The Greek DRG’s pricing and reimbursement policy for hospital care in public and private health providers does not include the productive factor labor (wages for medical, nursing, administrative and other staff), see Polyzos et al., (2013). For public hospitals, the labor cost is subsidized from the state. For private hospitals this is not the case, hence resulting in high direct OOP spending especially to cover for surgeons’ and anesthetists’ fees (formal and informal payments) that are paid separately. The revision of Greek DRG’s pricing with higher reimbursement rates is essential primarily in order to reach the levels of international experience and secondly to categorize the cost components of inpatient health care. However, this might result in increased social security contributions from all insured.

Also, health policy makers should focus on improving the qualitative and quantitative services in public hospitals in an effort to regain the trust of the population to upgraded public inpatient care facilities which are nowadays free of charge and more preferred than those of private hospitals (Kaitelidou et al, 2012). The allocation of more financial resources (e.g. higher salaries to medical and nursing staff) to public hospital system is imperative for eliminating great barriers of the past as low rate of satisfaction, long waiting lists for surgical services, informal payments, lack of medical interesting for patient, bounded accessibility etc (Liaropoulos et al, 2008). The efficient operation of public hospital care could reduce the utilization for inpatient care of private clinics and thus the incurred high personal spending of insured.

Cost sharing through deductibles, co-insurance, and co-payment proportions to social insurance reimbursements could be useful in discouraging unnecessary health care services provision and controlling public spending (Stokou et al, 2013; Rombaldoni, 2012). Nevertheless, social insurance and public health policy makers in Greece should tie formal cost sharing for health care services to socioeconomic characteristics of insured. Health care policy makers should readjust co – insurance shares for inpatient cases to private hospitals based on insured income level and hospitalization treatment necessity (Schokkaert et al, 2008).
Also a main problem afflicting the new Greek National Health Organization, reduces its reliability and lowers its monopsony power is the significant delay (more than 3 months) of payments to private health providers (Vassilakopoulou and Marmaras, 2013). Furthermore, the state imposes re-bate and claw-back mechanisms, which lead to extra recursive “haircuts” to private hospitals (Petmesidou, 2013).

5.2 Limitations and further research directions.

A limitation was the lack of availability of data related to the net annual income, expenditure/consumption or disposable income of the participants, similar to what other researchers have done (Xu et al., 2003; Xu et al., 2007; O'Donnell and Van Doorslaer, 2005); also, the inability to collect other income criteria of participants such as rentals turnover, financial assets etc. Moreover, another limitation was the inability to collect data like transportation expenses and income losses of insured as a result of provided hospitalization.

Directions for further research.

The PHI funding in European Union health care systems is limited due to the universal security of the population through the mandatory social or tax financed insurance schemes (Mossialos and Thomson, 2002). Nevertheless, PHI institution is an important player in health care financing even in health systems where public coverage plays a dominant role.

Undoubtedly, it remains a high priority for future research in order to examine the potential of PHI to reduce insured’s OOPs in private hospitals in Greece. The findings of our study call for a re – consideration of our model in addressing the PHI factor against the cost components of inpatient OOPs. In countries with low state health care funding due to fiscal weaknesses, it should be tested if PHI can be established as a parallel prepayment mechanism to SHI, efficient to provide financial risk pooling, especially against catastrophic OOPs.

6. CONCLUSIONS

Of vital importance to the Greek state is the co – operation of social and private health insurance. Complementary or supplementary private health insurance working in parallel to social insurance could be a potential mechanism of eliminating the high share of OOP expenses (Siskou et al, 2009). Private insurance is viewed as capable of offering solutions to the enormous funding problems of social insurance systems (Sekhri and Savedoff, 2005).

Our analysis, despite its limitations, leads to a conclusion that OOPs in private hospitals in Greece have a catastrophic impact especially amongst the poor people despite the “full” coverage of social insurance. The results indicated that the policy makers have to pay more attention to the catastrophic impact of OOPs and the funding inefficiency of SHI, which undermines the present and future
wellbeing of the population. A mechanism reducing the financial insecurity of high OOP spending is related to the more active involvement of private health insurance in social health insurance plans.

HOW TO BALANCE VALUE CREATION, APPROPRIATION AND EXPLOITATION IN THE EXPERIMENTAL LAB TEAMS: EVIDENCE FROM A FOCUS GROUP.

Iscaro, Valentina
Second University of Naples, Corso Gran Priorato di Malta, Capua, Italy

ABSTRACT
In a modern knowledge economy that is able to exploit collaboration, relational capital and external focus of the open innovation higher educational institutions have been requiring to be more entrepreneurial: embracing its third mission represents for Academia the only way to have a positive influence in the new collaborative value creation. What should educational institutions specifically do in order to become increasingly more “entrepreneurial”? A useful starting point would be that of providing Universities with enough resources that would allow them to open further innovative paths of action. At the basis of my on-going PhD research is the idea that the experimental lab may represent a valuable tool in helping both aspiring entrepreneurs and Universities. The experimental lab is a community of personnel who interact with each other and with the external environment to generate innovation. The lab supports aspiring entrepreneurs by the means of work in team that proceeds by a trial and error model to get an idea ready for launch in the marketplace. There are several matters involved in such an ecosystem: coordination efforts, trust, risk of abandonment, value appropriation and externalization.

The experimental lab literature has pointed out different solutions to organize the daily work, even if has not reached a final outcome yet. This paper attempts to give a contribution in this particular field by trying to identify the best way to develop teams and coordinate their tasks. More specifically: how to organize teams, how to realize a balance among common goals and personal purposes and how to reduce the risk related to virtuality? In order to evaluate these issues, it has needed a step forward in delineating processes and dynamics daily involved in the lab functioning and that had not yet been covered within the experimental lab literature.

To deal with this questions I used a focus group of experts to dissipate the most important themes and to make a contribution towards in shaping the functioning of an experimental lab in the daily work. Following the outcomes I have designed a virtual platform to simulate, by role play, the daily functioning of a lab in order to highlight limits, potentiality and related issues of knowledge sharing, value generation and appropriation.
Keywords: experimental labs, entrepreneurial university, start-up, knowledge sharing, virtual teams, simulation, focus-group.

INTRODUCTION

In a modern knowledge economy that is able to exploit collaboration, relational capital and external focus of the open innovation (Chesbrough 2003), higher educational institutions have been requiring to be more entrepreneurial: embracing its third mission (Etzkowitz and Leydesdorff, 2000; Etzkowitz, 2004; Jongloed et al., 2008) represents for Academia the only way to have a positive influence in the new collaborative value creation. According to Clark 1998, the entrepreneurial university has the ability to generate a focused strategic direction both in the formulation of academic goals and as well as in the translation of knowledge produced within the university into an economic and social utility. The urge of European universities to develop their entrepreneurial features has become more and more critical due to two main reasons: one being the gap between Europe and the US in encouraging a bottom-up entrepreneurial phenomenon and the other being the on-going economic crisis that carries along a severe lack of employment. What should educational institutions specifically do in order to become increasingly more “entrepreneurial”? Reflection is needed in terms of strategy, resources and capabilities, external environment (Rasmussen & Borch 2010, Kirby 2006, Gartner 19850) R&D commitment, intellectual eminence (Di Gregorio and Shane, 2003), specific research fields (O’Shea et al., 2005), older TTOs (Powers and McDougall, 2005), resources invested in TTO personnel (O’Shea et al., 2005), and path dependent (Kenney and Goe, 2004; O’Shea et al., 2005).

Considering that it is not possible to act on the external environment or historical choices, a useful starting point would be that of providing Universities with enough resources that would allow them to open further innovative paths of action. At the basis of my on-going PhD research is the idea that the experimental lab (Curley & Formica 2008) may represent a valuable tool in helping both aspiring entrepreneurs and universities. However, in order to evaluate the real effectiveness and efficiency of the experimental lab, I have designed a virtual platform that simulates, through role play, the daily functioning of a lab. Thus, with the attempt to clear a few ambiguities related to the lab dynamics, I realized a focus group with professors and experts. The article is divided as follows: section 2 displays an explanation of the experimental lab and the simulation platform. Section 3 explains the methodology used for the study, section 4 includes the results and section 5 presents a conclusion.

THE EXPERIMENTAL LAB

The experimental lab is a community of outsiders who become part of an innovative ecosystem rather than relying only on their capabilities (Andersson et al., 2009).
That innovative ecosystem is the Entrepreneurial University (Curley and Formica 2012) that exploits its knowledge base and collaborative network, to help aspiring entrepreneurs in turning an idea into a successful start-up. Aspiring entrepreneurs who simply hold an intuition and an entrepreneurial inclination can find valuable support in the experimental lab community, which allows them to access to capabilities and competences that they do not possess. The daily work in the experimental labs is built on collaboration and continuous feedbacks, in a pattern that involves continuous trials, errors and attempts. Substantial networking is extremely necessary and required for aspiring entrepreneurs in view of the serious struggles that the launching of a start-up would imply. The experimental lab offers this possibility in an evolutionary way through mentoring and coaching. Thus if the labs’ strength and value are in the knowledge that flows between people within the network, it is also important to acknowledge diversity as an added value as well as a risky obstacle. It is crucial to understand who the participants are, what their role in the network is, how do they interact with each other and what is the expected trade-off in an environment that cannot disregard a flawless definition of procedures. This ultimately raises the critical question: how well and concretely does the experimental lab operate? How can high-expectation entrepreneurs behave perfectly in accordance with the suggestions put forward by others, even if the ‘others’ are experts in the field? There are several matters involved in such an ecosystem: coordination efforts, trust, risk of abandonment, value appropriation and externalization. The experimental lab literature has pointed out different solutions to organize the daily work, even if has not reached a final outcome yet. This paper attempts to give a contribution in this particular field by trying to identify the best way to develop teams and coordinate their tasks. One of the first differentiations within the experimental lab literature divides participants into two major groups: problem seekers and problem solvers. The problem seekers have to identify the issues that might emerge in the real market, whereas the solvers should aim to find possible solutions for the indicated problems. The two groups are interchangeable: at each iterative step, seekers become solvers and vice versa (Curley & Formica 2008). The goal reached by this differentiation, i.e. problems identification and solution, is easily achievable thanks to the organization of groups and their participants that are based on areas of common interest, as later suggested in the literature. There are certainly different ways to organize the work in the experimental labs. One possibility is that each member involved makes a critical analysis of its own capabilities and competences, in order to evaluate the compatibility with the idea. The best team is made up of those who have the best match between project and personal knowledge. Another option is that the lab senior managers, “the coaches”, choose the most suitable participants, who could be already inside the network or outside of it. The third option is the “venture sitter” (Matricano & Pietrobon, 2010). The subject, in this case, would examine the idea’s characteristics and the expert’s capabilities to choose the
best combination between project and members who will thereafter arrange the team. The options that the venture sitter has are three:

1) A task force of experts that works in groups: each one expert in a specific field (marketing, strategy, research, technology, law, sales) analyse, diagnose and decide;
2) One member supervising a specific field and takes decision;
3) One member supervising a specific field but cannot take a decision if not before a confirmation from all other members.

Notwithstanding that literature offers valuable inputs and consultancy to face the daily work in the lab, there are open questions that this paper seeks to dissipate i.e. concrete teams’ organization per cognitive areas, value appropriation, regulation of relations and virtual network fragility. More specifically: how to organize teams, how to realize a balance among common goals and personal purposes and how to reduce the risk related to virtuality? The key matter is the interaction between team members which allows them to produce the "reaction" that is necessary from intention to action, so from idea to start-up.

THE METHOD: A FOCUS GROUP

In order to dissipate doubts and controversies during the platform design, I chose a focus group method.

The focus group is particularly useful to explore and exploit people’s knowledge and experiences. The group discussion is recommended when the researcher has open questions and wishes to encourage an open discussion in order to discover and welcome people’s opinions and the reasons behind them, accepting the possibility of taking the research into new, unexpected directions (Kitzinger 1995). The need to explore concepts in such deep manner persuaded me to use this qualitative method in order to make participants feel free to express themselves about different topics in their own vocabulary. Following an open track which includes a list of themes about what is going to be discussed, it has been possible to lead the dialogue in an open way analysing consensus, agreements and disagreements in a shared and common knowledge environment. The participants were not drawn together specifically for the research; the group was formed by colleagues and it "naturally occurred". This, in turn, enabled the creation of a hierarchy-less sample, making it easier for knowledge flow and exchange.

The discussion in a group proceeds with informal favouring cross-examination and participants challenging each other in contradictious (Kitzinger 1995).

Starting from the themes I personally wanted to explore, I identified 3 cognitive areas on how to organize the focus group discussion: entrepreneurship, innovation and finance. Based on these three
areas, I selected individuals amongst the University faculty staff, trying to form the best match between these three fields and the person’s background. The final group was composed of 5 people and 1 external observer. I provided participants with a graphic representation of the platform in order to help in the discussion and clarify the basic schema. The overall purpose in organizing a focus group was that of arguing about the open issues related to the experimental lab’s daily dynamics (organization of groups per cognitive areas, value appropriation and regulation of relations, virtual network fragility), in order to improve my research’s virtual platform. Inside these areas, participants were completely free to debate as they preferred, either following an order or jumping from topic to topic as they wished. The focus group conversed for approximately 70 minutes. This was recorded and transcribed, allowing me to take note of the different typologies of interactions, questions, complaints and mentions about each other’s opinions.

Analysis and results

Thematic network analysis (Attride-Stirling, 2001) is one of the primary methods of analysis of the focus group data. I was interested in the topics that were more common and more discussed amongst the participants, in relation to the 3 macro areas that have leaded this research. It was not a quantitative count on how many times some concepts were being discussed during the focus group, as much as an attempt to point out the subjects that were spoken for longer and that spontaneously arose from the experts’ considerations. My focus was not that of suggesting to the participants the global themes (Attride-Stirling, 2001), yet to simply propose them the macro concepts from where to start the debate. The analysis went on by examining the transcript’s conversation and defining the basic, organizing and global themes. The basic themes are simple premises and suggest very little about the text as a whole. They are specific beliefs about the central notion raised within the discussion.

The organizing themes, as the name suggests, are clusters of signification that organize the basic themes and summarize them. The global themes are the general claims that advance the question of the general meaning of the text as a whole. In this analysis, in addition, there is another level represented by the 3 macro-areas on which the discussion was conducted on. Beyond my indications on the specific areas, participants led the conversation preferring themes that in their opinion were more important than those recommended by me.

More specifically, they devoted less importance to 2 of the 3 macro-areas I proposed: team formation for cognitive areas and fragility of a virtual network. In relation to the team creation, they quickly concluded that it would not have been possible to realize only one general criterion, but that I should have chosen the best regulations according to the individual situation. About the fragility of the virtual network (the less debated theme), the immediately accepted proposal was that of providing
strong networks with some gates and thereafter arrange face to face meetings. The other rules and organizational mechanisms would have been enough to reduce the abandon risk.

Thanks to the focus group dynamics I took a step forward in my research on the topics that were not yet well-defined in the literature and from the standpoint of people’s daily involvement within those matters. Moreover, if on one hand the participants underestimated the importance of some themes, on the other they manifested the importance of concepts that I did not accurately consider myself in the research (i.e. the added value due to 3 smart databases, the definition of clearly differentiate objectives for simulation and research and the re-definition of the aspiring entrepreneur’s role in terms of activity). Thanks to the new emerging themes I have been able to realize a platform following a stronger idea about the different issues.

The thematic network analysis scheme is summarized in the appendix.

RESULTS

Following the evidence and the information that I gained from the focus group, I designed a platform based on the suggestions.

In relation to the risks related to a virtual network, the discussion was quickly solved by entrusting the solution to the physical meetings that should be planned at specific gates. This solution finds confirmation in the literature, according to which there are several risks related to the virtual teams and different solutions to avoid them. Nunamaker et al. 2009 indicate different principles for effective virtual team, which can be summarized in: reward structure, control system & attention focus, explicit and well-defined deliverables and work processes, establishment of a virtual presence. All these principles are able to reduce the risk of abandon and low commitment. Other researches have pointed out the importance of well-defined processes and face-to-face occasional meetings, in order to reduce the risks related to “dispersion” (Siebrat at al. 2009). Following the literature and the group outcomes, I adopted the stages and gates model (Cooper 1994) which is able to include both the accurately defined processes and face to face meetings. The analysis is well structured due to the partial stages that are able to process the idea step by step; this way of organizing the daily job facilitates the possibility to arrange meetings based on the gates provided.

One of the most debated themes was value appropriation and regulation of relationships. The major sources of concern were: why should human resources put their knowledge at the service of the platform? How should we protect the idea producers? How should we remunerate people and, at same time, ensure a non-disclosure condition?

The knowledge economy introduces something radically new in the mechanism of value production: the way knowledge assets create value is really different from that of physical assets (Boisot, 1998;
Rullani, 2004). While physical resources and embedded, tacit knowledge assets, by virtue of their spatio-temporal locality, present an irreducible level of scarcity which helps to make them appropriable, explicit knowledge is subject to complex appropriability problems. For this reason, knowledge exchanges cannot rely on traditional market dynamics, as the mere description of a knowledge asset, necessary for its exchange, partly transfers it, making it available to potential buyers who could use it without paying properly. This highlights an important cognitive issue related to experimental labs, i.e., the need for value appropriation by the adoption of mechanisms allowing members to extract value from the knowledge they contribute to generate and the activity of the start-up firm benefiting from it. While on the one hand it is important to support externalization processes, on the other hand it is necessary to provide experimental labs with isolating mechanisms in order to sustain knowledge sharing within the network, thus leveraging partners’ knowledge assets and fostering start-up activities. According to both Rullani (2004) and Boisot (1998), in order to keep sustainable the process of new knowledge creation, it is necessary the existence of some mechanisms allowing knowledge producers to appropriate an adequate part of the value they contributed to generate, i.e., some mechanisms stimulating, on the one hand, and governing, on the other, knowledge diffusion in order to keep the process of knowledge creation sustainable. It is therefore fundamental, when planning and implementing the functioning of an experimental lab, to provide it with ad hoc mechanisms which bring about the production of value through knowledge exchange and creation by means of members interactions. In order to allow this difficult balance between externalization and appropriation, the suggestion has been to provide the platform with common mechanisms in project financing, business angel network and spin-off regulations, which regulate the relationships by determining fixed rules. In the “work for equity”, I identified the principles as a good solution, importing directions and restrictions from the fields suggested (project financing, BAN, spin-off regulations). In a nutshell work for equity, a bottom-up phenomenon (increasingly common in the start-upping), is the opportunity to become a partner or receive a company’s financial instruments instead of earning a formal remuneration. Indeed, the achievement of personal goals for each member of the group is an important matter in the virtual team (Curley and Formica 2008, Nunamaker et al. 2009, Siebdrat et al. 2009) and the work for equity allows a balance between participation and remunerations. The experts in the focus group did not spend much time debating about the team composition (other macro-area suggested), rather, they drew their attention on the venture sitter’s role and their relationship with the aspiring entrepreneur. Leadership is an important feature also in the open, spontaneous community. The team’s temporal leadership moderates the relationship between temporal diversity and the team’s performance in such a way that time urgency and pacing style diversity exert a positive effect on the team’s performance (Mohammed & Nadkarni 2011). More
broadly, the team’s behaviour can be divided into four useful subcategories containing specific dimensions (Perry E. E. et al. 2013): preparation of task accomplishment (team mission analysis, goal specification, planning), task-collaborative behaviours (coordination, cooperation, and information exchange) team adjustment behaviours (back-up behaviours, intra-team coaching, collaborative problem-solving, and team practice innovation) work assessment behaviours (performance monitoring and systems monitoring). In order to comprehend the possible implications for the performance, the discussion mainly focused on three of these categories (preparation of task accomplishment, task-collaborative behaviours and work assessment behaviours). The group purpose was to shed light on the importance of the relationship between the coach/mentor (venture sitter) and the aspiring entrepreneur; only a well-balanced relationship, team composition and diversity can positively influence the performance. From this perspective, it is clear that there is not just one best way to compose the perfect team for several different reasons. Therefore, I reconsidered the aspiring entrepreneur’s role by providing a more dynamic activity. Concretely, I resized the venture sitter’s function in order to mold him into an advisor and change him into a figure between a mentor and a coach who helps the aspiring entrepreneurs without replacing them. Following the focus group, every function previously entrusted to the venture sitter has been reviewed and assigned to the aspiring entrepreneur who performs it under the venture sitter’s counselling. Consecutive to this path, I hypothesized a team composition model in which aspiring entrepreneurs and their venture sitters define the different cognitive areas on which to organize the job. Both roles are going to select human resources (which, how and how much) to assign to each area; they define timing, goals and assess and the group’s job step by step. In addition, during the whole process, the human resources are going to communicate with the aspiring entrepreneur.

**CONCLUSION**

The organization of a focus group with experts in the fields of entrepreneurship and innovation has been an important part in the research development. Thanks to a non-structured discussion, participants have raised the strengths, weaknesses, opportunities and threats of my design model, allowing improvements and drawing the platform in a more complete and useful way.

In the attempt to analyse the accuracy of the dynamics of the different phases on which I have structured the daily work in the experimental lab (in terms of groups’ structuring, relationships, remuneration system, stage & gate), the simulation could also be a way of verifying the effectiveness and efficiency of the platform. Starting from the evidence provided by the virtual team literature about the importance of leadership (Mohammed & Nadkarni 2011), a well-defined work processes and the regulation of members’ relationship, (Nunamaker et al. 2009; Siebrat at al. 2009) I attempted to
refine the design of the experimental lab based on the focus group outcome. Throughout the discussion, I led the attention on the daily dynamics and, more in particular, on the team creation, the risk of virtuality and value appropriation matters. These were all relevant issues that had not yet been covered within the experimental lab literature, which instead focused more on the general dynamics in an open ecosystem and on the venture sitter role (Andersson et al. 2009; Curley & Formica 2008, 2012; Matricano & Pietrobon 2010).

The platform may represent for the University one of the instruments to favour entrepreneurship, by increasing the capabilities possessed by the latter. However, capabilities are built over time and cannot be implemented simply by setting up structures and policies. Universities are characterized by high complexity, therefore different initiatives may be needed to build the necessary capabilities (Rasmussen & Borch 2010). In particular academia demands both top down pushes (institutional initiatives, structures, professors with a managerial backgrounds) and bottom up, spontaneous pulls and stimuli from students interested in entrepreneurship.

The platform is a tool that wishes to balance the top down and bottom up phenomena. Although it is a structure created and proposed by the university itself, it can survive only through the students’ effort. As a result from the experimental labs, the universities are successful in facing the second revolution: the critical step that leads to embrace the third mission. With this leap that brings Academia to be something more compared to the ordinary systems of today and in the light of this new fundamental entrepreneurial function, the goal may become the institutionalization of the experimental lab. This research seeks to make a contribution in shaping the functioning of an experimental lab in the daily work by taking a step forward in defining the interactions amongst venture sitter, human resources and the aspiring entrepreneur. I hereby identify in the work for equity a way to balance externalization and appropriation mechanisms, suggesting a stage & gate structure and face to face meeting in order to handle the risks related to the virtuality.

The purpose to provide an effective and efficient tool in the academia revolution is ambitious and more work has to be done; the simulation will bring out the weak elements from which to draw and model future research in terms of: team composition mechanisms, relationship between participants, role of the university, value appropriation rules daily dynamics.

DYNAMIC CAPABILITIES – FROM THE PERSPECTIVE OF
SUBSIDIARIES IN EMERGING MARKETS

Jaw, Bih-Shiaw; Jou, Wei-Ping; Wang, Christina Yu Ping; Lin, George C.K.
Institute of Human Resource Management, National Sun Yat-Sen University, Kaohsiung, Taiwan

ABSTRACT

Many multinational companies (MNC) have subsidiaries in emerging markets to tap on the local resources and marketplace. These subsidiaries navigate the changing requirements in local environment, while juggling to meet the performance expectations of their parent organizations. Due to market volatility, subsidiaries increasingly play vital roles in helping organizations mitigate business challenges and generate firm-specific dynamic capabilities in the process. This study taps on in-depth interviews with seasoned subsidiary managers based in fast-changing emerging markets in Central America and North Asia, to understand the roles of the subsidiaries and the underlying mechanisms and values that subsidiaries in emerging markets bring to the parent organizations. Findings from these interviews revealed that subsidiaries at different stages of organization developmental phases utilize various forms of dynamic capabilities and the importance of transnational management strategies in subsidiaries to attain sustainable competitive advantages. The study emphasizes on discovering the common critical success factors in well-established multinational companies that help built sustainable and productive subsidiaries.

Keywords: Dynamic Capabilities, Exploration, Exploitation, Subsidiaries, Organizational Learning, Entrepreneurial Leadership, Corporate Culture, Empowerment, Competitive Advantage, Transnational Management

INTRODUCTION

MNCs expand for multitude of reasons, often setting up subsidiaries in emerging markets outside of home country. The roles of subsidiaries support the parent company’s desire to seek new markets to diversify their business risks, groom new sources of revenues and seek new resources for sustainable future growth. Thus, subsidiaries are pivotal instruments for MNCs to horn multidimensional capabilities (Bartlett, C. A., and Ghoshal, S, 2002) for the sake of business continuity. Furthermore, new emerging markets are perceived to hold munificent opportunities for multinational corporations to build new capabilities to complement its current organizational capabilities. The organization’s need to stay ambidextrous in meeting changing market demands, carve out new competitive advantages to
differentiate from the competition, explore new markets for existing product lines and to exploit current organizational capabilities, has and will persist to stretch the capabilities of multinational firms today. As pointed out by O’Reilly, C.A., and Tushman, M.L. (2013), “In uncertain environments, organizational ambidexterity appears to be positively associated with increased firm innovation, better financial performance, and higher survival rates.”

In this research, detailed interviews were conducted with seasoned subsidiary leaders to understand how the subsidiaries of multinational firms navigate in the emerging markets where both institutional and market volatilities are acute. The insights shared by these subsidiary leaders could unveil the effects of dynamic managerial capabilities of MNCs in shaping the strategic directions of the subsidiary firms. Hence, the research objectives of this study are twofold. Firstly, to reveal the business strategies adopted by subsidiaries and their parent companies in managing business challenges. And to specify which dynamic capabilities were engaged more actively by subsidiaries in building business resilience for sustainability in the emerging markets they operate in.

LITERATURE REVIEW

Industrialization and globalization intensify the competition for MNCs and calls for organizations to put on the resource-based view hat and develop organizational capabilities to remain competitive in the marketplace. Pioneering scholars proposed that competitive advantages was based on “creative destruction of existing resources” (Schumpeter, 1934) which progress to configuration competence (Henderson and Cockburn, 1994) and then to combinative capabilities (Kogut and Zander, 1992). Teece, D. J., Pisano, G., and Shuen, A. (1997) developed the concept of interactive and adaptive set of “dynamic capabilities”. More recently, dynamic capabilities serve as the bases for studies in international expansion (Luo, 2001) and subsidiary initiatives (Wang, C.Y.P., Jaw, B.S., and Chang, Y.H., 2011). This study aims to find out which dynamic capabilities were more actively engaged in building business resilience for market sustainability in subsidiary firms.

Subsidiary Dynamic Capabilities

The dynamic capability perspective proposed by Wang et. al. (2011), an adaptation from Luo (2001), posited that the possession, deployment and upgrading of organizational capabilities must continue to be rejuvenated through learning derived from local context. The dynamic capabilities generated through learning in the local context of the subsidiaries must integrate well at a global level for organizational-level competitive advantage to take place. Despite being located in different emerging markets and having varying length of establishment, a common view shared by the subsidiary leaders during the interviews concur that dynamic capabilities take on the form of a firm’s core competences.
and must be adaptive to changes in the marketplace. Furthermore, dynamic capabilities are firm-specific and require active and continuous interactions of organizational resources to be developed and built on. Pavlou and El Sawy (2011) breaks down dynamic capabilities to four capabilities that are interrelated, namely sensing, learning, integrating and coordinating capabilities, being exercised simultaneously to sustain momentum in organizational growth. Given the clear composition of dynamic capabilities, multinational firms can specifically and strategically gear up the competencies of its subsidiaries accordingly in different markets. Firms deploy different management strategies in building up the operational capabilities in each area of dynamic capabilities to better utilize the available local resources to meet market demands.

**Transnational Management Strategies and Organizational Learning**

Management at MNCs recognize that the subsidiary managers have to make prompt decisions to address environmental changes, especially so in the vibrant emerging markets. While the resource-based view by (Makadok, 2001) highlight on the selection of right resources, dynamic capabilities on the other hand, emphasize on reconfiguration of the resources into operational capabilities. Dynamic capabilities building will require organizational learning where “Exploitation learning involves selecting, implementing, and adapting systems and capabilities that are already available…” and is for a firm’s short-term survival (Dixon, Meyer and Day, 2010) whereas, exploration learning is to ensure the firm possesses strategic flexibility to function in an ever changing environment (Hitt, Keat and DeMarie,1998). Effective knowledge-in-practice is contingent to putting in place organizational practices that best fit the work environment in order to drive performance (McIver, Lengnick-Hall, Lengnick-Hall and Ramachandran, 2013). Therefore, there is close engagement between subsidiary firm and MNC parent companies to switch to the most appropriate organizational learning mechanism quickly, to expedite fine-tuning processes in order to remain highly responsive to the fast-changing marketplace.

Subsidiaries are expected to be active contributors of firm-specific competitive advantages to the MNC (Birkinshaw, Hood and Jonnson, 1998); a key strategy for transnational management is the managing of knowledge stock from various subsidiaries. Studies have demonstrated that the knowledge base of a firm can be a source of sustainable differentiation for the organization to develop its set of inimitable competitive advantages (Gupta and Govindarajan, 2000). While the strategies of exploration and exploitation is no surefire success in business performance nor would the firm’s corporate longevity, the habitual use of these strategies become firm-specific capability for the subsidiary to manage its business challenges. As Levinthal and March (1993) suggested “engage in enough exploitation to insure the organization current viability and engage in enough exploration to insure its future
viability”. The capacity for a subsidiary to learn through its business challenges and the use of exploitation and exploration strategies will thus enhance dynamic capabilities.

The appointment of the right subsidiary leaders is an integral part of transnational management. DeSimone, R. L., and Werner, J. M. (2011) proposed that a change manager is someone in the organization who has “… the overall responsibility for accessing the need for change, determining the appropriate intervention activities, implementing the strategy, and evaluating the results.” The subsidiary leaders act as the change agent for headquarter, and are responsible to drive subsidiaries to perform according to assigned strategic roles and responsibilities. As Kor and Mesko (2012) highlighted, one can appreciate that the importance in deploying the appropriate subsidiary leaders as they are part of the “complex interdependencies between the firm’s choices in business and competitive strategy and its choice about managerial resource development and deployment practices and investments.” The right subsidiary leaders have to be efficient boundary spanners as country managers given that “…70 to 80 percent of the boundary spanning activities in a large formal organization were carried out by leaders.” (Costley and Howell, 2001)

Roger Gill (2002) proposed the notion that change management requires effective leadership that embodies an “integrative model of leadership” which comprises of “vision, values, strategy, empowerment, motivation and inspiration.” Thus, many MNC headquarters supports the setting up of a corporate culture through the subsidiary leadership. This also provides a stabilizing effect for subsidiary firms to perform their roles. Scholars such as Kotter and Heskett (1992) have pointed out that corporate cultures are not static, and can have powerful impact on business performance. The effect of corporate culture can “…enable a group to take rapid and coordinated action against a competitor or for a customer.” In an article on “Good to Great”, the authors highlighted that “Great companies have a strong culture that fosters productive behaviours. Whether “customer-service focused,” “earnings-per-share driven,” or “innovation centred,” the culture guides how employees think, what they do, and what outcomes are attended to.” (Evans and Butler, 2011)

RESEARCH METHOD

Two studies were conducted with three case companies in each study. The first study took place in December, 2012 and the second study, six months later. Semi-structured interviews were conducted lasting one to two hours each were arranged to attune the interviewees to the research topic. A set of questions were sent to interviewees upon their permission to participate in the study. Each interviewee was given a week to provide firm-specific responses to the questions and a scheduled face-to-face discussion or conference call was arranged thereafter for clarifications and further extraction of managerial insights. The interviewees were selected based on the functions they were accountable for.
and were in positions of authority to be actively engaged in the formation of corporate strategies which have direct influences over the roles of the subsidiary firms and in turn impact the various dynamic capabilities deployed.

The case companies are at varying stages of organizational transformation, and they are major players in their respective industries including oil and gas, chemicals, electronic parts, synthetic rubber and plastic products as well as building and industrial systems. In the first study conducted in December 2012, the three case companies were subsidiaries of companies of more than a century old. The three case companies were located in India, Taiwan and Mexico with parent companies of North America or European origins. With the findings from the first study, a second study was conducted in July 2013, with subsidiary companies of parent companies established in the 1960s to 1970s, located in second-tier cities of Mainland China. The parent companies of case companies in study 2 were from Taiwan. The intent of study 2 is to learn if the same strategies and dynamic capabilities were also tapped by younger MNCs to develop business resilience with subsidiary firms in a fast-growing emerging market such as China.

**Case Company Profile**

The case companies chosen were based on a few criteria, such as if the subsidiary firm has well-established parent company located in developed countries while it is located in an emerging market. Also, to detect the dynamism of adapting to changes, these subsidiary firms were undergoing significant business challenges within the short-term outlook. Questions were also asked if the Country Managers were veteran managers within the MNC and/or industry and the length of their expatriation in the emerging market.

The corporate headquarters of the case companies had put in place seasoned country managers who were overseeing specific changes to meet business goals. Each case company were contributing exceeding USD 100 million per year to the parent company in revenue turnover, and are positioned strategically to run the operations in regional markets. All of the subsidiaries have sales and manufacturing functions in the emerging markets.

**ANALYSIS AND FINDINGS**

**Relationship of Dynamic Capabilities, Subsidiary Leadership and Learning Culture**

*Study 1: Subsidiary firms in emerging markets with MNC parent companies of more than a century old.*

**Company A**

This India subsidiary firm main business is in building and industrial systems. It was formed through merger and acquisition eight ago. The German parent company is a conglomerate powerhouse with many lines of business and was seeking another potential market in Asia to set its foothold, and bought
two Indian companies. Before the current country manager was expatriated two years ago from the USA to integrate the India subsidiaries and to stem high employee turnover, this subsidiary was very much left on its own. There are thirty-two sales offices situated throughout India and the parent company was gearing up the subsidiary for a manufacturing plant to exploit its technological capabilities and skilled labour market.

The Country Manager admitted to continuously use his sensing and learning capabilities to steer the local company to position itself for exponential growth. The Country Manager not only has to align the operational capabilities of the thirty some local offices to deliver business performance, he also has to integrate and coordinate with the parent company to align strategic goals and tap on the resources and existing operational capabilities to giving the subsidiary a head-start against local competition, a goal made more challenging as the various offices are integrating to the corporate culture of the German MNC.

Company B

This Mexican subsidiary is also in the building and industrial systems business. It has been in the Central and Latin America for over twenty years and has management responsibility over the regional sales offices in seven countries. The parent company is based in the United States of America. The Managing Director is a seasoned manager with eighteen years tenure in the organization and is originally from Mexico City. He plays a pivotal role bridging the subsidiary with parent company and amongst the regional offices as there are diverse cultures and market requirements in the region. The Managing Director has to be sensitive to the peculiarities of the regional markets and effectively escalate unique requirements to headquarters level for R&D support. His work day is mostly spent coordinating and integrating activities with parent company and intra-regional. The Managing Director revealed that the parent company has a well established corporate culture in sharing best practices on a world-wide basis. This learning culture motivates this MNC to regularly cross-share information. The stable corporate culture provides a reassuring environment to its subsidiary employees to focus on local market responses.

Company C

Of the three case companies in study 1, this private Taiwanese chemical company with manufacturing facilities has the highest per head revenue of US$7 Million. This is a sixty year old joint-venture (JV) firm between a European and Taiwanese company. The challenge for this subsidiary firm is to maintain optimal business performance while motivating its staff to keep up the productivity till the closure of this subsidiary within the next two years.

The corporate culture of this JV is greatly influenced by the local parent company. The interviewee is an expatriate from the European parent company so his observations of how the local JV company
functions offer a different perspective to the JV company. The local top-management team (TMT) closely monitors the operational activities and manages the morale of the workforce. Regular discussions and reporting to update parent companies and to integrate knowledge and coordinate operational activities are carried out to continue to align corporate goals. The TMT of Company C also enjoys the highest level of autonomy and empowerment amongst the three companies and has almost no attrition in its staff strength for years. While the TMT are abiding to JV policies and is highly influence by the government-link Taiwan parent company, the TMT exhibited great resilience in managing the challenges presented by the imminent closure.

In study 1, mature subsidiaries (companies B and C) have well-established and stable corporate culture which allows them to focus in pushing for business performance by utilizing more integrating and coordinating capabilities. A product of two acquired local companies, company A needs setting up of corporate culture, especially learning culture to reap incremental performance through knowledge sharing. A stable corporate culture sets the platform for a subsidiary to cross-share best practices and cultivates a learning culture throughout the organization. The learning culture is the catalyst for the corporate to renew and fuel dynamic capabilities, so that integrating and coordinating capabilities can be organized to generate higher value for the firms. As the Managing Director of company B said “...our company has a very strong cross-sharing culture and while we exploit our worldwide best practices to provide localised solutions, the adaptations we made do not compromise our core values and corporate culture...and that helps us to stay ahead of competition”

The appointed country manager in the emerging markets has to possess a sharp acumen (ability to sense), entrepreneurial spirit (can-do attitude) and resilience in managing uncertainties to steer the subsidiary firms towards organizational goals set out by the parent company. This is demonstrated by all three interviewees in the case companies where they were put in place to “make things happen”. In Salvadore Maddi’s research (2004), people who work well under pressure and constant changes has three key attributes, namely knowing they have control or influence over what they do, commitment to something that they feel has importance and viewing changes as exciting challenges. The leaders of the subsidiary firms of these three companies exhibited these attributes and believed that their role in the emerging market is significant in shaping the directions of the subsidiary firms. From the interviews with the subsidiary leaders in study 1, these managers who helm the realm at the subsidiaries have mandated changes and through their leadership, directly enhanced the dynamic capabilities of the local entity. As the country manager of company C puts it “...companies are dynamic because of the business environment, the context it is in, and it has to constantly adapt. And....leadership helps to steer the direction for changes”.

Parent Company’s Strategy to build Subsidiary Dynamic Capabilities
Since the case companies were at different stages of organizational development, the dynamic capabilities more actively used by each of them to function effectively in the emerging markets were also different. The supportive role of the parent company includes providing expertise in R&D, expatriation of TMT members to the subsidiaries, training and developmental programs and institutionalizing sets of best practices and policies for governance and performance evaluation systems. The subsidiary firms internalize the rendered resources and reconfigure aptly to response to the market. In addition, the parent companies also assign appropriate level of autonomy to the subsidiaries and empower the subsidiary leaders to make timely responses to the local markets.

Parent companies put in place suitable candidates to take charge of the subsidiary firms as a managerial strategy so that these overseas arms will contribute positively to the organizations and complement headquarters’ set of dynamic capabilities. In the instances of the case companies, the subsidiary leaders demonstrated that they have the vision, share corporate values, align their organizational strategies, motivate and inspire their co-workers in the emerging markets and are given empowerment from the parent companies to enable changes.

**Assimilation of Parent Corporate Culture and Local Culture**

The alignment of parent company’s culture and that of subsidiaries is critical for the organization to grow in organizational resilience to business challenges. As shared by the country manager for Company C “Changing the overall culture of a company while conducting business and meeting budget has been an interesting balancing act. Focus, clear communication, consistency and tenacity are a must.” The analysis of the three case companies in study 1 indicated that each uses its own blend of dynamic capabilities to response to the parent companies and to the local market needs. Because companies B and C have reached maturity in the emerging markets, the engagement of sensing and learning capabilities appear to be less than company A which is newer to the local market. Stable and mature corporate culture, especially the learning culture which was most prominent in Company B, must be embedded in the day-to-day operations for subsidiaries to develop organizational capabilities. The combination of local culture and that of what parent company corporate culture is has produced a magical formula. This leads to better utilization of local resources and global practices to form a set of dynamic capabilities or competitive advantages that are firm-specific and unique to the subsidiary.

To summarize the findings in Study 1, corporate culture with a strong endorsement to learning culture lays the foundation for subsidiaries and parent companies to adapt to changing environment, as a stable corporate culture facilitates the building of new capabilities. MNC deploys appropriate subsidiary leaders with entrepreneurial-orientation and empower them for timely response to market and these subsidiary leaders in turn steer the subsidiary firms to meet performance goals and helps to foster integration of corporate and local cultures.
Study 2: Subsidiaries in China with MNC parent companies established in the 1960-70s.

Company D
This is a chemical plant located in Jiangsu province with twenty years presence in China. It is one of a dozen of subsidiaries that the Taiwan parent company has set up in Mainland China for sales and manufacturing purposes, tapping on the huge market potential and vast resources that China has to offer. The managing director is from Taiwan and has stationed at several subsidiaries throughout China for the last eighteen years. He has vast knowledge in the industry, having worked his way up from the R&D department to the local TMT position. His intimate knowledge of China as well as technical expertise made him a valuable asset to the parent company. The subsidiary leader is given full autonomy to run the subsidiaries. His opinion of the competitive advantage of the subsidiary is to create value in the market by staying a step ahead of institutional requirements. He exploits the technical expertise of the parent company and simultaneously explores what are the market requirements and setting up processes and technology to provide high standard for the China subsidiaries to execute well.

Company E
This subsidiary is situated in Kunshan, China for over fifteen years. It is a manufacturer of electronic materials. Its parent company in Taiwan has businesses in many types of industrial materials. The country manager has been in China for close to thirteen years and he emphasizes management of operating costs through continuous process improvement. He has had 2 years stint in the R&D department. His view on dynamic capabilities is in managing the entire product lifecycle and designing the manufacturing processes optimally to balance costs and potential revenue. Due to frequent updates on various standards for green and environmentally-friendly products by global clients and local government, he spends much time on intra-company and inter-company communications to align standard measurements and operational processes. Optimal exploitation of existing technologies to minimize incremental costs is utmost important in his operation and exploration of new clients or new applications are equally important to command a price premium.

Company F
This subsidiary is a manufacturer of synthetic rubber and plastic products based in an industrial zone in Jiangsu province, China. There are six subsidiaries within China set up in the past twelve years. The general manager believes that by taking good care of the subsidiary employees, and they will in turn provide good customer-service and generate quality and safe products. Being environmentally and socially responsible is part of the corporate culture to help the subsidiary stay deeply entrenched in the community, thus paving its way for sustainable growth. In addition, this subsidiary conducts a lot of internal training to enhance the skills, knowledge and attitudes of all levels of its employees. This
combination of being part of the community and equipping employees from all levels with training are strategies that work well for company F. The general manager was proud to mention that “...more than a quarter of staff exceed ten years of tenure with the firm”, which speaks volume for organizational commitment in China where high attrition is commonplace.

Market Initiatives and use of Exploitation and Exploration capabilities simultaneously

In study 2, the case companies’ subsidiary leaders echoed the view on their leadership and the empowerment warranted in providing the direction for the subsidiaries and to responding speedily to the market, deem as competitive advantage. As China is a relatively collective society, integration of cultures is very important. In China, the deployment of highly skilled Chinese-speaking Taiwanese TMT is seen as an effective transnational management strategy as this economy has high respect for managers who have seniority and expertise, and more importantly understands the Chinese culture and how the society works. Moreover, the Taiwanese TMT also pointed out the high level of institutional effects in China, and the need to proactively responses to local government requirements to secure business sustainability in the market. The display of organizational ambidexterity in switching between exploration and exploitation approaches in securing a favorable market position and making appropriate response to stakeholders are actively carried out. Thus, these unique insights from the subsidiary leaders acknowledged that market initiatives stimulate the subsidiary firms to accumulate and build on the relevant dynamic capabilities, simultaneously using both exploitation and exploration capabilities.

Despite differences in national cultures, industry types and the history of the parent MNCs, findings from these six case companies in the two studies suggest that there are more commonalities than there are contrasts. The commonalities include the authorization of capable subsidiary leadership with the right empowerment in managing the local entities so the subsidiary leader can be an effective change manager to provide timely responses to the market. MNC also have the talent resources to place the suitable country manager at the subsidiary to drive its desired performance. In addition, the parent company renders subsidiary support via shared core values through corporate culture and learning mechanisms to facilitate knowledge flow and synchronization of operational activities to meet business objectives. The subsidiaries internalize the support from parent company and combine with local resources, uses both exploration and exploitation strategies to formulate the subsidiary’s firm-specific competitive advantage. The contrasts amongst the case companies emphasize the importance of being responsive to the market with the deployment of market-oriented initiatives, especially for emerging markets with strong institutional effects to ensure sustainable growth for subsidiaries. Finally, case companies which displayed greater cohesiveness in integrating parent company culture with the
subsidiary’s local culture has a head-start in their participation in the competitive economy of these emerging markets.

CONCLUSION AND RECOMMENDATION

The two studies produced findings that provide evidence for active and complementary use of transnational strategies and dynamic capabilities in dealing with uncertainties and challenges in the marketplace. Firstly, the subsidiary leaders were instrumental conduit for the parent company to provide direction and clarity in leading the subsidiary to meet the business challenges. Subsidiary managers possess entrepreneurial leadership (ability to sense, “can-do” spirit and resilience) and are effective change managers. They have the capabilities to see the big picture with the long-term strategic organizational goals in mind while having the ambidexterity to handle the operational issues to meet short-term business survivability.

Next, establishing a learning culture and being attune to market initiatives help the subsidiary build its firm-specific dynamic capabilities. A corporate culture that celebrates the learning culture is a cornerstone for building new capabilities and exploration of new breakthroughs. This finding supports and infers that a learning organization will be able to adapt quickly to the changing environment and thus increase competitiveness to meet changes in local markets. Meanwhile, another business strategy for transnational companies is to proactively take on market initiatives in response to the environment. These market initiatives are stimulus for subsidiaries to build relevant dynamic capabilities to timely response to the market. This finding is especially important in the emerging market due to greater volatility in market forces. The market uncertainty calls for subsidiary to be adaptable and nimble in responses.

To specify which dynamic capabilities were engaged more actively by the subsidiaries so the local entities are more resilient in their operating environments, the respondents of these case companies unanimously mentioned that they must be given suitable empowerment to exercise change for timely and context-specific response to the market. After which, certain degree of corporate culture integration between parent and child companies will enable faster development of dynamic capabilities to help them be competitive. This integration requires a harmonious blend of both headquarter-driven corporate culture with local interpretation for effective internalization, without compromising the core values. While, building up competencies, the subsidiaries adapt a set of exploration and exploitation capabilities to keep up the momentum for growth. These two capabilities are used simultaneously but the proportion is tailored by the subsidiaries depending on the event on hand.

Managerial Implications
As MNCs race to gain market share and to increase productivity with as little incremental cost as possible, many organizations may overlook the need to help the workforce increase their learning capabilities through training. This is because nurturing talent from within a subsidiary takes many years. Failure to do this however, will risk the stagnation of skill sets and therefore limiting the capacity of the subsidiary workforce to be adaptable to changes in business requirements. Moreover, training may help the local workforce to feel more entrenched in the organization, thus may ease turnover rate of knowledge workers which is prevalent in emerging markets such as Mainland China and India. In this case, subsidiary dynamic capabilities and organizational resilience may grow with a stable knowledge-driven workforce.

Another managerial implication is the need for the subsidiary leaders to build a capable local management team. Given that the country managers and TMT for the case companies are foreigners or expatriates to the local companies, there could be sentiment that these leaders are not sinking roots and will not be present to see through the changes in the long run. Hence, some subsidiary staff may be resistant to changes and choose not to share relevant information. The coaching of a local management team will help subsidiary beef up on managerial capabilities and these home-grown leaders can contribute and guide the local workforce to align with corporate goals.

Finally, due to cultural diversity, the subsidiary leaders sent to manage the subsidiaries could enhance his ability to lead by going through cultural immersion training to accustom his communication and leadership style to the local context. MNC could consider cultural immersion program as a prelude for potential subsidiary leaders to help him to hit the road running by boosting his competence to integrate corporate culture with national culture.

**Further Research Suggestions**

As multinational corporations continue to look for new markets to extend their product lines, race to compete for market share, expand its competitive advantages beyond current capabilities, firms may not pay enough attention to long term goals and instead settles for short term gains. Since increasing dynamic capabilities is critical in sustaining corporate competitiveness to push for business performance and ensures sustainable growth, then the studying of learning mechanisms can be further explored to identify appropriate organizational learning strategies at different phases of organizational development.

It will also be interesting to find out about the different leadership styles in different countries with strong national cultures to identify the most appropriate subsidiary leader for MNC to groom and to leverage on for its talent bank. Future study on subsidiary leadership could include case companies from more emerging markets.
This study included case companies with manufacturing facilities and industrial products. Future research could be conducted to include service-oriented subsidiaries, such as the hospitality industry to find out if the strategies used to grow dynamic capabilities are similar.

Finally, another direction for future research is to follow these case companies to conduct a longitudinal study to see if there is any development in the dynamic capabilities due to differences in subsidiary roles or contextual changes.

THE INVESTMENT ATTRACTIVENESS OF UKRAINE: OPPORTUNITIES AND RISKS FOR FOREIGN INVESTMENT

Kachala, Tamara; Berezina, Olena
Cherkasy State Technological University, Ukraine

ABSTRACT
The article investigates the definition of “investment attractiveness” and factors that form the investment attractiveness at different levels of the economy. The factors system was established that determine the favorableness level of the investment climate. The structure takes into account: the objective factors; investment climate formation under the totality influence; the investment climate differentiation at different levels of the economy; synergies characteristic of investment climate; inclusion of the investment climate in the institutional system of the state; appearance of various risks as a result of certain conditions.

The main factors that affect the investment climate and investment attractiveness of Ukraine are: macroeconomic instability, due to the numerous risks of investing in the country, the low level of protection of foreign investors, which negatively affects the image of Ukraine and imperfect legislative regulation that negatively affects the profitability of investment, corruption and blocking foreign investment.

In order to improve the investment climate and investment attractiveness of Ukraine proposed urgent measures for improving the methodological basis for evaluation of investment attractiveness. Organizational-economic and legal mechanism of favorable investment climate formation in the region is worked out and described. This is consciously regulated system of economic, legal, organizational forms, methods, means and principles, as well as the regulated by state relations and interconnections which impact on the investment climate in the region. The mechanism is aimed to reduce investment risks and increase of investment potential in the region.

The research also proposes measures for improvement the investment attractiveness of Ukraine.

Keywords: investment attractiveness, investment climate, foreign investment, international rating agencies.
INTRODUCTION
The investment attractiveness of Ukraine is a strategic issue, as it stands in the way of economic reforms and integration into the world economic sector, which, among other issues, require significant financing. To solve this issue the country should create a favorable investment climate and reach the status of the investment-attractive country.

ANALYSIS OF THE RECENT RESEARCHES AND PUBLICATIONS
The study of this problem was engaged by many scientists and scholars: G. Alexander, J. Bailey, D. Epstein, P. Haidutsky, D. Harrison, N. Ighoshyn, K. Meyer, O. Nosova, W. Sharpe, J. Thompson. The following scholars as S. Aptekar, M. Bilopolskiy, I. Blank, M. Chumachenko, N. Datsiy, V. Gluschenko, V. Grinyova, P. Haidutsky, N. Hrebeniuk, I. Ivakhnenko, S. Ivanochko, O. Lemishko, M. Lesechko were dealing with the problem of attracting foreign investment and creating a favorable investment climate in Ukraine.

STATEMENT OF THE PROBLEM
At present there is no single methodological approach to assess the investment climate, industry, region or company. As most methods are based on the use of statistics and determined by the qualitative characteristics of the object using expert ratings and evaluation methods which are considered to contain high level of subjectivness and not to cover all the factors that influence this process. Thus, we consider the problems of the article to be actual and the one that needs further studying.

THE AIM OF THE PAPER
is to carry out a comprehensive analysis of investment attractiveness of Ukraine, to determine the factors that influence the attraction of foreign investment and provide appropriate recommendations for its improvement.

THE MAIN MATERIAL
Attracting foreign capital provides a variety of benefits and advantages for future economic development. At this stage Ukraine should create a favorable investment environment to attract huge financial resources. Foreign investment is really important to modernize the Ukrainian economy. First, foreign investment brings not only capital, but also modern technology. This leads to increasing of competitiveness, improvement of the quality of products and services and helps to reduce the costs.
Second, attracting of foreign investment leads to restoration and expansion of capital, implementation of investment programs, the rise of the economy, the saturation of the domestic market with competitive goods and services. Third, the direction of foreign investment in specific projects is always accompanied by retraining and training of personnel that helps domestic employees to obtain knowledge for effective use of new technologies and to obtain international contracts. Fourth, foreign investment leads to getting experience of the world economy, promote further improvement of the investment climate for both foreign and domestic investors. Fifth, the infusion of foreign investment accelerates the integration process of Ukraine in the world economy, leading to the development of integration processes of globalization, promotes and enables the country to occupy a leading place in the world economy. These arguments suggest increasing the level of foreign investment in the economy of Ukraine for its growth and recovery (Hrebeniuk, 2012, Gluschenko, 2009). The decisions of foreign investors will depend on all these components of investment attractiveness. The main factors that influence investment decisions include: the attractiveness of the country in the way of cost, sales and features of historical development, culture, language and political risk (table 1).

Table 1. Factors that form the investment attractiveness at different levels of the economy*

The factors system was established that determine the favorableness level of the investment climate (Fig. 1.). The structure takes into account: the objective factors; investment climate formation under the totality influence; the investment climate differentiation at different levels of the economy; synergies characteristic of investment climate; inclusion of the investment climate in the institutional system of the state; appearance of various risks as a result of certain conditions. The structure was transformed taking into account the need to eliminate the above drawbacks, and to consider it at the regional level.

The generalized structural module of investment climate has the form presented on Fig. 1.
In presented structural model, it is necessary to note the critical factors of the investment climate formation in the region. Under them we understand factors that cannot be formed by the management bodies of the state, region, economic entities (their groups), etc. as the subjects of investment management process in a certain area. We can include to them all natural resource potential of the territory, which is the base to select industries of its economic system in interregional and international labor division. The identification of these sectors does not depend on someone’s wishes, fashion, political situation and other. It is an objective evaluation process of the existing natural potential and choice of the most rational ways of its sustainable use, taking into account the changes in the external market environment. The process and the result of a decision making by the investor is another critical factor that defines not the investment attractiveness of the territory, but the management effectiveness of investment processes. Unlike the first critical factor it is characterized by the lack of comprehensive (and even sufficient) information on methods how to evaluate the situation and algorithms of investment decisions making and secondly, their high subjectivism, mass media influence, accepted stereotypes, fashion, etc. So this part of the formation process of the investment climate specifies its objective uncertainty, because unlike other it cannot be calculated with a high degree of certainty.

To assess the current investment climate in Ukraine we’ll pay attention to doing business and the competitiveness of the domestic economy of our country on the basic parameters (Table 2).

*Table 2 Evaluation of the investment climate in Ukraine by international rating*

The Future of Entrepreneurship

Due to table. 2, it is obvious Ukraine occupies the last position in the ratings and this is a sign of poor investment climate. We should note the negative trend on all ratings that means the national economy is becoming less attractive to foreign investors each year. According to the international analysts, one of the biggest problems of Ukraine's economy is the necessity for improving public institution activity. Businessmen consider bureaucracy and government regulation of business in Ukraine to be one of the highest in the world. This leads to the need of protecting property rights and minimize risks in raising funds and promoting investment in the country.

According to experts (Datsiy, 2009, Lemishko, 2007, Ivakhnenko, 2010), there are two main causes why the process of investment policy reform in Ukraine is slow down. They are: the slow pace in adopting changes in legislation and poor implementation of laws.

In order to improve the investment climate and investment attractiveness of Ukraine it is necessary to consider urgent measures for improving the methodological basis for evaluation of investment attractiveness. That will allow to determine the current situation of the country more accurately, to highlight the "problem" places and act as a tool to manage the country's attractiveness. We offer the following levels of assessment of investment attractiveness: 1) country (to minimize the number of parameters, to take into account national specificities of the economy, to apply mathematical methods for calculating the indicators), 2) industry, region (to study both short and long term perspectives, to use different sources of information and analysis of the full range of indicators, etc.), 3) enterprise (to create a universal technique that would be suited for the analysis of companies involved in various kinds of activities, taking into account the dynamics and trends of the company, competitive market position, etc.).

Organizational-economic and legal mechanism of favorable investment climate formation in the region (FICF) is consciously regulated system of economic, legal, organizational forms, methods, means and principles, as well as the regulated by state relations and interconnections which impact on the investment climate in the region (Fig. 2). It is a specific lever by which a state realizes a controlling influence on the investment climate in the region. It includes: 1) set of principles, directions and priorities of the activity organization on formation of favorable investment climate in the region; 2) economic forms, methods, means and tools of influence on the investment climate in the region; 3) set of regulated by state relations and interconnections of all participants of investment activities that ensure the effectiveness of the regulatory impacts on the investment climate.

The mechanism is aimed to reduce investment risks and increase of investment potential in the region. To achieve these goals we need to solve a set of related tasks, the priority of which is determined by
the regional authorities, depending on the diagnosis of the current state of the investment climate in the region, that is expressed in the identification of the most significant investment risk and investment potential; the components importance of investment risk and potential from the point of view of potential investors.

The mechanism FICF in the region is developed taking into account such important principles including: 1) focus on direct investments; 2) reduction of investment risks; 3) use of comparative advantages; 4) universality and adaptability of the basic features and tools of mechanism; 5) connection of the investment climate and investment activity; 6) integration of the regional mechanism in investment sphere of the single economic complex of the country.

Fig. 2. Structure of the mechanism FICF in the region
The mechanism FICF effect on investment activity in six main directions: 1) proposal formation of investment resources; 2) creation of quality demand from investments recipient; (3) creation of effective investment infrastructure in the region, which facilitates interaction between investor and investment recipient; 4) improvement of the regional legal base of investment; 5) reduction of administrative barriers to investment; (6) reduction of regional investment risks.

Methods, forms and methods of influence are used on each direction, and they are united into enlarged blocks of elements of the FICF mechanism.

I. The support system of investor includes the following elements: information support of potential investors, entry into the regional market, organization and support of investment projects.

II. The support system of investments recipients includes complex of consulting assistance and elements of administrative stimulation.

III. The development system of investment infrastructure includes the transport development, telecommunication infrastructure, hotel and tourist business, financial infrastructure of the region, development of leasing, franchising and the information and consulting services development in the field of investments.

IV. The reduction system of regional investment risks includes the development and improvement of investment policies and strategies in the region, complex programs on investment risks reduction, insurance of investments and increase of information openness of the region.

V. The improvement system of normative legal base of investment in the region is aimed at the formation of favorable investment and legal climate in the region. In this block we have to solve the following tasks:

1) to create favorable conditions for the participants of investment activity in the region;
2) to form the forms list of state support of investors in the region;
3) to determine the priority directions of investments attraction;
4) to form the list of priority investment projects in the region;
5) to reduce the investment legislative risk in the region.

All forms and ways of favorable legal climate formation in the sphere of investing must be contained in laws and legislative acts: law on state support of investment activity in the region; law on state and legal guarantees of the region; law on tax advantages; law on investment tax credit; law on the address investment program of the region and the list of priority investment projects; law on stimulation of economic development of the region, etc.
VI. Reduction system of administrative barriers to investment is aimed to overcome “small number of investment’s places: underdeveloped secondary land market, the taxation burden, currency regulations and customs procedures in the framework of foreign economic activity.

Here there are recommendations to regional authorities on the development of healthy competition in the region; inconsistencies elimination on how to use and interpret of laws and legislative acts; practice of public authorities on how to create their own consulting firms on the issues of land, construction, customs, migration and licensing.

The mechanism tools of FICF of direct and indirect influence on the investment climate in the region were divided into three blocks: administrative, financial and information. Despite of the allocation of all tools in separate blocks, the maximum effectiveness of the mechanism can only be achieved by their complex usage. The blocks represent a system of mechanism tools of the favorable investment climate formation. The mechanism effectiveness of the FICF is determined by using the monitoring system of investment activity in the region. During its formation it is necessary to apply the following algorithm:

1) to define measurable indicators of investment activity;
2) to establish the information sources for conducting the monitoring;
3) to select a data collection methods;
4) to determine the frequency and schedule of their collection;
5) to appoint responsible for obtaining the necessary information;
6) to determine the technology of processing and analysis of the received information;
7) to determine the recipients of the monitoring results for further use;
8) to form the methods of control and correction of the monitoring results;
9) to take into account the costs of monitoring.

CONCLUSIONS.

Investment climate is a system of diverse natural and geographical, financial, economic, socio-cultural, organizational and legal conditions and factors of the country. These factors define country’s attractiveness to investors. The most rating agencies don’t consider Ukraine to be an attractive country for investments. It was reported that the main factors that affect the investment climate and investment attractiveness of Ukraine are: macroeconomic instability, due to the numerous risks of investing in the country, the low level of protection of foreign investors, which negatively affects the image of Ukraine and imperfect legislative regulation that negatively affects the profitability of investment, corruption and blocking foreign investment.
The received mechanism of FICF summarizes some important points. Firstly, this mechanism is the basic that includes a common set of elements, which can be selected and detailed, in accordance with specific goals and objectives of each individual region.

Secondly, the mechanism FICF was developed based on the experience of the regions that have the most favorable investment climate in Kyiv, Dnipro). In these regions the state of investment activity was analyzed and the most effective methods of influence were identified.

Thirdly, all blocks of the mechanism are vector projections of socio-economic development of the region for investment platform. The structure and activity of the use of certain mechanism tools is determined by the economics characteristics of the region.

Fourthly, the mechanism is designed to reduce regional investment risks, while includes elements and influence tools on the investment potential of the region.

Fifthly, in the mechanism the tools were laid "feedback" or methods of basis influence that helps to improve the mechanism adaptability in the changing socio-economic conditions and effectiveness of regulatory impacts of the superstructure.

OPPORTUNITIES AND THREATS FOR THE RUSSIAN COPPER INDUSTRY AFTER THE COUNTRY’S ACCESSION TO THE WORLD TRADE ORGANIZATION

Kapustina, Larisa Mikhaylovna; Drevalev, Andrey Anatolievich

1 Institute of Management, Marketing and International Management, Ural State University of Economics, Ekaterinburg
2 Marketing and International Management, Ural State University of Economics, Ekaterinburg

ABSTRACT

Accession to the World Trade Organization (WTO) has strong impact on the country’s economy as it stimulates reduction of the international trade barriers. However few studies have been conducted in order to evaluate the consequences for specific industries and effects on the global market development for the case of Russian Federation which is one of the leading exporters of oil, gas, chemicals and metals.

The article concerns the influence that the accession of Russia to the WTO will have on the development of the national copper industry and the global copper market in its current state. The authors determine the role of Russia in the global copper market as a net exporter; discuss opportunities and threats connected with the country’s commitments as the WTO member state, mentioned in the previous researches; analyze the qualitative changes which result from the implementation of the specific terms of accession, scheduled to be implemented by the end of the years 2014 to 2016.

It is concluded by the authors upon the analyses that the values of both Russian exports and imports of goods with copper content are likely to show the upwards trend in the next years. However the global market downturn can compensate for the growth. At the same time the share of goods with low added value in the country’s commodity structure of exports is very likely to grow to meet the demand in the global market. Thus strategic marketing effort is required from the national companies to improve their competitive positions.

Keywords: world copper market situation, copper industry, export, import, trade barriers, tariff, customs duties rates.

INTRODUCTION

Copper was first used by humans presumably more than 10 000 years ago as one of the first metals to be extracted and processed. It is a soft and malleable metal, resistant to corrosion. Its alloys are a good
material as a conductor of heat and electricity. Nowadays about 30% of the copper produced is used in equipment production, including hi-tech appliances, another 30% is used in building construction, the other uses including infrastructure industries (copper wires are an essential part of power transmission systems), transport and common industrial use (copper radiators and pipes are widely used in various machinery). It is said that an average passenger car contains 1.5 kilometers of copper wire and from 20 to 45 kilograms of copper in the car parts (Doebrich, 2009).

The increase in demand resulted in the boost of production and the international trade turnover. It is China that is considered to be the market maker in the copper market nowadays. Still one of the remarkable events of the recent years was the accession of the Russian Federation to the World Trade Organization (WTO) in 2012. It is an international body, which aims at supervising and promoting the liberalization of the international trade.

Russian Federation is one of the top-ten world economies with the gross domestic product exceeding 3.3 trillion U.S. dollars (USD) and exports exceeding 540 billion USD according to the World Bank’s estimates. The country however only ranks 92 out of 189 states in the World Bank’s “Ease of Doing Business” ranking. The pace of economic development is partly limited by orientation on exporting of raw materials and dependency on importing industrial equipment. This results in ineffective regulation including construction permits and getting electricity, high cost of credit and low level of investment protection. All these factors lead to many enterprises being uncompetitive due to old production sites, out-of-date equipment and low labor productivity. But above that all, World Bank highlights the difficulties in trading across borders which exporters and importers have to overcome doing business in Russia. In this regard Russian Federation only ranks 157 out of 189 states by the conditions of getting involved in the international trade.

In order to speed up the economic development and make cross border trade more effective, the country has been seeking the WTO accession for almost 20 years since 1993. The main commitments finally undertaken in 2012 include reduction of import customs duties and elimination of export ones, significantly reducing the state influence on electric power market and other complex measures. In general, as a result, export-oriented industries should benefit from the increasing openness while some local companies that focus the domestic market competing with imports may be vulnerable to import boost.

The country’s commitments are to be implemented by the end of the transition periods or “schedules” which have been set for particular groups of goods. For many products with copper content the customs duties are to be reduced by the period of the years 2014 to 2016.

In this regard the main aim of the article is to provide the estimation of the influence that the accession to the WTO may have on the development of the Russian copper industry, which is an important
sector of the national economy, and estimate the consequences for the global copper market. In order to reach this goal the authors analyze the global market situation and the current position of Russia; review previous studies of the impact of the WTO accession on the Russian economy and copper industry in particular; discuss the questions if the commitments to reduce and eliminate customs duties support the country’s strategic goal of increasing the share of goods with high added value in exports and if they can lead to improving the country’s position in the global copper market.

**CURRENT SITUATION IN THE WORLD COPPER MARKET**

*Production*

According to the U.S. Geological Survey (Mineral Commodity Summaries, 2014), the world reserves of copper-bearing ores are estimated at the level of 690 million tons of metal with the world annual consumption exceeding 20 million tons. Significant reserves are possessed by Chile (190 million tons), Australia (87 million tons) and Peru (70 million tons), which together account for more than half of the world reserves. Large reserves of about 40 to 30 million tons are found in the U.S.A., Mexico, China, Russia, Indonesia and Poland. Other countries in total account for about 21% of the world reserves.

The world mine production of copper in the past seven years has increased by impressive 16% and is about to reach the level on 18 million tons of copper content (Mineral Commodity Summaries, 2008-2014). The leading mining countries are shown in Table 1 including Chile (32% of the world mine production) and China (9%) with Russia belonging to the group of states that have 5-7% of the global mine production.

Table 1. *World mine production of copper*
The world production of refined copper has increased by 16.9% in the period of 2007 – 2013 and amounts to 21 million tons, including 3.6 million tons developed from recycled materials (Mineral Commodity Summaries, 2014). The pattern of the refined copper production, according to the results of the year 2012, includes the following leaders: China (29% of the global production volume), Chile (14%), Japan (7%), USA (5%), Russia (4%), India (3%), Germany (3%).

The top copper producing companies are shown in Figure 1 (World commodity markets statistics, 2014).

![Figure 1. Refined copper production by company / thousand tons](image)

It should be noted that the list of the 10 companies which are the world’s leading producers includes three Russian copper producers, namely UGMK-Holding (also referred to as UMMC – Urals Mining & Metallurgical Co.), Norilsk Nickel, and Russian Copper Company. However, the combined capacity of the Russian market leaders does not exceed 4-5% of the global production, which is about 900 thousand tons of copper per year.

**Consumption**

Copper is a metal used in various fields. The shares of the end use sectors by their usage of the copper content in 2012 are presented in the Figure 2 (The World Copper Factbook, 2013).
World refined copper usage almost reached the level of 21 million tons in 2013 which is twice as much as the world consumption in 1987. The long-term dynamics are shown in Figure 3.

Currently the growth in demand is to a greater extent provided by an increase of the level of consumption in China which is accompanied by the growth of its own production, and increasing volume of raw materials imported from the Democratic Republic of Congo, Zambia, and Australia. The data by country and region is presented in Figure 4 (World commodity markets statistics, 2014).

![Figure 2. Major Uses of Copper by the End Use Sector, 2012](image)

**Figure 3.** \textit{Dynamics of the world copper consumption / thousand tons}

![Figure 4. World copper consumption dynamics by country (region) / thousand tons](image)

**Figure 4.** \textit{World copper consumption dynamics by country (region) / thousand tons}

\textit{Global trade and market price}
At the current stage, the overall import growth can mainly be attributed to the growth of demand from China, as it has been already mentioned. Most of the industrialized countries on the contrary have the demand for copper reducing in the last years. Still according to UNCTAD, the EU continues to play an important role in the global copper market (International Trade of Refined Copper, 2013). The list of leaders in terms of refined copper exports includes Chile, Germany, Japan, France, and Russia. Leading importers of refined copper are China, the U.S.A., Italy, Germany and France. Figure 5 shows the leading refined copper exporters and importers – excluding the trade in unrefined copper.

![Figure 5. Major refined copper exporters (left pie chart) and importers (right pie chart) during 2007-2012](image)

In the year of 2013, the copper market environment, unlike the previous 3 years, was characterized by production excess over the physical demand. One of the indicators of overproduction is the growth of copper stocks at the London Metal Exchange (LME). In early 2013, experts predicted growth in copper demand. The forecasts resulted in production growth. However, in the first half of 2013 the copper stocks have reached their historic highs for the last 10 years and totalled 516.8 thousand tons. (Day, 2013). The main destabilizing factor on the global non-ferrous metals markets currently is the China’s shift from increasing import volumes of raw materials to focusing on its domestic mining and production.

Against this background, the whole dynamics of the world market prices of non-ferrous metals since 2011 possess a predominantly bearish character, after the price has recovered from the slump of 2008. In particular, an average copper price in 2013 was recorded at 12.4% lower level than in 2012. The current price of copper demonstrates the dynamics instability. Thus, in March 2014 the cost of 1 ton of copper on the LME declined sharply from 7-7.2 thousand USD to 6.6 thousand USD, well below the average price level of the recent years. According to the expert forecasts, the trend toward price reduction will continue for the years of 2014-2015 (Saefong, 2014). The Figure 6 shows historic data and the authors’ estimates for 2014-2015.
All in all it may be not the best times for the copper producers including the Russian organizations which do not have sufficient weight in the global copper market for a significant impact on such market conditions. Thus global market slowdown in fact can be a significant threat for the copper industry development.

*Market position of Russian Federation*

In addition to the facts mentioned above, it should be noted, that the main copper refinement product in Russia is wire rod from 8 to 18 mm in diameter. This refinement product possesses the higher added value in comparison with copper cathodes, but less added value if compared to other products of the copper industry, such as stranded wire, pipes, fittings, and plate radiators. It is estimated that up to 70% of Russia's refined copper cathodes are processed into rods. Meanwhile, the domestic market capacity is limited, and thus, about half of the overall produced wire rod is exported (Uvarov, 2009).

Russian organizations secure their positions in the niche, they currently focus. According to the industry experts' estimates, almost all the export volume of the refined copper is sold to the countries of the EU (major importers being the Netherlands, Germany and Belgium) and Turkey. (The Urals Metal Market, 2011).

Some copper-bearing ore and scrap are imported by Russia from Kazakhstan. The non-ferrous metallurgical companies of the two countries have strong business links and forming of the Eurasian Economic Union of Russia, Kazakhstan and Belarus in 2015 can stimulate the development of new investment projects and support economic growth.

The analysis of available statistics on the Russian international trade in copper products (Fig. 7) clearly shows that Russia is a net exporter. Despite the marked local downturns (late 2008 - early 2009) and bursts (II quarter of 2012), the value of Russian exports of copper remains generally constant,
fluctuating around the level of 1200 million USD per quarter while the imports remain on the relatively low level of about 150 – 250 million USD per quarter.

Figure 7. \textit{Russian copper products exports, million USD.}

The Figure 7 data compared with Figure 6 show that more than two-fold reduction of the export volume during the time period between the years 2008-2009 occurred due to a decline in global demand and prices. During the second quarter of the year 2012, the export growth for more than 50\% if compared to the same period in 2011 had the background of a smooth reduction in world prices, which can be explained by the plans of manufacturers to increase export volumes before the possible prices slump, predicted for the summer and autumn seasons of the year 2012, or until the ratification of the WTO Accession Protocol, which was associated with significant uncertainty for the Russian market development.

\section*{CONSEQUENCES OF THE WTO ACCESSION FOR THE RUSSIAN COPPER INDUSTRY}

\textit{Literature review}

Russia had initiated negotiating the conditions of accession to the WTO in 1993 and it was finished in 2011. Surprisingly not so many scientific researches on the consequences for specific industries have been conducted during the long negotiation period. The main reasons for that include the complexity of the WTO documentation and the lack of the statistics on the development of the domestic industries. However some valuable studies should be mentioned that have been conducted by Russian and international organizations for the state authorities and national companies. Some of them discuss the prospects of non-ferrous metallurgy development alongside with other industries. A preliminary analysis, which was organized in 2002 by the Russian Academy of Sciences and the National Investment Council, revealed the threat of system problems occurring after accession to the
WTO in a number of industries, including metallurgy. The estimates performed on the inter-industry model for non-ferrous metals found a relatively high elasticity of imports and production volumes for import customs duty. So, under the condition of simultaneous decrease of import duties for 1 percentage point, there was anticipated the import growth by 1.79% and the decline in domestic production by 1.4% (Nikepelov et al., 2002). However, the analysis of the preliminary gradual increase of duties in 2010-2011 prior to their binding, revealed that, thanks to such preventive measures, no import growth could be expected in three of the 24 selected economy sectors, including non-ferrous metallurgy. For the latter, it was also anticipated that the previous production volumes could be preserved, in contrast to the ferrous metallurgy.

The multivariate analysis of the Russian economy development prospects, held jointly by the Ernst & Young Company and the New Economic School in 2011-2012, revealed that the non-ferrous metallurgy was expected to have the highest production growth after accession to the WTO of 114.45% by the end of the transitional period in comparison to the level of the year 2011 (Ivlev, et al., 2012).

The studies conducted by the World Bank, also predicted a significant positive effect of the accession to the WTO for the Russian non-ferrous metallurgy. In particular, 35 sectors of economy were identified for the survey of the year 2004, only 7 out of them were expected to have increase in production, and only 5 of them were expected to have an employment level growth due to the increase in production output. Non-ferrous metallurgy was mentioned to have both positive effects (Brodman, 2004).

In the analysis of sectorial and regional aspects of the accession to the WTO, the Russian analytical centre "WTO Inform" emphasized the high risks for the economy as a whole. At the same time the experts formed a favourable forecast of financial situation for the copper industry enterprises, including UGMK-Holding and Russian Copper Company; there was also stated the possibility of their revenue increase after the accession to the WTO.

It should be noted that most of the Russian copper-smelting companies had completed major modernization projects before accession to the WTO. The largest enterprises that produce refined copper are included into the vertically integrated companies: Norilsk Nickel, UGMK-Holding and Russian Copper Company – which account for more than 87% of the total industry production. Studies indicate a relatively high level of production competitiveness and, ability to work in accordance with the WTO conditions. Still the reduction of import duties should have positive impact on the costs of new investment projects. (Myzin, Kuklin, 2005).

The business community experts and the leading Russian business press ranked the industry risks for non-ferrous metallurgy as the lowest ones among other industries. It is assumed that the reduction of import barriers for copper products should not lead to the competition toughening on the domestic
market, which is not very attractive to foreign companies. Still the domestic production capacity growth rate is not likely to exceed 10-15% a year. (Aliev, 2011).

*Import duties reduction for products with copper content*

Analysis of the Russian Federation commitments for import duties reduction leads to the conclusion that for most of the commodity items, representing products with copper content of relatively low added value, the import duties are not bound and can be preserved at the level prevailing at the date of WTO accession. These conclusions are generally valid for the following groups of commodities according to the Harmonized System: 26 "Ores, slag, ash", 38 "Other chemical products", 73 "Articles made from Non-Ferrous Metals", 74 "Copper and articles thereof". The exceptions are represented only by separate commodity items and subgroups, the major of which are set forth in Table 2.

Table 2. *Tariff concessions of Russia in terms of import duties for certain types of copper products*

The data listed in Table 2 show the groups of goods with the corresponding code in the Harmonized System which helps to identify the product for the customs formalities, the bound rates of customs duties fixed in the accession protocol as a starting point and final bound rate to be introduced until the end of the year of implementation.

The rates shown in Table 2 in general correspond to the estimates of the overall reduction of average import tariff, as a result of WTO accession, which is from 10.3% to 7.2%, and the level of tariff protection of Russian non-ferrous metallurgy in particular, which is from 6.4% to 4.7%, at the end of the transitional period. A more significant reduction of duties will be applied to commodity items of the "Stranded wire, ropes, cables..." subgroup as shown in Table 2. In this regard, it should be noted that in general, much more substantial obligations to reduce import duties on average from 15-20% to 10% or below, have been taken in respect of a large number of products with high added value. This
list includes a wide range of products: copper insulated wires, electrical wires, cables, components, machinery, household electrical appliances, microelectronics, jewellery. It appears that in the long run the import of finished goods with copper content will increase which may impede the development of the domestic market. However it should be noted that the possible growth in the level of competition should have a beneficial effect on the development of the industry. It can stimulate performance improvement including cost reduction. At the same time a positive reflection of changes in the market position of domestic companies is possible only in conditions of favourable market situation and effective corporate management.

Cancellation of export duties for copper products

In general, as expected, the copper products manufacturers will increase export deliveries after the reduction and cancellation of currently applied export duties, which were designed to stimulate the production of goods with higher added value for the domestic market. Respective commitments of the Russian Federation are presented in Table 3.

Table 3. Tariff concessions of Russia in terms of export duties for copper products

The table columns are similar to Table 2 with an exception of the implementation period starting from the date of accession (August 2012) fixed in the official documents instead of stating a specific year. The listed rates of export customs duties applied at the date of WTO accession, proved to be an effective measure to limit the export of low-processed products, including copper scrap. Thus gradual or one-time reduction scheduled for the time period between the 2016-2017 years is associated with significant risks. They were clearly demonstrated by Russian companies in 2009 - 2011 when they obtained the opportunity to refocus their exports. In 2009, in response to the slump on the world commodity market, the export duties for copper cathodes (10% previously) were abolished. It led to dramatic increase in export of this produce with lower added value in comparison with the wire rod.
Reintroduction of the customs duties in 2010 resulted in stopping the export of cathodes while the copper wire rod exports, on the contrary, has increased significantly as a substitute. In this regard cancelation of export duties for all copper products including scrap is likely to cause the situation of stockists exporting scrap rather than selling it to processors on the domestic market. In this case many production development investment projects can be shut down. Currently, it is estimated that copper scrap provides 28% of raw copper for Russian industry. For instance, the representatives of the UGMK-Holding announced that the main reason for the reduction of copper production by 4.1% in the first half of 2013 was the lack of copper scrap. As a result, by the end of 2014 the overall production is expected to be reduced by 4.4% year-to-year (Milyaeva, 2013).

Thus, at the current stage the growth of copper production seems likely mostly in part of the low value-added products. In case of exports increasing with the goods of low processing degree, the dependence of the domestic market on foreign economic conditions will be sure to grow. Consequently, the main purpose of the companies’ operational and strategic management can fall down to preserving of the current position with respect to fluctuations in world market conditions. It may be considered the major threat for the industry development.

CONCLUSION

The research has been conducted mostly on the qualitative level by analysing the experts’ survey data, analytical reports of the national and international organizations, available statistics. In general the study shows the Russia’s role in the global copper market as a net exporter supplying mostly semi-finished goods. Accession to the WTO is likely to result in the growth of copper exports after reduction and cancellation of currently applied export duties. This will lead to the increase of the market share of the Russian companies including Norilsk Nickel, UGMK-Holding and Russian Copper Company. The growth will be limited by production capacity and the total export volume cannot be estimated to exceed in the short term the level of 1.5 million tons a year — which account for 7.5% of the global market showing the growth from the current level of about 5%. However the growth of export volume may be accompanied by the shift in its structure towards the goods with low added value, including scrap, which doesn’t match the country’s strategic goals.

At the same time accession to the WTO should have positive impact on the Russian copper industry by creating a more competitive business environment providing incentives for intensification of modernization processes. It is clearly shown in the several studies mentioned in the article, including the conclusions of the World Bank, Ernst & Young and the New Economic School, Russian Academy of Sciences and the National Investment Council. This trend can be supported by the opportunities of
forming the Eurasian Economic Union in 2015 as copper refining enterprises of Russia and Kazakhstan have strong business links.

Still, as the industry is currently very dependent on the global market situation, it is assumed that if no actions are taken by the companies, the forecasted global market downturn will sharpen the contradictions of the industry development including the shortage of recycled resources, relatively low efficiency of corporate management and slowdown of domestic demand. In order to exploit the benefits of the accession to the WTO the companies’ strategies should focus not on the production expansion but on creating a sustainable production process. This includes diversification of the product line, increasing the share of the goods with higher added value, developing mutually beneficial links with other enterprises of the associated industries, possibly focusing on the domestic market. If these actions are taken, Russia should strengthen its positions in the copper market, its companies overtaking partly the shares of the competitors in the European market.

The authors intend to continue the study on the qualitative level by creating models based on supply and demand curves for the Russian and the global markets for the specific products and the industry as a whole to estimate the qualitative effects.

KNOWLEDGE-INTENSIVE ENTREPRENEURSHIP AND LOW-TECH SECTORS: QUESTIONING THE SUCCESSFUL CREATION OF LOW-TECH BUT KNOWLEDGE-INTENSIVE VENTURES

Karagouni, Glykeria; Caloghirou, Yannis

Laboratory of Industrial and Energy Economics, Department of Chemical Engineering, National Technical University of Athens, Greece

ABSTRACT

The starting point of this paper is the ongoing discussion on knowledge-intensive entrepreneurship (KIE). Since recently the phenomenon had been assigned to high-tech sectors which are R&D and science-dominated. However, a new small but increasing stream of relevant literature argues that KIE is relevant if not pervasive in traditional, low-tech industries as well. Literature has offered a significant amount of insights related to the basic building blocks of low-tech (LT) KIE, i.e. knowledge, its sources and ways of exploitation, knowledge-intensive innovation and mechanisms and capabilities of reaching it, as well as types of LT-KIE ventures, among others. Furthermore, there is a plethora of skills, entrepreneurial characteristics and other antecedents and factors used as input, KIE management and output in KIE processes. However, there is a gap in the understanding of how low-tech but knowledge-intensive ventures are created, survive and grow within their mature and highly saturated business ecosystems. Therefore, the numerous valuable constructs of existing literature can assist the further exploration of the topic called low-tech knowledge-intensive entrepreneurship in order to understand how LT-KI entrepreneurs and entrepreneurial teams recognize or create opportunities and transform them into successful knowledge-intensive business capable to survive the stagnancy of traditional mature markets. The paper purports to start this discussion by posing the relevant research questions maintaining mainly an entrepreneurial approach of the LT-KIE phenomenon.

Keywords: low-tech industries, knowledge-intensive entrepreneurship, innovation, venture creation, knowledge, entrepreneurial approach, initial competitive advantages, resources

INTRODUCTION

Knowledge-intensive entrepreneurship (KIE) has been considered a type of high potential entrepreneurship which helps renew the economy. It indicates ventures whose initiation or expansion is based on the dynamic application of new knowledge. According to Malerba and Mckelvey’s (2010)
formal definition of knowledge-intensive entrepreneurship, KIE is associated with four basic characteristics:

- it concerns new firms (new ventures); new ventures that are innovative;
- new ventures engaging in activities that are knowledge intensive;
- and finally, new ventures that are not to be found solely in high-tech industries i.e. they may well be active in industries with medium or low-tech characteristics.

Therefore, KIEs are involved in venture creation which is a mechanism to translate knowledge into innovation (and further on, into survival and growth). Thus the ultimate objective in KIE is market success and not just the development of a radical innovation. Furthermore, entrepreneurs are considered knowledge operators, dedicated to the utilization of existing knowledge, the integration and coordination of different knowledge assets, and the creation of new knowledge, and engaged in the development of new products and technologies.

A detailed exploration of several KIE dimensions in an effort to unlock its riddles was provided by an FP7 Research program, called AEGIS. Actually, the survey based on a large set of data purported to identify motives, characteristics (including constituent knowledge assets and skills) and patterns in the creation and growth of new firms based on the intensive use of knowledge regardless sectors and levels of technologies. At firm level, the survey put emphasis on founders and founding teams’ skills and characteristics, type of company formation, funding issues and potential obstacles. It further focused on the performance, innovativeness, success factors and relevant capabilities of the formed company as well as the system factors that affected these parameters such as the sources of knowledge and customers and the links and networks. The survey further extended to issues such as the institutional and market environment, strategic analyses and business models.

On the other hand, the AEGIS case studies addressed several of the conceptual issues which related KIE to innovation systems, growth and performance while many of the case studies focus upon strategy, business models, mobilization of resources and other internal processes of the venture creation, as related to a temporal dimension.

However, up to date, the discussion about knowledge-intensive entrepreneurship (KIE) is still mainly focused on new technology-based firms or academic start-ups in high-tech sectors. Little attention has been paid to sectors that conduct no or only few formal R&D activities and that are therefore characterized as non-research-intensive or “low-tech” (LT).

How easy is it to apply KIE in low-tech sectors? Hirsch-Kreinsen and Schwinge (2011) describe low-tech sectors as mature ones with established technologies and production regimes and well-recognized standards, methods, and knowledge related to both products and processes. LT industries face fierce competition due to the easy copy of their basic technologies by competitors with lower cost
bases mainly in Asia. Furthermore, LT knowledge bases include mostly codified, transferable and well-known elements such as design methods, engineering routines or the know-how about markets and customer preferences with well-defined behavioral patterns. Innovations in these contexts are more or less path-dependent i.e. they are based on technological knowledge and capabilities that have been slowly evolving around established technological trajectories and thus incremental and of little value in producing competitive advantage. As a result, the growth rates as well as radical innovations in these industries are relatively low.

Consequently, the above constraints indicate that LT sectors and firms seem to offer only very limited opportunities for KIE development. However, such opportunities seem to exist in spite the “stable environment of low-tech industries” (Deutschmann, 2008). Furthermore, competitive pressure and the ever-changing and volatile global business environment of today seem to force LT actors towards knowledge-based breakthrough innovations, even if they are not so spectacular as in the cases of high-tech (Bender and Laestadius, 2005; Hirsch-Kreinsen, 2008). This is further confirmed by the existence of the so-called “gazelles” of mature industries (cf. Yudanov, 2009). Such cases indicate the KIE can be applied in LT sectors. However, there is still a significant gap in the understanding of how low-tech but knowledge-intensive ventures are created, survive and grow within their mature and highly saturated business ecosystems.

**KNOWLEDGE-INTENSIVE ENTREPRENEURSHIP AND LOW-TECH SECTORS**

An extensive literature review highlights the significance of low-tech sectors as well as their potential regarding innovation and the use of knowledge. Thus, paraphrasing Mendonça and von Tunzelmann (2004, p.15) who referred to LT- innovation the present thesis supports the view that, “KIE in low-tech industries should … not be seen as a contradiction in terms.” However, the recent research on KIE indicates that translation of knowledge to innovation through LT- KIE is more complex than expected compared to high-tech sectors. In the same vein, the limited research on LT-KIE shows that the sectoral conditions seem to affect to a significant extent the creation or exploitation of opportunities through knowledge, market, institutions, etc. as well as the creation of LT-KI ventures. Hirsch-Kreinsen and Schwinge (2011) relate LT-KIE firms’ competitive advantage to the abilities of introducing innovative products or processes by the exploitation and integration of technological advancements of other sectors mainly high- and medium-high-tech. According to them the impact of KIE at the firm level relates to technological development and capability building in order to create new market opportunities. However, there is no research or any approach to explain firm-level success and failure at the stage of LT-KI venturing. While there is some talk on competitive advantage
and capabilities this discussion remains caged within the borders of the innovation theory and not the field of entrepreneurship. Therefore, existent theory and empirical research has not so far offered deep insight or strong constructs of the LT-KIE topic into the direction of understanding a KI-LT new venture’s survival and growth. In other words there is actually a gap in the understanding and conceptualization of LT-KIE which addresses the very LT-KI venture creation from business idea to established low-tech business, not yet discussed by KIE researchers. Based on this discussion, the main research question is then:

**HOW AND WHY CERTAIN LOW-TECH BUT KNOWLEDGE-INTENSIVE VENTURES SURVIVE EARLY DEATH AND PROSPER WITHIN MATURE ECOSYSTEMS?**

In sum, the LT-KIE literature underscores the importance of a variety of factors, resources and innovation-related capabilities, but little work examines these from a new venture’s survival perspective. With so much attention devoted to the conceptualization of KIE, significance of resources and skills, and the role of knowledge and innovation, the LT-KIE literature has been concerned primarily with “what” questions. There has been less attention paid to “how” questions. In relevant research so far, how LT-KI entrepreneurs/entrepreneurial teams recognize or create opportunities, how they collect and process information, knowledge and other resources, how they arrive at valuations, and how they decide to act and succeed are issues not addressed by existing KIE theories. Therefore, it seems to be a gap in the understanding of the entrepreneurial approach of the LT-KIE phenomenon regarding the mechanisms by which new founders and founding teams will accumulate the bundle of resources, knowledge, skills and other inputs which have been quite expensively investigated in KIE literature. 

The purpose then of the present research is to contribute to the comprehensive understanding of KIE as a mechanism for the transfer of multifaceted knowledge into innovative economic entrepreneurial activities in low-tech sectors and to shed light on its unclear inter-relationships with determining venture-related factors. From a definition that proposes that KIE are new firms that are innovative and knowledge intensive, some key dimensions important for the theoretical conceptual and empirical analysis stem out. In its general view LT-KIE follows the KIE definition and therefore regards new knowledge and innovation-based venturing. Therefore, innovation, knowledge, venture creation with resources and capabilities, as well as entrepreneurial factors regarding the entrepreneur, the firm and the environment as derived from relevant literature, will be the initial building blocks for the preliminary attempt to explore further low-tech knowledge-intensive entrepreneurship.
INNOVATION

In the low-tech context, KIE is a mechanism of implementing an innovation which goes beyond the existing knowledge and it is new and significant to the sector or the product field. Accordingly, innovation constitutes a crucial building block of LT-KIE.

As indicated by the literature review during the last ten years there has been a rather significant interest for low-tech industries. Researchers have dealt with LT innovations and innovation activities and have found out that they are not necessarily the result of systematic research and development (Pavitt et al., 1987; Henderson and Clark, 1990; Napolitano, 1991; Walsh, 1996; Rametsteiner 2000; Robertson, et al., 2003; Bender, 2004; Caloghirou et al., 2004; Hirsch-Kreinsen et al., 2005; Robertson and Patel, 2007; Hirsch-Kreinsen, 2008; Böheim 2008; Segarra-Blasco, A., & Arauzo-Carod, 2008; Lichtenthaler, 2009). Research has been advanced with the engagement of the knowledge factor; alternative sources of knowledge and distributed knowledge bases have been intertwined with the spatial dimension of innovation (Granstrand et al., 1992; Lundvall and Johnson, 1994; Liebeskind, 1996; Nonaka and Konno, 1998; Howells, 2002; Rigby and Zook, 2002; Smith, 2000, 2002, 2003; Hirsch-Kreinsen et al., 2003 and 2005; Bender, 2004; Robertson and Smith, 2008; Malerba, 2008 and 2005; Burger – Helmchen, 2008; Grimpe and Sofka, 2009; Chen 2009; Tsai and Wang, 2009, Stam, 2009).

According to both literature and empirical findings (e.g. Gupta and McDaniel, 2002; Hirsch-Kreinsen, 2008), low-tech firms seek mainly new technical and practical knowledge linking external knowledge with the firm-specific knowledge base (Bender and Laestadius 2005; Medanoça 2009; Robertson and Smith 2008) relying on training and highly qualified personnel skills.

Accordingly, LT firms have been found to engage mainly in frequent changes or improvements of process technologies and new product development (Hirsch-Kreinsen 2008a, Robertson and Smith 2008, Robertson et al. 2009). While a very small percentage of individual low-tech firms develop R&D activities, the majority apply mainly open innovation (Hirsch-Kreinsen and Jacobson, 2008; Likar et al., 2008). Process, organizational and marketing innovations are more common (Heidenreich, 2009), while product innovations are in their majority incremental (Bender, 2004). It is also argued that cumulative incremental innovations are quite significant since they can expand, extend and leverage technological trajectories and can cause major economic impact (Dosi, 1982). A significant feature of low-tech innovation is the engagement of many stakeholders all along the value chain in open innovation. Suppliers have been found to be of utmost relevance, since low-tech firms rely heavily on raw material, machine and equipment technological advances (Bender, 2004; Heidenreich, 2009). In this context LT firms are widely termed as “supplier-dominated firms” referring to Pavitt’s taxonomy of sectoral innovation modes (Heidenreich, 2009; Robertson et al., 2003). However, they can also be
key users of high-tech ideas (Santamaria et al., 2009) contributing significantly to the development of technologies and knowledge diversification directed to new technological fields (Mendonca, 2009). However, even in the cases of LT-KIE, the relationship that exists between KIE and innovation is still straightforward; KI-LT entrepreneurs should transform new, knowledge-based ideas into economic activity. In order to succeed, the resulting knowledge-based innovation should go beyond the existing sectoral or product field-specific knowledge base by creating new knowledge, new ways of problem solving or new processes, products as well as new markets not applied or unknown in the industry before (Hirsch-Kreisen and Schwinge, 2011). In other words such innovations should be novel to the whole sector and thus creating the potential for the new venture to create new opportunities or otherwise develop a competitive advantage in order to enter the broader mature market in direct or indirect ways (e.g. get a share or by creating a niche market). Therefore, the producing innovation is strongly related to the novel business idea the entrepreneurs / entrepreneurial teams will develop in order to establish the new business. Sticking always to the fact that innovation is not born inside research or academic labs as in the cases of high-tech innovation, the following questions then emerge:

HOW DO LT-KI ENTREPRENEURS/TEAMS CREATE INNOVATIVE KNOWLEDGE-INTENSIVE BUSINESS CONCEPTS?

Knowledge

A major aspect therefore regards the importance of trans-sectoral knowledge bases (Bender and Laestadius, 2005; Hirsch-Kreinsen, 2008) and the broader need to transcend sectoral limits in cases of LT-KIE. Based on Robertson and Smith’s (2008) emphasis on the particular significance of the “distributed knowledge bases”, we expect that firms and individual entrepreneurs alone will not be able to be the drivers of KIE processes; instead they have to connect with actors, resources and opportunities from well outside the sector. Thus, accumulated knowledge can support a new way of combining trans-sectoral inputs or resources based on exploitative learning processes. Therefore, it seems that there are major differences between high-tech and low-tech KIE; the origins of high-tech innovation rely often - if not always - in out-of the lab, R&D-based technology followed by patents and other types of appropriability measures (Adams, Fontana and Malerba, 2012) and based on
sound scientific and technological knowledge. This does not seem to be the case regarding low-tech KIE where innovation activities are primarily based on “practical and pragmatic ways by doing and using” (von Tunzelmann and Acha, 2005). Yet, it is not easy to draw clear distinguishing lines between scientific knowledge and practical knowledge. While practical knowledge can be found in the context of operating processes, LT firms use and apply theoretical knowledge such as engineering knowledge or even R&D knowledge elsewhere produced. On the other hand, process innovations even if of incremental type entail a complex bundle of different pieces of knowledge which is not entirely practical and are mainly intramural, i.e. developed by the staff of the firm.

However, the science-based or technological knowledge within KIE does not have to be created by the entrepreneur or the diversifying low-tech firm. External sources of knowledge seem to be essential for low-tech innovation (Cockburn and Henderson, 1998; Santamaria et al., 2009). A growing number of researchers suggest that different forms of collaboration enable firms to engage in innovation (e.g. Chesbrough, 2003; Lichtenthaler and Ernst, 2009). However, innovation occurs through new combinations of resources, ideas, and technologies imposing a need for constant inflows of knowledge beyond firm- and sector-level boundaries (Chesbrough and Crowther, 2006). Accordingly, the third edition of the Oslo Manual (OECD 2005) has an expanded coverage of knowledge flows and the role of linkages in the innovation process. In its latest edition it thoroughly addresses innovation in less R&D-intensive, so-called low-tech industries implying the notion of open innovation. According to Robertson and Smith (2008) production relevant knowledge is distributed across firm-specific, sectoral or product-field specific and widely applicable knowledge-bases, whereas scientific-based knowledge is applied at every level. Collaborations can be with any type or organization such as universities or research institutes (Griliches, 1995; Caloghirou et al., 2001), suppliers and customers (von Hippel, 1988; Brown and Eisenhardt, 1995; Joshi and Sharma, 2004; Cousins et al., 2011), or any type of networks, alliances or joint ventures with other firms holding relevant knowledge (Chiesa and Manzini, 1998; Hagedoorn, 1993). A key aspect regards the correct balance between the development of internal knowledge (e.g. intramural R&D) and the adaptation of the acquired external knowledge.

VENTURING

LT-KIE regards ventures which are responses to innovative opportunities, emerging from knowledge in the form of new technology, new markets or even new ways of internal or external resources’ exploitation. Since KIE has been considered as a significant mechanism through which new entries in the markets (in the form of new firms or diversification of existing firms) bring new ideas, products,
services and processes (e.g. Radoceviz et al., 2010; Chaminade and Edquist, 2006), researchers have explored a significant range of factors; these factors can be broadly divided into those referring to the entrepreneur, to the firm, and to the environment within which firms and entrepreneurs operate. They are significant since they shape the process of KIE in terms of enabling or constraining entrepreneurial opportunities to implement an innovation. For example, Radosevic’s (2010) systemic approach of entrepreneurial opportunities offers such a list of environmental factors (scientific/technological, sectoral, demand, social cultural, institutional). In this systemic perspective entrepreneurial opportunity is constituted by technological, market and institutional opportunity that are understood as complements and are matched by the entrepreneurs.

The transition from venture creation to an early survival and continuation of the new firm has been also extensively explored and attributed to individual characteristics of the founders, the resources, the process and the environmental conditions (e.g. Gartner, 1985; Ardichvili & Gasparishvili, 2003; Beugelsdijk and Noorderhaven, 2005; Davidsson, 2006; Johnson et al.,2006; Kessler et al., 2012). Founders, firm, and contextual characteristics of new business ventures have been also explored regarding KI cases of high-tech industries or in general (e.g. Breschi, Malerba and Mancusi; Buenstorf (both in Malerba, 2010); Caloghirou et al., 2012; Camerani et al., 2012).

Malerba and McKelvey’s (2010) “KIE model” provided a novel conceptual framework, since active choices were made about the conceptualization of specific processes, key notions, parameters and characteristics of KIE. The phenomenon has been defined in terms of individual firm content of its human capital, irrespective of the sector. Human capital can be measured in terms of the education of the entrepreneur, the skills of the labor force, and so on. Accordingly, specific pre-firm assets (finance, resources and entrepreneurial perceptions) are translated into venture performance and growth through internal management, organization and networking. However, the source, quality and type of inputs and resources which could influence the success of LT- KIE as much as the internal management processes of the next phase are unexplored. For example, while classical theory on entrepreneurship has employed various classifications of resources and capabilities especially after the engagement of the resource based view (e.g. Amit and Schoemaker, 1993) in order to explain venture creation, this remained too vague in LT-KIE cases.

Actually, the task of attracting resources for a new venture has been assigned among the greatest challenges that new entrepreneurs face (Brush, Greene, & Hart, 2001; Ravasi and Turati 2005; Romanelli 1989; Stuart and Sorenson 2003), since limited resources jeopardize survival (Arthurs & Busenitz, 2006). Taking into consideration the fact that knowledge is a core resource of LT-KIE there are certain questions that remain unanswered. For example, an academic spin-off has access to specific knowledge; on the contrary it is highly questionable how LT-entrepreneurs locate the new
sources of knowledge, how they manage access to these sources, how they use knowledge in order to produce innovation and how they are going to transform the result into production lines, products and market success.

An interesting approach seems to be the Hirsch-Kreinsen and Schwinge model (2011) for low-tech industries which refers to the need of certain firm-level or individual-level capabilities in order to produce innovation. Even since the beginning of their research on LT-KIE, the authors regarded the activities at the level of individual firms or entrepreneurs to be an indispensible prerequisite for KIE in LT sectors, as the mediator of renewal of a whole system by making use of external opportunities. Attempting a cross-reference to conceptual considerations on the innovativeness of LT companies (cf. Bender and Laestadius, 2005), the authors stressed that this could be a matter of specific capabilities, a term provided by the well-known “resource based” approaches. The core message of this approach is that LT-KIE processes may be analyzed in terms of capabilities for orchestrating and mobilizing knowledge and other resources at the disposal of actors and firms (cf. Teece and Pisano, 1994). These capabilities are strongly interlinked with the knowledge bases; existing knowledge is the requirement for these capabilities development through the identification and effective integration of novel knowledge, while these capabilities lead to the specific knowledge expansion which constitutes the main feature of LT-KIE. Accordingly, major LT-KIE capabilities for Hirsch-Kreinsen and Schwinge are the capabilities to question existing knowledge and to identify and acquire (new) relevant knowledge from other knowledge bases.

However, this capability aspect approached mainly the innovation-side and not the entrepreneurial side of LT-KIE. The authors referred to it as “innovative capability” incorporating the “transformative capability” and “configurational capability” of Bender and Laestadius (2005), Bender’s (2004) synthesizing competence, or the somewhat older “combinative capability” introduced by Kogut and Zander (1992) and the architectural competence described by Rebecca Henderson and Kim Clark (1990).

In spite the above ones, there are hardly any other efforts made to identify firm-specific capabilities (and their dimensions) that can be sources of competitive advantage, or explain how combinations of competences and resources can be developed, deployed, and protected in order to start a viable new LT-KI venture. Although the notion that the nature of firms’ pre-entry capabilities determines the direction of expansion as firms survive and grow is not new (Nelson and Winter, 1982, Grant, 1991; Penrose, 1995), KIE models so far have focused more on the mechanisms of knowledge and innovation regarding capabilities; they seem to have neglected the entrepreneurial side of the issue. Several writers have lately offered insights on the important links between knowledge creation and its commercialization particularly at the early stages of a new venture. The capabilities perspective
seems to be missing while the quotation of Zahra et al. (2006) is still popular; “...research has not provided a compelling explanation for the ability of some new and established companies to create, define, discover and exploit entrepreneurial opportunities”.

Another issue of concern not well captured in KIE literature, according to our knowledge, regards the role and significance of the initial competitive advantage (CA) a new venture builds in order to survive and prosper. For Hirsch-Kreinsen and Schwinge (2011) the outcome of the KIE process is defined in terms of technological innovations as the direct result of this process and the impact of KIE innovations. In entrepreneurship literature the term of initial competitive advantage has been so far subject of discussions on the significance of resources and the importance of the founding team (e.g. Autio et al., 2009; Davidsson et al., 2003; Vanhoue et al., 2010). Russell (1989) claimed that creativity and innovative spirit give the new-born entrepreneurial organization its initial competitive advantage. Yet, while there are well developed theories on how to create and sustain the competitive advantage of established organizations, there are almost no explanations of how new ventures establish their initial competitive advantage especially in cases of low-tech venturing.

Furthermore, new firms, once established, often face resource base weaknesses (Singh et al., 1986) and are confronted with subsequent performance loss if these weaknesses are not dealt with. The nascent entrepreneurship literature indicates that it is necessary for entrepreneurs to create and adapt the resource base of the new firm (e.g. Garnsey, 1998; West and DeCastro, 2001). Yet, this issue is so far both theoretically and empirically unexplored within the LT-KIE literature. However, a study of Protogerou and Karagouni (2012) indicated that the evolution of new knowledge-intensive ventures may be related to the creation and development of dynamic capabilities. In the same vein, Zahra, Sapienza, and Davidsson (2006) consider that “new ventures need unique and dynamic capabilities that allow them to survive, achieve legitimacy, and reap the benefit of their innovation”. In addition, there is a limited but gradually increasing research on DCs regarding newly-founded firms with a number of empirical studies mainly of high-tech sectors, which indicate that new ventures need dynamic capabilities to reconfigure or modify their initial and rather poor resource bases in order to survive and grow (e.g. Arthurs & Busenitz, 2006; Zahra & Filatotchev, 2004; Grande, 2011). For example, Stam et al. (2007) found certain dynamic capabilities as most likely to accompany high-tech start-ups’ growth. The relative empirical studies regarding low-tech sectors are extremely few. Telussa et al. (2006) analyzed the new firm growth in association to dynamic capabilities using a sample of mostly low and medium-tech firms. In spite the above assumptions the issue is still far

---

1 Considering the fact that patented technologies and R&D results can be strong initial competitive advantages in cases of high-tech ventures. For example, a unique innovation is the motivation for the start-up of a life science firm (Audretsch, 2001), and innovation sets the strategic path of life science firms (in Carrick, 2012)
from clear: **how can then just established low-tech ventures overcome resource base weaknesses and evolve?**

A perspective of particular importance in LT-KIE regards the assumption that the phenomenon includes not only newly founded companies as denoted by Malerba and MvKelvey (2010) for high-tech sectors, but cases of change processes in established companies as well. This is due to a series of reasons and more precisely due to

a) the competitive pressure; existing low-tech firms are almost forced to change their competitive situation by adopting an increasingly reflective approach towards established practices and by looking for significant innovations (Hirsch-Kreinsen and Schwinge, 2011; Trigkas et al., 2012).

b) the declining course of the most traditional sectors and the global competitive pressures; it is quite difficult and rather risky for young entrepreneurs to start new low-tech companies (see for example the textiles and clothing industry)

c) the strong path dependency and the technologically established situation of low-tech sectors; it is quite difficult to come up with novel business ideas capable to allow new low-tech ventures enter existing mature and saturated markets and be viable

</tr>
</tbody>
</table>

Table 1: Summary of main and sub – research questions

LT-KIE is expected to be found more within established organizations but it is quite ambiguous if KIE will mean the same in both modes and whether they will share the same characteristics. For example, how important will the role of the existing knowledge pool of the parent company be? Will its organized routines play a positive or negative role in corporate venturing? How will the agents seek novel knowledge? What will be the role of existing resources and capabilities? Furthermore, while existing financial and human capital can solve relative problems, on the other hand technological or institutional path dependencies may create serious problems and core rigidities. This is an issue not
yet addressed in detail in LT-KIE research. Therefore, differences are expected to be found in most if not all the above LT-KIE building blocks regarding the emergence of knowledge-based innovation, the entrepreneurial process, the factors, constraints and opportunities as well as the evolution paths and performances.

CONCLUSION

There is a gap in the understanding of how LT-KI ventures are created, survive and grow within their mature and highly saturated business ecosystems. Literature has offered a significant amount of insights related to the basic building blocks of LT-KIE, i.e. knowledge, its sources and ways of exploitation, knowledge-intensive innovation and mechanisms and capabilities of reaching it, as well as types of LT-KIE ventures, among others. Furthermore, there is a plethora of skills, entrepreneurial characteristics and other antecedents and factors used as input, KIE management and output in KIE processes. These valuable constructs can assist the further exploration of the topic called low-tech knowledge-intensive entrepreneurship in order to understand how LT-KI entrepreneurs and entrepreneurial teams recognize or create opportunities and transform them into successful knowledge-intensive business capable to survive the stagnancy of traditional mature markets. By posing the research questions summarized in Table 1, we purport mainly an entrepreneurial approach of the LT-KIE phenomenon.

Abstract

The purpose of this study was to investigate successful methods for the prevention of parallel importation, and in particular to investigate what methods Bulgarian marketers consider to be effective. Additionally, the article looks at prevention in terms of the use of non-pricing tools. A qualitative study was performed via in-depth interviews. Nine interviews were conducted with marketing/sales managers from companies in different industry sectors. In the paper 16 different practical pricing and non-pricing tools, which marketers in Bulgaria use, are revealed. The paper identifies several strategies that can help in the prevention of, and successful fight against, parallel importation. This study reveals a different approach towards investigating the methods used to fight against parallel importation by exploring practitioners’ points of view and reactions. By focusing on practical strategies and researching connections with other marketing tools like relationship marketing, this paper contributes to both academia and practice.

Keywords: parallel import, parallel trade, grey marketing, relationship marketing, qualitative research, in-depth interviews, Bulgaria

INTRODUCTION

The world is becoming more and more globalised due to the availability of technologies that enable the sharing of information, and due to the growth of flexible logistics and reductions in freight costs (Palangkaraya and Yong, 2009). Due to various factors, international manufacturers often have different pricing strategies in different countries (Xiao et al., 2011). When neighbouring countries have significant price differences then a non-authorised move of products between them can happen. This practise is recognised in the literature and in real life as parallel import (PI) or trade, grey marketing (GM) or re-import (Chen, 2009; Grossman and Lai, 2008; Swee-Lim et al., 2010).

In the European Union (EU) there is regional exhaustion legislation. This means that if a manufacturer sells a product to a company in the EU, then this product can freely be transferred to
any country and point in the EU (Bhandari, 2010). In this way, problems with PI could occur. The significance of the problem has been identified by several scholars. For example Kermani (2010) showed that in 2007 the parallel trade of pharmaceutical products, in the EU only, was €4.7 billion. In terms of other industries, Chen (2009) shows that in the EU between 5% and 20% of the trade of electronics, cosmetics/perfumes, soft drinks and music recordings were subject to PI. In addition, Xiao et al. (2011) reported that in the Information Technology (IT) sector, $5 billion in profit and $40 billion of sales are lost due to PI each year.

This research was conducted in Bulgaria, one of the poorest members of EU (Eurostat, 2012). Although it is among the sources of GM (Xiao et al., 2011), according to Swee-Lim et al. (2010) PI into Bulgaria also occurs. The proposed solutions in the literature for the prevention of PI lie primarily in the field of pricing strategies (Grossman and Lai, 2008). Another option is to control the demand for parallel imported products (Jen-Hung et al., 2008). Although, this study explored both pricing and non-pricing strategies, the focus is on non-pricing methods. This study intends to fill a gap in the literature about Bulgarian marketers’ practices by revealing successful methods for the prevention of PI or at least to investigate what local marketers consider to be effective.

LITERATURE REVIEW

“Price, availability and demand” are the important factors that enable PI to happen (Ecock, 2008). The usual flow of products is from a low priced to a high priced market (Grossman and Lai, 2008; Xiao et al., 2011). However, there is evidence that the flow can be vice versa (Swee-Lim et al., 2010).

Viewpoints of the manufacturer, reseller and end-user

Many scholars have explored the effects of PI from the perspective of the manufacturers and while some define it as negative (Chen, 2009), others find that there are positive opportunities to increase profits (Xiao et al., 2011). Some of the arguments as to why marketers try to prevent PI are that it leads to loss of “profits, brand equity, or market positions” (Zhuang et al., 2012). Some scholars focus on the revenue and profit problems for the manufacturers (Xiao et al., 2011; Chen, 2009). This limiting of profits can then limit manufacturers’ incentive to undertake research and development (R&D) (Grossman and Lai, 2008; Palangkaraya and Yong, 2009). However, Matsushima and Matsumura (2010) explored a model in which profits and the investment in R&D could be increased (Grossman and Lai, 2008).

Manufacturers have three general ways of reacting to PI; deterring parallel trade by using uniform pricing, accommodating a certain volume of parallel trade by the trader, or confining its operation to the developed country (Mazumdar and Rajeev, 2010). Stopping sales in certain countries is an option.
available to manufacturers (Palangkaraya and Yong, 2009; Grossman and Lai, 2008), however Autrey and Bova (2012) show that there are other examples of actions that manufacturers can take in order to “prevent” GM. These are; “differentiating products across regions”, “reducing arbitrage opportunities by modifying transfer prices or retail prices”, “fines”, “legal action”, and “withholding reward programs including manufacturer rebates and access to the newest products”. Lastly, there are others options to help control the demand for parallel imported products (Jen-Hung et al., 2008). Some of the possible ideas are sales promotions, comparative advertisements and increased service fees. In addition, control could be done via contracts (Su and Mukhopadhyay, 2012). Xiao et al. (2011) and Jen-Hung et al. (2008) reported that PI has a negative influence on the brand due to creating price instability, decreasing control over distribution channels, confusing customers, and as a whole, creating “customer dissatisfaction”. Xiao et al. (2011) have researched the effects of PI on the manufacturer in the light of different channel structures. They found that in some cases there are negative effects while in other cases there are benefits. In research done by Jen-Hung et al. (2008); Ecock (2008) and Thompson (2009) some benefits of PI are suggested, they suggest that; it enables unofficial market segmentation, it enlarges the competition between resellers which makes the price fairer to the end-user, it prevents some “cartel practices”, which lead to “short-term market efficiency” and it reaches more consumers. Furthermore, this increases the production volumes of the manufacturer as the goods are produced in their own facilities.

It is assumed in the literature that the authorised resellers provide a better service as the manufacturers have trained their staff and are charging a higher price to the customers (Chen, 2009). Whereas, the unauthorised resellers are looking for short-term benefits and are not expected to invest heavily in the brand or in the market (Jen-Hung et al., 2008). Palangkaraya and Yong (2009) pointed out that the authorised resellers usually make “substantial investments to improve business by undertaking promotions and market development efforts”. An argument against PI is that this practice is discouraging the authorised resellers as it reduces their incentive to invest in the market and in the brand. This is due to the fact that grey marketers are using the marketing activities made by official resellers and/or manufacturers and are selling without any investment – they are called “free-riders” (Miller, 2009; Flath and Nariu, 2008). Although the unauthorised resellers do not have the same costs, depending on the product they may need to invest in order for the product to reach the end-users. These costs may include some distribution, advertisement, re-packaging or re-labelling and some import duties (Mueller-Langer, 2012). Autrey and Bova (2012) argue that making the high priced market more competitive will decrease the power of the parallel importer. The usage of regular “trade promotions, quantity discounts, rebates,
charge backs, and co-op credits” can make the authorised reseller comparatively very competitive (Su and Mukhopadhyay, 2012).

However, the end-user is the real customer and PI provides some benefits to them in terms of lower prices (Thompson, 2009) as this process has the function of “international price arbitrage” (Palangkaraya and Yong, 2009). Thompson (2009) and Richter (2008) reveal that a 15% price difference is sufficient to start a parallel import. On the other hand, Rich (2012) reports that some negative effects are; food products with a different taste, a short shelf life, products without appropriate labelling and/or language, and the use of ingredients that are not used or illegal in the respective region. Thompson (2009) revealed that the grey products “may differ from regular manufacturer-supplied versions” in terms of the following – warranty, connectivity standards and language.

**Relationship marketing**

Usually the parallel imported products reach the end-users through some level(s) of distribution and it can happen that some of the official resellers are involved. In order to keep its authorised customers loyal, the manufacturer is supposed to take some action, mainly in the field of relationship marketing (RM) because, as Luo and Kumar (2013) point out, it is very important for the manufacturers to maintain good relationships with their customers. It is essential to focus on and understand every single customer and to reach them individually. Mende et al. (2013) stated that the RM “is guided by the principle of tailoring marketing activities to the individual customer”.

Some of the benefits of doing RM with customers are directly connected to the prevention of PI in terms of increasing sales and maintaining customer loyalty (Darvish et al., 2012). Additionally, in various pieces of research important dimensions connecting RM with business-to-business (B2B) relationships have been identified. Connected to GM are trust, satisfaction, commitment, relationship benefits, bonding, attractiveness of alternatives, shared values and mutual goals (McNally and Griffin, 2007; Theron et al., 2008; Hollyoake, 2009; Theron and Terblanche, 2010 and Dimitriadis and Papista, 2011). Hollyoake (2009) pointed out that loyalty has a close relationship to the quality of communication between the manufacturer and B2B customers. Dimitriadis and Papista (2011) connect relationship quality with the availability of products.

In the literature, there is not much information about practical ways that companies use to accomplish their RM goals. One example is the paper by Chimote and Srivastava (2011) which defines several practical tools/items in the banking sector that are used in relationships with customers.
METHODOLOGY

For the purpose of the study, four Research questions (RQ) were prepared in order to investigate the subject:

RQ1: Uncover what marketing tools marketers in Bulgaria use to fight against PI
RQ2: Understand which tools are pricing and which non-pricing
RQ3: Uncover what the key characteristics of the non-pricing strategies and tools are
RQ4: Understand which non-pricing tools are considered to be successful by marketers in practice

The information was collected using a qualitative method: semi-structured in-depth interviews. This method was chosen because at the time of the research the state of knowledge in Bulgaria about parallel trade was limited. Searching for data in such a field where there is such a lack of information is usually done using qualitative methods (Sinkovics and Alfoldi, 2012). The research was conducted as an exploratory study using interviews (Frels and Onwuegbuzie, 2013). Interviews are among the qualitative methods for collecting information and are used often when the nature of a problem is not known or not understood in detail (Bulgarea, 2011; Gilmore et al., 2006). For the purposes of the research non-standardised, one-to-one and face-to-face interviews were used. In order to keep the interviews in the field of PI, some questions were prepared in advance.

Sample

Based on Jen-Hung et al. (2008) contacts with marketing and sales managers were chosen. The choice of industrial sectors was made based on local information available to the researchers and the findings of Chen (2009). The chosen industries were IT/electronics, construction and fast-moving-consumer-goods (FMCG) like cosmetics, detergents, and food. Exploring different industrial sectors provides a more practitioner-based focus. 39 marketing and sales managers were contacted from 23 companies using purposive sampling (Sinkovics and Alfoldi, 2012). Most of the companies are among, or represent, companies that are market leaders according to a list provided by Scott DeCarlo (2013). Nine interviews were done and in Table I some basic information about the participants can be seen. The interviews were done during the period of May/September 2013 in Bulgaria.

FINDINGS

Research question 1: What marketing tools are the marketers in Bulgaria using to fight against PI?

The nine interviewees mentioned 16 different tools that are used to prevent PI – both in pricing and non-pricing strategies. Six was the average number of tools that each of the managers mentioned in both the pricing and non-pricing categories. The tools in alphabetical order are: ‘advertisement and brand support’; ‘consistent assortment’; ‘discounts’; ‘follow market trends’; ‘gifts/free products’; ‘harmonised price’; ‘internal information about other countries’; ‘information campaigns’; ‘legal measures’; ‘loyalty programs and contracts’; ‘point of sale (POS) support and store displays’; ‘promotional packs/extra products’; ‘promotions’; ‘pull promotions’; ‘relationships’; ‘training and education’ and ‘warranty’. Table II shows how many of the managers used the particular tools.

Research question 2: Understanding which tools are pricing and which non-pricing

The separation of the tools into pricing and non-pricing was made mostly by the interviewed managers. Although it potentially creates some discrepancy with the academic literature, in this study we followed the practitioners’ point of view. From the tools that were listed in the answer to RQ1, the managers recognised the following as ‘pricing’: ‘discounts’; ‘harmonised price’; ‘promotional packs/extra products’ and ‘promotions’. These were recognised as non-pricing: ‘advertisement and brand support’; ‘consistent assortment’; ‘gifts/free products’; ‘information campaigns’; ‘legal measures’; ‘loyalty programs and contracts’; ‘POS support and store displays’; ‘pull promotions’; ‘relationships’; ‘training and education’ and ‘warranties’.

There were two tools/measures that were not included in both categories, as they were more connected with the company’s strategies and internal opportunities. These were ‘follow market trends’ and ‘internal information about other countries’.

Research question 3: Uncover what the key characteristics of the non-pricing strategies and tools are

In the following section the non-pricing strategies and tools that were revealed in RQ2 are presented in further detail. ‘Advertisement and brand support’ are generally connected to the usual marketing activities (Flath and Nariu, 2008). It was assumed by the respondents that investing in the brand will help with sales and relationships with customers and therefore will help in reducing parallel trade, however this is sometimes used by free-riders.

‘Consistent assortment’, or simply the assortment, is reported by Chernev and Hamilton (2009) as a factor that can influence sales. In this research a connection was found with the level of parallel trade as this could distinguish between the authorised resellers and the parallel traders and establish a trustful relationships with customers. Participant P4 said:

“We maintain a full portfolio unlike the parallel importer, because they often buy what the deal is at any moment and they have several products with limited quantity and therefore they (customers) cannot rely on him to continuously deliver a certain portfolio.”

Gifts or free products were explained by the participants as a kind of promotion where, in addition to the product, another type of product is given. According to P7, this could be “plush toys that are
branded, cups and ... other”. This practice was connected directly with ‘pull or sell-out promotions’ which influence sales directly (Liu et al., 2011). P1 explained:

“We tell our customers – take this quantity from us, the price is not as attractive as the PI but we will offer you a sell-out promotion which will help you to sell-out, and gifts are a very effective tool for attracting the end consumer.”

An ‘information campaign’ explains to direct or indirect customers the reasons why they should not get supplies through parallel importers (Jen-Hung et al., 2008). While some of the participants use it, others have stopped because the market is more mature at present and there is no need. In terms of the third category, it is not relevant as the products were the same and such a campaign would be useless.

Legal measures are taken by some of the interviewed companies although PI is legal in the EU (Grossman and Lai, 2008) and in particular in Bulgaria and no restrictions exist to prevent this practice. P8 said:

“If someone is sourcing products without proper labels or selling without documents, we use the power of the law to prevent this.”

Loyalty programs and contracts are tools that were used by all of the interviewed managers. As mentioned by Su and Mukhopadhyay (2012) and Hollyoake (2009), loyalty and contracts can influence PI. P6 connected these programs with parallel trade fights:

“These are loyalty programs that are associated with either a cash bonus or a no cash bonus or additional products and are bound by a target. The goal is to achieve better targets, but also limit PI.”

However, some of the customers refuse to sign such contracts and to participate in loyalty programs. The explanation was that they do not want to be limited by these contracts and wanted to have more trading freedom.

‘POS support and store displays’ are connected with advertisements and brand support but are separated in this paper because they was separated by the interviewed managers. According to Flath and Nariu (2008), this can even influence the sales of free-riders. The two companies that use this tool reported positive effects on PI conflicts. P9 explains:

“The benefit for our customers is that they get a better perception of stores, better service and therefore (the stores) are more attractive in the eyes of end-users”.

‘Relationships, ‘RM’ and ‘relationships with the customers’ are terms that were used by all of the interviewees. However, not all identified them as tools against PI. Baring in mind that loyalty programs are usually associated with RM and the fact that all of the respondents practice some form of such programs, it is obvious that all of them practice ‘relationships with customers’. Some of them may not have mentioned this as a tool because it was considered to be trivial and its’ importance was
not realised. This is consistent with the literature (Darvish et al., 2012; Luo and Kumar, 2013; Theron et al., 2008), where RM and trust is mentioned to be very important and to influence PI. P9 said: “RM and customer relations – this is something that earns their trust and has a preventative effect.”

‘Training and education’ of resellers’/retailers’ staff enables them to explain the products and make the sales, as mentioned by P9. Mirpuri and Narwani (2012) suggest that this can help with sales and loyalty.

Offering a ‘warranty’ period and servicing of devices is practiced by three of the interviewed companies. Although some companies might have different pricing or even not accept warranties, all of the companies treated the products equally without any separation based on the supply source. This is similar to the literature (Jen-Hung et al., 2008; Thompson, 2009,) and helps to maintain the image of the brand. Regarding some problems, P9 said: “The commercial warranty period of products sold in Bulgaria may vary to ones offered in other countries … We cannot guarantee the supply of spare parts for non-EU products, since those might be different and non-compliant with EU safety regulations.”

Research question 4: Understand which non-pricing tools are considered to be successful by marketers in practice

Table III shows the successful non-pricing tools according to the interviews.

Table III Successful non-pricing tools

Table III can be analysed in two ways. The first is to see how many companies said that a particular tool is successful. This determines the order of the tools in the Table and suggests that ‘Relationships’ is leading among the interviewees. However, if we explore the success of the tools in terms of how many companies use them ‘training and education’ is the most successful.

‘Loyalty programs and/or contracts’ are in the worst position according to both criterion. One of the possible explanations is that the customers do not want to sign such contracts and became
disinterested in them. Additionally, the interviews collected information about the perceptions of the pricing tools. The successful pricing tools/strategies are presented in Table IV.

*Table IV Successful pricing tools*

Based on a similar analysis to that for Table III, Pricing strategies as a whole are the most used tool in the prevention of PI. However, as the main battlefield with parallel trade is the price, those tools are not always successful. The most successful tool was the harmonised price. The second manager, even though it is not used by him, noticed the importance of this tool.

**DISCUSSION AND CONCLUSIONS**

For the purpose of this paper, the tools can be categorised as preventive and reactive. This differentiation is made based on the timing of use of the tool in respect to the time of the introduction of the parallel imported products to the market. According to the respondents, the pricing tools are more reactive and the non-pricing tools are more often preventive. The successful tools are those which are less likely to be used by free-riders and are used more often as preventive – ‘training and education’, ‘relationships’ and ‘harmonised price’.

The interviewed companies can be divided into two groups based on their industry sectors and their product type. The first group shows the companies from the FMCG sector with a sub division into Food and Non-food. The rest of the companies are in the second group called ‘other’. Five of the tools were used by both groups: ‘advertisement and brand support’, ‘consistent assortment’, ‘loyalty programs and contracts’, ‘promotional packs/extra products’ and ‘relationships’. Three of the tools were used by both FMCG sub groups: ‘discounts’, ‘gifts/free products’ and ‘promotions’. Legal measures were used only by companies in the Food FMCG sub group, while information campaigns were only used by companies in the Non-food FMCG sub group. The companies in the ‘other’ group were specifically using ‘harmonised price’, ‘Point of sale (POS) support and store displays’, ‘training and education’ and ‘warranties’. Due to the specifics of the business, it seems that the companies in the ‘other’ group could benefit from using preventive tools more often and eventually could become more successful in the prevention of PI.

This study explored the various tools that can influence the demand and the usage of parallel imported products. With the proper application of the right tools, in each case a company can
significantly reduce the levels of an unauthorised move of goods. The companies that relied on RM, developed relationships with their customers and adapted to changes in the business environment were more successful in the prevention of parallel trade.

There are several theoretical contributions this paper makes. The first is that it fills the gap in the literature regarding the practical tools/methods that marketers are using against PI. Second, it develops our perspective on some of the tools. Thirdly, it researches a connection between RM and PI. As this paper investigates the practitioners’ actions and tools, it provides some managerial implications too. First, it shows that the most successful tools have a preventive effect. Good relationships are a key factor in the prevention of, and reaction to, parallel trade. The ‘advertisement’, ‘POS’, ‘brand and promotional tools’ and activities which cannot be used directly by free-riders can help in the relationships with customers, can improve sales, and can also reduce the level of parallel trade. The managers should search for new and attractive ways of developing relationships with their customers via loyalty programs and/or contracts. Finally, the managers may find it successful to offer tailored actions and tools directed to specific company or types of companies, as relationships and needs may vary significantly.

This is probably the first study that addresses the methods used by marketers in Bulgaria to fight against PI. However, the study is not free of limitations. First, it is limited in quantity so generalisations could not be made. In addition, the experiences of relatively big companies were explored, while smaller ones could have different practices. Finally, the research was limited to companies operating in this country. Further research could explore more companies and their practices. Additionally, research could be done from the perspective of the companies who resell parallel imported products. Finally, further research could provide more information about different countries and could research the practices of one company in the various regions it operates in.

The Future of Entrepreneurship

THE ENERGY CURRICULUM: CHALLENGING THE HIGHER EDUCATION IN GREECE & CYPRUS

Kontakos, Panagiotis

Department of International and European Studies, University of Macedonia, Greece

THALES Programme has been co-financed by the European Union (European Social Fund - ESF) and Greek national funds through the Operational Program “Education and Lifelong Learning” of the National Strategic Reference Framework (NSRF).

ABSTRACT

The size and prospect of drilling substantial offshore oil and gas reserves in the Eastern Mediterranean, but also in the Ionian Sea, and the new requirements for development of extended energy infrastructures, have an unprecedented capacity not only to turn-around the current state of the economies of Greece and Cyprus, but also to profoundly shape their future economic, social, production, employment, geopolitical and geo-economic profiles for at least the coming 30 years. Accordingly, the need to reformulate their curriculums of higher education arises as an imminent strategic priority.

Considering that “energy” consists, most likely, the vastest discipline to study, the author asserts that the future energy curriculums in the two countries will need to encompass at least the following features: new-disciplinary, interdisciplinary, sustainability, cross-country and cross-region oriented (in the context of Eastern Mediterranean, Middle East, South-Eastern and Central Europe, Black-Sea).

The aim of this article is three-fold: firstly, to review the profile, structure, and penetration of energy related studies in the academic discipline of social sciences, as extracted from the curriculums of universities in Greece & Cyprus; secondly, to provide a literature review of respective curriculums worldwide and assess the suitability of such programs in the local context and perform comparisons with the global context; thirdly, to use the outcome of this paper as an input for other parallel work, in the structuring and development of a new
energy curriculum proposal in the fields of economics, business, finance, and management studies in Greece and Cyprus.

Keywords: education management, higher education, energy curriculum, energy economics, management, finance, business, Greece, Cyprus

INTRODUCTION
The size and prospect of drilling substantial offshore oil and gas reserves in the Eastern Mediterranean, but also in the Ionian Sea, as evidenced in the last years in the case of Cyprus, and recently by geological and seismic data in the case of Greece, along with the need for development of extended energy infrastructures, have an unprecedented capacity not only to turn-around the current state of the economies of Greece and Cyprus, but also to profoundly shape their future economic, social, production, employment, geopolitical and geo-economic profiles for at least the coming 30 years. These developments are further discussed in the next section of the paper.

In parallel, EU’s energy strategy for the period up to 2020, builds on eight priority corridors for electricity, gas and oil. Accordingly, on October 2013, a number of 248 energy infrastructure projects of common interest were selected and assessed as the most critical to implement from a European perspective (European Union, 2014a). The respective priority corridors to cross or be undertaken by Greece and Cyprus are expected to assign to both countries a major role or even establish them as a regional energy hub; these corridors are presented in more detail in the third section of the paper, in order to emphasize the significance of the subject.

In turn, in the fourth section of the article, the structure and penetration of energy related studies in the academic discipline of social sciences are examined, based on a review of the existing curriculums of universities in Greece and Cyprus; finally, by performing a literature review of respective curriculums worldwide, it is evaluated the suitability of such university programs in the local context and comparisons are performed with the global context.

OFFSHORE OIL AND GAS POTENTIAL IN GREECE AND CYPRUS
The emerging opportunities in the areas of offshore oil and gas exploration, extraction and management in Greece and Cyprus, have an unprecedented potential to reshape their entire profiles, at least during the first half of the 21st century. As the Greek PM announced in October, 2013 in the Hellenic Initiative forum in the United States, Greece, Cyprus and Israel have the capacity to cover the 50% of the needs in natural gas in Europe during the next 30 years (SKAI News, 2013).
More recently, the Greek Environment, Energy and Climate Change Minister presented on July 1st, 2014 Greece’s programme for offshore hydrocarbon exploration concessions in the Ionian Sea and south of Crete, during an event held in London. He presented the findings of seismic surveys in the area and also analysed the broader geopolitical framework, ahead of a tender to be launched in the coming period. The presentation included data from geological surveys covering 225,000 square km and the interpretation of this data, carried out by the French oil and gas consultancy BEICIP-Franlab. The Greek minister described the country’s potential as an energy hub, that stands “at the crossroads of western and southeast Europe and the new and traditional sources, making Greece the EU’s gateway for the Southern Corridor”.

The tender will be for test drilling in 20 blocks, defined on the basis of 50 parameters that include the depth of the seabed, geology and the environmental conditions revealed by a Strategic Environmental Impact Study, as well as the data from the seismic surveys. The minister’s presentation included the legal and financial framework that will govern the exploratory drilling, such as a new law on concessions incorporating the latest trends and best practices internationally, a stable and predictable environment for investors, a favourable tax regime (halved from 40 pct to 20 pct) to make investments competitive, the Hellenic Hydrocarbon Resources Management SA company set up to supervise the sector, while stressing this would be governed by EU rules on the safety of offshore drilling activity (ANSA News, 2014).

In 2011, significant offshore reserves of approximately 7 trillion cubic feet of natural gas were found in Cyprus’ Exclusive Economic Zone (EEZ). In October 2013, Houston-based Noble Energy, the licensee for block 12 in Cyprus’ EEZ, performed appraisal drillings in block 12. The results have confirmed natural gas reserves of 3.6 to 6 trillion cubic feet (tcf), with a gross mean of 5 tcf. At a second licensing round, licences for hydrocarbons exploration in offshore blocks have been awarded by the government for blocks 2, 3, 9, and 11, all adjacent to block 12. Specifically, blocks 2 and 3 were licensed to a consortium of Italy’s ENI and Kogas from South Korea, block 9 to a consortium of the French company Total (operator), Novatec and GPB Global Resources. Total was also granted hydrocarbon exploration licences in blocks 10 and 11, after signing two production sharing contracts with the Ministry of Energy in February 2013. Total has also been granted a licence by the Agriculture Minister for seismic exploration for oil and gas in block 10 and in parts of blocks 6, 7 and 11 of Cyprus’ EEZ.

More licences are due to be awarded as the government continues to evaluate the bids for the remaining blocks, with the exception of blocks 1, 4 and 13 for which no bids have been made. The government expects to complete the required infrastructure, including the pipelines and liquefaction plant, by 2018 and begin exporting natural gas in 2020 (Antoniou, 2014).
Speaking at a conference organised in July 2014 by the European Commission and the Governments of Cyprus and Malta, the country’s Minister for Energy, Commerce, Industry and Tourism, underlined that "Cyprus, as the southern most EU member state in a volatile and troubled region, has the potential to become a regional liquefaction hub and contribute to the long-term geopolitical stability, promoting peace and economic development."

PROJECTS OF COMMON INTEREST IN GREECE, CYPRUS AND EASTERN MEDITERRANEAN

In October 2011, the EC listed a complete package to boost trans-European infrastructure development in the areas of transport, energy and information society. Respectively, the Energy infrastructure package is comprised of legislative guidelines, proposals for setting up the infrastructure policies and the Connecting Europe Facility (CEF), providing financial aid (Kontakos and Zhelyazkova, 2014).

In this context, the term energy infrastructure covers electricity transmission lines, gas, CO2 and oil pipelines, Compressed Natural Gas, Liquefied Natural Gas reception facilities and electricity and gas storage.

The trans-European energy infrastructure guidelines identify eight priority corridors & four thematic areas that must be implemented in the coming decade. Further, to materialize these corridors/areas into tangible projects, the guidelines consider a new approach of identifying energy infrastructure projects that can obtain the label of Projects of Common Interest (PCIs). Thus, to qualify for financial support under the CEF, projects must firstly be recognized as PCIs. The final Union-wide list was approved in October 2013 and includes 248 CPIs, based on several criteria, such as a cost-benefit analysis (CBA), to demonstrate added value toward the achievement of EU’s energy overall energy goals and cross-border benefits that can further act as a mechanism to facilitate cost allocation among EU members.

In Figure 1 are depicted the eight priority corridors included in the Energy infrastructure package (European Union, 2014b, c). Among these corridors, the Southern Gas Corridor is expected to be of particular interest in the cases of Greece, Cyprus and Israel, as it directly involves respective infrastructure development for the transmission of gas from the Caspian Basin, Central Asia, the Middle East and Eastern Mediterranean Basin to the Union to enhance diversification of gas suppliers.
The major strategic perspective of the Southern gas corridor is two-fold: to bring new gas sources to the EU, and diversify particularly concentrated markets in SEE. The rationale is to directly link the EU gas market to large deposits of gas in the Caspian Region & Middle East (estimated at 90.6 tcm; for comparison, Russian proven reserves amount to 44.2 tcm) and the Eastern Mediterranean basin. Furthermore, the gas fields are geographically even nearer than the main Russian deposits (Figure 2).

The planned transit routes for these gas volumes are through Turkey, the Black Sea and the Eastern Mediterranean.

The pipeline components will also be improved for transporting substantial supplementary quantities of LNG to Europe, mainly from the Middle East. Initially this will be implemented with the construction of LNG reception points in Europe and via inter-connections to the wider network.

The strategic aim of the corridor is to accomplish a supply route to the EU of approximately 10-20% of EU gas demand by 2020, equivalent nearly to 45-90 bcma. Finally, the Southern Gas Corridor will essentially be an additional supply corridor to the existing ones from Russia, Norway and North Africa.
In Figure 3 below are depicted the specific projects in SEE and Eastern Mediterranean regions. Further to the Southern Gas Corridor already discussed, of particular interest is the development of a gas corridor for the transmission of gas produced offshore in the Eastern Mediterranean (mainly Cyprus and Israel). In addition, the EuroAsia Interconnector is already under construction to link Greek, Cypriot and Israeli power grids via the world’s longest submarine power cable with length 287 km and a power rating of 2,000 MW, with expected completion by 2016.

A REVIEW OF ENERGY EDUCATION IN SOCIAL SCIENCES WORLDWIDE
A review of other worldwide studies has been performed by the author, on how energy related education is incorporated in universities curriculums (Kontakos, 2014). The main conclusions of the review include:
The subjects of “sustainability” and “sustainable development” occupy significant part in the suggested curriculums (Blewitt et al., 2004, Sherren, 2005). Several surveys have been performed since 2001 by universities in UK, US, Australia, Spain mainly in engineering studies (Desha and Hargroves, 2010).

Renewable energy education has also attracted significant academic research. In the case of Turkey, it is addressed mainly by engineering courses and at encyclopedic level (Karabulut et al., 2011).

Several surveys aim to ascertain the extent of energy efficiency education (Desha and Hargroves, 2010) or carbon reduction education (Chen at al., 2013). Zografakis et al (2008), describe the results of an energy-thrift information and education project taking place in different levels of education in Crete, Greece, which records 321 students’ and their parents’ routine energy-related behaviour. Also, in a recent paper, undergraduate energy education in Greece is compared with relevant accredited engineering courses of the UK (Gelegenis and Harris, 2014).

Energy and environmental policy have been two rapidly developing inter-related subfields within the broad area of natural resource policy which are of considerable contemporary interest (Hamilton, 1983).

“Environmental economics” are an established subject globally, but only at a very limited extent in South-Eastern Europe (SEE) countries.

The major methodology used in the last decade to assess the extent at which energy education is incorporated in other fields is the questionnaire survey, principally at national level, and within engineering disciplines. However, there has not yet been a comprehensive assessment of the extent of various contents/directions included in energy education globally, or an assessment of whether critical energy literacies have been incorporated into social sciences curriculum.

The author suggests several possible reasons for this lack of a comprehensive assessment, including:

- Difficulty in assessing the extent to which “energy” knowledge & skills are embedded within the curriculum, due to the wide range of the term.
- The time and resource intensive nature of conducting a global survey across the thousands of departments offering social science degrees in many different languages.
- Potential reluctance of professional organizations, accrediting bodies or the universities themselves to reveal the results of performed surveys, as these may consist a competitive advantage in their planning, resourcing and accreditation programmes.
- Globally, a priority and traditional focus has been given in energy context in engineering curriculums only; As such, it is characterized by a lack or low degree of inter-disciplinarity.
In some countries, such as in the cases of Greece & Cyprus, the lack of related previous experience in industrial development, has further limited the relevant knowledge.

ENERGY EDUCATION IN GREECE AND CYPRUS

A review of the existing curriculums of universities in Greece and Cyprus was performed, to examine the structure and penetration of energy related studies in the academic discipline of social sciences. The main conclusions aforementioned by the author in the previous section apply also in the case of the two countries. Further, it can be concluded overall that higher education in Cyprus is characterized by the existence of more advanced levels of energy related curriculums, most of which have gradually appeared in the last five years, in comparison with Greece, where an effort has only been recently undertaken to introduce and establish related courses. Particularly, main conclusions from the review included:

- Lack of a comprehensive assessment at a national level to assess the extent of various contents/directions included in energy education in Greece and Cyprus;
- No local or very limited academic research was identified to have been performed related to the subject;
- “Environmental economics” and “Energy economics” cannot be supported that have been established as a subject of studies in Greece, particularly, and Cyprus;

Indicatively, energy related higher education, cooperation and research provided in the two countries has been initially associated with the activities underlined in the next paragraphs.

a) Cyprus

Some Higher Education Institutions have started to consider the opportunities provided by the rising new industry and offer a number of vocational and academic programmes of study in Bachelor and Master’s level relevant to the field.

1. In late 2007, MIT and the Cyprus Institute (CyI) launched a research and educational collaboration between energy, environment and water programs at the two institutions. Since then, the initial joint research projects have made substantial progress, new ones have been introduced and several postdocs funded by CyI have visited MIT to participate in the research, mainly in the fields of energy systems and engineering. Also, coordinated by CyI, an international group of scientists is involved with climate change studies and their social, economic and environmental consequences in the Eastern Mediterranean and North Africa.

MIT is collaborating on projects through its Cyprus Institute Program for Energy, Environment, and Water Resources (CEEW), which is housed within MIT’s Laboratory for Energy and the Environment (LFEE). The LFEE cooperated in the development of CyI’s Energy, Environment, and Water Research
Center (EEWRC). The EEWRC works in close collaboration with the Massachusetts Institute of Technology (MIT), the Max Planck Institute for Chemistry, the Cyprus Research Promotion Foundation (RPF) and many national institutions and organizations in Cyprus and the region. (EEWRC site, 2014).

2. From the review performed by the author, the most advanced effort to establish energy related courses has been undertaken by the University of Nikosia. Particularly, the following programmes of interest were identified (University of Nikosia site, 2014):

- BSc Energy, Oil and Gas Management, that takes place in 8 semesters. The program provides students with overall knowledge relating to the field of energy, oil and gas management. Students obtaining the Bachelor of Science degree in Energy, Oil & Gas Management have several opportunities for further studies: a) A Master of Science (MSc) degree in Oil and Gas or Energy Technology; b) Another related post-graduate degree such as the Master in Laws (LLM) degree with a related specialization. This Masters will not qualify them as lawyers but the knowledge gained will be substantial and very useful; c) A professional qualification, such as the ACCA or the Institute of Marketing for specialized knowledge in a business functional area which will be an ideal combination with their previous undergraduate background.

- Business Administration with Concentration in Energy, Oil and Gas Management (BSc, 4 years cycle) and Master in Business Administration with concentration in Oil, Gas and Energy Management (2 year cycle).

3. The European University Cyprus has established the following courses:

- Business Studies - Energy Resources Management (Oil and Gas), 4 Years, Bachelor of Business Administration. Graduates of the program are expected to be able to deal with financial and administrative matters relating to the areas of energy, oil and gas as well as the evaluation of the regulatory systems in the energy sector, environmental and climate change issues and renewable energy sources (European University Cyprus site, 2014).

4. The Levantine Training Centre (LTC) of ShipCon Limassol is a training centre of excellence for professionals involved also in the areas of Oil & Gas. LTC offers accredited and non-accredited courses covering a wide range of expertise in Continuous Professional Development of professionals. It has entered to agreements and formed strategic alliances with renowned world-class training providers with extensive experience and capabilities in the area of Oil & Gas professional training. The LTC courses are conducted in association with the London School of Energy Studies (LSES) and they are accredited by the Energy Institute of UK and professional bodies such as NEBOSH, IOSH and OPITO. (Levantine Training Centre site, 2014).
5. Finally, although not directly related to the subject of higher education, it is worthwhile to mention the Cyprus Energy Agency, which focuses on educational activities and presentations in schools in Cyprus. One of its main objectives is to provide systematic education, information and training sessions which address energy efficiency and renewable energy. Since April 2009, when began its education activities, the Energy Agency has visited more than 90 schools – covering all educational levels. The Agency has addressed more than 15,000 students and 1,000 teachers on the topics of renewable energy, energy saving, sustainable transport and environmental protection (Cyprus Energy Agency site, 2014).

Permanent Secretary of the Ministry of Energy, Commerce, Industry and Tourism, recently said that “according to a study by the Human Resources Development Authority, it is anticipated that more than 5000 jobs will be created in the hydrocarbon sector by 2019.” Therefore, he added, “all the players: the Government, academia and industry must come together to establish the supply chain of well trained professionals that this new industry demands to function efficiently, thereby maximizing benefits and meeting the high expectations of our society”. In this context, he said, “we have started a dialogue with a number of universities in Cyprus. At first, we are investigating the possibility of offering a number of scholarships to Cypriot graduate students on related subjects. We are also looking into the possibility of placing a number of students or recent graduates in companies” (Source: Famagusta Gazette, 2014).

b) Greece

The Department of International & European Studies of the University of Piraeus recently established a new Master’s Program in Energy (MSc in Energy): Strategy, Law & Economics, to run for the first time in the academic period 2014/15. This is the first Master’s program in Greece and one of the few programs in Europe dedicated to Energy strategy, law & economics. The curriculum of this Energy Master’s program has been designed under an interdisciplinary approach, echoing the demands and expectations of the market where strategy, policy, law and economics are closely intertwined. It aims at the direct access of its graduates in the market. Therefore, it incorporates, besides the scheduled lectures and seminars, talks and presentations by executives in companies of the energy sectors such as power plants, refineries and supply terminals, as well as academic visits in research institutes, regulatory authorities and think tanks.

After completion of the 2nd Semester and as part of the elaboration of their Master Thesis, students have the opportunity for practical training in companies and organizations related to the field (University of Piraeus site, 2014).

CONCLUSIONS
Europe is at an unprecedented junction for its immediate energy future. To achieve its energy and climate goals of “20-20-20 by 2020” a number of 248 energy have been recently selected and assessed as the most critical to implement from a European perspective. In parallel, the discovery of substantial quantities of natural gas within the Exclusive Economic Zones (EEZ) of Greece and Cyprus, opens new perspectives and creates a new impetus for the two countries to become key European energy market players. The respective priority corridors and infrastructure projects to be developed in both countries are expected to establish them as a regional energy hub. Accordingly, the need to reformulate their energy curriculums in higher education arises as an imminent strategic priority.

The current energy curriculums in Cyprus can be considered as more advanced in comparison with in Greece, where are primarily limited in the field of engineering studies. In both countries, no comprehensive national study has been performed in the case of social sciences; accordingly, several reasons were underlined, both at global and local levels.

Considering that “energy” consists, most likely, the vastest discipline to study, the author emphasizes that the future energy curriculums in both countries will need to encompass the following features: new-disciplinary, interdisciplinary, sustainability, cross-country and cross-region oriented (in the context of Eastern Mediterranean, Middle East, South-Eastern and Central Europe, Black-Sea).

The critical role that the countries are expected to undertake by 2020, provide new opportunities for partnerships and collaborations with other countries with vast industrial experience and infrastructure. This will facilitate the development of strong academic programs and create a significant research basis in the region. It is only through investing in human capital that both countries can successfully manage and benefit from their natural resources in the coming years and ensure sustainable growth and innovation.

A NEW APPROACH FOR ESTIMATING THE EXPECTED FDI INFLOWS:
THE TIP MODEL AND ITS APPLICATION IN THE TURKISH BANKING SECTOR

Kontakos, Panagiotis

Department of International & European Studies, University of Macedonia, Greece.

ABSTRACT
The aim of the paper is to present a newly developed top-down model, the so-called TIP model, to assess the potential FDI inflows in the banking sector of a country. Asset valuation principles, which were applied by the buyer to the target in other M&A transactions and are based on the price-to-book ratio, are used as a benchmark for the estimation of future FDI inflows.

The main function of the TIP model, in order to quantify the potential size of foreign investment, is to convert non-foreign-owned shareholder equity values to potential FDI inflows, by using historical price-to-book valuations as a vehicle. Although this method is widely used in international business practice for the valuation of individual M&A transactions, in the case of the TIP model it is applied at a top-down level for the total sector, and as such provides a unique, practical way to estimate the expected inflows. Further, a scenario analysis can be performed, by using various combinations of the input parameters of the model, which can also assist governmental decision making regarding privatizations. The applicability of the model is compared with other existing approaches used in the determination of future FDI inflows. Finally, to validate the model’s functionality, the Turkish banking sector is used as an applied case study.

Keywords: Foreign direct investments, mergers & acquisitions, valuation model, TIP model, banking, international business, scenario analysis, Turkey

INTRODUCTION
Turkey has been a leading example of reform-driven growth acceleration in the period 2001–2011. The turning point in the revival of the Turkish economy could be identified as the period starting after 2002. The collapse of a vicious cycle of serious failures of macroeconomic policy, largely characterized by first, a vast, ineffective public sector that was accumulating public deficits, which in turn were monetized through a centrally controlled and insolvent banking sector, and second,
prolonged political uncertainty, culminated in the financial and economic crisis of 2000–2001. This crisis was the worst so far, and of such magnitude as to cause a wave of reforms. The financial sector liberalization reforms introduced since the 2001 crisis placed the Turkish banking sector on a sound foundation and attracted significant inward foreign direct investment (FDI), amounting to US$39 billion during the decade 2000–2012 (CBRT, 2013; Kontakos, 2011).

The objective of this paper is to present a newly developed top-down model, the so-called TIP model, to assess the potential FDI inflows in the banking sector of a country; respectively, to validate the model’s functionality, the Turkish banking sector is used as an applied case study.

Asset valuation principles that were applied from the buyer to the target in other M&As in Turkey were used as a basis for estimating future FDI inflows, and are incorporated in a newly developed and presented top-down model, the so-called TIP model. The paper asserts that the distinctive growth attractiveness, large size in total assets, low penetration of financial services, and low market share of foreign-owned banks in the Turkish banking sector, versus the CEE and SEE banking sectors, can trigger substantial FDI inflows to Turkey from banks in developed economies. The size of these future FDI inflows is attempted to be evaluated through the use of the TIP model. Additionally, inflows in the banking sector can have a multiplier effect in stimulating FDI inflows to other sectors and can spread a further new dynamic in the Turkish economy. In my view, however, geopolitical stabilization, internal political cohesion, and further democratization deepening in Turkey are prerequisites for this to be materialized in the medium term.

The paper is structured as follows: First, to introduce the reader in the specifics of the Turkish banking sector, its historical evolution is summarized, including FDI trends and privatizations, foreign M&A, and the capital size of investment. Second, considering recent local M&A deals in the Turkish banking sector, the aim is to estimate the total size of future FDI inflows, by using respective asset-valuation ratios and multiples incorporated in the TIP model. The conclusions follow in the last section.

As author of the article, I would like to express my gratitude to my ex-colleagues, Theodore Karakasis and Ioannis Tegopoulos, general managers in the International Activities of Eurobank EFG Ergasias, for their valuable implicit contribution of knowledge. Furthermore, the so-called “TIP Model,” presented in the paper, has been named from the first-name initials of the aforementioned colleagues and myself. Eurobank EFG group is a European banking organization based in Athens, Greece, with total assets of €81.6 billion and presence that has previously reached 10 countries (as of end 2011).
EVOLUTION OF THE BANKING SECTOR IN TURKEY

The presence of foreign banks in Turkey can be traced back in the 19th century (Banks Association of Turkey, 2009; Encyclopedia of the Hellenic World, 2008). In the period that began after the establishment of the Republic of Turkey in 1923 and lasted until 1980, the banking sector was primarily under the control and influence of a centralized government, and was part of a planned economic policy. No licenses were granted in this period for establishing new foreign banks, except in few cases.

In 1980, four foreign banks (among 40 banks in total) were operating in Turkey, controlling 3.0 percent of the total assets in the banking sector. The gradual integration of the Turkish economy with the international financial system, accompanied by a process of financial liberalization and the lessening of regulatory barriers to the entry of foreign banks, encouraged foreign direct investments (FDI) and accelerated the entry of foreign banks into the Turkish banking sector after 1980s. During this period, foreign banks generally expanded by opening and operating branches; they were mostly focused on wholesale banking to serve their corporate customers. As a result, 18 foreign banks had been established by 2001. Despite the increase in the number of foreign banks, the share of assets of foreign banks in the total assets of the banking sector remained low. The assets of the foreign banks represented 3.2 percent of the total assets of the 61 banks operating in 2001.

The serious involvement of foreign banks in Turkey coincides chronologically with the reforms and progress achieved in the aftermath of the 2001 economic and financial crisis in Turkey, which made the banking sector profitable and attractive to foreign investors.

The banking sector effectively resisted the pressures and systemic risks from the instabilities that emerged in the global financial system and markets during 2008–2009; Turkish banks did not turn to state financial assistance to improve their capital reserves. The average Tier 1 capital ratio has declined, owing to an increase in risk-weighted assets on the back of a rebound in credit markets, but has remained high. As of December 2012, the capital adequacy ratio was standing at 17.9 percent, well above the average in the European Union. Credit quality problems in developed economies, arising from the US subprime loan crisis and the euro area sovereign debt crisis, have affected indirectly the operations of foreign banks in Turkey. Potential buyers stand to benefit from the financial difficulties of a number of European and American banks, which invested in Turkish banks a decade ago and are now selling because of their own troubled balance-sheets. Citigroup, for example, shed half of its 20% stake in Akbank, among the country’s top-five banks, in December 2013. Overall, deleveraging in the region by European banks has created opportunities currently exploited by Gulf banks.

As of December 2012, 49 banking institutions were operating in the Turkish banking sector; 32 of them were commercial banks (out of which 3 were state-owned deposit banks, 16 foreign banks, 12
private privately-owned deposit banks and 1 under the Deposit Insurance Fund), 13 were development and investment banks, and 4 were participation banks.

The commercial banks do not have participation accounts and the participation banks (dealing with Islamic banking) are not licensed to accept deposits. The development and investment banks are not allowed to issue deposit and participation certificates.

Mergers between Turkish banks have been rare, resulting in a high degree of concentration. The top 10 banks concentrated 87 percent of the total assets in the Turkish banking sector in 2012, 89 percent of the total net profit, 87 percent of the branches, and 84 percent of the employees (The Banks Association of Turkey, 2013).

A few large domestic banks, some state-owned and some private, dominate the financial sector. The private banks are often members of conglomerates with widely dispersed holdings throughout the economy. Banks often control as subsidiaries many major nonbanking financial institutions, such as insurance companies, mutual funds, factoring firms, and financial leasing companies (EIU, 2010). Turkey’s largest lender in asset terms in 2011 and 2012 was the privately-owned Is Bank. Its main private-sector rivals include the state owned Ziraat Bank and the privately-owned Garanti Bank, Akbank, and Yapi Kredi Bank.

At end December 2012, majority foreign-owned banks accounted for 13 percent of Turkish banking assets, 13 percent of total deposits, 14 percent of total loans, 20 percent of the branches network, and 14 percent of the employees, according to the Banks Association of Turkey. The main foreign players, in order of asset size, are Finans Bank (majority owned by National Bank of Greece), Denizbank (owned by the Franco-Belgian bank, Dexia), HSBC (UK) and ING (Netherlands).

Several major banks that are majority-owned Turkish banks have minority foreign shareholdings. These include Akbank (10 percent is owned by Citibank Overseas Investment Corporation); Garanti Bank (25.01 percent is owned by the Spanish BBVA, Banco BilbaoVizcaya Argentaria S.A); Sekerbank (33.98 percent is owned by an asset fund of the Government of Kazakhstan); and Yapi Kredi Bank (Koc Financial Services is the owner of 81.8 percent, in which the Italian Unicredit holds a participation of 50 percent and thus indirectly controls the 40.9 percent of Yapi Kredi Bank). Also, Turk Ekonomi Bank, in which BNP Paribas (France) has a large minority share of 34.43 percent, merged with the local unit of Fortis in March 2011. BNP Paribas had acquired Fortis’s Turkey unit when it bought the Belgian portion of the defaulted bank in 2009.

Based on the aforementioned minority participation shareholdings, foreign banks control an additional US$70,771 million, or 9.7 percent of total assets. When this is added to their majority participation of 13.4 percent, the adjusted market share in total assets reaches 23.1 percent.
The Turkish banks acquired by foreigners, in the period that followed after the restructuring of the banking sector, are presented in Table 1. One of the most sizable acquisitions in financial terms was announced in November 2010 by the Spanish BBVA, which agreed to pay US$5.8 billion for 24.9 percent of Garanti Bank, with an option to take full control in five years. General Electric was the seller of 18.6 percent for US$3.8 billion and Dogus Group of an additional 6.3 percent for US$2.1 billion. With an initial US$1.8 billion investment in Garanti in 2005, GE Capital realized US$5.2 billion in total proceeds, from dividends and the sale of the Garanti holdings, upon completion of the transaction.

The second acquisition in value was realized by the National Bank of Greece, which acquired a cumulative 90.1 percent stake in Finansbank for a total amount of US$5.3 billion in the period 2006–2008.

Russia’s biggest bank, Sberbank, is one of the newcomers with a chance of challenging the top five. In September 2013 it bought Denizbank for US$3.8 billion, Turkey’s tenth-biggest, from Dexia, a cash-strapped Belgian lender. The Russian bank is also adding 22 retail branches acquired by Citibank. Sberbank is the first Russian lender to buy a bank in Turkey. The deal would be the largest in Eastern Europe, the Middle East and Africa in 2013 and the biggest in Turkey since BBVA’s acquisition.

</table>

Also, in 2008, the National Commercial Bank (NCB) acquired 60 percent of Turkiye Finans Katilim bank for US$1.1 billion. NCB is the largest bank in Saudi Arabia; the acquisition represents the largest ever transaction in the interest-free Islamic banking sector in the world, and underlines the growing importance of this particular segment of the banking industry. It was NCB’s first major foray outside Saudi Arabia’s borders.

Based on the data of the Banks Association of Turkey, the total number of banking institutions decreased from 61 to 45 in the period 2001–2012, out of which 16 were foreign banks. Accordingly, the total assets in the banking sector have increased by 453 percent to US$730 billion and the loans have increased by 1395 percent to US$433 billion; the respective increases were significantly higher in the case of foreign banks.

Turkish banks were broadly profitable after 2002, although earnings were characterized by variability as a result of the impact of global financial turmoil. Profitability declined in 2008, but recovered by 52 percent in euro terms in 2009, as the spread between deposit rates and lending rates widened and loan provisions declined. Profit growth was much weaker at around 14 percent in 2010 and has remained stable in the period until 2013, reflecting the lower net interest income on contracting loan-deposit spreads, net interest margin erosion, intensified by mounting competition, and narrowing fees on relatively weaker loan originations.

Finally, as revealed by the relevant data, there is a significant expansion of the branch networks of foreign banks, which reached 2,012 branches in 2012 (or 20 percent of the total) from only 233 in 2001, whereas the staff employed in foreign banks within Turkey increased to 38,772 (or 21 percent of the total in the sector) from 5,395, and considerably exceeded the respective increases in the local banks. In particular, the total increase by 48,603 in employment in the Turkish banking sector during 2001–2010 can be attributed mainly to foreign banks.

THE TIP MODEL ASSESSMENT OF POTENTIAL FDI INFLOWS IN THE TURKISH BANKING SECTOR

The aim of this section is to assess the potential FDI inflows into the Turkish banking sector by utilizing other recent deals or acquisitions as a benchmark. Asset valuation principles, which were applied by the buyer to the target in other M&A transactions in Turkey and are based on the price-to-book ratio (P/B), are used as a basis for the estimation of future FDI inflows. It can be argued that the price-to-book ratio is the most widely applied and quoted ratio in all bank acquisitions internationally, and particularly in the CEE and SEE region.
The price-to-book ratio (P/B), also known as the price-equity ratio, is the ratio of the market value of equity to the book value of equity, where the book value is the shareholders’ equity on the balance sheet.

\[
\text{Price-to-book ratio} = \frac{\text{market value}}{\text{total shareholder equity}}
\]

In our case, the market value refers to the value paid by the acquiring bank to the target bank. To evaluate potential future acquisitions, and the respective amounts, previous disclosed price-to-book ratios from the period 2005–2012 are used as benchmarks. Overall, after a correction in the price-to-book ratios during the period of the global economic crisis, the price-to-book ratio started trending up again in 2011, pointing to an augmented international demand for Turkish banking assets, particularly in comparison with other regional markets; it declined again in 2012, reflecting the need of some European investors to divest from Turkey due to financial and capital difficulties in their home countries. As shown in Figure 1, the ratios range from a maximum of about 5.8 to a minimum of 1—that is, the price per share paid by an international investor to acquire a local bank in Turkey was within a range of 5.8 times the book value per share of the target, as when National Commercial Bank (NCB) acquired 40 percent of Turkiye Finans in July 2007, to 1 times the book value per share of the target, as in the case of Eurobank Tekfen’s acquisition of 99 percent by Burgan Bank of Kuwait in April 2012.

In particular, the shareholder equity of local banks in Turkey was used to estimate potential FDI inflows in the banking sector, by applying as a multiple an average price-to-book ratio from previous transactions in Turkey. A top-down model was newly developed for this purpose, the so-called TIP model, as shown in Table 2, based on the shareholders’ value of the local Turkish banks, which was US$75,632 million as of the end of 2012. This value is derived from data of the Banks Association of
In turn, TIP model is based on the following conservative assumptions:

1. An average price-to-book ratio of 1.5 times in each future transaction in the period 2012–2017;

Table 2: The TIP model estimation of potential FDI in the Turkish banking sector (in millions of US$)

2. The total shareholder’s equity in the system will increase by a compounded aggregate growth rate (CAGR) of 10 percent per annum in the period 2012–2017;
3. The total market share of foreign banks (including their minority participations) will progressively increase every year from 23 percent in 2012 to 40 percent in 2017 (the foreign share in owned banks with majority participation will increase from 13.3 percent to 28 percent, and the foreign minority participation will increase from 9.7 percent to 12 percent). Based on the aforementioned assumptions, a total amount of US$63 billion of inward FDI can be expected to be received in the banking sector within the period 2013–2017.

Furthermore, a scenario analysis can be performed, by using combinations of the input parameters, the price-to-book ratio, CAGR, and target total market share to be reached over the period or per annum. Such scenarios are presented in Table 3 and are depicted in Figure 2, with the total foreign market share increasing progressively as estimated previously up to 40 percent in 2017, but using different CAGR and price-to-book valuations over the period. A central, most probable range of these scenarios is marked in Table 3 (see box), and accordingly the potential FDI inflows are estimated between US$39 billion (CAGR = 7.5 percent and P/B ratio = 1) and US$90 billion (CAGR = 12.5 percent and P/B ratio = 2). As already implied in the TIP model, the core input parameter and main driver in the analysis to estimate the potential FDI inflows consists of the final foreign share that is assumed to be reached. Different final foreign shares generate different FDI inflows. It should be noticed, however, that our assumption of 40 percent market share to be controlled by foreign banks by 2017 is reasonable, particularly if the respective foreign shares in the regional sectors are considered.
Moreover, to support the results in the analysis, the following bottom-up attributes of the banking sector can validate the assumption of a potential 40 percent total foreign market share by 2017:

1. The Turkish government has shown a strong commitment to privatization. It has repeatedly announced plans in the media for the sale of the three state banks, which hold 29 percent of the total assets in 2012, and have been traditionally one of the main providers of loans to small and medium-sized companies. In particular, it has announced that it intends to sell stakes in secondary public offerings of the state’s Halk bank, Turkey’s third-largest public bank, with a market share of 8.3 percent in 2012. In addition, the government has indicated that Ziraat Bank, Turkey’s market leader, with a market share of 12.5 percent, will also be sold.

2. The minority holdings of foreign banks in Turkey were 9.7 percent in 2012, and consisted of the following participation in the respective local banks: BBVA, 25.01 percent; Citibank, 10 percent; Unicredit, 40.80 percent; BNB Paribas, 34.43 percent; BTA Securities (Turan Alem), 33.98 percent; and National Bank of Kuwait, 40 percent.

Accordingly, all these foreign institutions are highly likely to increase their local participation (and become majority shareholders) in the coming years. This scenario has been considered in the analysis presented in Table 2, where the minority participation of foreign banks is projected to reach 12 percent of the total shareholders’ equity by 2017.

3. The proximity of Turkey to the Arab states of the Gulf puts the country in a position to attract significant foreign investments in Islamic banking, and Istanbul is established as a regional finance center in the short run and as a global finance center in the long run. A steady development of the participation banks to attain a 10 percent share in total assets, from 5.1 percent in 2012, is projected by the Participation Banks of Turkey, and this is expected to receive significant support from the public authorities. This is also supported by the evidence that the compound annual growth rate (CAGR) of
raised funds in the participation banking sector was 35 percent during the past 2001-2010 (Ozsoy and Yabanli, 2010). Moreover, based on past experience, transactions in Islamic banking are accompanied by significant acquisition premiums.

4. Considering that Turkey has no restrictions on foreign ownership in the banking sector, and the challenge of breaking through a highly concentrated market, where the top ten banks control 87 percent of total assets in 2012, a number of international banks are expected to continue establishing greenfield operations.

Overall, the above analysis pinpoints to an immense unexploited potential of record future inflows of foreign investments in the sector, which is estimated at a range with an expected value of US$63 billion in the next years. This size of investment can revitalize and generate a new evolving momentum for the Turkish economy and can spur renewed foreign interest for investments and acquisition activity in other sectors.

CONCLUSIONS

The structural transformation that characterized the Turkish economy in the last years, especially since the 2001 crisis, has made it clearly resilient in the face of domestic and international shocks.

The banking sector experienced record inflows of foreign investment in the period 2005–2013, and the series of local bank acquisitions by foreign banking groups has contributed toward but has also been facilitated by the transformation of the Turkish financial framework. Sberbank, UniCredit, the National Bank of Greece, HSBC, BNP Paribas, Fortis, ING, General Electric Consumer Finance, Commercial Bank of Qatar and National Commercial Bank now all have significant commitments in Turkey.

The Turkish banking system is distinguished for its growth attractiveness and exceptional profitability, the low degree of financial intermediation, and the unpenetrated mortgage sector; it also is backed by positive population demographics, its large size in total assets, and the low market share of foreign-owned banks—all motives for foreign investment. All above highlight opportunities for future banking business growth and can attract international investors and stimulate substantial FDI inflows (Kontakos, 2012).

To quantify the potential for foreign investment, the TIP model was utilized; its main function is to convert non-foreign-owned shareholder equity values to potential FDI inflows, by using historical price-to-book valuations as a vehicle. Although this approach is widely used in international practice for the valuation of individual M&A transactions, it is applied at a top-down level for the sector, and as such provides a unique, practical way to estimate the expected inflows and bridge economic practice with theory. Based on some assumptions, which can be easily validated in practice, it is
estimated that a mean potential of US$63 billion inward FDI can be realized in the Turkish banking sector in period 2011–2015. The analysis suggests that this amount of foreign investment can stimulate additional investments in other sectors, and not only transform the Turkish economy, but position the Turkish banking sector on par with those of the largest European economies, such as Spain and Italy, and at the same time establish Istanbul as a global financial center and crossroad for accessing other countries where links with Europe are weaker (the Middle East, Caucasus, and Central Asia).

INFLUENCE OF TAX UNCERTAINTY AND GOVERNMENT EXPENDITURES VOLATILITY ON ECONOMIC GROWTH - CASE STUDY OF OECD COUNTRIES

Kotlán, Igor; Machová, Zuzana; Macek, Rudolf
Departmnet of National Economy, VŠB-TU Ostrava – Faculty of Economics, Ostrava, Czech Republic

ABSTRACT
The influence of taxation and government expenditures on the economic growth is the object of many empiric works, but the volatility of these variables is almost omitted. Therefore the aim of the paper is to describe the effect of taxation and government expenditure on long-term economic growth with a special emphasis on the impact of tax uncertainty and volatility of government expenditure in OECD countries with using the dynamic panel. The level of taxation is expressed not only by the traditional tax quota, but also by the World Tax Index – index designed by the authors. The results show that there exists the negative impact of volatility of government expenditures on economic growth – as the theoretical assumptions. In case of tax uncertainty there are contradictory results. Tax uncertainty expressed by tax quota is positively connected to the economic growth – contradicting the theoretical assumptions; but the use of the World Tax Index showed the negative impact of tax uncertainty on economic growth. Therefore the World Tax Index seems to be more the appropriate approximator of the level of taxation.

Keywords: Economic Growth, Tax Uncertainty, World Tax Index, Tax Quota, Dynamic Panel, OECD Countries.

INTRODUCTION
Almost all developed OECD countries are experiencing fiscal changes today which significantly affect the real tax burden. It is necessary to realize that the government expenditure or the tax burden uncertainty can represent a much more problematic factor than the level of these indicators. It is also obvious that if there exists the significant tax uncertainty, it is likely to damage long-term economic growth and economic welfare more than just a high tax burden. A high tax burden can lead to higher tax revenues in case of invalidity of the implications of the Laffer curve. If these higher tax revenues are used to finance productive government expenditures, the effect on economic growth may appear positive. This fact partially eliminates the potential negative growth effect of high taxation, which does
not apply in case of tax uncertainty. Analogically, the volatility of government expenditure can very similarly affect the level of output of the economy.

The aim of the paper is to describe the effect of taxation and government expenditure on long-term economic growth with a special emphasis on the impact of tax uncertainty and volatility of government expenditure in OECD countries with using the dynamic panel. The impact of taxation, resp. taxation uncertainty will be explored in all aspects of taxation by overall taxation.

INFLUENCE OF LEVEL AND VOLATILITY OF TAXATION AND EXPENDITURE ON ECONOMIC GROWTH

In an effort to achieve, insofar as possible, the best and most realistic determination of economic growth, economists try to include in their growth models a number of variables, among others those related to fiscal policy. Interest in these types of variables has deepened as a result of the current debt crisis and doubts about further EU integration. The aim of these models is therefore to test hypotheses about the impact of fiscal variables on economic growth (Kotlán and Machová, 2013). Fiscal variables mean the level of taxation and government expenditure, and also the size of the public sector. The most important authors dealing with this issue include e.g. Gemmel, Kneller and Sanz (2011). These conclude that the impact of fiscal variables on economic growth is ambiguous and depends on the nature of taxes (distortionary or non-distortionary) and government expenditure (productive or non-productive), with pro-growth effects being present only in productive expenditure, if financed from non-distortionary taxes. Distortionary taxes and unproductive government expenditure have a negative impact on economic growth. Devereux and Mansoorijan (1992) also point to the need to coordinate tax and expenditure policies, if fiscal policy is to positively affect growth. However, none of these studies addresses the extent to which economic growth can be influenced by tax uncertainty and the volatility of government expenditure. Fiscal volatility represents a kind of economic risk, which is associated primarily with expectations about future developments in tax bases and tax rates, or developments in government expenditure. Taking into account this type of risk can then modify the conclusions of empirical studies dealing with the effect of taxation and government expenditure on economic growth.

Effect of level and volatility of taxation on economic growth

The size and volatility of taxation affects economic growth through its effects on individual growth variables, in particular on the level of savings and capital accumulation, or the size of the human capital and technology (Macek, Machová and Kotlán, 2013a). In the case of taxation and its effect on growth, economists come to contradictory conclusions. Keuschnigg (2009) argues that investment
activities, and thus the growth, are negatively affected in particular by corporate tax, which is very often associated with decisions to place foreign direct investment. Labour taxation also leads to reduced investment activities due to the pressure on corporate profits caused by a drop in labour supply (Alesina et al., 1999).

The positive effect of taxation on human capital accumulation is also admitted by Lin (2001) in the case of public investment in education; however, in the case of private investment, most studies agree on the negative impact of taxation, in particular through personal income tax with a progressive tax rate (Erosa and Koreshkova, 2007), which reduces the returns from these investments.

Indirect taxes affect economic growth only through their effect on the substitution between leisure time and work, thus leading to a change in the ratio between labour and capital in production, while direct taxes also affect growth through other channels, e.g. those mentioned above. The negative influence of direct taxes on economic growth should thus be greater and their distortionary effects stronger compared to indirect taxes (Mamatzakis, 2005).

The issue of the distortionary nature of direct and indirect taxes is one of the most debated issues in terms of the influence of taxes on economic growth. As mentioned above, this problem is addressed primarily by Kneller, Bleaney and Gemmell (1999), who report that distortionary taxes negatively affect growth, while the effect of non-distortionary taxes is neutral or positive. Tax volatility or uncertainty, similarly as in the case of indirect taxes, affects growth variables primarily through the substitution effect, whether it is substitution between consumption and savings, or substitution between investments in the different types of capital. Its effect is thus particularly relevant in the case of distortionary taxes.

Decisions on the size of household savings are mostly influenced by taxation of labour, which reduces the amount of disposable income, also potentially leading, in the absence of tax uncertainty, to a reduction in the volume of savings and negative effect on growth. The influence of uncertainty on the level of taxation then depends on the elasticity of intertemporal substitution and risk aversion. For agents with high risk aversion, if elasticity is high, higher risk arising from uncertainty regarding labour tax rates will lead to higher substitution and an increase in the savings rate, which will have a positive effect on economic growth (Smith, 1996). The resulting effect of labour taxation on economic growth then depends on which of these effects prevails.

As for the accumulation of capital, the tax reduces the net rate of return from capital after tax, thus having a negative impact on economic growth. If there is uncertainty about future tax rates, economic agents with high risk aversion prefer the type of capital accumulation which is not taxed, which is not subject to uncertainty, or where such uncertainty is at least reduced. For example, if there is greater uncertainty about the tax rate on physical capital, this will lead to a greater accumulation of human
capital and vice versa. The substitution effect will thus influence the relationship between physical and human capital in production, which will also affect economic growth (Easterly et al., 1991). The resulting effect will depend on the type of capital with more uncertainty about the level of its taxation.

Economic theory implies that the impact of tax uncertainty on economic growth is the result of a number of different effects, and that it depends on which of them prevails. The results of empirical work in this area are unclear; however, it should be noted that they are generally limited to the impact of uncertainty on investment decisions.

**Effect of level and volatility of government expenditure on economic growth**

There is neither any consensus among economists on the relationship between government expenditure and economic growth. While Wagner (1911) and his law of increasing state activity (Wagner’s Law) says that economic growth leads to the growth of the public sector, including government expenditure, standard Keynesian theory understands government expenditure to be an exogenous factor that can be successfully used as a fiscal policy tool to promote economic growth. Lucas (1988) and Romer (1986) argue that only investments in human capital and research and development have pro-growth effects; Barro (1990) also considers investments in infrastructure as having pro-growth effects. As already mentioned, it is necessary to distinguish between productive and unproductive expenditures. Schaltegger and Torgler (2006) add that the effect of government expenditure on growth is negative in developed, wealthy economies with a large public sector and a greater proportion of non-productive expenditure due to crowding out.

When considering the impact of changes in government expenditure on economic growth, it is also necessary to take into account its temporal nature. As indicated by Friedman (1957) discretionary measures in the form of changes in government expenditure can positively influence growth, but only provided that these changes are not considered permanent by economic agents. Should households and firms consider the changes permanent, it would change their consumer and investment behaviour, which could have a negative effect on economic growth.

The volatility of government expenditure may theoretically have both a positive and negative effect on economic growth. The key aspect in this case is what impact the volatility of government expenditure has on output volatility, since the influence of the economic cycle on economic growth is generally seen in economic theory as negative (Badinger, 2012). By increasing or decreasing government expenditure in the Keynesian approach, it is possible to smooth out the economic cycle and positively affect mainly investment as well as consumption and economic growth; however, if fiscal policy is not in line with the cycle, if it is applied in a pro-cyclical manner, it alone may instead become the cause of output volatility (Afonso and Jalles, 2012). It follows that the pressure to reduce
government expenditure, and therefore its volatility, may affect growth positively, even during recessions, as it is accompanied by a reduction of discretionary measures, which may cause the cycle (Poterba, 1994). As indicated by Afonso and Furceri (2010), high volatility in government expenditure may also lead to the growth of interest rate volatility, which, in contradiction to the above described Keynesian approach, will negatively affect investment and economic growth.

Empirical studies confirming the positive effect of reducing discretionary measures and their volatility include e.g. Badinger (2012). The latter author, as well as previously Barro (1990), adds that the effect of the volatility of government expenditure on growth varies according to the level of development of each economy, being more important in less developed countries.

INTEGRATION OF FISCAL VARIABLES INTO EXTENDED MODEL OF GROWTH

The studies of Lucas (1988) or Romer (1986) gave rise to a body of largely empirical work, the aim of which was the best possible explanation of economic growth through the integration of other factors that affect it, including the taxation that is, nevertheless, not desirable to be considered in isolation. Its analysis should primarily include government expenditure financed by the taxes.

The standard approach by Barro (1990), Rebelo (1991), or Barro and Sala-i-Martin (2004) states that, in a steady state, the economy grows at the same rate as private consumption, and as physical and human capital. If agents maximize their utility function, the growth of the economy \( \gamma \) is thus given by the difference between the net marginal return to physical capital \( r \) and the rate of time preference \( \rho \) adjusted for the intertemporal elasticity of substitution in consumption \( 1/\theta \):

\[
\gamma = \frac{1}{\theta} (r - \rho). \tag{1}
\]

To state hypotheses for the empirical part of the paper, it is necessary to extend the model with fiscal policy variables. Barro (1990) modifies the equation 1 as follows, assuming the broad concept of capital \( K \) that includes both physical and human capital (consistently with Rebelo, 1991 and his AK model) and a flat tax rate on income \( \tau \) is that is used to fund government expenditure \( G \):

\[
\gamma = \frac{1}{\theta} \left[ (1 - \tau) \phi \left( \frac{G}{K} \right) (1 - \eta) - \rho \right]. \tag{2}
\]

where \( \phi \) expresses a positive decreasing marginal product, and \( \eta \) is the sensitivity of production to changes in \( G \) for a given \( K \). The growth rate of the economy is thus positively affected by productive government expenditure, which is also examined in the empirical part of the paper. The sensitivity of production to changes in government expenditure has, on the other hand, a negative influence on...
growth. The equation (2) also shows that the influence of taxation on the economic growth is negative. Nevertheless, there still remains the crucial question, whether the effect is actually negative in case of all types of taxes.

To answer the question, e.g. Milesi-Ferreti and Roubini (1998) modify the equation 1 to include different types of taxes classified by the function. However they still state that similar models are very detached from the real tax mixes in individual economies. Therefore, the authors of such models need to calibrate them in empirical works so as to be as close to the real world as possible.

One of such models that are very close to the reality is presented by Denaux (2007). His model shows how economic growth is affected by taxes on physical and human capital, taxes on property, taxes on consumption, and also by productive and unproductive government spending. However, in reality, e.g. capital gains make part of income of corporations as well as individuals. From that reason, it is not possible to find any good proxy of the physical capital tax in the model. Denaux (2007) uses the corporate income tax rate, which it is not accurate in fact. Similar situation occurs in case of human capital above all.

The main problem of the above models lies in fact that they use the functional classification of taxes and the social planner approach. The model below is based on the classification by object of taxation and the behavior of agents.

Households maximize their utility function as described e.g. by Barro and Sala-i-Martin (2004) for a given budget constraint that is:

\[
\dot{a} = (1 - \tau_w)aw + (1 - \tau_a)ra - (1 + \tau_c)c + tr, \quad (3)
\]

where \(a, w, l, c,\) and \(tr\) are per capita amounts of assets, wages, labor, consumption and transfers respectively, \(r\) is net marginal rate of return on physical capital, and \(\tau_w, \, \tau_a\) and \(\tau_c\) are tax rates on wages, property and consumption respectively. The budget constraint makes a limiting condition for the households’ behavior optimization. On the basis of the optimization, households decide on the consumption/leisure ratio, depending on the net after-tax marginal return \((r)\) that is also a crucial determinant of the behavior of firms.

In the sector of firms, the variables are related to the effective labor \(\hat{L} = Le^u\), where \(x\) is the technology growth rate. Then \(\hat{k} = \frac{K}{L}\) and \(\hat{c} = \frac{C}{L}\) applies. If the production function is \(Y = f(K, \hat{L})\), after-tax profit \((\tilde{\pi})\) is given as:

\[
\tilde{\pi} = \hat{L}\left[(1 - \tau_x)\dot{\hat{k}} - we^{-u} - \delta\hat{c} - \tau_x\hat{\pi}\right] - rk \quad (4)
\]

where \(\delta\) is the depreciation rate and \(\tau_x\) is the tax rate on profit. Setting the first derivatives of the function (eq. 4) equal to zero, we get:
Market clearing condition for the assets market states that $a = k$, resp. $\hat{a} = \hat{k}, \hat{a} = \hat{k}$, and the economy grows at the same rate as the physical capital, as stated above. Thus, from the equations (3), (5) and (6), we get the growth rate of the economy:

$$\gamma = \frac{k}{\hat{k}} = (1 - \tau_w) \left[ \frac{f'(\hat{k})}{k} - \frac{f'(\hat{k})}{\hat{k}} \right] + (1 - \tau_{\pi}) \left[ f'(\hat{k})(1 - \tau_{\pi}) - \delta \right] - \left( 1 + \tau_{s} \right) \frac{c}{k} + \frac{i}{k} - x - \frac{i}{l}. \tag{7}$$

Tax uncertainty can be understood as a part of the tax burden, which means an additional level of taxation for those agents with risk aversion. Tax uncertainty basically represents an additional tax rate which is different for different subjects, depending on the relationship of the subject to risk. The higher the risk aversion, the greater the increase in a certain subjective tax rate that also includes the tax uncertainty. In this case, the following applies in case of all types of taxes:

$$\tau_{i} = f(\tau_{i}^{s}, \tau_{i}^{v}), \tag{8}$$

where $\tau_{i}^{s}$ is tax rate size for the $i$ type of tax, and $\tau_{i}^{v}$ is tax rate volatility for the $i$ type of tax.

The model described therefore shows that, according to economic theory, the resulting effect of the size and volatility of the taxation on growth through all types of taxes, i.e. taxes on profits, taxes on wages, property taxes and consumption taxes, should be negative (Macek, Machová and Kotlán, 2013b), which makes the primary hypothesis for the empirical part of the paper.

**EMPIRICAL ANALYSIS: METHODOLOGY, DATA AND RESULTS**

The empirical analysis in this article is based on a dynamic panel model, which uses data for OECD countries for 2000-2010. Real GDP per capita in purchasing power parity (GDPCAP) is therefore the dependent variable. The independent variables are capital accumulation, expressed as a share of investment in real GDP in purchasing power parity (INVGDP) and the accumulation of human capital as a proportion of the population in the total population aged 25-64 having completed at least upper secondary education, as classified by ISCED (HUM SC). Other explanatory variables are then fiscal variables, including the level of government expenditure, the volatility of government expenditure, taxation and the size of the tax uncertainty.

The level of government expenditure is expressed as a share of government expenditure in nominal GDP. The volatility of government expenditure is expressed by the deviation of the government's expenditure (share of GDP) in each year from an average level of government expenditure during the reporting period for each country. However, none of the variables concerns total government expenditure.
expenditure, but only productive expenditure, in accordance with the work of Kneller, Bleaney and Gemmell (1999) and according to COFOG classification. They thus primarily include expenditure on general and public services, economic affairs, defence and education. By contrast, primarily expenditures on social affairs are excluded.

Tax uncertainty, similarly to the volatility of government expenditure, is expressed using deviations of the tax burden in each year from an average level of tax burden for the reporting period for each country. The selection of an indicator to express the tax burden is crucial both to calculate the uncertainty, and to express the level of taxation. As a standard, and also in this article, the tax burden is approximated using a tax quota, i.e. the share of tax revenues in nominal GDP; however, this brings about a whole range of negatives (Kotlán and Machová, 2012). As an alternative to the tax quota, the following analysis therefore also uses another indicator of the tax burden, the World Tax Index (WTI), designed for the purposes of macroeconomic comparisons and other analyses by the authors. It is a measure that combines hard data from internationally recognized sources (OECD, World Bank) with soft data obtained from an extensive survey carried out annually among tax experts from all OECD countries. The index consists of several parts: (1) Corporate Income Tax (CIT), (2) Personal Income Tax (PIT), (3) Value Added Tax (VAT), (4) Individual Property Taxes (PRO), and (5) Other Taxes on Consumption (OTC). The WTI is not only limited to tax rates, which are reflected, under certain circumstances, in the level of tax revenue and thus the tax rate; it includes other aspects associated with the tax burden, such as taxation progressivity, the administrative costs of taxation, or tax deductibility of expenses. For more details on the methodology for its construction, see Machová and Kotlán (2013). The dataset is freely available at www.worldtaxindex.com. Other data mentioned was drawn mainly from the OECD iLibrary Statistics, OECD Factbook Statistics and Penn World Table.

The method used was panel data regression. Given the relatively small number of countries and the relatively short time series, the combination of time and cross-country data is absolutely essential. This makes the presented statistics more reliable. The software used was E-Views, version (7).

The regressions performed aimed to verify the hypothesis of the existence of the impact of taxation and government expenditure, and particularly tax uncertainty and volatility of government expenditure on long-term economic level and hence economic growth. In the first phase, stationarity tests were performed using a panel unit root tests. The variables used were verified as stationary, but with regard to further interpretation of the results, they were expressed in logarithmic form. The lagged variables are designated (-1).

Using a robust estimator in calculating the covariance matrices ensured that the estimation results of standard deviations of parameters and hypothesis tests were correct with regard to a possible
occurrence of autocorrelation and heteroscedasticity. This method is called "White Period" and it is made possible by virtue of the econometric software used.

Given that this is a dynamic panel, which includes appropriate delays of the dependent and independent variables, it cannot be reliably estimated by OLS. As the estimation technique, a generalized method of moments (GMM) was used, which included the method of instrumental variables. This method uses the Arellano-Bond estimator (Arellano and Bond, 1991). The aforementioned estimation type ensures that the appropriate transformation process and using appropriate instruments eliminates the risk of endogeneity of the lagged values of the dependent variable and the independent variables with a random component. In the analyses below, the lagged values of the dependent variable were used as the instruments, with a lag of (-2). According to the Sargan test, the lagged values of the independent variables were not necessary to use.

The below model includes a lag of one period, as is usual in these types of studies. Alternatively, autoregression analyses with a two- and three-year delay were still carried out, with very similar results; however, with regard to the shortness of the time series, it would be impossible to reliably verify their validity from an econometric point of view.

The dynamic panel model of OECD countries for the period 2000-2010 is presented in the following tables 1 and 2. It uses lagged values of the dependent variable and other endogenous variables describing the impact of fiscal policy. This is the level of government spending and the level of taxation as well as the rate of their volatility. Given the focus of the paper, the question of particular importance is the volatility of fiscal variables. Table 1 presents a model which uses ordinary tax rate as the tax burden approximation; table 2 shows the author's own tax burden index – the World Tax Index (WTI), see above.

Note: Included in parentheses are t-statistics that are adjusted for heteroskedasticity and autocorrelation; standard deviations are calculated using robust estimates; *, **, *** indicate significance levels of 10%, 5%, and 1%, respectively; Arellano-Bond estimation.

The results presented in both tables show that substantial inertia can be seen for the GDP (GDP (-1)) indicator and a positive effect of the size of GDP in the previous period, as well as a very significant positive impact of the share of human capital (HUMSC) and investment rate (INVGDP), where the effect of percentage change in human capital is quantitatively greater than with the percentage change of physical capital.

Both models also show that there is a substantial positive impact of productive expenditure (EXPPROD(-1)) and a negative impact of taxation (TQ(-1)/WTI(-1)) on economic growth.

Also demonstrated was the negative impact of tax uncertainty measured by indicators of effective tax rates WTI (V_WTI(-1)), but a positive impact of tax uncertainty measured by the tax quota (V_TQ(-1)). Although theoretical assumptions about the negative impact of tax uncertainty was thus not confirmed if we use the tax burden, its negative impacts are quite apparent when using this alternative indicator.

The negative impact of government spending volatility (V_EXPPROD) in both models was also confirmed.

Due to the use of logarithms, the effect of these independent variables can be interpreted as the effect of their percentage change on the percentage change in output per worker. When using the tax quota, an adverse effect of the tax burden is shown, where a 10% tax quota increase reduces the GDP per capita in the following period by about 1.35%. If we use the alternative indicator of the tax burden (WTI), which better describes the effective tax burden, we find that increasing the tax burden (measured by WTI) is reflected in a decline of GDP per capita by 1.44%, which is a slightly larger counter-growth effect. From the above, one can conclude that using the alternative indicator of the tax burden leads to more negative counter-growth effects of taxation. Another issue is the tax volatility. Tax volatility is estimated as adversely affecting economic growth, but only when using the alternative index (WTI). Taxation and tax uncertainty thus seem to have a significantly more negative impact on economic growth than when taxation is approximated using the tax quota, i.e. using the relative tax revenues.

CONCLUSION

The current economic literature pays considerable attention to the impact of fiscal variables on economic growth. It focuses on the issue of taxation according to different types of taxes, on government expenditure and the size of the government sector, generally considering the effects of taxation to be negative, while seeing the effect of government spending, in the case of productive expenditure, as rather positive. However, studies of this type often neglect the fact that economic growth may be subject to effects other than the actual level of taxation and government expenditure. This is because fiscal variables can affect growth only due to their volatility, although their level has long been relatively low. Long run economic growth is inevitable for reaching economic welfare as the main aim of the economic policy makers. Economic welfare represents the improvement in all domains of society and therefore it can represent sustainable economic growth. Since the long run economic growth is a partial element of sustainable economic growth, it is necessary to realize that the way of fiscal variables impact on long run economic growth can be considered same as in the case of fiscal variables impact on sustainable economic growth.

As a result of higher stated, the aim of this paper was to describe the effect of taxation and government expenditure on long-term economic growth with a special emphasis on the impact of tax
uncertainty and volatility of government expenditure in OECD countries with using the dynamic panel.

The paper aims not only to assess the actual impact of the volatility of fiscal variables on economic growth, but in particular the use of the alternative indicator of the tax burden to calculate tax variables – the World Tax Index, which was designed by the authors. It is necessary to realize that limitations of this study can be assigned to the characteristics of tax quota as the aproximator of tax burden. This aproximator has a lot of shortcomings and therefore also Wolrd Tax Index was used. World Tax Index is based on the combination of soft and hard data and therefore it represents the real tax burden. It removes the shortages of tax quota and its value is more reliable than the value of tax quota in the case of tax burden measurement, but on the other hand it was available only for short time series.

The results of the empirical analysis confirm the economic theory of the negative impact of taxation and the positive effect of productive government spending on economic growth. The negative effect of taxation was demonstrated both when using the tax quota, and when using the WTI.

In compound models, i.e. models using both of these tax burden indicators, assumptions about the negative impact of volatility of government expenditure were also confirmed. However, the models show contradictory results in the case of the impact of tax uncertainty. When using the tax quota, it showed a positive influence on growth, which contradicts the theoretical assumptions, while the use of the WTI led to results consistent with theory and showed that the impact of tax uncertainty on economic growth is negative. From this perspective, the WTI seems to be more suitable to an approximate tax burden, and as such it is applicable not only in order to compare the tax burden for individual countries but also as an indicator of the tax burden in macroeconomic models, particularly in models of long-term economic growth e.g. Kotlánová and Kotlán (2012).

SUSTAINABILITY AND INNOVATION TO INCREASE CORPORATE COMPETITIVENESS: OPTIMISATION MODEL

Krivorotov, Vadim; Kalina, Alexey; Belyaeva, Zhanna; Erypalov, Sergey
Graduate School of Economics and Management, Ural Federal University, Russia

ABSTRACT
Modern organisations of all forms and origin face the necessity to force innovations and be sustainable in order to promote its business excellence. The level of a firm competitiveness is measured by a number of methods, which are covered in full in the academic literature. Sustainability is a key issue for organizations in the twenty-first century as they increasingly acknowledge that their policies and practices have social and/or environmental consequences. Accordingly, many companies are implementing elements of sustainability into their business practices. The set of those new managerial technologies comprise innovative approach to the optimization of the numerous competitive sources. In light of this, it is imperative that new methodologies and frameworks to facilitate the understanding of sustainability concepts in the business environment are to be developed. The framework suggested in the paper helps to outline a set of propositions regarding the nature and process of innovative and sustainable development considering many factors influencing a firm.

Keywords: innovation, organizational competitiveness, sustainability management, organizational sustainability

UNDERSTANDING ORGANISATIONAL COMPETITIVENESS AND SUSTAINABILITY

The competitiveness of the enterprise is a complex, integrated indicator, which is formed under the influence of many factors that affect a business entity. The most cited definition was suggested by Porter, who identified four determinants of a country that can affect the global competitiveness of companies located there: factor endowments; demand conditions; related and supporting industries; and the strategy, structure and rivalry of the companies in a country. He also identified two external variables – government policy and chance - that impact on the determinants and thus on competitiveness more generally (Porter, 1990). Competitiveness of enterprises is a concept referring to the ability of firms to sustain and gain in market share through their cost and pricing policy, innovative use of production factors and novelties in product characteristics. It is often measured by the share of the products of one manufacturer (in value terms) on the domestic and international market of those
products. The analysis of impacts on cost and capacity to innovate, however, is mainly about the drivers of competitiveness.

We argue, competitiveness and sustainability are mutually reinforcing concepts that bring innovation management techniques to a company. The concept of sustainable enterprise is related to the general approach to sustainable development, originally enunciated in the Brundtland Report, as “forms of progress that meet the needs of the present without compromising the ability of future generations to meet their needs” (C. Holliday and J. Pepper, 2001), an approach which postulates a holistic, balanced and integrated perspective on development and which has subsequently been elaborated and endorsed through declarations emanating from a number of high-level global development forums, including the United Nations Conference on Environment and Development held at Rio de Janeiro in 1992 and the World Summit for Social Development held at Copenhagen in 1995.

Thus, in contrast to narrowly defined, traditional perspectives which depict enterprises in terms of linear input–output relationships centered solely on maximizing short-term economic value, an integrated approach to sustainable enterprise development takes a more holistic, integrated and long-term view (figure 1), which makes a stylized distinction of what in practice are overlapping and interdependent operational and policy spheres (micro-, macro- and meta-levels). At the centre are the sustainable enterprises which comprise a number of different stakeholders, including shareholders,
employers, employees and customers, as well as relationships with suppliers, governments and the broader community.

At the same time, operational efficiency incorporates a comprehensive assessment of enterprise’s activities which subsequently raise the efficiency of its production factors, and hence interrelations with stakeholders. In order to attain operational efficiency a company needs to minimize redundancy and waste while leveraging the resources that contribute most to its success and utilizing the best of its workforce, technology and business processes. The reduced internal costs that result from operational efficiency enable a company to achieve higher profit margins or be more successful in highly competitive markets. While we are talking about cost reduction, the later could not be cut, but optimized in order to balance the interests of stakeholders. This is still an issue in Russia, and for instance BRICs countries- sustainability is still not very much related with the primarily competitive driver (Belyaeva, 2013).

The legal responsibility is also important to be considered competitive and entails expectations of legal compliance and playing by the “rules of the game.” From this perspective, society expects business to fulfill its economic mission within the framework of legal requirements. But while regulations may successfully coerce firms to respond to an issue, it is difficult to ensure that they are applied equitably (Pratima, 2002). And finally, mutual sources of research support the idea that companies with good records of CSP have a competitive advantage in attracting employees (Backhaus, Stone, and Heiner, 2002).

Thus, the mentioned sources of the enterprise’s development directly influence all competitive and sustainable factors. A regulated change of those factors could become a systemic management of the enterprise’s competitiveness (Krivorotov, 2007; Belyaeva, 2013).

**SYSTEM APPROACH TO ENTERPRISE’S COMPETITIVENESS MANAGEMENT AND ITS CHALLENGES**

Competition within the market is vital for business and society to understand and test how to best meet people’s needs with more sustainable solutions. Markets liberate ingenuity by en-couraging experimentation and rewarding those ideas that meet people’s needs and aspira-tions most efficiently (Holliday S and Pepper J, 2011) Approaches to enterprise development have traditionally focused on project-level technical assistance and finance. Today if a busi-ness does not explore eco-oriented opportunities within its products, processes or services, it does not learn much from its environment focused business activities. When it foregoes its opportunities to learn from environmental challenges, opportunities to build ecocentric organ-isational culture may also slip away (Banerjee, 2002). Obviously, effective social dialogue is a means for fostering better workplace relations and helping to
nurture sustainable enterprise development. Considering mentioned above challenges for of the enterprise's competitiveness management system, we suggest the logic of interaction of factors and sources of the enterprise's competitiveness (Figure 2).

![Diagram](image)

**Figure 2. Management of competitiveness of the enterprise**

The strategic positioning is based a lot with two key ingredients. One of them represents enterprise's relations with the external environment. It may be interpreted as its ability to adapt to the organization and business environment, its level of innovation management, which is crucial for any modern market-oriented enterprise. This component characterizes the enterprise's adaptability to the conditions of the external environment, the flexibility of its response to the environmental changes (Ansoff, 1989).

We focus on the adaptability of enterprise system, which determines enterprise's sustainable development. The adaptability is understood as a constant innovation activity that involves all business processes both internally and externally, and also affects key stakeholders. It is the second driver – Innovation, we argue, which provides and sustains the conditions for adaptability. Innovation and adaptability together form the necessary and sufficient conditions for the enterprise's strategic market positioning. (Santo, 1990).
The high level of adaptability of the enterprise depends on following targets in strategy problem tailored for the particular stakeholder, partner and its individual needs and opportunities to choose from the variety of competing companies in the market according to the scale of preferences. These preferences can be arranged according to specified criteria, reflecting mainly basic consumer characteristics, their price and quality, now have undergone significant changes towards integrated diversity and complexity.

It is absolutely clear, that the leading enterprises are those that can adapt its strategy to a more diverse market needs. The challenge of today requires the ability to initiate demand for upgraded services and goods to lead the market, and in the same time develop internal social responsibility in order to be sustainable and competitive creating innovation and social added value. Any organisational structure might be irrelevant (Nadella, 2013) because no competition or innovation is going to respect those boundaries. Everything now is going to have to be much more compressed in terms of both cycle times and response times.

The level of meeting the above-mentioned criteria sets preconditions of enterprise positioning in the market. High adaptability corresponds to the adequate market share, while mistakes and miscalculations, irrelevant actions to maintain the required adaptability will inevitably affect the loss of former market position.

The logical understanding of assessing the effectiveness of the enterprise’s market positioning can be formalized applying its characteristics in the system of «Adaptability – Innovation» strategy. There would be 4 types of companies.

1. Companies with low adaptability and innovation due to the lack of a clear strategic development plan can be attributed to the problem category, and their disappearance from the market might be just a matter of time, unless the attitude towards innovation management is changed.

2. Companies with passive innovation and high level of market adaptability result from applied strategy of economy of scale, which is provided by a well-developed technology. However, leadership positions are defined by equipment maximum production lifecycle.

3. Companies with low market adaptability, while innovation rate is rather high. It is not rare, when innovation activity does not bring adequate returns because of the needless market ideology, therefore the updates of production processes don't result in their embodiment in the mass product. Eventually, the miscalculations in the strategic marketing "dilute" highly developed innovation, making it ineffective.

4. Strategic Leaders – The innovation management intersects globally with the structure of production, human resources management, marketing and promotion strategy, social and ecological responsibility.
Thus, the most important role for sustainable competitive organization is performed by innovations level of technological processes, product updates, improvement of production and labor organization methods, formation of an adequate management system, etc. Implementation of these measures is aimed at amplification of enterprises’ innovative activity, as well as enhancement of an operating efficiency and market adaptability, i.e. those key sources of competitiveness of an enterprise, determining its level. (Table 1)

</tbody>
</table>

Table 1. Systems of tentative indicators of innovation run by sustainability

Taking the above into consideration, the initial selection of innovative activities is logical to be made on the basis of an evaluation matrix, reflecting the degree of impact of a certain innovative change on the enterprise’s indicators of operational efficiency and market adaptability. However, activities aimed at improving the operating performance, are linked to the need to improve internal business processes, while activities, aimed at increasing the level of market adaptability, must take into account and positively change external conditions for the functioning of an economic entity (Fig. 3).

**OPTIMISATION MODEL OF COMPETITIVENESS’ MANAGEMENT ENHANCEMENT**

The criterion for selection of the most significant innovation activities for the enterprise is the priority of their influence on primary increment in one of two indicators (operational efficiency or market adaptability). Each of them is quantified, and requires some adjustment (Krivorotov et al. 2013). Comparison of these figures gives clear organisational guidelines whether to start upgrading the enterprise’s operating efficiency, or its market adaptability; and allows ranking the contents of planned innovation changes.
Figure 3.  *Differentiation of innovation changes according to their influence on sources of enterprise’s competitiveness*

The next stage is to examine selected activities for their compliance with productive capacity of the enterprise, its resource potential, level of staff efficiency, established organizational culture, etc. Based on matrix-resource modeling we evaluate compliance of innovative activities with the above mentioned criteria. In this form of assessment innovations under evaluation are placed vertically in the matrix, and existing financial, economic, labor, information and other resources of the enterprise are put horizontally (Table 2).

<table>
<thead>
<tr>

<td>$P_{m1}X_1$</td>
<td>$P_{mn}X_n$</td>
</tr>
</tbody>
</table>

Table 2. Matrix-resource model for evaluation of innovations

The completed matrix is an optimization task, formulation of which is as follows. It is required to maximize information about the study of $n$-dimensional area described by the
unknown quantities of the innovations under consideration \( X_j \), provided the limited amount of resources \( P_j \), considering optimality criterion \( C_j \), which can be defined as an average expert evaluation of the significance of each innovation for the enterprise:

\[
F(H_j) = \sum_{j=1}^{n} C_j X_j \to \max, \quad \sum_{j=1}^{n} P_{ij} X_j \leq P_{i0},
\]

\[
X_j = \begin{cases} 
0, & \text{if the innovation is not implemented} \\
1, & \text{if the innovation is implemented} 
\end{cases}
\]

\( X_j \) values, which can be obtained by solving the problem, help to model a program of innovation, backed by necessary resources for its implementation.

It should be noted that the current task in the above interpretation differs from the classical optimization task. First of all, it concerns the solution obtained. In classical optimization problem (for instance, Kantorovich et al., 1972) as a result of its solution optimal allocation of resources among all considered innovative projects is obtained, which is not correct from the standpoint of practical implementation, since any innovation project \( X_j \) requires resources to be defined in advance for its implementation. Therefore, their partial allocation is not enough for realization of the project. In the interpretation of form (1) only the most relevant and backed with resources will be implemented.

**DISCUSSIONS AND FURTHER RESEARCH**

Nevertheless, the comprehensive evaluation of the innovation activities impact considers all possible effects, including economic, research, resource-based, social, economic, ecological enhancements, must be seen in a close relationship. Mentioned above interrelation determines the interdependence of these effects and some artificiality of its differentiation. The main difference is in the nature of these effects and the time to obtain the expected result. If businesses through innovative reforms achieve lower material and energy production (resource effect) and lowers its cost, this leads to an economic effect in the form of additional profit.

The described model can also be used to evaluate compliance of planned innovations with the level of management of any type of organisation. In this case, management functions and its implementation level evaluated by expert, which are placed in the matrix instead of the resources. A result of innovations to improve working conditions is followed by improved safety and reduced loss of working time (social effect).

The considered value chain contributes into one integral effect, resulting with a clear sustainable competitive strategy of the company.
So, the authors consider the proposed approach to the selection of prospective innovation projects, taking into account required resources for their implementation, to be universal. It could be applied to organisations of any form of ownership, organizational and legal forms.

The principal contribution of this paper is to provide a comprehensive and integrative theoretical framework for defining competitive strategy of today organization. Future research should involve the development and validation of the model to include empirical testing.

‘RELIABILITY’ OF ONLINE PAYMENT PROCESS – A STUDY OF END USER’S PSYCHOLOGY

Kundu, Sukanya¹; Datta, Saroj Kumar²

¹Alliance School of Business, Alliance University, Bangalore, India
²School of Business, Galgotias University, Greater Noida, UP, India

ABSTRACT

Reliability is an abstract term and often used in the stream of engineering as a performance measure. In behavioural science when we talk about reliability what does it actually mean? Which parameters can be used to measure the term reliability? What are the major dimensions of the term ‘reliability’? A conceptual framework of the term ‘reliability’ has been designed using two phases. In first phase analyzing the literatures and interviewing frequent online shoppers, it was found that from end user’s perspective e-payment process consists of four stages, each stage having some reliability component associated. In the second phase questionnaire consisting of nineteen questions was circulated to get data on customer perception about reliability of e-payment process. Five major factors were explored. The results show customers perceive rectification of errors in time and with least intervention from their end is the greatest influencer of reliability of e-payment process. Confidentiality of customers’ personal and financial data is the next most important dimension of reliability of e-payment. Online shoppers perceive that a timely confirmation of their e-payment should be in process to add reliability to the system and a proper authentication technique can improve the overall reliability of the e-payment process.

Keywords: e-payment, reliability, confidentiality, authentication, confirmation, rectification

INTRODUCTION

Electronic commerce is the process of buying and selling or exchanging of products, services, and information via computer networks including the Internet (Voss, 2003). An online shop, e-shop, e-store, Internet shop, webshop, webstore, online store, or virtual store tries to create a similar situation of buying products or services at a bricks-and-mortar retailer or in a shopping mall. Many payment methods can be used for online purchases (Hsieh, 2001; Roberts, 2004a; Roberts, 2004b). Online payment is defined as an electronic payment made via a web browser for goods and services using credit or debit cards (Bitpipe, 2006). Online payment is considered more time-efficient and cost-efficient, convenient and flexible for customers and businesses (Sorkin, 2001; Yu, His, & Kuo, 2002).
Online shoppers commonly use credit card to make payments, however some systems enable users to create accounts and pay by alternative means, such as debit card, various types of electronic money, cheque, wire transfer/delivery on payment, postal money order, paypal etc. The financial part of a transaction might be processed in real time (for example, informing the consumer that their credit card was declined before they log off), or might be done later as part of the fulfillment of the process. For any digital payment system to succeed the criteria needs to be fulfilled are acceptability, anonymity, convertibility, efficiency, integration, scalability, security, reliability, usability.

Electronic payment is an online service which is invoked when a customer gets involved in online transaction. It is important for a business to know whether a service, when offered to its customers, meets customer expectations or not. Service quality measure came into prominence with world famous SERVQUAL model by Parasuraman et al. subsequently when various Internet based and mobile based services became popular, models like, e-SQ and e-SERVQUAL (Zeithaml et al, 2000), WebQual (Watson and Goodhue, 2000; Barnes and Vidgen, 2002), SITEQUAL (Yoo and Donthu, 2001), eTailQ (Wolfinbarger and Gilly, 2003), GIQUAL (Tsoukatos and Rand, 2007), BANKZOT etc. was introduced. All of these models were concerned with quality of online services. These researches pointed out security of payment (Szymanski and Hise, 2000; Bauer et al., 2005; Siu and Mou, 2005; Khan and Mahapatra, 2009; Gupta and Bansal, 2012; Ashwina and Kiran, 2012) and privacy (Khan and Mahapatra, 2009; Akinci et al., 2010; Gupta and Bansal, 2012; Salarzehi et al., 2012) of related information as one of the most important determinant of service quality of online services. Therefore electronic payment process became researcher’s area of interest.

In some of the very early researches of service quality only reliability was identified as a significant dimension. Various researches on electronic service quality (Jun and Cai, 2001; Han and Beak, 2004; Khan and Mahapatra, 2009; Santouridis 2009; Salarzehi et al., 2012; Gupta and Bansal, 2012) revealed that reliability is one of the most important dimension. The service quality models also revealed that all the quality dimensions were correlated - one influencing other.

Reliability is an abstract term and often used in the stream of engineering as a performance measure. In behavioural science when we talk about reliability what does it actually mean? Which parameters can be used to measure the term reliability? What are the major dimensions of the term ‘reliability’?

The objective of the research is to find answer to these questions in the context of e-payment process. Very limited number of literatures can be found on this topic. Therefore to determine the parameters of reliability a two-step method was followed - first, literature review and second, personal interviews with frequent online shoppers. According to the feedback of the online shoppers the electronic payment process was divided into four distinct stages. Most of the parameters associated with these
four stages were also had a link to the past literatures. Additional parameters found in the literature were mapped against the four stages of e-payment process, as well as some parameter not present in the literature came out as a result of the interview process.

Once the parameters were fixed, to find answer to the last research question, data were collected from people who shop online frequently to get details regarding their perception of reliability of online payment process at different phases of online shopping.

This research contributes to the field of service quality, e-payment process and more specifically to reliability. This will help the practitioners to understand the customer perception of e-payment reliability and help them to improvise the payment system.

**CONCEPTUAL FRAMEWORK**

Reliability refers to the consistency of performance and dependability of companies (Parasuraman et al. 1985, 1988). Reliability comprises all features of an vendor’s ability to perform the promised services timely, dependably, and accurately e.g., providing services at the promised time, provision of error-free services (Jun et al., 2004; Kuo et al., 2005; Van Iwaarden et al., 2003; Jun et al., 2003; Benlian et al., 2011). Li et al. (2002) defined reliability as the ability of e-mail and web-based systems to provide accurate information and perform the promised service. When a website contains guarantees criteria, it increases the company’s overall reliability (Kaplan and Nieschwietz, 2003). A study on factors affecting consumers’ perception of electronic payment by Ming-Yen et al. (2013) in Malaysia reveals that benefits, self-efficacy, and ease of use exert significant influences on consumers’ perception towards e-payment. To study the impact of trust on e-payment channels at Saudi Arabia Saleh (2013) conducted a study which found out security and privacy are important factors that customers consider when using e-payment channels at the time of purchase.

Electronic payment (e-payment) is a service that has been defined as “the transfer of an electronic value of payment from a payer to a payee through an e-payment mechanism” (Kim et al., 2010). Service Reliability is an important consideration for any new service deployment. reliability of transactions on the Internet is important for customers (During the user interaction with the system, the user issues multiple tasks (or requests) at different time points for different services in the system. The user-perceived service reliability is the probability that all tasks in the user session are successfully completed (Wang and Trivedi, 2009). Neuman and Medvinsky (1996) opined that the reliability of e-payment operation system should be available online 24 hours a day without breaking down at any time. The American Institute of Certified Public Accountants, Inc. (AICPA) list five principles and criteria that they evaluate for trust services: security, availability, processing integrity, confidentiality, and privacy (AICPA, 2009). Service reliability depends on service availability of
various networks or computer systems (Keralapura, 2004; Wilson, 1998; Meharia, 2012). Service availability corresponds to the concept of service accessibility (Tortorella, 2005). System assurance is defined as reliability and security of trading system that leads to the safe and successful Internet transactions (Lee and Turban, 2001; Kim et al., 2005; Beldad et al., 2010). Reliability of the system has been linked with system performance under failures (Kulkarni, 1986). Unlike Meharia (2012), privacy and confidentiality parameters have been merged under dimension confidentiality in this research.

To further explore the construct of reliability in e-payment process semi structured interviews (Thompson et al., 1989) were conducted with frequent online shoppers. Most of them were a frequent online buyer and had a good experience in going through the process of e-payment. Based on the literature and interviews a framework was designed which extracts reliability element in each stage of e-payment. This framework depicted in figure 1 has been taken as the foundation of the conceptual model of reliability of e-payment. The four stages are as follows.

**Availability**: after selection of the item the shopping website redirects the user for making e-payment. Therefore for reliability in the availability refers to loading of the payment website, navigation from one page of authentication to the next and the durability of the communication link.

**Authentication**: Reliability in authentication phase depends on the number of password the online purchaser has to input for making an online payment, levels of authentication (minimum 2 level authentications), standardized method of authentication during different online transaction, easiness to follow the instructions while going through the authentication phase.

**Confirmation**: Reliability in the confirmation phase refers to the procedure that ensures the online transaction has failed or successful - it can be through message in mobile, an alert on the screen or an e-mail describing the fate of the online transaction. The confirmation should come within a permissible time limit and there should not be any link failure before the confirmation reaches to the online shopper.

**Rectification**: Rectification phase becomes reliable if problems are effectively handled i.e., proper solution is provided within minimum time and without much interference with the end-user.

**Confidentiality**: Confidentiality refers to the degree to which the website is safe and customer information is protected. This dimension holds an important position in online purchase decision. Customers perceive significant risks in the virtual environment of e-service if there are possibilities of improper use of their financial and personal data.
THE STUDY

Quantitative data used to extract the dimensionality of a process-based reliability model were collected by means of a structured questionnaire. Respondents judged the performance of nineteen reliability attributes on a five-point Likert-type scale anchored by 1="strongly disagree" and 5="strongly agree". All of the questions were positively formed. Convenience sampling method was followed in this stage. Responses were collected from customers at various shopping malls in city of Bangalore, India. They were asked to recall a recently used online shopping experience. Only the users of online shopping were chosen to assure that participants had sufficient online shopping experience so that all aspects of reliability of making online payment could be evaluated. Among the 345 distributed questionnaires, 278 were fully usable. In order to assess the Table 1 summarizes the basic demographic characteristics of the sample.
Table 1: Demographics of the sample

The validation of the reliability scale was done both through exploratory and confirmatory factor analysis and reliability analysis as per the guidelines provided by Churchill (1987) and Gerbing and Anderson (1988). This method of construct validation has been widely established in the literature (Baumgartner and Homburg, 1996).

To verify the construct validity of the measure factor analysis was used in which all the factors loaded highly (0.5 and above) on a single factor ensuring the uni-dimensionality of the scale. About all the subscales had alpha values greater than 0.6 which accounts for internal consistency of the scale constructs (Donio et al., 2006; Nunnally & Bernstein, 1994; Peterson, 1994). Table 2 depicts the alpha values, eigen values and factor loading for different constructs measuring the reliability of e-payment procedure in online shopping.

Table 2: Reliability and construct validity of measures of reliability of e-payment
In accordance to the results shown in table 2 no modification were needed in the structure of the construct. Therefore the research continued with five reliability constructs of e-payments.

In the next step the data were subjected to confirmatory factor analysis using AMOS 17.0 to test the model fit and the unidimensionality of the scale items. Maximum likelihood method has been used.

Table 3: Average variance extracted and composite reliability of the reliability construct

Next, the extracted dimensions were tested for their reliability and validity one by one by means of confirmatory factor analyses (CFA) with AMOS 17. The local fit indices indicator reliability, average variance extracted (AVE) were employed to evaluate each dimension (Baumgartner and Homburg, 1996; Churchill, 1987). The corresponding measures suggest a good fit of the extracted five dimensions of the reliability scale that are defined as: availability, authentication, confidentiality, confirmation and rectification.

The fit statistics propose a superior degree of reliability and convergent validity of all scale dimensions. In order to examine whether all identified dimensions actually refer to a superordinate construct of overall reliability, a second-order CFA was conducted using all extracted five reliability dimensions ($\chi^2 = 275; df=147$).
3.1 Convergent validity

Convergent validity of a scale measure is used to assess whether the individual scale items are related or not. It refers to the degree to which the two measures designed to measure the same construct are related (Netemeyer et al., 2003). To examine the convergent validity the factor loadings and average variance extracted were examined as suggested by Fornell and Larcker (1981). With a very few exception, most of the indicators in this study have factor loadings ranging from 0.5 to 0.9 which is in line with Bagozzi and Yi (1988). The average variance extracted for each factor is more than 0.5, which is acceptable.

3.2 Assessing the fitness of the model

Each of the five first-order dimensions has a significantly large (p<0.001) and positive loading on the second-order factor, ranging from 0.35 to 0.62. Furthermore, all correlations between the five constructs are significant at p<0.001, indicating that the five scales converge on a common underlying construct (Lages et al., 2005). This suggests that the higher order model accounts for the data well. The global fit indices of the higher order measurement model shown in table 4 propose an excellent model fit. It shows GFI (goodness-of-fit) = 0.911, AGFI (adjusted goodness-of-fit)=0.885, CFI(comparative fit index)=0.945, NFI(normed fit index)=0.889 and RMSEA (root mean square error of approximation) = 0.056 which indicates the unidimensionality of the factors (Gerbing and Anderson, 1988; Lu et al., 2007). Table 4 depicts the values of goodness-of-fit indices for reliability of e-payment.

3.3 Discriminant validity

Discriminant validity provides the information about whether the scores from a measure of a construct are unique rather than contaminated by other constructs (Schwab, 2005). To assess the discriminant validity of the constructs the AVE of each construct was compared to their corresponding inter construct squared correlation as recommended by Fornell and Larcker (1981). Discriminant validity is given when the shared variance among any two constructs (i.e., the square of their intercorrelation) is less than the AVE of each construct. Table 5 shows the AVE exceeds the squared correlations with the all the factors.

Table 5: Inter construct squared correlations of measures of reliability of e-payment
DISCUSSION AND CONCLUSION

Reliability is an abstract term. According to the engineering definition, reliability means the probability that a system will accurately perform its specified task under stated environmental
conditions. The purpose of the study was to develop a framework of reliability of e-payment to know what affects reliability while transacting over electronic medium.

e-payment process was analysed and found to be consisting of four main stages. From the analysis it has been found that reliability of e-payment is associated with availability of the payment website, proper authentication while making e-payment, confirmation of the fate of e-payment transaction and rectification of errors if it occurs. Apart from these four dimensions, reliability is also ensured by maintaining the confidentiality of the financial and personal data of the shopper.

The four constructs availability, authentication, confirmation and rectification constitutes of four variables each while the construct confidentiality consists of three variables. First each and every constructs were factor analysed. Five distinct dimensions came out of the analysis without any significant cross loading. All factor loadings were greater than 0.7. The reliability analysis of the constructs has also in acceptable range.

In the next stage confirmatory factor analysis was applied to the data. Availability of the website, authentication, confidentiality, confirmation and rectification - all these converged to the latent construct reliability ensuring that they all are contributing in determining reliability of the e-payment process. The scale suggests that error rectification has the highest weightage in determining the reliability of the e-payment process. Time to rectify the transaction related problem has the highest importance in this dimension. It indicates that if the identified errors are rectified properly taking minimum time that will make the e-payment system more reliable. Confidentiality of financial and personal data of the user is the second most important factor in determining reliability. Analysis of customer perception shows that privacy of personal information is the most important factor in determining confidentiality which in turn determines reliability. Online shoppers perceive that a timely confirmation of their e-payment should be in process to make the system more reliable. Proper authentication technique ensures the overall reliability of the e-payment process. Customers perceive that the proper authentication checks should be in place and the authentication process should be easy to follow. Though availability of the e-payment website has a significant impact on determining reliability of e-payment process but this is the factor which has least weightage. The major determining factor within availability is the network link which is responsible for loading time of the e-payment site and time taken to navigate from one page to another.

The results indicate that the online shoppers have matured and the technology has also been well adopted as the customers are giving more weightage for rectification and less for availability as availability of the e-payment site is taken for granted.
LIMITATION OF THE STUDY

Reliability is an important dimension in the research of service quality. Reliability has been identified as one of the major dimension in the researches of e-service quality also. Reliability of e-service encompasses the aspects related to the usage of the whole website. This research has analysed the reliability perception regarding e-payment only. Therefore it deals with the transactional part of the e-service only. Analyzing reliability of e-service as a whole including the transactional and the non-transactional part may indicate some other important dimensions.

The demographic factors can be significant predictors in assessing reliability of e-payment. Factors such as age and educational level can be considered as significant determinants reliability. Separate analysis has not been done these demographics.

Through more critical analysis of the e-payment process some new phases can be identified where reliability parameters plays an important role.

The sample has been taken from Bangalore area only. Taking samples from other metro cities like Delhi, Mumbai can give different result.

In emerging economies like India usage of Internet using mobile media and other than mobile media is quite high though compared to this usage of e-commerce is quite low. In such a situation, analysis on what the non-e-commerce users of Internet perceive about reliability of e-payment could be useful information for web service providers.

SCOPE FOR FURTHER RESEARCH

Reliability is an important dimension that determines service quality. In various phases of the service process parameters are checked for accuracy to ensure reliability of the system. Not much work has been done on this specific construct of service quality scale. Analyzing the online shoppers’ perception it can be seen that reliability is influenced by many other constructs of service quality like system availability, confidentiality etc. Therefore improvement in the areas like availability, confidentiality will have a considerable impact on the reliability of the e-payment system. This leaves an immense scope of work in the area of reliability.

LIVING UNDER HARSH CONDITIONS – FINDING YOUR WAY AS A PUBLIC SECTOR MANAGER
Larsen, Mette Vinther; Rasmussen, Jørgen Gulddahl
Department of Business and Management, Aalborg University, Denmark

ABSTRACT
Harsh conditions for executing management can be a sensible interpretation of the daily managerial work for many public sector managers. This is an argument we, based on teaching and research, rely on from talking with a considerable number of managers in Danish municipalities, regions, state, universities and hospitals.

The paper is based on four personal, micro-level stories told by managers in hospitals. The stories revolve around how they in their daily working ‘inner life’ try to understand, cope with, and develop new ways to improve their work under what they in general see as increasingly harsh conditions created by a stream of structural changes and budget cuts.

It is about how managers handle daily tasks and experiment with ways to match the ongoing organizational and structural changes in hospitals, and how this inspires the way they experience the actual conditions as managers and the organizational and institutional framework they work within.

The theoretical inspiration is drawn from research on management: Mintzberg and Pettigrew, from strategy-in-practice: Chia and Holt, and from relational leadership: Cunliffe, Hosking, Shotter, and Gergen. The purpose of the paper is to create micro and practice-based pictures of ‘the inner life’ of public management of today, and how middle managers in Danish public hospitals handle structural change.

Keywords: hospital management, practice based, every day practice, the ‘inner life’ of middle management, handling ongoing change, entrepreneurial actions.

INTRODUCTION
A story is told nearly World-wide about two ghosts traveling through the public sector. One ghost is named budget-cuts, the other managerialism (Hood 2001:12553). This is not a new story. It has its roots back perhaps four decades, and has been told as New Public Management and Governance, increased productivity and efficiency, cutting costs, budget- restraints, and improved steering (Hood 1995; Brunsson & Sahlin-Andersson 2000; Christensen & Lægreid 2007). And at the same time a
critique is directed toward the belief in managerialism that the important things always come from the
top of the organization (Alvesson & Svenningsson 2008: 146).

The interplay between these macro stories and what happens in the daily managerial life is analyzed
in different ways (Correia 2013). I this paper we want to go even further in the direction toward a
micro perspective on management. The analyses will be based on stories told by individual hospital
managers on how they through daily practice handle such conditions of change, to unite the general
plans for rather drastic change decided by top-management, with the daily interaction between
employees, patients, clients and users. These are stories on practical ways through interpretations,
´repair´ of inadequate structures, and mundane entrepreneurial activities to manage institutions,
divisions, sections, and employees under these changing conditions.

From stories told about conditions and concrete actions by four middle managers in Danish hospitals
the paper tries to analyze how these managers in different ways understand the conditions and how
they deal with overall, from the top decided, changes in the restructuring the organization and
management in hospitals. In this way we want to contribute on how middle managers in the hospital
system deal with major structural change under harsh conditions.

THE FOUR MANAGERS AND THE DANISH PUBLIC HOSPITAL SYSTEM

We try to analyze such managerial activities as concrete as possible. So we start with the presentation
of the main players. The four managers are placed in middle management positions in hospitals in
two, out of the five, regions in the Danish public hospital system. The public hospital system in each
region is governed by a politically elected council and managed by a regional hospital management.

Beside their job as managers all four managers, while we were in contact with them, all were involved
in activities to increase their managerial skills through post graduate courses and education. They has
from one to three decades of experience from the Danish public hospital system starting from
ordinary positions as medical doctor, nurse, administrator, or technician, have grown up, and with
success advanced in a system, in their perspectives, increasingly filled with change: from many small
hospitals to few much larger, in 2007 from twelve counties to five hospital regions, and from
traditional bureaucratic and technical administration to New Public Management.

The present change they experience on increased demand for management, steering, budget cuts, and
internal mergers within hospitals has much to do with political and administrative goals for increased
efficiency through organizing in larger sections and department, and increased horizontal co-
ordination in the treatment of patients.

They work in two different Danish hospital regions, but even if the organizational changes made in
these regions are not formally identically, in daily practice the structural changes look rather similar.
The job for these four managers, as they see it, is to meet these changes and budget-cuts with intentions to get the best out of it for their patients, and their employees. They experience these tasks as rather harsh, but manageable.

The four managers in this study are: a leading nurse, the leader of a service department, the deputy chief of a hospital division, and a hospital CEO. For this study the four are not chosen to represent anything outside their own management responsibilities and what they actually do. They work in different specific settings and with different tasks. What make them to some extent similar are, beside they all work in the Danish public hospital sector, and their wish for further insight in their own work, a mutual feeling of harsh times and challenges, and their will and efforts to find new and in a small scale entrepreneurial and innovative solutions.

**METHOD**

We have met the four managers individually between four to eight times during 2013. We have participated in with each of them for one to two hours conversations as listeners, but also commentators, and discussion partners. From our chosen methodological perspective (Alvesson & Skjöldberg 2009) stories about daily managerial practices are created through interview-conversations between the individual manager and us (Kvale 1996). We do not see ourselves as neutral, objective observers (Czarniawska 2004; Alvesson 2011). We are as researchers always involved, which is the perspective in our relational ontology of doing research (Cunliffe 2001; Gergen 2009; Berger & Luckmann 1966).

Through such conversations with the individual manager where the focus is directed toward what they are preoccupied with at the present moment it is possible to develop an understanding on how changes in the practical daily actions of the individual manager can be interpreted as ways to handle these macro-organizational changes created through decisions in regional councils and the top management of the regional hospital systems. The methodological perspective is to interpret activities at the micro level as seen through the eyes of the four managers.

Our inputs for writing the four tales as they are told in this paper are written statements from the managers, audio taped conversations, and our own notes from the conversations. The method is a kind of co-authoring (Cunliffe 2002). At the same time all the four tales are read and commented upon from each of the four managers before they are presented in this paper.

**THEORY**

In contrast to studies of macro-change in the public sector where principles of public sector steering, New Public Governance, interactions between politicians and administrators play the important role...
the study in this paper is directed toward micro-actions to cope with the daily responses and the practical handling of change. It can be seen as the meeting between ‘grand’ structural changes, and local routines (Feldmans & Pentland 2003), local norms, and taken for granted. It is the development of practical managerial means for handling new situations, and it has its focus on management-in-practice. We prioritize to analyze the emergent, more that the deliberately planned, (Mintzberg 2009: 153) and we draw on the practice turn in organization studies (Alvesson & Kärreman 2000).

The theoretical framework for understanding these stories and the activities behind are inspired from American pragmatism (James 1909) and especially how actions and interpretations interact and how practice and experiences (Corradi 2010) form the meaning of structural changes and micro actions. And how the interpretation of structural changes both lead to actions directly in line with such structural changes, and to entrepreneurial actions where managers dare to use alternative means and interpretations. Such entrepreneurial handlings of structural macro changes on the micro level of middle management action inspire us to use the concept of wayfaring/wayfinding instead of navigation (Chia & Holt 2008; Ingold 2008) as a perspective on these kinds of management.

Our framework is also inspired from the theoretical work on relational leadership (Cunliffe & Eriksen 2011; Hosking 2011; Uhl-Bien & Ospina 2012). An approach to leadership that emphasizes that leadership takes place and is realized between humans. Hence, the focus is not on the leader as a person, but on how he/she engages in relations with other organizational actors in- and outside the organization and how they through co-constructive practices make sense and handle everyday organizational challenges (Cunliffe & Eriksen, 2011, Hosking, 2011, Gergen 2009). In relation to the managers in this paper focus is on the interaction and relational processes between them and their employees, and how they co-constructively create local interpretations of macro changes.

FOUR TALES FROM THE HOSPITAL FIELD

The newly promoted leading nurse: As a result of a general change in the organization and management structures in the regional hospital system Maria has been selected and promoted to a position as leading nurse in a section. The section is a merger between several departments. This was part of a change in the entire regional hospital system: creating rather large sections with a section management under a division with a division management, which again was placed under the hospital management, which again referred to the regional health management and the elected regional council.

Maria interpreted this new organizational structure as a way for the region to increase efficiency, also as a mean to further budget-cuts, and at the same time as a way to better co-operation between the sections under the new division to increase the quality of how the individual patient was treated. She
also saw these changes as new top-initiated ways to strengthening the function of management at the different levels. She enjoyed her new responsibility including responsibility for a much larger staff. But she was from the start unsure of how she part of the new section management could support increased quality for patients.

At the same time she felt a lack of support both from employees, lower level managers, and from some of her fellow managers to support the new structure. To many of her colleagues the change was seen just as more of the usual budget-cut stuff. She also sensed a lack of ability in the section management to talk about the new responsibilities, demands and possibilities. And she experienced a number of defense mechanisms among her colleagues. But Maria gradually developed the idea that the new structure could be turned to the better if something was done concerning communication and meeting activities in the section management.

For that reason Maria decided, even if was not stated anywhere as her duty, to start a process improvement, and especially focus on one perspective in the new managerial structure: the idea that management should not be left to individuals, but to management teams. For her it became increasingly clear that a functioning team had to be developed out of the section management of five persons.

She therefore gradually at the regular section management meetings introduced themes as: how the section should stay in front of the development within its field, and how the management group should use time for elevating their meetings from only handling operative problems to a level where they regularly tried to analyze the tasks and goals from a more holistic perspective. This can be seen as an entrepreneurial approach to handle the new structure in an innovative way building on Marias earlier experiences.

To her and to the rest of the section management it created during a sequence of meetings in 2013 a type of management increasingly based on the team, not on five individuals. It also gradually created, in the team, a vision for making the section more visible not only for its own employees and to the division management. She did this also to make the section more visible to show that it worked actively to increase quality in its treatments and its co-operation internally within the division.

*The leader of the support department:* Frederic is the manager of a competence center and support department in the regional hospital system. A couple of years ago his department was created through a merger between two smaller specialized service departments. This was done as part of a modernization and merger process in the entire regional hospital system and at the same time to handle a severe - more than ten percent – budget-cut. It became a department that covers a broad array of support from purchase to financial advising and technical support for all the hospital in the region and the number of employees is one hundred.
Even if the budget cut and expected further cuts plays a role, Frederic’s major concern as a manager is the need for change and modernization of the function of his department and it mission and vision. He has, mostly based on his own ideas, re-constructed the department structurally to change it from two separate departments to one to create new lines of co-operation between the different functions, and to create synergy. He has managed to involve his six experienced section managers to create much more horizontal co-operations. An important idea behind this has been to increase the innovative capacity of the department. At the same time he wants to change the department from mainly being a reactive support and purchasing function to become a proactive support function for the technical functions at all the regional hospitals.

His goal is to couple his department in a much more interactive way to the vision of the entire hospital system: placing the patient at the center and create more quality and efficiency. He tries in the same process to learn from the following questions: what mistakes was made during the merger process? And what are the future core-areas for the department?

To Frederic the advise-function directed toward supporting the different part of the regional hospital system and the individual hospitals and departments is as important as the ability to purchase goods cheap and in excellent quality. The entire department has during the next three years to become one competence centre supporting a large number of hospital functions to increase the quality of treatment, but also research and development through his department’s deliverance of the most efficient medicine, equipment, and not at least: advices.

According to Frederic this led to a new and positive picture of the department in different areas of its environment and in the regional hospital management, but to Frederic it has also created some difficulties for himself. One of the big challenges for him is to change the views of the department employees and managers from being rather narrow specialists to become specialist with a broader view on co-operation, joint innovation and co-creation, and at the same time assessing the financial and cost consequences behind this view.

His main struggle through the year 2013 has been to balance between the increased expectations from the environments, the budget limits, and the capacity and values of his employees and managers. He also feels the pressure on himself as he sees the amount of work piling up, and he sometimes think that he have engaged in a change in vision, strategy and organizing that neither his staff, nor the regional hospital management are quite ready for yet. He reflects now and then if he just should have left his department in its original form.

The deputy chief of a hospital division: Helen has just been appointed to deputy chief of a large newly founded hospital division with nearly one thousand employees. She has come from a position as chief physician in a hospital in the neighboring region, a job she was not satisfied with because of very
unclear relationships within the daily management. So she expects a lot from her new job and is eager to perform.

It is not only a new position in a, to her, unknown division and hospital. It is also outside her specialization as a chief physician, and it is a new organizational structure with new managers at the divisional level. She tries to use her general hospital knowledge and experiences to understand the organizational practices that are developing and gradually to define her own function.

Her job is to be responsible for how the treatment of the patients functions and how this is coordinated between the different sections within the entire division. To improve this is a top-priority policy decided by regional council and through instructions from the regional hospital management. But to Helen this policy seems rather abstract and not very concrete described in the official papers. She is part of the division management group, which also contains her chief, the division manager, and the other deputy chief, responsible for personnel and human resources. But she is a little uncertain of how to define her own function. It is a priority area for the regional council, but in her job she has no authority to instruct employees, managers, sections or groups. If she wants something changed she has to bring it up for the division manager or at a management meeting. To some extent she fears that one could see her job as a kind of staff function.

This rather unclear situation is to her combined with an unclear relationship between the individual managers in the new division management, and also between the division and its sections. She observes many tactical and opportunistic operations between individual sections, not at least when budget-cuts have to be allocated or scares resources shared. Therefore she decides to give herself a role in the construction of an efficiently working management within the division.

She sees it as possible to use the force that lies in the new situation. She finds out that she has to work for creating a more unified leadership within the division. Her method is to some extent to use her own duties to reach the goal of more efficient production processes: coordinated treatment of patients, and increased efficiency in curing. She works to find out who in the division and section management are or could be the most dedicated toward reaching these goals.

During this process she also learns something for, and about, herself. She came to her new job seeing it as her task as an individual to understand and define the job she had got. But increasingly through this process Helen experiences that while she is working for the goals she has defined important, she also influences on how her fellow managers defines their jobs, and at the same time the way they understand their duties they influence the way she defines her job. The unclear and undefined function of her job and the function of division management motivate her into constructing a new way to function, and creating this way changes her understanding in a more entrepreneurial direction toward being active in creating increased collaboration.
The experienced CEO in the small hospital: Chris has been CEO for the smallest hospital in the region for a decade. It is a merger of three even smaller hospital made shortly after he got his present job. The hospital is today located at two different places some miles apart from each other and in this way in two separate local communities. At the same time it is located close to the regional boarder and in close distance to two larger hospitals in the neighboring region.

Chris is rather proud of that he has, together with his staff, managed to keep his hospital alive and able to take patients in directly from the street. This has not been easy in a period of several budget-cuts, fast technological development, centralization, and policies underlining “big is beautiful”. He knows that even if he has been able to cope with that up to now there are big risks for his hospital in the near future.

One of his main concerns is that it becomes increasingly difficult to attract medical personnel for permanent positions especially at one of the locations. Another is that hiring non-permanent staff is extremely expensive and results in coordination difficulties. A third concern is the fact that the recent change of the management structure in the regional hospital system is mostly in favor of the big units.

Chris is occupied with managing a difficult situation. The main formal argument for the existence of his hospital is the time it takes to transport patients from this part of the region, inhabited by twenty percent of its population, to the next nearest regional hospital, and the fact that it is expensive for the region if patients instead chose one of hospitals in the neighboring region closer to the local population. At the same time there seems to be a strong political will locally to keep the hospital alive. But this is also a curse because it means that every time Chris tries to reorganize between his two localities a massive critique appears from some regional politicians and a pressure group from one of the localities.

For Chris to get support to solve this is nearly impossible because small hospitals are definitively not the main priority for the regional hospital management. It seems at the moment occupied with the planning of a new very big and expensive regional hospital as part of a national health plan. The regional hospital management is not especially interested in being involved in the local challenges, and definitely not in having such questions brought up in the regional council. Is wants Chris to handle “his own” problems and to do what is needed, which to him seems in reality to close one of the localities, the one with the strong local support.

Therefore the task for Chris has during 2013 been to balance between regional hospital management goals and new structures, budget difficulties, keeping the quality high with lots of non-permanent staff, handling the local critique from one of the locations, and trying to keep a constructive dialogue with the regional hospital management. In this way Chris is, and have for years, been a manager handling practical problems entrepreneurially to secure the existence of his hospital.
ANALYZING THE WAYS THE FOUR MANAGERS INTERPRET ENVIRONMENTS, CHANGES, RELATIONS, AND EXPERIENCES

Each of the four managers is of course unique, but as we see the four together not very different from other hospital managers and managers in other parts of the public sector, we are in contact with in our research and teaching. Managers who work to find new practical solutions to handle the challenges of structural changes and budget cuts, and who especially in practice and on an every-day basis act entrepreneurially to develop such solutions. They are handling their different managerial tasks, trying to create an acceptable ‘inner life’ for their employees and patients, and at the same time manage budget-cuts and structural changes. From the four tales the following analysis interpret how environment, the organizational changes, unclearness, experiences, relationships, and entrepreneurial activities are interpreted and handled by the four managers.

The environment seen from the perspective of a local manager: The four managers have pictures of the broader environments and general trends in the development of society, the health sector and hospitals. From their different professional background they prioritize different important factors in the environments, but to some extent they – without knowing each other – have similar interpretations of what here and now are happening in the environments of the health sector, and they also have rather similar ideas of what is going on concerning the development within public sector management.

The hospital environments are seen by them as increasingly specialized, increasingly demanding more efficiency and quality in curing patients, and at the same time as demanding economies of scale, larger and fewer hospitals, and ‘more for less’. They can in one way agree with these demands, but at the same time they find it difficult to manage all these demands at the same time.

They know they have to manage within these institutional and political conditions. But their primary environment contains for them something much more local (Hosking 2011) and reachable: to Maria and Helen: neighboring departments, section, and the hospital management, to Frederic, in addition to this, important customers and the regional hospital management, and to Chris: also the politicians, regional hospital management, the local population, and the hospitals in the neighboring region.

The organizational changes and unclearness: The interpretations of the practical consequences of the formal organizational changes are in the four tales filled with flux, unclearness, and uncertainty (Tsoukas & Chia 2002; Chia & Holt 2009). None of the four managers have a clear, total and fixed picture of how the present changes will turn out in practice. They know a great deal about the formal lines and the formal ideas behind the present changes in organizational structures. But they also express that it is nearly impossible to anticipate the practical outcome of the interaction between new formalized managerial structure, the mergers and the creation of larger units, the plans for more cross
functional co-operation, and the daily operations. On top of that they are almost certain that the next budget-cut, the next organizational change and the next policy for re-structuring is luring just around the corner. But they have no certainty about how much it will change and when it will appear.

Even if they have a rather clear perspective on overall structures in the change plans decided by the regional council, and see such plans as structured after rather simple formalized principles then the actual, local consequences of these plans and what is expected of them look much more as processes where much is in a flux. This constructs for them an image of an ever changing environment (James 1909: 735-). The managers interpret these change processes from their individual local perspective, job function and local colleagues and employees. The way they experience the environment seems connected closely to how they interact with the local actions, norms, values and taken-for-granted.

The flux and unpredictability they experience from the realization of the actual plans, but also from the health and public sector environments in general makes them aware that they increasingly and actively have to develop means to cope with these ongoing, but incalculable changes, and they are quite certain that such means have to be flexible and closely coupled to persons and means close at hand. They work to create what they see as here-and-now solutions that couple the formal changes transformed into the local environment with the practices, taken for granted and norms of their section, department or hospital, but they also, as the stories Frederic and Maria tell, think ahead.

The use of experiences and relations: The four managers all have a fairly long career in the health sector – at least ten years. That have given all of them an impression that this sector is in a constant and increasing flux and change. This experience tells them that the next major change will appear within a few years and the next budget-cut will appear perhaps within the next year. So even if they are unsatisfied with this flux, it also gives them the belief that nothing is permanent and that their managerial actions also have to be a preparation for the next unpredictable change. At the same time they express that their experiences tell them that change of many kinds within hospitals increases.

Chris as CEO is perhaps the manager who is the most certain that new changes will appear because of the tension he experience between the local actors, the regional hospital management and his hospital. He has a solution he recommends to the regional hospital management, but is not sure that it will be followed. Frederic is using his experiences differently. He tries to use his knowledge about the flux and uncertainty to create new processes in his department in constructing an efficient competence center that will become a major player in delivering advices and services to all the hospitals in the region. His experiences tell him that it is important to be on the move and induce change.

Maria with her background in nursing and her promotion in the new organizational structure uses the experiences she has gathered as a manager at a lower level to work actively to create and develop what she sees as an important managerial team-structure. Using her professional competences as a
nurse and a manager she delivers an input to the team-building process. Helen is perhaps the manager who most dramatically has to transform her experiences as former chief physician where the natural-science ‘one best solution’ defined by her individually has, as she gradually move from a peripheral to a central position in the daily management of the division, to be changed to a more team-oriented soft and organizational style.

What seems to be increasingly important news to Helen, are for the three other managers something rather well-known. It is the co-construction processes with fellow managers Frederic and Chris rely on the close co-operation with their management teams, and Chris would have liked a closer co-operation with the regional hospital management to solve the local problems. They both express the importance of involving other managers and employees. This co-constructive approach is also what brings Maria to try to create stronger relations to the management team she is part of. Even if she is not the chief, but a member of the management team she tries to work actively for producing relationships that foster efficient decision-making in the team. Concerning Helen who came from an unsuccessful managerial co-operation in her former position also gradually involves in team-building processes within the division-management.

*Every-day entrepreneurial activities:* As described above the ‘grand plans’ for structural change and the budget-cuts created by the regional hospital management are not followed by detailed plans for implementation. The four managers know that they have to develop local solutions that will meet the new budget requirements and the increased expectations for efficiency from the regional hospital management concerning the new organizational and managerial structures and the creation of larger divisions, sections and department.

Chris has in his ten years as CEO constantly been engaged in the struggle for keeping the relatively small hospital alive as an independent unit with a broad specter of functions. He together with his management team has through the years developed a number of structural solutions, which could be seen as useful by the regional hospital management and the regional council, and at the same time not creating too much bad will among one of the localities where the hospital is located. Some of them have been accepted and implemented, others have been rejected. Also in the present situation he knows that the plans and ideas he has to present for the regional hospital management also have to be seen as innovative, entrepreneurial and politically acceptable.

Helen is in another situation because she changes her previous way of being entrepreneurial presenting individually developed solutions as a chief physician to an increasingly relational way to work together with her new colleagues in the division management. Maria, on the other hand, worked in her new job much more actively to present and discuss new solutions with her fellow managers in the section management. A way to manage that uses the skills and competences of an experienced
nurse, but in a much more entrepreneurial style and including co-managers from quite different professions.

Based on his story Frederic is perhaps the most entrepreneurial manager of the four. He sees the hospital system in the middle of a rather dramatic change from a stable structured and administrated type of organization with different and relatively separated professional groups fighting for influence and resource to something quite different. What he works toward is for his department to be part of a much more integrated type of organization where the need for quality and efficiency in the cure of patients demand much more strategic integration between medical, nursing, advising, servicing and managing.

**DISCUSSION**

These managers are part of middle management in the Danish public hospital system. What they do are to try to construct a more promising future out of a situation filled with flux and unclearneass by building their often rather mundane ideas into the present (Kornberger 2013). They do this without knowing for sure if these ideas are compatible with the ‘grand structural plans’ from the regional hospital management and without knowing if they will be accepted and further developed by their fellow managers and their staffs.

These ideas and how they have to act according to them are part of the daily work to fill up the gap between the grand plans and the daily dynamic of managing fragmented and interrupted (Mintzberg 2009:20) It is also the way these managers tries to couple between the preconditions of the ‘grand plans’ constructed after an navigating philosophy where the departure point of the organization and the entire hospital system is A, the arrival point is B, and the pattern of movement from A to B is linear and following a certain logic. And the ‘reality’ of the day-to-day change where much of the movement is emergent and where the next step is defined while it is taken, which can be seen as a wayfaring process (Ingold 2008: 75-76; Chia & Holt 2008).

This ‘co-ordination’ between the plans for structural change and the daily activities of middle management can be seen as part of the normal duties of a manager – to ensure that the production process is running smoothly and to use the newest and most efficient means created by specialist and the top-management and communicated down into the organization. This is an important perspective to see this under and a way to define the daily activities of management.

But it is more than a coordinating process. It is how the individual manager not only fills out the gaps in the formal plans for change. We can also be seen as the way managers tries to ‘repair’ inefficiencies in the formal plans. In these activities they bend or even move beyond some of the structural constrains. They do this with the intention to find workable solutions that functions toward the
patients, the staff, fellow managers and neighboring departments, sections and divisions. They try from the rather structural reforms to create manageable processes.

What this look as in the analyzes of the four tales could be seen as a kind of examples on how an important part of the public sector, the hospitals, are engaged in change not only through the plans and formal structural changes of the specialists and top-management, but certainly also from the daily entrepreneurial ‘repair’ of the practical inconsistencies of the formal plans. This way of seeing this important part of public management is directly connected both to the structural changes and to the environmental and organizational change.

This can be interpreted as an important change in the function of management in hospitals and in this way as part of the entire renewal of the organizing patterns. According to the four managers the managerial system of hospitals are in an ongoing change process. A process that goes from stability to flux, from long lasting structures to the launch of new plans and structures nearly before the previous have been taken into practice, and to increased importance of as well new managerial principles introduced as part of the structural plans and increased demands toward managers to manage. And as cycles that overlap each other, create disturbances, fight for attention, influences each other etc.

Seen in the perspective of the four managers this reveals a picture of the interplay between the daily response to flux, uncearness and uncertainty both in the environments and internally in the hospital organization, and the ways experiences are used to create entrepreneurial and practice innovative ways to build relations and to manage together. What we see in these four tales is not only managers living up to new standards, but also creating new standards to make the structural plans workable and through practical, entrepreneurial activities to improve the function the hospital, its divisions, sections and departments.

CONCLUSION AND PERSPECTIVES

One important conclusion from the four tales is how the managers prioritize the co-operation within the management group and in this way the co-creation of new practical ways to handle the daily managerial tasks. Important is also the accept that even when the structural plans both calls for improved weight on management and at the same time calls for increased team-work the managers choses to use the team as a mean for improved weigh on management, instead of individual action.

The second conclusion is that even if structural plans includes principles on how to manage the actual managers on the different levels have to use both their entrepreneurial skills and their experience as managers to find solutions that they can use in the local practice, some of them in line with the formal structural changes and some of them bending the structural constrains to find a workable solution that both follow the intentions of the ‘grand plans’ and create space for the daily coordination.

ABSTRACT

The purpose of the present article is to investigate impacts of the fear of failure on the dynamics of entrepreneurship in CEEC that entered the EU in 2004. A special attention is paid to entrepreneurial employees’ (intrapreneurial) activities and the innovation orientation, as the fear of failure often leads to individual choice to perform innovative activities while being employed or to use a good business opportunity while creating a new business. Based on Global Entrepreneurship Monitor (2012), nearly all of these countries belong to the efficiency-driven group of countries (except Slovakia and Slovenia) and seek for improvements of their innovation systems. The research question of the present paper is: how the fear of failure impacts the dynamics of entrepreneurship among Central and Eastern European Countries (further in the article, CEEC) that entered the European Union in 2004. The research is based on the Global Entrepreneurship Monitor methodology and a comparative analysis method. The introduction part of the article serves as the conceptual framework where the main entrepreneurship-related definitions, classifications and development trends are presented. To continue, the conceptual model, which incorporates the main impacts of the fear of failure on the dynamics of entrepreneurship and intrapreneurship, is presented and the GEM methodology explained.

Keywords: entrepreneurship trends, Central and Eastern Europe

INTRODUCTION

Although today the term ‘Entrepreneurship’ experiences its increasing popularity, impacts of social and cultural dimensions, such as the fear of failure, on entrepreneurship and intrapreneurship are not sufficiently examined. Today scholars agree that the fear of failure affects the perception of business opportunities and capabilities, attitudes, intentions as well as the decision to become an intrapreneur (entrepreneurial employee). The fear of failure in many cases can lead to individuals’ willingness to operate ‘under the roof of employer’, where principle risks are managed by top managers and/or
owners, or can discourage individuals to start business. To better understand impacts of the fair of failure within the entrepreneurial dynamics, it is important to have a profound understanding of historical development of the term of Entrepreneurship. An academic and theoretical concept of entrepreneurship emerged in the 17th century (it was first mentioned in Richard Cantillon and Adam Smith’s works); this area had not received sufficient attention until the end of 20th century (Stephenson, 2003). Casson, Yeung, Basu et al (2008) point out that entrepreneurship is examined quite extensively, but a single definition of entrepreneurship is still not found.

One of the newest and most recent definitions proposed by Shane and Venkataraman (2000) emphasizes: **Entrepreneurship** is a branch of business science which seeks to explain and understand how do opportunities rise and what results they bring to the creation of new or improvement of existing products or services (Shane and Venkataraman, 2000). Based on this definition, entrepreneurship is an area of human activities that consist of the following key factors that could be potentially affected by the fair of failure: 1) Seeing opportunity; 2) Understanding what is necessary to do to exploit this opportunity; 3) The ability to manage business, originated from the observed opportunities (Shane and Venkataraman, 2000).

It is valuable to draw the attention to the Madura (2006) definition of entrepreneurship which defines entrepreneurship as a process consisting of the disclosure of options and development through innovation, taking into consideration entrepreneurship resources, locations and status.

Based on Barringer and Duane Ireland (2006), the essence of entrepreneurship is the transfer of ideas and application of them in the market. Madura (2006) gives a definition which states that entrepreneurship is not necessarily a process of creating new organizations. Entrepreneurship can be found in an existing organization. According to Casson, Yeung, Basu et al (2008) a contemporary entrepreneurial philosophy began to evolve rapidly in the 20th century, whereas large-scale organizations established in the 19th century were working in newly developing sectors such as Electricals, Chemicals, Communications, and Automotive. The need of a new-type professionals emerged, as universities were not preparing them. All these factors accelerated the scientific research initiatives of entrepreneurship. In addition, the shift towards service industries has modified the entrepreneurial concept (Casson, Yeung, Basu, and Wadeson, 2008).

The topic of the present publication is innovative and relevant not only because of the complicity of the term ‘Entrepreneurship’, but also because of the specificity of the region and impacts of the fair of failure on entrepreneurship in this region. The selected countries (Slovakia, Slovenia, Hungary, Czech Republic, Poland, Lithuania, Latvia and Estonia) are similar in their experience of once in their history lacking knowledge-driven national systems of innovation; thus, their integration to the EU manifested in quite radical modifications of their economies, reshaping innovation processes as well as expressing
potential and progress which varied from one country to another. The communism experience is also associated with the fear of failure, as small and medium companies had little independence in managing their innovation processes and needed more to execute the delegated tasks and objectives. However, two countries (Slovakia and Slovenia) have managed to switch from the efficiency to innovation-driven group of countries, based on GEM classification (2012). Relying on the GEM methodology and classical comparison analysis method, the GEM data of the selected countries is compared while having a special focus on: the innovation orientation, the block of factors related to the uncertainty avoidance and the fear of failure as well as the block of indicators related to the entrepreneurship dynamics in the analysed countries.

**DRIVES AND BARRIERS OF ENTREPRENEURSHIP AND INTRAPRENEURSHIP**

While tackling different historical periods the question of ‘What is an entrepreneur?’ was answered differently (Hisrich and Peters, 1994). In the 18th century Francis Walker formed another definition of ‘Entrepreneur’, which finally separated people who had capital and were receiving dividends and people who were operating under shareholders’ requirements and generating money using their managerial skills. It created the foundation, which was later used by the academic society (Stopford and Baden-Fuller, 1994).

One of the first who had discovered Entrepreneurship was Schumpeter (1942). He emphasized the fact that a definition of an entrepreneur should be related to a person, who is not only willing, but also able to generate a new idea or invention and turn it into a successful innovation, which can be applied in practice. An entrepreneur uses this feature constantly and this allows him/her to discover innovative business models, new products and services. This proactivity significantly contributes to the progress of industries and long-term economic growth, and it is one of the reasons why entrepreneurship is so encouraging. Schumpeter (1942) argued that entrepreneurship gave the world not only new industries, but also a start to combinations of fused sectors. To summarize the Schumpeter’s approach the following definition can be used: an entrepreneur is a man who owns and organizes a company for personal gains (Schumpeter, 1952).

While interpreting the ideas of Drucker (1985) and Brut and Julin (2000), Pranckus and Raudonius (2013) argue that entrepreneurship comes from the creativity and support and it is necessary for everyone involved in business. In addition, Stoner (1999) and Freeman (1999) state that entrepreneurship is associated with a higher risk tolerance and innovative thinking. It is clear that features of intrapreneur or entrepreneur can be divided into ‘born with’ and ‘learned to’ (Stoner and Freeman, 1999).
The process of entrepreneurship, which could take place not only in the development of new companies, but also within already existing organizations, could be called internal entrepreneurship or intrapreneurship. Intrapreneurship and entrepreneurship share the same features that can be found in all the contemporary definitions of entrepreneurship: a greater risk tolerance, creativity, greater independence and remuneration (Kuřátko, Montagnaim and Hornsby, 1990). These factors are the main driving forces of any kind of entrepreneurship. Many authors describe Intrapreneurship as a Corporate Entrepreneurship. Veronique Bouchard, Olivier Basso (2011) argue that officially intrapreneurship appeared in Burgelman’s publication ‘Internal Company’s Development Process in a Large Diversified Corporation’. These authors argue that the success of the term ‘Intrapreneurship’ was because it was self-explaining (intra is internal). The early studies of intrapreneurship sought to find answers to the following questions: What is the difference between intrapreneurs and entrepreneurs?; What conditions do explain intrapreneurship?; What factors are stopping an internal entrepreneurship in large companies? (Bouchard and Basso, 2011).

High risk investments in a new business sector required a lot of time and work, but people were led by an entrepreneurial spirit, which allowed to be flexible and to make quick and appropriate decisions (Kansik as Laakkonen and Sapro, 2012). Intrapreneurship releases several strategically important respects: Innovation; Risk; Proactivity (Katz ir Shepherd, 2004).

Intrapreneurship is particularly relevant in today’s organizations, as modern people who believe in their talent and value to organizations usually expect something more than salaries. They want the freedom to create and manifest. According to Vince (2002), the absence of freedom creates the dissatisfaction with not only a company itself but also with duties of work. This reduces the productivity and ultimately leads to the search of a new job. Thereby, intrapreneurship is a method of liberating an organization serving individuals who believe that a company can do something different and better (Kanter, 1982). Intrapreneurship upgrades organizations and takes them to the next level (Garret and Covino, 2007). Rod Gapp and Ron Fischer (2007) argue that intrapreneurship is an internal organization process for the creation of separate units. Kolchin and Hyclak (1987) in turn give the greater importance in the process of intrapreneurship to providing new products and services within an organization. Hisrich, Peters and Shepherd (2009) basically follow the same Intrapreneurship results in innovations, it can be new products, services, systems or processes (Kolchin’s and Hyclak’s, 1987). Intrapreneurship definition is that the innovation process is controlled by employees, not by an organization itself. An organization, according to Politis (2005), provides an appropriate space for employees to work in an environment which provides the satisfaction. Madura (2006) argues that many scientists agree that while purposefully developing and nurturing intrapreneurship the culture can give positive results.
The influence of entrepreneurship and intrapreneurship on firms’ economic and financial indicators occurs not only by increasing the revenue or market share. This includes the initiation of a change in business and society. Ross and Unwalla (1986) link innovations to the original source, not only for new products and services, but also for an economic welfare and market stimulation.

Very often it is apparent that an internal businessman is a mix of traditional manager and entrepreneur (Lyles and Schwen, 2005). Active people within a right company and under right conditions can achieve technological and innovative breakthroughs much quicker because they are supported by ‘know how’ of a company (Mintzberg, 1979).

The organizational culture, according to Wallace, Hunt and Richards (1999), is all company’s employees working for one purpose, applying one or another managerial tactics, processes and resources; thus, forming the unique organizational culture. Barney (1986) argues that it is also one of the key competitive strengths of each company. Recently the organization’s culture was presented as a fundamental framework to manage innovations, the process of development and commercialization, helping to achieve a long-term success and competitiveness. Hall (2005) states that the environment in which innovation occurs is usually encouraging expectations, dreams as well as supports its members’ creativity, experimentation while being risk-tolerant.

Companies that develop the culture of product and process commercialize innovations much faster and easier. The environment which supports the creativity and experimentation enables the staff to use opportunities to develop new products while increasing the likelihood of commercializing the innovation. These aspects match with the philosophy of intrapreneurship, which is why fostering an internal culture of entrepreneurship in the work environment encourages new ideas, procedures, and synergy while encouraging the development of innovations (Wallace, Hunt and Richards, 1999).

The Rule’s and Irwin’s (1988) study examined measures used by companies to develop and implement the intrapreneurship atmosphere in organizations. There were 33 ways mentioned: Innovation, teams and work groups; Recruitment in order to implement new ideas in an organization; Strategic planning, focusing on innovations; Focused consumer testing of new opportunities and trends observed; Research and development activities.

Kuratko, Montagnais and Hornsby (1990) argue that the intrapreneurship success or failure depends on four factors: Innovation, development, testing and deployment of processes on the market, supported and encouraged by leaders of a company; Remuneration or reward systems designed to celebrate and reward achievements of the staff; Time management, work distribution, creating space for creations and research; The lack of organizational boundaries, which makes the work go beyond daily tasks (Kuratko, Montagnais and Hornsby, 1990).
According to Koen (2000), no matter how strong and creative the team of employees is, if there is no support from the management it is not possible to expect a good result. Antoncic and Hisrichs (2003) divided intrapreneurship into 8 dimensions.

Table 1. Dimensions of Intrapreneurship

This table shows that there are a sufficient number of channels through which an organization can benefit from intrapreneurship. The most important of these dimensions is the first: the emergence of a new company or branch. However, this is already a result which proves the presence of other dimensions in a company, which confirms that intrapreneurship is not only a powerful engine of innovations, but also a significant response to threats of an aggressive competition. Such factors as the management efficiency, human resource strategies, innovation encouragement tools, the competition in the market, economic, political and social environment as well as cultural characteristics, including the faire of failure, should be carefully analysed further in the paper.

METHODOLOGY AND CONCEPTUAL MODEL

The investigation regarding the impacts of the faire of failure on the dynamics of entrepreneurship in CEEC that entered the EU in 2004 is continued by presentation of the Global Entrepreneurship Monitor methodology. The present article supports important aspects of the research problem already tackled in the scientific literature review by the data from GEM 2011-2012.
Global Entrepreneurship Monitor survey is the largest study in the world on entrepreneurship (covering 90 researchers’ teams from different countries and conducted since 1999). The GEM data is gathered annually and is derived from two main sources: GEM Adult Population Survey (APS) and GEM National Experts Survey (NES).

Based on the Global Entrepreneurship Monitor methodology, countries are divided into three groups: 1) factors-oriented countries; 2) efficiency-driven countries 3) innovation-oriented countries. The study of entrepreneurship dynamics focuses on the transformation from one group of countries to another. GEM examines such entrepreneurship characteristics as motivation, innovation, competitiveness and growth potential. In the present article analyzed countries are classified according GEM methodology, as it is illustrated in Table 2.

*Table 2. Classification of analyzed countries according GEM methodology 2011-2012*

Source: GEM 2011-2012

Entrepreneurship is seen as a process, covering all the phases of the business cycle: from intending to start, to just starting, to running new or established enterprises and even discontinuing business. These surveys include the issue of new businesses, businesses ownership question or the motives for business terminating.

Survey Objective - the key purposes of GEM is to provide reliable data on entrepreneurship that will be useful in making meaningful comparisons, both internally and among countries with different economies over the time. GEM Adult Population Survey (APS) and GEM National Experts Survey (NES) were conducted using Global Entrepreneurship Monitor methodology. Characteristics of GEM Surveys in each analyzed country are provided in Appendix B.

On the national level these two surveys allow monitoring the dynamics of attitude on entrepreneurs and entrepreneurship as well as the level of intrapreneurship in each country. This will provide the necessary guidelines for different sectors of economy in order to achieve the growth of social and economic welfare.
APS survey was conducted using telephone interviews (CATI) method. The sample of respondents was drawn using random representative sample from adult population (18-64 years old). The standardized questionnaire developed by the GEM consortium (7 sections of questions about nascent entrepreneurs, owners, potential entrepreneurs, terminated business entrepreneurs, informal investors, intrapreneurship and innovation). The maximum possible statistical error ± 2.2%.

GEM NES focuses on the experts’ opinion of financial support, governmental policies and programs, education and training, R&D transfer, commercial and professional infrastructure, market openness, access to physical infrastructure, culture and social norms, capacity for entrepreneurship, economic climate, work force features, political, institutional and social context. The NES sample comprises a minimum of 36 respondents, with four experts drawn from each of the entrepreneurial framework condition categories. Out of this sample, a minimum of 25% must be entrepreneurs or business owners, and 50% must be professionals. Additional aspects such as geographical distribution, gender, the public versus private sector, and level of experience are also taken into account in selecting the sample random representative sample. Each selected expert was approved by the global GEM team. The interviews were conducting using personal face to face interviews or using web interviews (CAWI) methods. A standardized questionnaire developed by the GEM consortium was used during the interviews.

In order to obtain more exhaustive information the combination of data from both surveys (APS and NES) is used. This method of analysis enables to get insights from population point of view about entrepreneurship as well as to get expert attitude toward specific situation in particular country.

Statistical data analysis was conducted using IBM SPSS Statistics software. In assessing the results, it is necessary to pay attention to the statistical error. It is due to the fact that the respondents are selected, rather than performing a continuous survey. This error is calculated mathematically (calculations are attached in Appendix C)

The raw data was sent directly to the GEM data team for inspection and uniform statistical calculations before being made available to the participating economies. All statistical calculation is done using SPSS program.

The conceptual model of present article is created by modifying GEM model to address the problematic of the present research. Figure 1 shows, how the GEM data is analyzed in the present research by illustrating some details of the processes individuals may go through entrepreneurial behavior. The level of fear as well as perceived business opportunities and capabilities will influence the option individuals may choose: to develop entrepreneurial activities on their own or within the organizations. In addition to the above phases, phases of entrepreneurial activity are identified.
Discontinuation of activities in owning and managing business is also important aspects of entrepreneurship.

![Conceptual model](image)

**Figure 1. Conceptual model**

Source: own elaboration based on GEM data

The conceptual model incorporates the three main components that capture the multi-dimensional nature of entrepreneurship: entrepreneurial attitudes and perception, entrepreneurial intentions and activities, entrepreneurial employee activity. They are included in the model as components that produce innovation, economic growth and job creation, without details how they affect and reinforce each other. This uncertainty is intended, since it is reflected the view that all elements may affect each other rather than being components of a direct process. For example, in many countries, much employment creation comes from a small number of ambitious, fast-growing new businesses (Autio, 2007). Furthermore, potentially ambitious entrepreneurs react differently to different regulatory and legal regimes than those who are less ambitious (Levie and Autio, 2011). Moreover, the conceptual model illustrates the entrepreneurial employees’ activity as well as their role as potential future independent entrepreneurs.

**DISCUSSION**

Driven by the intention to test the conceptual model presented in the previous chapter of the present publication, the attitude and perception factors related to the fair of failure are examined while linking such aspects as the perceived opportunities, perceived capabilities, the fair of failure as well as entrepreneurial intentions. It could be assumed that the fair of failure has a remarkable effect on the perception of opportunities and capabilities. A stronger fair of failure leads to a lower number of perceived opportunities and/or perceived capabilities and as a result affects entrepreneurial intentions. It is interesting to check the dynamics of these factors in the analyzed countries, as they all had a relatively similar political, economic and social experience before entering the EU in 2004. The
trend from the year 2011 to 2012 is as well of significant importance. Poland, Latvia and Lithuania, the countries in geographical proximity, had similar percentages of people who have the fair to start business: in 2011 it varies from 40% in Lithuania to 43% in Poland and 41% in Latvia. In 2012 the Baltic states Latvia and Lithuania experienced the decrease in the fair of failure (by 4 % in Lithuania and Latvia); however, the situation in Poland had not changed. (As it was expected by many economists, Estonia, which joined the Global Entrepreneurship Monitor in 2012, had relatively lower rates of fair of failure (34%)).

![Figure 2. Entrepreneurial attitudes, perception and intentions (% of population aged 18-64)](image)

Source: GEM data 2011-2012

The improved indicators of fair of failure were followed by the improvement in percentages of people who identify the perceived opportunities and perceived capabilities: in 2011 the perceived opportunities in Lithuania and Latvia read 23% and 24% respectively, while the perceived capabilities stand at the marks of 35% and 47% respectively. In 2012 the perceived opportunities in Lithuania increase to the mark of 30% while the perceived capabilities reach 40%. The changes in Latvia are mixed: in 2012 the rate of perceived opportunities improves and reaches 33%, while the rate of perceived capabilities is downgraded to the figure of 44% respectively. Although the percentage of perceived capabilities in Estonia is in line with its Baltic peers, the indicator of perceived opportunities in Estonia is the highest among all the analyzed countries (45%). Poland did not experience the improvement in the indicator of fair of failure from 2011 to 2012; however, its perceived capabilities increase by 2% (to 54%) in 2012, while the number of people capable to identify the perceived opportunities is going sharply down (from 33% to 20%). A minor improvement of entrepreneurial intentions in Lithuania and Latvia (by 1% and 3% respectively) could be associated with the decrease in the percentage of people with the fair of failure and the improvement of their perceived opportunities.

As for Poland, remarkable negative changes in the perceived opportunities are not accompanied by such a sharp drop in entrepreneurial intentions; however, such dynamics is more in line with the
change in the dynamics of the fair of failure. Although the Polish situation calls for the necessity to ingeniously examine results of the year 2013, as there are too radical changes in the analyzed indicators, the 3 countries (Lithuania, Latvia and Poland) have the dynamic of entrepreneurial intentions not contradicting to the changes in the fair of failure. Although the data for Estonia is not available for the 2011, the similarities between these Baltic States are apparent.

The situation in other selected countries is not so clear. Perceived opportunities in 2011 in Slovakia and Slovenia are similar to the levels of Poland (53% in Slovakia and 51% in Slovenia), although there are some remarkable differences with respect to the perceived opportunities (23% in Slovakia and 18% in Slovenia). The perceived opportunities reach quite similar figures in 2012 (50% in Slovakia and 51% in Slovenia), while in terms of the perceived opportunities countries experience some changes (Slovakia experience the decrease by 5%, and Slovenia shows the increase of 2%). An interesting dynamics is witnessed regarding the relation between the fair of failure and entrepreneurial intentions. During the period of 2011-2012 Slovenia is capable to catch up Slovakia in terms of entrepreneurial intentions (this figure improves from 9% to 13%) mainly due to a sharp decrease in the fair of failure (from 31% to 27%). Slovakia increases the opposite trend, the fair of failure increases from 32% to 38%, while the entrepreneurial intentions fall down to 12%, compared to 18% in 2011.

The fair of failure in Hungary and Czech Republic in 2011 reads 35%, while the perceived opportunities are also very similar read (40% and 39% respectively). The perceived opportunities in Czech Republic is more similar to the situation in Slovakia in 2011(reads respectively 24%), the rate of perceived opportunities in Hungary is the lowest among the analyzed countries in 2011 and 2012 (decreases from 14% to 11%). As it could be expected this leads to the decreasing number of entrepreneurial intentions from 20% to 13%. To conclude, it is obvious that the situation in the analyzed region differs from country to country. Baltic States are more similar to each other, Slovenia and Slovakia already belong to the innovation-driven countries, thus, experience similar dynamics of the fair of failure and entrepreneurship intentions, Czech Republic is more similar to Hungary, but unfortunately the data for 2012 is not available, Hungary is quite specific in its low numbers of perceived opportunities. In all these cases the changes of the fair of failure are accompanied by the dynamics of entrepreneurship intentions, although countries are quite different within the region.
To continue it is interesting or examine the role of fear of failure on the dynamics of entrepreneurship per phase of entrepreneurial activity. The decreasing rates of fear of failure in Lithuania and Latvia do not correspond to higher numbers of Early Stage Entrepreneurs, as in Latvia this figure increases from 12% to 13%, while in Lithuania it drops from 11% to 7%. Both countries experience the increase in the figure of established business ownership (both reaches 8% in 2012), while the decrease of discontinued businesses is witnessed only in Lithuania (from 3% to 2%). The decreasing figure of perceived opportunities and a static figure of the fear of failure in Poland lead to constant rates of early stage entrepreneurship and discontinued business as well as a slight improvement in terms of the percentage of established businesses. Estonia doubles Lithuania regarding early stage entrepreneurship activity and exceeds the figure of Latvia by 1%; however it has a weaker situation regarding the percentage of established businesses (1% less than in Latvia and Lithuania, in 2012) and a higher number of discontinued businesses (reads 4% in 2012).

The rapidly decreasing fear of failure in Slovenia, innovation-driven country, is helping to catch up another innovation-driven country Slovakia in all the stages of entrepreneurial activity (the situation remains idem only in terms of discontinued businesses. The situation in Czech Republic in 2011 in terms entrepreneurship development per stage of phases of activities incorporates patterns of various countries of the analysed cluster. There could be similarities with Poland, Baltic countries and Hungary found. While witnessing the decrease in the perceived opportunities (from 14% to 11%) Hungary improves its position both in early stage entrepreneurship activity and established business ownership (by 3% and 6% respectively).
Taking into consideration that the data for the innovation orientation of early stage entrepreneurs as well as the entrepreneurial employee activity were collected only for the year 2011 it is still helpful to illustrate the proximity of the analyzed countries. In 2011, Latvia, Poland, Czech Republic and Slovenia had from 31% to 35% early stage entrepreneurs with the innovation orientation, while Lithuania, Hungary and Slovakia possessed from 20% to 25% of entrepreneurs with the innovation orientation.
The regional convergence is also witnessed in terms of entrepreneurial employee activities. In 2011 Slovakia, Czech Republic, Hungary, Poland and Latvia have relatively similar percentages of employees involved in entrepreneurial employee activity during the past three years (from 5% to 7.8%), while Lithuania and Slovenia were in lead (8.1% and 9.3%, respectively). These countries were also leading in terms of percentages of currently employed in entrepreneurial employee activity out of all employees (5.6% and 7.4% respectively). Other analyzed countries shown results from 3.6% to 5.2%. These numbers prove that the 8 analyzed CEEC countries are quite close in their innovation and intrapreneurial orientation. Although GEM indicators used for 2011 and 2012 for job expectations are slightly different they still show the differences among countries. In 2011 Slovakia (6.1%) takes lead in medium or high job expectations, followed by Lithuania (5.6%) and Latvia (5.4%). In 2012 Estonia joins the leading group of countries, while Latvia becomes a leader in terms of percentages of entrepreneurs who expect to employ 20 or more employees (3.1%).

Having the GEM data on the analyzed CEEC countries compared and the conceptual model tested there should be 3 important conclusions stated:

- Although these countries are very similar in their entrepreneurial dynamics, there are some peers’ subgroups seen in this cluster. Baltics States are more converged, although Estonia emerges as a group leader, Slovenia and Slovakia behave like innovation-driven countries and are quite different from other countries, the largest country Poland experiences quite specific development of entrepreneurship, while Hungary and Czech Republic are exceptional, according to many criteria, as it’s illustrated in Table 3.

Source: GEM data 2011-2012

- It is obvious that countries are similar in terms of intrapreneurship and innovation orientation; however, the fair of failure is more complex and culture-related factor in order to be converging only because of a common economic, social, political and business context of CEEC.
- Apart from such a contradicting argumentation, the role of fair of failure is clearly witnessed in the majority of analyzed countries, which matches the purpose of our article.

Example: Suppose that 2,000 respondents answered the question about business owner. Let’s say that 79% of them said that do not have any business. This means that with 95% probability it can be said that the real value is in the range of 79% ± 2.5%.
INFLUENCE OF SOCIAL MEDIA ON THE IMAGE FORMATION OF A TOURIST DESTINATION: DIFFERENCES BETWEEN VISITORS AND NON-VISITORS

ABSTRACT
A destination image is perceived differently depending on whether you have previously visited the destination or not. Previous experience influences the image perceived. Non-visitors base their perception on information sources consulted. Recently, information from social media whose content is user-generated (UGC) has become a new information source. The aim of this study is to analyze the weight that different web platforms have as information sources and their influence on motivations for visiting a tourist destination and the perceived image; and contrast it between visitors and non-visitors. The results are useful to define which communication channels are better to invest in and what motivations are better to highlight in the communication strategies, depending on whether the Destination Marketing Organizations (DMOs) prefer to promote the loyalty of visitors or getting new ones. To carry out this research we got 541 surveys from Mallorca, both visitors and non-visitors. We have analyzed the information sources, motivations; cognitive, affective and unique image, general image, the intention to visit and to recommend.

Keywords: destination image, image perception, user generated content, web platforms, social media

INTRODUCTION
Destination image is composed of cognitive and affective attributes (Beerli and Martin, 2004) and unique attributes (Qu, Kim and Im, 2011). Cognitive image is composed of the characteristics of the place. Affective image is generated by feelings. Unique image is formed by features that make the place different. Information sources and personal factors influence on the formation of cognitive and affective image (Beerli and Martin, 2004). Cognitive, affective and unique images exert an influence on the perception of the general image, at the same time it has an effect on the intention to visit and recommend (Qu et al., 2011). We can differentiate between secondary and primary images. The secondary image is formed only by information sources consulted before
visiting the destination (Phelps, 1986). The primary image is formed when the destination is visited. How to choose a destination involves some risk, sources of information play an important and essential role in the perception of destinations to be considered in the decision-making process (Mansfeld, 1992).

Information sources can be organic, formed by friends and acquaintances; induced, belonging to the authorities of the destination, suppliers or intermediaries and ads; or autonomous, formed by media, documentaries and movies (Gartner, 1993). Recently there has been research on the Internet as a source of tourist information (Seabra, Abrantes and Lages 2007, Eurostat, 2012) or specific services such as search engines (Buhalis, 2003), social networks (Buhalis and Law, 2008), tour operators websites (Zins, 2009), online reviews (Papathanassis and Knolle, 2011), social media (Mackay and Vogt, 2012). Internet sources can be classified as organic, induced and autonomous (Llodra-Riera, 2013), unlike Beerli and Martin (2004) who considered it only as induced.

Destination image is different depending on whether the individual has visited the place or not (Hsu, Wolfe and Kang, 2004). According to Selby and Morgan (1996), understanding the different perceptions from visitors and non-visitors allows us to see the most important attributes and to re-evaluate the images to be incorporated in the planning of tourism marketing. The level of tourist experience has a positive relationship with the cognitive image among tourists who visit for the first time, and with the affective image between repeaters (Beerli and Martin, 2004).

**LITERATURE REVIEW**

*Formation of the image of a tourist destination*

There is no universally accepted scale to analyze the image of a destination (Beerli and Martin, 2004; Gomez, Garcia and Molina, 2013). Echtner and Ritchie (2003) suggest an ordering of the attributes of a tourist destination, on a scale ranging from psychological to functional. Other classifications suggest dividing the attributes into cognitive and affective (e.g., Qu et al., 2011). Cognitive evaluations imply beliefs or knowledge about the attributes of a destination; an affective evaluation stems from feelings about the destination. In combination, they determine perceptions of an overall image of the destination (Baloglu and McCleary, 1999). Noting the findings of Echtner and Ritchie (2003), Beerli and Martin (2004), Hosany, Ekinci, and Uysal (2007), and Qu et al. (2011) each constructed new models for analyzing the image of destinations. Beerli and Martin (2004) analyze associations using attributes proposed by previous authors and relationships among different components of the perceived image and factors that influence it, including information sources (primary and secondary), motivations, accumulated tourist experiences, and socio-demographic characteristics. According to Qu et al. (2011), cognitive, affective, and unique images of the destination influence the possibilities of repeat visits and intentions to recommend it.

In this research different web platforms complement the indicators that traditionally constituted information sources, as a latent variable. Accordingly, in our effort to analyze the image of tourist destinations, we review
three models: Beerli and Martin’s (2004) global view of the image, with its focus on the cognitive and functional dimensions; Hosany et al.’s (2007) in-depth consideration of the affective and psychological dimensions; and Qu et al.’s (2011) study of the unique dimension. In this connection the main objectives of the research are: (1) to define a global model of the formation of the image of a tourist destination and (2) to analyze whether there are differences in the perception of the destination image between the segments of population of individuals who have visited the destination and those who have not visited it.

Hypothesis

Sources of information

Tourists consult varied information sources to decide and plan their trip. The information obtained by the previous experience also influences the image perceived (Beerli and Martin, 2004). Seabra et al. (2007) and Lookinside Travel (2012) provide an adequate classification of the different sources of information to consider. Furthermore, different Web platforms are used to disseminate tourism content, as we have explained in the introduction. In the literature consulted on the formation of a destination image there is no reference about the relation between information sources and motivations. However, if we reviewed the scientific corpus of persuasive communication, it was seen that persuasive messages, depending on the channels that were transmitted and the target audience that they had focused, were used to try to change behavior (Stiff and Mongeau, 2003) and therefore had an impact on motivation (Wood, 1982). From the above, hypothesis 1 has been proposed regarding the influence of information sources on the formation of cognitive, affective and unique images, and the influence of information sources on the motivations for travel to a destination.

Hypothesis H1A. Information sources influence the formation of cognitive image.
Hypothesis H1B. Information sources influence the formation of affective image.
Hypothesis H1C. Information sources influence the formation of unique image.
Hypothesis H1D. Information sources influence motivations.

Motivations

During the last three decades there have been reports on how the sociodemographic characteristics and the motivations that lead to travel influence both the process of image formation, as well as that of the selection of the destination (Mayo and Jarvis, 1981; Gartner, 1993; Baloglu and McCleary, 1999; Beerli and Martin, 2004). Beerli and Martin (2004) evaluated the relationship between the perceived image and motivations of tourists, their accumulated experience of holiday travel and socio-demographic characteristics. The results indicate that: (1) motivations influence the affective component of the image, (2) holiday tour experience has a significant relationship to cognitive and affective images, and (3) the socio-demographic conditions influence the cognitive and affective evaluation of the image. Different indicators are used in the literature to assess the construct "motivation". This research draws on the motivations used in the residential tourism survey conducted by UIB (University of the Balearic Islands) the results of which were published by Campo-Martínez, Garau-Vadell and
Martínez-Ruiz (2010). In addition, we added the general motivation that is taken into account in the PITIB 2012 (relax, discover, enjoy, learn, know), and those defined by Lookinside Travel (2012). Based on the above, we propose the hypothesis 2: motivations influence the formation of cognitive, affective and unique images as follows:

Hypothesis H2A. Motivations influence the formation of cognitive image.
Hypothesis H2B. Motivations influence the formation of affective image.
Hypothesis H2C. Motivations influence the formation of the unique image.

Cognitive, affective, unique and overall images

Regarding cognitive image, previous studies (e.g., Beerli and Martin, 2004; Qu et al, 2011) do not show a consensus on the attributes used to measure it; each of them used a different terminology to describe similar concepts. However, some researchers like Qu et al. (2011) agree on quality perceived as a part of the formation of the cognitive image. In relation to affective image, this image seems to have a consensus on the use of the affective attributes relating to personality and image, and to use the same measurement scales considered in different works (Hosanye et al., 2007; Murphy, Moscardo and Benckendorff, 2007). For this research, the affective attributes were selected based on the proposed model by Hosany et al. (2007). Finally, with respect to unique image, for this research, the attributes used corresponded to those proposed in the PITIB (2012). We have also added other attributes, used in tourist promotions conducted on Mallorca, and some of the most commonly used terms in searches about Mallorca made with search engines, such as rural farms to stay (to be checked with Google Global Market Finder from December 2012 - January 2013). We also consider rural farms, visits to vineyards and wineries and oil mills, promoted by the Balearics Government. There is a large consensus regarding the cognitive image that has a strong influence on the affective image (Beerli and Martin, 2004; Qu et al, 2011). Baloglu and McCleary (1999) show that evaluations of cognitive and affective perceptions have direct influences on the image. Qu et al., (2011) note how the unique image also contributes to the formation of the overall image. Note that in this research what is tested is whether the unique image also exerts an influence on the affective image. In response to this the following assumptions are made hypothesis 3: affective image is influenced by cognitive and unique images, and the overall image is influenced by cognitive, affective and unique images.

Hypothesis H3A. Cognitive image influences the formation of affective image.
Hypothesis H3B. Unique image influences the formation of affective image.
Hypothesis H3C. Cognitive image influences the overall perceived image.
Hypothesis H3D. Affective image influences the formation of perceived overall image.
Hypothesis H3E. Unique image influences the formation of perceived overall image.

Intention to visit and recommendation
If individuals perceive positively the overall image of the destination, it influences the intention to visit and recommend it (e.g., Campo-Martínez et al., 2010; Qu et al., 2011). In addition, it also seeks to know if the intention to visit the island influences the intention of recommending it. Based on the above, we formulate the following hypothesis 4: the overall image influences the intention to visit and recommend and the intention to visit influences the intention of recommendation.

Hypothesis H4A. The overall image influences the intention to visit.

Hypothesis H4B. The overall image influences the intention of recommendation.

Hypothesis H4C. The intention to visit the destination influences recommendation.

Proposed model

The model proposed (Figure 1) is the summary of all the hypothesis proposed. We contrasted the model between visitors and non-visitors.

RESEARCH

Design, methodology and composition of the sample

This research relied on an online questionnaire. The sample consists of potential users of the Internet. For our empirical investigation, we used image formation of Mallorca. It is a mature tourist destination, for which the main type of tourism is sun and beach. In recent years, responsible authorities have sought to diversify the tourist offer. For measuring the relations between variables we created scales of latent variables, observing explicit indicators, following previous researchers.

The resulting sample consists of 541 valid surveys which were gathered between 19th March and 2nd May, 2013. The universe is of international and national tourists as well as residents of Mallorca and the sample unit of a population of Internet surfers over 18 years old. The level of confidence is 95% for a sample error of 4.21%. We considered the segments of people who reside in Mallorca (23.8%), in Spain outside Mallorca (34.4%) and outside Spain (41.8%). 28.7% do not know residents. 68.25% have visited Mallorca. 13.3% are between 14 and 24.
The Future of Entrepreneurship

Years of age, 61.9% between 25 and 44 years, 20.9% between 45 and 64 years and 3.9% are over 65. 46% of those surveyed were men and 54% women. As regards gross family income, the sample is quite evenly distributed: 20.9% with less than €15,000, 27.7% from €15,001 to €30,000, 21.3% from €30,001 to €45,000, 13.9% from €45,001 to €60,000, and the rest (16.3%) more than €60,000.

Results

For verifying Hypotheses, first an exploratory factor analysis was performed which allowed us to identify the underlying structure, and to condense the information gathered from the information sources, motivations, cognitive affective and unique images constructs. Their dimensionality was analyzed by means of an exploratory factor analysis of the data using maximum likelihood extraction with direct oblimin rotation (Hair, Anderson and Tatham, 1999).

In accordance with the approach, a first-order confirmatory factor analysis was carried out. In order to ensure convergent validity, those items whose load factors were not significant or less than .50 were eliminated (Bagozzi and Baumgartner, 1994) or for those which the Lagrange Multiplier Test suggested significant relationships regarding a distinct factor of which they were indicators (Hatcher, 1994) (Tables 1, 2, 3, 4 and 5). The results, like the different resulting models, that the Chi-squared value is significant although when the size of the sample is large (\(N>200\)), this test tends to reject models which fit the data well; with the result that it is an unreliable indicator (James, Mulaik and Brett, 1982). Further, the rest of the specific indicators show a good fit (BBNFI; BBNNFI; CFI; IFI; AGFI and RMSEA).
For example, the confirmatory factor analysis of the scale sources of information (Table 1) shows how opinion leaders is the item with most weight (Lamda .894) followed by social networks specialized in tourism (.896), for measurement the latent variable of information sources. DMO would have to consider the spectrum of information sources, both offline and online, induced and autonomous, for promoting the destination. Besides, platforms which content is user-generated are as influential how traditional sources.

\[ GFI = 0.925 \]

\[ AGFI = 0.882 \]

\[ RMSEA = 0.085 \]

Table 5. Table 2: Confirmatory factor analysis of the scale of motivations
The confirmatory factor analysis of the scale of motivations (Table 2), indicates, i.e. that the price is the motivation which items that conforms this latent variable have less weight (Lambda .566 and .596). It can be interpreted that DMO would have not to base their communication strategy highlighting the price, but rather remarking motivations as discovery (.904) or enjoyment (.834).

Regarding the confirmatory factor analysis of cognitive image (Table 3), value for money of accommodation, sports, and nature are the items with more weight in the measurement of the latent variable (with a Lambda of .819, .805, and .770, respectively). These are the functional attributes more known in this case. DMO must consider if it wants emphasize the communication of these attributes or to introduce features of the destination less known.

Table 6. Table 3: Confirmatory factor analysis of the cognitive scale image
Relating to the confirmatory factor analysis of affective image (Table 4), the psychological attributes best considered, in the formation of this latent variable, are pretty, interesting, reliability and sincerity (with a Lamda of .830, .819, .807 and .807, respectively). For the DMO, keep those emotional values in its communication actions is a good strategy because of they are already recognized by users. In relation to the confirmatory factor analysis of unique image (Table 5), the attributes that influence more, in the formation of this latent variable, are those related with the rural dimension (learning how to make olive oil and wine on location, with a Lamda of .967 and .890 respectively).

Next, we estimate the model (Figure 1), we used SmartPLS2.0 (Ringle, Wende and Will, 2005), and we established the significance of the parameters using a bootstrap re-sampling procedure with 541 sub-samples, equal to the size of the original sample. We provide the results of the structural model in Table 6. To guarantee convergent validity, we eliminated indicators whose factor loadings were not significant at least at 0.6. The resulting model indicated no reliability problems, according to any well-establish criteria: Cronbach’s alpha, (≥ 0.7, Nunnally and Bernstein, 1994); compound reliability (<0.6, Bagozzi and Yi, 1988; Fornell and Larcker, 1981) and average variance extracted (<0.5, Fornell and Larcker, 1981). The most significant differences between visitors and non-visitors are (Table 6): (1) non-visitors give more weight to the websites from destinations, intermediaries and media as a source of information (FINF4). In both cases the UGC Websites are ranked fourth.

(2) On the cognitive image, those who have not visited the destination give more weight to the perceived quality of basic infrastructure (IMCOG3). (3) In both segments heritage (IMUNI1) is the factor with more weight to the unique image. Whereas for non-visitors the second factor is the elite sports (IMUNI3) and for visitors the second one is rural areas (IMUNI2). (4) In the case of affective image, non-visitors point in first place sincerity (IMAFEC3), in the second accessibility (IMAFEC2) and in the third the enthusiasm and sympathy (IMAFEC4); for non-visitors the order of the factors is enthusiasm and sympathy, openness and accessibility.

Table 7. Table 4: Confirmatory factor analysis of the affective image

To assess the predictive capacity of the structural model, we followed the criteria proposed by Falk and Miller (1992): The R-square of each dependent construct must be greater than 0.1. In Table 7, we provide the corresponding values, as well as the results of the comparison of the model proposed in Some hypotheses cannot be contrasted. For non-visitors, information sources do not influence affective image (H1B), and the cognitive and unique image do not influence the overall image (H3C and H3E). For visitors, information sources do not influence cognitive and affective image (H1A and H1b), and unique image do not influence affective image (H3B). Those results indicate that DMO have to implement different communication strategies. The
channels and the messages have to adapt to those who have visited the place previously or for those who have never visited it before.

Table 8. Table 5: Confirmatory factor analysis of the unique image

We can observe that relationships of the hypothesis have a different weight depending on whether the place has been visited or not (Table 7). For non-visitors, first, general image influences the intention to visit and recommendation. Third, affective image influences overall image, affective image on cognitive and motivation on cognitive image. Sixth, information sources influence on motivations and these on unique and affective images. Ninth, information sources influence the unique image and eleventh on cognitive image. And in tenth place, intention to visit influences the intention of recommendation. We could not test the influence of information sources on the affective image, and cognitive image and unique image on overall image.

Regarding destination image formation of visitors, first, cognitive image influences affective image; secondly, the overall image exert an influence on the intention to visit; third, motivations on cognitive image; fourth, affective
image on the overall image and this one on intent of recommendation. Sixth, information sources influence the motivations; seventh, intention of visiting on the intention of recommendation; eighth, motivations on unique image and then on the affective image. Tenth, cognitive image on the overall image. In the eleventh place, information sources influence the unique image and; twelfth, and in a negative form, unique image influences overall image. We could not test the influence of information sources on cognitive and affective image, and the influence of the unique image on affective image.

CONCLUSIONS

All information sources have a high weight in the process of formation of image of a tourist destination. For both, visitors and non-visitors, induced information sources have a higher weight, i.e. those belonging to the DMO, suppliers and intermediaries. For non-visitors induced website pages also have a lot of weight. Social Media are significant although it is the factor with less weight. Therefore it is advisable to spread content about the destination not only in the official sites but also through suppliers and intermediaries, including their websites, with images that it really wants to project by the DMO marketing plan. For this it is convenient to disseminate the content and images owned by DMO in a Creative Commons or Copy Left licenses. As for cognitive image it is important to project the quality of basic infrastructure to attract new visitors, as it is the dimension that takes greater weight in formation of the cognitive image. In the case of Mallorca, as for the unique image, visitors perceive a rural environment unique, this attribute can be enhanced further since non-visitors perceive heavier elite sports. It is recommended to highlight the quality of basic infrastructure and those unique attributes that visitors appreciate better for attracting new visitors and fulfilling their expectations.

Table 9. Table 6: Instrument for measuring the structural model: Reability and convergent validity
As for the model of image formation in both cases has a very significant weight that the overall image influences the intention to visit in first position for non-visitors and second, by those who already know the island. For non-visitors it is relevant that the overall image largely determines the intent of recommendation. We recommend to implement actions of viral marketing, inviting those who have the intention of visiting the destination to convince some companion to travel together with them. In both cases the affective image is the most influential factor in the overall image and the cognitive image on the affective image. For non-visitors cognitive image has no influence on the overall image. For visitants, information sources only have weight on the unique image. In any case information sources affect the affective image; the motivations influence affective image. Visit intention influence recommendation more on those who have already visited the destination. For maintaining the loyalty of visitants it is recommended to use direct and personalized marketing and to propose unique and new attractions in the destination to surprise them and maintain their attention, besides it would be interesting to engage them proposing they invite new visitants. Most hypotheses run better with the group of non-visitors. To attract new visitors it is recommended to maximize cognitive and unique images, using as prescribers webs from suppliers and intermediaries. It is advised too to emphasize affective attributes and motivations associated with the variables best rated by visitors, who are the ones who really know the destination. In summary, first it has to spread knowledge about the place, then emotions associated to motivations for visiting it.

STRUCTURAL CAPITAL AND BLACK AND SCHOLES METHOD: AN APPLICATION

Lombardi, Rosa; Manfredi, Simone; Nappo, Fabio; Russo, Giuseppe
Dep.t of Economics and Law, University of Cassino and Southern Lazio, Cassino, Italy

ABSTRACT
This paper provides a study based on the assessment of structural capital through the real option approach. In this way, the Black and Scholes method is used for an economic assessment of structural capital proposing research findings deriving from an empirical application. Methodology is based on a qualitative approach. Sourcing of data has been carried out through secondary sources.

Keywords: structural capital, real options, Black and Scholes, economic value, evaluation, intellectual capital.

INTRODUCTION
The paper studies the assessment of structural capital providing an updated conceptualization of methods existing through international literature, especially regarding real options methodology (Black and Scholes, 1972; Boer, 2000; Tseng and Barz, 2002; Zeng and Zhang, 2011). In particular, structural capital (Lerro and Schiuma, 2013; Teece, 2000) defines future cash flows and understanding its economic value with traditional methods is not easy.
Hence, the proposal is to provide a study of international methods used by academic and professional communities to evaluate structural capital, by proposing an application based on the Black and Scholes method (Black and Scholes, 1973). In this way, the aim of research is to understand how to evaluate structural capital (Chucchi, 2013) and if the economic value obtained from the application (findings) reveals an adequate measure of the asset. Therefore, the discussion is based on strong and weak points of Black and Scholes method in the assessment of structural capital.
The research approach is based on a qualitative method. Starting from a single method approach (Myers, 2013), the research is developed according to the study of international literature.
The article has the following structure. After the introduction, section two provides a literary review of methods used to assess structural capital. In particular, the study focuses on real option methods (Black and Scholes method). Section three describes the research methodology. Section four proposes the
research findings. Section five presents discussions and implications on research. Section six illustrates the conclusions, the limitations of the study and suggests future research.

LITERATURE REVIEW

The rule of structural capital (Itami, and Roehel, 1987) derives from the importance by all companies to create long term value (Daum, 2003).

Structural capital is part of intellectual capital (Edvinsson and Malone, 1997) and it is defined as a set of all the knowledge, coded and un-coded related to the company. Moreover, it includes patents, property rights, formal and informal organizational procedures, databases, networks, best practice, Internet, corporate values and organizational culture (Stewart, 1997; Sveiby, 1997).

In knowledge economy, the economic assessment of structural business (Boer, 1999; Ferrata, 2007) is necessary to understand its value in decision making process and to complete extraordinary operations between contemporary companies (Zanda, 1974). In this way, doctrine has undertaken the following methods:

1. cost-based approach;
2. value-based approach;
3. real options approach.

The cost-based approach is based on the economic of structural capital through actual or abstractly costs incurred for his creation, historical or reproduction cost. The value-based approach defines structural capital estimating future economic benefits deriving from company assets.

The first two approaches need to be applied by knowing defined income and financial flows in assessing knowledge. For this reason, the real option approach (Amram and Kulatilaka, 1999; Banerjee, 2003; Barnea et al., 1980; Trigeorgis, 1997; Tseng and Barz, 2002; Wu and Tseng, 1986; Zhang et al., 2008) appears suitable for the assessment of structural capital (Hilli et al., 2007) and particularly risky investments, although this assessment approach has also been criticized (Black and Cox, 1976).

The real options forms (Black, 1971; Black, 1989; Buckley et al., 2002; Myers and Majad, 1983; Zeng and Zhang, 2011) are the following: development real option; deferment real option; real flexibility option; abandonment real options.

The real options assessment can be based on another two methods:

- the Cox and Rubinstein method (Cox and Rubinstein, 1985);
- the Black and Scholes method (Black and Scholes, 1973).

The Cox and Rubinstein assumption is that price option underlying evolves according to a binomial multiplicative process. An example is that underlying asset can grow with probability q of a
multiplication factor equal to \( u \), or decrease with a probability equal to \( 1 - q \) and by a factor equal to the multiplication, replacing condition as \( u > d \) (Cox et al, 1979).

The Black and Scholes method estimates structural capital starting value of real option (call and put) with the following inputs (Fontana, 2011): rate index known with the same value in the time; it is possible to sell without resource. There are not limitations to the use of income deriving from this kind of sale; there are no transaction costs; share price follows random walk; the share does not pay dividends during the life of a derivate; there are no opportunities without risk.

Fixed boundary conditions, one expression of Black and Scholes formula (closed; call model) is the following:

\[
c = S_0 \times N(d_1) - Xe^{-iT} \times N(d_2)
\]

where:

\( c \) is the price of a European call real option;

and

\[
d_1 = \frac{\ln \left( \frac{S_0}{X} \right) + \left( i + \frac{\sigma^2}{2} \right) T}{\sigma \sqrt{T}}
\]

\[
d_2 = \frac{\ln \left( \frac{S_0}{X} \right) + \left( i - \frac{\sigma^2}{2} \right) T}{\sigma \sqrt{T}} = d_1 - \sigma \sqrt{T}
\]

in which:

\( c \) is the price of a (European) call (real option);

\( S_0 \) is the share price at the time 0;

\( X \) is the strike price;

\( i \) is the risk free rate;

\( T \) is the contract residual life;

\( \sigma \) is the volatility of share price;

\( e \) is the base of a natural logarithmic function;

\( N(x) \) is the cumulate function of a standardized normal.

The second expression of the Black and Scholes formula (put model) is the following:

\[
p = Xe^{-iT} \times N(-d_2) - S_0 \times N(-d_1)
\]

where:

\( p \) is the price of a European put real option and other letters are specified before.

**RESEARCH APPROACH**
The qualitative research approach (Myers, 2013) is based on an analysis of the literature related to structural capital assessment, with special reference to the Black and Scholes method and real options approach.

Starting from a single method approach, data acquisition (Yin, 1994) was achieved through secondary research sources specified as follow:
- scientific books and articles (international literature);
- databases (particularly, ebsco and google scholar), news, documents and websites.

Application of the Black and Scholes method is used for the economic assessment of structural capital. Therefore, the proposed research findings deriving from an empirical application based on a certain number of hypotheses, utilizing the above method through excel.

THE ANALYSIS OF CASE STUDY AND THE RESEARCH HYPOTHESES

We widely accepted the Idea about economic value of companies in the new economy derives mainly from intangible assets that belonging to them (a right, called intellectual property). Trademarks, patents, and licenses are strategic assets to, generate cash flows independently with respect to the business complex.

Despite the traditional methodology of discounting cash flows is well suited to their assessment, but in recent years certain intangible assets are come up, and raised a few questions about their accuracy of estimation. Particularly, we are referring that type of intangible assets to generate cash potential flow, since for this reason it becomes difficult to assess according to the DCF method.

In fact, the use of real options drives from the inability of traditional capital budgeting tools to measure flexibility and discretion of management inherent in some investment projects.

The idea underlying in the approach questions is it allows you to tie the net present value of the investment in two components: The first one represents by the static nature of the NPV (Net Present Value), and the second one is in dynamic nature represents options in the project.

In order to clarify the steps which led to a reasonable estimation value of an option, analyzes the case of evaluation of a license to a drug with opportunities for deferment of production, throughout the following research hypotheses.

In this sense it is reasonable to assume that a company uses the license in the case where the cash flows arising from the sale of the products exceed the costs incurred to make it happen.

The assessment methodology follows the chosen approach of ongoing Black & Scholes model. Particularly, the present value of cash flows ($ – cash flow), resulting from the introduction of the drug today is 34.165,30 (millions) euros determined by discounting for a reasonable rate of return on capital.
"i" (risk free rate), of average flows prospective conceivable conservatively through an assessment of the potential market of reference of the product.

The initial cost (K – investment) of the drug is in fact equivalent to 25.491.34 (millions) Euro, the license is also legally protected for 15 years. The risk free rate was determined based in the gross yield on government bonds (BTP 15 years of 13.01.2014 ) and equal to 2.50%.

And the standard deviation (σ std deviation), of listed companies operating in the biotechnology sector (Source: Damodaran "Jan"- 2014 ) appears to be a equal to 1.3364 .Consider that the product would have some impact on the market, particularly in the innovative way, it is easy to imagine the generation of extra profits by latter.

At the same time, however, the extra-profits will be linked to the period of legal protection of the license and then any delay (y - expected cost) in associating (linking to period) use of the same cost, the company bare on extra-profits.

RESEARCH FINDINGS AND DISCUSSION

The inputs have outlined lead through the application of the Black & Scholes method with the following estimates for "d" and "N (d)" (table 1 and 2; figure 1).

Table 2: Black & Scholes Application
Based on the hypothesis mentioned in the last paragraph, a fixed cash flow during the next 15 years and a fixed investment for the same years, it can be concluded that the next eleven years the project is worth more than the license. Therefore, delay in the start of production, nevertheless face losing the extra profits, which may result in an increase of present value for the project compared to what you could get from an immediate start.

The license value logically decreases from during the years, but it is interesting to observe that the option value become negative in the last years.

In this case considered a fixed cash flow and investment we will have a fixed VAN (Net Present Value), in relation to the hypothesis mentioned in the example.

The option for deferment just analyzed was evaluated as a call written on the cash flows generated by the project and with price equal to the same investment required for the implementation.

In this sense, the management may choose to exercise the option made by the project where the constitutive conditions sufficiently favorable. Or not to exercise the option and in this case to transfer the license to a third party.
CONCLUSION

In recent years, the method of cash flows has been strongly criticized by those who believe in the approach through real options. The traditional methods of capital budgeting are poorly adapted to the flexibility of certain projects and but the dynamism of the markets characterizing the same. On the base of literature review, introducing of Real Option Approach (ROA), gone beyond the limits of the Net Present Value (NPV) through the estimation of the various options inherent in a project.

In fact, the NPV assumes a symmetrical distribution of probabilities and a perfect coincidence with the modal value, explained by the lack of managerial flexibility. The real options introduce asymmetries in the probability distribution of the NPV particularly give the management some flexibility in decision-making that results in a greater chance to reap the benefits of positive future scenario.

However, that even the ROA, even today it is the most widely used method for estimating the present case at the high risk potential, begins with the subjective criticisms about litterateurs and new assessment personally goes on with me, by doing this, the reliability of the results to which the latter proofs has been completed.

The assessment and analysis made is not a new experiment, particularly the link operated between chaos theory and performance of the market, which would explain the occurrence of financial crises questioning the harmonious development of the market in the face of reality disharmonious similar to fractals (factors).

In light of the considerations made, it is appropriate to point out that this research is the basis for further studies that will address current trends in the field of structural capital evaluation.

EXCITEMENT, SOPHISTICATION AND UNIQUENESS AS DRIVERS TO CONSUMER-LUXURY CAR BRAND RELATIONSHIP

Loureiro, Sandra Maria Correia
Instituto Universitário de Lisboa, Business Research Unit

ABSTRACT

Research Aims
This research aims to contribute to go further in understanding the consumer-luxury car brand relationship. Hence, a model related to luxury car brand meanings and consumer-luxury car brand relationship is proposed and tested.

Keywords: Excitement, Sophistication, Uniqueness, Consumer-Brand Relationship, Luxury Cars Brands

THEORETICAL BACKGROUND AND HYPOTHESES FORMULATION

Product and organization associations represent the information linked to the node in the memory in the consumer’s mind (e.g., Keller, 1993; Krishnan, 1996). Several researchers have demonstrated the positive influence of favourable brand associations on attitude towards a new product of a company (e.g., Aaker and Jacobson, 2001) or a positive brand attitude towards existing products (e.g., Low and Lamb, 2000; Van Osselaer and Janiszewski, 2001). In this vein, brand attitude can be viewed as a consumer’s overall evaluation of a brand (product and organization). Favourable luxury car brand associations will lead to a positive luxury brand attitude and the following hypothesis is proposed: H1: Luxury car brand associations positively influences attitude towards luxury car brands.

Brand personality has been defined as the set of human or quasi-human characteristics (e.g., Keller, 1998; Petromilli and Michalczyk, 1999) that are associated with a given brand. Aaker (1997) found five dimensions for brand personality: sincerity, excitement, competence, sophistication, and ruggedness. Aaker (1997) evidenced that, whereas sincerity, excitement and competence tap an innate part of human personality, sophistication and ruggedness tap what the individuals’ desire but do not necessarily have. As Aaker (1997) also mentioned, sophistication is linked to brands such as Mercedes, Monet and Revlon. Later, Geuens et al. (2009) also developed an alternative brand personality with five dimensions: responsibility, activity, aggressiveness, simplicity, emotionality. The two scales have three very similar dimensions: excitement/activity, sincerity/aggressiveness and competence/responsibility. The last two dimensions represent a more romantic and sentimental...
(emotionality) feature and simplicity (ordinary, simple). Regarding Aaker’s (1997) perspective, the last two dimensions, sophistication (upper class and charming) and ruggedness (outdoorsy and tough), have been criticized for being based on user profiles instead of human personality structure (Azoulay & Kapferer, 2003; Geuens et al., 2009). The current study follows the conceptualization of Keller (1993) about brand image. Batra et al. (1993) and Davis et al. (2000) noted that brand personality can also be regarded as a component of brand image. Effectively, brand personality, the human or quasi-human characteristics can also build associations in the consumers’ minds. Thereby, the following hypotheses are formulated: H2: Luxury car brand personality positively influences luxury car brand image; H3: Luxury car brand attitude positively influences luxury car brand image.

Customer satisfaction has been studied from two perspectives: transactional and cumulative. The transactional perspective considers that consumers make a judgment of a specific service encounter or consumption situation (e.g., Oliver, 1980). In a cumulative perspective, satisfaction is a holistic evaluation of the total purchase and consumption experience with a product over time (e.g., Lewin, 2009; Nam et al., 2011). Following the last perspective, the current study satisfaction measured satisfaction as an overall evaluation of the luxury car brands. Several studies point out satisfaction has a consequence of a favourable customer image or corporate reputation (e.g., Loureiro and Miranda, 2008; Loureiro and Kastenholz, 2011). A positive brand image could contribute to mould the overall satisfaction of a luxury car brand and even increase the confidence towards a luxury car brand.

Trust, commitment and even satisfaction are considered relationship-based constructs (e.g., Garbarino and Johnson, 1999; Sirdeshmukh et al., 2002). Morgan and Hunt (1994, p. 23) define trust as the perception of “confidence in the exchange partner’s reliability and integrity”. Trust has been considered an important determinant of commitment (e.g., Kingshott and Pecotich, 2007; Loureiro et al., 2012). Therefore, the following hypotheses are presented: H4: Luxury car brand image positively influences overall satisfaction; H5: Overall satisfaction positively influences trust in luxury car brand; H6: Luxury car brand image positively influences trust in luxury car brand; H7: Trust in luxury car brand positively influences affective commitment to luxury car brand.

**METHODOLOGY**

The car brands considered in this study were firstly BMW, Audi and Mercedes-Benz, but also Lexus, Porsche, Lamborghini, Aston Martin, and Ferrari. The reason for choosing such brands is the fact that these brands are the most representative of the E (executive), F (luxury) and S (sport) car segments according to the European Union (1999). The participants, car owners of such brands, were elements of car brand communities in Portugal and the United Kingdom. We received 368 complete fulfilled questionnaires. The majority of respondents were male (97%), which corresponds to the
male/female ratio existing in these car brand communities. Most respondents were aged between 40 and 60 years old. First, the questionnaire was pre-tested by the managers and some members of the car brand communities, around ten individuals. Thereafter, the members of car online communities (car owners) were invited to participate using an online survey.

CONCLUSIONS AND IMPLICATIONS

The results clearly point out the importance of associating excitement, sophistication and even uniqueness to the luxury car brands. These associations lead to a more favourable brand image than the direct associations to the product or the organization. In fact, the car's modern design, good performance, concern about customers and professional staff are important features which lead to a favourable attitude of consumers towards the luxury car brand, but this is not enough to create a significant positive image in customers’ mind. The findings are in accordance with Batra et al. (1993) and Davis et al. (2000), which noted the potential influence of brand personality on creating a brand image in the consumers' minds. The role of brand personality on brand image seems to be more relevant in the context of luxury cars. Interestingly, more important than design, good performance and positive attitude towards the staff and corporate or car brand, is the encoding in memory nodes of words such as spirited, daring, imaginative, glamorous, charming, special or unique. These are key words that make the owner of the car desire and enjoy driving. The findings lead us to write some managerial implications. Luxury car manufacturers and brand managers should be aware that the magic, mystique and legend associated to the brand are really significant. Innovative design, performance, safety mechanisms, and up-to-date technology are key features, but above all luxury car brands should be able to build up in the consumers the excitement and the feeling that having and using the car is glamorous, charming and unique. Brands with tradition in the luxury market may avail themselves of the mythical images of glamor models and so may also convey to the consumers that the brand evolves without compromising tradition. New brands of luxury cars have to find an element that differentiates them and becomes them unique, through tangible associations (e.g., design, performance, new technology) and intangibles (e.g., create an idea that originates magic, excitement).

SOCIAL ENTERPRISE MANAGER’S CAREER PATH PREFERENCES:
FUTURE DIRECTIONS

Maher, Chi
School of Management and Social Sciences, St Mary’s University Twickenham, London

ABSTRACT

Purpose - this paper explores the career path preferences of third sector social enterprise managers in the UK. The literature suggests that understanding of managers’ career path preferences (a variety of trajectories an employee is willing to take inter/intra organisational that fulfils his/her career needs) will provide organisations with the ability to design an effective career path options that will match individual managers’ career needs with organisational needs (Petroni, 2000; Vos et al., 2007). However, there is insufficient research that has explored the career path preferences of third sector social enterprise managers. Given this gap in research, this paper seeks to identify whether we can conceptualize third sector social enterprise manager’s career path preferences as vertical, horizontal, cross-functional (Petroni, 2000; Vos et al., 2007) or a combination of these types of career paths.

Design/methodology - a mixed method research design was employed. A survey and semi-structured interviews were conducted with forty operational managers working in eight social enterprise organisations to ascertain their career path preferences. In addition, eight HR managers working in the same eight organisations were interviewed to provide insight into managerial career path management systems in small social enterprise organisations.

Originality/value - The research makes a significant contribution in the field of career paths management in small third sector social enterprise organisations; by identifying career path of operational managers’ which are not linked to monetary needs of individual’s. This is significant for small social enterprise organisations seeking to retain managers; not through the promise of high salaries and bonuses but instead through proving opportunities that will match manager’s career path needs.

Keywords: boundaryless career model, career paths, social enterprise, managers, third sector
INTRODUCTION

The DTI (2002:7) described social enterprises as:

‘…businesses with primarily social objectives whose surpluses are principally reinvested for that purpose, in the business or in the community, rather than being driven by the need to maximise profit for the shareholders or owners’.

Social enterprises are at the centre of current political and academic discourse in the UK (Alcock, 2010; Social Enterprise UK, 2011). The government believes that by the third sector adopting a social enterprise ‘business model’, will enable third sector organisations to become involved in commercial activities, either directly or through ‘trading arms’ (for example, charity shops, internet or community cafes) to support their social and environmental aims (Alcock, 2010; Scott and Teasdale, 2010). This will allow the sector’s organisations to be more sustainable and financially independent.

The UK Government’s expansion of the third sector social enterprise policy agenda opened up new funding streams that organisations benefited from such as: Future Builders, Capacity Builders Funds and Adventure Capital Fund. However, government funding to support third sector organisations to become financially independent have been mostly time-limited from the 1990s through to the current Coalition Government policy framework, which reduces public spending to the third sector (Cabinet Office, 2010; Wardle, 2013). This has affected managerial earnings. The average third sector manager earnings is 22.5 per cent lower than a public sector manager earnings and 27.8 per cent lower than a private sector manager earnings (NVCO, 2013). These factors have contributed to an increase in third sector operational managers’ turnover from 12.8 per cent in 2008 to 14.7 per cent in 2013 (NVCO, 2013). Small social enterprise organisations are seeking ways to develop appropriate and effective strategies to enable them to retain operational managers (Venter and Sung, 2011) and to develop managerial retention strategies that are not linked to pay awards (Coetzee and Schreuder, 2008; Guan et al., 2013).

Operational managers often undertake the management and day-to-day delivery of client services (Maher, 2009; Parry and Kelliher, 2011, Wardle, 2013). Therefore, the loss of a manager impacts on front-line service delivery, service management and the ability of organisations to comply with Quality Care Commission requirements, which form part of the government contractual agreement for third sector social enterprise (drug and alcohol) organisations (Parry and Kelliher, 2009; Mold, 2012).

Operational managers turnover does not only disrupt delivery of client services it can also threaten the timely implementation of newly commissioned services (Nickson et al., 2008; Knight et al., 2011).

---

1 The Care Quality Commission regulates all health and adult care services in England, including those provided by the NHS, local authorities, and the Third sector and Private sector organisations (The Care Commission, 2011). Scotland, Wales and Northern Ireland have a separate arrangement.
Furthermore, managerial turnover is considered as inimical to small social enterprise organisations; due to its direct costs, such as replacement costs involving advertising the post, administration of the recruitment process and the time spent on new employee inductions; and indirect costs, such as reduced organisational performance level, the loss of organisational knowledge and less success in the adaptation and implementation of evidence based practice for the treatment of clients (Carroll and Rounsaville, 2007; Kim and Lee, 2007; Eby et al., 2011).

Researchers regard turnover that results from individual-level factors (such as, moving house, early retirement) are beyond the organisation’s control and can occur in any organisation or sector (Knudsen et al., 2011). Therefore, this research focuses on exploring organisational factors that can be developed by small social enterprise organisations to enable them to reduce managerial turnover. There is evidence (Garavan et al., 2006; Wong, 2007; Rasdi et al., 2009) on ways organisations have reduced managerial turnover in the private and public sectors. These studies found that organisations can reduce managerial turnover by understanding and developing career paths that integrate career path needs of managers to organisational strategy.

The literature review suggests that careers and career paths in the third sector have largely been ignored by research with a few notable exceptions, such as Onyx and Maclean’s (1996) study of intrinsic and extrinsic factors influencing the careers of workers in the third sector, Harrow and Mole’s (2005) study of third sector chief executives careers and Maher’s (2009) study of factors influencing career development in the Not-For-Profit sector. However, there is insufficient research that has explored the career path preferences of third sector social enterprise managers. Given this gap in research, this study provides an original empirical reserach and understanding of career path preferences of social enterprise operational managers.

OBJECTIVES

The objectives of this research are to explore and identify the career path preferences of small third sector social enterprise operational managers in the UK.

Research questions:

- What are the career path preferences of small social enterprise operational managers?
- Is there a relationship between small social enterprise operational managers’ career needs, organisational factors and their career path preferences?
**LITERATURE REVIEW**

*Public policy*

The literature suggests that numerous public policy since the 1990’s, such as, the 1990 National Health Service and Community Care Act in April 1993 and the introduction of competitive tendering process for contracts to third sector organisation’s by the Labour Government in 1999, led to increased government regulation of the third sector and has influenced the development of managerial career paths in small third sector organisations (Nickson et al., 2008; Cunningham, 2010). The change in policy framework from grant-aid (funding awarded to third sector organisations to contribute to supporting particular social or environmental aims without specific outcome targets to be achieved); to formal contractual arrangements with specific outcomes targets (Osborne, 1997; Macmillan, 2010; Dickinson et al., 2012). Organisations are required to measure and report on every aspect of treatment outcome they achieve for clients (for instance, how many clients completed their treatment programme, enrolled in education or training) (Osborne; 1997; The Kings Fund, 2011; NVCO, 2012). Operational managers are usually assigned the role of contract management.

In recent years, government contracts are mostly awarded for one year and occasionally for three years and in some cases the funds are abruptly withdrawn if government priorities changes (Nickson et al., 2008; NVCO, 2012). This led to some third sector social enterprise organisations diversifying their funding sources to include other activities such as membership subscriptions, trading subsidiaries (community cafés and training services) and hiring of facilities (Lee, 1993; NVCO, 2011; Dickinson et al., 2012). Small social enterprise organisations that seek to raise funding from other sources have found that funding from these sources are also time limited (Cunningham, 2010; NVCO, 2012), ranging from a few months to a year (NVCO, 2012; Dickinson et al., 2012). This creates further financial uncertainties in these organisations and influences their ability to plan and develop managerial career paths (Cunningham, 2010; The Kings Fund, 2011; Parry and Kelliher, 2011). Next the discussion of boundaryless career model conceptualisation of career paths will help us to explore career paths in organisations.

*The boundaryless career model*

The boundaryless career model is based on the work DeFillipi and Arthur (1994) and Arthur and Rousseau (1996). They contend that due to changes taking place in the economy and labour market in the 1990s such as, organisations downsizing and de-layering that a career path based on a hierarchical, vertical progression in one organisation is not applicable in most organisations. They posited that career paths are no longer determined by the organisation. Individuals are self-directing and taking responsibility for accumulating and developing marketable skills and competencies in order to determine their career paths within and across organisations during their working life.
(DeFillippi and Arthur, 1994; Arthur and Rousseau, 1996). In this regard, the individual acquires information, knowledge and marketable skills that will make it easier for him/her to pursue a career path that is suited to their needs within any organisation (Coetzee and Roythorne-Jacobs, 2007; Dries and Verbruggen, 2012).

The boundaryless career model conceptualises career paths as follows:

i. Vertical: a vertical career path involves upward progression within one organisation or several organisations determined by the individual. The individual accumulates competencies and undertakes training to gain skills within and outside the organisation to enable him/her to pursue a vertical career path suited to their needs as and when the opportunity arises.

ii. Horizontal: a horizontal career path involves side-ways progression to a specific or a specialist job within one or several organisations as the opportunity arises to satisfy his/her career path preferences.

Cross-functional: a cross-functional career path is characterised by an individual preferring to work on short-term cross-cutting projects in an organisation or managing several inter-related projects across organisations as the opportunity arises (Petroni 2000; Vos et al., 2007).

The review of managerial career path studies reveals that managers in the private and public sectors are pursuing career paths as conceptualised by the boundaryless career model (Martin, 2005; Wong, 2007 Cappellen and Janssens, 2010). The findings of this research will be compared with previous managerial career paths studies shown in Figure 1.1.

METHODOLOGY

A mixed method research design was employed. Semi-structured interviews and a survey was conducted with forty operational managers working in eight (randomly selected) social enterprise organisations in three UK regions to ascertain their career path preferences in the sector. The surveys were assessed on a five-point Likert scale that allowed operational managers to indicate the importance of each of the statements from (1) being “very low importance” to (5) being “very high importance”. The reason for using the five-point Likert scale instead of a single item was due to the author operationally defining measurement of career path preferences as the average of all items relating to each career path. This method is in-line with Allen and Katz’s (1986) and Erdogmus’ (2004) approach in assessing the career path of managers and professionals in the private and public sectors.

The semi-structured interviews provided an opportunity for an in-depth understanding of the operational managers’ interview responses in relation to their reasoning for their different rankings of the career path survey. By this approach, the researcher is using the quantitative data and the explanatory power of qualitative data to provide an original contribution to knowledge and understanding of the career path preferences of operational managers.

In addition, eight HR managers working in the same eight organisations were interviewed to provide insight into managerial career management systems in small social enterprise organisations. The author employed computer-assisted qualitative data analysis software (CAQDAS) package (Bryman and Bell, 2011) Nvivo 9 to facilitate the data coding and clustering of themes.

FINDINGS

The survey results displayed in Table 1.1 show that operational manager’s career path preferences mean scores. A horizontal career path (4.01) has the highest mean score; a cross-functional career path (3.85) is rated second, while a vertical career path (3.13) is rated third by the operational managers.
Horizontal career path

Horizontal career path is the most preferred career path by the operational managers. The evidence suggest that operational managers are undertaking training to improve their skills and competencies; in order to pursue a horizontal career path within their area of specialism in their organisations. This supports Arthur and Rousseau (1996) suggestion that individuals acquire specific skills and knowledge to enable them to pursue the career paths that fulfils their career needs and values. For instance, operational manager 24 and 25 reported:

“The organisation has been pretty supportive offering training and some bursary. I’ve taken time off to do some training I can’t fault them. I have had some training on addiction work and it’s on-going. I have been building up my PDP [Personal Development Plan] yes pretty much; gaining knowledge and skills is on-going in this field. Also because my training is only in addiction, within the field I can complement different modalities. I want to specialise more in this particular area rather than move into say more general management position. My skills are needed here” (Operational manager 24: Counselling manager: Organisation F).

“The organisation has been very good very supportive this is where I want to be. I trained for years to get the Diploma [in counselling] so I want to stay developing the therapy side of things; I’m not interested in going into general management and fund-raising activities. I’ve kept up my PDP [Personal Development Plan]. I’m up to date with my counselling skills” (Operational manager 25: Counselling manager: Organisation F).

Operational manager 24 and 25 evidence clearly suggest that they want to remain as counselling specialists by developing their career paths in their area of specialism rather than into general management roles. These views were supported by organisation F: CEO/HR manager. She reported:

“All our managers are practising counsellors or therapists they are not interested in taking up full-time management posts. I have asked them and they’ve said no to general management. They are happy managing projects with some hands on client work. I have been encouraging managers to attend courses that would extend their project management skills. It always ends
up the same, they nominate to attend a course that is related to enhancing their therapeutic skills or addiction management knowledge ... their choice” (CEO/HR manager F: Organisation F).

The findings suggest that some operational managers stay in an organisation because they prefer a horizontal career path that offers them the opportunity to practice in their area of specialism. Therefore, organisations should recognise that they might not be able to retain some operational managers if they do not offer them opportunities to progress in their career path preferences.

The prevalence of horizontal career path among operational managers reinforces the findings of Chaudhry et al.’s (2012) study of managerial career paths in two multinational companies in Pakistan. However, there were some differences between the findings of this research and Chaudhry et al., (2012) findings. Chaudhry et al., (2012) found that several managers in their sample pursued horizontal career path within one organisation due to limited vertical path promotion opportunities available to indigenous Pakistan managers in the two large multinational companies. The main factors influencing small third sector social enterprise operational managers to pursue a horizontal career path is that, several of the study sample chose to pursue their career path preferences in a specific type of small social enterprise organisation that offers specialist services to a specific type of client group, which happens to be the services that these operational manager’s wants to specialise in.

Cross-functional career path

A Cross-functional career path is the second preferred career path by the operational managers. The research findings suggest that the main factors influencing operational managers to prefer a cross-functional career path; is that it enables them to improve their chances of having continuous employment, in their respective organisations due to the short-term nature of the third sector funding regime (Kings Fund, 2011; Scott and Teasdale, 2012).

Some operational managers that preferred cross-functional career paths; stated that they have only worked across different projects within their organisation in the last three years; due to the organisation’s income and funding structure. (Cunningham and James, 2007; The King’s’ Fund, 2011; Dickinson 2012). This has led to some operational managers preferring to work in a variety of cross-functional projects in order to widen their marketable skills base and knowledge, ready for when the next project comes along. Some operational managers reported:

“The organisation funded some qualification courses that I have been on and other courses. I regularly attend courses and up-date my C.V. With this sector you need to have your skills regularly up-dated if funding is coming to an end on a project that you’re working on and another project comes up if you can be fitted into a role there they will fit you in. So you
need to be ready to move across projects according to the funding received” (Operational manager 27: Services manager: Organisation E).

“The organisation provides opportunity for training even with all the changes taking place in this sector which affects our organisation. I have to take training on board. I have to be flexible to go where the work is, where we have funding for a project. I have grown to be strong to be positive in times of uncertainty. I have completed my NVQ [National Vocational Qualification] level three in management. I was leading one project, when we lost funding for that project I had to take on another project. I’m now managing the carer’s advocacy project and the home visiting project. You’ve to adapt. You’re learning all the time. It’s also rewarding working here” (Operational manager 28: Advocacy services manager: Organisation E)

Operational manager 27 and 28 stated that they always seek continuous skills development and training opportunities to enable them to enhance their skills and knowledge so that they can remain employed. Their views were supported by HR manager E evidence. HR manager E reported:

“Employment contracts are based on the funding we get. Most of our contracts are short term as you know. If a particular contract is ending the people working on that contract are moved to a project where we have received funding from another pot of money. So we have more sideways moves and cross-functional moves than upward moves for the reasons that I have described. Managers are move from project to project depending on what funding we have got in. However, we have had some upward moves for instance the CEO [Chief Executive Officer] was promoted from within the organisation. But an upward move does not happen that often” (HR manager E: Organisation E).

HR manager E’s evidence was further supported by HR manager B, who stated that the reasons why small social enterprise organisations predominantly provides cross-functional career path is due to the size of the organisation, funding structure and partnership arrangements with other organisations that are stipulated by some government contractual agreements. He reported:

“It is difficult with a small organisation to look at where managers are going to go. There isn’t much space for upward promotion here. We look at side-ways and multi-project management moves. We are contracted under a particular framework of ‘Supporting Peoples Agenda’. If a manager has a particular skill they want to further if we can find a way to make it happen, without breaching our contractual agreements, we will completely explore it. What we cannot do is to provide a service that another organisation is contracted to provide in order to accommodate someone’s career path needs. That will be undermining the agency’s partnership arrangements with other organisations. It is not easy to find the conditions to
fulfil each individual career path needs within an organisation of this size. So managers should be ready to move across to projects where we have funding at any particular time” (HR Manager B: Organisation B).

The evidence demonstrates that short-term funding of small social enterprise organisation’s abilities to develop a variety of career path options that are suited to the desired needs of managerial staff. As a result they offer managerial staff cross-functional career paths opportunities depending on the income and funding received.

The fieldwork finding conforms to Martin (2005), McCabe and Savery (2007) study of career paths of managers in Australia they found that most managers in their samples were pursuing a cross-functional career within their industry. Martin (2005) found that managers in his sample tend to pursue a cross-functional career path when the organisation was restructuring. McCabe and Savery (2009) found that managers in the convention and exhibition industry accumulated a portfolio of technical skills which gave them access to work on cross-functional projects in the industry in order to remain employed (projects in the convention and exhibition industry are often multi-dimensional and time limited). Similarly, third sector social enterprise operational managers that prefer a cross-functional career path were engendered by the need to remain employed in the sector due to short-term nature of third sector income and funded projects.

**Vertical career path**

Vertical career path is the third and least preferred career path by the operational managers. The fieldwork evidence suggests that a vertical path is preferred by some operational managers. These operational managers achieved a vertical career path through their own initiatives (identifying their training needs and attending the identified training courses) and organisational initiatives such as internal career advancement opportunities that their employing organisations have provided. They added that most of their qualifications post GCSE and A level education was provided by their organisations. This has enabled them to progress vertically within the organisation’s managerial hierarchy. Operational managers that prefer vertical career path reported:

“I started here as a receptionist. I have gained lots of skills and qualifications through training from this organisation they [the organisation] are very supportive, they are fantastic. When I find training that I needed, I went and presented it [the training course] and they [the organisation] have funded it. When the finance manager’s position came up because the finance manager retired, the director asked me if I would be interested in applying, I said yes. I applied and got the job. The organisation is akin to promoting from within the organisation because the people here already know how things work here” (Participant 1: Finance/development manager: Organisation A).
“The organisation has been fantastic. I started here as a support worker part-time. I was promoted to a co-ordinator and now I’m a team manager. My manager is great he has given me awareness and allowed me to use my initiatives to find training I need. He gave me exposure to things that other manager’s in other organisations would not necessarily get exposed to for example, training in management skills, visiting other projects which has helped me to move to the direction I want to go. Yeah helped me to move up” (Operational manager 11: community Inclusion manager Organisation C).

It is evident that these operational manager’s ability to pursue their career path preferences was made possible by their own efforts and the organisation’s initiatives. Operational manager 1 and 11 stated that without the training and support provided by the organisation; it would not have been possible for them to pursue their career path preferences within the organisation. These views were supported by HR manager C:

“We send managers to training such as, NVQ [National Vocational Qualification] courses which are suited to their role. If a manager has the aspirations to go up [vertical] managerial route and they are prepared to put in the time and effort to achieve that, we [the organisation] would support that. We support them to get there quickly. I will say it comes down to attitude of individuals if they come willing to be successful and fit in with the ethos and culture of the organisation. They will have the support [from the organisation] to help them to develop and progress. My director came through the internal ranks of the organisation, if you show initiatives the organisation will support you to progress where you want to go” (HR manager C: organisation C).

The evidence from HR manager C suggests that some small social enterprise organisations will support operational managers to pursue a vertical career path, if the individuals are committed to progressing through a vertical career path while helping the organisation to meets its objectives. The research finding provides additional support to the findings of previous managerial career paths studies (such as, McDonald et al., 2005; Kim et al., 2009) that found that vertical career path was pursued by managers in their sample.

The fieldwork findings provide important insight into the nature of the career path preferences of small social enterprise operational managers in the UK. Although the findings suggest that the career path preferences of operational managers conform to the career path preferences of managerial staff in the private and public sectors; some contextual third sector factors (such as, short-term funding, organisational size and government contractual agreements with small social enterprises (Scott and Teasdale, 2012) were identified as factors constraining the ability of small social enterprises to provide operational managers with career paths option.
CONCLUSION

The findings provides evidence that aspects of the boundaryless career model (Arthur and Rousseau, 1996) that conceptualises career paths (as horizontal career path, cross-functional career path and vertical career path within an organisation) were found to be evident as the career path preferences of small social enterprise operational managers.

A horizontal career path within one organisation is the most preferred career by the operational managers followed by cross-functional career path within one organisation. There was little evidence to suggest that operational managers preferring horizontal and cross-functional career paths across organisations. Therefore, the boundaryless career model conceptualisation of horizontal and cross-functional career paths across organisations was not supported by the research evidence.

Operational managers that preferred vertical career paths were able to do so when a position becomes available in their respective organisations. In the case of small social enterprise, vertical career path is not based on sequential ready-made vertical career path progression. It is more relational (a vertical career path progression is made available when funding is received or when someone retires). It is not surprising that a vertical career path is the least preferred career path by several operational managers in this study. Small social enterprise organisations have limited funding and income and as such, they are unable to develop layers of management ready for managerial progression.

Overall, the findings suggest that operational manager’s career path preferences in small social enterprise organisations are influenced by the individual’s values and career needs and the organisation’s ability to provide career path options. The findings suggest that operational managers are not totally independently self-directing their career paths as suggested by the boundaryless career model (Arthur and Rousseau, 1996). This led the author to define social enterprise operational manager’s ‘career path preference’ as:

“an intersection of an individual’s led initiatives (training, networking) and opportunities provided by the organisation (training, availability of jobs) to meet the person’s desired occupational and career path trajectories” (Original: Maher, 2013).

Small social enterprise organisations need to be aware of the factors that influence operational manager’s career path preferences and the positive outcomes (such as, retention, organisational commitment, etc.) that could be achieved when there is a match between operational manager’s career motives, career path preferences and organisational needs. This research provides an insight into the contextual factors that shape and constrain operational managers’ career path preferences in the third sector. This is significant for small social enterprise managers seeking to retain managers, not through the promise of high salaries and lifelong benefits, but rather through proving opportunities that will enable operational managers to develop projects and have independence in managing these projects.
An additional contribution of the research is that it addresses an important gap in the career path literature by providing a detailed exploration of the career path preferences of the third sector operational managers. The research findings have raised important issues for policy makers and organisations to consider, the future directions of operational managers career path preferences.

WHAT WINE TOURISTS WANT? A NETNOGRAPHIC ANSWER

Maizza, Amedeo; Cavallo, Federica; Iaia, Lea

Department of Management, Economics, Mathematics and Statistics, University of Salento, Lecce, Italy

ABSTRACT

The work aims at examining the online communication started by wine tourists on Web, in order to i) identify topics and subjects around which wine tourists mainly discuss and to ii) profile them, through a netnographic approach.

The originality of the paper can be identified in the application of the research methods still less used in the touristic marketing studies, although through them it is possible to express interesting research hypothesis.

Managerial involvements can be found in the possibility of using the results emerged from the analysis of the user generated contents (UGCs) so as to be able to (re)direct the communicational strategies, developing, at the same time, a targeted and personalized tourist offer.

Keywords: online wine tourism communication, wine tourist netnography, Web 2.0, wine.

INTRODUCTION

Wine is a product which can become the cornerstone of online socialization, thanks to its cognitive value, from which emotional and experiential circumstances originate, linked not only to its characteristics, but also to its area of origin (Mattiacci, Ceccotti and De Martino, 2006; Costantinides and Fountain, 2008; Li and Bernhoff, 2008; Vrontis et al., 2011a, b).

Consequently, wine tourism, too (Anholt, 2007; Hall et al., 2000) could show similar features, as it is identified for a different use of the touristic product, characterized by particular needs that often determine the reasons of customization of the tourist offer; in such context, indeed, peculiar needs (related to the knowledge of the specific area, culture, traditions and life style) prevail and extend the usual wine world field strictly speaking (Mitchell et al., 2000).

For the above-mentioned reasons, the role of web communication in this particular field seems to be significant but, at the same time, complex, as it requires targeted web marketing actions (Buhalis and Wagner, 2013); for enotouristic destinations the on-going digital revolution, indeed, can represent a

---

1 The current paper has to be considered as a preliminary phase of the research project called “The Apulian tourisms: analysis of the competitiveness of the Apulian territories” (original title: “I turismi di Puglia: Analisi della competitività dei territori pugliesi”), commissioned by Puglia Promozione, the Destination Management Organisation (DMO) of the Apulia Region.
big opportunity because the user generated contents (so-called UGCs; Wunsch-Vincent and Vickery, 2007) are valuable information in order to develop a customized, targeted communication which can allow a better customer experience and a far more incisive interaction (Sigala, 2012; Kujala, 2003).

NETNOGRAPHY: A BRIEF REVIEW

The paper, which is part of a wider field of research, is included in the studies connected to web communication, then trying to contextualize them in the field of such a specific sector as wine tourism. In this sense, it is possible to talk about consumer-to-business or reverse marketing due to the contribution that the tourist can give to the co-creation of many attributes of product-offering or other elements of marketing mix (Neuhofer et al., 2013; Prebensen and Foss, 2011; Tapscott, 2009; Zwick et al., 2008; Prahalad and Ramaswamy, 2004), in a perspective of digital prosumerism (Ritzer and Jurgenson, 2010).

It is thus particularly significant to try and outline the different typologies of web users on the basis of the different conversations and of the mostly discussed topics by such groups of Internet users; for this purpose the netnographic analysis may be used as a support (Kozinets, 2002).

Netnography develops as a branch of ethnography and cultural anthropology, applied to the Web; such technique is based on the body of contents from online sources, in which the topic under consideration as well as the subsequent interpretation of data are discussed (Kumar et al., 2013; Wu and Pearce, 2013; Ismail, 2010; Reynolds, 2010; Quinton and Harridge-March, 2010; Xiang and Gretzel, 2010; Puri, 2007; Dalli and Corciolani, 2007). As the textual contents (in their scientific-cultural dimension of social interaction) are more and more common on the Web, in the latest years there has been a sharp increase of studies and researches – especially in the sociological field – based on netnography, defined as “ethnography adapted to the complexity of contemporary social world”, in other words as a method that can provide a privileged access to the comprehension of “life in the age of technologically mediated culture” (Kozinets, 2010).

The netnographic approach used in the present paper is based on the direct observation of the virtual community through the analysis – without a direct participation – of the conversations realized on the communities examined (De Valck et al., 2009; Cova and Pace, 2007).

OBJECTIVES AND METHODOLOGY

Considering the importance of a permanent activity of examination/monitoring the consumer-generated media, the current paper starts from the follow research hypothesis:

The topics around which enotourists’ discussions revolve can offer useful advices for the business organization, in order to profile the wine tourists, so as to formulate a personalized and effective communication strategy.
So, the research question is:

*What are the main discussion topics on blogs, forums and communities? In other words, what are the most requested information by wine tourists and upon which they mainly discuss?*

Based on previous study (Fait *et al.*, 2014, Maizza *et al.*, 2014, Scorrano *et al.*, 2013), the following wine tourism destinations, considered of excellence by wine tourists, have been examined: Napa Valley, California, Bordeaux, France, Tuscany and Italy.

Then, a research on Google.com has been carried on (on December 2013), using the above-mentioned keywords (*wine tourism*, combined with each *destination name*): for such analysis, the results connected to the first three pages of the search tool “Discussion” have been examined. In this way, it has been possible to identify blogs, forum and communities about which wine tourists talk about the topic under consideration, discuss, exchange information and express opinions and/or decisions.

Such subjects have been re-elaborated, according to the *text mining* method – which allows, through the automatic extracting of information from a usually huge amount of different unstructured textual resources, to discover previously unknown information using computers (Witten, 2005) –, in order to emphasize the most recurring topics and the most sought-after topics/data by wine tourism lovers, with a double final purpose:

- pointing out the subjects around which these users mostly discuss, as well as verify if the data searched by users are (easily) available also on the business website of the related *wine destination*;
- comparing the results, diversifying them for wine-destinations, with the aim of realizing a netnography (defined by Kozinets as: “a new qualitative research methodology that adapts ethnographic research techniques to the study of cultures and communities emerging through computer-mediated communication” Kozinets, 2002) that allows to outline the characteristics and possible peculiarities of the different *wine tourists*, in relation to the mostly treated subjects.

**THE NETNOGRAPHY ON WINE TOURIST CONTENTS**

The Discussion search tool of Google.com has been used here. It reports as results only blogs, forums and communities on which the discussion is about the examined *wine destinations* (used as *keywords* for the research); from the results obtained, only the first three pages have been considered. From each of them the text of the title or of the given question has been taken, as well as all the comments/replies, except for those related to groups created on Google (www.groups.google.com), for which the registration to the community was necessary; in this way, it has been possible to assemble the contents of 25 online platforms for each enotouristic destination, each of which, provided, on the average, about twenty comments among *wine tourism* lovers. On the whole for each of the 6
destinations it has been analysed: 25 platforms, each containing at least 20 comments (in order to emphasize the overall numerosity of the analysed comments, it must be taken into consideration that the overall text analysed by the T-Lab software is equal to 1.000 pages in .doc format).

The textual content of the online discussions, identified employing the above-mentioned methodology, has been analysed through the text mining approach re-elaborating:

- 7,894 elementary contexts (cf. box),
- 19,592 forms,
- 16,291 terms (cf. box),

for a total amount of 308,675 occurrences, considering a threshold equal to 6.

The elementary contexts can be of four types: 1. *Phrases*, that is elementary contexts identified by strong punctuation (.?!) with minimum length of 1,000 characters; 2. *Fragments*, obtained through a segmentation algorithm that considers as elementary context every word sequence interrupted by a new paragraph (line break) and whose size is less than 400 characters; 3. *Paragraphs*, that is elementary contexts identified by strong punctuation (.?!) and by line break, with maximum length of 2000 characters; 4. *Short texts*, if the corpus is made up of texts with maximum size of 2000 characters (e.g. answers to open questions).

The T-Lab software, for all the lexical units of the corpus, reports two pieces of information: the first, called *form*, contains the transcription of lexical units (single words or multiword) as strings recognized by the software; the second, that is the *word*, contains the labels in which the lexical units have been grouped and classified during the phase of automatic lemmatisation.

From a first analysis, it is possible to notice that UGCs revolve mainly around the word “wine”, which records a number of occurrences equal to 3,376 (Such value of occurrence related to the term “wine” is higher to the element observed on wine destination websites; this is to be ascribed also to the greater sizes of the contents of discussions as compared to the former); after such climax, the most used keywords are those characterizing the ‘experience’ (323) of enotouristic journey, in the strict meaning of journey: “winery” (1,356), “tour” (1,203), “visit” (1,036), “taste” (815), “tourism” (489), “travel” (422), “vineyard” (371). Taking into account, instead, the evaluative aspect of the same experience, the words frequently used by enotourists turn out to be: “great” (619), “love” (308), “enjoy” (273), “beautiful” (228), “fun” (155), “wonderful” (145), “easy” (139), “amaze” (121).
In fact, although the discussions are linked by the same thread (the interest towards areas suitable for productions of high-quality wine), the macro online discussion among wine tourist can be led back to two typologies of "suggestion":

- **expert**: favouring the aspects linked to wine-cellar and vineyards to visit, to the produced wines and their characteristics, to tastings and the most important events organized on the area;
- **funny**: linked to complementary aspects of the places taken into consideration; the landscape, culture, history are emphasized as well as the gastronomic specialities, the traditions and the possible activities to be done during the holiday.

Anyway it is important to highlight that the names of wine destinations analysed recur in the text in the following order: “Italy” (684), “Napa” (521), “France” (353), “Tuscany” (336), “Bordeaux” (333) e “California” (192). These numerical values suggests two considerations:

- the first two destinations are those that can generate greater contents, thus obtaining a high number of posts;
- there are discussions and exchange of information about these main wine destinations not only when the post concerns directly or not the destination; for example, there usually recurs a reference to Italy when an opinion and/or a suggestion related to Tuscany is then extended and enriched with information regarding the whole country; moreover Italy appears in discussions concerning France, very often in order to make a comparison, that is to underline the peculiarities of each or emphasize the similarities.

This is also confirmed by a further in-depth analysis conducted through the Analysis of Correspondences (cfr. Fig. 1), allowing to agglomerate the dispersion of data in a reduced space, thus explaining the polarization of variables and terms by the axis of a Cartesian graph (the axes of the graph correspond to the factors, that is to variables created ex novo explaining the different oppositions between the poles of factors. Factorial polarity, that is the opposition on the horizontal and vertical axes of the graph, is determined by the Test Value; this index has a threshold value equal to 1,96, that is equal to the most common statistical significance (p. 0,05), and a positive or negative mark).

With the help of this instrument it has been possible to summarize the information traceable on blogs, forums and communities in a bi-dimensional space. The relations between the context units in terms of proximity-distance (similarity-difference) have been analysed, in order to identify the behaviour of the different wine tourists, in relation to the destinations under consideration.
From the interpretation of the graphic representation it is possible to classify, according to the netnographic approach, three main typologies of enotourists (the name given to the different groups comes from the interests noticed in the discussions observed):

- **sophisticated**: that is those who privilege the “fashionable” aspect of the site, who exchange views on which is the best “chateau” to visit or the best “vintage” offered by “wineries” during the tastings; with accurate precision, many suggestions concerns not only the technical characteristics of local productions, but also the price ("A red Bordeaux wine needs at least 10 years to mature. A young red Bordeaux, even when it comes from a grand chateau, is just bland and full of tannins. The complex fruit and mineral aromas need time to develop"); "More recent vintages range in price from $29 a bottle for the 2002 all the way up to $83 for the 1999"). The most frequent items are at a significant semantic proximity with the contents related to Bordeaux variable;

- **wine-oriented**: formed by enotourists that on the Web mostly discuss about Napa Valley and California; the information related to these two enodestinations are linked to the wine-world itself. They often discuss about people involved in the production chain; they talk about the best wines – very often emphasized with superlative adjectives –, the wine-cellars, the vineyards to visit and the importance of learning aspects linked to the growing and production during these tours ("Always a better experience doing the small production wineries, IMO. Meeting the owners and winemakers is so special!"); "The Syrah is slap-your-mama fantastic, and I could bathe in the Zinfandel and Cabernet. Even the Chardonnay is superb. None of Chris’ wines overpower you with alcohol, yet they’re all big, robust wines, including the white. You can actually..."
taste the grapes, the soil, the rocks, the wine. You HAVE to stop in here and buy a bottle or two. He’ll take you out amongst the grapes for an agriculture lesson if you ask him to. He’s always great about educating his customers. We’re headed out there for Memorial Day week, and I can’t wait. Can you tell I’m a big fan?>>; << The wines were quite good, and we really got a good education in wine country agriculture and wine making.>>).

- **typical-oriented**: wine tourists talking about Italy, Tuscany and France; on the Web they analyse cultural and architectonic aspects of these places, emphasizing history and traditions, as well as “food” and typical products. Tracing back their tours, they suggest in a detailed way the activities to do, the monuments to visit, how to buy the tickets for the museums and how to reach the most interesting towns (<<You’ll have a wonderful time discovering the area you stay in - shopping for local products, eating good food, drinking good wine (it is hard to eat badly in Tuscany, most “trattoria” have extensive wine lists just like the restaurants do) and most of all taking part of your nephew’s wedding in such a beautiful context as Tuscany!!>>).

Besides the observed clusters, there are also terms located around the centroid of the bi-dimensional space examined, that have proximity relations, from the lexical point of view, with all the enotouristic destinations under consideration. From the observation of these words, that are common to all the different destinations observed, a quite positive sentiment emerges by enotourists: as you can see from the previous graph (cfr. Fig. 1), the tour experience in the wine destinations is usually identified by lexical units, such as: “good”, “favourite”, “enjoy”, “excellent”, “great”, “nice”, “beautiful”, “wonderful”, “interest”, “pretty”.

It is useful to consider, at last, the presence, even if very reduced in number (only three), of negative adjectives; it is interesting to underline that lexical unities such as “negative”, “not good”, “expensive” do not qualify the products and/or the areas closely linked to the wine destinations under consideration, but are usually linked to the purchase of extra-services (water taxi, lunch, gift): <<From the cruise port you can choose three different means of water transport; most expensive is a private water taxi.>>, <<My favourite place in Italy is the island of Capri, but boy is it ever expensive! Me and my partner paid £30.00 for burger and chips each and one small beer each, and that was back in 2007!>>.

**CONCLUSIONS**

The present paper has originated from the hypothesis of research below (and the related questions): The topics around which the discussions of enotourists revolve can provide useful suggestion to the web marketing decisions, in order to allow the identification of wine tourists, so as to formulate a personalized an effective communication strategy.
Carrying on with the survey, it has been possible to outline the characteristics of the “new wine tourist”, well informed, who wants to choose its destination according to its interests and also to plan its free time, and becomes, at the same time, a ‘spokesperson’ of its own travel experiences in order to provide useful suggestions to the community members.

The analysis thus conducted has allowed, through the formulation of answers to the research questions, to confirm the hypothesis from where the work started and emphasize the need of a greater dynamism of the enterprises in order to preserve and/or improve its own competitive positioning; the monitoring of the online conversations, in fact, is an opportunity for wine destinations in order to identify the customers’ feedback, gaining knowledge related to their tourist experience and enrich the contents of the offered products.

The limit of the present study, mainly linked to the needs of synthesis of the present contribution, can be attributed to the netnographic approach used; it belongs to the observative kind and so, it didn’t provide any interaction with wine tourists.

It is considered interesting to further develop the netnographic analysis, favouring a participative approach, through the administration of questions addressed to enotourists, with the aim to investigate their perceptions in reference to the wine destinations observed and possibly increase the study sample. Also, it is considered interesting to compare the UGCs and the enotouristic destinations website contents (through the text mining approach) with the aim to evaluate the coherence or incongruence between the communication elements of each online content maker (wine tourist destination and tourist).

The research conducted can, in that sense, have managerial consequences in terms of definition of an integrated, tourist offer, targeted thanks to the analysis of “virtual discussion room” around the enterprise. These communicative platforms, in fact, offer significant informational opportunities useful to the planning of a personalized, valuable offer for the customer; they also allow to become acquainted with the perceptions of users, thus the brand image that is spread online thanks to the speed of diffusion that characterizes the communication and the online word of mouth.

ATTRIBUTES DRIVING THE WINE CHOICE PROCESS

Maizza, Amedeo1; Fait, Monica1; Scorrano, Paola1; Vrontis, Demetris2; Thrassou, Alkis2

1Dept. of Management, Economics, Mathematics and Statistics University of Salento, Lecce

ABSTRACT

Research Background: Wine businesses operate in an increasingly harsh and globalized competitive environment, characterized by shifting consumer behavioural trends, the rise of new players (Third World Countries, Banks and Overton, 2010) and unpredictability. They are thus obliged to strive for ‘strategic transcendence’, through holistic re-evaluation, redefinition and redevelopment of all their functional and marketing processes.

Research Aims: This paper analyzes attributes of the wine purchasing process and assesses, from a consumer-oriented perspective, their value as determinants of marketing strategy.

Research Methodology: Extensive theoretical research was conducted into various aspects of wine consumer purchasing behaviour. Subsequently, an empirical survey was performed, and the gathered data was processed with both descriptive and multivariate statistical techniques. The empirical research evaluated the theoretically identified variables in the context of the new competitive conditions that characterize the wine sector today.

Research Value: The research identified trends which, properly interpreted, add to our understanding of consumer behaviour and offer valuable guidance for the development and implementation of corresponding strategies (primarily concerned with marketing and branding) in the wine sector.

Keywords: Wine, Consumer, Country of Origin, Marketing, Branding

INTRODUCTION

Wine producers and sellers across the globe are operating in a challenging business context which is becoming increasingly harsh for all business-end stakeholders. Much like their counterparts in so many other industries (Thrassou, 2007), wine businesses are being forced into a competitive arena characterized by: a) globalization; b) shifting consumer behavioural trends; c) fluctuating and unpredictable macro-environmental business conditions; d) evolutionary restructuring and
repositioning of all production, distribution, sales and marketing aspects of the product (Rossi et al., 2012).

A key feature of the international wine-making sector today is the coexistence of various contexts of production and consumption. The traditional dichotomy (Campbell and Guibert, 2006) of wine producers that are the expression of an area and of the vine-grower’s experience (Old World: Italy, France, Spain, Germany and the UK), and production areas oriented to the achievement of a homogeneous product, no longer associated with a precise area of origin (New World: California, Australia, Argentina, New Zealand) is currently evolving rapidly. Key new players are emerging in the context of both production and consumption.

In the light of the above, this research analyzes attributes of the wine purchasing process in an effort to determine, from a consumer-oriented perspective, their impact on the development of marketing strategies. To this end, theoretical research into various aspects of wine purchasing was conducted. Subsequently, an empirical survey was performed to identify the ‘macro-themes’ underlying the process by which the consumer’s choice of ‘wine’ product is made.

Aware of the increasing need to translate academic findings into industrial applications, the research concludes by presenting the managerial implications of the findings.

THEORETICAL CONTEXT AND DEVELOPMENT OF THE HYPOTHESIS

A consumer-oriented approach to the wine market

In the current competitive context, knowledge of cognitive and behavioural elements that facilitate the perception of the product’s value proposition – and thus characterize the purchase process (Mowen, 1995; Thrassou et al. 2012) – is becoming increasingly important in terms of generating value for the customer (Wayland, Cole, 1997). In the above context therefore, this paper adopts a consumer-oriented approach, and considers the emotional, cognitive and behavioural dimensions of the purchasing process to be fundamental (Holbrook and Hirschman 1982; Schmitt, 2003; Vrontis et al., 2011a, b).

The starting point for this research was thus a review of the business literature with a view to identifying the attributes and variables that determine the purchase of wine. A case-by-case discussion of each of the works analysed is not possible here, but in terms of the theoretical part of this research, two broad categories of variable were identified: a) attributes/benefits strictly linked to the wine itself; b) attributes/benefits arising from the association between the wine and its place of origin (Table 1).

</tbody>
</table>

In accordance with the literature (Olson and Jacoby, 1972; Steenkamp, 1989; Oude Ophius, Van Trijip, 1995; Bernués et al, 2003a, 2003b), which cites the distinction between *intrinsic attributes* (organoleptic properties and physical characteristics of the product) and *extrinsic attributes* (price, brand, reputation, image, advertising), this study considered *Organoleptic Properties, Production Methods, Bouquet and Taste* in reference to the former, and *References, Packaging, Price, Information found in guides and on the label, Wine tasting, Educational Tours, Cellar door sales, information available on the internet, Reputation of producer, and Reputation of designation of origin* in reference to the latter.

In addition, in accordance with those authors who stress the association between the wine and its place of origin (Bilkey and Nes 1982; Al-Sulaiti and Baker 1998, Tragear et al., 1998; Van Ittersum et al. 2003) and give prominence to the wine’s hedonistic and *aesthetic* properties, linked to the “made in” effect (Bloch, 1986; Goldsmith and d’Hauteville, 1998; Charters and Pettigrew, 2006), this paper considered the following elements: *Artistic/Cultural Resources, Natural resources, Land and Wine events,*

---

*The Future of Entrepreneurship*  
Wine routes, Land information in brochures and Destination brands that identify the specific wine (e.g. Napa Valley, Tuscany, Bordeaux).

Research hypothesis

The paper adopts the subdivision into “old” wine regions (Italy, France, Spain, Germany and the UK), “new” regions (Australia, the California (USA), Argentina, New Zealand) and “third” regions (Brazil, India, China, Russia and Romania). Based on the findings of the above-cited literature (both general and, more importantly, specific to wine-making), it is argued here that some of the theoretically identified attributes act as behavioural guidelines, influencing the consumer’s choice of wine product.

Methodologically, the research was therefore designed and executed specifically to test the above hypothesis and guarantee the reliability and validity of the results.

EMPIRICAL RESEARCH METHODOLOGY

Sampling

Regarding the context of analysis and sampling, this study chose to focus on wine buyers due to their technical knowledge, creativity and ability to identify the market of reference and related trends (Kotler et al., 2012). The sample was selected from an international buyers database (Bestwineimporters) listing (a) importers from the top 10 wine-producing countries (Argentina, Australia, China, Chile, France, Germany, Italy, South Africa, Spain, the USA/California) and (b) importers to the top 10 wine consumer countries (Argentina, China, France, Italy, Germany, Romania, Russia, Spain, the UK, the USA).

Initially the sample population was composed of subjects from the following countries: France (120), Italy (113), Germany (850), the UK (542), Spain (85), the USA/California (1130), Argentina (38), Australia (106), New Zealand (53), China (47), South Africa (33), India (36), Russia, (65), Romania (39), Brazil (110).

The sample was then revised on the basis of: a) buyer website assessment (deemed methodologically necessary as contact with buyers was by Facebook, e-mail or filling in “contact us” fields in the period May-November 2013); and b) the buyers’ level of specialization, so as to include only those who trade in wine.

Since this was exploratory research conducted on a selected sample, the convenience sampling technique was applied and a total of 315 properly completed, valid questionnaires were collected, considered and analyzed (28 from the UK, 14 from France, 31 from Germany, 8 from Spain, 21 from

Italy, 35 from the USA, 25 from Argentina, 25 from Australia, 26 from New Zealand, 20 from South Africa, 22 from Brazil, 20 from India, 20 from China, 12 from Russia, 8 from Romania).

Questionnaire development and analysis

A semi-structured questionnaire was constructed with the aim of identifying and understanding perceptions of specific determinants of purchasing behaviour, and a pilot test was conducted.

For quantitative measurements, a five-point scale was used (5 = greatest importance, 1 = least importance). A validation test was also conducted by sending the first version of the questionnaire to 20 buyers working in 4 different geographical areas.

Data were analysed using SPSS software (Statistical Package for Social Science), with the gathered data being processed by descriptive and multivariate techniques. Factor analysis was used to test the research hypothesis.

RESULTS AND FINDINGS

Attributes guiding the consumer choice process

The first step of the research allowed the identification of ‘macro-themes’ influencing the consumer’s choice of ‘wine’ product on an international scale. The research sought to verify whether this process is indiscriminately structured, or whether certain groups of variables play a greater role than others, so as to identify possible guidelines for consumer-oriented marketing strategies. To this end, and to highlight the existence of a structure underlying the set of observed variables, Factor Analysis (appropriate for the explorative nature of the research) was applied.

The results of the KMO test (0.867, i.e. > 0.7) and Bartlett’s test were indicative of a correlation between the variables (p-value > 0.05), confirming the suitability of factor analysis. The analysis extracted five elements that explain 68.025% of variance (values of 60-70% being considered acceptable in terms of the informational function)\(^1\).

The data were interpreted by means of the rotated component matrix (Table 2), in which the variables are associated with the components with which they show the highest correlation.

\(^1\) The five identified components all have high values and summarize the information contained in the original data matrix. This is confirmed by the scree plot and the communalities (not shown here due to lack of space).
The first component, which we call ‘Relationship between territory and wine’, is characterized by the high correlation of variables indicative of the external visibility of this relationship (Artistic and Cultural Resources, Natural resources, Land and Wine events, Wine routes, Land information in brochures, Destination brand identifying the specific wine), and the perception of this relationship as a means to increase the value of the wine product. This confirms that the consistency between the product and the image of its region of origin, frequently cited in the literature, is a key element of a wine’s value.

The second component, which we call ‘Wine identity card’ relates to the wine itself, in the sense that it includes variables arising from its intrinsic features (Organoleptic Properties, Production Method, Bouquet, Taste, Reputation of producer, Reputation of Designation of Origin).

Extraction method: principal components analysis.

Rotation method: Varimax with Kaiser normalization.

The rotation met the convergence criteria in 7 iterations.
Bouquet, Taste) and the ‘reputation’ variable (Reputation of producer, Reputation of the Designation of Origin).

The third component, ‘Experiential identity of wine’, corresponds to the consumer’s need to ‘explore’ the wine, by means of a flow of information that is not linked to strictly oenological factors, but rather to experiential elements. The variables included here indicate a consumers’ need to know/understand the wine’s context through direct/experiential contact (Educational Tours, Cellar door sales) or via social communication tools (information on the internet, particularly blogs and social networks).

The fourth component, termed ‘Information in support of the purchase process’, is characterized by the correlation between three variables (References, Packaging, Information in the guides and on the label), indicative of a need for information in support of the purchase process, guaranteed by the numerous references, the packaging and the information included on the label (e.g. grape variety, alcohol by volume, place of production, etc.) and in the guides (tasting scores, competitions, matching, etc.).

The last component, ‘Price’, is fundamentally linked to economic evaluation at the time of purchase.

**CONCLUSIONS AND MANAGERIAL IMPLICATIONS**

The managerial literature, particularly of an empirical nature, has analyzed the process of consumer wine purchasing with regard to one or a small number of attributes. In contrast this paper considered attributes and variables identified by the literature but suggested a multi-dimensional vision of the process. Specifically it sought to understand whether this process is indiscriminately structured or whether certain groups of variables play a greater role than others in the process.

Due to the reduced representativeness of the statistical sampling, this research cannot thoroughly outline consumer behavioural trends in the international context. However, it may be said to have a) identified trends which, properly interpreted, add to our understanding of consumer behaviour and offer valuable guidance for the development and implementation of marketing and other strategies in the wine business sector; b) analyzed the attributes of the wine purchase process with regard to new players who are taking on a significant role in the production context as well as in wine consumption.

Specifically, Factor analysis revealed that:

1) The wine product can be analyzed multi-dimensionally in the context of international consumer behaviour. The wine product is diachronically permeated by its tangible attributes, which are relatively explicit and relate to taste, bouquet, colour and all the other characteristics that contribute to the knowledgeable consumers’ conscious evaluation of the wine’s ‘tangible’ qualities. Commercial success however is also very much a matter of marketing factors, relating to parameters such as price, brand recognition, accessibility, promotion, etc.
The research however, also indicated a less tangible aspect of wine identity that consciously or subconsciously affects consumers’ perception of the product, and consequently their preferences and choices. Typically, and of special interest to this research, this aspect relates to the wine’s country-of-origin.

2) The international wine market is characterised by five ‘macro-themes’ underpinning the perception of the general ‘wine’ product: ‘Relationship between territory and wine’, ‘Wine identity card’, ‘Experiential identity of the wine’, ‘Information in support of the purchase process’, and ‘Price’. From a consumer-oriented perspective then, the previous considerations can be interpreted as guidelines which modulate a value proposition in accordance with the consumers’ attitudes. They are linked to the following marketing concepts:

- The Wine Identity card component is linked to the product experience dimension, i.e. the consumer’s interaction with the product or the brand;
- The Price and Information in support of the purchase process components correspond to the shopping and service experience dimension, concerning consumer-store interaction (whether physical or virtual) (Maizza et al., 2013);
- The Experiential identity of the wine and Relationship between territory and wine components correspond to the hedonistic-experiential dimension of the consumption experience.

In conclusion, wine is perceived as a product giving physical enjoyment, but also increasingly as a means of association with the cultural and lifestyle connotations of the wine’s place of origin. The combination of the two constitutes what we might call the ‘wine experience’. Wine producers and sellers must develop both aspects of the product, in terms of both physical production and marketing practices. Today, as a consumer choice and a commercial activity, wine is no ordinary product, and its production and branding in those new countries which are now beginning to play a significant role in both production and consumption must take account of this.

This paper represents the first step in a wider research programme that will seek to determine whether there are:

- groupings of countries showing homogeneities or shared characteristics in the choice process;
- specific features that distinguish wine products in the perception process of new international players.

INVESTIGATING THE STAGES AND THE ROLE OF THE BUYING EXPERIENCE IN THE BUYING PROCESS OF CRAFT RETAILERS IN SOUTH AFRICA

Makhitha, KM
Department of Logistics, Vaal University of Technology, South Africa

ABSTRACT
Craft retailers play a dominant role in the craft industry value chain yet craft producers face difficulties selling to this market. Instead they resort to selling directly to end consumers and not through craft retailers. An understanding of craft retailer buyer behavior is a necessity for craft producers who want to sell their products successfully through the craft retailers. The purpose of this study was to investigate the buyer behavior craft retailers exhibit when buying from the craft producers. Survey was conducted among 233 craft retailers in SA. A convenience sampling method was adopted for the study. The findings revealed that craft retailers go through homogenous buying stages. The stages in the buying process did not differ across different types of craft retailers. The stages also did not differ according to the years of buying experience of craft retailers.

Keywords: buyer behavior, buying stages, buying process, craft retailers, craft producers

INTRODUCTION
In the last 10 years there has been a growing increase in the number of craft producers and craft retailers in SA (Department of Sports, Arts, Recreation and Culture, 2007). The increase is a result of a growing demand for craft products in the world market as well as the increase in the demand for souvenir products purchased by tourists during their travels (Moreno and Littrell, 2001). The role of craft retailers has also grown in importance as craft producers look into all available and alternative channels for distributing their products (Department of Sports, Arts, Recreation and Culture, 2007). The craft industry contributes about R2 billion to the gross domestic product (GDP) in retail sales, with craft retailers playing a dominant role in the craft industry value chain (Kaiser and Associates, 2005), making craft retail an important part of the craft industry value chain. Craft retailing takes place through over 500 craft stores and other types of stores such as galleries, museums, small interior shops, gift shops and craft markets as well as national chains such as clothing shops, interior décor shops, furniture stores, hypermarkets, discount stores and jewellery shops (Department of Trade and
There is limited information on the buying behavior of craft retailers and the fact that no existing study has focused on this particular topic is a motivation for this study.

ORGANIZATIONAL BUYER BEHAVIOR MODELS

Organizational buyer behavior refers to the process organizations go through when buying products or services (Dwyer and Tanner, 2009). A number of organizational and retail buyer behavior models exist that depict the stages in the buying process that organizations go through during the buying process. The first organizational buyer behavior model is the Robinson, Faris and Wind (1967) model. This model has been the most researched and most widely applied and published (Farell, 2006; Da Silva, Davies and Naude, 2002; Homburg and Kuester, 2001; Mawson and Fearne, 1997). It is generally known as the Buy Grid model. The model consists of the two sub-models, the buy phase and the buy class models. The buy phase model shows the stages that organizations follow in the buying process. There are eight stages, including recognition of a problem, determination of the product type needed, description of the product type needed, search for and qualification of potential suppliers, requisition and analysis of proposal, evaluation of proposal and selection of suppliers, selection of order routine and performance review (Hutt and Speh, 2007).

Other models of organizational buyer behavior include those developed by Webster and Wind (1972), De Boer, Labro and Morlacchi (2001) and Luo, Wu, Rosenberg and Barnes (2009). The model of Webster and Wind depicts the stages in the buying process as well as the tasks a buyer performs and the factors influencing such tasks during the buying process. The Webster and Wind model (1972) is similar to the Robinson et al. model (1967) in that they both depict the process buyers follow when involved in the buying decision. The difference is that the Webster and Wind (1972) model has fewer stages than that of Robinson et al., (1967). The De Boer et al. (2001) model reflects four stages in the buying process. This model emphasizes the relative importance of supplier selection and evaluation during the buying process. The Luo et al., (2009) model also shows four stages followed by a buyer during the process. Weele (2005) discussed six stages retailers go through when buying, arguing that retailers go through different stages in the buying process of an organization.

The above authors investigated the stages from the perspective of manufacturing organizations, while Weele (2005) discussed the stages from the perspective of retailers.

The Sheth (1981) model is another model that depicted the buyer behavior of retailers. This model was adapted from the Sheth (1973) model and was specifically developed for adoption by retailers. The model focuses on factors affecting retail buyers and the criteria retailers use during the buying process. It depicts only three stages in the buying process, which is why other models were adopted in this study. By adopting the stages from the above models, this study will investigate the buying
process and stages followed by craft retailers when buying craft products. The stages in the buying process in each of the stated models are shown in Table 1 below.

</table>
As can be seen from Table 1, researchers differed in the number of stages retailers go through during the buying process. Ghingold and Wilson (1998) and Burger and Cann (1995) identified six stages in the buying process. Applying the Robinson et al. (1967) model to buying by restaurants, Mawson and Fearne (1997) found that restaurants go through an extended decision-making process, with eight buying stages. Fawzy and Samra (2008) listed nine stages in the process of buying and selection of a meeting site.

**THE ROLE OF BUYING EXPERIENCE IN THE BUYING PROCESS**

The buying process, especially the supplier search stage, is influenced by the experience of a buyer. Some buyers look for suppliers from within their existing supply relationships, indicating the importance of the buying experience during the buying process (Johansson and Burt, 2004). According to Webster and Wind (1996:57) the learning experience of the buyer influences the buying decision. Da silva, Davies and Naude (2000) have also indicated that the less experienced buyers exhibit different buyer behavior compared to the experienced buyers. Since buyers are evaluated on the margins they can attain (Da silva, Davies and Naude, 2000), they could spend more time and effort searching and evaluating suppliers. Crittenden, Scott and Moriarty (1987) investigated the impact of buying experience in organizational buying. The study reported that the more inexperienced the buyer, the less invoked set they have and that those that are more experienced consider a large number of selection attributes during the supplier selection and evaluation stage. Park and Krishna (2001:267) and Yu, Fairhurst and Lennon (1996:20) also found that years of buying experience affect the decision on which supplier selection criteria to use when evaluating suppliers.
Furthermore, Moriarity and Spekman (1984:144) showed that experienced buyers develop greater knowledge of products and suppliers and feel more comfortable evaluating competing products and suppliers without assistance from other people. Buyers involved in repeat purchase situation develop a structured choice process while those involved in other situations would be involved in a different choice process (Bunn, Butaney and Hoffman, 2001; Sproule and Archer, 2000). This implies that buyers will go through different buying process depending on experience in buying a product. Johansson and Burt, (2004:810) reported that the experience of a buyer is only important when buyers select suppliers from the existing supply relationships and not when looking for new ones. Furthermore, Farrell (2006:96) found that buyer behavior of import buyers differed with years of buying experience. The buying experience was also found to apply mainly in the rebuy situation (Mawson & Fearne, 1997:242).

**PROBLEM STATEMENT, OBJECTIVES AND HYPOTHESES**

A study conducted among craft producers in Gauteng, South Africa revealed that they experience difficulties selling to craft retailers and that craft retailers purchase only 36 percent of craft products from SA (Department of Sports, Arts, Recreation and Culture, 2007). The Wesgro study (2000) also confirmed that craft producers find it difficult to access the craft retail market. As a result, some craft producers resort to selling directly to end consumers, using direct channels instead of selling through the retailers (Wesgro, 2000), this despite the growing role of craft retailers in the craft industry value chain. Craft retailers are creators of the markets, developers of new products and are also able to source new products (Hay, 2008). There is an active retail market for craft producers. However, craft producers do not have access to such markets. This is due to a lack of understanding of retail buyer behavior as well as of the selection criteria used to evaluate and select suppliers. Such an understanding would help suppliers to capitalize on the increased demand for their products (Skallerud and Gronhaug, 2010).

The purpose of the study is to investigate the buyer behavior of craft retailers in SA. The specific focus will be on the buying process followed by craft retailers when buying craft products.

The objectives of the study were as follows:

- To determine the buying stages that craft retailers go through when buying crafts.
- To ascertain if the buying stages differ across different types of craft retailers.
- To determine if the buying stages differ according to the years of buying experience of craft retailers.
To address the above objectives, two hypotheses were formulated.

From the above discussion, the following hypothesis was formulated:

H1: There are significant differences between types of craft retailers and the number of buying stages they go through

H2: There are significant differences between the years of buying experience of craft retailers and the buying stages they go through

METHODOLOGY

The study adopted a survey method targeted at craft retailers in South Africa. This included craft retailers of different types and sizes such as craft shops, small interior and gift stores, interior and decor shops, discounts retailers, clothing shops, furniture shops, museums, galleries, jewellery shops and destination retailers. A non-probability convenience sampling method was adopted owing to the difficulties of identifying craft retailers and the fact that there was no reliable and easily accessible database of craft retailers. According to Cooper and Schindler (2006) convenience sampling is suitable when there is time constraints and lists of available units are either incomplete and not up-to-date, as with the case of SA craft retailers.

Data were collected electronically through email as well as personally hand delivered questionnaires to craft retailers for self-completion. The total number of questionnaires sent out to craft retailers was 681. Of the 681 questionnaires, 273 were completed and returned. However, only 233 of the 273 completed questionnaires were usable, giving a response rate of 34 percent. The remaining 40 questionnaires were incomplete, with some questionnaires only half done or missing multiple responses; these were therefore disregarded and not included in the analysis.

The questionnaire was of self-completion nature and was designed using information collected from a preliminary qualitative study (interviews) which was conducted among craft retailers and industry experts as well as from the literature. Respondents were requested to indicate if they go through the 16 stages listed on the questionnaire by answering Yes or No. The questionnaire was pre-tested using the participant pre-test method with 12 craft retailers and the wording of some questions were slightly altered to ensure clarity. Furthermore craft retailers did not receive any incentives and participation was voluntarily.

Data were analyzed using SAS software. Descriptive statistics and ANOVA tests were conducted and the results are reported and discussed in the next section. ANOVA is a statistical analysis used to test the differences between two means (Sudman and Blair, 1988) and helps estimate group differences on their means among the groups. Where the estimates of scores and means do not differ, it is assumed that all the group means originate from the same sampling distribution of means. Where the group
means differ more than expected, it can be concluded that the group means were drawn from the different sampling distribution of means, and the null hypothesis that the means are the same is rejected (Tabachnick and Fidell, 2001). As ANOVA indicates differences only, the Duncan’s multiple range test, a post-hoc test which makes comparisons among groups to determine if significant differences exist (Hair, Black, Babin and Anderson, 2010), was used to identify where these differences between groups were.

ANALYSIS AND DISCUSSION OF THE FINDINGS

Descriptive statistics

The sample consisted of various types of retailers as depicted in Table 2 below. Of the 233 respondents, 94 were craft stores, representing 44 per cent of the total population. Destination retailers were the next biggest group, representing about 16 per cent (n=35) of the population, followed by the small interior/gift stores with about 12 per cent (n=27) of the population. The rest of the respondents, clothing stores, discount stores, furniture stores, galleries, museums, jewellery shops and destination retailers, had a very small representation.

For the purpose of statistical analysis, craft retailers were collapsed into five groups: the craft stores; small interior/gift stores; large retailers such as interior décor/homeware stores, clothing stores, discount stores and furniture stores; specialty stores such as galleries, museums and jewellery shops; and destination retailers. The five groups excluded the ‘other’ category since there were no types of retailer mentioned. Therefore, the five groups consisted of 214 responses. The representation of the
five groups were as follow: craft stores (44%), small interior/gift store (13%), large retailers such as clothing and décor stores (14%), specialty stores such as galleries, museums and jewellery shop (13%) and destination retailers (16%).

The respondents consisted of buyers, managers, owner-managers, manager-buyers and executives responsible for buying. The owner-managers were the largest group, comprising 44 per cent (n=101) of the population. Managers were the second largest group of respondents, comprising over 18 per cent (n=42) of the population. This was followed by manager-buyers, with about 14 per cent of the population (n=31). Buyers made up over 12 per cent of the population (n=28). The last group of respondents was the executives, who represented about 12 per cent of the population, consisting of 27 respondents.

Table 3 below depicts the stages craft retailers go through. The frequencies and percentages as well as the number of respondents are shown.

</table>

From Table 3 it is evident that the majority of craft retailers, as represented by 94 percent (N=219) of the respondents, indicated that they went through the stage of a need identification, and that ‘we determine the characteristics and/or quantity of craft products needed’, as indicated by 91 percent of respondents. Craft retailers do not all follow all the listed stages, as shown by the fact that 34 percent (N=79) of the respondents indicated that they did not go through the stage of developing a contractual agreement with the supplier, or ‘create a precise description of craft products needed’, as revealed by 33 percent (N=77) of respondents. Approximately 27 percent of the population (N=62) indicated that they also did not formulate criteria to evaluate suppliers. Generally the results of the stages listed in the buying process indicate a fairly high percentage of agreement (Yes) among the respondents regarding the stages retail buyers go through.

The stage which craft retailers use most when buying crafts is ‘we identify a need for craft products’, as indicated by almost 94 percent of respondents. This stage was followed by ‘we determine the characteristics and/or quantity of the craft products needed’, as shown by over 91 percent of the sample, ‘we evaluate and/or select craft suppliers’, with just over 87 percent of the population, ‘we negotiate trading terms of suppliers’, represented by over 87 percent of the sample and ‘we search for potential suppliers’, represented also by over 87 percent of the sample.
The least used stage in the buying process of a craft retailer is ‘we develop a contractual agreement with the supplier’, agreed to by about 66 percent of the sample, followed by ‘we create a precise description of the craft products needed’, which was agreed to by about 67 percent of the sample. The third least-used stage in the buying process of the craft retailers was found to be ‘we place trial order/s and finalize the approval of suppliers’, as indicated by over 72 percent of the sample. Another important aspect worth noting in the buying process is the fact that 28 percent (N=64) of craft retailers revealed that they did not place trial orders to finalize the approval of suppliers. Some craft retailers, as indicated by 34 percent of the respondents, did not enter into contractual agreements. It is evident that the majority of craft retailers do not develop contractual agreements with craft producers also applies in other industries sourcing products from informal and small organizations, where verbal orders, agreements and price negotiations are made (Bienabe and Vermeulen, 2007). Previous studies have indicated that in some buying situations, buyers have difficulty in measuring or specifying the exact nature of the products needed and that buyers are more concerned about the quality and performance of the product (Francis and Brown, 1985-86). Another study revealed that the exact specification evolves from the samples, through appearance and product sampling (Mawson and Fearen, 1997).

Furthermore, Esbjerg and Skytte (1999) found that the majority of retailers placed trial orders before they sourced more products, which supports the findings of this study, where 72 percent of craft retailers placed trial orders before large orders were placed. According to Johansson and Burt (2004), the buying stages differ for the first stages of the buying process while the rest of the stages in the process are similar. This study found that the first two stages were undertaken by the majority of craft retailers, as shown by the 94 percent and 91 percent of craft retailers who went through these stages in comparison with the percentages of those retailers who went through the other stages such as ‘we create a precise description of the craft.

**Testing the hypotheses**

The first hypothesis serves to determine whether the number of buying stages differs across the five types of craft retailers. ANOVA testing was conducted to test H1 and the results are reflected in Table 4.
Table 4: Mean scores and ANOVA results for stages across types of craft retailers

<table>

</tbody>
</table>

As can be seen in the table, the p-value of 0.1506 is larger than the specified significance level of 5 percent, thus showing no significant differences in the mean values of the number of stages of the buying process and across different types of craft retailers. Thus, there is no significant difference in the stages craft retailers go through across types of craft retailers. **H1 was therefore not supported and the null hypothesis was accepted.** According to Johansson and Burt (2004), the number of buying stages is determined by the types of products being bought and might not be the same for different types of products. However, the findings in this study suggested that different types of craft retailers do not differ regarding the number of stages they go through.

To test the second hypothesis, ANOVA testing was done to determine if there were significant differences between the numbers of stages across the years of buying experience. These results are reported in Table 5. As can be seen in the table, the p-value of 0.3351 is larger than the specified significance level of 5 percent, thus showing no significant differences in the mean values of the stages across years of buying experience. Therefore, the null hypothesis was accepted and H2 was not supported.

<td></td>
</tr>
</tbody>
</table>

It can be concluded that craft retailers with different years of buying experience do not differ regarding the number of buying stages they go through when buying craft products. It seems that buying experience plays no significant role in the number of buying stages used.
CONCLUSION AND LIMITATIONS OF THE STUDY

A list of 16 stages was provided based on the literature review and interviews. The majority of craft retailers (66 percent) go through a lengthy buying process consisting of 16 stages. This is an indication that the buying process of some craft retailers involves far more stages than those suggested in the existing literature. It is also an indication that craft product buying is a complex process and that craft retailers are involved in a new buy situation. This could be due to the lack of standards in the industry and the fact that craft producers are scattered all over the country. The most used stages in the buying process are 'we identify a need for craft products' (94 percent), 'we determine characteristics and/or quantity of the products needed' (91 percent), 'we search for potential suppliers' (87 percent), 'we evaluate and select suppliers' (97 percent), and 'we negotiate trading terms with suppliers' (87 percent). It is therefore important for craft producers to ensure that they are aware of the needs of retailers for craft products and also to ensure that retailers are aware of them. As some small craft producers may not have the necessary skills to enter into negotiations with large retailers, this is an area where government could play an important role by providing training and legal advice.

The least used stages are 'we develop contractual agreements with the supplier' (68 percent), 'we create precise description of the craft products needed' (67 percent) and 'we place trial order/s and finalize the approval of suppliers' (72 percent). No significant differences were found among the different types of craft retailers and the number of stages retailers go through. It can be concluded that the majority of craft retailers exhibit homogeneous buyer behavior by going through the same number of buying stages in the buying process. This suggests that little variation exists and will ultimately make it easier for craft producers who want to make use of a standard/undifferentiated approach of selling to craft retailers. Craft retailers with different years of buying experience also exhibit similar buyer behavior in going through the same number of buying stages, implying that experience does not play a role in the number of buying stages used.

The study adopted a convenience sampling method. Only craft retailers that were easily accessible were targeted. The non-response error and the sampling error could not be determined. Although the study targeted craft retailers in SA, it was not possible to target retailers in all the provinces because of lack of data on craft retailers. Some of them were inaccessible because their phones were out of order or the retailers were no longer in operation. Some craft retailers were not willing to participate. It was also not possible to target equal numbers of different types of craft retailers, owing to convenience sampling, fewer large retailers and because some of them were either not interested or they were difficult to get hold of. Owing to the nature of non-probability sampling, the respondents used in the study are not representative of the broader SA craft retail population. Therefore, the results cannot be generalized.
Although the study has identified the stages in the buying process, it did not provide information on what happens in each of the stages and how the stages are executed. Therefore a study could investigate what craft retailers do in the buying process and how they execute the process. This study might not apply to international retailers. Therefore another study could investigate the buyer behaviour of international craft retailers and compare the findings with those of the local retailers. This study could also be replicated in a different industry to investigate how retailers behave when buying other products.

ABSTRACT

With the rise of temperatures, the Arctic ice gradually melts away triggering a series of environmental, political and of course economic developments. Besides the vivid environmental concerns and the debate on the consequences, global economy is also expected to experience major changes. Each risk may constitute an opportunity, remark exemplified by the current case. Given that the Arctic will be accessible for the first time, unprecedented development opportunities emerge, as well.

At the same time, navigation will be possible not only in the summer but also during winter months, provided that no action is taken for the reversal of the temperature rise tendency. Climate change is a reality and its effects are going to become more evident as time goes by and the North will become a region of great and broad interest. Norway, not only an Arctic country but also an important one at the global energy map, is expected to hold its place for the coming decades, whereas Public - Private Partnership contracts and concessions may be convenient alternatives for the increased need of infrastructures, generated by the accessibility of the Arctic region.

Keywords: Arctic Ocean, Crimean Peninsula, Environmental change, Maritime Law, Piracy Law, Ports, Norway, Public - Private Partnership (PPP), Russia, Law of the Sea

INTRODUCTION: MOBILITY IN THE ARCTIC

The Arctic is a region that is going to draw the interest of the international community, increasingly in the years to follow, due to a number of reasons; it is about a region of particular interest for the global community as economies, trade routes and international relations will be called to balance on a new set of data. To date, we were used to studying the way human activities affect the environment, focusing on eliminating the negative impacts. For the first time in modern history, circumstances drive us to
examine how environmental change influences human activities and more specifically, politics, business and law.

In the past, the Arctic region did not attract a lot of attention, due to its inhospitable climate. However, Arctic ice melting has turned all eyes on this part of the globe. A new reality is being formed for shipping and modern maritime transport due to environmental change. Nevertheless, compact ice and an ambiguous legal regime cause significant complications, when it comes to matters of ship transit, transport, checks, research, rescue and exploitation of the available natural resources. With climate change acting as “threat multiplier”, the question put is how states will take part in the escalating competition to reap geopolitical and just as importantly economic benefits in a region rich in natural resources. In this context, coastal states are expected to seize the opportunities offered to develop their infrastructure in order to accommodate the increasing traffic. This paper is going to focus on Norway given that this state is an Arctic country, a part of the European economy and its ports are already included in the shipping routes crossing the Arctic Ocean.

Shipping, a sector intertwined with the natural environment, is expected to experience unprecedented development opportunities. Nevertheless, as in every endeavor there are numerous issues that need to be dealt with, before a development spurt takes place. The Arctic is an inhospitable yet promising region; a blend of natural wealth, shorter maritime routes, overlapping state claims and possible escalation of interstate tension. Taking under consideration the unpredictable nature of the region, there is questioning whether it is an economically viable effort. Still, if the global temperature does not begin to drop, this will only be a question of time. Regional states need to prepare themselves for this new reality, either by establishing -if not in place- a policy for the Arctic or by building the infrastructure that will be able to maintain or attract increased traffic and capital movement.

Given the acute economic crisis that affected all national economies and the difficulty to dispose public funds for various scopes, Public - Private Partnerships (PPPs), a relatively new legal and managerial tool, may just be what is needed to go through with the necessary planning and realization of projects that not only will benefit the owner country but they also will become a part of the emerging Arctic economy.
THE REGIONAL NATURAL ENVIRONMENT

The Arctic is most commonly identified with the North Pole or taken in by the “Arctic circle”; for the paper in hand, the region of the “Arctic” entails the Arctic Ocean and parts of the five coastal sovereign states, namely the U.S.A. (Alaska), Canada, Denmark (due to Greenland, a huge island that has become an autonomous state of Denmark out of EU!), Norway and Russia.

New climate data, namely global warming, have caused great environmental concern due to the series of changes brought upon sensitive ecosystems. Besides the environment, however, regional as well as global economy is expected to undergo changes. During the past, with the exception of the Cold War era, the Arctic rarely drew the attention of the global community, given the inhospitable conditions. Arctic ice melting is now oversetting this reality, even causing fears of an irreversible situation.

Figure 1: The Arctic Region
(Source: www.bugbog.com)

The Arctic is the most rapidly warming region of the planet and is therefore used as a global climate index due to its sensibility. According to ESA (European Space Agency) and NSIDC (National Snow and Ice Data Center) estimates, the lowest ice levels were observed during the past five years,

Figure 2: Diminishing Arctic ice (now – before)
(Source: http://www.epa.gov)
monitoring a time period from 1970s when the first satellite observations started, while the rate of diminishing ice coverage increases.

In addition, a pivotal aspect of the region’s prospects is that it is believed to hold around 15% and 30% of the undiscovered oil and natural gas reserves respectively (USGS), 85% of which is expected to be found within the maritime zones of the coastal states. Furthermore, there are significant minerals and fishing deposits. States’ rivalry for accessing these deposits has led to increased presence in the region (either scientific or military, for instance in the form of training) spurring fears of a potential escalation of tension.

AN INTERNATIONAL LAW APPROACH TO THE ARCTIC

The exploitation of resources is primarily claimed by the five aforementioned littoral states while other sovereign states of the broader region, such as Sweden, Finland and Iceland, state their presence, as well. Some of the major limitations of the region concern the pending maritime delimitation issues among the coastal countries. As expected, in a semi-closed sea like the Arctic, state claims overlap and rivalries follow. There is no settled legal and regulatory framework for the region - a prerequisite not only for the energy exploitation (extraction and transport), but for the fisheries’ management and search and rescue operations as well (Borgeson, 2009). It needs to be noted that fish population in the Arctic Ocean is among the largest ones globally, with around 10% of the world fisheries coming from there. However, as ice melts and water warms whilst fish does not abide by juridical and geopolitical schemes, such as rules and national borders, it is not known how they will react or whether they will move to the North, causing additional controversy for the Arctic states (Flores et al., 2003). The United Nations Convention for the Law of the Sea (UNCLOS), signed in 1982 and put into force in 1994, offers the legal framework for the delimitation of the maritime zones and for the resolution of disputes resulting from contested regions. As it defines, each coastal state is entitled to:

Maximum 12 n.m. of territorial waters, where it exerts absolute sovereignty (while beyond territorial waters may start “high seas” ruled by the principle of freedom),
a contiguous zone up to maximum 24 n.m., within which it has rights for specific purposes and an Exclusive Economic Zone up to 200 n.m. counting from the baselines (from which all maritime zones extend) and where it has rights of mainly economic nature (e.g. exclusive fishing rights, exploitation and preservation of natural resources etc.).

It needs to be noted that the Exclusive Economic Zone is a very important innovation of the UNCLOS, able to change the status quo of coastal states, as in the case of Cyprus.

The continental shelf (maximum extent of 200 n.m. and, on special occasions, of 350 n.m.) on the bed and subsoil of which there are rich natural resources, triggers the rivalries. It is notable that the
extension -if possible- has to be claimed within ten years starting from the date of the accession to the Convention; Finland 21.06.1996, Norway 24.06.1996, Sweden 25.06.1996, Iceland 14.02.1997, Russia 12.03.1997, Canada 07.11.2003, Denmark 19.12.2003. However, the USA have not yet ratified the Convention, hindering their ability to promote their interests in the region and possibly putting themselves in a strategically disadvantageous position on the political chessboard of the Arctic.

The current Law of the Sea comprises the UNCLOS and the Agreement of New York, in 1994, on international seabed, namely the seabed beyond the state limits.

In order to facilitate communication and cooperation, the Arctic Council was established in 1996 (Ottawa Declaration) as an intergovernmental forum for the Arctic governments and peoples. Currently, it has permanent members, namely the five coastal states, in addition to Sweden, Finland and Iceland that are considered to be Arctic states and to other states endowed with a permanent or ad hoc observer status. The main agenda of this scheme revolves around the topics of environment, sustainable development, know-how exchange, accident management, search and rescue operations etc. An interesting point is that security issues were not included in its mandate, following an objection of the USA, which almost all members shared. It is to signalize that four out of the five coastal states are NATO members and that NATO is ruled by the consensus principle of all members for decision-making. After all, security and defence issues are much more sensitive for a sovereign state and therefore they are issues upon which it is extremely hard to reach to an agreement.

Our attention is caught by the number of the countries which signed the Svalbard Treaty in 1920, an early indication of the persisting interest for the region and the involvement of third countries. As expected, neighboring states of the broader region share common interests, i.e.: economic ones (natural resources e.g. fisheries), energy ones (energy safety), transport ones (new global maritime transport, search and rescue), scientific ones as well as environmental concerns (climate change, biodiversity). Nevertheless, there are also some third actors wishing to gain benefits from the regional dynamic, such as the E.U. and China. The European Parliament considers the Arctic to be pivotal for the European (and energy) security and is trying to increase its presence in the region as well as to make up for the fragmented legal framework (The High Representative and the European Commission, 2008). New Arctic routes sound appealing to Japan, South Korea (shipbuilders specializing on ice conditions), Taiwan and India. In fact, some of them have already financed scientific expeditions to the Arctic. However, a solid legal and regulatory regime is vital in order to attract international investments.

The importance of a lucid legal regime in the region becomes evident when we think of ecosystem protection (pollution cleaning), search and rescue (increased Arctic tourism and commercial traffic) and navigation regulation as the ship traffic increases (danger of drug or weapon smuggling, illegal migration, terrorism). The protection of international commercial transit has great importance for the
secure transport – an issue that would acquire a hardcore position once commercial and technological change would enable regular maritime use and large scale resource extraction.

CASES OF RUSSIA’S EXPANSIONISM AND INTERNATIONAL LAW

It is to pay special attention to the strategic role of the successor of the superpower Soviet Union. Russia symbolically staked its claim to billions of dollars’ worth of oil and gas reserves in the Arctic Ocean on August 2nd 2007 when two submarines reached the seabed more than two and a half miles beneath the North Pole. A one-metre-high Russian flag was planted on the Lomonosov ridge, a motion that illustrated the new strategic interests of the states involved (The High Representative and the European Commission, 2008). The ridge is an underwater mountain crest that runs 1.240 miles across the polar region. In 2001, Russia submitted research findings to that effect to the UN, but they were turned down.

The current study has become particularly actual, on account of the very recent development in the Black Sea. The Crimean Peninsula, on a basis of a referendum, held in 16.03.2014, became a territory of the Russian Federation. This peaceful revolution of the majority of the inhabitants of the Peninsula, belonging to the sovereign state of Ukraine, has not been officially recognized; but it has highlighted the strategic role of Russia. So, a new important parameter has been added in international relations, the expansionism of the Russian superpower, even against International Public Law. This expansionism is bipolar and to a great extent sea-centred, exemplified by the developments in the Arctic and in the South (invasion in Ossetia and creation of a non-sovereign state there, in 2008, incorporation of the Crimean Peninsula and shortly afterwards the civil war in Eastern Ukraine, in 2014).

ARCTIC SHIPPING ROUTES AND PIRACY LAW

Everything has two sides; despite the somber environmental and sinuous political situation, the Arctic is being converted from a region of mainly scientific interest into one of significant commercial and national interest. Ice melting raises sovereignty questions but it also permits the transit of passages (though they remain dangerous due to adrift ice). At present, 4/5 of international trade is carried out by sea (International Transport Forum, 2012) and for a planet composed of water by 70% this is translated into passenger and freight access at any part of the globe. Long-distance maritime routes use “traditional” routes, the main of which go through the Panama Canal, the Suez Canal and the Malacca Straits that are heavily congested. The time required is long and increases the cost respectively. For instance, travelling from Murmansk to Ulsan, Korea through the Cape of Good Hope is 102 days long. Through the Suez it would be 80 days, while via the Northwest Passage, just 55. Besides that, the
danger of piracy, which main routes face, is present and despite the great efforts to eliminate it, it has not ceased to exist. Just the opposite, the “crime against humanity” according UNCLOS, piracy at high seas, has been dramatically come to actuality, the last two decades.

With the Arctic Ocean turning into a bridge of communication for distant regions of the globe, its use could also mean the bypassing of piracy prone locations. Incidents where cargo and crew are captured to be exchanged for ransom are not rare, causing fear for the seafarers and increased cost for the shipping companies. The toll is high, given that fatalities are also known to happen. Should the use of an Arctic route offer the possibility to avoid such mishaps, it could alter the main maritime routes currently in use.

The opening of the ever frozen North Passage and the shorter shipping routes by thousands of nautical miles bring the Arctic to the forefront. Following the example of the Norwegian explorer Amundsen, who sailed first through the North West Passage (1903-1906), and the S/S “Manhattan” (a specially reinforced supertanker) in 1969, the first ship able to follow a route suitable for commercial traffic and carry cargo (accompanied by a Canadian icebreaker), an Open Passage -the ardent passion of shipping since the 15th century- will become a reality. According to estimates, this will be feasible within just two or three decades, adding high value to a formerly inhospitable or even forsaken part of the world. The passage through Arctic waters offers the possibility to detour dangerous passages, it thus offers strategic alternatives to countries like Japan, which would greatly benefit in case it could bypass the Malacca Straits, on which it is currently dependent for its energy supply. Important states, such as China and Japan, which wish to use the Arctic passages, have been attracted, taking under
consideration that nautical miles and fuels are saved, thus cost is saved in comparison to traditional shipping routes.

When it comes to Arctic Routes, there are two that are currently in use and one which will become a reality, should the climate change proceed in the same pattern.

- The Northeast Passage or Northern Sea Route (NRS): It connects the Atlantic Ocean with the Pacific and can serve as a transit corridor for Europe and East Asia, an alternative to the Suez Channel and can reduce the distance by 40% compared to the route through the Indian Ocean. It is a maritime corridor adjacent for most of its part to the Russian Federation. Roughly described as running through the Norwegian, Barents, Kara, Laptev, East Siberian, and Chukchi seas to the Bering Strait.

- The Northwest Passage: This route links the Atlantic and the Pacific Oceans through the Canadian Arctic Archipelago and more specifically, starting from Baffin Bay through the archipelago to the Beaufort Sea through the Chukchi Sea to the Bering Sea. This can be an alternative for the Panama Canal, though it can be less predictable due to adrift floes which may block parts of the route. The use of this passage yields significant gains considering that the travel distance from Europe to the Asian markets would be shortened significantly and resources from Alaska or Northern Canada could reach North American and European markets much faster. It needs to be noted that there is a pending issue between Canada and the United States. Canada claims that the Canadian archipelago consists in internal waters, so
ships should comply with innocent passage rules whereas the USA (as the EU) maintain that this region should fall under the international strait regime, implicating free navigation.

- The Central Arctic Route: Should the climate change proceed, it is possible that there would be a point when ships would be able to cross the Arctic Ocean following a straight line. This is far from feasible at the moment and will only become a reality if the entire Arctic ice melts away.

Ice is a definitive factor regarding navigation and time needed for the passing. Although the Arctic routes are not consistently ice-free and often require the escort of icebreakers, ice tends to be thinner, facilitating the carving of channels. Ships are able to sail through starting early July to late November. In summer of 2012, 46 ships sailed through Arctic waters, according to Arctis research group (ARCTIS, 2013) carrying significantly more cargo compared to 2011. In case there is no radical shift in the climatic reality, more traffic is expected for the Arctic routes, a development that could dramatically change the current global shipping hubs.

![Figure 5: Arctic routes](http://agmetalminer.com)
It is notable that these routes are not expected to become a part of regular shipping any time soon, given that weather conditions not only vary, but they also remain extremely challenging. Even when the passages are free, they are navigable for a limited time frame for shipments and exploitation. Ships with no icebreaking capacity can only use them in summer months and polar class ships are not yet very common. Similarly, the exploitation of the natural resources, although discussed, faces severe hindrances and many prerequisites need to be met before there is easy access and therefore ability to exploit the region’s energy resources. The existing dangers, even when no legal settlement is needed, cannot be downgraded and the retraction of Shell in Kulluk due to extreme environmental conditions causing severe operational hindrances is indicative of the demanding conditions and the thorough programming needed to carry out such projects. The lack of adequate maritime traffic management poses further challenges, in addition to the environmental concerns.

An oil spill in the Arctic would have immense consequences for the regional and global seas, let alone the fact that cleaning operations would need to take place in extremely harsh conditions. High insurance rates, working dangers, uncertainty which discourages commercial shipments due to the extra (insurance) charges involved, big investments needed in the region (infrastructure, icebreaker construction) are found among the challenges. The abovementioned hurdles can easily nullify the advantages offered by shorter routes. Nonetheless, from a geographical viewpoint, sailing through the Arctic would imply great economic profit, given that the travel time is shorter, fuel is saved, the cost of transport is reduced and therefore the final price of the product for the consumer is also reduced along with fewer emissions for the environment.
REGIONAL ACTORS: NORWAY

The 2010 agreement between Norway and Russia, which delimited maritime zones and settled a long-lasting dispute at the Barents Sea, allows the unimpeded use of the waters in question. An unambiguous legal status can not only encourage investment activities but also be considered as a prerequisite, having in mind that precarious environments cause flee of capitals.

Norway is a coastal state with a significant maritime activity. Given that the vast majority of international commerce is carried out by sea, as already signalized, and 80% of the global industrial production takes place at the northern part of the globe, one can easily understand the importance of being at the geographic forefront. Norway has a vested and demonstrated interest in this sub-region.

Although Norway is not a member of EU, it is closely associated (European Economic Area, European Free Trade Association). Its economy is based on oil and natural gas and it is currently among the top energy producers worldwide and the second natural gas exporter (Russia being the first). In the same time, it is not a big consumer and therefore exports the majority of its production, providing among others, the EU with natural gas. The larger amount of the exported oil comes from platforms operating on the Norwegian Continental Shelf (NCS) and there are estimates about substantial reserves in the same region, to be exploited.

The Arctic, being an area of extreme climate conditions, is in need of a different approach in comparison to the traditional maritime routes. Ice conditions and lack of daylight during a long period of time, dictate that states need to cooperate for search and rescue issues, environmental protection etc. Norwegian authorities have opened the NCS to a wider range of enterprises whilst the local reserves attract big international companies. Today, there are around sixty oil companies involved in the Norwegian oil industry, with Statoil carrying out the majority of the activities on NCS.

Given the long coastline, Norway has numerous ports across the country serving as main transport centers. Mongstad, home of the principal refinery of the country, is also a port included in the aforementioned NSR passing. According to recordings (Northern Sea Route Information Office, 2011-2013), the ports of Alesund, Mongstad and Larvik in the South, as well as the ports of Kirkenes, Honningsvåg and Hammerfest in the North, are either start-ports or end-ports for ships crossing the NSR.

PPP AND CONCESSIONS PARTICULARLY IN NORWAY

PPP constitutes an important variation of the concession model, mainly for non-reciprocal projects, exemplified by jails, schools and hospitals (the three categories of scopes of the initial version of PPP, called PFI in the UK). However, concession is still in use, for reciprocal scopes, such as highways, ports and airports. Of course, in legal orders of the UK and the USA and according to a part of the scientific
theory, concessions are considered along with the PPP alternative. Anyway, both types of public contracts constitute the so-called “alternative contracting out” phenomenon. The main advantage of PPP method against the traditional method for public works consists in the fact that the public partner takes advantage from the involvement of the private partner for a long-term or at least mid-term period, having to do with the operation of the (usually non-reciprocal) project.

For the time being, in Europe PPP are most common in certain geographic regions (UK, Spain, Portugal, Italy, Germany, France), not having expanded as much as expected in the 1990s when the term was first put forth. Even today, that there is not one accepted model or even definition besides the loose definition of a cooperation between public authorities and the world of business (European Commission, 2004), the advantages are unequivocal; know-how, experience and practice sharing; maximization of the use of skills belonging to the private partner; optimizing the outcome given the funds or ensuring more funds through the participation of the private sector; increasing the transparency of public spending or even releasing state funds for other purposes; risks allocation.

Among the negative aspects of PPPs are cited the time needed to assess the final outcome, any legal or accounting impediments, the relatively inflexible character of the model in time, and most importantly the compatibility of the sectors involved in each project.

Governments have limited financial resources to allocate for improving public services and infrastructures and this is what led to the PPP model. Currently, PPP activity is not particularly high in Norway; nevertheless, this model is spreading geographically, across Europe, as well as thematically, over new sectors, giving a push to the development and completion of necessary infrastructure, while it releases state funds for social uses.

Commercial growth, continued rise of demand by Asian markets and the subsequent need for faster transport, combined with the environmental conditions and the progress of “ice technology”, may constitute an incentive for the wider use of PPPs in Norway in the hinterland, the coastal regions (upgrading, expansion, construction of ports) or for activities at sea (e.g. extraction platforms). More generally, the European Investment Bank expects investments in the fields of environment, transport, energy and research infrastructure for the years to follow.

It is very important that Norway is nowadays endowed with another region (Barents) for its activities, besides the North Sea and the Norwegian Sea. Should natural resources extraction start systematically and in a wider region by more countries, there will be a need for LNG carriers or even tankers, in addition to the development of the region, which would in turn create more traffic. Infrastructure is a necessary prerequisite for economic growth and will play a key role in maintaining competitiveness vis-à-vis the dynamically emerging economies.
Norway has proved its efficiency in investments and infrastructure with the long-term commitment to the hydrocarbon production. Its economy is successfully a mixed one, with important sectors being controlled by the state. In order to cope, however, with the increasing competitiveness in the region, more steps should be made in this direction. PPPs’ future depends on the evaluation which is yet to follow (positive feedback). Nevertheless, the environment is friendly, also taking under consideration the ranking of the state at the corruption classification (Transparency International, 2013). So, participation of private capitals can therefore be encouraged.

CONCLUSION: THE ARCTIC, A “CENTRAL” OCEAN?

The Arctic is a delicate ecosystem and a complex environment. Until quite recently the resolution of issues concerning this region was definitely not among the priorities of the coastal states, given that the region was permanently frozen and thus unapproachable. However, climatic data have changed what was taken for granted and the Arctic has been gaining importance due to its shipping routes and natural reserves (oil and gas exploration), mining operations, hydropower development, military advantages etc. Development attracts tourism at this remote part of the globe. High demand and carbon prices along with energy security unrest during some time period would justify the need to explore new energy sources and the costly and time consuming infrastructure the Arctic needs. Due to these new routes, maritime traffic is expected to increase in the region, making the passages significantly more important in economic terms. Radical changes are not expected any time soon, but the motives of lower transportation costs in combination with exemption from piracy high risks, of less time and of fewer emissions are far from negligible, therefore coastal states need to be able to host this traffic and reap benefits. Norway, a state with a strong presence in the European market and at the top rankings of the exporting countries, can use the PPP method to exploit the opportunity of attracting ships to its ports to become an Arctic hub. Despite the difficulties and the challenges of cooperation between such diverse partners, the expected benefit is too great to ignore. In the years to come, the Arctic may become a “central” ocean, given the geopolitical, environmental and economic stakes. Directly concerned countries, like Norway, need to plan ahead so that they won’t be left to follow puffing the leading actors, either state or business ones.

***

The Greek word for Freedom (“Ελευθερία”) etymologically signifies the coming motion, so the faculty of moving from place to place. So, the physical faculty of transport ties in with the legal faculty, namely the fundamental right, of Freedom. As a result, a “new” Ocean emerges, the Ocean of Freedom, historically exempted from international law crimes against humanity, such as piracy attacks. The great challenge for international community is to promote the Ocean of Freedom, being anyway a spot of
“high seas” according to the International Law, even against the five nearby states, to the “Bridge” (“Pons” in Latin) of Safety and Sustainable Development. All states involved, let alone the superpower of Russia with recent cases of bipolar expansionism, should comply with this diachronic rule.

Last, but not least, Norway, a country ruled by Nazi empire for its potential use for nuclear energy in the Second World War, has a major motive to contribute to an environmentally friendly, peaceful use of the Arctic. Ice melts, do friendships emerge?

WEBRELATED BUSINESS COMPANIES STRATEGY FOR NEW CUSTOMERS

Marsiglia, Bruno; Evangelista, Federica; Celenza, Domenico; Palumbo, Emanuela
Department of Economics and Law, University of Cassino and Southern Lazio, Cassino, Italy

ABSTRACT

This paper provides a study on web related B2B (Business to Business), B2C (Business to Customer) evaluation of strategy and methods for maximizing (expanding) the number of customer among the people (i.e. internet population), using cycling process externally for internal process of strategy which explains business exploration and agility, and online consumers their compulsive buying behaviour with a new strategy to capture them in large number. The web based industries are web based companies and web related companies, we concentrated on web related company through new innovative method called B2P (Business to People/Public) a schematic approach strategy diagram of B2P, and with external Process of strategy.

The B2B and B2C (Business to Customer) used by enterprises in peer to peer process is based on a qualitative approach, our sourcing of data has been carried out through secondary sources (paper, articles, open source).

The findings are with new schematic diagrams designed and drawn by us with an idea and proposal and approach strategy for attaining people interest in the online industry specially concentrated as example on online book selling company.

The originality of this paper called concept B2P is from different sources, examples, online articles and built on industry leaders advice through "linkedin.com" and web blogs.

Keywords: strategy, B2P, branding, internal process, online book company or industry, web related, web based, costumers, external cyclic process (data collection).

INTRODUCTION

This article attempts to evaluate and investigate the steps of technology strategy in online industry trends to attract people to become a customer, especially in the area of online business (Vrontis and Thrassou, 2007) web related and web based companies, technically so called e-commerce firms, and in their new strategies in the changing (Sia and Lee, 2006; Mandelli, 2000) the idea world for better
future business. The web based and web related companies generates each years on average 1.2 million jobs, they are small and medium enterprises with much high field business in different sectors.

After the invention of internet, day by day, the number of user are increasing as per the reports till 30th June 2012 the population 2.405.518.376 (http://www.internetworldstats.com/stats.htm) and business expands in to multi domain sectors. The enterprises use today a web technology and sites for better feasibility of business, we would like to introduce B2P (People/Public) concept in a highly regulated industry is the web related technology industry by innovators and risk takers who understand that tomorrow's success relies on today's relentless challenge of the status for future business based on B2B and B2C. We are introducing a bivariante broad perspective B2P concept, which evaluate and invent a new strategy on cyclic process which explains business exploration and agility and online consumers their compulsive buying behaviour with a new strategy of capturing costumers in large number.

The web based enabling technology helps the web related companies to generate most of the percentage in the business online, we will discuss the credibility and trust in online companies and new strategy to brand making like Amazon.com. The e-commerce industry is widespread importance of e-branding, prevalence of collaborative and customer-centric e-brand building strategies including co-branding and affiliating with established online and offline brands, distribution partnerships, content alliances and personalized e-mail contacts. The internet companies (Eisenmann, 2006) also seems to have employed a variety of traditional techniques.

The proposal is provided with idea of new concept called B2P (People/Public) which would support the expansion in numbers through cycling process of data analysis and by new strategies, and attracts the people to become a customer in web based and related companies, when it comes to web base they more into technology and transfers in to business for web related companies (i.e. we based companies enables, platform for new business enterprise), so, we would like to concentrate more on web related companies example online book seller and document article business, we are trying to focus what inspired to shift in strategy from B2C, B2B a new trend approach B2P with schematic diagram and strategies.

The research approach is based on qualitative methods, starting from a single method approach. The research is developed according to the study of international literature and from blogs of industry leaders.

This article has the following structure, from introduction, the section one provides a literary review of methods used to evaluate web based and web related companies, particularly, the study focuses on B2P (People/Public), it discuss in later section about what measure and data collected as empirical
evidence how the literature are, then the research approach explains what are the steps we gone through to write a finding with schematic diagrams with new concept of strategy B2P and the last section includes conclusion with the limitations of the study and suggests future research.

**LITERATURE REVIEW**

Many authors wrote about the internet based companies and strategies, after careful review of articles in the internet and few authors statement, unfortunately, first-generation e-commerce strategy (Vulkan, 2003) books were long on vision but short on detail. If the customers are moving online whole information technology (Warner, 1987) investment paradigm must shift, we tried to structure this widespread strategy problem for attracting people, to become a customer (with example of online book selling company development). Hence, the proposal is to provide a study and new way of categorizing the conceptual customer and other people to expand the business with strategy. The concept called as B2P (Business to People/Public).

The "Bill McChesney" IT Executive, from Large federal systems integration firm says while online consumers are less concerned like “sending your clone to work” or “outsourcing your exercise” people voted for cloud because of it possess shift to infrastructure transparency in which not to think about servers and storage give perfect solutions. And the traditional consumers about firm location maybe more concerned about unobservable quality, and to signal this, online retailers rely more on advertising than traditional retailers, the imperfect price competition may arise because of vertical product differentiation, incomplete consumer awareness and near‐perfect information exchange between retailers.

In online book industry the 100% profit per customer /consumer electronics/appliances Books Groceries Apparel Amazon trumped its rival once more by providing ratings of individual book reviews, so, yet everything they do in a virtual store cannot tell the online retailer, then how to trust online money transfer and company credibility, and if so, people buy books, but these questions always raised to the online company amazon.com. The past case studies and reports posed a notion of fraudulence in the transaction in the sense of money and data management.

The revenue data for the online book market reveal that consumers respond to advertising and website spending rather than low prices (Zott et al., 2005). Lim et al. (2006) says the trust in the online trading is based on quality of service, and if so, the customer will buy the goods evaluated through an empirical study of trust-building strategies. And the Greenfield (2001) explained posing approaches toward the business online in the prostration, the gaining is important, people are in N number it is ocean how much you grab, how much you gain in end of day is branding.
The leading-edge online tools in communicating their key to e-brand values and promoting their online platforms, considering for example in the case of online book selling company, what few people know is that the first online book selling is not amazon.com, the other was started before, but failed in reaching potential customers or not into globally and stacked only to the regions, where trend and strategy missed led them to be behind the competitors.

RESEARCH APPROACH

This qualitative research approach (Myers, 2013) is centred on the structural management of web related companies and web based companies for gaining customers with B2B and B2C strategy. The international literature on this topic is analysed.

Starting from the general understanding and data collection approach and strategy, data acquisition (Yin, 1994) was achieved through secondary research sources specified as follow:

- scientific books and articles;
- database such as Google scholar and e-marketing companies;
- schematic diagram's (internal and external process).

The application of new B2P concept and schematics diagram's for representation as well for strategy to attract People/Public to become a customer by internal and external process. The proposed research findings coming from a schematic diagram and references form the scholars article empirical application a new idea of B2P (continues cyclic process for customer gaining) strategy, marketing (Mandelli,1998) utilizing methods through schematics diagrams.

FINDINGS AND DISCUSSION

The concept of B2P generates a coherence and brought up base form B2B, B2C, and the key point for webs based companies and web related companies business established competitors to remember that innovation involves two essentially different activities coming up with a new technological, strategic (Burgelman and Maidique, 1988) or productive idea and then creating a market out of it. For an innovation to be successful, both activities have to be effectively coupled, but there is no need for the same organization to do both, one company may come up with a new and disruptive way of playing the game and another may take the idea and run with it. The findings section would explain how the strategy utilities and options are explored to grab most (Public) of attention.

The web based companies are crucial role in advancements, the online enabling tools makes user to be free moving and hassle free surfing with more optional and fast process obviously the big dealt in the online market in web based organization is "Cloud Technology".
We consider the next big trend after cloud computing might be PAAS is a Platform as a service, enables to consumers more on controlling of what and where they publish their info, and businesses want to manage subscribers and advertising recipients as discrete persons, rather than as a set of email and phone contacts that might be overlapping, and might be peercling, is next big revolution "P2P plus Cloud " once we move all critical systems to the cloud, we will be totally dependent on having network connectivity that would lead business for longer motion and time.

This paper concentrate much on web related companies, we would like to present an example of online book industry who sell and market for publishers, the trend, theoretical strategies are meant to be common for most of domains.

The revenue data for the online book market reveal that consumers respond to advertising and website spending rather than low prices as the market size expanded during 1997–2001, these endogenous sunk costs escalated, advertising-to-sales ratios and market-concentration ratios are much higher than for traditional book selling, using price and demand information for individual books over a number of weeks, we can find counter cyclical and cross-sectional price variation inconsistent with perfect price competition.

The two conflicting predictions have emerged regarding the effect of low cost information on price, first one states that all internet retailers will charge the same low price for mass produced goods. The second states that internet retailers will differentiate to avoid intense price competition (data collected in April 1999 on the prices of 107 books) in thirteen online and two physical bookstores, we find similar average prices online and in physical stores and substantial price dispersion online.

The best formula of the buyer always values in the result of benefits which mines from costs, since methods explains how the customer are, we started to concentrate on broad prospective in N (infinitive) number of people, then we come across a new split of people who are customers and might be customers and visitors by category, in order to increase number of selling irrespective of ages, considering the book online store with different category book from arts to technology (end to end type).

The internal process split diagram 1 explains the basic split of people for business and parallel the external life cycle with measurement analysis regularize and make understand for change strategy (in order to gain more customers) in the diagram 3.
Diagram 1. *Internal Process Split (Methodology) B2P*

The B2P internal diagram (predicted split diagram.1) for future strategy split into A, B from people, where the A split line represents who are already a customer (all the existing customer comes from people he/she might be a enterprise/institution representative or a small book shop for bulk order or individual customer) in A category. By keeping up offers and long-term subscription, coupons with special delivery package would benefit to sustain customers long time. The category B represents NC (not a customer's) but the they can be active as register user and visitors.

The registered users are from the non customer in terms of buying books online, we have sub clarified registered users as news letter subscribers and subscribers for offers who do occasional transactions. The news letter subscriptions are a good idea which intended to be part of companies announcement and latest deal and but the not interested buyers are 50 percent, and since the subscribers of offers and newsletter subscribers are similar in theory but they are different in action, the subscribers for offers are people who tend to be potential buyer, when they are need of a rebates and coupons issued on purchase.

In the category of visitors, the people are, who impressed by variety of books in online store always wanted to be up-to-date about their favorite book, then after sub category are visitors sub classified as
observers (might be general people or competitors) and people who want to keep in comparing the books published and who wish to be future subscriber a slow and study mood people fall in to this category.

The unexpected visitors and others are directed through adds (or) unintentional clicks, or people who are academic researchers and students searching through Google or Yahoo search engines, and who don't check the site ever ideal people large in percentage category "F", we try to evaluate and capture the people through cycling process and schematic diagram and we are going to evaluate these people under objectives, in order to make them as online buyer.

Let us assume by taking few indicator, the registered user are sub category register, the inbound marketing strategy an effective website strategy includes several components beyond the obvious. Like lead nurturing email campaigns, downloadable white papers, targeted ads based on visitor engagement, segmented newsletters, and more. Each strategy should be carefully considered based on the complexity of your sales cycle.

We understand how much education is required to reach close a potential customer likely to depends on education and the marketing plan. The product relatively simple and volume based, the customer likes product. The product require complex integration (or) contact from a sales associate and has to check customer care standards and antiquities; always better to checking the numbers of consumer segments does company target.

Writing a book online is a business which is reviewing the articles or books by others and increasing number of hits resultant in to sponsorship, branding for future, increasing brand value even by not selling or not served the direct service (net work sites, knowledge sites) might have a chance to result business mind run and long runs by turning the non customers in to potential clients. The Europeans (Zott et al, 2000), buying on-line to continue exponentially from 13.5 per cent of the online population.

Through the book reviews and discussion forums which are a form of virtual community a relatively new online bookstore called iBook, and how web based markets online auctions and electronic exchanges can overcome debacle calls trust with unknown people for trading money and for books and parallely gaining the customer through the strategy we would see in the predicted strategy diagram.2.
Diagram 2. The solution of Diagram 1

Literally we are presenting above an indirect form of 4’Ps for our business strategy, which are Product, Place, Price, Promotion, but by preference order according to the category of people fall in. We are going to discuss the resulting solution and topics motioned in diagram 2 from D and E step by step strategy in different order.

The wishes on occasions and book review information attract subscribers and make them feel comfort and trusted in relations with customer by wishing in every accession, and special movement sharing a review will bring the companies to transfer registered customer in to buyer “customer comfort is money”.

The Future of Entrepreneurship  

Then the logistic channels of the distribution, "Scribnet" is the example for review in book stores, permit to people to upload their documents and spread a word across about customer books and articles, reporting a performance of the new product (books) and company policies to reach higher customer satisfaction and new launches would increase the satisfaction and trusted level and another step would be subscription offers and book offers with low cost like offering a lifestyle membership, by providing the highest form of maturity membership that gives access to many different products and experience beyond own product. And the next is contracting with companies who want to extend beyond their core product offering like offer an ecosystem of suites and products companies in tenuous markets, example Peugeot’s Mu program gives consumers access to cars, bikes, buses, vans and more for rent on deduction through the online book store, and announcing an offer on separate mailing list who are in contact with the company longer than a year and encourage for feedback and blogger updates.

The user friendly web design and cost comparison is the best idea of attracting people, most of website in the web related companies like online book selling company don’t concentrate on friendliness of website and maximum percentage chances for user satisfaction to word custom web environment is unsatisfied need to utilize latest technology pro dynamic website design, and the cost comparison of on line book aligned with the rate of current company and with competitors would be the better option for new orders and increase in the sales.

The after contracting and offers would pass-on to the availability of realization of on demand goods, if you have a high-cost, or high-consideration product, low usage product, considering offering it on demand, through a shared access model like amazon.com. The legitimate offer always be pricing of books and term subscription offers change by time under competition are fixed pricing, dynamic pricing, bartering but always the buyers principle falls under value is benefits minus costs.

After pricing and designing the customer care experience is the most important part of query transaction, information purpose about books derives most efficient, and TAT (turnaround time) generated customer care companies appreciates with the higher inflow of people to the company for business (whether is maybe through e-mail or tail call) all about the antiquities.

Always the first step to gain a customer from people is tell them an incredible story, no one cares about features until they understand the solution, whether company creates software (or) sells books online, or point of sale terminals for retail outlets it’s the results that matter, but delivering truth and realistic things important and making a blog for the people who want to visit and update and discuss about technologies authors, anything which would gives a scope to communicate with other users is a better option of branding the business.
The one more option explained in diagram is SEO tracking and by third party, the search engine optimization is a new way of business by number of hits and first in first out formula believing system, how many clicks and how many times searched in the search engine makes the company to appear in the top list for reputation and for more opportunities to advertise optimizing the website more feasible standards. However, in the companies the idea of giving contract to the third party depend on the revenue and market share of the online book company. The attractive website may appeal to a broad audience, it's critical to test, and re-test website pages in an effort to optimize user experience and results.

The quality expressions is one of the factor that focus on quality of service and books, we know teams used to spend thousands of hours writing pages of website content going into excruciating detail about every feature available, sadly this instinct will dilute value proposition, and slow the buying process dramatically, keeping things simple will build trust and understanding early in the buying process.

The last section but not least important option creating people as customer from ideal people "F" category, the ideal people are most important to the market, where a need of bringing these potential buyer from physical to online, we choose traditional and few programmatic step to attract and make them internet friendly for purchasing books online and store canvassing and general digital marketing, the example canvassing in the electronics shop about electronics book on free touch screen display and encourage offers on buy. A lot of careful thought goes into the planning phase of digital projects prior to the design, or development work begins, this process is essential for strategic design that achieves business objectives, and follows optimal user experience, marketing is the predominant part of strategy (Rappart, 1979), the past writer missed posing a strategy where online book company can make a contract, to the different filed related shops and libraries, beauty salons and gaming points with setting up of touch screen web panel for people.

This experiment results into huge number of customer and generation of money by selling books, then the user starts to equate with internet and screen environment, slowly attracts toward to the ads on the screen and book display, online RSS (Really Simple Syndication) feeds cookies tracking, placing add in institutions commune's, libraries, advertise in gaming area, beauty sites.

This kind of tools help to improve performance and increase the satisfaction internally which would result into external customer increase to the company, both consumers and service providers take advantage of the many benefits it has offered. The adoption of virtual applications, architecture and service orientation computing are some of the factors that should be considered when thinking of cloud computing. We predicted and drawn a external cyclic process diagram. 3 which dealt with the market research on public data and behavioral analysis to find potential consumer form people, it's a continuous process irrespective of time.
Diagram 3. External life-cycle process

The cyclic process follow and support the internal process to gain new customers from the N number of people. External process starts with collecting market data of people who are internet users and Ideal non internet users using tools and market research, human resource and building documentation, structuring appropriate data from bulk according to objective set for first cycle and to transfer in to decode an transfer process where data into strategy, reaching to people of specific slot or set area compiling to measure for approach, where the strategy measured with regression models, into pure graphical representation, after approach with plan on line marketing through tools and agencies, until reaching objective to hold on more people, further migration of process to the Internal Process, it makes a new strategy based on external results.

CONCLUSIONS

If we want to sell toilet paper then we could start a toilet paper business right now online and if we truly kicked on to notch could make a living. My point is it's not what you sell as much as you believing that it will work, work hard, and work very smart to make it happen.

In the paper we tried to evaluate online business growth on base of new strategy gaining in long term by cyclic order and with collective analysis of data with management. We gave notions how the strategy can be further divided and evaluated for trade in the results to the business. The strategy,
exploration and agility discussed how the people are and how to capture them from different platforms, and the online consumer compulsive buying behavior analyzed.

But the paper provides enough notions and sub categories for the idea purpose, more incite work can be possible in future with web related industries connecting with B2P( people, that means increasing the number irrespective of age and specific area of interest) expanding till to end through step by step evaluation.

In light of the consideration made, it is appropriate to point out that this research is based for further that will address current trends in the field of web related companies strategy for gaining people as customers with a new concept called B2P(Business to People/Public) under cyclic process.

The example internet based strategic idea of business, we have noticed a company for knowledge sharing on consultation who are joint experts in the field and employees of other organization, through money grows in parallel and on form of KPO (knowledge processing outsourcing) competitor without hug set up as KPO. Example "Mavan" (www.mavan.com).

UPDATING ENVIRONMENTAL KNOWLEDGE THROUGH A KNOWLEDGE MANAGEMENT MODEL

Martinez-Martinez, Aurora; Cegarra-Navarro, Juan-Gabriel; Garcia-Perez, Alexeis

1Universidad Politécnica de Cartagena, Facultad de Ciencias de la Empresa, Cartagena (Murcia), Spain
2Faculty of Engineering and Computing, Coventry University, UK

ABSTRACT
A review of the literature confirms that a knowledge management framework which supports knowledge creation is required, particularly in those organisations having to deal with a changing environment. Socialisation, externalisation, combination and internalisation continue to be key processes for the creation of knowledge which enables organisations to successfully address environmental challenges. This paper examines the relevance and importance of a SECI model as an enabler of the processes of reusing and updating of environmental knowledge of an organisation. The research reported has confirmed that time is a key component of the implementation of a SECI model in organisations operating in a changing environment. It has been confirmed that such a strategy should focus on the reuse of prior environmental knowledge as a mechanism to establish within the organisation a context where new knowledge management processes are understood and adopted by employees. The paper also examines the relationship between environmental knowledge and organisational performance indicators. These relationships are examined through an empirical study of 87 companies in the Spanish hospitality sector. The results indicate that environmental knowledge at a given time (T) is found to be significant in predicting the knowledge management processes at a later point in time (T+6).

Keywords: SECI model, environmental knowledge, hospitality industry, performances and time.

INTRODUCTION
Environmental knowledge has become one of the most important intangible assets for organisations in the current competitive environment (Po-Shin & Li-Hsing, 2009). Environmental knowledge can be defined as the degree to which an individual or organisation becomes aware of and concerned with ecological issues (Amyx et al., 1994). Environmental knowledge may be thought of as comprising stocks of data, information and knowledge resources (environmental memories) that have been gathered and accumulated by an organisation by virtue of its knowledge structures (Chou et al., 2005). While the relationship between environmental knowledge and organisational performance has been
addressed by several authors (e.g. Boiral, 2002; Boiral, 2009; Cegarra & Martinez, 2010), there has been surprisingly little empirical investigation of the effects that environmental knowledge can have on knowledge management process (and vice versa) over a period of time.

Time has traditionally been considered in the management literature as a constant rather than a variable, a belief Bluedorn (2000) ascribes to people in general. Furthermore, as Bluedorn notes, the understanding of time as a constant is deeply institutionalised, which suggests that most people, most of the time, do not even consider the possibility that time may vary. This suggests that one should speak of ‘times’ rather than ‘time’ (Purser et al., 2005). In this study it is assumed that ‘times’ are sequential and enable first creating an environmental knowledge and then putting the upcoming environmental processes into a familiar context for members of the organisation. The question that arises is whether a knowledge management framework is needed to reuse and update prior knowledge of the environment and if so what can be done to face environmental challenges in the coming years (Cegarra et al., 2013).

In this regard, the SECI model (socialisation, externalisation, combination and internalisation) provides a good basis to explain the adoption of new environmental knowledge (Nonaka & Takeuchi, 1995; Nonaka et al., 2000). This paper aims to offer an empirically tested SECI model which helps identify how prior environmental knowledge in the Spanish hospitality sector may be reviewed and updated through the development of knowledge processes at a later time. In the conduct of this research, we have addressed the following questions: Does availability of environmental knowledge at a given time necessarily mean the use of environmental knowledge at a later time? How can hospitality companies update environmental knowledge resources? By addressing these questions this paper demonstrates that the availability of environmental knowledge at a given time does not necessarily guarantee the effectiveness of environmental knowledge at a later point in time.

The longitudinal study described in this paper involved two observations of the same variables over a period of six years (2008 and 2014). The proposed theoretical framework is presented in the following section. Details of the survey which was used to collect appropriate data to test the model is presented in section 3 and the results of testing the models are detailed in section 4. The results and managerial implications are discussed in section 5 which is followed by our general conclusions in section 6.

THE PROPOSED RESEARCH MODEL

Connecting the SECI model to environmental knowledge

Sustainable development is one of the world’s most important priorities in order to attain the well-being of mankind (Nouri et al., 2008). In the Spanish hospitality industry the growing interest of tourists in the environment has led to the promotion of ecotourism, and with it the efforts to develop
strategies that focus on the environment (Brockhoff et al., 1999). The concept of environmental knowledge has been invoked to characterise the way in which organizations align their strategic goals to sustainable development (Wernick, 2003). This means that organisations with environmental knowledge will know what can be done about environmental problems and they understand the benefits of environmentally responsible goals (Frick et al., 2004). As Po-Shin and Li-Hsing (2009) suggest environmental knowledge involves what people know and are concerned about regarding the natural environment, their responsibilities towards environmental protection and the relationship between the economy and sustainable development.

One way to gain environmental knowledge consists of developing a continuous process of dynamic interactions between strategic goals and environmental challenges. As Martelo and Cegarra (2014) noted, knowledge in a firm emerges both from inside and outside the firm. By doing so, the SECI model may play an important role in the creation of environmental knowledge since it is a way of transferring knowledge to refine the knowledge existing within the organisation while also improving the effectiveness of its search and retrieval strategies. A key argument supporting the SECI model is that knowledge held by individuals is shared with other individuals so it interconnects to a new knowledge (Nonaka et al., 2000).

Nonaka and Takeuchi (1995) suggest four dimensions of the SECI model, each playing different but complementary roles in explaining how knowledge can be created in organisations. While sharing tacit knowledge between actors is considered a socialisation process, tacit knowledge becomes explicit through an externalisation process. This conversion is due to a social process between groups and individuals (Nonaka & Takeuchi, 1995). While the ability to maintain the explicit knowledge within the organisation is defined as combination, internalisation happens when explicit knowledge transforms into tacit and thus becomes part of an individual’s expertise. Therefore, internalisation means understanding explicit knowledge.

The creation of environmental knowledge supposes, in this case, the reactivation and development of new information about events, trends, and relationships in the external environment of the organisation. For example, if there is no prior knowledge or history associated with environmental issues, then a failure to act towards achieving the strategic goals of the organisation may result in a search for environmental knowledge at a given time (T). This, in turn, fosters learning and therefore the absorption of new knowledge by employees (Choo & Auster, 1993). As Boiral (2002) points out, this knowledge includes employee compliance with new practices. Some of these new practices include the exchange of information and sharing of environmental concerns (Fryxel & Lo, 2003), the acceptance of constraints related to the prevention of pollution (Cordano & Frieze, 2000), and collaboration with technical services to develop cleaner processes (Aggeri, 1999).
The above considerations have led us to frame the first hypothesis of our study as follows:

**H1: The SECI model at moment (t0) has a positive effect on environmental knowledge at moment (t0).**

Connecting environmental knowledge to the SECI model over time

As competition intensifies and the pace of change accelerates, it is likely that aspects of environmental knowledge (e.g., environmental routines and procedures) will change over time, requiring the modification of some knowledge structures (Aggeri, 1999; Brockhoff et al., 1999). Prior research has also shown that the effect of environmental initiatives on business performances can vary substantially in a turbulent context (Cegarra et al., 2013), such as the Spanish hospitality sector during the period we have examined, under this framework it is necessary for hospitality companies to update what they know about environmental issues (Cegarra et al., 2013). It should also be noted that a set of authors are focused on time as variable to be taken into account. For Gist and Mitchell, (1992) an individual’s level of self-efficacy can be expected to change over time as new information and experience are acquired through direct experience with the task, performance feedback, and other factors. In this vein, Adam’s (1990) work shows, that “causal time” is seen as one-dimensional, structured in terms of past (t0), present (t1), and future (tn).

The above considerations lead us to argue that once prior knowledge and skill are assessed at a given time (T), there is a range of potential responses by employees, which are determined by the type and characteristics of the challenges. In addition, impact and importance of environmental knowledge varies over time and prior environmental knowledge can soon become outdated or obsolete at a different point in time. There may be a number of different ways of understanding the concept of ‘time’. In this regard, Crossan et al. (2005) focus on three characteristics of time, namely;
a) Time as a trigger for change. As Gersick’s (1991) work shows, groups with very different characteristics change their behaviour when approaching the middle of the span of time they have to perform a task;
b) Time acts as a coordination mechanism for change. Time creates a shared calendar for change and, thus, serves to schedule activities and to maximise their synchronisation (Hedberg et al., 1976); and
c) Time as a resource for change. These considerations lead us to argue that ‘time’ provides organisational members with the temporal space they need to reflect on and conceive prior environmental knowledge (Tyre et al., 1996; Eisenhardt & Brown, 1998).

Our focus is the relationship between causal time and environmental knowledge. For the purposes of this paper, we suggest that environmental knowledge is a process that happens over time, and takes time to update it (Lei et al., 1999; Purser et al., 2005). In this ‘from-to’ causal structure, whatever arises in the future has its origin in the past (Tulku, 1994), that means that hospitality companies which are responding to a series of new environmental challenges are forced to ‘think and act over time’
The Future of Entrepreneurship

(McKenna, 1997), and demands for instant responses frequently means relying on prior environmental knowledge (Purser et al., 1992). Therefore, when the rate of change itself is steadily accelerating, this means that it becomes highly problematic whether the environmental knowledge needed to increase company benefits can be accessed in a timely manner (e.g., Rondinelli & Vastag 2000; Zhang et al., 2000).

Over time environmental issues and management challenges are likely to change (Bohdanowicz, 2005). An example of this is the emergence of new environmental regulations which may go far beyond the current company’s plans to issue new standards for greenhouse gas emissions. As these environmental regulations change, it may become necessary for the organisation not only to exploit their prior environmental knowledge about these regulations but also to update (i.e. replace) such knowledge. Hence the ability of a firm to combine prior environmental knowledge with new one over time is therefore essential if a business is to align its processes, products and services with new challenges to face changing environmental issues. This is where a good knowledge management program such as a SECI program should distribute the new acquired information amongst all the employees involved in environment-related activities, codifying and storing such information for future uses, retrieving past successful environmental experiences, but also being able to continuously renovate past environmental experience with new acquired knowledge (Carmona-Moreno et al., 2004). As a consequence, the SECI program at a later point in time acts as a facilitator in the relationship between EK at a given moment and EK at a later point, since it means that new environmental knowledge can be socialised, externalised, combined and internationalised using past knowledge and also used in the innovation process.

Therefore, we propose the following hypothesis:

**H2**: The impact of environmental knowledge at moment (EK\textsubscript{t}) on environmental knowledge at a later moment (EK\textsubscript{t+n}) is positively mediated through a knowledge management program (SECI\textsubscript{t+n}).

**Connecting environmental knowledge to organizational performance**

The Spanish hospitality industry is a very complex one and requires intensive use of knowledge resources to successfully operate in a competitive market meeting the increasing needs of it customer (Claver-Cortés et al., 2006). In hospitality institutions, staff need appropriate and up-to-date knowledge to face a number of environmental challenges, including the need to implement new customer engagement strategies such as those based on social networks), increasing customer demands and global competition to reach and recruit customers (Chandana, 2001). These considerations lead us to argue that updated environmental knowledge plays an important role in the improvement of organisational performance since it facilitates a situation which, when something is being done wrong, the organisation can change to quickly resolve it (King & Lenox, 2001), which in
turn may help hotels achieve their operational full potential (Cegarra et al., 2010).
As the customer profile changes (e.g. physical location, behaviour, environmental preferences etc.), it becomes an imperative for hospitality companies not only to revise and update the environmental knowledge but also to effectively use such knowledge. Using up to date environmental knowledge have a positive effect in the public’s perception, which is likely to result on more visits to the hotels and benefitting from the use of their installations and services (Carmona-Moreno et al., 2004). As Boiral (2002) noted, the existence of environmental knowledge helps both companies and customers obtain beneficial results. For example, hotel operators encourage their guests to participate in new programmes to reuse their towels, which benefits the environment but also help reducing laundry expenses. Therefore, hotels equipped with up to date environmental knowledge can provide a more competitive way to deliver services, which could enhance the public perception as the company is seen to be socially responsible (Erdoğan & Tosun, 2009).

Hence, we state that:

**H3: The existence of environmental knowledge will determine the extent to which the company achieves better organizational performance**

Taking into account all of the above, this study proposes the structural model shown in Figure 1. In summary, a firm with a SECI program possesses a key capability for the updating of environmental knowledge. To manage prior environmental knowledge effectively, firms must put in place a SECI program at a later moment that enables employees to update their assumptions and then replace new or modified environmental knowledge. Finally, firms with a SECI program will be able to use up to date environmental knowledge in order to improve organisational performance.

![Figure 1: Theoretical model](image.png)

**RESEARCH METHOD**

**Data collection**

The focus of the data collection process was the Spanish hospitality industry, in particular the section dealing with hotel operation and management. Hotel operation and management is a very relevant sector within the Spanish economy (Cadarso, 2005). Spain ranks second in the world in this sector, both in terms of the number of travellers (behind France) and in terms of income from tourism
This industry reported 11.8% of the Spanish gross domestic product (GDP) in 2002 and 12.1% in 2001 (Claver-Cortés et al., 2006). Regarding the employment generated by the tourism sector, estimates indicate that it usually absorbs 10% of the total employment available in Spain. From the total Spanish population, over two hundred thousand people worked in hotels and guesthouses in August 2003 (National Statistics Institute Information Bulletin, 2003).

The reasons for choosing the Spanish hotel operation and management industry were twofold: on the one hand it is very important for the economy; on the other hand, it is a sector facing an increasing level of environmental challenges. For example, hotels have to operate in an environment dominated by high fixed costs. The management often has to deal with issues related to staff wages, significant utility bills and the expenses derived from maintenance of rooms and facilities. Managing a profitable hotel becomes a challenging endeavour, particularly in a period of recession. In this regard, 2008 was the year when the tourist industry did not contribute to the growth of the Spanish economy for the first time ever. Just the opposite, the income generated by the tourist industry in Spain decreased in 1.1% with respect to 2007 (National Statistics Institute Information Bulletin, 2008). Also, the Spanish hotel operator industry is an appropriate setting for an investigation of knowledge management practices and their impact on environmental knowledge. This is because companies within this sector have to face up to highly dynamic environments, strong competition and rapid advances in technology. As Carmona-Moreno et al. (2004) state, the environmental policy in hotels is fundamental for their results, as these depend, essentially, on the environment in which hotels are located. Thus, the preservation of the environment becomes a crucial factor influencing hotel operations. This preservation therefore requires an intensive use of new beliefs, norms, values, procedures, and routines.

The unit of analysis for this study was the company, on the assumption that aspects relating to the creation of environmental knowledge affect the entire organisation. Relevant data sets were collected through telephone interviews with the CEO or owner of the business using a simple structured questionnaire. We made use of a list of 560 Hotel Operators provided by the SABI database (from the SABI Database based on the statistics for the year 2006) as an initial sampling frame. All companies were included in the CNAE-552 (The Spanish National Classification of Economic Activities 552) and had more than ten employees. Before conducting the surveys, the businesses were contacted by telephone by our team and invited to participate in the study. Potential participants were informed of the objectives of the research and reassured of its strictly scientific and confidential nature, as well as the global and anonymous treatment to be given to any data collected. In total, 560 companies were

---

1 Sistema de Análisis de Balances Ibéricos (SABI database) contains financial information for 520,000 companies (480,000 from Spain and 40,000 from Portugal). This includes public and private, Spanish and Portuguese companies, with up to 10 years of data, updated daily.
contacted by telephone and invited to participate in the study. A total of 245 companies agreed to participate in the first instance. These 245 companies were then contacted again for the purpose of data collection. Participants were asked questions about environmental activities carried out by their hotels and the learning processes implemented to create environmental knowledge in a context of intensive innovation.

Data sets were gathered in two phases, the first of which lasted two months, from early September to the end of October 2008. From a sample of 245 companies, 127 companies responded to the survey. The size of these organisations (in terms of number of employees) can be described as follows:

- 41 of these companies have 10-49 employees,
- 59 companies have 50-249 employees,
- 18 companies have 250-499 employees, and
- 9 companies have more than 500 employees

This produces a response rate of 22.67% of the total number of companies invited to participate in the study and 51.83% response rate when we consider the companies which agreed to participate.

A comparison between companies which had provided a response and those that had not done so yielded no significant differences in relation to turnover, total assets or the number of employees, which suggests that non-response bias does not constitute a significant problem (Armstrong & Overton, 1977).

The second stage in the data collection process within this research was conducted six years after the completion of the first phase. For approximately two months, between January and February 2014, the same companies that had completed the survey six years earlier were contacted by the researcher. A survey was conducted and a total of 87 responses were collected, for a response rate of 15.53% of the total.

**Measures**

Churchill’s (1979) approach to questionnaire development was used. Scales were combined from several other relevant empirical studies with new items to make an initial list of 19 items distributed as follows: 4x3=12 of these measuring knowledge management processes, 3 focused on measurement of environmental knowledge and 4 items measuring organisational performance. The survey was initially validated by academics with expertise in organisational learning from Universities of Murcia and Cartagena (Spain) during the period of June – July 2008.

A series of telephone interviews were then conducted involving managers from a pilot sample of 2 leading Spanish hotels. These respondents were asked to indicate the reasons why they implement
environmental initiatives. All responses were related to economic reasons, e.g. conservation of materials or energy, adherence to industry codes or legislative requirements, decreased costs, process and product innovation. In fact, such initiatives were being used by businesses as communication tools to demonstrate their commitment to preventing issues which could have a negative impact on the environment. As a result of this pre-testing, we made some minor modifications based on the suggestions received. Specific issues relating to the development of the questionnaire and its related constructs are elaborated on below (see Appendix for a list of items).

- The final measures relating to the existence of knowledge management processes consisted of 4 items adapted from a scale designed by Lee and Choi (2003) to measure the constructs of knowledge socialisation, externalisation, combination and internalisation. Consistent with the findings of Lee and Choi (2003), items that addressed knowledge socialisation were interwoven with issues related to encouraging individuals in the organisation to track changing markets and share market intelligence with external agents. Also consistent with Lee and Choi’s (2003) findings, items that addressed knowledge externalisation were interwoven with issues related to the encouragement of selected individuals in the organisation to transform their tacit knowledge of customers or experts into easily understandable forms. Knowledge combination items described the process of formalising and storing concepts into a knowledge system, such as databases and knowledge bases so that reconfiguration of existing information through sorting, adding, combining, and categorising explicit knowledge could be used to create new knowledge. Knowledge internalisation items were focused on the use of knowledge about environmental issues to develop plans and to the implementation of such plans.

- Previous studies by Boiral (2002) provide guidance in developing items to measure environmental knowledge. The importance of ‘environmental knowledge’ to cognitively diverse teams relates to enhancement of technical, administrative and social strategies through the accurate understanding of the information available to groups and where such information is located in relation to environmental initiatives. This acknowledges the importance of supporting policies, rules, reporting structures and decision-making protocols that encourage the introduction of clean technologies and approaches to reduce pollution that often leads to substantial savings of materials and energy.

- As the use of objective measures may pose some challenges to researchers while making causal inference from the historical data (March & Sutton, 1997), this study adopts subjective measures to achieve a more comprehensive evaluation of performance of the firm. In this
regard, several measures of business performance have appeared in literature and we adopt the growth-based measures proposed by Kaplan and Norton (1992), and Klassen and McLaughlin (1999) for sales, profits and profitability on total assets.

Data analysis

This study uses PLS-Graph software version 03.00 Build 1058 (Chin, 2003) to conduct an analysis of the data collected. Using PLS involves following a two-stage approach (Barclay et al., 1995). The first step requires the assessment of the measurement model. This allows the relationships between the observable variables and theoretical concepts to be specified. This analysis is performed in relation to the attributes of individual item reliability, construct reliability, average variance extracted (AVE), and discriminant validity of the indicators of latent variables. In the second step, the structural model is evaluated. The objective of this is to test the extent to which the causal relationships specified by the proposed model are consistent with the available data. For hypothesis testing, we used the bootstrapping procedure recommended by Chin (1998).

In order to analyse the relationships between the different constructs and their indicators, we adopted the latent model perspective in which the latent variable is understood to be the cause of the indicators. We therefore refer to reflective indicators for first-order constructs or dimensions. Three constructs in the model are operationalised as first-order reflective constructs (i.e. environmental knowledge 2008, environmental knowledge 2014 and business performance 2014), while knowledge management practices on 2008 (SECI 08) and knowledge management practices on 2014 (SECI 14) are modelled as second-order reflective constructs. With regard to the measurement model, we began by assessing the individual item reliability (Table 1). The indicators exceed the accepted threshold of 0.7 for each factor loading (Carmines & Zeller, 1979).

</table>
From an examination of the results shown in Table 2 we can argue that all of the constructs are reliable. The values for both the Cronbach’s alpha coefficient and composite reliability are greater than the 0.7 required in the early stages of research and the stricter value of 0.8 for basic research (Nunnally, 1978). The AVE should be greater than 0.5. Meaning that 50% or more variance of the indicators should be accounted for (Fornell & Larcker, 1981). All the constructs of our model exceed this condition (Table 2). To assess the discriminant validity, we compared the square root of the AVE (the diagonal in Table 2) with the correlations between constructs (the off-diagonal elements in Table 2). On average, each construct relates more strongly to its own measures than to others.

As noted above, a second-order confirmatory factor analysis was conducted of a model depicting the constructs of knowledge socialisation, externalisation, combination and internalisation. From an examination of the results shown in Table 3 and Table 4, all first-order and second-order factor loadings were significant. In addition to this, all the knowledge creation constructs involving two organisations (i.e. SECI 08 and SECI 14) explain a high amount of variance in their respective knowledge processes (i.e. socialisation, externalisation, combination and internalisation), thereby providing evidence that SECI 2008 and SECI 2014 are multifaceted constructs, construed from four dimensions (i.e. socialisation, externalisation, combination and internalisation).

### RESULTS

The structural model resulting from the PLS analysis is summarised in Table 5, where the variance of endogenous variables (R²) and the standardised path coefficients (β) are shown. As it can be noticed, all the hypothesised relationships have shown to be significant, and therefore, the hypotheses leading this research have been confirmed to be valid. Since PLS makes no distributional assumptions in its parameter estimation, traditional parameter-based techniques for significance testing and modelling were used for this study (Chin, 1998). One significant consequence of the comparison between covariance structure analysis modelling approaches and PLS is that no proper overall goodness-of-fit measures exist for models using the latter (Hulland, 1999).

---
The structural model is evaluated by examining the R2 values and the size of the structural path coefficients. Adopting the approach used by Tippins and Sohi (2003), we looked for the presence of the mediating effect by comparing the direct effect between variables and the competing links where the mediated variable is inserted, whereby two significant links are estimated and evaluated in a search for significant differences. Table 5 shows the results of the two competing links. The proportion variance explained in ‘BP 14’ was 42 per cent. With regard to hypothesis H1, the influence of ‘SECI 08’ on ‘EK 08’ was evident (β = 0.71, p < 0.001).

With regard to hypothesis H2, we explored the presence of a mediating effect by comparing the relationship between ‘EK 08’ and ‘EK 14’, as well as the competing link where ‘SECI 14’ is included. Table 5 shows the results of these two competing links. The first link (direct effect) examined the direct relationship between ‘EK 08’ and ‘EK 14’, whilst the second link (partial mediation) examined the same relationship with ‘SECI 2014’ by acting as a mediator. The results of the partial mediation link support our hypothesis. Firstly, the partial mediation model explains more variance in ‘EK 14’ than the direct effect model (0.79 vs. 0.75). Secondly, positive relationships exist between ‘EK 08’ and ‘SECI 2014’ (β = 0.63, p < 0.001) and between ‘SECI 2014’ and ‘EK 14’ (β = 0.18, p < 0.05). Finally, the significant relationship between ‘EK 08’ and ‘EK 14’in the direct effect model (β = 0.86, p < 0.001) diminishes in the partial mediation model (β = 0.69, p < 0.001). We also estimated the ratio F2 suggested by Chin (1998), to understand the significance of the improvement of the partial mediation model over the direct effect model, whereby such an improvement is considered significant in those cases where F2 is greater than 0.02. In our study, F2 was found to be 0.19, and therefore we conclude that there has been a significant improvement. Together, these three areas provide significant evidence that there is a discernible mediating effect of ‘SECI 2014’ and that the partial mediation model represents a significant improvement over the direct effect model. With regard to hypothesis H3, the effects of ‘EK 14’ on ‘BP 14’ were fully verified (β = 0.64, p < 0.001). Consequently, the findings provided full support for H1, H2 and H3.

Table 5: Model statistics
DISCUSSION

The first contribution made by this research is the questioning of the existing models of the relationship between knowledge management processes and environmental knowledge over time. In doing so, the authors have included time as a variable in the analysis and, have focused on the need to create environmental knowledge at a given time (T) in order for a more efficient learning to take place at a later time (T+6). The concept of knowledge management processes was explored by studying the processes behind the organisational knowledge creation construct (i.e. socialisation, externalisation, combination, and internalisation) and then studying its impact on environmental knowledge. In summary, a null hypothesis [that environmental knowledge at a given time T is a prior step in the SECI program at a later point in time (T+6)] was tested against the alternative hypothesis [that environmental knowledge at time (T) is not a required prior step in the implementation of knowledge management processes] through an empirical study of 87 companies in the Spanish hospitality sector through PLS.

The second contribution of this research is derived from the results of testing the hypotheses in a real context. Environmental knowledge at time (T) is found to be significant in predicting the knowledge management processes. The managerial implications of the relationships observed between the factors that constitute the conceptual framework shown in Figure 1 are discussed in more detail below.

The analysis of the data collected provided full support for H1: (SECI 08 → EK 08). This finding corroborates the notion that specific knowledge management processes have to be used to create environmental knowledge and thereby contribute to its dissemination and retention within a company (Boiral, 2009). A possible explanation for the significance of such an effect may be related to the fact that before environmental knowledge can be created specific assumptions should be established and shared. Otherwise, only a few individuals within the organisation will have access to this relevant knowledge, which in turn may lead to the under-utilisation of relevant knowledge or the utilisation of knowledge which is not relevant, both of which cases are likely to lead to a degradation of environmental knowledge (Cegarra et al., 2013). One interpretation of this relationship is that through the knowledge management processes, a company can allow individuals to adjust their mental models and the nature of their assumptions to highlight some of the environmental issues and concerns that may have a direct effect on the entire company, its operation and results.

Regarding H2, the results support the position that if the organisation considers establishing an environmental knowledge at a given point in time, then this knowledge is likely to have a positive influence on the conditions that stimulate knowledge management processes for the creation of new environmental knowledge in the future, which may have a significant impact on the organisation and
its performance. A possible explanation for this result would be the fact that reusing prior environmental knowledge puts the upcoming knowledge management processes into a familiar context for members of the organisation. In other words, knowledge management processes provide a path which activates environmental knowledge which was previously created. We believe that this is an important finding which provides the basis for a hotel to develop, as such a development relies on the hotel’s ability to reuse and update the relevant knowledge of its workforce.

However, many hotel managers are cutting back on knowledge management programs by simply using prior environmental knowledge instead of implementing more innovative programs which are supported by knowledge of new environmental challenges (Aggeri, 1999). If this is the case it is possible that hotel managers are over-investing in the exploitation of prior environmental knowledge, and under-investing in (or underestimating the value of) mechanisms and aspects to develop and update existing environmental knowledge. This confirms the position adopted by Cegarra and Martinez (2010) when they argued that the use of environmental knowledge also needs to involve changes in the organisational knowledge structures. One way of doing this would be for senior management to set up a knowledge management program to embrace change and encourage new ideas and insights, which often lead to the creation of environmental knowledge. Our results show that a knowledge management program is a required step for the enhancement of environmental knowledge. In this respect, socialisation, externalisation, combination, and internalisation processes can be viewed as a mechanism for improving environmental knowledge as this may involve a process of replacing existing outdated environmental knowledge with new knowledge structures. SECI enhances the effectiveness and efficiency of EK which potentially leads to improved EK.

Regarding H3 (EK → BP), the results support the position that, in order to improve the performance of business operations, companies need to provide and support updated environmental knowledge. These findings are important in the ongoing debate surrounding the relationship between environmental knowledge and business performance, and reinforce the views that environmental knowledge may lead to increased company benefits (e.g. Rondinelli & Vastag 2000; Zhang et al., 2000). A possible explanation for these findings is determined by the fact that when information or knowledge is updated and is not fragmented within a company, customer feedback is easy to obtain and, as a result, performance improves. As Erdogan and Baris (2007) noted, environmental knowledge will lead to a reduced consumption of energy, water, and materials, thus improving organisational performance. Thus, the easy retrieval of environmental knowledge is a critical aspect in responding to the growing customer demand for environmentally friendly programs and hence improving organisational performance (Bohdanowicz, 2005).
Managerial implications
There are different methods for managing environmental issues. However, companies still show some resistance to change their current environmental programs. The general notion among many businesses is that once they have an environmental program in place, they should not change it. The results from this study contradict such a view. As competition intensifies and the pace of change accelerates, aspects of environmental knowledge (e.g. routines and procedures) are likely to change over time, requiring the modification of some of the contents of this knowledge. Our findings support the need for managers to become more aware of the need to consider time when they drive the conditions and/or context where environmental knowledge can be exploited to increase company benefits such as cost savings resulting from eco-efficiency. Time appears to be an interesting variable to understand how environmental knowledge emerges and how it can be updated to improve an organisation and its performance. With this notion in mind, we argue that traditional concepts of managing and leading change based on knowledge management processes need to consider methods which aim at deepening participation or immersion in the immediacy of the temporal flow.

CONCLUSIONS
The above findings suggest that the creation of environmental knowledge is an important factor for organisations to become competitive, but it is not sufficient for them to maintain such a competitive advantage over time. We would further observe that the creation of environmental knowledge strongly depends on environmental knowledge which was previously created and the previous implementation of a knowledge management program facilitating socialisation, externalisation, combination, and internalisation. Through this program, individuals will be able to update their mental models by focusing their efforts on problems that are more important for the organisation and its customers, which in turn facilitates the retrieval of prior environmental knowledge.

This study has some limitations. First, national cultural issues might influence the way organisations create and update environmental knowledge. Therefore, it would be interesting to extend the study to other countries, since national cultural issues might influence the results. Secondly, this study relies on the assumption that the CEO or general director of each of the organisation possesses key knowledge of the company and therefore our emphasis here is on finding commonalities among firms in terms of the critical knowledge areas they consider important and had access to. Although this subjective information is commonly used in studies (Glaister et al., 2008), future research using more than one individual who hold key knowledge within a firm (including managers, employees and even customers) will be a useful mechanism for the study to improve the internal validity of the SECI model and environmental knowledge. Thirdly, we would consider a further research into how other
organisational factors (e.g. organisations’ size and agility) which have not been included in this study are likely to affect the performance of the firm. Therefore, future research should investigate the potential links between different initiatives such as reducing waste production and resource and energy consumption by controlling and improving lighting, heating, ventilation, air conditioning, and water use, by making proper purchasing decisions on containers, use of returnable containers and recycling materials and the company goals. Finally, it may also be interesting to observe the change in the performance of companies after adopting environmental activities, through future case studies.

IMPLEMENTATION OF INNOVATION NETWORK: A CASE STUDY OF BIOTECH INDUSTRY IN CAMPANIA REGION

Matricano, Diego; Sorrentino, Mario

Department of Management, Second University of Naples, Italy

ABSTRACT

In order to achieve the economic and social development of specific contexts, entrepreneurial scholars suggest to leverage on the innovations networks that can be inspired by the triple helix model involving university-government-industry. The theoretical studies concerning this model have been addressed according to three main paths of research: the structure of innovation networks and the linkages established inside them; the external context; and the advantages and disadvantages deriving from being part of innovation networks.

The analysis of these three paths of research is useful to develop the case study of Campania Bioscience, an innovation network created in Campania, a Region in southern Italy, whose main goal is to create a system supporting innovation, research and competitiveness in the biotech industry.

The final aim of the paper is to verify if the theoretical results deriving from entrepreneurial literature have been considered when implementing Campania Bioscience.

Keywords: innovation network; triple helix model; university-government-industry; economic development; entrepreneurial university

INTRODUCTION

Generally speaking, policy makers are interested in defining and implementing specific actions and tools in order to support innovative processes and to achieve two main goals: to create wealth and occupation. Nowadays, in particular, policy makers are more and more interested in implementing innovation networks that are inspired by the triple helix model (involving university-government-industry) and that aim to:

- Achieve the economic development and growth of specific contexts;
- Exploit the innovations resulting from R&D activities carried out in the universities through the commercialization of new materials, new products or new processes;
- Support the small and medium enterprises (SMEs), which usually do not carry out research activities and risk to loose the market competition, by offering innovations to be exploited.
Implementation of innovation networks able to achieve the development of a context (the main goal of governments) by matching demand (by industries) and supply (by universities) of results of R&D activities is the main focus of the present paper. More precisely, the present paper tries to highlight the theoretical aspects concerning innovation networks and to verify if they have been considered and implemented in the biotech innovation network promoted by Campania Region, in the Southern Italy, and named “Distretto ad Alta Tecnologia Campania Bioscience”.

The present work is structured as it follows. In the following section, the concept of innovation network is presented and discussed. In particular, the passage from the closed innovation model to the open innovation model is underlined. After that, specific aspects of the innovation network are examined. In section three, after recalling the triple helix model involving university-government-industry, attention is paid to the structure that innovation networks can assume. In section four, attention is paid to the context in which innovation network can be settled. As known, synergies between university-government-industry are stronger if the subjects are geographically close. Then, in section five, since the innovation process assumes specific characteristics that cannot be generalized, attention is paid to the advantages and disadvantages that can derive from being part of a network. The theoretical aspects are instrumental to develop the case study of Campania Bioscience, an innovation network whose main goal is to create a system supporting innovation, research and competitiveness in the biotech industry by creating and developing strong collaborations between universities and industries (section six). Reflections on the start-of-the-art and on the possible implications evolutions of Campania Bioscience are included in the last section.

INNOVATION NETWORK

Nowadays, enterprises are moving from a closed innovation model, according to which innovation is secretly developed inside the enterprise itself, to an open innovation model, according to which innovations result from an exchange of knowledge and competences with external subjects who are part of their network (Aldrich and Zimmer, 1986; Dubini and Aldrich, 1991; Uzzi, 1997; Baum et al., 2000; Alvarez and Busenitz, 2001). The networks created in order to achieve the above goal are properly named innovation networks.

Even if the origins of this concept can be dated back to Nineties (Freeman, 1991; Lundgren, 1995; Osborn and Hagedoorn, 1997), recent contributions have tried to point out the main characteristics of innovation networks. According to Rycroft and Kash (2004), for example, “the innovation network is organized around constant learning. It is a set of linked organizations that create, acquire, and integrate the diverse knowledge and skills required to create and bring to the market complex technologies”. In the above case, the most important aspect that scholars try to underline is the constant learning by enterprises.
Very recent contributions, instead, have highlighted other aspects of the innovation network. Arranz and de Arroyabe (2012) maintain that “the innovation network is a socio-technical system formed by three interdependent subsystems: process, structure and governance” and so they highlight three aspects (process, structures and governance) that characterize each innovation network. According to Corsaro et al. (2012), instead, “the innovation network is the configuration of strategic entrepreneurial nets aimed at improving the effectiveness of innovation performance”. In this last case, the most important aspect of an innovation network is the final goal to achieve.

Despite the differences emerging from the above definitions, innovation networks can be defined as a group of subjects involved in technology transfer processes useful to share resources (mainly intangible ones, like knowledge or competences) in order to support and to foster innovative processes (Powell et al., 1996) and to foster the discovery of new entrepreneurial opportunities (Matricano, 2011). According to the above definition, innovation networks are very relevant in science-based industries (Hagedoorn, 1993, 2002), like ICT, nanotechnologies, and biotechnologies (Sorrentino, 2009).

Since it is not easy to study an innovation network as a whole, because of the peculiarities of each network and of each industry they are in, three main paths of research that have been addressed. They deal with:

- The structure of innovation networks and the linkages established inside them;
- The external context;
- The advantages and disadvantages deriving from being part of innovation networks.

These three paths of research are revised and debated in the following sections in order to try to point out their main characteristics.

**THE STRUCTURE OF INNOVATION NETWORKS**

Before analyzing the structure that innovation networks can assume, it is necessary to start from a deep change that universities are facing (Chiesa and Piccalunga, 2000; Etzkowitz et al., 2000; Shane, 2004; Bramwell and Wolfe, 2008). Nowadays, universities are not only involved in research and educational activities but they try to achieve their third mission (Etzkowitz and Leydesdorff, 1999, 2000; Etzkowitz et al., 2000; Etzkowitz, 2003) consisting in the exploitation of the results of R&D activities in order to support the economic development of the context they are in (Johnson, 2008). Enterprises have accepted this change and, above all, they are trying to leverage on the results of R&D activities carried out by universities: high salaries, high entry barriers, and instability in the market competition are driving enterprises to ask for innovations and universities seem to be able to supply them. To match demand (by industries) and supply (by universities) of results of R&D activities is not
an easy task. This is the reason why governments (meant both at a national and at a regional level) play a crucial role in achieving this task.

Based on the close relationships between universities and industries and on the relevance that governments assume in implementing and supporting these relationships, the *triple helix model* comes out (Etzkowitz *et al.*, 2000). From a theoretical perspective, the convergence of universities’, industries’ and governments’ aims is easy to understand. From a practical perspective, instead, implementation of specific actions is more complex. Governments, in fact, have to:

- Drive academic R&D activities towards results exploitable by industries;
- Promote the achieved results in order to inform enterprises about the existence of exploitable results;
- Manage the exchanges between universities and industries and to match demand and supply.

Even if it is clear who are the subjects involved, it is not possible to clarify any typical structure of innovation networks (Pittaway *et al.*, 2004; Salavisa *et al.*, 2012). As noted by Ricciardi (2006), in fact, each innovation network assumes the structure most fitting with the established results. Thus, no generalization is allowed. However, it seems possible to find out some key aspects that can give information about the structure of innovation networks. According to Ricciardi (2006), there are two key aspects concerning: the relevance of the subjects and the evolving structure over time.

As for the former, it is important to define whether the subjects promote the innovation network or if they decide to join an already existing one. If they are the promoters, they are expected to be more involved and to occupy the centre of the network itself. Thus, they can shape the network according to their needs. On the contrary, if the subjects join an already existing network, they do no have the possibility to shape it and so they can only accept the structure as it is. As for the latter, it is important to notice that innovation networks are supposed to last even if their structure can change. The possibility that new members can join it or that old members can leave it necessarily implies that the structure of the innovation network can be modified and, by consequence, it implies the impossibility of any generalization about it.

Another approach (Salavisa *et al.*, 2012), instead, identifies four key aspects that can determine the structure of innovation networks:

- Size: since enterprises enter or create innovation network in order to get resources they do not have, the higher is the number of subjects involved, the higher is the chance to obtain additional resources (Burt, 2000). It means that enterprises try to involve other subjects by modifying the structure of the innovation network they are in;
- Type: when subjects involved carry out similar activities, there can be a problem of redundancy (Burt, 1992); on the contrary, when subjects involved carry out dissimilar
activities, new resources are easily obtained (Baum et al., 2000). There is a continuous search of subjects to be in contact with and so the structure can be modified;

- Positioning: relational position makes the exchange of resources much easier and this is a very important aspect to be considered in innovation networks (Powell et al., 1999). Subjects in innovation networks try to get closer to the centre since and so possible changes in the structure can derive;

- Links: kind, content and frequency of links determine the possible structure of innovation networks. The decision to leverage on strong or weak ties (Granovetter, 1973, 1985), on formal or informal ones (Birley, 1985), on additional or redundant ones (Burt, 1992, 2000), on direct or indirect ones (Podolny and Baron, 1997; Ahuja, 2000) affect the structure of innovation network and make it impossible to generalize it.

According to the above contributions (Ricciardi, 2006; Salavisa et al., 2012), it is possible to generalize neither the structure of an archetypal innovation networks nor the structure of a specific innovation network since it can always change in both the cases.

THE EXTERNAL CONTEXT

The external context plays a very important role in technology transfer processes, determining the success or failure of innovation networks (Bramwell and Wolfe, 2008; Dell’Anno, 2010). Some contexts, meant as geographical contexts, can be considered as knowledge innovation zones where it is possible to establish very strong connections and to stimulate new entrepreneurial activities. In particular, this can be due to the spillover effect and to technological brokers.

The spillover effect, which can be defined as a positive externality that a subject involved in R&D activities can get from the results of R&D activities carried out by others, is much stronger if the source and the recipient of knowledge are geographically close (Dell’Anno, 2010). This is particularly true when the transfer processes concern tacit knowledge that is not formalized. Of course, if the transfer process concerns codified knowledge, for example through patents citations, geographical proximity is not so relevant.

As already anticipated, technological brokers play an important role in innovation networks and so they can affect the success or failure of innovation networks. Efficacy in technology transfer processes depends on the competences and on the skills that dedicated offices have – these offices are properly named technology transfer offices or industrial liaison offices. They deal with the commercialization of research results and, in particular, they deal with the facilitation of internal and external information flows and the definition of incentives (Phan and Siegel, 2006).
In contexts where the spillover effect is greater and where technological brokers are more efficient, innovation networks are more expected to achieve the established results.

**THE ADVANTAGES AND DISADVANTAGES DERIVING FROM BEING PART OF INNOVATION NETWORKS**

As noted by several scholars (Ahuja, 2000; Dhanaraj and Parkhe, 2006; Gardet and Mothe, 2011), empirical studies able to describe and to analyze technology transfer process are very rare because of the so many difficulties to be faced. For this reason, scholars have paid more attention to the advantages and disadvantages deriving from being part of innovation networks (Ricciardi, 2006). The main advantages deal with: knowledge transfer, distinctive competences, financial resources, and exploitation of innovations. The main disadvantages, instead, deal with: opportunistic behavior and asymmetric contributions and different aims.

The first advantage is related to easiness in transfers of tacit knowledge. The fact of being part of the same innovation network suggests assuming that all the subjects involved have already developed the absorptive capacity (Cohen and Levinthal, 1990), i.e. the ability to apprehend knowledge transmitted by others. This happens because of the specific knowledge that subjects have accumulated in the past. Of course, the exchanges implemented in the innovation networks reinforce the absorptive capacity. The second advantage is linked to distinctive competences that can be developed. As noted by Parente (2008), enterprises can develop integrative competences (in order to mix internal and external knowledge), coordinative capabilities (able to synchronize new acquired knowledge) and generative capabilities (through which new knowledge is created). The third advantage reveals itself in reference to funding and to economies of scale and of learning, which derive from sharing the costs of R&D activities. Finally, the last advantage consists in the straight exploitation of technological innovations.

However, being part of innovation networks can cause some disadvantages as well. The first can derive from opportunistic behaviors (Williamson, 1975) that others can put into practice, both before and after the drafting of the contract ruling the partnership. This kind of disadvantage has been examined in the agency theory (Jensen and Meckling, 1976). The second disadvantage, then, can arise when the subjects involved in the network do not share the resources arranged or when they pursue different aims. In both the cases, the subjects are forced to proceed with the network activity or they could be interested in leaving the network.

Both the possible advantages and disadvantages are shown in table 1.

A CASE STUDY OF BIOTECH INDUSTRY IN CAMPANIA REGION

The results of the analysis carried out in previous sections (about the networks’ possible structure, the external context and the achievable advantages or disadvantages) are instrumental to test whether the implementation of Campania Bioscience has been properly carried out.

Since the Second University of Naples – which has funded this research project – is located in Campania Region, the choice to refer to a network implemented in the same Region sounds obvious. However, the choice of the network to refer to is not. For this reason, the choice is rooted in the entrepreneurial literature. Open innovation network are very frequent in knowledge-based industries (Hagedoorn, 1993, 2002) that mainly deal with biotech or aerospace industries in Campania Region. Between them, the most recent network implemented in the Region is related to the biotech industry and from this it derives the choice to focus on Campania Bioscience.

In order to understand the peculiarities of the biotech industry (Pisano et al., 1988; Arora and Gambardella, 1990; Powell et al., 1996; Ahuja, 2000; Baum et al., 2000; Audretsch and Feldman, 2003; Boardman, 2008), it is suitable to start from some data published in a report edited by Ernst & Young (2012) entitled “Rapporto sulle Biotecnologie in Italia - BioinItaly Report 2012”. According to the data, Italy has one of the highest amounts of biotech ventures. Across Europe, only Germany and United Kingdom show better results. Data about the distribution of the Italian biotech ventures are shown in table 2.

Table 2. DISTRIBUTION OF THE ITALIAN BIOTECH VENTURES BY REGION

<table>
<thead>
<tr>
<th>The Italian biotech ventures by Region</th>
</tr>
</thead>
<tbody>
<tr>
<td>Region</td>

</tr>
<tr>
<td>Piemonte</td>
</tr>
<tr>
<td>Lazio</td>
</tr>
<tr>
<td>Emilia Romagna</td>
</tr>
<tr>
<td>Veneto</td>
</tr>
<tr>
<td>Toscana</td>
</tr>
</tbody>
</table>
Campania is at position number ten in the list and, according to specialists of the industry, it seems to be a promising context for future development of biotech industry.

The data about partnerships of Italian biotech ventures are of great interest too. While 54% out of all the biotech ventures is standing alone, 35% out of the total is located in scientific parks or in incubators, and the remaining 11% is located close to universities or research centers (table 3).

Source: “Rapporto sulle Biotecnologie in Italia - BioinItaly Report 2012”, Ernst & Young.

The above data, according to which 46% out of Italian biotech ventures is located in knowledge innovation zone, represent the starting point for the implementation of Campania Bioscience.

The project about the implementation of Campania Bioscience can be dated back to 22nd March 2011 when the feasibility study was presented. On 23rd April 2012 the Italian Ministry of University and Research (M.I.U.R.) has approved the above feasibility study and then, on 7th August 2012 the agreement between M.I.U.R. and Campania Region, properly named “Accordo di Programma Quadro”, has been signed.
All the partners involved in the network have shared the mutual-aid aim of the network so that the net gains will be reinvested in R&D activities. The social capital is nearly equal to 1.7 millions of euro (44% by research institutions, 44% by ventures, and 12% by technology transfer offices).

It is possible now to pay attention to the three paths of research presented above: the structure of the network, the context and the possible advantages/disadvantages.

As for the structure, Campania Bioscience is still in fieri and so it is not possible to study the possible evolutions of its structure. However, there are the three main subjects involved in the open innovation network. Campania Region has signed the agreement with M.I.U.R. and so the government plays an important role in this network. The research institutes (both universities and research centers) and the technology transfer offices involved are ten and the ventures involved are sixty-four. All the three main subject of the triple helix model are actively involved in the Campania Bioscience.

As for the context, the choice to involve only research institutes (both universities and research centers) and ventures that are located in Campania highlights the will to transform the Region in a knowledge innovation zone. Hopefully, this can support the process of inventing around, a process through which starting from a research result already achieved – like a patent – many other results can be achieved.

Finally, it is possible to analyze the possible advantages/disadvantages. The first advantage deals with knowledge transfer and distinctive competences (Powell et al., 1996; Powell, 1998; Garraffo and Sorrentino, 2009). The heterogeneity of the subjects involved in Campania Bioscience – ten research institutions and sixty-four ventures – surely represents one of the main strengths. The shared competences vary across the subjects and so knowledge transfers are expected to be effective and productive. As for the economic advantages linked to be part of a network (Cunningham, 2002; Audretsch and Feldman, 2003; Pisano, 2006), the social capital of nearly 1.7 millions euro and the mutual-aid aim seem to be right promises to the proceeding of the research activities.

Of course, attention needs to be paid to the disadvantages too. Up to now, disadvantages in Campania Bioscience have not emerged yet mainly because the network is very recent. However, some actions in order to reduce them have been thought and implemented. All the subjects involved, in fact, have been divided into three main lines of interventions (shown in table 4). Hopefully, this should avoid the raising of disadvantages by creating small groups where the partnership should be much easier.
Table 4. LINES OF INTERVENTION ESTABLISHED BY CAMPANIA BIOSCIENCE

</tr>
</tbody>
</table>

CONCLUSION

As emerged from the literature review, it is not possible to define an archetypal type of innovation network. It is only possible to fix some key-aspects like the structure (and its evolution), the context and the possible advantages/disadvantages.

The present study has tried to verify if these key aspects have been considered when implementing Campania Bioscience, a biotech innovation network promoted in Campania, a Region in southern Italy. The fact that they have been taken into account seems very promising even if it seems premature to assume that these characteristics can take to long-run positive results. Very often, in fact, disadvantages can be more relevant than the expected advantages and so the ongoing of the innovation network does not seem so obvious: theoretical research can be helpful to fix some guidelines but to implement them is not so straight.

Unfortunately, Campania Bioscience is still in an embryonic phase and so it is not possible to evaluate if and to which extent the implementation of the innovation network matches the theoretical guidelines emerged above. However, by proceeding as already done – leveraging on the positive key aspects and trying to avoid the possible disadvantages – Campania Bioscience could aspire to be the driver of future economic development of Campania Region and, above all, it could legitimately aspire to be a good example of the triple helix model.

IMPACT OF PHENOMENON OF MONEY LAUNDERING ON MODERN GLOBAL ECONOMY

Matysiewicz, Justyna; Smyczek, Sławomir
University of Economics in Katowice, Poland

ABSTRACT
Within the last few years the structure, function and effectiveness of the market system of many countries have undergone radical transformations. Liberalization of commodity and service turnover as well as a free flow of technology, people and, above all, capital has had a stimulating effect on the development of economy of these countries. Nevertheless, all these factors also create opportunities for various businesses to use different elements of the market systems in conducting some criminal activity and related to its money laundering. The development of the phenomenon of money laundering is mainly facilitated by differences existing between legal and financial systems of particular countries and international standards as well as by achievements of the scientific and technological revolution. The commonness of a fast and efficient information transfer combined with an unlimited possibility of global travelling brings about a situation where money laundering assumes new and more refined forms. Therefore, the harmfulness of the phenomenon can neither be treated as a one-facet problem nor considered in isolation from other elements of an economic and financial pathology. Money laundering can pose a serious threat both to individual firms and all market mechanisms on a regional and global scale. With respect to the above-presented problems, the goals of research were to define phenomenon of money laundering, its nature and evolution as well as mechanisms of its development, identification role of globalization of world economy on development the process of money laundering in the modern economy and assessment of a threat posed by the phenomenon to the functioning of firms, countries and the whole world economy.

Keywords: money laundering, determinants, global economy

INTRODUCTION
Globalization as result of expanding geographical range of interactions between different subjects of international relations has huge impact on market system in particular countries, regions and whole world. Within the last few years the structure, function and effectiveness of the market system of
many countries have undergone radical transformations. Liberalization of commodity and service turnover as well as a free flow of technology, people and, above all, capital has had a stimulating effect on the development of economy of these countries. Nevertheless, all these factors also create opportunities for various businesses to use different elements of the market systems in conducting some criminal activity and related to it money laundering. The development of the phenomenon of money laundering is mainly facilitated by differences existing between legal and financial systems of particular countries and international standards as well as by achievements of the scientific and technological revolution. The commonness of a fast and efficient information transfer combined with an unlimited possibility of global travelling brings about a situation where money laundering assumes new and more refined forms. Therefore, the harmfulness of the phenomenon can neither be treated as a one-facet problem nor considered in isolation from other elements of an economic and financial pathology. Money laundering can pose a serious threat both to individual firms and all market mechanisms on a regional and global scale.

With respect to the above-presented problems, the goals of research were to define phenomenon of money laundering, its nature and evolution as well as mechanisms of its development, identification role of globalisation of world economy on development the process of money laundering in the modern economy and assessment of a threat posed by the phenomenon to the functioning of firms, countries and the whole world economy.

Globalisation – notion and characteristics

The globalization can be also defined as a process where markets and production of different countries become more dependent on one another due to an increase in the volume of exchanged goods and services as well as due to the inflow of capital and technologies. Globalization can be perceived as a higher stage of internationalization, characterised by intense development of relations and interactions on a global scale. According to W. Anioł, nowadays, internationalization „evolves” into globalization as a result of expanding geographical range of interactions between different subjects of international relations, until it comprises the whole world. Hence, the internationalization can be treated as an initial concept of globalization. H. Cholaj describes globalization as the highest stage of internationalization, which constitutes multitude of processes and phenomena such as the international flow of goods, services, capital, technologies, information and human resources. The author also refers to it as a dominant orientation on the world’s market with respect to trade, investment and other transactions, as a territorial and institutional integration of markets and, finally, as global problem relating to ecological degradation which calls for international cooperation in providing adequate solutions (Berekoven, 1989). According to A.K. Koźmiński, in the economic sense, the main difference between the internationalization and globalization lies in their geographical range.
In case of internationalization, its range reaches several countries, whereas globalization comprises the whole global market. Internationalization is of gradable character where we can talk about less or more advanced stage of internationalization of companies, industries or the economy of a given country or region (Limanski, 2001).

Globalization has mainly comprised the production and sales of modern goods which are scientifically and technologically advanced (electronic, motor or chemical industry). Globalization is most vividly demonstrated through international investments, production and inter-corporation exchange rather than through traditional foreign trade. Following the assumptions, the development of globalization will take place simultaneously with the spread of information, and therefore, the future society will be not only the society of information but, first of all, a global one (Meissener, 1991).

The reasons for the acceleration of the globalization processes in the world, and especially their occurrence on a global scale, are connected with technological (technological and scientific revolution), political and socio-economic changes (Rymarczyk, 1996).

With respect to the first factor, its influence on the globalisation should be combined mainly with well-grounded interests of oligopolistic competitors and with huge investments made in research and development. Bearing the costs of investments, big corporations aim at their quick amortisation through selling which goes beyond the borders of domestic, or even neighbouring markets. The increase in sales volumes, and consequently, the extension of a production range, brings more benefits. The shortening of a product life cycle as a result of growing competition encourages countries to sell to the largest markets including the global one.

Another technological factor affecting the process of globalization relates to new inventions, mainly the Internet which facilitates and reduces the costs of transport and communication. The distance included in costs does not influence the price as much as before, and thus helps develop the international transfer of products and know-how.

The socio-economic factors, resulting from a homogenous character of consumers and their growing requirements, are also connected with technological changes. The development of transport and communication has facilitated not only the flow of goods and information, but also the movement of people whose tastes have become alike. The standardization of life styles and consumption patterns increases income levels and fosters educational development. As a result, there appear consumer groups whose buying behaviour with respect to goods and services is mainly conditioned by demoscopic or psychological factors, and not by the type of their nationality. This explains why the demand for these goods and services appear in different countries.

Another factor that has accelerated the process of globalization is the liberalization of the world trade combined with the policy of facilitating and supporting the flow of capital. This policy is advocated by
countries which send or receive the capital, and by organizations (e.g. World Bank) whose activity is crucial for supporting economic growth and for including Poland and other East-European countries in the process of globalization. Nevertheless, all these factors also create opportunities for various businesses to use different elements of the market systems in conducting some criminal activity and related to it money laundering.

**MONEY LAUNDERING – EVOLUTION AND CHARACTERISTICS**

Money laundering appeared for the first time in the twenties of the previous century in the United States of America. The phenomenon did not appear in the course of the evolution of crimes and transgressions of economic nature, but occurred as a new type of criminal activity which evolved together with the development of modern organized crime. High proceeds from illegal business and criminal operations, as well as threats following the investigation process against Alphonse Capone¹ forced the elites of the criminal world to legalize illicit funds (Bartosiak, 2003). The eighty-year-old history of money laundering, the history of an invasive character, can be divided into two stages of development. The first stage is characterized by the use of simple methods of funds legalization.² In the second stage of its development, money laundering evolved into specialized international criminal activity organized in a regular business defined as “full-time criminals” (Lerbell, 1978).

The main direction of the phenomenon evolution has been influenced by existing correlations between:

a) the process of transformation of small local criminal groups into organizations of a regional range, as well as the transposition of some of the groups into organizations of a distinct organizational structure,

b) fast-developing professional methods of activity of criminal groups,

c) new fields and areas of interest of criminal circles and new possibilities provided by ongoing geopolitical changes,

d) achievements of the scientific-technical revolution.

The legalization of big sums of money has become a necessity for members of criminal groups, as it is the “laundered” money that can ensure the “consumption of fruits” of criminal activity and guarantees its further development. Illegal funds come from two main sources of criminal activities:

---

¹ Al. Capone, the founder of a modern criminal organization whose activity involved corruption of politicians and police representatives, extortions, illegal gambling, and management of brothels. The gigantic annual proceeds of 60 mln dollars of that time (at present it equals about 2 billion dollars) were gained through illegal alcohol trafficking in the whole area of the State of Illinois. Al Capone was sentenced to 10 years in prison for evading tax on winnings gained in an illegal casino.

² Al. Capone bought a chain of city laundries and introduced illegal money into the legal circulation through fictitious proceeds from fictitious services.
1) traditional activities,
2) activities which evolved with new trends, as a consequence of system transformations of Central and Eastern Europe countries and a new process of international integration within the European Union.

Traditional offences and crimes which constitute a source of illegal funds comprise:
1) All types of drug crimes.
2) Tax frauds.
3) Customs crimes.
4) Arms trading, especially nuclear materials.
5) Organized prostitution including children prostitution and procurements.
6) International terrorism and contract murders.
7) Extortions and ransoms.
8) Trading children, women and life body organs.
9) Forgery of money, securities and personal documents.
10) Theft, smuggling and fencing stolen arts, antiques and luxury items.
11) Illegal transfer of people over international borders.
12) Production and trading of illegal software and counterfeited CDs and DVDs.

The second group of crimes which have been evoked by geopolitical changes comprises:
1) Activities directly related to business and financial operations in the field of privatization being part of a system transformation of CEE countries.
2) Frauds connected with a structural policy, particularly the embezzlement of the EU funds (Jasiński, 2002).

The process of money laundering consists in the introduction of means of payment, securities or other currencies of unknown origin into the legal circulation (Pracki, 1995). The executive activities may differentiate depending on the country where the money is laundered and on the profile of criminal activity. Nevertheless, these activities are always subjected to goals which can guarantee effective legalization of financial means:
1) hiding a real source of funds and identity of their owner,
2) constant supervision and necessary safety of illegal money in the process of its legalization.
3) legalization of illegal proceeds through their introduction into the official financial system.

The process of money laundering has been based on a three-stage model (Gilmore, 1999) for the sake of a precise description of stages, characteristic features and rules of the process functioning. Thanks to this, it is possible to define the areas of operational activities of money laundering, and, above all, to
expose the weak points of the mechanism whereby the probability of identifying suspicious financial operations is bigger.

Source: Author’s elaboration based on Wąsowski and Wąsowski, 2001 and Bilmore, 1999.

The revealed and examined cases of the legalization of illicit funds show that the process of money laundering can be conducted with the omission of particular stages, the stages may exist simultaneously or else they may overlap (Gilmore 1999, p. 37). Nevertheless, the executive activities always demonstrate the following features:

1) Complex forms of operational activities.
2) The use of a perfect camouflage.
3) Character of participants of the process.
4) The main objective of the operation.
5) A cross-border strategy of the operation.

In view of the growing importance of globalization of the world economy, the cross-border character of the process of money laundering is gaining still more significance. The international character of money laundering is presented in Table 2.

---

1 The omission of the first stage may occur due to:

1. Lack of possibility of purchasing financial assets: shares, bonds, banker’s and traveller’s cheques.
2. The use of deposit services provided by banks and deposit institutions “…exceptional attractiveness of deposit institutions for criminal groups as a result of a wide range of services which give “launderers” a possibility to hide deposits and legitimize incomes, in other words, to launder money through the second and third stage.

Source: Author's elaboration based on Lernell, 1978 and Jasiński, 2002.

The high adaptability of the process participants to new geopolitical conditions and their ability to use scientific and technological achievements contributes to the development of natural mechanisms which facilitate further evolution of money laundering.

**THE MODEL OF MONEY LAUNDERING PROCESS**

In order to precisely define the nature of particular stages of the process and existing relations between them, the model has been presented in block diagram as in Figure 1.

Figure 1. The classic process of money laundering

**Sources of origin of financial means**

Traditional crimes of primary nature.
Crimes being a consequence of new trends in organized criminal activity.

Anonymous entities participating in transactions.
Anonymous character of transactions.
Cash handling.

**Financial means appropriated for legalization**

Means of payment, securities

**Preparation of financial means**

The purifying or refining of money.
Transfer of money to the place of its allocation

The evasion of declarations or registration required for account deposits.

**Placement**

Disposal of funds gained from criminal activity

Blending legal and illegal money.
Deposits made into both fictitious and existing bank accounts.
Purchase of financial instruments.
Purchase of luxury items.
Money transfers.
Smurfing.
Purchase of foreign currencies.

Entering a system of financial disguise of money origin

**Layering**

Hiding the source and the owner of financial means.

The general rule of a fast money transfer.
SWIFT Society for Worldwide Interbank Financial Telecommunications.
EFT Electronic Funds Transfer.
Traditional ways of money transfers.
Purchase of financial assets such as shares, bonds, traveller’s or cashier’s cheques
Electronic transfers between accounts.
Simulation of a cash withdrawal.
Establishment of fictitious firms.
Purchase of companies in insolvency.

Return of clean money to the owner

**Integration**

Providing evidence of a legal character of financial means.

Transactions in tax havens.
Credit-deposit operations.
Purchase of expensive and luxury items.
Commercial transactions with foreign countries
Repayment of loans.

Source: Author’s elaboration based on Gilmore, 1999.

The process of money laundering is directly preceded by activities which aim at the adjustment of the money denomination to the most favourable value defined by one of the two procedures of further conduct:

1) The provision of funds to the place where attempts are made to introduce the funds into the banking system.

2) Placement – the first stage of the classic model of money laundering.

The provision consists in the transfer of illegal money from the place of illicit income to the place of money laundering. These are often tax havens where the focus is put on discretion and anonymity, regulations allow for cash deposits and the money exchange is not subject to monitoring. The provision is most frequently made through:

The Future of Entrepreneurship
1) A physical transfer of money.
2) The change of money into luxury items which are most frequently sold at cut prices after transportation.

The main objective of activities undertaken within the first stage of money laundering, referred to as placement, is the introduction of means of payment into the financial system by virtue of three types of operations:
1) Physical deposits into accounts (transaction structuring).
2) Deposits made into accounts through smurfing (smurfing).
3) Blending legal and illegal money (blending).

Physical deposits made into accounts (a proper definition of transaction structuring) consist in making various financial operations at the stage of placement. Deposits are made into all types of accounts, including fictitious accounts of non-existent companies, organizations and natural persons. This method, however, is restricted by the obligation to identify the ordering party of an operation and to register transactions over the equivalent value of 15,000 euros. In order to evade the obligation, combined transactions are used, where series of deposits below a certain regulatory cash limit are made into definite accounts. Thus, the accumulated funds are wired into collective accounts (Kowalski, 2001).

“Smurfing” is a form of a physical deposit and constitutes one of the safest, the most developed and the best organized technique of money laundering. It is also the most difficult to divulge, but at the same time very laborious and time-consuming. The method is used on all continents, especially in Asia and Europe. “Smurfing” involves splitting and distributing illicit money among “smurfs” who either pay the money into bank accounts below some limit sum or buy traveller’s cheques.

“Blending”, in other words mixing illicit money with legal funds, constitutes the oldest and the simplest method of money laundering at the placement stage. The blending of financial means is performed within three methods:
1) Supporting criminal activity.
2) Company takeovers.
3) Cooperation defined by terms and provisions stipulated in the agreement between the management of a company and leaders of a criminal group.

The method of blending illicit funds with legal proceeds of service companies, where cash flow (turnover) is very big and its volume is hard to estimate by law enforcement agencies, is defined as “supporting criminal activity”. If a company belongs to a criminal organization, it serves an extra function of an official place of employment for members of such an organization. The history of money laundering has witnessed cases where contracts were signed between owners of companies.
and organizers of the process of money laundering. Such indicative data as high turnovers and due settlement of VAT and income taxes have made the procedure extremely safe. Only sudden appearance of big volume turnovers, which are incompatible with the company’s size and potential, and an in-depth analysis of the company’s business activity may raise some suspicions which are, however, extremely difficult to confirm (Czajkowski, 2002).

The main objective of undertaken activities within the second stage of money laundering, referred to as layering, is the separation of funds from a source of their origin. This is achieved through various fast banking operations. The duration and number of performed transactions are subjective and launderers must be absolutely sure that the establishment of a real source of money origin is not feasible. In order to achieve this, the following methods are employed:

1. Fast transfers with the use of electronic tools:
   a) SWIFT (Society for Worldwide Interbank Financial Telecommunication),
   b) EFT (Electronic Funds Transfer) and traditional methods of money transfer.
2. The purchase of financial assets and the change of their form.
3. Setting up fictitious companies - even for one financial transaction.

Very fast performance of electronic orders and easy access to SWIFT and EFT make these tools perfect for layering interdepartmental, inter-bank and international operations with a simultaneous change of their name and owner (Wójcik, 2002).

Another method of money laundering at the stage of layering involves the purchase of financial assets which could not be bought in the previous stage. In this case the separation of illicit funds from their source occurs at the moment of purchase or during the change of a deposit form. Every restructuring of invested capital poses a threat of capital loss or its value change. The process of money laundering also employs a method which involves setting up fictitious companies or saving insolvent businesses whose accounts are used to conduct previously discussed activities (Zadworny, 2002).

The main objective of activities at the stage of integration is to legitimize both the criminals’ wealth and their high incomes. This is achieved through the introduction of both illegal and legal money into the joint circulation by means of the following methods:

1) Purchase and sale of luxury items and tangibles.
2) Repayment of loans.
3) Saving companies in bankruptcy.
4) Foreign trade transactions and transactions using transfer prices.
5) Credit-deposit activity (Gilmore, 1999).
The mechanism of money laundering through the purchase and sale of luxury items and tangible assets below the market price works in the following way: the payment of financial liabilities resulted from the purchase is effected from two sources:

1) the legal source with respect to the official price defined by the purchase-sale agreement.
2) the illegal source, with respect to the difference between the market price and the prices stipulated in the agreement (Fijalek, 2001).

The sale legalizes and justifies the profit. The method engages all kinds of real estate agencies as well as companies involved in selling means of transport, even without their knowledge of the game which they are part of. The repayment of loans with illicit funds is another method of money laundering at the stage of integration. The means obtained from the loan are proved legal, whereas the repayment is effected with funds from secret sources. The method is extremely effective and difficult to reveal, particularly when institutions applying for a loan are managed or controlled by criminal groups.

Another technique of money laundering at the integration stage consists in the introduction of financial means from a criminal activity into an insolvent company with an apparent intention of saving it. The procedure is facilitated by some attitudes of managers who are in charge of an insolvent company or its assets. They usually do not scrutinize the origin of saving funds, or else deliberately enable their legalization (Zadworny, 2002).

Some other methods of money laundering at the integration stage comprise international commercial transactions which use:

1) Double sources of import financing.
2) Manipulative changes of prices of imported goods.
3) Deliberate and planned lack of correspondence of a declared value and volume of imported goods to the market price and volume of goods delivered by the exporter (Matusz, 2002).

Such actions allow for the manipulation of customs duties whose lowered value is a decisive factor during the identification of suspicious transactions.

The technique of a double source of financing involves the introduction of illegal money into the circulation at the stage of payment for imported goods. This is performed by means of two sources of money:

1) The legal source, used to pay for imported goods at reduced prices according to invoices.
2) The illegal source, used to pay the difference resulted from a real value of imported goods and the legal payment (Kęsicka, 1993).

The method of transfer price manipulation is based on a deliberate change of the price value and most frequently constitutes one of the elements of wider-range criminal activities. The planned change of transfer prices and the use of differences in particular areas of taxation, which are obligatory for
both importers and exporters, lead to the development of informal financial relations between institutions participating in the process. The relations are of informal and mutual character, and their existence is known exclusively to the authors of the process. All this ensures an increase of the value of illegitimate money transfer by means of higher and lower taxation within:

1) Mutual provision of fictitious services.
2) Fictitious complaints concerning quality of a product or service.
3) Licence fees (Matusz, 2002).

The credit-deposit method of funds legalization at the stage of integration involves the use of illicit money as long-term deposits or low-interest loans. Illegal money deposited mainly with foreign banks in the form of long-term deposits constitutes a perfect security or a source of repayment of a loan granted mostly in a home country. The second element of the strategy comprises granting long-term and low-interest loans either by institutions participating in money laundering or directly by criminal groups. The borrowers are companies which have been denied credit facilities by other banks due to lack of credibility with respect to sources of loan repayment and to their financial and economic standing.

Money laundering is a process comprising a series of financial activities undertaken by the same “work group” and for the same reasons, expressed through repeated correlations and producing definite socio-economic results. The authors of the process are top specialists in banking and vast areas of law who aim at creating more effective and better concealed methods of money legalization. Hence, it can be presumed that there exist other, so-far undiscovered methods reaching beyond the popular techniques of money laundering.

FACTORS STIMULATING THE PROCESS OF MONEY LAUNDERING

The development of the international process of money laundering as a specialized area of organized criminal activity is fostered by the following factors:

1) Different legal and financial systems of states or state unions.

2) The role of progress being a result of the scientific-technical revolution initiated in the second half of the previous century.

Differences between financial and legal systems of countries and international standards are the most significant factor stimulating the process of money laundering.

The differences refer to four areas of the systems:

1) Competition – liberalization of regulations with respect to tax and banking law through implementation of governmental programmes concerning the creation of favourable conditions for entrepreneurship.
2) Legislation – lack of uniform international legal and financial standards with respect to: what is banned and what is allowed in a country.

3) Prevention – lack of international cooperation of specialized national law enforcement agencies with respect to continuation of prosecution of transgressions and crimes committed abroad.

4) Jurisdiction – the application of the principle of territory, which hinders effective adjudication also with respect to some organized crime including money laundering (Bojarski, 2001).

The deliberate exploitation of the above-presented differences by state governments contributes to the creation of tax havens whose numerous sophisticated legal and economic mechanisms open the way to the development of private enterprises. The liberalization of tax regulations and lack of bureaucratic management barriers attract foreign investors who foster economic development through commercial and investment operations. All this leads to the establishment of agencies of specialized law and auditing companies, as well as world banks and insurance companies. The agencies, which represent transnational organizations managing multibillion deposits, offer the most sophisticated financial services and, at the same time, ensure total anonymity of participants of banking operations and discretion of conducted transactions. The nineties of the 20th century witnessed the greatest boom of tax havens. Business operations which intend to open their activity in tax havens or are already present on their territory are offered competences such as:

1) Tax savings - people who run their own legal business can be relieved from any forms of taxation.

2) Discretion and anonymity - most institutions rendering financial services conform to the legal norm according to which any disclosure of information about owners of a company is deemed a penal act.

3) Protection of assets - majority of jurisdictions of tax havens has many legal norms protecting company assets or owners. Any court executions or verdicts passed by organs of other jurisdictions are subject to objection (Niklewicz, 2002).

Whatever their geographical locations, tax haven share the same characteristic features.
Table 3. Features of tax haven share

<tbody>
<tr>
<td>Liberalization of banking law</td>
<td>Liberal regulations with respect to the banking law enable anonymous bank account openings. Banks of Luxemburg, for example, accept cash deposits without asking any questions, which is unthinkable in other countries of the European Union. The authorities argue that similar regulations are obligatory in the competitive Switzerland, and as long as they are in force there, Luxemburg will not change its own regulations.</td>
</tr>
<tr>
<td>The change of interest taxation into fees and taxes of a symbolic value.</td>
<td>Tax savings are a consequence of the following facilities: 1. Payment of small administrative charges. 2. The change of all kinds of interest taxes such as profit tax, capital tax, capital transfer tax, inheritance or vat tax into lump-sum tax.</td>
</tr>
<tr>
<td>Strict banking secrecy</td>
<td>Within the cooperation with the judiciary, the disclosure of the banking secret is restricted; the secret can be revealed in the case of the most serious crimes.</td>
</tr>
<tr>
<td>The guarantee of security</td>
<td>Tax havens are located in areas which are free of military operations and in the vicinity of big markets. They are characterized by great economic and political stability of an economic region or a country.</td>
</tr>
<tr>
<td>Excellent technical facilities</td>
<td>Excellent technical facilities enable to carry our transactions by means of the most advanced tools. Tax havens have excellent transport infrastructure including air connections with the most strategic places of the world.</td>
</tr>
<tr>
<td>Favourable law regulations for launderers of dirty money</td>
<td>The law regulations are so designed as to protect and obtain capital. The authorities consciously allow for regulations conducive to money laundering. In 1962 president Charles de Gaulle threatened to deprive Monaco of water and electricity and imposed customs union on the principality. In 2000 Monaco was threatened again with legal sanctions by the French Ministry of Finance.</td>
</tr>
</tbody>
</table>

Source: Author’s elaboration based on Wąsowski and Wąsowski, 2001 and Wotava, 2000.

According to experts of International Monetary Fund, tax havens manage the deposit sum of over 5 thousand million dollars, which is half of the funds invested outside the states of the funds origin. It has been estimated that due to the existence of tax havens the third part of incomes of the global economy is not taxed. This does not mean, however, that tax havens are popular exclusively with criminal groups, as they provide a good place of investment for international corporations and people of high incomes, who want to optimize their tax expenses within legal regulations. Special Economic Zones created in Poland in order to attract foreign investors are also some kind of substitute for tax havens. Under the amendment of tax regulations of the year 2000, the Minister of Finance issued the order which classifies tax havens into:

1) Countries and territories recognized as tax havens due to their harmful competitive taxation.
2) Countries and territories considered tax havens with respect to transactions carried out within administrative services and other non-material services.
3) Countries and territories regarded as tax havens due to services of a financial character (Kościński, 1996).

The aim of the published order was to help tax offices deal with income tax issues concerning personal and corporate income tax payers who cooperate with businesses registered in tax havens.

The achievements of the scientific-technical revolution have stimulated the dynamic development of tools and technological means used to conduct criminal activity. The commonness of a fast and efficient information transfer combined with unlimited possibilities of global travelling has contributed to the emergence of cross-border organized crime. Electronic systems of money transfer have made money laundering an anonymous process, which is very difficult to identify. The phenomenon of legislative inertia has become a serious problem requiring some solutions in order to effectively prevent the process of money laundering. There are still no sufficient legal regulations concerning the issuance, circulation and purchase of electronic money (Wąsowski and Wąsowski, 2001), which is a virtual record on special SVC cards or on computer hard discs. According to the Bank of International Clearing in Basel, the electronic money should be “an untraceable and anonymous payment instrument to the bearer, allowing for an easy payment made to another person in any conditions and without participation of intermediary institutions.” The use of SVC cards with the microprocessor opens new possibilities for money launderers such as: payment for services and goods, transfer of money between accounts anywhere in the world and change of the money into classic means of payment without leaving any accounting trace. Unlike on-line transactions, the off-line ones preserve the anonymity of trading partners. In such cases the electronic money is usually issued for one transaction only. The so-far attempts of supervising the cyberspace have failed due to two reasons:

1) Technical limitations – the computing power of monitoring systems. According to some estimation by Interpol, the number of international transactions per day amounts to 70,000 and their total value equals 2 thousand million US dollars.

2) A protest of cyberspace users – an attack on the Internet users’ freedom (Kościelniak, 1999).

According to Bill Gates, the situation is dramatic, as the development of Internet techniques have annihilated the 25 year-old efforts of counteracting money laundering. The modern tools provided by the achievements of the scientific-technical revolution and the processes of the international integration have created possibility areas for organized crime.

**MONEY LAUNDERING AND GLOBAL ECONOMY – RELATIONS AND INFLUENCE**

It is impossible to provide an explicit definition of the negative influence of money laundering on market mechanisms, as the processes of funds legalization are one of the integral elements of organized criminal activity. No part of a finely created construction of organized crime, perfectly working in intricate mechanisms of the market games, can function in isolation. The neutralization of
at least one link of the relation chain of illegal operational activities will precipitate its failure. The denial of access to the consumption of illegitimate goods can render informal businesses insolvent, and thus cause their natural disappearance. Even a perfunctory analysis of the events in Columbia supports the thesis that the harmful influence of money laundering cannot be considered in isolation from other component pathologies of economic-financial character. The process of money laundering should be treated as a very serious threat to banking systems and market mechanisms on the macro-regional and global scale, especially when one takes into consideration the goals of organized criminal groups, the strategic significance of money laundering and the methods of its achievement.

</tbody>
</table>

The feedback between the closest environment of the process of money laundering and the process itself consists in stimulating the process in the first stage of the relation and counteracting it
through defensive mechanisms in the second one. A full definition of the feedback “paradox” requires some assessment of the process in three topic areas:

1) As a new mechanism which developed at the beginning of the 20th century, and which was not a consequence of the evolution of criminal activity. The mechanism was subject to transformations evoked by achievements of the scientific-technical revolution.

2) As a mechanism of appropriation defined through the infringement of narrow boundaries of lawful properties established by the socio-economic system.

3) Creation of new ethical and moral attitudes as a consequence of evolution of long-term development of the European cultural heritage (Jackson, 2004).

The human behaviour, which is determined by the process of evolution from the collecting era to the era of globalization, has been always expressed by a conflict between duties to the society and people’s individual needs. Money laundering as a process of the European heritage development requires some assessment with respect to: laws in force and motivation and justification of the human behaviour. This assessment should be made right at the turn of the centuries and at the moment of socio-geopolitical changes which are expressed through long-term trends characterized by revaluation.

CONCLUSIONS

The following paper present big influence of globalization on development the phenomenon on money laundering. It is necessary to underline that is not able to provide all objective and statistical presentation of the role and significance of particular factors stimulating the expansion and evolution of the process. This is due to the following reasons:

1) an interdisciplinary character of the research problems,

2) a short period of global and social recognition of the phenomenon as a threat to national and international systems.

Therefore, the following paper has focused on the presentation of the feedback nature in the following areas:

1) the influence of the scientific-technical revolution on the evolution of money laundering.

2) the role and importance of the interstate tax competition in the evolution of funds legalization.

3) threats posed by the process of money laundering to economic systems.

4) the concept range of the feedback assessment.

The achievement of the concept uniformity of international standards and regulations of organizational-legal systems of countries is an absolute necessity for the development and implementation of an effective system of preventing money laundering with respect to cooperation of
specialized institutions with the administration of justice. The turning point in each county system of combating the process of money laundering should be adoption of law preventing the introduction of money from illegal or unknown sources into the official circulation. The law should constitutes a basis for the legal and organizational system with regard to counteracting legalization of financial means. The system should composed of consistent penal, banking law and cautionary norms.

Summarizing the paper should be underline that it is impossible to define explicitly the negative influence of money laundering on the functioning of particular financial institutions and on the market mechanism in a regional and global dimension. It is presumed, however, that managers of financial institutions regard the legalization of illegal funds as a threat mainly to the global economy. In their opinion, the phenomenon leads predominantly to wrong allocation of capital in global terms and to the weakening of the effectiveness of the market mechanism. Hence, the presumption can be made that managers overlook the threats of money laundering to the functioning of market mechanisms or financial institutions on a regional scale.

CHOICE OF LOCATION FOR SERVICE INTERNATIONALIZATION STRATEGY FOR SMES

Meneses, Raquel; Teterevleva, Polina

Faculty of Economics, University of Porto, Porto, Portugal

ABSTRACT

Any company while going international faces several difficulties and limitations. A service company has some extra limitations due to the nature of the services it provides. Moreover, it is considered that the smaller and newer the company is, the more limitations it faces and the more difficult the process becomes. However, how can a small new service company internationalize?

The current study is a case analysis of a small Portuguese start-up company, which is working on the development, and implementation of a retail chain of cosmetics stores. The aim of the current study is to identify the key factors, which make the process of internationalization of such a company possible. The impact of the liability of foreignness, liability of outsidership, liability of smallness and newness, specifics of the process of the service internationalization and entrepreneurial aspect will be studied.

Keywords: Service Internationalization, Small and Medium Enterprises, Entrepreneurship, Location Choice, Networks, Entrepreneurial Experience.

INTRODUCTION

The rapid growth of globalisation, with the development of technology and service innovation going further every day, coupled with tough competition obliges companies to search for more sophisticated competitive advantages and develop international services. Besides, it is known that lately the economy has shifted towards services. About 75% of employment and gross national products are contributed by service activities in North America and Europe (Cicic et al, 1999, Lommelen at al., 2005). The process of service internationalization is also more complex than the process of goods internationalization.

Normally internationalization is connected with certain difficulties: liability of foreignness (Johanson & Vahlne, 1977; Zaheer, 1995, Hymer, 1960) and liability of outsidership (Johanson & Vahlne, 2009). Overcoming those liabilities requires a company to use many resources. If small companies do not have many resources available, they also face the liability of smallness (Aldrich & Audter, 1986) and the liability of newness (Singh et al 1986). How do they manage to go international? Do all
entrepreneurs manage the internationalization process the same way? Is entrepreneurial activity important for the process of internationalization?

There is not a wide variety of studies on service internationalization or the internationalization process for retail SMEs. When speaking about internationalization, some product supply for a foreign market is usually mentioned (Johanson & Vahlne, 1977, 2009; Oviatt & McDougall 1994, 2005), however the contemporary business world is providing us with far more opportunities. The existing theories and approaches will be analysed critically in order to find differences and similarities between the product and service internationalization processes. Within the framework of the current study a case of a PAR Company will be analysed. This company is working on opening retail chains of select cosmetics and perfumery stores. This company is a retail company which was created in February 2013 and which has already started the process of internationalization in Turkey, Brazil and Europe. This business case perfectly corresponds with our research question. The business case analysis was conducted using the Systematic Combining Approach (Dubois & Gadde 2002).

THEORETICAL BACKGROUND: INTERNATIONALIZATION CONSTRAINTS

Liability of Foreignness

In the academic literature there are studies describing the first constraint of internationalization – the liability of foreignness, which is connected with the fact that the new market entry is always facing a disadvantage of a lack of knowledge and the unprivileged position of the firm compared to local companies.

Hymer (1960) managed to identify several factors influencing a company when going international. The companies entering a foreign market have far less information about the market than the natives. Besides, local companies might have a different level of governmental support or the government might create additional barriers for foreign companies to enter. Finally, the currency rates fluctuation might create a currency risk, which in some cases might bring significant losses for the company. All these factors serve to accumulate an additional cost for the company in going international and might influence the success of such an initiative. Zaheer (1995) refers to the same factors defined by Hymer (1960), though he discovers that the firm might have several advantages, which compensate for the additional costs of doing business abroad. It is not always beneficial to copy local practices while doing business in another country since the company’s own practices might be more efficient and provide a competitive advantage over local companies.

According to the Uppsala model (Johanson & Vahlne, 1977), companies tend to formalize their entries incrementally – an establishment chain. They tend first to enter the psychically closest market because
the environment in those markets is easier to understand. Then companies tend to enter other markets gradually.

The basic assumptions of the Uppsala model are bounded by rationality and uncertainty. This model is dynamic: to be able to internationalize, the company has to acquire experiential knowledge, which in its turn can only be acquired while internationalizing. The firm, while making the decision regarding the location of the internationalization tends to undertake incremental commitment decisions, choosing the closest countries in terms of physical distance, in order to minimize the uncertainty of the market. Thus, the internationalization process necessarily requires many of the company’s resources in order to cover all the costs of doing business abroad and the time necessary for gaining experiential knowledge.

Liability of Outsidership

Twenty-two years later, Johanson and Vahlne (2009) consider outsidership in terms of a relevant network in the market rather than unfamiliarity, the main source of the uncertainty. Still considering knowledge creation as one of the fundamental processes and the biggest challenges for a company in the foreign market, they state that the company is using the network for searching and obtaining necessary information.

The growth of the level of knowledge might have a positive or negative impact on building trust and commitment. The reconsidered position of the authors states that the company, choosing the location for the internationalization, will go to the market where it and its partners see more opportunities. Moreover, in the situation where the company has no local partners yet, it will tend to choose the market where the opportunities for obtaining business connections are higher. The authors also argue that, while exploring the opportunity, such variables as trust, knowledge and commitment to the relationships should be taken into account.

Oviatt and McDougall in 1994 argue that “global start-ups” are not just uninteresting anomalies as was considered earlier, but new entities in the international market deserving detailed study. They define “... an international new venture as a business organization, that from inception, seeks to derive significant competitive advantage from the use of resources and the sale of outputs in multiple countries” (p. 49). The authors mention that the Uppsala Model is applicable for slowly internationalizing companies.

Oviatt and McDougall (2009) also pay attention to such elements as licensing and network alliances. They define International entrepreneurship as “the discovery, enactment, evaluation, and exploitation of opportunities - across national borders - to create future goods and services” (p.7). Oviatt and McDougall (1994, 2009) are moving us further towards understanding the nature of born global
companies; however, this article considers product internationalization and so does not answer our research question.

Schweizer, Vahlne and Johanson (2010) propose a more complex view of the internationalization process. They consider that internationalization should be seen as either a by-product of a firm's attempt to improve its position within the network or because of entrepreneurial action. In the article the authors suggest improvements to Johanson and Vahlne's (2009) business network internationalization process model, emphasising the entrepreneurial aspects of the process.

They consider the environment of the firm as dynamic, nonlinear and laced with networks. The model takes into account the importance of entrepreneurial activities, such as those needed for launching a born global company. Authors add such state variables as entrepreneurial capabilities as a supplement to knowledge and opportunities. Schweizer et al (2010) state that entrepreneurs operate under conditions of uncertainty and ambiguity, which is causes entrepreneurial hesitation, but also allows the entrepreneur to choose more freely among the objectives that only become visible during the process.

Opportunity exploration and opportunity creation are basic entrepreneurial activities (Brito & Meneses, 2007). However, the way these activities are carried out, depends on each case. To go international, firms might use a relationship approach: they use personal and existing business relationships in order to gain information about the potential partnerships to be established and connections to be made.

The previous experience of the entrepreneur is also an important factor. Brockhaus and Horwitz (1986) argue that entrepreneurs do not just learn from their previous experience, but profit from it. Entrepreneurs managing their second enterprise, tend to do better than those with their first one, both in terms of sales and profits. This can also be applied to entrepreneurial internationalization experience: in their study, Reuber & Fischer (1997) have found evidence to support their hypothesis that the management team with previous international experience uses a strategic partnership to a greater extent, promoting faster and more efficient internationalization of the firm. In a study conducted by Spence & Crick (2007), the rapid and successful internationalization process of the companies studied is explained by the fact that those companies were “hiring an executive with relevant experience whose main role was to guide the firm to strategic international development” (Spence & Crick, 2007, p. 226). Moreover, Andersson (2011) argues that a company can go international in a very short period of time, using the entrepreneur's prior knowledge and network. The strategy, which is “based on an entrepreneur’s knowledge, links to foreign markets and a cooperative arrangement with network partners, can be successful” (Andersson, 2011, p.638)

The research conducted by Andersson (2000), demonstrates that entrepreneurs are not all the same. They demonstrate different behavioural patterns, they are concerned with different aspects of the
business and they choose different strategies for their companies. There are three types of the entrepreneurs: Technical, Marketing and Structural:

- **Technical Entrepreneur** – his main concern is technology; the product and production development are his strategic priorities. Internationalization is not the key priority, however, a foreign order might lead to export internationalization or to a listening agreement, as long as this type of activities do not require many resources. The market choice depends on which countries are making the inquiries.

- **Marketing Entrepreneur** – the idea of the product/business for those entrepreneurs emerges from an existing need in the market and an idea of how to fulfil this need. He is proactive in the internationalization process and aims to find new channels to reach consumers. He is willing to establish new international ventures. This type of entrepreneur might choose markets in accordance with personal preferences and connections, instead of using an approach that is more rational.

- **Structural Entrepreneur** – He is aiming to restructure companies and industries. He acts in companies operating in mature industries and he implements his strategy at a corporate level. The process of internationalization is more the consequence of the entire strategy, rather than a goal for him. Markets are chosen according to the competitive situation.

The creation of a competitive advantage for SME while going international promotes the entrepreneur to innovate. Aron O’Cass & Weerawardena, (2009) argue “that the SME internationalisation process is an entrepreneurial activity and entrepreneurial SMEs pursuing international market entry actively undertake innovation in all areas of value-creating activities” (O’Cass & Weerawardena, 2009, p. 1338) Therefore, the capacity of the entrepreneur to innovate is an important factor in business success. According to Frishhammar & Andersson (2009) it is also vital for the entrepreneur to be proactive. Their study shows that this has a far greater influence on the success of SMEs internationalization than strategic orientations.

**Liability of Smallness and newness**

In 1986, Aldrich & Auster conducted a study proving that for all types of firms – small and large, there are both advantages and disadvantages, and there are strategies to overcome these disadvantages. Among the liabilities for small and new companies the authors define problems of raising capital, meeting all the government requirements and being competitive in terms of labour with larger organizations, however those paths are connected with the risk of increased dependence and possible loss of control. For small companies, there are several strategies for survival: partnership, franchising, contracting and being acquired. Aldrich & Auster (1986) state that small and new companies tend to have a higher mortality rate than larger, older ones. They draw the conclusion that normally, the price
of surviving, getting older and growing is high for many companies. They have to lose their autonomy.

Studying the liability of newness, Singh et al (1986) also conclude that the lifespan of new organizations is much shorter than for more mature ones. However, authors draw the conclusion that the acquisition of legitimacy by the organization significantly attenuates such liability. Singh et al (1986) also suggest that the attempts of the company to get institutional support might significantly increase its chance of survival.

The specifics of the service internationalization process

The main reason why the processes of service and product internationalization cannot be similar is hidden in the nature of the entities: “product” and “service”.

The key differences between product and service from the marketing and logistics point of view are the following. Firstly, products have physical distribution channels in order to reach the customer, while the majority of pure services do not need these (Demirkan et al, 2011). Therefore, talking about different entry modes while expanding into a new country, such as intermediaries, might not be relevant in some service companies’ cases. Secondly, the level of the personalization of the service is always much higher, as long as the service consumer always expects an individual approach, while good customers are purchasing standardized pieces very often (Patterson & Cicic, 1995; Cant & van Heerden, 2005). Thirdly, the product is a tangible entity; the customer has an opportunity to test it before buying, while the purchase of a service in many cases is based on trust (Patterson & Cicic, 1995, Goerzen & Makino, 2007; Boddewyn et al, 1986, Demirkan et al, 2011). Fourthly, the processes of creating products and services are totally different: the majority of products require machinery and raw materials, while services require skills, experience, competencies and motivation of the person who delivers the service (Cant & van Heerden, 2005; Goerzen & Makino, 2007). Fifthly, growing the business for the product company means producing more and reaching new clients, while for the service company expansion also requires improvement of the characteristics of the service provider (Demirkan et al, 2011; Cant & van Heerden, 2005, Boddewyn et al, 1986).

Therefore, we can see that all of the processes starting from creation and finishing with approaching the customer to provide goods and services are different; therefore, the internationalization paths of the goods providers and service providers are different too. For the service companies the entry mode, the production and the distribution channel should vary. The adaptation of the service for entering the new country is also more complicated rather than the adaptation of a product, as long as it implies taking further into consideration the cultural differences, the language, the diversification and access to technologies in the country, the behavioural norms and standards, the economic issues and so on.
In 1986, Boddewyn et al claim that one of the major difficulties in the process of service internationalization is associated with licensing and management contracts. “In their pure forms, they do not involve any equity since only technology or management skills are sold to another party [Buckley 1983b]. Besides, they use the “external market” rather than “internalization” within the international firm as a mode of transfer [Buckley and Casson 1985, p. 51]. Therefore, they cannot be considered forms of direct foreign investment” (p.47). The authors also emphasise the fact that the trade process in the case of services is losing its clarity and transparency – the money is paid, but there is no way either to estimate the process of production of the service or to control its quality.

Boddewyn et al (1896) also define several ownership advantages for service companies. Firstly, it is an Internalization Advantage: in the case of customer service, the internalization process might be conducted even in the absence of equity investments. Secondly, it is Location Advantage: in terms of location requirements, international services have no special problems. In 1995, Patterson & Cicic claim that due to the intangibility of the service, providers are limited in their entry mode options; meanwhile the entry mode is a key success factor for service internationalization. They also state that for those services, which require a lot of interaction between the customer and service provider, the cultural aspect is one of the key factors.

The development of the global economy, globalization and technological development have been changing the world rapidly. The development and spread of all kinds of communication technologies has moved service companies to a new level. In 1999, Cicic et al (1999) conducted research in order to develop a model of service internationalization. Some stages of the processes and service internationalization are similar to product internationalization; however, there are many stages, which are different. They define “hard” services – not pure services, but services embedded in goods, and “soft” services – the standard pure services. The “hard” services, due to their high similarity with goods are more likely to internationalize via standard and traditional entry modes; they are less influenced by cultural and technological differences, while “soft” services require a totally different approach, and the entry mode for such services should be adapted. The “hard” services due to their tangible nature have to pass all the phases: Pre-International Stage, Exporting Stage and Higher Commitment Stage, while “soft” services do not require the exporting stage due to their intangible nature. Retail service is a soft service according to this classification. Ergo, the cultural aspect, as well as the psychological aspect and the presence of necessary skills and expertise are the most important.

**CONCEPTUAL FRAMEWORK FOR ANALYSIS**

Any company entering the foreign market faces difficulties depending on the type of the company and the types of the goods/services the company offers.
Any company faces two major disadvantages. The first one is the liability of foreignness – disadvantages connected with lack of information about the host country market (Johanson & Vahlne, 1977; Hymer, 1960; Zaheer, 1995), an unprivileged position in the eyes of the local government (Hymer, 1960; Zaheer, 1995), higher costs of doing business abroad in comparison to local companies (Hymer, 1960; Zaheer, 1995), the currency risk (Hymer, 1960) and the availability of resources (Johanson & Vahlne, 1977). The second one is the liability of outsidership – the lack of a network in the target country, difficulties of identifying market opportunities, inability to make business connections and difficulty in gaining mutual trust with local partners (Johanson & Vahlne, 2009). Besides, the internationalization strategy might depend a lot on entrepreneurial action (Schweizer, et al., 2010), the type of the entrepreneur, as well as on his previous experience and network (Brockhaus & Horwitz, 1986; Reuber & Fischer, 1997; Andersson, 2000, 2011; Spence & Crick, 2007, Johanson & Vahlne, 2009). Moreover, the international entrepreneur should be innovative and proactive (O’Cass & Weerawardena, 2009; Frishammar & Andersson, 2009).

However, when a new, small company is willing to internationalize, there appear to be even more constraints – liability of newness and smallness - such issues as problems of raising capital, meeting all the government requirements and being competitive in terms of labour with larger organizations (Aldrich & Auster, 1986). There is also a very high probability of early failure in a young company, and even if it manages to survive, in many cases it risks losing its independence (Aldrich & Auster, 1986).

When a new small service company is searching for an opportunity to go international, it should be taking into account the types of services it is providing and the specific nature of those services. Depending on the type of service, “hard” and “sort” services follow different internationalization paths (Cicic et al, 1995). It is important to choose the entry mode carefully (Patterson & Cicic, 1995). The company should also take into account the difficulty of controlling the quality and the price of the service due to its intangible nature, and consider the psychological and cultural differences of the customers in the country of destination and be able to adapt the service correspondingly (Boddewyn et al, 1896). For a consumer to purchase a service, the trust factor is also essential (Patterson & Cicic, 1995, Goerzen & Makino, 2007; Boddewyn et al, 1986, Demirkan et al, 2011). Finally, it is important to mention that the market is not always a passive part in the internationalization process. In many cases, the market attracts the company there (Buvik, 2002; Brito & Meneses, 2007).

Therefore, we can define several challenges new service SMEs might face during their internationalization process (Table 1)
The methodology used for the current research is qualitative analysis. Within the framework of this study, the case study strategy will be used as long as such a strategy allows understanding of dynamic changes within single settings and is helpful to cope with the fact of intangibility of many resources in an organization (Hoskisson et al, 1999). The information was collected using the official documents of the company and conducting interviews with its founders, asking them to expound their view of the factors influencing the process of the internationalization of the company. – A triangulation approach was used, which is usual for case studies. The sources of evidence were combined while shifting between analysis and interpretation, which allows for collecting and double-checking findings (Dubbois & Gadde, 2002)

THE CASE

The case analysed in this study is a Portuguese start-up company which was founded in 2013 and is currently working on a project to create a new cosmetics brand and open its own brand and multi-brand cosmetics stores in Europe, Turkey and Brazil. Besides products, the concept of the brand, created by this company, assumes intense interaction with the clients. The two core values of the brand, personalization and emotional connection, assume a number of service activities. The company is a “hard” service provider.

The dimension of the company is impressively small. It was founded by 3 entrepreneurs who had previous experience in 3 key areas of the business: Retail & Logistics, Training & RD and Marketing & Communication.

Pedro has more than 15 years of experience in Retail & Logistics, opening and managing selective perfumery stores. He created and developed a retail chain for selective perfumeries, which became a...
reference in Brazil, winning the ALSHOP/VISA award in 2004, 2005 and 2006 for the best shop concept.

António is a chemical engineer and has 32 years of experience as a General Manager in a company, which was the biggest distributor of a select cosmetics brand in Portugal. While working for a Portuguese selective perfume company, he was responsible for launching international selective brands. For 7 years, António was the president of the Portuguese association of the cosmetics industry and a member of the European cosmetics and personnel care association COLIPA, based in Brussels. He is also currently working as a business consultant for a Portuguese Consultancy Company.

Rogério has 21 years of experience in designing and executing marketing and communication plans. He has a rich experience of working in the international business environment. Rogério has managed many Portuguese artists’ careers, as he has been working in the music industry for 15 years, organizing marketing campaigns with TV channels, radio stations, magazines and social media. He has also developed projects with international partners.

Besides the three founders there are 4 more people working in the company. We found this case interesting, since we can analyse a situation where 7 people are preparing and implementing such a global project.

DISCUSSION

Interviews were conducted with the founders and information collected. The importance of the factors mentioned in table 1 was studied. The following results were noted (table 2) (the numbers represent the number of times the issue was mentioned in the interviews and the documents):

<table>
<thead>
<tr>
<th>Liability of Foreignness</th>
<th>Liability of Outsidership</th>
<th>Liab. Smallness &amp; Newness</th>
<th>Spec. Service</th>

Table 2. The factors influencing the process of internationalization of PAR

It is interesting to note that from the results, the most relevant factor for PAR is the previous Experience of the Entrepreneurs (in line with Brockhaus & Horwitz, 1986; Reuber & Fischer, 1997; Andersson, 2011; Spence & Crick, 2007). António claimed in the interview: “Experience is the fundamental basis of the process. Without it, the founders would not have been able to advance with the project”.

The second important factor is the Types of Entrepreneurs; though there are not so many references, the impact of this factor is significant. PAR is the case where all 3 types are working together, complementing each other in terms of knowledge. Based on the actions, main concerns, core
competence and strategies of each of the founders, we can conclude that Pedro is a Structural Entrepreneur, António is a Technical Entrepreneur and Rogério is a Marketing Entrepreneur (Andersson, 2000; Brito & Meneses, 2007).

The next most important factor is Capability to Innovate. (O'Cass & Weerawardena, 2009) The experience in the three key areas not only helps the founders to organize and manage the business processes, but it also allows them to introduce new activities and services to the business which “has remained the same for the last dozen years, where all the stimuli are based on price” (António). They are capable of identifying the weak points of the business and presenting an innovative solution to gain competitive advantages.

Market Opportunity (Johanson & Vahlne, 2009) is also an important factor. The entrepreneurs are able to define existing opportunities and develop a project in accordance with them. To do so, the entrepreneurs should be proactive (Frishammar & Andersson, 2009), which is the fifth important factor for the current case. The Proactive Attitude allows entrepreneurs to identify, analyse and take advantage of market opportunity.

In the case of PAR, market is not a passive part of the process of internationalization. The three founders were contacted by business partners from Turkey with a view of developing a project specifically for the Turkish market. After this call, the current market situation was carefully studied and all the necessary information was obtained in order to make sure the opportunity existed. Adequate actions were undertaken to develop and implement the project. Thus, Market Call (Buvik, 2002; Brito & Meneses, 2007), Market Information (Johanson & Vahlne, 1977; Hymer, 1960; Zaheer, 1995) and Entrepreneurial Action (Schweizer, Johanson & Vahlne, 2010) are the next most relevant factors.

Some potential markets, seemed very attractive at first glance, but it became apparent that entry modes are very limited to this market. “There are countries in Central and South America where there are cartels” (António). Such organisations limit the entry modes and complicate the entry process. For these countries, PAR had to delay the process of internationalization - the Entry Mode limitations Factor (Patterson & Cicic 1995)

One of the biggest concerns named by the founders is the adaptation of the concept of the store, the brand identity and the communication strategy to make it attractive for young consumers in the destination countries. However, having partners in the destination countries facilitates the process of knowledge acquisition and negotiations. The large number of network connections also facilitates an access to suppliers, consultants, potential business partners, etc. Therefore, Cultural Aspect (Boddewyn et al 1896) and Relevant Network (Reuber & Fisher, 1997; Andersson 2011; Johanson & Vahlne, 2009) are of vital importance for the PAR case.
Capital Availability (Aldrich & Auster, 1986) is also an important factor for success in the process of internationalization for PAR. The investors and business partners are currently being sought. “The idea is very interesting; the project is innovative, so fortunately we cannot complain about a lack of investor interest to join us” (Rogerio). Meeting Governmental Requirements (Aldrich & Auster, 1986) is also a subject of concern; however, it is not a difficulty in PAR’s case since according to António “present legislation facilitates a lot of the export process”. Finally, such factors as Government Barriers (Hymer, 1960; Zaheer, 1995), Currency Fluctuation (Hymer, 1960), Cost of Doing Business Abroad (Hymer, 1960; Zaheer, 1995), Physical Distance (Johanson & Vahlne, 2009), Labour Competitiveness (Aldrich & Auster, 1986) and Lack of Transparency and Clarity (Boddewyn et al 1896) seem not to be relevant to the current stage of PAR’s internationalization process.

CONCLUSIONS AND LIMITATIONS

The case provides us with an example of how a company which only consists of 7 people is able to work on a projected retail chain of cosmetics stores which is supposed to be implemented on 3 continents.

We were able to witness the importance of entrepreneurial characteristics such as previous experience, the type the entrepreneur belongs to, innovation capabilities, proactivity and capacity to undertake certain actions. In the case of PAR, the entire project would have been impossible without the founders having these characteristics. The founders’ network is very important for the development of the project as well, since it is a source of getting market information and establishing the business connections.

We can conclude that the process of internationalizing a service company is more complex than the internationalization of a product company; however, such a small company managed to do it. In this case, the barriers are successfully overcome due to the capabilities of the management team.

This case stresses Hambrick and Mason’s (1984) idea that the company is often a reflection of its management team. In addition, we can conclude that when the 3 types of entrepreneurs collaborate and do business together, the internationalization process happens much faster, since they complement each other in terms of knowledge, and such collaboration helps in overcoming the obstacles the company faces during the internationalization process (Brito & Meneses, 2007).

The case is also interesting because the market plays an active role in the process of internationalization. The founders were asked to develop a project for a specific market, which later adapted for other countries. There are other factors, which influence the process of internationalization of the company such as market opportunity, market information, entry mode
limitations, cultural aspect, capital availability and meeting government requirements. However, the entrepreneurial spirit of the founders led them to recognize opportunities, and made them willing to undertake the risk.

The main limitation of the current research is that only one case was studied, therefore we suggest a more profound investigation be conducted with the participation of more companies with a profile similar to PAR’s.

RESPONSIBLE MANAGEMENT DURING THE FIRM’S INTERNATIONALIZATION TO BASE-OF-THE-PYRAMID COUNTRIES: A CASE-STUDY OF THE FABER-CASTELL GROUP

Meneses, Raquel F.¹, Staender, Christiane S.²

¹Dept. of Management, School of Economics and Management, University of Porto, Portugal
²School of Economics and Management, University of Porto, Portugal

ABSTRACT

Globalization has changed the international business environment, enabling firms to operate in more global and complex contexts with an increasing impact on society and the natural environment. Simultaneously, Responsible Business Practices (RBP) are growing in importance - not only domestically, but also during the firm’s internationalization to different contexts, such as from developed to base-of-the-pyramid countries (BOPs). Hence, the goal of this research is to assess whether and how a company, headquartered in the developed world, adopts and adapts RBP when internationalizing to BOPs. For this purpose, a qualitative methodology in form of a case study of the Faber-Castell Group, supported by a semi-structured interview with an internal key person in corporate sustainability, was used to study the international RBP behavior of the company. This research creates value in the field of International Business Studies, by integrating RBP, FDI and international business ethics in different contexts, and demonstrating how sustainable international management can be operationalized. The RBP adoption in BOPs depends on strong collaboration and dialogue networks with entities of different kinds that pursue profound local knowledge; however, a basic standardized RBP framework in combination with some RBP adaptation is necessary for a successful RBP adoption that results in a variety of internal and external benefits.

Keywords: International Business (Ethics); Internationalization; Responsible Business Practices; Adoption and Adaptation; Sustainable Management; Base-of-the-Pyramid

INTRODUCTION

As a matter of fact, globalization has changed the international business environment by enabling firms to operate in more global and rapidly changing contexts (Dahlsrud, 2008) in which the imperatives of global integration and local responsiveness are becoming increasingly critical for internationally operating companies (Bartlett and Ghoshal, 2002).
Moreover, whilst global governance lost its ability to effectively regulate affairs such as the way business affects social and environmental matters, some firms are gaining in impact and influence (Scherer and Palazzo, 2011) causing the need for responsible business practices (RBP) that lead to sustainable development (Landrum, 2007), defined as a “development that meets the needs of the present without compromising the ability of future generations to meet their own needs” (WCED, 1987, p.37).

Nevertheless, the debate on the firm’s nature in society and the relevance of RBP exists (Scherer and Palazzo, 2011; Friedman, 1970), yet currently strategies adding to business value, sustainable success and development are augmenting in importance, leading to an increased range of responsibilities that guide the firms’ global decision-making processes (Bardy et al., 2012).

Besides, the majority of countries have been considered developing or emerging in 2010 (Choi et al., 2010), existing a need for these countries to get more globally integrated in international business research, amongst others through RBP and sustainable development (UNCTAD, 2013; Choi et al., 2010).

The motivation to do more research on RBP and sustainable management in BOPs is associated with the future need of linking economic and social value creation, as well as the fact that far more research has been made on RBP in developed countries, than for the developing world, where a stronger need for corporate RBP exists since there are fewer institutions providing general social goods (Dobers and Halme, 2009). Furthermore, research on RBP implementation is scarce once the adoption of RBP being a changing process within firms (Lindgreen et al., 2009). Therefore, further research on the complexity of the RBP concept and its successful adoption across different cultures is required (Bondy and Starkey, 2014; Kleine and von Hauff, 2009; Lindgreen et al., 2009) and specific case studies of firms that integrate RBP, business ethics and FDI issues needed, in order to get a better understanding of the influence of contextual components that firms experience when designing their RBP strategies (Bardy et al., 2012).

Therefore, the focus of this research is on the impact of context on organizational behavior (Johns, 2006) by creating an attempt to answer the questions of whether and how a firm from the developed world adopts and adapts RBP when internationalizing to BOPs. This will be achieved by confronting theory and practice through a case study of a German-based company with responsibilities in BOPs and thus adds to the international management literature by addressing the recommendations mentioned earlier. In the following sections, the recent literature on RBP and BOPs will be reviewed, the adopted research methodology explained and the case study discussed. Conclusions, research limitations, as well as inputs for future research will then follow.
BUSINESS AND SOCIETY: RESPONSIBLE BUSINESS PRACTICES (RBP)

The business - society relationship is based on the interdependence of both parts and has generated strong criticism on our business system in the past, emphasizing the need that “companies must take the lead in bringing business and society back together” (Porter and Kramer, 2011; p.4) and thus causing business’ cumulative awareness of RBP, defined as a company’s voluntary activities that link social and environmental concerns with its business operations, by ethically interacting with its stakeholders (Van Marrewijk, 2003).

In fact, RBP is a complex and multi-disciplinary notion (Lindgreen et al., 2009) that has a variety of related concepts which include Corporate Sustainability (Van Marrewijk, 2003), Stakeholder Management (Choi and Wang, 2009), Corporate Social Responsibility (Carroll and Shabana, 2010) or Corporate Shared Value (Porter and Kramer, 2011), for instance. Most of these approaches differ from each other, but are based on the same general idea of business’ voluntary engagement in practices that favor its surroundings (Van Marrewijk, 2003). In this research, the same happens for RBP by integrating all related concepts.

Besides, in an era of increased public exposure through modern communication channels that enable a faster spread of information, a key proposition is that firms should pursue a triple bottom line, considering their economic, environmental and social performance and impact simultaneously and thus create corporate sustainability (Goel, 2010). Actually, it was found out that better relations to stakeholders lead to increased shareholder value in the long term (Choi and Wang, 2009), making RBP an indispensable management tool for the implementation of a successful business strategy (Dahlsrud, 2008). Here, RBP include firm responsibilities of a multidimensional nature (Carroll, 1991): the firm’s economic responsibility (producing goods and services that society needs and sell them at a fair price, maintain competitiveness and act efficiently, in order to be able to generate sufficient income to pay its bills and reward its shareholders (Carroll and Buchholtz, 2011)), legal responsibility (performing within regional or local legal obligations (Carroll and Shabana, 2010)), ethical responsibility (acting within social mores that are not codified by legislation (Jamali and Mirshak, 2007) and lastly, philanthropic responsibility (the voluntary contribution of the firm’s resources to society (Carroll and Buchholtz, 2011)). In short, modern firms have to assume responsibilities that go beyond the fulfillment of their missions (Jamali and Mirshak, 2007).

RBP ADOPTION

Recently, RBP forms and theories evolved, demonstrating that they might be accompanied by benefits for business when applied strategically (Porter and Kramer, 2011; Choi and Wang, 2009). Basically speaking, there are three RBP forms firms can apply, in order to operationalize their
responsibilities: Philanthropic Behavior, Integration and Innovation (Halme and Laurila, 2009). While Philanthropic Behavior means concentrating on RBP that take place outside the firm’s core business activities and does not produce direct benefits for the company, the idea of Integration aims more responsible behavior in existing core operations (e.g. paying just wages, stakeholder management, eco-efficient production) and thus succeeds to create benefits related to the firm’s reputation, risk reduction and cost-savings (idem.). Innovation, on the other hand, intents to create new business models or implement strategies that solve or at least alleviate societal problems while simultaneously creating strong business benefits (idem.).

Now, efforts have been made to describe the organizational process of RBP adoption; however, it is argued that this adoption is a company-specific process, meaning that every firm needs to give its own individual meaning to RBP action (Cramer et al., 2010). Here, a practical framework for RBP adoption is suggested by the German Council for Sustainable Development (GCSD) (2006), for instance, that allows managers a better organization of the RBP implementation process in general and includes the following steps (GCSD, 2006): (1) the identification of the firm’s intention to engage in RBP and thus create a win-win situation for itself and its stakeholders, including an analysis of the firm’s status quo and its surroundings (e.g. strategic goals, availability of resources, RBP activities of competitors, RBP forms and effects). (2) The definition of the firm’s focal points and the establishment of RBP goals to individualize its RBP action, referring to factors such as the firm’s philosophy, the aims of its action, sector-relevant issues, the firm’s capacity and legal context, stakeholder interests and the definition of the firm’s RBP to approach them. (3) The establishment of internal agreement and management commitment to certain RBP action, as well as clearly defined responsibilities are needed for RBP integration that can be achieved through codes of conduct, internal or industry-specific standards and management systems, for instance, and finally (4) RBP reporting, as well as internal and external stakeholder communication of RBP action are part of the continuous RBP improvement process and fundamental, in order to create more transparency and credibility (Kleine and von Hauff, 2009). Reporting can be done via GRI Guidelines, audits and certifications and through regular revisions by representatives of the industry and stakeholders, relevant, detailed and comparable information can be gathered. Moreover, the communication of RBP goals and action to all stakeholders, and thus adequate communication channels are of the utmost importance (GCSD, 2006) and in order to analyze indicators, goals and areas of action more properly, the Integrative Sustainability Triangle can be applied (see Kleine and von Hauff, 2009).

This process seems to be a useful tool for RBP adoption and following the steps is easy in well-known domestic market contexts. Yet, the question remains whether firms also proceed in this manner when operating abroad. The following sections will shed some light on this issue.
LINKING RBP AND THE FIRM’S INTERNATIONALIZATION PROCESS TO BOPS

De facto, global markets are more dynamic and diverse than domestic ones (Alon and Jaffe, 2013) and thus a variety of aspects need to be considered when linking RBP to the firm’s internationalization process (e.g. contextual components that may influence RBP action and that firms experience when developing their RBP abroad).

The majority of countries have been considered developing or emerging in 2010 (about 80% of the world’s population) and will be held as BOPs, namely (1) developing and (2) emerging countries (Choi et al., 2010) in the context of this research. BOPs represent great market opportunities and often provide lower relative labor costs that attract increasingly more firms headquartered in the developed world. Unfortunately, regulation inefficiencies and imprecision of suitable international business behavior exist (Scherer and Palazzo, 2011) and are serious aspects in this context as firms may exploit them for their purposes and act irresponsibly abroad (e.g corruption or social/environmental dumping practices). Besides, due to the existing cultural, economic, political and legal diversity that prevails between most developed countries and BOPs, there is a certain danger of ignoring different context-specific perspectives on RBP, and corporate misbehavior may also be a result of that (Dobers and Halme, 2009). Firms may be willing to contribute to sustainable local development, but without a proper analysis of what is really needed and understood as RBP, there won’t be such a win-win situation and the firm’s will to act responsibly might be understood quite negatively. It results from this that there is a growing importance of strategic RBP in BOPs that prevent negative externalities of insufficient local knowledge or even mere goal achievement, that strengthen sustainable international business and are accompanied by gains in competitive advantage, innovation and added value (Ganescu, 2012; Landrum, 2007). But what exactly is understood as fair behavior in each context, who defines what a specific community really needs and how do firms proceed to be able to implement successful RBP action in BOPs?

Certainly, the degree of context-specific RBP adaptation depends on the management’s global perspective of the firm (Alon and Jaffe, 2013). In Perlmutter’s (1969) line of thinking, this would mean that an ethnocentric RBP orientation would imply RBP standardization; a polycentric orientation strong RBP adaptation with subsidiaries developing their own strategy; a regiocentric orientation would develop one RBP strategy per region; and a geocentric view global RBP integration with some context-specific adaptations. Bondy and Starkey (2014) emphasize the on-going debate on whether RBP adoption should focus on global or local issues, and Arthaud-Day (2005) illustrates that there is a direct link between international business strategy and responsible business behavior. In that line of thinking, global firms would define standardized RBP wherever they operate; Multinationals would adopt
diverse RBP that would differ across contexts; Internationals would adopt different RBP in their home and host countries and Transnationals would adopt a mix of both global RBP integration in combination with an adaptation of this strategies to context-specific needs (idem.). Here, local managers with strong local knowledge of what a specific community really needs and understands as RBP are fundamental (idem.).

However, even once having obtained local knowledge on ethical values and RBP understanding, doubts start with which values to follow (those of the firm’s home market (absolutism), the ones of the host market (relativism) or even international/universal guidelines (universalism) (Alon and Jaffe, 2013), agreed minimum values shared across cultural boundaries (Melé and Sánchez-Runde, 2013), such as the International Standardization Organization’s (ISO) standards, the Organization for Economic Co-operation and Development’s (OECD) guidelines for multinational enterprises, the Global Reporting Initiative (GRI) guidelines, the UN Global Compact or the International Labour Organization’s (ILO) Convention.

Additionally, successful international RBP adoption requires sensitivity to host countries’ needs (Bondy and Starkey, 2014; Lindgreen et al., 2009) that can be obtained via collaboration (Baumann-Pauly et al., 2013) and is based on a partnership selection process- a decision that is influenced by each firm’s strategic goals- including (1) the assessment of possible partners, (2) partnership selection criteria setting and choice, (3) contact and (4) communication between partners on ideas for joint RBP adoption (Seitanidi and Crane, 2009). It comprises different kinds of collaboration, such as external engagement with local or international organizations (IOs), Non-governmental organizations (NGOs), intra-/inter-industrial collaboration, governmental institutions or external stakeholders and via RBP networks (e.g. CSR Europe, World Business Council for Sustainable Development (WBCSD)), as well as an internal one with employees (Sharma and Kearins, 2011; GCSD, 2006). Employee engagement is a success factor of RBP adoption as it creates support throughout the organization, and needs to be emphasized by employee training, communication and reporting on the importance of RBP, as well as what effects it has on the community and the firm (Bolton et al., 2011; Cramer et al., 2010). This also depends on an integration of RBP culture and action in corporate development processes at all levels, above all via horizontal integration across departments (Kleine and von Hauff, 2009).

To sum up, operating in BOPs brings about additional concerns on effective RBP adoption. It depends on the firm’s management perspective and internationalization strategy on which degree to adapt RBP; yet, successful international RBP adoption depends on context-specific adaptation that implies access to local knowledge, in order to create sustainable international business with mutual benefits. This access can be gained through different kinds of collaboration.
RESEARCH METHODOLOGY

Given the fact that realities such as the understanding of RBP and ethics are quite subjective issues, a qualitative methodology was chosen for the empirical part of this research. The case study method is appropriate in this sense as it allows the researchers to get an in-depth view of organizational decision-making processes (Yin, 2009). For this purpose, a variety of data sources were combined to provide a clearer understanding of the chosen firm’s international RBP behavior (also known as “triangulation” (Denzin, 1970)). Two different, but complementing data collection techniques were adopted: In the first place, a semi-structured interview was conducted based on interview guidelines we created through the literature review, to generate more details and collect testimonies of an internal key person responsible for RBP adoption and corporate sustainability. We assured the interviewee makes strategic RBP decisions on a daily and international basis and has a mature experience in the international RBP adoption process, thus enabling us to get more detailed insights into a number of RBP and their development within the firm. To guarantee data reliability, the interview statements were triangulated with publicly available as well as internal documents (such as sustainability and annual reports, as well as corporate presentations and information published on the firm’s websites) and external stakeholder perspectives (through newspaper articles, as well as websites and documents of NGOs, IOs and networks the firm is collaborating with). The data was collected from December 2013 - May 2014 and the company selected based on (1) its level of RBP engagement, in order to cover a wider spectrum of RBP adoption, (2) its experience regarding BOPs (operating in at least three BOPs) to make sure it has RBP adoption experience in diverse BOP contexts, and (3) its headquarter in the developed world, in order to ensure a greater difference between domestic and BOP culture. After gathering data from different sources, it was prepared for content analysis including full reading of the transcribed information, coding (creating categories and linked sub-categories and topic descriptions) and interpretation of facts.

CASE-STUDY: SUSTAINABLE INTERNATIONAL BUSINESS AT THE FABER-CASTELL GROUP

---The following data has been obtained through an extensive combination of internal and external sources, described in the section above. The information received thanks to the personal interview with Mr. Braun, Head of Corporate Quality and Sustainability at the Faber-Castell Group, on March, 10 2014, in Stein, Germany, will be referred to as “Braun, 2014”. ---

The world’s leading manufacturer of wood-cased pencils, Faber-Castell, was established in 1761 by Kasper Faber and is a family-owned company that counts on a wide range of products for drawing, writing and decorative cosmetics. Headquartered in Stein near Nuremberg, Germany, Faber-Castell is
one of the oldest industrial companies and is nowadays being managed in its 8th generation by Count Anton-Wolfgang von Faber-Castell. It was also under his management that Faber-Castell became a non-listed stock company in 2000, yet making a continuous and balanced investment in its economic, environmental and social responsibility domains (Braun, 2014).

Certainly, the choice for including the Faber-Castell Group in this research project has to do with its continuous search for sustainable development through diverse RBP forms and the way they are put into practice. Yet, another reason for this choice has to do with the company’s strong international presence and profound experience in BOPs, thus being an expert in cross-cultural RBP issues. Once having internationalized its operations via FDI, the Faber-Castell Group is nowadays operating 14 production sites in nine countries (Austria, Brazil, China, Colombia, Germany, India, Indonesia, Malaysia and Peru) and is marketing its products through 25 commercial subsidiaries, thus being represented in 120 different countries across the globe and counting on about 7,500 employees worldwide (idem.).

**DISCUSSION**

Even being a stock company, the Faber-Castell Group is able to demonstrate that it can just as well think and act in sustainable manners by innovatively combining shareholder and stakeholder theorists’ lines of thinking. This is being realized through a “triple bottom line” thinking which leads to true corporate sustainability (Van Marrewijk, 2003). The connection of these three domains is integrated into Faber-Castell’s corporate culture, policy (“10 Guiding Principles”) and core values (“Brand Essentials”) that have been centrally defined by the firm’s headquarters (HQ) and implemented in the firm’s worldwide operations through an integrated management system, called FABIQUUS, for standardized processes in quality, environmental and social issues. Here, a continuous improvement is achieved through PDCA (Plan, Do, Check, Act) cycles, leading to better efficiency, globally consistent quality and more transparency (through a reporting system based on the GRI).

Moreover, when it comes to the question of which ethical values and RBP understanding to apply in BOPs, Faber-Castell decided to opt for a mix of RBP Universalism and Relativism. This has also to do with the Firm’s geocentric management view and transnational strategy by promoting the collaboration of HQ and local management teams to establish globally integrated standards and permit certain local responsiveness: “(…) a certain basic framework of standards is needed, but you do also need to adapt to local circumstances in order to be successful with your international RBP strategy” (Braun, 2014). According to Bartlett and Ghoshal (2002), it is exactly this firm mentality of creating a mix of global integration and local responsiveness that is needed due to the increasing complexity of the international business environment. Actually, a great number of authors (Halme and Laurila, 2009;
Lindgreen et al., 2009; Jamali and Mirshak, 2007) confirm this idea by stating that contextual differences influence RBP needs and cause a demand for diverse responses, being local managers with local knowledge of appropriate RBP fundamental (Arthaud-Day, 2005), also for Faber-Castell: “(...) it is important to maintain a dialogue with subsidiaries and suppliers and to be sensitive to regional differences. (...) We pursue a decentralized organization and appreciate management teams consisting of locals that are strongly involved in each region. (...) Considering the subject of wage calculation, for instance, we decided to implement “decent wages” in our worldwide operations. As the comprehension of what is decent is country-specific, we decided to discuss the local understanding of decent wages with the local labor unions and managers. (...) Then, you also need to pay attention to regional differences in terms of not only paying salaries in money. In Indonesia, for instance, we have about 30 additional agreements such as washing laundry, medical assistance, child care programs, etc. that we provide to our employees. These are all issues that require strong local knowledge we don’t have here at the Faber-Castell headquarter” (Braun, 2014). Other ways of obtaining such context-specific knowledge include contacts such as to local governments or the UN and RBP collaboration with NGOs, as well as suggestions of local employees that have direct connections to local communities. Furthermore, cross-sector dialogue networks, such as in discussion groups of the World Wide Fund for Nature (WWF) or the Biodiversity for Good Company Initiative are seen as fundamental to share RBP ideas and experiences in different BOPs. Together with the support of the central sustainability department in Germany, viable and meaningful projects that are in line with the firm’s principles and goals are then selected and executed (Braun, 2014).

A specific example of globally integrated standards is the Faber-Castell Social Charta that was signed in 2000 with the trade union IG Metall (a strict code of conduct on social criteria that is based on the employment and working conditions of the ILO), as well as the principles of the UN Global Compact (which Faber-Castell joint as the first firm of its sector in 2003), for example. These standards are monitored by a regular three-level audit control (first, through internal checklists by each site, second by internal auditors from the HQ and third, by a monitoring committee consisting of external representatives of the international trade union BWI and IG Metall, internal management representatives, as well as work councils and local labor unions (idem.)). They are seen as the firm’s minimum standards that need to be respected on a worldwide basis, with no cultural or legal variation, even if local skepticism may arise (such as about labor unions that are quite unusual in Peru or the demand for collection pans, safety apparel that is unusual in most parts of Asia (Braun, 2014)). Nevertheless, in order to solve this skepticism and explain the benefits of these standards in each region, Faber-Castell works closely with the international trade union and its local agents that negotiate with governments and help the firm to correctly introduce the standards in each context (idem.). And
even more, the fact that the compliance of these standards is monitored by the local and the international labor unions and management teams demonstrates a strong degree of universal and local considerations.

Besides, the three RBP forms discussed earlier (Philanthropic Behavior, Integration and Innovation), can also be observed in the case of the Faber-Castell Group. Firstly, Philanthropic Behavior through the Graf von Faber-Castell Children’s Foundation, for instance, that provides financial, material and personal support aiming children’s development through international projects (such as helping charities, hospitals and schools in BOPs). Another specific project is the “Programa Voluntários” in Faber-Castell’s production sites in Brazil, where employees can support community projects with the aim of passing on their know-how to locals such as by raising awareness of environmental issues, while being exempted from work. Secondly, Integration by including more responsible behavior in core business operations on a daily basis, such as environmentally-friendly and certified production processes, packaging and products, using renewable energy sources in most production sites, using wood from own sustainable forestry in Brazil and Colombia, environment-friendly water-based paint; modern waste water treatment systems, etc. (Braun, 2014). Internal RBP include free leisure programs for employees, as well as language, literacy or computer classes, health prevention programs and even preparation courses for university that are defined and implemented by local managers in accordance with the HQ. “This has a strong motivation effect on our employees, because it improves their quality of life which in turn results in even more dedication and loyalty to the company and helps us to avoid fluctuations” (idem.). And thirdly, a certain degree of CR Innovation is achieved by implementing strategies that alleviate specific societal problems and simultaneously create long-term benefits for the company (Halme and Laurila, 2009). This win-win behavior may even be seen through the lenses of corporate shared value (CSV) thinking, namely “policies and operating practices that enhance the competitiveness of a company while simultaneously advancing the economic and social conditions in the communities in which they operate” (Porter and Kramer, 2011, p.6). Faber-Castell’s forestry projects in Brazil and Colombia can be seen as interesting examples of this CSV strategy. In its site in Prata, Brazil, for instance, 10,000 hectares of wasteland were planted with millions of pine-tree seedlings, ensuring a secure and planet-friendly supply for the firm, while simultaneously having a positive impact on the environment. And thanks to biodiversity programs together with local NGOs, the managed forests provide a new habitat for species of flora and fauna just as a by-product (Braun, 2014). It results from this that today, almost 100% of the wood used for production in Brazil come from Faber-Castell’s own forests- a great international aim for the near future (idem.). Besides, the company’s reforestation project in Colombia is another example of this CSV behavior by saving destroyed nature in an overgrazed region plagued by floods, poverty and droughts, providing job opportunities for local
farmers and simultaneously safeguarding the company’s future raw material supply: “We have made contracts (15-20 years extensible contracts) with about 51 local farmers that cultivate and reforest land for us. In return, they receive a monthly salary, 30% of the wood revenues and of the proceeds from the sale of carbon emission credits, a bonus from the UN for projects that restrict global greenhouse effects. So with us, the farmers have a constant timber buyer which allows them a higher standard of living as well” (idem.). Yet, all these RBP are being conducted with a healthy degree of self-interest: “We want and need to make profits- but sustainable ones. The forestry projects demonstrate that all parts are benefiting from it- the company, the environment and local communities- and that is what we understand as sustainable thinking and acting” (idem.). This sustainable international business strategy is created through RBP adoption and adaptation and accompanied by long-term organizational (e.g. improved reputation, competitive advantage, resource assurance), employee (e.g. increased motivation and less unethical treatment), societal and environmental benefits (e.g. reducing the firm’s environmental footprint and achieving socio-economic community development) (Ganescu, 2012) that constantly need to be consolidated through employee and management trainings throughout the firm’s operations and communicated to internal and external stakeholders (Braun, 2014).

**CONCLUSION, RESEARCH LIMITATIONS AND INPUTS FOR FUTURE RESEARCH**

In conclusion, it can be argued that the Faber-Castell Group is quite an interesting case to study when investigating RBP implementation during the firm’s internationalization process to BOPs. The case study demonstrates that the definition and implementation of RBP and sustainable management practices can only be carried out by relying on strong cross-sector collaboration networks and dialogue with international/local organizations, NGOs and local management teams that pursue a profound knowledge of what is needed and understood as responsible, decent and ethical behavior in each context. Faber-Castell adopts diverse RBP forms in BOPs, combining global RBP integration and local RBP responsiveness and successful RBP adoption is the result of this behavior. The main limitation of this research is its narrow scope in terms of having analyzed one specific case only. Future research in the field of cross-cultural RBP adoption and sustainable management could therefore include a wider scope of firms. However, it contributes to the existing literature on RBP in BOPs by integrating RBP, FDI issues and international business ethics, demonstrating how corporate sustainability can be operationalized, and has practical implications as it may serve as an example for managers developing RBP in BOPs.
ACKNOWLEDGEMENTS

The authors would like to thank Mr. Braun and his team for the support and the information sources provided for the creation of the case study.

ABSTRACT

The global economy and its structure have been changing constantly throughout the last decade due to new developing economies growing in size and joining together. As a result, attitudes toward international cooperation and management are changing as well. This article aims to define the extent of interrelatedness between the economies of the BRICS countries, as well as to understand how synchronized their business cycles are and whether or not the BRICS affiliation is having additional effects from its cooperation.

For this paper, we studied BRICS countries’ GDP in constant prices for the period from 1980 to 2013, including the periods of world economic crises, in order to confirm or refute the “decoupling hypothesis” being in effect in the developing countries in the BRICS economic union. The data was examined as a time series and researched using the Hodrik – Prescott filtering technique and spectral analysis. Using the Hodrik – Prescott filtering technique, we have shown that the output gaps of the BRICS countries are not all of the same variety, and there are various different natures of production gaps in effect. Spectral analysis has shown that any synchronization among the economic cycles is insignificant. Taken together, our empirical analysis explicitly indicates that it is too early to begin speaking of corroborating the effects of the “decoupling hypothesis” at this point.

Keywords: Globalization, BRICS, Hodrik – Prescott filtering, Economics cycle, Decoupling hypothesis
INTRODUCTION

Global trade and integration is one of the main forces driving the growth of the global economy and raising its efficiency. One of the basic indicators of the effective performance of economic unions and international trade stimulation is the presence of synchronization among the economic cycles of the countries involved in such unions (Erdorf and Heinrichs, 2011; Frankel and Rose, 1998; Imbs, 2004; Papageorgiou et al., 2010).

The BRICS countries, which are related to developing markets, were chosen as the subject of our research. The economies of developing countries have grown substantially over the past decade, and they have begun to play a more significant role in the global economy (Kose et al., 2008). As a result, the “decoupling hypothesis” is starting to be discussed more and more often. (Kose et al., 2008; Felices and Wieladek, 2012; Kawai and Petri, 2014; Yeyati and Williams, 2012)

It must be noted that the 2009 crisis brought several changes in the way this issue is discussed. Before the crisis, most of the literature spoke about supporting the decoupling hypothesis (Gilenko and Fedorova, 2014; Dooley and Hutchison, 2009). Since the crisis, a great deal of research has appeared which observes a decrease or total disappearance of signs of this effect in the meantime (Dimitriou et al., 2013; Wälti, 2012).

For scientists, the most pressing topic is still globalization, and it is here that professional opinions differ, as they always have. Some work notes the presence of “spillover effects” resulting from developing countries joining these kinds of unions (Das, 2010; Dooley and Hutchison, 2009), while other researchers are expressing apprehension as to the supposed positive effects of such unions (Tsheola, 2002).

In this study, we aim to research the output gaps of BRICS countries above and below their projections, and to use spectral analysis to determine the extent to which economic cycles are synchronized. A similar approach has earlier been used in regard to European Union countries in Papageorgiou et al., 2010; Frankel and Rose, 98; etc.

In the second part of this article, we used a Hodrik – Prescott filtering technique to study output gaps. This technique allowed us to discover positive and negative gaps of output in the BRICS countries. We went on to used spectral analysis to study the extent of synchronization of economic cycles. This spectral analysis was carried out based on time series of the BRICS countries’ GDP in constant price.

The third section provides and discusses the statistical results of the research. The fourth section analyzes the results and the contradictions which arose, and makes an attempt to explain them.
METHODS

Decoupling hypothesis

Before the 2009 crisis, it was possible to observe various symptoms of developing countries’ economic cycles becoming disconnected from those of developed countries (decoupling hypothesis). However, today, the situation has changed (Chkili and Nguyen, 2014). Countries with developed economies have gradually become stronger since the 2009 crisis. The USA and the European Union countries are gradually ending their policy of collective mitigation to stimulate their own productive forces, resulting in economic growth. While this is going on, developing countries are running into the problem of stagnant economic growth and the necessity of adapting to being in the “decrease” phase of the economic cycle. As a result, we are witnessing an outflow of capital and devaluation of national currency in developing markets, the markets which BRICS countries are connected with. In these conditions, it is doubtful that we will find evidence in support of the decoupling hypothesis.

Therefore, in order to eliminate the influence of financial markets, inflation, and currency exchange rates on the economic cycle, we chose to use GDP in constant price as the subject of empirical analysis in our research. Macroeconomic variables (like inflation) are also in part based on the economic cycle. This is the most traditional approach, and we intentionally did not scrutinize a large set of interrelated macroeconomic variables.

Hodrick–Prescott filtering

Hodrick–Prescott filtering is one of the most popular ways to expand a time series of economic data into a trend and a cycle. This expansion is crucial for us to express the output gap, the difference between the actual and predicted GDP. The existence of an output gap indicates that the economy is functioning at an inefficient level, using its resources either too much or not enough.

By “trend” we mean a certain steady, systematic change over the course of a long period. However, no matter how large the series, one can never be certain that the trend is not just part of a slow oscillation. Having set a trend apart from seasonal oscillating changes, series depict a more or less regular fluctuation. Seasonal effects are easiest to discover, set apart, and study. Here, changes are occurring which are applied to the system by some cyclical mechanism external in its relationship to the basic mechanisms which define the system’s behavior.

When determining the trend, we understand that any movement observed over the course of a long enough time will appear to be smoothed-out. This means that, at least locally, the component corresponding to the trend can be expressed by a polynomial of time $t$.

So, in our case, GDP is expanded into a trend and deviation from that trend (Hodrick and Prescott, 1997; Tsyplakov, 2011):

$$y_t = y_t^\theta + y_t^\epsilon.$$  \hspace{1cm} (1)
where $y_{t}^{\theta}$ is a trend or structural component of the time series and

$y_{t}^{\phi}$ is the cyclical component of the time series.

To get a smoothed-out series, we apply conditions which minimize the cyclical component’s deviation:

$$\sum_{t=0}^{n}(y_{t})^{2} + \lambda \sum_{t=0}^{n}[\left(y_{t+1}^{\theta} - y_{t}^{\theta}\right) - \left(y_{t}^{\phi} - y_{t-1}^{\phi}\right)]^{2} \rightarrow \min$$

(2)

where $\lambda$ is a Lagrange multiplier. For annual data, $\lambda = 100$.

Then, after isolating the trend, we inspected the rest of the series using spectral methods of analysis.

**Spectral analysis**

Next, after isolating the trend, we inspect the rest of the series using spectral methods of analysis (Kendall and Stuart, 1966).

We assume that, for any pair of values, there exists an autocorrelation:

$$\rho_{j} = \frac{\text{cov}(u_{t},u_{t-j})}{\sigma^{2}}$$

(3)

where $\rho_{j}$ is the correlation between members of the time series after filtering by $j$, $\text{cov}(u_{t},u_{t-j})$ is the covariance between members of the time series after filtering by $j$, $\sigma^{2}$ is the dispersion of the rest of the time series.

The total sum of coefficients $\rho_{0}, \rho_{1}, \rho_{2}, \ldots$ is called the correlogram of the series. By determining the correlation of the rest of the series in stages, without components of the basic trend, we can construct the correlogram, which lets us graphically trace the interdependence between members of the time series.

Then, when studying the different kinds of periodic processes (meaning processes which repeat over a defined period of time, including economic processes), the best way is to expand periodic functions that describe these processes in a trigonometric series. The simplest periodic functions are the trigonometric functions $\sin x$ and $\cos x$. The period $T$ of these functions is $2\pi$.

The simplest periodic process is a simple harmonic oscillation described by the function:

$$y = A \times \sin(\omega t + \phi_{0})$$

(4)

$$t \geq 0$$

(5)

where $A$ is the amplitude of the oscillation,

$\omega$ is the frequency,

$\phi_{0}$ is the phase offset.

This kind of function (and its graph) is called a simple harmonic. The fundamental period of the function is $T = \frac{2\pi}{\omega}$, which means that one full oscillation occurs in the span of time $\frac{2\pi}{\omega}$. The denominator $\omega$ shows how many oscillations will occur within the time unit $2\pi$. 

The Future of Entrepreneurship

Complex harmonic oscillation, which occurs as a result of applying a finite (or infinite) number of simple harmonics, is also described by the functions $\sin x$ and $\cos x$. This way, a constant periodic function can be expressed with this system of formulas (6), (7), (8):

$$A = \frac{2}{n} \sum_{t=1}^{n} u_t \cos \frac{2\pi t}{\lambda}, \lambda = \frac{2\pi}{a}$$  \hspace{1cm} (6)

$$B = \frac{2}{n} \sum_{t=1}^{n} u_t \sin \frac{2\pi t}{\lambda}$$  \hspace{1cm} (7)

$$S^2 = A^2 + B^2 = \frac{4}{n} \sigma^2 \nu(\lambda)$$  \hspace{1cm} (8)

where $u_t$ is a member of the time series after removing the trend;

$\lambda$ is the wavelength;

$S^2$ is the intensity of the oscillations.

The graph of $S^2$ is dependence on the wavelength $\lambda$ is called a periodogram.

**RESULT**

*Hodrick – Prescott filtering*

Using Hodrick – Prescott filtering, we isolated the cyclical component from the trend for all of the BRICS countries. Our goal in doing this was, first of all, to find the existence of an output gap, and second of all, to track the dynamic of output gaps to determine the effectiveness of the economy’s function. The results of the smoothed time series of the BRICS countries’ GDP are presented in figure 1.

From the figure, it is clear that output gaps in the BRICS countries have fundamentally different characteristics. For Brazil and South Africa, constant stochastic oscillations around the projected value of the GDP are normal. In other words, the output gap is sometimes positive and sometimes negative. This means that the economies of these particular two BRICS countries sometimes function with excessive, sometimes with deficient use of resources.
Figure 1. HODRICK – PRESCOTT FILTERING OF THE TIME SERIES OF BRICS COUNTRIES’ GDP

The Future of Entrepreneurship

India and China are characterized by a period of economic growth with a consistently positive output gap in the period from 1992 to 2005. This means that the economies of these two countries have used their resources too intensively and they are now encountering stagnant economic growth, for this reason among others. A similar phenomenon could be seen in Japan’s economy during the 1970s and 1980s, when a period of very fast economic growth was replaced by the so-called “lost decade”, a period of marked moderation and stop to economic growth. Excessively intense economic growth can not last forever. Our empirical results now tell us that the economies of India and China are now being threatened by another “lost decade”. However, it must be remembered that these are developing countries, not developed countries. Stable markets have not been established in them, and a “lost decade” may have drastic effects on their economies.

In Russia, the situation is more troubled. Russia’s output gap from 2001 on has been steadily negative, meaning that its economy is not working efficiently, not using its resources to a sufficient degree, and the global financial crisis of 2009 has only heightened this weakness. This shows that Russia has not finished dealing with the fallout from the 2009 crisis, and it won’t be easy to move on. Proof of this is the complete lack of any tendency toward reducing the negative output gap. Therefore, we see that the output gap dynamics of BRICS countries are various, and certain coincidences can be seen only between India and China, or Brazil and South Africa. This means that we can not corroborate the decoupling hypothesis or speak about additional economic effects of bringing countries together into the BRICS union.

Spectral analysis

Next, after eliminating the trend, we did additional research into the rest of the time series. Correlograms of the rest of the time series of BRICS countries’ GDP are depicted in figure 2.
The greatest dependence among the members of these series appear to be: for Brazil, members 5, 9, 10; for South Africa, members 13 and 14; for India, 8 and 9; for Russia and China, the chart appears flat. So, the graphs have different shapes and different natures, and there is not much correlation between them. As a result, the most intense oscillation in these remaining GDP time series will most likely be in those years with members of the time series with the most correlation. To confirm this, we have shown periodograms of these time series of BRICS countries’ GDP in figure 3.
Figure 3. PERIODOGRAMS OF THE TREND-LESS TIME SERIES OF BRICS COUNTRIES’ GDP

From the periodograms, we can see that, in South Africa, oscillation around the base trend occurs at 2-year intervals. In Brazil: 3 years. In Russia: 1.5 to 2 years. This correlates to oscillations in economic activity, which are connected with capital markets. India and China again confirm the conclusions which we made in the previous section.

On the whole, the results show that synchronization in the BRICS countries’ economic cycles is minimal, and we can not find evidence of the decoupling hypothesis.
DISCUSSION

Our research has show that the BRICS countries have different output gap dynamics, which prevents us from confirming any significant level of synchronization in the economic cycles of the BRICS countries and, as a result, prevents us from supporting the decoupling hypothesis.

Despite this, our research goes well with the existing paradigm of research on this topic. Before the financial crisis of 2009, there was an environment of fast growth of developing countries’ economies, especially Asian ones (Kose et al., 2008; Felices and Wieladek, 2012; Kawai and Petri, 2014). Most researchers found evidence of the decoupling hypothesis and spillover effects in their research (Das, 2010; Dooley and Hutchison, 2009 Gilenko and Fedorova, 2014). However, the global crisis of 2009 changed the trend (Yeyati and Williams, 2012) and research has begun to show more and more evidence of reduction in the decoupling hypothesis and spillover effects since the 2009 crisis.

Our research also indirectly supports the results of those other researchers who have noted a substantial decrease in the decoupling effect after the 2009 crisis (Dimitriou et al, 2013; Wälti, 2012).

In addition, the research shows that, in order to improve the efficiency of the economic union, the BRICS countries must first solve their internal structural problems.

CONCLUSION

We have done research on the level of synchronization in the economic cycles of the BRICS countries. In doing so, we used two methods: Hodrick – Prescott filtering and spectral analysis. By using Hodrick – Prescott filtering, we discovered the varied nature of the output gap dynamics of BRICS countries, which allowed us to conclude that the economic cycles are not sufficiently synchronized and that the decoupling hypothesis can not be supported at this time. Spectral analysis yielded similar results.

In the future, we plan to examine the BRICS countries’ cooperation using other macroeconomic variables.

INTANGIBLE ASSETS AND FINANCIAL PERFORMANCE OF RUSSIAN COMPANIES LISTED IN MOSCOW STOCK EXCHANGE

Mezentceva, Ann V.; Mezentceva, Olga V.

Institute of Material Studies and Metallurgy, The Ural federal university named after the first president of the Russia B.N. Eltsin, URFU, Ekaterinburg, Russia

ABSTRACT

One of the central problems of the global economy is the issue of attracting investment into different sectors of a national economy. The presence of intellectual capital among an enterprise’s assets is a substantial factor in attracting investment. This article researches how the size of an enterprise’s total stock revenue depends on intellectual capital’s share in the structure of the company’s assets. The model was based on data collected from the accounts of 41 public Russian companies, all of them part of the Moscow exchange. In this study, we operated on the assumption that the presence of intellectual capital would have a positive effect on the financial results of Russian companies; however, in the early stages of our research, we could not find a linear relationship between intellectual capital and financial results. Only deeper and more detailed analysis, based on non-linear regression models, led us to evidence supporting the positive correlation.

Keywords: investment, foreign direct investment, intellectual capital, intangible assets, total comprehensive income.

INTRODUCTION

An enterprise is an open system and, to better understand the factors of growth and development, any changes must be monitored by managing entities. Financial statement analysis can say a lot about an enterprise’s activities (Kaplan, and Norton, 1992). An enterprise’s financial analysis, lending an understanding of general economic tendencies, permits evaluation of such macroeconomic problems as: low level of international investment, capital withdrawal from their country, minimal levels of innovation, lack of competition, and stagnation of small businesses. In other words, it helps to evaluate everything intrinsic to the Russian business model of today.

In the global economy, one of business’s key drivers for success is innovation, along with intellectual capital. (Harlow 2013, Tan et al., 2007, Amin et al., 2014). Measuring innovation processes (Boly et al., 2014) and value creation through intellectual capital (Shakina and Barajas, 2014) are beginning to be
discussed more and more in research literature, as well as evaluating the effects of intellectual capital on a company’s activity. (Kim, S.H. and Taylor, D., 2014)

Intellectual capital’s effect on financial performance of companies is still an open question for developing countries. This is why most researchers are trying to find and evaluate the relationship between these factors (Tan et al., 2007, Amin et al., 2014).

In Russia, an enterprise’s bookkeeping is characterized by the near impossibility of exposing the amount of intangible assets, intellectual capital, and innovation, even in the most open and public companies. They are reflected in the consolidated accounts under “non-current asset”, “goodwill”, and “participation in joint-stock capital”. This is why, in our calculations, we used the value “non-current asset”, which in some instances included the value “goodwill”. In this work, we also tried to find a relationship between the value of intangible assets and the value of total revenue in 41 enterprises. The enterprises were selected from all companies listed in the Moscow exchange.

This article presents the results of an attempt to find an exponential relationship between values. Our analysis has shown that there is no logarithmic relationship between the analyzed data; a further analysis was carried out and a sinusoidal relationship was exhibited.

METHODS

Data and accounting of intellectual capital in Russia

In our research for analyzing the effects of intellectual capital on financial performance, we used annual consolidated financial account data of Russian companies from 2010 to 2012. We examined the information of 41 open public companies listed in the Moscow exchange, and its constituents the MICEX Index and RTS Index, which regularly publish their financial accounts by International Financial Reporting Standards or US GAAP.

International Financial Reporting Standards (IAS 38) allows advertising expenses, training, research and development expenses to be considered intangible assets. The goal of research and development is to acquire new knowledge. To be considered an asset (including intangible assets), the International Financial Reporting Standards require the following criteria: identifiability and oversight. An intangible asset must also be nonmonetary, without physical form, and capable of yielding economical benefits in the future.

International Financial Reporting Standards allow the following to be included among intangible assets: lists of clients, market knowledge, technical knowledge, uncompleted R&D, and other similar assets. This substantially expands our understanding of intangible assets. According to Rule GN8.12 of European Valuation Standards, regardless of whether they are reflected in the balance or not, intangible assets can be divided into two categories:
goodwill (unidentifiable intangible assets),
identifiable intangible assets.

It is recommended that “goodwill” be evaluated as a whole number, by means of converting surplus income into capital. Surplus income is defined as “rent goodwill” or economic gains. This means that “goodwill” is equated with capitalized economic gains.

In this way, the total comprehensive income should theoretically be connected with the worth of an enterprise’s intangible assets in a directly proportional manner.

In the accounts of several companies examined, the “goodwill” index is expressed within the index “intangible assets”, and as a result, in our calculus we used the sum of intangible assets and goodwill if they were expressed separately in the accounts. This was done so that the data for analysis would take an analogous appearance. In this way, we used the coefficient , which shows what portion of the enterprise’s overall assets is taken up by intangible assets and goodwill. It is important that the enterprises can be compared using this coefficient.

The index — allows us to evaluate the profitability of an enterprise’s actions and can also be compared with indexes of other companies.

Description of sample

In our research, we examined the financial accounts of Russian companies over the period from 2010 to 2012. Russian companies have only recently begun the practice of indicating intangible assets in their accounts. We found ample evidence that absolutely no intangible assets were accounted for in Russian companies’ bookkeeping from 2010 to 2011. For this reason, we were forced to examine only data from 2012 in our model. Obviously, this limited the results of our research somewhat.

The second limiting factor was that we have been examining companies which are included on the Moscow Stock Exchange, but which belong to different fields. It must be noted that all publicly-traded companies on the Moscow Stock Exchange are “flagships” of the Russian economy, meaning that they are the leaders of their fields in terms of assets, capitalization, and profit. We did not examine small and middle-sized businesses due to these enterprises’ data being inaccessible. The general distribution of our data grouped by economic sector is presented in table 1.
Regression analysis

In this way, we acquired sets of comparable data from 41 companies. We ran a regression analysis to discover the link.

The independent variable (X) was the portion of intangible assets in total assets, and the dependent variable (Y) was the portion of total comprehensive income for the year in revenue. A graphic depiction of the relationship is presented in figure 1. The relationship between the X and Y variables is portrayed as points on the coordinate plane (X,Y) and form an empirical linear regression Y of X.

![Graph showing regression model](image)

**Figure 1. Regression model showing the dependent relationship between X and Y**

Basic assumptions:

1. Let the following formula be true

\[ Y_t = a + bX_t + \varepsilon_t \tag{1} \]

where \( t = 1.41 \) is the number of factors in the sample being examined
$X_t$ is the deterministic variable
$Y_t$ is the dependent variable
$a$ is a constant
$b$ is the slope of the line
$\varepsilon_t$ is the deviation

2. $E\varepsilon_t = 0$, the value of error $\varepsilon_t$ is mathematically expected to equal 0;
3. Error $\varepsilon_t$ has a normal distribution when $t = 1.41$

We can calculate the values of regression of $a$ and $b$ using the method of least squared, as in formulas 2 and 3.

\[
b = \frac{n \sum x_t y_t - \frac{1}{n} \sum x_t \sum y_t}{n \sum x_t^2 - (\frac{1}{n} \sum x_t)^2}, \quad (2)
\]

\[
a = \frac{1}{n} \sum y_t - \frac{1}{n} \sum x_t b \quad (3)
\]

We tested our hypothesis $H_0: b = b_0 = 0$ using the standard criteria of linear regression: Student’s t-test and F-test.

As is obvious from figure 1, a linear approximation is unlikely to give good results. We decided instead to test other kinds of dependency, specifically logarithmic and sinusoidal. We incorporated these types of relationship into a linear one, using formulas 4, 5, and 6.

$Y = AX^b \quad (4)$

By making a logarithm of both sides of the equation, we can bring this relationship into a linear form:

$\ln Y = \ln A + b \ln X \quad (5)$

$Y = \sin \varphi_0 + \beta \sin X \quad (6)$

RESULTS

An analysis of the correlation helps to discover the trend and level of interrelatedness between two variables. The results of regression analysis by linear, logarithmic, and sine models are depicted in table 2.

</table>

Table 2. STATISTICS OF REGRESSION

From table 2, it is clear that the best approximation of the data occurs when using a sine-based model of dependency. However, we also see that the R-squared and F-statistic are very small. This implies
that we probably can not describe any kind of relationship between the data.

Since we received results which correspond poorly with the existing research (Lev et. al., 2009; Cohen and Vlismas, 2013), we tried to partially remove the limitations caused by examining enterprises from different fields by building a linear regression model specifically for the metallurgy sector of the Moscow Stock Exchange. We chose metallurgy because it is connected to the largest number of enterprises on the Moscow Stock Exchange. The results of this model are presented in Table 3.

</table>

Table 3. RESULTS OF LINEAR REGRESSION ON THE METALLURGY SECTOR

Although the R-squared value in this model seems much more ideal, the relationship between intangible assets and financial performance turned out to be opposite.

From an economical point of view, these results help to understand that innovation in Russian enterprises carries an administrative character, rather than a market-based character. At this time, an enterprise’s innovative activity and its intangible assets, including intellectual capital, do not have an effect on its generated income or its ability to attract investment in stocks. These results are not standard, and they are related to the unique features of Russia, as most research on the topic does succeed in finding a connection between intellectual capital and public corporations’ revenue. Another factor which has a substantial effect on these results is the lack of a developed institution to protect intellectual property in Russia. In practice, most companies do not need to commercialize the results of their innovative activities. This leads to intangible assets being absent from the consolidated accounts, and this information is instead incorporated into “investment in associates and joint ventures”.

DISCUSSION

The results of the research demonstrated no connection between Russian enterprises’ intellectual capital and their financial performance and ability to attract investment. This result is unexpected, given the background of the Russian government’s attempts to stimulate innovation and raise direct investment into Russia’s economy. In addition, most researchers recognize a positive connection between intellectual capital and the success of enterprise activity in other countries in the global economy (Amin et al., 2014, Manolopoulou and Tzelepis, 2014). It is important to note that up to 70%
of successful innovation in the world is achieved through the lens of the Demand-pull hypothesis (Nemet, 2009). Russia is a developing country with a significant share of raw material exports. It is possible that modern Russian enterprises have neither the experience nor the culture of innovation and asset generation in their knowledge base. This is why the market of direct investment in Russia is represented largely by companies in the raw materials sector of the economy, which has a low level of innovation and intellectual capital.

CONCLUSION

We researched the relationship between intellectual capital and financial performance to better understand how public Russian companies attract investment. Based on data about the portion of total assets taken up by intangible assets and about the value of total comprehensive revenue for the year, we created different models of dependency, specifically: linear, logarithmic, and sine-based. We came to the unexpected result that there is no connection between intellectual capital and finance performance in Russian enterprises. In the future, we are planning deeper research into the reasons for this connection’s absence.

A NEW WAY OF BUSINESS THROUGH THE EUROMEDITERRANEAN MODEL

Micheletti, Patrick

KEDGE Business School

ABSTRACT

The transformation of the model of management is mixed because it is based on economics concepts where the viability and the success of a good operation remain the concern first but also the continuity of the richness represented by human resources. It’s the reason for which we can affirm it can have a bringing together with the managerial practices of Arab countries and those of Europe like France. According to the preceding approaches on spaces of thinking, the Euro-Mediterranean model can be conceived like a space of directions:

For geographical reasons, even if the limit is fuzzy: thus, East and West of the Mediterranean sea can be considered like good examples for this demonstration due to different but similar things like the way of life, the landscape.

For historical reasons: philosophical, scientific bases and policies of the occident, primacy of economic flows until the end of the 19th century.

For sociological reasons: (strictly speaking) the Mediterranean way of life and thought (role of the community, research of the humanistic proximity, impacts of futility, logic of resistance) and with the historical Mediterranean pressures (frequency of the crises, interbreeding) but also (substantial rationality, diversity, accumulation and growth) and with the European historical pressure (constitution of an unique economic area).

For economic reasons: the permanent juxtaposition of levels of different richness and growth. This constitutes a first framework of the Mediterranean new model because we also notice that we not have opposition between North and the South, West and East; they offer a real possibility of bringing together and a mutual empowerment, and not antagonism.

They offer no catch to dichotomy North/Modernity/Industry and South/Tradition/Land, They can only to enrich our vision and our approach economic by market. That they make it possible to defuse the trap of the "Mediterranean values" whose contents (often fixed) cause dispute, schematics to the profit of the description of process authorizing the differences. To reason in term of process as enables us to approach management more easily as the contents of the values of the Euro-Mediterranean positioning and management.
TRACKS FOR A METHODOLOGICAL FRAMEWORK

The project: what characterizes the transformation of the economic and business model; it is the extraordinary variety of situations which make its apprehension complex and consequently any difficult intervention because of the singularity of each element being treated in particular with different and unbalanced methods of approach. One could, to even say that it is also what makes its interest because each challenge to take up will be proportionally more difficult compared to traditional situation. Initially, one can thus affirm that the operators intervening in the transformation of business to be not only voluntary and courageous but that they require should moreover surmount obstacles additional and specific to each type of situation. The complexity of the business which one finds in particular at the time of the transformation of the structure grows because of the multiplication of the variables and uncertainties to be taken into account in all the situations of business. From this complexity, we can be directed while betting on a complexity distributed on human complexity on all the levels. The organization of a cell project with a head of project identified and legitimate with a clear communication resting on in-house partners and into external (Businessmen, trade unions, consultants). The interactive connection between the signal business and the base cannot set up to leave from a head project or a cell project clearly identified. We do not mobilize the staff on strategic stakes starting from the emotional reaction on the importance which represents the weight of a decision and the consequences which result from this by making brief surveys or by forcing a dominant ideology to make adhere the staff and to mobilize it on the importance questions or of survival. The role of a head of project representing the connection between the customers and the signal business constitutes the first steps of a system which implemented in the duration and which aim at ensuring stability of the method and to consolidate each individual in his role of person in charge that can emit opinions or make constructive proposals. The principal goal is to crystallize around the head of the whole project of information which can play a determining role in very decision-making by taking a real decision, while classifying and while choosing what will be the strategic major importance and what concerns the second order. It is significant to specify that the head of project endorses a considerable responsibility because of his role and the decisions which are or will be taken thereafter.

The strategy: the transformation of the business model is mixed because it is based on economics concepts where the viability and the success of a good operation remain the concern first but also the continuity of the richness represented by human resources. It’s the reason for which we can affirm it can have a bringing together with the business practices of Arab countries and those of Europe. Each decision in the process of transformation implying the staff is the result of interactive connections intern and external through which the business policy is organized for the attack of objectives aiming
at satisfying in priority the interests of the shareholders. From this point of view, the evolution of the managerial practices centered on the policies of human stock management encounter real difficulties between the divergent interests of the shareholders in search of profitability in the short and medium term and the requirements of the professional life in the long run in particular on the fact of preserving the employment as long as possible. The results reached are thus the representation of these two types of connections which one can qualify "A feel single" insofar as the authority in the business will be exerted fully or "A double feel" insofar as this authority is lit and helped by the base. In fact, the two types of connections belong to a more complex unit including the environment by the signals of the market into external (emission) and the behavior of the in-house actors characterized by the attitudes and the reactions compared to the signals (reception). Located at the borders of the strategy of the firm, antagonisms of connections reveal various positions that is necessary to try as well as possible to combine interests of each part because of the essential principle of survival of the firm duplicated of the will of the managers to preserve the employment by developing the activity characterized mainly by the turnover. The interactive connections between the strategy of the firm and the policy of human stock management thus depend fully on the moment (time) and the place (space geographical: room, regional, national or foreign) in which they will be exerted. Thus, it is of primary importance to hold account in order not to be in permanent shift between the possibilities offered on activities, markets, outlets or quite simply of the scale economies related to the only fact it is more interesting to rationalize the costs by transferring them for example on others places of production and the requirements of profitability which are increasingly related to the human capital.

HOW TO DEFINE A SPACE?

To speak about the Euro-Mediterranean concept is a point of identification for a space in which the subsets political, sociological, and organizational (and why not geographical, physical, climatologic…) have behaviors different from the same subsets in others spaces. Thus, it seems possible to call upon the most recent work of geopolitics, and in particular those led by different authors in economics and management. They show a process of delocalization of the direction, fruit of acceleration of universalization and a new way of modernity, in a measure where we do not lead to a return towards the tradition. Their ways of thinking stay initially on the development of the plurality to the world level, which is declined on four axes:

- The decentralization of the modernity, which is not more European or euro-American. That is explained by the disappearance of the historical aspects (colonial world), economic or symbolic system (authority).
- The dissemination of the authority because "there is difficulty by thinking a political, social or cultural phenomenon from only one actor or from only one leader (State, religion)"; this dissemination leads to a "double pluralism: pluralism of the systems of direction and pluralism with inside of each system of direction."

- The rise of the relativism, like consequence of the preceding dynamics, but also by the philosophical dispute of universality to which we can oppose incommensurability by an increasing complexity that general dynamic vision cannot restore and by the refusal of the rejection of the egocentrism.

- The new kind of the honor of the nations, related to the end of a vision of the world in opposite blocks (fine of the cold war) allowing the primacy of the business and cultural (with the detriment of the ideology): Today it’s through the market that the” virility ”of the nations is expressed”.

After the structural factors identified, we are interested in the contents of spaces of direction as the place where three dynamics tangle up:

- The installation of a deliberative space in which can act the public or private actors. in order to pose and solve problems calling of the common solutions to this space…

- The production of "collective" and specific preferences to this space in the world game

- The capacity to convert these preferences and these deliberations into political performances…

Thus, we will qualify this space of direction any space able to answer simultaneously the conditions of deliberation, by enunciation and performance such as we have just defined them.

Without entering in a radical criticism of the definition of the space of direction, we note that its institutional dimension leads us to analyze the contents and the impacts of regionalization only through political constructions (European Community), religions or geographical spaces. We notice as well as the Euro-Mediterranean model does not enter any of these categories, but it doesn’t reject anyone. Thus, a finer investigation remains necessary.

THE BEGINNING OF THE EURO-MEDITERRANEAN MODEL OF BUSINESS

According to the preceding approaches on spaces of thinking, the Euro-Mediterranean model can be conceived like a space of directions:

- For geographical reasons, even if the limit is fuzzy: thus, East and West of the Mediterranean sea can be considered like good examples for this demonstration due to different but similar things like the way of life, the landscape.
- For historical reasons: philosophical, scientific bases and policies of the occident, primacy of economic flows until the end of the 19th century.
- For sociological reasons: (strictly speaking) the Mediterranean way of life and thought (role of the community, research of the humanistic proximity, impacts of futility, logic of resistance) and with the historical Mediterranean pressures (frequency of the crises, interbreeding) but also (substantial rationality, diversity, accumulation and growth) and with the European historical pressure (constitution of an unique economic area)
- For economic reasons: the permanent juxtaposition of levels of different richness and growth: Euro (money) is a quasi-perfect example of integration of diversity, for reasons of sustainable development predicting a common future:

Europe Community constitutes the greatest world fresh water reserve; blue gold becomes one of the major stakes of the geo strategy and an Euro-Mediterranean vision is essential, less than one hour of plane separates the European Union (GNP/inhabitant highest) and Africa. In fact, geographical space materialized by the Mediterranean Sea between the "rich person" and the "others".

While remaining voluntarily in the management approach, we see that there is matter to constitute a space of direction, since if we disregard (for the moment) public / institutional dimension, we find conditions of deliberation (in particular on the level private operators), of stating and performance. To further go, to materialize this space of euro-Mediterranean direction, implies to find identity marks.

We must move towards the definition of the euro-Mediterranean which rests:
- on European specificities, which are compared to the United States: economic conflict political competition and incompatibility of the social models.
- On approaches resting "on a kind of praise of heterogeneity? to substitute in the State of right of the "States of the rights" orchestrating diversity of the allegiances and the human memberships in order to differently treat them within companies in diversity.

The goal is to assure the accomplishment for each one individually by not forcing anybody to be detached or disavow its fasteners and while basing themselves precisely on these bonds, from the point of view where each one would be removed from the artificial yoke generated by the "homogenization".

On the capacity to identify "clean" interests, being able to involve divergences within the European Union including on what seems the Truth. Thus goes from there it of the concept of single market, considered by English as having to be most open possible on free of exterior so that it is based in an immense total market "the Mediterranean countries insist that the single market marks its identity with respect to outside, in particular by mechanisms of control". To define a space of euro-Mediterranean direction would not amount it proposing a political humanism resting on three bases:
- ontological equality in dignity, which seeks to be carried out through equality of the rights and the conditions, right conferred on each one to take part in the definition of the collective destiny like carrying out its individual destiny;

- the freedom, concretized in the individual conscience and the independence of mind, the distance kept vis-à-vis the communities of membership, the separation of the private and the public;

- the knowledge which means the dissociation of the knowledge and the ignorance, the knowledge and the capacity; the disclosure of the knowledge to all; the permission to doubt and call into question; the permanent possibility to transform the world with the risk of error; "the European universalism taken within the limits of our thinking and our knowledge, cannot completely include all philosophies European economics policies, whereas it appears more relevant for the Mediterranean nations of in relation with Mediterranean countries and further to exchange practices in management which could be very useful for everyone.

In this context the business model is designed to answer a series of questions essential to any business – who are the customers, what do they value, how that value can be delivered to the customer at an appropriate cost and how the business deploys its assets. It includes a description of the key assets, both physical and intangible such as intellectual property, governance structure and management. It consists of both a narrative of how the business works and the numbers – how it makes a profit. The concept came into vogue when the spreadsheet provided an easy way to test the financial implications of the narrative in a financial model which contained assumptions about costs, product demand, sales revenue and profit. The financial outcome of changes to the narrative, or assumptions about product demand, etc. can be tested in the spreadsheet model (Margretta 2002).

One reason for the popularity of the concept in the new economy, appears to have grown out of the need for the emerging dot com firms to have a comprehensive, but standard format, to explain to potential investors ‘how they were going to make their money’. The value proposition of dot com firms typically involved an innovative service or process for attracting a customer base. The proposed business model was often radically different. Often there was no precedent, no business experience, for instance, on which to base likely demand levels.

This constitutes a first framework of the Mediterranean new model because we also notice: - that we not have opposition between North and the South, West and East; they offer a real possibility of bringing together and a mutual empowerment, and not antagonism.

They offer no catch to dichotomy North/Modernity/Industry and South/Tradition/Land,

- That they can only to enrich our vision and our approach economic by market

- That they make it possible to defuse the trap of the "Mediterranean values" whose contents (often fixed) cause dispute, schematics to the profit of the description of process authorizing the differences.
To reason in term of process as enables us to approach management more easily as the contents of the values.

We can also see the arab business model from the strong point of it: the Islamic finance. In fact, the islamic arab business has proved to be a resilient system based on the basic principles of transparency and fairness in business, for example during the financial crisis which started from the US and hit. The resilience of Islamic financial institution is due to the unique business model which will continue to be different from the conventional banking due to its nature being the asset-based approach for each dealing.” Overwhelming majority of businessmen see an asset base a starting point for each and every deal making this business much secure, transparent and open for investors and bankers. We don’t believe in imagination as physical presence of assets is a basic ingredient for Islamic banking as this very basis has provided strong protective layers to each and every business in this industry. The Islamic banking industry also faced numerous challenges such as harmonization of Shariah standards and strict adherence to the basic principles of this type of banking while competing with its established peers called conventional banks.

The growth pattern and acceptance of the Islamic banking has been a hallmark behind the sustained growth of the Islamic banks and the financial institutions. This trend will be a ladder for achieving excellence for the entire Islamic banking industry in years to come.

**THEREBY, WE CAN PROPOSE THE EURO-MEDITERRANEAN BUSINESS MODEL**

Last approach of the prism: what can we do on the level business and research, by supporting us obviously on what we think and by locating us in logic of complementarities at the Anglo-Saxon model?

To create a euro-Mediterranean thought around business must lead us to a thought on diversity and complexity. This one is very present since several works were built on the same report: the difficulty of the neo-classic model dominating to account for the choices of the economic actors. This is not new in the sphere of management. A fast reference to the work it possible to recall that this we had identified several types of management that we briefly recall:

The Anglo-Saxon model with the dominance of business, competition, profit, individualism.

The Japanese model: growth, quality, integration, agreement,

The Euro-Mediterranean model: Management “in between”, people, internal negotiation, diversity

This approach of diversity is found in several disciplines of management. Some examples: - “To be together, firstly it’s probably to make together. It is necessary to clash with the complexity and the
construction of the future by the creativity, by the collective mobilization of the intelligence. That also means that it is imperatively necessary to rehabilitate the postulate of the specific one, of the locality and of immediately reaction, by combining them. It is necessary to support microphone-spaces of creation of the direction ".

Us plunged not only in one problems of the direction, but also in a new vision of management. The return to specific, with the room is a differentiation marked compared to the Anglo-Saxon model homogenizer.

These capacities must be like the capacity maintains a coherence of Organization between its organizational dimensions intern and external ". Even the financial managers are interested with diversity. We will also note that the transverse approaches of the managerial problems have very as a finality to better locate and better to include/understand diversities of the organizations and the actors the component (management of SME, governance, impacts of the TIC, durable development of the firms, social responsibility, quality, management of knowledge, innovation?), and this in order to better act. Taking account of:

- In the ethical plan, like paradigm interpretation legitimates evolutions;
- and on an emotional level, like horizon, desirable sign of the future ".

In fact : Euro-Mediterranean business has like field:

- the examination of the managerial practices of the companies and the men whose acts have as life or a starting territory the "areas" of the South of Europe, of the North of Africa and west of the Middle East. This geographical framework legitimates the conceptual roots of the euro-Mediterranean model but does not reduce the studies and the applications to this territory: we think that all the areas of the world are marked in their history by diversity, that all the decision makers, interested by an enrichment of the Anglo-Saxon model, must be integrated in a euro-Mediterranean approach. It is necessary to keep with esprit an opening on the Latin America, on the Chinese or Indian regional approaches. We could even think of Japan which modified its model insertion in Asia by giving up the metaphor of the flight birds (linearity, uniformity, Cartesian logic of the movement) for that of Symbiosis (diversity, harmony across the differences).
- Problems of pedagogy and research centered on specificity, diversity, the locality to have a more relevant systematic approach of the complexity of the organizations and their actors. The potential which is in front of us is huge. Thus, it seems to us that the Mediterranean approach (sea coast coastal traffic proximity) compared to Anglo-Saxon approach (ocean vastness) allows a thought on the decision-making. If we not regard the latter as step rational optimization under identified constraints, but a choice taken in a more or less reduced context of uncertainties, it seems that we can explain that:
The reduction of uncertainty for the Anglo-Saxons, confronted with the vastness and the lack of reference mark, passes by modeling and the very formalized contract, sources of homogenizing procedures,

- The space proximity offers to Mediterranean possibility of return (logical of experimentation more accentuated than modeling) and a permanent monitoring (less contract).

- The creation of grids of analysis and the actions leaving a ethnocentric vision the world and management, and making it possible to differently solve problems of survival, of development of the men, organizations and nations where the euro-Mediterranean world legitimate by its is lived of the crises and the conflicts and also by the solutions that it brought throughout its history and which it will continue to propose. The sustainable development of the firms and the nations can be conceived and be built only on one history. The Hofstede dimensions do not directly predict any phenomena or dynamics. Applying them to make sense of what happens in the world always has to take into account other factors as well as culture - notably national wealth, history, personalities, and coincidences. There is no quick fix to understand social life after taking a dose of Hofstede. But the dimensions, when well understood, do allow to predict a little better what is likely to happen. And they become more useful as you go from the specific case to the trend, average, or expectation. For instance, knowing about culture hardly helps to predict what car you will buy - but the trend among your compatriots to buy certain types of car in the coming years can be predicted fairly well. In the case of the business Mediterranean model we can involve the differences of culture in order to gather the best way to trade and develop business whatever the differences and the length of cultures.

The Hofstede dimensions of culture are group-level constructs. Dimensions of national culture are about societies; dimensions of organizational culture about organizational units. Neither is about individual differences between members of society or organizations. Comparing survey responses between individuals does not yield similar patterns to the cross-population comparisons on which the Hofstede dimensions are based. This kind of issue is known among scholars as the distinction between levels of analysis If we take into account the Islamic financial model we can find the basis of the system according to one item from the system:

**RECONCILING PUBLIC AND PRIVATE PARTNERS FOR OPERATING AIMS**

According to their culture and know how, public and private partners have different expectations and aims for their own performance. Nonetheless, they are obliged to be agreed on the Essential. Public partners are under pressure to improve the wealth both for citizens and companies by selecting areas of the most urgent needs and by helping everyone to be involved with their point of view and in action.
Private partners are looking for business with the highest profit and the lowest risk in order to be in the good agreement with shareholders in spite of many problems of employment supported mainly by public partners.

Thereby, how reconciling the two partners in keeping their aims by creating a new way of cooperation without being in arguing?

Before, we have to precise that public partners are evaluated by the vote of the electors and private partners by the vote of the shareholders. Both are periodically on the way to accept many hard conditions to survive.

Therefore, the first point and prior idea for each one is to preserve the status of its position to maintain themselves or simply to exist.

Personal relationships and continuity are serious issues notably in the vision where everyone expects in the improvement of what they can realize for both citizens and companies.

In other words, each one try to be the leader to renew the management to satisfy their voters but in reality they blocked each other.

The only issue of this question is to modify relationships between the two partners as so to find another sense of performance. This is a real challenge to use differences as « checks and appropriate size » to achieve public and private purposes. This requires negotiating the structure of what they want to do in advance.

The results of such negotiations reflect the power of each partner in outside the partnership; the main advantage is the creation of a balance of power for the partners.

If we would stay on the idea that one of them is more powerful than the other one, we can create nothing with this basis. By the way, it’s another idea of partnerships instead of having competitors with the aims to still get more and more, the partners become unified for operating aims. We completely change the message towards citizens and companies. Then, we enter in a strategy « win and win ».

However, to ensure relatively fair partnerships, public partners should not overtake their power in transforming it in a judgment of each situation they set up and private partners should be in a position sometimes to understand and to accept the public policy in favor of companies.

Negotiation in detailed terms such as those can plainly mean that on a hand, the new partnership costs by the involvement on another hand, the partnership make benefits for everyone because the balance is earned and the results can be measured.

The object relates mainly to the advantages which the private and public partners can mutually bring while ceasing looking itself like competitors.
They have to gain while collaborating on joint projects instead of systematically seeking to remain on closed aspects relating to their prerogatives. In other words: why not to make so that the public and private partners lay down common objectives in order to reach a decisive advantage for those which they represent and often are find themselves in the two camps. For example: we can belong to the public sector and to be interested by the results of the private companies, just like we can be in a private company and be interested in the performances of the public sector. In short terms: each sector is complementary especially if there are jointly laid down objectives.

We have to explain: operating aims:
In the private sector: companies need many services from public sector: for example education, transportation, social services, country services like water distribution, energy
In the public sector: citizens and civil servants need activities, profit, employment from companies
Then: If we consider that the sectors are in competition and completely different each other we can fall the success for everyone in the country. That's to say: collaboration is possible for the two sectors in order to succeed.
In transportation we can have both private and public companies on the same markets.
In this context, each company can make profit and create employment if the organization of transportation is discussed and share in the sense of the passenger.
In that example, we see the real advantage for everyone: shareholders, citizens, government, civil servants.
Then operating aims are agreement in competition organized in order to give advantages for everyone.
But we can think competition is wrong in this aspect of negotiation.
It seems to be true if we forget that government and mainly European Community is the keeper of competition in every country of EC.
It's a kind of guarantee to recognize aims like genuine and real systems of cooperation between the two sectors.
In this context, we can accept a new economic and political agent represents by European Community. The third agent is for citizens and companies the real issue of their own aims.

THE INFLUENCE OF ISLAMIC FINANCE ON FIRM’S CAPITAL STRUCTURE

Miglietta, Nicola; Battisti, Enrico

Department of Management, University of Turin, Italy

ABSTRACT

The aim of this paper is to investigate the different instruments and sources of capital structure in Islamic finance, highlighting the peculiarities and distinctive features compared to the traditional corporate finance. For traditional finance, theories about capital structure and its value creation for shareholders (shareholder’s value), a fundamental element of the financial goal of a corporation, have characterized several research determined the principles underpinning the modern corporate finance. Using an exploratory research methodology, this work, after resuming such models for capital structure’s construction, explores the main financial sources linked to Islamic finance, identifying the major differences and similarities with traditional corporate finance.

Keywords: Islamic Finance; Capital Structure; Profit and Loss Sharing; Ribā; Gharār; Maysīr; Harām; Value Creation.

1. INTRODUCTION

The set of legal institutions, financial instruments and companies that operate in accordance with the teachings and traditions of the Shari’ah (Islamic law) is the so-called Islamic finance. In the world there are more than 1.5 million Muslims and operate more than 350 financial institutions classified as Islamic Financial Institution (IFI). In the coming years it is estimated that the Assets Under Management (AUM), potentially managed in accordance with the principles of Islamic finance, which currently stands at 1.5 trillion dollars, could exceed 6 trillion (Grewal, 2013). To this date, the transformations that took place in the Islamic world during the last decades have marked the finance and, unlike the ’70s (period in which began the transfer of capital from the Arab world to the West), there is an Islamic finance that can be defined as such because of its supervening governance rules. This phenomenon is relatively new and fast-growing, it has taken on increasing significance and implications raised so relevant as to have attracted the interest of various researchers and scholars of finance (e.g. Solé, 2007; Iqbal and Mirakhor, 2007; Gomel el al., 2010; Krasicka and Nowak, 2012; Grewal, 2013). However, a large part of the financial community ignores, with particular reference to the capital structure, the specificity of the phenomenon and, in consideration of this, we believe the
above subject worthy of study. This derives in part from some basic assumptions. First, the high debt that characterizes today's companies has increased the effects of distortions in the risk-return relationship on which is founded the modern corporate finance (Miglietta and Battisti, 2011). The instability that ensued has created a selection of companies that, in order to survive, have developed strong adaptation skills to face the changing financial systems. Secondly, aspects such as transparency, social responsibility and the containment of speculation, which summarize the principles of Islamic finance and are only partly shared by the traditional corporate finance, summarize an idea of finance closely linked to the real economy (Salvi and Miglietta, 2013). In this sense, Islamic finance suggests specific procedures for selecting investments, prohibits the use of derivative financial instruments and imposes strict limits on indebtedness (which does not provide for the payment of interest but a remuneration based on the progress of the business whose implicit risk is shared with the lender) (Askari et al., 2010).

Islamic finance is based on religious-legal principles laid down by the Shari‘ah geared mainly to highlight what is denied to do, rather than on what is lawful to do instead. In fact, according to a fundamental principle of Shari‘ah, “everything is permitted, provided it is not expressly prohibited”. Transparency, social responsibility and the containment of speculation are the other principles on which Islamic finance is based.

In economic and financial terms, the main requirements examined by numerous researchers (e.g. Kahf and Khan, 1992; Warde, 2000; Siddiqi, 2004; Gatto, 2008; Hamau and Mauri, 2009), are:

- prohibition of ribā (fixed or determinable payments of interest on funds lent);
- prohibition of economic practices that involve excessive uncertainty (gharār) and speculation (maysīr);
- all conducts prohibited by the Koran (cd. Harām) are prohibited. Examples of prohibited activities by Koran are those related to tobacco, pornography, arms trade, alcohol, pork and gambling.

These principles offer interesting insights about the opportunity to interpret and measure the sources of funding for Islamic finance. In this regard, the methodology used in this work was exploratory where, drawing inspiration from the relationship between corporate finance (that can be defined as “traditional”) and capital structure (equity and debt), we have defined the fundamentals and the system of financial decisions with the aim to capture the similarities and differences between conventional and Islamic finance.
2. CAPITAL STRUCTURE’S CONSTRUCTION: BASIC CONCEPT AND THEORETICAL BACKGROUND

The corporate finance, outside the boarders of Islamic economics (or better, according to the approach in this paper we define as “traditional”), is an area of finance dealing with the financial decisions that businesses must undertake, the related tools, analysis and assessment techniques to be developed to support these decisions (Tardivo et al., 2012). As noted above, for the Islamic firm, finance represents the sum of legal institutions and financial instruments in accordance with the dictates and traditions of the Shari’ah. However, the system of financial decisions does not present particular differences (from a “substantial” viewpoint), in addition to the constraints dictated by Shari’ah which imposes a classification of financial instruments that must be structured on the basis of the individual features of the same. The traditional enterprise, regardless of the legal form necessary to the exercise of a particular activity, can be represented as a large box containing a set of assets that have been financed by raising funds of equity or debt. Financing alternatives, along with the investment choices and providing for the return on capital employed, represent the system of financial decisions (e.g. Haris and Raviv, 1991; Damodaran, 2011; Brealey et al., 2011). Even the Islamic firm, for to finance the activity, may use, in addition to the self-financing, instruments of debt or equity. The activities should be those not expressly prohibited by the Shari’ah and funding instruments must comply with the principles already mentioned. We believe that the guiding principles that underpin the traditional corporate finance can be applied also to the Islamic firm that, from this point of view, is not different from all the other companies. Each company must decide where invest its financial resources (investment decisions), how to find the necessary funds (financing decisions) and how much cash return to shareholders (dividend decisions).

The traditional corporate finance states that investment decisions should be oriented to activities and projects that have a positive net present value, with a yield a return (expected return) greater than the cost of capital employed. In practice, the yield a return is measured by cash flows and their distribution over time, taking into account the positive and negative collateral effects of the project. The level of yield increases for riskier projects and reflect the financing mix used.

First, reported to Islamic finance, you need to ask how the evaluation approach changes in the presence of a prohibition of interest (ribā) which excludes the monetary value of time (time value for money)? In fact, the absence of an opportunity cost of capital connected to the value of the currency in time would seem to exclude a traditional evaluation approach. However, despite the Shari’ah prohibits to consider the monetary cost of time as opportunity cost of capital, the use of standard benchmarks is a common practice followed by Islamic bank; it creates some doubts of interpretation but, in fact, solve the evaluation problem from the practical point of view (Shaikh, 2009). The financing decisions have a
direct impact on the definition of a capital structure. In this sense, according to the traditional finance, must be built a composition of sources that maximize the value of the investments, in line with the riskiness of the project. Financing decisions determine the capital structure (capital structure) of an enterprise, which gives rise to the determination of the minimum investment return represented by the cost of capital (Miglietta, 2004). The composition of the sources varies from company to company and must aim to minimize the Weighted Average Cost of Capital (WACC). In this sense, for the same expected return on investment, increase value creation for shareholders. Islamic finance is rich in financial instruments of the company that are structured using architectures similar to those of conventional finance and debt-based ones are the most widely used mode (Von Pock, 2007).

Secondly, how is it possible to reconcile this kind of tools within a scenario that prohibits the use of an interest rate (interest free economy)?

Even in this case, the prohibition is theoretical, in practice and in the operation of the instruments, there are a number of applications which, while giving rise to further perplexity from regulatory point of view, are defined Shari’ah compliant and then recognized as not prohibited. The system called profit and loss sharing, the mark-up financing, and the fees due on loans (and other technicalities) can be traced to the notion that the traditional finance is represented as the cost of borrowing money or financial.

The religious principles and bans that follow should therefore be subject, from time to time, to interpretation (Haron et al., 2009). This activity is entrusted to the Islamic jurists who study instruments to observe the precepts. The prohibition of interest is absolute; it means that it is always prohibited. However, it is allowed the profit margin. The uncertainty in the contracts and transactions (the prohibition of gharar) makes a contract void. This prohibition is not absolute, and a reasonable uncertainty can be tolerated without invalidating the transaction executed. From the combination of different forms of financing can be configured many financial transactions that recall the patterns of traditional finance (swaps, joint ventures and project financing). The dividend policy, finally, determines the methods and the extent of the cash flows that the company returns to its owners. This is typically done in two cases: when there are no investment opportunities and based on the characteristics of the shareholders.

In the scheme of reference of traditional corporate finance, the objective coincides with the firm’s target. The majority of scholars agree that this objective is the maximization of value (e.g. Rappaport, 1986; Guatri, 1991). Islamic finance does not have a different objective from the traditional one. Entrepreneurial activity must be carried out to create a profit and the objective of its management should be the maximization of the value of economic capital invested. According to legal precepts and religious principles, there is another objective, equally important and not only linked to maximize the value but also the maximization of collective welfare and the community.
By analyzing the characteristics of Islamic firm, its objective function does not differ from that of the so-called traditional company, but rather amplifies the concept of “value”, extending from the economic capital to the common welfare. In fact, any business activity spread to create an “added value”, which is then re-distributed or reinvested in the asset. For Islamic finance, and in accordance with the principles that govern it, that value is not measured only from the point of view of stakeholders (in respect of contributed capital), but also from the point of view of the target communities and its individuals, who have more general and extensive interests, related to well-being and demands of the community.

3. VALUE CREATION WITH THE OPTIMAL CAPITAL STRUCTURE FOR TRADITIONAL CORPORATE FINANCE

3.1. Cost of debt
In traditional corporate finance, financing (loan) implies a remuneration that is expressed in an interest rate. The cost of debt is defined as the remuneration requested by third parties who finance the firm according to the risk they endured. In formula:

\[ K_d = i \times (1 - t) \]

Where \( i \) denotes the gross interest rate paid to third parties, and \( t \) the tax rate.

How do you determine the interest? It is necessary to distinguish between short-term debts and medium-long term debts. For short-term debt is subject to a rate equal to the market price, adjusted by any expectations of a rise or fall. For medium-long term debt is necessary to consider the interest rate applied to loans with equivalent characteristics. Introducing the default risk that we will have:

\[ K_d = (r_f + \delta \times D/E + D) \times (1 - t) \]

Where \( r_f \) is the interest rate \emph{unlevered} (represents the minimum rate applicable in relation to the size of the company and the guarantees offered); \( \delta \) the coefficient of variation in the cost of debt to changes in leverage (\( D/E \)) and, finally, \( D/(D + E) \) the capital structure related to the debt.

3.2. Cost of equity
According to the traditional corporate finance the cost of equity is the return required to invest capital in a risky activity and represents the opportunity cost of capital incurred for failing to invest the capital in another activity of the same degree of risk. How do you estimate this return?

Following the logic of the models of risk and return (for example, Capital Asset Pricing Model), it is necessary to identify a rate of return relative to risk-free assets and a second component represented by the "premium" required to invest in a risky activity. With reference to a risk free return there should be no default risk and there should be no intermediate cash flows. The risk premium on the other hand depends on the characteristics of investors and the market. The market premium on the other hand
depends on the characteristics of investors and the market. To estimate this component are available historical data on premiums, adjusted and integrated in real terms, divided according country-risk and approaches based on the implied equity premiums. The market premium, finally, must be parameterized with the type of investment through the estimation of a factor called beta. This coefficient is closely related to the capital structure of the company and take on different values depending on the level of indebtedness.

The cost of equity is then expressed as follows:

\[ K_e = r_f + \beta_{\text{levered}} \times MP \]

where \( r_f \) is the risk free interest rate, \( MP \) is the market premium, defined as the difference between the yield a return (expected return) and the risk free interest rate. The \( \text{levered} \) Beta of the firm represents the systematic risk involved in the investment and expresses the change in the price of a security to changes in the market index. This coefficient is related to the capital structure by the following relationship:

\[ \beta_{\text{levered}} = \beta_{\text{unlevered}} \left[ 1 + (1 - t) \frac{D}{E} \right] \]

The cost of equity, depending on the structure, becomes:

\[ K_e = r_f + \beta_{\text{unlevered}} \left[ 1 + (1 - t) \frac{D}{E} \right] MP \]

4. VALUE CREATION WITH THE OPTIMAL CAPITAL STRUCTURE FOR ISLAMIC FINANCE

4.1. Cost of debt: Murabahah and Ijara

The Murabahah is a financial instrument that belongs to the type of debt, in that it provides that the contract price paid by the customer to the bank to obtain the asset, which it acquired on behalf of the former, is equal to that paid by bank to the manufacturer of the goods covered by the contract plus a mark-up, defined at the time of conclusion of the contract. According to the current practice within the Islamic banking system, the mark-up is defined on the basis of a benchmark rate of return, which generally consists of an interbank interest rate (Pisol et al., 2012). The contract price of a Murabahah (\( P_C \)) can be expressed by the following formula:

\[ P_C = I \cdot (1 + k_{\text{MUR}}) \]

Where, \( I \) is the capital outlay incurred by the bank to purchase the asset for the customer’s account and \( k_{\text{MUR}} \) is the contact’s mark-up set by the bank by way of remuneration for the brokerage service it played. For the firm \( k_{\text{MUR}} \) represents the cost that it incurs when it decided to resort to this form of financing.

Determining the price/cost of such funding sources, some sources confirm that the rate of return set by an Islamic bank on a contract of Murabahah and, therefore, the cost to be borne by a firm that decides to
use that tool, are a function of a number of factors. Some of these factors are the cost of funding incurred by the bank (represented by the rate of return on deposits) and the risk premium, which depends on the creditworthiness of the borrower (e.g. Usmani, 2002; Biancone, 2012).

The cost of a contract of Murabahah can, therefore, be expressed by the following formula:

\[ k_{MUR} = [r_b + (1 - \pi) E(L)] x (1-t) \]

Where:

- \( r_b \) is the rate of return benchmark that, in practice, may be established or an interbank interest rate applied in the major Western banking systems (such as LIBOR), or the one in force in the country where the single Islamic bank operates (for example, for Pakistan the KIBOR - Kerachi Inter Bank Offer Rate), or the BLR (Basing Lending rate) practiced by conventional banks that have headquarters in Islamic Country (Hasan, 2011).

- \( \pi E(r) + (1 - \pi)E(L) \) is the default spread, defined by the bank as a result of a loan applicant evaluation conducted on the company, which aims to estimate its probability of failure equal to \( (1 - \pi) \), the efficiency \( E(r) \) and the expected loss \( E(L) \). That increase, applied to the benchmark rate, is used to cover the credit risk to which the bank is exposed under a contract of Murabahah, which is, in turn, reflected in the contract price \( (P_c) \) (Rosly, 2011).

Based on the above, it is clear that the manner in which it is determined the cost of a contract of Murabahah \( (k_{MUR}) \) is similar to that which is followed in determining the cost of debt capital in the conventional financial system \( (k_d) \). In both cases, the base rate chosen as a reference, is increased by default spread which is a function of the creditworthiness of the borrower.

The Ijarah belongs to the category of debt, as it recognizes to the bank a guaranteed fixed return for the service it provided. As required by that form of contract, in fact, the rent that, periodically, the company is required to pay to the lessor bank is defined in such a way as to allow it to return disbursement, argued in an earlier period, for the purchase of the asset being Ijarah, and at the same time, obtain a profit margin. In practice, even with reference to this context, the literature informs that most of the Islamic banks, for to determine the required return, using as a benchmark the interest rate charged on loans from their conventional equivalents which present similar contract terms dell’Ijarah to those being evaluated (e.g. Kamal et al. 2008; Ahmad et al., 2011; Hanif, 2011). The determination of the profit margin for the Islamic bank is achieved by adding to the interbank interest rate at 1 year (in force in the Country in which it has operational headquarters) a spread, which amount varies according to a number of factors, such as what is below the Ijarah (which can be a building, a vehicle and a system), the duration of the contract and the creditworthiness of the counterparty. It follows that the final value is almost always in line with the interest to be applied in conventional financial systems for comparable loans.
The cost of an Ijarah for an enterprise \((k_i)\) then, can be represented by the following formula:

\[
k_i = (r + \text{spread}) \times (1 - t)
\]

Once again emerges, just as we have seen with reference to the contract of Murabahah, the mode of remuneration of the funder, carried out according to the same risk factors that, in the context of conventional finance, is a function of the cost of debt capital.

### 4.2. Cost of equity

In traditional corporate finance, the estimated cost of equity of a company is calculated using the Capital Asset Pricing Model (CAPM). The same assessment in Islamic finance, involves having to consider the different principles that govern the fundamentals: the lack of interest (riba), and sharing in the profits / losses of the company (Profit and Loss Sharing).

As is known, the formula underlying the CAPM states that:

\[
E(r) = k_e = r + \beta \cdot [E(r_m) - r]
\]

It follows that the expected return on a risky activity \(E(r)\) and, therefore, the cost of supporting the issuing undertaking to reward those who decide to invest in that specific activity \((k_e)\), is equal to the yield of a security risk-free \((r)\), plus a risk premium, \([E(r_m) - r]\), assigned by the market to risky assets, weighted by a coefficient that measures the degree of systemic risk that has that specific activity compared to the market, the beta of the firm \((\beta)\). The fact that, within the Islamic financial system, there is no provision (in theory) the opportunity to enjoy an interest rate, would imply the inapplicability of the CAPM to estimate the cost of equity due to the impossibility of identify rate risk-free (Damodaran, 2011).

However, we have examined how the process of formation of the cost of debt in Islamic finance provides a mechanism for the formation of the same cost based on a benchmark derived from traditional finance and equivalent to the "cost basis" of the same source which, through the application of a different principle (the mark-up), it forms a "cost complement". We believe that also in the process of estimating the cost of risk capital, in Islamic finance, can be associated with a "minimum return" that the lender expects the investment made. Combining this return to a situation of "minimal risk", the total cost could be determined by a similar mechanism that suggested by the CAPM. Some authors, still on the subject of not applicability of CAPM in Islamic finance, have identified as the rate to be used in substitution of the risk-free rate, the zakat rate (e.g. Ahmed and El-Ashker, 1987). These scholars, starting with the recognition that every Islamic investor is required to pay a capital tax (zakat), regardless of whether it is invested (in which case the sampling is done on the yield obtained) or is maintained in liquid form, they calculated what should be the minimum return required by an investor for Islamic ensure that there is a depletion of its capital. The minimum return is equal to the rate...
applied to capital in the levy zakat (z). In any case, accepting a "traditional" approach, the cost of risk capital, ceteris paribus, would be equal to:

\[ \text{k}_e = r_b + \beta \times \text{ERP} \]

Where:

- \( \text{k}_e \) is the cost of equity;
- \( r_b \) is the interest rate charged by operators in the context of pricing of Islamic financial contracts mark-up financing, considered as a proxy rate risk-free used by conventional finance;
- \( \beta \) is a parameter that measures the degree of risk specific activity to be financed;
- \( \text{ERP} \) is the equity risk premium, which reflects the judgment that investors have on the degree of risk involved in a given market and represents the premium required by them on investment in securities traded on it.

As is well known, there is an alternative model for calculating the cost of equity (Ke) and is represented in the traditional finance, the formula of Gordon about Dividend Discount Model (DDM), according to which:

\[ \text{k}_e = \left( \frac{D_1}{P_0} \right) + g \]

Where “D1” is the value of the expected dividends for the year ahead, “P0” is the price at time 0, the action of which it is estimated the cost and “g” is the growth rate of dividends.

However, this model in underdeveloped markets such as Islamic ones, that is not completely efficient, makes the assessment of the price of the company rather difficult if not relatively reliable. Proceeding in the estimate of the cost, according to the approach derived from the CAPM and founded on a different relation between risk and return, but it is assumed to always be a correlation that corresponds to a higher risk for a higher yield, could be detected individual parameters: \( r_b, \beta \) and ERP (Equity Risk Premium):

a. As a proxy for the rate risk-free, \( r_b \), in an Islamic context would tend to assume the same value of a western interbank rate, such as LIBOR, taking into account the fact that, in their current operations, Islamic banks employ this parameter rate as a benchmark against which is defined as the cost of Murabahah and Ijarah;

b. The specific activity of \( \beta \) can be estimated taking into account the fact that it reflects the policies adopted by the individual company and appears to be a function of three variables (the type of activity carried out by the company, the intensity of its operating leverage and that of financial leverage); applying, in this sense, the procedure known in traditional finance, the so-called bottom-up. As is known, the decomposition of beta in the three determinants allows to estimate the value without having to have a time series of prices of the target of evaluation (method bottom-up), but proceeding to estimate the unlevered beta of a sample of comparable listed.
Once you have calculated the average unlevered beta for the selected sample, we proceed to correct this value for the current debt ratio of the company being valued, reaching so, to define the beta levered

c. The Equity Risk Premium (ERP) can be estimated using the following formula

\[ \text{ERP} = \text{ERP required of a mature market} + \text{Award for Market Risk} \]

The ERP required in emerging markets, such as Islamic is a function of the country risk, which captures risk factors such as the degree of volatility of the inflation rate, the economic growth rate and the degree of transparency of the market.

As is known, the country risk can be expressed in terms of the degree of volatility that have yields of securities traded on an emerging market than that which characterizes the securities traded on the mature market. This estimate can be made based on calculating the Relative Standard Deviation of the market being analyzed \((x)\), obtained by dividing the standard deviation of the price of the shares traded on it with one that have securities traded on a mature market taken as a reference. To estimate the cost of equity of an Islamic enterprise, therefore, the risk premium of the market (ERP) can be estimated following the approach adopted by Damodaran, with reference to the Equity Risk Premium in the U.S. Market, assuming as it has a Country Risk equal to zero (Damodaran, 2013).

5. CONCLUSION AND SUGGESTIONS FOR FURTHER RESEARCH

As discussed above, the financing instruments of Islamic finance based on the mark-up, are inclined to assume a cost structure very similar to that of sources relating to traditional corporate finance. The scarcity of available data, however, leaves open a wide field of research for the future development of the knowledge on the topic. It should be recognized that, in a "mixed" system, can emerge situation of trade-off that may enable the assessments on the optimization of financial choices. As an example, analyzing the report of the State Bank of Pakistan (Ahmad and Hussain, 2012) concerning the trend of interest rates charged by Islamic banks and foreign ones operating in the country, emerges as the return required by an Islamic banks in range of operation to mark-up financing is less than that required by a foreign bank on a traditional loan (16.20% compared to 17% - period March 2012). The availability of these data allows facing another research topic linked to the possibility to analyze how a hypothetical use of Islamic capitals by a conventional firm in the form of Equity affects the WACC. In this paper we have seen that an increase in the level of leverage of the company can translate into an increase in its probability of failure that would result in:

- an increase in the cost of conventional debt \((k_d)\), since the additional financial obligations assumed by the company through the conclusion of the Murabahah it would increase the risk of
insolvency, which would result in deterioration of its creditworthiness, which could lead to a renegotiation of the terms of conventional financing by banks;

- an increase in the cost of equity (ke), inasmuch an increase in the debt capital translates into an increase in the financial risk of the issuing undertaking (reflected in its beta levered, β) and, therefore, an increase in the required return by the shareholders;

These results introduces new spaces for future research and empirical tests on the theoretical results obtained in the present work, in particular with reference to the WACC.

INTEREST RATES LIBERALIZATION OR ECONOMY CONTROL- THE CASE OF THE CHINESE BANKING SYSTEM

Mihai-Yiannaki, Simona1; Rios-Morales, Ruth2

1Department of Accounting Economics and Finance, European University Cyprus, Nicosia, Cyprus

ABSTRACT

The Chinese Central Bank decided on June 8th and July 6th, 2012 on the duplication and consecutive cut of the deposit and loan interest rates, together with the simultaneous loosening of the interest rate floating range of their financial institutions. Unquestionably, these measures resulted in a drastic change of the operating strategies of the whole banking system, for both nationalized and the private commercial banks.

The paper aims at following up on the causes and effects of these decisions in the Chinese banking arena, predicting a higher possible level of bad loans and followed by a higher systemic risk due to the major thee banks reaction and copy-cat decision in fixing interest rates.

The research methodology is utilizing the GARCH (1,1) model and the VaR to identify the way the interests are adjusted and study if this decision was towards a real liberalization or rather a controlled interest rate change by the authorities.

Eventually, the Chinese interest rate liberalization bring with it good and bad news to the economy, while the essence remains in how such liberalization is handled and what is it aimed for the entire economy.

Keywords: interest rates liberalization, GARCH model, VaR, risk management, commercial banking, China, economic models, central bank, emerging economy

INTRODUCTION

The term structure of interest rates, determining the relationship between yields on a bond and time to maturity, but also access to credit, and monetary policies, plays a fundamental role in economics and finance, including also in the derivatives pricing, hedging, and risk management (Hong et al, 2013).

The BOC (Bank of China) was the 3rd of all four, prodigious and nationalized commercial banks of China that was listed on the Chinese mainland and Hong Kong Stock Exchange since 2006. The development of BOC was under the influences of both government policies and of the financial market, factors which led to a number of calculated acts, the nature of which was determined to be imperative, in order to successfully adapt not only to the financial development and to the government policies, but
also to increase profitability and to attain a potential risk decrease in order to become more profitable and competitive worldwide.

Richard Harris (2014) an Interment fund executive in Hong Kong mentioned that the Chinese government’s world-record US$4 trillion of foreign reserves could back local government borrowing, but this is not cash with which to pay off irresponsible debt accumulation. The aim of this research was to investigate Chinese interest rate liberalization, especially the way interest-rates adjustment affected the development of BOC, through the analysis of BOC’s returns, risks and stock price and consequently be able to provide certain recommendations for the banking system. In this respect, we have looked into the following aspects:

- The impact of interest rate on profitability
- The effects of interest rate on stock price
- The influence of interest rate on risks

For bringing the study and its results closer to the readers, we adapted the paper structure, presenting first the methodology, then the literature review supporting directly the results analysis, followed by conclusions, recommendations, study limitation and further research, references and five appendices including the calculations of the models selected for this research.

**METHODOLOGY**

Our process of sample selection using secondary data analysis (Sekaran and Bougie, 2010) uses the following defining elements:

1. One-year deposit and loan interest rates, overnight Shanghai inter-bank offering interest rate, quarterly NII and equity of three banks: BOC (Bank of China), CCB (China Construction Bank) and CMBC (China Merchants Bank), and their daily stock price and turnover sourced from these banks’ websites.

2. The size of the sample: due to the requirements, minimum sample sizes of GARCH (1,1) and VaR were both 500 as the size of the data sample.

3. The time period of sample: the release time policy and other related factors; according to the principles above, this study selected a one-year and daily overnight Shanghai Offered interest rate, stock price and stock turnover of BOC in 500 days between September, 2010 and November, 2012.

   The data analysis’ steps used in this study are the following:

1. Research of NII and operating revenue from BOC’s quarterly, the half year and annual financial reports and then compared the proportions of NII accounting for operating revenue in each quarter from 2007 to 2012 to analyze the importance of NII to BOC profits (Molyneux and

2. Collected each quarterly return on equity (ROE) of BOC in the period of 2007 to 2012 from the BOC quarterly, both the half- a- year and annual financial reports, and then calculated the ROE. Noticed that this research used the NII instead of net income because its purpose was to discuss the relationship between interest rate and profits.

3. Calculated the change rate of ROE in local currency.

4. Collected and calculated the average deposit and loan interest rates and their change rate in each quarter. Discussed how the interest rate might impact net interest income and equity of BOC and the influence on its profitability. And then it also needed to compare the results of BOC to the results of CMBC.

Secondly, by aiming at the ways that interest rate impacted stock price, this research adopted adjusted GARCH (1,1) model to measure interest rate changes affecting the stock price volatility (Hong et al., 2013, Morgan. & Smith, 1987). Previous to this, it needed to verify whether the stock price had established any correlation between banks.

Therefore, the specific solution steps of this part were:

1. Used Spearman Correlation to calculate correlation coefficients between each of the two banks as shown in Appendix 1. If the coefficients were large enough, then it continued using GARCH(1,1) in order to resolve the question (Hong et al., 2007).

2. The variables were daily variations of SHIBOR $r_i$ and daily stock returns of BOC $\mu_i$. Moreover, $r_i$ was calculated through the followed formula:

$$r_i = R_i - R_{i-1} \quad (3.1)$$

where $R_i$ was $i$th day SHIBOR inter-bank offered overnight rate. $\mu_i$ was shown as:

$$\mu_i = \ln\left(\frac{S_i}{S_{i-1}}\right) \quad (i = 1, 2, \ldots, n) \quad (3.17)$$

(Hull, 2010)

where $S_i$ was the $i$th day BOC’s closing price in SSE Composite Index.

The specific steps to resolve this question were the following:

1. Introduced interest rate as an exogenous variable into adjusted GARCH(1,1) the formula being 3.11 in order to analyze the effects of interest rates on stock price from the aspect of the rise and fall of the rate. The research for the successful contemplation of the question was achieved by Excel.

2. Compared the results of BOC with two other banks in order to answer the research question, based on the results shown in Appendix 2, 3 and 4.
Thirdly, by using VaR (value at risk) to measure the bank’s risk, the use of several key factors was considered mandatory, such as the market value of the portfolio, holding period, confidence level and annual volatility.

The specific procedures to achieve VaR were the following:

1. Collected daily trading turnover of BOC stock in the sample and calculated the average turnover using arithmetic mean formula:

\[
\text{Turnover Average} = \frac{\sum \text{Daily trading turnover}}{\text{No. of days}}
\]  

(3.18)

The turnover average could be thought as an item of market value of portfolio.

2. Calculated the annual volatility \(\sigma_{\text{annual}}\) using historical data and then calculated the daily volatility \(\sigma_{\text{daily}}\) through accomplishing the following process:

First of all, let the return during the \(i\)th interval \(\mu_i\) be calculated by formula 3.17. (Hull, 2010)

Then calculated the usual estimate \(s\) of the standard deviation of the \(\mu_i\) by using the formula:

\[
s = \sqrt{\frac{1}{n-1} \sum_{i=1}^{n} (\mu_i - \bar{\mu})^2}
\]  

(3.19)

where \(n + 1\) was the number of observations, \(S_i\) was the value of variable at the of \(i\)th interval \((i = 0, 1, \ldots, n)\), \(\bar{\mu}\) was the mean of the \(\mu_i\). The standard deviation \(s\) was regarded as \(\sigma_{\text{annual}}\). (Hull, 2010)

3. Used the GARCH(1,1) model to get the results of BOC annual volatility. Because \(\sigma_1^2\) did not exist, so it could not ensure \(\sigma_2^2\). By adopting the Excel tool and using the sample variance of daily stock return \(\mu_i\) (saw the formula 3.16) as \(\sigma_1^2\) to get out the parameters in turn. Eventually all parameters joined into the GARCH (1,1) formula to calculate other \(\sigma^2_n\).

4. Figured out the daily volatility \(\sigma_{\text{daily}}\). the size of sample was 500. So set \(\tau = 1/500\) then the estimate for the daily volatility \(\sigma_{\text{daily}}\) should be (Hull, 2010, 2nd ed):

\[
\sigma_{\text{daily}} = \sigma_{\text{daily}}/\sqrt{500}
\]  

(3.20)

5. Substituted two different confidence levels into VaR model and discussed. It did not mean that the higher confidence level the better for the banks, the reason being that that profit was directly proportional to the risk; there would not be any profit without business risks. (Hull, 2010, 2nd ed). According to the estimated default probabilities as indicated by the rating class table from Christopher James (1996), the coverage level of class A (of these banks) should be 99.89%.

Therefore, this paper chose the two confidence coefficients 95% and 99.89% to see the differences in variability of the results, if the case.

6. Calculated the two other banks’ VaR (Jorion, 2001): the private bank CMBC and the nationalized commercial bank CCB, and then compared and discussed them in relation to BOC. This research question was achieved by Excel in Appendix 5.
Although, there is no perfect model used to resolve all the similar problems of GARCH (1,1), this model was used both in researching the relationships between interest rate and stock price, as well as evaluating the risk, repeatedly. The comparison with the results’ analysis of other banks helped provide some comprehensive information on BOC in order to understand its unique characteristics.

**LITERATURE REVIEW AND ANALYSIS OF RESULTS**

As shown in the following Figure 1, ROE fluctuation trends of BOC and CMBC were basically the same, but fluctuation of BOC was obviously stronger and more advanced than CMBC. Besides, they were not linked to fluctuations of interest rates. When interest rates rose, ROE might appear either as an upward or a downward trend (Kaufman, 1980, Chen 2007); even if interest rates did not change, the banks ROE fluctuating would still occur.

**Figure 1 Trends of Interest Rates & Their Change Rates and ROEs & Their Change Rates**

From the table above, persistence of BOC was very high, at 98.7%, meaning that volatility had a high persistence with an impact on stock price that would be sustained over a long term. One of the reasons...
of the weak relation between interest rate and stock price was that China’s interest rate controls limited the interest rate floating (Chen, 2007). Due to the fact that China’s financial reform was still at a preliminary stage, the development of financial market consists of many deficiencies: incomplete market system, lack of market risk-defending and regulatory ability, scarce trading products and tools, etc (Alpera and Anbar, 2011, Feyzőğlu, et al, 2009, Wright and James, 1996). As a result this has driven investors (mainly individual investors) to asset allocations that were converted between money market and capital market with difficulty. Interest rate in terms to the role of cash flow regulation was not obvious and less effects on the stock market volatility.

The second reason was the time-lag and conditionality of stock price to monetary policy, which could reduce the interest rate regulation function greatly, and may even achieved the opposite effect against the monetary policy goal (Mc Kinnon, 1973). The theory effect of interest rate adjustment on the stock market would become clear only through the overall mentality of the market tending to stabilization.

The third reason was the difference of real interest rate and nominal interest rate. Only when the nominal interest rates and real interest rates changed in the opposite direction, real interest rates could really reflect theory effect of impact of interest rate adjustment on the stock market. Nominal interest rates were slashing, due to the fact that the price of commodities fell faster and larger and as a result the real interest rates were likely to remain at high levels.

The fourth reason was the most direct reason affecting stock volatility, which was the relative price of the BOC stock. Early in the development of the stock market, the speculative phenomenon was prevailing and it caused the relative price of the stock of quite a lot of large listed companies to be were higher, and of course BOC was one of them as one of the big four banks. Although after several years of adjustment, the situation improved, but the risk was not completely eliminated. The high stock relative prices weakened the cuts effects, which limited the share price’s raise potential when interest rates decreased.

In addition, the excessive speculation and irrational behaviors of the Chinese investors often made stock market volatility deviate from the economic law. It led to the inverse relationship between interest rate and stock price lacking of solid foundation. The stock market could not act as a barometer of monetary policy affecting on the economy, which weakened the effect of monetary policy.

Through the combination of a number of researchers in the theoretical analysis of the stock market in China, it was easy to discover that China’s stock market was still a weak form efficient market which meant that the past historical market information was fully reflected in the current stock price. The market had not any rapid response after the interest rate continued to rise; the investors could also get a certain number of abnormal profits. The interest rate was out of action in short term.

It could be obviously proven that, the daily volatility and yearly volatility of BOC were both less than that of the other two banks. It indicated that once the interest rate was changed, the volatility of BOC stock price and risks of holding share were both smaller than the rest. Although the volatility of CCB was bigger than BOC’s, it was nevertheless more closed to it. CMBC volatility, obviously, was the largest one among the three, direct proportional to the risk of CMBC holdings.

For volatility analysis, risks of investing state-owned commercial banks were generally less than investing in private commercial banks. One of the reasons was that the state-owned banks were more cautious on loans compared to private banks, which generally only lent to large projects fostered by state policies or large state-owned enterprises, thus the risk of bad loans was small; vis-à-vis, private banks lending conditions and audit conditions were looser than state-owned, which led to high profit but once interest rates increased it would increased their bad loans risk. However, it is only in 2014, or more recently, when we noticed that Chinese property companies are buying stakes in banks and raising fears that the country’s already stretched developers are trying to obtain preferential financing from their lenders (Rabinovitch and Noble, 2014).

According to the analysis of the VaR, this model was mainly affected by two aspects: annual volatility and average trading volume. Observing the average trading volume only and compared with the other two, the average volume of BOC was the minimum, even less than half of CMBC. This was likely due to the fact that the profitability of the banks was relatively lower, and a low volatility led to reduced investment profits, thereby the trading volume per day was small. However, combined with annual volatility, the possible maximum loss was also the smallest, even though under every confidence coefficient -interest rate risk, BOC’s was the smallest in the three.

Utilizing Excel Solver to process data under the GARCH(1,1) (Formula 3.8) model and then draw the \( \omega, \alpha, \beta \) and daily volatility \( \sigma_{daily} \) and then use the formula (4.1) to get \( V_L \)

\[
V_L = \frac{\omega}{1 - \alpha - \beta}
\]  

(4.1)
Then formula 4.2 was used to calculate the volatility $\sigma_{\text{daily}}$ of BOC, CMBC and CCB in 500 days.

$$E[\sigma_{n+k}^2] = V_L + (\alpha + \beta)^n(\sigma_n^2 - V_L) \quad (4.2)$$

It asserted results from above and calculated these banks’ VaR through also utilizing Excel. The confidential level was also selected 95% and 99.89%.

The results above clearly proved the fact that, using the VaR model that was based on the GARCH(1,1) in order to calculate data, could basically reflect the similar characteristics to the former method. It could be said that the use the two methods in calculating the volatility of stock price was in both cases effective. The confidence was higher, the range of probability was greater, and then the probability of the biggest losses that the banks suffered was bigger.

There were great different values of daily volatility between using historical data method and GARCH(1,1). The first reason should be that the calculation principles were discrepant: the former only focused on the daily stock return $\mu$, and used standard deviation as the annual volatility; although GARCH(1,1) also used $\mu$, it introduced parameters to anticipate the process. Another reason was that they used different formulas to compute the daily volatility: the former only depended on
annual volatility, but the latter not only depended on annual volatility but also depended on the coefficients.

In addition, the influence of interest rate changes on BOC non-performing loans rate was also evident: as interest rates rose, the opportunity cost of loan would be expanded, the difficulty of the enterprise repayment and default risk would increase, thereby causing the ratio of bank bad debts would increase; As interest rates declined, the opportunity cost of lending shrank inevitably thus causing BOC’s bad debts rate to drop down.

But, due to the fact that BOC carried a lot of obligations regarding policy loans and strict systems of examination and approval, it therefore usually only lent the enterprises that the government would pay for, just as any other nationalized commercial bank in China did. These enterprises were large enough, which did not allow them to have measurable sensitivity to interest rates basically. In this case, when interest rates rose, the difficulty of the enterprise repayment became bigger and caused delinquency rates get higher in private banks than BOC. All in all, there was still a weak relationship between interest rate and BOC risk. However this cannot be extended to the other two banks that may encounter due to their risk higher NPL (non-performing loans) levels in the near future.

**CONCLUSION AND RECOMMENDATIONS**

It appears there was not a direct influence of interest rate on BOC profitability because the funding gap and duration gap controlled by managers could change the profitability of bank in general, while the results of the research confirm this also. Due to the fact that the influence of the interest rate on stock price was based on a variety of external factors, there was an ordinary correlation between interest rate and stock price. The volatility and value-at-risk of BOC were both smaller than of the other two banks. It indicated that the investment risk of BOC was lower than others and that BOC looks safer than the other two banks.

**How does the Chinese interest rate liberalization impact the development of BOC on its profits?**

Interest margin occupies an important position on the main profit of BOC at about 70%, because of the wide interest rate spread (Hong et al, 2013), the low social welfare level of the Chinese population, the segregation of financial business, China’s underdeveloped capital markets and fewer financial instruments.

These factors create high NII proportion of the operating income collectively. Due to the fact that there is not a direct relationship between interest rate and NII and equity and that the two variables can be adjusted by funding gap and duration gap respectively, managers therefore are able to change the character and size of the two gaps either together or respectively in order to fit the change of interest rates so as to influence the ROE used to measure BOC profitability (Gup and Kolari, 2005). Comparing
to CMBC, BOC can adjust the gaps beforehand, the reason may be BOC could get the information in advance as a state-owned bank and it has to adjust early as a large size bank, despite time lags.

**How does the Chinese interest rate liberalization influence the development of BOC on its stock price?**

According to the results of Spearman Correlation (Appendix 1), the coefficients between each of the two banks are about 99%. This means that once a bank stock price is increased, others stock prices will follow. This phenomenon is more obvious between the state-owned banks. The changes in interest rates impacting on BOC stock price volatility indeed exist, but the number is very small. The reason is that there are still other important factors influencing the BOC stock volatility, such as interest rate control, real interest rate, relative price, investor expectation and behaviors, weak market efficient form and time lag effect of monetary policy (Cheng, 2007).

In addition, compared with the private bank CMBC and with the nationalized bank CCB, the volatility of BOC stock price is smaller, which means that the price volatility of the BOC share is more difficult to be influenced by external factors than the other two banks. The GARCH(1,1) results show that the persistence of each bank was about 99%, which illustrates that the volatility of interest rate exists in a long-term impact on the volatility of stock price.

**How to identify and measure the interest rate risks of BOC?**

The results of VaR clearly proved the fact that, by using a VaR model that is based on the historical data and GARCH(1,1) it reflected the similar characteristics, which showed that both methods used to calculate the volatility of stock price are effective. Risks of investing state-owned commercial banks are generally less than that of the investing private commercial banks. The reason is that the state-owned banks are more cautious on loans compared to private banks and only lend to large projects fostered by state policies or large state-owned enterprises, thus the risk of bad loans is small.

Comparing BOC’s VaR with that of the other two banks, the reasons of minimum average volume of BOC include low volatility of stock price and low profitability. Besides, the higher the confidence level the greater the range of probability, and then the higher the probability of larger losses that banks will suffer. In addition, the rise of interest rates also causes the increase of the ratio of bank bad debts. But the bad debts extent of BOC was lower than private banks because it was under control of government.

**Conclusions about the research hypotheses**

There are indeed existing impacts of interest rate on BOC profitability, stock price and stock volatility though indistinctive. The correlations among the banks’ share prices are very strong, but it cannot indicate that it is all about the interest rate. The high persistence of each bank illustrates that, the banks stock price volatility impact on interest rate is long-term and is not changed easily in the short run.
Due to the Chinese complex financial environment, immature investors' psychology and other multiple important variables acting together, the influence of interest rate is very unidentified and difficult to be measured. Finally, compared with private banks, BOC has a relative low market risk which depends on strictly enforcing the monitoring systems, the latest inside story, and the bank looks to be more cautious on offering loans, as a state-owned bank.

**Recommendations**

The suggestions include two main aspects which include the increase of its earnings and the control and reduction of risks in line with the analyzed elements, as follows:

1. *Increase earnings* may include the increasing of income and the reduction of expenditures. However, both employ different strategies:

   1) Reduction of the costs and losses from the capital pool

   BOC uses capital pool to manage all the subsidiary banks capital uniformly in long-term duration. The BOC subsidiary bank must save deposit money from customers into Capital Pool to get capital interest deposit interest (part of subsidiary bank incomes) and take out money from it to provide loans to customers and also they need to pay capital pool loan interest (part of subsidiary bank expenses). The whole process is shown as follow:

   **Figure 2. Operating Process of BOC’s Capital Pool**

   ![Operating Process of BOC's Capital Pool](image)

   As the diagram indicates, the net interest incomes spreads of subsidiary banks equal to “loan interest - capital pool loan interest - deposit interest + capital pool deposit interest”. This measure might be good for mitigating risks, but it will cause the decrease of the income of subsidiary banks and the increase of operating costs. Therefore, BOC should optimize the capital pool strategy to increase the real net interest income of subsidiary banks.
2) Optimize loan structures
Because the bargaining power of small, medium and micro-sized enterprises are lower than that of large high quality loan customers and therefore the loan interest rates pricing for small, medium and micro-sized enterprises are higher than large high quality loan customers. This is one way to improve the profit of BOC. In order to decrease the influence of interest rate adjustment to the profit as much as possible, BOC should diversify more efforts to developing the intermediate and derivative business rather than interest income related.

3) Other measures
BOC may strengthen pricing management and improve pricing level, not only should further implementation of fine management complete the costs and benefits of accounting, but also it should have risks pricing power based on the credit risk, market risk and operation risk, so as to work out the rate interval you could handle, for the final deposit and loan interest rates pricing to provide technical support to prevent blind competition. BOC should also continue to develop the financial derivatives innovations.

2. Control and reduce the risks refers to three key strategies of BOC:

1) Scattered loan to spread out risk
In the past BOC was only lending loans to large state-owned enterprises which needed a lot of money and whose loan life was very long. Due to current circumstances these enterprises are restructuring a self-sustaining economic model. Thus this situation leads to high risk in terms of the repayment of the debt. BOC should begin to change the customer structure, from large and high bargaining power enterprises transferring to small, medium and micro-sized enterprises.

2) Operational risk management
The bank must continue in promoting the New Basel III Capital Accord operational risk project implementation, complete the bank operational risk management system, optimize the operational risk management information system, promote the integration of group operation risk monitoring platform construction, develop the operational risk management evaluation and capital measurement and improve the meticulous management. (Mihai Yiannaki, 2012).

3) Capital management
BOC needs to accord the medium and long-term capital planning requirements of the group to strengthen internal capital management, optimize the assets structure, in order to make the capital base further compaction. It should also continue to strengthen the capital management, improve the capital budget precision and efficiency, control risk asset scale reasonably, reduce the average weight of risk assets in order to realize the transformation from capital consumption to capital saving and promote the sustainable development of business.
In addition, it should increase the comprehensive benefit evaluation efforts, improve the weight of capital return index in the performance evaluation, guide the branch institutions and business department to develop the comprehensive benefit of higher capital take up less business preferentially, improve capital efficiency, to go “light capital” development way (Rose and Hudgins, 2012).

**RESEARCH LIMITATIONS**

As an empirical research paper, there must be some limitations that cannot be conquered. First of all, although this research focuses on the interest rate, it ignores the influence of inflation on the interest rate. Real interest rate is the real impact index of financial market behavior and banks profits.

Secondly, there is insufficient accuracy in the application of calculation formula and models. ROA, despite its small values should be used to analyze the impact of interest rate on profitability instead of ROE, because ROA could overcome the drawbacks of ROE, although there may be other off balance sheet activities involved in the creation of the NII (Gup and Kolari, 2005, and Crojé and de Beer, 2010).

Besides, there are shortcomings in using GARCH and VaR to measure volatility and risk of banks (Sensarma and Jayadev, 2009).

Thirdly, because the Back of China has been listed on the Chinese Stock Exchange since 2006, the data used to analyze is so limited that they cannot illustrate the conclusion of the research adequately. In addition, considering the reliability of the lack of data in the sample selection issues makes the peak data bigger and the results are dispersed and not obvious.

Fourthly, the data come from secondary research which sometimes cannot express the authenticity and integrality but always tend to the policy of government, which leads to an inaccurate conclusion of the research.

In addition, this research ignores the relationships among profits, stock price and risks but analyzes these aspects separately, as per Lobo (2000).

**FURTHER RESEARCH**

According to the limitations of this research and in order to make it better through further research, it could be indicated that there are three aspects that can be of great assistance: establish the precise models and select the appropriate sample for data analysis, join the two factors inflation rate and real interest rates instead of the nominal interest rate to study the relationships between interest rate liberalization and performance of BOC; pay more attention into analyzing the interrelation and interaction between and among the banks’ profitability, stock issues and risks (Mihai Yiannaki, 2013).

A SUSTAINABLE EUROPEAN MODEL OF LEADERSHIP, INNOVATION AND MANAGEMENT IN THE HEALTH & MEDICAL CARE SECTOR

Mihoreanu, Larisa

The Bucharest University of Economic Studies, Romania

ABSTRACT

The general objective of the large research is to identify and assess the characteristics, limitations and opportunities related to managing legal performing and sustainable businesses in the field of Health & Medical Care sector in order to build a new, innovative model, assuming that policy design is indeed an important new area of design there are implications and opportunities for the design community needs and business models. The specific or task objectives of the research program are the following: • highlight the role of the Health and Medical Care sector in the development of a sustainable growing economy, as mentioned in further more detailed objects and topics; • explore the application of health services management in the world and Europe; • understand the structure of health systems in the context of a multicultural region, in order to see the contributions that they bring to the maintenance and improvement of the population’s health state; • analyse the dynamics between the various components of the health systems in different regions; • understand the concept and dimensions of Health system performance; • explore national, organizational, provider, and patient interventions to improve the performance of health systems; • provide some guidelines to policy makers based on the lessons learned from the outcomes given by the different models and systems analysed within the context they were implemented in.

Keywords: bio leadership, sustainable development, healthcare sector, pharmaceutical industry.

The contemporary social and business environments are characterized by ongoing economic crisis and unsounded structural changes manoeuvred with austerity. Various sectors of activity make laboured effort to cope with internal causes and external forces during a long and difficult process to improve efficiency, competitiveness and profitability. As the entire economy the health sector requires sustainable complex growth in all fields of market and society, depending on macro indicators as they look at the moment. [Nature Reviews, vol. 11. p.3] [NHS Commissioning (2012) Developing the NHS Commissioning Board, p. 1-3]. The main line of reasoning resides in the complex the health care sector should play for all socio-economic, institutional, societal and political fields and operations. A reasonable good health is an indispensable requirement for the human welfare and has to be sustained
by economic and social development in order to be able to sustain the good systems health and support the humankind rights. The Articles 25 of the Universal Declaration of Human Rights states “Everyone has the right to a standard of living adequate for the health and well-being of himself and of his family, including food, clothing, housing and medical care and necessary social services, and the right to security in the event of unemployment, sickness, disability, widowhood, old age or other lack of livelihood in circumstances beyond his control.”

Despite the fact the European Union Area is positioning in the top regarding the care for health towards its citizens, there are still lots of differences to be amended at regional levels. Also will be important to understand the European health system role and position in attracting new people, creating new value through innovation of new treatments, investing in science and research, develop new therapies with high impact on the population.

Health systems’ performance varies from one country to another, but the discrepancies factors are not known enough. The Governments, the keepers of the health care systems, are more focused on the public care while disregard the private one. The history of health systems is not a longer one, dating from the century 20th but its evolvable rate is much higher. Western Europe used to be at the forefront in founding national health systems to protect its workers [Department of Health https://www.gov.uk/government/organisations/department-of-health]. Such models were progressively externalised to other countries; therefore the present project is an attempt to better understand this transformation and to capture the present state of the art in order to predict the next state that will respond better to the needs of the patients today and tomorrow.

In Europe, Britain was the first in 1948 to set up a National Health Service (NHS) which kept its name until today, just after attempts made by Russia (1917) and New Zealand (1938) the same year when the Universal Declaration of Human Rights was finalised For that reason the British system will be one of the systems that will be the focus of this project as it set an international example [Chatora R,Tumusiime P Health Sector Reform and District Health Systems, Jan 2004; 13-40].

In Europe, Britain was the first in 1948 to set up a National Health Service (NHS) which kept its name until today, just after attempts made by Russia (1917) and New Zealand (1938) the same year when the Universal Declaration of Human Rights was finalised For that reason the British system will be one of the systems that will be the focus of this project as it set an international example [Chatora R,Tumusiime P Health Sector Reform and District Health Systems, Jan 2004; 13-40].

Medical care Management necessitates urgent modifications and originative implementations of a matching reform. This will come along with a collateral study of what happens on the Pharmaceutical market, there where the research and development activity remains the wellbeing bases for all nations. Nevertheless, the focus of this project remains the finding of the best answer to the question of what is the best for medical services delivery - through public or private providers and what the appropriate mix of financing mechanisms: government expenditure, out of pocket, or various types of insurance
The pharmaceutical industry is also confronted with challenges such as intellectual property protection, advancing candidate drugs to the next milestones, regulatory compliance. To maintain income despite underperforming research and development (R&D) portfolios, rounds of mergers and acquisitions have occurred such that only 11 of 42 members of PhRMA existing in 1988 now survive [Nature Reviews, vol. 11. p.3]. A first consequence of all this change resides in reordering of the top ten pharmaceutical companies as ranked by market capitalization, although eight of the top ten companies in 2001 were still in the top ten in 2011.
The pharmaceutical industry is currently facing the key challenges of declining R&D productivity, higher barriers to commercial success for innovative drugs and substantial imminent losses of revenue from successful products due to generic competition. Awareness of these challenges has catalysed — and continues to drive — considerable reorganizations in the R&D structures of large pharmaceutical companies.
Among the goals of such reorganizations has been the promotion of the type of entrepreneurial culture and behaviour that is considered to thrive in smaller biotechnology companies [Nature Reviews, Vol. 11, p. 5] in the hope that this will increase R&D productivity. Indeed, industry observers have attributed some of the present crises in the pharmaceutical industry to the discouragement of entrepreneurial behaviour by limitations inherent in the unwieldy bureaucracies that can proliferate in large pharmaceutical companies [Nature Reviews, vol. 11. p. 17-18]. Interestingly, an assessment of the value of small biotechnology companies was driven by the innovation and science in the one or two products moving through their pipelines [Nature Biotechnology Vol. 22, p. 1215 – 1217].
The role of middle managers — defined as those individuals in large pharmaceutical companies who are not at the executive level but who lead large groups or departments and have considerable responsibilities for the successful conduct of projects and programmes — emerged as an important
Concern in the productivity of discovery units, even more so than in the case of development. One of the distinguishing characteristics of the biotechnology researchers refers to their closeness to science and their desire to retain the proximity [Nature Biotechnology Vol. 22, p. 1215 - 1217]. However, in other large pharmaceutical companies, excessive concern with milestones often detracts from the ability of research teams to remain close to science [Nature Reviews, vol. 11. p.3]. In the following five years, similar to the recent past, society will face dramatic changes, will witness a big loss in the market capitalization in the pharmaceutical sector because of the fact that the patent protection on today’s blockbuster drugs will disappear and, with that, the big profits for the “Large Pharma” companies [Nature Reviews, vol. 11. p. 17-18]

Challenges can be found when trying to find treatments for more complex disorders such as cancer, obesity, mental disorders and others such as orphan conditions which are called rare and are mainly unknown for the health care professional and completely lack of treatment. [Nature Reviews, Vol. 11, p. 5] [NHS Commissioning (2012) Clinical Advisory Group for Prescribed Services Final Recommendations, p. 1-227] These conditions, not easy to understand and manage, require more consideration to avoid unimaginable consequences.

Innovation is apparently the key solution but it necessitates a favourable environment that can support the take-off of new ideas and their successful implementation, and will not destabilize or hinder the entrepreneurial energies [Nature Reviews, Vol. 9, p. 683-689]. Nowadays new challenges test the health and medical care sectorspressuring the need to adapt for better serving patient have needs, and diminishing the society costs burden.

Some of these new challenges are coming from the emerging markets with big needs of investment in their Health Care infrastructure. Considering this, the evolution of today society accents also the importance of ICT serving the health care but not as an outcome per se, but as a mean in improving the living conditions of society as a hole or for segments of society. The main objective in developing and implementing ICT products is to assure the increase of the quality of life and social development.

Another challenge is represented by the treatment of the specific conditions and the lack of appropriate management and public policies in the field. In the meanwhile we don’t have to neglect that the evolution of nowadays society underlines the importance of information and communication technologies (ITC), not as a result per se, but as means of improvement of the living conditions which depend on both socio-economic aspects and the life style the man adopts. This is the reason why health related quality of life remains an indicator to take into consideration more and more within the set of measures regarding the efficiency in health care.

The nature of the diseases changed towards more complex and new conditions emerged and increased their incidence within a growing global population in such a way that what was rare before,
starts to be recognized more often and needs particular care and new innovative treatments. Present interest in the potential of translational medicine to find ‘the right drug for the right patient’ requires the integration of several activities. These include the search for biomarkers that not only help to select compounds at a preclinical stage, but also help to predict, stratify and monitor the patients and subgroups who will experience the requisite efficacy of the compound and an acceptable level of adverse events. To achieve this, collaboration between research and post marketing surveillance groups is also highly necessary. There is also a high need for a personal touch with the new model of customised medicine even for complex diseases like cancer. Ageing populations represent a new challenge for the society due to the age specific related conditions such as diabetes, hypertension, arthritis, dementia, and various form of cancer.

Establishing and maintaining an entrepreneurial culture during drug development is perhaps easier than during the research stage as the activities associated with this later phase are closer to product realization and clinical application. The inherent sense of urgency associated with the development stage is driven by the competitive environment, in which time to market with a differentiated product is an important determinant of success. Thus, the creation of special product teams for individual efforts and for therapeutic franchises, which are called by development and commercial leaders, is more likely to foster the entrepreneurial behaviours we have identified, such as ownership, outcome focus, passion and conviction, and the ability to recruit the best people. During the research stage, however, entrepreneurial behaviours are often compromised by several characteristics. These include:

- increasing size and complexity of any research groups;
- larger portfolios and a focus on increasing the number of ‘shots on goal’;
- focused middle managers on timelines and portfolios, instead of science, technology and leveraging external knowledge;
- influence on the commercial department (too early in the process);
- the evolving science and technology impact on organizational complexity;
- possibility of alignment between Head of R&D and CE.

As previously said, the aim of this project remains focused on studying the needs, expertise, resources and limitations of the different actors: pharmaceutical industry, hospitals, and patient associations, regulatory bodies in the Health & Medical Care sector, academia, and to offer a sustainable model of innovation, leadership and management that will better answer the needs of today’s patient at the European level [Vasile, A., Mihoreanu, L., Bondrea, A., An Insight into the Rationality of Economic Entities: Emerging from Crises with New Approaches to Social Sciences, 6th EMRBI Conference Estoril, Portugal, 23-24.09.2013][Vicious, T.G., Mihoreanu, L., Groan, L. (2013) Contemporary “Homo Economics”: Defining Wellbeing at the Crossroads of Economic Growth and Business Ethics, The 6th ERMBI Estoril, Portugal, 23-24.09.2013]. The major job is to take out some of the error from the trial-and-error process of drug discovery and management, so that the same level of expertise or resources
that big companies have at their disposal be put at a general disposal onto a large model/portal/platform. The model’s aim will be to bridge the clinical needs to the scientific discoveries from the public domain or industry within a Public – Private partnership [J., Bessant, J. (2011) Managing Innovation: Integrating Technological, Market and Organizational Change (John Wiley & Sons, 4th Edition: London)]. The evaluation of the social impact of new technological configurations will also be based on a theoretical conceptual framework, gathering the Compendium of Approaches for Impact Assessment of ICT-for-Development Projects (ICT4D) of Heeks, Molla (2009) and Gigler’s studies on evaluation framework based on the capability approach (2004) and on ‘informational capabilities’ (2011) perspectives.

The final research approach will be a multidisciplinary one, at the borderline between different diseases, adequate pharmacology, entrepreneurial methods implemented, managerial theories and practices and ITC methods all having multiple effects on the quality of life. Under such a frame the wealth will not be considered as an issue but the distribution of wealth is! This way, the innovative process will translate through science into new commercial drugs and make recommendations to policy makers focusing on the need to implement a sustainable model which will add value to the society by improving patients’ health and most importantly their quality of life.

ABSTRACT

As the amount of debt has gradually increased, particularly in recent years, Portugal is currently one of the European countries exhibiting one of the highest levels of overall indebtedness, including in both sovereign and private sectors. Indeed, this condition is the outcome of increasing levels of debt assumed not only by the government, but also by companies and families, being the later mostly due to mortgage loans and due charges. This paper focuses on the study of borrowing by Portuguese households. The research has been made in respect to the notion of debt, the consequences of recent developments in debt, among other factors. In order to analyze the factors that are most associated with debt, a study was developed using two multiple regression models, one using a longer time series and another shorter, evaluating the effect of several variables, such as consumption, savings, unemployment, inflation and interest rates, in order to check whether they could be associated with a higher level of debt.

INTRODUCTION

In less than twenty years, Portugal increased from a leverage ratio of just over 18% in 1990 to a rate of 130% of disposable income in 2007 (Frade, 2003). This was one of the highest increases in the rate of indebtedness of the European Union’s countries. Although this data does not serve to indicate the risk of default of families allows, nevertheless, to show how the Portuguese were able to take advantage...
during recent decades of favorable conditions associated with the opening of the credit market and the sharp decline in interest rates, the rising real incomes and improvements in the labor market that have led to a significant decline in the unemployment rate.

However, with the recent reversal of the economic cycle, the Portuguese population lives now difficult days and is faced with gloomy news about the state of the Portuguese economy; rising taxes, rising unemployment, cuts in subsidies, reductions in wages among other things, that the Portuguese people have to cope with. This situation is strongly associated with unbridled consumption experienced in recent years, which led to indebtedness of Portuguese Families. For many families the credit is a way to manage a short income budget, resulting in families that give use to credit cards and end up spending more than what they actually earn. It is for this reason that they have been living in standards far beyond their means. These factors have now led many families to renegotiate their loans leading many other to a situation of insolvency.

This status often creates a vicious cycle of debt since, after contracting a loan, families tend to have difficulties in settling this to respond before their financial commitments, so they tend to repeat the process, contracting new loans even leading to situations out of over-indebtedness (outstanding principal and interest value greater disposable income). The rapid accumulation of debt by households also justifies increased monitoring of their ability to repay loans. If the ability to continue to pay the debt on a regular and timely is particularly affected and a significant number of families fail to repay their loans, there may be consequences on financial stability in two main parts. On the one hand, on the financial situation of households own. On the other hand, from the point of view of the parties providing the credits. The current condition of the Portuguese financial sector portrays very well this consequence.

This study aims to determine the determinants and effects of borrowing by Portuguese Families. For such, several topics are researched, such as the concept of debt, debt indicators in Portugal, explanatory theories of debt, the factors influencing the debt will be studied; the effects of debt/debt in the economy, and finally analyzing whether the factors influencing the debt are negatively or positively associated. Household debt results from imbalances between receipts and expenditures of households, ie the result of mismanagement families with what you earn and what you can spend. However, debt is also related to loans that are granted to households, since we live in an era in which credits are made immense, often credits in order to pay other claims are also made. Thus, the problem of indebtedness arises when families can not meet their obligations.
DEBT FRAMEWORK

According to OCR Macro (2001), it is argued that although there is no common European definition of indebtedness, this can be defined as the result of an imbalance between spending and consumer income, thus leading to a failure to make payment under a or more debts, ie when the level of debt is unsustainable. The debt has been the subject of several studies in recent decades. This has been understood as a multifaceted behavior, since it had the contribution of various disciplines such as psychology, economics, sociology and political science. Indeed, according to Lea, Webley and Levine (1993), contract or having debts is not only related to economic variables, since these authors were studied by social and psychological variables to justify the debt, such as social support debt, styles financial management, consumer behavior, among other variables.

For Friedman (1957), one of the bases of the indebtedness theories is the theory of permanent income. This theory explains consumer behavior in relation to consumption and the formation of expectations. This considers the permanent income as a proportion of income that people consider in the future and maintain transitional income as the deviation of current income relative to permanent. According to this author the permanent consumption is defined by consumption that is planned by individuals, the transitional consumption results of specific factors in life such as job loss. This theory argues that the consumption plan of individuals depends on their expectations regarding permanent income, having a key role in making financial decisions.

Authors such as Modigliani and Brumberg (1954) and Wärneryd (1989), argue that the theory of life cycle is another perspective to explain consumer behavior. This theory is based on two assumptions which are: “individual behavior is oriented to the future”; and individuals optimize their resources throughout life; when you are optimizing their resources lifelong, individuals are sensitive to changes in interest rates; this income is an indicator of what the future will yield. Thus, individuals are rational economic actors, ie individuals who trace their financial behavior for the future in order to maintain a pattern of stable life. Young individuals tend to borrow at midlife settle debts incurred in the initial phase of your life and start worrying about the savings, so use them in retirement to maintain a stable standard of living (Modigliani and Brumberg 1954).

There are several factors that, according to several authors, influence the debt (eg Raaij and Gianotten, 1990). According to Raaij and Gianotten (1990), the people with higher income spend and contract more loans and show a greater propensity to use credit cards. In the study by Boddington and Kemp (1999), they found that the sex of the individuals also influences the debt. These authors found that men have higher amounts of debt to women. To Godwin (1998), the household size is another factor that is related to the increase in debt. The marital status of individuals, according to Kinsey (1981), is also related to the debt, because the study was carried out by these authors concluded that when one
is married, spending on credit cards are higher. According Lea et al. (1995) when a household is composed of a greater number of children of this household debt is higher, thus the number of children is another factor influencing the debt.

The educational level is indicated as another factor, as referred by Canner and Luckett (1991), and Lea et al. (1993), that influences the debt. These authors argue that households with less schooling and households with a higher level of education tend to have more debt relative to income. Cameron and Golby (1990) argue that age is negatively correlated with the amount of debt held by households. The debt is related to the life cycle in which it is the aggregate, since the financial commitments usually increases with age, and older individuals are more likely to have higher than younger individuals debts. Another factor that is related to debt are the attitudes to credit cards, since individuals who have a favorable attitude to credit cards have a higher likelihood of having multiple cards, have a higher level of indebtedness and are more subject advertising (Chien and Devaney 2001; Davies and Lea 1995). Social class, according to Solomon, Bamossy and Askegaard (2002) influences the debt, because when the individual belongs to a higher social stratum, believes that it is more advantageous to use credit to purchase luxury goods than those who belong to middle class or casualties. Bird, Hagstrom, and Wild (1997), argue that the employment situation is also strongly linked to debt, since the employed people tend to have a greater number of debts of the unemployed.

Factors influencing on debt

Braucher (2006), argues that excessive debt can be understood through two factors, cultural factors and structural, as can be seen in the following table.

<table>
<thead>
<tr>
<th>Structural factors</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Credit supply</td>

Source: Adapted from Braucher (2006).

Table 1 - Structural and Cultural Factors Influencing Over-indebtedness
The large increase in debt by households, according to Worthington (2006), constitutes a threat to the welfare of this, which leads to a successive increase of the debt in default and many orders of insolvency or over-indebtedness, this has been more sense in Western societies. This is a situation that entails a greater number of consequences for the individual and undermines your budget or your household balance, which leads to strong implications for social and psychological level these individuals, leading to an increased level of financial stress Worthington (2006). Once the economic and social consequences of over-indebtedness are important is essential to analyze the trend of debt and proceed to study the nature and extent of over-indebtedness. In addition to the implications for society, one can not forget the problems that over-indebtedness leads to the real sector of the economy, because the increase in cases of families unable to meet their financial commitments affect levels of trust necessary for the normal functioning of credit market.

The study of over-indebtedness of households, can be done from two perspectives, namely the microeconomic and macroeconomic perspective (OEC 2002). Studies of microeconomic origin, household indebtedness, are very important at the present time, due to the high level share of this sector and the increase of the breaches. This work studies the individual data of concrete, broken households by socio-economic characteristics, with the aim of assessing the extent and nature of the cases. The use of macroeconomic aggregates using data to establish through empirical models, the relationship between the number of cases of over-indebtedness and the evolution of certain socio-economic variables may be regarded as a solid approach according to existing literature.

The portuguese Debt case

Over recent year, according to Faria and Noorali (2004), the indebtedness of Portuguese Families increased a dramatic pace. A value of about 20% of disposable income in 1990 to 40% in 1995, arriving in 2004 to reach a value of 118%. For Flour (2007), this large increase was predictable and can be understood as part of the catching-up process. During this period the sharp decline in the rates of nominal and real interest, the abolition of some legal barriers as well as the climate of increased competition between banks, provided access to credit to a broader set of households compared to the previous decade.
The large growth of household indebtedness, according to the Centre on Consumer Debt, CSG (2002), reflected the rational adjustment of families and alterations to credit institutions, both supply-side and demand-side credit. On the supply side, the liberalization and deregulation of the Portuguese financial system and the consequent increased competition in the credit market have led institutions to invest in the segment of loans to individuals with low levels of debt. On the demand side, changing cultural patterns, the decline in interest rates, the increase in disposable income and the containment of unemployment have also promoted the growing indebtedness of Portuguese Families.

Over the years the public debt of countries has increased in most advanced economies and this trend was accompanied by a dynamic GDP growth. In many countries, including Portugal, public debt increased, on average about 30% of GDP in the sixties to just over 60 % of GDP in the last decade (Rother and Westphal, 2012). As the debt increases is important to analyze the economic impact as well as the strategy to exit the crisis. For Reinhart and Rogoff (2010) the debt in peacetime can be considered more problematic for the future growth of an economy, since the debt tends to be persistent for long periods of time compared to the explosions of debt in times of war. These authors argue that the economic and financial crises are conducive to contribute to the accumulation of public debt. The financial and economic crisis that has come to feel since 2008 has placed considerable strains on the debt and in general on the public finances of the euro area countries. The ratio of the budget deficit in the euro area increased rapidly from 0.7 % of GDP in 2007 to 6 % of GDP in 2010, while the gross government debt rose from 66% to 85 % of GDP in the same period.

According Rother and Westphal 2012, the literature on the relationship between public debt and economic growth is scarce, but has gained great importance. However, the existing literature points to a negative link between the ratio of government debt to GDP and the growth rate of steady state GDP per capita. However, some endogenous growth models show that it may be possible there is a positive impact on the transition to the steady state, depending on the type of public goods financed with debt.
In the study by Reinhart and Rogoff (2010), where we analyzed the evolution of public debt and the rate of GDP growth over more than two centuries, they concluded that there is a long period for a weak relationship between public debt and growth debt/GDP below a threshold of 90% of GDP and above this threshold, the ratios average growth rate falls by one percentage point.

**VARIABLES THAT INFLUENCE THE INDEBTEDNESS**

The indebtedness of Portuguese Families can be influenced by several factors, as previously mentioned. However at this point the variables (or factors) that will be used in the case study, what more can influence household debt, and the following are presented: Income of Families Portuguese; Savings of Portuguese Families; household consumption; the unemployment rate; the inflation rate; the interest rate; GDP.

**ANALYSIS MODELS DEBT**

**Methodology**

Household debt has been a major obstacle in resolving the deep economic and social crisis that Portugal is going through. Given this situation it is intended, at this point, make a study on the indebtedness of Portuguese Families, ie analyze which determinants and effects of borrowing by Portuguese Families. For this one goes to use two statistical estimation models.

**Samples and Models**

For this study will resort to an econometric model that has as dependent variable the "Indebtedness of Portuguese Families", a separate component, called the constant ($\beta_0$) is not influenced by the different explanatory variables. This study consists of two models, the first model where observations total 33, while the second model consists of 10 observations. Statistical data are presented as a time series. The Model 1 consist of six independent variables as the disposable income, savings accounts, the private consumption the unemployment rate, the inflation rate and the interest rate. The Model 2 consists of four explanatory variables being the disposable income, the rate unemployment, the interest rate housing loans to GDP. In order to study, interpret and analyze the data contained in gretl software, a statistical model, the OLS model will be used. The main problem consists in estimating the model that is best suited to the characteristics of the subject in question, ie the "Indebtedness of Portuguese Families".

**Hypotheses to be tested**

At this point we want to identify those factors that may influence the indebtedness of Portuguese Families, using the development of hypotheses. Thus, one can formulate the following research
hypotheses, for Model 1:

H1: The disposable income of individuals is positively associated with household debt.
H2: The savings is negatively associated with household debt.
H3: Private household consumption is positively associated with household debt.
H4: The unemployment rate is negatively associated with household debt.
H5: The inflation rate is positively associated with household debt.
H6: The interest rate is negatively associated with household debt.

Regarding Model 2, we intend to test the following hypotheses:

H1: The disposable income of individuals is positively associated with the indebtedness of Families.
H2: Interest rate housing loans is negatively associated with the indebtedness of Families.
H3: Unemployment rate is positively associated with the indebtedness of Families.
H4: The GDP is positively associated with the indebtedness of Families.

Analysis and discussion of results

Univariate analysis

Over the years the indebtedness of Portuguese Families, measured in this study through borrowings by them, has been increasing steadily and quite sharply since 1980. But it was from the year 1992 we noticed the most increase in debt. Regarding household consumption, this has also increased over the years he has had a more significant increase from the year 1989 with the value 28.3046 billion euros, though there was a decrease in the last two years under review. However, variables such as savings, the unemployment rate and inflation rate fluctuations have had quite a few over the years under study, and saving a larger peak in 2012 with € 14,452,500,000, the inflation rate in 1984 with 28.38% and the unemployment rate also in 2012 with 16.80% (as can be seen in the following table). Regarding the performance of individuals, these have gradually increased during most of the years under study, with a decrease in recent years.

Table 2 - Descriptive statistics
Bivariate analysis

By analyzing the correlation matrix it follows that the dependent variable is more correlated with saving, consumption and the interest rate, ie the increase of these variables is involved with the study variable. However, it also appears that the use is related to the interest rate and the rate of inflation and the inflation rate is related to the interest rate.

Table 3 - Correlation matrix

Multiple regression analysis

Given the variable under study, the indebtedness of Portuguese Families of two multivariate analysis models were constructed to sustain the developed theoretical concepts and hypotheses as defined.

Analysis of the estimated model (model 1)

The estimation model that is presented below was estimated by the method of least squares (OLS). Thus, the following model was obtained:

\[
\text{End}_i = -34230.8 + 0.193254 \text{Rend}_{\text{Disp},i} - 3.52141 \text{Poup}_i + 1.29804 \text{Cons}_i + 349975 \text{Tx}_{\text{des},i} + 236641 \text{Tx}_{\text{inf},i} - 212104 \text{Tx}_{\text{juro}}
\]

In the model obtained previously had a R-Squared (R2) of 0.974941, which means that the estimated model is satisfactory. As for the adjusted coefficient of determination, is a coefficient which discounts the effect of a large number of explanatory variables. Thus it can be seen that the model formulated is 0.969158. The formulated model can check the level of significance of each variable and its probative value. Thus, it appears that the significance level of 5% the income variables available and interest rate and constant are statistically significant and savings, consumption, unemployment rate and inflation rate variables are statistically significant and a significance level of 1%. Finalmente, o modelo respeita as hipóteses clássicas do modelo de regressão múltipla, nomeadamente homocedasticidade, ausência de autocorrelação dos erros e distribuição normal dos resíduos.
Analysis of the estimated model (model 2)

As previously stated this model was constructed over a shorter range (10 observations). Thus we obtained the following format:

$$\text{End}_t = -182581 + 0.365418 \text{Rend}_t - 190487 \text{Tx-Juro_habi}_t + 136961 \text{Tx_des}_t + 1.63188 \text{PIB}_t$$

In the model obtained previously made an R2 of 0.990384, which means that the estimated model is satisfactory, it is 0.982691 also high. In the model formulated it turns out that the significance level of 1% is it constant and a significance level of 10% the variables unemployment rate and GDP. What demonstrates that these variables may not be sufficient to explain the dependent variable.

**Finally, the model satisfies the classical assumptions of multiple regression including homoscedasticity, no autocorrelation of errors and a normal distribution of residuals model.**

Discussion of results

At this point of the thesis are made comparisons between the results obtained and the expected results. In Table 4 it can be seen that the results obtained for each of the study variables and the expected results for Model 1.

<table>
<thead>

<td>95%</td>
</tr>
</tbody>
</table>

**Table 4 - Comparison of results (Model 1)**

It also appears that the variables household savings and unemployment have not had the results the same as expected. Regarding savings, theories pointed to a positive association with the debt, but this has not turned out so the savings are negatively associated with debt, ie the more the savings increase more debt decreases. Regarding the unemployment rate, this was also not the result we expected, since the theories suggested a negative association towards the debt and turned out to be a positive association, ie the higher the unemployment rate, indebtedness. For the remaining variables (income, consumption, inflation rate and interest rate), it was found that the result was equal to the expected outcome variable interest rate is negatively associated to debt, so its increase results in a decreased in debt. Variable yield, consumption and inflation are positively associated, since the increase these variables leads to an increase of the variable debt households.

The following table (Table 5) relating to Model 2, it can be seen that only the variable rate of unemployment had a result different from the result expected. The income variable interest rate
housing loans to GDP submitted a result equal to the expected result.

<table>
<thead>

<td>-</td>
<td></td>
</tr>
<tr>
<td>GDP</td>
<td>+</td>
<td>+</td>
<td>90%</td>
</tr>
</tbody>
</table>

*Table 5 - Comparison of Results (Model 2)*

It was also found that the variables income and GDP are associated with the indebtedness of families in a positive way, so that the increase of these variables leads to an increase in household debt dependent variable. Only the variable interest rate housing loans had a negative towards the debt variable, so the increase in this variable leads to a decrease in debt variable association. When making a comparison between the two models (model 1 and modelo2), one can conclude that the variables that both models had in common even reached the results, we conclude also that both variables were not meeting with expected, but the results are better specified variables in Model 1 since they have greater statistical significance. Thus, it appears that to study the indebtedness of Portuguese Families, in this particular case is better than model 1 model 2 because model 1 is best explained and model 2 is not sufficient to analyze a fact so important to worldwide.

CONCLUSIONS

This study’s main objective was to determine what the determinants and effects of borrowing by Portuguese Families, since this topic is fairly current and only now has given a greater importance by modern literature on debt. To enable it to meet this objective, we carried out a research study, using firstly existing literature on the debt. Portugal has a large debt level, which was progressing very rapidly over the years, so its rate evolved much since the 90s to the present day, which meant that the risk of debt also increased sharply.

The debt can be defined as a result of an imbalance between spending and income of the consumer, in this particular case of Portuguese Families is also associated with loan commitments, most commonly mortgage and consumer debt, being mortgage loans the main source of debt. This can have a negative effect on the economy, since the increase in debt may cause a long term decrease in the growth rate of a country’s economy, as families are indebted and do not have as much capacity to consume, having to pay debt interests and fess, which may result the country economy to fall into recession.

There are several factors that can lead to debt. In the examination made in this paper, referring to model 1 these factors include disposable income, savings, consumption, unemployment rate, inflation rate and interest rate. As for Model 2, the variables examined were disposable income, the interest rate of loans to housing, unemployment and GDP. While making this study it was concluded that all variables used could bring significance to the model, ie, they are all important when studying the debt...
because they gave predictive explanation power to the model. Regarding Model 2 only two variables, the unemployment rate and GDP, have some significance to the model, but it is not enough to demonstrate that the chosen variables in Model 2 are satisfactory when analyzing household debt.

After obtaining the results of the regression model one can conclude that there was an association between the independent variables and the dependent variables. We also found that most of the results were against the expected results, namely the variables income, consumption, unemployment, inflation and interest rate. As in the model with 2 variables yield, interest rate housing loans to GDP. Thus it is concluded that the study variables in Model 1 are determinants of debt, which was not observed in model 2, and that the income variables available, private consumption, unemployment and inflation are positively associated with debt that is, an increase these variables results in an increase in the debt variable. As the savings and interest rate variables are negatively associated to debt, so when there is an increase in these variables the debt decreases.

It can also be noted that for the purpose of this paper, ie to analyze the determinants and effects of household debt in Portugal, the model 1 is the most powerful, since the variables associated with the model have more statistical significance, being therefore concluded that that this model was better specified.

When comparing the results obtained with the expected results, it can be concluded that four of the variables were against the expected result, as the variable interest rate presented a negative association with respect to debt and equities, while consumption and inflation exhibit a positive association with respect to the indebtedness of Portuguese Families. The other variables, such as the savings and unemployment, had also a model result opposite to the expected result.

It is important to note that increasing debt is a hot topic, this is due to the phase of crisis that Portugal, and other developed economies, are going through, so it continues to be important to develop studies on it such as to research other possible effects on the economy caused by indebtedness by other than households, such as by corporations, and the financial sector.

LAST MARKETING COMMUNICATION CHALLENGES IN LUXURY BRAND MARKETS: A COMPARATIVE ANALYSIS

Mosca, Fabrizio; Casalegno, Cecilia; Feffin, Alessandro

Department of Management, University of Turin, Italy

ABSTRACT

Marketing communication strategies, together with instruments and actors involved in their planning process, need to confront themself on the one hand with the evolution of technology and the other with the transformation of consumer behavior.

This research project assumes that companies should change their strategic action, if they want to communicate with their changing target. What happens in luxury mature markets?

The intent is to empirically examine how luxury companies communication strategies evolve towards a stronger relationship with the audience. This involves a continuous interaction and sharing of content and values in terms of enhancement (luxury brands value enhancement through exclusive content, so as to enhance the consumer experience), expression (strategic action for a more effective communication, in order to reach considered markets goals) and empathy (ability to establish a relationship with the customer can be more intimate).

Eventually, it is stressed that, in the present context, the players who have the most authority and esteem are the ones that have a higher number of impressions on social networks and a higher frequency of video views and shares content online.

Keywords: Integrated marketing communication, user generated content (UGC), luxury goods, mature markets, social networks, reputation, innovation, consumer behaviour, brand experience, engagement.

INTRODUCTION

Media continuous evolution has led to the consequent approach between business and target audience even in those markets where, traditionally, the business-consumer has always been top-down (Schultz, DE, 1992). In which way the technological progress is lived and declined in communication from luxury companies in mature markets?

Given that consumption is essentially a communication system that is expressed through a multitude of languages, the greater the stratification of a society, the more languages will be spoken and will be much more complex to analyse consumption dynamics. This is especially true for luxury goods (Chevalier, Mazzalovo, 2012), in a context where the use of communication is experiencing a transition
from “linear to multi device” (Mattiacci, 2012). The "future" of the luxury communication will be the result of a number of macro trends, some of which are already on the market, able of influencing the system of consumption both in general and in the specific context of the high quality products markets. In addition, if it is true that the traditional marketing mix variables are declined in a particular way within the luxury markets, it is necessary to wonder what is appropriate to share and communicate with the target audience manifesting a growing interaction propensity.

The main aim of the present research has some starting point. First of all, worldwide firms, nowadays, look ahead to the integrated communication tools as the most strategic way to improve their assets and business, especially over discontinuities (Casalegno et al., 2012). Secondly, managers have to consider that building a strong brand communication structure could be valid for all the stakeholders as extended audience (Kliatchko, 2008), since communication is not a two-way factor (Grunig, 2001) anymore. The present research has therefore a threefold goal: it wants to investigate how luxury brand communication has been evolved in the latest years, it focus the attention on the analysis of social and viral marketing new trends, it suggests a new application model in order to better manage new communication tools available in this multidirectional communication era, considering that the integration among various communication tools is nowadays the condition through which a firm can protect the core of its intangible competitive advantage.

THE CHANGE OF LUXURY GOODS COMMUNICATION AS STRATEGIC LEVER FOR A WIDER AWARENESS.

While the power of mass media is undergoing a decline, due above all to generation Y media attitudes, there is a growing interest in new media generated by the consumers themselves, or the so-called user-generated content (UGC): blogging, podcasting, online video (eg : Youtube, Vimeo), social networking (Facebook, Twitter, Pinterest, Google plus). Internet is getting the real "backbone of the media system" (CENSIS, 2012). The trend sees all organizations dealing with the programming of a communication plan that integrates all the tools with which they intend to interface with their stakeholders (Schultz, Tannenbaum, Lauterborn, 1993; Romano, 1988; Krugman et al., 1994; Collesei, 2002; Duncan, Mulhern, 2004; Aiello, Donvito, 2005; Collesei, Ravà, 2008; Belch, Belch, 1998, 2009). Companies don’t just have to be present on the web through “websites showcases,” but also they need to become the real protagonists in the process of information and experience creation and exchange, providing to users and brand followers dedicated spaces, content and additional services. The concept of integrated marketing communication - strictly related to the integrated firm communication (Romoli Venturi, Casalegno, De Palma, 2014) - becomes inseparable from the one concerning common values sharing with stakeholders: people talk about social values of corporate social responsibility, which assumes an
The attitude of protection of the environment (geographical, economic and social) on which the organization (firm, when for profit) intends to develop its strategic action. Porter and Kramer refer to the concept of social innovation (2011): they see in the sharing of values between the business community and the organization main key to competitive advantage. The above macro trends are to consider in addition to already well-established factors, such as: the ’90s West economic development, which led to a consolidation of high value product markets, traditionally recession proof; the opportunities arising from the internationalization and expansion which gave way to luxury brands to approach with success new markets; the emergence of the internet and social web related phenomena. In this context, consumers in mature markets have been characterized by a series of changes that led to contradictions and paradoxes. It is thus possible to consider three macro trends that will contribute to a substantial change in consumption related to competitive environments considered (Corbellini, Saviolo, 2007). The first is the search of experience and personal gratification. The decade in which we live (2010-2020) is characterized by the centrality of the experience (Mosca, Casalegno, Feffin, 2013). The focus is no longer on “what”, but on “how” people buy things. Therefore, Kotler (2006, 2009) third “P” - distribution - is becoming increasingly important in major luxury markets strategies and the point of sale becomes the final touch point in the integrated communication process. Here the consumer can impart, through tangible and intangible elements, the image of the brand itself (Mosca, 2011). The second is the technology pervasiveness. Nowadays, it is evident the overwhelming role technology has had on the purchase and use of goods scenario. In fact, thanks to advances in innovation, final consumers have changed their behaviour and role in the purchase, from passive to active users, expressing the desire to produce content and participate to products and services development of what they are "invited" to consume (Mosca, Casalegno, Feffin, 2013). The information technology increasing development (Rifkin, 2000) and the continuous compression of products life cycle reinforce new consumption mechanisms will be focused not in the possession of the product, but in wealth and consumption experiences sharing. Eventually, the third is named iper-mediation (Corbellini, Saviolo, 2007). The social stratification, in fact, has always been the basis of the luxury and fashion goods consumption in a ostentatious logic, this logic has always been related to show the others. To these motivation, that could be defined “historical”, in recent years it is to add others consider luxury consumptions to satisfy personal needs, well defined as “self realization” needs (Mosca, 2011). The contemporary presence of these two different consumption logics have taken to the birth of some bubbles demand (Brondoni, 2007), they are paradoxes, new buying behaviours. In recent years researchers and managers can find that various consumption forms are living together: from the more traditional buying behaviours (well described in the Conspicuous Consumptions Veblen Model), to the birth of the connaisseurs, ecc (Corbellini, Saviolo, 2007). This is due to the on-going changes related to
The Future of Entrepreneurship

purchasing schemes used by a customer defined (Okonkwo, 2010) as smart, well informed, always looking for brand new experiences and relationships. He/she is powerful, influential, individualist, but at the same time he/she looks for constant connections with the community.

THE LOC MODEL: A NEW SUGGESTION FOR A BETTER LUXURY COMMUNICATION.

In a new scenario where web experience is based on the exchange, sharing and collaboration, the luxury consumers are certainly not been immune to this revolution (Atwal, Alisair, 2009). In fact, especially in this particular competitive environment, consumers are looking for a deep and intimate relationship with brands (already suggested time ago by Roberts, 2005) that emphasize the recognition, respect, dialogue and collaboration with their customers. On the other hand, customers tend to reject those brands that do not recognize them the involvement and attention they require. In this scenario dominated by a stronger relationship between people and technology, communication and web, the luxury goods marketing requires new communication model based on 7E (4E +3E): Experience, Exclusivity, Engagement and Emotion (already perceptible in Okonkwo articles, for example), in addition to other 3E risen from the opportunities that the web, and in particular the social web, have brought in communication: Expression, Enhancement and Empathy (Mosca, Casalegno, Feffin, 2013).

Experience. During the recession and post-recession, unlike other markets, the traditional consumer of luxury does not have significantly limited their consumption. While the luxury market and the spending on luxury goods has grown, on the other side luxury consumers have become more selective, informed and a little bit cynical. Today, the purchase decisions of luxury consumers revolves around the question: "Is it worth it?". In this scenario, the luxury companies had to provide a unique and compelling/engaging experience (Okonkwo, 2005). Some authors have observed how the next decade will be characterized by the centrality of the experience. An example of this trend is offered by the luxury maison Burberry in the opening of his flagship store in London on September 14, 2012 in the heart of London. The flagship store, thanks to technology developed by the brand, is designed in order to increase customer’s engagement (and purchases) through in-store digital and tactile experience that shows the historical and artistic heritage of the brand. It was developed as the physical expression of Burberry.com, in fact rooms in the flagship store follow the sections of the website available online, diving customers in a digital and physical combined experience. In conclusion, the strategy put in place by Burberry not only allows customers to increase the perceived value of the brand improving their shopping experience, but allows to increase the permanence, in terms of the time spent in the store, creating desire to return and repeat the experience.
Exclusivity. In marketing exclusivity is considered as arising from the second P of marketing mix: the price. The exclusivity, however, has always been the cornerstone of luxury’s strategies and no appearance has never been more intensely protected. It is widely believed that the use of the digital marketing’s levers in luxury strategies could "put in jeopardy the exclusivity of the brand," but, on the contrary, they offer a real opportunity and an elegant way to control and develop such exclusivity increasing at the same time the visibility of the brands. As a result, the players of the luxury market have created exclusive platforms for consumers, as for instance the community. This expedient has been used, for example, by Burberry for its Art of Trench. Each maison, in fact, has a special icon which distinguishes one from another. For Burberry this icon is trench coat. For his symbol garment, it has been created a real fashion social network that collects shoots of characters, famous and not, who wear the icon of the company.

Engagement. Engagement in the luxury goods is granted and often evoked by one thing: the story. Any video, online experience or a simple post on Facebook, which is equipped with an engaging content, constitutes a story that arouses emotions and involves the viewer in an unique experience. Today, in the luxury markets, convince the consumer to buy is not sufficient. Convince them, however, to participate at an exclusive trip with and within the brand is the key to success and that is what stories make. Tiffany, for example, reported a significant increase in sales, after that the public and the press greeted with enthusiasm the microsite developed by the brand: What Makes Love True and mobile application Engagement Ring Finder; the two elements of digital marketing that conveyed the powerful and engaging history of the brand Tiffany in achieving the true love. Tiffany has decided not to focus only on selling products, but on an entire way of life.

Emotion. The combination of the three variables previously described, give life to the fourth element of the luxury marketing: emotion. Without the proper application of this key variable, the success of luxury brands is not sustainable in the long run. The reason is simple. The luxury firms have to do with a consumer that can buy almost anything he/she wants. In this context, the physical product acquires secondary importance in favor of what luxury consumers are really looking for: a more personal experience or an engaging story that will inspire in them a particular emotion.

Enhancement: enrichment of the content of luxury through exclusive content, that could be shared, in order to increase the consumer experience.

Expression: internet gives the chance to manage the communication time and spaces. This has given way to a communication that is more charming, elegant and dream-like, able to reach a specific target market which until now was not possible with the only above the line media.

Empathy: new UCG media are able to give to luxury firms personal information about customers and allowing companies to establish a more intimate relationship with the customer, that is in line with the
inversion of the traditional scheme communication that has influenced the current scenario in almost all markets.

The LOC model has been tested previously (Mosca, Casalegno Feffin, 2013) on a sample of about 600 people, for most part of generation Y and all within what are called mature markets. In this present study, the objective will be to test, in particular, the last model 3E that refer to more interaction with the target audience.

**WEB 2.0 STRATEGIES IN LUXURY MARKETS: A COMPARATIVE ANALYSIS.**

In order to better define development trends in luxury markets communication strategy, the case analysis methods have been considered to underline, when possible, different and similar firms’ media attitudes. The analysis has been based on ways through which global luxury goods firms integrate their communication tools each other, by focusing the attention on web and social strategies. To do that, the comparative analysis of thirty international cases – chosen to represent in an equal way different luxury brands markets - allows to estimate not just the on line presence, but even the contents different players post in order to share with the online audience. The surveys of the major social platforms (Facebook, Twitter, LinkedIn, YouTube) have been carried out at two different times. A first survey was carried out on a daily basis from April 14th 2013 to May 14th 2013, while a second survey was carried out after 10 months (March 14th, 2014). Were examined just such periods of time as it does not fluctuate - media and sales volumes – due to seasonal origin (eg: Christmas, Valentine's Day, Easter). The intent was to understand how the luxury markets players are approaching their use of social media tools in the field of wide consume and, more importantly, what kind of reaction from the audience these media strategies generate.

**RESULTS ANALYSIS AND FINDINGS**

The analysis allowed estimating the “web activity” of the thirty firms operating in the luxury markets, not only in quantity (number of like, followers and share), but also in terms of quality on the basis of the content published on line by the same businesses.

The interpenetration of the two surveys also allows to study the evolution underway in the new media, as far as the luxury sector as a whole, and to propose a hypothesis for management to optimize communication online.

</table>
Table 1 shows that over the years luxury firms have gradually developed a direct presence in the online media landscape, following the path already traced by the most advanced companies in the consumer products. Most companies have a Facebook page and is present through its own channel on YouTube. Concerning online contents and the typology of what posted by luxury firms, the daily report (April 2013-May 2013) has shown what follows in figure 1 and in figure 2.

Figure 1. The luxury firms online contents (daily monitoring 14th of April 2013-14th of May 2013, considering the major social networks).

![Figure 1: Luxury firms online contents](image1)

Figure 2 – Online contents purpose (daily monitoring 14th of April 2013-14th of May 2013, considering the major social networks).

![Figure 2: Online contents purpose](image2)
Figure 3 shows the awareness linked to new online media in terms of likes / shares and followers. This first analysis of social media use doesn’t consider the use of LinkedIn due to its scares use by luxury firms; is to underline this democratic social media use. Figure 4 also highlights (taking into account the top 10 companies analysed in terms of online visibility) as the firms use the YouTube channel to manage their communication. Such use of the web, in fact, allows companies to disseminate films that have a duration that gives the chance to build the idea of “dream” and the dreamlike landscape typical of the communication of the luxury brand. The data relating to other social media are to be considered: comparing the number of brands like Chanel with the one related to one of the most famous brand in the consumer market, such as Benetton, it turns out that that the number of like and share the first is twice that of the second. The above is as relevant as ever, taking into account the shortest time from brands like Chanel have developed their own online presence.

Figure 3. The UCG success in luxury markets”. (Monitoring of May 2013, compared with March 2014).

Figure 4. The top 10 luxury firms in terms of visibility” (Monitoring of May 2013, compared with March 2014).

Considering the different increases of visibility, the research has focused the attention on the possible correlation between the Facebook likes and Twitter followers, the one concerning Facebook likes and Twitter followers, the one concerning Facebook likes and
LinkedIn followers, the one concerning YouTube official channel visualisations and Facebook likes and the one concerning the increase of Twitter followers and YouTube visualisations. The used formula has been the Pearson-Bravals correlation index:

\[
C(x; y) = \frac{(x - \bar{x})(y - \bar{y})}{\sqrt{(x - \bar{x})^2}(y - \bar{y})^2} + 1
\]

In which: \(C(x;y)\) is the correlation to test; \(x\) is the augment of Twitter, LinkedIn and YouTube followers/visualizations; \(y\) is how much can augment the number of Facebook likes. Despite is not possible to say that the used sample can be statistically relevant - because of the scarce number of analysed players - the results can be interesting for an early stage research, because empirically show what is possible to reach by simply using the qualitative knowledge of social media use. Results show that the correlation doesn’t exists between Facebook and Twitter (in this case the correlation is \(C(x;y) = -0.011\)), nor between Facebook and LinkedIn (\(C(x;y) = -0.011\)), while between YouTube and Facebook is negative (\(C(x;y) = -0.3\)). If we consider the augment of Twitter followers (\(= x\)) and the increase of YouTube visualizations (\(= y\)), is possible to underline a correlation between the two factors (\(C(x;y) = 0.69\)).

**MANAGERIAL IMPLICATIONS AND RESEARCH LIMITS.**

Whereas, therefore, the web experience is based on the exchange, sharing and collaboration, consumers of luxury in mature markets are certainly not been immune to this revolution. Instead, they need to share their passion for luxury brands with other users on the network and trust you more and more of the opinions of the latter “acquaintances unknown” within the forum or blog. This is what literature sustains (Okonkwo, 2009): since the luxury is an identity, a concept – rather than a good or a service – luxury firms have to face the internet challenge if they want to lever on the emotion and they want to share their philosophy and their emotional values (Okonkwo, 2009) strictly tied to the brand. The existing literature (Campbell, Pitt, Parent, Berthon, 2011) can help managers in understanding that even in these particular markets it is possible to use democratic tools like internet and social medias, in order to improve values sharing and audience commitment, but little has been written concerning the concept of polarization of consumer behaviour. This should be considered especially in the areas of luxury, as it allows management to assess the intake of new strategic levers able to lead to the creation of a stable long-term relationship with their target. The results of this research can serve as a framework for all organizations wishing to compete in the luxury good markets. It considers that, especially in this particular competitive environment, consumers are looking for a deep and intimate relationship with brands that emphasize recognition, respect, dialogue and collaboration. On the
contrary, they tend to reject those brands that do not damage their involvement and attention they require. In addition, they tend to abandon those businesses that are not able to convey experiences, values, and, above all, excellent product concepts consistent between the real world and the online environment. In this perspective, the integrated communication takes on an increasing importance in the management of luxury brands.

Moreover, from the integrated marketing communication perspective, luxury markets players have to apply the same logic, but not with the same contents, of the consumer goods ones in the use of media tools. The approach to integration between old and new media is a duty. The integration between old and new media, together with the distribution systems, is strategic on one hand to renovate a luxury brand and transfer to the consumer the sense of modernity and innovation of the brand and, on the other, to build long lasting and strong relationships based on trust, able to provide customer loyalty in a second time.

Generation Y is more prone to web and social communication (CENSIS, 2013) and, more in general, young people used, nowadays, to spend most of their time online represent that part of the population between 15 to 20 years will be able to be a part of the demand for luxury. Even nowadays young people with money to spend are a significant test target for luxury player if we consider that this target is global, strongly attracted and influenced by luxury brands, innovative and it has an occasional access to the consumption of luxury goods.

The research presents some limits that can be turned in further steps. The biggest is that it is necessary to test luxury global users perception, whereas in mature markets perceptions and media habits may differ from those in other geographic markets. The use of a survey through which you are unable to test a sample of the world population, which well represents the universe to be tested, will be the next step of the research. This will take to reach media habits segmentation, distinguished by geographic area, can be a useful tool for managers of luxury companies.

CONSUMER BEHAVIOR IN CHOICE OF FOOD AND BRANDING

Nair, Suja .R1; Maram, Hari Krishna2

1Jain University, Bangalore, India
2Imperial College of Business Studies, Bangalore, India.

ABSTRACT

Purpose: To understand the conceptual link to consumer food choice behavior and learn on how to add to customer value through branding is proposed.

Methodology: Through a literature review the paper distinguishes the concepts relevant to consumer behavior and branding. The effects of these concepts while analyzing; consumer behavior in general and their food consumption behavior are discussed drawn from studying various research implications.

Findings/Practical value: A number of research studies signifying the influence of the interplay of diverse fields on the consumer behavior in the choice of food and in adding to customer value through branding were identified. The outcomes of these research studies should be of interest to behavioral researchers trying to analyze food consumption behavior among individuals.

Keywords: Consumer behavior, interdisciplinary, diversity, consumer decision making process, brand equity, food conception value, customer value, consumer evaluation of food, branding strategy.

INTRODUCTION

All marketing activities are evolved around the ‘consumer’, the key contributor to the growth of the organization. Consumer behavior calls for the study of human responses to the products, services and the marketing mix elements. Food is one of the basic needs of human beings, a source of nutrition for the body, serving a social and cultural function whose consumption has hedonic value. Trying to understand food consumption behavior is highly complex and very challenging because of the diverse influences of a wide range of science and social science disciplines. Over the past many decades there have been tremendous changes occurring in the pattern of consumers’ food choice behavior, visible in the way they go about food shopping and seeking eatery options. This has resulted in organizations opting for modifications in food production, processing and distribution. In the context of globalization today, we have tried to examine studies involving food choice among consumers from different places. The purpose of this paper is through analysis of various studies develop a framework of food choice behavior and further evaluate the extent to which branding can
influence choice of food. The structure of the paper is as follows. The paper commences with a brief discussion on the terms ‘Consumer Behavior’ and ‘Food Choice’ and then an overview of few studies will help to identify factors affecting food choice. We will then examine certain studies involving influences on food choice behavior and through discussions try to ascertain whether branding can influence food choice among consumers. Towards the end of the paper we have attempted a framework that will show the link between factors influencing food choice and branding.

In short, through discussions and analysis we propose to seek answer to the question whether branding can influence and add value to consumer food choice behavior.

‘CONSUMER BEHAVIOR’ AND ‘FOOD CHOICE’

Consumer Behavior, has been defined as the decision process and physical activity individuals engage in when evaluating, acquiring, using or disposing of goods and services (Loudon and Della Bitta, 2006).” The conceptual analysis of consumer behavior is greatly characterized by its interdisciplinary (namely, the fields of Philosophy, Psychology, Sociology, Anthropology etc.) nature. The study and analysis of the purchaser’s behavior is mainly centered on three variables: the process of decision making in purchasing, factors influencing the purchase behavior and the one of the consumer (Rabontu and Boncea, 2007). Involvement of the many variables and their tendency to interact and influence one another makes the study of consumer behavior very complex. So, typically, models or frameworks of consumer behavior are developed and used to deal with this complexity.

This paper will focus on Food Choice, which refers to the human eating behaviour or food selection expressed in terms of what food people like and choose to eat. We will briefly examine few studies that have identified factors affecting food choice among individuals.

- Sheperd’s study (1985), states that factors affecting food choice can be divided into three:
  * Food (physical/chemical properties, nutrient content)
  *Person (Perception of sensory attributes, psychological factors-personality, moods)
  *Economic and Social (Price, availability of brand, social/cultural-attitudes)

- Steenkamp (1993) felt that any comprehensive analysis of food consumption behavior mandates taking into consideration the interactions between three types of determinants or factors, namely, properties of the food, factors related to the person and environmental factors.

Properties of the food include the physical and chemical properties and nutrients content (physical form, macro nutrients proportions, fiber contents, energy value) and specific substances (sugar, seasoning, salt etc.). Factors related to the person include biological (for instance, sex, age, body
weight), psychological and personality factors. Environmental factors include socio-cultural, economic and marketing factors.

- Popkin, Duffey and Larsen’s study (2005), illustrates environmental influences on consumers’ food choice, physical activity and energy balance. The environment includes macro and community level factors at the external level i.e. economic, legal and policy influences. It also examines ways in which the external environment affects food choice and diet, physical activity and obesity issues among the larger population.

From the above studies we propound that factors which typically affect consumers’ food choice are: (a) the food product, (b) the individual person and (c) certain external environmental factors. These factors could influence the decision making process which will then lead to the consumer making a food choice. For instance, assume a family of four visits a ‘Pizza Hut’ outlet to try out the food offerings there. Their final choice of food will greatly depend on the offerings (its nutritional content), the persons (their age, health consciousness and gender) and external environment factors (culture, social background, price value equation, etc.).

Figure 1: Factors affecting consumer’s food choice

STUDIES TO EXAMINE INFLUENCES ON CONSUMER’S FOOD CHOICE BEHAVIOR:

The consumer behaviour discipline works on the assumption that to be successful, organization’s must determine the specific needs and wants of their targeted market and deliver the desired satisfaction better than competitors (Schiffman and Kanuk, 2005). The study of consumer behavior is complex because of its multidisciplinary approach. An early attempt to illustrate this can be traced to
the Self-Concept theory (Grubb, Grathwohl, 1967) which laid the theoretical foundation of a model of consumer behavior by examining the relationship between the psychological characteristics (an individual’s self concept) and the symbolic value he associates to the goods he buys. Tybout and Hauser’s study (1981) called for the creation of a marketing audit based on a conceptual model of consumer behavior which can be used for evaluating marketing strategy decisions. [Marketing audit is a comprehensive assessment of all angles (both internal and external influences) of marketing operations in an organization]. The findings suggest that by measuring the variables in the model and mapping their relationships, the managers will be able to identify strategies for altering consumers’ behavior and subsequently evaluate the impact of these also. Another popular representation of consumer behavior is depicted in the Engel, Blackwell and Miniard, 1982 model (Loudon and Della Bhitta, 2006) which suggests viewing consumer behavior as a decision process comprising of five activities (motivation and need recognition, search for information, evaluation of alternatives, purchase and outcomes) which occur over a period of time.

Analyzing food choice behavior:
While embarking through various research studies attempting to analyse food choice among individuals, one can gain a perspective on the evolving consumer behavior.

- We start by briefly going through few studies wherein the researchers’ attempt to analyse consumer food choice on the basis of a certain framework or model.

* The Meulenberg and Steenkamp study attempted to analyse consumer behavior with respect to food through interplay between behavior and economic research of consumer food choice. Such integrated approaches permitted the researchers to link the behavioral concept to the economic concept characteristics and further extend the findings of the research to more actionable marketing research such as product development.

* Consumers are very much concerned about the quality and safety of the food they consume revealed a study (Chang, Tseng, Chu, 2013). This study involving consumers from Taipei, in Taiwan attempted to examine the role of a food traceability system that can create value in food exchange. The European Union (EU) General Food Law Regulation defines traceability as,” the ability to trace and follow a food, feed, food-producing animal or substance through all stages of production and distribution” (ibid, p.1362). The study used a modified 3M framework to examine the relationship between consumer personality (elemental, compound, situational and surface traits) and a food traceability system. The findings revealed that consumers with elemental traits of ‘openness, conscientiousness, extroversion and material and body needs’ presented the two compound traits of ‘need for learning’ and ‘health consciousnesses’. The latter traits influenced consumer ‘concern for food value’ and ‘perception of food traceability labels’.

The Future of Entrepreneurship
The following studies substantiate that consumer food choice is greatly influenced by the interplay of certain variables and external factors.

* Steenkamp’s study (1993) on the basis of review of literature had made a classification of the determinants of food consumption behavior by concentrating on a single or few related factors. This study suggests that researchers from consumer behavior discipline (because of its interdisciplinary background) need to take a broader approach by integrating determinants from several categories. For instance, examine how physical characteristics of the product and social/cultural factors together can influence perceptions on food? How the interactions between cognitive and cultural and physiological induced effects can affect food choice and so on.

* Luomala’s study (2004) with reference to Finnish consumers, emphasized on one food attribute factor, namely, meaning that consumers attach to ‘the origin -of-food’, which would influence their decision making especially in terms of their attitude, evaluation, willingness to buy and choose food.

* A study by Pliner and Mann (2004) tried to examine the effect of social influence and palatability on food choice and the amount of food consumed. The experiment revealed that social influence manipulation had no effect on participants’ food choices with most of them choosing the palatable food. The findings of the study highlighted the importance of palatability in food eating behaviour. The study demonstrated that when individuals were asked to select from two foods, of which they would eat a moderate amount, (informational) social influence was ineffective in inducing them to consume the unpalatable food.

* Popkin, Duffery and Larsen’s study (2005) had examined the environment (in the external context including both the macro and community level) factors that influences the diet and physical activity, causing health disparities among the US population. These researchers emphasized on the need to foster interdisciplinary approaches as well as develop an understanding of the factors that mediate and moderate the association between the environment, physical activity and health outcomes. Thus, the above studies demonstrate that marketers will need to examine the efficacy and impact of the various factors which influence consumer’s choice of food when initiating marketing of food products.

* There has been a growing awareness among consumers about the benefits of healthy eating. Such health conscious consumers seek to evaluate the nutritional content value and healthy benefits when making food choices. This aspect is illustrated in the following studies which will throw more light on how consumers make healthy eating choices.

* Bui and Kemp’s study (2011), attempted to examine variables that are crucial in the brand building process especially for ‘healthy’ brands among USA consumers. The findings indicated three essential
variables: brand credibility, commitment and connection, to be of utmost importance for the development of branding strategies for such “Healthy Brands”.

*Bui., at.el’s study (2013) tried to evaluate how parents in the US make food product choices for their children by looking into the nutritional information provided on the label. The findings of the study indicated that parents are more likely to choose healthier options for their children when a food group information system (providing specific nutrient claims complementing a nutrient claim) is utilized.

*Walsh’s study (2014) involving North America University students tried to examine whether priming a healthy eating goal can cause depleted consumers to prefer healthier snacks. This research implied that associating brands with health related claims may or may not affect the consumer food choice, which was dependent on the state of depletion of the consumer. I.e. when consumers are depleted, health related claims are unlikely to have an impact, whereas, in a state of no depletion it is more likely that health related claims affect their food choice.

* Wang’s study (2013) involving undergraduate students from Northern University, Taiwan, tried to investigate consumer attitudes towards visual packaging and its hierarchical impact on perceived food quality and brand preference. The results showed that attitudes towards visual packaging directly influence consumers’ perceived food product quality and brand preference and indirectly influences food product value.

The above section of studies imply that with the growing segment of health conscious customers, food manufacturers and marketers need to re-work their product lines and visual packaging to create ‘healthy versions’ of product brands through effective communication and brand management systems.

➢ With advances in the field of Science and Technology it is likely that consumer food choice will be more evolved in the future. This mandates food marketers to work towards creating good food retail experience and value consumption for a long term growth. The following studies will illustrate how food marketers can work towards this.

*Saarijarvi, Kuusela and Rintamaki (2013) through a case study of a major Finnish food retailer attempted to explore and analyze how Internet based service applications can facilitate customers’ post-purchase experiences in food retailing context. This type of service application provided customers four distinct types of information including: Playing, Check-pointing, Learning and Goal orientation, which facilitated their post-purchase food retail (utilitarian or hedonic nature) experiences and the degree of transformation varying from low to high. Such experiences not only generate positive word of mouth but can pave the way for long term loyalty too.

*Dagevos and Ophem’s exploratory study (2013), worked towards the development of a consumer centred concept of value in the field of food i.e., Food Consumption Value (FCV). FCV encompasses
four elements; Product value, Functional value, Process value and Ethical considerations along with Location value and Emotional value. The study propounds viewing value of the food market beyond its traditional ‘nutritional aspect’ and ‘value for money’. It suggests that feelings a food can arouse are valuable intangibles and very crucial for value creation and building competitiveness in the long run. Thus, marketers need to strive towards creating post-purchase positive experience and customer centric value in food consumption for a long term growth.

CAN BRANDING INFLUENCE FOOD CHOICE BEHAVIOUR?

How a brand is identified from the consumers’ perspective is the core of a good brand building program. Generally, the power of a brand name is referred to as brand equity. Aaker referred to brand equity as a set of brand assets and liabilities linked to a brand, its name and symbol that add to or subtract from the value provided by a product or service to a firm and/or to that firm’s customers (Sheth and Mittal, 2003, p.399). For the investors, brand equity will be the brand evaluation measured as the financial worth of a brand name. While, for the customer, brand equity will be the value of the brand when compared to that of the competitor’s brands.

We will now examine few studies to determine whether branding can influence the choice of food behavior among individuals.

* Firms need to work towards effective brand building and management because there exists a symbiotic relationship between brands and the cognitive behavior of consumers (Rajagopal, 2006).
* Kathuria and Gill’s study (2013) in India revealed that while a majority of consumers had brand awareness of branded rice, only half of them were aware of branded sugar. Since the factors influencing purchase of selected branded commodity food products were flavour, aroma and absence of the usage of insecticides/pesticides and adulterants, the researchers felt that marketers need to work towards creating brand awareness among consumers and frame marketing strategies for different market segments based on demographics.
* A study to understand ‘Adapting to slow food movement and brand management’ (2012) and Massa and Testa’s (2012) study highlighted the role of ideology in brand strategy with reference to large scale food retailing in Italy. The study concluded that a strong and effective communication retailer ideology that is shared with consumers, who in turn are also asked to participate in the construction of meanings of the retail setting (store layout), can work out to be a powerful tool in brand strategy.
* While trying to explore the antecedents in a hedonic consumable product such as the chocolate market, it was found that brand satisfaction is the most significant factor for brand loyalty followed by brand value and brand equity (Kuikka and Laukkanen, 2012). This study further indicated that testing
of the moderating effect of the hedonic value showed brand satisfaction on attitudinal loyalty to be significantly stronger among consumers with high hedonic value when compared to consumers with low hedonic value.

*A study to analyze the relative importance of brand-packaging and taste in affecting brand preferences for manufacturer and store brands in food product categories indicated that once the product is consumed taste is the strongest attribute determining the choice of the preferred stimulus and influence of price and product brand packaging are specific to the product category analyzed (Mendez, Oubina and Rubio, 2011).

The above few studies on the relevance of branding for food products indicate that creating brand awareness, the role of ideology, brand satisfaction, taste, price and packaging duly influence food brand choices. The broad purpose of a brand strategy is to identify ways to develop brand satisfaction among consumers, which will then lead to brand loyalty and ultimately result in brand equity in the long run.

On the basis of the discussions in the paper reiterating the complexity and interplay of the various factors and variables affecting consumer food choice we have attempted at developing a framework which will show how branding can also be used as an aid to the consumer decision making process in this regard.

![Figure 2: Framework linking factors influencing consumer food choice and branding.](image-url)
From the above framework one can see that the variables influencing food choice affect consumer’s decision making which results in them selecting or choosing the food. This can be observed and used by the firm to work out a branding strategy aimed at increasing customer value, satisfaction and loyalty. Another view suggests that an awareness of the variables influencing consumer food choice and affecting their decision making can be used by the firm to plan a branding strategy which can influence consumers’ food choice resulting in enhanced customer value, satisfaction and loyalty in the long run. This reiterates that food marketers can use branding to effectively influence consumers food choice behavior positively.

CONCLUSIONS AND LIMITATIONS

The above discussion have conveyed that analysing consumer choice of food is highly complex involving the interplay of many variables such as health and nutrition, social and other environmental factors, informational (food labels and packaging) and post-purchase retail experiences. Nevertheless, an understanding of the impact of the various influences can be used by food marketers to work out a suitable branding strategy and create customer (brand) value for their products.

A limitation of this paper is that all discussions and analysis have been done on the basis of secondary research data. A primary data survey would have helped to learn more on the current happenings in this field of study and also substantiate whether the earlier findings hold good even today. Another limitation is that although attempts were made to refer to studies from various regions, it was not possible to obtain much information from many of the developed countries (other than a few) and even from emerging and growing economies such as Asia (barring a few), the Middle East and African countries. Even though consumption of food is a basic need, the social and cultural variations amongst different regions will affect the way it is consumed. So as to obtain a broader perspective, analyzing food choice behaviour of consumers from across the world would be interesting. Today, when the world is referred to as a global village and marketers are seeking to expand their market across seas, it will really be interesting to learn more on the variations in food choice among consumers across various regions, and this also can be an area of probing and researching in the future.

ABSTRACT
The paper’s purpose is to look into the factors aiding entrepreneurship in India. It highlights parameters that lead to successful entrepreneurship. Entrepreneurial intentions too have been dealt with. A range of issues and themes have been examined through secondary research. The overview includes data from salient published articles that empirically assessed the effects of variables, both from internal/external/environmental context on entrepreneurship. The primary research includes an exploratory study through a survey being conducted over a sample size of thirty entrepreneurs in the city of Mumbai, India. The findings and results will be used by other researchers and business support agencies in this field not to forget the fact that higher education

Keywords: Entrepreneurship, Success factors, Eco system, Education and Course Design

INTRODUCTION

DEFINITIONS OF ENTREPRENEURSHIP
In the early 20th century, Schumpeter, J., insisted that entrepreneurship was far too important a part of capitalism to be ignored. He proposed that innovation or the use of an invention to create a new product or service was the driving force behind the creation of new demand for goods and services. The market was, therefore, not perfect but chaotic because of the regular occurrence of entrepreneurs entering the market with new innovations. This process of “creative destruction” destroyed the static market described by the neoclassicists and created a dynamic market which had continuous changes in buyer and supplier behavior. It was these entrepreneurs who developed innovations to create new demand that was the mechanism of wealth creation and distribution. Influenced by the Austrian school, (Kirzner, I, 1973), made a further contribution to entrepreneurship theory. He defined
entrepreneurs as individuals who grasp opportunities for pure entrepreneurial profit and they did this by uncovering unnoticed profit opportunities by being alert to them. Whereas (Stevenson, H's 2006) in his definition included the following factors, pursuit of opportunity; rapid commitment and change; multi-stage decision making; using other peoples' resources, managing through networks and relationships and compensating for value created. Entrepreneurship, a much debated topic, has been defined by (Collins and Moore, 1970) in the for-profit literature as “the catalytic agent in society which sets into motion new enterprises, new combinations of production and exchange.” According to Low and McMillan (1988) or Bygrave and Hofer (1991), the entrepreneur can be defined as a person with a special gift for recognizing opportunities and the capacity to mobilize external resources, generally the property of others, to exploit said opportunities. Low and MacMillan's define entrepreneurship as "creation of new enterprise" (Low and MacMillan, 1988). According to Shane and Venkataraman (2000), entrepreneurship is a field of business, that seeks to understand how opportunities, create something new (new products or services, new markets, new production processes, new ways of organizing) and are discovered or created by individuals (entrepreneurs) and how various means are used to exploit or develop these opportunities into business ventures. To put it simply, entrepreneurship involves recognizing an opportunity to create a new business venture (Eckhardt & Shane, 2003). Entrepreneurship has been considered as the engine of economic growth (Schumpeter, 1942) and has gained importance over the years.

LITERATURE REVIEW

Young, E.C., & Welsch, H.P. (1993) suggest through their study that the factors affecting entrepreneurship are financial independence, zeal to supplement family income, family encouragement and other encouraging support groups, luxury of developing a hobby, extension of credit from suppliers & discriminatory practices. Business regulation factors like recession, inflation, government regulations, high interest rates, federal taxes, state insurance, high wages and financial factors like seasonal fluctuations of cash, lack of working capital, lack of financial information and lack of working capital are other factors which influence entrepreneurship. The negative factors are recruiting problems, business obstacles like obtaining a loan, finding good location, lack of counsel or knowledge and individual obstacles like lack of encouragement, lack of confidence in customers and risk of start up.

Startiené, G., & Remeikienė, R (2008) suggest through their study that there are various factor groups affecting gender gap in entrepreneurship such as demographic factors like immigration; economic factors like labour market, unemployment; institutional and government factors like capital availability; organizational factors; social and psychological factors; and cultural factors. They have
further considered various factors which “Push” or increase the gender gap and “Pull” or decrease the gender gap. Whereas Gaddam, S. (2007) proposes, two factors influencing entrepreneurship, external and internal. The external factors can be broadly classified into economic factors like trade policies, taxation levels, patents, government intervention, regulations and monetary policies and per capita income. The internal factors can be classified into the need for achievement, locus of control and risk bearing capacity. Other factors are demographic factors like age, experience, education; environmental factors; cultural factors like the recognition that is given to venture creators, the prevailing attitudes towards success and failure and the degree to which people regard the pursuit of opportunities as socially legitimate; social factors like lifestyle, tastes and preference. This list is not exhaustive; it is just a broad classification. Rani, B., & Rao, D. (2007) suggest through their study that the factors influencing women entrepreneurship include factors viz, wanting to be self employed (business sector), gain prestigious status, profit motive, utilizing professional expertise, providing employment to others, education or economic status of husband or father, work home conflict, making fruitful use of free time, and benefiting from government initiatives. Other factors stated are socio personal such as resistance from family, indifferent attitude of society, male dominance, limited liberty given to women; motivational factors such as run the business successfully, setting up another enterprise, expansion, socio economic needs; locational factors such as power supply, industrial environment, credit facility, availability of raw material, skilled man power. The discouraging factors are discouragement from family, competition, labour problems (industry), inadequacy of credit and difficulty in getting technical know-how (service sector).

Ertuna Z.E. and Eda, G. (2011), have investigated the role of higher education with regard to the entrepreneurial intentions and traits of university students in Turkey. They suggest that that the factors affecting the intentions are locus of control; need for achievement; innovativeness; risk taking ability. Other factors which control it are gender and family background of an individual. Wage rate and unemployment rate are the extrinsic factors which are not considered in the study. Religion, family income, self efficacy and energy level are other factors which influence entrepreneurial intentions.

Nabi, G & Holden, R. (2008) suggest through their study that university education influences individual’s career-orientation and mindset towards self-employment. Factors such as attitude towards entrepreneurship in terms of perceived desirability of entrepreneurship as a career option, perceived feasibility in starting up (e.g. entrepreneurial skills and personality traits) and a willingness to act (i.e. actually a start up). Perceived desirability (e.g. poor image, lack of personal desire), perceived feasibility (e.g. lack of finance, skills, self-efficacy), propensity to act on decisions (e.g. lack of self efficacy to follow through or start up a new business) are other factors. There is a gap between
intent and action. They suggest that evolutionary approaches, be used to develop students as reasonable adventurers and to develop an enterprising mindset. Fresh B-school graduates are increasingly shunning the security of a steady job and striking out on their own. (Gohain, M.P. 2014)

Kshetri, N suggests through his study that there are three institutional pillars which affect entrepreneurship- regulative, normative and cognitive. Regulative component contains factors like government support towards entrepreneurship, strong rules of law and enforcement mechanism. Normative component contains factors like societal perception of entrepreneurs and societal expectation from entrepreneurs. Cognitive component deals with factors like assessment of entrepreneurship as an occupation and relationship between culture and entrepreneurship.

Lewis, Prestin; Lu, Wei; Yin Hao; Li, Yong; Vaccaro, Louis C suggest through their study that there are three major forces that govern entrepreneurship environment- culture, economics and policy. Culture is determined by number of hours worked, likeliness to become an entrepreneur and social network (level of trust and strength). Economic environment is determined by chances that the venture will succeed and funding opportunities whereas different policies that affect entrepreneurship are taxation policy, legal approval to start a business and government sponsored programs to start a business.
METHODOLOGY & RESEARCH DESIGN

Entrepreneurs have been on a rapid growth phase over the past decade. With an increase in numbers comes greater competition and quest for perfection. There exists the need for an in depth study which will help understand the growth of entrepreneurs. Resources available to most entrepreneurs are scarce and limited. In India 38.8% entrepreneurs are necessity entrepreneurs, while around 35.9% fall under the opportunity entrepreneurs’ category (Global Entrepreneurship Monitor, Global report 2013).

The researchers have attempted to establish the factors that influence entrepreneurship in India. Secondary research for theoretical comprehension and primary for current practices being undertaken was attempted through quantitative research. The survey questionnaire was adapted & modified from, (Cohoon. J. M., Wadhwa M & Mitchell M, 2010), The Anatomy Of An Entrepreneur, are successful women entrepreneurs different from men. Prior to administering the modified questionnaire inputs were drawn from six academicians in the area of entrepreneurship. They contributed in providing critique in constructing the modified questionnaire. Empirical, conceptual and works of practitioners were chosen for concept understanding from databases of Ebsco, Proquest and the internet. Entrepreneurship is a vast area and hence the study has been limited to only the factors influencing entrepreneurship. Unfortunately, no reliable database of entrepreneurs from which to draw exists. Existing lists of entrepreneurs are limited in their scope, tend to contain many inaccuracies and require considerable purging and correcting.

The success of venture creation depends on the individual, environment, economic and financial factors. An assessment of factors influencing entrepreneurship would ensure that the right eco system for breeding successful entrepreneurs exists. Entrepreneurs do not have the luxury of time or resources when starting up, hence awareness of the relevant aspects that support growth would prove useful. Once entrepreneurial motivating factors, challenges in setting up ventures and the external conditions are identified, the entrepreneurs can work towards overcoming these challenges. Knowing aspects of entrepreneurial success will be a value addition to the upcoming entrepreneurs.

The sampling methodology used was convenience or judgment sampling. Further as these respondents knew others in the same field a purposive method of snowball sampling was resorted to. In order to improve the response rate, purposive sampling was included as a part of the survey design. The sample consisted of alumni entrepreneurs, guest speakers who had visited a business school campus, entrepreneurial friends & acquaintances. Permission for data collection was obtained from the respondent, later a multi-part online instrument (e.g., a survey) through the administering of a structured questionnaire with thirty seven questions was used to obtain data.

The researchers faced a non-response error. One hundred and thirty four questionnaires were
administered. Two reminders too were also sent. Forty responses received were screened to check for errors of which four were found erroneous and were discarded. This reduced the total sample size to thirty six. Organizations like; Thane entrepreneurs’ network & United India that support entrepreneurship were also sent the questionnaires to forward to their networks.

Inferential statistics has been the method used where statistics gathered from a sample has been used to reach conclusions regarding the population. The responses were then coded and later the data was tabulated in MS Excel. The data analysis was then carried out using statistical software SPSS. The following methods of analysis were used, frequency distribution, t test, testing of hypothesis, ANOVA, discriminant analysis. All hypotheses were tested at 5% level of significance. Participants were informed that the study was being conducted to complete an academic paper and that their responses would be kept confidential and their participation was voluntary. It was assumed that the respondents are truthful when responding to questions on the survey and that entrepreneurship is critical to them.

RESULTS OF THE STUDY

The respondents were given a set of parameters and asked to determine their perception towards. A five point rating scale was used to judge the responses, where (1) = Not at all important, (2) = not important, (3) = neither important nor unimportant, (4) = important and (5) = very important. Similarly challenges were rated, where (1) indicates not a challenge, (2) indicates small challenge, (3) indicates somewhat of a challenge (4) represents big challenge (5) indicates extremely big challenge.

On conducting a frequency distribution for the socio economic standing the entrepreneur, members in the family who have started a business’s before the entrepreneur, marital status and children in the family, the following results were obtained.

<table>
<thead>
<tr>
<th>Table 2 Socioeconomic standing of family</th>
<th>Frequency</th>
<th>Percent</th>
<th>Valid Percent</th>
<th>Cumulative Percent</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parents are professional with a college education, and more often with postgraduate degree</td>
<td>13</td>
<td>36.1</td>
<td>36.1</td>

<td>100</td>
<td></td>
</tr>
</tbody>
</table>
Therefore the sample suggests that maximum number of entrepreneurs come from highly educated families where parents are professionals with post graduates degrees. This is followed by individual whose parents have become richer in their life time. The least number of entrepreneurs come from families with rich forefathers.

| Table 3 Members of the family started businesses before the entrepreneur |
|---------------------------------|-----|-----|-----|-----|
|                                  | Frequency | Percent | Valid Percent | Cumulative Percent |
| First in my immediate family to start a business | 18 | 50 | 50 | 50 |
| Other                            | 18 | 50 | 50 | 100 |
| Total                            | 36 | 100 | 100 |   |

Thus the results show that 50% of the entrepreneurs under the study are first generation entrepreneurs.

| Table 4 Marital status when the entrepreneur started his/her first business |
|------------------------------------------------------------|-----|-----|-----|-----|
| Single                                                      | Frequency | Percent | Valid Percent | Cumulative Percent |
| Married                                                     | 25 | 69.4 | 69.4 | 69.4 |
| Total                                                       | 11 | 30.6 | 30.6 | 100 |
|                                                             | 36 | 100 | 100 |   |

The findings suggest that individuals start business when they have lesser family obligations, i.e. when they are unmarried or single.

| Table 5 Number of children living in the household |
|-------------------------------|-----|-----|-----|-----|
| None                          | 24 | 66.7 | 66.7 | 66.7 |
| 2                             | 7  | 19.4 | 19.4 | 86.1 |
| 1                             | 2  | 5.6  | 5.6  | 91.7 |
| 3                             | 2  | 5.6  | 5.6  | 97.2 |
| 4                             | 1  | 2.8  | 2.8  | 100 |
| Total                         | 36 | 100 | 100 |   |

The sample suggests that entrepreneurs’ start ventures, when they have less family obligation that is no children.

**Hypothesis testing**

**ANOVA**

**Hypothesis 1**

H0: There is no significant difference in the various motivational factors across the city of birth

H1: There is significant difference in the various motivational factors across the city of birth
The city of birth has been divided into four groups; (1) metropolitan cities (2) tier 1 cities (3) tier 2 cities and (4) tier 3 cities. At a significance level of 0.05, it is observed that there is no significant difference in the various motivational factors across the city of birth.

**Independent sample t test**

In the present study, for the two hypotheses a two tailed test was used and a 0.05 level of significance seemed appropriate for this decision. The method is measured on a five point scale where (1) indicates not at all important, (2) indicates unimportant, (3) neither important nor unimportant (4) represents important (5) indicates very important.

**Hypothesis 2**

H0: There is no significant difference in the way various factors affect solo entrepreneur and team of entrepreneurs

H1: There is significant difference in the way various factors affect solo and team of entrepreneurs
At a significance level of 0.05 it is observed that there is significant difference in the way various factors affect solo entrepreneur and team of entrepreneurs for business factor contractual obligations:
documentation, paperwork and approvals from the government [Solo entrepreneur (M=4.5, S.D.=0.96)], [Team of entrepreneurs (M=3.73, S.D.=1.35)] with solo entrepreneur giving more importance than team of entrepreneurs; for financial factor (lack of working capital) , [Solo entrepreneur (M=4.29, S.D.=1.32)] [Team of entrepreneurs (M=4.55, S.D.=0.51)] with team of entrepreneurs giving more importance than solo entrepreneur and other factors (company’s founding team), [Solo entrepreneur (M=3.86, S.D.=1.46)][Team of entrepreneurs (M=4.73, S.D.=0.55)] with team of entrepreneurs giving more importance than solo entrepreneur. Apart from these three parameters, there is no significant difference in the way various factors affect solo entrepreneur and team of entrepreneurs.

A point to note is, two factors, namely business factor (exemptions provided by the government to entrepreneurs) and financial factors (capital availability), are sensitive at a 0.10 level of significance.

Descriptive analysis

The sample as a whole considered the following factors important; economic factors (low economic activity in the economy); business factors (contractual obligations - documentation, paperwork and approvals from the government); financial factors (seasonal fluctuations of cash); financial factors (lack of financial information); financial factors (capital availability); other factors (prior industry / work experience, lessons you learned from your previous successes, company’s founding team; technological factors (access to technology and applications, readiness of status of technology and access to technology and competence networks). Additionally, the following factors are considered to be between “important” and “very important” where the inclination is towards being “very important” by our sample of entrepreneurs; financial factors (lack of working capital) and other factors (lessons you learned from your previous failures).

Overall situations relating to financial factors and technological factors are considered important by entrepreneurs. Whereas cultural factors relating to the caste and religion is considered unimportant.

Hypothesis 3

H0: There is no significant difference in the various challenges faced by solo entrepreneur and team of entrepreneurs

H1: There is significant difference in the various challenges faced by solo entrepreneur and team of entrepreneurs

The method is measured on a five point scale where (1) indicates not a challenge, (2) indicates small challenge, (3) indicates somewhat of a challenge (4) represents big challenge (5) indicates extremely big challenge. At significance level of 0.05, it is observed that the challenges faced by solo and team of entrepreneurs significantly differ for the challenge “Lack of confidence in me by customers” (Solo
entrepreneur: Mean 2.07 and Standard deviation 1.439; Team of entrepreneurs: Mean 2.09 and Standard deviation 0.868). Apart from this challenge, there is no significant difference in the various challenges faced by solo and team of entrepreneurs. But there is one challenge, “Amount of time and effort required”, which is sensitive at a 0.10 level of significance.

**Descriptive analysis**

Lack of prior experience in running a business, lack of available mentors or advisors and amount of time and effort required is “somewhat of a challenge” according to our sample set of entrepreneurs. Rest all the factors range between “small challenge” and “Somewhat of a challenge”.

**Discriminate analysis**

Canonical correlation shows that there is a strong relationship between predicted variables in the results generated. The most important is the coefficient matrix. It represents the highest loading variables in the affecting entrepreneurship. The most important factors affecting entrepreneurship positively are, exemption provided by the government to entrepreneurs (17); business factors: control over timelines to repay loans (14), barriers to entry (10) and economic factors: per capita income (9). Whereas, the most important factors affecting entrepreneurship negatively are, in economic factors: presence of high income level in the country (-13); cultural factors: the religion the entrepreneur belongs to (-9); business: determination of lending rates of the financial institutions (-9) and business factors: government regulation on sourcing of products (-7).

Further for solo entrepreneurs, the most important factors positively influencing are, business: control over timelines to repay loans (368), exemption provided by government to entrepreneurs (328); cultural: the degree by which people regard entrepreneurship as a career (301); business: entry barriers to enter (288) and finally economic: price level of the product/service they were offering (272). Whereas, the factors affecting entrepreneurship negatively are, in economic factors: presence of high income group (-315); financial factors: capital availability (-295) business factors: presence of industrial clusters (-270) and lastly financial: lack of working capital (-270).

For team of entrepreneurs, the most important factors influencing positively are, business: control over timelines to repay loans (238); cultural: degree to which people regard entrepreneurship as a career (190); business: exemption provided by business to entrepreneurs (177), entry barriers to enter (176) and ultimately economic: price level of the product or service you were offering (175). Whereas, factors affecting entrepreneurship negatively are, in economic factors: presence of high income group (-315); financial: capital availability (-183); business: presence of industrial clusters (-181); economic: presence of high income group (-173) and business: tax, customs duty levied by the government (-125).

**Fisher’s linear discriminant functions**
LIMITATIONS OF THE STUDY

The family background of the entrepreneur could have been assessed with more in depth questions on the education of the parents & place of birth. Additionally, data not being captured in this study include, whether the entrepreneur started a venture, closed it and followed this with being employed in an organization and later starting a new venture. The difficulty encountered in the research was that only entrepreneurs were considered, instead a specific target population could have been determined. Serial entrepreneurism, family managed businesses amongst others were all categorized as entrepreneurs. Being a India centric study one cannot apply the outcome in Toto across geographical areas. Care must be exercised to invoke cultural considerations with minimal of changes in the survey format which would enlarge the scope of study and its usefulness.

CONCLUSION

As revealed by this study it is obvious that there exists a plethora of factors which impact the issue of ‘wanting to be ‘an entrepreneur which in turn does not permit gross generalization. However factors like educational background of parents, parents who have grown rich during their lifetime, role and extent of government involvement besides availability of capital have a pronounced impact in driving entrepreneurship. It should also be noted that 50% of entrepreneurs were first generation entrepreneurs lending further credence to the factors mentioned herein.

ESTABLISHMENT OF THE NATIONAL PROGRAMME OF
VOCATIONAL GUIDANCE IN LITHUANIA: CHALLENGES AND
PERSPECTIVES

Nazelskis, Eugenijus¹; Laurinaitis, Arūnas²

¹Vilnius University International Business School, Lithuania
²Lithuanian Confederation of Industrialists, Lithuania

ABSTRACT

In Lithuania, where its economy is recovering from crisis, many industrial enterprises encounter sharper increased shortages of qualified workers. However, in most cases, this shortage in the country’s labor market is not around some one particular occupation that raises selectively the requirements for human qualifications in knowledge, health, or psychic particularities, but for multitude of popular vocations, such as for long-distance drivers, welders, cooks, etc.

The national labor market frequently encounters paradoxical situations; during times of high unemployment and expanded educational levels employers ask the state for permission to import third country specialists because of deficits in many vocations. For some occupations such shortages already existed for several years with no indications of future improvement.

Balancing the demand and supply of skilled workforce in the labor market is a challenge of vocational guidance. Current skills mismatches in the labor market indicate, that the currently applied national program for vocational guidance in the national education system is not able to solve these skills mismatches. This prompts the search for ways and means for improving the situation.

This article, while seeking to achieve a balance between supply and demand as well as rational utilization of available human capital, analyses the causes of the continuous deficit of skilled workforce in various fields. It also will provide recommendations to correct the situation.

Keywords: Vocational guidance, human resource management, skills mismatches, labour market

INTRODUCTION

The relevance of the subject theme is based on the contemporary situation in Lithuania’s labor market, characterized by asymmetry and disproportion between supply and demand of workforce, because there is a surplus of some specialists and a shortage of others. Furthermore, contradictory situations
appear, when despite of high unemployment and big supply of educated workforce employers ask for state’s permission to import middle level professionals (drivers, welders, cooks, etc.) from the third countries, because such skilled workers can not be found in the local labour market. Such shortages exist in Lithuanian labor market for several years now with no visible indications of change in the future.

At the same time statistical data indicate that one fourth of university and college level graduates in social science studies are forced to take jobs as common laborers upon their arrival in the labor market. Among the graduates in engineering manufacturing and processing studies this index reaches almost a half, while among graduates of agricultural and veterinary studies it reaches 60 percent (Lithuanian Labour Exchange, 2014). The number of the graduates of universities going to the initial VET schools for retraining is also increasing.

According to data of the Ministry of Education and Science, 423 graduates of higher education entered vocational schools: 222- university graduates, 201 college, while in year 2012 such number of people almost doubled - it grew to 812, who have diplomas of higher education, 464 of them are university graduates, 348 – college (Juknevičiute, 2013).

However, the situation, where most people work below their qualifications can last a long time, since experts note that young people are not reacting to the labour market needs and tend to make the same preferences in choosing their fields of studies to become economist, lawyer, psychologist, business administrator, manager. They face the biggest risk of unemployment. One of the reasons of this situation is that a significant part of young people choose their vocational pathway without prior evaluation of the employment possibilities. Therefore it is not surprising, that a major part of young people having attained higher education degree, but unable to find jobs must re-qualify and often end up looking for work outside Lithuania, choosing the life of emigrants.

All this urges us to study and analyse the reasons for evoking deformations in the market place and in utilization of human capital as well as to search for ways and means to correct the situation.

Vocational guidance plays crucial role in dealing with labour market mismatches in many countries. Effective vocational guidance can act as a remedy of existing skills mismatches (when it is provided to the unemployed persons), but it’s most important target should be prevention of structural unemployment by directing youth to the vocational pathways providing qualifications that are in demand in the labour market. We claim that strategic and long-term prevention of structural unemployment and skills mismatches requires systemic national programme of vocational guidance with the key role played by employers. In this paper we will try to provide the arguments for this statement by analysing the role of enterprises in the process of vocational guidance, disclosing the attitudes of enterprises to their involvement of in the vocational guidance and providing arguments.
for the establishment of the national programme of the employers led vocational guidance.
To solve the above tasks the were applied different research methods:

a) Systemic analysis of the different factors and features of the involvement of enterprises in the vocational guidance based on the desktop research.
b) Analysis of available statistical data.
d) Empirical research consisting of: 1) Interviews with employers and leaders of associated business structures; 2) Questionnaires for surveying of leaders in associated structures.

Interviews were performed in three economic sectors:
1. Transport.
2. Metal processing industry.
3. Information technology.

THE ROLE OF ENTERPRISES IN THE PROCESS OF VOCATIONAL GUIDANCE

The role and importance of enterprises in choosing vocation and, in general, in vocational guidance becomes apparent when an individual at some point has to find answers to himself: what I want to be? What path in my life I should take? And what profession or occupation I should choose? The answer is not an easy one as choice of a profession or occupation is a complex and responsible individual psychological act. It results in huge psycho-social consequences not only to a person himself, but also the entire society.

Occupational choice and its subjective and objective factors are the central objects of vocational guidance and its research. Choice of occupation or profession involves numerous contradictions and conflicts between the objective factors defined by the labour market demand and subjective factors, that are defined by the needs and intentions of learners and employees. Theories of psychology, sociology and education science focus on the different aspects of these factors and involvement of enterprises in the vocational guidance process. For example, the theory of occupational choice offered by Parsons is focused on the fit of the personality to the work environment, while the theories of dynamic personality are focused on the complex interdependencies between the dynamic change of personality and the process of the choice of occupation or profession. Very similarly, the theories focused on the structure of personality (Axelrod, Ginzberg, Ginsburg, Miller, Super), motivation (Maslow, Vrum) and individual’s choices (Holland, Tyler) stress the complexity and changeability of personality as the key factors in the choice of occupation or profession. These theories also bring the concepts of occupational choice oriented to the personality and subjectivity, such as the concept of casual occupational choice, internal impulse of the occupational choice (Yolland), free development of
personality (Holland, Ginzberg, Super). Obviously, these theories and concepts considered the role of enterprises as secondary factor in the process of occupational choice led by the persons. Very different attitudes to subjective and objective factors of vocational guidance were typical for the theories and concepts developed by the scientists from the former Soviet Union. The concepts of human existence developed by Vygotski, Rubinstein and Leontiev placed socially useful work at the centre of human existence largely ignoring the personal needs and interests of humans. Such theoretical assumptions largely influenced development of vocational guidance in the Soviet Union.

Lithuanian scientist L. Jovaiša has developed psychosocial theory of vocational guidance targeted to the optimal usage of personal resources in the vocational training and subsequent work. He discerned three main factors of the occupational choice: 1) requirements of occupations and professions, 2) demands of economy and labour market; 3) vocation of person for certain work or occupation. This model of vocational guidance is rather similar to the model proposed by S. Fukuyama, who discerned the following factors of mature occupational choice: 1) self-analysis of the personal features and resources; 2) knowledge and awareness of the world of work; 3) introduction to occupation and its requirements by practicing the concrete occupations. All these factors require systemic pedagogical support. For example, young people need methodical guidance and help from teachers in performing self-analysis of their personal features and resources. Equally so, in analysing the requirements of work and occupations young people need both access to information about occupations and consultations provided by the teachers and professionals. Referring to the models of vocational guidance proposed by Jovaiša and Fukuyama there can be discerned several types of requirements of systemic vocational guidance related to above mentioned factors: work process requirements, labour market needs and personal vocation for the occupation. These requirements present different implications to the involvement of enterprises in the vocational guidance. Referring to the work process requirements there can be discerned availability of information about the work processes and monitoring of the changes of work processes. Effective vocational guidance requires access to comprehensive, systemic and regularly updated information about the contents of work processes in the different occupations and professions. Availability of such information can be ensured by the different measures and instruments, such as occupational standards, national and sectoral databases of occupations and qualifications, catalogues and registers of occupations and qualifications (for example, national repository of the descriptors of occupations in France – ROME, or the open system of information and guidance on occupations and qualifications AIKOS in Lithuania). In spite of the domination of the national governments in designing and implementation of these measures in many countries, the involvement of enterprises and social partners by providing information and expertise is of crucial importance for the quality of these measures. Monitoring of the occupational change also
requires solid and concerted efforts of research institutions, enterprises and other social partners. It ensures relevant updating of the information about the work process requirements, what is of crucial importance for vocational guidance in the current context of fast changes in the world of work. Referring to the factors of vocational guidance related to labour market needs, there can be discerned labour market forecasting and exercising influence to the development of labour market needs. Effective vocational guidance requires reliable information about the labour market changes, that can be provided by systemic and regulative labour market needs forecasting. In the nowadays conditions of the fast and unpredictable social and economic change labour market forecasting is very often undervalued and its reliability is doubted. However, despite of its multiple limitations, labour market forecasting is absolutely indispensable not only for the long term labour market policies and strategies, but also for the vocational guidance. Relevance and reliability of labour market needs forecasting highly depend on the involvement of employers in this process on the enterprise, sector and national levels. National and European strategies of the knowledge-based economy often require from the state and social partners to take more responsibilities and to make more efforts to improve the quality of employment and to enhance the demand for high-quality and knowledge intensive jobs. Enhancement of the demand for such jobs is perceived as a key factor for development of competitive economy. Referring to the factors of vocational guidance related to personal vocation, there can be mentioned orientation of the educational process to assistance for learners to discover their personal vocation and to strengthen it. This orientation requires from educational institutions to become more open to the world of work by establishing stronger cooperation with enterprises and involving the skilled employees and professionals in the educational process. Implementation of the competence based paradigm in the education process also fits to this purpose. Providing to young learners systemic pedagogical and psychological support in discovering and nurturing their personal vocation becomes very challenging undertaking for general and vocational education providers in the context of dynamically changing occupations, work processes and labour market. It requires to restructure the education process by including different propaedeutic and work-based learning measures.

Development of vocational guidance can be based on the different methodological principles, that can even contradict each other. Hupfer and Spöttl (2014) discern the principles of vocationalism and employability. The object of vocationalism is development of an occupational identity through mastering of the professional domain, while the principle of employability is focused on the market oriented dispositions and attitudes that ensure the competitive features of person in the labour market. This principle is based on the assumption of the domination of economic organisation of work and disregards educational and vocational-pedagogical principles of the work and it’s organisation.
These two principles, if taken separately, lead to the different models of vocational guidance. The principle of vocationalism requires comprehensive and hollistic vocational guidance based on the systemic consideration of the different subjective factors, such as needs of development of personality and occupational identity, ethical and moral aspects of work. Vocational guidance ruled by the principle of employability will be more focused on the requirements of workplaces and orientation to the “objective“ requirements of workplaces to the performance, such as concrete sets of knowledge and skills to perform the work tasks. It turns to the different roles and involvement to the employers in these models. In the model of vocational guidance based on the vocationalism, the main role of employers is active participation in the educational process by providing the comprehensive information about work processes, involving skilled employees and experts in the preparation and execution of vocational guidance measures, designing and implementing different propaedeutic and apprenticeship measures and events in order to disclose to young people the hollistic picture of work processes and professionals. Enterprises treat their participation in the vocational guidance not only from the point of view of their business interests, but also from the point of view of public social responsibility. In the model of vocational guidance based on the employability the enterprises participate in this process by „marketing“ their offered workplaces and presenting the requirements of skills, competences and qualifications. Here the participation of enterprises in vocational guidance processes is more strictly based on the current needs of recruitment and human resource management.

2. INVOLVEMENT OF BUSINESSES IN CAREER GUIDANCE

The problem of the shortage of skilled workforce in specific sectors of economy of Lithuania has been discussed for a number of years. Interestingly, the biggest shortages of skilled workforce is noticed in ordinary and middle skilled occupations, rather than any specific or unique professions with special requirements for skills and competences.

The number of work permits issued to foreign nationals in the Republic of Lithuania indicates the shortage of skilled workforce and its extent on the domestic labour market. The data are provided in Figure 1 below.
According to the data contained in Figure 1, in the recent decade, the number of work permits issued to foreign nationals in Lithuania has been significantly growing, and it has already reached a four-digit level. This causes concern, however, one should also remember that third-country nationals are employed only in the sectors that face the shortage of professionals from Lithuania and EU member states. According to the data of the Lithuanian Labour Exchange of 2010, long-distance drivers, hull assemblers, welders and cooks (Foreign Nationals in Lithuania, 2011) were in the highest demand.

In terms of the shortage of certain occupations, the labour market situation, from a time perspective, continues to deteriorate, as the gap between the supply of and demand for the lacking occupations is still widening. The number of work permits for specialists of different occupations (especially the truck drivers) is rather important (Figure 2).
In 2012 alone, Lithuania issued 4,125 work permits to these third-country professionals.

Admittedly, the demand for cargo truck drivers might be still increasing in the future, as in 2011 alone 6,300 cargo truck driver job vacancies were registered for international carriage of goods, and only 1,100 of these were filled by Lithuanian drivers (Kleinauskas, 2012). At the same time, statistics reveal that, at present, two thirds of long-distance cargo truck drivers are aged between 40 and 60. (“Mercedes-Benz” Intends to Tackle the Shortage of Drivers by Using Innovative Methods). The ageing of cargo truck drivers also causes concern over the sufficient number of these professionals in the future.

With the widening gap between supply and demand, the domestic labour market situation is also becoming more complicated in relation to welding professionals. Statistics show that the labour market demand for welders was increasing even under the conditions of economic crisis: in 2009, 2010 and 2011 there were 1,700, 2,400 and 3,000 welding job vacancies respectively (Suvinio nuo emigracijos nesustabdo ir 4 tūkst. Lt atlyginimas, Delfi, 2012).

Above described situation enhanced to carry out research in order to clarify the reasons for the persistent shortage of individual occupations on the labour market and to explore the involvement of companies in vocational guidance.

In February 2014 there have been interviewed representatives of the several sectoral associations of business enterprises. These include: (1) Lithuanian National Road Carriers Association “Linava”, which at present joins 954 carriers – transport companies owning around 20,000 commercial vehicles for international carriage of goods and approximately 3,000 buses and trolleybuses for carriage of
passengers; (2) Lithuanian Welders Association that unites representatives of the welding industry (machinery production, metalworking) - there are approximately 700 companies engaged in welding technologies; and (3) National Association of the Information and Communication Technologies (ICT) Industry “Infobalt”, which currently unites 138 Lithuanian ICT companies and research and education institutions. These companies and organisations employ over 10,000 ICT specialists.

It should be noted that the ICT industry it suffers from a dramatically widening gap between supply of and demand of skilled employees. Data contained in Figure 3 (Brazauskas, 2011) show the shortage of ICT specialists and the perspectives of meeting the demand.

![Fig. No.3: Training of IT professionals and their demand in the domestic economy](image)

In 2011-2016, the gap between the supply of and demand for ICT specialists will reach 6,000. This estimate does not consider possible increase in specialist mobility and entry of potential investors to this Lithuanian sector, which might widen the gap even further.

The data contained in Figure 3 reveal that the gap on the labour market between the supply of and demand for IT specialists is further widening. In 2011-2016, the shortage of IT specialists is expected to reach 6000. Lack of skilled employees hinders the promotion of investments in the country’s economy and impedes the development of economy and individual industries.

Research was primarily aimed at establishing the groups of professionals that were the most required in the above mentioned sectors.

The data obtained were systematised on the basis of Lithuanian Classification of Occupations. They are provided in Table 1 below.

**Table No.1. Number of lacking workers by professional group**
Statistics provided in Table 1 show that three sectors alone need 17,000 skilled workers. This implies that filling these job vacancies would lead to a significant decrease of the unemployment rate in Lithuania. On 1 February 2014, the unemployed registered with local labour exchange offices numbered 210,900. They accounted for 11.5% of the country’s population of working age, including 111,700 unemployed males and 99,300 unemployed females. On 1 February 2014, there were 24,000 registered young unemployed persons under the age of 25. (Lithuanian Labour Exchange, Information, 2014).

Some labor market forecasts failed in detecting the shortage of IT specialists. Although it was estimated that (see Table 1) the requirement of IT specialists would reach 6,000 in 2016, the study shows that already now 10,000 persons are required.

The managers of the above mentioned associations were asked about the reasons for the shortage of workers in their sectors. Taking into consideration the possible variety of causes of the shortage of experts on the labour market, the managers of the associations were requested to name five key reasons for the shortage of skilled workforce. In addition, they were asked to rate their answers from 5 to 1, where 5 points were given to the most important aspect. The data obtained were systematised and are provided in Figure 4 below.
Fig. No. 4. Key reasons, as seen by associations, for the shortage of certain occupations on the domestic labour market

According to Figure 4, there are 11 main reasons why companies suffer the shortage of workers. Yet, the fact that young persons choose an occupation regardless of the labour market needs is predominant among other reasons. This implies that the responsibility for the shortage of certain skilled workers or specialists basically rests with those who choose their occupation.

However, such a position taken by the respondents raises doubts and a number of questions as to: (1) the objectivity and moral correctness of this attitude; (2) the sufficiency of efforts of businesses to encourage young people to opt for occupations that are absolutely necessary for the country’s economy; (3) extent of the usage of human resources potential in meeting business requirements for necessary occupations; and (4) the need for employers to change their attitude to both young persons and their occupational choice.

Such issues are reasonable and well-founded. For instance, whenever the shortage of cargo truck drivers is mentioned, it is often claimed that this is a male-dominated occupation, and this stereotype is still common in Lithuania. However, in the USA and Canada women working as cargo truck drivers account for 5% of the overall number of truck drivers. Americans admit that they are not satisfied with such situation and target to increase the employment of women in this position to
achieve that women would make at least 10% of total cargo truck drivers. It should be noted that the cases where man and wife, father and daughter, couples, etc. work as long-distance drivers are quite common in the United States. For driving pairs, this is not only the way to earn money, but also the possibility of travelling together, communicating, enjoying their work and life. The United Kingdom, France, Sweden and some other countries even have organisations promoting employment of women for cargo truck driver jobs. Such organisations are particularly successful in Sweden. However, there are no considerations of this employment niche for women in Lithuania. Respondents say, that one of the reasons for excluding such an occupation as an option for choice is distancing from the family. However, the practice of other countries demonstrates that, in a number of cases the occupation of a long-distance driver can unite families rather than to pull them apart.

Reasons related to the quantity and quality of specialist training come in second place. It should be noted that, according to the interviewed business associations, the initial VET schools and higher education establishments fail to meet the needs of quantity and quality of skilled specialists.

In some cases, as for example, in case of welders the graduates of initial VET schools do not have all certificates that are needed for the immediate work after employment. Here the problem lies in the insufficiency of the contents of provided qualifications for the execution of work tasks. It’s no wonder that employers who recruit such persons still need to devote a great deal of effort and money to their further vocational training for them to obtain documents necessary for the job. For this reason, when recruiting staff, employers give priority to persons with all needed qualifications and professional experience rather than young graduate specialists. This partially explains why the problem of youth unemployment persists in Lithuania, though at the same time there is a shortage of professionals in the different fields (like, for example, welding).

The current situation shows that the issues related to training of specialists of specific areas need to be tackled in order to increase youth employment. It could be possibly dealt with through a better cooperation between employers and training institutions and by joining efforts in the preparation of occupational standards and their integration in curricula. Nevertheless, documents and surveys (Nazelskis, Tutlys, 2013) reveal that this kind of cooperation is still rather weak.

Studies of Peter Drucker, a famous American manager and the author of a number of research papers, are valuable in dealing with the sensitive and complicated issue of specialist training. Taking into consideration worldwide social transformations and the role of organisations in transformation processes, this researcher claims that: “Only the organisation can convert the specialised knowledge of the knowledge worker into performance, and the human capital to the structural capital” (Drucker 1994:88). Due to the need of highly skilled workers the involvement of organisations in specialist training become an objective necessity.
Further, the representatives of business associations were asked about their involvement in vocational guidance. The data obtained were systematised and are provided in Table 4 below.

**Table No. 4. Involvement of business associations in vocational guidance**

Not all associations gave a positive answer to the question about their involvement in vocational guidance. This implies that not all of them are practically engaged in such activities. Since the association “Linava” gave no answer to the successive questions related to vocational guidance, this is a well-founded assumption.

Following the question about the involvement of companies and associations in vocational guidance, respondents were further asked about the forms of their involvement in vocational guidance. Their responses were systematised and are provided in Table 5 below.

It should be noted that the data contained in Table 5 speak of a controversial and interesting phenomenon – companies are convinced that they participate in vocational guidance, but their indicated forms of involvement show that these representatives have rather distorted understanding of the contents of vocational guidance. Bigger part of their indicated measures hardly have anything in common with vocational guidance on the whole or play only a secondary role in the vocational guidance process. In addition, their indicated measures evidence, that vocational guidance provided by economic entities lacks clear structure and focus.

In this context, it is worth mentioning that modern information technologies offer wide opportunities for economic entities to take part in vocational guidance and provision of information about occupations and skills needs. Specifically, the development of specialised websites allows the
provision of information about occupations, their need, prospects and requirements of each specific occupation for human skills, knowledge, health and physiological characteristics.

Also, it should be reminded that persons choosing an occupation, planning their future and seeking vocational retraining should be aware of social and economic aspects of a specific occupation, such as salary rates, social benefits, health implications, cultural and routine conditions, possibilities to attain qualification, training institutions providing required training, etc.

Practice shows that preparation of specialised information publications, articles and radio or television broadcasts dedicated to young persons, parents, teachers, redundant workers and jobseekers are also effective in vocational guidance. These measures, however, are missing in the analysis of the provision of vocational guidance by companies and their associations.

Likewise, the analysis of the provision of vocational guidance by companies and associations shows the lack of an proactive approach of economic entities in the organisation of joint information events with the Lithuanian Labour Exchange for: (a) redundant workers; (b) the long-term unemployed; and (c) persons whose occupation is redundant on the labour market and who thus are unable to find a job according to their specialisation. It needs to be reminded that these groups form a tremendous reserve for the supply of necessary workers.

Further, to ensure the objectivity of the assessment of activities of companies and associations in the field of vocational guidance, informantss had to answer the following two clarifying questions: (1) Does your company (association) implement any vocational guidance programme? In response to this question, all respondents frankly admitted having no such programme; (2) How much money do you allocate for vocational guidance? Responses to this question reveal that the Welders Association allocates a considerable amount for vocational education of pupils (up to LTL 200,000 a year), including non-formal education and professional development of teachers (LTL 1.3 million in two years). This association also provides LTL 2.75 million (EU funds, budget funds and companies’ funds) for work with students. However, no funds are specifically used for vocational guidance purposes.

Summarised findings of the empirical research show that individual segments of the Lithuanian labour market are facing a critical situation caused by the shortage of skilled workers. At the same time, the research reveals that economic entities, which should be the most concerned about the sufficient supply of professionals on the labour market, fail to take any part in vocational guidance or their involvement is very limited and episodic.
NECESSITY FOR CHANGING THE ATTITUDE OF ECONOMIC ENTITIES TO VOCATIONAL GUIDANCE AND FOR SPECIALIST TRAINING IN ORDER TO DEVELOP THE NATIONAL PROGRAMME FOR VOCATIONAL GUIDANCE IN THE EDUCATION SYSTEM

Statistics speaking of the shortage of professionals in specific areas of the country’s labour market, first of all, encourage finding ways and measures to rectify the situation; second, it becomes evident that the existent National Programme for Vocational Guidance in the Education System and the vocational guidance system functioning within its framework are incapable of fully ensuring the supply of skilled professionals that are required for the country’s economy and labour market. However, it would be wrong to attribute full responsibility for the current situation on the Lithuanian labour market only to pedagogical vocational guidance provided by education institutions. On the contrary, even from a retrospective view of the history of Lithuanian pedagogical vocational guidance, education workers have significantly contributed to the development of vocational guidance in Lithuania and the global theory and practice of vocational guidance. Their contribution becomes even more visible in the context of vocational guidance in Lithuania and historical changes.

It should be noted that, in vocational guidance, a number of democracies followed the evolutionary path. In our country vocational guidance was altogether banned for a long time. This prohibition was imposed in 1936 by the special resolution of the Central Committee of the Communist Party of the Soviet Union on pedagogical deviations in the people’s commissariat education system. This resolution categorically prohibited vocational guidance research or the use of test methods and stopped the application of any psychological techniques and professional selection.

Following Lithuania’s annexation and incorporation in the USSR in 1940, the abovementioned resolution automatically came into force in Lithuania and was valid until the middle of the last century. As rightly noted by K.G. Pelikian (Пиликян 2009:38-45), a prominent researcher of the USSR history of vocational guidance, this prohibition was lifted in the mid 40’s of the last century owing to the efforts, courage and ingenuity of A.Volkovsky, L.Jovaiša, M.Vinogradova, G.Galkytė, M.Kopanev, B.Uspensky and other researchers who argued for the necessity of training young persons for occupation.

Lithuanian education workers (L.Jovaiša, G.Galkytė, etc.) substantially contributed to the revival of vocational guidance. With the revival of vocational guidance, Lithuanian researchers channelled tremendous efforts into theoretical foundations of vocational guidance, experimental research and practical use of research results. Important contribution in the development of theoretical foundations was made by L.Jovaiša and S.Kregždė, who were destined not only to open the door to vocational guidance, but also to lay theoretical foundations in this area.
While building theoretical foundations for vocational guidance, L. Jovaiša came up with an idea and developed a vision, which is dealing with objectively existent contradictions between the public demand for skilled professionals required to secure the functioning of the country’s economy and the needs, abilities, subjective attitude to work and career choices of a particular person by training and educating of a person and through the personality development. Thus, then prevalent administrative, party and military mobilisation measures, which helped to ensure staffing in a number of cases, were opposed with a tailored education system dedicated to pupils’ professional focussing, development of their ability to choose an occupation with full awareness and assistance in their career choices, when needed.

It should be further noted that vocational guidance, as being closely associated with the need to give answers to complicated philosophical questions about the human being, ideals, values, etc. of the society and of an individual, naturally covers fundamental problems for young people that encourage search for the meaning of human life and allow for real possibilities of achieving one’s life goals. Such responses already entail a number of further questions about human rights and freedoms enjoyed in the country, personal life management possibilities, rational use of human potential in economy and a number of other factors affecting personal and society’s life.

By referring to vocational guidance and personal aspects of career choice, L. Jovaiša found an effective method and measure allowing for: (1) the change of the government’s and society’s attitude to a person; and (2) the extension of human rights and freedoms and a conscious and responsible management of personal life. Conditions were also provided for the commencement and promotion of scientific discussions on critical issues of the social life of that time.

It should, however, be admitted that, regardless of the achievements of the time in vocational guidance, under the conditions of planned economy vocational guidance could function only within a strict framework: it was fully regulated by the state which planned how many persons were to be admitted to universities, higher vocational technical schools (now transformed to the universities of applied science), vocational and technical training schools, etc. In addition, graduates of training institutions were compulsorily appointed to perform certain jobs for a set number of years. As a result, economic entities did not have to take care of staffing or compete for workers, as only a timely application sufficed to ensure the supply of necessary specialists. However, such practice did not stimulate companies and organisations to take part in vocational guidance and created a stereotype that the vocational choice was personal, family or training institutions’ concern.

Further, in Lithuania’s transition from the planned economy to the market economy, vocational guidance received considerably less attention. Young persons were left to make their own choices. In other words, previous achievements in the area of vocational guidance were lost, though nothing new
was created. Naturally, such a vocational guidance situation led to the misbalance on the country’s labour market, which faces severe shortage of some occupations and, at the same time, the redundancy of other occupations.

With the final shift to the market economy, vocational guidance again was brought into focus. High aspirations towards vocational guidance were associated with the National Programme for Vocational Guidance in the Education System approved by Order No ISAK-2332 of the Minister of Education and Science of 3 December 2007. The Programme was revised by Order No V-580 of the Minister of Education of Science of the Republic of Lithuania of 25 June 2013.

Yet, a few years after the approval and revision of the Programme, the labour market situation seems to be even deteriorating with the increasing youth emigration, disproportion between supply and demand on the labour market and the shortage of experts of specific areas.

Naturally, in order to balance supply and demand on the labour market, it is necessary to change the attitude of companies and organisations to vocational guidance, as surveys show that economic entities poorly understand their position, role and importance in terms of the choice of career and vocational guidance, and also its benefits for individuals, economic entities and the society as a whole. Therefore, to make sure that economic entities take a different approach to vocational guidance, it is important that companies and organisations fully understand the advantages of effective vocational guidance. In this context, research data provided by S.N.Kurovskaja (Куровская, 2009:23) are indeed useful. Based on the experience of foreign states and research findings concerning the benefits of career guidance for population and economic entities, she provides the following data: (1) effective vocational guidance reduces the time and costs of vocational training by 2-2.5 times; (2) reduces staff turnover by three times; and (3) increases performance efficiency by 20-30%.

Significant research in relation to the importance of the choice of career and its effect on economic entities is introduced by researcher A.Zaicev (Зайцев, 2011). He conducted research in 2010 after surveying the employed from Western Europe, Eastern and Central Europe and Russia as regards their satisfaction with their career choices.

This research revealed that Western Europeans dissatisfied with their career choices accounted for maximum 15%, the majority of which are workers employed at production facilities. At the same time, such workers in Eastern Europe and former Soviet Union countries accounted for 30%, while in Russia dissatisfied persons aged between 40 and 50 made up to 50%. Notably, a number of respondents openly admitted that they consider their jobs as servitude and that they only perform their duties from 9 a.m. to 6 p.m. and are ready to change their occupation at the earliest opportunity.

The findings of this research make it evident that, from the employer’s perspective, building a team of like-minded individuals, readily investing in staff training and professional development, increasing
corporate performance efficiency, ensuring business stability or reducing staff turnover pose a serious problem, as due to the wrong choice of career quite a significant number of workers look forward to the first opportunity to change the occupation they dislike.

At the same time, it should be admitted that the change of employers’ attitude to vocational guidance and even their good will alone might be insufficient in order to use the available human capital in a rational way and to balance the labour market situation, as the provision of vocational guidance requires special knowledge and abilities to carry out specialised research and use the outcomes in practice.

In other words, in order to meet changing demand of the economy for workers, a number of tasks related to career choices need to be performed by practitioners working in companies and organisations, because it is economic entities, seeking a competitive advantage, who should be the most concerned about the availability of professionals of relevant areas. This is why the engagement of practitioners in vocational guidance is an objective necessity, which encourages companies and organisations to have specialists who are capable of using participatory research based methods and to develop the information and know-how about work processes and occupations.

According to a widely used definition of the modern human resource management saying that “human resource management is understood as a systematic and uninterrupted process aimed at satisfying ever changing staffing needs of a company and at formulating a staffing policy in order to ensure long-term and effective company’s operation” (Чукуреев, Корытова, 2010:14), in modern companies and organisations the responsibility for meeting the staffing needs, as a rule, rests with HR managers. For this reason, taking into account the importance of their professionalism and the necessity of their contribution to vocational guidance, the analysis of the preparedness of HR experts for the provision of vocational guidance is inevitable.

Looking to the position of human resource management within the system of the study fields of higher education in Lithuania, human resource management is not regarded as a separate field or branch of science and makes a part of management science studies. We can assume, that it indicates certain lagging behind of human resource management studies in Lithuania comparing to other countries, where this management area has developed into an independent branch of science, including active research, defence of doctoral theses and award of doctoral degrees in human resource management.

In Lithuania, human resource management studies makes part of corporate management studies (code S190) in the study field Management and Administration. In other words, human resource management studies are mainly focused on individual companies, while the studies of human resource management on the sectoral, regional or national levels remain ignored.
Deeper analysis of study programmes of human resources management reveals, that at present, eight Lithuanian higher education institutions train specialists more or less related to human resource management.

</table>
In terms of the level of provided degrees and qualifications, universities provide study programmes on the (1) bachelor and (2) master level. However, degrees related to vocational guidance are awarded in different areas, including educational sciences, career education or human resource management. The analysis of study programmes and their descriptions shows that graduates of educational sciences are qualified for work in: (a) a number of education institutions and their management institutions; (b) labour market services; (c) labour exchange offices; (d) vocational and career guidance centres; and (e) staff training and career guidance services of enterprises, firms, companies and other organisations. Definitely, experts of this area are prepared to engage in vocational guidance. The negative aspect is that the possibilities of using them in companies are highly limited, as there are no large companies in Lithuania which could afford to have their own staff training and vocational guidance centres. Even the major Lithuanian concerns cannot afford experts with narrow specialisation in their HR units due to high costs, as modern HR management units perform a wide range of functions requiring knowledge in a number of human resource management areas.

A similar situation is with career designing experts, who, during their studies, gain fundamental theoretical knowledge in educational sciences, career designing and psychology, required for human resource development in education and labour market systems. Admittedly, these professionals are very valued by specialised companies engaged in recruitment and selection of employees and providing services to a number of other companies in the country, because these experts are trained to assess personal skills and abilities by using descriptions, tests, surveys, evaluation scales and other methods. In practice, even large industrial companies hire specialised companies for staff selection, because this is more cost-effective than in the case of own experts within the HR management structure.

It may be reasonably assumed that, depending on financial possibilities, the needs of businesses may be best answered by professionals who completed study programmes of human resource management and handling, personnel management and strategic leadership. Yet, these programmes do not cover vocational guidance. This suggests that it would be reasonable to integrate the course of vocational guidance in human resource management programmes in order to balance the supply of and demand for workers on the labour market, as the availability of vocational guidance experts in companies and organisations would allow for further development in the area of vocational guidance.

Conclusions and Recommendations

Lithuanian companies and organisations still have a poor understanding of their position, role and functions in the process and within the framework of career choice and vocational guidance and the impact on the formation, accumulation and effective use of the human capital.
Unless a number of companies and organisations change their focus and approach to the planning of their staffing needs and the stern attitude to vocational guidance, it quite unlikely that the situation on the Lithuanian labour market will develop in a positive way, structural unemployment will decrease on the domestic labour market, the rate of youth employment and the efficiency of the use of human capital will increase and the state will comply with its international obligations.

The research reveals that economic entities, which should be the most concerned about the sufficient supply of professionals on the labour market, fail to take any part in vocational guidance or their involvement is very limited and episodic. It also shows that economic entities neither implement any vocational guidance programmes nor allocate any funds for their implementation.

Current gap between the current supply of and demand for occupations on the labour market is caused by axiological differences manifested in the discrepancies between a personal choice and learning of a given occupation and employers’ needs and expectations rather than by the human factor or intellectual, physical or physiological possibilities of following occupations that are in demand on the labour market.

In order to ensure that economic entities take a different approach to vocational guidance, it is important that companies and organisations fully understand the advantages of efficient vocational guidance. Furthermore, it would be reasonable to integrate the course of vocational guidance in human resource management programmes in order to balance the supply of and demand for workers on the labour market, as the availability of vocational guidance experts in companies and organisations would allow for further development in the area of vocational guidance.

PROVIDING SERVICE QUALITY IN EXCLUSIVE RESTAURANTS: A SURVEY OF DINERS IN THREE RESTAURANTS AT A GAUTENG CASINO COMPLEX

Nicolaides, Angelo

Graduate School of Business Management, University of South Africa

ABSTRACT

A number of studies have established that service quality has a direct impact on a restaurant’s profitability. This study made an empirical assessment of customers’ perceptions and expectations of service to measure service quality in three restaurants in a casino complex in Gauteng Province in South Africa. The research helped to assess the levels of customer satisfaction with service provision in three restaurants and identified factors that contribute to customer satisfaction and dissatisfaction; It also determined the current status of service and compared and ranked three restaurants service provision. Another importance was the aiding in the establishment of customer service standards for the restaurants concerned. The tipping of waitrons was also used as an indicator of customer satisfaction with service provision in general. A three-column SERVQUAL instrument was used together with part of the Fishbein model. The study was able to firstly determine and analyze service gaps that exist in the service delivery procedure to measure service quality as well as general customer satisfaction and secondly, to evaluate customers’ attitudes towards the service measure attributes of similar restaurants in the same location. The findings offer implications to improve service quality in restaurant business in general.

Keywords: Service quality, tipping, restaurants, SERVQUAL, Fishbein model.

INTRODUCTION

In the last few decades, service quality and customer satisfaction have become critically important aspects for restaurant owners and managers to consider if they are serious about expanding our even keeping an existing business. In South Africa there are a number of restaurant chains as well as unique restaurants that resemble what were previously referred to as steakhouses in the period 1960-1980. Hsieh & WU (2007:1) maintain that service quality is a server’s endeavour that is observable by a diner throughout a service encounter. This will ultimately influence the outcome of the service. When we speak of the quality of service executed this refers to the promptness, friendliness or attentiveness of
the person who is serving (Bodvarsson et al., 2003). Since competition for business is becoming increasingly greater, it is especially managers who try to maintain existing customers while seeking to attract new ones. The aspect which attracts customers the most is service quality excellence.

The dining experience comprises tangible and intangible elements. The tangible elements can easily be improved, but the intangible aspects of restaurant service require great attention. Researcher indicates that the ability to deliver high quality service provision will provide long-term financial viability and lead to more sustainable business success (Keiser, 1988). Researchers have postulated that there exists a very strong relationship between customer satisfaction and loyalty to restaurants (Szymanski and Henard, 2001) and the notion that service quality excellence impacts business profits has been apparent for a number of years (Baker & Crompton, 2000; Zeithaml & Bitner, 2000). A study conducted by Bodvarsson et al. demonstrates that predicted service quality significantly affects the size of a tip that a waiter obtains (Bodvarsson et al. 2003; Parrett, 2006). Tipping is considered to be an efficient way of rewarding workers for good work and serves as a major incentive to encourage service quality excellence (Lynn et al., 1993:478; Lynn 2003:140). Consequently, tipping can be used as an indicator of customer satisfaction. This is directly linked to the idea of superior quality of service which is undoubtedly an aspect that can add value to a restaurant’s product offerings and ultimately impacts on a restaurant’s bottom-line as it leads to customer loyalty via repeat visits (Lee, Barket, & Kandampully, 2003). The key purpose of this study was primarily to understand the restaurants’ levels of service quality as per customers’ perceptions of service delivered, the customers’ satisfaction levels with service provision, and thirdly the customers’ assessment regarding other restaurants in the same location. The findings of the research were anticipated to provide useful service quality provision suggestions for the restaurants involved.

**MOTIVATION FOR THE STUDY AND RESTAURANT BACKGROUND**

The research was conducted in order to:

1. assess the levels of customer satisfaction with service provision in three restaurants;
2. identify factors that contribute to customer satisfaction and dissatisfaction;
3. determine the current status of service;
4. compare and rank three restaurants service provision;
5. help establish customer service standards for the restaurants concerned.

There were three restaurants involved in the study. The largest restaurant in the study case, which shall be termed ‘X’, is a privately owned franchise operation which has a large number of restaurants in operation in Gauteng. This operation has 364 seat capacity and 12 waitrons, 15 cooks/chefs, 4 cleaning...
staff, 2 front of house managers and 3 floor managers who may not all work at the same time, but rather in varying shifts. The cuisine served could be considered to be wholesome family meals and the menu has a large variety of dishes. Items on the menu range from pizzas, salads, and farinaceous dishes to antipasto, meat, fish and vegetarian fare. There is also a selection of starters and desserts to choose from. Drinks include coffees, teas, soft drinks and alcoholic beverages. The targeted customers include casino walk-ins, families and friends going out for either lunch or dinner, and from time-to-time, special events such as engagement parties, birthday parties etc, for which an upstairs ‘private area’ seating for 120 is available. This establishment also prepares special breakfast menus for Saturday mornings. This popular brand name family restaurant has appealing furnishings that create a homely ambience and it is easily accessible and pleasant to be in. It is a casual to smart dress code restaurant.

Restaurant ‘Y’ has a capacity of 188, with 9 waitrons -4 of whom are seasonal and 3 cooks/chefs. It staffs 3 cleaning staff, 1 front of house manager and 2 floor managers and 4 cleaning staff. Restaurant ‘Z’ has a capacity of 165, with 5 fulltime waitrons and 5 seasonal waitrons. It has 2 chefs/cooks, 1 front of house manager and 1 floor manager as well as 4 cleaning staff. Both restaurants ‘Y’ and ‘Z’ are privately owned and not part of any franchise operation and only a short distance from restaurant ‘X’ both offer various styles of steak and other meals in what are seemingly silver-service cuisine set-ups with high back chairs and stylish candle holders and wine glasses, for example. They would be considered to be luxury restaurants. The menus both include appetizers, soups, antipasto, salads, entrées (steaks), dessert, and a selection of soft drinks and alcoholic beverages. In each of the restaurants, ‘X’, ‘Y’ and ‘Z’, the customers can select whatever they wish to order and thus can create their own series of courses which will comprise their ultimate meal. The style of the decor in these restaurants makes diners feel they should dress up to eat there, although there were a number of casually dressed diners present at the times the research was conducted.

This study will hopefully serve as a practical guideline for the managers of the three restaurants under review, especially the floor managers and waitrons. The outcome of this study will be to further develop the service quality provision of staff in order to satisfy customers’ needs and expectations so as to maintain customer loyalty and enhance profits.

LITERATURE REVIEW

Research clearly shows that it costs a lot more to attract new customers to a restaurant, than to retain existing customers (Oliver, 1999; Rosenberg & Czepiel, 1983). Restaurants in today’s food and beverage industry are thus required to satisfy customers through continuous service quality excellence, and indeed, should do so in any event (Gabbie & O’Neil, 1996). In fact, customers need to be delighted with the service they obtain. Service quality means the difference between the customers’ expectations of
service delivery and their perceived service. The service provided to customers by a restaurant has a huge and immediate impact on the company’s profits since it is directly related to customers’ perceptions of services rendered and to general satisfaction. Repeat business and customer loyalty demand service quality excellence (Zeithaml & Bitner, 2000). What is tricky to determine is which intangible characteristics are most important to a customer (Berry & Parasuraman, 1991).

The research aimed at measuring service quality through analysing the tipping of waitrons by customers as well as by attempting to comprehend the perceptions of customers concerning the service provided. Customer expectation refers to uncontrollable factors including past experiences, personal needs, word of mouth, and external communication about service. Customer perception refers to customers’ feelings of pleasure / displeasure or the reaction of the customers’ in relation to the performance of the restaurant staff in satisfying their needs.

The literature suggests that there is a strong correlation between tipping amounts indicating customer satisfaction and repeat business by satisfied customers which ultimately leads to enhanced profitability for a restaurant business (Azar, 2007; Parrett, 2006; Getty & Getty, 2003; Tsang & Qu, 2000). Lynn et al. (1993), considers tipping to be an almost “pervasive consumer behaviour” of significant economic value. As stated earlier, it is vital for a restaurant operation to fully comprehend its customers’ attitudes towards service quality provision, assuming that this is in fact happening (Kandampully, 1997). The customers’ attitudes concerning service provision cannot be measured simultaneously on SERVQUAL’s five service measure attributes. What can be used here is the Fishbein model.

**USING SERVQUAL**

The perceptions of the customers in the service process is crucially important as the business needs to be aware if there is any discrepancy between perceived service and that expected by the customers (Parasuraman, Zeithaml, & Berry, 1985). Where there is a clear incongruity this is generally referred to as the service “gap” (Oliver, 1981). Parasuraman, Zeithaml, & Berry, (1985), developed the SERVQUAL model which is still widely used today to evaluate service quality. The SERVQUAL (Gap model) is an instrument used for measuring service quality, in terms of the discrepancy between customers’ expectations regarding service offered and the perception of the service received by them; Respondents are required to answer questions about both their expectation and their perception.

Parasuraman, Zeithaml, & Berry broke service quality down into five dimensions, namely. Reliability, Responsiveness, Tangibles, Assurance and Empathy. They evaluated service quality by subtracting a customer’s score that is based on a perception of the service provider’s performance, from the customer’s expected score. Where customers were satisfied with service quality provision, there has
been higher service quality which resulted in higher satisfaction levels. The dimension of Reliability relates to what is considered to be accurate and highly dependable service provision. Responsiveness relates to the desire of a server to provide prompt service to the customer. The Tangible dimension relates to the equipment used, physical facilities as well as the appearance of the waitrons, for example (waitron is a non-gender specific term for waiter or waitress). Assurance related to the product knowledge of the waitrons, their welcoming attitudes, as well as their ability to be trusted. The Empathy dimension relates to their ability to come across as genuinely caring for the needs of the customers. The scores obtained by using the SERVQUAL model thus represent the variation between expected and perceived service quality. Literature supports the use of SERVQUAL (Gap model) as a valid and reliable measure of the quality of the service for food and beverage operations, for example (Stevens, Knutson, & Patton, 1995; Nel & Pitt, 1993).

THE FISHBEIN MODEL

Ajzen and Fishbein, (1980), developed a model which is based on the hypothesis that a customers’ behaviours are the result of a cognitive process in which they systematically processes all accessible information. This information describes beliefs, attitudes and behaviours for a wide range of attitude measurement. Consequently by using both SERVQUAL and the Fishbein model to evaluate service quality provision levels and satisfaction, the customers’ attitudes can be assessed as an evaluation of a psychological item which is encapsulated in five attributes namely, good or bad, harmful or beneficial, pleasant or unpleasant, likeable, dislikeable (Fishbein, 2000). Such a methodology can help in understanding the attitudes of customers towards a restaurant and also allows for the measurement of these qualities in different restaurants.

The beliefs, attitudes and behaviours of customers are evaluated using the Fishbein Model. Beliefs refers to the knowledge that a customer has concerning objects, their attributes, and their benefits. The objects would include the products (food and beverage), people (restaurant staff), companies, and things about which people hold beliefs and attitudes such as quality service provision. The attributes are the characteristics or features than an object may or may not possess. The benefits include all the positive outcomes that attributes might provide to the customer such as enjoyment of food, relaxing ambience, quality service, value for money etc. It is important to realize that people buy a whole lot of benefits, not product attributes.

The cognitive component of the tripartite model is generally assessed by using a version of the multi-attribute or Fishbein model where:

$$Ao=\sum BiEi$$

and where: $Ao = \text{the overall attitude toward object } o$

$Bi = \text{the strength of the belief that object } o \text{ has some particular attribute } i$
Ei = the evaluation of the goodness or badness of attribute i

In this model, evaluative component consequently serves as something of a weight. The Fishbein model is well utilised by consumer researchers and greatly assists to measure restaurant customers’ attitudes towards the SERVQUAL’s five attributes. It is nonetheless not necessary to adopt its mathematical equation for the research. The model was modified in this research using Solomon’s theory (2002) to suit the requirements of the study, in that consumer behavior is a study of all the processes involved when customers or groups of customers, choose to buy and use, services, ideas, or experiences to satisfy their particular needs and desires. The ‘exchange’ aspect when a customer goes to a restaurant, and when they are given and receive something of value, is a fundamental part of marketing. Consumer behavior thus involves a wide variety of participants. Customers also influence on the buying processes as they tell friends and family about their varied experiences when dining out.

In another model as developed by Bodvarsson et al (1997), it is the waitrons who are requested to report on tips received by them for service rendered to diners as the latter tend to exaggerate on this aspect. Bodvarsson et al.’s suggest that there is a strong two-way causal relationship between the diners’ experience of service quality provision and the percentage of tips received. The waitrons’ expectations of tips to be received has an influence on the quality of service which is supplied and the service quality provision also influences the amount of tip that is dispensed (Bodvarsson et al., 2003).

**TIPPING**

Tipping is a complimentary payment for service rendered in the context of restaurants by customers to waiters, in particular, but is not exclusive to hospitality *per se*. Tipping is generally considered to be a social norm and many diners feel a need to tip because others around them are tipping tip and as such it is expected (Azar, 2005). If diners do not tip, those with them may perceive them to be stingy and they consequently feel pressurised to tip so that those accompanying them will respect them more. Generally speaking then, tipping may be regarded as a social convention that most customers in South Africa would adhere to (Bodvarsson et al., 2003). In a survey conducted by Azar (2007) to assess whether repeating diners’ tips were more sensitive to service quality provision than tips of non-repeating diners, the findings suggested that the tips of repeating diners are less sensitive to service quality provision than the tips of non-repeating diners. Consequently we may say that future service provision as a motivation for customers to tip is not supported by the literature and therefore only social norms appear to motivate tipping patterns. Parrett’s (2006) conducted a study in Virginia in the United States to address the issue of why diners tip and how much they tip. The results demonstrated that age as a control variable, had a marked effect on tip size. Older people tend to tip more as well as more frequently than younger people (Parrett, 2006). Parrett also found that diners who pay with cash
tend to tip more than diners who pay using credit cards. Furthermore, when there were less than 3
diners at a table, tip size decreased; while for tables of more than three diners, tip size increased. Sill
(2004) states that service is very important and restaurants should not over-promise and under-deliver.
Research in the United States has also indicated that Blacks are less familiar that Whites with tipping
norms and this suggests that the Black-White differences in tipping, can be significantly reduced by
making customers aware of tipping norms (Lynn, 2006 a).

METHODOLOGY
The methodology was mixed, and was thus both quantitative and qualitative in nature.
The quantitative data was analytical and it allowed the researcher to arrive at a universal statement. A
survey described and explained tipping issues and had a quantitative analysis and questionnaires were
utilised.
The qualitative methodology used aim was detail and depth of understanding to demonstrate and
understand possibilities, but not necessarily on how frequently they occur but it produced descriptive
data, which was generally the participants’ own words pertaining to their experience or perception of
service quality provision. The researcher was thus more concerned with understanding rather than
explaining. He was seeking novel or unanticipated findings and the theme of the research was
essentially phenomenological where the participants’ perspectives were the empirical point of
departure. This was basically a focus on real-life experiences. The researcher was able to interpret and
describe the actions of various people, including employees and customers. The SERVQUAL
instrument as well as the theory of Ajzen & Fishbein, were adopted to achieve some of the research
objectives. In addition a seven-item, five-point Likert scale (Question 1) was used to measure the
practice of tipping as a social rule in the area. The SERVQUAL was used to measure customer
satisfaction with service quality provision, while the Fishbein model was used for multi-attribute
attitude assessment.

SERVQUAL RESEARCH
The greatest part of the survey was designed on a three-column approach and the five attributes as
defined in the SERVQUAL model as postulated by Parasuraman, Zeithaml and Berry (1988). In this
approach, a brainstorming session was conducted and the selected group of five employees from the
different restaurants met for just less than two hours to discuss and define the variables/factors for each
of the five attributes as defined in the SERVQUAL (also known as the Gap Model) adopted. Each of the
appointed members were in supervisory positions as front-line servers. As a result of the brainstorming
meeting, 35 variables were created and used to illustrate and measure an attribute of the SERVQUAL
model. The factors to be evaluated were included in the survey (Questions 1-5) and each factor was measured on a scale of 1 (extremely low) to 10 (extremely high). The second part of the survey was designed to evaluate SERVQUAL’s five service measure attributes for the respective restaurants. The questionnaire was pre-tested with a convenience sample of approximately 15 customers using a collaborative participant pre-testing method. Data for the main study was collected during June and July 2012 by means of a self-administered survey. Customers were approached by the researcher/s after dining at either restaurant X, Y or Z and after they had paid their bills.

**SAMPLE USED**

Since it is easier to study a representative sample of a population, rather than an entire population, a sample was used. Sampling was thus used to select a group with the view to determine the characteristics of a large group (the population). The sample should display the same characteristics as the population. Stoker’s sample size (1985) as quoted in De Vos et al (2002), suggests that from a population of 1000, 14% should be used thus comprising 140 respondents. The researcher opted to use 200 respondents as an appropriate sample size. The target sample for the proposed study consisted of adult diners (>18 years of age) at three restaurant, X, Y and Z, in a casino complex in Gauteng province, South Africa. The units of analysis were thus the individual adult diners to the restaurants in question and they were a segment of the population that is representative of the entire population (Chase, 1967). The respondents were stratified according to age and randomly selected on the basis of convenience sampling (accidental sampling). Random selection means selecting a sample in such a way that each member of the population has an equal chance to be selected. In a random sample then, the researcher assumes that the characteristics of the sample approximate those of the general population. This approach takes people or other units that are readily available, such as those that arrive on the scene by simple happenstance. It contributes towards validity and reliability and to a large degree eliminates biases. Customers who were previously allowed to express an opinion were eliminated from the study on subsequent arrivals at the restaurants in question.

This method was used as it is similar to that used by Mukherjee and Nath (2005) for similar studies on service quality. This study aimed to achieve a minimum sample size of 200 respondents. The realised sample size of the study amounted to 212 questionnaires, with a favourable response rate of 94.33%. A total of 200 questionnaires were analysed. The survey was distributed using a person-to-person method to individual restaurant customers as they left either restaurant X, Y or Z. They were given the survey on a hard board with a pen attached and a gift pack comprising of a box of Belgian chocolates. The researcher provided guidelines and instructions on how to respond to the survey questions. Data
was gathered over a nine day period and 212 surveys were completed of which 200 were used. Unusable surveys were eliminated.

THE SERVICE GAPS

The SERVQUAL of Parasuraman et al (1988), was used to compare customers’ expectations with their experiences so as to demonstrate where service delivery has either strengths or weaknesses. As in most Gaps Theory research, the clearest gap, Gap 1, was the one between customers’ expectations of service provision and their perceptions of the service provision that they actually received in the restaurants. This was the most critical gap that required study by making using of a three-column SERVQUAL. Gap 2 was the discrepancy between management assumptions that customers require fast service and service delivery. Gap 3 was the discrepancy between management targets of food been delivered within ten minutes of an order being placed and actual service provision. Gap 4 related to the discrepancy between the service quality provision as evaluated by customers’ attitudes on the service attributes amongst each of the three restaurants. Gap 5 related to general perceptions of poor service quality provision.

It is important to bear in mind that service quality provision is by its very nature a highly subjective concept and with this in mind, what the customers’ think about service quality provision is essential to success for any food and beverage operation. Customer satisfaction clearly results from a service
encounter and by assessing if expectations are met when compared to actual performance in a restaurant. The service quality would relate to how a customer feels about a restaurant’s excellent service provision or otherwise. Value would relate to how a customer relates the quality of a dining experience with the price paid and if it was ‘good value for money’ or if there is some psychological benefit such as relaxation away from an otherwise humdrum daily routine.

THE SURVEY TOOL

| Voluntary Survey:  RESTAURANT X  Y  Z  (circle establishment- researcher will assist. |
| Respondent number: ___________ (number provided by researcher/s) |

Dear patron
In an effort to improve service quality levels in restaurants in general, kindly complete the survey as accurately and honestly as possible. Thank you for your willingness to assist in this research initiative. The purpose of the survey is to determine the levels of service quality provision in each of three restaurants and some aspects are related to tipping of waitrons. The survey should take about seven minutes to finish. You will remain anonymous throughout this highly confidential survey. Answers provided will be utilised only for research on service quality provision. Answers cannot be right or wrong. Answer by inserting a cross (X) in the relevant block.

Please indicate your age:

| 18 - 25 |
| 26 - 35 |
| 36 - 45 |
| 46 - 55 |
| 56 - 65 |
| 66 – 99 |

Your gender   (place an X on your selection)   Male   Female

Your race   Black   White   Coloured   Indian

Question 1.

Kindly consider each statement below carefully and indicate the extent to which you
agree or disagree with each one. (Please mark with an (X) 1 for “strongly agree”, 5 for “strongly disagree” or select an option in-between).

Question 5.

5.1 What was the total bill? \[ R \] _________________

5.2 How much did you tip the waitron? \[ R \] _________________

5.3 I will / will not recommend this establishment (delete whichever does not apply)

Part 2 of the Survey evaluates SERVQUAL attributes as well as tip size in Tables 1 and 2 respectively. At the end of the survey, customers could make general comments on any aspect.

EVALUATION OF THE 5 SERVQUAL (GAP) DIMENSIONS FOR THE RESPECTIVE RESTAURANTS.

In this part of the survey, there were two questions. Customers were required to give a score on a scale (1 to 10) on their expectation from the restaurant about each attribute so as to gauge their reflection on the service quality provision experienced by them. Question two (Table 1) was designed to measure the importance of the five attributes for multi-attribute attitude measurement. An aggregated scale measurement, which is considered to be valid, was used to measure the reliability of the methods of data collection. Respondents were requested to rate the five attributes based on their perceived importance. Table 2 measured tipping of waitrons.

“Strongly agree” was coded as 1, “Agree” as 2, “Neutral” as 3, “Disagree” as 4 and “Strongly disagree” as 5. The lower the mean score for an item, the stronger customers’ agreement with that item. The items in the scale were all reverse scored and thus the lower the mean score for an item, the lower the customer’s level of agreement with the item. Since the items all tend to fall between 4 and 5, this indicates that the customers’ have a strong level of agreement with the items in the scale. Where there is a minor standard deviation (relative to that of other items) this indicates that customers tended to
answer the item in a similar fashion. All the items have relatively low standard deviations which mean that all the customers tended to concur in their responses to the questions posed.

<td>0.79</td>
</tr>
</tbody>
</table>
An answer of “Strongly agree” was coded as 1, “Agree” as 2, “Neutral” as 3, “Disagree” as 4 and “Strongly disagree” as 5. It is evident that where there is a lower mean score for an item, the stronger the customer’s ranking of agreement with that item. Where there is a large standard deviation this indicates that customers tended to answer the item in somewhat of a unique way. However, all of the items have relatively high standard deviations, which indicate that customers were inclined to be at variance in their answers to the question posed.

</tbody>
</table>

A response of “Strongly agree” was coded as 1, “Agree” as 2, “Neutral” as 3, “Disagree” as 4 and “Strongly disagree” as 5. It is apparent that the lower the mean score for an item, the stronger the customers’ levels of agreement with that particular item. Where there is a minor standard deviation (relative to that of other items) this indicates that customers tended to answer the particular question in about the same way. These items have relatively low standard deviations and this means that customers tended to agree in their responses to the question posed. All of the 200 customers answered the payment mode- question 4. Of these, 165 or 82.5% paid by means of credit card. 21 or 10.5% paid by debit card, 5 or 2.5% paid cash and 9 or 4.5% paid by other such as cheque.

Some studies on tipping in the United States have examined the possibility that race differences in tipping vary with the race of the waitron (Lynn, et. al. 2006; Willis, 2003). In each of these studies, the interaction between customer and waitron race was not significant. In this study tipping by race, produced an interesting finding. Blacks left smaller average restaurant tips than Whites, suggesting
that Blacks tip less than Whites do even when provided comparable levels of service. It did not make a difference that the waitron was black. It appears that Blacks do not know that it is customary to tip 10 percent of the bill size in South African restaurants.

A five point Likert scale was used to measure the customers’ tipping behaviour at the restaurants. This measure included 14 Likert scale statements of which the scale points were labelled: 1 = Strongly agree, 2 = Agree, 3 = Neutral, 4 = Disagree and 5 = Strongly disagree. The Cronbach alpha coefficient for the 14 items was 0.84 indicating internal consistency reliability. In restaurant X, in which tip size was assessed, the results indicate that the smallest bill size that customers received was R18.50 and the largest bill size was R2656.00. The average bill size of each of the three establishments is R259.70 and the bill size variable has a standard deviation of 87.44. The total number of bills processed was 201 and the average tip size for credit card transactions was R20.00. Cash tips were pocketed directly by the waitrons and there is no record for such. Minimum tip size was R2.50 and maximum was R35.00. The standard deviation was 4.77 and the mean was R15.89. Over a three and a half week period (01 April 2012 to 25 April 2012) at restaurant X, the employee tip report indicates that a directly tipped total of R27327.64 was gained by a total of 12 waitrons. This gives an average tip gain over the period for each waitron of R2277.30. By category of sales at each of the three restaurants, the largest tips were obtained at dinner times, followed by lunch and then breakfast. The highest tip amounts were for tables of more than four guests and the least at tables with only one guest. Virtually all of the waitrons were black employees and 70% of these were women. The largest tips were paid to men.

A multiple item rating scale was utilised to assess various determinants of service quality provision the restaurants X, Y and Z. This encompassed ten Likert scale items. The scale points were categorized as follows: 1 = Strongly agree, 2 = Agree, 3 = Neutral, 4 = Disagree and 5 = Strongly disagree. The Cronbach alpha coefficient for the ten items was 0.87, which indicates that there is acceptable internal consistency reliability. Higher overall scores indicated a higher level of service quality provision experienced by customers.

**FINDINGS**

The most stated gaps in the study related to “waitron responsiveness”, “inadequate assurance” and “clean ablution facilities”. In each case customers felt more quality was required. The key demographic profile of the survey respondents was males who especially like to visit Restaurant X. Most customers are between 36 to 45 years of age (21%). while customers between 56 and 65 years of age (11.5%-all in that age category), patronised Restaurant X. It was clear from the research that the desired satisfaction levels of expected service provision the customers’ hoped to receive, was predominantly from Restaurant X. The least acceptable establishment was Restaurant Y. The score for
the multi-attribute attitude measurement was calculated by making use of a modified equation as per Solomon (2002): Where, A is the overall attitude toward the restaurant, B the strength of the belief that the restaurant has any type of attribute (i), (i) the SERVQUAL attribute of a restaurant, (j) the restaurant, (k) the customers of a restaurant, (l) the customer evaluation of the strength or weakness of the attribute (i), (n) indicates the total number of customers. In making use of this equation, a customer’s attitude towards a restaurant’s service quality provision was measured based on the total of the products obtained by multiplying the mean values of each of the SERVQUAL attributes and their respective mean value of importance.

Restaurant X had the highest total mean attitude (8.94) and Restaurant Z (7.96), while Restaurant Y had the lowest total mean attitude (7.66). The variance between each of these three restaurants is thus small. The findings do however suggest that customers of Restaurant X expect a certain kind of service given that it is part of a restaurant franchise brand. Not surprisingly then, it achieved the highest Assurance attribute rating. In some cases, service failure on the part of a waitron or kitchen staff, was exacerbated by poor floor management techniques where managers failed to effectively deal with failures and where public arguments with customers were almost a norm. Restaurant X, as the most popular restaurant of the three investigated should reassess the attributes of Empathy and Tangibles for improvement if it is desirous of obtaining a greater market share. The research is clear that Restaurant X generally provides quality service to its customers. There are however concerns with ablution facilities that are not as clean as patrons would like them to be. The same applied to Restaurants Y and Z. Service was generally in line with what customers’ expected but portions were not considered to be value for money in either of the restaurants. There was also an observation that meals were not balanced nutritionally and that vegetables, for example, had to be paid as an extra item in some cases. Customers felt this was not acceptable.

Service performance levels as perceived by customers were generally above the “minimum service level,” but where however below the level of service that customers desire. The least problematic area for Restaurant X, was between perceived and desired service delivery presented for the attribute Responsiveness. This indicated that the restaurant’s service is comparatively good. The Tangibles attribute was also fairly good. For restaurants Y and Z, service delivery was considered to be poor and prices were “unrealistic”. The fastest service was at Restaurant Z, but that also had the least customers. The dirtiest ablution facility was at Restaurant Y. Waitrons in this restaurant were also sloppily dressed and the least empathetic. The training of waitrons was considered to be in need of improvement although it was acceptable, perhaps indicating a complacency amongst the South African consumer. Noise levels were the highest at Restaurant X, which is not surprising given that it
had the most customers overall. The seating and ambience in all three restaurants was acceptable but could be improved. Dining areas were all ‘fairly clean’, but the method of cleaning tables after others had just eaten at a table was considered ‘laughable’. Menu items were acceptable, but prices were considered to high for certain items. The Assurance and Reliability attributes were consistent in Restaurant X-although some customers disagreed. It was mentioned in one customer comment that the floor manager of Restaurant Z was a ‘pig’. After a complaint was made about cold food, he told the customers they were welcome to go elsewhere if they were not happy. Any customer service failure such as this, especially the information provided by the customer at the time that the complaint is lodged, should be viewed as a critical marketing research data, which is necessary not only for immediate service recovery but for the improvement of future performance which will hopefully lead to customer loyalty. Seventeen of the customers surveyed commented that they found prices to be higher than what they recalled from previous visits to each of the three restaurants. Restaurant customers typically store prices of meals in their memories (Grewal et al., 1998). Consequently, if the prices on a menu are higher than what the customer expects to pay, customer satisfaction will be negatively affected. It is thus important, for restaurants to have competitive menu prices for the market segment in which they seek to position their offerings.

Parking of vehicles was not problematic and customers felt safe in the casino complex, given that the area is boomed and that there is a visible security personnel presence. The evidence suggests that there is room for improvement in all three restaurants, especially Y and Z. especially tangibles need improvement. Better waitron training could also to a large degree result in better service quality provision in all three restaurants. The poorest floor management was in Restaurants Y where the person ‘irritated’ customers by constantly asking if everything was alright. Waiters should be certain and concise when taking orders, and meals and drinks must be delivered to diners within a reasonable time, ideally within 15 minutes. This requires effective training. It is also clear that South African customers who opt to pay using a credit or debit card tend to leave larger tips than those paying with cash. Previous studies have demonstrated that regular customers tend to leave larger tips than new customers (Azar, 2007) and this was found to be the case in this research.

The researcher was able to evaluate the service quality provision, and gained greater understanding of the customers’ satisfaction levels as well as attitudes toward SERVQUAL’s service attributes. It was discovered that there is indeed a large variance in service quality provision, which manifested itself in the tipping of waitrons. Based on comments obtained in the survey, it is apparent that waitrons who serve customers well develop a relationship with them that promotes service quality provision. This concurs with Fernandez (2004) who states that personal connections are what drive excellent service quality. From comments made, it is also clear that tip size provided by a customer at a restaurant is
not only affected by the quality of service they receive, but also by the economic state of the country. However, despite economic downturns, prompt and good quality service, is likely to result in bigger tips for waitrons’ and in return patronage, but black customers must be educated about the customary 10% tip in South Africa. If we rank the restaurants in terms of the findings, Restaurant X would in ‘gold medal’ position, Restaurant Z would obtain ‘silver’ and Restaurant Y would obtain ‘bronze’. The findings of this research provide useful suggestions to the restaurants in question for taking any necessary corrective actions to improve their service quality provision but there were some limitations.

STUDY LIMITATIONS

SERVQUAL is a simple and useful model for qualitatively exploring and assessing customers’ service experiences. It is widely used by service delivery organizations and is considered to be an efficient model in helping a business to intensify its efforts in However SERVQUAL’s five dimensions are not universals, and do not draw on established economic, statistical and psychological theories. Service quality provision is also linked to employee satisfaction, which was not investigated in this study. SERVQUAL does to an extent illustrate the core of what service quality provision may mean including price, but it may also include other psychological and economic benefits. The intangibility, heterogeneity and inseparability of services create problems for managers and employees and thus also for customers.

The results of the study are based on a relatively small sample size which has been chosen from a small geographic during a short time period. Although the sample is reliable, it would be more accurate to expand this research throughout the province of Gauteng. There may well be other relevant restaurant service quality provision attributes that could influence customers’ expectations and perceptions about their overall dining experience that are not included in this study.

The sample size of n=200 was acceptable, but a bigger sample would have allowed for more authoritative analyses and findings. There could also have been more restaurants evaluated and ideally three from the same brand of franchise as Restaurant X. More efficient scales could be developed where individual items can be grouped together to reflect the construct which is to be measured. The nature of the environment was problematic as respondents were approach after leaving a restaurant where they had dined and were initially distrustful. There was also, in some cases extremity bias, where diners responded to questions by ticking the same number in a Likert scale, for all the items in a scale.
CONCLUSION

The results of the gap analysis make it clear that the restaurant service providers did not meet customers’ expectations. The indication is that overall restaurant service quality fell below the customers’ expectations and that satisfaction was not as high as it should have been. There is thus room for service quality provision improvement in each of the restaurants. The three restaurants in this study could improve service quality provision through especially the dimensions of responsiveness, reliability and assurance. While how a waitron behaves may not directly influence customer satisfaction with a meal, it may have an indirect effect on customer satisfaction via quality service provision.

In terms of the findings of this study, three of the biggest gaps related to “waitron responsiveness”, “inadequate assurance” and “clean ablution facilities”, meaning that customers’ expected much more responsive waitrons, greater assurance that quality of service and food would be good, and cleaner rest rooms than was actually experienced. All of the attributes in Table 3, with the widest statistically significant gaps represent severe deficits and require the significant attention of restaurant managers and staff in terms of making required improvements. The findings indicate that most of the customers’ expectations concerning restaurant quality service provision are best explained by the subsequent factors, namely, appearance and ambience of facilities, a feeling of assurance, personalized service, satisfaction, responsiveness and reliability of waitrons. The latter determined the tip size they obtained to a large extent. The results thus strongly suggest that restaurant managers must train staff effectively and make certain that they provide timely service. The competence and efficiency of staff is critical to success. This will mean that there is accurate billing and service that is free of errors, leading to enhanced levels of customer satisfaction.

The critical strategy to retain customers is to improve service recovery quality, and by having a quick response to service failure. Consequently restaurant managers must immediately begin to focus attention on ensuring that future service delivery levels are high and seek to enhance the strength of customer relationships with each of the complaining customers. Managers should thus be attentive to recovery service quality as much as they are to service quality provision and should therefore enhance complaint management by having suggestion boxes at the front-desk or present customers with survey material to assess quality matters. Managers should formulate a competitive strategy based on a modified model of service quality provision to keep loyal customers and to enhance customer relationship management. Customer satisfaction undoubtedly has a major and direct effect on customers’ behavioural intentions. Despite its shortfalls and limitations, this study implies some new contributions. The findings contribute to the development of a service quality provision excellence approach that will help to identify customers’ expectations and hopefully encourage staff performance.
improvement in the three restaurants studied. The results may thus expand knowledge of restaurant service quality provision that could drastically improve business for the restaurants involved as well as restaurants in general.

ABSTRACT

The present paper discusses some of the findings of an ongoing “Green & Smart Furniture” (GSF) research project. It actually focuses on third-age consumers’ behavior and interest in purchasing smart and eco-friendly wooden furniture. The research reveals the critical elements for a successful design and production of GSF products that will enhance both needs and expectations of the consumers. Thus, 399 specially constructed questionnaires were gathered during 2013, which were further elaborated and statistically analyzed with SPSS ver 17.0.

Results are quite encouraging for the enterprises that would decide to design and produce smart and eco-friendly wooden products. Consumers show a significant interest in purchasing GSF at a percentage of 70%. They are willing to pay an extra amount of 9% in average than regular prices of conventional furniture. The most important factors in purchasing GSF have been found to be price, quality, functionality, safety and ergonomics, as well as the type of raw materials.

Keywords: Green Wooden Furniture, Smart Furniture, GSF, Market research, Consumers’ Behaviour, Third age, Greece, sustainability

1. INTRODUCTION

European Union, is one of the biggest manufacturers, traders and consumers of wooden product in the world (European Commission, 2013). Furthermore, the sector of furniture manufacturing in the E.U. has a strong presence internationally, mainly because of the high quality standards in technical and aesthetical level (UEA, 2005). During the period 2000-2007, furniture industry has known significant growth because of a sum of specific conditions. Nevertheless, there is in general a growing concern related to the environmental consequences that occur by the production, use and disposal of goods during the end of their life (Humphrey and Schmitz, 2001).
The knowledge on environmental consequences of the materials that are been frequently used in a particular industrial sector, constitutes enterprises capable to improve their products and their production processes by an environmental point of view and thus to accelerate their entrance to the emerging markets of green products (Nedermark, 1998).

Many furniture manufacturers at a global level, understand the responsibility they have in making environmental friendly furniture, since green products in general that are gradually been introduced in markets, force the designers of products to include environmental criteria in the production processes and in final products (Maxwell and van der Vorst, 2003; Shapiro and White, 1999) and thus the number of such enterprises is growing constantly (Frondel et al., 2007; Epstein and Roy, 2006).

Regarding Greek furniture sector, a related study of Papadopoulos et al., (2010) has shown that the majority of the Greek furniture enterprises are strongly support green entrepreneurship and certification of wood regarding its environmental impacts. Through this process, the firms believe that they will be able to develop new fields of entrepreneurial activity, based to certified ecological furniture products, enhancing their competitiveness and innovative activity (Trigkas et al., 2011).

2. LITERATURE REVIEW

2.1 Green wooden products

Eco-furniture or “green” furniture, is defined as a product of furniture designed to minimize the environmental impact during its whole life-cycle (Albino et al., 2009; Baumann et al., 2002) and thus furniture with characteristics of environmental compatibility, taking into consideration all the stages in furniture life-cycle (Alhola 2008; Progetto Life, 2005).

Several research initiatives have been launched during the last years regarding furniture design and production that are environmental friendly. The ‘Life Environmental Ecofriendly furniture project’ has been launched in Italy during 2001 aiming in developing furniture prototypes with elements compatible to environmental protection, taking under consideration all the stages of a furniture life cycle (Progetto Life, 2005).

A very interesting initiative was also the Finnish Furniture Panel launched in 2004 focusing to environmental impacts of furniture during their life cycle, further aiming in finding solutions regarding the development of the sustainable growth of the furniture industry in the country (Finnish Furniture Panel, 2005; Nissinen and Parikka, 2007). Additionally, several web sites were developed, containing all the related information regarding issues concerning ecological furniture, for manufacturers as long for the consumers (Ecosmes, 2005; Nordic Ecolabelling, 2003; GRIP, 1998).

2.2 Smart furniture
Furniture constitutes part of our everyday living environment especially inside buildings, through which the user comes to a direct interactive contact in executing several activities. Studying daily routine and needs of a person through its interaction with furniture and utilizing technology, it is possible to develop new uses for furniture that will contribute to the improvement of quality of life.

Smart furniture constitutes the future evolution and tendency in furniture industry (Tokuda et al., 2003; Zongdeng and Wenjin, 2010). Thus, a smart furniture product has the capability to alter a conventional space into an intelligent spot that includes computing systems (Ito et al., 2003). Since a smart furniture is equipped with computing networks, sensors (Mavrommati et al., 2003) and several information technology devices, it could offer many different services, either by itself or in cooperation with other devices and items of the everyday human environment under the context of a Ubiquitous Computing (UmpiComp) environment (Wuliji, 2009). UmpiComp environments, regard the method in including and using computing systems in a way that constitutes them available to our everyday living environment, making them simultaneously "invisible" to the user (Weiser, 1993).

In a related study (Karvelas, 2007), some of the research projects in the field are presented, regarding smart furniture in networking to ubiquitous computing systems and environments.

Indicatively we refer the construction of a smart table which can recognize what and how much we are eating and which has been developed by a research team of the National University of Taiwan. The Dietary-Aware Dining Table using sensors for measuring the wage of objects and RFID technology in identifying objects, could know the amount and the type of food that has been consumed by the users during one meal (Chang et al., 2006).

Another example has to do with the Drift Table and the Key Table which were developed under the context of the project for residential technologies of Equator IRC, as smart furniture embedding functions such as, slow moving presentations of aerial photos, which their speed, direction and height are defined by the disposal of objects on its surface and their wage, or such as in understanding the mood of the user by the force that he put objects on the surface, using wage sensors (Gaver et al., 2004; Boucher et al., 2006).

The E.U. is also giving special attention in the development of smart furniture for the third age through the funding of the WIDER project (2014), in order to give the opportunity to furniture industries across Europe to innovate and differentiate from the competition and to produce this kind of products.

2.3 Target group for Eco and Smart furniture

The U.S. Congress spends approximately $1.5 trillion for health care services on a yearly basis, while the forthcoming years the population of the third age is expected to become bigger than the younger
one (AAHSA, 2003; Dishman, 2004). The percentage of the U.S. population that is expected to be over 65 years old, shows constantly a growing tendency and it is foreseen to reach the 18,2% of the country’s total population in 2025, with this tendency to be global (Dishman, 2004). Furthermore, the improvement of living and the evolutions in the medicine science have contributed to the increment of the expected living, since during the second half of the 20th century expected living has been increased by 30-40 years (Huth, 1986, Pennathur et al., 2003). According to the forthcoming evolutions in medicine science and biochemist, the expected living is foreseen to be further increased for 20-30 years during the next generation (Pennathur et al., 2003).

Ageing in the third age is manifested usually through the reduction of stamina, ware down of bones and muscles atrophy, slowing down of senses and spiritual capabilities, loss of balance and slowing down of person’s activity and mobility (Pheasant, 1986 in Comfort, 2003a; Burke, 1990). Many research efforts has been made internationally during the last years regarding the design and development of products that would make easier the way of living of the aged people improving their surrounding space, especially in residencies, aiming to the confrontation or to the tempering of the negative consequences of ageing (Anderson, 1975; Demirbilek, 1999; Haigh, 1993; Naqvi et al., 1994; Pinto et al., 2000; Comfort, 2003a; Jönsson, 2003; Pennathur et al., 2003; Nikopoulos, 2010).

Thus the target group for “smart and eco furniture” under the context of the present research, has to do with the third age to which the research could offer many solutions in improving their everyday living, through becoming more independent, reduction of health care costs, improvement of their quality of life, securing spare time for persons that are involved to their treatment, improvement of their capabilities and cure until a level through everyday treatment. Regarding furniture enterprises, such an effort could have economic benefits in case of their mass production.

The aim of the present research under the context of the project GSF – Green and Smart (Eco-logical) Furniture, was to register the opinions and the correspondence of furniture consumers of the third age regarding smart and sheer ecological furniture, having as a main scope the introduction of the criteria according to which the first furniture with the above mentioned elements, will be designed at a European level.

3. RESEARCH METHOD

A research instrument was developed to serve as the basis for collecting data pertaining to the study’s parameters. All questionnaire items were constructed using self-typing 5-point Likert scales. Furthermore a number of questions would be of multiple-choice type. Both are well-accepted practices in this type of research. It should be noted that most questions reflect perceptions of the interviewed sample in order to outline the trends regarding GSF for the specific target group.
The items pertaining to each scale were pre-tested with 5 face-to-face interviews. The pre-testing process allowed the researchers to assess the content validity of items and ensure that interviewees understood the research instrument as they were intended.

The questionnaire included 4 different groups of interest and a total of 23 questions. The first group of questions regarded the general characteristics of furniture products that are currently used by the consumers. The second group included 9 questions related to the awareness of the consumers regarding the meaning of ecology and the inclusion of technology in furniture products specifically, but also into their everyday living in general. The third group constitutes of questions related to the type, specific characteristics and elements of smart and ecological furniture which could be developed as long the amount that the consumers are willing to pay extra in acquiring such a product. Finally, the fourth group was formed by questions regarding the profile of the consumers that have participated in the research in order to highlight the specific characteristics of the potential consumers of smart and ecological furniture.

The research was addressed to a random sample of 399 consumers from different regions of the country during 2013. Questions were selected in such a way in order to be short and comprehensive for the best possible convenience of the participants.

Before the launch of the study, a content validity test was conducted regarding the questionnaire. This test was based on discussions with furniture enterprises and specialized scientists in the furniture field along with the extended literature reviewing. Following this, a pilot questionnaire was tested to 10 consumers. The pre-sampling results indicated the points that needed to be further clarified improving the quality of the questionnaire (Dillman, 2000).

The construct validity was based on the test of unidimensionality of the elements constituting each factor, as well as the content validity of each factor separately. We used Factor analysis according to the method of Principal Component Analysis. Regarding the content validity of the research variables, the statistical factor of Cronbach’s Alpha was used (Siomkos and Vasilikopoulou, 2005; Chantzoudis et al., 2009; Sarigiannidis et al., 2009).

Data were processed and analyzed using the statistic package SPSSWIN ver 17.0 and all the related tests of Frequencies, Descriptives, Crosstabs, Correlation analysis and Cluster analysis were made (Norusis, 2007; Howitt and Cramer, 2003), in order to highlight the specific characteristics of the potential consumers of smart and ecological furniture and the range of integration regarding attributes – functions of the furniture products.

4. RESULTS
The sample consists mainly of people between 61 - 75 years old, of low and average annual family income ranging from 5.000€ to 20.000€. Furthermore, the majority states that they live in towns in detached residences with a surface from 50 to 100 square meters, while the 24,0% of them owns bigger spaces (101 - 120 square meters). The majority live with husbands/wives or the rest of the family.

The analysis of the first group of the research’s questions delineated the contemporary use of furniture in residences and their specific characteristics regarding people of the third age. Spending most time, in their living room (at a percentage of 40,4%) and kitchen (at a percentage of 32,6%) the target group places great importance on chairs (27,9%) and tables. Wooden furniture comes also first to the participating consumers’ favor regarding everyday use.

A 54,4% of the target-group consumers admit that they are not willing to replace conventional furniture with green and smart ones unless it is cheaper (Figure 1). This finding is quite normal considering the squeezed income in the current difficult economic climate in Greece during the last 4 years. However, there are also three more criteria that seem to have a significant role in purchasing GSF: a) health condition (50,4%), b) assistance of GSF to everyday living (49,4%) and c) environmental protection along with the improvement of their everyday living conditions (49,1%). The last criterion confirms further previous relative researches (Papadopoulos et al., 2010; Trigkas et al., 2011) regarding the role of environmental protection in developing new target groups and markets for the furniture and wood sectors in Greece and in general, as well as for the development of new entrepreneurial opportunities under the context of green entrepreneurship. The awareness of contemporary consumers of environmental issues indicates that the area of green furniture should be an alternative aspect under consideration by furniture enterprises when forming their competitive strategies.

![Figure 1. Criteria for changing conventional furniture with smart and ecological ones](image)

The analysis of the answers to the third-group questions indicated characteristics and properties desired by GSF in regard to:

- environmental and natural resources protection,
- technology and its applications
the specific needs and demands of end users and their surrounding space.

Therefore, the most important criteria using a 5-Linkert scale (with 1 as very much) appear to be:

a) sustainability regarding natural resources’ use (ranking 1.72),

b) production processes that respects the environment (1.74),

c) energy saving during production and use (1.79) and

 d) to be manufactured by recyclable materials (1.82).

Attributes such as ergonomics, safety, use of ecological finishing materials, the ability of reusing the components in the end of life-cycle and the use of innovative materials, follow at a lower significance ranking.

It should mentioned that these findings coincide with EU policies on furniture’s value chain, which set among major priorities the production and use of products that minimize their environmental footprint, in the context of efficient use of resources and sustainability. Forest products should follow the Cascade principle according to the European Commission (2013), and thus present a life cycle of: a) production, b) reuse, c) recycle, d) bioenergy production and e) eco-disposal of wooden products.

Table 1. Criteria that ecological furniture should meet (ranking 1 till 5, with 1=very much and 5=not at all)

The familiarity of third-age consumers with technology was further explored as well as the range of inclusion of computing systems into several technological applications and functions. 36.3% of the respondents consider the use of technology as a good idea while the 31.6% consider it as quite necessary and a 25% stated that technology helps a lot their everyday living. These consumers seem to have bigger familiarity with technology mainly regarding applications such as the use of mobile phones (2.54), home automations like automatic wind screens and lightning (3.39), use of audiovisual
means such as TV, DVD, projectors. (3.43), and IT and internet at a ranking of 3.79 and 4.00 respectively.

Focusing more on the specific characteristics and properties of smart furniture, the analysis of the results has revealed that the anthropocentric design constitutes the basic property of the furniture product with technological characteristics to follow. Such attributes could be the capability of warning for health problems of the person at home or the capability to communicate with the user and interact with its environment.

These findings could be further correlated with the results of Table 2, regarding the aims that smart furniture should achieve. Thus, at a declining significance ranking, the participants consider that smart furniture should facilitate user’s everyday living > execute some routine activities > secure an independent everyday living of the person > generate a pleasant environment inside the house.

Aims regarding the health of the user, such as the function of becoming a warning device in health and safety issues and the monitoring of the person’s health in general follow with a ranking of 2.03. Chi square test has shown that a statistical significant correlation exists between groups of ages and a) the property of facilitating the communication with other people outside the house (Pearson X² = 33.53, for a significance level >99.9% Approx. Sig= 0.001) and b) monitoring of person’s health (Pearson X² = 32.51, for a significance level >99.5% Approx. Sig= 0.005). Hence, the older the person, the bigger becomes the need of communication with other people and the monitoring of their health.

</table>

Table 2. Properties and characteristics of smart furniture (ranking 1 till 5, with 1=very much and 5=not at all)

Thus, anthropocentric design is significant for smart furniture with the potential to facilitate user’s everyday routines in a pleasant environment inside the house with parallel simple and easy-to-use technological support in health issues such as monitoring and warning.

Finally, the three most important factors that influence the participants’ decision in purchasing GSF appear to be price, quality and functionality of the furniture as presented in Table 3. The rest of the factors follow, such as safety and ergonomics, environmental protection, technology and the design.
FACTORS | Rank | Std. Dev. 
--- | --- | --- 
Price | 1.40 | .821 
Quality | 1.43 | .750 
Functionality | 1.53 | .820 
Safety and ergonomics | 1.60 | .862 
Raw materials | 1.70 | .926 
Environmental protection | 1.81 | 1.009 
Technology | 2.29 | 1.295 
Design | 2.40 | 1.326 

Table 3. Factors and range of influence in purchasing smart and ecological furniture (ranking 1 till 5, with 1=very much and 5=not at all)

The above mentioned factors of Table 3 are correlating each other and the correlation analysis using the Pearson correlation coefficient (Pcc) indicates that at a significance level of 0.01 the factors that affect positively each other in order for a consumer to buy GSF are the following:

- Quality in relation to a) raw materials used for manufacturing (Pcc = 0.606), b) functionality (Pcc = 0.469), c) ergonomics and safety (Pcc=0.412).
- Price in relation to a) quality (Pcc = 0.365) and b) functionality (Pcc = 0.229).
- Functionality in relation to a) safety and ergonomics (Pcc = 0.626) and b) raw materials used in manufacturing (Pcc = 0.560).
- Design in relation to a) technology (Pcc = 0.624) and b) ergonomics and safety (Pcc = 0.455).

Based on these findings, it is speculated that the added value for the GSF consumer is significantly related to economic factors, which is quite expected within the context of the severe Greek economic crisis. Qualitative characteristics and facilitation of everyday routine of users follow indicating that the main criteria regarding the decision of purchasing GSF are not substantially different of those for the conventional furniture. Nevertheless, firms will have to detect these specific elements that will allow them to achieve differentiation during production, including the incorporation of sophisticated technology and environmental protection in their products.

Following the above mentioned findings and according to Table 4, it is observed that the consumers' preferences, regarding the functions that a smart furniture could have, are mainly oriented towards: a) the convenience in maintenance and cleaning (1.64), b) convenience in movement (1.67), c) safety (1.71) and d) support of persons for changing spots of the furniture or adjustment of its dimensions according to their anthropometric characteristics.
The functions of smart furniture should secure convenience and adjustments to individual anthropometrics and kinesiology according to age and safety. The average consumer of the third age, according to the research, thinks of multifunctional furniture, which will furthermore contribute towards the reduction of everyday living cost through the satisfaction of a wider range of needs.

Of significant importance are also the findings presented in Figure 2 which concern the extra amount of money that the consumers are willing to pay in order to buy GSF. A rather satisfactory 27.4% states that are willing to pay a 5-10% extra for GSF compared to conventional furniture. Adding the percentage of those who are willing to pay an extra 1-5% (22.4%) and an extra 11-15% (18.6%), a cumulative percentage of 68% of the research sample seems willing to pay till 15% more for GSF in relation to a conventional furniture.

These findings are quite significant, since besides the economic downturn and its dramatic consequences to the family income and the furniture sector in Greece, consumers are willing to pay extra for the added value of a furniture product with technological and ecological innovations to satisfy specific needs. This information is quite valuable for the furniture manufacturing sector; it actually can constitute an important recommendation regarding competitive strategies based on differentiation. Reconsideration of low-cost business strategies towards innovation and differentiation are quite sufficient to secure a significant part of the internal market and furthermore, to boost extroversion within the crisis context (Papadopoulos et al., 2012; Trigkas et al., 2012; Papadopoulos et al., 2010).

### Table 4. Functions of a GSF (ranking 1 till 5, with 1=very much and 5=not at all)

</table>
Thus, according to the above mentioned results, it seems that there exists a “critical mass” of consumers of GSF in Greece, which can constitute a significant market for innovative Greek furniture enterprises during the period of the economic recession. Furthermore, the specific type of furniture can also support export activities which are rather rare for the Greek furniture sector.

Using cluster analysis we tried to focus more on the preferences of the target group of potential GSF consumers in relation to their specific characteristics and profile, such as their age and income. Table 5 presents the basic GSF properties and characteristics in relation to the consumers’ age. Thus, it seems that for almost the sum of the age groups, these properties are convenience in maintenance and cleaning and the convenience in moving the furniture, especially for ages over 66 years old, as well as supporting in changing positions when sitting. The capability of warning for health problems seems to play a significant role for ages over 75 years old.

What are the main reasons that our target group would decide to pay an extra amount of money? The research indicated (Table 6) that there are actually different criteria for different ranges of percentages of extra amounts. More precisely, the actual purchase price and the level of quality are the main criteria for people who are willing to pay 1-15% more for GSF. The actual price seems to be the only criterion for paying more than 20% since there is a common perception that GSF will be rather expensive. However, the people who seem willing to pay an extra amount of 1-5% expect also better ergonomics, safety, functionality and assurance that environmental protection has been taken into account during production. On the contrary, the results show the willing to pay of the consumers an extra amount from 16-20% has to do mainly with the design of a GSF.

5. CONCLUSIONS - PROPOSALS

Wooden furniture is still the first preference of the participants of the research, regarding everyday use. Thus, wood could constitute the basis for the construction of a GSF, since it is by its nature an ecological material having the minor environmental footprint in relation to other materials. This property can be even of greater value when wood comes from certified sustainable managed forests and if the wood products bear the relevant labeling at European and international level according to UNECE and FAO (2012).
The criterion of price in relation to the quality plays the most fundamental role in the purchasing decision of GSF and the willingness to change conventional furniture. Modern consumers that belong to the third age seem to have a great awareness regarding environmental issues, a fact that enterprises should take into consideration and include to their planning and strategy.

GSF properties and characteristics of special interest seem to be the promotion of sustainability in natural resources use, the environmentally friendly production process, energy saving during its production and recyclable materials (when other than wood).

Regarding the "smart" - technological characteristics of the GSF, the significant ones are these of the ability to warn for health problems of the person, the ability to communicate with the end users and the ability to interact with its environment, with ergonomic design as a core element. Thus, the participants in the present research consider that "smart" furniture should facilitate their everyday routine and secure independence of the person. Regarding the specific technological applications that could be included to smart furniture, the technology of mobile phones seems to be more familiar to the users with the use of audiovisual means and use of computers and internet to follow.

The main criteria regarding the purchasing decision of GSF do not substantially differentiate in relation to conventional furniture products, a fact that can direct furniture enterprises towards the development of their competitive advantages. Nevertheless, regarding their manufacturing strategy they should detect these elements that differentiate them from competition and allow them to achieve their targets, including sophisticated technology and environmental protection in their products.

The majority of the sample state that are willing to pay an extra amount of 9% in average of the price of a conventional product, while the 2/3 of the consumers could afford a 15% extra amount. This percentage is of great importance if we take under consideration the reduced available income of the consumers because of the economic crisis in Greece during the last 4 years. This percentage is higher than the one found in a relevant study regarding the market of furniture with only ecological characteristics (Papadopoulos et al., 2013). A 10% states that they are not willing to pay extra, a fact that can be explained because of the reasons mentioned above.

These findings are quite encouraging regarding the existence of potential GSF consumers in Greece and indicate that third-age consumers are willing in purchasing GSF that includes sophisticated characteristics and properties focused on their needs which also comply with ecological standards.

The capability in warning a familiar person to the GSF user for health problems seems to play a significant role for ages over 75 years old, which are these group of ages that usually need medical care.

The present research is the first in Greece and at European level, according to our knowledge. We could argue that it promotes the development of innovation for furniture manufacturing industries, in
order to approach an extended range of consumers, through the production of GSF. Thus, a new pathway is opening in confronting the difficulties and strong competition that furniture sector faces at national and European level, and recover the crisis (Papadopoulos et al., 2013). Furthermore, findings constitute an optimistic message towards furniture manufacturing sector; firms should redesign their strategy (Papadopoulos et al., 2009), focusing in differentiation by including GSF products in their portfolio, innovating through the production and promotion of furniture products with high added value. This fact could secure a share of the domestic market and boost extroversion, which is of great importance. This optimistic thesis is further certified by the findings of a previous study regarding only ecological furniture (Papadopoulos et al., 2013), where Greek and Cypriot enterprises consider the development of ecological furniture very positively, without mentioning the inclusion of “smart” elements.

Findings also certify the research of Tokuda et al., (2003) and Zongdeng and Wenjin, (2010), that "smart" furniture constitutes the future trend and evolution in the furniture industry.

The present research has certain limitations. Further research could be extended to a bigger sample of consumers in Greece and other countries e.g. Cyprus, Italy, Germany, Spain, France, Russia, Portugal, Israel etc. In this way, we could have a holistic picture of trends and tendencies in these countries too and develop a more concrete portfolio of characteristics and properties of innovative green and smart furniture.

AKNOWLEDGEMENTS

This research has been co-financed by the European Union (European Social Fund - ESF) and Greek national funds through the Operational Program "Education and Lifelong Learning" of the National Strategic Reference Framework (NSRF) - Research Funding Program: ARCHIMEDES III. Investing in knowledge society through the European Social Fund.

ABSTRACT

Kolkata is known world over as the “City of Joy” and is also treated as the cultural hub of India. Brands from within the country as well as from abroad are trying to connect with their target audience of Kolkata. Advertisers are making use of both rational and emotional appeals in their advertising campaign in order to position their brands in the mind of the target audience in Kolkata.

Celebrity endorsement has become very prominent in mass media and advertisers are signing the Bollywood Celebrities for their brand endorsement purpose with the expectation of creating brand recall and preference among the target audience.

The objective of this paper is aimed at determining the proficiency of selected Bollywood Celebrities in generating Brand Recall among the respondents of different gender and age groups in Kolkata.

Primary research was conducted with cross sectional research design by applying survey method among a randomly selected sample of 400 respondents in Kolkata with a structured questionnaire. Independent sample t-test and ANOVA techniques were used for analyzing the data.

The findings show that all the selected Bollywood celebrities are highly familiar among the respondents. There is no significant difference in their brand recall generation capacity among male and female respondents. However, they are having a significant impact in generating brand recall among the respondents belonging to the age group (18-25) years compared to the others three age groups selected for the study.

Keywords: Bollywood, Brand Recall, Globalization, Kolkata, Celebrity, Media.
INTRODUCTION

Bollywood Celebrities from the Hindi film Industry in Mumbai are having huge fan following in India and are also seen endorsing brands across product categories be it FMCG, Consumer Durables, Service brands and even they are a part of various social awareness campaigns.

As per reports available based on a study conducted by AdEx India a division of TAM Media research, Celebrity Endorsement Advertising volume witnessed a growth by 26% in January - June 2013 in comparison with January - June 2012.

From the same study it is evident that the Hindi Film Stars (HFS), actors and actresses from Bollywood, Mumbai captured 80% of Celebrity Advertising in terms of Advertisement Volume in January - June 2013 followed by Sports Celebrities, Television Actors and Actresses.

One of the major developments in the business world during the decade of the 90’s was the Globalization of markets. The emergence of a largely borderless world has created a new reality for all types of companies. Swiss-based Nestle and Netherlands-based Unilever is among two of world’s largest consumer product companies because they have learned the art of marketing their brands to consumers in countries around the world. Two of the world’s major marketers of cellular telephones are from Scandinavian countries. Nokia is based in Finland and Ericsson is located in Sweden.

In the era of Globalization, multinational corporations trying to connect with the Indian target audience are quick to realize this trend and are hiring famous Bollywood celebrities for their brand endorsement purpose.

A study conducted among MBA students of Pune in India to determine the association between celebrity advertising and brand recall shows that recall for female celebrity advertisement is lesser compared to that of male celebrity (Dhotre and Bhola 2010).

Branding in some form or the other has been around for centuries. The initial intention was for craftsmen and others to identify their unique work so that the customers could easily recognize them.

It is worthy to note that marks have been found on early Chinese porcelain, on pottery jars from ancient Greece and Rome and on goods from India dating back to about 1300 B.C.

According to (Keller, 2007) Procter and Gamble put the first brand management system in to place, whereby each of their brands had a manager assigned to only that brand who was responsible for its financial success.

According to (Keller, 2007), Branding is treated as a means to distinguish the goods of one producer from those of another. According to the American Marketing Association (AMA) a brand is a “name, term, sign, symbol or design, or a combination of them, intended to identify the goods and services of one seller or group of sellers and to differentiate them from those of competition”.

The Future of Entrepreneurship

Celebrity endorsement enhances product information and creates awareness among consumers. It helps them to recall the brands of the durable products (Balakrishnan & Kumar 2011).

A study conducted by (Bimal et. al. 2012) reveals that celebrity endorsers are used by the companies for brand equity. It has also showed that consumer think that celebrity endorsed advertisement are reliable and they have the knowledge. They are able to recall the product, the consumers feel associated and it has also helped in influencing the demand of the products.

In the present situation it is extremely relevant to understand the proficiency of the Bollywood celebrities in generating brand recall as huge amount of money is paid to these celebrities as endorsement fees and they are also occupying huge amount of space and time in print and audio visual media as brand endorser.

*Branding challenges and opportunities*

In the words of (Keller, 2007) the reality is that although brands may be as important as ever to consumers, brand management may be more difficult than ever. A number of developments have occurred recently that have complicated marketing practices and made the job of brand manager even challenging.

- Savvy Customers
- Brand Proliferation
- Media fragmentation
- Increased Competition
- Decreasing Brand loyalty
- Learning Advantage
- Consideration Advantage
- Choice Advantages

The recent report about the Best Global Brands of 2013 published by Interbrand shows that Apple has secured the top position followed by Google and others. The list of top 10 best global brands is presented in the figure below.

Figure-1 Top 10 Global Brands of 2013 (Source: interbrand.com)

On focusing our attention from the Global context to Indian situation we see that the Most Trusted Brand of 2013 as per a study conducted by economictimes.indiatimes.com in Indian context is Colgate followed by Dettol, Clinic Plus and others.

Between unexpected climbers and widely anticipated slips, India's largest brands continue to command a lion's share of the trust of its consumers. The list of top twenty five most trusted brands is presented in the figure below. The figures in brackets represent brand ranks from Most Trusted Brand 2012 study.
In order to cope up with this challenging situation of connecting with the culturally diverse Indian target audience MNC's and the domestic players are taking the celebrity route to brand building.

Celebrity endorsement in India

In India now it has become a common phenomenon among advertisers and their advertising agencies to use Indian Celebrities for promoting their brands. Celebrities are considered as “any individual who enjoys public recognition and who uses this recognition on behalf of a consumer good by appearing with it in an advertisement” (McCracken, 1989).

This definition of celebrity is considered in this study and it encompasses Movie stars from Bollywood Mumbai. In this study the term “Celebrity” will encompass a variety of endorsements including those in explicit mode “I endorse this product”, the implicit mode “I use this product”, the imperative mode “You should use this product” and the co present mode “the celebrity appears with the product” (McCracken, 1989).

LITERATURE REVIEW

According to (Keller, 2007) Brand Awareness consists of brand recognition and brand recall performance. Brand Recognition relates to consumers’ ability to confirm prior exposure to the brand when given the brand as a cue.

Brand Recall relates to consumers’ ability to retrieve the brand from memory. It requires that the consumers correctly generate the brand from memory when given a relevant cue.

In the words of (Keller, 2007) Brand Awareness also involves linking the brand- the brand name, logo, symbol and so forth- to certain association in memory. Brand Recall can further be classified as unaided recall and aided recall.

According to (Keller, 2007) in unaided recall consumer recall the brand unaidedly where as in aided recall various types of cues are presented to help the consumer recall the brand.

Effect of celebrity endorsement on Brand Awareness-Recall has been an area of research that has been studied by researchers. A celebrity was better than other endorsers in enhancing brand name recall (Friedman and Friedman 1979).
A study conducted among MBA students of Pune in India to determine the association between celebrity advertising and brand recall shows that recall for female celebrity advertisement is lesser compared to that of male celebrity (Dhotre and Bhola 2010).

It is also evident from existing literature that a celebrity was better in enhancing brand name recall than a non-celebrity (Petty et. al. 1983). A physically attractive celebrity paired with an attractiveness-related product could enhance brand name recall (Kahle and Homer 1985).

Misra and Beatty (1990) also showed that celebrity/product congruency is better in enhancing brand name recall than an incongruent or irrelevant celebrity.

However different findings emerged from a study conducted by (Costanzo and Goodnight 2005). The results presented in their study, however, found that a celebrity recognized in a magazine advertisement did not increase consumer recall of the brand endorsed by the celebrity for both professional athlete celebrities and other entertainment celebrities who are not professional athletes (Costanzo and Goodnight 2005). The results of their study raise questions relative to using celebrity endorsements to enhance brand recall. Celebrity endorsement enhances self-brand connections when consumers aspire to be like the celebrity, but harms them when consumers do not; this effect is more pronounced when the brand image is congruent with the celebrity’s image (Escalas and Bettman 2009).

Another study conducted on “Effectiveness of Celebrity Advertisements” by (Rajeswari et. al. 2010) highlighted that factors like age, gender, viewers’ status, monthly family income, educational qualification, period of awareness of celebrity advertisements and the type of celebrities (Film stars, Sports stars, Professional models and TV personalities) have close relationship with the level of effectiveness of celebrity advertisements.

However factors like family type and frequency of watching the advertisements have no significant relationship with the level of effectiveness of celebrity advertisements.

Celebrity endorsement enhances product information and creates awareness among consumers. It helps them to recall the brands of the durable products (Balakrishnan & Kumar 2011).

From review of existing literature it is seen that contradictory findings emerged regarding the effect of celebrity endorsement on Brand recall. Most of the earlier studies were conducted with students and were experimental in nature. Hence the present study is conducted not just among students but respondents of different gender and age groups in Kolkata.

Research Objectives & Hypothesis

The study is undertaken with the following broad objectives-

- First to determine the Brand Recall generation capacity of Bollywood celebrities among male and female respondents in Kolkata.
Second to understand the Brand Recall generation capacity of Bollywood celebrities among respondents of different age groups selected for the study in Kolkata.

Keeping the above objectives in mind the following hypothesis are formulated:

H01: There is no difference in Brand Recall score of Bollywood celebrities among male and female respondents in Kolkata.

H02: There is no difference in Brand Recall Score of Bollywood celebrities among respondents of different age groups in Kolkata.

**Research Methodology**

In the first part of the study 10 Bollywood Celebrities were selected based on a pilot study conducted among 50 respondents in Kolkata depending on their familiarity and Popularity. Thereafter, the brands endorsed by each of these 10 Indian Celebrities were tracked from advertisements featuring in Television and News papers during the study period as presented in table 1.

*Table 1 Brand endorsement details of 10 selected Bollywood celebrities (source the researchers’ survey)*

Cross sectional research design was applied for collecting the primary data by survey method from the respondents of Kolkata. A structured questionnaire was administered for collecting the data. The Target population was defined in terms of elements-male and female 18 years to 49 years, sampling unit-household, and extent- city of Kolkata. The Sample Size was arrived at 400 for the study keeping in mind the availability of time, resources, and sample size used in similar studies. The sample size was also selected keeping in mind 95% confidence level and 5% confidence interval.
The first question was asked to ascertain the familiarity of the Bollywood celebrities. The next two questions were asked to find out the Brand Recall score of the Bollywood celebrities. The actual number of correct brands unaidedly recalled against a celebrity is noted for calculating the Unaided Brand Recall score of that celebrity. Similarly the actual number of correct brands aidedly recalled against a celebrity is noted for calculating the Aided Brand Recall score of that celebrity. The Unaided and Aided Brand recall Score of the Bollywood celebrities among male and female respondents are presented in table 2 and table 3 respectively.

Table 5 Aided Brand recall score of Bollywood celebrities among respondents of different age groups (source the researcher’s survey).

RESEARCH FINDINGS

It is clearly evident that all the respondents in Kolkata are having 100% familiarity with the selected Bollywood celebrities. Shah Rukh Khan is having the maximum Brand Recall generation capacity among both male and female respondents followed by Amitabh Bachchan. The list of five top Bollywood celebrities in terms of their Brand Recall generation score is presented below in table 6.

Table 6 Top Five Bollywood celebrities in terms of their Unaided and Aided Brand recall Score among male and female respondents of Kolkata (source the researcher’s survey).

It is interesting to note that regarding the first hypothesis the results of the independent sample t-test for Unaided Brand Recall shows t statistic of 1.436 with 18 degrees of freedom. The corresponding two-tailed p-value is 0.168, which is more than 0.05 and 0.01. Similarly for Aided Brand Recall the t
statistic is 0.499 with 18 degrees of freedom. The corresponding two-tailed p-value is 0.624 which is more than 0.05 and 0.01. Therefore the null hypothesis is accepted at 5% significance level which means the Brand Recall score of Bollywood Celebrities is same among male and female respondents in Kolkata.

</tr>
</tbody>
</table>

In regard to the second hypothesis, one way between groups ANOVA was conducted. The F value is 67.318 with 3 degrees of freedom for Unaided Brand Recall score and the F value is 12.552 with 3 degrees of freedom for Aided Brand Recall score and both are significant. Multiple comparisons were done and mean difference is significant at 0.05 levels.
Hence the second null hypothesis is rejected and it is evident that the Brand Recall Score of the Bollywood celebrities in the age group (18-25) years is significantly different compared to the other three age groups selected for the study as shown below.

**DISCUSSION**
Effect of celebrity endorsement on Brand Awareness-Recall has been an area of research that has been studied by researchers. A celebrity was better than other endorsers in enhancing brand name recall (Friedman and Friedman 1979).

It is also evident from existing literature that a celebrity was better in enhancing brand name recall than a non-celebrity (Petty et. al. 1983). A physically attractive celebrity paired with an attractiveness-related product could enhance brand name recall (Kahle and Homer 1985).

Celebrity endorsement enhances self-brand connections when consumers aspire to be like the celebrity, but harms them when consumers do not; this effect is more pronounced when the brand image is congruent with the celebrity’s image (Escalas and Bettman 2009).

A study conducted among MBA students of Pune in India to determine the association between celebrity advertising and brand recall shows that recall for female celebrity advertisement is lesser compared to that of male celebrity (Dhotre and Bhola 2010).

We have conducted the present study among a wider demographic profile of respondents in Kolkata and it contradicts the findings of the above mentioned study. It is evident from the present study that Brand Recall Score of the male Hindi Film Stars (HFS) is same as the Brand Recall Score of the female Hindi Film Stars (HFS) among both male and female respondents of Kolkata.

Interestingly, different findings emerged from a study conducted by (Costanzo and Goodnight 2005). The results presented in their study, however, found that a celebrity recognized in a magazine advertisement did not increase consumer recall of the brand endorsed by the celebrity for both professional athlete celebrities and other entertainment celebrities who are not professional athletes (Costanzo and Goodnight 2005).

They conducted their study with a convenience sample of business students only but we have conducted the present study with respondents from different demographic profile and not just students in Indian cultural context.

Another study conducted on “Effectiveness of Celebrity Advertisements” by (Rajeswari et. al. 2010) highlighted that factors like age, gender, viewers’ status, monthly family income, educational qualification, period of awareness of celebrity advertisements and the type of celebrities (Film stars, Sports stars, Professional models and TV personalities) have close relationship with the level of effectiveness of celebrity advertisements.

The present study is having some resemblance with the above mentioned study and also goes a step further in presenting the fact that there is a substantial variation in Brand Recall Score of Hindi Film Stars (HFS) among the respondents of the four age groups selected for the study. The Brand Recall Score of the Hindi Film Stars (HFS) in the age group (18-25) years is significantly different compared to the other three age groups. It is seen from review of existing literature that Celebrity endorsement
enhances product information and creates awareness among consumers. It helps them to recall the brands of the durable products (Balakrishnan & Kumar 2011).

The findings of the present study is not just having resemblance with the earlier study mentioned above but also takes it forward. The results of the present study not just include brands of Durable products but also Fast Moving Consumer Goods and Service brands.

LIMITATIONS & SCOPE FOR FURTHER RESEARCH
Since the study is conducted with just 10 Bollywood celebrities and is restricted to the geographical region of Kolkata it might go down as a limitation of the present piece of work.

The phenomenon of brand endorsement by celebrities is a contemporary and challenging area for research. In future building on this piece of research, celebrities from other profession and their role in generating brand recall can be studied in a wider geographic context.

CONCLUSION
In today’s dynamic and cut throat competitive market environment brands are leaving no stone unturned to connect with their target audience. The Bollywood Celebrities are enjoying high familiarity among the respondents in Kolkata and are endorsing multiple brands across different product categories. They are proficient enough in generating brand recall among respondents of both the gender but their brand recall competency is significantly higher among the respondents in the age group between (18-25) years compared to the respondents of the other age groups who are slightly older.

THEORETICAL AND PRACTICAL IMPLICATIONS
On the academic scene although the phenomenon of Celebrity Brand endorsement have been studied from different perspective across the globe, in Indian context and specially in Kolkata the impact of Bollywood celebrities in generating brand recall is not much evident in existing literature. Therefore in this research a modest attempt has been made to understand the brand building process with Bollywood celebrities in Kolkata which is expected to contribute to the existing body of knowledge.

This piece of research is expected to provide valuable practical insight to advertisers in taking note of the fact that Bollywood Celebrities are having significant Brand Recall among the respondents belonging to the age group (18-25) years in Kolkata.

A CONCEPTUAL FRAMEWORK OF NEED, FIT AND VALUE BASED CO-CREATION WHILE EXTENDING OR CREATING THE BRAND

Paul, Soumi1; Peretti, Paola2; Datta, Saroj Kumar3

1Supreme Knowledge Foundation Group of Institutions, India
2Stockholm School of Economics, Sweden
3VIT Business School, VIT University, India

ABSTRACT

Purpose: The previous findings suggest there is a place for value development and the use of co-creation in the marketing by engaging the customers in the process by providing complete transparency and a proper feedback loop. One area of business where co-creation can return significant dividends is on extending the brand or brand category. Whilst consumers have few unmet needs, having more choice of products and services than they have ever had, they do not appear to be entirely satisfied. Now a day’s people do not want products; they want solutions to their problems. They are, however, in an ideal position to suggest improvements to a product or new category that they might have been using or looking for. It ensures to fit with need, which creates value associated with innovation and business creation.

Methodology: The research methodology used in this study is a state-of-the art of this topic. The idea is to convert all the main topics around the value co-creation concept and to identify research gaps and implications and suggest possible need for further researches.

Findings: This article, through an in depth literature review analysis, identifies this paradigm shift and it presents a conceptual model of value co-creation activity based on company-customer-brand management perspective. The objective is to offer an agenda for future research of this emerging paradigm. The study proposes Company-customer-brand based Co-creation research framework.

Implications: Constant innovation is essential to ensure that the offerings meet the needs of customers well. By providing productized offering instead of generic offerings, the company can incorporate the features that would cater to the emerging needs of customers. The study suggests companies can undertake innovations by adopting co creation to offer more values to customers. It also ensures the way to the move from theory to practice.

The paper highlights the need to reconsider the role of consumers in the co-creation process and identifies various gaps in the knowledge of brands and their management that have become apparent because of the changing market environment. No longer can marketers afford to rely on the untested assumption that increases in customer satisfaction and share
will translate automatically into higher financial performance. This dilemma suggests a reformulation of the marketing discipline as about developing and managing intangible assets – customer and channel relationships and brands – to maximize economic value. We call this value-based marketing. This view of marketing is theoretically appealing and places marketing activities in a pivotal role in the strategy formulation process. We hope this typology and research agenda fosters greater appreciation for an investigation into this important phenomenon.

**Originality:** The study points to the critical role of creating visibility for change as well as the importance of the infrastructure supporting changes. It is ascertain that the findings support the needs for degree of freedom in both way communication of customers and marketing departments in new product/brand development and changes.

**Keywords:** Conceptual model of value co-creation, consumer co-creation; brand management; brand value co-creation.

**INTRODUCTION**

The focus of effective value creation has been emerged and proved to be a current concern in the present decade. Fit with need which creates value associated with innovation and business creation has been already discussed for so long in previous years. In the past, the process of value creation was almost confined within the business. Previously the entiremarketing process starting from product design, production, marketing promotion, branding and control of sales channels could be performed in-house with minimal consumer input (see Figure 1). The role of the consumer was seen solely at the end-of-line points of consumer interaction, not during the process of value creation. Value creation occurs when the company has the resources and capabilities to produce a product or service that is desired by market participants like customers. They describe the promising, active role consumers may play in the previously firm-dominated world of new product development and even in brand development. This is the high time for understanding of co creation process from both customer and company side. Since 1995 the literature has analyzed the potential impact of the Internet in terms of consumer marketing. Mahajan and Wind (1989) anticipated the Internet’s possible contribution as an element able to create discontinuity in the trend, generating a profound change in the market dynamics and, therefore, with implications on the performance of entire sectors and businesses. The Internet can change consumers’ behavior unpredictably (Fox, 1995; Molenaar, 1996), with an impact.

---

on conventional marketing and its main activities (Peterson et al, 1995). This situation creates challenges and opportunities that organizations must take into account, in terms of brand management (De Chernatony, 2004).

According to Prahalad and Ramaswamy (2000), the customer’s role has undergone a change and the customers have become “co-creators of value” instead of being passive. In particular the co-creation or co-production process is grounded on an aware and stimulated co-operation between companies and consumers, which interact through their operating resources (skills, knowledge, competencies, experience, physical and immaterial spaces, etc.) to co-create value about brands, products and/or services of the same companies. The term co-creation implies collaboration between the firm and some other entity. In this particular context, the consumer collaborates in the creation of value. Knowledge is a source of competitive advantage since it fosters innovation (Grant, 1996; Nonaka& Takeuchi, 1995). Thus, the knowledge provided by customers may help companies to adequately assess and fulfill customers’ needs, and reduce the risks of product failure (Ogawa and Piller, 2006). This interaction can take place anywhere within the business operation (not just at the point of sale). Geoffrey Moore’s crossing the Chasm (1999) highlighted the importance of companies working with early adopter customers. In addition, MIT professor Eric von Hippel wrote about user-created innovation in his Sources of Innovation (1994). The previous findings suggest there is a place for value development and the use of co-creation in the marketing by engaging the customers in the process by providing complete transparency and a proper feedback loop. This study assumes that valuable innovations may be produced outside the firm (Chesbrough, 2003), and from different players, such as customers, suppliers, manufacturers, universities. In this paper, the focus is on company’s one specific stakeholder - the customer.

One area of business where co-creation can return significant dividends is on extending the brand or brand category. Whilst consumers have few unmet needs, having more choice of products and services than they have ever had, they do not appear to be entirely satisfied. Nowadays people do not want products, they want solutions to their problems. They are, however, in an ideal position to suggest improvements to a product or category that they might have been using or looking for. Previous conceptualizations and measures overlook consumers’ as co-creators of brand value in terms of line extension, brand extension etc. In extension, brand equity is predominantly considered as a consumer based rather than company based. Brand equity can be defined as how much the consumers are willing to pay premium in order to enjoy the brand.
Figure 1 – Traditional model: value chain with transactions between independent parties.

Source: personal work.

RESEARCH METHODOLOGY
The research methodology used in this study is a state-of-the-art of this topic. The idea is to cover all the main topics around the value co-creation concept (see Figure 2) and to identify research gaps and implications and suggest possible need for further researches.

Figure 2 – Literature Review: analysis of different components of consumer co-creation, brand management perspective.

Source: personal work

Research Objectives
Main objectives are the following ones:

- to collect, document, scrutinize, and critically analyze the current research literature on value elements in marketing and how co-creation between the sender (firm) and receiver (consumer) happens;
- to establish the scope of company - consumer co-creation in a marketing strategy like brand extension, line extension etc.
- The study will propose directions for the firms when and how in various stages implementing extension strategy involving consumers may help in sustaining as well as improving brand’s equity.

LITERATURE REVIEW

The following literature stream intends to identify all the different components of a possible model of consumer co-creation. According to the theoretical perspective of “working consumer” proposed by Cova and Dalli (2009), consumer co-creation is analyzed in multiple theoretical perspectives. These theoretical perspectives, although with different approaches and aims, have addressed the value co-production and co-creation constructs, and put in evidence that consumers, by their knowledge, competencies, skills and experience are always actively involved as value co-creators. In particular, this is known as the theoretical perspective of value co-creation (Prahalad and Ramaswamy, 2004, 2000) and it is part also of the theoretical perspective of S-D Logic (Lush and Vargo, 2004, 2006) or value co-producers (Norman and Ramírez, 1993). On the other side there is the theoretical perspective of consumption experience, the one that happen during the consumption experience stage (Carù and Cova, 2007; Holt, 1995, 2002; Prahalad and Ramaswamy, 2004). Finally it is important to remember that consumers can have an active role also during the phase of service production (service co-production), interacting with operational resources (i.e.: front office employees) of the company, in the theoretical perspective of co-production (Bitner, 1990; Eiglier and Langeard, 1977; Lovelock, Wirtz, 2007; Bitner, Booms and Tetreault, 1990).

Co-creation

The consumer collaboration work on different brand interacting blocks that represent spaces in which the company and/or its customers actively participate to create brand equity. These blocks are the following ones: production (execution) of the operational activities related to components of an existing product or services or their mix (i.e.: defining a package) closely designed by the company and not changable by the consumers; brand offering system improvement (product, service, experience related), which added value in terms of benefits (functional and psychosocial) and attributes (tangible and intangible) for the consumers; brand offering system innovation. The consumer collaboration is generally stimulated and designed by the companies and takes place on all these areas.

Co-creators
In this scenario recent developments provide a growing number of consumers a greater role in the exchanges with companies (Hoyer et al. 2010) consumers are only willing to share their creative ideas, honestly state their product preferences, and spend significant amounts of time modifying existing product concepts if their expectations are met. Considering that, consumers’ motivations depend on personality and that motivations are quite heterogeneous among user groups. As there are numerous personal characteristics and personality traits that affect consumers’ motives, in the following we concentrate on those characteristics that either relate to consumers’ creativity as main prerequisites for their ability to make valuable and innovative contributions to a firm’s new product development process. Co-creators are persons with exploratory behavior with the tendency to explore or investigate new environments, like the following ones:

- **Innovators**: According to Thomke and von Hippel (2002, p. 78), “Turning customers into innovators requires no less than a radical change in management mind-set.” Specifically, co-creation’s highly interactive nature may require firms to adopt an open culture in which their goals, activities, and processes are highly transparent and collaborative (Ogawa and Piller 2006; Prahalad and Ramaswamy 2004).

- **Novelty seeker**: Novelty seeking (NS) is a personality trait associated with probing activity and long associated with unmet human needs. In this particular context we are mainly talking about product-based need. Novelty seekers are turns out to be one of the crucial predictors in various decision making activities.

- **Early adopter**: This specific target have creation and construction behaviours that allow them to design and provide the products that the later adopters will follow.

**Organizations are also getting involved** in co-creation following the thought of C.K. Prahalad and Venkat Ramaswamy of Co-Creating Unique Value with Customer. Companies applied the principles to a broader range of business activities and beyond of traditional marketing practices. Companies engaged customers in the delivery of their experience. The case study of Harley Davidson reveals, bikers riding together and customizing their motorcycles according to their need. Personalized experience value and thus knowledge of need, and finally delivering the value which fit their need.

**Motivation for Co-Creation**

Little is known about **why customers** contribute to co-creation projects initiated by producers. Motivated consumers to make more and even better contributions or attract additional consumers interested in the topic. Many consumers appear to be increasingly less fulfilled by the act of consumption itself but begin to engage in creative contributions to fulfill own psychological benefits (Thompson et al. 2006). Mainly, the customers who are “dissatisfied with available choices and want
to co-create value and thereby co-create value”. Based on the literature review analysis, we can summarize that main motivations for co-creation are the following ones: interest in innovation; to gain knowledge; to show ideas; to get monetary rewards etc.

Organizational benefits

Organizational benefits that co-creation can generate are the following ones:

- **Innovation of existing business – Prolong the brand life cycle / product life cycle.**
  One of the main benefit is that co-creation will allow to prolong product life cycle. Product’s superiority is in itself no longer sufficient to guarantee its success. The fast pace of technological development and the increased speed with which imitations turn up on the market have dramatically shortened product life cycles. Product life cycle refers to the phases, starting from the product’s first launch into the market until its final withdrawal. To prolong the life cycle of a brand or product an organization need to use skillful marketing strategies. Reputed companies rarely withdraw the product from the market rather than they try to extend the life of the product through innovative extension strategy.

- **Innovation in an enterprise – Constant orientation.**
  For example Brand orientation is closely related to the idea of innovation. It is a deliberate approach to work with brands, both internally and externally. Strong brands offer several advantages to firms such as entry barriers to competitors (Karakaya and Stahl, 1989), opportunity for brand extensions (Pitta and Katsanis, 2001), etc. Urde (1999) presents a brand Orientation model that focuses on brands as strategic resources. According to him “Brand Orientation is an approach in which the processes of the organization revolve around the creation, development, and protection of brand identity in an ongoing interaction with target customers with the aim of achieving lasting competitive advantages in the form of brands” (p. 117-118).

- **Creation of future business – NPD by line extensions, brand extensions.**
  Participatory branding brings users, brands & suppliers together and that’s good for customer-focus. Assessing customers need of their favourite brand to their service, for new product under the same brand name and assessing customers need for absolutely new brand’s creation.

Two way process of Value Co-Creation

Value co-creation is an emerging business, marketing and innovation paradigm describing how customers and end users could be involved as active participants in the design and development of personalized products, services and experiences (Prahalad & Ramaswamy, 2004; Etgar, 2008; Payne,
Storbacka, &Frow, 2008). Co-creation is here defined broadly as the creation of value by consumers. Interpretations of value and the processes of value creation are rapidly evolving from product- and firm-centric perspectives (e.g. Porter, 1980) to ‘personalized consumer experiences’ (Prahalad & Ramaswamy, 2004). We are emphasizing here for two-way process of value creation on the idea generation, and virtual process of communicating those ideas by maintaining proper feedback loops. You can’t just ask customers what they want and then try to give that to them. By the time you get it built, they’ll want something new” , Steve Job. So, the smart way is to involve your customers on the value making process.

**Ideation contests**: This willingness to collaborate on the consumer side is willingly accepted by firms, since they know that new perspectives and consumers’ knowledge can lead to ideas with higher commercial attractiveness (Urban and von Hippel 1988; Lilien et al. 2002). Many firms today actively build infrastructures to integrate consumer input into their innovation funnel. One of the tools applied in this contest is ideation contests as a form of co-creation to get easy access to a worldwide pool of talented people in order to generate fresh ideas (Schweitzer et al. 2012; Terwiesch & Xu 2008). Participating users apply their skills, experience, and creativity to provide a solution for a particular need. They do this in order to develop new products under an established brand or absolutely new brand that better meet consumers’ wants and needs and to decrease the high failure rates of new product introductions, especially common in extension strategies.

**Virtual process**: consumers are considered a valuable source of innovation. Researchers as well as consultants claim to virtually engage consumers in co-creation activities such as the generation, design, refinement, and testing of ideas and new product concepts. More recently, however, the discursive power model advocating co-creativity between consumer and firm has emerged (e.g. Holt, 2002), largely enabled by the emergence of new technologies. In addition, technological advances provide consumers easy access to knowledge, which in turn enhances their abilities and access to design tools to apply their knowledge. The internet facilitates collective co-creation by connecting individuals with other consumers or the firm (Blazevic and Lievens 2008). The Internet increases access to knowledge that can enhance consumers’ ability to engage in creative pursuits. ‘crowdsourcing’ processes (e.g. wikis and open-source software) (see, e.g.; Anderson, 2006; Howe, 2009; Jenkins, 2008; Leadbetter, 2009; Li & Bernoff, 2008; Scoble & Israel, 2006; Tapscott, 2008; Tapscott & Williams, 2007). The process of co-creation is largely enabled by the emergence of new technologies that facilitate multimedia and immersive exchange (e.g. virtual worlds, role-playing, content sharing, ideation contests, collective intelligence, and social-networking websites). Organization may create a separate tab in their company website for submitting customers requirements, they may submit design which actually fit their need and it may continue up to final value creation.
Feedback process: An open feedback loop to reflect upon the impact of the chosen interventions which lead to a new docking phase due to the new situation created by those interventions. Instead of traditional Branding Co-creation branding is On demand. Participating, Messaging, Experienceing can be maintained through proper feedback loop. Very less chances of product failure because the product or Content ideas that customers already know (because it was their idea only).

Scope of Co-Creation
Co-creation is a form of marketing strategy or business strategy that emphasizes the generation and ongoing realization of mutual firm-customer value. It views markets as forums for firms and active customers to share, combine and renew each other's resources and capabilities to create value through new forms of interaction, service and learning mechanisms.

Line or category Co-Creation
Typically, customers (or users) have the most accurate and detailed knowledge about their need while manufacturers (or providers) have the most accurate and detailed knowledge about how best to solve these needs. Unfortunately, most new products fail to deliver on their objectives (Christensen 1997). Hence, marketing scholars and practitioners have duly devoted substantial attention toward improving this co-creation processes. Traditional marketing thought and practice largely views new product or category development as entire firm-based. A new perspective in which customers are active co-creators of the products they buy and use is currently challenging this established paradigm. Innovation co-creation practices are strongly growing in many organizations. For example, Swarovski invited designers and creative consumers from all over the world to engage in a watch design contest. More than 1,650 participants joined to showcase their talent and submit their designs. In total, they created over 2,000 different watches. The generated content served as basis for a book on watch trends.

BRAND CO-CREATION
Customer brand co-creation is defined as a collaborative activity in which customers actively contribute to the creation of brand identity and image as well as idea, information, product, service and experience offered under particular brand. This research seeks to explore brand co-creation as an innovative brand development approach and a unique experience for consumers. Participation of customers in brand co-creation leads to an increased level self-brand connection. This study has important managerial implications by demonstrating that during turbulent times, companies can reduce their expenses on new brand development projects as well as establish a strong connection between consumers and a brand before the brand is launched to the market. To date, brand
development has been studied from a limited perspective on "how to" design successful logos and brand names (Lehmann and Keller 2006; Christodoulides 2008). Representatives of the brand design research stream are traditionally considered mainly by consultants and managers as the active creators of a brand identity and image that would then be projected to consumers (Lowrey and Shum 2007; Henderson and Cote 1998). In contrast to new brand development outsourced to brand consultants and advertising agencies that cost hundreds of thousands of dollars (Keller and Lehmann 2006; Keller 2008), customer brand co-creation may become a valuable strategy as well as a unique and meaningful consumer brand experience (Prahalad 2004). It may ensure the successful launch of new brand due to the fact that it was originated by prospective customers, who envision new brand and became loyal to it from the start of its introduction to the market (Payne et al. 2008). Moreover, these enthusiasts of brand co-creation may spread positive word-of-mouth (WOM) and accelerate the speed of brand growth. Scholars paid limited attention to the option of customers being active participants in brand development. Few studies that considered brand co-creation described the successful stories of service co-creation (Boyle 2007) and car share experience (Payne et al. 2008).

KEY FINDINGS

A substantial portion of the research was concerned about trends emerged in the past decade involving consumer co-creation. In marketing research, yet there is a dearth of studies exploring how companies are involving ordinary customers in their innovation process (Hoyer et al., 2010). Existing marketing and innovation studies on Co creation focus on customer relationship management and ignore new product development (Hoyer et al., 2010), with a few exceptions (Prügl and Schreier, 2006; Rowley et al., 2007; Füller and Matzler, 2007; Kohler et al., 2009; Kristensson and Magnusson, 2010; Füller et al., 2011). There is a research gap exists concerning the mutual interests and roles of an organization as well as a customer, the simple process that we may follow to go from theory to practice at any size of organization, the impact of this value creation feature on new product-related outcomes like brand extension, line extension etc. This paper is one of the pioneering studies to explore consumer “co-creation” within a framework of developing co-creation process in the context of introducing an extension and introducing a new brand as well.
**PRACTICAL IMPLICATION**

The paper highlights the need to reconsider the role of consumers in the co-creation process and identifies various gaps in the knowledge of brands and their management that have become apparent because of the changing market environment.

Source: personal work
No longer can marketers afford to rely on the untested assumption that may increases in customer satisfaction and share will translate automatically into higher financial performance. This dilemma suggests a reformulation of the marketing discipline as about developing and managing intangible assets – customer and channel relationships and brands – to maximize economic value. We call this value-based marketing. This view of marketing is theoretically appealing and also places marketing activities in a pivotal role in the strategy formulation process. Marketing strategy lies at the heart of value creation. It is the platform on which are based growth, profitability and return on investment. Marketing strategy defines the choices about which customers the business will serve and how it will create customer preference. By targeting appropriate markets and creating a differential advantage the firm gains the opportunity to grow and create the margin spread that is the basis for value creation. Finally social implications are so important. We support the call for the value-based marketing by emphasizing and redefining the role of customers as co creators.

CONCLUSIONS

In today’s highly competitive marketplace, a growing number of firms are placing increased reliance upon innovation as a means of achieving growth and profitability. Unfortunately, most new products fail because they do not adequately satisfy customer wants or needs. Thus, as a means of minimizing market failure and enhancing financial performance, an increasing number of firms are empowering customers and allowing them to actively participate in the product or brand category extension process. As we have shown, this customer empowerment can take a number of distinct forms. Although co-creation types has its own potential benefits and challenges, they all lie outside the boundary of traditional worldview, and hence, are contributing to the emergence of an exciting new paradigm. Thus, firms should look beyond the confines of their traditional extension approaches and develop effective strategies for identifying and harnessing the ideas, skills and talents of their customers. Moreover in today’s turbulent environment, continuous improvement and effective design & change have become requirements for all organizations. As a result, designing and managing organizational change has been a frequently studied topic over the last decade. Yet, literature suggests that about 70% of all change initiatives fail (Beer & Nohria, 2000), clearly indicating despite the wealth of methodologies and guidelines for change that are available today, we still know less than we should. The study points to the critical role of creating visibility for change as well as the importance of the infrastructure supporting changes. It is ascertain that the findings support the need for degree of freedom and adjusts to mistakes that explicitly consider the role of marketing departments in new product development and changes. We hope this typology and research agenda fosters greater appreciation for and investigation into this important phenomenon.
FUTURE RESEARCH

In the area of globalization, the marketing activities of companies need to have a global orientation. If it is not done, the customers of certain countries would be alienated and they would not be amenable to using the company’s products. These may require some degree of customization. Researchers may work on co-creation while customization.

The Future of Entrepreneurship

INNOVATIVE STARTUPS, THE IMPACT OF FOUNDERS’ CHARACTERISTICS ON THE EARLY STAGE: A CLUSTER ANALYSIS

Pepponi, Federica1; Pisoni, Alessia2; Onetti, Alberto2
1CrESIT – Research Centre for Innovation and Life Science Management, University of Insubria, Italy
2Department of Economics, University of Insubria, Italy

ABSTRACT
The paper aims at analyzing the process of startup creation at its very early stage, investigating the connection between the distinctive traits of the entrepreneurs and the arising profiles of the new ventures. In order to do so, we performed a cluster analysis on a sample of Italian innovative startups and their founders. The peculiar features that are statistically significant for the clusterization provide useful information on the initial phases of the innovative venture creation. The results of our exploratory study yield valuable knowledge on the Italian context. Findings suggest that some specific traits of the entrepreneurial profile of the new venture (mainly educational background and previous experience), may have an initial imprinting effect on its firm profile and, hence, its likelihood to grow and to be successful.

Keywords: new venture/startup, entrepreneurial profile, founders, founding team/early founding team/new venture team, fundraising.

INTRODUCTION
The positive impact that new venture creation has on economic growth, innovation and job creation has been proved (Audretsch, 2003). Entrepreneurs are responsible for the economic development through the introduction of innovative ideas, in terms of products, processes, markets and organization. In order to reach this goal an entrepreneur must be able to successfully implement these innovations, which means to satisfy a (new) customer and thus, across job supply, providing economic growth. As stressed by Cuervo, Ribeiro and Roig (2010), the competitiveness of a country’s firms, which determines the creation of its wealth and dynamism, relies fundamentally on the capabilities of its entrepreneurs and managers. As reported by Reynolds (2004), the junction or “choice point” in which an individual decides to get into the startup process is influenced by three groups of variables, those related to individuals, their characteristics and personal background, to their motivations and cognitive features, and finally to the context or environment in which the process takes place. From each of these variables depends the output of the process that is the
possibility that the firm is born, develops and grows, or that it ceases. Therefore, creating a new firm is not so simple. It takes different abilities, knowledge and skills, whose impact on the process may depend on the stage of its development (Klotz et al., 2014). For this reason, and given the relevance of the phenomenon of new venture creation, this paper attempts to shed new light on the role played by the characteristics of the entrepreneur(s) in the very early stage of the above mentioned startup process. Thus, we think that the proposed cluster analysis may help in providing useful information on the process of new ventures creation. The study is focused on a specific national context, Italy.

The paper is structured in 4 sections. Section 1 provides a comprehensively review of the literature on entrepreneurial characteristics affecting the startup process. On the basis of the theoretical framework previously described, section 2 presents the research design and the methodology. Section 3 describes the analytical procedure and cluster profiles. Section 4 discusses findings, provides concluding remarks and future research implications.

LITERATURE REVIEW: THE ENTREPRENEURIAL PROFILE AND THE STARTUP PROCESS

In prevailing literature, entrepreneurship is often linked to the discovery and exploitation of profit opportunities (March, 1991). Anyway, as noted by Freeman (1982), firms do not arise spontaneously from opportunities in the absence of human action, but instead are founded through the exploitation of organizational efforts made by individuals. This is consistent with more recent literature on the so called “personality approach/perspective” on opportunity identification, i.e. an individual’s unique personality is assumed as the key driving force for entrepreneurial activity. Many authors distinguish entrepreneurs from other individuals by looking for particular cognitive traits, such as risk propensity, need for achievement and self-confidence (Brockhaus, 1980) in order to detect the individual traits that delineate the successful entrepreneur (Timmons and Spinelli, 1994). In particular, two factors are strongly related to the ability to identify new business opportunities: entrepreneurial alertness, i.e. a unique attitude to sense environmental variations and recognize related opportunities (Kirzner, 1978) and prior knowledge and experience (Shane, 2000). Aldrich and Zimmer (1986) pointed out that a more comprehensive explanation for new firm creation would be that of specifying how individual experience impacts the likelihood that people will found firms. Individual’s prior knowledge and experience could be considered both as arising from work experience (Cooper et al., 1994), as well as from education (Gimeno et al., 1997). An organic attempt to systematize the field of study of entrepreneurship was made by the Entrepreneurship Research Consortium (ERC). The ERC demonstrated that for developing a representative portrait of entrepreneurial activity, individuals should be studied in real time, while involved in the startup process (Gartner et al., 2004). In doing so,
they classified the main variables affecting new venture creation. The first group of variables relates to
the individual’s personal characteristics, such as: age, gender, race and ethnicity, region of residence,
household structure, personal background (i.e. educational background, work experience and
functional expertise). The second group is related to the entrepreneur’s cognitive features, i.e.
motivational drivers that lead an individual to choose the entrepreneurial career rather than others. As
pointed out by Shaver (1985), reasons for getting into a business (or not) matter, because they are
generally considered as the basis of intentions.

Even though prevailing literature on entrepreneurship seems to be concentrated on the role of the
individual entrepreneur, today new innovative firms are more likely to be founded by teams rather
than individuals (Gartner et al., 1994; Beckman, 2006). To this regard, Cooper and Daily (1997) found
that successful high-growth firms are usually built around a team. Further studies reported that team-
founded firms have higher success rates, if compared to firms started by single founders (Ensley et al.,
2006). In particular, scholars have increasingly recognized the role played by founding teams/early
founding teams/new venture teams (NVT) (Ucbasaran et al., 2003; Klotz et al., 2014) in shaping the
new venture in its early stages of development and growth. Research on NVTs has focused mainly on
the impact that factors such as team members’ basic demographic features, team composition, team
members’ networks, have on new venture performance. Insofar, studies on NVTs analyze how
experience (education background, specialization and functional experience) of team members
positively affect firm performance (Beckman, 2006). Furthermore, the relationship between NVT
composition, i.e. heterogeneity vs. homogeneity (educational background, age, diversity of views and
skills of each team member), and firm performance despite being in-depth investigated still remains
an open/controversial issue (Hmieleski and Ensley, 2007). Social capital and business network are
other important NVT input variables. Furthermore, Wright, Hmieleski, Siegel and Ensley (2007) assert
that there is a lack of knowledge regarding how individuals and teams impact the effectiveness
through which innovative ventures are created and subsequently grown. They also underline the
central role played by individuals and teams in the development and growth of technology-based
ventures. This is why studying the formation of startup companies means analyzing the
characteristics of their founders and how these features affect the output of the entrepreneurial
process, i.e. the “initial imprinting effect of NVT” (Klotz et al., 2014).

Gaps identified and research focus

There are not many empirical/qualitative updated works related to the analysis on the characteristics
of Italian startups and their founders, although this topic is of primary importance to understand the
startup process. The novelty of this work is, thus, represented by the exploration of a population on
which we have no great prior knowledge, in a significant, yet peculiar, phase of its life. Under this
perspective, our work differentiates itself from other studies (Grandi and Grimaldi, 2003; Colombo et al., 2004; Colombo and Grilli, 2010; Colombo and Piva, 2012) mainly because of the analysis performed (no previous cluster analysis on the population of Italian startup/NVT) and the target population (focus on a very early stage). In our analysis we try to collect knowledge on startups’ characteristics during the very first steps of their lives, and not ex post. As reported by Foo, Wong and Ong (2005), we know little about early phases of teams engaged in new venture activities and how variables as human capital affect team outcomes. The broad majority of researches on this matter are often performed when the venture has already successfully formed. One major challenge of studying early entrepreneurship in the Italian scenario is, as reported by Colombo and Piva (2012), to find complete information and univocal estimates on the Italian population of new innovative ventures. This is due to the fact that most individuals who are defined as “self-employed” by official statistics actually are salaried workers with atypical employment contracts. On the basis of official data, such individuals cannot be distinguished from entrepreneurs that create new ventures (Colombo and Grilli, 2005). The relevance of this work is represented by the exploration of a population that has so far been little studied, because of the already mentioned difficulties, and is in a peculiar instant of its life. For these reasons it is so important to look at startups even when they are not yet fully incorporated or operative, to better figure out how they evolve and what are the characteristics driving this evolution.

**RESEARCH DESIGN AND METHODOLOGY**

The core of this study is to explore the characteristics of Italian startups and of their founders, as a team and as individual entrepreneurs, as these topics appear to be the most critical factors both in the startup process and for company development and growth (Ucbasaran et al., 2003). We also focus on factors enhancing the development of the business idea and on team formation, analyzing factors that refer to the startup as a whole (“company specific factors”) as well as to single individuals composing the entrepreneurial team (“human capital”). In our work we combine data profiling the new ventures with the aggregation at team level of the individual characteristics of team members (i.e. entrepreneurs). Throughout this union we aim at identifying consistent clusters and the features that are significant for clusterization. In doing so we used dummy and categorical ordinal variables and we classified them using hierarchical cluster analysis. We run the classification following a post-hoc or no a priori technique, whose purpose is to define groups according to the data, as explained by Wedel and Kamakura (2002). In order to perform our analysis we chose the method of cluster analysis, since it “…can provide very rich descriptions of configurations without overspecifying the model” (1996, p. 442). As measure of proximity we use the squared Euclidean distance, and the hierarchical method is used to approach the analysis. Since we aim at producing an exploratory classification of observations,
taking into account that neither the clustering variables nor the number and nature of the resultant groups are strictly linked to deductive theory, the chosen method to identify clustering variables is the inductive one. In fact, as suggested by Ketchen and Shook (1996), we tried to consider as many variables as possible because it was not foreseeable what variables differentiate among observations. Moreover, as reported by Punj and Stewart (1983), there are no clear guidelines to determine the boundaries of clusters. Therefore, the use of many clustering variables is expected to maximize the likelihood of discovering meaningful differences. Due to the fact that our sample of data does not contain outliers, we decided not to use variables standardization. After transforming non-ordinal categorical variables into dummy variables, we needed to correct multicollinearity of data by reducing from to 1 the possible modalities that the variable can assume. We also performed several tests to assess that this operation does not compromise the quality of the information provided.

To perform our analysis we chose a hierarchical algorithm that is the Ward’s method (Ward, 1963). As stressed by Ketchen and Shook (1996), Ward’s method is best suited for studies that present two characteristics: (i) the number of observations in each cluster are expected to be approximately equal; (ii) there are no outliers. Within our data set, it assigns observations with similar entrepreneurial and firm characteristics into progressively larger endogenously determined clusters. For determining the number of clusters in a data set, with regard to hierarchical methods, we followed the basic procedure as explained by Ketchen and Shook (1996). In order to evaluate the reliability of the obtained results we performed cluster analysis multiple times, changing algorithms and methods. In this way reliability is indicated by the degree of consistency in solutions (Ketchen and Shook, 1996).

Sample description

The final sample is composed of 107 Italian innovative startups and 254 entrepreneurs, spread into the different founding teams. Data were collected by the Mind the Bridge Foundation (MTB), a non-profit (501 c3) corporation based in San Francisco, through its business plan competition thought to scout new business projects with a strong commitment to innovation and marked ambitions of growth. As stated by Foo, Wong and Ong (2005), using data of participants of a business plan competition can be quite useful and relevant (i.e.: identify teams engaged in the early stages of the entrepreneurial process; scout firms and founders characteristics and perform longitudinal studies, monitoring the phenomenon in a specific area or region). The questionnaire submitted to the founders of the startups participating to the MTB Business Plan Competition was designed by MTB-CrESIT (Research Centre for Innovation and Life Science Management of Insubria University). More specifically, data gathered contains information on the new venture, such as the year of incorporation and place of establishment,
sector, number of founders, business description and available market data, company investment profile (capital raised and investors typology). Moreover, demographic information on the founders and management’s team are collected, such as date and place of birth, gender, education path, role played in the new venture, prior working experiences and prior entrepreneurial experience. Answers were on a voluntary basis and respondents could complete the questionnaire from June to July 2012. A small part of the received applications were discarded as being partially incomplete.

FINDINGS: ANALYTICAL PROCEDURE AND CLUSTER PROFILES

The analytical procedure we performed consisted of three main stages: identification of the number of clusters, assignation of observations to clusters, assessment of the stability of cluster’s solution (Stock and Zacharias, 2011). The findings of our analysis consist of three clusters, each one with its own characterization, and a set of variables which turned out to be significant for clusterization. The identification of the number of clusters was made using the dendrogram, as there were no significant jumps in the agglomeration coefficients. After the identification of the number of clusters by using the Ward linkage, the 107 firms of the sample are assigned into the three groups. The following table 1 summarizes the cluster distribution of variables, included in the research model, as a percentage of the total.

The level of significance of each variable is verified through a Chi-Square test. To calculate Chi-Square ($\chi^2$), we used a cross-tabulation which shows the frequencies of joint occurrences between variables. We tested the significance using $\alpha = 0.05$. There are five variables that are significant for the clusterization ($p$-value < 0.05), which are the following: (i) the startup has been funded ($\chi^2 = 28.08; df^1 2; p$-value 0.000); (ii) the amount of capital raised to date ($\chi^2 = 85.979; df 14; p$-value 0.000); (iii) at least one co-founder has one previous job experience ($\chi^2 = 17.942; df 2; p$-value 0.000); (iv) average number of previous work experiences, as an aggregate of the team ($\chi^2 = 35.344; df 4; p$-value 0.000); (v) average years of previous job experience, as an aggregate of the team ($\chi^2 = 52.584; df 12; p$-value 0.000).

According to the distinctive features characterizing the identified clusters, we titled: Cluster 1: Techno entrepreneurs - 1st generation startups; Cluster 2: Employees turned entrepreneurs - Born into crisis startups; Cluster 3: Proven entrepreneurs - Scalable startups.

**DISCUSSION AND CONCLUSION**

*Cluster 1: Techno entrepreneurs - 1st generation startups*

“Techno entrepreneurs” are young entrepreneurs with a prevailing technical background and no prior job experience. In the majority of cases techno-startuppers are young adults whose first job experience is represented by the creation of a startup. In other cases, they are research fellows with a technical profile. Some of the latter declare previous entrepreneurial experience, although more likely via academic spin-offs rather than startups per se. The companies created by techno-startuppers (that we define as “1st generation startups”) raise funds mainly from co-founders (57%). The average amount of
capital received is quite small, comprised between 1 and 10 thousand Euros (38%). Some peculiar traits of these founders may explain why these startups raise limited funding. These include weak managerial background and almost no prior work experience that may compromise their ability in attracting more structured sources of funding. The founding teams are pretty lean (24% of the startups included in this cluster are one-man bands, i.e. only one founder). These ventures operate mainly in high-tech fields. Not surprisingly, the inspirational source of their business idea is represented primarily (62%) by the educational path undertaken by the co-founders, which is also responsible for their team formation often at an academic institution.

Cluster 2: Employees turned entrepreneurs - Born into crisis startups

Founding teams within this group are formed by individuals who mainly come from more conventional job positions. In fact, as reported by recent studies published by Italian Chambers of Commerce, with the advent of the financial crisis a lot of people who lost or were unsatisfied with their jobs reinvented themselves into startuppers (a sort of “career pivoting”). This explains why among these teams we find individuals with a high level of job experience and long employment tenure. For these reasons we decided to label them as “Employees turned Entrepreneurs”. Individual achievement in many cases acts as a trigger in the decision of such individuals to become entrepreneurs. Thus, the need for independence and for self-recognition may turn into a strong push to become self-employed (Johnson et al., 2004). The companies created by these employees-turned-startuppers are what we define “Born into crisis startups”. Within this cluster, startups show a limited ability to raise capital (only 44% of them received external funds). The co-founders background is responsible for the low entrepreneurial attitude characterizing these startups. The prior work environment plays a critical role in this group, being the main source of inspiration of the business idea. Note that in 20% of the teams there is at least one female co-founder.

Cluster 3: Proven entrepreneurs - Scalable startups

Proven entrepreneurs are highly educated and experienced. This group is characterized by the highest level of education: 13% of the founders have a Ph.D. and almost one out of ten a MBA. They have strong managerial background (more than half of them have a degree in Business Administration) and are quite experienced. Almost all of them present prior job experience and 38% a previous entrepreneurial experience. Such percentage may look a little small. In fact, we believe that teams involved in these startups are driven and motivated by a precise and structured entrepreneurial idea, which explains why they are so good at fundraising. Furthermore, these founding teams present a broad international experience, as 31% of the co-founders had at least one job experience abroad and 25% attained a degree in a foreign university. The work environment (50%) represents the most
common place for future co-founders first meeting. This could mean that after they met and developed the business idea, which has quite varied origins, into an effective business model (Onetti et al., 2012; Onetti and Zucchella, 2014), they decided to become full-time entrepreneurs. Co-founders are characterized by different sources of specific knowledge, performing a good balance between technical and managerial skills. This seems to be a successful ingredient for the exploitation of the business idea. Evidence of this success is provided by the high amount of funds raised by these startups. Thus, we called the founders of such startups “Proven Entrepreneurs”. We define the companies that originated by these teams as “Scalable Startups”, since these ventures have greater efficacy in raising capital and, therefore, higher chances to succeed. All of them were successful at fundraising, and more than 30% raised more than 200 thousand Euros (50% more than 100 thousand Euros). They were able to attract funds from structured sources such as seed funds, foundations, accelerators and venture capitalists. Teams tend to be larger (22% of them are composed of more than four founders).

According to these clusters, some general considerations emerge. The degree of fundraising is significantly different. The first cluster displays scarce variety among the sources of funding and a limited ability to obtain medium-high amounts of capital. The second group shows limited abilities to raise capital: small percentage of firms with little funding. The third cluster, instead, presents an outstanding ability in raising money. The level of job experience of the founders is also fairly varied. The first cluster has a low level of experience at the aggregate level, both in terms of number of previous jobs and years of employment. The second group includes a sample of firms whose founders show a high level of work experience. The third cluster displays a good level of job experience and a stronger international attitude. These results are supported by literature. In fact, Shane and Khurana (2003) affirm that differences in career experience lead to differences in evaluations, by potential entrepreneurs themselves and by others, of an entrepreneur’s ability to: (i) access resources that help entrepreneurs in starting organizations; (ii) adapt to the role of the entrepreneur; (iii) continuously adapt the business model to market needs/changes.

Therefore, previous work experience is key in both venture creation and fundraising. First of all, Haveman and Cohen (1994) argue that individual’s career experiences have an impact on firms foundings. Furthermore, Shane and Khurana (2003) stress out that one of founders’ harder task is to convince others to reallocate resources in non-traditional ways. They state that if individuals are successful in their prior careers, they will be more likely able to convince not only potential investors, but also employees and other stakeholders. Hence, prior experience and career is positively related to the ability of obtaining resources. Shane and Cable (2002) provide evidence that experience is positively related to the ability of obtaining resources. For instance, they show that prior
entrepreneurial experience is an important predictor of the ability to obtain funds for a new venture. We have also seen that to be relevant for the final output are the characteristics of the entrepreneurial team as a whole. Indeed, today at the helm of innovative firms it is more likely to find NVT rather than one-man bands.

We believe these results to be very interesting, as they remark how work and international experience are crucial success factors for startups at the very early stage, as those participating to a business plan competition. In fact, these features are strong enablers of fundraising, which happens to be vital at this particular time, allowing startups to get off the ground and consequently grow. Then, our findings support the argument, inspired by competence-based theories, that founders’ capabilities and knowledge are a driver for startups growth. Innovative firms founded by individuals who have a higher level of work experience exhibit superior growth, with all else equal (Colombo and Grilli, 2005). Moreover, Colombo and Grilli (2005) asserted that startups established by such individuals are more likely to obtain external private equity financing, which of course has a sizeable positive effect on growth. The latter relationship is clearly visible in our results as well. Founders of firm belonging to cluster 3, in fact, present qualified international working experiences, so contributing to their startups’ ability to attract huge amount of funds from various sources.

With regard to further research, we identified two directions that, in our opinion, appear to be especially promising. First of all, recent studies (Klotz et al., 2014) suggest to examine how the characteristics of the firm are influenced by the stage of team development. For instance, firms and teams features may differ from the idea evolution phase to the exploitation phase. From the results presented in this work, it seems clear what are the team characteristics driving the startup evolution at a very early stage. Further analysis could highlight how those features may differ when the company reaches a later stage of development and fundraising is no longer the primary need. In addition, a cross-country analysis should be performed to better understand the positioning of the Italian startup ecosystem, and to allow to overcome the country specificities of the sample that lead to results that are not fully generalizable. Since accounting for the role of individuals in the startup process is critical for advancing theory, a cross-country comparison of sample of entrepreneurs/new venture teams may represent stimulating challenges for future research.

FINANCIAL RISK ANALYSIS OF PORTUGUESE TEXTILE AND TOURISM COMPANIES

ABSTRACT
Textile and tourism sectors are two important industries in the Portuguese economy. However, its high exposure to both internal and international economic volatility make the companies operating in these economic sectors particularly vulnerable to economic crises, such as the ones which have been impacting Portugal and the European Union.
The objective of this paper is to evaluate and understand the impact of size and age on the financial health of textile and tourism companies, measured by economic indices.
An empirical based model is proposed. Its implications are derived and tested on a sample of 4061 Portuguese companies from textile and tourism sectors, during the period 2005-2009.
The findings suggest that age has a major impact on the risk of failure, rather than size. Whereas the effect of age is generally positive regarding the financial health of the company, the effect of size is less clear and ultimately depends on the age of the company.

Keywords: Age, size, business failure, textile and tourism industries.

INTRODUCTION
Although the first empirical studies of bankruptcy prediction have been developed around the thirties by Fitzpatrick (1932) and Smith and Winakor (1935), the topic gained a new visibility and new academic relevance in the sixties, with the researches of Beaver (1966) and Altman (1968). Since then a growing number of researchers has investigated on this topic.
At a time when the national and international scene is marked by an economic and financial crisis, and in times of market downturn and economic difficulties, to understand why some companies fail and others don’t, is a topic of extreme interest. The economic consequence of company’s failure is enormous, especially for employees, investors and creditors.
During the last four decades a growing number of researches came up with formulas to predict the bankruptcy of a company. The set of predictive variables proposes on the studies is considerably
heterogeneous. Age and size are two variables well investigated, however previews research is not clear about how age and size affects business failure, especially we do not know how these models perform when tested with Portuguese companies.

The objective of this paper is to evaluate and understand the impact of size and age on the financial health of textile and tourism companies, measured by economic indices, and therefore also evaluates their risk of failure. Its implications are derived and tested on a sample of 4061 Portuguese companies from textile and tourism sector.

LITERATURE REVIEW

It can be said that in all these decades of empirical research on bankruptcy prediction failed to produce agreement on which variables are good predictors and why. (Hol et al., 2002) However, in all those models mentioned above, there are several works that, through different perspectives consider size, age and sector as key variables to explain the probability of failure and growing businesses.

Some studies have concluded that the size is negatively correlated with the probability of failure (Thompson, 1976; Altman et al. 1977; Ohlson, 1980; Evans, 1987; Hall, 1987; Chen and Lee, 1993; Audretsch and Mahmood 1995; Cummins et al. 1995 or Turetsky and McEwen, 2001).

Chen and Wong (2004) reported that one of the main factors which significantly affect the financial health of companies is its size. Honjo (2000) used a proportional hazards model to show that software companies with an important size are less likely to fail. Turetsky and McEwen (2001) argue that large firms are expected to have better risk management. For Berger and Udell (1995), the oldest the company is, the lower are costs of external financing. In the same sense, Holmes et al. (1994 ) mention that smaller companies often have more limited access to financing and a greater financial cost. Mazzi (2011) reported that family firms are, in general, significantly younger than nonfamily firms. Similar finding was obtained by Villalonga and Amit (2006), Lee (2006) and Miller et al. (2007).

Serrano et al. (2005) argue that small firms are more likely to fail than large enterprises. The authors added that the ratios depend on the size of the company, but the way it does it, varies over different countries. Buehler et al. (2006) found that the percentage of companies that fail decrease with age.

In the literature on corporate risk there are also authors who use size as an explanatory variable in their models of business failure prediction (Ohlson , 1980; Peel et al. , 1986; Peel and Peel , 1988 or López et al., 1998).

The results obtained by Audretsch and Mahmood (1995) suggest that exposure to the risk of new firms tend to be larger in highly innovative sectors. These authors argue that new firms can reduce the risk of failure by increasing their size, indicating that the structure of ownership and size of young companies have influence on the probability of survival. Audretsch (2001 ) finds that young companies do not
have economies of scale. He also states that some companies manage to successfully grow and others remain small and ultimately may have to exit the market.

On the subject we also highlight the contributions of Fariñas and Moreno (2000) and Calvo and García (2006). Using a sample of Spanish companies Fariñas and Moreno (2000) concluded that the failure of firms declines with age and size. Calvo and García (2006) carried out an empirical study to analyze the structure of financial risk the Spanish industry in the period 1997-2001, analyzing the impact of the size and age of the company. The findings of the will towards the existence of an inverse relationship between the size and age of the company and its financial risk. Concerning the impact that causes the size and age of the company on risk variables analyzed, these authors concluded that the size factor is more relevant than the ability to return the ancient debt and economic profitability of the company, and a higher incidence in antiquity capitalization and financial stability of the companies.

**METODOLOGY**

*Selection of the sample*

To develop this study, we used the information of the annual accounts (balance sheet and income statement) collected from the SABI database. The sample comprises 4061 companies from sectors of textile and tourism. The information collected refers to the year 2005-2009.

*Variables*

The variables are the size and age. The variable age measures the time in years since the constitution of the company till the year of 2009. This variable is categorized in three categories: less than 5 years, between 5 and 15 years and more than 15 years.

For the size of the companies we follow the Commission Recommendation 96/280/EC of 3 April 1996, considering four categories. The size of the company is measured also in an ordinal scale: micro companies, small companies, medium companies and large companies. However, due to the inexistence of large companies with less than 5 years, and the relative very low frequency of large companies in the sample, the analysis was performed excluding those companies. Hence only three categories for size were considered in the analysis.

Five continuous indices were collected to measure the financial health of the company. These five variables have a great power to discriminate and classify the financial state and the risk of failure of the company according to Calvo and García (2006).

These indices are:

\[ X_1 = \frac{\text{Net profit} + \text{Depreciation expense} + \text{Provisions}}{\text{Liabilities}}; \]

\[ X_2 = \frac{\text{Current assets} - \text{Current Liabilities}}{\text{Total assets}}; \]

\[ X_3 = \frac{\text{Equity}}{\text{Total assets}}; \]

The Future of Entrepreneurship
X4 = Operating profit (or loss) / Total assets.

Statistical Analysis

Since there are four metric dependent variables (the four indices) and two ordinal predictor variables (size and age), the first goal is to evaluate the significance of the differences across groups defined by the predictor variables, to be able to conclude the significance of the impact of at least one of the predictor variables (size or age) on the indices measured.

Univariate analysis of variance (ANOVA) is a statistical technique that is used to determine whether samples are drawn from populations with equal means, so it is the adequate statistical instrument to evaluate the impact of predictors on each of the five dependent variables separately. This approach has the disadvantage of ignoring the possibly correlation between the dependent variables, and so a significant or nonsignificant ANOVA may be identified erroneously.

When one wants to simultaneously explore the relationship between several categorical independent variables and two or more continuous dependent variables, the statistical technique recommended is the multivariate analysis of variance (MANOVA), which is an extension of ANOVA. MANOVA procedure optimally combines the multiple dependent variables into a single value that maximizes the differences across groups, assessing how the dependent variables differ as a whole across the categories of the independent ones. Only after a significant MANOVA individual ANOVAs are performed to evaluate the impact of predictors on each of the dependent variables.

Therefore, MANOVA seems to be the adequate procedure as a starting point of the present study, as MANOVA can detect differences among the dependent variables, even when univariate tests show no differences. If a significant difference is achieved, separate ANOVAs can be employed to address the individual differences for each dependent variable.

Before applying these statistical procedures, it is important to check the presence of outliers. ANOVA and MANOVA are especially sensitive to outliers and their effect on Type I error.

The assumption of univariate normality in case of ANOVA or multivariate normality in case of MANOVA must be also checked. As in ANOVA, MANOVA tests are believed to be robust against violations of multinormality when the individual group sizes are large enough, which means that the impact on the final results are negligible. Monte Carlo studies (Mardia 1971; Olson 1974) show that departures from multivariate normality of MANOVA test statistics may reduce statistical power, but generally with only small effects on the type I error.

The next issue to be addressed is the equality levels of variance (in the case of one dependent variable, ANOVA) or equality of the covariance matrices (in the case of multiple dependent variables, MANOVA) across the groups, so that the variance (ANOVA) or the covariance matrices (MANOVA)
for each group, are not concentrated in only a limited range of the categories of the predictor variables. If unequal variance/covariance across groups is present, the standard errors are affected and consequently the results of the tests. The effect of this is more severe when the sample size of the groups are small or very different.

In the present study some extreme points for each group were identified and eliminated prior to the analysis. The assumption that the data on each group conforms to a multivariate normal was checked and found to be violated. The same happens with the univariate normality distributions. The equality of the covariance matrices is also not met, nor the equality of variances for each of the dependent variables.

With these obstacles it is advisable to perform alternative procedures.

A nonparametric method, based on permutation tests, permutational MANOVA (McArdle, 2001; Anderson, 2001) was performed. For the permutational MANOVA (Anderson, 2001) the test statistic is a multivariate analogue to Fisher’s F-ratio. The p-values are estimated using permutations. Under a true null hypothesis, the groups of multivariate observations can be exchangeable. Thus, permutations are performed to achieve new values for the statistic, giving the entire distribution of the statistic under a true null hypothesis.

This test is a test for differences in location among groups of multivariate observations. The test requires that the observations are independent and that they have similar distributions. It does not require the assumption of multivariate normality as MANOVA does. However, this test (as the parametric one) is sensitive to heterogeneity of variances. This means that a significant difference among groups may be due to differences in dispersion and/or differences in location. Although the statistic sensitivity to differences in variances among groups, it takes no account on the covariances among variables, as the parametric MANOVA (which assumes not only the equality of the variances but also that the covariances of the variables do not differ across groups) (Anderson, 2001). Hence, this test is less demanding concerning assumptions than the parametric MANOVA. The test was performed resorting on the vegan R package (R, 2011; Oksanen et al, 2013).

The results achieved by the permutational MANOVA are resumed in table 1.

Table 1. *Permutational MANOVA*
The interaction term represents the joint effect on the dependent variables of the two predictors, size and age. If the interaction is nonsignificant the effects of the factors are independent, which means that the effect of one factor is the same for each level of the other factor and the main effects can be interpreted directly. The result (p=0.009) points to the existence of strong evidence of interaction between size and age. Hence, the main effects of size and age must be interpreted with caution. Those main effects show that the variable age shows a little stronger impact than size over the dependent variables.

A parametric MANOVA was also performed (table 2), despite the unmet assumptions, to compare to the results obtained by the permutational MANOVA. The results show moderate to strong evidence of interaction, confirming the findings already obtained with the permutational MANOVA. Concerning the main effects, the outcome points to a nonsignificant result concerning size, and reinforces the strong effect of age (table 2) achieved by the preceding test.

Table 2. MANOVA

As both MANOVAs show significant results, the study of the impact of size and age on each of the four dependent variables is required. As the sampled populations have distributions away from normality and do not have similar variances, four permutational ANOVAs and four two-way ANOVAs were undertaken and compared. Moreover, the results were also reported by a robust alternative to the sample mean and median for estimating the location (Huber’s M-estimator) for each of the dependent variables.

Table 3 displays the results obtained by the parametric and permutational ANOVAs with both main and interaction effects.
Only variable X1 show no evidence of interaction between size and age. By checking the sum of squares and the p-values of each dependent variables, it is plain the bigger importance of age over size in explaining the financial risk of failure, except for variable X4, where size becomes significant (p = 0.007) for the permutational ANOVA. This result must be interpreted with caution, since this is also the variable that shows the stronger evidence of interaction.

The results are supported by Huber's M-estimator (Huber 2009) (table 4) for each group across each of the dependent variables. These results also reveal a direct association between age and the financial health of the companies (except for the impact on variable x4 of micro and small companies), which means that older companies have less risk of failure. This direct association is also found when analyzing the association between size and the dependent variables without controlling for age. However, when controlling for age, one achieve to different results (table 4). The interaction between age and size does not allow the interpretation of the impact of size alone, as interaction can confound the effect of size.

CONCLUSION

In the economic literature there are many studies to consider size and age as key variables to explain the probability of failure and growing businesses. The objective of this paper is to evaluate the impact of size and age on the financial health of textile and tourism companies, measured by economic indices. From empirical study we can draw the following conclusions.

Age has a stronger impact on the risk of failure than size. This result is not consistent with the obtained by Quirós and Lisboa (2014) and Pérez et al. (2004). However, due to the significant interaction effect present, the individual results must be controlled for the effects of the other predictor. Particularly, this is true concerning the effect of size.

The impact of size must be interpreted independently for each level of age. Whereas the effect of age is generally positive regarding the financial health of the company, the effect of size is less clear and depends on the age of the company.

Due to the inexistence of large companies with less than 5 years, and the relative very low frequency of large companies in the sample, the analysis was performed excluding those companies. To overcome this limitation, a larger sample will be used in a future research, in order to try to have a proxy sample of every industry.

RADICAL INNOVATION OF BUSINESS MODEL - IS BUSINESS MODELLING A KEY TO UNDERSTAND THE ESSENCE OF DOING BUSINESS?

Philipson, Sarah

University of Gävle & Linnaeus University, Sweden

ABSTRACT

‘Business model’ is a fairly new academic concept; competing with Porter’s ‘sustainable strategic competitiveness’ and ‘strategic fit’ (Porter, 1996), Prahalad & Bettis ‘dominant logic’ (Prahalad & Bettis, 1986) to give key explanatory understanding of firm performance.

We discuss business modelling based on an action research case and show just how fundamental it is. It links fundamental academic discussion of recent decades around concepts such as ‘sustainable competitive advantage’, ‘structural capital’ and ‘tacit knowledge’.

Keywords: business model, value, customer needs, competitive advantage, dominant logic, strategy.

BACKGROUND

Business Model is “…a system that solves the problem of identifying who is (or are) the customer(s), engaging with their needs, delivering satisfaction, and monetizing the value.” (Baden-Fuller & Haefliger, 2013).

The concept of business modelling is fairly new and has been discussed in academia the last twenty years (Bettis & Prahalad, 1995; Sawhney, 1999; Amit & Zott, 2001; Stähler, 2002/2013-08-05; Chesbrough & Rosenbloom, 2002; Osterwalder, 2004; Chesbrough & Schwartz, 2007; Andriopoulos & Lewis, 2009; Chesbrough, 2010; Doz & Kosonen, 2010; Mets, 2009; Teece, 2010; Yunus, Moingeon & Lehmann-Ortega, 2010; Teece, 2010 and Baden-Fuller & Haefliger, 2013). But in many ways it has similarities with the earlier concepts of dominant logic (Prahalad & Bettis, 1986; Bettis & Prahalad, 1995), and strategic fit (Porter, 1996). Business models are considered as part of the strategy subfield.

Acknowledgement. I am indebted to one of the anonymous reviewers of the 7th Annual Conference of the EuroMed Academy of Business. Confronting Contemporary Business Challenges through Management Innovation, Kristiansand, 18-19 September 2014, for invaluable comment on an earlier version of this paper, to Professor Emeritus Robert Desman, Mgt & Entrepreneurship at Kennesaw State University, Atlanta, Georgia.
and the most important journals in which the issue is discussed are the ‘Strategic Management Journal’ and ‘Long Range Planning’.

Both theoretically and practically there is a lack of studies: “The paucity of literature (both theoretical and practical) on the topic is remarkable, given the importance of business design, particularly in the context of innovation. The economics literature has failed to even flag the importance of the phenomenon, in part because of an implicit assumption that markets are perfect or very nearly so. The strategy and organizations literature has done little better. Like other interdisciplinary topics, business models are frequently mentioned but rarely analyzed…”, Teece (2010:192).

One reason may be that it draws from and integrates a variety of academic and functional disciplines, gaining prominence in none, Chesbrough & Rosenbloom (2002:533). And for practitioners Bettis & Prahalad (1995:7) suggest that their research suggested how difficult highly intelligent managers found thinking strategically about businesses with different characteristics or their own core business, when the industry structure changed significantly.

Hence, it is still valid to present and interpret practical examples in the form of cases of business modelling. We provide such a case based on our own action research.

THE CASE, ABB TRUCK SERVICE

Between 1982 and 1994 the author worked as a management consultant for the ABB group. In 1988 Bengt Svensson, then CEO of ABB Truck - a subsidiary of ABB - suggested that we should re-engineer the business rationale of the service division of the company. ABB Truck produced big electrical forklift trucks for the European car, food and roll-on/roll-off industry. They lifted between 1,2 and 7 ton. In the Swedish market the service business had some 225 service technicians and 75 middle managers and administators. The blue-collar workers’ union enthusiastically supported the project. ABB Truck Service was a business unit of ABB Truck AB, serving and repairing complicated machines at the customers’ sites.

The business was limited to the Swedish market, as the mother company; ABB Truck AB, only sold to the European market and did not have a large enough market share outside Sweden to motivate a repair and service business, which instead was done by the partners’ selling the machines.

METHOD

This case study is an example of action research, a set of different methodological approaches based on Dewey (1933), Lewin (1946) and Argyris (1993), all after Lüscher & Lewis (2008). The researcher was hired as project manager of a major change project in the company, a filial to Asea Brown Boveri, ABB. The reference group was the CEO of the company, the strategic business unit manager and the
chair of the blue-collar workers union. In the case I was not only a consultant with a specific task. I had worked with ABB Truck since 1985 (and with ABB since 1982) and had been working with organizational change in marketing, production, services, and made the specification for software to manage the short term rental fleet. During 8 months I was hired as regional general manager for sales and services, and negotiated a five-year rental contract (capital and service) with the Volvo Car Corporation for 500 machines. The expertise necessary for the re-engineering project was acquired by a large number of interviews and observation of all kind of employees in the SBU and through monthly dialogues in the reference group.

THE PURPOSE
The purpose was formulated to

1) **Radically improve the value** for the industrial customers. This was interpreted as halving the down-time of the machines.

2) **Radically reduce costs**, in order to be competitive in the long run – give value for money.

3) **Loyalise the service technicians** by a better work environment by empowerment, as *their tacit knowledge was key to competitiveness*. Their union was interested in ensuring the long-term competitiveness of the company, hence securing the jobs. This ensured their co-operation. As we intended to radically reduce the number of white-collar jobs, we did not expect to be able to co-operate with the white-collar union. “Johan S.”, the local chair of the blue-collar workers union, ”Metal”, was heavily involved both in the envision and realization of the system as a member of the reference group and a key dialogue partner.

Porter (1996) proposes that to make a competitive advantage sustainable it must be **embedded in the organisation** so that competitors cannot just imitate a few specific traits of the offering, they would have to imitate the whole organisation. To create such sustainable advantage we had to create new structural capital and **assure** that *the tacit knowledge of the workforce* did not leave at the end of the working day.

THE RE-ENGINEERING PROCESS
The process was conducted in seven distinct but overlapping phases:

1) Formulate a new business idea.

2) Innovating a new way of organizing the business,

3) Develop new systems supporting the new organization.

4) Develop new routines for how to use the new system.

5) Educating the work force in the new work methods, systems and routines.
6) Implementation of the new organization.
7) Rationalization to achieve the second goal.

A NEW BUSINESS MODEL

We started by building a vision for how the division would function seven years after the start of the project. The Service workers should become ‘virtual entrepreneurs’, ordering spare parts and reporting work done. Through portable computers, with mobile phones as modems the technician should access exploded blueprints on central server for searching solutions to the problems with the faulty machine. Then the technician would order spare parts over the computer. These were to be flown in, arriving at the customer’s site the next day. After repair the technician reported his work through the server. An invoice was automatically generated and sent to the customer. With a printer under the passenger seat of the service car the technician would give the customers small quotes. – Hence, an integrated workflow.

NEW CONCEPT FOR ORGANIZING THE BUSINESS; NEW WORKFLOW

The number of workshops was to be reduced, the technician at the customer’s site would do the lion’s share and only occasionally would a machine be brought in to the workshop. We would centralize the spare parts warehouse to enable overnight delivery from the nation’s principle airport; there would no longer be any spare parts administrators at local workshop. The new workflow was developed with detailed flow mapping and was discussed in a reference group including the CEO of ABB Truck, the union leader, the division manager and the division controller.

It meant that the structural capital of the company was increased, by the development of new systems and new routines. But the company also needed the tacit knowledge (Polyani, 1966) of the technicians; the ‘sticky’ solutions knowledge (von Hippel, 1994). In order to secure this tacit knowledge, we considered their loyalty as essential. We achieved this by empowering them; they were to become their own masters in all elements of the work that was not embedded in the structural capital. This can be seen as an example of “...business model are substantially more complex and more dynamic with two-sided business models...” (Baden-Fuller & Haefliger, 2013) [Our emphasis].

NEW SYSTEMS

A systems architecture was then specified that could uphold this vision. We specified a central server, an IBM AS400 machine, which hosted all manuals with construction designs that could be “exploded” down to the smallest level of detail. It also hosted the database of the spare parts warehouse.
The architecture for a client system for the technicians was designed. To actually make the necessary server and client software, a computer consultancy was engaged. Every step of the coding was verified and the researcher was the interface between business knowledge and information technology. Installed in a portable computer, the technicians were given access to the server through a dial-up connection over a mobile phone. They also had a small printer installed under the passenger seat of their car. At the time this was new technology. We did not invent this, but this, at the time new technology, enabled a radically re-invented business model.

The project work included

1) Functional specification of a new spare parts system.
2) Functional specification of technicians’ order and reporting system.
3) Project management of systematisation and programming done by outside computer consultants.

NEW ROUTINES

The implementation was not self-evident. A model routine was developed for the workers and leaders to learn what to make out of the system.

EDUCATING THE WORK FORCE

Together with the labour union’s representatives we educated the technicians in the use of the systems and the routines.

IMPLEMENTATION

The new spare parts centre was built near Arlanda, outside Stockholm. Personal computers, mobile phones, and printers were bought for 225 technicians. In 1992, four years after the project had started, all technicians had received education and the necessary equipment.

RATIONALIZATION

A major rationalization was that two-thirds of the 75 administrators were made redundant. Most of them were given pre-pension or other jobs in the ABB group. This rationalization of course influenced the future price of services, and hence the value for money offered to clients.
RESULTS

The downtime of customers' machines were reduced from 3 days to 1.5 day. Overhead was reduced from 75 to 25 employees. The change took 4 years, from 1988 to 1992. When the whole ABB Truck group was taken over by Cargotec some years later, they closed the whole company except the new way of operating the service business, giving it a value of 200 MUS $.

The most important effects where enhanced quality of service:

- The instant access to manuals reduced the time to find the defective detail and hence the time the machine was non-operational.
- The technician previously had ordered the spare part by phone from a local spare parts centre, where an administrator would manually identify if he had the part in stock. If not he had to order it from the factory. Often this entailed delays of three to four days. In the new organization the immediate order of spare-parts reduced the time to get the part, and hence the time the machine was non-operational. The missing part was sent by parcel post the same day from a centralized shipment centre close to Arlanda, the main Swedish airport, arriving at the client's site before noon the next day.
- The technicians where authorized to give the client minor quotes (up to some 1000 euros in present value), immediately printing the quote on his printer.
- The technician reported work time and spare parts used over the system, directly generating an invoice in the central server. Apart from being the most important rationalising element, it meant that the quality of the information of the invoice increased, passing information directly from the primary source to the invoice.

All this were only changes in the technological service support system, but all of them radically increased the quality of service, as well as decreasing the cost; hence the future price of the service.

The overall process can be viewed as a design process, where the service was engineered or re-engineered. This design has consequences for the technological support system, as well as for the actual service delivery system; both of the latter influencing the quality of service.

THEORETICAL INTERPRETATIONS

This case is an example of organizational innovation. "...new business models can themselves represent a form of innovation.", Teece (2010:176). To change the ‘dominant logic’ (Bettis & Prahalad, 1995; cf. also Levitt, 1960) in an industry, it is necessary to establish radical goals for the project. These goals are an example of what Prahalad (2006) calls the ‘innovation sandbox’, the challenging requirements for the project that is the necessary for radical innovation. You should "...start by identifying the core constraints that they must overcome to achieve a breakthrough innovation."
Prahalad (2006:3). To halve the downtime is different from incremental innovation based on gradual increase of effectiveness. The requirement to reduce the overhead more than 50% was also radical. Both requirements where inspired by the at the time current ‘T50’-projects (halve-the-time) running in the ABB group. Of course the demands were less radical than the examples Prahalad (2012) gives, of reducing the price for cataract surgery or a cooker for the Indian poor to 1/50th of the extant price. But it is still radical, as the theoretical limit of the machine down-time – by flying in spare-parts ‘à la minute’ – would be some 6 hours and to an exuberant, not sustainable cost. We had to base our change on standardised parcel post.

CUSTOMER NEEDS

“The chances of good design are greater if entrepreneurs and managers have a deep understanding of user needs...”, Teece (2010:190). The formulation of the principles of the organisational change, must be based on intimate knowledge of the customers’ needs, ”The starting point of the process was a detailed and in-depth understanding of the consumer...”, Prahalad (2012:7). Innovations are often ”...based on intuitive hunches rather than informed understanding...”, Margolin (1997:227). See also Prahalad (2010). “Rather than researching markets, they must immerse themselves in the lives of their target consumers.”, Prahalad (2006:7). The innovators that Prahalad (2012:7) studied used video-ethnography to identify not only what people say they need. Many researchers have identified this intimate knowledge as a key for successful innovation and competitiveness. The strategy researcher Porter (1990) identified ‘commitment to the target group’ [our emphasis] as a key antecedent to international competitiveness. This commitment permits the firm to gain an intimate knowledge of the customers. The entrepreneurship researcher von Hippel (1994) identified the ‘stickiness of needs information’ as a key issue for innovation, i.e. how to understand customers’ needs. Instead of ethnography von Hippel developed a method called the lead-user theory for how to learn these needs before the competitors, von Hippel (1986); Herstatt & von Hippel (1992); Urban, & von Hippel (1998); Olson & Bakke (2001); Liien et al. (2002); Lüthje & Herstatt (2004); Lettl et al. (2006), and Franke et al. (2006). These issues are discussed in many journals in different subfields, but the most important are ‘Management Science’, ‘The Journal of Product Innovation Management’, and ‘Design Studies’.

The reference group had an intimate knowledge of the business and the customers through visiting customers, and used the knowledge of other employees, most prominently that of the CEO and the union leader. But in retrospect it was risky not conducting a more systematic in-depth study of the needs of the clients.

BUSINESS MODEL
Research about business models is young, and "...relatively little concepts and tools exist to help managers capture, understand, communicate, design, analyze and change the business logic of their firm.", Osterwalder (2004:22).

Stähler (2002/2013-08-05) gave one of the earliest summaries of the essential elements of a business model.

The value proposition of ABB Truck Service was to reduce downtime for the customers' machines. The architecture was an integrated workflow that in more than 98% of the time gave the customer access to the machine within 36 hours. The price for customers was cost-based. In retrospect it could be questioned if this pricing model captured value the best; alternatives could have been a fixed price for each type of intervention or even a diminishing price after 36 hours had past – even if that might involve heavy extra costs for ABB Truck Service. But, in the complete re-engineering this was one of the few stable parameters in the game!

Recently Teece (2010) gave the definition, which is today most accepted in the literature: “The essence of a business model is in defining the manner by which the enterprise delivers value to customers, entices customers to pay for value, and converts those payments to profit.” "In essence, a business model embodies nothing less than the organizational and financial ‘architecture’ of a business.”, Teece (2010:172, 173). “We define the business model as a system that solves the problem of identifying who is (or are) the customer(s), engaging with their needs, delivering satisfaction, and monetizing the value.”, Baden-Fuller & Haefliger (2013:419). Or, a “…business model should be able to link two dimensions of firm activity value creation and value capture...”. (Baden-Fuller & Haefliger (2013:419).

Expressed in this way it is the essence of classical economy (Smith, (1776/1970:131; Ricardo, 1817/1971:55; Marx, 1933/1969:15), use value for exchange value.
Teece presented the following table as a summary of the most important elements of a business model:

<table>
<thead>
<tr>
<th>BM component</th>
<th>Questions to ask</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Value Proposition</strong></td>
<td>What value does the company create for customers and partners?</td>
</tr>
<tr>
<td><strong>Product/Services</strong></td>
<td>What does the firm sell?</td>
</tr>
<tr>
<td><strong>Architecture</strong></td>
<td>How and through what configuration is value created?</td>
</tr>
<tr>
<td><strong>Revenue Model</strong></td>
<td>How does the company earn money?</td>
</tr>
</tbody>
</table>

*Table 1, Business model, Teece (2010:173).*

**BUSINESS MODELS AND STRATEGY**

“...a business model is more generic than a business strategy. Coupling strategy analysis with business model analysis is necessary in order to protect whatever competitive advantage results from the design and implementation of new business models.”, Teece (2101:180). Strategy is conceived as being thought out in advance, or *planned*. This *ex ante* assumption is valid in some cases, where the business model is a set-up that has been conceived in advance. For instance, Southwest Airlines may have actually been built based on a pre-conceived strategy, Porter (1996). However, the more common situation involves strategy evolving as a result of a learning process, either by *consciously experimenting* (known in literature as ‘agility’), or the as a result of *learning from unplanned reactive responses* to competition or customer responses. This situation seems to have occurred with IKEA, where what has been perceived in retrospect as a planned process, was actually more the result of adaptation to customer response (Porter, 1996).

The fundamental strategy question is how does one build a sustainable competitive advantage and get a super normal profit. It not enough to develop a successful business model to assure competitive advantage, as imitation is so easy, Teece (2010:173). Porter (1996:62) wrote that a company could outperform rivals only if it can establish a difference that it can preserve. Such a difference can be sustained if it can make many choices embedded in organizational praxis, which necessitate competitors to imitate not only discrete advantages. Hence that competitive advantage grows out of the entire system of activities. Rivals will get little benefit from imitation, unless they successfully match the whole system, Porter (1996:73-74). In the ABB Truck Service case the new competitive advantages were based on a large set of new activities: the online access to blow-ups of design drawings – online-order of spare parts – overnight delivery of spare parts – direct operator reporting
of work done – immediate central invoicing. In order to copy the new achieved advantages, a competitor has to copy all elements, including training of the work force, and effective routines for handling of the system.

The new ‘business model’ we developed fulfils ‘Rosenbloom’s criteria’, Chesbrough (2010:355):

1. Articulates the value proposition
2. Identifies a market segment and specify the revenue generation mechanism
3. Defines the structure of the value chain required to create and distribute the offering and complementary assets needed to support position in the chain
4. Details the revenue mechanism(s) by which the firm will be paid for the offering
5. Estimates the cost structure and profit potential
6. Describes the position of the firm within the value network linking suppliers and customers
7. Formulates the competitive strategy by which the innovating firm will gain and hold advantage over rivals.

Chesbrough & Rosenbloom (2002:535) mean that strategy and business development is different and that strategy is superimposed on business models:

• The business model starts by creating value for the customer, and constructs the model around delivering that value. There is some attention to capture in a portion of the value created, but the emphasis upon value capture and sustainability much stronger in the realm of strategy.
• A second difference lies in the creation of value for the business, versus creation of value for the shareholder.
• A final difference is in the assumptions made about the state of knowledge held by the firm, its customers and third parties. The business model construct consciously assumes that this knowledge is cognitively limited, unbiased by the earlier success of the firm. Strategy generally requires careful, analytic calculation and choice, which assumes that there is a great deal of reliable information available. It similarly assumes that any cognitive limitations on the part of the firm are of limited importance.

We disagree, in our view the business model, how the firm intends to create value for a set of customers, is a prerequisite for profits, which thus are conditional of the value-creation – unless profits are a result of a rip-off, see image 2.
Economy and energy

The interest of the owners: PROFIT

The interest of the workers: WAGE

The goal of the firm: Serve the target group

Use value

ANALYSIS OF THE CASE

We created a new business model by delivering superior value to a lower cost. To make this business model sustainable new structural capital, by new systems and routines, was created and to keep the tacit knowledge in the firm we empowered them in order to loyalise them.

Image 2. Economy and Energy, own.

Image 3. The Case, own.
CONCLUSIONS

The case presented shows business modelling as key to achieving sustainable competitive advantage. More case studies will improve the scientific understanding of business modelling at the present stage of development.

OTHER CONCEPTS AND IMPLICATIONS

The case could be viewed from many other perspectives, not discussed here: the performance effects of workers' empowerment (McEwan & Sackett, 1998; Vidal, 2007; Udo & Ebiefung, 1999; Waldeck & Leffakis, 2007; Waldeck, 2007), strategies for implementing organisational change (Gupta, Chen & Chiang, 1997; Khazanchi, Lewis & Boyer, 2007), service innovation theories, and many others. Specialized researchers study each of these issues, and often have specific journals more or less dedicated to such studies.

The Future of Entrepreneurship

DOES FINANCE IMPROVE BUSINESS PERFORMANCE IN THE INFORMAL ECONOMY?

Pontus, Engström; Trond, Randøy

School of Business and Law, University of Agder, UiA, Kristiansand, Norway

ABSTRACT

This study investigates the impact of financial capital (microfinance) on the performance of micro-enterprises in the informal economy. The theoretical basis for this study is the Schumpeterian notion that entrepreneurs are able to create value due to their ability to make new resource combinations, of which financial capital is one of the most important and easily convertible resources. To test our hypotheses we apply a cross-sectional unique dataset of microenterprises in the informal sector in Ecuador. We observe how the provision of microloans, as a measure of financial capital, allows micro-entrepreneurs to multiply their income generating opportunities and achieve a higher return on equity (ROE). In addition, greater debt financing is positively related to the operating efficiency, measured as return on assets (ROA). Critical to the decision to exploit an entrepreneurial opportunity is also the entrepreneur’s financial literacy, and we find that entrepreneurs with a higher financial literacy achieve higher performance than others. However, an important observation is that growth comes at the expense of performance up to a certain size, implicating that diminishing economies of scale negate the positive effects of debt financing in the informal sector. Our results suggests that lending is best suited for firms with an asset size greater than USD 129,000. This has an important policy implication in that growing the size of a small business, through increased debt financing, may not necessarily lead to enhanced overall performance.

Keywords: microentrepreneurs, financial capital, microfinance, informal economy, financial literacy, firm performance

INTRODUCTION

Microenterprises are the common economic backbone of most poor and emerging economies. Most of these enterprises operate in the legal “shadow” or the informal economy\(^1\), representing up to 70% of GDP in some emerging economies versus 13% in higher income OECD countries (Schneider et al. 2010).

\(^1\) The informal economy is commonly defined as those income generating activities which are “unregulated by the institutions of society, in a legal and social environment in which similar activities are regulated” (Portes et al. 1989, p.12).
While research on the informal economy exists, it has largely been anecdotal with little theoretical underpinning (Webb et al. 2013), and has to a large extent been overlooked by mainstream entrepreneurship research (Bruton et al. 2008). In line with the call for future research on funding of microenterprises (Moss et al. 2014; Bruton et al. 2013), this study specifically assess if and how access to finance enhances entrepreneurial performance of microenterprises in the informal economy.

Microfinance has over the recent years emerged as a significant funding source for microenterprises in poor countries (CGAP 2014), supported by increasingly professionalized microfinance institutions (Randøy et al. 2013). Microfinance has been advocated as a tool to facilitate entrepreneurship and eradicate poverty (Pitt & Khandker 1998;). While the link between access to finance and poverty has been extensively researched (Roodman & Morduch 2013; Khandker 2005), the link between access to finance and entrepreneurship in the informal sector has not. In our review of existing research we thus identify a gap in the literature, which due to microenterprises significant role in developing economies should be of public policy interest, and also help develop entrepreneurship theory (Bruton et al. 2013), both from a financing perspective but also from a growth aspect.

We use Ecuador as the empirical context of this study, which we argue is a representative example when studying entrepreneurship in the informal economy (World Bank 2012). First, there is an extensive informal economy (Canelas 2014; Schneider et al. 2010; Albornoz et al. 2011), and second there are well-developed regulated microfinance institutions specifically targeting the informal economy. Third, due to unique access to inside information from one major microfinance institution, we get access to microenterprises that have been seeking external financing from a microfinance institution. Forth, we also have data that allow us separate financing of business related activities versus financing of consumption. By assessing poor microentrepreneurs and their microenterprises in the informal side of an emerging economy, as called for by Moss et al. (2014), we are adding to the existing literature on the performance of microenterprises in the informal sector (De Mel et al. 2008; Honig 1998).

This article is organized as follows. First follows a review of entrepreneurship literature relating to entrepreneurial performance and access to financial capital in the informal sector. Second a series of hypotheses are developed. Third, the unique research methodology is presented including constructs and measures. Following this we test the hypothesis using an OLS regression technique. Last we discuss and conclude the findings, its limitations and implications for scholars as well as practitioners.

THEORY DEVELOPMENT AND HYPOTHESES

Where traditional banking does not reach out to needy microenterprises, the entrepreneur must bear the full risk of the project and, if possible, do the financing him- or herself (Knight, 1921). Business
owners of microenterprises in the informal economy typically rely to a large degree on internal financing, as external formal bank-based debt or equity financing is not available to these actors. If external financing is available, it often comes at a high cost from moneylenders or other kind of informal providers of capital, so high that it deters from making any investments. Therefore microfinance institution comes in as a third alternative, bridging the formal and the informal economy, typically with much lower interest rates than informal money lenders. In seeking debt to finance an expanding business, the microentrepreneur, or the capitalist part of this individual, is also sharing the risk with external sources (e.g. the microfinance institution). If the entrepreneur is successful, the lending activity results in an improved performance of the business. We argue that little research attention has been made to the nature of the entrepreneurial opportunities in the informal sector, and the type of returns an entrepreneur can achieve.

If the entrepreneur is the specialist in risk-taking or alleviating uncertainty (Knight 1921), seeking an external financier may not only be a sign of lacking financial capital, but rather that the risks involved are too great for the entrepreneur to bear alone. We argue that the adverse self-selection by the entrepreneur, partly based on asymmetric information that the other sources of funding do not possess, makes the entrepreneur better informed about his or her capabilities. In order to deal with such adverse selection by entrepreneurs, the microfinance bank would conduct careful credit screening and apply interest rates and fees in order to compensate for the uncertainty of overly risky and/or unprofitable entrepreneurial investments or activities, and also to deter from these. If these interest rates are set too high, then none of the proposed investments will be undertaken, if set too low, the bank’s operations become unsustainable. To an entrepreneur, the cost of financing (cost of capital) is thus something to be weighted against the available opportunities and their economic returns. If a positive spread exists between the cost of borrowing and the investment opportunities, then financial theory says that value can be created through reinvesting and growing the business. The microenterprise should invest up to the point when the marginal benefit from an incremental investment is equal to the marginal cost.

Schumpeter (1934) describes the success of entrepreneurs in terms of an entrepreneurial profit. The empirical entrepreneurship literature uses various measures of performance such as efficiency, growth, profit, size, liquidity, success/failure, market share and leverage, often with a focus on the consequence of good performance. Among these measures, efficiency, growth and profit are the most common (Murphy et al. 1996). Increasingly some are also using a return to capital measure (McKenzie & Woodruff 2008; De Mel et al. 2008), but this is typically unavailability due to insufficient accounting numbers (requiring both income statement and balance sheet numbers).

---

1 The term moneylenders refers to informal providers of credit that are commonly charge 100% per year or more in interest rates and apply harsh collection methods.
Firm performance may be viewed from two perspectives – the entrepreneur-perspective and the firm perspective. From an entrepreneur-perspective, the main interest is the generated income in relation to the capital the entrepreneur has invested, the equity commitment, hence the most appropriate measure is Return on Equity (ROE). Return on Assets (ROA) on the other hand measures the return on all capital invested and is therefore a better proxy of the firm’s operating performance or efficiency.

Financial capital provides a medium of exchange and trade, and facilitates investments. This might be taken for granted in developed economies, but getting access to working capital is a major challenge among poor micro-entrepreneurs in the informal economy. The ability to exit the barter economy, where exchanging goods and services is complex and expensive, provide potential large saving to the entrepreneur. Research shows that financial capital as a medium of exchange lowers transaction costs and makes operating a business more efficient (Saving 1971; Jack & Suri 2011).

Financial capital may either be internally generated funds or available through external financing. In this study, the external financing will be seen as provision of debt from microfinance institutions. Financing a firm is dependent on the reinvestment opportunities and the availability of financing – which together make up the nature of the entrepreneurial opportunity (Shane &Venkataraman 2000). The decision to seek and obtain “financing” is essentially a decision to exploit an entrepreneurial opportunity, preceded by the discovery phase.

In capital constrained areas of the world, the lack of financing severally hinders entrepreneurship and firm growth (Ayyagari et al. 2008). Lacking capital is therefore a business risk, which affects the performance of the firm. While the seminal study by Modigliani & Miller (1958) proposes that capital structure (debt / equity ratio) is independent to performance of the firm, the intention by the authors was not to argue that capital structure is irrelevant (Miller 1988). In terms of the impact of financing on the performance of micro enterprises, there are a limited number of studies, especially from a less developed country and the informal economy.

Honig (1998) studied microenterprises in the informal economy in Jamaica, finding among other things the importance of considering heterogeneity among microenterprises, such as separating between those with employees and those with no employees. The study showed that those who received a business loan had a higher income, especially among the self-employed. Copestake et al. (2001) found in the case of Zambia that business performance and household income significantly improved upon taking a second loan, but for those, nearly half of the clients, who did not continue with their second loan fared worse. A qualitative case study by Hietalahti & Linden (2006) on poor women in the northern eastern South Africa revealed that some of the poorest women were able to improve their life modestly with access to microloans, but also highlight that the conditions for successful entrepreneurship differs depending on the degree of poverty.
In a recent quantitative study, Mahmood & Rosli (2013) study on Malaysian microenterprises that microcredit had a significant impact on the performance. A number of studies applying randomized control trials (RCTs) have in addition looked at the impact of business grants, also a form of financing, to microentrepreneurs. McKenzie & Woodruff (2008) found in an RCT on Mexican microenterprises monthly returns to capital of 20-33 percent which corresponded to a return between 3 and 5 times higher than the charged interest rate. The RCT did not adjust the returns for the opportunity cost of pursuing an alternative activity as argued by for instance Shane & Venkataraman (2000), therefore exaggerating the performance. De Mel et al. (2008) found in a study on Sri Lanka a monthly return on capital of 4.6-5.3% (55%-63% annually), also higher than prevailing interest rates, here deducting an opportunity cost of labor.

Because of the grant focus of existing randomized control studies, little attention is paid to how debt (the main instrument used in microfinance) affects firm performance. In addition, the randomized control trials are focused on very tiny businesses. Berge et al. (2011) looked at the effects of a small business grant, USD 60. De Mel et al. (2008) used a business grants of USD 100 to USD 200 to businesses with a maximum asset size of USD 1,000, where the size of these grants in some cases were equal to a value greater than the original capital invested. Small and equal grant based RCTs fail to take into account the different business needs, where a relatively small grant to a larger microenterprise, for instance with assets worth USD 1,000, will have a relatively little impact in comparison to the same size grant to a very small microenterprise with for instance assets worth USD 100. This study looks at the effect of an average total debt financing of between USD 2,628 and USD 41,623, thus capturing the effects of a more business varied financing, given the various nature of the businesses.

If microenterprises are provided with microfinance debt, we expect to see a positive impact on firm performance. Thus, one should expect the return on equity to increase and more earnings generated as these microenterprise are able to increase their disposable assets. In Figure 1, this is illustrated as the debt is used to acquire income-generating assets (the equity multiplier). If the reinvestment opportunities can be done at a rate of return which is higher than the lending rates, then value is created. Lacking capital is thus a constraint which hinders entrepreneurs from optimizing a realizable set of investment opportunities (Evans & Jovanovic 1989), including having access to sufficient working capital. In a setting where there are entrepreneurial opportunities present, financing allows the entrepreneur to exploit these opportunities. Net of interest expense and amortization, the microentrepreneur reaps the reward through an improved ROE, thus:

Hypothesis 1: Financing through microdebt is positively related to entrepreneurial performance (ROE).

Lacking access to debt not only prevents micro entrepreneurs from expanding their income generating activities, but it also hinders experimentation in general or using cash as a resource cushion (Cyert &
March 1963; Bourgeois 1981). While debt allows the income generating activities to be expanded, through the availability of financing and debt, the operating efficiency (ROA) can also be improved, if the entrepreneur can select opportunities with higher margins and or asset turnover. The second hypothesis thus reads:

Hypothesis 2: Financing through microdebt is positively related to entrepreneurial operating performance (ROA).

In the discovery of an entrepreneurial opportunity and the subsequent exploitation, the rate of borrowing needs to be compared against the expected financial return from the assets that the borrowing provides, especially when the financing is done with a regulated microfinance institution. This demands a certain level of financial literacy. Honig (1998) found in a Jamaican context different results based on education, suggesting no benefit to performance from high school education, but rather from college education. Thus, we suggest that entrepreneurs that are financially literate should outperform those who are not, such that:

Hypothesis 3: Financial literacy is positively related to entrepreneurial performance (ROE, ROA)

RESEARCH METHOD

Researching poor microentrepreneurs in emerging/developing economies provide a number of inherent challenges. Obtaining detailed data from the informal economy is for instance difficult as micro-entrepreneurs typically do not maintain financial records and in addition often mix family and business transactions. These challenges also include getting access to respondents, sample selection biases, the respondents weak knowledge of financial terminology; their ability to respond to surveys (with numbered Likert scales to mention one such challenge). Many of these challenges have been overcome with our unique research design.

In order to get access to microenterprise we have collaborated with Banco D-Miro from Ecuador. This microfinance institution is a regulated microfinance institution with 41,000 clients, based in the coastal regions, where a large part of the economy is informal. Banco D-Miro is owned by the Norwegian NGO Mission Alliance, a faith-based Christian organization. The roughly 100 credit officers who work at Banco D-Miro have manually collected financial data, partly through manually filled out application forms, but also including home visits, for the overall assessment of risk and credit worthiness of the clients. Prior to credit approval, the branch manager reviews the credit application. As credit default does not benefit the branch manager or the credit officer, this process vows for a better quality data, than an entirely self-reported measure of entrepreneurial performance. The data is very detailed and allows for fine-grained analysis of both income statements and balance sheet items, even separating family and business income and assets, thus allowing us to focus specifically on the performance of the
micro-enterprise. Data relating to both the balance and the income statement is obtained at the moment the microentrepreneur’s sought financing for their opportunities.

In addition to the data collected through the survey and the data collected by the credit officers of D-Miro, Ecuador’s microfinance institutions are by law required to report information to a credit bureau, which provide us with more individual credit information then is common in many other emerging informal economies (World Bank 2013). This process provides for complete picture of the microentrepreneurs financial situation, including loans to other financial institutions.

Lastly, to achieve a sufficient and representative sample for the statistical analysis we have used three available client categories of approximately 250 clients each: 1) clients who did not renew the loan, 2) clients with payment problems and 3) clients with no payment problems. All in all 755 microfinance clients are included. The respondents where then split into two groups, of which 480 had debt and 275 did not at the time of the loan application.

As a measure of the dependent variable, we are using the ROE and ROA in line with the discussion above. To avoid that outliers drive the results, the yearly ROE and ROA have been winsorized at the 5% level, such that for ROE, firms with an Equity of less than $2,500, had the equity set to $2,500, and for ROA, firms with a total assets less than $3,200 dollar, used an asset value of $3,200 (a similar approach to Hvide & Møen 2010). While the median ROE and ROA remained the same, at 73% and 63% respectively, the variance dropped by 94 and 96% to 73% for ROE and 28% for ROA.

In addition, since the microentrepreneur does not pay a formal salary to him/herself, we have added a proxy number for the opportunity cost of labour into the reported income, in line with suggestions from past research (Shane & Venkataraman 2000). While the minimum wage is intended to set a wage floor, the actual floor may be much lower in the informal sector if formal jobs or alternatives are not available. Canelas (2014) find, using data from the National Statistics and Census Institute of Ecuador, that informal wage workers earn on average 91% of the minimum wage during 2010-2012. We therefore assume that the opportunity cost of labour for the informal sector in Ecuador in 2013 to be the actual minimum wage of USD 318 multiplied by 91%, i.e. USD 289. As a result the median ROE was reduced from 63% to 44% and the median ROA from 63% to 37%.

Financial capital can be equity or debt. In the microfinance industry, the initial and most widely form of capital provided is microdebt. In this study we will look at two groups of micro-entrepreneurs; one group with debt (480 firms) and the other group with no debt (275 firms) at the time of seeking a new loan with Banco D-Miro.

Building upon a previously tested concept (Lusardi & Mitchell 2011a) we have used three questions to test entrepreneurs understanding of the financial concepts, compounded interest, inflation and
risk/diversification. The first two questions are directly from Lusardi & Mitchell (2011) whereas the third question was adapted to better fit this context. Three questions were asked:

Suppose you had $100 in a savings account and the interest rate was 2% per year. After 5 years, how much do you think you would have in the account if you left the money to grow: more than $102, exactly $102, less than $102?

Imagine that the interest rate on your savings account was 1% per year and inflation was 2% per year. After 1 year, would you be able to buy more than, exactly the same as, or less than today with the money in this account?

Do you think that the following statement is true or false? Investing everything in one opportunity usually provides a more certain economic reward than investing smaller amounts in many different opportunities.

We control for the entrepreneur’s gender as many microfinance programs typically favour women over men. In addition we control for age, education, and size. We use total assets, here Winsorized at the 5% level, for size and also include a transformed size-square measure to capture some of the unique characteristics of size. In addition, we control for industry using the definitions proposed by the United Nations for the informal sector (United Nations 2008, p. 279-281). Often, the informal sector is numerically dominated by manufacturing, repair services and trade. In the context of the informal sector of Ecuador, the sample is dominated by wholesale and retail trade (53%), of which the most common forms are clothing establishments, good and grocery retail, bazar and cosmetics followed by a number of smaller commercial businesses of varying kind. Following wholesale and retail trade was manufacturing (18%), restaurants (8%), agriculture, forestry and fishing (6%), transportation (5%), other personal service activities (4%), education; human health and social work activities (2%), construction (2%), repair services (2%) etc. Furthermore, the urban vs rural characteristics may also explain differences in performance (Honig 1998), wherefore this is also controlled for using the ratio of urban to rural persons living within the city area to which each microentrepreneur belongs using data from the National Statistics and Census Institute of Ecuador (INEC 2011).

**ANALYSIS AND RESULTS**

As seen in Table 1, the average annual revenue of the microenterprises is USD 26,688. These statistics are generally not available in previous research (Honig 1998; Copestake et al. 2001), which most often leaves us with the definition of a microenterprise as a business with less than 10 employees. Most firms in the data set have below 10 employees, with a limited number having reportedly up to 15 employees.
In terms of background variables, our sample include 12% rural microentrepreneurs and finds that 35% have completed primary school, 59% had finished or had some sort of secondary school degree, with only 4% attaining a higher degree beyond secondary education. In a similar study, Magill & Meyer (2005) found that for urban Ecuadorian enterprises, 46% had finished primary school, 41% had some or had completed a secondary education with 12% having an education beyond the secondary education. They note that these levels are higher than for the general population.

In line with Honig (1998), we have segmented the regression results based on being a business without employees or with employees. In addition, due to the informality, the notion of employment is vague, wherefore we also select those who say that at least two individuals, apart from themselves, work in their business. The regression in Table 4 indicates that when controlling for gender, age, urban vs rural, education and industry, there is a significant positive association between debt-funded microentrepreneurs and higher ROE for all cases and subgroups. This supports our first hypothesis that an increased level of debt is positively related to firm performance. Hypothesis two is also supported in that debt financing has a positive impact on the operating performance of the firm, ROA. In terms of financial literacy, we find support that individuals with higher financial literacy also perform better. However, a deeper look at the analysis reveals that this only holds true among the microenterprises with no employees, suggesting that practitioners need to specifically teach financial literacy to these clients, prior to engaging in financing.
Among the control variables, the general level of education of the micro entrepreneur is not shown to have any impact on performance of the microenterprises they own. However, male entrepreneurs with no employees have a higher ROA than female. In addition, rural based microenterprises with no employees have higher performance. Among the industry controls, none of the industries had a significant impact on performance (ROE and ROA).

Size is negatively related to performance, however not all the time. In other words, adding another fridge or scaling the businesses in this local business environment comes at a cost since demand is fairly constant. By squaring the size factor we find that the size factor actually improves performance above a certain threshold (see figure 1). Up to a certain size, taking on debt is negative to the performance of the firm. This finding is supported by industry research from US Aid who found in their review of the informal sector in Ecuador that most microentrepreneurs were not convinced debt represented an opportunity to grow (Magill & Meyer 2005): “Credit is not seen as a positive tool to grow a business, but rather as a cost or penalty to be avoided at almost any cost” (p. 118), and recommend MFI’s to exercise caution when “focusing on credit as a solution to the problems facing microentrepreneurs”.

The Future of Entrepreneurship

Table 2. *Regression analysis*

However, after a certain size, financing starts to add value. In figure 1 below, it is shown that taking on debt worsens the performance for firms below USD 137,000 for ROA and USD 129,000 for ROE, in other words at the higher end of the sample used in this analysis. If the entrepreneur has employees, this lowers the break-even point somewhat. This has important policy implications. It illustrates how MFIs could analyze their existing clientele to find the cut-off point were financing does and does not add value. This allows MFIs to refocus their attention on the larger microenterprises where economic development and value creation is taking place, and avoid the smaller firms where financing actually depresses the performance on average.

In addition to separating between firms with no employees and firms with employees, the nature or industry may also show different effects (see Table 2), depending on the local conditions. The two largest industries represented in the sample are wholesale (and retail) trade and manufacturing, representing 71% of the sample. The regression analysis yields similar results for debt as an impact on the returns on the return for the wholesale trade sector, but is not yielding as strong signals for the manufacturing sector. We also see a different representation and impact of gender in wholesale trade.
DISCUSSION AND CONCLUSION

This study finds that microfinance as a tool to assist microenterprises in their growth, does not necessarily allow for value creation in the informal economy. Specifically, the study finds that while debt in itself improves performance, the increased size of the firm negates the positive effects on performance from debt financing. We operationalize entrepreneurial performance as the microenterprises’ Return on Equity (ROE) and its overall Return on Assets (ROA). We observe that the Ecuadorian microenterprises in our sample on average show very high average financial returns (adjusted ROA of 45% and ROE of 59%), which assuming no impact on returns from growth would lead us to assume growth is value creating. However, in the highly competitive environment of the informal economy in emerging economies, the incremental growth results in a drop in returns which
negates the value creation from growth. We call this the debt-growth trade-off. This has previously been identified as anecdotal evidence by practitioners (Magill & Meyer 2005), cautioning donor organizations to push finance as a means to support economic development, which is here given robust empirical support.

Financial competencies are generally seen as an important prerequisite for successful financial planning (Lusardi 2012), and we see the same pattern among microenterprises in Ecuador. Specifically, we find that microenterprises’ that are owned and managed by more financial literate micro-entrepreneurs display significantly higher financial performance, both in term of ROA and ROE. This suggests that financial literacy plays a role in the discovery and the decision to exploit an entrepreneurial opportunity in relation to a situation where external debt financing is required.

Specifically, this study makes three contributions to the microfinance and entrepreneurship, microfinance and growth literatures. First, it extends capital structure theory to micro-enterprises in emerging economies, and shown how financial return numbers can be successfully estimated even when being in the informal economy. Second, it adds to the literature on entrepreneurship, microfinance and growth literature by highlighting how debt impacts micro-enterprises’ financial return, specifically in relation to the size of the business, where smaller businesses see diminishing economies of scale, whereas the economies of scale occur mostly among the larger microenterprises. This has been recently called for by Bruton et al. (2011). Third, we contribute to the social entrepreneurship literature by establishing a connection between the social mission of a microfinance institution and its (potential) ability to reduce poverty is misdirected when specifically targeting the poorest and smallest businesses.

The study is not without limitation. We are limited by the fact that we attempt to infer causality (the impact of debt on performance) using a cross-sectional dataset. We have tried to reduce this problem by selecting micro-enterprises with and without debt prior to being include in the sample (and by that have an element of longitudinal design), and by trying to control for other potentially confounding variables such as gender, age of entrepreneur, industry etc. In future research, we suggest that the issue is pursued with longitudinal data. Another limitation is that there might be institutional and cultural variables that make generalizing beyond Ecuador difficult. This study is limited to micro-enterprises that have pursued on particular microfinance institution. For example, the fact that D-Micro is pursuing social goals, even though this is the norm in the industry, might impact the self-selection of microentrepreneurs that pursue this particular microfinance institution.

In terms of policy recommendations for practitioners, this study highlights that microfinance institutions and other donor organizations need to assert caution when extending credits to microentrepreneurs in the informal sector. The results highlight that larger microenterprises may
benefit more, and thus be a more suitable target when trying to create economic development. Our data also shows that financial literacy is important in the entrepreneurial process, particularly firms with a few several employees.

THE USE OF SOCIAL MARKETING IN SMOKING PREVENTION: A STUDY OF GENERATION Y’S SMOKERS’ SUGGESTIONS

Priporas, Constantntinos-Vasilios1; Kamenidou, Irene2

1International Management & Innovation Department, Middlesex University, Business School, London, UK
2Business Administration, Eastern Macedonia and Thrace Institute of Technology, Kavala, Greece

ABSTRACT

The aim of this study was to explore Generation Y smokers’ perspectives on youth smoking prevention in the social marketing framework in Greece. A qualitative study was adopted using 10 mini focus groups with smokers of Generation Y to enable an in-depth exploration of the research issue to be undertaken. The findings provide social marketers and policy makers with a better understanding of what the targeted audience value about smoking prevention practices. The participants proposed that prevention campaigns could include practices such as an anti-smoking education for parents, anti-smoking education in elementary schools, the creation of more public sports fields in order to enable young people to have more access to sports activities, celebrity visits and speeches in schools, intense anti-smoking advertising campaigns, and a few suggested the prohibition of smoking in public places with the simultaneous imposition of huge fines for smoking. For social marketers and social policy makers, these are important and effective suggestions since they come from younger and older generation Y smokers from a nation with a very high rate of tobacco consumption and offer a more wide-ranging strategic approach to youth anti-smoking campaigns.

Keywords: social marketing, smoking prevention, generation Y, focus groups, Greece

INTRODUCTION

One of the main issues in social marketing is smoking and how to reduce and prevent it (Brenkert, 2002). The harmful effects of smoking on human health are documented in a considerable number of longitudinal research studies, though it seems that the results of such surveys do not tend to persuade smokers (Slovic, 2000) and use of tobacco products continues to be a major public health concern in the 21st century.

In Greece, the smoking population is considered to be amongst the highest in the world. According to the OECD (2011) for the year 2009, 40% of Greek adults smoked, smoking more than 3,000 cigarettes per person in 2007 (The Economist, 2008) rising to 4,313 for the year 2012 (Nation Master.com).
According to the European Commission (2012), Greece is a country where smoking increased rather than decreased from 2009 and even though the taxes on each cigarette package make up more than 75% of its retail price (WHO, 2011, p.68), Greeks are the heaviest smokers in the world. This situation has sparked warnings from health experts since the country is facing a smoking epidemic which could have significant effects on the economy and on the cost of running health services (Vardavas and Kafatos, 2007).

In this context, this paper presents the findings from a qualitative study on generation Y smokers’ suggestions about adolescent smoking prevention in the context of social marketing. It is very important to underline that generation Y (people who were born roughly between 1977 and 1994) are an essential target for marketing since little academic research into this generation has been done especially in the social marketing context. The research was carried out in Greece, where very limited research has been conducted in the field of social marketing (Polyzoidis, 2013) and where the marketing culture needs more development (Rivero and Theodore, 2013). These findings could serve as reference for future studies on the topic and this research could contribute to reducing and preventing smoking in Greece and countries with similar problems through research-led social marketing programs.

SOCIAL MARKETING AND ANTI-SMOKING CAMPAIGNS

Social marketing campaigns are used to foster change and encourage behaviors that will improve the health or well-being of the target audience or of society as a whole (Wharf-Higgins, 2011; Quin et al., 2010). Although social marketing tends to focus on behavioral change there are two different approaches to this. The main approach (downstream social marketing) focuses on the individual and on creating personal incentives to encourage them to change their behavior. The other approach (upstream social marketing) focuses on systems change and focuses on changing policy and environments to promote behavioral change. Upstream approaches are similar to those usually undertaken by public health researchers which suggest the potential for beneficial inter-disciplinary work (Hoek and Jones, 2011).

The effectiveness of social marketing campaigns has been questioned. Wolburg (2006) stated that social marketing campaigns are not always as effective as expected. The problem faced by some social marketing campaigns is that they set out to persuade large numbers of people to change their behavior even though people are already fully aware of the potential consequences of this behavior (Rotfeld, 2001). Some social campaigns have even had unintended negative (boomerang) effects (Ringold, 2002), where people reacted against the prescriptiveness of a campaign (Brehm and Brehm, 1981). For example, there have been cases of increased cigarette smoking among college student
smokers in response to antismoking messages (Wolburg, 2006). These kinds of reactions are most common among younger people, especially adolescents because of their desire for independence, individuality, and their rejection of authority (i.e., Miller et al., 2006). In order for a person to make the rational choice to not smoke, they must have complete information and be able to process it efficiently. However, the addictive qualities of nicotine and the effectiveness of tobacco marketing also leads consumers away from making rational choices (Wayne et al., 2004). It is clear that the main difficulty for social marketing campaigns, compared to traditional campaigns, lies in the fact that the marketers are attempting to influence an audience to change their behavior from something that is familiar and accepted to something that is new and sometimes more difficult than their normal habits. Nevertheless, social marketing has been criticized for not treating people like autonomous beings. Social marketing campaigns have claimed that marketing’s focus on the individual largely ignores the social, economic and environmental factors that influence individual health behaviors (Donovan, 2011).

METHODOLOGY

Given the exploratory nature of the study and the scarcity of studies in the field focusing on the Generation Y perspective, qualitative research was considered ideal since it provides insights and understanding of the problem setting. Focus group interviews were used, to get participants opinions about a particular issue (Andronikidis and Lambrianidou, 2010; Kapoulas et al., 2004) and because they allow researchers to understand consumers’ everyday behavior and experiences and how they interpret reality in their own terms (Threlfall, 1999). In this study the researchers adopted the concept of the “mini-focus group” (Keegan, 2009; Edmunds 1999; Krueger, 1994). Their group sizes ranged from five to six participants with a total of 56 participants in 10 focus groups. Each session lasted about 100 minutes on average, ranging from 90 minutes to 2 hours (Edmunds, 1999) in order to avoid any possible fatigue or loss of interest (Packer-Muti, 2010). In all circumstances the time was sufficient to allow discussion on all areas of interest that arose. The groups were formed so as to be fairly homogeneous, mainly in terms of age. The sessions were conducted in the facilities of a consulting firm in Thessaloniki, with which one researcher was associated with. One of the researchers took on the role of the moderator (Hartman, 2004) and ensured that all group discussions were constructive and went smoothly without problems (Churchill and Iacobucci, 2002). The sessions ended with participants final thoughts and remarks and then the moderator-researcher provided a brief summary of what had been discussed to ensure that their interpretation of the discussion was correct.
Generally a convenience sampling was adopted, however, participants were selected based on their relevance to the study and their ability to discuss the research issue; participants had to be smokers and in the age range of 18-35 (Generation Y). The focus groups followed a semi-structured format with participants discussing the open-ended predetermined questions introduced by the moderator. The questions were developed to guide discussion and in order to elicit specific details. The main research question was “What actions in the social marketing context should be taken by policy makers, non-profit organisations and the community in order to prevent adolescents’ smoking”. A discussion guide was prepared to help ensure that the focus groups covered the topic of interest and were all conducted in a similar manner. The discussions were videotaped for data analysis to limit the bias and full transcripts were produced as soon as possible after the sessions. The focus groups were then transcribed and a content analysis procedure was then undertaken. This paper will focus only on suggestions for smoking prevention, especially for young people.

Demographic profile of the participants
A total of 56 adult smokers participated in the ten focus groups. The ages of the sample varied between 18 and 34 years old, while the largest proportion, 35 (62.5%) were between 18 and 25 years old and the rest 21 (37.5%) were between 26 and 34 years old. Referring to gender, 30 (54%) were males. The majority, 41 (73%) were single while the rest 15 (27%) were married and 13 of them had one or two children. Half of the respondents were University students, while the rest of the participants reported to be salaried employees (14, 25%), public employees (8, 14%) and professionals (6, 11%). In terms of the educational level of the non-university students, 13 (23%) indicated that they had a bachelors degree; 12 (22%) had a high school diploma-vocational degree; and 3 (5%) had a masters degree.

FINDINGS AND DISCUSSION
The vast majority of respondents, 50 (89%) smoked a particular brand of cigarettes. Regarding the number of cigarettes smoked daily; 12% smoked up to 9; 30% smoked 10-15, 23% smoked 16 to 20 and 35% smoked 21+ cigarettes. Additionally, 45 participants (80%) stated that they started smoking before the age of 18 and the main reason for this was peer pressure (50%) and curiosity (40%). All respondents knew the harmful consequences of smoking, while 27 (48%) of them had tried to quit smoking. In addition, when they were asked what they would do if their children started smoking the vast majority answered that they would try to discourage them from smoking (52; 93%).
Prevention campaigns

Social marketing campaigns by providing knowledge on an individual and community level can be an effective tool for health education and behavioral change strategies. This requires the targeting of influential people in communities who have the authority to make institutional policy and legislative change (Andreasen, 2006; Hastings et al., 2000). Traditionally, public policies to limit smoking have predominantly relied on tools such as increasing cigarette price through taxation, restrictions on smoking in public places, school programmes, advertising regulations, information campaigns and regulations on youth access to tobacco products, and large graphic warning labels on packages (Pierce et al., 2012).

The participants (younger and older Gen Y-ers) proposed that the prevention campaign should include six main initiatives which expressed similar opinions. These should be focused on parents (family), schools, and the state (municipal authorities and government). They were:

1. Anti-smoking education starting with parents, especially smokers
2. Anti-smoking education in elementary schools
3. Celebrity spokespersons in schools
4. Intense anti-smoking advertising campaigns
5. The creation of more sports fields so that children can take part in physical activities
6. Prohibition of smoking in public places and the simultaneous imposition of huge fines on smokers

Parents anti smoking education

Various studies show that parental smoking increases the likelihood of smoking by their children (Otten et al., 2007; Vardavas et al., 2007). The majority of respondents asserted that smoking prevention starts with parents, especially if they are smokers, pointing out that children accept parental influence on their behaviour, considering it as "normal" and "right". They characteristically stated:

“...it is crucial that parents are “trained” not to smoke in the home or near their children. If they attend some anti-smoking seminars, it would be very helpful in getting them to move in the right direction......... Both of my parents smoke in front of me and my brother, in the house,....... everywhere, anywhere. Why should I consider smoking bad for my health? Why would I understand at 12, 13, 14 years old that my parents which loved each other and us would do something so harmful like committing long-term suicide? They were grownups and our paradigm in life - the same goes for all kids - we follow the example of our parents. We consider their behavior right, acceptable and that we should replicate it in the future” (Male, 21, FG3)
As prior research indicates, family plays a vital role in youth smoking behavior. McNeal, (1987) emphasizes that children model their parent behaviors and attitudes. Sancho et al. (2011) state that children are spending less time talking and interacting with parents and more time exposed to media and interacting with friends which is in accordance with the study of Kristjansson et al. (2008) who suggested that the amount of time parents spend with their children could be a factor in protecting their children from taking up smoking.

Anti-smoking education in the elementary school

Schools are places where social behaviours are modelled and reinforced (Lovato et al., 2010). For most participants, anti-smoking education in elementary school was considered to be the most effective way to prevent smoking. Heavy smokers particularly insisted that anti-smoking education must start at elementary school, but shouldn’t stop there and should be continued to gymnasium and lyceum. For example, one of the participants stated:

"…..I believe that smoking prevention education programs must start with the 4th to 6th graders at elementary school at the latest, …………… innovative ideas should be used. For example, there could be a glass box with an electronic mouth inside that is attached to lungs. In this box the teacher could put some clothes inside. This mouth could smoke 2-3 cigarettes in the box and after an hour or two, the teacher could take out the clothes and give it to the children to smell. This awful smell is a way to encourage children to dislike smoking, especially if the teacher emphasizes that their skin, mouth and hair also smell this way. Additionally, the lung could change color or texture by smoking day by day and at the end of the year it would be obviously altered. I do understand that this is costly, but the cost in the long run is very small compared to the benefits" (Male, 26, FG4).

Researchers have found that if tobacco use begins in elementary school it increases greatly in middle school and therefore prevention should begin in early elementary school (e.g. Wilson et al., 2002), while Ellickson et al. (1993) state that the younger one starts smoking, the more resistant they are to change. Kolbe et al. (2001) state that anti-smoking educational plans and strategies which are school-based are very important in order to discourage students from smoking, because school takes up many hours of the day for children and adolescents (Watts et al., 2010).

Celebrities as anti-smoking spokespersons

Many participants focused on the role that celebrities could play in smoking prevention, especially if they were invited to schools or the schools could go e.g. to the theatre and actors could talk about smoking and its consequences. One of them stated that it all adds up to self confidence and "loving" yourself, and that’s the point that celebrities should focus on. They typically asserted:
“We should use celebrities that young people admire and want to be like, to deliver speeches in schools and highlight the negative effects of smoking...Some of them used to smoke and gave up. Let them tell their story. Adolescents do not listen to their parents about giving up smoking or to never trying it, because if a parent smokes, then their advice to not smoke will fall into a gap, and because at their age they want to be rebels - starting in their own home!” (Male, 30, FG9).

“...there are certain celebrities (musicians, athletes, actors) that are role models for many teenagers and they could deliver a series of speeches in schools all over Greece about smoking and its harmful consequences. Also there could be a day where the teacher takes the class to a play, where actors give anti-smoking messages” (Female, 26, FG4).

Studies on celebrity endorsements of anti-tobacco messages have been shown to be effective in improving the understanding of the dangers of smoking and encouraging people to quit smoking (Chapman and Leask, 2001; Seghers and Foland, 1998). In these campaigns celebrities can discuss the consequences of smoking for their careers, particularly in how it can affect their talents, for example, the band Boyz II Men argued that smoking had negatively affected their singing (Farrelly et al., 2003).

**Anti smoking advertising campaigns**

Many participants stated that there is a need for an anti-smoking campaign. Older participants stated that these campaigns should be mainly televised, focusing on the consequences by using images of smokers’ vital organs as a main theme. On the other hand, younger Gen Yers focused on the internet and social media for antismoking campaigns. The following extracts outline this view:

“...there is a need for very intense anti-smoking TV advertising campaigns focusing on pictures of smokers’ vital organs......maybe this way the adolescents will be shocked and avoid smoking” (Male, 33, FG8).

Anti-smoking TV campaigns tend to focus more heavily on the severity of harm than on self-efficacy and subjective norms (Cohen et al., 2007). The successful use of threat is largely determined by how an individual copes with the threat being communicated, and their level of health resistance (Dickinson-Delaporte and Holmes, 2011). Fear appeals are considered to be highly persuasive and thus they are very often used by health marketers to influence an audience. However, they should be exercised with caution since they can generate guilt, envy, anger, sadness (Dillard and Anderson, 2004), or even chronic anxiety (Gallope1-Morvan et al., 2011).

Additionally, some younger participants emphasize the usefulness of the Internet in social advertising campaigns.

“..... I believe a good and very effective way of targeting adolescents is to use the Internet for anti-smoking advertising campaigns, since we spend long hours "surfing" and do not watch TV. There are
so many pop up ads, even in YouTube when we are watching a music video. ……why not have anti-smoking messages especially from the bands or the singers?, this would certainly be more effective than other images such as smokers' lungs and teeth....” (Male, 18, FG9).

Lately, the use of the internet and web technologies in health promotion has become an increasingly widespread and popular practice (Waters et al., 2011), even as a potentially essential resource in health behavior change intervention and programs (Marcus et al., 2007). Additionally, internet and social media usage by children and adolescents is among their most common activities these days (Kaiser Family Foundation, 2010).

Public sports fields-physical activities
Many respondents believe that there is a positive association between smoking prevention and sports activities. For example, a father with a small kid stated:

“...I wish we had had a sports field in my neighborhood when I started smoking....... Now nearby our house there is a small field,....... and when my son reaches the age of 5 or 6 I will go there to play with him and maybe he will like the sports and join a sports team and this way he can avoid this bad habit” (Male, 33, FG7).

Taras (2005) asserts that physical activities programs can “help children develop social skills, improve mental health, and reduce risk-taking behaviors”. Several studies found that individuals involved in all forms of physical activity tend to smoke less (i.e., Kristjansson et al., 2008).

Prohibition of smoking in public places and tax increases
The initiatives which received the least support were the prohibition of smoking in public places (i.e., restaurants, cafes, bars), the imposition of huge fines on smokers and tax increases on cigarettes. Mainly light smokers and older participants suggested these initiatives, while other thought this would just motivate them to purchase cigarettes from the "black market".

More specifically a light smoker stated:

“...although, I am a smoker I believe that we have to respect the rights of nonsmokers, especially in places like cafes, and restaurants where a lot of people gather and many of them are non-smokers and adolescents ......A solution could be a general prohibition on smoking in all public places with imposition of huge fines on smokers and owners. Many countries have a very strict anti-smoking law....so do we.... But it is just for existing and not for being applied”  (Male, 25, FG5).

Social marketing literature (e.g. Hoek and Jones, 2011) indicates that legislation is often a necessary antecedent for individual behavior change where the sought change is immensely difficult for individuals to accomplish. In Greece, anti-smoking policy does exist, and has been in place for many
years. However, factors such as the spirit of tolerance towards individual life styles that runs through Greek society and the fact that Greece is a tobacco producing country have contributed to their failure. Additionally the existence of a pro-tobacco culture and a growing number of teenage smokers is making the problem worse (Vardavas and Kafatos, 2007).

CONCLUSIONS

The meaning of social marketing contains a justification for involvement in social issues, such as antismoking campaigns (Kotler et al., 2002). Thus, social marketing could be applied to behavioural change and attitudinal change towards smoking mainly through prevention and by approaching young people before they start smoking.

In Greece, the smoking population is considered to be the largest one in the world and has a high initiation percentage of teenagers to smoking. Thus, it is imperative for non-profit organizations and central and local governmental authorities to discourage young people from starting smoking with the assistance of social marketing initiatives. To our knowledge, this paper is the first attempt to present the suggestions of generation Y, younger and older adult smokers’ on smoking prevention for children and adolescents in the social marketing context. The main proposals of the study’s participants incorporate practices such as parents’ anti-smoking education, more engagement by local communities by providing more public sports facilities so that children can take part in physical activities, celebrities speeches in schools, anti-smoking education in elementary school, intense anti-smoking advertising campaigns, and the prohibition of smoking in public places with simultaneous impositions of huge fines on smokers. Although, these findings are partly similar to indications in the literature, they offer a more holistic and modern view especially from an underexplored population (Generation Y smokers) in a heavy smoking country.

Limitations and suggestions for future research

It is important that some restrictions of the research, which offer opportunities for further research, are recognized. This article presented the results of qualitative research, which was exploratory in its nature. The examination of a small number of generation Y participants, although adequate for this study’s purposes, restricts our ability to make generalizable claims related to anti smoking initiatives in the context of a social marketing campaign.

Despite the limitations, this study contributes to current knowledge about what kind of anti-smoking campaigns Generation Y smokers ask for in order to act proactively towards smoking. Further research can pursue and validate the current findings of this research with new facts and a larger nationwide sample. Despite the increase in public health consciousness of the direct and indirect
effects of smoking, adolescents still try tobacco products. Recognizing the different prototypes of smoke initiation is essential since these differences have important implications for prevention and research. Understanding the micro and macro social context (e.g., family, friends, school) of adolescent smoking is the first step towards designing and implementing smoking prevention programs (Kristjansson et al., 2008).

THE ADOPTION OF ACADEMIC TECHNOLOGY TRANSFER PRACTICES: AN INDIVIDUAL LEVEL PERSPECTIVE

Pucci, Tommaso; Zanni, Lorenzo

Department of Business and Law, University of Siena, Italy

ABSTRACT

The study aims to explore what are the determinants and the intensity of the adoption of academic technology transfer practices. Starting from the analysis of the literature we propose a conceptual model to explain which are the determinants of university-industry relations and how they influence such relations. The model is tested on the faculty of the University of Siena active in the area of Life Sciences with specific reference to consulting and patenting activities. The results show how the University can no longer be regarded as a “monolithic” actor, but as an organization in which the adoption and diffusion of an organizational practice are influenced significantly by the individual characteristics of each subject of the organization. It highlights in particular how a certain scientific reputation is associated positively with the number of registered patents and negatively, over a certain threshold, to the number of consultancies carried out. It finally highlights an “imperfect complementarity” between patenting and consultancies. The latter increased in the presence of a patent, but not vice versa. It therefore seems to exist a trade-off between scientific reputation and university-industry relationships. The achievement of a certain level of scientific quality initially favors the provision of consultancy work, but over a certain threshold, the scientist begins to focus on the scientific productivity. Conversely, with regard to patent, the relationship is positive and the scientific excellence in some way facilitates the transfer of the scientific results in an exploitable asset (the patent).

Keywords: organizational behaviour, technology transfer, academic entrepreneurs, life sciences, university-industry linkages

1. INTRODUCTION

The studies on the technology transfer practices, and in particular on the patenting activity, explode since the 80s also on the wave of some significant public policies adopted by the United States. If we focus on academic technology transfer the theme begins to find ample space in scientific journals since the mid-90s. More recently, many studies in the literature have explored the ways in which individual academics choose and manage their engagement activities with industry (e.g., D’Este and Patel, 2007;
Landry et al., 2010; Giuliani et al., 2010; Colyvas and Haeussler, 2011; Perkmann et al., 2011). The University has in fact begun to support its two historic and traditional missions of education and advancement of knowledge through basic research also with a third mission: to contribute to the economic development of a country or region (Etzkowitz et al., 2000, p. 313). Academic Institutions may in fact contribute to the potential for innovation and R&D (Lazzeroni and Piccaluga, 2003) as suppliers of human capital at different levels and degrees of specialization, such as technology transfer centers promoting the economic exploitation of scientific results, as producers par excellence of new knowledge or as centers of regional development through the management of innovation projects in the area. The way in which this occurs covers a broad spectrum of activity that goes beyond the simple management of intellectual property rights (Cohen et al., 2002; D’Este and Patel, 2007).

Surely the activities mostly explored in the literature were (Landry et al., 2007): Patenting (Henderson et al., 1998; Mowery et al., 2002), Licensing (Thursby and Thursby, 2002) and Spin-off (Link and Scott, 2005; Shane and Stuart, 2002). However, it is now generally recognized that, alongside these, other types of university-industry relations should be considered: consultancy works, joint research programs, and also informal activities such as meetings, seminars, etc (Giuliani et al., 2010; Landry et al., 2010).

We aim to answer to the following research questions: 1) What are the determinants that explain the propensity of an academic to engage in consulting and patenting activities? 2) What are the determinants that have a significant influence on the number of consultancies and the number of patent registrations? 3) Is there a complementary relationship between the two types of activities, and between these and the performance of collateral domains (e.g. scientific productivity)?

2. THEORETICAL BACKGROUND

In the first half of the 2000s many studies on technology transfer have focused in particular on the role of institutions, first of all the universities and the Offices of Technology Transfer (Lamboy, 2004; Bercovitz et al., 2001; Siegel et al., 2003). Despite the increasing attention paid to the institutional role within the process of technology transfer, there is still no consensus in the literature about the determinants of the links between universities and industry (Giuliani et al., 2010). Giuliani et al., (2010) identify two predominant theoretical approaches (Giuliani et al., 2010, p. 749): 1) “evolutionary” and “resource-based view” approaches: in this case the formation of links depends on the capabilities and skills of the actors (single researcher or organizations) who take part, 2) “institutional” approach: the formation of links instead depends on the context in which the actors are established (type of organization, culture, the environment in which the research takes place, etc.). As we have already mentioned, in particular, there is a recent literature on the characteristics of
individual researchers and their role in determining university-industry relationships (e.g. Bercovitz and Feldman, 2008; Boardman and Ponomariov, 2009) and some studies have also tried to combine the two approaches in a complementary manner (e.g. Giuliani et al., 2010; Landry et al., 2010; Perkman et al., 2011). Nevertheless conclusive results in the literature on the determinants of the linkages between universities and industry do not seem to be present yet. (Giuliani et al., 2010, p. 749). First of all, at the theoretical level the two approaches that have prevailed until a few years ago, seem, by themselves, unable to explain the real determinants of U-I interactions due to the presence of different actors (individual vs. organization), stakeholders, logics, etc. This limitation seems now overtaken by a complementary vision of the two theories (e.g., D’Este and Fontana, 2007; Landry et al., 2007b; Boardman, 2009; Landry et al., 2010; Giuliani et al., 2010). In rare cases it has also been sought to understand how participation in activities of technology transfer and the diffusion of the same organizational practice is influenced by the work context in which the individual researcher is operating (e.g. Bercovitz and Feldman, 2008). In particular, the distance that at different levels (cultural, political and technological: cfr Ansari et al., 2010; Fiss and Zajac, 2004) separates the behavior of a researcher from another one of the same organization (department or research group) was not taken into account or only partially considered (e.g. Bercovitz and Feldman, 2008; Giuliani et al., 2010). Finally, in rare cases, it has been investigated the possible effects of complementarity, substitution or independence between the different modes and channels of interaction U-I (e.g. Bercovitz and Feldman, 2008; Landry et al., 2010 Crespi et al., 2011). At the empirical level instead very few longitudinal studies have examined the heterogeneity in the behavior of the individuals involved in technology transfer activities (e.g., Crespi et al., 2011), however sometimes limiting the analysis to few channels of interaction (e.g. Bercovitz and Feldman, 2008). Finally, with respect to many individual and institutional determinants included in the models of engagement conflicting results have been found.

3. CONCEPTUAL FRAMEWORK

Starting in particular from the work of Bercovitz and Feldman (2008), Giuliani et al., (2010), Landry et al. (2010), Landry et al. (2007b), Stephan et al. (2007) and trying to develop, integrating them where possible, the models proposed in these contributions, we propose a framework of analysis that will help to clarify the determinants that, on the one hand, explain the propensity of an academic to undertake consulting or patenting activities and, secondly, explain the extent of these specific relationships between universities and industry. The framework of analysis is shown in figure 1.
Figure 1: the factors that determine and influence the adoption and intensity of technology transfer practices

Compared to the contributions mentioned above institutional nominations have been included among the “status” effects. Among the “reputation” effects we have considered the “access to distant knowledge”. We will verify in fact if the collaboration with foreign colleagues have influence on the extent of university-industry relations or on the propensity to engage in such activities. Compared to the model of Giuliani et al. (2010) we finally have included the effects of what we here call “complementarity”. We wonder if the patenting activity can influence the consulting activity and vice versa (as suggested by Landry et al., 2010, or Bercovitz and Feldman, 2008). Finally, we emphasize that at the level of theoretical premise not all factors that influence the amount of university-industry relations can also determine the propensity of an academic to entertain such relationships as suggested in Stephan et al., 2007.
4. METHODOLOGY

Empirical setting and measures

The study is based on a dataset containing the curricular data, the scientific productivity, the number of registered patent and the consulting activities of 301 academics of the University of Siena, active in the field of Life Sciences. The population was selected basing on the following criteria: 1) be still serving at the Università di Siena at 31 December 2010, 2) be at least the author of an article in the Life Sciences area published in peer-reviewed journals.

In particular, the data sources for each section of the dataset are:

- Scientific productivity: search engines and bibliographic databases available at the University of Siena (in particular ISI Web of Science);
- Curricular variables: curriculum vitae available on line on the website of the Departments;
- Patents: free access patent databases available on line;
- Consulting activities: the data were made available by the Liaison Office of the University of Siena.

The variables included in the model are:

A) Dependent variables:
   a.1) CT: measures the number of research agreements or consultancy works during the period 1991-2010;
   a.2) Patents: measures the number of patents (patent families) registered in period 1991-2010.

B) Independent variables:
   B.1) “Demographic” variables:
       b.1.1) Age: measure the age (in years) of each academic researchers;
       b.1.2) Gender: measured as a dichotomous variable that takes the value “1” if the subject is male and “0” if female.
   B.2) “Educational” variables:
       b.2.1) SpecPhD: measures the level of education attained by the individual academic through a dichotomous variable that takes the value “1” if the person holds a PhD degree or specialization (the latter in the medical field), “0” otherwise;
       b.2.2) Visiting: dummy variable that takes the value “1” if the academic has carried periods of visiting at universities or research centers abroad during their postgraduate training period or already acting as a visiting professor.
   B.3) “Status” variables:
b.3.1) Role: dummy variable that takes the value “1” if the academic is full Professor or associate Professor, “0” otherwise;
b.3.2) InstNom: dummy variable that takes the value “1” if the subject had institutional nominations within its Department or University, “0” otherwise.

B.4) “Reputational” variables:
- Quantity and quality of scientific productivity:
b.4.1) NPubl: total number of publications;
b.4.2) IFcum: cumulative impact factor of the researcher.
- The position within the international scientific network and access to distant knowledge:
b.4.3) NetCentr: indicates the centrality of the researcher within the scientific network measured as: \( d(ni) / (g-1) \) x 100, where \( d(ni) \) is the index of degree within a network and \( g \) is the total number of nodes in the network;
b.4.4) CoautFor: indicates the proportion of foreign co-authors (affiliated to foreign universities) with which the academic has published.

B.5) “Complementarity” variables:
b.5.1) DummyCT: dummy variable that takes the value “1” if the researcher carried out consultancy works, “0” otherwise;
b.5.2) DummyPat: dummy variable that takes the value “1” if the academic has registered a patent, “0” otherwise.

B.6) “Institutional” variables:
b.6.1) SizeDept: For each researcher measures the number of researchers affiliated to their Department;
b.6.2) PeerEffCT: For each subject is measured as the difference between the total numbers of consultancies carried out by the researchers affiliated to the Department and their own;
b.6.3) PeerEffPat: For each subject is measured as the difference between the total number of patents registered by the researchers affiliated to the Department and their own;

Finally, we have included in the model the dichotomous control variable MED that takes the value “1” if the researcher belongs to the medical field, “0” otherwise. It is not possible at present to use the variable spin-off for the small number of academics who have participated in the creation of entrepreneurial activity.

5. RESULTS

In order to investigate the university-industry relationships and a series of relevant factors, we have chosen to use a count data model based on the likelihood approach: the zero-inflated negative
binomial (ZINB) model. The choice is motivated both by the discrete nature of the response variables (consultancies and patents) and by the high proportion of zeros within these (cfr Stephan et al., 2007 or Landry et al., 2007b). In particular, the excess of zeros may arise from two distinct processes: in the first case the value “0” is recorded for those academics who have never done consultancy work or registered patents, respectively, in the second case, the “0” can originate from the fact that the academics of the sample did not do some of the two activities investigated in the time window considered.

Tables 1 and 2 show the descriptive statistics of the response variables (number of consultancies and the number of patents) with reference to the dichotomous independent variables used.

Table 2: Descriptive statistics of the number registered patents by the dichotomous variables

Table 3 shows the descriptive statistics of all variables and their correlation coefficient.
Table 3: Descriptive statistics and correlations

The analysis of the correlation matrix shows some problems of collinearity between variables. To overcome these problems, we have decided to exclude from the analysis the variable NPubl.

We show now the results of the econometric model before processing with reference to consultancies and then to patents. As already mentioned, the ZINB model used in the econometric analysis that follows begins with the estimation of the probability that the response variable takes the value zero.

To check and initially limit the number of variables to be inserted in the inflate section (the one that estimates the probability of zeros) of the ZINB model, we have proceeded to initially and separately estimate a classical logit model. In both cases, pre and post removal of six outliers, the results show that the analysis of the correlation matrix shows some problems of collinearity between variables. In particular, the significant correlations between Age and academic Role (ρ = 0.600), between SizeDept and PeerEffCT (ρ = 0.635), between SizeDept and PeerEffPat (ρ = 0.601), between NPubl and NetCentr (ρ = 0.859) and between NPubl and IFcum (ρ = 0.910), leave doubt about their collinearity.

To overcome these problems, we have decided to exclude from the analysis the variable NPubl.

We show now the results of the econometric model before processing with reference to consultancies and then to patents. As already mentioned, the ZINB model used in the econometric analysis that follows begins with the estimation of the probability that the response variable takes the value zero.

To check and initially limit the number of variables to be inserted in the inflate section (the one that estimates the probability of zeros) of the ZINB model, we have proceeded to initially and separately estimate a classical logit model. Table 4: Results of the zero-inflated negative binomial regression for number of consultancies

Not significant collinear variables were excluded from the analysis.

For the consultancy activity (CT), the probability of being zero increases with the decreasing of the cumulative IF (IFcum) and with the size of Department (SizeDept), as well as it decreases in the presence of institutional nominations (InstNom) and with the academic role (Role).

Gender, Age, Visiting and DummyPat are positive predictors of the number of consultancies. SpecPhD is negatively associated. It is interesting to note that the scientific reputation (IFcum) is a
determinant of the propensity to engage in consulting activities but is negatively associated with the number of the latters. This gives a U-shaped inverted relationship. If the IFcum grows, the number of predicted events (consultancy works) increase up to a certain threshold and then it decrease. The same survey methodology was then carried out with reference to the number of patents (Table 5).

Table 5: Results of the zero-inflated negative binomial regression for number patents

With regard to the patenting activity, the probability that this takes the value “0” increases when PeerEffPat decreases, in correspondence of the Role and finally in the case of a Visiting. Regarding instead to the predictors of the number of patents, only the IFcum and the size of the Department (it is
possible to obtain the same result by replacing the collinear variable PeerEffPat) are positively associated with the number of registered patents.

6. DISCUSSION

First, the comparison between the two types of technology transfer activities shows that the reputation acquired by researchers thanks to the quality of their scientific productivity is a positive predictor of the number of registered patents (complementary effect) but a negative one (beyond a certain threshold) of the number of consultancy works (substitution effect). This result is in line with that part of the literature arguing that a trade-off between scientific publication and university-industry relations exists (e.g. Landry et al., 2007a). Achieving a certain level of scientific quality takes time and dedication subtracted to consultancy activity and vice versa. In the case of patents the relationship is positive. A part of the literature in this regard has shown that the number and quality of publications brings to excel in other activities such as patenting (e.g. Breschi et al., 2008). Figure 2 highlights the two relationships.

![Figure 2: Predict number of events (Consultancies and Patents) as a function of the scientific quality](image)

The patent is a factor whose presence ensures a positive margin in terms of the number of consultancies. This can be attributed to the fact that having a patent can motivate companies to apply for academic collaboration in order to use or to incorporate scientific discoveries into their activities.
As regards to the other individual variables, age and gender are positive predictors for the number of consultancies as already part of the literature supports (e.g. Boardman and Ponomariov, 2009). Also a visiting period in a foreign university or research centre increases the number of consultancy works while it decreases in the case of specialization or PhD. In both cases (visiting and degree of education) Giuliani et al. (2010) do not reach significant results. Our result is supported, however, by what the same authors argue: a high specialization level may lead to the academic focus on the scientific productivity (Giuliani et al., 2010, p. 750). Coming to the institutional factors the size of the Department is a positive predictor of the number of patents (see Landry et al., 2010) but also a positive factor in explaining the propensity of the researcher to engage in consulting activity. Compared to the patenting activity, the distance (in terms of patents) from the colleagues of the Department (PeerEffPat) is a key factor to explain the propension and a positive predictor of the number of patents (cf. Bercovitz and Feldman, 2008). Finally, the role and the institutional nominations are significant in explaining the propensity of the academic to undertake consulting activities. The reputation of the subject due to his academic status increases the probability of seeing him involved with the industrial world (cfr D’Este and Patel, 2007; D’Este and Fontana, 2007; Boardman and Ponomariov, 2009).

7. IMPLICATIONS, LIMITS AND FUTURE RESEARCH DEVELOPMENT

The study confirms that the University can no longer be regarded as a “monolithic” actor as claimed, until the end of 80s, by the most of the literature that has dealt with the relationships between university and industry (Link and Tassey, 1989, p. 49). The universities today present themselves as “organized anarchy” (Cohen et al., 1972; March et al., 1976) where the individual characteristics can influence significantly the propensity of the single academic to maintain links with industry (Landry et al., 2010; Giuliani et al., 2010). This raises new problems for the governance of the academy (Kraatz and Ikenberry, 2005; March et al., 1976). New analytical frameworks are necessary to understand and evaluate the technology transfer processes (Landry et al., 2010; Haeussler and Colyvas, 2011; Perkmann et al., 2011) and their diffusion within the organization. The study suggests that policy makers and university administrators have to formulate their knowledge transfer strategies based on portfolios of activities (cfr Landry et al., 2010) rather than on a single technology transfer practice. In line with the obtained results it is possible to differentiate the activities of the academics to maximize their performance, in particular by identifying the threshold levels among scientific productivity and other technology transfer activities. On this basis it is possible to provide incentives and/or different career development allocating resources to maximize the outcomes of the portfolio of activities rather than a single practice. For example to anchoring the career advancement of single
The scholar to the only scientific productivity, as happens in many countries (e.g., Italy), may not be the most effective and efficient way to promote the development of the University limiting, de facto, the capability to raise external funding sources.

The proposed research highlights some limitations. In particular, the analysis was conducted only on one medium-size university. A subsequent analysis of most universities (of different sizes) and, possibly belonging to different national systems, would help to further validate the results achieved. Secondly, a longitudinal analysis of the phenomenon could allow to strengthen the results. Finally, the analysis was carried on a single scientific field, albeit large, the Life Sciences.

REGION OF ORIGIN AND PRODUCT KNOWLEDGE. A CROSS-NATIONAL ANALYSIS OF THE PURCHASING DECISIONS OF CHIANTI CLASSICO WINE

Pucci, Tommaso1; Rabino, Samuel2; Zanni, Lorenzo1

1Department of Business and Law, University of Siena, Italy
2D’amore-McKim School of Business, Northeastern University, Boston, US

ABSTRACT

The paper explores the country of origin (COO) effect in the wine sector with particular emphasis on the region of origin (ROO) as a factor when evaluating alternatives in the purchasing decision-making process. The ROO identifies key information about the product. It is now generally recognized that the terroir is a crucial attribute for the quality of a wine. We have focused on case study of the appellation of Chianti Classico on the German, British, USA and Canadian markets. The choice is motivated by the long history and international reputation of the Chianti Classico. Specifically, the paper aims to answer the following main research questions: what is the importance of the country of origin/region of origin assigned by consumers in an evaluation of Italian wines and the evaluation of Chianti Classico? Is there a relationship between the region of origin and knowledge of wine in the choice processes of the buyers? The image of the Chianti Classico influences the willingness to pay a premium in the analyzed markets included in the current study? Is there a difference in product perception and buying behavior among consumers of “Old” and “New World”? The analysis was conducted on a total sample of 2,380 consumers. The results confirm the importance of the COO and especially the ROO in the process of purchase of wine products. Specifically, it reveals that COO and ROO influence on the purchasing process in different ways, and that knowledge and a familiarity with a brand might have a moderating effect on purchase decisions. It was also found that in cases where consumers were not familiar with the product choices the ROO effect might be positive factor leading to acceptance of higher prices for wines originating in well recognized regions.

Keywords: Region of Origin, Country of Origin Effect, Knowledge, Wine

RELEVANT LITERATURE AND THEORETICAL BACKGROUND

During recent years the importance of the “made in” information as a cue in product evaluation has grown considerably (Bloemer et al., 2009) and many scholars have focused their research on the
Country of Origin (COO) (Ashil and Sinha, 2004; Pucci et al., 2012) that is the country where the product is manufactured (Bilkey and Ness, 1982). The COO is a not-physical attribute of the product (extrinsic cues) on which consumers can base their purchasing decisions (Cattin et al., 1982; Kakamura and Agarwal, 1999), especially in situations in which intrinsic cues (e.g. design, taste, performance, etc.) lack or is not possible to evaluate them. The relevance of the origin depends on the cognitive relations that a consumer establishes between the place of origin of the product and the perceived quality of the attributes of the same (Verlegh and Steenkamp, 1999). This is particularly true for agricultural products (Thode and Maskulka, 1998), where the Region of Origin (ROO) identifies basic information about the product (Ittersum et al., 2003; Keown and Casey, 1995). The ROO is in fact an area with specific characteristics (e.g., tradition, culture, environment, etc.) identifiable from other areas of the Country. The ROO plays a decisive role in particular in the purchasing process of wine’s consumers and it is now generally accepted in the literature that the terroir is an attribute inextricably linked to the quality of the wine itself (Keown and Casey, 1995; Heslop et al., 2010; Remaud and Lockshin, 2009). The specific characteristics of the wine make it impossible to assess the quality before having consumed the product. Among the extrinsic cues the ROO is therefore one of the fundamental attributes of the wine product on which consumers can base the selection process (Schamel and Anderson, 2003; Perrouty et al., 2006). The importance of ROO is also recognized, in agri-food sector, by the existence of geographic indications (GIs) as protected geographical trademark (Čačić et al., 2011). Heslop et al., 2010 suggest that the ROO does not simply describe the origin of the product (extrinsic cue) but it also encompasses intrinsic attributes (e.g. the soil) which contribute to quality and taste of wine product. The ROO is therefore a complex attribute and its effect can be influenced by the knowledge that the consumer has about the product's origin. On the one hand, the literature has shown that the effect of COO in the buying process is negatively associated with the level of product knowledge (Rao and Monroe, 1988; Maheswaran, 1994; Veale et al., 2006). In the case of ROO some researchers suggested that the use of ROO as a promotional instrument increases with the level of expertise of the consumer with respect to the evaluated wine category (Rasmussen and Lockshin, 1999; Guidry et al., 2009; Atkin and Johnson, 2010). Some authors have also suggested that this direct and positive relationship between knowledge and the effects of ROO may not be generalizable to regions whose popularity has spread independently of the region itself (e.g. Chianti, Brunello di Montalcino, Bordeaux, etc.). The research of Losi et al., 2012, suggests for example that in the case of internationally known wine regions, the ROO effect on wine purchasing process is strong not only for experienced consumers but also for those with little knowledge of wine choices.
The present work focuses on evaluating effects of COO in the wine sector with particular emphasis on the ROO as an attribute used by consumers when evaluating choices during. The case study that we develop is the appellation Chianti Classico in the American, German, Canadian and English markets. The choice is driven to a large extent by the long history and international reputation of Chianti (Keown and Casey, 1995; Famularo et al., 2010). The Chianti Classico appellation, in particular, is the most ancient area in the Chianti Region with a production of approximately 3% of the entire Italian wine production (Malorgio and Grazia, 2007). Secondly the appellation Chianti Classico historically has been oriented toward the generation of sales in export markets. According to the statistical reports of the Chianti Classico Wine Consortium (Consorzio Chianti Classico, 2010) in fact, the four countries under investigation represent the first four in terms of volume of exports.

In particular, we aim to answer the following four main research questions:

1. What is the relative importance of the country of origin/region of origin that might be assigned by consumers when evaluating Italian wines and Chianti Classico?
2. Does there exist a discernible relationship between the region of origin and knowledge of wine in the decision-making process of the consumer?
3. Does the image of the Chianti Classico brand influences the willingness to pay a premium in the evaluated markets?
4. Do product perceptions and buying behavior differ among consumers of “Old” vs. “New World”?

**EMPIRICAL SETTING AND METHODOLOGY**

The case study that we explore is that of the Chianti Classico wine. The territory of Chianti Classico was first officially identified in 1716 on legal notice by the Grand Duke of Tuscany Leopold III. At that point the production area (about 70,000 hectares) was delimited according to Italian ministerial decree in 1932 (Malorgio and Grazia, 2007). The recent legislation (ratified in 1996) establishes that the composition of the Chianti Classico wine has to be of minimum 80% Sangiovese grape and for a minimum of 20% of other red grapes varieties as for example Merlot or Cabernet Sauvignon (www.chianticlassico.com).

The research was based on a questionnaire composed of twelve closed questions (five of them using a Likert scale 1-5). The questionnaire concluded with five questions for demographic related questions including gender, age, income, employment and the level of education of respondents. The questionnaire was translated and corrected by a native speaker for each of the four countries included in the study and then retranslated into Italian to reflect any deviations from the understanding of the contained terms. The population of interest represents adults wine consumers. The sample consists of
2,380 consumers. The characteristics and the geographical distribution of the sample are shown in Table 1.

Note: * likert scale 1-5; ** Dichotomous variables

Table 1: Characteristics of the sample

Although the composition of the sample by area appears heterogeneous in terms of socio-demographic variables (age, education level, etc.), the sample size was appropriate considering our focus on cognitive processes vs the generalization of overall results (cf. Aiello et al., 2009).

RESULTS

To analyze the main research objective, a question which contained the relevance of different extrinsic and intrinsic cues was asked. Interviewees were initially asked to rate each attribute on a five-point answer scale ranging from “not at all important” to “extremely important”. The chosen cues were selected by different prior researches (Perrouty et al., 2006; McCutcheon et al., 2009; Atkin and
Johnson, 2010; Spielmann and Babin, 2011). Five attributes were chosen: Brand name, COO/Appellation of Origin, Alcohol content, Grape variety and price. Figure 1 compares the five attributes with reference to the wine in general with those specifically referring to the Chianti Classico wine. Values included in the continuous circles did not suggest a statistically significant difference at level $t < 99\%$. Values included in the dashed lines did not suggest a statistically significant difference at level $t < 95\%$.

With regard to the first research question, analysis indicates that the COO represents a critical attribute when purchasing wine, in particular for Canada (4.08) and Germany (3.83). It is also important, albeit less, for the U.S. (3.50) and the UK (3.05). In the purchasing of Chianti Classico wine the ROO is important for the American consumer (3.91) as well as for German (3.83) and Canadian consumers (3.64). Less important is for the UK market (2.86).

Figure 1: Comparison between relevant attributes in wine purchasing process and those in “Chianti Classico” wine.

The Future of Entrepreneurship

It also points out that for all four analyzed markets in the case Chianti Classico wine, the brand is more important than it is for the purchasing of wine in general, highlighting the Chianti Classico brand awareness compared to other wines. As for the attribute price, there are no significant differences with regard to the purchase of wine and buy wine Chianti Classico in any of the four markets although the variable appears more decisive with regard to the U.S. and UK. Finally, as regards the percentage of alcohol in the U.S. alone this variable is important.

To answer to the second and third research questions respondents were asked to rate (on a Likert scale) how strongly they associate each attribute with Italian wine and with Chianti Classico wine, from 1 as the lowest level of association to 5 as the highest level of association. In the first case, we attempt to assess the “country-related product image” (CRPI), namely the image of a specific product from a country (Bursi et al., 2012). In the second case, we evaluate the “region-related product image” (RRPI), namely the image of a specific product from a Region. All the attributes were selected by a previous research study Conducted by Zamparini et al., 2010, except from “trendy”, that in Zamparini’s study was called innovative. The same scale was used in Losi et al., 2012. Figure 1 compares CRPI and RRPI for each analyzed market. Values included in the circles do not have statistically significant difference at level t < 99%.

First, it is evident that consumers of USA, Canada and UK associate to Chianti Classico wine each of the attributes proposed lower values compared to the same Italian wine (in all three cases, the gray line is in fact always below the darker line used for the CRPI). The image of Chianti Classico therefore seems to have a more significant value compared to Italian wines in general only for the German market.

Tradition/culture and high quality are the attribute with the highest associations with regard CRPI and RRPI for the U.S., Canada and Germany. UK also gives higher values to tradition / culture but acknowledges the major Italian wine elegance. The UK consumers are also those that differentiate more the image of the Chianti Classico wine from that of Italian wine in general.
USA consumers are those who attribute higher values to all the attributes both in the case of the Chianti Classico wine that in the case of Italian wine in general, and are also those for which the difference between the two perceptions (CRPI and RRPI) is the smallest.

Respondents were asked to assess the level of their wine knowledge (the last question in figure 3) and the level of the Italian wine knowledge. With reference to the Italian wine knowledge, this is rated according to the familiarity of respondents with Italian wine, to their ability to distinguish among different Italian wine regions and to their propensity to search on web some information about Italian wines.

Figure 2: Country-Related Product Image (CRPI) and Region-Related Product Image (RRPI)
Canadian and British are the two groups of consumers with the highest knowledge of the wine products, 3.25 and 2.84 respectively. USA consumers exhibited the highest level of familiarity with Italian wines (3.22), while the Canadians were more able to differentiate among the different Italian wine regions (2.83). In order to gain Table 2 provides consumption information specific to Chianti Classico and shows the percentage of customers within each country that consumed at least once a Chianti Classico wine and visited at least once in the Region.

### Table 2: Consumption experience and visit of the Region

</tr>
</tbody>
</table>

Approximately 93% of Canadian respondents consumed at least once a bottle of Chianti Classico wine and in 43.03% of cases they actually visited the region of production. The Germans have a high level of consumption experience (85.45%). Within the German sample also included were consumers who visited region of Chianti Classico the most (45.49%). Only in 9.76% of cases, however, American respondents also visited the region.
Finally, Table 3 shows the willingness to pay more for an Italian wine and for a Chianti Classico wine.

</tr>
</tbody>
</table>

*Table 3: Willingness to pay more for an Italian wine and for a Chianti Classico wine*

British consumers, Americans and Canadians in more than 60% of cases are willing to pay more for an Italian wine and in more than 50% of the cases would be willing to pay more for a Chianti Classico wine. Only in 38% of cases, however, German consumers recognized a greater value to Italian wine but in only 46% of cases they were willing to pay more for a bottle of Chianti Classico wine.

**DISCUSSION, CONCLUSION AND FURTHER RESEARCH**

This empirical analysis carried out confirms the importance of the COO and especially the ROO consideration when examining wine purchase decisions. The role of information on the country/region of origin can have a dual impact on the consumer's evaluation process (Han, 1989): first the so-called "halo effect" namely the fact that the COO can serve as a qualitative signal in all those situations in which the consumer is not familiar with the product or the brand; secondly, the "summary effect" i.e. the abstraction process that takes place when an image of a country is grounded in previous experiences and perceptions of the attributes that characterize products from that country. In sum, the evaluation of the product quality or brands originating in a specific territory is based on the two effects cited (Yasin et al., 2007; Jaffe and Nebenzahl, 2001).

Despite the importance of COO and ROO in the process of wine purchasing by the consumers of the four countries analyzed, the comparison of Tables 1, 2 and 3 and Figures 1, 2 and 3 indicates a large heterogeneity in the perceptions of the attributes of the italian wines in general and Chianti Classico wine in particular. This shows how the effect of Country of Origin and Region of Origin depend strongly on the cultural context within which the two phenomena are analyzed.

The USA customers have a low knowledge of wine and use the COO information as an important element during the product evaluation process. The same consumers have a higher knowledge of Italian wine and assign importance to ROO when making choices. Ultimately, Americans were found to be willing to pay more for an Italian wines in general rather than specifically for a Chianti Classico. The British have little knowledge of wine in general is that of Italian wine. COO and ROO have less effect on the purchasing process respect for U.S. consumers; however, are willing to pay more for an Italian wine or a Chianti Classico in particular. Canadians have high level of wine knowledge and a
high knowledge of Italian wines. COO and ROO are important in their buying process and they are willing to pay more for either Italian wines or a Chianti Classico. Even though an high percentage of Germans (85,45%) consumed a Chianti Classico wine, they were found to possess little knowledge of Italian wines and of wines in general. They use ROO and COO as considerations in the decision-making process but are willing to pay more for the Chianti Classico wine.

The results thus confirm that COO and ROO effects play a role the buying process in different ways, and also that knowledge and familiarity with the product might have a moderating effect on choice behavior. Even in cases that reflect a very limited knowledge, the effect of ROO is positive with respect to the willingness to recognize a premium price for wines from well known regions such as Chianti Classico (cf. German consumers), but it is also true that for expert consumers (e.g., Canadians) the effect of ROO is equally positive.

With regard to the final research question, it was concluded that there was no particular evidence that the ROO and COO effects are at work for consumers originating from “New World” (USA and Canada). The same applies for consumers coming from “Old World” (UK and Germany). In this regard, a repetition of our survey in different countries will deepen the understanding with regard to COO and ROO contributions to the overall choice process as experienced by wine consumers.

ABSTRACT

Two of the world’s largest markets, the EU and China, have initiated negotiations to lower down their markets’ barriers in pursuit of a multi-billion-dollar free-trade deal. Although the European Commission has proposed a new generation of competitiveness-driven bilateral free trade agreements with emerging and developing countries, some EU member countries are skeptical of China’s trade practices which have halted Brussels and Beijing negotiations. However, some EU officials have suggested that this agreement will be a stepping stone for future liberalization of the EU economy and that a free trade agreement with China is only a matter of time. The purpose of this study is to investigate the comparative advantage of EU members and China, how complementary trade is between the EU and China and how similar are the exports of these prospective FTA partners. This is a research paper based on secondary data analysis; data is obtained from various official entities. This study uses statistical and machine learning techniques in order to detect meaningful trade relationships between the EU and China.

Keywords: Free Trade Agreements, International Treaties, Bilateral Trade Agreements, Double Taxation Treaties, European Union, China

INTRODUCTION

In recent years, the trade partnership between the EU and China has developed significantly; China has become the EU’s biggest source of imports as well as one of the EU’s fastest growing export markets. Likewise, the EU has also become China’s biggest source of imports. It has been estimated that currently China and Europe’s trade surpasses €1 billion a day (European Commission, 2014). Despite this significant trade partnership development, the EU records an important trade deficit with China. This is in part a reflection of China’s extraordinary trade evolution, since it became a member of the WTO in 2001 (Rodrik, 2006; WTO, 2011). China’s exports rate of growth has been estimated to reach 30 percent a year before the financial crisis. Currently, around 70 percent of all goods manufactured in China are exported (Li et al., 2014).
China’s free trade policy has been driven by the need to secure its export growing trend and has been increasingly active in trade agreement negotiations with developed and developing countries. Since 2001, China has signed 12 trade agreements, it has six under negotiation and four under consideration; negotiations under consideration emphasize large markets such as the EU and US markets (Li et al., 2014). For a number of years, China has represented to the developed countries the opportunity of a low-cost labour force (Feenstra and Wei, 2009). Nowadays, this given fact is reversing as China is producing sophisticated components that require high-skill labour force that compete with developed countries’ manufacturing products. Such competition has been related to controversial issues associated with anti-dumping and unfair competition (European Commission, 2014).

The aim of this study is to investigate the comparative advantage of EU members and China, how complementary trade is between them and how similar are the exports of these prospective FTA members. The study reported in this paper can provide fundamental knowledge for policy makers in Europe, specially when updating the policy agenda for free trade negotiations. The remainder of this paper is organized as follows: section 2 introduces the conceptual background of bilateral investment agreements. Section 3 presents an overview of related literature in this topic of research, section 4 specifies the methodology utilized in this study. Section 5 presents the findings of our study, while section 6 addresses policy implications. Finally some conclusions and recommendations are provided in the section 7.

**CONCEPTUAL BACKGROUND**

Although the free trade doctrine dates back to the days of the famous economists Adam Smith and David Ricardo, it is only in the past three decades that countries from around the world have been embracing free trade agreements. The early doctrine of free trade advocated that free trade among countries leads to economic efficiencies through trade diversion. Today, the World Trade Organization (WTO) argues that free trade is directly associated with economic growth and development (WTO, 2011). The WTO promotes free trade negotiations intended at reducing international trade barriers and ensuring fair trade competition for all negotiating countries. Together with its predecessor organization the GATT, the WTO has established a strong international trading system from which 159 countries are members of this organization (WTO, 2014).

Despite the growing recognition of the role of free trade agreements, there is no consensus on the definition of these legal instruments; however, the following definition explains some of the common features of free trade agreements:

“The WTO agreements cover goods, services and intellectual property. They spell out the principles of liberalization, and the permitted exceptions. They include individual countries’ commitments to lower
customs tariffs and other trade barriers, and to open and keep open services markets. They set procedures for settling disputes. They prescribe special treatment for developing countries. They require governments to make their trade policies transparent by notifying the WTO about laws in force and measures adopted, and through regular reports by the secretariat on countries' trade policies.” World Trade Organization (2014)

Although the term Free Trade Agreements (FTAs) is commonly used for a variety of legal trade instruments such as bilateral trade agreement, regional trade agreement, free trade agreement, reciprocal trade agreement and preferential trade agreement, such instruments are used at different times and in different ways, differing largely from FTAs. Free Trade Agreements comprise preferential arrangements under which tariffs and some other barriers to trade are lowered only for those countries party to the agreement; these barriers for other countries are not reduced by the agreement (Brownsell et al., 2012). Therefore, distinguishing the characteristics of each of these legal instruments is an important endeavor in the assessment of their effects.

RELATED LITERATURE
The rapid increase of international trade flows in recent decades has motivated a large and growing body of academic literature in this field. Some theoretical and empirical papers go back to the fundamentals of the theory of comparative advantage developed by David Ricardo (1817). Ricardo argued that economic prosperity will increase when countries specialize in producing goods that have a lower opportunity cost and engage in trade exchange. The theory of comparative advantage, also known as the international trade theory, is one of the most famous theories in the field of international trade and has been conveyed by a number of economists among them Harberler (1930), Vainer (1937), McKenzie (1954), Jones (1961), Paul Samuelson (2001), Shiozawa (2007). While international trade theory states that benefits from trade come from the specialization in a country's comparative advantage (Maneschi, 1999), the benefits of a country engaging in free trade agreements are stated by the theories of trade agreements.

In today's economic literature, two theoretical approaches that offer a foundation for trade agreement analysis are found: the terms-of-trade theory and the commitment theory. Both theories suggest that countries engage in signing free trade agreements to enhance their economic development policies (Obradovic, 2012). However, these theories differentiate from each other by suggesting different reasons for signing these legal instruments. The terms-of-trade theory suggest that in the absence of trade agreements countries engage in war trade which is detrimental for all countries' economy. This theory states that free trade agreements permit negotiating countries to cooperate and evade such trade war of protectionism (Maggi and Rodriguez-Clare, 2005). Whereas the commitment theory
suggests the benefit in signing a trade agreement follows from the negotiating governments committing to specific policies and to resisting pressures from domestic special interests groups. Although these theories are not mutually exclusive, both theories suggest that identification of the economic benefits for the negotiating countries as imperative (Bagwell and Staige, 2011).

There are considerable advantages for countries that engage in the liberalisation of tariff barriers which is the primary purpose of free trade agreements (Kirkwood 2011). In the present global economy, domestic industry attains significant commercial opportunities that are absent in the domestic economy. Trade liberalisation can be a positive force for economic growth and development; policies that reduce trade barriers facilitate the movement of goods and services, and deliver economic benefits (Stiglitz and Chalton, 2005; WTO, 2011). It has been found that by engaging in trade liberalisation, some countries have boosted their economy following exposure to international competition, via greater innovation and efficiency of domestic industry (Staiger and Tabellini, 1999).

Despite some significant advantages that trade agreements may bring to a country, there are also significant challenges that trade liberalisation can deliver to the domestic economy; these can be directly attributed to the levels of skills of the labour force (Obradovic, 2012). However, evidence also suggests that trade liberalisation has not benefited other countries as some sectors of their economies were unable to compete in the international market; those sectors were mainly labour intensive sectors that produced low-priced goods (Stiglitz and Chalton, 2005). The World Trade Organization (WTO) tried to address these issues in the Doha Round in 2001.

The same year that the Doha Round commenced, China became a member of the WTO. China’s main reason for joining the World Trade Organization was the securing of access for its export sector into the global market (Li et al., 2014). The incorporation of China as a member of the WTO has greatly benefited its economy, seminal empirical studies have demonstrated the advantages China has obtained from its WTO membership (Van-Hoa, 2008). Chinese economic reforms that started in the late 1970s, have led to the emergence of the Chinese economy based on openness and competition. Today, one of the prominent feature of the Chinese economy is its economic competitiveness expressed in the outsized surplus of its balance of payments due to the outstanding performance of the export sector. The remarkable performance of the export sector is reflected in the impressive growth of Chinese GDP in recent decades (World Bank, 2013). This extraordinary economic growth has led China to surge as an economic and political world leader, impelling an interesting discussions among academic, policy makers and business leaders.

The Chinese export sector has been characterised by its labour intensive manufacturing and low cost of production, features that have been the main attractions for foreign investment (Rios-Morales and Brennan, 2010). Although China is the world’s manufacturing base, its considerable global presence in
international trade poses challenges to trading partners; some countries have experienced the decline of their exports due to strong Chinese competition (Feenstra and Wei, 2009). China has become an outstanding competitor in export markets, as well as the world’s largest importer of raw material, intermediate inputs, and other goods (WTO, 2011). Furthermore, its manufacturing sector has experienced rapid development and sophistication, producing exports labeled as high-tech (Wang and Wei, 2010). The Chinese government has been actively promoting the rising sophistication of the manufacturing sector through the creation of high-tech industrial zones around the country (Rodrik, 2006). The sophistication of the export sector indicates that manufacturing skills have also been upgraded; enhanced exports are directly attributed to higher levels of skills (Van-Hoa, 2008). Therefore, China has emerged as a direct competitor with producers in developed countries (Feenstra and Wei, 2009).

METHODOLOGY

The availability of comprehensive datasets and the very limited set of empirical studies on EU-China comparative advantages related to free trade agreements have motivated us to employ quantitative approaches to provide an assessment of the potential economic effects of the proposed free trade agreement. This is a research paper based on secondary data analysis; data is obtained from various official entities. This study uses statistical and machine learning techniques in order to detect meaningful and relevant trade relationships between the EU and China.

In order to be able to compare trends for economies that significantly differ in their size, we have computed relative rankings for a closed set of countries consisting of China and 27 EU countries. The computation starts by building two ordered lists of countries in respect of the value of their imports from some target country and exports to the same target country. Table 1 presents the lists for Austria in year 2012 for the total of all commodities.

Table 4: Ordered lists for Austria

<table>
<thead>
<tr>
<th>Country</th>
<th>Imports from Austria (in millions of USD)</th>
<th>Import rank</th>
<th>Country</th>
<th>Exports to Austria (in millions of USD)</th>
<th>Export rank</th>
</tr>
</thead>
<tbody>
<tr>
<td>Germany</td>
<td>50,000</td>
<td>27</td>
<td>Germany</td>
<td>74,000</td>
<td>27</td>
</tr>
<tr>
<td>Italy</td>
<td>11,000</td>
<td>26</td>
<td>Italy</td>
<td>11,000</td>
<td>26</td>
</tr>
<tr>
<td>France</td>
<td>7,400</td>
<td>25</td>
<td>Netherlands</td>
<td>8,300</td>
<td>25</td>
</tr>
<tr>
<td>Estonia</td>
<td>-</td>
<td>-</td>
<td>Latvia</td>
<td>33</td>
<td>3</td>
</tr>

<td>127</td>
<td>2</td>
<td>Cyprus</td>
<td>12</td>
<td>2</td>
</tr>
<tr>
<td>Malta</td>
<td>44</td>
<td>1</td>
<td>Malta</td>
<td>8</td>
<td>1</td>
</tr>
</tbody>
</table>

The positions of countries in the lists determine their export and import ranks. The country that is first in the list has rank 27 while the last one has rank 1. Taking Austria as an example, Germany has both...
import and export ranks of 27 while Malta has both ranks of 1. Relative rank is defined as the difference between the export and the import ranks for the same country:

\[ \text{Relative rank} = \text{Export rank} - \text{Import rank} \]

When Austria is the target, then in year 2012 relative ranks for Germany, Italy, Cyprus, Malta and some other countries are 0 because they have identical export and import ranks. The largest relative rank of 9 relates to the Netherlands (export rank 25, import rank 16) while the smallest value of -4 relates France (export rank 21, import rank 25) while China’s relative rank is -4 (export rank 15, import rank 19). Higher values of relative ranking are characteristic of more export oriented economies.

The total relative rank for an individual country is the sum of relative ranks computed for in respect of all of the other members of the closed set of 28 countries:

\[ \text{Total relative rank} = \sum_{\text{all members}} \text{Relative rank} \]

For the year 2012 for the total of all product types, the highest total relative rank in the set of 28 countries obtains for China and equals 135. The lowest value obtains for the UK and equals -84.

A characteristic of the above defined measure is that it defines export/import characteristics of a country regardless of the actual size of the economy and regardless of general trends in international trade. For example, it means that in spite of absolute increasing trade data, the ranking of a country can be decreasing. The methodology is especially appropriate for recognizing long term trends.

**FINDINGS**

Our findings suggest that trade between the EU and China have risen at a substantial rate since 2003. In recent years, China has become the EU’s biggest source of imports as well as one of the EU’s fastest growing export markets. Likewise, the EU has also become China’s largest source of imports. It has been estimated that currently China and Europe’s trade surpasses €1 billion a day (European Commission, 2014). In the context of the development of this significant trade partnership, the EU records a significant trade deficit with China (figure 1). In 2012, the EU-China trade ratio was 0.55 (total EU exports of goods to China divided by total EU imports of goods from China). It was also found that among the EU countries, Austria and Germany have a positive trade balance with China, with ratios of 1.65 and 1.24, respectively. However, for all other EU countries the ratio was below 1.0.
Figure 1: EU27 to China total exports and total imports (in billions of USD)

![Graph showing EU27 exports and imports to China from 1995 to 2010.]

Total all commodities EU27 exports and imports from China in billions of dollars.

In terms of comparative advantages, we have found that the EU has comparative advantages over China in trade for the following commodities: high-skill (ratio 1.34) and medium-skill technology-intensive manufacturing products (ratio 1.96), road vehicles (ratio 4.57), primary products (ratio 1.69), and chemical products (1.19). For the following items EU has ratios less than one: manufactured goods (ratio 0.48), machinery and transport equipment (ratio 0.67), miscellaneous manufactured articles (ratio 0.13), labour-intensive and resource-intensive manufactures (ratio 0.08), office machines and automatic data processing machines (ratio 0.03).

Figure 2: Ratio of EU exports to and imports from China for high skill manufactures. France, Sweden, and Ireland had highest ratio among all EU27 countries in year 2012.

![Graph showing the ratio of EU exports to and imports from China for high skill manufactures from 1995 to 2010.]

France, Sweden, and Ireland had highest ratio among all EU27 countries in year 2012.
Ratio of exports and imports from China for high skill manufactures. It is presented as a total for all EU27 (blue) and for France, Sweden, and Ireland that had highest ratio among all EU27 countries in year 2012.

High-skill and technology-intensive manufactured products are potentially very relevant for EU. In year 2012 they represented 20% of total EU export. Among EU countries most successful have been France (ratio 4.06), Sweden (ratio 3.77), and Ireland (ratio 2.90) (Figure 2). In this respect the most interesting is Sweden which has recorded an almost constant increase of the export/import ratio of high-skill products with China over a period of 15 years. Large differences among EU countries can be noticed. Many less developed EU countries have a ratio in high-skill products of less than one. Actually, significant changes can be noticed within EU. When we look at the ranking data (Figure 3) then Poland is a success story with increase of almost 35 ranks in the period of 10 years. In year 2002 Poland has been a strong high-skill product importer with relative rank equal -95 while in year 2012 it had relative rank -60. In the same period Sweden has lost almost 25 ranks within EU (from rank 51 to rank 31) in spite of its success in respect of China.

Figure 3: Total relative rank for high-skill and technology-intensive manufactures

In terms of skills, China demonstrates advantage over the EU in labour-intensive and resource-intensive manufactures exports. In terms of relative ranks, China has an almost constantly very high score of between 300 and 350 for labour-intensive products. Even in the case of a free trade agreement it can be expected that that relation will remain very similar. China demonstrates superiority over the EU also in low-skill and technology-intensive manufactured exports. In contrast to labor-intensive products there has been a significant Chinese increase in the period 1995-1999 but now it is almost constant with relative rank about 200 (figure 4). Among EU countries the most significant changes over the period of 10 years for low-skill products are in respect of UK and Poland. UK has lost 60 ranks (from -39 to -99) while Poland has lost 35 ranks (from rank 8 to rank -27).
Medium-skill and technology-intensive manufactured exports has been the field of most notable changes in the period of the last 15 years (Figure 5). China has increased its relative rank from -81 to +85! The maximal value has been rank 128 in year 2008. The Czech Republic has been a constant success story within the EU. In the last 15 year period its relative rank has increased from 49 to 67. Even more significant has been the decline of Sweden. Its relative rank has decreased from 27 to -44. It may be assumed that similar trends will continue also in the near future and that changes may be even stronger in case of the free trade agreement with China.

Relative ranking data demonstrate most significant EU-China changes in respect of all food items, beverages and tobacco products, and agricultural raw materials. Currently these goods present a very small part of total trade, but in all of them, the EU has potential for significant export increase consistent with the significant change in the data in the past ten years in favor of EU countries.
The complementarities of the EU and China can provide opportunities for economic development. While the Chinese market becomes significant for EU exports, the EU Commission needs to be aware of the challenges that EU firms might face in the future in terms of competitiveness. EU authorities must ensure that this free trade agreement works both ways.

POLICY IMPLICATIONS

Despite the extraordinary surge in trade between the EU and China and the interest that this topic has impelled among policymakers, market players and scholars, academic research in this particular field of research is limited. This study is contributing to scientific research in the field of international business. It will also provide fundamental knowledge for policy makers in Europe, specially when updating the policy agenda of free trade negotiations.

CONCLUSIONS AND RECOMMENDATIONS

While trade partnership between the EU and China represents enormous opportunities for both markets, the fast growing sophistication of Chinese manufacturing, in the last past decade, denotes some challenges for the European manufacturing sector. Our study confirms that China records a significant trade surplus with Europe. This study also suggests that China has not only developed competitive advantage over the EU in labour-intensive and resource-intensive manufactured exports, but has also demonstrates over the period of the past 15 years, that medium-skill and technology-intensive manufactured exports have developed advantages over the EU. In this sector, China has increased its relative rank from -81 to +85. It may be assumed that similar trends will continue in the near future and that changes may be even stronger in case of the free trade agreement with China.

Behind China’s impressive transformation in becoming one the world’s biggest trading powers and of the development of its industrial structure has been China’s governmental policy regime. These policies of promotion and protection have shaped the export basket with a range of increasingly sophisticated products directed to the export market (Rodrik, 2006) and have been the main driving forces of exports sophistication; hence, China signifies a direct competitor of developed countries’ manufacturers (Feenstra and Wei, 2009). Therefore, the EU members countries and the Commission need to be aware of the challenges that EU firms are likely to face in the future in terms of competitiveness. EU authorities must ensure that any free trade agreement works both ways.

RELATIONSHIP MARKETING IN THE COMMUNITY PHARMACY: THE IMPACT OF NETWORK LOYALTY PROGRAMS ON STORE LOYALTY

Rodrigues, Catarina¹; Nobre, Helena²; Becker, Kip³

¹University of Minho, Portugal
²University of Aveiro, Portugal
³Boston University, Metropolitan College, USA

ABSTRACT

The research was designed to explore the importance of loyalty programs in today’s competitive community pharmacy environment. Although this marketing tool is used to promote a loyal behavior of the customer, the results show a weak relationship between program loyalty and store (pharmacy) loyalty. This indicates that in order to create a successful competitive advantage for the pharmacy a loyalty program needs to be of value, rare, not perfectly imitated or easily replaced. When analyzing the value perception construct, the results indicated the importance of the psychological benefits of belonging to a loyalty program. When the loyalty program is implemented, not as a resource strategy, but as a “me too” strategy it is more likely not to meet marketing expectations and the expected benefits. Additionally, the authors analyze the effects of household characteristics on program perceived value.

Keywords: Network loyalty programs, pharmacy, network strategy, marketing loyalty

INTRODUCTION

One of the most remarkable trends over the two decade in marketing has been a change of focus form single transactions to relationships (Grönroos, 1994; Hennig-Thurau & Hansen, 2000). The 60’s predominated marketing-mix concept and the 4P’s model, with the development of industrial marketing and services marketing, has given rise to a need for an alternative approach to the marketing concept (Aijo, 1996; Grönroos, 1996; Gummesson, 1987), that better reflected the relationships that were incorporated in the marketing-mix (Waterschoot & Bulte, 1992). Grönroos (1994, p. 9), extending the initial definition of Leonard Berry in 1983, defines the goal of relationship marketing (RM) as “establish, maintain, and enhance relationships with customers and other partners, at a profit, so that the objectives of the parties involved are met.” The most successful buyer-seller relationships are characterized by mutual trust and sharing of information and continuous display of commitment and satisfactory performance of the partner’s respective role (Barnes, 1994). The tangible
benefits of the adoption of RM strategies were first published in 1990 by Dawkins and Reichheld. They stated that a higher rate of retention corresponds to a higher profit for the company (Dawkins & Reichheld, 1990). These effects are explained by the fact that a company that targets the retention rate is supported by a solid base of repeat sales (Dawkins & Reichheld, 1990), by the positive word-of-mouth (Bowen & Shoemaker, 1998) and by the fact that a loyal customer tends to spend more than a new one (Bhattacharya & Bolton, 2000). Loyalty is now seen as one of the most important drivers of success in a business (Reichheld, 1996) making it the core goal of any strategic planning in marketing (Dick & Basu, 1994; Diller, 2000). As a result the last decade has seen the blossoming of the loyalty programs (LP) market, especially in retail organizations (Sharp & Sharp, 1997). LP are defined as an integrated system of marketing actions that reward and, therefore, enhance the loyal behavior of the customer through several economic, psychological and sociological mechanisms (Leenheer, van Heerde, Bijmolt, & Smidts, 2007). Despite the wide interest LP, few studies are devoted to the potential impacts of the LP on actual consumer behavior, and the research provides contradictory outcomes (Meyer-Waarden, 2007).

CONCEPTUAL MODEL AND HYPOTHESES OF STUDY

The launch of any LP has as main objective to strengthen the relationship between the focal store and its customers, in order to differentiate it and to provide new approaches to address an increasingly competitive market. In the case of network LPs, where the management of the LP is made by a specific company, but the ownership of the LP is distributed through several firms, it is much easier to established the firm’s critical size, such as number of memberships, but this also means that the firm as limited influence on his LP strategy (Reinartz, 2006). And, recognizing that an LP does entail costs, including financial, labor and psychological capital (Uncles, Dowling, & Hammond, 2003), the authors studied antecedents and consequences of network LPs when applied to community pharmacy business. The conceptual model that forms the basis of the study is presented in figure 1. Based on the bibliographic research, six hypotheses were generated, focusing on the relationships between value perception, program satisfaction, program loyalty and store (pharmacy) loyalty. Additionally, the authors analyze the effects of household characteristics on program perceived value.
The effects of value perception on loyalty

According to O'Brien and Jones (1995) a LP that effectively promotes store loyalty should combine five elements that, when together, determine the value of the program: (1) cash value of redemption rewards, (2) redemption choice, (3) aspirational value, (4) perceived likelihood of achieving rewards, and (4) the scheme’s ease of use. These perceived benefits may help us understand why customers join LP and, as consequence, how this benefits drive loyalty (Mimouni-Chaabane & Volle, 2010).

H1a: The loyalty program will be positively influenced by the program perceived value.
H1b: The program satisfaction will be positively influenced by the program perceived value.
H1c: Value perception positively influences store loyalty.

The mediator effect of satisfaction in the value/loyalty relationship

Satisfied customers tend to concentrate their purchases within the same company more so than those customers who are not satisfied. As a result satisfaction is an important determinant of loyalty (Yang & Peterson, 2004).

H2a: Program satisfaction will have a positive effect on store loyalty.
H2b: Program loyalty will be positively influenced by program satisfaction.

The effects of loyalty programs on loyalty

As referred before, empirical evidence available on the effectiveness of the LP is limited and contradictory (Lewis, 2004; Mägi, 2003; Meyer-Waarden, 2007). Some researchers do express their doubts about the benefits of LP and suggest that, in a competitive market, good programs are imitated. Once the program has become generic across competing firms there would be a return to the initial situation (Meyer-Waarden, 2007; Yi & Jeon, 2003). Despite the empirical evidence, it seems
intuitive that LP members concentrate their purchases on a particular company and are less likely to visit competitors. In the case of network LPs, this relationship between program loyalty and store loyalty may not be observed since the member can distribute their purchases through several firms, and still continue to gather benefits from the LP.

H3: Store loyalty will be positively influenced by program loyalty.

The effects of household characteristics on program perceived value

Not all customers associate the same benefits to a certain LP (Allaway, Gooner, Berkowitz, & Davis, 2006; Mimouni-Chaabane & Volle, 2010), making it plausible that any effect of the LP in the customer behavior will be moderated by some member’s characteristics (Mägi, 2003). Because it is difficult to suggest what individual factors are important, or to determine the direction of their impact, the authors did not derive a specific hypotheses related to this assumption but base this on the research related to individual differences as an exploratory character.

H4: The household characteristics influence the program perceived value.

METHOD

A survey was carried out in a community pharmacy in Vila Verde, a town in the north of Portugal. It is also noted that while community pharmacies in Portugal are represented by one major institution they do compete individually in their market environment. The network LP in this environment is analyzed and results shared by several community pharmacies who then gather the combined benefits of their collective effort. The data for this study was collected by using self-administered questionnaires distributed using convenience sample technique. The population of interest for this study was defined as consumers of a focal community pharmacy who were member of the LP. The survey instrument used a comprehensive set of 17 questions that were directly tied to the four constructs of the study. The interval scale was anchored using a Likert type measurement approach. Five response categories with properties labeling for the scale end points form (1) which denotes “strongly disagree”, and (5) for “strongly agree”. Following the conduction of a pretest to verify the suitability of the terminology used as well as clarity of the instructions and scales, to more questions were added to characterize the type of experience the member as with the LP (reward redemption and membership time length). A total of 72 surveys were validated (See table 1).

**DATA PROFILE**

Customer’s sample (N=72) included 53 (76.8%) females and 16 (23.2%) males and more than 50% of the respondents aged between 24 and 44 years old. Most of the individuals had a household of three
people (34.7%) and most of them also didn’t have infants in their family household (58.3%). Table 2 provides a general result of customers sample profile.

Another important statistic was the length of experience with the LP. 70.5% of the respondents claimed that they were members for more than one year, however only 51.4% of them had already redeem points.

RESULTS

In order to explore the various relationships proposed in the conceptual model, the Pearson’s correlation coefficients (R) and the determination coefficient \( R^2 \) were calculated between the latent constructs. The Pearson’s correlations between the independent variable perceived value and dependent variables program satisfaction, program loyalty and store loyalty were analyzed. This analysis demonstrated two strong correlations: between perceived value and program satisfaction \( (r = 0.74, p < 0.01) \) and between perceived value and program loyalty \( (r = 0.64, p < 0.01) \). Analysis between the variable perceived value and store loyalty resulted in a moderate correlation \( (r = 0.419, p < 0.01) \). The extracted correlation from the analysis of the independent variable satisfaction and the dependent variable program loyalty has shown to be very strong \( (r = 0.82, p < 0.01) \). Regarding the program satisfaction variable and the variable store loyalty a moderate correlation \( (r = 0.496, p < 0.01) \) was found. Also, moderate \( (r = 0.493, p < 0.01) \) is the correlation between the independent variable program loyalty and store loyalty.

To assess whether the program perceived value is dependent on some characteristics of the household, we resorted to the use of the chi-square test \( (X^2) \) implemented in the software of statistical analysis SPSS Statistics (v.21 software, IBM SPSS, Chicago, IL). The inferential statistical analysis does suggest that the program perceived value is independent of the number of people in the household \( (X^2 = 71.7, p = 0.421, N = 70) \), the existence of infants in the household \( (X^2 = 19.1, p = 0.163, N = 71) \) and age \( (X^2 = 64.5, p = 0.663, N = 71) \). It is also possible to claim that the program perceived value construct is dependent on the marital status of the member of the program \( (X^2 = 70.6, p = 0.004, N = 71) \). See table 3 for results of the hypotheses tested.

DISCUSSION

One of the primary goals of this study was the evaluation of a network LP from the perspective of the pharmacy customer. The results provide a more focused and better understanding of the process of developing an effective LP that is able to satisfy their members (consumers) and as a consequence of that satisfaction create a loyalty to the pharmacy. The incorporation of program perceived value and program satisfaction permitted the authors to test the importance of these constructs on the formation of loyalty towards the store program. As highlighted in table 2, the study determined a strong empirical support for several of the hypothesis (H1a, H1b and H2b). The study also determined there was empirical evidence supporting that members of a network LP who recognize value to the program are satisfied with it and, as a result, engage in behaviors that strengthen their relationship with the community pharmacy. These results are in agreement with previous studies (Sunny Hu et al., 2010; Yi & Jeon, 2003). It should, however, be noted that, by splitting the path between program perceived value and store loyalty in two ways it was determined that the positive influence that perceived value has upon store loyalty is stronger if a loyalty program exists. This result is in agreement with previous studies (Sunny Hu et al., 2010; Yi & Jeon, 2003) that explain the mediator effect of program loyalty on store loyalty. However, unlike the outcome of these previous studies that found no significant correlation between program perceived value and store loyalty the authors established a positive correlation, although moderate, between the two constructs.

The results indicate that the value of the loyalty program is perceived by consumers and that these consumers are satisfied with it. It should be noted, however, that many of the program members, while claiming to be satisfied with the loyalty program never actually collected (enjoyed) the tangible benefits which were the possibility of exchanging loyalty points for products. Possibly, the psychological benefits of belonging to the LP and accumulating points have an important role in the construction of their perceptions of value and consumer satisfaction levels, as suggested by Dowling and Uncles (1997) even when these same consumers do not actually participate in the tangible benefits of the program. In line with this reasoning are the results of Arbore and Estes (2013) who explored the role of psychological benefits, and how the LP through the possibility of rewarding its members with prizes or discounts can influence their perceived status.

The assumptions of the authors that the program’s perceived value would vary according to age and depending on the type of household were not confirmed. This result contradicts the results of previous studies (Meyer-Waarden & Benavent, 2003) that reported the possession and use of LP is dependent on the different life cycles and that are function, for example, of age and profession.
CONCLUSION

As Barney (1991) stated in his work, in order to any strategic resource to become a sustained competitive advantage it has to be valuable, rare, imperfectly imitable and non-substitutable. The weak correlation between program loyalty and store loyalty could be explained by the fact that this network LP is not exclusive property of the focal pharmacy. This implies that there may be members who are only loyal to the program (not the specific store) and will dividing their purchases among the several pharmacies within the same loyalty program. Regardless of type and goal to be achieved with the LP any program should have as its strategic objective to contribute to increase the operating profit of the company. This finding may have consequences for companies that use a franchise system where a central loyalty program could increase overall firm profits but not promote a unique loyalty/profitability to a specific store. The findings also indicate that as more firms come under competitive pressure to adopt LPs as a marketing tool without a clearly developed strategy such programs may not generate a competitive advantage for the company.

RESEARCH LIMITATIONS

In consideration of limitations or generalizations of research outcomes two factors should be considered. The first relates to the study’s external validity as the respondents were selected by convenience so may not be an accurate representation of the population of community pharmacy LP members. A second weakness the endogenous nature of LP meaning that already loyal customers have a higher tendency for engaging in a LP. This phenomenon may artificially enhance the effects of program loyalty on store loyalty.

The Future of Entrepreneurship

FIRM AGE AND FIRM PERFORMANCE: A LITERATURE REVIEW

Rossi, Matteo

University of Sannio, Italy

ABSTRACT

Purpose – In the last thirty years the link between firm age and performance has fascinated a lot of scholars. The debate on this topic have produced mixed results, which resulted in extensive economics debate, albeit without a systemic vision. As a result, the firm age literature has not yet developed a paradigm and the purpose of this paper is to present a review of the existing literature.

Design/methodology/approach – Author carried out a review of literature on firm age and performance.

Originality/value – Since 1990 there has been a major attention on firm age and firm performance. To address this important topic paper presents here a review of literature, starting to a simple question: age benefits performance?

Keywords: firm age, longevity, firm performance, old firms, new firms.

INTRODUCTION

In biology, aging is a process related with a decline in the physical functioning of a body, such as the capability to remember, move, and hear (Loderer and Waelchli, 2010). It is interesting to know whether firms also weaken/strengthen and increase/lose their ability to compete over time, and to know why that happens.

Early empirical work on firm dynamics looked at firm size but not firm age. The seminal work by Gibrat (1931) led to interest in the firm size distribution (FSD) (e.g. Hart and Prais, 1956; Simon and Bonini,1958) and also in the relationship between firm size and growth rate (e.g. Hall, 1987; Hart and Oulton, 1996). However, later on interest in firm age began to grow, as some studies included age as an explanatory variable in regressions that investigate differences in firm performance. Nevertheless the relevance of age to firm dynamics has attracted comparatively little attention (Stinchcombe, 1965; Dunne, Roberts, and Samuelson, 1989; Singh and Lumsden, 1990; Brüderl and Schüssler, 1990; Barron, West, and Hannan, 1994; Caves, 1988; Hannan, 1998, Hannan, Pólos, and Carroll, 2003a, b), except in the management literature. <<The prior belief would seem to be that age benefits performance. For one thing, firms learn about their abilities and about how to do things better as they get older. For another,
The available empirical evidence shows that life expectancy increases with age, and that better firms survive. There are, however, reasons to disagree (Loderer and Waelchli, 2009: 4). The paper is organized as follows. Next section outlines a literature review on firm age and firm performance, and finally paper presents the conclusions and managerial implications.

**FIRM AGE AND PERFORMANCE: A LITERATURE REVIEW**

The relationship between firm age and survival has been investigated by a growing number of scholars (Evans, 1987a,b; Fariñas and Moreno, 2000; Mata and Portugal, 2004; Bartelsman et al., 2005), but the results have not been clear-cut.

An early contribution coined the term “liability of newness” to describe how young organizations face higher risks of failure (Stinchcombe, 1965). More recently, however, authors have referred to the “liability of adolescence” (Bruderl and Schussler, 1990; Fichman and Levinthal, 1991).

For Bruderl and Schussler (1990) it’s possible to distinguish two periods of an organizational life cycle. In an early phase, referred to as adolescence, death risks are low, because decision makers are monitoring performance, postponing judgment about success or failure. Meanwhile, organizations often live on a stock of initial resources. In a later phase, initial monitoring has ended and organizations are subject to the usual risks of failure (Bruderl and Schussler, 1990: 530).

Fichman and Levinthal (1991) develop a research on liability of adolescence that explain why firms face an initial honeymoon period in which they are buffered from sudden exit by their initial stock of resources.

It’s possible to underline two different vision in the organization evolution of firms: the first one suggests that old and large organizations become increasingly dominant over their environment, the second one suggests that as organizations age they become less able to respond to new challenges.

Barron et al. (1994) investigate which of these visions best characterizes the evolution of state-chartered credit unions in New York City from 1914 through 1990 by analysing the effects of organizational age, size, and population density on rates of organizational failure and growth. The authors find evidence that old and small institutions are more likely to fail, while young and small organizations have the highest growth rates (Barron et al., 1994: 381). They identify “liabilities of senescence and obsolescence” according to with older firms are expected to face higher exit hazards once other influences (such as firm size) are controlled for.

Various studies in the Industrial Organization literature, report that life expectancy increases with age (Dunne et al., 1989), and better firms survive (Baker and Kennedy 2002). Hopenhayn (1992) shows that, under plausible assumptions, older firms enjoy higher profits and value. The general thrust of the literature on the survival of firms has taken two directions. One starts from the process of
learning by doing and examines the impact of learning on survival firms (Jovanovic, 1982). He affirms that the longer a firm remains in the market, the more it learns about its true costs and its relative efficiency and the less likely it is to fail.

An alternative, complementary approach is reflected in the work of Gort and Klepper (1982). They view variations in survival as consequences of changes in the rate and character of technological change as an industry evolves over the life cycle of its principal products. This approach is confirmed and extended by Jovanovic and MacDonald (1994a).

Also other studies sustain this point of view. In fact, there is ample empirical support for the proposition that survival and age have a positive relation. Dunne et al. (1989), using Census of Manufactures data for sixteen years (1972-87), find a positive relation between firm age and survival throughout the observed age range. Baldwin and Gorecki (1991) examine entry in Canadian manufacturing industries in the 1970-81 period and find high mortality among entrants. Audretsch (1991) analyse the experience of 11,000 manufacturing firms over a ten year period; he reaches a similar conclusion about the relation of age and survival.

Hopenhayn (1992) develops a dynamic stochastic model for a competitive industry. «The paper extends long-run industry equilibrium theory to account for entry, exit, and heterogeneity in the size and growth rate of firms» (Hopenhayn, 1992: 1127). Paper results show that, under acceptable assumptions, mature firms realize higher profits and value.

Baker and Kennedy (2002) realize a study builds on research from both finance and industrial organization and is consistent with a Schumpeterian view of economic development. «The death of old firms and the subsequent birth of new ones thus greatly hastens economic development. Death by takeover allows a target firm’s management to redeploy the assets of the disappearing firm; death by bankruptcy and liquidation often puts those assets into the market for reallocation to new managers» (Baker and Kennedy, 2002: 351).

Two studies that underline why age could impair performance are Hannan and Freeman (1984) and Leonard-Barton (1992). For these scholars there are different reasons why age could harm performance. In fact they sofﬁrme their attention on the organizational rigidities and inertia. In their perspective age can have adverse effects on performance also because of the organizational rigidities and inertia it brings about and because it impairs the ability of firms to perceive valuable signals. This conduct often makes sense, because it helps firms focus on their core skills and raise reliability and accountability (Hannan and Freeman, 1984). Codification makes it hard to recognize, accept, and implement change when doing so would be appropriate. Also age reduces flexibility and discourages change. At the same time, whatever learning beneﬁts the firm can capture in its established lines of
business, they probably decline over time. As pointed out above, the stock of learning might increase at a decreasing rate. Overall, older firms could therefore lose their competitive edge.

More recently, other researchers have analysed the role age plays in the performance of surviving firms (Calvo, 2006; Garnsey et al., 2006; Stam and Wennberg, 2009).

Calvo has investigated age effects by focusing specifically on samples of young firms. In his article he tests Gibrat’s Law for small, young and innovating Spanish firms: <<All the results reject Gibrat’s law and support the proposition that small firms have grown larger. Additionally, the results show that old firms grow less than young ones, and innovating activity – both process and product – is a strong positive factor in the firm’s survival and its employment growth>> (Calvo, 2006: 117).

Garnsey et al. (2006) explore processes and paths of new firms growth. They <<find that new firm growth is non-linear and prone to interruptions and setbacks to an extent overlooked in the literature. From the model of development used, five propositions are drawn concerning measurable features of new firms’ growth paths; these relate to patterns of survival, continuousness of growth, turning points, reversals and cumulative growth>> (Garnsey et al., 2006: 1).

Another important analysis on the role age plays in the performance of surviving firms was conducted by Stam and Wennberg (2009). They present empirical evidence on the effects of research and development (R&D) on new product development, interfirrm alliances and employment growth during the early life course of firms. <<The main finding of this study is that R&D plays several roles during the early life course of high-tech as well as high-growth firms. The effect of initial R&D on firm growth seems to be through increasing levels of interfirrm alliances in the first post-entry years. R&D efforts enable the exploitation of external knowledge>> (Stam and Wennberg, 2009: 85).

Coad (2010) studies the processes of firm growth by applying a vector autoregression model to longitudinal panel data on French manufacturing firms. He observes the coevolution of key variables such as growth of employment, sales, gross operating surplus, and labour productivity growth. <<Preliminary results suggest that employment growth is succeeded by the growth of sales, which in turn is followed by growth of profits. Generally speaking, however, growth of profits is not followed by much employment growth or sales growth. Quantile regressions highlight some asymmetries between negative-growth and fast-growth firms>> (Coad, 2010: 1677).

Other scholars (Cabral and Mata, 2003; Angelini and Generale, 2008; Cirillo, 2010) have tracked the evolution of the firm size distribution overtime, for cohorts of ageing firms. Using a comprehensive data set of Portuguese manufacturing firms, Cabral and Mata, (2003) show that the firm size distribution is significantly right-skewed, evolving over time toward a lognormal distribution. <<Past conventional wisdom has held that expected firm growth rates are independent of size (Gibrat’s Law), and that the firm size distribution is stable and approximately lognormal. Recent
empirical evidence, however, shows that the first of these facts does not hold when considering more complete data sets than those used in the past. In this paper, we show that the second fact a lognormal distribution of firm size also fails to hold in more complete data sets>> (Cabral and Mata, 2003: 1083). Their paper document two stylized facts about the firm size dimension: the distribution of young firms is very skewed to the right (most of the mass is on small firms); and the skewness tends to diminish monotonically with firm age (the distribution of older firms is more symmetric than that of young firms). Their paper presents a simple theoretical model in which financial constraints determine the observed FSD evolution, and provides supporting empirical evidence. Starting from this article Angelini and Generale (2008) focus the attention on the evolution of firm size distribution. They develop a study based on a sample containing survey-based measures of financial constraints for Italian firms. Main results are: <<Our main results, based on a sample containing survey-based measures of financial constraints for Italian firms, can be summarized as follows. First, the negative link between financial constraints and firm size is confirmed: firms that declare to be constrained are on average smaller than those that do not. Second, when narrow definitions of financial constraints are adopted, such constraints seem to be a real problem for a small minority of firms. Third, financial constraint problems are found to be relatively more frequent among very young firms, those up to six years of age, but not enough to alter the previous two conclusions>> (Angelini and Generale, 2008: 435-437). Cabra and Mata contribution inspire also Cirillo’s research (2010). In fact, he realise a similar analysis with Italian firms using the CEBI database, also considering firms’ growth rates. Other research has focused on differences in performance and behaviour across firms of different ages. For example, it has been suggested that the age of a firm is positively related to its productivity levels: <<In our sample of long-lived large firms, we find that differences in the mix of workers across businesses are significantly related to differences in productivity levels across businesses, but there is little discernible relationship between changes in productivity and changes in worker mix>> (Haltiwanger et al., 1999: 97).

Brown and Medoff (2003) investigate the relationship between how long an employer has been in business (firm age) and wages. They find that firms that have been in business longer pay higher wages: <<Another interesting (though, given the size of our sample, somewhat tentative) conclusion is that the relationship between firm age and wages is not monotonic. Wages fall as firm age increases, but this relationship appears to be reversed among older firms>> (Brown and Medoff, 2003: 694). The seniority rules in the organization was studied by Loderer and Waelchli (2009). In many firms, under a seniority principle, employees who have been with the organization longer have benefits at the expense of rookie employees. Whatever the reason for their existence and acceptance within the organization, seniority rules in compensation can provide inadequate incentives for managers to
perform. If so, the performance of older firms could deteriorate with the age of the organization (Loderer and Waelchli, 2009: 7).

A relation between firm age and performance could also be induced by the age and tenure of the managers within the organization. Finkelstein and Hambrick (1990) underline three different reasons why older managers could be responsible of organizational inertia:

1. "as individuals spend time in an organization, and particularly as they succeed and climb the organization’s hierarchy, they become convinced of the wisdom of the organization’s ways" (Finkelstein and Hambrick, 1990: 486),

2. "Related to the effects tenure has on commitment to the status quo are those it has on risk taking. At one level, commitment derives from certain "psychological risks" of change" (Finkelstein and Hambrick, 1990: 487), and

3. "Finally, tenure tends to restrict information processing. Over time, organization members develop habits, establish "customary" information sources, and rely more and more on past experience instead of on new stimuli" (Finkelstein and Hambrick, 1990: 487).

Bartelsman et al. (2005) realize a comparative analysis of firm demographics and survival in OECD countries. "While average firm size differs across countries, due to both sectoral specialization and within-sector characteristics, we find similar degrees of firm churning across countries. In most of them, about 20% of firms enter and exit most markets every year; and about 20–40% of entering firms fail within the first 2 years of life. However, post-entry growth of successful entrants is much higher in the USA than in Europe, which may be indicative of barriers to firm growth as opposed to barriers to entry" (Bartelsman et al., 2005: 365).

An interesting research was developed by Bellone et al. (2008). They examine market selection – in French manufacturing in the nineties – along the firm life cycle. This article "argues that the determinants of firm survival have different effects depending on firm age. Results show that exiting firms display low levels of profitability and productivity. This selection process is more severe for young firms because industry structures favour the survival of mature firms" (Bellone et al., 2008: 753).

Firm life cycle, obsolescence and firm’s original endowments are main topics of two important studies developed by Agarwal and Gort (1996, 2002). They report evidence that hazard rates initially fall and then rebound as firms get older. The authors see survival as the trade-off between obsolescence of a firm’s original endowments, on the one hand, and net investments and learning-by-doing, on the other. Eventually, the increase in endowments falls below the obsolescence rate. This could be explained with two reasons:
- the first one is that the stock of learning increases at a decreasing rate (important lessons are learned first and there is only a finite stock of information to be learned about a technology);
- the second one is that the adaptability of old endowments diminishes and investment opportunities in new technology shrink as the product market ages.

In 1996, they examine entry, exit and the survival of firms in terms of evolutionary changes in the market from the first introduction of a product to maturity of the market. Agarwal and Gort (1996) show the key role that the evolutionary stage of the product cycle plays in determining entry, exit and survival rates of firms: <<Entry rates appear to be affected profoundly by stage-related changes in both the rate of technical advance and the form that innovations take. Exit is determined largely by stage-related changes in the intensity of competition. Survival rates reflect both market and individual firm attributes. The role of market attributes, once again related to the stage of the product cycle, is reflected initially in rising hazard rates for early entrants in new markets. The power of market attributes is also reflected in the higher survival rates for new entrants than for incumbents for high-technology products>> (Agarwal and Gort, 1996: 497).

In 2002, Agarwal and Gort starting from a simple question: <<What is it, other than random shocks, that determines the probability of survival for a firm in a given market?>> (Agarwal and Gort, 2002: 184), analyse Firm Life Cycles and Firm Survival. They show that <<firm survival is crucially dependent on both the product and the firm life cycles. With regard to the firm life cycle, there appear to be two spans of time over which hazard rates decline. The decline continues until the obsolescence of initial endowments finally raises hazard rates... The relation of survival to age of the firm is not simply an empirically observed regularity, but follows an endogenously determined path predicted by the life cycle of the firm. The result that technology intensive industries are associated with higher hazard rates is explained by the faster obsolescence of initial endowments in such industries>> (Agarwal and Gort, 2002: 190).

Huergo and Jaumandreu (2004a,b) have investigated how probability of innovation and productivity growth, change across the firm age distribution. In the first article they looks at the probability of introducing innovations by manufacturing firms at different stages of their lives. Their results show that <<the probability of innovating widely varies by activity, and that small size per se broadly reduces the probability of innovation, but also that entrant firms tend to present the highest probability of innovation while the oldest firms tend to show lower innovative probabilities>> (Huergo and Jaumandreu, 2004a: 193). In a second article authors looks directly at the impact of firms’ age and (process) innovations on productivity growth. They found <<that firms enter the market experiencing high productivity growth and that above-average growth rates tend to last for many years, but also that productivity growth of surviving firms converges. Process innovations at
some point then lead to extra productivity growth, which also tends to persist somewhat attenuated for a number of years>> (Huergo and Jaumandreu, 2004b: 541).

Autio et al. (2000) observe that ‘born global’ firms, experience faster growth in international sales than their older counterparts. They interpret this finding as evidence that younger firms are better able to develop export capabilities because they are better able to learn how to succeed in uncertain environments. "The central contributions of this study include the introduction of the concept of “learning advantages of newness” and a confirmation of the usefulness of knowledge-based and learning views for understanding international expansion issues. We proposed that as firms get older, they develop learning impediments that hamper their ability to successfully grow in new environments and that the relative flexibility of newer firms allows them to rapidly learn the competencies necessary to pursue continued growth in foreign markets">> (Autio et al., 2000: 919).

Berger and Udell (2005) analyse the source of small business finance, and how capital structure varies with firm size and age. They identify some notable qualitative differences between the financing of small business in different age (infants, adolescent, middle-aged, old): "We identify four different source of equity and nine different sources of debt, and show how the capital structure changes with the size and age of the firm">> (Berger and Udell, 2005: 50).

Similarly, Reid (2003) tracks small businesses in their first few years after inception and observes that the debt ratio decreases over time. He expounded a dynamic theory of the small firm "assuming entrepreneurs maximise business value over a finite time horizon". He conducts a research on thirty-five key financial variables for one hundred and fifty new small business starts over a three year period after inception. Principal results are: "(a) Steady growth of output (sales), including some phases of consolidation, (b) Steady growth of capital, as measured by fixed assets, (c) Sensitivity of debt (observable also through gearing) to the interest rate on long-term debt, (d) Absence or deferral of dividend payments, (e) Retiral of debt when sales are consolidated. This could be attributed to a cheap equity regime, (f) Increase in debt when sales are rising. This could be attributed to a cheap debt regime, (g) Arguably a sensitivity of equity (observable also through gearing) to the relative costs of debt and equity">> (Reid, 2003: 283).

An interesting research was conducted by Coad et al. (2010). They analyse the firm performance related to firm age between 1998 and 2006, for Spanish manufacturing firms. They begin their work with a simple question: do firms deteriorate with age (like milk) or do they improve with age (like wine)? "In this paper we found evidence supporting both the milk hypothesis and the wine hypothesis. As evidence that firms improve with age, we found that ageing firms experience rising levels of productivity, profits, larger size, lower debt ratios, and higher equity ratios. Furthermore, older firms are better able to convert sales growth into subsequent growth of profits and productivity."
On the other hand, we also found evidence that firm performance deteriorates with age. Older firms have lower expected growth rates of sales, profits and productivity, they have lower profitability levels (when other variables are controlled for), and also that they appear to be less capable to convert employment growth into growth of sales, profits and productivity. Analysis of the growth rate distributions for different age groups shows that older firms are less likely to experience fast growth, while they are just as likely as younger firms to experience rapid decline (Coad et al., 2010: 26). Furthermore their results that younger firms are more successful at converting employment growth into growth of sales, profits, and productivity. Meanwhile, older firms look to do better at converting sales growth into growth of profits and productivity.

The analysis of literature review shows that there isn’t an unique point of view on relationship between longevity and performance. This brief literature review has shown that, although progress has been made in our understanding of how firm age affects firm performance, there are still many opportunities remaining for improving our understanding of how firm behaviour changes as firms grow older.

CONCLUSIONS

Although firm age has attracted the attention of a big number of scholars, results have often been mixed. The complexity of the phenomenon is attested to by the fragmentation of the literature, which has prevented the formulation of a general theory on this topic. Most of the existing researches has been empirical work.

These considerations are equally valid for the relation between firm age and firm performance. The large part of studies are focused generically on firm performance, only a little part of these studies are focused on financial performances.

The heterogeneity of scholarly contributions in this field is also related to the difficulty of defining the subject of investigation: firm age can be studied referring to young firm or old firm. Also on performance the analysis can be conducted on innovation performances, organizational performances, financial performances, or other performances. However, all these considerations can explain only partially the excessive fragmentation of the literature. Naturally, literature fragmentation is not limited to the field of firm age and performance, but in this field it provides a clear opportunity for progress. To take advantage of this opportunity, however, it is necessary to conduct a comparison of the various themes, methods of investigation, and data used. Only in this way will it be possible to explore in depth this topic, which remains controversial as far as methodology, objectives, and results are concerned because of its extreme complexity.

EXPLORING CONTINUITY OF CARE IN INTEGRATED HEALTH CARE SETTINGS

Rudawska, Iga

Faculty of Economics and Management, University of Szczecin, Szczecin, Poland

ABSTRACT

Continuity of care is considered to be an important feature of high quality health care. It is a wide-ranging concept, that encompasses several different aspects of health care. However, it is not often evaluated explicitly, because of the lack of suitable measurement instruments. Therefore, the purpose of this paper is to identify chronic patients’ experiences and values associated to continuity in care. In order to accomplish this purpose a single focus group interview with 12 chronic ill patients has been carried. Collected responses were analysed thematically and grouped into dimensions of continuity of care. As a result of the study, eight dimensions of experienced continuity of care were identified: patients’ involvement, decision-making support, cross-boundary continuity, coordination of activities, communication with the patient, problem solving, availability, and patient-centeredness. This study develops a patient-based framework for evaluating continuity of care. It also identifies key transition points with problems of lack of continuity.

This paper is part of the research project financed by National Science Centre in Poland (No. 2012/05/B/HS/02213).

Keywords: relationship management, quality indicators, patients’ experience, health care, qualitative study

INTRODUCTION

Health care is becoming more patient-centred and, as a result, the experience of users of care and evaluation of their experience are considered seriously, and used to evaluate the delivery of care (Vrijhoef et al., 2009; Wagner et al., 2005). There is considerable amount of literature about patient satisfaction and experience (Linder-Pelz, 1982; Pascoe, 1993), but it is not clear how to appropriate the instruments are to measure patient experience with care in integrated health care settings. The issue becomes even more important when, quality and satisfaction tools validated by health plans are implemented as a marketing instrument. This is especially the case in current policies towards the integration of health care in Poland.
Integration of care is defined by the WHO as “bringing together inputs, delivery, management and organization of services related to diagnosis, treatment, care, rehabilitation and health promotion wherein integration is regarded as a means to improve the services in relation to access, quality, user satisfaction and efficiency” (Gröne and Garcia-Barbero, 2001). Considering patients’ perspective in this integrated care approach, a measurement instrument is needed to appropriately evaluate the experience of chronically ill people.

Continuity of care is considered to be an important feature of high quality integrated health care. It is a wide-ranging concept, that encompasses several different aspects of health care. There is evidence that continuity of care is linked with greater patient satisfaction (Schers et al., 2005; Mechanic, 2004). However, it is not often evaluated explicitly, because of the lack of suitable measurement instruments. Therefore, the purpose of this paper is to identify chronic patients’ experiences and values associated to continuity in care. The study has been based on the research project sponsored by the National Science Centre in Poland (No. 2012/05/B/HS/02213).

THEORETICAL FRAMEWORK

The term of continuity of patient care appears in numerous discussions as a fundamental aim of integrating the process of health care service provision in Europe (Antunes and Moreira, 2011). In turn, patient satisfaction is a reflection of the problems occurring during a service provision process. Any loopholes in the process coordination, be it between service providers themselves, or between patients and care providers, can thus be treated as threats to continuity of patient care, which impacts on the achieved treatment results (Weinberg et al., 2007). In the context of integrated health care, continuity of patient care is understood as a qualitative dimension concerning seamlessness of health care process provision. The legacy that the 1990’s left behind is the perception of continuity of care from the patient’s perspective, as the patient’s experience of a coordinated and seamless progress/development of care (Cowie et al., 2009).

Currently, researchers use multi-dimensional models to describe the discussed concept. One such model is Haggerty’s team interpretation, treating continuity of care as a combination of (Haggerty, 2003):

- informational continuity – ability of a service provider, from the patient’s perspective, to take the right decisions based on sufficient information source regarding patient’s medical history;
- management continuity – ability of a service provider/network of service providers, from the patient’s perspective, to establish a cohesive care management plan;
- relational continuity – ability of a service provider, from the patient’s perspective, to continue the provision of care by medical professionals the patient is familiar with.
What is crucial in this interpretation for further consideration is adding long-term relations to continuity as well as concentrating on an individual patient and his/her needs. In turn, concentration on an individual patient lies close to the concept of patient/client-oriented care, and more broadly to human-oriented care (Kodner, 2003).

In this paper we adopt multi-dimensional concept of continuity established by G.K. Freeman (Freeman et al., 2003). He defined continuity of care as experiencing a coordinated and smooth sequence of health services by patients. In order to achieve it, according to G. Freeman (Freeman et al., 2003), a health care system needs to feature:

- continuity of information – ensuring information transfer following the patient in the system,
- cross-boundary and team continuity – ensuring effective communication between professionals and services and with patients,
- flexible continuity – ensuring adjustments to patient’s needs over time,
- longitudinal continuity – minimizing the number of physicians treating a given patient in a given health care unit (such as family physician practice),
- relational continuity – assigning one or more individuals with whom the patient can establish and maintain a relationship in the therapeutic process.

What has emerged clearly from above discussion of defining continuity of care is that there is still considerable conceptual and empirical debate surrounding this issue. Based on empirical findings and the conceptual development of the continuity of care concept, continuity of care understood as service quality indicator is now often believed to be the antecedent of patients’ satisfaction (Kasper et al., 1999; Schneider and White, 2004). Approached from our proposed vantage point, the measurement of continuity of care would be thus about a perception (this is what I observe), perhaps relative to expectations; the measurement of patient satisfaction would be about an evaluation (this is what I feel).

Purpose and Method

The main purpose of this paper is to identify chronic patients’ experiences and values associated to continuity in care. To accomplish it a qualitative study was carried out. The qualitative study comprised of a single focus group interview (FGI) conducted in the form of an open discussion with 12 patients suffering from a chronic condition, who may be treated as informants. The procedure of the focus group interview followed the guidelines set forth for that type of study (Krueger, 1994).

The study was guided by two research questions:

- what variables do patients perceive to be significant in the continuity of care?,
- how can the isolated elements be grouped in order to establish a model of evaluating patient care quality in the respect of continuity of care?
Potential participants of the patients’ panel were intentionally selected through a community interview. The criteria of participants’ selection for the focus group interview were as follows: the patient is an adult, the patient suffers from a chronic medical condition - on account of a chronic illness the patient has frequent (over 7 times a year) contact with the health care system, the patient is able to participate in a meeting lasting approximately 2 hours.

An analysis of transcripts of the gathered material allowed identifying 56 comments defining patients’ needs, feelings, preferences and experiences in respect of health care in chronic conditions. Subsequently, the statements were entered into ATLAS.ti software program for management of qualitative study data. Preliminary analysis involved encoding the comments from the transcript of the FGI. Then the author assigned the encoded comments to several central categories by applying Strauss’ and Corbin’s method of comparison in pairs (Glaser and Strauss, 2009). The names of sets were identified on the basis of the literature of the subject dedicated to integrated health care. Their understanding and interpretation were also submitted to discussion with patients during the plenary panel.

**RESULTS**

The qualitative study comprised of a focus group interview (FGI) conducted in the form of an open discussion with patients suffering from a chronic condition, who may be treated as informants. Tables 1, 2, 3, and 4 show the patients’ characteristics.

The central categories (labels) comprised: patient involvement, decision-making support, availability, communication, organization and coordination of the service provision process, continuity, problem resolution and focus on the patient. As a result, a schedule of central categories and sub-categories was compiled describing the dimensions of service quality provided to chronically ill patients, which can be treated as indicators and sub-indicators in the evaluation of service quality delivered to the analysed patient segment (Table 5).

Table 5. Central categories and their detailed dimensions of continuity of care delivered to chronically ill patients identified in the FGI.

Source: own research.

Most of the indicators (central categories) identified above, such as patient involvement, decision-making support, problem resolution, communication with the patient, activities organization and coordination, flexibility and availability refer to the process of service provision to patients with
chronic conditions. The remaining ones, i.e. ensuring continuity in its various dimensions, focus on the patient, are of structural nature.

DISCUSSION AND FINDINGS

Analysing the results obtained through the FGI, it is worth emphasizing that the chronically ill patients themselves rarely use terms such as: “continuity of care”, “coordination”, “therapy planning”, “integration of care” to describe their experience, needs and feelings with regard to systematic use of health services. Furthermore, assigning a particular experience or need expressed in a patient’s comment to one of the eight main categories was problematic at times on account of mutual interrelation of individual dimensions and possibility of illustrating a number of various sub-categories with a single comment at the same time.

Patients described their previous experience with health care system in regard to continuity as the care they have been receiving since the diagnosis identifying their chronic condition was made. They were referring to check-ups and systematically repeated tests related to a given chronic disease. Some declared that “patients need to demand the tests from their doctors,” (P5, female, 64 years old) “the patient more often than not reminds the doctor of it,” (P4, female, 63 years old) or they articulated their needs for such tests by saying: “a family doctor should recommend that a patient of a particular age (i.e. an elderly patient) take the tests that the patient is entitled to on account of his/her age” (P8, female, 73 years old). The respondents were also referring to the significance of continuity of care by demonstrating their concern resulting from deficiency of care:

- “intervals between visits [are] 9, 10 months – I believe that it is too rarely. It is hard to refer to a doctor you see so seldom as your attending physician” (P1, male, 41 years old).

High frequency of visits and consultations resulting from exacerbation of condition symptoms seems to be the parameter describing the quality of care delivered to a chronically ill patient. This component acquires particular significance at the start of therapy, where the patient’s ignorance is confronted with the need to deal with a chronic condition on an everyday basis. Hence patients particularly value extensive consultations with numerous specialists at initial episodes of chronic diseases, which improve their understanding of the circumstance they are in. The effect of such an attitude to the service recipient, which in fact constitutes an indicator of the focus on the patient (patient in the centre), involves closer adherence to therapy regime and acceptance of any related inconveniences.

Experience of longitudinal continuity may be perceived as a pre-condition necessary for the establishment of relational continuity. Patients appreciate the situations in which they are recognizable. It builds their sense of security, which may contribute to achieving better therapeutic
results: “when I come to the outpatient clinic, everyone knows me, greets me and it is very pleasing” (P3, male, 81 years old).

The element of continuity of care in chronic diseases that the patients value is the possibility of obtaining assistance/consultation in emergencies. Flexible continuity also manifests itself through service provider’s readiness to change appointment dates suitably to patients’ preferences. Here is an account of one of the FGI’s participants describing her experience in this regard: “they have their schedules, and I have mine” (P12, female, 45 years old). A majority of patients experience lack of flexible continuity, especially with respect to the waiting time for scheduled consultations and delays in making appointments. Here are several responses recorded during the FGI:

- “there was no problem with issuing a referral, however there was one with actually making use of it” (P2, female, 39 years old).

Communication and its continuity appear to be another important component of patient care in patient-service provider relation. The quality of communication is chiefly defined as the ability to listen to the other party and to convey a certain amount of information, including on the course of therapy, any possible adverse effects, any risk related to a procedure, expected results. Patients’ experience in this respect related during the group interview was rather negative. The following patients’ accounts are symptomatic:

- “I had no idea that [if] I take Eutyrox it will cause diabetes. No one has informed me of that” (P6, female, 70 years old),

- “The doctor just whizzed by” (P9, female, 69 years old).

The element of continuity of care in chronic diseases that the patients value is the possibility of obtaining assistance/consultation in emergencies. Since the needs of chronically ill patients change over time, they find it important that medical professionals react quickly enough. Such situations may thus be related to flexible continuity, which involves adaptation of a service to the patients’ needs. One such option is provision of services by medical professionals selected by the patient. Here is how one of the interview participants perceives the phenomenon: “I have a regular cardiologist, however not the one I would have liked, but the one I had to choose” (P7, female, 62 years old).

Erosion of continuity may occur at any stage of the process of patient care provision, although the greatest risk of it appearing exists in the course of a patient’s transfer from one stage of health care to another, for instance from primary health care to secondary specialist outpatient care, from outpatient care to hospital-based setting, or from hospital-based setting to primary care. Transition of the patient from one stage of care to another typically involves exacerbation of symptoms; it necessitates more extensive diagnostics or a hospital discharge. All of the above situations generate a different demand for health care and different intensity of health care services consumption. The loopholes in the
continuity of health care may therefore result in delays of care provision, misinformation, or problems of a communicative nature. Consequently, the patient may seek alternative solution to the medical problem, disregard medical advice, or even decide to discontinue treatment.

ORIGINALITY / VALUE

The results of the conducted qualitative study constitute an important premise for the construction of a methodological tool, comprising a set of indicators describing continuity of care from the perspective of the patient. Identification of the dimensions of health care continuity over chronically ill patients in Polish health care settings as well as identification of any possible loopholes in such continuity constitutes a vital cognitive value of this stage of methodological procedure. The developed framework provides an assessment of various dimensions of continuity of care that is applicable to integrated health care settings in Poland but could also serve as a reference list for evaluating continuity of care in other settings. Assessment of these aspects of patients’ experience is of particular value in relation to chronic disease management in Poland and other countries that face aging societies.

As does most research, this study has certain limitations that affect the interpretation of the results and simultaneously suggest directions for further research. The study was conducted in a single region (West Pomerania). Including other regions of Poland might have identified contextual boundaries to the findings. Moreover, the study is comprised of a single FGI and could have benefited from including additional ones.

Additional research related to continuity of care could examine whether some quality dimensions are common across health care levels (primary care, out-patient specialist care, in-patient care) or relevant only for particular level (in that case out-patient). It could also refine the assessment tool referring perceived quality of integrated health care programmes. Finally, further research could address the value of different integrated delivery schemes and overall success of the patient relationship management.

Despite above mentioned limitations, the findings reported in this paper offer a better understanding of relationship marketing in health care settings.

CUSTOMER PERCEIVED VALUE IN BUSINESS-TO-BUSINESS MARKETING: IS IT STILL ENOUGH?
Russo, Ivan; Confente, Ilenia; Cobelli, Nicola
Department of Business Administration, The University of Verona, Verona, Italy

ABSTRACT
This study provides a better understanding of business relationships between suppliers and industrial buyers. Based on previous research models, we explored the value drivers that industrial buyers, in particular health professionals, perceived as relevant in the hearing-aid distribution industry. A nationwide online survey was the principal data-collection instrument. Based on previous research, we evaluated several drivers measuring the perceived value delivered by hearing-aid suppliers, including offer quality, service elements, relationship costs and personal interaction. We researched not only the customer value (CV) but also the ability of the suppliers to anticipate customer needs. The results demonstrated that other than offer quality, none of these drivers represents or affects the customer value. However, these drivers were found to affect the anticipation of customer needs, surprisingly demonstrating that succeeding in each of the drivers reflects the anticipation of customer needs but not customer value.

Keywords: customer value, supplier–customer relationships, customer value anticipation, business-to-business relationship, health-care professionals, industrial marketing, service quality, service marketing, switching cost, vendor evaluation.

INTRODUCTION
Research investigating customers’ perceptions of value generally distinguishes between ‘desired value’ (what the customer desires to receive) and ‘received value’ (the customer’s perceptions about the value delivered). This perspective can be termed ‘value for the customer’. Woodruff (1997) found that many apparently different definitions were actually in fact similar, generally involving a trade-off between what the customer receives, identified as quality, benefits, worth, or utilities, and what they give in exchange. Ulaga and Eggert (2006) highlighted that in business-to-business (B2B) contexts, relationship benefits seem to represent a strong potential for differentiation in key-supplier relationships. According to Flint et al. (2002), the implication for managers is that they should attempt to understand the whole-value hierarchy of their offering and avoid defining it strictly by its attributes. Buyer value can be created at any point in the chain by...
making the buyer either more effective in their markets or more efficient in their operations. The notion of value has been at the heart of marketing for nearly 20 years (Ritter and Walter, 2012). Before communicating the value offering to customers, companies should translate the value-delivery strategy into detailed actions and activities to be undertaken at any level of the organisation. Customer value has been found to measure some important aspects that are generally not included in customer-satisfaction measurements. Measuring customer value can be of particular help in today’s changing and highly competitive business environment because it allows a comparison between alternative offerings and provides data that is useful for understanding and anticipating customers’ current and future needs.

Research has demonstrated that deeper insight into the sources of value creation can create superior value propositions in a competitive global marketplace (Anderson and Narus, 2008; Blocker et al., 2011; Heinonen et al., 2013). Business marketers have cited the need for greater understanding of the drivers of customer value as a priority (Anderson and Narus, 2008).

Our study focused on customers’ perceived value (CV) defined as the customers’ perceived trade-off between benefits and sacrifices within relationships (Lam et al., 2004; Ulaga and Eggert, 2006; Blocker et al., 2011; Prior, 2013), and customer value anticipation (CVA) in B2B contexts. This study aimed at contributing to the debate on customer value by advancing its exploration and considering the business relationship between suppliers and industrial buyers (their customers) of health-care services. We tested different constructs (offer quality, personal interaction, service support, supplier know-how, relationship costs, operational costs) to measure the value perception delivered by their suppliers.

The research model of this study is based on the need for more research on measuring the constructs of the B2B context in different complex industry sectors (Bloker et al., 2011; Lindgreen et al., 2004; Ritter and Walter, 2012; Prior, 2013). The choice of health-care services was due to the increasing attention of scholars on such services in the B2B context (Crié and Chebat, 2012). This study attempts to address the calls of previous research to provide new insight into customer value through a national online survey conducted in Italy exploring customers’ value perceptions and CVA at the retailer level in the hearing-solutions industry in Italy.

**LITERATURE**

Most recent B2B literature (Walter et al., 2001; Nyaga et al., 2010; Lepak et al., 2007; Ritter and Walter, 2012) simply defines customer value as a trade-off between benefits and sacrifices perceived by the customer in a supplier’s offering. The benefits and sacrifices perceived, and hence the perception of value, may vary depending on the changes in the importance given to the distinct elements of the
offering. Ulaga and Eggert (2006) found that in B2B contexts, relationship benefits seem to represent a strong potential for differentiation in the key-supplier relationship. Core differentiators would be represented by service support and the interpersonal interaction with the supplier firm and, secondarily, by the supplier firm’s expertise and ability to improve a customer’s time to market. Relationship value in the B2B context is a dynamic process, and the nature and characteristics of the value sought are constantly changing across different supply-chain members (Cannon and Homburg, 2001).

Research on building customer-value theory in B2B contexts has focused on defining the concept of customer value (Woodruff, 1997), measuring its antecedents (Ulaga and Eggert, 2006), and exploring value creation as a process (Grönroos, 2008) that dynamically unfolds in relationships (Blocker and Flint, 2007; Flint et al., 2002). Smith and Colgate (2007) identified four major categories of value that organisations can create: functional/instrumental value, experiential/hedonic value, symbolic/expressive value, and cost/sacrifice value.

Blocker et al. (2011) tested the role of proactive customer orientation for creating customer value in global markets. Their hypothesis was based on the consideration that the higher complexity of a multinational context makes it more difficult for customers to evaluate providers and fosters feelings related to ambiguity and risk. Understanding the customer’s value chain and their end values and goals in the value hierarchy is very useful in discovering the customer’s unexpressed and latent needs. Another interesting area of research is the CVA dimension that is defined as the kind of capability that can be seen as a dynamic capability (Eisenhardt and Martin, 2000), itself an extension of the resource-based view of the firm, and more specifically, a specific kind of dynamic capability termed an ‘operant resource’ (Flint et al., 2011). There are several operations of business using different customer-value constructs (Smith and Colgate, 2007; Russo and Cardinali, 2012). However, there remains a gap in the literature on the role anticipation on the part of the supplier plays in contributing to the level of value customers perceive suppliers help to create.

Blocker et al. (2011) model provided a relevant contribution to the literature by exploring the antecedents of customer value, for example, standards. Starting from this point, our study allowed us to compare the value constructs measured by Blocker et al. (2011) as applied to the ICT industry context. We particularly considered the following key factors: the offer quality, personal interaction with employees, support services, supplier’s know-how and relational/transactional costs from the perspective of specialized hearing-aid buyers. Table 1 lists the hypothesis of our study.

Our study concentrated on the analysis of the manner in which value is perceived and evaluated by specialist buyers, particularly focusing on the supplier’s ability to deliver value, as well as its capability to anticipate value.

**METHODS**

*Data sample and collection*

Data collection focused on perceived value drivers with business customers working in the health-care
service. We surveyed key informants (i.e. acting industrial buyers) about their perception of the value delivered by their main provider of hearing aids.

The health industry was selected for several reasons. The complexity of the products in the market has driven final customer to search for advice from trustworthy and reliable sources. As such, this industry represents a good example of a changing marketing-channel structure that has emerging actors who have adopted a larger role in the manufacturer/end customer exchange.

We used the following participant inclusion criteria:

- professionals enabled by law to resell hearing aids
- professionals running a business at the retail level
- professionals with the freedom of choice of their suppliers
- voluntary participation.

We identified 840 health-care professionals belonging to the Italian Audiologists Association (ANA) who met the criteria. However, 340 were excluded because they were actors of structured hearing-aid distribution chains (i.e. franchisees) and therefore, did not meet the freedom of choice criterion. We selected 500 health-care professionals who met the criteria and sent them an email with a link to a secure web survey. This survey was completed after a pre-test that refined the structure of the survey, and the items involved in the survey.

In September 2013, a pilot survey was administered on a convenience sample of 20 participants. The principal finding was that respondents, due to their cultural background, found it difficult to understand some of the items of the original version of the questionnaire. Consequently, it was necessary to refine the structure of the survey and of some of the items listed in the survey, by providing examples for each item proposed.

Questions were divided into two main sections. Section A surveyed the demographic characteristics of respondents and the information about the relationship with their key hearing-aid supplier (e.g. experience with hearing-aid products, length of the partnership, total expenditure with their main supplier). Section B surveyed customer-value constructs adopting a 1–7 Likert scale (i.e. 1=highly dissatisfied to 7=highly satisfied).

We received 317 complete responses; all respondents were audiologists running a small business in the Italian hearing-aid distribution industry. They purchased products/services from hearing-aid suppliers and they were enabled by law to resell them to hearing-impaired end users. They were the key players in the transaction between suppliers and the hearing-impaired end users, evaluating the best value offering and advising the final customers.

On average, respondents had been working for several years within this industry and seventeen per cent had experience of ‘more than 30 years’. Thirty-eight per cent declared having long-term
experience in the industry (i.e. from 20 to 30 years), and 39 per cent indicated having ‘from 10 to 20 years’ experience. Only six per cent had fewer than 10 years’ experience within the industry.

Forty-three per cent of the participants declared having a long-term relationship of more than 7 years with their main supplier, and 40 per cent of respondents declared 70 per cent to 90 per cent of their total expenditure was to their main supplier. At least 20 per cent stated they received 90 per cent of their products from their main supplier.

**Data analysis**

Respondents were asked to evaluate the main value drivers provided their main hearing-aid supplier. This included the main value drivers highlighted by previous research in other B2B industries (Blocker, 2011; Blocker et al., 2011; Ulaga and Eggert, 2006, Lam et al., 2004). In addition, the construct of CVA was added to the model, first as a predictor, then as the dependant variable (Flint et al., 2011).

**Table 6. Customer-value constructs**

Data were analysed through descriptive statistics, a correlation analysis among the main constructs and a linear regression model exploring the effect of the value drivers on the overall customer value and on the CVA perceived by business customers. The following regression models were elaborated using R software:

\[ \text{Customer Value} = \beta_0 + \beta_1 \text{Offer Quality} + \beta_2 \text{Personal interaction} + \beta_3 \text{Service support} + \beta_4 \text{Supplier know how} + \beta_5 \text{Acquisition costs} + \beta_6 \text{Switching costs} + \beta_7 \text{Customer value anticipation} + \epsilon \]
b)

**Customer Value Anticipation =**

\[ \beta_0 + \beta_1 \text{Offer Quality} + \beta_2 \text{Personal interaction} + \beta_3 \text{Service support} + \beta_4 \text{Supplier know-how} + \beta_5 \text{Acquisition costs} + \beta_6 \text{Switching costs} + \beta_7 \text{Customer value} + \varepsilon \]

To assess reliability, we assessed the internal consistencies. The value of the normalised Cronbach’s alpha was 0.72, in line with the minimum value of 0.7 suggested by Cortina (1993). The value of Cronbach’s alpha for each item was also examined to verify whether the exclusion of any items could improve the overall alpha.

**FINDINGS**

Table 3 presents the main correlations among the drivers, highlighting a strong and positive correlation between the different value drivers (e.g. personal interaction, service support, supplier know-how) with the evaluation of the ability of hearing-aid suppliers to anticipate customers’ needs (i.e. CVA).

Table 7. Correlation of constructs

The results confirm previous research that has found value creation to be a dynamic process (Grönroos, 2008), where providers need to identify and anticipate latent needs (Blocker et al., 2011). Very few constructs are connected to customer value. For example, this is seen in offer quality having a positive relationship with overall customer value. Generally, relationship costs and switching costs are not correlated with customer value or CVA.

The first regression analysis focused on the effect of several value-drivers constructs on the overall customer-value perception (Table 4).

The results demonstrate that all these constructs (adopted from previous literature) do not represent or affect the evaluation of customer value apart from the perception of offer quality.

However, this result is not the same when considering CVA, the perception and evaluation of which might be the result of business customers’ perception of almost each value-driver construct (Table 5).
In this case, all the value constructs are significant and positively related to CVA. The conclusion is that some customers might come to expect suppliers to anticipate their needs and desires (even if they themselves cannot). As shown by Grönroos (2011), suppliers’ actions can be more effective if they are able to anticipate and provide solutions to unexpressed needs. In addition, relationship costs negatively affect the ability of the main supplier to anticipate customer needs, as the more the customers need to spend and invest to maintain the relationship with the supplier, the less the supplier is able to satisfy their customers’ needs effectively. In such a scenario, competitive advantages can be obtained by suppliers identified by customers as able to match their needs spontaneously with a flexible offer (Prior, 2013).

**IMPLICATIONS**

This study has allowed us to investigate the different constructs of value perceived in the B2B relationship. Further, this study contributes to the B2B marketing and relationship literature about health-care buyers’ (at the retail level) perceived value towards their main suppliers. This study also provides useful implications in the analysis of the manner in which these buyers can affect the value proposition from the supplier in the B2B context, identifying different factors of importance of value drivers, and evaluating the supplier’s ability to deliver value in a specific business context. The relevance of our findings is that CVA capabilities appear to be an operant resource that may offer a competitive business advantage.

This study addresses the need to assess the increasing complexity of understanding the roles (Flint et al., 2011), relationships, and drivers among buyers, suppliers, and other parties in marketing channels (Prior, 2013; Ritter and Walter, 2012).

Our study found that the technical features of the product were of secondary importance. In dealing with their customers, hearing-aid suppliers should move away from concentrating on the technical features of a device to focusing on the provision of support for its successful operation. This implies that suppliers should grant ongoing practical support and service to customers by also anticipating their needs on the basis of their wider and deeper knowledge of the market. We have demonstrated that buyers desire proactive suppliers. CVA capability seems to be a distinguish resource offering potential competitive advantages in competitive sector. From a business-management perspective, the results suggest that effective cooperation between suppliers and specific buyers is required. Improving the cooperation of all these service-network participants is paramount to improving product and services provision to end users.

**CONCLUSION**
Our study confirms the importance of strong cooperation between hearing-aid suppliers and the retailer. The justification of the necessity of this cooperation lies in the fact that retailers do not resell a standard product. Rather, they offer their final clients a personalised solution that includes the device, several fittings, and assistance services. Final clients search for a unique hearing solution and expect the audiologist to be flexible and sympathetic, just as audiologists as retailers expect their suppliers to be proactive in offering flexible and anticipating solutions, indirectly matching final clients’ expectations. In sum up, it seems that the value-anticipation process is intrinsic to this market. Further consideration could be given to the possibility of adopting a vertical integration process that would allow the supplier and retailer work in very close contact to ensure their perspective of the offer system is similar.

Our results are limited to aspects of CV and CVA operationalised in a specific business context and our research does not explain to how this is done. Future research on CV and CVA could be conceptualised in a more complex manner, particularly focused on understanding how suppliers might effectively anticipate the needs of the customers.

STRUCTURAL CAPITAL IN KNOWLEDGE ECONOMY: GENERAL INSIGHTS

Russo, Giuseppe; Rosa Lombardi; Federica Evangelista
Department of Economics and Law, University of Cassino and Southern Lazio, Cassino, Italy

ABSTRACT

Purpose – The paper aims at analysing the role of structural capital in the current scenario, defining the management and evaluation profiles.

Methodology – The research approach is based on a qualitative methodology with the application of a single method approach. The sources of research are of a secondary type (paper, news, journal open access).

Findings – The findings of research originate from systematization of international literature. The objective is to represent the strong and weak points of the management and economic evaluation profiles of structural capital.

Originality/value – Structural capital favours the circulation of knowledge within a company and stimulates the creation of long term value. In this way, accessibility to company knowledge plays a rather important role if analysed from an internal perspective as well as from an external perspective.

Keywords: structural capital, intellectual capital, management, economic assessment.

INTRODUCTION

In the past decades, international literature (Lev, 1999; Guthrie and Petty, 2000; Stewart, 1997) has actively examined the theme of intellectual capital.

Despite the fact that taxonomy on this theme is varied, the paper analyses the structural capital and its management and assessment profiles. The objective is to offer the academic community and experts in this field with an updated conceptualization on this theme.

So, the objective of the research is in defining the role of structural capital in contemporary organizations (Zanda, 2011). Structural capital can be interpreted by starting with the definition of intellectual capital. Through a qualitative research approach, international literature on this topic is examined, supposing that the creation of long term value is generated by the very best management of structural capital.

The structure of the article is the following. After the introduction, section two analyses the literature related to intellectual capital, structural capital, its management profiles and economic appraisal.
Section three describes the research approach adopted. Section four illustrates the research results. Section five illustrates the final considerations, the limits and future perspectives of the study.

LITERATURE REVIEW

Intellectual Capital in Knowledge Economy

Ever since the Nineties, the attention focused on knowledge has resulted in confirmation of the strategic role of intellectual capital (Petty and Guthrie, 2000; Kaufmann and Schneider, 2004). This immateriality is seen as a range of intangible resources that, if correctly appraised in company management (Darroch, 2005; Du Plessis, 2007), result in an increase in long term company value (Chen et al, 2005).

The OECD (1999) considers intellectual capital as the economic value of two categories of intangible company resources: structural capital (or organizational) and human capital. The structural capital of a company refers to elements such as the characteristics of computer systems and distribution networks; human capital includes internal company resources (personnel) as well as external company resources (customers and suppliers). The definition identifies a specific distinction of the term intellectual capital and intangible resources, often mistakenly used as synonyms.

Peterson and Bjurstrom (1991) highlight another definition of intangible resources. The authors classify company intangibilities into three macro categories: human capital, market capital and confidence capital. Human capital includes a range of qualities that characterize the resources used within the company, such as leadership (Bennis and Nanus, 1985; Bradford and Cohen, 1984; Friedman, 1985; Mintzberg, 1973), motivations, know-how and the ability to achieve the objectives; the capital market identifies the perception that customers have of the company and of its products; finally, confidence capital indicates the opinions as well as the behaviour of company stakeholders with regards to the company, as well as the ability of the company to prove its reliability.

Edvinsson, Saint-Onge and Pettrash (Edvinsson and Malone, 1997) have drawn up a model called the Value Platform. It can identify the inter-relations that are important for the creation of value. They identify human capital, organizational capital and customer capital as elements of intellectual capital.

Stewart (1999) defines intellectual capital as “all intellectual material – knowledge, intellectual features, experience – that may be made available to create wealth”. According to the author, intellectual capital consists of three conceptual dimensions: human capital, relational capital and structural capital.

Structural capital represents coded and non coded company knowledge, technology, inventions, formal and informal organizational procedures, best practices, patents, databases and Intranet networks.
Structural Capital and Its Management

Structural capital is an expression of the organizational and management aspects of a company; it can be defined through the range of coded and non-coded knowledge of the characteristics of a contemporary company.

Sullivan (2000) examines the intellectual activities deriving from the innovations produced by intellectual capital. Intellectual assets include programmes, inventions, processes, databases, methodologies, industrial projects and intellectual property rights (patents, copyrights, brands, trade secrets) on which the company can claim property rights.

As far as Sveiby is concerned (1997) structural capital (or the internal structure) includes a range of patents, models, administrative systems and software created by employees and owned by the organization. Company culture is also included.

Company culture plays a very important role in the development or organizational aspects that can generate, manage and maintain intellectual capital within the organization; it includes a range of rules, values and principles that affect the decisions made by company employees.

This generates a dynamic interdependence between human capital and structural capital. The knowledge and skills of each individual play a very important role in the creation of structural capital. Individual knowledge is appraised, diffused among company employees and transformed into action.

The role played by structural capital in the creation of value has resulted in the need for development of its management methods aimed at greater availability of knowledge within the organization (Sánchez et al., 2000).

The increase in this immateriality favours the circulation of knowledge within the company and stimulates the creation of long-term value (Teece, 2000; Varian, 2005).

In this way, accessibility to company knowledge plays a very important role if analysed from an internal as well as external perspective.

Starting from the internal perspective, intangible goods require adequate management methods as they are characterized by a high level of dispersion. This characteristic results in the need for collection and coding.

A creative approach to coded knowledge presumes its conceptualisation with regards to the new situation.

The creation of knowledge generates resistance by the holders, who fear that they may lose their prestige and contractual power with regards to the organization. Furthermore, the knowledge of the competitors can be copied and new costs related to use of internal personnel as well as requests for external consultancy may arise.
In order for knowledge to be diffused within the organisation and contribute to the creation of new internal capital, the company must develop:

- a leadership focused on knowledge management initiatives (Alavi and Leidner, 1999; Bollinger and Smith, 2001) that stimulates personnel to favour the exchange of knowledge;
- a culture that encourages the development and use of cognitive capital, also in a modern manner;
- operative systems that favour sharing of the knowledge assets by employees;
- an organizational structure of a reticular type in which individuals are assigned shared values and objectives. This kind of organisational structure allows for the outlining of variable responsibilities, which in turn stimulate individuals towards greater creativeness and dynamism in answering external requests.

Structural capital belongs to the organisation in its entirety. It may be reproduced and made available to each individual (Stewart, 2002; Daum, 2003).

An analysis of accessibility of structural capital involves problems related to knowledge management. The development and creation of new knowledge also requires important investments. Consequently, the demand to protect such knowledge from imitations and embezzlement by others, so that the company may take advantage of the economic benefits deriving from creation of the innovative idea.

The methods of protection that contemporary organizations make use of also include a technical protection and a legal protection.

The technical protection limits access to knowledge developed through access control. Legal protection, however, allows the modern company to legally protect the knowledge developed against improper use by others, that may use them without any right to do so.

Legal or technical protection of structural company capital has two results. It stimulates company investments in terms of research and development but at the same time it limits the diffusion of knowledge and, subsequently, the creation of new knowledge due to the effect of its accumulation.

The Economic Value of Structural Capital

The economic value of structural capital may be estimated through the use of three main approaches: the cost-based approach, the value-based approach and the real option-based approach.

The cost-based approach is based on historical cost and on reproduction cost for an estimate of the economic value of structural capital.

The historical cost includes all costs borne by the company related to invention and application activities of a technology. This method is not easy to apply: many mutual costs borne in the various research centres exist and the total of costs may not adequately represent the value of technology. The cost of reproduction represents all of the costs required for the creation of an element of utility similar
to the technology included in the estimate. The application of this method includes some limits: the
difficult identification of replacement knowledge in terms of utility and the ones available on the
market as well as the uncertainty that the costs borne for the creation of technology may guarantee the
same results.

The value-based approach assesses the future economic benefits that technology can provide to the
profitability of a company. While approaching the estimate, however, two problems arise:
identification of the flow of expected economic benefits, choice of the rate of updating such benefits
and the definition of the life of technology.

The flow of expected economic benefits may derive from future differential profit generated by the
difference between economic benefits achieved before the use of new technology and the economic
benefits that will be achieved by introduction of the same.

In this way, assessment of technology, carried out through updating of the flows of future benefits,
updated at an adequate rate of remuneration for pure capital and risk investment, represents a
theoretical value of general exchange, equal and neutral, that satisfies the seller as well as the buyer.
The exchange value of the technology is represented in the following formula (Zanda et al., 2005):

\[ W_i = \sum_{s=1}^{k} C_s (1 + i)^{-s} \]

where:

\( W_i \) is the economic value of technology;

\( C_s \) is the flow of competitive benefits or differentials provided by technology to the company in \( k \)
number of years;

\( i \) is the discount rate of benefit flows that takes into consideration risk and remuneration for pure
capital investment.

The value-based approach has been applied by Ferrata (Ferrata, 2007). He estimates the economic
value of base research through the insurance related logic, considering some aspects such as the need
for new knowledge as indicated by demand, conclusion of basic research of the laboratory problems
including in the project, the benefits deriving from the sale of each unit of product following the
development of technology. The assessment of basic research can be represented in the following
formula (Ferrata, 2007):

\[ Y = \sum_{s=1}^{k} P_t (\Delta R_{s-\infty})_{s-t-m} \]

where:
Y \quad \text{value of the basic research project with } k \text{ as the alternatives of use;}

k \quad \text{markets involved in the research field;}

P_i \quad \text{probability of exceeding the limits that do not allow for the use of knowledge on the market } i;

i \quad \text{minimum net incomes, estimated with reference to the market } i;

r\% \quad \text{discount rate;}

m \quad \text{estimate of the time necessary to make the project operative on the market } i;

t \quad \text{the period of time in which the cash flows generated by the market } i \text{ are expected to extend.}

Another approach suitable to an estimate of the economic value of structural capital is the real option-based approach. This starts with the doctrine (Amram, 1999, Black and Scholes, 1971) that considers it suitable for the assessment of applied research as the method, characterized by rationality, objectivity and neutrality, can enhance the investments characterized by a high level of uncertainty. The real option is set up as an option related to an investment project.

The problems innate in this method refer to the definition of contractual conditions, to be clarified on each occasion, and compliance of the investment with some characteristics: the value of the investment is affected by contingent values, the uncertainty of the investment results in the need for further information; the possibility of making changes to the strategy underway; flexibility of the investment, the entrepreneur may choose several alternative businesses. As the investment adopts several strategies, it has high growth possibilities.

The assessment process includes several types of real options: development real options, connected with “platform investments” for the implementation of other projects; deferment real options, related to the opportunity of postponing the decision related to further investments for a certain period of time; real flexibility options, typical of research projects in which the final objectives can be easily changed. The real options of abandonment provide the executor with the possibility of interrupting the project within a certain period of time, at advantageous conditions, in the hypothesis in which it is no longer convenient in future investment developments.

Existence of the real options can be empirically proved starting with a preference for investments in research with greater liquidity on the market between two investments with the same characteristics.

The approach proposed by Amran and Kulatilaka (1999) articulates the real option model in four phases: definition of the mathematical model according to the characteristics and sources of uncertainty; application of the assessment model of the option (Cox et al., 1979; Black and Scholes, 1972); examination of the results achieved according to the data included in the model; possible
redefinition of the investment according to the re-elaboration of strategies or results that are not in line with expectations of management.

RESEARCH APPROACH

The research approach is based on the qualitative method (Maylor and Blackmon, 2005; Myers, 2013). Research investigates into the topic of structural capital, emphasizing the role undertaken by the latter in the economy of knowledge. Therefore, special attention is given to the following aspects:

- the notion of structural capital;
- the profiles of management and enhancement of structural capital;
- definition of the correct trade-off between accessibility and protection of company structural capital.

The acquisition of data has been carried out using the single-method approach (Yin, 1994). The sources of research are of a secondary nature and have been selected using the following research:

- 20 scientific articles have been selected related to the topics: “intellectual assets”, “knowledge management”, “structural capital” and “real option”;
- 2 databases have been used, 20 scientific articles have been consulted through the EBSCO database, found through research using the word “intellectual capital”; through Google Scholar 10 scientific articles have been consulted using the keyword structural capital;
- several websites, news and open access journals have been consulted.

FINDINGS AND DISCUSSIONS

The results of research are born from an analysis of international literature related to structural capital. Structured knowledge stimulates the accumulation of knowledge inside and outside of the organization that has generated it; they may inspire the creation of new technologies (Choen and Levinthal, 1989) and the formulation of new ideas.

Among the aspects investigated, it can be seen that the traditional methods of social capital assessment are not capable of assessing investments into applied research, enhancing opportunities. The high level of uncertainty in the results of investments makes it difficult to estimate the value of technology (starting with costs necessary to create an equivalent technology of use) and to attribute sure profitability or financial flows to the same.

The real options reply to this requirement, even if their main elements (current price, applicable price, method of execution of the option), in the Option Pricing Model, are not easy to identify.
Another element of reflection is the choice between protection or diffusion of knowledge. The protection of structural capital offers the organisation the achievement of a leading position in the market and the acquisition of adequate economic returns aimed at covering the costs borne for the creation and development of knowledge.

An excessive level of protection of intellectual property limits access to new knowledge, restricting its accumulation process. Breakage of the balance between old knowledge and new knowledge therefore occurs.

The trade-off between accessibility of structured knowledge and its protection does not have just one solution. The very best solution derives from an analysis of structural capital involved in the protection and the ability of the innovator to take hold of the economic benefits created by it (Tan et al., 2007; Maditinos et al., 2011; Kannan, and Aulbur 2004).

The measure in which new knowledge can be imitated by competitors depends on the simplicity with which technology is understood and communicated. This characteristic is a result of the nature of knowledge (tacit or coded) of the team to lead that the innovator enjoys on the market and the life cycle of structural capital.

Correct management of structural capital requires a connection between the life cycle of technology and management of intellectual property. A universal approach may not be sufficient (Chesbrough, 2006).

The forms of protection of intangible goods are not always successful in playing the role of protection. An example of this is represented by the illegal copies of goods or the possibility of developing goods that are similar to those of the innovator.

This situation results in a reduction in earnings of the original manufacturers/inventors of the goods and an increase in costs borne by them for appeals deriving from the violation or presumed violation of intellectual property.

The solutions proposed for limitation of these phenomenon include granting of open source knowledge. The editorial contents of goods, texts, images, videos and software through specific user licenses are shared by several operators, who can use them and make changes freely.

The use of this form of liberalization for products that are difficult to protect is recommended, as the open source concession of structured knowledge results in a reduction of economic returns of the inventors; the manufacturing companies can compensate the economic losses suffered through the sale of complementary products.

However, if the company owns ideas and patents that are not used because they are not functional for the activity carried out, the trade-off between accessibility and the protection of structural capital may
be mitigated through their transfer (including by means of a license) to companies capable of taking advantage of their potentials (Chesbrough, 2006).

Often companies do not use all of the ideas developed and patented. As far as the company system is concerned, these ideas represent a waste of resources. They are demoralizing for the human resources that have created them and may slow down the flow of innovation.

The license or transfer of part of the structural capital unused allows for diffusion of the knowledge developed and the development of new knowledge to companies capable of capturing the potentials (Rappaport, 1986).

At the same time, the company owning the patent may take advantage of the economic benefits of this technology that, otherwise, would have been worthless.

**CONCLUSIONS, LIMITS AND PERSPECTIVES**

A lot of literature can be attributed to intellectual capital. The companies that take advantage of internal knowledge for the creation of innovation and of efficient and effective production processes guarantee a position of competitive advantage.

Contemporary companies are rich, vital and competitive when they own a high level of intellectual capital.

In this regard, company performance is seen in its entirety, as the range of results achieved, considering the tangible and intangible elements.

This document has introduced an updated conceptualisation of structural capital to the intangible components, with special reference to management and assessment profiles.

With regards to external management of company knowledge, the trade-off between accessibility of structural capital and its protection has been investigated. The protection of structural capital, on the one hand, guarantees remuneration of investments made to the entrepreneurs; on the other hand it favours the emergence of illegal forms of acquisition of knowledge.

On the contrary, the opening of structured knowledge favours the circulation of new knowledge and has active participation in the creation of further knowledge. In this case, all of the organizations benefit from the economic results of the idea, reducing proceeds for the company that invented it. However, this does not represent a disincentive for the inventor company in creating further investments in terms of knowledge, limiting the development and increase of internal company capital.

Contemporary companies tend to favour the correct balance between sharing and protection. In this regard, the achievement of long term stable results is preferred.
The limits of the article include its theoretical form and the fact that the analysis carried out represents an updated conceptualization of literature, found through the research method previously illustrated. Therefore, future research aims at systematizing the main literature on the topic of structural capital with the objective of providing another qualitative analysis.

GOVERNANCE, ACCOUNTABILITY AND PARTICIPATORY BUDGET BETWEEN MYTH AND REALITY. THE ITALIAN CASE

Russo, Salvatore

Department of Management, Ca’Foscari University, Italy

ABSTRACT

This paper explores the implications of participatory budget (PB) in Italy, inspired by insights and reflections on public governance, accountability, participation and inclusion of citizens in the local authority expenditure decisions. In particular it focuses on the characteristics of the context in which PB has encountered practical implementation, the way by which it is realized, the most common type of intervention and, finally, the criticalities in the units of analysis. The conclusions give way to considerations on actions still required to promote PB, so that it can really be seen as a tool for improving accountability.

Keywords: Public governance, participatory budget, accountability

INTRODUCTION

In the last twenty years, the public sector has been characterized by innovative processes and managerial tools with new visions and trends (Hood, 1991; Rhodes 1996; Lapsley, 2008). Among these, a logic of participation and citizens involvement has emerged with the aim of diffusing the adoption of new forms of governance and promoting shared decision making. The need to build a system of participating mode of citizenship and collaborative governance appears pressing in order to connect policy effects with both expectations and needs of different social groups by discharging accountability (Newman et al., 2004). This is modifying the conventional rules of democracy, in order to encourage participation, dialogue, consensus and various expressions of interests in those contexts traditionally reserved to the policy maker (Lehtonen, 2006).

If the New Public Management (NPM) has revised the role of the citizen by assimilating it to that of a customer in a “marketized” Public Administration, a new emergent vision makes the citizen an active subject in a process in which the citizen’s role is integrated with government and based on a new vision of the accountability paradigm (Hummels, 1998; King et al. 1998; Goetz and Jenkins, 2001;
Ackermann, 2004). The same concept of public value, in its evolution, has considered the “co-participation” as key-element to pursue public interest (Moore, 1995). Consequently, the very concept of public governance should benefit from the enrichment deriving from the direct involvement of citizens in public decision-making, thus stimulating the activation of accountability processes in which politicians, managers and citizens are fully involved (Bekke et al., 1995). This represents a starting point for new theorizations as well as multilevel governance (Rhodes, 1996; Stoker, 1996; Pierre e Stoker, 2000; Irving and Stansbury, 2004; Soma and Vatn, 2010) or collaborative governance (Newman et al., 2004; Fung and Wright, 2001; Fung, 2006).

Among the heterogeneous instruments of the participative democracy, undoubtedly, the PB plays an important role both for the impact exercised on society as a whole and for the involvement of several social groups in the resource allocation process. “At the heart of such initiatives is the right to increase councillors’ decision-making, with more localized citizen involvement in determining resource allocations” (Mitlin, 2004:6).

From a review of the literature it is possible to observe that several experiences in those poor areas of the world where the citizens’ involvement in public decision-making is encountered as an useful support for the construction of a priority scale taking into account political needs, social and economic differences (Eberle, 2001, 2007). These initiatives have also influenced the most industrialized countries with the adaptation of both methods and instruments to the context requirements, so that it is now possible to discuss how this has come about and what the concrete effects are (Ebdon, 2000; Gaventa, 2004; Lehtonon 2006, Sintomer et al., 2008).

In Italy, an increasing number of municipalities have been implementing participatory budgeting, so this may be considered a good starting point for some interpretative reflections and empirical observations. Coherently, this paper explores the relationship between Local Authorities and citizens’ participation, and aims to answer the following questions: 1) what does mean the PB in the evolutionary forms of public governance?; 2) what are the main benefits and criticalities in the PB implementation in the Italian municipalities?

The first section of the paper is dedicated to the concepts of governance, participative and deliberative democracy. The second section is devoted to the instruments mainly used in the implementation of participatory democracy. The third section focuses on the PB. The fourth section examines the case of some Italian municipalities that have initiated experiences of participatory budgeting. Finally, discussion and conclusions.
2. PUBLIC GOVERNANCE, PARTICIPATIVE AND DELIBERATIVE DEMOCRACY

From the point of view of the public management theory that, over the last two decades, has supported changes in both the organization and structure of the public sector, firstly it is possible to observe the ethical dimension that has focused on the relations and integration between administrators and administered. The reforms have sought to transform the culture of public organizations, which includes encouraging employees to think of citizens as customers to be served instead of clients to be managed (Hood, 1991; Osborne and Gaembl, 1992; Saarelainen, 1999).

NPM has paid excessive attention to the possibility of exercising market control rather than democratic control, thus emphasizing the customer role of citizens and reducing their political role (Hood, 1991, Ferlie et al., 1996, Lapsley, 2008). However, what has taken a non-negligible meaning, together with the key principles of effectiveness, efficiency, responsibility and accountability, is the transparency in the action of the public administration. Transparency, in terms of a strong concept of responsibility, is powerfully rooted in the phenomenon of participatory democracy, and can be reached only by providing highly organized tools and means for citizens’ activism in the political process. Transparency is also strongly related to the concept of self-governing, according to which citizens do not have only an impact on the services offered by the public administration but also take part in the production process, firstly as co-decision-makers on “what” and “how” to produce, and secondly as co-producers of the service (Sjöblom 1999:22).

A complementary perspective is provided by the stakeholder theory. It assumes that a company (public or private) has a series of constituent groups depending on the context of the activities in which they operate (Freeman, 1984; Jones and Wicks, 1999). The concept of stakeholders in the public administration assumes a wide meaning compared with private firm, as all the individuals or their social and economic groups are holders of a “stake”, which derives from their role in society (Handley and Howell-Moroney, 2010). Stakeholders are not primarily seen as actors who can influence the organization’s continuity, but as individuals and groups who have a legitimate claim on the organization to participate in the decision-making process simply because they are affected by the organization’s practices, policies and actions (Hummels, 1998:1408). By highlighting the ways for a change through the development of a new administration model based on cooperation, collaboration and integration, this implies an overrun of what is traditionally indicated as a sort of bipolarism that sees citizens and administrators as antagonists. In this regard, the use of the term “co-governance” suggests properly that the borders between state and civil society are vanishing (Goetz and Jenkins, 2001; Ackerman, 2004; Arena, 2006).
In the field of public policy two different paths in this approach are proposed: the method of pressure and the method of comparison (Bobbio, 2002, 2004, 2006). The first, which is related to the expression “participatory democracy”, considers participation as a tool to give a voice to weak social subjects, who are marginalized or traditionally excluded, through social movements or associations. The method of pressure responds to an idea of participatory democracy which is supported by social movements and is reflected in the “participatory budget” experiments carried out in the Latin American countries and, in general, in those countries whose economies are particularly disadvantaged. (Abers, 1998; De Sousa Santos, 1998; Allegretti, 2001; Gret and Sintomer 2002; Harnecker, 2003)

In contrast, the method of comparison, which coincides with deliberative democracy, is based on the assumption that civil society has a pluralist nature. It does mean participation as a comparison of dialogic nature, between citizens which have conflicting ideas, different points of view or opposing interests, in order to draw up common solutions and to find a common ground or, at least, to clarify the terms of the conflict for finding a common ground of action. The relationship is no longer of dualistic type between people and administration, but is rather a multi-voiced dialogue in which the public administration assumes a neutral role and is equal to the other actors (Pellizzoni 2005: 23). Comparison and co-decision are two crucial moments in validating the deliberative process, which are not longer guided only by elected bodies, but are determined by a majority, built for a specific purpose and therefore, legitimized to choose. The difference between the theory of deliberative democracy and other theories of democracy is consequently locus (Chambers, 2003:308). Deliberative democracy is ‘talk-centric’ not ‘voting-centric’.

The experiences referring to the deliberative democracy theory are based on two essential points: the use of comparison argued and the inclusion of all the interests and points of view that are affected by the social actors. In substance if in the model of participatory democracy the citizens are invited to take part in the debate, by opinions, suggestions and, sometimes, direct claims, in the deliberative model they are directly involved in decision-making process and are able to determine the outcome (Heimans, 2002).

Both models reflect the transition from a traditional view, towards a vision in which the citizens become co-protagonists in the decision-making processes. From a preliminary analysis of studies in the literature of international bodies (World Bank, International Monetary Fund, etc.) on the subject of stakeholder participation in the implementation of the Poverty Reduction Strategy Process (PRS) (Eberlei, 2001, 2007), one can observe a multiple approach in the methods of interaction between politicians and citizens, at the various stages of the political cycle. The degrees of participation, which
are normally considered to be formal, vary and may take the form of the following actions: 1) sharing of information; 2) consultation, 3) joint decision; 4) partnership; 5) control.

Contributions from policy studies (OECD, 2001) consider that engaging citizens in policy making is a core element of good governance, and contributes to building public trust in government, raising the quality of democracy and strengthening civic capacity. Because of its direct interest in the problem at stake, this study deserves a more detailed analysis. The OECD’s vision of citizens’ involvement encompasses three levels: a) access to information; b) Consultation; c) Active participation.

It acknowledges equal standing for citizens in setting the agenda, proposing policy options and shaping the policy dialogue, although the responsibility for the final decision or policy formulation rests with government” (OECD 2001: 23; Gramberger, 2001).

Accountability represents one of the ten guiding principle proposed by OECD (2001) for engaging citizens with policy making (the other are Commitment, Rights, Clarity, Time, Objectivity, Resources, Co-ordination., Evaluation, Active citizenship).

On the one hand, this marks the abandonment of the conventional interpretations of the public government supported by the concept of power coming from the authority (typical of the traditional public administration) and, on the other hand, it introduces the power of communication as a source of an innovative idea of co-shared administration. This is based essentially on the principles both of “subsidiarity” and “organisational autonomy”, since the first legitimates the autonomous citizens’ initiative in the alliance with the public administration to solve problems of general interest; the second, in its relational dimension, needs to establish in a pluralist society equal relations between the different areas of interests, both public and private (Arena, 2006: 82; Bourgon 2007).

That assertion allows to sustain a sequential logic, by starting from the concept of co-shared democracy, passing through the phase of participatory democracy or dialogical, and coming to that is commonly reported as the democracy of stakeholders. In this last paradigm, public governance represents the phenomenon to which politicians, citizens and interest groups contribute in an active way. On this innovative concept of governance, accountability and transparency of public action exercise a strong influence (Dwyer, 2005). In fact, accountability does not exercise its strength only in the operational phase of reporting from the decision-maker to the citizen, but it is inevitably a substantial component of reinforcement in the opening behavior that the decision-maker implements, by making citizens sharing the same decisions and putting them in a position to evaluate the effectiveness and the outcome of policies, both ex ante (programming ) and ex post (control of results).

We talk in this way about social accountability defined by the World Bank (2005:1) as “an approach towards building accountability that relies on civic engagement, i.e., in which it is ordinary citizens and/or civil society organizations who participate directly or indirectly in exacting accountability”.

The Future of Entrepreneurship
3. PARTICIPATORY BUDGET AS AN INSTRUMENT OF CO-SHARED LOCAL GOVERNANCE

Among the different forms that currently seem to develop the paradigm of deliberative democracy, the PB approach, in which interests of the participants intersect and integrate, seems to have reached a certain degree of success, keeping its original features and treating predefined arguments on which decisions have to be made (Gret and Sintomer, 2002; Bobbio, 2002). In this approach, citizens and/or organizations in civil society are actors in the decision-making process together with the representative bodies.

PB allows the citizens of an area (neighbourhood, regeneration or local authority area) to participate in the allocation of part of the local Council’s or other statutory agency’s (health services, police) available financial resources. PB aims to increase transparency, accountability, understanding and social inclusion in local government affairs. PB applies to a varying amount of the local Council’s budget and the actual process is developed to suit local circumstances (PB Tool kit, 2008:4).

PB directly involves local people in making decisions on local spending and priorities for a defined public budget. PB processes can be defined by geographical area (whether that refers to a neighbourhood or to a larger area) or by theme. This means engaging residents and community groups in discussions and voting on spending priorities, making spending proposals, and voting on them, as well as giving local people a role in the scrutiny and monitoring of processes and results, in order to inform subsequent PB decisions.

The legitimacy of the power to manage the common resources of the collectivity derives from the mandate granted by the citizens to the elected representatives. However, in this historic phase, which is characterized by a scarcity of public resources together with the presence of strong social pressures, the complicated and complex system of rules determines conditions that undermine the representative mechanisms. So, it generates a deep split between both consensus and/or political opportunity and the capacity of the public administration to respond to the real needs of the community. The PB as a tool mainly used in areas of the world that are particularly depressed economically are characterized by strong social contrasts, seems to be a solution in western countries to improve the performance of public services and face to the fiscal stress (Ebdon and Franklin, 2006).

The main factors inspiring the PB approach in Latin America have reference to: scarcity of resources, fiscal decentralization, need for transparency in policy and resource allocation (Roberto, 1996; Heimans, 2002; Cabannes, 2004; Afonso, 2006). PB is not a document but a pervasive process engaging all those who have an interest in public administration. The reference to local government is frequently mentioned as a cause of the various bottom-up experiences that have been increasing in
many countries. PB does not reverse the roles in local government but creates a synergy in the knowledge of public interest between politicians and citizens.

Many contributions to the literature tend to highlight two different profiles in the PB approach. “The experiences fall between simple consultation with citizens, whereby the executive and legislative branches retain all the power, and deliberative experiences, in which the decisions of PB councilors have real power and are endorsed by the municipal council” (Cabannes, 2004:28; cfr. Heimans, 2002). The implementation of PB would demonstrate that the democratic and transparent administration of the financial resources is a powerful and very appropriate way to avoid corruption or deviation of the public funds, generating popular public participation.

The first PB experience was launched by the workers’ party in 1989 in Porto Alegre, capital of the Brazilian State of Rio Grande do Sul. The workers’ aim was to fight serious problems related to power concentration, resource waste, political affairs and corruption. That experience led the way for similar experiences all over the world (Abers, 1998; De Sousa Santos, 1998; Allegretti, 2001; Gret and Sintomer, 2002; Harnecker, 2003). Over 300 Brazilian municipalities adopted PB between 1989 and 2004, and cities in at least 30 other countries also have adopted PB (Wampler and Avritzer, 2006; Cabannes, 2004). The phenomenon has also caught on in Europe, where there are different rules in the various countries because PB does not imply a definition of rules but is a philosophy permeating the process of elaboration. More than 300 municipalities in countries such as Venezuela, Canada, Spain, France and Chile, and the UK have already used PB. In the UK, for example, experiences of PB began to catch on in the cities of Salford and Manchester in 2000. A 2008 report by the PB unit - a project of the charity Church Action (Participatory budgeting in the UK: values, principles & standards, 2008) – claims that 22 pilot projects have led to some form of participatory budget. The objective was to ensure that by 2012 each local authority area should have a PB.

Aspects of the PB Process

The process of PB generally requires citizens to be engaged in decision-making. It extends the succession of stages of the cycle annual budget formulation and approval which afford investments and projects to be allocated to the emerging local needs. In the participation process for the budget formulation, procedures and activities are not scheduled and, on the basis of indications from the experiences already gained in different countries, it is possible to design a sort of prototype of the process articulation as follows:

- preparation of feasibility studies to support the evaluation of the investments or projects;
- preparation of a proposal in the areas concerning the participatory process;
- monitoring process in the budget approval;
- monitoring in the budget management with specific reference to the priorities;
monitoring the provision process (competitive tenders, contracting);
monitoring services provision for the public works.

In these activities it is reasonable to think about the joint attention paid by both public administration and citizens to budget performance.

PB involves citizens and political forces in collaboration, therefore it has the prerogative to include in the resource allocation process those who traditionally are not involved in political decisions. There are really no universal rules about the application of PB. The methodologies may vary depending on the local authority and its requirements. So there are rules which determine the percentage amount of resources to entrust to the citizens' decisions.

Given the citizens' involvement, PB creates opportunities for greater effectiveness in the distribution of public funds and increases social cohesion. According to the advocates of PB, this implies a certain amount of advantages (Heimans, 2002:10) as citizens' empowerment and promotion of public learning; democratization of macroeconomic policy; integration among different social groups; co-shared economic and social growth.

Certainly PB is not a “consolation prize” for citizens but a decision-making instrument that is able to rebuild a relationship of trust between institutions and citizens at the same time the risks is that “people may view PB as just another bandwagon” while it is a new way of planning and budgeting. Therefore, the risk is that may be a mystification of the participation tool (Wampler and Avritzer, 2006). Other risks are: a potential impact on fiscal discipline of the increased demands on governments through participation; an erosion of the legitimacy of established democratic institutions, such as parliament, in favour of less accountable civil society organizations; an escalation of conflict over resource allocation and distribution among participating social groups; the “capture” of participatory processes by local elites, by the most vocal constituencies or by those with vested interests. In this sense the PB represents a tool for modernising local governance and activating the community to improve the local public services.

4. THE ITALIAN WAY TOWARDS CITIZENS’ PARTICIPATION

As in most European States – according to the OECD report 2009 - also in Italy, in the last few years there has been the introduction of some form of citizen participation, in particular in the local authorities (mostly the Municipalities). There are also experiences that have launched a regional form of participation, by codifying methods and tools. This is the emblematic case of the Tuscany Region, which approved a law in 2007 whose content promotes regional instruments of deliberative democracy (Floridia, 2008; OECD 2009). Other experiments are in progress in other regions (Lazio Region, Emilia-Romagna Region)
In general, the administration of the local authority recalls closely the concepts of participatory democracy and deliberative democracy and particularly the small-size municipalities are more involved than others.

The advent of ITC and the start of e-Governance projects simplify the accessibility to the public administration by the use of web sites (for example online forums, wikis) and speed up the dialogue between public and institutions. It is the substance of the policies and the immediate tangibility of their effects to involve citizens by pushing them towards forms of organization where they can take an active part in the dialogue and be present in the choices relating to resource allocation.

Further the recent reforms in Italy have introduced new figures of responsibility and have embedded in the public rules principles of efficiency, effectiveness and economy that did not previously feature in any law. This change has strongly contributed to move their culture towards the dissemination of a management logic based on results, at the top of which there is the principle of accountability of the organizational units in the achievement of the objectives.

The new managerial approach has meant a revolution in terms of prevailing strategic objectives, using the human resources as the main source of competitive advantage, in a management process which sees the co-sharing of objectives within the organization and a tendency to continuous improvement.

The challenge of the programming and control (P&C) system consists precisely in its capacity for adaptation and depends upon the elasticity of response to the context of reference. The P&C system, which constitutes a cross-operating system on which the different stages of activities and translation of political intent depend, is thus a fertile ground for allowing citizens participate in decision-making.

It enables a cyclical transition from strategy to programming, management and reporting, by providing in each of these steps appropriate monitoring activities and forms of control. So doing programming extends in a horizontal span and is able to predict what will happen at every step.

In this succession forms of interaction between politicians and citizens, public officials and citizens may take place in a traditional way (for example with forms of questioning in municipal councils) or with innovative instruments. The implementation of P&C systems requires not only a certain degree of innovation in the instruments used, but also a change at the organizational level, through the involvement of all the operational units and the coordination of all activities. This implies a redefinition of the strategies and a change of management in a results-oriented logic. In addition, the complexity of the control system impacts on the quality of the external information, by improving the excise of responsibilities and the guarantee of greater transparency that comes from the public (Garlatti e Pezzani, 2000; Hinna, 2004; Pezzani, 2005).

The need to comply with accountability, considered one of the main factors underpinning the path of deliberative democracy, is part of that change in the culture of public administrations which considers...
as the aspects of economy as the ethical aspects of management, by opening the way for new reflections on the perspective for improving the performance of the local authority. This is a tool that allows for comparison and the sharing of common objectives, and can be seen also as an instrument for the reduction of potential social conflict. The information function seeks to give account to the citizens of the use of public resources and the accomplishment of strategic objectives. At the same time, it meets the requirements for greater accountability from the internal offices, thus playing a strong motivational role.

In the light of this recent innovation the role and the meaning of PB should be interpreted by considering it as a dynamic process in which politicians, civil servants and citizens are involved. That surely may influence P&C system and the way politicians and public manager discharge accountability. The degree of inclusiveness, the importance of participation in decision-making processes, their extension, the channels of communication and the evaluation mechanisms are unquestionably the keys to a successful PB experience. Further, PB may also support the local authority in facing the difficulties and constraints currently present in the system of public finance.

5. THE RESEARCH

On the basis of the theoretical conditions highlighted a research has set up by formulating a series of questions that have engaged the development of an empirical survey focused on a set of Italian municipalities that have acquired considerable experience on the participatory budget.

The survey was carried out by paying attention to the selection of municipalities, either well-documented in the literature or for having placed the project details on their own websites. The keyword inserted for their detection was “participatory budget”, assuming that the term in itself requires a continuous relationship with the citizens, so that occurs mainly by using channels such as Internet. The sample is based on only 11 local authorities (provinces capital and municipalities) that between 2009 and 2011 have collaborated with the research team. The first item has aimed to explore the ways in which PB has been implemented and how it was structured. Secondly, we asked “whether” and “to what extent” the PB is able to affect the programming process. Finally, “if” the PB is really able to ensure greater accountability of public decision-makers and managers in respect of citizens’ expectations, and can it ensure a long-term sustainability. That was followed identifying contacts with the responsible units for participatory budget. Subsequently, a questionnaire containing 20 questions was designed with reference to the following modules: characteristics of context; mode of citizens’ involvement; process execution; aims and achievements.

It should be specified that, in Italy, the PB has been implemented, especially in the municipalities located in the central and northern regions since 2000, except for some experience such as
Grottammare (Ascoli Piceno), which started in the early 1990s. In different local contexts, however, the PB was often put out of action or replaced by social reporting, another tool for discharging accountability. This last, while encouraging the citizens’ contribution in the phase of countercheck and audit, seems to limit the concrete incisiveness of the citizens’ participation. In some cases, the interviewees themselves made it possible to further deepen the experience, especially from the point of view of the setting-up of the PB process, to highlight the differences characterizing the practices of the citizen participation model.

The aim of the research was to find out the tangible benefits of the PB experience and include the stories of participatory democracy within local policies that imply the creation of deliberative arenas, debates and dialogues, by which the representative democracy mechanisms can be innovated. This was also to verify if these experiences really operate for the benefit of the majority of the population and what direction is followed by the PB process in any interviewed municipality.

**Findings**

The procedures of the PB are very different and depend on the context where the process is implemented. The experiences are almost all addressed towards progressive experiments that have highlighted the strong points of the PB. These consist mainly in adjusting its rules so that the process can always adapt to the characteristics of individuals, by reestablishing the relationships among the different institutions and groups of the civil society. It is considered a tool of aggregation and permits the abandonment of old forms of policy for guaranteeing a transparent administration in the choices made by local governments. In fact they are different experiences even if, through the networks for the exchange, as in the case of the URBAL program, it is to build a consciousness of mutual benefit (between public administration and civil society). Moreover, in a few years, some experiences are trying to formalize the process, in order to make sure a certain continuity and to develop particular skills in the field but, above all, with aim of practicing more and more a “legitimizing policy”, after the electoral vote. In this perspective the PB is used as an instrument putting in relationship the representative democracy with some moments of deliberative democracy. The observed experiences reveal that the joining element is the location of some fundamental steps in the construction of PB, such as: emerging needs, priority voting (all participants brainstorm a list of ideas), verification of feasibility and insertion of specific expenses in the annual budget. In detail, every Municipality interviewed has been trying to adapt the process to the demands and characteristics of the participants and to what the administration would really like to achieve.

**Characteristics of context**

Since the municipalities were chosen exclusively on the basis of the indispensable condition that they had completed a PB experience, their characteristics are heterogeneous as regards the number of
inhabitants and the composition of the population. Firstly, the data about PB come from small and medium-sized municipalities (54%) and only 5 (46%) are provincial capitals. The geographical area mostly concerned is North Italy.

Almost all of the municipalities are run by centre-left governments, under which it has been chosen to apply the participatory budgets. Only in two cases (Grottammare and Isola Vicentina), the government is represented by a civic list, composed of individuals not belonging to any political party.

In the majority of cases, the option of introducing the PB has been a political choice, proposal by the Mayor and town counselors, while presenting the electoral program. The Italian case that inspired the PB in most cases (Castel Maggiore, Isola Vicentina, Ivrea, Modena and Vimercate), is Pieve Emanuele (MI), which was one of the first Italian municipalities to implement a participatory process, thus maturing a large experience in this field. Among the international experiences, the inspiring PB case is that of Porto Alegre, as well as those of the Latin America (Bel Horizonte-Capoliveri), with which a relationship of interchange and cooperation, within the European programs, has been initiated.

It is important to highlight the role that some municipalities such as Modena, Ivrea and Castel Maggiore have had in spreading the experience. Through seminars and conferences, they have been proposed moments of comparison among local authorities which have activated or would like implement experiences of participative democracy. The aim was to make known, analyze and compare the various experiences, so as to develop cooperation between institutions and improve and disseminate the forms of participation. In some cases, in which a large resonance to the communication was given for empowering participation (for example in Ivrea), the Municipality has joined the work table “URP of URP”1, on the topic “communicate the participation”, by focusing attention on the aspects of communication in the context where citizens are included in the decision-making process. Through a comparison of analogous experiences there has been an attempt to deepen the role that communication plays in the PB implementation, both in general and in relation to the different phases that characterize the co-shared processes.

In all the cases surveyed the PB path has been formalized as a new management tool by means of specific regulations. This is subjective compared to every experience, but only in two towns attention has been paid to including the PB in the “accounting rules” of the institution. Collaborations with other local authorities have been initiated especially for spreading the experience and for a comparison, but it is not a very common practice (only four municipalities out of 11). In most cases, a special office is activated to manage the PB steps and it’s properly called “Participation Office”. In the

---

1 URP in Italy is Ufficio Relazioni con il Pubblico, “Public relations Office” in the public administration
other cases it is related to the financial service, or social policies service. Rarely, the PB management is entrusted with the competence of the Communication Office, or of the Financial services.

**Rules for citizens’ involvement**

The main forms of citizens’ involvement for bringing them closer to the public administration choices are questionnaires during the periodical quarter assemblies, the institution of a participation office, posting flyers, the continuous updating of the municipal web site. In particular, in Ivrea a “Suggestions” box was opened, as well as an area on the website for sending proposals, comments and suggestions on how to achieve and improve the process of citizen participation; in Bergamo some citizens were interviewed and small focus groups (with a maximum of ten people) were organized; Reggio Emilia distributed a tabloid newspaper describing the various stages of the process to all families resident in the quarter where the PB was implemented. The instruments used to involve citizens frequently are: the grid of priorities and votes, the operational plan, as an instrument of resources allocation to each project, questionnaires and polls, postcards, modules of proposals.

In the municipalities of Bergamo, Castel Maggiore, Grottammare, Isola Vicentina, Ivrea, Reggio Emilia and Udine the administration has launched training courses for citizens and public officials, to improve the approach to this experience and to ensure the proper conduct of the participatory process. These training sessions are carried out, in particular, during assemblies. In particular, in Udine, initial conferences have been activated to find out more about the experiences of Brazilian city of Santa Maria Rio Grande do Sul, with which Udine has established a cooperation inside the URBAL project. In Ivrea pilot meetings were organized with the trade union representatives and four associations which play an important role in the economic context of the territory in order to discuss the experience of past and on-going participation.

As regards the age groups of the participating population is not very accurate since some of the municipalities have not carried out a monitoring process. On average, it is possible to say that the most involved residents fall into the 45-55 age band. Since this is especially important if one considers that young people, the most important resource to enable the process to really affect a cultural change in programming, is not very present.

**Themes and criticalities of the PB process**

In the municipalities of Bergamo, Castel Maggiore, Ivrea and Udine, the participatory process takes place over the whole year, from January to December. In other municipalities, instead, the process is concentrated in the second half of the year, after the formal approval of the budget. The subjects discussed are chosen according to the citizens’ preferences and their emerging needs in Grottammare, Isola Vicentina, Ivrea, Reggio Emilia and Udine. Instead in Bergamo, Castel Maggiore, Cinisello Balsamo, Modena and Vimercate the themes that will be discussed on assembly and among those in
which will vote the proposals, shall be selected by the mayor and by the Municipal Council, and are more the themes of culture and leisure, public works and environment. In the Municipality of Trento the themes are chosen by a committee, formed by the mayor, three assessors and by the representatives of constituencies. On the one hand, this choice is made to avoid the citizens’ proposals going beyond both the competences and resources of the administration, but on the other hand it may be so restrictive that it discourages the public from proposing measures to implement. For that reason, even if the proposals are not present in the predefined areas of intervention and therefore they cannot be discussed in this occasion, a list of them will still reported to the competent bodies. Generally to assign predefined themes for addressing participation offers a clear point of reference and reassures the citizenship, above all in the preliminary approach to PB.

In Castel Maggiore there are two types of assemblies: public assemblies, open to all, and thematic assemblies, reserved for associations and organisations in the area, concerning education, the regional economy, the nonprofit sector, the area of production and commerce, trade organizations and unions. Also the number of assemblies carried out is rather variable but in any event, beyond the assemblies for listing the emerging needs, other assemblies are made to for getting a feedback information about what the administration has actually done for implementing feasible actions.

In the quarters of Ivrea, Isola Vicentina and Modena the costs linked to the PB procedure were attributed to a specific item inherent respectively to services for the participation. In all the other experiences analyzed, specific items and relative costs are divided according to department, with the other items of the various sectors concerned.

In Modena the proposals emerging from the assemblies are subject to an examination by means of tables of territorial comparison, so the administration may assess the financial and technical feasibility. In Reggio Emilia, as well as in Grottammare, the evaluation is entrusted in the technical work tables, involving all competent leaders in the field, the project team, the representatives of each quarter and the citizens’ delegates appointed during the meetings. The work table shall submit to control the proposals on the basis of two factors, the technical and legal feasibility and the compatibility of the acts already adopted; finally, estimates costs and time of implementation.

The area of co-decision on which major projects were achieved, as in most of the experience examined, is that of Culture and leisure (73%); immediately after Public Works (64%), Welfare (64%), Environment (55%), Safety (37%) Mobility (37%). This shows how the PB may be used for investment in infrastructure even if it requires at the same time a great capacity for alternatives selection that often the respondents/participants do not have. As a result, with reference to these areas the BP represents a test bench of legitimization and a guide in the choices that the political bodies have to translate in action.¶
With reference to the PB investigated, firstly it emerged the need to clarify what the areas of competence were with reference to the proposed measures, mistakenly charged to other institutions. Contextually politicians (and their delegates) had to dissolve the initial mistrust, by launching issues and stimulating participation. In fact in the most recent experience, several obstacles depend on the difficulties encountered to explain how the PB proposals have to be submitted, where these are required. Often this does not lead to a successful path, because who is confused in the face of topics and issues that require specific skills, in addition to the common civic sense, tends to abandon the assembly of PB.

Secondly, there are some communication difficulties due also to the gap between citizens and administrations which often are not able to get people involved in participation.

For example in the municipality of Isola Vicentina, the project of BP was used as a tool to build a scenario on the future of the town, by defining a comprehensive a long run plan in which the actions indicated by citizens in assemblies were consistent with the project, in order to save resources and to maximize the social utility. The PB experience has not been successful and the citizenship has not seen the implementation of those projects as compared to the initial forecasts.

In the town of Modena instead the assemblies have been spread in a non-homogeneous manner, without continuity and in this case, emphasis was placed on the low quality of the proposals that were viewed as a sort of “shopping list”. Consequently, in 2008, the PB was suspended because of problems in the constituencies, from both political and organizational points of view. The principal obstacle seems to be derived from the representative bodies that have seen in PB a sort of field invasion, that is an obstacle in the regular flow of the decision-making process. Without abandoning the way to participation, that is always seen as an opportunity, the administrators tried to address the technical difficulties deriving from the non-inclusion of PB in the procedures of the municipality and chosen to give priority to targeted interventions. From 2010 onwards is in fact proposed a new path focused on municipal areas that tries to involve those social groups, in particular young people and migrants, which traditionally have been very active in public life. The process hesitate in the detection and selection of projects considered to be worthy and compatible with their inclusion in the programming documents to be translated into financial expenses in annual budget. Among the cases analyzed, just two experiences have been completely abandoned (Cinisello Balsamo and Isola Vicentina)

6. CONCLUSIONS

If from the theoretical point of view the BP gets its justification in the development of democratic dynamic and represents the most allusive procedure of deliberative democracy, from the operative
The PB approach represents a method to joint to P&C system. Its performance depends on the tenacity and the conviction by which it is implemented and, especially, on the impact that may have internally and externally. Unlike management tools that are only recently introduced into the culture of the local government, the BP imposes itself as a path to have a multifunctional impact, acting in several directions. First of all, it acts on the political level and consequently on both the economic-financial and management levels. From a political perspective the PB gives its greater contribution to enable the decisions on investment policy in the territory and on themes of common interest where the citizens' preferences are mediated by the policy capacity of government, the involvement of political bodies and the reaction of the public personnel responsible for the coordination of all activities related to the PB process.

This may create a strong strategic value to advantage of the investment planning and in particular, of the annual budget operation. At the economic and financial level the PB enables citizens to take part in the resources allocation process, although in most cases it reserves to citizens only a residual investment quota, or even anchored to a so specific investment, that the procedure doesn't appear convincing and convenient compared to the arising overheads costs. In this regard, the participation, by its very nature, affects only investment expenses for the benefit of the entire community (i.e. public works etc.). Besides, it would be questionable to imagine that co-decisions may relate to the resources allocation regarding the current expenditure. In such a way the PB becomes an instrument for ensuring significance to the financial management of the investments, according to the principles of transparency, efficiency and effectiveness.

From the organizational and management perspective the process has repercussions both inside and outside the institution. Internally, the PB is an instrument for innovation that primarily affects the economic-financial area and communications. Both areas should coordinate for the execution of the operations of citizens' involvement and document completion, bringing it up only in the last phase of approval by political body. This requires the deployment of a set of skills that are able to support the high flow of information generated and the interaction of the main players in the various phases of participation. No activation of a proper process may involve the approach’s failure. It’s no accident that successful PB experiences are largely the result of a path undertaken by small municipalities, which are intrinsically facilitated by many more relationships rooted in the social fabric than larger municipalities have, because, in this last case the plurality of interests makes cohesion more difficult to reach. In the municipalities with a greater population density, not infrequently the PB process takes place by a territory partitioning in quarters or districts and its coordination often involves just a few parts of the city. In general, in order that BP can play a key role, it must not be a simple consultation, but a true voluntary process of opening from the administrative apparatus to participation, by sharing...
of decision-making process and control by the citizens with their direct involvement in public choice and with the activation of the necessary flow of information needed to make participants aware of choices taken. Only by this way the PB may be an effective instrument of deliberative democracy and a strengthening of the programming process getting a positive impact on governance. The experimentation of PB in different Italian local governments not only showed an important educational content and a capacity to mobilize resources by spreading the concept of active citizenship through a more dynamic vision of democracy and its effects, but it has also helped to improve the transparency of the process, by stimulating a greater awareness of the concept of accountability of political bodies and managers. It has also permitted to those administrations that have dared to risk in this opening to control and direct involvement of citizens in our own, the construction of social pacts, inclusive of most vulnerable members of citizenship, and the growth of political consensus. In this sense, the PB represents an instrument of consensual strategic choices, supported by a co-sharing of difficulties, expectations, objectives and benefits, in the medium and long term. The implementation of PB is not the construction of a instrumental model but arises as the construction of a relational model able to simplify the choices and the tasks of public decision-makers, with the involvement of the users of these choices.

TITLE: IMPACT FINANCING FOR IMPACT ENTREPRENEURSHIP

Saltini, Tommaso
Università Cattolica del Sacro Cuore – ALTIS, Italy

ABSTRACT

The research aims at understanding how policy makers and public institutions can interact with different investors’ categories in order to design regulations and innovative investments funds. The scope of these instruments is to encourage impact entrepreneurs to start up sustainable businesses focused on finding solutions in order to face needs and problems affecting society.

The paper proposes a phased consequential plan, summing up priorities to be carried out by policy makers in order to catalyze impact capital for impact entrepreneurship. The plan presents consequential activities to be implemented by policy makers, instruments to set in place and actors to get involved. Different structures of impact capital funds, designed to catalyze both private and public capital, are also presented. Public capital can be crucial to encourage and catalyse both local and international investors as well as to bring in technical and financial expertise. Setting up public-private funds, both as co-investors and as guarantor, the public actor acts as a catalyst for first-time impact capital investors, creating the conditions and confidence for subsequent operations through demonstration effects.

Overall, the paper identifies key issues and instruments in order to pursue both social impact and financial results, thereby fostering a comprehensive development. Furthermore, the paper brings out the fact there is a growing set of investors categories and entrepreneurs that are willing and able to create both social and financial value.

Keywords: Entrepreneurship, Impact Capital, Venture Capital, Venture Philanthropy, Sustainable Development, Policy maker.

INTRODUCTION AND LITERATURE REVIEW

This research aims at understanding how policy makers and public institutions can interact with traditional investors in order to design regulations and innovative investments funds. The scope of these instruments is to encourage impact entrepreneurs to start up sustainable businesses focused on finding solutions in order to face needs and problems affecting society.
According to the most recent literature, impact investing has the potential to unlock significant sums of private investment capital to complement public resources and philanthropy in addressing global challenges (Bugg-Levine A., 2013; Clark C., Emerson J., Thornley B., 2013; Clark C., Kleissner L., 2013, Johnson K., Lee H., 2013; Saltuk Y., 2011; JP Morgan Report, 2010). Studies and reports published by The Global Impact Investing Network have been taken into consideration as well (www.thegiin.org). Impact investments are identified as investments made into companies, organizations, and funds with the intention of generating social and environmental impact alongside a financial return (Saltuk Y., Bouri A., Mudaliar A., Pease M., 2013; O'Donohoe N., Leijonhufvud C., Saltuk Y. 2010; Bugg-Levine A., Emerson J. 2011, Rangan V.K., Appleby S., Moon L. 2011). Both public capital and private capital converge in impact investing as well as venture philanthropy organizations are doing (Kohn H., Karamchandani A., Katz R., 2012, Thornley B., Wood D., Grace K., Sullivant S. 2011). Venture philanthropy organizations are also innovating their approach to investing in both profit and non-profit entities, providing them with both financial and nonfinancial support in order to increase their societal impact (EVPA Publication 2012). Nowadays, the venture philanthropy approach includes the use of the entire spectrum of financing instruments (grants, equity, debt, etc.) and pays particular attention to the ultimate objective of achieving societal impact (OECD Development Centre, 2014; Balbo L, Mortell D, Ostlander P, 2008; Cummings Metz A., Hehenberger L., 2010). Impact investments are carried out mainly by impact capital funds, but both venture philanthropy organizations and profit driven venture capital are increasingly committed to investments focused on social and environmental impact (Saltuk Y. 2011; Richter K. H., 2011). Impact capital funds are operating with the same technical features of venture capital ones, providing professional equity co-invested with the entrepreneur to fund an early stage venture, and providing seed or start-up financing (Black B., Gilson R., 1998; Bygrave W.D., Timmons J.A. 1992). The key characteristics of venture philanthropy funds as well as venture capital and impact capital funds are high engagement, tailored financing, multi-year support, non-financial support, involvement of networks, organizational capacity building and performance measurement (Buckland L., Hehenberger L., Hay M., 2013; Grossman A., Appleby S., Reimers C., 2013). Venture philanthropy, impact capital and venture capital funds differ in terms of priority given to social return and financial return. While venture capital funds are exclusively focused on financial return, impact capital funds are committed to impact investments (Credit Suisse, 2012; Morino M., 2012). These investments may generate a financial return, but the societal impact comes first. It is a so-called impact first strategy. Grant funding carried out by venture philanthropy funds, on the other hand, involves the provision of non-repayable donations to the social purpose organization supported. This is the case of an impact only strategy (Grossman A., Appleby S., Reimers

Literature related to venture capital industry development has also been taken into consideration (Black and Gilson, 1998; Gompers P., Lerner J., 1998, 1999; Gilson 2003; Landstroem H, 2007). Furthermore, the paper is carried out based on potential lessons learned from other countries in setting up venture capital instruments focused on developing a specific region or industry [Israel (Avnimelech 2008; Avnimelech and Teubal 2003; 2004a; 2004b); Germany (Becker and Hellmann 2005), Italy (Finlombarda 2002, 2003)] drawing important conclusions for emerging countries. Previous work has stressed the importance of a proper policy framework and supporting programs for fostering venture capital industry development (Avnimelech 2008; OECD 2000; 2004; 2006; Saltini 2006; 2013). However, this paper does not address the literature and the theoretical papers dealing with the venture capital industry but focuses instead on the interrelation that exists with the impact investing prospective. The results and contribution offered are strongly driven from the empirical analyses carried out in the selected countries of the Mediterranean Region and Europe.

METHODOLOGY AND OBJECTIVES

The considerations reported are based on the experience of special funds set up in a number of countries putting together both public and private resources. Information has been collected also looking at European investments funds investing in the Mediterranean region, i.e., countries around the Mediterranean Sea with the inclusion of Jordan. Moreover, empirical country analyses have been carried out in the following countries: Egypt, Jordan, Tunisia, Palestine, and Israel. Five junior researchers spent time over three years (November 2006, February 2010) along with a senior researcher (from 2006 until 2013) meeting key stakeholders, grouped in the three main categories: investors and fund managers; entrepreneurs and industry associations; and officers of public institutions and international organizations.

The empirical research was supported and carried out in collaboration with the United Nations Industrial Development Organization (UNIDO) field offices in Cairo, Tunis and Amman and from the headquarter based in Vienna. Empirical analysis was also carried out in the Lombardy Region of Italy, interacting particularly with policy makers, investors and philanthropists.

The following categories of actors were interviewed and proposals drawn with their support: regional investors, incubators, accelerators and technology parks, entrepreneurs from investee companies, investors, philanthropists, officers from public institutions and international organizations (multilateral organizations for development – MODs, development financial institutions DFIs).

International regional conferences in Dubai, London, Bethlehem, Tel Aviv, Amman and Milan, in the
period 2006-2010, were also attended and proved to be useful for collecting significant information, and data and feedback from stakeholders.

Country empirical analyses have also been carried out spending long periods in the field researching in close cooperation and getting engaged with local and international stakeholders networks (Saltini 2006; 2009a; 2009b; 2010; 2013).

The first objective of this paper is to summarize, proposing a phased consequential plan, priorities to be carried out by policy makers in order to catalyze impact capital for impact entrepreneurship. The plan presents consequential activities to be implemented by policy makers, instruments to set in place and actors to get involved.

The second objective is to outline different structures of impact capital funds that aim at leveraging resources from different partners, investing both private and public capital. Consistently, the paper aims at drawing policy-makers’ attention to the emerging markets of the Mediterranean region as well sharing practical input to plan potential cross-border initiatives. Priorities and fund structures outlined have been developed using case studies, literature reviews and empirical analyses carried out at country level in the Mediterranean region.

The paper underlines the importance of coordination among different stakeholders to set up the right policy to create preliminary conditions for launching innovative financial instruments and investment models for sound and sustainable development affecting positively environment and society. Several impact capital actors’ categories need to act simultaneously in setting up innovative funds willing and able to ensure a positive and effective impact.

Considerable research remains to be done on impact investing policy and on practical investment schemes that can be set up, also with governments’ contributions, to catalyze impact investors.

**A PLAN FOR POLICY MAKERS TO FOSTER IMPACT INVESTING**

Governments setting proper policies play a crucial role for directing potential investors (public national and multilateral institutions, investment funds, foundations, individuals) into investments which have a social and environmental impact. The role a government chooses to play may be as a direct participant as co-investors in the market, or influencing through regulations (Thornley B., Wood D., Grace K., Sullivant S. 2011).

Policy makers must play an important role to ensure impact financing for impact entrepreneurship. A complete set of policies must be set in place geared toward the local and regional conditions that continuously enable the following of changes in circumstances and market evolution (Gompers P., Lerner J., 1998, 1999, 2001). Programs should focus on confronting specific country system failures and
aim at leveraging positive conditions present in the local context. A critical factor is policy makers’ capabilities that should be able to set priorities and translate them into programs and policies. Hence assembling skilled teams of policy makers, academic experts, and specialized professionals, is mandatory in order to design the appropriate policy to catalyze impact financing (Rangan V.K., Appleby S., Moon L. (2011). To create a venture capital industry significant efforts and coordination among different actors are required (Gilson R.2003). As learned from empirical analyses, two critical factors must drive policy maker attention: long-term timing and strategic markets development. Policies that support impact investing aim at creating investment ecosystems with a long-term prospective. Public resources must be committed to develop strategic markets and industrial sectors, so leading other sources of private capital, coming spontaneously while protected by policy objective.

Policy makers must pay attention to allow preliminary conditions to emerge in order to catalyze impact capital investors and afterwards they must design regulations and invest public resources to start up and foster the beginning phase. Past successful experiences, and failures of European and American policy makers attempting to set up the venture capital funds to foster high-tech industry during the 80s and 90s, help to understand how important it is to create a positive environment (Becker R., Hellmann T., 2005; Florida R. and Smith D.F., 1993).

The design of a comprehensive policy framework represents a key issue for setting up a new impact capital industry, particularly for countries where social problems are spreading and where political turmoil is a threat. Empirical analyses carried out in the Mediterranean region confirm the importance of the government role to design good policy (Saltini 2006, 2009a, 2009b, 2010).

The Israeli and some European country experiences, both successful and unsuccessful, also support this evidence (Avnimelech 2008; Avnimelech and Teubal 2004a, 2004b; Finlombarda 2002, 2003; OECD 2000, 2004, 2006).

A phased plan is here proposed to foster impact investing for impact entrepreneurship, particularly in emerging markets. Key players (such as government bodies, development financial institutions, multilateral development organizations, universities, R&D centres, multinational enterprises, philanthropic funds and NGOs as well as private investors) need to act simultaneously in setting up special programs and policies to encourage the emergence of impact capital funds aiming at improving economic development ensuring positive impact on society.

A long-term economic development strategy should be adopted in order to phase the emergence, the beginning and the development of the impact capital industry in a specific region or country. Governments play a special role throughout the three-phased approach proposed. The policy makers can either influence impact capital development or play a direct role directing capital and participating with different level of involvement in setting up supporting programs and impact funds.
Governments along with universities and, in emerging markets as well, multilateral organizations for development and NGOs, have a significant role in pursuing the preliminary objectives of the emergence phase. Economic stability, reached through a sound investments policy framework, is a key factor to catalyse investors. However, impact capital, both from the investors and entrepreneurs side, is a people-intensive business. Technical assistance is crucial, improving training offer and cultural awareness, and is a way to contribute to the development of impact business models (Bugg-Levine A., 2013). Conditions to generate impact and make a contribution are always to be able to learned, as well as investment passion and creativity in solving problems. In this phase, it is important to improve the ability to take the initiative, and to foster the desire, particularly in the young generations, to do business to find effective solutions.

To pursue and reach economic sustainability it is necessary to move away from the logic of exploitation and short-term financial speculation. It is necessary to create new financial entities that work with new spirit to developed long-term strategies, creating value innovating products and optimizing production through process innovations.

In the beginning phase, the first objective is to support impact entrepreneurs to design and validate business models (Kohn H., Karamchandani A., Katz R., 2012). Extremely challenging but particularly relevant in emerging markets is to focus upon supporting R&D activities, the enhancement of innovation capabilities, and the stimulation of entrepreneurship culture. Therefore, governments should commit resources to enhance R&D programs and projects, in order to create new products and services for launching innovative impact businesses and for innovating traditional industries as well.

A second objective must be to design policies directing capital more toward impact opportunities (Thornley B., Wood D., Grace K., Sullivant S. 2011). This can happen by launching supporting programs and pilot funds, coordinating public and private capital, invested with the principal aim of generating other impact funds. In this phase, key actors are the impact investors, both impact first and financial first investors (Monitor Institute, 2009; Richter K. H., 2011). Coordinating actors and integrating the different investing instruments is also crucial to ensure long-term sustainability for both impact entrepreneurs and impact funds investing in small and growing businesses.

In the development and consolidation phase it is important to launch a different typology of impact funds and to elaborate policy to foster their stability and capacity to implement long-term investment strategies. Attention must be paid to assure both social and financial return and to design a methodology to measure them. The design of proper development policies can increase the amount of impact capital. Policies dealing with investments rules and policies that provide co-investment increase the supply of impact investing capital by catalysing private investors, through risk sharing with governments (Kohler J, Kreiner T, Sawhney J, 2011). When an equity investor is investing in
small risky businesses, the involvement in the business development process of capacity development organizations, such as NGOs, MODs, DFIs or any other technical assistance organizations with specific industry expertise, is also appreciated.

In order to improve the exit opportunities for investors, policy makers must regulate properly also the merger and acquisitions market, in particular by improving transparency and financial information credibility (Hill K. 2007).

During the consolidation phase crises can arise. In this case, priority should be given to assuring a minimum level of activity in start-ups, targeting innovation. During critical times government involvement and forms of direct financial support can be a determining factor in the industry’s survival and therefore help to overcome the crisis and reach a stronger consolidation status (Gilson R. 2003; Karaomerlioglu D.C., Jacobsson S. 2000).

Source: own elaboration

DFIs – Development Financial Institutions
MODs – Multilateral Organizations for Development
The overall objective of the proposed **phased plan for policy makers to foster impact capital for impact entrepreneurship** is to improve access to financial resources and catalyse impact financing. Impact entrepreneurs must be supported to get access to grants as well to debt and equity instruments. They must also be helped to understand if and when they need capital, as well as to understand terms for transition from one form of source of financing to another.

What appears to be crucial is that policies and programs should not create dependence on aid and grants, from private philanthropy and government programs. In the long term, any business, whether social or profit focused, should be scaled and provide returns to its investors.

**IMPACT FUNDS, BETWEEN PUBLIC AND PRIVATE**

Government institutions, along with development financial institutions, multilateral development organizations and NGOs, can facilitate the setting up of innovative impact capital funds, with participation by both private and public capital. These funds are the key instruments of the development phase of the proposed plan for policy makers. However, actors’ awareness must be pursued during the emergence phase. Different actors must be brought together in order to design common strategies, draft regulations and commit resources.

Impact capital funds, leveraging public and private capital, must be launched during the beginning phase. Impact funds, which leverage public and private resources and know-how, must have a well-focused mission to invest in industries that are crucial for the country’s development and should also be geared to develop depressed strategic sectors. These instruments thus have the final goal of setting up new companies and supporting growth of micro-small enterprises operating in underdeveloped regions. Different funds should be set up according to geography, industry, human capital group (youth, women, etc.), and country priorities (Kohler J, Kreiner T, Sawhney J, 2011; Godeke S., Pomares R., 2009). Therefore, public capital can be crucial to encourage and catalyse both local and international investors as well as to bring in technical and financial expertise. Public actors can reduce the risk of investing for impact, not only in depressed regions and in rational industries with steady growth, but also in the beginning phase of the impact industry development. This phase is still characterized by an incomplete policy framework and by the absence of certain investors’ categories, actors’ know-how and financial instruments in the market. The public actor acts as a catalyst for first-time impact capital investors, creating the conditions and confidence for subsequent operations through demonstration effects (Bouri A., Mudaliar A., GIIN, 2013).
impact capital industry is desired but it is important to recall that the government as facilitator and investor should have the ultimate goal of creating self-sustainable markets rather than creating conditions for dependency. After target goal achievement, public actors are expected to timely remove their presence. Pressuring governments to take action as facilitators and investors also presents considerable risk, as this involvement could become too intrusive, thereby stifling real development. Risk of distortions is high and must be avoided. With particular reference to experiences analyzed in Israel, Italy, Germany and Turkey (EIF 2011; Avnimelech G., M. Teubal 2003; Finlombarda 2002, 2003; Becker R., Hellmann T., 2005) as well as with reference to the empirical analysis carried out in the Mediterranean region, funds schemes are proposed to be developed by mutual involvement of public and private players. Funds structures proposed should be properly adapted to address country and region specific weaknesses and challenges.

Public-private, fund of funds

A fund of funds can be set up as a national, international, and public-private partnership. A fund of funds is considered in this paper as a co-investor in other impact capital funds. The fund may also use part of the capital allotment to directly invest and co-invest in enterprises (Ramsinghani M., 2011; Strachman D. A., 2009; Bygrave W.D., Timmons J.A., 1992).

Public-private fund of funds is a financial tool that has been used with good incisiveness in several developed countries, to support venture capital funds focused on seed and early investment stages. The fund structure proposed refer to Yozma Fund in Israel, to ERP-EIF Dachfonds and LfA-EIF Facility in Germany, and iVCi in Turkey. (EIF 2011; Avnimelech, G., M. Teubal, 2004, and Israel Venture Association, www.iva.co.il).

A fund of funds is based on an agreement signed by parties that commit capital to invest in venture capital whose target is strictly related to the principles and priorities jointly indicated by the investors involved. Public-private fund of funds represent a good instrument to make use of public resources due to its multiplying positive effect of mobilizing and directing private funds to priority areas and strategic industries. This instrument is particularly useful to boost impact funds to invest in start ups and to help scaling business model with impact. A fund of funds structure is attractive to institutional investors, as it creates a portfolio approach that spreads the investment risk. The fund of funds approach also enables the government to support the growth of the key market and industry without
distorting or competing with other investors categories active in the country.

![Diagram of Public private, fund of funds.](image)

Public actors involved such as the ministry of industry, universities, research institutions, etc.) co-invest in private initiatives. The public actor in charge underwrites shares of fund of funds’ capital (share A) together with public and private institutional investors (share B).

The fund regulations establish ex ante that the public actor in charge underwrites shares of the fund that have different rights than the shares underwritten by institutional investors and by other private investors that invest in daughter funds in which the fund of funds co-invests. Shares A have a limitation on the maximum return in terms of IRR (Internal Rate of Return).

A development financial institution can also act as co-investor in a fund of funds instead of the government and thereby represents the public interest in the partnership.

**Capital guaranteed impact fund**

A capital guaranteed impact fund is an equity fund set up for raising private capital through a management company, whereby the capital is guaranteed by a public entity (ministry, central bank, development agencies in case of emerging markets and development countries, etc.).

The guarantor works adjacent to an impact fund, encouraging private investors investing either in other impact funds with a regional or industry focus or investing directly in impact enterprises, reducing the risk of losing the invested capital. The fund is managed by independent qualified managers and financed with private capital. The investments are guaranteed by a public entity, which has as its objective the increasing development of new, promising micro and small impact enterprises and strategic industries.
The fund firms and their managers are requested to follow specific guidelines dictated by the governments or related public institutions. So, the funds are provided to foster all those sector and economic activities that are considered priority objectives.

![Diagram of Capital Guaranteed Impact Fund](image)

Figure 3. Capital guaranteed impact fund.

The impact fund is guaranteed by a governmental institution (guarantor) committing itself to repurchase a percentage of the participation (net of dividends) if the value of the latter, after a certain period of time (7-10 years) is evaluated lower than the original investment on the basis of predefined mechanisms. Acting as guarantor, the public actor can foster sustainable development without an immediate disbursement. The public actor will receive a guarantee fee from the fund and it will benefit from profit sharing. Furthermore, it will play an active role appointing some board members and exercising a veto right for investments exceeding a pre-established amount. Reducing the risk to invest on small business model focus on impact solutions, the guarantor spurs investors and so catalyzes local and foreign capital resources.

**Three partners impact fund**

The proposed scheme should be consist of three partners: government or international public institution such as a regional development financial institution, private investors and multilateral development organizations or non-governmental organizations. The use of a three partners impact fund is a recommended structure for developing countries with high risk factors and where the financial system is weak.
In the proposed scheme, government plays an active role as investor and in controlling the impact capital fund. Nevertheless, an independent and reputable management team must run the fund. Management is the key factor for any successful venture capital firm and particularly for an initiative driven by public money (Bygrave W.D., Timmons J.A., 1992; Gompers P., Lerner J., 1998).

A crucial role in setting up an impact fund, where the government is leading as investor, can be played by a third partner, represented by a multilateral development organization or by a non-governmental organization.

This category of actors, usually due to internal regulation constraints, cannot act as investors but only as facilitators investing grants capital.

Multilateral organizations for development, such as UN agencies and international NGOs, are willing to sustain government driven initiatives for industrial development. These stakeholders can therefore play an important role in the reduction of agency administrative costs, which are higher than usual when the impact fund is committed to invest in micro and small businesses. Intensive mentoring and monitoring activities need to be offered to foster the numerous companies in the portfolio. As well as making this important contribution, the benefit would consist in selecting a good flow of deals, by pointing out type and size of promising suitable investors.

An international and reputable actor, such as a UN agency, is a significant plus in securing the new fund nature and for highlighting the strong idealism for development of the institutional public investor which will commit financial public resources.

**Bi-national Fund**

A bi-national fund is established when two nations pledge a predetermined sum for the pursuit of common objectives. A direct participation of public institutions or ministries is foreseen. An agreement which defines the content of the project, its objectives, and activities to be carried out, is jointly prepared by the authorities and officers involved.
A similar initiative can also be promoted by other parties, especially those preferably belonging to a specific region with common development objectives and where businesses and political interaction positively characterize country relations. A board of directors is appointed by the two governments, and is independent in its decision-making.

The bi-national fund represents a good instrument to streamline R&D projects, as well as to foster knowledge and capabilities sharing. This instrument has been specifically used by the Israeli government in the last few decades to consolidate relationships with historical friendly nations such as U.S. and Canada, as well as to explore new possibilities with nations such as Korea and Singapore.

For emerging countries, this instrument could represent a concrete support to improve overall economic and trade relations within key country partners. A bi-national fund is a good vehicle to favor synergies between companies from the two nations and facilitate technology transfer.

**RESULTS AND CONTRIBUTIONS**

The paper proposes a phased plan for policy makers in order to encourage long-term and strategic planning to foster impact capital for impact entrepreneurship.

Concrete impact capital schemes bringing together public and private actors were also elaborated and recommended to catalyse new resources.

The first empirical confirmation, coming from experiences and information collected in the field, is about the importance of bringing together social impact and financial return. These two factors are crucial for personal, corporate and society success.

Policy and investment strategy cannot be geared only toward the good of either the individual or a single community, but indeed to the common good for the entire collectivity. Policy makers have a key role in influencing stakeholders through laws and regulations set up to catalyse impact investors and supporting impact entrepreneurs.

The research underlines the fact that governments can provide direct and indirect financial support
fostering investments in low-income communities and toward depressed industries and markets. When private capital seeks social and environmental benefits, there is an opportunity for governments to design partnerships and set up innovative funds.

The emergence and development of the impact capital industry will improve the matching between pure investors and philanthropist, as well as private and public actors.

Pursuing impact is a means, not only to prevent improper exploitation but also a good way to foster human creativity, industry potentiality and nation development. The paper brings out the fact that there is a growing set of investors categories and entrepreneurs that are willing and able to create both social and financial value. Giving importance and attention to the single person, the future, the environment, and to the importance of giving a contribution for the "others" around us, have an increasing value for a sound business development. The intention to generate impact must not be considered incompatible with the effective capacity to generate profit. In the society, challenges and needs are changing, but the need of partnership and to develop long-term strategy as well as need to face the difficulties the new generation are facing is consistent.

The paper proposes practical action at policy level and concrete investment schemes that can enable countries to become more competitive in attracting investments, overcoming barriers and maximising the impact of both local and international investors.

The research clarifies the importance of bringing all actors categories closer to working for impact. Players that play a key role are not only investors and entrepreneurs, but also all those stakeholders that can facilitate operations and preliminary conditions emergence such as governments, multilateral organizations for development, development financial institutions, universities, industry associations and specialized professionals.

A STRUCTURAL MODEL PROPOSAL FOR INTERNAL CORPORATE
SOCIAL RESPONSIBILITY

Sánchez-Hernández, M.I.; Gallardo-Vázquez, D.

1Business Administration and Sociology, University of Extremadura, Spain
2Financial Administration and Accountancy, University of Extremadura, Spain

ABSTRACT

The understudied internal side of Corporate Social Responsibility has the emphasis on employees as strategically important to pursuit responsible actions. This paper considers responsible human capital business practices as key factors explaining competitive success across firms. The purpose of this article is to demonstrate that Internal Corporate Social Responsibility is a good management framework for business competitiveness. Supported by the scarce academic literature in the field, the article starts by the definition of selected indicators to build constructs and to develop a structural model able to explain several relationships of causality between the internal side of Corporate Social Responsibility, business innovation, performance and competitive success with structural equation modeling as selected methodology. The conclusion after the statistical analysis procedure applied to a sample of 590 firms in the Mediterranean region of Extremadura in Spain is significantly positive, confirming three of the four hypotheses developed in the conceptual model. To finish, some suggestions for the future research agenda emerge from this first attempt to approach the internal side of responsibility to competitiveness in business management.

Keywords: Corporate Social Responsibility, CSR, Internal Corporate Social Responsibility, ICSR, Human Resources, HR, competitiveness

INTRODUCTION

According to the renewed definition by the European Commission, Corporate Social Responsibility (CSR) is the responsibility of enterprises for their impacts on society with reference to collaborate with stakeholders "to integrate social, environmental and ethical concerns, respect for human rights and consumer concerns into their business operations and their core strategy" (COM 2011:7). Matten and Moon (2008: 405) highlighted the heterogeneity of the definitions of CSR when they expressed that “CSR is an umbrella term overlapping with some, and being synonymous with other, conceptions of business-society relation”. In general terms, CSR have been considered “an organization’s obligation to maximize its positive impact on stakeholders and to minimize its negative impact” (Ferrell et al.
Although CSR is constantly evolving, Agliata et al. (2010) set up the most important key concepts around the term. They highlight the stress on corporate management as promoter of responsible actions, the explicit reference to global interests, the reference to overcoming strict legal obligations and the integration in the performance of the company’s activities.

In strategic terms, CSR is considered a source of competitive advantage (Branco and Rodrigues 2006; Porter and Kramer 2006; McWilliams and Siegel, 2011). In turn, the understudied internal side of CSR has the emphasis on employees as strategically important to pursue responsible actions. The focus of this work is the study of Internal Corporate Social Responsibility (ICSR) in business and the question is whether responsible human capital business practices could be considered key factors explaining competitive success across firms or not. The purpose is to demonstrate that ICSR is a good management framework for business competitiveness.

After this introduction, in the following sections the focus turns to the various aspects of ICSR in order to define the construct. After that, a structural model is built considering also innovation and performance as strategic variables. Methodology and statistical results are briefly presented with attention in conclusion in the future research agenda.

**THE ICSR THEORETICAL BACKGROUND**

Taking into account the strategy of Corporate Social Responsibility (CSR) established in recent years by a big number of companies, two theories are supporting the framework in which the ICSR is supported. First, we highlight the Theory of Stakeholders. The so-called stakeholders or groups of interest were defined as “those groups or individuals who can affect or are affected by the achievement of entity objectives” (Freeman, 1984: 25). Nowadays it is generally accepted that stakeholders are those individuals or groups whose objectives depend on what the organization is doing and from which the organization depends (Johnson et al. 2008). The term stakeholder include owners and shareholders, employees, suppliers, creditors, customers, debtors, government, unions, nonprofit organizations and the public in general. According to the theory, it is generally recognized that CSR has two dimensions: external and internal. The definitions from Atkinson et al. (1997) and Frooman (1999) have special emphasis on the goal of this work. According to Atkinson et al. (1997) two groups of interest are distinguished, those qualified “from the environment” (customers, shareholders and society) and those qualified “from the process” (owners, employees and suppliers). From this point of view, the second collective, and specially the employees, are the focus of the ICSR. Complementary, Frooman (1999) distinguished two groups of collectives. The “strategic collective” referring those that affect the operational process of the organization and the “moral collective” affected by the actions of the organization. According to the internal vision of CSR, the moral one
would involve special attention of the company being considered the collective in whom internal performances are based and will be mainly those affected by the business actions.

The second theory supporting the study is The Theory of Resources and Capabilities. According to Cardona (2011) the study of business strategy has been developed around two major perspectives: the competitive environment view, which analysis has been derived from the model of the five competitive forces developed by Porter (1980) and the key success factors, and the complementary resources and capacities view for the achievement of competitive advantages sustainable in the long-term, where human resources are considered key factors for competition.

Assuming Grant’s postulate (2010), the business strategy is focused on the pursuit of profits, consisting of achieving competitive advantages and ensuring the survival and prosperity. To identify the sources of business profits, we do special attention to the relevant aspects to the organizations by themselves: their unique and heterogeneous resources and capabilities, which should be oriented according to the strategy to be implemented, in a process of permanent adjustment, given the turbulence of the market and competition in all sectors. According to several authors (Barney, 1991; Peteraf, 1993; Teece et al, 1997; Sáez de Viteri, 2000; Grant, 2010; Cardona, 2011), sources of competitive advantages exist within the organization and human capital is one of them. It includes people with the potential of learning, openness to change, adaptability, teamwork ability, personal relationships, leadership, entrepreneurship, as well as psychological and sociological aspects. Consequently, the internal focus of CSR could be considered also a source of competitive advantages that need to be studied.

BUILDING A STRUCTURAL MODEL FOR ICSR

When companies are involved in CSR activities, the internal dimension determinates relations with their internal stakeholders, specially their employees. Taking into account that classical organizational boundaries have become obsolete because “what once was ‘outside’ the organization is now ‘inside’ and vice versa” (Schoemaker et al. 2006, 449) we found in this fact a fundamental reason for the emergence of the internal face of CSR.

Nowadays the external side of CSR and the internal one are more related than ever showing higher interconnectivity as have been shown by Sánchez-Hernández and Grayson (2012). The emphasis on employees as strategically important to a firm’s success has contributed to the interaction of strategy and Human Resources (HR) management issues (Barney, 2001).

According to Acedo et al. (2006), human capital is a key factor explaining performance differences across firms. Schomaker et al. (2006) argued that treating HR management and CSR separately is an outdated approach because organizations develop towards open systems where cooperative action is
based on the willingness of humans to bring in and develop their talents as part of communities of work. Crook et al. (2011) have pointed out the importance of “specific” employees, referring to the best and brightest human capital available in the labor market, to achieve high performance.

In addition, the relationship between performance and competitive success has been noted in business strategy fieldwork by Porter (1980, 1991) and other authors (i.e. Spanos and Lioukas, 2001; Wagner and Schalteggers, 2003). Previous work has demonstrated the mediation role of innovation between CSR and performance (Gallardo-Vázquez and Sánchez-Hernandez, 2012). Innovation, that is intrinsically about identifying and using opportunities to create new products, services, or work practices (Van de Ven, 1986) could be also identified as a mediator variable when considering ICSR because it is widely accepted that improvements on HR management have a positive impact on innovation (Subramaniam and Youndt, 2005). Based on the above, the conceptual model proposed (Figure 1).

![Figure 1. structural model proposal](image)

The model includes four related latent variables that make up the proposed causal relationships defined in the following hypotheses:

**H1:** There is a direct and positive relationship between the ICSR and performance

**H2:** There is a direct and positive relationship between performance and competitive success

**H3:** There is a direct and positive relationship between the ICSR and innovation

**H4:** There is a direct and positive relationship between innovation and competitive success

### MEASURES

According to the ICSR principles, the primarily internal stakeholders guarantee in companies is the facilitation of employment (recruiting employees, guarantee jobs and wages) particularly taking into account special goals such as job security and the raising of the employment for women and ethnic
minorities. The final purpose will be to improve quality of life of employees ensuring a healthy work environment and to avoid any discrimination in payment and social exclusion. The selected indicators reflecting ICSR actions are shown in table 1 (from ICSR1 to ICSR18) selectively supported by Turker (2009), Agudo-Valiente et al. (2012), Gallardo-Vázquez and Sánchez-Hernández (2012), Lu et al. (2012) and Pérez et al. (2012).

Table 1. Selected indicators to measure ICSR

To measure performance, innovation and competitive success we have considered scales previously used by Gallardo-Vázquez and Sánchez-Hernández (2012). Performance is considered a reflective construct with eight indicators (from P1 to P8) as well as innovation with ten (from INV1 to INV10) and competitive success with ten indicators (from C1 to C10).

CONTEXT OF THE STUDY, SAMPLE AND PROCEDURE

The information for this investigation was collected from business services managers in the Autonomous Community of Extremadura, in southwester Spain. The broad argument to choose services in this work is that the fit between Human Resources Management and CSR strategy is greater in services than it is in manufacturing supporting highlighting the internal side of CSR.
Moving to justify the selected region, we have to say that since 2010, a special plan for the promotion of CSR exists in the Region. The main pillars for building a responsible culture in the region are: The Law of CSR in Extremadura (15/2010 of 9 December) and the Decree (110/2013 of 2 July) for the establishment of the Autonomous Council for the promotion of Social Responsibility of Extremadura, the Office of Corporate Social Responsibility, and the Procedure for qualification and registration of socially responsible companies.

The representative sample of regional business services comprised 590 SMEs with their corresponding predetermined substitute firms to control the non-response index. The objective universe was drawn from Spain’s Central Enterprise Directory (SCED). Before beginning the study, we calibrated the representativeness of the sample of firms that were to participate in the survey. To this end, weighting coefficients were established according to the defined strata of the firms in the sample. Possible biases relative to the characteristics of the total population of the Directory were checked for using statistical tests comparing the structure of the sample with the total population of the SCED. The results justified the validity of the sample for the purposes of the study. A pilot test was also carried out in order to check that the survey would be appropriately interpreted by the respondent.

The administration of one ad hoc questionnaire was by telephone interviews with business services managers. They were carried out using the CATI system (Computer Aided Telephone Interviewing). The participation index was 11.07%, corresponding to the percentage of firms in which a valid interlocutor agreed to participate in the study. A total of 590 completed surveys were collected, which resulted in a response rate of 11.07%.

**EMPIRICAL RESULTS**

In order to validate the ICSR scale, a structural equations model (SEM) have been tested considering it very suitable for research interests where the phenomena in question is relatively new and where the theoretical model and their measures are not well formed (Chin, 1998). The purpose of SEM is double. The first step is to analyze whether the theoretical concepts are properly measured by the observed indicators. This analysis has been carried out for the two attributes validity (measuring what one really wanted to measure) and reliability (whether the process is stable and consistent). To this end, we have calculated the individual item reliability, the internal consistency or reliability of the scales, the average variances extracted (AVE), and the discriminant validity. A brief of main results are shown in table 2.

Table 2. Main results for the measurement model

The second step of the analysis of the structural model consists of the estimation of the assumed causal and linear covariance relationships among exogenous and endogenous latent constructs. In this last stage of the analysis, the hypotheses have been tested by examining the magnitude of the standardized parameters estimated between constructs with the corresponding $t$-values that indicate the level of significance. We have employed bootstrap routine (Chin, 1998), a non-parametric resampling technique that offers the $t$-statistic values. An overview of the results can be inferred from table 3.

**DISCUSSION AND CONCLUSION**

We have established a set of indicators that define ICSR as a result of a dynamic process that provides information about a firm’s actions in responsible HR management. The set of developed indicators will help to build a fluid and meaningful dialogue with employees of the firm, allowing continuous improvement and, as has been demonstrated empirically, increasing the firm’s competitiveness. The conceptual model has been tested empirically confirming hypotheses H2, H3 and H4. The first hypothesis has been rejected and the relationship between ICSR and firm performance has not been confirmed probably because performance depends highly on external factors not considered here. Consequently, the validated model is show in figure 2 where innovation is a mediator variable between ICSR and competitive success in accordance with previous work in CSR (Gallardo-Vázquez and Sánchez-Hernández, 2012) where ICSR was not isolated from the holistic construct of firm responsibility.

![Figure 2. validated model](image_url)
This study highlights the importance of the emergence of new frameworks to understand CSR and one of them is the interplay between ICSR and other strategic variables to pursue competitiveness. As regards the usefulness and implications of this research in business practice, it facilitates managers the work of definition and development of indicators for measuring the variables involved in diagnosing their position respect to ICSR. The validation of the model that includes these linkages empirically reliable will help HR managers and CSR managers to work together and to understand why they should pay attention to issues of HR and CSR with a holistic view and what to expect from the efforts they make towards employees’ quality of life.

From the point of view of the theory, this research initiates other future researchers to perform, on the basis of the variables considered. Furthermore, the results confirm that ICSR will play an important role in the competitive success of business in the Mediterranean area in the near future. Being managers aware of this fact, they will surely want to take the path of responsible HR management.

Some limitation of the study are recognized as the survey was aimed at executives of firms in a unique Mediterranean region, with a particular job position and not only HR managers or CSR managers. The procedure therefore only represents the perception described by managers. However, we will reinforce the present pioneer study by different views and methods in order to contrast and compare the results obtained. We shall also be continuing to use the validated ICSR measurement scale here to test alternative structural models to know whether ICSR influences other strategic variables related to firm competitiveness.

The Future of Entrepreneurship

THE SUCCESS FACTORS OF A SICILIAN MARKET-ORIENTED WINE COOPERATIVE

Schimmenti, Emanuele; Borsellino, Valeria; Asciuto, Antonio; D'Aquisto, Marcello; Di Gesaro, Mariarosa; Zinnanti, Cinzia

Department of Agricultural and Forest Sciences, University of Palermo, Palermo, Italy

ABSTRACT

Wine cooperatives have a long tradition in Sicily, as well as in Italy and in Europe. The objective of this paper is to reconstruct the general framework of the Sicilian wine cooperatives that still account for nearly 80% of the regional wine grapes production. In this context we examine the productive, organizational and commercial strategies of a case study: Cantine Settesoli. Founded in Menfi (Western Sicily, Italy) in 1958 on the initiative of a group of wine grape-growers, the Cantine Settesoli has developed over the decades and now represents the major bottled wine cooperative in Sicily, whose 2,135 members own 5% of Sicilian vineyards. With its four wine-making plants, a volume of grapes processed in the last three-year financial period (2011-13) of more than 43,000 tons of grapes per year, an average annual turnover of €47.7 million, and a constant attention to environmental and social issues, Cantine Settesoli stands out as the protagonist in the wine scene, both national (especially with the brands Settesoli and Mandrarossa) and international (with the brand Inycon). It effectively implements traditional and innovative tools of productive, commercial and strategic management, thus representing a model of successful firm in a regional context of cooperatives generally pegged to productive and commercial strategies product-oriented.

Keywords: Wine cooperatives; Sicily; management; strategy; success; performance

INTRODUCTION

Wine cooperatives in Europe were established between the mid and late 1800s (Touzard et al., 2008; Pomarici, 2009) in order to cope with the economic difficulties of growers and also following the prevailing political ideology and sociological influences of the time (Touzard et al., 2008). These cooperatives are now continuing to be a vital economic resource, especially for growers with small vineyard plots. In 2010, in Sicily 40,629 wine-growing farms (equal to 10.4% of the national total), of which 41.4% had a wine growing area less than one hectare and 85.5% less than 5 hectares (Istat, 6th Agricultural census). The Sicilian companies when considered on an individual scale do not appear to have any opportunity to compete in the wine market, however when merged within a cooperative
business model, the results are substantially different, showing improved trading power in wine sale (Di Vita et al., 2013). As a result, wine cooperatives (thanks to public funds) are able to invest in technology, innovation and research, improve quality wine, promote new forms of packaging, reduce processing unit costs due to economies of scale (Copa-Cogeca, 2010). It must, however, be emphasized the growing presence of new country producers and exporters (Australia, United States, Chile, etc) - which in a very short time have shown efficient competitive capabilities in technical and economic terms (Ciasullo and Festa, 2013) -, the reform of wine Common Market Organisation (CMO) - targeted to reduce the productive potential of European Union (EU) countries and to guide the supply towards quality production (Pomarici, 2009) -, and in addition, the change in consumer’s profile (MiPAAF, 2013; Lanfranchi et al., 2014), particularly in developed countries - linked to the economic development of society and the change of wine-consumption habits-, which have significantly influenced both the structure of the sector and the balance between demand and supply of EU wine production, making it extremely challenging for those companies that operate within it, including cooperatives.

This is the context that fits the economic and productive activity of the wine-growing farms in Sicily. Between 2010-2011, 626 Sicilian bottling companies (private and cooperative) were accounted for a total bottled volume of 193 million pieces (Torcivia, 2012a), most of which produced by private companies; in contrast, a significant share of the regional production of wine grapes is delivered directly to wine cooperatives, which for several years have gone through a process of downsizing also due to the prevailing strategy of producing and selling musts and bulk wines. However, if on the one hand the number of cooperatives within the wine industry in Sicily has decreased, revenues - at least for larger companies- is on the rise, as well as figures concerning bottled wine (in terms of both pieces and turnover), which still remain in the modest numbers’ bracket (18.0%) in comparison to the overall supply of regional wine (Torcivia, 2012b).

Data presented by the Regional Department of Agriculture, Rural Development and Mediterranean Fisheries ranks Sicily first in the list of the Italian regions for overall land under wine grapes in 2013, accounting to 103,063 hectares. In the same year grape production amounted to 856,387 tons, while the overall wine production amounted to 6,150,007 hectolitres. In recent years, in face of a marked alternating production with downward trend, there has been a gradual decline in wine growing areas, due to their abandonment, characterized by low profitability, and to the implementation of the interventions provided by the wine CMO (Schimmenti et al., 2013), which led to an intense process of restructuring and conversion of vineyards in Sicily (Borsellino et al., 2012), resulting in quality improvement of wine-grapes which effectively allows to obtain excellent wines. This trend is confirmed in the Sicilian wine trade flows that, in the period 2000-2011 (Inea, 2013) have shown a significant contraction of exports in terms of quantity (-66.0%, due to the decrease in exports of bulk
wines and musts), meanwhile showing an opposite trend in terms of value (+5.7%), related to the increasing amount of bottled wines.

Within the regional wine industry, Cantine Settesoli, subject of this study, differs distinguishably from the other cooperatives, as it has been able to combine tradition and strong local rooting with the new trends that shape wine industry. The aforementioned is, in fact, now the largest wine cooperative in Sicily for bottled volumes (about 2/3 of the net sales revenue in 2013, of which approximately 62% of all overseas turnover), and has a primary place in the national and international wine market.

The objective of this paper is to illustrate the way in which a cooperative society, encompassing the entire value chain, made its productive, organizational, sales and marketing strategies, a point of strength for the commercial success, and a model of market-oriented firm in a regional association context generally characterised by production and commercial strategies product-oriented; the above statement encompasses a strong enough reason to investigate, after a brief introduction on wine cooperatives in Sicily, all stages of the supply chain and the economic and financial performances of this case study.

**LITERATURE REVIEW**

In the EU, over 60% of agricultural produce is marketed by cooperatives (Copa-Cogeca, 2010) that nowadays, like other businesses, are facing increasing competitive pressures and have to cope both with new market opportunities and with a greater diversification of consumers’ needs and preferences. Cooperatives, unlike private firms, sustain a more conservative attitude revealing traditional preference for the low-cost focus strategy (Salavou and Sergaki, 2013) and facing greater difficulty in adopting market-oriented strategies (Bono et al., 2012). The above statement supports Hardesty (2005), who found that many agricultural cooperatives have chosen a cost-leadership strategy, producing as a private label supplier, but only few cooperatives have developed national brands, because of their structural characteristics. Traditional cooperative governance model, in fact, can partially affect development path and efficiency of the cooperatives (Bono et al., 2012) and also the implementation of a market-oriented strategy (Hardesty, 2005; Beverland, 2007; Bono et al., 2012; Couderc and Marchini, 2011). In order to gain competitive positions both within and outside Europe, cooperatives have to move towards more market orientation (Beverland, 2007), by formulating innovation strategies (Perlines et al., 2013), improving quality, distribution management, distribution channels and marketing conditions (Hardesty, 2005; Beverland, 2007), as well as productive efficiency. The current economic situation, with the entrance on the world productive scenario of new countries (Crescimanno and Galati, 2013) with a more aggressive marketing policy (Ciasullo and Festa, 2013) and new competition tools (brands, grape varieties and PGI products), has forced wine cooperatives
to adapt and respond to the new wine market competition arena (Coelho and Castillo-Girón, 2011) by increasing their size, seeking to establish strategic alliances, pursuing mergers with other cooperatives, rationalizing assets, improving the professionalism of their workforces, implementing innovative capital acquisition methods and formulating strategies to expand into multi-country markets (Pomarici, 2009; Perlines et al., 2013). Maietta and Sena (2008, 2010) analysed Italian wine firms and found that cooperatives are well-equipped to cope with increasing market competition and financial constraints. Bono et al. (2012) and Couderc and Marchini (2011) observed that wine cooperatives had successfully improved their competitive position through two main different strategies outlined below: structural costs (bottling plant, storage hall, marketing and sales efforts) saving and marketing large volumes of bulk tailored wine made for market leaders “négociants” and their private labels (“differentiated” B2B market), or the implementation of processing activities in order to shift their product range from bulk to bottled wine with their own brands (B2C market). More recently, Schamel and Santos Arteaga (2013) reveal that Alto Adige (Italy) wine cooperatives manage to organize their production decision in such a way to be able to compete -and even beat- with private wineries in terms of wine quality and reputation. Barros and Santos (2007) highlight that Portuguese wine cooperatives are allowed to be more efficient than their private counterparts thanks to different resources, scale economies and organizational structure.

The cooperative sector is pivotal within the Italian wine industry in terms of diffusion, numbers and strategic relevance, covering in some regions (Abruzzo, Sicily and Trentino-Alto Adige) over 65% of the regional wine grape production (Capitello and Agnoli, 2009); Sicily, Veneto and Emilia-Romagna represent on a whole around 60% of the overall national wine production from cooperatives (Pomarici, 2009). Cooperatives take also part in important consortium, as the Chianti Classico one, carrying out operations of purchasing, production and bottling (Gaeta and Corsinovi, 2013). Recent studies analyse and verify the health status of wine cooperative sector both at domestic level (Pomarici, 2009; MiPAAF, 2013; Ufficio Studi di Mediobanca, 2014;) and in some local contexts (Maietta and Sena, 2008, 2010; Capitello and Agnoli, 2009; Chinnici et al., 2011; Couderc and Marchini, 2011; Torcivia, 2012a, b; Schamel and Santos Arteaga, 2013). These studies outline a new Italian wine cooperation system, whose productive focus shifted to the production of valuable products (bottled or aging wines) that reach directly, even with effective branding policies, the final market, especially the international one, from which a growing wine demand is observed (in face to a significant and structural decline in domestic consumption).
SURVEY METHODOLOGY

In order to outline the framework of Sicilian wine cooperatives, in the absence of complete and comprehensive official data, we used records published in previous papers related to this theme (Torcivia, 2009, 2012b) and provided by the Regional Department as well as data collected directly from the web page of the Sistema Informativo Agricolo Nazionale (SIAN).

The investigation of the Cantine Settesoli carried out through direct interviews and a survey questionnaire used in previous researches (Schimmenti et al, 2011; Schimmenti et al, 2013) and adapted to the wine sector. The questionnaire (organised into three sections, the first one relating to the general characteristics of firm, the second part relating to the analysis of the technical aspects of production and processing, and the third one concerning the commercial aspects as well as aspects involving the use of hardware and software’s infrastructure), submitted to Settesoli managers on several stages due to the complexity of the cooperative activities, allowed the collection of data concerning production, processing and trading topics with reference to the financial years of 2011-2013 (each financial cycle opens on July 1st and ends on June 30th of the following year, therefore the data collected refer to the grape-harvests 2010-2012), and socio-structural and managerial aspects referred to the 2013 year, thereby reconstructing all the stages of supply chain. The study also provided the evaluation of the cooperative’s performance by analysing its financial statements of the last three administrative-accounting years (2011-2013), made comparable by performing the reclassification of the Balance Sheet (based on financial criteria) and Income Statement (on the basis of value added), and the determination of the main financial ratios: profitability ratios (ROI, ROS, ROT and ROD), structural indicators of assets (the rate of the circulating assets and the rate of the fixed assets), of the liabilities (financial autonomy and debt ratios) and of balance sheet (equity-to-fixed-assets ratio, working capital and current ratio, and quick ratio). ROI, ROS and quick ratio were also compared with those ones obtained from other surveys on the regional and national wine sector (Ufficio Studi di Mediobanca, 2014; MiPAAF, 2013).

WINE COOPERATIVES IN SICILY

Wine cooperatives in Sicily were born in the ‘30s, but began to have relevance only in the early ‘70s, showing a substantial growth up to 2001, when 102 active cooperatives were recorded. In the following years, up until now, the sector has experienced a significant reduction in numbers, especially due to product management issues or to the phenomena of merging and acquisitions (Torcivia, 2012b).

In 2013, based on the SIAN data, the cooperatives which have regularly declared their wine production were 59, with a total of over 0.7 million tons of wine-grapes delivered, with a ratio of 82%
among the production of wine-grapes within the regional production; those deliveries have concerned in prevalence white grapes (0,5 million tons) as opposed to the black ones. The presence of wine cooperatives has always been more consistent in the province of Trapani (33 units in 2013) province has the regional leadership in terms of wine growing area, followed by the provinces of Palermo and Agrigento with a significantly lower number of cooperatives (respectively, 12 and 9). Moreover, according to the data collected from the SIAN web page in 2013, there were 19,471 wine-grape suppliers (both members of cooperatives that non-members) within such companies; in particular, there are only three cooperatives with over 1,000 suppliers: Cantine Colomba Bianca (1,836 units), Cantine Settesoli (1,691 units) and Cantine Ermes (1,045 units). When taking into consideration the vineyard area, only Cantine Settesoli and Cantine Colomba Bianca exceed, individually, the threshold of 4,000 hectares of vineyards, while within the processing aspect only four coops (Cantine Colomba Bianca, Cantine Ermes, Cantine Settesoli and Cantine Europa) processed more than 40,000 tons of grapes each.

RESULTS
Managerial, socio-structural and productive aspects
The organization of Cantine Settesoli is very complex and articulated. More specifically, the winery has established an organizational structure in which managerial responsibilities of the various business functions, broken down by sector technical management and distribution channel/destination market, are delegated to managerial roles with specific skills according to a pyramidal system of responsibility.

Founded in Menfi (in province of Agrigento, Western Sicily) in 1958 with the legal status of agricultural cooperative society, Cantine Settesoli’s mission is to enhance the wine grape production of its members, and to protect and improve the conditions and activities of members operating within the local area. Its vineyards’ areas, which extend for about 5,500 hectares, make it not only the largest vineyard in Sicily (covering around 5% of the regional wine growing area), but also a great source of employment for farmers and more generally for the local population as a result of the generated satellite activities. The members of the cooperative amount to 2,135 (of which 1,841 delivered their production in the 2012 harvest), mostly represented by farmers; at the same time the cooperative resorts to non-members wine-growers.

In 2013, the number of permanent employees accounted for 47 units (14 staff units more than in 2011), while seasonal workforce was employed for a total of 26,091 working days (1,184 days more than in 2011).
The four wine-making plants, together with bottling, packaging and storage of wines cover an area of 18,960 square metres, with the addition of squares, cars parking, roofed areas, etc. with an overall outer surface of 94,783 square metres.

In the “vineyard Settesoli” the most common method of grape growing is the simple spurred cordon, and the cultivation of both indigenous and non-indigenous grape varieties (black and white grape) can be found.

Processing and commercialisation

After the harvest (in recent years mechanised harvesting of white grapes during the night has been introduced) and the delivery of grapes to the cooperative, the process of winemaking begins in its different stages: crushing, fermentation and subsequent classification of each batch in order to create specific cuvée. The production cycle is completed by an automated line for bottling and packaging, with an effective capacity of about 9,500 pieces/hour (bottle, bag in box and tetra-brick). The data regarding the last 4 grape harvests show a remarkable production variability, with a minimum peak in 2011 (41,213 tons of processed grapes) and a maximum peak in 2013 (55,982 tons), mainly ascribable to climatic conditions (Table 1).

In the three grape harvests 2010-2012, there has been an increase in the average price paid per ton, due to the increase in sales prices both in Italy and abroad; the aforementioned confirms the validity of the company’s strategy to focus on wine quality and on the more lucrative markets.

Cantine Settesoli focuses its commercial strategy on brand’s reputation, on the perceived value of the product and a complete line of products which has three brands of packaged wine -Settesoli, Mandrarossa and Inycon- covering all price and consumption ranges.

Inycon, available only on foreign market, has successfully been sold for over 10 years within the major grocery chains in the United Kingdom. The brand is also becoming popular within other markets such as Belgium, the Netherlands and Switzerland.

In Italy, however, the company has decided to focus solely on Settesoli and Mandrarossa lines. For the Settesoli label the company has created a national sales network to ensure a widespread presence.
across the country through large-scale retail channels (around 15). The brand, aimed at a target audience of consumers who ask for a good wine at an affordable price, includes three product lines: the line “Settesoli GD” (with a final price of 3.50-4.50 €/bottle), the line “Porta Palo” (2 €/bottle), and the line “Torre Solada (1.20 €/tetra-brick).

The “Mandrarossa” wines represent the top range: produced from a careful selection of grape varieties, are marketed towards a medium-high target (Ho.Re.Ca, etc.) market, with an average sales price of about 10 €/bottle.

Finally, in addition to the three aforementioned brands, part of wine is bottled and marketed with private labels of channel stores, whilst another part is sold in bulk quantities.

Most of the cooperative revenues (the average figure for the three years amounted to 47.7 million €/year) derives from the sale of packaged wine, followed at a considerable distance from the bulk one; the revenue generated by the sale of musts and other minor products is very low. Packaged wine is primarily marketed in the foreign market, while the bulk wine and the musts are addressed to the national market (Table 2).

The business strategies adopted by the company for bottled wines are closely linked to different markets and distribution channels: within the international market, business relationships are managed through a joint venture with a British partner, while in the national market the medium-term objective is to propose, especially in the large-scale retail channel, increasing volumes of product with excellent value for money. It is not, however, disregarded the sale of products at reasonable prices (tetra-brick) driven by specific demands of consumers with limited disposable income. The business strategy of the company provides, among other things, the launch of new products and packaging.

M.C./M.C.R.: Concentrated grape must/Rectified Concentrated Grape Must.

Informatisation and communication

The cooperative utilizes very innovative hardware and software tools for various activities, such as orders, sales and quality management, warehouse operations, payroll activities, contract management and marketing operations.
Cantine Settesoli has two websites (www.cantinesettesoli.it and www.mandrarossa.it) providing a wide variety of information and services: wine shop, where consumers can buy products directly from the cellar. The Internet is also used to access banking services, to source new customers and suppliers, for on-line purchasing and for e-learning.

On each label of the Cantine Settesoli packaging there is a stamped identification code that allows to travel backwards through all stages of the supply chain. In addition, on Settesoli and Mandrarossa labels there is the QR Code that refers the consumer to an iPad app created by the cooperative and promoted for the first time at the 2013 Vinitaly.

The process of the Settesoli brand-building began some years ago with a strong marketing strategy promoted on national TV, on Sky Sports channels, on some of the press, the web, and through the marketing at both national and international wine fairs.

Throughout the year, Cantine Settesoli welcomes enthusiasts and professionals from all over the world for guided tours (in several languages) which start from the vineyard and continue and conclude in the cellar with a wine-tasting.

Research and development

The company, also with the collaboration of Regional bodies, has been actively involved in research and development, in order to keep up to date with new technological means of production, wine quality improvements, sourcing of raw material and embrace a sustainable method of packaging its products.

The cooperative has also embarked on a long research program aimed at broadening its ampelographic base and hence improve the quality of their wines; the results of such research are then transferred to all the members.

The company has recently developed a photovoltaic system with a total capacity of 537 kWp and a biomass plant that generates “clean” heat and power through the use of led lamps, and has also adopted fibreless wood paper for its packaging operations.

In 2003, the company has also successfully achieved the major goal to be able to fully trace and certify each stage of the production cycle; and currently it has a large number of quality certifications, some of which are explicitly required by the foreign market.

Finally, the company supports and embraces humanitarian programs.

Economic and financial performance

The economic and financial analysis of a cooperative operating in the agri-food system must encompass various factors that characterize these types of company, such as the limited equity capital, participation of members in the financing under various forms and the mutualistic aims pursued (MiPAAF, 2009). Transformation cooperatives tend to remunerate their members at a greater rate than
the market prices; therefore, their income statements do not generally indicate profits, with a significant impact on the financial ratios.

As noted above, this study has taken into consideration the financial statements of Cantine Settesoli of the last three administrative-accounting years (2011-2013). The analysis carried out, with reference to the composition of the assets, shows a high prevalence of current assets, which stood stable at around 72-73%, mainly represented by trade and other receivables (consisting mostly in short-term loans to customers and members) and wine inventories, while fixed assets, principally composed of the tangible assets, are approximately 27-28% (Figure 1).

The examination of the company’s liabilities shows an overall low level of capitalization (net equity) - that is distinctive among cooperative societies- and a significant use of borrowed capital -among which current liabilities have a clear and growing prevalence- that is offset by a gradual reduction in consolidated liabilities (consisting mostly in self-financing members, which amounted last year to just over €9 million, and in medium-long term liabilities).

![Figure 1. Evolution of the equity structure in the triennium 2011-2013.](image)

An examination of income statement highlights a significant proportion of raw material costs (varying between 69.5% and 72.4% in the three investigated years) and the breakeven reached at the end of the financial year, taking into account the distribution of profits to members.

The value added shows an increasing trend (from €6.8 million to €6.9 million) but fluctuates when considered in relative terms; a similar trend was noted for the gross operating margin. The operating income of Cantine Settesoli shows an increasing trend (reaching €511,588 in 2013). Financial charges show a negative trend due to increased exposure to the banking system (from -€608,109 to -€907,995). More specific information on the company’s profitability may be obtained by reading the ROI, which has increased the given figures slightly by around 1% (Table 3). These values are lower than the average in the sample of 33 Italian cooperatives (3.0% in 2012) and in the sample of regional wine firms, coops and not (1.3% in 2012) as reported on the wine sector survey carried out by the Ufficio
Studi di Mediobanca (2014).

*Table 3: Balance sheet ratios in the triennium 2011-2013.*

From the analysis of ROS, its growth appears to be steady inclined, which signifies a positive sales policy accrued by the company, although the figures are still relatively low when compared with those ones collected by MiPAAF (2013), related to others medium-large wine cooperatives (2.4% in 2011). Within the three years, ROT figures show stable values, whilst low ROD values (albeit increasing) indicate the careful choices made by the cooperative in accepting external sources of finance. Finally, the leverage shows an increase in corporate debts.

Among the structural indicators, those relating to assets confirm the high degree of elasticity of the invested capital, which denotes the ability of the cooperative to adapt suitably to changing market conditions; whilst the composition of the liabilities highlights the lack of financial autonomy that may cause difficulties in accessing to credit, settlement of liabilities and development. Referring to balance sheet indicators, the equity-to-fixed-assets ratio assumes decreasing values but higher than 1, expressing a sustainable situation in terms of the strength of the company’s assets. The assessment of cash equivalents by the cooperative was made through the determination of the working capital and the current ratio, which indicate, respectively in absolute and relative terms, a good availability of the firm even though in steady decrease. Within the analysis of the company’s solvency, the quick ratio shows, in 2013, a situation in which short-term debt may be extinguished only by the return in liquid form of a part of inventories. The above is in line with data reported in the survey on the national wine cooperation carried out by the MiPAAF (2013).

**DISCUSSION AND CONCLUSION**

The winemaking industry has represented for many years a leading market within national and Sicilian agro-food sector, which continues to be object of investments. Within the same sector, wine
cooperatives play an important role, especially in those regions, as the case of Sicily, where supply is fragmented. The Sicilian cooperatives in recent years have reported a numerical scaling, although a high number of product-oriented companies still concentrate most of the regional wine supply, without having been yet oriented towards the production specialization (in alternative to bottling) achievable, according to Couderc and Marchini (2011), through the production of bulk wine suitable to contract specifications aimed at satisfying market leaders as négociants and their private label (B2B differentiation strategy). Herein we analysed the activities of the supply chain implemented by the cooperative Cantine Settesoli, a very prominent wine-producing market-oriented company on both regional and national level, whose evolution has ensured an efficient management and beneficial outcomes for its members.

To keep up with the ever changing wine market, the cooperative Settesoli, which ranks first in terms of bottled wine within the Sicilian wine cooperatives, has the goal to increase the production of the more profitable brands, although it still sells a significant amount of bulk wine. At the same time, the cooperative is aware of the various markets demands and the different consumers and therefore is inclined to continue with the production of more affordable wine products that can be used on a daily basis.

The cooperative carries out on-going research and development aimed at improving the quality of its produced wines, through the use of technical means and advanced technologies.

On an international level Cantine Settesoli has established a very prosperous joint venture with a British partner, and on a national level it has established trading affiliations with the large-scale retail channels (main distribution channel in Italy) -despite they have proven to be costly and lengthy with their payments (60-90 days)- and with the restoration, in which the most criticality concerns payment timing (in many cases over 120 days).

By investing about 3% of its turnover in marketing and promotion as well as having increased its sales in the domestic and international markets, Cantine Settesoli plays a pivotal role among the local community, also in terms of tourist attraction by promoting and participating to wine and gastronomic events. From a management point of view, these initiatives have greatly increased the complexity of the business and its programming and created the need for relevant managerial skills, but requiring at the same time the use of external financing due to the lack of financial autonomy, characteristic of agri-food cooperatives and in particular of wine cooperatives.

Cantine Settesoli successfully implements traditional and innovative management tools, and given its growth prospects, it can be viewed as a business model to be followed, as part of a cooperative Sicilian wine system that must face an increasingly competitive market. In this regard, future research could be directed towards the study of those Sicilian cooperatives still product-oriented but able to develop
themselves towards a B2C market or to differentiate their B2B strategy through the offer of “differentiated” bulk wines.

EXPATS IN LUXEMBOURG: HOW CULTURAL SPECIFICITIES IMPACT THE USE OF SOCIAL NETWORKING TECHNOLOGIES AND HUMAN RESOURCE PRACTICES IN LUXEMBOURG

Schinzel, Ursula

United Business Institutes, Luxembourg

ABSTRACT

The purpose of this research is to investigate, in this world of global mobility, the cultural and language characteristics of Luxembourg that may influence the tendency of HR specialists in Luxembourg to utilise NSNT. The methodology is first a profound literature review in global mobility, in HRM and NSNT, second interviews in 41 companies, and third questionnaires in 1 company with 134 filled-in questionnaires, evaluated in SPSS. Findings are: first, the author finds that HR managers are reluctant to using NSNT, keeping practices surprisingly mainly unchanged. Second, looking at the specific political, economic and historical context of Luxembourg using Hofstede’s cultural dimensions, the author finds that Luxembourg has a high level of ‘Uncertainty-Avoidance’, ‘Long-Term-Orientation’ combined with ‘Happiness’. Limitations are the comparatively small sample size, the data collected only in one company, and the lack of a strong theory to link culture and happiness, and could all have biased the results and their interpretations. Practical implications are given for expats, their spouses and family coming for work to the Grand Duchy of Luxembourg, trying to cope with the cultural and linguistic specificities described in this research, especially in the HR Domain and global mobility. Regarding social implications, the author hypothesizes that the reluctance to use NSNT is related to Luxembourg’s high score on ‘Uncertainty-Avoidance’ and that Luxembourgish language is used as an identifier. The originality of this research lies in its usefulness for expats, global managers, in their attempt of integration into Luxembourg.

Keywords: Global mobility, expats, Human Resource Management (HRM), Social Networking, cross-cultural management, Hofstede’s cultural dimensions

INTRODUCTION

The purpose of this study is to explain to expats, their spouses and family coming for work to the Grand Duchy of Luxembourg, in this world of global mobility trying to cope with the cultural and
linguistic specificities described in this research, especially in the Human Resources Domain the impact of social networking technologies on human resources practices in Luxembourg while analysing the cultural pattern of Luxembourg. Digital social networks like LinkedIn, Viadeo, Xing, Facebook and Twitter have revolutionised human resources practices. This research investigates (1) global mobility and expats, (2) dimensions of culture, (3) economic, geographical, political and social context in Luxembourg, (4) Luxembourg’s history, (5) culture and language, (6) Luxembourgish language, (7) Human Resource Management, and (8) social networking technologies. In this world of global mobility, this research investigates the extent of the use of new social networking technologies in Luxembourg, considering its cultural pattern. For expats, their spouses and family, the Grand Duchy of Luxembourg and its specific place in Europe are detailed. The research will be undertaken within the specific political, economical and historical context of Luxembourg. Hofstede’s dimensions of culture are discussed: ‘Individualism/Collectivism’, ‘Power Distance’, ‘Masculinity/Femininity’, ‘Uncertainty Avoidance’, ‘Long-Term Orientation/Short-Term Orientation’, ‘Indulgence versus Restraint’ and ‘Monumentalism’. The hypothesis is discussed that this reluctance to use social networking technologies is founded in Luxembourg’s high score on ‘Uncertainty Avoidance’. Also the fact, that the Luxembourgish language, a challenge for all expats, is used as an identifier in the Grand Duchy, might represent a brake to the extent of use of new social networking technologies. Human Resources Practices have a historical background and have developed throughout the years. While standard HRM was for a long time exclusively about HR administration, it is nowadays still about HR administration but also about recruiting and staffing best practices, talent management, and more and more about communication, new social technologies and e-HR. The research question is: Why have human resources specialists in Luxembourg been reluctant to utilise new social networking technologies, considering its special cultural pattern following Hofstede? Interviews, questionnaires and case studies are performed in 41 companies in Luxembourg. Results are presented. Conclusion, references and appendices follow.

GLOBAL MOBILITY

Globalization of business intends global mobility of people. These people move from one country to another, moving their entire family and homes, taking on responsibilities and encountering challenges never thought of (Brookfield 2011). Cross-national collaboration (Hinds et al. 2011) is increasing, bringing increasing complexity, fragmentation (Tharenou 2005) and employees’ careers challenges, given the intensity of global mobility and repeated staff transfers (Shaffer et al. 2012). Most expat destinations are United States, China, and United Kingdom (Brookfield 2011). Despite some recent research, there is a lack in knowledge concerning expatriation, especially in small, so far
unexplored countries, such as the Grand Duchy of Luxembourg. This research intends to provide information both for companies and individuals, facilitating the expatriation process into Luxembourg, providing insight into (1) global mobility, (2) Luxembourg’s special culture, (3) Luxembourg’s history, (4) Luxembourg’s language, (5) Human Resource management practices in general (6) social networking technologies in general and in Luxembourg.

Among the existing literature the research is investing into research of short-term international assignments in multinational companies facing cost issues together with rising staff mobility, including short-term, commuter, rotational, contractual and virtual assignments (Tahvanainen et al. 2005). It is also researching into career choices, challenges and career consequences associated with corporate global employees – flexpatriates, short-term assignees and international business travellers (Shaffer et al. 2012). When staffing global positions, challenges arise through the manageability of multiculturalism (Harvey et al. 2011) trust – affective and competence-based – helps subsidiary acquiescence to headquarters. Intercultural aspects of collaboration across national boundaries are researched by Hinds et al. (2011) using social networks and technology use to illustrate how cultural differences generate different behaviour, explaining potential incompatibilities in the global workplace. This shows that mostly the complexity of global staffing in expatriate assignments is underestimated and more strategy is needed for global staffing (Collings et al. 2007; Welch et al. 2007). Also the complexity of work-family conflict, psychological turbulences in international assignments and exacerbating effects of the expat-commitment are researched by Shaffer, Harrison, Gilley, and Luk (2001).

DIMENSIONS OF CULTURE

Geert Hofstede (1980), in his monumental research on culture at IBM, has instigated worldwide research efforts. Culture has been found to have dimensions, the question is not if, but how many. Hofstede initially came up with four dimensions - Individualism versus Collectivism, Uncertainty Avoidance, Power Distance, and Masculinity versus Femininity. He later added a fifth dimension, Long-term versus Short-term Orientation (Bond and Hofstede 1983), and has just added a sixth dimension - Indulgence versus Restraint (Hofstede 2001) and together with Minkov (2011) is about to add a seventh dimension - Monumentalism.

Hofstede (1980) defines culture as the “collective programming of the mind which distinguishes the members of one human group from another”. Hofstede defines Uncertainty avoidance (UAI) as “the extent to which people feel threatened by uncertainty and ambiguity and try to avoid these situations” (Hofstede 2001). He defines Individualism (IDV) as “people looking after themselves and their immediate family only, versus people belonging to in-groups that look after them in exchange for
loyalty” (Hofstede 2001). The individualism/collectivism cultural dimension has been researched in detail by Triandis (1995) and Triandis and Gelfand (1998) dividing into four dimensions: vertical and horizontal individualism and vertical and horizontal collectivism. Power Distance (PDI) is defined as “the extent to which less powerful members of a society accept and expect that power is distributed unequally” (Hofstede 2001). Masculinity/Femininity (MAS) is defined as: “the dominant values in a masculine society are achievement and success; the dominant values in a feminine society are caring for others and quality of life” (Hofstede 2001). Hofstede (2001) defines Long-Term Orientation (LTO) as “the extent to which a society exhibits a pragmatic future-orientated perspective rather than a conventional historic or short-term point of view.” Hofstede defines Indulgence versus Restraint (IVR) as: “Indulgence stands for a society that allows relatively free gratification of basic and natural human drives related to enjoying life and having fun. Restraint stands for a society that suppresses gratification of needs and regulates it by means of strict social norms” (www.geerthofstede.nl). Minkov defines Monumentalism (MON) versus Flexumility as: high pride, immutable identities, values, norms and beliefs (Minkov 2011).

Today, Hofstede’s work is known, accepted, praised, replicated, and also criticized. Some significant culture studies have followed Hofstede. They include culture research projects such as the Chinese Value Survey by Bond et al. (2004), Cameron and Quinn (2011), De Mooij (2011), Gert Jan Hofstede et al. (2002), the GLOBE by House et al. (2004), the European Value Survey and the World Value Survey by Inglehart (2005, 2008, and 2011), Minkov (2011), Schein (2009), Schwartz (1990), Smith (2006; 2002), Triandis (1982 and 1995), Trompenaars and Hamden-Turner (1997). Researchers besides the Hofstede era are Scholz and Böhm (2008) who specialize into Human Resources and Lewis (2006) who specializes in language programming. Researchers beyond the Hofstede’s era, such as Nakata (2009), Briley (2009), and Hong (2000), have extended cultural research into psychology, anthropology, and philosophy.

In 2010, together with his son Gert Jan Hofstede and Michael Minkov, Hofstede published “Cultures and Organizations, Software of the Mind, Third Edition”. In this edition Hofstede et al. surprised with a sixth dimension of culture titled “indulgence versus restraint”, or “subjective well-being” or “happiness,” constructs. The influence of Minkov is not only felt by the addition of a seventh dimension of culture titled “Monumentalism”, but also Hofstede’s advice not to invest further in data collection, but to rather use secondary data, as Minkov (2010) who analyzed Inglehart’s data from www.worldvaluessurvey.org, has done.

Geert Hofstede’s research has not only been subject to enthusiasm (Sorge 1983, Triandis 1982), or to reviews (Cooper 1982, Eysenck 1981, Smith 2002, Smith 2006) but also to criticism, contestation and controversy (McSweeney 2002, Roberts and Boyacigiller 1984, Søndergaard 1994). Hofstede states: “I
made a paradigm shift in cross-cultural studies, and as Kuhn (1970) has shown, paradigm shifts in any science meet with strong initial resistance” (Hofstede 2002). The discussion exchange between Hofstede and McSweeney is regarded as closed by Hofstede. Hofstede also had an exchange with Hampden-Turner and Trompenaars (1997) about the validity of their filled-in questionnaires. The debate between Hofstede and the GLOBE led Smith to write his 2006 article about the famous elephants. The five main criticisms of Hofstede’s approach have been enumerated by Hofstede (2002) himself: “(1) Surveys are not a suitable way of measuring cultural differences; (2) Nations are not the best units for studying cultures; (3) A study of the subsidiaries of one company cannot provide information about entire national cultures; (4) The IBM data are old and therefore obsolete; and (5) Four or five dimensions are not enough.”

This study takes on the second challenge of Hofstede’s criticism, namely, that national boundaries are not the best unit of analysis of studying culture, and uses the example of Luxembourg to demonstrate that language is a better identifier of culture rather than geographical boundaries of nations. It compares data collected in three subsidiaries of one company in Germany, France and Luxembourg, to demonstrate that Luxembourg's dimensions of culture are not proxies for the average values found by Hofstede in France and Germany, but rather are unique and a result of Luxembourgish, which, along with French and German, is one of the official languages of the Grand Duchy. Hence, the next section delineates background information about Luxembourg such as economic, geographical, political, social, historical and language, as well as some research reports about culture and happiness in Luxembourg, followed by a set of hypotheses.

ECONOMIC, GEOGRAPHICAL, POLITICAL AND SOCIAL CONTEXT IN LUXEMBOURG

Luxembourg is a parliamentary democracy with a constitutional monarch at its head. Along with Belgium, Germany, France, Italy and the Netherlands, the Grand Duchy was one of the signatories of the Treaty of Rome in 1957. The ensuing creation of the EEC (European Economic Community) and EURATOM (European Atomic Energy Community) formed the nucleus of the later EU. On 18 April 1951 it was a founding member of the CECA (Communauté Européenne du Charbon et de l’Acier, or in English, European Coal and Steel Community), the Paris treaty, together with the Federal Republic of Germany, France, Italy, the Netherlands and Belgium. In Luxembourg, European cultures meet on a small piece of land, that hosts people with high level of tolerance. The European Commission has its seat in Brussels and Luxembourg. On May 1st, 2004, ten new countries joined the European Union, including seven former Eastern Bloc countries. On January 1st, 2007 two more such countries joined, establishing the current membership at 27 countries.
The Grand Duchy of Luxembourg’s motto is: “Mir wölle bleiwe wat mir sinn”, which in English means “We want to remain what we are”. The capital of Luxembourg carries the same name as the monarchy. Official languages are German, French, and Luxembourgish. The Government is a Parliamentary Democracy and a Constitutional Monarchy. The Grand Duke’s name is Henri; the Prime Minister is Jean-Claude Juncker. The population is growing fast, as in 2009 it was approximately 493,000, in 2010 it was approximately 502,000 and in 2011 it was approximately 511,000. It is the world’s only remaining Grand Duchy. It has the second highest Gross Domestic Product per capita ($84,829; IMF 2011) in the world. It is a founding member of ECSC (European Coal and Steel Community), European Union, NATO, OECD; it has been part of the euro zone since 1999. This shows its high interest in European integration. The small army often is the subject for a laugh: it consists of around 800 soldiers. There is no navy and no air force. Luxembourg is the host to 17 NATO AWACS airplanes, one A400M military cargo plane that are shared with Belgium, and 3 NATO Boeing 707.

Luxembourg is one of the smallest European countries, it measures 2,586 km², 82 km long and 57 km wide at its longest and widest points. Until the 1960 the steel industry was the engine of Luxembourg’s economy; after 1960, the banking and financial sector took over. The Luxembourgish language is a German dialect from the Mosel region, filled with French and Dutch words and expressions. Luxembourgish is one of the three national languages. In school, pupils speak and study in German, French, Luxembourgish, and may later study English, Portuguese and Italian.

Luxembourg's total population consists of 511,800 inhabitants of whom 290,500 (56.76%) are Luxembourgers and 221,300 (43.24%) are foreigners (data from statec, 2011). During the day time, 138,700 cross-border workers come to Luxembourg to work: 74,100 French, 37,800 Belgian, and 37,500 German. This means a total of 357,800 for domestic employment. 357,800 people were working in Luxembourg in 2010, out of them 219,100 were residents and 138,700 were cross-border workers. 39% of the domestic employment consists of cross-border workers.

The capital of Luxembourg had approximately 94,000 inhabitants in 2011, 60% of whom were foreigners. During the day, this equation changes dramatically, as the work force is commuting into the town of Luxembourg from Germany, France and Belgium. The TGV link makes Luxembourg only two hours away from Paris. RTL (Radio Television Luxembourg) and SES ASTRA (Société Européenne des Satellites); European Skype, eBay and Amazon are headquartered in Luxembourg. Working in Luxembourg is described in detail by American Chamber of Commerce (2010).

There are 45,000 European civil servants, out of this number 9,500 are present in Luxembourg; this means 5.5% of the Luxembourg active population. 42.3% of the Luxembourgers are civil servants (IPSE, 2010). The European Institutions in Luxembourg are: Secretariat of the European Parliament,
European Council (2nd), Court of Justice and Court of Auditors. There are also: European Investment Bank, European Investment Fund, European Union Publications Office, and Eurostat. The European Institutions are distributed following: Brussels hosts the Commission, Council of Ministers, European Council (1st), Parliament (2nd). Strasbourg hosts the Parliament, Luxembourg hosts the Parliament (secretary), Council (2nd), Court of Justice, Court of Auditors. Frankfurt hosts the European Central Bank, see more information on the website of the Office for Official Publications of the European Union http://ec.europa.eu/publications.

There is very little research in general about Luxembourg. The existing literature is mostly descriptive (Background Note Luxembourg 2006, Dumont et al. 2008, paperJam). The most recent publication, in French, on history and politics in Luxembourg has been written by Haag (2011) and includes excellent photographs underlining his detailed historical overview. One recent publication is from IPSE (2010), in German, but it does not relate in any way to Hofstede’s dimensions, nor does Spizzo’s book published in 1995.

**LUXEMBOURG’S HISTORY**

Despite all the wars in Europe Luxembourg still survives. Despite all the requests from the European partners for fiscal homogeneity, despite the demands to abolish the borders and the ending of bank secrecy, and the exchange of information on bank accounts, Luxembourg still survives. Luxembourg is a small country, and it is strongly attached to the rock it is built on, like a medieval defensive city (Spizzo 1995).

Luxembourg has always stayed politically ‘neutral’. This ‘neutrality’ has often been compared with Switzerland’s neutrality. Luxembourg was able to stay neutral between its two mighty neighbouring countries, France and Germany. Therefore the ‘privileges’, namely, low direct and indirect taxes, low or non-existent income tax, work opportunities, low unemployment, high salary, cheap gasoline, cigarettes, alcohol, and more, are seen as a unifying identifier for the Luxembourgers. These privileges make the difference between the ‘in-group’ and the ‘out-group’ (Briley 2005), between ‘being Luxembourg or not’.

After World War I the need was to assure national identity, to make people understand why it was important to be ‘Luxembourgers’, to give value to the concept of ‘citizenship’, and being a ‘Luxembourg citizen’. Only when Nazism engulfed this small country, because to the Germans this small piece of land seemed to be German, did the linguistic aspect attain its importance.

History shapes the character of a nation. Haag (2011) states, that Luxembourg developed from a provincial town to a European capital, an international financial centre, and a worldwide freight centre. In 2008 the Clausen zone was created for entertainment, in 2005 the Philharmonic Orchestra
was inaugurated, the MUDAM in 2006 and the Congress Centre in 2012 (Haag 2011). The 2010 Mercier report puts Luxembourg in 20th position among 221 towns for its quality of life (Haag 2011 p. 541). Prominent European personalities, such as Robert Schumann, Jean-Claude Juncker, and Jacques Santer, are from Luxembourg (Haag 2011). RTL – Radio Television Luxembourg, SES Astra – Société Européenne des Satellites, and EIB – European Investment Bank - are important companies from Luxembourg (Haag 2011). Luxembourgers are trilingual, sometimes quadri-lingual or quinti-lingual, or command even more languages, as described in the following.

CULTURE AND LANGUAGE

The relationship between ‘culture and language’ has been studied by Kashima and Kashima (1998), testing the use of first- and second-person singular pronouns (‘I’ and ‘you’) in correlation with Individualism, and by doing so correlating language and culture. The relationship between ‘cultural background’, ‘language’, ‘geographic region’ and ‘ethnic identity’ was researched by Taylora et al. (1973). Lewis (2006) specializes in research on ‘language programming’ in relation to cross cultural leadership. Sherzer (2009) investigates the relationship between grammar and culture, where language conditions thought, perception and world view. Bi-culturals ability of frame switching through language has been researched by Briley et al. (2005) and Hong et al. (2000). Language has been identified as a manipulator of consumers’ behaviour (Briley et al. 2005; Hong et al. 2000). As argued earlier, Luxembourg with its special Luxembourgish language as well as other official languages, and its unique demand for the command of Luxembourgish as a condition for citizenship, provides an appropriate background for testing the role of language as an identifier of culture. Luxembourg’s language is described next, followed by the relevant hypotheses.

LUXEMBOURGISH LANGUAGE

Today, 320,000 people are Luxembourgish native speakers. The Luxembourgish language (Spizzo 1995) has become the discriminating factor to distinguish between those who are able to benefit from Luxembourgish citizenship and those who are not. Luxembourgish possesses the characteristics of a dialect, proven by the fact that there is no translation of the Bible into Luxembourgish. Luxembourgish is a spoken language and does not have a long written tradition (Spizzo 1995). The language defines the in-group (Briley 2005) and the out-group. Those who speak Luxembourgish are part of the in-group and those who do not speak the language are part of the out-group. Official documents are in French or in German. Mostly, French is used for bureaucratic issues, and German is used for the religious ceremonies. This dialect has become the discriminating element for citizenship.
In order to benefit from all of the advantages of the Luxembourgish nationality one has to be able to speak Luxembourgish. Citizenship is only awarded to people who speak Luxembourgish (Spizzo 1995). The language, therefore, provides access to the advantages and rights associated with citizenship.

Luxembourgish authorities are an example of long-term orientation; they were able to adapt and react to some of the crises in the steelmaking industry and in the banking system, always with the objective of guaranteeing stability and wealth for the people. It seems as if there was an invisible line of stability and wealth that was guaranteed throughout the centuries. Typical words for the national identity are wealth, privileges, stability through the maintenance of the attractiveness of the country compared to neighbouring countries, because of its industry, its labor market, its fiscal benefits, all key for the success of the country. Being part of this system and the feeling it gives is the glue of the country, the sense of being part of it (Spizzo 1995).

Following the description of Luxembourg and its culture, it is argued that Luxembourg's dimensions of culture are not proxies for the average values found by Hofstede in France and Germany, but rather are unique and a result of Luxembourg's language, which is also the official country language since 1984. The following hypotheses are offered:

Hypothesis 1: Native Luxembourgers scores on the PDI, UAI, IDV, MAS, LTO, IVR, MON cultural dimensions are significantly different from the scores of non-Luxembourgers in Luxembourg.

If hypothesis 1 is corroborated then the scores on Hofstede's dimension should reflect a tendency of Luxembourgish native language speakers to score differently than the scores of French, German and Foreigners in Luxembourg. The following hypothesis is offered:

Hypothesis 2: There are significant differences between Hofstede et al.'s (2010) PDI, UAI, IDV, MAS, LTO, IVR, MON cultural dimensions estimates for Luxembourg and the empirical values found in this study for Luxembourgers with Luxembourgish Nationality.

HUMAN RESOURCE MANAGEMENT

Human Resources Practices have a historical background and have developed throughout the years (Armstrong 2009, Bratton and Gold 1999) and with the changing world of work (Krautand Korman 1999). Twenty years ago, Human Resources Policies were mostly related to Administration (Mahoney and Deekop 1986): salary, vacation, absence, work hours, headcount and accounting. In many companies, the accounting department was part of the Human Resources Department. Following this administrative trend, arrived a movement focused on motivation (Kuvaas and Dysvik 2009). Human Resources became centred on motivation of employees, recruiting, training, evaluation, and
recognition. More recently Human Resources (Gilley and Maycunich 2000) is driven by communication (English et al. 2007), (Bada and Madon 2006), international HR (McLean and McLean 2001), recruiting in the globalised HR world (Sparrow 2007) and networking (Tixier 2004, Slagter 2009).

Standard HRM is about recruiting and staffing best practices (Ryan et al. 2003), talent management (Tansley et al. 2007), HR administration (Mahoney and Deckop 1986), communication (Curtis et al. 1989) and e-HR (Lengnick-Hall and Lengnick-Hall 2006).

Martin and Reddington (2010) are developing a model of e-human resources, focusing on the relationship between HR strategy, e-HR goals and architectures and positive and negative e-HR outcomes in their publication “Theorizing the links between e-HR and strategic HRM: a model, case illustration and reflections.” Following Scandula and Williams (2000) it’s about “Research methodology in management, and about current practices, trends, and implications for future research.” Collins and Clark (2003) make the link between strategic HRM practices and social networks to deduct as a result the increase of performance. Marchington (2008) sees the following topics as main HRM topics: absenteeism, job satisfaction and relational co-ordination, global HRM, job and role design, recruitment, appraisal, the HR business partner model, and the role of HR in international mergers and acquisitions. Kuvaas and Dysvik (2009) write about “Perceived investment in employee development, intrinsic motivation and work performance.” Scullion et al. (2007) published “International human resource management in the 21st century: emerging themes and contemporary debates.” Tixier (2004) asks “Does the evolution of the human resources practices imply the implementation of an information system?” Slagter (2009) sees “HR practices as predictors for knowledge sharing and innovative behaviour: a focus on age.” HRM research also goes into strategic HRM (Mäklä et al. 2012) and Control systems that might prevent managers from unethical behaviour, because it gives them a feeling of being treated fairly (Langevin and Mendoza 2013).

**SOCIAL NETWORKING TECHNOLOGIES**

Following Boese 2009; Cross et al. 2003; Cross and Thomas 2009, Fernandez et al. 2000, HRM standard practices and e-HRM (Martin and Reddington 2010), digital social networks like LinkedIn, Facebook (Kirkpatrick, 2010) and Twitter have revolutionised human resources practices. Google has changed the way we see our world (Auletta 2009) and changes our habits (Jarvis 2009), and the internet does modify our brain (Carr 2010). Some even wish to make the internet stop (Zittrain 2009). Due to the social technologies, we have to reconsider how we can live and win in a transformed world (Li and Bernoff 2008), and how we interact in times of Facebook (Stengel 2010), where the new digital generation grows up with naturally, contrary to the generations before them (Tapscott 2009).
Historically, Barnes (1954) was the founder of the definition of social networks and his research dates back to 1954. This study was followed by works from Rees (1966) on information networks in labour markets, and by Milgram (1967), who tested the “small world”. De Schweinetz (1932) was the forerunner of economists and sociologists who distinguished between the formal and the informal methods used to find a job. Granovetter (1973, 1985, and 1995) studied the informal methods of finding a job according to him, discovering the “forces of the weak ties”.

Sammartino McPherson (2009) describes Tim Berners-Lee (2000) who imagined a world wide web, encouraging social interactions, giving people without huge technical competences and knowledge the possibility to publish online content, free of charge, unlimited in space and time and the opportunity to interact with others.

The research paper from Hasgall and Shoham (2007) is “Digital social network and the complex organizational systems”, where social networks in organisations are viewed as a shared knowledge system backed by management.

An interesting article is to be found from Jones (2010) about how to use Twitter, Facebook and LinkedIn in recruitment. Boese (2009) writes about standard HRM practices and social network analysis.

In the view of Shirky (2009 and 2010) people go through different stages of “Gin, Television and Social Surplus”. Firstly, they meet in pubs for a drink and later they spent their free time watching TV. Next, they reach the phase where they like to share and communicate, to produce and not only to consume. Following Tapscott (2009) the reluctance for the use of new technologies lies within the generation gap. He describes the “Net-Generation” as learners who are rethinking talent and management, and who are in networks and in families.

Hypothesis 3:

Hypothesis 3: HR specialists in Luxembourg are reluctant to utilise new social networking technologies due to their specific cultural identity. As a result, the practical techniques used related to recruiting, integration, evolution, training, talent management and the evaluation of employees remain largely unchanged. This hypothesis is based upon on an assumption that needs to be justified.

What causes this reluctance? Specific cultural facts, differences in nationalities, or age, or gender or other facts (Fisher and Howell 2004, Reddington et al. 2010)? What has been the extent of the use of new social networking technologies in Luxembourg? Why have human resources specialists in
Luxembourg been reluctant to utilise new social networking technologies? How do they do HRM? How to make them use the new technologies?

My work engages in debates resulting from my review of HRM Practices in general, based on relevant literature, ERP (Lengnick-Hall and Lengnick-Hall 2006) and theory in comparison to the practices currently in use. My work will show that Luxembourg is different from other markets, confirming Greenwald and Kahn’s (2005) “All Strategy is Local”. Luxembourg has a specific work environment that is not in-line with the theories of the globalised world (IPSE 2010, AmCham 2010).

- Which standard HRM practices (Kuvaas and Dysvik 2009; Marchington 2008) in recruiting, evaluation, information gathering, training, outplacement were typically used in the past by Luxembourg companies and are still used?
- When used, which social networking technologies do companies prefer and how does their use impact performance (Collins and Clark 2003)? A look into the past and into the future of Networking in Luxembourg.
- Is the local use of these Social Networking Technologies affected by cultural specificities (McLean and Campbell 2003), (Scullion et al. 2007) or age (Tapscot 2009)? What is the impact of the specific cultural identity and language (Jameson 2007)?

**METHODS**

**Respondents**

- Collecting primary data via Participant Observation, following Saunders et al. (2009), Strauss and Corbin (2008), Taylor and Bogdan (1998), Wilson (2010): participation at seminars, conferences, meetings, dinners, breakfasts, networking events, organised by: e.g. hrone, POG, AmCham, Chamber of Commerce, Sacred Heart University, IGS, Recruitment Matters (http://www.recruitmentmatters.com/news/newsletter/index.html), in e.g. Hotel Sofitel, Hotel Hilton, BGL BNP Paribas, Banque de Luxembourg, Dexia…
- Collecting primary data via Face-to-Face Interviews and questionnaires with e.g. Luxair, HSBC, Deloitte, euroscript, Lindab, RTL, European Investment Bank, ZithaKlinik, Ernst & Young, Banque Privée Edmond de Rothschild, Cactus, Delphi, fast, aims, Rita Knott Consulting, Thierry Ernst Consulting, Ville de Luxembourg, Municipality of Sanem, University of Luxembourg, Ketterthill, Soludec, SES Astra, John Zink, Paul Würth, Centre de Recherche Public Henri Tudor (2008), Office des Publications de l’Union Européenne, KPMG, Oostvogels, Equity Fund among others, in total 41 companies. Case study with ZithaKlinik and Centre de Recherche Public Henri Tudor
• Collecting primary data via Hofstede’s original questionnaires in one company: Lindab Buildings, Diekirch.

**Instruments**

• My questionnaire has been used in paper and online to enquire about HRM practices and the impact of digital social networks on these HRM practices in Luxembourg and Hofstede’s (2001) original questionnaire has been used to measure his cultural dimensions. The questions concerning HRM practices are: (1) ‘What means is your company using in recruiting?’ (2) ‘Which digital social networks does your company use?’ (3) During the recruitment process, how does your company gather information about a candidate?’ (4) After the recruitment process, how does your company gather information about its employees?’ (5) ‘What are the advantages of digital social networks?’ (6) ‘What are the disadvantages of digital social networks?’ (7) ‘Did the use of digital social networks change the role of the human resource specialists in Luxembourg? If yes, how? If not, why not?’ (8) ‘Do you see any risks, dangers while using digital social networks in the human resource practices of recruiting, evaluation, evolution, training…’ (9) ‘Which internet pages are accessible in your company? (is Facebook accessible?’ (10) ‘How is networking mainly done in Luxembourg?’

• Excel is used to come up with the graphs resulting from the above questions.

• Nationality does not always correspond to native language and therefore questionnaires were distributed in English, French and German.

• A pilot study was conducted to pre-test the questionnaire’s face validity.

• As ethical concerns may emerge at all stages of the research (Elms et al. 2010), precautions have been taken to ensure confidentiality. Questionnaires have been anonymous. Equity in treatment regardless of gender, race or nationality was always guaranteed (Robertson 2008).

• Hofstede’s (2001) original questionnaire has been used to measure his cultural dimensions. Questions have been added to measure respondents’ happiness and background information.

• After the initial screening and cleaning of the collected data, Hofstede’s (2010) original formula, were used to calculate Hofstede’s cultural dimensions **Power Distance Indicator (PDI)**, **Uncertainty Avoidance Indicator (UAI)**, **Individualism-Collectivism (IDV)**, **Masculinity-Femininity (MAS)**, **Long-Term Orientation (LTO)**, **Indulgence Versus Restraint (IVR)**, **Monumentalism (MON)**. Pearson Correlations were calculated among all variables.

• One question was used to measure Happiness: “Are you a happy person always, usually, sometimes, seldom, or never?
The following Demographic data served as control variables: native language, command of other languages, gender, age, hierarchical rank and education. Age was measured in an eight-point scale, educational background and rank were measured on a seven-point scale.

RESULTS

Human Resource Managers in Luxembourg are reluctant to use digital social networks, due to their cultural identity. Human Resources practices have a historical and cultural background and has developed throughout the years. The recruitment sector has been revolutionised by Facebook, LinkedIn, Xing, Twitter and Blogger, but not so in Luxembourg. This is given by the high score in ‘Uncertainty Avoidance’ following Hofstede.

The means used in recruiting are mainly advertisement in newspapers (25) and spontaneous applications (23). Digital social networks (8) are far the less used mean in recruiting, see the following table.

Table 1

<table>
<thead>
<tr>
<th>What means is your company using in recruiting?</th>

How networking is mainly done in Luxembourg is shown in table 5. This shows that most networking is done through private contacts, (37), followed by meetings, events, seminars (33), clubs and associations (25) and leisure (19).
What are the advantages of Digital Social Networks? was answered as follows:

- Growing its network, connecting to former colleagues or friends where you lost contact
- Increases network, spreads brand awareness, no cost
- (Re) connecting to people; discover other social network forms. Contacting people without facing or calling them. Timeless networking (anytime in day and night)
- It can help to find someone who can answer you a specific question. Especially LinkedIn is very useful there
- The world just got smaller!
- Easy to use and to find information you need
- Quickly found information
- It gives you a first impression to be confirmed or not
- I have 2 daughters: 24 and 22 years old who are on Facebook, with the style of live of the students’ live, Erasmus contacts, their way of keeping contact in the entire world, with students they didn’t see for some months. To find back friends that one wishes to find back. To exchange information.
- Faster creation of a network, widening of one’s network
- Broad database, normally quite actual information
- Big space of information, fast work, easy communication
- Accessibility, information available quicker
- Being able to reach fast a number of people whom I couldn’t contact by any other means. Our site: “Your future at Deloitte”: We find them at their homes, they don’t need to move. The number of people! The different profile of the people, their diversity, the entire world, the
world is getting very small.

- A lot of information is available. Fast.
- Contact passive candidates.
- Contact candidates out of location.

In your opinion, what are the disadvantages of Digital Social Networks? was answered as follows:

- None
- Low quality
- If you allow too many details to be shown to public users there might be a lack in privacy
- People may lie about their experience, job title...
- Lack of personal touch
- Very little usage potential for finding the right staff. People tend to exaggerate their skills and don’t talk about deficiencies. Endorsements might help a bit, but when you look at them they don’t seem to be more than a friendly turn.
- It’s not always easy to control if information found is trustfully
- No confidentiality
- No control on distribution of information
- Private info, not always accurate
- The content is not trustful
- It is an advantage and a disadvantage: fast communication, a lot of information
- The contact has to be private, personal. I don’t want to make public what is private. It’s the illusion of transparency. In the world of the companies, one has to be transparent, that means invisible. Therefore one doesn’t say the truth anymore.
- To share too much information with everyone. The 1st degree of this kind of network.
- Not confidential enough, sometimes too transparent
- If not used properly, may lead to abuse. Private data access. Information posted may not be 100% accurate
- One can create a profile that isn’t true. One can create an identity without being it. As recruiter one tries to get known. You have to control the posts, not to allow dialogues politically not correct. One has to manage this every day.
- I am not really up to date to reply to this question.
- Information is not as complete as a CV.
Do you see any risks, dangers while using Digital Social Networks? was answered as follows:

- Lowering of Quality
- No – Which ones?
- We talk about the professional environment, right? Then I don’ see many risks. The situation is different of course for tools like Facebook etc where people show pictures that the world shouldn’t see and that are impossible to delete.
- The main risk is that it is so easy to use / make contact that there is a temptation to leave “face-to-face”-contact by side
- See disadvantages
- Preservation of private life
- Of course, there are risks associated by using DSN but it doesn’t affect on recruitment process
- Yes, it can not be your only resource.
- This mix of private life – professional life. Facebook has a non-stop memory. You cannot delete the memory of Facebook. Even if I have nothing to hide, I don’t want to show it to everyone.
- The limits of the network: “ok, we are linked, yes, and what now?” The weak border between the private and the professional.
- Reliability of information, respect of personal data, standard demand driven streamlining of data, over-simplification of search = interesting profiles not taken into account
- Risks in confidentiality. Risks of copies. Risks of discretion.
- Yes: reputation. Information is spread fast, without control. Not to be deleted: it is on the net, it will stay there forever.
- Privacy. Not suitable photos.
- Approach people not matching our requirements/criteria.
- No, very helpful too, especially for HR people

The below correlation matrix shows that Luxembourgers are characterised for being long term oriented, they indulge in life, they are uncertainty avoidant, and they are happy.

The figure above closes this chapter on data analysis. The next paragraph is on limitations of this study.

LIMITATIONS

Thus, the comparatively small sample size, the data collected only in one company, and the lack of a strong theory to link culture and happiness, could all have biased the results and their interpretations. Yet, it is likely that scores that were found to be significant in a small sample are likely to be made even more significant in a larger sample. Also, focusing on one small country and one company has provided the opportunity to indirectly control for many exogenous variables that otherwise would have the potential to 'contaminate' the relationships between the variables. The next paragraph is on discussion and implications.
DISCUSSION AND IMPLICATIONS

The purpose of this study was to explain, in this world of global mobility, the cultural and language characteristics of Luxembourg that may influence the tendency of human resources specialists in Luxembourg to utilise new social networking technologies such as LinkedIn, Viadeo, Xing, Facebook and Twitter. Increasingly global mobility (Tahvanainen et al. 2005), more collaboration across borders (Hinds et al. 2011), strategy in global staffing (Collings et al. 2007), complexity, struggling the work-family balance (Shaffer et al. 2001), trust building (Harvey et al. 2011), career consequences (Shaffer et al. 2012) this research is interesting for expats, their spouses and family coming for work to the Grand Duchy of Luxembourg, trying to cope with the cultural and linguistic specificities. Tharenou (2005) finds out the main reasons why people accept expat work: money, professional development and challenging content; and why people won’t accept expat work: family commitments and disruption.

The study is the result of the link between literature on standard HRM practices, e-HRM (Martin and Reddington 2010) and practice in Luxembourg business life (IPSE 2010, AmCham 2010). It provides an answer for HRM specialists to the question: “How to be successful in multicultural, international Luxembourg?” Cultural identity, intercultural communication, language and international business are discussed by Jameson (2007). How to do business with social networks in international trade (Rauch 2001)? HR Managers will be made aware of the usefulness of digital social networks and may potentially implement them into their current HRM Practices (Guler and Guillen 2010).

The aim is to analyse Luxembourg and its way of business while continuing to evolve with changing technologies. The questions discussed go deep into the analysis of everyday business life, cultural identity, language and international trade in Luxembourg (Horner 2009, Kingsley 2009, Davis 2009). One must genuinely accept and understand the meaning of “Mir wëlle bleiwe wat mir sinn”. If one does not make an effort to integrate into Luxembourg’s specific business culture, success in Luxembourg may never be possible (Background Notes 2006; Neefs and Laures 2010).

By employing a unique sample that includes respondents who speak French, German and Luxembourgish in France, Germany and Luxembourg this study has managed to corroborate the notion that language is a good identifier of culture. While scores in this study for French and Germans in France and Germany resemble to a great extent Hofstede’s scores for these two countries, and while scores in this study resemble Hofstede’s estimates for Luxembourgers who speak any official language of the Grand Duchy, Hofstede’s estimates varied to a great extent from this study scores for Luxembourgers who command Luxembourgish as their mother tongue. This is a unique testimony for the relationships between language and culture, while controlling for country.
Some proven relationships between culture, represented by such dimensions as Long Term Orientation, and high level of Indulgence, and happiness, have been corroborated in this study. It is self evident that two measures, that measure similar concepts, namely, Indulgence on a national level and Happiness on the individual's level should be related to each other. The Grand Duchy’s political, social and economic stability allows people to plan for the long term, thereby providing support for people’s need for security and life predictability. It is possible that this is the key for the relationship between Long Term Orientation and Happiness in Luxembourg found in this study. To validate this argument it is worth citing Hofstede himself: "At 70 Luxembourg has a high score on uncertainty avoidance which means that as a nation they are quiet reluctant to test unknown territories. Security is a key word in Luxembourg; there is not one activity which is not depending on some sort of security control from authorities; from banker’s money to safety exits in a restaurant. It makes the live in Luxembourg very safe, but some would argue a bit boring. New ideas, new methods, new management techniques must first be proven to work in other countries in order to be accepted in Luxembourg. Historically more “farmers” than “traders” the inhabitants kept that good old “common sense” made of cautiousness which has proven to be profitable for a country who managed not to be at war since the Napoleonic time! (http://geert-hofstede.com/luxemburg.html). Since this is the first time that such efforts are being made to find the relationship between happiness and culture, those results should be taken cautiously.

Not surprisingly, Indulgence was found to be significantly related to Individualism and Masculinity, two concepts that are part of Indulgence definition. The significant relationship between Indulgence and Monumentalism, and the significant negative relationship between Monumentalism and age, may indicate that younger people tend to be more individualistic, monumental and, therefore, happy. This hypothesis could only be corroborated by enlarging the sample size, a fact which would allow conducting more sophisticated statistics than mere correlation.

This research could be used by expat-Managers, HR professionals, recruiters, head-hunters and HR directors in Luxembourg and globally wishing to collaborate with Luxembourg, who would like to consider evolving technologies and their potential use in Luxembourg’s business environment with its cultural identity (Jameson 2007) in international trade (Rauch 2001).

FUTURE RESEARCH

Future studies could focus on strategies and challenges of global human resource management, researched by Ananthram and Chan (2013) concentrating on the challenges they enumerate: degree of standardisation of HR, foreign industrial relations, labour laws, time zones, cross cultural differences and cultural sensitivity, leadership development, communication, expatriates’ adjustments,
inflexibility and work-family balance (Ananthram and Chan 2013), and evolve further into the two branches of the current research: first, focus on the relationship between language and culture and empirically validate it for other languages. Thus, in-country studies comparing the dimensions of culture could be conducted in places such as Switzerland that contains four official languages, in Germany where a minority command Turkish as a mother tongue, or even in China where the people of the south command Mandarin while the people of the north command Cantonese, and yet they all belong to the same Hun group. A second possible avenue for future research could focus on the influence of culture over people’s happiness. Since a new cultural dimension, namely Indulgence, is now available, happiness could be measured at both the national culture level and the individual’s state of mind. Expansion of the current research model and the use of its instruments in a number of other organizations and countries have the potential to strengthen the validity of the current research findings by generalizing them over new populations, and by making them more specific. In any case, be it the study of language and culture or culture and happiness, larger samples would allow for the application of more sophisticated statistical methods, such as regression models, that would allow the exploration of the relative influence of language over culture, and cultural dimensions over happiness. Thus, despite its limitations, the current study has paved the way for major replications and refinements and the substantiation of very important hypotheses that have theoretical as well as practical implications for researchers, managers and others, across the globe.

In this world, where millions of people migrate from one country to another, and where communities become greatly diverse, the ability of the use of countries’ national boundaries as the fault lines that define culture dimensions, to explain and predict management and other societal behaviours, is very limited. Students of culture should make it their habit to measure social units’ cultural dimensions by varying the respondents across languages, and maybe even across dialects, rather than across common national boundaries.

WHY NETWORKS, A SHARED LANGUAGE AND STORYTELLING HELP ORGANISATIONAL ADVANTAGE IN MICROFOUNDERATIONS — INTERNATIONAL ENVIRONMENTS AND STRATEGIC HUMAN RESOURCE MANAGEMENT

Schinzel, Ursula

United Business Institutes, Luxembourg

ABSTRACT

This research, based on Nahapiet and Ghoshal (1998), investigates why networks, a shared language and storytelling help organisational advantage in microfoundations in international environments, especially in Strategic Human Resource Management (SHRM). The first part of this paper is dedicated to an in-depth literature review. In the second part, the research method is explained: survey questionnaires were developed based on Nahapiet and Ghoshal (1998), translated from English to French and German and distributed. The questionnaire consisted of 28 closed questions on a five-point Likert scale and two open questions regarding networks in person or digital networks, producing many direct quotes from the respondents. A total of 253 questionnaires were collected, out of which 246 were usable. One interview was conducted for the purpose of this research, with the objective to validate the results from the questionnaires, but it was not included into this paper. Further research could focus on qualitative research methods, as well as the influence of new media and age. In the third part, the findings of this research are presented: Networks provide access to information, are easily accessible, flexible and efficient, diverse, they are fast, cheap, “Who you know” determines “What you know”, there are obligations, norms, and expectations within a network, and there are issues with trust and confidentiality in networks. Some HR managers have a preference for networks in person compared to digital networks; their respective arguments are presented. A shared language is used as identifier as it defines the in-group and distinguishes from the out-group, is important in social relations, enables people to discuss and exchange information, to ask questions, to conduct business, creates group-specific communication codes, enables the combining of information, the development of new concepts and the creation of new knowledge, and influences our perception. If people do not speak the language, they are kept apart and have restricted or no access to information. Storytelling is used to show and transmit values, norms, and culture, to share knowledge and understanding, it is useful in education and training, it helps to communicate quickly, naturally, clearly; with storytelling one can focus on a vision and plan the future, solve
problems and conflicts, inspire continuous innovation, manage change, and make decisions. It is proposed that networking, in person and in digital form, a shared language as identifier and storytelling are capabilities for shaping the future and success of microfoundations in international environments. Conclusion and discussion, limitations, further research, and references follow.

**Keywords:** Strategic Human Resource Management (SHRM), networks, storytelling, language as identifier, international entrepreneurship, microfoundations

**INTRODUCTION**

This research, based on Nahapiet and Ghoshal (1998), investigates why networks, a shared language and storytelling help organisational advantage in microfoundations in international environments, especially in Strategic Human Resource Management (SHRM). Survey questionnaires, developed by the author based on Nahapiet and Ghoshal (1998) and consisting of 28 closed and 2 open questions were used to determine the extent of influence of success in microfoundations in international environments. 246 usable questionnaires were collected and one interview was conducted, to validate the findings from the questionnaires. However, the interview was not included into this paper. Practical advice is offered to HR managers of how to use these means for organizational advantage in microfoundations in international environments.

The literature review that follows this introduction concentrates first on microfoundations, second on Human Resource Management, globalisation and e-HRM, third on networks, forth on digital social networks, fifth on language as identifier, and finally on storytelling in organisations. The literature review is followed by the methods chapter. The results follow the methods chapter. The findings to the research questions are presented: Why do you think networks, a shared language and storytelling help organisational advantage in microfoundations? The additional research question is: “Do you prefer networks in person to digital networks like Facebook, LinkedIn, and Twitter?” Findings are presented, issues with networks in person and with digital networks are shown, and reasons why respondents would prefer networks in person or digital networks are demonstrated. Conclusion and discussion, research limitations, and future research follow.

**LITERATURE REVIEW**
MICROFOUNDATIONS

Microfoundations have gained in influence in strategic management over the last years. Individuals have a basic influence on strategic management, is the argument. Strategic human resource management is one field of research interests besides economics, psychology, sociology, motivation, cognition, marketing, strategy, entrepreneurship, communication, and others. Foss (2010, p. 12) defines microfoundations as “foundations of something, namely aggregate concepts and/or relations between aggregate variables”, ... it is “an instance of reductionism”, ... “of how individual decision-making influence firm behaviour”. The discussion between “methodological individualism” versus “methodological collectivism” goes “whether individuals (“micro”) or social collects (“macro”) have explanatory primacy”.

The interest in the theory of the firm started nearly 40 years ago now. The theory of firm scholars focusses on the causes of “organisational advantage”, contrary to its failure (Nahapiet and Ghoshal, 1998, p. 242). They include trust, networks, network ties, network configuration, shared narratives and shared language and codes in their research of the organisational advantage. They see the roots of intellectual capital in the social relations and structures - “who knows who” affects “what you know”.

In strategy, Porter (1996) was the pioneer, initiating a loop of decade-long discussion and theory on business structures, procedures and performance, slowing down any positive development (Teece, 2007). Teece says (2007, p. 510) “Fortunately, the existing literature on strategy, innovation, and organization and the new literature on dynamic capabilities have identified a panoply of processes and routines that can be recognized as providing certain microfoundations for dynamic capabilities.” He says that new opportunities are sensed through scanning, creation, learning, and interpretive activity. “Opportunities get detected by the enterprise because of two classes of factors. First, as stressed by Kirzner (1973), entrepreneurs can have differential access to existing information. Second, new information and new knowledge (exogenous or endogenous) can create opportunities, as emphasized by Schumpeter (1934)”.

This chapter [you said “part” before] finishes with the call of Teece et al. (1997, p. 530): “Researchers in the field of strategy need to join forces with researchers in the fields of innovation, manufacturing, and organizational behaviour and business history”. The next chapter is on HRM with a focus on today’s challenges, globalisation, and e-HRM.

HUMAN RESOURCE MANAGEMENT, GLOBALISATION AND E-HRM

HR practices have developed throughout the years (Armstrong, 2009) and with the changing world of work (Scholz and Böhm, 2008). Twenty years ago, HR practices were mostly related to administrative issues such as salary, vacation, absence, work hours, headcount and accounting. In many companies,
the accounting department was part of the HR department. Following this administrative trend a movement that focused on employees’ motivation, recruitment, training, evaluation, talent management and recognition (Kuvaas and Dysvik, 2009).

More recently HRM is driven by communication, international HR, Strategic HRM, global HRM and recruitment in the globalised world, migration and geographical (im)mobility and networking and e-HRM (Stone and Dulebohn, 2013).

Rising staff mobility, including short-term international assignments in multinational companies and transfers, commuters, as well as rotational, contractual and virtual assignments, brings increasing complexity, fragmentation of employees’ careers, the taking on of responsibilities and encountering challenges never thought of previously (Shaffer, 2001, 2012), increasing networking, and e-HRM. e-HRM influences all HR activities and their usage, through cost reduction, decision-making, IT system, and IT security. e-HRM focuses on the relationship between HR strategy, e-HR goals and architectures and positive and negative e-HR outcomes (Martin and Reddington, 2010). e-HRM influences human resource planning, recruitment, selection, performance management, work flow, training, compensation, and performance cost reduction, strategic HRM (Collins and Clark, 2003; Porter, 1996), change in usage, including training, especially e-learning, decision-making, and information systems combined with IT security. The next chapter is on networks with a focus on digital social networks.

**NETWORKS**

Networks provide access to resources (Nahapiet and Ghoshal, 1998, p. 246), networks are an important source and determine information benefits. Networks - “Who you know” determine “What you know”. There are three forms of information benefits: access, timing and referrals. Networks provide efficient screening and distribution of information and knowledge. Networks allow speed in getting the right information. Networks allow people in the network the opportunity to provide, combine, exchange information and also give referrals with the information. Nahapiet and Ghoshal (1998, p. 252) state this reputational endorsement influences the value of the information.

Networks come in different forms, either in person or in digital form. Granovetter (1973) identified the role of the “loose ties” in information exchange in networks. These ties allow the transmission of information. The network structure depends on its density, connectivity, hierarchy, flexibility and ease of information exchange and the accessibility for the network members to the information (Nahapiet and Ghoshal, 1998, p. 252). The lower costs of accessing information through networks, especially through digital networks, are one of the advantages, besides the diversity and efficiency of the network information structure.
DIGITAL SOCIAL NETWORKS

Digital social networks like LinkedIn, Facebook (Kirkpatrick, 2010) and Twitter have revolutionised human resources practices (Cross and Thomas, 2009). Google has changed the way we see our world and our habits (Auletta, 2009), and the internet has modified our brain (Carr, 2010). Some even wish to stop the use of the internet (Zittrain, 2009). Due to the social networking technologies, we have to reconsider how we can live and win in a transformed world (Li and Bernoff, 2008), and how we interact in times of Facebook (Stengel, 2010), where the new digital generation of digital natives grows up, contrary to the generations before them. Tapscott (2009) has identified the reluctance to use new technologies as a result of the generation gap. He describes the “Net-Generation” as learners who are rethinking talent and management, and who are in networks and in families.

Social networks in organisations are viewed as a shared knowledge system backed by management, as standard HRM practices and social network analysis (Boese, 2009), and used especially in recruitment (Jones, 2010).

“The internet is among the few things humans have built they truly don’t understand. The internet is the largest experiment of anarchy in the history” (Schmidt and Cohen, 2013, p. 3). “Think of all the websites visited, ... of every job found, ... consider what the lack of top-down controls allow: the online scams, the bullying campaigns, the hate-group websites and the terrorist chat rooms. Through the power of technology, age-old obstacles to human interaction, like geography, language and limited information, are falling” (Schmidt and Cohen, 2013, p. 3). “Communication technologies will continue to change our institutions from within and without” (Schmidt and Cohen, 2013, p. 11). The benefits of networks are efficiency, flexibility, accessibility, diversity of information, low cost, high speed, “Who you know” determines “What you know”. Issues with digital networks relate to confidentiality, obligations, norms, and expectations within a network, the trustworthiness of the network members and the information provided. The next chapter is on language and especially on language as identifier.

LANGUAGE AS IDENTIFIER

Language is used as identifier. It is used to determine the “in-group” and to distinguish it from the “out-group” (Briley et al., 2005, p. 353). The ability of bi-cultural people of frame switching through language has been researched by Briley et al. (2005) and Hong et al. (2000). Language plays an important role in social relations, in exchange, sharing of context, transfer of information, conception, perception and knowledge creation (Nahapiet and Ghoshal, 1998, p. 253). Nahapiet and Ghoshal (1998, p. 253) suggest a shared language has three ways of influence on exchange: first on social relations, second on perception, and third enhances the combination capabilities. For the first point, a
shared language enables people to “discuss and exchange information, ask questions, and conduct business in society”. In cases where people do not speak the language, they are kept apart and have restricted or no access to this information. This is because first, a shared language is linked to our social relations, it is about “who knows who” – “who knows what” – “who speaks what (language)”. Second, a shared language is important for the development of new concepts, of new knowledge. The shared communication codes are important for the combination and transmitting of information. Third, a shared language influences our ways of perception. Our awareness is influenced by our language.

Benefits of a shared language are “defines the in-group, distinguishes from the out-group”, creates group-specific communication codes, is important in social relations, is used as identifier, enables the development of new concepts and creating new knowledge, enables the combining of information, enables people to discuss and exchange information, to ask questions, to conduct business, influences our perception, and if people do not speak the language, they are kept apart and have restricted or no access to this information. The next chapter is on storytelling, more precisely the use of storytelling in organisations and its benefits.

STORYTELLING IN ORGANISATIONS

Storytelling is used in organisations for many different purposes. These range from communicating a complex idea to solving problems, making decisions, planning for the future, (Denning, 2011) and training (Davidson, 2004). It is also used to state the organisation’s norms, values and the culture, to disseminate knowledge, to manage change and to focus on a vision (Boyce, 1996; Boje, 2008).

Following Denning (2004, p. 44, p 150-153) the objectives of storytelling in organisations are 1) to communicate a complex idea and to spark action, 2) to communicate who you are, 3) to transmit values, 4) to get people working together in a group or community 5) to tame the grapevine or neutralize negative gossip, 6) to share information and knowledge, 7) to lead people into the future.

For Denning (2011) and Clark (2004), storytelling is a tool to achieve business purposes. There are a number of different approaches to developing profiles to help people plan their future work with storytelling. Some approaches examine the high-value forms of organisational storytelling: communicate complex ideas, communicate who you are, transmit values, promote team work, stop rumours, share information and knowledge and lead people into the future (Denning, 2011; Sharp, 2000), to manage conflicts, address issues, resolve conflict and face challenges, and to lead more efficiently (Friedman, 2009). This is how Coca-Cola uses stories to build stronger emotional bonds, for example with the “Happiness Factory”.

The Future of Entrepreneurship

Stories are beneficial for organisations, they are mainly used to inspire success. By telling stories, there is a connection with the audience, storytelling makes the audience involved and excited, which may not have been the case otherwise. It helps the younger generation to learn, to access and to connect with tradition. Stories are beneficial in education and learning (Davidson, 2004). The internet is used to tell stories (Paula Kahumbu, interviewed by David McKenzie. (http://edition.cnn.com/2012/10/01/world/africa/paula-kahumbu-kenya-lions/index.html?eref=edition). Stories tend to stick in the mind longer than abstract ideas alone (Heath and Heath, 2008).

Scholz and Böhm (2008) investigate human resource research in Europe with the objective of avoiding fatal and expensive mistakes. Valid for Europe, this is even truer for the world. Information on the different socio-economic, political and cultural conditions in the world could contribute to better understanding between counterparts. Personality, culture and human nature are the three levels of uniqueness in mental programming. Stories, again, could help prevent misunderstandings between cultures.

METHOD
Survey questionnaires were used to determine the extent to which networks, a shared language and storytelling influence the success of microfoundations in international environments. A standardised questionnaire was developed, based on Nahapet and Ghoshal (1998), consisting of 28 closed questions in form of a five-point Likert scale and 2 open questions, producing many direct quotes from the respondents. The questionnaire consisted of five parts: (1) Assessment of the organisational advantage of networks, (2) of a shared language, (3) of storytelling, (4) two open questions on the preference of ‘networks in person’ to ‘digital networks’, (5) questions on personal data such as job, industry, gender, age, native language, other languages spoken, nationality, birth nationality, residency, origin, and education. The original English version was translated by native speakers into French and German and back-translated into English for validity check. Over the summer of 2013, they were distributed to business people in Luxembourg and Germany and to participants at different academic conferences. This explains the high percentage of doctorates in the sample. One interview was conducted to confirm the validity of the questionnaire’s results, but it was not further evaluated for this research. Future research is necessary to do so.

RESULTS
The results of the questionnaire are shown in the following chapter. A five-point Likert scale was used and average, median, minimum and maximum per question were calculated.
The first question: “Why do you think Networks help organisational advantage?” was answered as follows: the highest average score was for the answer “Provide access to information” with an average of 4.29 out of 5. The second highest score went to the answer “Accessibility, easy access to information, flexibility and efficiency” with an average of 4.01 out of 5. The third highest score was to the answer “High Speed (Timing) to this information” with 3.94 out of 5. “Low cost of access to information” scored with 3.83 out of 5 came in fourth place. “Who you know” determines “What you know” (brings together information from different sources and disciplines)” scored 3.74, “Diversity of information” scored 3.69, “There are obligations, norms, and expectations within a network” scored 3.57, “Trust (trustworthiness of the network members and the information provided)” scored 3.46, and last place took “Confidentiality” with 3.06 out of 5. The median for nearly all questions was 4, although the median score for “Trust” was 3.5 and “Confidentiality” was 3. The current discussion on confidentiality, espionage, listening and recording of all digital information finds its confirmation here. Minimum was 1 and maximum was 5 for all responses.

The second question: “Why do you think a shared language helps organisational advantage?” was answered as follows: The highest average score was for the answer “A shared language is important in social relations” with a score of 4.24 out of 5. The second highest score went to the answer “Enables people to discuss and exchange information, to ask questions, to conduct business” with an average of 4.20 out of 5. The third highest score was to the answer “A shared language is used as identifier” with an average of 3.97 out of 5. “Creates group-specific communication codes” scored 3.90, “Enables the combining of information” scored 3.74, “Enables the development of new concepts and creating new knowledge” scored 3.68, “Influences our perception” scored 3.66. The lowest average score was 3.62 for both “Defines the in-group and distinguishes from the out-group” and “In case people don’t speak the language, they are kept apart and have restricted or no access to information”. The median was 4 for all responses. Minimum was 1 and maximum was 5 for all responses.

The third question: “Why do you think Storytelling helps organisational advantage?” was answered as follows: The highest average score was for the answer “Show and transmit values, norms, and culture”, with an average of 4.07 out of 5. The second highest score went to the answer “Share knowledge and understanding” with an average of 3.99 out of 5. The third highest score was “Useful in education and training” with an average of 3.84 out of 5. “Communicate quickly, naturally, clearly” scored 3.72, “Focus on a vision” scored 3.59, “Solve problems and conflicts” scored 3.47, “Inspire continuous innovation” scored 3.45, “Manage change” scored 3.37, “Focus and plan the future” scored 3.31. The lowest score was for the answer “Make decisions” with an average of 3.17 out of 5. The median was 4 for most responses, with a 3 for “manage change”, “focus and plan the future” and “make decisions”. Minimum was 1 and maximum was 5 for all responses.
The two open questions produced many direct quotes from the respondents. Here is what respondents said: The question: “Do you prefer Networks in person to Digital Networks like Facebook, LinkedIn, and Twitter?” was answered as follows:

201 prefer networks in person, 57 respondents prefer digital networks, 12 say both are important. Respondents who say both networks are important, have no preference, as both have advantages and disadvantages. Here is what some of the respondents said:

“I use both – they both have their advantages and disadvantages, preferring the personal contact that allows me to use also “other channels” than the digital way.”

“I believe that it may be important to distinguish between a) being introduced to the network or creating a network and b) the consequent network contact. If a) then I would prefer networks in person since I get a better sense of other people by seeing them in person and talking to them face-to-face. But if it is an ongoing network with people who I already “know” then it really doesn’t matter”.

“I prefer to better know the people in my network – by meeting them I can assess their knowledge, motives, trustworthiness and the quality of the information we can exchange. Digital networks have the potential to be less trustworthy and potentially less useful. The best solution is combination of networks that provides opportunities for face-to-face contacts and digital network contacts.”

Respondents who prefer “networks in person” argue: Networks in person are based on a personal relationship, the relationship is real, not artificial, eye contact is important, high confidentiality, people contact, private contact, personal contact, I am close to the person, to the other people, there are confidentiality issues with digital networks, trustworthiness of the information, lower risk of distribution of negative rumours, security, trust, better communication, better understanding, better interaction, it is our habit, my expectations are met, confidential information is kept among few insiders, to talk is always better to avoid misunderstanding, face-to-face is better, because you can see the behaviour of the person, The body language is important. There is no body language in digital networks, Greater honesty and more substantial conversation than in digital networks, I can see the emotions of my contact. You cannot see emotions in digital networks, besides emoticons 😊 ☹️, exchange of emotions, of trust, spending time together, team building activities, reliability of the source of information. Here what some respondents say:

“The private, personal contact with people facilitates the building and the maintenance of
“Networks such as Facebook, LinkedIn and Twitter are extremely easy to join and therefore get logged up with people joining in on a whim or “just in case”. Personal networks require more personal investment and therefore are entered into more selectively and with more thought as to their relevance and benefits.”

“Digital networks cannot replace personal contact.”

Issues with networks in person are: there are obligations with networks, there are expectations in networks, and networks are time consuming.

Reasons why respondents would prefer “digital networks” are: Easy accessibility of information, low cost, diversity of information, speed of access and publication, flexibility, efficiency, and digital networks are an easy way to have access to private lives.

One respondent says:

“I do not network a lot but, I prefer digital networks if I need to find a piece of information since it provides the access. It is low cost, fast, and diverse and in most circumstances it does not hold any obligations.”

Issues with digital networks are: Confidentiality issues, misuse of trust, false expectations, digital networks are not my world, I am not member of Facebook, Twitter, etc., digital networks are lacking personal contact and therefore are less efficient, superficiality, there are pictures put on Facebook without the permission of the person in the picture, while digital networks are growing, personal contact is lost among people, digital networks are too time consuming, the quality of the information is not always given. Respondents say:

“Networking is convenient but sometimes causes troubles, especially when we connect with someone who we don’t know well.”

“I want nothing more than to be kept in peace. I keep contact with people with whom I want contact. That’s all.”

“Do you really know who you are networking with?”

“I am old! So, I am not used to digital networks, which also seem less rich in context.”
Is the preference for networks in person or digital networks a question of age? Will the younger generation be more reliant on digital networks? Or will the current trend of digitalisation be reversed due to abuse, espionage, and cyber-criminality? Will the future show us where the world will go?

More and more digital contacts, faster, free of charge, always available, and everywhere accessible, is this the future? Or will we prefer deep private contacts without superficiality, but with trust, with honesty, with real friendships – far away from +500 Facebook friends – real experiences, events, parties, and relationships? Is the choice to be made between real life and digital life? Is it a matter of age or culture, or gender or education or job category, or nationality and languages spoken? Further research will be necessary to find an answer to these questions, as well as to the following questions: Have we reached the limitations of the digital world? Are we approaching the limits of the e-era, of e-recruiting, e-HRM, e-banking, and e-relationships?

CONCLUSION AND DISCUSSION

The findings of this research are: networks, a shared language and storytelling help the organisational advantage in microfoundations in international environments. Networks are strong among HR managers, with a preference to networks in person compared to digital networks. Networks are a big help to the organisational advantage in microfoundations because, first, they provide access to information, second they provide this information easily, in a flexible manner, and efficiently, and third, they are fast. The cost for this information is low, because of the network. Advantages of networks in person are trustworthiness, confidentiality, reliability, security, good communication, personal contact, body language, eye contact, exchange of emotions, spending time together, building teams, and honesty. Issues with networks in person are that there are obligations, expectations, and it is time consuming.

Advantages of digital networks are the ease of access to information, low cost, speed of access, flexibility, efficiency, and diversity of information.

Issues with digital networks are confidentiality, trust, the lack of personal contact and the perceived lack of information quality, and increased time devoted to using them.

Globalisation, the internet, knowledge management help the organisational advantage in microfoundations in international environments.

A shared language is important in social relations. It enables people to discuss and exchange information, to ask questions and to conduct businesses. Language is used as an identifier. It also creates group-specific communication codes and influences our perception, enables us to combine information, to develop new concepts and create new knowledge. If you do not speak the language,
you are not the “in-group”, but the “out-group”, you are kept apart and have restricted access to information. This is how a shared language helps organisational advantage in microfoundations.

**Storytelling** is a powerful means of SHRM. Storytelling enables the distribution and transmission of values, norms and culture. It is used to share knowledge and understanding and is useful in education and training. Storytelling allows people to communicate, inspires innovation, helps to solve problems and conflicts, to focus and plan the future, to focus on a vision and to take decisions.

It is proposed that networking, in person and in digital form, a shared language as identifier and storytelling are capabilities for shaping the future and success of microfoundations in international environments.

**LIMITATIONS**

The comparatively small sample size is a factor that threatens the generalisation of the findings, as well as the weak theoretical connection between SHRM, the use of networks, a shared language, and storytelling.

**FURTHER RESEARCH**

The main objective of this research was to investigate why networks, language and storytelling help organisational advantage in microfoundations. Survey questionnaires were used to determine the extent to which networks, language, and storytelling influence the success of microfoundations. Further research could focus on qualitative research methods, using more interviews, as well as the influence of new media and age. Interviewing could be of advantage to this research. Indeed, one interview was conducted for the purpose of this research, which validated the findings from the questionnaires. But, it was not included into this paper.

Further research could be made in the domain of new media, comparing digital networks to networks in person, raising the question of the influence of the age of the person on this preference. Furthermore, the limitations of e-HRM, of e-recruiting, e-learning could be the centre of interest in future research.

Another path of further research could be the possible negative outcomes of storytelling.

THE ROLE OF NETWORKS IN INTERNATIONALIZATION OF BORN GLOBAL INFORMATION TECHNOLOGY FIRMS: THE CASE OF SMES IN LITHUANIA

Sekliuckiene, Jurgita

Department of Strategic Management, School of Economics and Business, Kaunas University of Technology, Kaunas, Lithuania

ABSTRACT

This study explores the phenomenon of the born global firms and network as a core activity in internationalization process, especially for entrepreneurial SMEs from small countries. Study aims at filling the gap by providing a comprehensive empirical analysis on this issue in small Central and Eastern European country Lithuania. Despite limited resources that usually characterize new entrepreneurial developments, born global companies achieve substantial international sales in early stage and rapid internationalization, they are niche oriented and usually create innovations. Understanding the internal and external reasons which stimulate born global companies to be involved in international market and network role in the internationalization process were main research questions. Lithuanian SMEs information technology companies were investigated. In the article the internationalization motives are provided which influence the growth of Lithuanian born global information technology firms in terms of network and entrepreneurial quality. Finally, the research contributes to the phenomenon of born global firms and may be useful to SMEs reaching for a more successful penetration to foreign markets.

Keywords: born global, networks, international entrepreneurship, information technology industry, Lithuania.

INTRODUCTION

Because of the growth of international business integration and globalization, internationalization of services companies became as a necessity trying to remain and develop their business despite the size of firm, managed resources, and type of the activity. Also, internationalization process is becoming an important strategic element in reaching for sustainable growth of the firm. Relevancy of theory and practice are grounded on the possibility to explore preconditions of internationalization that enables susceptible to knowledge information technology firms. Those born global firms usually distinguish for entrepreneurial performance, ability to act internationally, and the influence of networks to them. In
addition, born global firms achieve good results by acting in networks. The research problem was analyzed by such scholars as Onkelinx and Sleuwaegen (2010), Johanson and Vahlne (2003) and others, who were exploring internationalization of MNEs. Internationalization stages were investigated by such scholars as Vasilchenko and Morrish (2011), Gonzalez and Sieglinde (2012). Sheppard and McNaughton (2011) as well as Kontinen and Ojala (2012) are the researchers who were exploring factors that determine a rapid internationalization process of born global firms, models, and barriers. The biggest number of researches was done in the concept formation of born global firms; however, the information of the activity of this phenomenon, particularly the network among born global firms is missing. Over the last few years an increase of researchers and practicians' interest in network influence to the internationalization of born global companies is noticed. The researches were done by Andersson and Wictor (2003), Autio et al. (2000), and Zhou et al. (2007). The researches are focused on entrepreneurial characteristics of born global firms from Scandinavian countries, Ireland, Israel, and USA. The research based on entrepreneurship on network processes was analyzed by Slotte-Kock and Coviello (2010). However the internationalization of born global Lithuanian firms and the role of network is quite a new subject requiring deeper analyses. The research problem is supposed by fast changes, which determine that internationalization strategies of born global firms from emerging markets, as Lithuania is one of the emerging countries in Central and Eastern Europe. Therefore, network among born global firms, motives and barriers that condition decision making, and a search for new successful internationalization path are one of the most relevant scientific fields. The research problem may be revealed by following questions: what are internal and external factors that stimulate the penetration of Lithuanian information technology firms to international markets? what are the external linkages of born global companies acting in networks? Aim of the article - to explore involvement of Lithuanian born global information technology firm in networks and what the role of networks is. Due to the limited research in Lithuania on the topic, the systematic and comparative literature analysis and empirical approach to tackling this issue by applying a qualitative research of information technology companies were employed.

LITERATURE REVIEW

Although internationalization is an essential factor for the growth potential of born global companies, it is quite difficult process and requires a lot of companies’ resources. Limitation of resources and experience as well as the possible risk to organization are the key factors disturbing the internationalization of SMEs. Inspite of this, the number of born global within SMEs is constantly
increasing, these firms are successful in penetration to international markets, and their main characteristic is a rapid internationalization to foreign markets. Scientific literature provides a variety of firms which started their activities in international markets from the very beginning after the establishment, and these were called High Technology Start-Ups, International New Ventures, International Entrepreneurs. However, it is noticed that most of the scholars analyzing the performance of these companies describes them as Born Global firms (Knight and Cavusgil, 2004; Rialp et al., 2005; Gabrielsson et. al., 2008; and others). According to Hagen et al. (2012), the increasing number of dynamic firms is noticed, which penetrate to international markets after a short period of their establishment, entering many foreign countries and lay under obligation to those countries. Such firms export their production up to 25% to the foreign markets (Andersson ir Victor, 2004). As Luostarinen and Gabrielsson (2006) state, at the beginning of their activities, born global firms sell up to 50% of their production outside their countries. In comparison with traditional firms, born global companies are more specialised and niche oriented with unique, innovative products that are either more custom made or more standardised (Dib et al., 2010; Freeman et. al., 2012). They target a narrow customer segment, which might be geographically distributed (Aspelund and Moen, 2010). Born global firms see themselves as owning or possessing a source of competitive advantage in foreign markets by way of their expertise, unique product features, better technical service, knowledge competences or a combination thereof (Evangelista, 2005; Kudima et al. 2008). Born global companies usually work very entrepreneurial. International entrepreneurship of these companies associated with international oriented and experience, proactive, risk-taking behavior that crosses national border, level of technical and know-how knowledge (Dib et. al., 2010; Hartsfield et. al., 2008). The firm’s entrepreneurial orientation contributes to its ability to create processes, practices, and decision making activities that are linked with successful entrance to foreign markets (Knight and Cavusgil, 2004; Roudini and Osman, 2012). The managers of firms that follow an international entrepreneurial orientation stress the importance of having a proactive and innovative approach to operating in international markets. This orientation in foreign environments supports a firm’s awareness of key strategic initiatives that enable international success (Knight and Cavusgil, 2004).

According to Knight, Cavusgil (2009), and Halldin (2012), the origination of born global enterprises was stimulated by following aspects: 1) Advancement of technologies in production and transportation systems. 2) The enforcement to specialise in order to sustain competitiveness of the firm; it determined the emergence of many niche oriented markets. In order to function in niche oriented markets, firms had to increase the number of their customers by moving to global markets. 3) Advancement of information technology. 4) The advantages of small firms: better reaction, flexibility, adaptability. 5) Globalization based on knowledge, which eliminated many international trade barriers. 6) Trends in
the world networks, which formed because of advancement of information technology. In addition, for the use of social networks, born global firms are able to master global market information and effectively apply it to the business expansion. (Oviatt ir McDougall, 1995; Freeman ir Cavusgil, 2007; Hartsfiel et al., 2008; Schulz et al., 2009).

In the perspective of network theories, internationalization is associated with a creation of new networks and grounded on theories of dependancy of social exchanges and resources based view (Johanson and Vahlne, 2003). Relationships among participants in network appear because of the aim to exchange valuable resources, and this interface continues until it is beneficial for both of the parties. When the network is already established, enterprises share among them all the works what means a dependancy on each other (Sasi and Arenius, 2008). Gilchrist (2009) states that network is a movement and share of ideas, information, knowledge, practise and experience, and exchanges among members aiming at common interest of creating added value in a particular field. According to a provided definition, three key network elements may be exhibited: a common aim of the participants, collective relations, and operations in the network. The network of born global companies comprises of collective relations among firms and external members (clients, suppliers, business agents, competitors, universities, and other players), who could have an ability to propose something in exchange of something to other members of the network (Hite and Hesterly, 2001; Zhou et al., 2007). Born global company may mobilize resources through external relationships to pursue its goals (Johansson, 2005).

Entrepreneurial enterprises situated in a network of existing and to be formed relations with important upstream (e.g. suppliers, parent company), downstream (e.g. distributors, customers) and horizontal actors (e.g. competitors, alliances, universities, ). These relations derive characteristics from the resource requirements of the company and as such also influence the growth of the firm in two important respects. Firstly by way of influencing the identification of opportunities, and secondly by influencing how the opportunities are acted upon and realized (Johansson, 2005).

Network theory stresses that networks help the firm overcome any resource constraints that they encounter; also provides better access to resources and international opportunities, and international network relationships reduce risk while entering foreign markets. Network is essential for a born global firm in overcoming any resource constraints that it encounters (Kocak and Abimbola, 2009). In the initial stages, born global firms leverage their networks to generate organizational skills and competencies, including technological capabilities (Cavusgil and Knight, 2009). Network relationships also generate the social capital that provides a better access to resources and international opportunities and the means by which to overcome the liabilities of newness and foreignness (Kocak and Abimbola, 2009). Therefore, after internationalization is well underway, managerial focus shifts to developing human resources to support further growth. Subsequently, the firm turns its emphasis to building its
client and distribution base. For born global firms networks are critical for generating social capital and provide for the acquisition, mobilization, and development of the needed resources (Cavusgil and Knight, 2009).

BRIEF OVERVIEW OF LITHUANIAN INFORMATION TECHNOLOGY INDUSTRY

Lithuanian IT services firms distinguish for their orientation to export markets. Several years ago Lithuanian firms were competing in foreign markets mainly for low labor costs. In the last years Lithuanian IT companies have been participating in the international exhibitions, have been creating clusters and high added valued products that are successful over the world. The results were increase of export volumes, emergence of new clients and increase of foreign investments to Lithuanian IT sector (Ivanovas, 2013). In 2012 the main export markets of Lithuanian companies provided IT services were Denmark (23,7 % of the total sector export; the value was 15 million Litas, 1 EUR=3.456 Litas), Singapore (respectively 16,6 % and 10 million Litas), USA (respectively 11,8 % and 7 million Litas), Finland (respectively 8,3% and 5 million Litas), and Germany (respectively 8,1 % and 5 million Litas) (Dovydénas et al., 2012). Moreover, exports of computer and information services continued their steady growth in Lithuania. The export of IT services reached 114,2 percent in the period of 2010-2012, and exports took about 2.5% of overall country’s exports in 2011 (Enterprise Lithuania, 2011). In addition, there is forecasted a fast export growth of IT services. Such a rapid growth of IT services export was mostly influenced by direct foreign investments to IT services sector. Finally, qualification of Lithuanian IT firms meets all the set requirements. That is shown by such companies as DeutchBank, which was provided of software by Alna Software, Nokia, which became a partner with a creator and producer of telecommunication products Teltonika, and Bentley Sytems, which works with Lithuanian programmers for twelve years (Penkios svarbiausios Lietuvos IT sektoriaus raidos tendencijos, 2013).

METHODOLOGY

The empirical research aim was to explore factors affecting companies’ internationalization and companies international entrepreneurship; the importance of partnership and network in born global companies activities. Based on relevant management literature described earlier, the investigation dimensions were identified: stimulation of the origination of born global enterprises and internationalization motives and assessment of the the role of network as the core activity in value creation. The following specific objectives (SO) have been formed:
SO1: to identify the motives that have impact on involvement of the born global firms in international activities and international entrepreneurship. Such exploratory variables were explored: external and internal factors, affecting the beginning of international activities.

SO2: to assess the external relations and the role of network in born global companies activities. The research criteria were investigated: profile of main partners and the external linkages between horizontal, upstream and downstream actors, sustainability of collaborations, partner finding methods, scale and scope of the networks, benefits of being involved in networks and barriers to networking.

On the ground of Lithuanian Statistics Department (2013) 2185 firms belonged to Lithuanian IT sector in 2012. Small and medium sized enterprises were the predominant ones in IT sector and comprise around 84% of all IT firms. IT enterprises are united by Infobalt Lithuania association, which is a locally and internationally recognized representative of Lithuanian ICT industry. Infobalt Lithuania cooperates with the state institutions of Lithuania and other partners. Association is a member of Digital Europe and World Information Technology and Services Alliance (WITSA), international ICT industry organizations. Based on the data of the association, around 150 Lithuanian IT enterprises are exporting on a regular basis. Other firms are limited to the local market or export their production to foreign markets occasionally.

The research sample was 28 companies (E1, E2, E3, ..., E28) that were selected from Infobalt Lithuania database, accepted to be surveyed by using an interview. Such criteria for choosing the respondents for qualitative research have been selected: 1) the company should be involved in international activities; 2) income derived from foreign markets includes more than 25 %. The semi-structured questionnaire has been developed and content analysis has been made. Selected companies agreed to participate in an hour-long semi-structured interview. The approach allowed the researcher to ask supplementary questions. The organisations chosen for the collection of qualitative information through semi-structured interviews are listed in Table 1.

The sample is not representative for the population, but it is significant if compared to IT companies that started their international activities in the first three years from their establishment. Some of interviewed companies were not actively involved in other international networks and it is another limitation to research.
**Enterprises** | **Number of employees in Lithuanian SMEs company / number of employees in foreign subsidiaries** | **Year of establishment** | **The beginning of international activities** | **Sales in foreign markets, approx. (%)**

*Size of the company estimated by number of employees, when micro sized enterprise has 1-9 employees, small sized has 10-49 employees, medium sized has 50-249 employees, large sized more than 250 employees (Law on Small and Medium Business Development, 2010).

Table 1. *Sample characteristics: Lithuanian information technology born globals*

Characteristic data of the surveyed companies revealed that the majority of the companies are micro sized: 11 companies involved in the research have up to 10 employees, 8 companies small sized, and have from 14 to 50 employees, other surveyed medium sized companies have up to 80 employees, and only one company has 210 workers. The survey was carried out in April – May 2013.

**RESULTS**

SO1: to identify the motives and factors, that have impact on involvement of the born global firms in international activities. Managers of the SMEs companies that took part in the research have pointed
out that they work in the markets of European countries, USA, Asia, and Africa. Information technology services are mainly exported to USA, Latvian, and German markets. These markets are attractive for Lithuanian IT companies due to diversification of the business risk, protection from national currency depreciation, opportunities of involvement in international networks by offering an innovative product which is being created by the cluster of Lithuanian IT firms.

Main motives which push born global companies to act quickly in international markets are risk distribution and small Lithuanian market, in which companies do not have a possibility to expand their business and to find a segment of the market for provided services: “In Lithuania there was no market which can be oriented for service”, “<…> the Lithuanian market is too small for us”, “<…> in Lithuania we did not find our market segment”. The aim to foothold in foreign markets for Lithuanian IT sector companies is not so important, and the least important thing – competitors operating in the local market.

The external factors compared with internal ones do not have a significant impact on the international start-up activity and entrepreneurship of Lithuanian born global IT companies. The worst impact on firms has information technology spread, which may be considered to contribute to accelerating firm’s presence in the foreign markets, their ability to compete with much larger companies. Partnership also affects company’s internationalization. It can be seen that networking and cooperation with partners for Lithuanian born global IT sector companies provides valuable knowledge and makes it easy to start-up internationally, predisposes joint-ventures start-up. Partially, the beginning of the international activities of the enterprise is driven by increasing competition in the international market. The managers of companies mentioned that accelerating development of information technologies leads to greater support of non-financial public institutions, and as a result companies are learning on their own more often. An accelerating pace of information technologies predisposes born global IT sector companies to connect to networks.

Lithuanian IT sector companies collect information about the customers, competitors and service sales systematically. Only few companies in foreign markets perform market research in foreign countries due to the high costs. Company’s decision making are mostly influenced by the international environment. Cooperation with partners and network as well as local market influence strategic decisions only partially. The biggest part of Lithuanian IT sector companies entered international market rapidly and immediately. These companies have entrepreneurial characteristics: the ability to respond rapidly to changing customer needs and environmental factors, ability to take risky decisions, interest in future forecasts. Results of the study shows that in several companies the income from international markets is almost 100%, and these companies are solely oriented to foreign markets.

SO2: to assess the external relations and the role of network in born global companies activities. Research results revealed that born global IT companies collaborate with various national and
international organizations. Most of the companies (25 out of 28) stated that they collaborate with foreign market (where their firms operate) companies: “Our main partners are foreign companies. And we have lots of benefits from the cooperation with them”. However many Lithuanian born global companies cooperate with Lithuanian firms (17 out of 28) operating in Lithuania. Managers of surveyed company noted that “cooperation with Lithuanian organizations helps to compete abroad and we are cooperating with Lithuanian Business Support Agency, Enterprise Lithuania”, “<...> when a task-specific knowledge is needed, then we appeal to Lithuanian companies with necessary expertise for that”. Representatives of IT companies have stated that companies are cooperating with customers (13 out of 28) when providing service (“Our customers are our partners, since cooperation with them improves our quality of services provided”, “<...> clients help us to figure out pros and cons of the services provided in the most efficient way”, “<...> in collaboration with clients we create new products”). Horizontal cooperation with educational institutions and universities (12 out of 28) is useful, because “collaboration with universities brings us considerable benefit. Cooperating with educational institutions we organize surveys, idea development workshops”, “<...> we are taking various projects in collaboration with universities, and it brings benefits to both the company, students and university. One of our main partners is Kaunas University of Technology with an innovative platform, start-up space and variety of technological solutions and services”.

The most popular partner finding method of SMEs companies is Internet (16 out of 28) and the recommendations of friends and acquaintances (16 out of 28). The surveyed managers of IT companies noted, that “first of all, we are looking for partners we could collaborate with; then, we are searching for contacts of those firms on Internet, and finally, we are trying to make acquaintance of them”, “<...> when I want to collaborate with someone, I ask my colleagues and friends for recommendations or necessary contacts, and only then I begin to search for it through other channels”. The active search is performed in Lithuanian institutions, which provide business support and affiliate search engines. Enterprise Lithuania is one of the main founding partners of Startup Lithuania movement which promotes the development of new entrepreneurial companies and their business acceleration (www.startuplithuania.lt/) by involving them in specialized events, supporting in finding investors, providing trainings and consultations. For the SMEs companies investment may be the gate opener to the international markets because trade channels can be formed through the new partner network and using their experience, specific knowledge of the market. The managers mentioned that “in the partner search database the provided information allows to select the firms easier and faster to whom might be able to cooperate”, “<...> the best way for us to find foreign partners we might collaborate with is through the partner search database provided by Association of Lithuanian Chambers of Commerce, Enterprise Lithuania, Startup Lithuania”.

The Future of Entrepreneurship

A part of Lithuanian born global IT sector companies is looking for partners in international exhibitions, fairs and conferences. The analysis of the study showed that majority of the surveyed companies participate in the association Infobalt Lithuania activities, however in other international networks participate only 15 out of 28 surveyed subjects. 3-7 companies are usually running in the network. The few companies are involved in network with 14-15 firms: upstream actors (suppliers), downstream actors (distributors, customers) and horizontal actors (competitors). Companies adapt and align their networks to gain the resources they need to ensure successful emergence and growth. Partnership with strong foreign companies is substantial. Strong partner which actively participate in an international network provides the access to necessary resources, skills and competencies. Such activities which are being developed between network partners were identified: knowledge sharing (26 out of 28), experience (21 out of 28), creation and production of innovative products (14 out of 28), consolidation in the foreign markets (13 out of 28), research and development activities (7 out of 28), costs sharing (2 out of 28). The managers mentioned: „While collaborating, not only we transfer our knowledge to partners, but also we get a lot of information from them which is useful for our activity“, „We often arrange meetings where we are able to share our knowledge with partners because that is a way to improve firm performance“, „In order to avoid mistakes that were done by us or by our partners, it is important to share the experience“.

Acting in the network with other companies, Lithuanian IT sector companies gain a competitive advantage on the local and foreign markets. The effect of network promotes and stimulates innovation, which is very important in order to maintain a competitive advantage in the local and foreign markets: “In cooperation with business firms we gain experience which is applied in reality. Our position in the foreign markets is consolidated by the network“, „<…> acting in networks let us to get useful information from professionals of different fields as well as to share our ideas with them“. The interviewed managers have agreed that cultural attitudes are main barriers that influence the development of international networks and social capital. Communication disturbance because of unclear information or information abundance have been named as main barriers by most respondents („<…> information abundance may result in reduction of relationships with partners; although the information may be of a high importance, because of the large amount of information it is not always read on time“, „<…> at the early stage of cooperation it is usually difficult to understand partners as the manner of communication is different as well as the ways of exchanging information“). At the begining of international business activities many firms confront with language barrier described as follows: „As soon as we began to collaborate with foreign partners, we faced a language barrier as it was quite difficult to understand the accent of employees“, „<…> at the early beginning, employees were not good at spoken English and it was not
so easy to communicate with partners face to face”. Finally, the collaboration is not enhanced because of unobtainable tasks and results that are planned with partners, and steady adjustments to the partners.

CONCLUSION
The data of the empirical research revealed, that internationalization of Lithuanian born global information technology firms is determined by external (IT development, partnership, and network) and internal factors (manager’s knowledge and skills, firm’s innovation, unique services) which become catalyst for motives to emerge. The accelerator of internationalization becomes the effect of network and partnership support between born global companies and their partners. In some cases the partner is university. University’s innovation centres or start – up spaces works like platforms for new entrepreneurial firms, providing them with support, knowledge and infrastructure. The part of the surveyed companies usually has the network of 14-15 national and international business firms, upstream, downstream and horizontal actors. It is important to have a strong partner which could access to new partners in networks and provided necessary resources for the development of new products seeking the growth and the development of Lithuanian born global company. The company’s position in international markets is strengthened by network with different institutions, international associations. It also enhances cooperation between enterprises, development and implementation of new projects, customer search; provides an opportunity to share knowledge and experiences, and to learn from the partners. However, the part of the surveyed Lithuanian information technology firms is not involved in the international networks. There are several possible explanations for that. Firstly, Lithuanian government and universities started to actively promote entrepreneurial star-up activities only few years ago. During the last two years there were lots of start-up events, conferences, workshops, IT business missions which were very successful. These events encourage young entrepreneurs quickly start international activities. The multinational players entering the market like Barclays, Western Union, and IBM impacted on the costs of human resources, and competitiveness of Lithuanian SMEs. Nevertheless, this reason might be as an accelerator in the nearest future. Highly qualified employees with work and network experience in multinationals might start to run their own SMEs business. This finding suggests a necessity of further research on international entrepreneurial orientation in information technology industry and network development of Lithuanian born global issues. The further research could be enriched with comparison between different types of businesses: micro, small and medium sized enterprises.

STRATEGIC ORIENTATIONS AND TYPOLOGY OF AGRICULTURAL COOPERATIVES AND PRIVATE FOOD FIRMS IN GREECE

ABSTRACT

Agricultural Cooperatives maintain an important position in food supply chain. However, their role, nowadays, in Greece has languished for several reasons. One of them is the lack of strategy. This problem is connected with the difficulty of applying appropriate competitive methods. The situation becomes even more difficult for cooperatives if we consider that they have to compete with dynamic private food businesses. This paper attempts to identify differences in the strategic orientation of agricultural cooperatives and private food firms established in the Northern part of Greece. Thirty five private food firms and 29 agricultural cooperatives were participated in the current study. Data were collected by means of a questionnaire aimed to evaluate 21 methods of strategic orientation on a seven point Likert type scale. Principal Component Analysis was performed to identify strategic orientations. The empirical findings support that these organizations adopt seven strategic orientations (Axis1: Strategic orientation of marketing focus, Axis2: Product Customization, Axis3: New Products, Axis4: Expansion and Efficiency, Axis5: External funding and pricing, Axis6: Product quality focus, and Axis7: Resources and Production). However, cooperatives differ significantly from private firms in two of them capturing elements of marketing focus and new products. As such, the former remain traditional and cost-oriented without innovative elements while the latter invest in differentiation and focus strategy, trying to become more innovation driven. Based on the particular findings, practitioners and policy-makers advance their knowledge on how organizations within the food sector of a European country, namely Greece, establish their basis of competitive advantage.

Keywords: competition, generic strategies, agricultural cooperatives, food firms
INTRODUCTION

Strategic orientation is the competitive actions or the overall orientation that a firm adopts in the market in order to become more competitive (Zheng, Yang and McLean, 2010). It is an extremely important weapon for firm policy and operational decisions as it describes the direction that a firm should follow in order to achieve its goals as well as the potential alternatives to change its performance (Philipsen, et al., 2013). Cooperative firms are no exceptions to this principle. Their performance cannot be adequately measured unless evaluated in the context of strategy options and the strategies actually pursued by them (Kalogeras et al., 2005).

Porter’s typology (emerged in 1980) seems to be the most popular paradigm in the literature on business strategy. According to his original model of distinctive generic business-level strategies, there are four different strategies (differentiation, low cost, low cost focus, and differentiation focus strategy) which determine how a firm develops an advantage with respect to competitors in the same industry or in similar market environments along with the relative merits in terms of performance outcomes. Although Porter did not coin the terms cost leadership and differentiation, he first discussed the importance of choosing and focusing on one of the alternatives (Dess and Davis, 1984).

In Greece, the majority of the agricultural cooperatives prefer competitive methods based purely on competitive pricing “make the product and sell it” than the differentiation strategy “choose the value, provide the value and communicate the value” (Kalogeras et al., 2005). However, this strategy is no longer considered the best practice for the Greek food sector which should focus on the optimization of the product added value in order to produce legitimate economic benefits for cooperative members (Baourakis et al., 2002).

Based on the above, the current study examines the competitive methods that follow 35 private food firms and 29 agricultural cooperatives in Northern Greece. The objectives of the study are: 1) to uncover the dimensions of the strategic orientations adopted by the sampled organizations, 2) to compare the private food firms and agricultural cooperatives relative to the parts and the dimensions of their strategic orientations, and c) to develop two typologies (one for private food firms and one for agricultural cooperatives) concerning the dimensions of their strategic orientations. This empirical study contributes to the research on generic strategies in several respects. First, it enhances the empirical evidence on competitive methods and generic strategies within Europe. The use of data from a European country, namely Greece, constitutes a contrasting example that projects a view beyond the US context, which dominates the literature (Salavou and Sergaki, 2013). Second, this study underlines differences in the competitive methods of agricultural cooperatives (29) and private food firms (35) established in the Northern part of Greece and provide vital evidence at the national level (the food sector is of great importance for the Greek economy).
RESEARCH FRAMEWORK

According to Porter (1996, p. 68), “Strategy is the creation of a unique and valuable position, involving a different set of activities”. The meaning of strategic positioning is to choose those activities that yield superior profitability because there are different from rivals’ and consequently they create a sustainable competitive advantage (Minarik, 2007). Porter proposes three different approaches to strengthening competitive advantages: Overall cost leadership, differentiation, and focus. The first emphasizes on low cost relative to competitors. The second strategy requires that the firm creates something unique which permits the firm to command higher than average prices. The third strategy requires that a firm concentrates on a specific group of customers, geographic markets, or product line segments (Dess and Davis, 1984). All three strategies have important benefits for the firm.

Strategic orientations within an industry are represented by the views of the manager of the firm about the competitive methods that the firm uses. Porter (1980) recognizes that the strategies that companies use to compete in an industry can differ in a wide variety of ways, and he proposes a number of “strategic dimensions” that should capture the possible differences among the strategic orientation of companies in a given industry. These dimensions are comprised of competitive methods that include brand identification, channel selection, technological leadership, cost positioning, service and leverage, among others.

Dess and Davis (1984) developed a questionnaire with a 21 competitive dimension instrument in order to measure a firm’s strategic position in the context of Porter’s classification of topology and demonstrate the viability and usefulness of categorizing firms within an industry into strategic groups on the basis of their intended strategies. The study concluded that the three main strategy types were present and consistent with Porter’s contention that commitment to at least one of the three generic strategies will result in higher performance than if the firm becomes stuck in the middle. Furthermore, they found that the low cost cluster had the highest average return on total assets. The significance of the above mentioned study lies in both developing an instrument which could be used to depict a firm’s strategic orientation as well as in the establishment of the usefulness of the Porter typology in describing business level strategy.

Gilinsky et al. (2001) examined whether different strategies are associated with different firm sizes. The empirical results demonstrated that small firms focus on a well-defined customer group and serve local markets. Larger firms focus on responding to customer needs and new product, as well as in innovation.

Marques et al (2000) adopted the same 21-item competitive methods questionnaire of Dess and Davis (1984) and applied it in 12 Portuguese crystal industry firms. They discovered that the two groups of
firms with positive returns on equity pursued a cost leadership strategy based on efficiency of production and cost leadership strategy based on production innovation.

In Greece the evidence is limited. Only few empirical studies (Salavou et al., 2013; Papadopoulou et al., 2012) in the food sector examine the generic strategies that agricultural cooperatives and private food firms adopt in relation with their performance level. More specifically, Salavou et al. (2013) concluded that Greek agricultural cooperatives show greater proclivity for the low-cost focus strategy. The successful implementation of this strategy requires particular consideration to the organizational structure, management control and compensation policy of the cooperative. On the contrary, the private food firms emphasize on differentiation-based strategies. Finally, the choice of the appropriate generic strategy (pure or hybrid) is of vital importance for their economic viability. Papadopoulou et al. (2012) concluded that Greek agricultural cooperatives are mainly focused on specific geographic areas with low cost products (low-cost focus strategy). This attitude is in line with their preference to be followers (i.e., imitate competitors) rather than pioneers (i.e. innovate).

The preferences of the private food firms for market oriented strategies are in line with former empirical researches in Greece (Salavou, 2010, Salavou et al., 2009, Spanos et al., 2001). These researches also report on the association of strategies (pure and hybrid) with performance for firms competing either at home or in foreign markets. All of them conclude that the hybrid, and not the pure, is the dominant form of competitive advantage.

Salavou and Halikias (2009) investigated 82 Greek exporting private firms. They empirically examined types of exporting firms, strategy orientations and profitability of differential emphasis. Spanos et al. (2001) examined 147 Greek manufacturing firms, following the Dess and Davis’ (1984) 21 competitive dimension questionnaire. Their findings indicated that together with strategies both industry and firm asset effects significantly contributed to firm success.

The current study tries to investigate the specific competitive methods that adopt 35 private food firms and 29 agricultural cooperatives in Northern Greece, in order to address the following question: Do agricultural cooperatives need to be as strategic oriented as private food firms? More specifically, strategic actions of firms and cooperatives, without a priori theoretical assumptions and settled general strategy axes were studied. Secondly, a typology of private food firms and agricultural cooperatives, based on their strategic “behavior” was performed.

Analyzing the strategic profile of the Greek Agricultural Cooperatives and Private food firms is extremely important for several reasons: Firstly, cooperatives constitute significant players with a long history in Northern Greece. Secondly, the food sector constitutes 17% of total number of the Greek enterprises, contributing 22% of total employment and 21% of annual turnover in the manufacturing
industry (Salavou et al., 2013). Thirdly, Northern Greece is dominated by isolated rural places with limited access to resources needed for survival or development (Salavou et al., 2013).

MATERIALS AND METHODS

Thirty five agricultural cooperatives and 72 private food firms, all of them established in Northern Greece, were approached for participating to the research. The final sample consisted of 64 organizations, including 35 private food firms (IOFs) and 29 agricultural cooperatives in Northern Greece. The response rate was 82.9% for the agricultural cooperatives and 48.6% for the private firms. Although the sampled organizations cannot be considered as a random sample, in the statistical sense, however it is a representative one because it includes almost the whole number of agricultural cooperatives in Northern Greece (29 out of 35) and a relative large and adequate portion of the private food firms. Data were collected during 2009 by a structured questionnaire through personal interviews with the top management, consisting mainly of general managers and sales managers. In order to pre-test the research questionnaire, the general managers of three agricultural cooperatives and three private food firms, not included in the final sample, were interviewed to ascertain the comprehensiveness and phrasing of the questionnaire items. The questionnaire included specific questions to evaluate 21 methods of strategic orientation on a seven point ordinal scale (1: not significant at all, 2: too little significant, 3: a little significant, 4: moderately significant, 5: significant enough, 6: very significant, 7: extremely significant), (see full list in Table 2). This measure is based on a 7-point Likert-type scale adopted by Dess and Davis (1984).

First of all an analysis of given answers was carried out using methods of descriptive statistics. Thereby we investigated the importance that firms of the sample are giving to the applied methods of strategic orientation. In order to satisfy part of the objective number 2, we used the Mann-Whitney test to determine the differences among all methods of strategic orientation between private and cooperative firms (at $P<0.05$). Because of no previous experience and knowledge about how the methods of strategic orientation are linked we applied the Principal Component Analysis (PCA) method, with Varimax rotation, (Hair et al., 2010) on the total sample of private and cooperative firms. We expected that PCA would reveal structural components or dimensions of strategic orientation given the answers on the 21 questions. Answering to objective number 1, the implementation of this method revealed seven general strategic axes for the firms and the cooperatives of the sample: Axis 1: Strategic orientation of marketing focus, Axis 2: Product Customization, Axis 3: New Products, Axis 4: Expansion and Efficiency, Axis 5: External funding and pricing, Axis 6: Product quality focus, and Axis 7: Resources and Production.
The reliability and the internal consistency of the derived axes were examined by computing and evaluated the corresponding Cronbach’s a (alpha) reliability coefficient and the average Discrimination Index (DI), respectively. Generally, values of Cronbach’s alpha ≥0.70 and values of average DI≥0.20 are considered satisfactory (Nunnally and Bernstein, 1994). For each axis an average score per organization was computed as the mean value of the responses to the items that mainly load on the specific axis (Spector, 1992).

A series of Wilcoxon tests was applied to find the statistically most significant axes of strategic orientation. Then applying the Mann-Whitney test we statistically tested the differences between private and cooperative food firms relative to the seven axes of strategic orientation; these comparisons enabled us to fulfill objective number 2. In all hypotheses testing procedures involving the Mann-Whitney and the Wilcoxon tests the observed significance level (P-value) was computed with the Monte-Carlo simulation method, utilizing 10,000 re-sampling circles (Mehta & Patel, 1996).

This approach leads to valid inferential conclusions even in case where the statistical and the methodological presuppositions of the Non-Parametric tests are not satisfied.

At a next stage, following Aggelopoulos et al. (2013) and in order to satisfy the objective number 3, the Hierarchical Cluster Analysis method was applied using as input variables the scores of organizations on the seven strategic orientation axes. The construction of the clusters was based on the Ward’s criterion, while the square of the Euclidean distance was used to measure the (dis)similarity of the business units (Hair et al., 2010). Before entering the analysis, the input variables were transformed into z-scores. The validity of the cluster solution (results non shown) was tested by a methodological scheme proposed by Michos et al. (2012) and Zafiriou et al. (2012). The contribution of each strategic orientation axis in cluster formation was identified by examining the magnitude and the statistical significance of the corresponding $R^2$ coefficients of determination estimated by the application of a series of one-way ANOVAs; cluster membership was used as the independent variable and each of the seven strategic orientation axes as the dependent. The value of $R^2$ indicates the percentage of variance of the examined variable accounted by the differences between the clusters. Finally, for testing the ability of each strategic orientation axis in predicting the cluster membership we performed a Categorical Regression Analysis with optimal scaling (Meulman, 2003) cluster membership was entered in the analysis as the dependent categorical variable and the axes scores as the predictors. Categorical regression can accommodate nominal, ordinal, and scale variables. Nominal and ordinal variables are optimally transformed into interval variables. After this process, multiple regression analysis is applied to these transformed variables. All the statistical analyses were accomplished by the SPSS v.15.0 statistical package enhanced with the modules Exact Tests (for Monte-Carlo simulation) and Categories (for Categorical Regression).
RESULTS

For the first step of the analysis, each chief executive officer (CEO) was asked to rate the importance of each competitive method to the success of the economic organization’s overall strategy. Further down, the questionnaires were separated into two groups (cooperatives and private food firms) and examined the CEOs’ answers according to the competitive methods that they apply in their firm/cooperative. The 64 responses were initially analyzed using Principal Component Analysis. Table 1 presents the most important competitive methods that are used in private food firms and cooperatives in Northern Greece, based on the CEOs’ evaluation of each competitive method’s contributions to each economic organization’s strategic orientation.

Table 1. Importance of the methods of strategic orientation: Cooperatives vs Private Firms
Regarding the Cooperatives, the statistical analysis revealed that the following competitive methods were viewed as most critical to the achievement of strategic success (Table 1): “Customer service” (6.38), “product quality control” (6.17), “operating efficiency” (5.83), “competitive pricing” (5.79), “experienced & trained staff” (5.66) and “improvement of existing products” (5.33). The lowest rated competitive methods that contribute to organizational strategic success included the “development of new products” (3.93), “ability to produce specialized products” (3.78) and “promotion of products in market segments with high pricing” (3.22).

Regarding the Private Food Firms, the following competitive methods were viewed as most critical to the achievement of strategic success: “product quality control” (6.60), “customer service” (6.57), “experienced and trained staff” (6.20), “establishment of brand name” (6.14), “products in market segments with high pricing” (6.00), as well as on “operating efficiency” (5.97). The lowest rated competitive methods that contribute to organizational strategic success included: “minimization of the external funding” (4.33), “expansion in new markets” (4.23) and “resourcing” (4.04). Table 1 reports the statistical significant differences among competitive methods for private and cooperative food firms. Then we tested all the differences among methods of strategic orientation between private and cooperative food firms, using Mann - Whitney test (Table 1). In particular, private and cooperative food firms differ in the following methods: “Development of new products”, “product quality control”, “experienced/ trained staff”, “competitive pricing”, “establishment of brand name”, “distribution channels control”, “resourcing”, “ability to produce specialized products”, “products in market segments with high pricing”, and “advertising”.

Table 2 presents the main results of PCA and Item Analysis. Only loadings >0.50, in absolute value, are presented for better interpretation. The Principal Component Analysis revealed seven axes of strategy which explain 72.2% of the total variance (Table 2).

The first axis (F1) explaining 25.2% of the total variance, refers to the adoption of the following methods: E16 “servicing specific geographic areas”, E21 “industry reputation”, E11 “change in technical and marketing methods”, and E20 “advertising”. The reliability and the consistency of this axis was measured respectively by the indices: Cronbach’s alpha (0.79) and average Discrimination Index (DI) (0.59). The average score of this axis was 4.9. So this axis could be named as “Axis of marketing strategy and functions”.

The second axis (F2), labeled product customization explaining 11.0% of the total variance, is associated with the questions E8 “wide range of products”, E18 “ability to produce specialized products”, and E2 “customer service (Cronbach’s alpha=0.76 and average DI=0.39). The average score of this axis was 5.3.

The third axis (F3), labeled new products explaining 9.4% of the total variance, consists of four competitive methods: E1 “development of new products”, E5 “experienced/ trained staff”, E13
“distribution channels control”, and E19 “products in market segment with high pricing” (Cronbach’s alpha=0.74 and average DI=0.55). The average score of this axis was 5.1. So it could be characterized as “Axis of orientation to the specialized products of high added value”.

The fourth axis (F4), labeled expansion and efficiency explaining 8% of the total variance, is linked with the following two competitive methods of strategic orientation: E3 “operating efficiency” and E17 “expansion in new markets (geographic or product)”. So it could be called as the "Axis of expansion and efficiency" (Cronbach’s alpha=0.75 and average DI=0.38). The average score of this axis was 5.2.

The fifth axis (F5), labeled external funding and pricing explaining 7.1% of the total variance (Cronbach’s alpha=0.71 and average DI=0.35), is associated with the following two methods of strategic orientation: E7 “competitive pricing” and E15 (minimization of use of external funding). The average score of this axis was 4.9.

The sixth axis (F6), labeled product quality focus explaining 5.8% of the total variance, consists of two competitive methods: E4 “product quality control” and E9 “improvement of existing products” (Cronbach’s alpha=0.72 and average DI=0.50). The average score of this axis was 6.0.

Finally, the seventh axis (F7), labeled resourcing and production explaining 5.3% of the total variance, is associated with the following two methods of strategic orientation: E12 “change in production processes” and E14 “resourcing” (Cronbach’s alpha=0.75 and average DI=0.38). The average score of this axis was 4.5.

After creating the axes for applied methods of strategic orientation, it is observed that axes with higher importance are the following: F6 (control and improvement of product quality) with average score 6.0, F2 (product and customers) with average score 5.3, and F4 (expansion and efficiency) with average score 5.2. According to a series of Wilcoxon tests the axis F6 was the most significant (P<0.001 in all comparisons) and the axis F7 the least significant (P<0.05 in all comparisons). Observing Table 3 the researchers conclude that the differences in strategic orientations are statistically significant in only two axes, namely the marketing focus (F1 axis) and new products (F3). Both axes comprise competitive methods of the “differentiation” strategy.

According to the Principal Component Analysis as well as the Mann-Witney test, cooperatives are more cost-oriented (they mainly choose competitive pricing and resourcing). On the contrary, private food firms are more marketing and innovation oriented (they choose the following methods: development of new products, product quality control, experienced/trained staff, establishment of brand name, distribution channels control, production of specialized products, products in market segments with high pricing as well as advertising).

The analysis of the results reveals that the competitive methods of cooperatives in Greece belong to the cost leadership strategy. On the other hand, private food firms apply competitive methods more of
“differentiation” strategy and less of the “differentiation focus” generic strategy. Earlier empirical result (Salavou, 2010 on Greek firms of the services sector implies that the hybrid form of competitive advantage, which places high emphasis on low cost, is the prevailing and the best-performing strategic choice. In a related vein, evidence from Greek manufacturing private firms (Spanos et al., 2004) shows that pure generic strategies are less profitable than hybrid strategy combinations. Consequently, regarding the need of cooperatives for innovation and marketing techniques, they should leave pure strategy and gain more “hybrid” strategic orientation, combining competitive methods from both generic strategies in order to become more competitive. Methodological Note for PCA: The minimum sample size needed in PCA (in order to achieve stability of the results) is an extremely controversial issue. It is affected by many factors such as the communality of the variables, the ratio of the number of components to the number of variables and the size of the components’ loadings. According to Preacher and MacCallum (2002) and MacCallum et al. (1999) as long as the communalities of the variables are high >0.60 (smallest communality in our data 0.61, data not shown), or the average communality to be at least 0.70 (0.72 in our case), the sample size is not so crucial. Based on the above discussion the sample size used in the present study is statistically adequate. Hierarchical Cluster Analysis revealed three clusters (Table 4): cluster E1 which includes 14 cooperatives (48.3% of the total sample), E2 which includes 8 cooperatives (27.6% of the sample), and E3 which includes 7 cooperatives (24.1% of the sample).

*ns: No significant difference
According to Table 4, cluster E₁ includes cooperatives with higher values in strategic axes F₁ “Axis of marketing strategy and functions”, F₂ “product customization”, F₅ “external funding and pricing”, F₆ “product quality”, F₇ “resourcing and production”, and lower values in axes F₃ “new products” and F₄ “expansion and efficiency”. Cluster E₂ includes cooperatives with low values in all the studied strategic axes. Cluster E₃ consists of cooperatives which appear to have the higher values in all the studied strategic axes. According to the values of R² the strategic axes F₃, F₆ and F₇ had the higher contribution in cluster formation. Relative Importance index indicates that strategic axes F₃, F₇, and F₁ had the higher predictive ability (for cluster membership prediction).

*K-W: Kruskal-Wallis test P value. *For each strategic axis mean values followed by different boldface exponential letter are statistically significant different at P<0.05, according to a series of Mann-Whitney tests.

Table 4. Cooperatives' clusters profile relative to the average scores of the seven strategic axes

Hierarchical Cluster Analysis also revealed three firm clusters (Table 5): cluster G₁ which consists of 11 firms (31.4% of the total firms participating in the study), G₂ which includes 12 firms (34.3%), and G₃ which also includes 12 firms (34.3%). According to Table 5, cluster G₁ consists of firms with the higher values in all the studied strategic axes. Cluster G₂ includes firms with moderate value in strategic axe F₁ “Axis of marketing strategy and functions”, F₃ “new products” and F₅ “external funding and pricing”. Firms in cluster G₂ have high values in strategic axes F₂ “product customization” and F₆ “product quality”, and low value in F₄ “expansion and efficiency” and F₇ “resourcing and production”. Cluster G₃ includes firms with low values in all the studied strategic axes.

Table 5. Firms’ clusters profile relative to the average scores of the seven strategic axes

According to the values of R<sup>2</sup>, the F<sub>3</sub>, F<sub>6</sub>, and F<sub>4</sub> strategic axes had the higher contribution in firms’ cluster construction. Relative Importance Index indicates that the strategic axes F<sub>3</sub>, F<sub>4</sub>, and F<sub>5</sub> had the higher predictive ability (for cluster membership prediction).

A comparison between firm and cooperative overall performance indicated a significant difference (at P<0.05, according to a Mann-Whitney test), meaning that firms overall performance (mean score=5.2) is higher compared to cooperative performance (mean score=4.5).

CONCLUSIONS

Research efforts have yielded so far empirical evidence in support of a positive “strategy-performance link” which implies that strategy and performance are positively correlated and that strategic orientation generates competitive advantage (Minarik, 2007, Miller and Friesen, 1986).

The main issue this study raises is whether agricultural cooperatives need to be as strategic oriented as private food firms. The empirical findings of this study confirm that agricultural cooperatives need to be as strategic oriented as private food firms (in a pure or hybrid form) to sustain competitive advantage (either based on cost or on differentiation). The competitive methods of “differentiation strategy” will help cooperative to consolidate its competitive advantage and survive in the hypercompetitive market. In particular, the empirical evidence provided here identifies differences in
the strategic orientation of 64 organizations – 35 private food firms and 29 agricultural cooperatives-established in the Northern part of Greece. Although these organisations adopt seven strategic orientations, cooperatives differ significantly from private firms in two of them capturing elements of marketing focus and new products. As such, the former remain traditional and cost-oriented without innovative elements while the latter invest in differentiation and focus strategy, trying to become more innovation driven.

The particular results corroborate prior evidence in Greece (Salavou et al., 2013, Papadopoulou et al., 2012) claiming that agricultural cooperatives sustain a more conservative approach towards cost cuttings. However, the successful implementation of this strategy requires particular consideration to the organizational structure, management control and compensation policy, which in great extent lack from cooperatives. Furthermore, the cost-oriented strategy is in line with their preference to be followers (i.e., imitate competitors) rather than pioneers (i.e. innovate).
