ramon Llull University, Barcelona, Spain*The authors are grateful to IEMed for the received support*

Purpose - This paper provides the first qualitative exploratory overview of the Mediterranean System of Innovation (MSI) and presents the results of an interactive work with 25 different innovation delegates from northern and southern Mediterranean countries. The study comes at the turning point where the Union for the Mediterranean is designing the innovation policies and debating the mechanisms to boost the central activities.

Design / Methodology / Approach - This research applies the literature of National Systems of Innovation, applying the functions perspective, to study the means Mediterranean countries use to advance its innovation capacity. In collaboration with IEMed, this research invited delegates from northern and southern Mediterranean countries, program directors and European Commission representatives to present the activities in their countries.

Findings- The data shed light on the most relevant enabling and blocking mechanisms for innovation as well as showed that R&D support is slightly changing to services and business models. Finally, it highlighted the relevance of having a defined innovation strategy necessary for increasing the existing capabilities.

Originality / value - The value of this research represents the use of the system of innovation functions perspective to explore the Mediterranean region. Further research could focus on exploring the differences between the northern and southern Mediterranean countries.

Keywords - Mediterranean System of Innovation, Innovation, Intermediaries

Paper type - Research paper

INTRODUCTION

The field of Systems of Innovation approach has existed for a little more than two decades, following the seminal work by Freeman (1987). Currently, it is used for the systemic study of the “elements and relationships which interact in the production, diffusion and use of new knowledge (Lundvall, 1992)”. This arrangements aim to increase market interactions, stimulating the generation and transfer of knowledge, skills and competences necessary for the formation of spillovers and economic growth. Research in systems of innovation has progressively expanded the focus of its study, traditionally at the national level (; Lundvall, 1992; Nelson, 1993), to explain innovation at the continental (Freeman, 2002), regional (Cooke, et al. 2004), sectoral (Malerba, 2004) and technological levels (Bergek et al. 2008). Further, it contributed to other theoretical fields such as innovation, and social networks (Dodgson 2008; Assimakopoulos 2007), knowledge and learning (Lorenz and Lundvall 2006) and innovation policy (OECD 2008).

Up to know empirical research has focused on specific industries or institutional factors avoiding a broader explanation of National System of Innovation (Tylecote 2007; Eickelpasch and Fritsch, 2005) or offered a broad perspective which does not explain how institutions shape organization’s innovative behavior (Mowery and Rosenberg 1993, Nelson 1993). The former approach has focused on sectors such as biotechnology and E-economy (OECD 1997; Dodgson, et al. 2008; Lester 2001). The latter approach includes broader longitudinal explanations of national systems (Freeman 2001; Nelson 1993) that covered a wide range of organizations, institutions in both developed countries (Arundel, *et al.*, 2007) and catching up ones (Hu and Mathews, 2005; Motohashi and Yun 2007).

Recently, efforts have been conducted to the study of Continental systems of innovation such as Europe (Arundel et al., 2007) or Scandinavia (Lundvall, 2008). A review of the literature on the Mediterranean System of Innovation (MSI)¹³³, however, revealed no single contribution has made the effort to comprehend the dynamics and components of it. Accordingly, the Mediterranean area should have an initial exploratory

¹³³ Our analysis is based on the Social Science Citation Index (SSCI) of Thomson-ISI available on the on-line database and consistent with the aim of our focus of study.

analysis of the organizations and institutions affecting its development. This analysis is relevant on the light of the ongoing turning point to consolidate the Union for the Mediterranean that will have major implications on the future innovation policies as well as on the de-pollution of the Mediterranean Sea, the establishment of maritime and land highways, civil protection initiatives to combat natural and man-made disasters, a Mediterranean solar energy plan, the inauguration of the Euro-Mediterranean University in Slovenia, and the Mediterranean Business Development Initiative focusing on micro, small and medium-sized enterprises.

Accordingly, this paper explores the functioning presenting some evidence on the functions of the Mediterranean System of Innovation (Edquist, 2006). The novelty of this contribution, apart of been the first one of its kind at the Mediterranean system level, it highlights the perceived relevance of intermediary organizations connecting organizations across regions.

Our discussion proceeds by analysing data provided by 25 selected innovation actors such as politicians, project managers and academics from various Mediterranean countries in collaboration with the Institut Europeu de la Mediterrània IEMed (European Institute of the Mediterranean). We study the MSO through the following research questions: a) how the Mediterranean System of Innovation (MSI) accomplishes the innovation system functions? Our results suggest the MSI has partially accomplished different innovation functions. However, the collected data revealed that the design of the system of innovation strategy and the role of intermediary organizations are two central activities for the development of the system.

The remainder of this paper is structured as follows. Section 2 describes the literature review on systems of innovation and each of the functions mentioned in the literature. The third section describes our research design. We continue in section 4 where we integrate our empirical data in the functions perspective of the systems of innovation. The final section summarizes the research and offers suggestions for further research.

LITERATURE REVIEW

The field of Systems of Innovation (SI) approach can be interpreted as institutional arrangements to provide connectivity among economic actors (Carlsson, 2007). These attempt to increase market interactions stimulating the generation and transfer of knowledge, skills and competences necessary for the formation of spillovers and economic growth. In this respect, the system of innovation framework is based on the following core aspects: first, it places innovation and learning process at the centre of the focus, second, it employs historical and evolutionary perspectives; thirdly, it emphasizes the idea of interdependency, and non-linearity and finally emphasizes the role of institutions for promoting innovation (Edquist, 2006). These aspects offer researchers with the sufficient perspective to explain the performance and transformation of systems at different levels of analysis.

Edquist (1997) suggest studies on systems of innovation include “all important economic, social, political, organizational, institutional, and other factors that influence the development, diffusion and use of innovations (Edquist 1997)”. Most of these studies emphasize the two-way relationship of mutual embeddedness between institutions and organizations that influences the performance and change of the system. Further, systems of innovation are conceptualized as the set of institutions and organizations along with the relationships among them. Institutions influence the interaction of public and private organizations. These are understood as sets of common habits, routines, established practices, rules or laws that regulate the relations and interactions between individuals and groups (Edquist and Johnson, 1997) and reduce the uncertainty by providing information and incentives. On the other hand, organizations represent the main vehicles for innovation in that they create, develop and diffuse groups of technologies. These include private as well as public organizations e.g. firms, universities, industry associations, scientific and professional societies, regulatory agencies, organizations for higher education and research technology, support entities and intermediaries.

Functions of Systems of Innovation

An established contribution to the study of systems of innovation represents the function approach (Chaminade and Edquist, 2005; Liu and White, 2001; Gali and Teubal, 1997) that is used to explain how an innovation system works in comparison to how it is composed or structured (Markard and Truffer, 2008). According to Jacobsson and Bergek (2004) and Hekkert et al. (2007), the fundamental reasons that justify the use of the functions approach are: 1) it allows researchers to conduct comparisons between innovation systems with different institutional set-ups; 2) it enables a more systematic method for mapping the determinants of innovation cycles and feedback loops and 3) it makes it possible to deliver a clear set of policy targets as well as methods to meet these targets.

Table 1 presents selected contributions to the functions perspective, the four groups of innovation activities to be considered by policy makers and the suggested indicators that describe the overall dynamics of innovation systems. Following, this paper briefly presents these four themes and sub-themes.

Provision of Knowledge inputs to the innovation process

This function, provision of R&D and competence building, emerged out of the perspective of interactive learning proposed by Lundvall (1992). It has evolved and focused on the how knowledge is created, transferred and exploited (David and Foray 1995; Johnson and Jacobsson 2003; Lam and Lundvall 2006) as well as the learning capability of individuals, organizations and regions related to human resource development and competence building (Lundvall et al., 2002).

<i>Grouping innovation activities and policy</i>	<i>Edquist (2006)</i>	<i>Bergek et al. (2008)</i>	<i>Gali and Teubal (1997)</i>	<i>Indicators for innovation systems</i>

Functions usually performed by intermediary organizations</i>	<i>Volume capital and VC, volume and quality of human resources, complementary assets</i>

Table 1. Overview of the Functions of Innovation Systems

Traditionally, this activity has been carried out by public research centres and financed by public agencies. However, recent policy instruments promote a change towards more interactive involvement coming from private organizations towards either developing already basic research or co-investing in new lines research for producing basic research.

Provision of markets-demand site factors

These two functions involve the 1) articulation of quality requirements from the demand side and 2) the formation of new product markets. The former one refers to the activities of organizations, institutional mechanisms and demand side that can influence on the direction of search of new technologies, strategies, etc. This function involves an interactive match of, for example: visions, expectations and beliefs in growth potential, regulations and policy, articulation of demand from leading customers and crisis in current businesses. The second activity, formation of new product markets, studies the factors driving and hindering market formation such as the articulated demand, price/performance of new technologies, market demands and protected spaces for technologies. Finally, the result of this analysis should explain the mechanism and customer's preferences that facilitated the formation of new markets and technologies, revealing the (un) efficiency of different mechanisms.

Provision of constituencies to the innovation system

This function explores the three inputs to the innovation system: 1) creating and changing organizations for the development of new fields of innovation, 2) networking through markets and other mechanisms and 3) legitimacy. The function, creating and changing organizations for the development of new fields of innovation, supports the deployment of new technologies through the creation of new start-ups or new entrepreneurial activities in established firms. Entrepreneurial experimentation is measured using the number of new entrants, number of different types of applications and the breath of technologies used, as well as the character of technologies employed (Bergek et al., 2008). The second function, networking through markets and other mechanisms, explores the ongoing continuous interaction among firms, universities and users where networks or clusters of firms facilitate the exchange of information (Carlsson and Stankiewicz, 1991). Further, it analyzes the mechanisms that facilitate the formation of learning relations among a variety of actors in innovation processes as well as the emergence or entry of positive externalities i.e. new entrants, specialized intermediate goods and service providers.

Finally, legitimacy is a matter social acceptance and compliance with relevant institutions (Bergek et al., 2007). It is considered as a conscious process, through continuous actions between public and private organizations and individuals. The process of legitimation is aligned to the institutional alignment and enactment of new institutions i.e. incentives or obstacles to innovation.

Support services for innovation firms

Finally, the formation and development of systems of innovation depends on the support services provided by private and public organizations that include: 1) Incubating activities, 2) financing innovation processes and 3) provision of consultancy services (Edquist, 2006). The first one involves the provision of facilities and administrative support for innovation projects. The second involves the activities necessary for commercializing and facilitating the diffusion of R&D. Finally, the last activity involves the provision of consultancy advice for the commercialization and appropriation of technologies.

RESEARCH DESIGN

This research was carried in collaboration with the European Institute of the Mediterranean (IEMed) as part of the first study on innovation for the Union for the Mediterranean. This process initiated with a formal meeting in Barcelona on the 12th of February at the IEMed workshop “Innovation as a Motor of Development in the Euro-Mediterranean Region”. At the meeting, 25 selected innovation actors such as politicians, project managers and academics from various Mediterranean countries were invited to presented their national projects and provided comments in four different work-sessions: 1) Promotion of business innovation through the structuring of National Innovation Systems (NIS) and the creation of national agencies for the promotion of innovation, 2) funding mechanisms and promotion of innovation, 3) technology transfer and 4) promotion of innovation through international technology cooperation. Secondly, the major themes were identified by the researchers and commented with 5 representative attendees from Turkey, Egypt, and Spain and members from IEMed.

Finally, in this research we are aware of the differences between the northern and the southern Mediterranean countries. However, this paper attempts to be the first analysis on functions of the overall system rather than on its differences.

THE FUNCTIONS OF THE MEDITERRANEAN SYSTEM OF INNOVATION (MSI)

This part informs how the system of innovation functions is carried out on the MSI. This part follows the ten functions suggested by Edquist (2006) and complements the analysis with the indicators provided by Bergek et al. (2008), Hekkert et al. (2007), Chaminade and Edquist (2005), Carlsson et al. (2005), Liu and White (2000) and Gali and Teubal (1997).

Current situation in the MSI

This paper attempts to highlight the presented and discussed activities at the IEMed Workshop with 25 representatives from various Mediterranean countries. The structure of this point attempts to highlight arguments (table 2) to each innovation function as well as explain each one briefly.

Provision of R&D and Competence building

In the MSI the provision of R&D and competence building is supported as part of specific national programmes such as the “programme National de Recherche et d’Innovation (PNRI)” in Tunisia or the Industrial Innovation Programmes in Italy. Furthermore, at the IEMed workshop, representatives of Mediterranean countries expressed their overall agreement on recognizing not all types of innovation require research and not all research leads to innovation. Indeed, in the Mediterranean region a few numbers of innovations emerge out of basic scientific research and, in compare to European economies, are generally practiced as close as possible to markets. Nowadays, the increasing tendency is to support innovation on services and business model innovation. The Mediterranean reality reveals the provision of R&D and competence building, in the Mediterranean countries, is not limited to basic science but it also includes services and business model innovations.

Linking innovation activities and policy	Activities (Edquist, 2006)	Mediterranean System of innovation
Provision of Knowledge inputs	1) Provision of R&D and Competence Building	"Innovation is not research. Half of innovation is done without research. Mediterranean countries lack the capability to transform knowledge on business models for the service sector"
Provision of markets-demand site factors	1) Articulation of quality requirements (demand side)	"When I listened to the last presentation and went through different actions, I thought where is the strategy? And the strategy came last. I would have thought the strategy has to come first. This is something; we observe rather often that we are lost in details. I believe there are too many programmes in support of innovation, research, clusters. There are just too many and most the programmes have no impact"
	2) Formation of new product markets	"Nowadays, the only programmes addressing the lack of collaboration, between the Mediterranean region and the European region, are the Eureka and Medibtikar"
Provision of constituents inputs to the innovation process	1) Creating/changing organizations needed for the development of new fields	"In the Mediterranean region the only existing program of collaboration is Medibtikar that is designed to 1) increase the efficiency of incubators and technological parks across the region, 2) increase and enable technology transfer, 3) find early stage financing to increase innovation, 4) innovation management and 5) support for specific sectors"
	2) Networking through markets and other mechanisms	"Medibtikar facilitates the establishment of innovation networks through its five axes of operation (1) Services to incubators and technology parks, 2) development of technology transfer, 3) financing innovation, 4) innovation management and 5) sectoral support). Other local initiative is the one from ACCIÓ that has the initiative to create networks of innovation support to narrow interactions between universities and firms"
		"Enterprise networks represent coordinated actions between companies targeted at increasing their critical mass and at strengthening their presence on the market without necessarily having to merge"
	"In the Mediterranean region, Medibtikar, had the supporting role to set-up TTOs to facilitate the membership of Mediterranean countries to the Enterprise Europe Network (EEN). Up to now, five Mediterranean countries have already the partnership and other five are receiving help to write a proposal for acceptance"	
3) Changing institutions that provide incentives or obstacles	"A definitive and unique Mediterranean legal framework is apparently too complex and specialized that might encounter not only legal discrepancies but also cultural differences. Furthermore, it apparently represents a low priority for private companies collaborating with the research sector"	
Support services for innovation firms	1) Incubating activities	"Technology Transfer Offices (TTO) are relevant actors for the innovation process because these have the role to promote the generation, transfer or commercialization of the knowledge that may be applied to business activity" . "TTO are responsible to design, coordinate and manage a framework of technology transfer between university and companies"

	2) Financing of innovation activities	<p><i>"Most people qualify innovation support as a vitamin that helps to make the economy more robust, healthy. You could also qualify it as an aspirin if some people have some headache...The question is whether you can tackle the current economic and financial crisis with vitamin pills and aspirin. I doubt!"</i></p> <p><i>Three funding levels of innovation support: 1) Specific support for innovation initiatives (innovation vouchers) , 2) Specific innovation funds (Early stage funding through a business angel network), 3) General funds (Scientific and technological research investment, fund, competitive fund, Competitiveness and Development Fund and Enterprise Financing fund)</i></p>
	3) Provision of consultancy services of relevance for innovation processes	<p><i>"Two forms of consultancy facilitate the innovation process: 1) innovation agencies and 2) innovation intermediaries". 1) Innovation agencies financing innovation activities for the system of innovation and acting as facilitator of companies willing to unlock their potential to innovate and 2) Public-Private-Partnerships (PPP), private organizations, or programmes collaborating with the innovation process, from a non-technological perspective.</i></p>

Table 2. Current situation on Mediterranean System of Innovation

Articulation of quality requirements

In this part we use the indicator “targets set by governments and regulatory pressure” to study the articulation of quality requirements. Specifically, we observed the national innovation strategies of Mediterranean countries. Currently, in the Mediterranean countries, the issue of the innovation strategy is of high relevance because most innovation programmes do not have an impact on innovation and do not enforce the development of capabilities. Two comparing scenarios represent the Italian and Moroccan innovation tools. On the one hand, the former addresses 1) demands of an already specific type of companies (SMEs), 2) specific sectors and 3) innovative opportunities whereas the later provide opportunities to 1) a larger set of priority sectors, 2) emerging industrial sectors and 3) clusters and potential innovation initiatives. However, neither of these innovation strategies presents a clear strategy for enduring the development of capabilities and collaboration in the Mediterranean region. Finally, the last two major issues for the national innovation strategy include the designing and implementing an innovation strategy that embraces common goals that are perceived by everyone as long-term objectives as well as the diverse number of innovation actors who present their competences and needs.

Formation of new product markets

The formation of new product markets is in the Mediterranean area promoted by searching for new collaboration agreements between Mediterranean countries and national technology agencies in Europe. . However, a long lasting and formal collaboration has not been identified. Currently, the only programmes addressing the collaboration, between the Mediterranean region and the European region, are the Eureka and Medibtikar programmes.

Creating/changing organizations needed for the development of new fields

The system of innovation function “creation and change of organizations needed for the development of new fields” is measured by the number of diversifying activities of incumbents and the breath of technologies used in the Mediterranean region. Innovation activities are observed at the Mediterranean, national, cluster and sectoral level. At the Mediterranean level, the only existing program of collaboration is Medibtikar that is designed to 1) increase the efficiency of incubators and technological parks across the region, 2) increase and enable technology transfer, 3) find early stage financing to increase innovation, 4) innovation management and 5) support for specific sectors.

Collaboration at the regional and cluster level has been more predominant in the Mediterranean region. For example, the Barcelona city council has as objective to: 1) boost the role of Barcelona in terms of innovation, 2) link national and international innovation activities to the territory and 3) be recognized as an engine of innovation and research. A similar alternative represents the meta-districts in Italy that are scattered throughout the entire territory to benefit the sectoral synergies by 1) aggregating networks of SMEs; 2) supporting collaboration with the research system and 3) intensifying the exchange of know-how between companies.

At the sectoral level, collaboration is feasible by identifying companies' problems and future opportunities. A representative example is the ICT sector in Egypt that emerged out of a small group of private investors and policy makers, both having a common understanding of market needs and mutual interest. Following, once the system was on its emerging phase, it became institutionalized by governmental entities. The success factor in this case was the informality and collaboration among companies.

"Our experience with textiles is that it is much easier to do this in the private sector. Businessmen and women everywhere can change the way they do things very quickly if assured a financial return on their efforts"

Networking through markets and other mechanisms

In the Mediterranean region two forms of networks were ranked as highly relevant, for the development of the system of innovation, the first one is the innovation network and the second the enterprise network.

Innovation networks represent an initiative to improve the connection of universities, entrepreneurs, companies and technology parks engaged in the innovation process. Currently, Medibtikar facilitates the establishment of innovation networks through its five axes of operation (1) Services to incubators and technology parks, 2) development of technology transfer, 3) financing innovation, 4) innovation management and 5) sectoral support). Other local initiative is the one from ACCIÓ (the Catalan Innovation agency) that has the initiative to create networks of innovation support to narrow interactions between universities and firms.

An enterprise network has the principal function of supporting the connection of companies, particularly for SMEs, that require advice to establish new alliances, develop their business model and find the appropriate business partner.

"Enterprise networks represent coordinated actions between companies targeted at increasing their critical mass and at strengthening their presence on the market without necessarily having to merge"

In the Mediterranean region, Medibtikar, had the supporting role to set-up TTOs to facilitate the membership of Mediterranean countries to the Enterprise Europe Network (EEN). Up to now, five Mediterranean countries have already the partnership and other five are receiving help to write a proposal for acceptance. The EEN creates value for companies by providing the platform where SMEs are able to propose a technology offer and send it to a large network of firms in 60 countries. By the same token, they can write a technology request and express their specific need for a technology in a particular area.

Changing institutions that provide incentives or obstacles

Apparently, a common Mediterranean legal framework represents an enabler mechanism for collaboration among Mediterranean countries.

"Normally, there is a temptation to explore things that do not harm such as 1) metrics, statistics, mapping; 2) technology transfer. However, if you are on the high-tech industries the issues are different and include confidentiality and trust that require an innovation system in

place that allows real cooperation between clusters. Apparently, long-term cooperation demands a strong system of innovation but we are not usually allow to talk about it (issues affecting a system of innovation) because it demands to discuss about legal frameworks, civil rights, IPR, law enforcement and academic freedom, etc."

Apparently, the idea of a common Mediterranean legal framework is advantageous for the development of the MSI. However, up to now, mechanisms to successfully achieve it remain vague.

Incubating activities

Technology Transfer Offices (TTO) are relevant actors for the innovation process because these have the role to promote the generation, transfer or commercialization of knowledge to be applied for business activities. Furthermore, TTO are responsible to design, coordinate and manage a framework of technology transfer between university and companies.

Currently, three activities are conducted to improve the technology transfer process in the Mediterranean regions. The first initiative is the establishment of new enterprise partnerships that could occur through mergers and acquisitions with foreign companies. The second initiative is to increase the technology transfer initiatives on the Mediterranean service sector, along the product value chain. Finally, Mediterranean countries are searching for initiatives to establish new alliances between specialized southern Mediterranean agencies for innovation and European ones.

Financing of innovation activities

According to the attendees to the IEMed workshop, innovation funding has been broadly spread among different industries, sectors and technologies, without analyzing and measuring their impact. In the short-term, however, this form of distributing the scarce funding resources demands a necessary change in the funding model.

"Innovation support is been changed and if not, it will stop"

Currently, in the Mediterranean region the mechanisms for funding innovation include:

Firstly, the broadest level of funding is known as the general funding initiatives. In Italy this initiative are focused on fertilizing: 1) basic and industrial research, 2) competitive development and innovation and 3) the development of the Italian productive system. The second level is the Specific Innovation Funds for defined entrepreneurial or company activities. This initiative could be coordinated by public or private initiatives and usually the funding is lower and more targeted, in compare to the upper level. Thirdly, a specific support for innovation initiatives represents the innovation vouchers, adopted in the Netherlands, France and Finland. Innovation vouchers assist individual companies with their innovation ideas or activities. However, the use of them could vary on the amount and exigencies.

Provision of consultancy services of relevance for innovation processes

Innovation intermediaries, providing support and consultancy to, facilitate the development of the MSI by providing personalized support to organizations, entrepreneurs and scientists. In

the Mediterranean area two types of intermediaries were identified. On the one hand, innovation agencies represent public institutions providing support to: 1) finance innovation activities for the system of innovation, 2) act as facilitator of companies willing to unlock their potential to innovate and 3) provide coaching and information activities for companies. On the other hand, innovation intermediaries are public, Public-Private-Partnerships (PPP), private organizations, or programmes collaborating with the innovation process, from a non-technological perspective. The offered services include networking activities, provision of coaching and valorisation instruments.

“This not technology transfer, strictly speaking but the technology center is actually providing the type of support in different areas that enterprises really need to make a difference”

CONCLUSION

The contribution of this paper has both a theoretical and empirical relevance. On the one hand, it represents the first exploratory study of the Mediterranean System of Innovation and the validation of the functional systems perspective as well as the indicators. Our analysis suggests that the functional perspective is an appropriate instrument to conduct a systematic method for mapping the determinant of the MSI and to propose policy guidance. However, existing measures provide, partially, guidance to observe the activities conducted by organizations and effect of institutions. For example, Mediterranean countries conduct less R&D investments on new technologies but invest resources on services and new business models. On the other hand, the result of this research highlights some drawbacks on the MSI such as the innovation strategy and innovation networks. Furthermore, this research confirmed the relevance of intermediary organizations facilitating the formation and development of systems of innovation.

Based on this exploratory research, further research should attempt to: 1) explore each the northern and southern Mediterranean system innovation separately and 2) specifically explore the role of intermediaries linking the activities from different countries.

³University of Macedonia, Department of Business Administration, 40 G. Stamatelou Str, Ano Toumpa - GR54352, Thessaloniki, GREECE

Purpose. To support that crisis management is more necessary than ever as a business competency for organizations that are involved in the tourism sector. Tourism is a vital economic activity for the majority of the Mediterranean countries, and it is facing an increasing number of crises and disasters in the last years.

Design/methodology/approach. The paper provides a definition framework for crises and disasters, focusing in the tourism sector, through a brief literature review. Following, it uses some statistical evidence to support the important role of tourism for the Mediterranean economies, and then refers to some indicative cases of crises and disasters related with tourism in Mediterranean countries.

Findings. Since tourism is a very important economic activity for the Mediterranean countries, tourist businesses in these countries should enforce their crisis management competencies, and get better prepared against these phenomena.

Research limitations/implications. There is not quantitative evidence for the consequences of the crises and disasters cases used in this paper to the tourism industry.

Originality/value. The paper could be useful to practitioners that are involved in tourist businesses in Mediterranean countries, by stimulating their interest for crisis management.

Key words: tourism, crisis management

Paper type: General review

INTRODUCTION

The existing literature concerning tourism has noted an increasing number of disasters and crises, which affect the tourism industry, ranging from natural to human influenced incidents. In recent years the global tourism industry has experienced many crises and disasters including terrorist attacks, political instability, biosecurity threats, natural disasters etc. Many of the scholars that have studied this field (i.e Faulkner, 2001, Sausmarez, 2007) argue that there is a lack of research on crisis or disaster phenomena in the tourism industry, on the impacts of such events on both the industry and specific organisations, and the responses of the tourism industry to such incidents. More over, the existing literature focuses mainly in the management of crises after they have happened and the recovery process. Little job has been done concerning the pre crisis phase. This lack of interest and research is somewhat surprising considering that crisis management, disaster recovery and organisational continuity are important competencies for managers in both the public and private sector.

This paper aims to support the significance of crisis (and disaster) management and crisis preparation for organizations involved in the tourism industry. Especially in countries where tourism is an important contributor for their national economies, such as Mediterranean countries, these issues become more imperative.

Crises and disasters are defined in order to better understanding of these phenomena. The paper focuses further on the nature of crises and disasters for tourism industry. In order to enforce the necessity of organizational preparation in the tourism industry, the paper presents some brief statistical data, which are indicative of the importance of the tourism sector for most of the Mediterranean countries. Moreover, some indicative cases of crises and disasters in Mediterranean Area are presented in order to support that these situations are nowadays common phenomena, very next to us, and provide some evidence of these unpredictable situations that can harm tourist activity.

Finally the paper address some future research issues which could contribute to better understanding, planning and management of crises and disasters in an increasingly complex and disaster prone world always in relation with tourism industry.

DEFINING CRISES AND DISASTERS

The term "crisis" is widely used in several scientific contexts (i.e. medicine, psychology, economy, society etc). The use of the term, however, varies depending on the context in which it is being used and the researcher's discipline. In the organizational literature, crisis is defined as follows: *a low-probability, high-impact event that threatens the viability of the organization and is characterized by ambiguity of cause, effect, and means of resolution, as well as by a belief that decisions must be made swiftly* (Pearson and Clair, 1998). Pearson and Mitroff (1993) suggest that crises are events which pose threats to the viability of organisations. Seymour and Moore (2000) argue that crisis can threaten reputation, lives and the survival of an organisation. Faulkner (2001) argues that crises or disasters can be described as 'sudden challenges which might test the organisation's ability to cope'. All the existing definitions and approaches converge to that crises and disasters are unpleasant and difficult situations that have to be managed as effectively as possible. Contemporary crisis management approaches have supported that businesses and stakeholders involved in crisis situations should be benefited by the experience.

Crises are now occurring more frequently, possibly as a result of greater pressures on business and industry from global market demands, and they may have a much more severe impact. Elsubbaugh et al. (2004) suggest that crisis is an inevitable part of business today and cannot be separated from regular business activity. Understanding crises and disasters, their lifecycle and potential impacts and actions can help in the development of strategies by organisations to deal with such incidents, and stop or reduce the severity of their impacts on business and society, despite their complexity.

CRISES & DISASTERS IN THE TOURISM INDUSTRY

There are several approaches for the definition of the term crisis in the tourism industry. Laws and Prideaux (2005) argue that the term crisis in tourism industry usually refers to an event that leads to a shock resulting in the sudden emergence of an adverse situation. McKercher & Hui

(2004) point out that, crises are inevitable, 'episodic events that disrupt the tourism and hospitality industry on a regular basis' and Coles (2004) adds 'when not in crisis, destinations are in an extended programme of practically pre-event-limbo, almost waiting for the important trigger event to take place'. Parsons (1996) gave a very interesting view that can be used for the classification of tourism crises. He suggested three types of crises depending on their gestation period: a) Immediate crises, where little or no warning exists therefore organisations are unable to research the problem or prepare a plan before the crisis hits, b). emerging crises, these are slower in developing and maybe able to be stopped or limited by organisational action, and c) Sustained crises: that may last for weeks, months or even years. Similar to Parson's classification is the one of Seymour and Moore (2000), who have suggested that crises are of two types: the "cobra" type, which strikes suddenly and the "python" type which occurs gradually. Karagiannis et al. (2006) suggest an alternative aspect to classify the crises that affect tourism industry, using the factor of human involvement in the crises cases (direct, indirect, no human involvement). Similar is the classification of Sausmarez (2007), who argues that crises are traditionally classified as either *natural* (hurricanes and earthquakes) or *man-made* (industrial accidents, plane crashes and terrorist events).

But which types of crises and disasters are the most threatening for the tourism industry? Beirman (2003) focuses in five main reasons that result in a destination crisis: a) international war or conflict and prolonged manifestations of internal conflict, b) a specific act or acts of terrorism, especially those directed at or affecting tourists, c) a major criminal act or crime wave, especially when tourists are targeted, d) a natural disaster, such as an earthquake, storm or volcano, causing damage to urban areas or the natural environment and consequently impacting on the tourism infrastructure, and e) health concerns related to epidemics and diseases; these may be diseases which impact on humans directly or diseases affecting animals, which limit access to tourist attractions. Lepp and Gibson (2003) through their literature review pick out four major risk factors: terrorism, war and political instability, health concerns and crime. At the International Society of Hospitality Consultants (ISHC) Annual Conference held in San Diego, California, in 2006, ISHC Members participated in a series of roundtable discussions to identify the ISHC Top Ten Global Issues and Challenges in the Hospitality Industry for 2006. Among these ten issues were havoc from natural disasters and growing global uncertainty for security and safety. Maditinos & Vassiliadis (2008) proposed a cast of features for crises and disasters, which even if occur on local level and can be magnified in a considerable area, sometimes affecting the global tourism industry (Table 1). They consider that terrorism, natural disasters, political instability and war and epidemics are the four most serious kinds of crises for the tourism industry.

<i>Type of crisis</i>	<i>Gestation Period</i>	<i>Cobra-Python</i>	<i>Human Involvement</i>	<i>Man Made - Natural</i>
<i>Terrorism</i>	<i>Immediate</i>	<i>Cobra</i>	<i>Direct</i>	<i>Man made</i>
<i>Natural Disasters</i>	<i>Immediate</i>	<i>Cobra</i>	<i>Indirect & No Involvement</i>	<i>Man Made & Natural</i>
<i>Political instability and War</i>	<i>Sustained</i>	<i>Python</i>	<i>Direct</i>	<i>Man made</i>
<i>Epidemics - diseases</i>	<i>Emerging</i>	<i>Python</i>	<i>No Involvement</i>	<i>Natural</i>

Table 1 - Cast of features of "happen locally – affect globally" tourism crises. Source: Maditinos & Vassiliadis (2008)

WHY IS CRISIS & DISASTER MANAGEMENT IMPORTANT FOR TOURIST BUSINESSES?

There is a worldwide view, which has been formed during the last years that the current state of the world is directly responsible for an increase in disasters and crises. Our environment has become a more crowded world and as the population increases pressures such as urbanisation, the extension of human settlement, and the greater use and dependence on technology have perhaps led to an increase in disasters and crises (Richardson, 1994). The globalisation of the tourism industry has led to a rapid expansion of tourist businesses on an international scale in order to expand their market share and profitability (i.e. multinational hotel chains, rent-a-car companies etc). However, this process has also opened businesses up to a wider set of 'global risks' involved in running businesses at such a scale, as globalisation is often seen as complex and chaotic (Jessop, 1999). The world is also becoming more interdependent and connected so that small-scale crises and disasters may be "happened locally but they affect tourism globally" (Meditinos & Vassiliadis, 2008). Political instability or the outbreak of war in one part of the world can dramatically reduce tourist travel patterns to other parts of the world as experienced by the Gulf War of 1991 and the Iraq conflict in 2003. Tourism is therefore highly susceptible to external factors and pressures in the wider operating environment.

However, tourism is also an important economic sector for many countries and many destinations are dependent upon tourism for their growth and survival. Especially for most of the Mediterranean countries (as it will be presented below), tourism constitutes an economic sector with great contribution to their GNP, offering thousands of jobs and multiple positive consequences. This important role of tourism puts increasing pressure on managers and planners to consider the impact of crises and disasters on the industry and develop strategies to deal with the impacts to protect tourism business and society in general. Crisis and disaster management should be a core competency for tourism destination managers as well as business managers.

THE IMPORTANCE OF TOURISM SECTOR FOR MEDITERRANEAN COUNTRIES

Tourism is a major global economic sector and is increasingly making a contribution to national economies, particularly in developing countries, where it generates employment, stimulates regional development and is a means of attracting foreign exchange (Sausmarez, 2007). There has been spectacular growth in international tourism over the last 50 years, with

arrivals increasing at an average rate of 6.4% from 25.3 million in 1950 to an 763.2 million in 2004 (WTO, 2006).

International tourism came of age in coastal areas and islands of the Mediterranean in the decades after the late 1950s (Bramwel, 2003). First, came many of the coastal areas of Spain and Italy. In the late 1960s came Greece, Malta and Cyprus. All of these areas began attracting unprecedented numbers of tourist. From 1970s onwards, mass tourism also developed in North Africa's Mediterranean Countries such as Morocco and Tunisia. The Mediterranean has become a byword for summer mass tourism.

Mediterranean countries form some of the world's top tourist destinations (some of them are in the top of international ranking according to their tourism receipts, see Table 4), registering over 243 millions of international tourist arrivals in 2005 (Table 2) according to WTO (2006) and more than 150 billion euros receipts from tourism for the same period. In 2008 tourism in these countries accounted for about 2.6% of the GDP (Table 3).

No one can dispute the variety that the Mediterranean offers. From traditional sun and sand destinations (like Spain, Greece, Turkey and Tunisia) to those with a high cultural or heritage-based component (in particular France, Greece and Italy), the Mediterranean's coastal areas are mainly visited for holiday and leisure purposes, although other incentives are gradually gaining ground, as is also occurring at a world level, such as travel for health purposes or professional and business reasons. (Manera & Taberner, 2005).

What is very interesting about tourism in Mediterranean Countries, is that they have to operate simultaneously both like partners and competitors as well. This means that when bad things happen to one country (i.e. political instability, epidemics) the neighbour countries are very possible to be affected directly or indirectly. From this point of view Mediterranean

countries should co-operate in relation to some important issues, which affect the tourism activity in a major scale than a single country itself (i.e. political instability, epidemics etc).

But the neighbour countries are also competitors between each others. For example, Greece has not suffered any serious terrorism attack over the last couple of decades and thus is considered to be a safe destination. Moreover, the technological know-how acquired to support the organisation of the 2004 Olympic Games in Athens has enhanced the image of Greece with respect to safety. As a result, security is one of the competitive advantages of Greece compared to other Mediterranean countries, such as Turkey and certain North African destinations. Indeed, over the last couple of years, Greece has gained from terrorism incidents in Turkey (2003 and 2008 Istanbul bombings) and Egypt (2005 Sharm el-Sheikh bombings), something which led to extremely high occupancy in most Greek summer destinations (Euromonitor Global Market Information Database, 2009b).

CRISES AND DISASTERS CASES IN MEDITERRANEAN COUNTRIES

Following, there is a very brief presentation of some crises and disasters cases related with Mediterranean tourist destinations. The selection of these cases is random and has been done in order to support that crises and disasters incidents, though usually unpredictable, are frequent and happen next to us. One limitation that has to be noted here is the absence of quantitative data concerning the consequences of these crises cases in terms of revenues and losses for the tourism industry. But undoubtedly, they had multiple negative consequences for tourism activities in the areas where these incidents took place.

Political instability in Mediterranean Middle East

The tense situation in the Middle East has affected Middle East countries, especially the Mediterranean ones, politically, economically and with regard to travel and tourism, and has led to the portrayal of these countries as a dangerous place, thus deterring tourists to some extent. In addition, in July and August 2006, the war between Israel and Lebanon hampered travel and tourism in the area (Euromonitor Global Market Information Database, 2009b). Although the war took place in northern Israel, travel and tourism especially throughout Israel was negatively affected. Furthermore, the high level of security governing everyday life while being a necessary factor in bringing back a sense of safety is also often characterised by rigid and exhausting regulations in almost all public locations. Although Israelis are accustomed to this, it is not always easy for incoming tourists to live under such conditions.

The outlook of travel and tourism in the area is expected to be affected mostly by regional political stability and security issues, as these factors have a critical effect on factors such as growth of the economy and growth in disposable income. These factors also affect international public opinion and national morale and they impact travel and tourism (Euromonitor Global Market Information Database, 2009b).

Terrorist Attacks in several Mediterranean Places

Several terrorist attacks happened during the recent year in several Mediterranean places. Some of them were extremely severe and caused serious damages with many victims (injured

and dead people). These terrorist acts harmed also the image of the places where happened, in terms of safety and security. Although there is no quantitative evidence of this damage, it is logical that these acts affect tourist patterns either in a short or in a long term. Such cases were the following:

- **Egypt.** The 2005 Sharm el-Sheikh attacks were a series of terror attacks on July 23, 2005, perpetrated by a Wahhabi organization, targeting the Egyptian resort city of Sharm el-Sheikh, located on the southern tip of the Sinai Peninsula. Eighty-eight people were killed, the majority of them Egyptians, and over 200 were wounded by the blasts, making the attack the deadliest terrorist action in the country's history. The bombings coincided with Egypt's Revolution Day, which commemorates Nasser's 1952 overthrow of King Farouk. They were intended to hurt one of Egypt's most important vacation spots, a tourism capital that had billions of dollars invested in it, and achieved that goal as it was registered that many tourists vacated and there were numerous cancellations. Historically, foreign tourists have been a common target of attacks dating back to the early 1990s. Militants have typically been motivated by a combination of Islamic fundamentalism and opposition to the Mubarak government, and attacking foreigners including non-Muslims while hurting Egypt's tourist trade was seen as serving both goals. The most bloody attack prior to the Sharm el-Sheikh bombings was the November 1997 Luxor massacre, in which 58 foreign tourists and four Egyptians died. In October 2004, a series of bomb attacks killed 34 people in Taba, also on the Sinai Peninsula. In April 2005 Cairo was hit by two days of terrorist violence, in which three foreign tourists were killed. (Wikipedia, 2009a).
- **Morocco.** Morocco experienced a serious terrorist attack in 2003, with Casablanca bombings, on May 16, 2003. The attacks were the deadliest terrorist attacks in the country's history. Forty five people died and more that 100 were injured. The attacks occurred four days after the Riyadh compound bombings that targeted Western compounds in Riyadh, Saudi Arabia, killing 26 people. World leaders condemned the attacks, coming on the heels of the Riyadh compound bombings. In response to that attack and the Casablanca attacks, the U.S. Department of Homeland Security raised the terror threat level to Orange (Wikipedia, 2009b). These attacks made serious harm to country's profile as a safe tourist destination. However, the security approach and the measures that were adopted, restored the country's tourist profile (Euromonitor Global Market Information Database , 2009b).
- **Spain.** The 11 March 2004 Madrid train bombings (also known as 3/11 and in Spanish as 11-M) consisted of a series of coordinated bombings against the Cercanías (commuter train) system of Madrid, Spain on the morning of 11 March 2004 (three days before Spain's general elections), killing 191 people and wounding 1,800. In France, the Vigipirate plan was upgraded to orange level and in Italy, the Government declared a state of high alert. Although Madrid's security and safety image was seriously harmed, tourism in the Spanish capital, recovered within months of the attack. The quick response of the Spanish security forces in detaining the main suspects within a week (who were finally convicted in October 2007) helped to recover confidence in Spain as a safe destination for tourists from overseas (Wikipedia, 2009c).

Disastrous fires in Greece

In the summer of 2007, Greece was severely hit by forest fires. Three consecutive waves of heavy fires raged all across the country from late June to early September. The most severe incident was the catastrophic fires in Peloponnesus. From 24 to 28 August 2007, a series of fires took place in Peloponnesus, leading to the greatest forest fire disaster of the contemporary Greek State history. Even the ancient Olympia site, which is in Peloponnesus, was threatened by the blazes. Ancient Olympia, which hosted the Olympics for centuries from 776 BC, holds an Olympic flame ceremony every two years and is among the most popular tourist sites in the country. The site and its museum were saved but all the forest area around it burned down (Bassi and Kettunen, 2008).

Peloponnesus mega fires have gone on record as the most catastrophic in the country's history and the most catastrophic of the last decades in Europe (WWF Hellas, 2007). They destroyed not only forests and agricultural lands, but also entire villages, infrastructure and they left 67 people dead. Hundreds of houses were burned and thousands of people fled the fires, seeking temporary refuge in schools, hotels and regional health centers (Triandafyllou, 2007). The rapidly advancing fires caught many people unaware. These fire events have been cited in the press as the fourth worst disaster due to forest fires worldwide since 1871 and by far the deadliest for humans in recent years (Bassi and Kettunen, 2008).

Among other severe consequences (environmental, social etc), the fires also resulted in **economic damage**. The Greek government declared a state of emergency and allocated about €300 million for emergency relief. However, the final cost of the fires is difficult to be estimated. Tourism and agriculture were hard-hit and the regeneration of forests will take many years. An independent estimate by the international assessment firm Standard & Poors evaluates the damage in the range of €3 to 5 billion, corresponding to 1.4% to 2.4% of the country's GDP (Bassi and Kettunen, 2008).

Swine Influenza: a world pandemic

International tourism demand has deteriorated further due to the impact of the global economic recession. International tourist arrivals declined at a rate of 8% between January and February 2009, leaving the overall volume at the same level as recorded in 2007. At the same time, influenza A (H1N1) is starting to affect the sector. Its impact is being closely monitored by the Madrid-based United Nations World Tourism Organization (UNWTO) in collaboration with the Geneva-based World Health Organization (WHO). (Strohman, 2009).

Adding to the consumer and business uncertainty and the loss of confidence, the Influenza A (H1N1) pandemic has created an increasing degree of confusion around the issue of whether it is safe to travel. UNWTO has been very active in pressing for a clear WHO position and is working closely with the International Civil Aviation Organization (ICAO) to ensure a balanced decision making process.

Within the United Nations system, UNWTO has a direct line to express the interests of tourism and travel. At this stage, the extent of the spread, sustainability and the complete health implications of the virus remain uncertain. Given the increased public awareness, engagement and the resulting elevated concern, calls for the urgent need for response must be viewed in

context – awareness is key, not abrupt and uninformed reactions. So far, Northern, Southern and Mediterranean Europe, North-East Asia, South Asia and the Middle East are amongst the most affected sub-regions (Strohman, 2009).

THE NEED FOR CRISIS PREPAREDNESS IN TOURIST BUSINESS

Crises and disasters have become a new reality for tourism industry. Factors that affect this new reality are the fact that the world is also becoming more interdependent and connected. However, the negative consequences of these incidents can be moderated if the stakeholders involved in tourism industry get prepared for confronting such incidents. But, as Prideaux et al. (2003) note, crisis preparation is not yet an integral component of tourism business practice, and many tourism executives seem reluctant to anticipate the need. So, the need for crisis preparedness is obvious. Koor – Misra (1995) defines crisis preparation as an ongoing process of developing organizational capabilities to prevent, contain and recover from crises, and to learn from experience. Furthermore, Siomkos and Maditinos (2001) support that crisis preparation is very important for organizations involved in high risk business activities like airlines, coastal shipping etc. Pearson (2002) identifies the obvious: there is no way to ensure that an organization will escape crises. The only way for an organization to minimize crisis damage is either to avert crisis if possible or to manage it effectively. This can be achieved by being as best prepared as possible. Crisis preparation should be of high concern for every business involved in tourism industry.

CONCLUSIONS

Tourism is the single largest non-government economic sector in the world and the most important economic activity for several local economies worldwide. It is also a fragile industry in that demand for travel is highly susceptible to numerous disasters and crises. The globalisation of the tourism industry and the fact that the world is also becoming more interdependent and connected, have led to a new reality for tourism industry. Crises that occur in one single place of the world can affect the tourism around the broader area or worldwide. Understanding crises and disasters, their lifecycle and potential impacts and actions can help in the development of strategies by organisations to deal with such incidents.

By understanding these phenomena more effective strategies can be developed to stop or reduce the severity of their impacts on business and society, despite their complexity. Strategies to deal with these different crisis situations will vary depending on time pressure, the extent of control and the magnitude of these incidents. Of course, crises and disasters impacts do not last forever. Usually, tourism activity returns back to normal life after a recovery period.

Mediterranean area constitutes one of the most favour tourist destinations worldwide. Tourism industry is making an important contribution to Mediterranean national economies, particularly in developing countries, where it generates employment, stimulates regional development and is a means of attracting foreign exchange. Crises and disasters, such as political instability, terrorist attacks, natural disasters, and epidemics incidents, though unpredictable are a common phenomenon in Mediterranean countries and affect the tourism industry directly or indirectly in several ways. This means that managers of the organizations

involved in tourist business should adopt crisis management as a part of their organizational routine.

Future research should be focused on several issues that have to be further examined and analyzed in order to improve understanding crises' aspects. These issues include:

- An analytical quantitative approach of the impacts that these kinds of crises have for the Mediterranean tourism industry expressed in terms of tourism revenues.
- The duration of the recovery period examining and analyzing quantitative data of typical cases of crises, like the ones presented above.
- The way in which the tourism aspects of these adverse events of crises are managed either effectively or not.
- Thoughts and beliefs of managers of tourist businesses and organizations involved in tourism industry about crises that happen locally and affect globally.

What comes as a final conclusion of this paper, is that all the stakeholders involved in the tourism sector in Mediterranean countries (i.e. businesses, local authorities, professional associations, governments etc) have to realise this: as tourism is a basic economic activity for them, any crisis or disaster may disrupt their business continuity and cause serious damages to their operations. So, preparation for crises and disasters and the development of crisis management techniques and strategies could contribute to avert such unpleasant situations or to minimise their negative effects if they finally do happen. Thus, crisis management is not a luxury but a contemporary necessity for Mediterranean tourism industry.

CORPORATE SOCIAL RESPONSIBILITY: EVIDENCE FROM THE ATHENS STOCK EXCHANGE

Maggina, Anastasia¹; Tsaklanganos, Angelos²

¹*Ph.D. Business Consultant*

²*Ph.D. University of Nicosia, Professor Emeritus, Aristotle University of Thessaloniki*

Corporate social responsibility(CSR) is considered in a research context based on dichotomous analytical techniques such as discriminant analysis and logit specifications.Using these techniques it is shown if CSR can be forecasted,which are the discriminating variables between companies that have CSR and those that do not have CSR and which statistical technique fits better to the data drawn from these two groups of companies as far as the companies listed in the Athens Stock Exchange is concerned.Results indicate that very few variables play a role in the discrimination between the two groups of companies while size does not play a role almost at all.

INTRODUCTION

Corporate social responsibility(CSR) has been considered a modern way of doing business.It has a long experience in the USA and is a recent phenomenon in Greece as far as the companies is concerned.On the other hand,Greece has a long tradition as regards to donations by individuals:since ancient Greece individuals donated funds to the State or to erect public buildings.In the international arena CSR means actions like making extensive charitable contributions,promoting community development plans,maintaining plants in economically depressed locations, establishing environmental protection procedures,etc.As Tsaklanganos has put it,other areas of social responsibility are i)small and minority-owned firms that can be developed with the help of big business through monetary assistance,managerial training and technical guidance,ii)educational functions in the community beyond the plant by providing financial support to schools for equipment,libraries and construction,donating supplies or manpower,allowing the use of their office facilities in the night for college and community educational programs and,iii)renewal of cities by building or renovating middle-and-low cost housing,helping improve transportation facilities and upgrading other municipal services.CSR is seen as a key driver for engaging the wider community as an important stakeholder in business activity.

According to the Awareness and Social Behavior Index(ASBI) as developed by the MEDA Communication SA in Greece the 39.5% of a sample knows about the existence of companies that have CSR.Eight out of ten employees in the private and public sector agree that CSR is very important to social life.The 6.5 out of 10 employees report that they do not know if the business enterprise in which they work has CSR.Finally,34.5% of the citizens report that companies use CSR to improve their image.

The institution of CSR has been established in the framework of corporate governance for Greek companies listed in the Athens Stock Exchange.The rate of companies that have CSR is 8.6%(24 companies over 279 companies that report financial statements in the Internet) and

8.39% for the final sample used in this study(23 over 274 companies).For the first time a company has been awarded a prize for CSR.This is Bank of Piraeus which has been awarded a prize by the Greek Chamber of Industry and Commerce.

Because the phenomenon is very recent in Greece,we first examine the characteristics of companies that have CSR and those that do not have CSR.Dichotomous analytical techniques have been employed in order to discriminate the two groups of companies.This paper purports to compare empirical findings drawn from the application of two dichotomous statistical techniques through an assessment of the analytical quality of ratio analysis using data drawn from the Athens Stock Exchange.

The rest of the paper is organized as follows.Next section II reviews the literature.Section III contains the research design.Section IV reports empirical findings.Section VI concludes with a summary and suggestions for further future research.

REVIEW OF THE LITERATURE

CSR even if it is an old business discipline it has very infantly been studied.Research studies are very scarce.CSR has its origins on community issues.Dr Demming as far back as 1946,had argued that “statistical quality techniques ought not to be limited to economic applications”.He argued on the significance from social contributions that would emerge,through the application of quality tools and techniques.Demming’s views were further stressed by Juran(1994) who has often argued quality Institutions to expand their mandate by placing more emphasis on rendering service to society.

Although social issues have been debated for centuries,only recently they have joined the mainstream management literature as a legitimate area for inquiry.Levy(1999) expresses the opinion that corporate philanthropy and social initiatives are the heart and soul of business.He stresses the fact that “social endeavors must be consistent with business objectives for earning profit(heart) and must express the values of serving society(soul)”.

CSR in social welfare has shown that certain firms have responded to these concerns by devoting more resources to CSR.It has been considered an active source of competitive advantage.According to Lin et al.(2009) CSR can be a proactive business strategy and an effective marketing tool to create and sustain a competitive advantage.However,in some companies management has resisted,arguing that additional CSR investment is inconsistent with efforts to maximize profits.This disagreement has prompted researchers to examine the relationship between CSR and financial performance in an effort to assess the validity of these concerns.

The management literature has acknowledged social responsibility as an important corporate duty(Tsaklanganos,1974;1976;Quinn et al.,1987; McGuire et al.,1988).As Carrington(1970) has formulated it,a healthy business system can not exist in a sick society.Tsaklanganos(1976) has argued that business must also participate in solving the problems of the community and the society at large.According to Arlow et al.(1982), Ullmann (1985),Mc Guire et al.(1988) CSR is very significant in corporate decision making and the relationship between a firm’s social policies or actions and its financial performance is an important topic.

In the literature the main body of research has been focused on the relationship between firm's social responsibility and their financial performance. There are three standpoints. The first is that firms face a trade-off between social responsibility and financial performance. These proponents propose that firms incur costs from socially responsible actions that put them at an economic disadvantage compared to other less responsible firms (Aupperle et al., 1985; Ullmann, 1985; Vance, 1975). A second standpoint is that the explicit costs of corporate social responsibility are minimal and that firms may actually benefit from social responsible actions in terms of employee morale and productivity (Moskowitz, 1972; Parke et al., 1975). Finally, the third standpoint refers to the fact that the costs for socially responsible actions are significant but are offset by a reduction in other costs. According to stakeholder theory (Cornell et al., 1987) apart from stockholders and bondholders those with less explicit claims should be satisfied. Alexander et al. (1978) and Bowman et al. (1975) have asserted that stakeholders may see CSR as indicating management skill. An increase in perceived social responsibility may improve the image of the firm's management and permit it to exchange costly explicit claims for less costly implicit charges. If a firm does not act in a socially responsible manner, parties of implicit contracts concerning the social responsibility of the firm may attempt to transform the implicit agreements that will finally be more costly to it. Firms with an image of high CSR may find that they have more low-cost implicit claims than other firms and thus have higher financial performance (Cornell et al., 1987).

Research into the relationship between corporate social responsibility and financial performance has been developed on the basis of some theoretical arguments. Those who have asserted that there is a negative relation between social responsibility and financial performance argue that high responsibility results in additional costs that put a firm at an economic disadvantage compared to other less socially responsible firms (Bragdon et al., 1985; Vance, 1985). Those who argue for a positive association cite improved employee and customer goodwill as an important outcome of social responsibility (Davis, 1975). Socially responsible activities may also improve a firm's standing with such important constituencies as bankers, suppliers, creditors, investors, and government officials who may bring economic benefits (Moussavi et al., 1986). According to Spicer (1978), bankers and other institutional investors have reported social considerations to be a factor in their investment decisions. Thus far, high CSR may improve a firm's access to sources of capital.

Apart from the relationship between CSR and measures of financial performance, an argument for a relationship between social responsibility and such measures of financial risk as variance in earnings and in stock returns is also made (Spicer, 1978; Ullmann, 1985). Low levels of social responsibility may increase a firm's financial risk. Investors may consider less socially responsible firms to be riskier investments because they see management skills at the firm as low (Alexander et al., 1978; Spicer, 1978). In contrast, a high degree of CSR may permit a firm to have relatively low financial risk as the result of more stable relations with the government and the financial community. Besides, it is asserted that in case of high social responsibility firms may also have a low percentage of total debt to total assets that helps them to continue to satisfy implicit claims.

CSR may also be linked to past firm performance. Financial performance may influence a firm's evolving social policy and actions (Ullman, 1985). If CSR is viewed as a significant

cost, firms with relatively high past financial performance may be more willing to absorb these costs in the future (Park et al., 1975; Ullmann, 1985). In contrast, less profitable firms may be less willing to undertake socially responsible actions.

Previous empirical research on the relationships between CSR and measures of firm performance has yielded mixed results. Moskowitz (1972) reported higher than average stock returns for highly ranked firms in terms of his evaluation of their level of social responsibility. Vance (1975) found a subset of the firms rated by Moskowitz had lower stock-market performance than a comparison sample of firms listed in the NYSE Composite Index, Dow Jones Industrials, and S & P Industrials. In other studies (Alexander et al., 1978) where an attempt is made to adjust stock-return performance measures for risk the relationship between social responsibility and market performance is very low.

Bragdon et al. (1972), Bowman et al. (1975), and Park et al. (1975) have reported a positive association between CSR and accounting-based measures of performance. Cochran et al. (1984) found a positive correlation between social responsibility and accounting performance after controlling for the age of assets. In contrast, Aupperle et al. (1985) found no significant relationships between social responsibility and a firm's return on assets (ROA) adjusted by its ranking in the Value Line Safety Index. Sturdivant et al. (1977) by categorizing firms as best, honorably mentioned, and worst in terms of social responsibility found that firms with an honorable mention had higher accounting-based performance than the other firms. McGuire et al. (1988) found that firms low in social responsibility also experience lower return on assets (ROA) and stock-market returns than do firms high in social responsibility. Their most interesting result is that prior performance is generally a better predictor of CSR than subsequent performance. Lin et al. (2009) by examining 1000 Taiwanese cases in which firms include their R & D expenditures as one of their business strategies for sustainable development, they identify their charitable expenditures as contribution to CSR. Based on theoretical assertions and empirical evidence, they identified a positive relationship between CSR and financial performance. They found that while CSR does not have much positive impact on short-term financial performance, it does offer a remarkable long-term fiscal advantage.

THE RESEARCH DESIGN

Research Method

The research question which is set first leads to the suitable research method that will be employed in this study. Could companies that have CSR be discriminated from companies that do not have CSR, how correctly they can be classified and whether prediction can be appropriately used in decision making. A suitable research method is to compare companies that have CSR with a control group of companies that do not have CSR. Discriminant analysis and logit specification are the most suitable statistical techniques that have been successfully tested in many fields in order to discriminate between groups of companies. Depending on the nature of the data of the two groups of companies alternative methods such as discriminant analysis and logit specifications are tested in the purpose of the appropriate selection with no ignorance of theoretical dogmas and proliferations. Theoretically, it has been argued that if the explanatory variables are normally distributed, then one should use discriminant analysis. However, if the

explanatory variables are not normally distributed, then discriminant analysis gives inconsistent estimates, and one is better off using logit analysis (Maddala, 1991). Logistic regression is considered preferable not only because of theoretical reasons but due to the particularities of the sample selection. Theoretically, logistic regression is usually preferable to discriminant analysis when one wants to see the contribution of each variable to differentiating between groups. It is also effective even when the main objective is classification.

Discriminant analysis is a statistical technique used for predicting group membership on the basis of the values on a set of predictors' variables. It operates with the conditional distribution of x (explanatory variables) given y (dependent variable). The model has the following general form:

$$Y_i = 1 \text{ if } P(Y_i = 0/X_i^*)L_{01} < P(Y_i = 1/X_i^*)L_{01}$$

$$Y_i = 0 \text{ otherwise}$$

where

$P(Y_i = 1/X_i^*)$ as a posterior probability of $Y_i = 1$.

A logit model specifies the conditional distribution of y given x . It assumes that $g(x) = \text{logit}\{\Pi(x)\}$ is the linear function of covariates (x) of the i^{th} subject with the logit as the dependent variable. Specifically, $g(x) = a + bx$ with

$$\Pi(x) = \frac{e^{a+bx}}{1 + e^{a+bx}}$$

where $\Pi(x)$ denotes the conditional probability that Y occurs, conditional that it did not occur. In other words, $\Pi(x) = P(Y=1/Y=0)$ with Y denoting the outcome variable.

Variables Selection

The variables used are represented by the financial ratios selected in this study. They have been selected in order to have a full picture of the profile of the company and have been employed in other studies (Maggina, 2008). The list of financial ratios used has as follows:

<i>Financial Ratios</i>	<i>Abbreviation</i>
<i>Net Income:Total Assets(return on assets)</i>	<i>NITA</i>
<i>Cash:Current Liabilities(liquidity ratio)</i>	<i>CASCL</i>
<i>Cash:Total Assets(liquidity ratio)</i>	<i>CASTA</i>
<i>Quick Assets:Total Assets(quick ratio)</i>	<i>QATA</i>
<i>Current Assets:Sales(return on current assets)</i>	<i>CASA</i>
<i>Net Worth:Total Debt(equity to debt ratio)</i>	<i>NWTD</i>
<i>Receivables:Inventories(short-term financial ratio)</i>	<i>RECINV</i>
<i>Working Capital:Total Assets(working capital turnover)</i>	<i>WCTA</i>
<i>Total Debt:Total Assets(leverage ratio)</i>	<i>TDTA</i>
<i>Net Income:Sales(return on sales)</i>	<i>NISA</i>
<i>Sales:Working Capital(working capital turnover)</i>	<i>SAWC</i>

Profitability,liquidity,and leverage ratios as figured out above have been tested and successfully justified as the leading ratios for corporate prediction purposes.

The Sample Selection

Companies listed in the Athens Stock Exchange have been selected for investigation in this study.The size of the sample is based on the number of firms appeared in the Internet for one and two years before the event of CSR commencing with the most recently published data on 2008.The total number of firms that reported financial statements published in the Internet is 279 companies for year 2008.Companies which satisfy the presumption of two consecutive years before the event of CSR are 274.Thus far,companies with CSR are 24 in the Internet and they are 23 in the final sample.

EMPIRICAL FINDINGS

In a consideration of means of each variable used in the analysis,results are more illustrative of the differences between groups of companies.Companies with CSR and companies without CSR do not present great differences except variables X_{11} and X_7 when data for one year before the event are used.Obviously,this is an evidence that Sales/Working Capital and Receivables/Inventories will be the most crucial variables in the discriminating process as well as the predictive ability of models employed in this study.When data for two years(one year before and two years before the event) are used means differ between the two groups of companies for variables like X_5 (Current Assets/Sales), X_7 (Receivables/Inventories), X_6 (Net Worth/Total Debt), X_{11} (Sales/Working Capital) and X_2 (Cash/Current Liabilities).

Table 1: Average Ratios (Means)

A non-parametric method and a suitable one for ordinal data specifies the most significant variables at 5% level of significance. Kolmogorov-Smirnov is an appropriate statistic to test normality. It is of high importance to test normality because outliers may have a big influence. Prior studies have shown that non-normally distributed financial ratios are characterized with the presence of outliers. Worth noting that we have fifty one outliers in variables X₇ and X₁₁ in companies with no CSR in all years under consideration, eighteen outliers in variable X₆ in companies with no CSR, eleven outliers in variable X₂, and nine outliers in variable X₅ in companies with no CSR. Remember that the number of outliers is very small in other studies when the matter of the distributional properties of financial ratios is examined (Deakin, 1976; So, 1987; Karels and Prakash, 1987).

Numbers in parenthesis indicates two tails significance

Table 2:Normality Test(Kolmogorov-Smirnov)

As shown in Table 2 most of the variables in CSR companies are not normally distributed. In contrast, companies without CSR are normally distributed.

The choice of the best fitting model is stressed through a discussion of all empirical findings drawn from a test of discriminant and logit analysis. In each year, a company is observed in one

of two alternative states. Coefficients for each model and for each variable in one and two years before the event of CSR along with the whole data set are given below:

Table 3 – Regression Coefficients

Wilks' Lamda which is one of the various statistics available for weighting up the addition or deletion of variables in the analysis, is generally low. In discriminant analysis almost all variables contribute marginally (see Table 3) except variable X_4 (Quick Assets/Total Assets) which is the most discriminating variable. Furthermore, the low eigenvalue means that each variable alone can not sufficiently explain the model. In discriminant analysis the significance of the test is a strong evidence which leads to the selection of the best statistical technique. When logit is employed there are many variables that operate as strong discriminating variables but they are not statistically significant. These are X_1 (Net Income/Total Assets), X_3 (Cash/ Total Assets), X_4 (Quick Assets/Total Assets), X_8 (Working Capital/Total Assets) and X_9 (Total Debt/Total Assets).

Once the values of the discriminant coefficients are estimated, it is possible to calculate discriminant scores for each observation in the sample, or any firm, and to assign the observations to one of the groups based on this score. The essence of the procedure is to compare the profile of an individual firm with that of the alternative groupings. In this manner, the firm is assigned to the group it is most closely resembles.

As far as the correct classification, results offered in next Table 4 justify the preference of logit against discriminant analysis. Firms are more correctly classified using logit.

When all data (both years) are used the percentage of correct classification is 92.0% with a logit model and 70.4% with discriminant analysis. When outliers are excluded the rates are 92.2% and 73.8% respectively. In a similar vein, when one year-before data are used results are 92.7% for logit and 74.8% for discriminant analysis. When outliers are excluded the rates are 91.6% and 74.3% respectively.

	<i>Discriminant Analysis</i>		<i>Logit Model</i>	
<i>One-Year-Before(All data)</i>	165(76.7)	50(23.3)	215	0(100.00)
	9(47.4)	10(52.6)	17	2(10.5)
	74.8%		92.7%	
<i>One-Year-Before(Outliers excluded)</i>	125(76.2)	39(23.8)	163	1(99.4)
	7(46.7)	8(53.3)	14	1(6.7)
	74.3%		91.6%	
<i>Two Years-Before(All data)</i>	312(71.7)	123(28.3)	434	1(99.80)
	17(44.7)	21(55.3)	37	1(2.6)
	70.4%		92.0%	
<i>Two Years-Before(Outliers excluded)</i>	255(75.0)	85(25.0)	340	0(100.00)
	12(40.0)	18(60.0)	29	1(3.3)
	73.8%		92.2%	

Table 4: Classification Table for GROUP(Percent Correct-Overall Index)

Even if assets size is included in the models with data either one year before or two years before the event prediction accuracy does not change significantly. This means that size of companies does not play a role in the discrimination between companies that have CSR and those that do not have CSR.

These findings are very close to other business events (i.e. bankruptcies, mergers and acquisitions, liquidations, auditors' switching, etc.). Based on the above empirical findings, it is suggested that the prediction model is an accurate forecast of the event of CSR. Finally, normality in data sets played a role in the success of one versus the other model since the moderate degree of normality led to logit rather than discriminant analysis.

CONCLUSIONS AND SUGGESTION FOR FUTURE RESEARCH

In an application of two dichotomous models that tested both the determinants of a dichotomous choice in an infantly investigated area of research in a specific country and worldwide the robustness of two widely used models indicates that the business event of CSR can be predicted by a rate higher than 90.0% using a logit specification. The discriminating factors between the two groups of companies are mainly variables X_1 (Net Income/ Total Assets), X_3 (Cash/Total Assets), X_4 (Quick Assets/Total Assets), X_8 (Working Capital/Total Assets), and X_9 (Total Debt/Total Assets) but they are not statistically significant at 5% level of significance. They are statistically significant at a higher level of significance. What is suggested in the literature is that it may be more fruitful to consider financial performance as a variable influencing social responsibility than the reverse.

This study used data from listed companies. The situation would be different in the case of no listed companies. This is a matter for future research since the business environment would be changed. Another avenue for future research is to study whether profitable companies have more CSR than companies with losses or reduced sales.

**WHAT REPORTING FOR THE GLOCAL ENTERPRISE?
ISSUES RELATING TO SOCIAL AND PERFORMANCE REPORTING IN
BUSINESSES AND INSTITUTIONS IN LOCAL AND GLOBAL CONTEXTS**

Migliaccio, Guido¹

¹Lecturer of Management and Managerial Accounting, University of Sannio, Benevento - Italy

In socio-economic areas, the “glocal” model which mediates characteristics of globalization with those of more deep rooted localism, seems to be flourishing. Governed by its own principles, it is radically changing the logics of business management. When can a business be defined glocal? And how can glocal management be defined, taking into account complications arising from the simultaneous presence of global, local and glocal functions? How do the effective needs for communication change on the part of enterprises present simultaneously in different areas? And above all, can economic and financial communications addressed to broader, heterogeneous areas be covered by a single Financial Statement? Would it be feasible to overcome the “prism effect” with a “concertina” format Financial Statement flexible and adaptable to the contingent needs of the different phases? Should we presume that stakeholders are mere spectators of property tax and legal communication, or is it feasible that they can become proactive “prosumers” of the Financial Statement?

Keywords: Glocal enterprise, Financial Statement, Socio-economic communication.

INTRODUCTION: THE “PRINCIPLES” OF GLOCALISM

In the scenario of the complex phenomenon of globalization, economics and business studies are virtually collocated between two extremes.

On the one hand, the standardized lifestyles approach linked to its relative scenario of productive assets, investments and consumption¹³⁴.

On the other, the ability to accentuate and exalt traditional differences and as a result, logical processes and procedures for value creation.

A model of production and consumption positioned between these two extremes appears to emerge in which simultaneously, the innovative aspects of globalization are combined with local traditions, frequently factors of effective competitive strategy.

There are many complex causes underpinning this model which appears to mediate elements of globalization with those of more deep-rooted localization.

¹³⁴ Said LEVITT, *Globalization of Markets*, recur in LEVITT, *Ted Levitt on Marketing*, from p. 133: “The world’s needs and desires have been irrevocably homogenized ... Companies must learn to operate as if the world were one large market – ignoring superficial regional and national differences”.

Certainly the resulting “glocalism” issue raises questions in socio-economic, corporate communication and public administration contexts.

In the first instance, problems of definition arise as concerns “Glocal” in general terms and as regards the actors of economic competitive enterprise in particular.

‘Glocalism’ or ‘glocal’ a neologism, coined in the 80s in Japan, became common usage in Britain thanks to the sociologist Roland Robertson¹³⁵ and was later used more extensively in a professional sense by Zygmunt Bauman¹³⁶ to mediate the demands of globalization with those of local realities. Founded on principles and ethical values, the concept reflects a simple to complex sequence. Individual and group centred, it considers both material and immaterial features of local heritage fundamental, placing the local community i.e. personal relations and the interaction of individuals in terms of community “subsystems” of more complex organizations. The economic issue implies production of goods and services designed for the global market, but adapted to local laws that require procedures that can be summed up in the slogan: think global, act local¹³⁷.

A free global market is therefore instrumental to the needs of the individual, the protagonist of a micro group which expands, develops and interacts with other more complex scenarios, until culminating in the reality of globalisation.

The global and the local can coexist¹³⁸, the former can be considered the evolution of the latter; in other words, a complex system that preserves the original local structures¹³⁹.

In such a complex context, firms need to devise managerial perspectives and competence that are totally different compared to those applied in local or international¹⁴⁰ scenarios, or on the contrary, typically international contexts.

Meanwhile the government and in particular, local authorities are called upon to perform new functions in social areas traditionally under their supervision besides supporting productive activities.

The outcome is the need for innovative methods of communication on the part of enterprises and local authorities addressed to these new categories of stakeholders or, to traditional categories albeit made up of actors characterised by unusual or peculiar¹⁴¹ traits.

¹³⁵ ROBERTSON, *Globalization*.

¹³⁶ BAUMAN, *Globalizzazione e GLOCALizzazione*.

¹³⁷ See ONKVISIT, SHAW, *GLOCAL advertising*, and CHAMPY, *Think globally, sell locally*.

¹³⁸ “L’approccio glocale è caratterizzato dall’incontro e dal dialogo fra attori globali e attori locali, nella prospettiva della costruzione di una maggiore forza negoziale comune: la ricerca di convenienze e interessi comuni fra luoghi e flussi globali per la realizzazione di progetti di cooperazione”, from the web site of the association Globus et Locus (www.globusetlocus.org, consulted July 25, 2009) that promotes the analysis of glocal issues emerging from the dialectic between global and local translating them into strategic actions.

¹³⁹ Some organizations have been working for years in the spirit of globalization. Among these, the *glocal Forum*, active since 2001 for cooperation between cities (www.glocalforum.org).

¹⁴⁰ Also part of Italian culture is sensitive to the socio-economic phenomenon, considering also the actual involvement of many firms (see: VACIAGO, *Piccole imprese in un mondo «glocale»*; PRETI, *Azienda glocal*; TARDIA, *Glocalizzazione*; D’AGOSTINO, *Glocalismo*; SEDDA, *Glocal*, AMATO MANGIAMELLI, *Glocalizzazione*). Also be noted that studies on social capital and human relations with the company have a clear common with the centrality of individual and group membership typical of glocalism (see RICCI, *Capitale sociale ed umano*, from p. 193, and references cited).

Table 1: The "Principles" of glocalism

<p>Premises</p> <p><i>Technology changes the ideas of time and space and has unified the world;</i></p> <p><i>Innovation facilitates the encounter between knowledge and power in order to create values;</i></p> <p><i>Innovation means new opportunities but also threats;</i></p> <p><i>Mobility dominates over permanency, consequently it develops relations that are independent of territories;</i></p> <p><i>Relations without boundaries change the meaning of places and open up new relationships between the global and local: the global penetrates all loci and every locus is part of a global dimension;</i></p> <p><i>The new glocal world is destined to be the world of every population;</i></p> <p><i>Glocalism should not mean stateless uniformity, imbalance, eco-drama;</i></p> <p><i>New policies, new institutions and new powers are needed;</i></p> <p><i>To benefit from global and to defend local needs no borders, citizen-ship/nationality or sovereignty;</i></p> <p><i>The end of nationalism does not mean the end of ethnic and regional cultural identities;</i></p> <p><i>Managing mobility and the territory calls for new political relations;</i></p> <p><i>In mediating between coexistence and economics, the central institution is the firm regulated by global markets where it operates in functional networks linked on a global scale;</i></p> <p><i>These functions determine the mobility of goods, people and relations that are often detached from the territory and therefore difficult to regulate by traditional institutions;</i></p> <p><i>New glocal institutions capable of linking global firms and local business people, can mediate between the global economy and local coexistence.</i></p> <p>Claims</p> <p><i>A new statehood in which individuals, different races and nations can live together on an equal footing;</i></p> <p><i>Territorial communities free from local or national influence;</i></p> <p><i>A new citizenship based on multi-membership: the possibility, for all to feel cosmopolitan, Italians, Europeans, Mediterranean, Catholics, Muslims, liberals, socialists, etc. without losing their sense of political identity;</i></p> <p><i>The opportunity to operate freely in the rich and dynamic structure of functional territorial networks</i></p> <p><i>New cosmopolitan governance essential for ensuring in a glocal world, a clean environment, peace, rights and justice.</i></p>
--

141 A detailed list of the main stakeholders of an undertaking is proposed by RICCI, *Bilancio degli alberghi*, from p. 108. Tourism is a sector where glocalism is very important and has even greater potential; see: BOOKIN BLOG, *Glocale, Il futuro linguaggio del web*, and *Il futuro linguaggio del web*; and also SALAZAR, *Tourism and Glocalization*.

Aims

To create innovative currents of thought, institutions and strategic policy as guidelines for the stakeholders/ actors of the new glocal era;

Create new relationships between the permanency and mobility of goods, persons and ideas;

Devise rules of coexistence that reconcile efficiency and democracy in the new functional/practice communities on a global and local scale;

Reorganize territories especially in relation to the newborn glocal-cities where innovative complexes of functional networks meet up with pre-existing citizen groups;

Create new institutions/powers and above all, new levels of meta-national statehood.

Glocalize institutions (Chamber of Commerce, Banks/Foundations, Provinces, Regions, to improve coordination with multinational groups, large banks, groups of small and medium enterprises undertaking the glocalist challenge;

Link the thousands of partnership structures and local services with the glocal scale web of crosscutting functional networks;

Train new generations for new challenges.

Source: adapted from Bassetti, Manifesto dei glocalisti.

“GLOCAL” ENTERPRISE?

The complexity of the “glocal” scenario *tout court* necessitates identifying firms which are “glocal”.

The issue is whether economic parties can be distinguished from local and international companies, or rather, whether “glocalism ” can be considered mainly a form of partial internationalism in which companies gradually address generally wider contexts and preserve deep roots or otherwise, in their territory of origin¹⁴²?

As concerns “glocal” enterprise, what parameters can be considered when defining the category in terms of the organizational and management features that render it a stable form of productive entity?

Applying a merely functional approach could lead to defining as “glocal” a business that applies at least one global functional strategy alongside other “local” strategies...

Together with organizational processes and logics rooted in a specific territorial area, the globalization of marketing strategies (or more simply, marketing) prospects well-known strategies and practice¹⁴³.

¹⁴² See the main theories of international trade and the internationalization of enterprises, in MARINO, *Impresa e relazioni internazionali*, from p. 38.

¹⁴³ Subject to its guiding principles, the globalization seeks to preserve the individual identity within a complex system. In marketing, “glocalization” means therefore compared the characteristics of the local product in the global market when it proposed setting up his own niche and, conversely, local needs than by the overall product that can adapt (including related services) to the peculiarities of local demand. For the necessary depth, see: FOGLIO, *Glocal marketing*; YOUNG, *Glocal marketing*; SVENSSON, *Globalization of marketing activities*; THOMPSON, ARSEL, *Experiences of Glocalization*.

Likewise for companies that besides globalizing supplies or sales, also globalize production processes by locating businesses in different areas.

In other words, traditional multi-domestic strategies based on exports or productive decentralization normally precede transnational or homogeneous¹⁴⁴ global strategies.

These strategies however, do not identify specific “glocal” trends that qualify a business as such, classifying it among the ethnocentric, polycentric, geocentric region-centric kind¹⁴⁵ or those in categories which classify businesses as global, transactional, corporate and multi-local¹⁴⁶.

A more logical and perhaps more satisfactory focus might be addressed to strategic choices of a strictly “glocal” nature which could help to define the business as such¹⁴⁷.

However, this is a very vast and varied category taking into account that potential combinations between local and international functions could be many and characterised by differing grades of glocalism.

WHAT MANAGEMENT FOR GLOCAL BUSINESS?

The diverse nature of glocal companies makes it difficult to identify specific features of their management which is usually characterised by the firm’s global functions both on a local and global (glocal) scale and the acknowledged glocal direction of its strategies.

The glocal business approach confined to purely global marketing functions and combined with local management has much in common with traditional models of management. On the other hand, the scenario is different where the human resource factor/element involved in the production process is global not only in terms of delocalized plants but also in terms of local firms that rely on workers of different ethnic, and cultural status, who have to coexist in a unique production context. In this case, the logics of diversity management are better suited compared to the more traditional standardized type of management¹⁴⁸.

¹⁴⁴ PORTER, *Competizione globale*, p. 19

¹⁴⁵ BERTOLI, *Strategie internazionali*, from p. 67.

¹⁴⁶ *Ibidem*, from p. 71. See also BUCKLEY, GHOURI, *Globalization*.

¹⁴⁷ “Strategic management in any type of organization ... has got a new dimension today. This dimension is the all too familiar ‘glocal’ vision. Well, what is really interesting and worth analyzing for all managers, leaders and entrepreneurs of today’s progressive, knowledge-based corporations, is that this ‘glocal’ element is now an indisputably imperative ingredient for all successful organizations – in different flavours, of course!”; KRISHNAN, *Glocal in Organizational Strategy*, p. 1, concluding regarding (p. 11): “Hence, it may be concluded that most successful organizations leverage the ‘glocal’ concept when it comes to mission, resources and geographical locus and control. This is what makes any organization follow the ‘glocal’ strategy. I have therefore formed the following acronym for ‘glocal’: Global Long-term Objectives Customized to Assets Locally, where the explanation to each of the keywords is given in the following depiction”. For further details see also SVENSSON, *Glocalization*.

¹⁴⁸ In recent years in Italy and abroad are spreading studies on topic. See, among others: CUOMO; MAPELLI, *Diversity management*; MAURI, VISCONTI, *Diversity management*; ARREDONDO, *Diversity management*; COX, *Cultural diversity in organizations*; KANDOLA, FULLERTON, *Diversity in action*.

Even the combination of local traditional financial sources with instruments raised on international markets can result in so-called glocal finance management, which evidently demands appropriately suitable and flexible professional expertise¹⁴⁹.

It is impossible to identify a priori specific features of management of glocal businesses without identifying beforehand, local, global and glocal functions.

What is certain is that a comprehensive global approach coexisting permanently with a local approach demands a mentality open to both innovation and tradition¹⁵⁰ inspiring specific organization, mediated between deep rooted conservative habits and stimuli deriving from a 'global approach.

The logical consequence of these considerations is the expanding of categories of stakeholders in terms of dimension and importance as the case may be, in relation to the extent of global and local elements simultaneously present. In addition to local stakeholders characterized by well known features, global stakeholders need to be taken into proper consideration when undertaking the managerial choices necessary (Table 2). This has repercussions naturally, on choice in a communicative-institutional, commercial and financial terms and in a more general, socio-economic sense.

WHAT COMMUNICATION FOR GLOCAL BUSINESS?

The preservation of "local" in a global context is accomplished by extensively analysing content for the purpose of protecting individuals and groups.

New technologies in effect, have the merit of universalizing information, but they often distort it and favour the superficial standardization of language, the latter being the primary element to preserve of any culture. In other words, what is needed is not translations, but rather deep structured cultural and linguistic adaptation.

This also applies to websites and Internet communications a primary vehicle of globalization, communicating with users through familiar expressions and figures of speech: what should be avoided are culturally distant messages addressed to segments of users having limited computer literacy, who are strongly oriented towards local scenarios and are destined to be potential users of the network services¹⁵¹.

Glocal communications should therefore take into account:

- a. the vast variety of stakeholders from different local and global backgrounds;
- b. the need to preserve local languages, while at the same time, encouraging global communication.

149 Even banks can be glocal companies. See GRANELLI, *Glocal banking*, and the strategic guidelines of the Antonveneta bank outlined in PEGHIN, *Antonveneta banca «glocale»*.

150 See: BEUKEMA, CARRILLO, *Globalism/Localism at Work*; BEUKEMA, *Work restructuring as ongoing glocal processes*; GONZALEZ, *Middle management in ottica glocal*; RICHINS, *Glocal business management*; and especially SHI, *Organizational factors of globalization and localization*.

151 BOOKIN BLOG, *Glocale, il futuro linguaggio del web*, and, from the same web site: *Il futuro linguaggio del web*.

It is clear that mediation is problematic because globalization tends towards standardization and a single language, while conversely, localization favours the preservation of typical local idioms.

However, mediation is necessary and feasible for many areas of corporate, institutional, managerial, marketing and economic-financial communication¹⁵².

As concerns institutional communication, mediation is fundamental seeing as relations with the public are involved. Another factor to be taken into account is that this type of communication contributes to building the reputation of the institution, attributing to the latter uniform features even though the means of communicating should adapt to the specific practices of each place.

A unified reputation and a unified image throughout the world could result from easily understood messages communicated across different cultures.

A website for example, the first medium for presenting a firm should use colours, music and images in line with the expectations of an area: not simply one site in many languages, but a number of sites directly proportional to the areas of interest.

Similar principles of communication should guide management directly responsible for relations with the parties involved in the administration of the company.

A need for glocal communication arises especially when the actors involved belong to different ethnic, cultural and ideological backgrounds regardless of where the business units are situated.

Communication in this case, should be regulated within the context of diversity management which enhances diversity by means of unequivocal guidelines/resolutions adapted to individual characteristics.

However, the most complex kind of communication is that of glocal marketing which has to provide perceptions of corporate supply value to markets that might well have extremely different characteristics.

The promotional mix and in particular commercial communication policies, need to have a common perspective, specifying what content to share in each area, how to communicate, and above all the consistency with other "images" of the company.

The importance of this form of communication is strictly connected to glocal marketing which inspires it.

Under-researched and certainly in need of further reflection, however, is communication dealing with economic and financial relations with investors to whom patrimony, financial and income balances have to be reported and accounted for.

In conclusion it is feasible to emphasize the essential role internal and external communication plays in a glocal company taking into account the many different

¹⁵² The classification is in BOCCARDELLI, MARCATI, MARCHIGIANI, *Strategie e politiche di marketing*, from p. 306.

stakeholders¹⁵³ involved. External sources communicate the various opportunities offered to customers / users in global and local areas and at the same time, collect input on potential improvements, proposing different operational perimeters which are (more or less circumscribed).

Frequent managerial changes characteristic of glocal strategies need to be communicated promptly to avoid prejudicing institutional reputation on the markets.

Meanwhile, internal communication, enhances the wealth of information possessed and disseminates the priorities identified by the different "sensors" of the organization.

Internal communication also facilitates the updating of core and peripheral actors and the circulation of news throughout the glocal circuit. Internal stakeholders contribute directly to the provision of institutional goals: organizational changes are consequently more easily assimilated as they are the express manifestation of emerging needs. Internal communication becomes a tool for understanding and promoting change, favours a common vision of the value of the job, and spreads a sense of belonging, enhancing and motivating staff in a positive and sought-after context.

In short, the benefits of accurate and appropriate communication are extended considerably in glocal realities.

WHAT FINANCIAL STATEMENT FOR GLOCAL BUSINESS?

The increasing number and type of stakeholder and the need inherent in the ethical principles of glocalism to preserve local languages pose serious problems for accounting procedures which fundamentally, are difficult to resolve.

A preliminary issue involves identifying to whom Accountancy Reporting be addressed. The question is should the range of recipients for reporting be limited exclusively to particularly competent, qualified individuals whose expertise already includes global knowhow?

A single universal accounting language in this case, might be a practical solution, acceptable also to glocal companies willing to trim the range of stakeholders involved. However, this solution would circumvent the need to respect the local language considered in terms of convenience merely marginal, but it would also invalidate the fundamental function of the Financial Statement, i.e. that of addressing all stakeholders, regardless of dimension and extent of globalization and consequently, their degree of international accounting literacy.

The outcome would be the cancellation from the range of potential users: the countless small retailers, clients and employees by limiting access to the Financial Statement to banks, large investors or customers / suppliers with an international dimension. However, this pathway appears extremely reductive and simplistic, especially in a productive fabric characterized by a large population of small operators traditionally bound to local accounting procedures.

¹⁵³ Further reading: TETTAMANZI, LUONI, FOSSATI, *Comunicazione con gli stakeholder*; and GRAMIGNA, *Comunicazione per la pubblica amministrazione*.

Consequently, the general establishing of international accounting standards imposed by the major economic powers appears to be the result of the logics of globalization, which however, are hardly compatible with those of glocalism.

The feasibility of currently implementing simplified accounting standards in Italy¹⁵⁴ that in any event tend to crash with local traditions, puts another focus on the issue without however, prospecting an effective alternative. On the other hand, nationalistic approaches in favour of conservation of traditional economic-financial communications would certainly clash with the requirements of internationalism. The proposal of adopting a unique Financial Statement implementing international accounting standards accompanied by balance sheets drawn up with local logics in the relevant areas of interest involved would be a highly impractical solution, especially taking into account that financial statements drawn up on the basis of diverse criteria would logically, ascribe substantially diversified incomes and consequently, mixed patrimonial patterns both on a qualitative and quantitative scale. Even the project of compiling a “glocal¹⁵⁵” language glossary as the outcome of the complex mediation between radically different modes of representation would be a hazardous task, given the wide gap separating the various approaches. The distance between the “Great Wall of China¹⁵⁶” and “Hadrian’s Wall¹⁵⁷” aptly describes the two perspectives; a plausible risk of colonisation in value terms could also result merely because of widespread diffusion over vast areas. Consequently, as concerns Accountancy in the first instance, the problem appears extremely difficult to resolve unless the so-called “prism effect” of the Financial Statement can be overcome and a category devised for classifying its “prosumers”...

Ethical and social accountability¹⁵⁸: also need to be taken into account: ethical principles, including those of localism call for ethical and social accountability in support of traditional type Financial Statements or their equivalent. In drawing up a balance sheet/Financial statement the most problematic issues are those linked to corporate identity and corporate mission played out on different stages and consequently linked to scenarios and contexts of a widely differing kind. As a result, social relations need to be far more structured and elaborate.

The number of stakeholders furthermore, renders their effective involvement problematic (a complex scenario even in more circumscribed contexts). A survey of their number would be useful especially if the involvement on the part of stakeholders right from the start of the accountancy project were envisaged as opposed to their merely taking note of judgments and opinions on the issue.

In conclusion, some relevant considerations concerning the relations between enterprise and the public administration, would also not be out of place seeing as the latter is obliged to move in a glocal perspective.

Is it still feasible nowadays to define as “local” the different local authorities or entities. The characteristics of their intercultural, ethnic cosmopolitan background are neither compatible

with domestic and/or “provincial” issues calibrated on the safeguarding of specific ‘local’ culture nor with that of the digitalised provision of services where contingent relations are enacted on a global scale.

It should be asked what kind of communication is expected by the public (the various categories of public) or at least the informed public, from state institutions generally speaking, seeing that cities which have changed radically, are now also glocal¹⁵⁹. Furthermore, what relationship can and must be established between glocal enterprise communication and communication on the part of the public administration, frequently called on to support economic activities?

FINAL CONSIDERATIONS

How can the «the prism effect» of the balance sheet be overcome?

In the context of international marketing the prism effect (as opposed to Newton’s traditional perspective) expresses the deformity of judgement on the part of potential foreign consumers caused by the environmental variables affecting the positioning of a product¹⁶⁰.

In accountancy studies the prism effect image can best be utilized to delineate the practical choice of a single balance sheet/financial statement capable of satisfying the different needs of the company’s stakeholders: a unidirectional flow of information taking on different syntax and values in relation to the diverse needs of the parties involved (Table 3).

The limits of such a choice are evident: practically speaking, it is impossible to satisfy everyone and in any event, there will always be one or more categories of privileged users who benefit more than others from the method of financial reporting adopted¹⁶¹. Traditionally, while aware of penalizing imbalance for some operators, the option has always been for a single financial statement, considering the use of alternative forms to meet the needs of different groups of users, operatively speaking, far too complicated.

Can such a practice still be envisaged for glocal enterprise, taking into account the far wider range of categories of public involved, not to mention their diverse needs and different characteristics?

Limits, tolerable in the past, are no longer acceptable and more appreciable solutions are needed (taking into account widespread business management culture) to facilitate the current extremely rapid processing of data accountancy,

unheard of in the past.

¹⁵⁹ See SAONARA, *Città globale*; and BARONI, *Città nell’era digitale*.

¹⁶⁰ VALDANI, *Scelta del prodotto*, from p. 216 (and references cited therein), where he distinguishes between transparent, amplifying, distorting and reducing effect.

¹⁶¹ In the European financial statement, adopted also by Italian civil law, have been privileged creditors. In the Anglo-Saxon model inspired to IAS/IFRS are protected especially current and potential investors. A detailed comparison is available in DEZZANI, *IAS*.

Reflections should be made on the effective devising of an “open¹⁶²” balance sheet/financial statement, made up of a basic schedule and various appendices of potential data for compilation in conformity with the needs of different users, which to date has been envisaged merely as an academic hypothesis.

In reality, the practice of appending a schedule of patrimonial assets together with other useful accounting data is common in the documentation of many firms. This is often mandatory to conform to national regulations imposing more frequent, more articulated and more comprehensive exhaustive communications. It would not be difficult to impose such practice in international contexts. This would then create uniform criteria for full financial reporting, diversified on the basis of the principal categories of beneficiaries.

A basic schedule consequently for compilation – effective and estimated data together with any supplementary information in conformity with the purpose of the document¹⁶³ (table 4).

Naturally a transitional period would have to accompany such radical innovation in financial accounting for specialist operators and beneficiaries of the information to become familiar with it. The redundancy of the prism effect of the financial statement consequently, would appear to be quite complicated, but technically possible.

A “prosumer” for financial reporting?

The reflections induced by the glocal scenario towards an “open” system of reporting can be synthesized in the need for more flexibility in financial balance sheet communication to meet the needs of the many different users. Such flexibility is fully in line with the new direction taken by the international accounting standards IAS/IFRS for Financial Statements that envisage the adapting of balance reporting to information needs, while respecting a required minimum content¹⁶⁴. Freedom of expression, after years of strict adherence to formal guidelines offers numerous opportunities. On the horizon, flexibility may be the answer for effective

¹⁶² Proposed and supported by CAPALDO, *Informazione esterna d'impresa*, from p. 169: “A mio parere si potrebbe pensare alla predisposizione di un bilancio per così dire «aperto», di un bilancio la cui composizione resti affidata alla persona che deve utilizzarlo ed alla quale naturalmente occorrerà dare i necessari elementi di base. (...) Nel bilancio (...) si iscriveranno solo le quantità oggettive e talune quantità nominali (...), cioè quelle la cui determinazione non richiede stime ed apprezzamenti di alcun genere. Viceversa, le poste connesse con quantità aventi diversa natura verranno per così dire lasciate «in bianco». Per ciascuna di esse si dovranno fornire gli elementi necessari perché si possa, di volta in volta, procedere alla loro corretta determinazione in aderenza allo scopo per il quale il bilancio viene composto”. Similarly in CAPALDO, *Bilancio e informazione esterna*, p. 267: “(...) si può esplorare l'ipotesi di un bilancio, per così dire, aperto. L'idea che ne è alla base è molto semplice e consiste nel comporre il bilancio in modo ch'esso fornisca non un «risultato» d'esercizio ma gli elementi indispensabili perché il lettore possa costruire il «tipo di risultato» che ritiene conforme alle sue esigenze di conoscenza e, al tempo stesso, possa trarre tutte le altre informazioni sulla situazione economico-finanziaria dell'azienda, comunemente richieste ad un bilancio”.

¹⁶³ “È ormai pacifico, nella dottrina, che le valutazioni di bilancio e, più precisamente, i criteri di queste valutazioni, possono mutare secondo i fini per i quali il bilancio viene composto o, per dir meglio, secondo le conoscenze che dal bilancio si vogliono trarre. Senza la specificazione dei fini, intesi in questo senso, non è possibile comporre o interpretare logicamente alcun bilancio”, see ONIDA, *Bilancio d'esercizio*, p. 4. Similarly AMODEO, *Bilancio*, p. 236: “È universalmente noto, e non mette conto insistervi qui, che il bilancio non può rispondere, in un'unica struttura, ad esigenze diverse. (...) Poiché i criteri di valutazione si conformano al proposito del bilancio, a propositi diversi corrispondono diversi criteri di valutazione. Talché il risultato profferito dal bilancio discende da quelle finalità e dai corrispondenti criteri”.

¹⁶⁴ See MIGLIACCIO, *Schemi di bilancio*; and *Schemi di rendicontazione*.

communication that highlights the peculiarities of any organisation in a given period, and in response to the needs of their stakeholders.

Wider dissemination of accounting skills could result in the now merely utopian scenario of financial statements agreed upon with the users, the latter no longer seen as passive recipients of information required by law or chosen by top management at the pinnacle of the pyramid.

Differentiated, flexible methods of financial reporting, meeting minimum conditions set out by Italian legislation, could be devised from constant interaction between the company (companies or local authorities) and the beneficiaries of the information. The stakeholders logically would become so to speak, "prosumers", "consumer-actors"¹⁶⁵, producers and consumers of the financial information that interests them (Table 5).

The practice could be extended, to the compilation of Financial Statements and economic assets envisaging an active role on the part of stakeholders - already common in the productive manufacturing sector - and frequently invoked for the compilation of social statements in order to avoid self-reference.

HISTORICAL CHALLENGE OF CORPORATION ADJUSTMENT: LOGISTICS STRATEGY AND SUSTAINABILITY

Malindretos, George¹

¹*Athens Harocopion University*

Scope: To assist understanding of the supply chain management (SCM) and supply chain strategy (SCS) and to promote performing implementation for succeeding a value creating process, dynamic competitive advantage and sustainability.

Methodology: First, a brief historical survey of the emergence of logistics discipline and its advance to SCM and SCS, following changes in actual business conditions and the New Information Technology. Second, a literature review on the SCM and the development of the SCS. Third, engagement more particularly with the issue of terminology concerning the concepts of SCM and SCS and the most relevant ones, such as systems, strategies, systemic and strategic thinking, etc. Fourth, examining more specifically the long dominance of the conventional positive deduction approach and hypothesis testing, against induction, abduction, and constructive participatory action approach, modern mixed methods and knowledge management. Fifth, direct analysis at network level upon the interdisciplinary character of the SCM and SCS and a holistic approach based on a value creation process of integrated planning (cost/benefit analysis, a feasibility study, a business plan), stressing the critical role of collective action, alliances, strategy to performing goals implementation, coordination, information net, formation of a feedback process. Sixth, preliminary results of a survey concerning the logistics services providers (3PL) in the Attica area, Greece, with focus on the segmental logistics services outsourcing and the need for integrated value SCS. Seventh, basic conclusions of the study for supporting the formation of SCM and application of performing SCS, for restoration of equal chances to the SMEs along with infrastructure and incentives policies.

Main outcomes: Better understanding of the advancements in SCM and SCS and improvement of the research validity in strategic thinking for the planning process and performing goals implementation. Expected benefits in reducing the risks of failure and achieving sustainability through improving capabilities from restoring SCS role in performance. Presentation of the preliminary results concerning the use of SCS by companies in the Attica area, Greece.

Originality: No claim of own ideas, but utilizing synthetic collective action, know-how and experience, for mobilization of all available resources, improving capabilities and successful facing the contemporary challenge of adjustment to the new landscape of corporation environment. Attributing special importance to the critical role of SCS for a value creating supply chain process and to foundation of a collective think-tank for technical assistance to design, planning and performing implementation in support of SMEs to achieve equal chances as safe-valve to competitiveness and sustainability. Expectation of drawing actual experience from a responsible collective after sales service consultancy initiative (recent Italian Universities partnership).

Key words: Supply Chain Management (SCM). Supply Chain Strategy (SCS). Sustainable Competitive Advantage (SCA). Integrated Supply Chain Management (ISCM). Business Process Re-engineering (BPR).

INTRODUCTION

The area of SCM along with SCS has become very popular in recent years. This is evidenced by marked increase in practitioner and academic publications, conferences, professional development programs and university courses (Burgess et al, 2006). SCM along with increasing attention within strategic management and recent empirical research in strategy has much to offer (Cheng et al., 2006). To avoid prolixity, it is useful to mark the most important issues with which the literature has been engaged and succinctly to avoid duplications, there are sufficient references and focus to some of the most unresolved yet issues, such as the methodology and the strategic issue. In view of lack in theory and presence of rigidity in traditional methodology in the research of SCM, as a field in infancy, this study addresses mainly to practitioners and attributes special attention to the methodology in a particular way. Since SCM has been developed along with the changes in the actual conditions of transactions and technology: first, it is engaged with the historical dynamic pace of the advance of logistics to SCM followed by the SCS. Second, it presents the main points of the literature review by academicians. Third, it refers to the issue of definition of the SCM, SCS and related concepts, as means to meet the requirements of customer satisfaction and creating value through inter-firm integration. Fourth, the same procedure is followed, with the research methods that have been used, again according to the literature review. Fifth, an integrated analysis is carried out by use of holistic approach, pointing out critical success factors such as collective action, alliances, strategic thinking, coordination and performance criterion. Sixth, it presents the preliminary results of a survey study in progress, concerning how the supply chain strategy (SCS) is perceived and applied in Attica major Athens area, Greece. Finally, a series of conclusions are drawn, with focal attention to the correct planning and implementation of SCM and SCS for succeeding compound sustainable competitive advantage for all allied partners in a value supply chain (Blankenburg et al., 1999).

This structure and intermix penetration in this study is expected to help its main scope of contributing, at least, towards overcoming still misconceptions and misunderstandings and the problems of research validity and rigidity. Insofar, as paucity or misuse is due to misinformation especially of SMEs, then there will be a loss of validity and possibly have adverse long-term effects, an often gap in 'revolutional' or 'innovative' contributions, due to lack of contact with actual reality and requirements. The research conclusions in retrospect can give useful thinking on how to improve performance in terms of dynamic competitive advantage and sustainability.

This research as a whole may reasonably be expected to facilitate better understanding and contribute in promoting the strategy formation and performance in implementation of change business plans; to meet the major contemporary challenge of adjustment to the new landscape of transactions and technology environment.

Sufficient bibliography is presented to help further detailed information concerning the enhancement of Logistics to the SCM and SCS.

HISTORICAL SURVEY

In view of that the field of SCM and SCS are passing through the infancy stage, the historical knowledge of the emergence and rapid advance in application seems to have significant practical importance. A brief review of this historical pace follows in this paper, without

reference to the controversy of the historical school and the anglo-saxon theoretical school of thought.

The birth of Logistics can be traced back to ancient war times of Greek and Roman empires, when military officers titled as 'Logistikas' were assigned the duties of providing services related to supply and distribution of resources. This was done to enable the soldiers to move from their base position to a new forward position efficiently, which could be a crucial factor in determining the outcome of wars. This also involved inflicting damage to the supply locations of the enemy and safeguarding one's own supply locations. Thus, this led to the development of a system which can be related to the current day system of logistics management.

During the Second World War (1939-1945), logistics evolved greatly. The army logistics of United States and counterparts proved to be more than the German army could handle. The supply locations of German armed forces were inflicted with serious damages and Germany was not able to wreak the same havoc on its enemy. The United States military ensured that the services and supplies were provided at the right time and in the right place. Operational research and linear programming were used in the aim to provide these services when and wherever required, in the most optimal and economical manner. The best available options to do the task were developed. This also gave birth to several military logistics techniques which are still in use, albeit in a more advanced form.

The evolution in the 1950s and 1960s, emphasized the priority goal of most manufacturers in mass production to minimize unit production cost as the primary operations strategy, with little product or process flexibility, slow new product development and exclusive reliance on in-house technology and capacity (introversive perfectionism). It had considered sharing technology and expertise with customers or suppliers too risky and unacceptable with consequent little emphasis placed on cooperative and strategic buyer-supplier partnership. 'Bottleneck' operations were cushioned with high inventories to maintain a balanced line flow, resulting in huge investment in work in process (WIP). The purchasing function was generally regarded as being a service to production, and managers paid limited attention to issues concerned with purchasing (Farmer, 1997; Tan, 2001).

In the 1970s, chiefly, Manufacturing Resource Planning (MRP) was introduced and managers realized the impact of huge WIP on manufacturing cost, quality, new product development and delivery lead-time. Manufacturers resorted to new materials management concepts to improve performance within the 'four walls' of the company (Aschner, 1997).

In the 1980s, the intense global competition forced world-class organizations to offer low cost, high quality and reliable products with greater design flexibility. Manufacturers utilized just-in-time (JIT), Economic Resources Planning (ERP) and other management initiatives, to improve manufacturing efficiency and cycle time (Farmer, 1997). In the fast-paced JIT manufacturing environment with little inventory to cushion production or scheduling problems, manufacturers began to realize the potential benefit and importance of strategic and cooperative buyer-supplier relationships. The concept of SCM emerged as manufacturers experimented with strategic partnerships with their immediate suppliers. In addition to the procurement professionals, experts in transportation and logistics carried the concept of materials management a step

further, to incorporate the physical distribution and transportation functions, resulting in the integrated logistics concept, also known as SCM.

The SCM evolution continued into the 1990s as organizations further extended best practice in managing corporate resources to include strategic suppliers and the logistics function in the value chain. Supplier efficiency was broadened to include more sophisticated reconciliation of cost and quality considerations. Instead of duplicating non-value-adding activities, such as receiving inspection, manufacturers trusted suppliers' quality control by purchasing only from a handful of qualified or certified suppliers (Inman and Hubler, 1992). More recently, many manufacturers and retailers have embraced the concept of supply chain management to improve efficiency across the value chain. Manufacturers now commonly exploit supplier strengths and technology in support of new product development (Ragatz et al., 1997; Morgan and Monczka, 1995), and retailers seamlessly integrate their physical distribution function with transportation partners to achieve direct store delivery or cross docking without the need for receiving inspection (St. Onge, 1996). A key facilitating mechanism in the evolution of supply chain management is a customer-focus corporate vision, which drives change throughout a firm's internal and external linkages (Christopher, 1992).

An open issue remains to trace out and suggest useful opportunities for researchers as we carry SCM literature into the next decade. We have to follow the often hope that this study will be helpful to SCM academics to clarify the boundaries defining our field, but also assist researchers from referent disciplines and those new to the field of SCM research to attain better understanding as to where the field currently stands and the type of research that is needed to advance the SCM literature in future decades.

LITERATURE REVIEW

Within a new landscape of transactions and technology environment, manufacturers and wholesale and retail service providers have increasingly sought to collaborate with their suppliers and upgrade their purchasing and supply management functions from a traditional clerical role to an integral part of a new phenomenon known as SCM, to enhance sustainable competitive advantage. (e. g. Christopher, 1990, 1992; Gattorna, 1990, Gattorna and Walters, 1996; Laios and Moschuris, 1999; Lynch et al., 2000; Tan, 2001; Ho et al., 2002; Giannakis and Croom, 2004; Chen and Paulraj, 2004; Burges et al., 2006; Cheng et al., 2006; Jonhson et al., 2007).

The term SCM is the most widely used to describe this philosophy. Unfortunately, there is no explicit description of SCM or its activities referring to relevant concepts such systems, strategies, etc. in the literature (New, 1997). Also, there are in part tautological definitions of the SCM (Harland, 1996).

More specifically, there seems not to exist definitional consensus (New, 1997; Cox et al., 2001; Kauffman, 2002; Quayle, 2003; Mentzer et al., 2001). Scott and Westbrook (1991) and New and Payne (1995) describe SCM as the chain linking each element of the manufacturing and supply process from raw materials through to the end user, encompassing several organizational boundaries. According to this broad definition, SCM encompasses the entire value chain and addresses materials and supply management from the extraction of raw materials to its end of useful life. There seems to be more recently a converging adoption of the term of Mentzer et al.,

(2001): SCM is defined as the systemic, strategic coordination of the traditional business functions and the tactics across these business functions within a particular company and across businesses within the supply chain, for the purposes of improving the long-term performance of the individual companies and the supply chain as a whole. This definition has to be taken in a 'liberal' manner within the scope of the research at hand (Burgess et al., 2006).

While in principle this definition of SCM addresses the supply process throughout the value chain, a practical approach has proposed to consider only strategically important suppliers in the value chain (Tan, 2001). Because, technically, the value chain is too complex to achieve a full integration of all business entities within it.

A third definition of SCM emerges from the transportation and logistics literature of the wholesaling and retailing industry, emphasizing the importance of physical distribution and integrated logistics. There is no doubt that logistics is an important function of business and is evolving into strategic SCM (New and Payne, 1995). Physical transformation of the products is not a critical component of this definition of SCM, as was originally used (Lamming, 1996). The primary focus is to the efficient physical distribution of final products from the manufacturers to the end users in an attempt to replace inventories with information (Christopher, 1996; Christopher et al., 1998).

The military inheritance had certain distortion implications in the use of the concept of strategy, strategic, etc. (Gattorna, 1990b; Bender, 1990; Chopra and Meindl, 2001). Actually, the term strategy has emerged in the management literature during the sixties and since then followed rapid extension in use (Ansoff, 1965; Bowman, 1992). It has been traditionally emphasized the rationality of analysis, as a step-by-step process. It has been noticed that this view is not without problems. More particularly, it does not account for the social, cultural, political and cognitive aspects of the process of strategy development (Bailey and Johnson, 1992). Consequently, doubts have been raised especially in cases of unexpected shifts in the environment, unforeseen problems in implementation or limitations in the process, that can operate to restrict the efficiency of strategy formulation and its realization (1958, 1969, 1988; Watson, 1992). The result of this may mean that an organization's intended strategy is not realized to actual strategy (Mintzberg, 1994; Morash et al., 1996). So, strategy, if not sufficiently founded, may be exposed to a vision and further on possibly to virtual reality.

There is also, certain ambiguity in the use of the concept of system and its derivatives, such as systemic thinking, etc. The borrowing of the term from the mathematics and the physical science is hardly compatible with the contradictory abuse of it, by identifying actually subsystems and processes within the supply chain (e.g. information system, warehousing system, etc.) (Malindretos, 2006). Reconsideration of the system concept goes back to 1934 (Bertalanffy, 1962; Boulding, 1956). The change in the system in network terms of the supply chain is incorporated in the broad framework of change to face a variety of challenges, against the piecemeal approaches traditionally used to initiate and manage change (Forrester, 1961; Houlihan, 1988).

In recent years, along with the advance in the field of logistics into a broader SCM orientation, it has proceeded in maturing and more strategic character (Cooper, et al., 1997; Kent and Flint 1997; Chopra and Meindl, 2001). In lack of a solid theoretical grounding, SCM researchers have often incorporated theories and methodologies from neighbouring disciplines (Stock, 1990, 1997).

In parallel, strategy researchers have increasingly focused on supply chain topics. Accordingly, researchers in both SCM and SCS have extended the linkages between their respective fields. In effect, 'the practices of logistics and SCM along with their associated benefits (better customer service, lower cost, higher quality, and improved competitive advantage) are linked closely with the strategic management literature' (Wisner, 2003). In the list of borrowed closely relevant concepts are mentioned the integration, the concepts of processes, the networks and channels, the logistics and strategic principles and the concepts and rules of the competitive and efficient markets (Lambert & Stock, 1993; Kline, 1998; Ballou, 1999; Chopra & Meindl, 2001, Bowersox et al., 2002; Rodrigues, et al., 2004; Dirk & Taco, 2005, etc.).

There is a number of literature reviews published in the top scholarly journals in the fields of operations management, logistics, purchasing and SCM (Croom et al. 2000; Carter and Ellram 1998; Burges et al., 2006; Cheng et al., 2006). The literature review of academic research in the SCM focuses on the existing trends and gaps in the supply chain literature of published papers selecting a number from the most known academic journals. By use of an investigative approach, as a rule it examines (1) the existing literature, (2) subject categories covered, (3) various levels of the chain, (4) methods employed by researchers in their studies and (5) data analysis techniques utilized (Guinipero, et al., 2008). A conceptual framework of the most highly researched categories in SCM indicates that there is a need for more research that will seek to understand the nature of multiple links in SCM chains and networks.

Most representative research in converging supply chain and strategy topics, is the following:

- Porter's (1980, 1985) so called five-forces model (with five forces which influence industry profitability being: competitive rivalry; barriers to entry; threat of substitutes; the power of buyers and the power of the suppliers), had proposed choice among three 'generic strategies' (classified in cost-leadership, differentiation and focus), in pursuing to achieve competitive advantage. This model has been employed by many to mention Lynch et al., (2000) and Wisner (2003), among others.
- Growing attention gained the analysis and evaluation of SCS by use of various tools, such as a multi-agent simulation model (Tian and Tianfield, 2006). The SCS framework has also been approached in a set of structural elements of the supply chain [customer-product-process-resource (CPPR)], that put together in different degrees of alignment (Martnez and Shunk, 2006).
- The increasingly captivating approach of Global Strategic Management (GSM), in the mainstreams of Strategic Management. Connecting Strategic Management to globalization was seen in terms of three broad themes: as a stage in the development of a corporation, as a causal link between strategy and structure and the so called 'Process School', that the transnational enterprises have to achieve constant balancing between 'economic imperative' and the 'political imperative' (Lynch et al., 2000; Rodrigues et al., 2004; Miller, 2004).
- The Transaction cost theory (Williamson 1975, 1985) has been applied by Ellram (1991) and others.

- The resource-based view (Wernerfelt, 1984; Barney, 1991) has been utilized by Olavarrieta and Ellinger (1997) and Zsidisin et al. (2003).
- The Dynamic capability theory (Teece et al., 1997) has provided theoretical insights to Sinkovics and Roath (2004). However, despite the application of relevant strategy theories to SCM, a large body of strategy research that has empirical findings and supporting research methods (e.g. PEST-DG, SWOT) remain largely unexplored by SCM researchers.

A recent empirical strategic management literature research stream has analysed firms that focus on establishing alliance relationships to form strategic networks (Cheng et al., 2006). Strategic networks are composed of inter-organizational ties that are enduring, have strategic significance for the firms entering them, and include strategic alliances, joint ventures, long-term buyer-supplier partnerships, and a host of similar ties (Gulati et al., 2000). Management researchers have developed an extensive literature on alliances, as categorized by the organizational structure suggested by Gulati (1998).

The SCM researchers can learn more about the field of strategy and incorporate strategy research to a greater degree into their own efforts. The relevant strategy literature provides supply chain researchers guidance on how to internationalize key SCM variables (Cheng et al., 2006).

As the SCM has been a melting pot of various disciplines, it encompasses influences from logistics and transportation, operations management and materials and distribution management, total quality management, purchasing and information technology (IT), strategic thought, etc. (Bechtel and Jayaram, 1997; Stock, 1990, 1997; Benton, 1990; Cooper et al., 1997; Kent & Flint, 1997; Wisner, 2003, Cheng et al., 2006; Burgess et al., 2006; Guinipero et al., 2008;). Ideally, an encompassing philosophy of SCM embraces all functions to produce an overall SCS that ultimately enhances firm performance (Croom et al., 2000). However, the literature is still very fragmented and although several studies purport to discuss supply chain issues, most of the existing research examines one link of the chain, or more importantly focuses on one ingredient in the supply chain performance mix (Lynch et al., 2000; Rodrigues et al., 2004; Burgess et al., 2006; Cheng et al., 2006; Guinipero et al., 2008).

RESEARCH METHODOLOGY

Since logistics is interdisciplinary by definition: it stems from many different scientific traditions (Arlbjørn and Halldorsson, 2002) and is influenced by economic and behavioural approaches and scientific disciplines (Stock, 1997). However, the central approach in logistics research tradition has been that of deduction, which follows a conscious direction from a general knowledge to a specific case. It has favoured positivist reasoning, while qualitative and interpretative research has been rather scarce (Mentzer and Kahn, 1995; Arlbjørn and Halldorsson, 2002; Näslund, 2002). Therefore, the various methods that have been used in logistics research, ranging from mathematical modelling and simulation to survey research, case studies and interview methods, come under the dominant positivist deduction approach.

The prevalence of the deduction research approach and the positivist paradigm implies little research on a new man/technology interface and theory development to date, which is

surprising for a relatively new scientific discipline (Listou, 1998; Kotzab et al., 2005; Kovacs and Spens, 2005). It has been pointed out anyhow that the task of theory development is very important in order to further validate this relatively young scientific discipline (Stock, 1997). The inductive research approach reasons through moving from a specific case or a collection of observations to general conclusions, i.e. from facts to theory. It consists of a theory development process that starts with empirical observations and seeks to establish generalizations and a theoretical frame (Arlbjørn and Halldorsson (2002).

A stream of research has focused attention in promoting the use more particularly of abduction (e. g. Kotzab et al., 2005; Kovács and Spens, 2005). Because, the abductive approach stems from the insight that most great advances in science neither followed the pattern of pure deduction nor of pure induction, in the process from rules to result (Taylor et al., 2002). The abduction starts from results, namely the reality of an existing situation and uses any kind of information and piece of knowledge, including grounded approach and purposive action approach as well as know-how and experience, and acknowledges the critical importance of cooperation, and human resource development. Main differentiation with the deductive and the inductive approach is whether theory precedes theory or follows it.

The abductive approach also differs from deduction and induction in its research process from rule to result. In abductive reasoning, the case presents a plausible but not logically necessary conclusion, provided that its anticipated rule is correct. An empirical event or phenomenon is related to a rule, which gives new insight (or supposition) about the event or phenomenon.

The absence of abduction and abductive approach, and the lack of background of the research in logistics have initiated increasing divergent attempts to knowledge in recent years. A stream of research has focused attention to promote the use of induction and more particularly of abduction (Kotzab et al., 2005; Kovács and Spens, 2005).

Surveys and case studies, with discipline to sampling, representativeness and procedures can assist abductive analysis, provided it uses any piece of information and adopt mixed research methodology (Creswell, 2002; Malindretos et al., 2002; Malindretos, 2006). It is reminded that while both deduction and induction adopt single way causation, it is acknowledged the critical importance of the human resource development, the cooperation, and the coordination, for knowledge creation and innovation within the today complex context (Drucker, 1988; Castells, 2000; Spens and Kovacs, 2006).

Quantitative methods are generally associated with numerical (quantifiable) data, but collecting quantitative data can just as well be interpreted qualitatively (Harkland et al., 2003). Sometimes, hypotheses based solely on some type of a mathematical model, have been proved pure tautologies and existential statements, and the great mathematician Pólya (1957) included creativity and 'heuristic' the centerpiece of his discussion of methodology.

The integration process requires choice of mixed research methodology, network formation at value supply chain level by interdisciplinary action methodology research framework, with focus on mobilization, partnership, cooperation and coordination of all available resources, capabilities, and know-how infrastructure for building-up of an effective value chain supply network addressing for search of new methods (Stock, 1997).

FURTHER ANALYSIS

The literature review has shown the need for further analysis in the strategic planning and its implementation to achieve performing results in competitive advantage and sustainability. It is recalled that the literature has been looked from three perspectives: the supply chain integration, strategy and planning, and implementation issues, which concern critical factors for performing application, as well as issues specific to inter and intra-organizational aspects of supply chain initiatives. Sufficient understanding serves to highlight the inter-dependence between integration requirements (technologies, logistics, and partnerships), the strategic view of supply chain systems, and performing implementation. The strategic nature of adopting a supply chain framework provides significant potential benefits, and requires trading partners to think and act strategically. This is easier said than done within a stand-alone organization, let across a diverse and dispersed group of trading partners.

The research on the strategic management and the SCS has attributed attention to the framework of interrelationships in planning network structures, inter-organization and coordination requirements. Global supply chain design extends for selecting facilities at international locations with involvement of special globalization factors.

Particular attention is centered to the process of improving knowledge, to meet a twin research challenge: the advance from the supply to value chain and strategic vision to strategic fit. This has to be conceived as change in philosophy, attitudes, work and life style and practices. Otherwise stated, the advance of knowledge starts from self-knowledge, which may go back to human existence, the human nature, etc., addressing itself to interdisciplinary research, with extension to biology, psychology, sociology, etc.

Although the literature review has shown that research has been largely practitioner-led, with theory following (Voss et al., 2002), that is possibly not irrelevant to the not rare strategic, tactical and / or operational faults, and presence of significant rates of firm failures. It is recalled that theory development has been generally accepted as an essential requirement for the proper development of any field (Popper, 1961; Kuhn, 1970; Wacker, 1998).

However, it is broadly agreed that realignment in the strategy-structure relationship and further connection among strategy, structural planning and operational processes may lead to maximum improvement of the financial performance (Galbraith and Nathanson, 1978; Lynch et al., 2000; Shapiro, 2001; Rodrigues et al., 2004; Cheng, 2006). No doubt, there exists a conceptual framework concerning the relationship of corporation strategies, structural and organizational planning and operational processes (Chow et al., 1995) and it depends on the connection and alignment between structural relationships and strategic choices (Dalton et al., 1980; Galunic and Eisenhardt, 1994; Miller, 2004). It is also mentionable the more recent occupation with the existence of 'relational flows' of planning and measurable integration of the structural, technological and operational flows of materials, service suppliers and customers (Bowersox et al., 2002). However, although there has been some application of strategic theories in the SCM, there are still open significant possibilities for further research (Cheng et al., 2006).

A major research advance is to be found in restoration of the planning process and of the strategy issue, by overcoming misconceptions and validating the marriage of the strategic thinking with practice, which faces the most critical problem of performing implementation. More specifically, strategic thinking is essential to planning and comprehensive unified strategy can be critical to performing goals implementation (not segmented strategies justified).

Main potential capabilities to overcome constrains and mobilization of all available infrastructure, know-how and experience is to be found in realization of a new man/technology pact and the critical role of information and equal competitive chances. More specifically, sole focus to new technologies and automation are not anymore taken as a recipe, but in connection with high education quality and creation of equal chances, to reap the fruits of over-specialization and attain substantiate sustainable competitive advantage. Because product/service quality creates value through user satisfaction and produce synergy effects by effective collective action, innovative work climate, coordination and control, throughout the supply chain. Thus, to success of competitive advantage passes anymore from strategic thinking and the social mission of the company, to follow Mintzberg and Ghoshal et al. consignments.

Actually, many failures were due to unbalanced and ill planned reliance on technology, on conventional thinking and partial character practices, by undervaluing the current complex interdependencies and the critical role of the human factor in new ideas, innovation and effectiveness (Malindretos, 2007). Past methodologies and practices can not apprehend a major historical transformation that has taken place from the mass production age of the first post-war period (Braudel, 1977). Holistic approach and strategic thinking can help to understand that the past company environment is irreversibly over, as the boom of marketing, advertisement, fashion and the like have reached their limits: as mass production was directed to absorption largely within the developed world. Since, consumer society led to a demonstration like social stratification, it is hardly accommodating anymore with progress and competitiveness, it is harmful to physical and social environment, and is prone to instability and crisis (crime, overdebt, threats to social cohesion, etc.). Proactive intervention to a new world financial and economic crisis can be seen in new strategic thinking for micro and macro-logistics application to safeguard effective and renewable flow of resources.

Main impediment looks to be what can be called the 'meditative society' (media control for use of misinformation for company profitability, intermediation in public works, etc.). Because, it drives to distortions and rigidities which are both destabilizing and harm progress and sustainability, as strengthening short-sightedness and asymmetric information (adverse selection and moral hazard), and preventing 'equal chances', necessary for achieving sustainable competitive advantage, competitiveness and sustainability, within the new firm's environment. In this connection, it is worth noting that the research on the factors of the SCM and policy recommendations by OECD and other international economic organizations, referring to the factors of competitiveness do not attribute major importance to the issue of 'equal chances' and 'terms of competition'. However, the EU Framework Program for Competitiveness and Innovation for the period 2007-2013 has attributed target priority to the SMEs, indicating that it is related with the lag of meeting the Lisbon goals.

MAIN SURVEY'S RESULTS

A survey has been performed concerning the use of SCS by big size companies in the Attica area of Greece : twenty Greek and multinational companies participated, including ten super market retailers. Although the survey research, has not been completed yet (August 2009), a number of interesting remarks have emerged which are reasonably expected not to divert from the final study results (table 1). It has to be noticed firstly the high validity of this study in view of that the reviewed have shown confidence as the study was carried out for research purposes and the confirmation that the information and data provided would be kept in secret from other competitors.

A significant result is that there is inadequate understanding of the logistics processes, in identifying them with the integrated approach of the SCS. In particular, the great majority of the reviewed had assigned outsourcing (3PL) in transport and warehousing based on the criterion of capital and operational cost- savings and consider that the strategic potential is closely associated with the technological problem.

One more result that came out concerned the converging reasoning for the companies that have assigned certain outsourcing as well as by the logistics service providers. This implies that outsourcing has not been incorporated in a restructuring and reorganization design (re-engineering plan) and has not been extended beyond the boundaries of the company level.

Quite the contrary is the case of big size retail companies like super markets, domestic or multinational, which have introduced in great majority integrated supply chain systems, since they recognize supply chain performance as the key to sustainability rather than focusing upon current profitability. This is in line with the increasing competition on the level of supply chain rather than on individual enterprises level.

The survey has revealed that most super market retailers have already organized impressive distribution centers, considering them as critical value adding nodes, creating significant competitive advantages in the supply chain.

Apart from sales and procurement, it is more than obvious that, retailers recognize warehousing and distribution processes as core processes, aiming at incorporating them in their holistic strategic supply chain approach; despite the fact that considerably big 3PL providers have already developed their infrastructure in the area. Moreover, according to the survey, the sustainability issue is directly connected with provision of high quality customer service and customers' loyalty, rather than with cutting operational costs. Their goal is therefore to organize and control the flow of goods not only from the point of consumption but also from the point of supply. In effect, their role is beyond retailing, imposing their contract terms to wholesalers and manufacturers and farmers, in terms of procurement and distribution.

Thus, they have increased their power concerning the terms of trade in the procurement from manufacturers and more so with the small size farmers, in view of distorted cooperative movement, diverted in income subsidization of crops, within the possibilities of the CAP of the EU. Behind such a situation lies the record mark-up between major crop producer prices and final prices charged to the urban consumers (up to three to five times).

<i>Basic response elements</i>	<i>Outcome / Conclusion</i>
<i>Inadequate understanding of logistics processes</i>	<i>Lack of supply chain integrated approach</i>
<i>Strong focus on cost savings based on technology by 3PLs and a limited number of companies</i>	<i>Strengthening of short-sightedness benefits</i>
<i>Converging reasoning for outsourcing by companies and 3PL providers</i>	<i>Lack of planning and supply chain strategy</i>
<i>Super market retailers : connection of supply chain performance contribution with sustainability</i>	<i>Effective control of supply</i>
<i>Connection of sustainability with dedication to customer service and loyalty by super market retailers</i>	<i>Unfavoring 3PLs in their SCS</i>

Table 1 – Main survey's results

CONCLUDING REMARKS

The firms are today operating a 'chaos-tolerant' supply chain in a globalized markets environment of increasing uncertainty, and have to face the challenge of hard competition to manage complexity and increase profitability, competitiveness, and growth. The SCS can meet the challenge of interfirm collaboration at supply chain level and compromise the different perspectives of manufacturers, retailers, transportation and logistics service providers. It has critical importance, in view of that a 'strategic mistake' at start may damage irrevocably the sustainability goal of the firm.

In view of a situation of lacking conceptual, theoretical and methodological agreement, special attention has been attributed to the issue of clearing-up and choosing the appropriate research methodology (right concepts, constructive research action for all parties' participation, knowledge management). Strategic thinking is essential to holistic planning to assure comprehensive SCM solutions and cope with capabilities and constraints by specific programs, towards formation of an appropriate value creating supply chain network. SCS can contribute in meeting the targets of effective utilization of resources in combination, by cooperation and best practices for low total cost and value creation to the customers, based on foundation of a dynamic feed-back process, upon appropriate coordination and control.

The preliminary results of a study carried out in Attica major area, Greece have shown inadequate information and lack of understanding of the logistics processes, particularly, in relation with the integrated approach of the SCS. Holistic approach and strategic thinking can

therefore contribute in overcoming past practices, distortions and rigidities which hamper competitive and efficient markets through 'asymmetric information' (adverse selection and moral hazard), within conditions of 'media society'.

However, 'equal chances' lengthen the time-horizon, facilitate reliability of expected cost/benefits estimates and support achieving sustainable competitive advantage, competitiveness and sustainability. In this connection, the EU Framework Program for Competitiveness and Innovation for the period 2007-2013 has attributed target priority to the SMEs, indicating that it is closely related with the lag of meeting the Lisbon goals. Moreover, state authorities may strengthen infrastructure and incentives by use also strategic thinking and adoption of certified official professional lists, to maximize value creation, competitiveness and sustainability.

ENTREPRENEURSHIP LOCAL INITIATIVES AND THE ADJUSTMENT OF POLICIES AND REGULATIONS. A CASE STUDY

Martins, Susana Paula Leitão da Silva¹; Moreira, António Carrizo²

¹Ph.D Student, DEGEI, University of Aveiro, ADRIMAG, Praça Brandão Vasconcelos, 10, 4540-110 Arouca, PORTUGAL

²Assistant Professor, DEGEI; University of Aveiro, DEGEI – Department of Economics, Management and Industrial Engineering, University of Aveiro, Campus Universitário de Santiago 3810-193 Aveiro, PORTUGAL

Purpose – The main purpose of the paper is to provide an example of a bottom-up approach to entrepreneurial policy and its mismatch with the top-down approach SMEs policy.

Design/methodology/approach – The paper analyses a case study of an entrepreneurial support organisation that addresses local development in rural areas.

Findings – The paper highlights the important role of innovation in rural areas and the need to close the gap between entrepreneurial policy and SMEs policy.

Research limitations/implications – The main limitation stems from the fact that it is the outcome of a single case study. One practical implication is that the incubation of business ideas poses a challenge when there is a mismatch between entrepreneurial policy and SMEs policy.

Keywords: entrepreneurship, rural areas, entrepreneurial policy, local initiatives

Paper type: Case study

INTRODUCTION

Entrepreneurship is strongly affected by economic, social and institutional conditions both at local and regional level. Many programmes to support entrepreneurs are better implemented by local authorities or organisations rather than by national entities because actions can best be tailored to the specific needs of businesses and the involvement of a wider range of actors can bring a richer mix of competencies to the project.

Entrepreneurship support organisations (ESO) linked to social economy play a key role in several phases of the entrepreneurial support – namely in the pre-start-up and start-up phases – helping potential entrepreneurs through the process of exploring ideas, gaining knowledge and skills, preparing business plans and mobilising resources. In the start-up phase, ESOs can also provide counselling and information, start-up financing, market plan assistance and training opportunities. In sum, ESOs are important resources for the implementation and development of entrepreneurship support methodologies and practices.

Local authorities and entities can face some problems and difficulties when designing and implementing new projects and methodologies, namely in the field of entrepreneurship and business creation. They might need, like entrepreneurs, to overcome some barriers related with (a) regulatory issues; (b) cultural and social bonds; and (c) financial and economic burdens.

This paper defines the case study of the implementation of a methodology for incubating business ideas and supporting entrepreneurs in Portugal, which will be known as CRER methodology, developed by an ESO.

The main purpose of the paper is to present a case study of the CRER project that addresses a bottom-up approach of entrepreneurial local initiatives and the need to adjust entrepreneurial policy to take full advantage of this innovative approach.

After this introduction, the next section presents the main concepts of local development and its relationship with entrepreneurship. The third section addresses the specificities of entrepreneurship policies. The fourth section presents the CRER project/methodology and explores the case study. Finally, the fifth section presents the conclusion and main challenges for the future.

LOCAL DEVELOPMENT AND ENTREPRENEURSHIP

Entrepreneurship has been studied for quite a long time (Cantillon, 1755; Schumpeter, 1912) though its concept is still an open issue (Drucker, 1985; Zacharies, Bygrave and Shepherd, 2000) because it can be approached as an action and as a result.

Entrepreneurship and the creation of enterprises play a structural and dynamic role in terms of job creation, innovation and economic growth, poverty alleviation, creation of social opportunities and empowerment of the less favoured and marginalised social groups (OECD, 2004).

The economic, social and institutional conditions both at local and regional level strongly affect Entrepreneurship. OECD (1998) considers that many important programmes to support entrepreneurship are best designed and implemented by local authorities or organisations. Specific factors at local level can encourage entrepreneurship through local measures and programmes designed and implemented by local authorities and institutions such as: business incubators, advisory and information services, business networks, loan guarantee consortia, information brokerages for informal venture capitalists, training schemes and entrepreneurship awareness programmes. As actions can best be tailored to the specific needs of businesses and the involvement of a wider range of actors can bring a richer mix of competences to the project local initiatives have particular advantages in encouraging entrepreneurship through local measures.

Local authorities and institutions have an important role to play in the design and implementation of entrepreneurship policies and in the mobilisation and allocation of local programmes to target groups (CEC, 2003). For example, managerial training programmes can be best delivered through local bodies or decentralised offices of national programmes. These local institutions can adapt schemes to an area's specific needs, which can be difficult for central authorities. They can also operate near the trainees, allowing them to undertake training without spending excessive time away from the workplace.

The entrepreneurial activity is not alike in all countries, regions and cities: it is conditioned by various factors, settled in the behaviour, motivations and knowledge of the individual, but it is dependent on opportunities, on available resources and on socio-economic conditions (Stathopoulou, Psaltopoulos, Skuras, 2004). Clearly, entrepreneurial activities vary widely between nations, industrial areas, cities and less favoured areas due to the specificities of the different economic environment.

The existence of a favourable economic environment is not going, by itself, to provide an entrepreneurial activity: countries/regions must create conditions and facilities for the development of entrepreneurship and entrepreneurs (Busch and Juska, 1997). According to Velasco (2003) for entrepreneurship to flourish a number of conditions must be in place, such as financial resources, strong educational and training facilities, efficient infrastructures, uniform commercial law and limited regulations, equal opportunities, low taxes and tax incentives free trade, support from large corporations, research facilities, industrial zones, public-private partnership and encouragement and support from society.

The ideal environment for entrepreneurship is where enterprises can take advantage of the agglomeration and proximity to use sources of information, qualified labour, technology and capital. There is an intimate relationship between entrepreneurship and economic and social development (Malecki, 1997): innovations developed inside local networks support businesses and present new opportunities for entrepreneurs to launch new firms. Rural areas are far from this ideal environment as networks are poorly developed, innovative activities are not part of the local culture and enterprises struggle to become more competitive (Keeble and Tyler, 1995).

Entrepreneurship is shaped by legal, institutional and social factors, environmental opportunities, potential entrepreneurs, organisational contexts, unique business concepts and resources (Morris, 1998; Audretsch and Thurik, 2004). Therefore, networks, knowledge, innovation and transfer of experiences can be fundamental for the development of an entrepreneurial environment.

Recently, practitioners and analysts working on entrepreneurship have been placing considerable importance to the development of social capital and a culture of supportive of entrepreneurial venture (OECD, 1998). Social capital is understood as *“networks, trust, working through partnership, spatial communities, common culture and norms, transfer of experience and mobilisation. Horizontal cooperation is shown to be more effective and trust more evident between same level institutions or groups of people at horizontal level”* (Parissaki and Humphreys, 2005, pp.7).

The interaction between individuals within formal and informal networks builds trust, communication, participation and a cultural dimension and the involvement in social networks affects positively the economic development: the level of entrepreneurship and consequent economic growth, employment and social inclusion (Mandl et al, 2007). Thus, social capital in certain rural areas can provide and contribute for the development of entrepreneurship, employment, social inclusion and economic growth. The partnership and the transfer of experiences between entities from different regions and with distinct competencies and practices are crucial for the regional development and innovation.

Social entrepreneurship has also emerged in public and private non-for-profit sectors. It is viewed as a new way of dealing with the complex social needs as it is linked to a complex framework of political, social and economic changes that take place at local, regional, national and global levels (Martins, 2007b).

The objective of social economy enterprises is to give support and services to their members or society and it is more and more being recognised as fundamental to the society and economy: they are significant economic actors and play a key role, involving their members and citizens in

society. Social enterprises help to find answers to the changes that happen in society and they are important sources of entrepreneurship and job creation.

The European Commission divides social economy enterprises into: cooperatives, mutual societies, associations or voluntary organisations and foundations. They contribute for a more efficient competition in the market, they offer a great potential for job creation and new ways of entrepreneurship and employment. They are based on the member's activities, and they follow the new needs and favour the citizen's participation.

The OECD (1998) also recognise that non-for-profit organisations have high number of services in health, education, training, culture, social and science research, community networks support, among others, and have social objectives instead of profit goals.

Although social capital and social economy entities are important for the development of innovative and entrepreneurial projects in certain regions, and contribute to promote employment, social cohesion and enterprise creation, there are some difficulties and barriers to foster entrepreneurship and business creation. These barriers stretch throughout the whole society, but they are not alike for all the individuals. Although some obstacles are common to all people, some groups find specific obstacles, namely, women, young people, people with disabilities, ethnic minorities, jobless and people living in rural or distressed areas.

There may be a variety of barriers to entrepreneurship, depending on the industry sector, region and type of enterprise (Martins et al, 2004). The Green Paper of Entrepreneurship (Commission of European Communities, 2003) identifies a number of common barriers that limit the creation of new firms across the EU including:

- Regulatory barriers, such as administrative barriers to entry;
- Cultural and social barriers, such as the 'fear of failure' and a lack of entrepreneurial knowledge and skills;
- Financial and economic barriers, such as, insufficient access to risk capital, seed /early stage capital and long-term financing.

Besides the barriers linked to the individual, new and innovative projects related with entrepreneurship and business creation can face some implementation difficulties because barriers can occur and inhibit the promotion of entrepreneurship and the improvement and implementation of methodologies, instruments and processes.

ENTREPRENEURSHIP POLICIES

Although entrepreneurship policy is emerging as an important area of economic policy development, and it is a relatively new phenomenon, countries usually focus their policies on SMEs rather than on entrepreneurship. Many countries are trying to create a more entrepreneurial society but their work is often impeded by (a) the lack of definition of entrepreneurship as a concept; (b) the lack of clarity between SME and Entrepreneurship policy; and (c) the lack of knowledge about how to respond to the emergence of an entrepreneurial society (Stevenson and Lundstrom, 2001).

Audretsch (2003) defends it is necessary to make a distinction between the traditional small business policies and entrepreneurship policies. SMEs policy refers to policies implemented by a ministry or government agency charged with a mandate to promote SMEs and it is normally targeted towards the existing stock of enterprises and virtually all of the instruments are designed to promote the viability of the SMEs. While SMEs policy has a focus on the existing stock of enterprises, entrepreneurship policy includes potential entrepreneurs as well as the existing enterprises. Entrepreneurship policy has a greater sensitivity to framework or environmental conditions that influence the entrepreneur's process decision making. There is also a difference related with the entities responsible for the implementation and development of entrepreneurship and SMEs policies: virtually every country has a ministry in charge of the SME sector, with several instruments and agencies to promote SMEs. In what concerns entrepreneurship, there is no agency or ministry responsible for its promotion and entrepreneurship policy can usually be found across a wide spectrum of ministries and agencies.

Stevenson and Lundstrom (2001: pp.3) define entrepreneurship policy as: *"...measures taken to stimulate entrepreneurship, aimed at pre-start, start-up and early post start-up phases of the entrepreneurial process, designed and delivered to address the areas of motivation, opportunity and skills, with the primary objective of encouraging more people to consider entrepreneurship, to move into the nascent stage and proceed into start up and early phases of a business."*

The OECD (2005) approaches that entrepreneurship policy differently from SME policy and claims that without sound entrepreneurship policies there cannot be strong SMEs. On the other hand, SMEs policy cannot substitute entrepreneurship policy. The two policies are complementary and should be carried out together. Therefore, entrepreneurship policy and SMEs policies need to be viewed as a continuum, encompassing the pre-start-up, start-up, growth and expansion stages of the enterprise. Clearly this approach considers entrepreneurial policy targeted to individuals and institutions and SME policy targeted to firms.

Lundstrom and Stevenson (2005) claim that in order to favourably influence the economic environment, there is a need to clarify the entrepreneurial process and to define the scope of both the entrepreneurship policy and SMEs policy in each phase of this process.

Lundstrom and Stevenson (2005) consider that entrepreneurship process has five phases: 1) awareness; 2) pre-start (nascent); 3) start-up; 4) early post start-up and 5) maintenance and expansion.

The process begins with becoming aware of entrepreneurship as an option and continues through the early stages of survival and growth of a firm: entrepreneurship policy will play a predominant role in the nascent phase and SME policy when the business has survived the post start-up period (Lundstrom and Stevenson, 2005):

- In the awareness phase, the policy objective is to raise the level of interest in entrepreneurship as an option and also provide opportunities for people to recognize their potential qualities and behaviours. SME policy does not play a significant role in this phase.

- In the nascent phase, policy is concerned with developing the individual's intentions and actions towards starting a business, supporting nascent entrepreneurs and promoting the pursuit of certain opportunities. SME policy plays a marginal role.
- In the start-up phase, individuals start their business. It is the phase where measures to reduce regulatory and procedural barriers to entry and measures to provide counselling and information, start-up financing, market plan assistance and training opportunities are taken. These measures are linked with entrepreneurship policy but also with SME policy.
- In the early post start-up phase, policy interest will shift to (a) early success and failure; (b) the potential of growth companies; (c) seed financing possibilities; (d) market development; (e) administrative and regulatory burdens; (f) networking; (g) counselling; and (h) technology issues. This is a phase where many services providers target their support and where policymakers implement many measures. This phase also falls in the area of SME policy.
- In the maintenance and expansion phase, policy deals with sustainability, productivity and growth issues. SME policy plays a large role while entrepreneurship policy decreases.

Usually, governments differ in their policy goals and priorities, but the main policies fall into six general areas (Lundstrom and Stevenson, 2005): 1) entrepreneurship promotion; 2) entrepreneurship education; 3) the environment for start-ups; 4) start-up and seed capital financing; 5) business support measures for start-ups; and 6) target group strategies.

ESOs linked to social economy, like business centres, business incubators and local development associations, play a key role in the phase of pre-start-up phase, working to help people through the process of exploring ideas, gaining knowledge and skills, preparing business plans and mobilising resources.

CASE STUDY OF CRER PROJECT

The project region and objectives

The CRER Project was promoted by a non-profit rural development association – ADRIMAG – and was funded by the EQUAL initiative, which is testing since 2001 new ways of tackling discrimination and inequality experienced by those in work and looking for jobs.

ADRIMAG's area has seven municipalities (Arouca, Castelo de Paiva, Castro Daire, Cinfães, São Pedro do Sul, Sever do Vouga and Vale de Cambra) and is located in the Centre/North of Portugal. It is a mountainous and agricultural area with 1688 km², with beautiful landscapes and high environmental quality, used often for adventure and extreme sports. The area has a rich historic and cultural patrimony, regional products and typical gastronomy with strong potential for tourism development (Moreira, 2006).

ADRIMAG's territory is composed of municipalities with rural characteristics. It is a debilitated and disfavoured economic area, integrated in the "less-favoured Portugal", with a per capita GDP below 75% of the national rate (Ministério da Economia, 2004).

The region has no integrated transportation system, which makes it difficult for both tourists and residents to cut across the region as the main means of transportation is the personal car.

ADRIMAG's main social characteristics (negative population growth rate, low level of education strong ageing index, high level of unemployment) constitute an important barrier that needs to be surmounted in order to promote innovation, entrepreneurship and business creation in the region (ADRIMAG, 2004).

The lack of alternative ways to finance and support the creation and development of new enterprises hinders the diffusion of innovative and entrepreneurial initiatives: there is a lack of training and personalised support to give and promote competencies in the field of business creation. As a consequence of this *portrait* there is a strong need to foster entrepreneurship and innovation.

The economic backbone of ADRIMAG's region is composed of micro, small and medium-sized firms (Moreira, 2006). While entrepreneurship is discussed at national policy level, few rural areas have been able to address entrepreneurs at the centre of the strategic development of rural *milieus*.

ADRIMAG's region has a very poor set of ESOs operating throughout the community. For example, business and innovation centres, technology development centres and incubating centres are quite scarce or non-existing hindering the entrepreneurial process. The available centres supporting entrepreneurial activities are understaffed and under budgeted and lack a dynamic, entrepreneurial flavour. People living in this rural area, such as young people, women and jobless need the support of a structure to foster entrepreneurship and help them with the business creation.

In questionnaires developed among prospective entrepreneurs living in ADRIMAG's area, the following obstacles were identified (ADRIMAG, 2004): poor access to capital; lack of industrial space; poor business logistics; lack of institutional support; heavy administrative and bureaucratic burdens and lack of information about support and programmes for business creation.

Taking into account the main social and economic characteristics of ADRIMAG's area, the objective of CRER project was to create an ESO to test and experiment business ideas (an idea incubation centre) in order to help potential rural entrepreneurs engaging in entrepreneurial activities before the formal creation of the business firms, which helps promoters both to diminish the business risk as well as to learn about the "being an entrepreneur".

CRER methodology

ADRIMAG developed a partnership with other local and regional institutions and decided to promote a project named CRER in order to develop the entrepreneurial capabilities at local and regional level. The main objectives of the CRER partnership were the following ones:

- The creation, in rural areas, of a structure to test business ideas, through the adaptation and incorporation of methodologies and instruments developed in France;

- The organisation and definition of the methodology that will be implemented in the structure;
- The support, advice and training to entrepreneurs based in a mentoring methodology developed by the partnership of the project.

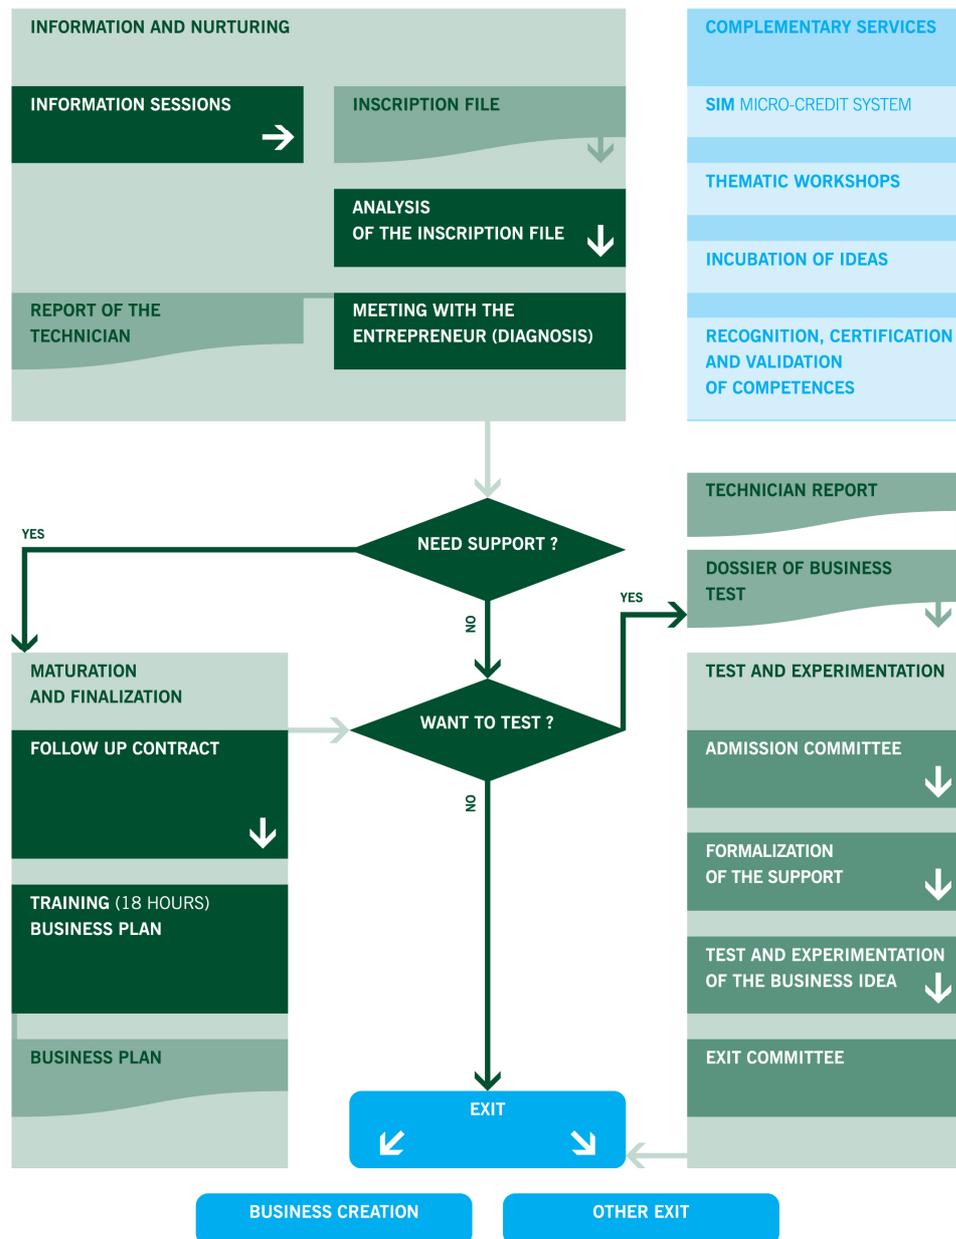

The CRER methodology integrates a support mechanism for both the elaboration of a business plan and the test and experimentation of businesses before the creation of the new enterprise, which is a blend of several methodologies used both in France and in Portugal. It was decided also to incorporate some contributions of an integrated system to support entrepreneurs and a micro credit system in order to support entrepreneurs in financing the creation of their enterprises.

The CRER methodology was developed taking into account both local/regional characteristics of the ADRIMAG's region and the need to support rural entrepreneurs in an integrative way throughout the following three different phases, as shown in figure 1:

- *Information and Nurturing* entrepreneurship and business creation
- *Maturation and Finalisation* of a business plan
- *Test and Experimentation* of business ideas

CRER METHODOLOGY

COPYRIGHT © CRER, 2007

(Previous page) Figure 1 – CRER Methodology

Each phase involves different actions with several tasks. Each action has instruments and procedures in order to help the CRER development agents in supporting the potential entrepreneur throughout each phase.

As it is clear from figure 1, the only compulsory phase in which the prospective entrepreneur must participate is the phase of information and nurturing and, according to the diagnosis of the entrepreneur/idea/project, the entrepreneur can proceed either to other phases or to create his/her own business elsewhere.

The methodology was designed to facilitate entrepreneurs' work and was adapted to rural entrepreneurs' needs and motivation.

Information and Nurturing

The phase of Information and Nurturing is the initial phase of the process of rural entrepreneurial support. In this phase the entrepreneur is interviewed and her/his business ideas are assessed. A file is prepared with the personal details motivations of the entrepreneur, his/her business ideas and an analysis of the entrepreneur's needs in terms of support or resources.

The objective of the interview is to analyse the entrepreneur profile, his/her technical and personal competencies, the business idea, the business viability and the possibility of supporting the entrepreneur in the next phases. This action is the most important in the whole follow up process as it ends with a business check-up about the entrepreneur/idea/project concerning the type of support the prospective entrepreneur will be given during the following phases of the process.

Clearly, all entrepreneurs must go through this stage as the diagnosis, as well as other instruments, will reveal the potentialities of the entrepreneur/idea/project.

Maturation and Finalisation

The phase of maturation and finalisation is the phase of elaboration of the business plan. This phase begins with the establishment of a contract between the entrepreneur and the CRER institution in order to define the duration and the terms of support and training.

The training/support is composed by sessions of training and individual support in which the entrepreneur is supported by a technician/tutor in order to elaborate a business plan.

The sessions are supposed to last for three/four months. The tutor helps the entrepreneur with the search and collection of information, and the training received by the entrepreneur is expected to help him/her with the preparation of the business plan.

By the end of this phase, the entrepreneur must have a business plan, an investment plan and a financial plan and must understand, explain and defend their contents to third parties.

Test and Experimentation

The experimentation and test is the most innovative phase of all the process: it allows the entrepreneur to test the business idea, before the formal creation of the enterprise. It can be considered a radical innovation as it was not legally possible in Portugal to incubate business ideas before the beginning of this project.

The entrepreneur will have the support of the CRER structure and his/her tutor in all main business areas: accounting, finance, marketing, communication, image, branding, etc.

Before the formal admittance to the CRER structure for incubating the business idea all the documentation prepared during the previous phase needs to be approved by the CRER Admission Committee. The entrepreneur with the help of the tutor must define the objectives the new venture is to achieve during the test and book a file with the business plan for the Admission Committee to approve. The tutor must analyse this file and check that all procedures and criteria of entry are fulfilled to incubating the new business idea. The admission criterion is based on the potentiality of the entrepreneur and on his/her business plan.

During the test and experimentation, the entrepreneur has the opportunity to test his/her business without the formal creation of the firm. The entrepreneur will have administrative support from the CRER structure, which will be responsible for the emission of invoices and receipts during this phase.

Regular meetings are expected to take place between the tutor and the entrepreneur throughout this phase. Regarding accountancy, the entrepreneur must analyse all accounting incoming and outgoing documents, expenses, sheet balances, funds, etc. Regarding commercial issues, the entrepreneur receives support in the preparation of all communication and image instruments, the promotion of the activity and in the assessment of the monthly sales.

A balance of the entrepreneur's competencies is going to be prepared regularly in order to assess the activities developed and the results obtained during this phase.

Taking into account the both the business idea and the entrepreneur's evolution, the Committee will make some suggestions about the entrepreneur, the business idea and the project in order to a successful new venture can be formally created.

Obstacles and Difficulties

There were two kinds of problems regarding legislation: one concerned with the institution and other concerned with the potential entrepreneur.

Institutionally, prior to this project, there was no legislation regarding ESO providing services of testing and experimentation of business ideas. Regarding the entrepreneur, the Portuguese legislation does not allow an unemployed person to receive social benefits while exercising a new business venture, even in the test and experimentation phase of the new firm creation process.

Portugal did not have any institution with the objective of testing and experimenting business ideas before the CRER project. Due to a gap in the Portuguese legislation, the decision of the DP was to create an association to help the entrepreneurs with all the procedures in the test and

experimentation phase, namely, in order to create the legal environment for the potential entrepreneur to issue invoices and receipts whilst the firm has not legally created.

The test and experimentation phase is a particular step in the business creation process that is not yet legally regulated in Portugal. This follow up process during the test, in which the entrepreneur is active and producing products or providing services, question the entrepreneur status because according to the Portuguese legislation:

- The beneficiary cannot be considered as unemployed because he/she is neither looking for a job, nor is available for work; besides that, the beneficiary is not unemployed, because he/she is working for the promotion and development of his/her own business, because he/she has to sell his/her products and services to test the business and to make the analysis of the economic and financial viability of the business;
- The beneficiary cannot be considered as a trainee, because the training that he/she receives is tailored to his/her business specific needs. Accordingly, the support that he/she receives is not a formal training that fits the legal framework of the professional training in Portugal, namely in terms of structure, modules, timetable and training program;
- The beneficiary cannot be considered as being in a probation, because although she/he develops her/his own activity in a real context of work and for his/her own benefit, he/she does not have practical on-the-job training;
- The beneficiary cannot be considered as a manager, because she/he does not have an enterprise created, the products that she/he sells and the services that she/he develops are not invoiced in her/his name but in the name of the structure that gives him/her the legal and juridical framework.

Clearly, policy programmes are forced and defined to support SMEs needs and are not tuned with entrepreneurial needs as it is clear during the test and experimentation phase of the CRER methodology.

In order to support potential entrepreneurs it is then necessary to define the status of the potential entrepreneurs: Unemployed? Trainees? In probation? Entrepreneurs? Can they be unemployed and can they continue to receive their unemployment benefits?

Solutions

During the experimentation of the methodology, in the implementation of CRER project, it has been very difficult to explain to entrepreneurs the methodology during the phase of test and experimentation because of the innovation of the methodology in Portugal. The status of the entrepreneur during the test was also difficult to define due to the specificity of the test and the support legislation.

In order to overcome these two difficulties the DP decided to create a non-for-profit association (because it could do all the activities and promote all the services of an ESO) to help entrepreneurs in the test and experimentation phase, namely, substituting the entrepreneurs in the case of invoices and receipts.

The solution found taking in account the status of the entrepreneur was that the entrepreneur would be a trainee during the test and experimentation phase of the business idea. This allowed circumventing the gap of the Portuguese legislation that encourages all unemployed to receive training during their unemployment period.

CONCLUSIONS AND MAIN CHALLENGES FOR THE FUTURE

The CRER project is aimed at pre-start and start-up phases of the entrepreneurial process, designed and delivered to address the areas of motivation, opportunity and skills, with the primary objective of encouraging more people to consider entrepreneurship, to move into the nascent stage and proceed into start up and early phases of a business.

The CRER methodology has been under assessment for more than two years and its main objective was to stimulate entrepreneurship, giving potential entrepreneurs the opportunity to develop their skills and competencies, helping them with the elaboration of the business plan as well as with the search for financing in order to create their own enterprises, taking in account their characteristics and profiles.

The main innovation of the project is related with: (a) the integration of different phases in the support of business creation and entrepreneurship that rural entrepreneurs can use according to their needs and goals and (b) the possibility to test and experiment a business without the formal creation of an enterprise. In short, it is a business ideas incubator with a hands-on approach to training prospective entrepreneurs, which is an action oriented to supporting prospective entrepreneurs before the actual creation of the new business.

During the conception of the project and methodology, several barriers emerged due to the lack of support legislation, concerning the structure and the entrepreneur. But the main obstacle was linked with the entrepreneur: the inexistence of a support legislation related with the entrepreneur status was a barrier to the proper implementation and development of the project. The indefinite status of the entrepreneur was clearly an obstacle for the experimentation of CRER project, mainly in the phase of test and experimentation of business ideas. It was very difficult to influence less-favoured target groups of the project to join the project in the phase of test and experimentation of business ideas because they end up losing their unemployed status and therefore their subsidies.

Clearly, this project is the result of a local entrepreneurial initiative targeted for less-favoured individuals of rural areas. It started as a bottom-up approach addressing local less-favoured target groups by an ESO committed to tackle the entrepreneurial process in the pre-start up and start up phases.

The methodology was tested between March 2007 and September 2008 and helped with the creation of seven enterprises and fifteen new jobs. The radical innovation of the methodology in the test and experimentation phase did not reach the defined objectives as it did not help to motivate the main target segment of the project: unemployed people living in rural areas. This gap is the result of a mismatch between the social policy that is particularly focused on the SMEs and not on entrepreneurialism.

If the creation of an ESO helped to overcome some of the operational issues during the test and experimentation phase, the creation of an experimental period helped the CRER partnership in the implementation and spread of the methodology.

The incubation of business ideas needs an endorsement of a governmental organisation in order to tackle it from the entrepreneurial point of view and not from the SME point of view.

If the CRER methodology is to succeed and to disseminate to other rural areas it is important to address the status of the entrepreneurs in order to support them during the phases of awareness, pre-start and start-up. The definition of the entrepreneur status is important because it allows him/her to have a support and a legal status before the creation of an enterprise, namely during the phase of experimentation and test of business ideas.

Another challenge for the CRER methodology is to disseminate its concept in other regions and target groups. As a consequence, the concept is being tested since September 2008 in a Portuguese university and in a professional school in which the main target groups are the following ones: young skilled students, people looking for new jobs or for the first job, which are much more motivated to test and experiment new business ideas.

What seems to be an ideal approach to deal with social and SME policy seems to be endangering the entrepreneurial mindset of less-favoured rural segments of the population. Accordingly, if the CRER methodology is to succeed in what concerns the awareness and the pre-start up phases a more entrepreneurial policy is needed to give those unemployed and less-favoured groups the opportunity to test and experiment their businesses and therefore to play a more active, entrepreneurial role in society.

The main challenge for the future is to overcome top-down approaches to entrepreneurship (and it is very important to bear in mind that Portugal has a very centralised approach to entrepreneurship and innovation) and welcome local innovativeness that follow bottom-up approaches that challenge status quo policies.

Another challenge for the future is to diffuse this approach to other target groups as professional/technical/vocational schools, universities, municipalities, among others, in order to give the society a brand new perspective in entrepreneurial activities.

INTELLECTUAL ENTREPRENEURSHIP – EXOGENOUS REACTIVE OPPORTUNISTIC ALERTNESS OR ENDOGENOUS PROACTIVE INTELLECTUAL COMPETENCE

Mavridis, Dimitrios G.¹

¹*Professor for Business Administration, Technological Educational Institute of West Macedonia, Kozani, Greece, www.teikoz.gr, Head of Department of Financial Management, GR – 50 100 Kozani*

Purpose - In this paper we are trying to enable a shifting from the exogenous reactive paradigm of the opportunistic “hunter” entrepreneur to an endogenous intellectual proactive “philosopher” entrepreneurship.

Design / methodology / approach - We analyse the entrepreneurial intellectual / agentive cognitive “marriage” - Entrepreneurial Knowledge Conversion - by using elements of the Intellectual Capital theory, related concepts of Aristotle, Parmenides and Nonaka (1994). In other words we combine proactive intellectual and active agentive qualities and make therewith a syncrasis (mixture) of both elements – psychron (cold) and thermon (warm) after Parmenides by using the Aristotelian epistemological and ontological dimensions as they have been first drawn by Nonaka (1994).

Findings - The philosopher or “intellectual entrepreneur” Thales has demonstrated that even philosophers could be much better entrepreneurs, if they would have pursuits of such ends. He combined in the above mentioned model proactive (psychron) intellectual and active (thermon) agentive qualities. The concerned relationships are presented in form of an Entrepreneurial Knowledge Conversion (EKC) Concept which ends with the “praxis-friendly” accounts of the Intellectual Entrepreneurial Competence (IEC), the Intellectual Entrepreneurial Performance (IEP) and Intellectual Capital Statements (ICS).

Research limitations / implications - This present paper itself is a syncrasis of concepts, theories and ideas of the past as well as of the approaching future. Either elements or dimensions – past (historic) and future (stochastic) - are difficult “inhales”, so that further research is necessary to tighten the first shaped concept of the Proactive Intellectual Entrepreneurship (PIE).

Originality / value - The below shaped concept of the proactive intellectual entrepreneurship (PIE) offers another paradigm of the entrepreneurial conception. It visualizes the syncratic entrepreneurial intellectual / agentive cognitive elements as an entrepreneurial proactive concept which subsumes an intellectual entrepreneur as perceptor (ET), as conceptor (TT), as converter (TE) and as distributor (EE)¹⁶⁶.

Keywords: Intellectual Entrepreneurship, Corporate Performance & Competence

PROLEGOMENA

When Aristotle (Politika, A 8-9, 1257 α , 5-15) is saying that the price of goods depends on buyer’s own perceived usage utility he is therewith addressing the *subjective ophelimistic price theory* or the capitalistic based view on elasticity of demand. But when goods are objects for exchange - he continues - and not for the own usage, then the related value comes up due to the cost of the product’s ingredients like material and labour. This second case addresses the *objective materialistic price theory* which has been first re-developed by the Scholastics in the

¹⁶⁶ E = Explicit, T= Tacit

medieval times and influenced later on the “Marxist view” of added value of labor (Xenophontis, *Oeconomicus*, 1826, I, 10-12).

Therefore accounting is predetermined either as a progressive one (progressive cost accounting, *expenses oriented*) or as a retrograde one (retrograde cost accounting, *earnings oriented*). In this way the two economic systems of “capitalism” (subjective, earnings, profit) and materialism or “communism” (objective, expenses, labour cost) found their prodromal theoretic thinker in the person of Aristotle and his *value theory*. He determined somehow the related entrepreneurial business directions of the cost-minimising and / or revenue-maximising entrepreneur. Even Adam Smith in his work “*An inquiry into the nature and causes of the Wealth of Nations (1776)*” made the distinction between *value in use* and *value in exchange*, while Francois Quesnay mentions a *valeur usuelle* and a *valeur vénale* (Houmanidis, 1991).

Although entrepreneurship in our times is understood mainly in economic dimensions, in the antiquity it was more then obvious that any kind of organized and coordinated activities requests outstanding “entrepreneurial” qualities (Mavridis, 2009). Entrepreneurship in the antiquity was held as a special kind of “*profession*”, because the related businesses were risky and uncertain, especially in the distant seaborne trade. Therefore entrepreneurship has been philosophically (“*episteme*”) analyzed and scientifically (“*techne*”) practiced in the daily life¹⁶⁷.

Historically the centrality of the entrepreneur concept is not really a new one. It has been recognized by ancient writers and philosophers in Greece¹⁶⁸ as an important factor for wellbeing of the state. Xenophon (Mavridis, 2009) had not only recognized the “physiocratic” importance of the land (soil) for fruitful harvesting, but also the impact of skills and knowledge (“*knowledge*” or “*intellectual entrepreneur*”), especially when he talked first about the entrepreneur and distinguished so far between the functions of *manager* (knower) and *entrepreneur* (owner) (Mavridis, 2009).

As mentioned above the classical entrepreneur conceptional discussion itself has been started in the antiquity mainly by the ancient Socratic authors Xenophon and Aristotle (Karayiannis, A., 1990). In the modernity the mentioned concept has been elaborated in detail by Cantillon (1680-1734), Jean-Baptiste Say (1767-1832), Alfred Marshall (1842-1924), Joseph Schumpeter (1883-1950), Frank Knight (1885-1972) and Israel Kirzner¹⁶⁹. These mentioned economists introduced a paradigm shifting in the conception of *successful entrepreneurship* or at least they have put an additional accentuation¹⁷⁰. The crucial points for the last six thinkers are dealing with the entrepreneur’s position in the economy as a whole and within its firm, with the definition of his task, with his personality and related abilities, with the determination of the demand and supply in the market and finally with the expected returns and drives (Van Praag, 1999).

¹⁶⁷ For Schumpeter’s “Gap position” see Mavridis (2009).

¹⁶⁸ See the works of Xenophon (430 – 354 B. C.) “*Oeconomicus*” and “*Poroi*”. See also Mavridis (2009)

¹⁶⁹ Karayiannis, A. (Karayiannis, 1990) mentions in his work “*Democritus on Ethics and Economics*” that Democritus is in many entrepreneurial issues the “teacher” of the above mentioned Socratic philosophers.

¹⁷⁰ For the issues of other authors like Schmoller, Sombart, Walras, Weber, Wieser and others see Pittaway (2005) and Ebner (2005).

Cantillon (1680-1734) introduced the concept of the “entrepreneur” and had acknowledged the entrepreneurial function¹⁷¹ while he is distinguishing the three types of economic agents. The traditional capitalists or landowners are representing in the intellectual capital theory the physical capital, the entrepreneurs have their equivalent in the structural capital or arbitragers or “equalizers”¹⁷² and the workers in the human capital. The entrepreneurs finally are facing the dilemma of *risk* and *uncertainty*¹⁷³.

Jean-Baptiste Say (1767-1832) in his work “*A Treatise on Political Economy or the Production, Distribution and Consumption of Wealth*” (1803) puts an additional dimension in the entrepreneurial concept which sounds “fresh” but it is not such (see Xenophon’s work “*Oeconomicus*”, in: Mavridis, 2008a), namely the role of the manager.

In this context Say declares the agriculture industry (physiocratic, physical capital), the manufacturing industry (like structural capital) and the commercial industry (like human capital) as the only types of industry which are able to create value (Van Praag, 1999). He further seeks related connotations between the three mentioned industry types and the three types of knowledge: theoretical *intellective* knowledge (*episteme*), applied *agentive* knowledge (*techne*) and executed knowledge (*praxis*).

While *episteme* flows easily to other national economies (knowledge dissemination) the areas of *techne* (production) and *praxis* (distribution) are pure entrepreneurial domains, where the entrepreneur creates products for human needs and through this consumption he is gathering all those monetary revenues to use them again as an input for the production of goods. In this way the entrepreneur creates wealth for land owners (rent for physical capital), for capital owners (interest for monetary capital) and labor owners (wages for human capital).

Although the early neo-classical economists like A. Marshall (1842-1924), F. Y. Edgeworth (1845-1926) and A. C. Pigou (1877-1959) had seriously included the entrepreneur concept in their investigations the later neo-classical successor thinkers had almost “erased” it. The “mechanized” homo-economicus concept has formally (dis-) solved all problems with its “imperfect” perfectionism. In a system without any asymmetries concerning information, uncertainties, risks, preferences and equilibriums there is no need for entrepreneurs even no need for human beings but for *robotized men* or *humanized machines* – maybe the perfect consequence of the Cartesian “*cogio ergo sum*” doctrine (Nonaka, 1994).

Alfred Marshall (1842-1924) has developed a concept introducing *innovation*, *alertness* and a *general ability* as a supreme quality. Joseph Schumpeter (1883-1950) most ideas are put in his work “*The Theory of Economic Development*” (1911)¹⁷⁴. He is supposed to have turned down the existing entrepreneurial paradigm: from *manager* to the *leader* of the firm, from innovation

¹⁷¹ Cantillon declares in his posthumous publication “*Essai sur Nature du Commerce en Générale*” (1755) the entrepreneur as a contributor or enabler or driver for the society’s economic value, In: Praag Van (1999).

¹⁷² Cantillon sees as the central role of entrepreneur that of the exchanger and equalizer of supply and demand!

¹⁷³ Landowners and workers are not facing risk and uncertainty because the interest rates as well as the wage rates are contractually fixable, but selling prices not, see also Mavridis (2009).

¹⁷⁴ He represents the Austrian School and was educated under Boehm-Bawerk and influenced by Walrasian general equilibrium thinking (“creative destruction”).

practitioner (applier or executor) to innovation creator, from exogenous innovation to endogenous, from *agentive entrepreneur* (techne) to *intellective entrepreneur* (episteme), from entrepreneur with agentive potential to one with intellective competence or expertise¹⁷⁵.

Frank Knight (1885-1972) highlighted the difference between *risk* and *uncertainty* in his thesis "*Risk, Uncertainty and Profit*" (1921). Uncertainty (unlike risk) is a type of probability without any valid basis, without empirical past values, because it concerns outcomes of unique events. Israel Kirzner emphasizes the *entrepreneurial alertness* for discovering and exploiting profit opportunities and doing so he forms the equilibrating forces of the market (Nonaka, 1994).

For many centuries the above shaped paradigmatic entrepreneur typus of a hunter waiting to see first the birds (opportunities) flying (exogenous) along and then take action as "entrepreneurial hunter". This means that the golden rule of entrepreneurship has been focused on action – either active or reactive. This "hunter society" related entrepreneurial stage of "wait and see" formed an almost purely agentive entrepreneurial "thymosophy" or entrepreneurial *modus vivendi*, whereby the intellective aspect comes "under the wheels".

It is known that the philosopher or "intellectual" Thales (6 c. B. C.) has bought in advance all olive presses, because he has seen during the springtime that the olive trees were full with fruits. In fact he made big business as the only owner of oil making manufactures in his home country, in Asia Minor. He just wanted to demonstrate to the "non-intellectual" entrepreneurs of his time that even philosophers could be much better entrepreneurs; only as true philosophers they do not have pursuits of such ends. In other words Thales combined *proactive* intellective and *active* agentive qualities and made therewith a *syncrasis* (mixture) of both elements – *psychron* (cold) and *thermon* (warm) after Parmenides. According to the above mentioned the intentions of the present paper are:

- First to visualize the entrepreneurial intellective / agentive cognitive "marriage" (Entrepreneurial Knowledge Conversion - EKC) by using elements of the Intellectual Capital theory, related concepts of Aristotle, Parmenides and Nonaka.
- Secondly to present the explicit entrepreneurial related manifestation in form of accounts either as Intellectual Entrepreneurial Competence (IEC) or Intellectual Entrepreneurial Performance (IEP).
- Finally the "accountant-friendly" used Intellectual Capital Statements (ICS) should help to state the obvious "entrepreneurial practicability" of the intellectual entrepreneurial proactive concept which subsumes an intellectual entrepreneur as perceptor (ET), as conceptor (TT), as converter (TE) and as distributor (EE).

INTELLECTUAL ENTREPRENEURSHIP

¹⁷⁵ Houmanidis (1991) is hitting that point when mentioning that Schumpeter seems to ignore the contributions of the ancient thinkers and especially that of Xenophon, Plato and Aristotle to these mentioned points.

Intellectual capital taxonomy

The Socratic philosophers (Xenophon, Plato, Aristotle) and up to the late ones of the 19th and 20th century knowledge in its many facets has been matter for extensive and exhaustive discussions. They asked thoroughly and theoretically about the phenomenon “knowledge”, its essence, properties and its perceiving modes. Only they have recognized knowledge as a special input type as having many interesting aspects and characteristics in context with the entrepreneurial activity (Mavridis, 2009). From the moment on that production became a more complicated and more sophisticated “process chain» and the related “value chain” has been shifted from its tangible to its intangible determined character the cognitive values have replaced the materialistic and technological ingredients, so that the supplies and the deliveries of goods are replaced through supplied (used) and delivered (created) knowledge values (“*knowledge network*”).¹⁷⁶ From the beginning of the value chain (supplier) up to its end (customers) the share of the “cognitive inputs” is steadily increasing¹⁷⁷. In this way more and more knowledge or cognitive “parts” are included or produced and also “consumed”. This means that the classic economic paradigm turns around where tangible traditional views, aspects and concepts are reconceptualized getting an intangible touch.

This turning to the “knowledge society” (Nonaka, 1994) has its consequences for the whole economy and especially for the entrepreneurial corporates. The questions raised now have to do with the whole range of decisions beginning from the needs of the customers and ending in prescriptions for the suppliers. The whole tangible transformation (production) chain has to be reoriented due to the intangibility of the cognitive “resources”. Organizations have to think about the production, distribution and acquisition of cognitive or intellectual resources, intellectual capital and intellectual “spare parts”. Therefore the entrepreneurial role has to be aligned with the new cognitive processes. As Nonaka precisely mentions the western thinking was dominating for long time by the finite “information-processing”¹⁷⁸ (MIS – Management Information Systems) mentality looking always for “problem solving” or mechanistic production decisions, while the new cognitive shifting asks for holistic “knowledge creation” (MIS - Management Innovation Systems) or “problem creation” (Nonaka, 1994; Mavridis, 2009).

In this context one of the supreme entrepreneurial attributes – *innovation* – cannot be sufficiently explained and understood with the “solving” mentality but more with the “creating” one. Solving is more equivalent to the entrepreneurial maxim of the *invention* doctrine, which is in fact directed towards quantitative colored solutions or “combinations”. Obviously the assumption of the exogenous “technological change” is tightly connected with the *inventional* or problem solving thinking, while the endogeneity orientation of technological change leads to *innovation* and knowledge creation. Therefore the apparent conclusion is the quest for a new entrepreneurial paradigm – the *knowledge entrepreneur* - the “knowledge or

¹⁷⁶ Knowledge users (buyers, importers) and knowledge producers (sellers, exporters) of cognitive production / consumption resources

¹⁷⁷ Imagine the value structure (hard parts, soft parts and firmware parts) of any product in the past (a car build 1900) and today. See also Coulson-Thomas, 2000.

¹⁷⁸ The acronym “MIS” (Management Information Systems) should be read from now on as “Management Innovation Systems”!

problem maker”, not the “*knowledge or trouble-shooter*”. This concerns not only the organizational structures and processes, but the whole “cognitive infrastructure” of the enterprise. The classic high level “authorities” for knowledge creation, production, documentation and dissemination – like universities, technological institutes and other related research centers – have to rearrange their passive commitment as only providers of inventional problem solving knowledge to an active role of innovation catalysts.

Intellectual entrepreneurial concept

The knowledge subject as a part of the knowledge process has also been discussed by the above mentioned philosophers and expressions like “Know-What” and “Know –Who” have been established by Aristotle first. While the object based knowledge is divided in tacitly or Nooumenon (Plato) and explicitly perceived or Phenomenon (Aristotle) one, the subject based (human) knowledge is for both (Plato and Aristotle) either tacit (T) or explicit (E). Tacitly or explicitly created knowledge presumes living humans (ontology) and nature or cosmos (epistemology) and “the continual dialogue between tacit and explicit knowledge” dimensions (Nonaka, 1994).

This dialogue or process of knowledge creation passes some phases or steps, like (a) knowledge acquisition (information flow), (b) knowledge creation, (c) knowledge manifestation and (d) knowledge application. In the acquisition phase information helps the person to “update” his “data” base, whereby explicit information (E) is converted to tacit (T) knowledge (1.ET). In the creation phase the person rearranges, re-concepts and updates in his mind his knowledge base concepts according to his intentions, commitments, beliefs and ethical values (2.TT). The knowledge manifestation concerns the transformation of tacit knowledge to the explicit one, whereby the person manifests his tacit knowledge by using the cognitive infrastructure of the enterprise and makes it available to the organization (3.TE). In the last step the explicit made knowledge is distributed to the “stakeholders” or to the society itself by using the relational “knowledge network” (4.EE) (Nonaka, 1994; Mavridis, 2008).

The above mentioned modes or modules of *knowledge conversion* are four different autonomous but also integrated states of knowledge creation and explain four *individual* and *organizational* types of knowledge conversion (Nonaka, 1994):

1. In the first (1.ET) mode the perceived environment (object, “*Know-What*”) is tacitly individualized (“**internalization**”) as an Aristotelian *eidōs* (mental object) (**LC – Learning or Systemic Capital**).
2. In the second (2. TT) one -defined as “**combination**” - the individuals readjust or update their tacit (analogue) knowledge (“*Know-Who*”) base (**HC – Human Capital**).
3. In the third (3. TE) one which is named “**socialization**” the person converts tacit mental models (“*Know-How*”) to common (group or corporate) explicit knowledge patterns (**SC – Structural Capital**).
4. In the fourth (4. EE) phase defined as “**externalization**” the explicit “digitized” (“*Know-When*”) knowledge base is distributed or spilled over to the “Stakeholders” or society or culture (**RC – Relational Capital**).

Existing knowledge (prior knowledge) as an explicit, digitized or documented knowledge is declared as a “stock” of knowledge which can be transferred or disseminated (“flow” knowledge). This *knowledge flow* enables creation of new knowledge “under production” or “under construction” (Lambooy, 1997). This type of knowledge is called learning or systemic knowledge (LC). The meeting of both knowledge types (old and new “tacit” knowledge) takes place in the brain of the “*knowledge capitalist*”, which forms the *human capital* (HC).

Since tacit knowledge became explicit or documented, it can be used to create value in form of products, services, methods or even new knowledge and is part of hardware (matter), software (methods, algorithms) or brain ware (ideas, concepts, attitudes, values). This type of tacit knowledge expressed as technology capital is regarded as *structural capital* (SC).

Every firm usually wants to distribute the own produced values (products, services, methods, ideas or knowledge) to customers and other “stakeholders” and also needs to receive from suppliers their produced values (products, services, methods, ideas or knowledge). This type of knowledge working behind is in reality an exchange enabler and is called relational network or *relational capital* (RC).

The sum of learning capital (LC), human capital (HC), structural capital (SC) and relational capital (RC) is defined as the intellectual capital (IC). Structural capital (SC) and relational capital (RC) are mainly visible or explicit and therefore form the tangible part of the intellectual capital (IC) while the human capital (HC) is its intangible part. Inwarded knowledge tends to address self-administrative issues, which deal more with the firm (internal environment) itself. Discussing about the specific contribution of intellectual capital on growth it is necessary to understand it, to express its *structure* and finally to *measure* it. Still now the wish of the academic community to understand IC is more than apparent so that many writers have discussed about the essence of human capital, knowledge or intellectual capital (Bontis, 1998; Nonaka & Takeuchi, 1995; Mouritsen, 1998; Sveiby, 1997; Edvinsson & Malone, 1997; Mavridis, 2004, Mavridis 2006).

All of them have accepted commonly that the main parts of IC are the human capital (HC as competencies of the employed staff), the organizational capital (OC as firmware in form of procedures, documentations, systems and methods) and the relational capital (RC expressed as customer / supplier based advantages). Intellectual capital (IC) is therefore the sum of individual competencies (HC), structural capital (SC), organizational structures (OC) and relational capital (RC) as the sum of dynamic relationships (like “supplier and customer” relations in its broader cast). Organizational capital (OC) and customer (supplier) capital (RC) are said to be the structural capital (SC) or the expressed or manifested knowledge, while the firm’s total IC is equal to the HC and SC (Scandia’s IC system).

When the individual *tacit* human capital (latent capital) is getting transformed to *explicit* collective capital (structural or manifested capital) then the knowledge capital is a *flow*, otherwise a *stock capital* - stock or structure (Bontis, 1998). As a resultant of all these thesis and antithesis the synthesis seems to be a pragmatic path melting (grinding and / or polishing) all the extreme tensions. The question is like in Parmenides work the *analogy* or portions of the *synchysis* mixture (*psychron* = cold and *thermon* = warm) (Andriopoulos, 1995, pp. 53 ff). This addresses the problem of the dominating or subordinating streams or the question of supremacy

of episteme or that of techne, this of spirit or that of matter, mind or body, science or technology, sophia or phronesis (Mavridis, 2006).

We are trying therefore when taking into consideration the *syncratic* dimensions (“*hypervallon*”= *additive*) of Parmenides, the Aristotelian ontological and Socratic epistemological aspects mentioned by Nonaka (Nonaka, 1994) to reshape a new intellectual concept for the entrepreneurial activity- *The Concept of Intellectual Entrepreneurship (CIE)*. Due to the above *syncrasis model* we distinguish between four types of *intellectual thinking* (episteme) or *agentive doing* (techne) concerned with the *epistemological* dimension (Figure 1):

1. Learning or systemic capital (psychron / intellectual - sophia) – perceptive
2. Human capital (psychron / intellectual - episteme) - conceptive
3. Structural capital (thermon / agentive - techne) - applicative
4. Relational capital (thermon / agentive - phronesis) - integrative

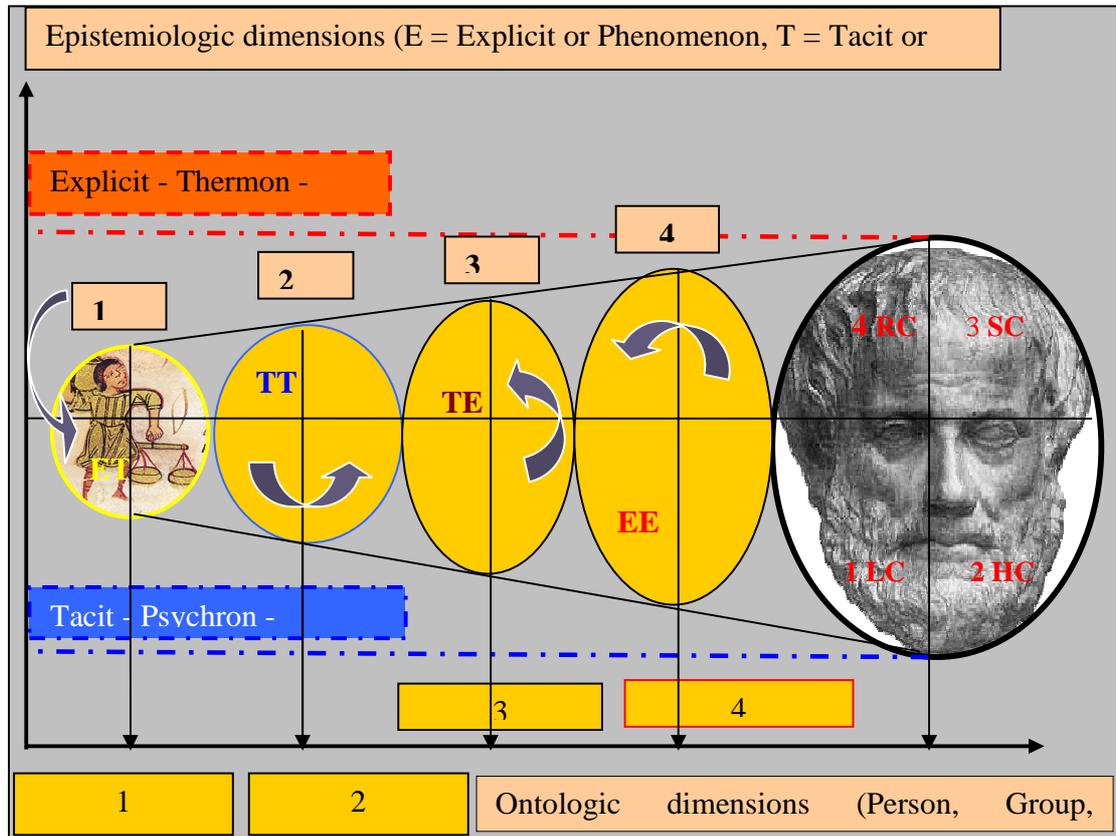

Figure 1: The Spiral of Entrepreneurial Knowledge Conversion

In the level of the individual or ontological knowledge the synchrasis equivalents are the following:

- 5. Know-What (knowledge, science, *psychron*, sophia) – Learning capital (LC)
- 6. Know-Who (person, authority, *psychron*, episteme) – Human capital (HC)
- 7. Know-How (skills, methods, *thermon*, techne) – Structural capital (SC)
- 8. Know-When / Where (duration, frequency, extension, *thermon*, phronesis)-
Relational capital (RC) (Nonaka, 1994; Mavridis, 2009).

The above types 1, 2 and 5, 6 form the *individual knowledge* in its tacit (episteme) and explicit (techne) dimension. The types 3, 4 and 7, 8 form the *collective knowledge* with their embedded tangible and intangible aspects. Individual as well as collective knowledge is determined by the subject (knower), the object (known) and the related equivalents competence (know-how) and performance (know-when):

- 9. The Known (either perceptive or integrative) represents the *working or operating*

capital of the firm (Fenstermacher, 1994).

10. The Knower (either conceptive or applicative) represents the *starting* (human) capital of the firm.
11. The Knower competency (conceptive – applicative competence) represents the individual ability to express its (tacit) knowledge through action (agentive knowledge potential).
12. The Knower performance shows the ability of the firm to transform the individual (tacit) knowledge into explicit systemic power (perceptive – integrative) for the firms' internal organization itself (inwarded or intrinsic organization) or to bring it towards (customers) and upwards (suppliers) the value chain or stakeholder line (outwarded or extrinsic organization) (Price, 1997).

The possible combinations of the above Matrix on the related axis points (Competence as micro dimension and Performance as macro dimension) are (Figure 2):

13. Perceptive state (cold) & Conceptive state (cold) – Human Capital (HC)- Know-Who (Function)
14. Applicative state (warm) & perceptive state (cold) – Structural Capital (SC)- Know-How (Task)
15. Conceptive state (cold) & integrative state (warm) – Systemic or Learning Capital (LC)-Know-What (Internal organization)
16. Applicative state (warm) & integrative state (warm) – Relational Capital (RC)- Know-When (External organization)

With an additional restructuring and in order to provide a balance sheet scheme with extensions to a better prognostic and diagnostic accountability we get *vertically* the left side (HC, SC) and the right side (LC, RC). The so created balance between HC, SC and RC, LC expresses the

- *Human Entrepreneurial Competence* (HC, SC) and its equivalent value chain or
- *Stakeholder or Entrepreneurship Performance* (RC, LC).

When turning or changing the sides we get a *horizontal* division in two equivalent parts which are *Technology* (SC, RC) and *Methodology* (HC, LC):

- *Agentive Entrepreneurial Potential* (active Technology - SC, RC) and the
- *Intellective Entrepreneurial Potential* (proactive Methodology - HC, LC).

When *crossing* the balanced sides we get the following four entrepreneurial competence / value node combinations:

- *Agentive Entrepreneurial Competence* (Human Competence - Agentive Potential)
- *Agentive Entrepreneurial Value* (Stakeholder Performance - Agentive Potential)
- *Intellective Entrepreneurial Competence* (Human Competence - Intellective Potential)
- *Intellective Entrepreneurial Value* (Stakeholder Performance - Intellective Potential)

We see that all nodes are syncrasis points of more properties and expresses cognitive dimensions dealing with the *person*, the *knowledge*, the *system* and the *relations*. The model combines personal (individual) and organizational (collective) attributes in order to express *individual entrepreneurial competence* and collective or *organizational entrepreneurship performance*. The succeeding syncrasis mixture (cold - warm) states, like the conceptive (cold), the perceptive (cold), the applicative (warm) and the integrative (warm) deliver the four basic IC parts (Figure 3):

- HC- Human Capital
- SC - Structural Capital
- LC –Learning Capital
- RC –Relational Capital

HC and SC are the basis for *Human Entrepreneurial Competence*, while RC and LC the Stakeholder, Corporate or Entrepreneurship Performance. The active *agentive potential* has its source in the out-warded SC and RC, while the *intellective potential* in the in-warded HC and LC. Finally *Intellective Entrepreneurial Competence* is equal to *Intellective Entrepreneurial Value* (IEC = IEV) and *Agentive Entrepreneurial Competence* is equal to *Agentive Entrepreneurial Value* (AEC = AEV). In other words to every competence element exists an equivalent value element (balance sheet), so that we can say

- **IEC** - Intellectual Entrepreneurial Competence (agentive + intellective)
- =
- **IEV** - Intellectual Entrepreneurial Value (agentive + intellective)

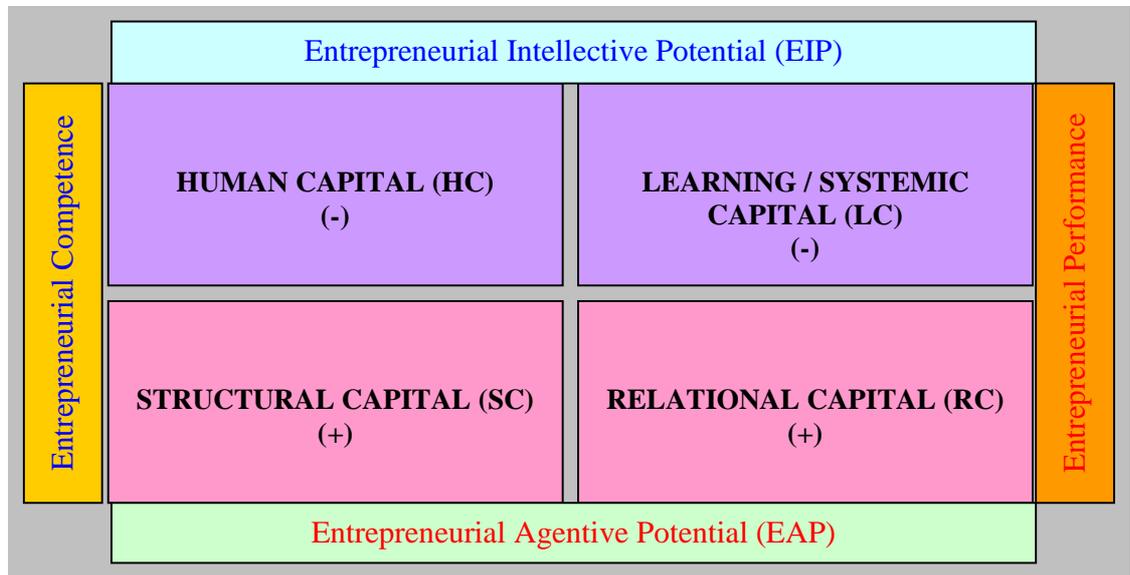

Figure 2: Modes of Entrepreneurial Knowledge (Mavridis, 2008b)

Having all above in mind the *harmonizing* (not equalizing – downwards or upwards) of the proportions of the cognitive elements first and *forcing* the intellectual (cold) and agentive (warm) elements in order to create a reasonable entrepreneurial intellectual capital value is the indicated reasonable intellectual entrepreneurship strategy. The crucial point is the difference (Parmenides called it “*hypervallon*” = surplus, the “value-added”, see Andriopoulos, 1995, pp 53 ff) between the cold / warm states and its relative percentage!

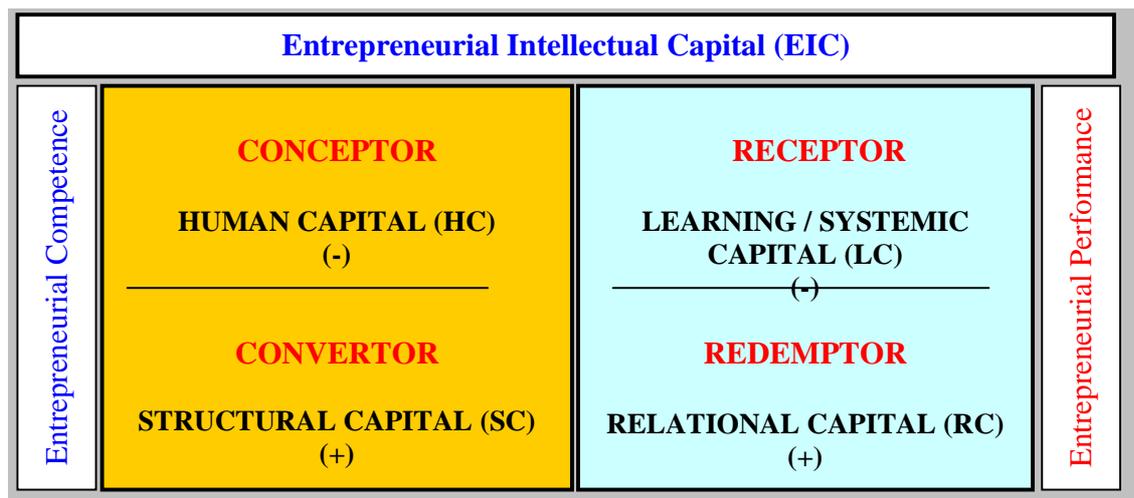

Figure 3: Entrepreneurial Intellectual Capital (Mavridis, 2008b)

CONCLUSIONS

For long time the classic entrepreneur was like a hunter waiting for exogenous flying “fried chicken” before taking action as entrepreneur. This entrepreneurship paradigm has been focused only or mainly on action – whether active or reactive. This “wait and see” concept formed an almost purely *agentive* entrepreneurial behavior. Therefore and so long innovation and the related entrepreneurial opportunities have been regarded as an exogenous factor directed through an imaginative “invisible hand” there was no need to think about the source of innovativeness and change so far. Since it is recognized that entrepreneurial opportunities and technological change are determined by endogenous caused and knowledge determined innovations the *causa* knowledge management and intellectual capital has advanced to non-plus-ultra topic. Although it is easy to realise that any firm could not exist if its personnel would leave suddenly its jobs, the new (old) concept of the “knowledge firm”, “knowledge entrepreneur” or “knowledge society” remains still a wishful dream in the daily entrepreneurial praxis. It is not intended to explain all the reasons now, but it seems that one of the most important is the inability of understanding the essence, provenience and emergence of the topic.

From the antiquity up to the modernity many thinkers have tried to grasp the real essence of the “knowledge” as well as that of the role of the “entrepreneur”. The (Pre) Socratians have tried to shed light on the cognitive “black box” and have made reasonable progress so far that all the succeeding thinkers are following more or less the two main thinkers of the antiquity – namely either Plato or Aristotle. In the modernity the French Cantillon had introduced the concept of “entrepreneur”, while others enriched the whole concept by introducing other aspects. Jean-Baptiste Say sees (like Xenophon before him) the entrepreneur as manager. Marshall first puts the dimension of innovation into discussion and in this way he made knowledge to an entrepreneurial agenda. Schumpeter continues with the ideas of Cantillon (entrepreneur), Say (manager) and Marshall (innovation) and declares the entrepreneur as the engine (not just the wheels) of the economy, who acts as a dynamic *inventor* and *innovator*, as a manager and leader, as a creator of endogenous based business opportunities. Knight makes difference between the Schumpeterian “*non-risk bearer*” and the true decision-maker who is managing the firm through true entrepreneurial judgment (when true uncertainty exists as a probability without empirical data of the past - non-routine tasks) and estimation (when true risk exists as a probability with empirical data of the past).

This Knightian approach addresses again the emergence of knowledge and especially the new knowledge, because the solution of non-routine tasks requests the application of “new ways”. Kirzner highlights the issue of the competence of error correction (“trial-and error”) and so reintroduces Arrow’s “learning-by-doing” which is tightly connected with the intellectual aspects of the entrepreneurial activity. While the above mentioned thinkers elaborated their entrepreneurial issues some others tried to explain in a descriptive way the production function or in other words the role of the various factors or resources for the economy. Almost parallel to the above mentioned entrepreneurial views, economists¹⁷⁹ defined equivalent production function or made attempts to explain what, how and why has an impact on the create value of the economy.

¹⁷⁹ Solow, Mincer, Lucas, Romer

Their production functions or growth¹⁸⁰ models regard almost unisono capital stock and labor as explanative factors for economic welfare. Later on literacy and experience follow as explanative variables for growth. The production function of Acs (Acs et al, 2005) takes into consideration the entrepreneurial knowledge, the expected earnable profits, the earnable wage rates, the intensity of knowledge exploitation, barriers to entry the market and other factors. In this context the most important conclusion – due to a related analysis - is that the above mentioned growth model confirms entrepreneurship as strongly and significantly depending on the level of knowledge stock. This goes quite conform to the recognition of the endogenousness of innovation and implies the importance of knowledge and its creation and distribution (spillovers).

Having in mind Nonaka’s approach, Aristotle’s epistemological and ontological diacritics but also considering the syncrasis theory of Parmenides we developed a spiral model of knowledge modes which is fully applicable to the entrepreneurial concept. In this way we developed the typology or taxonomy of knowledge production and divided the related intellectual capital into four categories (LC – Systemic or learning capital, HC- Human Capital, SC – Structural Capital and RC – Relational Capital).

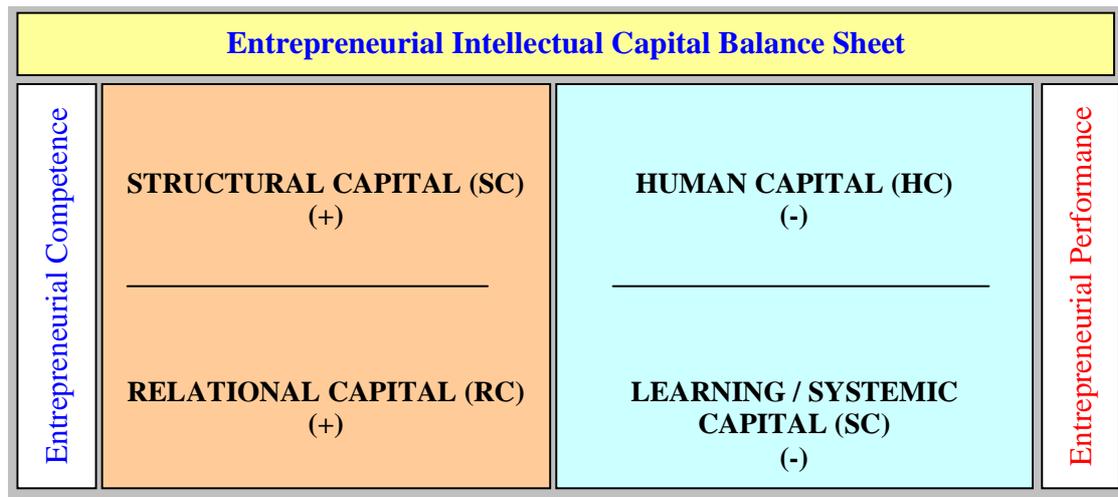

Figure 4: Intellectual Capital Balance

Through arrangements and rearrangements of the basic concept we are constructing a new intellectual taxonomy which is able to show some distinguished entrepreneurial aspects, like intellectual and agentive potential, entrepreneurial intellectual capital and its competence or performance dimensions. In order to present those dimensions or “states” in the known

¹⁸⁰Gunnar Myrdal (Myrdal, 1956) in his research about economic growth elaborated a distinction between the qualitative term development and the quantitative one growth, meaning that first the qualitative base has to be established before quantitative effects can occur. This point stresses the fact that quantitative tactical measurements grasp only when qualitative strategic infrastructure (strategic framework) has been set before. This distinction addresses the issue that knowledge or cognitive (qualitative) abilities are especially increasing when used while traditional resources and other production factors have diminishing returns.

“familiar” financial statement manner we reconvert those aspects into an entrepreneurial intellectual capital balance sheet (cognitive balance sheet, Figure 4) and entrepreneurial intellectual capital profit & loss account (cognitive profit & loss account, Figure 5).

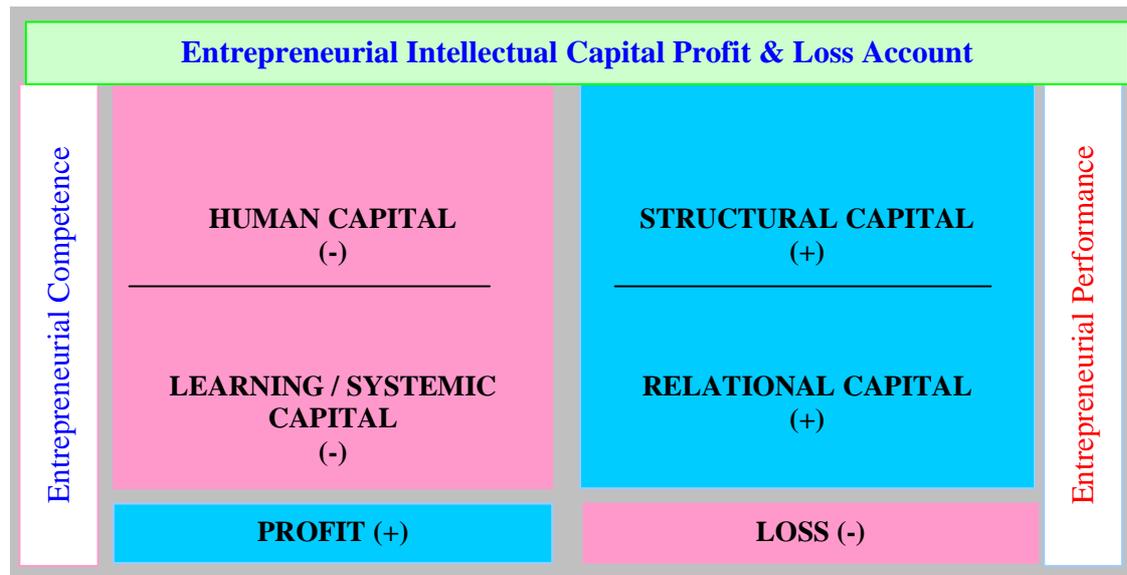

Figure 5: Intellectual Capital Account

Due to the above mentioned results the entrepreneurial activity means acquisition (ET / LC), conception (TT / HC), documentation (TE / SC) and distribution (EE / RC) of the knowledge initiated innovation capital and entrepreneurs could be therefore divided in perceptors, conceptors, converters and distributors of intellectual capital based innovation. The above mentioned philosopher and “intellectual entrepreneur” Thales combined proactive intellectual and active agentive qualities so that he passed through all stages of intellectual entrepreneurship, as perceptor (ET), as conceptor (TT), as converter (TE) and as distributor (EE).

TELEMEDICINE: OBTAINING THE COMPETITIVE ADVANTAGE IN HEALTHCARE SERVICES

Mavridis, Dimitrios¹; Feka, Virginia²

¹MBA, Kingston University of London – ICBS Thessaloniki Business School, Thessaloniki – Greece

²Lecturer on Strategic Management, Kingston University – Greece, PhD Candidate University of Macedonia - Greece

INTRODUCTION

The fact that Telemedicine and robotic surgery applications are increased in quantity and ratios of use makes this Medicine field extremely interesting. Taking into consideration that we refer to a brand new kind of medical application, the need to examine and study the object becomes more requisite.

Telemedicine application in medical daily routine is now reality, including teleconference and telesurgery networks which are more and more applied and developed.

DEFINITION OF TELEMEDICINE

«Telemedicine is the rendering of medical services even in the cases of distance between the patient, the doctor and other specialized information and knowledge».

FEATURES AND SKILLS

The **main features and skills** of Telemedicine are the following:

- Administration of the patients' identity details, which are registered in the terminal under the form of patient list.
- Administration of medical information and its organization as a total comprising simple examinations.
- Administration of medical information exchange under the form of incidence.
- High quality communication between the users in real time.
- Remote follow up and monitoring of the patient.
- Communication speed in cases of emergency.
- Transfer of medical data from remote centers to specialized doctors in order to get diagnosis.
- File registration of the patient and its immediate use in case of emergency (patient's electronic file).

- Information Systems for automation of medical works (transfer of medical data within or between hospitals).
- Services for information and education through network regarding doctors, patients and citizens.
- Teleservices for consulting purposes and first aid in emergency incidences.

MAIN GOALS OF TELEMEDICINE

Follow the main goals of Telemedicine:¹⁸¹

- Transfer of information, not the patient.
- Better quality and easy access on medical care services.
- Better information on patients.
- Medical expertise, available to everyone regardless of the patient's location.
- Higher efficiency and productivity of medical care services.
- Quicker and safer decisions for treatment, thanks to the transfer of medical images and the easy access to the medical file.

NEEDS FULFILLED BY TELEMEDICINE

Below are listed the needs fulfilled by Telemedicine:¹⁸²

- Remote areas with low-quality rendering of medical services
- Navigation.
- Home treatment.
- Emergency incidences.
- Health tourism units.
- Consulting units to doctors.
- Teletraining.
- Covering of unusual specializations
- Homogenization of medical services.

The basic feature of telemedicine is distance. However, distance may not be too remote. It may connect two parts of the same hospital, two buildings of the same block, two cities, two islands or two continents. The distance may be relatively small but telemedicine may assist by fulfilling its goal without useless time-consuming procedures on behalf of the doctor who provides specialized knowledge and experience.

¹⁸¹ Koutsouris D., (2003), *Telemedicine for Emergency – Laboratory of Biomedical Technology*.

¹⁸² Koutsouris D., (2003), *Telemedicine for Emergency Incidents, Laboratory of Biomedical Technology*

We'd easily conclude that those are supporting technologies and not a new form of medicine.

Nevertheless, it is certain that the adoption of those technologies leads to the need for new models of organization and rendering of medical services. From that point of view, Telemedicine may be considered to be new procedure in the field of medicine or health.

The service of Telemedicine provides a system of administration and distribution of medical information (cardiograms, ultrasounds, CT scans etc) with multiple applications in the fields of diagnosis, treatment and training of doctors. Based on the use of telecommunication and information systems and the conversion of medical information into electronic form, the following main directions of services and applications are signalized:

- Telediagnosis.
- Teletreatment.
- Teletraining.
- Teleconsulting.

POTENTIAL USERS

Knowledge on Telemedicine issues is extremely useful qualification for scientists and the other employees in the health field, given that they allow the practice of medicine upon methods connected to the modern requirements of society, e.g increased mobility of the citizens, demands for equal access on quality services, confrontation of the speedy increase on scientific knowledge and taking advantage of modern technologies for the immediate access on knowledge sources, immediate communication with experts in order to face complex medical problems and lastly, the systematic formation and elaboration of electronic medical files for patients.

At the same time, the telematics technologies contribute efficiently to the solution of the problem of the perpetual medical education and training and the constant and efficient communication and information.

Following the above, Telemedicine programs offer the chance for training of young people, mainly experts, in subject fields related to crucial cognitive objects while they equip them with the required knowledge concerning the modern way of rendering health services, where needed. Those capabilities allow the equal participation in modern activities of rendering of health and care services within the frame of both European Union and global community.

THE ADVANTAGES OF TELEMEDICINE

The use of Telemedicine attributes the following **advantages**:

- Direct communication of doctors located mainly in remote areas for exchange of opinions and treatment of extraordinary circumstances.
- Drastic reduction of the communication time between Hospitals and doctors.
- Minimization of purposeless transfer of patients resulting to cost reduction.

- Update of rendered health services at level of local administration.
- Broad covering of medical cases.
- Treatment of problems in remote and isolated areas and in primary health care units through telematic applications.
- Update of the work environment by the medical staff with the use of modern technology and services based on international models.
- Facilitation and update of the constant doctor training.

POTENTIAL PROBLEMS

However, in Telemedicine applications it is possible to meet the following problems:

- Usually, there is no integrated image for the patient's situation.
- Sometimes, the demand for telediagnosis and tele-expert opinion is not automatically incorporated in the system.
- Telediagnosis is not automatically incorporated in the electronic file of the patient so that it will be available for future reference.

In addition, there is the issue of trust on medical information and security of the entire system. The medical information fall into the restriction of medical confidentiality that should be assured. Moreover, the organization and structure of the system and the registered information should assure the required information for the most secure possible diagnosis by the remote doctor. The above may be handled within the frame of a revised and updated legal-medical environment.

Plus, although the idea of Telemedicine becomes more and more known recently, its applications are restricted. The main factors that contributed to this fact are the following:

- The telecommunicative lines so far do now allow easy and cheap quick transfer of bandwidth. Thus, the applications requiring on-line image transfer or particularly video, are hardly diffused.
- Technology runs quicker than the human habits' change. It takes time for the doctors and the patients to accept innovative technological applications.
- Most applications are formed by financed researching programs and, upon the expiry of their financing, there is not opportunity or interest to keep them on use.
- There are no important national strategies for Telemedicine.

TELEMEDICINE AS SOCIAL SUPPORT

As a country's living standard is improved, the requirements for quality services are increased while the pressures for constant improvement of their quality are enhanced.

«Quality consists of all the features of a product or service required by the users»

The quality of services is always defined by certain qualities that exist or should exist. Provided that the services are properly designed, the most important are the following:

- Their availability and the access on them
- Their acceptance
- Their possibility of use in relation to the expenses resulted
- The possibility for control

So, within the frame of Telemedicine application as important health service, potential problems in the availability of services and the access on them should be treated immediately. However, this is expected to result when the solutions will be given for the total population at the level of telephony.

Until then, the difficulties are enhanced due to the deficiencies in human resources and the weaknesses to welcome and distribute the patients in the hospitals and the Instant Aid Centers, as well as the existence of typical service of telemedical notification (mainly for the Senior Citizens), operating only regarding relative programs of the municipalities throughout the country.

THE GREEK TELEMEDICINE PROGRAM

Telemedicine launched application in Greece in 1994 based on the dispatch of medical data, e.g X rays or ECGs and other information, through common telephone lines from the remote Health Centers of the program in Sismanoglio General Regional Hospital of Athens.

The aim of the Program is the systematic support and update of contents by those healthcare units with the transportation, through Telemedicine systems, of specialized diagnostic and treatment services.

Within the frame of National Health System, the Telemedicine Program operates, financed by the Ministry of Health and Care, which connects small Hospitals, Health Centers and Regional Clinics with the reference center of the program installed in the Regional General Hospital of Attiki «Sismanoglio»¹⁸³ and the General Thorax Diseases Hospital in Athens «I Sotiria».

However, the Telemedicine Unit of the Health National System located in Sismanoglio Hospital of Athens lastly collapsed facing vital problems that result by deficient staffing, faulty technical and informative support and –overall- failure of public hospitals¹⁸⁴.

On the other hand, there is the award of Telemedicine Unit in the Hospital "Sotiria" among public EU organizations who were evaluated within the frame of the competition «e – Inclusion

¹⁸³<http://www.mohaw.gr>

¹⁸⁴ «Kathimerini» newspaper: «Telemedicine collapsed within five years», 29 – 04 – 07, article by Mrs Bouloutza P.

awards 2008»¹⁸⁵. This Unit renders primary care services to senior citizens suffering from chronic diseases without the need to be transferred home.

By examining the general plan, the operation of telemedicine units helps the strengthening of trust towards the local health services, given that the residents get to know the capability of the doctors to transfer the problem in the experts of the hospitals. This fact contributes - at a certain extent - to the interception of internal immigration due to health reasons.

Furthermore, it may also contribute to the national, tourist policy, by giving the chance to the vulnerable tourist groups to know the ability of instant service of an eventual problem through telemedicine in the place of holiday¹⁸⁶.

It is not difficult to perceive the respective difficulties faced by the remote and incorporated hospitals or Health Centers in Telemedicine Programs within continental and island Greek territory. The support, the collaboration and the mutual assistance are automatically refuted when there is nobody on the side of the doctor "on the other side of the line" for all potentials. All the above problems will be perpetually enhanced with the following factors:

- Deficient public financing. The incorporation of Telemedicine Program into financing programs by EU would certainly assure viability and growth.
- Faulty training. The individuals that constitute the support group of the Program either are small in number in relation to the requirements or deemed to be insufficient at the level of knowledge and skills.
- No motives. The possibility for constant training does not seem even a perspective due to multiple and insuperable functional hindrances.

Provided telemedicine will be treated and offered as "public good" and not as additional parameter in the competition field, the nursing institutes will be able to cover current needs, as follows:

- The demographic changes
- The quality of services
- The equity in access
- The improvement of clinic result
- The research and technology
- The inspection of expenses in health services
- The business opportunities.

STRATEGIC ANALYSIS OF THE ENVIRONMENT

¹⁸⁵ *Kathimerini* newspaper: «Telemedicine Award in Sotiria – from Europe», 15 – 11 – 08, article by Mrs Bouloutza P.

¹⁸⁶ «*Kathimerini*» newspaper: «Telemedicine collapsed within five years», 29 – 04 – 07, article by Mrs Bouloutza P.

The work attempts to reach -at least within the frame of theories – the hospital institutes with applications and technologies, by examining how the information, that is the strategic advantage to be produced by this fermentation, influences the moves and the decisions by the Institutes within the frame of rendered services. In fact, we are looking forward to reveal the need of existence of telemedicine systems in modern hospital institutes.

SECTOR DETAILS

Recently, the hospital field in Northern Greece is marked by new classifications due to takeovers and mergers between societies of three wider activities in fields (general clinic, obstetric and gynecological clinics, diagnostic centers). The result of this tendency is the domination of very strong business groups for rendering of medical services which offer full range of services for treatment and diagnosis.

The competition lately is extremely intense between the private health units, which is concisely focused on points like the renewal of medical-technological equipment, the range, the quality and the speed of rendered services, the network and the collaboration with insurance organizations.

Recently, we notice important changes on the operation of private health sector in various European Union countries, which are combined with demographic factors, the reduction of state interventionism and the technology evolution. In some EU countries, the possession of private treatment centers is gradually transmitted by groups of doctors to great financial groups or insurance organizations, who, in turn, introduce modern promotion methods for sales guided by the qualitative update of the rendered services.¹⁸⁷

CORPORATE STRATEGY

The business strategies in the health field began to operate but mainly exist in Greece the last ten years, where the rendering of medical services by private clinics was extremely increased.

The release of private health and its following increase forced the involved persons to proceed to the detection and adoption of strategy in order to survive in the different new landscape and manage to strengthen that way their position by formulating the frames of this developing market. In particular, the efficient administration and operation of various clinics (which operate as separate companies) by the abovementioned groups, constitutes a principal reason to «build» common and efficient strategy, by following always the motto «although nobody can claim that strategy assures success, it surely helps at its achievement».¹⁸⁸

STRATEGIC COMPETITIVENESS

The Theory of Resources and Abilities explains how the business resources (material and immaterial) in combination with the skills (marginal and principal) constitute potential sources of comparative advantage. The selection and respect of strategy assures its durability in time¹⁸⁹,

¹⁸⁷ ICAP, (2006), *Sectoral Study: Private Health Services*, page 3

¹⁸⁸ Papadakis V., (2002), *Business Strategy: Greek and International Experience*, page 31

¹⁸⁹ Malavakis Ch., (2007), *Notes on the Course Strategic Management – ICBS*.

which requires also the operation, the contribution and the collaboration of multiple powers of the business or the organization.¹⁹⁰

- Within the frame of competition between the private hospitals, the powers and the resources consist on the plants and the medical-technological equipment of high technology (material resources),
- The existence of famous doctors, trained nursing and administrative staff (human resources),
- The existence of competitive nursing packs that is supported by integrated systems of administrative and financial administration (system resources).
- Lastly, we recognize the «reputation» and the «good will» as resources with great value (immaterial resources).

The business resources are not always able to offer competitive advantage and success. The possession of a unique resource does not automatically lead to success. It is certain that a business may fail provided it has not the skills that allow it to develop and win-win benefit of this advantage.

Consequently, it is not enough for a business to have resources. It should undoubtedly combine the precious resources and form skills resulting in fact by the proper combination and the integration of a group of resources.

This means that potential perspectives for the following result by the installation of telemedicine system in nursing institute:

- Possibility to schedule the surgeries.
- Spare time in the occupation of surgery rooms.
- Time and money profits due to delays.
- Transaction of more interventions in less time.
- Less hospitalization time – spare of clinics – more patients' admittance – increase of completeness and incomes.

In fact, the first «customer» who benefits from telemedicine advantages is the surgeon - doctor, who wants to benefit as much as possible from such quality, by forming such work surrounding. Secondly, the patient has a clearer image about the term and the quality of hospitalization and treatment. In any case, those factors reinforce the prestige and the value of a nursing institute.

To conclude, those factors should not be treated segmentally but as complementary units that influence each other positively or negatively. In addition, we should take into account that changes occur with time. This may be due to the changing environment or the occurrence of

¹⁹⁰ Siomkos G., (2004), *Strategic Marketing*, page 122

competitors. The result may be the failure of a strategic factor of success and its replacement by another.¹⁹¹

COMPETITIVE ADVANTAGE

Competitive advantage is constituted by all business means or acts to assure predominance towards the competitors and simultaneous important profits. The competitive advantages result by the availability and administration of resources as well as the abilities of the business administration and staff¹⁹². Provided a “matching” is achieved between the internal business surrounding and its strategic design, then we will be able to say that the benefit of advantage acquisition is achieved.¹⁹³

Nevertheless, the existence of business resources is not enough to form competitive advantage. The competitive advantage is formed by combinations of resources and their proper administration in a way to form such business skills as to support and maintain competitive advantages¹⁹⁴.

The provision and installation of high-technology machines obviously assure priority of the hospital against competition. However, the faulty or insufficient use automatically cancels it. Such a result is due to reasons like lack of user's training (liability of the supplier and the administration that should assure excellent training), failure to take advantage of equipment capabilities, deficient or erroneous diagnosis, bad reputation of the hospital, weakness for investment amortization.

According to the theory of sustainable competitive advantage based on resources [Oliver, 1997],¹⁹⁵ the competitive advantage is the result of distinctive, rational, administrative options, optional accumulation and investment of resources, strategic factors of the field and the imperfection factors of the market.

METHODOLOGY, AIM & GOALS OF THE RESEARCH

The work is based on the empirical observation that, in the frame of great investments in health field and the assurance of competitive advantage, we notice recently a wider adoption of applications of telemedicine technology.

This research aims firstly at the investigation of both the existence and perception of usefulness of telemedicine application. Secondly -and provided the telemedicine application is stated- it reveals the reasons of its installation, based on which expectations and it later mentions whether the expectations are met. The goals consist on the following:

- Revision and presentation of private and public hospital field (in the area of Thessaloniki)

¹⁹¹ Terzidis K., (2004), *Management – Strategic Approach*, Editions Syngroni Ekpaideftiki, page. 99

¹⁹² Kazazis N., (2004), *Efficient Marketing*, page. 143

¹⁹³ *Understanding Competitive Advantage: The Importance of Strategic Congruence and Integrated Control* - Springer Berlin Heidelberg 2005.

¹⁹⁴ Kazazis N., (2004), *Efficient Marketing*, page. 144

¹⁹⁵ Siomkos G., (2004), *Strategic Marketing*, page 122

- Registration of the range of telemedicine application in the Greek hospital system
- Research, registration and analysis of those reasons for which the telemedicine application could be considered to be competitive advantage.
- Research of all factors that contribute to the recognition and maintenance of the competitive advantage.

The research was implemented under two points of view: the first regarding the examination and finding of strategic advantage through the theoretical model's filter while the second aiming at the study and setting of parameters that lead to the maintenance of this advantage.

RESEARCH RESULTS

Within the frame of the research, personal interviews were implemented with the directors and administrators of the biggest hospital units (private and public) in the area of Thessaloniki. The way of approach was a Non-Structured Personal Interview that assured:

- A «real» and reliable image of the hospital field
- The elimination of distance that separates theories from their application in the market field
- The collection of interior data by contributing to the reliability of the research
- The initially informal measurement of treatment by the heads of the hospital units in the perspective to apply Telemedicine.

From the answers of the sample, it results that there is contact and knowledge of Medical Informatics' applications, like Telemedicine. The advantages are recognized and known even if not applied in the administered hospital. Despite all these, where applicable (e.g dispatch of cardiograms and X rays through Internet), the usefulness and value are confirmed regarding speed and spare on the treatment of a case with diagnosis and service of remote patients.

Equally important advantage of the Medical Information resulting by the answers of the sample, is the improvement of rendered medical services of hospital institutes. In that way, less medical and nursing staff is employed or it is employed for less time. Therefore, the institutes that use previous technology, improve their operation and the services they render in general. More important presumption is the answers of the interviewees who keep on having this opinion because they consider that, with the use of Medical Informatics, the waiting time of patients and the cost are both reduced, by contributing to the positive operation of the institutes, the improvement of their services and the acquisition of important advantages towards the competition.

In any case, although no new detail or conclusion arose, the answers demonstrate that the new generations of administrative persons have wider opinion of medical and technological applications and that, in some hospitals, Telemedicine applications (regardless of the kind and the degree of expression) constitute daily medical practice. This occurs mainly in the private sector since public hospitals (in the area of our sample) have no activity to show.

And the reasons which led the percentage of our sample to the adoption of Telemedicine relate to the reduction of service cost, the improvement of rendered services and the increase of speed of patients' service.

On the other hand, the higher percentage of our sample believes that Telemedicine application in the hospital institute where they activate, did not attribute the expected results and this is due to the fact that there is no required staff familiarization and there is lack of appropriate structures and infrastructures which would render its application more efficient. This weakness consists on the impression that Telemedicine applications reach difficult heights (like the required equipment) while the last rampart of the arguments is the reserve for the staff ability to meet such an investment.

Lastly, let's not omit to mention that our sample, despite the realized expectations at a certain extent, expects additional profits and results at operational and financial level. Nevertheless, the decision for future or already existing installation of telemedicine system is based on those expectations.

Lastly, the answers of the sample state that Telemedicine application is also realized for purposes of reputation and prestige of each hospital institute without constituting dominant priority.

After having investigated how the interviewees perceive Telemedicine and its effects, we wanted to examine which are the changes to be brought in the internal structure and the operation of hospital institutes.

To conclude, we mention that most people believe that with the use of the proper, medically evaluated, technology, the rate of success for interventions is increased, the waiting time is reduced, the works are automated and a collaboration frame is formed between the specialized staff and universities and clinics.

CONCLUSIONS

As first and impulsive conclusion we could state the fact that Telemedicine applications approach rapidly the daily routine of the medical acts. It is now reality for global and also Greek medical data because nowadays its applications are more often used. The percentage 75% of our research's sample has adopted at a certain extent and form an application of Telemedicine.

Telemedicine, where and when applicable in the hospitals, constitutes a simplified form in relation to the respective applications of wider extent and higher technology of Medical Informatics mainly destined for military sector. Besides, Telemedicine applications in the surgical field give a sidelong glance towards robotic surgery that is already presented as trade article (Da Vinci system).

Regarding hospital institutes in the area of Thessaloniki, the basic conclusion resulting by the research is that there are Telemedicine applications in the diagnostic and surgical field, mainly in the private sector while the public hospitals are still delayed in this field.

The truth is that none of the hospitals that apply Telemedicine use it as spearhead in Marketing. However, the use of Telemedicine applications is made in order to acquire

reputation and prestige, by aiming at the update of the equipment, the rendered services and in long-term the cognitive level of their nursing staff.

The as above analysis brings us in front of an assured expectation for update of services; the update of the training level for medical and nursing staff constitutes first priority for each interviewee.

This may be due to the fact that such an effect is considered to be given (as natural sequence) and gravity is given to the update of rendering of services and the reputation/prestige of hospitals.

In the latter two fields, the expectations focus on the use of Telemedicine in the surgical field with parallel profits on the scientific documentation, the speed on interventions, the scientific preciseness and efficiency.

It is certain that the good intentions are in excess regarding the installation of Telemedicine system. At diagnostic or surgical level, the administrations and the directions of clinics are in fact willing to work in an environment that offers safety and quality guarantee. The biggest hindrance so far (financial cost) is overcome nowadays with structured financial-technical studies, increased financial capabilities of the hospitals and mainly the change of mentality by persons who constitute the administration and may recognize the profits and pros of such an investment.

Our research has revealed that the interviewees know and perceive the advantages of Telemedicine, regardless of the application on their own hospital or not. The determinant of "human resources" will reveal or collapse an application that can make the difference, one way or another.

The successful conjugation is purely matter of administration of resources and priorities. This means that, if we assume that the use of high technology constitutes default panacea by undermining the human factor, then the failure is given. On the contrary, if we use this technology for maximum performance through the update of the users' cognitive object, then the competitive advantage will be achieved and new data may be formed in the structure and the operation of parts using Telemedicine, like :

- Efficient way of working (definition of procedures, surgery programming)
- Quality assurance (functionality – ergonomics of units, high level of equipment),
- In general, it assures the users who are used to such situation and it would be difficult to restore or function without it

In our opinion, the human-centered approach in the dilemma "human or machines" is an inevitable and preferable approach. Although in this case we move on the edges of the limits of philosophy, the catalyst for the revelation, application and efficiency of any technology form was and remains the human and its moral-mental qualities.

Concerning its technological skills, their growth was always complying with the development of the technology itself, based on the deep knowledge and specialization. Those two elements

(knowledge and specialization) may be helping the Telemedicine users to take ultimate advantage of the system abilities and himself to acquire new and develop old knowledge leading to its personal and professional improvement and progress.

Telemedicine is an advanced technology solution in the universal problem of access on healthcare since, thanks to its use, the geographical isolation is not further obstacle on the human basic needs for fast and high level medical care and attributes requirements to the institutes for strong advantages.

SUGGESTIONS

For the moment, the development of Telemedicine is directly related to the development of broadband and use of its applications on the operation and networking of hospital institutes.

In the public sector, the installation and extension of the network "Syzeffix" forms stable infrastructures for the update of telecommunicative infrastructure of public sector, by offering thus an access network and orientation for the State organizations, wishing to meet the needs for their communication with telephony (telephonic communication between the organizations), given (communication of Computers – Internet) and video (teleconference – teletraining). In addition, the private sector, by using the applications of broadband for its own internal communications (telephony and internet) forms its own separate network.

Given this fact (use with differentiations at the level, the degree and the kind of applications) and from the:

- Installation of a modern telematic network for use by health units with perspectives of extension.
- Development of integrated informatic system for primary units.
- Installation and use of common software of electronic medical files, especially in primary health care
- Access from all network points in medical and information databases (Greek and Foreign).
- Use of modern telecommunicative equipment (following the international standards) for teleconferences and parallel data transfer.
- Use of network for perpetual training of medical and nursing staff in remote areas.
- Quality administration and assurance.
- Application of international standards and protocols (HL7, DICOM, ISO-EN etc).

In order to materialize the National Telemedicine Network, resources and material-technical infrastructure are required. For this purpose, the implementation will proceed gradually. At first phase, the National Center of Telemedical Services could be established and at second phase, telemedical works will be executed at national scale.

The establishment of an institution (or a Committee) that will assume the organization and administration of such attempt could be installed in university hospital or university institute or other scientific organization and there will be collaboration of doctors or electric engineers and

computer engineers with specialization in Biomedical Technology, Telecommunications and Informatics.

Therefore, the proper use and benefits from Telemedicine is not only issue for users and administrators. They will have sufficient technical knowledge, so that they:

- Evaluate the technical features of Telemedicine systems
- Recognize their abilities and how they can maximize
- Carry out the installation
- Assume the maintenance and update of the equipment

From the point of view of the medical and nursing staff, the use of Telemedicine could:

- Produce stimuli and conditions for lifelong learning.
- Lead to development of intrahospital seminars and experiences
- Bring the adoption of new data in working conditions
- Give birth to the use of new protocols and requirements in medical research.

All these should take place in an innovative organization and culture environment of telemedical services, that will lifelong inform and train all involved scientists/users, aiming ultimately to the change of mentality and «culture» in the working area.

Perhaps in a future ideal world of hospital rendering of services could belong the operation of an Intrahospital Metropolitan Network, where will also belong and collaborate the hospitals of public and private sector, aiming at the promotion of Health as social good, the prevention and treatment of emergency incidences, the immediate access in crucial health details of the patient (electronic hospital file), the introduction of Telemedicine dimension in medical practice, as well as its compliance with the European legislation and mainly EU Directive 95/46 (regarding personal data protection).

NATURE, ELEMENTS AND PROCESS OF CUSTOMER ORIENTATION: EVIDENCES FROM SERVICE FRONT LINE

Mekoth, Nandakumar¹; Barnabas, N.²; Heggde, Githa S.³

¹Professor in Management, Department of Management Studies, Goa University, Taleigao Plateau, Goa, India

²Associate Professor in Marketing, Symbiosis Institute of Business Management

³Ph.D, Professor and Dean, Marketing, Welingkar Institute of Management, Welingkar Education, Bangalore 560 100

Purpose – This study is an attempt to understand how customer orientation happens in an organization particularly with reference to the role of front line.

Design/methodology/approach- Critical Incident Technique was employed to collect stories of customer oriented responses from the front end managers of twenty interactive services organizations. The collected stories were analyzed and interpreted to capture the nature, elements and process of front end initiated customer oriented response.

Finding- The responses were found to be systemic, localized and benefit driven in nature. Managerial initiative, system support and frontline participation were the elements which contributed to customer orientation. The process involved followed a generic decision making model with sequential steps of awareness, authentication, alternative generation, evaluation, response design, trial implementation, full scale implementation, and impact assessment and communication.

Research limitations/implications – Further research work should focus on implications for human resource development in the front end for an attitudinal change through education and training. This should be in the form of developing a need for assigning highest priority for the customer need.

Originality/value – This paper provides a detailed study of the need for nurturing the leadership and initiative of the front line manager. Further, the current study should enlighten the top management of service organization that many customer oriented response initiation and implementation can occur at the grass root level within the organization rather than out of the vision of the top management.

Keywords: Customer Orientation, Service Delivery, Response Implementation

INTRODUCTION

Marketing philosophy entails that customer oriented organizations are better positioned to achieve long term business success than the ones that are not (Deshpande, Farely and Webster 1993; Kotler 2000). Customer orientation has been considered as an integral element of Market Orientation (Deng and Dart 1994) leading to superior firm performance in terms of profitability (Narver and Slater 1990), employee commitment and esprit de corps (Jaworsky and Kohli 1990). Given this significance of customer orientation, researchers in marketing have profusely studied factors contributing to superior customer orientation as well as varying implications of customer orientation across different organizational contexts (Chang and Lin 2008, Harris and Strong 2004, Ceyhern and Dursun 2007, Sax and Weitz 1982).

THEORETICAL BACKGROUND

Researchers in the past have suggested the study of market orientation in a disaggregated manner (Noble, Sinha and Kumar 2002), particularly differentiating customer orientation and competitor orientation as separate constructs since their drivers are different (Homburg, Grozdanovic and Klarmann 2007). Customer orientation, particularly, has been treated as a culture driven, over all organizational orientation (du Gay and Salaman 1992) as well as individual employee orientation (Saxe and Weitz 1982). Researchers have studied influence of individual characteristics such as personality traits on customer orientation of service workers (Brown et al. 2002, Liu and Chen 2006). However, researchers have not given sufficient attention to the role of front end service unit in designing and delivering customer oriented response and especially to *how* such responses happen.

The boundary spanning employees could play a key role in making the firm customer oriented. The role includes understanding, filtering and interpreting information and resources to and from the service organization and its customers (Zeithaml, V. A. and Bitner M. J. 2000). They also participate in designing and more so, in implementing customer oriented responses (Heskett, Jones, Loveman, Sasser Jr and Schesinger 1994). These customer oriented responses could be on the front end employees' own initiative or by virtue of the front end employee participating actively in organizations' top management driven customer orientation (Carr and Lopez 2007). There are multiple drivers for customer oriented behavior. While individual initiated customer oriented behavior by front end employee is driven by personality factors like openness and agreeableness (Periatt, Chakraborty and Lemay 2007, Liu and Chen 2006) a more widespread- organization wide- customer oriented behavior is impacted by a market oriented organizational culture (Narver and Slater 1990). For example employee empowerment was identified to be positively impacting customer orientation (Bowen and Lawler 1992; Peccei and Rosenthal 2001). Similarly, education and training, involvement and contribution, and reward structure (Iris Mohr-Jackson 1991) were also found to be driving customer oriented behavior in service organizations at the front end.

Besides explaining key drivers of customer oriented behavior, existing literature deals in implications of customer orientation as well. Customer orientation of front end service employees was found to be positively influencing firm performance (Keilor, Parker and Pettijohn 2000) service quality (Carol, Carol and Rachel 2003) job satisfaction, commitment and organizational citizenship behavior (Donavan, Brown and Mowen 2004).

The predominant measure for service quality was proposed by Parasuraman, Zeithaml and Berry (1988) in the form of SERVQUAL. Superior service quality leads to customer satisfaction and loyalty which in turn results in superior performance (Parasuraman et al. 1985). Service quality is achieved through matching or exceeding customer expectations (Zeithaml, Bitner and Gremler 2006). This would involve understanding, designing and delivering service promises in tune with customer expectations. Thus customer oriented behavior becomes a prerequisite of superior service quality and resultant customer satisfaction. Therefore, an understanding of the nature, elements and process of customer oriented behavior could facilitate front line employees as well as service organizations in improving on their customer orientation.

As discussed earlier, past research has largely concentrated on the key drivers and consequences of a customer oriented behavior. However, effort has not been made in identifying

the nature, elements and processes of customer oriented behavior. An adequate understanding of these would demand a study into the “how” of customer oriented behavior. Therefore, the current research attempts to explore the nature, elements and process of customer oriented behavior in interactive services and the role of front end in implementing the customer oriented response.

THE CONTEXT

Service, because of its intangible and inseparable nature, can only be delivered through customer-provider interaction. In almost all cases the provider is represented by service delivery personnel or service facility. Hence a customer oriented response in services has to be implemented through these boundary spanning elements. Service customers bring in variable demands and expect on the spot adaptations in services delivered. Service personnel, being organic in nature, are in a better position to understand the specific need and design and implement a response than an inorganic facility. Considering that the front end employees play a critical role in interactive services in becoming customer oriented, the researchers studied the characteristics and the process of customer orientation at the boundary spanning unit in interactive services. Hence, this research is carried out in the context of the front line unit of interactive services represented by the front line manager.

METHODOLOGY

Yin (1994) suggests that in order to answer a research question as to “how” a phenomenon occurs, an exploratory, qualitative and case based research strategy shall be adopted. As the researchers were primarily interested in the process of customer oriented action, they adopted an exploratory, critical incident based approach. A critical incident is described as one that makes a significant contribution either positively or negatively to an activity or phenomenon (Bitner, Boom and Tetreault 1990, Grove and Fisk 1997 and Chell 1998). Studies in the past in similar areas like market orientation have heavily relied on narrations or oral histories by protagonists in initiating and implementing such activities (Gerhart 2006). In the current study, the researchers identified 20 customer oriented incidents. These incidents were particularly drawn from customer interacting levels of medium or large service organizations. The researchers chose a chief protagonist in these specific customer oriented incident to narrate the story. Further, as the method demands, the incidents were qualified by asking the respondents to report only those which they perceived to be making a significant contribution to the organization and which happened in the recent past. By qualifying these incidents, the researchers ensured that high impact customer oriented activities at the front end alone got attention and the scope of the study was limited to impactful incidents.

Further the definition of CIT entails two aspects to be taken care of at the time of collection of self report of the protagonist. One is the incident in itself and the second is the phenomenon or the theme which it contributes to. In the case of the present study, the incidents were customer oriented responses and the theme was customer orientation in itself which is constituted by customer oriented information collection and processing and also the response. Hence the guidelines for interviews contained items about the response as well as the information about the customer which led to the response.

Trained investigators collected oral stories from front end managers on a customer oriented response (incident in this case) that the respondents themselves considered important. The organizations were selected by using convenience sampling method. The respondents were facilitated to be natural and were encouraged to narrate the full spectrum of the incident with very minimal interference from the investigators in the form guiding. The spectrum involved what the incident was, why it occurred, who all participated, and how the entire incident occurred. The first transcript was prepared by the investigators with verbatim reproduction of narration wherever possible. The researchers analyzed the transcripts one by one whereby every next incident contributed to insights and relationships identified in the previous cases or revealed new insights or relationships.

In the analysis the researchers used a general frame work with three dimensions namely nature, elements and process of customer orientation. This frame work was used keeping in mind the research objective of exploring, identifying and describing the nature, elements and processes involved in customer oriented response in the service front end. Insights drawn from the information gathered were formed into data categories the aggregate of which gave a comprehensive understanding of the phenomenon under study. Each data category was labeled and a collection of categories contributed to the three dimensions of the frame work.

DATA ANALYSIS

By a close examination of the transcripts derived from the reported critical incidents, the researchers arrived at the nature (what), elements (which) and processes (how) of front end involved customer oriented activity. The insights arrived at from the analysis of the incidents are described below.

Nature of Customer Oriented Action:

Customer oriented activity in the front end was by and large found to be systemic in nature. By systemic we mean that a response was designed and implemented keeping all such future occurrences in mind without having to address on a case to case basis. Homburg, Grozdanovic and Klarmann (2007) distinguish between cognitive and affective organizational systems that drive customer and competitor orientation. While cognitive systems refer to the extent of information processing within an organization the affective systems refer to the existence of values and norms to which the members are emotionally attached. They found that while affective organizational system is more important in driving responsiveness to customers, cognitive organizational system is more important in driving responsiveness to competitors. Similarly, we found that along with the implementation of a newly designed customer oriented response, supporting policies, procedures, guidelines and rules were also laid down by the organizations or units with an intention to drive similar customer oriented response in future. E-statement for ICICI credit card for travelling customers, Travel Insurance Policy for a new age group at Bajaj, Redefining responsibilities of staff in Reservations Office (CRO) at Landscape Resort, Introduction of express counter and separation of cash and card counters at Big Bazaar, Annual Maintenance Scheme at Bajaj service station, Express Delivery in case of short time for servicing and Night Shift during high demand by Bajaj Service Station were all examples for the same. All of the above responses were destined to be continuing for future with associated rules

and procedures for supporting the implementation. After restructuring the CRO at Landscape Resort, the manager observed:

“.....the work responsibilities were restructured; all the six CRO officers were made responsible for attending calls and the new policy was explained through a workshop organized”.

Implementation of these systems was in such a way that it was clearly communicated to the customers as well as to front end employees. For example, the “new” e-statement facility provided by ICICI received a prominent position in front page of the company website and cash and card payment queue labels appeared prominently above Big Bazaar billing counters. We conclude from these observations that while disparate customer oriented action might happen at the individual employee level due to personality traits and characteristics of the employee, high impact and pervasive customer oriented responses, that in most cases become a regular feature in future, draw support from systems and procedures for their continued implementation.

Benefit orientation was another characteristic of customer oriented activity. The responses initiated and designed by the front end manager were evaluated on cost and revenue bases. In most cases cost and revenue implications of customer oriented actions were evaluated with the involvement of higher authorities. The facilitation of revenue collection without much of cost was one among the reasons for introducing e-statement facility in ICICI credit card division. Branch manager of ICICI observed:

“the senior management and all of us concerned realized the importance of such feedback that was crucial in receiving payments....giving an opportunity to augment service offering to enhance customer satisfaction”.

Similarly, Revenue loss due to customers leaving the store even after picking the item because of long queues was controlled by introducing a billing counter at the drug store of the super market that did not demand corresponding additional cost. Bajaj Allianz did test marketing and projected the financial feasibility of introducing newer policy for aged customers while Landscape Resort considered CRO restructuring due to business loss as booking agents prioritized other hotels.

One of the major characteristics of customer oriented responses was that the implementation of these responses demanded higher levels of localization. The role of front end manager, as chief protagonist for a customer oriented change, facilitated the implementation of locally relevant responses. Local adaptations were made both in the service design and delivery as well as in marketing communication. Because domestic business customers coming to Goa carried some exotic images of Goa much like the tourist customers they expected an in-house bar at Ginger, a unit of the no-frills hotel chain. The Goa branch manager of Ginger Hotels had to get a bar sanctioned against Ginger’s organizational policy. Similarly, customer response at Fabindia’s Panaji unit demanded more localized promotional strategies as against Fabindia’s policy that resulted in superior business. e.g., Billboard on top of Inox multiplex and advertisement in local newspapers.

Customer oriented responses, in many cases, also required support and involvement of staff at the front end besides the manager. Therefore, as a practice, the front end managers included

the immediate staff as early as response design stage through implementation and follow up. For example, the front line manager at Bajaj service station, Mr. Subhash, consulted and involved the head mechanic and others under him while deciding on night shifts as well as delivery based on service time requirement. He remarked:

“...since implementation involves the rest of the mechanics, I consult the head mechanic from the beginning.....also orienting and training people if needed”.

Elements of Customer Oriented Action:

The elements involved in the customer oriented response were not many. We found three main elements namely managerial initiative and leadership, front end implementers and system support.

In all the responses a front end manager took lead in selecting, pursuing, designing and implementing the customer oriented response. For example, in the introduction of single customer service number at Cidade de Goa, restructuring CRO at Landscape, introduction of bar in Ginger's Goa property, installation of separate billing counters at Big Bazaar and introduction of e-statement facility at the ICICI credit card division were all at the initiative and persistent pursuit of front end managers. The service manager at Cidade de Goa states

“I carried out a survey on other hotels as to how they were tackling this service issue, took the results to the CEO.....the project took about one year from conceptualization to implementation that involved training employees, adding infrastructure and new recruitments”.

In most cases implementation of customer oriented response required participation of front end employees. The elicitation of participation took the forms of consultation in designing response (the involvement of chief mechanic in Bajaj service station), training for implementation (training of CRO staff at Landscape, training of counter sales executives in Bharne Creations) as well as assignment of roles in the implementation (all the incidents except the case of e-statement of ICICI for credit card customers).

In many cases, introduction of customer oriented response benefitted from existing organizational systems and practices as well as technological systems. Existence of rules, procedures, and roles were examples of organizational systems gearing up to support customer oriented response as in the case of ideation lab of ICICI bank, and feedback department of Café Coffee Day. These findings were found to be similar to past research findings that job design and value based training and the resultant employee empowerment lead to customer oriented behavior (Peccei and Rosenthal 2001). The outlet manager at CCD narrates the role of feedback department:

“The outlets forward all feedback slips to Bangalore where they are carefully scrutinized.....suggestions regarding eatables are passed on to food and beverages department, those regarding décor and service quality are passed on to marketing department”.

On the other hand, introduction of software and hardware were examples of technology systems supporting implementation (online access to credit card statement in ICICI bank, new telecom infrastructure at Cidade de Goa, call forward facility at Landscape Resort).

Process of Customer Oriented Action:

The first step in most cases was the front end service unit, specifically the manager, becoming aware of the need for a customer oriented action. This awareness was not a proactive discovery. Rather, a customer complaint, informal sharing of information by a customer or a channel member, formal reporting system and feedback mechanism brought such a need to the notice of the front end manager. For example, the cluster branch manager of ICICI credit cards received many customer complaints like the following one:

“I have made my credit card payment on the basis of SMS received and I have actually not received the hard copy of detailed statement by mail. In case I am travelling abroad, I am unable to even receive this SMS and hence unable to access any credit card payment service.”

However, this awareness was followed by detailed information collection for authentication which can be considered proactive. For example, the CRO manager at Landscape did the following steps for authentication; a) paid personal visits to major travel agents and sought their opinion and facts, b) made live booking calls from agents office, c) made 50 dummy calls over three weeks and tabulated the results.

Once the authentication revealed need for an action, further steps followed in the form of assessing possible alternative responses including financial implication. After selecting the optimum alternative, a detailed response design followed. This detailed response design, many a times, required participation of other members responsible for contributing to the design of the responses. These responses were then implemented on a trial basis. Along with the trial implementation, participating front line employees were trained to adapt to the changed system and areas for closer control and monitoring were identified. On successful lessons from trial implementation the customer oriented response was implemented as an organizational system throughout the organization. In certain cases, regular collection of information on the impact of the customer oriented response was gathered and communicated to the frontline response implementers with the purpose of motivating them.

While following the steps in generic decision making, the process also displayed a few specific features. The generic managerial decision making process involves the five steps of: a) problem identification b) developing alternative courses of action c) Evaluating and selecting alternatives d) Implementing alternatives and e) monitoring consequences of action (Koontz 2000). Figure 1 depicts the typical process involved in a customer oriented action that the front end manager considered important. The means of becoming aware of the issue, authentication of the issue, front end employee participation in designing response and impact assessment were salient to the process.

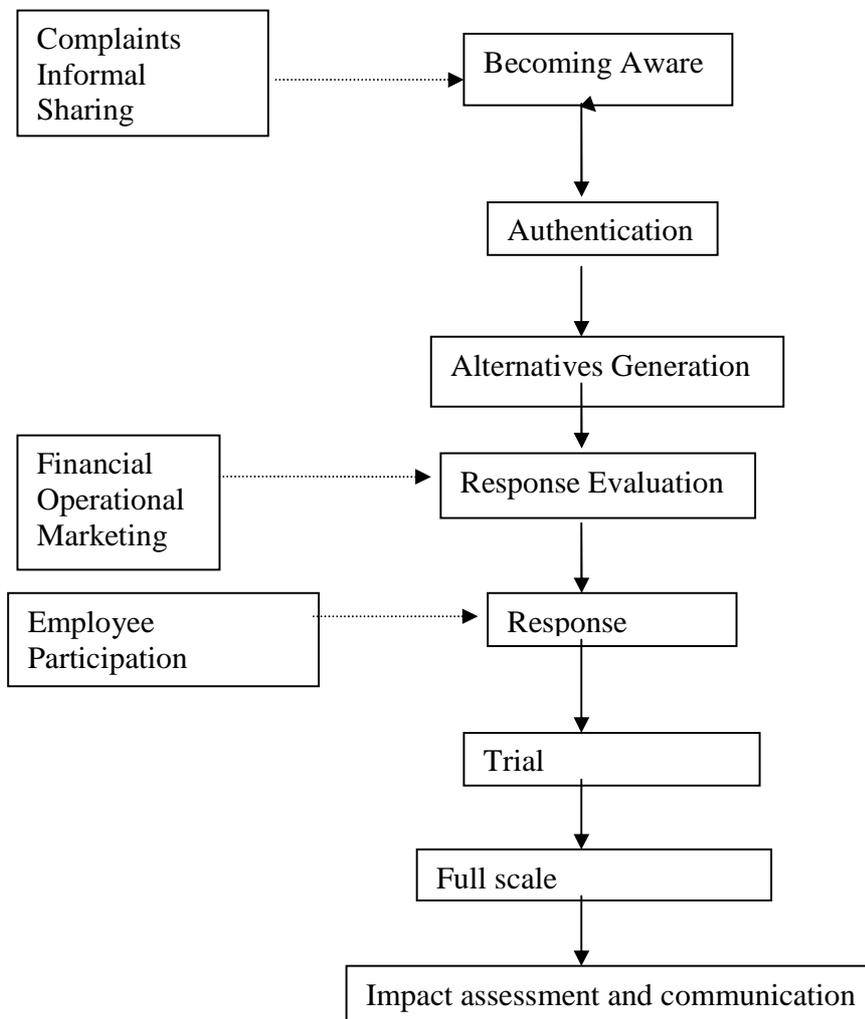

Figure 1: Process of Customer Oriented Action at the Service Front End

MANAGERIAL IMPLICATIONS

Given the systemic nature of responses and the need for system support for implementation, the onus is placed on the managers at higher levels to institutionalize the practices by designing or facilitating the design of proper systems in the form of policies, procedures, guidelines and rules. Again the reactive nature of customer oriented behavior stresses the need for systems and procedures which enable and facilitate the customers to express their needs and difficulties. Customer surveys, suggestion boxes and toll free numbers are some examples. The initiative, persuasiveness and persistence of the front line manager from becoming aware to impact

assessment and communication has been found to be extremely important in the entire process. This has implication for front end manager selection, empowerment and facilitation.

Further the findings of the study have implications for human resource development in the front end for an attitudinal change through education and training. This should be in the form of developing a need for assigning highest priority for the customer need. The effort will be particularly relevant in the implementation of the customer oriented response through the front end. The need for nurturing the leadership and initiative of the front line manager is also evident from the research. Further, the findings of the current study should enlighten the top management of service organization that many customer oriented response initiation and implementation can occur at the grass root level within the organization rather than out of the vision of the top management. This calls for a change in perspective from a top down customer orientation to a bottom up customer orientation.

LIMITATIONS

The research is based only on 20 incidents. Therefore, for many of the conclusions drawn a minimum number of at least five incidents (Zaltman) contributing to each insight were not available. Hence the contribution of this research largely remains generation of themes and insights relating to nature, elements and process of customer oriented responses rather than validation of the same.

JOB SATISFACTION IN CYPRUS

Michael, Andrew¹

¹*Intercollege Larnaca, Cyprus, Northcentral University Arizona, U.S.A*

Purpose – The aim of this paper is to present the results of a study that investigated individuals' levels of job satisfaction in selected industries in Cyprus and to determine whether there were any statistically significant differences between males and females.

Design/methodology/approach – In this cross-sectional study, the Minnesota Satisfaction Questionnaire (MSQ) short-form was used to measure job satisfaction levels. A total of 643 employees from a range of industries that included banking, education, electricity, telecommunications, drainage and sewerage, and water supply participated in this survey. Participants' quantitative responses were analyzed using SPSS.

Findings – The results showed that the majority of survey subjects reported that overall they were satisfied with their job, and that they experienced slightly higher intrinsic (compared to extrinsic) job satisfaction levels. No statistically significant difference was found between the mean job satisfaction levels of males and females.

Research limitations/implications – The validity of the findings depends in part on the extent to which respondents provided answers that were truly indicative of their attitudes. A potential limitation is that subjects provided answers that were socially desirable or that contributed to the avoidance of cognitive dissonance. Additionally, respondents may have differed from non-respondents limiting the generalizability of the results. Future research could investigate job satisfaction levels in other industries in Cyprus and assess the relationship between job satisfaction and behavioural outcomes such as performance and turnover.

Originality/value – The results of this study can be compared to those of the International Social Survey Program (ISSP) published in 1997 to identify job satisfaction trends in Cyprus. Human Resource managers in the subject industries may take into consideration the findings of this study to determine whether there is need to take measures to improve certain job facet levels of job satisfaction.

Keywords: Job satisfaction, Human Resource Management, Cyprus

Article type: Research paper

INTRODUCTION

In today's increasingly competitive global market, firms need to take all necessary steps to retain and increase their customers in order to remain profitable. This requires the efficient production and provision of quality products and services which in turn partly depends on having experienced, motivated and productive employees. The evidence suggests that individuals who are satisfied with their jobs are more likely to exhibit desirable behaviors that enhance the efficiency and performance of the organizations that they work for.

Job satisfaction is an important work attitude that has been extensively studied in industrial and organizational psychology (Davis, 2006; Spector, 1997). Job satisfaction is viewed as an important attitude because of its perceived influence on individuals' work productivity, organizational commitment, organizational citizenship behavior, actual turnover, as well as customer satisfaction and organizational performance. Although research has yielded mix

results with effect sizes varying across studies, overall the empirical findings suggest that the interest in job satisfaction is merited (Kennedy, 2005; Robbins and Judge, 2009; Sousa-Poza and Sousa-Poza, 2007).

Evidence obtained for other countries suggests that job satisfaction is related to the aforementioned attitudinal and behavioral outcomes. Yet there is limited knowledge on job satisfaction levels in Cyprus. The purpose of this paper is to present the results obtained from a cross-sectional study on the job satisfaction levels of individuals employed in selected industries in Cyprus and to show whether there are any statistically significant differences between male and female job satisfaction levels. The implications of the findings are discussed and the results are compared to those of the 1997 International Social Survey Program. The limitations of this study are identified and recommendations for future research are made.

LITERATURE REVIEW

Research on job satisfaction has been conducted on the various methodological approaches to its measurement and differences in job satisfaction levels (e.g. Donohue and Heywood, 2004; Edgar and Geare, 2005; Oshagbemi, 1999; Sousa-Poza and Sousa-Poza, 2000); on the factors determining job satisfaction (e.g. Crossley and Highhouse, 2005; Judge *et al.*, 2000, 2002; Smucker *et al.*, 2003); and on the attitudinal and behavioural outcomes of job satisfaction (Bowling, 2007; Currall *et al.*, 2005; Judge *et al.*, 2001; Sousa-Poza and Sousa-Poza, 2007). What follows is a brief review of the construct and literature regarding the extent to which there are demographic differences with respect to job satisfaction.

Dimensions of Job satisfaction

Job satisfaction is an attitude that reflects individuals' beliefs and feelings about their jobs. These beliefs and feelings can be perceived holistically i.e. as overall job satisfaction, or as comprised of various job facets. Thus, one can refer to individuals' overall (general) job satisfaction levels, as well as to their satisfaction with respect to particular extrinsic job facets such as pay, working conditions, fringe benefits, supervision, coworkers, and job security, as well as intrinsic job factors such as the nature of the work, freedom to work independently, and advancement opportunities (Smucker *et al.*, 2003).

Measuring job satisfaction

Job satisfaction is usually measured by the use of questionnaire surveys in which individuals rate their job satisfaction level according to a Likert-type response scale. Various instruments have been developed and used to measure individual facet and/or global levels of job satisfaction (Clusky and Vaux, 1997; Crake, 2003; Davis, 2006; Kane, 1996; Lovelace, 1996). Some of the more commonly used instruments that have exhibited good validity and reliability are the Job Descriptive Index (JDI) and Job in General Scale (JIG; Balzer *et al.*, 1997); the Job Satisfaction Blank (JSB; McNichols *et al.*, 1978); and the Minnesota Job Satisfaction Questionnaire (MSQ; Weiss *et al.*, 1967).

Demographic differences in job satisfaction

Various studies (yielding mixed results) have been conducted to determine whether demographic variables such as gender and age are statistically significant explanatory factors of job satisfaction levels. For instance, in investigating the relationship between women's job satisfaction and age, Chambers (1999) did not find a statistically significant difference between younger and older women's job satisfaction levels. Similarly, the results of a longitudinal study by Jespen and Sheu (2003) did not show job satisfaction to be related to either gender or age. Using data from the National Longitudinal Survey of Youth (NLSY), Donohue and Heywood (2004) did not find differences in job satisfaction between younger female employees and males. Nor did Moyes *et al.* (2006) in their study of Hispanic Accounting Professionals in the U.S. find gender or age to be statistically significant explanatory factors of job satisfaction.

The aforementioned findings, however, contrast with the results of other studies. For instance, in Gallup's annual work polls, older workers aged 50 and above tend to be more satisfied with their jobs than younger workers. In two other studies, Lawler (2003) found that women scientists were far more dissatisfied with their jobs than men, yet Clark (as cited in Donohue and Heywood, 2004) found that in Britain women were far more satisfied with their jobs. Sousa-Poza and Henneberger (2002) found that in white-collar (non-manual) professions, women experienced greater levels of job satisfaction than men in both the UK and the USA. In an earlier study, Tang and Talpade (1999) found that men expressed higher levels of satisfaction with pay than women but women experienced higher satisfaction with coworkers than did men. In explaining this difference, these authors suggested that women may have initially been content to choose jobs that paid less in return for more attractive and flexible work schedules. However, any short-term satisfaction derived from other attractive job attributes may have dissipated over time as individuals began to experience dissatisfaction with their comparatively low pay. The aforementioned findings suggest that although certain studies show that there are no significant differences in job satisfaction levels between males and females, other studies have found such differences to exist. In such cases, women and men tend to be satisfied or dissatisfied with different job facets. Yet these differences are not consistent across countries.

According to Gallup's annual polls on work in the U.S., the percentage of full or part-time employed adults who have expressed being *somewhat or completely satisfied* with their jobs has ranged between 84 to 89 percent during the last twenty years while those expressing being *somewhat or completely dissatisfied* have ranged between 11 and 15 percent (Gallup Organization). Similarly, in other countries the majority of workers have also expressed being overall satisfied with their jobs. The results of the 1997 International Social Survey Program (ISSP) showed that the percentage of individuals (employees and self-employed) who expressed being *fairly, very or completely satisfied* with their job ranged from a low of 59.1% in Russia to a high of 89.9% in The Netherlands. In Cyprus, this percentage was 87.2. The percentage of those who expressed being *fairly, very or completely dissatisfied* ranged from a low of 2.5% in Cyprus to a high of 15.5% in Russia. When taking into account those who stated that they were *neither satisfied nor dissatisfied*, the percentage of those who did not express being satisfied with their work ranged from a low of 10.1% in The Netherlands to 41% in Russia. For the ISSP survey, job satisfaction was measured using a one-item global rating instrument. The ISSP survey results for a selected number of countries are shown in Table 1.

	<i>n</i>	<i>Percent of those Fairly, Very or Completely Satisfied</i>	<i>Percent of those Fairly, Very or Completely Dissatisfied</i>	<i>Percent of those who did not express being satisfied</i>
<i>Cyprus</i>	602	87.2	2.5	12.8
<i>Israel</i>	912	81.2	7.9	18.8
<i>France</i>	704	75.9	10.1	24.2
<i>Italy</i>	482	78.8	8.3	21.4
<i>Netherlands</i>	1175	89.9	4.0	10.1
<i>Portugal</i>	888	71.4	6.8	28.6
<i>Spain</i>	406	83.5	5.2	16.5
<i>Hungary</i>	625	62.2	8.2	37.8
<i>Czech Rep</i>	552	78.9	6.7	21.0
<i>Slovenia</i>	534	66.7	7.0	33.2
<i>Bulgaria</i>	477	78.4	8.6	21.6
<i>Russia</i>	859	59.1	15.5	41.0
<i>G. Britain</i>	571	78.9	11.0	21.3
<i>U.S.A.</i>	834	83.4	9.3	16.6
<i>Japan</i>	776	71.8	14.7	28.1

Table 1 - Levels of Job Satisfaction

Although the ISSP results suggest that the majority of workers are satisfied with their work, it is possible that the use of a global (one-item) instrument measure may have inflated job satisfaction levels (Oshagbemi, 1999). Moreover, the above results do not distinguish between employees and self-employed. The results of the ISSP survey did show that self-employed people were more satisfied with their jobs than employees. Thus, the proportion of *employees* who were satisfied was lower than the percentages presented in Table I. In addition, although the majority of respondents expressed satisfaction with their jobs, in certain countries a sizeable minority were not satisfied. For instance, in Israel, Italy, Bulgaria, the Czech Republic and Great Britain approximately one fifth were not satisfied with their job. However, in Cyprus the percentage of those not satisfied was only 12.8%. The findings of this study permit comparisons to be made to the ISSP's 1997 study thus enabling any trends to be identified.

Consequences and determinants of job satisfaction

Most studies have shown a negative relationship between job satisfaction and behavioral responses such as absenteeism and turnover (e.g. Cable and Parsons, 2001; Hellriegel and Slocum, 2004; Newstrom, 2006; Tepper, 2000; Sousa-Poza and Sousa-Poza, 2007; Thomas and Au, 2002), and a positive relationship between job satisfaction and organizational commitment, organizational citizenship behavior, customer satisfaction, and job performance (e.g. Judge *et al.*, 2001; Robbins and Judge, 2009; Susskind, *et al.*, 2003). Although not all absences and turnover are detrimental, evidence shows that absenteeism and high labor turnover are very costly for organizations (e.g. Hardy *et al.*, 2002; Hellriegel and Slocum, 2004; Lu, 1999; Robbins and Judge, 2009). Thus, organizations that are able to attain and maintain high levels of job satisfaction can

be more efficient and effective due to greater employee commitment, better service and performance, and lower costs associated with high absenteeism and turnover.

Although measuring job satisfaction levels is important, it is equally important for managers to determine the factors that may lead to job dissatisfaction. Research evidence shows that person-job fit, person-organization fit, genetic disposition and personality factors are correlated to job satisfaction levels (e.g. Dormann and Zapf, 2001; Judge and Bono, 2001; Judge *et al.*, 2002). The way that managers implement human resource practices has also been found to be significantly related to employees' work attitudes (Edgar and Geare, 2005). Therefore, the purpose of this study was to measure current job satisfaction levels in selected industries and to identify the job facet areas where employees are dissatisfied. The findings may help managers and other decision-makers address potential areas of concern thus helping their organizations to experience the positive attitudinal and behavioural outcomes that arise from improved job satisfaction levels. The results also allow comparisons to be made with the findings in other countries with respect to any possible demographic differences in job satisfaction levels.

METHODOLOGY

A cross-sectional, non-experimental methodological approach that involved hypothesis testing and descriptive statistics was used in this study. The research was carried out in noncontrived settings (Sekaran, 2003). A survey questionnaire was used to collect the information required for data analysis. This study investigated the following three research questions:

1. To what extent, if any, are employees in Cyprus overall satisfied with their jobs?
2. To what extent, if any, is there a statistically significant difference between the extrinsic and intrinsic job satisfaction levels?
3. To what extent, if any, is there a statistically significant difference in the job satisfaction levels of men and women?

Sampling Method

Specific industries were chosen to participate in this study because their work environments met certain criteria that were deemed important for this research. These included education, banking, electricity supply, telecommunications, the port authority, water supply, and sewerage and drainage. Therefore, purposive sampling was used to choose participant organizations for this study. This sampling approach allows the researcher to obtain information from specific types of people who meet the criteria set by the researcher and who can provide the desired information (Sekaran, 2003). One of this study's objectives was to determine the extent to which there is a difference between extrinsic and intrinsic job satisfaction levels. Therefore, it was necessary to select organizations in which employees experience adequate extrinsic factors such as convenient work hours/schedules, job security and good pay. In Cyprus, extrinsic job factors are prevalent in banking and educational institutions, and public sector organizations. Thus, the chosen participants were comprised of individuals working in primary, secondary and tertiary level (private and public) educational institutions, 17 branches of three large banks, six banking cooperative societies, the Cyprus Port Authority, the Cyprus Telecommunications Authorities

(CYTA), a local public Sewerage and Drainage Board, the Electric Authorities of Cyprus (EAC) and Water Boards in three towns.

Within all the participating organizations (except banking and educational institutions) simple random sampling was used by the organizations' contact persons to select employee participants. The selection of employees in financial and educational institutions was made using a nonprobabilistic convenience sampling method. This approach was necessary in choosing participants because a list of all the employees could not be obtained and thus not every employee in the respective sample populations had an equal chance of being selected.

Data Collection Methods

Having obtained permission from participating organizations' directors/managers, questionnaires were hand distributed to contact persons (mainly HR personnel or administrators) who gave reassurances that the questionnaires would be distributed to a randomly selected sample of employees. Each questionnaire was accompanied by an explanatory cover letter and a prepaid stamped envelope. Organizations were provided with survey collection boxes in which employees could drop their answered questionnaires. Alternatively, employees could mail their responses to the researcher using the prepaid stamped envelopes that accompanied the questionnaires. Participants were given 2 weeks to return their anonymously answered questionnaires. Most responses were obtained from the survey collection boxes.

Participating employees were asked to provide demographic information regarding their age group, educational level, job title, and income group level. Subjects' levels of job satisfaction with respect to 20 facets of work and work environments were measured using the Minnesota Satisfaction Questionnaire (MSQ) short form, a 20 item instrument that utilizes a 5-point Likert type scale response. This scale ranges from 1 to 5, where 1 = *I am very dissatisfied*, and 5 = *I am very satisfied*. The Minnesota Satisfaction Questionnaire provides a comprehensive, reliable and valid measurement of job satisfaction (Weiss *et al.*, 1967; Crake, 2003). High reliability coefficients have been recorded for the MSQ short-form. The MSQ's construct, concurrent, and content validities are supported by evidence in the Manual for the MSQ.

In contrast to other instruments that measure job satisfaction, the MSQ allows a researcher to potentially collect more information about which particular job aspects contribute to positive or negative work attitudes. Furthermore, the MSQ also produces two factor-based scores that distinguish between intrinsic and extrinsic satisfaction. A general (overall) job satisfaction score is obtained via a summation of the responses to the 20 job facet items (Weiss *et al.*, 1967).

Although there is evidence that single (global) measures of job satisfaction yield similar results to multiple-item measures (Robbins and Judge, 2009), the use of a multiple-item instrument makes it possible to relate job dissatisfaction to specific job aspects thus permitting managers to identify areas where corrective action can be taken to improve job satisfaction levels (Oshagbemi, 1999). For instance, two individuals may both experience low levels of job satisfaction as indicated by a global measure. However, a multiple-item measure of job satisfaction may show that one's dissatisfaction derives from perceived low pay whereas the

other person's dissatisfaction may be mainly due to a lack of perceived advancement opportunities.

Due to the existence of a number of measures of job satisfaction, researchers and managers face a dilemma in deciding which instrument to use. This decision is important as different instruments may yield different results (Crake, 2003). For instance, in his study of job satisfaction measures, Oshagbemi (1999) found that in comparison to results obtained using multiple-item measures, single-item measures overestimated the proportion of individuals satisfied with their jobs and greatly underestimated both the proportion of dissatisfied people and those who showed indifference. This should therefore be taken into account when interpreting findings regarding job satisfaction levels in surveys that have used single-item measures as is the case with the ISSP.

Data Analysis

Hypothesis testing and descriptive statistics were used to investigate the research questions. To investigate research question 1 (the extent to which employees in Cyprus are overall satisfied with their jobs), frequencies of overall job satisfaction ratings were calculated and a one sample *t* test on overall job satisfaction was conducted. The null hypothesis was that employees are neither satisfied nor dissatisfied overall with their jobs. To investigate research question 2 (the extent to which there is a statistically significant difference between the extrinsic and intrinsic job satisfaction levels of employees), the mean extrinsic and intrinsic facet-specific job satisfaction levels were calculated and a *t* test on the means was conducted. To investigate research question 3 (the extent to which there is a statistically significant difference between the job satisfaction levels of males and females), a two-independent-samples *t* test was conducted.

Limitations

As in any survey questionnaire, it is possible that the subjects answered questions incorrectly either because they did not fully or clearly understand them or because they were not willing to spend the necessary time to answer them carefully or seriously. In addition, despite the anonymous nature of the survey and reassurances of confidentiality, subjects may not have provided honest answers fearing that somehow their responses might be identified leaving them exposed to their managers. This is more likely to have occurred if a department had a small number of employees and/or the answered questionnaires were hand delivered to a particular person instead of being placed in the survey collection box. Moreover, participants may have responded to the job satisfaction questions in a way that reduced potential cognitive dissonance. Thus, individuals may have expressed satisfaction or avoided expressing dissatisfaction to avoid such dissonance. In addition, although the usable response rate of 36% was satisfactory, there is always the possibility that the non-participants differed from the survey subjects thus compromising the interpretation and generalizability of the results. Finally, the findings cannot be generalized to the whole population as participating organizations were not selected with a random probabilistic sampling method, and employees in educational and financial institutions were selected using a convenience sampling approach.

RESULTS

General (overall) job satisfaction

Table 2 shows the subjects' general (overall) job satisfaction levels for each of the five instrument ratings. Out of the 643 individuals who provided useable responses, 59 (9.2%) reported that overall they were *very satisfied* with their job. Another 392 respondents (61%) stated that they were overall *satisfied* with their jobs. Thus, a total of 451 (70.2%) reported being either overall *very satisfied* or *satisfied* with their job. However, 181 employees (28.1%) stated that they were *neither satisfied nor dissatisfied* and 11 respondents (1.7%) stated that they were overall *dissatisfied* with their jobs. No one reported being overall *very dissatisfied*. These results show that almost a third of those surveyed (29.8%) did not express being overall satisfied with their jobs.

<i>General (Overall) Job Satisfaction</i>	<i>Frequency</i>	<i>Percentage</i>	<i>Cumulative Percentage</i>
<i>Very dissatisfied</i>	0	0	0
<i>Dissatisfied</i>	11	1.7	1.7
<i>Neither dissatisfied nor satisfied</i>	181	28.1	29.8
<i>Satisfied</i>	392	61.0	90.8
<i>Very satisfied</i>	59	9.2	100.0
<i>Total</i>	643	100.0	

Table 2 - Frequencies of General Job Satisfaction Ratings

Table 3 shows the results of the one-sample t test on overall job satisfaction. The hypothetical population mean was assumed to be 3, i.e. individuals are neither satisfied nor dissatisfied overall with their jobs. The difference between the observed mean and hypothetical population mean was 0.66. The probability of observing a sample t value greater than +33.30 or less than -33.30 is less than 0.0005. The significance level is small ($p < 0.0005$) thus permitting the rejection of the null hypothesis that Cypriot employees are neither satisfied nor dissatisfied. Since the observed mean was 0.66 above the hypothesized population mean, the alternative hypothesis that Cypriot employees overall are satisfied with their jobs can be accepted.

Mean	Std. Dev.	Std. Error Mean	t	df	Significance (2-tailed)	Mean Differ.	95% Con. Interval of the Difference	
							Lower	Upper
3.66	.50	.02	33.30	642	.000	.662	.63	.70

Table 3- One-sample t test on overall job satisfaction

Facet-specific job satisfaction levels

Table 4 shows the mean ratings of the 20 MSQ job facet items. Subjects expressed being satisfied the most with the way their job provided for steady employment (mean = 4.27). Other job facets that subjects expressed being relatively more satisfied with were the chance to do things for other people (social service, mean = 4.09); the feeling of accomplishment they get from their job (achievement, mean = 3.90); the chance to do something that makes use of their abilities (ability utilization, mean = 3.89); and the chance to work alone on the job (independence, mean = 3.89). Subjects reported the least satisfaction with the chances for advancement on the job (promotion opportunities, mean = 3.00); the way their company's policies are put into practice (mean = 3.10); the praise they get for doing a good job (recognition, mean = 3.33); and the competence of their supervisors in making decisions (mean = 3.42).

(n = 643)	Mean	Std. Deviation
Steady employment	4.27	0.72
Social service	4.09	0.71
Achievement	3.90	0.88
Ability utilization	3.89	0.80
Independence	3.89	0.81
Moral values	3.88	0.83
Variety - Do different things	3.74	0.98
Activity - Keeping busy	3.74	0.85
Creativity - Using own methods	3.73	0.90
Being somebody	3.69	0.80
Working conditions	3.68	0.96
Responsibility	3.67	0.90
Coworkers	3.60	0.96
Authority	3.58	0.72
Pay related to work	3.56	0.99
Human relations supervision	3.46	1.02
Technical supervision	3.42	0.99
Recognition	3.33	0.98
Company policies & practices	3.10	0.88
Promotion opportunities	3.00	1.04

Table 4 - Hierarchy of Facet-specific Job Satisfaction Levels

Table 5 presents the frequencies and percentages of the subjects' 20 MSQ facet-specific satisfaction levels for each of the five satisfaction/dissatisfaction ratings. Fifty seven individuals (8.9%) stated that they were *very dissatisfied* with their chances for advancement on the job, and 32 individuals (5%) were *very dissatisfied* with the praise they received for doing a good job. On the other hand, two hundred fifty three (39.3%) stated that they were *very satisfied* with the way their job provided for steady employment, 181 (28.1%) with the chance to do things for other people and 152 (23.6%) with the feeling of accomplishment they got from their job.

Although the majority of subjects expressed being *satisfied* or *very satisfied* with 16 of the 20 measured job facets, there do appear to be some areas of concern. For instance, only 32.7% of the subjects expressed being *satisfied* or *very satisfied* with the way company policies are put into practice, and only 35.7% with the chances for advancement on the job. Less than half the subjects (47.1%) expressed being *satisfied* or *very satisfied* with the praise they get for doing a good job, and just over half with the chance to tell other people what to do (53%), the competence of their supervisors in making decisions (52.9%) and the way their boss handles subordinates (53.7%).

(n = 643) Job facets	Very dissatisfied		Dis-satisfied		Neither Dissatisfied nor satisfied		Satisfied		Very Satisfied	
	n	%	n	%	n	%	n	%	N	%

Table 5 - Frequencies of Facet-Specific Satisfaction Ratings. Notes: ^aAbility utilization. ^bCompany policies and practices.

Extrinsic and intrinsic job satisfaction

Researchers have differentiated between job factors with respect to whether an individual obtains satisfaction intrinsically by performing the job or extrinsically from some external source (Herzberg *et al.*, 1959). For most part there tends to be a consensus regarding the categorization of the job factors. However, certain variables (e.g. advancement opportunities, job security) have been viewed as extrinsic and intrinsic factors by different researchers in different studies (e.g. Herzberg *et al.*; Weiss *et al.*, 1967).

In this study, the following job facets are considered to contribute to extrinsic job satisfaction: supervision – human relations; supervision - technical; company policies and practices; compensation; working conditions; co-workers; and job security. The following facets are considered to contribute to intrinsic job satisfaction: activity, independence, variety; social status; moral values; social service; authority; ability utilization, responsibility; creativity; achievement; advancement; and recognition.

The mean facet-specific job satisfaction levels (that were presented in Table 4) are distinguished (in Table 6) according to whether they are considered as contributing to extrinsic or intrinsic job satisfaction. The highest levels of extrinsic job satisfaction arose from *job security*, *working conditions* and *coworkers*. The highest levels of intrinsic job satisfaction arose from *social service*, *achievement*, *ability utilization*, and *independence*. The mean for intrinsic job satisfaction was 3.70 slightly higher than that for extrinsic job satisfaction (3.58). The standard deviations for extrinsic job facets ranged from 0.72 for *job security* to 1.02 for *supervision - human relations*. The standard deviations for intrinsic facets ranged from 0.71 for *social service* to 1.04 for *advancement opportunities*. For both categories, the facet with the highest mean rating had the smallest standard deviation.

<i>n</i> = 643		
<u>Extrinsic</u>	Mean	SD
<i>Job security (Steady employment)</i>	4.27	0.72
<i>Working conditions</i>	3.68	0.96
<i>Coworkers</i>	3.60	0.96
<i>Monetary compensation</i>	3.56	0.99
<i>Supervision – Human relations</i>	3.46	1.02
<i>Supervision – Technical</i>	3.42	0.99
<i>Company policies & practices</i>	3.10	0.88
<i>Extrinsic Job Satisfaction Mean</i>	3.58	
<u>Intrinsic</u>		
<i>Social service</i>	4.09	0.71
<i>Achievement</i>	3.90	0.88
<i>Ability utilization</i>	3.89	0.80
<i>Independence</i>	3.89	0.81
<i>Moral values</i>	3.88	0.83
<i>Variety – Do different things</i>	3.74	0.98
<i>Activity – Keeping busy</i>	3.74	0.85
<i>Creativity – Using own methods</i>	3.73	0.90
<i>Social status – Being somebody</i>	3.69	0.80
<i>Responsibility</i>	3.67	0.90
<i>Authority</i>	3.58	0.72
<i>Recognition</i>	3.33	0.98
<i>Advancement opportunities</i>	3.00	1.04
<i>Intrinsic Job Satisfaction Mean</i>	3.70	

Table 6 - Extrinsic and Intrinsic Facet-Specific Job Satisfaction Levels

The results of a *t* test on the intrinsic and extrinsic job satisfaction means are shown in Table 7. The probability of observing a sample *t* value greater than +6.79 or less than -6.79 is less than

0.0005. The significance level is small ($p < 0.0005$) thus permitting the rejection of the null hypothesis that the average difference between the two means is 0. Hence, the subjects of the participating organizations obtain slightly more satisfaction from intrinsic job factors compared to extrinsic job factors. This finding was statistically significant at the 0.05 level.

Mean Difference	Std. Dev.	Std. Error Mean	95% Confidence Interval of the Difference		t	df	Sig. (2-tailed)
			Lower	Upper			
.11866	.44289	.01747	.08436	.15295	6.794	642	.000

Table 7 - T-test on intrinsic and extrinsic job satisfaction

Reliability of MSQ scales

Correlational analysis of the 20 MSQ items produced correlation coefficients that ranged from .09 for *authority* and *activity* to .73 between *human relations supervision* and *technical supervision*. Cronbach's Alpha was calculated to determine the internal consistency of the 20 MSQ scales. Cronbach's coefficient alpha indicates how well a set of items measure a single one-dimensional latent construct such as job satisfaction. High inter-item correlation coefficients suggest that the instrument is a good measure of the single one-dimensional latent construct (Crake, 2003; Sekaran, 2003).

Table 8 shows the results of the reliability analysis scale. The reliability coefficients ranged from a low of .879 for the *creativity*, *responsibility* and *human relations* scales to a high of .887 for the *job security* and *activity* scales. The general job satisfaction scale had a reliability coefficient of .88.

	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Squared Multiple Correlation	Cronbach's Alpha if Item Deleted
Activity - Keeping busy	69.50	94.79	.36	.22	.887
Independence	69.34	93.86	.45	.29	.884
Variety - Do different things	69.49	91.41	.49	.32	.883
Being somebody	69.54	92.69	.53	.38	.882
Human relations supervision	69.78	88.94	.60	.63	.879
Technical supervision	69.81	90.48	.53	.57	.882
Moral values	69.35	93.81	.44	.23	.884
Steady employment	68.97	96.21	.34	.24	.887
Social service	69.14	94.83	.45	.34	.884
Authority	69.65	95.70	.38	.28	.886
Ability utilization	69.34	92.64	.54	.39	.882
Company policies & practices	70.13	91.20	.57	.43	.880
Pay related to work	69.67	91.93	.46	.33	.884

Achievement	69.33	90.79	.59	.44	.880

Table 8 - Reliability Analysis of Job-Satisfaction Scale (Cronbach's Alpha).

Notes: Number of cases = 643. Statistics for scale: Mean = 73.23; Variance = 101.528; Stan. Dev. = 10.076; Variables = 20. Reliability Coefficients 20 items Alpha = .888. Cronbach's Alpha Based on Standardized Items = 0.887. (The Alpha coefficient is an estimate of the true alpha which is a lower bound for the true reliability.)

Gender differences in job satisfaction

Table 9 shows the results of the two-independent-samples *t* test that was conducted to determine if there is a statistically significant difference between the job satisfaction levels of men and women. The observed significance level for the Levene test is large therefore the null hypothesis that the two population variances are equal cannot be rejected. Thus, equal variances are assumed. Since the equal variance *t* test was used, the degrees of freedom are just the sum of the two sample sizes minus 2. The mean difference is .003. The observed two-tailed significance level is more than 0.05 ($p = .939$). Since the confidence interval includes the value of 0, the null hypothesis that the mean job satisfaction levels of females and males are equal cannot be rejected.

Gender		n	Mean	Std. Deviation	Std. Error Mean
Overall job	Female	376	3.6616	.50485	.02604
Satisfaction	Male	265	3.6585	.50185	.03083

	Levene's Test For Equality of Variances		t test for Equality of Means						
	F	Sig.	t	df	Sig. (2- tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference Lower Upper	
Equal variances assumed	.085	.77	.076	639	.939	.00308	.04039	-.076	.0824
Equal variances not assumed			.076	570.557	.939	.00308	.04035	-.076	.0823

Table 9 - test on mean job satisfaction levels of males and females

Note: Although responses were obtained from 643 employees, two respondents did not indicate their gender therefore for this t test n = 642.

CONCLUSIONS

One of the objectives of this study was to determine the extent to which employees in Cyprus are overall satisfied with their jobs. The results of this study indicate that the employees in the selected industries are overall satisfied with their jobs. However, the proportion of those who expressed some level of job satisfaction (70.2%) was lower than that found in the 1997 ISSP survey (87.2%). Thus, the percentage of this study's respondents (29.8%) who did not express overall job satisfaction was more than twice as large as that in 1997 (12.8%). This comparison however must be made having in mind that the participating organizations for this study were not randomly chosen and only employees but no self-employed individuals comprised the sample.

The second objective of this study was to determine the extent to which there is a significant difference between the extrinsic and intrinsic job satisfaction levels. The results indicate that this survey's subjects experienced a statistically significant higher level of intrinsic job satisfaction. When considering job satisfaction with respect to specific job facets, almost 40% of the respondents were *very satisfied* with the way their job provided for steady employment. This finding was not unexpected as one of the job characteristics of the participating organizations is that there is job security. However, approximately only a third of the respondents expressed some level of satisfaction with their perceived promotion opportunities and the way company policies are put into practice. Less than half were satisfied with the recognition they get for their

performance and only slightly more than half were happy with the competence of their supervisors and the way their superiors handle their subordinates.

The third objective was to determine the extent to which there is a significant difference in the job satisfaction levels of men and women. The results of this study did not show that a statistically significant difference exists between the job satisfaction levels of males and females. This finding is similar to that found by Jespen and Sheu (2003), Donohue and Heywood (2004), and Moyes *et al.* (2006). It does however contrast with other findings (e.g. Sousa-Poza and Henneberger, 2002).

MANAGERIAL IMPLICATIONS

The results of this study suggest that managers need to evaluate the way they handle their subordinates, and the way they put company policies into practice. Are the relatively low job satisfaction levels with respect to these job facets due to employees' perceived lack of fair treatment by their superiors? Is there a need for certain managers to improve their interpersonal and social skills? Given that just over half the respondents expressed satisfaction with the competence of their superiors, is there a need to improve supervisors and managers technical and managerial skills? Do subordinates feel that they know more than their superiors? If so, what implications might this have with respect to perceived fairness and motivation? According to equity theory of motivation, individuals' motivational levels are influenced by their perception of the extent to which they are treated fairly (Johns and Saks, 2005). Individuals compare, for instance, the rewards they receive in return for what they offer to their employer (e.g. effort, quality of work, loyalty, level of education and work experience). Perceived inequity may result in dissatisfaction that may in turn negatively affect motivation (Johns and Saks, 2005).

Moreover, the low proportion of those satisfied with the praise they get from their superiors for their work echoes a common phenomenon found in other studies (Robbins & Judge, 2009). Employees seem to value and have a need to receive praise for their work. Yet managers are not offering adequate recognition. Frederic Herzberg's two-factor theory posits that workers will experience job satisfaction when their job has or offers them intrinsic factors such as recognition, achievement, responsibility, advancement, growth, and an interesting work (Herzberg *et al.*, 1959). Studies have shown that recognition can be an important motivational tool (Caudron, 1995; Nelson, 1996). Compared to other methods used to motivate workers, recognition tends also to be less costly (Robbins and Judge, 2009).

Future research could be conducted in Cyprus to determine if the aforementioned findings generalize across other industries including the private sector. Research could be carried out to determine how important managers perceive recognition to be and whether they feel that they adequately recognize their subordinates' good performance. It may be that managers are purposely selective in the praise they give so that it is more meaningful. Alternatively, managers may be hesitant to praise their workers fearing that the latter will begin to slack off or expect pay rises that the organization cannot afford. Research can also be conducted to determine if the relatively high job satisfaction levels are associated with high levels of worker productivity, customer satisfaction, and organizational performance.

RECENT BANK BAILOUTS - LESSONS TO LEARN WHEN PATIENCE IS A VIRTUE

Mihai-Yiannaki, Simona¹

¹Ph.D., M.B.A., Affiliation : European University Cyprus- Laureate International Universities (EUC), 6 Diogenes, Street, Engomi, Nicosia, 1516, P.O. Box: 22006, Cyprus

Purpose: Most recent bank bailouts from financial and economic perspective turn to be politicized. This paper frames ten effective implications/lessons of the most recent bank bailouts of 2007-2009 in the Western economy model when analyzing actual shareholders' value retrenchment or growth opportunities.

Design/methodology/approach: Use of literature review and re-conceptualised framework of event study methodology. Secondary data analysis of qualitative and quantitative information.

Findings: Recent bank bailouts relate to: global bailout interconnections, economic downturn and liquidity boost, abnormal returns, efficiency recovery, evade social costs, new opportunities for M&A, new risk management applications, opportunistic investors and eventually patience. Some findings recommend shareholders to grasp opportunities for bargains from bailout banks as well as still harvest their existing investments. At the same time economic education and control becomes another important solution.

Research limitations/implications: Consequently, as the paper targets most recent bailouts, a still ongoing event, there is a need for extended financial data that could enhance some cause-related solutions after economic recovery.

Practical implications: The practicality of the paper refers to guiding management of both government and financial institutions on the choice for reasoning bank bailouts, providing some critical thinking views to investors as well as academics.

Originality/value: There has not yet been written research or studies on the most recent financial crises bailouts, due to the process continuation. The novelty of the paper's resides not in calculating ratios and interpreting them, but rather to looking more into some interesting strategic moves used to boost shareholders' value.

Paper classification: Conceptual paper

Key words: shareholders' value, bank bailout, bank consolidation, M&As, financial crisis, social corporate responsibility

INTRODUCTION AND METHODOLOGICAL REASONING:

Bank bailout main theoretical motive

Bank bailouts are happening in various cases, some relate to real financial opportunities to save a "too big to fail institution". Others, (Stern and Feldman, 2003) look upon the perceived growing concern of the moral hazard, for which there is a need for a bailout in the first place.

If we revisit to the main stream of motives for which bank bailouts occur, we identify a common denominator: moral hazard, a spinout of information asymmetries in the financial market that lead most of the time to the so called principal – agent problem. This relates simply to a conflict of interests at least on two different levels: the principal- usually the government in this case, and the agent- the lending institutions or the banks in general.

An interesting combination of facts is mirrored in the concept of systemic moral hazard, which transmits a unique dispute in regulatory responses. The argument lies in that the most appropriate response to systemic moral hazard is "preventive prediction." (Okamoto, 2008). It is essentially difficult to reward individuals for producing preventive prediction. Therefore markets fail to produce it at optimal levels, and thus prevent systemic moral hazard and the kind of crisis we are facing.

Some may say that managers should look for prosperity without 'hurting' their customers or principals again, by secluding or keeping away information. And all this is encouraged as the principal cannot perfectly monitor the agent. Therefore, one of the causes of these financial crises and therefore of the bailouts resides in *lack of proper supervision and monitoring* and not the business pattern.

Since we could see many other banks succeeding in securitisation and lending activities, as well as in keeping their depositors satisfied, while others do not, it becomes simplistic to assume that their long term strategies are wrong. Banks need to take risks through lending, and the rule is the riskiest loans could yield highest returns. A moral hazard appears if banks make risky loans thinking that they that will repay nicely in good conditions. Yet, these banks will not be liable for any loss if their transactions collapse. Thus, such banks keep the profits but will dispose of social costs. During the years, taxpayers, depositors, and creditors have always been in the tragic situation of compensating for the losses made by the banks' risky financial decisions. This is because they partner in one way or another with them at various stages of their lifetime.

Bank bailouts by governments, central banks or other institutions can drag on risky lending in the future, if those that take the risks become "bullet proof "in front of potential losses. It appears that a central bank, by announcing and committing *ex-ante* to a bailout policy that is reliant on the recognition of certain states of nature (such as an adverse macroeconomic shock incident), creates a risk-reducing "value effect" that more than compensates for the moral hazard component of the policy (Cordella and Levy-Yeyati, 2003).

Of course, there are other causes. One can argue that the government can efficiently provide liquidity except when too much liquidity asks for inflationary pressure; it can protect the currency when eroded by lack of confidence and high deficit. In this situation the banks get hurt in their funding costs, while this ruins depositors' confidence in both safety and liquidity at the same time. Yet, most often history is forgotten and confidence is reestablished slowly through gaining higher yields again for the banks' customers or by other various rewards (as we would see in the cases analysed in this paper).

In terms of methodology used for this paper, the main source of information is based on event study analysis during 2007-2009 in U.S. and Western European markets as to the evolution of the bailed out banks as to their strategies and share prices. This method provides the paper useful information that can be correlated with the secondary data gathered on bailout literature review as well as on the current bailout banks' strategic analysis. Bank reports and tertiary analyses were interpreted in order to find the correlation with the literature review as the events unfolded.

LITERATURE REVIEW AND THE PAPER FRAMEWORK

This section of the paper displays under a literature review format the author's suggested lessons from bank bailouts, as they are presented through secondary data analysis and event methodology. Of these lessons, some may interact with each other, while other will stand alone. The table below shows the ten pinpointed lessons their essence. This will facilitate following the paper's recommendation and conclusions.

<i>Lesson No</i>	<i>Related to</i>	<i>Lesson Learned</i>
1	<i>The electorate's creeping confidence</i>	<i>There is no need for bailout if it deepens financial crisis eventually through lack of confidence.</i>
2	<i>Too-big-to-fail rule vs. Too-many-to-fail rule</i>	<i>In contrast to the too-big-to-fail problem of the large banks, the too-many-to-fail problem affects small banks more by giving them stronger incentives to usher.</i>
3	<i>M&As vs. hidden bailouts</i>	<i>Non-distressed mergers may be motivated by the desire to prevent bailouts. Bank consolidation may be eligible for bailouts, but the non-banks may line up for M&As.</i>
4	<i>Hijacking the guilty bank</i>	<i>Either government protective schemes or imprudent banking practices make the "guilty bank" sensitive to takeovers.</i>
5	<i>The equality issue and the cultural – innovation clash</i>	<i>Innovation goes with banking anytime, but its constructive nature depends on the cultural lens in viewing equality issues</i>
6	<i>Who to save first</i>	<i>Bailouts cannot be ethically justified because the losers exceed the winners. Taxpayers seem to be the main concern, but corporations are first.</i>
7	<i>The long term perspective of the social costs</i>	<i>Bailout targets eventually fail, due to government favoring underperforming public firms, thus increasing social costs.</i>
8	<i>The grape-vine effect</i>	<i>The banking crisis in a country leads creditors to reexamine policymakers' willingness to bailouts in other countries.</i>
9	<i>Bank pricing strategies</i>	<i>Higher prices spring everywhere since regulators suffer an opportunity cost of capital from not receiving any earnings from bank sales or liquidation on short term.</i>
10	<i>Bailout recuperation time-and investors 'money-loop</i>	<i>The bank can repay its debt when it's stable enough to fulfill capital requirements, so when the bank starts repaying substantially the state is viewed by investors as a sign of strength, no matter the depth of the financial aid allocated per GDP.</i>

Table 1. *The ten lessons of bank bailouts (Source: author's analysis)*

1st Lesson (The electorate's creeping confidence)

Bank solvency crises are due to macroeconomic shocks in a model where government is prone to bailout because of cronyism (Vaugirard, 2007). When we transact in a multi-globalised economy or overwhelmingly 'foreign-ised', with so many interdependencies, anyone may think of the citizens' rights to dismiss the government and rule against its decision if they believe that a bailout is not justified. Thus, both political and banks' balance sheet uncertainties enlarge the set of factors for which a banking crisis occurs and may increase financial instability. Politico-financial crises may stem from foreign lenders' loss of confidence rather than liquidity issues or lending incapacity. *There is no need for bailout if it deepens financial crisis eventually through lack of confidence.*

There are also cases where money from the bailout went to purchase another bank or bailout money went to CEO's bonuses or parties (end of the year), and this should be only the less tough part of the story.

2nd Lesson (Too-big-to-fail rule vs. Too-many-to-fail rule)

Too-many-to-fail problem happens when the number of bank failures is quite large, the regulator finds it *ex-post* optimal to bailout some or all failed banks. When the number of bank failures is rather small, failed banks can be acquired by the stronger more protective banks. This could give the industry some incentives to regroup and increases the risk that many banks may fail together at a later stage. The *ex-post* optimal regulation may thus be time-inconsistent or sub-optimal from an *ex-ante* standpoint (Acharya and Yorulmazer, 2007).

In contrast to the too-big-to-fail problem which mainly affects large banks, it is interesting to show that the *too-many-to-fail* problem affects small banks more by giving them stronger incentives to usher. We may add here that the actual match between the banks, when these merge or get acquired should also be analysed from this perspective. There is the perception that failing banks can be saved by mergers with healthy banks, yet the theory and practice shows how the new merged bank has higher chances of failure than the actual saved by merger bank (Shih, 1999).

This is due to the fact that motives of M&A could lead sometimes to the success or failure of the new bank (Mihai Yiannaki, 2007). In this sense, there seems to be many other banks and industries looking at how they will ensure post-merger or acquisition integration success. That is to say that no decisions will be made till the climate is more favorable.

3rd Lesson (M&As vs. hidden bailouts)

On the same line of thought, most bank merger studies do not account for hidden bailouts, which may lead to biased results. In a study that employed a unique data set of approximately 1000 mergers to analyze the determinants of bank mergers (Koetter *et al.*, 2007), the authors used undisclosed information on banks' regulatory intervention history to distinguish between distressed and non-distressed mergers. Among merging banks, they found that improving financial profiles lower the likelihood of distressed mergers more than the likelihood of non-distressed mergers. The likelihood to acquire a bank is also reduced but less than the probability

to be acquired. Both distressed and non-distressed mergers have poorer CAMEL profiles than non-merging banks.

Therefore in terms of observing regulations, the bank consolidation in the asset management industry is set to intensify as overruling the law and the client demands for independence and force banks to skim off their funding arms. And, since the investment management industry is in early days of consolidation, it seems that this trend is in place for a while and that is around independence. The rate of growth of the independents has been double that of the banks. The reason for it is the increasingly difficulty of a bank to have a top-tier position in institutional investment banking and in institutional investment management.

It is interesting to notice then that non-distressed mergers may be motivated by the desire to pre-empt serious future financial distress and prevent regulatory intervention, such as bailouts.

4th Lesson (Hijack the guilty bank)

Once Japan got into a crony bank system failure after the 1990's, it had successive government laws backing guarantee schemes for commercial banks deposits, method viewed as an excessive example of encouraging imprudent banking practices, misallocating financial resources and prolonging structural weaknesses (Stern and Feldman, 2003).

Across the Ocean, a different extreme, all the major investment banks, Bear Stearns, Lehman Bros, Merrill Lynch, Goldman and Sachs, Morgan Stanley, etc. were they essentially wrong? Their core business relied on easy access to credit, and when one of their main "assets" (mortgage backed securities) posed danger to the stakeholders, they suddenly became less valuable in securing their own loans. Without sufficient business to run they became really bankrupt. *Hence, are they all to be treated equally in the eye of the regulators when it comes to doing the same mistake to get bailed out?*

The latest "capital injection" plan of the U.S. is less bound to the fundamental problems of the bailouts, as is just a short run "shock buffer" aimed at reducing volatility and reinstalling investors' confidence. Whether it can do so without addressing the real problems is not clear (Congleton, 2008). *Then, are the bank bailouts really addressing the same problem? Where is the equality and equity stake placed and then where has the difference gone?*

5th Lesson (The equality issue and the cultural –innovation clash)

Coming back to the social issue of equality, and pinching on "cultural issues", each country puts in practice its own bailout system depending on the structural problems of their banks gridlock. Following the 3rd Lesson we can identify by logic that there are apparently three types of bailouts:

1. one done by the state for the simple and untranslatable reason "too big to fail"
2. one preformed by the private sector through M&A or bank consolidation
3. one done for the "people we know"

“These days even with Alan Greenspan admitting that he was wrong to believe that the financial industry could regulate itself, Reaganesque rhetoric about the magic of market place and the evils of government intervention sounds ridiculous” (Paul Krugman, 2008).

Is it then safe to just trust the government bailouts, thinking they will keep their promises as not to use taxpayers' money to refill the loss too soon? And by the way, where do they record this loss and how do they keep track of it? How deep can we look at the abyss if we are let to do so? Then, when are we going to pay for this loss and at what extent and with what types of costs? Many of the ABS (asset based securities) and mortgages have not yet been withdrawn from the market, still. New innovation in this financial intermediation is therefore needed and new solutions can come up from the market to stop the loss. *Then, how much innovation can we let in the market and who is to decide its constructive nature?*

6th Lesson (Who to save first?)

Discussing about solutions, recent academic research (Murphy, 2008) implies ways out to this recent crisis that are considered to be far less costly than a bailout of investors who made poor financial decisions with respect to credit analysis. But if we play on who is to blame, then we shall reach no positive ending soon enough. However, it becomes necessary to learn who are the winners and the losers? Utilitarian analysis concludes that bailouts cannot be ethically justified because the losers exceed the winners (McGee, 2008). Applying rights theory, Mc Gee reaches the same conclusion for different reasons.

Thus, the emergency legislation for spending \$1.5 trillion on purchasing financial firms' troubled assets to address the current financial crisis, also suggests a superior alternative (Bebchuk, 2008) for achieving the two goals of the proposed legislation:

1. restoring stability to the financial markets and
2. protecting taxpayers and especially the sub-prime borrowers, but these are not ethically interconnected.

So where does ethics and social corporate responsibility come in? To see these results now lets have a look at the 2008 fall's injection of trillions of dollars of federal money into the rehabilitation of the U.S. financial system. Also, all recent efforts by lending institutions and government sponsored agencies have failed to arrest the ruthless climb in foreclosures. Rather, little has been spent to the easing of home foreclosures.

7th Lesson (The long term perspective of the social costs)

Governments in the E.U. do often bail out firms in distress by granting state aid. Data from 86 cases during the years 1995-2003 (Glowicka, 2006) addressed two issues: the impact of bailouts on bankruptcy probability and the determinants of bailout policy. There are some interesting results that require attention:

1. First, the estimated discrete-time hazard rate increases during the first four years after the subsidy and drops after that, suggesting that some bailouts only delayed exit instead of preventing it. The number of failing bailouts could be reduced if European control was tougher.

2. Second, governments' bailout decisions favoured public firms, even though public firms did not outperform private ones in the survival chances.
3. Third, subsidy choice is an endogenous variable in the analysis of the hazard rate. Treating it as exogenous underestimates its impact on the bankruptcy probability.

We would conclude on this issue with a question: What if private banks act like public firms, will the bailout still be in use? *Could it actually provide increased consumer satisfaction and less social costs in the long run?*

8th Lesson (The grape-vine effect)

Policymakers choose whether to rescue failing banking systems by weighing the previous lesson's social costs of crises against the costs associated with raising taxes to finance bailouts. They are the only ones who can appraise those social costs of bank liquidation.

In this scenario, financial crises may result from the public's self-fulfilling prophecies about equilibrium outcomes, as lenders' expectations impinge on the taxation cost of bailouts.

The lesson shows that a *banking crisis in a country leads creditors to reexamine policymakers' willingness to bailouts in other countries*, which eventually makes their banks more vulnerable to self-confirming depositors' runs (Vaugirard, 2005). This can be approximated to the effect of the American bank bailout announcing on the UK and other E.U. countries bailing out their distressed banks.

9th Lesson (Bank pricing strategies)

Bank customers benefit fully from *higher loan interest rates* (Ecomomist.com, 2008) to cover abnormal returns (Yoroulmazer, 2008) in post bailout activity. This move reflects the actual market and not the forced Central Banks' frequent reduction of inter-banking interest rates, created for liquidity and lending boosting.

One can notice that, all recently bailout banks in U.K. utilize higher loan interest rates compared to non-bailout banks. At the same time once a bailout is announced, the other banks in the respective market follow a certain degree of abnormal returns in their share price, but also modifications of their balance sheet structure, that can direct them to undertake more speculative actions for their rehabilitation. Such events though may disturb the equilibrium of those healthy banks. In time, such confidence erosion may bring further problems to the already bailout banks.

The higher the propagation effect to the banking sector, the more severe the healthy banks get affected, should the bailout banks be largely linked through wholesale funding to other local financial institutions (Bank of England, 2007). Another cause for high new interest rates charging customers, despite their temporary character is due to market forces remedy and is correlated to the fact that bailouts are also costly in the model. This is so since the regulators suffer an opportunity cost of capital from not receiving any earnings from bank sales or liquidations. (Acharya and Yoroulamzer, 2007).

10th Lesson (Bailout recuperation time-and investors' money-loop)

Soft budget constraint (SBC) is actually a commitment issue in an economic system.

Modern studies focus on the transitional economies, "lack of financial disciplines in the state sector" (Kornai, 1980, 1992). The unenforceable bankruptcy threats, as well as various subsidies, credits, and price-supports, etc., cause this lack of discipline, recognized by Kornai (1980).

There are some other explanations of the soft budget constraint (Shleifer and Vishny, 1994) which are related to the politics: the reason that a government bails out a firm or a bank comes from the fact that the political price of permitting bankruptcy is too high. Government ownership in a bank at this point seems to be a disadvantage when attracting and retaining good customers and employees. But, in a banking system, the central bank will not just let the local banks go to bankruptcy and then she has to deal with systematical financial crisis.

In any case, the central bank would like to rescue those local banks which are suffering from a huge amount of bad loans, when there is also a prospect that the bank will repay sooner the financial support. This are the cases of USB in Switzerland (Simmons J., Logutenkova E. (2009), RBS and Lloyds in U.K (Mail Online, 2009). and other 10 banks in the U.S. The US Treasury announced that 10 banks had been cleared to repay Government aid because they had raised sufficient capital (Hudson and Judge, 2009).

Yet, thinking of the 5th lesson, a responsible or sustainable way in bailout repayment means that *the bank can repay mandatory convertible bonds or buy-back shares when it's stable enough to fulfill capital requirements*. In this respect it is noticeable to see how the bank that repays the state is viewed by investors as a sign of strength, no matter the depth of the financial aid allocated per GDP. And, indeed, just let's have a look at the total costs these bailouts weigh in the various economies over the years:

I. Latin America 1980s:	
	Argentina 13%
	Chile 20%
II. Mexico 1994-5: 15-20%	
III. East Asia 1997-98:	
	Thailand 42%
	Indonesia 36%
	Korea 20%
	Malaysia 21%
III. The US banking crisis: 2007-2010*	USA: 60%- no .1 GDP provider in the world
(2009/2010)	UK:46% - top 6 GDP provider in the world

Table 2. Banking Sector Bailout Cost/GDP (Sources: Ricardo Hausmann and Liliana Rojas-Suarez, eds., *Banking Crises in Latin America*, 1996; Deutsche Bank Research, *Global Emerging Markets*, December 1998, and author

analysis and estimates 2007-2010.) *But, Western Economies (U.S. Canada and Europe) fell off in World's GDP from 52% to 49.5% during 2008-2009.

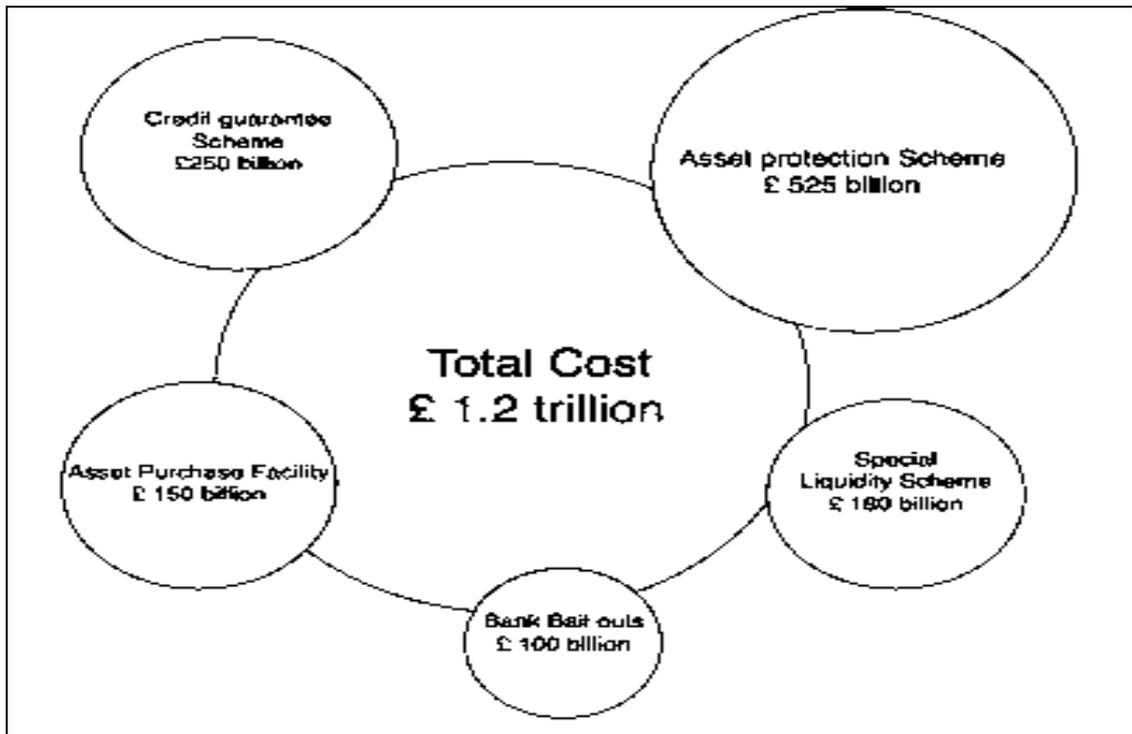

Fig. 1. UK bailout costs in total GDP year 2009. Sources: Ricardo Hausmann and Liliana Rojas-Suarez, eds., *Banking Crises in Latin America*, 1996; Deutsche Bank Research, *Global Emerging Markets*, December 1998.

Then, once emerging economies bounce back more rapidly than mature economies, we can foresee a shorter timeframe for this financial crisis, despite its stretching and depth.

RECOMMENDATIONS TO INCREASE SHAREHOLDERS' VALUE

Each single lesson presented tries to raise a signal on why to keep, when to sell, where to buy shares in the banking industry and which aspects of this industry were most dynamic during the financial crisis. Along with the possible outcomes of bailouts, there is a chance to be able to identify good bailout deals that can eventually be a sound source of profit for investors.

Thereby, a banking institution bailout it does not mean it overlaps with a negative connotation for investors or existing shareholders. Should it turn out that the bank is a new potential target for cash holders and opportunistic investors, the issue is then to protect eventually these organisations from predatory takeovers. In the anticipation of such actions it is not totally mistaken treating bailouts as takeovers which miss the pre-merger or pre-acquisition phase, let alone the integration phase.

Specifically, each potential or existing bank shareholder that is aware of these bailout lessons could take advantage in trying to identify her/his target and compare other options in the market.

In order to optimise their portfolio profitability and safety, investors should act on certain moves at each stage of the bailout as it follows:

1. bailout environment (legislation background, socio-economic connotations to the public, fraud related perceptions and management abuse systems, at the base of building trust and rapport with locals);
2. bailout announcement (lack of pre-bailout information could harm the transaction afterwards), it has to be in line with a clear vision of the future bank strategy and focused on an appropriate time horizon with resilience on short term pressures;
3. bailout procedure understanding (cash vs. bond issuance or guarantee provision);
4. bailout financial commitment (both the government and the banks' commitment in redressing the financial institution, i.e maintaining the private decentralised decision making through professional teams expertise of the both parties involved);
5. bailout managerial board nomination (in case of board change or dismissals) and keep directors independence;
6. identification of the new bailout bank customer base (clientele refocus);
7. bailout strategy rethink (should be analysed and disclosed in a transparent way for feedback purposes as well, also leave room for innovation capabilities to develop that are investment cycle dependent and improve lending practices standards) ;
8. new bank share price recalculation and company revaluation (market flotation and control of rumor selling), analyse short term trading, but pay attention on long term position taking.

Possible Scenarios

The Bank has authorization from its investors to increase its share capital by as much as “x” percent, which wouldn’t allow The Bank to repay the state in full at the current price. Under other scenarios, the government could convert the bonds into shares and sell them on the market, or find investors to buy the mandatory convertible notes. “It would certainly be right for the state to get out from this investment,” “In global business, we still see a lot of insecurity among employees at The Bank as long as the state is involved.”

The Bank’s Tier 1 capital ratio, a gauge of the bank’s ability to absorb losses, stood at 10.5 percent at the end of the first quarter, compared with 14.1 percent its competitor, which declined government assistance. By converting bonds while The Bank trades at or below the minimum conversion price of 18.21, the government would get the highest amount of shares.

The government would have to sell shares at a minimum of about 12.5 to recoup its investment, taking into account interest payments on the bond, according to calculations based on terms of the deal. The state is entitled to receive interest payments of about 750 million per year until the notes mature in June 2011, regardless of the timing of the conversion.

1. Nevertheless, investors could keep track of the market moves and rumors under Efficient Market Hypothesis (Fama and French, 1970). They may also foresee the share prices Random Walk (Burton, 1973), despite the close probability of Irrational Exuberance (Burton, 2000) in pricing.
2. Yet, some studies have attributed this forecastability to the tendency of stock market prices to “overreact.” DeBondt and Thaler (1985), for example, argue that investors are subject to waves of optimism and pessimism that cause prices to deviate systematically from their fundamental values and later to exhibit mean reversion. They suggest that such overreaction to past events is consistent with the behavioral decision theory of Kahneman and Tversky (1979), where investors are systematically overconfident in their ability to forecast either future stock prices or future corporate earnings.
3. These findings give some support to investment techniques that rest on a “contrarian” strategy, which is, buying the stocks/groups of stocks, that have been out of favour for long periods of time and eluding those stocks that have had large run-ups in the past.
4. When the bailout banks come back in the market, due to governmental economic support and bailout massive schemes, investors tend to trust the bailout firm based on its behaviour prior to the financial crisis rather than the capital input. Thus, shareholders could experience sudden share price augmentation just before the payback of the bailout and other *opportunistic investors could enter the equation, so beware of the bad wolf.*

5. For example, what it is noticeable two and a half years after the beginning of the financial crisis is that a few countries from the Arab Golf (Qatar, UAE, Saudi Arabia), most of them US "partners" support through either government or private equity firms cash injections in the U.S as well as in other E.U. feasible target financial institutions (Reuters, 2009).
6. Higher global credit crisis was exacerbated by excessive complexity of structural credit products (which will resume their demand sooner or later, as complex solutions to investors and risk management problems are always in need, no matter the effort and skills required to analyse and resolve them. Just like junk bonds came back from the crisis of the '80s, we will have the same effect on securitization. New bills will be issued even it will have to be under a simpler securitization form or a more complex one later on. Eventually, a long term solution related to the banking systems is improving risk management techniques through tighter regulation and supervision of risk control mechanisms, providing structured products transparency, while foreseeing the next move in these banks' financial strategy (Mihai Yiannaki, 2008). Innovation and creativity remains a key ingredient as long as it is explained and understood by everyone.
7. However, such regulations should not discriminate between banks, hedge funds and other alternative investment market players in the financial sector. Such a flaw could ruin the other financial intermediaries' competitive power, while redistributing it to banks.

CONCLUSIONS

Why do governments bail out banking systems in distress? There is possible for the central banks to supply liquidity by issuing government securities backed by tax revenue and at the same time to pay attention to the follow up of the situation as well as the redress of the main cause of the bailout (i.e. the financial crisis).

As for the regulators and governments, there is no bigger mistake than to bail out a 'too big to fail bank' neglecting all combined efforts from the industry to help the public cope with social costs or overlooking the social corporate responsibility. There is not much banks can do to stay away from bailouts in financial crisis anyway, just to stay focused on their environment rebuilding while participating to it, focusing on retail banking, with limited investment banking operations, and lean on a long-buoyant domestic market.

At the same time a large alternative and hedge funds market will replace the trust given to banks, but in a less regulated environment as well. Most likely, due to still fierce competition, such funds will be further regulated in their detriment (as they are not a bailout target), but for customer/investor's benefit.

However, bailed institutions, healthy banks and other financial institutions together with the government should carefully resume the monitoring and the reestablishing of the bank supervision at least as per already existing international standards and agreements such as Basel II Accord or the Credit Directives in the E.U. Specifically, the element of control becomes the

wheel when navigating in murky waters while re-analysing all costs incurred, not just book losses, and it should advance the solution to a positive upturn.

Eventually, it is the customer who is affected and has to pay much more not only in terms of tax, but also for obtaining loans from bailout institutions at higher costs, apart from often having restricted access to such products. Not only the customer is a key element in re-establishing share prices through indirect payments, but also by restoring her/his confidence and trust in the banking organization, if not in the whole banking system.

Hence, the investor or even any common customer would be now the most interested in not having bank bailouts in the economy at a first glance, but in time, it proves that bailouts are not that bad if one can provide a sound economic education to the two categories. Eventually, bailout banks can yield investors acceptable returns as soon as, or if the bailout mechanism pays back.

It is important to clearly mention that it would be useful in near future to apply this paper's framework to more aspects in banking, to a larger panel of banks across the Globe as well as on a longer period. In terms of bank performance, the author continues her research by preparing another paper on bank efficiency after the recent credit crunch.

In the next study, there are other financial aspects considered in a comparative relation between healthy banks and bailed out banks whose shares were/are listed. This new paper aims at identifying through financial data analysis first the reasons behind the financial crisis, secondly the bailout need and last but not least the main triggers that made some banks more bailout dependent than others. Such a study will close the loop in the lessons learnt from recent bailouts and it is related to bailouts' ultimate effects related to banks' financial standing.

PROMOTIONAL TOOLS IN HIGHER EDUCATION: THE CASE OF PRIVATE UNIVERSITIES IN CYPRUS

Morphitou, Ria¹; Louca, Soula²

¹*University of Nicosia, 46 Makedonitissas Ave., P.O. Box 24005, 1700 Nicosia, Cyprus*

²*University of Nicosia*

Cyprus's higher education system is in transition and the role of the private higher education sector is under review. These internal changes are intended to market Cyprus's educational system more competitively. Our argument is presented in three stages; an initial exploration of the tertiary education market of Cyprus, then a consideration of educational promotional tools and the literature relevant to Cyprus. Finally we comment on the impact this analysis could have on the development of a promotional plan for Private Universities.

Key Words

Promotion, Advertising, Public Relations, Word of Mouth

INTRODUCTION

The operationalisation of marketing in Cyprus's private tertiary education system as 'increasing student numbers' is problematic from both an educationalist's and a marketer's perspective. Although the USA has embraced a specific professional stance as 'enrollment management' and the UK has taken a broader marketing orientation that clearly embraces recruitment neither has adopted a crude sales orientation approach which we detect in Cyprus. These different perspectives lead to differences in implementation for both domestic and international recruitment.

Cyprus's private higher education sector – influenced by both of these international traditions – is facing new challenges in terms of domestic demand, the need to increase international student recruitment, pressure of EU harmonization and the realization of the potential growth due to its geo-political location. This paper uses these insights on the readiness of private higher educational institutions to exploit national and regional markets as Cyprus seeks to become a regional centre of educational excellence. We find the sales orientation is unlikely to build a sustainable future but that it is maintained by short-term institutional goals and inappropriate government policies if growth is their objective.

Our argument is presented in three stages; an initial exploration of the tertiary education market of Cyprus, then a consideration of educational promotional tools and the literature relevant to Cyprus. Finally we comment on the impact this analysis could have on the development of a promotional plan for Private Universities.

We will not be making the case for private versus public institutions in this paper but we follow Zumeta's assessment that nonprofit higher education "is a valuable to the nation" (1992:363) when referring to the USA.

RESEARCH METHODOLOGY

Initially, to capture the domain of the constructs in the research model the authors carried out an extensive literature search on the research issue. Then we performed an exploratory study, in-depth personal interviews with 20 students. The pilot study was performed in an effort to identify the major promotional issues that affect student selection in Tertiary Education. The full scale data collection was performed through a personal survey.

The findings are based on a small-scale survey of 460 students from different nationalities responded to a questionnaire distributed at two privately owned, English speaking institutions in the republic of Cyprus and two in the North site. Students were taking Marketing courses as part of their undergraduate degrees. The questionnaire consisted of both open and close ended questions and in some cases 5 point Likert scales were used as well. A non-probability sampling method was used. The students were surveyed in classrooms as part of the research team teaching schedule. The respondents voluntarily participated with no pressure, penalty or reward used for those who did or did not wish to do so. The data was analyzed using the SPSS package.

THE CYPRUS SITUATION

Cypriots like or at least attend higher education. The demand for higher education has risen considerably over the last 20 years and at present over 60% of all secondary school leavers continue in post-secondary education (Department of Statistics and Research, 1999). This figure is based on a 130% increase in student numbers in tertiary education from 1970/1971 to 1998/1999. This demand has led to the development of an effective private sector which, since the 1970s has had more students than the public sector, mainly in vocational provision (Koyzis, 1989). This has led to special measures introduced in 1987 to accredit private institutions, which has produced the recognition of higher education programs by the government of Cyprus which eventually led to the . The number of places offered by the University of Cyprus and the Public Tertiary Education Institutions of Cyprus and the Technological Education Institutes of Greece has increased in line with qualified demand maintaining an access of supply.

The trend in distribution of students in Cypriot institutions compared to overseas has changed with rapid domestic growth between 1980/1982 and 1990/1991 with corresponding numbers dropping in foreign universities and a reversal in this trend since 1996/1997. (Where the drop seems particularly dramatic is in the number going to Greek universities down from 13% between 1999 and 2000 to only 3% during 2001). The main beneficiary of Cypriots studying abroad is the UK with demand in the USA static and other destinations declining. The most popular discipline is business administration with engineering, medicine and social studies the next most popular.

The Greek Cypriot desire for higher education seems to be as much driven by intrinsic desires for higher studies as well as an instrumentality of employability (Menon 1997). This has led to a mismatch of graduate skills with labour needs, resulting in an oversupply of graduates. This in itself raises the central issue of educational planning of the marketing of alternative routes to

employment other than higher education. This demand management of the Cypriot educational market is too complex to be considered here.

The current structure of higher education is summarized in the Government booklet, 'Higher Education in Cyprus'. The central role is given to the Department of Higher and Tertiary Education within the Ministry of Education and Culture. This Department covers registration, supervision and accreditation of all the private institutions and certain aspects of the University of Cyprus and in association with appropriate other ministries the seven public institutions of non-university higher education. As Koyzis (1997) indicates, European accession and the inevitable harmonization within the European *aquis communautaire* will mean that the higher education sector will have to examine these realities, which may result in repositioning the roles of the public and the private providers. Already two new universities, a technical and an open university, have been approved by the government and accreditation criteria have been devised to turn some of the existing private institutions into universities.

LITERATURE REVIEW ON EFFECTIVE PROMOTIONAL PLANS FOR TERTIARY EDUCATION

In his essay, "Cap, Gown, Mouse," Curry (2003) reports that, "The number of people seeking higher education worldwide has grown exponentially in recent years, rising from 13 million in 1960 to 65 million in 1991. It's projected to hit 130 million by 2010. The developing world is no exception. China, for instance, currently sends 6 percent of its students to tertiary education and hopes to increase that figure to 15 percent by 2010" (p. 102). In fact, the demand for tertiary educational services is increasing more rapidly than developing nations can respond by building universities (Curry, 2003). In response, "Almost all countries have displayed a vigorous expansion in tertiary level education over recent decades. Almost everywhere this expansion of the tertiary level of education is connected with institutional reforms for the selection, management, and channeling of growing masses of students" (Muller & Gangl, 2003, p. 32). Not surprisingly, many tertiary educational institutions are experiencing a number of other challenges today, including identifying how best to accommodate the increasing number of students, mobilize staff and resources, develop relevant curricula and teaching procedures, as well as remaining competitive during a period of skyrocketing costs (Nevin, 2003). According to Wagner, learners at the tertiary level are ". . . more diverse in terms of their backgrounds, interests and career paths. The new challenge is how to adapt program to student demand, rather than the traditional approach of plugging students into programs" (pp. 14-15). Not only are the students themselves becoming more diverse in their educational needs, there remains a fundamental lack of access to tertiary educational facilities throughout the developing world today (Nevin, 2003).

In this environment, a superior approach to the promotion of traditional delivery of tertiary educational services would be to find a place for everyone who wanted higher education as means of enhancing skills and knowledge, improving life-chances and addressing the enormous waste generated by social exclusion (Wagner, 1998). In fact, as Ramcharan (2004) emphasizes, "No country has achieved sustained economic development without substantial investment in human capital" (p. 309). Likewise, as Andersson and Gunnarsson (2003) point out, "The expansion of education not only helps generate technical and professional labor for industrial upgrading, but also enhances opportunities for upward social mobility, including

skills enhancement and higher remuneration" (p. 113). This point is also made by Barr and Crawford (2005) who report, "Education and training have a number of characteristics that make them unusual. Though partly enjoyed for its own sake education is, to a large extent, undertaken because it increases an individual's future earning capacity. It has all the characteristics of a personal investment" (emphasis added) (p. 121).

Because it is such an enormous investment of individual time, resources, and effort, the promotion of a tertiary education should focus on identifying what higher education students want and need to learn today. In this regard, Wagner suggests that, "One possible way of doing this is to work more closely with schools as part of the drive to improve their flexibility and understanding of how students want to learn" (p. 16). This approach is congruent with numerous studies that have shown time and again the inextricable association between higher education and expanded employment opportunities (Langouet, 2002).

There are some important constraints and considerations that must be taken into account in developing appropriate promotional plans for tertiary educational institutions in order to ensure their effectiveness, though. For instance, depending on the geographic setting, a promotional plan for a tertiary educational institution could highlight the additional and more lucrative employment opportunities afforded to graduates. For instance, Shavit, Muller and Tame (1998) maintain that the linking of educational qualifications and occupational achievement is the weakest in less stratified and standardized social systems. According to these authors, "In Ireland -- a weakly stratified system -- employers rely on success in school because this is tested according to nationally standardized procedures, and thus workers' credentials represent their respective rank in the job queue" (p. 7). The geographic setting also affects student access to tertiary educational institutions, and while distance learning programs have afforded some relief, much more remains to be done, especially for rural areas. For instance, Moore and Anderson (2003) report that, "Today, most if not all universities engage in some form of distance education, particularly using information technology to deliver online curriculum and support" (p. 379). According to Alston and Kent (2003), "Declining rural access to tertiary education exacerbates power differentials resulting from globalization and restrains access to the opportunities of globalization and hinders rural revitalization. For many rural young people, restricted access to tertiary education is a significant barrier to the development of a skilled knowledge-focused workforce in rural and remote regions" (p. 5). Moreover, many minorities and indigenous populations remain severely underrepresented in tertiary educational institutions around the world. Therefore, any promotional plan designed to improve access to these students would require reformation of existing policies, appropriate levels of funding, involvement in decision making, and reevaluation of the curriculum (Gair, Miles & Thomson, 2005). For this purpose, one analyst recommends that, "The capacities of these institutions need to be enhanced so that they could respond to society's changing needs in the context of an increasingly globalized world economy" (Ruben, 2007, p. 37).

ANALYSIS OF RESULTS

	<i>Nationality</i>	<i>Valid Percent</i>
<i>Valid</i>	<i>Cypriot</i>	66,0
	<i>British</i>	1,0
	<i>Chinese</i>	2,0
	<i>Middle East</i>	5,0
	<i>Russian</i>	9,0
	<i>Africa</i>	2,0
	<i>Other</i>	15,0
	<i>Total</i>	100,0

Table 1. Nationality

The highest percentage of the sample is Cypriot students, because in all Universities participated, local students consist of the 80% of the student population. The 25% of the Cypriot students interviewed are Turkish Cypriots.

		<i>Valid Percent</i>
<i>Valid</i>	<i>Friends</i>	56,0
	<i>Other</i>	7,0
	<i>Relatives</i>	5,0
	<i>Media</i>	26,0
	<i>Search Engine</i>	4,0
	<i>Online Social Network</i>	2,0
	<i>Total</i>	100,0

Table 2. Where did you hear about the University?

It is very obvious through the results that both local and international students rely on information received through their friends, and the media definitely plays an important role especially for Cypriot students.

Only 7% of the students [Other] said that they first learned of their enrolling college through materials mailed to their home, a college fair, an admissions publication, or a meeting with an admissions counselor from a particular school. These are the sources in which the college or university has some control.

More than 60% said that they first heard of their enrolling college from friends/classmates/word-of-mouth, family members who attend/ed, a friend who attends, family advice, and to a much less degree high-school guidance counselors or high-school teachers. More importantly, a prospective student who learned of a college from a “third party” is nearly four times more likely to apply and twice as likely to enroll.

		<i>Valid Percent</i>
	<i>Yes</i>	<i>77,0</i>
	<i>No</i>	<i>23,0</i>
	<i>Total</i>	<i>100,0</i>

Table 3. *Have you seen an advertisement of the University before registering?*

It is essential that the majority of students are exposed to the Mass Media which might justify the investment made by local Universities. Therefore contrary to reports from Northern Europe and the U.S.A where they claim that this age group is not exposed to the media, it is surprising that Cypriot students are influenced by advertising messages.

		<i>Percent</i>
	<i>Attracted your attention</i>	22,0
	<i>Encouraged you to visit the University</i>	37,0
	<i>Changed the image that you had about the University</i>	8,0
	<i>Influenced you to register at the University</i>	5,0
	<i>Other</i>	4,0
	<i>Total</i>	76,0
<i>Missing</i>	<i>System</i>	24,0
<i>Total</i>		100,0

Table 4. Do you believe that the advertising message...

An interesting effect of the mass media on students is that it attracts the attention of the students but mainly it encourages students to visit the university. We can conclude however, that to attract the attention or a visit does not guarantee enrollment. Therefore we might suspect that the service received during the visit might be a factor that influences decision making. Future research will assist us in establishing such a theory.

		<i>Percent</i>
	<i>Yes</i>	72,0
	<i>No</i>	28,0
	<i>Total</i>	100,0

Table 5. Do you have a friend/ relative who is studying at the University?

Another important issue and justification of previous information received is that the majority of students do have a friend/relative at the university. We might very carefully conclude again that students do prefer to attend a university that they have a friend. Further analysis demonstrated that it is true for both local and international students.

DISCUSSION

Can you think of an industry, outside higher education, where the competition for attention, customers, and money has gotten more fierce in the past decade, yet the “marketing” budgets

have remained relatively modest? These are just some of the challenges for higher education. Yet, surprisingly, little has changed in the promotion of universities. Communication offices continue to churn out news releases and unfortunately, traditional techniques and approaches just are not enough for you institution to be heard above the din.

The present economic crisis will create dramatic changes in the way universities promote themselves. We use the term “promotional marketing” because we are talking about the techniques for reaching the many constituencies of a college or university, not the “product” of an institution such as adjustments in the academic, social, residential and professional programs (which are also probably necessary).

Service versus Publicity

Promotion, and especially promotion that provides a service, can play a great part in increasing the visibility, prestige and status of a college or university. With publicity through the media, colleges and universities are at the whim of a fickle mass media industry. Even the best story about your institution can be sabotaged by breaking news.

The theory is simple: Colleges and universities are at their best when they educate. Educational materials that are made available to already financially strapped high schools demonstrate the institution’s commitment to education, are low-keyed, and result in greater visibility. The materials may be posters, videotapes, computer programs or hand-outs.

Utilizing Alumni

Alumni will need to play a greater role in the promotion of any college or university for practical and economic reasons. A resource that is generally underutilized, the alumni, if handled properly, can be effective players in the marketing and public relations effort. And their service is generally free.

To get the world out more effectively to new audiences, colleges and universities will need to reject the centralized public relations programs of the past where all promotional activities were controlled from the campus. The most successful promotional efforts in the future will involve alumni and parents in target areas developing promotional programs and generating publicity themselves – with gentle oversight from the campus.

Who better to promote an institution in a given city than the community leaders, media mavens, and corporate leaders in a college’s alumni and parent database? A campus communication professional will be better utilized if he or she serves as liaison to task forces in target cities rather than churning out news releases that are eventually lost on the desk of city editors.

Word-of-Mouth Marketing

There may be no more complicated marketing task than unraveling what creates the image of a university. Only a few constituencies really have an image and, therefore, the future of an institution. Reaching these constituencies requires a variety of approaches.

While goods can be promoted well in advertising, the business of marketing an intangible service, like a college education, requires the mobilization of people. For example, it's neither the admissions office nor the guides to universities that alert students to a college. It is a wide variety of people with great or little ties to the college or university. In fact, in a survey produced by George Daphne in June 2008 demonstrated that more than eight of 10 college-bound seniors said they first heard of their heard of their enrolling college from friends/classmates/word-of-mouth, family members who attend/ed, a friend who attends, family advice, and to a much less degree high-school guidance counselors or high-school teachers. More importantly, a prospective student who learned of a college from a "third party" is nearly four times more likely to apply and twice as likely to enroll.

What does this have to do with a college's image? A great deal. A college is only as strong as the enthusiastic volunteer support of its key constituencies. A positive news story in a national media outlet may provide a short term "bump", but it will be the day-to-day references and referrals close to and simply acquainted with the college that will drive the image.

Appreciating the role of the various constituencies and effectively utilizing these groups requires approaching word-of-mouth marketing (or reputational marketing) in a deliberate way.

High Tech Equals High Touch

We are not among those who believe technology and the Internet are going to change the world of communications overnight. Yet we are certain that prospective students, parents of students, alumni, and the public will increasingly expect to pick and choose the information they want electronically. Our studies (in depth interview) show that seven out of 10 prospective students have access to a computer at home. About three out of 10 have access to the Internet form home. These figures are increasing daily.

All institution's Home Page on the Internet will eventually become an institution's "front door" surpassing all but direct mail and word-of-mouth as the way for a prospective student to learn more about your college or university. At last count, we found 15 "search engines" for colleges. Some of these let students set certain preference parameters such as size, major, location, and safety. Once the parameters are set, the service provides a list of downlinks, direct connections, to the college and universities that meet the specified parameters. More systems are on the way. This means your institution will need to know about all the search engines and your institution's place in them.

For the immediate future, complex graphics and video will be less important since most prospective students will access the college's Home Page via telephone modem from their home – a terribly slow form of communication. (Nearby nine of 10 prospective students expect to contact colleges on the Internet from their homes, not their schools.)

Reaching The New Generation

Effectively reaching the new generation of students for student recruitment purposes, and eventually alumni communications, will require a shift from traditional media and messages.

First and foremost, neither mass media advertising nor more strident claims about your institution will be effective. We found that only three of 10 young people believe advertising paints a true picture of a product. This generation is very skeptical about those things that they understand and that includes media and advertising. That is why simplicity and honesty are often more effective and credible in the admissions process – even if it is not as “slick” as the mass media.

The age group hates to be bored. They seek entertainment in everything they do – this not only includes what they expect from college, but how they get their information. One research study actually suggested that the attention span of most adolescents is about eleven minutes – roughly the time between commercials in a typical television show. The need for more exciting and entertaining admissions materials as well as a greater use of interactive techniques will become the status quo of tomorrow.

Interestingly, the day of the college video may already be over. Young people see film and video as the ultimate managed medium. After all, they have seen Jurassic Park but they know dinosaurs no longer exist. Great special effect, however, do. In our own studies, we found that only two of 10 respondents said a college video had a great impact on a student’s decision to apply to a college. These young people know that you can manufacture a happy campus, complete with happy kids, and shoot a tree from a hundred angles to make it look like a forest. Student produced material (even videos) or an Internet “chat room” where prospective students can ask questions of students, faculty and staff will have greater impact for many students than a flawlessly produced video.

Colleges will also need to be more cautious of the visual images. This generation is visually sophisticated. In our in depth interviews, we have found that students often ignore the foreground of admissions photographs and concentrate on the detail in the background. They look for truth in the details, not in the things we want them to see.

The final warning: universities cannot think all students respond alike. In our studies of students concerning admissions communications we found a variety of differences. Science students, for example, prefer telephone call to printed materials. Students interested in business are more likely to prefer electronic contacts such as e-mail or CD-ROM. Students interested in the humanities prefer student written materials to “official materials of the college” .

CONCLUSION

So here are some “predictions” to help give you insight into how your institution might fare in the competitive future. In the new world of higher education marketing, we envision these trends:

- To endear target audiences, the college or university will have to develop highly visible services for high schools, parents, legislators, alumni and other key influencers.
- Positioning a college with other high profile organizations rather than a hit or miss publicity program (through the media) will be the more effective choice.
- Alumni, the last available and credible “low cost” resource, will have to play a larger role in promoting the institution and recruiting students.

- There will be an increased emphasis on “word-of-mouth marketing.”
- Technology will make it possible and also require an effective one to one marketing program.
- Colleges and universities will need to develop a clear position that can be stated simply, effectively and often.
- Publications and communications with prospective students, current students and young alumni will need to reflect this generation’s visual acuity, sophisticated taste in media, and insatiable appetite for entertainment.

These will be the new challenges for promotional marketing of higher education in the future.

Additionally, colleges and universities are, for the most part, leaders in interactive marketing through the Internet. Some colleges already receive as many as one of three applications electronically and the Internet Home Page for many colleges receive as many as 2,000 to 4,000 “visitors” a week. Low promotional budgets have resulted in some of the most creative approaches to promotion found in marketing. When budgets are tiny compared to the task at hand, creativity has to be plentiful resource.

There is a brave new world ahead for the promotion and marketing of colleges, but it is not that colleges are approaching from a standing start. Yet the task is awesome.

IS THERE NEW EVIDENCE TO SHOW THAT PRODUCT AND INTERNATIONAL DIVERSIFICATION INFLUENCE SMEs PERFORMANCE?*

Muñoz-Bullón, Fernando¹; Sanchez-Bueno, Maria J.²

¹Facultad de Ciencias Sociales y Jurídicas, Universidad Carlos III de Madrid, Calle Madrid, 126, E-28903 - Getafe (Madrid), SPAIN

²Facultad de Economía y Empresa, Universidad de Salamanca, Campus Miguel de Unamuno s/n, E-37007 – Salamanca, SPAIN

Purpose. We examine the joint effect of product and international diversification strategies on the performance of small and medium enterprises (SMEs) in Spain.

Design/methodology/approach. We rely on a panel data of small and medium Spanish manufacturing enterprises over the period 1993-2006, collected from the Spanish Survey of Business Strategies.

Findings. The evidence reveals the existence of a negative relationship between geographic expansion and profitability. Likewise, the adoption of both product and international diversification is not associated with higher performance.

Research limitations/implications (if applicable). A promising avenue for future research is the analysis of firms located in different countries (for example, emerging economies), or the study of this issue considering factors such as the ownership structure (family firms, the role of the State and banks, etc).

Practical implications (if applicable). Our analysis underlines the fact that the distinctive particularities of SMEs –for example, limited resources, lack of previous experience in the adoption of new products and accessing new markets– might constrain diversification as an alternative for firm growth. As a practical implication, Spanish SMEs should overcome their shortcomings before adopting diversification in order to improve the profitability associated with these strategies.

Originality/value. Although Spain's economic structure is highly segmented and made up of mainly SMEs, research on these companies in this country is rather scarce. In particular, the distinctive characteristics of SMEs mean that diversification might have different performance implications than for larger companies. Moreover, our analysis offers new insights compared to previous research, which has traditionally relied on cross-section data.

Key words: Product diversification, international diversification, corporate performance, SMEs.

INTRODUCTION

The corporate development of firms provides strong support for the relevance of the diversification strategy, involving both product and international diversification (Delios, Xu, and Beamish, 2008; Li and Greenwood, 2004; Li and Yue, 2008; Qian, 2002; Shyam, 2009). Although this topic has been extensively researched, our knowledge on the relationship between product or/and international diversification strategies and corporate performance is still limited (Geringer, Tallman, and Olsen, 2000; Geyikdagi and Geyikdagi, 1996; Kim, Hoskisson, and Wan, 2004). Moreover, research has traditionally focused on large and well-established firms in industrialized countries (Dastidar, 2009; Hitt, Hoskisson, and Kim, 1997; Mayer and Whittington, 2003; Ruigrok and Wagner, 2003), with a general conclusion being that the impact of these strategies on corporate performance is unclear (Datta, Rajagopalan, and Rasheed, 1991; Grant, Jammine, and Thomas, 1988; Hoskisson and Hitt, 1990).

In contrast with the findings on large corporations, small and medium enterprises (SMEs) are generally characterized by the lack of both resources for product development and managerial talent in international expertise (Hitt, Hoskisson, and Kim, 1997; Qian and Li, 2002; Ruigrok and Wagner, 2003). Accordingly, the distinctive characteristics of SMEs mean that diversification might have different performance implications than for larger companies (Lu and Beamish, 2001). This has led us to analyze the joint effect of product and international diversification strategies on the performance of a sample of small and medium Spanish manufacturing enterprises over the period 1993-2006. In so doing, we rely on a panel data of firms that offers new insights compared to previous research, which has traditionally relied on cross-section data (Wiersema and Bowen, 2008).

An additional motivation for our research is that although Spain's economic structure is highly segmented and made up of mainly SMEs - 99.87 percent of existing firms are SMEs (according to data from the Central Business Directory of the INE in 2003) - research on such issues in this country is rather scarce (Galan, Gonzalez, and Zuñiga-Vicente 2007; Ramirez and Espitia, 2001, 2002; Santalo and Becerra, 2006).

Finally, while literature on strategy has generally ignored the differences between nations and temporal contexts (Geringer, Tallman, and Olsen, 2000, p. 54), our analysis draws upon specific new contextual data, in line with recent studies (Hitt *et al.*, 2006; Wan and Hoskisson 2003), which allows us to cover a recent timeframe in which firms in Spain are facing new challenges in their expansion (for example, technological change, globalization). Thus, our analysis complements earlier works on the effect of diversification strategies on corporate performance. In short, the relevance of our analysis stems from the fact that, as noted by several authors (Ramanujam and Varadarajan, 1989; Simmonds, 1990; Simmons and Lamont, 1996), both the timeframe and the sample dependent nature of our cumulative understanding of diversification-performance relationships constitute an important challenge for researchers.

Our results reveal the existence of a negative relationship between geographic expansion and profitability. In addition, the adoption of both product and international diversification is not associated with higher performance. Our interpretation underlines the fact that the distinctive particularities of SMEs (for example, limited resources, lack of previous experience in the

adoption of new products and accessing new markets) might constrain diversification as an alternative for firm growth. As a conclusion, Spanish SMEs should overcome their shortcomings before adopting diversification in order to improve the profitability associated with these strategies.

The paper is organized as follows: the second section provides a brief review of the literature on the diversification-performance relationship; the third section presents the methodology applied; the fourth section offers the most relevant results and the last section concludes.

THEORETICAL FOUNDATIONS

Product and International Diversification: Their Effect on Performance

For many years scholars have studied the relationship between product and international diversification strategies and performance separately (for example, Contractor, Kundu, and Hsu, 2003; Kim, Hoskisson, and Wan, 2004; Palich, Cardinal, and Miller, 2000). Nevertheless, recent studies have also tackled the effects of both strategies on firm performance (for example, Geringer, Tallman, and Olsen, 2000; Hitt, Hoskisson, and Ireland, 1994; Sambharya, 1995). Given that there are similarities between the analyses of the impact of these two strategies on corporate performance, the combined effect of the entry into new product lines and into new geographical areas is expected to have some influence on performance independently of the individual impact (Geringer, Tallman, and Olsen, 2000; Tallman and Li, 1996): "Including both product and international diversification in a study enhances the overall understanding of firms' diversification strategies and how they may affect performance" (Kim, Hoskisson, and Wan, 2004, p. 618-619). Thus, our focus in this work is to provide new insights into the performance implications stemming from firms simultaneously expanding their product and geographic scope.

Firms adopting both product and international diversification may perform better than firms that do not due to the greater opportunities for achieving synergies by leveraging resources (for example, distribution channels, brand equity). As a result, the firm will gain economies of scope across multiple product portfolios and geographic markets. For this reason, both strategies generally have a positive impact on a firm's performance (Chang and Wang, 2007; Delios and Beamish, 1999; Kim, Hwang, and Burgers, 1993). The literature predicts that prior adoption of a product diversification strategy provides experience on managing multiple product-markets, which can be exploited in international markets to achieve positive interaction (Hitt, Hoskisson, and Kim, 1997).

In spite of these benefits, simultaneous expansion into new products and countries might also imply a downturn in performance. The reason being that these strategies may be used by managers to pursue their own personal goals (for example, reduction of employment risk, status, compensation) at the expense of the firm's profitability and growth (Kim, Hoskisson, and Wan, 2004; Seth, Song, and Pettit, 2000). Furthermore, greater coordination is needed when a firm's operations expand into new products and international markets, which in turn may lead to cost inflation (Chang and Wang, 2007; Hoskisson and Hitt, 1990; Jones and Hill, 1988; Williamson, 1985). Finally, diversification may be costly for firms when bridging the gap between internal

corporate settings and the external environment: when product-diversified firms also expand internationally, differences in culture, government regulations, economic development or currency fluctuations between countries may also have some impact on their performance (Chang and Wang, 2007; Wan, 1998).

As already explained above, whereas most prior research on growth by diversification has focused on large firms, our analysis deals with Spanish SMEs, rendering it important to consider the particularities that may help to explain the adoption of product and international diversification activities by these types of companies.

On the one hand, SMEs generally have fewer resources than larger companies (Bloodgood, Sapienza, and Almeida, 1996; Lu and Beamish, 2001, 2006). For this reason, although diversification may improve their performance by exploiting synergies amongst businesses and by obtaining economies of scale and scope (Delios and Beamish, 1999; Markides and Williamson, 1994), smaller companies are expected to be less likely to achieve scale economies and, therefore, less likely to improve their performance. Likewise, the lack of information and experience that many small entrepreneurs have regarding products and markets can constrain their diversification strategies (Westhead, Wright, and Ucbasaran, 2001), particularly when the new markets abroad are radically different from the original markets (Lu and Beamish, 2001).

On the other hand, other distinguishing characteristics of SMEs may lead us to regard product diversification and internationalization as important ways of improving performance. Since SMEs are typically less rigid and bureaucratic than larger corporations, their advantages in terms of organizational flexibility or innovation may allow them to better develop new products and/or access new markets (Pett and Wolf, 2007; Qian, 2002). Furthermore, many SMEs are owner-controlled or managed with the owner's interests closely aligned with those of the firm (Pett and Wolf, 2007, p. 4). Indeed, founders themselves own and manage such firms (Lu and Beamish, 2006). Thus, because managers are less likely to diversify in order to uphold their own self-interest (growth and reduction of their personal employment risk), the expansion into new products and markets might be associated with better performance.

Based on the previous arguments, we suggest the following hypothesis:

Hypothesis 1: The joint effect of product and international diversification affects the firm's performance.

METHODOLOGY

Sample

We use a large firm-level data panel compiled by the Spanish Ministry of Science and Technology since 1990: the Survey of Business Strategies (ESEE) for the years 1993 to 2006. The ESEE covers a wide range of Spanish manufacturing SMEs operating in all industries. The sample is representative of Spanish manufacturing firms with between 10 and 200 employees (SMEs); it is probabilistic and stratified by industry and firm size. A number of firms have been eliminated from the original sample, most of them for lack of relevant data (product lines, foreign markets, etc). Thus, our final dataset is an unbalanced data panel of 16,839 (firm-year) observations (and 2,446 companies).

Variables

Corporate Performance (Dependent Variable). While previous literature has considered both accounting-based (for example, growth, profitability) and market-based measures (for example, risk) of corporate performance (Palich, Cardinal, and Miller, 2000), we focus on two measures of financial performance (Colpan, 2006; Geringer, Tallman, and Olsen, 2000; Kim, Hoskisson, and Wan, 2004; Sambharya, 1995; Tallman and Li, 1996): ROA (Return on Assets) and ROS (Return on Sales) - see Geringer, Beamish, and daCosta (1989); Lu and Beamish (2001); and Palich, Carini, and Seaman (2000). These are the only measures of performance that can be computed with the dataset at hand. In order to avoid potential endogeneity problems and facilitate causal inference, we chose a one-year lag between the independent and dependent variables (Geringer, Tallman, and Olsen, 2000; Lu and Beamish, 2004).

Product Diversification (Independent Variable). There are several definitions of product diversification (see, for example, Ramanujam and Varadarajan (1989) or Hoskisson and Hitt (1990)); both continuous measures - such as the entropy measure (Palepu, 1985) or the Herfindahl index (Berry, 1974) - and categorical measures - such as Rumelt's approach (1974). In our analysis, we use a dummy variable to indicate whether a firm diversifies (it equals 1 if the firm diversifies, either through related or unrelated diversification, and 0 otherwise), since data on continuous measures for diversification are not available in the ESEE.

International Diversification (Independent Variable). Internationalization is defined as "a strategy through which a firm expands the sales of its goods or services across the borders of global regions and countries into different geographic locations or markets" (Hitt, Ireland, and Hoskisson, 2007, p. 251). A dummy variable is used with a value of 1 if the firm has expanded its activities towards foreign markets, and 0 otherwise.

Control Variables. Recent studies recommend controlling a number of variables that are likely to have an impact on the firm's performance (Chang and Wang, 2007; Geringer, Tallman, and Olsen, 2000; Kim, Hoskisson, and Wan, 2004). In our analysis, we include the following control variables:

Firm Size: it was operationalized through the logarithm of total sales, in line with previous studies (Kim, Hoskisson, and Wan, 2004; Tallman and Li, 1996; Wan, 1998).

Leverage: the percentage of long-term debt over total assets was used to measure this variable. Prior works showed that leverage is likely to affect corporate performance (Delios and Beamish, 1999; Geringer, Tallman, and Olsen, 2000; Tallman and Li, 1996).

Liquidity: we use a standard measure of liquidity - the current ratio; i.e., the ratio of current assets to current liabilities.

Research and Development Activities (R&D): we use a dummy variable indicating whether the firm develops R&D activities. Some studies predict a relationship between a firm's R&D effort and its performance (Colpan, 2006; Lu and Beamish, 2001). For instance, R&D activities provide unique advantages in domestic and international markets for companies and may therefore result in superior performance (Chang and Wang, 2007; Delios and Beamish, 1999).

Market Demand: demand changes are additionally viewed from an economic perspective as a basic determinant of performance. We measured the trend of demand through a set of dummy

variables reflecting whether the market addressed by the company has enlarged, remained constant or decreased, as well as through a dummy variable which shows whether the market addressed by the firm is in recession. Finally, we also include the log transformation of the firm's use of production capacity.

Industry Effects: several dummy variables are included which represent the industry to which the firms belong (Kim, Hoskisson, and Wan, 2004). The literature suggests that differences between sub-industries may lead to different corporate performance (Chang and Wang, 2007; Delios and Beamish, 1999; Grant, Jammine, and Thomas, 1988).

Time Trend: we also included dummy variables for each year of observation, since previous studies have indicated that the consequences of product and international diversification may vary over time (Chang and Wang, 2007; Geringer, Tallman, and Olsen, 2000).

Method

To gain confidence in the relationship between joint product and international diversification and corporate performance, it is necessary to isolate the effects of these strategies on the firm's subsequent performance. This will allow us to check whether or not expansion into new products and markets in the past (i.e., in the previous year) has any impact on profitability in the current year.

The simplest approach to address this issue is to regress performance on the diversification variables (both product and international diversification). However, unobserved organizational attributes may lead to bias in the estimation of the performance impacts of these strategies. For instance, management decisions will affect the implementation of diversification decisions, the risk arising from the latter and numerous strategic operational procedures. All of these decisions will have some impact on how efficiently the diversification strategies are managed, and as a result will affect firm performance. Moreover, estimates of the coefficients on diversification variables will be biased if the error term is correlated with these diversification variables. Firms with high performance due to unobservables - such as unmeasured inputs, differences in input (or output) quality, differences in technology and management decisions - may show a greater tendency to diversify because such firms may be better able to invest in these strategies. The converse might also be true. Firms with low profitability due to unobserved characteristics may invest more in diversification, given that the investment may serve to raise performance. As a result, Ordinary Least Squares (OLS) estimation may generate biased parameters. It is therefore necessary to model unobserved attributes statistically. Given that several sequential (yearly) observations of the same firm are recorded in the ESEE, unobserved variables can be eliminated by specifying a fixed effects or a random effects model. In our case, fixed effects estimates are preferred to random effects estimates¹⁹⁶.

¹⁹⁶ We ran a Hausman test to choose between fixed and random effects models (results are not shown but are available upon request). This tests the null hypothesis that the coefficients estimated by the random effects estimator are the same as the ones estimated by the fixed effects estimator (see Hausman, 1978).

More specifically, given the longitudinal data on a firm's corporate performance, the effects of product and international diversification observed for firm i at moment $t-1$ on performance at moment t can be modeled as follows:

$$\text{Ln}(P_{it}) = Z_{it-1} \alpha + \lambda_i + \varepsilon_{it} \quad (1)$$

where P_{it} is firm i 's performance associated with the current year; Z_{it-1} is a vector of observable variables associated with the previous year, which may influence the firm's performance in the current year; λ_i is a time-invariant firm-specific error that captures the effects of unobservable characteristics; and ε_{it} is assumed to have constant variance and to be uncorrelated across individuals and time. The possible correlation between unobservables and observables is thus accounted for in the estimation of the parameter of interest, α .

Results

Table 1 presents means and standard deviations of the variables included in the present work.

<i>Variable</i>	<i>Mean</i>	<i>Std. Dev.</i>
ROA (%)	14.4620	16.49
ROS (%)	9.5926	11.34
Product diversification (1=yes)	0.2086	0.41
International diversification (1=yes)	0.4524	0.50

Number of firms	2,446	

Table 1. Main Descriptive Statistics. Source: Survey of Business Strategies (1993- 2006).

Table 2 and Table 3 show results for the interaction effect of product and international diversification on profitability (ROA and ROS). Model 1 is the baseline model that includes only control variables. As can be observed, size and capacity have a significant positive impact on performance, whereas performance is negatively related to recession periods in every specification. In addition, when market share is constant or diminishing, its effect on profitability is worse than when it is increasing. Results concerning ROA also show a negative and significant effect of leverage on profitability. The remaining control variables are non-significant.

Models 2, 3 and 4 provide separate results on the relationship between product and international diversification and performance. The results in these models report that product diversification has a statistically non-significant relationship with performance. In contrast, the coefficient on geographic diversification is significant and negatively associated with profitability. Thus, Spanish firms in our sample are unsuccessful in improving their performance by expanding into new geographical markets.

Analogously, Model 5 tests Hypothesis 1, which suggests that the joint effect of product and international diversification may have some influence on performance. However, the estimated coefficient on the interaction term between product and international diversification is non-significant. Therefore, we find no support for our hypothesis. These findings are in line with previous works (Chang and Wang, 2007; Geringer, Beamish, and daCosta, 1989; Geringer, Tallman, and Olsen, 2000), which also provided evidence on the statistical non-relevance of the adoption of international and product diversification at the same time.

CONCLUSION

Although diversification strategies (product and international diversification) are becoming increasingly relevant for small and medium sized enterprises, there is still limited evidence on their impact on the latter's corporate performance (for example, Lu and Beamish, 2001, 2006; Qian, 2002). Likewise, there exists a shortage of data on the interaction effect of product and international diversification strategies on corporate profitability (for example, Hitt, Hoskisson and Ireland, 1994; Tallman and Li, 1996), because most of literature has focused on the linkage between diversification strategies and performance separately (for example, Kim, Hoskisson, and Wan, 2004; Palich, Cardinal, and Miller, 2000). Thus, in order to provide new knowledge and develop current theory on this issue, it seems appropriate to study the growth path of SMEs and the relationship between the strategies of these companies and their performance. For this purpose, we have used a sample of small and medium enterprises on a new context (Spain) and a recent time period (1993-2006).

The evidence provided indicates that the expansion of SMEs in Spain towards foreign markets is associated with lower performance. In addition, our results do not support any significant difference in performance when adopting new products and accessing new markets at the same time.

Our interpretation of these findings rests on the notion that SMEs are unlikely to have the resources and capabilities required to successfully access new product lines or geographic areas (Lu and Beamish, 2001). In addition, intense international competition and the co-ordination costs associated with these strategies may reduce the profitability that these companies derive from them. When the domestic market is saturated, SMEs may encounter greater difficulties in using their established connections for further expansion than larger companies (Wan, 1998). Thus, two possibilities arise: on the one hand, SMEs may decide not to adopt these strategies in case they do not eventually gain economic value from the strategies analyzed. On the other hand, given that expanding into new products and markets implies new challenges and involves risks for small and medium enterprises, before implementing these strategies, they need to learn from prior experience and overcome these disadvantages. Likewise, in this setting, government funds may be crucial to help these companies improve their performance.

In interpreting our results, we must underline the context and time period considered in our analysis. In recent years, both the European economic integration process and the wave of privatization experienced in Spain have stimulated product and international diversification for Spanish firms, particularly among large and well-established enterprises (Guillen, 2001, 2005). However, although the trend towards diversification became increasingly widespread in Spain during the 1990s and the beginning of the 21st century (Binda and Iversen, 2007; Galan, Sanchez, and Zuñiga-Vicente, 2005; Galan and Sanchez, 2009), Spanish firms have not yet reached the levels of diversification recorded in other economies (US, France, Germany, Italy, or UK) (Mayer and Whittington, 2003). Thus, it is reasonable to contend that SMEs in Spain are less likely to achieve substantial improvements in performance stemming from these strategies.

This study has several implications. While firms can choose between a product diversification strategy or a geographic expansion strategy in order to improve their performance, advancing in

these two dimensions at the same time may not always be the most profitable alternative. Indeed, it is also the most difficult to implement successfully. Thus, managers must consider several relevant factors (profitability, risk, etc) before developing new products and accessing new international markets.

Finally, although unfortunately the data do not allow to test whether the relationship between corporate performance and diversification strategies is anything other than linear, it may indeed be possible that the impact of product and international diversification on performance may follow a curvilinear or sigmoid form (see, for example, Contractor, Kundu, and Hsu, 2003; Hitt, Hoskisson, and Kim, 1997; Palich, Cardinal, and Miller, 2000; Thomas, 2006). This issue remains open for future research. Another promising avenue for future research is the analysis of firms located in different countries (for example, emerging economies), or the study of this issue considering factors such as the ownership structure (family firms, the role of the State and banks, etc). Moreover, while we have used quantitative measures of performance, it would be interesting to use strategic measures or examine other criteria apart from financial performance (such as, e.g., product innovation) in order to enrich the analysis.

GLOBAL EVALUATION AND LOYALTY OF LISBON AS A TOURIST DESTINATION – PORTUGAL

Neves, Joana Maria¹; Loureiro, Sandra²

¹Technical University of Lisbon, PORTUGAL

²University of Aveiro, PORTUGAL

Purpose: this study aims to identify the more relevant factors which influence the global evaluation of Lisbon as a tourist destination, as well the intention to return.

Design/methodology/approach: it was taken PLS – Partial Least Squares approach to structural equations modeling. A survey was carried out on the main Lisbon Visitor Attractions and hotels, in a sample made up of 552 individuals.

Findings: the results show that global quality/price evaluation and cultural perspectives are the main factors to explain the global evaluation of the Lisbon destination. Furthermore, beside a positive global evaluation, the environment safety has a direct and positive impact on the intention to return to Lisbon.

Research limitations/ implications: the study is focused in a specific sample – the visitors of Lisbon, so the results obtained here should be contrasted with those of other International tourist destinations.

Practical implications: ascertaining the main factors of the global evaluation of a tourist destination will make a valuable contribution to the professionals of the destination to enable them to adapt their strategies of positioning, communication and promotion, as well as developing the specific offer to those visitors.

Originality/value: if we take into consideration the growing competitiveness among tourist destinations and the potential that global evaluation measurement represents as a tool of management of destinations, so it is critical understanding the factors which influence the global evaluation of a tourist destination, as well its level of loyalty by visitors.

Keywords: Destination Global Evaluation; Satisfaction; Loyalty; Return; Tourist Destination.

Paper Type: Research Paper.

INTRODUCTION

The importance of understanding the factors determining a tourist destination's ability to compete efficiently in a mosaic of competition (Fallon, 2007), i.e. the ability of a destination to satisfy its visitors' needs, is a critical vector for tourist destinations' managers. From the point of view of Tourism Marketing, the destinations' loyalty is also a core instrument in evaluating the real needs of a tourist destination's visitors. Thus it is vitally important to assess the suitability and efficiency of supply in terms of trip motives, tourist products, facilities, services and programs, which altogether represent the experiences the tourists are offered with.

In this framework, the global evaluation of Lisbon as a tourist destination by its visitors and the probability of their returning and/or recommending it to family and friends is a vital instrument in its management and thus a pre-requisite for its sustainability.

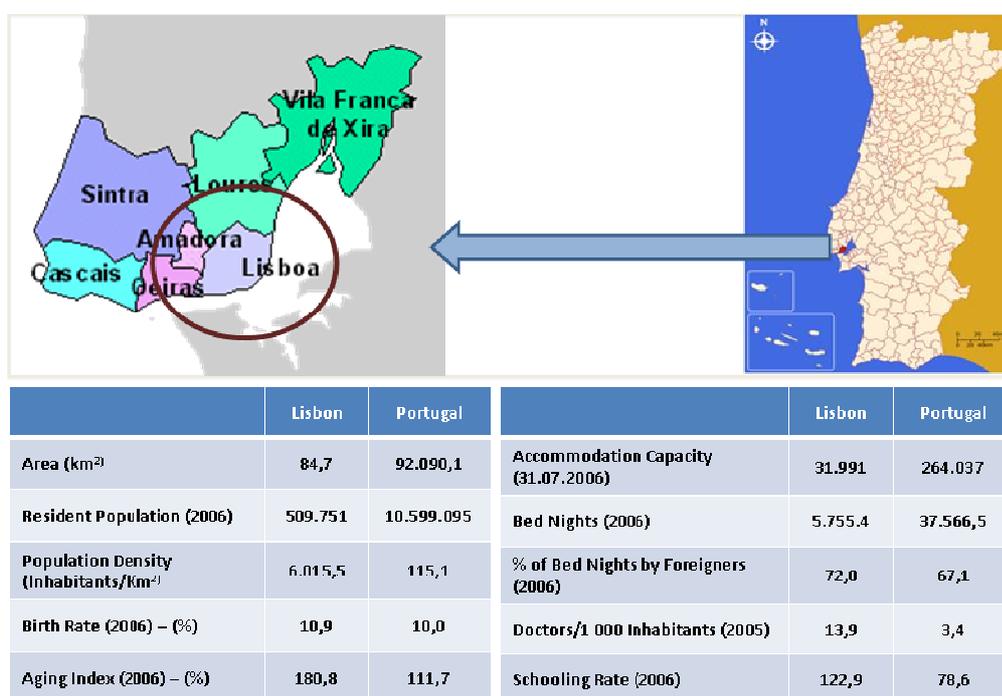

Therefore, this study aims to identify the relevant factors which influence the global evaluation of Lisbon destination and the intention to return.

To satisfy the aforementioned goal, the study is split into six sections. Section two contains a brief picture about Lisbon as a major Portuguese tourist destination; section three provides an overview of the literature to justify the constructs and the theoretical model. The fourth section describes the method used to validate the model, reporting the results in the fifth section. Finally, the sixth section outlines the conclusions and the likely research benefits.

LISBON IN THE TOURIST CONTEXT

Lisbon, the capital of Portugal, located on the River Tagus, has an area of 84.7 km² and a population of 509 751 (Portuguese National Statistics Institute, 2007). The city benefits from an excellent geographical location, from a mild climate all year round, from a wide range of tourist attractions, good international air links and a variety of accommodation options, making it the second main Portuguese tourist destination (the first one is Madeira Island).

According to the Associação de Turismo de Lisboa (2007), between 1995 and 2005, the accommodation supply grew around 113%, the number of foreign guests 68% and tourist receipts around 34.5%. In 2006 Lisbon accounted for 12.1% of Portugal's total accommodation capacity and 15.3% of hotel nights booked. Among the bookings, foreigners accounted for an average of 72.8% in the capital compared to 67.1% nationally (Figure 1).

Fonte: INE (2007) – Lisbon Region Statistical Yearbook, 2006.

Picture 1 – Picture of Lisbon as a Tourist Destination

Overall profits in the hotel trade from 2005 to 2007 were €443 181 255, €497 849 987 and 568 077 924 respectively, which translates into an average annual rise of around 13.2%.

LITERATURE REVIEW

Satisfaction has traditionally been defined as a global affective response to consumption of a service (Westbrook, 1987), and is considered very important due to its role in creating competitive advantages (Mittal *et.al.*, 2005). Highly satisfied customers will be faithful to the brand, will remain as clients for longer, will communicate through word of mouth and will contribute to increasing the supply and sales (Oliver, 1997; Anderson *et.al.*, 1994).

When transposing this perspective to the tourism context, it can be stated that the satisfaction is relevant to the destinations' competitiveness and management (Fallon, 2007), as well as to the suitability of its communication, promotion and segmentation strategies (Lee and Carr, 2004; Yuksel and Rummington, 1998).

According to Moutinho (2000), satisfaction is a complex and multidimensional concepts, deriving from the Latin words *facere* and *satis*, which imply "doing the sufficient". It is generally understood as a post-consumption result, i.e. it represents the evaluation made by a customer after experiencing a good or a service. This means that whenever the result of the experience is positive, thus corresponding to initial expectations, the tourist remains satisfied (Pizam *et.al.*, 1978; Bigné *et.al.*, 2005).

Authors such as Parasuraman *et .al.* (1985) and Reisinger and Turner (2003) postulate that satisfaction is the result of the destination's performance, measured through comparing initially created perceptions and images with the experience of the destination. From this point of view, satisfaction can include subjective perceptions, as well as specific destination or product attributes (Klaus, 1985). Therefore, the data resulting from the study of satisfaction levels identifies the attributes most valued by the destination's visitors, their impact on the destination choice-making and how deeply the destination management strategies match its current and potential visitors' needs.

Truong and Foster (2006) also refer to satisfaction in tourism as the relationship between the tourists' expectations and the destination's intrinsic characteristics.

Along this line of thought, Oliver (1980) postulates as regards the in its dominating expectation-fulfillment paradigm that satisfaction is formed by way of a cognitive comparison of perceived performance of a product or service and the expectations the customer had before the purchase. This means that when the perceived performance exceeds the expectations it causes satisfaction, but when the perceived performance is below the expectations it causes non-satisfaction.

The characteristics of tourism supply are also mentioned as potential factors of satisfaction (Van Raaij and Francken, 1984), mainly when they are coherent with the perceptions, attitudes and values of the visitors (Hughes, 1991; Kosak and Rimmington, 2000). The quality of the product or the service (Crompton and Love, 1995) and the reasons for individual trips (Sirakaya, 2003) are also seen as relevant on the study of the tourism satisfaction.

Another dimension in the study of consumer behavior is loyalty. Consumer loyalty is often recognized as being a strategic objective for companies (Reichheld, 1993; Oliver, 1999), as well in the tourism context. This dimension is related to the probability of a tourist repeating visits to destinations, recommending or promoting it near friends and relatives (Bowen and Shoemaker, 1998). It means that loyalty is related to specific behavior demonstrated through the intention to return to a certain tourist destination.

According to Petrick and Sirakaya (2004), consumer loyalty is clearly a critical aspect for firms or destinations because it is more desirable, and less expensive, to retain existing customers than to attract new ones. So, loyalty becomes a fundamental strategic component of a destination region.

On the other hand, loyalty is pursued by the destinations' management as a way of securing the visitors' relationship with the destinations. It consists of the visitors' identification and trust revealed towards the destination. Weiner (2000) states that a loyal customer regularly attributes eventual destination failures to exogenous factors, not to those strictly connected with the service suppliers. Thus the concept of loyalty plays a central role both in global visitor satisfaction and in post-acquisition behaviour. Therefore, the destinations managers' challenge lies in understanding and appropriately using the information obtained about their clients' loyalty (Petrick, 2005).

Loyalty was originally perceived from a merely behavioural perspective, i.e. as a function of purchase frequency or a proportion of market share (Cunningham, 1956). It evolved due to the necessity of an attitudinal perspective to be included, as the results of various studies, such as those in the field of brand loyalty, revealed the difficulty of associating loyalty with mere accounting of purchase frequencies. Nevertheless, neither behavioural nor attitudinal perspectives contain all of the consumer loyalty components, which is why it becomes necessary to add other dimensions, such as cognitive variables (Jacoby and Kyner, 1973).

There seems to be a significant difference between various possible types of loyalty, such as the number of visits paid by first-time visitors as compared to the repeat ones (Opperman, 2000). The author suggests that the consumers of the service should be divided into five specific groups: (i) non-buyer consumer – the one who has not bought the visit to a destination yet; (ii) disappointed consumer – first-time buyer, though with a negative experience; (iii) unstable consumer – first-time consumer with a positive experience, although oscillating among other suppliers; (iv) unfaithful consumer – first-time buyer that can be characterized by a reduced demand for novelty; (v) relatively loyal, loyal and very loyal consumer – the ones who pays a lot of visits, differing in frequency and intensity from previous visits. The above mentioned author believes different types of tourists demand different marketing strategies.

In line with the above information, the global evaluation of a tourist destination depends on various factors, including satisfaction, expectations and the destination's inherent motivational factors. A casual relationship between these factors and the tourists' intention to return to the destination is also established.

METHODOLOGY

The inquiry questionnaire hetero-administrated by the Data Crítica interviewers – a market research company engaged by the Associação de Turismo de Lisboa (the entity responsible for the destination management) – was carried out between May 1 and November 30, 2007, in traditional Lisbon hotel business spots, mainly hotels, as well as the main tourist attractions.

The sample was collected through a process of quota sampling, taking into account visitors' citizenship and final destinations. The weight of each citizenship category was measured through the number of hosts per country, who spent the night in the Lisbon promotional area between 2001 and 2005.

The questionnaire comprises six sessions, namely: (1) the reasons for visiting the region; (2) the Lisbon region's attributes evaluation; (3) the region's global evaluation; (4) the probability of returning to the Lisbon region; (5) the expectations fulfilment; and (6) the socio-demographic characteristics of the surveyed persons.

Each item of the factors of evaluation of Lisbon region and overall evaluation was recorded on a 10-point scale (1 = minimum, 10 = maximum). The 'probability of return' question was recorded on a 4-point scale, and the 'expectations fulfilment' question - on a 5-point scale. All the constructs are formed by a single item, apart from the environment safety construct (5 items), and the Cultural construct (4 items). 848 questionnaires were collected, of which 552 were completed in their entirety as regards the studied variables, representing 65% of the global sample.

Besides the descriptive statistics, the PLS (Partial Least Square) technique was applied, in order to estimate the path coefficients of the structural equations model. This technique is based on an iterative combination of principal components analysis and regression, and it aims to explain the variance of the constructs in the model (Chin, 1998).

In terms of advantages, the PLS simultaneously estimates all path coefficients and individual item loadings in the context of a specified model, and as a result it enables researchers to avoid biased and inconsistent parameter estimates. In fact, PLS models are based on prediction-oriented measures, unlike the covariance fit like covariance structure models developed by Karl Jöreskog (or the LISREL program developed by Jöreskog and Sörbom). The re-sampling Bootstrap process was applied to analyze whether the structural paths are or are not significant, and the Blindfolding technique was used to calculate the Q^2 indices.

RESULTS

As for the socio-demographic characteristics of the respondents, 64.7% are 45 years old or above, of whom 26.8% are over 65. 22.1% are between 45 and 54, and 15.8% are between 55 and 64 years old. Only 7.6% of the surveyed people are between 15 and 24, and 27.7% are between 25 and 44. In terms of academic degree, 76.9% of respondents have a high formal level of education, considering that 28.6% state to have attended higher education, Bachelor's Degree (25.5%) and Master Degree and PhD (22.8%). 42% are married, 19.9% are widowers and 19.4% are single or divorced. Most of respondents (52.5%) are male.

<i>Age</i>	<i>%</i>	<i>Education level</i>	<i>%</i>	<i>Marital status</i>	<i>%</i>	<i>Gender</i>	<i>%</i>	<i>Country of residence</i>	<i>%</i>
15 to 24	7.6	Elementary	2.4	Single	17.8	Male	52.5	In the EURO 27	76.3
25 to 34	13.9	Secondary	11.2	Married or together	42.0	Female	47.5	Russia	0.2
35 to 44	13.8	Academical Frequency	28.6	Divorced/or separate	19.4			Norway	2.2
45 to 54	22.1	Academical Degree	25.5	Widower	19.9			Switzerland	2.4
55 to 64	15.8	Post-Grad. degrees	22.8	Don't answer	0.9			Brazil	1.4
65 +	26.8	Don't answer	9.4					Canada	5.8
								USA	8.9
								Japan	0.2
								Australia	1.3

Table 1. Study Technical Sheet.

As for the mother country, the majority of the respondents are European (76.3%), followed by the Americans (8.9%) and the Canadians (5.8%). Most of the nationals of the 27 EU countries come, in decreasing order, from Spain, Germany, Italy, United Kingdom and France. They intend to stay an average of six nights in the Lisbon Region.

As for the reasons for visiting the Lisbon Region, the majority of respondents (over two-thirds) list them as holidays, recreation and leisure, visits to family and friends (11.2%) and business trips (10.7%). Only 1.3% participates in congresses, fairs or business.

<i>Construct</i>	<i>Mean (Std. Deviation)</i>	<i>Item loading</i>	<i>Cronbach's alpha</i>	<i>AVE*</i>
<i>Cultural</i>			0.8742	0.6618
<i>Monuments, museums and attractions</i>	7.9 (1.1)	0.850		
<i>Night life</i>	7.8 (1.0)	0.748		
<i>Cultural offer</i>	7.8 (0.9)	0.850		
<i>Commercial offer</i>	7.8 (0.9)	0.772		
<i>Attractions diversity</i>	7.7 (0.8)	0.842		
<i>Environment safety</i>			0.9011	0.7124
<i>Traffic</i>	7.4 (1.3)	0.833		
<i>Absence of noise</i>	7.5 (1.1)	0.849		
<i>Quality of the air</i>	7.6 (1.0)	0.904		
<i>Safety</i>	7.6 (0.9)	0.774		
<i>Cleanliness</i>	7.6 (1.0)	0.855		

Table 2. Measurement Results-PLS analysis

Good consistency can be observed of both scales (environment safety $\alpha=0.9011$; cultural $\alpha=0.8742$); the weight of each of the factors, which varies between good and laudable (Hutcheson and Sofroniou, 1999), and there is convergent validity, as the AVE indices surpass 0.5.

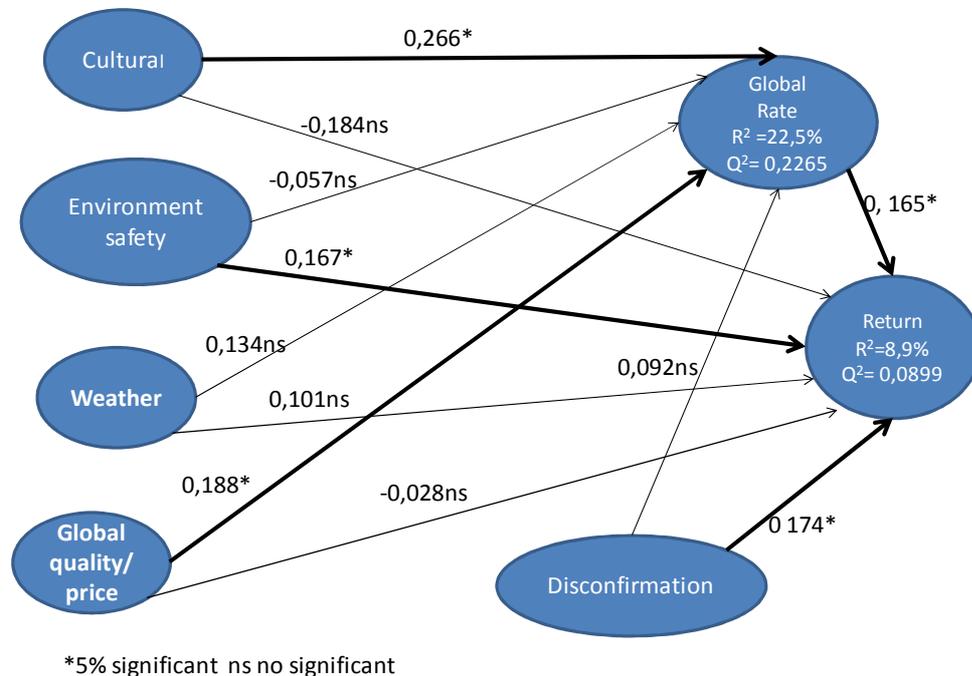

Figure 1: Structural Results

Figure 1 allows us to verify that the Global rate antecedent factors explain its variation only in 22.5% of the sample and the intention to return is only explained by the variables considered by 8.9% of the respondents. The culture factor (with 5 items) has a significant influence on the global evaluation of the tourist destination, but not on the intention to return. The environmental safety variable influences the intention to return positively, but does not exert a significant effect on the global evaluation of the Lisbon destination. The climate does not exert any significant impact. The expectations fulfilment (non-fulfilment) contributes significantly to the intention to return. The higher the global evaluation of the Lisbon tourist destination the higher is the tendency to return. The quality/price ratio is important for the destination's global evaluation.

Tenenhaus et al. (2005) propose the geometric mean of the average communality (outer mode) and the average R² (inner model) that is limited between values of 0 and 1 as overall goodness of fit (GoF) measures PLS (Cross validated PLS GoF). The index for this model is 0.4, which is not high and reveals that the model should be improved.

CONCLUSIONS

This study constituted a first attempt to apply the PLS technique to a set of latent variables related to the Lisbon destination.

In overall terms, the average classifications ascribed to the factors and items considered antecedent to the Global rate latent variable are high, which shows that the surveyed tourists have a good perception of the Lisbon tourist destination. However, the global evaluation of the

tourist destination (global rate) and of the intention to return is scarcely explained by the variables considered in the current study.

Therefore, other explanatory variables should be considered in future studies. Nevertheless, cultural aspects (Monuments, museums and attractions, Night life, Cultural offer, Commercial offer, Attractions diversity) and the quality/price ratio are important for the global evaluation of the Lisbon tourist destination, while the feeling of security, the absence of noise, the cleanliness, the traffic control and the expectations fulfilment are more important for the tourists' returning in the future.

The tourists' favourable perception of the feeling of security in Lisbon can present a surplus value compared to other destinations, to be applied in the Lisbon marketing communication. Also, an ongoing effort to reduce noise and control traffic should not be ignored.

These are the aspects to be paid attention to by the Associação de Turismo de Lisboa, the shopkeepers and the overall population living and working in Lisbon, if it intends to retain its place as the tourists' favourite destination.

The suggested model might constitute an important tool for public and private organizations involved in the tourist industry. The two constructs mentioned elsewhere seem to yield valuable clues for the definition of segmentation and positioning strategies by tourism professionals and may even facilitate the development of adequate supply for the needs of Lisbon visitors.

In future studies, other variables contributing to explain the destination's global evaluation and the intention to return should be considered. This also applies to other items, in order to better seize the different components which form the concept of loyalty to a tourist destination.

⁵eBusiness Management School, Scuola Superiore ISUFI, University of Salento, Lecce Italy

Purpose - To provide a methodology for the implementation of e-Business solutions in small and medium enterprises. The main goal of this methodology is to provide SME companies with ICT solutions that helps them automate their processes for increasing value creation potential.

The Approach - This paper integrates different well known methodologies used for process management, change management as well as international standards for process mapping and modelling.

Findings - The methodology seeks on one hand to bring about a "proof of concept" about ICT and e-business adoption in SME companies and on the other hand to provide support for the transition of firms to an e-business vision that would allow them to face the challenges of the Digital Economy.

Research limitations/implications - The methodology framed needs to be supported by empirical data in order to prove its efficiency. Further research studies we are undertaken are going to accomplish this limitation.

Practical implications - A comprehensive and structured framework that allow to find out in which level of ICT use the firms actually are positioned and then to define those processes and critical areas where ICT tools can increase the business value.

Originality/value - This paper offers a methodological framework that links together engineers and managers to define in collaboration the right starting point and the right way to follow for adopting and using ICT tools and applications for business transformation and value creation

Keywords: *eBusiness, SME, Change management, business process reengineer.*

INTRODUCTION

The increasing rate of technological diffusion are transforming radically the economic and social landscape. They are changing rules, laws and factors which guide the competition among enterprises. The sustainable competitive advantage comes from the capacity to continuously improve, innovate, upgrade, and configure resources and competencies to match environmental needs (Eisenhardt and Fabrizi 1995; Feeny and Willcocks 1998).

These trends put forth major challenges especially for small and medium enterprises (SME), which count for about 96% and 99% of total number of enterprises in OECD countries (OECD, 2002). As a matter of fact, SME seems to have an advantage over large enterprises for their agility, flexibility and innovating potential. However, their competitiveness and sustainability in complex environments require the adoption of new business configurations based on the value creating potential of ICT tools and applications. ICT-s could play a major role allowing SME to

expand the potential benefits originating from linking electronically with suppliers, customers, and other business partners, to engage in the wide array of domestic linkages between users and producers and between the knowledge producing sector (universities and R&D institutes) (Meyer-Stamer, 1998, Nadvi, 1995; Nadvi & Schmitz, 1997; UNCTAD, 1998).

Nevertheless, SME potentialities are being constrained by small size, lack of resources, lack of adequate management style, high complexity and risk of innovation, limited ability to identify and work with new customers and suppliers across borders. While large enterprises have done revolutionary steps and improvements toward exploitation and exploration of ICT tools and intangible assets for innovativeness and competitiveness, small and medium enterprises are falling largely behind. They are reluctant on embracing the new technologies and changing the management practices.

In this paper we try to formulate a methodology that guide them toward the use of ICT in a feasible way tailored to their needs.

ICTs FOR SME BUSINESS TRANSFORMATION

Information and Communication Technologies (ICT) offer SME a wide range of possibilities for improving their competitiveness. As Oecd (2002) report argues, the use of ICT and its applications create substantial benefits for firms at intra and inter-firm level. In particular at intra-firm level they contribute on making communication within the firm faster and the management of the firm's resources more efficient, they increase the efficiency of business processes by the use of seamless transfer of information through shared electronic files and networked computers. At inter-firm level, benefits of ICT are related with the reduction of transaction costs and increased speed and reliability of transactions; the reduction of inefficiencies resulting from lack of co-ordination between firms in the value chain (OECD, 2002) as well as the reduction of information asymmetries between buyers and suppliers and the creation of closer relationships among trading partners (Moodley, 2002).

However, if we analyze the present situation of the introduction and use of information technologies in SME, we can see that a vast majority of enterprises from all sectors and countries uses computers and has Internet access. But in a lot of cases they are used only for basic functionalities, and not to improve internal and external communication, or to activate new information services.

As the figure shows smaller companies still struggle with the requirements of getting digitally connected with their suppliers and customers. If they cannot cope with the requirements of the digital economy, however, they risk being eliminated from the value systems that tend to be orchestrated by large firms (eBbusiness Watch, 2008).

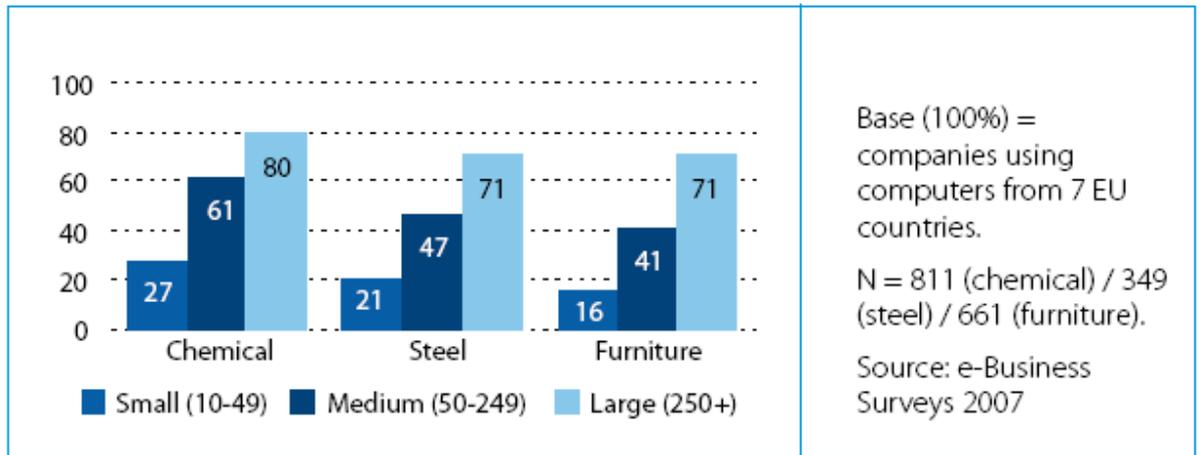

Figure 1 - % of companies with an ERP system (by sector and size, 2007)

As argued by Fulantelli and Allegra (2003) developing a full awareness of the huge potentials of ICT is the starting point for every attempt to introduce ICT-based processes in a company. Forcing the introduction of technology is one of the main reasons behind the failure of several attempts of the SMEs to become e-business organizations or simply to use ICT effectively for new services.

Venkatraman (1994) model of five levels of 'IT - induced business transformation' is a good starting point to analyze the firms's positioning on the use of ICTs firms for then defining the best approach that guide firms toward the efficient use of ICT, tailored to their needs.

The higher levels of business transformation offer potentially greater benefits but require corresponding changes in organisational structure and in the role that ICTs have to play within the business processes.

The five phases of Venkatraman model are:

The phase '**Localised exploitation**' is the one that requires the lowest level of business transformation and the lowest expected benefits. It involves the employment of standard IT applications with minimal changes to the organisational structure of the firm.

In the **internal integration** level firms can start to build the internal electronic infrastructure which allows the integration of various tasks, processes and functions within an organisation and then uses this platform to integrate these intra-organisational business processes. Venkatraman (1994) argues that this is an evolutionary step from 'Localised exploitation' and a shift to the third level in this model represents a fundamental shift to a more revolutionary use of information and communications technologies within the business process.

Business Process Redesign (BPR) phase requires the uses of ICT as a lever for designing new business procedures rather than simply overlaying the technology on the existing organisational framework.

The Business Network Redesign involves the use of ICT to step beyond traditional intra- organisational boundaries to include clients, suppliers, and changes the competitive environment by introducing a need for greater co-operation between trading partners.

The fifth level, **Business Scope Redefinition**, arises once the network is in place. This level addresses the question 'What role, if any, does ICT have to play in influencing business scope and the logic of business relationships within the extended business network?'

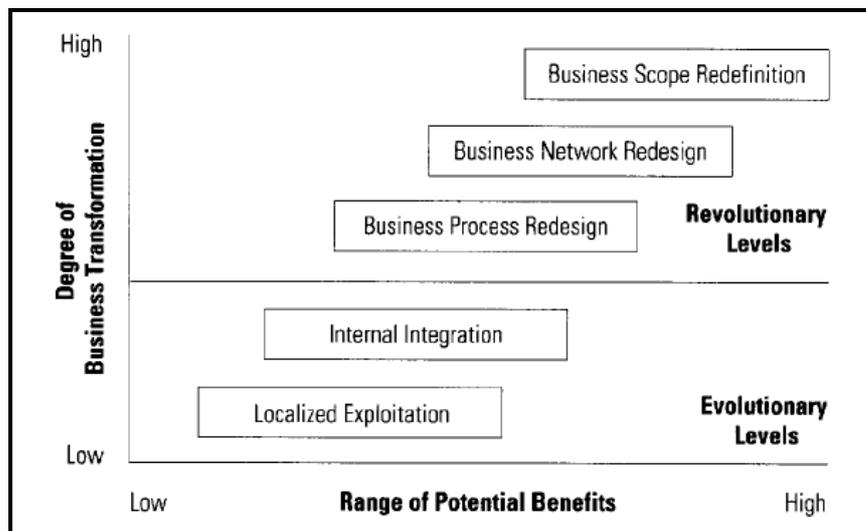

Figure 2: Five Levels of IT adoption. Source: Sloan Management Review

According to this framework, we have tried to formulate a methodology that defines the right starting point and the right way to follow for adopting and using ICT tools and applications for business transformation and value creation.

THE METHODOLOGY

The Methodology for introducing innovative e-Business solutions to SME is based in three main phases (figure 3):

- Analysis of 'As-Is' situation:
- Process redesign;
- Process automation.

This methodology integrates different well known methodologies used for process management, change management as well as international standards for process mapping and modelling.

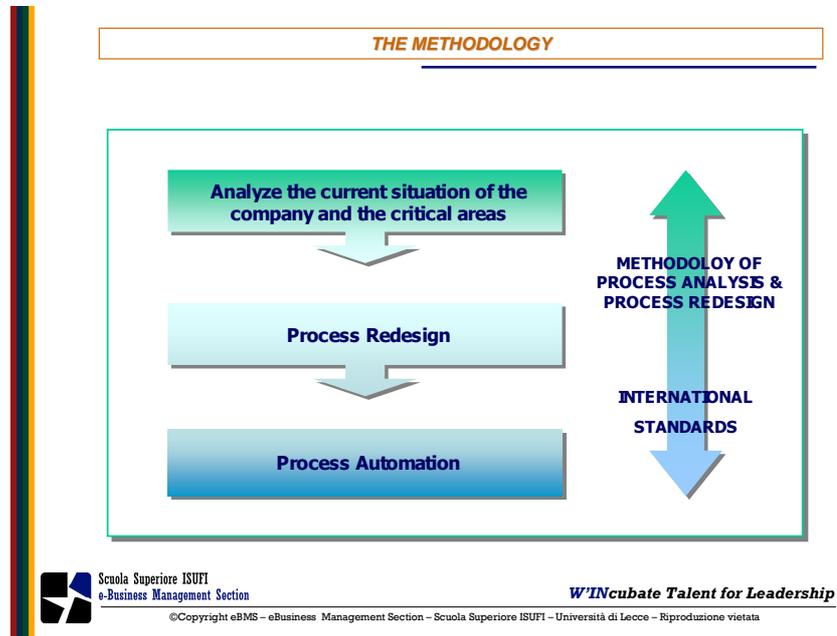

Figure 3: The Methodology Phases

In particular the methodologies used include:

- the MIT process handbook;
- the matrix of change tool used for designing the best pathway for change;

While the international standards used consist on BPMN for business process mapping and XPD L for the business process execution.

In the following sections we will explain in detail each of the three steps of the methodology along with tools, solutions we use in each phase.

The analysis of 'As-Is' situation

The methodology starts with an analytical phase that is aimed to describe the general situation of the firm under consideration. This phase has a two fold objective:

The industry analysis and the firm specific analysis.

The industry analysis aims to identify opportunities and constraints of the context where the firm operates. In order to do this, it is important to identify and examine factors that shall be taken into account while planning and organizing the e-business project. The five porter forces analyzes is used in this phase as a framework for industry analysis of the industry.

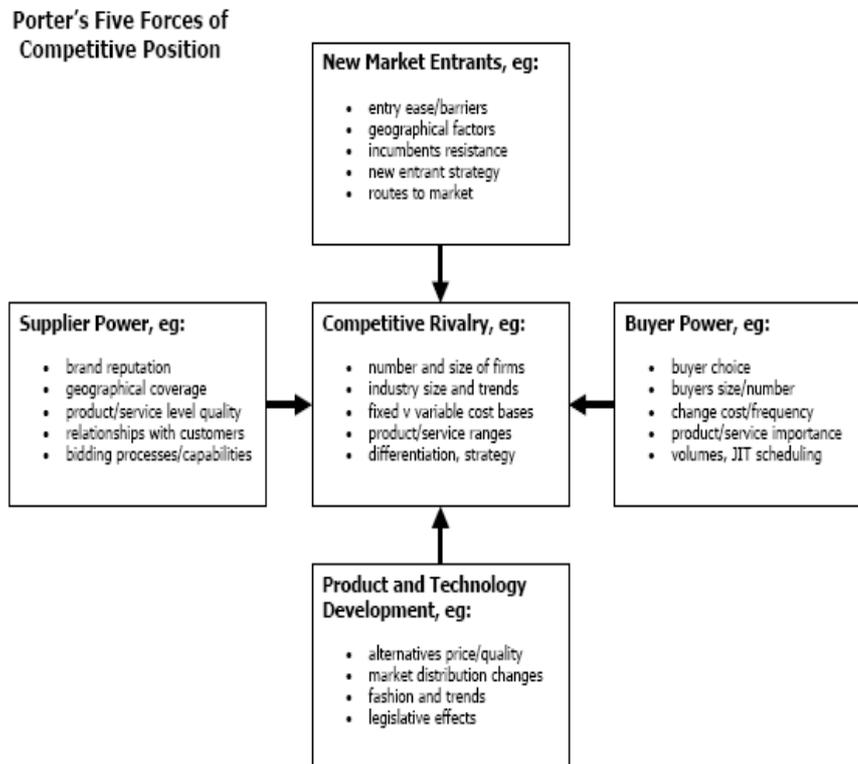

Figure 4: Porter Five forces

In particular the following issues can be analyzed:

- the competitive boundaries of this industry
- the major products/services sold in this industry.
- the major customers in this industry. Who will they be in 5 years?
- the principal channels through which products/services are sold.
- The best practices by which products/services reach the customer within these channels
- the major competitors (rivals) in this industry. What is the intensity of their involvement? Who will be the competitors in 5 years?
- the barriers to entry into this industry.
- the industry leaders? Outline general business strategies the leading firms in the industry follow.
- The substitutes for products/services of the industry that exist or are on the horizon.
- how firms in this industry add value to products/services throughout their value chain.

The method used for industry analysis consist mainly on a desk research where statistics, country/sector reports, previous literature and case studies are analysed to sketch out a description of the context.

The firm level analysis on the other hand is aimed to realize a thorough understanding of the current issues that the business taken in consideration is facing. In this stage a deepen knowledge of how the business function actually is realized, through direct visits and personal interviews. This step aims at depicting the organization's business processes, functions, services as well as for identification of bottlenecks, the diagnose of the relation practices of the company with its clients and suppliers, identification and analysis of improvement opportunities and definition of an implementation concept.

The first task of this phase is to understand in general terms the company activity, resources and structures.

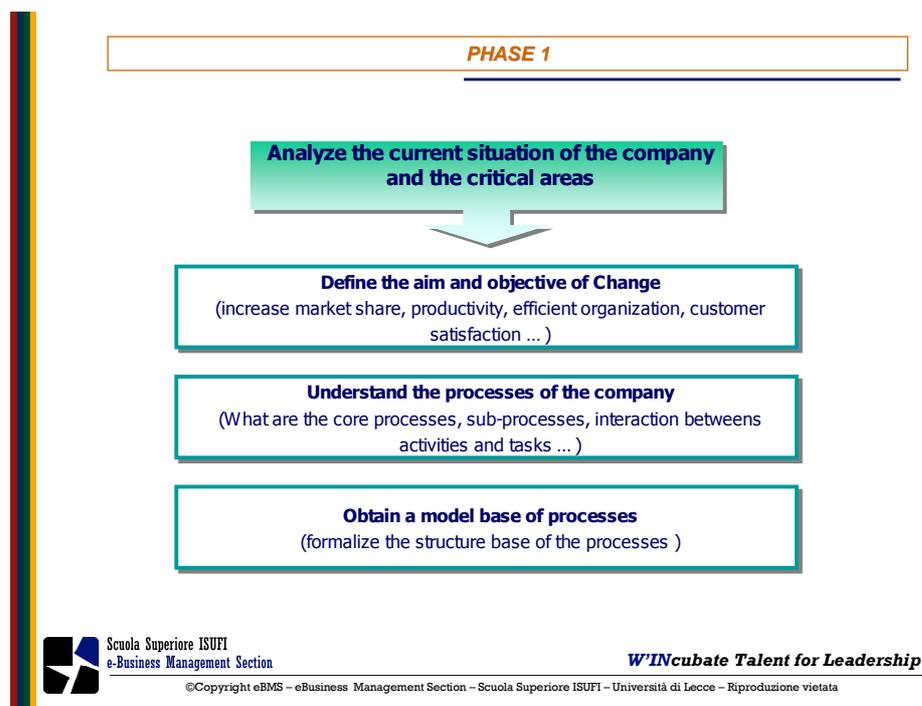

Figure 5: Phase 'As-Is'

In analyzing the 'As-Is' situation of the firm particular emphasis should be given to identification of critical areas which are not well practised in the SME under consideration, but which are of major importance for the achievement of the stated business objectives. This holistic analysis approach clearly indicates all bottlenecks and stresses those which are critical for the achievement of the key strategic business objectives and which, therefore, have to be eliminated with the highest priority.

The method used for the assessment of current situation focus on a survey research consisting on direct observations, questionnaires and interviews with the executives managers of the business. In trying to understand and describe the current situation, particular emphasis need to be given to 4 main areas:

1. Internal Environment – through which it will be possible to depict the organisational structure of the business, its main activities, processes and functions, as well as the strategy, resources, assets and performance issues.
2. External Environment – is aimed to trace how the business relate and interact with its customers, suppliers and stakeholders in general.
3. eReadiness – to carry out an assessment of current ICT adoption and IS skills used by the firm in its organisational processes and the IT tools that are associated to them. This is aim is to elaborate a snapshot of the company in terms of IS/IT.
4. Future Trends – through which it is possible to detect the future plans of the company regarding new technologies adoption; New business models; New collaboration process.

After this first screening an analysis of the data collected is needed through which is possible to recognize activities and habits (culture of work) that are interesting to maintain, as well as identifying weaknesses and threats that have to be overcome with the proposals subsequent to this phase.

Being that our focus is to provide firms with ICT solutions that helps them automate their process for increasing efficiency, a detailed analysis of the business process is needed.

Using as guideline framework the “Value Chain Analysis” of Porter (1985) the objective is to evaluate the current business process performed by the company, to identify the main supply chain actors, their roles and types of relationships with the firms as well as to define to which extent the current internal activities contribute to company’s competitive position.

In order to structure the analysis, the activities are divided in primary activities and secondary activities. The first ones are the ones oriented to the reception of raw materials, production processes, distribution, Marketing and after sales services. The last ones are the activities of support that focus in facilitating the tasks of the primary central activities.

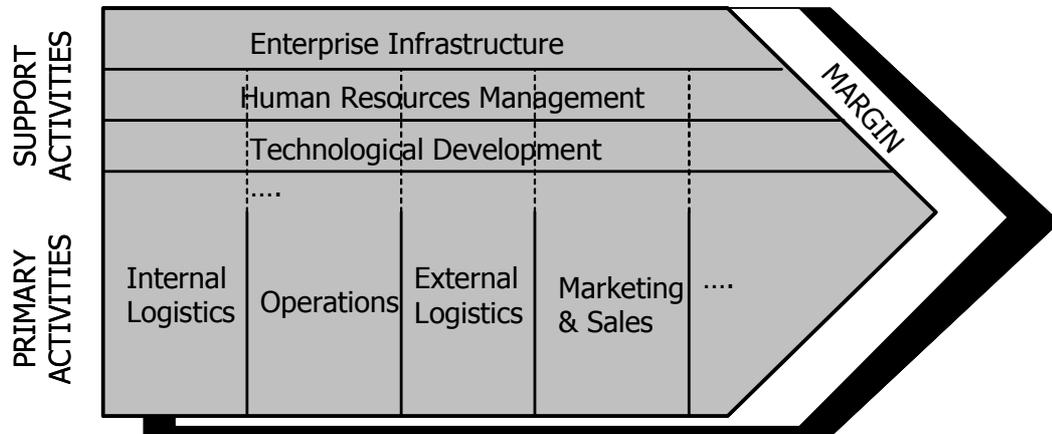

Figure 6: Value Chain. Company Value Chain (Porter, 1985)

The idea is to evaluate each activity on the basis of:

- Which activities have been proved to be well done, and maybe done in a better way than the competitors? (hence, it is considered as being a strength)
- Which activities are considered to be done incorrectly, or less efficient than the competitors? (hence, it is considered as being a weakness)

Normally, the activity-comparison is done in reference to the leading companies in the sector, or for the defects, the one that is considered as the main competitor of the company, object of the analysis.

Phase II - Process Redesign

Process analysis

After defining the activities the next step is to analyze processes of the company. The aim of this task is to analyze in detail the processes of the firms to define which are those critical areas where ICT/IOS tools can increase the business efficiency.

In analysing processes it is important to define how does the process work, who do what and when, with which other processes, and departments the process relates and interacts. A business processes modelling is realized in this phase which consists of the mapping of each business process according to the following conceptual schema.

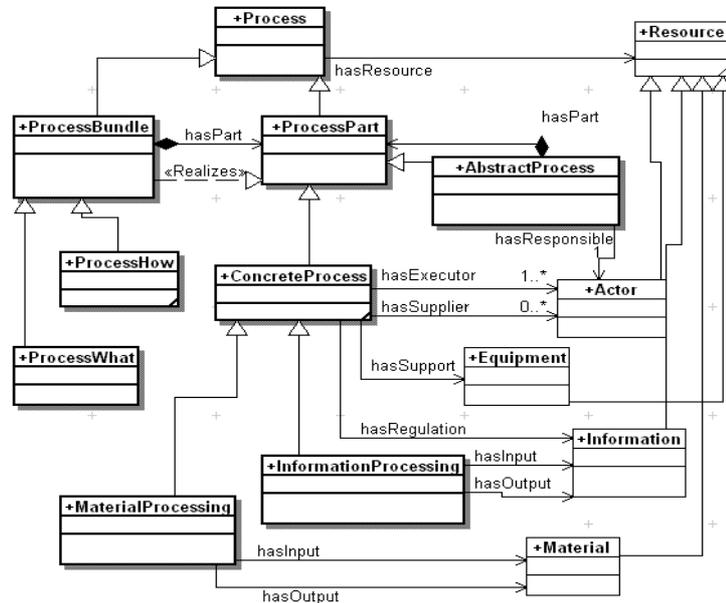

Figure 7: An example of business process modelling

This conceptual scheme is a graphical way of representing business processes, however it is considered as a good starting point for mapping processes on the MIT PH. The analysis of the main workflow processes, will allow us to organise the company activities, in such a way as to allow the identification of a unique person that is responsible of the process (that is he/she assumes the direction of the process from the beginning till the end, even though other departments and persons may intervene during the processing).

This mapping will be the basis for identifying key processes and sub processes, henceforth very useful for the business processes breakdown.

Process analysis and the modelling will permit us to define main weaknesses and criticalities of the firms. Thus a business processes reengineering needs to be performed in order to improve business processes performance.

As Venkatraman (1994) argues the most important advantage of Business Process Redesign (BPR) can be realized starting with the change of the current business process, that should be also integrated. With the aim to reach this goal, IT functionalities could be used to design a new organization and the linked new business processes, that can involve both a part of the organization or the total one.(Venkatraman 1994).

Business process reengineering

Business Process reengineering is a process through which it is intended to optimise and adjust a company's business processes and valorise whether these should be changed before applying an IT application to support them. Consequently, a very important component of business process reengineering is *change management*, and many reengineering processes have failed because of a lack of systematic and methodical view on how to manage change.

The Matrix of Change (Brynjolfsson et al, 1997) is a valid tool that can be used for defining the best path toward change management. MOC is a **visualization tool**, developed by the MIT e-Business Centre, for capturing the existing and desired states of a proposed change in an organization/business system. It provides a systematic way to judge those business practices that matters most. It highlights interactions among these practices and possible transition difficulties from one set of practices to another. This method encourages various stakeholders to provide feedback on proposed changes. Then, it uses process interactions to provide guidelines on the pace, sequence, feasibility and location of change.

The Matrix of Change functions as a four-step process, which are the following (Brynjolfsson et al, 1997):

- **Identify Critical processes:** On the basis of the questionnaires and interviews completed in the previous phase and with the help of the MIT PH modelling, the identification of key processes is significantly simplified. Along with this task, it is also important to identify these processes "with the end in mind", that is identifying the *purpose or business objective of change*, whether it is organisational learning, market share, flexibility, customer satisfaction, or something else. Then, and in order to help the building of the matrix, it is recommended to undergo the breaking of *current practices into constituent parts*, and then breaking *target practices into constituent parts*. The current state, identified in the previous step, describes how the organization functions prior to the change, in terms of the organization's configuration of strategy, activities, practices and work processes. The future state ideally specifies how the organization should function after the change initiative has been implemented successfully.

Key processes can be normally grouped into **categories** by:

function (e.g., marketing, human resources, manufacturing);

business objective (e.g. acquisition of a new market segment);

Strategic initiative / such as business projects (e.g. elimination of non-value-adding costs and speed).

- **Identify System interactions:** After describing existing and target practices in the agrifood domain, the two triangular matrices are filled in order to identify complementary and competing practices and, consequently, the level of stability of current and future system. Complementary processes reinforce one another whereas conflicting processes work at cross-purposes.

If practice areas are complementary their resulting matrix interaction is therefore a "+" (practices are reinforcing). If on the other hand, practices are competing - doing less of a competing practice increases returns to the other a "-" would be entered.

So, interactions can be quite easily identified following a purpose-driven aggregation of target processes. If some doubts still exist a little brainstorming among project managers can be useful to definitely solve them.

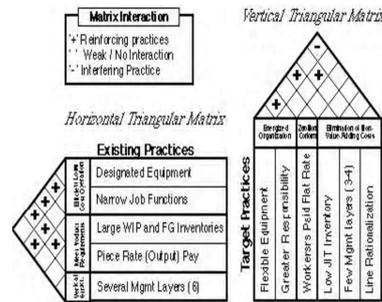

Figure 8: Horizontal and Vertical matrices capture the existing and target practices respectively (example taken from an MIT case study: MacroMed)

- Identify transition interactions: Next, a Transition Matrix is drawn - a square matrix combining the horizontal and vertical matrices, which helps in determining a plan for change, in defining the best path from old to new and, consequently, the degree of difficulty in shifting from existing to target practices. The transition matrix shows the interactions involved in moving from existing practices to a clean slate and it shows how important interactions between proposed changes may play out.

The percentage of positive and negative signs in the transition matrix indicates how disruptive the change process will be. A transition matrix with a comparatively large number of complementary practices and few conflicting practices indicates that the change will be relatively incremental and non-disruptive. Likewise, large number of conflicting practices indicates that the change will be disruptive; therefore the location and timing to implement the change become critical. A fairly negative transition matrix also signals the importance to take into consideration alternative practices or, in other words, a different business model. Finally, the Matrix of Change team should catch the firm’s level of awareness of opportunities and risks.

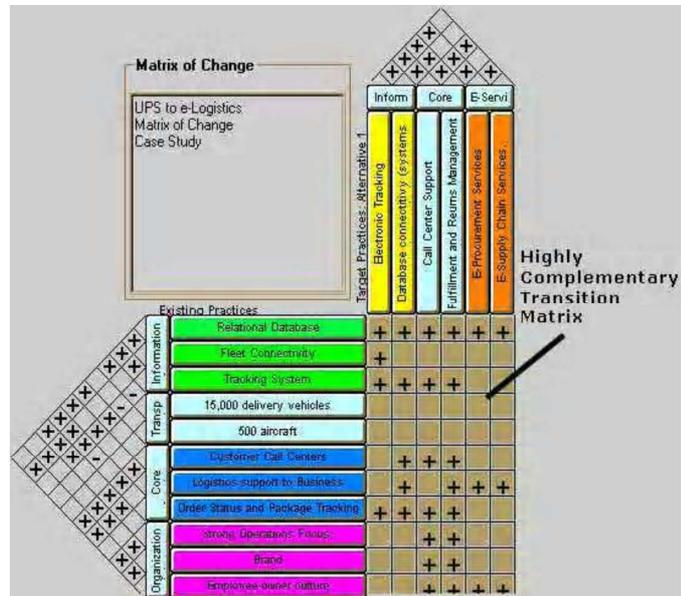

Figure 9: Transition Matrix : Old and New practices (example taken from an MIT case study: UPS)

- Survey Stakeholders: In this final step, the team needs to determine where various stakeholders stand with respect to retaining current practices and implementing target practices. Just as listening to the “Voice of the Customer” is essential to building a better product, listening to the “Voice of the Stakeholder” is essential to building a better process. Several different groups should be given the opportunity to indicate how important each process is to their job performance. Evaluation is captured generally by some structured organizational survey using a five point Likert scale anchored at zero. A value of "+2" means that a practice is extremely important and a value of "+1" that a practice is important but not essential, while a value of "-2" indicates a strong desire to change or reject business as usual. Blanks indicate zero values or no strong preference with respect to maintaining or eliminating these practices.

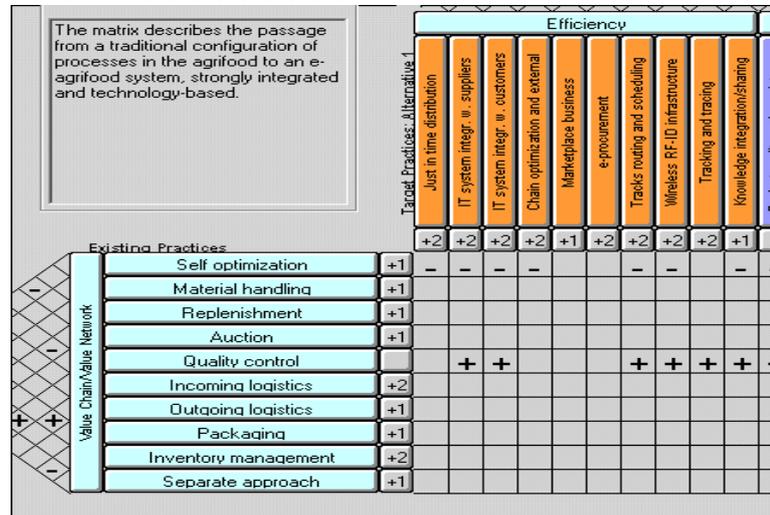

Figure 10: Stakeholder's evaluation (example taken from an Agrifood domain study)

Once the target practices are defined and evaluated, knowing how the existing and proposed business systems interact with each other, the next steps consist of:

- Interpreting the matrix of change, that is identifying the implications for change management. In this sense the Matrix of Change is a useful tool for addressing the following questions:

Feasibility: Do the set of practices representing the goal state constitute a coherent and stable system? Is our current set of practices coherent and stable? Is the transition likely to be difficult?

Sequence of execution: Where should change begin? How does the sequence of change affect success? Are there reasonable stopping points?

Location: Are we better off instituting the new system in a Greenfield site or can we reorganise the existing location at a reasonable cost?

Pace and Nature of Change: Should the change be slow or fast? Incremental or radical? Which groups of practices, if any, must be changed at the same time?

Stakeholder evaluations: Have we considered the insights from all stakeholders? Have we overlooked any important practices or interactions?

Each major area in the Matrix of Change serves various roles and addresses different aspects of these five issues. Taken together, they offer useful guidelines on where, when, and how fast to implement the change.

Modelling the new business processes and workflows inherent to the target practices

Based on the proposed target practices, new business processes arise. These new business processes correspond mainly to processes related to new chain and organisational models, new

online processes (in the case the company is ready to adopt a new business model based on Internet) and finally new processes inherent to the application of a new technological tool (ICT).

Through the use of the MIT PH library as well as by using other best practices cases it is possible to define some possible alternatives for improving the criticalities of the processed identified. thus it is possible in this way to realize a table with the main criticalities identified and possible solutions and alternatives identified.

The different alternatives and solutions identified needs to be evaluated in order to chose the best one that fits to firm's needs.

This mapping will be the basis for designing the new organisational model of the company.

Phase III - Process automation:

The process automation phase consist on digitalizing the processes according to alternatives defined by an ICT company. The focus here is to refine the basic model in order to obtain a machine readable model. Well known international standards such as BPMN; XPDL, BPEL will be used in this phase for modelling the processes that needs to be automated. The work is then to coordinate the workflow and to adapt the pre-configured process to the company situation. Next tasks are the specification of the necessary application software and interfaces with legacy systems.

CONCLUSIONS

This paper presents a methodology that guide SME toward the use of ICT in a feasible way tailored to their needs. It is argued that before starting an initiative of ICT introduction in SME, it is important to firstly undertake a detailed assessment of the firms to understand the state of the art of ICT use. Many times ICT use doesn't guarantee profitability and many times worse the competitive position of firms (Porter, 1985). On of the main reasons associated with that is the fact that application and implementation of ICT tools and infrastructures are not suitable for their needs and objectives. The first step is the establishment of an appropriate and tailored approach. Every project or initiative needs to be rooted in a very careful, analytical and dynamic approach. In many cases the shift toward new electronic business models is limited to a simple transfer of information and services online without taking into consideration the re-engineering process needed to grasp the full benefits. Part of the approach is to engage in a rigorous assessment of the current situation, the reality on the ground, articulate costs, impacts and benefits as well as continuously monitor and evaluate the project upgrading.

However, starting at the right point and in the right way doesn't automatically guarantee success and competitive advantage to SMEs. There need to exist some conditions and prerequisites that a firm need to satisfy in order to efficiently implement the ICT tools and application:

Human resources – The availability of appropriate skills is central for successful ebusiness implementation. Thus, it is important to assess the technological profile of the employees involved in business processes. It is important to indicate whether the actual ICT skills and profiles exist and if not which types of skills, capabilities and competencies are missing. Also,

training plan need to be established defining the education programs needed, for what time, to whom etc. The training plan will take into account the profiles of the people involved in the tasks articulated by each module of the e-Business solution to be installed. The purpose of the training plan is to fit as much as possible the needs of the employees, in order to create full adherence to the e-business initiative and to the cultural change as well. Also, lifelong learning is an essential prerequisite as the rate of change increases and new technologies, practices and competitive models emerge.

- Change management issues, also, must be addressed as new work practices, new ways of processing and performing tasks are introduced. The use of new ICT tools and applications will revolutionizes and reinvents the business. Employees fear changes in general and ICT applications in particular as they believe that ICT would replace them and so cause job losses. Thus, employee resistance to change is still the biggest barrier to successful change. Moreover, it is very difficult in a short time to turn off traditional methods of working and learn new ones. Addressing resistance successfully means ensuring the existence of incentives for employees to learn and change and the establishment of well-structured plans that embrace employee participation throughout all stages of a change process.

- Leadership is one of the main driving forces of every new and innovative project or initiative. A leader which is able to understand the real costs and benefits of the project, to motivate, influence,

include and support other organizations and institutions, is required. Leadership is necessary before, during and after project implementation. Before the project is initiated, leadership is needed in order to explain the concept, the model and create awareness; during the project, leadership is needed to manage change and support the project; and after the project, it is needed to pledge the required flexibility and adaptability of the initiative. Top leadership involvement and clear lines of accountability for making management improvements are critical to overcoming organizations' natural resistance to change, marshalling the resources needed to improve management, and building and maintaining the organization wide commitment to new ways of doing government (McClure, 2001).

TURKISH CONSUMERS' EVALUATION OF CHINESE GOODS: DOES THE PERCEPTION VARY ACROSS PRODUCT CATEGORIES AND PRODUCT ATTRIBUTES?

Öztürk, Sevgi Ayşe¹; Kaya, Feyza²

¹Marketing, Department of Business, Faculty of Economics and Administrative Sciences, Anadolu University, Eskişehir, Turkey

²Marketing, Department of Business, Faculty of Economics and Administrative Sciences, Anadolu University, Eskişehir, Turkey

Purpose - Although various research has found negative attitudes towards Chinese goods, China has continuously increased its share of the world's exported goods. Consumers internationally including Turkish consumers are skeptical about Chinese goods. Despite this fact, dominance of Chinese goods in Turkish market seems unstoppable since its share has increased up to 90% in some product categories. The purpose of this research is to explore overall perception of Chinese goods relative to other countries. Particularly, the research investigates whether the Turkish consumers' evaluation of Chinese goods varies across specific product categories and particular product attributes such as design, performance, technology, quality, price, and creativity. In addition, the study tries to find out if the evaluation of product attributes and product categories differ in accordance with consumer demographics.

Design/methodology/approach - The study has followed a quantitative approach. For attaining the above aims, a field survey was conducted in Eskişehir, Turkey. The data was collected face-to-face by a structured questionnaire from a sample of 300 people. In the questionnaire, to represent categories, we have chosen nine specific products that China have relatively high share in Turkish market. Also we have identified twelve product attributes to be evaluated by the respondents in a scale.

Findings - China has been ranked as the least preferred country by 35.8% of the respondents. The findings of the study revealed that Turkish consumers' perceptions of country of origin vary significantly across the product attributes. The respondents have found the price dimension as the most favorable attribute of the Chinese products followed by design, creativity and entertainment attributes. The research has also found that country of origin perceptions of China tend not to be product category-specific. Although the most favorable product category was souvenir/gifts and the least favorable was air conditioners/heaters category, the difference in the perceptions of these product categories was not significant. The study did not find significant role of the consumer demographics in the evaluation of Chinese products with respect to product categories and product attributes.

Research limitations/implications - The present study has just focused on Turkish consumers' evaluation of Chinese goods. Comparative studies conducted in different countries are needed to have a better understanding of the perception of Chinese goods.

Originality/value - Chinese goods in Turkey have been a controversial issue and discussed heavily in various context. Although there were findings about the opinions of entrepreneurs and executives on Chinese goods, information about the consumers' perceptions was lacking. So by exploring the consumer perspective, this study filled such a gap in the literature. The study may provide valuable insights for Chinese goods marketers in Turkey.

Keywords *Perception of Chinese goods, Product categories, Product attributes, Country of origin, Consumer behavior, China, Turkey*

Paper type Research paper

INTRODUCTION

Perceptions of products are influenced by many stereotypes. Country of origin in other words, our perceptions about where the product is coming from is an important stereotype that influences our evaluations of products. Country of origin studies in the marketing literature goes back to 1960's. China, as being one of the most proverbial countries of the last decade has been subject to the country of origin studies more recently. Country of origin may provide advantages or disadvantages for products coming from different countries. Various researches suggest a negative country of origin perception for Chinese products. For example, a survey made by Interbrand, have found "Made in China" hurts Chinese brands (Roberts, 2007). So to hide country of origin many products use "Made in PRC" (People's Republic of China) instead of made in China labels. Contrary to research results, China has been a phenomenon for the world economy and almost it has been impossible to find any product that is not manufactured in China or originally Chinese all around the world. Turkey was not an exception. By 2007, China was the third country in terms of Turkey's import volume and it was possible to find Chinese goods in 30 different product categories ranging from toys to electronics. Meantime, popular press was full of negative news about Chinese goods and also industry representatives warned public against Chinese goods. So in this research we have made an attempt to explore the preference of Chinese goods relative to other countries' products and particularly to explore if the evaluation differs with respect to different product categories and product attributes.

Various researches have shown that country of origin perception differs with respect to product category and product attributes. Kaynak and Çavuşgil (1983) found that consumers suggest that quality perceptions tend to be product-specific. Eroglu and Machleit (1988) showed that country of origin is a significant indicator of product quality, but its relative influence varies by product category as well as by individual and product variables. It has been shown in several studies that stereotypes of products from a particular country could vary by product category (Eroglu and Machleit, 1989 in Choe and Cho, 2000). M. Sadiq Sohail (2004) examined the country of origin effect of products made in China. The study focused on the questions of the evaluation of specific product dimensions by Malaysian consumers; and consumers' assessment of different product categories. It was found that products made in China had been rated highly for their competitive pricing. Foodstuffs were generally found to be the popular preference of product category by Malaysian consumers. In another survey by Leo J. Shapiro and Associates (2002), it was found that The Americans hold medium and low level of interest in buying Chinese goods. They have shown relatively more interest in buying electronics, computers, textile and television coming from China (Shenkar, 2007). So in this research we have followed a similar approach and focused on the evaluation of different product categories and product attributes.

REVIEW OF RESEARCH ABOUT THE EVALUATION OF CHINESE GOODS

Evaluation of Chinese goods by the world consumers has been a popular subject for international market research companies in recent years. Possibly because of the latest news about the potentially unsafe products coming from China and because of its being a threat for

local manufacturers, they have conducted various researches in different parts of the world. However in the marketing literature, there are fewer researches about country of origin effect of China and consumers' evaluations of Chinese goods. Some of the research results have been summarized below.

Kaynak and Kara (2000) found that compared to the products coming from Japan, USA and Western Europe Chinese products were perceived to be inferior in terms of reliability, durability and service by Turkish consumers. In other words Turkish consumers did not have positive perceptions and evaluations about products coming from China.

Huddleston et al. (2001) found that generally, USA and German products were rated more favorably when compared to Chinese products among Polish consumers. In their study performed in Russia, it was concluded that quality ratings of Chinese products were very low and Russian consumers perceived Chinese products to be much lower in quality than Russian products (Huddleston et al., 2000).

Yee and Wa (2004) revealed that when people see a product which is from Mainland China, they may have strong perceptions that the product is not good. The results also prove that people in Hong Kong do not like China brand products very much; they think the products are old-fashioned, cheap and not innovative. In their study, Lyden et al. (2005) have found that there is some sort of negative impact on Swedish consumers when products are made in China.

Cengiz and Kırkçbir (2007) found that the products made in China were evaluated high by the mean price and innovativeness but quality, performance, durability, assortment and other attributes were seen defective by Turkish consumers. Leonidou et al. (2007) found that Chinese goods consistently received lower scores among British consumers, denoting worse design, quality, distribution and service compared to the US goods, which received lower evaluations.

A survey by Angus-Reid Global Monitor (2007) in Canada showed that 51% of respondents were paying closer attention to product labels when shopping because of recent recalls of Chinese-made products. The survey also reported that about 83% consumers think that Chinese products sold in Canada should carry a label of origin stamp. Similarly, a separate Reuters-Zogby poll gauging consumer confidence in the U.S. has found that 35% of respondents were "very worried," and another 43% were "somewhat worried" about the safety of Chinese products. A recent series of product safety scares involving products ranging from pet food to toothpaste to toys has shaken consumer confidence in made-in-China goods (<http://www.cbc.ca/canada/story/2007/09/19/china-products.html>). In another Zogby Poll research in 2007 it was found that 82% concerned about buying goods from China (Powell, 2007). According to a survey by Gallup in 2007, a solid majority of Americans report paying more attention to which countries produce the products they buy, say they are making an effort to avoid buying products made in China, and express a willingness to pay higher prices for similar goods made in the United States. The public estimates that close to half of imported food and manufactured goods from China violate U.S. health and safety standards (Jones, 2007).

An online poll by U.S. news channel MSBNC showed that 77% of 9,865 people said they were for 'China-free' labeling. According to a Reuters/Zogby poll released in mid-September 2007, around 78 % of Americans worry about the safety of Chinese imports, and a quarter have stopped buying food from China, with 23% no longer buying Chinese toys, and 16% imposing a

total brand ban. The poll found more intense worry among poorer consumers and women. Almost 40% of British consumers are less likely to buy Chinese-made toys because of Mattel's recent crisis, according to a YouGov survey commissioned by Marketing Week (Kasriel, 2007).

Synovate Company (2005) found that only one in eight respondents from the US and key markets in Europe think highly of the quality of products made in China and Korea. Chinese and Korean products may be seen as low quality, but they are also low cost, so the perceived value is significantly higher than quality. (<http://www.synovate.com/knowledge/infact/issues/200601/>).

A poll conducted by The New York Times/CBS News concluded that 35% of the adults surveyed consider Chinese imports to be more unsafe than imports from other countries, but 55% said their perception that Chinese imports are more harmful is a result of the recent wave of recalls. The survey further indicated that 71% of the participants were aware of a product's country of origin upon purchase, and only 14% stopped purchasing Chinese goods because of the recalls (Weisman and Connelly, 2007).

TURKEY-CHINA TRADE RELATIONS: CHINESE GOODS IN TURKEY

China introduced market reforms in the early 1980s; only a third of the economy is now directly state-controlled. Since joining the World Trade Organization in 2001, China has rapidly become an economic force, doubling its share of global manufacturing output, creating a commodity-market boom and accumulating \$1 trillion of foreign-exchange reserves. In 2004 China became the largest exporter of information and communication technology (ICT) exports (Economist.com, Nov 12th 2007).

Trade relations of China and Turkey have started with trade agreement signed in 1970's. (http://www.tisk.org.tr/yayinlar.asp?sbj=ana&ana_id=51). Starting with the door locks, Chinese goods have penetrated to all sectors ranging from cars to computers to carpets. (<http://www.atonet.org.tr/yeni/index.php?p=60&l=1>). By the year 2003, pulling ahead of Japan and South Korea, China has become the largest trade partner of Turkey among the Asia-Pacific countries (http://www.ekodialog.com/Makaleler/turk_cin_iliski.html).

Table 1 shows the trade relations between China and Turkey. A significant increase in trade volume occurs in 1995. By the year 2000, trade volume has reached 1.4 billion dollars and after 2002, a continuously increasing trend is observed in the imports from China. The table also indicates a big deficit in the trade relations of two countries. For example, in the year 2007 import from China was 13.2 billion dollars while the exports to the China were just about 1 billion dollars.

<u>YEAR</u>	<u>EXPORT</u>	<u>IMPORT</u>
1990	37	246
1991	20	172
1992	144	172
1993	512	255
1994	355	258
1995	67	539
1996	65	556
1997	44	787
1998	38	846
1999	37	895
2000	96	1.345
2001	199	926
2002	268	1.368
2003	505	2.610
2004	392	4.476
2005	550	6.885
2006	693	9.669
2007	1.040	13.234
2008/9	1.176	12.249

Table 1. Turkey – China Foreign Trade (Million \$)¹⁹⁷

By the first half of 2007, 7.4% of the imported goods were coming from China and following the Russia and Germany it was the third country in terms of Turkey's imports (http://www.kobifinans.com.tr/tr/dis_pazar/0406/17200/5).

Ankara Chamber of Commerce has conducted a research about Chinese product in Turkey in 2004 and has reported that the penetration of Chinese goods have been seen in 30 different sectors. According to the research 95 % of all the toys, 76 % of armatures, 45% of eyeglasses, 25% of carpets and half of the air conditioners in the Turkish market were coming from China. Table 2 shows the penetration of Chinese goods in diverse sectors such as bicycles, electronics, toys and ceramics (www.atonet.org.tr). So, China was chosen for this research, as it is one of the most important commercial partners of Turkey and also it is a very controversial country in terms of the products they export to the global markets.

RESEARCH METHOD

This study draws upon fieldwork conducted in Eskişehir. Eskişehir is rated as 3rd most livable city of Turkey in terms of life quality, health, education, livability, development and other socio-economic data according to a study of United Nations Development Agency (Gözütok, 2008). In this research, quota sampling was used. In the selection of the sample units we have considered the age and gender distribution of Eskişehir according to the latest census data. Distribution of the population in terms of income and education level is considered also. Data were collected from 300 respondents by means of self-administered questionnaire. For the respondents who do not have sufficient education to fill the questionnaire and who need help because of their age we have read the questions in the questionnaire and asked for their response. The data gathering process was carried out in December 2007 and January 2008. The questionnaire consisted of four major parts; the first asked the preference of Chinese products relative to other countries' products with a ranking question; the second part comprised the questions about the respondents' experiences with Chinese products. The third part of the questionnaire included product categories and product attributes to be assessed by the respondents as "good" or "bad" in a five point Likert scale. Finally, the last section of the questionnaire explored the demographic profile of the consumer in terms of age, gender, education, and monthly household income which are used to interpret the responses to other questions.

Data analysis took the following forms; first of all, percentage frequencies were estimated for ranking and experience questions; second, mean scores were estimated for each product categories and product attributes measured on five-point rating scales; third, t-test and one-way ANOVA tests were employed in order to find out the role of demographics on the evaluation of Chinese goods.

FINDINGS

Sample Profile

In terms of demographic characteristics, the sample was more or less equally split between males and females. The sample comprised 156 males and 144 females. In terms of age grouping, 20.3% of the respondents were in the age group 18-24. Just over half (50.3%) of the sample was aged between 25-44, while the remainder (29.3%) were in the age group 45-74. In terms of education, just 13.1 % of the participants in the survey had received mainly primary education or was literate; more than half of the participants (51.7%) had only secondary or high school education, while the remaining 35.2% had graduated from university, master or PhD program. With regard to monthly average household income, 27.3% of the respondents earned less than 1000TL (1TL≈0.5Euro), another 46.8% was in the range of 1001TL to 2000TL, while the remainder (25.9%) had an income exceeding 2001TL.

<i>Demographic variables</i>	<i>Frequency</i>	<i>%</i>
<i>Age</i>		
18-24	61	20.3
25-44	151	50.3
45-74	88	29.3
<i>Sex</i>		
Male	156	52.0
Female	144	48.0

Preference of Chinese Products

In this research instead of asking the overall assessment of Chinese products, we wanted to learn about the preference of Chinese products relative to other countries' products. So in the questionnaire we have described a scenario and asked respondents to consider unbranded products from different parts of the world. All the attributes of the products are assumed to be completely similar (price, quality, design, size) other than the country of origin. We asked respondents to rank the country/region preference for this product over a list of 8 countries/regions including Eastern Europe, Japan, USA, Western Europe, Turkey, China, and Arabian Countries. As seen from the table a very small part of the respondents indicate that that they would prefer the goods coming from China. Only 5% of the respondents ranked Chinese product as their first, second, third and fourth choice. So the result of this ranking question indicates a negative preference for Chinese products.

<i>China as the first choice</i>	0.4%
<i>China as the second choice</i>	1.2%
<i>China as the third choice</i>	1.7%
<i>China as the fourth choice</i>	1.7%
<i>China as the fifth choice</i>	6.2%
<i>China as the sixth choice</i>	23.9%
<i>China as the seventh choice</i>	29.2%
<i>China as the eighth choice</i>	35.8%

Table 4. Ranking of the Preference of Chinese Product

Experience with Chinese Products

We have also asked the respondents' experiences with Chinese products. In order to learn about their experiences with Chinese products we have asked two different questions. We have differentiated the original Chinese products from the products with Western origin but manufactured in China. In the questionnaire, we have described what we mean by Chinese products. As seen from the table 5, nearly half of the respondents indicated that they had bought an original Chinese product. We wanted respondents to name this product and to assess their satisfaction level. Mean satisfaction level for Chinese products experienced was 2.85 (5 refers total satisfaction- 1 refers total dissatisfaction). While 2.8% of the respondents expressed total satisfaction, 34.7% of those who have purchased Chinese product expressed satisfaction. But an examination of the brands of the products declared by the respondents has shown that consumers can not differentiate between originally Chinese products and products manufactured in China. Some examples of brands that are mentioned as Chinese were Song Yang automobile, Yong Sen automobile, Nike shoes, Bianchi, Barbie toys, Awio mp3 player, Sukida scooter, Yumatu watches, Puma shoes, and Teac mp3.

		<i>Frequency</i>	<i>Valid Percent</i>
<i>Valid</i>	<i>Yes</i>	123	44,7
	<i>No</i>	152	55,3
	<i>Total</i>	275	100,0

Table 5. Have you ever bought an original Chinese brand?

Table 6 shows the responses to the question about the purchase of a product manufactured in China but having a Western origin such as some sneakers and laptops. 34% of the respondents indicated that they have bought such a product while 24% haven't bought such a product.

		<i>Frequency</i>	<i>Valid Percent</i>
<i>Valid</i>	<i>Yes</i>	90	34,0
	<i>No</i>	62	23,4
	<i>Do not know</i>	112	42,3
	<i>Total</i>	265	100,0

Table 6. Have you got any original Western products but which are manufactured in China?

Assessment of Chinese Products with respect to product attributes and dimensions

The analysis above indicates negative evaluations of Chinese products. So how this situation can be explained considering the fact that China's share in Turkish market is very high in various product categories. To address this question we wanted respondents to assess Chinese goods in different product categories and with respect to different product attributes.

Product Attributes	N	Mean
<i>Design (appearance, ease of use)</i>	283	3,3216
<i>Performance</i>	269	2,7138
<i>Technology</i>	274	3,0109
<i>Quality</i>	276	2,3080
<i>Safety</i>	271	2,2989
<i>Guarantee</i>	258	2,1744
<i>Price</i>	271	4,0074*
<i>Durability</i>	273	2,2344
<i>Creativity/innovation</i>	265	3,2868
<i>Funny (being a fun)</i>	255	3,2824
<i>Healthy (suitable for health)</i>	261	1,9579*
<i>Reputation (prestige, image)</i>	270	2,1000

Table 7. Descriptive Statistics for Product Attributes

5= very good , 1= very bad

The dimensions listed for assessment are selected as a result of the review of literature, a review of news about Chinese good in popular press and an observation of stores selling mainly Chinese goods. For instance, observation of the products that are sold in such stores has shown that some of these products were very interesting, funny and creative. With respect to specific product dimensions consumers have different evaluations. The most favored dimension of Chinese goods was price, followed by design, creativity and fun. The respondents evaluate Chinese goods bad in terms of health, prestige and safety.

In the research we asked consumers to assess Chinese products in different categories. The categories for assessment were selected from the list of Chinese product in Turkey that has been declared in Ankara Chamber of Commerce's report.

Product Categories	N	Mean
<i>Toys</i>	281	2,7580
<i>Souvenir/gifts</i>	281	3,0996*
<i>Glassware</i>	262	2,9313
<i>Air conditioners/heaters</i>	205	2,5463*
<i>Household textiles/clothing</i>	231	2,6537
<i>Stationery</i>	243	2,8107
<i>Automobiles</i>	188	2,5904
<i>Electrical small home appliances</i>	237	2,6245
<i>Luggage/bags</i>	226	2,9735

Table 8. Descriptive Statistics for Product Categories

5= very good , 1= very bad

Souvenirs appeared to be liked most by the respondents. Luggage and bags were rated as the second favorable product categories followed by the glassware and stationary. The respondents did not rate any product category as very bad. Air conditioners and heaters have the smallest mean score followed by the automobiles.

In order to analyze if the respondents with different demographic profile have different evaluations for each product category and product attribute t-test and one-way ANOVA were used. The study did not find significant role of the consumer demographics in the evaluation of Chinese products with respect to product attributes. Gender, age, education level, and household income seem not affecting the evaluation of Chinese goods with respect to product attributes. However, with respect to product categories the evaluation of respondents with different demographic characteristics differs in some categories. According to t-test results, there was a significant difference between male and females in the evaluation of automobiles; female respondents rated this category higher than the male respondents. One-way ANOVA results have shown that there was a significant difference in the evaluation of glassware between the respondents in the 18-24 age range and 45-74 age range; younger respondents rated this category more favorable. Also the respondents in 18-24 age range evaluated small home appliances more positive than the respondents in the 25-44 range.

Table 10. Evaluation of categories of products made in China

SUMMARY AND CONCLUSIONS

The high share of Chinese products in various product categories has been perceived as a threat for local manufacturers in Turkey. At the same time, lots of unfavorable news has been published in popular press about products coming from China. Despite these, various data show the penetration of Chinese products in many consumer product markets in Turkey. So the purpose of this paper was to have a better understanding of the evaluation of Chinese products by Turkish consumers. In this study rather than thinking all the Chinese products as uniform, we investigated the evaluation of products in different categories. Also we focused on the evaluation of the different attributes of the product rather than considering an augmented product. The preference of Chinese products relative to the products of different countries is explored. The respondents generally ranked Chinese products as their last choices.

The lowest rated product category by the respondents was air conditioners and heaters category. This finding seems very understandable in the context of Turkey. One of the popular advertising campaigns in 2009 winter was about a Turkish heater brand. The advertisement which is banned later was informing the consumers that the heater was not a Chinese product and giving the message that consumers must avoid buying Chinese products because of poor quality. The highest mean score was for products which we described as souvenirs and gifts. Considering the Turkish culture of gift giving this may be very understandable. Since gift giving in various occasions is very popular in Turkey, Chinese goods have provided cheap alternatives. However, the respondents' evaluation of product categories could be described as moderate since the respondents did not evaluate any product category as very good or very bad. So in this research we did not find significant differences in the evaluation of Chinese goods with respect to different product categories. The difference between the highest rated product category and the lowest rated category was just about 0.5 in the 5 pointed Likert scale.

The results regarding the assessment of product attributes show that consumers find the prices of Chinese products good. This finding is consistent with the previous findings about Chinese goods. Also they think positive about the design, creativity and fun feature of these products. The findings suggest consumers' concern about the health, prestige and safety. Considering the difference between the highest rated (mean score: 4.0) and the least rated product attribute (mean score: 1.9), we may conclude that the evaluation of Chinese goods differ when specific dimensions of the products are considered.

Although there were findings about the opinions of entrepreneurs and executives on Chinese goods in Turkey, information about the consumers' perceptions was lacking. So by exploring the consumer perspective, we have made an attempt to fill such a gap. Considering the respondents' ranking of the Chinese goods at the bottom of the country list, their evaluation regarding product attributes and categories seem more favorable. In our research respondents think favorable in some dimensions and they do not have very negative evaluations in some product categories. If the safety and performance dimensions of Chinese products are improved, more favorable opinions may be expected. Since this study was conducted in one of the most developed cities of a developing country, it is important to replicate this study in different socio-economic contexts such as different cities in Turkey and different countries. This study may provide a basis for future research on the comparative evaluation of Chinese goods versus

Turkish goods on different product categories and dimensions. Further research about the evaluations of Chinese goods by the manufacturers and retailers in Turkey may be explored to make a comparison. Learning about the perspectives of consumers, retailers and manufactures may help producing better policies on imports from China.

CONSUMER ACCULTURATION: RESEARCH ON FOOD CONSUMPTION PATTERNS OF TURKISH IMMIGRANTS IN GERMANY

Ozturk, Sevgi Ayşe¹; Sevim, Nurdan²

¹Anadolu University, Faculty of Economics and Administrative Sciences, Anadolu Universit, Yunus Emre Campus 26470 Eskisehir

²Bilecik University Bozuyuk Vocational School Marketing Department, Bilecik University Bozuyuk Vocational School 11300 Bilecik

Purpose: By the end of 2007, 2.790.000 Turkish people were living in Germany and they constitute the largest ethnic group of the country. Although Turkish people have presence in Germany for about 45 years, their potential as consumers has been ignored until recently. However, they have a spending power of about 16.9 billion euro annually. Thus, the purpose of this research is to explore the consumption patterns and shopping behaviors of Turkish immigrants in Germany. We focused on the consumption and shopping of food products, and investigated whether food consumption patterns change due to the ethnic identification of immigrants.

Design/methodology/approach: A quantitative approaches was used to collect data. We conducted a field survey in Cologne, Germany. Cologne is the city with the highest ratio of Turkish people compared to the whole population. The data was collected via a questionnaire from a sample of 438 people representing a very similar demographic make up of Turkish people in Germany.

Findings: The findings show that ethnic identification has considerable impact on the food consumption patterns. Turkish consumers still maintain their original consumption culture for food products. Since most of the respondents identify themselves with their country of origin rather than to the home country, this kind of consumption makes sense. Most of the consumers prefer Turkish retailers and Turkish brands for meat, meat processed products and for vegetables. The study has found that respondents with strong ethnic identity have more preference for the food stuff of Turkish culture, for Turkish food retailers and Turkish restaurants.

Research limitations/implications: This study provides valuable implications for ethnic marketing which has become a very popular marketing practice all around the world. Although different ethnic groups such as Hispanics, Chinese and Africans have been studied a lot, Turkish consumers in Europe have not been investigated much. Thus, this study provides a starting point for future research about the food consumption patterns and consumer acculturation of Turkish immigrants in Western Europe. The main limitation of the study is that the sample for field survey was selected just from Cologne.

Originality/value: Prior research about consumer acculturation and consumption patterns of Turkish immigrants in Germany and Western Europe is very limited. Therefore this study which is funded by TÜBİTAK (The Scientific and Technological Research Council of Turkey) fills such a gap in marketing literature. Especially Turkish and European entrepreneurs who want to target Turkish immigrants in Europe will have a better understanding of the specific characteristics of this market.

Key words: Turkish immigrants, food consumption patterns, Germany, ethnic identification, consumer acculturation

INTRODUCTION

The immigration of Turkish people to Germany has started in 1960's (Unat-Abadan, 1964, s.7; Martin, 1991: 3; Şen, 1993, s.1;). They have arrived Germany as guest workers and their intention was to stay for a few years, save money and then return back to Turkey. However, their plans for going back to Turkey were always postponed and couldn't come true because of the economic and financial conditions. Thus, today it is known that 2.790.000 Turkish people (Turkish Ministry of Labour and Social Security, 2007) are living in Germany and they constitute the largest ethnic group in the country, consequently the largest group of ethnic consumers. When Turkish immigrants crossed borders and started to live in a new home country, they took their cultures to their new homes. Naturally, the new home has its own culture. In the literature, the general process of movement and adaptation to one consumer cultural environment by members of another consumer culture is known as consumer acculturation (Penaloza, 1990). So what happens to the immigrant consumers in acculturation process? The dual pull of two cultures will affect consumer acculturation processes and outcomes in the following ways: 1) immigrants internalize the stigma of being the mainstream's other; 2) they may denounce themselves and their culture, decreasing their differences by assimilating product in attempt to fit in; 3) they may ignore or reject pressure to assimilate, cultivating instead social structures within which aspects of their previous culture are maintained; 4) they may reject aspects of their culture of origin and/or immigration and may express combinations of these strategies (Wamwara-Mbugua, 2003, p. 36-37).

Consumer acculturation studies have been very popular and research on marketing to ethnic groups has made great strides in the last 40 years (Sekhon, 2007; Odgen, Odgen and Schaua, 2002; Gentry. Jun, ve Tansuhaj, 1995; Penaloza, 1994; Wallendorf ve Reilly, 1983). Various ethnic groups such as Hispanics, Afro-Americans are investigated intensively. However, there has been little research on the consumer behavior and consumer acculturation of Turkish immigrants in Germany. German-Turkish population forms an important and growing segment within the mainstream German population. Having a spending power about €16.9 billion and constituting 3.1 % of the total population in Germany (Kraus-Weysser and Ugurdemir-Brincks, 2002), Turkish consumers deserve more research about their acculturation process and resultant consumption patterns. This group combines a youthful population profile with "social climber" status, incomes and image and a love of consumerism, as well as continued affinity to the Turkish "home" culture. (Erdem and Schmidt, 2008). Accordingly, in this study we have made an attempted to explore Turkish immigrants in Germany from the perspective of consumption patterns. Consumption patterns compasses a wide array of products and services, but in this research we focused on the food consumption. Since food is a cultural symbol and it is one of the cultural traits that humans learn first from childhood (Werbeke and Lopez, 2005), we wanted to explore food consumption patterns of immigrants and to investigate the impact of ethnic identification on food consumption of Turkish immigrants in Germany.

THEORETICAL BACKGROUND

Consumer acculturation, ethnic identification and food consumption

When an individual finds him/herself surrounded by a dominant culture other than the one he/she grew up in, that individual will simultaneously experience a desire to maintain some aspects of his original culture and adapt some aspects of the dominant culture. Ethnic identity and acculturation are two constructs that go hand in hand and need to be examined together in order to accurately identify their influence on the consumer behavior (Sobal, 2008, 32). Generally, identity is a concept rooted in answers to such questions as "What am I?" and "What am I not?" (Christian et al., 1976; Brand, et al., 1974). It is used to refer to an individual's sense of who she/he is (Shapiro and Dashefsky, 1974; Frideres and Goldenberg, 1982). Ethnic identity is used in the analysis of consumption as an indicator for the consumption behavior of ethnic minorities. Hence, those members of an ethnic minority who have a very strong ethnic identity will also differ in their consumption behavior compared to the mainstream society, as the ethnic identity also influences the way of life in the mainstream society and therefore e.g. their eating habits (Palumbo and Teich, 2004). Among the various cultural dimensions of ethnic identity on food preferences are one of the most widely accepted dimensions (Driedger, 1975; Phinney, 1990; Rosenthal and Feldman, 1992). Ethnic identity reflects the retention of behaviors and attitudes of the culture of origin. This retention should presumably be evident across many aspects of behavior which include food consumption (Laroche et al., 1993).

Previous findings about the ethnic identity and food consumption of Turkish immigrants in Germany

There are several findings about the ethnic identification of Turkish people in Germany. Polat (1998) states, that a development of the second generation to a bicultural ethnic identity is observable. However, it is indicated that a sole German identity is not evident among the Turkish second generation immigrants. Another research by Kaya and Kentel (2005) has found that 60 % of Turkish people in Germany have hyphenated identification. Half of the immigrants identified themselves as Turkish/European and 10 % as European/Turks. In his research about ethnic marketing for Turks in Germany, Erdem (2006) has found that Turkish population in Germany can be characterized as of having a relatively strong ethnic identity.

At the first years of immigration of Turkish workers to Germany, food was a serious problem. Pork was avoided, veal was expensive and lamb was not available. As a result of being uninformed and with the desire to save money, they had an unbalanced diet (<http://www.girisim.net/turkbakkal.htm>). Factors such as the improvement of the standards of living, religious prohibitions, time spared for eating and accessibility of food have changed the eating habits of the immigrants. They had got acquainted with ready to eat meals, frozen food and canned food (Narman, 1972). Turkish people had experienced significant problems in daily life, particularly about shopping and food at the first years of immigration. The first generation of immigrants had difficulties in recognizing the products sold in Germany and couldn't decide which type of food products to buy, mainly because of the language problem. Negative attitude towards pork because of the religion and culture had created confusion especially when

shopping for foodstuff. Therefore, the first generation had a fixed diet, mainly consisting of pasta, eggs and canned fish. During 1960's Turkish immigrants could not eat meat and meals containing meat in the cafeterias of the factories because of their aversion of pork. In these years Turkish wholesalers were selling the food stuff that they had brought from Turkey in front of the Guest Houses where the Turkish workers were living. At the end of 1960's German groceries called Tante Emma started to sell Turkish food.

Especially immigrants' desire for some food of their origin, lead their luggage to be full of food when they were coming back to Germany after their summer vacations in Turkey. Immigrants' need and desire for Turkish food could not be satisfied by German groceries and supermarkets at that time and there were no other alternatives to satisfy this need. The problem of finding food has been started to be solved in 1970's. German supermarkets noticed the demand for Turkish food and ordered Mediterranean fruits and vegetables until the first groceries opened in the 1970s (Eryılmaz, 2002).

Today it is possible to find Turkish food almost in all part of Germany. Although Turkish migrants are represented in 100 different market sectors in Germany the weight still lies in the retail (34.9 %) and gastronomy (23 %). (<http://freenet-homepage.de/alamanci/SAYFALAR/demografi.htm>) A survey conducted by the Zentrum für Türkei Studien in Bonn(now in Essen) showed that a very high percentage of Turkish entrepreneurs in Europe active in catering. Fast food stand owners and the small storekeepers who sell Turkish food and imports from Turkey constitute the majority of this group of entrepreneurs. With very few exceptions people can find all sorts of Turkish food and ingredients in these stores, sometimes a better quality than those found in Turkey (Çağlar, 1995, p. 55; Çağlar, 1998).

METHOD

The purpose of this research is to explore the effect of ethnic identification on food consumption patterns of Turkish immigrants living in German. Firstly, we have found how the respondents felt about their ethnic identity and classified the sample in terms of strength of ethnic identification. Specifically, our study focused on the following research questions:

1. What are the consumption frequency of foods that may be referred as belonging to Turkish culture and German culture and the effect of ethnic identification on the consumption of food stuff?
2. Do the immigrants bring food from Turkey and if so what type of food stuff are brought from Turkey?
3. What is the effect of ethnic identification on the preference of retail outlets for food buying?
4. What is the effect of ethnic identification on the preference of restaurants?

The research study was conducted in Cologne, Germany. We have chosen immigrants living in Cologne to gather data since the ratio of Turkish immigrants in Cologne is the highest compared to the whole population. The research sample was selected according to snowball sampling technique where education, age, income and generation were used as profile variables.

In addition, 15 in-depth interviews with Turkish people living in Cologne were conducted in October 2008 by the authors themselves in order to understand Turkish immigrants' consumption behaviors and patterns. These interviews were also employed in finalizing the structured questionnaire, which was used in the field survey.

The field survey was conducted by 20 interviewers who are Turkish students at the University of Cologne. Before the fieldwork started, the authors trained the interviewers about the objectives of the research and procedures of the fieldwork. Then the interviewers gathered data from the selected sample of respondents via face-to-face interview technique. The data gathering process has been completed in May 2009 and June 2009. 460 respondents were interviewed, among which 438 interviews were decided to be eligible for analysis. The characteristics of the research sample are depicted in the table below.

FINDINGS

Demographic profile of respondents

Table 1 indicates the demographic profile of the sample. The sample consisted of 438 Turkish immigrants, of whom 55 percent were male and 45 percent were female, and the percentages of married, single and widowed respondents were 61, 32 and 7 respectively. Regarding the age distribution of the respondents; 16% of the sample is in 18-24 age range, 17% in 25-30 age range and 19% in 36-45 age range. The ratio of respondents in 46-55, 56-65 and over 65 age ranges were 3%, 6% and 1%, respectively. The age structure is similar to the age structure of the Turkish population in Germany. The demographics on monthly income identify two dominant categories: 1.001 € -2.000 € and 2.001 € -3.000 €. Approximately 18 % of the respondents have monthly income over 3.001 € and 12% of the respondents have a monthly income less than 1.000 €.

Regarding the education of the sample there are two groups as who were educated in Turkey and who had education in Germany. The first group who were educated in Turkey consists of 241 respondents. There were a few immigrants (5%) in the sample without formal education but who were literate. 19% of immigrants have elementary degree, 15 % of immigrants have junior High School degree, 36% of immigrants have high school degree and 25% of immigrants have college/university and above degree. The second group who were educated in Germany are consists of 178 respondents. 17% of immigrants have Hauptschule degree, 23 % of immigrants have Realschule degree, 10% of immigrants have Gymnasium degree and 50% of immigrants have Universität and above degree.

Gender		Marital Status	
Male	55%	Married	61%
Female	45%	Single	32%
		Widowed	7%
Age		Educated in Turkey (n=241)	
18-24	16%	Literate	5%
25-30	17%	Elementary School	19%
31-35	19%	Junior High School	15%
36-45	27%	High School	36%
46-55	19%	College/University	25%
56-65	6%		
66 ≥	1%	Educated in Germany (n=178)	
Income		Hauptschule	17%
1.000 € or <	12%	Realschule	23%
1.001 € - 2.000€	44%	Gymnasium	10%
2.001 € - 3.000€	26%	Universität	50%
3.001 € - 4.000€	11%		
4.001 € or >	7%		

n=438

Table 1. Demographic Profile of Respondents. Ethnic identification of the respondents

In this research firstly we have measured ethnic identification of Turkish people in Germany. The ethnic identification was measured by nine items, mostly adapted from previous ethnic identification scales (Alvarez, 2004, s. 68; Zea et al, 2003; Laroche et al, 1996). Table 2 shows the scale that we have used in this research. We have categorized the respondents into three levels in terms of their Turkish identification due to the responses to the scale items. Half of the respondents have high ethnic identification, 12 % have medium level of identification and 38% of the respondents have weak ethnic identification. (Figure 1)

	<i>Alpha (α)</i>
<i>I am proud of my country of origin</i>	.702
<i>I feel good about being Turkish</i>	
<i>I feel associated to my country of origin</i>	
<i>I feel proud of Turkish heritage</i>	
<i>I feel proud about being German</i>	
<i>I feel part of Germany</i>	
<i>I feel that I'm thinking and behaving like a German</i>	
<i>I feel comfortable with the German way of life</i>	
<i>I feel at home in the Germany</i>	
<i>1= strongly agree</i>	
<i>5=strongly disagree</i>	

Table 2. Ethnic Identification Scale

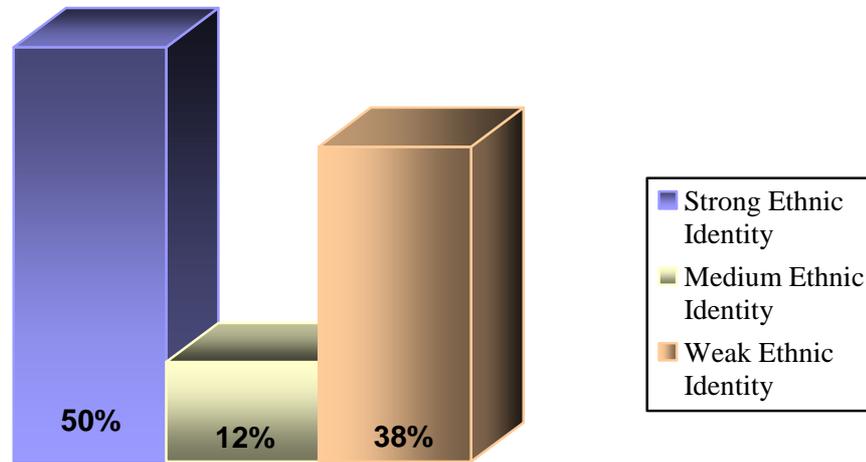

Figure 1. Levels of the Felt Ethnic Identity of the Respondents

Consumption of the food products

In order to learn about food consumption patterns we have provided consumers a list of food stuff and meal that are representative of Turkish culture and German culture. There was not a list of such food products that was used in previous studies and in the context of a global world where the preferences and tastes of people are getting similar preparing such a list was not easy. Thus, in order to determine the list of both cultures' food and meal we have asked the opinions 15 participants during the in-depth interviews and we combined them with our own observations. Then we have asked the consumers consumption frequency of these food stuff with a scale where 1 represents frequent, and 5 represents never. (Table 3)

	Total Sample	Strong Ethnic Identity	Medium Ethnic Identity	Weak Ethnic Identity	ANOVA <i>p</i>
Yoghurt/ayran ^{Turkish}	1.72	1.53	1.74	1.95	.003*

Table 3. Consumption Frequency of the Turkish and German Food Stuff by the Respondents with Different Level of Felt Ethnic Identity. * $p < .01$ ** $p < .05$. 1:very frequent, 5: never

The table 3 shows the consumption frequency of several food stuff that can be referred as belonging to Turkish and home country cultures. The table also shows the consumption differences among the respondents who are categorized as feeling high, medium and low level of ethnic identity. Analysis of the findings is not easy and should be done with caution considering the fact that some of the food staff given in the table has different consumption frequencies in an average diet and for example consumption of some beverages are influenced by the religious attitudes of the people. For instance, beer is taken as a beverage of German culture and raki is taken as a beverage of Turkish culture in this research. Since both of them are

alcoholic beverages and alcohol is prohibited by Islam religion the consumption rate of these beverages are very low. As it is seen from the table, consumption frequency of Turkish food increases as the consumers' level of ethnic identity increases. We have conducted ANOVA test to see if the differences in consumption levels were significant among three groups of ethnic identification. According to test results, Turkish immigrants with a strong ethnic identification tend to consume more of the food associated with their original culture. However, Turkish immigrants with a weak ethnic identification also seem to consume Turkish food. Weak ethnic identifier consumers consume more of the German food compared to the consumers with higher ethnic identity levels.

Food brought from Turkey

In Turkey one of the important symbols representing Turkish immigrants in Germany was a luggage or a car full of Turkish food such as tomato paste or dried peppers. Especially before 90's when the immigrants had used their cars instead of plane for transportation this was a very common practice. In our research we wanted to explore if it is still a retained habit to bring food from Turkey to Germany. We asked the respondents if they had brought with them some foods and/or if they have ordered their friends/acquaintances to deliver some products from Turkey in the last 3 years. The table 4 below shows the percentage of respondents who have brought some of the listed food stuff from Turkey. As it is seen from the table mostly Turkish snack was brought from Turkey(56% of the sample), followed by Turkish delight(54%), Turkish coffee 41%) and dried fruits and vegetables (41%).

	<i>Frequency</i>	<i>Percent</i>
<i>Tomato paste</i>	121	28
<i>Dry legumes</i>	103	24
<i>Turkish snack(almond, hazelnut, peanut etc)</i>	274	56
<i>Turkish delight</i>	235	54
<i>Turkish Coffee</i>	181	41
<i>Dried Fruits and vegetable</i>	178	41
<i>Spices</i>	190	43
<i>Cheese</i>	127	29
<i>Fresh fruit and Vegetable</i>	52	12
<i>Bakery products (such as home made pasta)</i>	87	20
<i>Baklava /Dessert</i>	112	26

Table 4. Food Stuff Brought From Turkey

	<i>Ethnic Identity</i>				<i>p</i>
	<i>Total Sample</i>	<i>Strong Ethnic Identification</i>	<i>Medium Ethnic Identification</i>	<i>Weak Ethnic Identification</i>	
<i>Tomato paste</i>	28%	28%	39%	24%	.118
<i>Dry legumes</i>	24%	27%	29%	22%	.554
<i>Turkish snack(almond, hazelnut, peanut etc)</i>	56%	60%	49%	52%	.150
<i>Turkish delight</i>	54%	57%	57%	49%	.255
<i>Turkish Coffee</i>	41%	48%	37%	33%	.012**

<i>Spices</i>	43%	49%	43%	37%	.072
<i>Cheese</i>	29%	33%	33%	21%	.035**
<i>Fresh fruit and Vegetable</i>	12%	17%	10%	6%	.003*
<i>Bakery products</i>	20%	23%	28%	14%	.031**
<i>Baklava /Dessert</i>	26%	25%	29%	25%	.794

Table 5. Chi Square Results for Food Brought and Felt Ethnic Identity. * $p < .01$ ** $p < .05$

Despite the fact that most of the products listed above are available in Germany, it seems that it is still a habit for Turkish immigrants to take food from Turkey. It may be possible that the tastes of such products may not be similar or these products may be a reminder of their origin cultures. Chi-Square analysis regarding the impact of ethnic identity on types of food brought from Turkey shows that more of the Turkish immigrants with a strong ethnic identification tends to bring food from their home country (Table 5). Turkish people who have a weak ethnic identification also bring food from Turkey, but lesser amount of them continue this habit. The below quotation from a research about Turkish consumers in Denmark may also help to interpret our findings.

“Consumption of Turkish food works towards the reinforcement of the Turkish cultural identity as the members of the immigrant community gather together around a dinner table and share their cultural heritage. While the first generation Turkish immigrants continue to eat in traditional Turkish ways (baking bread and Turkish pastries at home, bringing dried goods from Turkey), the descendants integrate Danish food more into their meals” (Üçok, 2006).

Preference of shopping outlets for food buying

We have also asked the respondents the type of outlets they prefer for food buying. We have measured the visiting frequency of various types of shopping outlets including both German and Turkish retailers. The list of shopping outlets for food is based on authors' observation in Cologne and in-depth interviews with 15 Turkish people living in Cologne.

	<i>Means</i>	<i>S. D.</i>
<i>Discount markets as Aldi, Lidl or Penny</i>	1.97	.99
<i>Turkish groceries, small markets</i>	2.25	1.13
<i>German bakeries as Kamps</i>	2.57	1.47
<i>Turkish butchers</i>	2.68	1.29
<i>Turkish bakeries</i>	2.88	1.53
<i>Street bazaars</i>	3.44	1,41
<i>Super or Hyper markets as Renee or Metro</i>	4.04	1.21
<i>German delicatessen</i>	4.18	1.25
<i>Organic markets</i>	4.56	.89

Table 6. *Types of Outlets for Food Buying. 1= more than once a week (very frequent). 5= several times in a year (seldom). n=438*

As it is seen from the table 6, discount markets are visited more than the other retailers for buying food stuff followed by the Turkish groceries. The least preferred shopping outlets are organic markets and German delicatessen that sells generally German food.

Participants of the in-depth interviews emphasized meat consumption as a concern in Germany. Accordingly we have asked several questions about meat consumption. Table 7 shows that Turkish immigrants are very sensitive on this issue. We did not question the religious attitudes of respondents in this research but to a large extent the responses to these questions can be interpreted by religious considerations and culture. As the Chi square analysis shows, the level of ethnic identity influences meat consumption. Respondents feeling strong ethnic identity are more cautious about hellal meat, pork and buying Turkish brands of meat compared to those with a weaker identification (Table 7).

	<i>Mean (Total Sample)</i>	<i>Strong Ethnic Identification</i>	<i>Medium Ethnic Identification</i>	<i>Weak Ethnic Identification</i>	<i>p</i>
<i>Buy only hellal meat</i>	1.41	79%	68%	30%	.000*
<i>Consider meat processed products to be fork free or hellal</i>	1.49	81%	68%	28%	.000*
<i>Buy only Turkish brands of meat processed products</i>	1.31	88%	68%	45%	.000*
<i>Want the owner/employee of the meat retailer to be Turkish</i>	1.40	65%	53%	30%	.000*

Table 7. Chi square Results for Meat Consumption and Felt Ethnic Identity. * $p < .01$

Eating out of home

Another question to learn more about food consumption was the preferences of respondents when they eat out of home. We have asked if they go out for eating and about the frequency of this occasion. As seen in the table 8,5 % of the respondents have indicated that they never eat in the restaurants/cafes etc. and 17 % eat a few times in a year. 30 % of the respondents indicated that they eat out of home at least once a week.

	<i>Frequency</i>	<i>Percent</i>
<i>Once a week or more</i>	133	30
<i>Once in two weeks</i>	96	22
<i>Once a month</i>	114	26
<i>A few times in a year</i>	73	17
<i>Never</i>	22	5
<i>Total</i>	438	100

Table 8. Frequency of Eating Out of Home

We have questioned where they prefer to eat when they go out for lunch/dinner.

	Mean (Total Sample)	Strong Ethnic Identification	Medium Ethnic Identification	Weak Ethnic Identification	<i>p</i>
Turkish restaurants	2.00	1.79	1.82	2.32	.000*
Other countries restaurants such as Italian, Chinese restaurants	3.29	3.73	3.17	2.77	.000*
Fast-food restaurants such as McDonald's, Burger King	3.34	3.39	3.33	3.28	.422
Muslim country restaurants such as Syria, Lebanon restaurants	3.99	3.97	3.78	4.07	.194

Table 9. Chi Square Results for Preferred Restaurants and Felt Ethnic Identity.

1:always 5: never. * $p < .01$

The respondents mostly preferred the eat at the Turkish restaurants, followed by the restaurants of non-Muslim countries restaurants such as Italian, Chinese restaurants and fast-food restaurants such as McDonald's, Burger King. The least preferred restaurants were other Muslim countries' restaurants. One of the interesting finding of the research was that about % 40 of the respondents have never tried German cuisine and % 40 have reported that never cooked meal in their home that doesn't belong to Turkish culture (Table 9).

Acculturation process may provide different outcomes for immigrants. We have asked immigrants if any change have occurred in their eating/drinking habits during their stay in Germany. 41 % of the sample's response to this question was "yes". As the Table 10 demonstrates, just one third of the respondents feeling strongest ethnic identity have expressed that some change has occurred in their eating/drinking habits. However, more than half of the consumers feeling weak ethnic identity have told that they have experienced a change in food habits.

	Ethnic Identity				<i>p</i>
	Total Sample	Strong Ethnic Identification	Medium Ethnic Identification	Weak Ethnic Identification	
Change in the eating/drinking habits	41%	35%	38%	51%	.006*

Table 10. Changing Eating/Drinking Habits and Felt Ethnic Identity (t-test results). * $p < .01$

SUMMARY AND CONCLUSIONS

In this study, we have made an attempt to explore food consumption patterns of Turkish immigrants in Germany. We have focused on consumption and shopping practices related to

food in this study. As mentioned in the paper ethnic identity reflects the retention of behaviors and attitudes of the culture of origin. This research also justifies that retention of food consumption habits of Turkey(country of origin) is very apparent among immigrants. Although retention of food consumption habits is more evident on consumers who are feeling strong identification to their original countries, the weak ethnic identifiers also retain their food consumption habits. More than half of the sample seems unaffected from the German culture in terms of food preferences. Respondents who feel strong Turkish identification have more preferences for Turkish food, Turkish restaurants and Turkish food retailers. In spite of many Turkish and German retailers selling Turkish food and plus many restaurants serving Turkish food it is interesting that Turkish people still retain the habit of bringing food from Turkey. The respondents with stronger ethnic identification tend to bring food more than the weak identifiers.

In this paper we have just analyzed the effect of ethnic identification on food consumption. Further analysis may provide more insights to understand the food consumption of Turkish people in Germany. The effect of generation, duration of stay, religious attitudes and demographic variables such as income, education, age, and gender may be analyzed to have a better understanding of consumer acculturation process. Since this research was conducted in Cologne, the findings from this study may represent the immigrants living in a big urban area where many type of retailers and restaurants are available. Immigrants living in rural areas may exhibit different food consumption patterns.

The findings of this paper may provide implications for entrepreneurs. Especially Turkish and European entrepreneurs who want to target Turkish immigrants in Germany will have a better understanding of the specific characteristics of this market. The findings may be used by food marketers/retailers for market segmentation based on ethnic identity level of immigrants. Also the findings about products brought from Turkey may be used for decisions about product assortments and advertising messages.

FORMING OF CORPORATE IMAGE IN UKRAINE: FEATURES AND TENDENCIES

Pan, Liliya¹

¹*National University "Kyiv-Mohyla Academy", Faculty of Economic Sciences, vul. Voloska 10, office 308, Kyiv, 04070, Ukraine*

At the beginning of XXI century Ukrainian market, being integrated in a world economy, accepts international tendencies to the increase of role of intangible assets in the receipt of income. Ukrainian business starts to pay more attention to image and to the corporate keeping among key audiences. This process in the Ukrainian economy was begun by regional offices of multinational corporations – Coca-Cola, Philip Morris, Nestle – strategic investors which position themselves as national producers. Home enterprises of fuel and energy complex, finances, food retail industry, in the conditions of hard competitive activity and dynamic of market development fully feel the necessity of forming and advancement of own corporate image both on Ukrainian and world, market. Priority export competent industries are under threat of worsening of the external state of affairs and loss of price advantages. It induces them to change strategy and displace accents from a price competition to an imaginary competition.

The row of factors cause an increase of attention of research scientists and leaders of companies to the corporate image.

Firstly, today in Western countries increase the requirements to permanent organic growth of enterprises, that forces executive directors to estimate intangible assets (including goodwill) for getting the exact proofs of success. Thus earlier companies tended to high up the cost of goodwill to make the prices of their stocks higher. Today they are forced to write off the part of goodwill and consciously to be ready for the falling of their market price. Such situation stimulates the search of more exact methods of money appraisal of image.

Secondly, demand of consumers, their minimum conservatism, thirst of experiments with which they substitute one goods and services for another – it requires an additional efforts from companies to win the loyalty of clients. The stable positive image allows companies to exceed the bounds of exhausting price competition and choose strategy of imaginary competition.

Thirdly, the necessity of imaginary management is related not only to demand but also with suggestion. Rapid technological progress and the obsolescence of capital assets provoked by it automatically reduce the particle of the fixed assets and promote the particle of intangible assets in the structure of company's balance. On such conditions guidance no longer can ignore an image, effective management of which allows to attract additional investments and promote the balance and market price of company.

Fourthly, the image of organization has completely definite economic potential, especially in trade, sphere of financial and unfinancial services, where the level of trust has not lesser value, than other absolutely financial indexes.

Besides, exceptionally financial indexes, not always can explain the cause-effect connection and often mislead guidance.

All mentioned earlier facts were instrumental in more active study of concept of image and development of methods of estimation with the purpose of subsequent more effective management and purposeful correction of companies' activity.

In Western Europe and United States of America to the study of marketing aspect of image devote their works C.J. Fombrun, G.Daunting, K.J. Roberts, W. Raylens, T. Ambler, J. Volker and others. Connection between a corporate image and perception of employees the company investigate in his works S. Khogan. Works of L. F. Dzhey and others are devoted to financial aspect of estimation and account of image (goodwill).

On postsoviet space to the elaboration of imaginary theories pay attention in their works M. Tomilova, T. Primak, V. Shkardun, T. Akhtyamov, I. Aleshina, V. Kureyko. In Ukraine A. Mendrul and V. Larcev develop the methods of estimation of goodwill.

One of basic problems of image research in Ukraine is disparity of English and Ukrainian terminology which resulted synonymous application on denotation of one concept of a number of absolutely different terms in economic literature. Such inconsistency of key category does not allow to build the clear structure of image and, accordingly, conduct him complex estimation.

The intangible assets of enterprises became the object of active researches of economists and ponderable factor of income creation yet on the beginning of 80th century. Then companies began actively to produce their own image and by this try to win loyalty of consumers not to the separate product, but to all company. It enabled to increase the volumes of output (and, accordingly, incomes) from the already produced commodities and services and preliminary to create the circle of potential consumers for new production.

Active development of imaginary theories began in the United States of America and countries of Western Europe - wherein a powerful competition at the fund market required the search of the new approach to the increase of market price of company. In economic literature the concepts of "intangible assets", "corporate image", "corporate reputation" and "goodwill" began to be used with that frequency, as demand, supply and maximization of income. Absence of clear limits between these categories and relative novelty of scientific conceptions of image first of all resulted the concentration of researcher's attention on explanation of actuality of problem and development of methods of image estimation, but not on determination of basic concepts.

The Ukrainian researchers of image actively drew on accomplishments of western scientists, adapting them to the terms of the Ukrainian economy. Presence of the Ukrainian analogues alongside with the foreign terms in their disposal resulted transformation of mentioned earlier list to the almost synonymous row and was completed with "appearance", "good name", "business reputation" and "corporate brand". Such voluntary use of terminology results misunderstanding and complicates development of the constituents system of corporate image.

Because of it, foremost it is necessary to give determination actually to the concept „image" and to find out a difference between terms, which circulate in literature on denotation of this category.

In Ukrainian and Russian economic literature the most widespread is such determination of image of organization:

An image of organization is integral perception of organization by the public different groups, which is formed on the basis of information about the various sides of organizations' activity which are saved in their memory; existing in people's consciousness system of presentations and estimations the object of which is a company.

Ukrainian economists T. Primak and M.V.Tomilova select two constituents of image of organization - descriptive and estimating. A descriptive constituent is the aggregate of all knowledges about the organization, accessible for every group of stakeholders. An estimating constituent is related to attitude of public toward a firm. It exists by virtue of that the information, which is saved in memory, is not perceived indifferently, but excites estimations and emotions. To divide these two constituents of image is possible only very conditionally. In reality they are inseparably linked and come forward as the unique unit [1, p. 249], [2, p. 48].

On Jean-P'er Boduan's thought, the image of company depends mainly from estimation, that stakeholders take away on two indexes – action and conduct [3, p. 60]. Thus under the influence he understands the character of company's activity, condition of work, and consequences of its functioning for surroundings. A conduct is attitude of corporation toward society. Basis for the stakeholder's estimations, company's actions and conduct are public agreements, shown mainly in legislative acts. But basic in the Boduan's theory is a thesis that a public idea is formed under act of the system of values, which stands higher then actions and conduct. However what legal activity of company was from the point of view a constitution or other acts of the legal adjusting, if it does not coincide with the system of values of public, it will not be legitimate and, accordingly, will not have a positive image.

Michael Elashkin, director of company Elashkin Research, one of not many Russian businessmen, which made an attempt divide the concept of brand, image and reputation [4, p.14]. so, according to his opinion, a brand is a constituent of reputation which on condition of existence of strong brand makes an additional value in reputation. Vice versa, reputation promotes successful branding. If a brand (even corporate) can exist separately from a company and be sold by other participants of market, reputation is inseparable from organization, from business on the whole. Concerning an image, his company creates it independently by marketing specialists and PR-services. A company will be able to get beautiful reputation, if this artificially created image will be accepted by society. The illusion of positive image can be created, but it will exist only until then, while clients and partners will not see a difference between this illusion and real actions of company.

Although American researcher T. Ambler considers such differentiation far-fetched and inappropriate. According to his opinion, the author of this work tries to define that image is nothing other then a brand (or the capital of brand), which is a basic intangible asset and personifies the created additional value. The industrial marketing and electronic commerce (B2B) try to avoid a concept brand, which initial was used only on commodity markets, and simply replace it with business reputation or goodwill. Consequently, T. Ambler, sees not a single of principle difference between these categories, except of a particular branch use [5, p.17].

The specialists of international consulting company PBN consider reputation one of components of company appearance. Other his component is an image. Thus, as well as M. Elashkin, they support a thesis that image is produced by the company purposefully, and reputation exists in opinions of people not depending on the desire of company. And gap between an image and reputation is pernicious for a company [6, p.20]. Although we completely agree with that the company can purposefully form part of the image in consciousness of people, what will be told about, but consider completely groundless a thesis that an image and reputation is two constituents of company appearance. In fact English "image" correctly to translate into Ukrainian as "appearance". Consequently, after the above-mentioned hypothesis, appearance is part of itself, and it is nonsense.

Taking into account all of afore-mentioned, to our opinion, most adequate essence of concept there is such variant of determination of image:

The image is the system of subjective presentations and estimations of organization of different groups of public, which exists regardless of desire of company and can be only sent by it in necessary direction.

Subjectivity of this system is to the effect that a company will not have an image until it external registration, conduct, marketings actions will not be reflected in the consciousness of stakeholders while they will not have the own judgement (positive or negative) concerning to activity of company.

Any aspect of functioning of organization can be examined in a short-term and long-term period. An image is not an exception. And exactly from the point of view long- or short-term we select two components an image: first impression and reputation (figure 1).

The first impression is presentation and estimations of organization by public different groups in a short-term period to the direct contact with it.

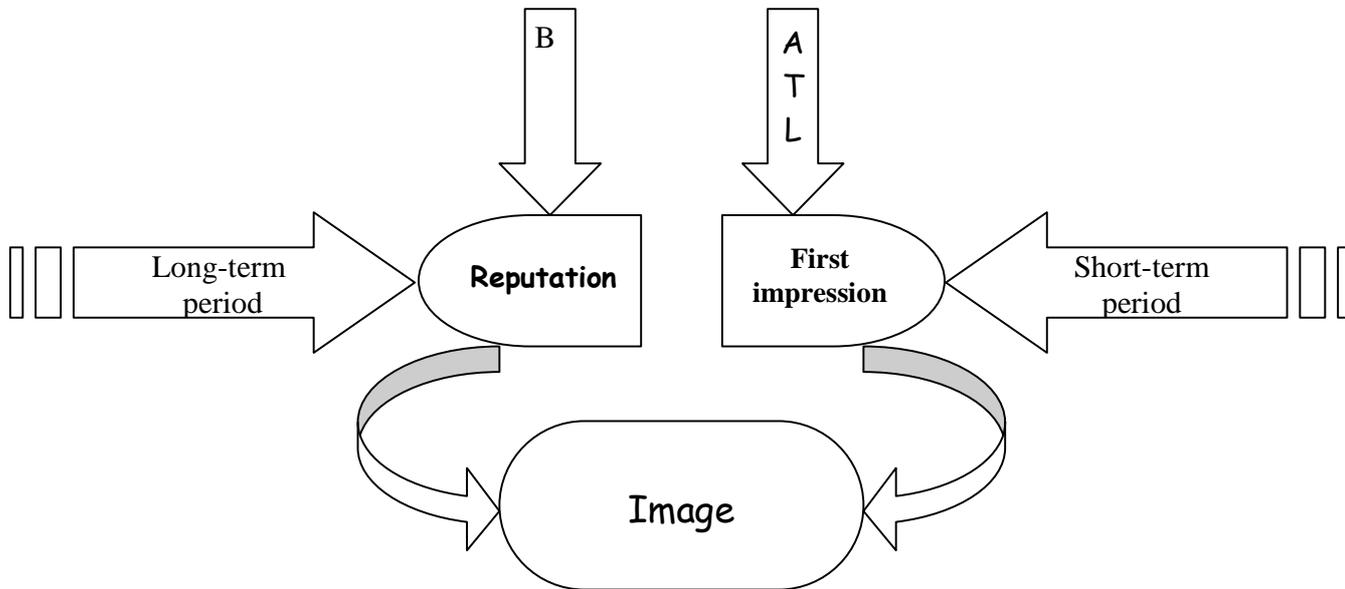

Figure 1 – the image of a company in a short-term and long-term period

In forming of the first impression a major role plays an original appearance (environment), and also publicity policy. Facilities of ATL (“above the line”) – of traditional direct advertising – build a brand, image, create legend, cause certain associations. With the help of such facilities it is the most easy for company to offer own vision of the image to stakeholders. But it costs to remember, that the first impression will not play a decision role in fixing of image in a long-term period, that is why activity of firm in this direction will carry tactical, but not strategic character only.

Reputation is an stakeholder’s estimation of company conduct in a long-term period. A determinant role here is played not by declarations, but by the real acts which determine attitude toward the firm of market participants. In a long-term period exactly reputation will make the lion’s share of image. Despite reputation fall under company’s influence more less then the first impression, marketing specialists can correct it by the instruments of BTL (“below the line”). PR measures, promotion-actions, merchandising, direct-marketing in practice incarnate dialog with an user. But only efforts of marketing department will be not enough for forming positive reputation, in fact it has least direct contacts with stakeholders and effective work of all of departments of the company will play a major role in this process, beginning from the greatest guidance and concluding a sales department.

In the process of forming in consciousness of representatives of different groups, related to company’s activity, its image, a major role is played by intercommunication between reputation and first impression. Dug up between these components is baneful for a company. What positive the first impression is, created mainly by publicity actions was not, if the result of actions and conduct of firm (qualities of commodities and services, service, financial

performance, level of social indicators, are responsibility and others like that) is negative reputation, at such terms a company it will not be succeeded to produce a proof positive image which will allow to get additional profits.

W. Raylens, president of Asia Pacific Burson-Marsteller, marks that every company has that reputation (and accordingly and that image) which it deserves [7, p.27], and no publicity budgets, scale support of sporting and cultural events, maximally creative PR-actions of have nothing in common with a proof positive image. Formula in obedience to which scale publicity budgets equaled a strong corporate image worked in 60th or 80th the previous century. But today considerable charges do not guarantee a proof image. A truth spreads far quick than attractive tempting advertising carries out influence on the first impression of consumers and societies on the whole. The first impression which is not based on reality is unsteady and impressionable. ATL and BTL facilities are needed in an order to help marketing specialists to correct image, to influence on him, but there is an idea that it can provide boundless growth of incomes is only a myth.

If the first impression dissatisfied the subject of market relations, it more credible will refuse to collaborate with a company at all until this component of image for the given to the subject will not change under act of external or internal factors. If it however agree to collaboration and reputation will fully confirm the first impression, existence of proof negative image will be provided for a company. If reputation and first impression is not equivalent, in a next period of time stakeholder will look over the first impression and again find oneself at the beginning of chain.

Under circumstances of the positive first impression, stakeholder will have a desire to get to know more activity of company. On the basis of these relations or already made by others judgements about such relations, a company image will be formed in stakeholder's consciousness. If reputation will answer the first impression, as a result will be existence of proof positive image. Under the other circumstances in next moment of time the correction of the first impression will take a place and we will get the exclusive circle of co-operation of reputation and first impression.

Both reputation and first impression, can change in course of time, that is why the purpose of company is the permanent monitoring and regular estimation of image after all of his constituents.

The concept of image and the concept of brand shouldn't be equated. A brand first was used as a complete synonym to the trade mark and touched mainly consumer goods. Today the concept of brand considerably broadened and fully seceded from TM and exceeded a supply consumer market. Today **brand** – it the name and logotype, not only unique suggestion of commodities or services but also appearance which is formed for consumers as a reaction on this suggestion, system of associations and reflexes, related to this product. Existence of brand foresees the presence of proof associations with a product, which select him among competitors and create a additional price. Money estimation of additional brand value as an intangible asset, created in the process of marketing activity, is named the capital of brand or money estimation of brand capital.

Professor D. Aker was the first who popularized conception of capital. In his work "Management of brand capital ", which was published in 1991 he determines the capital of brand as set of assets and obligations, related to the brand, its name and character, which are added or subtracted from a value, offered as a product or service [8, p.15]. Basic components of brand capital, which are selected by D. Aker, is loyalty, knowledge about the name, perception of quality, associations, related to the brand, rights on intellectual property.

It follows to pay a attention to that a brand touches a product (commodity or service) which offers company, not depending on that, whether each has a separate brand of products of firm, whether move forward the brand of company at the market. Besides a brand as appearance of commodity or service is formed mainly on the basis of supervisions, reviews and reactions of consumers, – basic stakeholders of the company, not paying attention to opinions of other subjects of business-relations. For this reason, to our opinion, it is not appropriately to equate the concept of brand with the concepts of image.

The unique concept which, on our opinion, maximally related to the category a "image" is a concept "goodwill". **Goodwill** (from English – *goodwill* is "prestige of firm") is the money estimation of part of company's intangible assets, formed on the basis of positive image. Unlike an image, goodwill does not foresee determination of high-quality descriptions of company image, but only is a sum on which the cost of assets is increased if there is positive imaginary descriptions. Because of goodwill is a financial index and his major aspect is a money estimation, most economists examine this concept self through the prism of method of estimation and determine goodwill as special immaterial asset, inseparable from an enterprise, which is determined as a difference between the cost of all of intangible assets and cost of those intangible assets which can be estimated separately [9, p. 77].

Thus it should be noticed that goodwill arises up only when a company gets incomes, higher then the current market rates of profitableness on tangible and separated intangible assets. It does not mean that at zero goodwill an image absents in firms. It only specifies on yet not formed positive appearance of company by stakeholders so, that it can provide it's overcomes. Uneffective work on creation, management and correcting of image can result the absence of overcomes or situation, where goodwill becomes negative and transforms on badwill. Badwill does not mean that a firm has a negative image or is unprofitable, although it is not eliminated, - he only tells that the profitableness of this enterprise is less than market level.

Goodwill as an immaterial asset has three basic descriptions:

- Goodwill – it the immaterial asset undissociated from an enterprise that can not be sold separately;
- Goodwill exists only at presence of surplus profits;
- Goodwill is not amortized.

Consequently, goodwill, on its essence, is a money estimation formed by consumers, employees, business-partners and other interested subjects of organizational image. Functioning each of these two terms has the expressly outlined limits:

an image is a category of marketing specialists which examine the high-quality estimation of company appearance;

goodwill is a term of financial department and book-keepings which give the quantitative estimation of this type of immaterial assets.

Taking into account all that, we should clearly distinguish the brand of company, which can exist separately from it and can be sold or passed in the use (for example, on chart of franchising), and its image which is the system of presentations and estimations of subjects of market relations concerning this company and there can not be a pose by it. At the same time it is impossible to equate reputation of enterprise and its image. Reputation is only component part of image and is formed in a long-term period. Other constituent of image – first impression – is though short-term, but by no less important part of image. Main task of managers of a company – is to provide a minimum break between the first impression and reputation in the process of forming, monitoring, high-quality estimation and correction of image, on the whole or his separate constituents. Quantitative estimation to the results of marketing activity of a image management gives a financial department, expecting a difference between intangible assets and those their constituents, which can be certain separately, that is goodwill.

Abstract, on the first sight, concept of image of company has the fully concrete measuring. It consists of certain set of elements, densely related to each other, each of that touches the certain aspect of company activity. Breaking up the image of enterprise on constituents, researchers use two approaches:

- selection of elements by objects, image each of that is the constituent of general image of company;
- selection of elements by subjects of perceptions, which give an estimation a company and its activity.

In obedience to the first approach the image of organization can be considered as a aggregated index which includes eight basic component: image of commodity, image of consumer, image of stuff, image of main guidance, business-image, social image, visual image and internal image. A similar chart is offered in works of M. V. Tomilova and T. O. Primak [1], [2].

The image of commodity is an estimation of features, technical descriptions of making of commodity, its possibilities to satisfy the necessities of consumers. The basic indexes of image of commodity is its technological and consumer quality, price competitiveness, and also quality of concomitant services and service.

The image of consumer is a public picture of having a special target segment of company and its estimation. A clients' lifestyle of this company, their character and social status, are reflecting on organization, at the same time fastening on it the image of company, created for satisfaction of necessities exactly of this group of consumers.

The image of personnel is a public judgement about the personnel of enterprise. This element of organizational image acquires a decision value for the enterprises of service sphere and trading companies, which personnel is in a direct contact with consumers. In these industries a competence, level of culture and socially demographic descriptions of employees, has a not less influence on the eventual image of organization, than image of commodity.

The image of main guidance is an estimation of administrative command of enterprise as whole, which is formed by the personnel of enterprise. Among major factors, which produce an

image of main guidance – his exterior, features of conduct, socially demographic descriptions, parameters of unbasic activity (stages of professional career, domestic position, interests, and others like that), acts, psychological descriptions, style of conduct of business, relations with employees. Researches conducted by a company Burson-Marstellers in Europe and United states showed that reputation of main guidance was 45 % of general corporate image [7, p.28].

The business-image is part of general image, which is the aggregate of public presentations about organization as a subject of entrepreneurial activity. Public and expert estimations are formed on the basis of finance-economical performance of enterprise and reports indicators in MASS-MEDIA.

The social image is a picture of wide public about social aims and role of enterprise in economic, social and cultural life of country. Today the aspect of social responsibility of company acquires all greater weight, especially in those industries which do not have a positive social image a priori (for example, production of swizzles or tobacco wares, enterprise of processing industries, a production of which is harmful for an environment and others). Marketings measures, such as sponson, patronage of art, support of public motions, participation, in the decision of problems of ecology and health protection, directed on the increase of social role of company and neutralization of the negative impression, which makes sphere of its functioning on public.

The visual image is an estimation of original appearance of enterprise, his interior and exterior, trading and demonstration floors, external appearance of personnel, and also brandname symbolism and other elements of brandname style. A visual image in fact personifies the first impression of consumers and business-partners.

The internal image is an attitude, foremost to the personnel, to the corporate culture and socially psychological climate of collective. A positive internal image is the certificate of that employees count this company physically and emotionally comfortable place of work, which is up to their cultural and psychological ideals and has the same moral and ethical values.

Similar classification of image components in the process of estimation allows to discover, as each of them influences on the general image of organization. However it should be remembered that an image is formed, foremost, in consciousness of people and that is why we are interested not by an object that is a transmitter of certain descriptions, but a subject opinions of which personify an image. Therefore at the terms of similar analysis of structure of image it is necessary to probe the relationship of every group of subjects of economic relations with organization or select the group of stakeholders for each component of image, for which this component is major at image forming. Thus, if the second variant is elected, the certain degree of authenticity of results of subsequent estimation is lost, in fact every component can be identically important both for a personnel and for consumers, business-partners and other interested persons.

Proceed from these very arguments, we consider that a construction of such structure of image is expedient, the elements of which will be subjects perceptions, which give an estimation to a company and its activity. This structure of corporate image was offered by W. D. Shkardun and T. M. Akhtyamov [10].

The general structure of image can be divided on external and internal. The internal contains those indexes which are important above all things for the personnel of enterprise, while the external deals with the estimations of consumers, business-environment, government bodies and society.

Image of enterprise for consumers is formed by the people's idea about the unique descriptions, which, to their minds, are inherent to the products of enterprise: design, quality, popularity of trade mark, service and discount system. Important in forming of image for consumers are a price policy of enterprise, knowledge and understanding of the declared mission and strategy, and also brandname style of company.

The business-image of enterprise is a idea of it as of subject of entrepreneurial activity, formed in consciousness of partners, shareholders, investors. Ethics of conduct of business, reliability, loyalty of company in relation to partners, informative openness, and also indexes of business activity, come forward as the basic determinants of business-image.

The social image of enterprise is made by public judgements about social aims and the role of enterprise in economic, social and cultural life of society. A social image is formed by informing society about the social aspects of activity of enterprise.

The image of enterprise for state structures is formed on the basis of minds of representatives of regional administration, executive and legislative power to the basic aspects of enterprise activity. For state structures as a special purpose image orientators are meaningfulness of products of company for providing of consumer necessities and economic development of region, degree of participation of enterprise in the regional social programs, observance of local and national laws, norms and rules of running a business, given working places for the habitants of district, openness of enterprise for informal contacts.

An internal image of enterprise is an idea of personnel about the enterprise. Thus a personnel is examined not only as a factor of competitiveness of company but also as an important information source for external audience. The basic determinants of internal image are a culture of enterprise (system of selection and studies of personnel, relations of leaders and inferiors, system and criteria of estimation of work of personnel, facilities of motivation, social privileges, brandname style of company) and socially psychological climate (the emotional state of collective, individual mood and estimation of life condition and work of personality in collective).

In this chart the internal image of organization (that attitude of personnel toward it and potential employees) occupies the last place. But the most part of researchers, in particular T. Ambler and W. Raylens disagree with such hierarchy of constituents of image. According to W. Raylens, the workers are the best starting point for the construction of proof emotional connections [7, p.28]. To our opinion, it follows to select two aspects of personnel influence on the combined image of company.

First of all, attitude of employees toward a company has a substantial influence on forming of resulting corporate image at the market of labour. Attitude of guidance toward present workers, work conditions, financial and moral encouragements determine the level of prestige of company for potential employees. As the last usually do not have an opened previous access to similar information, their estimations will be founded, above all things, on the basis of ideas and impressions of already existent workers. Balance of ideas, at least, for firms from the sphere of

services, finds out cause-effect connection between the image of employer and business efficiency [11].

Second of all, considerable part of companies, especially those, which work in trade and sphere of services, examine a personnel as the first buyers. For them connection between satisfaction of workers and consumers is banal. If the first understand and support marketing purposes of firm, if for them is formed its positive appearance, they will care of external consumers with a maximal return. Susan Khogan names employees the ambassadors of image, which present a company to clients exactly in such appearance, which they perceive it [12].

Researches, conducted by MORI (Market and Opinion Research Institute) and MCA (The Management Consultancies Association) in Britain, showed that in the list of reasons which the repeated purchases depend on, co-operating with a personnel took the third place after a price and quality [5, c. 177].

Today understanding of importance of internal constituent of image goes out far outside the sphere of services and trade. General Director of General Electric Jack Welsh marks that people are a heart and soul of company. They exactly, according to his opinion, are the primary factors of forming of reputation [7, p.29].

Therefore image which will be formed in consciousness of personnel no less important for appearance of company for consumers. Monitoring, estimation and correction must be preceded the analysis of external image. Exactly from these reasons main and most difficult priority of company activity of Pepsi in 80th the previous century consisted in fixing of reputation of marvellous job after the company [13, p. 359]. At the same time decision about the internal marketing should be accepted on the basis of degree of influence of personnel positions and its conduct on efficiency of work of company.

We should pay attention to that the reflection of certain descriptions of company image needs to be estimated at once in consciousness of a few interested persons. For example, knowledge of the mission and strategy declared by enterprise identically strongly influences on the eventual image of corporation as in the list of consumers, so personnel, business-partners, public organs and society. Such importance of mission is predefined that the self clear understanding of own tasks and aims of activity of company guidance at the present market, and also possibility of report of these aims to the interested persons select company among the great number of competitors. Moreover consumers, a personnel and business-partners, agreeing to the collaboration, consent to divide the declared mission and guidance values, and consequently, loyalty of these groups of subjects in future will be based not only on price advantages or high wage level, but on those values which are important for a company.

Second, the most widespread description of company activity which has a considerable influence on forming of positive image is its informative openness.

Forming the image of organization in the imagination, a man tries to attain internal harmony. The theory of cognitive dissonance asserts that presentation, feeling, ideas, which enter into contradiction with other presentations, feelings and ideas of individual, result the violation of internal harmony of personality. Investigation is a situation of psychological discomfort. A requirement in achievement of internal harmony, returning to the state of the lost equilibrium induces a man to fill with maintenance

an element which failing independently, that not always can go to the benefit an enterprise. So in the future, inculcating new information, it will be to overcome the barrier of the already existent aim. Risks, related to the informative blanks in the structure of image become more dangerous in the epoch of informative society, when information about the company activity is accessible for all of the interested parties more than ever. Their perception is formed on the basis of reports in mass medias which offer the all greater range of business- publication. Thus these reports not always are reliable and objective, very and often contain rumours only about this or that event. As rumours are information, that can not be confirmed by anyone, but also not refuted, they come into a notice until then, while there will not be a reaction from those exactly, who is touched by these rumours. Since it will take a place, rumours grow into «yesterday's news» and agiotage round them calms down. And vice versa, the bigger informative vacuum is and the longer rumours circulate in him, the more intensive this circulation will be and the greater harm will be caused by it to the image of company. The negative consequences of existence of rumours can affect both image of company in the eyes of consumers and personnel and other subjects. Thus, distribution of rumours at the financial market results decline of price of equities and falling of business-image of enterprise. As investigation of appearance of unconfirmed information about the defect of product there can be perceptible reduction of volumes of sale, and rumours about reduction of working places reduce motivation of workers and image of company at this group of subjects. With similar problems clashed the most known firms – Coca-Cola through poisoning with drinks in a few European countries, AOL Time Warner during confluence of two companies, Parmalat after distribution of information about possibility of company bankruptcy.

Consequently, in the conditions of informative society when the audience of company, including eventual consumer, expect the extended access to information about an enterprise, its commodities and services, results of financial activity and social person, trying to fill an informative vacuum, it is very important for every element of structure of image to be informatively filled by organization.

The authors of the structure of image described earlier select only four groups of subjects from the general audience of company. A consulting company Inside Story is in a collaboration with the academician G. Dauling offered more detailed chart of image (actually its long-term constituent – reputation) on the basis of subjects of perception. Did this chart got the name “360° reputations” [14].

On the modern stage the Ukrainian companies can be divided into two unequal groups. Those companies which corporate keeping and image is already formed, make less part so far. The basic task of marketings, PR and HR- departments of such companies consists in support and correction of the first impression and reputation of enterprise. Domestic companies which has already succeeded in getting a proof positive image from stakeholders indisputably have considerable competitive edges on the more numeral group of organizations for which forming of image until now remains the matter of the future.

Despite that the value of imagemaking policy in Ukraine is still underestimated, for the that group of companies, which however work above the complex forming of image, its estimation and correction is possible to select the row of general lines:

- expansion of role and volumes of the indirect advertising and PR;

- transferring of accents of forming of image from an consumer market to the market of labour;
- growth of informative openness of companies for all of subjects of forming an image.

Sponsor programs, grants, founded by the company, patron of art activity have a long-term strategic value and are useful foremost as an attractive image of company which is formed for an ordinary consumer and before public's eyes. As it was said, exactly the indirect advertising and activity of department of public relations are the basic elements of company influence on forming a long-term components of image - reputations. Most actively it is used by those companies, which activity carries antisocial character a priori – production of alcoholic spirits, tobacco industry, processing enterprises that are harmful for an environment.

Today sponson is one of the most widespread facilities of forming of image among the successful companies. As a result of research of potential for development a social appearance of company that was carried out by Center of innovations and development in 1999, it appeared that: 28 % polled companies consider sponson and corporate support the quite good advertising of enterprise; 24 % companies perceive indirect advertising and PR as a good mean of improvement of the image.

The first Ukrainian company that actively began to use sponsor actions for forming loyalty of consumers and demonstration of own social responsibility and personal interest in cultural growth of nation was a company Nemiroff. The number of such enterprises grows. Thus, for example, "Vinnicyam'yaso" conducts a lot of long-term eleemosynary actions: provides medicines hospitals, organizes eleemosynary dinners for veterans and etc. A pharmaceutical firm "Falbi" is known by such eleemosynary actions, as guardianship of Novograd-Volinskyj children's home, transmission of medicines in Fund "Ukraine – for children". "Obolon" and "Pravex-Bank" finance eleemosynary dining-rooms, a firm "Orifley" supports development of medical researches, related to treatment of cancer of suckling gland. The active participants of sponsor actions in a sporting sphere, organizations of musical concerts are vodka companies. The operators of mobile communication MTC and Kyivstar help the pupils of children's homes and other socially unscreened layers of population. During 2006 the company "Kyivstar" took part in 7 eleemosynary actions within the limits of the program of company "Kyivstar – for people, for a country!". In December 2005 company TNK-BP Ukraine signed an agreement about 4-years partnership with USAID, within the limits of which is carried out financing of project "Health of mother and child" with a general budget 7,2 million dollars of the USA. Particle of TNK-BP Ukraine makes 1,2 million dollars. Analogical project named "Healthy maternity" is supported by a company MTC.

Lately, the Ukrainian corporations try to use an internetresource for informing of public about their social responsibility more actively. Today considerable part of large companies has the proper section of site, which informs about the conducted eleemosynary and sponsor actions, and also vision of the role a company, in life of society. It allows to provide more influence of charity on producing a positive image of company at wider circle of persons. A rather successful innovation of mobile operator MTC is placing request on the receipt of sponsor or eleemosynary help on the site of electronic form. So a company aims to rotin own nonincentive and possibility of every Ukrainian to get a help from MTC.

The thematic analysis of eleemosynary and sponsor actions allowed to select such most widespread spheres: support of national-cultural actions and projects; sporting athletic motion; socio-economic development; a help in the decision of social problems.

It should be mentioned that in actions, supported by corporate sponsors, quite often take part and state structures, organs of executive power. For example, often Ministry of culture and arts comes as co-organizer of cultural eleemosynary actions; organizer of sport eleemosynary action "Race under the chestnuts" is Management in matters of physical education and sport of Kiev city state administration; The ministry of information takes part in organization of the Allukrainian days of press and book. Such collaboration of state structures, business companies and public organizations, is a certificate of effective intersectoral collaboration.

In their image-making policy Ukrainian companies begin to displace accents from an consumer market to the market of labour. Understanding double importance of company estimation of personnel (firstly, as a basic source of knowledges for potential employees, secondly, as a bridge between a company and eventual consumers), enterprises become more opened for the employees. Wide distribution is acquired by more loyal method of management, delegation of plenary powers, on lower levels, work in commands. A collaboration begin not with the reports of official duties, but with a mission and values. Organization of regular seminars for the increase of level of qualification of personnel comes forward as the important element of company activity, giving to employees the wide possibilities, for quarry growth. For the increase of loyalty level of employees internal PR-actions are conducted. For example, in 2006 a company "Kyivstar" developed and realized a project the "Best from the best", with the purpose of providing psychological comfort for personnel and feeling of meaningfulness for an own firm. Within the limits of project the 30 best employees were defined, were award a prize and determined by special diplomas. On an internal site "Kyivstar" a company placed interviews with winners, in which they were divided ideas about a company and their role in it. At the same time, considerable part of enterprises actively participates in demonstration of own advantages at the market of labour, organizing "Days of Career", inculcating the programs of internship for students. The popular has become supporting students of profile univercities with nominal grants. For support of positive image of organization is important a permanent "visual presence" at the market of labour, reminding to a special purpose audiences, that a company exists, and as an employer – has substantial advantages over competitors. Forms of such presence can be most various: press-releases, to the publication in facilities of mass information, participating in exhibitions and seminars, presentation of companies in higher educational establishments. Multinational corporations which work at the Ukrainian market place information about itself as an employer on the electronic sites. Concerning domestic companies, only their insignificant part on their sites next to information for consumers places and information for workers, for example sites "BudMaks" and "Velika Kishenya", contain information about present vacancies and so on. More and more enterprises demonstrate its own advantages at the market of labour, taking part in "Days of Career", inculcating the programs of internship for students (MTC, P&G);

Facts, mentioned earlier, testify that the Ukrainian companies begin to trust in virtue of image. A next step must be liquidation of dissonance between the first impression and reputation in order to change a corporate image from an abstract category into an : intangible asset which

alongside with other assets will provide an investment attractiveness and participate actively in the increase of companies potential .

CONSUMER'S BEHAVIOUR AND LOCAL PRODUCTS: A PERCEPTION MODEL

Pantano, Eleonora¹

¹*University of Calabria, Italy*

The main aim of this research is to study the perception of consumers regarding regional products from Calabria and the role of Magna Græcia culture in their buying behaviour. In fact, many products and artefacts reflect the finds in the region from the ancient Greek era which ran from the VIII Century B.C. to the 1st Century A.D.. Despite this considerable patrimony Calabria has still not fully exploited its potential.

The basic assumption underlying this research is that such processes are characterised by certain variables inextricably linked to the territory. The goal, therefore, is to construct a model to help us identify the main relevant factors. Currently, there remains a gap in the literature about the degree of influence played by the territorial image and other potentially influential factors have not yet been analyzed thoroughly.

The aim of this research, therefore, is to analyze the perception of local products from the Calabria region as heritage of Magna Græcia period in order to identify a new model which can deliver concrete results for the area as regards marketing strategies and territorial communication, thereby influencing in a positive way regional development.

To achieve this task, the research conducted has been developed by using two different approaches: the first qualitative, the second quantitative. In particular, the qualitative method (in depth-interviews with marketing experts) has been used initially to find important considerations which constituted the base on which the quantitative research (based on the questionnaires with consumers) can then build upon.

Keywords: consumer' behaviour, local products, consumer's perception, Magna Græcia, regional image.

INTRODUCTION

The main aim of this research is to study the perception of consumers regarding regional products from Calabria and the role of Magna Græcia culture in their buying behaviour.

The basic assumption underlying this research is that such processes are characterised by certain variables inextricably linked to the territory. The goal, therefore, is to construct a model to help us identify the main relevant factors. A model which describes this process could be used to define marketing strategies geared to enhancing the image of Calabria, by promoting its local resources. Many researches (Tellstrom et al., 2005), in fact, suggests that the use of traditional culture can help revitalise a region and create a bond between the consumer and a particular area.

We have chosen to analyse Calabria because it is a region that possesses an enormous inheritance from the point of view of art, culture, nature, history and archaeology which is often not fully exploited or fully known. In particular, the resources of major interest and importance are those dating from the period of Greek colonisation which has come to be known as Magna Graecia (Bertacchini, 2008). Many products and artefacts recall ancient Greek traditions and

often reflect the finds in the region from the ancient Greek era which ran from the VIII Century B.C. to the 1st Century A.D.. We can easily find close links between archaeology and numerous Calabrian local products, both food and drink and otherwise.

Nevertheless, Calabria has a very strong arts and crafts tradition involved in the production of local food specialties (such as salami and other pork products, various kinds of cheese, liqueurs made from locally grown plants and herbs) as well as gold jewelry and musical instruments, while there is a strong growth in the production of cultural goods and services led by local museums and the universities.

Only one enterprise on nine exports outside Calabria (ibid., 2005) and very few businesses invest in marketing or communication strategies. This demonstrates the importance of bringing to the fore such a valuable resource as the region's arts and crafts industries.

Despite this considerable patrimony Calabria has still not fully exploited its potential as a tourist destination on account of the low profile outside the region of what the region has to offer- in terms of products and culture - and the lack of promotion and attention devoted to cultural extras such as museums and archaeological parks (Confindustria Calabria, 2005; Servidio et al., 2008; Pantano 2008a,b).

In this scenario, it is very useful for Calabria the developing of new strategies to promote its local products, based on consumer perception of these ones.

Models of consumer's perception currently available in the literature refer to a process of perception for products in general in which the main factors that influence the consumer are not linked to a particular place, but rather to the consumer's own characteristics (in the sense of values and beliefs, opinions, lifestyle and so on) or to the product itself (physical characteristics, brand, price etc.) and the place where it is sold; certain authors claim that factors connected to the internal characteristics of the consumer are the most important and these characteristics are not under the control of retailers (Bäckström & Johansson, 2006).

Other studies (Dimara & Skuras, 2003; Skuras & Dimara, 2004; Mattaicci & Vignali, 2004) recognize the value the consumer gives to products associated with certain places or regions, although they do not specify which territorial factors lead the consumer to purchase a particular item.

In this work it is considered that factors such as the image and culture of a region have the greatest influence in the choice of purchasing local products.

If local products are the expression of a place, whose characteristics they embody, then it is clear that the ancient traditions of a culture like that of Magna Græcia can strongly influence the perception of a product.

The development of a model of perception that takes into account the cultural influences can have significant repercussions on the development of territorial marketing in the fields of business, tourism and society in general and spread this awareness on a national and international level.

The studies conducted up till now have shown that cultural aspects (image and territorial identity) influence the perception of the consumer, but these studies have not analyzed the

extent to which these contribute to the creation of a model of perception of local products; in other words there remains a gap in the literature. Furthermore, the degree of influence played by the territorial image and other potentially influential factors have not yet been analyzed thoroughly.

These can be built up on the basis of the development of a model of the perception of consumers regarding local products from the Calabria region stemming from Magna Græcia.

The aim of this research, therefore, is to analyze the perception of local products from the Calabria region as heritage of Magna Græcia period in order to identify a new model which can deliver concrete results for the area as regards marketing strategies and territorial communication, thereby influencing in a positive way regional development. The research undertaken is of an inter-disciplinary nature being comprised of elements linked to both marketing and psychology, which combine to produce revealing insights.

RESEARCH METHODOLOGY

The research conducted has been developed by using two different approaches: the first qualitative, the second quantitative.

The qualitative part is oriented to the analysis of interviews with the major producers in Calabria of goods connected with Magna Græcia. The quantitative part, on the other hand, has been conducted through the administration of a questionnaire.

The decision was made to combine the two approaches because the qualitative approach can provide useful guidelines for the subsequent quantitative phase. In fact, several authors suggest that qualitative methods should be used initially for the analysis, in order to find important considerations which will constitute the base on which the quantitative research can then build upon (Cahill, 1996; Mangan, 2004).

According to Vinten (1994), in fact, qualitative research allows the investigator to bring out the point of view of the interviewee and helps the development of hypotheses (May, 1996). It also allows the investigator to study the issue in question in depth (Burke & Onwuegbuzie, 2004); moreover, the successive phase of quantitative research can then go beyond the limitations linked to quantitative forecasts and can proceed to the testing of hypotheses and theories. In fact, the quantitative research is developed through in-depth interviews that, by and large, follow the most common method utilized for data collection in qualitative research (Dyer 2006; Ritchie & Lewis, 2003). In this phase, unexpected variables can easily come to light (Muijis, 2004). The awareness of the major producers in Calabria on consumer's purchasing behaviour can, in fact, help us to find new variables and improve the initial perception model, enriching its content, before the verification stage, through quantitative research.

On the basis of information obtained from the qualitative research a questionnaire is drawn up to use with consumers. This is one of the most effective instruments to acquire clear information on a limited number of subjects (Dyer, 2006), whose main characteristic is to collect numeric data, that can be subjected to statistical analysis (Walker, 2005; Muijis, 2004).

We have chosen to carry out a qualitative investigation, through the analysis of a case-study held to be particularly significant in the patrimony of Calabrian producers of traditional goods

with explicit links to the culture of Magna Graecia, and in-depth interviews with some producers, who are believed to possess information on consumer's behaviour, which are useful to our research because of their experience in the sector, their market share, and the strategies they utilize.

The stage regarding the interviews with the producers lasted just over a month and was completed in November 2008. The final stage, consumer research, lasted from December 2008 to the beginning of March 2009.

Qualitative research generates important results for the individuation of a preliminary model of perception of local Calabrian products, which constitutes the basis for the subsequent quantitative research.

It was considered sufficient to interview ten producers as those involved in the research are the major producers of Calabrian specialties traceable to the Magna Graecia heritage, furthermore they have good experience and the firms' dimension are such that they can provide useful results for the research. The firms excluded from research were either too small or lacking in an adequate firm culture in order to possess significant information.

QUALITATIVE RESULTS

The key of the success of one of the most important Calabrian goldsmith is the relationship with the territory (Pantano, 2008). In fact, the goldsmith underlines in each product the relationship with Calabria, this is a distinctive characteristics of his products, likewise culture, art and traditions own of the region (ibid., 2008), which is the reference of the firm.

This is the basic step for the following interviews with marketing experts. In particular ten marketing experts has been interviewed (CEO and Sale Directors).

After having collected the information from the interviews and having identified the most useful statements for the research, we proceeded to the individuation of some codes, each of which corresponds to an influencing factor. With the support of MaxQda software we analyzed the frequency of such words in the text in order to carry out a more in-depth analysis of the interviews with the aim of identifying the most important influencing factors according to the producers of local specialties in Calabria (Figure 1): uniqueness (frequency of code 1), memory (frequency 2), emotional experience (2), brand (2), distribution (3), label (4), tradition (4), point of sale (4), link with territory (4), local (4), price (7), quality (8), territorial image (9), packaging (15). In particular, each code corresponds to a color.

	ID del codice	Codice	Tutti i segmenti codificati
■	12	unicità	1
■	10	ricordo	2
■	9	esperienza emotiva	2
■	6	marca	2
■	14	distribuzione	3
■	5	etichetta	4
■	8	tradizione	4
■	3	punto vendita	4
■	13	legame territorio	4
■	1	tipico	4
■	2	prezzo	7
■	11	qualità	8
■	7	immagine	9
■	4	confezione	15

Figure 1: Frequency of codes (factors) in the interviews with the producers.

From the analysis of the interviews it emerged that a local product is an object bought as a memento of the place, independently of the emotional experience connected to the place.

Furthermore, the label was of great importance for producers, as it is in their view the first thing the consumer notices and it encapsulates all the characteristics of the product, its history, its tradition and its link with the territory (many of them in fact utilize some Grecian symbols to recall the link with the ancient culture of Magna Græcia).

We went on to eliminate two factors, following evidence from the interviewees who agreed in saying such factors did not influence their clients' perception: the quality of the product and the emotional experience linked to the location of the product itself.

The quality of the product in the case of local products does not influence consumers' perception as (according to the producers) consumers already consider the local product as one of good quality, as it is made with good quality raw materials and traditional and handmade manufacturing processes which give the product a higher value.

In the empirical model initially presented we thought the consumer's emotional experience in the location would have an influence on the perception of local products linked to that same territory, as it was thought that if consumers had had an enjoyable experience in the place they would have perceived the products as being very good. The producers, on the contrary, agreed on the fact that the experience does not influence the consumers nor their predisposition to buying, as the products are bought mainly during a holiday regardless of the positive or negative emotions experienced therein. The majority buy the product in order to take back an object which will remind them of the place, or as a gift to their loved ones as a symbol of the place visited.

We can infer the ways in which we can cluster into one single code *emotional experience and memories*, as they have very similar relations with the other codes. This is justified by the fact that the emotional experience lived in a place influences one's memories of the place. If tourists have a positive experience in a certain place they will take away with them a positive memory,

and vice versa if they have a negative experience they will take away with them a negative memory.

It is further possible to cluster into one single code *point of sale* and *brand* as these also have similar relations. This is justified by the fact that local products are usually niche products and are thus not very well known, their brand is usually the same as the name of the shop in which they are sold. This name recalls the link with the territory or the name of the owner. Therefore, the brand is identified with the name of the shop and vice versa.

QUANTITATIVE RESULTS

In this section we start from the results obtained from the qualitative research for the drafting of a survey of consumers who were interviewed, between December 2008 and February 2009.

To calculate the most suitable sample size to obtain an error of 5% we used the formula below:

$$\frac{N}{1+d^2*(N-1)} = n$$

Where

n= sample size

N= population size

D= probability of error

In total the people interviewed were 536, so the expected probability of error is even inferior. In particular, deriving from the formula the exact value of the probability of error corresponding to 536 interviewees, we obtain a value of 4.32% for the probability of error of the sample examined.

Structure of the questionnaire

The questionnaire was structured into 64 questions and articulated around 3 main sections:

fundamental components (interviewee's profile, knowledge of the certified guarantees for local European products, point of sale, knowledge of local products, sources of information of such knowledge);

potentially influential factors (convenience of the product, product packaging, cultural factors linked to the place of production, place of production);

consumer's behaviour concerning such products (frequency of purchase, cost of each purchase).

In the model to be tested we assume that there might be some correlation between culture-related factors and other factors which influence consumer's perception, this hypothesis is tested in the quantitative stage. In particular, the initial model relative to consumer's perception which

we want to test and eventually improve by using the quantitative research with consumers is the following (Figure 2):

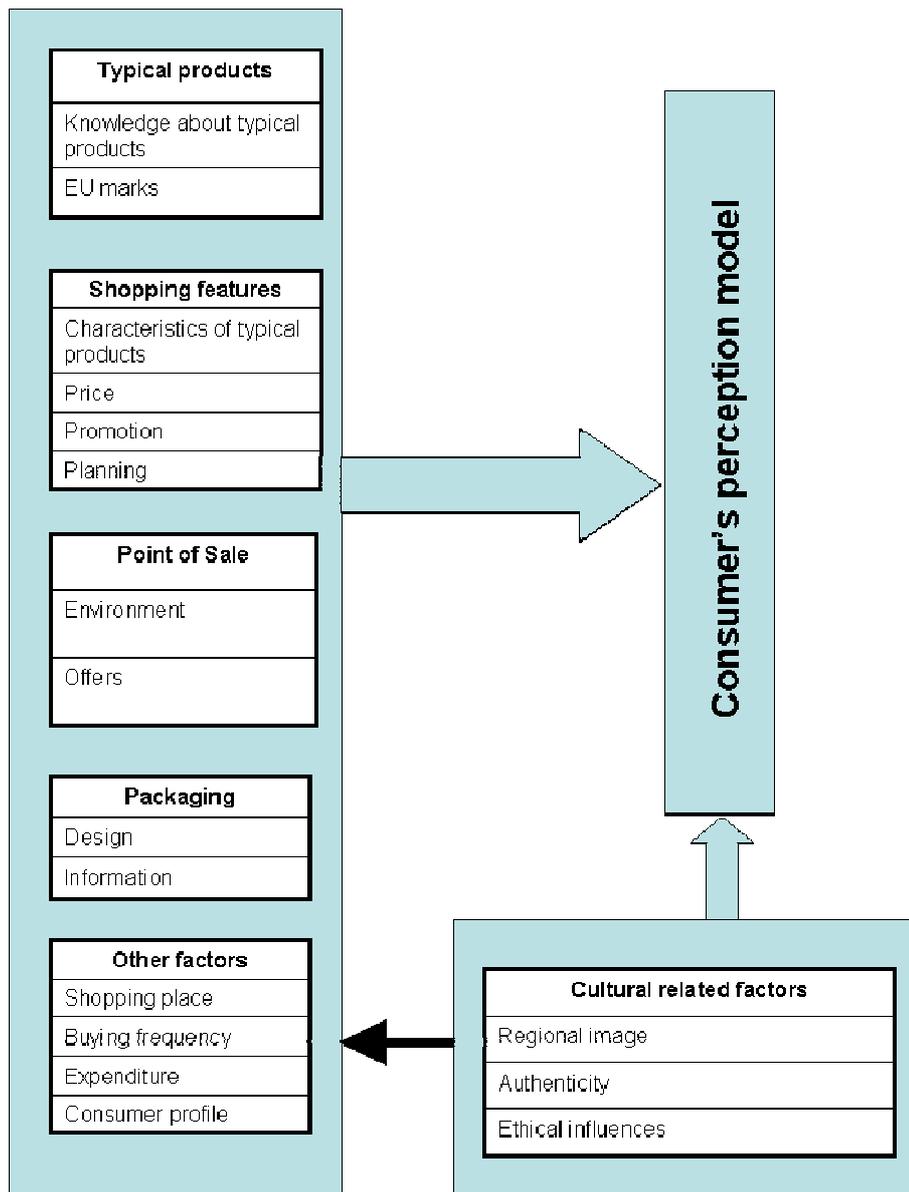

Figure 2: Initial model of consumer's perception of local products.

Analysis of results

With the support of SPSS software we analyzed the quantitative data.

The first step in the analysis of the results involves evaluating the reliability of the questionnaire.

Initially we have carried out a factor analysis, which is conducted to study, summarize, and simplify the relations in a group of variables (Barbaranelli, 2006). In particular we evaluate the suitability of the variables, the factoriability of the correlation matrix (matrix which contains the correlations between the observed variables); furthermore, we choose the method of extraction of the factors, the number of factors, the method of rotation of the factors; and we interpret and validate the solution.

Through factor analysis we can carry out Bartlett's sphericity test.

This indicates whether the test is significant, i.e. if the sample is sufficiently wide and it is thus possible to carry out factor analysis, if this is not the case the correlations between variables are too low and factor analysis cannot be made.

Further, it is possible to carry out a Kaiser-Meyer-Olkin (KMO) sample adequacy test which provides an index for comparing the dimension of the observed correlations with respect to the partial correlations. In particular, if this index has a value in excess of 0.90, the results are considered to be excellent; if its value is between 0.70 and 0.80 the results are acceptable; if the value is between 0.60 and 0.70 the results are mediocre; if the final value is inferior to 0.60 the results are scarce or not acceptable and thus it is not advisable to proceed to a factor analysis (Field, 2005). Principal components factor analysis was executed with Varimax rotation, as this method allows for a better separation of the various factors (Barbaranelli, 2006); furthermore, factors leading less than 0.40 are omitted to improve the clarity of the obtained results.

The results has been reported in the following table (Table 1).

All KMO values are more than the recommended value of 0.6.

<i>Section</i>	<i>Item</i>	<i>KMO</i>
<i>Local products and quality certifications</i>	11	0,784
<i>Product characteristics and purchasing occasions</i>	12	0,654
<i>Point of sale</i>	7	0,624
<i>Packaging</i>	6	0,621
<i>Regional influence</i>	8	0,707

Table 1: Results item and KMO values.

Following this stage we considered important an evaluation of the reliability of the scale used. Reliability "means that the scale should consistently reflect the construct it is measuring" (Field,

2005). To evaluate the reliability of the submitted questionnaire, it is necessary to analyse Cronbach's alpha. This is a coefficient which evaluates the reliability of psychological and educational measurements (Cronbach & Shavelson, 2004). It is "a kind of correlation with a possible range from 0 to 1.00" (ibid., 2004). If its value "is near 0 then the quantified answers are not reliable at all, and if it is close to 1 the answers are very reliable" (Leontitsis & Pagge, 2007).

Results are presented in Table 2:

<i>Item total correlation</i>	<i>Alfa di Cronbach</i>	<i>item</i>
<i>Local products and certification marks</i>	,626	11
<i>Product characteristics and occasion of purchase</i>	,608	12
<i>Point of sale</i>	,633	7
<i>Packaging</i>	,668	6
<i>Regional influence</i>	,637	8

Table 2: Results item and scale analysis.

"The values 0,7 or 0,75 are often used as cutoff value of Cronbach's alpha and thus for the reliability of the test" (Christmann & Aelst, 2006), but in some cases (depending on the number of items involved) even lower values are considered acceptable (Duhachek et al., 2005), particularly if they are in excess of 0,6. As we can see in the table above all items have a value in excess of 0,6 and in some cases very near 0,7.

Some chi-square tests have been carried out in order to evaluate the relationship between two variables. The significance value small enough (conventionally less than .05) then the hypothesis that the variables is rejected because they are in some way related (Field, 2005; Muijs, 2004). In fact, chi-square test can "guide model modifications or adding constraints even when the less constrained model is highly significant" (Yuan & Bentler, 2004).

Only the most relevant chi-square tests are reported in detail. For variable age group a chi-square value is 33,52, df is 5 and p (asymptotic significance)= 0.004. That means that, using a the 0.05 cut-off point, the difference is statistically significance (Muijs, 2004).

The test showed that statistically there is a significant relationship of the variable age between the sample population and the population. For variable provincial group a chi-square value is 42,97, df is 18 and p (asymptotic significance)= 0.001. That means that, using a the 0.05 cut-off point, the difference is statistically significance (Muijs, 2004). The test showed that statistically there is a significant relationship of the variable provincial between the sample population and the total population.

The first significant data that emerged from the descriptive analysis was related to the frequency of purchase

The majority of the consumers interviewed (536) said that they buy Calabrian local products linked to the tradition of Magna Græcia once or twice a month. This value finds confirmation in the fact that the expense incurred is relatively low and that the majority of these products is purchased in supermarkets (although only a small amount of such products is distributed through type of outlet) and it shows how the diffusion of the products under examination has so far only had a slight impact on the habits of Calabrian consumers.

Relatively to the monthly expense, the majority of the people declared they spend less than 50 Euros, particularly in the lower age group of the population (under 35s). This also reflects the diverse financial capabilities and the different attention toward local products which lead the older band of the population to spend, as was predictable, sums even in excess of 100 Euros. In fact, the average monthly expenditure per age group is higher in the older age groups. These results imply the fact that often such people's shopping involves the support of the whole family nucleus, which in the younger age groups may only be formed by one person.

The data is further confirmed by the average monthly expenditure in relation with the level of education: the greater the level of education, the greater the average expenditure. It is assumed, in fact, that a higher degree of education corresponds to higher financial capabilities and thus a tendency to spend more.

Another interesting datum is connected to the place in which consumers buy such products. What emerges is the preference on the part of the consumers to buy such products in supermarkets. In fact, only a very small percentage of the interviewees maintain they buy them on the internet (14% circa), whereas the rest maintain they never buy them. This value finds confirmation in the fact that only a few Calabrian producers have a website, and among these the majority uses the site only as a virtual display, in contrast with what happens in other Italian regions or in other European countries, such as Germany, in which the internet largely supports the sales which, in fact, are made through the use of various channels (Schröder & Zaharia, 2008).

Furthermore, purchases are rarely, if ever, made in the place of production, which in some cases is hard to reach or not adequately taken care of. Most of the purchases of local products deriving from Magna Græcia are made in supermarkets (about 55% of the interviewees buys often or very often in supermarkets), where only a small quantity of the great variety of such products is available. As regards the occasion for purchase, most of the interviewees do not plan on buying a local product (about 80%), in particular the prevalence of the interviewees buy such products whilst on holiday (circa 80%) or as a gift (circa 60%) (Figure 48).

Furthermore, around half of the interviewees maintain that a particular price can lead to a purchase, even when not previously decided.

Among the promotional activities preferred by the consumers' interviewed regarding the purchase of these products, we certainly see in-store tasting.

Almost 90% answered that this is one of the best promotional activities to make the product known and to induce to a purchase. A great number of interviewees (75%) has said that reductions in price or particular discounts can incentivise a purchase confirming the data previously collected on the influences of a lower price than usual. Furthermore, flyers distributed in the streets are very important: through these consumers can discover a particular

product or the place in which to buy it, which is generally not well known because it addresses a niche public. Finally, regarding the shop sign, only half of the interviewees said they were impressed by it enough to be driven to enter a shop. As regards the packaging of the product, just over half said it should look attractive, whilst almost 80% declared that the package should be manageable and easy to open. This data can be justified by the fact that the products under exam are generally bought during a holiday or as a gift, therefore it is particularly important that the packaging can be transported easily.

A high percentage of the interviewees (about 80%) has said that the packaging should also be see-through or have a transparent part through which one can see its contents.

This characteristic allows consumers to observe what they buy, also leaving them with a greater sense of security toward such products.

Regarding the packaging, the interviewees also expressed their opinion on the information which should appear on the label. In particular, most of the interviewees require the presence of detailed information on the manufacturing place (about 97%), secondly information on the utilized materials (about 95%) and finally information on the link with the territory (about 85%).

These data are justified by growing consumer's awareness toward the products they buy, and their increasing preference for natural materials, genuine (in the case of alimentary products) and not altered in a laboratory or artificially created. For these reasons it has also become fundamental to know the place where the product has been made and the techniques used in its production. Local products generally possess these characteristics and, for this reason, they are usually considered by consumers of superior quality.

Another very important factor which emerged from the analysis is that related to the interviewees' knowledge of local products (certification marks). Over 60% know such marks and they consider them certifications of guarantee of the quality of these local products, but only half of the interviewees buy such products on a regular basis or have a particular interest in the products which have such symbols.

In fact, about 50% of the interviewees agree in affirming that products with such marks are effectively of superior quality compared to similar ones without the certifying mark.

The subsequent step is related to the regression analysis. This is a technique which allows researchers to examine the relation between one or more independent variables (IV) or between an outcome variable and a dependent variable (DV) (Barbaranelli, 2006; Field, 2004; Muijss, 2004), with the aim of:

- analyzing the effects of the independent variables on the dependent variables in function of a certain model;

- identifying a linear combination of the independent variable in order to predict in an optimal manner the value assumed by the dependent variable (Barbaranelli, 2006).

In particular, in this analysis the qualitative indications derived from the interviews with the major Calabrian producers are tested.

The use of the SPSS software allows researchers to find not only a simple correlation coefficient, but also collinearity statistics: Tolerance and Variance Inflation Factor (VIF) (Liu et al.,

2003), i.e. to what extent the factors are interlinked. "Tolerance = $1 - R^2$, where R^2 is squared multiple correlation of i th variable with other independent variables" (ibid., 2003). When its value is close to 0, the variable is almost a linear combination of the other independent variables (ibid., 2003). VIF is reciprocal of tolerance. "Variables with low tolerance tend to have large VIF, so variables with low tolerance and large VIF suggest that they have a collinearity. No variables of the initial model have high collinearity.

None of the variables in the initial model have high collinearity.

Initially, we analysed the influences of the local products (VIF= 1,495), shopping features (VIF=1,373), point of sale (retail point) (VIF 1,451), packaging (VIF=1,558) and culture related factors (VIF=1,729) on consumer's perception (Figure 3), in particular it is the latter ones that seem to have the main influence.

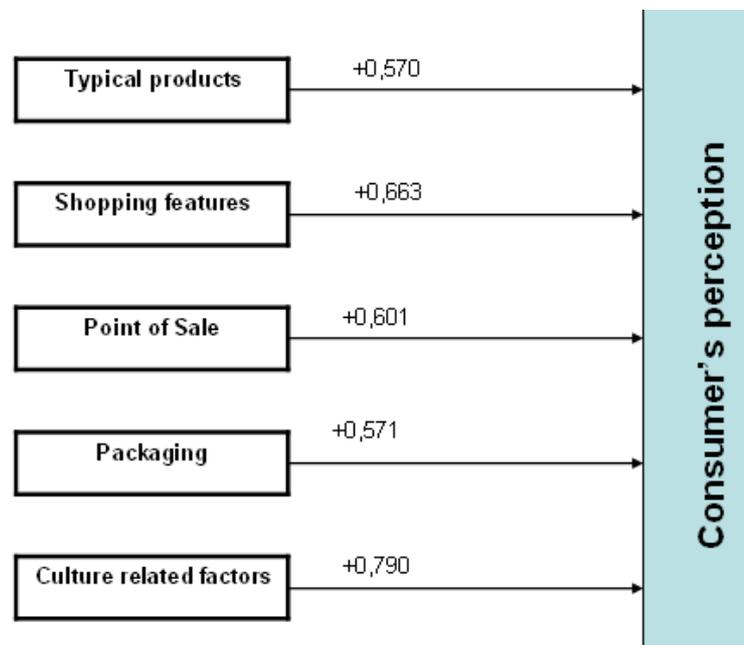

Figure 3: Multiple regression results on consumer's perception influencing factors.

Initially, we analysed the influences of the local products (VIF= 1,495), shopping features (VIF=1,373), point of sale (retail point) (VIF 1,451), packaging (VIF=1,558) and culture related factors (VIF=1,729) on consumer's perception, in particular it is the latter ones that seem to have the main influence.

For this reason, we have proceeded to a further regression analysis to see how much cultural factors influence local products, shopping features, retail point and packaging individually (Figure 54). As highlighted in Figure 4, we can see how *ethical* influences do not intervene in the perception process in a significant manner, having a very low Beta value.

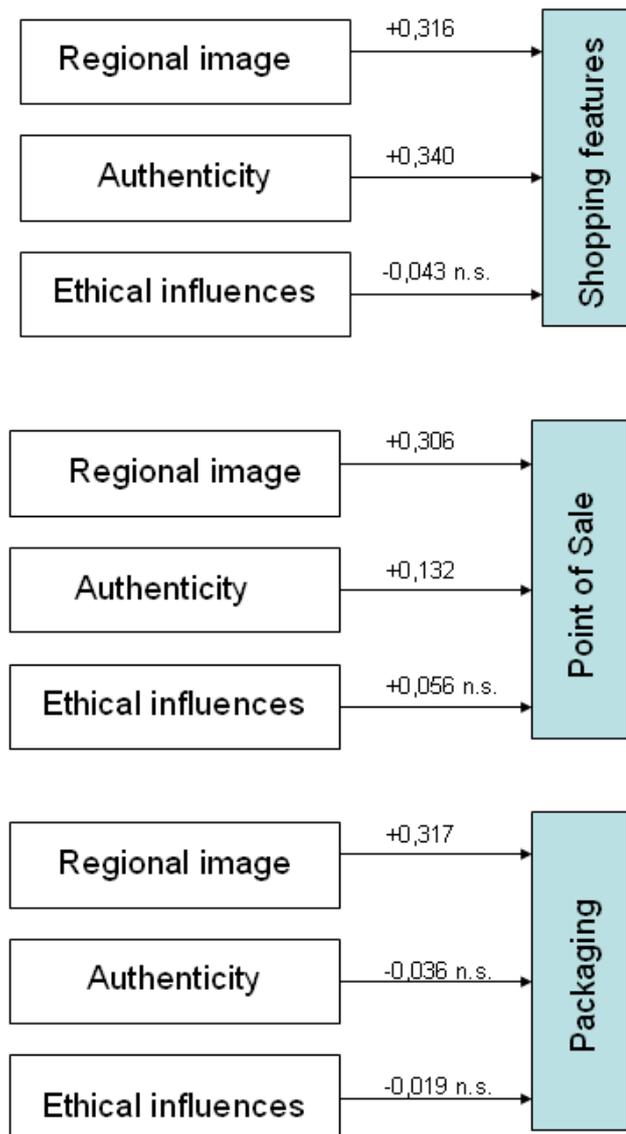

Figure 4: Multiple regression results of culture related factors on the other influencing factors.

CONSUMER'S PERCEPTION OF MAGNA GRÆCIA PRODUCTS

The next step of the research is to evaluate the index related to how the local products perception influences the buying behaviour of consumers, in particular shopping frequency and average expenditure on local products. To evaluate this we carried out a linear multiple regression. The results are shown in Figure 5.

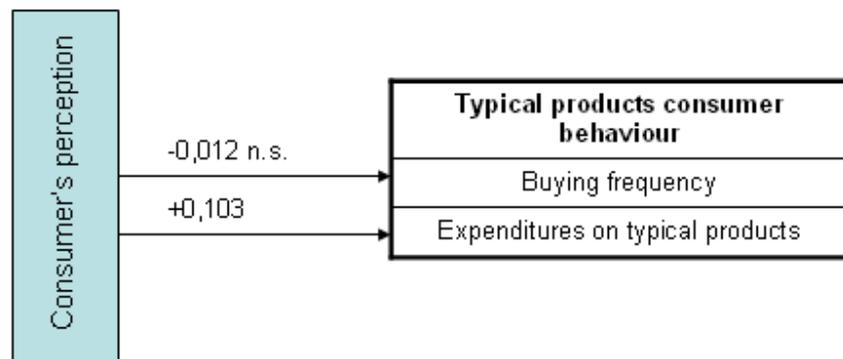

Figure 5: Multiple regression results of consumer's perception on consumer's behaviour.

In particular, it emerges from the figure that the perception does not influence the buying frequency, but only the average expenditure on local products. This result is explained by the fact that if consumers perceive the product as somehow endowed with superior quality, it is likely not that they will go out and buy them more often, but rather that when they do go out and buy the product, they will buy more of it.

After that we also analyzed other factors, to evaluate how much these may influence consumer's perception.

Among the various factors only the shopping place resulted significant, in particular the manufacturing place ($\beta=0.179$) and the specialized shops ($\beta=0.186$).

Only a minority (of the range) of Calabrian local products is sold in supermarkets, this distribution justifies the obtained values.

In Table 3 we show the ranking of the factors which influence the consumer's perception model. In particular, only those factors which directly influence consumer's perception were listed. It must also be stressed that cultural factors are the main influences and that they include Regional image, Authenticity and Ethical influences.

<i>Direct influences</i>		
<i>Rank</i>	<i>Dimensions</i>	<i>Beta</i>
1	<i>Local products</i>	0,570
2	<i>Shopping features</i>	0,663
3	<i>Point of Sale</i>	0,601
4	<i>Packaging</i>	0,571
5	<i>Culture related factors</i>	0,790
<i>Other influencing factors</i>		
1	<i>Shopping place</i>	0,365
2	<i>Education</i>	0,004 (n.s)
3	<i>City</i>	-0,044 (n.s)
<i>Consumer's behaviour of local products</i>		
1	<i>Buying frequency</i>	-0,012 (n.s)
2	<i>Expenditures on local products</i>	0,103

Table 3: Ranking of model dimensions directly influencing consumer's perception.

In Table 4 we summarize the values for the influences of cultural factors on the other components of the system, from which it is evident that the main influences are those determined principally by the Regional image. It is further possible to note that Ethical influences do not influence the other components of the model.

<i>Cultural factors influencing others of model</i>			
	<i>Regional image</i>	<i>Authenticity</i>	<i>Ethical influences</i>
<i>Local products</i>	0,163	0,125	-0,084 (n.s)
<i>Shopping features</i>	0,316	0,340	-0,043 (n.s)
<i>Point of sale</i>	0,306	0,132	0,056 (n.s)
<i>Packaging</i>	0,317	-0,036 (n.s)	-0,093 (n.s)

Table 4: Influences of cultural factors on the other model dimensions.

After the factor analysis within the item and the scale analysis, questions 6.2, 6.3 11.2, and 12.2 were eliminated.

After the regression, on the contrary, we highlighted that ethical influences do not influence shopping features, retail point and packaging. This implies that this variable will be completely eliminated from the final model.

There are no other variables which need to be removed from the final model.

Adaptation of the initial model

After a stage in which the results of the quantitative research were presented in detail, we now move on to the one related to identifying the modifications to be made to the initial model (Figure 6).

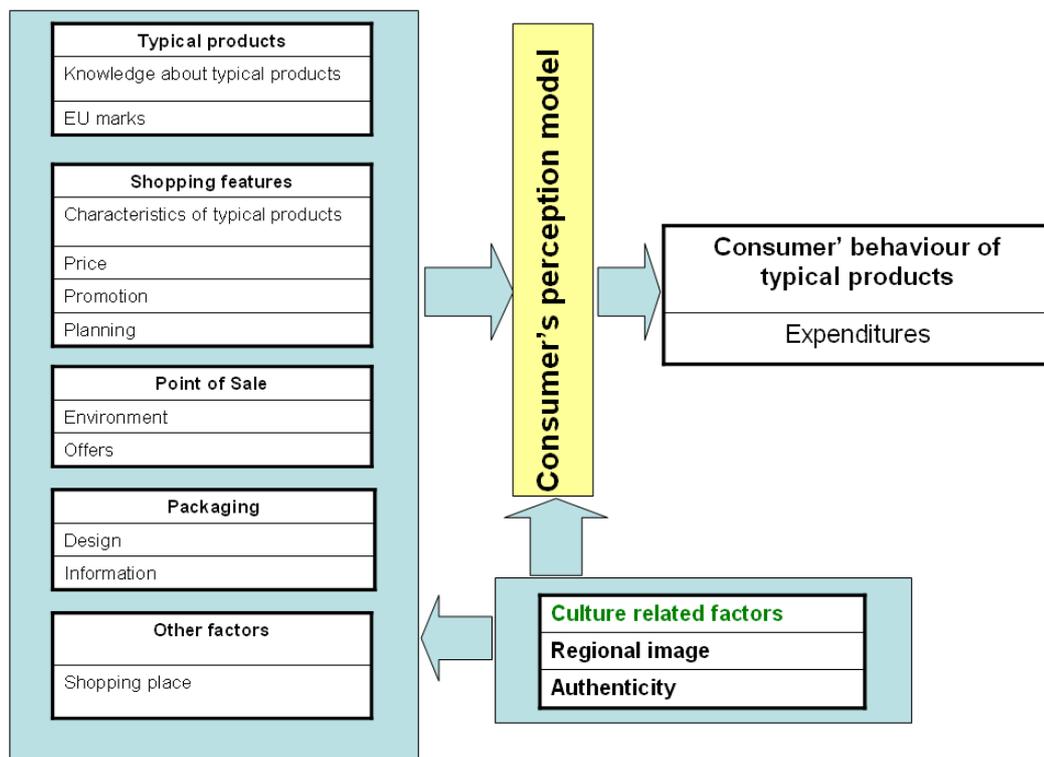

Figure 6: Adapted perception model for Calabrian local products coming from Magna Græcia.

The final model is different from the initial one most of all because of the fact that the cultural factors which influence consumer's perception are exclusively reducible to regional image and authenticity. Furthermore from the final model one can clearly see that consumer's perception influences consumer's behaviour regarding the average expenditure on traditional products. Finally the quantitative research has confirmed that culture related factors influence considerably also all the other factors which influence consumer's perception.

IMPLICATIONS FOR TERRITORIAL MARKETING

The results obtained have shown to what extent (both as territorial image and authenticity) the cultural component affects the process of product perception. Calabrian producers can use these results to define marketing and communication strategies which focus more on the link with tradition, so that the new market sector represented by consumers with an interest for local, traditional products made by artisans could be exploited. Only a part of these strategies have emphasised this connection so far, and have done so inaccurately.

Such strategies, aiming at the promotion of the Calabrian territory through the valorization of its specificity, may do well to focus on the message that local products have an ancient historical and cultural value as they originate directly from the Greek colonisations.

In the light of the results obtained, such a connection could be communicated on the wrapping, which should give more information relating to the place of production, the production techniques and traditions; it could also be shown in the retail point by developing a more traditional atmosphere and by paying greater attention to detail. Also, co-operative associations of producers could be set up to increase their impact on large-scale retailers and overcome the obstacle of high royalties.

It has also emerged from the research that over 60% of Calabrian businesses do not invest either on advertising or communication strategies as a whole. The setting up of a consortium, with the support of the Regione Calabria, could enable businesses to exploit digital communication tools and related studies to promote local resources within a global perspective.

CONCLUSIONS AND FUTURE WORKS

The aim of this research was to present a model of perception of Calabrian products from Magna Græcia starting from the assumption that the ancient culture underlying these products in some ways influences consumer's perception of them. Another objective of this work was to identify the factors that may influence the process of perception of the products in question, in order to single out possible implications for territorial marketing.

The research confirmed that a close connection exists between the two, and that the factor represented by regional image and authenticity considerably affects product perception and also influences other factors which play a part in the process of perception. Such factors include knowledge of local products, shopping features, points of sale and packaging.

Price turned out to be a minor influence in the perception of local products, while it is a key factor in the perception of brand products, where price has been shown not only to affect perception but is also a discriminating element in the purchase.

Moreover, regional image and authenticity have a direct effect on other factors, as these can underline in some ways the connection with territory, traditions and local culture.

Cultural factors also influence directly the retail point, where both the atmosphere and design can recall the territory with special images, colours and materials. Cultural elements affect the characteristics of the packaging too, which should contain all the information necessary to stress the connection with the territory, culture and traditions of the place of origin, as well as special

images, colours or shapes that recall that connection. They also affect the characteristics of the product and related marketing activities.

Finally the model shows how consumer's perception of these products manifests itself in consumer's behaviour at the moment of perception, influencing average expenditure but not the frequency of purchase. In the light of this, it is possible to affirm that consumers do not increase the frequency of purchase of these products, but rather the expenditure they dedicate to buying them. In some cases consumers prefer to purchase these products instead of similar, as consumers are prepared to justify a higher price with better quality.

The presented model could be generalized by extending the research to a larger sample of consumers with the aim of identifying possible common factors or differences.

Furthermore, it is possible to blow up the model, developing the individual determining factors further, in order to single out the details which affect product perception.

In conclusion, the model can be generalized by referring to Calabrian local products in general and after -by getting foreign tourists involved- identify a model of consumer's perception regarding "Made in Italy" products. New marketing and communication strategies related to the territory could be developed for the Calabrian region which focus on this particular message.

Purpose – The aim of this paper is to analyze how the Information and Communication Technology (ICT) and, in particular, the pervasive environments, can be more efficient tools for promoting tourism destinations. The study comes at a time when several researches are being focused on its potentialities on the tourism sector, as an important enabler of innovation and new marketing strategies, which could have implication on the developing of local economies. In particular, these tools can be used for promoting destination with a strong archaeological value.

Design/methodology/approach - We have analyzed the most used technologies in the tourism field, with emphasis on the pervasive environments. Afterwards, we analyzed the case of the archeological virtual reconstruction by using stereoscopy tools of the Greek walls located in Vibo Valentia (Southern Italy). This represents a meaningful example of a pervasive environment with the purpose of the promotion of Vibo Valentia City by exploiting its archaeological resources and the new tool of ICT.

Findings - The advances in technologies offer many interactive tools for promoting touristic destination, as well as provide interactive tools capable of improve tourists experience and, as consequence, influence their final decision-making. In particular, the pervasive environments allow tourists to live a more immersive experience, by enhancing the presentation and interpretation of the touristic assets. Furthermore, these environments can be integrated with other ICT to improve the offer of services for tourists. For instance, several current websites display three-dimensional model of objects, so that user can visualize these objects rotating them on the computer screen.

Research limitations/implications - To date, the analyzed pervasive environment has not been tested on a statistical significative sample of population. A qualitative and a quantitative research can be carried out to gain more data on consumers' response, in order to improve the current environments used to deliver this information. Afterwards, the environment will be tested with the application of 3D sound techniques in order to improve the user immersive experience providing a more realistic context.

Originality/value - In recent years, the competition among territories grow more than in the past. In this scenario, it plays a key role the development of new strategies for promoting the territorial resources to attract more tourists and gain a competitive advantage if compared to the other territories. This paper investigate how the new advances in ICT provide efficient tools to achieve this goal, and in particular how the pervasive environments can have the potential to have the major impact in the promotion of touristic destinations, which have not been fully investigated in the current literature.

Keywords Tourism destination, Tourist behaviour, Virtual Reality, ICT, Pervasive environments

INTRODUCTION

In recent years, the competition among territories grows more than in the past. The current advances in technology have developed new tools for promoting the territorial resources in

order to attract more tourists. In this scenario, the idea of digital tourism or e-tourism developed fast. It can be defined as the promotion of a touristic product (Cooper and Hall, 2007), which includes different services and activities such as websites, virtual and augmented reality, interactive environments, and so on. In fact, the tourism digital environments offer new services for consumers. In particular, it allows consumers to access to information and purchase touristic products in an easier way than in the past. To date, tourism enterprises are focusing on new approaches based on Information and Communication Technology (ICT) to increase the territorial promotion. These approaches exploit several internet tools.

In the tourism context, it is possible to exploit the ICT tools to make tourism business operations more profitable than in the past (Cooper and Hall, 2007). To date, there is still a gap in the research of the use of pervasive environments in tourism. For instance, in previous studies we have applied these technologies in other sectors like retailing (Pantano, 2009a,b) or for supporting learning process (Pantano and Tavernise, 2009).

The aim of this paper is to show how the integration of ICT and with Virtual Reality tools can be exploited for promoting tourist destinations in order to support the tourist decision-making process. In particular, these technologies allow to improve the promotion of local tourism resources and to influence the people evaluation of the touristic place (MacKay and Couldwell, 2004). From this point of view, consumer emotions play an important role in the place evaluation motivating and supporting the consumers during the purchase phase. In addition, these technologies allow to share the information about touristic places in order to assure a large diffusion of the contents, reducing the operational cost to promote it.

The paper is organized as follows: in the first section the traditional tools for promotion of tourism destination have been analyzed. The second one shows the most used ICT in the tourism field. Finally, the last one investigate how the pervasive environments can be a powerful tool for promoting tourism destination, by analyzing the case of the Greek walls in Vibo Valentia City (Southern Italy).

PROMOTION OF TOURISTIC DESTINATION

The study of destination imagery is an important aspect of the tourism research. From the cognitive point of view, each visitor may have different motivations to visit a specific destination. In this case, the image perception of the destination plays an important role because it not only supports the decisional process of the tourists but also stimulates its emotional state. In fact, planning the trip is an ongoing enjoyable and interactive social process, where fantasy and emotions play an important role and tourists are involved in continuing information search. By going this information search process, the tourist creates a "mental image" or "mental model" of what the travel experience might look like coherent with his/her need (Tapachai and Waryszak, 2000). Such an image is generally accepted to be based on functional consequences, and on the psychological characteristics, which consumers associate with a specific destination, by influencing tourist decision making behavior (Tapachai and Waryszak, 2000).

Recent studies of destination making and tourist behaviour focused on the analysis of the relationship between destination imagery and tourists preferences for the place (Sirakaya and Woodside, 2005; Son, 2005). For example, other studies have been carried out to explore the

positive and negative perspective of destinations, by analyzing several attributes (Pearce, 1982; McLellan and Fousher, 1983; Richardson and Crompton, 1988). These studies carried out that destination image influences tourist behaviour (Pearce, 1982). The wide number of studies on tourist destination image shows that image plays a key role in the marketing and promotion of destinations. In particular, Echtner and Ritchie (1991) show the existence of three factors that support the image of a destination:

A psychological/functional dimension.

The common/unique dimension.

Holistic/attributes axes.

In the last years, more pluralistic approaches to understanding tourism destination imagery formation have become louder (Feighey, 2003; MacKay and Couldwell, 2004). For instance, few of them have started to use photographs of the touristic destination for analyzing consumers' emotional response (Dann, 1996; MacKay and Couldwell, 2004; MacKay and Fesenmaier, 1997). To date, new methodologies to deliver touristic information have been proposed, most of them based on the use of ICT and, in particular on virtual and augmented reality approaches, which enable new ways to visualize complex data.

It is possible to improve the communication of destination imagery, by applying these tools in the tourism field and, as consequence, to create in tourist mind a virtual experience, or virtual test, of the destination attractiveness. In this case, the destination image is most exciting and capable to fast attract the attention of the visitor, which develops a more complex mental representation of the touristic place. In our opinion, these technologies offer new possibilities to communicate and to promote the asset of the touristic locality.

The future of destination image will need to harness these technologies to understand how improve touristic promotion and how influence on touristic behaviour. Destination imagery has many challenges and innovation will be a critical component. The innovation will have to be in harness with creative solutions attracting the future visitors.

APPLICATIONS OF ICTS TO TOURISM CONTEXT

The current research on the field of new technologies carried out new tools for a universal, interactive and ubiquitous communication access, which influenced the tourism industry. In fact, it allows tourist to achieve fast and reliable information, improves the service quality and the tourists satisfaction (Buhalis and Law, 2008).

In this scenario, many authors are focusing on the best application of ICT in the tourism sector in order to increase the added value of the touristic offer (García-Crespo *et al.*, 2008), which implies the creation of high customized tourist packages for users. As consequence, these technologies aim to have a pervasive effect on the creation, production and consumption of touristic products (Stamboulis and Skayannis, 2003). In fact, the buying of touristic products has been largely adopted via Internet and the Internet advertising is one of the main communication tools in the touristic sector (Wu *et al.*, 2008). In this field, the most used ICT are applied to realize virtual reconstructions of touristic destinations, for creating contents for mobile devices (e.g.

PDA, Smartphone, and iPod), web portals and their related recommendation systems, and for pervasive environments.

In fact, the virtual reconstructions are realized in order to create virtual environments capable to let users live the touristic experience via computer or devices for mobile communication. These reconstructions can be related to objects, models, and constructions. They can be very effective in the case of archaeological finds, because they reproduce the places and the objects in their original state.

As a meaningful example, we can consider the virtual reconstructions of the Temple of Lokroi (Southern Italy). The virtual reconstructions allow the tourists to visit the Temple in its original state, otherwise, today there are present only few ruins. The Virtual Reality applications are realized, therefore, to allow users to interact and explore the environment improving the quality of visiting experience. In this way, they facilitate the learning process, because they allow to live new and engaging learning experience. Furthermore, these virtual reconstructions are capable of promoting the protection of cultural heritage and, at the same time, they diffuse the heritage to a wide part of population, because they don't use invasive or corruptive techniques, which can cause the deterioration of the environment.

The use of web portals for creation of touristic packages supports tourists during the destination choice. Indeed, these systems provide several offers and allow tourists to create their favorite tourist package. Furthermore, they provide an intelligent matching between offered tours and the travellers' need and requests (Kanellopoulos, 2008). In this way, they help people to find the best package tour that satisfy their personal preferences (ibid., 2008).

To achieve this task, web portal are frequently equipped with recommendation systems, which are capable to choose one or more alternatives from a set of possibilities by a filtering process (Iijima and Ho, 2007). Hence, these systems provide tools to support tourists in finding the best solution based on his/her own profile (Schafer *et al.*, 2000). Moreover, a personalized recommendation system could retrieve the optimal product (Cao and Lee, 2007). The products can be suggested on the base of the top sellers on a web site, on the tourists demographics characteristics or on the past consumer' buying behaviour (Kwon, 2003). In this way, the recommendation systems can provide solutions which fit the tourists, by focusing on tourists' behaviour, preferences, requests and support their decision process.

Moreover, the use of mobile devices equipped with Global Positioning Systems (GIS) can give an information aid for archaeological visits (Cutri *et al.*, 2008). In particular, the tourists can access to the virtual reconstruction directly on their mobile devices. The GIS recognizes the geographical position and sends the information needed. Hence, these systems can simulate the visits for a wide range of environments. The virtual reconstructions of these ambient on the mobiles, therefore, allow users to enhance their tour. "This type of systems can mix real and virtual worlds, allowing the combination of the geographical location with the exact historical or cultural information" (ibid., 2008).

Very often, the interaction between user and system is multimodal. In fact, the user can exploit different input devices: voices, clicks on the display, or the geographical position recognition. The multimodality facilitates the interaction process (Oviatt, 2003a, b). Hence,

tourists can interact with the virtual environment, and they can use it to understand better the real one. In this way, the learning process is more productive, by requiring a less mental effort.

The use of pervasive environment for promoting tourist destination will be analysed in the next section.

PERVASIVE ENVIRONMENTS FOR PROMOTION OF TOURISTIC DESTINATIONS

The pervasive environments consist of three fundamental parts (Steventon and Wright, 2006):

The physical world where the user live.

The digital world (composed by the digital knowledge which influences the actions in the physical one).

The interface between the physical world and the digital one.

These environments are based on a decentralized computing landscape (Hansmann *et al.*, 2003). Furthermore, they focus on a large variety of small devices with enhance users' experience. In a touristic context, pervasive environments provide users the possibility to explore virtually the touristic destinations, by exploiting the opportunities offered by Virtual Reality and integrating several input and output devices. In fact, they allow users to explore the environment and interact with 3D objects and scenarios enhancing the visiting experience.

The application of these technologies enhances the tourism activity, because the system allows users to easy interact with the object present in the virtual environments. This interaction is multimodal, in fact, it is produces by several inputs: finger touch as mouse-click, voice, and body movements. In particular, the system is capable to recognize the users spatial movements (usually through webcam, or systems for the users shadow in the floor), and as consequence they can modify the projected images to give users the feeling of being really in the environment. This interaction creates a new standout, which engages the tourists and facilitates the learning process.

Moreover, the current research in the tourism sector is focusing on the developing of more realistic environments, strictly linked to the intelligent ambient with the function of touristic guide, in order to make the touristic experience more exciting.

The case of the Vibo Greek wall in Stereoscropy

A meaningful example of pervasive environment is the virtual reconstruction of the Vibo Greek walls by using the stereoscopic tools. The Greek walls located in Vibo Valentia city (Southern Italy) dates back in the V century B.D.. The walls aim to border the situ to the North East. These walls foresaw a defence guaranteed by the ditch and by the thickness of the walls as well as the opportunity of sorties from the doors¹⁹⁸.

Currently, there are present only few ruins of these walls (see Figure 1), but it has been possible to reconstruct them by using 3D graphical tools.

¹⁹⁸ Cfr: <http://www.virtualmg.net>

Figure 1: The current state of the Greek walls of Vibo Valentia.

In particular, we used a Virtual Reality Theatre (see Figure 2) based on two projectors, a wide screen, a tracking system and a 3D workstation which allows users to visualize three-dimensionally the Greek walls by exploiting the stereoscopic tools (Pantano and Tavernise, 2009).

Figure 2: The visualization of the Vibo Valentia Greek walls in the Virtual Reality Theatre.

The stereoscopy technique allows the 3D visualization of the reconstruction by using glasses with polarized lens. This is a visualization technique, which gives users a perception of three-dimensionality of the objects. The effect is caused by the combination of two images of the same object from different points of view. In this way, users are able to live a more immersive and engaging experiences into reconstructed environments.

Using this system, the tourists wear the special glasses for the stereoscopy in order to visualize the 3D environment, and then can explore and interact with through a computer mouse, which simulate the body movements in the environment. In this way, the system recognizes the tourist spatial position and changes the point of view in relation of his/her movements.

Hence, tourists can have the feeling to really walk over the Greek walls, explore them, interact with the objects and understand the original state of the walls (see Figure 3).

Figure 3: The visualization of the Vibo Valentia Greek walls in stereoscopy.

By a comparison of Figure 1 and Figure 3, it is possible to notice how tourist requires a less mental effort to understand the value of the current ruins, and to create the mental image of the original state.

The use of pervasive environments, therefore, can influence tourists during the decision making process, because they could have the desire to really visit the reconstructed places and really explore the man achieve more information on the history of these environments. In fact, on one hand the use of these technologies promotes the cultural resources of a place; on the other one it enhances the educational aspect of the holiday.

DISCUSSIONS

The analyzed technologies have the common characteristic to promote the touristic destinations in a new way, by involving tourists in living a new immersive experience. It is possible to compare their characteristics to investigate the other common points and the different ones, in order to propose the development of new technologies to be more efficient than the tools currently used (Table 1).

	Virtual reconstructions	Recommendation systems	Mobile devices	Web portals	Pervasive environments
<u>Interactivity</u>	yes	yes	yes	yes	yes
Multimodal Interaction	no	no	yes	no	yes
Customized information	no	yes	no	yes	no
Supporting decision making	no	yes	no	yes	no
Customized tourist packages	no	yes	no	yes	no
Supporting learning	yes	no	yes	no	yes
Recognition tourist' geographical position	yes	no	yes	no	yes

Table 1: The main characteristics of the most used ICTs in the tourism sector.

The Table 1 shows that the common characteristic of the ICT is the interactivity, which allows to enhance the tourist experience. It should be possible to integrate Virtual Reality tools to increase the performances of the system, as well as the quality of the services and, as consequence, improve the tourist perception of the touristic place. In particular, it is possible to integrate in a pervasive environment a recommendation system (or a web portal) with the mobile devices, by developing a software application available via mobile which is capable to provide the tourists information needed and supports him/her in the decision-making process.

In this way, the tourist who explores the 3D environment can access to more information and, as consequence, satisfy his/her knowledge needs. Hence, in the competitive contest among territories (Das and DiRienzo, 2009), these technologies are capable to emphasize the uniqueness of the cultural heritage of the territory in a new way, and to give territory an important added value in tourist perception. In fact, these technologies facilitate the creation of a mental destination image (Govers *et al.*, 2007). Therefore, the technologies influence the creation of the touristic image and, as consequence, they could play a key role in the tourist's buying behaviour of a tourism package.

CONCLUSIONS AND FUTURE WORKS

The main purpose of this paper was to analyze the current ICT for the promotion of the touristic territory, and in particular the case of the pervasive environments. We have described how the use of advanced technologies can contribute to make more attractive territorial touristic product. In fact, these technologies allow the development of on-line applications that can deliver rich multimedia contents, blending text, 3D images, sound and video in order to overcome the intangible nature of the product. The virtual reality technology based on video and interactive 3D visualization allow to consumers to test the product *in advance*. Furthermore, on one hand these technologies increase the quality of the communication strategies; on the other one they keep the information providers individuality, by exploiting the potentiality of the interactivity between tourists and computer. In order to manage these demands, concepts for individualized multi-layout presentation abilities and interactive presentation of tourism contents are used to support the consumer. To date, the ICTs offer the possibility to create touristic landscapes, which increase the quality of the delivered information. Also, it helps tourists to find what they are looking for and present it an easy pleasurable and meaningful way.

Moreover, the use of new technologies, and in particular of pervasive environments, becomes very efficient tools in the promotion of places with a strong archaeological value, as in the case of Vibo Valentia. In fact, they allow tourists to deeply the great value of that place in an easier way. The territorial attractiveness communication has an important role to promote the touristic potentiality. Indeed, the integration of different technologies and tools affects tourist's perception and the subsequent decision-making process, by increasing the perception of the tourists in exploring an environment that includes many assets.

In this phase, the study did not attempt to describe the user interaction with the system, but only to show some touristic applications of the pervasive environment for promoting territorial resources. However, research about what element to contribute to improve the touristic

attractiveness should be a high priority for future research. Future studies should identify the cognitive functions involved during the navigation in virtual environment and their impact on people's perception of the territorial attractiveness. Of course, the theoretical considerations described in this study must be interpreted with caution.

Furthermore, the analysed system will be tested with tourists to carry out qualitative and quantitative data in order to propose new tourism marketing strategies based on the use of pervasive environments for promoting tourist destination. In fact, a qualitative research will be carried out to analyze the tourists' point of view and their opinion on the experience, to implement the system.

Afterwards, it will be tested the application of 3D sound techniques in order to "increase the immersive experience in the virtual reality environments and hence prove a more realistic virtual environment" (Zhou *et al.*, 2004b) on the tourist experience.

In addition, the quantitative method will focus on a task analysis approach, based on the analysis of the users-system interaction. In particular, this analysis will have effects also on the Human-Computer Interaction (HCI) sector, due to the analysis of the interaction between users (tourists) and virtual contents.

⁴*Department of Wood & Furniture Design and Technology, Technological & Educational Institute of Larissa, Greece*

Purpose - The present research examines the possibility of certified timber promotion with sustainable forest management, developing an effective green marketing for the enterprises and the involved institutions of the Greek sector of timber.

Design / methodology/ approach - 55 specifically structured questionnaires, prototypes for the aim of the research, were collected from the Greek timber enterprises, on April 2009. The questionnaires were processed and analyzed with the statistical program SPSS of ver17.0, using descriptive statistics and correlation analysis. The main purpose was the investigation of knowledge, use and promotion of certified timber that emanates from forests under sustainable management, planning thus the green marketing.

Findings - The Greek enterprises of the timber sector, express a great interest on the protection of forests all over the world ranging from illegal loggings to their rational management. At the same time, they wish in their overwhelming majority the sustainable management of Greek forests to be certified.

These enterprises believe that the movement of green buildings reaches with a slow however pace also Greece and forecast that green consumers are prone to offer an additional percentage of about 6% on price, in order to buy certified timber products.

There exists big confidence in most Institutions of Higher Education (Universities and Technological Institutions) for the promotion of certified timber products. Companies propose their publicity through newspapers and magazines, as well as Internet portals of high approach.

Finally, the reflections on the growth of this new market of timber are expressed and discussed.

Practical Implications - The knowledge of the market of certified timber and the future developments in the next 5 years constitute a precious tool for the enterprises of timber, as well as the whole of the institutions involved in order to take proper decisions and conquer an important share of the market of green consumers. We also propose an effective way of green marketing applications.

Originality / value - It is the first research on green marketing and the promotion of certified products of timber in the Greek market, while similar work is very limited even on an international level.

INTRODUCTION

Green marketing

In our days the environmental problems concern all active citizens, as well as enterprises and institutions all over the world much more than those thirty years ago. International researches show that the consumers worry more for the environment and change gradually their behaviour (Arbuthnot, 1977; Simons, 1992; Diamantopoulos et al., 2003). Thus, a market has begun to develop for viable or sustainable products, whose position the active consumers want to strengthen, since it is a way to contribute - although indirectly - to the protection of the environment (Cornwell and Schwegker, 1995; Cleveland et al., 2005).

The enterprises gradually recognize the various competitive advantages and the enterprising opportunities (Johri, 1998) that arise from this ecological consuming approach, entering the word "green" in many of their activities. Thus, in parallel with the concept of Corporate Social Responsibility, the concept of "green marketing" has also been cultivated with sufficiently effective practices.

As "Green marketing" we could name the planning, development and promotion of products or services that satisfy the needs of consumers in quality, output, accessible prices and service, without however a negative affect on the environment with regard to the use of raw material, the consumption of energy etc (Davis, 1991; Kangis, 1992; Meffet and Kirchgeorg, 1994; Jain and Kaur, 2004; Peattie and Grane, 2006; Grant, 2008; Pride and Ferrell, 2008).

Surely, green marketing must be more than either a green way of marketing, or the marketing of so-called green products according to Kangis (1992). Green has to refer both to the method and to the product. This is why the very idea of green marketing needs considerable development and analysis, with closed rules and integrity in economic, scientific, academic and ethical terms.

According to the literature, the environmental parameter has been included in the strategy of marketing from the beginning of 1990s (Herbigand and Butler, 1993; Lampe and Gazda, 1995; Peattie, 1999).

Notwithstanding the existing obstacles, "green marketing" progressively gains continuously more supporters, specifically in sectors that concern the climatic change and forest protection.

In Greece, even if we are in the initial stages of this tendency, green marketing is expected to strengthen and influence the market even more. It is reported that in the USA the "green market" is calculated at 250 billions \$, while 63 million of consumers are directed towards products that either protect the environment contrary to the conventional ones, or have been produced with processes that respect the society and the environment. The same consumers are prone to spend an additional 7-20% in order to buy pure "green" products and reject the non-viable alternatives, offered to them by the conventional market (Reitman, 1992). According to a recent research, at a world level, the positive fame of a company about its environmental responsibility is

determined by the 53% of consumers (roughly 1 billion) as a decisive reason that makes them buy and use its products (Spanos, 2008).

The "green consumer" concept was the epicentre of the environmental marketing strategies of the "win – win" type, as well as the key concept, on which marketing academicians and professionals focused at the end of 80s and in the beginning of 90s (Diamantopoulos et al., 1994; Elkington, 1994; Shrivastava, 1995; Porter and Van Der Linde, 1995; Chan and Lau, 2000). Wagner (1997) showed that at market segmentation using demographic criteria "*Socio-demographic attempts to profile the green consumer have not always yielded strongly indicative results, and the results produced in one study have been repeatedly contradicted in another*".

Of course, in order to forecast consuming environmental conscience, it is necessary to investigate the social demographic variables (Jain and Gurmeet, 2006), since thus we can achieve a better policy mapping for the placement of green products and the determination of the strategy of a marketing - mix that will be the most suitable for the various green market departments.

Generally, today we observe an increase of the ecological conscience of consumers which results in the increased demand for green products, a phenomenon that is well exploited by a great number of enterprises, which start offering green products and services (Chan, K., 1999; Ottman, 1992; Peattie and Ratnayaka, 1992; Salzman, 1991; Vandermerwe and Oliff, 1990).

A relevant research has elected that the consumers that are interested in environmental matters take their purchasing decisions with criteria beyond the usual consuming models. Thus, it is observed that they reject excellent technical products because they are conscious of their damaging consequences in the environment due to the productive process or their disposal or because this is a way to show that they disapprove certain activities of their producers, suppliers or investors (Drucker, 1973; Bernstein, 1992; Peattie, 1995; Peattie, 1999).

In 1991, the 13% of all new products, sold in the USA made some sort of environment claim (Davis, 1991; Horovitz, 1992). The bigger problem both for marketers and consumers appears to be the environmental terms that are used for the promotion of their "green" or "ecological" products. Terms as recyclable and friendly to the environment have suffered hard criticism and today are avoided by the enterprises because of the difficulty of their definitions' documentation (Lampe and Gazda, 1995). In the USA, in 1990 a research showed that the problem faced when promoting "green" marketing was the increased number of consumers that did not believe in the companies' environmental statements (Schwartz, 1990). Thus, the creation of marketing strategies that used sonorous messages of sustainability met serious difficulties for the enterprises and specifically their creators (Shelton, 1994).

In their research Lampe and Gazda (1995) pointed out that "*every aspect of the product: design, production, packaging, use and disposal, provides an opportunity for a company not only to protect the environment but also to benefit from positive consumer attitudes towards the environment*".

In the Greek market, a recent research (2009) realised by the Athens Laboratory of Research in Marketing in collaboration with the Centre of Sustainability (CSE) about the "green marketing" proved among others that the overwhelming majority of the consumers (92.8%) has a positive attitude towards the enterprises that are sensitive on environmental matters. This

result represents mainly women of bigger age, married with children, housewives and pensioners. The 96.4% declare that the enterprises are compelled to contribute in the protection of the environment, while the 56% of these avoid products made by enterprises that do not respect the environment. The same research elected that the more basic reasons that enterprises strategize for the protection of the environment are in order to improve their image in the market (4.54), to differentiate from competition (3.92), to gain publicity (3.84), to increase their sales (3.63), to achieve favourable taxation (3.54) and finally to really contribute to the protection of environment (3.47).

Pittee (1995), Van Dam and Apeldoorn (1996) elected that ideas round what it could constitute sustainability for enterprises or at least sustainable marketing are: a redefinition of the "product", a willingness to change markets, an emphasis on benefits from product use, marketing communication that aims to inform rather than just impress, a focus beyond current consumers needs, a willingness to manage demand and expectation downwards, an emphasis on cost instead of price and taking more responsibility. Finally, Grant (2008) points out that "sustainability changes everything", while Johri (1998) shows that the future of green marketing strategy passes through the perception that consumers like "green" messages.

In the European Union there exist organisations that support enterprises to develop in a sustainable way, providing modern and practical methodologies and applying environmental and social criteria, such as the: Centre for Sustainability and Excellence (CSE), Global Reporting Initiative (GRI), United Nations Global Compact, European Foundation for Quality Management (EFQM), European Business Ethics Network (EBEN), European Committee (EC) etc (Avlonas, 2008).

"Green marketing" is considered by many researchers as an important opportunity for the enterprises to innovate even more and acquire an important advantage against the competition (Ottman, 1998; Kaufman, 1999; Laroche et al., 2001).

Pride and Ferrell (2008) consider that the objectives of green marketing should be: a) to eliminate waste, which should focus on the production of products without waste instead of getting rid of waste, b) to re-invent the concept of product in order to become consistent with the environmental commitment, g) to price the products portraying the real cost, which means high value for the money of the consumer and d) to create profitability via the creation of operational occasions that derive from the environmental conscience in the market.

In a study that was realised in the Great Britain, the researchers initially concluded that in general the ecological attitude of consumers changed positively. Nevertheless, these tendencies were not translated into real purchasing behaviour (Donaldson, 2005). This study reported the strong faith of consumers in the known commercial brands and in the feeble behaviour referring to the "green" claims, which was the main cause behind the consuming failure to interpret their concerns beyond the environment in their behaviour.

A comparative study examined how British and Rumanian enterprises promoted their green products in international markets. The conclusions presented are that while the British enterprises had focused their attention on the world fame of their products in order to promote the green claims to international consumers, the Rumanian ones had rested in the sales of agents supporting their green claims in the foreigner markets (Gurau and Ranchhod, 2005).

In a recent study (Alsmadi, 2007) that investigates the environmental behaviour of Jordanian consumers, a high level of environmental conscience is revealed. Unfortunately however this positive tendency and preference in the "green" products does not appear in the practice, obviously because this consumers have a stronger faith in the traditional products and a small confidence in the green statements. The above obstacles are further strengthened by the lack of environmental conscience by a lot of enterprises and the existence of a large scale of prices for the same product, many of which included an impetuous estimate of environmental responsibility. The same phenomenon has been presented in other researches too (Ottman, 2004; Donaldson, 2005; Cleveland et al, 2005).

Recognizing the role that the consumers can play in the protection of environment and ensure a better life for the future generations so much the governments, as well as the non governmental organisations have begun to aim at environmental campaigns in this consumer – target group (Wasik, 1992; Grunert, 1993; McGougall, 1993).

Grunert (1993) finds the important differences between the persons that belong to different professional groups with regard to various environmental departments of conscience. Although the contact of profession with the environmental conscience differs from product to product, the results general show that are the groups referring to housekeepers and/or professionals and services that have the strongest environmental conscience with regard to most of the environmental fabrications.

Naturally, all consumers are not always fervent and factual supporters of the protection of environment and certainly are not particularly influenced by the "green" marketing. However, they constitute a target group which can prove particularly profitable and effective for the enterprises that will be activated in the sectors of production and disposal of friendly to the environment products (Diamantopoulos et al., 2003; Jain and Kaur, 2006).

Creating more sustainable marketing strategies is expected to be a difficult process, since the majority of consumers still ignore what is finally mend by sustainability and remains undecided about the capability of enterprises to contribute to the protection of the environment. Becoming winners of this battle will be the key challenge for marketers of the new millennium (Davis, 1993; Peattie, 1999; Jain and Kaur, 2003; Murphy, 2005).

Timber certification coming from sustainable forests management

Today the "activation" of society for the protection of the environment has set the protection of forests and their rational and sustainable management, as priorities of its "agenda".

The negotiations of the first period of the Kyoto protocol obligations (2008-2012) and the following one (after 2013) are being in development. Key subjects, related to the forests include the reduction of emissions from the deforestation and the devalorisation of forests and the economies of forest management and the harvested forest products (Stevens et al., 1998).

This interest began as an organised movement, from the beginning of 80s, when it was decided the commercial embargo (boycott) of the tropical timber from the European and American markets. However this metre created enormous social problems to the populations of these countries, so in 1990 a non governmental environmental organisation was constituted

under the name "Alliance for tropical forests – RFA" aiming at the promotion of products from forests of sustainable management. In 1993 the Council of Forest Management or Council of Care of Forests (Forest Stewardship Council – FSC) was founded in collaboration with environmental organisations, wood processing industries and big forest owners, while in 1999 a new institution, the PEFC was founded by the small forest owners of Central Europe (Hansen, 1997; Humphries et al., 2001; Cashore et al., 2003).

Finally, today the certified forest regions reached the 320 million hectares worldwide in the middle of 2008 (UNECE and FAO, 2008).

The sustainable managed certified forests occupy the 8.3% of total extent of forests all over the world and the 13.4% of forests that they manage. The countries of Western Europe have certified more than the 50% of the total extent of their forests, in North America more than the 1/3, while in Africa and Asia only 0.1%. Roughly the 80-90% certified forests in the world are found in northern hemisphere, where the two thirds of world production of round timber are produced. More from half (57%) of the certified forests are found in Northern America (UNECE and FAO, 2005).

Globally the United Kingdom, the USA and Germany have the most certified institutions, while outside from UNECE region, Japan, China and Brazil are the leaders in this classification (UNECE and FAO, 2008).

According to the report of FAO (2007) the certification of the management of forests and the production of timber products with labels play a very important role in the social role of forests. The environmental importance of raw materials used by the timber sector predicates both to state and common opinion to show a special interest in the application of regulations and safety valves against the waste of the specific materials (Stevens et al., 1998).

The fundamental aims and objectives of forest certification are: a) the improvement of the management of forests, b) the guarantee of new markets, capable for the absorption of produced certified products and g) the control of certification of all processes up to the sale of final products, in order to safeguard their sustainable origins (Hansen, 1997; Hubbard, 2005; Sustainable Green Ecosystem Council, 2008).

In a relative research (Tosiaki et al., 2006) is pointed out that in Finland, where there exists some important experience on the forest certification, the enterprises of the timber sector do not have any expectations of gaining more money from an "additional price" paid by the consumers. On the contrary, they do so because they believe in the viability of their forests and for their own well being within the frame of their corporate social responsibility. Besides they consider that through this certification, they will play a more dynamic role in the exploitation of new markets.

Both in the USA, what in W. Europe there are promoted development programs on "green buildings" which increasingly influence the conditions of the market for forest products in both positive and negative ways (World Green Building Council, 2008; UNECE and FAO, 2008). The movement of "green purchasers" that was developed during the last years in N. America and W. Europe starts appearing in a slow but regular pace in Greece, creating a niche market area. The possibility of exports in countries with increased "green" purchasing public is particularly seductive.

Today the number of Greek consumers of biological, ecological and certified products is rather limited, although a slow increase has been forecasted (Stamou, 2005).

The certification of the sustainable origins of forest products can be used by the Greek enterprises that are activated in the timber sector as an effective Marketing tool for the extension in new markets and the improvement of their ecological profile (Juslin et al., 2002; Poku - Marboah et al., 2005; Papadopoulos and Karagouni, 2007)

According to the ever memorable Professor of the Faculty of Forestry in AUTH Dr N. Stamou (2005):

- the certified products of timber sooner or later will prevail and check this market that will emanate from sustainable and environmentally friendly managing forests
- The role of the consumer with environmentally friendly behaviour –final purchaser of products of timber –will become continuously more important, so that products of timber that will not emanate from sustainable managing forests will not be able to easily find a place in the market.
- The enterprises with certified products of timber will be gradually developed.
- The existence and viability or the exclusion of enterprises of timber in the market will be directly influenced by the environmental sensitization of citizens.

In the market of forest products there exists an important amount of research that has dealt with the certification of sustainable management of forests and certified products of timber that emanate from this forests (Hansen, 1997; Karna et al., 2003; Rametsteiner and Simulab, 2003). Many researchers underlined the eagerness of consumers to pay some price for the purchase of certified products (e.g., Rametsteiner, 1999; Jensen et al., 2003; Ozanne and Vlosky, 2003). Still, there is not much research done on the promotion of certified products in the timber and furniture market (Juslin and Kansen, 2002; Tosiaki et al., 2006).

In order to cover this void, the aim of this research was the investigation of Greek enterprises and involved institutions on timber subjects, in order to map the existing situation and analyze the prospects of growth of certified products of timber coming from sustainable managing forests. Besides, one of our intentions was the location of the benefits and prospective reflections that could result when entering such products to the market. The analysis would lead to the determination of the 4 Ps of green marketing (product, price, place, promotion), so that Greek enterprises and Greek consumers are supplied with green products effectively and contribute directly and / or indirectly to the protection of the environment in the best possible ways. This research aspires to constitute a precious tool of effective application of green marketing in this direction with medium-term or even long-term objectives.

METHOD OF RESEARCH

The data of this primary research were collected using the method of questionnaire formulation, collection and elaboration. The questionnaires were specifically structured for the aim of the present research, according to the basic principles of marketing research (Gordon and Langmaid, 1988; Tull and Hawkins, 1990; Doyle, 1998; Aaker et al. 2004). The essential

preconditions of green marketing, that is the responsibility, the transparency, the reliability and the perspicacity as well as the connection with the strategy (Avlonitis, 2008) were also taken into account. The researchers are special scientists and addressed the company executives with personal interviews. The questioned sample was selected after particular processes, when considered capable to answer.

The research questionnaire included 3 different groups and comprised by 37 questions in total. The first team included 9 questions relative to the general characteristics and the profile of each enterprise (name, address, legal form, year of foundation, activities, main products, occupied personnel etc). The second group included 11 questions relative to the application of the directive of European Union that referred to the CE marking for the products of timber in Greece and finally 17 close-type questions on knowledge, use and promotion of certified timber from sustainable managing forests in Greece.

55 enterprises and institutions were randomly selected. They are all directly related to the Greek timber market and they were questioned during their presence at the International Trade Show of FURNIMA (Furniture Machinery Exhibition) carried out in Thessalonica, in March 2009. The questions were structured to be short and comprehensible in order to be pleasantly answered.

The pilot application of the questionnaire in five companies revealed the weak points of questions that needed more elaboration, which led to a further improvement of the questionnaire quality in its final form (Dillman, 2000).

The data were registered, processed and analyzed with the special statistical program SPSSWIN ver 17.0. The analysis includes Frequencies, descriptive statistics (Descriptives) and Crosstabs, controls of independence among all the variables with the X^2 criterion, correlation analysis and analysis of variance (t - test) (Norusis, 2007; Howitt and Cramer, 2003).

RESULTS

The green marketing mix, the reflections on the certified timber market development when it comes from sustainable managing forests and the profile of the enterprises involved in this research are presented in the following paragraphs.

The green product – The certified timber coming from sustainable managing forests.

The concept of certified timber, as well as the concept of forest viability appears to be familiar at roughly half of those involved in the Greek market of timber (Figure 1). Still, the concept of certified timber produced from sustainable managing forests is rather hazy for the 24% of the asked. The relevant analysis regarding the legal form of the enterprises showed that no LTD and Trade Companies is familiar to the concept, while the 61.5% of SAs have a good knowledge on it. X^2 controls showed that the knowledge of certification appears to relate statistically positively with the annual turnover of the enterprises (Pearson $X^2 = 19.136$, Cramer 's $V = 0.516$ for sig. level > 90%, Approx. Sig = 0, 085). More concretely, the bigger the annual turnover of an enterprise, the more the knowledge that exists about the real significance of certified timber products from sustainable managing forests.

Accordinging the years of operation it appears that the enterprises that have been founded during the decays 1991-2000 and 1981-1990 possess the deeper knowledge of the concept at a percentage of 66.7% and 58.8% respectively. The knowledge of this concept is well under the mean for the newer enterprises (year of foundation > 2000), as well as the oldest ones (< 1980).

Things are quite different when asking about the concept of the sustainable forest management; it is noted that the 87.5% of new enterprises (year of foundation after 2000) and the 66.7% of the ones founded during the decade 1991-2000 reveal a much better knowledge of its significance. Besides, the significance of forest viability is familiar to the forest world since the 19th century, while hardly the last seven years it appears to be widely used in other sectors - at least in Greece. Concerning the number of occupied personnel it appears that the enterprises that have less than 10 employees (60.0%) possess the deeper knowledge of the concept.

The knowledge of the concept is related statistically negatively with the annual turnover of the asked enterprises (Pearson $X^2 = 11.619$, Cramer's $V = 0.568$ for sig. level > 90%, Approx. Sig = 0.071). More concretely, the smaller the annual turnover of an enterprise, the more the knowledge that exists about the concept of sustainable forest management.

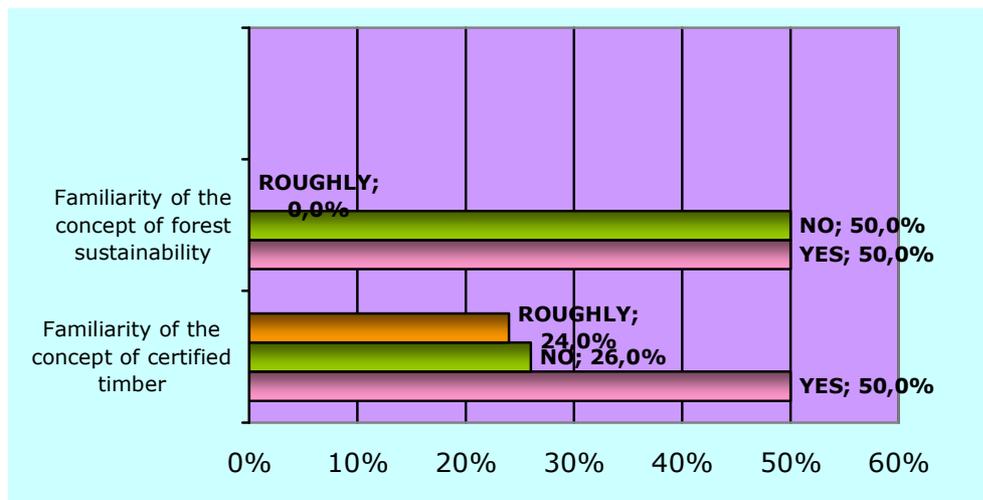

Figure 1. Knowledge of the concepts of certified timber and sustainable management of forests

Figure 2 presents the interest of the interviewees in the protection of forests all over the world from both illegal loggings and the non-rational management. It appears to be important at a percentage of 94.1% (62.7% "too much" and 31.4% "very much") and it proves the sensitivity of Greek institutions of timber concerning the protection of sources of the products they process, trade or manage. This interest is far more than natural if we remember the devastating fires in summer 2007 that burnt to ashes more than 200.000 hectares of forest in Greece. This fact appears to create favourable conditions for the promotion of certified timber from sustainable managing forests.

According to the crosstab analysis, individual enterprises show a great interest at a percentage of 29.6%; well below the mean (62.7%). This can be explained, since individual enterprises are run by the entrepreneur him/herself and everything has to be done by him/her. Consequently their interest for the protection of forests comprises a secondary interest.

What seems rather strange is the fact that the enterprises that declared a minor interest in forest protection are the very big ones, i.e. those that occupy more than 100 employees. Furthermore, there exists a statistically significant negative correlation between the interest of forests' protection from illegal logging and their sustainable management and the number of occupied personnel (Pearson $X^2 = 41.277$, Cramer's $V = 0.586$ at a sig. level $> 99.9\%$, Approx. Sig = 0.000). That is to say, the more the personnel number the less the interest for the protection of forests. In other words, the more impersonal the enterprises the more they focus in profits and the more indifference they show, since they leave problems to be resolved by other more "romantic" actors.

A small percentage of enterprises (3.9%) shows no interest in the consequences of thoughtless logging of forests on the timber market, while the overwhelming majority declares that they will be very negative at a percentage of 45.1% and simply negative at a percentage of 51.0% respectively.

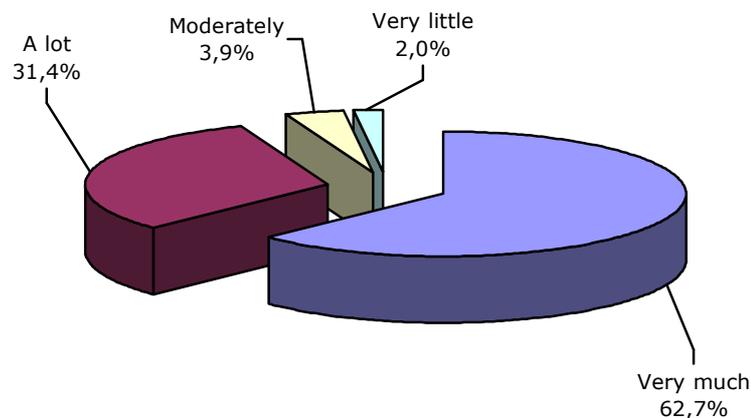

Figure 2. Interest for the protection of all forests in the world from the illegal loggings and their non rational management

The first impressions of the asked enterprises about the predominance in the market of timber from certified forests are presented in Table 1. The tendency of necessity for direct imposition of this opinion in the market of timber is slightly ahead at a percentage of 35.3%. They further believe that there will shortly appear a kind of pressure from the consumers to the enterprises of timber and furniture to produce certified products at a percentage of 31.4%. Of course, in this question there is also some reserve and reflection expressed on the difficulties of application of such an undertaking from the 1/3 of asked enterprises. Finally there is also the pessimistic view of the 9.8% that considers that such an application will create big problems for their enterprises.

<i>a/a</i>	<i>Predominance of certified timber in the market</i>	<i>Percentage %</i>	<i>N</i>
1	<i>This opinion is immediately imposed to prevail</i>	35,3	18
2	<i>Difficulty in the application in the market</i>	33,3	17
3	<i>There will be pressure from the consumers to the enterprises of timber and furniture to produce certified products</i>	31,4	16
4	<i>Sooner or later this opinion will prevail</i>	27,5	14
5	<i>There does not exist consuming conscience for use of products that protect the environment</i>	27,5	14
6	<i>It will influence considerably the structure and the composition of the market of products of timber</i>	23,5	12
7	<i>There will exist pressure from the state to timber and furniture enterprises to produce certified products</i>	13,7	7
8	<i>It will create important problems in the enterprises</i>	9,8	5

Table 1. Opinions of asked enterprises on the predominance of timber from certified forests in the market

In Greece the only sustainable certified forest is the "Mainalo forest" in Peloponnesus since 2004, although it is not also particularly known even in the Greek market. A 45.1% declared the certification of Greek forests for production of timber through sustainable management as very essential (while a percentage of 51.0% declared it as simply essential (Figure 3). That was quite normal after the above mentioned thoughts on forest protection. Besides we should also point out that in any case the overwhelming majority of Greek forests are sustainable managed but they just lack a "formal" certification.

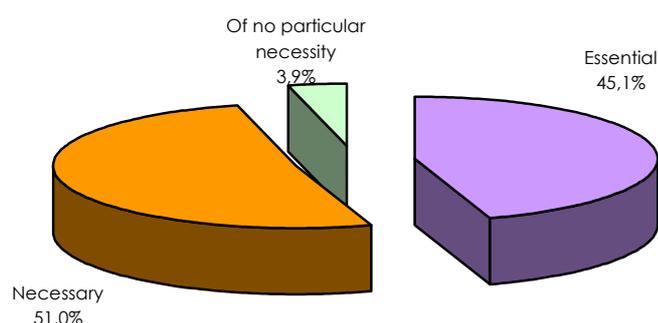

Figure 3. Opinions on the necessity of certification of Greek forests for the production of timber from sustainable management

In a first research in the Greek timber market, we posed the question of knowing the movement of "green" buildings; that is to say buildings that have the minimal possible consumption of energy and use materials that protect the environment. This is applied with success in the USA initially and in certain countries of Western Europe with success the very last years. In all "green" building manufacturing the raw material is timber from sustainable managed forests.

According to UNECE and FAO (2008) the policy of promotion of "green buildings" contributes to the continuously stronger promotion of timber certified products from certified forest regions. Norway, Finland and Luxembourg use certified timber to a large extent because of the high degree of certification of their forests, while Switzerland, Slovenia, Czech Republic and Liechtenstein have created a relatively good market of certified timber, specifically in the retail sector of "do it yourself". In Germany and the United Kingdom a lot of products in the manufacturing sector bear labels of certification. In France, where the use of timber in the manufactures today is relatively low (10%), the objective is to increase it to 12.5% till 2012. Finally, Italy appears to be particularly active in the sector of green buildings, although there is only a 5.3% of enterprises that produce doors, windows and floorings that have been certified relatively.

In the Greek market even if the presence of "green" houses is very timid, it is shown by this research that this movement is almost known to Greek enterprises at a percentage of 62.7% (Figure 4). This fact denotes that there is no need of a big promotional effort in order to inform Greek enterprises on this subject. This finding is further confirmed by the fact that the 94.1% of these declare that green houses might create a positive set also in Greece (Figure 4). Where will be supposed to give particular emphasis is the intense advertising informative movement towards consumers and particularly those that constitute initially the target - market ("green consumers").

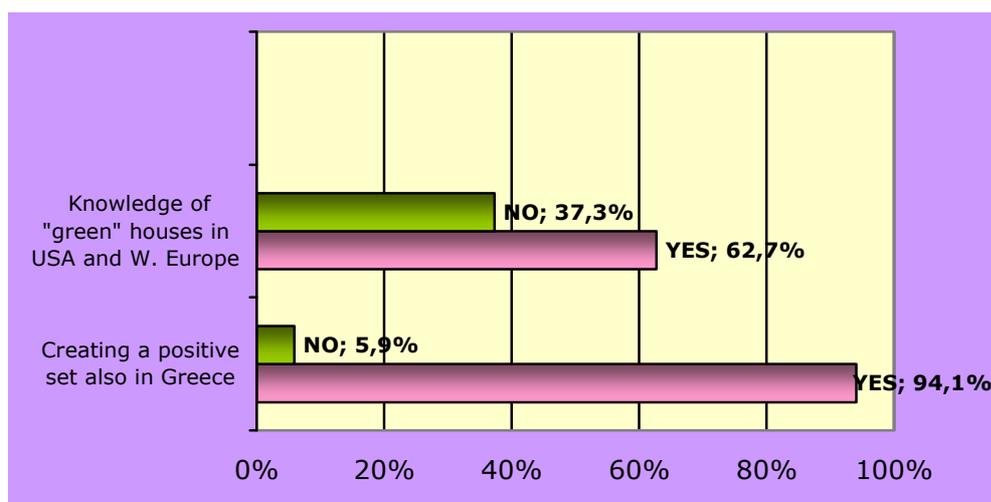

Figure 4. Knowledge of the "green" houses movement in W. Europe and USA and prospects of creation of a positive current also in Greece

The forecast of Greek timber enterprises on the growth of the institution of "green" houses in Greece refers to the next decay at least, with the majority (42%) declaring that this will happen after 10 years, while the same percentage forecasts a development during the next 5-10 years (Figure 5). GPs appear to be the most optimistic at a percentage of 22.2%; they believe that this institution will be developed very shortly in 3-5 years, while the Ltds in their bigger percentage (66.7%) believe that "green" buildings will start creating some important current in the Greek market in 5-10 years.

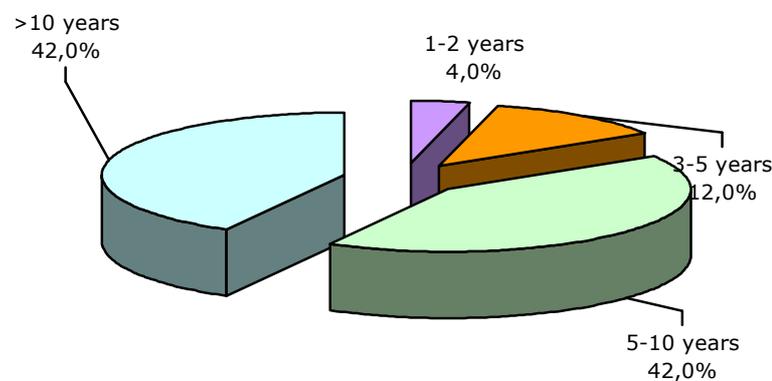

Figure 5. Years in which a development of "green buildings" is expected in Greece

Green pricing

Figure 6 presents the additional percentage that the enterprises consider that consumers are prone to pay in order to choose certified timber from sustainable managed forests or those that are supplied with furniture products and know that these have been produced using certified timber as raw material. Their majority (41.2%) believes that it must not exceed a 1-5% of their conventional value. The weighted average of this additional price amounts in 5,6%. A similar research (Owari et al., 2006) showed that this rate for the Finnish timber oscillates from 1-4%.

Control X^2 showed that the additional percentage of money that the consumers would pay for the above product is statistically related a) with the legal form of the sample enterprises (Pearson $X^2 = 37.249$, Cramer's $V = 0.465$ at a sig. level >95%, Approx. Sig = 0.011). That is to say, individual and GPs consider that this percentage should be the lowest possible (under 5%), while the Trade Companies have the tendency to propose much higher percentages, and b) with the annual turnover of the enterprises (Pearson $X^2 = 38.112$, Cramer's $V = 0.514$ at a sig. level >95% Approx. Sig = 0.034, kendall 's tau - c = 0.056), that is to say, the smaller the annual turnover of enterprises the bigger the percentages they propose for the consumers to pay. Obviously they wrongly believe that it constitutes a good "occasion" in order to increase their income.

The same Figure (6) further presents the estimates made by the enterprises of the research sample that the demand of certified timber will lead to increase of prices comparing with the already existing relevant products in an average weighted level of 9.8%.

A rather important divergence (4.2%) is observed when comparing the two above mentioned percentages, that is to say what consumers are prone to pay (5.6%) and the increase in the prices of the market (9.8%). It is the Greek market alone that eventually will show the price of balance.

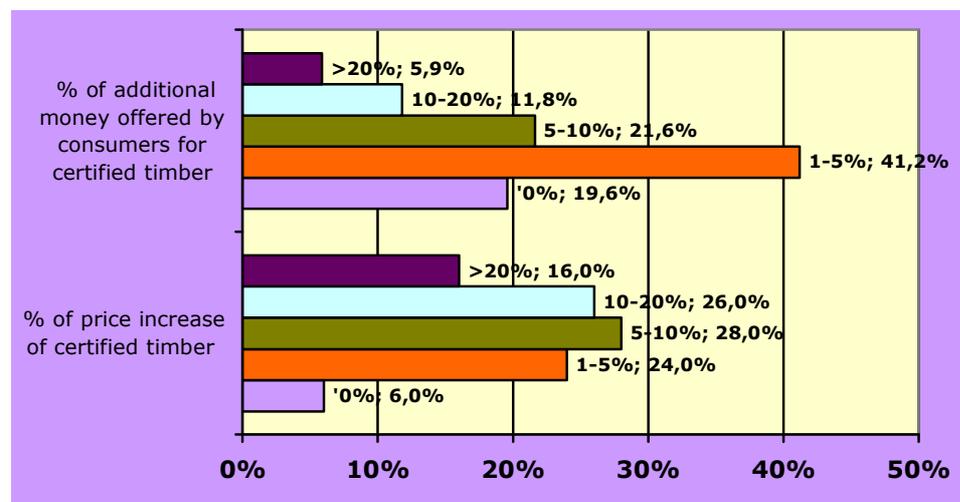

Figure 6. Percentages (%) on a) price increase because of certified timber concerning "traditional – conventional" products and b) the additional money consumers are prone to pay in order to buy certified timber or furniture end – products which will guarantee safety and will emanate from environmentally protected regions

Green marketing channels

Tables 2 and 3 present the proposed institutions that are directly or indirectly involved in the disposal of certified timber from sustainable managed forests or general named "channels of internal communication". Their sorting showed that the institution that the sampled enterprises consider as the first timber promotion priority are the wood working industries (mean 1.88) with lumbermen and furniture producers following.

Among the institutions that support the timber and furniture sectors, that is to say the channels of exterior communication, Universities and Technological Educational Institutes appear to enjoy the bigger confidence. They are considered independent, objective institutions with specialised knowledge (mean 4.58). The public opinion makers (4.94) and the contractors – constructors (5.02) follow.

Control X^2 showed that the big confidence given by the asked enterprises to Universities and Technological Educational Institutes appears to relate statistically with the annual turnover of the enterprises (Pearson $X^2 = 70.051$, Cramer's $V = 0.569$ at a sig. level >95%, Approx. Sig = 0,021, Kendall's tau - c = 0,052), that is to say, the smaller the annual turnover of the enterprises the

more they entrust the institutions. This is due to the characteristics of the Educational Institutions that were mentioned before.

The relevant controls X^2 for all the institutions resulted that there does not exist any statistically important relation among them at least for a confidence level $> 90\%$.

<i>a/a</i>	<i>Institution</i>	<i>Mean</i>	<i>Sorting (%)</i>		
			<i>1</i>	<i>2</i>	<i>3</i>
<i>1</i>	<i>Lumbermen</i>	<i>1.94</i>	<i>40,8</i>	<i>32,0</i>	<i>26,0</i>
<i>2</i>	<i>Timber processing industry</i>	<i>1.88</i>	<i>24,5</i>	<i>48,0</i>	<i>26,0</i>
<i>3</i>	<i>Furniture producers</i>	<i>2.22</i>	<i>34,7</i>	<i>20,0</i>	<i>48,0</i>

Table 2. Channels of internal communication through which the message of certified timber disposal is supposed to pass (scale 1-3 with 1 = most important)

<i>a/a</i>	<i>Institution</i>	<i>N</i>	<i>Mean</i>	<i>Std Deviation</i>
<i>1</i>	<i>Universities and TEI</i>	<i>50</i>	<i>4,58</i>	<i>2.56</i>
<i>2</i>	<i>Public opinion makers</i>	<i>49</i>	<i>4,94</i>	<i>2.95</i>
<i>3</i>	<i>Contractors-constructors</i>	<i>50</i>	<i>5,02</i>	<i>2.45</i>
<i>4</i>	<i>State institutions</i>	<i>49</i>	<i>5,27</i>	<i>2.56</i>
<i>5</i>	<i>Private Consumers</i>	<i>50</i>	<i>5,43</i>	<i>3.13</i>
<i>6</i>	<i>Architects</i>	<i>50</i>	<i>5,54</i>	<i>2.35</i>
<i>7</i>	<i>Government</i>	<i>50</i>	<i>5,74</i>	<i>3.89</i>
<i>8</i>	<i>Civil Engineers</i>	<i>50</i>	<i>5,80</i>	<i>2.75</i>

<i>10</i>	<i>Public Service</i>	<i>49</i>	<i>6,10</i>	<i>3.03</i>

Table 3. Channels of exterior communication through which the message of certified timber disposal is supposed to pass (scale 1-10 with 1 = most important)

Green marketing communication - Green promotion

The publicity and promotion of certified timber that comes from sustainable managed forests constitute a necessity for the 63.8% of enterprises that participated in this research (Figure 7).

Control X^2 elected that the above necessity relates statistically significantly with the legal form of the asked enterprises (Pearson $X^2 = 25.453$, Cramer's $V = 0.571$ at a sig. level $> 99.5\%$, Approx. Sig = 0.005). That is to say, the individual enterprises and LTDs consider this necessity much bigger than the SAs which do not consider it too important.

The concept of the promotional energies is presented in Figure 8.

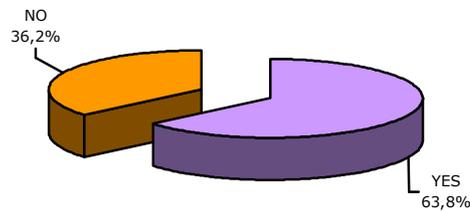

Figure 7. The publicity and the promotion of the use of certified timber as a necessity in percentages %

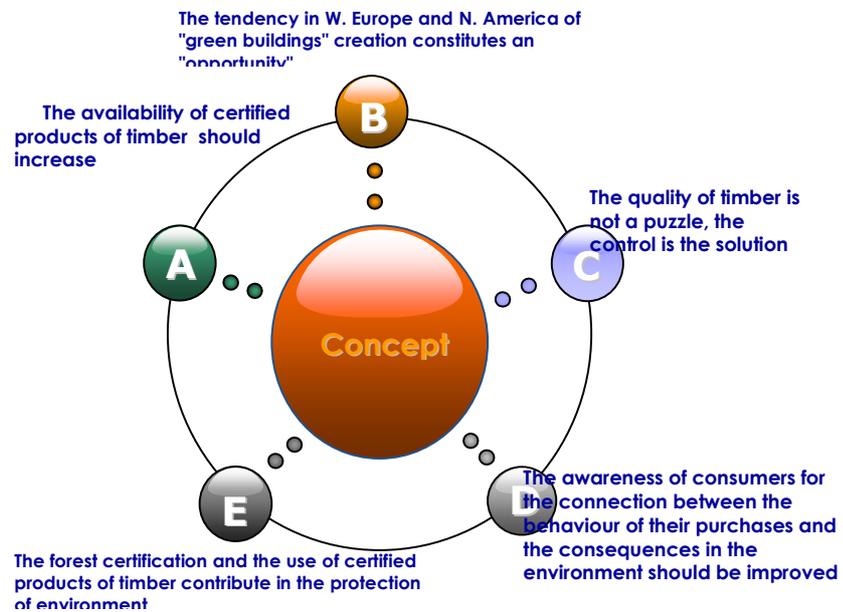

Figure 8. The promotion concept of certified timber use

Communication actions proposed by the enterprises of the present research (Table 4) as necessary are the traditional means (newspapers and magazines) ranking first at a percentage of 60.7% and immediately afterwards the use of Internet with the publicity of certified timber (that emanates from sustainable managed forests) in high visiting portals (50.5%). The use of Internet ranking high when evaluated as a means of communication was also noted in a relative research for the Finnish timber (Owari et al., 2006). There seems to be a rather small preference in collaborations with non governmental organisations or consumers unions (28,1%) as well as the use of Internet through special web pages such as facebook, blogs etc Particularly the last

mentioned media are not too familiar to the asked enterprises, which do not seem to know their effectiveness in the message promotion.

Press publicities could be communicated in Greek special magazines of the timber and furniture sector (eg Epipleon, Wood And Furniture etc), or sector bulletins that could be interested in such information such as engineering and interior design magazines, as well as decoration magazines addressed at consumers and Sunday newspapers.

The main aims of the events and meetings could: a) the reinforcement of public environmental conscience, b) the encouragement for a wider use of timber, c) the emphasis on the quality of wooden manufactures and furniture production and d) the diffusion of technical information on the products of timber

<i>a/a</i>	<i>Communication actions</i>	<i>Percentage %</i>	<i>St.dev</i>
1	<i>Publicity in newspapers and magazines</i>	60,7	31,8
2	<i>Internet and portals of high visiting rate</i>	50,5	33,1
3	<i>Creation and frequent mission of material at professionals and technical companies</i>	47,6	28,7
4	<i>Frequent newsletters to sent as SMEs and professionals</i>	46,0	33,8
5	<i>Organisation of events – meetings</i>	39,1	26,6
6	<i>Whole - page advertisements</i>	39,0	25,4
7	<i>Collaborations with Non governmental organisations, consumers unions etc</i>	28,1	23,5
8	<i>Internet through Facebook, Blogs etc</i>	20,2	24,2
9	<i>Other</i>		

Table 4. Percentage % of use of communication actions for the promotion of certified timber

The reflections

Table 6 presents the reflections brought up in discussion by the enterprises referring to the entire subject of green marketing and the promotion of certified timber from sustainable managed forests, in order to specify suitable measures and limit any risk as far as possible.

The most important question they place is the extent to which consumers, the conditions of the market and the competition allow the turn to green marketing. The second place belongs to the problem of the price, the guarantees and the economic benefits such as discounts – if any that will support the product. Both questions are rated with a 4.15 (with 5 to mean totally important). Product cost accounting (3.89) receives an intermediate importance, while distribution channels and the network of intermediaries seem to slightly puzzle them.

Since all 12 factors presented at Table 5 are related to each other, a cross-correlation analysis was contacted using Pearson correlation. The results are presented in Table 6.

At a significance level of 0.01 the factors that influence one another are:

1. The factor "Raw Materials, brand name, package, size, colour and general appearance of product" called Product Characteristics from now on with the one referring to " Distribution channels and more specifically networkS of intermediaries " (Pearson correlation coefficient = 0.462)
2. The factor of Product Characteristics with the "best quantity of production " (Pearson correlation coefficient = 0.385)
3. The factor about the capability of the existing productive capacity of enterprise referring to mechanical equipment, technical knowledge, building installations etc to cover the new needs with the one asking about the sufficiency of enterprises (salesmen, distribution means, employees in the marketing department etc) (Pearson correlation coefficient = 0.383)
4. The factor dealing with the price, the guarantees, and the economic benefits such as discounts – if any- that will support the product, with the Product Characteristics (Pearson correlation coefficient = 0.382)
5. The factor of the height of new investments with the variable cost and the overload the constant cost, the disposal expenses, publicity and generally production (Pearson correlation coefficient = 0.377)

<i>a/a</i>	<i>Communication actions</i>	<i>Importance</i>	<i>St.dev</i>
1	<i>The extent to which consumers, market conditions and the competition allow this development.</i>	4.15	0.93
2	<i>The price, the guarantees, and the economic benefits such as discounts – if any- that will support the product</i>	4.15	1.04
3	<i>Raw Materials, brand name, package, size, colour and general appearance of product</i>	3.98	1.06
4	<i>The capability of the existing productive capacity of enterprise referring to mechanical equipment, technical knowledge, building installations etc to cover the new needs</i>	3.89	1.00
5	<i>The variable cost and the overload of the constant cost, the disposal expenses, publicity and generally production</i>	3.89	1.07
6	<i>The process and the time of replacement of traditional timber with certified</i>	3.83	1.09
7	<i>The height of new investments</i>	3.78	1.05
8	<i>The sufficiency of enterprises (salesmen, distribution means, employees in the marketing department etc</i>	3.74	1.11
9	<i>The venture for the enterprise and the degree of uncertainty</i>	3.60	1.36
10	<i>The best production quantity</i>	3.55	1.16
11	<i>Choice among self financing or other financing forms such as borrowing, Leasing etc</i>	3.53	1.21
12	<i>Distribution channels and more specifically the network of intermediaries</i>	3.45	1.23

Table 5. Reflections for the production and disposal of certified timber (Scale of importance 5-1, with 5 =the most important)

From literature review (Stamou, 2005) it appears that the most basic criteria in order to make a decision on certified timber products correlate substantially with the additional profit which Greek enterprises will reap from the materialization of such a decision. They mainly refer to:

- a) The size of the recorded demand of certified timber products
- b) The sufficiency of this size so that will be able to guarantee the change from the traditional enterprising policy to the one of certified products
- c) The positive probability of an increasing demand in the market of certified timber products

d) The expectation of businessman of certified products of timber it has concrete advantages in this market

e) The expectation of better prices of certified timber products against the prices of "traditional" ones

f) the obligatory application of current relative legislation

g) The competitiveness of enterprises in the creation and development of new products, in the case they have to produce and offer both "traditional" and certified products.

THE PROFILE OF ENTERPRISES

Most enterprises (31.7%) declare the trade of products of timber, as their exclusive activity, while only a 14.6% are producers (mainly of particle boards).

In regard to the legal form of enterprises that participated in the present research, the bigger percentage (37.2%) are individual enterprises followed by SAs with a 30.2%, GPs (20,9%), Ltds (7.0%) and Trade Companies (2.3%).

The enterprises occupy roughly a mean of 23.8 employees. Small companies (10-50 employees) comprise the bigger percentage (47.5%), micro firms (<10) the 40.0%, medium ones (51-100) a 10.0% and finally there is a 2.5% with above 100 employees.

In their majority the enterprises are mature and experienced that have been founded before 1990 at a percentage of 63.4%, while an important percentage (22.0%) of them have been founded during the last decay (after 2000).

Finally, with regard to the annual turnover the 38.9% of the enterprises present a turnover of 1.000.000 – 5.000.000 €, the 25.0% a 500.000 – 1.000.000 €, an 11.1% above 5.000.000 €, while there is another 11.1% with less than 100.000 €.

Variables	t-test	Pearson correlation coefficients											
		1	2	3	4	5	6	7	8	9	10	11	12
1. The extent to which the consumers, the conditions of market and the competition allow this development.	30.519	.180											
2. The extent to which the existing productive capabilities of enterprises in mechanical equipment, technical knowledge, building installations etc can cover the new needs	26.559	.100	1.000

Table 1: Pearson correlation coefficients of reflections on the production and disposal of certified timber

** Correlation is significant at the 0.01 level (2-tailed).

* Correlation is significant at the 0.05 level (2-tailed).

CONCLUSIONS – PROPOSALS

The key findings derived from this study are as follows:

- The Greek enterprises of the timber sector show a great interest in the protection of forests in all the world from illegal loggings and traditional management. This big sensitivity of Greek enterprises appears to create favourable conditions for the promotion of certified timber that comes from sustainable managed forests. Bigger enterprises express relatively a weaker interest in the protection of forests.
- The asked enterprises wish in the overwhelming majority the certification of the sustainable management of Greek forests.
- The asked enterprises believe that the movement of green buildings comes also in Greece but in a slow pace. They forecast that the green consumers are prone to offer an additional price of a 6% roughly in order to buy certified products of timber.
- A particular emphasis in the green marketing should be given in the intense advertising informative movement of consumers and particularly in those that constitute initially the target – market of "green consumers".
- There exists a big confidence in most Institutions of Higher Education (Universities and TEIs) which are considered capable to promote the certified products of timber.
- Publicity is proposed through newspapers, magazines, as well as the Internet, specifically by high visiting portals.
- Finally, companies express fundamental thoughts and problems on the growth of this new timber market mostly referring to the probability of such a development and the role of consumers, market conditions and the competition as well as the price, the guarantees, and the economic benefits that will characterize the product.

The timber market depends directly on the growth of forestry. Synergies are necessary for the sake of the world economy and the protection of environment. It is well established that the certification of forests and products of timber contributes in the protection of environment.

The structured strategy of green marketing can be seen as an antidote in the economic crisis of today and even more afterwards.

The timber sector owes to maintain the quality of products at high levels and to decide composed movements in pricing, so that it maintains its fame and at the same time to be found at a high level of integration when the crisis settles.

The tendency of "green buildings" construction should be supported all over Greece. At the same time motives should be given to certify the Greek forests, which are even today under informal sustainable management.

The realisation and promotion of the above mentioned activities are essential for an effective publicity of certified timber. It requires however the combined actions of the relevant institutions such as confederations, Higher Education Institutions, non governmental organisations, editors, volunteers etc.

With regard to the means of communication and promotion of certified timber, the so - called *social media* could be also more developed, with Facebook groups such as “Green Buildings”, “Forests under sustainable management”, “Use of only Certified Timber Products” etc

Consumers should become aware of their power to contribute in the protection of environment even through the purchase of certified timber. Besides, the timber that is sold and comes from sustainable managed forests offers a lot of profits in many directions.

Literature review has shown that the majority of successful enterprises that trade certified products of timber have incorporated environmental matters in their commercial strategies and in their practices.

The present research could be continued, investigating the intention of Greek consumers to use certified timber from sustainable managed forests, after the diffusion of the findings of the present research.

The state is called to apply a forest policy which will adapt in the global developments and ensure the viability of forest exploitations Policies should also be able to support and strengthen the first steps of enterprises that supply sustainable certified timber.

INVESTMENT DECISIONS UNDER UNCERTAINTY: RESEARCH TRENDS

Paškevičius, Arvydas¹; Petras, Dubinskas²

¹*Dr. of Social Sciences, Associate Professor of Economics, International Business School at Vilnius University, Saulėtekio ave. 22, LT-10225 Vilnius, Lithuania*

²*Master of Management and Business Administration, lecturer, International Business School at Vilnius University, Saulėtekio ave. 22, LT-10225 Vilnius, Lithuania*

The purpose of this article is to present an overview of the principal trends in the area of taking investment decisions under the conditions of uncertainty. The identified trends of the research are grouped by the hypotheses produced and methodologies employed by the authors in relation to the hypotheses.

Three principal groups of the trends have been identified: a) the school of rational choice theory; b) the school of the irreversibility theory; c) the school employing models of both the rational choice and the irreversibility theory. By using econometric models the rational choice theory arrives at a conclusion that investors would refrain from investing where they envisage a high likelihood of a loss. The impact of uncertainty upon investment is in all cases negative. With the growth of uncertainty investment is shrinking rapidly. The irreversibility theory opposes the rational choice theory by employing empiric methods and concluding a necessity to consider a possibility that part of the investors may never return. Investors in all cases have an option to wait and suspend their investment until updated information becomes available and the situation turns more favourable for investment. Even in the face of a considerable likelihood of a loss investors will not in all cases choose to withdraw from the market. Furthermore, one of the principal theories claim that an increase in uncertainty will not produce an adverse effect upon investment in absolutely all cases. Finally the two trends were merged, complementing the existing models by a fixed cost factor and replacing the time factor by an investment volume factor.

We believe that the present article will encourage further interest in the impact of uncertainty conditions upon investment decisions and will prompt new, previously undiscovered areas of research.

Key words: investment decisions, uncertainty, rational choice theory, irreversibility theory, investment strategy.

INTRODUCTION.

Taking appropriate investment decisions is one of the most important factors for business success, therefore in most business units the process of the search for efficient solutions is a matter of special focus. The search is at times significantly impeded by the ever changing business environment. Few things would remain unchanged over a long term, therefore the decision making process frequently faces a good deal of uncertainty where future changes in business environment or their possible impact upon business cannot be completely projected.

Capital markets are likely to be among the most rapidly changing environments, furthermore, most frequently permeated with uncertainty. Most business entities being part of capital markets are inevitably forced to take investment decisions under uncertainty, therefore such investment decisions are undoubtedly a matter requiring special attention. The aim of the

present article is to explore the process of research of passing investment decisions under uncertainty and the directions of development of such research. The tasks of the article include (a) identification of the principal directions of research in the process of taking investment decisions under uncertainty, and (b) overview of the main aspects of the research and methods selected by the researchers. The research method is based on the classification of the identified research papers (on the subject of passing investment decisions under uncertainty) according to the research areas and methods selected by the authors.

UTILITY THEORY.

Before 1960s the impact of uncertainty upon decision making by consumers and firms was a frequent object of research, however, the role of uncertainty in capital markets or its impact upon an investment decision-making process did not attract sufficient attention of researchers. Most of capital market research has been carried out only under clear-cut and well-defined conditions (Fisher, 1930; Markowitz, 1952; Markowitz, 1959). The first attempts to develop an investment decision model under uncertainty were taken in 1962, when Farrar presented his model on the basis of the classical utility theory. The principal hypothesis claimed that investor choices depend upon the utility curve. The model was compiled using the mathematical programming method (Farrar, 1962)

Similar research methods were subsequently used by Merton. His inquiry into the investment decision making process under uncertainty was carried out in the same plane of macroeconomics, however, differently from Farrar, Merton based his research upon investment, rather than utility theory (Merton, 1977).

RATIONAL CHOICE AND ADJUSTMENT COST THEORIES.

A slightly different route was taken by Hirshleifer who became interested in the subject of investment decision making under uncertainty in the context of the investigation of the factors causing price changes. Having employed the already known game and rational choice theories, as well as the theorem of Modigliani-Miller, he developed a time-state model, based on the statement that uncertainty is changing following the same course as time. Investment for a longer period will mean that an investor will need to develop a long-term strategy.

To design such a strategy is a complex task as long-term strategic decisions are heavily loaded with uncertainty due to insufficient information. The longer the planned period for investment, the larger is the extent to which the shortage of information causes uncertainty that in its own turn is unavoidably related to risk. Therefore a conclusion should be drawn that investment decisions are affected by the degree of tolerated risk or accessible information (Hirshleifer; 1965, 1966). The same *time-state* model was subsequently used to compose the model for the calculation of the liquidity premium (Hirshleifer, 1972), project the equity price changes and determine the influence of the uncertainty factor upon an investor costs (Lucas and Prescott, 1971). Equally as in the case of the utility theory, the presented research most often uses econometric and mathematical-statistical methods. For the purposes of determining the effect of uncertainty upon investment decisions, the latter methods were used for an extensive period of time, as it was believed that empiric methods are not capable of accurately measuring the effect of uncertainty upon investment (von Kalckreuth, 2000). Using the econometric modelling U. von

Kalckreuth attempted to accurately assess the effect on the basis of the case of Germany. His fundamental hypothesis maintains that uncertainty is composed of two parts: (a) sales uncertainty; (b) cost uncertainty. The two uncertainties are equally important in the assessment of the impact upon investment. Uncertainty in all cases has a negative impact upon investment demand. In the event both uncertainty indicators increase by at least 1 percent, the investment demand on average declines by 6.5 percent (von Kalckreuth, 2000).

IRREVERSIBILITY THEORY

The research on the subject of investment decisions under uncertainty was supplemented by the irreversibility theory that opposed the rational choice and the adjustment cost theories. Ordinarily the decision is considered to be irreversible where, once the decision is taken, the choice possibilities in the long period are significantly restricted. For instance, an investor has to decide where to invest the funds owned. The investor then faces two alternatives – first – to invest into equities, or second – into government securities. Where an investor decides to invest into liquid Government securities, the decision will have no irreversibility effect as the investor shall be at any time able to sell the Government securities and use the proceeds to acquire the shares that he had not acquired before. The irreversibility effect arises where no options remain available or at least they are materially restricted, once the decision has been taken. For instance, an investor acquires illiquid equities. Such equities are hardly sellable, therefore, once they are acquired, there seems to be no other optimal solution than to continue holding them. Thus the decision to acquire the illiquid shares is considered to be irreversible. The rational choice theory disregards the decision irreversibility effect and treats all decisions as reversible.

One of the first researchers who started investigating the impact of the “irreversibility effect” upon investment decisions under uncertainty was C. Henry. In the presence of a clear-cut certainty an investor shall be able to accurately assess the situation, and his decision will have an irreversibility effect, which, as a result, facilitates his assessment of the return of all possible alternatives. In the face of uncertainty the investor may find it difficult to assess the possible financial consequences of his decision, or whether he will be able to modify it in the future (Henry, 1974). Differently from the theories discussed earlier, Henry most often uses empiric, rather than mathematic-econometric methods.

The importance of the irreversibility fact has been also acknowledged by Pindyck (1991). Similar to Henry, Pindyck has been criticising econometric models and claimed them entirely inappropriate for research of investor behaviour (specifically under uncertainty). Econometric models fail to provide any explanation for and do not facilitate any more accurate prognostication of the changes in investment costs. Neither do the econometric models provide an answer to the question why certain countries or business sectors invest more than others. It is necessary to consider that most of the costs, according to Pindyck, shall never be recovered. Furthermore, econometric models entirely disregard the fact that investors most often do enjoy a possibility to suspend the investment until they receive additional information about costs, prices, etc. The principal hypothesis is that investment decisions are affected by the possibility to suspend investment under uncertainty in addition to the cost irreversibility effect. The statement that investment into a project is expedient, only provided the future cash flows are larger than the related investment costs is not correct in case the investment costs are irreversible

and where the investment may be suspended. This consideration renders investment specifically susceptible to a range of risks, e.g., uncertainty about future prices and operating costs that define cash flows, also the uncertainty about the future interest rates, investment costs and time (Pindyck, 1991). This hypothesis is based on the research of the irreversibility theory by Ben Bernanke, who concluded that under uncertainty conditions an investor who opts to suspend investment until he receives more information, acquires an advantage against the investor continuing to invest under uncertainty. According to Bernanke, under uncertainty it is much more advantageous to suspend the investment than continue to invest under fear that the project will not be implemented and the idle time will generate excessive loss (Bernanke, 1983). Slightly later Pindyck expanded his theory by producing a hypothesis claiming that uncertainty concerning income and costs affects investment decisions in two different ways: (a) uncertainty may appreciate the assets which will cause the growth of the investment; (b) where the investment is "irreversible" and may be suspended, it is likely that alternative costs will increase, as a result whereof the general investment costs will increase and the value of the assets starts declining (Pindyck, 1993). In this connection the impact of uncertainty was further considered not only upon investment decisions, but also on prices and the determination of companies to enter the market or withdraw from it. A conclusion was arrived at that irreversibility has an impact upon price equilibrium which, in its own turn determines the resolution of companies to enter the market. The analysis of the indicators of American industry allowed a conclusion that where the uncertainty doubles, the required return rate increases by about 20 percent (Caballero and Pindyck, 1996). Nevertheless, in the opinion of some researchers, the relation between uncertainty and investment as established by Caballero and Pindyck is quite loose. In reality this relation is much stronger (Boyle and Guthrie, 2003). Boyle and Guthrie, while referring to the research by Dixit and Pindyck (1994), have produced their original investment timing model which they have supplemented by financial limitations. According to this model, a company has "eternal" rights to invest into a project and prefers to choose a date for its investment to ensure the highest return. Investment shall be accomplished where the value of the project is higher than the costs incurred while waiting. This model is based on the assumption that a company may allocate for the project an unlimited amount of funds, in other words, the financing risk is eliminated. Under the circumstances where the investment period is flexible, it is highly recommended to acquire insurance coverage. Such insurance will enable the company to suspend its investment under unfavourable conditions and help the company avoid losses due to premature involvement in the project. On the basis of this model, a conclusion was produced to the effect that the increase in uncertainty may cause an increase or a decrease of the investment depending on the source of the uncertainty (Boyle and Guthrie, 2003). This, to an extent, contradicts the statement that uncertainty may produce only an adverse effect (von Kalckreuth, 2000).

"ANTI-RATIONAL CHOICE" THEORY.

In the first half of the 20th c. attempts were made to explain most of the decisions by referring to the rational choice theory. Research in economics was dominated by the claims that even under uncertainty decisions are taken following the rationality criteria alone (Neumann and Morgenstern, 1947; Savage, 1951, and others). Referring to the works by Kahneman and Tversky (1979) G.Loomes and R.Sugden criticised the rational choice theory and significantly downgraded its role in decision-making under uncertainty (Loomes and Sugden, 1982). Although neither Loomes nor Sugden ever endeavour to specifically investigate *investment decisions*, they nevertheless were using the works of such researchers as Hirshleifer, Markowitz and others, and employed some of their research methods. These theories were to a large extent similar to those compiled on the basis of econometric methods.

PRICE CHANGE AND ADJUSTMENT COST RESEARCH.

Some 20 years after the first publication of the works of Hirshleifer on investment decisions under uncertainty, the factors causing price changes again become an object of research. Also, there are attempts to assess the impact of accidental price changes upon corporate investment decisions. Researchers get back to the impact of uncertainty upon costs, i.e., there is some revival of the *adjustment cost* theory (Abel, 1983). Abel constructs his model of optimal behaviour under uncertainty using mathematical models. He arrives at a conclusion that an investor behaves in an optimal way where, in view of changing conditions, the behaviour itself remains stable, irrespective of the duration of the investment. This means that even under the recession in the capital markets investors should not jump to any drastic decisions (e.g., start selling all their financial assets). Following an accidental price change, sooner or later there will be a return to the initial situation, thus it is by retaining the assets held that investors will suffer the least possible loss (Abel, 1983). A similar course in his research was followed by Dixit who claimed that under uncertainty and in view of accidental price jumps investors find it complicated to decide on the most appropriate time to enter the market, or to withdraw from it. In the process of investment decision-making under uncertainty Dixit proposes to be guided by the call option model, under which the option price fixing is equated to investment costs and the option premium is the possibility to withdraw from the market with the least loss on the price. In other words the investor purchases a possibility to withdraw in case the conditions turn adverse (Dixit, 1989).

The decision to enter the market or withdraw from it depends upon two factors, i.e., variable costs and the interest on the costs of entering and withdrawal from the market. Where the variable costs with the added entry cost interest are lower than any potential revenues, then it is a favourable moment to start the entry into the market process. A proper moment to withdraw from the market is when variable costs less the withdrawal costs interest are higher than potential income (Dixit, 1989). In his later articles Dixit modified his position to a certain extent and arrived at the conclusion that not in all cases investors will withdraw from the market where prices fall below the variable cost average (Dixit, 1992). In this respect Dixit acquires significant similarity with the hypothesis of the irreversibility theory school claiming that under adverse conditions it is much more rational to stick to a "waiting" strategy, than withdraw from

the market (Henry, 1974; Bernanke, 1983; Pindyck, 1991). Some time later Dixit's research was expanded by developing a new optimal investment strategy under uncertainty. The successful application of this strategy is related to the limit control policy at any time moment. The adjustment costs theory was also supplemented by introducing into the research the replacement costs of an asset by another asset (Eberly and van Mieghem, 1997, Harrison and van Mieghem, 1999).

RATIONAL CHOICE THEORY + IRREVERSIBILITY THEORY.

Finally, a number of research papers appeared demonstrating the attempts to reconcile the game, rational choice and adjustment cost theories with the irreversibility theory, in the underlying research employing both stochastic and deterministic methods (Abel *et al.*, 1996). This novelty of the trend was in its introduction, in the context of the investigation of investment decisions under uncertainty, and of the fixed costs factor. Until that time such decisions were examined only from the viewpoint of variable costs. The classical cost management theory maintains that where the investment costs are equal to a zero, then the investment value shall be equal to a zero too. In this case, however, the fixed costs that also to an extent affect the situation, were disregarded. It is exactly for this reason that the new model was supplemented by fixed costs (Abel and Eberly, 1994).

According to the advocates of this new trend, the optimal investor behaviour normally includes three probable modes: (a) when the investment result is positive; (b) when the investment result is equal to a zero; and (c) when the investment result is negative. Representatives of the game theory, rational choice and cost adjustment theories most often limit their focus upon the first case only being guided by an idea that a prudent investor will not invest in view of a possibility of loss, or the investment return shall be equal to a zero, therefore the examination of all other modes, except the first one is meaningless. The irreversibility theory is slightly more extensive and covers not only the first case under which investors enjoy returns, but also the second mode where the return is equal to a zero. Still, this theory, just like the rational choice theory, does not examine the cases where the investment performance is loss-making (Abel and Eberly, 1994). The game and the irreversibility models were also exploited in some other research exercises. P.Murto and J.Keppo used both models in an attempt to determine how, under uncertainty conditions, a company competes for investment possibilities (projects). What will be the effect upon a company where there being only one investment possibility it is taken by its competitor (Murto and Keppo, 2002).

THE USE OF FINANCIAL INSTRUMENTS UNDER UNCERTAINTY

It has been noticed that all earlier theories were most often pooling their efforts to attempts to prove the impact of uncertainty upon investment decisions and determine the extent of the impact. When referring to specific investment strategies a most frequent solution was to limit oneself to abstract proposals that are hardly applicable in practice, since no specification is provided as to which financial instruments need to be used in order to implement the proposals successfully, i.e., the issue on how, under uncertainty, it is possible to implement the investment strategies developed. Corporate managers find a search for such instruments a challenging task, since in all cases in order to properly use an instrument it is absolutely necessary to objectively

assess the uncertainty conditions. Practical application has shown that uncertainty is most often overestimated or underestimated (Courtney *et al*, 1997). Researchers from the Harvard University, H.Courtney, J. Kirkland and P.Viquerie, distinguished four levels of uncertainty and proposed different financial instruments to manage the investment portfolio under each such level (Courtney, *et al*, 1997).

THE MOST RECENT RESEARCH TRENDS.

Until now, most researchers based their models of investment under uncertainty on the factor of timing (Hirshleifer, 1965; Hirshleifer, 1966; Lucas and Prescott, 1971; Dixit and Pindyck, 1994; Boyle and Guthrie, 2003). The more recent developments show that such models are being developed with reference to the investment volume, rather than the timing factor. Having introduced the factor of investment volume in their research, K.Huisman and P.Kort have arrived at a conclusion that under a low degree of uncertainty leader companies will invest less than companies "followers". In view of the growing uncertainty, the situation reverses as companies "leaders" start investing more than companies "followers". Also it has been established that under a high level of uncertainty the leading companies will not only invest more than smaller companies, they will invest considerably earlier than the latter. Under a lower level of uncertainty the situation will be inverted (Huisman and Kort, 2009). In their research Huisman and Kort, similarly to many other advocates of the game theory employ econometric methods (Huisman *et al.*, 2003; Huisman ir Kort, 2009).

CONCLUSIONS.

The research of the investment decision-making under uncertainty may be categorised into three principal trends: (a) rational choice, game and adjustment cost theories; (b) irreversibility theory, and (c) a joint theory that combines both theoretic models: that of the rational choice and of the irreversibility.

The research of investment decisions under uncertainty started with the use of the rational choice, game and adjustment cost theories (Hirshleifer, 1965, 1966, 1972; Lucas and Prescott, 1971, and others). Until that time the investment decision-making was tested only under "certainty" conditions (Fisher, 1930; Markowitz, 1952; Markowitz 1959). Most models of the school designed to assess the impact of uncertainty upon investment were developed taking into consideration the timing factor. In almost all cases the researchers conclude that uncertainty has upon investment exclusively adverse effect (Hirshleifer, 1965, 1966, 1972; Lucas and Prescott, 1971; von Kalckreuth, 2000 ad others). Researchers were mostly employing econometric methods in belief that empiric will not facilitate any more accurate assessment of the impact of uncertainty upon investment decisions.

Representatives of the irreversibility theory stand as opponents to the rational choice theory, maintaining that econometric methods have failed to produce an accurate answer, since in the examination of the impact of uncertainty upon investment due account must be taken of a possibility that part of investors may never return to the market. In all cases investors have an option to await and suspend their investment until updated information becomes available and the situation turns more favourable for investment. The irreversibility theory, in contrast to the rational choice theory, claims that even in view of a significant likelihood of a loss not in all

cases will investors withdraw from the market. Furthermore, one of the principal theories claim that an increase in uncertainty will not produce an adverse effect upon investment in absolutely all cases. The research by the representatives of this school most often employs empiric methodology (Henry, 1974; Bernanke, 1983; Pindyck, 1991, 1993; Dixit and Pindyck 1994; Caballero and Pindyck, 1996; Boyle and Guthrie, 2003).

Finally, the two trends were streamlined by expanding the existing models with a number of new aspects. For example, some researchers introduced the fixed cost factor (Abel and Eberly, 1994), consideration was given to the effect of competition (Murto and Keppo, 2002), and the investment volume factor was introduced to replace the timing factor (Huisman and Kort, 2009).

Emergence of some new trends in the area can in no way be overruled, as the existing theories have not yet succeeded in addressing all arising problems, in order to comprehensively assess the impact of uncertainty upon investment decisions.

IMPACT OF GLOBALIZATION ON CELEBRITY ENDORSEMENT IN INDIA

Patra, Supriyo¹; Datta, Saroj. K.²

¹Prof., George College, Kolkata, 136, B.B. Ganguly Street Kolkata-700012. West Bengal. India

²Professor and Dean, Faculty of Management Studies, Mody Institute of Technology and Science, Lakshmanagarh-332311. India

Globalization has made the world more nearly a single, homogeneous, market place, but there will always be economic, geographic, cultural and technological difference. Standardization and localization are the two **Marketing Communication** strategies used in International Marketing Communication.

PURPOSE: The concept of **Integrated Marketing Communication (IMC)** has added a new dimension in the way companies are trying to connect with their target audience. With brands becoming “**me-too**” in terms of features, quality etc. it became all the more challenging for Indian companies to connect with their target audience.

Every brand is trying to create its own identity in the market and advertisers are trying to figure out and highlight the **Unique Selling Proposition (USP)** of the brand to their target audience in order to create their own identity and thereby gain competitive advantage.

The phenomenon of **Celebrity endorsement** has attracted a lot of attention world wide and in Indian context the situation is no different. **Celebrities** are people who are successful in their own profession, who enjoy public recognition and have huge fan following and media attention. **Celebrities** are occupying huge amount of advertising space and time across different mass media be it print, electronic or outdoor and companies are also spending huge amount of money to sign them for advertising their brands.

The celebrity endorsement started gaining prominence in India since 1980. The opening up of the Indian economy in early 90's paved the way for multinationals to tap the huge Indian market and communication with the **target audience** became all the more challenging for advertisers and their advertising agencies.

APPROACH & OBJECTIVES: This research paper is **focused** at understanding the impact of globalization in Indian advertising context **firstly** in regard to emerging trends noticed in the field of celebrity endorsement in India like **multiple brand endorsement, celebrity overexposure, and celebrity voice over in advertising.**

Secondly exploring the different dimension of **challenges** involved in selecting Indian celebrities for brand endorsement.

Finally suggesting a **guideline** for advertisers and their advertising agencies to hire the right celebrity for brand endorsement in various mass media in a competitive global market situation.

RESEARCH DESIGN: The research **methodology** will comprise of both **primary and secondary research** activities with a sample survey method comprising of a structured questionnaire.

Primary Research is conducted to find out the consumer's response regarding the study objectives discussed earlier.

FINDINGS: Primary data collected during the course of the study is analyzed using simple percentages and '**Q**' **score** of the selected Indian celebrities were found out to determine the **familiarity and popularity** of the selected celebrities among the target audience.

The findings of the research will be of immense benefit to advertiser and their advertising agencies in **hiring the appropriate celebrity** for their brand endorsement in a changing global scenario.

RESEARCH LIMITATIONS: Just as any other research study, this study has got some limitations as mentioned below. The study is conducted with a sample of 100 respondents in Kolkata only and for the study only 10 Indian celebrities (**Hindi Film Stars**) were selected.

SCOPE FOR FURTHER RESEARCH: The study gives a clear direction for **further research** in this aspect of exploring the impact of Globalization on celebrity endorsement phenomenon in India measuring the familiarity and popularity of Indian celebrities in a much broader manner with celebrities from other walks of life and among larger sample size covering much broader geographic area.

PRACTICAL IMPLICATION: In Indian context identifying and selecting the right celebrity for brand endorsement is a challenging issue for advertiser and their advertising agencies as huge amount of money and other resources are at stake.

Gone are those days when celebrities were mostly selected for brand endorsement based on **gut feeling**. In the beginning of the **21st century** companies can no longer rely on gut feeling alone. This paper will bring to light the **challenges** faced by Indian advertisers in selecting Indian celebrities for their brand endorsement. The paper is also aimed at suggesting guideline like **'Q' rating score** and **principle of congruity** to Indian companies in selecting the right celebrity for their brand endorsement to connect with their target audience.

ORIGINALITY & VALUE: This study will provide valuable insight to Indian advertiser and their advertising agencies regarding the familiarity and popularity of the selected celebrities in terms of their **'Q' score** and eventually determine their **ranking**. This may be referred by advertiser before selecting a celebrity for brand endorsement.

Key words: Globalization, Marketing Communication, Celebrity endorsement, Principle of Congruity, 'Q' score.

Category of paper: Research Paper

INTRODUCTION

One of the major developments in the business world during the decade of the 90's was the **Globalization** of markets. The emergence of a largely borderless world has created a new reality for all types of companies.

Products and services developed in one country quickly find their way to other countries where they are finding encouraging acceptance. Consumers around the world wear **Nike** shoes, eat at **McDonald's**, shave with **Gillette** razors, use **Apple** and **Dell** computers, drink Coca-Cola and Pepsi, talk on mobile phones made by **Nokia** and **Motorola** and drive **Ford**, **Honda** etc.

Companies are concentrating on international markets for a number of reasons. Many companies in the **United States and Western Europe** have recognized that their domestic markets offer them limited opportunities for expansion because of slow population growth, saturated markets, intense competition and /or unfavourable marketing environment.

Most European nations are relatively small in size and without going for foreign markets would not have the economies of scale to compete against larger U.S and Japanese counterpart. **Swiss- based Nestle and Netherlands- based Unilever** are the two of world's largest consumer product companies because they have learned the art of marketing their brands to consumers in countries around the world.

Two of the world's major marketers of cellular telephones are from Scandinavian countries. Nokia is based in Finland and Ericsson is located in Sweden. At present companies are also pursuing international markets because of the opportunities they offer for growth and profits.

Globalization has spread its arms far and wide and developing economies like **India** is also touched by it and experiencing its impact.

Survival Mantra under Globalization-

In today's dynamic and intense competitive market situation survival for the fittest is the new mantra. There has been a shift from the traditional concept of "**seller's market**" to the new and emerging concept of "**Buyer's market**".

The customer is the king in today's context and in India both the MNC's and the domestic players are leaving no stone unturned to connect with their target audience.

There has been a radical shift from the traditional promotional mix elements to a new and emerging **Integrated Marketing Communication** concept. The phenomenon of using celebrities in advertisements is creating a lot of noise world over and in our country the situation is no different.

Facts about celebrity endorsement world over-

A **celebrity** is a person who is successful in his/her own profession, widely recognized in a society and have huge fan following and enjoy media attention. It can be said that within a corresponding social group, celebrities generally differ from the social norm and enjoy a high degree of public awareness.

20% of all TV commercial features celebrities. Celebrities are used in advertisement because it is expected that celebrities have "**stopping power**". In other words, they can draw attention of the Target Audience to the advertising message in a much **cluttered media environment**.

Company's think a popular celebrity will favourably influence the target audience's feelings and attitude and purchase behaviour and can enhance the target audience's perception of the product in terms of image and/or performance.

Emergence of Celebrity Endorsement in India-

Celebrity endorsement in India started gaining prominence since 1980's. The introduction of television added a variable effective medium of communication. Celebrities are people who are recognized by a large group of people. Celebrities may convey a broad range of meanings, involving demographic, personality and lifestyle types.

One of the primary goals of advertising is the persuasion of customers, i.e., the active attempt to change or modify consumer's attitude towards brands. In this respect, the credibility of an advertisement plays an important role in convincing the target audience of the attractiveness of the company's brand.

Pursuing a celebrity endorsement strategy enables advertisers to project a credible image in terms of expertise, persuasiveness, trustworthiness, and objectiveness. Marketers have been leveraging celebrity appeal for a long time.

Celebrity Endorsement in Present Scenario-

The dawn of the 21st century saw the phenomenon of celebrity endorsement gaining increasing prominence in our country. Multinationals as well as domestic companies are going the extra yard to sign up leading Hindi Film stars for endorsing their brands.

Today's celebrities in Indian context are especially from **Bollywood (Hindi film industry in Mumbai)** like Mr.Amitabh Bachchan, Mr. Shah Rukh Khan, and Mr.Amir Khan etc.

In recent times, we had the **Shah Rukh-Santro** campaign with the objective of overcoming the hindrance that an unknown **Korean company** (Hyundai Motors) faced in the **Indian market**. The objective was to earn faster brand recognition, association and emotional unity with the target group.

In 2008 Shah Rukh Khan was endorsing 42 brands in 81 creative executions and the duration of his ad presence was a 1,639 hours. Saif Ali Khan was seen endorsing 23 brands and was present for 1252 hours in television advertising.

According to a report by AdEx India, a division of TAM, Media- all TV commercials showing the following celebrities across TV channel in 2008

<i>Indian Celebrities (Hindi Film Stars)</i>	<i>Total time (Hrs)</i>	<i>No. Of Brand Endorsed</i>	<i>Advertiser</i>	<i>Category</i>
<i>Shah Rukh Khan</i>	<i>1639</i>	<i>42</i>	<i>21</i>	<i>26</i>
<i>Priyanka Chopra</i>	<i>1542</i>	<i>18</i>	<i>8</i>	<i>12</i>
<i>Saif Ali Khan</i>	<i>1252</i>	<i>23</i>	<i>11</i>	<i>14</i>
<i>Kareena Kapoor</i>	<i>965</i>	<i>21</i>	<i>8</i>	<i>11</i>
<i>Hrithik Roshan</i>	<i>906</i>	<i>20</i>	<i>12</i>	<i>12</i>
<i>Amir Khan</i>	<i>647</i>	<i>10</i>	<i>5</i>	<i>5</i>
<i>Juhi Chawla</i>	<i>325</i>	<i>17</i>	<i>9</i>	<i>12</i>

(Table1 showing –Number of Brands endorsed by leading Indian celebrities)

Emerging Trends in Celebrity Advertising in India-

The last decade of the 20th century opened the flood gates for multinational companies to explore the vast Indian market with their product and service offerings. The domestic players got to face a stiff competition from their counterparts from abroad.

The following trends are evident in celebrity advertising-

- **Overshadowing the product**-The target audience may focus their attention on the celebrity and may fail to notice the brand. Company should select a celebrity who can attract attention and convince the target audience, yet not overshadow the brand.
- **Overexposure**-In the beginning of the 21st century it is common to see celebrities endorsing more than one brand. **Multiple brand endorsement** is common among Indian celebrities and this often brings to light the concept of celebrity **over exposure**.

- **Celebrity branding** is a type of [branding](#), or [advertising](#), in which a [celebrity](#) uses his or her status in society to promote a product, service or charity. Celebrity branding can take several different forms, from a celebrity simply appearing in advertisements for a product, service or charity, to a celebrity attending PR events, creating his or her own line of products or services, and/or using his or her name as a brand.

At present there has been a trend towards celebrity **voice-overs** in [advertising](#). Some celebrities have distinct voices which are recognizable even when they not present on-screen. **Mr. Amitabh Bachchan** in Indian context is one such example. This is a more subtle way to add celebrity branding to a product or service.

- **Target Audience Receptivity**-In any celebrity endorsement deal proper match of the celebrity with the target audience profile is very essential to establish the right connects with the target audience.
- **Risk to Advertiser**-There has been a lot of instance of leading celebrities getting caught in **controversies** in their personal life. This is an important aspect that needs to be taken in to consideration and moral clause should be implemented to deal with this issue.

Beauty brands and fragrance houses have traditionally aligned themselves to celebrities. Sometimes that association surpasses the endorser's original claim to fame and we see an actress make headlines not for her craft but for her endorsement.

Celebrity endorsement is a costly proposition. It's a subject that never fails to stir debate. Hindi Film Stars earn enormous amount of money through brand endorsements. Most of the leading film stars from **Bollywood** are endorsing not just one but **multiple brands** in different product category.

LITERATURE REVIEW

As per **Atkins and Block (1983)** a research on effectiveness of celebrity endorsement

found that celebrities may be influential because celebrities are viewed as dynamic with both attractive and likeable qualities. In addition to this their name and fame is thought to attract attention to the product or service they are endorsing.

Another study by **Mc.Cracken (1989)** who is the Celebrity Endorser? Cultural Foundations of Endorsement process offer a new approach to celebrity endorsement. He criticized the **source credibility** and **source attractiveness** model and proposed the **meaning transfer model** as an alternative. The findings highlighted how meanings pass from celebrity to product and from product to consumer as per this model. The paper also mentions that according to this model the secret of celebrity endorsement is largely cultural in nature.

A study conducted by **Ohanian and Roobina (1990)** on construction and validation of a scale to measure celebrity endorsers' perceived Expertise, Trust worthiness and Attractiveness aimed at developing a scale for measuring celebrity endorsers' perceived expertise, trustworthiness, and attractiveness. Accepted **psychometric scale-development** procedures were followed which

meticulously tested a large pool of items for their reliability and validity. Further, use of this scale can improve the understanding of how consumers in different situations react to different sources and how source credibility influences purchase intentions.

The study also revealed that since the large sums of money is spent on celebrity advertising, advertisers should use the scale as an integral part of their effectiveness testing and tracking. The scale is simple to use and convenient for large-sample administrations. For segmentation strategies, the wisdom of using a celebrity and the spokesperson's effectiveness for different demographic and psychographic consumer groups can be evaluated by applying this scale.

This concept also has applications beyond the use of celebrity spokespersons: the scale can be applied effectively in choosing the most appropriate "average consumer" as a spokesperson.

Finally, the dimensions of a celebrity endorser's credibility, along with consumer demographics and psychographics, can be used as potential predictors of attitude toward and intention to purchase a specific product.

As per Jagdish Agrawal & Wagner A. Kamakura (1995) a research on "The Economic worth of Celebrity Endorsers": An Event Study Analysis has typically focused on theories explaining how celebrity endorsements influence consumers' attitudes and intentions. The authors assess the impact of celebrity endorsement contracts on the expected profitability of a firm by using event study methodology.

The study also highlighted that Celebrity endorsement has become a prevalent form of advertising in the United States. Despite extensive literature on the effects of celebrity endorsements on consumers' brand attitudes and purchase intentions, little is known about the economic value of these endorsements.

The study revealed that the announcement of a celebrity endorsement contract, is usually widely made known in the business press, and is used as information by market analysts to evaluate the potential profitability of endorsement expenditures, thereby affecting the firm's expected return.

Announcements of 110 celebrity endorsement contracts were analyzed. Findings of the study indicate that, on average, the impact of these announcements on stock returns is positive and suggest that celebrity endorsement contracts are generally viewed as a worthwhile investment in advertising.

A study conducted by **Erdogan (1999)** on Celebrity Endorsement: A Literature Review focused how can companies select and retain the right' celebrity among many competing alternatives, and, simultaneously manage this resource, while avoiding potential pitfalls? This paper seeks to explore variables, which may be considered in any celebrity selection process. The study gave emphasis on '**Q'rating technique**.

This paper has identified factors from the academic literature which may have managerial importance for selecting celebrity endorsers. Notably, effectiveness of celebrity endorser is found to be moderated by several factors in the literature; celebrity attractiveness and credibility, product-celebrity match, message and product type, level of involvement number of endorsements by celebrities, target audience characteristics, and overall meanings (e.g. personality; values, standards) attached to celebrities.

Besides these factors, economic visibility of endorsers, regulative issues, compatibility with overall marketing strategy, and potential risks must be simultaneously also considered.

Mohan K. Menon et al.(2001) study on Celebrity Advertising: An assessment of its relative effectiveness examines difference between advertisement with celebrity and corresponding advertisement with non-celebrities. The paper in order to assess the relative effectiveness of celebrity advertisement, two types of advertising executions, Celebrity versus non-celebrity, were tested across print advertisement for six products: American Express, Apple Computers, Avon Cosmetics, Milk, Pepsi-Cola and Ray Ban Sunglasses. The sample comprised of students at south eastern University. Overall, the results from this study do not support the view that using celebrity advertisement is more believable or effective than non-celebrity advertisement for brands tested in this study.

According to **Sejung Marina Choi et al. (2005)** the study analyzed television commercials featuring celebrities from two different countries-the United States and Korea based on two different cultural dimensions. First **low versus high** context and secondly **individualism versus collectivism**. The findings highlighted that celebrities in the U.S advertisement's often **portrayed themselves** (i.e. they served as spokes person), while the majority of Korean celebrities acted in roles. Another interesting finding of the study was that many Korean celebrities appeared to promote more than one brand.

Based on the review of literature it was evident that some research works on celebrity endorsement have been carried out in the United States and other western countries. The impact of **Globalization** on celebrity endorsement in India was selected as an interesting area that could be explored and emerging trend in celebrity advertising may be identified.

Moreover, most of the studies conducted so far focused on certain specific areas thus providing the scope for this aspect of determining the **familiarity and popularity** of Indian celebrities(Hindi Film Stars) by applying the '**Q**' score technique.

It is clearly evident from **previous research works** in the field of celebrity endorsement that applying the '**Q**' score technique to determine the familiarity and popularity of Indian celebrities based on feedback from the respondent from different demographic background will be very relevant and useful for companies and their advertising agencies under the present context of Globalization of markets.

SCOPE AND SIGNIFICANCE OF THE STUDY-

The phenomenon of celebrity endorsement is assuming increasing importance world wide. During the course of review of literature it was clearly evident that there is ample **scope** of exploring this issue in India with Indian celebrities (especially with **Hindi Film Stars** from **Bollywood**). In India celebrity endorsement is becoming very popular and companies are also trying to rope in leading Hindi Film Stars for endorsing their brands. The study is aimed at understanding the impact of globalization and emerging trends noticed in case of celebrity endorsement.

The **significance** of this study lies in the fact that it is aimed at determining the **challenges** faced by advertisers in selecting a celebrity for brand endorsement and providing guidelines to them (technique that may be adopted) to help select the right celebrity because huge amount of money and other resources are at stake.

The business performance of company's using celebrities in their advertising campaign to a great extent rest on selecting the right celebrity to connect with their target audience.

The **findings** of the study will definitely bring to light the ranking of the celebrities and their 'Q' score (based on familiarity & popularity), which will be of immense use to companies and their advertising agencies for identifying the right celebrities for endorsing their brands.

RESEARCH OBJECTIVES

This research paper is **focused** at understanding the impact of globalization in Indian advertising context –

- **Firstly** in regard to emerging trends noticed in the field of celebrity endorsement in India like **multiple brand endorsement, celebrity overexposure, and celebrity voice over in advertising.**
- **Secondly** exploring the different dimension of **challenges** involved in selecting Indian celebrities for brand endorsement.
- Finally suggesting a **guideline** for advertisers and their advertising agencies to hire the right celebrity for brand endorsement in various mass media in a competitive global market situation.

CELEBRITY SELECTION –THE INHERENT CHALLENGES.

Selecting the right and appropriate celebrity for brand endorsement is really a challenging proposition. The various **dimensions of challenges** faced by the advertiser and their advertising agencies regarding celebrity selection may encompass the following aspects-

- Celebrity's fit with the brand image
- Celebrity Target Audience match
- Celebrity's **familiarity** among the Target audience
- Celebrity's **popularity** among Target audience
- Cost associated with getting a celebrity
- Celebrity credibility
- Physical attractiveness
- Celebrity endorsing Multiple Brands.

Using celebrity for brand endorsement is a costly proposition as these celebrities as endorsement fees charge huge amount of money. There are positive as well as negative aspects involved.

Talking about the positives it can be said that Celebrities are used in advertisement because it is expected that celebrities have “**stopping power**”. In other words, they can draw attention of the Target Audience to the advertising message in a much cluttered media environment. If celebrities get caught in controversies in their personal life then it might have an adverse effect among the target audience about the image of the celebrity.

Keeping the study objectives in mind this research paper tries to address the challenges encountered by advertisers in **selecting the appropriate celebrity** for brand endorsement. The techniques presented below will act as a guideline for advertiser in selecting the right celebrity for their brand endorsement in present global marketing environment.

‘Q’ SCORE Technique-

The phenomenon of celebrity endorsement is spreading across the globe in a big way. Many marketers believe strongly in the value of celebrity in touching people and hence the amount of money paid to them continues to escalate. Companies are looking to hire celebrities who will attract viewers’ attention and enhance the image of the company or brand.

The question of selecting the right celebrity for endorsement has attracted lot of attention world wide. Some companies rely on the **instinct and gut feeling** of their executives whereas others turn to research findings that measures a celebrity’s appeal as well as other factors that will provide valuable insight into his or her warmth, trust and credibility among the target audience.

‘Q’ SCORE – To help choose the right Celebrity endorser.

‘Q’ Score is normally used by companies to select the right celebrity for endorsing their brand and finding the ranking of the celebrity as per the consumers’ response.

The ‘Q’ score answers the question “how appealing is the person among those who do know him or her?” To help select the right celebrity endorser many companies and their ad agencies can rely on “Q” rating that are calculated by conducting surveys among the respondents.

The respondents are asked to indicate two things **firstly** – Whether they have seen /heard about the selected celebrities? **Secondly**, If yes- then the respondents are asked to rate the celebrities on a scale that includes-One of my Favourite, Very Good, Good, Fair, or Poor.

What does ‘Q’ rating indicate?

- The **Familiarity** score indicates the percentage of people who have heard of the celebrity.
- While “ONE OF MY FAVOURITE” score is an absolute measure of the appeal or **popularity** of the celebrity.

Calculating ‘Q’ ratings-

‘Q’ rating is calculated by taking the percentage of respondents who indicate that a celebrity is “ONE OF MY FAVOURITE” and dividing that number by the percentage of respondents who indicate that they have heard of that person.

'Q' ratings are also broken down on the basis of various demographic parameters such as respondent's age, income, occupation, education and gender. This will give a clear idea to different companies and their advertising agencies about how a celebrity's popularity varies among different groups of consumers.

This study focuses on finding the 'Q' score of Indian celebrities among respondent belonging to different demographic profile.

PRINCIPLE OF CONGRUITY – An important consideration.

A state of "**Congruity**" is said to exist when a target audience has a positive attitude towards a source (celebrity) and a message or a negative attitude towards both.

How ever in real life situation it is often seen that the target audience may hold one attitude towards the **source** (celebrity) and opposite attitude towards the **message**. If a person hears likable celebrity praise a brand that he/she dislikes then the person will either respect the **celebrity** somewhat less or respect the **brand** somewhat more.

If the same celebrity is found to be endorsing other brands, which that person dislikes, then he/she will develop a negative view of the celebrity and maintains a negative attitude towards the brand.

The "**Principle of Congruity**" bring to light the fact that celebrity can use their image to reduce some negative feelings towards a brand but loose some esteem with their Target Audience.

The **techniques and concepts** discussed, if given due consideration will be very handy to advertiser and advertising agencies in their effort to select the right celebrity for their brand endorsement.

RESEARCH DESIGN

Exploratory study is conducted to get clarity of the objective by interacting with the respondents. Huge amount of money is spend on celebrity endorsement to reach the target audience belonging to different demographic profile therefore it is very important to find out the familiarity and popularity of the selected celebrities among the respondent.

First phase - Finding the **awareness and familiarity** of the 10 celebrities among different respondent group such as Students, Teachers, Business Men Housewife and respondent belonging to other occupations.

Second phase -In the second phase the **popularity** of the selected celebrities among the different respondent group was studied and with that overall ranking of the 10 celebrities were found out using 'Q' score technique.

Based on the study objectives mentioned above the research methodology comprised of both Primary Research and Secondary Research activities as mentioned below-

Secondary Research

A list of 10 Film Stars is prepared from the Hindi Film Industry in Mumbai who are endorsing multiple brands at present for the purpose of the study. Hindi Film Stars are selected for the study because of their huge **popularity and fan following** throughout the country.

After formulating the research problem, next the research design was framed. A research design is the conceptual structure within which the research is to be conducted- it deals with the collection, measurement and analysis of data.

Sample Design

Primary Research is conducted to find out the consumer's response regarding the study objectives discussed earlier.

Sample Size- A Sample size of 100 individuals, both **male** and **female** in the age group between 18-45 years belonging to different category such as **Students, Teacher, Businessmen, Housewife etc.** is considered.

Sampling Type- Judgmental and Convenience sampling is done to select the respondents.

Data Collection

Data is collected by **Personal Interview Method** from the respondent in **Kolkata**.

Research Instrument used for the study was a structured **Questionnaire**.

Data analysis and Interpretation – Primary data collected during the course of the study is analyzed using simple percentages and '**Q**' **score** of the selected celebrities were found out to determine the familiarity and popularity of the selected celebrities.

FINDINGS

From the research study it is **first** evident that the impact of **Globalization and Liberalization** in India have brought to light the **emerging trends** in celebrity endorsement like "**multiple brand endorsement**" by Indian celebrities. In this regard it deserve mention that leading Hindi movie stars from Bollywood (Mumbai) like **Mr. Shah Rukh Khan** is endorsing 42 brands, **Mr. Hrithik Roshan** is endorsing 20 brands Ms. Juhi Chawla is endorsing 17 brands and Mr. Amir Khan is endorsing 10 brands followed by others.

The findings regarding the **second** study objective, dealing with the **challenging dimension** in regard to celebrity selection for brand endorsement is addressed by undertaking a sample survey in Kolkata to determine the most familiar and popular Indian celebrities.

The **study objective** relating to the **familiarity** of the celebrity among the respondents shows that all the **Hindi Film Stars** from Bollywood have 100% familiarity among the respondents. (Table 2)

Findings' regarding the **study objective** relating to **popularity** of the celebrities among the respondents shows that among all the **Hindi Film Stars Amitabh Bachchan** and **Shah Rukh Khan** both are having the maximum popularity (47%) followed by Amir Khan (41%), Rani Mukherjee (38%), Hrithik Roshan (33%), Salman Khan (20%), Aishwarya Rai Bachchan (19%),

Preeti Zinta (17%), Juhi Chawla (12%) and Saif Ali Khan (11%) is having the least popularity among the film stars.(Table 3)

In order to deal with the challenges inherent in selecting the appropriate celebrity for brand endorsement The “Q” score technique and the concept of “principle of congruity” should be given due consideration by the advertisers.

Findings regarding the **final study objective** clearly bring to light the ‘Q’ score of the **10 Indian Celebrities**. Among all the selected celebrities **Amitabh Bachchan and Shah Rukh Khan** are both having the **highest ‘Q’ score (47)** followed by **Amir Khan (41), Rani Mukherjee (38)** etc. (Table 4)

Finally based on the ‘Q’ score overall **ranking** of the 10 celebrities is done and **Amitabh Bachchan and Shah Rukh Khan** emerged as the top most celebrity (**rank1**) followed by Amir Khan (rank 3) and Rani Mukherjee in 4th place and Saif Ali Khan is having the lowest rank.(Table 5) . **The findings will be useful for advertisers to hire the appropriate celebrity for their brand endorsement.**

<i>Sr.No</i>	<i>Celebrities(Name)</i>	<i>Number of Respondent Familiar</i>	<i>Percentage (%)</i>

LIMITATION & SCOPE FOR FURTHER RESEARCH-

It was an attempt to understand the impact of **Globalization** in a developing economy like **India** specific to **celebrity endorsement phenomenon**. The research paper tried to cover the theoretical aspect about the emerging trends noticed in celebrity advertising in India and also present the findings of an empirical study undertaken in Kolkata among respondents of different demographic profile. The study is conducted with a sample of 100 respondents in Kolkata only and for the study only 10 Indian celebrities (**Hindi Film Stars**) were selected.

The study gives a clear direction for **further research** in this aspect of exploring the impact of Globalization on celebrity endorsement in India and determining the familiarity and popularity of Indian celebrities in a much broader manner with celebrities from other walks of life (not just Hindi Film Stars) and among larger sample size covering much broader geographic area.

THEORETICAL AND PRACTICAL IMPLICATION

The existing literature reviewed on celebrity endorsement phenomenon focuses on tackling this challenging issue in the **United States** and other Western countries from different aspect by highlighting the “**source credibility model**”, “**meaning transfer model**”, measuring the “**economic worth of celebrity endorser**”, and exploring the “**cultural dimension in celebrity endorsement**”.

Our research paper is aimed at contributing to the existing body of theoretical knowledge by exploring the impact of **Globalization** on celebrity endorsement in a developing economy like **India**. It tries to highlight the emerging trends noticed in celebrity endorsement in India and challenges faced by advertisers in India to successfully connect their brand to their target audience. The paper also tries to provide a **guideline** in selecting the right celebrity based on “Q” score technique based on an empirical research findings.

The **practical relevance** of this paper lies in the fact that advertisers and their advertising agencies in India may take note of the technique suggested in the paper while thinking of connecting their brands with the target audience using Indian celebrities. The findings that emerged from the research clearly shows the familiarity and popularity of the ten selected celebrities based on the respondents feedback coming from diverse demographic background.

CONCLUSION

In the beginning of the 21st century the impact of Globalization is felt in developed and developing countries world over. This research paper was conceived with two broad dimensions in mind.

First part dealt with understanding the impact of Globalization on celebrity endorsement in India with respect to emerging trends noticed like multiple brand endorsement by celebrities, celebrity voice over in advertising etc.

The **second part** identified the challenges faced by advertisers and their advertising agencies in their attempt to use celebrities to connect their brand with their target audience.

Finally **empirical research** was undertaken with 10 Indian celebrities (Hindi Film Stars from Bollywood, Mumbai) among a selected sample to determine the **familiarity and popularity** of

Indian celebrities because they are endorsing different brands and occupying huge amount of advertising space and time across different mass media.

The findings that emerged from the study throw a lot of light regarding the **familiarity and popularity** of the celebrities among respondents belonging to different demographic profile.

Mr. Amitabh Bachchan & Mr. Shah Rukh Khan emerged as the most popular celebrities with the highest "Q" score and **Saif Ali Khan** is rated as the least preferred celebrity having the lowest "Q" score.

The study also gives a clear indication to leading companies and their advertising agencies regarding the '**Q**' score of the 10 selected celebrities and their **ranking** which can be used as a **guideline** to select the appropriate celebrity for endorsing their brand to reach their target audience in today's Global market place..

Key words: associations – social capital – social network

INTRODUCTION

Cooperation and collaboration among firms is not a new phenomenon. Within the current competitive environment, it is widely recognized the distinctive role played by inter-firm cooperation (Anand, Khanna, 2000). The network literature – although confusing for the heterogeneity of the level of analysis implemented, the kind of relational properties studied and the particular techniques carried out – seems to agree on the relevance of socio-economic and strategic-organizational factors in the constitution of different forms of collaboration (Contractor & Lorange, 2002). Starting from this awareness, our work aims at exploring the role of business associations in stimulating collaborative attitudes. Specifically, business associations are viewed as one of the possible motivations that account for the adoption of collaborative behaviours among their members. Aiming at understanding the value of being inserted within an association network for its members, our study presents a results of research project on 797 firms associated to Confindustria Salerno, one of 103 Territorial Business Associations of the Confederation of Italian Industry (Confindustria).

THEORETICAL BACKGROUND

Inter-firm cooperation is a very heterogeneous phenomenon which needs some semantic specifications. In our work, we will adopt a broad definition of collaborations which sees them as a result of a wide range of motives and goals, taking a wide spectrum of different forms and extending from horizontal to vertical boundaries (Gulati, 1998, p. 293). Following this perspective, cooperation might comprehend both short term contracts and complete mergers. It can be properly seen as a continuum where the 2 sides are represented by short term contracts and mergers, being able to assume disparate intermediate forms, as shown in figure 1 (Contractor, Lorange, 2002, p.486).

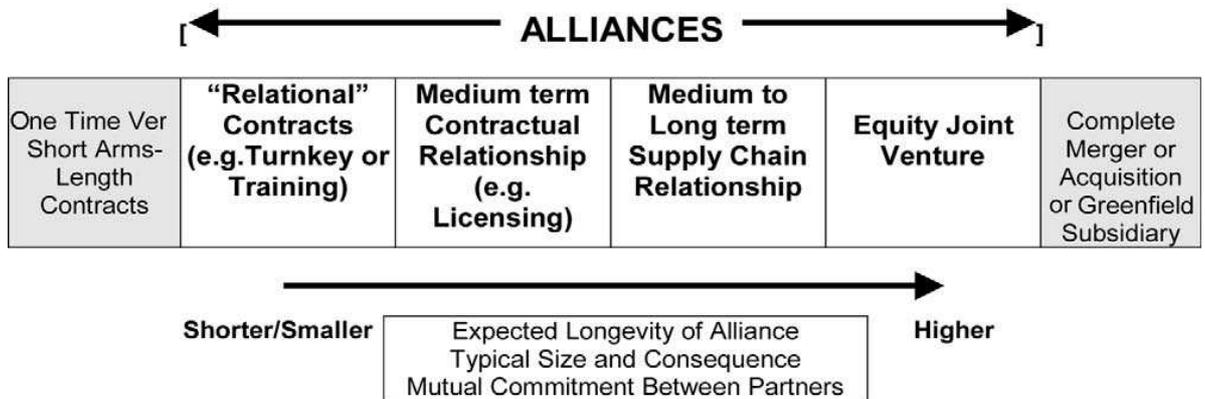

Fig. 1 - Alliances types. Source: Contractor, Lorange (2002, p.486)

Prior research on cooperation have highlighted disparate motivations that can lead firms to cooperate. Two broad class of explanations have been offered to explain the formation of inter-firm linkages.

One set of explanations has focused on the strategic and resource need of firms. Following this perspective firms form inter-organizational ties in order to obtain access to needed assets (Hagedoor and Schakenraad, 1990; Harrigan, 1988; Nohria and Garcia- Pont, 1991); learn new skills or acquire tacit knowledge (Baum, Calabrese, and Silverman, 2000; Hennart, 1988; Kogut, 1988; Doz, Hamel, and Prahalad, 1989; Hamel, 1991; Powell, Kogut, and Smith-Doerr, 1996); manage their dependence upon other firms (Pfeffer and Salancik, 1978).

A second set of explanations calls for a more contextualised approach to traditional strategic problems and ask for the acknowledgement of the role played by social relations in economic dynamics (Granovetter, 1985). According to this perspective, the collaborative attitude is stimulated by the social context in which one is involved and the particular position occupied in the prior network (Gulati, 1995; 1999; Gulati and Gargiulo, 1999; Walker, Kogut, and Shan, 1997).

This study proposes a framework to explain the formation of inter-firm cooperation within a rich social context. The social context examined is represented by the relationships that firms have with the business association. Such a context do has effect on a firm's action (Granovetter, 1985). The social context of a business association network constraints and shapes a firm's action with regard to alliance formation and partner selection which in turn determines its position in the network (Gulati, 1995, Ahuja, 2000). These prior ties, both direct and indirect, create a social network in which most firms are embedded, and it becomes an important source of information for them about the reliability and capabilities of their current and potential partners. Not only, it also gives to firms the opportunity to meet and get to know. Such a context helps firms to learn about new tie opportunities and also enhances their trust in current and potential partners. Information can be a salient catalyst for alliances, which may have significant risks associated with them. By providing conduits for valuable information, business associations may play an important role in shaping future alliance formation.

In this sense, a business association might play the role of broker, having an embedded ties with firms between them unconnected and act as "go-between". The role of a business

association might be that of establish trustworthiness between the two unconnected actors. The process develops through a transfer of expectations of behavior from the prior embedded relations to the new one (Uzzi, 1997, p. 679). In this way, are the actors already involved in embedded ties who facilitate the birth of other embedded ties among their contacts, transferring to them behavioral norms and values, trust, reciprocity, opportunities (Capaldo, 2004, p. 81).

Put another way, the presence of a business association intensify the relationships among its members so making possible the creation of a social network of associates.

This business association network might mobilise social resources via the particular kind of relationships activated within it. That is to say that this network might have a distinctive role in leveraging social capital.

The literature has been vague about what social capital is. A prior research on network studies (Delli Paoli, 2009) has offered a more delimited definition of social capital, both from a theoretical and empirical point of view. In such a research, a content analysis was carried out on 185 scientific articles coming from a set of selected high-rated journals. In order to create a typology of these studies a procedure of multiple correspondence analysis in conjunction with cluster analysis was implemented. The result of the procedure is shown in figure 2.

The clusters so obtained have been interpreted as specific dimensions of the umbrella concept of social capital. Following this perspective, social capital could be seen as a general concept which includes a governance, a structural, a relational, a positional and an expressive dimensions. Put more specific, the sources of social capital are particular tie properties, tie content, specific structure or positions within them. The direct effects of social capital are represented by informational, control, governance, expressive and positional advantages. In table 1, is provided a conceptual synthesis of the operational and theoretical focus of each cluster.

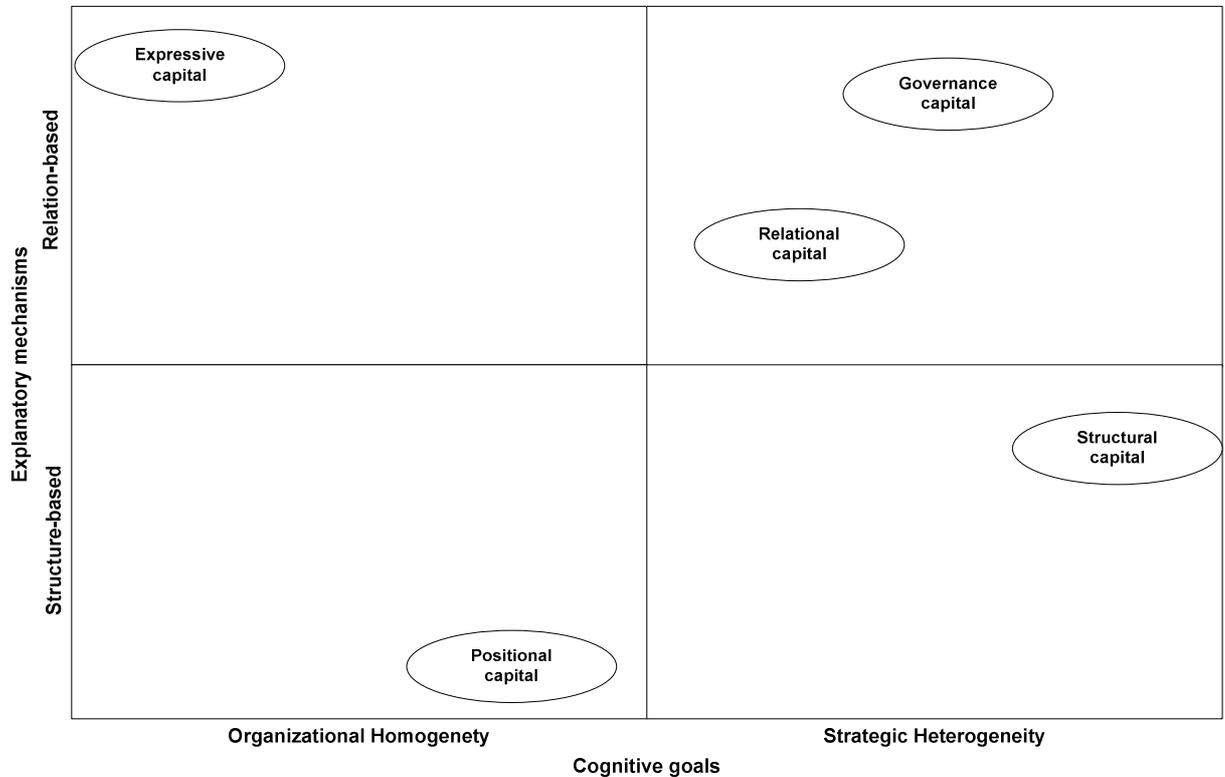

Fig. 2 - The 5 dimensions of social capital. Source: Delli Paoli, 2009, p. 141

Cluster	Operational focus	Theoretical perspective
Positional capital	Structural equivalence	Capital conferred by similarity in a relational space.
Structural capital	Structural holes – centrality	Idiosyncratic capital which derives from efficient network structures.
Governance capital	Ties' social content – density	Expectational capital which provides social mechanisms of control.
Relational capital	Tie's strength – frequency – direction – multiplexity	Capital provided by formal properties of ties.
Expressive capital	Ties' identity content	Capital which provides the degree of consensus, status recognition and identification.

Tab. 1 - A conceptual synthesis of the 5 clusters. Source: Delli Paoli, 2009, p. 142

RESEARCH METHOD

The study presents as unit of analysis the firms associated to Confindustria Salerno, one of 103 Territorial Business Associations of the Confederation of Italian Industry (Confindustria). Founded in 1910, Confindustria represents the interests of Italian companies to leading political and administrative institutions, including parliament, the government, trade unions and other

social partners; it is the main organisation representing Italian manufacturing and services companies; a total of 126.590 companies of all sizes - employing a total of 4.771.000 employees - are voluntary members of the organisation. Companies can become members of the Confederation through territorial associations or sector associations and regional federations that are Confindustria members. The organisations associated to Confindustria (Direct members) are 253:

- 103 Territorial Associations: consisting of companies established in the same provincial area, from different production sectors;
- 99 Sector Associations: consisting of companies from all over Italy that operate in similar and related production activities;
- 18 Regional Confindutria branches: consisting only of territorial associations located in the same region;
- 18 Sector Federations: consisting of sector associations, directly or indirectly affiliated with Confindustria, with a shared mission of dealing with common problems or interests (economic, technical/production, trade union and employment related, market and promotional);
- 3 special aim federations: formed by trade associations to achieve a common goal or roll out a project in special areas;
- 15 associate members (related sectors – fewer rights and duties).

The study was carried out on the total number of firms associated to Confindustria Salerno (797 firms). Members of firms were approached by means of a questionnaire – prevalently made of close-ended questions – sent to them by ordinary or electronic mail; 180 of these firms answered to our questionnaire.

The questionnaire contained questions about the respondents' ties to the other actors. In our case, actors are collective entities (firms) but an individual person representing the firms reports on the collective's ties. The technique used to collect data is known as *free recall*. In other words, on the questionnaire was not reported to the respondent a complete list of the actors in the network. In addition, there was no constrain on the number of firms that an individual respondent could choose. In fact, presenting with a complete list of the actors in the actor set would have produced a very long list of 797 firms which would be meaningless and impossible to read for the respondents¹⁹⁹.

As you can see from the concept map provided in figure 3, our questionnaire was articulated into an informational and a relational dimensions. The former is concerned with contextual

¹⁹⁹ There are 3 different techniques that can be used in a questionnaire:

- 1) Roster vs free recall;
- 2) free vs fixed choice;
- 3) rating vs complete rankings.

For a comprehensive view of these different question formats see Wasserman, Faust (1994, pp. 45-49)

variables such as year of registration in the association and firms' industry. The latter is divided into 2 parts: the first concerns with the quality, frequency and intensity of the associates' relationships with the business association (Confindustria Salerno), the second is related to the ties among firms associated, the identification of these firms, the frequency, intensity and degree of trust invested in these linkages.

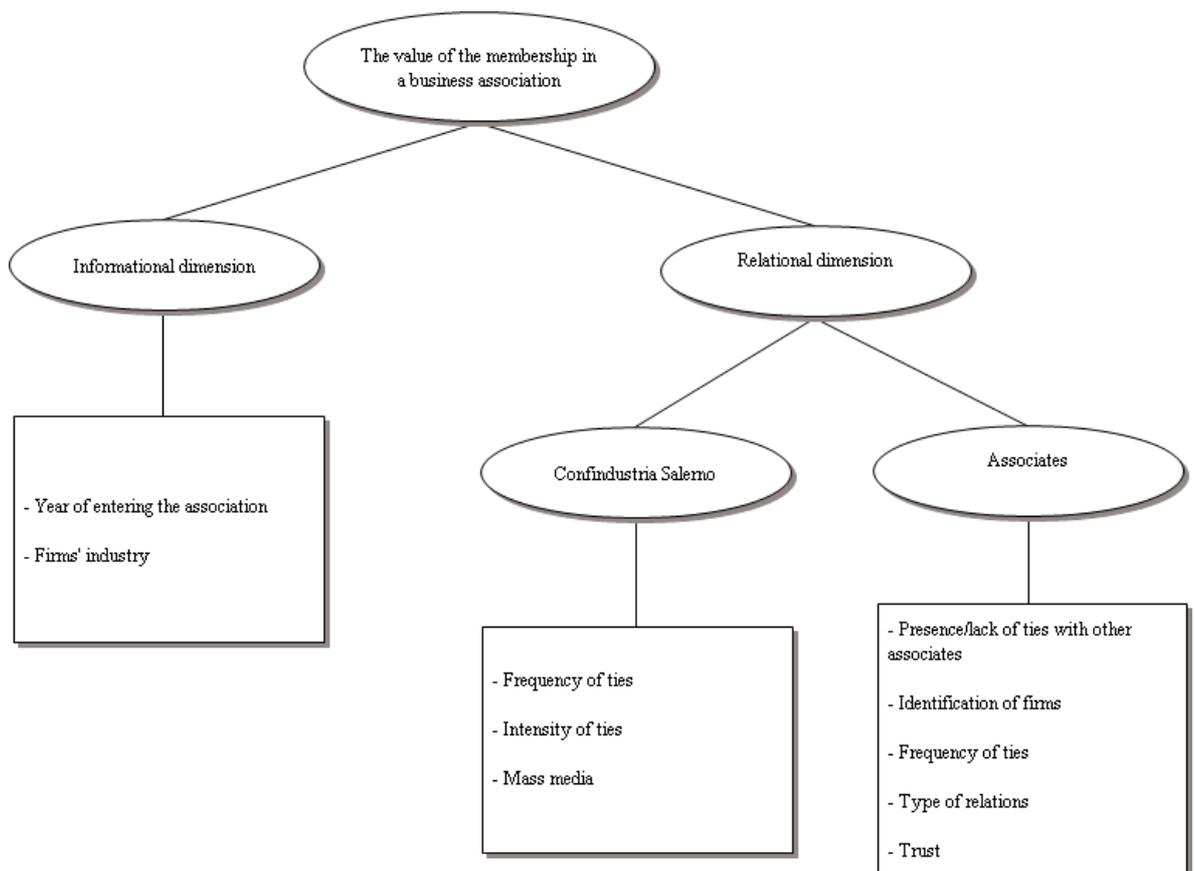

Fig. 3 - Concept map

Our exploratory study was carried through a mixed procedure. First, we implemented a descriptive analysis of our data using conventional methods. Second, we used a sociomatrix in order to reconstruct the relational texture of our network. We applied social network techniques with the aid of Ucinet 6.

The study proposed here is just a first step in the direction proposed, an indispensable step to have a preliminary idea of the relational effects caused by the affiliation. Here, we present the result of a pilot study aimed at detecting the potential association between having an active relation with the business association and the development of other relations with its members, and exploring the structural architecture of this network. The study represents the basis on which can be built a future investigation. In other word, at this stage, we propose an attempt to

evaluate the existence of links among associates and to map their architecture in order to develop some theoretical hypothesis which will be tested by a following study.

RESULTS

We first checked for the potential association between the participation in the association life and the collaborative attitude of associates.

The participation in the association life was measured through the participation to the different kind of events organized by the association and the frequency of their exchanges with the association. In other words, by using these two variables we have combined their categories, so building a typology of relations with the association which shows 3 categories: lack of relation, irregular relations, continuous relations. The result is shown in figure 4.

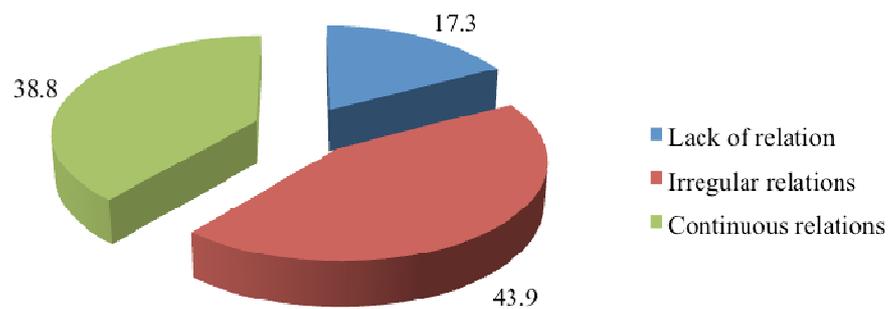

Fig. 4 – The typology of relations with the Association

A cross tabulation between this typology and the variable which measures the presence of linkages to other firms affiliated to Confindustria signals an association between a continuous relation with the association and the presence of ties to other members. As shown in table 2, the percentage of firms who declares themselves to have ties to other firms rises from 52,9% among those who have almost no relation with the association to 89,5% of those who have a continuous relation with it.

	No	Yes	Total
Lack of relation	47,1	52,9	100,0
Irregular relations	23,4	76,5	100,0
Continuous relations	10,5	89,5	100,0
Total	22,4	77,6	100,0

Tab. 2 – Typology of relations with the association * Relations with other associates (Row Percentage)

As further step, we tried to make operational the strength of relations among associates crossing the frequency of ties and the degree of trust invested in them. We obtained another typology which at this time synthesises the strength of linkages to other firms into 3 categories: weak, intermediate, strong.

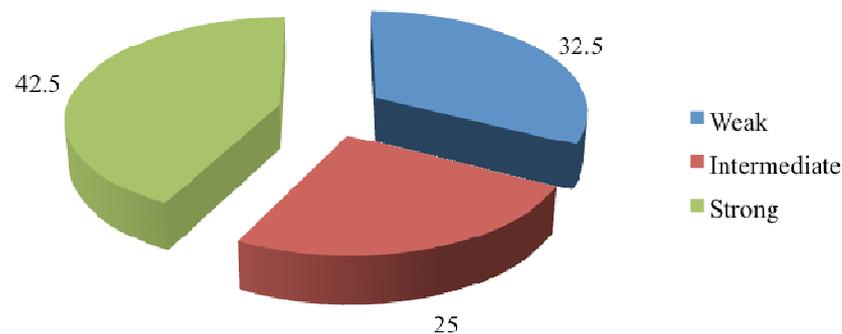

Fig. 5 - The strength of ties among associates

By cross tabulating this typology with the typology of relations with the association (tab. 3) we note that those firms who have an irregular relation with Confindustria keep up a weak relation with other associates (63,6% vs 33,8% of the sample). On the contrary, those who show a continuous relation with Confindustria seem to have strong linkages to other firms (67,7% vs 41,6% of the sample).

	<i>Lack of relation</i>	<i>Irregular relations</i>	<i>Continuous relations</i>	<i>Total</i>
<i>Weak</i>	63,6	40,0	16,1	33,8
<i>Intermediate</i>	9,1	37,1	16,1	24,7
<i>Strong</i>	27,3	22,9	67,7	41,6
<i>Total</i>	100,0	100,0	100,0	100,0

Tab. 3 - Strength of ties among associates * typology of relations with Association (Column Percentage)

In addition, the affiliation to Confindustria seems to influence the degree of trust invested in the linkages with other associates: firms who present a continuous relations with the association seem to invest a higher level of trust in the relations with the other members (62,9% vs 44,1% of the sample).

	<i>Lack of relation</i>	<i>Irregular relationsn</i>	<i>Continuous relations</i>	<i>Total</i>
<i>Partial trust</i>	70,6	65,9	37,1	55,9
<i>Complete trust</i>	29,4	34,1	62,9	44,1
<i>Total</i>	100,0	100,0	100,0	100,0

Tab 4 - Typology of relations with Association * level of trust in the relations among associates (column percentage)

To sum up, there seems to be an association between the relation with the association and the development of linkages with other firms. However, this association needs to be tested by further studies.

Turning to explore the structural architecture of our network of associates, we start with some basic demographics. Our network has 180 actors represented by firms associated to Confindustria Salerno. In any network, there are $k * k-1$ ordered pair of actors, where k is the number of actors. Put the same way, the number of possible ties grows exponentially with the size of the network. Thus, in our network of 180 nodes, with directed data, there are $180*179$ possible ties, that is 32220 logically possible relationships. The density of our overall network is just of 0,052. That is, just 0,52% of all possible ties are present (168).

In our network there is no path²⁰⁰ between every pair of actors in the network. This means that it is disconnected. The nodes in a disconnected network may form connected subsets called

²⁰⁰ There are some network properties which need to be introduced since they are not only important in themselves, but are also building blocks for later properties. We refer to walks, trail and paths. A walk is a sequence of nodes and relations beginning and ending with nodes (Wasserman, Faust, p. 105; Hanneman, Riddle, 2005, p. 103). In a walk nodes and relations may be included more than once. A trail is a walk where relations are not used more than once. Instead a path is a walk where neither nodes and relations are used more than once.

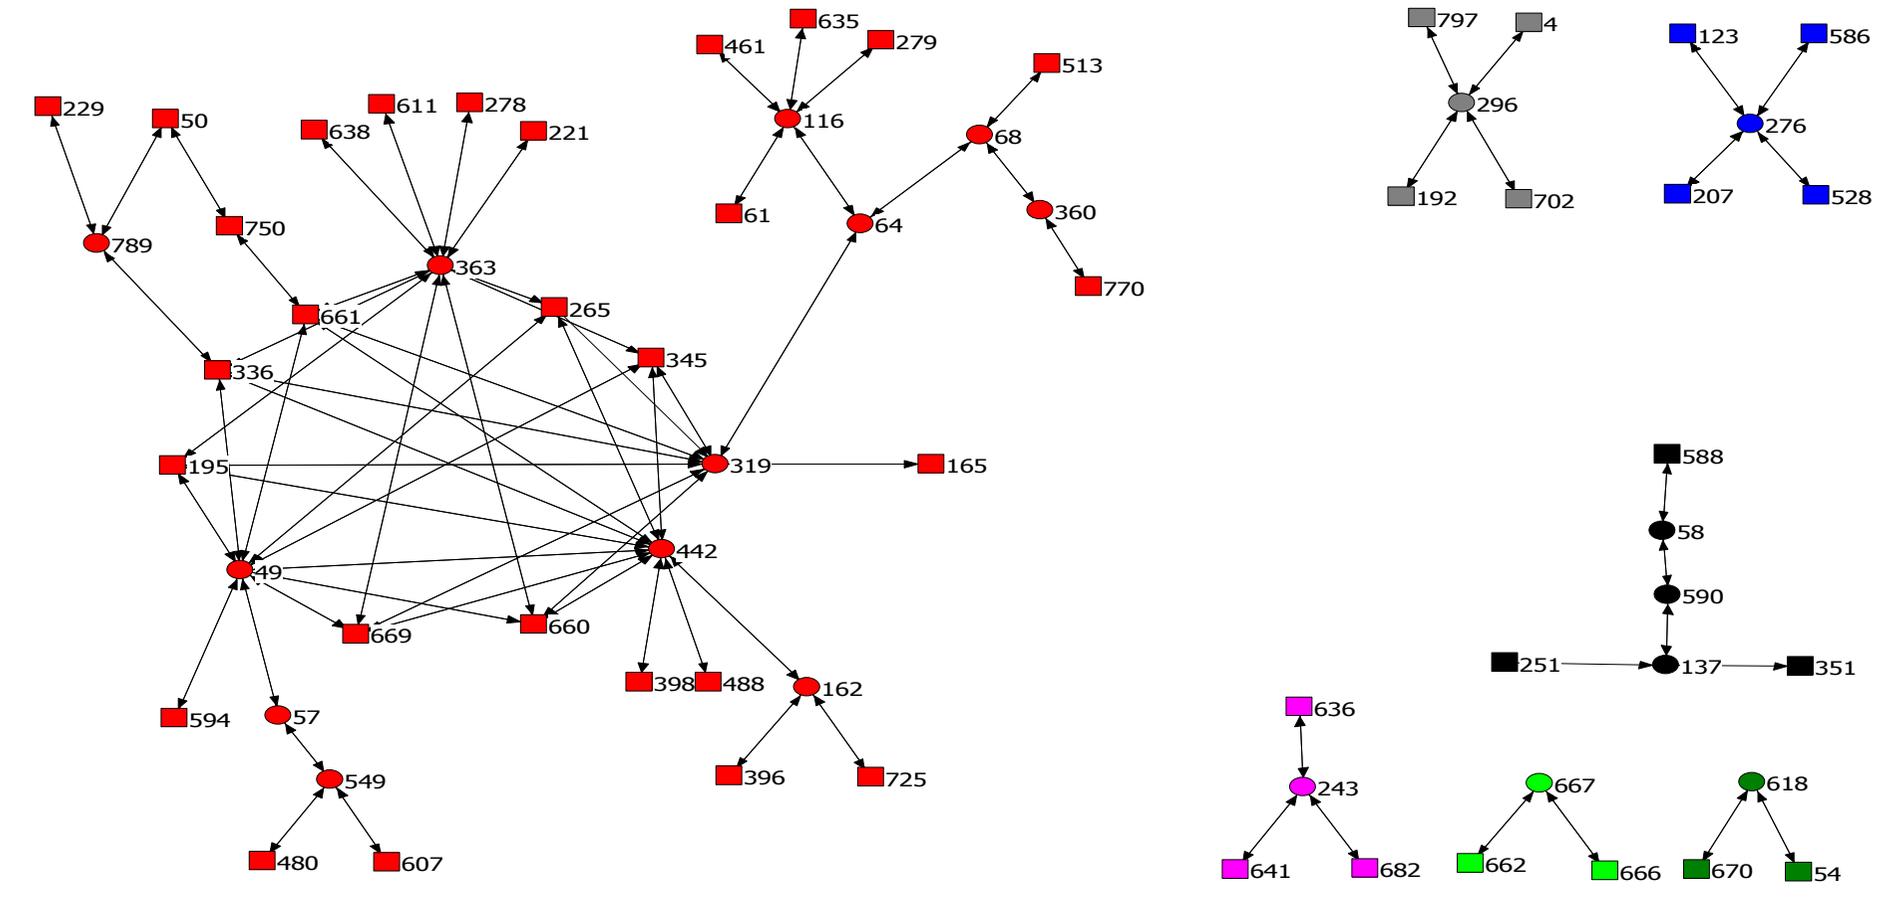

components. Obviously, a connected network has just one component. Thus, a component can be defined as the maximal connected subgraph where there is a path between all pair of nodes in the subgraph (no matter how long), but no paths between the nodes in different subgraphs.

Our business association network presents 7 components, shown in different colours in figure 6.

There are several paths between a pair of nodes and these paths differ in length. In network terminology a geodesic identifies the shortest path between two nodes (Wasserman, Faust, 1994, p. 110). When a network is disconnected – as in our case – we cannot exactly quantify the geodesic distances among all pairs. That is why we concentrate on the main component of our network (shown in figure 6 in blue). Here, the average geodesic distance is 3.8, that is on average the steps necessary to reach other firms are less than 4.

The largest geodesic distance between any pair of nodes in a network determines its diameter. Since our network is disconnected, considered overall its diameter is infinite (or undefined). We can instead calculate the diameter of our main component, not considering any geodesic outside that component. In this case, the diameter of the component would be the length of the largest geodesic within the graph. The diameter of the main component is 8. In other words, in order to get from one side of the network to the other are necessary 8 steps.

Fig. 6 - A representation of the 7 components

There are some nodes and lines that are critical for the connectivity of a network. The connectivity of a network is function of whether a network remains connected when some lines and nodes are deleted. Some nodes are defines *cutpoints* because if deleted would disconnect the network. In figure 6, these nodes present a circle shape.

Since the data in our network are asymmetric, we can distinguish between ties being sent and ties being received, calculating the degree of a node. This can tell us a good bit about the way in which actors are embedded in the network. We distinguish 2 kind of degrees: the in-degree and the out-degree. The former informs about the tendency of actor to make choices, the latter the tendency to receive choices. In other words, the former is the sum of connections from the actor to others, the latter the sum of ties which are sent to the focal actors. Semantically, the out-degree is a measure of expansiveness (Wasserman, Faust, 1994, p. 125) and influence (Hannerman, Riddle, 2005, p.97), the in-degree of receptivity, popularity, power and prestige.

The nodes which present a higher out-degree value, so being sender of connections, are 49, 319, 363 and 442. Firm 49 communicates with 10 other firms, 319 with 8 firms, 363 and 442 with 11. Thus, there seems to be a variation in the roles that these firms play as sources of information. Examining the statistics for in-degree, we find that the sinks or receiver of connections – that is the firms with higher in-degree – are the same nodes. Perhaps these firms act as “communicators” and “facilitators” in the network.

The degree of firms is often an effective measure of an actor’s centrality and power. Firms who have more ties may be advantaged positions since they could have alternative ways of satisfy their needs and be able to call on more resources of the network as a whole. These firms can be considered third parties and deal makers in exchanges among other associates. It also appears that our business association network may have a group of central actor rather than a single “star”. Nevertheless, the graph centralization measure, which describes the centralization of the network as a whole, is of 21%. This means that, overall, the power of individual actors does not seem to vary substantially. This measure expresses the degree of variance in our network as a percentage of that of a perfect star network of the same size²⁰¹. Thus, it can be stated that in our network positional advantages are rather equally distributed.

However, this measure only takes into account the immediate ties an actor has, ignoring its indirect ties to all others. One actor might be linked to many others which can be in turn rather disconnected from the overall network. Thus, it can be appropriate to focus on the distance from each actor to all others. That is the reason why we calculate the reach centrality which measures the portion of all others ego can reach in one step, two steps, three steps and so on. As we can see from table 5, firms 49, 363 and 442 reach around 30% of other firms with 1 step. Firms 49, 195, 265, 336, 345, 660, 661 and 669 reach around 50% of other firms with 2 steps. Finally, firms 195, 265, 319, 336, 345, 660, 661 and 669 reach almost all actors with 4 steps.

²⁰¹ The star network is the most centralized network. In it positional advantages are unequally distributed since all the actors have degree of one and the star has degree of the number of actors, less one.

Tab. 5 - Proportion of nodes reachable by each node in n steps

By trying to avoid to be misled from patterns that are local and in order to find the most central actors in terms of the global or overall structure of our network, we use the eigenvector of geodesic distances. The highest eigenvector is provided by firms 49, 319, 363 and 442. In this case the overall centralization is more than 51%. This is much more than the network centralization measure provided by degree centrality (21%) and suggests that some of the

apparent differences in power using degree centralization may be due more to global than to local inequalities.

Still, interactions between non adjacent firms may depend on firms who lie on the paths between them (Wasserman, Faust, 1994, p. 188). These last firms might have influence and control over the ties among nonadjacent firms. Thus betweenness centrality measures the number of times a node lies along the geodesic (the shortest path) of two actors. Through this measure we can see that, in order, firms with the highest betweenness are 319, 64, 442, 49, 363, 116, 336, 68 and 57 and that there is a lot of variation in actor betweenness (standard deviation=156,951 relative to a mean of 107.075). This means that a lot of connections cannot be made in this network without the aid of intermediary. In this sense, in our network there are several structural constraints which could be important for group formation, stratification and for the development of social capital. These structural constraints are represented by firms which have a continuous relation with the Association, as show in figure 7 where we represent in red the firms with a continuous relation and in blue those with an irregular or absent relation .

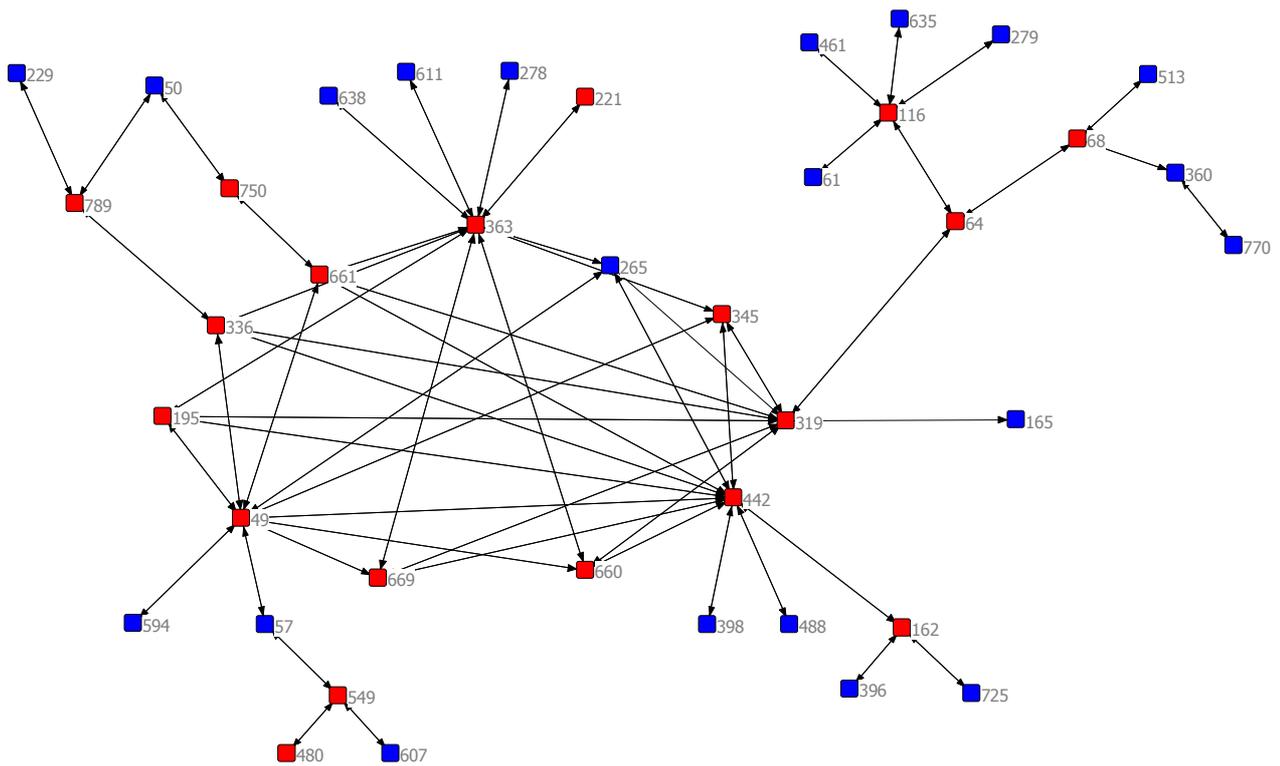

Fig. 7 - Firms with a continuous relation with the Association

DISCUSSION

The study has shown some firms to be more central than others. The firms which are structurally more central seem to also have an active and continuous relation with the association. These firms might have a particular role in the process of creation of social capital.

Thus, in the case of a business association network, three out of the five abovementioned seems to be the dimensions of social capital which can be potentially activated: the governance, structural and expressive dimensions. At this point we are able to hypothesize some theoretical proposition which need to be tested with a more elaborated study.

First, the particular kind of relations enabled by a business association can create a closely knit network where members can trust each other to honor obligations diminishing the uncertainty of their exchange and the risk of opportunism.

Proposition 1: being inserted within a Business Association network – through reciprocity which turns relationships into mechanisms of social control – might have governance implications.

Second, the particular structure of this association may itself have an informational and control value. The former is supposed to derive from the bridging of structural holes by particular firms, the latter from the central position of certain players.

Proposition 2: by being inserted within a Business Association network there might be structural advantages which determine informational and control benefits.

This network might also be a source of organizational identity and social support. In this sense this particular ties can be referred as determinants of identity, forging not only a sense of personal belonging but also creating and sustaining a normative framework within which actors can act.

Proposition 3: a Business Association network might be a source of identity forging, status recognition, shared representation, languages, codes and systems of meaning among parties.

RESEARCH AGENDA

A further investigation is needed in order to improve our knowledge of the mechanisms at the basis of affiliation. As further steps, we aim at:

1. converting values, attitudes, opinions, norms and languages into measurable variables. Starting from the belief that the mere fact of a tie implies little about the likelihood that collaborative effects will materialize and that motivations constitute not merely a contingency factor but a direct source of social capital, we will focus on internalization of norms, values, attitudes and opinions. Stated the difficulty of values' measurement, we will adopt qualitative methods, considered more suitable with the complexity of the subject. In particular, we are going to use techniques based on non-directivity, such as *hermeneutic interviews* (Montesperelli, 1998) and *stories* (Marradi, 2005). The interviews will be done through the typology of relations built

which will help to identify “typical firms” concerning with the different types of relations with the association and among associates.

2. The results obtained with the aid of qualitative procedures will be used to select measurable variables to be inserted into a questionnaire to be polled to the totality of firms.
3. Multiple regression will be used to test whether associationism do have an effect on the development of social capital.

Then, in this way we can intende the term *business association* as “specific modality of social interaction based on proximity”, while a *Business Association* can be qualified in metaphorical sense as a “place in which social interactions are developed between affiliated entrepreneurs”. This view to confer force to the influence that Business Associations could release on the conditions necessary for the creation of value in structural, relational and cognitive terms (Gulati, 1995; Walker *et al.*, 1997; McPherson *et al.*, 2001; Merret *et al.*, 2008; McCormick *et al.*, 2008).

EQUITY ALLIANCES AND INFORMAL RELATIONS: THE “BUSINESS GROUP STRATEGY” OF MAX MARA FASHION GROUP

Piana, Bice Della¹; Cacia, Claudia²

¹Assistant Professor of Business Administration, University of Salerno, Via Ponte Don Melillo, 84084 Fisciano (SA), Italy

²Phd in “Marketing&Communication”, University of Salerno, Via Ponte Don Melillo, 84084 Fisciano (SA), Italy

Key words: Business group - equity alliances - informal relations

During the last two decades, interfirm alliances have been considered as clever vehicle by means of corporations expand their scope and implement their strategy, developing their organizational structure and relation context (Anderson, 1990).

The term “alliances” covers diverse modalities of governance, from relational contracting to licencing, from the supply-chain relationships, to equity joint ventures (Gulati & Singh, 1998). The Lorange & Contractor (2002) classification will be used on the basis of which an alliance is “any inter-firm cooperation that falls between the extremes of discrete, short-term contracts and the complete merger of two or more organizations”. Details of the some of the most common agreements and the different ways in which firms can co-operate with one another are shown below in Fig.1

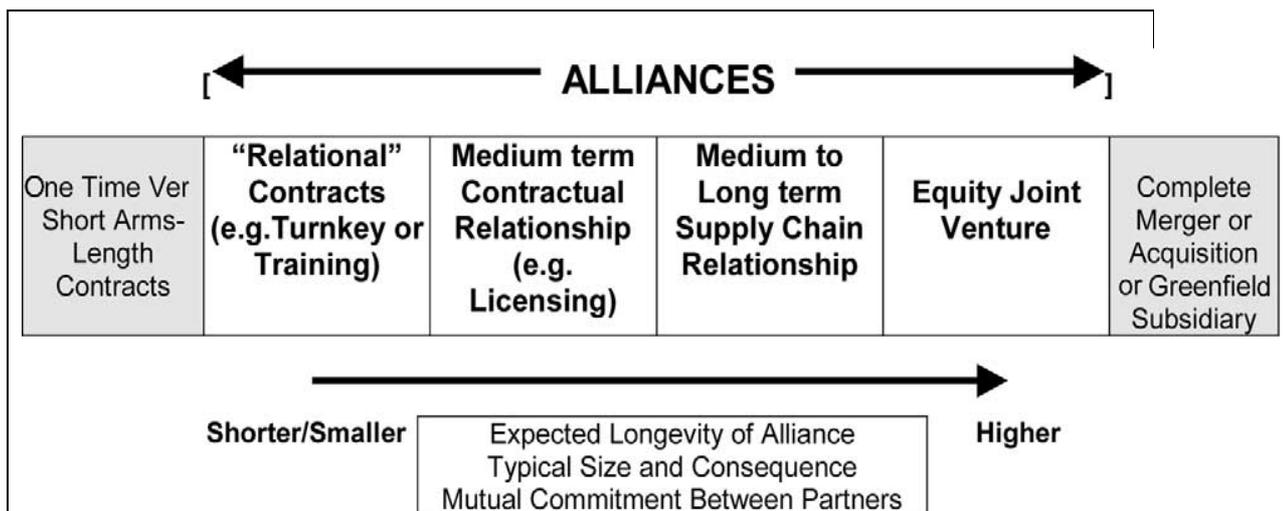

Fig. 1 – A typology of alliances. Source: Lorange & Contractor, 2002.

Considering the legal and technical specific of interfirm alliances, Barney (2002) discriminate between *non-equity alliance*, *equity alliance* and *joint venture*. The first one are those in which the cooperation is carry out by contracts turn on systematic and settled collaboration (Rispoli, 1989), but without any property right (i.e., *franchising*, *licensing*). The second one are similar to the *non-equity alliance* excluding for the property right. In fact, this kind of ties are characterized by the equity sharing, even mutual between partners and by a strong strategic interest, that could assure the government. Inside of *equity-alliance* there are the *joint venture* that consist of a new owned independent firm at the same time managed by several partner that share profit and loss (Hennart, 1988).

Making an allowance for the cultural distance of partners and their motives in entering alliances, the choices in governance of them are various, from structural point of view, and complex from social network perspective. Then, the analysis of their architecture of coordination is complex.

Prior research on governance structure of alliances, have considered the presence of share equity in alliances as synonymous with hierarchy (Gulati and Singh, 1998). Alliances involving equity considered to be more hierarchical than non-equity exchange (Hennart, 1988; Teece, 1992). Equity has been considered an indicator of hierarchy because it is considered to be an effective mechanism for managing the rent appropriation concerns associated with partnering (Pisano et al., 1988; Moon and Khanna, 1995).

In alliances, hierarchical controls formalize interactions between partners (Van de Ven, 1976) and clarify boundaries on decisions and activities; then, they simplify decision making (Galbraith, 1977). More over, hierarchical controls in alliances facilitate coordination through informal means and create a sense of shared purpose that can motivate and guide individual participants and minimize conflict among them (Barnard, 1938; Ghoshal and Moran, 1996).

On the other hand, when there is trust, firms no longer consider hierarchical controls to be necessary (Powell, 1990; Ring and Ven de Ven, 1992; Gulati, 1995). An important consequences of the embeddedness of economic transactions such as alliances in a social structure of trusting relationship is that the partners are likely to have greater confidence in the predictability of each other's actions and thus anticipate lower appropriation concerns when they form an alliances (Granovetter, 1985; Gulati and Gargiulo, 1999).

Gulati and Singh (1998) argue that the presence of equity sharing masks any important element helpful for classifying the governance structure of alliances: presence of distinct degree of hierarchical controls and different way in which such controls manifest themselves.

This considerations about the elements that can help us to understand the governance structure of alliances suggested us a reflection in order to the relational's architecture of the business group and induce to ask us if the current definition of corporate strategy can explain the actual strategic dynamic of business group.

Recently, business group are emerged as a distinct theme in the literature from other types of firm network based on strategic relationship among companies (Khama and Yafeh, 2005).

Cuervo-Cazurra (2006) argues that business group are "a set of legally-separate firms with stable relationships operating in multiple strategically unrelated activities and under common ownership and

control". In this point of view, business group are identified as a type of firm network, with a multiple stable relationships, but in a different way from these one, business group are characterized merely by stable relationships on the basis of common ownership. Instead, the other types of relationship among firms - like supplier, distributor, strategic, geographic - are classify as firm network.

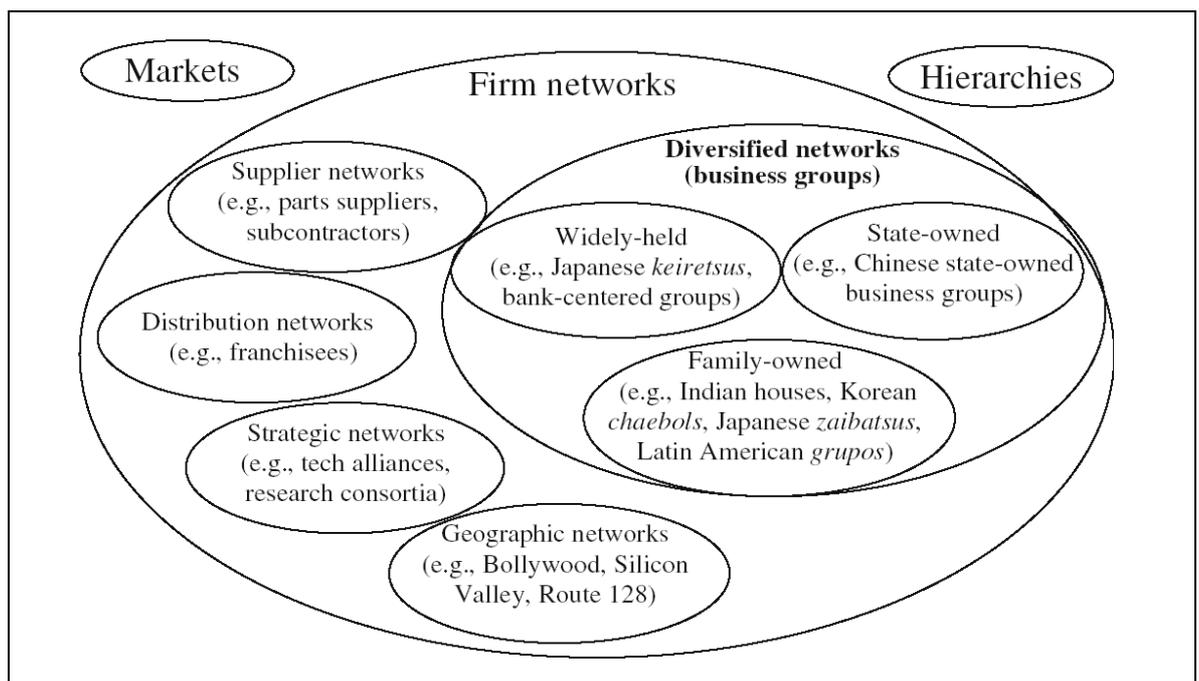

Fig. 2 – Separating business groups from other firm network. Source: Cuervo-Cazurra, 2006

We do not share this definition that undervalue the weight of informal relationships. There are many other definition of business group but despite of the multiplicity of studies there is no one accepted.

According to Granovetter (2005: 429) in our framework *"Business groups are sets of legally separate firms bound together in persistent formal and/or informal ways. The level of binding is intermediate between, and should be contrasted to two extremes that are not business groups: sets of firms linked merely by short-term strategic alliances, and those legally consolidated into a single entity."*

Therefore, in our study we would like to analyze informal relationship as an identifying characteristic of the business group and, at the same time, as a dimension that can gather the strategic dynamic of business group.

The aim of this paper is to analyze the relational's architecture of the business groups and their evolution over the time to highlights their strategic dynamics.

Starting from considerations we develop an explorative study on Max Mara fashion Group (MMFG), an Italian business group of Textile-clothing industries, that have to support our new framework of "business group strategy".

The research is performed in different steps:

I) Analysis and identification of business group

- a) Search and selection of network's firms by obtaining number of MMFG's holding/ shares;
- b) Identifying the connection of members in the governing bodies of the firms of the MMFG (Interlocking directorship);
- c) Longitudinal analysis of equity alliances and informal relations (connection of members).

II) Extrapolation of the scheme that can understand relational's architecture of the MMFG and its evolution over the time to highlights its strategic dynamics.

Our study raises a number of issues to be explored and debated by future research. Pragmatically, the study describes a MMFG behavior that might facilitate the comprehension of its strategic dynamics but we know limit of this study because there are numerous other questions that arise one we consider the dynamic evolution of the alliances. As Gulati and Singh (1998) argue, "it would be useful to examine how the governance structure of alliances changes as expectations and goals of partners in the alliances evolve, as well as the extent of asset-specific investments undertaken by the partners and how these may change over time".

'STANDARDIZATION/ADAPTATION' OF PROMOTIONAL CHANNELS IN EURO-MEDITERRANEAN COUNTRIES

Poulis, Konstantinos¹; Poulis, Efthimios²

¹University College Cork, IRELAND

²Buckinghamshire New University

Purpose: The purpose of the current paper is to shed more light on the influence of a tourism-oriented environment on the promotional strategies of fast-moving consumer goods firms

Design/methodology/approach: The study utilises an exploratory, qualitative research design through fourteen case studies of fast-moving consumer goods firms operating in the tourism-oriented environment of Greece

Findings: Findings show that most firms utilise adapted promotional channels due to the influence of structural characteristics of the tourism industry and tourists' modes of behavior

Research limitations/implications: The qualitative study's outcomes are limited to the context that is investigated and thus, future researchers are encouraged to investigate similar contexts with the goal of generalising findings to the population

Practical implications: Findings suggest that firms ought to appreciate the contextual idiosyncrasies of Euro-Mediterranean countries (as a result of international tourism) and thus, tailor their programs to these idiosyncrasies, which are distinct from other non-tourism-oriented environments

Originality/value: To the best of authors' knowledge, this is the first paper that investigates the tourism-induced idiosyncrasies of Euro-Mediterranean countries and their attendant consequences on fast-moving consumer goods firms' promotional strategies. In light of the increasing importance of global consumer mobility, such studies are expected to increase.

Keywords: standardization, adaptation, promotional channels, fast-moving consumer goods, tourism

Research paper

INTRODUCTION

International marketing is a scientific field with a well-grounded evolution over time, which has offered a holistic picture of how firms market their products across countries. Pitfalls, blunders, success stories and several models highlighting strategies and factors have been presented that allow us to better understand how firms serve the needs of millions of people around the world (Whitelock and Fastoso, 2007; Vrontis, 2003; Dalgic and Heijblom, 1996; Ricks, 1993; Kashani, 1989; Jain, 1989). In particular, the international marketing constructs of *standardisation vs. adaptation* (henceforth described as **SA**) have been long utilised in order to portray the strategic marketing alternatives firms have when they deploy their international business operations (Fastoso and Whitelock, 2007; Vrontis and Vronti, 2004; Boddewyn and Grosse, 1995; Cavusgil et al., 1993).

This literature on the SA debate has been largely developed upon a major premise. This is the assumption that all consumer groups in a country are culturally homogeneous (or at least, treated as such) or that, intra-country cultural variations are less important than inter-country differences. This might have been a necessary condition for the field to excel however, several

studies increasingly highlight the strong influence of the multicultural character of national markets, as a result of e.g. immigration or inherent, within-country racial pluralism (Cui, 1997; Chung and Wang, 2006). Therefore, the relevance of political boundaries as frameworks of national homogeneity is decreased to a certain extent and inducements stemming from within-country cultural diversity also feature as influential for strategy-making.

From the point of view of the present paper, an even more important feature of such studies is that these researches use the SA construct to explain marketing strategies of firms in a domestic, yet multicultural context. For example, Cui (1997) uses the SA framework to explore alternative marketing strategies of consumer goods firms operating in the single but multi-ethnic market of America (as a result of immigration) while Chung and Wang (2006) recently considered the multi-cultural cities of China and applied the SA framework in the services sector across culturally diverse Chinese cities. These authors point out that *"the same framework of standardization vs. customization can be applied to marketing to consumers of different ethnic cultures in the domestic market"* (Cui, 1997, p.125) since such markets are *"...a small scale model of the global market"* (p.125) in which, similarity of the marketing offering to all consumers denotes standardization whereas different strategies among ethnic segments denote adaptation.

Therefore, authors such as Cui (1997) or Chung and Wang (2006) applied a standardization/adaptation lens on local marketing actions directed towards people with diverse cultural backgrounds. Such works are particularly relevant since the marketing of food, beverage and cosmetics firms are portrayed as being heavily influenced by the cultural diversity of consumers (e.g. Cui, p.126). These industries are the focus of this study, too and it seems that the cultural pluralism within a country is of vital importance for firms marketing such products.

In particular, this paper is interested in how fast-moving consumer goods (FMCG) firms' promotional channel strategies are influenced by the 'international' character of most Mediterranean countries, either towards standardization or adaptation. As we will explain, this 'international' character comes as a result of international tourism. Hereafter, we delineate the nature of the problem, we pose our research questions, we explain the methodology and we present findings with the purpose of generating a relevant model and empirically-laden propositions.

CONTEXTUAL BACKGROUND AND RESEARCH OBJECTIVE

The approach Cui (1997) and Chung and Wang (2006) utilize, that is applying the SA framework to intra (or within) country diversities, is also used in this study. However, this time, with a particular reference to the tourism-induced multicultural character of Euro-Mediterranean countries such as Spain, Croatia, Cyprus, Malta or Greece. We strongly agree with the quote in the EuroMed Journal of Business that *'the challenges and threats to managers and researchers that operate within the region often have distinct differences to those experienced in other geographic areas in the world'* (<http://info.emeraldinsight.com/products/journals/journals.htm?PHPSESSID=ocphmtucelij0tj18hso9bmio2&id=emjb>, retrieved on the 6th of June 2009) e.g. as opposed to Northern European or Northern American countries.

This quote matches with our motivation for the formulation of this paper. In particular, we approach the phenomenon of international tourism (which is a key macro-environmental feature of the Euro-Mediterranean region) as a challenge for FMCG firms; a phenomenon that warrants closer attention. Thus, a main aim of this study is to explain this contextual idiosyncrasy of the region and explore how the environmental opportunities and threats that this unique marketplace development brings induce firms' promotional channel strategies towards standardisation or adaptation.

Specifically, in a number of Euro-Mediterranean countries, there is a large influx of foreign consumers, or tourists, from many countries and for a significant part of the year. As can be seen from the following table, for developed countries with mature markets such as France or Spain, the annual influx of tourists collectively exceeds the population of these countries by large margins.

	<i>Tourist Arrivals</i> (millions of tourists)	<i>Domestic population</i> (millions of inhabitants)
<i>France</i>	79.08	60
<i>Spain</i>	58.45	40
<i>Italy</i>	41.05	58
<i>Greece</i>	14.78	11

Table 1: Foreign and domestic consumers in a country (2006 data²⁰², World Tourism Organization/World Tourism)

In these countries, tourism transforms a relatively limited national market into a much larger, multinational market. In a sense, during the tourist season (which can be most of the year), firms operating in these countries face 'international' marketing tasks but within the confines of an enlarged country. These firms do not have to serve only the 'native', permanent population but also a multicultural group of consumers on a temporary basis per annum.

For this research though, the most important thing is that it is not only firms in the tourist sector (e.g. hotels, tour operators, airline companies, travel agents etc.) that are thus affected. Clearly, tourists are also consumers of a whole range of goods and services that are not produced by the tourist industry. For example, tourists consume beers, soft drinks, ice creams, toothpastes and snack food. Thus, tourists are consumers of packaged goods belonging to product categories that are sold in the destination/market even if tourism was not developed at all in the country and also are sold in the tourists' usual habitat back home.

This market feature, while having challenging implications for FMCG firms is a reality the research community in business studies has not investigated before. Despite tourism's importance as one of the largest industries in the world, the fact that it affects numerous non-tourism-related firms in several countries is still unexplored. We currently do not know how these FMCG firms selling food, beverage and cosmetics products tackle this additional and nationally heterogeneous consumer base that temporarily changes the status quo of the markets they operate. Therefore, the research objective of this study is the following:

To explore the consequences of within country diversity as a result of inbound tourism for the promotional channel strategy of FMCG firms operating in the tourist-receiving country

RESEARCH QUESTIONS AND LITERATURE REVIEW

Our literature review revolves around the core SA debate in international marketing research. This rich body of established knowledge has been developed for many decades already and given the research objective of this study, it is the SA strategies and their antecedents/drivers that are germane. Thus, standardization/adaptation literature was the main pool of insight that guided data collection and informed case data analysis. Specifically, we approached the SA literature with the purpose of extracting insights related to the following research questions:

- 1) How does the contextually idiosyncratic character of Mediterranean markets as a result of international tourism influence FMCG firms' promotional channel strategy towards standardization or adaptation?
- 2) What factors lead to one or the other approach?

At this point, we clarify the following definitions for the two main constructs used in our study (adapted from Cui, 1997 and Chung and Wang, 2006):

Standardization refers to using the same promotional channel strategies towards the tourist population with the ones used for the permanent, local population throughout the year while

Adaptation refers to using promotional channel strategies which are different to the ones used for the permanent, local population

The background forces that influence a firm's decision to standardize or adapt its strategy are numerous and the literature has identified and investigated a wide range of them. Buzzell (1968) was one of the pioneers of the debate and made a thorough analysis of the benefits of standardization including significant cost savings, consistency with customers, improved planning and control and the exploitation of good ideas on a worldwide scale. However, he also considered the barriers to standardization, which impose a limit to the degree of standardization in elements of the marketing mix. Overall, he offered a comprehensive model of the influential variables with regards to the degree of standardization of marketing elements. Those variables were classified as market characteristics including the physical environment, the stage of economic development and cultural factors, industry conditions including product life-cycle and competition, marketing institutions including the distribution system and the advertising channels and legal restrictions.

Since then, research grew but this growth and the discrepancies of findings in SA studies have necessitated the use of classification schemes of factors, which grew bigger and were refined by several authors via meta-analyses and integration of empirical research (e.g. Vrontis, 2003; Papavassiliou and Stathakopoulos, 1997; Agrawal, 1995). The outcome of these classifications has given rise to several dichotomies of factors (internal vs. external, mandatory vs. desirable, environmental-industrial-organizational, controllable vs. uncontrollable factors etc.) which offer a convenient and insightful way of portraying reality.

Following the work of such authors, the literature results reveal that marketing standardization or adaptation is a situation-specific decision that cannot follow a 'golden rule' or equation of success but rather it is the outcome of the need for fit between the chosen strategy and environmental contingencies (Katsikeas et al., 2006; Okazaki et al., 2006). For example, promotional channels may vary enormously across contexts due to e.g. availability of channels. Therefore, an important issue for the firm/researcher is to unravel the complexity of factors that work out towards standardization or adaptation and preferably do so through a context-specific lens.

A first set of the numerous factors that dictate SA strategies are the environmental factors. These consist of economic, socio-cultural, political forces (political environment, religion, climate, laws etc.), which influence international operations directly or indirectly (Chung, 2003; Cavusgil et al., 1993; Akaah, 1991). Such factors can be prohibiting for the implementation of a standardization approach, no matter how desirable it is, and it is suggested that firms must always scan the external environment before launching their standardised/adapted strategies (Vrontis and Pavlou, 2008).
