ABSTRACT

The wine sector is one of the most representative of both Italy and other foreign countries thanks to the richness of fine wines and a combination of know-how, craftsmanship and traditions held by Italian producers. Therefore, the wine sector represents a key factor for attracting tourism, due to a wine tourism phenomenon which involves both a niche of experts persons and tourists in general.

Our research goals are twofold. The first is to examine the impact of wine consumption trend on Italian and foreign wine companies in terms of economic performance. The second goal is to identify the most relevant green concepts for the wine industry with regard to addressing environmental challenges.

We formulated two research hypotheses correlated to the above goals. The objective of the research was identified through an analysis of the national and international literature on the research topic. In addition, a quantitative and qualitative survey was conducted in order to achieved to research objectives.

It emerged that Italian wine consumption trend negatively impacted on core business performance, while not on the return on equity; despite the world consumption crisis, global wine consumption is kept to a similar extent in pre-crisis period and foreign companies in the sample have obtained an increase in economic performance. In addition, the tendency towards a green economy is also involving the wine sector, due to companies' susceptibility to a greater focus on the environment.

The implications of this study are related to the potential of the wine sector in Italy and in other foreign countries. This sector represents an interesting field of action for related companies in terms of turnover and profitability.

In order to overcome the limitations of the present research, it would be interesting to compare the potential and dynamics of wine consumption on performance with that of other economic sectors, which are also representative of a country economy. Furthermore, some suitable econometric models would be usefull to carry out a simulation on the impact of a series of external and internal variables of the wine market on the performance.

Keywords: *wine sector; Italian wine companies; foreign wine companies; performance; green economy.*

INTRODUCTION

The wine sector is one of the most representative of both Italy and other foreign countries thanks to the variety of fine wines and a combination of know-how, craftsmanship and traditions held by Italian producers. The wine sector is composed of three different groups:

- companies that produce grapes, and then produce and commercialize wine;
- companies that produce and commercialize wine, buying grapes from external suppliers;
- companies that commercialize wine, which is purchased from external supplier.

Wine is a typical export product when the country's product is recognized for its high quality, tradition or competitiveness in terms of quality/price. Therefore, each market is split into domestic and foreign: domestic markets refer to those who live or operate in that country and tourists, while foreign customers are those outside of the country.

This means that the wine sector represents a key factor for attracting tourism, due to wine tourism which involves both experts and tourists in general.

Our research goals are twofold. The first is to examine the impact of the wine consumption trend on Italian and foreign wine companies in terms of economic performance. The second goal is to identify the most relevant green concepts for the wine industry with regard to addressing environmental challenges.

This analysis is placed within our wider study focusing on business opportunities of Italian companies, for which wine can represent an important turnover source (Giacosa, Giovando and Mazzoleni, 2014). It emerged that Italy is the second largest wine producer in the world, after France, thanks to the varied territory, the favorable climate, and the experience and entrepreneurship of the companies.

This study is motivated by observing the profound changes that have taken place in the wine market over the last 20 years in Italy and abroad. The context has been characterized by recent and profound changes in wine consumption, creating new business prospects for wine companies. While wine was considered a local product without much potential for investments and exports until the 1970s, subsequently a following for quality wine has developed. Investments from family firms and big groups in Italian and foreign market increased the scope of the wine sector. In such a context, business opportunities for wine companies become notable. In addition, the movement towards a green economy is interesting in the wine sector for understanding whether wine companies are susceptible to a greater focus on the environment.

LITERATURE

The wine sector has been considered for its ability to attract tourism, and representing a business opportunity for wine companies (Marks, 2011; Ritchie, 2009) due to a “wine tourism phenomenon” attracting expert persons (Clemente-Ricolfea et al., 2012; Groves and Belk, 1998). In attracting tourism, wine sector has a positive impact on regional competitiveness and its drivers (Jaffe and Nebenzahl, 2008; Viassone, 2009; Vrontis and Viassone, 2013; Zanni, 2004). Wine tourism also effects accelerated change both in terms of sales and production, as a consequence of constantly changing geography in the wine sector (Rossi et al., 2012).

The literature focused on the different types of companies operating in the wine sector, classifying them as:

- bigger companies operating in a global level (Rossi, 2008; Wittwer et al., 2003; Zanni, 2004);
- medium and small-sized companies (Holden and Weber, 1994; Beverland and Lockshin, 2001).

In addition, the wine market has been differentiated in old markets and new markets, such as Chinese and Russian, which are seeing increasing growth in wine consumption (Anderson and Wittwer, 2013). By observing the business model of the companies in the wine sector, they have been classified in two groups: the first one is composed of medium and large wine companies operating in a global market; the second group is composed of smaller companies operating in a niche market and with a modest or insistent internationalization process, which needs network models of organization to increase competitive advantage (Aldrich and Zimmer, 1986; Birley, 1985; Aldrich, Reese and Dubuni 1989; Ohmae, 1989; Brown and Butler, 1995).

In addition, some studies made a comparison between business opportunities in agriculture and manufacturing sectors. The manufacturing sector represents a driving force of the Italian economy. The importance of wine sector (belonging to the agriculture sector) has become clear for the Italian economy, thanks to its ability to increase revenue over the time considered (from 2007 to 2012), in contrast to the manufacturing sector (Giacosa, Giovando and Mazzoleni, 2014).

Several scholars observed performance in wine sector (Heijbroek, 2003; Coelho and Rastoin, 2004 and 2006). In particular, some studies investigate wine performance and show an improvement in some countries, such as French wine companies (Amadiou and Viviani, 2010; Viviani 2009), Greek companies (Venieris, 1989), South African firms (Esterhuizen and van Rooyen, 2006) or Spanish (Suàrez-Ortega and Valamo-Vera, 2005).

Other studies observed the impact of economics and economic sociology on performance, by assessing the role of local inter-firm networks in innovation dynamics and economic performance in a cluster of cooperatives (Chiffolleau et al., 2007).

Several studies focused on the trend of alcohol consumption in different parts of the world,

identifying the relevant economic, social, religious and cultural factors that impact on wine consumption (Trach, 2013; Gillespie, 2005; Thach and Olsen, 2005). Several differences emerged between countries (Trevisan et al., 2011; Thach and Olsen, 2006).

With particular reference to wine consumption, other studies observed the recent changes in wine consumption as a consequence of changes to the socio-demographic, cultural, political and economic behaviour of the context in which companies operate due to several inputs; also the companies' activity impacts on wine consumption by means of a series of outputs (Giacosa, Giovando and Mazzoleni, 2014; López-Valeiras Sampedro et al., 2010; Rohan et al., 2007).

Wine consumption is influenced both by individual characteristics (Hall and Hall, 1990; Harrisson and Huntington, 2000; Peterson and Kern, 1996), and by perceptions of quality in objective and subjective terms (Lancaster, 1971). Objective quality is influenced by intrinsic characteristics of the product in terms of its chemical and organoleptic properties. However, subjective quality is governed by consumer perception connected to his or her preferences (Cavicchi, 2008; Steenkamp, 1989) and could be evaluated according to four dimensions (Brunso, Fjord and Grunert, 2002). These are taste and appearance, healthiness, convenience, and the purchase price.

Several studies focused both on the need to drink wine and the method of its consumption, as well as on the variables that impact on consumers' purchasing choices in terms of brand knowledge (Dotson et al., 2012; Goodman, 2009; Nowak et al., 2004), quality and packaging (de Luca, 2006; Bland, 2004; Pastore and Vernuccio, 2003).

According to green concepts for the wine industry, with thousands of different definitions the discourse field of sustainability has become so wide and divergent that it has largely become irrelevant (Pezzey 1997; Perman, Ma et al. 2003; Hopwood and Mellor 2005). Elkington (1998) introduced the term "triple bottom line" which is the most specific entry relating to sustainability for smaller entities like firms. The triple bottom line refers to the three pillars: economic, social and ecological sustainability. Two distinct versions of sustainability emerged in the 1970's; weak and strong sustainable development (Neumayer, 2003). Weak sustainable development (Weak) and strong sustainable development (Strong) give the three pillars different weight and meaning. The goal in Weak is that utility or consumption does not decline over time (Pezzey, 1997). In practice, social and ecological resources are to be used as input into economic development. Many academics have concluded that this version of sustainability is not sufficient, given the tremendous environmental challenges we are facing (Daly 1999; Zadek 2004; Holden and Linnerud 2007; Nilsen, 2010; Peeters, 2012).

The present study contributes to expanding the literature via the following two observations. Firstly, it verifies the impact of the recent world crisis on the wine sector in terms of both consumption trends

and companies' economic performance. Secondly, it identifies the most relevant green concepts for the wine industry with regard to addressing environmental challenges. It is a very recent phenomenon due to companies' attention to a green strategy: not only in the manufacturing sector, but also in the agricultural one, that the theme of green strategy has to be included in companies' business development plans.

METHODOLOGY

In order to achieve the research objectives, we have articulated the following research hypotheses:

H1: The recent world crisis which involved the industrial and financial economy has not strongly affected the wine sector. Indeed, the wine market is particularly susceptible to a strong tradition in drinking wine, influenced by the socio-demographic and cultural context. This is especially true in those countries with a high wine consumption culture.

H2: the tendency towards a green economy is involving the wine sector, due to companies' greater focus on the environment.

To demonstrate the above-mentioned research hypotheses, the research methodology has been carried out in the following phases:

1) First phase: the research hypotheses were analysed by examining the existing literature, according to several topics, such as the characteristics of the wine sector, the different typologies of companies belonging in the sector, wine consumption trends and the performance of wine companies. In addition, we referred to green economy concepts applied to wine sector;

2) Second phase: the research methodology was differentiated in relation to the above hypotheses:

a) With reference to H1: the objective to be reached is quantitative in nature. The analysis of the economic performance of wine companies has been articulated into the following observation focus:

- Italian companies: we firstly analysed the relevance of the wine sector compared to the manufacturing sector, which represents the core of the Italian economic texture. To this end, we compared the index numbers for turnover within the wine sector with that of the manufacturing sector, for the period 2007 to 2011. This allowed us to evaluate the wine sector compared to the manufacturing sector, and establish which one is characterised by positive trends in relation to turnover. Then, we verified the impact of the world crisis on Italian wine consumption from 2007 to 2011. We then observed the impact of Italian wine consumption on the economic performance of a sample composed of the major Italian wine companies. This sample consists of the 108 largest Italian companies with a turnover of more than 25 million Euro (these companies have achieved a total turnover of 2.67 billion Euro in 2011) (Table 1). The economic data observed were the following: turnover, ebitda, ebit, net

earning, ROI and ROE. The quantitative source for both foreign and Italian companies is represented by a series of market data, the processing of which allowed us to deduce wine sector trends drivers in Italy. The market data was obtained from reports of major Italian trade associations operating in the wine sector, as well as the National Institute of Statistics (ISTAT), and the research department of a major Italian bank;

	Revenues 2011 (million Euro)
Cantine Riunite & GIV	498
<i>including: GIV – Gruppo Italiano Vini</i>	368
<i>including: Cantine Riunite & CIV</i>	161
Caviro	247
<i>Gruppo Campari (wine department)</i>	185

Mgm Mondo del Vino	57
Ruffino	57

Table 1. *The top 25 Italian wine companies of the sample- Source: personal elaboration on Mediobanca (2013)*

- Foreign companies: we firstly verified the impact of the world crisis on world wine consumption from 2007 to 2011. We referred to literature that stated that the global crisis began in 2007 (Deaglio, 2008). Subsequently, we observed the impact of world wine consumption on the economic performance of a sample composed of the major wine companies worldwide. This sample consists of

the 13 largest internationally listed companies with a turnover of more than 150 million Euro (these companies have achieved a total turnover of 7.9 billion Euro in 2011) (Table 2). The economic data observed were the following: turnover, ebitda, ebit, net earning and ROE.

Companies	Countries
Constellation Brands	USA
Treasury Wine Estates	Australia
Distell Group	South Africa
Vantai Changyu Pioneer Wine	China
Vma Concha y Toro	Chile
Vranken-Pommery	France
Lans on-BCC	France
Sektkellerei Schloss	Germany
Laurent Perrier	France
Andrew Peller	Canada
Vma San Pedro Tarapaca	Chile
Advini	France
Australian Vmtage Ltd	Australia
Vma Santa Rita	Chile

Table 2. *The sample of foreign wine companies- Source: personal elaboration on Mediobanca (2013)*

b) With reference to H2: the objective to be reached is qualitative in nature. We made a brief overview of the most relevant concepts for the wine industry with regard to addressing environmental challenges. We tried to emphasise how the concept of ecological sustainability is applied in the wine sector, referring to strong sustainable development or strong sustainability.

RESULTS

In this section, the research results are presented in relation to the following observation points:

- The performance of the Italian and foreign wine companies (*referred to H1*);
- The green concepts for the wine industry (*referred to H2*).

The economic performance of Italian and foreign wine companies

The analysis of the economic performance of wine companies has been articulated into the following observation focuses:

- Italian companies;
- Foreign companies.

Before observing the economic performance of the Italian wine companies, we verified the relevance of the Italian wine sector within the Italian economic context. For this purpose, we compared the wine sector trends in terms of sales to that of the Italian manufacturing sector, which constitutes a driving force of the Italian economic system (Table 3).

	2007	2008	2009	2010	2011
Wine sector	100.00	102.30	98.60	102.90	112.00
Manufacturing sector	100.00	100.60	83.20	89.80	96.10

Table 3. *Wine sector and manufacturing sector turnover comparison (index numbers of turnover)- Source: Giacosa, Giovando and Mazzoleni, 2014 on Mediobanca, 2013 data*

It emerged that wine sector turnover increased over time, despite the global financial crisis for which there was a sales reduction in 2009. This trend didn't hold true for the manufacturing sector: pre-global financial crisis levels were not reached in 2011. In 2011, wine sector turnover was about 17% higher than that of the manufacturing sector. Therefore, the wine sector is an important one for the Italian economy, due to its ability to increase revenue over the time considered: which has not been the case in the manufacturing sector.

The wine sector has a comparable relevance to the Italian economic system to the manufacturing sector. To explore this issue, we considered the ability of Italian wine companies to attract foreign consumers. The origin of turnover according to end markets is shown below (Table 4).

	2007	2008	2009	2010	2011
Domestic market	6.2	0.3	-3.5	0.6	5.6
International market	8.2	4.8	-3.9	8.9	12.6
Total revenues	7.1	2.3	-3.7	4.4	8.9

Table 4. *Origin of turnover to end markets (% variation compared to previous year- Source: Giacosa, Giovando and Mazzoleni, 2014 on Mediobanca, 2013 data*

It emerged that a great ability to attract foreign customers and exports have been major driving forces for turnover growth within the sector: indeed, Italian wine is globally recognised as being good quality. In particular, in 2011 and export sales are more than double sales in Italy.

When considering export volumes, Italy is clearly a more important player (21 million hectoliters of wine) than France (15 million hectoliters of wine), although the turnover generated by exports was higher for France (7.9 billion euros) than Italy (4.7 billion euros) (Wine Monitor, 2012). Large and medium companies have a tendency towards exporting (exports represent more than 90% of sales for some companies), while export sales are marginal or non-existent for small companies. The most popular markets for Italian wine are the USA, with 1.054 million euros of exports, a revenue growth

of 8% and volumes growth of 2% compared to the previous year; Germany, with a billion euros of turnover and a new exports market of about 7%; the UK, with 570 million euros turnover and a new exports market of about 9%; and Switzerland, with 311 million euros turnover, and purchase of 700 thousand hectoliters, despite a reduction in exports of 9% compared to the previous year. Therefore, the wine sector is an important sector for Italian companies, as Italy is the second largest wine-producing country in the world, after France.

We can conclude that the wine sector is important to the Italian economic context when compared to the manufacturing sector and that it has a strong ability to attract foreign consumers.

With reference to *H1*, we firstly analysed Italian wine consumption compared to world wine consumption (Table 5).

	2007	2008	2009	2010	2011	Var. 2007-2011 (%)
Italy	26,7	26,2	23	24,6	23,1	-13.5
Total world wine consumption	251,1	245,2	243,3	242,2	243,8	-2.9

Table 5. *Italian wine consumption (in hl/000.000)- Source: OIV, 2013*

World wine consumption decreased by 2.91% from 2007 to 2011, while Italian wine consumption decreased of 13.5%. Therefore, it seems that the world consumption crisis has had a stronger negative impact on Italian wine consumption than world wine consumption.

Then, we investigated the impact of the global crisis on the economic performance of a sample of 108 major Italian companies in the wine sector whose turnover is over 25 million euros (Table 6). Of these major Italian companies, the one with the biggest turnover is Cantine Riunite (498 million euros turnover in 2011), whose revenue is seventh in the world wine sector. Other Italian companies with remarkable turnovers are Caviro (247 million euros) in 11th position, a division of Campari Wine (185 million euros) in 16th position, Cavit (152 million euros) in 19th position, and P. Antinori (150 million euros) in 20th position (Mediobanca, 2013).

Years	2007	2008	2009	2010	2011	Var. 2007/2011
Revenues	4,394	4,495	4,330	4,521	4,923	12.0
Ebitda	436	387	385	436	459	5.3
Ebit	252	197	191	240	254	0.8
Net earning	58	34	64	142	99	70.7
ROI (%)	6.3	5.2	4.8	5.6	5.9	-6.3
ROE (%)	2.7	1.8	3.2	6.6	4.4	62.7

Table 6 – *Economic data at the aggregate level of main Italian wine companies (dati in €/000.000)- Source: Mediobanca, 2013*

Even if Italian wine consumption decreased by 13.5%, the turnover at the aggregate level increased by 12% over these years, beyond a downturn in 2009. Ebitda increased by 5.3% and net earning strongly increased by 71%). Core business performance (ROI) was 5.9% in 2011 (with a decrease of 6.3%), while the return of equity (ROE) was 4.4% in 2011 (with a strong increase of 62.7%).

Therefore, it seems that the negative trend of wine consumption has had a negative impact on ROI. However, the negative wine consumption trend has not had a negative impact on ROE.

H1 is partially confirmed: Italian wine consumption trends negatively impacted on ROI, but not on the ROE.

With reference to the H1, we also analyzed the trend of world wine consumption from 2006 to 2011 to assess the impact of the global crisis on consumption (Table 7).

	2006	2007	2008	2009	2010	2011
France	33	32.2	30.8	30.2	28.9	29.3
USA	27.2	28.3	28	27.3	27.6	28.4
Italy	27.3	26.7	26.2	23	24.6	23.1
Germany	20.2	20.8	20.7	20.2	19.7	19.7
China	13.3	13.6	13.7	15	15.8	16.3
UK	12.7	13.7	13.5	12.7	13.2	12.9
Argentina	11.1	11.2	10.7	10.3	9.8	9.8
Spain	13.5	13.1	12.2	11.3	10.4	9.9
Russia	10.8	11.7	11.3	10.1	-	-
Australia	4.6	4.8	4.9	5.1	5.3	5.3
Romania	5.5	5.5	5.4	4.9	-	-
Portugal	4.8	4.5	4.5	4.5	4.7	4.6
Canada	4	4	4	3.7	-	-
Brazil	3.5	3.3	3.3	3.5	3.5	3.8
Holland	3.5	3.6	3.8	3.5	3.5	3.8
South Africa	3.4	3.6	3.6	3.4	3.5	3.5
Chile	2.4	3	2.3	3.1	3.2	3
Other Countries	43.2	47.5	46.3	51.5	68.5	70.4
Total	244	251.1	245.2	243.3	242.2	243.8

Table 7. *Wine world consumption (in hl/000.000)- Source: OIV, 2013*

This analysis shows that world wine consumption is almost constant over time. A detailed analysis of the individual countries in the sample shows that, except for the increase in China (13.3 to 16.3) and the decrease in Italy (from 27.3 to 23.1), for the other countries the consumption is almost constant over time. Therefore, the global downturn in consumption does not seem to have had an impact on world consumption in the wine industry globally: the global players in the wine industry divide a market that does not seem to decrease.

Below, the distribution of wine consumption among the different continents in 2011 is shown (Table 8).

Countries	North America	South-Central America	Europe	Asia, Australia and New Zealand	Rest of the World
% of wine consumption	37.40	56.00	23.40	18.70	14.90

Table 8. *Distribution of wine world consumption (2011)- Source: personal elaboration on Mediobanca, 2013*

America (North America 37.40% and Central and South America 56%) is a major wine consumer, followed by Europe and then the other continents.

We said that the world wine sector was not affected by a global consumption crisis, subsequently, it was observed that the world's wine consumption trend has had repercussions on the economic performance of the main wine groups in the sample (Table 9).

Years	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	Var 2002/2011
Revenues	5.267	6.104	6.400	7.022	7.178	6.478	6.559	6.451	6.708	6.598	25.27%
Ebitda	881	1.075	1.054	1.195	1.201	1.181	1.192	1.240	1.280	1.325	50.40%
Ebit	726	887	875	986	992	944	956	1.007	1.061	1.118	53.96%

ROE (%)	11.25	9.79	9.56	9.11	10.16	-3.28	-0.05	9.76	16.59	15.14	-

Table 9 – *Economic data at the aggregate level of the main groups in the world (in € / 000,000)- Source:*

Mediobanca, 2013

Analyzing first of all the turnover and net profit in the aggregate sample, we see a substantial growth over the years, apart from a decline in the years 2007 and 2008. We can see that the crisis emerges in a small way in the wine sector in the years 2007 and 2008, followed by a marked improvement in subsequent years. In addition, comparing the aggregated net income data for the sample with world wine consumption from 2009 to 2011, shows that compared to constant consumption of wine, there is a marked increase in the aggregate net income from 2009 to 2010 and a slight decrease from 2010 to 2011.

To analyse the impact of the global crisis on the economic performance of the major groups in the industry worldwide in the sample, we compared the trend with EBITDA, EBIT and Net Earnings. EBIT and EBITDA showed continued growth. It appears that companies' core business has always been growing notwithstanding the economic crisis. Moreover, this steady growth also occurred in 2007 and 2008, the year in which income decreased. The trend of ROE has been steadily increasing from 2002 to 2011 if we consider the period as a whole: despite a decline from 2003 to 2005 and the decrease of profitability in 2007 and 2008, there has been a steady increase since 2009, reaching very significant values both in 2010 and in 2011 (with a decrease in 2011).

With reference to the main world wine groups, H1 is confirmed. Despite the world consumption crisis, global wine consumption has kept to a similar level as in pre-crisis period (2003 to 2006). After a setback in 2007 to 2008, the companies in the sample have managed to increase their economic performance.

Green concepts for the wine industry

With reference to H2, it emerged that one of the future challenges and opportunities for business development is represented by global environmental degradation visible through the serious problems induced by man-made climate change, and industries' green initiatives in response to this situation. We must define what we mean when we talk about and use the various green concepts. This part gives a brief overview of the most relevant concepts for the wine industry with regard to addressing environmental challenges; sustainability¹, the "triple bottom line", organic and biodynamic production, carbon footprint and LCA. We focus on the most important differences, how some of them are related and offer some examples from the literature on the wine industry.

This research refers to Elkington issue (1998) about the "triple bottom line". In the literature, we said that many scholars stated that this version of sustainability is not sufficient, given the tremendous environmental challenges we are facing (Daly 1999; Zadek 2004; Holden and Linnerud 2007; Nilsen, 2010; Peeters, 2012), and this paper supports that conclusion. Instead, we look further into Strong sustainability. This is the only discussion in this part of whether the concept itself is actually appropriate to mitigate the environmental situation. For all approaches, critical investigations must be made to avoid contributing to green-washing and green rhetoric (Norman and MacDonald, 2004).

Strong sustainability is defined as giving the three pillars equal weight; they are all to be concentrated. The first pillar, economic sustainability, is addressed in the other parts of this paper through the concept of performance. The second pillar, social sustainability is often described at community level. It is challenging to find encompassing definitions, but the following two descriptions capture some of its complexity: 1) A community is to be continually in the process of creating physical and social environments and enhancing those community resources which enable people to mutually support each other in fulfilling the functions of life and attaining their full potential (Newton, 2000). 2) A life-enhancing condition within communities, and a process within communities that can achieve that condition (McKenzie, 2004). In practical business life, Pratt states that firms which have a vision for social sustainability, have staff who tend to work harder, have greater company loyalty, and demonstrate more enjoyment in their work ((Pratt and Pratt, 2010) referred to in (Thompson and

¹ "Sustainability" is mostly used through this paper, as short for "sustainable development". There are however nuances between the two, which we will not explore here. Also in this chapter "ecological" is most often used, instead of the broader and more anthropocentric term "environmental".

Forbes, 2011)). A case study of a wine producer in New Zealand finds that social responsibility is created by treating all staff as stakeholders in the business. The same study points to the existence of and huge potential for farmers to join networks in local communities to share experiences and resources. (Thompson and Forbes, 2011). The concept of corporate social responsibility (CSR) could be elaborated upon here, but due to the limited space, we just point to possible common features between the concept of social sustainability and CSR.

The third and last pillar of Strong sustainable development is ecological sustainability which can be defined as the degree of a practice to which activities can be continued indefinitely, without negatively altering the limiting factors that permit the existence and flourishing of other groups of entities, including other organisations (Starik and Rands, 1995). Limiting factors determine the carrying capacity of a given ecosystem for a type of entity and include food, water, shelter, breeding and rearing sites, predators, competitors, disease organisms and other toxins (Odum, 1989) for living species.

Corporations stand to benefit from moving toward ecological sustainability by reducing costs through ecological efficiencies, capturing emerging green markets, gaining first-mover advantage in their industries, ensuring long-term profitability, establishing better community relations, and improving their image (Shrivastava, 1995).

Several more recent concepts have emerged which can contribute to ecological sustainability; organic (Lawrence, Cheshire et al. 2004), biodynamic, LCA and carbon footprint. Organic is the most widespread green approach in the wine industry and in general it means wine made from organic grapes. In 2012 the EU arrived at common rules for organic wine (European Commission 2012). EU organic vineyards are mostly located in the EU-15, with Spain cultivating the biggest area in 2011, followed by France and Italy (European Commission 2013).

Although addressing overconsumption in the affluent part of the world is a significant part of creating ecological sustainability (Røpke 2006; WWF, 2010), consumers are at the same time contributing to greening the wine industry as described by Bisson et.al.: "As consumers become more aware of the vulnerability of our global environment, the demand for sound agricultural production practices is increasing. In the future, the perception of the producer as a conscientious environmental steward will be an important influence on the consumer's purchasing decision. This is due in part to the fact that the typical wine consumer is well educated and affluent" (Bisson, Waterhouse et al. 2002). An example from the consumer side in Norway, a non-EU member, is that organic wine is the only officially registered green concept for wines. All providers of organic products in and to Norway, must be certified by the organisation Debio (www.debio.no). There has been a steady increase in organic wine

consumption in Norway for many years, although market share is still only about 1% (Vinmonopolet March, 2014)¹.

Biodynamic refers to an agricultural system with a holistic approach in the spirit of anthroposophy and Rudolf Steiner, which in short introduces additional requirements to an organic system. Biodynamic farming notes the interdependence of nature and the lunar effect on active soils. Biodynamic winemakers allow the vineyard to operate as a self-sustaining entity within the surrounding ecosystem, placing emphasis on all living organisms contributing to the farm (Stasi, Seccia et al. 2010).

Life cycle assessment (LCA) is an approach that assesses the broad environmental impacts associated with a product, a material or an activity. A thorough LCA involves analysing the whole life span of the unit at hand (Ingebrigtsen and Jakobsen 2007), more popularly described as a cradle-to-grave approach. Carbon footprint also takes a cradle-to-grave approach, but is limited to estimating greenhouse gas (GHG) emissions. Cichelli et.al. (2012) has done a case study using carbon footprint analysis of an Italian wine product, and comparing it with a LCA on the same product. The International Organization of Vine and Wine (OIV) has issued general principles of measuring GHG emissions from the wine industry (International Organisation of Vine and Wine 2011).

H2 is confirmed. We have produced a brief overview of the most relevant green concepts for the wine industry, offering examples and literature to proceed further. We have tried, in this very limited space, to specify how each concept is different. The last concepts however, can all contribute to ecological sustainability, but ecological sustainability is still only one out of 3 pillars in the much broader concept of strong sustainable development or strong sustainability. Being specific about these green concepts makes it easier to investigate if and how the wine industry, and others as well, can contribute to a greener future.

CONCLUSIONS, IMPLICATIONS AND LIMITATIONS

The wine sector represents an important driver both for Italy and other foreign countries, thanks to the variety of fine wines and a combination of know-how, craftsmanship and traditions held by producers. In these terms, the wine sector has been considered a key factor for increasing tourism, due to its ability to attract both experts and tourists in general.

We investigated the impact of wine consumption trends on Italian and foreign wine companies in terms of economic performance. It emerged that, despite the Italian wine consumption having

¹ Vinmonopolet has the exclusive right to retail wine, spirits and strong beer in Norway. The figures can be obtained by contacting them directly by e-mail.

decreased by 13.5%, the turnover of the sample companies increased by 12% over the years, apart from a downturn in 2009, Ebitda increased by 5.3% and net earning strongly increased by 71%. Italian wine consumption trends negatively impacted on core business performance (the ROI was 5.9% in 2011, with a decrease of 6.3%), but not on the return on equity (the ROE was 4.4% in 2011, with a strong increase of 62.7%). Therefore, H1 is partially confirmed: Italian wine consumption trends negatively impacted on core business performance, but not on the return on equity.

For foreign companies, it emerged that turnover, Ebit, Ebitda and net profit showed a substantial growth over the years, apart from a decline in the years 2007 and 2008. In addition, return on equity (ROE) has been steadily increasing from 2002 to 2011, if we consider the whole period. Despite the world consumption crisis, global wine consumption has remained at a similar level to the pre-crisis period (2003 to 2006); indeed, after a setback in 2007 to 2008, the companies in the sample have managed an increase in economic performance. Therefore, H1 is confirmed.

As an additional goal, we identified the most relevant green concepts for the wine industry with regard to addressing environmental challenges. A brief overview of the most relevant green concepts for the wine industry emerged. We specified how each concept is different in the wine sector and how it can contribute to ecological sustainability. Therefore, the tendency towards a green economy also involves the wine sector, due to companies' susceptibility to a greater focus on the environment. H2 is then confirmed.

The implications of this study are related to the potential of the wine sector in Italy and in other foreign countries. This sector represents an interesting example for related companies in terms of turnover and profitability. This is applicable to wine companies, as well as to those operating in other areas related to wine, such as wine bars, restaurants, food and wine management and e-commerce companies, research laboratories, and wine consulting firms.

In order to overcome the limitations of the present research, it would be interesting to compare the potential and dynamics of wine consumption on performance with that of other economic sectors, which are also representative of a country economy. Furthermore, through the use of suitable econometric models, it would be interesting to carry out a simulation of the impact of a series of external and internal variables of the wine market on the performance.

University of Turin, Italy

ABSTRACT

This research aims to analyse the dynamics of the book value of assets of a cross-section of all Italian insurers between 1998 and 2012, correlating this with Italian nominal GDP in the same period. Subsequently, to permit more in-depth investigation of these dynamics, the research moves from an analysis of the absolute values to analysis of the rates of change of the book value of assets of the insurers included the sample with those of the Italian GDP. Lastly, for more detailed analysis, attention has been focused on certain items of assets considered particularly significant.

Keywords: *Italian insurance, balance sheet, GDP, technical provisions, liabilities, investment .*

INTRODUCTION

The financial crisis, started with the sub-prime crises in 2007, has a strong impact on financial decisions of both banks and insurance companies, as well as for the entire financial sector (Billio et al. 2012, Schich, 2010). Financial institutions changed their investment decisions and objectives, as it can be seen in changes in their financial statements and, most of all, in their balance sheets, as the attention to different kinds of risks and risk management policies increased (Baxter et al. 2013; Geneva Association Systemic Risk Working Group, 2010) . Many studies focused their attention on the period before the financial crisis and others mainly dealt with the consequences of the 2007/2008 fall (Adrian, 2011). We think that not enough emphasis has been paid considering longer periods that goes beyond specific events. That is why in this paper we focused our attention to a fifteen-years period, in order to catch the differences that may have happened in long-period trends. We think that in the financial sector a strong concern about short-period effects may bias and fade deeper long term occurrences. Other studies (Zhiguo, 2010) considered only specific items or group of assets, but a general, integrated and systemic view of the changes in the entire balance sheet asset-side is missing.

The innovative aspects of our research may be the following ones:

- 1- it considers long-term period instead of only short time ones;
- 2- it concentrates to the specific insurance sector (that have some peculiar characteristics, specific laws, rules and regulators)

- 3- it is focused on changes in the asset-side of the companies in an integrated and systemic view.

Similarly to any other company, insurers maintain relationships with the surrounding environment and can be represented by an "input-output" model (Ferrero, 1987) according to which they obtain a set of inputs from the environment, consisting of factors of production, constraints and conditions and, through a process of transformation, generate a set of outputs. Together with banks, financial intermediaries and credit institutions, insurers form part of a so-called "financial system". The financial system links the entire economic system through financial relations (Onado, 2000). Within this system, insurers carry out their business according to a different methodology. In fact, in the insurance sector, the production cycle is inverted, i.e. they first of all sell their insurance products and then furnish the related services, incurring typical costs through payment of claims and payment of benefits in the form of annuities or payment of a capital sum.

This difference in their production cycle, compared with an industrial enterprise, has repercussions on all management aspects (Marchionni, 2006) of both Non-life or Life business. In fact, insurers may provide Non-life and Life coverage.

In Non-life business, the insurance contract transfers a risk (so-called "pure risk") from the insured to the company. Non-life business is usually divided into:

- personal insurance, offering protection against the risks of personal accident or illness;
- property insurance, offering protection of property against various risks (fire, theft);
- liability insurance, offering protection against any reimbursements that the insured may be required to pay for third party damages.

In Life business, the insurer promises to pay the insured a benefit in the form of an annuity or a capital sum on occurrence of a specific event affecting the life of the insured. Life insurance products generally cover pension schemes, protection, savings and investment.

This research aims to analyse the dynamics of the book value of assets of a cross-section of all Italian insurers between 1998 and 2012, correlating this with Italian nominal GDP in the same period. Subsequently, to permit more in-depth investigation of these dynamics, the research moves from an analysis of the absolute values to analysis of the rates of change of the book value of assets of the insurers included the sample with those of the Italian GDP. Lastly, for more detailed analysis, attention has been focused on certain items of assets considered particularly significant.

This research adopts a different approach to previous works proposed in literature as regards empirical profile. More specifically, the study has been carried out on a section of the balance sheet of insurers that is not frequently analysed and considering a much broader time frame. This has made it possible to highlight changes in the balance sheet items analysed following modifications in the external

environment in the same period. In particular, this period was affected by a far-reaching worldwide crisis involving, in particular, the financial sector and, consequently, also companies operating on the Italian market. The sample considered is particularly representative as it comprises all insurance companies operating in Italy, both listed and unlisted.

LITERATURE

In addition to banks, credit and financial intermediaries, the financial system also comprises insurers (Schich, 2010, Forestieri & Mottura 2000) which have always been studied from many different angles. One of the main issues addressed by academics is the risk factor inherent in insurance business (Billio et al., 2012, Di Cagno & Adamo, 2000); in fact, final consumers transfer any negative economic effect of a specific risk to insurers (Bertini 1987, Hedges 1963). Certain researchers have, therefore, addressed and investigated theoretical models for optimisation of risk management at insurance companies (Baxter, 2013, Browne, 1995, Cummins & Sommer, 1995, Fleming and Zariphopoulou 1987) or developing an assets/liabilities management model using multistage stochastic programming able to determine an optimal investment strategy such as to permit correct definition of risks by insurers' governance structure (Carino et al 1994) with problems also tied to reinsurance (Cao and Wan 2009, Zhang and Siu, 2009).

National and international regulations have attempted to control and monitor the many risks inherent in insurance business. Controls applied on the insurance market have focussed in particular on relationships between risk and solvency, reflected in the Solvency project and its last update, Solvency II, now being completed (Wagner J., 2014, Schumacher L, Barnhill, T.M. Jr. 2011). This issue has been investigated from several viewpoints (Gryglewicz, 2011, Sherris 2006, Butsic 1994), dedicating particular attention to insurers' economic capital, i.e. Solvency Capital Requirements, and many observers have focussed on evaluating insurers' balance sheets to verify compliance with the necessary capital requirements (Meyers 2003, Mildenhall 2002, Myers et al 2001); the financial stability of insurers between different continents has also been verified (Siegel 2013). Other studies have generally addressed insurers' balance sheets from the point of view of international (Zhiguo, 2010, Floreani, 2008 Focarelli and Doni, 2006) and national (Bocchino et al, 2012, Cameran, M. 2000; Selleri, 1991) accounting standards. Others have concentrated on the way in which certain balance sheet items of insurers have been influenced by reporting or fiscal objectives (Gaver et al, 2010, Koijen et al., 2013) or by underestimation of technical provisions on the balance sheet (Petroni 1992) or verifying the adequacy of reserves (liability adequacy test) (Giovando, 2006). Various observers have examined the relationship between a series of stochastic models used by insurers and the dividend distributed by these to their shareholders (Haili Y. and Yijun H, 2010, Lin X. S, 2003, Taksar, 2000).

Our analysis concentrates on items of assets on the balance sheet of Italian insurers. Many studies of the business world have examined the relationship between balance sheet items and economic data or macroeconomic variables. At the start of the 1990s, (Gibrat, 1930) highlighted a relationship between growth and firm size; subsequently (Storey 1994) included amongst the fundamental variables for analysis of a company, i.e. growth and performance, also size and age and the total assets variable as proxy for measuring the size of the company is used for “modern companies” (Chen C., Jaggi B., 2000). However, none of these types of analyses has been carried out at insurers in the period considered. More specifically, our research considers the period 1998-2012, a broad time horizon that makes it possible to overcome short-term business cycle trends, and a sample of the entire Italian insurance sector, generating incremental results compared with existing literature from an empirical point of view. Consequently, the results obtained provide a “snap-shot” of the economic situation of insurers.

METHODOLOGY

This study addresses certain elements of the balance sheet of Italian insurers, observed in the period between 1998 and 2012. This period selected represents one the most significant aspects of this study as, covering a time frame of fifteen years, it permits representation of the phenomena irrespective of short-term economic trends and captures more in-depth structural dynamics.

The research has been carried out in the following phases:

1. phase 1 – definition of the aims of the research and review of literature on the dynamics of the book value of assets of insurance companies
2. phase 2 – analysis of the aggregate financial accounts of Italian insurers and data collection, with particular attention to the dynamics of the book value of assets compared with the trend of Italian GDP
3. phase 3 – within the dynamics of the book value of assets, analysis of the evolution of the asset categories, with a focus on two groups of specific items: investments and reinsurers’ share of technical provisions
4. phase 4 – analysis and interpretation of the data.

The data refer to the entire universe of Italian insurers, the number of which obviously varies over the years. For 2012, 235 insurers have been considered. Various comparisons have also been made with the universe of European insurers. The balance sheet data used are the aggregate data of the entire sector. The data of the balance sheets and of other insurance sector indicators have been taken from ANIA (Associazione Nazionale fra le Imprese Assicuratrici), IVASS (Istituto per la Vigilanza delle Assicurazioni) and CEA (European Insurance and Reinsurance Federation) databases, suitably

integrated with data taken from the statutory accounts of the main insurers. Other data have been obtained mainly from ISTAT (Istituto Nazionale di Statistica) and EUROSTAT.

For this purpose, our *main hypothesis* is based on the consideration that the business of Italian insurers, according to the type of activity carried out, is substantially “rigid” over the years and, compared with macroeconomic variables such as GDP, tends to conform with these. Subsequently, it has been considered interesting to verify the composition of the book value of assets of insurers and how this has changed in the period considered. The schedule of the Balance Sheet – Assets of insurers reflects items characterised by an increasing level of liquidity and collectability for both Non-life and Life business. The classification of items of the “Balance Sheet - Assets ” section envisages a distinction between “durable fixed assets” and “non-durable fixed assets” whereby the former comprise assets held for the purpose of continued use in the business of the company consistently with company management strategy in accordance, therefore, with certain assumptions concerning long-term use (the investments set forth in class B “intangible assets”, CI “land and buildings” and CII “investments in Group companies and other shareholdings” are considered to be durable fixed assets).

Debtors (receivables) are not classified according to a time criterion as in any other type of balance sheet but according to the nature of the transaction and related counterparty, making an initial distinction between debtors arising out of direct insurance operations (or direct business) and debtors arising out of reinsurance operations (inward reinsurance) followed by a subsequent distinction according to counterparty, i.e. insureds, intermediaries, insurance companies and reinsurers. The condensed Balance Sheet of an Italian insurance company (according to Italian GAAP) is shown below indicating only the macro-classes:

ASSETS	LIABILITIES and EQUITY
A) Amounts Owed By Shareholders	A) Capital And Reserves
B) Intangible Assets	B) Subordinated Liabilities
C) Investments	C) Technical Provisions
D) Investments To The Benefit Of Life Policyholders Who Bear The Investment Risk And Deriving From Management Of Pension Funds	D) Technical Provisions For Investments To The Benefit Of Life Policyholders Who Bear The Investment Risk And Deriving From Management Of Pension Funds
D Bis) Technical Provisions Borne By The Reinsurers	E) Provisions For Risks And Charges
E) Amounts Owed By Debtors	F) Deposits Received From Reinsurers
F) Other Assets	G) Debts And Other Liabilities
G) Accruals And Deferred Income	H) Accruals And Deferrals

Table 1. *Condensed Balance Sheet of an Italian insurance company (according to Italian GAAP)*

MAJOR FINDINGS

The first phase of the study was dedicated to analysing the dynamics of the book value of assets over the fifteen years considered. As seen in the review of literature, the book value of assets is commonly used as proxy of firm size. Between 1998 and 2012, the aggregate variable “total assets”, aggregated for

all the Italian insurers studied, showed a marked growth trend, in nominal terms, with an almost threefold increase in value between the start and end of the period considered (+182%). The mean annual growth rate was 7.15%. The only two years in the entire period considered in which total assets decreased were 2007 and 2008 when the international crisis made its effects felt at international level (summer of 2007 with the sub-prime crisis mainly on the US market, summer/autumn 2008 with numerous bailouts of banking and insurance colossus (the case of AIG, according to Forbes 2000 the sixth world-wide insurance colossus, whose stock slumped by more than 40% in 2008 can be considered emblematic), the shrinkage of the stock market (on September 15th 2008 the Dow Jones index closed down just over 500 points, marking the largest drop from the period immediately after the September 11th attacks) and the Lehman Brothers bankruptcy. (Grynbaum, 2008)

To discover the factors that affect the trend of the “book value of total assets” variable of Italian insurers, an initial significant comparison can be made with nominal GDP.

The graph highlights a noteworthy similarity between the trends of total assets of Italian insurers and Italian GDP. In particular, it can be seen that the trend of insurers’ total assets apparently “anticipates” GDP dynamics by around one year. This prompts a number of preliminary considerations. Firstly, as it is not possible to establish a direct cause-effect relationship between the two variables, the most plausible hypothesis for interpretation would seem to be that both variables depend on the macroeconomic and business cycle context. In other words, both variables (the “size” of the insurers and Italian GDP) depend on an articulated, complex set of economic variables that constitute a “proxy” of the situation of the economic system. By definition, albeit not without contestations and problems, a country’s GDP is used as synthetic macroeconomic indicator to represent its “state of health” (amongst others, a country’s GDP also comprises the insurance sector although in terms of revenues and not of insurance assets; in other words, considering a country’s GDP as the sum of the values added of all undertakings operating in a given economic system (Castellino, 2002).

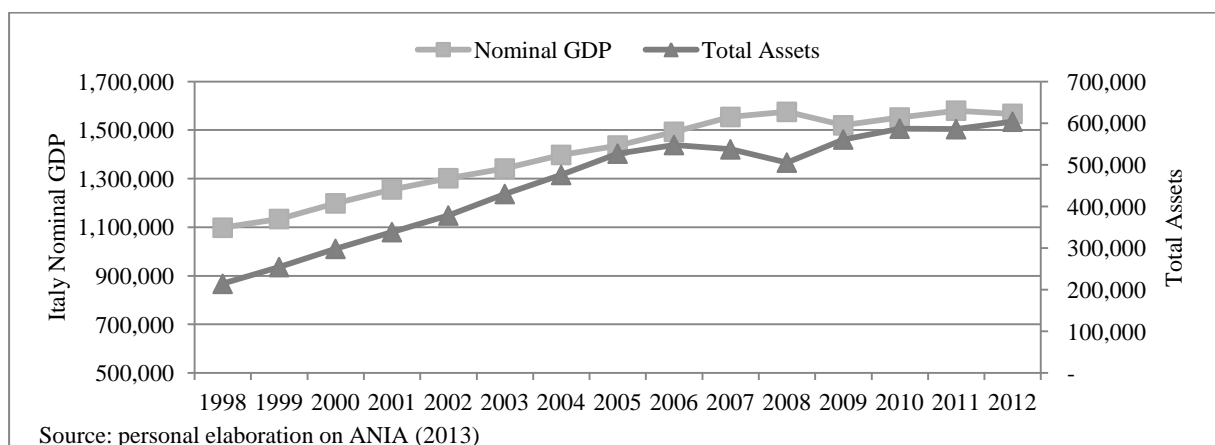

Figure 1. *Nominal GDP and Total Assets evolution*

Secondly, the fact that insurers' assets reflect the dynamics of GDP one year in advance could suggest that the financial and insurance market reacts more "quickly" to changes in the economic context compared with GDP which, insofar as a global macroeconomic indicator of the real economy, is structurally "slower" in reflecting inversions of cycle as it considers the universe of all the production activities of an economic system (including industrial activities and those that, as opposed to services and in particular the financial sector, react more slowly to changes in demand. Consider, for example, the necessarily longer reaction times in terms of acceleration or slowing of the production activity of a large industrial enterprise that may also have backlogs of orders to be filled and work in progress).

Thirdly, the "anticipatory capacity" of the size variable of insurers, which must necessarily be investigated in more depth in more specific, dedicated studies, could be used to forecast economic trend, as is the case in other sectors and categories (for example, luxury goods often used as economic cycle "indicators").

For more in-depth observation of the dynamics considered, it is useful to move from examining absolute values to rates of change. Comparing the rates of change of the book value of assets of Italian insurers with those of Italian GDP, it is possible to observe the following dynamics.

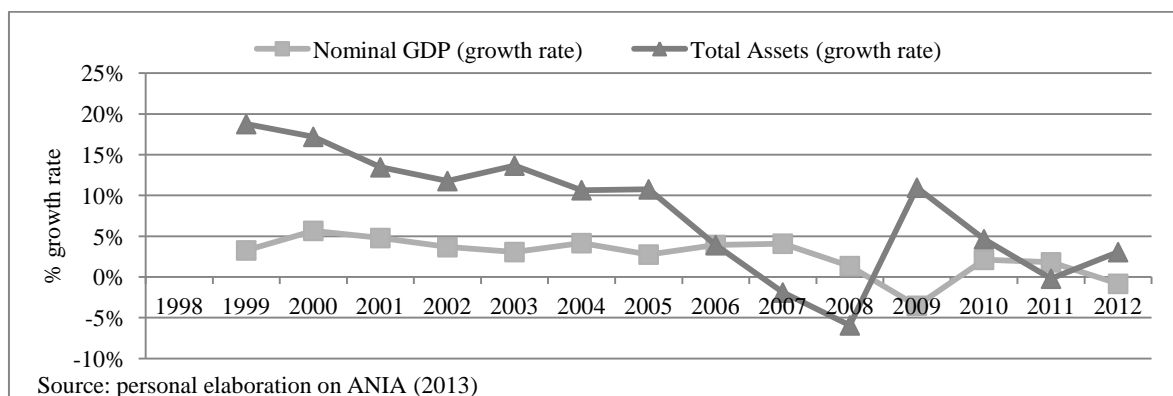

Figure 2. *Nominal GDP and Total Assets growth rates*

As opposed to the long-term growth rate revealed by examining the absolute values, the rates of change of total assets of Italian insurers show an evident downturn between 1999 (compared with 1998) and 2008, a "rebound" in 2009 and then a further decline in subsequent years.

The rate of change of insurers' total assets is characterised by much greater volatility than GDP. This is fairly evident considering that GDP is a much broader indicator that reflects the dynamics and changes in the entire economic system. Insurers' assets are, therefore, much more "dynamic" and tend to amplify economic changes.

Also in terms of rates of change, the around one year anticipation of total assets in relation to GDP is confirmed. The decline in GDP between 2007 and 2009 is in fact anticipated by total assets between 2006 and 2008, with a "rebound" in 2009 (corresponding to the upswing in GDP in 2010).

To permit more in-depth analysis, the third phase of the research focussed on certain items of the book

value of assets of insurers considered particularly significant, i.e. investments and reinsurers' share of technical provisions.

As is known, the balance sheet of an insurance company reflects the typical nature of insurance business, for example with regard to the so-called "inverted cycle" phenomenon deriving from the fact that revenues are anticipated compared with costs. On the one hand, this involves recording of "technical provisions" under liabilities and, on the other, stresses the importance of the book value of investments used to "cover" provisions. Therefore, the dynamics of the book value of investments of an insurance company reflect the company's asset management decisions regarding coverage of technical provisions, i.e. commitments assumed towards insureds. It must be stressed that, as the insurance sector is strictly regulated, the criteria adopted regarding investments covering technical provisions are not entirely at the discretion of the company and must comply with various requirements imposed by the regulator that are usually reflected in three conditions: liquidity (variable according to the type of insurance, as it is evident that the liquidity requisite must be weighted according to the specific characteristics of the type of insurance whereby, for example, for Life business, it will be determined in a different measure from Non-life business), profitability and safety.

A further specific aspect of insurance business concerns the dynamics of the reinsurance phenomenon according to which part of the risks are "ceded" to other insurers i.e. to specific reinsurers. The impact of this activity on the balance sheet concerns the recording under assets of provisions corresponding to portions of risk ceded in reinsurance. Therefore, the trend of the reinsurers' share of technical provisions reveals the dynamics and behaviour of insurers with regard to cession of risks in reinsurance. The investments and, subsequently, provisions ceded in reinsurance are examined and commented on below.

Examining the trend of investments, it can be observed that these reflect to a significant extent the trend of total assets, thereby confirming that these are the main, most significant item of assets on the balance sheet for an insurance company.

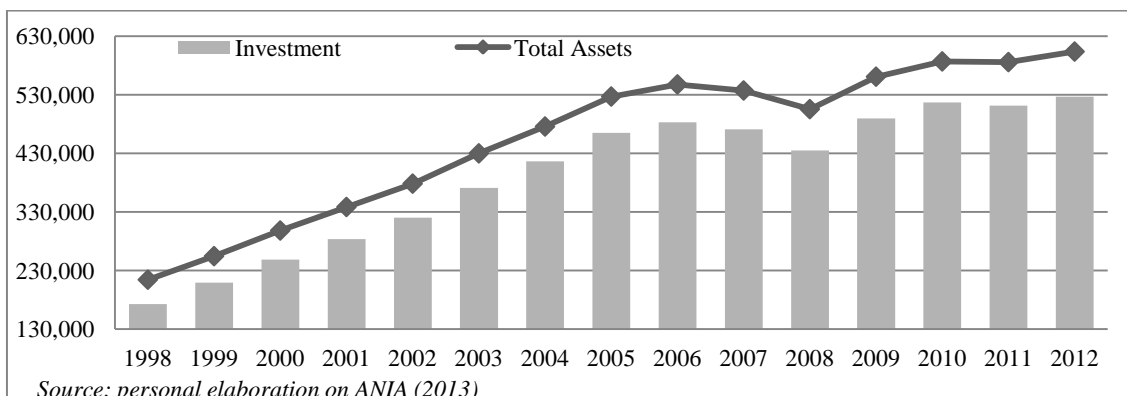

Figure 3. Total Italian Insurers' Investment Portfolio (€m)

This means that the dynamics of total assets significantly reflect the dynamics of total investments (in

other words, the other items of assets assume a secondary character) which, in turn, reflect the dynamics of technical provisions, i.e. of commitments assumed towards insureds in force at the end of the year.

In 2012, total investments of Italian insurers represented 87.3% of total book value while, fifteen years ago (in 1998), they represented “only” 80.6%. Therefore, although in absolute terms the other items of assets have increased in amount, their percentage weight has decreased. Therefore, investments reflect the dynamics highlighted previously with regard to considerations on the trend of the book value of total assets.

However, it is interesting, within the category of investments, to distinguish between the part of investments covering commitments under Life contracts from those covering the Non-life segment.

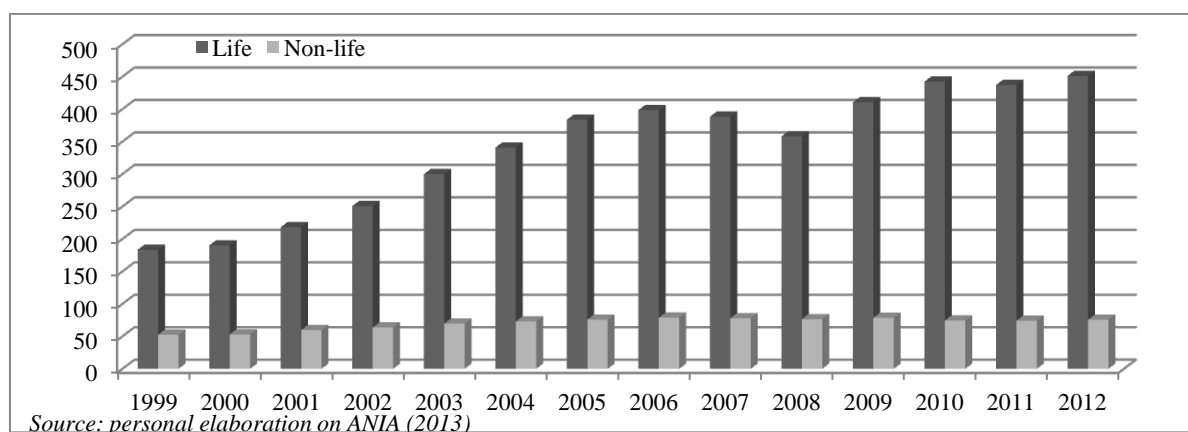

Figure 4. Life vs. non-life insurers' investment portfolio (€b)

Various interesting conclusions can be drawn from the graph of Life and Non-life investments (Processing of ANIA data). Firstly, the growing weight of Life business investments that reflects an expansion of this type of business (in particular in Italy but not only), also spurred by pension system reforms and greater sensitivity to private pension schemes (so-called “second and third pillar”). While, in 1999, the ratio between the Life business and Non-life business investments was equal to 3.5, in the last three years (2010-2012) Life business investments have, on the average, been equal to six times those of Non-life business.

Also, the dynamics of Non-life investments seem to be less accentuated compared with Life business that, apparently, reflects to a greater extent the dynamics highlighted previously with regard to the trend of total assets and GDP. Between 1999 and 2012, Non-life investments increased by 44% compared with an upswing of 146% in Life business. To investigate this latter aspect, it may be interesting to analyse the annual growth rates of investments according to business line.

Figure 5 shows and confirms that the growth rate of Non-life investments is mainly constantly lower than that of Life business, with less marked fluctuations. Therefore, Life business, also presumably due to the different type of investments and time horizon (longer in Life business), is decidedly more

“volatile” compared with the greater stability of other business lines. This is evidently consistent, as already mentioned, also with the specific characteristics and differences between Life and Non-life business, characterised by different time horizons, expected returns and risk profiles.

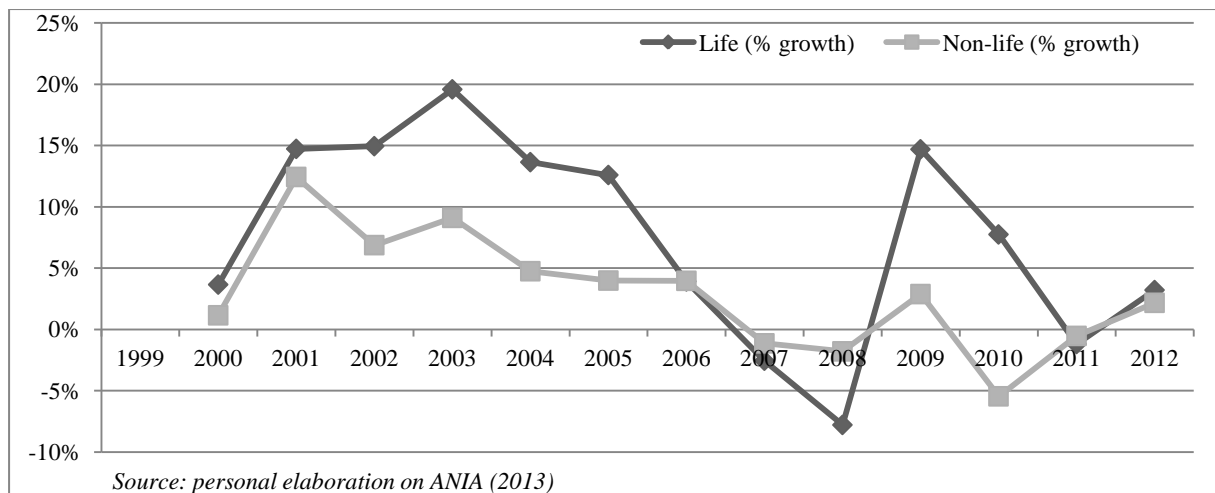

Figure 5. Life and non-life insurers' investment portfolio growth rate

The sharp downswing in 2007 and 2008 was forged by two main causes: the fall in stock markets triggered in the second half of 2007 and the rise in sovereign yields (as is known, as sovereign bond yields increase, the price of the stock decreases).

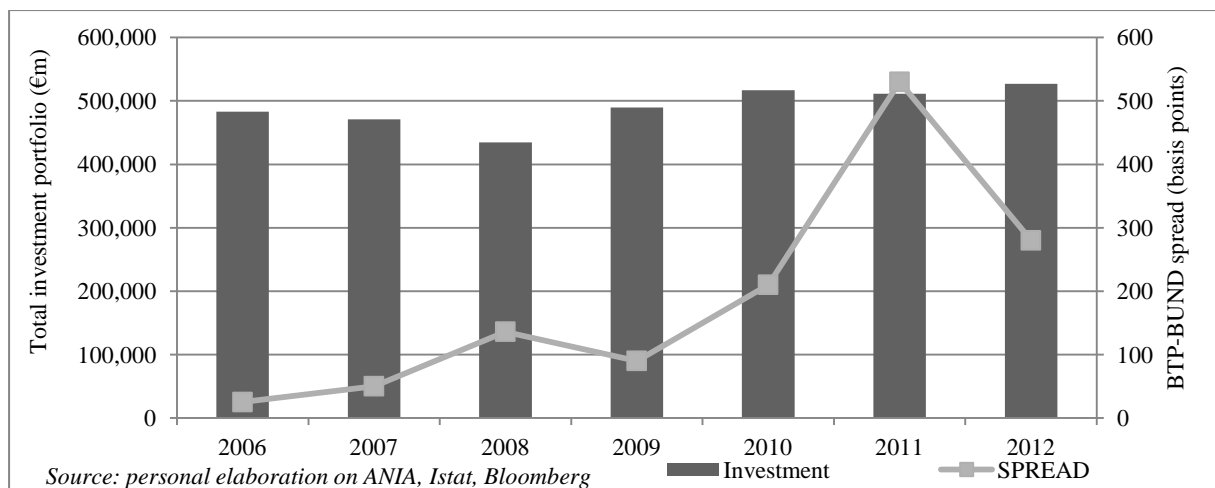

Figure 6. Total Italian insurers' investment portfolio (€m) and BTP-BUND spread (basis points)

To assess the impact of the sovereign debt “crisis”, in particular that of Italy, it may be useful to compare the trend of Italian insurers' investments and that of spread between Italian ten-year BTP and German bunds maturing on the same date. This spread (expressed in basis points) is commonly used to measure market “perception” of the sovereign risk of a country (in our case, Italy). The values indicated in figure 6 refer to the values of BTP-Bund spread at year end. As can be noted, although Italian insurers' investments mainly comprise bonds and fixed-income securities, no significant relationship is revealed (at least by an analysis of this type) between the trend of spread and the total value of

investments. In fact, an increase in spread is accompanied by a decline in value (market price) of Government bonds. A reasonable hypothesis for interpretation (to be verified through more extensive analysis) could be that insurers have increased their purchases in order to “offset” the reduction in the market value of sovereign bonds. In this way, the total value of investments (in Euro) would not have been affected by significant variations.

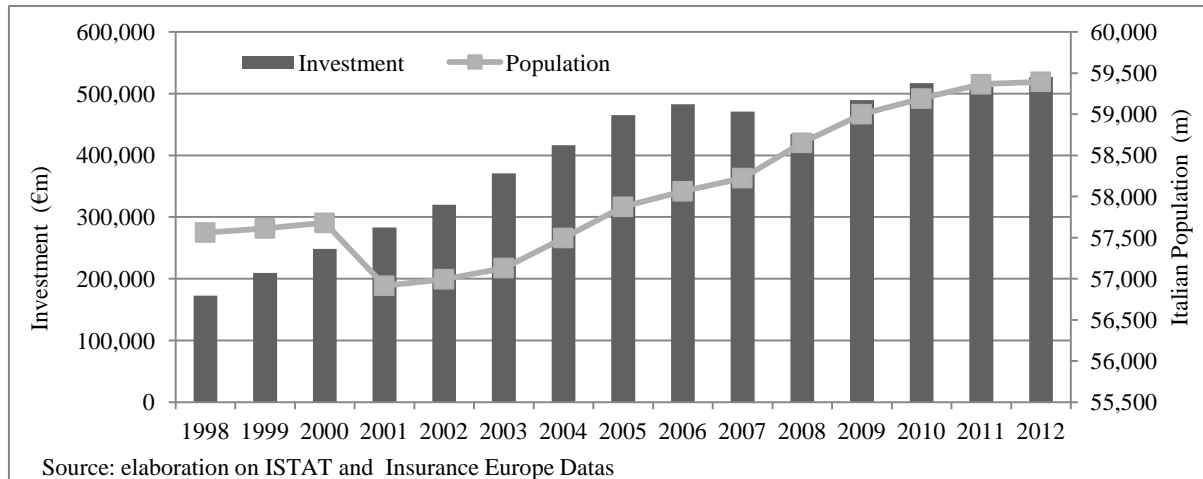

Figure 7. *Total Italian Insurers' investment portfolio (€m) and Italian Population (m)*

Furthermore, there is apparently no significant relationship between the trend of Italian insurers' investments and that of the Italian population (in the graph above, the value of the Italian population refers to December 31 of each year). Although insurance business is correlated with demographic trend (especially as regards Life business but also to a lesser extent for Non-life business), the data, especially in the last ten years, do not, apparently, highlight a particularly evident link. In fact, in the last 12 years, the Italian population has been characterised, substantially, by continuous, constant growth. However, such dynamics, as highlighted previously, are not apparently reflected in insurers' investments.

A further interesting comparison can be made analysing the trend of insurers' investments at European level. According to Insurance Europe data (the European insurance and reinsurance federation) which cover an even longer time frame (20 years, from 1993 to 2012 inclusive), a completely similar trend to that of Italian companies can be observed, leading to two main considerations. The first is that the trend of Italian insurers' investment portfolios is similar and aligned with that of other European companies. The second consideration is that, presumably, the factors that have generated certain dynamics in Italian insurers' investments are the same as those that have determined the same dynamics at European level. In other words, the “causes” of the trends highlighted here cannot be attributed to national dynamics or exclusively to the Italian context, but to an international macroeconomic perspective, of at least European but also reasonably much broader scope.

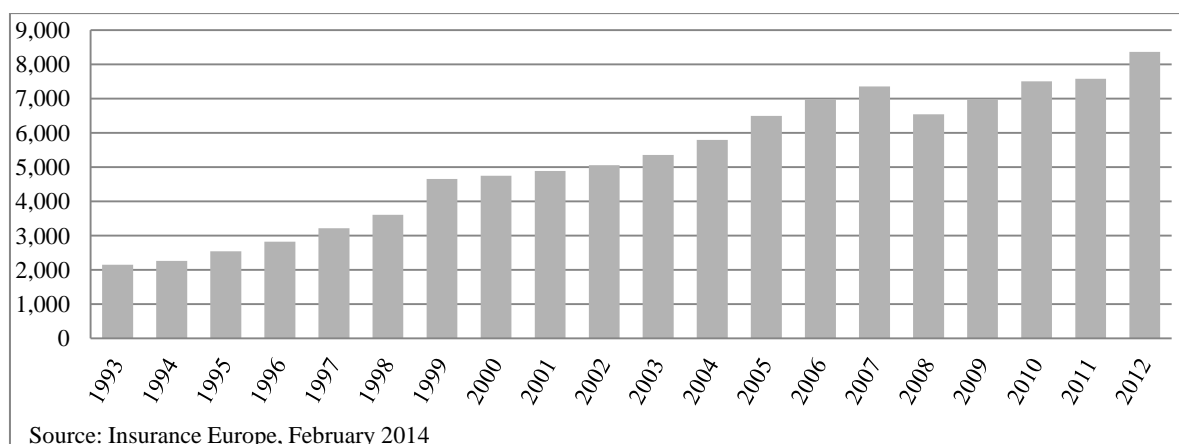

Figure 8. *Total European insurers' investment portfolio (€bm) from 1993 to 2012*

Moving to a further level of detail, the structure of Italian insurers' investment portfolios is analysed. As can be noted, insurers invest the largest proportion of their portfolio in debt securities and other fixed-income securities. This can also be ascribed to the indications and constraints of the Supervisory Authority and application of the principles of healthy, prudent management referred to above. However, certain dynamics, summed up in the figure 9, are particularly interesting especially if analysed in the time series of the period considered.

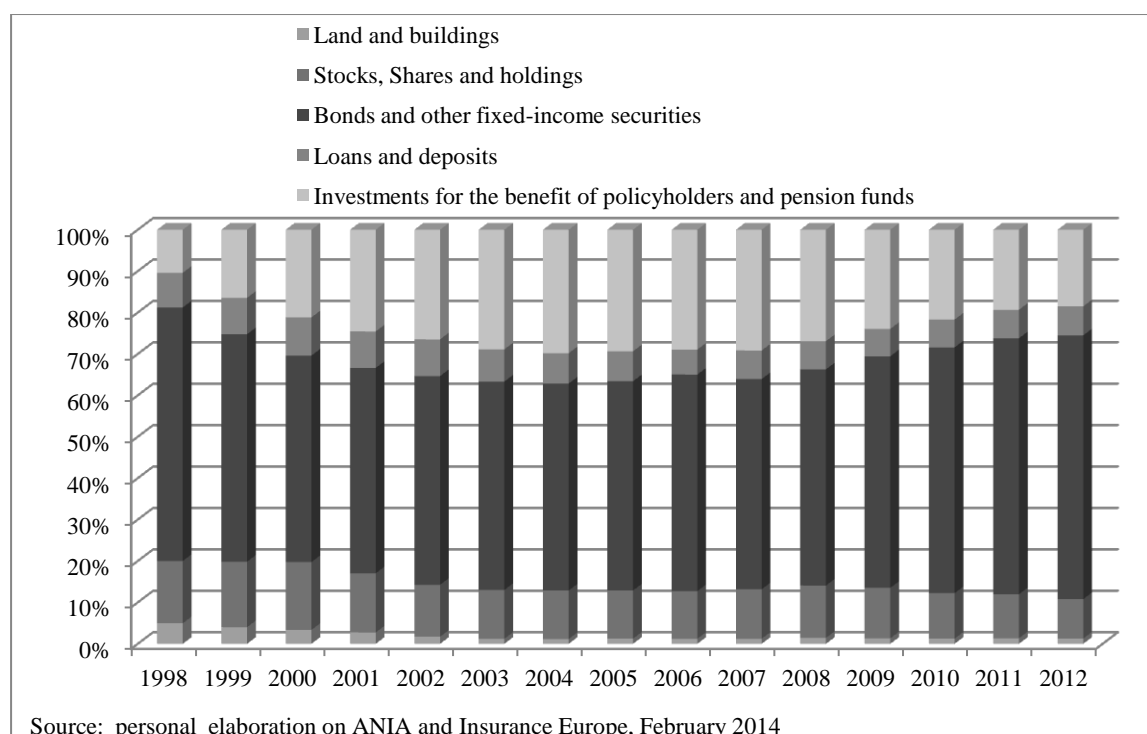

Figure 9. *Structure of Italian insurers' investment portfolios from 1998 to 2012*

An initial significant consideration concerns the percentage decline in the weight of investments in tangible assets in the last fifteen years and, in particular, in the "Land and buildings" category, which have moved from 5% (of total investments) in 1998 to 1.3% in 2012. This item comprises land and buildings intended for "industrial" use, i.e. in the business of the company, and for residential use (for

use by third parties). Real estate investments (e.g. high class properties for rental) have always been one of the most typical, traditional forms of investment widely used by Italian insurers, as these investments offered various “guarantees” in terms of reduced risk (and in terms of changes in the value of the property and returns). However, the gradual, constant reduction over the fifteen years considered is only in relative terms. The absolute trend of the book value of “Land and buildings” is more specific and is shown in Figure 10.

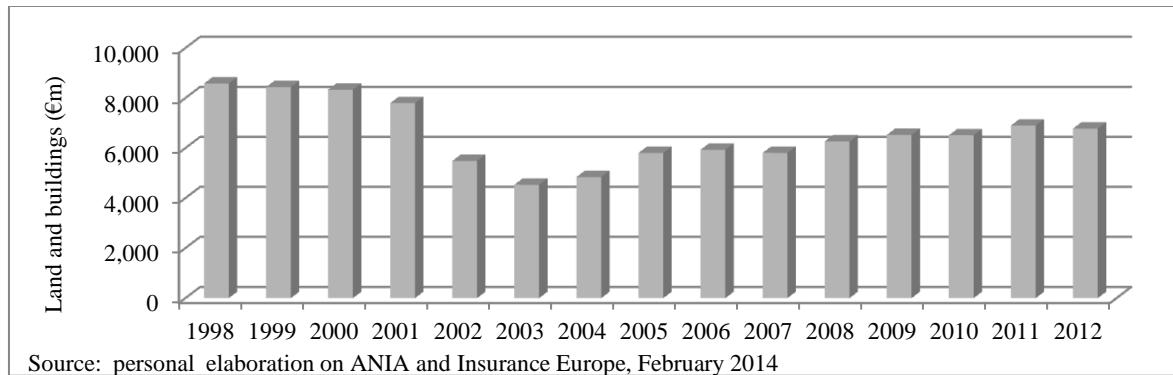

Figure 10. *Land and buildings (€m)*

In the last fifteen years, the minimum value was recorded in 2003, also in line with the trend of the real estate market. However, in 2012, in absolute terms, this item remained at a value around 20% lower than the maximum of 1998.

However, the most significant item of Italian insurers' investments in percentage terms is “Bonds and other fixed-income securities” which, in 2012, accounted for more than 60% of total investments. The percentage weight of this item has varied with a very different trend from that of “Land and buildings” and, as can be observed in the graph below, has been antithetical to that of stocks and shares. In fact, it can be noted that when the percentage of fixed-income securities in the portfolio decreases, that of full risk securities increases and vice versa. In the three-year period 1998-2000, the percentage of bonds in insurance portfolios has decreased, presumably due to expansion of equity markets and an increase in stock exchange prices. Vice versa, between 2001 and 2003, when the net economy and “dot-coms” bubble burst, the percentage weight of shares decreased, accompanied by an increase in that of fixed-income securities. From 2007 onwards, with the financial and economic crisis, the percentage of bonds increased once again. Evidently, this percentage is affected by two factors: not only the “quantity” of securities present in the portfolios of Italian insurers but also the change in their prices, in particular end of period “write-downs” when the impairment in value is considered permanent.

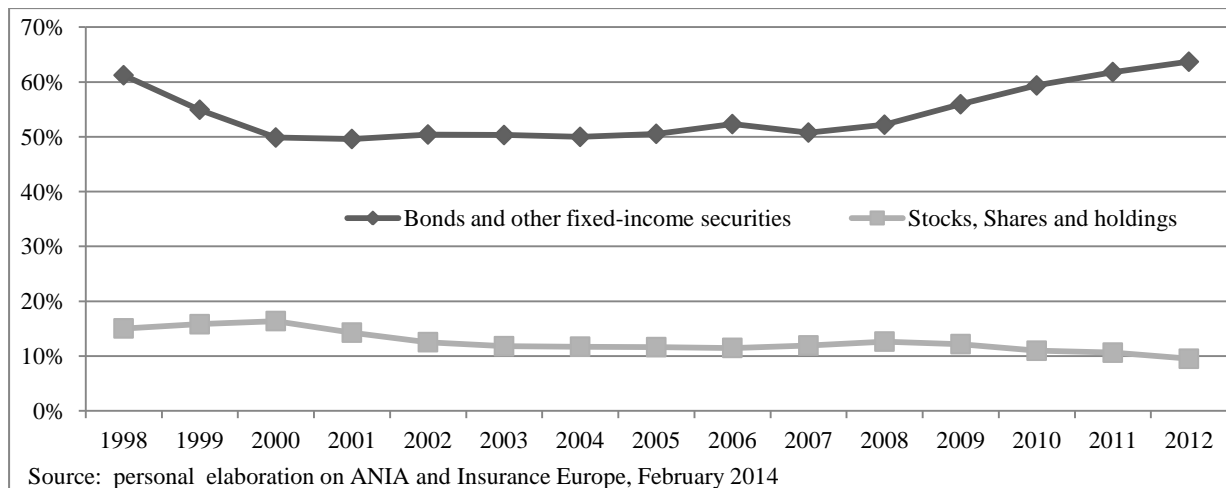

Figure 11. *Investment portfolio percentage composition*

The last item of assets on the balance sheet of Italian insurers examined concerns the reinsurers' share of technical provisions, i.e. the part of technical provisions ceded to reinsurers. In fact, for greater clarity, the gross amounts are stated in technical provisions under liabilities on the balance sheet, recording at the same time the quota of provisions corresponding to reinsurance cessions under assets.

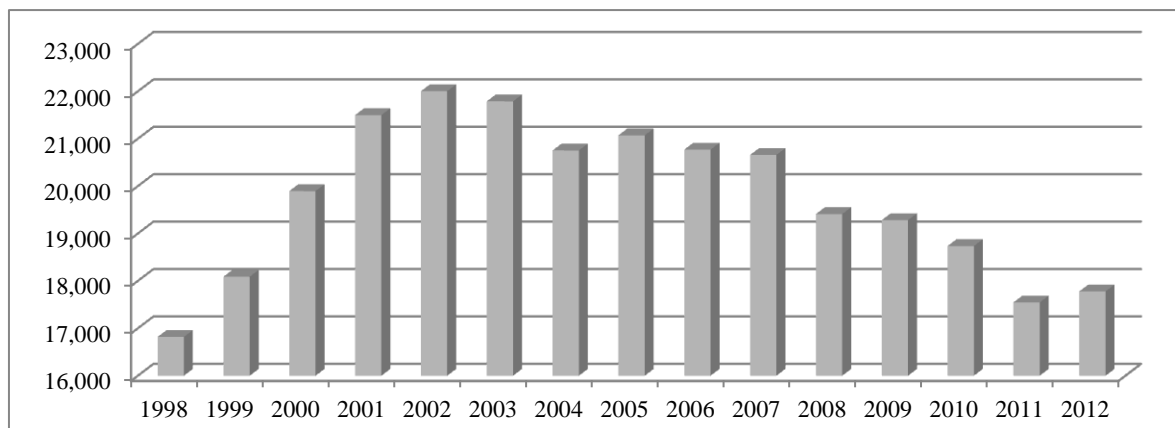

Figure 12. *Technical provisions borne by reinsurers (€m)*

As can be noted from the graph, the trend of reinsurers' share of technical provisions in the fifteen years considered by this study, increased considerably between 1998 and 2002, reaching the maximum value in the entire period considered. A decrease in 2004, followed by a short upswing in 2005, was followed by a tendential decline that resulted, in 2011, in a level lower than that of 1999.

Attempting a possible interpretation of this phenomenon, it could be assumed that Italian insurers, in the period of crisis from 2007 onwards, in an attempt to increase their earnings, maintain higher margins of risk inside the company and therefore reduce reinsurance cessions.

CONCLUSION

Between 1998 and 2012, the Italian insurance industry has shown that a close correlation exists between its firm size proxy and GDP. The period considered, intentionally broad in order to capture medium- and long-term trends, reflects very different, heterogeneous economic situations, ranging from a period of growth to a period of recession induced by the 2007/2008 economic-financial crisis.

Our analysis has revealed that the firm size proxy apparently anticipates the economic trend of GDP by around one year.

This would demonstrate, as opposed to the initial hypothesis, that the Italian insurance market adapts very quickly to the surrounding economic context and even anticipates this. This would indicate that the sector analysed is an important “signpost” factor in anticipating the macroeconomic variables of the rest of the country. This could be explained by the fact that, insofar as an indicator of the global economy, GDP is structurally “slower” in reflecting on-going changes compared with the insurance sector and probably the financial sector in general. This is consistent with theories of rational expectations according to which, in the medium- and long-term at macroeconomic level, the expectations of stakeholders in the economic system tend to be correct. This can also be asserted with regard to the short-term; for this reason, our research considers, as already indicated above, a time horizon of fifteen years that makes it possible to go beyond economic trends.

All the considerations regarding information furnished “a priori” are also confirmed when analysing the growth rate of the book value of assets of the companies of the sample with Italian GDP.

Lastly, a more detailed analysis of the book value of investments in the period considered reveals that these are particularly significant as regards all assets on the insurance balance sheet. Inside the investments category, an analysis has been made of how investments covering Life business exceed those relating to Non-life business, thereby demonstrating the consequent increase in the Life business of insurers. Also, correlating this with the demographic trend of the country, it has been seen that although the business of insurers is correlated with demographic trend, it does not seem to be particularly influenced by this. A reduction, in particular in percentage terms, in investments in tangible assets in the investment portfolio can be noted in the years considered.

The last consideration concerns the reinsurers’ share of technical provisions that increased until 2002 and then declined constantly. Our interpretation of this phenomenon is that the crisis that occurred in these years induced insurers, in order to increase their earnings, to maintain increasingly higher portions of risk inside the company, ceding increasingly fewer risks to reinsurers.

The limitations of this research include, on the one hand, the need to verify impact on the entire financial sector, extending this at least to the banking sector while, on the other, it would be extremely

useful to compare the Italian situation with that of other countries in and outside the Euro zone in order to verify similarities and differences.

ABSTRACT

Primary health care services delivery and its effects on patient satisfaction are very important for healthcare managers as it affects healthcare results and organizations operational expenses' management. Patient satisfaction is typically view it as a multidimensional construct. The purpose of this study is to exploit the theoretical frameworks of three-factor theory in order to identify the service delivery factors affecting patient satisfaction formation and to investigate whether there is an asymmetric service quality-satisfaction relationship. Regression analysis with dummy variables was used to analyze the responses of 407 primary healthcare services' users, which were collected via personal interviews using a properly designed questionnaire. The results showed empirical support to the three-factor theory in the context of primary health care services by confirming the asymmetric relationship between service delivery performance assessment and patient satisfaction. Implications for practice and directions for future research are then discussed.

Keywords: *Patient satisfaction, service quality, three-factor theory, service process evaluation, primary healthcare services*

INTRODUCTION

One of the major tasks of health care managers is to continuously improve the effectiveness of the health care services in order to increase users' satisfaction and loyalty, since this objective influences health care outcomes and contributes to institutions accountability's demonstration (Raposo et al., 2009). A satisfied patient is more inclined to follow doctor's prescription, which in turn will affect patients' satisfaction with the service outcome (e.g. symptoms relief) (MAcStravic, 1991), avoids complaining and lawsuits (Ahorony and Strasser, 1993) is more loyal to and provides positive referrals about the service provider (Mekoth et al., 2011; Chang et al., 2013). On the other side, there is a connection between patient satisfaction and staff satisfaction (Welch, 2010). The assessment of

satisfaction with healthcare services is dynamic and multidisciplinary process (Lovato et al., 2013) and is considered as the most important factor for healthcare systems' planning and effectiveness assessment (Dzomeku et al., 2011; Bhattacharyya et al., 2013).

Primary health care is a major element of any health care system (Raposo et al., 2009), since it brings healthcare closer to citizens' place of residence and work, operating as their first level of contact with health care system (Cueto, 2004, Souliotis and Lionis, 2003). According to Noula et al. (2007), primary health care in Greece is still underperforming. Despite the efforts that have been undertaken over the last decade, the effectiveness of the systems needs to be improved by upgrading the relevant services offered, especially at a regional level. This pressure for improvement is further enhanced by the increase of primary health care services' demand as a result of the bad economic conditions of Greece during the last five years (Benos and Kondilis, 2012).

So in order for the state to plan and deliver better primary health care services, it is fundamental to identify and assess the service factors that their improvement will lead to patient satisfaction. The knowledge of these parameters will be valuable for managers in order to conduct the appropriate modifications that will positively affect system's effectiveness.

Many previous research efforts, regarding the relation between attribute-level performance and patient satisfaction, argue that service quality attributes have a symmetric influence on patient satisfaction, meaning that the effects of service quality deterioration on dissatisfaction will be the same with the relevant effect on satisfaction caused by an equal increase in service quality (Andaleeb, 2001; Choi et al., 2005; Raposo et al., 2011; Mekoth et al., 2011; Mehta, 2011). In this modeling framework, service improvements prioritization, based on the "voice of the customer", is performed with the use of "importance-performance analysis" IPA (Marttila and James, 1977). In a typical IPA, managerial decisions are based on the attributes' position on a two-dimensional grid in which the two axes depict the scores of attributes importance and performance as assessed by system users.

However, numerous studies on the determinants of customer satisfaction reveal that the relationship between attribute-level performance and customer satisfaction can be asymmetric, meaning that the importance of satisfaction determinants may vary, depending on their current level of attribute-performance (Mittal et al., 1998; Matzler and Renzl, 2007; Miculic and Prebezac, 2008). In such a case, many researchers have shown that the results of IPA may be misleading (Matzler and Renzl, 2007; Miculic and Prebežac, 2008; Tsirintani et al. 2010).

The purpose of this paper is to address this shortcoming of IPA, as a tool for primary health care systems improvement, by implementing the "penalty-reward-contrast analysis" (PRCA), a method for primary healthcare services attributes categorization, proposed by Matzler and Renzl (2007) and Miculic and Prebezac (2008), which is based on the nature of their relationship with patient

satisfaction. Moreover, the results of the two analyses are compared and discussion of findings is presented, followed by research and managerial implications, research limitations and directions for further research.

LITERATURE REVIEW

Patient satisfaction

There are several approaches in defining patient satisfaction. For some researchers patient's satisfaction is defined as the gap between expected and perceived characteristics of a service (Fitzpatrick and Hopkins 1983), while for others patient's satisfaction is a special form of attitude, reflecting the extent to which a patient liked or disliked the service after having experienced it (Woodside et al., 1989). For John (1991), patients' satisfaction concept includes both approaches. In this way, patients' satisfaction can be viewed as an attitude resulting from the confirmation or disconfirmation of expectations (result perspective) or as a process, resulting from the level of expectations the patient takes to the service experience (process perspective). Thus, it is not only important to know the result from the service experience, but also what are the causes and dimensions that give rise to satisfaction.

The most recent models of customer's satisfaction consider satisfaction as an enlarged process or an interaction system around purchase, use and repurchase acts. A working definition of patient satisfaction, proposed by Welch (2010) and Sun et al. (2001), includes the following: 1) overall satisfaction, and 2) behavioral intentions reflecting patients' likelihood to recommend their service provider and their willingness to return. Indeed, these 3 overall measures abound in the literature as practical indicators of patient satisfaction. This new perspective recognizes that the customer psychological reaction to a service cannot be represented as the result of one only episode, but as a series of activities and continuous reactions along time. In this way, the aggregation of individuals, occasions, stimuli and measurements is a good way to surpass some of the problems related to traditional analysis (Johnson 1995; Johnson et al., 1995).

Primary healthcare system service attributes

Researchers agree that perceived service quality is an attitude towards or a global judgment about the superiority or inferiority of a service (Grönroos, 1990; Cronin and Taylor, 1992; Parasuraman et al., 1988). Moreover, Berry et al. (1988) argue that service quality is a great differentiator and the most powerful competitive weapon of service organizations.

In health care services provision in particular, Donabedian (1980) argues that service quality assessment should include an analysis of the structure to achieve a given level of healthcare quality (the characteristics of doctors, hospitals and staff); of the process (interaction with the structure) and of the result (what happens to the patient after the medical act). Considering the combined effects of the structure and process elements of health care services, Carr-Hill (1992) found that patient's satisfaction is mainly affected by six dimensions including medical care and information, food and physical facilities, non-tangible environment, nursing care, quantity of food and appointment bookings.

With regards to the result dimension of healthcare services provisioning, though it is considered as the most important element for patients (Mummalaneni and Gopalakrishna (1995), it is not very well studied and this is attributed to its measurement difficulty caused by the very large period of time between the moment when service is provided and the results' revealing (Choi et al., 2005). Moreover, Boller et al. (2003) consider the result of healthcare services is a consequence of the service's quality and not one of its components, stressing the importance to focus on the structure and the process when analyzing service quality in health care services. Finally, Peyrot et al. (1993) argue that it is possible to improve patients' satisfaction through the improvement of aspects that are not related to the service's outcome quality, but, through aspects related to process quality.

For primary health care services Bryant et al. (1998) suggest that the main aspects of service quality assessment include socio-emotional variables, referring to the perceptions that patients have about the communication and interpersonal capacities of healthcare services (affection, empathy, politeness); system variables, referring to the physical or technical aspects of the local in which the service is provided, such as, the waiting time for the appointment, access to services, technical quality of services, costs, comfort of equipment and the appointment's duration; influential variables, such as, list of contacts (family and friends); and moderating variables, referring to socio-demographic variables and state of health.

On the nature of the relationship between service quality and patient satisfaction

The majority of empirical studies consistently suggest that service quality is an antecedent of satisfaction. The theoretical support is based on the attitudinal framework, developed by Bagozzi (1992), which suggests that customers first evaluate a service cognitively (service quality assessment), and then they react emotionally to this appraisal (satisfaction). Most previous studies consider that the relationship among service quality of health care and patient satisfaction is linear and symmetric (Andaleeb, 2001; Choi et al., 2005; Raposo et al., 2009; Mekoth et al., 2011; Zamil et al., 2012). The result of the relationship identification among service quality attributes and patient satisfaction is the importance of service attributes in determining patient satisfaction which along with service

attributes-performance are used for conducting the importance-performance analysis (IPA) (Martilla and James, 1977). IPA assumes that attribute's performance and importance are independent variables and the relationship between service-attributes' performance and patient satisfaction is linear (Deng, 2007). Kano et al. (1984) were the first who classified products/services attributes by considering their potentiality in creating customer satisfaction. The three-factor theory, proposed by Kano et al. (1984) presumes that the effect of a product/service attribute on customer satisfaction varies according to its performance. This fact signifies the existence of asymmetric relationships among service-attributes and overall satisfaction. In the customer satisfaction context, service attributes are characterized as being (Matzler et al., 2004):

Basic: they reflect the minimum requirements that service providers have to offer to the customers. They may cause dissatisfaction, if they are not offered, but do create high satisfaction, if they are not offered. When performance of the basic factors is low, their influence on satisfaction becomes very important, while when their performance is high, their influence on satisfaction decreases and become unimportant.

Performance: they produce high customer satisfaction when they are offered, but they may also produce dissatisfaction, if they are not offered. The effect on overall satisfaction is linear and symmetric.

Excitement: they reflected unexpected aspects of services offered given that their existence may produce high customer satisfaction, but their absence does not create dissatisfaction. The importance of the excitement factors increases when their performances are high, but they become unimportant when they underperform.

Penalty-rewards-contrast analysis (PRCA) is commonly used for service attributes classification as basic, performance and excitement factors according to their asymmetric influence on overall satisfaction (Busaca and Padula, 2005). In the context of primary health care services, the studies that use the three-factor theory of patient satisfaction are scarce. This study is trying to fill this gap in order to achieve its objective to provide an alternative for service improvement planning.

RESEARCH METHODOLOGY

Sample and data collection

The target population of this study was users of primary healthcare services who visited the outpatient departments of public hospitals in the district of Athens. Eight hospitals were selected for data collection. Four of them were specific disease hospitals and the others were general hospitals. A stratified random sampling was utilized with a sampling ratio of 1:5 meaning that for every five patients that got out of the clinics one was interviewed. 700 questionnaires were distributed (650 in

morning clinics and 150 in afternoon clinics). The fieldwork was conducted during April and May 2013. Contacts were made at different times of the day and days of the week in order for day and time related bias to be eliminated. The procedure resulted in 420 filled questionnaires of which 407 usable questionnaires were coded for data analysis, yielding a net response rate of about 58%. Using the Armstrong and Overton (1997) procedure, nonresponse bias was evaluated by comparing early respondents with late respondents for all constructs considered in this study. No significant differences were recorded at the 0.050 level of significance.

In relation to gender, 57.3 % of the respondents were female. In relation to age, 14% of respondents were in the 18-24 age-group; 19% in the 25-34 age-group; 19% in the 35-44 age-group; 20% in the 45-54 age-group; 13% in the 55-64 age-group; and 13% were above 65 years old. 3% of the respondents failed to report their age. 54% of the respondents were married and 29% were single. In terms of monthly income, 33% of the respondents' monthly salary is less than €1,000; 19% gets between €1,000 and €2,000; and 6% gets more than €2,000. 33% of the respondents failed to report their monthly income. In terms of educational background, 34% of respondents have a university degree. Finally, 56% of the respondents have visited primary health care services less than 6 time during the last twelve months; 13% between six and twenty times and 3% more than twenty times. 18% of the respondents failed to report services' usage frequency.

Measures and survey instrument design

Data were collected through a questionnaire developed to understand patients' perception about primary healthcare service quality. The questionnaire was divided in five sections: the first addressing general information about respondents' demographics and primary health care usage pattern (frequency and motives). The next four sections addressed specific questions about patients' perception on hospital's facilities condition, administrative processes, medical and nursing care. The scales used to measure the four primary healthcare service attributes were adopted from the studies of Dagger et al., (2007) and Raposo et al. (2009). The scale proposed by Oliver (1980) was used to measure patient satisfaction reflecting overall satisfaction, expectations disconfirmation and needs disconfirmation. All items were measured on 5-point Likert scales anchored at 1 (strongly disagree) and 5 (strongly agree).

Data analysis methods

Firstly, exploratory Factor Analysis (EFA) was conducted for the items of primary healthcare service attributes and patient satisfaction. The purpose of this analysis was to reduce all items to a smaller and

manageable set of variables (Malhotra, 2010). Secondly, IPA was employed to identify prior areas of recourse allocation aiming to increase patients' satisfaction by using the service attributes importance and performance means. Finally, PRCA was used to classify primary healthcare service attributes according to their asymmetric influences on patient satisfaction.

RESULTS

Exploratory factor analysis

Table 1 show EFA results (i.e. rotated components matrix) for items measuring primary healthcare service attributes and patient satisfaction. The Kaiser-Meyer-Olkin (KMO) measure of sampling adequacy is an index used to examine the appropriateness of factor analysis. The value of KMO statistic for this study is 0.95 which shows that the factor analysis is appropriate. Based on the eigenvalue criterion the analysis revealed the existence of five factors, namely Nursing Care (NC); Facilities Condition (FC); Medical Care (MC); Administrative Services (AS); and Patient Satisfaction (PS). The percentages of total variance attributed to each factor are 46.34%, 10.35%, 5.92%, 5.08% and 3.23% respectively. The total variance explained is 70.93%, well above the proposed cut-off value of 50% (Malhotra, 2010). Internal consistency; convergent validity and discriminant validity estimations were used to test the strength of the proposed measures. All factor loadings are greater than 0.55 implying significant constructs' convergent validity. Constructs' discriminant validity is also confirmed, since there are no items strongly loading (> 0.4) on two or more factors. Finally, a reliability test was conducted for each component by calculating Cronbach's alpha. All relevant values range between 0.77 and 0.96 (> 0.7) which means that the internal consistency of the items in the new scales is very good (Tabachnick and Fidell, 2007).

Importance-Performance Analysis

For performing IPA, performance and importance means of each service quality dimension were calculated. The means were employed for positioning the attributes on the IP matrix. In the current study, the implicit importance of the four service attributes was calculated using a linear regression model expressing their symmetric impact on patient satisfaction. Performance means for each service attributes are provided in Table 1 and the implicit importance of the four service-attributes determining patient satisfaction are given in Table 2.

Table 1: Factor analysis results for primary health care service attributes

Regression analysis results revealed all service attributes significantly affect patient satisfaction, explaining 46.2% of variance in patient satisfaction and that Medical Care is the most important

service quality attribute, followed by Facilities Conditions, Nursing Care and Administrative Services. The grand means of implicit importance and service attributes performance separate the matrix into four quadrants as illustrated in Figure 1. IPA matrix shows that Medical Care is a “keep-up the good work” attribute, meaning that is highly important for the customers and performs highly. Nursing Care and Administrative Services are “low-priority” attributes. These attributes were not considered as important as other attributes by patients, while their performance were perceived relatively lower than others. Finally, Facilities Condition is characterized as “concentrate here” attribute. Service providers have to particularly focus on the improvement of this attribute in order to increase patient satisfaction.

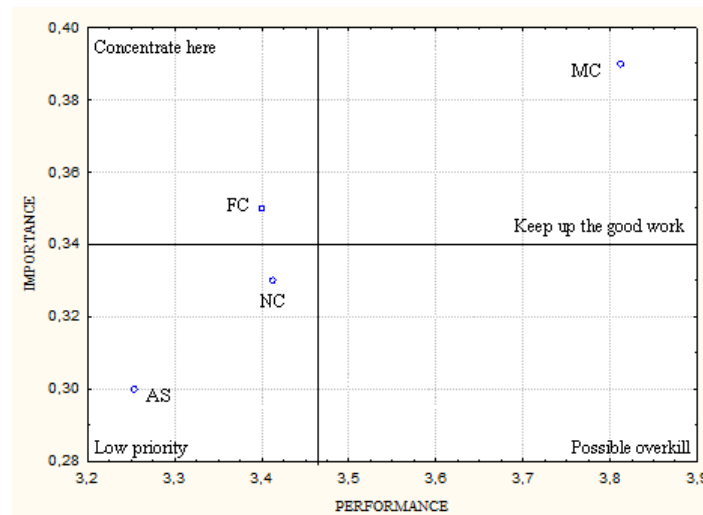

Figure 1: Importance-performance analysis (IPA) for patient satisfaction

Penalty-reward contrast analysis

PRCA uses dummy variables to test the asymmetric relationships among service quality attributes performance and patient satisfaction in order to classify the service attributes in categories provided by the three-factor theory (Matzler et al., 2006). Thus factor scores, obtained from the exploratory factor analysis, in the lower quartile were used to form one dummy variable to quantify the influence of the attributes when satisfaction is low. In the same way, the factor score in the upper quartile were used to quantify the impact of the attributes in case of high satisfaction. Based on this recoding, a multiple regression was conducted with these dummy variables. Thus for each attributes two regression coefficients are obtained: one indicating attributes' impact on patient satisfaction when its performance is high; and the other indicating attributes' impact on patient satisfaction when its performance is low. The results of PRCA are given in Table 2 and illustrated in Figure 2.

The dummy regression model was statistically significant ($F = 43.39$, $p = 0.00$), explaining 45.5% of variance in patient satisfaction. The analysis indicated that all dummy variables' coefficients have the

right sign and they are significantly affect patient satisfaction at the 0.05 level of significance. T-test was used to test the equality of penalty and reward indices for all service performance attributes. The results of t-tests indicated that the null hypothesis ($\beta_{j+} = \beta_{j-}$) can be rejected for Medical Care ($p=0.000$); Nursing Care ($p=0.001$); and Administrative Services ($p=0.019$) and can be accepted for Facilities Conditions ($p=0.186$), meaning that there was an asymmetric relationship among primary healthcare service performance and patient satisfaction for three out of four service attributes.

PHCSQ factors	Regression coefficients ^a	Dummy variable regression coefficients ^b			
		Reward indices	Penalty indices	Parameters equality test t-value	Factors classification
Nursing Care	0.33***	0.25***	-0.14***	3.17***	Excitement
Facilities	0.35***	0.18***	-0.23***	0.89(ns)	Performance
Medical Care	0.39***	0.31***	-0.15***	3.95***	Excitement
Administrative Services	0.30***	0.12*	-0.24***	2.08***	Basic
F	88.33***	43.39***			
R ²	0.462	0.455			

Notes: All regression coefficients are standardized coefficients

^a symmetric influences of service quality attributes

^b asymmetric influences of service quality attributes

** $p < 0.05$

*** $p < 0.001$

Table 2: Relationship between service quality attributes and patient satisfaction

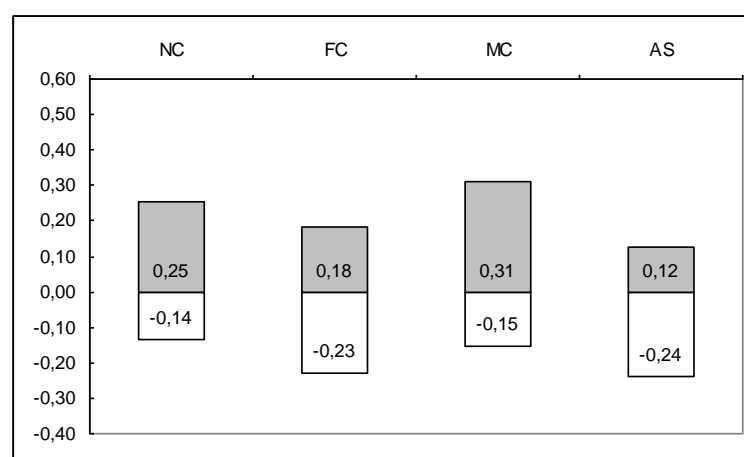

Figure 2: Penalty-reward-contrast-analysis for patient satisfaction

More specifically, Administrative Services are classified as basic factor, because its relevant penalty index is higher than its reward index. Thus, increasing their performance above expectations is not

going to increase patient satisfaction, since it establishes “a market entry threshold”. Facilities Condition is classified as performance factor. That factor relates to patient satisfaction if its performance is high and may produce dissatisfaction when underperforms. Finally, Medical and Nursing Care are classified as excitement factors, because their penalty indices are much lower than their respective reward indices. Therefore, the way for primary healthcare services efficiency improvement is to increase patient satisfaction by improving the provided medical and nursing care.

DISCUSSION AND CONCLUSIONS

Knowing the primary healthcare service attributes’ characteristics is very important for researchers and practitioners, since their importance can be used for actions prioritization towards patient satisfaction increase and system’s effectiveness improvement. Therefore, in this research study, the symmetric and asymmetric effects of primary healthcare attributes on patient satisfaction, through PRCA, are investigated.

The IPA findings, resulted from the linear symmetric relationship among four service attribute performance and patient satisfaction, suggested that Administrative Services and Nursing Care are classified as “low priority” service attributes; Medical Care as a “keep up the good work” attribute and only Facilities Condition was identified as a “needs improvement” attribute.

As far as the Administrative Services and Facilities Condition performances are concerned, the results of IPA and PRCA coincide. More specifically, the Administrative Services is a basic factor and as such low priority should be given to them, since any improvement of its performance will not increase patient satisfaction, whereas the current performance level’s retention is perceived as adequate by system’s users. On the other side, Facilities’ condition is a performance factor and as such the improvement of its performance will positively affect patient satisfaction while its performance reduction will deteriorate patient satisfaction. However, the results of IPA and PRCA with respect to Medical and Nursing Care diverge. These two attributes were found to be excitement factors and as such they have the power to affect patient satisfaction only in case of performing above patients’ expectations.

In summary, the results of this study signal the importance of identifying the performance and excitement factors of primary healthcare services, because high patient satisfaction can be achieved by paying particular attention to these factors. Based on the results of the PRCA, the highest priority should be given to the improvement of Medical and Nursing Care and then to the improvement of Facilities condition. Finally the retention of Administrative Services’ current level of performance should be the target of healthcare managers since only its performance decrease will negatively affect patient satisfaction.

Many previous studies have confirmed the patient-physician relationship as the most important indicator of patient satisfaction. Patients feel more satisfied when they have confidence to the doctor and they have established a constant communication with him (Ali and Ndubisi, 2011). The new finding, that needs to be further investigated, is the role of nurses in the relationship between primary healthcare service's providers and patients. This study, in accordance with the findings of Scardina (1994), highlights the importance for service providers to invest in the nursing personnel's development, in order to take advantage of the fact that nurses are much closer to the patient, than other members of the staff, and they can easier establish relationships with them.

This study has some limitations that should be considered when interpreting its findings. First, the findings and the implications of this research were obtained using a cross-sectional study. This reduces the ability of the study to reflect the temporal changes in the research constructs. Second, the relationships among primary healthcare service attributes and patient satisfaction were validated with data from one country. Performing the study across different countries would provide evidence about the generalizability of the service quality dimensions and the robustness of the relationships among the constructs determining patient satisfaction.

Funding: This study was financially supported by a research project conducted by the department of Health Economics of the Technological Educational Institute of Athens and funded by the European Social Fund (E.S.F.) and the Ministry of Education, Lifelong Learning and Religious Affairs of Greece 2012-2015.

DOES THE GERMAN SCHOOL SYSTEM PREPARE FOR CULTURALLY SENSITIVE MANAGERS?

Göhlich, Véronique; Bremser, Kerstin

International Business Department, Faculty of Business and Law, Pforzheim University of Applied Sciences, Pforzheim, Germany

ABSTRACT

Purpose: Literature shows abundant evidence that the country of upbringing does influence a child's perception on cultural issues and will hitherto also influence its intercultural competences. Schooling also has an important impact on cross-cultural competences since it is in school where pupils deepen their knowledge of culturally acceptable behavior. In Europe, school systems still differ widely. The research focuses on how the German school system influences German managers – and here especially their leadership styles – working in a French environment.

Design / Methodology / Approach: The exploratory study relies on an in-depth interviewing. Five in-depth case studies of German managers working in French companies were conducted.

Findings: Results indicate that their schooling in Germany did influence their leadership style and management preferences. However they needed to adapt upon start of their career in France.

Research limitations / Implications: The study was limited to a small sample of managers employed in different industries in France. It would be interesting to increase the sample size as well as the industry coverage in order to test generalizability of the study.

Social and practical implications: The study showed that the five interviewed German managers could successfully adapt to French reality, accept differences and use them in their favor due to the values they learned at school. They brought from the German school system appropriate language skills combined with tolerance for other cultures. However they missed acceptance for authority, competitive spirit and flexibility towards time. Also they had to learn at the working place how to express things on a moderate and diplomatic way, avoiding any open criticism.

Keywords: *Intercultural Competence, Germany, France, School system, Leadership*

INTRODUCTION

France is Germany's closest and most important partner in Europe. With no other country does it coordinate all its policies more extensively or regularly (Trouille, 2013). However the cultural differences between France and Germany remain significant (Strübing, 1997). A main cause can be found in the values which are taught in the family and at school. The school systems differ substantially between France and Germany (Hans, 2012). The goal of this paper is to analyze how German managers are affected through the values they learned at school when working in France. This paper is structured as follows:

Firstly based on the literature review, it will be analyzed to which extent the cultural values can be related to the German school system and how the leadership styles depend on national cultures.

Secondly, after having presented the methodology, the results of in-depth interviews with five German managers working in France will show how the values taught at school prepare German managers for working in a French led company.

The results will be finally discussed and recommendations for policy makers and German managers will be given in the last section.

LITERATURE REVIEW

Germany and France have been growing together even more during the past 50 years and commercial contacts between German and French firms are intense. On the one hand, this leads to more and more German managers working for French companies and having to deal with French subordinates as well as French superiors. On the other hand many German companies depend upon the French market for sales and supplies and have to deal with French suppliers or customers. Since supplier – customer relationships are heavily intertwined German managers should be able to communicate effectively with their French counterparts. This implies not only the ability to master the foreign language but also to understand culturally based behavior.

Literature on the relation between schooling and ability to acquire culturally effective leadership qualities is scarce. This study intends to close the gap. The literature review will therefore first consider works in the field of culture, than studies about education and finally compare leadership style depending on national culture.

One of the first studies in the context of intercultural management has been conducted by Kluckhohn and Strodtbeck (1961). They observed five main value orientations (relationship between human being and nature, attitude towards others, attitude towards time, main characteristics of human nature, preferred mode of activity) that have been extended by other researchers throughout time (e.g. Schein, 1990, Hofstede and Hofstede, 2011, Trompenaars and Hampden-Turner, 2010 or e.g. Hall and Hall,

2007). Schein (1990) extended their research so that his five categories comprise humanity's relationship to nature, the nature of reality and truth, the nature of human nature, the nature of human activity, and the nature of human relationship. Those categories are fundamental to each human being, invisible and unconscious. Children acquire them through acculturation in their own society and do not question them. More visible and interlinking are values, strategies, aims and philosophies. It is here where cultures meet and can be understood (Barmeyer and Maryrhofer, 2008). Several differences between French and German culture can be observed. The French society is predominantly catholic and shaped by Cartesian tradition with regard to the "nature of reality and truth". Descartes is one of the most influential French philosophers and scientists. His classic statement "cogito, ergo sum" (I think, therefore I am) influenced the entire French educational system with the so-called Cartesian doubt - a) accept only things you know to be true, b) dissect the truth into small pieces, c) first solve the easy problems, d) make sure to complete a list of remaining problems. This approach is still taught at school and motivates every French person to question anything unless truth has been proven. In professional life this facilitates a continuous search for new, innovative solutions and established working orders are not necessarily observed (Heidenreich, 1995). It is common understanding that national institutions are responsible for establishing the "truth" (Uterwedde, 2013). This leads to a belief in a hierarchical "nature of human relationships" and a very hierarchical society as measured by Hofstede (2011). The expectations of French employees is that their managers give them clear tasks but also endorse the responsibility, acting as a mentor or father who is going to control and to solve eventual problems (Barmeyer, 2008). Successful French managers put emphasis on a personal relationship with their subordinates rather than concentrating on fact-based management (Höhne, 2012).

Germany's culture on the other way is predominantly based on fact-based management (Uterwedde, 2013). Compared to France, many companies have adopted a more participative management style in the last decades. This fits well to the Lutheran tradition where people are supposed to be self-reliant and cannot be granted any absolution by the institution Church. Thus, the nature of human relationship is not as hierarchical and hierarchies are not as important and not as developed as in France (Barmeyer and Davoine, 2008). In Germany power in corporations tends to be split horizontally between divisions which are then required to cooperate (Barmeyer and Davoine, 2008). The expectations from German employees to their managers is to involve them into all processes, including planning and decision making and to delegate to them a part of the responsibility (management by delegation). Science is rooted in a Humboldt tradition and based on observation of nature and detection of pure facts out of observation ("nature of reality and truth"). Facts play an important role in life and fact-based work is highly valued by Germans (Barmeyer and Davoine, 2008). Therefore, within Germany trust can be built through fact-based communication, since facts form the observed basic

truth. In addition, communication is rather direct and centers on the facts (Lewis, 2005). In professional life this creates a climate where people coming out of different school systems (dual system, higher education, professional colleges) can communicate with one another and status is mainly conferred through expert knowledge, not through prior education (Heidenreich, 1995).

This brings up the first research question:

To which extent are the cultural values described above related to the German school system?

German school system

After having described certain cultural characteristics, it remains interesting to explore whether or not these issues have been taught at school. The German school system is on the one hand very selective, one other hand very individual. It is selective because at the age of ten (or twelve in some states) children are sorted into three types of secondary schooling. Only the Gymnasium leads to the university entrance exam. In addition, after tenth grade students are tested for their ability to enter university prep phase (Gannon, 2004). Fact is that in Germany the enrollment in tertiary education reaches 44% against 65% in France (World Economic Forum, 2013). In Germany, authority over education has been delegated to the individual states that are solely responsible for schooling. They accommodate differences and develop educational standards through the “Kultusministerkonferenz” (KMK) where education ministers of all 16 states come together. Primary school is four to six years (depends on the state); secondary school is eight or nine years. After twelve or thirteen years of schooling children can obtain the Abitur which is – among other qualifications – the main university entry examination. All states recognize their Abitur. Education frameworks used to be very general and only the so called “PISA shock” increased cooperation in this area (Oberhuemer, 2005). Teaching standards for the main subjects in secondary schooling (German, Math, and Foreign Languages) have been formulated recently, recommendations on values taught in secondary school exist since the 1970s (Kultusministerkonferenz, 2013). Teaching standards for teaching in Math and German (Kultusministerkonferenz, 2004a, Kultusministerkonferenz, 2004b) date from 2004, general guidelines on elementary schooling have been developed in the 1970s (Kultusministerkonferenz, 1996). Taking into account that today’s managers started school prior to 1980 and finished it in the late 1990s they were not yet subject to standardization efforts and have been taught widely differing contents. Still, certain values should have been taught everywhere. For primary schooling, those values are (Kultusministerkonferenz, 1996):

- Foster interest in learning and acquiring knowledge.
- Develop an individual point of view.
- Learn problem solving methods (especially through acquisition of mathematical knowledge).
- Be part of nature and protect it.

- Know your cultural roots but be open to the world.

The values to be conveyed through secondary schooling are (Kultusministerkonferenz, 2013):

- Individual responsibility, formalized in the possibility to select the main subjects that influence final grades and discard subjects that the individual student finds difficult (within certain limits).
- Community thinking epitomized in the many different school systems that achieve federal recognition only through their broad acceptance at the community level.
- Responsibility to sustain society and democracy.
- Acquire and structure knowledge individually.
- Work and communicate in teams.

In addition, pupils are required to have attended classes in at least German, Math, two foreign Languages, History and Religion (or Ethics). Other courses can be selected from the fields of Science, Music, Arts and Sports.

Fuchs, Werner and Wallau (2008) describe a paradox in the German approach to schooling: All federal states curricula emphasize individualization of the curriculum to dedicate time to pupil's involvement as well pupil-teacher dialogue and a very individual approach to different learning abilities. However, in reality the very detailed curricula that dictate learning input leave teacher's limited freedom to achieve these goals.

Taking all this information together, schools stress several aspects of a future manager's life:

- Individualism
- Importance of team work and flat hierarchies (moderate Power distance)
- Ability to structure and plan (high Uncertainty avoidance)
- Learn about the past, sustain the future (Long-term orientation)
- Success / achievement orientation (high Masculinity) through early selection process after elementary school and second selection process after having completed tenth grade.

Therefore, it can be concluded that the main aspects of culture and management culture are taught at school.

This leads to the formulation of the next research question: How does the German schooling and the values taught prepare future managers for working in a French context?

METHODOLOGY FOR THE EMPIRICAL WORK

Given the scarcity of literature on the subject and the exploratory nature of the question, the study relied on a multiple case study approach in order to build a theory. Case studies are ideally suited to answer how and why questions where the investigator has little control over the event and a real world phenomenon is involved (Yin, 2014). It helps to understand the dynamics present in a defined setting

(Eisenhardt, 1989). A total of three German managers with working experience with French were initially chosen and personally interviewed in order to pre-test the interview-guidelines. Interviews lasted between one and two hours. Afterwards, results were analyzed and more restrictive criteria for selecting new interviewees were defined: the respondents needed to be German persons, having gone to school in Germany and living and working as a manager in a French led company for at least three years. The definition of a manager in the study was somebody in the organization who had to report to his hierarchy, and himself has a team under his responsibility.

The interview-guideline was adapted to this new pool and sent to the respondents at least two days in advance in order to give them the time to reflect about the questions. This guideline helped them to gather their thoughts on selected topics, which would then be discussed during the interview. Interviews with all five respondents lasted between one and three hours. Four of the interviewees are working geographically in Paris or Paris vicinity, which is not surprising since most of the well-paid and representative positions in France are located in Paris. One has been seconded from the Paris headquarters of his company to Toulouse. For a summary of the interviewees' characteristics see Table 2.

Respondent	Gender	Age	Area	Degree	Company	Position	Work relation with France	Time spent in France
A	Male	35-44	Toulouse	PhD in Engineering-	Multinational Engineering	Vice President	responsible for contacts to multinational joint-ventures	7 years
B	Female	35-44	Paris	Master in Finance	Bank	Director Marketing	Responsible for marketing campaigns	More than 20 years
C	Male	35-44	Paris	Bachelor Business-Degree and MBA	Telecoms	Director Costing Department	Responsible for reporting and use of pricing systems globally;	5 years
D	Male	45-54	Paris	Business Degree	Construction and Packaging Products	Senior-controller	International controlling	More than 20 years
E	Female	35-44	Paris	University Degree in nutrition science	French Research Institution	Project-Engineer	Research-project	14 years

Table 2. *Summary of Cases*

The interview was split in two parts. It centered on the perceptions about leadership of German leaders working in a French environment and what they observe or assess in their responsibilities in France compared to what they know from Germany. Interviewees were asked to reflect about leadership attributes like intelligence, charisma, communication skills, creativity, commitment, team spirit, leadership style, implication in networks and typical career paths, ability to manage time and work-life balance as suggested by Kouzes et al. (2008). In the second part, respondents were asked to assess what they had been learning in the German school system.

INTERVIEW FINDINGS AND DISCUSSION

The remarks of the respondents centered foremost on communication skills and emphasized the difficulty of French managers to communicate effectively in English and to implement open criticism. Language plays a crucial part in France as one respondent stated: “it is crucial to express oneself in a moderate, polite and diplomatic way”. The cultural identity depends on how well and fancy you are able to communicate in a language. Since only a minority of French managers is able to speak a foreign language at this very high level, French managers generally avoid speaking English, thus not exercising on a frequent basis and losing even more of their capacity to communicate in English (Wickert, 1992). Moreover, the way French is spoken defines social status. Already in the 18th century, French were competing in private and public contests in the Parisians “Salons” to prove their language proficiency. Having charisma and being able to address any audience with the right words and the right tone is an important attribute for a good French manager. This was also observed by the respondents: “French managers can be very passionate and emotional, fighting and competing for their ideas and for more power. They use their networks to get more influence”.

All respondents were able to speak French at a very high level, some of them having not even a foreign accent. So they did not feel like being disadvantaged, especially since they all had the benefit of speaking perfectly at least two further languages, which made them very special in the French business landscape as they discovered: “you have a big asset if you speak several languages”. They noted that this was beneficial from what they learned at school. As they stated, in school they learned to present in front of groups very well and to discuss and present in a foreign language. Within Europe (Germany’s most important sphere of influence), the dominant languages were (and still are) French and English. Thus, in order to educate future managers successfully, German school children were always told the importance of mastering English and French. Given that Germany is a fact-based society, it is more important to get the facts across in any language than to sound beautiful in any language (contrary to the French situation). Here the German school system taught our respondents very beneficial skills. However, the domination of the French language shows the love of French people for persons that

express themselves on a very polite and elaborate level, are ready wit and have repartee. This is one issue, where German school-children surely miss out, since it is not a focus of school teaching as the respondents also noted. Another observation from our respondents was the limitation of French managers to address problems openly. This is directly related to the importance of the personal relationship and the absolute priority to not endanger this relationship: diplomacy is a must, which prevails over telling a potentially disturbing truth: "Open-criticism is a no-go, especially in the group" as one respondent remarked. If you criticize what somebody says, you put the focus on criticizing the person, while the focus will remain on the fact in Germany. It was observed that the French way of arguing is something new to a German: "We have not been extensively trained to debate, to fight for one's point of view or to do lobbying. This is something I really learned when I started to work in France". Also the way to behave in the team and to evaluate conflicts was new to our respondents: "Conflicts between people are a real issue. There is limited willingness to negotiate and to find a consensus. Emotions can be difficult to manage in a team and appear sometimes little professional. There is this national tendency to go into contestation."

The German society is a lesser hierarchical one than the French one, information is a source of knowledge and not of power. Thus, children are taught at school to discuss and argue fact-based, give and accept criticism and go into details which implies that information is given away easily. In order to be successful in a French setting, these characteristics are counter-efficient as one interviewee put it, "you do not share power in France. Competition is very strong at all levels". In addition, as our respondents noted, they did not learn at school to accept the authority of the teacher, which is a must in a hierarchical society. Our respondents stated that in France "if you don't get along with the big boss, you would better switch the position".

The difference in dealing with time has been analyzed by Hall and Trompenaars (Hall and Hall, 2007; Trompenaars and Hampden-Turner, 2010a) and the results of the case studies confirm their theory: French managers are not as good as Germans in being punctual ("the clock does not rule the day in France. There is much more flexibility regarding the behavior to time and to following rules.") Being punctual is not always from benefit as the interviewees commented: "It does not really matter when you get into the office in the morning; however it is expected in most companies that you do not leave before 8 pm". Exercising a tight coordination is also not a strong point of a French manager. They often need pressure to really get involved. French managers can better live with unexpected situations. They like opportunities in order to demonstrate their improvisation skills and their flexibility (Barmeyer, 1996). A French specificity is the so-called 'Systeme D', which is the art of bending rules without breaking them (Trompenaars and Hampden-Turner, 2010a). As our respondents stated, Germans already learn at school very well how to organize themselves and plan their work on their own given

the importance of punctuality in German society. One of them quoted: "We could decide to work overly hard to get finished sooner, or to take less courses in order to be more involved in extra-curriculum activities or to be able to work besides studying. The studies were not squeezed into a strict time framework. We were responsible for managing our time and for our results." However, Germans do not learn to work under pressure the way French people do as was also observed: "Compared to what I experienced when starting to work in France, I remember my studies as with little pressure and competition". Thus, in this case again respondents were confronted with new situations. Our respondents all agreed that "Things in France can work out, even if it first seems it will never work out", "It is amazing to see that things work out and develop well, although you first thought this will never do". Also they stated that "It can be much quicker to get things decided in France since only the top manager needs to be convinced for making a decision". Here, they observed culturally different behavior and judged – given their own acculturation – with surprise that the French behavior is different, but can be as successful as the German one.

Regarding Drive / Passion, French managers can be very passionate and competitive, fighting for their ideas, bringing new alternatives even if the best solution seems to be obvious. "Managers love to not do the obvious, but often choose to go for the more complex, as if they want to prove that they are better and smarter". This spirit for competition is directly related to the French school system which is very selective and puts pupils under pressure from the elementary school upwards. The need for demonstrating a logical, well worded speech is prevalent to the option for agreeing to the best compromise for the group. French have in mind a "win-lose" negotiation scheme, in contrast to the Germans who favor a "win-win" approach. Therefore, it is difficult for French top-managers to be Team-players and to delegate without having the feeling to lose power and authority as was also noted "French top-managers usually are no team-players. They tend to not delegate as extensively as German managers in order to not lose power. Also they do not actively care for conviviality regarding their subordinates. Common social events are rare. They separate quite strictly work and private sphere." All respondents stated that French managers have a very strategically minded way to manage, in contrast to the German way which tends to be more operational. The traditional mindset "Diviser pour mieux regner" (inhibit coalition building to retain more power) is still in use today. "Managers think strategic and not operational".

From the remarks of our respondents, team work and community thinking were very important during schooling. "We had no school in the afternoon, only once a week one to two hours or physical education during the last two years before the Abitur. Extra-curriculum activities were very important. We all had hobbies (sport, music, etc.) scheduled in the afternoon or spent time with friends. So I grew in the scheme where school was not everything." These are aspects that the German school system

emphasizes. Together with the ability to dialogue with the teacher (= authority), German children are prepared for a consensus seeking, delegating management style which will not be of use to them if working in a French environment.

Another particularity of the French management is the importance of networks and personal relationships (Pateau, 1999). Without a powerful network, it is almost impossible to receive important information for defining the right strategy to follow as one interviewee stated: "I am aware about the importance of networks, but I have no chance to integrate them", "For top management positions, the alumni from the French "Grandes Écoles" have better chances, because of the network they have among each other. In the middle management, the biographies become wider and more diversified. There you need a mentor who will push you.". Information is a source of power, which in a hierarchical society needs to be held and is not given away easily. Your success in doing so will influence significantly how much power you have, and therefore will boost or not your career since "there is no systematic system for development and education on the job. Whether you do it depends on your relationship with your superior". The political nature of French organizations encourages information to be seen as a source of power and therefore is not easily given away (Schneider and Barsoux, 2003). This was also noted during the interviews: "If you want a decision being made, go to the top and convince there", "If you want to get information, you need to look for it, using your network. Information is power. You give it away if you trust somebody or if you want to act strategically"

Empathy was also an issue which was seen differently depending on the country culture. As already discussed, French managers do not deliver information systematically and broadly, since information is associated with power. While a good manager in a German organization needs to be very knowledgeable in order to coordinate properly the tasks he has been delegating to his team and readjusting if necessary the responsibilities he has been given away, a manager in a French organization will not give away the responsibility for the complete task as could be observed: "there is a fear for people in the middle management to take initiatives. They want to have everything approved through the hierarchy. At the same time, French people like to adapt the rules to their own needs, they do that all the time." Therefore a French manager will need to spend more time to motivate employees and tightly control their tasks since "the first attitude is to say no or to think at reasons why things cannot work out. As a manager, you have a huge task to motivate people" Since the people might not have the overview, a manager will spend more time fitting everything back together (Liouville and Schmidt, 1999). This greater hierarchical distance in France leads to a bigger human distance between managers and their collaborators as was also commented upon: "the only place where you exchange private news is the coffee vending machine on the floor"" At least, our German interviewees have

noticed that very few of their French colleagues seem to have extended intercultural competence. The importance of this competence is not well recognized and established yet. The younger French managers however seem to have a better understanding for this requirement. The German school system on the other hand with its focus on “know your cultural roots but be open to the world” does teach school children some basics of intercultural knowledge. Given the high migrant population in Germany, this will certainly increase within the next decades.

The current study shows that school systems, in this case the German one, are culturally tilted towards the dominant values of this society and it is difficult to acquire knowledge that prepares for a successful start in a different culture. However, recent research revealed that individuals high on cultural metacognition are more apt at adjusting their expectations when a different-culture counterpart disconfirms culture-specific behaviors (Mor, Morris, and Joh, 2013).

CONCLUSION

According to the study, it can be concluded that where the German school system does not teach values to succeed in France, it is actually quite successful in bringing cultural metacognition to its pupils, enabling them to adapt quite easily to environments where culture-specific behaviors are quite different. Most likely this cultural metacognition is transferred through the German desire to learn from the past and prepare for the future as well as the sense for community thinking. When one moves abroad, the new community seems to become the focal point of interest, so that these interests have to be sustained.

From this research certain implications for policy makers and for the corporate environment arise. In order to educate managers that are successful in a French (and more generally in a foreign) environment, policy makers should continue the path that has recently been started, teaching children tolerance and respect for other cultures. In addition, a strong focus should be set on those skills that were found to be beneficial, i. e. ability to communicate in other languages or community thinking. However, also very important seems to be creating awareness that things can work out, even if they are not argued fact-based or result from a consensus process.

Companies can learn from the study that in order to be successful in a French environment care has to be taken to select people that are fluent in the French language and understand the cultural environment. In addition, training could be beneficial to teach skills such as networking and communicating the right way.

Obviously, the research has some limitations. Firstly, it would be interesting to extend the sample to other professions. So far, only managers have been researched that were very fluent in French. It would be also interesting to extend our research to German managers who work in English because of missing

language skills. Moreover, it would be also interesting to observe the reverse situation: French managers in German-led companies in order to be able to develop guidelines for a sound intercultural education. This is especially important given the success of schools in Germany that issue two degrees at a time: the French baccalauréat and the German Abitur. These three approaches will be the next steps to continue this research.

CONFLICT MANAGEMENT: FUNDAMENTAL APPROACHES FOR PROMOTING THE INSTITUTION

Gouda, Hanan

International Cooperation, Arab Academy for Science, Technology and Maritime Transport, AASTMT,
Alexandria, Egypt

ABSTRACT

The human behavior could impact any self or professional development, differences in goals and backgrounds are necessary for organizational well-being, but frustration, resentment, inequalities, competition... etc. are where the conflict finds its roots. They are all syndromes of a covert conflict in the growing number of employees, especially those who are reaching the top of their grades. Under such organizational pressure, inadequacies can often be accompanied by feelings of anger, appeals and deep disappointment by the quality of the working lives and the apparent incapacity to find effective and lasting strategies to work life's difficulties and challenges. Compromises, confrontation, clarification among others, are ways to address individual-organizational value conflicts. While choosing the approach to resolve a conflict, its important to know that conflicts can have benefits not only disadvantages for the team. Even if there are benefits, the inconveniences could have a devastating effect on the organization. Managing conflicts step by step can be a low-cost and a high-impact element of the total compensation package. Management might orchestrate staff heart and mind by eliciting commitment, and focusing on intellectual capital growth which will increase development on a global scale The central message of this paper is to explain how conflicts are a natural outcome of organizing, performance, but these differences can throw groups into conflicts and what are the different approaches to deal with them according to the situation.

Keywords: *Conflicts, Organization strategy, Sources, Benefits, Drawbacks, Coping strategies, management, Politics, solutions.*

INTRODUCTION

The presence of so many organizations on the market in almost all fields is now increasing competition on a global scale. In order to survive, almost all organizations are confronted with the challenge of initiating pioneering changes to enhance their competitive position. Nowadays we are witnessing great changes in the world with the new technologies, the globalization of trade and also continuously developing demand.

In Egypt, due to the high population and the high unemployment rate, organizations tend to have more labor than they actually need. The productivity of a certain organization could still be the same in some cases even if they reduced their labor by half.

This phenomena leads to two main organizational issues, first on a strictly financial scale, and second on the conflicts issues, which is what we will be discussing in this article.

Institutions are continually changing in order to increase their competitive advantage and gain more market share but also adapt themselves to the new trends and technologies to meet customer satisfaction, but It's a vicious cycle and the only way an organization could find the optimal solution is to learn advanced management skills. Managers tend to ignore that with all the strategies and production between all organization's activities comes conflicts. "One of the subtler challenges for those who study communication and conflict is to explain how people come to understand this exchange when the "arrows" are indirect or tacit"

Top management positions and administration tend to adopt a passive approach and ignore conflicts in their institutions instead of struggling to recognize, understand, and apprehend it and deal with conflicts effectively to find ways of reducing, preventing, or dismissing it. As a result to this approach by managers, organization's assets and resources may not be effectively and efficiently used and some of it are wasted as their personnel involve themselves in dysfunctional conflicts and fail to use the opportunity of using this conflict or problem to improve their effectiveness and solve it once and for all. "Conflict is the natural process by which we mediate all of our differences". Conflicts are a part of human beings that cannot be denied, Conflicts in institutions are a problem facing all types of organization, but they do not all use the same approaches to fight or solve this issue. Is there an optimal approach to deal with conflicts in institutions? How can conflicts be avoided? And what are the management's skills required to do that? The aim of conflict management is to administer conflicts in order to limit its negative aspects. The objective of this research is to increase learning and group outcomes including performance in organizing the company environment by recommending tools to managers. The used theory we will start by elaborating on the types of conflicts that occur repeatedly within institutions, the different approaches to deal with conflicts and their sources, the benefits and drawbacks and try to answer our problematic question by developing an optimal theory step by step to approach conflicts and also the required qualities for a good conflict manager.

The theory exposed in this paper is to identify the types of conflict in order to choose the most suitable solution that wouldn't generate an additional cost to the organization and would respect the individual differences at the same time. In resolving conflicts using this approach, in practice, we follow initiative tools and a step-by-step management.

Indeed, this way of conflict resolution brings efficient and applicable skills to cope with interpersonal or business crisis. It guides managers through the supervision of conflicts within the organization.

WHAT IS A CONFLICT?

A conflict or a conflict situation is the outcome of an opposition between persons or entities. A conflict is generally responsible for emotions such as anger, frustration, fear, sadness, and resentment, among others. Occasionally it can be through aggression and violence. The term conflict is also used to describe a state of contradiction. If a person or entity does not agree with the ideas of the other that does not necessarily characterizes a situation of conflict. It often occurs when one party attempts to affirm its position regardless of the positions of other parties. "One key to making conflict productive is to achieve a relative power balance between the parties. Productive ways to balance power include empowering the weaker party, having the stronger party limit their own power or increase their dependence on the weaker party, or strengthening the parties commitment to maintaining their relationship."

"The mechanics involved in managing conflict, are tools that we use to turn a perfectly natural event into a positive and growth-producing outcome". We often think that the conflict between people is a "bad" relationship. However, many sociologists or philosophers (such as Hegel or Nietzsche) or psychologists develop a more positive view of the conflict as a "type" of relationship between individuals. Psychologists Dominique Picard and Marc Edmond consider that conflicts are not errors of communication, but that it is normal and common to argue in any relationship or situation that involves communication, whether it's direct or indirect. *"Relationship problems are inherent in the nature and dynamics of a relationship because living together and communicate is complicated and difficult"*. Nevertheless, the conflicts are often experienced in agony, and if it is not appropriately and immediately treated, it prevents the relationship to grow and be productive and prevent partners to succeed. That is why it is frequently necessary to regulate and resolve.

CONFLICT IN ORGANIZATIONS

Conflicts are an endless in the existence of an organization. Conflict or confrontation situation do not usually receive a lot of attention. "A new form of cosmopolitan conflict resolution is emerging, which offers a hopeful means for human societies to handle their conflicts non-violently and eventually to transcend and celebrate their differences". The negotiation of a conflict often involves third parties designated officially to participate in the dispute settlement. "In arbitration the conflicting parties choose a neutral third party to decide the outcome of their conflict. Mediators help the parties to negotiate, and reach their own mutual agreement. ". Conflicts are rather in the interactions between

the members over their daily routine activities within the institutions or between employee and his direct hierarchical superior or even between two partner institutions.

We consider there are 4 stages in every conflict: irritation, annoyance anger and violence. The objective of each organization is to keep any conflict within the irritation or annoyance level and never reach anger or violence. "The organizational members to select and use the appropriate styles of handling conflict so that various situations can be effectively dealt with. Organizational learning and effectiveness can be enhanced through an appropriate diagnosis of and process and structural interventions in conflict. "Conflicts in institutions are usually considered by people and managers to always have a negative impact on the team and the organization. "When conflict becomes a win-lose contest in our minds, we immediately try to win". We tend to ignore the fact that sometimes it can have positive effects like motivation, positive competition or develop communication skills for the parties involved, that's why managers are expected to adapt the institution to these approaches but this is challenging because they expect to manage and deal with conflicts within the organization, but they are often one of the parties involved, which means they have to develop their skills and approaches too before implementing them within the organization.

TYPICAL CONFLICTS IN ORGANIZATION

Interdependence conflicts:

Interdependence conflicts occur within the work environment, when the duty of a person depends on the duty of another, when there is interdependence of tasks. These conflicts often occur also in teamwork, when one group is lacking support from another group, when there is a horizontal communication between two departments that have a workflow interdependence, and on a bigger scale, organizations lacking support from suppliers, or partners.

This type of conflicts could also occur when there is an inappropriate segregation of duties, which is the concept of having more than one person required to complete a task. The concept of having more than one individual in one single task is usually used to prevent errors or fraud, so it is advantageous and productive for the organization, however it does generate complications and conflict that could be time-consuming for the team.

Internal conflicts:

Internal conflicts are what occur when goals are not coherent. People who have a personal objective linked with decision-making, sometimes goes against the best decision for the project, or when one department's goals are not fitting the goals of the organization, or when the decision-making is made

by a department without consulting what is appropriate for other departments so its is not the best alternative for the project or the organization's sake. These conflicts are also characterized by unclear methods and procedures for heavy prioritized work. The routine activities or tasks are usually characterized by rules, procedures and hierarchical referrals, and this is why they do not generate as much conflicts as the heavy exceptional activities. The lack of communication in an organization creates a malfunction that is also a reason why internal conflicts occur. The means of communication should not be limited and should be expanded between the various departments to support the workflow interdependence.

Leadership conflicts:

The leadership conflicts are based on perception and intellectual abilities. Two or more persons whether they are on the same hierarchical level, or not that have different views on how a task should be performed. When they are not on the same level, the supervisor is definitely going to pursue his thoughts, but when two persons on the same horizontal level, there will be a conflict generated by this malfunction. Leadership conflicts also occur when a person is having an ideological conflict with immediate superior, because it disturbs the work harmony and synchronization. While making a decision or setting an objective, if two or more persons share the task, it could create also a leadership conflict.

Organizational conflicts:

A dysfunctional organizational function: characterized by poor distribution of tasks, no specific job definitions, interdependence of tasks

Dysfunctional organizational functions are the source of many conflicts. They are characterized by a limited or poor distribution of tasks. There are no definitions or models on how to perform the task, no specific job description and among that an interdependence of tasks, these three elements generate conflicts that could affect more than one department in the organization. A lack of effective relationship and coordination with the hierarchy was demonstrated to form disorder harmonization too. The last organizational conflict source is the scarcity of resources. A malfunction within scarcity of resources like space, equipment, training is a crucial source of conflicts that affect the workflow interdependence.

Psychological conflicts:

The psychological conflicts are manifested by persons in various forms: *violence, anxiety, depression, aggression, frustration etc.* They are mostly related to the personality of individuals involved and depend on the scale of the conflict or confrontation. It is the most it is the most unforeseen and therefore not a predictable type of conflicts. In the work environment it is hard to determine the personality of individuals only based on their work performance, consequently conflicts can begin with two persons

working in a team while having personalities completely distinctive. They are also due to a lack of post/person adequacy; for a person to be good in a certain post, it shouldn't be determined only by academic or professional experience, the character, the personality and the temperament are colossal factors to consider as well.

Economic sources:

Conflicts due to economic sources arisen usually when a company is realizing substantial profits without fairly distribution to their staff or without compensating them. It could also occur due to failures of dysfunctions of the financial department, due to fraud or theft that could misfortune all employees. The unfair distribution of expenses among various departments could also generate conflicts and especially when there is an important workflow interdependence and horizontal coordination.

SOURCES OF CONFLICTS

Source	Reason
Ideas	Conflict of opinion or ideology that have arisen when there is a clash of concepts, thoughts, or viewpoints.
Interests/Needs	Conflict of competition or rivalry noticeable in occupations where search results is needed. Characterized by the confrontation between those who have some experience and graduates who want to develop new abilities.
Position/Role	Conflicts of authority or power that oppose two people of the same rank hierarchy following encroachment by one on the skills of the other. Could also occur vertically between two people of different hierarchy, when one imposes his ideology on the other.
Personality	Misunderstanding that it always finds its source in a conflict arising from a misinterpretation of facts or shares.
Values	Conflict that have arisen when there is a clash of morals, ethics, standards or beliefs of two persons.

CONFLICTS OUTCOMES FOR TEAMS

The conflict outcome for a team can vary depending on how the conflict is solved, whether it has been avoided or not, which type of conflict happened and which approach was used.

The positive outcomes are: team spirit reinforcement, reinforced team productivity, and captured opportunities by parties in conflict. "The management of organizational conflict involves the diagnosis

of and intervention in conflict. A proper diagnosis should include the measures of the amount of conflict, the styles of handling interpersonal conflict, sources of conflict, and learning and effectiveness. It should also indicate the relationships of the amount of conflict and conflict-handling styles to their sources and learning and effectiveness". The negative outcomes are: team disruption, team lack of productivity and an increased risk within the team.

The main Benefits of Conflicts are that it promotes growth, through learning to overcome challenges in unison with others among that, it promotes creativity and innovation as solutions are suggested to overcome the differences between the stakeholders. Going through conflicts encourage the development of interpersonal skills, as individuals strive to get on with each other in spite of their differences and builds a mutual understanding of different values, aspirations and cultures because sometimes people are not trying to be difficult, they just have a different mind-set. The social change and progress, challenges the team and benefits them as society changes, develops and culture unfolds. The process of resolution of conflict stimulates overcoming the stagnation effect. The challenge of conflict resolution or confrontation in general also promotes originality and reflection when your viewpoint is questioned. The core Drawbacks of conflicts for a team is that it creates a higher stress amongst the parties and a lower productivity as effort and resources are redirected into the conflict and away from the work in hand for all the parties involved. So the Time spent in the actual conflict and in resolution is taken away from other, more important matters. If the conflict is between several departments this could prevent or slow the entire organizational process. There is also lower interpersonal cohesion as individuals and among their supporters, people take sides and begin to stereotype each other. "The intervening party must assess the conflict, design an intervention, and choose appropriate intervention tactics. To be effective the intervening party must have excellent communication skills.

They must gain control of the process and transform the conflict elements. Taking sides shifts one from being a third party, to being a participant in the conflict ". During a conflict, inappropriate decisions are made to support the various causes and positions of the parties, or simply while trying to end the conflict. When hierarchy is involved, Status and ego become more important than reason and reality, which amplifies the conflict. The possibility of increased costs to cover negotiation preparation, negotiation time, mediation and/or arbitration costs and, perhaps, legal costs are also a major drawback of conflicts. So how can we deal with conflicts and make sure we gain the positive outcome for the team and the benefits for the organization?

COPING STRATEGIES

In psychology, coping is expending conscious effort to solve personal and interpersonal problems, and

seeking to master, minimize or tolerate stress or conflict. Psychological coping mechanisms are commonly termed coping strategies or coping skills. "Conflict and its constructive management are important for the optimal functioning of organizations; however, most conflict management recommendations still focus on conflict reduction, resolution or minimization, because of the negative impact it can have on organizations and individuals. Conflict management should rather be focused on continuous transformation. It can lead to distress and distraction from work, affecting decision-making processes, relationships and individual effectiveness, as well as productivity and creativity."

Denial: Rather than face an ugly situation, an individual can pretend that it does not exist. Reality is denied; the situation and any discussion about the conflict situation are avoided.

Repression: When denial becomes so extreme that someone is unable to recall the conflict, this is repression. For example, an individual can have strong negative emotions about a person or a group, without knowing why he/she feels so strongly because the original cause is emotionally too difficult to confront again.

Projection: Rather than accepting the conflict situation and taking any responsibility for it, it is projected onto someone, or something, else. Thus, an innocent bystander in a situation could be forced into the role of victim.

Displacement: When power differences make it impossible or inappropriate to be angry with a person or group, or there is a social or other constraint, then the anger is referred onto another, usually weaker, party. For example, an employee may be pressured by his manager, the employee in return is bad tempered with his wife, so the wife snaps at their son, who kicks the cat - this is displacement

Regression: Sometimes, because the conflict is difficult to manage, an individual may regress to behaviors that he or she successfully used as a child in order to cope with stress and/or pressure. Such behavior could include crying, stamping feet, shouting or refusing to speak.

Fantasy: Rather than deal with the real world in which there is conflict, the individual breaks away into prolonged fantasy. In extreme cases an individual may report things that were said - believing them to be true - when, in fact, they are a fantasized version of events.

Intellectualization: Here the conflict is spoken about in a clinical and abstract way with no recognition of individual emotion or involvement. Conflict usually generates a lot of emotion, and if this is ignored then total resolution is not normally achieved.

CONFLICT MANAGEMENT: POSSIBLE APPROACHES AND WHEN TO USE THEM

► Avoid / Withdraw: no resolution

This approach should be used in cases where the parties are not ready to confront, when one party has to withdraw due to a deadline or when the tension is too important and may have a severe impact on the entire organization.

► Force: Impose a solution

The force approach should be used in a situation where you know you are right, when there is an actual “do or die” situation and when relationship with the other party is not important.

► Smooth: Decrease emotions

This situation creates an obligation for a trade-off at later date, used mainly when you wish to maintain harmony or when any solution is adequate

► Compromise: both parties approximately satisfied

To be used in a situation when a “win/win” is required or when you have limited time preventing the parties from confrontation. This approach is also basic for maintaining relationships

► Collaborate: Incorporate view points in the decision

This approach can only be used when you have time, when tension is too important or when commitment mode is possible.

► Confront: Solving problems

This approach also can only be used when there is enough time, when there is mutual trust and when you want to build strong skills and values within the team or institution.

INDUCTING CONFLICTS

In the institution one of the party or the manager is sometimes obligated to initiate a conflict. These situations are a proactive way to solve a problem: by initiating the conflict the person is forced to make the other party realize that their comportment or acts is a source of misunderstanding and generates a problem for the institution. "The difference between a well managed and a poorly managed conflict is a function of how we respond- of whether we act or react to the conflict, and of what skills and strategies we employ in the process". There are two main elements for initiating a conflict: when and how?

When? When a decision must be facilitated immediately, any emergency or death/life matter, when the offender does not realize his behavior is a source of conflict, when there is a lot to gain by ending the offender's behavior or when frustration appears regularly.

How? The manager could initiate a conflict by directly making a status focusing on facts, by expressing feelings or needs and interest either personal or organizational. There is also a less offensive way like formulating a request or offering a proposal while expressing the benefits on an institutional level.

In order to deal with these conflicts and be able to resolve them or initiate them when needed, several qualities are indispensable to be a good conflict manager rather than just a manager. The most important attitude is to be win-win oriented, to present the case and benefits on institutional level that could profit both parties in order to adjust them into ending the conflict.

These aspects require the manager to be a good educator too, be able to discuss, teach, learn, communicate and interconnect between parties. The manager should have empathy, responsiveness, and approachability and be emotionally intelligent in order to find the appropriate tactic to deal with complications. While resolving conflicts, in order to avoid intensification of the problem, the manager should be a good negotiator, especially when he or she is one of the parties involved. A plus would also be an appreciated sense of humor, to cheer and push employees to be more optimistic, confident and enthusiastic.

HOW TO MANAGE CONFLICTS STEP BY STEP

Stage	Purpose	Advantages	Disadvantages
Identify stakeholders	To make sure that we address the whole and precise conflict	- Puts an end to the issue. - Simple approach	- Time consuming - Confusing
Study the problem	To collect information to check relevancy and accuracy	- Improving Relationship with employees - Relevant data	-Not certain - Have to consider all perspectives
Select a strategy	To approach conflict according to appropriate technique	- Effective and efficient - Adaptable and flexible	- Confusing - Strategic decision
Set climate for conflict resolution	Formal, informal, involving hierarchy or not, one to one or group meetings	- Helps solving conflict - Large part of the resolution process	- Hard decision - Need a lot of information
Start to act	Using the selected approach, tackle or avoid, the conflict, and motivate employees.	- Generating Hope within employees - Satisfying all parties involved	-Might cause another conflict - Critical decision

CONCLUSION

To conclude, we can say that organizations have always faced conflicts but now more than ever it has to manage them and evolve in order to survive in the market and attain its objectives. The sources of

conflicts are various and depend on the type of the organization and its ideologies, they arisen among all levels of the hierarchy and affect on more than one level. Managers can use the positive impact as a competitive situation but if opposing actions generate antagonistic state, the manager needs to take decision, and needs to know how to deal with it. Once the goal is defined, alternatives are identified; a choice with the highest probability of success is selected to face the problem. When conflicts do not receive enough attention as we explained, their outcomes are worse and could involve other parties and reach a no settlement point. The outcomes of any conflict are only relevant if the conflict is solved in an appropriate convenient way. Coping strategies are a way to solve interpersonal problem to minimize conflict, they depend on person's psychology and personality, and it is a way to accept the existing of a certain conflict without dealing with it. If a person fails to cope with the conflict, it is time to manage it, there is many possible approaches and should be used according to the current situation faced. In certain conditions, managers forced to initiate conflicts in critical situation in order to reach organization's goals. There is précised presented stages to manage conflicts step by step each approach has certainly advantages and disadvantages, and it is up to the manager to decide what, when and how an approach should be applied to solve the present conflict, and this is why they require certain qualities.

ENTREPRENEURIAL INTENTIONS: A GROUNDED THEORY OF GREEN-FIELDING

Green, J; Binsardi, B

Business School: Glyndŵr University, UK

ABSTRACT

A conclusive rationale behind the continued global growth in entrepreneurial activity remains the subject of academic and economic debate. This study provides additional insight into entrepreneurial intentions via the application of an inductive methodology, grounded theory where the aim is theory generation rather than verification and therefore the original findings provide a fresh contribution to knowledge.

The paper provides a contextual background and subsequently draws on a theoretical sample, drawn from a range of sectors that are geographically located in North East Wales to generate the grounded theory. A summary of grounded theory principles and procedures follows. The range of properties and sub-categories pattern out during the coding process of the empirical data which depict earnest behaviour in a range of contrasting situations linked to individual concerns. The concerns are founded on two main factors, circumstance and aspiration which fall into three descriptive areas of expected to, need to and want to.

Throughout the data the central behaviour themes demonstrate a desire to seek fresh opportunities, remote from traditional organizational and hierarchical constraints, conceptualised as green-fielding. The paper introduces a selection of diverse concepts with the literature review to enrich the study.

Within the concluding discussion it is evident that the broad nature of entrepreneurial origins produces additional knowledge as working patterns evolve to encompass societal changes and priorities. Seeking further clarity as to where and to what extent the identified categories cross over, or have clear-cut boundaries is the recommended area for further research.

Keywords: *grounded theory, entrepreneurial intentions, business inheritance, project-based careers, third-age entrepreneurship, demographics*

CONTEXTUAL BACKGROUND

An expansion in zero and micro-sized businesses was accurately predicted to continue increasing (Green, 2012a, Green, 2012b) to reflect the growth in project-based i-careers, characterised by an individual operating in the manner of a business entity. Various sources, including the UK Global Entrepreneurship Monitor (www.gemconsortium.org/Data) retrieved on 02 February 2014) and the Department for Business, Innovation & Skills reported entitled Early Stage Entrepreneurial Activity Rate (May 2013) report a steady increase in business start-ups following a relatively static period since the millennium. Burn-Callendar (2013) reported 90,000 new businesses being created in the first half of 2013, a rise of 3.4% during the same period in 2012. Almost half of these businesses were set up with less than £2,000 of working capital and required no external funding. Companies House figures for new start-ups have increased from 440,600 in 2011 to 484,224 in 2012 and unaudited indications provide a total figure for 2013 as being 526,446.

The education sector is supporting would-be entrepreneurs with two new courses commencing in October 2013. In Swansea a new BTEC qualification for 16-19 year olds was launched under the banner of the Entrepreneurship Academy Wales. Glyndŵr University validated a BSc Entrepreneurship, the first course of its type in Wales and accepted the first cohort of students in Autumn 2013.

Established entrepreneurial businesses are participating in a pledge to make Wales a centre of entrepreneurial activity. This initiative is supported by The Big Debate (business.wales.gov.uk/entwales2013 retrieved on 02 February 2013). The debates ran from November 2013 to March 2014 and attracted wide audiences.

In terms of age profile one in six new businesses started in the UK are run by individuals who are 50 and over (bbc.co.uk/2/hi/business/7138965)

Based on this growth, this paper seeks to establish the intentions that lie behind this structural change in the make-up of businesses that is cited by www.telegraph.co.uk/finance/businessclub/10471135, 25 November 2013 as being the driver behind economic growth in the UK during the 2013/14 period with one in five of the 90,000 new business started in the first half of 2013 classified as high growth.

THEORETICAL SAMPLE

An initial search of the literature, with a view to sourcing a definition of terms revealed that most previous research on entrepreneurial intentions has used student samples (Vinogradov, Kolvereid & Timoshenko, 2013). This opinion suggested a gap, which was expanded further when searching for research on aristocratic entrepreneurs which proved to be almost non-existent and provided a rationale to undertake the research based on the individual as the unit of analysis. The boundaries of

the sampling framework, which complies with the technique of theoretical sampling, are adhered to through delimiting to a manageable scale (Glaser, 1998). This study incorporates several strands in order to add to existing knowledge from which students or recent graduates were excluded, the sectors are listed in table 1. Choice and necessity, for individuals over 35 years of age, and those who were subject to enterprise inheritance formed the diverse theoretical sample.

Respondent	Entrepreneurial Intention	Sub-Category
1	Clothing for the Elderly	Butter-flying/need to
2	Frontier Vacations / Events	Inheriting/expected to
3	Beef rearing	Inheriting/expected to
4	Storage and retrieval facilities	Swan-singing/want to
5	Entertainment /Catering	Inheriting/expected to
6	Technology Solutions /Software Development	Swan-singing/want to
7	Gardening services /app based	Butter-flying/need to
8	The European Student Abroad	Butter-flying/need to
9	Community Activity	Swan-singing/want to

METHODOLOGY

The methodology used to produce the theory of green-fielding is grounded theory. This section provides a brief overview of the procedures that are completed in the application of the methodology. Grounded theory is a general methodology with no theoretical perspective that can be used with any type of data and any theoretical concept. It is a concept indicator method that requires a search for latent patterns in the data being used (Glaser, 2013) that emerges when the analysis is pitched at an abstract, conceptual level. According to Griffiths (2013) the virtue of the method is the neutrality in terms of the approach to data to provide a bedrock that generates the categories of the theory.

Staying open to what can emerge during the grounded theory methodology presents various views, one being the suspension of knowledge and preconceptions (Glaser 2013). To illustrate the suspension of knowledge the abstract concept of mental boxing is proposed which requires the researcher to metaphorically close the lid on a body of knowledge for a period of time until the memo sorting and writing up stages are reached. Imas, Wilson and Weston (2012) comment on respondents being knowledge-makers in their own right and the focus should be on the actual words, rather than superimposition of the analyst's interpretation.

The seminal text for any grounded theory study is *The Discovery of Grounded Theory* written by Barney Glaser and Anselm Strauss in 1967. Within this text there is clarity that a grounded theory should enable prediction and explanation of data; to be useful in theoretical advances; be usable in practical applications and give control of situations. This tall order provides a perspective on behaviour to

guide research. Clear categories are verifiable in the present and understandable from any viewpoint. In achieving these criteria the theory fits, works and has relevance to the subject matter being researched.

Generating a grounded theory requires the generation of “conceptual categories or their properties from evidence; then the evidence from which the category emerged is used to illustrate the concept.” (Glaser and Strauss 1967:23). The theory is made up of categories and properties within a “systematic relationship between these two elements.” (Glaser and Strauss 1967:36). A property is an element of a category, which in turn is a stand-alone element of the theory illustrated in a conceptual manner, indicated by the data, and not the data itself.

Glaser and Strauss (1967) urge the grounded theorist to incorporate diversity and levels to synthesise connections within the data. This is achieved through theoretical sampling which requires the analyst to jointly collect, code and analyse the data and then deciding what data to collect next and from what source in order to develop the emerging theory (Glaser and Strauss 1967). This is the process of constant comparison to enable integration, consistency, plausibility and retaining a closeness to the data during the coding process.

To complete the constant comparison cycle (Glaser and Strauss, 1967) requires four stages which are undertaken after each sample of data is collected and coded on a line by line basis. These processes commence with the comparison of incidents applicable to each category through establishing similarities or differences with previous incidents. At this stage a memo to capture thoughts should be written. A memo taps “into initial freshness” (Glaser and Strauss 1967:107) of reflection, reduce conflict and reach conclusions.

Following comparison the integration of categories and their properties occurs and involves notice and realization of “some related theoretical sense” (Glaser and Strauss 1967:109). Delimiting the theory prevent overwhelming issues by removing non-relevant properties to reduce the theory to a small number of higher level concepts and supports the generalization of theory into other areas. This practice underpins saturation, a stage where if a further incident is only adding bulk it is not coded as it adds nothing further to the theory.

At the writing up stage the analytic framework forms “a reasonably accurate statement of the matters studied” (Glaser and Strauss, 1967:113). Sorted memos are brought together under category headings with codes to reach theoretical completeness revolving around a core category, which has a preponderance of relationships with many other categories and properties (Glaser, 1998).

THE GROUNDED THEORY OF GREEN-FIELDING

By engaging in the practice of theoretical sampling as an integral process when generating a grounded theory the empirical data patterned out into three sub-categories, each possessing their own distinct conceptual properties. In presenting the grounded theory of green-fielding, the linear sequence belies the concurrent sequence of data collection and coding. The theory is then drawn together under the core category, which conceptually depicts the central concern-resolving behaviour of would-be entrepreneurs.

A grossly over-looked segment of entrepreneurial research is the UK aristocracy who find themselves in a position of inheriting, often in either unexpected or earlier than anticipated circumstances, a business. On the surface this may appear an easy option, however the data suggests otherwise with references to accumulated debt, antiquated premises, outdated and inadequate organizational processes, poor human resource management and, in some cases, the prospect of substantial death duties, evidenced by: *"I had lots of taxes to pay and I had to work, I had no other means of supporting myself."* The level and scope of entrepreneurial intentions demonstrates acute innovation, borne of necessity where a sense of destiny, continuity and responsibility is deeply ingrained. This scenario generated the property of entitling, in many instances to fulfil the aspirations of others and to provide for future generations, the data states: *I was 13 when my father died and MD at 30."*

Within the somewhat rarefied surroundings of old-established business ventures there remains an aura of tradition and tightly interwoven bloodlines that is conceptualised within the theory as draw-bridging to severely limit any potential for diluting, contaminating or fragmenting; the core assets are clearly viewed as requiring protecting through *"I had to lend the company my pension money"*. In this type of situation *"don't be too arrogant to delve into every aspect."*

In contrast the behaviours within this sub-category that are clearly in evidence are a discerning awareness of the need to practice entrepreneurship through diversification when the draw-bridging techniques are attended to and there is a necessity to cross the defences and engage in a wider and more open context. Gerund examples from the data include *livestocking, corporate entertaining and shopping*. The intentions being two-fold; first to generate revenue that is profitable and second to exploit the doorstep unique selling points in a manageable manner which is conceptualised as regrouping in order to practise longer-term green-fielding. A final category is evident, as the absence of sound planning being experienced leads to a decision, to practice the concept of reserving. This type of behaviour requires financial and legal acumen to ensure clarity for the next generation and data fragment and originates from: *"I ploughed a lot back"* and *"I set-up share schemes"* and *"I'm never going to let this happen again."*

Inheriting as the sub-category is drawn together with references to: *"it will be a different era"* and *"someone running a business who hasn't planned for the future is leaving turmoil for others."* Culminating in the view that: *"Complacency is a death warrant for the next generation."*

Within the second sub-category, butterflying there is a saturation related to the search for the elusive elixir of wealth that has previously proved difficult to establish. Data fragments make reference to *"having no choice"*, the naming of the property. This is the view of the respondents and is a mental concept rather than physically factual, their view is depicted as *"I was unemployable."*

Respondents eligible for this sub-category relate a fragmented series of economic activity, routine work has proved unsatisfactory from a personal perspective and the data refers to *quitting*, frequently with little consideration for the consequences beyond the short-term abruptness. Attention is then diverted to other or new activities, which may be within a different sector and involve prospecting behaviour to ascertain possible future opportunities, which are relayed as being brief and suggest a quick-fix approach and evidence of limited tenacity, via *"it never quite made the grade."*

This is required in order to provide sufficient revenue to sustain the basic foraging elements of living that require personal movement for survival and are viewed as being *"racked with difficulties"* and there is increasing urgency as options reduce and *"it was desperate"* so that the view becomes *"it has to work."* There is evidence of *"weak foundations"*.

There are occurrences of repeated behaviour by the respondents which is required due to the short-term nature of the efforts which disappoint and conceptually pattern out to depict the haphazard movements and intermittent hoverings of a butterfly. The activity requires *"going round the corner"* in search of yet more new pastures.

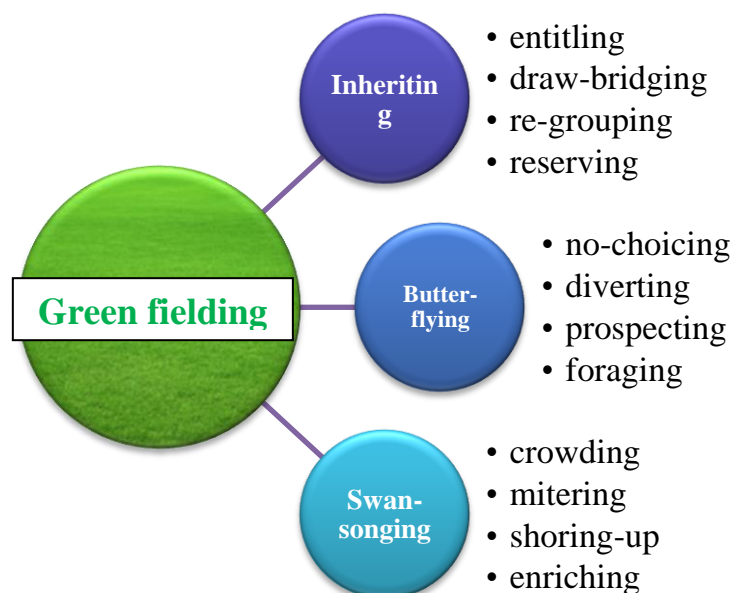

Figure 1: The grounded theory of green-fielding

Swan-singing is the third sub-category of the grounded theory where the data identifies several behaviours. Unsurprisingly the demographic profile of respondents in this area of the theory was older than in the other two. The sub-category is populated with two properties; one being respondents who had pursued a successful corporate career and may have experienced a redundancy situation, the other was populated by an opportunity to engage in a contracting situation or a bootlegging situation came to fruition.

The data makes reference to *"there was a cage above my head, it was full of lifers in there"* to describe a situation at the higher structural levels where selection, frequently repeated, has already occurred. In the traditional triangular shaped hierarchy there is limited availability at the top level, leading to crowding. In flatter organizations *"the gentle slope away from the centre is an organizational leakage"* both incidents conceptualise a movement away from a crowded centre, illustrated by: *"I felt I had enough about me to set up on my own"* and the concern resolving behaviour is *"I wanted to be at the summit."*

Mitering evolved from the concept of abutting from a corner to provide *"a strong foundation"*, the opposite of butterflying that emanated from *"don't spend money you haven't got"* and being asked *"fancy coming along, there might be some work?"* which is the evidence of bootlegging.

One property is labelled shoring-up and this concept refers to financial needs where pension provisions are deemed to be insufficient, which is addressed through *"living frugally"* or family finances require topping up to pay for education *"that hasn't finished yet"* or care for others and the outcome is a period of *getting by"*.

It is clear from the data that this entrepreneurial activity has *"passion"* and an opportunity to ensure that the *"learning never stops"* to make active use of a *"mind that is always ticking over."* Enriching occurs in response to the *"temptation to do something was burning"* and *"the drive is there."*

Again in the category of swan-singing is the need to be *"uncluttered"* and have *"a clear mind"* because *"ideas have been sitting in compartments"* and *"when you can jump in and be away, that is fantastic!"* The entrepreneurial feel is one of release to a sparsely populated place where ideas flourish.

Green-fielding depicts a freshness where contemplation, ambition, aspiration and conviction have space in which to converge into a unique offering that is the foundation of entrepreneurial intention.

CONCEPTUAL FRAMEWORK

This section presents a concise review of the literature that has relevance to the theory of green-fielding.

The provision of a precise definition of an entrepreneur is subject to extensive debate within the literature which Yeung (2002) referred to as being a jungle of terminology. A view that it is

“insufficient to define an entrepreneur as an innovator without including some element of commercialisation” (Howorth, Tempest and Coupland, 2005) is based on the difficulties associated with the separation of actions and characteristics of entrepreneurs and the dynamic nature of the concept.

Carter and Jones-Evans (2000) refer to the involvement of managerial skills and capabilities that enable small businesses to demonstrate entrepreneurship in responding to structural and economic change. Ahmed, Zgheib, Kowatly and Rhetts (2012) propose that most existing definitions of entrepreneurship and the entrepreneur incorporate the outcomes of entrepreneurial activity. Also featuring in attempts to create a precise definition is the creation of new organizations and identifying and implementing goals using initiative to build an enterprise based on the individual traits of self-motivation and self-reliance.

There are two models frequently referred to within the literature appertaining to entrepreneurial intentions, one is cited as being The Classic Entrepreneurial Intentions Model by Elfing, Brännback and Carsrud (2009) that was originally developed by Krueger and Carsrud (1993) and makes reference to perceived social norms, that may be present during early upbringing and perceived desirability of the entrepreneurial state as one driver and perceived self-efficacy and perceived feasibility as a second driver, where personal beliefs are a driver and practicalities not overwhelming. All four factors combine to support intentions.

The second model is the theory of planned behaviour. Ajzen (2012) reviews the elements of the model which prioritises the extent to which people believe they can perform a given behaviour if they are inclined to do so. Contributory factors include pre-determined action towards a specific target within a context and timeframe. Individuals behave in a manner that overcomes obstacles using information and skills. Performance and perseverance generally increase with self-efficacy that supports “go through” (Green, 2012:114), when expected consequences and anticipated difficulties require perseverance (Ajzen, 2012), frequently evident in the early stages of the entrepreneurial venture.

A number of entrepreneurial intention syndromes have been sourced, they include: eureka, if-only, misfit and moonlighter, identified by Birley (1996) and the unfriendly push and no alternative (Beaver and Jennings, 2005). These syndromes have some similarities to the properties identified in the newly conceived theory of green-fielding.

Very little work is traceable on the topic of inheriting despite the position of sole proprietorship lacking a legal personality (Gaffney-Rhys and Jones, 2013). This study highlights the advantages of pre-emptive rights despite the findings which suggest many entrepreneurs stating they did not like to think about dying, respondents were not ready, or believed they were too young. In order to amend these views, the use of stories to clarify experiences and draw on prediction and understanding to

draw on inherited knowledge to generate a collective prediction. This enables knowledge to be transferred from being in the head to being in the system and encourage continuity (Garcia-Lorenzo, Nolas and de Zeeuw, 2008). A similar concept depicts entrepreneurship as an evolving unit: “as a member of society passing on key genes to successive generations” (Breslin and Jones, 2012:295) with a view to interacting in order to differentiate rather than replicate. This process is enabled through selecting for or against habits of thought, which are derived from habits of life, both of which are subject to revision on the basis of what will best support progress. As a result niche construction is established in which an individual uses time and space to make alterations (Breslin and Jones, 2012).

There are also elements of evolution referred to by Misra (2012) who comments on the belief in endowed entrepreneurial DNA which has a never-say-die spirit, opportunity recognition acumen and in-charge body language. The theory of optimal foraging also makes reference to evolutionary aspects. Pyke (1984) has written extensively on this theory that is based on a number of assumptions, including an individual's contribution to the next generation, measured in genes or ideas respectively. The extent to which the heritable component of behaviour is learned or innate is also considered, along with the currency of fitness. Pyke (1984) bases the theory on diet, patch choice, departure rules connected with patch exits and central place foraging. Optimal foraging is achieved when maximum return is obtained from the forage, handling times are efficient, the rate of encounter effective, leading to fitness currency. From a conceptual perspective it is relatively straightforward to apply this theory to entrepreneurial intentions and subsequent success.

From the view point of making selections with regard to foraging, whatever the format of the forage, choice theory or revealed preference and incentive compatibility drawn from game theory also have relevance. Game theory is a tool for analysing interactions among multiple entities and incorporates behaviour, feelings, decisions and an interdependency insight (Blumentritt, Mathews and Marchisio, 2012). The payoff of a dominant strategy within game theory exceeds all others taking into account the clearly stated problem or situation, those involved, the prevailing conditions, the payoffs from the various choice and predictions. The complexities have clear relevance when evaluating entrepreneurial intentions.

Where circumstances are radical, entrepreneurial activity is characterised by uncertainty and potentially boundary crossing, factors which provide the lifeblood of new ventures (Burke and Myers, 2007) but may experience a shortfall in the supporting area of knowledge intensity. These points are similar to those raised by Breslin and Jones (2012) and the difficulties encountered when attempting to achieve a balance between creativity and routinization as being a major difficulty.

Overcoming difficulties when entrepreneurial activity may be involuntary is eased somewhat by the expansion of the service sector which characteristically possesses low initial capital requirements and

low barriers to entry (Krasniqi, 2009). Further support originates from the presence of a prospector approach to strategy using the Miles and Snow model, which suggests a greater propensity to engage in opportunity seeking practices (O'Regan and Ghobadian, 2005). Personality influences that underpin prospecting include, targeting, organizing and support (Kickul and Gundry, 2002) that enable under exploited opportunities to be identified in a unique way (Breslin and Jones, 2012). Imas, Wilson and Weston (2012) focus on alternative thinking to create opportunities at the margins of society, using the concept of the barefoot entrepreneur where a better future is the aim. Much of the focus from this starting point is self-reliant, survival tactics where spirituality and defiance mechanisms are drawn upon.

Grey (2007) suggests the wisdom and experience of people approaching retirement is insufficiently utilised and entrepreneurial activity provides an alternative to leisure and may become a practical necessity as inflation catches up during longer retirement periods. The routine of employment is no longer applicable and the income can be viewed as a shoring-up contribution. With increasing age, individuals have come to understand their own strengths and weaknesses (Baron, Franklin and Hmieleski, 2013) and cope with stressors associated with entrepreneurial set up issues.

DISCUSSION

Green-fielding contributes an additional segment of knowledge to previous work carried out in the area of entrepreneurial intentions as it conceptualises behaviours that reflect the changing expectations of the current workforce that seeks a complex intertwining of change and continuity in response to callings at various stages in life. There are several strands warranting emphasis at this stage, first is the desire to create an entity based on original, individual ideas and expectations with a view to generating new and different personal circumstances for the future, in the manner of an i-career. The i-career (Green, 2012a) is characterised by the individual taking charge of economic activity within the workplace in the manner of a micro-business, as opposed to a traditional employee or worker. Decisive mannerisms as opposed to a passive acceptance are evident within the i-career. Reflecting on these initial points it is clear that green-fielding answers concern-resolving behaviour in addition to possessing relevance and adds to the body of knowledge.

Structured organizations are a relatively recent concept, originating in the Industrial Revolution as machines enabled mass production to take over from individual craft production. Whilst there were valid economic reasons for this industrialisation of life, with improved education, health and life expectancy comes personal questioning about the purpose of work and the ability for a traditional model to meet post-industrial expectations. It is clear from the data that this is not occurring and

green-fielding could be given a harsher name of back-lashing against large corporations, globalization and structured team-working as a panacea for economic activity.

The grounded theory depicts a personal search, in various forms, for an individual approach, whether that is through inheritance, which is expected to, or butter-flying, which is needs to. Inheriting has a tendency to arrive in an earlier than expected manner and brings with it scenarios that Gaffney-Rhys and Jones (2013) revealed and urge earlier actions to limit asset damage and the need to draw-bridge during the entrepreneurial set-up stages.

As grounded theory is not restrained by the literature, the concept of optimal foraging (Pyke, 1984), game theory (Blumentritt, et al., 2012) and prospecting strategies (O'Regan and Ghobadian, 2005) all underpin the entrepreneurial quest for, as yet, untapped opportunities. The blend of green-fielding properties with these theories is supportive of survival and could conceptually relate to the popular operational management technique of lean manufacturing.

An ageing population is, in itself, presenting new, challenging situations and provides opportunities for individuals who want to, with a range of experiences and self-knowledge (Grey, 2007; Baron et al., 2013) also to venture into new pastures when the prospect of immediate retirement is not welcoming. This may be for social or economic reasons.

Governments and practitioners are recommended to ensure education and employment legislation are both able to match the projectification of working patterns in line with i-career characteristics are aligned with the global expansion of the incidences of entrepreneurial activity being a major contributor to economic growth.

The concept of passing on entrepreneurial DNA is revealed as being far wider than inheriting, it stems from the far more fundamental desire to leave a legacy – and procreation within the field of business provides a tangible form of asset to bequeath. The over-riding concerns are to locate a metaphorical green-field space from which an entrepreneur is able to forage in an optimal manner to ensure the enterprise is fit to trade. The challenge for educators, governments and practitioners is to provide this type of environment, a legacy for the current cohort of incubating entrepreneurs where inventions, however born, whether necessity or otherwise, have an environment in which they are able to flourish and contribute to economic prosperity.

AREAS FOR FURTHER RESEARCH

Green-fielding theory has sufficient diversity that is could be readily broken down further into three theories to provide additional depth and provide progression towards generalisation, originating from different theoretical sampling. This research would probably generate new properties and categories and therefore provide additional insight.

Such is the contrast between butterflying and swan-singing that research to establish where and if cross-over between the two sub-categories occurs would generate further new knowledge.

ABSTRACT

Purpose – To examine social health insurance's risk pooling mechanisms and the catastrophic impact that health care OOPs can have on insureds' income and wellbeing.

Background: The Greek state has reduced their funding on health as part of broader efforts to limit the large fiscal deficits and rising debt ratios to GDP (OECD, 2013). Benefits cuts and limitations of Social Health Insurance (SHI) reimbursements result in Greek population substantial Out of Pocket Payments (OOP).

Objective: To examine how well the new Greek SHI reform protects individuals against catastrophic OOPs for unexpected inpatient health shocks in private hospitals.

Data: The data was obtained after a cross sectional survey in 2013 and comprised a sample of 413 insured who were hospitalized at once in affiliated private hospitals with SHI in the main three urban centers of the country.

Methods: We used ordinary least squares methods, in order to estimate the relationship between OOPs and SHI funding for these hospitalization events. Moreover, the catastrophic impact of OOPs on individuals' living standards based on the widely accepted measurement tools and indicators of the literature set.

Results: The regression results indicated that the OOPs for inpatient care in private hospitals have a positive relationship with SHI funding. The empirical results also, showed that the SHI funding is inadequate to total inpatient financing.

Conclusion: The health policy makers have to give serious consideration to the perspective of a SHI system which should be supplemented by the Private Health Insurance (PHI) sector.

Originality/Value: Financial catastrophe from OOPs incur as well in developed economies despite the presence of pre-paid insurance schemes, as a result of the last financial crisis and the painful austerity adjustments.

Keywords: OOPs, health shock, financial catastrophe, social health insurance, informal payments, austerity, Greece.

1. INTRODUCTION

The current study aims at investigating the extent and distribution of “Out of Pocket Payments (OOP)” of insureds in private hospitals affiliated to the Social Insurance System, assessing the factors affecting OOP spending as well as evaluating OOPs’ catastrophic impact on insureds’ budget. On evidence from the Greek Social Health Insurance (SHI) system, the study addresses the following research questions:

- (i) How well does the Greek SHI protect insured members against financial burden or catastrophe due to OOPs to private health providers?
- (ii) Do individuals face catastrophic health costs relative to their income?
- (iii) Which is the association between SHI contribution and OOPs to inpatient health events?
- (iv) Which factors affect OOPs?

The financial crisis that the Globe is currently experiencing is extremely painful as regards funding existing health care systems (Fanourgiakis and Kanoupakis, 2014). Especially in Greece, the national health care provision system is on the focus of structural public reforms and severe funding cuts in the frames of the Memorandum of loan agreements signed between Greece and its creditors (Papadopoulos and Roumpakis, 2012). The creation of the National Organization for the Provision of Health Services (EOPYY) in 2011, as a unified social health insurance (SHI) fund, was among the Country’s major reforms (Pappa et al., 2013).

EOPYY funds primary and secondary health care costs in private health providers. However, coverage and benefits limitations often result in considerable OOP spending (Kaitelidou and Kouli, 2012). In fact, the Greek health system is characterized by considerable OOP expenses, which in 2010 approached 38.40% (not including informal “under the table payments”) of total health expenditures (THE). The OECD countries’ average was about half of that figure for the same year (OECD, 2012). In addition, “under the table” OOPs account for one fifth of total private expenses for health care (Simou and Koutsogeorgou, 2014).

A health OOP can be defined as catastrophic when it requires in excess of 10% of a household’s income or consumption expenditure (Russell, 2004; Ranson, 2002). Previous research shows that, across countries, high OOPs often result in budget constraints or even financial catastrophe for individuals and households. Financial catastrophe due to OOPs is shown to be strongly related to weakness or absence of social insurance mechanisms, low per-capita population income and exorbitant health care charges (Xu et al, 2003).

Existing literature mainly focuses on the financial catastrophe that high health care OOPs bring to households in developing and low income countries, with insufficient or almost nonexistent social health systems (e.g. Alam and Mahal, 2014; Ekwochi et al., 2014; Narci et al., 2014; Misra et al., 2013;

Van Minh et al., 2013; Gotsadze et al., 2009; Leive and Xu, 2008; O'Donnell et al., 2008; Xu et al., 2007; Su et al., 2006; O'Donnell and Van Doorslaer, 2005; Van Doorslaer, 2005; Wagstaff and Van Doorslaer, 2003). Only a few studies examined the financial burden of health OOPs, for the years before the outbreak of the 2008 financial crisis (e.g. Kronenberg and Barros, 2013; Xu et al., 2007; Merlis et al., 2006; Waters et al., 2004). Xu et al. (2007, 2003) showed that there is a positive relation between the percentage of OOPs on THE and the proportion of households facing catastrophic health payments. Portugal, Spain, Greece, Switzerland and the U.S.A. presented significant proportions of households facing catastrophic health spending despite the presence of social insurance mechanisms. Furthermore, for the U.S.A., Merlis et al. (2006) and Waters et al. (2004) indicated that substantial OOPs for medical expenses resulted in households' large financial shocks and well-being downturns. Regarding Europe, several studies examined OOP spending, especially for the poor, chronically ill and elderly before the financial crisis (Kronenberg and Barros, 2013; Scheil-Adlung and Bonan, 2013), several of which investigated the size of OOPs, as well as the determinant factors causing these expenses.

Not much evidence exists on the financial burdens or the catastrophic effects of health OOPs to households in developed economies, especially those suffering from fiscal problems and are in deep recession as a result of the financial crisis of 2008. The present paper attempts to fill the literature gap regarding the presence of catastrophic OOPs for inpatient health care in private providers in an E.U. country with a developed public insurance system; Greece. The study aims to quantitatively examine SHI and OOP funding allocation on hospitalization events with a particular focus on the effects on insureds' welfare.

In addition, the majority of the literature has treated OOPs as an aggregate figure. Regarding inpatient health care in the private sector, where OOPs are usually higher than in the public sector, the analysis requires a more detailed approach. Thus, the examination of OOPs for hospital events should include all types of financing (SHI, PHI, OOP, donations etc.) and where possible a differentiation of them into sub – categories (e.g. SHI and/or PHI - allocation funding, OOP – formal direct, informal payments, co-insurance etc.) combined with reliable data on living standards (income). The current study provides new evidence and goes beyond the impact analysis of individuals' private health expenditures on their income through presenting detailed information on OOP spending categorization and SHI funding allocation associated with each individual hospitalization experience in private hospitals.

The remainder of this paper is structured as follows: Firstly, we considered useful to present the background and current situation of the Greek health insurance system. Afterwards, we described the methods which have been used to our analysis. In the following sections we illustrated our results, we

discussed them and finally we concluded the paper providing policy implications, ideas for further research and concluding remarks.

2. THE GREEK HEALTH SYSTEM

During the last thirty years, the Greek state health policy is primarily focused on ensuring the accessibility to and utilization by the entire population of health care structures and resources, regardless of income level. The objective is the universal coverage of the population with high quality healthcare services at low or no-cost to individuals. The overriding principle of equity in delivering and financing health care was the great challenge of any government since 1981 (Liaropoulos and Tragakes, 1998).

According to Adamakidou and Kalokairinou (2009) the health system in Greece was financed across two main axes, public and private. The public axis includes government subsidies and compulsory social insurance financing. The private health funding comprises OOPs, donations - charities and private health insurance (PHI) financing, the latter to negligible levels over time (Siskou et al, 2009).

The system is characterized by a mixed structure known as 'Beveridge and Bismarck insurance model' (Economou, 2010). On the demand side, the system operates as a Bismarck model through a broad range of social insurance agencies and funds. The main feature of this diversity is promoting injustices across the population (Sotiropoulos, 2004). Just in 2008, a partial merger of social insurance organizations took place while at the beginning of 2012 almost all insurance carriers are under the umbrella of EOPYY, which now covers 90% of population (Groenewegen and Jurgutis, 2013). Objectives of EOPYY are: (i) to control costs and retain health spending through the monopsony power that it theoretically holds and (ii) to ensure the adequacy of health care services and especially equal distribution of them to the population (Wingfield, 2012). Regarding supply, the system works as a Beveridge model (Vrachatis and Papadopoulos, 2012), through N.H.S public hospitals, regional dispensaries, Health Centers and affiliated private health providers.

Nowadays, in the midst of rapid changes and reforms which all lead to greater

curbing of public health spending, the situation of the system is particularly worrying (Vandoros et al., 2013) with OOPs for primary and secondary health care as a share of THE being among the highest in developed economies (Kaitelidou et al., 2012; Kondilis et al., 2011, Liaropoulos et al.; 2008, Davaki and Mossialos, 2006). The Greek healthcare system is among the most privatized between countries of the E.U., in a member state whose citizens incur strong income reductions and public policy in health expenditure is a tool to achieve financial goals (Niakas, 2013).

3. STUDY METHODS

3.1 Data Collection and Sampling Methodology.

A cross-sectional quantitative study was conducted. Data consisted of individuals' hospitalization costs in private clinics/hospitals and respective funding arrangements, such as SHI, and categorization of OOPs, based on a combination of archival data, documentation papers and structured interviews. Moreover, information on age, gender, treatment, informal OOPs and annual gross income of participants was obtained. Given the data requirements, convenience sampling was the most suitable option in this research. Convenience sampling facilitates the targeting of a specific population and is widely used in social and behavioral sciences (Wang et al. 2004), while when a study requires the examination of relationships among several variables a convenience sampling is considered adequate (Calder et al., 1981). First, this sampling method permitted us to purposively select participants who had experienced hospitalization in private clinics. Second, the survey exclusively included public, private employees and pensioners for the purpose of collecting accurate and real data of their annual gross income. Entrepreneurs, farmers and freelancers were excluded due to the fact that in Greece high proportion of this taxpayer group aiming on tax evasion refusing to declare real income (Koutsogeorgopoulou et al., 2014). Collecting information from participants of both genders, various socio-economic statuses, coming from various parts of the country, hospitalization experience from private clinics in the major urban centers in the country additionally controlled for uncertainty and bias of convenience sampling (Skowronck and Duerr, 2009). The study was conducted from Dec 2012 until May 2013, where 567 insured respondents hospitalized at least once during this period were contacted. The final sample size resulted in 413 hospitalization cases.

3.2 Determination of the study variable "out of pocket payments" (OOP).

OOPs include all expenses paid directly by the users of health services and categorized on direct payments, formal cost sharing and informal payments (Mossialos & Thomson, 2002).

1. Direct payments are expenses for health services, not covered by any insurance carrier, social or private.
2. Formal cost sharing is the users' cost involvement for health services both for SHI and PHI (Paccagnella et al, 2013). Regarding SHI, co- insurance is used as a term to describe a fixed percentage of the total health care costs which is paid by the users, while the rest is covered by the SHI. Respectively co – payment can be described as a fixed amount paid by users per health service, regardless of the total health care cost. Finally, an amount paid by the insured before any activation of the insurance coverage can be described as a deductible policy (Kutzin, 1998, Chalkley and Robinson, 1997, Rubin and Mendelson, 1996). A high default deductible amount usually involves lower premiums. Robinson (2002) stated that the application of formal cost sharing usually pursued as a policy in countries where public resources are insufficient or limited, when the public health budgets are under pressure and austerity regime, and when citizens are not disposed to make generous funding of health system through increased insurance contributions or taxation.
3. Informal or under the table payments, are health consumers' payments to health providers in the form of gift, kind or money transactions in order for the former to ensure higher quality and faster medical care etc. (Lewis, 2002). Informal OOPs represent a remarkable share relative to total health expenditure, particularly in Central, Eastern, Southern European and Former Soviet Union countries (Ensor, 2004). This phenomenon, according to published studies of Dimova et al. (2011) and Balabanova and McKee (2002) is well known in South Eastern European countries and occurs widely in Greek public hospitals where medical staff mainly receive payments from patients in order to ensure for them better treatment and bypass long term waiting lists for surgeries (Vandoros et al., 2013; Kaitelidou et al, 2012; Notara et al, 2010; Liaropoulos et al, 2008; Mossialos et al, 2005). Regarding the private health sector, informal payments occurs, when patients pay without the professionals issuing legal invoices or do so for a small portion of their remuneration (Pappada and Zylberberg, 2014).

3.3 Measurement of financial impact of OOPs.

The measurement indicator of the socioeconomic status, the ability to pay or the living standards level of the households varies in the literature (O'Donnell et al, 2008). In our study we used as measurement indicator of the living standards of the hospitalized individuals the level of their annual gross income, which is exclusively derived from salaries, wages or pensions. According to O'Donnell et al (2008), gross income as a measure of living standards of households is preferable than collecting complex consumption data, especially in developed economies where a large share of the population works formally.

Drawing from Xu et al. (2003), we used the ratio of OOP to THE as a measure of how well a health system protects its people. Xu et al. (2005) and Xu et al. (2003) support the view that a sufficient SHI system is represented from a ratio of OOP to THE less than 15%, which can result in a lower percentage of households exposed to financial catastrophe or even to financial burden due to OOP health care payments.

The variable choice of the denominator that quantifies the catastrophic level or the extremely high financial burden of such health spending also varies in literature. We used the ratio of OOPs to annual gross household income of insured with thresholds ranging from 5% to 25% (O'Donnell and Van Doorslaer, 2005; Wagstaff and Van Doorslaer, 2003). Van Doorslaer et al (2006) suggest that a 10% threshold of OOPs to income or consumption illustrates the benchmark at which a household economy is compelled to decrease other important expenditures, liquidate assets or enter to a spiral of debt in order to cope with this spending.

Thus, we generated a fraction variable aiming to indicate OOPs of individuals as a proportion of their annual gross income. Following several studies (O'Donnell, Van Doorslaer, Wagstaff and Lindelow, 2008; Wagstaff, 2008; Limwattananon et al. 2007; Wagstaff and Van Doorslaer 2003; Wagstaff, Van Doorslaer, O'Donnell and Lindelow, 2003) we computed our data aiming on construction of Headcount (HC), Overshoot (O), concentration indices (CE and CO) as well as rank weighted (RW) HC and O. Concentration indices CE and CO and RWH and RWO denote the prevalence-incidence, intensity and distribution of such spending, respectively.

3.4 Statistical Analysis - Variable Construction of inpatient health funding.

The main components of THE for these inpatient cases are SHI funding and OOPs. The main dependent variable is insured's private hospitalization OOPs, including co-insurance expenses and direct extra payments to private hospitals. Also, they comprise direct formal and informal payments to physicians. We adopted a similar computation approach to that of Zhang and Liu (2013) properly customized to our micro level data. The equation form of the above inpatient health care funding categorization is, thus, given as follows:

$$\text{THE} = \text{SHI} + \text{OOP},$$

$$\text{where OOP} = \text{SCI} + \text{FPC} + \text{FPP} + \text{IPP}$$

Table 1 illustrates the overall funding allocation of hospitalization in contracted with the EOPYY private hospitals and the definitions of our dependent (DVs) and independent (IVs) variables.

Table 1 The overall health financing model and the explanatory variables of the hospitalization cases			
Funding	Abb/tions	Definition of Variables	Short Explanation
Total Health Expenditure	THE		OOP+SHI
Aggregate OOPs	OOP	dependent	SCI+FPC+FPP+IPP
1.Statutory co-insurance	SCI		30% or 50% respectively of Greek DRG's pricing practice
2.Formal payments to Clinics	FPC		OOP-extra charges with the issue of legal invoices
3.Formal payments to Physicians	FPP		Spending with the provision of legal tax services receipt to insured
4.Informal payments to Physicians	IPP		Spending without the issue of legal tax document
Social Health Insurance	SHI	independent	70% or 50% respectively of Greek DRG's pricing practice
Potential Relevant Factors			
Annual Gross Income	AGI	independent	wages or pensions in €
Age	A	independent	Range: 21-85 years old
Gender	G	independent	male or female (dummy)
Type of Hospitalization Care	THC	independent	Surgery or not (dummy)
Existence of informal OOP	EIOOP	independent	yes or no(dummy)

In order to estimate our IV-DV relationships we used multivariate regression analysis under ordinary least squares (OLS) methods. In line to Matsaganis et al. (2009) our econometric model was considered the most appropriate for analyzing OOPs for hospitalization cases. The gathering of micro – data cases for OOP expenses and its' categorization into subgroups eliminate the possibility to have zero values of OOPs for inpatient health care by the insured. The former was firstly facilitated by the sampling method to collect accurate data for OOPs from insurance fund, private hospitals and individuals, who had experienced the hospitalization phenomenon, in private clinics and secondly by the minimal recall period of absorbing them.

To control for non-normality, all continuous variables were transformed to log scale. We adapted one double-logarithmic regression model approach. The individual log of OOPs for each hospitalization case was our dependent variable with explanatory variables the SHI funding, annual gross income, age, dummies for gender (1=male, 0=female), surgery in hospitalization events (1=yes, 0=no), existence of informal payments (1=yes, 0=no). Thus, the transformed multivariate regression model will be:

$$\ln(OOP_i) = b_0 + b_1 \times \ln(SHI_{1i}) + b_2 \times \ln(A_{2i}) + b_3 \times G_{3i} + b_4 \times \ln(AGI_{4i}) + b_5 \times EIOOP_{5i} + b_6 \times THC_{6i} + u_i$$

where $OOP_i = SCI_i + FPC_i + FPP_i + IPP_i$

All explanatory variables were entered in the model, and statistical significance was assessed at $p < 0.05$. Also, with a view to address our research questions, we used descriptive statistical analysis. Statistical analysis was conducted using the econometric software package EViews.

4. RESULTS

Descriptive Results

The inpatient cases involved 254 men (61.20%) and 159 women (38.80%). The average age of hospitalized individuals was 51.50 years. The average annual gross income of participants was €15,242.66. The average OOP spending is €1,655.24, corresponding to 10.86% of average annual gross income of households. The THE of these inpatient cases was €1,297,743.32 while the allocation of funding is presented in Table 2. SHI funding stood at €614,130.20 and covered only 47.32% of THE, with the remaining 52.68% being OOP.

Table 3 presents the allocation of OOPs into sub-categories, while noteworthy is the finding that the informal total payments to physicians is greater than 13% of overall inpatient OOPs.

Table 2 The funding sources of hospitalization cases (N=413).

Funding Sources	€	%
SHI	614.130,20	47,32
OOP total (A+B)	683.613,12	52,68

Allocation of OOPs	€	%
Private Clinics Total Payments (SCI + FPC)	435.597,12	63,72
Formal Total Payments to Physicians (FPP)	157.406,00	23,03
Informal Total Payments to Physicians (IPP)	90.610,00	13,25
Total OOPs	683.613,12	100,00

Table 4 presents the socioeconomic status, health expenditure funding and

hospitalization cause by individuals' annual gross income quartiles with payments expressed as a share of funding type (Roy and Howard, 2007). Out of the 217 hospitalization cases that included surgery, 94 (43.32%) reported incidents of informal payments exclusively to surgeons and anesthetists who didn't issue legal invoices. A small percentage 4.61% (n=10) regarded a combination of formal and informal payments to physicians. In these cases physicians usually issue receipts for their medical services accounting to a small percentage of their actual remuneration.

Table 4 Socioeconomic status, health expenditure funding and hospitalization cause by individuals' annual gross income quartiles

Variable name	Individuals Annual Gross Income quartiles				Aggregate
	Q1 (0-25%)	Q2 (25-50%)	Q3 (50-75%)	Q4 (75-100%)

Catastrophic incidence and intensity results.

Table 5 presents the percentage of individuals suffering catastrophic health inpatient payments to private providers. 30.99% of hospitalized individuals made OOPs less than 5% of their annual gross income. The Headcount illustrates a descending trend with the raise of the given thresholds. Almost, 69% percent of insureds pay more than 5%, 37,80% more than 10% of their annual gross income on inpatient health care in private hospitals and around ten percent of them make OOPs greater than the one quarter of their annual wage or pension earnings. For all thresholds the concentration index (CE)

note negative values, demonstrating the potentiality of the worse off to incur catastrophic OOPs. This is in line with the incidence of catastrophic OOPs, presented for intensity in Table 6. The negative values of the concentration index (CO) in each threshold indicate that poor individuals spend proportionately more than the better off for inpatient health treatment in private hospitals. The catastrophic prevalence and intensity according to the distribution of individuals' living standards (RWH and RWO) are higher in all thresholds from the un-weighted HC and O, indicating that the individuals who go beyond the given ratio threshold show a trend to be poorer.

Table 5 Incidence of catastrophic OOP for inpatient health care in private providers – Headcount Index

Threshold	OOPs as a percentage of Annual Gross Income			
	5%	10%	15%	25%
Headcount Index (HC)	69,01%	37,80%	22,06%	9,75%
Concentration Index (CE)	-0,1093	-0,0733	-0,0754	-0,0807
Rank Weighted Headcount Index (RWH)	76,55%	40,57%	23,72%	10,54%

Table 6 Intensity of catastrophic OOP for inpatient health care in private providers – Overshoot Index

Threshold	OOPs as a percentage of Annual Gross Income			
	5%	10%	15%	25%
Catastrophic Payment Overshoot (O)	7,11%	4,59%	3,14%	1,70%
Mean Positive Overshoot (MPO)	10,30%	12,14%	14,26%	17,48%
Concentration Index (CO)	-0,1624	-0,1337	-0,1547	-0,1962
Rank Weighted Overshoot (RWO)	8,26%	5,20%	3,63%	2,03%

Regression Results

Table 7 presents the multivariate regression results regarding the impact of control determinants on OOPs. Three factors significantly predict aggregate OOP expenditures ($p < 5\%$). The estimated regression beta for patients' age indicates that old age is associated with higher OOP spending. The logarithmic SHI reimbursement and the surgery processing in inpatient treatment were the most important determinants. A positive change of 0.63% in OOP is justified when a surgical case takes place. Accordingly, an increase of 1% in the SHI funding is associated with an increase in OOP almost by 0.64%. The effects of gender, annual income and presence of informal payments are not statistically significant for the size of OOP spending ($p > 0.05$). The utilization and access to inpatient health care in the private sector is equal to all respondents but the extent of their personal funding is not affected by their annual earnings.

The overall fit of the regression model is very good, with an R-squared of 81.21%, which indicates that the independent variables explain a lot of the variation in OOP spending.

Table 7 Relation between OOPs and independent variables				
Variable name	Coefficient	Std. Error	t - Statistic	p - value
Constant	1,754536	0,680150	2,579630	0,0102

Surgery	0,634147	0,050295	12,608430	0,0000
R-squared: 0,8121				

5. DISCUSSION

The extremely high proportion of health care OOPs in Greece are comparable to those in economies with insufficient social health insurance (Kwon, 2011, Sun et al, 2009, Doorslaer, et al 2007, O'Donnell and Van Doorslaer, 2005). The results of our study confirm the literature for Greek and other health systems which suffer high proportion of OOPs to THE despite the coverage of insurance systems (Xu et al, 2007). The high percentage (52.68%) of OOPs in the overall hospitalization cost indicates that Greek SHI does not protect sufficiently its people against catastrophic health care payments when hospitalized in private establishments (Xu et al, 2003). In our study, the SHI funding to total inpatient health expenditure was less than 50% and the remaining was heavily dependent on OOPs, in confirmation of previous studies (Davaki and Mossialos, 2006). Also our study indicates that informal payments in Greece occur not only in public but also in private hospitals with high amounts of revenue losses for the Greek state.

Despite the safety nets of Greek SHI against health risk, the share of OOPs to family income is enormous creating, thus, funding inequalities (Economou, 2010), financial insecurity and depriving the economy from valuable financial sources. According to Van Doorslaer et al. (2005) the catastrophic effect of OOPs presents short and long term consequences to household finances and in extension to the economy. Coping with OOPs affects individuals' wellbeing through reducing consumption or compromising obligatory expenditures (purchases of commodities-services, education, taxation etc) that in the long term will be catastrophic for a household's economy (Adhikari et al., 2009; Leive and Xu, 2008).

Moreover, our results give evidence that catastrophic OOPs in private hospitals are disproportionately greater for the worse-off rather than the better-off individuals. Similar conclusion presented by Adhikari et al (2009) for hospital care of Kala-azar disease in Nepal. The disproportionate concentration of catastrophic OOPs among the poor households also was demonstrated in India (Dilip, 2010), in Kenya (Chuma and Maina, 2012), in Nigeria (Onwujekwe et al, 2013), in Ghana (Akazili, 2010), in Botswana and Lesotho (Akinkugbe and Chama-Chiliba, 2012), in Latvia (Xu et al,

2009) and Albania (Tomini et al, 2013), where extensive reference of informal payments is also noted. Also, Van Doorslaer et al (2007) reported catastrophic incidence and intensity of OOP spending for health care among the worse-off in China, Nepal and Taiwan. According to Wagstaff and Van Doorslaer (2000, 1999) vertical equity in financing is displayed when individuals or households with a greater ability to pay make a greater level of contribution for health care expenditures. The results of both Tables 5 and 6 disprove the existence of vertical equity in financing for inpatient health care in private hospitals. Similar results were demonstrated by Uga and Santos (2007) for Brazilian health system financing. They showed that the worse-off contributed proportionally more than the richest segments of the population for health care. Also, they proved that the Brazilian public health system stimulated the income inequality because of high OOPs.

Finally, regression results bring forward new knowledge for the proportion of SHI funding to total inpatient cost in private hospitals in Greece. The level of SHI hospitalization cost reimbursement affects positively the level of OOPs. This paradoxical situation has primarily to do with the imposition of a significant rate of statutory co – insurance to hospitalization cost by the insured. As already explained in previous section of this study, the SHI pays for inpatient care based on DRG's practice (Care Regulation of EOPYY, published in the 3054/18-11-2012 Gazette of the Government). A costly in value DRG imposes high (30% or 50%) proportionate personal cost participation for individuals. Also, for expensive and severe medical DRG's, the average hospitalization stay and treatment is greater and thus, the extra expenses which private hospitals impose to the insured (advanced level rooms, hygiene materials, high tech operations and diagnostic tests etc.) are higher (Lieberman and Wagstaff, 2009). In contrast, to other health care systems, in Greece, pre-admission notification to hospitals for insured by a family doctor is not a necessary treatment (Exadaktylos, 2005). Thus, when it comes to private hospitals there is no gate-keeping subjected to a clinical audit. Also, in the case of health services the patient loses the "consumer sovereignty" and the health care supplier decides for the choice of treatment. The asymmetric information between patient and health provider (surgeon, diagnostic center, private hospital) can lead to artificial or supplier – induced demand and consequently all these to increments for SHI and insured OOP funding (Matsushima and Yamada, 2013)

The presence of high co-insurance rates, the physicians' extra fees and the high pricing policy of private hospitals penalize the insured through the creation of remarkable OOP spending. This paradoxical situation is described by Wagstaff and Lindelow (2008) in a study for the Chinese health insurance, as a demand inducement from the public health coverage which results remarkable OOPs for health care to users. Further, Ekman (2007) advocated that health insurance in Zambia can increase

the risk of catastrophic OOP spending. The previous authors reported that this can take place through the payments of high-tech and luxurious health services in expensive private providers due to the inefficiency of public health sector to provide the obvious.

5.1 Policy Implications.

The alarming findings of our study under the new insurance reform in Greece impose the adoption of policy measures that will drastically reduce the high individuals' contribution to THE. The great share of OOPs in inpatient cases in private hospitals downgrades the risk pooling mechanism of the new insurance carrier and creates financial burdens to the insured.

The Greek DRG's pricing and reimbursement policy for hospital care in public and private health providers does not include the productive factor labor (wages for medical, nursing, administrative and other staff), see Polyzos et al., (2013). For public hospitals, the labor cost is subsidized from the state. For private hospitals this is not the case, hence resulting in high direct OOP spending especially to cover for surgeons' and anesthetists' fees (formal and informal payments) that are paid separately. The revision of Greek DRG's pricing with higher reimbursement rates is essential primarily in order to reach the levels of international experience and secondly to categorize the cost components of inpatient health care. However, this might result in increased social security contributions from all insured.

Also, health policy makers should focus on improving the qualitative and quantitative services in public hospitals in an effort to regain the trust of the population to upgraded public inpatient care facilities which are nowadays free of charge and more preferred than those of private hospitals (Kaitelidou et al, 2012). The allocation of more financial resources (e.g. higher salaries to medical and nursing staff) to public hospital system is imperative for eliminating great barriers of the past as low rate of satisfaction, long waiting lists for surgical services, informal payments, lack of medical interesting for patient, bounded accessibility etc (Liaropoulos et al, 2008). The efficient operation of public hospital care could reduce the utilization for inpatient care of private clinics and thus the incurred high personal spending of insured.

Cost sharing through deductibles, co-insurance, and co-payment proportions to social insurance reimbursements could be useful in discouraging unnecessary health care services provision and controlling public spending (Stokou et al, 2013; Rombaldoni, 2012). Nevertheless, social insurance and public health policy makers in Greece should tie formal cost sharing for health care services to socioeconomic characteristics of insured. Health care policy makers should readjust co – insurance shares for inpatient cases to private hospitals based on insured income level and hospitalization treatment necessity (Schokkaert et al, 2008).

Also a main problem afflicting the new Greek National Health Organization, reduces its reliability and lowers its monopsony power is the significant delay (more than 3 months) of payments to private health providers (Vassilakopoulou and Marmaras, 2013). Furthermore, the state imposes re-bate and claw-back mechanisms, which lead to extra recursive “haircuts” to private hospitals (Petmesidou, 2013).

5.2 Limitations and further research directions.

A limitation was the lack of availability of data related to the net annual income, expenditure/consumption or disposable income of the participants, similar to what other researchers have done (Xu et al., 2003; Xu et al., 2007; O'Donnell and Van Doorslaer, 2005); also, the inability to collect other income criteria of participants such as rentals turnover, financial assets etc. Moreover, another limitation was the inability to collect data like transportation expenses and income losses of insured as a result of provided hospitalization.

Directions for further research.

The PHI funding in European Union health care systems is limited due to the universal security of the population through the mandatory social or tax financed insurance schemes (Mossialos and Thomson, 2002). Nevertheless, PHI institution is an important player in health care financing even in health systems where public coverage plays a dominant role.

Undoubtedly, it remains a high priority for future research in order to examine the potential of PHI to reduce insured's OOPs in private hospitals in Greece. The findings of our study call for a re – consideration of our model in addressing the PHI factor against the cost components of inpatient OOPs. In countries with low state health care funding due to fiscal weaknesses, it should be tested if PHI can be established as a parallel prepayment mechanism to SHI, efficient to provide financial risk pooling, especially against catastrophic OOPs.

6. CONCLUSIONS

Of vital importance to the Greek state is the co – operation of social and private health insurance. Complementary or supplementary private health insurance working in parallel to social insurance could be a potential mechanism of eliminating the high share of OOP expenses (Siskou et al, 2009). Private insurance is viewed as capable of offering solutions to the enormous funding problems of social insurance systems (Sekhri and Savedoff, 2005).

Our analysis, despite its limitations, leads to a conclusion that OOPs in private hospitals in Greece have a catastrophic impact especially amongst the poor people despite the “full” coverage of social insurance. The results indicated that the policy makers have to pay more attention to the catastrophic impact of OOPs and the funding inefficiency of SHI, which undermines the present and future

wellbeing of the population. A mechanism reducing the financial insecurity of high OOP spending is related to the more active involvement of private health insurance in social health insurance plans.

HOW TO BALANCE VALUE CREATION, APPROPRIATION AND EXPLOITATION IN THE EXPERIMENTAL LAB TEAMS: EVIDENCE FROM A FOCUS GROUP.

Iscaro, Valentina

Second University of Naples, Corso Gran Priorato di Malta, Capua, Italy

ABSTRACT

In a modern knowledge economy that is able to exploit collaboration, relational capital and external focus of the open innovation higher educational institutions have been requiring to be more entrepreneurial: embracing its third mission represents for Academia the only way to have a positive influence in the new collaborative value creation. What should educational institutions specifically do in order to become increasingly more “entrepreneurial”? A useful starting point would be that of providing Universities with enough resources that would allow them to open further innovative paths of action. At the basis of my on-going PhD research is the idea that the experimental lab may represent a valuable tool in helping both aspiring entrepreneurs and Universities. The experimental lab is a community of personnel who interact with each other and with the external environment to generate innovation. The lab supports aspiring entrepreneurs by the means of work in team that proceeds by a trial and error model to get an idea ready for launch in the marketplace. There are several matters involved in such an ecosystem: coordination efforts, trust, risk of abandonment, value appropriation and externalization.

The experimental lab literature has pointed out different solutions to organize the daily work, even if has not reached a final outcome yet. This paper attempts to give a contribution in this particular field by trying to identify the best way to develop teams and coordinate their tasks. More specifically: how to organize teams, how to realize a balance among common goals and personal purposes and how to reduce the risk related to virtuality? In order to evaluate these issues, it has needed a step forward in delineating processes and dynamics daily involved in the lab functioning and that had not yet been covered within the experimental lab literature. To deal with this questions I used a focus group of experts to dissipate the most important themes and to make a contribution towards in shaping the functioning of an experimental lab in the daily work. Following the outcomes I have designed a virtual platform to simulate, by role play, the daily functioning of a lab in order to highlight limits, potentiality and related issues of knowledge sharing, value generation and appropriation.

Keywords: *experimental labs, entrepreneurial university, start-up, knowledge sharing, virtual teams, simulation, focus-group.*

INTRODUCTION

In a modern knowledge economy that is able to exploit collaboration, relational capital and external focus of the open innovation (Chesbrough 2003), higher educational institutions have been requiring to be more entrepreneurial: embracing its third mission (Etzkowitz and Leydesdorff, 2000; Etzkowitz, 2004; Jongloed et al., 2008) represents for Academia the only way to have a positive influence in the new collaborative value creation. According to Clark 1998, the entrepreneurial university has the ability to generate a focused strategic direction both in the formulation of academic goals and as well as in the translation of knowledge produced within the university into an economic and social utility. The urge of European universities to develop their entrepreneurial features has become more and more critical due to two main reasons: one being the gap between Europe and the US in encouraging a bottom-up entrepreneurial phenomenon and the other being the on-going economic crisis that carries along a severe lack of employment. What should educational institutions specifically do in order to become increasingly more “entrepreneurial”? Reflection is needed in terms of strategy, resources and capabilities, external environment (Rasmussen & Borch 2010, Kirby 2006, Gartner 1985) R&D commitment, intellectual eminence (Di Gregorio and Shane, 2003), specific research fields (O’Shea et al., 2005), older TTOs (Powers and McDougall, 2005), resources invested in TTO personnel (O’Shea et al., 2005), and path dependent (Kenney and Goe, 2004; O’Shea et al., 2005).

Considering that it is not possible to act on the external environment or historical choices, a useful starting point would be that of providing Universities with enough resources that would allow them to open further innovative paths of action. At the basis of my on-going PhD research is the idea that the experimental lab (Curley & Formica 2008) may represent a valuable tool in helping both aspiring entrepreneurs and universities. However, in order to evaluate the real effectiveness and efficiency of the experimental lab, I have designed a virtual platform that simulates, through role play, the daily functioning of a lab. Thus, with the attempt to clear a few ambiguities related to the lab dynamics, I realized a focus group with professors and experts. The article is divided as follows: section 2 displays an explanation of the experimental lab and the simulation platform. Section 3 explains the methodology used for the study, section 4 includes the results and section 5 presents a conclusion.

THE EXPERIMENTAL LAB

The experimental lab is a community of outsiders who become part of an innovative ecosystem rather than relying only on their capabilities (Andersson et al., 2009).

That innovative ecosystem is the Entrepreneurial University (Curley and Formica 2012) that exploits its knowledge base and collaborative network, to help aspiring entrepreneurs in turning an idea into a successful start-up. Aspiring entrepreneurs who simply hold an intuition and an entrepreneurial inclination can find valuable support in the experimental lab community, which allows them to access to capabilities and competences that they do not possess. The daily work in the experimental labs is built on collaboration and continuous feedbacks, in a pattern that involves continuous trials, errors and attempts. Substantial networking is extremely necessary and required for aspiring entrepreneurs in view of the serious struggles that the launching of a start-up would imply. The experimental lab offers this possibility in an evolutionary way through mentoring and coaching. Thus if the labs' strength and value are in the knowledge that flows between people within the network, it is also important to acknowledge diversity as an added value as well as a risky obstacle. It is crucial to understand who the participants are, what their role in the network is, how do they interact with each other and what is the expected trade-off in an environment that cannot disregard a flawless definition of procedures. This ultimately raises the critical question: how well and concretely does the experimental lab operate? How can high-expectation entrepreneurs behave perfectly in accordance with the suggestions put forward by others, even if the 'others' are experts in the field? There are several matters involved in such an ecosystem: coordination efforts, trust, risk of abandonment, value appropriation and externalization. The experimental lab literature has pointed out different solutions to organize the daily work, even if has not reached a final outcome yet. This paper attempts to give a contribution in this particular field by trying to identify the best way to develop teams and coordinate their tasks. One of the first differentiations within the experimental lab literature divides participants into two major groups: problem seekers and problem solvers. The problem seekers have to identify the issues that might emerge in the real market, whereas the solvers should aim to find possible solutions for the indicated problems. The two groups are interchangeable: at each iterative step, seekers become solvers and vice versa (Curley & Formica 2008). The goal reached by this differentiation, i.e. problems identification and solution, is easily achievable thanks to the organization of groups and their participants that are based on areas of common interest, as later suggested in the literature. There are certainly different ways to organize the work in the experimental labs. One possibility is that each member involved makes a critical analysis of its own capabilities and competences, in order to evaluate the compatibility with the idea. The best team is made up of those who have the best match between project and personal knowledge. Another option is that the lab senior managers, "the coaches", choose the most suitable participants, who could be already inside the network or outside of it. The third option is the "venture sitter" (Matricano & Pietrobon, 2010). The subject, in this case, would examine the idea's characteristics and the expert's capabilities to choose the

best combination between project and members who will thereafter arrange the team. The options that the venture sitter has are three:

- 1) A task force of experts that works in groups: each one expert in a specific field (marketing, strategy, research, technology, law, sales) analyse, diagnose and decide;
- 2) One member supervising a specific field and takes decision;
- 3) One member supervising a specific field but cannot take a decision if not before a confirmation from all other members.

Notwithstanding that literature offers valuable inputs and consultancy to face the daily work in the lab, there are open questions that this paper seeks to dissipate i.e. concrete teams' organization per cognitive areas, value appropriation, regulation of relations and virtual network fragility. More specifically: how to organize teams, how to realize a balance among common goals and personal purposes and how to reduce the risk related to virtuality? The key matter is the interaction between team members which allows them to produce the "reaction" that is necessary from intention to action, so from idea to start-up.

THE METHOD: A FOCUS GROUP

In order to dissipate doubts and controversies during the platform design, I chose a focus group method.

The focus group is particularly useful to explore and exploit people's knowledge and experiences. The group discussion is recommended when the researcher has open questions and wishes to encourage an open discussion in order to discover and welcome people's opinions and the reasons behind them, accepting the possibility of taking the research into new, unexpected directions (Kitzinger 1995). The need to explore concepts in such deep manner persuaded me to use this qualitative method in order to make participants feel free to express themselves about different topics in their own vocabulary. Following an open track which includes a list of themes about what is going to be discussed, it has been possible to lead the dialogue in an open way analysing consensus, agreements and disagreements in a shared and common knowledge environment. The participants were not drawn together specifically for the research; the group was formed by colleagues and it "naturally occurred". This, in turn, enabled the creation of a hierarchy-less sample, making it easier for knowledge flow and exchange.

The discussion in a group proceeds with informal favouring cross-examination and participants challenging each other in contradiction (Kitzinger 1995).

Starting from the themes I personally wanted to explore, I identified 3 cognitive areas on how to organize the focus group discussion: entrepreneurship, innovation and finance. Based on these three

areas, I selected individuals amongst the University faculty staff, trying to form the best match between these three fields and the person's background. The final group was composed of 5 people and 1 external observer. I provided participants with a graphic representation of the platform in order to help in the discussion and clarify the basic schema. The overall purpose in organizing a focus group was that of arguing about the open issues related to the experimental lab's daily dynamics (organization of groups per cognitive areas, value appropriation and regulation of relations, virtual network fragility), in order to improve my research's virtual platform. Inside these areas, participants were completely free to debate as they preferred, either following an order or jumping from topic to topic as they wished. The focus group conversed for approximately 70 minutes. This was recorded and transcribed, allowing me to take note of the different typologies of interactions, questions, complaints and mentions about each other's opinions.

Analysis and results

Thematic network analysis (Attride-Stirling, 2001) is one of the primary methods of analysis of the focus group data. I was interested in the topics that were more common and more discussed amongst the participants, in relation to the 3 macro areas that have leaded this research. It was not a quantitative count on how many times some concepts were being discussed during the focus group, as much as an attempt to point out the subjects that were spoken for longer and that spontaneously arose from the experts' considerations. My focus was not that of suggesting to the participants the global themes (Attride-Stirling, 2001), yet to simply propose them the macro concepts from where to start the debate. The analysis went on by examining the transcript's conversation and defining the basic, organizing and global themes. The basic themes are simple premises and suggest very little about the text as a whole. They are specific beliefs about the central notion raised within the discussion.

The organizing themes, as the name suggests, are clusters of signification that organize the basic themes and summarize them. The global themes are the general claims that advance the question of the general meaning of the text as a whole. In this analysis, in addition, there is another level represented by the 3 macro-areas on which the discussion was conducted on. Beyond my indications on the specific areas, participants led the conversation preferring themes that in their opinion were more important than those recommended by me.

More specifically, they devoted less importance to 2 of the 3 macro-areas I proposed: team formation for cognitive areas and fragility of a virtual network. In relation to the team creation, they quickly concluded that it would not have been possible to realize only one general criterion, but that I should have chosen the best regulations according to the individual situation. About the fragility of the virtual network (the less debated theme), the immediately accepted proposal was that of providing

strong networks with some gates and thereafter arrange face to face meetings. The other rules and organizational mechanisms would have been enough to reduce the abandon risk.

Thanks to the focus group dynamics I took a step forward in my research on the topics that were not yet well-defined in the literature and from the standpoint of people's daily involvement within those matters. Moreover, if on one hand the participants underestimated the importance of some themes, on the other they manifested the importance of concepts that I did not accurately consider myself in the research (i.e. the added value due to 3 smart databases, the definition of clearly differentiate objectives for simulation and research and the re-definition of the aspiring entrepreneur's role in terms of activity). Thanks to the new emerging themes I have been able to realize a platform following a stronger idea about the different issues.

The thematic network analysis scheme is summarized in the appendix.

RESULTS

Following the evidence and the information that I gained from the focus group, I designed a platform based on the suggestions.

In relation to the risks related to a virtual network, the discussion was quickly solved by entrusting the solution to the physical meetings that should be planned at specific gates. This solution finds confirmation in the literature, according to which there are several risks related to the virtual teams and different solutions to avoid them. Nunamaker et al. 2009 indicate different principles for effective virtual team, which can be summarized in: reward structure, control system & attention focus, explicit and well-defined deliverables and work processes, establishment of a virtual presence. All these principles are able to reduce the risk of abandon and low commitment. Other researches have pointed out the importance of well-defined processes and face-to-face occasional meetings, in order to reduce the risks related to "dispersion" (Siebrat et al. 2009). Following the literature and the group outcomes, I adopted the stages and gates model (Cooper 1994) which is able to include both the accurately defined processes and face to face meetings. The analysis is well structured due to the partial stages that are able to process the idea step by step; this way of organizing the daily job facilitates the possibility to arrange meetings based on the gates provided.

One of the most debated themes was value appropriation and regulation of relationships. The major sources of concern were: why should human resources put their knowledge at the service of the platform? How should we protect the idea producers? How should we remunerate people and, at same time, ensure a non-disclosure condition?

The knowledge economy introduces something radically new in the mechanism of value production: the way knowledge assets create value is really different from that of physical assets (Boisot, 1998;

Rullani, 2004). While physical resources and embedded, tacit knowledge assets, by virtue of their spatio-temporal locality, present an irreducible level of scarcity which helps to make them appropriable, explicit knowledge is subject to complex appropriability problems. For this reason, knowledge exchanges cannot rely on traditional market dynamics, as the mere description of a knowledge asset, necessary for its exchange, partly transfers it, making it available to potential buyers who could use it without paying properly. This highlights an important cognitive issue related to experimental labs, i.e., the need for value appropriation by the adoption of mechanisms allowing members to extract value from the knowledge they contribute to generate and the activity of the start-up firm benefiting from it. While on the one hand it is important to support externalization processes, on the other hand it is necessary to provide experimental labs with isolating mechanisms in order to sustain knowledge sharing within the network, thus leveraging partners' knowledge assets and fostering start up activities. According to both Rullani (2004) and Boisot (1998), in order to keep sustainable the process of new knowledge creation, it is necessary the existence of some mechanisms allowing knowledge producers to appropriate an adequate part of the value they contributed to generate, i.e., some mechanisms stimulating, on the one hand, and governing, on the other, knowledge diffusion in order to keep the process of knowledge creation sustainable. It is therefore fundamental, when planning and implementing the functioning of an experimental lab, to provide it with ad hoc mechanisms which bring about the production of value through knowledge exchange and creation by means of members interactions. In order to allow this difficult balance between externalization and appropriation, the suggestion has been to provide the platform with common mechanisms in project financing, business angel network and spin-off regulations, which regulate the relationships by determining fixed rules. In the "work for equity", I identified the principles as a good solution, importing directions and restrictions from the fields suggested (project financing, BAN, spin-off regulations). In a nutshell work for equity, a bottom-up phenomenon (increasingly common in the start-upping), is the opportunity to become a partner or receive a company's financial instruments instead of earning a formal remuneration. Indeed, the achievement of personal goals for each member of the group is an important matter in the virtual team (Curley and Formica 2008, Nunamaker et al. 2009, Siebdrat et al. 2009) and the work for equity allows a balance between participation and remunerations. The experts in the focus group did not spend much time debating about the team composition (other macro-area suggested), rather, they drew their attention on the venture sitter's role and their relationship with the aspiring entrepreneur. Leadership is an important feature also in the open, spontaneous community. The team's temporal leadership moderates the relationship between temporal diversity and the team's performance in such a way that time urgency and pacing style diversity exert a positive effect on the team's performance (Mohammed & Nadkarni 2011). More

broadly, the team's behaviour can be divided into four useful subcategories containing specific dimensions (Perry E. E. et al. 2013): preparation of task accomplishment (team mission analysis, goal specification, planning), task-collaborative behaviours (coordination, cooperation, and information exchange) team adjustment behaviours (back-up behaviours, intra-team coaching, collaborative problem-solving, and team practice innovation) work assessment behaviours (performance monitoring and systems monitoring). In order to comprehend the possible implications for the performance, the discussion mainly focused on three of these categories (preparation of task accomplishment, task-collaborative behaviours and work assessment behaviours). The group purpose was to shed light on the importance of the relationship between the coach/mentor (venture sitter) and the aspiring entrepreneur; only a well-balanced relationship, team composition and diversity can positively influence the performance. From this perspective, it is clear that there is not just one best way to compose the perfect team for several different reasons. Therefore, I reconsidered the aspiring entrepreneur's role by providing a more dynamic activity. Concretely, I resized the venture sitter's function in order to mold him into an advisor and change him into a figure between a mentor and a coach who helps the aspiring entrepreneurs without replacing them. Following the focus group, every function previously entrusted to the venture sitter has been reviewed and assigned to the aspiring entrepreneur who performs it under the venture sitter's counselling. Consecutive to this path, I hypothesized a team composition model in which aspiring entrepreneurs and their venture sitters define the different cognitive areas on which to organize the job. Both roles are going to select human resources (which, how and how much) to assign to each area; they define timing, goals and assess and the group's job step by step. In addition, during the whole process, the human resources are going to communicate with the aspiring entrepreneur.

CONCLUSION

The organization of a focus group with experts in the fields of entrepreneurship and innovation has been an important part in the research development. Thanks to a non-structured discussion, participants have raised the strengths, weaknesses, opportunities and threats of my design model, allowing improvements and drawing the platform in a more complete and useful way.

In the attempt to analyse the accuracy of the dynamics of the different phases on which I have structured the daily work in the experimental lab (in terms of groups' structuring, relationships, remuneration system, stage & gate), the simulation could also be a way of verifying the effectiveness and efficiency of the platform. Starting from the evidence provided by the virtual team literature about the importance of leadership (Mohammed & Nadkarni 2011), a well-defined work processes and the regulation of members' relationship, (Nunamaker et al. 2009; Siebrat et al. 2009) I attempted to

refine the design of the experimental lab based on the focus group outcome. Throughout the discussion, I led the attention on the daily dynamics and, more in particular, on the team creation, the risk of virtuality and value appropriation matters. These were all relevant issues that had not yet been covered within the experimental lab literature, which instead focused more on the general dynamics in an open ecosystem and on the venture sitter role (Andersson et al. 2009; Curley & Formica 2008, 2012; Matricano & Pietrobon 2010).

The platform may represent for the University one of the instruments to favour entrepreneurship, by increasing the capabilities possessed by the latter. However, capabilities are built over time and cannot be implemented simply by setting up structures and policies. Universities are characterized by high complexity, therefore different initiatives may be needed to build the necessary capabilities (Rasmussen & Borch 2010). In particular academia demands both top down pushes (institutional initiatives, structures, professors with a managerial backgrounds) and bottom up, spontaneous pulls and stimuli from students interested in entrepreneurship.

The platform is a tool that wishes to balance the top down and bottom up phenomena. Although it is a structure created and proposed by the university itself, it can survive only through the students' effort. As a result from the experimental labs, the universities are successful in facing the second revolution: the critical step that leads to embrace the third mission. With this leap that brings Academia to be something more compared to the ordinary systems of today and in the light of this new fundamental entrepreneurial function, the goal may become the institutionalization of the experimental lab. This research seeks to make a contribution in shaping the functioning of an experimental lab in the daily work by taking a step forward in defining the interactions amongst venture sitter, human resources and the aspiring entrepreneur. I hereby identify in the work for equity a way to balance externalization and appropriation mechanisms, suggesting a stage & gate structure and face to face meeting in order to handle the risks related to the virtuality.

The purpose to provide an effective and efficient tool in the academia revolution is ambitious and more work has to be done; the simulation will bring out the weak elements from which to draw and model future research in terms of: team composition mechanisms, relationship between participants, role of the university, value appropriation rules daily dynamics.

DYNAMIC CAPABILITIES – FROM THE PERSPECTIVE OF SUBSIDIARIES IN EMERGING MARKETS

Jaw, Bih-Shiaw; Jou, Wei-Ping; Wang, Christina Yu Ping; Lin, George C.K.

Institute of Human Resource Management, National Sun Yat-Sen University, Kaohsiung, Taiwan

ABSTRACT

Many multinational companies (MNC) have subsidiaries in emerging markets to tap on the local resources and marketplace. These subsidiaries navigate the changing requirements in local environment, while juggling to meet the performance expectations of their parent organizations. Due to market volatility, subsidiaries increasingly play vital roles in helping organizations mitigate business challenges and generate firm-specific dynamic capabilities in the process. This study taps on in-depth interviews with seasoned subsidiary managers based in fast-changing emerging markets in Central America and North Asia, to understand the roles of the subsidiaries and the underlying mechanisms and values that subsidiaries in emerging markets bring to the parent organizations. Findings from these interviews revealed that subsidiaries at different stages of organization developmental phases utilize various forms of dynamic capabilities and the importance of transnational management strategies in subsidiaries to attain sustainable competitive advantages. The study emphasizes on discovering the common critical success factors in well-established multinational companies that help built sustainable and productive subsidiaries.

***Keywords:** Dynamic Capabilities, Exploration, Exploitation, Subsidiaries, Organizational Learning, Entrepreneurial Leadership, Corporate Culture, Empowerment, Competitive Advantage, Transnational Management*

INTRODUCTION

MNCs expand for multitude of reasons, often setting up subsidiaries in emerging markets outside of home country. The roles of subsidiaries support the parent company's desire to seek new markets to diversify their business risks, groom new sources of revenues and seek new resources for sustainable future growth. Thus, subsidiaries are pivotal instruments for MNCs to horn multidimensional capabilities (Bartlett, C. A., and Ghoshal, S, 2002) for the sake of business continuity. Furthermore, new emerging markets are perceived to hold munificent opportunities for multinational corporations to build new capabilities to complement its current organizational capabilities. The organization's need to stay ambidextrous in meeting changing market demands, carve out new competitive advantages to

differentiate from the competition, explore new markets for existing product lines and to exploit current organizational capabilities, has and will persist to stretch the capabilities of multinational firms today. As pointed out by O'Reilly, C.A., and Tushman, M.L. (2013), "In uncertain environments, organizational ambidexterity appears to be positively associated with increased firm innovation, better financial performance, and higher survival rates."

In this research, detailed interviews were conducted with seasoned subsidiary leaders to understand how the subsidiaries of multinational firms navigate in the emerging markets where both institutional and market volatilities are acute. The insights shared by these subsidiary leaders could unveil the effects of dynamic managerial capabilities of MNCs in shaping the strategic directions of the subsidiary firms. Hence, the research objectives of this study are twofold. Firstly, to reveal the business strategies adopted by subsidiaries and their parent companies in managing business challenges. And to specify which dynamic capabilities were engaged more actively by subsidiaries in building business resilience for sustainability in the emerging markets they operate in.

LITERATURE REVIEW

Industrialization and globalization intensify the competition for MNCs and calls for organizations to put on the resource-based view hat and develop organizational capabilities to remain competitive in the marketplace. Pioneering scholars proposed that competitive advantages was based on "creative destruction of existing resources" (Schumpeter, 1934) which progress to configuration competence (Henderson and Cockburn, 1994) and then to combinative capabilities (Kogut and Zander, 1992). Teece, D. J., Pisano, G., and Shuen, A. (1997) developed the concept of interactive and adaptive set of "dynamic capabilities". More recently, dynamic capabilities serve as the bases for studies in international expansion (Luo, 2001) and subsidiary initiatives (Wang, C.Y.P., Jaw, B.S., and Chang, Y.H., 2011). This study aims to find out which dynamic capabilities were more actively engaged in building business resilience for market sustainability in subsidiary firms.

Subsidiary Dynamic Capabilities

The dynamic capability perspective proposed by Wang et. al. (2011), an adaptation from Luo (2001), posited that the possession, deployment and upgrading of organizational capabilities must continue to be rejuvenated through learning derived from local context. The dynamic capabilities generated through learning in the local context of the subsidiaries must integrate well at a global level for organizational-level competitive advantage to take place. Despite being located in different emerging markets and having varying length of establishment, a common view shared by the subsidiary leaders during the interviews concur that dynamic capabilities take on the form of a firm's core competences

and must be adaptive to changes in the marketplace. Furthermore, dynamic capabilities are firm-specific and require active and continuous interactions of organizational resources to be developed and built on. Pavlou and El Sawy (2011) breaks down dynamic capabilities to four capabilities that are interrelated, namely sensing, learning, integrating and coordinating capabilities, being exercised simultaneously to sustain momentum in organizational growth. Given the clear composition of dynamic capabilities, multinational firms can specifically and strategically gear up the competencies of its subsidiaries accordingly in different markets. Firms deploy different management strategies in building up the operational capabilities in each area of dynamic capabilities to better utilize the available local resources to meet market demands.

Transnational Management Strategies and Organizational Learning

Management at MNCs recognize that the subsidiary managers have to make prompt decisions to address environmental changes, especially so in the vibrant emerging markets. While the resource-based view by (Makadok, 2001) highlight on the selection of right resources, dynamic capabilities on the other hand, emphasize on reconfiguration of the resources into operational capabilities. Dynamic capabilities building will require organizational learning where “Exploitation learning involves selecting, implementing, and adapting systems and capabilities that are already available...” and is for a firm’s short-term survival (Dixon, Meyer and Day, 2010) whereas, exploration learning is to ensure the firm possesses strategic flexibility to function in an ever changing environment (Hitt, Keat and DeMarie, 1998). Effective knowledge-in-practice is contingent to putting in place organizational practices that best fit the work environment in order to drive performance (McIver, Lengnick-Hall, Lengnick-Hall and Ramachandran, 2013). Therefore, there is close engagement between subsidiary firm and MNC parent companies to switch to the most appropriate organizational learning mechanism quickly, to expedite fine-tuning processes in order to remain highly responsive to the fast-changing marketplace.

Subsidiaries are expected to be active contributors of firm-specific competitive advantages to the MNC (Birkinshaw, Hood and Jonnson, 1998); a key strategy for transnational management is the managing of knowledge stock from various subsidiaries. Studies have demonstrated that the knowledge base of a firm can be a source of sustainable differentiation for the organization to develop its set of inimitable competitive advantages (Gupta and Govindarajan, 2000). While the strategies of exploration and exploitation is no surefire success in business performance nor would the firm’s corporate longevity, the habitual use of these strategies become firm-specific capability for the subsidiary to manage its business challenges. As Levinthal and March (1993) suggested “engage in enough exploitation to insure the organization current viability and engage in enough exploration to insure its future

viability". The capacity for a subsidiary to learn through its business challenges and the use of exploitation and exploration strategies will thus enhance dynamic capabilities.

The appointment of the right subsidiary leaders is an integral part of transnational management. DeSimone, R. L., and Werner, J. M. (2011) proposed that a change manager is someone in the organization who has "... the overall responsibility for accessing the need for change, determining the appropriate intervention activities, implementing the strategy, and evaluating the results." The subsidiary leaders act as the change agent for headquarter, and are responsible to drive subsidiaries to perform according to assigned strategic roles and responsibilities. As Kor and Mesko (2012) highlighted, one can appreciate that the importance in deploying the appropriate subsidiary leaders as they are part of the "complex interdependencies between the firm's choices in business and competitive strategy and its choice about managerial resource development and deployment practices and investments." The right subsidiary leaders have to be efficient boundary spanners as country managers given that "...70 to 80 percent of the boundary spanning activities in a large formal organization were carried out by leaders." (Costley and Howell, 2001)

Roger Gill (2002) proposed the notion that change management requires effective leadership that embodies an "integrative model of leadership" which comprises of "vision, values, strategy, empowerment, motivation and inspiration." Thus, many MNC headquarters supports the setting up of a corporate culture through the subsidiary leadership. This also provides a stabilizing effect for subsidiary firms to perform their roles. Scholars such as Kotter and Heskett (1992) have pointed out that corporate cultures are not static, and can have powerful impact on business performance. The effect of corporate culture can "...enable a group to take rapid and coordinated action against a competitor or for a customer." In an article on "Good to Great", the authors highlighted that "Great companies have a strong culture that fosters productive behaviours. Whether "customer-service focused," "earnings-per-share driven," or "innovation centred," the culture guides how employees think, what they do, and what outcomes are attended to." (Evans and Butler, 2011)

RESEARCH METHOD

Two studies were conducted with three case companies in each study. The first study took place in December, 2012 and the second study, six months later. Semi-structured interviews were conducted lasting one to two hours each were arranged to attune the interviewees to the research topic. A set of questions were sent to interviewees upon their permission to participate in the study. Each interviewee was given a week to provide firm-specific responses to the questions and a scheduled face-to-face discussion or conference call was arranged thereafter for clarifications and further extraction of managerial insights. The interviewees were selected based on the functions they were accountable for

and were in positions of authority to be actively engaged in the formation of corporate strategies which have direct influences over the roles of the subsidiary firms and in turn impact the various dynamic capabilities deployed.

The case companies are at varying stages of organizational transformation, and they are major players in their respective industries including oil and gas, chemicals, electronic parts, synthetic rubber and plastic products as well as building and industrial systems. In the first study conducted in December 2012, the three case companies were subsidiaries of companies of more than a century old. The three case companies were located in India, Taiwan and Mexico with parent companies of North America or European origins. With the findings from the first study, a second study was conducted in July 2013, with subsidiary companies of parent companies established in the 1960s to 1970s, located in second-tier cities of Mainland China. The parent companies of case companies in study 2 were from Taiwan. The intent of study 2 is to learn if the same strategies and dynamic capabilities were also tapped by younger MNCs to develop business resilience with subsidiary firms in a fast-growing emerging market such as China.

Case Company Profile

The case companies chosen were based on a few criteria, such as if the subsidiary firm has well-established parent company located in developed countries while it is located in an emerging market. Also, to detect the dynamism of adapting to changes, these subsidiary firms were undergoing significant business challenges within the short-term outlook. Questions were also asked if the Country Managers were veteran managers within the MNC and/or industry and the length of their expatriation in the emerging market.

The corporate headquarters of the case companies had put in place seasoned country managers who were overseeing specific changes to meet business goals. Each case company were contributing exceeding USD 100 million per year to the parent company in revenue turnover, and are positioned strategically to run the operations in regional markets. All of the subsidiaries have sales and manufacturing functions in the emerging markets.

ANALYSIS AND FINDINGS

Relationship of Dynamic Capabilities, Subsidiary Leadership and Learning Culture

Study 1: Subsidiary firms in emerging markets with MNC parent companies of more than a century old.

Company A

This India subsidiary firm main business is in building and industrial systems. It was formed through merger and acquisition eight ago. The German parent company is a conglomerate powerhouse with many lines of business and was seeking another potential market in Asia to set its foothold, and bought

two Indian companies. Before the current country manager was expatriated two years ago from the USA to integrate the India subsidiaries and to stem high employee turnover, this subsidiary was very much left on its own. There are thirty-two sales offices situated throughout India and the parent company was gearing up the subsidiary for a manufacturing plant to exploit its technological capabilities and skilled labour market.

The Country Manager admitted to continuously use his sensing and learning capabilities to steer the local company to position itself for exponential growth. The Country Manager not only has to align the operational capabilities of the thirty some local offices to deliver business performance, he also has to integrate and coordinate with the parent company to align strategic goals and tap on the resources and existing operational capabilities to giving the subsidiary a head-start against local competition, a goal made more challenging as the various offices are integrating to the corporate culture of the German MNC.

Company B

This Mexican subsidiary is also in the building and industrial systems business. It has been in the Central and Latin America for over twenty years and has management responsibility over the regional sales offices in seven countries. The parent company is based in the United States of America. The Managing Director is a seasoned manager with eighteen years tenure in the organization and is originally from Mexico City. He plays a pivotal role bridging the subsidiary with parent company and amongst the regional offices as there are diverse cultures and market requirements in the region. The Managing Director has to be sensitive to the peculiarities of the regional markets and effectively escalate unique requirements to headquarters level for R&D support. His work day is mostly spent coordinating and integrating activities with parent company and intra-regional. The Managing Director revealed that the parent company has a well established corporate culture in sharing best practices on a world-wide basis. This learning culture motivates this MNC to regularly cross-share information. The stable corporate culture provides a reassuring environment to its subsidiary employees to focus on local market responses.

Company C

Of the three case companies in study 1, this private Taiwanese chemical company with manufacturing facilities has the highest per head revenue of US\$7 Million. This is a sixty year old joint-venture (JV) firm between a European and Taiwanese company. The challenge for this subsidiary firm is to maintain optimal business performance while motivating its staff to keep up the productivity till the closure of this subsidiary within the next two years.

The corporate culture of this JV is greatly influenced by the local parent company. The interviewee is an expatriate from the European parent company so his observations of how the local JV company

functions offer a different perspective to the JV company. The local top-management team (TMT) closely monitors the operational activities and manages the morale of the workforce. Regular discussions and reporting to update parent companies and to integrate knowledge and coordinate operational activities are carried out to continue to align corporate goals. The TMT of Company C also enjoys the highest level of autonomy and empowerment amongst the three companies and has almost no attrition in its staff strength for years. While the TMT are abiding to JV policies and is highly influence by the government-link Taiwan parent company, the TMT exhibited great resilience in managing the challenges presented by the imminent closure.

In study 1, mature subsidiaries (companies B and C) have well-established and stable corporate culture which allows them to focus in pushing for business performance by utilizing more integrating and coordinating capabilities. A product of two acquired local companies, company A needs setting up of corporate culture, especially learning culture to reap incremental performance through knowledge sharing. A stable corporate culture sets the platform for a subsidiary to cross-share best practices and cultivates a learning culture throughout the organization. The learning culture is the catalyst for the corporate to renew and fuel dynamic capabilities, so that integrating and coordinating capabilities can be organized to generate higher value for the firms. As the Managing Director of company B said *"...our company has a very strong cross-sharing culture and while we exploit our worldwide best practices to provide localised solutions, the adaptations we made do not compromise our core values and corporate culture...and that helps us to stay ahead of competition"*

The appointed country manager in the emerging markets has to possess a sharp acumen (ability to sense), entrepreneurial spirit (can-do attitude) and resilience in managing uncertainties to steer the subsidiary firms towards organizational goals set out by the parent company. This is demonstrated by all three interviewees in the case companies where they were put in place to "make things happen". In Salvatore Maddi's research (2004), people who work well under pressure and constant changes has three key attributes, namely knowing they have control or influence over what they do, commitment to something that they feel has importance and viewing changes as exciting challenges. The leaders of the subsidiary firms of these three companies exhibited these attributes and believed that their role in the emerging market is significant in shaping the directions of the subsidiary firms. From the interviews with the subsidiary leaders in study 1, these managers who helm the realm at the subsidiaries have mandated changes and through their leadership, directly enhanced the dynamic capabilities of the local entity. As the country manager of company C puts it *"...companies are dynamic because of the business environment, the context it is in, and it has to constantly adapt. And....leadership helps to steer the direction for changes"*.

Parent Company's Strategy to build Subsidiary Dynamic Capabilities

Since the case companies were at different stages of organizational development, the dynamic capabilities more actively used by each of them to function effectively in the emerging markets were also different. The supportive role of the parent company includes providing expertise in R&D, expatriation of TMT members to the subsidiaries, training and developmental programs and institutionalizing sets of best practices and policies for governance and performance evaluation systems. The subsidiary firms internalize the rendered resources and reconfigure aptly to response to the market. In addition, the parent companies also assign appropriate level of autonomy to the subsidiaries and empower the subsidiary leaders to make timely responses to the local markets.

Parent companies put in place suitable candidates to take charge of the subsidiary firms as a managerial strategy so that these overseas arms will contribute positively to the organizations and complement headquarters' set of dynamic capabilities. In the instances of the case companies, the subsidiary leaders demonstrated that they have the vision, share corporate values, align their organizational strategies, motivate and inspire their co-workers in the emerging markets and are given empowerment from the parent companies to enable changes.

Assimilation of Parent Corporate Culture and Local Culture

The alignment of parent company's culture and that of subsidiaries is critical for the organization to grow in organizational resilience to business challenges. As shared by the country manager for Company C *"Changing the overall culture of a company while conducting business and meeting budget has been an interesting balancing act. Focus, clear communication, consistency and tenacity are a must."* The analysis of the three case companies in study 1 indicated that each uses its own blend of dynamic capabilities to response to the parent companies and to the local market needs. Because companies B and C have reached maturity in the emerging markets, the engagement of sensing and learning capabilities appear to be less than company A which is newer to the local market. Stable and mature corporate culture, especially the learning culture which was most prominent in Company B, must be embedded in the day-to-day operations for subsidiaries to develop organizational capabilities. The combination of local culture and that of what parent company corporate culture is has produced a magical formula. This leads to better utilization of local resources and global practices to form a set of dynamic capabilities or competitive advantages that are firm-specific and unique to the subsidiary.

To summarize the findings in Study 1, corporate culture with a strong endorsement to learning culture lays the foundation for subsidiaries and parent companies to adapt to changing environment, as a stable corporate culture facilitates the building of new capabilities. MNC deploys appropriate subsidiary leaders with entrepreneurial-orientation and empower them for timely response to market and these subsidiary leaders in turn steer the subsidiary firms to meet performance goals and helps to foster integration of corporate and local cultures.

*Study 2: Subsidiaries in China with MNC parent companies established in the 1960-70s.*Company D

This is a chemical plant located in Jiangsu province with twenty years presence in China. It is one of a dozen of subsidiaries that the Taiwan parent company has set up in Mainland China for sales and manufacturing purposes, tapping on the huge market potential and vast resources that China has to offer. The managing director is from Taiwan and has stationed at several subsidiaries throughout China for the last eighteen years. He has vast knowledge in the industry, having worked his way up from the R&D department to the local TMT position. His intimate knowledge of China as well as technical expertise made him a valuable asset to the parent company. The subsidiary leader is given full autonomy to run the subsidiaries. His opinion of the competitive advantage of the subsidiary is to create value in the market by staying a step ahead of institutional requirements. He exploits the technical expertise of the parent company and simultaneously explores what are the market requirements and setting up processes and technology to provide high standard for the China subsidiaries to execute well.

Company E

This subsidiary is situated in Kunshan, China for over fifteen years. It is a manufacturer of electronic materials. Its parent company in Taiwan has businesses in many types of industrial materials. The country manager has been in China for close to thirteen years and he emphasizes management of operating costs through continuous process improvement. He has had 2 years stint in the R&D department. His view on dynamic capabilities is in managing the entire product lifecycle and designing the manufacturing processes optimally to balance costs and potential revenue. Due to frequent updates on various standards for green and environmentally-friendly products by global clients and local government, he spends much time on intra-company and inter-company communications to align standard measurements and operational processes. Optimal exploitation of existing technologies to minimize incremental costs is utmost important in his operation and exploration of new clients or new applications are equally important to command a price premium.

Company F

This subsidiary is a manufacturer of synthetic rubber and plastic products based in an industrial zone in Jiangsu province, China. There are six subsidiaries within China set up in the past twelve years. The general manager believes that by taking good care of the subsidiary employees, and they will in turn provide good customer-service and generate quality and safe products. Being environmentally and socially responsible is part of the corporate culture to help the subsidiary stay deeply entrenched in the community, thus paving its way for sustainable growth. In addition, this subsidiary conducts a lot of internal training to enhance the skills, knowledge and attitudes of all levels of its employees. This

combination of being part of the community and equipping employees from all levels with training are strategies that work well for company F. The general manager was proud to mention that *"...more than a quarter of staff exceed ten years of tenure with the firm"*, which speaks volume for organizational commitment in China where high attrition is commonplace.

Market Initiatives and use of Exploitation and Exploration capabilities simultaneously

In study 2, the case companies' subsidiary leaders echoed the view on their leadership and the empowerment warranted in providing the direction for the subsidiaries and to responding speedily to the market, deem as competitive advantage.

As China is a relatively collective society, integration of cultures is very important. In China, the deployment of highly skilled Chinese-speaking Taiwanese TMT is seen as an effective transnational management strategy as this economy has high respect for managers who have seniority and expertise, and more importantly understands the Chinese culture and how the society works. Moreover, the Taiwanese TMT also pointed out the high level of institutional effects in China, and the need to proactively responses to local government requirements to secure business sustainability in the market. The display of organizational ambidexterity in switching between exploration and exploitation approaches in securing a favorable market position and making appropriate response to stakeholders are actively carried out. Thus, these unique insights from the subsidiary leaders acknowledged that market initiatives stimulate the subsidiary firms to accumulate and build on the relevant dynamic capabilities, simultaneously using both exploitation and exploration capabilities.

Despite differences in national cultures, industry types and the history of the parent MNCs, findings from these six case companies in the two studies suggest that there are more commonalities than there are contrasts. The commonalities include the authorization of capable subsidiary leadership with the right empowerment in managing the local entities so the subsidiary leader can be an effective change manager to provide timely responses to the market. MNC also have the talent resources to place the suitable country manager at the subsidiary to drive its desired performance. In addition, the parent company renders subsidiary support via shared core values through corporate culture and learning mechanisms to facilitate knowledge flow and synchronization of operational activities to meet business objectives. The subsidiaries internalize the support from parent company and combine with local resources, uses both exploration and exploitation strategies to formulate the subsidiary's firm-specific competitive advantage. The contrasts amongst the case companies emphasize the importance of being responsive to the market with the deployment of market-oriented initiatives, especially for emerging markets with strong institutional effects to ensure sustainable growth for subsidiaries. Finally, case companies which displayed greater cohesiveness in integrating parent company culture with the

subsidiary's local culture has a head-start in their participation in the competitive economy of these emerging markets.

CONCLUSION AND RECOMMENDATION

The two studies produced findings that provide evidence for active and complementary use of transnational strategies and dynamic capabilities in dealing with uncertainties and challenges in the marketplace. Firstly, the subsidiary leaders were instrumental conduit for the parent company to provide direction and clarity in leading the subsidiary to meet the business challenges. Subsidiary managers possess entrepreneurial leadership (ability to sense, "can-do" spirit and resilience) and are effective change managers. They have the capabilities to see the big picture with the long-term strategic organizational goals in mind while having the ambidexterity to handle the operational issues to meet short-term business survivability.

Next, establishing a learning culture and being attune to market initiatives help the subsidiary build its firm-specific dynamic capabilities. A corporate culture that celebrates the learning culture is a cornerstone for building new capabilities and exploration of new breakthroughs. This finding supports and infers that a learning organization will be able to adapt quickly to the changing environment and thus increase competitiveness to meet changes in local markets. Meanwhile, another business strategy for transnational companies is to proactively take on market initiatives in response to its environment. These market initiatives are stimulus for subsidiaries to build relevant dynamic capabilities to timely response to the market. This finding is especially important in the emerging market due to greater volatility in market forces. The market uncertainty calls for subsidiary to be adaptable and nimble in responses.

To specify which dynamic capabilities were engaged more actively by the subsidiaries so the local entities are more resilient in their operating environments, the respondents of these case companies unanimously mentioned that they must be given suitable empowerment to exercise change for timely and context-specific response to the market. After which, certain degree of corporate culture integration between parent and child companies will enable faster development of dynamic capabilities to help them be competitive. This integration requires a harmonious blend of both headquarter-driven corporate culture with local interpretation for effective internalization, without compromising the core values. While, building up competencies, the subsidiaries adapt a set of exploration and exploitation capabilities to keep up the momentum for growth. These two capabilities are used simultaneously but the proportion is tailored by the subsidiaries depending on the event on hand.

Managerial Implications

As MNCs race to gain market share and to increase productivity with as little incremental cost as possible, many organizations may overlook the need to help the workforce increase their learning capabilities through training. This is because nurturing talent from within a subsidiary takes many years. Failure to do this however, will risk the stagnation of skill sets and therefore limiting the capacity of the subsidiary workforce to be adaptable to changes in business requirements. Moreover, training may help the local workforce to feel more entrenched in the organization, thus may ease turnover rate of knowledge workers which is prevalent in emerging markets such as Mainland China and India. In this case, subsidiary dynamic capabilities and organizational resilience may grow with a stable knowledge-driven workforce.

Another managerial implication is the need for the subsidiary leaders to build a capable local management team. Given that the country managers and TMT for the case companies are foreigners or expatriates to the local companies, there could be sentiment that these leaders are not sinking roots and will not be present to see through the changes in the long run. Hence, some subsidiary staff may be resistant to changes and choose not to share relevant information. The coaching of a local management team will help subsidiary beef up on managerial capabilities and these home-grown leaders can contribute and guide the local workforce to align with corporate goals.

Finally, due to cultural diversity, the subsidiary leaders sent to manage the subsidiaries could enhance his ability to lead by going through cultural immersion training to accustom his communication and leadership style to the local context. MNC could consider cultural immersion program as a prelude for potential subsidiary leaders to help him to hit the road running by boosting his competence to integrate corporate culture with national culture.

Further Research Suggestions

As multinational corporations continue to look for new markets to extend their product lines, race to compete for market share, expand its competitive advantages beyond current capabilities, firms may not pay enough attention to long term goals and instead settles for short term gains. Since increasing dynamic capabilities is critical in sustaining corporate competitiveness to push for business performance and ensures sustainable growth, then the studying of learning mechanisms can be further explored to identify appropriate organizational learning strategies at different phases of organizational development.

It will also be interesting to find out about the different leadership styles in different countries with strong national cultures to identify the most appropriate subsidiary leader for MNC to groom and to leverage on for its talent bank. Future study on subsidiary leadership could include case companies from more emerging markets.

This study included case companies with manufacturing facilities and industrial products. Future research could be conducted to include service-oriented subsidiaries, such as the hospitality industry to find out if the strategies used to grow dynamic capabilities are similar.

Finally, another direction for future research is to follow these case companies to conduct a longitudinal study to see if there is any development in the dynamic capabilities due to differences in subsidiary roles or contextual changes.

THE INVESTMENT ATTRACTIVENESS OF UKRAINE: OPPORTUNITIES AND RISKS FOR FOREIGN INVESTMENT

Kachala, Tamara; Berezina, Olena

Cherkasy State Technological University, Ukraine

ABSTRACT

The article investigates the definition of "investment attractiveness" and factors that form the investment attractiveness at different levels of the economy. The factors system was established that determine the favorableness level of the investment climate. The structure takes into account: the objective factors; investment climate formation under the totality influence; the investment climate differentiation at different levels of the economy; synergies characteristic of investment climate; inclusion of the investment climate in the institutional system of the state; appearance of various risks as a result of certain conditions.

The main factors that affect the investment climate and investment attractiveness of Ukraine are: macroeconomic instability, due to the numerous risks of investing in the country, the low level of protection of foreign investors, which negatively affects the image of Ukraine and imperfect legislative regulation that negatively affects the profitability of investment, corruption and blocking foreign investment.

In order to improve the investment climate and investment attractiveness of Ukraine proposed urgent measures for improving the methodological basis for evaluation of investment attractiveness. Organizational-economic and legal mechanism of favorable investment climate formation in the region is worked out and described. This is consciously regulated system of economic, legal, organizational forms, methods, means and principles, as well as the regulated by state relations and interconnections which impact on the investment climate in the region. The mechanism is aimed to reduce investment risks and increase of investment potential in the region.

The research also proposes measures for improvement the investment attractiveness of Ukraine.

Keywords: *investment attractiveness, investment climate, foreign investment, international rating agencies.*

INTRODUCTION

The investment attractiveness of Ukraine is a strategic issue, as it stands in the way of economic reforms and integration into the world economic sector, which, among other issues, require significant financing. To solve this issue the country should create a favorable investment climate and reach the status of the investment-attractive country.

ANALYSIS OF THE RECENT RESEARCHES AND PUBLICATIONS

The study of this problem was engaged by many scientists and scholars: G. Alexander, J. Bailey, D. Epstein, P. Haidutsky, D. Harrison, N.Ighoshyn, K. Meyer, O. Nosova, W. Sharpe, J. Thompson. The following scholars as S. Aptekar, M. Bilopolskiy, I. Blank, M. Chumachenko, N. Datsiy, V. Gluschenko, V. Grinyova, P. Haidutsky, N. Hrebenuk, I. Ivakhnenko, S.Ivanochko, O. Lemishko, M. Lesechko were dealing with the problem of attracting foreign investment and creating a favorable investment climate in Ukraine.

STATEMENT OF THE PROBLEM

At present there is no single methodological approach to assess the investment climate, industry, region or company. As most methods are based on the use of statistics and determined by the qualitative characteristics of the object using expert ratings and evaluation methods which are considered to contain high level of subjectiveness and not to cover all the factors that influence this process. Thus, we consider the problems of the article to be actual and the one that needs further studying.

THE AIM OF THE PAPER

is to carry out a comprehensive analysis of investment attractiveness of Ukraine, to determine the factors that influence the attraction of foreign investment and provide appropriate recommendations for its improvement.

THE MAIN MATERIAL

Attracting foreign capital provides a variety of benefits and advantages for future economic development. At this stage Ukraine should create a favorable investment environment to attract huge financial resources. Foreign investment is really important to modernize the Ukrainian economy.

First, foreign investment brings not only capital, but also modern technology. This leads to increasing of competitiveness, improvement of the quality of products and services and helps to reduce the costs.

Second, attracting of foreign investment leads to restoration and expansion of capital, implementation of investment programs, the rise of the economy, the saturation of the domestic market with competitive goods and services. Third, the direction of foreign investment in specific projects is always accompanied by retraining and training of personnel that helps domestic employees to obtain knowledge for effective use of new technologies and to obtain international contracts. Fourth, foreign investment leads to getting experience of the world economy, promote further improvement of the investment climate for both foreign and domestic investors. Fifth, the infusion of foreign investment accelerates the integration process of Ukraine in the world economy, leading to the development of integration processes of globalization, promotes and enables the country to occupy a leading place in the world economy. These arguments suggest increasing the level of foreign investment in the economy of Ukraine for its growth and recovery (Hrebeniuk, 2012, Gluschenko, 2009). The decisions of foreign investors will depend on all these components of investment attractiveness. The main factors that influence investment decisions include: the attractiveness of the country in the way of cost, sales and features of historical development, culture, language and political risk (table 1).

Factors	Level of influence		
	macrolevel	mesolevel	microlevel
Institutional	<ul style="list-style-type: none"> - internal and external political stability of the country; - guarantee of rights and freedoms; - the degree of government intervention in the economy; - trade policy of the country; - the level of integration of national legislation in the global legal framework; - stability of the economic, financial and tax law; - protection of intellectual property, domestic and foreign investors' rights in the country; - customs policy and participating in the world organizations. 	<ul style="list-style-type: none"> - internal and external political stability of the region; - guarantee of rights and freedoms; - the degree of government intervention in regional economy (industry); - support for small and medium businesses in the area (field); - trade policy in the region; - protection of intellectual property in the region; - easy obtaining of permits and connection to city communications. 	<ul style="list-style-type: none"> - internal stability policy of the company; - guarantee of rights and freedoms of an employee; - degree of government intervention in the economy of the enterprise; - trade policy of a company; - company activity according to the current regulatory and legal legislation; - development of communication networks in the enterprise.
Economical	<ul style="list-style-type: none"> - general characteristics of the economy and stability of the national currency; - GDP growth; - taxes, fees, benefits; - the possibility of repatriation of capital; - characteristics of the banking system and its services in the economy; - environmental conditions: requirements of standardization, quotas and penalties in the economy of the country; - currency and financial risks. 	<ul style="list-style-type: none"> - general characteristics of regional economy (industry); - growth rate of GDP; - needs and resources region (field); - information campaign in the region (field); - ecological situation: requirements of standardization, quotas and fines in the region's economy (industry); - characteristics of local markets. 	<ul style="list-style-type: none"> - general characteristics of enterprise economy; - rate of growth of gross output of enterprises; - rates of average return on enterprises of this type; - easy access to credits for enterprises; - financial risks; - level of information security and access to global networks; - cost of inputs.

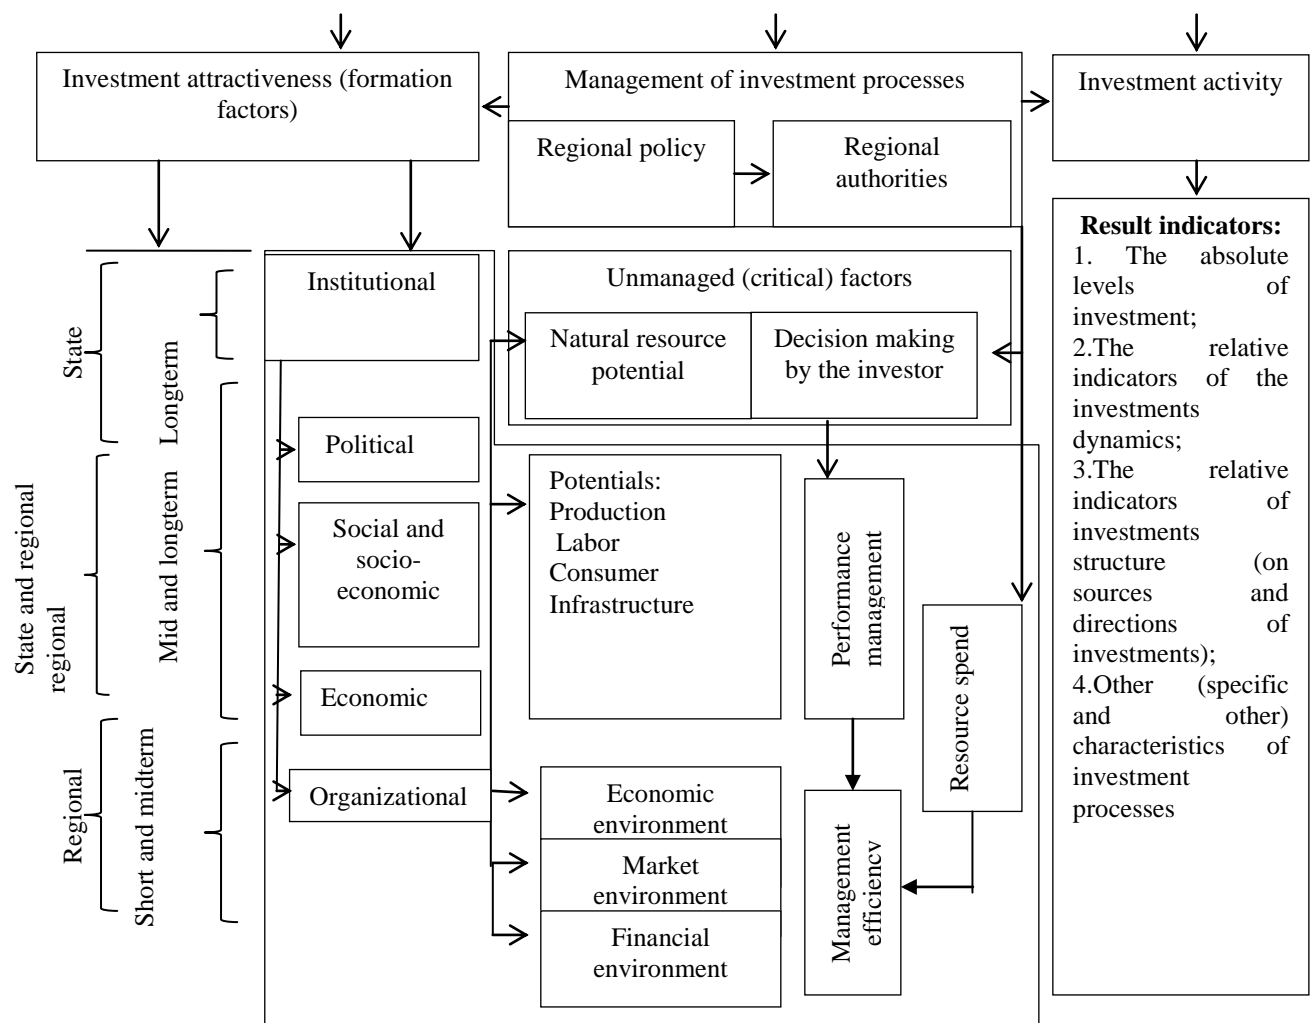

Social	- level of social development, - social conditions and living standards in the country; - tolerant society against other religions and nationalities in the country; - degree of political activity in the country; - level of criminality in the country; - level of the trade union movement in the country.	- level of social development of a society, social and living conditions in the region; - degree of political activity of the population in the region; - level of criminality in the region. - level of trade union movement in the region.	- level of education and - qualification training of employees; - trade unions activity on the - enterprises; - social and psychological climate on the enterprises; - styles and forms of management in the company.

Table 1. Factors that form the investment attractiveness at different levels of the economy*

* compiled by Grinyova, 2005, Ivanochko, S. 2011, Sharpe, Alexander, Bailey, 2001

The factors system was established that determine the favorableness level of the investment climate (Fig. 1.). The structure takes into account: the objective factors; investment climate formation under the totality influence; the investment climate differentiation at different levels of the economy; synergies characteristic of investment climate; inclusion of the investment climate in the institutional system of the state; appearance of various risks as a result of certain conditions. The structure was transformed taking into account the need to eliminate the above drawbacks, and to consider it at the regional level.

The generalized structural module of investment climate has the form presented on Fig. 1.

In presented structural model, it is necessary to note the critical factors of the investment climate formation in the region. Under them we understand factors that cannot be formed by the management bodies of the state, region, economic entities (their groups), etc. as the subjects of investment management process in a certain area. We can include to them all natural resource potential of the territory, which is the base to select industries of its economic system in interregional and international labor division. The identification of these sectors does not depend on someone's wishes, fashion, political situation and other. It is an objective evaluation process of the existing natural potential and choice of the most rational ways of its sustainable use, taking into account the changes in the external market environment. The process and the result of a decision making by the investor is another critical factor that defines not the investment attractiveness of the territory, but the management effectiveness of investment processes. Unlike the first critical factor it is characterized by the lack of comprehensive (and even sufficient) information on methods how to evaluate the situation and algorithms of investment decisions making and secondly, their high subjectivism, mass media influence, accepted stereotypes, fashion, etc. So this part of the formation process of the investment climate specifies its objective uncertainty, because unlike other it cannot be calculated with a high degree of certainty.

To assess the current investment climate in Ukraine we'll pay attention to doing business and the competitiveness of the domestic economy of our country on the basic parameters (Table 2).

Index	Years			Note
	2011	2012	2013	
Corruption Organization Index Transparency International	152 place among 182	144 place among 176	144 place among 177	Corruption Index
Rating of Doing Business	145 place among 183	152 place among 183	137 place among 189	Rating of Doing Business (easy opening of company, licensing, hiring employees, registering property, getting credit, protecting investors' interests)
Rating of Competitiveness World Competitiveness Yearbook	57 place among 59	56 place among 59	49 place among 60	Research in competitiveness (state of the economy, government efficiency, business efficiency and the state of infrastructure)

Index of Global Competitiveness of Economy World Economic Forum	82 place among 139	73 place among 144	89 place among 144	Competitiveness, institution quality, infrastructure, macroeconomic stability, education, financial market development)

Table 2 Evaluation of the investment climate in Ukraine by international rating *

** compiled by International ratings of business and economic competitiveness (2013), Ukrainian Association of Investment <[http: www.uaib.com.ua](http://www.uaib.com.ua)>*

Due to table. 2, it is obvious Ukraine occupies the last position in the ratings and this is a sign of poor investment climate. We should note the negative trend on all ratings that means the national economy is becoming less attractive to foreign investors each year. According to the international analysts, one of the biggest problems of Ukraine's economy is the necessity for improving public institution activity. Businessmen consider bureaucracy and government regulation of business in Ukraine to be one of the highest in the world. This leads to the need of protecting property rights and minimize risks in raising funds and promoting investment in the country.

According to experts (Datsiy, 2009, Lemishko, 2007, Ivakhnenko, 2010), there are two main causes why the process of investment policy reform in Ukraine is slow down. They are: the slow pace in adopting changes in legislation and poor implementation of laws.

In order to improve the investment climate and investment attractiveness of Ukraine it is necessary to consider urgent measures for improving the methodological basis for evaluation of investment attractiveness. That will allow to determine the current situation of the country more accurately, to highlight the "problem" places and act as a tool to manage the country's attractiveness. We offer the following levels of assessment of investment attractiveness: 1) country (to minimize the number of parameters, to take into account national specificities of the economy, to apply mathematical methods for calculating the indicators), 2) industry, region (to study both short and long term perspects, to use different sources of information and analysis of the full range of indicators, etc.), 3) enterprise (to create a universal technique that would be suited for the analysis of companies involved in various kinds of activities, taking into account the dynamics and trends of the company, competitive market position, etc.).

Organizational-economic and legal mechanism of favorable investment climate formation in the region (FICF) is consciously regulated system of economic, legal, organizational forms, methods, means and principles, as well as the regulated by state relations and interconnections which impact on the investment climate in the region (Fig. 2). It is a specific lever by which a state realizes a controlling influence on the investment climate in the region. It includes: 1) set of principles, directions and priorities of the activity organization on formation of favorable investment climate in the region; 2) economic forms, methods, means and tools of influence on the investment climate in the region; 3) set of regulated by state relations and interconnections of all participants of investment activities that ensure the effectiveness of the regulatory impacts on the investment climate.

The mechanism is aimed to reduce investment risks and increase of investment potential in the region. To achieve these goals we need to solve a set of related tasks, the priority of which is determined by

the regional authorities, depending on the diagnosis of the current state of the investment climate in the region, that is expressed in the identification of the most significant investment risk and investment potential; the components importance of investment risk and potential from the point of view of potential investors.

The mechanism FICF in the region is developed taking into account such important principles including: 1) focus on direct investments; 2) reduction of investment risks; 3) use of comparative advantages; 4) universality and adaptability of the basic features and tools of mechanism; 5) connection of the investment climate and investment activity; 6) integration of the regional mechanism in investment sphere of the single economic complex of the country.

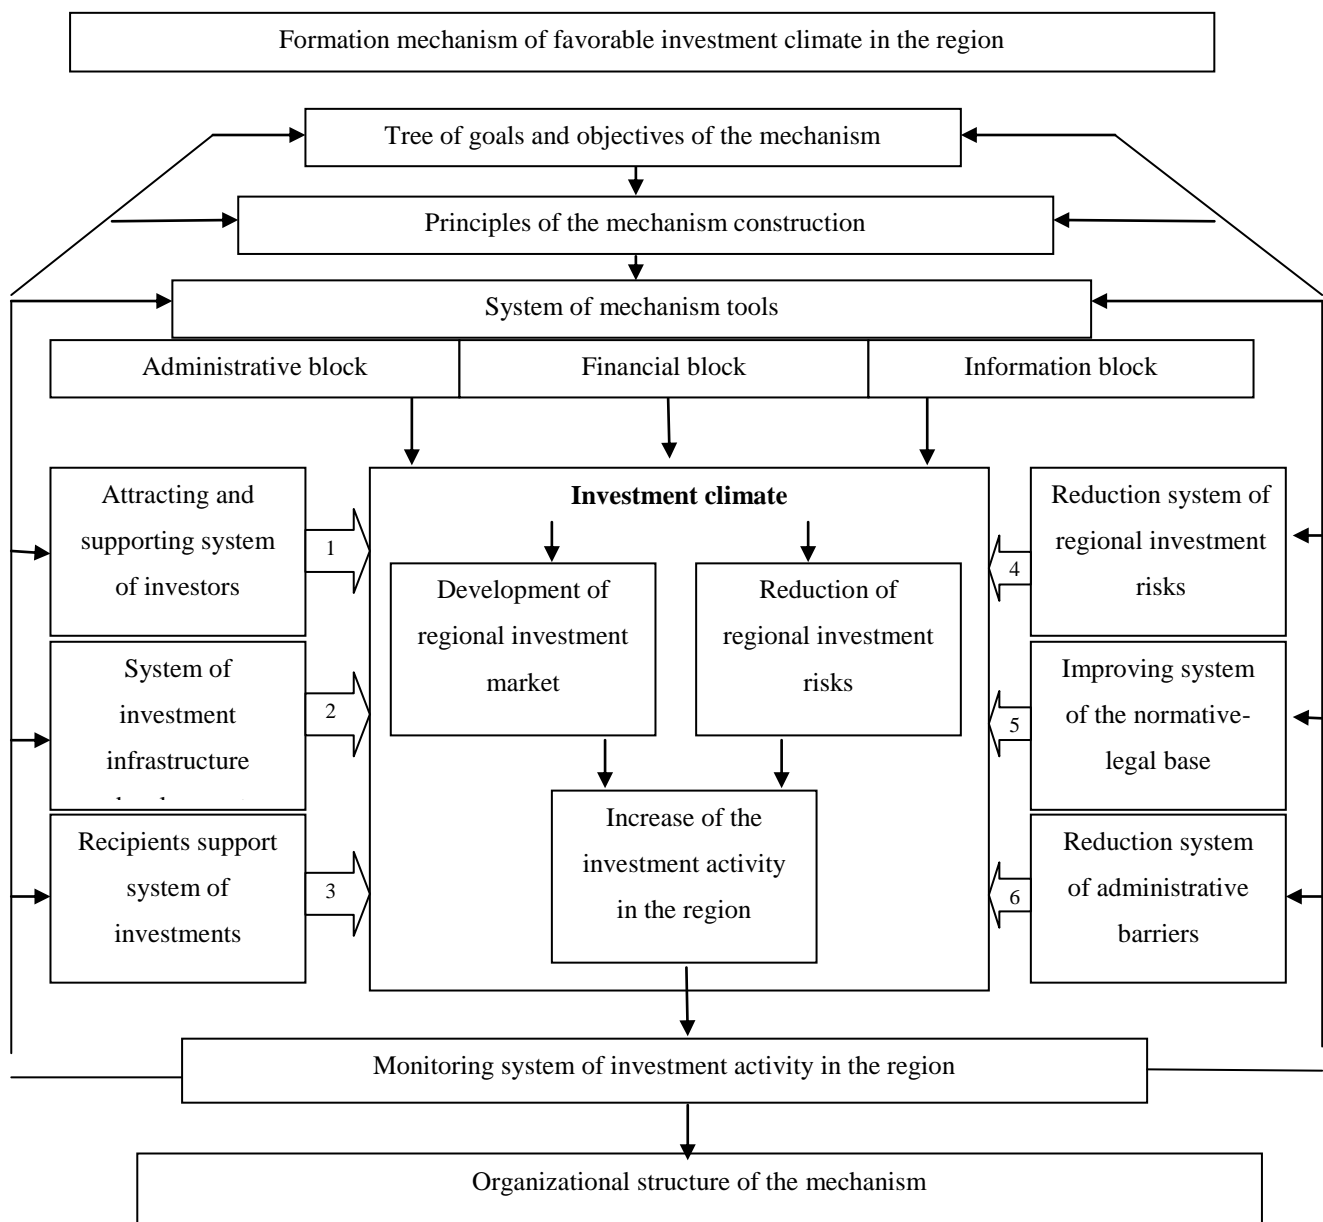

Fig. 2. Structure of the mechanism FICF in the region

The mechanism FICF effect on investment activity in six main directions: 1) proposal formation of investment resources; 2) creation of quality demand from investments recipient; (3) creation of effective investment infrastructure in the region, which facilitates interaction between investor and investment recipient; 4) improvement of the regional legal base of investment; 5) reduction of administrative barriers to investment; (6) reduction of regional investment risks.

Methods, forms and methods of influence are used on each direction, and they are united into enlarged blocks of elements of the FICF mechanism.

I. The support system of investor includes the following elements: information support of potential investors, entry into the regional market, organization and support of investment projects.

II. The support system of investments recipients includes complex of consulting assistance and elements of administrative stimulation.

III. The development system of investment infrastructure includes the transport development, telecommunication infrastructure, hotel and tourist business, financial infrastructure of the region, development of leasing, franchising and the information and consulting services development in the field of investments.

IV. The reduction system of regional investment risks includes the development and improvement of investment policies and strategies in the region, complex programs on investment risks reduction, insurance of investments and increase of information openness of the region.

V. The improvement system of normative legal base of investment in the region is aimed at the formation of favorable investment and legal climate in the region. In this block we have to solve the following tasks:

- 1) to create favorable conditions for the participants of investment activity in the region;
- 2) to form the forms list of state support of investors in the region;
- 3) to determine the priority directions of investments attraction;
- 4) to form the list of priority investment projects in the region;
- 5) to reduce the investment legislative risk in the region.

All forms and ways of favorable legal climate formation in the sphere of investing must be contained in laws and legislative acts: law on state support of investment activity in the region; law on state and legal guarantees of the region; law on tax advantages; law on investment tax credit; law on the address investment program of the region and the list of priority investment projects; law on stimulation of economic development of the region, etc.

VI. Reduction system of administrative barriers to investment is aimed to overcome “small number of investment’s places: underdeveloped secondary land market, the taxation burden, currency regulations and customs procedures in the framework of foreign economic activity.

Here there are recommendations to regional authorities on the development of healthy competition in the region; inconsistencies elimination on how to use and interpret of laws and legislative acts; practice of public authorities on how to create their own consulting firms on the issues of land, construction, customs, migration and licensing.

The mechanism tools of FICF of direct and indirect influence on the investment climate in the region were divided into three blocks: administrative, financial and information. Despite of the allocation of all tools in separate blocks, the maximum effectiveness of the mechanism can only be achieved by their complex usage. The blocks represent a system of mechanism tools of the favorable investment climate formation. The mechanism effectiveness of the FICF is determined by using the monitoring system of investment activity in the region. During its formation it is necessary to apply the following algorithm:

- 1) to define measurable indicators of investment activity;
- 2) to establish the information sources for conducting the monitoring;
- 3) to select a data collection methods;
- 4) to determine the frequency and schedule of their collection;
- 5) to appoint responsible for obtaining the necessary information;
- 6) to determine the technology of processing and analysis of the received information;
- 7) to determine the recipients of the monitoring results for further use;
- 8) to form the methods of control and correction of the monitoring results;
- 9) to take into account the costs of monitoring.

CONCLUSIONS.

Investment climate is a system of diverse natural and geographical, financial, economic, socio-cultural, organizational and legal conditions and factors of the country. These factors define country’s attractiveness to investors. The most rating agencies don’t consider Ukraine to be an attractive country for investments. It was reported that the main factors that affect the investment climate and investment attractiveness of Ukraine are: macroeconomic instability, due to the numerous risks of investing in the country, the low level of protection of foreign investors, which negatively affects the image of Ukraine and imperfect legislative regulation that negatively affects the profitability of investment, corruption and blocking foreign investment.

The received mechanism of FICF summarizes some important points. Firstly, this mechanism is the basic that includes a common set of elements, which can be selected and detailed, in accordance with specific goals and objectives of each individual region.

Secondly, the mechanism FICF was developed based on the experience of the regions that have the most favorable investment climate in Kyiv, Dnipro). In these regions the state of investment activity was analyzed and the most effective methods of influence were identified.

Thirdly, all blocks of the mechanism are vector projections of socio-economic development of the region for investment platform. The structure and activity of the use of certain mechanism tools is determined by the economics characteristics of the region.

Fourthly, the mechanism is designed to reduce regional investment risks, while includes elements and influence tools on the investment potential of the region.

Fifthly, in the mechanism the tools were laid "feedback" or methods of basis influence that helps to improve the mechanism adaptability in the changing socio-economic conditions and effectiveness of regulatory impacts of the superstructure.

OPPORTUNITIES AND THREATS FOR THE RUSSIAN COPPER INDUSTRY AFTER THE COUNTRY'S ACCESSION TO THE WORLD TRADE ORGANIZATION

Kapustina, Larisa Mikhaylovna¹; Drevalev, Andrey Anatolievich²

¹Institute of Management, Marketing and International Management, Ural State University of Economics, Ekaterinburg

² Marketing and International Management, Ural State University of Economics, Ekaterinburg

ABSTRACT

Accession to the World Trade Organization (WTO) has strong impact on the country's economy as it stimulates reduction of the international trade barriers. However few studies have been conducted in order to evaluate the consequences for specific industries and effects on the global market development for the case of Russian Federation which is one of the leading exporters of oil, gas, chemicals and metals.

The article concerns the influence that the accession of Russia to the WTO will have on the development of the national copper industry and the global copper market in its current state.

The authors determine the role of Russia in the global copper market as a net exporter; discuss opportunities and threats connected with the country's commitments as the WTO member state, mentioned in the previous researches; analyze the qualitative changes which result from the implementation of the specific terms of accession, scheduled to be implemented by the end of the years 2014 to 2016.

It is concluded by the authors upon the analyses that the values of both Russian exports and imports of goods with copper content are likely to show the upwards trend in the next years. However the global market downturn can compensate for the growth. At the same time the share of goods with low added value in the country's commodity structure of exports is very likely to grow to meet the demand in the global market. Thus strategic marketing effort is required from the national companies to improve their competitive positions.

Keywords: *world copper market situation, copper industry, export, import, trade barriers, tariff, customs duties rates.*

INTRODUCTION

Copper was first used by humans presumably more than 10 000 years ago as one of the first metals to be extracted and processed. It is a soft and malleable metal, resistant to corrosion. Its alloys are a good

material as a conductor of heat and electricity. Nowadays about 30% of the copper produced is used in equipment production, including hi-tech appliances, another 30% is used in building construction, the other uses including infrastructure industries (copper wires are an essential part of power transmission systems), transport and common industrial use (copper radiators and pipes are widely used in various machinery). It is said that an average passenger car contains 1.5 kilometers of copper wire and from 20 to 45 kilograms of copper in the car parts (Doebrich, 2009).

The increase in demand resulted in the boost of production and the international trade turnover. It is China that is considered to be the market maker in the copper market nowadays. Still one of the remarkable events of the recent years was the accession of the Russian Federation to the World Trade Organization (WTO) in 2012. It is an international body, which aims at supervising and promoting the liberalization of the international trade.

Russian Federation is one of the top-ten world economies with the gross domestic product exceeding 3.3 trillion U.S. dollars (USD) and exports exceeding 540 billion USD according to the World Bank's estimates. The country however only ranks 92 out of 189 states in the World Bank's "Ease of Doing Business" ranking. The pace of economic development is partly limited by orientation on exporting of raw materials and dependency on importing industrial equipment. This results in ineffective regulation including construction permits and getting electricity, high cost of credit and low level of investment protection. All these factors lead to many enterprises being uncompetitive due to old production sites, out-of-date equipment and low labor productivity. But above that all, World Bank highlights the difficulties in trading across borders which exporters and importers have to overcome doing business in Russia. In this regard Russian Federation only ranks 157 out of 189 states by the conditions of getting involved in the international trade.

In order to speed up the economic development and make cross border trade more effective, the country has been seeking the WTO accession for almost 20 years since 1993. The main commitments finally undertaken in 2012 include reduction of import customs duties and elimination of export ones, significantly reducing the state influence on electric power market and other complex measures. In general, as a result, export-oriented industries should benefit from the increasing openness while some local companies that focus the domestic market competing with imports may be vulnerable to import boost.

The country's commitments are to be implemented by the end of the transition periods or "schedules" which have been set for particular groups of goods. For many products with copper content the customs duties are to be reduced by the period of the years 2014 to 2016.

In this regard the main aim of the article is to provide the estimation of the influence that the accession to the WTO may have on the development of the Russian copper industry, which is an important

sector of the national economy, and estimate the consequences for the global copper market. In order to reach this goal the authors analyze the global market situation and the current position of Russia; review previous studies of the impact of the WTO accession on the Russian economy and copper industry in particular; discuss the questions if the commitments to reduce and eliminate customs duties support the country's strategic goal of increasing the share of goods with high added value in exports and if they can lead to improving the country's position in the global copper market.

CURRENT SITUATION IN THE WORLD COPPER MARKET

Production

According to the U.S. Geological Survey (Mineral Commodity Summaries, 2014), the world reserves of copper-bearing ores are estimated at the level of 690 million tons of metal with the world annual consumption exceeding 20 million tons. Significant reserves are possessed by Chile (190 million tons), Australia (87 million tons) and Peru (70 million tons), which together account for more than half of the world reserves. Large reserves of about 40 to 30 million tons are found in the U.S.A., Mexico, China, Russia, Indonesia and Poland. Other countries in total account for about 21% of the world reserves.

The world mine production of copper in the past seven years has increased by impressive 16% and is about to reach the level on 18 million tons of copper content (Mineral Commodity Summaries, 2008-2014). The leading mining countries are shown in Table 1 including Chile (32% of the world mine production) and China (9%) with Russia belonging to the group of states that have 5-7% of the global mine production.

Rank as of 2013	Country	Mine production by year, thousand tons of copper content							2013 to 2007, %	Share in the world mine production
		2007	2008	2009	2010	2011	2012	2013 (e)

Table 1. *World mine production of copper*

The world production of refined copper has increased by 16.9% in the period of 2007 – 2013 and amounts to 21 million tons, including 3.6 million tons developed from recycled materials (Mineral Commodity Summaries, 2014). The pattern of the refined copper production, according to the results of the year 2012, includes the following leaders: China (29% of the global production volume), Chile (14%), Japan (7%), USA (5%), Russia (4%), India (3%), Germany (3%).

The top copper producing companies are shown in Figure 1 (World commodity markets statistics, 2014).

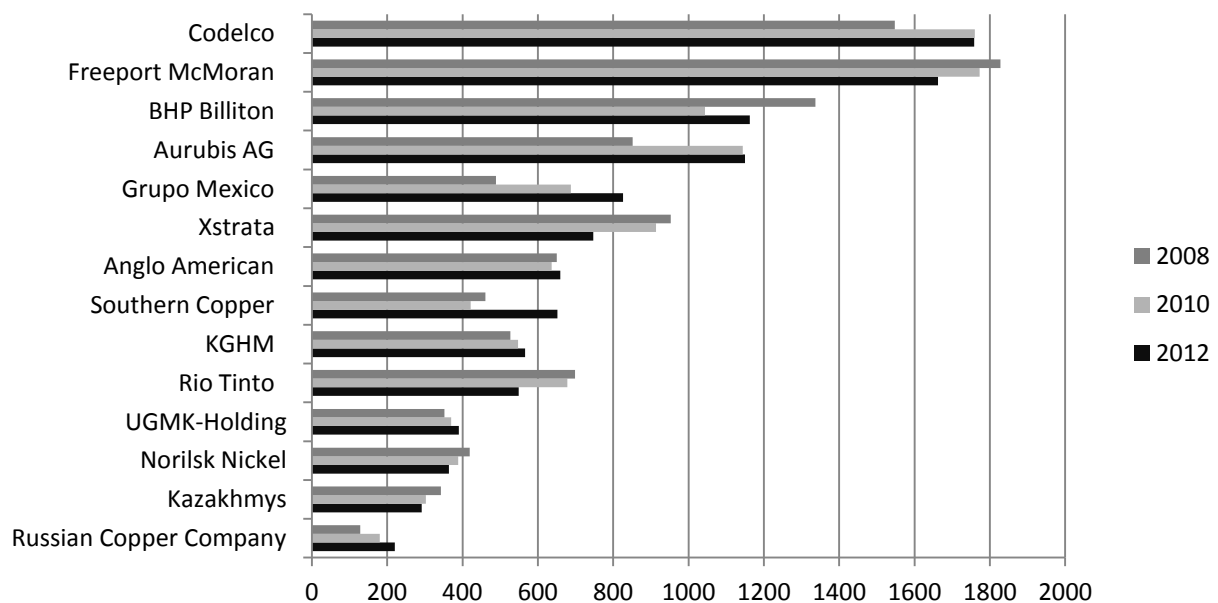

Figure 1. *Refined copper production by company / thousand tons*

It should be noted that the list of the 10 companies which are the world's leading producers includes three Russian copper producers, namely UGMK-Holding (also referred to as UMMC – Urals Mining & Metallurgical Co.), Norilsk Nickel, and Russian Copper Company. However, the combined capacity of the Russian market leaders does not exceed 4-5% of the global production, which is about 900 thousand tons of copper per year.

Consumption

Copper is a metal used in various fields. The shares of the end use sectors by their usage of the copper content in 2012 are presented in the Figure 2 (The World Copper Factbook, 2013).

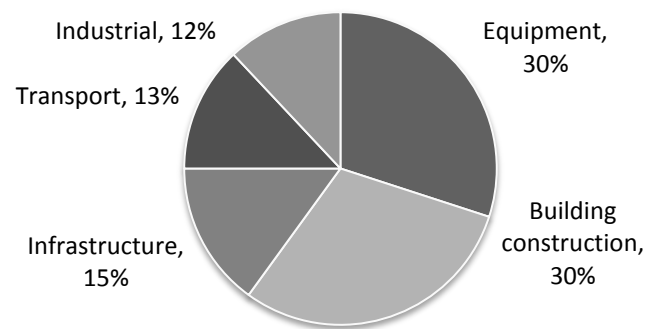

Figure 2. *Major Uses of Copper by the End Use Sector, 2012*

World refined copper usage almost reached the level of 21 million tons in 2013 which is twice as much as the world consumption in 1987. The long-term dynamics are shown in Figure 3.

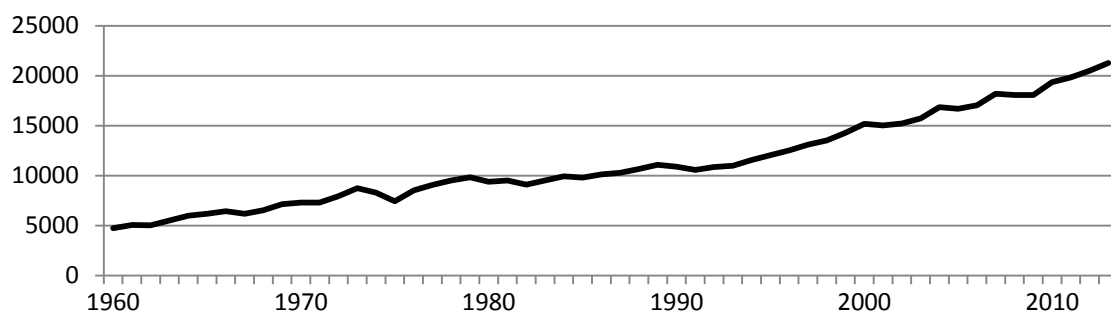

Figure 3. *Dynamics of the world copper consumption / thousand tons*

Currently the growth in demand is to a greater extent provided by an increase of the level of consumption in China which is accompanied by the growth of its own production, and increasing volume of raw materials imported from the Democratic Republic of Congo, Zambia, and Australia. The data by country and region is presented in Figure 4 (World commodity markets statistics, 2014).

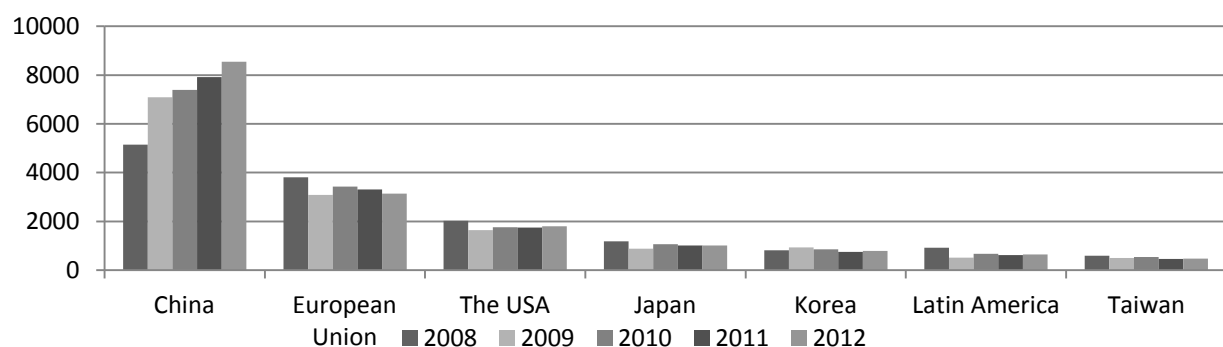

Figure 4. *World copper consumption dynamics by country (region) / thousand tons*

Global trade and market price

At the current stage, the overall import growth can mainly be attributed to the growth of demand from China, as it has been already mentioned. Most of the industrialized countries on the contrary have the demand for copper reducing in the last years. Still according to UNCTAD, the EU continues to play an important role in the global copper market (International Trade of Refined Copper, 2013). The list of leaders in terms of refined copper exports includes Chile, Germany, Japan, France, and Russia. Leading importers of refined copper are China, the U.S.A., Italy, Germany and France. Figure 5 shows the leading refined copper exporters and importers – excluding the trade in unrefined copper.

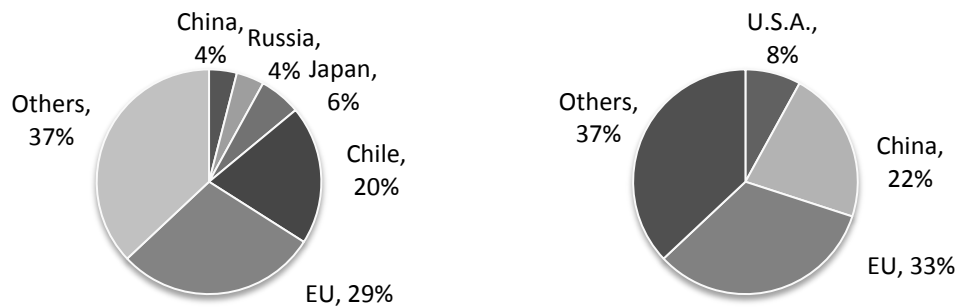

Figure 5. Major refined copper exporters (left pie chart) and importers (right pie chart) during 2007-2012

In the year of 2013, the copper market environment, unlike the previous 3 years, was characterized by production excess over the physical demand. One of the indicators of overproduction is the growth of copper stocks at the London Metal Exchange (LME). In early 2013, experts predicted growth in copper demand. The forecasts resulted in production growth. However, in the first half of 2013 the copper stocks have reached their historic highs for the last 10 years and totalled 516.8 thousand tons. (Day, 2013). The main destabilizing factor on the global non-ferrous metals markets currently is the China's shift from increasing import volumes of raw materials to focusing on its domestic mining and production.

Against this background, the whole dynamics of the world market prices of non-ferrous metals since 2011 possess a predominantly bearish character, after the price has recovered from the slump of 2008. In particular, an average copper price in 2013 was recorded at 12.4% lower level than in 2012. The current price of copper demonstrates the dynamics instability. Thus, in March 2014 the cost of 1 ton of copper on the LME declined sharply from 7-7.2 thousand USD to 6.6 thousand USD, well below the average price level of the recent years. According to the expert forecasts, the trend toward price reduction will continue for the years of 2014-2015 (Saefong, 2014). The Figure 6 shows historic data and the authors' estimates for 2014-2015.

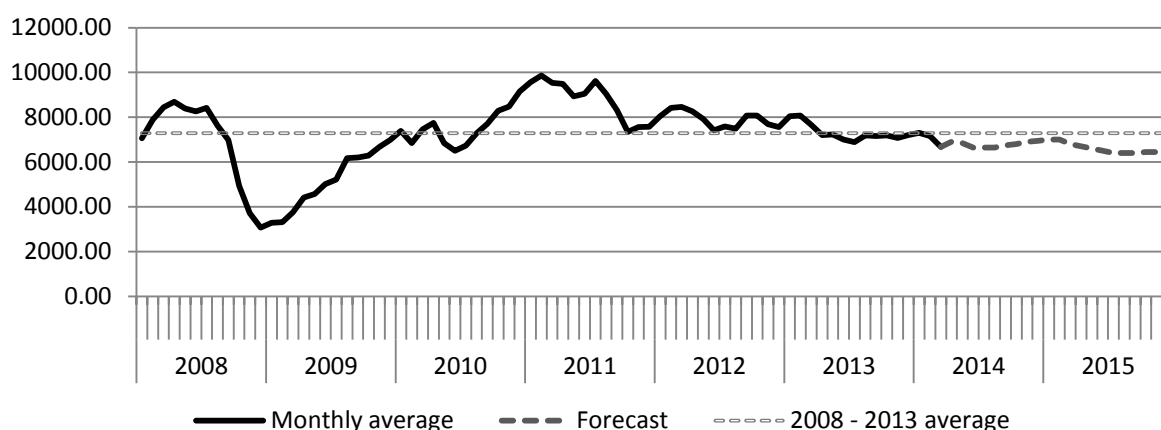

Figure 6. *Dynamics of the copper price on the London Metal Exchange, USD / t*

All in all it may be not the best times for the copper producers including the Russian organizations which do not have sufficient weight in the global copper market for a significant impact on such market conditions. Thus global market slowdown in fact can be a significant threat for the copper industry development.

Market position of Russian Federation

In addition to the facts mentioned above, it should be noted, that the main copper refinement product in Russia is wire rod from 8 to 18 mm in diameter. This refinement product possesses the higher added value in comparison with copper cathodes, but less added value if compared to other products of the copper industry, such as stranded wire, pipes, fittings, and plate radiators. It is estimated that up to 70% of Russia's refined copper cathodes are processed into rods. Meanwhile, the domestic market capacity is limited, and thus, about half of the overall produced wire rod is exported (Uvarov, 2009).

Russian organizations secure their positions in the niche, they currently focus. According to the industry experts' estimates, almost all the export volume of the refined copper is sold to the countries of the EU (major importers being the Netherlands, Germany and Belgium) and Turkey. (The Urals Metal Market, 2011).

Some copper-bearing ore and scrap are imported by Russia from Kazakhstan. The non-ferrous metallurgical companies of the two countries have strong business links and forming of the Eurasian Economic Union of Russia, Kazakhstan and Belarus in 2015 can stimulate the development of new investment projects and support economic growth.

The analysis of available statistics on the Russian international trade in copper products (Fig. 7) clearly shows that Russia is a net exporter. Despite the marked local downturns (late 2008 - early 2009) and bursts (II quarter of 2012), the value of Russian exports of copper remains generally constant,

fluctuating around the level of 1200 million USD per quarter while the imports remain on the relatively low level of about 150 – 250 million USD per quarter.

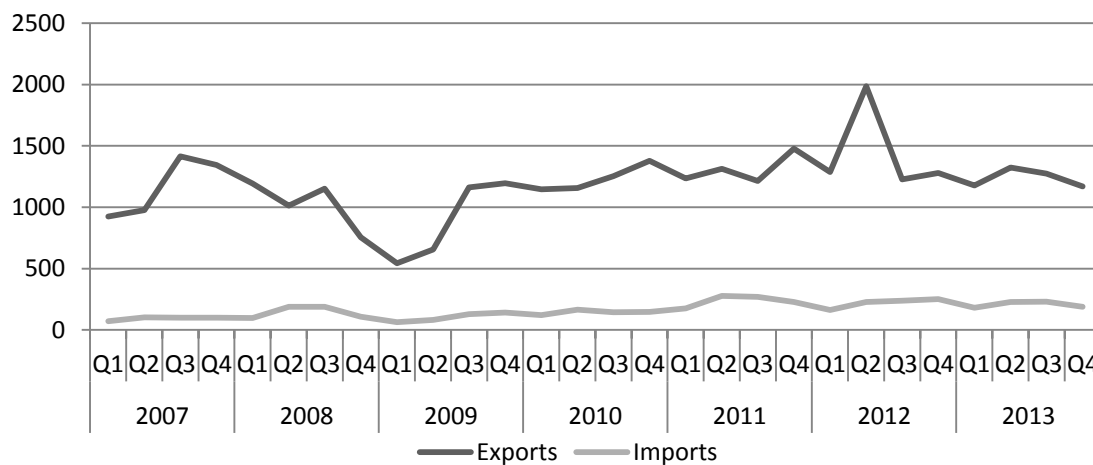

Figure 7. *Russian copper products exports, million USD.*

The Figure 7 data compared with Figure 6 show that more than two-fold reduction of the export volume during the time period between the years 2008-2009 occurred due to a decline in global demand and prices. During the second quarter of the year 2012, the export growth for more than 50% if compared to the same period in 2011 had the background of a smooth reduction in world prices, which can be explained by the plans of manufacturers to increase export volumes before the possible prices slump, predicted for the summer and autumn seasons of the year 2012, or until the ratification of the WTO Accession Protocol, which was associated with significant uncertainty for the Russian market development.

CONSEQUENCES OF THE WTO ACCESSION FOR THE RUSSIAN COPPER INDUSTRY

Literature review

Russia had initiated negotiating the conditions of accession to the WTO in 1993 and it was finished in 2011. Surprisingly not so many scientific researches on the consequences for specific industries have been conducted during the long negotiation period. The main reasons for that include the complexity of the WTO documentation and the lack of the statistics on the development of the domestic industries. However some valuable studies should be mentioned that have been conducted by Russian and international organizations for the state authorities and national companies. Some of them discuss the prospects of non-ferrous metallurgy development alongside with other industries.

A preliminary analysis, which was organized in 2002 by the Russian Academy of Sciences and the National Investment Council, revealed the threat of system problems occurring after accession to the

WTO in a number of industries, including metallurgy. The estimates performed on the inter-industry model for non-ferrous metals found a relatively high elasticity of imports and production volumes for import customs duty. So, under the condition of simultaneous decrease of import duties for 1 percentage point, there was anticipated the import growth by 1.79% and the decline in domestic production by 1.4% (Nikepelov *et al.*, 2002). However, the analysis of the preliminary gradual increase of duties in 2010-2011 prior to their binding, revealed that, thanks to such preventive measures, no import growth could be expected in three of the 24 selected economy sectors, including non-ferrous metallurgy. For the latter, it was also anticipated that the previous production volumes could be preserved, in contrast to the ferrous metallurgy.

The multivariate analysis of the Russian economy development prospects, held jointly by the Ernst & Young Company and the New Economic School in 2011-2012, revealed that the non-ferrous metallurgy was expected to have the highest production growth after accession to the WTO of 114.45% by the end of the transitional period in comparison to the level of the year 2011 (Ivlev, *et al.*, 2012).

The studies conducted by the World Bank, also predicted a significant positive effect of the accession to the WTO for the Russian non-ferrous metallurgy. In particular, 35 sectors of economy were identified for the survey of the year 2004, only 7 out of them were expected to have increase in production, and only 5 of them were expected to have an employment level growth due to the increase in production output. Non-ferrous metallurgy was mentioned to have both positive effects (Brodman, 2004).

In the analysis of sectorial and regional aspects of the accession to the WTO, the Russian analytical centre "WTO Inform" emphasized the high risks for the economy as a whole. At the same time the experts formed a favourable forecast of financial situation for the copper industry enterprises, including UGMK-Holding and Russian Copper Company; there was also stated the possibility of their revenue increase after the accession to the WTO.

It should be noted that most of the Russian copper-smelting companies had completed major modernization projects before accession to the WTO. The largest enterprises that produce refined copper are included into the vertically integrated companies: Norilsk Nickel, UGMK-Holding and Russian Copper Company – which account for more than 87% of the total industry production. Studies indicate a relatively high level of production competitiveness and, ability to work in accordance with the WTO conditions. Still the reduction of import duties should have positive impact on the costs of new investment projects. (Myzin, Kuklin, 2005).

The business community experts and the leading Russian business press ranked the industry risks for non-ferrous metallurgy as the lowest ones among other industries. It is assumed that the reduction of import barriers for copper products should not lead to the competition toughening on the domestic

market, which is not very attractive to foreign companies. Still the domestic production capacity growth rate is not likely to exceed 10-15% a year. (Aliev, 2011).

Import duties reduction for products with copper content

Analysis of the Russian Federation commitments for import duties reduction leads to the conclusion that for most of the commodity items, representing products with copper content of relatively low added value, the import duties are not bound and can be preserved at the level prevailing at the date of WTO accession. These conclusions are generally valid for the following groups of commodities according to the Harmonized System: 26 "Ores, slag, ash", 38 "Other chemical products", 73 "Articles made from Non-Ferrous Metals", 74 "Copper and articles thereof". The exceptions are represented only by separate commodity items and subgroups, the major of which are set forth in Table 2.

Commodity group (extended Harmonized System code)	Bound Rate at Date of Accession, %	Final Bound Rate, %	Year of Implementatio n
Ores, slag, ash (2603 00 000 0)	5	3	2014
Fungicides: preparations based on copper compounds(3808 92 100 0)	5	3	2014
Stranded wire, ropes, cables, plaited bands, slings and the like, of iron or steel, not electrically insulated plated or coated with copper-zinc base alloys (brasses), including: the ones with fittings attached, or made up into articles, for use in civil aircraft (7312 10 410 1) and other (7312 10 410 9)	15 15	5 7.5	2014 2014
Copper tubes and pipes of refined copper (7411 10 100 0, 7411 10 900 0)	5	3	2014
Copper tube or pipe fittings (for example, couplings, elbows, sleeves): of copper alloys (7412 20 000 0)	5	3	2014

Table 2. *Tariff concessions of Russia in terms of import duties for certain types of copper products*

The data listed in Table 2 show the groups of goods with the corresponding code in the Harmonized System which helps to identify the product for the customs formalities, the bound rates of customs duties fixed in the accession protocol as a starting point and final bound rate to be introduced until the end of the year of implementation.

The rates shown in Table 2 in general correspond to the estimates of the overall reduction of average import tariff, as a result of WTO accession, which is from 10.3% to 7.2%, and the level of tariff protection of Russian non-ferrous metallurgy in particular, which is from 6.4% to 4.7%, at the end of the transitional period. A more significant reduction of duties will be applied to commodity items of the "Stranded wire, ropes, cables..." subgroup as shown in Table 2. In this regard, it should be noted that in general, much more substantial obligations to reduce import duties on average from 15-20% to 10% or below, have been taken in respect of a large number of products with high added value. This

list includes a wide range of products: copper insulated wires, electrical wires, cables, components, machinery, household electrical appliances, microelectronics, jewellery.

It appears that in the long run the import of finished goods with copper content will increase which may impede the development of the domestic market. However it should be noted that the possible growth in the level of competition should have a beneficial effect on the development of the industry. It can stimulate performance improvement including cost reduction. At the same time a positive reflection of changes in the market position of domestic companies is possible only in conditions of favourable market situation and effective corporate management.

Cancellation of export duties for copper products

In general, as expected, the copper products manufacturers will increase export deliveries after the reduction and cancellation of currently applied export duties, which were designed to stimulate the production of goods with higher added value for the domestic market. Respective commitments of the Russian Federation are presented in Table 3.

Commodity group (extended Harmonized System code)	Bound Rate at Date of Accession, %	Final Bound Rate, %	Implementatio n period (years)
Copper oxides and hydroxides (2825 50 000 0)	6.5	0	4
Copper mattes, cement copper (precipitated copper) (7401 00 000 0)	10	0	4
Unrefined copper; copper anodes for electrolytic refining (7402 00 000 0)	10	0	4
Refined copper; copper cathodes and crude copper alloys (7403 11 000 0 – 7403 29 000 0)	10	0	4
Copper waste and scrap (7404 00 100 0 – 7404 00 990 0)	50, but not less than 420 € / 1000 kg	10, but not less than 84 € / 1000 kg	5
Master alloys of copper (7405 00 000 0)	10	0	4

Table 3. *Tariff concessions of Russia in terms of export duties for copper products*

The table columns are similar to Table 2 with an exception of the implementation period starting from the date of accession (August 2012) fixed in the official documents instead of stating a specific year. The listed rates of export customs duties applied at the date of WTO accession, proved to be an effective measure to limit the export of low-processed products, including copper scrap. Thus gradual or one-time reduction scheduled for the time period between the 2016-2017 years is associated with significant risks. They were clearly demonstrated by Russian companies in 2009 - 2011 when they obtained the opportunity to refocus their exports. In 2009, in response to the slump on the world commodity market, the export duties for copper cathodes (10% previously) were abolished. It led to dramatic increase in export of this produce with lower added value in comparison with the wire rod.

Reintroduction of the customs duties in 2010 resulted in stopping the export of cathodes while the copper wire rod exports, on the contrary, has increased significantly as a substitute.

In this regard cancelation of export duties for all copper products including scrap is likely to cause the situation of stockists exporting scrap rather than selling it to processors on the domestic market. In this case many production development investment projects can be shut down. Currently, it is estimated that copper scrap provides 28% of raw copper for Russian industry. For instance, the representatives of the UGMK-Holding announced that the main reason for the reduction of copper production by 4.1% in the first half of 2013 was the lack of copper scrap. As a result, by the end of 2014 the overall production is expected to be reduced by 4.4% year-to-year (Milyaeva, 2013).

Thus, at the current stage the growth of copper production seems likely mostly in part of the low value-added products. In case of exports increasing with the goods of low processing degree, the dependence of the domestic market on foreign economic conditions will be sure to grow. Consequently, the main purpose of the companies' operational and strategic management can fall down to preserving of the current position with respect to fluctuations in world market conditions. It may be considered the major threat for the industry development.

CONCLUSION

The research has been conducted mostly on the qualitative level by analysing the experts' survey data, analytical reports of the national and international organizations, available statistics. In general the study shows the Russia's role in the global copper market as a net exporter supplying mostly semi-finished goods. Accession to the WTO is likely to result in the growth of copper exports after reduction and cancellation of currently applied export duties. This will lead to the increase of the market share of the Russian companies including Norilsk Nickel, UGMK-Holding and Russian Copper Company. The growth will be limited by production capacity and the total export volume cannot be estimated to exceed in the short term the level of 1.5 million tons a year – which account for 7.5% of the global market showing the growth from the current level of about 5%. However the growth of export volume may be accompanied by the shift in its structure towards the goods with low added value, including scrap, which doesn't match the country's strategic goals.

At the same time accession to the WTO should have positive impact on the Russian copper industry by creating a more competitive business environment providing incentives for intensification of modernization processes. It is clearly shown in the several studies mentioned in the article, including the conclusions of the World Bank, Ernst & Young and the New Economic School, Russian Academy of Sciences and the National Investment Council. This trend can be supported by the opportunities of

forming the Eurasian Economic Union in 2015 as copper refining enterprises of Russia and Kazakhstan have strong business links.

Still, as the industry is currently very dependent on the global market situation, it is assumed that if no actions are taken by the companies, the forecasted global market downturn will sharpen the contradictions of the industry development including the shortage of recycled resources, relatively low efficiency of corporate management and slowdown of domestic demand. In order to exploit the benefits of the accession to the WTO the companies' strategies should focus not on the production expansion but on creating a sustainable production process. This includes diversification of the product line, increasing the share of the goods with higher added value, developing mutually beneficial links with other enterprises of the associated industries, possibly focusing on the domestic market. If these actions are taken, Russia should strengthen its positions in the copper market, its companies overtaking partly the shares of the competitors in the European market.

The authors intend to continue the study on the qualitative level by creating models based on supply and demand curves for the Russian and the global markets for the specific products and the industry as a whole to estimate the qualitative effects.

KNOWLEDGE-INTENSIVE ENTREPRENEURSHIP AND LOW-TECH SECTORS: QUESTIONING THE SUCCESSFUL CREATION OF LOW-TECH BUT KNOWLEDGE-INTENSIVE VENTURES

Karagouni, Glykeria; Caloghirou, Yannis

Laboratory of Industrial and Energy Economics, Department of Chemical Engineering, National Technical University of Athens, Greece

ABSTRACT

The starting point of this paper is the ongoing discussion on knowledge-intensive entrepreneurship (KIE). Since recently the phenomenon had been assigned to high-tech sectors which are R&D and science- dominated. However, a new small but increasing stream of relevant literature argues that KIE is relevant if not pervasive in traditional, low-tech industries as well. Literature has offered a significant amount of insights related to the basic building blocks of low-tech (LT) KIE, i.e. knowledge, its sources and ways of exploitation, knowledge-intensive innovation and mechanisms and capabilities of reaching it, as well as types of LT-KIE ventures, among others. Furthermore, there is a plethora of skills, entrepreneurial characteristics and other antecedents and factors used as input, KIE management and output in KIE processes. However, there is a gap in the understanding of how low-tech but knowledge-intensive ventures are created, survive and grow within their mature and highly saturated business ecosystems. Therefore, thee numerous valuable constructs of existing literature can assist the further exploration of the topic called low-tech knowledge-intensive entrepreneurship in order to understand how LT-KI entrepreneurs and entrepreneurial teams recognize or create opportunities and transform them into successful knowledge-intensive business capable to survive the stagnancy of traditional mature markets. The paper purports to start this discussion by posing the relevant research questions maintaining mainly an *entrepreneurial approach* of the LT- KIE phenomenon.

Keywords: *low-tech industries, knowledge-intensive entrepreneurship, innovation, venture creation, knowledge, entrepreneurial approach, initial competitive advantage, resources*

INTRODUCTION

Knowledge-intensive entrepreneurship (KIE) has been considered a type of high potential entrepreneurship which helps renew the economy. It indicates ventures whose initiation or expansion is based on the dynamic application of new knowledge. According to Malerba and McKelvey's (2010)

formal definition of knowledge-intensive entrepreneurship, KIE is associated with four basic characteristics:

- it concerns new firms (new ventures); new ventures that are innovative;
- new ventures engaging in activities that are knowledge intensive;
- and finally, new ventures that are not to be found solely in high-tech industries i.e. they may well be active in industries with medium or low-tech characteristics.

Therefore, KIEs are involved in *venture creation* which is a mechanism to translate *knowledge* into *innovation* (and further on, into survival and growth). Thus the ultimate objective in KIE is market success and not just the development of a radical innovation. Furthermore, entrepreneurs are considered knowledge operators, dedicated to the utilization of existing knowledge, the integration and coordination of different knowledge assets, and the creation of new knowledge, and engaged in the development of new products and technologies.

A detailed exploration of several KIE dimensions in an effort to unlock its riddles was provided by an FP7 Research program, called AEGIS. Actually, the survey based on a large set of data purported to identify motives, characteristics (including constituent knowledge assets and skills) and patterns in the creation and growth of new firms based on the intensive use of knowledge regardless sectors and levels of technologies. At firm level, the survey put emphasis on founders and founding teams' skills and characteristics, type of company formation, funding issues and potential obstacles. It further focused on the performance, innovativeness, success factors and relevant capabilities of the formed company as well as the system factors that affected these parameters such as the sources of knowledge and customers and the links and networks. The survey further extended to issues such as the institutional and market environment, strategic analyses and business models.

On the other hand, the AEGIS case studies addressed several of the conceptual issues which related KIE to innovation systems, growth and performance while many of the case studies focus upon strategy, business models, mobilization of resources and other internal processes of the venture creation, as related to a temporal dimension.

However, up to date, the discussion about knowledge-intensive entrepreneurship (KIE) is still mainly focused on new technology-based firms or academic start-ups in high-tech sectors. Little attention has been paid to sectors that conduct no or only few formal R&D activities and that are therefore characterized as non-research-intensive or "low-tech" (LT).

How easy is it to apply KIE in low-tech sectors? Hirsch-Kreinsen and Schwinge (2011) describe low-tech sectors as mature ones with established technologies and production regimes and well-recognized standards, methods, and knowledge related to both products and processes. LT industries face fierce competition due to the easy copy of their basic technologies by competitors with lower cost

bases mainly in Asia. Furthermore, LT knowledge bases include mostly codified, transferable and well-known elements such as design methods, engineering routines or the know-how about markets and customer preferences with well-defined behavioral patterns. Innovations in these contexts are more or less path-dependent i.e. they are based on technological knowledge and capabilities that have been slowly evolving around established technological trajectories and thus incremental and of little value in producing competitive advantage. As a result, the growth rates as well as radical innovations in these industries are relatively low.

Consequently, the above constraints indicate that LT sectors and firms seem to offer only very limited opportunities for KIE development. However, such opportunities seem to exist in spite the “stable environment of low-tech industries” (Deutschmann, 2008). Furthermore, competitive pressure and the ever-changing and volatile global business environment of today seem to force LT actors towards knowledge-based breakthrough innovations, even if they are not so spectacular as in the cases of high-tech (Bender and Laestadius, 2005; Hirsch-Kreinsen, 2008). This is further confirmed by the existence of the so-called “gazelles” of mature industries (cf. Yudanov, 2009). Such cases indicate the KIE can be applied in LT sectors. However, there is still a significant gap in the understanding of how low-tech but knowledge-intensive ventures are created, survive and grow within their mature and highly saturated business ecosystems.

KNOWLEDGE-INTENSIVE ENTREPRENEURSHIP AND LOW-TECH SECTORS

An extensive literature review highlights the significance of low-tech sectors as well as their potential regarding innovation and the use of knowledge. Thus, paraphrasing Mendonça and von Tunzelmann (2004, p.15) who referred to LT- innovation the present thesis supports the view that, “KIE in low-tech industries should ... not be seen as a contradiction in terms.” However, the recent research on KIE indicates that translation of knowledge to innovation through LT- KIE is more complex than expected compared to high-tech sectors. In the same vein, the limited research on LT-KIE shows that the sectoral conditions seem to affect to a significant extent the creation or exploitation of opportunities through knowledge, market, institutions, etc. as well as the creation of LT-KI ventures.

Hirsch-Kreinsen and Schwinge (2011) relate LT-KIE firms’ competitive advantage to the abilities of introducing innovative products or processes by the exploitation and integration of technological advancements of other sectors mainly high- and medium-high-tech. According to them the impact of KIE at the firm level relates to technological development and capability building in order to create new market opportunities. However, there is no research or any approach to explain firm-level success and failure at the stage of LT-KI venturing. While there is some talk on competitive advantage

and capabilities this discussion remains caged within the borders of the innovation theory and not the field of entrepreneurship.

Therefore, existent theory and empirical research has not so far offered deep insight or strong constructs of the LT-KIE topic into the direction of understanding a KI-LT new venture's survival and growth. In other words there is actually a gap in the understanding and conceptualization of LT-KIE which addresses the very LT- KI venture creation from business idea to established low-tech business, not yet discussed by KIE researchers. Based on this discussion, the main research question is then:

HOW AND WHY CERTAIN LOW-TECH BUT KNOWLEDGE-INTENSIVE VENTURES SURVIVE EARLY DEATH AND PROSPER WITHIN MATURE ECOSYSTEMS?

In sum, the LT-KIE literature underscores the importance of a variety of factors, resources and innovation-related capabilities, but little work examines these from a new venture's survival perspective. With so much attention devoted to the conceptualization of KIE, significance of resources and skills, and the role of knowledge and innovation, the LT-KIE literature has been concerned primarily with "what" questions. There has been less attention paid to "how" questions. In relevant research so far, how LT-KI entrepreneurs/ entrepreneurial teams recognize or create opportunities, how they collect and process information, knowledge and other resources, how they arrive at valuations, and how they decide to act and succeed are issues not addressed by existing KIE theories. Therefore, it seems to be a gap in the understanding of the *entrepreneurial approach* of the LT- KIE phenomenon regarding the mechanisms by which new founders and founding teams will accumulate the bundle of resources, knowledge, skills and other inputs which have been quite expensively investigated in KIE literature.

The purpose then of the present research is to contribute to the comprehensive understanding of KIE as a mechanism for the transfer of multifaceted knowledge into *innovative economic entrepreneurial activities in low-tech sectors* and to shed light on its unclear inter-relationships with determining venture-related factors. From a definition that proposes that KIE are new firms that are innovative and knowledge intensive, some key dimensions important for the theoretical conceptual and empirical analysis stem out. In its general view LT-KIE follows the KIE definition and therefore regards new knowledge and innovation-based venturing. Therefore, innovation, knowledge, venture creation with resources and capabilities, as well as entrepreneurial factors regarding the entrepreneur, the firm and the environment as derived from relevant literature, will be the initial building blocks for the preliminary attempt to explore further low-tech knowledge-intensive entrepreneurship.

INNOVATION

In the low-tech context, KIE is a mechanism of implementing an innovation which goes beyond the existing knowledge and it is new and significant to the sector or the product field. Accordingly, innovation constitutes a crucial building block of LT-KIE.

As indicated by the literature review during the last ten years there has been a rather significant interest for low-tech industries. Researchers have dealt with LT innovations and innovation activities and have found out that they are not necessarily the result of systematic research and development (Pavitt et al., 1987; Henderson and Clark, 1990; Napolitano, 1991; Walsh, 1996; Rametsteiner 2000; Robertson, et al., 2003; Bender, 2004; Caloghirou et al., 2004; Hirsch-Kreinsen et al., 2005; Robertson and Patel, 2007; Hirsch-Kreinsen, 2008; Böheim 2008; Segarra-Blasco, A., & Arauzo-Carod, 2008; Lichtenthaler, 2009). Research has been advanced with the engagement of the knowledge factor; alternative sources of knowledge and distributed knowledge bases have been intertwined with the spatial dimension of innovation (Granstrand et al., 1992; Lundvall and Johnson, 1994; Liebeskind, 1996; Nonaka and Konno, 1998; Howells, 2002; Rigby and Zook, 2002; Smith, 2000, 2002, 2003; Hirsch-Kreinsen et al., 2003 and 2005; Bender, 2004; Robertson and Smith, 2008; Malerba, 2008 and 2005; Burger – Helmchen, 2008; Grimpe and Sofka, 2009; Chen 2009; Tsai and Wang, 2009, Stam, 2009). According to both literature and empirical findings (e.g. Gupta and McDaniel, 2002; Hirsch-Kreinsen, 2008), low-tech firms seek mainly new technical and practical knowledge linking external knowledge with the firm-specific knowledge base (Bender and Laestadius 2005; Medanoça 2009; Robertson and Smith 2008) relying on training and highly qualified personnel skills.

Accordingly, LT firms have been found to engage mainly in frequent changes or improvements of process technologies and new product development (Hirsch-Kreinsen 2008a, Robertson and Smith 2008, Robertson et al. 2009). While a very small percentage of individual low-tech firms develop R&D activities, the majority apply mainly open innovation (Hirsch-Kreinsen and Jacobson, 2008; Likar et al., 2008). Process, organizational and marketing innovations are more common (Heidenreich, 2009), while product innovations are in their majority incremental (Bender, 2004). It is also argued that cumulative incremental innovations are quite significant since they can expand, extend and leverage technological trajectories and can cause major economic impact (Dosi, 1982). A significant feature of low-tech innovation is the engagement of many stakeholders all along the value chain in open innovation. Suppliers have been found to be of utmost relevance, since low-tech firms rely heavily on raw material, machine and equipment technological advances (Bender, 2004; Heidenreich, 2009). In this context LT firms are widely termed as “supplier-dominated firms” referring to Pavitt’s taxonomy of sectoral innovation modes (Heidenreich, 2009; Robertson et al., 2003). However, they can also be

key users of high-tech ideas (Santamaria et al., 2009) contributing significantly to the development of technologies and knowledge diversification directed to new technological fields (Mendonca, 2009). However, even in the cases of LT-KIE, the relationship that exists between KIE and innovation is still straightforward; KI-LT entrepreneurs should transform new, knowledge-based ideas into economic activity. In order to succeed, the resulting knowledge-based innovation should go beyond the existing sectoral or product field-specific knowledge base by creating new knowledge, new ways of problem solving or new processes, products as well as new markets not applied or unknown in the industry before (Hirsch-Kreinsen and Schwinge, 2011). In other words such innovations should be novel to the whole sector and thus creating the potential for the new venture to create new opportunities or otherwise develop a competitive advantage in order to enter the broader mature market in direct or indirect ways (e.g. get a share or by creating a niche market). Therefore, the producing innovation is strongly related to the novel business idea the entrepreneurs / entrepreneurial teams will develop in order to establish the new business. Sticking always to the fact that innovation is not born inside research or academic labs as in the cases of high-tech innovation, the following questions then emerge:

HOW DO LT-KI ENTREPRENEURS/TEAMS CREATE INNOVATIVE KNOWLEDGE-INTENSIVE BUSINESS CONCEPTS?

Knowledge

Searching the literature, knowledge intensiveness in LT sectors was heavily questioned through kinds of knowledge and ways of combining existing codified knowledge with practical knowledge in a competitive way (Napolitano, 1991, Pavitt, 1984, Lichtenthaler, 2009, Robertson and Patel, 2007, Hirsch-Kreinsen et al. 2005), and a clear orientation to innovation (Heidenreich 2009, Fagerberg, 2005).

A major aspect therefore regards the importance of **trans-sectoral knowledge bases** (Bender and Laestadius, 2005; Hirsch-Kreinsen, 2008) and the broader need to transcend sectoral limits in cases of LT-KIE. Based on Robertson and Smith's (2008) emphasis on the particular significance of the "distributed knowledge bases", we expect that firms and individual entrepreneurs alone will not be able to be the drivers of KIE processes; instead they have to connect with actors, resources and opportunities from well outside the sector. Thus, accumulated knowledge can support a new way of combining trans-sectoral inputs or resources based on exploitative learning processes. Therefore, it seems that there are major differences between high-tech and low-tech KIE; the origins of high-tech innovation rely often - if not always - in out-of the lab, R&D-based technology followed by patents and other types of appropriability measures (Adams, Fontana and Malerba, 2012) and based on

sound scientific and technological knowledge. This does not seem to be the case regarding low-tech KIE where innovation activities are primarily based on “practical and pragmatic ways by doing and using” (von Tunzelmann and Acha, 2005). Yet, it is not easy to draw clear distinguishing lines between scientific knowledge and practical knowledge. While practical knowledge can be found in the context of operating processes, LT firms use and apply theoretical knowledge such as engineering knowledge or even R&D knowledge elsewhere produced. On the other hand, process innovations even if of incremental type entail a complex bundle of different pieces of knowledge which is not entirely practical and are mainly intramural, i.e. developed by the staff of the firm.

However, the science-based or technological knowledge within KIE does not have to be created by the entrepreneur or the diversifying low-tech firm. External sources of knowledge seem to be essential for low-tech innovation (Cockburn and Henderson, 1998; Santamaria et al., 2009). A growing number of researchers suggest that different forms of collaboration enable firms to engage in innovation (e.g. Chesbrough, 2003; Lichtenthaler and Ernst, 2009). However, innovation occurs through new combinations of resources, ideas, and technologies imposing a need for constant inflows of knowledge beyond firm- and sector-level boundaries (Chesbrough and Crowther, 2006). Accordingly, the third edition of the Oslo Manual (OECD 2005) has an expanded coverage of knowledge flows and the role of linkages in the innovation process. In its latest edition it thoroughly addresses innovation in less R&D-intensive, so-called low-tech industries implying the notion of open innovation. According to Robertson and Smith (2008) production relevant knowledge is distributed across firm-specific, sectoral or product-field specific and widely applicable knowledge-bases, whereas scientific-based knowledge is applied at every level. Collaborations can be with any type or organization such as universities or research institutes (Griliches, 1995; Caloghirou *et al.*, 2001), suppliers and customers (von Hippel, 1988; Brown and Eisenhardt, 1995; Joshi and Sharma, 2004; Cousins *et al.*, 2011), or any type of networks, alliances or joint ventures with other firms holding relevant knowledge (Chiesa and Manzini, 1998; Hagedoorn, 1993). A key aspect regards the correct balance between the development of internal knowledge (e.g. intramural R&D) and the adaptation of the acquired external knowledge.

VENTURING

LT-KIE regards **ventures** which are responses to innovative opportunities, emerging from knowledge in the form of new technology, new markets or even new ways of internal or external resources' exploitation. Since KIE has been considered as a significant mechanism through which new entries in the markets (in the form of new firms or diversification of existing firms) bring new ideas, products,

services and processes (e.g. Radocevitz et al., 2010; Chaminade and Edquist, 2006), researchers have explored a significant range of factors; these factors can be broadly divided into those referring to the entrepreneur, to the firm, and to the environment within which firms and entrepreneurs operate. They are significant since they shape the process of KIE in terms of enabling or constraining entrepreneurial opportunities to implement an innovation. For example, Radosevici's (2010) systemic approach of entrepreneurial opportunities offers such a list of environmental factors (scientific/technological, sectoral, demand, social cultural, institutional). In this systemic perspective entrepreneurial opportunity is constituted by technological, market and institutional opportunity that are understood as complements and are matched by the entrepreneurs.

The transition from venture creation to an early survival and continuation of the new firm has been also extensively explored and attributed to individual characteristics of the founders, the resources, the process and the environmental conditions (e.g. Gartner, 1985; Ardichvili & Gasparishvili, 2003; Beugelsdijk and Noorderhaven, 2005; Davidsson, 2006; Johnson et al., 2006; Kessler et al., 2012). Founders, firm, and contextual characteristics of new business ventures have been also explored regarding KI cases of high-tech industries or in general (e.g. Breschi, Malerba and Mancusi; Buenstorf (both in Malerba, 2010); Caloghirou et al., 2012; Camerani et al., 2012).

Malerba and McKelvey's (2010) "KIE model" provided a novel conceptual framework, since active choices were made about the conceptualization of specific processes, key notions, parameters and characteristics of KIE. The phenomenon has been defined in terms of individual firm content of its human capital, irrespective of the sector. Human capital can be measured in terms of the education of the entrepreneur, the skills of the labor force, and so on. Accordingly, specific pre-firm assets (finance, resources and entrepreneurial perceptions) are translated into venture performance and growth through internal management, organization and networking. However, the source, quality and type of inputs and resources which could influence the success of LT- KIE as much as the internal management processes of the next phase are unexplored. For example, while classical theory on entrepreneurship has employed various classifications of resources and capabilities especially after the engagement of the resource based view (e.g. Amit and Schoemaker, 1993) in order to explain venture creation, this remained too vague in LT-KIE cases.

Actually, the task of attracting resources for a new venture has been assigned among the greatest challenges that new entrepreneurs face (Brush, Greene, & Hart, 2001; Ravasi and Turati 2005; Romanelli 1989; Stuart and Sorenson 2003), since limited resources jeopardize survival (Arthurs & Busenitz, 2006). Taking into consideration the fact that knowledge is a core resource of LT-KIE there are certain questions that remain unanswered. For example, an academic spin-off has access to specific knowledge; on the contrary it is highly questionable **how LT-entrepreneurs locate the new**

sources of knowledge, how they manage access to these sources, how they use knowledge in order to produce innovation and how they are going to transform the result into production lines, products and market success.

An interesting approach seems to be the Hirsch-Kreinsen and Schwinge model (2011) for low-tech industries which refers to the need of certain firm-level or individual-level capabilities in order to produce innovation. Even since the beginning of their research on LT-KIE, the authors regarded the activities at the level of individual firms or entrepreneurs to be an *indispensible prerequisite* for KIE in LT sectors, as the mediator of renewal of a whole system by making use of external opportunities. Attempting a cross-reference to conceptual considerations on the innovativeness of LT companies (cf. Bender and Laestadius, 2005), the authors stressed that this could be a matter of specific capabilities, a term provided by the well-known “resource based” approaches. The core message of this approach is that LT-KIE processes may be analyzed in terms of capabilities for *orchestrating and mobilizing knowledge and other resources at the disposal of actors and firms* (cf. Teece and Pisano, 1994). These capabilities are strongly interlinked with the knowledge bases; existing knowledge is the requirement for these capabilities development through the identification and effective integration of novel knowledge, while these capabilities lead to the specific knowledge expansion which constitutes the main feature of LT-KIE. Accordingly, major LT-KIE capabilities for Hirsch-Kreinsen and Schwinge are the *capabilities to question existing knowledge and to identify and acquire (new) relevant knowledge from other knowledge bases*.

However, this capability aspect approached mainly the innovation-side and not the entrepreneurial side of LT-KIE. The authors referred to it as “innovative capability” incorporating the “transformative capability” and “configurational capability” of Bender and Laestadius (2005), Bender’s (2004) synthesizing competence, or the somewhat older “combinative capability” introduced by Kogut and Zander (1992) and the architectural competence described by Rebecca Henderson and Kim Clark (1990).

In spite the above ones, there are hardly any other efforts made to identify firm-specific capabilities (and their dimensions) that can be sources of competitive advantage, or explain how combinations of competences and resources can be developed, deployed, and protected in order to start a viable new LT-KI venture. Although the notion that the nature of firms’ pre-entry capabilities determines the direction of expansion as firms survive and grow is not new (Nelson and Winter, 1982, Grant, 1991; Penrose, 1995), KIE models so far have focused more on the mechanisms of knowledge and innovation regarding capabilities; they seem to have neglected the entrepreneurial side of the issue. Several writers have lately offered insights on the important links between knowledge creation and its commercialization particularly at the early stages of a new venture. The capabilities perspective

seems to be missing while the quotation of Zahra et al. (2006) is still popular; "...research has not provided a compelling explanation for the ability of some new and established companies to create, define, discover and exploit entrepreneurial opportunities".

Another issue of concern not well captured in KIE literature, according to our knowledge, regards the role and significance of the **initial competitive advantage** (CA) a new venture builds in order to survive and prosper. For Hirsch-Kreinsen and Schwinge (2011) the outcome of the KIE process is defined in terms of *technological innovations* as the direct result of this process and the *impact* of KIE innovations. In entrepreneurship literature the term of initial competitive advantage has been so far subject of discussions on the significance of resources and the importance of the founding team (e.g. Autio et al., 2009; Davidsson et al., 2003; Vanhoutte et al., 2010). Russell (1989) claimed that creativity and innovative spirit give the new-born entrepreneurial organization its initial competitive advantage. Yet, while there are well developed theories on how to create and sustain the competitive advantage of established organizations, there are almost no explanations of **how new ventures establish their initial competitive advantage especially in cases of low-tech venturing**¹.

Furthermore, new firms, once established, often face resource base weaknesses (Singh et al., 1986) and are confronted with subsequent performance loss if these weaknesses are not dealt with. The nascent entrepreneurship literature indicates that it is necessary for entrepreneurs to create and adapt the resource base of the new firm (e.g. Garnsey, 1998; West and DeCastro, 2001). Yet, this issue is so far both theoretically and empirically unexplored within the LT-KIE literature. However, a study of Protogerou and Karagouni (2012) indicated that the evolution of new knowledge-intensive ventures may be related to the creation and development of dynamic capabilities. In the same vein, Zahra, Sapienza, and Davidsson (2006) consider that "new ventures need unique and dynamic capabilities that allow them to survive, achieve legitimacy, and reap the benefit of their innovation". In addition, there is a limited but gradually increasing research on DCs regarding newly-founded firms with a number of empirical studies mainly of high-tech sectors, which indicate that new ventures need dynamic capabilities to reconfigure or modify their initial and rather poor resource bases in order to survive and grow (e.g. Arthurs & Busenitz, 2006; Zahra & Filatotchev, 2004; Grande, 2011). For example, Stam et al. (2007) found certain dynamic capabilities as most likely to accompany high-tech start-ups' growth. The relative empirical studies regarding low-tech sectors are extremely few. Telussa et al. (2006) analyzed the new firm growth in association to dynamic capabilities using a sample of mostly low and medium-tech firms. In spite the above assumptions the issue is still far

¹ Considering the fact that patented technologies and R&D results can be strong initial competitive advantages in cases of high-tech ventures. For example, a unique innovation is the motivation for the start-up of a life science firm (Audretsch, 2001), and innovation sets the strategic path of life science firms (in Carrick, 2012)

from clear: **how can then just established low-tech ventures overcome resource base weaknesses and evolve?**

A perspective of particular importance in LT-KIE regards the assumption that the phenomenon includes not only newly founded companies as denoted by Malerba and MvKelvey (2010) for high-tech sectors, but cases of change processes in established companies as well. This is due to a series of reasons and more precisely due to

- a) the competitive pressure; existing low-tech firms are almost forced to change their competitive situation by adopting an increasingly reflective approach towards established practices and by looking for significant innovations (Hirsch-Kreinsen and Schwinge, 2011; Trigkas et al., 2012).
- b) the declining course of the most traditional sectors and the global competitive pressures; it is quite difficult and rather risky for young entrepreneurs to start new low-tech companies (see for example the textiles and clothing industry)
- c) the strong path dependency and the technologically established situation of low-tech sectors; it is quite difficult to come up with novel business ideas capable to allow new low-tech ventures enter existing mature and saturated markets and be viable

Main research question:
<i>How and why</i> certain low-tech but knowledge-intensive ventures survive early death and prosper within mature ecosystems?
Guiding Research Questions
a) How do LT-KI entrepreneurs/teams create innovative knowledge-intensive business concepts?
b) How do LT-KI entrepreneurs / entrepreneurial teams locate the new sources of knowledge, manage access to these sources and use knowledge in order to produce innovation and how do they transform the innovative result into production lines, products and market success?
c) How can new LT-KI ventures overcome resource base weaknesses and evolve?

Table 1: Summary of main and sub – research questions

LT-KIE is expected to be found more within established organizations but it is quite ambiguous if KIE will mean the same in both modes and whether they will share the same characteristics. For example, how important will the role of the existing knowledge pool of the parent company be? Will its organized routines play a positive or negative role in corporate venturing? How will the agents seek novel knowledge? What will be the role of existing resources and capabilities? Furthermore, while existing financial and human capital can solve relative problems, on the other hand technological or institutional path dependencies may create serious problems and core rigidities. This is an issue not

yet addressed in detail in LT-KIE research. Therefore, *differences are expected to be found in most if not all the above LT-KIE building blocks regarding the emergence of knowledge-based innovation, the entrepreneurial process, the factors, constraints and opportunities as well as the evolution paths and performances.*

CONCLUSION

There is a gap in the understanding of how LT-KI ventures are created, survive and grow within their mature and highly saturated business ecosystems. Literature has offered a significant amount of insights related to the basic building blocks of LT-KIE, i.e. knowledge, its sources and ways of exploitation, knowledge-intensive innovation and mechanisms and capabilities of reaching it, as well as types of LT-KIE ventures, among others. Furthermore, there is a plethora of skills, entrepreneurial characteristics and other antecedents and factors used as input, KIE management and output in KIE processes. These valuable constructs can assist the further exploration of the topic called low-tech knowledge-intensive entrepreneurship in order to understand how LT-KI entrepreneurs and entrepreneurial teams recognize or create opportunities and transform them into successful knowledge-intensive business capable to survive the stagnancy of traditional mature markets. By posing the research questions summarized in Table 1, we purport mainly an *entrepreneurial approach* of the LT- KIE phenomenon.

²International Management & Innovation Department, Middlesex University, Business School, London, UK

Abstract

The purpose of this study was to investigate successful methods for the prevention of parallel importation, and in particular to investigate what methods Bulgarian marketers consider to be effective. Additionally, the article looks at prevention in terms of the use of non-pricing tools. A qualitative study was performed via in-depth interviews. Nine interviews were conducted with marketing/sales managers from companies in different industry sectors. In the paper 16 different practical pricing and non-pricing tools, which marketers in Bulgaria use, are revealed. The paper identifies several strategies that can help in the prevention of, and successful fight against, parallel importation. This study reveals a different approach towards investigating the methods used to fight against parallel importation by exploring practitioners' points of view and reactions. By focusing on practical strategies and researching connections with other marketing tools like relationship marketing, this paper contributes to both academia and practice.

Keywords: *parallel import, parallel trade, grey marketing, relationship marketing, qualitative research, in-depth interviews, Bulgaria*

INTRODUCTION

The world is becoming more and more globalised due to the availability of technologies that enable the sharing of information, and due to the growth of flexible logistics and reductions in freight costs (Palangkaraya and Yong, 2009). Due to various factors, international manufacturers often have different pricing strategies in different countries (Xiao *et al.*, 2011). When neighbouring countries have significant price differences then a non-authorised move of products between them can happen. This practise is recognised in the literature and in real life as parallel import (PI) or trade, grey marketing (GM) or re-import (Chen, 2009; Grossman and Lai, 2008; Swee-Lim *et al.*, 2010).

In the European Union (EU) there is regional exhaustion legislation. This means that if a manufacturer sells a product to a company in the EU, then this product can freely be transferred to

any country and point in the EU (Bhandari, 2010). In this way, problems with PI could occur. The significance of the problem has been identified by several scholars. For example Kermani (2010) showed that in 2007 the parallel trade of pharmaceutical products, in the EU only, was €4.7 billion. In terms of other industries, Chen (2009) shows that in the EU between 5% and 20% of the trade of electronics, cosmetics/perfumes, soft drinks and music recordings were subject to PI. In addition, Xiao *et al.* (2011) reported that in the Information Technology (IT) sector, \$5 billion in profit and \$40 billion of sales are lost due to PI each year.

This research was conducted in Bulgaria, one of the poorest members of EU (Eurostat, 2012). Although it is among the sources of GM (Xiao *et al.*, 2011), according to Swee-Lim *et al.* (2010) PI into Bulgaria also occurs. The proposed solutions in the literature for the prevention of PI lie primarily in the field of pricing strategies (Grossman and Lai, 2008). Another option is to control the demand for parallel imported products (Jen-Hung *et al.*, 2008). Although, this study explored both pricing and non-pricing strategies, the focus is on non-pricing methods. This study intends to fill a gap in the literature about Bulgarian marketers' practices by revealing successful methods for the prevention of PI or at least to investigate what local marketers consider to be effective.

LITERATURE REVIEW

"Price, availability and demand" are the important factors that enable PI to happen (Ecock, 2008). The usual flow of products is from a low priced to a high priced market (Grossman and Lai, 2008; Xiao *et al.*, 2011). However, there is evidence that the flow can be vice versa (Swee-Lim *et al.*, 2010).

Viewpoints of the manufacturer, reseller and end-user

Many scholars have explored the effects of PI from the perspective of the manufacturers and while some define it as negative (Chen, 2009), others find that there are positive opportunities to increase profits (Xiao *et al.*, 2011). Some of the arguments as to why marketers try to prevent PI are that it leads to loss of "profits, brand equity, or market positions" (Zhuang *et al.*, 2012). Some scholars focus on the revenue and profit problems for the manufacturers (Xiao *et al.*, 2011; Chen, 2009). This limiting of profits can then limit manufacturers' incentive to undertake research and development (R&D) (Grossman and Lai, 2008; Palangkaraya and Yong, 2009). However, Matsushima and Matsumura (2010) explored a model in which profits and the investment in R&D could be increased (Grossman and Lai, 2008).

Manufacturers have three general ways of reacting to PI; deterring parallel trade by using uniform pricing, accommodating a certain volume of parallel trade by the trader, or confining its operation to the developed country (Mazumdar and Rajeev, 2010). Stopping sales in certain countries is an option

available to manufacturers (Palangkaraya and Yong, 2009; Grossman and Lai, 2008), however Autrey and Bova (2012) show that there are other examples of actions that manufacturers can take in order to “prevent” GM. These are; “differentiating products across regions”, “reducing arbitrage opportunities by modifying transfer prices or retail prices”, “fines”, “legal action”, and “withholding reward programs including manufacturer rebates and access to the newest products”. Lastly, there are others options to help control the demand for parallel imported products (Jen-Hung *et al.*, 2008). Some of the possible ideas are sales promotions, comparative advertisements and increased service fees. In addition, control could be done via contracts (Su and Mukhopadhyay, 2012). Xiao *et al.* (2011) and Jen-Hung *et al.* (2008) reported that PI has a negative influence on the brand due to creating price instability, decreasing control over distribution channels, confusing customers, and as a whole, creating “customer dissatisfaction”. Xiao *et al.* (2011) have researched the effects of PI on the manufacturer in the light of different channel structures. They found that in some cases there are negative effects while in other cases there are benefits. In research done by Jen-Hung *et al.* (2008); Ecock (2008) and Thompson (2009) some benefits of PI are suggested, they suggest that; it enables unofficial market segmentation, it enlarges the competition between resellers which makes the price fairer to the end-user, it prevents some “cartel practices”, which lead to “short-term market efficiency” and it reaches more consumers. Furthermore, this increases the production volumes of the manufacturer as the goods are produced in their own facilities.

It is assumed in the literature that the authorised resellers provide a better service as the manufacturers have trained their staff and are charging a higher price to the customers (Chen, 2009). Whereas, the unauthorised resellers are looking for short-term benefits and are not expected to invest heavily in the brand or in the market (Jen-Hung *et al.*, 2008). Palangkaraya and Yong (2009) pointed out that the authorised resellers usually make “substantial investments to improve business by undertaking promotions and market development efforts”. An argument against PI is that this practice is discouraging the authorised resellers as it reduces their incentive to invest in the market and in the brand. This is due to the fact that grey marketers are using the marketing activities made by official resellers and/or manufacturers and are selling without any investment – they are called “free-riders” (Miller, 2009; Flath and Nariu, 2008). Although the unauthorised resellers do not have the same costs, depending on the product they may need to invest in order for the product to reach the end-users. These costs may include some distribution, advertisement, re-packaging or re-labelling and some import duties (Mueller-Langer, 2012).

Autrey and Bova (2012) argue that making the high priced market more competitive will decrease the power of the parallel importer. The usage of regular “trade promotions, quantity discounts, rebates,

charge backs, and co-op credits” can make the authorised reseller comparatively very competitive (Su and Mukhopadhyay, 2012).

However, the end-user is the real customer and PI provides some benefits to them in terms of lower prices (Thompson, 2009) as this process has the function of “international price arbitrage” (Palangkaraya and Yong, 2009). Thompson (2009) and Richter (2008) reveal that a 15% price difference is sufficient to start a parallel import. On the other hand, Rich (2012) reports that some negative effects are; food products with a different taste, a short shelf life, products without appropriate labelling and/or language, and the use of ingredients that are not used or illegal in the respective region. Thompson (2009) revealed that the grey products “may differ from regular manufacturer-supplied versions” in terms of the following – warranty, connectivity standards and language.

Relationship marketing

Usually the parallel imported products reach the end-users through some level(s) of distribution and it can happen that some of the official resellers are involved. In order to keep its authorised customers loyal, the manufacturer is supposed to take some action, mainly in the field of relationship marketing (RM) because, as Luo and Kumar (2013) point out, it is very important for the manufacturers to maintain good relationships with their customers. It is essential to focus on and understand every single customer and to reach them individually. Mende *et al.* (2013) stated that the RM “is guided by the principle of tailoring marketing activities to the individual customer”.

Some of the benefits of doing RM with customers are directly connected to the prevention of PI in terms of increasing sales and maintaining customer loyalty (Darvish *et al.*, 2012). Additionally, in various pieces of research important dimensions connecting RM with business-to-business (B2B) relationships have been identified. Connected to GM are trust, satisfaction, commitment, relationship benefits, bonding, attractiveness of alternatives, shared values and mutual goals (McNally and Griffin, 2007; Theron *et al.*, 2008; Hollyoake, 2009; Theron and Terblanche, 2010 and Dimitriadis and Papista, 2011). Hollyoake (2009) pointed out that loyalty has a close relationship to the quality of communication between the manufacturer and B2B customers. Dimitriadis and Papista (2011) connect relationship quality with the availability of products.

In the literature, there is not much information about practical ways that companies use to accomplish their RM goals. One example is the paper by Chimote and Srivastava (2011) which defines several practical tools/items in the banking sector that are used in relationships with customers.

METHODOLOGY

For the purpose of the study, four Research questions (RQ) were prepared in order to investigate the subject:

RQ1: Uncover what marketing tools marketers in Bulgaria use to fight against PI

RQ2: Understand which tools are pricing and which non-pricing

RQ3: Uncover what the key characteristics of the non-pricing strategies and tools are

RQ4: Understand which non-pricing tools are considered to be successful by marketers in practice

The information was collected using a qualitative method: semi-structured in-depth interviews. This method was chosen because at the time of the research the state of knowledge in Bulgaria about parallel trade was limited. Searching for data in such a field where there is such a lack of information is usually done using qualitative methods (Sinkovics and Alfoldi, 2012). The research was conducted as an exploratory study using interviews (Frels and Onwuegbuzie, 2013). Interviews are among the qualitative methods for collecting information and are used often when the nature of a problem is not known or not understood in detail (Bulgarea, 2011; Gilmore *et al.*, 2006). For the purposes of the research non-standardised, one-to-one and face-to-face interviews were used. In order to keep the interviews in the field of PI, some questions were prepared in advance.

Sample

Based on Jen-Hung *et al.* (2008) contacts with marketing and sales managers were chosen. The choice of industrial sectors was made based on local information available to the researchers and the findings of Chen (2009). The chosen industries were IT/electronics, construction and fast-moving-consumer-goods (FMCG) like cosmetics, detergents, and food. Exploring different industrial sectors provides a more practitioner-based focus. 39 marketing and sales managers were contacted from 23 companies using purposive sampling (Sinkovics and Alfoldi, 2012). Most of the companies are among, or represent, companies that are market leaders according to a list provided by Scott DeCarlo (2013). Nine interviews were done and in Table I some basic information about the participants can be seen. The interviews were done during the period of May/September 2013 in Bulgaria.

No	Position	Gender	Age	Company	Industry
1	Marketing manager	Female	30-35	International	FMCG – cosmetics
2	Marketing manager	Female	35-40	International	FMCG – detergents
3	Sales manager	Male	35-40	International	Construction/bath products
4	Brand manager	Female	25-30	International	FMCG – batteries and devices
5	Brand manager	Female	30-35	International	FMCG – food and beverages
6	Brand manager	Female	30-35	International	FMCG – food

7	Brand manager	Female	25-30	Local	FMCG – food and cosmetics
8	Sales manager	Male	35-40	International	FMCG – food
9	Marketing manager	Male	30-35	International	IT/electronics

Table I Profile of respondents and companies

The data that the interviews revealed was analysed formally using an “imaginative and interpretive manner” (Sinkovics and Alfoldi, 2012) where the answers from open-ended questions needed further interpretation. The analysis of the interviews was done in two stages. In the first stage information which was included in order to start and lead the interviews, but was not relevant to the study, was separated out. These were questions regarding the company, distribution channels, sourcing of parallel trade, etc. In the second stage, the answers to the four RQs were defined. During this stage, the emphasis was put on the respondents’ understanding and definitions of the methods and after that, their responses were compared with the academic literature. With the limited number of interviews, generalisation is not possible. The results represent the experience of these particular companies.

FINDINGS

Research question 1: What marketing tools are the marketers in Bulgaria using to fight against PI?

The nine interviewees mentioned 16 different tools that are used to prevent PI – both in pricing and non-pricing strategies. Six was the average number of tools that each of the managers mentioned in both the pricing and non-pricing categories. The tools in alphabetical order are: ‘advertisement and brand support’; ‘consistent assortment’; ‘discounts’; ‘follow market trends’; ‘gifts/free products’; ‘harmonised price’; ‘internal information about other countries’; ‘information campaigns’; ‘legal measures’; ‘loyalty programs and contracts’; ‘point of sale (POS) support and store displays’; ‘promotional packs/extra products’; ‘promotions’; ‘pull promotions’; ‘relationships’; ‘training and education’ and ‘warranty’. Table II shows how many of the managers used the particular tools.

Tools	How many companies use the tool
loyalty programs/contracts	9
relationships	7
advertisement/brand support	6
discount	6
consistent assortment	5
promotional packs/extra products	4
gifts/free products	3
pull promotions	3
follow market trends	2
information campaign	2

legal measures	2
POS support and store displays	2
promotions	2
training/education	2
harmonised price	1
internal information about other countries	1
warranty	1

Table II Tools that are used by the managers for fighting with the parallel trade and how much they are used

Research question 2: Understanding which tools are pricing and which non-pricing

The separation of the tools into pricing and non-pricing was made mostly by the interviewed managers. Although it potentially creates some discrepancy with the academic literature, in this study we followed the practitioners' point of view. From the tools that were listed in the answer to RQ1, the managers recognised the following as 'pricing': 'discounts'; 'harmonised price'; 'promotional packs/extra products' and 'promotions'. These were recognised as non-pricing: 'advertisement and brand support'; 'consistent assortment'; 'gifts/free products'; 'information campaigns'; 'legal measures'; 'loyalty programs and contracts'; 'POS support and store displays'; 'pull promotions'; 'relationships'; 'training and education' and 'warranties'.

There were two tools/measures that were not included in both categories, as they were more connected with the company's strategies and internal opportunities. These were 'follow market trends' and 'internal information about other countries'.

Research question 3: Uncover what the key characteristics of the non-pricing strategies and tools are

In the following section the non-pricing strategies and tools that were revealed in RQ2 are presented in further detail. 'Advertisement and brand support' are generally connected to the usual marketing activities (Flath and Nariu, 2008). It was assumed by the respondents that investing in the brand will help with sales and relationships with customers and therefore will help in reducing parallel trade, however this is sometimes used by free-riders.

'Consistent assortment', or simply the assortment, is reported by Chernev and Hamilton (2009) as a factor that can influence sales. In this research a connection was found with the level of parallel trade as this could distinguish between the authorised resellers and the parallel traders and establish a trustful relationships with customers. Participant P4 said:

"We maintain a full portfolio unlike the parallel importer, because they often buy what the deal is at any moment and they have several products with limited quantity and therefore they (customers) cannot rely on him to continuously deliver a certain portfolio."

Gifts or free products were explained by the participants as a kind of promotion where, in addition to the product, another type of product is given. According to P7, this could be "plush toys that are

branded, cups and ... other". This practice was connected directly with 'pull or sell-out promotions' which influence sales directly (Liu *et al.*, 2011). P1 explained:

"We tell our customers – take this quantity from us, the price is not as attractive as the PI but we will offer you a sell-out promotion which will help you to sell-out, and gifts are a very effective tool for attracting the end consumer."

An 'information campaign' explains to direct or indirect customers the reasons why they should not get supplies through parallel importers (Jen-Hung *et al.*, 2008). While some of the participants use it, others have stopped because the market is more mature at present and there is no need. In terms of the third category, it is not relevant as the products were the same and such a campaign would be useless.

Legal measures are taken by some of the interviewed companies although PI is legal in the EU (Grossman and Lai, 2008) and in particular in Bulgaria and no restrictions exist to prevent this practice. P8 said:

"If someone is sourcing products without proper labels or selling without documents, we use the power of the law to prevent this."

Loyalty programs and contracts are tools that were used by all of the interviewed managers. As mentioned by Su and Mukhopadhyay (2012) and Hollyoake (2009), loyalty and contracts can influence PI. P6 connected these programs with parallel trade fights:

"These are loyalty programs that are associated with either a cash bonus or a no cash bonus or additional products and are bound by a target. The goal is to achieve better targets, but also limit PI."

However, some of the customers refuse to sign such contracts and to participate in loyalty programs. The explanation was that they do not want to be limited by these contracts and wanted to have more trading freedom.

'POS support and store displays' are connected with advertisements and brand support but are separated in this paper because they were separated by the interviewed managers. According to Flath and Nariu (2008), this can even influence the sales of free-riders. The two companies that use this tool reported positive effects on PI conflicts. P9 explains:

"The benefit for our customers is that they get a better perception of stores, better service and therefore (the stores) are more attractive in the eyes of end-users".

'Relationships, 'RM' and 'relationships with the customers' are terms that were used by all of the interviewees. However, not all identified them as tools against PI. Baring in mind that loyalty programs are usually associated with RM and the fact that all of the respondents practice some form of such programs, it is obvious that all of them practice 'relationships with customers'. Some of them may not have mentioned this as a tool because it was considered to be trivial and its' importance was

not realised. This is consistent with the literature (Darvish *et al.*, 2012; Luo and Kumar, 2013; Theron *et al.*, 2008), where RM and trust is mentioned to be very important and to influence PI. P9 said:

“RM and customer relations – this is something that earns their trust and has a preventative effect.”

‘Training and education’ of resellers’/retailers’ staff enables them to explain the products and make the sales, as mentioned by P9. Mirpuri and Narwani (2012) suggest that this can help with sales and loyalty.

Offering a ‘warranty’ period and servicing of devices is practiced by three of the interviewed companies. Although some companies might have different pricing or even not accept warranties, all of the companies treated the products equally without any separation based on the supply source. This is similar to the literature (Jen-Hung *et al.*, 2008; Thompson, 2009,) and helps to maintain the image of the brand. Regarding some problems, P9 said: *“The commercial warranty period of products sold in Bulgaria may vary to ones offered in other countries ... We cannot guarantee the supply of spare parts for non-EU products, since those might be different and non-compliant with EU safety regulations.”*

Research question 4: Understand which non-pricing tools are considered to be successful by marketers in practice

Table III shows the successful non-pricing tools according to the interviews.

Tool	Companies that say it is successful	Percentage of total	Companies that use it	Percentage of those using it
Relationships	5	56%	7	71%
Advertisement and brand support	3	33%	6	50%
Gifts/free products	2	22%	3	67%
Training and education	2	22%	2	100%
Legal measures	1	11%	2	50%
Loyalty programs and contracts	1	11%	9	11%
POS support and store displays	1	11%	2	50%

Table III Successful non-pricing tools

Table III can be analysed in two ways. The first is to see how many companies said that a particular tool is successful. This determines the order of the tools in the Table and suggests that ‘Relationships’ is leading among the interviewees. However, if we explore the success of the tools in terms of how many companies use them ‘training and education’ is the most successful.

‘Loyalty programs and/or contracts’ are in the worst position according to both criterion. One of the possible explanations is that the customers do not want to sign such contracts and became

disinterested in them. Additionally, the interviews collected information about the perceptions of the pricing tools. The successful pricing tools/strategies are presented in Table IV.

Tool	Companies that say it is successful	Percentage of total	Companies that use it	Percentage of those using it
Price strategies	5	56%	9	56%
Harmonised price	2	22%	1	200%
Promo packs/extra products	1	11%	4	25%

Table IV Successful pricing tools

Based on a similar analysis to that for Table III, Pricing strategies as a whole are the most used tool in the prevention of PI. However, as the main battlefield with parallel trade is the price, those tools are not always successful. The most successful tool was the harmonised price. The second manager, even though it is not used by him, noticed the importance of this tool.

DISCUSSION AND CONCLUSIONS

For the purpose of this paper, the tools can be categorised as preventive and reactive. This differentiation is made based on the timing of use of the tool in respect to the time of the introduction of the parallel imported products to the market. According to the respondents, the pricing tools are more reactive and the non-pricing tools are more often preventive. The successful tools are those which are less likely to be used by free-riders and are used more often as preventive – ‘training and education’, ‘relationships’ and ‘harmonised price’.

The interviewed companies can be divided into two groups based on their industry sectors and their product type. The first group shows the companies from the FMCG sector with a sub division into Food and Non-food. The rest of the companies are in the second group called ‘other’. Five of the tools were used by both groups: ‘advertisement and brand support’, ‘consistent assortment’, ‘loyalty programs and contracts’, ‘promotional packs/extra products’ and ‘relationships’. Three of the tools were used by both FMCG sub groups: ‘discounts’, ‘gifts/free products’ and ‘promotions’. Legal measures were used only by companies in the Food FMCG sub group, while information campaigns were only used by companies in the Non-food FMCG sub group. The companies in the ‘other’ group were specifically using ‘harmonised price’, ‘Point of sale (POS) support and store displays’, ‘training and education’ and ‘warranties’. Due to the specifics of the business, it seems that the companies in the ‘other’ group could benefit from using preventive tools more often and eventually could become more successful in the prevention of PI.

This study explored the various tools that can influence the demand and the usage of parallel imported products. With the proper application of the right tools, in each case a company can

significantly reduce the levels of an unauthorised move of goods. The companies that relied on RM, developed relationships with their customers and adapted to changes in the business environment were more successful in the prevention of parallel trade.

There are several theoretical contributions this paper makes. The first is that it fills the gap in the literature regarding the practical tools/methods that marketers are using against PI. Second, it develops our perspective on some of the tools. Thirdly, it researches a connection between RM and PI. As this paper investigates the practitioners' actions and tools, it provides some managerial implications too. First, it shows that the most successful tools have a preventive effect. Good relationships are a key factor in the prevention of, and reaction to, parallel trade. The 'advertisement', 'POS', 'brand and promotional tools' and activities which cannot be used directly by free-riders can help in the relationships with customers, can improve sales, and can also reduce the level of parallel trade. The managers should search for new and attractive ways of developing relationships with their customers via loyalty programs and/or contracts. Finally, the managers may find it successful to offer tailored actions and tools directed to specific company or types of companies, as relationships and needs may vary significantly.

This is probably the first study that addresses the methods used by marketers in Bulgaria to fight against PI. However, the study is not free of limitations. First, it is limited in quantity so generalisations could not be made. In addition, the experiences of relatively big companies were explored, while smaller ones could have different practices. Finally, the research was limited to companies operating in this country. Further research could explore more companies and their practices. Additionally, research could be done from the perspective of the companies who resell parallel imported products. Finally, further research could provide more information about different countries and could research the practices of one company in the various regions it operates in.

THE ENERGY CURRICULUM: CHALLENGING THE HIGHER EDUCATION IN GREECE & CYPRUS

Kontakos, Panagiotis

Department of International and European Studies, University of Macedonia, Greece

THALES Programme has been co-financed by the European Union (European Social Fund - ESF) and Greek national funds through the Operational Program "Education and Lifelong Learning" of the National Strategic Reference Framework (NSRF).

ABSTRACT

The size and prospect of drilling substantial offshore oil and gas reserves in the Eastern Mediterranean, but also in the Ionian Sea, and the new requirements for development of extended energy infrastructures, have an unprecedented capacity not only to turn-around the current state of the economies of Greece and Cyprus, but also to profoundly shape their future economic, social, production, employment, geopolitical and geo-economic profiles for at least the coming 30 years. Accordingly, the need to reformulate their curriculums of higher education arises as an imminent strategic priority.

Considering that "energy" consists, most likely, the vastest discipline to study, the author asserts that the future energy curriculums in the two countries will need to encompass at least the following features: new-disciplinary, interdisciplinary, sustainability, cross-country and cross-region oriented (in the context of Eastern Mediterranean, Middle East, South-Eastern and Central Europe, Black-Sea).

The aim of this article is three-fold: firstly, to review the profile, structure, and penetration of energy related studies in the academic discipline of social sciences, as extracted from the curriculums of universities in Greece & Cyprus; secondly, to provide a literature review of respective curriculums worldwide and assess the suitability of such programs in the local context and perform comparisons with the global context; thirdly, to use the outcome of this paper as an input for other parallel work, in the structuring and development of a new

energy curriculum proposal in the fields of economics, business, finance, and management studies in Greece and Cyprus.

Keywords: *education management, higher education, energy curriculum, energy economics, management, finance, business, Greece, Cyprus*

INTRODUCTION

The size and prospect of drilling substantial offshore oil and gas reserves in the Eastern Mediterranean, but also in the Ionian Sea, as evidenced in the last years in the case of Cyprus, and recently by geological and seismic data in the case of Greece, along with the need for development of extended energy infrastructures, have an unprecedented capacity not only to turn-around the current state of the economies of Greece and Cyprus, but also to profoundly shape their future economic, social, production, employment, geopolitical and geo-economic profiles for at least the coming 30 years. These developments are further discussed in the next section of the paper.

In parallel, EU's energy strategy for the period up to 2020, builds on eight priority corridors for electricity, gas and oil. Accordingly, on October 2013, a number of 248 energy infrastructure projects of common interest were selected and assessed as the most critical to implement from a European perspective (European Union, 2014a). The respective priority corridors to cross or be undertaken by Greece and Cyprus are expected to assign to both countries a major role or even establish them as a regional energy hub; these corridors are presented in more detail in the third section of the paper, in order to emphasize the significance of the subject.

In turn, in the fourth section of the article, the structure and penetration of energy related studies in the academic discipline of social sciences are examined, based on a review of the existing curriculums of universities in Greece and Cyprus; finally, by performing a literature review of respective curriculums worldwide, it is evaluated the suitability of such university programs in the local context and comparisons are performed with the global context.

OFFSHORE OIL AND GAS POTENTIAL IN GREECE AND CYPRUS

The emerging opportunities in the areas of offshore oil and gas exploration, extraction and management in Greece and Cyprus, have an unprecedented potential to reshape their entire profiles, at least during the first half of the 21st century. As the Greek PM announced in October, 2013 in the Hellenic Initiative forum in the United States, Greece, Cyprus and Israel have the capacity to cover the 50% of the needs in natural gas in Europe during the next 30 years (SKAI News, 2013).

More recently, the Greek Environment, Energy and Climate Change Minister presented on July 1st, 2014 Greece's programme for offshore hydrocarbon exploration concessions in the Ionian Sea and south of Crete, during an event held in London. He presented the findings of seismic surveys in the area and also analysed the broader geopolitical framework, ahead of a tender to be launched in the coming period. The presentation included data from geological surveys covering 225,000 square km and the interpretation of this data, carried out by the French oil and gas consultancy BEICIP-Franlab. The Greek minister described the country's potential as an energy hub, that stands "at the crossroads of western and southeast Europe and the new and traditional sources, making Greece the EU's gateway for the Southern Corridor".

The tender will be for test drilling in 20 blocks, defined on the basis of 50 parameters that include the depth of the seabed, geology and the environmental conditions revealed by a Strategic Environmental Impact Study, as well as the data from the seismic surveys. The minister's presentation included the legal and financial framework that will govern the exploratory drilling, such as a new law on concessions incorporating the latest trends and best practices internationally, a stable and predictable environment for investors, a favourable tax regime (halved from 40 pct to 20 pct) to make investments competitive, the Hellenic Hydrocarbon Resources Management SA company set up to supervise the sector, while stressing this would be governed by EU rules on the safety of offshore drilling activity (ANSA News, 2014).

In 2011, significant offshore reserves of approximately 7 trillion cubic feet of natural gas were found in Cyprus' Exclusive Economic Zone (EEZ). In October 2013, Houston-based Noble Energy, the licensee for block 12 in Cyprus' EEZ, performed appraisal drillings in block 12. The results have confirmed natural gas reserves of 3.6 to 6 trillion cubic feet (tcf), with a gross mean of 5 tcf.

At a second licensing round, licences for hydrocarbons exploration in offshore blocks have been awarded by the government for blocks 2, 3, 9, and 11, all adjacent to block 12. Specifically, blocks 2 and 3 were licensed to a consortium of Italy's ENI and Kogas from South Korea, block 9 to a consortium of the French company Total (operator), Novatec and GPB Global Resources. Total was also granted hydrocarbon exploration licences in blocks 10 and 11, after signing two production sharing contracts with the Ministry of Energy in February 2013. Total has also been granted a licence by the Agriculture Minister for seismic exploration for oil and gas in block 10 and in parts of blocks 6, 7 and 11 of Cyprus' EEZ.

More licences are due to be awarded as the government continues to evaluate the bids for the remaining blocks, with the exception of blocks 1, 4 and 13 for which no bids have been made. The government expects to complete the required infrastructure, including the pipelines and liquefaction plant, by 2018 and begin exporting natural gas in 2020 (Antoniou, 2014).

Speaking at a conference organised in July 2014 by the European Commission and the Governments of Cyprus and Malta, the country's Minister for Energy, Commerce, Industry and Tourism, underlined that "Cyprus, as the southern most EU member state in a volatile and troubled region, has the potential to become a regional liquefaction hub and contribute to the long-term geopolitical stability, promoting peace and economic development."

PROJECTS OF COMMON INTEREST IN GREECE, CYPRUS AND EASTERN MEDITERRANEAN

In October 2011, the EC listed a complete package to boost trans-European infrastructure development in the areas of transport, energy and information society. Respectively, the Energy infrastructure package is comprised of legislative guidelines, proposals for setting up the infrastructure policies and the Connecting Europe Facility (CEF), providing financial aid (Kontakos and Zhelyazkova, 2014).

In this context, the term energy infrastructure covers electricity transmission lines, gas, CO₂ and oil pipelines, Compressed Natural Gas, Liquefied Natural Gas reception facilities and electricity and gas storage.

The trans-European energy infrastructure guidelines identify *eight priority corridors & four thematic areas* that must be implemented in the coming decade. Further, to materialize these corridors/areas into tangible projects, the guidelines consider a new approach of identifying energy infrastructure projects that can obtain the label of Projects of Common Interest (PCIs). Thus, to qualify for financial support under the CEF, projects must firstly be recognized as PCIs. The final Union-wide list was approved in October 2013 and includes 248 PCIs, based on several criteria, such as a cost-benefit analysis (CBA), to demonstrate added value toward the achievement of EU's energy overall energy goals and cross-border benefits that can further act as a mechanism to facilitate cost allocation among EU members.

In Figure 1 are depicted the eight priority corridors included in the Energy infrastructure package (European Union, 2014b, c). Among these corridors, the *Southern Gas Corridor* is expected to be of particular interest in the cases of Greece, Cyprus and Israel, as it directly involves respective infrastructure development for the transmission of gas from the Caspian Basin, Central Asia, the Middle East and Eastern Mediterranean Basin to the Union to enhance diversification of gas suppliers.

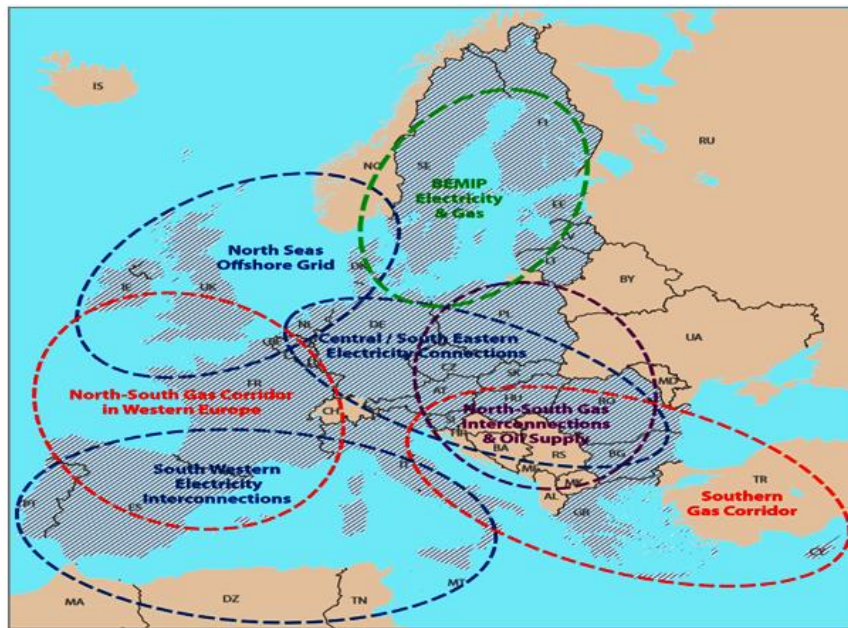

Figure 1. European energy infrastructure priorities for electricity, gas & oil; Adopted from © European Union – Directorate-General for Energy

The major strategic perspective of the Southern gas corridor is two-fold: to bring new gas sources to the EU, and diversify particularly concentrated markets in SEE. The rationale is to directly link the EU gas market to large deposits of gas in the Caspian Region & Middle East (estimated at 90.6 tcm; for comparison, Russian proven reserves amount to 44.2 tcm) and the Eastern Mediterranean basin. Furthermore, the gas fields are geographically even nearer than the main Russian deposits (Figure 2). The planned transit routes for these gas volumes are through Turkey, the Black Sea and the Eastern Mediterranean.

The pipeline components will also be improved for transporting substantial supplementary quantities of LNG to Europe, mainly from the Middle East. Initially this will be implemented with the construction of LNG reception points in Europe and via inter-connections to the wider network.

The strategic aim of the corridor is to accomplish a supply route to the EU of approximately 10-20% of EU gas demand by 2020, equivalent nearly to 45-90 bcma. Finally, the Southern Gas Corridor will essentially be an additional supply corridor to the existing ones from Russia, Norway and North Africa.

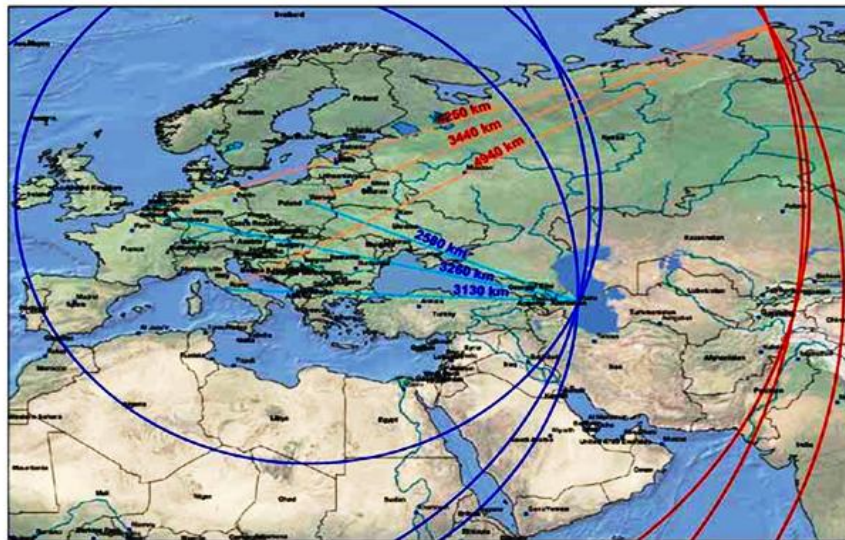

Figure 2. Comparison of distances of main Eastern gas supplies to main EU consumption hubs; Adopted from © European Union – Directorate-General for Energy

In Figure 3 below are depicted the specific projects in SEE and Eastern Mediterranean regions. Further to the Southern Gas Corridor already discussed, of particular interest is the development of a gas corridor for the transmission of gas produced offshore in the Eastern Mediterranean (mainly Cyprus and Israel). In addition, the *EuroAsia Interconnector* is already under construction to link Greek, Cypriot and Israeli power grids via the world's longest submarine power cable with length 287 km and a power rating of 2,000 MW, with expected completion by 2016.

A REVIEW OF ENERGY EDUCATION IN SOCIAL SCIENCES WORLDWIDE

A review of other worldwide studies has been performed by the author, on how energy related education is incorporated in universities curriculums (Kontakos, 2014). The main conclusions of the review include:

- The subjects of “sustainability” and “sustainable development” occupy significant part in the suggested curriculums (Blewitt *et al.*, 2004, Sherren, 2005). Several surveys have been performed since 2001 by universities in UK, US, Australia, Spain mainly in engineering studies (Desha and Hargroves, 2010).
- Renewable energy education has also attracted significant academic research. In the case of Turkey, it is addressed mainly by engineering courses and at encyclopedic level (Karabulut *et al.*, 2011).
- Several surveys aim to ascertain the extent of energy efficiency education (Desha and Hargroves, 2010) or carbon reduction education (Chen *et al.*, 2013). Zografakis *et al.* (2008), describe the results of an energy-thrift information and education project taking place in different levels of education in Crete, Greece, which records 321 students’ and their parents’ routine energy-related behaviour. Also, in a recent paper, undergraduate energy education in Greece is compared with relevant accredited engineering courses of the UK (Gelegenis and Harris, 2014).
- Energy and environmental policy have been two rapidly developing inter-related subfields within the broad area of natural resource policy which are of considerable contemporary interest (Hamilton, 1983).
- “Environmental economics” are an established subject globally, but only at a very limited extent in South-Eastern Europe (SEE) countries.

The major methodology used in the last decade to assess the extent at which energy education is incorporated in other fields is the questionnaire survey, principally at national level, and within engineering disciplines. However, there has not yet been a comprehensive assessment of the extent of various contents/directions included in energy education globally, or an assessment of whether critical energy literacies have been incorporated into social sciences curriculum.

The author suggests several possible reasons for this lack of a comprehensive assessment, including:

- Difficulty in assessing the extent to which “energy” knowledge & skills are embedded within the curriculum, due to the wide range of the term.
- The time and resource intensive nature of conducting a global survey across the thousands of departments offering social science degrees in many different languages.
- Potential reluctance of professional organizations, accrediting bodies or the universities themselves to reveal the results of performed surveys, as these may consist a competitive advantage in their planning, resourcing and accreditation programmes.
- Globally, a priority and traditional focus has been given in energy context in engineering curriculums only; As such, it is characterized by a lack or low degree of inter-disciplinarity.

- In some countries, such as in the cases of Greece & Cyprus, the lack of related previous experience in industrial development, has further limited the relevant knowledge.

ENERGY EDUCATION IN GREECE AND CYPRUS

A review of the existing curriculums of universities in Greece and Cyprus was performed, to examine the structure and penetration of energy related studies in the academic discipline of social sciences. The main conclusions aforementioned by the author in the previous section apply also in the case of the two countries. Further, it can be concluded overall that higher education in Cyprus is characterized by the existence of more advanced levels of energy related curriculums, most of which have gradually appeared in the last five years, in comparison with Greece, where an effort has only been recently undertaken to introduce and establish related courses. Particularly, main conclusions from the review included:

- Lack of a comprehensive assessment at a national level to assess the extent of various contents/directions included in energy education in Greece and Cyprus;
- No local or very limited academic research was identified to have been performed related to the subject;
- “Environmental economics” and “Energy economics” cannot be supported that have been established as a subject of studies in Greece, particularly, and Cyprus;

Indicatively, energy related higher education, cooperation and research provided in the two countries has been initially associated with the activities underlined in the next paragraphs.

a) Cyprus

Some Higher Education Institutions have started to consider the opportunities provided by the rising new industry and offer a number of vocational and academic programmes of study in Bachelor and Master’s level relevant to the field.

1. In late 2007, MIT and the Cyprus Institute (CyI) launched a research and educational collaboration between energy, environment and water programs at the two institutions. Since then, the initial joint research projects have made substantial progress, new ones have been introduced and several postdocs funded by CyI have visited MIT to participate in the research, mainly in the fields of energy systems and engineering. Also, coordinated by CyI, an international group of scientists is involved with climate change studies and their social, economic and environmental consequences in the Eastern Mediterranean and North Africa.

MIT is collaborating on projects through its Cyprus Institute Program for Energy, Environment, and Water Resources (CEEW), which is housed within MIT's Laboratory for Energy and the Environment (LFEE). The LFEE cooperated in the development of CyI's Energy, Environment, and Water Research

Center (EEWRC). The EEWRC works in close collaboration with the Massachusetts Institute of Technology (MIT), the Max Planck Institute for Chemistry, the Cyprus Research Promotion Foundation (RPF) and many national institutions and organizations in Cyprus and the region. (EEWRC site, 2014).

2. From the review performed by the author, the most advanced effort to establish energy related courses has been undertaken by the University of Nicosia. Particularly, the following programmes of interest were identified (University of Nicosia site, 2014):

- BSc Energy, Oil and Gas Management, that takes place in 8 semesters. The program provides students with overall knowledge relating to the field of energy, oil and gas management. Students obtaining the Bachelor of Science degree in Energy, Oil & Gas Management have several opportunities for further studies: a) A Master of Science (MSc) degree in Oil and Gas or Energy Technology; b) Another related post-graduate degree such as the Master in Laws (LLM) degree with a related specialization. This Masters will not qualify them as lawyers but the knowledge gained will be substantial and very useful; c) A professional qualification, such as the ACCA or the Institute of Marketing for specialized knowledge in a business functional area which will be an ideal combination with their previous undergraduate background.

- Business Administration with Concentration in Energy, Oil and Gas Management (BSc, 4 years cycle) and Master in Business Administration with concentration in Oil, Gas and Energy Management (2 year cycle).

3. The European University Cyprus has established the following courses:

- Business Studies - Energy Resources Management (Oil and Gas), 4 Years, Bachelor of Business Administration. Graduates of the program are expected to be able to deal with financial and administrative matters relating to the areas of energy, oil and gas as well as the evaluation of the regulatory systems in the energy sector, environmental and climate change issues and renewable energy sources (European University Cyprus site, 2014).

4. The Levantine Training Centre (LTC) of ShipCon Limassol is a training centre of excellence for professionals involved also in the areas of Oil & Gas. LTC offers accredited and non-accredited courses covering a wide range of expertise in Continuous Professional Development of professionals. It has entered to agreements and formed strategic alliances with renowned world-class training providers with extensive experience and capabilities in the area of Oil & Gas professional training. The LTC courses are conducted in association with the London School of Energy Studies (LSES) and they are accredited by the Energy Institute of UK and professional bodies such as NEBOSH, IOSH and OPITO. (Levantine Training Centre site, 2014).

5. Finally, although not directly related to the subject of higher education, it is worthwhile to mention the Cyprus Energy Agency, which focuses on educational activities and presentations in schools in Cyprus. One of its main objectives is to provide systematic education, information and training sessions which address energy efficiency and renewable energy. Since April 2009, when began its education activities, the Energy Agency has visited more than 90 schools – covering all educational levels. The Agency has addressed more than 15,000 students and 1,000 teachers on the topics of renewable energy, energy saving, sustainable transport and environmental protection (Cyprus Energy Agency site, 2014).

Permanent Secretary of the Ministry of Energy, Commerce, Industry and Tourism, recently said that “according to a study by the Human Resources Development Authority, it is anticipated that more than 5000 jobs will be created in the hydrocarbon sector by 2019.” Therefore, he added, “all the players: the Government, academia and industry must come together to establish the supply chain of well trained professionals that this new industry demands to function efficiently, thereby maximizing benefits and meeting the high expectations of our society”. In this context, he said, “we have started a dialogue with a number of universities in Cyprus. At first, we are investigating the possibility of offering a number of scholarships to Cypriot graduate students on related subjects. We are also looking into the possibility of placing a number of students or recent graduates in companies” (Source: Famagusta Gazette, 2014).

b) Greece

The Department of International & European Studies of the University of Piraeus recently established a new Master’s Program in Energy (MSc in Energy): Strategy, Law & Economics, to run for the first time in the academic period 2014/15. This is the first Master’s program in Greece and one of the few programs in Europe dedicated to Energy strategy, law & economics. The curriculum of this Energy Master’s program has been designed under an interdisciplinary approach, echoing the demands and expectations of the market where strategy, policy, law and economics are closely intertwined. It aims at the direct access of its graduates in the market. Therefore, it incorporates, besides the scheduled lectures and seminars, talks and presentations by executives in companies of the energy sectors such as power plants, refineries and supply terminals, as well as academic visits in research institutes, regulatory authorities and think tanks.

After completion of the 2nd Semester and as part of the elaboration of their Master Thesis, students have the opportunity for practical training in companies and organizations related to the field (University of Piraeus site, 2014).

CONCLUSIONS

Europe is at an unprecedented junction for its immediate energy future. To achieve its energy and climate goals of “20-20-20 by 2020” a number of 248 energy have been recently selected and assessed as the most critical to implement from a European perspective. In parallel, the discovery of substantial quantities of natural gas within the Exclusive Economic Zones (EEZ) of Greece and Cyprus, opens new perspectives and creates a new impetus for the two countries to become key European energy market players. The respective priority corridors and infrastructure projects to be developed in both countries are expected to establish them as a regional energy hub. Accordingly, the need to reformulate their energy curriculums in higher education arises as an imminent strategic priority.

The current energy curriculums in Cyprus can be considered as more advanced in comparison with in Greece, where are primarily limited in the field of engineering studies. In both countries, no comprehensive national study has been performed in the case of social sciences; accordingly, several reasons were underlined, both at global and local levels.

Considering that “energy” consists, most likely, the vastest discipline to study, the author emphasizes that the future energy curriculums in both countries will need to encompass the following features: new-disciplinary, interdisciplinary, sustainability, cross-country and cross-region oriented (in the context of Eastern Mediterranean, Middle East, South-Eastern and Central Europe, Black-Sea).

The critical role that the countries are expected to undertake by 2020, provide new opportunities for partnerships and collaborations with other countries with vast industrial experience and infrastructure. This will facilitate the development of strong academic programs and create a significant research basis in the region. It is only through investing in human capital that both countries can successfully manage and benefit from their natural resources in the coming years and ensure sustainable growth and innovation.

A NEW APPROACH FOR ESTIMATING THE EXPECTED FDI INFLOWS: THE TIP MODEL AND ITS APPLICATION IN THE TURKISH BANKING SECTOR

Kontakos, Panagiotis

Department of International & European Studies, University of Macedonia, Greece.

ABSTRACT

The aim of the paper is to present a newly developed top-down model, the so-called TIP model, to assess the potential FDI inflows in the banking sector of a country. Asset valuation principles, which were applied by the buyer to the target in other M&A transactions and are based on the price-to-book ratio, are used as a benchmark for the estimation of future FDI inflows.

The main function of the TIP model, in order to quantify the potential size of foreign investment, is to convert non-foreign-owned shareholder equity values to potential FDI inflows, by using historical price-to-book valuations as a vehicle. Although this method is widely used in international business practice for the valuation of individual M&A transactions, in the case of the TIP model it is applied at a top-down level for the total sector, and as such provides a unique, practical way to estimate the expected inflows. Further, a scenario analysis can be performed, by using various combinations of the input parameters of the model, which can also assist governmental decision making regarding privatizations. The applicability of the model is compared with other existing approaches used in the determination of future FDI inflows. Finally, to validate the model's functionality, the Turkish banking sector is used as an applied case study.

Keywords: *Foreign direct investments, mergers & acquisitions, valuation model, TIP model, banking, international business, scenario analysis, Turkey*

INTRODUCTION

Turkey has been a leading example of reform-driven growth acceleration in the period 2001–2011. The turning point in the revival of the Turkish economy could be identified as the period starting after 2002. The collapse of a vicious cycle of serious failures of macroeconomic policy, largely characterized by first, a vast, ineffective public sector that was accumulating public deficits, which in turn were monetized through a centrally controlled and insolvent banking sector, and second,

prolonged political uncertainty, culminated in the financial and economic crisis of 2000–2001. This crisis was the worst so far, and of such magnitude as to cause a wave of reforms. The financial sector liberalization reforms introduced since the 2001 crisis placed the Turkish banking sector on a sound foundation and attracted significant inward foreign direct investment (FDI), amounting to US\$39 billion during the decade 2000–2012 (CBRT, 2013; Kontakos, 2011).

The objective of this paper is to present a newly developed top-down model, the so-called TIP model, to assess the potential FDI inflows in the banking sector of a country; respectively, to validate the model's functionality, the Turkish banking sector is used as an applied case study.

Asset valuation principles that were applied from the buyer to the target in other M&As in Turkey were used as a basis for estimating future FDI inflows, and are incorporated in a newly developed and presented top-down model, the so-called TIP model. The paper asserts that the distinctive growth attractiveness, large size in total assets, low penetration of financial services, and low market share of foreign-owned banks in the Turkish banking sector, versus the CEE and SEE banking sectors, can trigger substantial FDI inflows to Turkey from banks in developed economies. The size of these future FDI inflows is attempted to be evaluated through the use of the TIP model. Additionally, inflows in the banking sector can have a multiplier effect in stimulating FDI inflows to other sectors and can spread a further new dynamic in the Turkish economy. In my view, however, geopolitical stabilization, internal political cohesion, and further democratization deepening in Turkey are prerequisites for this to be materialized in the medium term.

The paper is structured as follows: First, to introduce the reader in the specifics of the Turkish banking sector, its historical evolution is summarized, including FDI trends and privatizations, foreign M&A, and the capital size of investment. Second, considering recent local M&A deals in the Turkish banking sector, the aim is to estimate the total size of future FDI inflows, by using respective asset-valuation ratios and multiples incorporated in the TIP model. The conclusions follow in the last section.

As author of the article, I would like to express my gratitude to my ex-colleagues, Theodore Karakasis and Ioannis Tegopoulos, general managers in the International Activities of Eurobank EFG Ergasias, for their valuable implicit contribution of knowledge. Furthermore, the so-called "TIP Model," presented in the paper, has been named from the first-name initials of the aforementioned colleagues and myself. Eurobank EFG group is a European banking organization based in Athens, Greece, with total assets of €81.6 billion and presence that has previously reached 10 countries (as of end 2011).

EVOLUTION OF THE BANKING SECTOR IN TURKEY

The presence of foreign banks in Turkey can be traced back in the 19th century (Banks Association of Turkey, 2009; Encyclopedia of the Hellenic World, 2008). In the period that began after the establishment of the Republic of Turkey in 1923 and lasted until 1980, the banking sector was primarily under the control and influence of a centralized government, and was part of a planned economic policy. No licenses were granted in this period for establishing new foreign banks, except in few cases.

In 1980, four foreign banks (among 40 banks in total) were operating in Turkey, controlling 3.0 percent of the total assets in the banking sector. The gradual integration of the Turkish economy with the international financial system, accompanied by a process of financial liberalization and the lessening of regulatory barriers to the entry of foreign banks, encouraged foreign direct investments (FDI) and accelerated the entry of foreign banks into the Turkish banking sector after 1980s. During this period, foreign banks generally expanded by opening and operating branches; they were mostly focused on wholesale banking to serve their corporate customers. As a result, 18 foreign banks had been established by 2001. Despite the increase in the number of foreign banks, the share of assets of foreign banks in the total assets of the banking sector remained low. The assets of the foreign banks represented 3.2 percent of the total assets of the 61 banks operating in 2001.

The serious involvement of foreign banks in Turkey coincides chronologically with the reforms and progress achieved in the aftermath of the 2001 economic and financial crisis in Turkey, which made the banking sector profitable and attractive to foreign investors.

The banking sector effectively resisted the pressures and systemic risks from the instabilities that emerged in the global financial system and markets during 2008–2009; Turkish banks did not turn to state financial assistance to improve their capital reserves. The average Tier 1 capital ratio has declined, owing to an increase in risk-weighted assets on the back of a rebound in credit markets, but has remained high. As of December 2012, the capital adequacy ratio was standing at 17.9 percent, well above the average in the European Union. Credit quality problems in developed economies, arising from the US subprime loan crisis and the euro area sovereign debt crisis, have affected indirectly the operations of foreign banks in Turkey. Potential buyers stand to benefit from the financial difficulties of a number of European and American banks, which invested in Turkish banks a decade ago and are now selling because of their own troubled balance-sheets. Citigroup, for example, shed half of its 20% stake in Akbank, among the country's top-five banks, in December 2013. Overall, deleveraging in the region by European banks has created opportunities currently exploited by Gulf banks.

As of December 2012, 49 banking institutions were operating in the Turkish banking sector; 32 of them were commercial banks (out of which 3 were state-owned deposit banks, 16 foreign banks, 12

private privately-owned deposit banks and 1 under the Deposit Insurance Fund), 13 were development and investment banks, and 4 were participation banks.

The commercial banks do not have participation accounts and the participation banks (dealing with Islamic banking) are not licensed to accept deposits. The development and investment banks are not allowed to issue deposit and participation certificates.

Mergers between Turkish banks have been rare, resulting in a high degree of concentration. The top 10 banks concentrated 87 percent of the total assets in the Turkish banking sector in 2012, 89 percent of the total net profit, 87 percent of the branches, and 84 percent of the employees (The Banks Association of Turkey, 2013).

A few large domestic banks, some state-owned and some private, dominate the financial sector. The private banks are often members of conglomerates with widely dispersed holdings throughout the economy. Banks often control as subsidiaries many major nonbanking financial institutions, such as insurance companies, mutual funds, factoring firms, and financial leasing companies (EIU, 2010). Turkey's largest lender in asset terms in 2011 and 2012 was the privately-owned Is Bank. Its main private-sector rivals include the state owned Ziraat Bank and the privately-owned Garanti Bank, Akbank, and Yapi Kredi Bank.

At end December 2012, majority foreign-owned banks accounted for 13 percent of Turkish banking assets, 13 percent of total deposits, 14 percent of total loans, 20 percent of the branches network, and 14 percent of the employees, according to the Banks Association of Turkey. The main foreign players, in order of asset size, are Finans Bank (majority owned by National Bank of Greece), Denizbank (owned by the Franco-Belgian bank, Dexia), HSBC (UK) and ING (Netherlands).

Several major banks that are majority-owned Turkish banks have minority foreign shareholdings. These include Akbank (10 percent is owned by Citibank Overseas Investment Corporation); Garanti Bank (25.01 percent is owned by the Spanish BBVA, Banco BilbaoVizcaya Argentaria S.A); Sekerbank (33.98 percent is owned by an asset fund of the Government of Kazakhstan); and Yapi Kredi Bank (Koc Financial Services is the owner of 81.8 percent, in which the Italian Unicredit holds a participation of 50 percent and thus indirectly controls the 40.9 percent of Yapi Kredi Bank). Also, Turk Ekonomi Bank, in which BNP Paribas (France) has a large minority share of 34.43 percent, merged with the local unit of Fortis in March 2011. BNP Paribas had acquired Fortis's Turkey unit when it bought the Belgian portion of the defaulted bank in 2009.

Based on the aforementioned minority participation shareholdings, foreign banks control an additional US\$70,771 million, or 9.7 percent of total assets. When this is added to their majority participation of 13.4 percent, the adjusted market share in total assets reaches 23.1 percent.

Table 1. Turkish banks: Foreign investors' acquisitions from 2001 through 2013

Year	Target	Buyer	Country of buyer	Deal value, millions of US\$	Stake %
2013	Citi Turkey (Consumer Banking)	Denizbank (Sperbank)	Russia	22	100
2013	AlternatifBank	Commercial Bank of Qatar	Qatar	448	70,8
2012	DenizBank A.S.	Sberbank	Russia	3.793	99,85
2012	Odea Bank	Audi Bank	Lebanon	300	100
2012	Eurobank Tekfen	Burgan Bank	Kuwait	359	99,3
2011	Garanti Bankasi	BBVA	Spain	5.800	24,9
2010	Millenium Bank	Credit Europe Bank NV	Netherlands	44	95
2008	Türkiye Finans Katılım Bankası	National Commercial Bank	Saudi Arabia	1.080	60
2007	Akbank T.A.S.	Citibank	US	3.100	20
2007	Oyak Bank	ING Bank N.V.	Netherlands	2.700	100
2007	Sekerbank	Turanalem Securities	Kazakhstan	610	33,98
2007	Turkish Bank	National Bank of Kuwait	Kuwait	160	40
2007	Garanti Bank (Settl. & Custody)	Deutsche Bank AG	Germany	115	100
2006	DenizBank A.S.	Dexia Bank	Belgium	3.221	98,9
2006	Tekfenbank	EFG Eurobank Group	Greece	182	70
2006-08	Finansbank	National Bank of Greece	Greece	5.271	90,1
2005	C Kredi Kalkinma	Bank Hapoalim	Israel	113	57,5
2005	Yapi Kredi Bank	UniCredit	Italy	1.395	57,4
2005	Garanti Bankasi	GE Consumer Finance	US	1.560	25,5
2005	Disbank	Fortis	Belgium	1.125	89,3
2005	TEB	BNP Paribas	France	217	42,1
2002	Kocbank	UniCredit	Italy	240	50
2001	Sitebank	Novabank	Portugal	3	100
2001	Demirbank	HSBC	UK	350	100

Source: Undersecretariat of Treasury, P. Kontakos (2014)

The Turkish banks acquired by foreigners, in the period that followed after the restructuring of the banking sector, are presented in Table 1. One of the most sizable acquisitions in financial terms was announced in November 2010 by the Spanish BBVA, which agreed to pay US\$5.8 billion for 24.9 percent of Garanti Bank, with an option to take full control in five years. General Electric was the seller of 18.6 percent for US\$3.8 billion and Dogus Group of an additional 6.3 percent for US\$2.1 billion. With an initial US\$1.8 billion investment in Garanti in 2005, GE Capital realized US\$5.2 billion in total proceeds, from dividends and the sale of the Garanti holdings, upon completion of the transaction.

The second acquisition in value was realized by the National Bank of Greece, which acquired a cumulative 90.1 percent stake in Finansbank for a total amount of US\$5.3 billion in the period 2006–2008.

Russia's biggest bank, Sberbank, is one of the newcomers with a chance of challenging the top five. In September 2013 it bought Denizbank for US\$3.8 billion, Turkey's tenth-biggest, from Dexia, a cash-strapped Belgian lender. The Russian bank is also adding 22 retail branches acquired by Citibank. Sberbank is the first Russian lender to buy a bank in Turkey. The deal would be the largest in Eastern Europe, the Middle East and Africa in 2013 and the biggest in Turkey since BBVA's acquisition.

Also, in 2008, the National Commercial Bank (NCB) acquired 60 percent of Türkiye Finans Katılım bank for US\$1.1 billion. NCB is the largest bank in Saudi Arabia; the acquisition represents the largest ever transaction in the interest-free Islamic banking sector in the world, and underlines the growing importance of this particular segment of the banking industry. It was NCB's first major foray outside Saudi Arabia's borders.

Based on the data of the Banks Association of Turkey, the total number of banking institutions decreased from 61 to 45 in the period 2001–2012, out of which 16 were foreign banks. Accordingly, the total assets in the banking sector have increased by 453 percent to US\$730 billion and the loans have increased by 1395 percent to US\$433 billion; the respective increases were significantly higher in the case of foreign banks.

Turkish banks were broadly profitable after 2002, although earnings were characterized by variability as a result of the impact of global financial turmoil. Profitability declined in 2008, but recovered by 52 percent in euro terms in 2009, as the spread between deposit rates and lending rates widened and loan provisions declined. Profit growth was much weaker at around 14 percent in 2010 and has remained stable in the period until 2013, reflecting the lower net interest income on contracting loan-deposit spreads, net interest margin erosion, intensified by mounting competition, and narrowing fees on relatively weaker loan originations.

Finally, as revealed by the relevant data, there is a significant expansion of the branch networks of foreign banks, which reached 2,012 branches in 2012 (or 20 percent of the total) from only 233 in 2001, whereas the staff employed in foreign banks within Turkey increased to 38,772 (or 21 percent of the total in the sector) from 5,395, and considerably exceeded the respective increases in the local banks. In particular, the total increase by 48,603 in employment in the Turkish banking sector during 2001–2010 can be attributed mainly to foreign banks.

THE TIP MODEL ASSESSMENT OF POTENTIAL FDI INFLOWS IN THE TURKISH BANKING SECTOR

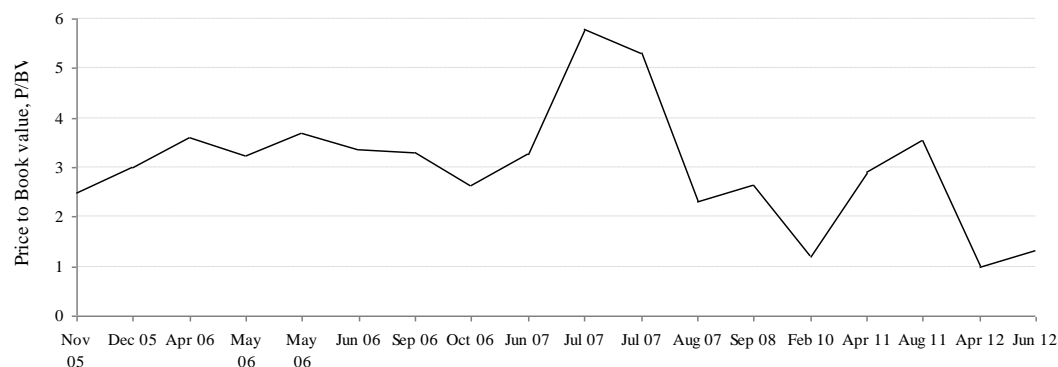

The aim of this section is to assess the potential FDI inflows into the Turkish banking sector by utilizing other recent deals or acquisitions as a benchmark. Asset valuation principles, which were applied by the buyer to the target in other M&A transactions in Turkey and are based on the price-to-book ratio (P/B), are used as a basis for the estimation of future FDI inflows. It can be argued that the price-to-book ratio is the most widely applied and quoted ratio in all bank acquisitions internationally, and particularly in the CEE and SEE region.

The price-to-book ratio (P/B), also known as the price-equity ratio, is the ratio of the market value of equity to the book value of equity, where the book value is the shareholders' equity on the balance sheet.

$$\text{Price-to-book ratio} = \text{market value} / \text{total shareholder equity}$$

In our case, the market value refers to the value paid by the acquiring bank to the target bank. To evaluate potential future acquisitions, and the respective amounts, previous disclosed price-to-book ratios from the period 2005–2012 are used as benchmarks. Overall, after a correction in the price-to-book ratios during the period of the global economic crisis, the price-to-book ratio started trending up again in 2011, pointing to an augmented international demand for Turkish banking assets, particularly in comparison with other regional markets; it declined again in 2012, reflecting the need of some European investors to divest from Turkey due to financial and capital difficulties in their home countries. As shown in Figure 1, the ratios range from a maximum of about 5.8 to a minimum of 1—that is, the price per share paid by an international investor to acquire a local bank in Turkey was within a range of 5.8 times the book value per share of the target, as when National Commercial Bank (NCB) acquired 40 percent of Turkiye Finans in July 2007, to 1 times the book value per share of the target, as in the case of Eurobank Tekfen's acquisition of 99 percent by Burgan Bank of Kuwait in April 2012.

Graph 1. Foreign bank acquisitions in Turkish banking sector; valuations of transactions

In particular, the shareholder equity of local banks in Turkey was used to estimate potential FDI inflows in the banking sector, by applying as a multiple an average price-to-book ratio from previous transactions in Turkey. A top-down model was newly developed for this purpose, the so-called TIP model, as shown in Table 2, based on the shareholders' value of the local Turkish banks, which was US\$75,632 million as of the end of 2012. This value is derived from data of the Banks Association of

Turkey; the respective shares of foreign-owned banks in local banks (13.3 percent) and the minority participation shares of foreign banks in local banks (9.7 percent) were extracted from the total shareholder's equity in the sector.

Table 2. The TIP model estimation of potential FDI in the Turkish banking sector (in millions of US\$)						
	2012	2013	2014	2015	2016	2017
						CAGR 2010-15
<i>Total shareholders equity</i>	98.202	108.022	118.824	130.707	143.777	158.155
<i>Local banks</i>	75.632	79.261	83.022	86.911	90.924	95.057
<i>Foreign banks</i>	13.053	17.852	23.300	29.465	36.427	44.270
<i>Minority foreign participation</i>	9.517	10.908	12.503	14.331	16.426	18.827

						Total FDI inflow
						62.722
						54.034

Source: P. Kontakos (2014)

In turn, TIP model is based on the following conservative assumptions:

1. An average price-to-book ratio of 1.5 times in each future transaction in the period 2012–2017;

2. The total shareholder's equity in the system will increase by a compounded aggregate growth rate (CAGR) of 10 percent per annum in the period 2012–2017;
3. The total market share of foreign banks (including their minority participations) will progressively increase every year from 23 percent in 2012 to 40 percent in 2017 (the foreign share in owned banks with majority participation will increase from 13.3 percent to 28 percent, and the foreign minority participation will increase from 9.7 percent to 12 percent). Based on the aforementioned assumptions, a total amount of US\$63 billion of inward FDI can be expected to be received in the banking sector within the period 2013–2017.

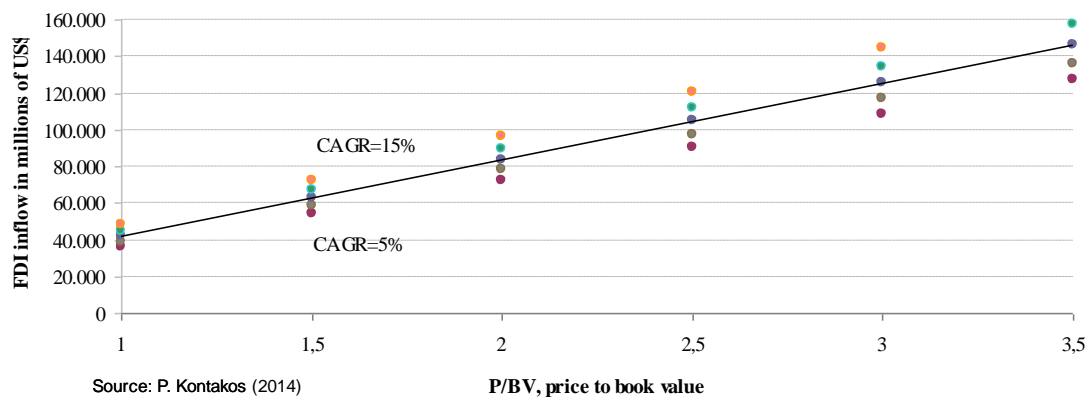

Table 3. Scenario analysis of potential FDI inflows (in millions of US\$)

	CAGR	5%	7,5%	10%	12,5%	15%
P/B value						
1		36.270	38.955	41.815	44.859	48.097
1,5		54.405	58.432	62.722	67.288	72.145
2		72.540	77.910	83.630	89.718	96.194
2,5		90.675	97.387	104.537	112.147	120.242
3		108.810	116.865	125.444	134.577	144.291
3,5		126.945	136.342	146.352	157.006	168.339

Source: P. Kontakos (2014)

Furthermore, a scenario analysis can be performed, by using combinations of the input parameters, the price-to-book ratio, CAGR, and target total market share to be reached over the period or per annum. Such scenarios are presented in Table 3 and are depicted in Figure 2, with the total foreign market share increasing progressively as estimated previously up to 40 percent in 2017, but using different CAGR and price-to-book valuations over the period. A central, most probable range of these scenarios is marked in Table 3 (see box), and accordingly the potential FDI inflows are estimated between US\$39 billion (CAGR = 7.5 percent and P/B ratio = 1) and US\$90 billion (CAGR = 12.5 percent and P/B ratio = 2). As already implied in the TIP model, the core input parameter and main driver in the analysis to estimate the potential FDI inflows consists of the final foreign share that is assumed to be reached. Different final foreign shares generate different FDI inflows. It should be noticed, however, that our assumption of 40 percent market share to be controlled by foreign banks by 2017 is reasonable, particularly if the respective foreign shares in the regional sectors are considered.

**Graph 2. Potential FDI inflows in the Turkish banking sector, 2013 through 2017,
in millions of US dollars**

Moreover, to support the results in the analysis, the following bottom-up attributes of the banking sector can validate the assumption of a potential 40 percent total foreign market share by 2017:

1. The Turkish government has shown a strong commitment to privatization. It has repeatedly announced plans in the media for the sale of the three state banks, which hold 29 percent of the total assets in 2012, and have been traditionally one of the main providers of loans to small and medium-sized companies. In particular, it has announced that it intends to sell stakes in secondary public offerings of the state's Halk bank, Turkey's third-largest public bank, with a market share of 8.3 percent in 2012. In addition, the government has indicated that Ziraat Bank, Turkey's market leader, with a market share of 12.5 percent, will also be sold.
2. The minority holdings of foreign banks in Turkey were 9.7 percent in 2012, and consisted of the following participation in the respective local banks: BBVA, 25.01 percent; Citibank, 10 percent; Unicredit, 40.80 percent; BNB Paribas, 34.43 percent; BTA Securities (Turan Alem), 33.98 percent; and National Bank of Kuwait, 40 percent.

Accordingly, all these foreign institutions are highly likely to increase their local participation (and become majority shareholders) in the coming years. This scenario has been considered in the analysis presented in Table 2, where the minority participation of foreign banks is projected to reach 12 percent of the total shareholders' equity by 2017.

3. The proximity of Turkey to the Arab states of the Gulf puts the country in a position to attract significant foreign investments in Islamic banking, and Istanbul is established as a regional finance center in the short run and as a global finance center in the long run. A steady development of the participation banks to attain a 10 percent share in total assets, from 5.1 percent in 2012, is projected by the Participation Banks of Turkey, and this is expected to receive significant support from the public authorities. This is also supported by the evidence that the compound annual growth rate (CAGR) of

raised funds in the participation banking sector was 35 percent during the past 2001-2010 (Ozsoy and Yabanli, 2010). Moreover, based on past experience, transactions in Islamic banking are accompanied by significant acquisition premiums.

4. Considering that Turkey has no restrictions on foreign ownership in the banking sector, and the challenge of breaking through a highly concentrated market, where the top ten banks control 87 percent of total assets in 2012, a number of international banks are expected to continue establishing greenfield operations.

Overall, the above analysis pinpoints to an immense unexploited potential of record future inflows of foreign investments in the sector, which is estimated at a range with an expected value of US\$63 billion in the next years. This size of investment can revitalize and generate a new evolving momentum for the Turkish economy and can spur renewed foreign interest for investments and acquisition activity in other sectors.

CONCLUSIONS

The structural transformation that characterized the Turkish economy in the last years, especially since the 2001 crisis, has made it clearly resilient in the face of domestic and international shocks.

The banking sector experienced record inflows of foreign investment in the period 2005–2013, and the series of local bank acquisitions by foreign banking groups has contributed toward but has also been facilitated by the transformation of the Turkish financial framework. Sberbank, UniCredit, the National Bank of Greece, HSBC, BNP Paribas, Fortis, ING, General Electric Consumer Finance, Commercial Bank of Qatar and National Commercial Bank now all have significant commitments in Turkey.

The Turkish banking system is distinguished for its growth attractiveness and exceptional profitability, the low degree of financial intermediation, and the unpenetrated mortgage sector; it also is backed by positive population demographics, its large size in total assets, and the low market share of foreign-owned banks—all motives for foreign investment. All above highlight opportunities for future banking business growth and can attract international investors and stimulate substantial FDI inflows (Kontakos, 2012).

To quantify the potential for foreign investment, the TIP model was utilized; its main function is to convert non-foreign-owned shareholder equity values to potential FDI inflows, by using historical price-to-book valuations as a vehicle. Although this approach is widely used in international practice for the valuation of individual M&A transactions, it is applied at a top-down level for the sector, and as such provides a unique, practical way to estimate the expected inflows and bridge economic practice with theory. Based on some assumptions, which can be easily validated in practice, it is

estimated that a mean potential of US\$63 billion inward FDI can be realized in the Turkish banking sector in period 2011–2015.

The analysis suggests that this amount of foreign investment can stimulate additional investments in other sectors, and not only transform the Turkish economy, but position the Turkish banking sector on par with those of the largest European economies, such as Spain and Italy, and at the same time establish Istanbul as a global financial center and crossroad for accessing other countries where links with Europe are weaker (the Middle East, Caucasus, and Central Asia).

INFLUENCE OF TAX UNCERTAINTY AND GOVERNMENT EXPENDITURES VOLATILITY ON ECONOMIC GROWTH - CASE STUDY OF OECD COUNTRIES

Kotlán, Igor; Machová, Zuzana; Macek, Rudolf

Department of National Economy, VŠB-TU Ostrava – Faculty of Economics, Ostrava, Czech Republic

ABSTRACT

The influence of taxation and government expenditures on the economic growth is the object of many empiric works, but the volatility of these variables is almost omitted. Therefore the aim of the paper is to describe the effect of taxation and government expenditure on long-term economic growth with a special emphasis on the impact of tax uncertainty and volatility of government expenditure in OECD countries with using the dynamic panel. The level of taxation is expressed not only by the traditional tax quota, but also by the World Tax Index – index designed by the authors. The results show that there exists the negative impact of volatility of government expenditures on economic growth – as the theoretical assumptions. In case of tax uncertainty there are contradictory results. Tax uncertainty expressed by tax quota is positively connected to the economic growth – contradicting the theoretical assumptions; but the use of the World Tax Index showed the negative impact of tax uncertainty on economic growth. Therefore the World Tax Index seems to be more the appropriate approximator of the level of taxation.

Keywords: *Economic Growth, Tax Uncertainty, World Tax Index, Tax Quota, Dynamic Panel, OECD Countries.*

INTRODUCTION

Almost all developed OECD countries are experiencing fiscal changes today which significantly affect the real tax burden. It is necessary to realize that the government expenditure or the tax burden uncertainty can represent a much more problematic factor than the level of these indicators. It is also obvious that if there exists the significant tax uncertainty, it is likely to damage long-term economic growth and economic welfare more than just a high tax burden. A high tax burden can lead to higher tax revenues in case of invalidity of the implications of the Laffer curve. If these higher tax revenues are used to finance productive government expenditures, the effect on economic growth may appear positive. This fact partially eliminates the potential negative growth effect of high taxation, which does

not apply in case of tax uncertainty. Analogically, the volatility of government expenditure can very similarly affect the level of output of the economy.

The aim of the paper is to describe the effect of taxation and government expenditure on long-term economic growth with a special emphasis on the impact of tax uncertainty and volatility of government expenditure in OECD countries with using the dynamic panel. The impact of taxation, resp. taxation uncertainty will be explored in all aspects of taxation by overall taxation.

INFLUENCE OF LEVEL AND VOLATILITY OF TAXATION AND EXPENDITURE ON ECONOMIC GROWTH

In an effort to achieve, insofar as possible, the best and most realistic determination of economic growth, economists try to include in their growth models a number of variables, among others those related to fiscal policy. Interest in these types of variables has deepened as a result of the current debt crisis and doubts about further EU integration. The aim of these models is therefore to test hypotheses about the impact of fiscal variables on economic growth (Kotlán and Machová, 2013). Fiscal variables mean the level of taxation and government expenditure, and also the size of the public sector. The most important authors dealing with this issue include e.g. Gemmel, Kneller and Sanz (2011). These conclude that the impact of fiscal variables on economic growth is ambiguous and depends on the nature of taxes (distortionary or non-distortionary) and government expenditure (productive or non-productive), with pro-growth effects being present only in productive expenditure, if financed from non-distortionary taxes. Distortionary taxes and unproductive government expenditure have a negative impact on economic growth. Devereux and Mansoorijan (1992) also point to the need to coordinate tax and expenditure policies, if fiscal policy is to positively affect growth. However, none of these studies addresses the extent to which economic growth can be influenced by tax uncertainty and the volatility of government expenditure. Fiscal volatility represents a kind of economic risk, which is associated primarily with expectations about future developments in tax bases and tax rates, or developments in government expenditure. Taking into account this type of risk can then modify the conclusions of empirical studies dealing with the effect of taxation and government expenditure on economic growth.

Effect of level and volatility of taxation on economic growth

The size and volatility of taxation affects economic growth through its effects on individual growth variables, in particular on the level of savings and capital accumulation, or the size of the human capital and technology (Macek, Machová and Kotlán, 2013a). In the case of taxation and its effect on growth, economists come to contradictory conclusions. Keuschnigg (2009) argues that investment

activities, and thus the growth, are negatively affected in particular by corporate tax, which is very often associated with decisions to place foreign direct investment. Labour taxation also leads to reduced investment activities due to the pressure on corporate profits caused by a drop in labour supply (Alesina *et al.*, 1999).

The positive effect of taxation on human capital accumulation is also admitted by Lin (2001) in the case of public investment in education; however, in the case of private investment, most studies agree on the negative impact of taxation, in particular through personal income tax with a progressive tax rate (Erosa and Koreshkova, 2007), which reduces the returns from these investments.

Indirect taxes affect economic growth only through their effect on the substitution between leisure time and work, thus leading to a change in the ratio between labour and capital in production, while direct taxes also affect growth through other channels, e.g. those mentioned above. The negative influence of direct taxes on economic growth should thus be greater and their distortionary effects stronger compared to indirect taxes (Mamatzakis, 2005).

The issue of the distortionary nature of direct and indirect taxes is one of the most debated issues in terms of the influence of taxes on economic growth. As mentioned above, this problem is addressed primarily by Kneller, Bleaney and Gemmell (1999), who report that distortionary taxes negatively affect growth, while the effect of non-distortionary taxes is neutral or positive. Tax volatility or uncertainty, similarly as in the case of indirect taxes, affects growth variables primarily through the substitution effect, whether it is substitution between consumption and savings, or substitution between investments in the different types of capital. Its effect is thus particularly relevant in the case of distortionary taxes.

Decisions on the size of household savings are mostly influenced by taxation of labour, which reduces the amount of disposable income, also potentially leading, in the absence of tax uncertainty, to a reduction in the volume of savings and negative effect on growth. The influence of uncertainty on the level of taxation then depends on the elasticity of intertemporal substitution and risk aversion. For agents with high risk aversion, if elasticity is high, higher risk arising from uncertainty regarding labour tax rates will lead to higher substitution and an increase in the savings rate, which will have a positive effect on economic growth (Smith, 1996). The resulting effect of labour taxation on economic growth then depends on which of these effects prevails.

As for the accumulation of capital, the tax reduces the net rate of return from capital after tax, thus having a negative impact on economic growth. If there is uncertainty about future tax rates, economic agents with high risk aversion prefer the type of capital accumulation which is not taxed, which is not subject to uncertainty, or where such uncertainty is at least reduced. For example, if there is greater uncertainty about the tax rate on physical capital, this will lead to a greater accumulation of human

capital and vice versa. The substitution effect will thus influence the relationship between physical and human capital in production, which will also affect economic growth (Easterly *et al.*, 1991). The resulting effect will depend on the type of capital with more uncertainty about the level of its taxation.

Economic theory implies that the impact of tax uncertainty on economic growth is the result of a number of different effects, and that it depends on which of them prevails. The results of empirical work in this area are unclear; however, it should be noted that they are generally limited to the impact of uncertainty on investment decisions.

Effect of level and volatility of government expenditure on economic growth

There is neither any consensus among economists on the relationship between government expenditure and economic growth. While Wagner (1911) and his law of increasing state activity (Wagner's Law) says that economic growth leads to the growth of the public sector, including government expenditure, standard Keynesian theory understands government expenditure to be an exogenous factor that can be successfully used as a fiscal policy tool to promote economic growth. Lucas (1988) and Romer (1986) argue that only investments in human capital and research and development have pro-growth effects; Barro (1990) also considers investments in infrastructure as having pro-growth effects. As already mentioned, it is necessary to distinguish between productive and unproductive expenditures. Schaltegger and Torgler (2006) add that the effect of government expenditure on growth is negative in developed, wealthy economies with a large public sector and a greater proportion of non-productive expenditure due to crowding out.

When considering the impact of changes in government expenditure on economic growth, it is also necessary to take into account its temporal nature. As indicated by Friedman (1957) discretionary measures in the form of changes in government expenditure can positively influence growth, but only provided that these changes are not considered permanent by economic agents. Should households and firms consider the changes permanent, it would change their consumer and investment behaviour, which could have a negative effect on economic growth.

The volatility of government expenditure may theoretically have both a positive and negative effect on economic growth. The key aspect in this case is what impact the volatility of government expenditure has on output volatility, since the influence of the economic cycle on economic growth is generally seen in economic theory as negative (Badinger, 2012). By increasing or decreasing government expenditure in the Keynesian approach, it is possible to smooth out the economic cycle and positively affect mainly investment as well as consumption and economic growth; however, if fiscal policy is not in line with the cycle, if it is applied in a pro-cyclical manner, it alone may instead become the cause of output volatility (Afonso and Jalles, 2012). It follows that the pressure to reduce

government expenditure, and therefore its volatility, may affect growth positively, even during recessions, as it is accompanied by a reduction of discretionary measures, which may cause the cycle (Poterba, 1994). As indicated by Afonso and Furceri (2010), high volatility in government expenditure may also lead to the growth of interest rate volatility, which, in contradiction to the above described Keynesian approach, will negatively affect investment and economic growth.

Empirical studies confirming the positive effect of reducing discretionary measures and their volatility include e.g. Badinger (2012). The latter author, as well as previously Barro (1990), adds that the effect of the volatility of government expenditure on growth varies according to the level of development of each economy, being more important in less developed countries.

INTEGRATION OF FISCAL VARIABLES INTO EXTENDED MODEL OF GROWTH

The studies of Lucas (1988) or Romer (1986) gave rise to a body of largely empirical work, the aim of which was the best possible explanation of economic growth through the integration of other factors that affect it, including the taxation that is, nevertheless, not desirable to be considered in isolation. Its analysis should primarily include government expenditure financed by the taxes.

The standard approach by Barro (1990), Rebelo (1991), or Barro and Sala-i-Martin (2004) states that, in a steady state, the economy grows at the same rate as private consumption, and as physical and human capital. If agents maximize their utility function, the growth of the economy (γ) is thus given by the difference between the net marginal return to physical capital (r) and the rate of time preference (ρ) adjusted for the intertemporal elasticity of substitution in consumption ($1/\theta$):

$$\gamma = \frac{1}{\theta}(r - \rho). \quad (1)$$

To state hypotheses for the empirical part of the paper, it is necessary to extend the model with fiscal policy variables. Barro (1990) modifies the equation 1 as follows, assuming the broad concept of capital (K) that includes both physical and human capital (consistently with Rebelo, 1991 and his AK model) and a flat tax rate on income (τ) is that is used to fund government expenditure (G):

$$\gamma = \frac{1}{\theta} \left[(1 - \tau) \phi \left(\frac{G}{K} \right) (1 - \eta) - \rho \right], \quad (2)$$

where ϕ expresses a positive decreasing marginal product, and η is the sensitivity of production to changes in G for a given K . The growth rate of the economy is thus positively affected by productive government expenditure, which is also examined in the empirical part of the paper. The sensitivity of production to changes in government expenditure has, on the other hand, a negative influence on

growth. The equation (2) also shows that the influence of taxation on the economic growth is negative. Nevertheless, there still remains the crucial question, whether the effect is actually negative in case of all types of taxes.

To answer the question, e.g. Milesi-Ferreti and Roubini (1998) modify the equation 1 to include different types of taxes classified by the function. However they still state that similar models are very detached from the real tax mixes in individual economies. Therefore, the authors of such models need to calibrate them in empirical works so as to be as close to the real world as possible.

One of such models that are very close to the reality is presented by Denaux (2007). His model shows how economic growth is affected by taxes on physical and human capital, taxes on property, taxes on consumption, and also by productive and unproductive government spending. However, in reality, e.g. capital gains make part of income of corporations as well as individuals. From that reason, it is not possible to find any good proxy of the physical capital tax in the model. Denaux (2007) uses the corporate income tax rate, which it is not accurate in fact. Similar situation occurs in case of human capital above all.

The main problem of the above models lies in fact that they use the functional classification of taxes and the social planner approach. The model below is based on the classification by object of taxation and the behavior of agents.

Households maximize their utility function as described e.g. by Barro and Sala-i-Martin (2004) for a given budget constraint that is:

$$\dot{a} = (1 - \tau_w)wl + (1 - \tau_a)ra - (1 + \tau_c)c + tr, \quad (3)$$

where a , w , l , c , and tr are per capita amounts of assets, wages, labor, consumption and transfers respectively, r is net marginal rate of return on physical capital, and τ_w , τ_a and τ_c are tax rates on wages, property and consumption respectively. The budget constraint makes a limiting condition for the households' behavior optimization. On the basis of the optimization, households decide on the consumption/leisure ratio, depending on the net after-tax marginal return (r) that is also a crucial determinant of the behavior of firms.

In the sector of firms, the variables are related to the effective labor $\hat{L} = Le^{xt}$, where x is the technology growth rate. Then $\hat{k} = \frac{K}{\hat{L}}$ and $\hat{c} = \frac{C}{\hat{L}}$ applies. If the production function is $Y = f(K, \hat{L})$

, after-tax profit (π) is given as:

$$\hat{\pi} = \hat{L} \left\{ (1 - \tau_\pi) \left[f(\hat{k}) - we^{-xt} - \delta \hat{k} \right] - r\hat{k} \right\}, \quad (4)$$

where δ is the depreciation rate and τ_π is the tax rate on profit. Setting the first derivatives of the function (eq. 4) equal to zero, we get:

$$f'(\hat{k}) = \frac{r}{(1 - \tau_f)} + \delta \text{ and (5)}$$

$$w = [f(\hat{k}) - f'(\hat{k})\hat{k}]e^{xt}. \text{ (6)}$$

Market clearing condition for the assets market states that $a = k$, resp. $\hat{a} = \hat{k}, \dot{a} = \dot{k}$, and the economy grows at the same rate as the physical capital, as stated above. Thus, from the equations (3), (5) and (6), we get the growth rate of the economy:

$$\gamma = \frac{\dot{k}}{k} = (1 - \tau_w) \left[\frac{f(\hat{k})}{\hat{k}} - f'(\hat{k}) \right] + (1 - \tau_a) [f'(\hat{k})(1 - \tau_\pi) - \delta] - (1 + \tau_c) \frac{\hat{c}}{\hat{k}} + \frac{\hat{t}r}{\hat{k}} - x - \frac{\dot{l}}{l}. \text{ (7)}$$

Tax uncertainty can be understood as a part of the tax burden, which means an additional level of taxation for those agents with risk aversion. Tax uncertainty basically represents an additional tax rate which is different for different subjects, depending on the relationship of the subject to risk. The higher the risk aversion, the greater the increase in a certain subjective tax rate that also includes the tax uncertainty. In this case, the following applies in case of all types of taxes:

$$\tau_i = f(\tau^S_i, \tau^V_i), \text{ (8)}$$

where τ^S_i is tax rate size for the i type of tax, and τ^V_i is tax rate volatility for the i type of tax.

The model described therefore shows that, according to economic theory, the resulting effect of the size and volatility of the taxation on growth through all types of taxes, i.e. taxes on profits, taxes on wages, property taxes and consumption taxes, should be negative (Macek, Machová and Kotlán, 2013b), which makes the primary hypothesis for the empirical part of the paper.

EMPIRICAL ANALYSIS: METHODOLOGY, DATA AND RESULTS

The empirical analysis in this article is based on a dynamic panel model, which uses data for OECD countries for 2000-2010. Real GDP per capita in purchasing power parity (GDPCAP) is therefore the dependent variable. The independent variables are capital accumulation, expressed as a share of investment in real GDP in purchasing power parity (INVGDGP) and the accumulation of human capital as a proportion of the population in the total population aged 25-64 having completed at least upper secondary education, as classified by ISCED (HUM SC). Other explanatory variables are then fiscal variables, including the level of government expenditure, the volatility of government expenditure, taxation and the size of the tax uncertainty.

The level of government expenditure is expressed as a share of government expenditure in nominal GDP. The volatility of government expenditure is expressed by the deviation of the government's expenditure (share of GDP) in each year from an average level of government expenditure during the reporting period for each country. However, none of the variables concerns total government

expenditure, but only productive expenditure, in accordance with the work of Kneller, Bleaney and Gemmell (1999) and according to COFOG classification. They thus primarily include expenditure on general and public services, economic affairs, defence and education. By contrast, primarily expenditures on social affairs are excluded.

Tax uncertainty, similarly to the volatility of government expenditure, is expressed using deviations of the tax burden in each year from an average level of tax burden for the reporting period for each country. The selection of an indicator to express the tax burden is crucial both to calculate the uncertainty, and to express the level of taxation. As a standard, and also in this article, the tax burden is approximated using a tax quota, i.e. the share of tax revenues in nominal GDP; however, this brings about a whole range of negatives (Kotlán and Machová, 2012). As an alternative to the tax quota, the following analysis therefore also uses another indicator of the tax burden, the World Tax Index (WTI), designed for the purposes of macroeconomic comparisons and other analyses by the authors. It is a measure that combines hard data from internationally recognized sources (OECD, World Bank) with soft data obtained from an extensive survey carried out annually among tax experts from all OECD countries. The index consists of several parts: (1) Corporate Income Tax (CIT), (2) Personal Income Tax (PIT), (3) Value Added Tax (VAT), (4) Individual Property Taxes (PRO), and (5) Other Taxes on Consumption (OTC). The WTI is not only limited to tax rates, which are reflected, under certain circumstances, in the level of tax revenue and thus the tax rate; it includes other aspects associated with the tax burden, such as taxation progressivity, the administrative costs of taxation, or tax deductibility of expenses. For more details on the methodology for its construction, see Machová and Kotlán (2013). The dataset is freely available at www.worldtaxindex.com. Other data mentioned was drawn mainly from the OECD iLibrary Statistics, OECD Factbook Statistics and Penn World Table.

The method used was panel data regression. Given the relatively small number of countries and the relatively short time series, the combination of time and cross-country data is absolutely essential. This makes the presented statistics more reliable. The software used was E-Views, version (7).

The regressions performed aimed to verify the hypothesis of the existence of the impact of taxation and government expenditure, and particularly tax uncertainty and volatility of government expenditure on long-term economic level and hence economic growth. In the first phase, stationarity tests were performed using a panel unit root tests. The variables used were verified as stationary, but with regard to further interpretation of the results, they were expressed in logarithmic form. The lagged variables are designated (-1).

Using a robust estimator in calculating the covariance matrices ensured that the estimation results of standard deviations of parameters and hypothesis tests were correct with regard to a possible

occurrence of autocorrelation and heteroscedasticity. This method is called "White Period" and it is made possible by virtue of the econometric software used.

Given that this is a dynamic panel, which includes appropriate delays of the dependent and independent variables, it cannot be reliably estimated by OLS. As the estimation technique, a generalized method of moments (GMM) was used, which included the method of instrumental variables. This method uses the Arellano-Bond estimator (Arellano and Bond, 1991). The aforementioned estimation type ensures that the appropriate transformation process and using appropriate instruments eliminates the risk of endogeneity of the lagged values of the dependent variable and the independent variables with a random component. In the analyses below, the lagged values of the dependent variable were used as the instruments, with a lag of (-2). According to the Sargan test, the lagged values of the independent variables were not necessary to use.

The below model includes a lag of one period, as is usual in these types of studies. Alternatively, autoregression analyses with a two- and three-year delay were still carried out, with very similar results; however, with regard to the shortness of the time series, it would be impossible to reliably verify their validity from an econometric point of view.

The dynamic panel model of OECD countries for the period 2000-2010 is presented in the following tables 1 and 2. It uses lagged values of the dependent variable and other endogenous variables describing the impact of fiscal policy. This is the level of government spending and the level of taxation as well as the rate of their volatility. Given the focus of the paper, the question of particular importance is the volatility of fiscal variables. Table 1 presents a model which uses ordinary tax rate as the tax burden approximation; table 2 shows the author's own tax burden index – the World Tax Index (WTI), see above.

DEPENDENT VARIABLE	GDP per capita (PPP) (LOG(GDPCAP))
LOG(GDPCAP(-1))	0,595 (21,1263)**
LOG(INVGDP)	0,284 (20,496)**
LOG(HUMSC)	0,304 (4,367)**
LOG(EXPPROD(-1))	0,129 (3,414)**
LOG(V_EXPPROD(-1))	-0,001 (-1,930)*
LOG(V_TQ(-1))	0,001 (2,636)**
LOG(TQ(-1))	-0,135 (-5,351)**
Number of observations	306
Number of instruments	34
J-statistics	32,97

Table 1. *Effect of tax uncertainty and volatility of government expenditure using tax quota indicator*

*Note: Included in parentheses are t-statistics that are adjusted for heteroskedasticity and autocorrelation; standard deviations are calculated using robust estimates; *, **, *** indicate significance levels of 10 %, 5 %, and 1 %, respectively; Arellano-Bond estimation.*

The results presented in both tables show that substantial inertia can be seen for the GDP (GDP (-1)) indicator and a positive effect of the size of GDP in the previous period, as well as a very significant positive impact of the share of human capital (HUMSC) and investment rate (INVGDGP), where the effect of percentage change in human capital is quantitatively greater than with the percentage change of physical capital.

Both models also show that there is a substantial positive impact of productive expenditure (EXPPROD(-1)) and a negative impact of taxation (TQ(-1)/WTI(-1)) on economic growth.

Also demonstrated was the negative impact of tax uncertainty measured by indicators of effective tax rates WTI (V_WTI(-1)), but a positive impact of tax uncertainty measured by the tax quota (V_TQ(-1)). Although theoretical assumptions about the negative impact of tax uncertainty was thus not confirmed if we use the tax burden, its negative impacts are quite apparent when using this alternative indicator.

The negative impact of government spending volatility (V_EXPPROD) in both models was also confirmed.

Due to the use of logarithms, the effect of these independent variables can be interpreted as the effect of their percentage change on the percentage change in output per worker. When using the tax quota, an adverse effect of the tax burden is shown, where a 10% tax quota increase reduces the GDP per capita in the following period by about 1.35 %. If we use the alternative indicator of the tax burden (WTI), which better describes the effective tax burden, we find that increasing the tax burden (measured by WTI) is reflected in a decline of GDP per capita by 1.44 %, which is a slightly larger counter-growth effect. From the above, one can conclude that using the alternative indicator of the tax burden leads to more negative counter-growth effects of taxation. Another issue is the tax volatility. Tax volatility is estimated as adversely affecting economic growth, but only when using the alternative index (WTI). Taxation and tax uncertainty thus seem to have a significantly more negative impact on economic growth than when taxation is approximated using the tax quota, i.e. using the relative tax revenues.

DEPENDENT VARIABLE	GDP per capita (PPP) (LOG(GDPCAP))
LOG(GDPCAP(-1))	0,574 (19,589)**
LOG(INVGDP)	0,265 (21,901)**

CONCLUSION

The current economic literature pays considerable attention to the impact of fiscal variables on economic growth. It focuses on the issue of taxation according to different types of taxes, on government expenditure and the size of the government sector, generally considering the effects of taxation to be negative, while seeing the effect of government spending, in the case of productive expenditure, as rather positive. However, studies of this type often neglect the fact that economic growth may be subject to effects other than the actual level of taxation and government expenditure. This is because fiscal variables can affect growth only due to their volatility, although their level has long been relatively low. Long run economic growth is inevitable for reaching economic welfare as the main aim of the economic policy makers. Economic welfare represents the improvement in all domains of society and therefore it can represent sustainable economic growth. Since the long run economic growth is a partial element of sustainable economic growth, it is necessary to realize that the way of fiscal variables impact on long run economic growth can be considered same as in the case of fiscal variables impact on sustainable economic growth.

As a result of higher stated, the aim of this paper was to describe the effect of taxation and government expenditure on long-term economic growth with a special emphasis on the impact of tax

uncertainty and volatility of government expenditure in OECD countries with using the dynamic panel.

The paper aims not only to assess the actual impact of the volatility of fiscal variables on economic growth, but in particular the use of the alternative indicator of the tax burden to calculate tax variables – the World Tax Index, which was designed by the authors. It is necessary to realize that limitations of this study can be assigned to the characteristics of tax quota as the aproximator of tax burden. This aproximator has a lot of shortcomings and therefore also Wolrd Tax Index was used. World Tax Index is based on the combination of soft and hard data and therefore it represents the real tax burden. It removes the shortages of tax quota and its value is more reliable than the value of tax quota in the case of tax burden measurement, but on the other hand it was available only for short time series.

The results of the empirical analysis confirm the economic theory of the negative impact of taxation and the positive effect of productive government spending on economic growth. The negative effect of taxation was demonstrated both when using the tax quota, and when using the WTI.

In compound models, i.e. models using both of these tax burden indicators, assumptions about the negative impact of volatility of government expenditure were also confirmed. However, the models show contradictory results in the case of the impact of tax uncertainty. When using the tax quota, it showed a positive influence on growth, which contradicts the theoretical assumptions, while the use of the WTI led to results consistent with theory and showed that the impact of tax uncertainty on economic growth is negative. From this perspective, the WTI seems to be more suitable to an approximate tax burden, and as such it is applicable not only in order to compare the tax burden for individual countries but also as an indicator of the tax burden in macroeconomic models, particularly in models of long-term economic growth e.g. Kotlánová and Kotlán (2012).

SUSTAINABILITY AND INNOVATION TO INCREASE CORPORATE COMPETITIVENESS: OPTIMISATION MODEL

Krivorotov, Vadim; Kalina, Alexey; Belyaeva, Zhanna; Erypalov, Sergey

Graduate School of Economics and Management, Ural Federal University, Russia

ABSTRACT

Modern organisations of all forms and origin face the necessity to force innovations and be sustainable in order to promote its business excellence. The level of a firm competitiveness is measured by a number of methods, which are covered in full in the academic literature. Sustainability is a key issue for organizations in the twenty-first century as they increasingly acknowledge that their policies and practices have social and/or environmental consequences. Accordingly, many companies are implementing elements of sustainability into their business practices. The set of those new managerial technologies comprise innovative approach to the optimization of the numerous competitive sources. In light of this, it is imperative that new methodologies and frameworks to facilitate the understanding of sustainability concepts in the business environment are to be developed. The framework suggested in the paper helps to outline a set of propositions regarding the nature and process of innovative and sustainable development considering many factors influencing a firm.

Keywords: *innovation, organizational competitiveness, sustainability management, organizational sustainability*

UNDERSTANDING ORGANISATIONAL COMPETITIVENESS AND SUSTAINABILITY

The competitiveness of the enterprise is a complex, integrated indicator, which is formed under the influence of many factors that affect a business entity. The most cited definition was suggested by Porter, who identified four determinants of a country that can affect the global competitiveness of companies located there: factor endowments; demand conditions; related and supporting industries; and the strategy, structure and rivalry of the companies in a country. He also identified two external variables – government policy and chance - that impact on the determinants and thus on competitiveness more generally (Porter, 1990). Competitiveness of enterprises is a concept referring to the ability of firms to sustain and gain in market share through their cost and pricing policy, innovative use of production factors and novelties in product characteristics. It is often measured by the share of the products of one manufacturer (in value terms) on the domestic and international market of those

products. The analysis of impacts on cost and capacity to innovate, however, is mainly about the drivers of competi-tiveness.

We argue, competitiveness and sustainability are mutually reinforcing concepts that bring innovation management techniques to a company. The concept of sustainable enterprise is related to the general approach to sustainable development, originally enunciated in the Brundtland Report, as “forms of progress that meet the needs of the present without compromising the ability of future generations to meet their needs”(C. Holliday and J. Pepper, 2001), an approach which postulates a holistic, balanced and integrated perspective on development and which has subsequently been elaborated and endorsed through declarations emanating from a number of high-level global development forums, including the United Nations Conference on Environment and Development held at Rio de Janeiro in 1992 and the World Summit for Social Development held at Copenhagen in 1995.

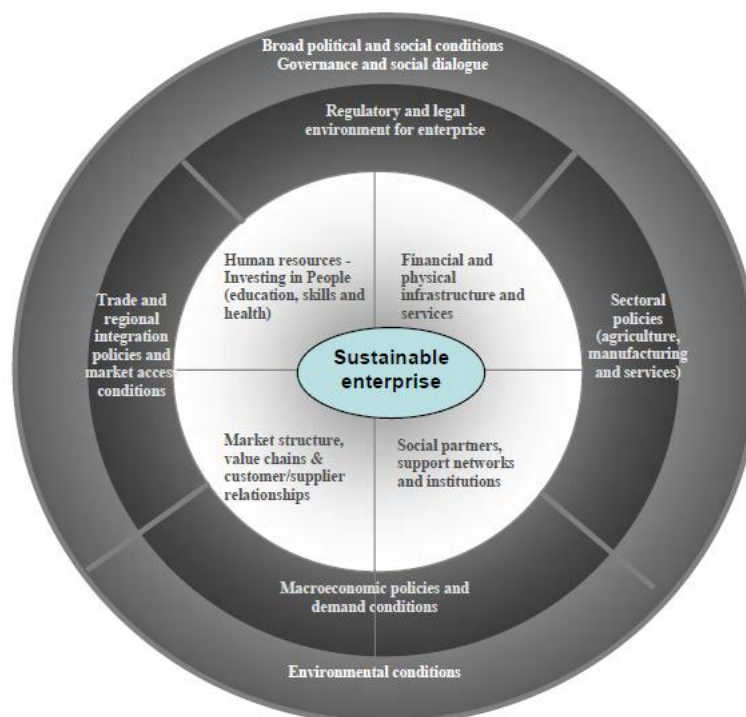

Figure 1. *An integrated Approach to Sustainable Enterprise (ILO, 2007)*

Thus, in contrast to narrowly defined, traditional perspectives which depict enterprises in terms of linear input–output relationships centered solely on maximizing short-term economic value, an integrated approach to sustainable enterprise development takes a more holistic, integrated and long-term view (figure 1), which makes a stylized distinction of what in practice are overlapping and interdependent operational and policy spheres (micro-, macro- and meta-levels). At the centre are the sustainable enterprises which comprise a number of different stakeholders, including shareholders,

employers, employees and customers, as well as relationships with suppliers, governments and the broader community.

At the same time, operational efficiency incorporates a comprehensive assessment of enterprise's activities which subsequently raise the efficiency of its production factors, and hence interrelations with stakeholders. In order to attain operational efficiency a company needs to minimize redundancy and waste while leveraging the resources that contribute most to its success and utilizing the best of its workforce, technology and business processes. The reduced internal costs that result from operational efficiency enable a company to achieve higher profit margins or be more successful in highly competitive markets. While we are talking about cost reduction, the latter could not be cut, but optimized in order to balance the interests of stakeholders. This is still an issue in Russia, and for instance BRICs countries- sustainability is still not very much related with the primarily competitive driver (Belyaeva, 2013).

The legal responsibility is also important to be considered competitive and entails expectations of legal compliance and playing by the "rules of the game." From this perspective, society expects business to fulfill its economic mission within the framework of legal requirements. But while regulations may successfully coerce firms to respond to an issue, it is difficult to ensure that they are applied equitably (Pratima, 2002). And finally, mutual sources of research support the idea that companies with good records of CSP have a competitive advantage in attracting employees (Backhaus, Stone, and Heiner, 2002).

Thus, the mentioned sources of the enterprise's development directly influence all competitive and sustainable factors. A regulated change of those factors could become a systemic management of the enterprise's competitiveness (Krivorotov, 2007; Belyaeva, 2013).

SYSTEM APPROACH TO ENTERPRISE'S COMPETITIVENESS MANAGEMENT AND ITS CHALLENGES

Competition within the market is vital for business and society to understand and test how to best meet people's needs with more sustainable solutions. Markets liberate ingenuity by encouraging experimentation and rewarding those ideas that meet people's needs and aspirations most efficiently (Holliday S and Pepper J, 2011). Approaches to enterprise development have traditionally focused on project-level technical assistance and finance. Today if a business does not explore eco-oriented opportunities within its products, processes or services, it does not learn much from its environment focused business activities. When it foregoes its opportunities to learn from environmental challenges, opportunities to build ecocentric organizational culture may also slip away (Banerjee, 2002). Obviously, effective social dialogue is a means for fostering better workplace relations and helping to

nurture sustainable enterprise development. Considering mentioned above challenges for of the enterprise's competitiveness management system, we suggest the logic of interaction of factors and sources of the enter-prise's competitiveness (Figure 2).

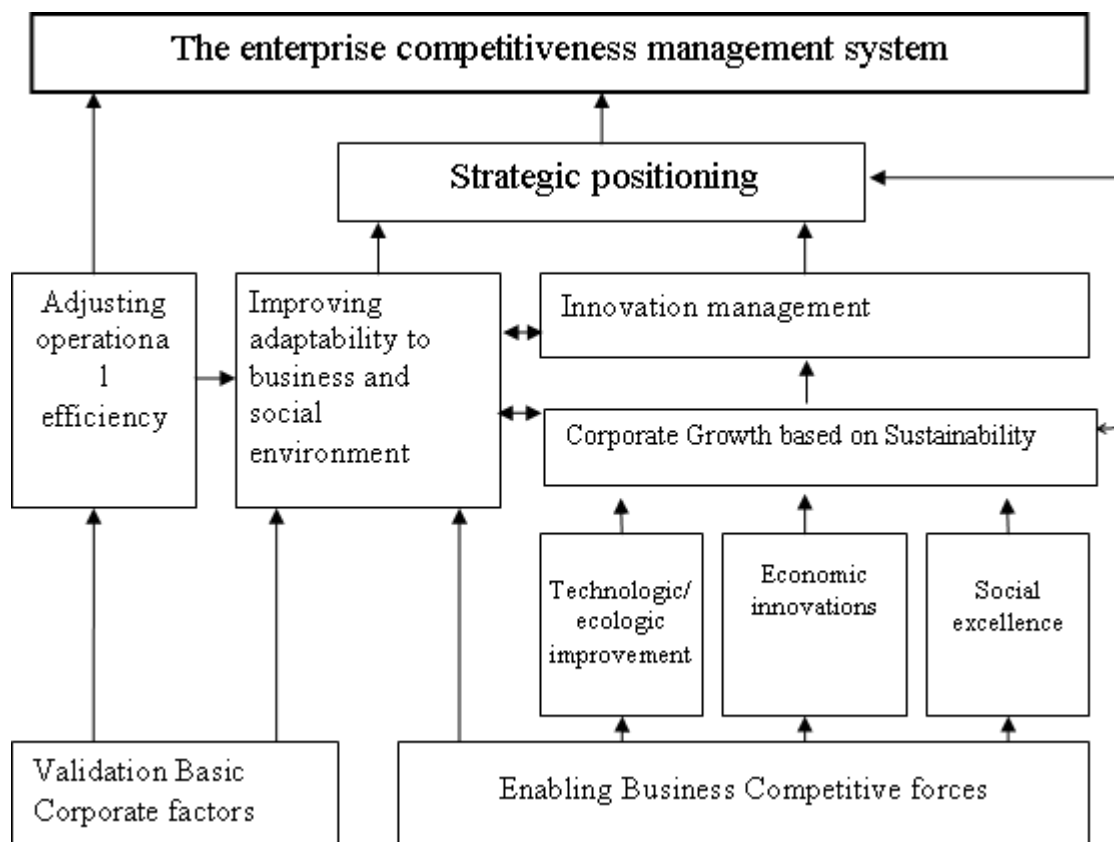

Figure 2. *Management of competitiveness of the enterprise*

The strategic positioning is based a lot with two key ingredients. One of them represents en-terprise's relations with the external environment. It may be interpreted as its ability to adapt to the organization and business environment, its level of innovation management, which is crucial for any modern market-oriented enterprise. This component characterizes the enterprise's adaptability to the conditions of the external environment, the flexibility of its response to the environmental changes (Ansoff, 1989).

We focus on the adaptability of enterprise system, which determines enterprise's sustainable development. The adaptability is understood as a constant innovation activity that involves all business processes both internally and externally, and also affects key stakeholders. It is the second driver – Innovation, we argue, which provides and sustains the conditions for adaptability. Innovation and adaptability together form the necessary and sufficient conditions for the enterprise's strategic market positioning. (Santo, 1990).

The high level of adaptability of the enterprise depends on following targets in strategy problem tailored for the particular stakeholder, partner and its individual needs and opportunities to choose from the variety of competing companies in the market according to the scale of preferences. These preferences can be arranged according to specified criteria, reflecting mainly basic consumer characteristics, their price and quality, now have undergone significant changes towards integrated diversity and complexity.

It is absolutely clear, that the leading enterprises are those that can adapt its strategy to a more diverse market needs. The challenge of today requires the ability to initiate demand for upgraded services and goods to lead the market, and in the same time develop internal social responsibility in order to be sustainable and competitive creating innovation and social added value. Any organisational structure might be irrelevant (Nadella, 2013) because no competition or innovation is going to respect those boundaries. Everything now is going to have to be much more compressed in terms of both cycle times and response times.

The level of meeting the above-mentioned criteria sets preconditions of enterprise positioning in the market. High adaptability corresponds to the adequate market share, while mistakes and miscalculations, irrelevant actions to maintain the required adaptability will inevitably affect the loss of former market position.

The logical understanding of assessing the effectiveness of the enterprise's market positioning can be formalized applying its characteristics in the system of «Adaptability – Innovation» strategy. There would be 4 types of companies.

1. Companies with low adaptability and innovation due to the lack of a clear strategic development plan can be attributed to the problem category, and their disappearance from the market might be just a matter of time, unless the attitude towards innovation management is changed.
2. Companies with passive innovation and high level of market adaptability result from applied strategy of economy of scale, which is provided by a well-developed technology. However, leadership positions are defined by equipment maximum production lifecycle.
3. Companies with low market adaptability, while innovation rate is rather high. It is not rare, when innovation activity does not bring adequate returns because of the needless market ideology, therefore the updates of production processes don't result in their embodiment in the mass product. Eventually, the miscalculations in the strategic marketing "dilute" highly developed innovation, making it ineffective.
4. Strategic Leaders – The innovation management intersects globally with the structure of production, human resources management, marketing and promotion strategy, social and ecological responsibility.

Thus, the most important role for sustainable competitive organization is performed by innovations level of technological processes, product updates, improvement of production and labor organization methods, formation of an adequate management system, etc. Implementation of these measures is aimed at amplification of enterprises' innovative activity, as well as enhancement of an operating efficiency and market adaptability, i.e. those key sources of competitiveness of an enterprise, determining its level. (Table 1)

Innovations Run by Sustainability				
Economic Effect	R&D Effect	Resource-Based Effect	Social Effect	Ecological Effect
Profit-innovation and license activities Sales Volume Growth Production Quality Increase ROI and ROA increase	New Types of production New Equipment facilities New Technologies IT share Increased levels of automation products Improving organizational level of production and labor	Increased rates of return on assets Accelerated turnover of working capital Increase in labor productivity Reduced material and energy production Reduced complexity of production processes	Income Growth Labour Workplace safety Working Environment HR Qualification Growth Social Values Satisfaction HR turnover reduction	Reduction of air pollution Reducing waste production Producing environment-friendly goods Improved ergonomic working conditions Reducing environmental pollution fines

Table 1. Systems of tentative indicators of innovation run by sustainability

Taking the above into consideration, the initial selection of innovative activities is logical to be made on the basis of an evaluation matrix, reflecting the degree of impact of a certain innovative change on the enterprise's indicators of operational efficiency and market adaptability. However, activities aimed at improving the operating performance, are linked to the need to improve internal business processes, while activities, aimed at increasing the level of market adaptability, must take into account and positively change external conditions for the functioning of an economic entity (Fig. 3).

OPTIMISATION MODEL OF COMPETITIVENESS' MANAGEMENT ENHANCEMENT

The criterion for selection of the most significant innovation activities for the enterprise is the priority of their influence on primary increment in one of two indicators (operational efficiency or market adaptability). Each of them is quantified, and requires some adjustment (Krivorotov et al. 2013).

Comparison of these figures gives clear organisational guidelines whether to start upgrading the enterprise's operating efficiency, or its market adaptability; and allows ranking the contents of planned innovation changes.

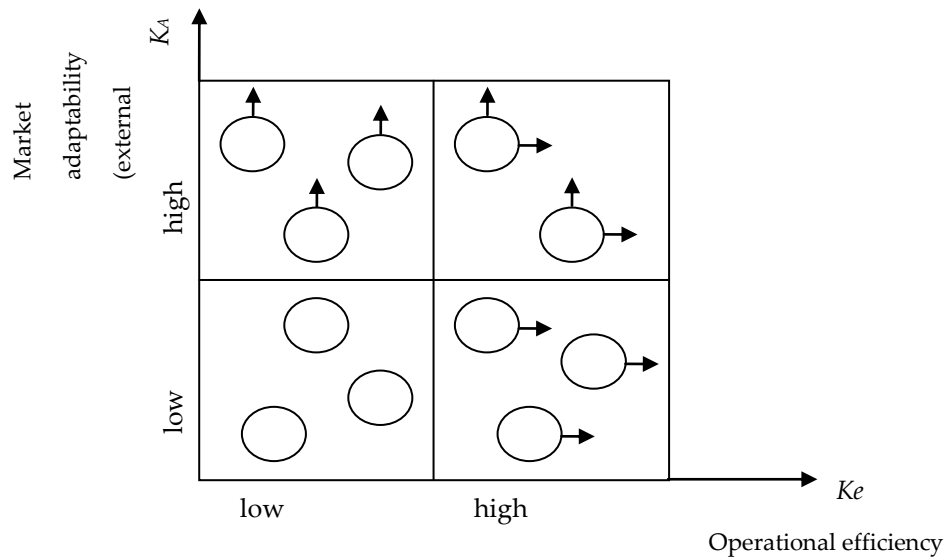

Figure 3. *Differentiation of innovation changes according to their influence on sources of enterprise's competitiveness*

The next stage is to examine selected activities for their compliance with productive capacity of the enterprise, its resource potential, level of staff efficiency, established organizational culture, etc. Based on matrix-resource modeling we evaluate compliance of innovative activities with the above mentioned criteria. In this form of assessment innovations under evaluation are placed vertically in the matrix, and existing financial, economic, labor, information and other resources of the enterprise are put horizontally (Table 2).

Types of resources	Innovations under evaluation				Restrictions on types of resources
	$H_1 = C_1 X_1$	$H_2 = C_2 X_2$...	$H_n = C_n X_n$	
P_1	$P_{11} X_1$	$P_{12} X_2$...	$P_{1n} X_n$	$\sum P_{1j} X_j \leq P_{1\phi}$
P_2	$P_{21} X_1$	$P_{22} X_2$...	$P_{2n} X_n$	$\sum P_{2j} X_j \leq P_{2\phi}$
\vdots	\vdots	\vdots	\vdots	\vdots	\vdots
P_m	$P_{m1} X_1$	$P_{m2} X_2$...	$P_{mn} X_n$	$\sum P_{mj} X_j \leq P_{m\phi}$

Table 2. Matrix-resource model for evaluation of innovations

The completed matrix is an optimization task, formulation of which is as follows. It is required to maximize information about the study of n -dimensional area described by the

unknown quantities of the innovations under consideration (X_j), provided the limited amount of resources (P_j), considering optimality criterion (C_j), which can be defined as an average expert evaluation of the significance of each innovation for the enterprise:

$$F(I_j) = \sum_{j=1}^n C_j X_j \rightarrow \max, \quad \sum_{j=1}^n P_{ij} \cdot X_j \leq P_{i\phi},$$

$$X_j = \begin{cases} 0, & \text{if the innovation is not implemented} \\ 1, & \text{if the innovation is implemented} \end{cases} \quad (1)$$

X_j values, which can be obtained by solving the problem, help to model a program of innovation, backed by necessary resources for its implementation. It should be noted that the current task in the above interpretation differs from the classical optimization task. First of all, it concerns the solution obtained. In classical optimization problem (for instance, Kantorovich et al., 1972) as a result of its solution optimal allocation of resources among all considered innovative projects is obtained, which is not correct from the standpoint of practical implementation, since any innovation project X_j requires resources to be defined in advance for its implementation. Therefore, their partial allocation is not enough for realization of the project. In the interpretation of form (1) only the most relevant and backed with resources will be implemented.

DISCUSSIONS AND FURTHER RESEARCH

Nevertheless, the comprehensive evaluation of the innovation activities impact considers all possible effects, including economic, research, resource-based, social, economic, ecological enhancements, must be seen in a close relationship. Mentioned above interrelation determines the interdependence of these effects and some artificiality of its differentiation. The main difference is in the nature of these effects and the time to obtain the expected result. If businesses through innovative reforms achieve lower material and energy production (resource effect) and lowers its cost, this leads to an economic effect in the form of additional profit.

The described model can also be used to evaluate compliance of planned innovations with the level of management of any type of organisation. In this case, management functions and its implementation level evaluated by expert, which are placed in the matrix instead of the resources. A result of innovations to improve working conditions is followed by improved safety and reduced loss of working time (social effect).

The considered value chain contributes into one integral effect, resulting with a clear sustainable competitive strategy of the company.

So, the authors consider the proposed approach to the selection of prospective innovation projects, taking into account required resources for their implementation, to be universal. It could be applied to organisations of any form of ownership, organizational and legal forms.

The principal contribution of this paper is to provide a comprehensive and integrative theoretical framework for defining competitive strategy of today organization. Future research should involve the development and validation of the model to include empirical testing.

‘RELIABILITY’ OF ONLINE PAYMENT PROCESS – A STUDY OF END USER’S PSYCHOLOGY

Kundu, Sukanya¹ ; Datta, Saroj Kumar²

¹Alliance School of Business, Alliance University, Bangalore, India

²School of Business, Galgotias University, Greater Noida, UP, India

ABSTRACT

Reliability is an abstract term and often used in the stream of engineering as a performance measure. In behavioural science when we talk about reliability what does it actually mean? Which parameters can be used to measure the term reliability? What are the major dimensions of the term ‘reliability’? A conceptual framework of the term ‘reliability’ has been designed using two phases. In first phase analyzing the literatures and interviewing frequent online shoppers, it was found that from end user’s perspective e-payment process consists of four stages, each stage having some reliability component associated. In the second phase questionnaire consisting of nineteen questions was circulated to get data on customer perception about reliability of e-payment process. Five major factors were explored. The results show customers perceive rectification of errors in time and with least intervention from their end is the greatest influencer of reliability of e-payment process. Confidentiality of customers’ personal and financial data is the next most important dimension of reliability of e-payment. Online shoppers perceive that a timely confirmation of their e-payment should be in process to add reliability to the system and a proper authentication technique can improve the overall reliability of the e-payment process.

Keywords : e-payment, reliability, confidentiality, authentication, confirmation, rectification

INTRODUCTION

Electronic commerce is the process of buying and selling or exchanging of products, services, and information via computer networks including the Internet (Voss, 2003). An online shop, e-shop, e-store, Internet shop, webshop, webstore, online store, or virtual store tries to create a similar situation of buying products or services at a bricks-and-mortar retailer or in a shopping mall. Many payment methods can be used for online purchases (Hsieh, 2001; Roberts, 2004a; Roberts, 2004b). Online payment is defined as an electronic payment made via a web browser for goods and services using credit or debit cards (Bitpipe, 2006). Online payment is considered more time-efficient and cost-efficient, convenient and flexible for customers and businesses (Sorkin, 2001; Yu, His, & Kuo, 2002).

Online shoppers commonly use credit card to make payments, however some systems enable users to create accounts and pay by alternative means, such as debit card, various types of electronic money, cheque, wire transfer/delivery on payment, postal money order, paypal etc. The financial part of a transaction might be processed in real time (for example, informing the consumer that their credit card was declined before they log off), or might be done later as part of the fulfillment of the process. For any digital payment system to succeed the criteria needs to be fulfilled are acceptability, anonymity, convertibility, efficiency, integration, scalability, security, reliability, usability.

Electronic payment is an online service which is invoked when a customer gets involved in online transaction. It is important for a business to know whether a service, when offered to its customers, meets customer expectations or not. Service quality measure came into prominence with world famous SERVQUAL model by Parasuraman et al. subsequently when various Internet based and mobile based services became popular, models like, e-SQ and e-SERVQUAL (Zeithaml et al, 2000), WebQual (Watson and Goodhue, 2000; Barnes and Vidgen, 2002), SITEQUAL (Yoo and Donthu, 2001), eTailQ (Wolfenbarger and Gilly, 2003), GIQUAL (Tsoukatos and Rand, 2007), BANKZOT etc. was introduced. All of these models were concerned with quality of online services. These researches pointed out security of payment (Szymanski and Hise, 2000; Bauer et al., 2005; Siu and Mou, 2005; Khan and Mahapatra, 2009; Gupta and Bansal, 2012; Ashwina and Kiran, 2012) and privacy (Khan and

Mahapatra, 2009; Akinci et al., 2010; Gupta and Bansal, 2012; Salarzahi et al., 2012) of related information as one of the most important determinant of service quality of online services. Therefore electronic payment process became researcher's area of interest.

In some of the very early researches of service quality only reliability was identified as a significant dimension. Various researches on electronic service quality (Jun and Cai, 2001; Han and Beak, 2004; Khan and Mahapatra, 2009; Santouridis 2009; Salarzahi et al., 2012; Gupta and Bansal, 2012) revealed that reliability is one of the most important dimension. The service quality models also revealed that all the quality dimensions were correlated - one influencing other.

Reliability is an abstract term and often used in the stream of engineering as a performance measure. In behavioural science when we talk about reliability what does it actually mean? Which parameters can be used to measure the term reliability? What are the major dimensions of the term 'reliability'?

The objective of the research is to find answer to these questions in the context of e-payment process. Very limited number of literatures can be found on this topic. Therefore to determine the parameters of reliability a two-step method was followed - first, literature review and second, personal interviews with frequent online shoppers. According to the feedback of the online shoppers the electronic payment process was divided into four distinct stages. Most of the parameters associated with these

four stages were also had a link to the past literatures. Additional parameters found in the literature were mapped against the four stages of e-payment process, as well as some parameter not present in the literature came out as a result of the interview process.

Once the parameters were fixed, to find answer to the last research question, data were collected from people who shop online frequently to get details regarding their perception of reliability of online payment process at different phases of online shopping.

This research contributes to the field of service quality, e-payment process and more specifically to reliability. This will help the practitioners to understand the customer perception of e-payment reliability and help them to improvise the payment system.

CONCEPTUAL FRAMEWORK

Reliability refers to the consistency of performance and dependability of companies (Parasuraman et al. 1985, 1988). Reliability comprises all features of a vendor's ability to perform the promised services timely, dependably, and accurately e.g., providing services at the promised time, provision of error-free services (Jun et al., 2004; Kuo et al., 2005; Van Iwaarden et al., 2003; Jun et al., 2003; Benlian et al., 2011). Li et al. (2002) defined reliability as the ability of e-mail and web-based systems to provide accurate information and perform the promised service. When a website contains guarantees criteria, it increases the company's overall reliability (Kaplan and Nieschwietz, 2003). A study on factors affecting consumers' perception of electronic payment by Ming-Yen et al. (2013) in Malaysia reveals that benefits, self-efficacy, and ease of use exert significant influences on consumers' perception towards e-payment. To study the impact of trust on e-payment channels at Saudi Arabia Saleh (2013) conducted a study which found out security and privacy are important factors that customers consider when using e-payment channels at the time of purchase.

Electronic payment (e-payment) is a service that has been defined as "the transfer of an electronic value of payment from a payer to a payee through an e-payment mechanism" (Kim et al., 2010). Service Reliability is an important consideration for any new service deployment. reliability of transactions on the Internet is important for customers (During the user interaction with the system, the user issues multiple tasks (or requests) at different time points for different services in the system. The user-perceived service reliability is the probability that all tasks in the user session are successfully completed (Wang and Trivedi, 2009). Neuman and Medvinsky (1996) opined that the reliability of e-payment operation system should be available online 24 hours a day without breaking down at any time. The American Institute of Certified Public Accountants, Inc. (AICPA) list five principles and criteria that they evaluate for trust services : security, availability, processing integrity, confidentiality, and privacy (AICPA, 2009). Service reliability depends on service availability of

various networks or computer systems (Keralapura, 2004; Wilson, 1998; Meharia, 2012). service availability corresponds to the concept of service accessibility (Tortorella, 2005). System assurance is defined as reliability and security of trading system that leads to the safe and successful Internet transactions (Lee and turban 2001; Kim et al. 2005; Beldad et al. 2010). Reliability of the system has been linked with system performance under failures (Kulkarni, 1986). Unlike Meharia (2012), privacy and confidentiality parameters have been merged under dimension confidentiality in this research.

To further explore the construct of reliability in e-payment process semi structured interviews (Thompson et al., 1989) were conducted with frequent online shoppers. Most of them were a frequent online buyer and had a good experience in going through the process of e-payment. Based on the literature and interviews a framework was designed which extracts reliability element in each stage of e-payment. This framework depicted in figure 1 has been taken as the foundation of the conceptual model of reliability of e-payment. The four stages are as follows.

Availability : after selection of the item the shopping website redirects the user for making e-payment. Therefore for reliability in the availability refers to loading of the payment website, navigation from one page of authentication to the next and the durability of the communication link.

Authentication: Reliability in authentication phase depends on the number of password the online purchaser has to input for making an online payment, levels of authentication (minimum 2 level authentications), standardized method of authentication during different online transaction, easiness to follow the instructions while going through the authentication phase.

Confirmation : Reliability in the confirmation phase refers to the procedure that ensures the online transaction has failed or successful - it can be through message in mobile, an alert on the screen or an e-mail describing the fate of the online transaction. The confirmation should come within a permissible time limit and there should not be any link failure before the confirmation reaches to the online shopper.

Rectification : Rectification phase becomes reliable if problems are effectively handled i.e., proper solution is provided within minimum time and without much interference with the end-user.

Confidentiality : Confidentiality refers to the degree to which the website is safe and customer information is protected. This dimension holds an important position in online purchase decision. Customers perceive significant risks in the virtual environment of e-service if there are possibilities of improper use of their financial and personal data.

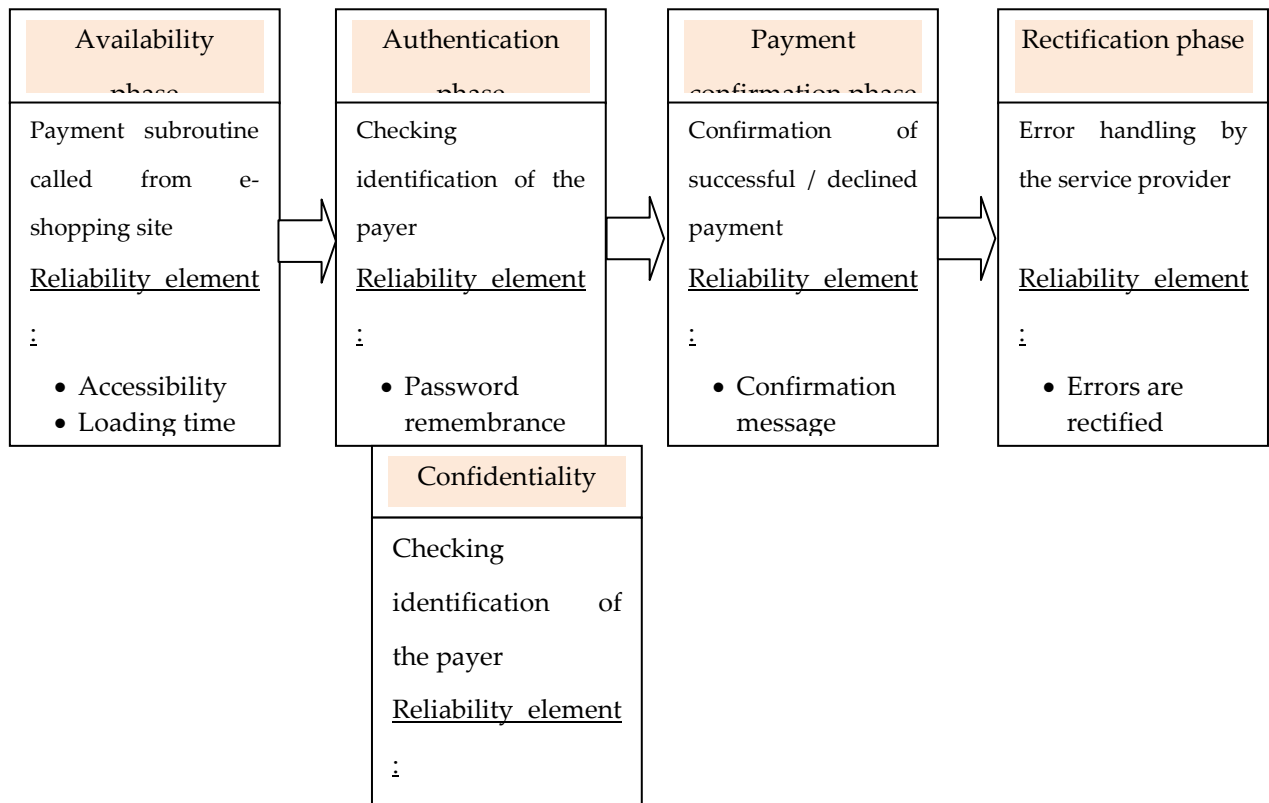

Figure 1: *Reliability parameters involved in the phases of e-payment process*

THE STUDY

Quantitative data used to extract the dimensionality of a process-based reliability model were collected by means of a structured questionnaire. Respondents judged the performance of nineteen reliability attributes on a five-point Likert-type scale anchored by 1="strongly disagree" and 5="strongly agree". All of the questions were positively formed. Convenience sampling method was followed in this stage. Responses were collected from customers at various shopping malls in city of Bangalore, India. They were asked to recall a recently used online shopping experience. Only the users of online shopping were chosen to assure that participants had sufficient online shopping experience so that all aspects of reliability of making online payment could be evaluated. Among the 345 distributed questionnaires, 278 were fully usable. In order to assess the Table 1 summarizes the basic demographic characteristics of the sample.

Variable	Percentage
<i>Age in years</i>	
< 20	5
20-40	60
41-60	35
<i>Sex</i>	
Male	64
Female	36
<i>Frequency of online purchase</i>	
1 or less times in six months	20
5 to 8 times in six months	65
5 or more times a month	15

Table 1: *Demographics of the sample*

The validation of the reliability scale was done both through exploratory and confirmatory factor analysis and reliability analysis as per the guidelines provided by Churchill (1987) and Gerbing and Anderson (1988). This method of construct validation has been widely established in the literature (Baumgartner and Homburg, 1996).

To verify the construct validity of the measure factor analysis was used in which all the factors loaded highly (0.5 and above) on a single factor ensuring the uni-dimensionality of the scale. About all the subscales had alpha values greater than 0.6 which accounts for internal consistency of the scale constructs (Donio et al., 2006; Nunnally & Bernstein, 1994; Peterson, 1994). Table 2 depicts the alpha values, eigen values and factor loading for different constructs measuring the reliability of e-payment procedure in online shopping.

Dimension items	Item label	Mean	Eigen value	Factor loadings	Cronbach alpha	Variance explained
Availability			2.58		.817	64.60
1. online shopping site can be accessed anytime anywhere	PAVL1	3.35		.748		
2. time to load the page for making e-payment	PAVL2	3.08		.832		
3. time to navigate from one page to another while making payment	PAVL3	3.12		.776		
4. link remains stable in between transaction	PAVL4	3.06		.854		
Authentication			3.15		.911	78.91
1. easy to follow the instructions while the online shopping site authenticates	PATHN1	3.32		.829		
2. need not to remember too many passwords	PATHN2	2.93		.873		
3. easy to follow different authentication method for different payment options	PATHN3	2.78		.937		
4. site provides several levels of authentication	PATHN4	2.83		.910		
Confidentiality			2.01		.754	67.09
1. Personal information are not used for promotional activities	PCNFD1	2.68		.824		
2. Privacy of personal information is retained	PCNFD2	2.65		.851		
3. Confidentiality of financial information (like credit card no, A/C no) is retained	PCNFD3	2.55		.781		
Confirmation			2.5		.817	64.75
1. Always receive payment confirmation after transaction	PCFRM1	2.96		.753		
2. It takes no time to receive payment confirmation after transaction	PCFRM2	2.98		.810		
3. Link never fails before receiving payment confirmation	PCFRM3	3.01		.823		
4. Products/ service delivered after receipt of confirmed payment	PCFRM4	3.13		.821		
Rectification			2.38		.445	59.70
1. transaction problem (if any) is rectified	PRCT1	3.21		.778		
2. It takes no time to rectify the transaction related problems	PRCT2	3.23		.743		
3. shopping site need not to be contacted for rectification of transaction related problems	PRCT3	3.13		.830		
4. needs no effort from my side to rectify transaction related problems	PRCT4	3.16		.737		

Table 2 : Reliability and construct validity of measures of reliability of e-payment

In accordance to the results shown in table 2 no modification were needed in the structure of the construct. Therefore the research continued with five reliability constructs of e-payments.

In the next step the data were subjected to confirmatory factor analysis using AMOS 17.0 to test the model fit and the unidimensionality of the scale items. Maximum likelihood method has been used.

Dimension items	Factor loadings CFA	CRR	AVE
Availability		.818	.534
PAVL1	0.576		
PAVL2	0.793		
PAVL3	0.630		
PAVL4	0.861		
Authentication		.908	.717
PATHN1	0.686		
PATHN2	0.780		
PATHN3	0.974		
PATHN4	0.913		
Confidentiality		.758	.513
PCNFD1	0.700		
PCNFD2	0.802		
PCNFD3	0.639		
Confirmation		.818	.532
PCFRM1	0.632		
PCFRM2	0.705		
PCFRM3	0.768		
PCFRM4	0.802		
Rectification		.776	.467
PRCT1	0.676		
PRCT2	0.635		
PRCT3	0.793		
PRCT4	0.617		

Table 3: *Average variance extracted and composite reliability of the reliability construct*

Next, the extracted dimensions were tested for their reliability and validity one by one by means of confirmatory factor analyses (CFA) with AMOS 17. The local fit indices indicator reliability, average variance extracted (AVE) were employed to evaluate each dimension (Baumgartner and Homburg, 1996; Churchill, 1987). The corresponding measures suggest a good fit of the extracted five dimensions of the reliability scale that are defined as: availability, authentication, confidentiality, confirmation and rectification.

The fit statistics propose a superior degree of reliability and convergent validity of all scale dimensions. In order to examine whether all identified dimensions actually refer to a superordinate construct of overall reliability, a second-order CFA was conducted using all extracted five reliability dimensions ($\chi^2 = 275$; $df = 147$).

3.1 Convergent validity

Convergent validity of a scale measure is used to assess whether the individual scale items are related or not. It refers to the degree to which the two measures designed to measure the same construct are related (Netemeyer et al., 2003). To examine the convergent validity the factor loadings and average variance extracted were examined as suggested by Fornell and Larcker (1981). With a very few exception, most of the indicators in this study have factor loadings ranging from 0.5 to 0.9 which is in line with Bagozzi and Yi (1988). The average variance extracted for each factor is more than 0.5, which is acceptable.

3.2 Assessing the fitness of the model

Each of the five first-order dimensions has a significantly large ($p < 0.001$) and positive loading on the second-order factor, ranging from 0.35 to 0.62. Furthermore, all correlations between the five constructs are significant at $p < 0.001$, indicating that the five scales converge on a common underlying construct (Lages et al., 2005). This suggests that the higher order model accounts for the data well. The global fit indices of the higher order measurement model shown in table 4 propose an excellent model fit. It shows GFI (goodness-of-fit) = 0.911, AGFI (adjusted goodness-of-fit)=0.885, CFI(comparative fit index)=0.945, NFI(normed fit index)=0.889 and RMSEA (root mean square error of approximation) = 0.056 which indicates the unidimensionality of the factors (Gerbing and Anderson, 1988; Lu et al., 2007). Table 4 depicts the values of goodness-of-fit indices for reliability of e-payment.

Fit indexes	Recommend d Value	Observed Value
Chi-square/ df	≤ 3.0	1.872
GFI	≥ 0.90	0.911
AGFI	≥ 0.80	0.885
RMR	≤ 0.05	.032
CFI	≥ 0.90	0.945
NFI	≥ 0.90	0.889
RFI	Close to 0.90	.871
TLI	Close to 0.90	.936
RMSEA	≤ 0.05	0.056

Table 4: *Confirmatory factor analysis goodness-of-fit indices*

3.3 Discriminant validity

Discriminant validity provides the information about whether the scores from a measure of a construct are unique rather than contaminated by other constructs (Schwab, 2005). To assess the discriminant validity of the constructs the AVE of each construct was compared to their corresponding inter construct squared correlation as recommended by Fornell and Larcker (1981). Discriminant validity is given when the shared variance among any two constructs (i.e., the square of their intercorrelation) is less than the AVE of each construct. Table 5 shows the AVE exceeds the squared correlations with the all the factors.

Construct		Inter construct squared correlation	
Availability	<-->	Authentication	0.040
Availability	<-->	Confidentiality	0.033
Availability	<-->	Confirmation	0.041
Availability	<-->	Rectification	0.052
Authentication	<-->	Confidentiality	0.166
Authentication	<-->	Confirmation	0.031
Authentication	<-->	Rectification	0.084
Confidentiality	<-->	Confirmation	0.054
Confidentiality	<-->	Rectification	0.136
Confirmation	<-->	Rectification	0.223

Table 5 : *Inter construct squared correlations of measures of reliability of e-payment*

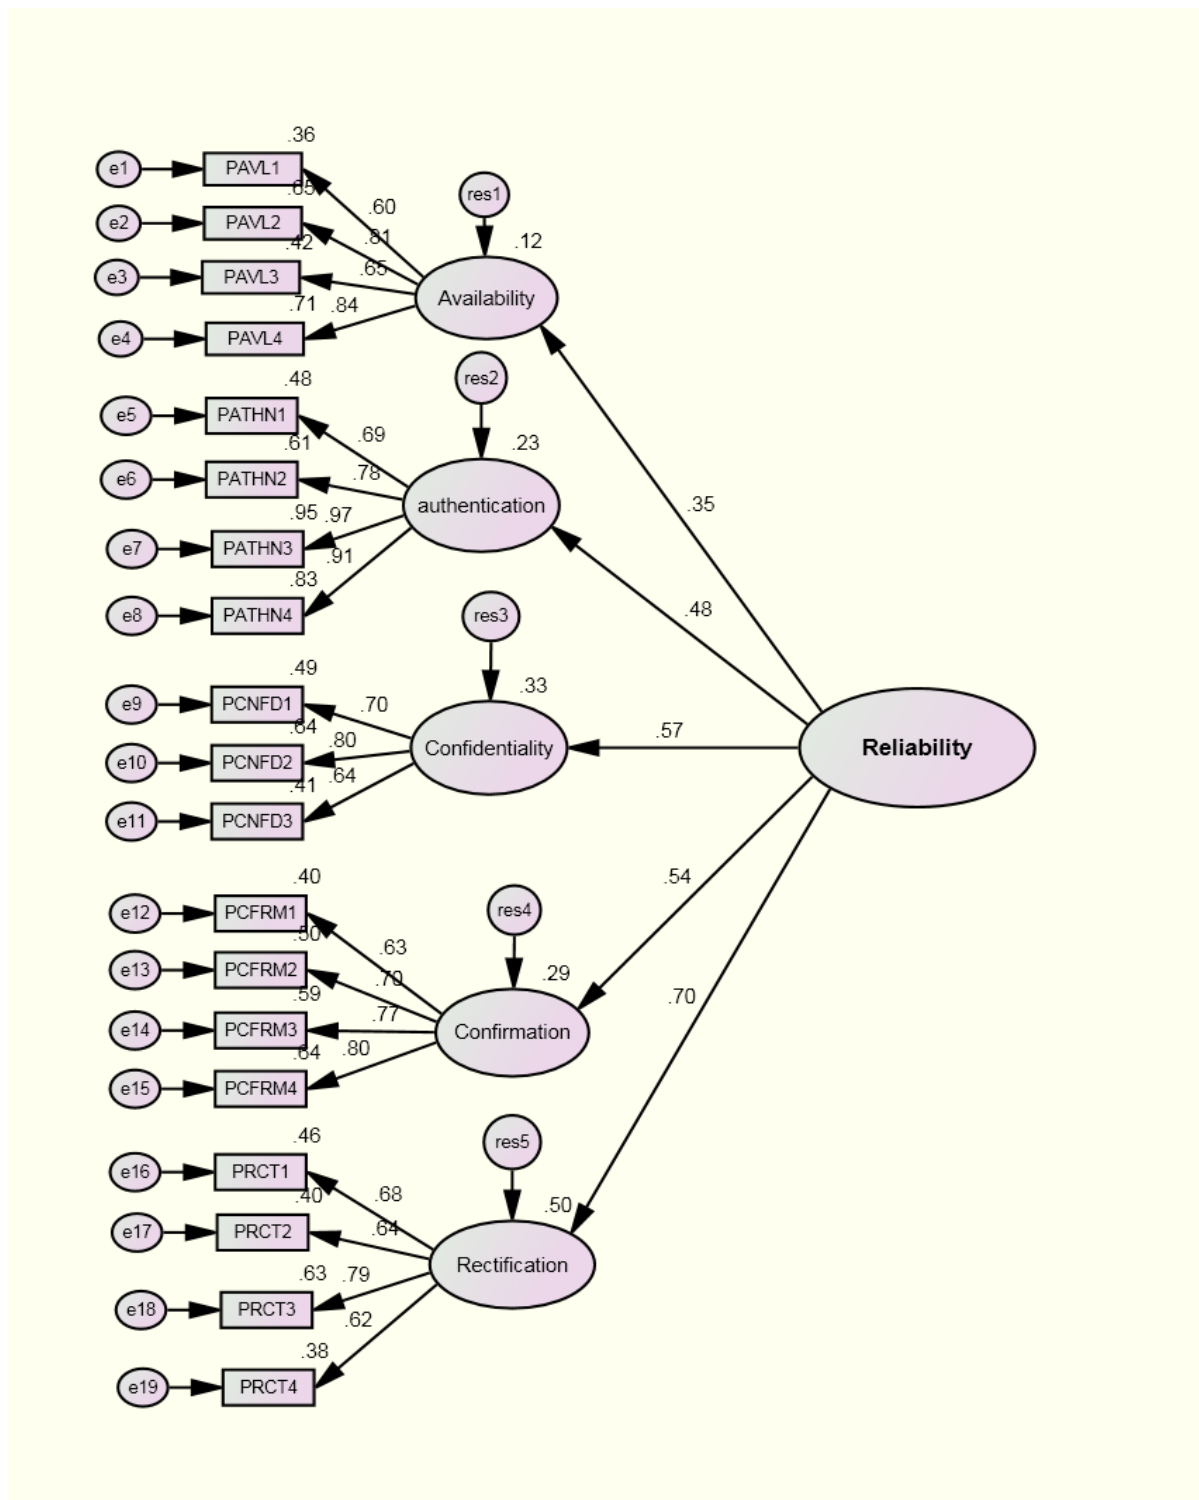

Figure 3 : Measurement model for reliability of e-payment

DISCUSSION AND CONCLUSION

Reliability is an abstract term. According to the engineering definition, reliability means the probability that a system will accurately perform its specified task under stated environmental

conditions. The purpose of the study was to develop a framework of reliability of e-payment to know what affects reliability while transacting over electronic medium.

e-payment process was analysed and found to be consisting of four main stages. From the analysis it has been found that reliability of e-payment is associated with availability of the payment website, proper authentication while making e-payment, confirmation of the fate of e-payment transaction and rectification of errors if it occurs. Apart from these four dimensions, reliability is also ensured by maintaining the confidentiality of the financial and personal data of the shopper.

The four constructs availability, authentication, confirmation and rectification constitutes of four variables each while the construct confidentiality consists of three variables. First each and every constructs were factor analysed. Five distinct dimensions came out of the analysis without any significant cross loading. All factor loadings were greater than 0.7. The reliability analysis of the constructs has also in acceptable range.

In the next stage confirmatory factor analysis was applied to the data. Availability of the website, authentication, confidentiality, confirmation and rectification - all these converged to the latent construct reliability ensuring that they all are contributing in determining reliability of the e-payment process. The scale suggests that error rectification has the highest weightage in determining the reliability of the e-payment process. Time to rectify the transaction related problem has the highest importance in this dimension. It indicates that if the identified errors are rectified properly taking minimum time that will make the e-payment system more reliable. Confidentiality of financial and personal data of the user is the second most important factor in determining reliability. Analysis of customer perception shows that privacy of personal information is the most important factor in determining confidentiality which in turn determines reliability. Online shoppers perceive that a timely confirmation of their e-payment should be in process to make the system more reliable. Proper authentication technique ensures the overall reliability of the e-payment process. Customers perceive that the proper authentication checks should be in place and the authentication process should be easy to follow. Though availability of the e-payment website has a significant impact on determining reliability of e-payment process but this is the factor which has least weightage. The major determining factor within availability is the network link which is responsible for loading time of the e-payment site and time taken to navigate from one page to another.

The results indicate that the online shoppers have matured and the technology has also been well adopted as the customers are giving more weightage for rectification and less for availability as availability of the e-payment site is taken for granted.

LIMITATION OF THE STUDY

Reliability is an important dimension in the research of service quality. Reliability has been identified as one of the major dimension in the researches of e-service quality also. Reliability of e-service encompasses the aspects related to the usage of the whole website. This research has analysed the reliability perception regarding e-payment only. Therefore it deals with the transactional part of the e-service only. Analyzing reliability of e-service as a whole including the transactional and the non-transactional part may indicate some other important dimensions.

The demographic factors can be significant predictors in assessing reliability of e-payment. Factors such as age and educational level can be considered as significant determinants reliability. Separate analysis has not been done these demographics.

Through more critical analysis of the e-payment process some new phases can be identified where reliability parameters plays an important role.

The sample has been taken from Bangalore area only. Taking samples from other metro cities like Delhi, Mumbai can give different result.

In emerging economies like India usage of Internet using mobile media and other than mobile media is quite high though compared to this usage of e-commerce is quite low. In such a situation, alanysis on what the non-e-commerce users of Internet perceive about reliability of e-payment could be useful information for web service providers.

SCOPE FOR FURTHER RESEARCH

Reliability is an important dimension that determines service quality. In various phases of the service process parameters are checked for accuracy to ensure reliability of the system. Not much work has been done on this specific construct of service quality scale. Analyzing the online shoppers' perception it can be seen that reliability is influenced by many other constructs of service quality like system availability, confidentiality etc. Therefore improvement in the areas like availability, confidentiality will have a considerable impact on the reliability of the e-payment system. This leaves an immense scope of work in the area of reliability.

LIVING UNDER HARSH CONDITIONS – FINDING YOUR WAY AS A PUBLIC SECTOR MANAGER

Larsen, Mette Vinther; Rasmussen, Jørgen Gulddahl

Department of Business and Management, Aalborg University, Denmark

ABSTRACT

Harsh conditions for executing management can be a sensible interpretation of the daily managerial work for many public sector managers. This is an argument we, based on teaching and research, rely on from talking with a considerable number of managers in Danish municipalities, regions, state, universities and hospitals.

The paper is based on four personal, micro-level stories told by managers in hospitals. The stories revolve around how they in their daily working 'inner life' try to understand, cope with, and develop new ways to improve their work under what they in general see as increasingly harsh conditions created by a stream of structural changes and budget cuts.

It is about how managers handle daily tasks and experiment with ways to match the ongoing organizational and structural changes in hospitals, and how this inspires the way they experience the actual conditions as managers and the organizational and institutional framework they work within.

The theoretical inspiration is drawn from research on management: Mintzberg and Pettigrew, from strategy-in-practice: Chia and Holt, and from relational leadership: Cunliffe, Hosking, Shotter, and Gergen. The purpose of the paper is to create micro and practice-based pictures of 'the inner life' of public management of today, and how middle managers in Danish public hospitals handle structural change.

Keywords: *hospital management, practice based, every day practice, the 'inner life' of middle management, handling ongoing change, entrepreneurial actions.*

INTRODUCTION

A story is told nearly World-wide about two ghosts traveling through the public sector. One ghost is named budget-cuts, the other managerialism (Hood 2001:12553). This is not a new story. It has its roots back perhaps four decades, and has been told as New Public Management and Governance, increased productivity and efficiency, cutting costs, budget- restrains, and improved steering (Hood 1995; Brunsson & Sahlin-Andersson 2000; Christensen & Lægreid 2007). And at the same time a

critique is directed toward the belief in managerialism that the important things always come from the top of the organization (Alvesson & Svenningsson 2008: 146).

The interplay between these macro stories and what happens in the daily managerial life is analyzed in different ways (Correia 2013). In this paper we want to go even further in the direction toward a micro perspective on management. The analyses will be based on stories told by individual hospital managers on how they through daily practice handle such conditions of change, to unite the general plans for rather drastic change decided by top-management, with the daily interaction between employees, patients, clients and users. These are stories on practical ways through interpretations, 'repair' of inadequate structures, and mundane entrepreneurial activities to manage institutions, divisions, sections, and employees under these changing conditions.

From stories told about conditions and concrete actions by four middle managers in Danish hospitals the paper tries to analyze how these managers in different ways understand the conditions and how they deal with overall, from the top decided, changes in the restructuring the organization and management in hospitals. In this way we want to contribute on how middle managers in the hospital system deal with major structural change under harsh conditions.

THE FOUR MANAGERS AND THE DANISH PUBLIC HOSPITAL SYSTEM

We try to analyze such managerial activities as concrete as possible. So we start with the presentation of the main players. The four managers are placed in middle management positions in hospitals in two, out of the five, regions in the Danish public hospital system. The public hospital system in each region is governed by a politically elected council and managed by a regional hospital management.

Beside their job as managers all four managers, while we were in contact with them, all were involved in activities to increase their managerial skills through post graduate courses and education. They have from one to three decades of experience from the Danish public hospital system starting from ordinary positions as medical doctor, nurse, administrator, or technician, have grown up, and with success advanced in a system, in their perspectives, increasingly filled with change: from many small hospitals to few much larger, in 2007 from twelve counties to five hospital regions, and from traditional bureaucratic and technical administration to New Public Management.

The present change they experience on increased demand for management, steering, budget cuts, and internal mergers within hospitals has much to do with political and administrative goals for increased efficiency through organizing in larger sections and department, and increased horizontal co-ordination in the treatment of patients.

They work in two different Danish hospital regions, but even if the organizational changes made in these regions are not formally identically, in daily practice the structural changes look rather similar.

The job for these four managers, as they see it, is to meet these changes and budget-cuts with intentions to get the best out of it for their patients, and their employees. They experience these tasks as rather harsh, but manageable.

The four managers in this study are: a leading nurse, the leader of a service department, the deputy chief of a hospital division, and a hospital CEO. For this study the four are not chosen to represent anything outside their own management responsibilities and what they actually do. They work in different specific settings and with different tasks. What makes them to some extent similar are, besides they all work in the Danish public hospital sector, and their wish for further insight in their own work, a mutual feeling of harsh times and challenges, and their will and efforts to find new and in a small scale entrepreneurial and innovative solutions.

METHOD

We have met the four managers individually between four to eight times during 2013. We have participated in with each of them for one to two hours conversations as listeners, but also commentators, and discussion partners. From our chosen methodological perspective (Alvesson & Skjöldberg 2009) stories about daily managerial practices are created through interview-conversations between the individual manager and us (Kvale 1996). We do not see ourselves as neutral, objective observers (Czarniawska 2004; Alvesson 2011). We are as researchers always involved, which is the perspective in our relational ontology of doing research (Cunliffe 2001; Gergen 2009; Berger & Luckmann 1966).

Through such conversations with the individual manager where the focus is directed toward what they are preoccupied with at the present moment it is possible to develop an understanding on how changes in the practical daily actions of the individual manager can be interpreted as ways to handle these macro-organizational changes created through decisions in regional councils and the top management of the regional hospital systems. The methodological perspective is to interpret activities at the micro level as seen through the eyes of the four managers.

Our inputs for writing the four tales as they are told in this paper are written statements from the managers, audio taped conversations, and our own notes from the conversations. The method is a kind of co-authoring (Cunliffe 2002). At the same time all the four tales are read and commented upon from each of the four managers before they are presented in this paper.

THEORY

In contrast to studies of macro-change in the public sector where principles of public sector steering, New Public Governance, interactions between politicians and administrators play the important role

the study in this paper is directed toward micro-actions to cope with the daily responses and the practical handling of change. It can be seen as the meeting between 'grand' structural changes, and local routines (Feldmans & Pentland 2003), local norms, and taken for granted. It is the development of practical managerial means for handling new situations, and it has its focus on management-in-practice. We prioritize to analyze the emergent, more than the deliberately planned, (Mintzberg 2009: 153) and we draw on the practice turn in organization studies (Alvesson & Kärreman 2000).

The theoretical framework for understanding these stories and the activities behind are inspired from American pragmatism (James 1909) and especially how actions and interpretations interact and how practice and experiences (Corradi 2010) form the meaning of structural changes and micro actions. And how the interpretation of structural changes both lead to actions directly in line with such structural changes, and to entrepreneurial actions where managers dare to use alternative means and interpretations. Such entrepreneurial handlings of structural macro changes on the micro level of middle management action inspire us to use the concept of wayfaring/wayfinding instead of navigation (Chia & Holt 2008; Ingold 2008) as a perspective on these kinds of management.

Our framework is also inspired from the theoretical work on relational leadership (Cunliffe & Eriksen 2011; Hosking 2011; Uhl-Bien & Ospina 2012). An approach to leadership that emphasizes that leadership takes place and is realized between humans. Hence, the focus is not on the leader as a person, but on how he/she engages in relations with other organizational actors in- and outside the organization and how they through co-constructive practices make sense and handle everyday organizational challenges (Cunliffe & Eriksen, 2011, Hosking, 2011, Gergen 2009). In relation to the managers in this paper focus is on the interaction and relational processes between them and their employees, and how they co-constructively create local interpretations of macro changes.

FOUR TALES FROM THE HOSPITAL FIELD

The newly promoted leading nurse: As a result of a general change in the organization and management structures in the regional hospital system Maria has been selected and promoted to a position as leading nurse in a section. The section is a merger between several departments. This was part of a change in the entire regional hospital system: creating rather large sections with a section management under a division with a division management, which again was placed under the hospital management, which again referred to the regional health management and the elected regional council.

Maria interpreted this new organizational structure as a way for the region to increase efficiency, also as a mean to further budget-cuts, and at the same time as a way to better co-operation between the sections under the new division to increase the quality of how the individual patient was treated. She

also saw these changes as new top-initiated ways to strengthening the function of management at the different levels. She enjoyed her new responsibility including responsibility for a much larger staff. But she was from the start unsure of how she part of the new section management could support increased quality for patients.

At the same time she felt a lack of support both from employees, lower level managers, and from some of her fellow managers to support the new structure. To many of her colleagues the change was seen just as more of the usual budget-cut stuff. She also sensed a lack of ability in the section management to talk about the new responsibilities, demands and possibilities. And she experienced a number of defense mechanisms among her colleagues. But Maria gradually developed the idea that the new structure could be turned to the better if something was done concerning communication and meeting activities in the section management.

For that reason Maria decided, even if it was not stated anywhere as her duty, to start a process improvement, and especially focus on one perspective in the new managerial structure: the idea that management should not be left to individuals, but to management teams. For her it became increasingly clear that a functioning team had to be developed out of the section management of five persons.

She therefore gradually at the regular section management meetings introduced themes as: how the section should stay in front of the development within its field, and how the management group should use time for elevating their meetings from only handling operative problems to a level where they regularly tried to analyze the tasks and goals from a more holistic perspective. This can be seen as an entrepreneurial approach to handle the new structure in an innovative way building on Maria's earlier experiences.

To her and to the rest of the section management it created during a sequence of meetings in 2013 a type of management increasingly based on the team, not on five individuals. It also gradually created, in the team, a vision for making the section more visible not only for its own employees and to the division management. She did this also to make the section more visible to show that it worked actively to increase quality in its treatments and its co-operation internally within the division.

The leader of the support department: Frederic is the manager of a competence center and support department in the regional hospital system. A couple of years ago his department was created through a merger between two smaller specialized service departments. This was done as part of a modernization and merger process in the entire regional hospital system and at the same time to handle a severe - more than ten percent - budget-cut. It became a department that covers a broad array of support from purchase to financial advising and technical support for all the hospital in the region and the number of employees is one hundred.

Even if the budget cut and expected further cuts plays a role, Frederic's major concern as a manager is the need for change and modernization of the function of his department and its mission and vision. He has, mostly based on his own ideas, re-constructed the department structurally to change it from two separate departments to one to create new lines of co-operation between the different functions, and to create synergy. He has managed to involve his six experienced section managers to create much more horizontal co-operations. An important idea behind this has been to increase the innovative capacity of the department. At the same time he wants to change the department from mainly being a reactive support and purchasing function to become a proactive support function for the technical functions at all the regional hospitals.

His goal is to couple his department in a much more interactive way to the vision of the entire hospital system: placing the patient at the center and create more quality and efficiency. He tries in the same process to learn from the following questions: what mistakes were made during the merger process? And what are the future core-areas for the department?

To Frederic the advice-function directed toward supporting the different part of the regional hospital system and the individual hospitals and departments is as important as the ability to purchase goods cheap and in excellent quality. The entire department has during the next three years to become one competence centre supporting a large number of hospital functions to increase the quality of treatment, but also research and development through his department's deliverance of the most efficient medicine, equipment, and not at least: advice.

According to Frederic this led to a new and positive picture of the department in different areas of its environment and in the regional hospital management, but to Frederic it has also created some difficulties for himself. One of the big challenges for him is to change the views of the department employees and managers from being rather narrow specialists to become specialist with a broader view on co-operation, joint innovation and co-creation, and at the same time assessing the financial and cost consequences behind this view.

His main struggle through the year 2013 has been to balance between the increased expectations from the environments, the budget limits, and the capacity and values of his employees and managers. He also feels the pressure on himself as he sees the amount of work piling up, and he sometimes thinks that he has engaged in a change in vision, strategy and organizing that neither his staff, nor the regional hospital management are quite ready for yet. He reflects now and then if he just should have left his department in its original form.

The deputy chief of a hospital division: Helen has just been appointed to deputy chief of a large newly founded hospital division with nearly one thousand employees. She has come from a position as chief physician in a hospital in the neighboring region, a job she was not satisfied with because of very

unclear relationships within the daily management. So she expects a lot from her new job and is eager to perform.

It is not only a new position in a, to her, unknown division and hospital. It is also outside her specialization as a chief physician, and it is a new organizational structure with new managers at the divisional level. She tries to use her general hospital knowledge and experiences to understand the organizational practices that are developing and gradually to define her own function.

Her job is to be responsible for how the treatment of the patients functions and how this is coordinated between the different sections within the entire division. To improve this is a top-priority policy decided by regional council and through instructions from the regional hospital management. But to Helen this policy seems rather abstract and not very concrete described in the official papers.

She is part of the division management group, which also contains her chief, the division manager, and the other deputy chief, responsible for personnel and human resources. But she is a little uncertain of how to define her own function. It is a priority area for the regional council, but in her job she has no authority to instruct employees, managers, sections or groups. If she wants something changed she has to bring it up for the division manager or at a management meeting. To some extent she fears that one could see her job as a kind of staff function.

This rather unclear situation is to her combined with an unclear relationship between the individual managers in the new division management, and also between the division and its sections. She observes many tactical and opportunistic operations between individual sections, not at least when budget-cuts have to be allocated or scarce resources shared. Therefore she decides to give herself a role in the construction of an efficiently working management within the division.

She sees it as possible to use the force that lies in the new situation. She finds out that she has to work for creating a more unified leadership within the division. Her method is to some extent to use her own duties to reach the goal of more efficient production processes: coordinated treatment of patients, and increased efficiency in curing. She works to find out who in the division and section management are or could be the most dedicated toward reaching these goals.

During this process she also learns something for, and about, herself. She came to her new job seeing it as her task as an individual to understand and define the job she had got. But increasingly through this process Helen experiences that while she is working for the goals she has defined important, she also influences on how her fellow managers defines their jobs, and at the same time the way they understand their duties they influence the way she defines her job. The unclear and undefined function of her job and the function of division management motivate her into constructing a new way to function, and creating this way changes her understanding in a more entrepreneurial direction toward being active in creating increased collaboration.

The experienced CEO in the small hospital: Chris has been CEO for the smallest hospital in the region for a decade. It is a merger of three even smaller hospital made shortly after he got his present job. The hospital is today located at two different places some miles apart from each other and in this way in two separate local communities. At the same time it is located close to the regional boarder and in close distance to two larger hospitals in the neighboring region.

Chris is rather proud of that he has, together with his staff, managed to keep his hospital alive and able to take patients in directly from the street. This has not been easy in a period of several budget-cuts, fast technological development, centralization, and policies underlining “big is beautiful”. He knows that even if he has been able to cope with that up to now there are big risks for his hospital in the near future.

One of his main concerns is that it becomes increasingly difficult to attract medical personnel for permanent positions especially at one of the locations. Another is that hiring non-permanent staff is extremely expensive and results in coordination difficulties. A third concern is the fact that the recent change of the management structure in the regional hospital system is mostly in favor of the big units.

Chris is occupied with managing a difficult situation. The main formal argument for the existence of his hospital is the time it takes to transport patients from this part of the region, inhabited by twenty percent of its population, to the next nearest regional hospital, and the fact that it is expensive for the region if patients instead chose one of hospitals in the neighboring region closer to the local population. At the same time there seems to be a strong political will locally to keep the hospital alive. But this is also a curse because it means that every time Chris tries to reorganize between his two localities a massive critique appears from some regional politicians and a pressure group from one of the localities.

For Chris to get support to solve this is nearly impossible because small hospitals are definitively not the main priority for the regional hospital management. It seems at the moment occupied with the planning of a new very big and expensive regional hospital as part of a national health plan. The regional hospital management is not especially interested in being involved in the local challenges, and definitely not in having such questions brought up in the regional council. Is wants Chris to handle “his own” problems and to do what is needed, which to him seems in reality to close one of the localities, the one with the strong local support.

Therefore the task for Chris has during 2013 been to balance between regional hospital management goals and new structures, budget difficulties, keeping the quality high with lots of non-permanent staff, handling the local critique from one of the locations, and trying to keep a constructive dialogue with the regional hospital management. In this way Chris is, and have for years, been a manager handling practical problems entrepreneurially to secure the existence of his hospital.

ANALYZING THE WAYS THE FOUR MANAGERS INTERPRET ENVIRONMENTS, CHANGES, RELATIONS, AND EXPERIENCES

Each of the four managers is of course unique, but as we see the four together not very different from other hospital managers and managers in other parts of the public sector, we are in contact with in our research and teaching. Managers who work to find new practical solutions to handle the challenges of structural changes and budget cuts, and who especially in practice and on an every-day basis act entrepreneurially to develop such solutions. They are handling their different managerial tasks, trying to create an acceptable 'inner life' for their employees and patients, and at the same time manage budget-cuts and structural changes. From the four tales the following analysis interpret how environment, the organizational changes, unclearness, experiences, relationships, and entrepreneurial activities are interpreted and handled by the four managers.

The environment seen from the perspective of a local manager: The four managers have pictures of the broader environments and general trends in the development of society, the health sector and hospitals. From their different professional background they prioritize different important factors in the environments, but to some extent they – without knowing each other – have similar interpretations of what here and now are happening in the environments of the health sector, and they also have rather similar ideas of what is going on concerning the development within public sector management.

The hospital environments are seen by them as increasingly specialized, increasingly demanding more efficiency and quality in curing patients, and at the same time as demanding economies of scale, larger and fewer hospitals, and 'more for less'. They can in one way agree with these demands, but at the same time they find it difficult to manage all these demands at the same time.

They know they have to manage within these institutional and political conditions. But their primary environment contains for them something much more local (Hosking 2011) and reachable: to Maria and Helen: neighboring departments, section, and the hospital management, to Frederic, in addition to this, important customers and the regional hospital management, and to Chris: also the politicians, regional hospital management, the local population, and the hospitals in the neighboring region.

The organizational changes and unclearness: The interpretations of the practical consequences of the formal organizational changes are in the four tales filled with flux, unclearness, and uncertainty (Tsoukas & Chia2002; Chia & Holt 2009). None of the four managers have a clear, total and fixed picture of how the present changes will turn out in practice. They know a great deal about the formal lines and the formal ideas behind the present changes in organizational structures. But they also express that it is nearly impossible to anticipate the practical outcome of the interaction between new formalized managerial structure, the mergers and the creation of larger units, the plans for more cross

functional co-operation, and the daily operations. On top of that they are almost certain that the next budget-cut, the next organizational change and the next policy for re-structuring is lurking just around the corner. But they have no certainty about how much it will change and when it will appear.

Even if they have a rather clear perspective on overall structures in the change plans decided by the regional council, and see such plans as structured after rather simple formalized principles, then the actual, local consequences of these plans and what is expected of them look much more as processes where much is in a flux. This constructs for them an image of an ever changing environment (James 1909: 735 -). The managers interpret these change processes from their individual local perspective, job function and local colleagues and employees. The way they experience the environment seems connected closely to how they interact with the local actions, norms, values and taken-for-granted.

The flux and unpredictability they experience from the realization of the actual plans, but also from the health and public sector environments in general makes them aware that they increasingly and actively have to develop means to cope with these ongoing, but incalculable changes, and they are quite certain that such means have to be flexible and closely coupled to persons and means close at hand. They work to create what they see as here-and-now solutions that couple the formal changes transformed into the local environment with the practices, taken for granted and norms of their section, department or hospital, but they also, as the stories Frederic and Maria tell, think ahead.

The use of experiences and relations: The four managers all have a fairly long career in the health sector – at least ten years. That have given all of them an impression that this sector is in a constant and increasing flux and change. This experience tells them that the next major change will appear within a few years and the next budget-cut will appear perhaps within the next year. So even if they are unsatisfied with this flux, it also gives them the belief that nothing is permanent and that their managerial actions also have to be a preparation for the next unpredictable change. At the same time they express that their experiences tell them that change of many kinds within hospitals increases.

Chris as CEO is perhaps the manager who is the most certain that new changes will appear because of the tension he experience between the local actors, the regional hospital management and his hospital. He has a solution he recommends to the regional hospital management, but is not sure that it will be followed. Frederic is using his experiences differently. He tries to use his knowledge about the flux and uncertainty to create new processes in his department in constructing an efficient competence center that will become a major player in delivering advices and services to all the hospitals in the region. His experiences tell him that it is important to be on the move and induce change.

Maria with her background in nursing and her promotion in the new organizational structure uses the experiences she has gathered as a manager at a lower level to work actively to create and develop what she sees as an important managerial team-structure. Using her professional competences as a

nurse and a manager she delivers an input to the team-building process. Helen is perhaps the manager who most dramatically has to transform her experiences as former chief physician where the natural-science 'one best solution' defined by her individually has, as she gradually move from a peripheral to a central position in the daily management of the division, to be changed to a more team-oriented soft and organizational style.

What seems to be increasingly important news to Helen, are for the three other managers something rather well-known. It is the co-construction processes with fellow managers Frederic and Chris rely on the close co-operation with their management teams, and Chris would have liked a closer co-operation with the regional hospital management to solve the local problems. They both express the importance of involving other managers and employees. This co-constructive approach is also what brings Maria to try to create stronger relations to the management team she is part of. Even if she is not the chief, but a member of the management team she tries to work actively for producing relationships that foster efficient decision-making in the team. Concerning Helen who came from an unsuccessful managerial co-operation in her former position also gradually involves in team-building processes within the division-management.

Every-day entrepreneurial activities: As described above the 'grand plans' for structural change and the budget-cuts created by the regional hospital management are not followed by detailed plans for implementation. The four managers know that they have to develop local solutions that will meet the new budget requirements and the increased expectations for efficiency from the regional hospital management concerning the new organizational and managerial structures and the creation of larger divisions, sections and department.

Chris has in his ten years as CEO constantly been engaged in the struggle for keeping the relatively small hospital alive as an independent unit with a broad specter of functions. He together with his management team has through the years developed a number of structural solutions, which could be seen as useful by the regional hospital management and the regional council, and at the same time not creating too much bad will among one of the localities where the hospital is located. Some of them have been accepted and implemented, others have been rejected. Also in the present situation he knows that the plans and ideas he has to present for the regional hospital management also have to be seen as innovative, entrepreneurial and politically acceptable.

Helen is in another situation because she changes her previous way of being entrepreneurial presenting individually developed solutions as a chief physician to an increasingly relational way to work together with her new colleagues in the division management. Maria, on the other hand, worked in her new job much more actively to present and discuss new solutions with her fellow managers in the section management. A way to manage that uses the skills and competences of an experienced

nurse, but in a much more entrepreneurial style and including co-managers from quite different professions.

Based on his story Frederic is perhaps the most entrepreneurial manager of the four. He sees the hospital system in the middle of a rather dramatic change from a stable structured and administrated type of organization with different and relatively separated professional groups fighting for influence and resource to something quite different. What he works toward is for his department to be part of a much more integrated type of organization where the need for quality and efficiency in the cure of patients demand much more strategic integration between medical, nursing, advising, servicing and managing.

DISCUSSION

These managers are part of middle management in the Danish public hospital system. What they do are to try to construct a more promising future out of a situation filled with flux and unclearness by building their often rather mundane ideas into the present (Kornberger 2013). They do this without knowing for sure if these ideas are compatible with the 'grand structural plans' from the regional hospital management and without knowing if they will be accepted and further developed by their fellow managers and their staffs.

These ideas and how they have to act according to them are part of the daily work to fill up the gap between the grand plans and the daily dynamic of managing fragmented and interrupted (Mintzberg 2009:20) It is also the way these managers tries to couple between the preconditions of the 'grand plans' constructed after an navigating philosophy where the departure point of the organization and the entire hospital system is A, the arrival point is B, and the pattern of movement from A to B is linear and following a certain logic. And the 'reality' of the day-to-day change where much of the movement is emergent and where the next step is defined while it is taken, which can be seen as a wayfaring process (Ingold 2008: 75-76; Chia & Holt 2008).

This 'co-ordination' between the plans for structural change and the daily activities of middle management can be seen as part of the normal duties of a manager – to ensure that the production process is running smoothly and to use the newest and most efficient means created by specialist and the top-management and communicated down into the organization. This is an important perspective to see this under and a way to define the daily activities of management.

But it is more than a coordinating process. It is how the individual manager not only fills out the gaps in the formal plans for change. We can also be seen as the way managers tries to 'repair' inefficiencies in the formal plans. In these activities they bend or even move beyond some of the structural constrains. They do this with the intention to find workable solutions that functions toward the

patients, the staff, fellow managers and neighboring departments, sections and divisions. They try from the rather structural reforms to create manageable processes.

What this look as in the analyzes of the four tales could be seen as a kind of examples on how an important part of the public sector, the hospitals, are engaged in change not only through the plans and formal structural changes of the specialists and top-management, but certainly also from the daily entrepreneurial 'repair' of the practical inconsistencies of the formal plans. This way of seeing this important part of public management is directly connected both to the structural changes and to the environmental and organizational change.

This can be interpreted as an important change in the function of management in hospitals and in this way as part of the entire renewal of the organizing patters. According to the four managers the managerial system of hospitals are in an ongoing change process. A process that goes from stability to flux, from long lasting structures to the launch of new plans and structures nearly before the previous have been taken into practice, and to increased importance of as well new managerial principles introduced as part of the structural plans and increased demands toward managers to manage. And as cycles that overlap each other, create disturbances, fight for attention, influences each other etc.

Seen in the perspective of the four managers this reveals a picture of the interplay between the daily response to flux, unclearness and uncertainty both in the environments and internally in the hospital organization, and the ways experiences are used to create entrepreneurial and practice innovative ways to build relations and to manage together. What we see in these four tales is not only managers living up to new standards, but also creating new standards to make the structural plans workable and through practical, entrepreneurial activities to improve the function the hospital, its divisions, sections and departments.

CONCLUSION AND PERSPECTIVES

One important conclusion from the four tales is how the managers prioritize the co-operation within the management group and in this way the co-creation of new practical ways to handle the daily managerial tasks. Important is also the accept that even when the structural plans both calls for improved weight on management and at the same time calls for increased team-work the managers choses to use the team as a mean for improved weigh on management, instead of individual action.

The second conclusion is that even if structural plans includes principles on how to manage the actual managers on the different levels have to use both their entrepreneurial skills and their experience as managers to find solutions that they can use in the local practice, some of them in line with the formal structural changes and some of them bending the structural constrains to find a workable solution that both follow the intentions of the 'grand plans' and create space for the daily coordination.

ABSTRACT

The **purpose** of the present article is to investigate impacts of the fair of failure on the dynamics of entrepreneurship in CEEC that entered the EU in 2004. A special attention is paid to entrepreneurial employees' (intrapreneurial) activities and the innovation orientation, as the faire of failure often leads to individual choice to perform innovative activities while being employed or to use a good business opportunity while creating a new business. Based on Global Entrepreneurship Monitor (2012), nearly all of these countries belong to the efficiency-driven group of countries (except Slovakia and Slovenia) and seek for improvements of their innovation systems. The research question of the present paper is: how the fair of failure impacts the dynamics of entrepreneurship among Central and Eastern European Countries (further in the article, CEEC) that entered the European Union in 2004. The research is based on the Global Entrepreneurship Monitor methodology and a comparative analysis method. The introduction part of the article serves as the conceptual framework where the main entrepreneurship-related definitions, classifications and development trends are presented. To continue, the conceptual model, which incorporates the main impacts of the fair of failure on the dynamics of entrepreneurship and intrapreneurship, is presented and the GEM methodology explained.

Keywords: *entrepreneurship trends, Central and Eastern Europe*

INTRODUCTION

Although today the term 'Entrepreneurship' experiences its increasing popularity, impacts of social and cultural dimensions, such as the fair of failure, on entrepreneurship and intrapreneurship are not sufficiently examined. Today scholars agree that the fair of failure affects the perception of business opportunities and capabilities, attitudes, intentions as well as the decision to become an intrapreneur (entrepreneurial employee). The fair of failure in many cases can lead to individuals' willingness to operate 'under the roof of employer', where principle risks are managed by top managers and/or

owners, or can discourage individuals to start business. To better understand impacts of the fair of failure within the entrepreneurial dynamics, it is important to have a profound understanding of historical development of the term of Entrepreneurship. An academic and theoretical concept of entrepreneurship emerged in the 17th century (it was first mentioned in Richard Cantillon and Adam Smith's works); this area had not received sufficient attention until the end of 20th century (Stephenson, 2003). Casson, Yeung, Basu et al (2008) point out that entrepreneurship is examined quite extensively, but a single definition of entrepreneurship is still not found.

One of the newest and most recent definitions proposed by Shane and Venkataraman (2000) emphasizes: **Entrepreneurship** is a branch of business science which seeks to explain and understand how do opportunities rise and what results they bring to the creation of new or improvement of existing products or services (Shane and Venkataraman, 2000). Based on this definition, entrepreneurship is an area of human activities that consist of the following key factors that could be potentially affected by the fair of failure: 1) Seeing opportunity; 2) Understanding what is necessary to do to exploit this opportunity; 3) The ability to manage business, originated from the observed opportunities (Shane and Venkataraman, 2000).

It is valuable to draw the attention to the Madura (2006) definition of entrepreneurship which defines entrepreneurship as a process consisting of the disclosure of options and development through innovation, taking into consideration entrepreneurship resources, locations and status.

Based on Barringer and Duane Ireland (2006), the essence of entrepreneurship is the transfer of ideas and application of them in the market. Madura (2006) gives a definition which states that entrepreneurship is not necessarily a process of creating new organizations. Entrepreneurship can be found in an existing organization. According to Casson, Yeung, Basu et al (2008) a contemporary entrepreneurial philosophy began to evolve rapidly in the 20th century, whereas large-scale organizations established in the 19th century were working in newly developing sectors such as Electricals, Chemicals, Communications, and Automotive. The need of a new-type professionals emerged, as universities were not preparing them. All these factors accelerated the scientific research initiatives of entrepreneurship. In addition, the shift towards service industries has modified the entrepreneurial concept (Casson, Yeung, Basu, and Wadeson, 2008).

The topic of the present publication is innovative and relevant not only because of the complicity of the term 'Entrepreneurship', but also because of the specificity of the region and impacts of the fair of failure on entrepreneurship in this region. The selected countries (Slovakia, Slovenia, Hungary, Czech Republic, Poland, Lithuania, Latvia and Estonia) are similar in their experience of once in their history lacking knowledge-driven national systems of innovation; thus, their integration to the EU manifested in quite radical modifications of their economies, reshaping innovation processes as well as expressing

potential and progress which varied from one country to another. The communism experience is also associated with the fear of failure, as small and medium companies had little independence in managing their innovation processes and needed more to execute the delegated tasks and objectives. However, two countries (Slovakia and Slovenia) have managed to switch from the efficiency to innovation-driven group of countries, based on GEM classification (2012). Relying on the GEM methodology and classical comparison analysis method, the GEM data of the selected countries is compared while having **a special focus on: the innovation orientation, the block of factors related to the uncertainty avoidance and the fear of failure as well as the block of indicators related to the entrepreneurship dynamics** in the analysed countries.

DRIVES AND BARRIERS OF ENTREPRENEURSHIP AND INTRAPRENEURSHIP

While tackling different historical periods the question of 'What is an entrepreneur?' was answered differently (Hisrich and Peters, 1994). In the 18th century Francis Walker formed another definition of 'Entrepreneur', which finally separated people who had capital and were receiving dividends and people who were operating under shareholders' requirements and generating money using their managerial skills. It created the foundation, which was later used by the academic society (Stopford and Baden-Fuller, 1994).

One of the first who had discovered Entrepreneurship was Schumpeter (1942). He emphasized the fact that a definition of an entrepreneur should be related to a person, who is not only willing, but also able to generate a new idea or invention and turn it into a successful innovation, which can be applied in practice. An entrepreneur uses this feature constantly and this allows him/her to discover innovative business models, new products and services. This proactivity significantly contributes to the progress of industries and long-term economic growth, and it is one of the reasons why entrepreneurship is so encouraging. Schumpeter (1942) argued that entrepreneurship gave the world not only new industries, but also a start to combinations of fused sectors. To summarize the Schumpeter's approach the following definition can be used: an entrepreneur is a man who owns and organizes a company for personal gains (Schumpeter, 1952).

While interpreting the ideas of Drucker (1985) and Brut and Julin (2000), Pranckus and Raudonius (2013) argue that entrepreneurship comes from the creativity and support and it is necessary for everyone involved in business. In addition, Stoner (1999) and Freeman (1999) state that entrepreneurship is associated with a higher risk tolerance and innovative thinking. It is clear that features of intrapreneur or entrepreneur can be divided into 'born with' and 'learned to' (Stoner and Freeman, 1999).

The process of entrepreneurship, which could take place not only in the development of new companies, but also within already existing organizations, could be called internal entrepreneurship or intrapreneurship. Intrapreneurship and entrepreneurship share the same features that can be found in all the contemporary definitions of entrepreneurship: a greater risk tolerance, creativity, greater independence and remuneration (Kuřátko, Montagnaim and Hornsby, 1990). These factors are the main driving forces of any kind of entrepreneurship. Many authors describe Intrapreneurship as a Corporate Entrepreneurship. Veronique Bouchard, Olivier Basso (2011) argue that officially intrapreneurship appeared in Burgelman's publication 'Internal Company's Development Process in a Large Diversified Corporation'. These authors argue that the success of the term 'Intrapreneurship' was because it was self-explaining (intra is internal). The early studies of intrapreneurship sought to find answers to the following questions: What is the difference between intrapreneurs and entrepreneurs?; What conditions do explain intrapreneurship?; What factors are stopping an internal entrepreneurship in large companies? (Bouchard and Basso, 2011).

High risk investments in a new business sector required a lot of time and work, but people were led by an entrepreneurial spirit, which allowed to be flexible and to make quick and appropriate decisions (Kansik as Laakkonen and Sapro, 2012). Intrapreneurship releases several strategically important respects: Innovation; Risk; Proactivity (Katz ir Shepherd, 2004).

Intrapreneurship is particularly relevant in today's organizations, as modern people who believe in their talent and value to organizations usually expect something more than salaries. They want the freedom to create and manifest. According to Vince (2002), the absence of freedom creates the dissatisfaction with not only a company itself but also with duties of work. This reduces the productivity and ultimately leads to the search of a new job. Thereby, intrapreneurship is a method of liberating an organization serving individuals who believe that a company can do something different and better (Kanter, 1982). Intrapreneurship upgrades organizations and takes them to the next level (Garret and Covino, 2007). Rod Gapp and Ron Fischer (2007) argue that intrapreneurship is an internal organization process for the creation of separate units. Kolchin and Hyclak (1987) in turn give the greater importance in the process of intrapreneurship to providing new products and services within an organization. Hisrich, Peters and Shepherd (2009) basically follow the same Intrapreneurship results in innovations, it can be new products, services, systems or processes (Kolchin's and Hyclak's, 1987). Intrapreneurship definition is that the innovation process is controlled by employees, not by an organization itself. An organization, according to Politis (2005), provides an appropriate space for employees to work in an environment which provides the satisfaction. Madura (2006) argues that many scientists agree that while purposefully developing and nurturing intrapreneurship the culture can give positive results.

The influence of entrepreneurship and intrapreneurship on firms' economic and financial indicators occurs not only by increasing the revenue or market share. This includes the initiation of a change in business and society. Ross and Unwalla (1986) link innovations to the original source, not only for new products and services, but also for an economic welfare and market stimulation.

Very often it is apparent that an internal businessman is a mix of traditional manager and entrepreneur (Lyles and Schwen, 2005). Active people within a right company and under right conditions can achieve technological and innovative breakthroughs much quicker because they are supported by 'know how' of a company (Mintzberg, 1979).

The organizational culture, according to Wallace, Hunt and Richards (1999), is all company's employees working for one purpose, applying one or another managerial tactics, processes and resources; thus, forming the unique organizational culture. Barney (1986) argues that it is also one of the key competitive strengths of each company. Recently the organization's culture was presented as a fundamental framework to manage innovations, the process of development and commercialization, helping to achieve a long-term success and competitiveness. Hall (2005) states that the environment in which innovation occurs is usually encouraging expectations, dreams as well as supports its members' creativity, experimentation while being risk-tolerant.

Companies that develop the culture of product and process commercialize innovations much faster and easier. The environment which supports the creativity and experimentation enables the staff to use opportunities to develop new products while increasing the likelihood of commercializing the innovation. These aspects match with the philosophy of intrapreneurship, which is why fostering an internal culture of entrepreneurship in the work environment encourages new ideas, procedures, and synergy while encouraging the development of innovations (Wallace, Hunt and Richards, 1999).

The Rule's and Irwin's (1988) study examined measures used by companies to develop and implement the intrapreneurship atmosphere in organizations. There were 33 ways mentioned: Innovation, teams and work groups; Recruitment in order to implement new ideas in an organization; Strategic planning, focusing on innovations; Focused consumer testing of new opportunities and trends observed; Research and development activities.

Kuratko, Montagnais and Hornsby (1990) argue that the intrapreneurship success or failure depends on four factors: Innovation, development, testing and deployment of processes on the market, supported and encouraged by leaders of a company; Remuneration or reward systems designed to celebrate and reward achievements of the staff; Time management, work distribution, creating space for creations and research; The lack of organizational boundaries, which makes the work go beyond daily tasks (Kuratko, Montagnais and Hornsby, 1990).

According to Koen (2000), no matter how strong and creative the team of employees is, if there is no support from the management it is not possible to expect a good result. Antoncic and Hisrichs (2003) divided intrapreneurship into 8 dimensions.

Dimension	Description
1. New company	Establishment of new independent company.
2. New type of business	Business development
3. Innovation of product or service	Development of new services or products
4. Process update	Process innovation
5. Internal renewal	Formation of a new strategy etc.
6. Risk taking	Fast adaption and decision making
7. Proactivity	Management orientation to innovation
8. Aggressive competition	Will to compete

Table 1. Dimensions of Intrapreneurship

Source: Antoncic, B., Hisrich R. D. (2003) Clarifying the intrapreneurship concept. Emerald, p. 26

This table shows that there are a sufficient number of channels through which an organization can benefit from intrapreneurship. The most important of these dimensions is the first: the emergence of a new company or branch. However, this is already a result which proves the presence of other dimensions in a company, which confirms that intrapreneurship is not only a powerful engine of innovations, but also a significant response to threats of an aggressive competition. Such factors as the management efficiency, human resource strategies, innovation encouragement tools, the competition in the market, economic, political and social environment as well as cultural characteristics, including the fair of failure, should be carefully analysed further in the paper.

METHODOLOGY AND CONCEPTUAL MODEL

The investigation regarding the impacts of the fair of failure on the dynamics of entrepreneurship in CEEC that entered the EU in 2004 is continued by presentation of the Global Entrepreneurship Monitor methodology. The present article supports important aspects of the research problem already tackled in the scientific literature review by the data from GEM 2011-2012.

Global Entrepreneurship Monitor survey is the largest study in the world on entrepreneurship (covering 90 researchers' teams from different countries and conducted since 1999). The GEM data is gathered annually and is derived from two main sources: GEM Adult Population Survey (APS) and GEM National Experts Survey (NES).

Based on the Global Entrepreneurship Monitor methodology, countries are divided into three groups: 1) factors-oriented countries; 2) efficiency-driven countries 3) innovation-oriented countries. The study of entrepreneurship dynamics focuses on the transformation from one group of countries to another. GEM examines such entrepreneurship characteristics as motivation, innovation, competitiveness and growth potential. In the present article analyzed countries are classified according GEM methodology, as it is illustrated in Table 2.

Country	Group of Country, 2011	Group of Country, 2012
Slovakia	Efficiency--driven economies	Innovation--driven economies
Slovenia	Innovation--driven economies	Innovation--driven economies
Hungary	Efficiency--driven economies	Efficiency--driven economies
Czech Republic	Innovation--driven economies	
Poland	Efficiency--driven economies	Efficiency--driven economies
Latvia	Efficiency--driven economies	Efficiency--driven economies
Lithuania	Efficiency--driven economies	Efficiency--driven economies
Estonia		Efficiency--driven economies

Table 2. Classification of analyzed countries according GEM methodology 2011-2012

Source: GEM 2011-2012

Entrepreneurship is seen as a process, covering all the phases of the business cycle: from intending to start, to just starting, to running new or established enterprises and even discontinuing business. These surveys include the issue of new businesses, businesses ownership question or the motives for business terminating.

Survey Objective - the key purposes of GEM is to provide reliable data on entrepreneurship that will be useful in making meaningful comparisons, both internally and among countries with different economies over the time. GEM Adult Population Survey (APS) and GEM National Experts Survey (NES) were conducted using Global Entrepreneurship Monitor methodology. Characteristics of GEM Surveys in each analyzed country are provided in **Appendix B**.

On the national level these two surveys allow monitoring the dynamics of attitude on entrepreneurs and entrepreneurship as well as the level of intrapreneurship in each country. This will provide the necessary guidelines for different sectors of economy in order to achieve the growth of social and economic welfare.

APS survey was conducted using telephone interviews (CATI) method. The sample of respondents was drawn using random representative sample from adult population (18-64 years old). The standardized questionnaire developed by the GEM consortium (7 sections of questions about nascent entrepreneurs, owners, potential entrepreneurs, terminated business entrepreneurs, informal investors, intrapreneurship and innovation). The maximum possible statistical error $\pm 2,2\%$.

GEM NES focuses on the experts' opinion of financial support, governmental policies and programs, education and training, R&D transfer, commercial and professional infrastructure, market openness, access to physical infrastructure, culture and social norms, capacity for entrepreneurship, economic climate, work force features, political, institutional and social context. The NES sample comprises a minimum of 36 respondents, with four experts drawn from each of the entrepreneurial framework condition categories. Out of this sample, a minimum of 25% must be entrepreneurs or business owners, and 50% must be professionals. Additional aspects such as geographical distribution, gender, the public versus private sector, and level of experience are also taken into account in selecting the sample random representative sample. Each selected expert was approved by the global GEM team. The interviews were conducting using personal face to face interviews or using web interviews (CAWI) methods. A standardized questionnaire developed by the GEM consortium was used during the interviews.

In order to obtain more exhaustive information the combination of data from both surveys (APS and NES) is used. This method of analysis enables to get insights from population point of view about entrepreneurship as well as to get expert attitude toward specific situation in particular country.

Statistical data analysis was conducted using IBM SPSS Statistics software. In assessing the results, it is necessary to pay attention to the statistical error. It is due to the fact that the respondents are selected, rather than performing a continuous survey. This error is calculated mathematically (calculations are attached in **Appendix C**)

The raw data was sent directly to the GEM data team for inspection and uniform statistical calculations before being made available to the participating economies. All statistical calculation is done using SPSS program.

The conceptual model of present article is created by modifying GEM model to address the problematic of the present research. Figure 1 shows, how the GEM data is analyzed in the present research by illustrating some details of the processes individuals may go through entrepreneurial behavior. The level of fear as well as perceived business opportunities and capabilities will influence the option individuals may choose: to develop entrepreneurial activities on their own or within the organizations. In addition to the above phases, phases of entrepreneurial activity are identified.

Discontinuation of activities in owning and managing business is also important aspects of entrepreneurship.

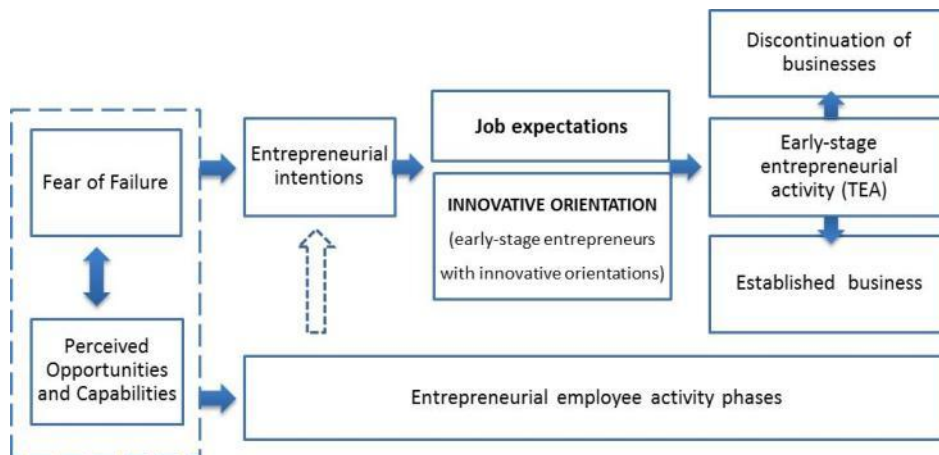

Figure 1. Conceptual model

Source: own elaboration based on GEM data

The conceptual model incorporates the three main components that capture the multi-dimensional nature of entrepreneurship: entrepreneurial attitudes and perception, entrepreneurial intentions and activities, entrepreneurial employee activity. They are included in the model as components that produce innovation, economic growth and job creation, without details how they affect and reinforce each other. This uncertainty is intended, since it is reflected the view that all elements may affect each other rather than being components of a direct process. For example, in many countries, much employment creation comes from a small number of ambitious, fast-growing new businesses (Autio, 2007). Furthermore, potentially ambitious entrepreneurs react differently to different regulatory and legal regimes than those who are less ambitious (Levie and Autio, 2011). Moreover, the conceptual model illustrates the entrepreneurial employees' activity as well as their role as potential future independent entrepreneurs.

DISCUSSION

Driven by the intention to test the conceptual model presented in the previous chapter of the present publication, the attitude and perception factors related to the fear of failure are examined while linking such aspects as the perceived opportunities, perceived capabilities, the fear of failure as well as entrepreneurial intentions. It could be assumed that the fear of failure has a remarkable effect on the perception of opportunities and capabilities. A stronger fear of failure leads to a lower number of perceived opportunities and/or perceived capabilities and as a result affects entrepreneurial intentions. It is interesting to check the dynamics of these factors in the analyzed countries, as they all had a relatively similar political, economic and social experience before entering the EU in 2004. The

trend from the year 2011 to 2012 is as well of significant importance. Poland, Latvia and Lithuania, the countries in geographical proximity, had similar percentages of people who have the fair to start business: in 2011 it varies from 40% in Lithuania to 43% in Poland and 41% in Latvia. In 2012 the Baltic states Latvia and Lithuania experienced the decrease in the fair of failure (by 4 % in Lithuania and Latvia); however, the situation in Poland had not changed. (As it was expected by many economists, Estonia, which joined the Global Entrepreneurship Monitor in 2012, had relatively lower rates of fair of failure (34%).

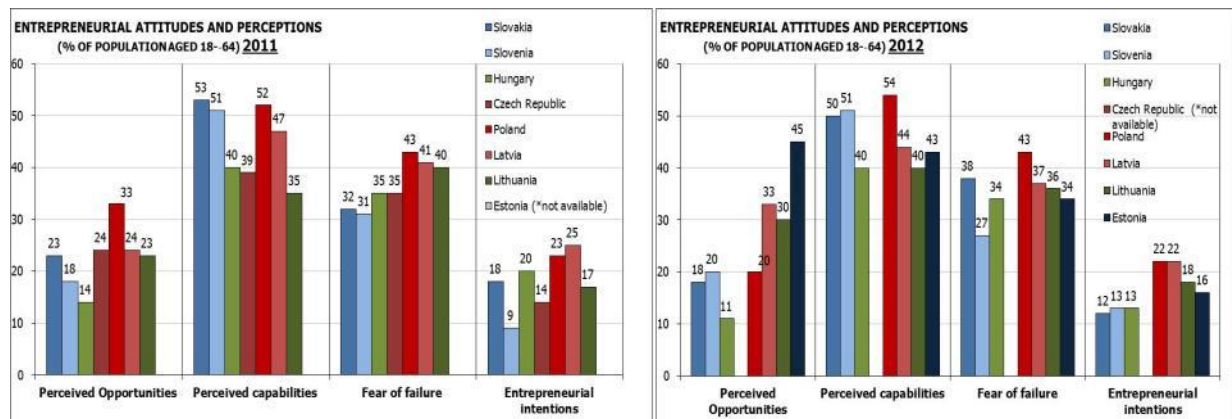

Figure 2. Entrepreneurial attitudes, perception and intentions (% of population aged 18-64)

Source: GEM data 2011-2012

The improved indicators of fair of failure were followed by the improvement in percentages of people who identify the perceived opportunities and perceived capabilities: in 2011 the perceived opportunities in Lithuania and Latvia read 23% and 24% respectively, while the perceived capabilities stand at the marks of 35% and 47% respectively. In 2012 the perceived opportunities in Lithuania increase to the mark of 30% while the perceived capabilities reach 40%. The changes in Latvia are mixed: in 2012 the rate of perceived opportunities improves and reaches 33%, while the rate of perceived capabilities is downgraded to the figure of 44% respectively. Although the percentage of perceived capabilities in Estonia is in line with its Baltic peers, the indicator of perceived opportunities in Estonia is the highest among all the analyzed countries (45%). Poland did not experience the improvement in the indicator of fair of failure from 2011 to 2012; however, its perceived capabilities increase by 2% (to 54%) in 2012, while the number of people capable to identify the perceived opportunities is going sharply down (from 33% to 20%). A minor improvement of entrepreneurial intentions in Lithuania and Latvia (by 1% and 3% respectively) could be associated with the decrease in the percentage of people with the fair of failure and the improvement of their perceived opportunities.

As for Poland, remarkable negative changes in the perceived opportunities are not accompanied by such a sharp drop in entrepreneurial intentions; however, such dynamics is more in line with the

change in the dynamics of the fair of failure. Although the Polish situation calls for the necessity to ingeniously examine results of the year 2013, as there are too radical changes in the analyzed indicators, the 3 countries (Lithuania, Latvia and Poland) have the dynamic of entrepreneurial intentions not contradicting to the changes in the fair of failure. Although the data for Estonia is not available for the 2011, the similarities between these Baltic States are apparent.

The situation in other selected countries is not so clear. Perceived opportunities in 2011 in Slovakia and Slovenia are similar to the levels of Poland (53% in Slovakia and 51% in Slovenia), although there are some remarkable differences with respect to the perceived opportunities (23% in Slovakia and 18% in Slovenia). The perceived opportunities reach quite similar figures in 2012 (50% in Slovakia and 51% in Slovenia), while in terms of the perceived opportunities countries experience some changes (Slovakia experience the decrease by 5%, and Slovenia shows the increase of 2%). An interesting dynamics is witnessed regarding the relation between the fair of failure and entrepreneurial intentions. During the period of 2011-2012 Slovenia is capable to catch up Slovakia in terms of entrepreneurial intentions (this figure improves from 9% to 13%) mainly due to a sharp decrease in the fair of failure (from 31% to 27%). Slovakia increases the opposite trend, the fair of failure increases from 32% to 38%, while the entrepreneurial intentions fall down to 12%, compared to 18% in 2011.

The fair of failure in Hungary and Czech Republic in 2011 reads 35%, while the perceived opportunities are also very similar read (40% and 39% respectively). The perceived opportunities in Czech Republic is more similar to the situation in Slovakia in 2011 (reads respectively 24%), the rate of perceived opportunities in Hungary is the lowest among the analyzed countries in 2011 and 2012 (decreases from 14% to 11%). As it could be expected this leads to the decreasing number of entrepreneurial intentions from 20% to 13%. To conclude, it is obvious that the situation in the analyzed region differs from country to country. Baltic States are more similar to each other, Slovenia and Slovakia already belong to the innovation-driven countries, thus, experience similar dynamics of the fair of failure and entrepreneurship intentions, Czech Republic is more similar to Hungary, but unfortunately the data for 2012 is not available, Hungary is quite specific in its low numbers of perceived opportunities. In all these cases the changes of the fair of failure are accompanied by the dynamics of entrepreneurship intentions, although countries are quite different within the region.

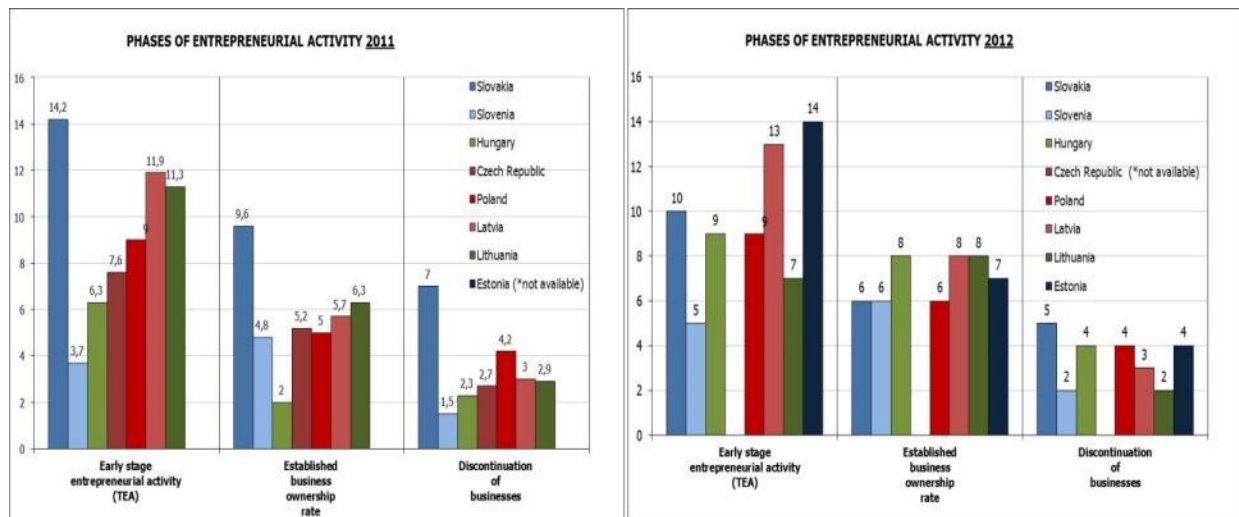

Figure 3. Phases of entrepreneurial activity (% of population aged 18-64)

Source: GEM data 2011-2012

To continue it is interesting to examine the role of fair of failure on the dynamics of entrepreneurship per phase of entrepreneurial activity. The decreasing rates of fair of failure in Lithuania and Latvia do not correspond to higher numbers of Early Stage Entrepreneurs, as in Latvia this figure increases from 12% to 13%, while in Lithuania it drops from 11% to 7%. Both countries experience the increase in the figure of established business ownership (both reaches 8% in 2012), while the decrease of discontinued businesses is witnessed only in Lithuania (from 3% to 2%). The decreasing figure of perceived opportunities and a static figure of the fair of failure in Poland lead to constant rates of early stage entrepreneurship and discontinued business as well as a slight improvement in terms of the percentage of established businesses. Estonia doubles Lithuania regarding early stage entrepreneurship activity and exceeds the figure of Latvia by 1%; however it has a weaker situation regarding the percentage of established businesses (1% less than in Latvia and Lithuania, in 2012) and a higher number of discontinued businesses (reads 4% in 2012).

The rapidly decreasing fair of failure in Slovenia, innovation-driven country, is helping to catch up another innovation-driven country Slovakia in all the stages of entrepreneurial activity (the situation remains idem only in terms of discontinued businesses). The situation in Czech Republic in 2011 in terms entrepreneurship development per stage of phases of activities incorporates patterns of various countries of the analysed cluster. There could be similarities with Poland, Baltic countries and Hungary found. While witnessing the decrease in the perceived opportunities (from 14% to 11%) Hungary improves its position both in early stage entrepreneurship activity and established business ownership (by 3% and 6% respectively).

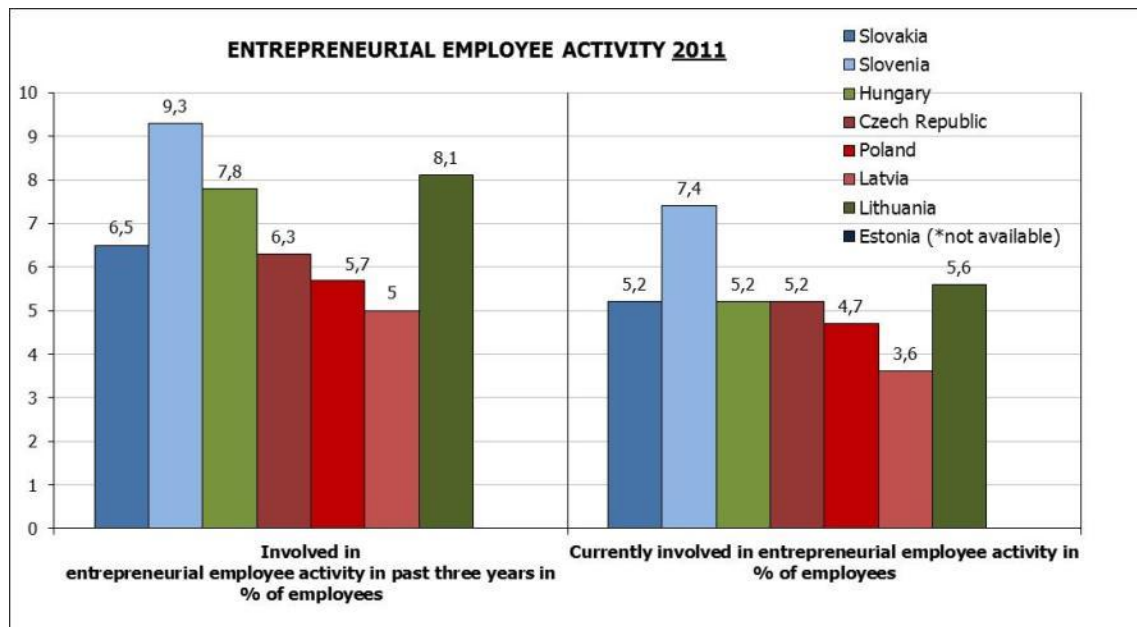

Figure 4. Entrepreneurial employee activity (% of population aged 18-64)

Source: GEM data 2011-2012

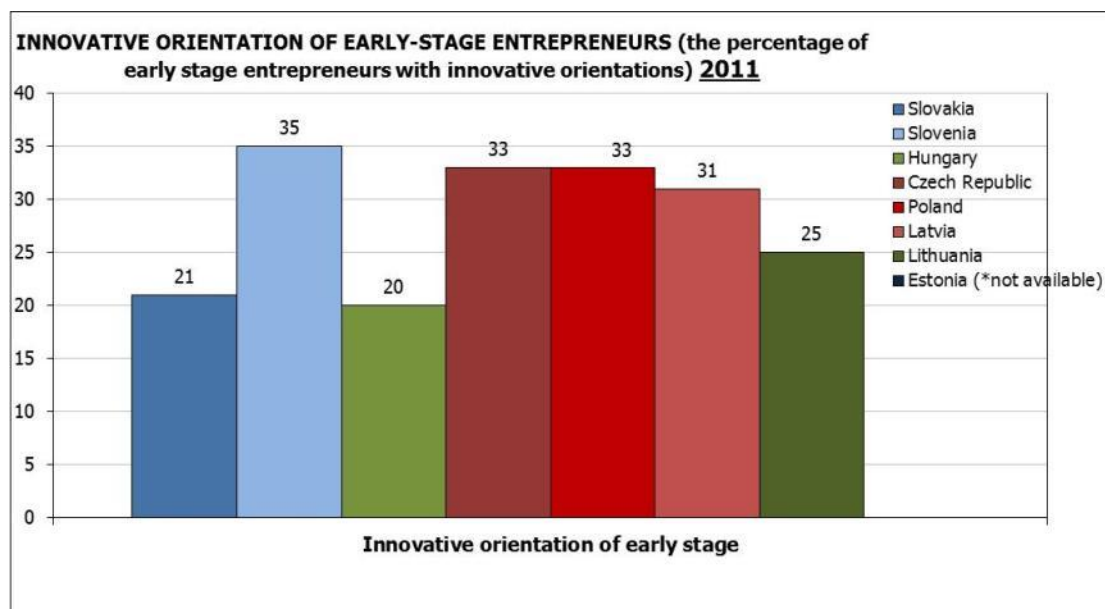

Figure 5. Innovative orientation (% of early-stage entrepreneurs)

Source: GEM data 2011-2012

Taking into consideration that the data for the innovation orientation of early stage entrepreneurs as well as the entrepreneurial employee activity were collected only for the year 2011 it is still helpful to illustrate the proximity of the analyzed countries. In 2011, Latvia, Poland, Czech Republic and Slovenia had from 31% to 35% early stage entrepreneurs with the innovation orientation, while Lithuania, Hungary and Slovakia possessed from 20% to 25% of entrepreneurs with the innovation orientation.

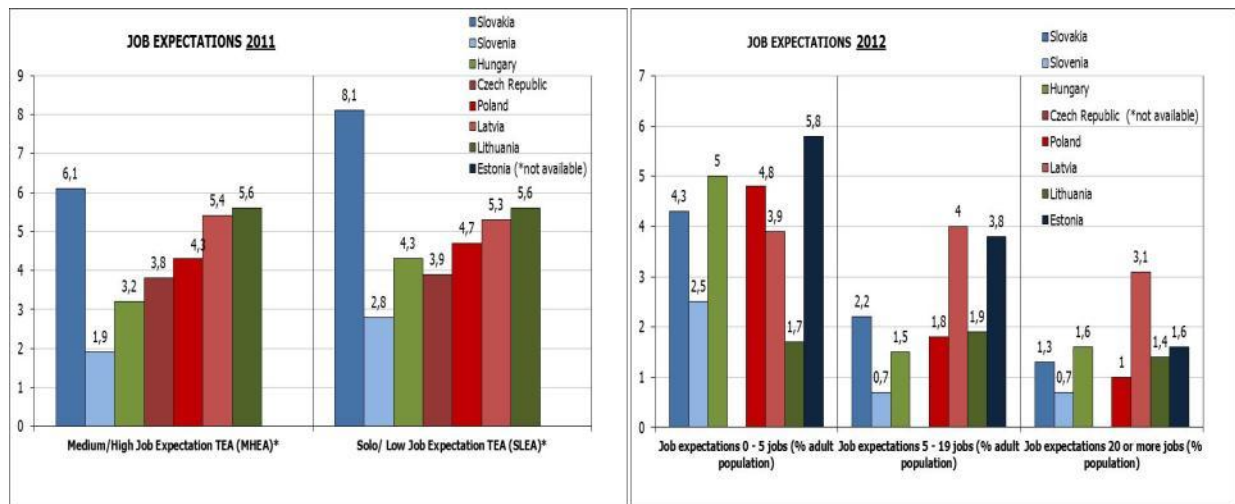

Figure 6. Job expectations (% of early-stage entrepreneurs)

Source: GEM data 2011-2012

The regional convergence is also witnessed in terms of entrepreneurial employee activities. In 2011 Slovakia, Czech Republic, Hungary, Poland and Latvia have relatively similar percentages of employees involved in entrepreneurial employee activity during the past three years (from 5% to 7,8%), while Lithuania and Slovenia were in lead (8,1% and 9,3%, respectively). These countries were also leading in terms of percentages of currently employed in entrepreneurial employee activity out of all employees (5.6% and 7,4% respectively). Other analyzed countries shown results from 3,6% to 5,2%. These numbers prove that the 8 analyzed CEEC countries are quite close in their innovation and intrapreneurial orientation. Although GEM indicators used for 2011 and 2012 for job expectations are slightly different they still show the differences among countries. In 2011 Slovakia (6,1%) takes lead in medium or high job expectations, followed by Lithuania (5.6%) and Latvia (5,4%). In 2012 Estonia joins the leading group of countries, while Latvia becomes a leader in terms of percentages of entrepreneurs who expect to employ 20 or more employees (3.1%).

Having the GEM data on the analyzed CEEC countries compared and the conceptual model tested there should be 3 important conclusions stated:

- Although these countries are very similar in their entrepreneurial dynamics, there are some peers' subgroups seen in this cluster. Baltics States are more converged, although Estonia emerges as a group leader, Slovenia and Slovakia behave like innovation-driven countries and are quite different from other countries, the largest country Poland experiences quite specific development of entrepreneurship, while Hungary and Czech Republic are exceptional, according to many criteria, as it's illustrated in Table 3.

	Fear of failure	Perceived opportunities	Perceived capabilities	Entrepreneurial intentions
Slovakia	↑ +6	↓ -5	↓ -3	↓ -6
Slovenia	↓ -4	↑ +2	0	↑ +4
Hungary	↓ -1	↓ -3	0	↓ -7
Poland	0	↓ -13	↑ +2	↓ -1
Latvia	↓ -4	↑ +9	↓ -3	↓ -3
Lithuania	↓ -4	↑ +7	↑ +5	↑ +1

Table 3. Change of entrepreneurial indicators during 2011-2012

Source: GEM data 2011-2012

- It is obvious that countries are similar in terms of intrapreneurship and innovation orientation; however, the fear of failure is more complex and culture-related factor in order to be converging only because of a common economic, social, political and business context of CEEC.
- Apart from such a contradicting argumentation, the role of fear of failure is clearly witnessed in the majority of analyzed countries, which matches the purpose of our article.

Example: Suppose that 2,000 respondents answered the question about business owner. Let's say that 79% of them said that do not have any business. This means that with 95% probability it can be said that the real value is in the range of $79\% \pm 2.5\%$.

INFLUENCE OF SOCIAL MEDIA ON THE IMAGE FORMATION OF A TOURIST DESTINATION: DIFFERENCES BETWEEN VISITORS AND NON-VISITORS

⁴Marketing, University of Castilla-León, Burgos, Spain

ABSTRACT

A destination image is perceived differently depending on whether you have previously visited the destination or not. Previous experience influences the image perceived. Non-visitors base their perception on information sources consulted. Recently, information from social media whose content is user-generated (UGC) has become a new information source. The aim of this study is to analyze the weight that different web platforms have as information sources and their influence on motivations for visiting a tourist destination and the perceived image; and contrast it between visitors and non-visitors. The results are useful to define which communication channels are better to invest in and what motivations are better to highlight in the communication strategies, depending on whether the Destination Marketing Organizations (DMOs) prefer to promote the loyalty of visitors or getting new ones. To carry out this research we got 541 surveys from Mallorca, both visitors and non-visitors. We have analyzed the information sources, motivations; cognitive, affective and unique image, general image, the intention to visit and to recommend.

Keywords: *destination image, image perception, user generated content, web platforms, social media*

INTRODUCTION

Destination image is composed of cognitive and affective attributes (Beerli and Martin, 2004) and unique attributes (Qu, Kim and Im, 2011). Cognitive image is composed of the characteristics of the place. Affective image is generated by feelings. Unique image is formed by features that make the place different. Information sources and personal factors influence on the formation of cognitive and affective image (Beerli and Martin, 2004). Cognitive, affective and unique images exert an influence on the perception of the general image, at the same time it has an effect on the intention to visit and recommend (Qu et al., 2011). We can differentiate between secondary and primary images. The secondary image is formed only by information sources consulted before

visiting the destination (Phelps, 1986). The primary image is formed when the destination is visited. How to choose a destination involves some risk, sources of information play an important and essential role in the perception of destinations to be considered in the decision-making process (Mansfeld, 1992).

Information sources can be organic, formed by friends and acquaintances; induced, belonging to the authorities of the destination, suppliers or intermediaries and ads; or autonomous, formed by media, documentaries and movies (Gartner, 1993). Recently there has been research on the Internet as a source of tourist information (Seabra, Abrantes and Lages 2007, Eurostat, 2012) or specific services such as search engines (Buhalis, 2003), social networks (Buhalis and Law, 2008), tour operators websites (Zins, 2009), online reviews (Papathanassis and Knolle, 2011), social media (Mackay and Vogt, 2012). Internet sources can be classified as organic, induced and autonomous (Llodra-Riera, 2013), unlike Beerli and Martin (2004) who considered it only as induced.

Destination image is different depending on whether the individual has visited the place or not (Hsu, Wolfe and Kang, 2004). According to Selby and Morgan (1996), understanding the different perceptions from visitors and non-visitors allows us to see the most important attributes and to re-evaluate the images to be incorporated in the planning of tourism marketing. The level of tourist experience has a positive relationship with the cognitive image among tourists who visit for the first time, and with the affective image between repeaters (Beerli and Martin, 2004).

LITERATURE REVIEW

Formation of the image of a tourist destination

There is no universally accepted scale to analyze the image of a destination (Beerli and Martin, 2004; Gomez, Garcia and Molina, 2013). Echtner and Ritchie (2003) suggest an ordering of the attributes of a tourist destination, on a scale ranging from psychological to functional. Other classifications suggest dividing the attributes into cognitive and affective (e.g., Qu et al., 2011). Cognitive evaluations imply beliefs or knowledge about the attributes of a destination; an affective evaluation stems from feelings about the destination. In combination, they determine perceptions of an overall image of the destination (Baloglu and McCleary, 1999). Noting the findings of Echtner and Ritchie (2003), Beerli and Martin (2004), Hosany, Ekinci, and Uysal (2007), and Qu et al. (2011) each constructed new models for analyzing the image of destinations. Beerli and Martin (2004) analyze associations using attributes proposed by previous authors and relationships among different components of the perceived image and factors that influence it, including information sources (primary and secondary), motivations, accumulated tourist experiences, and socio-demographic characteristics. According to Qu et al. (2011), cognitive, affective, and unique images of the destination influence the possibilities of repeat visits and intentions to recommend it.

In this research different web platforms complement the indicators that traditionally constituted information sources, as a latent variable. Accordingly, in our effort to analyze the image of tourist destinations, we review

three models: Beerli and Martin's (2004) global view of the image, with its focus on the cognitive and functional dimensions; Hosany et al.'s (2007) in-depth consideration of the affective and psychological dimensions; and Qu et al.'s (2011) study of the unique dimension. In this connection the main objectives of the research are: (1) to define a global model of the formation of the image of a tourist destination and (2) to analyze whether there are differences in the perception of the destination image between the segments of population of individuals who have visited the destination and those who have not visited it.

Hypothesis

Sources of information

Tourists consult varied information sources to decide and plan their trip. The information obtained by the previous experience also influences the image perceived (Beerli and Martin, 2004). Seabra et al. (2007) and Lookinside Travel (2012) provide an adequate classification of the different sources of information to consider. Furthermore, different Web platforms are used to disseminate tourism content, as we have explained in the introduction. In the literature consulted on the formation of a destination image there is no reference about the relation between information sources and motivations. However, if we reviewed the scientific corpus of persuasive communication, it was seen that persuasive messages, depending on the channels that were transmitted and the target audience that they had focussed, were used to try to change behavior (Stiff and Mongeau, 2003) and therefore had an impact on motivation (Wood, 1982). From the above, hypothesis 1 has been proposed regarding the influence of information sources on the formation of cognitive, affective and unique images, and the influence of information sources on the motivations for travel to a destination.

Hypothesis H1A. Information sources influence the formation of cognitive image.

Hypothesis H1B. Information sources influence the formation of affective image.

Hypothesis H1C. Information sources influence the formation of unique image.

Hypothesis H1D. Information sources influence motivations.

Motivations

During the last three decades there have been reports on how the sociodemographic characteristics and the motivations that lead to travel influence both the process of image formation, as well as that of the selection of the destination (Mayo and Jarvis, 1981; Gartner, 1993; Baloglu and McCleary, 1999; Beerli and Martin, 2004). Beerli and Martin (2004) evaluated the relationship between the perceived image and motivations of tourists, their accumulated experience of holiday travel and socio-demographic characteristics. The results indicate that: (1) motivations influence the affective component of the image, (2) holiday tour experience has a significant relationship to cognitive and affective images, and (3) the socio-demographic conditions influence the cognitive and affective evaluation of the image. Different indicators are used in the literature to assess the construct "motivation". This research draws on the motivations used in the residential tourism survey conducted by UIB (University of the Balearic Islands) the results of which were published by Campo-Martínez, Garau-Vadell and

Martínez-Ruiz (2010). In addition, we added the general motivation that is taken into account in the PITIB 2012 (relax, discover, enjoy, learn, know), and those defined by Lookinside Travel (2012). Based on the above, we propose the hypothesis 2: motivations influence the formation of cognitive, affective and unique images as follows:

Hypothesis H2A. Motivations influence the formation of cognitive image.

Hypothesis H2B. Motivations influence the formation of affective image.

Hypothesis H2C. Motivations influence the formation of the unique image.

Cognitive, affective, unique and overall images

Regarding cognitive image, previous studies (e.g., Beerli and Martin, 2004; Qu et al, 2011) do not show a consensus on the attributes used to measure it; each of them used a different terminology to describe similar concepts. However, some researchers like Qu et al. (2011) agree on quality perceived as a part of the formation of the cognitive image. In relation to affective image, this image seems to have a consensus on the use of the affective attributes relating to personality and image, and to use the same measurement scales considered in different works (Hosany et al., 2007; Murphy, Moscardo and Benckendorff, 2007). For this research, the affective attributes were selected based on the proposed model by Hosany et al. (2007). Finally, with respect to unique image, for this research, the attributes used corresponded to those proposed in the PITIB (2012). We have also added other attributes, used in tourist promotions conducted on Mallorca, and some of the most commonly used terms in searches about Mallorca made with search engines, such as rural farms to stay (to be checked with Google Global Market Finder from December 2012 - January 2013). We also consider rural farms, visits to vineyards and wineries and oil mills, promoted by the Balearics Government. There is a large consensus regarding the cognitive image that has a strong influence on the affective image (Beerli and Martin, 2004; Qu et al, 2011). Baloglu and McCleary (1999) show that evaluations of cognitive and affective perceptions have direct influences on the image. Qu et al., (2011) note how the unique image also contributes to the formation of the overall image. . Note that in this research what is tested is whether the unique image also exerts an influence on the affective image. In response to this the following assumptions are made hypothesis 3: affective image is influenced by cognitive and unique images, and the overall image is influenced by cognitive, affective and unique images.

Hypothesis H3A. Cognitive image influences the formation of affective image.

Hypothesis H3B. Unique image influences the formation of affective image.

Hypothesis H3C. Cognitive image influences the overall perceived image.

Hypothesis H3D. Affective image influences the formation of perceived overall image.

Hypothesis H3E. Unique image influences the formation of perceived overall image.

Intention to visit and recommendation

If individuals perceive positively the overall image of the destination, it influences the intention to visit and recommend it (e.g., Campo-Martínez et al., 2010; Qu et al., 2011). In addition, it also seeks to know if the intention to visit the island influences the intention of recommending it. Based on the above we formulate the following hypothesis 4: the overall image influences the intention to visit and recommend and the intention to visit influences the intention of recommendation.

Hypothesis H4A. The overall image influences the intention to visit.

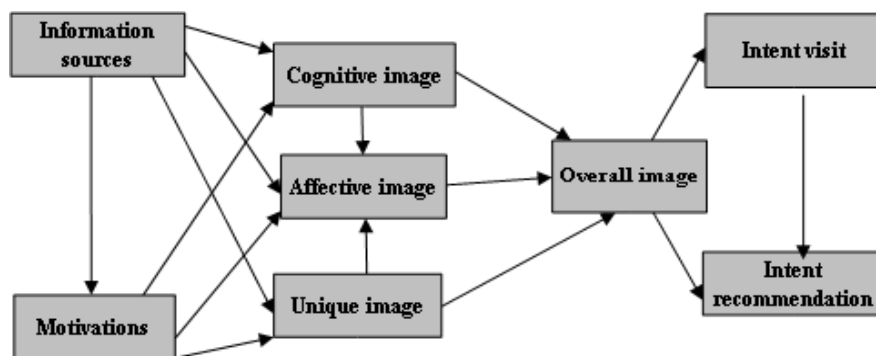

Hypothesis H4B. The overall image influences the intention of recommendation.

Hypothesis H4C. The intention to visit the destination influence tos recommendation.

Proposed model

The model proposed (Figure 1) is the summary of all the hypothesis proposed. We contrasted the model

Figure 1: Model of the formation of the image of a tourist destination.

between visitors and non-visitors.

RESEARCH

Design, methodology and composition of the sample

This research relied on an online questionnaire. The sample consists of potential users of the Internet. For our empirical investigation, we used image formation of Mallorca. It is a mature tourist destination, for which the main type of tourism is sun and beach. In recent years, responsible authorities have sought to diversify the tourist offer. For measuring the relations between variables we created scales of latent variables, observing explicit indicators, following previous researchers.

The resulting sample consists of 541 valid surveys which were gathered between 19th March and 2nd May, 2013. The universe is of international and national tourists as well as residents of Mallorca and the sample unit of a population of Internet surfers over 18 years old. The level of confidence is 95% for a sample error of 4.21%. We considered the segments of people who reside in Mallorca (23.8%), in Spain outside Mallorca (34.4%) and outside Spain (41.8%). 28.7% do not know residents. 68.25% have visited Mallorca. 13.3% are between 14 and 24

years of age, 61.9% between 25 and 44 years, 20.9% between 45 and 64 years and 3.9% are over 65. 46% of those surveyed were men and 54% women. As regards gross family income, the sample is quite evenly distributed: 20.9% with less than €15,000, 27.7% from €15,001 to €30,000, 21.3% from €30,001 to €45,000, 13.9% from €45,001 to €60,000, and the rest (16.3%) more than €60,000.

Results

For verifying Hypotheses, first an exploratory factor analysis was performed which allowed us to identify the underlying structure, and to condense the information gathered from the information sources, motivations, cognitive affective and unique images constructs. Their dimensionality was analyzed by means of an exploratory factor analysis of the data using maximum likelihood extraction with direct oblimin rotation (Hair, Anderson and Tatham, 1999).

Table 4. Table 1: Confirmatory factor analysis of the scale sources of information

In accordance with the approach, a first-order confirmatory factor analysis was carried out. In order to ensure convergent validity, those items whose load factors were not significant or less than .50 were eliminated (Bagozzi and Baumgartner, 1994) or for those which the Lagrange Multiplier Test suggested significant relationships regarding a distinct factor of which they were indicators (Hatcher, 1994) (Tables 1, 2, 3, 4 and 5). The results, like the different resulting models, that the Chi-squared value is significant although when the size of the sample is large ($N > 200$), this test tends to reject models which fit the data well; with the result that it is an unreliable indicator (James, Mulaik and Brett, 1982). Further, the rest of the specific indicators show a good fit (BBNFI; BBNNFI; CFI; IFI, AGFI and RMSEA).

For example, the confirmatory factor analysis of the scale sources of information (Table 1) shows how opinion leaders is the item with most weight (Lamda .894) followed by social networks specialized in tourism (.869), for measurement the latent variable of information sources. DMO would have to consider the spectrum of information sources, both offline and online, induced and autonomous, for promoting the destination. Besides, platforms which content is user-generated are as influential how traditional sources.

Table 5. Table 2: Confirmatory factor analysis of the scale of motivations

The confirmatory factor analysis of the scale of motivations (Table 2), indicates, i.e. that the price is the motivation which items that conforms this latent variable have less weight (Lamda .566 and .596). It can be interpreted that DMO would have not to base their communication strategy highlighting the price, but rather remarking motivations as discovery (.904) or enjoyment (.834).

Regarding the confirmatory factor analysis of cognitive image (Table 3), value for money of accommodation, sports, and nature are the items with more weight in the measurement of the latent variable (with a Lamda of .819, .805, and .770, respectively). These are the functional attributes more known in this case. DMO must consider if it wants emphasize the communication of these attributes or to introduce features of the destination less known.

Table 6. Table 3: Confirmatory factor analysis of the cognitive scale image

Relating to the confirmatory factor analysis of affective image (Table 4), the psychological attributes best considered, in the formation of this latent variable, are pretty, interesting, reliability and sincerity (with a Lamda of .830, .819, .807 and .807, respectively). For the DMO, keep those emotional values in its communication actions is a good strategy because of they are already recognized by users.

In relation to the confirmatory factor analysis of unique image (Table 5), the attributes that influence more, in the formation of this latent variable, are those related with the rural dimension (learning how to make olive oil and wine on location, with a Lamda of .967 and .890 respectively).

Next, we estimate the model (Figure 1), we used SmartPLS2.0 (Ringle, Wende and Will, 2005), and we established the significance of the parameters using a bootstrap re-sampling procedure with 541 sub-samples, equal to the size of the original sample. We provide the results of the structural model in Table 6. To guarantee convergent validity, we eliminated indicators whose factor loadings were not significant at least at 0.6. The resulting model indicated no reliability problems, according to any well-establish criteria: Cronbach's alpha, ($\alpha > 0.7$, Nunnally and Bernstein, 1994); compound reliability (< 0.6 , Bagozzi and Yi, 1988; Fornell and Larcker, 1981) and average variance extracted (< 0.5 , Fornell and Larcker, 1981). The most significant differences between visitors and non-visitors are (Table 6): (1) non-visitors give more weight to the webs from destinations, intermediaries and media as a source of information (FINF4). In both cases the UGC Websites are ranked fourth. (2) On the cognitive image, those who have not visited the destination give more weight to the perceived quality of basic infrastructure (IMCOG3). (3) In both segments heritage (IMUNI1) is the factor with more weight to the unique image. Whereas for non-visitors the second factor is the elite sports (IMUNI3) and for visitors the second one is rural areas (IMUNI2). (4) In the case of affective image, non-visitors point in first place sincerity (IMAFEC3), in the second accessibility (IMAFEC2) and in the third the enthusiasm and sympathy (IMAFEC4); for non-visitors the order of the factors is enthusiasm and sympathy, openness and accessibility.

Table 7. Table 4: Confirmatory factor analysis of the affective image

To assess the predictive capacity of the structural model, we followed the criteria proposed by Falk and Miller (1992): The R-square of each dependent construct must be greater than 0.1. In Table 7, we provide the corresponding values, as well as the results of the comparison of the model proposed in Some hypotheses cannot be contrasted. For non-visitors, information sources do not influence affective image (H1B), and the cognitive and unique image do not influence the overall image (H3C and H3E). For visitors, information sources do not influence cognitive and affective image (H1A and H1b), and unique image do not influence affective image (H3B). Those results indicate that DMO have to implement different communication strategies. The

channels and the messages have to adapt to those who have visited the place previously or for those who have never visited it before.

Table 8. Table 5: Confirmatory factor analysis of the unique image

We can observe that relationships of the hypothesis have a different weight depending on whether the place has been visited or not (Table 7). For non-visitors, first, general image influences the intention to visit and recommendation. Third, affective image influences overall image, affective image on cognitive and motivation on cognitive image. Sixth, information sources influence on motivations and these on unique and affective images. Ninth, information sources influence the unique image and eleventh on cognitive image. And in tenth place, intention to visit influences the intention of recommendation. We could not test the influence of information sources on the affective image, and cognitive image and unique image on overall image.

Regarding destination image formation of visitors, first, cognitive image influences affective image; secondly, the overall image exert an influence on the intention to visit; third, motivations on cognitive image; fourth, affective

image on the overall image and this one on intent of recommendation. Sixth, information sources influence the motivations; seventh, intention of visiting on the intention of recommendation; eighth, motivations on unique image and then on the affective image. Tenth, cognitive image on the overall image. In the eleventh place, information sources influence the unique image and; twelfth, and in a negative form, unique image influences overall image. We could not test the influence of information sources on cognitive and affective image, and the influence of the unique image on affective image.

CONCLUSIONS

All information sources have a high weight in the process of formation of image of a tourist destination. For both, visitors and non-visitors, induced information sources have a higher weight, i.e. those belonging to the DMO, suppliers and intermediaries. For non-visitors induced website pages also have a lot of weight. Social Media are significant although it is the factor with less weight. Therefore it is advisable to spread content about the destination not only in the official sites but also through suppliers and intermediaries, including their websites, with images that it really wants to project by the DMO marketing plan. For this it is convenient to disseminate the content and images owned by DMO in a Creative Commons or Copy Left licenses. As for cognitive image it is important to project the quality of basic infrastructure to attract new visitors, as it is the dimension that takes greater weight in formation of the cognitive image. In the case of Mallorca, as for the unique image, visitors perceive a rural environment unique, this attribute can be enhanced further since non-visitors perceive heavier elite sports. It is recommended to highlight the quality of basic infrastructure and those unique attributes that visitors appreciate better for attracting new visitors and fulfilling their expectations.

Table 10. Table 7: Contrast of hypotheses

As for the model of image formation in both cases has a very significant weight that the overall image influences the intention to visit in first position for non-visitors and second, by those who already know the island. For non-visitors it is relevant that the overall image largely determines the intent of recommendation. We recommend to implement actions of viral marketing, inviting those who have the intention of visiting the destination to convince some companion to travel together with them. In both cases the affective image is the most influential factor in the overall image and the cognitive image on the affective image. For non-visitors cognitive image has no influence on the overall image. For visitors, information sources only have weight on the unique image. In any case information sources affect the affective image; the motivations influence affective image. Visit intention influence recommendation more on those who have already visited the destination. For maintaining the loyalty of visitors it is recommended to use direct and personalized marketing and to propose unique and new attractions in the destination to surprise them and maintain their attention, besides it would be interesting to engage them proposing they invite new visitors. Most hypotheses run better with the group of non-visitors. To attract new visitors it is recommended to maximize cognitive and unique images, using as prescribers webs from suppliers and intermediaries. It is advised too to emphasize affective attributes and motivations associated with the variables best rated by visitors, who are the ones who really know the destination. In summary, first it has to spread knowledge about the place, then emotions associated to motivations for visiting it.

For further research it would be interesting to analyze what kind of image and content are shared by a destination through intermediaries and suppliers' websites and social media and how it can modify or enrich the image projected by the DMO.

STRUCTURAL CAPITAL AND BLACK AND SCHOLES METHOD: AN APPLICATION

Lombardi, Rosa; Manfredi, Simone; Nappo, Fabio; Russo, Giuseppe

Dep.t of Economics and Law, University of Cassino and Southern Lazio, Cassino, Italy

ABSTRACT

This paper provides a study based on the assessment of structural capital through the real option approach. In this way, the Black and Scholes method is used for an economic assessment of structural capital proposing research findings deriving from an empirical application. Methodology is based on a qualitative approach. Sourcing of data has been carried out through secondary sources.

Keywords: *structural capital, real options, Black and Scholes, economic value, evaluation, intellectual capital.*

INTRODUCTION

The paper studies the assessment of structural capital providing an updated conceptualization of methods existing through international literature, especially regarding real options methodology (Black and Scholes, 1972; Boer, 2000; Tseng and Barz, 2002; Zeng and Zhang, 2011).

In particular, structural capital (Lerro and Schiuma, 2013; Teece, 2000) defines future cash flows and understanding its economic value with traditional methods is not easy.

Hence, the proposal is to provide a study of international methods used by academic and professional communities to evaluate structural capital, by proposing an application based on the Black and Scholes method (Black and Scholes, 1973).

In this way, the aim of research is to understand how to evaluate structural capital (Chucchi, 2013) and if the economic value obtained from the application (findings) reveals an adequate measure of the asset. Therefore, the discussion is based on strong and weak points of Black and Scholes method in the assessment of structural capital.

The research approach is based on a qualitative method. Starting from a single method approach (Myers, 2013), the research is developed according to the study of international literature.

The article has the following structure. After the introduction, section two provides a literary review of methods used to assess structural capital. In particular, the study focuses on real option methods (Black and Scholes method). Section three describes the research methodology. Section four proposes the

research findings. Section five presents discussions and implications on research. Section six illustrates the conclusions, the limitations of the study and suggests future research.

LITERATURE REVIEW

The rule of structural capital (Itami, and Roehel, 1987) derives from the importance by all companies to create long term value (Daum, 2003).

Structural capital is part of intellectual capital (Edvinsson and Malone, 1997) and it is defined as a set of all the knowledge, coded and un-coded related to the company. Moreover, it includes patents, property rights, formal and informal organizational procedures, databases, networks, best practice, Internet, corporate values and organizational culture (Stewart, 1997; Sveiby, 1997).

In knowledge economy, the economic assessment of structural business (Boer, 1999; Ferrata, 2007) is necessary to understand its value in decision making process and to complete extraordinary operations between contemporary companies (Zanda, 1974). In this way, doctrine has undertaken the following methods:

1. cost-based approach;
2. value-based approach;
3. real options approach.

The cost-based approach is based on the economic of structural capital through actual or abstractly costs incurred for his creation, historical or reproduction cost.

The value-based approach defines structural capital estimating future economic benefits deriving from company assets.

The first two approaches need to be applied by knowing defined income and financial flows in assessing knowledge. For this reason, the real option approach (Amram and Kulatilaka, 1999; Banerjee, 2003; Barnea et al., 1980; Trigeorgis, 1997; Tseng and Barz, 2002; Wu and Tseng, 1986; Zhang et al., 2008) appears suitable for the assessment of structural capital (Hilli et al., 2007) and particularly risky investments, although this assessment approach has also been criticized (Black and Cox, 1976).

The real options forms (Black, 1971; Black, 1989; Buckley et al., 2002; Myers and Majad, 1983; Zeng and Zhang, 2011) are the following: development real option; deferment real option; real flexibility option; abandonment real options.

The real options assessment can be based on another two methods:

- the Cox and Rubinstein method (Cox and Rubinstein, 1985);
- the Black and Scholes method (Black and Scholes, 1973).

The Cox and Rubinstein assumption is that price option underlying evolves according to a binomial multiplicative process. An example is that underlying asset can grow with probability q of a

multiplication factor equal to u , or decrease with a probability equal to $1 - q$ and by a factor equal to the multiplication, replacing condition as $u > d$ (Cox et al, 1979).

The Black and Scholes method estimates structural capital starting value of real option (call and put) with the following inputs (Fontana, 2011): rate index known with the same value in the time; it is possible to sell without resource. There are not limitations to the use of income deriving from this kind of sale; there are no transaction costs; share price follows random walk; the share does not pay dividends during the life of a derivate; there are no opportunities without risk.

Fixed boundary conditions, one expression of Black and Scholes formula (closed; call model) is the following:

$$c = S_0 \times N(d_1) - Xe^{-i_1 T} \times N(d_2)$$

where:

c is the price of a european call real option;

and

$$d_1 = \frac{\ln\left(\frac{S_0}{X}\right) + \left(i_1 + \frac{\sigma^2}{2}\right)T}{\sigma\sqrt{T}}$$

$$d_2 = \frac{\ln\left(\frac{S_0}{X}\right) + \left(i_1 - \frac{\sigma^2}{2}\right)T}{\sigma\sqrt{T}} = d_1 - \sigma\sqrt{T}$$

in which:

c is the price of a (European) call (real option);

S_0 is the share price at the time 0;

X is the strike price;

i_1 is the risk free rate;

T is the contract residual life;

σ is the volatility of share price;

e is the base of a natural logarithmic function;

$N(x)$ is the cumulate function of a standardized normal.

The second expression of the Black and Scholes formula (put model) is the following:

$$p = Xe^{-i_1 T} \times N(-d_2) - S_0 \times N(-d_1)$$

where:

p is the price of a European put real option and other letters are specified before.

RESEARCH APPROACH

The qualitative research approach (Myers, 2013) is based on an analysis of the literature related to structural capital assessment, with special reference to the Black and Scholes method and real options approach.

Starting from a single method approach, data acquisition (Yin, 1994) was achieved through secondary research sources specified as follow:

- scientific books and articles (international literature);
- databases (particularly, ebsco and google scholar), news, documents and websites.

Application of the Black and Scholes method is used for the economic assessment of structural capital. Therefore, the proposed research findings deriving from an empirical application based on a certain number of hypotheses, utilizing the above method through excel.

THE ANALYSIS OF CASE STUDY AND THE RESEARCH HYPOTHESES

We widely accepted the Idea about economic value of companies in the new economy derives mainly from intangible assets that belonging to them (a right, called intellectual property). Trademarks, patents, and licenses are strategic assets to, generate cash flows independently with respect to the business complex.

Despite the traditional methodology of discounting cash flows is well suited to their assessment, but in recent years certain intangible assets are come up, and raised a few questions about their accuracy of estimation. Particularly, we are referring that type of intangible assets to generate cash potential flow, since for this reason it becomes difficult to assess according to the DCF method.

In fact, the use of real options drives from the inability of traditional capital budgeting tools to measure flexibility and discretion of management inherent in some investment projects.

The idea underlying in the approach questions is it allows you to tie the net present value of the investment in two components: The first one represents by the static nature of the NPV (Net Present Value), and the second one is in dynamic nature represents options in the project.

In order to clarify the steps which led to a reasonable estimation value of an option, analyzes the case of evaluation of a license to a drug with opportunities for deferment of production, throughout the following research hypotheses.

In this sense it is reasonable to assume that a company uses the license in the case where the cash flows arising from the sale of the products exceed the costs incurred to make it happen.

The assessment methodology follows the chosen approach of ongoing Black & Scholes model. Particularly, the present value of cash flows ($S - \text{cash flow}$), resulting from the introduction of the drug today is 34.165,30 (millions) euros determined by discounting for a reasonable rate of return on capital

"i" (risk free rate), of average flows prospective conceivable conservatively through an assessment of the potential market of reference of the product.

The initial cost (K – investment) of the drug is in fact equivalent to 25.491,34 (millions) Euro, the license is also legally protected for 15 years. The risk free rate was determined based in the gross yield on government bonds (BTP 15 years of 13.01.2014) and equal to 2.50 % .

And the standard deviation (σ std deviation), of listed companies operating in the biotechnology sector (Source: Damodaran "Jan"- 2014) appears to be a equal to 1.3364 .Consider that the product would have some impact on the market , particularly in the innovative way, it is easy to imagine the generation of extra profits by latter.

At the same time, however, the extra- profits will be linked to the period of legal protection of the license and then any delay (y - expected cost) in associating (linking to period) use of the same cost, the company bare on extra- profits.

RESEARCH FINDINGS AND DISCUSSION

The inputs have outlined lead through the application of the Black & Scholes method with the following estimates for "d" and "N (d)" (table 1 and 2; figure 1).

Table 2: Black & Scholes Application

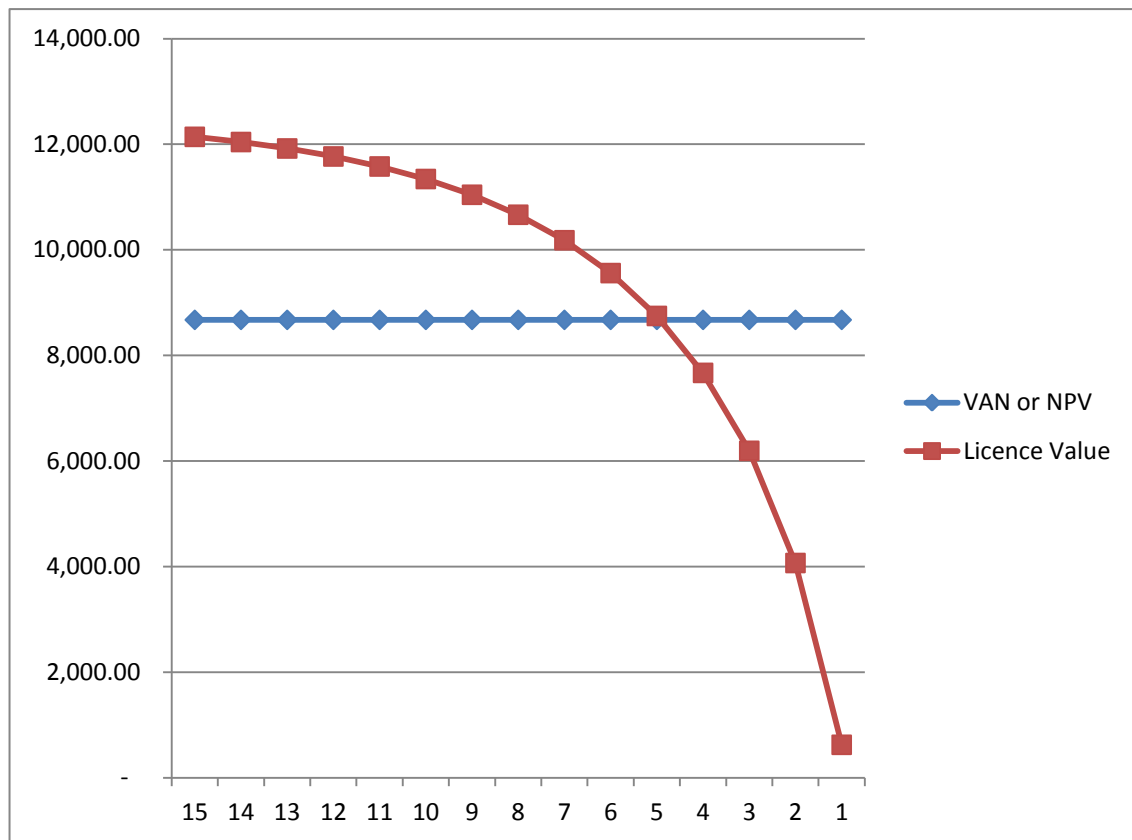

Figure 1: licence trend value

Based on the hypothesis mentioned in the last paragraph, a fixed cash flow during the next 15 years and a fixed investment for the same years, it can be concluded that the next eleven years the project is worth more than the license. Therefore, delay in the start of production, nevertheless face losing the extra profits, which may result in an increase of present value for the project compared to what you could get from an immediate start.

The license value logically decreases from during the years, but it is interesting to observe that the option value become negative in the last years.

In this case considered a fixed cash flow and investment we will have a fixed VAN (Net Present Value), in relation to the hypothesis mentioned in the example.

The option for deferment just analyzed was evaluated as a call written on the cash flows generated by the project and with price equal to the same investment required for the implementation.

In this sense, the management may choose to exercise the option made by the project where the constitutive conditions sufficiently favorable. Or not to exercise the option and in this case to transfer the license to a third party.

CONCLUSION

In recent years, the method of cash flows has been strongly criticized by those who believe in the approach through real options. The traditional methods of capital budgeting are poorly adapted to the flexibility of certain projects and but the dynamism of the markets characterizing the same.

On the base of literature review, introducing of Real Option Approach (ROA), gone beyond the limits of the Net Present Value (NPV) through the estimation of the various options inherent in a project.

In fact, the NPV assumes a symmetrical distribution of probabilities and a perfect coincidence with the modal value, explained by the lack of managerial flexibility. The real options introduce asymmetries in the probability distribution of the NPV particularly give the management some flexibility in decision-making that results in a greater chance to reap the benefits of positive future scenario .

However, that even the ROA, even today it is the most widely used method for estimating the present case at the high risk potential, begins with the subjective criticisms about litterateurs and new assessment personally goes on with me, by doing this, the reliability of the results to which the latter proofs has been completed.

The assessment and analysis made is not a new experiment, particularly the link operated between chaos theory and performance of the market, which would explain the occurrence of financial crises questioning the harmonious development of the market in the face of reality disharmonious similar to fractals (factors).

In light of the considerations made, it is appropriate to point out that this research is the basis for further studies that will address current trends in the field of structural capital evaluation.

EXCITEMENT, SOPHISTICATION AND UNIQUENESS AS DRIVERS TO CONSUMER-LUXURY CAR BRAND RELATIONSHIP

Loureiro, Sandra Maria Correia

Instituto Universitário de Lisboa, Business Research Unit

ABSTRACT

Research Aims

This research aims to contribute to go further in understanding the consumer-luxury car brand relationship. Hence, a model related to luxury car brand meanings and consumer-luxury car brand relationship is proposed and tested.

Keywords: Excitement, Sophistication, Uniqueness, Consumer-Brand Relationship, Luxury Cars Brands

THEORETICAL BACKGROUND AND HYPOTHESES FORMULATION

Product and organization associations represent the information linked to the node in the memory in the consumer's mind (e.g., Keller, 1993; Krishnan, 1996). Several researchers have demonstrated the positive influence of favourable brand associations on attitude towards a new product of a company (e.g., Aaker and Jacobson, 2001) or a positive brand attitude towards existing products (e.g., Low and Lamb, 2000; Van Osselaer and Janiszewski, 2001). In this vein, brand attitude can be viewed as a consumer's overall evaluation of a brand (product and organization). Favourable luxury car brand associations will lead to a positive luxury brand attitude and the following hypothesis is proposed:

H1: Luxury car brand associations positively influences attitude towards luxury car brands.

Brand personality has been defined as the set of human or quasi-human characteristics (e.g., Keller, 1998; Petromilli and Michalczyk, 1999) that are associated with a given brand. Aaker (1997) found five dimensions for brand personality: sincerity, excitement, competence, sophistication, and ruggedness. Aaker (1997) evidenced that, whereas sincerity, excitement and competence tap an innate part of human personality, sophistication and ruggedness tap what the individuals' desire but do not necessarily have. As Aaker (1997) also mentioned, sophistication is linked to brands such as Mercedes, Monet and Revlon. Later, Geuens et al. (2009) also developed an alternative brand personality with five dimensions: responsibility, activity, aggressiveness, simplicity, emotionality. The two scales have three very similar dimensions: excitement/activity, sincerity/aggressiveness and competence/responsibility. The last two dimensions represent a more romantic and sentimental

(emotionality) feature and simplicity (ordinary, simple). Regarding Aaker's (1997) perspective, the last two dimensions, sophistication (upper class and charming) and ruggedness (outdoorsy and tough), have been criticized for being based on user profiles instead of human personality structure (Azoulay & Kapferer, 2003; Geuens et al., 2009). The current study follows the conceptualization of Keller (1993) about brand image. Batra et al. (1993) and Davis et al. (2000) noted that brand personality can also be regarded as a component of brand image. Effectively, brand personality, the human or quasi-human characteristics can also build associations in the consumers' minds. Thereby, the following hypotheses are formulated: **H2:** Luxury car brand personality positively influences luxury car brand image; **H3:** Luxury car brand attitude positively influences luxury car brand image.

Customer satisfaction has been studied from two perspectives: transactional and cumulative. The transactional perspective considers that consumers make a judgment of a *specific* service encounter or consumption situation (e.g., Oliver, 1980). In a cumulative perspective, satisfaction is a holistic evaluation of the total purchase and consumption experience with a product over time (e.g., Lewin, 2009; Nam et al., 2011). Following the last perspective, the current study satisfaction measured satisfaction as an overall evaluation of the luxury car brands. Several studies point out satisfaction has a consequence of a favourable customer image or corporate reputation (e.g., Loureiro and Miranda, 2008; Loureiro and Kastenholz, 2011). A positive brand image could contribute to mould the overall satisfaction of a luxury car brand and even increase the confidence towards a luxury car brand.

Trust, commitment and even satisfaction are considered relationship-based constructs (e.g., Garbarino and Johnson, 1999; Sirdeshmukh et al., 2002). Morgan and Hunt (1994, p. 23) define trust as the perception of "confidence in the exchange partner's reliability and integrity". Trust has been considered an important determinant of commitment (e.g., Kingshott and Pecotich, 2007; Loureiro et al., 2012). Therefore, the following hypotheses are presented: **H4:** Luxury car brand image positively influences overall satisfaction; **H5:** Overall satisfaction positively influences trust in luxury car brand; **H6:** Luxury car brand image positively influences trust in luxury car brand; **H7:** Trust in luxury car brand positively influences affective commitment to luxury car brand.

METHODOLOGY

The car brands considered in this study were firstly BMW, Audi and Mercedes-Benz, but also Lexus, Porsche, Lamborghini, Aston Martin, and Ferrari. The reason for choosing such brands is the fact that these brands are the most representative of the E (executive), F (luxury) and S (sport) car segments according to the European Union (1999). The participants, car owners of such brands, were elements of car brand communities in Portugal and the United Kingdom. We received 368 complete fulfilled questionnaires. The majority of respondents were male (97%), which corresponds to the

male/female ratio existing in these car brand communities. Most respondents were aged between 40 and 60 years old. First, the questionnaire was pre-tested by the managers and some members of the car brand communities, around ten individuals. Thereafter, the members of car online communities (car owners) were invited to participate using an online survey.

CONCLUSIONS AND IMPLICATIONS

The results clearly point out the importance of associating excitement, sophistication and even uniqueness to the luxury car brands. These associations lead to a more favourable brand image than the direct associations to the product or the organization. In fact, the car's modern design, good performance, concern about customers and professional staff are important features which lead to a favourable attitude of consumers towards the luxury car brand, but this is not enough to create a significant positive image in customers' mind. The findings are in accordance with Batra et al. (1993) and Davis et al. (2000), which noted the potential influence of brand personality on creating a brand image in the consumers' minds. The role of brand personality on brand image seems to be more relevant in the context of luxury cars. Interestingly, more important than design, good performance and positive attitude towards the staff and corporate or car brand, is the encoding in memory nodes of words such as spirited, daring, imaginative, glamorous, charming, special or unique. These are key words that make the owner of the car desire and enjoy driving. The findings lead us to write some managerial implications. Luxury car manufacturers and brand managers should be aware that the magic, mystique and legend associated to the brand are really significant. Innovative design, performance, safety mechanisms, and up-to-date technology are key features, but above all luxury car brands should be able to build up in the consumers the excitement and the feeling that having and using the car is glamorous, charming and unique. Brands with tradition in the luxury market may avail themselves of the mythical images of glamor models and so may also convey to the consumers that the brand evolves without compromising tradition. New brands of luxury cars have to find an element that differentiates them and becomes them unique, through tangible associations (e.g., design, performance, new technology) and intangibles (e.g., create an idea that originates magic, excitement).

SOCIAL ENTERPRISE MANAGER'S CAREER PATH PREFERENCES: FUTURE DIRECTIONS

Maher, Chi

School of Management and Social Sciences, St Mary's University Twickenham, London

ABSTRACT

Purpose - this paper explores the career path preferences of third sector social enterprise managers in the UK. The literature suggests that understanding of managers' career path preferences (a variety of trajectories an employee is willing to take inter/intra organisational that fulfils his/her career needs) will provide organisations with the ability to design an effective career path options that will match individual managers' career needs with organisational needs (Petroni, 2000; Vos et al., 2007). However, there is insufficient research that has explored the career path preferences of third sector social enterprise managers. Given this gap in research, this paper seeks to identify whether we can conceptualize third sector social enterprise manager's career path preferences as vertical, horizontal, cross-functional (Petroni, 2000; Vos et al., 2007) or a combination of these types of career paths.

Design/methodology - a mixed method research design was employed. A survey and semi-structured interviews were conducted with forty operational managers working in eight social enterprise organisations to ascertain their career path preferences. In addition, eight HR managers working in the same eight organisations were interviewed to provide insight into managerial career path management systems in small social enterprise organisations.

Originality/value - The research makes a significant contribution in the field of career paths management in small third sector social enterprise organisations; by identifying career path of operational managers' which are not linked to monetary needs of individual's. This is significant for small social enterprise organisations seeking to retain managers; not through the promise of high salaries and bonuses but instead through proving opportunities that will match manager's career path needs .

Keywords: *boundaryless career model, career paths, social enterprise, managers, third sector*

INTRODUCTION

The DTI (2002:7) described social enterprises as:

‘...businesses with primarily social objectives whose surpluses are principally reinvested for that purpose, in the business or in the community, rather than being driven by the need to maximise profit for the shareholders or owners’.

Social enterprises are at the centre of current political and academic discourse in the UK (Alcock, 2010; Social Enterprise UK, 2011). The government believes that by the third sector adopting a social enterprise ‘business model’, will enable third sector organisations to become involved in commercial activities, either directly or through ‘trading arms’ (for example, charity shops, internet or community cafes) to support their social and environmental aims (Alcock, 2010; Scott and Teasdale, 2010). This will allow the sector’s organisations to be more sustainable and financially independent.

The UK Government’s expansion of the third sector social enterprise policy agenda opened up new funding streams that organisations benefited from such as: Future Builders, Capacity Builders Funds and Adventure Capital Fund. However, government funding to support third sector organisations to become financially independent have been mostly time-limited from the 1990s through to the current Coalition Government policy framework, which reduces public spending to the third sector (Cabinet Office, 2010; Wardle, 2013). This has affected managerial earnings. The average third sector manager earnings is 22.5 per cent lower than a public sector manager earnings and 27.8 per cent lower than a private sector manager earnings (NVCO, 2013). These factors have contributed to an increase in third sector operational managers’ turnover from 12.8 per cent in 2008 to 14.7 per cent in 2013 (NVCO, 2013). Small social enterprise organisations are seeking ways to develop appropriate and effective strategies to enable them to retain operational managers (Venter and Sung, 2011) and to develop managerial retention strategies that are not linked to pay awards (Coetzee and Schreuder, 2008; Guan et al., 2013).

Operational managers often undertake the management and day-to-day delivery of client services (Maher, 2009; Parry and Kelliher, 2011, Wardle, 2013). Therefore, the loss of a manager impacts on front-line service delivery, service management and the ability of organisations to comply with Quality Care Commission¹ requirements, which form part of the government contractual agreement for third sector social enterprise (drug and alcohol) organisations (Parry and Kelliher, 2009; Mold, 2012).

Operational managers turnover does not only disrupt delivery of client services it can also threaten the timely implementation of newly commissioned services (Nickson et al., 2008; Knight et al., 2011).

¹ The Care Quality Commission regulates all health and adult care services in England, including those provided by the NHS, local authorities, and the Third sector and Private sector organisations (The Care Commission, 2011). Scotland, Wales and Northern Ireland have a separate arrangement.

Furthermore, managerial turnover is considered as inimical to small social enterprise organisations ; due to its direct costs, such as replacement costs involving advertising the post, administration of the recruitment process and the time spent on new employee inductions; and indirect costs, such as reduced organisational performance level, the loss of organisational knowledge and less success in the adaptation and implementation of evidence based practice for the treatment of clients (Carroll and Rounsaville, 2007; Kim and Lee, 2007; Eby et al., 2011).

Researchers regard turnover that results from individual-level factors (such as, moving house, early retirement) are beyond the organisation's control and can occur in any organisation or sector (Knudsen et al., 2011). Therefore, this research focuses on exploring organisational factors that can be developed by small social enterprise organisations to enable them to reduce managerial turnover. There is evidence (Garavan et al., 2006; Wong, 2007; Rasdi et al., 2009) on ways organisations have reduced managerial turnover in the private and public sectors. These studies found that organisations can reduce managerial turnover by understanding and developing career paths that integrate career path needs of managers to organisational strategy.

The literature review suggests that careers and career paths in the third sector have largely been ignored by research with a few notable exceptions, such as Onyx and Maclean's (1996) study of intrinsic and extrinsic factors influencing the careers of workers in the third sector, Harrow and Mole's (2005) study of third sector chief executives careers and Maher's (2009) study of factors influencing career development in the Not-For-Profit sector. However, there is insufficient research that has explored the career path preferences of third sector social enterprise managers. Given this gap in research, this study provides an original empirical reserach and understanding of career path preferences of social enterprise operational managers.

OBJECTIVES

The objectives of this research are to explore and identify the career path preferences of small third sector social enterprise operational managers in the UK.

Research questions:

- What are the career path preferences of small social enterprise operational managers?
- Is there a relationship between small social enterprise operational managers' career needs, organisational factors and their career path preferences?

LITERATURE REVIEW

Public policy

The literature suggests that numerous public policy since the 1990's, such as, the 1990 National Health Service and Community Care Act in April 1993 and the introduction of competitive tendering process for contracts to third sector organisation's by the Labour Government in 1999, led to increased government regulation of the third sector and has influenced the development of managerial career paths in small third sector organisations (Nickson et al., 2008; Cunningham, 2010). The change in policy framework from grant-aid (funding awarded to third sector organisations to contribute to supporting particular social or environmental aims without specific outcome targets to be achieved); to formal contractual arrangements with specific outcomes targets (Osborne, 1997; Macmillan, 2010; Dickinson et al., 2012). Organisations are required to measure and report on every aspect of treatment outcome they achieve for clients (for instance, how many clients completed their treatment programme, enrolled in education or training) (Osborne; 1997; The Kings Fund, 2011; NVCO, 2012). Operational managers are usually assigned the role of contract management.

In recent years, government contracts are mostly awarded for one year and occasionally for three years and in some cases the funds are abruptly withdrawn if government priorities changes (Nickson et al., 2008; NVCO, 2012). This led to some third sector social enterprise organisations diversifying their funding sources to include other activities such as membership subscriptions, trading subsidiaries (community cafés and training services) and hiring of facilities (Lee, 1993; NVCO, 2011; Dickinson et al., 2012). Small social enterprise organisations that seek to raise funding from other sources have found that funding from these sources are also time limited (Cunningham, 2010; NVCO, 2012), ranging from a few months to a year (NVCO, 2012; Dickinson et al., 2012). This creates further financial uncertainties in these organisations and influences their ability to plan and develop managerial career paths (Cunningham, 2010; The Kings Fund, 2011; Parry and Kelliher, 2011). Next the discussion of boundaryless career model conceptualisation of career paths will help us to explore career paths in organisations.

The boundaryless career model

The boundaryless career model is based on the work DeFillipi and Arthur (1994) and Arthur and Rousseau (1996). They contend that due to changes taking place in the economy and labour market in the 1990s such as, organisations downsizing and de-layering that a career path based on a hierarchical, vertical progression in one organisation is not applicable in most organisations. They posited that career paths are no longer determined by the organisation. Individuals are self-directing and taking responsibility for accumulating and developing marketable skills and competencies in order to determine their career paths within and across organisations during their working life

(DeFillippi and Arthur, 1994; Arthur and Rousseau, 1996). In this regard, the individual acquires information, knowledge and marketable skills that will make it easier for him/her to pursue a career path that is suited to their needs within any organisation (Coetzee and Roythorne-Jacobs, 2007; Dries and Verbruggen, 2012).

The boundaryless career model conceptualises career paths as follows:

i. Vertical: a vertical career path involves upward progression within one organisation or several organisations determined by the individual. The individual accumulates competencies and undertakes training to gain skills within and outside the organisation to enable him/her to pursue a vertical career path suited to their needs as and when the opportunity arises.

ii. Horizontal: a horizontal career path involves side-ways progression to a specific or a specialist job within one or several organisations as the opportunity arises to satisfy his/her career path preferences.

Cross-functional: a cross-functional career path is characterised by an individual preferring to work on short-term cross-cutting projects in an organisation or managing several inter-related projects across organisations as the opportunity arises (Petroni 2000; Vos et al., 2007).

The review of managerial career path studies reveals that managers in the private and public sectors are pursuing career paths as conceptualised by the boundaryless career model (Martin, 2005; Wong, 2007 Cappellen and Janssens, 2010). The findings of this research will be compared with previous managerial career paths studies shown in Figure 1.1.

Figure 1.1: A sample of managerial career path empirical studies

Author (s)	Date	Research sample	Research findings
Gunter et al.	2002	A study of career paths of 494 German expatriate managers on international assignments	Boundaryless (vertical and horizontal) career paths within and across organisations
McDonald et al.	2005	A study of senior public sector managers in Australia.	Traditional (vertical) career path within the organisation.
Martin	2005	A study of 49 Australian managers' career trajectories after experiencing major organisational restructuring.	Boundaryless (vertical, horizontal and cross-functional) career paths within and across organisations.
Wong	2007	A study of the career choice of 117 Taiwanese managers' careers in China.	Boundaryless vertical and horizontal career paths within and across organisations.
McCabe and Savery	2007	A study of 126 managers' career paths in the convention and exhibition industry in Australia.	Boundaryless (vertical, horizontal and cross-functional) career paths within and across organisations.
Kim et al.	2009	A study of 34 male career path profiles of general managers of Korean super deluxe hotels.	Traditional (vertical) career path within an organisation.
Cappellen and Janssens	2010	A study of career realities of 45 global managers.	Boundaryless (vertical and Horizontal) career paths within an organisation.

METHODOLOGY

A mixed method research design was employed. Semi-structured interviews and a survey was conducted with forty operational managers working in eight (randomly selected) social enterprise organisations in three UK regions to ascertain their career path preferences in the sector. The surveys were assessed on a five-point Likert scale that allowed operational managers to indicate the importance of each of the statements from (1) being “very low importance” to (5) being “very high importance”. The reason for using the five-point Likert scale instead of a single item was due to the author operationally defining measurement of career path preferences as the average of all items relating to each career path. This method is in-line with Allen and Katz’s (1986) and Erdogmus’ (2004) approach in assessing the career path of managers and professionals in the private and public sectors.

The semi-structured interviews provided an opportunity for an in-depth understanding of the operational managers’ interview responses in relation to their reasoning for their different rankings of the career path survey. By this approach, the researcher is using the quantitative data and the explanatory power of qualitative data to provide an original contribution to knowledge and understanding of the career path preferences of operational managers.

In addition, eight HR managers working in the same eight organisations were interviewed to provide insight into managerial career management systems in small social enterprise organisations. The author employed computer-assisted qualitative data analysis software (CAQDAS) package (Bryman and Bell, 2011) Nvivo 9 to facilitate the data coding and clustering of themes.

FINDINGS

The survey results displayed in Table 1.1 show that operational manager’s career path preferences mean scores. A horizontal career path (4.01) has the highest mean score; a cross-functional career path (3.85) is rated second, while a vertical career path (3.13) is rated third by the operational managers.

Table: 1.1: Operational manager's career path preferences mean scores (N=40)

Career Paths	N	Mean
Horizontal	40	4.01
Cross-functional	40	3.85
Vertical	40	3.13

Source: Compiled by Author

Horizontal career path

Horizontal career path is the most preferred career path by the operational managers. The evidence suggest that operational managers are undertaking training to improve their skills and competencies; in order to pursue a horizontal career path within their area of specialism in their organisations. This supports Arthur and Rousseau (1996) suggestion that individuals acquire specific skills and knowledge to enable them to pursue the career paths that fulfils their career needs and values. For instance, operational manager 24 and 25 reported:

“The organisation has been pretty supportive offering training and some bursary. I’ve taken time off to do some training I can’t fault them. I have had some training on addiction work and it’s on-going. I have been building up my PDP [Personal Development Plan] yes pretty much; gaining knowledge and skills is on-going in this field. Also because my training is only in addiction, within the field I can complement different modalities. I want to specialise more in this particular area rather than move into say more general management position. My skills are needed here” (Operational manager 24: Counselling manager: Organisation F).

“The organisation has been very good very supportive this is where I want to be. I trained for years to get the Diploma [in counselling] so I want to stay developing the therapy side of things; I’m not interested in going into general management and fund-raising activities. I’ve kept up my PDP [Personal Development Plan]. I’m up to date with my counselling skills” (Operational manager 25: Counselling manager: Organisation F).

Operational manager 24 and 25 evidence clearly suggest that they want to remain as counselling specialists by developing their career paths in their area of specialism rather than into general management roles. These views were supported by organisation F: CEO/HR manager. She reported:

“All our managers are practising counsellors or therapists they are not interested in taking up full-time management posts. I have asked them and they’ve said no to general management. They are happy managing projects with some hands on client work. I have been encouraging managers to attend courses that would extend their project management skills. It always ends

up the same, they nominate to attend a course that is related to enhancing their therapeutic skills or addiction management knowledge ... their choice" (CEO/HR manager F: Organisation F).

The findings suggest that some operational managers stay in an organisation because they prefer a horizontal career path that offers them the opportunity to practice in their area of specialism. Therefore, organisations should recognise that they might not be able to retain some operational managers if they do not offer them opportunities to progress in their career path preferences.

The prevalence of horizontal career path among operational managers reinforces the findings of Chaudhry et al.'s (2012) study of managerial career paths in two multinational companies in Pakistan. However, there were some differences between the findings of this research and Chaudhry et al., (2012) findings. Chaudhry et al., (2012) found that several managers in their sample pursued horizontal career path within one organisation due to limited vertical path promotion opportunities available to indigenous Pakistan managers in the two large multinational companies. The main factors influencing small third sector social enterprise operational managers to pursue a horizontal career path is that, several of the study sample chose to pursue their career path preferences in a specific type of small social enterprise organisation that offers specialist services to a specific type of client group, which happens to be the services that these operational manager's wants to specialise in.

Cross-functional career path

A Cross-functional career path is the second preferred career path by the operational managers. The research findings suggest that the main factors influencing operational managers to prefer a cross-functional career path; is that it enables them to improve their chances of having continuous employment, in their respective organisations due to the short-term nature of the third sector funding regime (Kings Fund, 2011; Scott and Teasdale, 2012).

Some operational managers that preferred cross-functional career paths; stated that they have only worked across different projects within their organisation in the last three years; due to the organisation's income and funding structure. (Cunningham and James, 2007; The King's' Fund, 2011; Dickinson 2012). This has led to some operational managers preferring to work in a variety of cross-functional projects in order to widen their marketable skills base and knowledge, ready for when the next project comes along. Some operational managers reported:

"The organisation funded some qualification courses that I have been on and other courses. I regularly attend courses and up-date my C.V. With this sector you need to have your skills regularly up-dated if funding is coming to an end on a project that you're working on and another project comes up if you can be fitted into a role there they will fit you in. So you

need to be ready to move across projects according to the funding received” (Operational manager 27: Services manager: Organisation E).

“The organisation provides opportunity for training even with all the changes taking place in this sector which affects our organisation. I have to take training on board. I have to be flexible to go where the work is, where we have funding for a project. I have grown to be strong to be positive in times of uncertainty. I have completed my NVQ [National Vocational Qualification] level three in management. I was leading one project, when we lost funding for that project I had to take on another project. I’m now managing the carer’s advocacy project and the home visiting project. You’ve to adapt. You’re learning all the time. It’s also rewarding working here”(Operational manager 28: Advocacy services manager: Organisation E)

Operational manager 27 and 28 stated that they always seek continuous skills development and training opportunities to enable them to enhance their skills and knowledge so that they can remain employed. Their views were supported by HR manager E evidence. HR manager E reported:

“Employment contracts are based on the funding we get. Most of our contracts are short term as you know. If a particular contract is ending the people working on that contract are moved to a project where we have received funding from another pot of money. So we have more sideways moves and cross-functional moves than upward moves for the reasons that I have described. Managers are move from project to project depending on what funding we have got in. However, we have had some upward moves for instance the CEO [Chief Executive Officer] was promoted from within the organisation. But an upward move does not happen that often” (HR manager E: Organisation E).

HR manager E’s evidence was further supported by HR manager B, who stated that the reasons why small social enterprise organisations predominantly provides cross-functional career path is due to the size of the organisation, funding structure and partnership arrangements with other organisations that are stipulated by some government contractual agreements. He reported:

“It is difficult with a small organisation to look at where managers are going to go. There isn’t much space for upward promotion here. We look at side-ways and multi-project management moves. We are contracted under a particular framework of 'Supporting Peoples Agenda'. If a manager has a particular skill they want to further if we can find a way to make it happen, without breaching our contractual agreements, we will completely explore it. What we cannot do is to provide a service that another organisation is contracted to provide in order to accommodate someone’s career path needs. That will be undermining the agency’s partnership arrangements with other organisations. It is not easy to find the conditions to

fulfil each individual career path needs within an organisation of this size. So managers should be ready to move across to projects where we have funding at any particular time” (HR Manager B: Organisation B).

The evidence demonstrates that short-term funding of small social enterprise organisation’s abilities to develop a variety of career path options that are suited to the desired needs of managerial staff. As a result they offer managerial staff cross-functional career paths opportunities depending on the income and funding received.

The fieldwork finding conforms to Martin (2005), McCabe and Savery (2007) study of career paths of managers in Australia they found that most managers in their samples were pursuing a cross-functional career within their industry. Martin (2005) found that managers in his sample tend to pursue a cross-functional career path when the organisation was restructuring. McCabe and Savery (2009) found that managers in the convention and exhibition industry accumulated a portfolio of technical skills which gave them access to work on cross-functional projects in the industry in order to remain employed (projects in the convention and exhibition industry are often multi-dimensional and time limited). Similarly, third sector social enterprise operational managers that prefer a cross-functional career path were engendered by the need to remain employed in the sector due to short-term nature of third sector income and funded projects.

Vertical career path

Vertical career path is the third and least preferred career path by the operational managers. The fieldwork evidence suggests that a vertical path is preferred by some operational managers. These operational managers achieved a vertical career path through their own initiatives (identifying their training needs and attending the identified training courses) and organisational initiatives such as internal career advancement opportunities that their employing organisations have provided. They added that most of their qualifications post GCSE and A level education was provided by their organisations. This has enabled them to progress vertically within the organisation’s managerial hierarchy. Operational managers that prefer vertical career path reported:

“I started here as a receptionist. I have gained lots of skills and qualifications through training from this organisation they [the organisation] are very supportive, they are fantastic. When I find training that I needed, I went and presented it [the training course] and they [the organisation] have funded it. When the finance manager’s position came up because the finance manager retired, the director asked me if I would be interested in applying, I said yes. I applied and got the job. The organisation is akin to promoting from within the organisation because the people here already know how things work here” (Participant 1: Finance/development manager: Organisation A).

“The organisation has been fantastic. I started here as a support worker part-time. I was promoted to a co-ordinator and now I’m a team manager. My manager is great he has given me awareness and allowed me to use my initiatives to find training I need. He gave me exposure to things that other manager’s in other organisations would not necessarily get exposed to for example, training in management skills, visiting other projects which has helped me to move to the direction I want to go. Yeah helped me to move up” (Operational manager 11: community Inclusion manager Organisation C).

It is evident that these operational manager’s ability to pursue their career path preferences was made possible by their own efforts and the organisation’s initiatives. Operational manager 1 and 11 stated that without the training and support provided by the organisation; it would not have been possible for them to pursue their career path preferences within the organisation. These views were supported by HR manager C:

“We send managers to training such as, NVQ [National Vocational Qualification] courses which are suited to their role. If a manager has the aspirations to go up [vertical] managerial route and they are prepared to put in the time and effort to achieve that, we [the organisation] would support that. We support them to get there quickly. I will say it comes down to attitude of individuals if they come willing to be successful and fit in with the ethos and culture of the organisation. They will have the support [from the organisation] to help them to develop and progress. My director came through the internal ranks of the organisation, if you show initiatives the organisation will support you to progress where you want to go” (HR manager C: organisation C).

The evidence from HR manager C suggests that some small social enterprise organisations will support operational managers to pursue a vertical career path, if the individuals are committed to progressing through a vertical career path while helping the organisation to meet its objectives. The research finding provides additional support to the findings of previous managerial career paths studies (such as, McDonald et al., 2005; Kim et al., 2009) that found that vertical career path was pursued by managers in their sample.

The fieldwork findings provide important insight into the nature of the career path preferences of small social enterprise operational managers in the UK. Although the findings suggest that the career path preferences of operational managers conform to the career path preferences of managerial staff in the private and public sectors; some contextual third sector factors (such as, short-term funding, organisational size and government contractual agreements with small social enterprises (Scott and Teasdale, 2012) were identified as factors constraining the ability of small social enterprises to provide operational managers with career paths option.

CONCLUSION

The findings provides evidence that aspects of the boundaryless career model (Arthur and Rousseau, 1996) that conceptualises career paths (as horizontal career path, cross-functional career path and vertical career path within an organisation) were found to be evident as the career path preferences of small social enterprise operational managers.

A horizontal career path within one organisation is the most preferred career by the operational managers followed by cross-functional career path within one organisation. There was little evidence to suggest that operational managers preferring horizontal and cross-functional career paths across organisations. Therefore, the boundaryless career model conceptualisation of horizontal and cross-functional career paths across organisations was not supported by the research evidence.

Operational managers that preferred vertical career paths were able to do so when a position becomes available in their respective organisations. In the case of small social enterprise, vertical career path is not based on sequential ready-made vertical career path progression. It is more relational (a vertical career path progression is made available when funding is received or when someone retires). It is not surprising that a vertical career path is the least preferred career path by several operational managers in this study. Small social enterprise organisations have limited funding and income and as such, they are unable to develop layers of management ready for managerial progression.

Overall, the findings suggest that operational manager's career path preferences in small social enterprise organisations are influenced by the individual's values and career needs and the organisation's ability to provide career path options. The findings suggest that operational managers are not totally independently self-directing their career paths as suggested by the boundaryless career model (Arthur and Rousseau, 1996). This led the author to define social enterprise operational manager's 'career path preference' as:

“an intersection of an individual's led initiatives (training, networking) and opportunities provided by the organisation (training, availability of jobs) to meet the person's desired occupational and career path trajectories” (Original: Maher, 2013).

Small social enterprise organisations need to be aware of the factors that influence operational manager's career path preferences and the positive outcomes (such as, retention, organisational commitment, etc.) that could be achieved when there is a match between operational manager's career motives, career path preferences and organisational needs. This research provides an insight into the contextual factors that shape and constrain operational managers' career path preferences in the third sector. This is significant for small social enterprise managers seeking to retain managers, not through the promise of high salaries and lifelong benefits, but rather through providing opportunities that will enable operational managers to develop projects and have independence in managing these projects.

An additional contribution of the research is that it addresses an important gap in the career path literature by providing a detailed exploration of the career path preferences of the third sector operational managers. The research findings have raised important issues for policy makers and organisations to consider, the future directions of operational managers career path preferences

WHAT WINE TOURISTS WANT? A NETNOGRAPHIC ANSWER¹

Maizza, Amedeo; Cavallo, Federica; Iaia, Lea

Department of Management, Economics, Mathematics and Statistics, University of Salento, Lecce, Italy

ABSTRACT

The work aims at examining the online communication started by wine tourists on Web, in order to i) identify topics and subjects around which wine tourists mainly discuss and to ii) profile them, through a netnographic approach.

The originality of the paper can be identified in the application of the research methods still less used in the touristic marketing studies, although through them it is possible to express interesting research hypothesis.

Managerial involvements can be found in the possibility of using the results emerged from the analysis of the user generated contents (UGCs) so as to be able to (re)direct the communicational strategies, developing, at the same time, a targeted and personalized tourist offer.

Keywords: *online wine tourism communication, wine tourist netnography, Web 2.0, wine.*

INTRODUCTION

Wine is a product which can become the cornerstone of online socialization, thanks to its cognitive value, from which emotional and experiential circumstances originate, linked not only to its characteristics, but also to its area of origin (Mattiacci, Ceccotti and De Martino, 2006; Costantinides and Fountain, 2008; Li and Bernhoff, 2008; Vrontis et al., 2011a, b).

Consequently, wine tourism, too (Anholt, 2007; Hall *et al.*, 2000) could show similar features, as it is identified for a different use of the touristic product, characterized by particular needs that often determine the reasons of customization of the tourist offer; in such context, indeed, peculiar needs (related to the knowledge of the specific area, culture, traditions and life style) prevail and extend the usual wine world field *strictly speaking* (Mitchell *et al.*, 2000).

For the above-mentioned reasons, the role of *web communication* in this particular field seems to be significant but, at the same time, complex, as it requires targeted *web marketing* actions (Buhalis and Wagner, 2013); for enotouristic destinations the on-going digital revolution, indeed, can represent a

¹ The current paper has to be considered as a preliminary phase of the research project called "The Apulian tourisms: analysis of the competitiveness of the Apulian territories" (original title: "I turismi di Puglia: Analisi della competitività dei territori pugliesi"), commissioned by Puglia Promozione, the Destination Management Organisation (DMO) of the Apulia Region.

big opportunity because the user generated contents (so-called UGCs; Wunsch-Vincent and Vickery, 2007) are valuable information in order to develop a customized, targeted communication which can allow a better *customer experience* and a far more incisive interaction (Sigala, 2012; Kujala, 2003).

NETNOGRAPHY: A BRIEF REVIEW

The paper, which is part of a wider field of research, is included in the studies connected to *web communication*, then trying to contextualize them in the field of such a specific sector as wine tourism. In this sense, it is possible to talk about *consumer-to-business* or *reverse marketing* due to the contribution that the tourist can give to the co-creation of many attributes of *product-offering* or other elements of *marketing mix* (Neuhofer *et al.*, 2013; Prebensen and Foss, 2011; Tapscott, 2009; Zwick *et al.*, 2008; Prahalad and Ramaswamy, 2004), in a perspective of *digital prosumerism* (Ritzer and Jurgenson, 2010).

It is thus particularly significant to try and outline the different typologies of web users on the basis of the different conversations and of the mostly discussed *topics* by such groups of Internet users; for this purpose the netnographic analysis may be used as a support (Kozinets, 2002).

Netnography develops as a branch of ethnography and cultural anthropology, applied to the Web; such technique is based on the body of contents from online sources, in which the topic under consideration as well as the subsequent interpretation of data are discussed (Kumar *et al.*, 2013; Wu and Pearce, 2013; Ismail, 2010; Reynolds, 2010; Quinton and Harridge-March, 2010; Xiang and Gretzel, 2010; Puri, 2007; Dalli and Corciolani, 2007). As the textual contents (in their scientific-cultural dimension of social interaction) are more and more common on the Web, in the latest years there has been a sharp increase of studies and researches – especially in the sociological field – based on netnography, defined as “ethnography adapted to the complexity of contemporary social world”, in other words as a method that can provide a privileged access to the comprehension of “life in the age of technologically mediated culture” (Kozinets, 2010).

The netnographic approach used in the present paper is based on the direct observation of the virtual community through the analysis – without a direct participation – of the conversations realized on the communities examined (De Valck *et al.*, 2009; Cova and Pace, 2007).

OBJECTIVES AND METHODOLOGY

Considering the importance of a permanent activity of examination/monitoring the *consumer-generated media*, the current paper starts from the follow research hypothesis:

The topics around which enotourists' discussions revolve can offer useful advices for the business organization, in order to profile the wine tourists, so as to formulate a personalized and effective communication strategy.

So, the research question is:

What are the main discussion topics on blogs, forums and communities? In other words, what are the most requested information by wine tourists and upon which they mainly discuss?

Based on previous study (Fait *et al.*, 2014, Maizza *et al.*, 2014, Scorrano *et al.*, 2013), the following wine tourism destinations, considered of excellence by wine tourists, have been examined: Napa Valley, California, Bordeaux, France, Tuscany and Italy.

Then, a research on *Google.com* has been carried on (on December 2013), using the above-mentioned keywords (*wine tourism*, combined with each *destination name*): for such analysis, the results connected to the first three pages of the *search tool "Discussion"* have been examined. In this way, it has been possible to identify blogs, forum and communities about which wine tourists talk about the topic under consideration, discuss, exchange information and express opinions and/or decisions.

Such subjects have been re-elaborated, according to the *text mining* method – which allows, through the automatic extracting of information from a usually huge amount of different unstructured textual resources, to discover previously unknown information using computers (Witten, 2005) –, in order to emphasize the most recurring *topics* and the most sought-after topics/data by wine tourism lovers, with a double final purpose:

- pointing out the subjects around which these users mostly discuss, as well as verify if the data searched by users are (easily) available also on the business website of the related *wine destination*;
- comparing the results, diversifying them for wine-destinations, with the aim of realizing a netnography (defined by Kozinets as: “*a new qualitative research methodology that adapts ethnographic research techniques to the study of cultures and communities emerging through computer-mediated communication*” Kozinets, 2002) that allows to outline the characteristics and possible peculiarities of the different *wine tourists*, in relation to the mostly treated subjects.

THE NETNOGRAPHY ON WINE TOURIST CONTENTS

The *Discussion search tool of Google.com* has been used here. It reports as results only blogs, forums and communities on which the discussion is about the examined *wine destinations* (used as *keywords* for the research); from the results obtained, only the first three pages have been considered. From each of them the text of the title or of the given question has been taken, as well as all the comments/replies, except for those related to groups created on Google (*www.groups.google.com*), for which the registration to the community was necessary; in this way, it has been possible to assemble the contents of 25 online platforms for each enotouristic destination, each of which, provided, on the average, about twenty comments among *wine tourism* lovers. On the whole for each of the 6

destinations it has been analysed: 25 platforms, each containing at least 20 comments (in order to emphasize the overall numerosity of the analysed comments, it must be taken into consideration that the overall text analysed by the T-Lab software is equal to 1.000 pages in .doc format).

The textual content of the *online discussions*, identified employing the above-mentioned methodology, has been analysed through the text mining approach re-elaborating:

- 7.894 elementary contexts (cf. box),
- 19.592 forms,
- 16.291 terms (cf. box),

for a total amount of 308.675 occurrences, considering a threshold equal to 6.

The elementary contexts can be of four types: 1. *Phrases*, that is elementary contexts identified by strong punctuation (?!), with minimum length of 1.000 characters; 2. *Fragments*, obtained through a segmentation algorithm that considers as elementary context every word sequence interrupted by a new paragraph (line break) and whose size is less than 400 characters; 3. *Paragraphs*, that is elementary contexts identified by strong punctuation (?!), and by line break, with maximum length of 2000 characters; 4. *Short texts*, if the corpus is made up of texts with maximum size of 2000 characters (e.g. answers to open questions).

The T-Lab software, for all the lexical units of the corpus, reports two pieces of information: the first, called *form*, contains the transcription of lexical units (single words or multiword) as strings recognized by the software; the second, that is the *word*, contains the labels in which the lexical units have been grouped and classified during the phase of automatic lemmatisation.

From a first analysis, it is possible to notice that UGCs revolve mainly around the word “wine”, which records a number of occurrences equal to 3.376 (Such value of occurrence related to the term “wine” is higher to the element observed on wine destination websites; this is to be ascribed also to the greater sizes of the contents of discussions as compared to the former); after such climax, the most used keywords are those characterizing the ‘experience’ (323) of enotouristic journey, in the strict meaning of journey: “winery” (1.356), “tour” (1.203), “visit” (1.036), “taste” (815), “tourism” (489), “travel” (422), “vineyard” (371). Taking into account, instead, the evaluative aspect of the same experience, the words frequently used by enotourists turn out to be: “great” (619), “love” (308), “enjoy” (273), “beautiful” (228), “fun” (155), “wonderful” (145), “easy” (139), “amaze” (121).

In fact, although the *discussions* are linked by the same thread (the interest towards areas suitable for productions of high-quality wine), the macro online discussion among wine tourist can be led back to two typologies of “*suggestion*”:

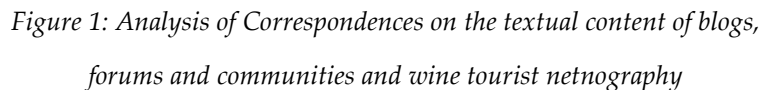

- *expert*: favouring the aspects linked to wine-cellar and vineyards to visit, to the produced wines and their characteristics, to tastings and the most important events organized on the area;
- *funny*: linked to complementary aspects of the places taken into consideration; the landscape, culture, history are emphasized as well as the gastronomic specialities, the traditions and the possible activities to be done during the holiday.

Anyway it is important to highlight that the names of *wine destinations* analysed recur in the text in the following order: “Italy” (684), “Napa” (521), “France” (353), “Tuscany” (336), “Bordeaux” (333) e “California” (192). These numerical values suggests two considerations:

- the first two destinations are those that can generate greater contents, thus obtaining a high number of posts;
- there are discussions and exchange of information about these main wine destinations not only when the post concerns directly or not the destination; for example, there usually recurs a reference to Italy when an opinion and/or a suggestion related to Tuscany is then extended and enriched with information regarding the whole country; moreover Italy appears in *discussions* concerning France, very often in order to make a comparison, that is to underline the peculiarities of each or emphasize the similarities.

This is also confirmed by a further in-depth analysis conducted through the *Analysis of Correspondences* (cfr. Fig. 1), allowing to agglomerate the dispersion of data in a reduced space, thus explaining the polarization of variables and terms by the axis of a Cartesian graph (the axes of the graph correspond to the *factors*, that is to variables created ex novo explaining the different oppositions between the poles of factors. Factorial polarity, that is the opposition on the horizontal and vertical axes of the graph, is determined by the Test Value; this index has a threshold value equal to 1,96, that is equal to the most common statistical significance (p. 0,05), and a positive or negative mark).

With the help of this instrument it has been possible to summarize the information traceable on blogs, forums and communities in a bi-dimensional space. The relations between the context units in terms of proximity-distance (similarity-difference) have been analysed, in order to identify the behaviour of the different wine tourists, in relation to the destinations under consideration.

- sophisticated*: that is those who privilege the “fashionable” aspect of the site, who exchange views on which is the best “chateau” to visit or the best “vintage” offered by “wineries” during the tastings; with accurate precision, many suggestions concerns not only the technical characteristics of local productions, but also the price (<<A red Bordeaux wine needs at least 10 years to mature. A young red Bordeaux, even when it comes from a grand chateau, is just bland and full of tannins. The complex fruit and mineral aromas need time to develop>>; <<More recent vintages range in price from \$29 a bottle for the 2002 all the way up to \$83 for the 1999>>). The most frequent items are at a significant semantic proximity with the contents related to Bordeaux variable;
- wine-oriented*: formed by enotourists that on the Web mostly discuss about Napa Valley and California; the information related to these two enodestinatons are linked to the *wine-world* itself. They often discuss about people involved in the production chain; they talk about the best wines – very often emphasized with superlative adjectives –, the wine-cellar, the vineyards to visit and the importance of learning aspects linked to the growing and production during these tours (<<Always a better experience doing the small production wineries, IMO. Meeting the owners and winemakers is so special! >>; <<The Syrah is slap-your-mama fantastic, and I could bathe in the Zinfandel and Cabernet. Even the Chardonnay is superb. None of Chris’ wines overpower you with alcohol, yet they’re all big, robust wines, including the white. You can actually

taste the grapes, the soil, the rocks, the wine. You HAVE to stop in here and buy a bottle or two. He'll take you out amongst the grapes for an agriculture lesson if you ask him to. He's always great about educating his customers. We're headed out there for Memorial Day week, and I can't wait. Can you tell I'm a big fan?>>; << The wines were quite good, and we really got a good education in wine country agriculture and wine making.>>).

- *typical-oriented: wine tourists talking about Italy, Tuscany and France; on the Web they analyse cultural and architectonic aspects of these places, emphasizing history and traditions, as well as "food" and typical products. Tracing back their tours, they suggest in a detailed way the activities to do, the monuments to visit, how to buy the tickets for the museums and how to reach the most interesting towns (<<You'll have a wonderful time discovering the area you stay in - shopping for local products, eating good food, drinking good wine (it is hard to eat badly in Tuscany, most "trattoria" have extensive wine lists just like the restaurants do) and most of all taking part of your nephew's wedding in such a beautiful context as Tuscany!!>>).*

Besides the observed clusters, there are also terms located around the centroid of the bi-dimensional space examined, that have proximity relations, from the lexical point of view, with all the enotouristic destinations under consideration. From the observation of these words, that are common to all the different destinations observed, a quite positive *sentiment* emerges by enotourists: as you can see from the previous graph (cfr. Fig. 1), the *tour experience* in the wine destinations is usually identified by lexical units, such as: "good", "favourite", "enjoy", "excellent", "great", "nice", "beautiful", "wonderful", "interest", "pretty".

It is useful to consider, at last, the presence, even if very reduced in number (only three), of negative adjectives; it is interesting to underline that lexical unities such as "negative", "not good", "expensive" do not qualify the products and/or the areas closely linked to the wine destinations under consideration, but are usually linked to the purchase of extra-services (water taxi, lunch, gift): <<From the cruise port you can choose three different means of water transport; most expensive is a private water taxi.>>, <<My favourite place in Italy is the island of Capri, but boy is it ever expensive! Me and my partner paid £30.00 for burger and chips each and one small beer each, and that was back in 2007!>>.

CONCLUSIONS

The present paper has originated from the hypothesis of research below (and the related questions):

The topics around which the discussions of enotourists revolve can provide useful suggestion to the web marketing decisions, in order to allow the identification of wine tourists, so as to formulate a personalized and effective communication strategy.

Carrying on with the survey, it has been possible to outline the characteristics of the “new wine tourist”, well informed, who wants to choose its destination according to its interests and also to plan its free time, and becomes, at the same time, a ‘*spokesperson*’ of its own travel experiences in order to provide useful suggestions to the community members.

The analysis thus conducted has allowed, through the formulation of answers to the research questions, to confirm the hypothesis from where the work started and emphasize the need of a greater dynamism of the enterprises in order to preserve and/or improve its own competitive positioning; the monitoring of the online conversations, in fact, is an opportunity for wine destinations in order to identify the customers’ *feedback*, gaining knowledge related to their tourist experience and enrich the contents of the offered products.

The limit of the present study, mainly linked to the needs of synthesis of the present contribution, can be attributed to the netnographic approach used; it belongs to the *observative* kind and so, it didn’t provide any interaction with *wine tourists*.

It is considered interesting to further develop the netnographic analysis, favouring a participative approach, through the administration of questions addressed to enotourists, with the aim to investigate their perceptions in reference to the wine destinations observed and possibly increase the study sample. Also, it is considered interesting to compare the UGCs and the enotouristic destinations website contents (through the text mining approach) with the aim to evaluate the coherence or incongruence between the communication elements of each online content maker (wine tourist destination and tourist).

The research conducted can, in that sense, have managerial consequences in terms of definition of an integrated, tourist offer, targeted thanks to the analysis of “*virtual discussion room*” around the enterprise. These communicative platforms, in fact, offer significant informational opportunities useful to the planning of a personalized, valuable offer for the customer; they also allow to become acquainted with the perceptions of users, thus the *brand image* that is spread online thanks to the speed of diffusion that characterizes the communication and the *online word of mouth*.

ABSTRACT

Research Background: Wine businesses operate in an increasingly harsh and globalized competitive environment, characterized by shifting consumer behavioural trends, the rise of new players (Third World Countries, Banks and Overton, 2010) and unpredictability. They are thus obliged to strive for 'strategic transcendence', through holistic re-evaluation, redefinition and redevelopment of all their functional and marketing processes.

Research Aims: This paper analyzes attributes of the wine purchasing process and assesses, from a consumer-oriented perspective, their value as determinants of marketing strategy.

Research Methodology: Extensive theoretical research was conducted into various aspects of wine consumer purchasing behaviour. Subsequently, an empirical survey was performed, and the gathered data was processed with both descriptive and multivariate statistical techniques. The empirical research evaluated the theoretically identified variables in the context of the new competitive conditions that characterize the wine sector today.

Research Findings: The research identified five 'macro-themes' associated with the perception of the generic product 'wine': 'Relationship between territory and wine', 'Wine Identity card', 'Experiential identity of the wine', 'Information in support of the purchase process', and 'Price'.

Research Value: The research identified trends which, properly interpreted, add to our understanding of consumer behaviour and offer valuable guidance for the development and implementation of corresponding strategies (primarily concerned with marketing and branding) in the wine sector.

Keywords: *Wine, Consumer, Country of Origin, Marketing, Branding*

INTRODUCTION

Wine producers and sellers across the globe are operating in a challenging business context which is becoming increasingly harsh for all business-end stakeholders. Much like their counterparts in so many other industries (Thrassou, 2007), wine businesses are being forced into a competitive arena characterized by: a) globalization; b) shifting consumer behavioural trends; c) fluctuating and unpredictable macro-environmental business conditions; d) evolutionary restructuring and

repositioning of all production, distribution, sales and marketing aspects of the product (Rossi et al., 2012).

A key feature of the international wine-making sector today is the coexistence of various contexts of production and consumption. The traditional dichotomy (Campbell and Guibert, 2006) of wine producers that are the expression of an area and of the vine-grower's experience (Old World: Italy, France, Spain, Germany and the UK), and production areas oriented to the achievement of a homogeneous product, no longer associated with a precise area of origin (New World: California, Australia, Argentina, New Zealand) is currently evolving rapidly. Key new players are emerging in the context of both production and consumption.

In the light of the above, this research analyzes attributes of the wine purchasing process in an effort to determine, from a consumer-oriented perspective, their impact on the development of marketing strategies. To this end, theoretical research into various aspects of wine purchasing was conducted. Subsequently, an empirical survey was performed to identify the 'macro-themes' underlying the process by which the consumer's choice of 'wine' product is made.

Aware of the increasing need to translate academic findings into industrial applications, the research concludes by presenting the managerial implications of the findings.

THEORETICAL CONTEXT AND DEVELOPMENT OF THE HYPOTHESIS

A consumer-oriented approach to the wine market

In the current competitive context, knowledge of cognitive and behavioural elements that facilitate the perception of the product's *value proposition* – and thus characterize the purchase process (Mowen, 1995; Thrassou et al. 2012) – is becoming increasingly important in terms of generating value for the customer (Wayland, Cole, 1997). In the above context therefore, this paper adopts a *consumer-oriented* approach, and considers the emotional, cognitive and behavioural dimensions of the purchasing process to be fundamental (Holbrook and Hirschman 1982; Schmitt, 2003; Vrontis et al., 2011a, b).

The starting point for this research was thus a review of the business literature with a view to *identifying the attributes and variables that determine the purchase of wine*. A case-by-case discussion of each of the works analysed is not possible here, but in terms of the theoretical part of this research, two broad categories of variable were identified: a) attributes/benefits strictly linked to the wine itself; b) attributes/benefits arising from the association between the wine and its place of origin (Table 1).

Dimensions	Unit of analysis	Authors
Attributes/ benefits strictly linked to wine	organoleptic properties, grape variety, method of production	Golan and Shalit, 1994; Schamel, 2006.
	price, information on the label, in guides and on the internet	Koewn and Casey, 1995; Chaney, 2000; Scorrano 2011.
	destination brand of the producer and the producer's reputation/identifiability	Gil and Sánchez, 1997; Quester and Smart, 1998; Jarvis et al., 2003; Vrontis et al., 2011a.
	reputation/identifiability of designation (country, region) of origin	Skuras and Vakrou, 2002; Martínez-Carrasco et al., 2006; Vrontis et al., 2011a, b.
Attributes/b enefits arising from the association between the wine and its place of origin	historical, symbolic and environmental elements of the area	Tragear et al., 1998; Maizza and Rosato, 2008; Fait, 2010; Vrontis and Thrassou, 2011.
	origin as the main tool for identifying the wine product and its related quality	Bilkey and Nes, 1982; Al-Sulaiti and Baker, 1998; Vrontis et al., 2006.
	consistency of the product with the image of the region of origin	Van Ittersum et al., 2003; Fait, 2012; Rossi et al. 2012.
	hedonistic, aesthetic and high-profile qualities of the wine product, linked to the "made in" effect	Bloch, 1986; Charters and Pettigrew, 2006; Vrontis and Thrassou, 2007.

Table 1: Review of literature in the wine market

In accordance with the literature (Olson and Jacoby, 1972; Steenkamp, 1989; Oude Ophius, Van Trijip, 1995; Bernués et al, 2003a, 2003b), which cites the distinction between *intrinsic attributes* (organoleptic properties and physical characteristics of the product) and *extrinsic attributes* (price, brand, reputation, image, advertising), this study considered *Organoleptic Properties, Production Methods, Bouquet and Taste* in reference to the former, and *References, Packaging, Price, Information found in guides and on the label, Wine tasting, Educational Tours, Cellar door sales, information available on the internet, Reputation of producer, and Reputation of designation of origin* in reference to the latter.

In addition, in accordance with those authors who stress the association between the wine and its place of origin (Bilkey and Nes 1982; Al-Sulaiti and Baker 1998, Tragear et al., 1998; Van Ittersum et al. 2003) and give prominence to the wine's hedonistic and **aesthetic** properties, linked to the "made in" effect (Bloch, 1986; Goldsmith and d'Hauteville, 1998; Charters and Pettigrew, 2006), this paper considered the following elements: *Artistic/Cultural Resources, Natural resources, Land and Wine events,*

Wine routes, Land information in brochures and Destination brands that identify the specific wine (e.g. Napa Valley, Tuscany, Bordeaux).

Research hypothesis

The paper adopts the subdivision into “old” wine regions (Italy, France, Spain, Germany and the UK), “new” regions (Australia, the California (USA), Argentina, New Zealand) and “third” regions (Brazil, India, China, Russia and Romania). Based on the findings of the above-cited literature (both general and, more importantly, specific to wine-making), it is argued here that *some of the theoretically identified attributes act as behavioural guidelines*, influencing the consumer’s choice of wine product.

Methodologically, the research was therefore designed and executed specifically to test the above hypothesis and guarantee the reliability and validity of the results.

EMPIRICAL RESEARCH METHODOLOGY

Sampling

Regarding the context of analysis and sampling, this study chose to focus on wine buyers due to their technical knowledge, creativity and ability to identify the market of reference and related trends (Kotler et al., 2012). The sample was selected from an international buyers database (*Bestwineimporters*¹) listing (a) importers from the top 10 wine-producing countries (Argentina, Australia, China, Chile, France, Germany, Italy, South Africa, Spain, the USA/California) and (b) importers to the top 10 wine consumer countries (Argentina, China, France, Italy, Germany, Romania, Russia, Spain, the UK, the USA)².

Initially the sample population was composed of subjects from the following countries: France (120), Italy (113), Germany (850), the UK (542), Spain (85), the USA/California (1130), Argentina (38), Australia (106), New Zealand (53), China (47), South Africa (33), India (36), Russia, (65), Romania (39), Brazil (110).

The sample was then revised on the basis of: a) buyer website assessment (deemed methodologically necessary as contact with buyers was by Facebook, e-mail or filling in “contact us” fields in the period May-November 2013); and b) the buyers’ level of specialization, so as to include only those who trade in wine.

Since this was exploratory research conducted on a selected sample, the *convenience sampling* technique was applied and a total of 315 properly completed, valid questionnaires were collected, considered and analyzed (28 from the UK, 14 from France, 31 from Germany, 8 from Spain, 21 from

¹ For further information, see <http://www.bestwineimporters.com/it/index.html>

² The lists of countries are from the OIV Report 2012

Italy, 35 from the USA, 25 from Argentina, 25 from Australia, 26 from New Zealand, 20 from South Africa, 22 from Brazil, 20 from India, 20 from China, 12 from Russia, 8 from Romania).

Questionnaire development and analysis

A semi-structured questionnaire was constructed with the aim of identifying and understanding perceptions of specific determinants of purchasing behaviour, and a pilot test was conducted.

For quantitative measurements, a five-point scale was used (5 = greatest importance, 1 = least importance). A validation test was also conducted by sending the first version of the questionnaire to 20 buyers working in 4 different geographical areas.

Data were analysed using SPSS software (Statistical Package for Social Science), with the gathered data being processed by descriptive and multivariate techniques. *Factor analysis* was used to test the research hypothesis.

RESULTS AND FINDINGS

Attributes guiding the consumer choice process

The first step of the research allowed the identification of 'macro-themes' influencing the consumer's choice of 'wine' product on an international scale. The research sought to verify whether this process is indiscriminately structured, or whether certain groups of variables play a greater role than others, so as to identify possible guidelines for consumer-oriented marketing strategies. To this end, and to highlight the existence of a structure underlying the set of observed variables, *Factor Analysis* (appropriate for the explorative nature of the research) was applied.

The results of the KMO test (0.867, i.e. > 0.7) and Bartlett's test were indicative of a correlation between the variables (p-value > 0.05), confirming the suitability of factor analysis. The analysis extracted five elements that explain 68.025% of variance (values of 60-70% being considered acceptable in terms of the informational function)¹.

The data were interpreted by means of the rotated component matrix (Table 2), in which the variables are associated with the components with which they show the highest correlation.

¹ The five identified components all have high values and summarize the information contained in the original data matrix. This is confirmed by the scree plot and the communalities (not shown here due to lack of space).

	Component				
	<i>Relationship between territory and wine</i>	<i>Wine Identity card.</i>	<i>Experiential identity of the wine</i>	<i>Information in support of the purchase process</i>	<i>Price</i>
Artistic and Cultural Resources	0.715				
Natural resources	0.689				
Land and Wine events	0.826				
Wine routes	0.788				
Land information in brochures	0.759				
Destination brand identifying the specific wine	0.668				
Organoleptic Properties		0.834			
Production Method		0.658			
Bouquet		0.865			
Taste		0.870			
Reputation of producer		0.525			
Reputation of Designation of Origin		0.598			
Educational Tour			0.773		
Cellar door sale			0.828		
Information on the internet			0.574		
References				0.786	
Information in guides and on the label				0.535	
Packaging				0.831	
Price					0.854

Notes:

Extraction method: principal components analysis.

Rotation method: Varimax with Kaiser normalization.

The rotation met the convergence criteria in 7 iterations.

Table 2: Rotated component matrix

The first component, which we call ‘*Relationship between territory and wine*’, is characterized by the high correlation of variables indicative of the external visibility of this relationship (Artistic and Cultural Resources, Natural resources, Land and Wine events, Wine routes, Land information in brochures, Destination brand identifying the specific wine), and the perception of this relationship as a means to increase the value of the wine product. This confirms that the consistency between the product and the image of its region of origin, frequently cited in the literature, is a key element of a wine’s value.

The second component, which we call ‘*Wine identity card*’ relates to the wine itself, in the sense that it includes variables arising from its intrinsic features (Organoleptic Properties, Production Method,

Bouquet, Taste) and the 'reputation' variable (Reputation of producer, Reputation of the Designation of Origin).

The third component, '*Experiential identity of wine*', corresponds to the consumer's need to 'explore' the wine, by means of a flow of information that is not linked to strictly oenological factors, but rather to experiential elements. The variables included here indicate a consumers' need to know/understand the wine's context through direct/experiential contact (Educational Tours, Cellar door sales) or via social communication tools (information on the internet, particularly blogs and social networks).

The fourth component, termed '*Information in support of the purchase process*', is characterized by the correlation between three variables (References, Packaging, Information in the guides and on the label), indicative of a need for information in support of the purchase process, guaranteed by the numerous references, the packaging and the information included on the label (e.g. grape variety, alcohol by volume, place of production, etc.) and in the guides (tasting scores, competitions, matching, etc.).

The last component, '*Price*', is fundamentally linked to economic evaluation at the time of purchase.

CONCLUSIONS AND MANAGERIAL IMPLICATIONS

The managerial literature, particularly of an empirical nature, has analyzed the process of consumer wine purchasing with regard to one or a small number of attributes. In contrast this paper considered attributes and variables identified by the literature but suggested a multi-dimensional vision of the process. Specifically it sought to understand whether this process is indiscriminately structured or whether certain groups of variables play a greater role than others in the process.

Due to the reduced representativeness of the statistical sampling, this research cannot thoroughly outline consumer behavioural trends in the international context. However, it may be said to have a) identified trends which, properly interpreted, add to our understanding of consumer behaviour and offer valuable guidance for the development and implementation of marketing and other strategies in the wine business sector; b) analyzed the attributes of the wine purchase process with regard to new players who are taking on a significant role in the production context as well as in wine consumption. Specifically, *Factor analysis* revealed that:

1) The wine product can be analyzed multi-dimensionally in the context of international consumer behaviour. The wine product is diachronically permeated by its tangible attributes, which are relatively explicit and relate to taste, bouquet, colour and all the other characteristics that contribute to the knowledgeable consumers' conscious evaluation of the wine's 'tangible' qualities. Commercial success however is also very much a matter of marketing factors, relating to parameters such as price, brand recognition, accessibility, promotion, etc.

The research however, also indicated a less tangible aspect of wine identity that consciously or subconsciously affects consumers' perception of the product, and consequently their preferences and choices. Typically, and of special interest to this research, this aspect relates to the wine's country-of-origin.

2) The international wine market is characterised by five 'macro-themes' underpinning the perception of the general 'wine' product: 'Relationship between territory and wine', 'Wine identity card', 'Experiential identity of the wine', 'Information in support of the purchase process', and 'Price'. From a consumer-oriented perspective then, the previous considerations can be interpreted as guidelines which modulate a *value proposition* in accordance with the consumers' attitudes. They are linked to the following marketing concepts:

- The *Wine Identity card* component is linked to the *product experience* dimension, i.e. the consumer's interaction with the product or the brand;
- The *Price* and *Information in support of the purchase process* components correspond to the *shopping and service experience* dimension, concerning consumer-store interaction (whether physical or virtual) (Maizza et al., 2013);
- The *Experiential identity of the wine* and *Relationship between territory and wine* components correspond to the hedonistic-experiential dimension of the *consumption experience*.

In conclusion, wine is perceived as a product giving physical enjoyment, but also increasingly as a means of association with the cultural and lifestyle connotations of the wine's place of origin. The combination of the two constitutes what we might call the 'wine experience'. Wine producers and sellers must develop both aspects of the product, in terms of both physical production and marketing practices. Today, as a consumer choice and a commercial activity, wine is no ordinary product, and its production and branding in those new countries which are now beginning to play a significant role in both production and consumption must take account of this.

This paper represents the first step in a wider research programme that will seek to determine whether there are:

- groupings of countries showing homogeneities or shared characteristics in the choice process;
- specific features that distinguish wine products in the perception process of new international players.

INVESTIGATING THE STAGES AND THE ROLE OF THE BUYING EXPERIENCE IN THE BUYING PROCESS OF CRAFT RETAILERS IN SOUTH AFRICA

Makhitha, KM

Department of Logistics, Vaal University of Technology, South Africa

ABSTRACT

Craft retailers play a dominant role in the craft industry value chain yet craft producers face difficulties selling to this market. Instead they resort to selling directly to end consumers and not through craft retailers. An understanding of craft retailer buyer behavior is a necessity for craft producers who want to sell their products successfully through the craft retailers. The purpose of this study was to investigate the buyer behavior craft retailers exhibit when buying from the craft producers. Survey was conducted among 233 craft retailers in SA. A convenience sampling method was adopted for the study. The findings revealed that craft retailers go through homogenous buying stages. The stages in the buying process did not differ across different types of craft retailers. The stages also did not differ according to the years of buying experience of craft retailers.

Keywords: *buyer behavior, buying stages, buying process, craft retailers, craft producers*

INTRODUCTION

In the last 10 years there has been a growing increase in the number of craft producers and craft retailers in SA (Department of Sports, Arts, Recreation and Culture, 2007). The increase is a result of a growing demand for craft products in the world market as well as the increase in the demand for souvenir products purchased by tourists during their travels (Moreno and Littrell, 2001). The role of craft retailers has also grown in importance as craft producers look into all available and alternative channels for distributing their products (Department of Sports, Arts, Recreation and Culture, 2007).

The craft industry contributes about R2 billion to the gross domestic product (GDP) in retail sales, with craft retailers playing a dominant role in the craft industry value chain (Kaiser and Associates, 2005), making craft retail an important part of the craft industry value chain. Craft retailing takes place through over 500 craft stores and other types of stores such as galleries, museums, small interior shops, gift shops and craft markets as well as national chains such as clothing shops, interior décor shops, furniture stores, hypermarkets, discount stores and jewellery shops (Department of Trade and

Industry, 2005). There is limited information on the buying behavior of craft retailers and the fact that no existing study has focused on this particular topic is a motivation for this study.

ORGANIZATIONAL BUYER BEHAVIOR MODELS

Organizational buyer behavior refers to the process organizations go through when buying products or services (Dwyer and Tanner, 2009). A number of organizational and retail buyer behavior models exist that depict the stages in the buying process that organizations go through during the buying process. The first organizational buyer behavior model is the Robinson, Faris and Wind (1967) model. This model has been the most researched and most widely applied and published (Farell, 2006; Da Silva, Davies and Naude, 2002; Homburg and Kuester, 2001; Mawson and Fearne, 1997). It is generally known as the Buy Grid model. The model consists of the two sub-models, the buy phase and the buy class models. The buy phase model shows the stages that organizations follow in the buying process. There are eight stages, including recognition of a problem, determination of the product type needed, description of the product type needed, search for and qualification of potential suppliers, requisition and analysis of proposal, evaluation of proposal and selection of suppliers, selection of order routine and performance review (Hutt and Speh, 2007).

Other models of organizational buyer behavior include those developed by Webster and Wind (1972), De Boer, Labro and Morlacchi (2001) and Luo, Wu, Rosenberg and Barnes (2009). The model of Webster and Wind depicts the stages in the buying process as well as the tasks a buyer performs and the factors influencing such tasks during the buying process. The Webster and Wind model (1972) is similar to the Robinson *et al.* model (1967) in that they both depict the process buyers follow when involved in the buying decision. The difference is that the Webster and Wind (1972) model has fewer stages than that of Robinson *et al.*, (1967). The De Boer *et al.* (2001) model reflects four stages in the buying process. This model emphasizes the relative importance of supplier selection and evaluation during the buying process. The Luo *et al.*, (2009) model also shows four stages followed by a buyer during the process. Weele (2005) discussed six stages retailers go through when buying, arguing that retailers go through different stages in the buying process of an organization.

The above authors investigated the stages from the perspective of manufacturing organizations, while Weele (2005) discussed the stages from the perspective of retailers.

The Sheth (1981) model is another model that depicted the buyer behavior of retailers. This model was adapted from the Sheth (1973) model and was specifically developed for adoption by retailers. The model focuses on factors affecting retail buyers and the criteria retailers use during the buying process. It depicts only three stages in the buying process, which is why other models were adopted in this study. By adopting the stages from the above models, this study will investigate the buying

process and stages followed by craft retailers when buying craft products. The stages in the buying process in each of the stated models are shown in Table 1 below.

Table 1: Stages in the buying process

Stage in the buying process	Robinson <i>et al.</i> , 1967	Webster and Wind, 1972	Sheth 1981	De Boer <i>et al.</i> model (2001)	Luo <i>et al.</i> model (2009)	Weele (2005)	Stages investigated in this study
Problem recognition	√	√		√			Problem recognition
Estimation of the demand for a particular product						√	Estimating the demand for a particular product
Determination of product assortment policy and distribution strategy						√	Determine product assortment policy and distribution strategy
Determination of characteristic and quantity needed	√						Determination of characteristic and quantity needed
Precise description of characteristic and quantity of items needed	√	√					Precise description of characteristic and quantity of items needed
Determination of and decision on the supplier selection criteria to be used			√	√	√		Determine and decide on the supplier selection criteria to be used
Search for and qualification of potential sources	√	√	√			√	Search for and qualification of potential sources

Acquisition and analysis of suppliers	√	√		√	√		Acquisition and analysis of suppliers
Evaluation of proposals and selection of suppliers	√	√	√	√	√	√	Evaluation of proposals and selection of suppliers
Selection of order routine	√					√	Selection of order routine
Performance feedback evaluation	√				√	√	Performance feedback evaluation

As can be seen from Table 1, researchers differed in the number of stages retailers go through during the buying process. Ghingold and Wilson (1998) and Burger and Cann (1995) identified six stages in the buying process. Applying the Robinson *et al.* (1967) model to buying by restaurants, Mawson and Fearn (1997) found that restaurants go through an extended decision-making process, with eight buying stages. Fawzy and Samra (2008) listed nine stages in the process of buying and selection of a meeting site.

THE ROLE OF BUYING EXPERIENCE IN THE BUYING PROCESS

The buying process, especially the supplier search stage, is influenced by the experience of a buyer. Some buyers look for suppliers from within their existing supply relationships, indicating the importance of the buying experience during the buying process (Johansson and Burt, 2004). According to Webster and Wind (1996:57) the learning experience of the buyer influences the buying decision. Da Silva, Davies and Naude (2000) have also indicated that the less experienced buyers exhibit different buyer behavior compared to the experienced buyers. Since buyers are evaluated on the margins they can attain (Da Silva, Davies and Naude, 2000), they could spend more time and effort searching and evaluating suppliers. Crittenden, Scott and Moriarty (1987) investigated the impact of buying experience in organizational buying. The study reported that the more inexperienced the buyer, the less invoked set they have and that those that are more experienced consider a large number of selection attributes during the supplier selection and evaluation stage. Park and Krishna (2001:267) and Yu, Fairhurst and Lennon (1996:20) also found that years of buying experience affect the decision on which supplier selection criteria to use when evaluating suppliers.

Furthermore, Moriarity and Spekman (1984:144) showed that experienced buyers develop greater knowledge of products and suppliers and feel more comfortable evaluating competing products and suppliers without assistance from other people

Buyers involved in repeat purchase situation develop a structured choice process while those involved in other situations would be involved in a different choice process (Bunn, Butaney and Hoffman, 2001; Sproule and Archer, 2000). This implies that buyers will go through different buying process depending on experience in buying a product.

Johansson and Burt, (2004:810) reported that the experience of a buyer is only important when buyers select suppliers from the existing supply relationships and not when looking for new ones. Furthermore, Farrell (2006:96) found that buyer behavior of import buyers differed with years of buying experience. The buying experience was also found to apply mainly in the rebuy situation (Mawson & Fearne, 1997:242).

PROBLEM STATEMENT, OBJECTIVES AND HYPOTHESES

A study conducted among craft producers in Gauteng, South Africa revealed that they experience difficulties selling to craft retailers and that craft retailers purchase only 36 percent of craft products from SA (Department of Sports, Arts, Recreation and Culture, 2007). The Wesgro study (2000) also confirmed that craft producers find it difficult to access the craft retail market. As a result, some craft producers resort to selling directly to end consumers, using direct channels instead of selling through the retailers (Wesgro, 2000), this despite the growing role of craft retailers in the craft industry value chain. Craft retailers are creators of the markets, developers of new products and are also able to source new products (Hay, 2008). There is an active retail market for craft producers. However, craft producers do not have access to such markets. This is due to a lack of understanding of retail buyer behavior as well as of the selection criteria used to evaluate and select suppliers. Such an understanding would help suppliers to capitalize on the increased demand for their products (Skallerud and Gronhaug, 2010).

The purpose of the study is to investigate the buyer behavior of craft retailers in SA. The specific focus will be on the buying process followed by craft retailers when buying craft products

The objectives of the study were as follows:

- To determine the buying stages that craft retailers go through when buying crafts.
- To ascertain if the buying stages differ across different types of craft retailers.
- To determine if the buying staged differ according to the years of buying experience of craft retailers.

To address the above objectives, two hypotheses were formulated.

From the above discussion, the following hypothesis was formulated:

H₁ There are significant differences between types of craft retailers and the number of buying stages they go through

H₂ There are significant differences between the years of buying experience of craft retailers and the buying stages they go through

METHODOLOGY

The study adopted a survey method targeted at craft retailers in South Africa. This included craft retailers of different types and sizes such as craft shops, small interior and gift stores, interior and decor shops, discounts retailers, clothing shops, furniture shops, museums, galleries, jewellery shops and destination retailers. A non-probability convenience sampling method was adopted owing to the difficulties of identifying craft retailers and the fact that there was no reliable and easily accessible database of craft retailers. According to Cooper and Schindler (2006) convenience sampling is suitable when there is time constraints and lists of available units are either incomplete and not up-to date, as with the case of SA craft retailers.

Data were collected electronically through email as well as personally hand delivered questionnaires to craft retailers for self-completion. The total number of questionnaires sent out to craft retailers was 681. Of the 681 questionnaires, 273 were completed and returned. However, only 233 of the 273 completed questionnaires were usable, giving a response rate of 34 percent. The remaining 40 questionnaires were incomplete, with some questionnaires only half done or missing multiple responses; these were therefore disregarded and not included in the analysis.

The questionnaire was of self- completion nature and was designed using information collected from a preliminary qualitative study (interviews) which was conducted among craft retailers and industry experts as well as from the literature. Respondents were requested to indicate if they go through the 16 stages listed on the questionnaire by answering Yes or No. The questionnaire was pre-tested using the participant pre-test method with 12 craft retailers and the wording of some questions were slightly altered to ensure clarity. Furthermore craft retailers did not receive any incentives and participation was voluntarily.

Data were analyzed using SAS software. Descriptive statistics and ANOVA tests were conducted and the results are reported and discussed in the next section. ANOVA is a statistical analysis used to test the differences between two means (Sudman and Blair, 1988) and helps estimate group differences on their means among the groups. Where the estimates of scores and means do not differ, it is assumed that all the group means originate from the same sampling distribution of means. Where the group

means differ more than expected, it can be concluded that the group means were drawn from the different sampling distribution of means, and the null hypothesis that the means are the same is rejected (Tabachnick and Fidell, 2001). As ANOVA indicates differences only, the Duncan's multiple range test, a post-hoc test which makes comparisons among groups to determine if significant differences exist (Hair, Black, Babin and Anderson, 2010), was used to identify where these differences between groups were.

ANALYSIS AND DISCUSSION OF THE FINDINGS

Descriptive statistics

The sample consisted of various types of retailers as depicted in Table 2 below. Of the 233 respondents, 94 were craft stores, representing 44 per cent of the total population. Destination retailers were the next biggest group, representing about 16 per cent (n=35) of the population, followed by the small interior/gift stores with about 12 per cent (n=27) of the population. The rest of the respondents, clothing stores, discount stores, furniture stores, galleries, museums, jewellery shops and destination retailers, had a very small representation.

Table 2: Types of craft retailers

Types of craft retailers	Frequency	Percentage
Craft store	94	43
Small interior/gift store	27	12
Interior decor/home ware store such as Mr Price Home	13	6
Clothing store such as Woolworths or Truworths	7	3
Discount store such as Makro or Game	2	1
Furniture store	8	4
Gallery	7	3
Museum	5	2
Jewellery shop	16	7
Destination retailers	35	16
Other (please specify)	6	3
TOTAL	220	100

n= 220 Missing responses = 13

For the purpose of statistical analysis, craft retailers were collapsed into five groups: the craft stores; small interior/gift stores; large retailers such as interior décor/homeware stores, clothing stores, discount stores and furniture stores; specialty stores such as galleries, museums and jewellery shops; and destination retailers. The five groups excluded the 'other' category since there were no types of retailer mentioned. Therefore, the five groups consisted of 214 responses. The representation of the

five groups were as follow: craft stores (44%), small interior/gift store (13%), large retailers such as clothing and décor stores (14%), specialty stores such as galleries, museums and jewellery shop (13%) and destination retailers (16%).

The respondents consisted of buyers, managers, owner-managers, manager-buyers and executives responsible for buying. The owner-managers were the largest group, comprising 44 per cent (n=101) of the population. Managers were the second largest group of respondents, comprising over 18 per cent (n= 42) of the population. This was followed by manager-buyers, with about 14 per cent of the population (n=31). Buyers made up over 12 per cent of the population (n=28). The last group of respondents was the executives, who represented about 12 per cent of the population, consisting of 27 respondents.

Table 3 below depicts the stages craft retailers go through. The frequencies and percentages as well as the number of respondents are shown.

Table 3: Stages in the buying process

Stages in the buying process	N	Frequencies		Percentages	
		Yes	No	Yes	No
We identify a need for craft products	233	219	14	93.99	6.01
We determine the characteristics and/or quantity of the craft products needed	232	210	22	90.52	9.48
We create a precise description of the craft products needed	231	154	77	66.67	33.33
We estimate the demand for a particular craft item	231	195	36	84.42	15.58
We determine the product assortment i.e. product lines/range and number of product per product line)	230	188	42	81.74	18.26
We decide how much stock to keep and therefore how much to invest	233	194	39	83.26	16.74
We formulate the criteria that will be used to evaluate suppliers	232	170	62	73.28	26.72
We search for potential suppliers	232	202	30	87.07	12.93
We visit and/or interact with the supplier to learn more about them	232	187	45	80.60	19.40

Stages in the buying process	N	Frequencies		Percentages	
		Yes	No	Yes	No
We evaluate and/or select craft suppliers	233	203	30	87.12	12.88
We place trial order/s and finalize the approval of suppliers	232	168	64	72.41	27.59
We negotiate trading terms with suppliers	232	202	30	87.07	12.93
We develop a contractual agreement with the supplier	231	152	79	65.80	33.77
We place replenishment orders i.e. more quantities after the first trial order	232	176	56	75.86	24.14
We expedite and evaluate the supplier's and product performance	231	200	31	86.58	13.42
We provide the suppliers with feedback about their product performance	232	184	48	79.31	20.69

From Table 3 it is evident that the majority of craft retailers, as represented by 94 percent (N=219) of the respondents, indicated that they went through the stage of a need identification, and that 'we determine the characteristics and/or quantity of craft products needed', as indicated by 91 percent of respondents. Craft retailers do not all follow all the listed stages, as shown by the fact that 34 percent (N=79) of the respondents indicated that they did not go through the stage of developing a contractual agreement with the supplier, or 'create a precise description of craft products needed', as revealed by 33 percent (N=77) of respondents. Approximately 27 percent of the population (N=62) indicated that they also did not formulate criteria to evaluate suppliers. Generally the results of the stages listed in the buying process indicate a fairly high percentage of agreement (Yes) among the respondents regarding the stages retail buyers go through.

The stage which craft retailers use most when buying crafts is 'we identify a need for craft products', as indicated by almost 94 percent of respondents. This stage was followed by 'we determine the characteristics and/or quantity of the craft products needed', as shown by over 91 percent of the sample, 'we evaluate and/or select craft suppliers', with just over 87 percent of the population, 'we negotiate trading terms of suppliers', represented by over 87 percent of the sample and 'we search for potential suppliers', represented also by over 87 percent of the sample.

The least used stage in the buying process of a craft retailer is 'we develop a contractual agreement with the supplier', agreed to by about 66 percent of the sample, followed by 'we create a precise description of the craft products needed', which was agreed to by about 67 percent of the sample. The third least-used stage in the buying process of the craft retailers was found to be 'we place trial order/s and finalize the approval of suppliers', as indicated by over 72 percent of the sample. Another important aspect worth noting in the buying process is the fact that 28 percent (N=64) of craft retailers revealed that they did not place trial orders to finalize the approval of suppliers. Some craft retailers, as indicated by 34 percent of the respondents, did not enter into contractual agreements. It is evident that the majority of craft

The fact that some craft retailers do not develop contractual agreements with craft producers also applies in other industries sourcing products from informal and small organizations, where verbal orders, agreements and price negotiations are made (Bienabe and Vermeulen, 2007). Previous studies have indicated that in some buying situations, buyers have difficulty in measuring or specifying the exact nature of the products needed and that buyers are more concerned about the quality and performance of the product (Francis and Brown, 1985-86). Another study revealed that the exact specification evolves from the samples, through appearance and product sampling (Mawson and Fearen, 1997).

Furthermore, Esbjerg and Skytte (1999) found that the majority of retailers placed trial orders before they sourced more products, which supports the findings of this study, where 72 percent of craft retailers placed trial orders before large orders were placed. According to Johansson and Burt (2004), the buying stages differ for the first stages of the buying process while the rest of the stages in the process are similar. This study found that the first two stages were undertaken by the majority of craft retailers, as shown by the 94 percent and 91 percent of craft retailers who went through these stages in comparison with the percentages of those retailers who went through the other stages such as 'we create a precise description of the craft.

Testing the hypotheses

The first hypothesis serves to determine whether the number of buying stages differs across the five types of craft retailers. ANOVA testing was conducted to test H_1 and the results are reflected in Table 4.

Table 4: Mean scores and ANOVA results for stages across types of craft retailers

Types of craft retailers	N	M	SD	DF	F value	P value
Craft store	90	13.16	2.42	4	1.70	0.1506
Small interior/gift stores	26	11.84	3.01			
Large stores	28	13.53	2.39			
Specialty stores	27	12.88	3.05			
Destination retailers	35	12.80	2.63			

As can be seen in the table, the p-value of 0.1506 is larger than the specified significance level of 5 percent, thus showing no significant differences in the mean values of the number of stages of the buying process and across different types of craft retailers. Thus, there is no significant difference in the stages craft retailers go through across types of craft retailers. **H₁ was therefore not supported and the null hypothesis was accepted.** According to Johansson and Burt (2004), the number of buying stages is determined by the types of products being bought and might not be the same for different types of products. However, the findings in this study suggested that different types of craft retailers do not differ regarding the number of stages they go through.

To test the second hypothesis, ANOVA testing was done to determine if there were significant differences between the numbers of stages across the years of buying experience. These results are reported in Table 5. As can be seen in the table, the p-value of 0.3351 is larger than the specified significance level of 5 percent, thus showing no significant differences in the mean values of the stages across years of buying experience. Therefore, the null hypothesis was accepted and H₂ was not supported.

Table 5: Mean scores and ANOVA results for stages across years of buying experience

Buying experience	N	M	SD	DF	F value	P value
0-5 years	73	13.19	2.65	2	1.10	0.3351
>5-10 years	69	13.00	2.30			
10+ years	64	12.62	2.95			

It can be concluded that craft retailers with different years of buying experience do not differ regarding the number of buying stages they go through when buying craft products. It seems that buying experience plays no significant role in the number of buying stages used.

CONCLUSION AND LIMITATIONS OF THE STUDY

A list of 16 stages was provided based on the literature review and interviews. The majority of craft retailers (66 percent) go through a lengthy buying process consisting of 16 stages. This is an indication that the buying process of some craft retailers involves far more stages than those suggested in the existing literature. It is also an indication that craft product buying is a complex process and that craft retailers are involved in a new buy situation. This could be due to the lack of standards in the industry and the fact that craft producers are scattered all over the country. The most used stages in the buying process are 'we identify a need for craft products', (94 percent), 'we determine characteristics and/or quantity of the products needed' (91 percent), 'we search for potential suppliers' (87 percent), 'we evaluate and select suppliers' (97 percent), and 'we negotiate trading terms with suppliers' (87 percent). It is therefore important for craft producers to ensure that they are aware of the needs of retailers for craft products and also to ensure that retailers are aware of them. As some small craft producers may not have the necessary skills to enter into negotiations with large retailers, this is an area where government could play an important role by providing training and legal advice.

The least used stages are 'we develop contractual agreements with the supplier' (68 percent), 'we create precise description of the craft products needed' (67 percent) and 'we place trial order/s and finalize the approval of suppliers' (72 percent). No significant differences were found among the different types of craft retailers and the number of stages retailers go through. It can be concluded that the majority of craft retailers exhibit homogeneous buyer behavior by going through the same number of buying stages in the buying process. This suggests that little variation exists and will ultimately make it easier for craft producers who want to make use of a standard/undifferentiated approach of selling to craft retailers. Craft retailers with different years of buying experience also exhibit similar buyer behavior in going through the same number of buying stages, implying that experience does not play a role in the number of buying stages used.

The study adopted a convenience sampling method. Only craft retailers that were easily accessible were targeted. The non-response error and the sampling error could not be determined. Although the study targeted craft retailers in SA, it was not possible to target retailers in all the provinces because of lack of data on craft retailers. Some of them were inaccessible because their phones were out of order or the retailers were no longer in operation. Some craft retailers were not willing to participate. It was also not possible to target equal numbers of different types of craft retailers, owing to convenience sampling, fewer large retailers and because some of them were either not interested or they were difficult to get hold of. Owing to the nature of non-probability sampling, the respondents used in the study are not representative of the broader SA craft retail population. Therefore, the results cannot be generalized.

Although the study has identified the stages in the buying process, it did not provide information on what happens in each of the stages and how the stages are executed. Therefore a study could investigate what craft retailers do in the buying process and how they execute the process. This study might not apply to international retailers. Therefore another study could investigate the buyer behaviour of international craft retailers and compare the findings with those of the local retailers. This study could also be replicated in a different industry to investigate how retailers behave when buying other products.

ARCTIC ICE MELTING AND NORWEGIAN PORT POTENTIALS

Maniatis, Antonios¹; Sioussiouras, Petros²; Baxevas, Evi²

¹Technological Educational Institute of Ionian Islands, Greece

²Dept. of Shipping, Trade and Transport, University of the Aegean, Greece

ABSTRACT

With the rise of temperatures, the Arctic ice gradually melts away triggering a series of environmental, political and of course economic developments. Besides the vivid environmental concerns and the debate on the consequences, global economy is also expected to experience major changes. Each risk may constitute an opportunity, remark exemplified by the current case. Given that the Arctic will be accessible for the first time, unprecedented development opportunities emerge, as well.

At the same time, navigation will be possible not only in the summer but also during winter months, provided that no action is taken for the reversal of the temperature rise tendency. Climate change is a reality and its effects are going to become more evident as time goes by and the North will become a region of great and broad interest. Norway, not only an Arctic country but also an important one at the global energy map, is expected to hold its place for the coming decades, whereas Public - Private Partnership contracts and concessions may be convenient alternatives for the increased need of infrastructures, generated by the accessibility of the Arctic region.

INTRODUCTION: MOBILITY IN THE ARCTIC

The Arctic is a region that is going to draw the interest of the international community, increasingly in the years to follow, due to a number of reasons; it is about a region of particular interest for the global community as economies, trade routes and international relations will be called to balance on a new set of data. To date, we were used to studying the way human activities affect the environment, focusing on eliminating the negative impacts. For the first time in modern history, circumstances drive us to

examine how environmental change influences human activities and more specifically, politics, business and law.

In the past, the Arctic region did not attract a lot of attention, due to its inhospitable climate. However, Arctic ice melting has turned all eyes on this part of the globe. A new reality is being formed for shipping and modern maritime transport due to environmental change. Nevertheless, compact ice and an ambiguous legal regime cause significant complications, when it comes to matters of ship transit, transport, checks, research, rescue and exploitation of the available natural resources. With climate change acting as “threat multiplier”, the question put is how states will take part in the escalating competition to reap geopolitical and just as importantly economic benefits in a region rich in natural resources. In this context, coastal states are expected to seize the opportunities offered to develop their infrastructure in order to accommodate the increasing traffic. This paper is going to focus on Norway given that this state is an Arctic country, a part of the European economy and its ports are already included in the shipping routes crossing the Arctic Ocean.

Shipping, a sector intertwined with the natural environment, is expected to experience unprecedented development opportunities. Nevertheless, as in every endeavor there are numerous issues that need to be dealt with, before a development spurt takes place. The Arctic is an inhospitable yet promising region; a blend of natural wealth, shorter maritime routes, overlapping state claims and possible escalation of interstate tension. Taking under consideration the unpredictable nature of the region, there is questioning whether it is an economically viable effort. Still, if the global temperature does not begin to drop, this will only be a question of time. Regional states need to prepare themselves for this new reality, either by establishing -if not in place- a policy for the Arctic or by building the infrastructure that will be able to maintain or attract increased traffic and capital movement.

Given the acute economic crisis that affected all national economies and the difficulty to dispose public funds for various scopes, Public - Private Partnerships (PPPs), a relatively new legal and managerial tool, may just be what is needed to go through with the necessary planning and realization of projects that not only will benefit the owner country but they also will become a part of the emerging Arctic economy.

THE REGIONAL NATURAL ENVIRONMENT

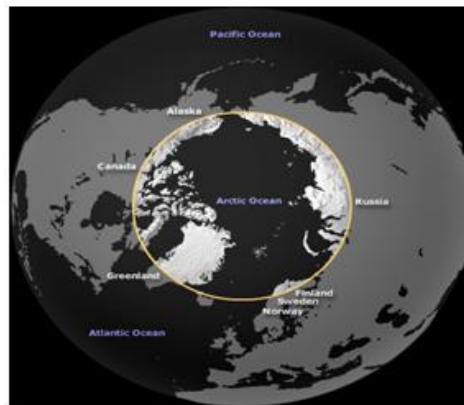

Figure 1: The Arctic Region
[Source: www.bugbog.com]

The Arctic is most commonly identified with the North Pole or taken in by the “Arctic circle”; for the paper in hand, the region of the “Arctic” entails the Arctic Ocean and parts of the five coastal sovereign states, namely the U.S.A. (Alaska), Canada, Denmark (due to Greenland, a huge island that has become an autonomous state of Denmark out of EU!), Norway and Russia.

New climate data, namely global warming, have caused great environmental concern due to the series of changes brought upon sensitive ecosystems. Besides the environment, however, regional as well as global economy is expected to undergo changes. During the past, with the exception of the Cold War era, the Arctic rarely drew the attention of the global community, given the inhospitable conditions. Arctic ice melting is now oversetting this reality, even causing fears of an irreversible situation.

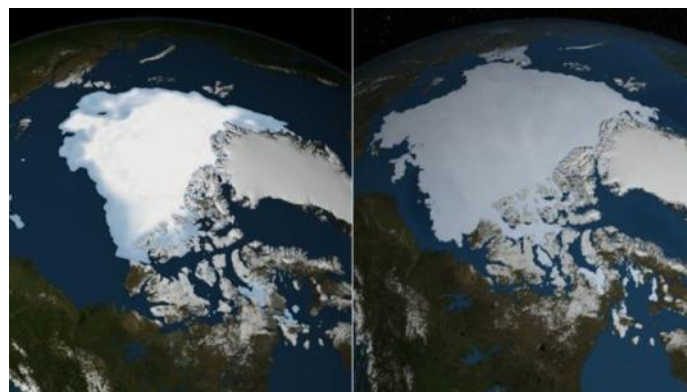

Figure 2: Diminishing Arctic ice (now – before)

Source: <http://www.epa.gov>

The Arctic is the most rapidly warming region of the planet and is therefore used as a global climate index due to its sensibility. According to ESA (European Space Agency) and NSIDC (National Snow and Ice Data Center) estimates, the lowest ice levels were observed during the past five years,

monitoring a time period from 1970s when the first satellite observations started, while the rate of diminishing ice coverage increases.

In addition, a pivotal aspect of the region's prospects is that it is believed to hold around 15% and 30% of the undiscovered oil and natural gas reserves respectively (USGS), 85% of which is expected to be found within the maritime zones of the coastal states. Furthermore, there are significant minerals and fishing deposits. States' rivalry for accessing these deposits has led to increased presence in the region (either scientific or military, for instance in the form of training) spurring fears of a potential escalation of tension.

AN INTERNATIONAL LAW APPROACH TO THE ARCTIC

The exploitation of resources is primarily claimed by the five aforementioned littoral states while other sovereign states of the broader region, such as Sweden, Finland and Iceland, state their presence, as well. Some of the major limitations of the region concern the pending maritime delimitation issues among the coastal countries. As expected, in a semi-closed sea like the Arctic, state claims overlap and rivalries follow. There is no settled legal and regulatory framework for the region -a prerequisite not only for the energy exploitation (extraction and transport), but for the fisheries' management and search and rescue operations as well (Borgeson, 2009). It needs to be noted that fish population in the Arctic Ocean is among the largest ones globally, with around 10% of the world fisheries coming from there. However, as ice melts and water warms whilst fish does not abide by juridical and geopolitical schemes, such as rules and national borders, it is not known how they will react or whether they will move to the North, causing additional controversy for the Arctic states (Flores et al., 2003). The United Nations Convention for the Law of the Sea (UNCLOS), signed in 1982 and put into force in 1994, offers the legal framework for the delimitation of the maritime zones and for the resolution of disputes resulting from contested regions. As it defines, each coastal state is entitled to:

Maximum 12 n.m. of territorial waters, where it exerts absolute sovereignty (while beyond territorial waters may start "high seas" ruled by the principle of freedom),
a contiguous zone up to maximum 24 n.m., within which it has rights for specific purposes and
an Exclusive Economic Zone up to 200 n.m. counting from the baselines (from which all maritime zones extend) and where it has rights of mainly economic nature (e.g. exclusive fishing rights, exploitation and preservation of natural resources etc.).

It needs to be noted that the Exclusive Economic Zone is a very important innovation of the UNCLOS, able to change the status quo of coastal states, as in the case of Cyprus.

The continental shelf (maximum extent of 200 n.m. and, on special occasions, of 350 n.m.) on the bed and subsoil of which there are rich natural resources, triggers the rivalries. It is notable that the

extension -if possible- has to be claimed within ten years starting from the date of the accession to the Convention; Finland 21.06.1996, Norway 24.06.1996, Sweden 25.06.1996, Iceland 14.02.1997, Russia 12.03.1997, Canada 07.11.2003, Denmark 19.12.2003. However, the USA have not yet ratified the Convention, hindering their ability to promote their interests in the region and possibly putting themselves in a strategically disadvantageous position on the political chessboard of the Arctic.

The current Law of the Sea comprises the UNCLOS and the Agreement of New York, in 1994, on international seabed, namely the seabed beyond the state limits.

In order to facilitate communication and cooperation, the Arctic Council was established in 1996 (Ottawa Declaration) as an intergovernmental forum for the Arctic governments and peoples. Currently, it has permanent members, namely the five coastal states, in addition to Sweden, Finland and Iceland that are considered to be Arctic states and to other states endowed with a permanent or ad hoc observer status. The main agenda of this scheme revolves around the topics of environment, sustainable development, know-how exchange, accident management, search and rescue operations etc. An interesting point is that security issues were not included in its mandate, following an objection of the USA, which almost all members shared. It is to signalize that four out of the five coastal states are NATO members and that NATO is ruled by the consensus principle of all members for decision-making. After all, security and defence issues are much more sensitive for a sovereign state and therefore they are issues upon which it is extremely hard to reach to an agreement.

Our attention is caught by the number of the countries which signed the Svalbard Treaty in 1920, an early indication of the persisting interest for the region and the involvement of third countries. As expected, neighboring states of the broader region share common interests, i.e. economic ones (natural resources e.g. fisheries), energy ones (energy safety), transport ones (new global maritime transport, search and rescue), scientific ones as well as environmental concerns (climate change, biodiversity). Nevertheless, there are also some third actors wishing to gain benefits from the regional dynamic, such as the E.U. and China. The European Parliament considers the Arctic to be pivotal for the European (and energy) security and is trying to increase its presence in the region as well as to make up for the fragmented legal framework (The High Representative and the European Commission, 2008). New Arctic routes sound appealing to Japan, South Korea (shipbuilders specializing on ice conditions), Taiwan and India. In fact, some of them have already financed scientific expeditions to the Arctic. However, a solid legal and regulatory regime is vital in order to attract international investments.

The importance of a lucid legal regime in the region becomes evident when we think of ecosystem protection (pollution cleaning), search and rescue (increased Arctic tourism and commercial traffic) and navigation regulation as the ship traffic increases (danger of drug or weapon smuggling, illegal migration, terrorism). The protection of international commercial transit has great importance for the

secure transport - an issue that would acquire a hardcore position once commercial and technological change would enable regular maritime use and large scale resource extraction.

CASES OF RUSSIA'S EXPANSIONISM AND INTERNATIONAL LAW

It is to pay special attention to the strategic role of the successor of the superpower Soviet Union. Russia symbolically staked its claim to billions of dollars' worth of oil and gas reserves in the Arctic Ocean on August 2nd 2007 when two submarines reached the seabed more than two and a half miles beneath the North Pole. A one-metre-high Russian flag was planted on the Lomonosov ridge, a motion that illustrated the new strategic interests of the states involved (The High Representative and the European Commission, 2008). The ridge is an underwater mountain crest that runs 1.240 miles across the polar region. In 2001, Russia submitted research findings to that effect to the UN, but they were turned down.

The current study has become particularly actual, on account of the very recent development in the Black Sea. The Crimean Peninsula, on a basis of a referendum, held in 16.03.2014, became a territory of the Russian Federation. This peaceful revolution of the majority of the inhabitants of the Peninsula, belonging to the sovereign state of Ukraine, has not been officially recognized; but it has highlighted the strategic role of Russia. So, a new important parameter has been added in international relations, the expansionism of the Russian superpower, even against International Public Law. This expansionism is bipolar and to a great extent sea-centred, exemplified by the developments in the Arctic and in the South (invasion in Ossetia and creation of a non-sovereign state there, in 2008, incorporation of the Crimean Peninsula and shortly afterwards the civil war in Eastern Ukraine, in 2014).

ARCTIC SHIPPING ROUTES AND PIRACY LAW

Everything has two sides; despite the somber environmental and sinuous political situation, the Arctic is being converted from a region of mainly scientific interest into one of significant commercial and national interest. Ice melting raises sovereignty questions but it also permits the transit of passages (though they remain dangerous due to adrift ice). At present, 4/5 of international trade is carried out by sea (International Transport Forum, 2012) and for a planet composed of water by 70% this is translated into passenger and freight access at any part of the globe. Long-distance maritime routes use "traditional" routes, the main of which go through the Panama Canal, the Suez Canal and the Malacca Straits that are heavily congested. The time required is long and increases the cost respectively. For instance, travelling from Murmansk to Ulsan, Korea through the Cape of Good Hope is 102 days long. Through the Suez it would be 80 days, while via the Northwest Passage, just 55. Besides that, the

danger of piracy, which main routes face, is present and despite the great efforts to eliminate it, it has not ceased to exist. Just the opposite, the “crime against humanity” according UNCLOS, piracy at high seas, has been dramatically come to actuality, the last two decades.

With the Arctic Ocean turning into a bridge of communication for distant regions of the globe, its use could also mean the bypassing of piracy prone locations. Incidents where cargo and crew are captured to be exchanged for ransom are not rare, causing fear for the seafarers and increased cost for the shipping companies. The toll is high, given that fatalities are also known to happen. Should the use of an Arctic route offer the possibility to avoid such mishaps, it could alter the main maritime routes currently in use.

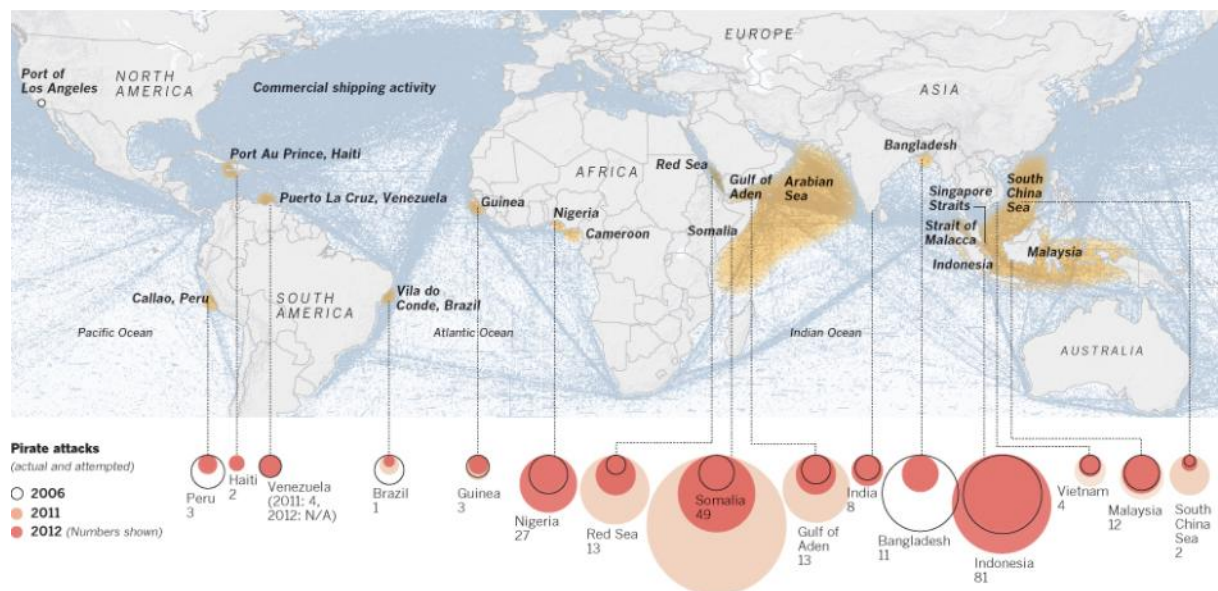

Figure 3: Piracy prone areas

Source: <http://graphics.latimes.com/towergraphic-la-fg-sea-piracy/>

The opening of the ever frozen North Passage and the shorter shipping routes by thousands of nautical miles bring the Arctic to the forefront. Following the example of the Norwegian explorer Amundsen, who sailed first through the North West Passage (1903-1906), and the S/S “Manhattan” (a specially reinforced supertanker) in 1969, the first ship able to follow a route suitable for commercial traffic and carry cargo (accompanied by a Canadian icebreaker), an Open Passage -the ardent passion of shipping since the 15th century- will become a reality. According to estimates, this will be feasible within just two or three decades, adding high value to a formerly inhospitable or even forsaken part of the world. The passage through Arctic waters offers the possibility to detour dangerous passages, it thus offers strategic alternatives to countries like Japan, which would greatly benefit in case it could bypass the Malacca Straits, on which it is currently dependent for its energy supply. Important states, such as China and Japan, which wish to use the Arctic passages, have been attracted, taking under

consideration that nautical miles and fuels are saved, thus cost is saved in comparison to traditional shipping routes.

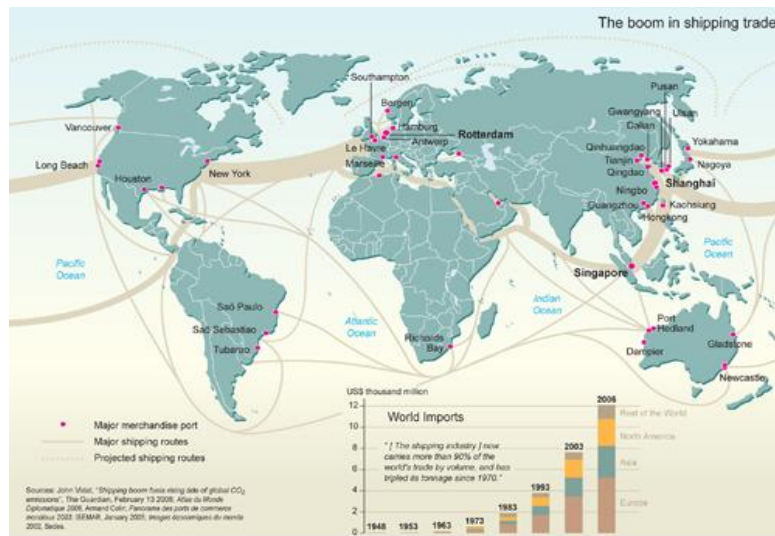

Figure 4: Shipping Trade Routes

Source: UNEP-Arendal, <http://www.grida.no>

When it comes to Arctic Routes, there are two that are currently in use and one which will become a reality, should the climate change proceed in the same pattern.

- ♦ The Northeast Passage or Northern Sea Route (NRS): It connects the Atlantic Ocean with the Pacific and can serve as a transit corridor for Europe and East Asia, an alternative to the Suez Channel and can reduce the distance by 40% compared to the route through the Indian Ocean. It is a maritime corridor adjacent for most of its part to the Russian Federation. Roughly described as running through the Norwegian, Barents, Kara, Laptev, East Siberian, and Chukchi seas to the Bering Strait.
- ♦ The Northwest Passage: This route links the Atlantic and the Pacific Oceans through the Canadian Arctic Archipelago and more specifically, starting from Baffin Bay through the archipelago to the Beaufort Sea through the Chukchi Sea to the Bering Sea. This can be an alternative for the Panama Canal, though it can be less predictable due to adrift floes which may block parts of the route. The use of this passage yields significant gains considering that the travel distance from Europe to the Asian markets would be shortened significantly and resources from Alaska or Northern Canada could reach North American and European markets much faster. It needs to be noted that there is a pending issue between Canada and the United States. Canada claims that the Canadian archipelago consists in internal waters, so

ships should comply with innocent passage rules whereas the USA (as the EU) maintain that this region should fall under the international strait regime, implicating free navigation.

- ♦ The Central Arctic Route: Should the climate change proceed, it is possible that there would be a point when ships would be able to cross the Arctic Ocean following a straight line. This is far from feasible at the moment and will only become a reality if the entire Arctic ice melts away.

Ice is a definitive factor regarding navigation and time needed for the passing. Although the Arctic routes are not consistently ice-free and often require the escort of icebreakers, ice tends to be thinner, facilitating the carving of channels. Ships are able to sail through starting early July to late November. In summer of 2012, 46 ships sailed through Arctic waters, according to Arctis research group (ARCTIS, 2013) carrying significantly more cargo compared to 2011. In case there is no radical shift in the climatic reality, more traffic is expected for the Arctic routes, a development that could dramatically change the current global shipping hubs.

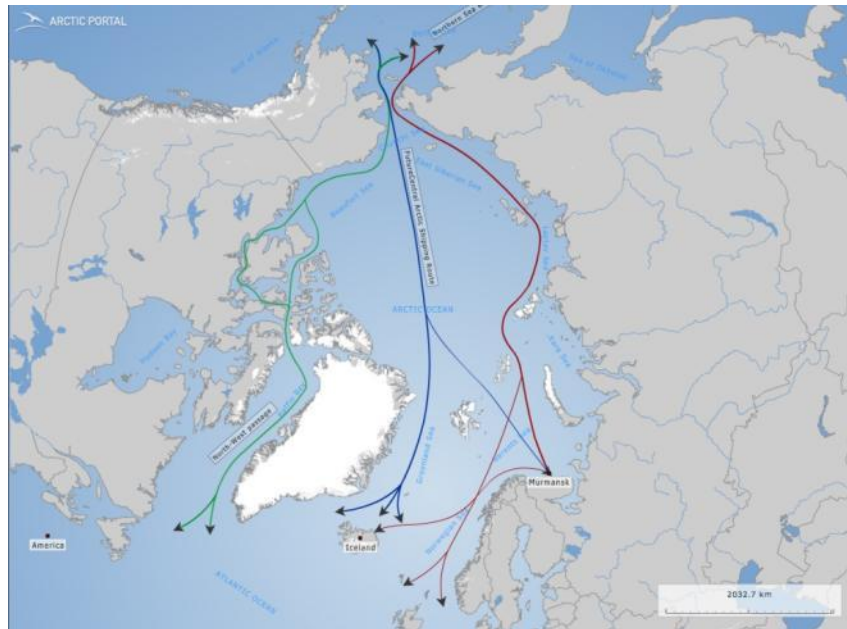

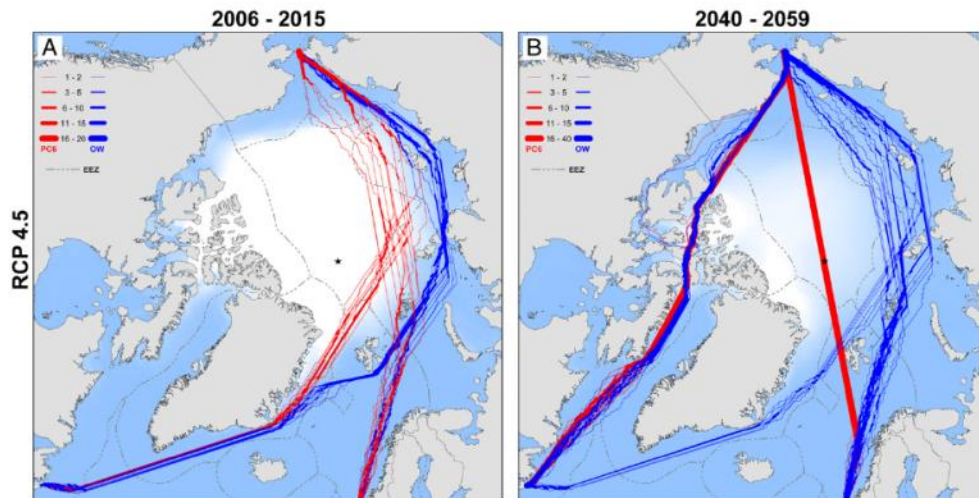

Figure 5: Arctic routes

Figures 6,7: Arctic marine use

Source: Smith, Stephenson, PNAS, 2013, p.3

It is notable that these routes are not expected to become a part of regular shipping any time soon, given that weather conditions not only vary, but they also remain extremely challenging. Even when the passages are free, they are navigable for a limited time frame for shipments and exploitation. Ships with no icebreaking capacity can only use them in summer months and polar class ships are not yet very common. Similarly, the exploitation of the natural resources, although discussed, faces severe hindrances and many prerequisites need to be met before there is easy access and therefore ability to exploit the region's energy resources. The existing dangers, even when no legal settlement is needed, cannot be downgraded and the retraction of Shell in Kulluk due to extreme environmental conditions causing severe operational hindrances is indicative of the demanding conditions and the thorough programming needed to carry out such projects. The lack of adequate maritime traffic management poses further challenges, in addition to the environmental concerns.

An oil spill in the Arctic would have immense consequences for the regional and global seas, let alone the fact that cleaning operations would need to take place in extremely harsh conditions. High insurance rates, working dangers, uncertainty which discourages commercial shipments due to the extra (insurance) charges involved, big investments needed in the region (infrastructure, icebreaker construction) are found among the challenges. The abovementioned hurdles can easily nullify the advantages offered by shorter routes. Nonetheless, from a geographical viewpoint, sailing through the Arctic would imply great economic profit, given that the travel time is shorter, fuel is saved, the cost of transport is reduced and therefore the final price of the product for the consumer is also reduced along with fewer emissions for the environment.

REGIONAL ACTORS: NORWAY

The 2010 agreement between Norway and Russia, which delimited maritime zones and settled a long-lasting dispute at the Barents Sea, allows the unimpeded use of the waters in question. An unambiguous legal status can not only encourage investment activities but also be considered as a prerequisite, having in mind that precarious environments cause flee of capitals.

Norway is a coastal state with a significant maritime activity. Given that the vast majority of international commerce is carried out by sea, as already signalized, and 80% of the global industrial production takes place at the northern part of the globe, one can easily understand the importance of being at the geographic forefront. Norway has a vested and demonstrated interest in this sub-region.

Although Norway is not a member of EU, it is closely associated (European Economic Area, European Free Trade Association). Its economy is based on oil and natural gas and it is currently among the top energy producers worldwide and the second natural gas exporter (Russia being the first). In the same time, it is not a big consumer and therefore exports the majority of its production, providing among others, the EU with natural gas. The larger amount of the exported oil comes from platforms operating on the Norwegian Continental Shelf (NCS) and there are estimates about substantial reserves in the same region, to be exploited.

The Arctic, being an area of extreme climate conditions, is in need of a different approach in comparison to the traditional maritime routes. Ice conditions and lack of daylight during a long period of time, dictate that states need to cooperate for search and rescue issues, environmental protection etc. Norwegian authorities have opened the NCS to a wider range of enterprises whilst the local reserves attract big international companies. Today, there are around sixty oil companies involved in the Norwegian oil industry, with Statoil carrying out the majority of the activities on NCS.

Given the long coastline, Norway has numerous ports across the country serving as main transport centers. Mongstad, home of the principal refinery of the country, is also a port included in the aforementioned NSR passing. According to recordings (Northern Sea Route Information Office, 2011-2013), the ports of Alesund, Mongstad and Larvik in the South, as well as the ports of Kirkenes, Honningsvåg and Hammerfest in the North, are either start-ports or end-ports for ships crossing the NSR.

PPP AND CONCESSIONS PARTICULARLY IN NORWAY

PPP constitutes an important variation of the concession model, mainly for non-reciprocal projects, exemplified by jails, schools and hospitals (the three categories of scopes of the initial version of PPP, called PFI in the UK). However, concession is still in use, for reciprocal scopes, such as highways, ports and airports. Of course, in legal orders of the UK and the USA and according to a part of the scientific

theory, concessions are considered along with the PPP alternative. Anyway, both types of public contracts constitute the so-called “alternative contracting out” phenomenon. The main advantage of PPP method against the traditional method for public works consists in the fact that the public partner takes advantage from the involvement of the private partner for a long-term or at least mid-term period, having to do with the operation of the (usually non-reciprocal) project.

For the time being, in Europe PPP are most common in certain geographic regions (UK, Spain, Portugal, Italy, Germany, France), not having expanded as much as expected in the 1990s when the term was first put forth. Even today, that there is not one accepted model or even definition besides the loose definition of a cooperation between public authorities and the world of business (European Commission, 2004), the advantages are unequivocal; know-how, experience and practice sharing; maximization of the use of skills belonging to the private partner; optimizing the outcome given the funds or ensuring more funds through the participation of the private sector; increasing the transparency of public spending or even releasing state funds for other purposes; risks allocation.

Among the negative aspects of PPPs are cited the time needed to assess the final outcome, any legal or accounting impediments, the relatively inflexible character of the model in time, and most importantly the compatibility of the sectors involved in each project.

Governments have limited financial resources to allocate for improving public services and infrastructures and this is what led to the PPP model. Currently, PPP activity is not particularly high in Norway; nevertheless, this model is spreading geographically, across Europe, as well as thematically, over new sectors, giving a push to the development and completion of necessary infrastructure, while it releases state funds for social uses.

Commercial growth, continued rise of demand by Asian markets and the subsequent need for faster transport, combined with the environmental conditions and the progress of “ice technology”, may constitute an incentive for the wider use of PPPs in Norway in the hinterland, the coastal regions (upgrading, expansion, construction of ports) or for activities at sea (e.g. extraction platforms). More generally, the European Investment Bank expects investments in the fields of environment, transport, energy and research infrastructure for the years to follow.

It is very important that Norway is nowadays endowed with another region (Barents) for its activities, besides the North Sea and the Norwegian Sea. Should natural resources extraction start systematically and in a wider region by more countries, there will be a need for LNG carriers or even tankers, in addition to the development of the region, which would in turn create more traffic. Infrastructure is a necessary prerequisite for economic growth and will play a key role in maintaining competitiveness vis-à-vis the dynamically emerging economies.

Norway has proved its efficiency in investments and infrastructure with the long-term commitment to the hydrocarbon production. Its economy is successfully a mixed one, with important sectors being controlled by the state. In order to cope, however, with the increasing competitiveness in the region, more steps should be made in this direction. PPPs' future depends on the evaluation which is yet to follow (positive feedback). Nevertheless, the environment is friendly, also taking under consideration the ranking of the state at the corruption classification (Transparency International, 2013). So, participation of private capitals can therefore be encouraged.

CONCLUSION: THE ARCTIC, A "CENTRAL" OCEAN?

The Arctic is a delicate ecosystem and a complex environment. Until quite recently the resolution of issues concerning this region was definitely not among the priorities of the coastal states, given that the region was permanently frozen and thus unapproachable. However, climatic data have changed what was taken for granted and the Arctic has been gaining importance due to its shipping routes and natural reserves (oil and gas exploration), mining operations, hydropower development, military advantages etc. Development attracts tourism at this remote part of the globe. High demand and carbon prices along with energy security unrest during some time period would justify the need to explore new energy sources and the costly and time consuming infrastructure the Arctic needs. Due to these new routes, maritime traffic is expected to increase in the region, making the passages significantly more important in economic terms. Radical changes are not expected any time soon, but the motives of lower transportation costs in combination with exemption from piracy high risks, of less time and of fewer emissions are far from negligible, therefore coastal states need to be able to host this traffic and reap benefits. Norway, a state with a strong presence in the European market and at the top rankings of the exporting countries, can use the PPP method to exploit the opportunity of attracting ships to its ports to become an Arctic hub. Despite the difficulties and the challenges of cooperation between such diverse partners, the expected benefit is too great to ignore. In the years to come, the Arctic may become a "central" ocean, given the geopolitical, environmental and economic stakes. Directly concerned countries, like Norway, need to plan ahead so that they won't be left to follow puffing the leading actors, either state or business ones.

The Greek word for Freedom ("Ελευθερία") etymologically signifies the coming motion, so the faculty of moving from place to place. So, the physical faculty of transport ties in with the legal faculty, namely the fundamental right, of Freedom. As a result, a "new" Ocean emerges, the Ocean of Freedom, historically exempted from international law crimes against humanity, such as piracy attacks. The great challenge for international community is to promote the Ocean of Freedom, being anyway a spot of

“high seas” according to the International Law, even against the five nearby states, to the “Bridge” (“Pons” in Latin) of Safety and Sustainable Development. All states involved, let alone the superpower of Russia with recent cases of bipolar expansionism, should comply with this diachronic rule.

Last, but not least, Norway, a country ruled by Nazi empire for its potential use for nuclear energy in the Second World War, has a major motive to contribute to an environmentally friendly, peaceful use of the Arctic. Ice melts, do friendships emerge?

WEBRELATED BUSINESS COMPANIES STRATEGY FOR NEW CUSTOMERS

Marsiglia, Bruno; Evangelista, Federica; Celenza, Domenico; Palumbo, Emanuela

Department of Economics and Law, University of Cassino and Southern Lazio, Cassino, Italy

ABSTRACT

This paper provides a study on web related B2B (Business to Business), B2C (Business to Customer) evaluation of strategy and methods for maximizing (expanding) the number of customer among the people (i.e. internet population), using cycling process externally for internal process of strategy which explains business exploration and agility, and online consumers their compulsive buying behaviour with a new strategy to capture them in large number. The web based industries are web based companies and web related companies, we concentrated on web related company through new innovative method called B2P (Business to People/Public) a schematic approach strategy diagram of B2P, and with external Process of strategy.

The B2B and B2C (Business to Customer) used by enterprises in peer to peer process is based on a qualitative approach, our sourcing of data has been carried out through secondary sources (paper, articles, open source).

The findings are with new schematic diagrams designed and drawn by us with an idea and proposal and approach strategy for attaining people interest in the online industry specially concentrated as example on online book selling company.

The originality of this paper called concept B2P is from different sources, examples, online articles and built on industry leaders advice through "linkedin.com" and web blogs.

Keywords: *strategy, B2P, branding, internal process, online book company or industry, web related, web based, costumers , external cyclic process (data collection).*

INTRODUCTION

This article attempts to evaluate and investigate the steps of technology strategy in online industry trends to attract people to become a customer, especially in the area of online business (Vrontis and Thrassou, 2007) web related and web based companies, technically so called e-commerce firms, and in their new strategies in the changing (Sia and Lee, 2006; Mandelli, 2000) the idea world for better

future business. The web based and web related companies generates each years on average 1.2 million jobs, they are small and medium enterprises with much high field business in different sectors.

After the invention of internet, day by day, the number of user are increasing as per the reports till 30th June 2012 the population 2.405.518.376 (<http://www.internetworldstats.com/stats.htm>) and business expands in to multi domain sectors. The enterprises use today a web technology and sites for better feasibility of business, we would like to introduce B2P (People/Public) concept in a highly regulated industry is the web related technology industry by innovators and risk takers who understand that tomorrow's success relies on today's relentless challenge of the status for future business based on B2B and B2C. We are introducing a bivariate broad perspective B2P concept, which evaluate and invent a new strategy on cyclic process which explains business exploration and agility and online consumers their compulsive buying behaviour with a new strategy of capturing costumers in large number.

The web based enabling technology helps the web related companies to generate most of the percentage in the business online, we will discuss the credibility and trust in online companies and new strategy to brand making like Amazon.com . The e-commerce industry is widespread importance of e-branding, prevalence of collaborative and customer-centric e-brand building strategies including co-branding and affiliating with established online and offline brands, distribution partnerships, content alliances and personalized e-mail contacts. The internet companies (Eisenmann, 2006) also seems to have employed a variety of traditional techniques.

The proposal is provided with idea of new concept called B2P (People /Public) which would support the expansion in numbers through cycling process of data analysis and by new strategies, and attracts the people to become a customer in web based and related companies, when it comes to web base they more into technology and transfers in to business for web related companies (i.e. we based companies enables, platform for new business enterprise), so, we would like to concentrate more on web related companies example online book seller and document article business, we are trying to focus what inspired to shift in strategy from B2C, B2B a new trend approach B2P with schematic diagram and strategies.

The research approach is based on qualitative methods, starting from a single method approach. The research is developed according to the study of international literature and from blogs of industry leaders.

This article has the following structure, from introduction, the section one provides a literary review of methods used to evaluate web based and web related companies, particularly, the study focuses on B2P (People/Public), it discuss in later section about what measure and data collected as empirical

evidence how the literature are, then the research approach explains what are the steps we gone through to write a finding with schematic diagrams with new concept of strategy B2P and the last section includes conclusion with the limitations of the study and suggests future research.

LITERATURE REVIEW

Many authors wrote about the internet based companies and strategies, after careful review of articles in the internet and few authors statement, unfortunately, first-generation e-commerce strategy (Vulkan, 2003) books were long on vision but short on detail. If the customers are moving online whole information technology (Warner, 1987) investment paradigm must shift, we tried to structure this widespread strategy problem for attracting people, to become a customer (with example of online book selling company development). Hence, the proposal is to provide a study and new way of categorizing the conceptual customer and other people to expand the business with strategy. The concept called as B2P (Business to People/Public).

The "Bill McChesney" IT Executive, from Large federal systems integration firm says while online consumers are less concerned like "sending your clone to work" or "outsourcing your exercise" people voted for cloud because of it possess shift to infrastructure transparency in which not to think about servers and storage give perfect solutions. And the traditional consumers about firm location maybe more concerned about unobservable quality, and to signal this, online retailers rely more on advertising than traditional retailers, the imperfect price competition may arise because of vertical product differentiation, incomplete consumer awareness and near-perfect information exchange between retailers.

In online book industry the 100% profit per customer /consumer electronics/appliances Books Groceries Apparel Amazon trumped its rival once more by providing ratings of individual book reviews, so, yet everything they do in a virtual store cannot tell the online retailer, then how to trust online money transfer and company credibility, and if so, people buy books, but these questions always raised to the online company amazon.com. The past case studies and reports posed a notion of fraudulence in the transaction in the sense of money and data management.

The revenue data for the online book market reveal that consumers respond to advertising and website spending rather than low prices (Zott *et al.*, 2005). Lim *et al.* (2006) says the trust in the online trading is based on quality of service, and if so, the customer will buy the goods evaluated through an empirical study of trust-building strategies. And the Greenfield (2001) explained posing approaches toward the business online in the prostration, the gaining is important, people are in N number it is ocean how much you grab, how much you gain in end of day is branding.

The leading-edge online tools in communicating their key to e-brand values and promoting their online platforms, considering for example in the case of online book selling company, what few people know is that the first online book selling is not amazon.com, the other was started before, but failed in reaching potential customers or not into globally and stacked only to the regions, where trend and strategy missed led them to be behind the competitors.

RESEARCH APPROACH

This qualitative research approach (Myers, 2013) is centred on the structural management of web related companies and web based companies for gaining customers with B2B and B2C strategy. The international literature on this topic is analysed.

Starting from the general understanding and data collection approach and strategy, data acquisition (Yin, 1994) was achieved through secondary research sources specified as follow:

- scientific books and articles;
- database such as Google scholar and e-marketing companies;
- schematic diagram's (internal and external process).

The application of new B2P concept and schematics diagram's for representation as well for strategy to attract People/Public to become a customer by internal and external process. The proposed research findings coming from a schematic diagram and references form the scholars article empirical application a new idea of B2P (continues cyclic process for customer gaining) strategy, marketing (Mandelli,1998) utilizing methods through schematics diagrams.

FINDINGS AND DISCUSSION

The concept of B2P generates a coherence and brought up base form B2B, B2C, and the key point for webs based companies and web related companies business established competitors to remember that innovation involves two essentially different activities coming up with a new technological, strategic (Burgelman and Maidique, 1988) or productive idea and then creating a market out of it. For an innovation to be successful, both activities have to be effectively coupled, but there is no need for the same organization to do both, one company may come up with a new and disruptive way of playing the game and another may take the idea and run with it. The findings section would explain how the strategy utilities and options are explored to grab most (Public) of attention.

The web based companies are crucial role in advancements, the online enabling tools makes user to be free moving and hassle free surfing with more optional and fast process obviously the big dealt in the online market in web based organization is "Cloud Technology".

We consider the next big trend after cloud computing might be PAAS is a Platform as a service, enables to consumers more on controlling of what and where they publish their info, and businesses want to manage subscribers and advertising recipients as discrete persons, rather than as a set of email and phone contacts that might be overlapping, and might be peercling, is next big revolution "P2P plus Cloud " once we move all critical systems to the cloud, we will be totally dependent on having network connectivity that would lead business for longer motion and time.

This paper concentrate much on web related companies, we would like to present an example of online book industry who sell and market for publishers, the trend, theoretical strategies are meant to be common for most of domains.

The revenue data for the online book market reveal that consumers respond to advertising and website spending rather than low prices as the market size expanded during 1997–2001, these endogenous sunk costs escalated, advertising-to-sales ratios and market-concentration ratios are much higher than for traditional book selling, using price and demand information for individual books over a number of weeks, we can find counter cyclical and cross-sectional price variation inconsistent with perfect price competition.

The two conflicting predictions have emerged regarding the effect of low cost information on price, first one states that all internet retailers will charge the same low price for mass produced goods. The second states that internet retailers will differentiate to avoid intense price competition (data collected in April 1999 on the prices of 107 books) in thirteen online and two physical bookstores, we find similar average prices online and in physical stores and substantial price dispersion online.

The best formula of the buyer always values in the result of benefits which mines from costs, since methods explains how the customer are, we started to concentrate on broad prospective in N (infinite) number of people, then we come across a new split of people who are customers and might be customers and visitors by category, in order to increase number of selling irrespective of ages, considering the book online store with different category book from arts to technology (end to end type).

The internal process split diagram 1 explains the basic split of people for business and parallel the external life cycle with measurement analysis regularize and make understand for change strategy (in order to gain more customers) in the diagram 3.

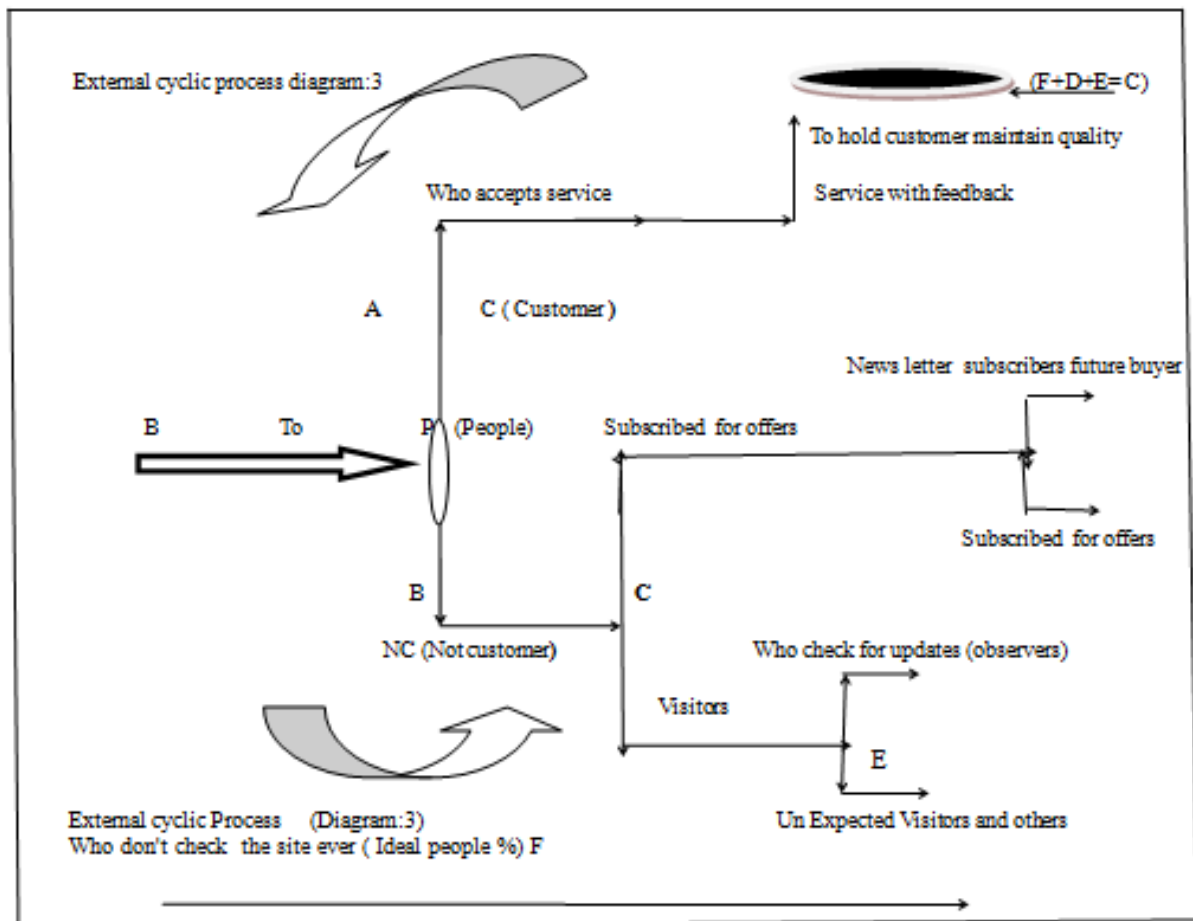

Diagram 1. Internal Process Split (Methodology) B2P

The B2P internal diagram (predicted split diagram.1) for future strategy split into A, B from people, where the A split line represents who are already a customer (all the existing customer comes from people he/she might be a enterprise/institution representative or a small book shop for bulk order or individual customer) in A category. By keeping up offers and long-term subscription, coupons with special delivery package would benefit to sustain customers long time. The category B represents NC (not a customer's) but the they can be active as register user and visitors.

The registered users are from the non customer in terms of buying books online, we have sub clarified registered users as news letter subscribers and subscribers for offers who do occasional transactions. The news letter subscriptions are a good idea which intended to be part of companies announcement and latest deal and but the not interested buyers are 50 percent, and since the subscribers of offers and newsletter subscribers are similar in theory but they are different in action, the subscribers for offers are people who tend to be potential buyer, when they are need of a rebates and coupons issued on purchase.

In the category of visitors, the people are, who impressed by variety of books in online store always wanted to be up-to-date about their favorite book, then after sub category are visitors sub classified as

observers (might be general people or competitors) and people who want to keep in comparing the books published and who wish to be future subscriber a slow and study mood people fall in to this category.

The unexpected visitors and others are directed through adds (or) unintentional clicks, or people who are academic researchers and students searching through Google or Yahoo search engines, and who don't check the site ever ideal people large in percentage category " F", we try to evaluate and capture the people through cycling process and schematic diagram and we are going to evaluate these people under objectives, in order to make them as online buyer.

Let us assume by taking few indicator, the registered user are sub category register, the inbound marketing strategy an effective website strategy includes several components beyond the obvious. Like lead nurturing email campaigns, down loadable white papers, targeted ads based on visitor engagement, segmented newsletters, and more. Each strategy should be carefully considered based on the complexity of your sales cycle.

We understand how much education is required to reach close a potential customer likely to depends on education and the marketing plan. The product relatively simple and volume based, the customer likes product. The product require complex integration (or) contact from a sales associate and has to check customer care standards and antiquities; always better to checking the numbers of consumer segments does company target.

Writing a book online is a business which is reviewing the articles or books by others and increasing number of hits resultant in to sponsorship, branding for future, increasing brand value even by not selling or not served the direct service (net work sites, knowledge sites) might have a chance to result business mind run and long runs by turning the non customers in to potential clients. The Europeans (Zott et al, 2000), buying on-line to continue exponentially from 13.5 per cent of the online population. Through the book reviews and discussion forums which are a form of virtual community a relatively new online bookstore called iBook, and how web based markets online auctions and electronic exchanges can overcome debacle calls trust with unknown people for trading money and for books and parallelly gaining the customer through the strategy we would see in the predicted strategy diagram.2.

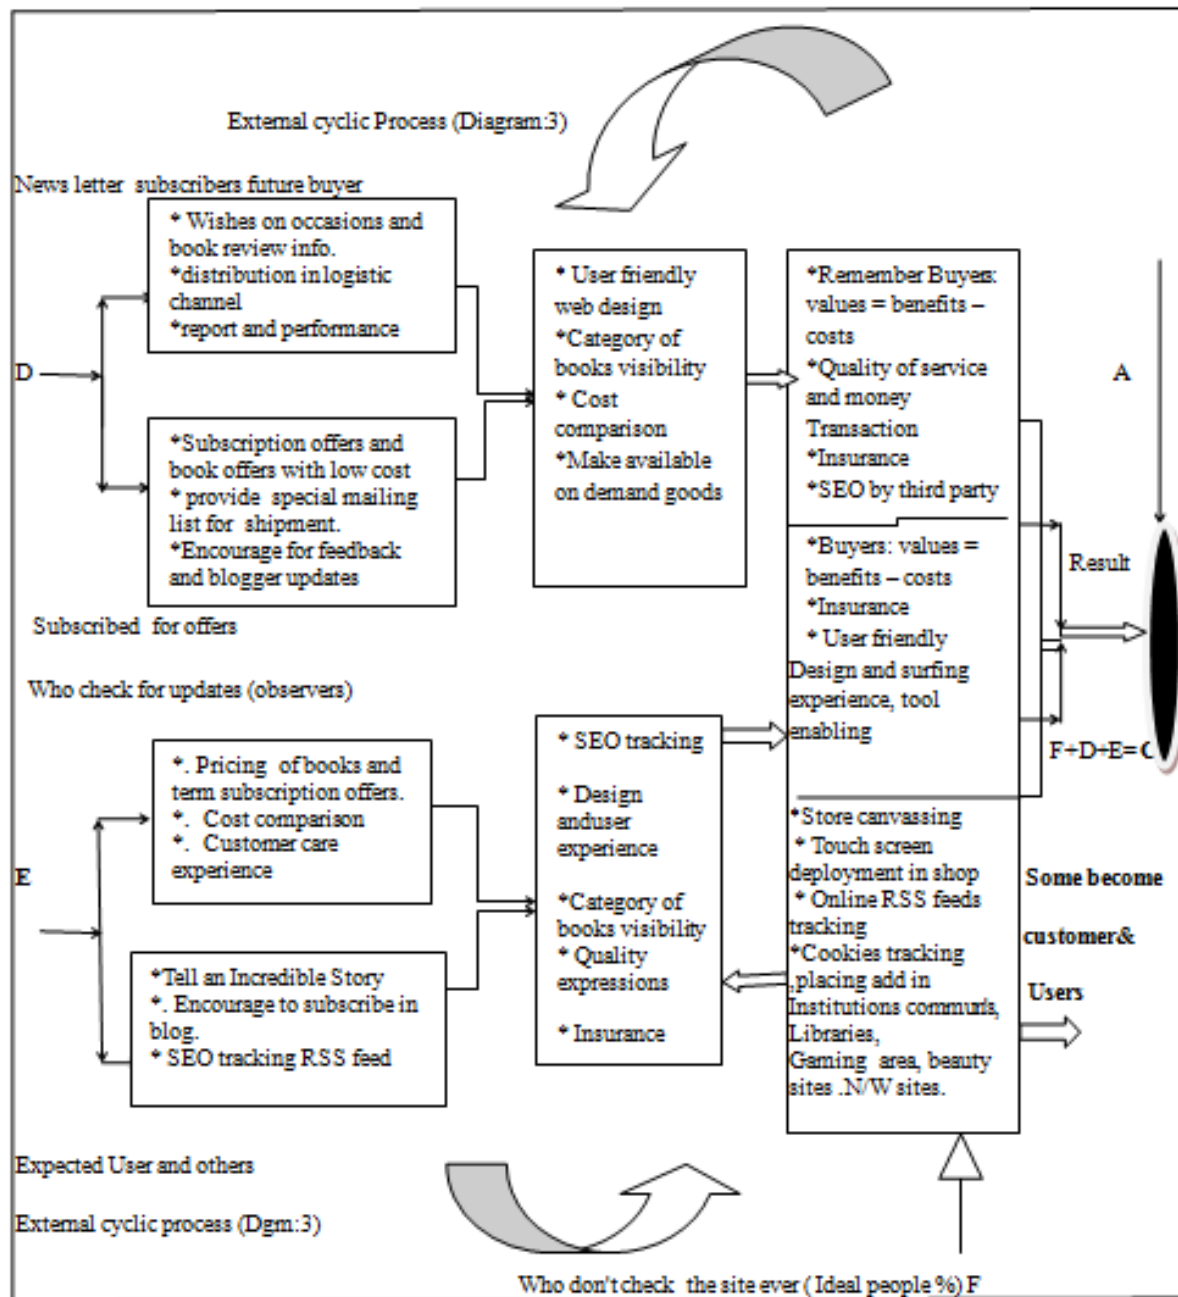

Diagram 2. The solution of Diagram 1

Literally we are presenting above an indirect form of 4Ps for our business strategy, which are Product, Place, Price, Promotion, but by preference order according to the category of people fall in. We are going to discuss the resulting solution and topics motioned in diagram 2 from D and E step by step strategy in different order.

The wishes on occasions and book review information attract subscribers and make them feel comfort and trusted in relations with customer by wishing in every accession, and special movement sharing a review will bring the companies to transfer registered customer in to buyer "customer comfort is money".

Then the logistic channels of the distribution, "Scribnet" is the example for review in book stores, permit to people to upload their documents and spread a word across about customer books and articles, reporting a performance of the new product (books) and company policies to reach higher customer satisfaction and new launches would increase the satisfaction and trusted level and another step would be subscription offers and book offers with low cost like offering a lifestyle membership, by providing the highest form of maturity membership that gives access to many different products and experience beyond own product. And the next is contracting with companies who want to extend beyond their core product offering like offer an ecosystem of suites and products companies in tenuous markets, example Peugeot's Mu program gives consumers access to cars, bikes, buses, vans and more for rent on deduction through the online book store, and announcing an offer on separate mailing list who are in contact with the company longer than a year and encourage for feedback and blogger updates.

The user friendly web design and cost comparison is the best idea of attracting people, most of website in the web related companies like online book selling company don't concentrate on friendliness of website and maximum percentage chances for user satisfaction to word custom web environment is unsatisfied need to utilize latest technology pro dynamic website design, and the cost comparison of on line book aligned with the rate of current company and with competitors would be the better option for new orders and increase in the sales.

The after contracting and offers would pass-on to the availability of realization of on demand goods, if you have a high-cost, or high-consideration product, low usage product, considering offering it on demand, through a shared access model like amazon.com. The legitimate offer always be pricing of books and term subscription offers change by time under competition are fixed pricing, dynamic pricing, bartering but always the buyers principle falls under value is benefits minus costs.

After pricing and designing the customer care experience is the most important part of query transaction, information purpose about books derives most efficient, and TAT (turnaround time) generated customer care companies appreciates with the higher inflow of people to the company for business (whether is maybe through e-mail or tail call) all about the antiquities.

Always the first step to gain a customer from people is tell them an incredible story, no one cares about features until they understand the solution, whether company creates software (or) sells books online, or point of sale terminals for retail outlets it's the results that matter, but delivering truth and realistic things important and making a blog for the people who want to visit and update and discuss about technologies authors, anything which would gives a scope to communicate with other users is a better option of branding the business.

The one more option explained in diagram is SEO tracking and by third party, the search engine optimization is a new way of business by number of hits and first in first out formula believing system, how many clicks and how many times searched in the search engine makes the company to appear in the top list for reputation and for more opportunities to advertise optimizing the website more feasible standards. However, in the companies the idea of giving contract to the third party depend on the revenue and market share of the online book company. The attractive website may appeal to a broad audience, it's critical to test, and re-test website pages in an effort to optimize user experience and results.

The quality expressions is one of the factor that focus on quality of service and books, we know teams used to spend thousands of hours writing pages of website content going into excruciating detail about every feature available, sadly this instinct will dilute value proposition, and slow the buying process dramatically, keeping things simple will build trust and understanding early in the buying process.

The last section but not least important option creating people as customer from ideal people "F" category, the ideal people are most important to the market, where a need of bringing these potential buyer from physical to online, we choose traditional and few programmatic step to attract and make them internet friendly for purchasing books online and store canvassing and general digital marketing, the example canvassing in the electronics shop about electronics book on free touch screen display and encourage offers on buy. A lot of careful thought goes into the planning phase of digital projects prior to the design, or development work begins, this process is essential for strategic design that achieves business objectives, and follows optimal user experience, marketing is the predominant part of strategy (Rappart, 1979), the past writer missed posing a strategy where online book company can make a contract, to the different filed related shops and libraries, beauty salons and gaming points with setting up of touch screen web panel for people.

This experiment results into huge number of customer and generation of money by selling books, then the user starts to equate with internet and screen environment, slowly attracts toward to the ads on the screen and book display, online RSS (Really Simple Syndication) feeds cookies tracking, placing add in institutions commune's, libraries, advertise in gaming area, beauty sites.

This kind of tools help to improve performance and increase the satisfaction internally which would result into external customer increase to the company, both consumers and service providers take advantage of the many benefits it has offered. The adoption of virtual applications, architecture and service orientation computing are some of the factors that should be considered when thinking of cloud computing. We predicted and drawn a external cyclic process diagram. 3 which dealt with the market research on public data and behavioral analysis to find potential consumer form people, it's a continuous process irrespective of time.

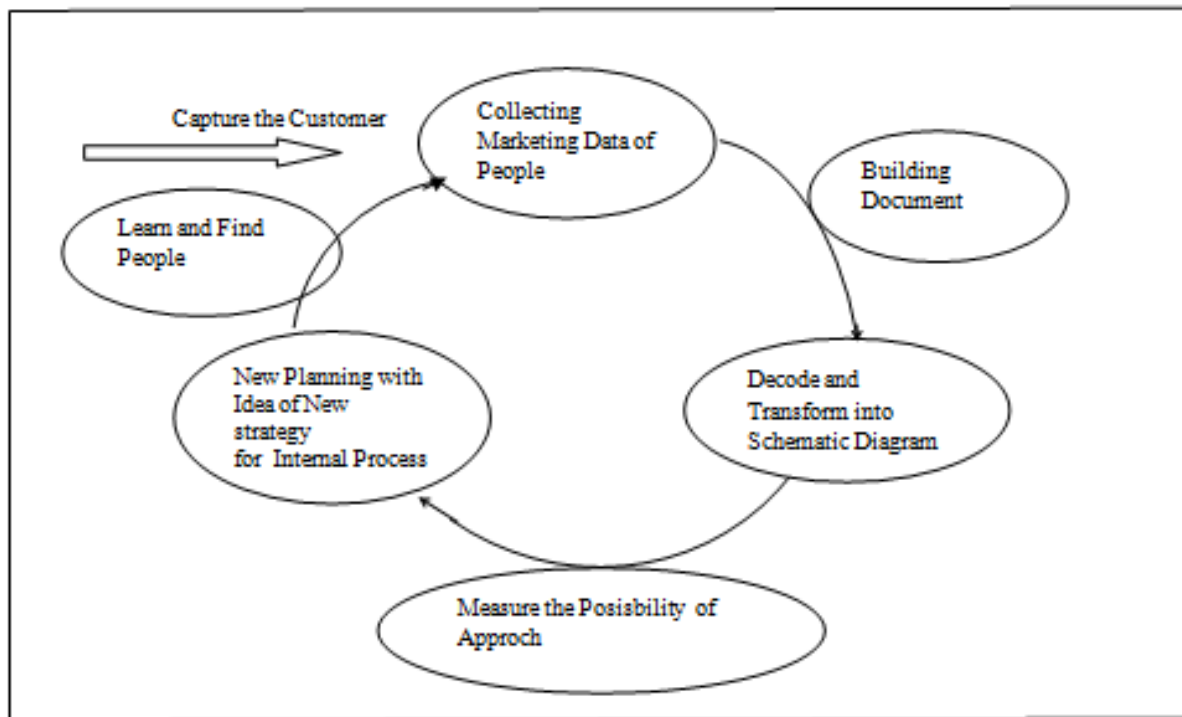

Diagram 3. External life-cycle process

The cyclic process follow and support the internal process to gain new customers from the N number of people. External process starts with collecting market data of people who are internet users and Ideal non internet users using tools and market research, human resource and building documentation, structuring appropriate data from bulk according to objective set for first cycle and to transfer in to decode an transfer process where data into strategy, reaching to people of specific slot or set area compiling to measure for approach, where the strategy measured with regression models, into pure graphical representation, after approach with plan on line marketing through tools and agencies, until reaching objective to hold on more people, further migration of process to the Internal Process, it makes a new strategy based on external results.

CONCLUSIONS

If we want to sell toilet paper then we could start a toilet paper business right now online and if we truly kicked on to notch could make a living. My point is it's not what you sell as much as you believing that it will work, work hard, and work very smart to make it happen.

In the paper we tried to evaluate online business growth on base of new strategy gaining in long term by cyclic order and with collective analysis of data with management. We gave notions how the strategy can be further divided and evaluated for trade in the results to the business. The strategy,

exploration and agility discussed how the people are and how to capture them from different platforms, and the online consumer compulsive buying behavior analyzed.

But the paper provides enough notions and sub categories for the idea purpose, more incite work can be possible in future with web related industries connecting with B2P(people, that means increasing the number irrespective of age and specific area of interest) expanding till to end through step by step evaluation.

In light of the consideration made, it is appropriate to point out that this research is based for further that will address current trends in the field of web related companies strategy for gaining people as customers with a new concept called B2P(Business to People/Public) under cyclic process.

The example internet based strategic idea of business, we have noticed a company for knowledge sharing on consultation who are joint experts in the field and employees of other organization, through money grows in parallel and on form of KPO (knowledge processing outsourcing) competitor without. hug set up as KPO. Example "Mavan " (www.mavan.com).

UPDATING ENVIRONMENTAL KNOWLEDGE THROUGH A KNOWLEDGE MANAGEMENT MODEL

Martinez-Martinez, Aurora¹; Cegarra-Navarro, Juan-Gabriel¹; Garcia-Perez, Alexeis²

¹Universidad Politécnica de Cartagena, Facultad de Ciencias de la Empresa, Cartagena (Murcia), Spain

²Faculty of Engineering and Computing, Coventry University, UK

ABSTRACT

A review of the literature confirms that a knowledge management framework which supports knowledge creation is required, particularly in those organisations having to deal with a changing environment. Socialisation, externalisation, combination and internalisation continue to be key processes for the creation of knowledge which enables organisations to successfully address environmental challenges. This paper examines the relevance and importance of a SECI model as an enabler of the processes of reusing and updating of environmental knowledge of an organisation. The research reported has confirmed that time is a key component of the implementation of a SECI model in organisations operating in a changing environment. It has been confirmed that such a strategy should focus on the reuse of prior environmental knowledge as a mechanism to establish within the organisation a context where new knowledge management processes are understood and adopted by employees. The paper also examines the relationship between environmental knowledge and organisational performance indicators. These relationships are examined through an empirical study of 87 companies in the Spanish hospitality sector. The results indicate that environmental knowledge at a given time (T) is found to be significant in predicting the knowledge management processes at a later point in time (T+6).

Keywords: *SECI model, environmental knowledge, hospitality industry, performances and time.*

INTRODUCTION

Environmental knowledge has become one of the most important intangible assets for organisations in the current competitive environment (Po-Shin & Li-Hsing, 2009). Environmental knowledge can be defined as the degree to which an individual or organisation becomes aware of and concerned with ecological issues (Amyx *et al.*, 1994). Environmental knowledge may be thought of as comprising stocks of data, information and knowledge resources (environmental memories) that have been gathered and accumulated by an organisation by virtue of its knowledge structures (Chou *et al.*, 2005). While the relationship between environmental knowledge and organisational performance has been

addressed by several authors (e.g. Boiral, 2002; Boiral, 2009; Cegarra & Martinez, 2010), there has been surprisingly little empirical investigation of the effects that environmental knowledge can have on knowledge management process (and vice versa) over a period of time.

Time has traditionally been considered in the management literature as a constant rather than a variable, a belief Bluedorn (2000) ascribes to people in general. Furthermore, as Bluedorn notes, the understanding of time as a constant is deeply institutionalised, which suggests that most people, most of the time, do not even consider the possibility that time may vary. This suggests that one should speak of 'times' rather than 'time' (Purser *et al.*, 2005). In this study it is assumed that 'times' are sequential and enable first creating an environmental knowledge and then putting the upcoming environmental processes into a familiar context for members of the organisation. The question that arises is whether a knowledge management framework is needed to reuse and update prior knowledge of the environment and if so what can be done to face environmental challenges in the coming years (Cegarra *et al.*, 2013).

In this regard, the SECI model (socialisation, externalisation, combination and internalisation) provides a good basis to explain the adoption of new environmental knowledge (Nonaka & Takeuchi, 1995; Nonaka *et al.*, 2000). This paper aims to offer an empirically tested SECI model which helps identify how prior environmental knowledge in the Spanish hospitality sector may be reviewed and updated through the development of knowledge processes at a later time. In the conduct of this research, we have addressed the following questions: Does availability of environmental knowledge at a given time necessarily mean the use of environmental knowledge at a later time? How can hospitality companies update environmental knowledge resources? By addressing these questions this paper demonstrates that the availability of environmental knowledge at a given time does not necessarily guarantee the effectiveness of environmental knowledge at a later point in time.

The longitudinal study described in this paper involved two observations of the same variables over a period of six years (2008 and 2014). The proposed theoretical framework is presented in the following section. Details of the survey which was used to collect appropriate data to test the model is presented in section 3 and the results of testing the models are detailed in section 4. The results and managerial implications are discussed in section 5 which is followed by our general conclusions in section 6.

THE PROPOSED RESEARCH MODEL

Connecting the SECI model to environmental knowledge

Sustainable development is one of the world's most important priorities in order to attain the well-being of mankind (Nouri *et al.*, 2008). In the Spanish hospitality industry the growing interest of tourists in the environment has led to the promotion of ecotourism, and with it the efforts to develop

strategies that focus on the environment (Brockhoff *et al.*, 1999). The concept of environmental knowledge has been invoked to characterise the way in which organizations align their strategic goals to sustainable development (Wernick, 2003). This means that organisations with environmental knowledge will know what can be done about environmental problems and they understand the benefits of environmentally responsible goals (Frick *et al.*, 2004). As Po-Shin and Li-Hsing (2009) suggest environmental knowledge involves what people know and are concerned about regarding the natural environment, their responsibilities towards environmental protection and the relationship between the economy and sustainable development.

One way to gain environmental knowledge consists of developing a continuous process of dynamic interactions between strategic goals and environmental challenges. As Martelo and Cegarra (2014) noted, knowledge in a firm emerges both from inside and outside the firm. By doing so, the SECI model may play an important role in the creation of environmental knowledge since it is a way of transferring knowledge to refine the knowledge existing within the organisation while also improving the effectiveness of its search and retrieval strategies. A key argument supporting the SECI model is that knowledge held by individuals is shared with other individuals so it interconnects to a new knowledge (Nonaka *et al.*, 2000).

Nonaka and Takeuchi (1995) suggest four dimensions of the SECI model, each playing different but complementary roles in explaining how knowledge can be created in organisations. While sharing tacit knowledge between actors is considered a socialisation process, tacit knowledge becomes explicit through an externalisation process. This conversion is due to a social process between groups and individuals (Nonaka & Takeuchi, 1995). While the ability to maintain the explicit knowledge within the organisation is defined as combination, internalisation happens when explicit knowledge transforms into tacit and thus becomes part of an individual's expertise. Therefore, internalisation means understanding explicit knowledge.

The creation of environmental knowledge supposes, in this case, the reactivation and development of new information about events, trends, and relationships in the external environment of the organisation. For example, if there is no prior knowledge or history associated with environmental issues, then a failure to act towards achieving the strategic goals of the organisation may result in a search for environmental knowledge at a given time (T). This, in turn, fosters learning and therefore the absorption of new knowledge by employees (Choo & Auster, 1993). As Boiral (2002) points out, this knowledge includes employee compliance with new practices. Some of these new practices include the exchange of information and sharing of environmental concerns (Fryxel & Lo, 2003), the acceptance of constraints related to the prevention of pollution (Cordano & Frieze, 2000), and collaboration with technical services to develop cleaner processes (Aggeri, 1999).

The above considerations have led us to frame the first hypothesis of our study as follows:

H1: The SECI model at moment (t_0) has a positive effect on environmental knowledge at moment (t_0).

Connecting environmental knowledge to the SECI model over time

As competition intensifies and the pace of change accelerates, it is likely that aspects of environmental knowledge (e.g. environmental routines and procedures) will change over time, requiring the modification of some knowledge structures (Aggeri, 1999; Brockhoff *et al.*, 1999). Prior research has also shown that the effect of environmental initiatives on business performances can vary substantially in a turbulent context (Cegarra *et al.*, 2013), such as the Spanish hospitality sector during the period we have examined, under this framework it is necessary for hospitality companies to update what they know about environmental issues (Cegarra *et al.*, 2013). It should also be noted that a set of authors are focused on time as variable to be taken into account. For Gist and Mitchell, (1992) an individual's level of self-efficacy can be expected to change over time as new information and experience are acquired through direct experience with the task, performance feedback, and other factors. In this vein, Adam's (1990) work shows, that "causal time" is seen as one-dimensional, structured in terms of past (t_0), present (t_1), and future (t_n).

The above considerations lead us to argue that once prior knowledge and skill are assessed at a given time (T), there is a range of potential responses by employees, which are determined by the type and characteristics of the challenges. In addition, impact and importance of environmental knowledge varies over time and prior environmental knowledge can soon become outdated or obsolete at a different point in *time*. There may be a number of different ways of understanding the concept of 'time'. In this regard, Crossan *et al.* (2005) focus on three characteristics of time, namely;

- a) Time as a trigger for change. As Gersick's (1991) work shows, groups with very different characteristics change their behaviour when approaching the middle of the span of time they have to perform a task;
- b) Time acts as a coordination mechanism for change. Time creates a shared calendar for change and, thus, serves to schedule activities and to maximise their synchronisation (Hedberg *et al.*, 1976); and
- c) Time as a resource for change. These considerations lead us to argue that 'time' provides organisational members with the temporal space they need to reflect on and conceive prior environmental knowledge (Tyre *et al.*, 1996; Eisenhardt & Brown, 1998).

Our focus is the relationship between casual time and environmental knowledge. For the purposes of this paper, we suggest that environmental knowledge is a process that happens over time, and takes time to update it (Lei *et al.*, 1999; Purser *et al.*, 2005). In this 'from-to' causal structure, whatever arises in the future has its origin in the past (Tulku, 1994), that means that hospitality companies which are responding to a series of new environmental challenges are forced to 'think and act over time'

(McKenna, 1997), and demands for instant responses frequently means relying on prior environmental knowledge (Purser et al., 1992). Therefore, when the rate of change itself is steadily accelerating, this means that it becomes highly problematic whether the environmental knowledge needed to increase company benefits can be accessed in a timely manner (e.g., Rondinelli & Vastag 2000; Zhang *et al.*, 2000).

Over time environmental issues and management challenges are likely to change (Bohdanowicz, 2005). An example of this is the emergence of new environmental regulations which may go far beyond the current company's plans to issue new standards for greenhouse gas emissions. As these environmental regulations change, it may become necessary for the organisation not only to exploit their prior environmental knowledge about these regulations but also to update (i.e. replace) such knowledge. Hence the ability of a firm to combine prior environmental knowledge with new one over time is therefore essential if a business is to align its processes, products and services with new challenges to face changing environmental issues. This is where a good knowledge management program such as a SECI program should distribute the new acquired information amongst all the employees involved in environment-related activities, codifying and storing such information for future uses, retrieving past successful environmental experiences, but also being able to continuously renovate past environmental experience with new acquired knowledge (Carmona-Moreno *et al.*, 2004). As a consequence, the SECI program at a later point in time acts as a facilitator in the relationship between EK at a given moment and EK at a later point, since it means that new environmental knowledge can be socialised, externalised, combined and internationalised using past knowledge and also used in the innovation process.

Therefore, we propose the following hypothesis:

H2: The impact of environmental knowledge at moment (EK_{t_0}) on environmental knowledge at a later moment (EK_{t+n}) is positively mediated through a knowledge management program ($SECI_{t+n}$).

Connecting environmental knowledge to organizational performance

The Spanish hospitality industry is a very complex one and requires intensive use of knowledge resources to successfully operate in a competitive market meeting the increasing needs of its customer (Claver-Cortés *et al.*, 2006). In hospitality institutions, staff need appropriate and up-to-date knowledge to face a number of environmental challenges, including the need to implement new customer engagement strategies such as those based on social networks), increasing customer demands and global competition to reach and recruit customers (Chandana, 2001). These considerations lead us to argue that updated environmental knowledge plays an important role in the improvement of organisational performance since it facilitates a situation which, when something is being done wrong, the organisation can change to quickly resolve it (King & Lenox, 2001), which in

turn may help hotels achieve their operational full potential (Cegarra *et al.*, 2010).

As the customer profile changes (e.g. physical location, behaviour, environmental preferences etc.), it becomes an imperative for hospitality companies not only to revise and update the environmental knowledge but also to effectively use such knowledge. Using up to date environmental knowledge have a positive effect in the public's perception, which is likely to result on more visits to the hotels and benefitting from the use of their installations and services (Carmona-Moreno *et al.*, 2004). As Boiral (2002) noted, the existence of environmental knowledge helps both companies and customers obtain beneficial results. For example, hotel operators encourage their guests to participate in new programmes to reuse their towels, which benefits the environment but also help reducing laundry expenses. Therefore, hotels equipped with up to date environmental knowledge can provide a more competitive way to deliver services, which could enhance the public perception as the company is seen to be socially responsible (Erdogan & Tosun, 2009).

Hence, we state that:

H3: The existence of environmental knowledge will determine the extent to which the company achieves better organizational performance

Taking into account all of the above, this study proposes the structural model shown in Figure 1. In summary, a firm with a SECI program possesses a key capability for the updating of environmental knowledge. To manage prior environmental knowledge effectively, firms must put in place a SECI program at a later moment that enables employees to update their assumptions and then replace new or modified environmental knowledge. Finally, firms with a SECI program will be able to use up to date environmental knowledge in order to improve organisational performance.

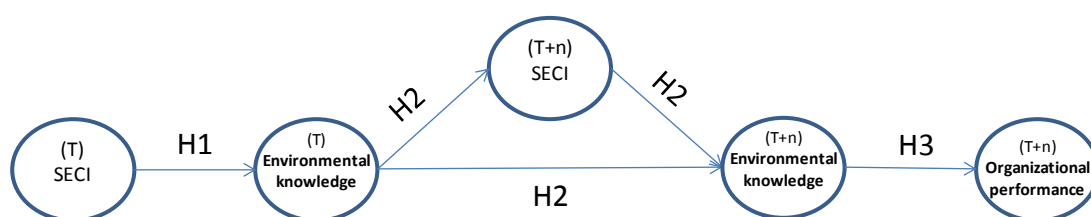

Figure 1: *Theoretical model*

RESEARCH METHOD

Data collection

The focus of the data collection process was the Spanish hospitality industry, in particular the section dealing with hotel operation and management. Hotel operation and management is a very relevant sector within the Spanish economy (Cadarsó, 2005). Spain ranks second in the world in this sector, both in terms of the number of travellers (behind France) and in terms of income from tourism

(behind the USA) (WTO, 2009). This industry reported 11.8% of the Spanish gross domestic product (GDP) in 2002 and 12.1% in 2001 (Claver-Cortés *et al.*, 2006). Regarding the employment generated by the tourism sector, estimates indicate that it usually absorbs 10% of the total employment available in Spain. From the total Spanish population, over two hundred thousand people worked in hotels and guesthouses in August 2003 (National Statistics Institute Information Bulletin, 2003).

The reasons for choosing the Spanish hotel operation and management industry were twofold: on the one hand it is very important for the economy; on the other hand, it is a sector facing an increasing level of environmental challenges. For example, hotels have to operate in an environment dominated by high fixed costs. The management often has to deal with issues related to staff wages, significant utility bills and the expenses derived from maintenance of rooms and facilities. Managing a profitable hotel becomes a challenging endeavour, particularly in a period of recession. In this regard, 2008 was the year when the tourist industry did not contribute to the growth of the Spanish economy for the first time ever. Just the opposite, the income generated by the tourist industry in Spain decreased in 1.1% with respect to 2007 (National Statistics Institute Information Bulletin, 2008). Also, the Spanish hotel operator industry is an appropriate setting for an investigation of knowledge management practices and their impact on environmental knowledge. This is because companies within this sector have to face up to highly dynamic environments, strong competition and rapid advances in technology. As Carmona-Moreno *et al.* (2004) state, the environmental policy in hotels is fundamental for their results, as these depend, essentially, on the environment in which hotels are located. Thus, the preservation of the environment becomes a crucial factor influencing hotel operations. This preservation therefore requires an intensive use of new beliefs, norms, values, procedures, and routines.

The unit of analysis for this study was the company, on the assumption that aspects relating to the creation of environmental knowledge affect the entire organisation. Relevant data sets were collected through telephone interviews with the CEO or owner of the business using a simple structured questionnaire. We made use of a list of 560 Hotel Operators provided by the SABI¹ database (from the SABI Database based on the statistics for the year 2006) as an initial sampling frame. All companies were included in the CNAE-552 (The Spanish National Classification of Economic Activities 552) and had more than ten employees. Before conducting the surveys, the businesses were contacted by telephone by our team and invited to participate in the study. Potential participants were informed of the objectives of the research and reassured of its strictly scientific and confidential nature, as well as the global and anonymous treatment to be given to any data collected. In total, 560 companies were

¹ Sistema de Análisis de Balances Ibéricos (SABI database) contains financial information for 520.000 companies (480.000 from Spain and 40.000 from Portugal). This includes public and private, Spanish and Portuguese companies, with up to 10 years of data, updated daily.

contacted by telephone and invited to participate in the study. A total of 245 companies agreed to participate in the first instance. These 245 companies were then contacted again for the purpose of data collection. Participants were asked questions about environmental activities carried out by their hotels and the learning processes implemented to create environmental knowledge in a context of intensive innovation.

Data sets were gathered in two phases, the first of which lasted two months, from early September to the end of October 2008. From a sample of 245 companies, 127 companies responded to the survey.

The size of these organisations (in terms of number of employees) can be described as follows:

- 41 of these companies have 10-49 employees,
- 59 companies have 50-249 employees,
- 18 companies have 250-499 employees, and
- 9 companies have more than 500 employees

This produces a response rate of 22.67% of the total number of companies invited to participate in the study and 51.83% response rate when we consider the companies which agreed to participate.

A comparison between companies which had provided a response and those that had not done so yielded no significant differences in relation to turnover, total assets or the number of employees, which suggests that non-response bias does not constitute a significant problem (Armstrong & Overton, 1977).

The second stage in the data collection process within this research was conducted six years after the completion of the first phase. For approximately two months, between January and February 2014, the same companies that had completed the survey six years earlier) were contacted by the researcher. A survey was conducted and a total of 87 responses were collected, for a response rate of 15.53% of the total.

Measures

Churchill's (1979) approach to questionnaire development was used. Scales were combined from several other relevant empirical studies with new items to make an initial list of 19 items distributed as follows: 4x3=12 of these measuring knowledge management processes, 3 focused on measurement of environmental knowledge and 4 items measuring organisational performance. The survey was initially validated by academics with expertise in organisational learning from Universities of Murcia and Cartagena (Spain) during the period of June – July 2008.

A series of telephone interviews were then conducted involving managers from a pilot sample of 2 leading Spanish hotels. These respondents were asked to indicate the reasons why they implement

environmental initiatives. All responses were related to economic reasons, e.g. conservation of materials or energy, adherence to industry codes or legislative requirements, decreased costs, process and product innovation. In fact, such initiatives were being used by businesses as communication tools to demonstrate their commitment to preventing issues which could have a negative impact on the environment. As a result of this pre-testing, we made some minor modifications based on the suggestions received. Specific issues relating to the development of the questionnaire and its related constructs are elaborated on below (see Appendix for a list of items).

- The final measures relating to the existence of knowledge management processes consisted of 4 items adapted from a scale designed by Lee and Choi (2003) to measure the constructs of knowledge socialisation, externalisation, combination and internalisation. Consistent with the findings of Lee and Choi (2003), items that addressed knowledge socialisation were interwoven with issues related to encouraging individuals in the organisation to track changing markets and share market intelligence with external agents. Also consistent with Lee and Choi's (2003) findings, items that addressed knowledge externalisation were interwoven with issues related to the encouragement of selected individuals in the organisation to transform their tacit knowledge of customers or experts into easily understandable forms. Knowledge combination items described the process of formalising and storing concepts into a knowledge system, such as databases and knowledge bases so that reconfiguration of existing information through sorting, adding, combining, and categorising explicit knowledge could be used to create new knowledge. Knowledge internalisation items were focused on the use of knowledge about environmental issues to develop plans and to the implementation of such plans.
- Previous studies by Boiral (2002) provide guidance in developing items to measure environmental knowledge. The importance of 'environmental knowledge' to cognitively diverse teams relates to enhancement of technical, administrative and social strategies through the accurate understanding of the information available to groups and where such information is located in relation to environmental initiatives. This acknowledges the importance of supporting policies, rules, reporting structures and decision-making protocols that encourage the introduction of clean technologies and approaches to reduce pollution that often leads to substantial savings of materials and energy.
- As the use of objective measures may pose some challenges to researchers while making causal inference from the historical data (March & Sutton, 1997), this study adopts subjective measures to achieve a more comprehensive evaluation of performance of the firm. In this

regard, several measures of business performance have appeared in literature and we adopt the growth-based measures proposed by Kaplan and Norton (1992), and Klassen and McLaughlin (1999) for sales, profits and profitability on total assets.

Data analysis

This study uses PLS-Graph software version 03.00 Build 1058 (Chin, 2003) to conduct an analysis of the data collected. Using PLS involves following a two-stage approach (Barclay *et al.*, 1995). The first step requires the assessment of the measurement model. This allows the relationships between the observable variables and theoretical concepts to be specified. This analysis is performed in relation to the attributes of individual item reliability, construct reliability, average variance extracted (AVE), and discriminant validity of the indicators of latent variables. In the second step, the structural model is evaluated. The objective of this is to test the extent to which the causal relationships specified by the proposed model are consistent with the available data. For hypothesis testing, we used the bootstrapping procedure recommended by Chin (1998).

In order to analyse the relationships between the different constructs and their indicators, we adopted the latent model perspective in which the latent variable is understood to be the cause of the indicators. We therefore refer to reflective indicators for first-order constructs or dimensions. Three constructs in the model are operationalised as first-order reflective constructs (i.e. environmental knowledge 2008, environmental knowledge 2014 and business performance 2014), while knowledge management practices on 2008 (SECI 08) and knowledge management practices on 2014 (SECI 14) are modelled as second-order reflective constructs. With regard to the measurement model, we began by assessing the individual item reliability (Table 1). The indicators exceed the accepted threshold of 0.7 for each factor loading (Carmines & Zeller, 1979).

Note: * Year 2014

Table 1: *Factor Loadings of reflective constructs*

From an examination of the results shown in Table 2 we can argue that all of the constructs are reliable. The values for both the Cronbach's alpha coefficient and composite reliability are greater than the 0.7 required in the early stages of research and the stricter value of 0.8 for basic research (Nunnally, 1978). The AVE should be greater than 0.5. Meaning that 50% or more variance of the indicators should be accounted for (Fornell & Larcker, 1981). All the constructs of our model exceed this condition (Table 2). To assess the discriminant validity, we compared the square root of the AVE (the diagonal in Table 2) with the correlations between constructs (the off-diagonal elements in Table 2). On average, each construct relates more strongly to its own measures than to others.

As noted above, a second-order confirmatory factor analysis was conducted of a model depicting the constructs of knowledge socialisation, externalisation, combination and internalisation. From an examination of the results shown in Table 3 and Table 4, all first-order and second-order factor loadings were significant. In addition to this, all the knowledge creation constructs involving two organisations (i.e. SECI 08 and SECI 14) explain a high amount of variance in their respective knowledge processes (i.e. socialisation, externalisation, combination and internalisation), thereby providing evidence that SECI 2008 and SECI 2014 are multifaceted constructs, construed from four dimensions (i.e. socialisation, externalisation, combination and internalisation).

RESULTS

The structural model resulting from the PLS analysis is summarised in Table 5, where the variance of endogenous variables (R²) and the standardised path coefficients (β) are shown. As it can be noticed, all the hypothesised relationships have shown to be significant, and therefore, the hypotheses leading this research have been confirmed to be valid. Since PLS makes no distributional assumptions in its parameter estimation, traditional parameter-based techniques for significance testing and modelling were used for this study (Chin, 1998). One significant consequence of the comparison between covariance structure analysis modelling approaches and PLS is that no proper overall goodness-of-fit measures exist for models using the latter (Hulland, 1999).

The structural model is evaluated by examining the R² values and the size of the structural path coefficients. Adopting the approach used by Tippins and Sohi (2003), we looked for the presence of the mediating effect by comparing the direct effect between variables and the competing links where the mediated variable is inserted, whereby two significant links are estimated and evaluated in a search for significant differences. Table 5 shows the results of the two competing links. The proportion variance explained in 'BP 14' was 42 per cent. With regard to hypothesis H1, the influence of 'SECI 08' on 'EK 08' was evident ($\beta = 0.71$, $p < 0.001$).

With regard to hypothesis H2, we explored the presence of a mediating effect by comparing the relationship between 'EK 08' and 'EK 14', as well as the competing link where 'SECI 14' is included. Table 5 shows the results of these two competing links. The first link (direct effect) examined the direct relationship between 'EK 08' and 'EK 14', whilst the second link (partial mediation) examined the same relationship with 'SECI 2014' by acting as a mediator. The results of the partial mediation link support our hypothesis. Firstly, the partial mediation model explains more variance in 'EK 14' than the direct effect model (0.79 vs. 0.75). Secondly, positive relationships exist between 'EK 08' and 'SECI 2014' ($\beta = 0.63$, $p < 0.001$) and between 'SECI 2014' and 'EK 14' ($\beta = 0.18$, $p < 0.05$). Finally, the significant relationship between 'EK 08' and 'EK 14' in the direct effect model ($\beta = 0.86$, $p < 0.001$) diminishes in the partial mediation model ($\beta = 0.69$, $p < 0.001$). We also estimated the ratio F2 suggested by Chin (1998), to understand the significance of the improvement of the partial mediation model over the direct effect model, whereby such an improvement is considered significant in those cases where F2 is greater than 0.02.. In our study, F2 was found to be 0.19, and therefore we conclude that there has been a significant improvement. Together, these three areas provide significant evidence that there is a discernible mediating effect of 'SECI 2014' and that the partial mediation model represents a significant improvement over the direct effect model. With regard to hypothesis H3, the effects of 'EK 14' on 'BP 14' were fully verified ($\beta = 0.64$, $p < 0.001$). Consequently, the findings provided full support for H1, H2 and H3.

Hypotheses	Path coefficients	T values	R ²	ΔR^2	F ²
H1: SECI 08 → EK 08	0.71***	14.19	0.50		
H2 EK 08 → SECI 14	0.63***	8.94	0.40		
H2: SECI 14 → EK 14	0.18**	1.98	0.79		
H2: EK 08 → EK 14 (only direct effect)	0.86***	11.67	0.75		
H2: EK 08 → EK 14 (mediated by SECI 14)	0.69***	5.07	0.79	0.04	0.19

 $t(.01,499)=2.585711627$, $t(.05,499)=1.964726835$.

Table 5: Model statistics

DISCUSSION

The first contribution made by this research is the questioning of the existing models of the relationship between knowledge management processes and environmental knowledge over time. In doing so, the authors have included time as a variable in the analysis and, have focused on the need to create environmental knowledge at a given time (T) in order for a more efficient learning to take place at a later time (T+6). The concept of knowledge management processes was explored by studying the processes behind the organisational knowledge creation construct (i.e. socialisation, externalisation, combination, and internalisation) and then studying its impact on environmental knowledge. In summary, a null hypothesis [that environmental knowledge at a given time T is a prior step in the SECI program at a later point in time (T+6)] was tested against the alternative hypothesis [that environmental knowledge at time (T) is not a required prior step in the implementation of knowledge management processes] through an empirical study of 87 companies in the Spanish hospitality sector through PLS.

The second contribution of this research is derived from the results of testing the hypotheses in a real context. Environmental knowledge at time (T) is found to be significant in predicting the knowledge management processes. The managerial implications of the relationships observed between the factors that constitute the conceptual framework shown in Figure 1 are discussed in more detail below.

The analysis of the data collected provided full support for H1: (*SECI 08* → *EK 08*). This finding corroborates the notion that specific knowledge management processes have to be used to create environmental knowledge and thereby contribute to its dissemination and retention within a company (Boiral, 2009). A possible explanation for the significance of such an effect may be related to the fact that before environmental knowledge can be created specific assumptions should be established and shared. Otherwise, only a few individuals within the organisation will have access to this relevant knowledge, which in turn may lead to the under-utilisation of relevant knowledge or the utilisation of knowledge which is not relevant, both of which cases are likely to lead to a degradation of environmental knowledge (Cegarra *et al.*, 2013). One interpretation of this relationship is that through the knowledge management processes, a company can allow individuals to adjust their mental models and the nature of their assumptions to highlight some of the environmental issues and concerns that may have a direct effect on the entire company, its operation and results.

Regarding H2, the results support the position that if the organisation considers establishing an environmental knowledge at a given point in time, then this knowledge is likely to have a positive influence on the conditions that stimulate knowledge management processes for the creation of new environmental knowledge in the future, which may have a significant impact on the organisation and

its performance. A possible explanation for this result would be the fact that reusing prior environmental knowledge puts the upcoming knowledge management processes into a familiar context for members of the organisation. In other words, knowledge management processes provide a path which activates environmental knowledge which was previously created. We believe that this is an important finding which provides the basis for a hotel to develop, as such a development relies on the hotel's ability to reuse and update the relevant knowledge of its workforce.

However, many hotel managers are cutting back on knowledge management programs by simply using prior environmental knowledge instead of implementing more innovative programs which are supported by knowledge of new environmental challenges (Aggeri, 1999). If this is the case it is possible that hotel managers are over-investing in the exploitation of prior environmental knowledge, and under-investing in (or underestimating the value of) mechanisms and aspects to develop and update existing environmental knowledge. This confirms the position adopted by Cegarra and Martinez (2010) when they argued that the use of environmental knowledge also needs to involve changes in the organisational knowledge structures. One way of doing this would be for senior management to set up a knowledge management program to embrace change and encourage new ideas and insights, which often lead to the creation of environmental knowledge. Our results show that a knowledge management program is a required step for the enhancement of environmental knowledge. In this respect, socialisation, externalisation, combination, and internalisation processes can be viewed as a mechanism for improving environmental knowledge as this may involve a process of replacing existing outdated environmental knowledge with new knowledge structures. SECI 14 enhances the effectiveness and efficiency of EK 08 which potentially leads to improved EK 14.

Regarding H3 (*EK 14* → *BP 14*), the results support the position that, in order to improve the performance of business operations, companies need to provide and support updated environmental knowledge. These findings are important in the ongoing debate surrounding the relationship between environmental knowledge and business performance, and reinforce the views that environmental knowledge may lead to increased company benefits (e.g. Rondinelli & Vastag 2000; Zhang *et al.*, 2000). A possible explanation for these findings is determined by the fact that when information or knowledge is updated and is not fragmented within a company, customer feedback is easy to obtain and, as a result, performance improves. As Erdogan and Baris (2007) noted, environmental knowledge will lead to a reduced consumption of energy, water, and materials, thus improving organisational performance. Thus, the easy retrieval of environmental knowledge is a critical aspect in responding to the growing customer demand for environmentally friendly programs and hence improving organisational performance (Bohdanowicz, 2005).

Managerial implications

There are different methods for managing environmental issues. However, companies still show some resistance to change their current environmental programs. The general notion among many businesses is that once they have an environmental program in place, they should not change it. The results from this study contradict such a view. As competition intensifies and the pace of change accelerates, aspects of environmental knowledge (e.g. routines and procedures) are likely to change over time, requiring the modification of some of the contents of this knowledge. Our findings support the need for managers to become more aware of the need to consider time when they drive the conditions and/or context where environmental knowledge can be exploited to increase company benefits such as cost savings resulting from eco-efficiency. Time appears to be an interesting variable to understand how environmental knowledge emerges and how it can be updated to improve an organisation and its performance. With this notion in mind, we argue that traditional concepts of managing and leading change based on knowledge management processes need to consider methods which aim at deepening participation or immersion in the immediacy of the temporal flow.

CONCLUSIONS

The above findings suggest that the creation of environmental knowledge is an important factor for organisations to become competitive, but it is not sufficient for them to maintain such a competitive advantage over time. We would further observe that the creation of environmental knowledge strongly depends on environmental knowledge which was previously created and the previous implementation of a knowledge management program facilitating socialisation, externalisation, combination, and internalisation. Through this program, individuals will be able to update their mental models by focusing their efforts on problems that are more important for the organisation and its customers, which in turn facilitates the retrieval of prior environmental knowledge.

This study has some limitations. First, national cultural issues might influence the way organisations create and update environmental knowledge. Therefore, it would be interesting to extend the study to other countries, since national cultural issues might influence the results. Secondly, this study relies on the assumption that the CEO or general director of each of the organisation possesses key knowledge of the company and therefore our emphasis here is on finding commonalities among firms in terms of the critical knowledge areas they consider important and had access to. Although this subjective information is commonly used in studies (Glaister *et al.*, 2008), future research using more than one individual who hold key knowledge within a firm (including managers, employees and even customers) will be a useful mechanism for the study to improve the internal validity of the SECI model and environmental knowledge. Thirdly, we would consider a further research into how other

organisational factors (e.g. organisations' size and agility) which have not been included in this study are likely to affect the performance of the firm. Therefore, future research should investigate the potential links between different initiatives such as reducing waste production and resource and energy consumption by controlling and improving lighting, heating, ventilation, air conditioning, and water use, by making proper purchasing decisions on containers, use of returnable containers and recycling materials and the company goals. Finally, it may also be interesting to observe the change in the performance of companies after adopting environmental activities, through future case studies.

APPENDIX: QUESTIONNAIRE ITEMS

Socialization of knowledge (1= high disagreement and 10= high agreement):
SOC_1: Our company stresses gathering information from suppliers and customers.
SOC_2: Our company stresses building databases on products and service.
SOC_3: Our company stresses planning strategies by using published literature.
Externalisation of knowledge (1= high disagreement and 10= high agreement):
EXT_1: Our company stresses the use of deductive and inductive thinking.
EXT_2: Our company stresses the use of metaphors in dialogue for concept.
EXT_3: Our company stresses exchanging various ideas and dialogues.
Combination of knowledge (1= high disagreement and 10= high agreement):
COM_1: Our company stresses building up environmental materials by gathering management figures.
COM_2: Our company stresses building databases on products and service
COM_3: Our company stresses planning strategies by using published literature, computer simulation and forecasting.
Internalization of knowledge (1= high disagreement and 10= high agreement):
INT_1: Our company stresses forming teams as a model and conducting acquisition from databases, and sharing results with entire departments.
INT_2: Our company stresses enactive activities with functional departments by cross-functional development teams
INT_3: Our company stresses sharing and trying to understand management visions through communications with fellows.
Environmental knowledge (1= high disagreement and 10= high agreement):
EK_1: The company (hotel) uses less polluting industrial processes and products
EK_2: The company (hotel) has developed a green program (waste management, control of effluents, inventory of pollution sources)
EK_3: The company (hotel) has developed a drafting of environmental emergency plans and measures
Business Performance (1=much worse than competitors and 10=much better than competitors):
BP_1: Growth rate of sales
BP_2: Growth rate of profits
BP_3: Profitability rate on total assets
BP_4: Greater productivity

IMPLEMENTATION OF INNOVATION NETWORK: A CASE STUDY OF BIOTECH INDUSTRY IN CAMPANIA REGION

Matricano, Diego; Sorrentino, Mario

Department of Management, Second University of Naples, Italy

ABSTRACT

In order to achieve the economic and social development of specific contexts, entrepreneurial scholars suggest to leverage on the *innovations networks* that can be inspired by the *triple helix model* involving university-government-industry. The theoretical studies concerning this model have been addressed according to three main paths of research: the structure of innovation networks and the linkages established inside them; the external context; and the advantages and disadvantages deriving from being part of innovation networks.

The analysis of these three paths of research is useful to develop the case study of *Campania Bioscience*, an innovation network created in Campania, a Region in southern Italy, whose main goal is to create a system supporting innovation, research and competitiveness in the biotech industry.

The final aim of the paper is to verify if the theoretical results deriving from entrepreneurial literature have been considered when implementing *Campania Bioscience*.

Keywords: *innovation network; triple helix model; university-government-industry; economic development; entrepreneurial university*

INTRODUCTION

Generally speaking, policy makers are interested in defining and implementing specific actions and tools in order to support innovative processes and to achieve two main goals: to create wealth and occupation. Nowadays, in particular, policy makers are more and more interested in implementing innovation networks that are inspired by the *triple helix model* (involving university-government-industry) and that aim to:

- Achieve the economic development and growth of specific contexts;
- Exploit the innovations resulting from R&D activities carried out in the universities through the commercialization of new materials, new products or new processes;
- Support the small and medium enterprises (SMEs), which usually do not carry out research activities and risk to loose the market competition, by offering innovations to be exploited.

Implementation of innovation networks able to achieve the development of a context (the main goal of governments) by matching demand (by industries) and supply (by universities) of results of R&D activities is the main focus of the present paper. More precisely, the present paper tries to highlight the theoretical aspects concerning innovation networks and to verify if they have been considered and implemented in the biotech innovation network promoted by Campania Region, in the Southern Italy, and named "*Distretto ad Alta Tecnologia Campania Bioscience*".

The present work is structured as it follows. In the following section, the concept of innovation network is presented and discussed. In particular, the passage from the *closed innovation model* to the *open innovation model* is underlined. After that, specific aspects of the innovation network are examined. In section three, after recalling the *triple helix model* involving university-government-industry, attention is paid to the structure that innovation networks can assume. In section four, attention is paid to the context in which innovation network can be settled. As known, synergies between university-government-industry are stronger if the subjects are geographically close. Then, in section five, since the innovation process assumes specific characteristics that cannot be generalized, attention is paid to the advantages and disadvantages that can derive from being part of a network. The theoretical aspects are instrumental to develop the case study of *Campania Bioscience*, an innovation network whose main goal is to create a system supporting innovation, research and competitiveness in the biotech industry by creating and developing strong collaborations between universities and industries (section six). Reflections on the start-of-the-art and on the possible implications evolutions of *Campania Bioscience* are included in the last section.

INNOVATION NETWORK

Nowadays, enterprises are moving from a *closed innovation model*, according to which innovation is secretly developed inside the enterprise itself, to an *open innovation model*, according to which innovations result from an exchange of knowledge and competences with external subjects who are part of their network (Aldrich and Zimmer, 1986; Dubini and Aldrich, 1991; Uzzi, 1997; Baum *et al.*, 2000; Alvarez and Busenitz, 2001). The networks created in order to achieve the above goal are properly named innovation networks.

Even if the origins of this concept can be dated back to Nineties (Freeman, 1991; Lundgren, 1995; Osborn and Hagedoorn, 1997), recent contributions have tried to point out the main characteristics of innovation networks. According to Rycroft and Kash (2004), for example, "*the innovation network is organized around constant learning. It is a set of linked organizations that create, acquire, and integrate the diverse knowledge and skills required to create and bring to the market complex technologies*". In the above case, the most important aspect that scholars try to underline is the constant learning by enterprises.

Very recent contributions, instead, have highlighted other aspects of the innovation network. Arranz and de Arroyabe (2012) maintain that *“the innovation network is a socio-technical system formed by three interdependent subsystems: process, structure and governance”* and so they highlight three aspects (process, structures and governance) that characterize each innovation network. According to Corsaro *et al.* (2012), instead, *“the innovation network is the configuration of strategic entrepreneurial nets aimed at improving the effectiveness of innovation performance”*. In this last case, the most important aspect of an innovation network is the final goal to achieve.

Despite the differences emerging from the above definitions, innovation networks can be defined as a group of subjects involved in technology transfer processes useful to share resources (mainly intangible ones, like knowledge or competences) in order to support and to foster innovative processes (Powell *et al.*, 1996) and to foster the discovery of new entrepreneurial opportunities (Matricano, 2011). According to the above definition, innovation networks are very relevant in science-based industries (Hagedoorn, 1993, 2002), like ICT, nanotechnologies, and biotechnologies (Sorrentino, 2009).

Since it is not easy to study an innovation network as a whole, because of the peculiarities of each network and of each industry they are in, three main paths of research that have been addressed. They deal with:

- The structure of innovation networks and the linkages established inside them;
- The external context;
- The advantages and disadvantages deriving from being part of innovation networks.

These three paths of research are revised and debated in the following sections in order to try to point out their main characteristics.

THE STRUCTURE OF INNOVATION NETWORKS

Before analyzing the structure that innovation networks can assume, it is necessary to start from a deep change that universities are facing (Chiesa and Piccalunga, 2000; Etzkowitz *et al.*, 2000; Shane, 2004; Bramwell and Wolfe, 2008). Nowadays, universities are not only involved in research and educational activities but they try to achieve their third mission (Etzkowitz and Leydesdorff, 1999, 2000; Etzkowitz *et al.*, 2000; Etzkowitz, 2003) consisting in the exploitation of the results of R&D activities in order to support the economic development of the context they are in (Johnson, 2008). Enterprises have accepted this change and, above all, they are trying to leverage on the results of R&D activities carried out by universities: high salaries, high entry barriers, and instability in the market competition are driving enterprises to ask for innovations and universities seem to be able to supply them. To match demand (by industries) and supply (by universities) of results of R&D activities is not

an easy task. This is the reason why governments (meant both at a national and at a regional level) play a crucial role in achieving this task.

Based on the close relationships between universities and industries and on the relevance that governments assume in implementing and supporting these relationships, the *triple helix model* comes out (Etzkowitz *et al.*, 2000). From a theoretical perspective, the convergence of universities', industries' and governments' aims is easy to understand. From a practical perspective, instead, implementation of specific actions is more complex. Governments, in fact, have to:

- Drive academic R&D activities towards results exploitable by industries;
- Promote the achieved results in order to inform enterprises about the existence of exploitable results;
- Manage the exchanges between universities and industries and to match demand and supply.

Even if it is clear who are the subjects involved, it is not possible to clarify any typical structure of innovation networks (Pittaway *et al.*, 2004; Salavisa *et al.*, 2012). As noted by Ricciardi (2006), in fact, each innovation network assumes the structure most fitting with the established results. Thus, no generalization is allowed. However, it seems possible to find out some key aspects that can give information about the structure of innovation networks. According to Ricciardi (2006), there are two key aspects concerning: the relevance of the subjects and the evolving structure over time.

As for the former, it is important to define whether the subjects promote the innovation network or if they decide to join an already existing one. If they are the promoters, they are expected to be more involved and to occupy the centre of the network itself. Thus, they can shape the network according to their needs. On the contrary, if the subjects join an already existing network, they do not have the possibility to shape it and so they can only accept the structure as it is. As for the latter, it is important to notice that innovation networks are supposed to last even if their structure can change. The possibility that new members can join it or that old members can leave it necessarily implies that the structure of the innovation network can be modified and, by consequence, it implies the impossibility of any generalization about it.

Another approach (Salavisa *et al.*, 2012), instead, identifies four key aspects that can determine the structure of innovation networks:

- Size: since enterprises enter or create innovation network in order to get resources they do not have, the higher is the number of subjects involved, the higher is the chance to obtain additional resources (Burt, 2000). It means that enterprises try to involve other subjects by modifying the structure of the innovation network they are in;
- Type: when subjects involved carry out similar activities, there can be a problem of redundancy (Burt, 1992); on the contrary, when subjects involved carry out dissimilar

activities, new resources are easily obtained (Baum *et al.*, 2000). There is a continuous search of subjects to be in contact with and so the structure can be modified;

- Positioning: relational position makes the exchange of resources much easier and this is a very important aspect to be considered in innovation networks (Powell *et al.*, 1999). Subjects in innovation networks try to get closer to the centre since and so possible changes in the structure can derive;
- Links: kind, content and frequency of links determine the possible structure of innovation networks. The decision to leverage on strong or weak ties (Granovetter, 1973, 1985), on formal or informal ones (Birley, 1985), on additional or redundant ones (Burt, 1992, 2000), on direct or indirect ones (Podolny and Baron, 1997; Ahuja, 2000) affect the structure of innovation network and make it impossible to generalize it.

According to the above contributions (Ricciardi, 2006; Salavisa *et al.*, 2012), it is possible to generalize neither the structure of an archetypal innovation networks nor the structure of a specific innovation network since it can always change in both the cases.

THE EXTERNAL CONTEXT

The external context plays a very important role in technology transfer processes, determining the success or failure of innovation networks (Bramwell and Wolfe, 2008; Dell'Anno, 2010). Some contexts, meant as geographical contexts, can be considered as *knowledge innovation zones* where it is possible to establish very strong connections and to stimulate new entrepreneurial activities. In particular, this can be due to the *spillover effect* and to *technological brokers*.

The *spillover effect*, which can be defined as a positive externality that a subject involved in R&D activities can get from the results of R&D activities carried out by others, is much stronger if the source and the recipient of knowledge are geographically close (Dell'Anno, 2010). This is particularly true when the transfer processes concern tacit knowledge that is not formalized. Of course, if the transfer process concerns codified knowledge, for example through patents citations, geographical proximity is not so relevant.

As already anticipated, *technological brokers* play an important role in innovation networks and so they can affect the success or failure of innovation networks. Efficacy in technology transfer processes depends on the competences and on the skills that dedicated offices have – these offices are properly named *technology transfer offices* or *industrial liaison offices*. They deal with the commercialization of research results and, in particular, they deal with the facilitation of internal and external information flows and the definition of incentives (Phan and Siegel, 2006).

In contexts where the *spillover effect* is greater and where *technological brokers* are more efficient, innovation networks are more expected to achieve the established results.

THE ADVANTAGES AND DISADVANTAGES DERIVING FROM BEING PART OF INNOVATION NETWORKS

As noted by several scholars (Ahuja, 2000; Dhanaraj and Parkhe, 2006; Gardet and Mothe, 2011), empirical studies able to describe and to analyze technology transfer process are very rare because of the so many difficulties to be faced. For this reason, scholars have paid more attention to the advantages and disadvantages deriving from being part of innovation networks (Ricciardi, 2006). The main advantages deal with: knowledge transfer, distinctive competences, financial resources, and exploitation of innovations. The main disadvantages, instead, deal with: opportunistic behavior and asymmetric contributions and different aims.

The first advantage is related to easiness in transfers of tacit knowledge. The fact of being part of the same innovation network suggests assuming that all the subjects involved have already developed the *absorptive capacity* (Cohen and Levinthal, 1990), i.e. the ability to apprehend knowledge transmitted by others. This happens because of the specific knowledge that subjects have accumulated in the past. Of course, the exchanges implemented in the innovation networks reinforce the absorptive capacity. The second advantage is linked to distinctive competences that can be developed. As noted by Parente (2008), enterprises can develop integrative competences (in order to mix internal and external knowledge), coordinative capabilities (able to synchronize new acquired knowledge) and generative capabilities (through which new knowledge is created). The third advantage reveals itself in reference to funding and to economies of scale and of learning, which derive from sharing the costs of R&D activities. Finally, the last advantage consists in the straight exploitation of technological innovations.

However, being part of innovation networks can cause some disadvantages as well. The first can derive from opportunistic behaviors (Williamson, 1975) that others can put into practice, both before and after the drafting of the contract ruling the partnership. This kind of disadvantage has been examined in the agency theory (Jensen and Meckling, 1976). The second disadvantage, then, can arise when the subjects involved in the network do not share the resources arranged or when they pursue different aims. In both the cases, the subjects are forced to proceed with the network activity or they could be interested in leaving the network.

Both the possible advantages and disadvantages are shown in table 1.

Table 1. IMPLICATIONS OF BEING PART OF INNOVATION NETWORKS

Advantages	Disadvantages
1) Knowledge transfer 2) Distinctive competences 3) Financial resources 4) Exploitation of innovations	1) Opportunistic behaviour 2) Asymmetric contributions and different aims

Source: Adaptation from Ricciardi (2006).

A CASE STUDY OF BIOTECH INDUSTRY IN CAMPANIA REGION

The results of the analysis carried out in previous sections (about the networks' possible structure, the external context and the achievable advantages or disadvantages) are instrumental to test whether the implementation of *Campania Bioscience* has been properly carried out.

Since the Second University of Naples – which has funded this research project – is located in Campania Region, the choice to refer to a network implemented in the same Region sounds obvious. However, the choice of the network to refer to is not. For this reason, the choice is rooted in the entrepreneurial literature. Open innovation network are very frequent in knowledge-based industries (Hagedoorn, 1993, 2002) that mainly deal with biotech or aerospace industries in Campania Region. Between them, the most recent network implemented in the Region is related to the biotech industry and from this it derives the choice to focus on *Campania Bioscience*.

In order to understand the peculiarities of the biotech industry (Pisano *et al.*, 1988; Arora and Gambardella, 1990; Powell *et al.*, 1996; Ahuja, 2000; Baum *et al.*, 2000; Audretsch and Feldman, 2003; Boardman, 2008), it is suitable to start from some data published in a report edited by Ernst & Young (2012) entitled “*Rapporto sulle Biotecnologie in Italia - BioinItaly Report 2012*”. According to the data, Italy has one of the highest amounts of biotech ventures. Across Europe, only Germany and United Kingdom show better results. Data about the distribution of the Italian biotech ventures are shown in table 2.

Table 2. DISTRIBUTION OF THE ITALIAN BIOTECH VENTURES BY REGION

The Italian biotech ventures by Region		
Region	Number	Percentage
Lombardia	129	32.74%
Piemonte	43	10.91%
Lazio	42	10.66%
Emilia Romagna	36	9.14%
Veneto	25	6.35%
Toscana	24	6.09%

Sardegna	23	5.84%
Friuli Venezia Giulia	20	5.08%
Liguria	9	2.28%
Campania	8	2.03%
Marche	7	1.78%
Sicilia	7	1.78%
Puglia	6	1.52%
Trentino Alto Adige	3	0.76%
Umbria	3	0.76%
Calabria	3	0.76%
Abruzzo	2	0.51%
Valle d' Aosta	2	0.51%
Basilicata	1	0.25%
Molise	1	0.25%
Total	394	100.00%

Source: “Rapporto sulle Biotecnologie in Italia - BioinItaly Report 2012”, Ernst & Young.

Campania is at position number ten in the list and, according to specialists of the industry, it seems to be a promising context for future development of biotech industry.

The data about partnerships of Italian biotech ventures are of great interest too. While 54% out of all the *biotech* ventures is standing alone, 35% out of the total is located in scientific parks or in incubators, and the remaining 11% is located close to universities or research centers (table 3).

Table 3. SPATIAL LOCALIZATION OF ITALIAN BIOTECH VENTURES

Localization of Italian biotech ventures	
Kind of localization	Percentage
Standing alone	54%
In scientific parks or incubators	35%
Close to universities or research centres	11%
Total	100%

Source: “Rapporto sulle Biotecnologie in Italia - BioinItaly Report 2012”, Ernst & Young.

The above data, according to which 46% out of Italian biotech ventures is located in knowledge innovation zone, represent the starting point for the implementation of *Campania Bioscience*.

The project about the implementation of Campania Bioscience can be dated back to 22nd March 2011 when the feasibility study was presented. On 23rd April 2012 the Italian Ministry of University and Research (M.I.U.R.) has approved the above feasibility study and then, on 7th August 2012 the agreement between M.I.U.R. and Campania Region, properly named “*Accordo di Programma Quadro*”, has been signed.

All the partners involved in the network have shared the mutual-aid aim of the network so that the net gains will be reinvested in R&D activities. The social capital is nearly equal to 1.7 millions of euro (44% by research institutions, 44% by ventures, and 12% by technology transfer offices).

It is possible now to pay attention to the three paths of research presented above: the structure of the network, the context and the possible advantages/disadvantages.

As for the structure, Campania Bioscience is still *in fieri* and so it is not possible to study the possible evolutions of its structure. However, there are the three main subjects involved in the open innovation network. Campania Region has signed the agreement with M.I.U.R. and so the government plays an important role in this network. The research institutes (both universities and research centers) and the technology transfer offices involved are ten and the ventures involved are sixty-four. All the three main subject of the *triple helix model* are actively involved in the Campania Bioscience.

As for the context, the choice to involve only research institutes (both universities and research centers) and ventures that are located in Campania highlights the will to transform the Region in a *knowledge innovation zone*. Hopefully, this can support the process of *inventing around*, a process through which starting from a research result already achieved – like a patent – many other results can be achieved.

Finally, it is possible to analyze the possible advantages/disadvantages. The first advantage deals with knowledge transfer and distinctive competences (Powell *et al.*, 1996; Powell, 1998; Garraffo and Sorrentino, 2009). The heterogeneity of the subjects involved in *Campania Bioscience* – ten research institutions and sixty-four ventures – surely represents one of the main strengths. The shared competences vary across the subjects and so knowledge transfers are expected to be effective and productive. As for the economic advantages linked to be part of a network (Cunningham, 2002; Audretsch and Feldman, 2003; Pisano, 2006), the social capital of nearly 1,7 millions euro and the mutual-aid aim seem to be right promises to the proceeding of the research activities.

Of course, attention needs to be paid to the disadvantages too. Up to now, disadvantages in *Campania Bioscience* have not emerged yet mainly because the network is very recent. However, some actions in order to reduce them have been thought and implemented. All the subjects involved, in fact, have been divided into three main lines of interventions (shown in table 4). Hopefully, this should avoid the raising of disadvantages by creating small groups where the partnership should be much easier.

Table 4. LINES OF INTERVENTION ESTABLISHED BY CAMPANIA BIOSCIENCE

The lines of intervention
Line 1 – Industrial Research and Experimental Development – concerns three main fields of research:
A) Development and production of new biotech products
B) Diagnostics, bio-sensorial systems and innovative technology for biomedical industry
C) Development and experimentation of new therapies
Line 2 – High Education - deals with education of researchers and technicians and concerns:
A) Industrial research projects and pre-competitive development
B) Managerial and technical skills
Line 3 – Promotion, internalization, diffusion and technology transfer – includes six actions:
Action 1: Diffusion, <i>dissemination</i> and valorisation of the research results
Action 2: Patent protection
Action 3: Supporting the start-up process
Action 4: Internationalization of the District and <i>networking</i> activities to get external funds
Action 5: Communication inside and outside the District
Action 6: Cooperation in international R&D activities

Source: Report edited by Distretto ad Alta Tecnologia Campania Bioscience, 2012.

CONCLUSION

As emerged from the literature review, it is not possible to define an archetypal type of innovation network. It is only possible to fix some key-aspects like the structure (and its evolution), the context and the possible advantages/disadvantages.

The present study has tried to verify if these key aspects have been considered when implementing *Campania Bioscience*, a biotech innovation network promoted in Campania, a Region in southern Italy. The fact that they have been taken into account seems very promising even if it seems premature to assume that these characteristics can take to long-run positive results. Very often, in fact, disadvantages can be more relevant than the expected advantages and so the ongoing of the innovation network does not seem so obvious: theoretical research can be helpful to fix some guidelines but to implement them is not so straight.

Unfortunately, *Campania Bioscience* is still in an embryonic phase and so it is not possible to evaluate if and to which extent the implementation of the innovation network matches the theoretical guidelines emerged above. However, by proceeding as already done – leveraging on the positive key aspects and trying to avoid the possible disadvantages – *Campania Bioscience* could aspire to be the driver of future economic development of Campania Region and, above all, it could legitimately aspire to be a good example of the *triple helix model*.

IMPACT OF PHENOMENON OF MONEY LAUNDERING ON MODERN GLOBAL ECONOMY

Matysiewicz, Justyna; Smyczek, Sławomir

University of Economics in Katowice, Poland

ABSTRACT

Within the last few years the structure, function and effectiveness of the market system of many countries have undergone radical transformations. Liberalization of commodity and service turnover as well as a free flow of technology, people and, above all, capital has had a stimulating effect on the development of economy of these countries. Nevertheless, all these factors also create opportunities for various businesses to use different elements of the market systems in conducting some criminal activity and related to its money laundering. The development of the phenomenon of money laundering is mainly facilitated by differences existing between legal and financial systems of particular countries and international standards as well as by achievements of the scientific and technological revolution. The commonness of a fast and efficient information transfer combined with an unlimited possibility of global travelling brings about a situation where money laundering assumes new and more refined forms. Therefore, the harmfulness of the phenomenon can neither be treated as a one-facet problem nor considered in isolation from other elements of an economic and financial pathology. Money laundering can pose a serious threat both to individual firms and all market mechanisms on a regional and global scale. With respect to the above-presented problems, the goals of research were to define phenomenon of money laundering, its nature and evolution as well as mechanisms of its development, identification role of globalization of world economy on development the process of money laundering in the modern economy and assessment of a threat posed by the phenomenon to the functioning of firms, countries and the whole world economy.

Keywords: *money laundering, determinants, global economy*

INTRODUCTION

Globalization as result of expanding geographical range of interactions between different subjects of international relations has huge impact on market system in particular countries, regions and whole world. Within the last few years the structure, function and effectiveness of the market system of

many countries have undergone radical transformations. Liberalization of commodity and service turnover as well as a free flow of technology, people and, above all, capital has had a stimulating effect on the development of economy of these countries. Nevertheless, all these factors also create opportunities for various businesses to use different elements of the market systems in conducting some criminal activity and related to it money laundering. The development of the phenomenon of money laundering is mainly facilitated by differences existing between legal and financial systems of particular countries and international standards as well as by achievements of the scientific and technological revolution. The commonness of a fast and efficient information transfer combined with an unlimited possibility of global travelling brings about a situation where money laundering assumes new and more refined forms. Therefore, the harmfulness of the phenomenon can neither be treated as a one-facet problem nor considered in isolation from other elements of an economic and financial pathology. Money laundering can pose a serious threat both to individual firms and all market mechanisms on a regional and global scale.

With respect to the above-presented problems, the goals of research were to define phenomenon of money laundering, its nature and evolution as well as mechanisms of its development, identification role of globalisation of world economy on development the process of money laundering in the modern economy and assessment of a threat posed by the phenomenon to the functioning of firms, countries and the whole world economy.

Globalisation – notion and characteristics

The globalization can be also defined as a process where markets and production of different countries become more dependent on one another due to an increase in the volume of exchanged goods and services as well as due to the inflow of capital and technologies. Globalization can be perceived as a higher stage of internationalization, characterised by intense development of relations and interactions on a global scale. According to W. Anioł, nowadays, internationalization „evolves” into globalization as a result of expanding geographical range of interactions between different subjects of international relations, until it comprises the whole world. Hence, the internationalization can be treated as an initial concept of globalization. H. Chołaj describes globalization as the highest stage of internationalization, which constitutes multitude of processes and phenomena such as the international flow of goods, services, capital, technologies, information and human resources. The author also refers to it as a dominant orientation on the world’s market with respect to trade, investment and other transactions, as a territorial and institutional integration of markets and, finally, as global problem relating to ecological degradation which calls for international cooperation in providing adequate solutions (Berekoven, 1989). According to A.K. Koźmiński, in the economic sense, the main difference between the internationalization and globalization lies in their geographical range.

In case of internationalization, its range reaches several countries, whereas globalization comprises the whole global market. Internationalization is of gradable character where we can talk about less or more advanced stage of internationalization of companies, industries or the economy of a given country or region (Limanski, 2001).

Globalization has mainly comprised the production and sales of modern goods which are scientifically and technologically advanced (electronic, motor or chemical industry). Globalization is most vividly demonstrated through international investments, production and inter-corporation exchange rather than through traditional foreign trade. Following the assumptions, the development of globalization will take place simultaneously with the spread of information, and therefore, the future society will be not only the society of information but, first of all, a global one (Meissener, 1991).

The reasons for the acceleration of the globalization processes in the world, and especially their occurrence on a global scale, are connected with technological (technological and scientific revolution), political and socio-economic changes (Rymarczyk, 1996).

With respect to the first factor, its influence on the globalisation should be combined mainly with well-grounded interests of oligopolystic competitors and with huge investments made in research and development. Bearing the costs of investments, big corporations aim at their quick amortisation through selling which goes beyond the borders of domestic, or even neighbouring markets. The increase in sales volumes, and consequently, the extension of a production range, brings more benefits. The shortening of a product life cycle as a result of growing competition encourages countries to sell to the largest markets including the global one.

Another technological factor affecting the process of globalization relates to new inventions, mainly the Internet which facilitates and reduces the costs of transport and communication. The distance included in costs does not influence the price as much as before, and thus helps develop the international transfer of products and know-how.

The socio-economic factors, resulting from a homogenous character of consumers and their growing requirements, are also connected with technological changes. The development of transport and communication has facilitated not only the flow of goods and information, but also the movement of people whose tastes have become alike. The standardization of life styles and consumption patterns increases income levels and fosters educational development. As a result, there appear consumer groups whose buying behaviour with respect to goods and services is mainly conditioned by demoscopic or psychological factors, and not by the type of their nationality. This explains why the demand for these goods and services appear in different countries.

Another factor that has accelerated the process of globalization is the liberalization of the world trade combined with the policy of facilitating and supporting the flow of capital. This policy is advocated by

countries which send or receive the capital, and by organizations (e.g. World Bank) whose activity is crucial for supporting economic growth and for including Poland and other East-European countries in the process of globalization. Nevertheless, all these factors also create opportunities for various businesses to use different elements of the market systems in conducting some criminal activity and related to it money laundering.

MONEY LAUNDERING – EVOLUTION AND CHARACTERISTICS

Money laundering appeared for the first time in the twenties of the previous century in the United States of America. The phenomenon did not appear in the course of the evolution of crimes and transgressions of economic nature, but occurred as a new type of criminal activity which evolved together with the development of modern organized crime. High proceeds from illegal business and criminal operations, as well as threats following the investigation process against Alphonse Capone¹ forced the elites of the criminal world to legalize illicit funds (Bartosiak, 2003). The eighty-year-old history of money laundering, the history of an invasive character, can be divided into two stages of development. The first stage is characterized by the use of simple methods of funds legalization.² In the second stage of its development, money laundering evolved into specialized international criminal activity organized in a regular business defined as “full-time criminals” (Lerbell, 1978).

The main direction of the phenomenon evolution has been influenced by existing correlations between:

- a) the process of transformation of small local criminal groups into organizations of a regional range, as well as the transposition of some of the groups into organizations of a distinct organizational structure,
- b) fast-developing professional methods of activity of criminal groups,
- c) new fields and areas of interest of criminal circles and new possibilities provided by ongoing geopolitical changes,
- d) achievements of the scientific-technical revolution.

The legalization of big sums of money has become a necessity for members of criminal groups, as it is the “laundered” money that can ensure the “consumption of fruits” of criminal activity and guarantees its further development. Illegal funds come from two main sources of criminal activities:

¹ Al. Capone, the founder of a modern criminal organization whose activity involved corruption of politicians and police representatives, extortions, illegal gambling, and management of brothels. The gigantic annual proceeds of 60 mln dollars of that time (at present it equals about 2 billion dollars) were gained through illegal alcohol trafficking in the whole area of the State of Illinois. Al Capone was sentenced to 10 years in prison for evading tax on winnings gained in an illegal casino.

² Al. Capone bought a chain of city laundries and introduced illegal money into the legal circulation through fictitious proceeds from fictitious services.

- 1) traditional activities,
- 2) activities which evolved with new trends, as a consequence of system transformations of Central and Eastern Europe countries and a new process of international integration within the European Europe.

Traditional offences and crimes which constitute a source of illegal funds comprise:

- 1) All types of drug crimes.
- 2) Tax frauds.
- 3) Customs crimes.
- 4) Arms trading, especially nuclear materials.
- 5) Organized prostitution including children prostitution and procurements.
- 6) International terrorism and contract murders.
- 7) Extortions and ransoms.
- 8) Trading children, women and life body organs.
- 9) Forgery of money, securities and personal documents.
- 10) Theft, smuggling and fencing stolen arts, antiques and luxury items.
- 11) Illegal transfer of people over international borders.
- 12) Production and trading of illegal software and counterfeited CDs and DVDs.

The second group of crimes which have been evoked by geopolitical changes comprises:

- 1) Activities directly related to business and financial operations in the field of privatization being part of a system transformation of CEE countries.
- 2) Frauds connected with a structural policy, particularly the embezzlement of the EU funds (Jasiński, 2002).

The process of money laundering consists in the introduction of means of payment, securities or other currencies of unknown origin into the legal circulation (Pracki, 1995). The executive activities may differentiate depending on the country where the money is laundered and on the profile of criminal activity. Nevertheless, these activities are always subjected to goals which can guarantee effective legalization of financial means:

- 1) hiding a real source of funds and identity of their owner,
- 2) constant supervision and necessary safety of illegal money in the process of its legalization.
- 3) legalization of illegal proceeds through their introduction into the official financial system.

The process of money laundering has been based on a three-stage model (Gilmore, 1999) for the sake of a precise description of stages, characteristic features and rules of the process functioning. Thanks to this, it is possible to define the areas of operational activities of money laundering, and, above all, to

expose the weak points of the mechanism whereby the probability of identifying suspicious financial operations is bigger.

Table 1. Stages and main objectives of the process of money laundering

Stages of the process	Main objectives of the stages of a classic process of money laundering
Placement	Disposal of illegal money through: <ul style="list-style-type: none"> - purchase of luxury items or real estate - purchase of financial instruments - different forms of deposits with financial institutions
Layering	Separation of illegal money from the source of its origin through: <ul style="list-style-type: none"> - purchase of short-term deposits, - very frequent financial operations , - artificial extension of the duration of financial transactions.
Integration	The introduction of illegal money into the legal circulation through assimilation of the illegal and legal funds.

Source: Author's elaboration based on Wąsowski and Wąsowski, 2001 and Bilmore, 1999.

The revealed and examined cases of the legalization of illicit funds show that the process of money laundering can be conducted with the omission of particular stages,¹ the stages may exist simultaneously or else they may overlap (Gilmore 1999, p. 37). Nevertheless, the executive activities always demonstrate the following features:

- 1) Complex forms of operational activities.
- 2) The use of a perfect camouflage.
- 3) Character of participants of the process.
- 4) The main objective of the operation.
- 5) A cross-border strategy of the operation.

In view of the growing importance of globalization of the world economy, the cross-border character of the process of money laundering is gaining still more significance. The international character of money laundering is presented in Table 2.

¹ The omission of the first stage may occur due to:

1. Lack of possibility of purchasing financial assets: shares, bonds, banker's and traveller's cheques.
2. The use of deposit services provided by banks and deposit institutions "...exceptional attractiveness of deposit institutions for criminal groups as a result of a wide range of services which give "launderers" a possibility to hide deposits and legitimize incomes, in other words, to launder money through the second and third stage.

Table 2. Characteristic features of the process of money laundering

No	Characteristics of crime defined as a business
1.	Complex forms of operational activities are characterized by high adaptability to a dynamic changes occurring in the environment and by high flexibility of functioning, which is developed through the use of the most recent technological and scientific achievements. All this is reinforced by extremely strict internal discipline within criminal organizations.
2.	The use of a perfect camouflage - refined appearances of a legal operation.
3.	The character of the process participants. These are not "people from a social margin" but "high-class specialists in banking and law whose activities are supported by state legislators.
4.	The main objective of the operation; a cut-throat pursuit to maximize profits.
5.	A cross-border strategy of the operation pursued within the international criminal operation enables launderers to use all types of loopholes in order to facilitate the concealment of illegal funds and their origin.

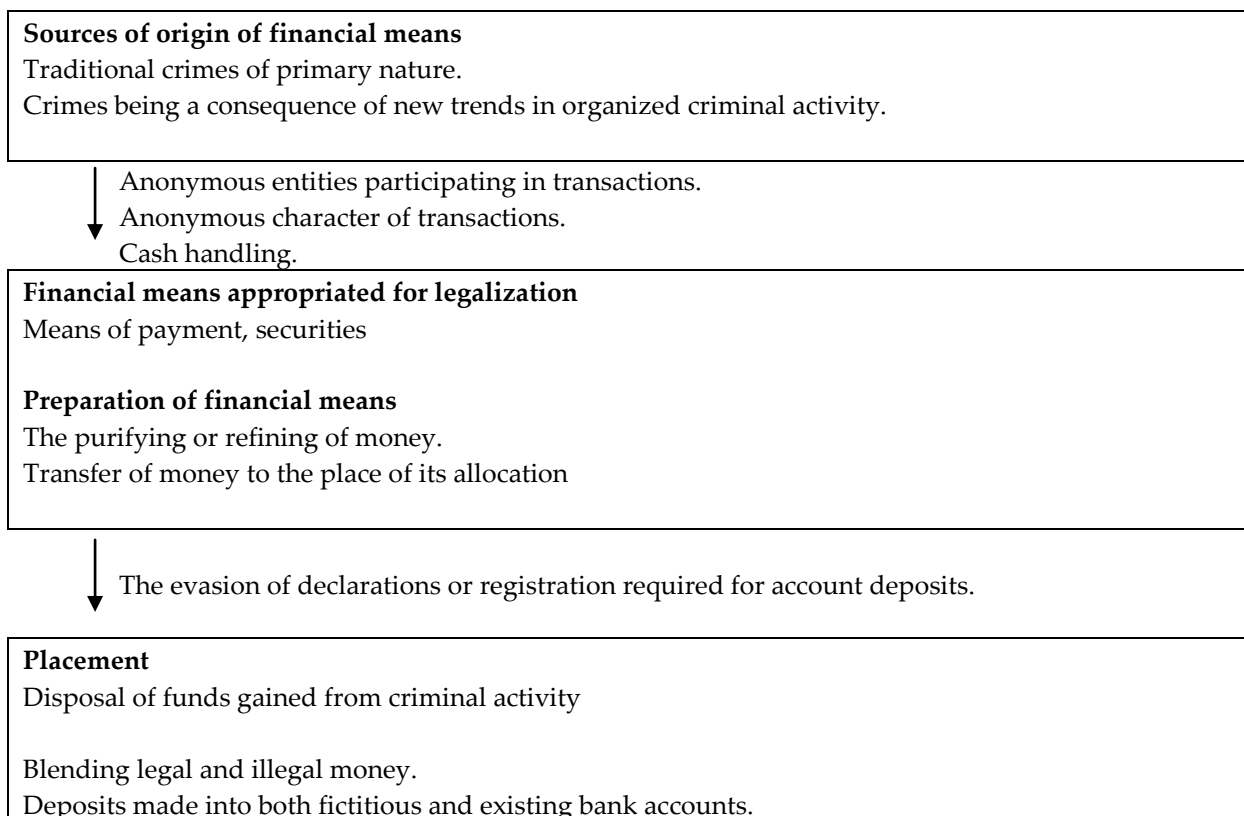

Source: Author's elaboration based on Lernell, 1978 and Jasiński, 2002.

The high adaptability of the process participants to new geopolitical conditions and their ability to use scientific and technological achievements contributes to the development of natural mechanisms which facilitate further evolution of money laundering.

THE MODEL OF MONEY LAUNDERING PROCESS

In order to precisely define the nature of particular stages of the process and existing relations between them, the model has been presented in block diagram as in Figure 1.

Figure 1. The classic process of money laundering

Purchase of financial instruments.
 Purchase of luxury items.
 Money transfers.
 Smurfing.
 Purchase of foreign currencies.

Entering a system of financial disguise of money origin

Layering

Hiding the source and the owner of financial means.

The general rule of a fast money transfer.
 SWIFT Society for Worldwide Interbank Financial Telecommunications.
 EFT Electronic Funds Transfer.
 Traditional ways of money transfers.
 Purchase of financial assets such as shares, bonds, traveller's or cashier's cheques
 Electronic transfers between accounts.
 Simulation of a cash withdrawal.
 Establishment of fictitious firms.
 Purchase of companies in insolvency.

Return of clean money to the owner

Integration

Providing evidence of a legal character of financial means.

Transactions in tax havens.
 Credit-deposit operations.
 Purchase of expensive and luxury items.
 Commercial transactions with foreign countries
 Repayment of loans.

Source: Author's elaboration based on Gilmore, 1999.

The process of money laundering is directly preceded by activities which aim at the adjustment of the money denomination to the most favourable value defined by one of the two procedures of further conduct:

- 1) The provision of funds to the place where attempts are made to introduce the funds into the banking system.
- 2) Placement – the first stage of the classic model of money laundering.

The provision consists in the transfer of illegal money from the place of illicit income to the place of money laundering. These are often tax havens where the focus is put on discretion and anonymity, regulations allow for cash deposits and the money exchange is not subject to monitoring. The provision is most frequently made through:

- 1) A physical transfer of money.
- 2) The change of money into luxury items which are most frequently sold at cut prices after transportation.

The main objective of activities undertaken within the first stage of money laundering, referred to as placement, is the introduction of means of payment into the financial system by virtue of three types of operations:

- 1) Physical deposits into accounts (transaction structuring).
- 2) Deposits made into accounts through smurfing (smurfing).
- 3) Blending legal and illegal money (blending).

Physical deposits made into accounts (a proper definition of transaction structuring) consist in making various financial operations at the stage of placement. Deposits are made into all types of accounts, including fictitious accounts of non-existent companies, organizations and natural persons. This method, however, is restricted by the obligation to identify the ordering party of an operation and to register transactions over the equivalent value of 15,000 euros. In order to evade the obligation, combined transactions are used, where series of deposits below a certain regulatory cash limit are made into definite accounts. Thus, the accumulated funds are wired into collective accounts (Kowalski, 2001).

“Smurfing” is a form of a physical deposit and constitutes one of the safest, the most developed and the best organized technique of money laundering. It is also the most difficult to divulge, but at the same time very laborious and time-consuming. The method is used on all continents, especially in Asia and Europe. “Smurfing” involves splitting and distributing illicit money among “smurfs” who either pay the money into bank accounts below some limit sum or buy traveller’s cheques.

“Blending”, in other words mixing illicit money with legal funds, constitutes the oldest and the simplest method of money laundering at the placement stage. The blending of financial means is performed within three methods:

- 1) Supporting criminal activity.
- 2) Company takeovers.
- 3) Cooperation defined by terms and provisions stipulated in the agreement between the management of a company and leaders of a criminal group.

The method of blending illicit funds with legal proceeds of service companies, where cash flow (turnover) is very big and its volume is hard to estimate by law enforcement agencies, is defined as “supporting criminal activity”. If a company belongs to a criminal organization, it serves an extra function of an official place of employment for members of such an organization. The history of money laundering has witnessed cases where contracts were signed between owners of companies

and organizers of the process of money laundering. Such indicative data as high turnovers and due settlement of VAT and income taxes have made the procedure extremely safe. Only sudden appearance of big volume turnovers, which are incompatible with the company's size and potential, and an in-depth analysis of the company's business activity may raise some suspicions which are, however, extremely difficult to confirm (Czajkowski, 2002).

The main objective of undertaken activities within the second stage of money laundering, referred to as layering, is the separation of funds from a source of their origin. This is achieved through various fast banking operations. The duration and number of performed transactions are subjective and launderers must be absolutely sure that the establishment of a real source of money origin is not feasible. In order to achieve this, the following methods are employed:

1. Fast transfers with the use of electronic tools:
 - a) SWIFT (Society for Worldwide Interbank Financial Telecommunication),
 - b) EFT (Electronic Funds Transfer) and traditional methods of money transfer.
2. The purchase of financial assets and the change of their form.
3. Setting up fictitious companies - even for one financial transaction.

Very fast performance of electronic orders and easy access to SWIFT and EFT make these tools perfect for layering interdepartmental, inter-bank and international operations with a simultaneous change of their name and owner (Wójcik, 2002).

Another method of money laundering at the stage of layering involves the purchase of financial assets which could not be bought in the previous stage. In this case the separation of illicit funds from their source occurs at the moment of purchase or during the change of a deposit form. Every restructuring of invested capital poses a threat of capital loss or its value change. The process of money laundering also employs a method which involves setting up fictitious companies or saving insolvent businesses whose accounts are used to conduct previously discussed activities (Zadworny, 2002).

The main objective of activities at the stage of integration is to legitimize both the criminals' wealth and their high incomes. This is achieved through the introduction of both illegal and legal money into the joint circulation by means of the following methods:

- 1) Purchase and sale of luxury items and tangibles.
- 2) Repayment of loans.
- 3) Saving companies in bankruptcy.
- 4) Foreign trade transactions and transactions using transfer prices.
- 5) Credit-deposit activity (Gilmore, 1999).

The mechanism of money laundering through the purchase and sale of luxury items and tangible assets below the market price works in the following way: the payment of financial liabilities resulted from the purchase is effected from two sources:

- 1) the legal source with respect to the official price defined by the purchase-sale agreement.
- 2) the illegal source, with respect to the difference between the market price and the prices stipulated in the agreement (Fijałek, 2001).

The sale legalizes and justifies the profit. The method engages all kinds of real estate agencies as well as companies involved in selling means of transport, even without their knowledge of the game which they are part of. The repayment of loans with illicit funds is another method of money laundering at the stage of integration. The means obtained from the loan are proved legal, whereas the repayment is effected with funds from secret sources. The method is extremely effective and difficult to reveal, particularly when institutions applying for a loan are managed or controlled by criminal groups.

Another technique of money laundering at the integration stage consists in the introduction of financial means from a criminal activity into an insolvent company with an apparent intention of saving it. The procedure is facilitated by some attitudes of managers who are in charge of an insolvent company or its assets. They usually do not scrutinize the origin of saving funds, or else deliberately enable their legalization (Zadworny, 2002).

Some other methods of money laundering at the integration stage comprise international commercial transactions which use:

- 1) Double sources of import financing.
- 2) Manipulative changes of prices of imported goods.
- 3) Deliberate and planned lack of correspondence of a declared value and volume of imported goods to the market price and volume of goods delivered by the exporter (Matusz, 2002).

Such actions allow for the manipulation of customs duties whose lowered value is a decisive factor during the identification of suspicious transactions.

The technique of a double source of financing involves the introduction of illegal money into the circulation at the stage of payment for imported goods. This is performed by means of two sources of money:

- 1) The legal source, used to pay for imported goods at reduced prices according to invoices.
- 2) The illegal source, used to pay the difference resulted from a real value of imported goods and the legal payment (Kęsicka, 1993).

The method of transfer price manipulation is based on a deliberate change of the price value and most frequently constitutes one of the elements of wider-range criminal activities. The planned change of transfer prices and the use of differences in particular areas of taxation, which are obligatory for

both importers and exporters, lead to the development of informal financial relations between institutions participating in the process. The relations are of informal and mutual character, and their existence is known exclusively to the authors of the process. All this ensures an increase of the value of illegitimate money transfer by means of higher and lower taxation within:

- 1) Mutual provision of fictitious services.
- 2) Fictitious complaints concerning quality of a product or service.
- 3) Licence fees (Matusz, 2002).

The credit-deposit method of funds legalization at the stage of integration involves the use of illicit money as long-term deposits or low-interest loans. Illegal money deposited mainly with foreign banks in the form of long-term deposits constitutes a perfect security or a source of repayment of a loan granted mostly in a home country. The second element of the strategy comprises granting long-term and low-interest loans either by institutions participating in money laundering or directly by criminal groups. The borrowers are companies which have been denied credit facilities by other banks due to lack of credibility with respect to sources of loan repayment and to their financial and economic standing.

Money laundering is a process comprising a series of financial activities undertaken by the same “work group” and for the same reasons, expressed through repeated correlations and producing definite socio-economic results. The authors of the process are top specialists in banking and vast areas of law who aim at creating more effective and better concealed methods of money legalization. Hence, it can be presumed that there exist other, so-far undiscovered methods reaching beyond the popular techniques of money laundering.

FACTORS STIMULATING THE PROCESS OF MONEY LAUNDERING

The development of the international process of money laundering as a specialized area of organized criminal activity is fostered by the following factors:

- 1) Different legal and financial systems of states or state unions.
- 2) The role of progress being a result of the scientific-technical revolution initiated in the second half of the previous century.

Differences between financial and legal systems of countries and international standards are the most significant factor stimulating the process of money laundering.

The differences refer to four areas of the systems:

- 1) Competition – liberalization of regulations with respect to tax and banking law through implementation of governmental programmes concerning the creation of favourable conditions for entrepreneurship.

- 2) Legislation – lack of uniform international legal and financial standards with respect to: what is banned and what is allowed in a country.
- 3) Prevention – lack of international cooperation of specialized national law enforcement agencies with respect to continuation of prosecution of transgressions and crimes committed abroad.
- 4) Jurisdiction – the application of the principle of territory, which hinders effective adjudication also with respect to some organized crime including money laundering (Bojarski, 2001).

The deliberate exploitation of the above-presented differences by state governments contributes to the creation of tax havens whose numerous sophisticated legal and economic mechanisms open the way to the development of private enterprises. The liberalization of tax regulations and lack of bureaucratic management barriers attract foreign investors who foster economic development through commercial and investment operations. All this leads to the establishment of agencies of specialized law and auditing companies, as well as world banks and insurance companies. The agencies, which represent transnational organizations managing multibillion deposits, offer the most sophisticated financial services and, at the same time, ensure total anonymity of participants of banking operations and discretion of conducted transactions. The nineties of the 20th century witnessed the greatest boom of tax havens. Business operations which intend to open their activity in tax havens or are already present on their territory are offered competences such as:

- 1) Tax savings - people who run their own legal business can be relieved from any forms of taxation.
- 2) Discretion and anonymity - most institutions rendering financial services conform to the legal norm according to which any disclosure of information about owners of a company is deemed a penal act.
- 3) Protection of assets - majority of jurisdictions of tax havens has many legal norms protecting company assets or owners. Any court executions or verdicts passed by organs of other jurisdictions are subject to objection (Niklewicz, 2002).

Whatever their geographical locations, tax haven share the same characteristic features.

Table 3. Features of tax haven share

Feature	Structure of the feature
Liberalization of banking law	Liberal regulations with respect to the banking law enable anonymous bank account openings. Banks of Luxemburg, for example, accept cash deposits without asking any questions, which is unthinkable in other countries of the European Union. The authorities argue that similar regulations are obligatory in the competitive Switzerland, and as long as they are in force there, Luxemburg will not change its own regulations.
The change of interest taxation into fees and taxes of a symbolic value.	Tax savings are a consequence of the following facilities: 1. Payment of small administrative charges. 2. The change of all kinds of interest taxes such as profit tax, capital tax, capital transfer tax, inheritance or vat tax into lump-sum tax.
Strict banking secrecy	Within the cooperation with the judiciary, the disclosure of the banking secret is restricted; the secret can be revealed in the case of the most serious crimes.
The guarantee of security	Tax havens are located in areas which are free of military operations and in the vicinity of big markets. They are characterized by great economic and political stability of an economic region or a country.
Excellent technical facilities	Excellent technical facilities enable to carry our transactions by means of the most advanced tools. Tax havens have excellent transport infrastructure including air connections with the most strategic places of the world.
Favourable law regulations for launderers of dirty money	The law regulations are so designed as to protect and obtain capital. The authorities consciously allow for regulations conducive to money laundering. In 1962 president Charles de Gaulle threatened to deprive Monaco of water and electricity and imposed customs union on the principality. In 2000 Monaco was threatened again with legal sanctions by the French Ministry of Finance.

Source: Author's elaboration based on Wąsowski and Wąsowski, 2001 and Wotava, 2000.

According to experts of International Monetary Fund, tax havens manage the deposit sum of over 5 thousand million dollars, which is half of the funds invested outside the states of the funds origin. It has been estimated that due to the existence of tax havens the third part of incomes of the global economy is not taxed. This does not mean, however, that tax havens are popular exclusively with criminal groups, as they provide a good place of investment for international corporations and people of high incomes, who want to optimize their tax expenses within legal regulations. Special Economic Zones created in Poland in order to attract foreign investors are also some kind of substitute for tax havens. Under the amendment of tax regulations of the year 2000, the Minister of Finance issued the order which classifies tax havens into:

- 1) Countries and territories recognized as tax havens due to their harmful competitive taxation.
- 2) Countries and territories considered tax havens with respect to transactions carried out within administrative services and other non-material services.
- 3) Countries and territories regarded as tax havens due to services of a financial character (Kościński, 1996).

The aim of the published order was to help tax offices deal with income tax issues concerning personal and corporate income tax payers who cooperate with businesses registered in tax havens.

The achievements of the scientific-technical revolution have stimulated the dynamic development of tools and technological means used to conduct criminal activity. The commonness of a fast and efficient information transfer combined with unlimited possibilities of global travelling has contributed to the emergence of cross-border organized crime. Electronic systems of money transfer have made money laundering an anonymous process, which is very difficult to identify. The phenomenon of legislative inertia has become a serious problem requiring some solutions in order to effectively prevent the process of money laundering. There are still no sufficient legal regulations concerning the issuance, circulation and purchase of electronic money (Wąsowski and Wąsowski, 2001), which is a virtual record on special SVC cards or on computer hard discs. According to the Bank of International Clearing in Basel, the electronic money should be “an untraceable and anonymous payment instrument to the bearer, allowing for an easy payment made to another person in any conditions and without participation of intermediary institutions.” The use of SVC cards with the microprocessor opens new possibilities for money launderers such as: payment for services and goods, transfer of money between accounts anywhere in the world and change of the money into classic means of payment without leaving any accounting trace. Unlike on-line transactions, the off-line ones preserve the anonymity of trading partners. In such cases the electronic money is usually issued for one transaction only. The so-far attempts of supervising the cyberspace have failed due to two reasons:

- 1) Technical limitations – the computing power of monitoring systems. According to some estimation by Interpol, the number of international transactions per day amounts to 70,000 and their total value equals 2 thousand million US dollars.
- 2) A protest of cyberspace users – an attack on the Internet users’ freedom (Kościelniak, 1999).

According to Bill Gates, the situation is dramatic, as the development of Internet techniques have annihilated the 25 year-old efforts of counteracting money laundering. The modern tools provided by the achievements of the scientific-technical revolution and the processes of the international integration have created possibility areas for organized crime.

MONEY LAUNDERING AND GLOBAL ECONOMY – RELATIONS AND INFLUENCE

It is impossible to provide an explicit definition of the negative influence of money laundering on market mechanisms, as the processes of funds legalization are one of the integral elements of organized criminal activity. No part of a finely created construction of organized crime, perfectly working in intricate mechanisms of the market games, can function in isolation. The neutralization of

at least one link of the relation chain of illegal operational activities will precipitate its failure. The denial of access to the consumption of illegitimate goods can render informal businesses insolvent, and thus cause their natural disappearance. Even a perfunctory analysis of the events in Columbia supports the thesis that the harmful influence of money laundering cannot be considered in isolation from other component pathologies of economic-financial character. The process of money laundering should be treated as a very serious threat to banking systems and market mechanisms on the macro-regional and global scale, especially when one takes into consideration the goals of organized criminal groups, the strategic significance of money laundering and the methods of its achievement.

Table 4. The influence of money laundering on modern economy

Area of influence	Range of influence			Structure of the area of influence
	micro	region	glob	
Corruption	yes	yes	yes	Corruption of politicians, state executives and bankers who are decision makers in the management of businesses functioning in the interest area of organized crime. Such a state of affairs provokes negative opinions and undermines credibility of state banking and financial systems.
Financial policy		yes		Lack of stabilization of a monetary system caused by unbalanced liabilities and bad assets structure, which may lead to system crises.
		yes		Unstable foreign currency and interest rates caused by sudden and short-term international money transfers.
		yes		Unexpected changes in money demand.
	yes			A risk of undermining the bank stability.
			yes	Erroneous capital allocation in global terms decreasing the value of a global product.
Rules of fair competition		yes	yes	The infringement of fair competition rules. Whatever the costs, the safe turnover of illicit funds is of prior importance to operational activities of money laundering. The infringement leads to market dominance and may give rise to a partial monopoly of laundering companies.
		yes		The disturbance of balance of goods and real estate prices causes market destabilization through a deliberate price change by applying one of money laundering methods.
		Yes		The negative influence on people's motivation to conduct a legal business activity in view of competition from secret and informal businesses which are not subject to any charges and duties in favour of the state and their personnel.
Fiscal policy		yes		Mistakes in the formulation of a fiscal policy caused by the use of erroneous statistical macroeconomic parameters.
		yes		A wrong fiscal policy demonstrated through ineffective tax collection from business enterprises, which results in wrong allocation of public expenditure.

The feedback between the closest environment of the process of money laundering and the process itself consists in stimulating the process in the first stage of the relation and counteracting it

through defensive mechanisms in the second one. A full definition of the feedback “paradox” requires some assessment of the process in three topic areas:

- 1) As a new mechanism which developed at the beginning of the 20th century, and which was not a consequence of the evolution of criminal activity. The mechanism was subject to transformations evoked by achievements of the scientific-technical revolution.
- 2) As a mechanism of appropriation defined through the infringement of narrow boundaries of lawful properties established by the socio-economic system.
- 3) Creation of new ethical and moral attitudes as a consequence of evolution of long-term development of the European cultural heritage (Jackson, 2004).

The human behaviour, which is determined by the process of evolution from the collecting era to the era of globalization, has been always expressed by a conflict between duties to the society and people’s individual needs. Money laundering as a process of the European heritage development requires some assessment with respect to: laws in force and motivation and justification of the human behaviour. This assessment should be made right at the turn of the centuries and at the moment of socio-geopolitical changes which are expressed through long-term trends characterized by revaluation.

CONCLUSIONS

The following paper present big influence of globalization on development the phenomenon on money laundering. It is necessary to underline that is not able to provide all objective and statistical presentation of the role and significance of particular factors stimulating the expansion and evolution of the process. This is due to the following reasons:

- 1) an interdisciplinary character of the research problems,
- 2) a short period of global and social recognition of the phenomenon as a threat to national and international systems.

Therefore, the following paper has focused on the presentation of the feedback nature in the following areas:

- 1) the influence of the scientific-technical revolution on the evolution of money laundering.
- 2) the role and importance of the interstate tax competition in the evolution of funds legalization.
- 3) threats posed by the process of money laundering to economic systems.
- 4) the concept range of the feedback assessment.

The achievement of the concept uniformity of international standards and regulations of organizational-legal systems of countries is an absolute necessity for the development and implementation of an effective system of preventing money laundering with respect to cooperation of

specialized institutions with the administration of justice. The turning point in each county system of combating the process of money laundering should be adoption of law preventing the introduction of money from illegal or unknown sources into the official circulation. The law should constitute a basis for the legal and organizational system with regard to counteracting legalization of financial means. The system should be composed of consistent penal, banking law and cautionary norms.

Summarizing the paper should underline that it is impossible to define explicitly the negative influence of money laundering on the functioning of particular financial institutions and on the market mechanism in a regional and global dimension. It is presumed, however, that managers of financial institutions regard the legalization of illegal funds as a threat mainly to the global economy. In their opinion, the phenomenon leads predominantly to wrong allocation of capital in global terms and to the weakening of the effectiveness of the market mechanism. Hence, the presumption can be made that managers overlook the threats of money laundering to the functioning of market mechanisms or financial institutions on a regional scale.

CHOICE OF LOCATION FOR SERVICE INTERNATIONALIZATION STRATEGY FOR SMES

Meneses, Raquel; Teterevleva, Polina

Faculty of Economics, University of Porto, Porto, Portugal

ABSTRACT

Any company while going international faces several difficulties and limitations. A service company has some extra limitations due to the nature of the services it provides. Moreover, it is considered that the smaller and newer the company is, the more limitations it faces and the more difficult the process becomes. However, how can a small new service company internationalize?

The current study is a case analysis of a small Portuguese start-up company, which is working on the development, and implementation of a retail chain of cosmetics stores. The aim of the current study is to identify the key factors, which make the process of internationalization of such a company possible. The impact of the liability of foreignness, liability of outsidership, liability of smallness and newness, specifics of the process of the service internationalization and entrepreneurial aspect will be studied.

Keywords: *Service Internationalization, Small and Medium Enterprises, Entrepreneurship, Location Choice, Networks, Entrepreneurial Experience.*

INTRODUCTION

The rapid growth of globalisation, with the development of technology and service innovation going further every day, coupled with tough competition obliges companies to search for more sophisticated competitive advantages and develop international services. Besides, it is known that lately the economy has shifted towards services. About 75% of employment and gross national products are contributed by service activities in North America and Europe (Cicic et al, 1999, Lommelen et al., 2005). The process of service internationalization is also more complex than the process of goods internationalization.

Normally internationalization is connected with certain difficulties: liability of foreignness (Johanson & Vahlne, 1977; Zaheer, 1995, Hymer, 1960) and liability of outsidership (Johanson & Vahlne, 2009). Overcoming those liabilities requires a company to use many resources. If small companies do not have many resources available, they also face the liability of smallness (Aldrich & Audter, 1986) and the liability of newness (Singh et al 1986). How do they manage to go international? Do all

entrepreneurs manage the internationalization process the same way? Is entrepreneurial activity important for the process of internationalization?

There is not a wide variety of studies on service internationalization or the internationalization process for retail SMEs. When speaking about internationalization, some product supply for a foreign market is usually mentioned (Johanson & Vahlne, 1977, 2009; Oviatt & McDougall 1994, 2005), however the contemporary business world is providing us with far more opportunities. The existing theories and approaches will be analysed critically in order to find differences and similarities between the product and service internationalization processes. Within the framework of the current study a case of a PAR Company will be analysed. This company is working on opening retail chains of select cosmetics and perfumery stores. This company is a retail company which was created in February 2013 and which has already started the process of internationalization in Turkey, Brazil and Europe. This business case perfectly corresponds with our research question. The business case analysis was conducted using the Systematic Combining Approach (Dubois & Gadde 2002).

THEORETICAL BACKGROUND: INTERNATIONALIZATION CONSTRAINTS

Liability of Foreignness

In the academic literature there are studies describing the first constraint of internationalization – the liability of foreignness, which is connected with the fact that the new market entry is always facing a disadvantage of a lack of knowledge and the unprivileged position of the firm compared to local companies.

Hymer (1960) managed to identify several factors influencing a company when going international. The companies entering a foreign market have far less *information* about the market than the natives. Besides, local companies might have a different level of governmental support or the government might create additional *barriers* for foreign companies to enter. Finally, the currency rates fluctuation might create a *currency risk*, which in some cases might bring significant losses for the company. All these factors serve to accumulate an additional cost for the company in going international and might influence the success of such an initiative. Zaheer (1995) refers to the same factors defined by Hymer (1960), though he discovers that the firm might have several advantages, which compensate for the additional costs of doing business abroad. It is not always beneficial to copy local practices while doing business in another country since the company's own practices might be more efficient and provide a competitive advantage over local companies.

According to the Uppsala model (Johanson & Vahlne, 1977), companies tend to formalize their entries incrementally – an establishment chain. They tend first to enter the psychically *closest market* because

the environment in those markets is easier to understand. Then companies tend to enter other markets gradually.

The basic assumptions of the Uppsala model are bounded by rationality and uncertainty. This model is dynamic: to be able to internationalize, the company has to acquire experiential knowledge, which in its turn can only be acquired while internationalizing. The firm, while making the decision regarding the location of the internationalization tends to undertake incremental commitment decisions, choosing the closest countries in terms of physical distance, in order to minimise the uncertainty of the market. Thus, the internationalization process necessarily requires many of the company's *resources* in order to cover all the costs of doing business abroad and the time necessary for gaining experiential knowledge.

Liability of Outsidership

Twenty-two years later, Johanson and Vahlne (2009) consider outsidership in terms of a relevant *network* in the market rather than unfamiliarity, the main source of the uncertainty. Still considering knowledge creation as one of the fundamental processes and the biggest challenges for a company in the foreign market, they state that the company is using the network for searching and obtaining necessary information.

The growth of the level of knowledge might have a positive or negative impact on building trust and commitment. The reconsidered position of the authors states that the company, choosing the location for the internationalization, will go to the market where it and its partners see more *opportunities*. Moreover, in the situation where the company has no local partners yet, it will tend to choose the market where the opportunities for obtaining business connections are higher. The authors also argue that, while exploring the opportunity, such variables as trust, knowledge and commitment to the relationships should be taken into account.

Oviatt and McDougall in 1994 argue that "global start-ups" are not just uninteresting anomalies as was considered earlier, but new entities in the international market deserving detailed study. They define "... an international new venture as a business organization, that from inception, seeks to derive significant competitive advantage from the use of resources and the sale of outputs in multiple countries" (p. 49). The authors mention that the Uppsala Model is applicable for slowly internationalizing companies.

Oviatt and McDougall (2009) also pay attention to such elements as licensing and network alliances. They define International entrepreneurship as "the discovery, enactment, evaluation, and exploitation of opportunities - across national borders - to create future goods and services" (p.7). Oviatt and McDougall (1994, 2009) are moving us further towards understanding the nature of born global

companies; however, this article considers product internationalization and so does not answer our research question.

Schweizer, Vahlne and Johanson (2010) propose a more complex view of the internationalization process. They consider that internationalization should be seen as either a by-product of a firm's attempt to improve its position within the network or because of *entrepreneurial action*. In the article the authors suggest improvements to Johanson and Vahlne's (2009) business network internationalization process model, emphasising the entrepreneurial aspects of the process.

They consider the environment of the firm as dynamic, nonlinear and laced with networks. The model takes into account the importance of entrepreneurial activities, such as those needed for launching a born global company. Authors add such state variables as *entrepreneurial capabilities* as a supplement to knowledge and opportunities. Schweizer et al (2010) state that entrepreneurs operate under conditions of uncertainty and ambiguity, which causes entrepreneurial hesitation, but also allows the entrepreneur to choose more freely among the objectives that only become visible during the process.

Opportunity exploration and opportunity creation are basic entrepreneurial activities (Brito & Meneses, 2007). However, the way these activities are carried out, depends on each case. To go international, firms might use a relationship approach: they use personal and existing business relationships in order to gain information about the potential partnerships to be established and connections to be made.

The previous *experience* of the entrepreneur is also an important factor. Brockhaus and Horwitz (1986) argue that entrepreneurs do not just learn from their previous experience, but profit from it. Entrepreneurs managing their second enterprise, tend to do better than those with their first one, both in terms of sales and profits. This can also be applied to entrepreneurial internationalization experience: in their study, Reuber & Fischer (1997) have found evidence to support their hypothesis that the management team with previous international experience uses a strategic partnership to a greater extent, promoting faster and more efficient internationalization of the firm. In a study conducted by Spence & Crick (2007), the rapid and successful internationalization process of the companies studied is explained by the fact that those companies were "hiring an executive with relevant experience whose main role was to guide the firm to strategic international development" (Spence & Crick, 2007, p. 226). Moreover, Andersson (2011) argues that a company can go international in a very short period of time, using the entrepreneur's prior knowledge and network. The strategy, which is "based on an entrepreneur's knowledge, links to foreign markets and a co-operative arrangement with network partners, can be successful" (Andersson, 2011, p.638)

The research conducted by Andersson (2000), demonstrates that entrepreneurs are not all the same. They demonstrate different behavioural patterns, they are concerned with different aspects of the

business and they choose different strategies for their companies. There are three *types of the entrepreneurs*: Technical, Marketing and Structural:

- Technical Entrepreneur – his main concern is technology; the product and production development are his strategic priorities. Internationalization is not the key priority, however, a foreign order might lead to export internationalization or to a licensing agreement, as long as this type of activities do not require many resources. The market choice depends on which countries are making the inquiries.
- Marketing Entrepreneur – the idea of the product/business for those entrepreneurs emerges from an existing need in the market and an idea of how to fulfil this need. He is proactive in the internationalization process and aims to find new channels to reach consumers. He is willing to establish new international ventures. This type of entrepreneur might choose markets in accordance with personal preferences and connections, instead of using an approach that is more rational.
- Structural Entrepreneur – He is aiming to restructure companies and industries. He acts in companies operating in mature industries and he implements his strategy at a corporate level. The process of internationalization is more the consequence of the entire strategy, rather than a goal for him. Markets are chosen according to the competitive situation.

The creation of a competitive advantage for SME while going international promotes the entrepreneur to *innovate*. Aron O'Cass & Weerawardena, (2009) argue “that the SME internationalisation process is an entrepreneurial activity and entrepreneurial SMEs pursuing international market entry actively undertake innovation in all areas of value-creating activities” (O'Cass & Weerawardena, 2009, p. 1338). Therefore, the capacity of the entrepreneur to innovate is an important factor in business success. According to Frishammar & Andersson (2009) it is also vital for the entrepreneur to be *proactive*. Their study shows that this has a far greater influence on the success of SMEs internationalization than strategic orientations.

Liability of Smallness and newness

In 1986, Aldrich & Auster conducted a study proving that for all types of firms – small and large, there are both advantages and disadvantages, and there are strategies to overcome these disadvantages. Among the liabilities for small and new companies the authors define problems of raising *capital*, meeting all the *government requirements* and being *competitive in terms of labour* with larger organizations, however those paths are connected with the risk of increased dependence and possible loss of control. For small companies, there are several strategies for survival: partnership, franchising, contracting and being acquired. Aldrich & Auster (1986) state that small and new companies tend to have a higher mortality rate than larger, older ones. They draw the conclusion that normally, the price

of surviving, getting older and growing is high for many companies. They have to lose their autonomy.

Studying the liability of newness, Singh et al (1986) also conclude that the lifespan of new organizations is much shorter than for more mature ones. However, authors draw the conclusion that the acquisition of legitimacy by the organization significantly attenuates such liability. Singh et al (1986) also suggest that the attempts of the company to get institutional support might significantly increase its chance of survival.

The specifics of the service internationalization process

The main reason why the processes of service and product internationalization cannot be similar is hidden in the nature of the entities: “product” and “service”.

The key differences between product and service from the marketing and logistics point of view are the following. Firstly, products have physical distribution channels in order to reach the customer, while the majority of pure services do not need these (Demirkan et al, 2011). Therefore, talking about different entry modes while expanding into a new country, such as intermediaries, might not be relevant in some service companies’ cases. Secondly, the level of the personalization of the service is always much higher, as long as the service consumer always expects an individual approach, while good customers are purchasing standardized pieces very often (Patterson & Cicic, 1995; Cant & van Heerden, 2005). Thirdly, the product is a tangible entity; the customer has an opportunity to test it before buying, while the purchase of a service in many cases is based on *trust* (Patterson & Cicic, 1995, Goerzen & Makino, 2007; Boddewyn et al, 1986, Demirkan et al, 2011). Fourthly, the processes of creating products and services are totally different: the majority of products require machinery and raw materials, while services require skills, experience, competencies and motivation of the person who delivers the service (Cant & van Heerden, 2005; Goerzen & Makino, 2007). Fifthly, growing the business for the product company means producing more and reaching new clients, while for the service company expansion also requires improvement of the characteristics of the service provider (Demirkan et al, 2011; Cant & van Heerden, 2005, Boddewyn et al, 1986).

Therefore, we can see that all of the processes starting from creation and finishing with approaching the customer to provide goods and services are different; therefore, the internationalization paths of the goods providers and service providers are different too. For the service companies the entry mode, the production and the distribution channel should vary. The adaptation of the service for entering the new country is also more complicated rather than the adaptation of a product, as long as it implies taking further into consideration the cultural differences, the language, the diversification and access to technologies in the country, the behavioural norms and standards, the economic issues and so on.

In 1986, Boddewyn et al claim that one of the major difficulties in the process of service internationalization is associated with licensing and management contracts. "In their pure forms, they do not involve any equity since only technology or management skills are sold to another party [Buckley 1983b]. Besides, they use the "external market" rather than "internalization" within the international firm as a mode of transfer [Buckley and Casson 1985, p. 51]. Therefore, they cannot be considered forms of direct foreign investment" (p.47). The authors also emphasise the fact that the trade process in the case of services is losing its *clarity and transparency* – the money is paid, but there is no way either to estimate the process of production of the service or to control its quality.

Boddewyn et al (1896) also define several ownership advantages for service companies. Firstly, it is an Internalization Advantage: in the case of customer service, the internalization process might be conducted even in the absence of equity investments. Secondly, it is Location Advantage: in terms of location requirements, international services have no special problems. In 1995, Patterson & Cicic claim that due to the intangibility of the service, providers are limited in their *entry mode options*; meanwhile the entry mode is a key success factor for service internationalization. They also state that for those services, which require a lot of interaction between the customer and service provider, the *cultural aspect* is one of the key factors.

The development of the global economy, globalization and technological development have been changing the world rapidly. The development and spread of all kinds of communication technologies has moved service companies to a new level. In 1999, Cicic et al (1999) conducted research in order to develop a model of service internationalization. Some stages of the processes and service internationalization are similar to product internationalization; however, there are many stages, which are different. They define "hard" services – not pure services, but services embedded in goods, and "soft" services – the standard pure services. The "hard" services, due to their high similarity with goods are more likely to internationalize via standard and traditional entry modes; they are less influenced by cultural and technological differences, while "soft" services require a totally different approach, and the entry mode for such services should be adapted. The "hard" services due to their tangible nature have to pass all the phases: Pre-International Stage, Exporting Stage and Higher Commitment Stage, while "soft" services do not require the exporting stage due to their intangible nature. Retail service is a soft service according to this classification. Ergo, the cultural aspect, as well as the psychological aspect and the presence of necessary skills and expertise are the most important.

CONCEPTUAL FRAMEWORK FOR ANALYSIS

Any company entering the foreign market faces difficulties depending on the type of the company and the types of the goods/services the company offers.

Any company faces two major disadvantages. The first one is the liability of foreignness – disadvantages connected with lack of information about the host country market (Johanson & Vahlne, 1977; Hymer, 1960; Zaheer, 1995), an unprivileged position in the eyes of the local government (Hymer, 1960; Zaheer, 1995), higher costs of doing business abroad in comparison to local companies (Hymer, 1960; Zaheer, 1995), the currency risk (Hymer, 1960) and the availability of resources (Johanson & Vahlne, 1977). The second one is the liability of outsidership – the lack of a network in the target country, difficulties of identifying market opportunities, inability to make business connections and difficulty in gaining mutual trust with local partners (Johanson & Vahlne, 2009). Besides, the internationalization strategy might depend a lot on entrepreneurial action (Schweizer, et al., 2010), the type of the entrepreneur, as well as on his previous experience and network (Brockhaus & Horwitz 1986; Reuber & Fischer 1997; Andersson 2000, 2011; Spence & Crick, 2007, Johanson & Vahlne, 2009). Moreover, the international entrepreneur should be innovative and proactive (O'Cass & Weerawardena, 2009; Frishammar & Andersson, 2009).

However, when a new, small company is willing to internationalize, there appear to be even more constraints – liability of newness and smallness - such issues as problems of raising capital, meeting all the government requirements and being competitive in terms of labour with larger organizations (Aldrich & Auster, 1986). There is also a very high probability of early failure in a young company, and even if it manages to survive, in many cases it risks losing its independence (Aldrich & Auster, 1986).

When a new small service company is searching for an opportunity to go international, it should be taking into account the types of services it is providing and the specific nature of those services. Depending on the type of service, “hard” and “soft” services follow different internationalization paths (Cicic et al, 1995). It is important to choose the entry mode carefully (Patterson & Cicic 1995). The company should also take into account the difficulty of controlling the quality and the price of the service due to its intangible nature, and consider the psychological and cultural differences of the customers in the country of destination and be able to adapt the service correspondingly (Boddewyn et al 1896). For a consumer to purchase a service, the trust factor is also essential (Patterson & Cicic, 1995, Goerzen & Makino, 2007; Boddewyn et al, 1986, Demirkan et al, 2011). Finally, it is important to mention that the market is not always a passive part in the internationalization process. In many cases, the market attracts the company there (Buvik, 2002; Brito & Meneses, 2007).

Therefore, we can define several challenges new service SMEs might face during their internationalization process (Table 1)

Liability of Foreignness	Market Information (MI)	Cost of Doing Business Abroad (CDBA)
	Government Barriers (GB)	Physical Distance (PD)
	Currency Fluctuation (CF)	Resources Availability (RA)
Liability of Outsidership	Relevant Network (RN)	Previous Experience (PE)
	Market Opportunities (MO)	Types of Entrepreneur (TE)
	Entrepreneurial Action (EA)	Capability to Innovate (CI)
	Market Call (MC)	Proactive Attitude (PA)
Liability of Smallness & Newness	Capital Availability (CAv)	Labour Competitiveness (LC)
	Meeting Governmental Requirements (MGR)	
Specifics of Service Internationalization	Lack of Transparency and Clarity (LTC)	Cultural Aspect (CAs)
	Entry Mode Limitations (EML)	Trust Based (TB)

Table 1. *Factors influencing the process of internationalization of service SMEs*

METHODOLOGY

The methodology used for the current research is qualitative analysis. Within the framework of this study, the case study strategy will be used as long as such a strategy allows understanding of dynamic changes within single settings and is helpful to cope with the fact of intangibility of many resources in an organization (Hoskisson et al, 1999). The information was collected using the official documents of the company and conducting interviews with its founders, asking them to expound their view of the factors influencing the process of the internationalization of the company. – A triangulation approach was used, which is usual for case studies. The sources of evidence were combined while shifting between analysis and interpretation, which allows for collecting and double-checking findings (Dubbois & Gadde, 2002)

THE CASE

The case analysed in this study is a Portuguese start-up company which was founded in 2013 and is currently working on a project to create a new cosmetics brand and open its own brand and multi-brand cosmetics stores in Europe, Turkey and Brazil. Besides products, the concept of the brand, created by this company, assumes intense interaction with the clients. The two core values of the brand, personalization and emotional connection, assume a number of service activities. The company is a “hard” service provider.

The dimension of the company is impressively small. It was founded by 3 entrepreneurs who had previous experience in 3 key areas of the business: Retail & Logistics, Training & RD and Marketing & Communication.

Pedro has more than 15 years of experience in Retail & Logistics, opening and managing selective perfumery stores. He created and developed a retail chain for selective perfumeries, which became a

reference in Brazil, winning the ALSHOP/VISA award in 2004, 2005 and 2006 for the best shop concept.

António is a chemical engineer and has 32 years of experience as a General Manager in a company, which was the biggest distributor of a select cosmetics brand in Portugal. While working for a Portuguese selective perfume company, he was responsible for launching international selective brands. For 7 years, António was the president of the Portuguese association of the cosmetics industry and a member of the European cosmetics and personnel care association COLIPA, based in Brussels. He is also currently working as a business consultant for a Portuguese Consultancy Company.

Rogério has 21 years of experience in designing and executing marketing and communication plans. He has a rich experience of working in the international business environment. Rogério has managed many Portuguese artists' careers, as he has been working in the music industry for 15 years, organizing marketing campaigns with TV channels, radio stations, magazines and social media. He has also developed projects with international partners.

Besides the three founders there are 4 more people working in the company. We found this case interesting, since we can analyse a situation where 7 people are preparing and implementing such a global project.

DISCUSSION

Interviews were conducted with the founders and information collected. The importance of the factors mentioned in table 1 was studied. The following results were noted (table 2) (the numbers represent the number of times the issue was mentioned in the interviews and the documents):

Liability of Foreignness				Liability of Outsidership				Liab. Smallness & Newness		Spec. Service Internationalization	
MI	11	CDBA	0	RN	12	PE	14	CAv	4	LTC	0
GB	0	RA	0	MO	12	TE	6	MGR	1	EML	3
CF	0			EA	12	CI	13	LC	0	CAs	6
PD	0			MC	6	PA	10			TB	0

Table 2. *The factors influencing the process of internationalization of PAR*

It is interesting to note that from the results, the most relevant factor for PAR is the previous Experience of the Entrepreneurs (in line with Brockhaus & Horwitz, 1986; Reuber & Fischer, 1997; Andersson, 2011; Spence & Crick, 2007). António claimed in the interview: "Experience is the fundamental basis of the process. Without it, the founders would not have been able to advance with the project".

The second important factor is the Types of Entrepreneurs; though there are not so many references, the impact of this factor is significant. PAR is the case where all 3 types are working together, complementing each other in terms of knowledge. Based on the actions, main concerns, core

competence and strategies of each of the founders, we can conclude that Pedro is a Structural Entrepreneur, António is a Technical Entrepreneur and Rogério is a Marketing Entrepreneur (Andersson, 2000; Brito & Meneses, 2007).

The next most important factor is Capability to Innovate. (O'Cass & Weerawardena, 2009) The experience in the three key areas not only helps the founders to organize and manage the business processes, but it also allows them to introduce new activities and services to the business which "has remained the same for the last dozen years, where all the stimuli are based on price" (António). They are capable of identifying the weak points of the business and presenting an innovative solution to gain competitive advantages.

Market Opportunity (Johanson & Vahlne, 2009) is also an important factor. The entrepreneurs are able to define existing opportunities and develop a project in accordance with them. To do so, the entrepreneurs should be proactive (Frishammar & Andersson, 2009), which is the fifth important factor for the current case. The Proactive Attitude allows entrepreneurs to identify, analyse and take advantage of market opportunity.

In the case of PAR, market is not a passive part of the process of internationalization. The three founders were contacted by business partners from Turkey with a view of developing a project specifically for the Turkish market. After this call, the current market situation was carefully studied and all the necessary information was obtained in order to make sure the opportunity existed. Adequate actions were undertaken to develop and implement the project. Thus, Market Call (Buvik, 2002; Brito & Meneses, 2007), Market Information (Johanson & Vahlne, 1977; Hymer, 1960; Zaheer, 1995) and Entrepreneurial Action (Schweizer, Johanson & Vahlne, 2010) are the next most relevant factors.

Some potential markets, seemed very attractive at first glance, but it became apparent that entry modes are very limited to this market. "There are countries in Central and South America where there are cartels" (António). Such organisations limit the entry modes and complicate the entry process. For these countries, PAR had to delay the process of internationalization - the Entry Mode limitations Factor (Patterson & Cicic 1995)

One of the biggest concerns named by the founders is the adaptation of the concept of the store, the brand identity and the communication strategy to make it attractive for young consumers in the destination countries. However, having partners in the destination countries facilitates the process of knowledge acquisition and negotiations. The large number of network connections also facilitates an access to suppliers, consultants, potential business partners, etc. Therefore, Cultural Aspect (Boddewyn et al 1896) and Relevant Network (Reuber & Fisher, 1997; Andersson 2011; Johanson & Vahlne, 2009) are of vital importance for the PAR case.

Capital Availability (Aldrich & Auster, 1986) is also an important factor for success in the process of internationalization for PAR. The investors and business partners are currently being sought. "The idea is very interesting; the project is innovative, so fortunately we cannot complain about a lack of investor interest to join us" (Rogerio). Meeting Governmental Requirements (Aldrich & Auster, 1986) is also a subject of concern; however, it is not a difficulty in PAR's case since according to António "present legislation facilitates a lot of the export process".

Finally, such factors as Government Barriers (Hymer, 1960; Zaheer, 1995), Currency Fluctuation (Hymer, 1960), Cost of Doing Business Abroad (Hymer, 1960; Zaheer, 1995), Physical Distance (Johanson & Vahlne, 2009), Labour Competitiveness (Aldrich & Auster, 1986) and Lack of Transparency and Clarity (Boddewyn et al 1996) seem not to be relevant to the current stage of PAR's internationalization process.

CONCLUSIONS AND LIMITATIONS

The case provides us with an example of how a company which only consists of 7 people is able to work on a projected retail chain of cosmetics stores which is supposed to be implemented on 3 continents.

We were able to witness the importance of entrepreneurial characteristics such as previous experience, the type the entrepreneur belongs to, innovation capabilities, proactivity and capacity to undertake certain actions. In the case of PAR, the entire project would have been impossible without the founders having these characteristics. The founders' network is very important for the development of the project as well, since it is a source of getting market information and establishing the business connections.

We can conclude that the process of internationalizing a service company is more complex than the internationalization of a product company; however, such a small company managed to do it. In this case, the barriers are successfully overcome due to the capabilities of the management team.

This case stresses Hambrick and Mason's (1984) idea that the company is often a reflection of its management team. In addition, we can conclude that when the 3 types of entrepreneurs collaborate and do business together, the internationalization process happens much faster, since they complement each other in terms of knowledge, and such collaboration helps in overcoming the obstacles the company faces during the internationalization process (Brito & Meneses, 2007).

The case is also interesting because the market plays an active role in the process of internationalization. The founders were asked to develop a project for a specific market, which later adapted for other countries. There are other factors, which influence the process of internationalization of the company such as market opportunity, market information, entry mode

limitations, cultural aspect, capital availability and meeting government requirements. However, the entrepreneurial spirit of the founders led them to recognize opportunities, and made them willing to undertake the risk.

The main limitation of the current research is that only one case was studied, therefore we suggest a more profound investigation be conducted with the participation of more companies with a profile similar to PAR's.

RESPONSIBLE MANAGEMENT DURING THE FIRM'S INTERNATIONALIZATION TO BASE-OF-THE-PYRAMID COUNTRIES: A CASE-STUDY OF THE FABER- CASTELL GROUP

Meneses, Raquel F. ¹, Staender, Christiane S. ²

¹Dept. of Management, School of Economics and Management, University of Porto, Portugal

²School of Economics and Management, University of Porto, Portugal

ABSTRACT

Globalization has changed the international business environment, enabling firms to operate in more global and complex contexts with an increasing impact on society and the natural environment. Simultaneously, Responsible Business Practices (RBP) are growing in importance - not only domestically, but also during the firm's internationalization to different contexts, such as from developed to base-of-the-pyramid countries (BOPs). Hence, the goal of this research is to assess whether and how a company, headquartered in the developed world, adopts and adapts RBP when internationalizing to BOPs. For this purpose, a qualitative methodology in form of a case study of the *Faber-Castell Group*, supported by a semi-structured interview with an internal key person in corporate sustainability, was used to study the international RBP behavior of the company. This research creates value in the field of International Business Studies, by integrating RBP, FDI and international business ethics in different contexts, and demonstrating how sustainable international management can be operationalized. The RBP adoption in BOPs depends on strong collaboration and dialogue networks with entities of different kinds that pursue profound local knowledge; however, a basic standardized RBP framework in combination with some RBP adaptation is necessary for a successful RBP adoption that results in a variety of internal and external benefits.

Keywords: *International Business (Ethics); Internationalization; Responsible Business Practices; Adoption and Adaptation; Sustainable Management; Base-of-the Pyramid*

INTRODUCTION

As a matter of fact, globalization has changed the international business environment by enabling firms to operate in more global and rapidly changing contexts (Dahlsrud, 2008) in which the imperatives of global integration and local responsiveness are becoming increasingly critical for internationally operating companies (Bartlett and Ghoshal, 2002).

Moreover, whilst global governance lost its ability to effectively regulate affairs such as the way business affects social and environmental matters, some firms are gaining in impact and influence (Scherer and Palazzo, 2011) causing the need for responsible business practices (RBP) that lead to sustainable development (Landrum, 2007), defined as a “development that meets the needs of the present without compromising the ability of future generations to meet their own needs” (WCED, 1987, p.37).

Nevertheless, the debate on the firm’s nature in society and the relevance of RBP exists (Scherer and Palazzo, 2011; Friedman, 1970), yet currently strategies adding to business value, sustainable success and development are augmenting in importance, leading to an increased range of responsibilities that guide the firms’ global decision-making processes (Bardy et al., 2012).

Besides, the majority of countries have been considered developing or emerging in 2010 (Choi et al., 2010), existing a need for these countries to get more globally integrated in international business research, amongst others through RBP and sustainable development (UNCTAD, 2013; Choi et al., 2010).

The motivation to do more research on RBP and sustainable management in BOPs is associated with the future need of linking economic and social value creation, as well as the fact that far more research has been made on RBP in developed countries, than for the developing world, where a stronger need for corporate RBP exists since there are fewer institutions providing general social goods (Dobers and Halme, 2009). Furthermore, research on RBP implementation is scarce once the adoption of RBP being a changing process within firms (Lindgreen et al., 2009). Therefore, further research on the complexity of the RBP concept and its successful adoption across different cultures is required (Bondy and Starkey, 2014; Kleine and von Hauff, 2009; Lindgreen et al., 2009) and specific case studies of firms that integrate RBP, business ethics and FDI issues needed, in order to get a better understanding of the influence of contextual components that firms experience when designing their RBP strategies (Bardy et al., 2012).

Therefore, the focus of this research is on the impact of context on organizational behavior (Johns, 2006) by creating an attempt to answer the questions of whether and how a firm from the developed world adopts and adapts RBP when internationalizing to BOPs. This will be achieved by confronting theory and practice through a case study of a German-based company with responsibilities in BOPs and thus adds to the international management literature by addressing the recommendations mentioned earlier. In the following sections, the recent literature on RBP and BOPs will be reviewed, the adopted research methodology explained and the case study discussed. Conclusions, research limitations, as well as inputs for future research will then follow.

BUSINESS AND SOCIETY: RESPONSIBLE BUSINESS PRACTICES (RBP)

The business - society relationship is based on the interdependence of both parts and has generated strong criticism on our business system in the past, emphasizing the need that “companies must take the lead in bringing business and society back together” (Porter and Kramer, 2011; p.4) and thus causing business’ cumulative awareness of RBP, defined as a company’s voluntary activities that link social and environmental concerns with its business operations, by ethically interacting with its stakeholders (Van Marrewijk, 2003).

In fact, RBP is a complex and multi-disciplinary notion (Lindgreen et al., 2009) that has a variety of related concepts which include Corporate Sustainability (Van Marrewijk, 2003), Stakeholder Management (Choi and Wang, 2009), Corporate Social Responsibility (Carroll and Shabana, 2010) or Corporate Shared Value (Porter and Kramer, 2011), for instance. Most of these approaches differ from each other, but are based on the same general idea of business’ voluntary engagement in practices that favor its surroundings (Van Marrewijk, 2003). In this research, the same happens for RBP by integrating all related concepts.

Besides, in an era of increased public exposure through modern communication channels that enable a faster spread of information, a key proposition is that firms should pursue a triple bottom line, considering their economic, environmental and social performance and impact simultaneously and thus create corporate sustainability (Goel, 2010). Actually, it was found out that better relations to stakeholders lead to increased shareholder value in the long term (Choi and Wang, 2009), making RBP an indispensable management tool for the implementation of a successful business strategy (Dahlsrud, 2008). Here, RBP include firm responsibilities of a multidimensional nature (Carroll, 1991): the firm’s economic responsibility (producing goods and services that society needs and sell them at a fair price, maintain competitiveness and act efficiently, in order to be able to generate sufficient income to pay its bills and reward its shareholders (Carroll and Buchholtz, 2011)), legal responsibility (performing within regional or local legal obligations (Carroll and Shabana, 2010)), ethical responsibility (acting within social mores that are not codified by legislation (Jamali and Mirshak, 2007) and lastly, philanthropic responsibility (the voluntary contribution of the firm’s resources to society (Carroll and Buchholtz, 2011)). In short, modern firms have to assume responsibilities that go beyond the fulfillment of their missions (Jamali and Mirshak, 2007).

RBP ADOPTION

Recently, RBP forms and theories evolved, demonstrating that they might be accompanied by benefits for business when applied strategically (Porter and Kramer, 2011; Choi and Wang, 2009).

Basically speaking, there are three RBP forms firms can apply, in order to operationalize their

responsibilities: Philanthropic Behavior, Integration and Innovation (Halme and Laurila, 2009). While Philanthropic Behavior means concentrating on RBP that take place outside the firm's core business activities and does not produce direct benefits for the company, the idea of Integration aims more responsible behavior in existing core operations (e.g. paying just wages, stakeholder management, eco-efficient production) and thus succeeds to create benefits related to the firm's reputation, risk reduction and cost-savings (idem.). Innovation, on the other hand, intends to create new business models or implement strategies that solve or at least alleviate societal problems while simultaneously creating strong business benefits (idem.).

Now, efforts have been made to describe the organizational process of RBP adoption; however, it is argued that this adoption is a company-specific process, meaning that every firm needs to give its own individual meaning to RBP action (Cramer et al., 2010). Here, a practical framework for RBP adoption is suggested by the German Council for Sustainable Development (GCSD) (2006), for instance, that allows managers a better organization of the RBP implementation process in general and includes the following steps (GCSD, 2006): (1) the identification of the firm's intention to engage in RBP and thus create a win-win situation for itself and its stakeholders., including an analysis of the firm's status quo and its surroundings (e.g. strategic goals, availability of resources, RBP activities of competitors, RBP forms and effects). (2) The definition of the firm's focal points and the establishment of RBP goals to individualize its RBP action, referring to factors such as the firm's philosophy, the aims of its action, sector-relevant issues, the firm's capacity and legal context, stakeholder interests and the definition of the firm's RBP to approach them. (3) The establishment of internal agreement and management commitment to certain RBP action, as well as clearly defined responsibilities are needed for RBP integration that can be achieved through codes of conduct, internal or industry-specific standards and management systems, for instance, and finally (4) RBP reporting, as well as internal and external stakeholder communication of RBP action are part of the continuous RBP improvement process and fundamental, in order to create more transparency and credibility (Kleine and von Hauff, 2009). Reporting can be done via GRI Guidelines, audits and certifications and through regular revisions by representatives of the industry and stakeholders, relevant, detailed and comparable information can be gathered. Moreover, the communication of RBP goals and action to all stakeholders, and thus adequate communication channels are of the utmost importance (GCSD, 2006) and in order to analyze indicators, goals and areas of action more properly, the Integrative Sustainability Triangle can be applied (see Kleine and von Hauff, 2009).

This process seems to be a useful tool for RBP adoption and following the steps is easy in well-known domestic market contexts. Yet, the question remains whether firms also proceed in this manner when operating abroad. The following sections will shed some light on this issue.

LINKING RBP AND THE FIRM'S INTERNATIONALIZATION PROCESS TO BOPS

De facto, global markets are more dynamic and diverse than domestic ones (Alon and Jaffe, 2013) and thus a variety of aspects need to be considered when linking RBP to the firm's internationalization process (e.g. contextual components that may influence RBP action and that firms experience when developing their RBP abroad).

The majority of countries have been considered developing or emerging in 2010 (about 80% of the world's population) and will be held as BOPs, namely (1) developing and (2) emerging countries (Choi et al., 2010) in the context of this research. BOPs represent great market opportunities and often provide lower relative labor costs that attract increasingly more firms headquartered in the developed world. Unfortunately, regulation inefficiencies and imprecision of suitable international business behavior exist (Scherer and Palazzo, 2011) and are serious aspects in this context as firms may exploit them for their purposes and act irresponsibly abroad (e.g. corruption or social/environmental dumping practices). Besides, due to the existing cultural, economic, political and legal diversity that prevails between most developed countries and BOPs, there is a certain danger of ignoring different context-specific perspectives on RBP, and corporate misbehavior may also be a result of that (Dobers and Halme, 2009). Firms may be willing to contribute to sustainable local development, but without a proper analysis of what is really needed and understood as RBP, there won't be such a win-win situation and the firm's will to act responsibly might be understood quite negatively. It results from this that there is a growing importance of strategic RBP in BOPs that prevent negative externalities of insufficient local knowledge or even mere goal achievement, that strengthen sustainable international business and are accompanied by gains in competitive advantage, innovation and added value (Ganescu, 2012; Landrum, 2007). But what exactly is understood as fair behavior in each context, who defines what a specific community really needs and how do firms proceed to be able to implement successful RBP action in BOPs?

Certainly, the degree of context-specific RBP adaptation depends on the management's global perspective of the firm (Alon and Jaffe, 2013). In Perlmutter's (1969) line of thinking, this would mean that an ethnocentric RBP orientation would imply RBP standardization; a polycentric orientation strong RBP adaptation with subsidiaries developing their own strategy; a regiocentric orientation would develop one RBP strategy per region; and a geocentric view global RBP integration with some context-specific adaptations. Bondy and Starkey (2014) emphasize the on-going debate on whether RBP adoption should focus on global or local issues, and Arthaud-Day (2005) illustrates that there is a direct link between international business strategy and responsible business behavior. In that line of thinking, global firms would define standardized RBP wherever they operate; Multinationals would adopt

diverse RBP that would differ across contexts; Internationals would adopt different RBP in their home and host countries and Transnationals would adopt a mix of both global RBP integration in combination with an adaptation of this strategies to context-specific needs (idem.). Here, local managers with strong local knowledge of what a specific community really needs and understands as RBP are fundamental (idem.).

However, even once having obtained local knowledge on ethical values and RBP understanding, doubts start with which values to follow (those of the firm's home market (absolutism), the ones of the host market (relativism) or even international/universal guidelines (universalism) (Alon and Jaffe, 2013), agreed minimum values shared across cultural boundaries (Melé and Sánchez- Runde, 2013), such as the International Standardization Organization's (ISO) standards, the Organization for Economic Co-operation and Development's (OECD) guidelines for multinational enterprises, the Global Reporting Initiative (GRI) guidelines, the UN Global Compact or the International Labour Organization's (ILO) Convention.

Additionally, successful international RBP adoption requires sensitivity to host countries' needs (Bondy and Starkey, 2014; Lindgreen et al., 2009) that can be obtained via collaboration (Baumann-Pauly et al., 2013) and is based on a partnership selection process- a decision that is influenced by each firm's strategic goals- including (1) the assessment of possible partners, (2) partnership selection criteria setting and choice, (3) contact and (4) communication between partners on ideas for joint RBP adoption (Seitanidi and Crane, 2009). It comprises different kinds of collaboration, such as external engagement with local or international organizations (IOs), Non-governmental organizations (NGOs), intra-/inter-industrial collaboration, governmental institutions or external stakeholders and via RBP networks (e.g. CSR Europe, World Business Council for Sustainable Development (WBCSD)), as well as an internal one with employees (Sharma and Kearins, 2011; GCSD, 2006). Employee engagement is a success factor of RBP adoption as it creates support throughout the organization, and needs to be emphasized by employee training, communication and reporting on the importance of RBP, as well as what effects it has on the community and the firm (Bolton et al., 2011; Cramer et al., 2010). This also depends on an integration of RBP culture and action in corporate development processes at all levels, above all via horizontal integration across departments (Kleine and von Hauff, 2009).

To sum up, operating in BOPs brings about additional concerns on effective RBP adoption. It depends on the firm's management perspective and internationalization strategy on which degree to adapt RBP; yet, successful international RBP adoption depends on context-specific adaptation that implies access to local knowledge, in order to create sustainable international business with mutual benefits. This access can be gained through different kinds of collaboration.

RESEARCH METHODOLOGY

Given the fact that realities such as the understanding of RBP and ethics are quite subjective issues, a qualitative methodology was chosen for the empirical part of this research. The case study method is appropriate in this sense as it allows the researchers to get an in- depth view of organizational decision-making processes (Yin, 2009). For this purpose, a variety of data sources were combined to provide a clearer understanding of the chosen firm's international RBP behavior (also known as "triangulation" (Denzin, 1970)). Two different, but complementing data collection techniques were adopted: In the first place, a semi-structured interview was conducted based on interview guidelines we created through the literature review, to generate more details and collect testimonies of an internal key person responsible for RBP adoption and corporate sustainability. We assured the interviewee makes strategic RBP decisions on a daily and international basis and has a mature experience in the international RBP adoption process, thus enabling us to get more detailed insights into a number of RBP and their development within the firm. To guarantee data reliability, the interview statements were triangulated with publicly available as well as internal documents (such as sustainability and annual reports, as well as corporate presentations and information published on the firm's websites) and external stakeholder perspectives (through newspaper articles, as well as websites and documents of NGOs, IOs and networks the firm is collaborating with). The data was collected from December 2013 - May 2014 and the company selected based on (1) its level of RBP engagement, in order to cover a wider spectrum of RBP adoption, (2) its experience regarding BOPs (operating in at least three BOPs) to make sure it has RBP adoption experience in diverse BOP contexts, and (3) its headquarter in the developed world, in order to ensure a greater difference between domestic and BOP culture. After gathering data from different sources, it was prepared for content analysis including full reading of the transcribed information, coding (creating categories and linked sub-categories and topic descriptions) and interpretation of facts.

CASE-STUDY: SUSTAINABLE INTERNATIONAL BUSINESS AT THE FABER-CASTELL GROUP

---The following data has been obtained through an extensive combination of internal and external sources, described in the section above. The information received thanks to the personal interview with Mr. Braun, Head of Corporate Quality and Sustainability at the Faber-Castell Group, on March, 10 2014, in Stein, Germany, will be referred to as "Braun, 2014". ---

The world's leading manufacturer of wood-cased pencils, Faber-Castell, was established in 1761 by Kasper Faber and is a family-owned company that counts on a wide range of products for drawing, writing and decorative cosmetics. Headquartered in Stein near Nuremberg, Germany, Faber-Castell is

one of the oldest industrial companies and is nowadays being managed in its 8th generation by Count Anton-Wolfgang von Faber-Castell. It was also under his management that Faber-Castell became a non-listed stock company in 2000, yet making a continuous and balanced investment in its economic, environmental and social responsibility domains (Braun, 2014).

Certainly, the choice for including the Faber-Castell Group in this research project has to do with its continuous search for sustainable development through diverse RBP forms and the way they are put into practice. Yet, another reason for this choice has to do with the company's strong international presence and profound experience in BOPs, thus being an expert in cross-cultural RBP issues. Once having internationalized its operations via FDI, the Faber-Castell Group is nowadays operating 14 production sites in nine countries (Austria, Brazil, China, Colombia, Germany, India, Indonesia, Malaysia and Peru) and is marketing its products through 25 commercial subsidiaries, thus being represented in 120 different countries across the globe and counting on about 7.500 employees worldwide (idem.).

DISCUSSION

Even being a stock company, the Faber-Castell Group is able to demonstrate that it can just as well think and act in sustainable manners by innovatively combining shareholder and stakeholder theorists' lines of thinking. This is being realized through a "triple bottom line" thinking which leads to true corporate sustainability (Van Marrewijk, 2003). The connection of these three domains is integrated into Faber-Castell's corporate culture, policy ("10 Guiding Principles") and core values ("Brand Essentials") that have been centrally defined by the firm's headquarter (HQ) and implemented in the firm's worldwide operations through an integrated management system, called FABIQUS, for standardized processes in quality, environmental and social issues. Here, a continuous improvement is achieved through PDCA (Plan, Do, Check, Act) cycles, leading to better efficiency, globally consistent quality and more transparency (through a reporting system based on the GRI).

Moreover, when it comes to the question of which ethical values and RBP understanding to apply in BOPs, Faber-Castell decided to opt for a mix of RBP Universalism and Relativism. This has also to do with the Firm's geocentric management view and transnational strategy by promoting the collaboration of HQ and local management teams to establish globally integrated standards and permit certain local responsiveness: "(...) a certain basic framework of standards is needed, but you do also need to adapt to local circumstances in order to be successful with your international RBP strategy" (Braun, 2014). According to Bartlett and Ghoshal (2002), it is exactly this firm mentality of creating a mix of global integration and local responsiveness that is needed due to the increasing complexity of the international business environment. Actually, a great number of authors (Halme and Laurila, 2009;

Lindgreen et al., 2009; Jamali and Mirshak, 2007) confirm this idea by stating that contextual differences influence RBP needs and cause a demand for diverse responses, being local managers with local knowledge of appropriate RBP fundamental (Arthaud-Day, 2005), also for Faber-Castell: "(...) it is important to maintain a dialogue with subsidiaries and suppliers and to be sensitive to regional differences. (...) We pursue a decentralized organization and appreciate management teams consisting of locals that are strongly involved in each region. (...) Considering the subject of wage calculation, for instance, we decided to implement "decent wages" in our worldwide operations. As the comprehension of what is decent is country-specific, we decided to discuss the local understanding of decent wages with the local labor unions and managers. (...) Then, you also need to pay attention to regional differences in terms of not only paying salaries in money. In Indonesia, for instance, we have about 30 additional agreements such as washing laundry, medical assistance, child care programs, etc. that we provide to our employees. These are all issues that require strong local knowledge we don't have here at the Faber-Castell headquarter" (Braun, 2014). Other ways of obtaining such context-specific knowledge include contacts such as to local governments or the UN and RBP collaboration with NGOs, as well as suggestions of local employees that have direct connections to local communities. Furthermore, cross- sector dialogue networks, such as in discussion groups of the World Wide Fund for Nature (WWF) or the Biodiversity for Good Company Initiative are seen as fundamental to share RBP ideas and experiences in different BOPs. Together with the support of the central sustainability department in Germany, viable and meaningful projects that are in line with the firm's principles and goals are then selected and executed (Braun, 2014).

A specific example of globally integrated standards is the Faber-Castell Social Charta that was signed in 2000 with the trade union IG Metall (a strict code of conduct on social criteria that is based on the employment and working conditions of the ILO), as well as the principles of the UN Global Compact (which Faber-Castell joint as the first firm of its sector in 2003), for example. These standards are monitored by a regular three-level audit control (first, through internal checklists by each site, second by internal auditors from the HQ and third, by a monitoring committee consisting of external representatives of the international trade union BWI and IG Metall, internal management representatives, as well as work councils and local labor unions (idem.)). They are seen as the firm's minimum standards that need to be respected on a worldwide basis, with no cultural or legal variation, even if local skepticism may arise (such as about labor unions that are quite unusual in Peru or the demand for collection pans, safety apparel that is unusual in most parts of Asia (Braun, 2014)). Nevertheless, in order to solve this skepticism and explain the benefits of these standards in each region, Faber-Castell works closely with the international trade union and its local agents that negotiate with governments and help the firm to correctly introduce the standards in each context (idem.). And

even more, the fact that the compliance of these standards is monitored by the local and the international labor unions and management teams demonstrates a strong degree of universal and local considerations.

Besides, the three RBP forms discussed earlier (Philanthropic Behavior, Integration and Innovation), can also be observed in the case of the Faber-Castell Group. Firstly, Philanthropic Behavior through the Graf von Faber-Castell Children's Foundation, for instance, that provides financial, material and personal support aiming children's development through international projects (such as helping charities, hospitals and schools in BOPs). Another specific project is the "Programa Voluntários" in Faber-Castell's production sites in Brazil, where employees can support community projects with the aim of passing on their know-how to locals such as by raising awareness of environmental issues, while being exempted from work. Secondly, Integration by including more responsible behavior in core business operations on a daily basis, such as environmentally-friendly and certified production processes, packaging and products, using renewable energy sources in most production sites, using wood from own sustainable forestry in Brazil and Colombia, environment-friendly water-based paint; modern waste water treatment systems, etc. (Braun, 2014). Internal RBP include free leisure programs for employees, as well as language, literacy or computer classes, health prevention programs and even preparation courses for university that are defined and implemented by local managers in accordance with the HQ. "This has a strong motivation effect on our employees, because it improves their quality of life which in turn results in even more dedication and loyalty to the company and helps us to avoid fluctuations" (idem.). And thirdly, a certain degree of CR Innovation is achieved by implementing strategies that alleviate specific societal problems and simultaneously create long-term benefits for the company (Halme and Laurila, 2009). This win-win behavior may even be seen through the lenses of corporate shared value (CSV) thinking, namely "policies and operating practices that enhance the competitiveness of a company while simultaneously advancing the economic and social conditions in the communities in which they operate" (Porter and Kramer, 2011, p.6). Faber-Castell's forestry projects in Brazil and Colombia can be seen as interesting examples of this CSV strategy. In its site in Prata, Brazil, for instance, 10.000 hectares of wasteland were planted with millions of pine-tree seedlings, ensuring a secure and planet-friendly supply for the firm, while simultaneously having a positive impact on the environment. And thanks to biodiversity programs together with local NGOs, the managed forests provide a new habitat for species of flora and fauna just as a by-product (Braun, 2014). It results from this that today, almost 100% of the wood used for production in Brazil come from Faber-Castell's own forests- a great international aim for the near future (idem.). Besides, the company's reforestation project in Colombia is another example of this CSV behavior by saving destroyed nature in an overgrazed region plagued by floods, poverty and droughts, providing job opportunities for local

farmers and simultaneously safeguarding the company's future raw material supply: "We have made contracts (15-20 years extensible contracts) with about 51 local farmers that cultivate and reforest land for us. In return, they receive a monthly salary, 30% of the wood revenues and of the proceeds from the sale of carbon emission credits, a bonus from the UN for projects that restrict global greenhouse effects. So with us, the farmers have a constant timber buyer which allows them a higher standard of living as well"(idem.). Yet, all these RBP are *being conducted with a healthy degree of self-interest: "We want and need to make profits- but sustainable ones. The forestry projects demonstrate that all parts are benefiting from it- the company, the environment and local communities- and that is what we understand as sustainable thinking and acting"* (idem.). This sustainable international business strategy is created through RBP adoption and adaptation and accompanied by long-term organizational (e.g. improved reputation, competitive advantage, resource assurance), employee (e.g. increased motivation and less unethical treatment), societal and environmental benefits (e.g. reducing the firm's environmental footprint and achieving socio-economic community development) (Ganescu, 2012) that constantly need to be consolidated through employee and management trainings throughout the firm's operations and communicated to internal and external stakeholders (Braun, 2014).

CONCLUSION, RESEARCH LIMITATIONS AND INPUTS FOR FUTURE RESEARCH

In conclusion, it can be argued that the Faber-Castell Group is quite an interesting case to study when investigating RBP implementation during the firm's internationalization process to BOPs. The case study demonstrates that the definition and implementation of RBP and sustainable management practices can only be carried out by relying on strong cross-sector collaboration networks and dialogue with international/local organizations, NGOs and local management teams that pursue a profound knowledge of what is needed and understood as responsible, decent and ethical behavior in each context. Faber-Castell adopts diverse RBP forms in BOPs, combining global RBP integration and local RBP responsiveness and successful RBP adoption is the result of this behavior. The main limitation of this research is its narrow scope in terms of having analyzed one specific case only. Future research in the field of cross-cultural RBP adoption and sustainable management could therefore include a wider scope of firms. However, it contributes to the existing literature on RBP in BOPs by integrating RBP, FDI issues and international business ethics, demonstrating how corporate sustainability can be operationalized, and has practical implications as it may serve as an example for managers developing RBP in BOPs.

ACKNOWLEDGEMENTS

The authors would like to thank Mr. Braun and his team for the support and the information sources provided for the creation of the case study.

ABSTRACT

The global economy and its structure have been changing constantly throughout the last decade due to new developing economies growing in size and joining together. As a result, attitudes toward international cooperation and management are changing as well. This article aims to define the extent of interrelatedness between the economies of the BRICS countries, as well as to understand how synchronized their business cycles are and whether or not the BRICS affiliation is having additional effects from its cooperation.

For this paper, we studied BRICS countries' GDP in constant prices for the period from 1980 to 2013, including the periods of world economic crises, in order to confirm or refute the "decoupling hypothesis" being in effect in the developing countries in the BRICS economic union. The data was examined as a time series and researched using the Hodrik – Prescott filtering technique and spectral analysis. Using the Hodrik – Prescott filtering technique, we have shown that the output gaps of the BRICS countries are not all of the same variety, and there are various different natures of production gaps in effect. Spectral analysis has shown that any synchronization among the economic cycles is insignificant. Taken together, our empirical analysis explicitly indicates that it is too early to begin speaking of corroborating the effects of the "decoupling hypothesis" at this point.

Keywords: *Globalization, BRICS, Hodrik – Prescott filtering, Economics cycle, Decoupling hypothesis*

INTRODUCTION

Global trade and integration is one of the main forces driving the growth of the global economy and raising its efficiency. One of the basic indicators of the effective performance of economic unions and international trade stimulation is the presence of synchronization among the economic cycles of the countries involved in such unions (Erdorf and Heinrichs, 2011; Frankel and Rose, 1998; Imbs, 2004; Papageorgiou *et al.*, 2010).

The BRICS countries, which are related to developing markets, were chosen as the subject of our research. The economies of developing countries have grown substantially over the past decade, and they have begun to play a more significant role in the global economy (Kose *et al.*, 2008). As a result, the “decoupling hypothesis” is starting to be discussed more and more often. (Kose *et al.*, 2008; Felices and Wieladek, 2012; Kawai and Petri, 2014; Yeyati and Williams, 2012)

It must be noted that the 2009 crisis brought several changes in the way this issue is discussed. Before the crisis, most of the literature spoke about supporting the decoupling hypothesis (Gilenko and Fedorova, 2014; Dooley and Hutchison, 2009). Since the crisis, a great deal of research has appeared which observes a decrease or total disappearance of signs of this effect in the meantime (Dimitriou *et al.*, 2013; Wälti, 2012).

For scientists, the most pressing topic is still globalization, and it is here that professional opinions differ, as they always have. Some work notes the presence of “spillover effects” resulting from developing countries joining these kinds of unions (Das, 2010; Dooley and Hutchison, 2009), while other researchers are expressing apprehension as to the supposed positive effects of such unions (Tsheola, 2002).

In this study, we aim to research the output gaps of BRICS countries above and below their projections, and to use spectral analysis to determine the extent to which economic cycles are synchronized. A similar approach has earlier been used in regard to European Union countries in Papageorgiou *et al.*, 2010; Frankel and Rose, 98; etc.

In the second part of this article, we used a Hodrik – Prescott filtering technique to study output gaps. This technique allowed us to discover positive and negative gaps of output in the BRICS countries. We went on to use spectral analysis to study the extent of synchronization of economic cycles. This spectral analysis was carried out based on time series of the BRICS countries’ GDP in constant price.

The third section provides and discusses the statistical results of the research. The fourth section analyzes the results and the contradictions which arose, and makes an attempt to explain them.

METHODS

Decoupling hypothesis

Before the 2009 crisis, it was possible to observe various symptoms of developing countries' economic cycles becoming disconnected from those of developed countries (decoupling hypothesis). However, today, the situation has changed (Chkili and Nguyen, 2014). Countries with developed economies have gradually become stronger since the 2009 crisis. The USA and the European Union countries are gradually ending their policy of collective mitigation to stimulate their own productive forces, resulting in economic growth. While this is going on, developing countries are running into the problem of stagnant economic growth and the necessity of adapting to being in the "decrease" phase of the economic cycle. As a result, we are witnessing an outflow of capital and devaluation of national currency in developing markets, the markets which BRICS countries are connected with. In these conditions, it is doubtful that we will find evidence in support of the decoupling hypothesis.

Therefore, in order to eliminate the influence of financial markets, inflation, and currency exchange rates on the economic cycle, we chose to use GDP in constant price as the subject of empirical analysis in our research. Macroeconomic variables (like inflation) are also in part based on the economic cycle. This is the most traditional approach, and we intentionally did not scrutinize a large set of interrelated macroeconomic variables.

Hodrick – Prescott filtering

Hodrick – Prescott filtering is one of the most popular ways to expand a time series of economic data into a trend and a cycle. This expansion is crucial for us to express the output gap, the difference between the actual and predicted GDP. The existence of an output gap indicates that the economy is functioning at an inefficient level, using its resources either too much or not enough.

By "trend" we mean a certain steady, systematic change over the course of a long period. However, no matter how large the series, one can never be certain that the trend is not just part of a slow oscillation. Having set a trend apart from seasonal oscillating changes, series depict a more or less regular fluctuation. Seasonal effects are easiest to discover, set apart, and study. Here, changes are occurring which are applied to the system by some cyclical mechanism external in its relationship to the basic mechanisms which define the system's behavior.

When determining the trend, we understand that any movement observed over the course of a long enough time will appear to be smoothed-out. This means that, at least locally, the component corresponding to the trend can be expressed by a polynomial of time t .

So, in our case, GDP is expanded into a trend and deviation from that trend (Hodrick and Prescott, 1997; Tsyplov, 2011):

$$y_t = y_t^g + y_t^c, \quad (1)$$

where y_t^g is a trend or structural component of the time series and

y_t^c is the cyclical component of the time series.

To get a smoothed-out series, we apply conditions which minimize the cyclical component's deviation:

$$\sum_{t=0}^{\infty} (y_t^c)^2 + \lambda \sum_{t=0}^{\infty} [(y_{t+1}^g - y_t^g) - (y_t^g - y_{t-1}^g)]^2 \rightarrow \min \quad (2)$$

where λ is a Lagrange multiplier. For annual data, $\lambda = 100$.

Then, after isolating the trend, we inspected the rest of the series using spectral methods of analysis.

Spectral analysis

Next, after isolating the trend, we inspect the rest of the series using spectral methods of analysis (Kendall and Stuart, 1966).

We assume that, for any pair of values, there exists an autocorrelation:

$$\rho_j = \frac{\text{cov}(u_t, u_{t-j})}{\sigma^2}, \quad (3)$$

where ρ_j is the correlation between members of the time series after filtering by j ,

$\text{cov}(u_t, u_{t-j})$ is the covariance between members of the time series after filtering by j , σ^2 is the dispersion of the rest of the time series.

The total sum of coefficients $\rho_0, \rho_1, \rho_2, \dots$ is called the correlogram of the series. By determining the correlation of the rest of the series in stages, without components of the basic trend, we can construct the correlogram, which lets us graphically trace the interdependence between members of the time series.

Then, when studying the different kinds of periodic processes (meaning processes which repeat over a defined period of time, including economic processes), the best way is to expand periodic functions that describe these processes in a trigonometric series. The simplest periodic functions are the trigonometric functions $\sin x$ and $\cos x$. The period T of these functions is 2π .

The simplest periodic process is a simple harmonic oscillation described by the function:

$$y = A * \sin (at + \varphi_0) \quad (4)$$

$$t \geq 0 \quad (5)$$

where A is the amplitude of the oscillation,

ω is the frequency,

φ_0 is the phase offset.

This kind of function (and its graph) is called a simple harmonic. The fundamental period of the function is $T = \frac{2\pi}{\omega}$, which means that one full oscillation occurs in the span of time $\frac{2\pi}{\omega}$. The denominator ω shows how many oscillations will occur within the time unit 2π .

Complex harmonic oscillation, which occurs as a result of applying a finite (or infinite) number of simple harmonics, is also described by the functions $\sin x$ and $\cos x$. This way, a constant periodic function can be expressed with this system of formulas (6), (7), (8):

$$A = \frac{2}{\pi} \sum_{t=1}^n u_t \cos \frac{2\pi t}{\lambda}, \lambda = \frac{2\pi}{\alpha} \quad (6)$$

$$B = \frac{2}{\pi} \sum_{t=1}^n u_t \sin \frac{2\pi t}{\lambda} \quad (7)$$

$$S^2 = A^2 + B^2 = \frac{4}{n} \sigma^2 \varpi(\lambda) \quad (8)$$

where u_t is a member of the time series after removing the trend;

λ is the wavelength;

S^2 is the intensity of the oscillations.

The graph of S^2 is dependence on the wavelength λ is called a periodogram.

RESULT

Hodrick – Prescott filtering

Using Hodrick – Prescott filtering, we isolated the cyclical component from the trend for all of the BRICS countries. Our goal in doing this was, first of all, to find the existence of an output gap, and second of all, to track the dynamic of output gaps to determine the effectiveness of the economy's function. The results of the smoothed time series of the BRICS countries' GDP are presented in figure 1.

From the figure, it is clear that output gaps in the BRICS countries have fundamentally different characteristics. For Brazil and South Africa, constant stochastic oscillations around the projected value of the GDP are normal. In other words, the output gap is sometimes positive and sometimes negative. This means that the economies of these particular two BRICS countries sometimes function with excessive, sometimes with deficient use of resources.

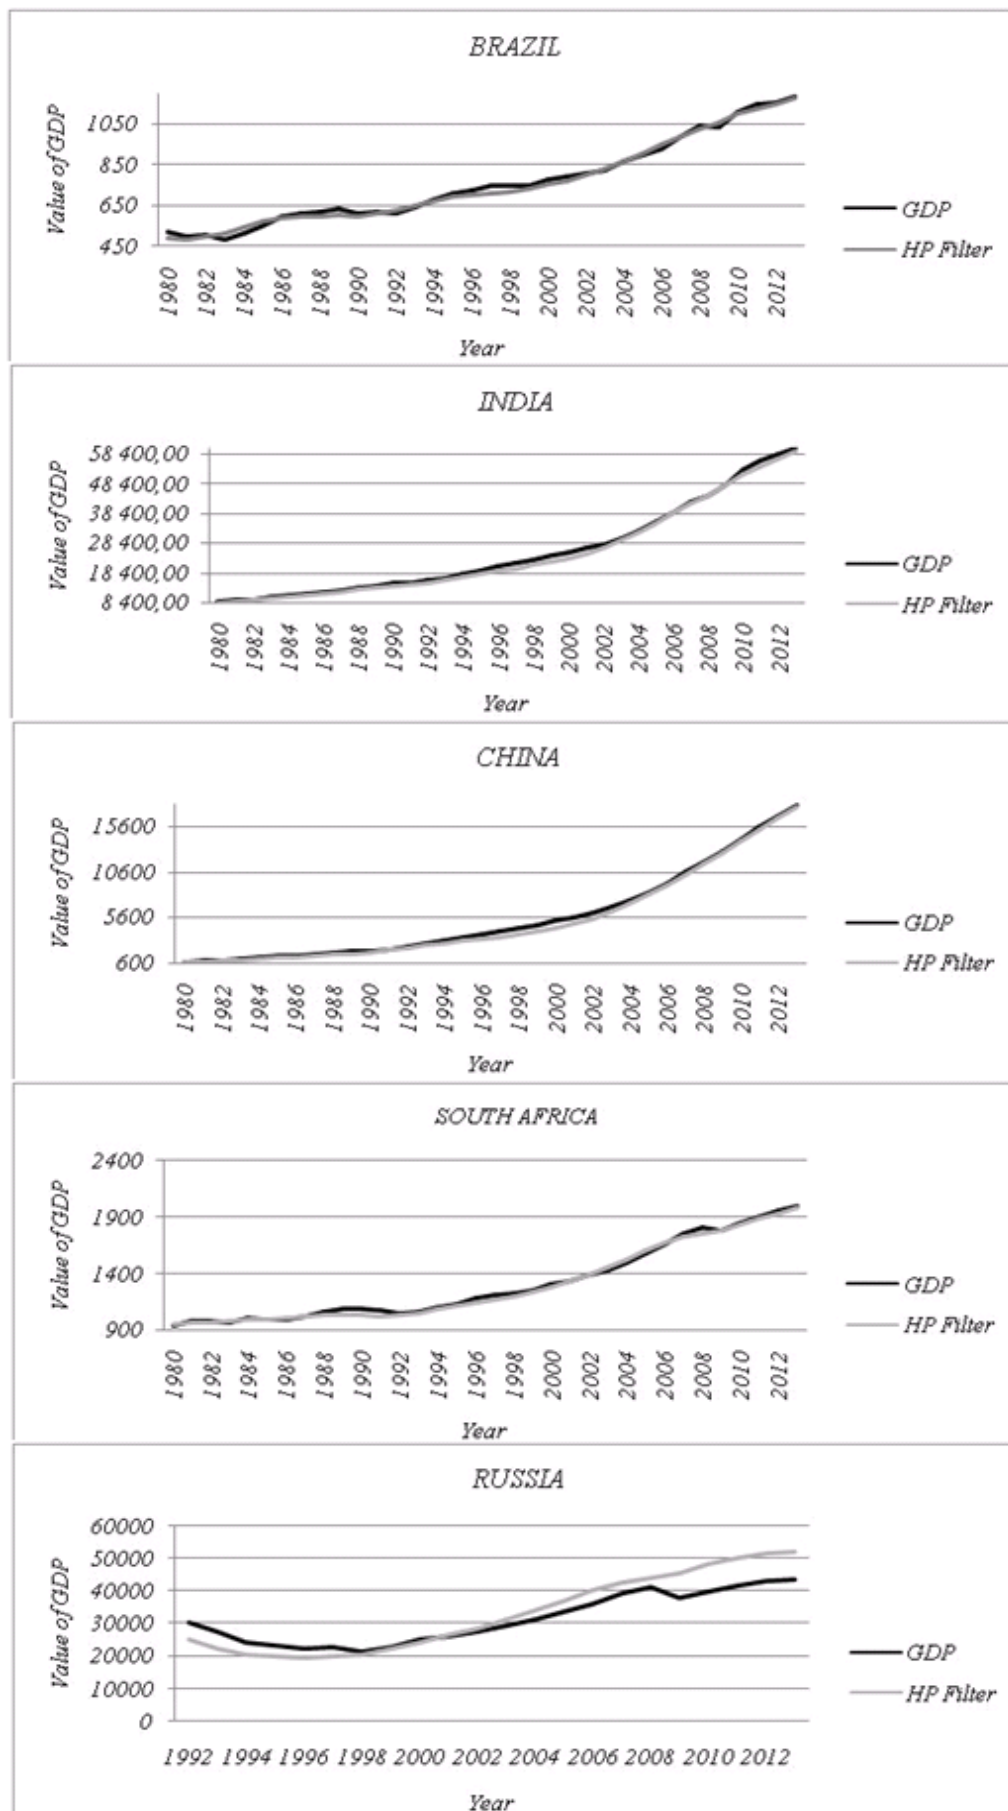

Figure 1. HODRICK – PRESCOTT FILTERING OF THE TIME SERIES OF BRICS COUNTRIES' GDP

India and China are characterized by a period of economic growth with a consistently positive output gap in the period from 1992 to 2005. This means that the economies of these two countries have used their resources too intensively and they are now encountering stagnant economic growth, for this reason among others. A similar phenomenon could be seen in Japan's economy during the 1970s and 1980s, when a period of very fast economic growth was replaced by the so-called "lost decade", a period of marked moderation and stop to economic growth. Excessively intense economic growth can not last forever. Our empirical results now tell us that the economies of India and China are now being threatened by another "lost decade". However, it must be remembered that these are developing countries, not developed countries. Stable markets have not been established in them, and a "lost decade" may have drastic effects on their economies.

In Russia, the situation is more troubled. Russia's output gap from 2001 on has been steadily negative, meaning that its economy is not working efficiently, not using its resources to a sufficient degree, and the global financial crisis of 2009 has only heightened this weakness. This shows that Russia has not finished dealing with the fallout from the 2009 crisis, and it won't be easy to move on. Proof of this is the complete lack of any tendency toward reducing the negative output gap.

Therefore, we see that the output gap dynamics of BRICS countries are various, and certain coincidences can be seen only between India and China, or Brazil and South Africa. This means that we can not corroborate the decoupling hypothesis or speak about additional economic effects of bringing countries together into the BRICS union.

Spectral analysis

Next, after eliminating the trend, we did additional research into the rest of the time series. Correlograms of the rest of the time series of BRICS countries' GDP are depicted in figure 2.

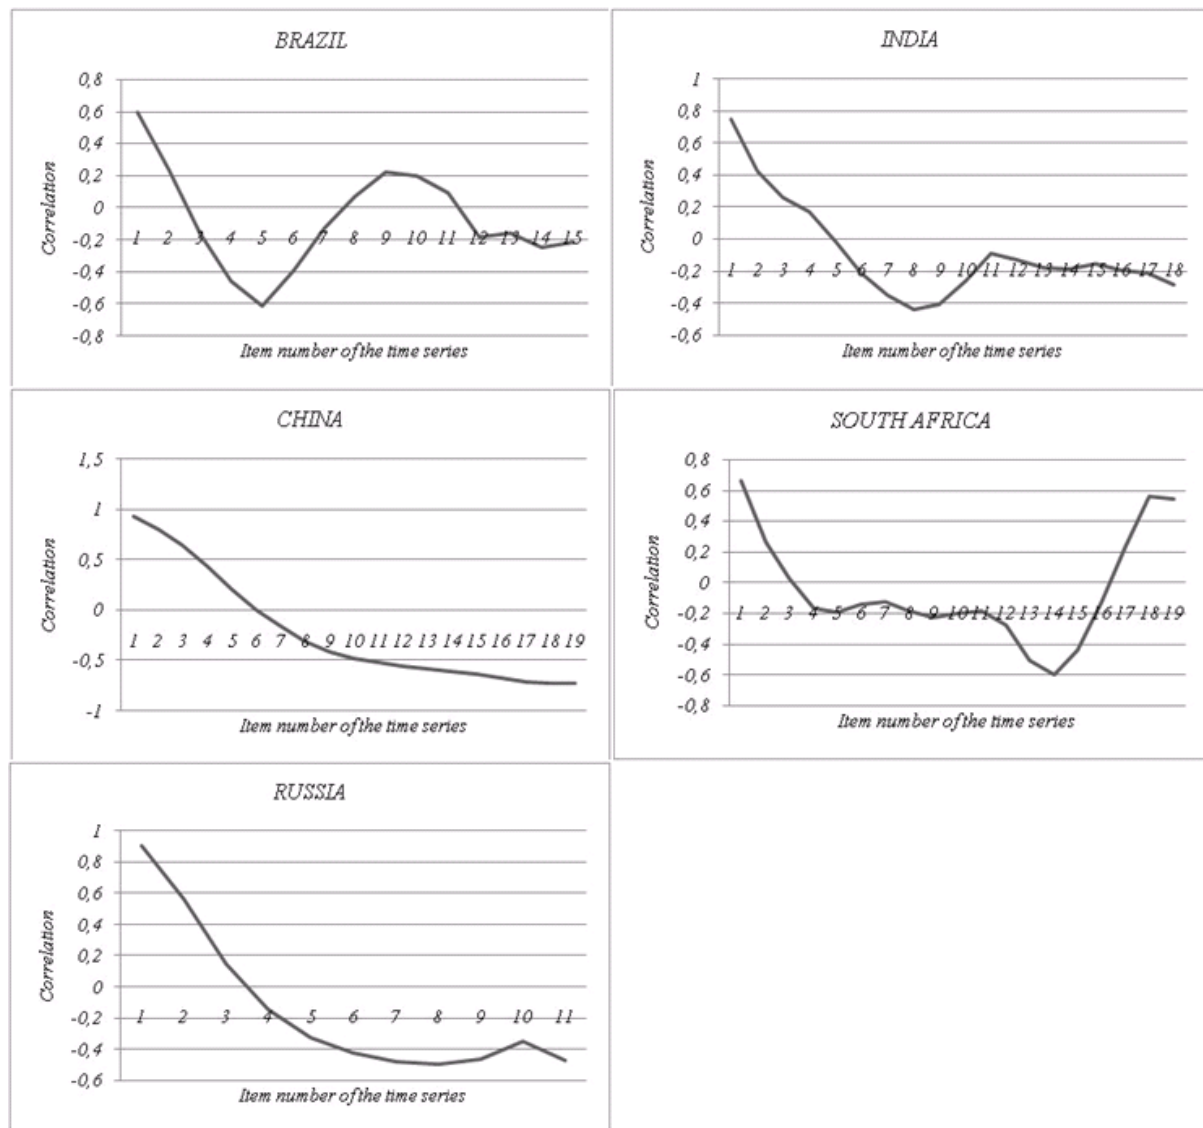

Figure 2. CORRELOGRAMS OF THE REMAINING TIME SERIES OF BRICS COUNTRIES' GDP

The greatest dependence among the members of these series appear to be: for Brazil, members 5, 9, 10; for South Africa, members 13 and 14; for India, 8 and 9; for Russia and China, the chart appears flat. So, the graphs have different shapes and different natures, and there is not much correlation between them. As a result, the most intense oscillation in these remaining GDP time series will most likely be in those years with members of the time series with the most correlation. To confirm this, we have shown periodograms of these time series of BRICS countries' GDP in figure 3.

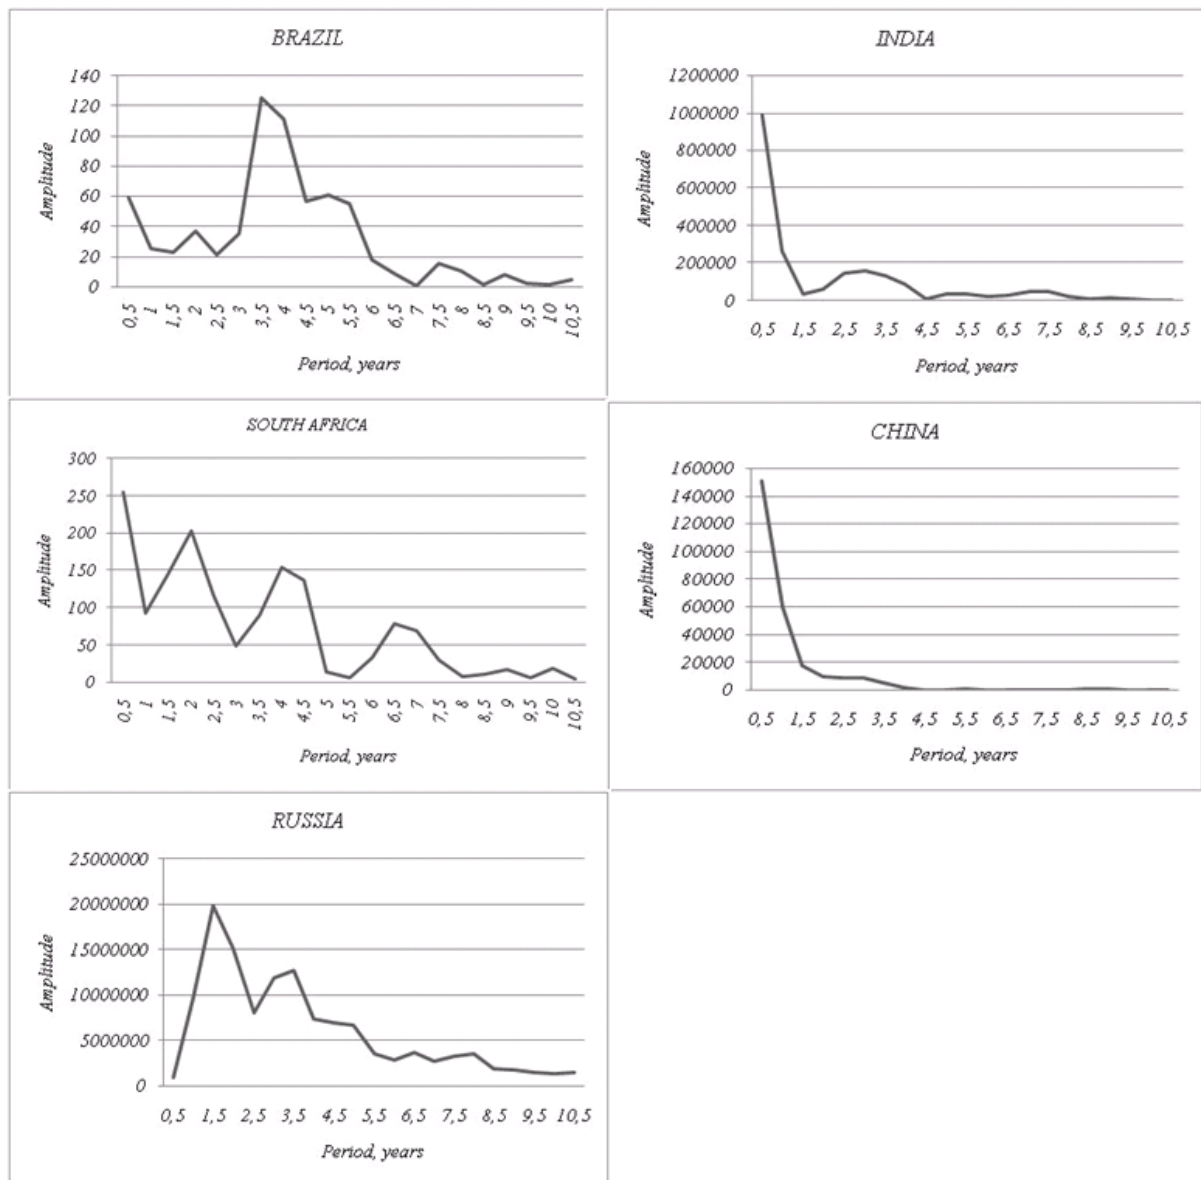

Figure 3. PERIODOGRAMS OF THE TREND-LESS TIME SERIES OF BRICS COUNTRIES' GDP

From the periodograms, we can see that, in South Africa, oscillation around the base trend occurs at 2-year intervals. In Brazil: 3 years. In Russia: 1.5 to 2 years. This correlates to oscillations in economic activity, which are connected with capital markets. India and China again confirm the conclusions which we made in the previous section.

On the whole, the results show that synchronization in the BRICS countries' economic cycles is minimal, and we can not find evidence of the decoupling hypothesis.

DISCUSSION

Our research has show that the BRICS countries have different output gap dynamics, which prevents us from confirming any significant level of synchronization in the economic cycles of the BRICS countries and, as a result, prevents us from supporting the decoupling hypothesis.

Despite this, our research goes well with the existing paradigm of research on this topic. Before the financial crisis of 2009, there was an environment of fast growth of developing countries' economies, especially Asian ones (Kose *et al.*, 2008; Felices and Wieladek, 2012; Kawai and Petri, 2014). Most researchers found evidence of the decoupling hypothesis and spillover effects in their research (Das, 2010; Dooley and Hutchison, 2009 Gilenko and Fedorova, 2014). However, the global crisis of 2009 changed the trend (Yeyati and Williams, 2012) and research has begun to show more and more evidence of reduction in the decoupling hypothesis and spillover effects since the 2009 crisis.

Our research also indirectly supports the results of those other researchers who have noted a substantial decrease in the decoupling effect after the 2009 crisis (Dimitriou et al, 2013; Wälti, 2012).

In addition, the research shows that, in order to improve the efficiency of the economic union, the BRICS countries must first solve their internal structural problems.

CONCLUSION

We have done research on the level of synchronization in the economic cycles of the BRICS countries. In doing so, we used two methods: Hodrick – Prescott filtering and spectral analysis. By using Hodrick – Prescott filtering, we discovered the varied nature of the output gap dynamics of BRICS countries, which allowed us to conclude that the economic cycles are not sufficiently synchronized and that the decoupling hypothesis can not be supported at this time. Spectral analysis yielded similar results.

In the future, we plan to examine the BRICS countries' cooperation using other macroeconomic variables.

INTANGIBLE ASSETS AND FINANCIAL PERFORMANCE OF RUSSIAN COMPANIES LISTED IN MOSCOW STOCK EXCHANGE

Mezentceva, Ann V.; Mezentceva, Olga V.

Institute of Material Studies and Metallurgy, The Ural federal university named after the first president of the Russia B.N. Eltsin, URFU, Ekaterinburg, Russia

ABSTRACT

One of the central problems of the global economy is the issue of attracting investment into different sectors of a national economy. The presence of intellectual capital among an enterprise's assets is a substantial factor in attracting investment. This article researches how the size of an enterprise's total stock revenue depends on intellectual capital's share in the structure of the company's assets. The model was based on data collected from the accounts of 41 public Russian companies, all of them part of the Moscow exchange. In this study, we operated on the assumption that the presence of intellectual capital would have a positive effect on the financial results of Russian companies; however, in the early stages of our research, we could not find a linear relationship between intellectual capital and financial results. Only deeper and more detailed analysis, based on non-linear regression models, led us to evidence supporting the positive correlation.

Keywords: *investment, foreign direct investment, intellectual capital, intangible assets, total comprehensive income.*

INTRODUCTION

An enterprise is an open system and, to better understand the factors of growth and development, any changes must be monitored by managing entities. Financial statement analysis can say a lot about an enterprise's activities (Kaplan, and Norton, 1992). An enterprise's financial analysis, lending an understanding of general economic tendencies, permits evaluation of such macroeconomic problems as: low level of international investment, capital withdrawal from their country, minimal levels of innovation, lack of competition, and stagnation of small businesses. In other words, it helps to evaluate everything intrinsic to the Russian business model of today.

In the global economy, one of business's key drivers for success is innovation, along with intellectual capital. (Harlow 2013, Tan *et al.*, 2007, Amin *et al.*, 2014). Measuring innovation processes (Boly *et al.*, 2014) and value creation through intellectual capital (Shakina and Barajas, 2014) are beginning to be

discussed more and more in research literature, as well as evaluating the effects of intellectual capital on a company's activity. (Kim, S.H. and Taylor, D., 2014)

Intellectual capital's effect on financial performance of companies is still an open question for developing countries. This is why most researchers are trying to find and evaluate the relationship between these factors (Tan *et al.*, 2007, Amin *et al.*, 2014).

In Russia, an enterprise's bookkeeping is characterized by the near impossibility of exposing the amount of intangible assets, intellectual capital, and innovation, even in the most open and public companies. They are reflected in the consolidated accounts under "non-current asset", "goodwill", and "participation in joint-stock capital". This is why, in our calculations, we used the value "non-current asset", which in some instances included the value "goodwill". In this work, we also tried to find a relationship between the value of intangible assets and the value of total revenue in 41 enterprises. The enterprises were selected from all companies listed in the Moscow exchange.

This article presents the results of an attempt to find an exponential relationship between values. Our analysis has shown that there is no logarithmic relationship between the analyzed data; a further analysis was carried out and a sinusoidal relationship was exhibited.

METHODS

Data and accounting of intellectual capital in Russia

In our research for analyzing the effects of intellectual capital on financial performance, we used annual consolidated financial account data of Russian companies from 2010 to 2012. We examined the information of 41 open public companies listed in the Moscow exchange, and its constituents the MICEX Index and RTS Index, which regularly publish their financial accounts by International Financial Reporting Standards or US GAAP.

International Financial Reporting Standards (IAS 38) allows advertising expenses, training, research and development expenses to be considered intangible assets. The goal of research and development is to acquire new knowledge. To be considered an asset (including intangible assets), the International Financial Reporting Standards require the following criteria: identifiability and oversight. An intangible asset must also be nonmonetary, without physical form, and capable of yielding economical benefits in the future.

International Financial Reporting Standards allow the following to be included among intangible assets: lists of clients, market knowledge, technical knowledge, uncompleted R&D, and other similar assets. This substantially expands our understanding of intangible assets. According to Rule GN8.12 of European Valuation Standards, regardless of whether they are reflected in the balance or not, intangible assets can be divided into two categories:

- goodwill (unidentifiable intangible assets),
- identifiable intangible assets.

It is recommended that “goodwill” be evaluated as a whole number, by means of converting surplus income into capital. Surplus income is defined as “rent goodwill” or economic gains. This means that “goodwill” is equated with capitalized economic gains.

In this way, the total comprehensive income should theoretically be connected with the worth of an enterprise’s intangible assets in a directly proportional manner.

In the accounts of several companies examined, the “goodwill” index is expressed within the index “intangible assets”, and as a result, in our calculus we used the sum of intangible assets and goodwill if they were expressed separately in the accounts. This was done so that the data for analysis would take an analogous appearance. In this way, we used the coefficient γ , which shows what portion of the enterprise’s overall assets is taken up by intangible assets and goodwill. It is important that the enterprises can be compared using this coefficient.

The index — allows us to evaluate the profitability of an enterprise’s actions and can also be compared with indexes of other companies.

Description of sample

In our research, we examined the financial accounts of Russian companies over the period from 2010 to 2012. Russian companies have only recently begun the practice of indicating intangible assets in their accounts. We found ample evidence that absolutely no intangible assets were accounted for in Russian companies’ bookkeeping from 2010 to 2011. For this reason, we were forced to examine only data from 2012 in our model. Obviously, this limited the results of our research somewhat.

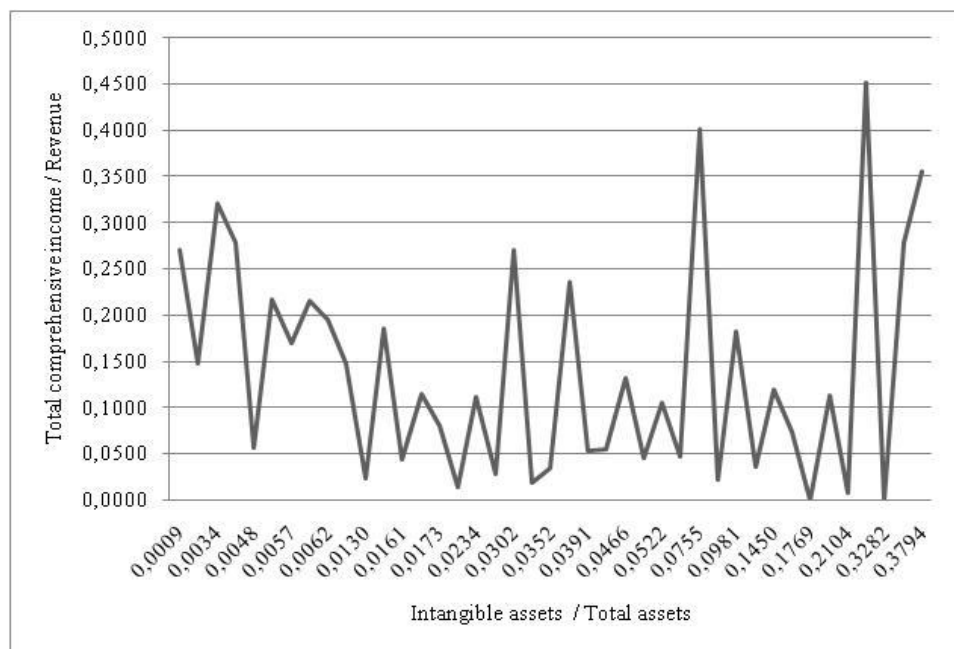

The second limiting factor was that we have been examining companies which are included on the Moscow Stock Exchange, but which belong to different fields. It must be noted that all publicly-traded companies on the Moscow Stock Exchange are “flagships” of the Russian economy, meaning that they are the leaders of their fields in terms of assets, capitalization, and profit. We did not examine small and middle-sized businesses due to these enterprises’ data being inaccessible. The general distribution of our data grouped by economic sector is presented in table 1.

Field	Number of enterprises in sample
Mechanical Engineering	2
Energy Development	5
Transport	2
Metallurgy	10
Construction and Construction Materials	3
Consumer Sector	3
Telecommunication	3
Chemicals and Petrochemicals	2
Oil, Gas, and Coal	7
Financial Sector	4

Table 1. *DISTRIBUTION OF DATA BY ECONOMIC SECTOR**Regression analysis*

In this way, we acquired sets of comparable data from 41 companies. We ran a regression analysis to discover the link.

The independent variable (X) was the portion of intangible assets in total assets, and the dependent variable (Y) was the portion of total comprehensive income for the year in revenue. A graphic depiction of the relationship is presented in figure 1. The relationship between the X and Y variables is portrayed as points on the coordinate plane (X,Y) and form an empirical linear regression Y of X.

Figure 1. *REGRESSION MODEL SHOWING THE DEPENDENT RELATIONSHIP BETWEEN X AND Y*

Basic assumptions:

1. Let the following formula be true

$$Y_t = a + bX_t + \varepsilon_t, \quad (1)$$

where $t = \overline{1.41}$ is the number of factors in the sample being examined

X_t is the deterministic variable

Y_t is the dependent variable

a is a constant

b is the slope of the line

ε_t is the deviation

2. $E\varepsilon_t = 0$, the value of error ε_t is mathematically expected to equal 0;

3. Error ε_t has a normal distribution when $t = \overline{1.41}$

We can calculate the values of regression of a and b using the method of least squared, as in formulas 2 and 3.

$$b = \frac{n \sum X_t Y_t - \sum X_t \sum Y_t}{n \sum X_t^2 - (\sum X_t)^2}, \quad (2)$$

$$a = \frac{1}{n} \sum Y_t - \frac{1}{n} \sum X_t b \quad (3)$$

We tested our hypothesis $H_0: b - b_0 = 0$ using the standard criteria of linear regression: Student's t-test and F-test.

As is obvious from figure 1, a linear approximation is unlikely to give good results. We decided instead to test other kinds of dependency, specifically logarithmic and sinusoidal. We incorporated these types of relationship into a linear one, using formulas 4, 5, and 6.

$$Y = AX^b \quad (4)$$

By making a logarithm of both sides of the equation, we can bring this relationship into a linear form:

$$\ln Y = \ln A + b \ln X \quad (5)$$

$$Y = \sin \varphi_0 + \beta \sin X \quad (6)$$

RESULTS

An analysis of the correlation helps to discover the trend and level of interrelatedness between two variables. The results of regression analysis by linear, logarithmic, and sine models are depicted in table 2.

Type of relationship	Linear	Logarithmic	Sine
Coefficient of multiple correlation R	0,025249	0,155812	0,341662
R-squared	0,000255	0,024277	0,116733
A	0,123823	0,123989	-4,49882
B	0,183656	0,183321	-0,49426
F-statistic	1,0102	0,970374	5,154271

Table 2. STATISTICS OF REGRESSION

From table 2, it is clear that the best approximation of the data occurs when using a sine-based model of dependency. However, we also see that the R-squared and F-statistic are very small. This implies

that we probably can not describe any kind of relationship between the data.

Since we received results which correspond poorly with the existing research (Lev et. al., 2009; Cohen and Vlismas, 2013), we tried to partially remove the limitations caused by examining enterprises from different fields by building a linear regression model specifically for the metallurgy sector of the Moscow Stock Exchange. We chose metallurgy because it is connected to the largest number of enterprises on the Moscow Stock Exchange. The results of this model are presented in Table 3.

Parameter	Value
Coefficient of multiple correlation R	0,62283
R-squared	0,38792
A	0,14325
B	-0,52411
F-statistic	5,07024
Instances observed	10

Table 3. *RESULTS OF LINEAR REGRESSION ON THE METALLURGY SECTOR*

Although the R-squared value in this model seems much more ideal, the relationship between intangible assets and financial performance turned out to be opposite.

From an economical point of view, these results help to understand that innovation in Russian enterprises carries an administrative character, rather than a market-based character. At this time, an enterprise's innovative activity and its intangible assets, including intellectual capital, do not have an effect on its generated income or its ability to attract investment in stocks. These results are not standard, and they are related to the unique features of Russia, as most research on the topic does succeed in finding a connection between intellectual capital and public corporations' revenue. Another factor which has a substantial effect on these results is the lack of a developed institution to protect intellectual property in Russia. In practice, most companies do not need to commercialize the results of their innovative activities. This leads to intangible assets being absent from the consolidated accounts, and this information is instead incorporated into "investment in associates and joint ventures".

DISCUSSION

The results of the research demonstrated no connection between Russian enterprises' intellectual capital and their financial performance and ability to attract investment. This result is unexpected, given the background of the Russian government's attempts to stimulate innovation and raise direct investment into Russia's economy. In addition, most researchers recognize a positive connection between intellectual capital and the success of enterprise activity in other countries in the global economy (Amin *et al.*, 2014, Manolopoulou and Tzelepis, 2014). It is important to note that up to 70%

of successful innovation in the world is achieved through the lens of the Demand-pull hypothesis (Nemet, 2009). Russia is a developing country with a significant share of raw material exports. It is possible that modern Russian enterprises have neither the experience nor the culture of innovation and asset generation in their knowledge base. This is why the market of direct investment in Russia is represented largely by companies in the raw materials sector of the economy, which has a low level of innovation and intellectual capital.

CONCLUSION

We researched the relationship between intellectual capital and financial performance to better understand how public Russian companies attract investment. Based on data about the portion of total assets taken up by intangible assets and about the value of total comprehensive revenue for the year for, we created different models of dependency, specifically: linear, logarithmic, and sine-based. We came to the unexpected result that there is no connection between intellectual capital and finance performance in Russian enterprises. In the future, we are planning deeper research into the reasons for this connection's absence.

A NEW WAY OF BUSINESS THROUGH THE EUROMEDITERRANEAN MODEL

Micheletti, Patrick

KEDGE Business School

ABSTRACT

The transformation of the model of management is mixed because it is based on economics concepts where the viability and the success of a good operation remain the concern first but also the continuity of the richness represented by human resources. It's the reason for which we can affirm it can have a bringing together with the managerial practices of Arab countries and those of Europe like France. According to the preceding approaches on spaces of thinking, the Euro-Mediterranean model can be conceived like a space of directions:

For geographical reasons, even if the limit is fuzzy: thus, East and West of the Mediterranean sea can be considered like good examples for this demonstration due to different but similar things like the way of life, the landscape.

For historical reasons: philosophical, scientific bases and policies of the occident, primacy of economic flows until the end of the 19th century.

For sociological reasons: (strictly speaking) the Mediterranean way of life and thought (role of the community, research of the humanistic proximity, impacts of futility, logic of resistance) and with the historical Mediterranean pressures (frequency of the crises, interbreeding) but also (substantial rationality, diversity, accumulation and growth) and with the European historical pressure (constitution of an unique economic area).

For economic reasons: the permanent juxtaposition of levels of different richness and growth. This constitutes a first framework of the Mediterranean new model because we also notice that we not have opposition between North and the South, West and East; they offer a real possibility of bringing together and a mutual empowerment, and not antagonism.

They offer no catch to dichotomy North/Modernity/Industry and South/Tradition/Land,

That they can only to enrich our vision and our approach economic by market.

That they make it possible to defuse the trap of the "Mediterranean values" whose contents (often fixed) cause dispute, schematics to the profit of the description of process authorizing the differences. To reason in term of process as enables us to approach management more easily as the contents of the values of th Euro-Mediterranean positioning and management.

TRACKS FOR A METHODOLOGICAL FRAMEWORK

The project: what characterizes the transformation of the economic and business model; it is the extraordinary variety of situations which make its apprehension complex and consequently any difficult intervention because of the singularity of each element being treated in particular with different and unbalanced methods of approach. One could, to even say that it is also what makes its interest because each challenge to take up will be proportionally more difficult compared to traditional situation. Initially, one can thus affirm that the operators intervening in the transformation of business to be not only voluntary and courageous but that they require should moreover surmount obstacles additional and specific to each type of situation. The complexity of the business which one finds in particular at the time of the transformation of the structure grows because of the multiplication of the variables and uncertainties to be taken into account in all the situations of business. From this complexity, we can be directed while betting on a complexity distributed on human complexity on all the levels. The organization of a cell project with a head of project identified and legitimate with a clear communication resting on in-house partners and into external (Businessmen, trade unions, consultants). The interactive connection between the signal business and the base cannot set up to leave from a head project or a cell project clearly identified. We do not mobilize the staff on strategic stakes starting from the emotional reaction on the importance which represents the weight of a decision and the consequences which result from this by making brief surveys or by forcing a dominant ideology to make adhere the staff and to mobilize it on the importance questions or of survival. The role of a head of project representing the connection between the customers and the signal business constitutes the first steps of a system which implemented in the duration and which aim at ensuring stability of the method and to consolidate each individual in his role of person in charge that can emit opinions or make constructive proposals. The principal goal is to crystallize around the head of the whole project of information which can play a determining role in very decision-making by taking a real decision, while classifying and while choosing what will be the strategic major importance and what concerns the second order. It is significant to specify that the head of project endorses a considerable responsibility because of his role and the decisions which are or will be taken thereafter.

The strategy: the transformation of the business model is mixed because it is based on economics concepts where the viability and the success of a good operation remain the concern first but also the continuity of the richness represented by human resources. It's the reason for which we can affirm it can have a bringing together with the business practices of Arab countries and those of Europe. Each decision in the process of transformation implying the staff is the result of interactive connections intern and external through which the business policy is organized for the attack of objectives aiming

at satisfying in priority the interests of the shareholders. From this point of view, the evolution of the managerial practices centered on the policies of human stock management encounter real difficulties between the divergent interests of the shareholders in search of profitability in the short and medium term and the requirements of the professional life in the long run in particular on the fact of preserving the employment as long as possible. The results reached are thus the representation of these two types of connections which one can qualify "A feel single" insofar as the authority in the business will be exerted fully or "A double feel" insofar as this authority is lit and helped by the base. In fact, the two types of connections belong to a more complex unit including the environment by the signals of the market into external (emission) and the behavior of the in-house actors characterized by the attitudes and the reactions compared to the signals (reception). Located at the borders of the strategy of the firm, antagonisms of connections reveal various positions that is necessary to try as well as possible to combine interests of each part because of the essential principle of survival of the firm duplicated of the will of the managers to preserve the employment by developing the activity characterized mainly by the turnover. The interactive connections between the strategy of the firm and the policy of human stock management thus depend fully on the moment (time) and the place (space geographical: room, regional, national or foreign) in which they will be exerted. Thus, it is of primary importance to hold account in order not to be in permanent shift between the possibilities offered on activities, markets, outlets or quite simply of the scale economies related to the only fact it is more interesting to rationalize the costs by transferring them for example on others places of production and the requirements of profitability which are increasingly related to the human capital.

HOW TO DEFINE A SPACE?

To speak about the Euro-Mediterranean concept is a point of identification for a space in which the subsets political, sociological, and organizational (and why not geographical, physical, climatologic...) have behaviors different from the same subsets in others spaces.

Thus, it seems possible to call upon the most recent work of geopolitics, and in particular those led by different authors in economics and management. They show a process of delocalization of the direction, fruit of acceleration of universalization and a new way of modernity, in a measure where we do not lead to a return towards the tradition. Their ways of thinking stay initially on the development of the plurality to the world level, which is declined on four axes:

- The decentralization of the modernity, which is not more European or euro-American. That is explained by the disappearance of the historical aspects (colonial world), economic or symbolic system (authority).

- The dissemination of the authority because "there is difficulty by thinking a political, social or cultural phenomenon from only one actor or from only one leader (State, religion)"; this dissemination leads to a "double pluralism: pluralism of the systems of direction and pluralism with inside of each system of direction".
- The rise of the relativism, like consequence of the preceding dynamics, but also by the philosophical dispute of universality to which we can oppose incommensurability by an increasing complexity that general dynamic vision cannot restore and by the refusal of the rejection of the egocentrism.
- The new kind of the honor of the nations, related to the end of a vision of the world in opposite blocks (fine of the cold war) allowing the primacy of the business and cultural (with the detriment of the ideology): Today it's through the market that the "virility" of the nations is expressed".

After the structural factors identified, we are interested in the contents of spaces of direction as the place where three dynamics tangle up:

- The installation of a deliberative space in which can act the public or private actors. in order to pose and solve problems calling of the common solutions to this space...
- The production of "collective" and specific preferences to this space in the world game
- The capacity to convert these preferences and these deliberations into political performances...

Thus, we will qualify this space of direction any space able to answer simultaneously the conditions of deliberation, by enunciation and performance such as we have just defined them.

Without entering in a radical criticism of the definition of the space of direction, we note that its institutional dimension leads us to analyze the contents and the impacts of regionalization only through political constructions (European Community), religions or geographical spaces. We notice as well as the Euro-Mediterranean model does not enter any of these categories, but it doesn't reject anyone. Thus, a finer investigation remains necessary.

THE BEGINNING OF THE EURO-MEDITERRANEAN MODEL OF BUSINESS

According to the preceding approaches on spaces of thinking, the Euro-Mediterranean model can be conceived like a space of directions:

- For geographical reasons, even if the limit is fuzzy: thus, East and West of the Mediterranean sea can be considered like good examples for this demonstration due to different but similar things like the way of life, the landscape.

- For historical reasons: philosophical, scientific bases and policies of the occident, primacy of economic flows until the end of the 19th century.
- For sociological reasons: (strictly speaking) the Mediterranean way of life and thought (role of the community, research of the humanistic proximity, impacts of futility, logic of resistance) and with the historical Mediterranean pressures (frequency of the crises, interbreeding) but also (substantial rationality, diversity, accumulation and growth) and with the European historical pressure (constitution of an unique economic area)
- For economic reasons: the permanent juxtaposition of levels of different richness and growth: Euro (money) is a quasi-perfect example of integration of diversity, for reasons of sustainable development predicting a common future:

Europe Community constitutes the greatest world fresh water reserve; blue gold becomes one of the major stakes of the geo strategy and an Euro-Mediterranean vision is essential, less than one hour of plane separates the European Union (GNP/inhabitant highest) and Africa. In fact, geographical space materialized by the Mediterranean Sea between the "rich person" and the "others".

While remaining voluntarily in the management approach, we see that there is matter to constitute a space of direction, since if we disregard (for the moment) public / institutional dimension, we find conditions of deliberation (in particular on the level private operators), of stating and performance. To further go, to materialize this space of euro-Mediterranean direction, implies to find identity marks. We must move towards the definition of the euro-Mediterranean which rests: - on European specificities, which are compared to the United States: economic conflict political competition and incompatibility of the social models. - On approaches resting "on a kind of praise of heterogeneity? to substitute in the State of right of the "States of the rights" orchestrating diversity of the allegiances and the human memberships in order to differently treat them within companies in diversity.

The goal is to assure the accomplishment for each one individually by not forcing anybody to be detached or disavow its fasteners and while basing themselves precisely on these bonds, from the point of view where each one would be removed from the artificial yoke generated by the "homogenization".

On the capacity to identify "clean" interests, being able to involve divergences within the European Union including on what seems the Truth. Thus goes from there it of the concept of single market, considered by English as having to be most open possible on free of exterior so that it is based in an immense total market "the Mediterranean countries insist that the single market marks its identity with respect to outside, in particular by mechanisms of control". To define a space of euro-Mediterranean direction would not amount it proposing a political humanism resting on three bases:

- ontological equality in dignity, which seeks to be carried out through equality of the rights and the conditions, right conferred on each one to take part in the definition of the collective destiny like carrying out its individual destiny;
- the freedom, concretized in the individual conscience and the independence of mind, the distance kept vis-à-vis the communities of membership, the separation of the private and the public;
- the knowledge which means the dissociation of the knowledge and the ignorance, the knowledge and the capacity; the disclosure of the knowledge to all; the permission to doubt and call into question; the permanent possibility to transform the world with the risk of error; "the European universalism taken within the limits of our thinking and our knowledge, cannot completely include all philosophies European economics policies, whereas it appears more relevant for the Mediterranean nations of in relation with Mediterranean countries and further to exchange practices in management which could be very useful for everyone.

In this context the business model is designed to answer a series of questions essential to any business – who are the customers, what do they value, how that value can be delivered to the customer at an appropriate cost and how the business deploys its assets. It includes a description of the key assets, both physical and intangible such as intellectual property, governance structure and management. It consists of both a *narrative* of how the business works and the *numbers* – how it makes a profit. The concept came into vogue when the spreadsheet provided an easy way to test the financial implications of the narrative in a financial model which contained assumptions about costs, product demand, sales revenue and profit. The financial outcome of changes to the narrative, or assumptions about product demand, etc. can be tested in the spreadsheet model (Margretta 2002).

One reason for the popularity of the concept in the new economy, appears to have grown out of the need for the emerging dot com firms to have a comprehensive, but standard format, to explain to potential investors 'how they were going to make their money'. The value proposition of dot com firms typically involved an innovative service or process for attracting a customer base. The proposed business model was often radically different. Often there was no precedent, no business experience, for instance, on which to base likely demand levels.

This constitutes a first framework of the Mediterranean new model because we also notice: - that we not have opposition between North and the South, West and East; they offer a real possibility of bringing together and a mutual empowerment, and not antagonism.

They offer no catch to dichotomy North/Modernity/Industry and South/Tradition/Land,

- That they can only to enrich our vision and our approach economic by market
- That they make it possible to defuse the trap of the "Mediterranean values" whose contents (often fixed) cause dispute, schematics to the profit of the description of process authorizing the differences.

To reason in term of process as enables us to approach management more easily as the contents of the values.

We can also see the arab business model from the strong point of it : the Islamic finance. In fact, the islamic arab business has proved to be a resilient system based on the basic principles of transparency and fairness in business, for example during the financial crisis which started from the US and hit. The resilience of Islamic financial institution is due to the unique business model which will continue to be different from the conventional banking due to its nature being the asset-based approach for each dealing," Overwhelming majority of businessmen see an asset base a starting point for each and every deal making this business much secure, transparent and open for investors and bankers. We don't believe in imagination as physical presence of assets is a basic ingredient for Islamic banking as this very basis has provided strong protective layers to each and every business in this industry, The Islamic banking industry also faced numerous challenges such as harmonization of Shariah standards and strict adherence to the basic principles of this type of banking while competing with its established peers called conventional banks.

The growth pattern and acceptance of the Islamic banking has been a hallmark behind the sustained growth of the Islamic banks and the financial institutions. This trend will be a ladder for achieving excellence for the entire Islamic banking industry in years to come.

THEREBY, WE CAN PROPOSE THE EURO-MEDITERRANEAN BUSINESS MODEL

Last approach of the prism: what can we do on the level business and research, by supporting us obviously on what we think and by locating us in logic of complementarities at the Anglo-Saxon model?

To create a euro-Mediterranean thought around business must lead us to a thought on diversity and complexity. This one is very present since several works were built on the same report: the difficulty of the neo-classic model dominating to account for the choices of the economic actors. This is not new in the sphere of management. A fast reference to the work it possible to recall that this we had identified several types of management that we briefly recall:

The Anglo-Saxon model with the dominance of business, competition, profit, individualism.

The Japanese model: growth, quality, integration, agreement,

The Euro-Mediterranean model: Management "in between", people, internal negotiation, diversity

This approach of diversity is found in several disciplines of management. Some examples: - "To be together, firstly it's probably to make together. It is necessary to clash with the complexity and the

construction of the future by the creativity, by the collective mobilization of the intelligence. That also means that it is imperatively necessary to rehabilitate the postulate of the specific one, of the locality and of immediately reaction, by combining them. It is necessary to support microphone-spaces of creation of the direction ".

Us plunged not only in one problems of the direction, but also in a new vision of management. The return to specific, with the room is a differentiation marked compared to the Anglo-Saxon model homogenizer.

These capacities must be like the capacity maintains a coherence of Organization between its organizational dimensions intern and external ". Even the financial managers are interested with diversity. We will also note that the transverse approaches of the managerial problems have very as a finality to better locate and better to include/understand diversities of the organizations and the actors the component (management of SME, governance, impacts of the TIC, durable development of the firms, social responsibility, quality, management of knowledge, innovation?), and this in order to better act. Taking account of:

- In the ethical plan, like paradigm interpretation legitimates evolutions;
- and on an emotional level, like horizon, desirable sign of the future ".

In fact : Euro-Mediterranean business has like field:

- the examination of the managerial practices of the companies and the men whose acts have as life or a starting territory the "areas" of the South of Europe, of the North of Africa and west of the Middle East. This geographical framework legitimates the conceptual roots of the euro-Mediterranean model but does not reduce the studies and the applications to this territory: we think that all the areas of the world are marked in their history by diversity, that all the decision makers, interested by an enrichment of the Anglo-Saxon model, must be integrated in a euro-Mediterranean approach. It is necessary to keep with esprit an opening on the Latin America, on the Chinese or Indian regional approaches. We could even think of Japan which modified its model insertion in Asia by giving up the metaphor of the flight birds (linearity, uniformity, Cartesian logic of the movement) for that of Symbiosis (diversity, harmony across the differences).
- Problems of pedagogy and research centered on specificity, diversity, the locality to have a more relevant systematic approach of the complexity of the organizations and their actors. The potential which is in front of us is huge. Thus, it seems to us that the Mediterranean approach (sea coast coastal traffic proximity) compared to Anglo-Saxon approach (ocean vastness) allows a thought on the decision-making. If we not regard the latter as step rational optimization under identified constraints, but a choice taken in a more or less reduced context of uncertainties, it seems that we can explain that:

- The reduction of uncertainty for the Anglo-Saxons, confronted with the vastness and the lack of reference mark, passes by modeling and the very formalized contract, sources of homogenizing procedures,
- The space proximity offers to Mediterranean possibility of return (logical of experimentation more accentuated than modeling) and a permanent monitoring (less contract).
- The creation of grids of analysis and the actions leaving a ethnocentric vision the world and management, and making it possible to differently solve problems of survival, of development of the men, organizations and nations where the euro-Mediterranean world legitimate by its is lived of the crises and the conflicts and also by the solutions that it brought throughout its history and which it will continue to propose. The sustainable development of the firms and the nations can be conceived and be built only on one history. The Hofstede dimensions do not directly predict any phenomena or dynamics. Applying them to make sense of what happens in the world always has to take into account other factors as well as culture - notably national wealth, history, personalities, and coincidences. There is no quick fix to understand social life after taking a dose of Hofstede. But the dimensions, when well understood, do allow to predict a little better what is likely to happen. And they become more useful as you go from the specific case to the trend, average, or expectation. For instance, knowing about culture hardly helps to predict what car you will buy - but the trend among your compatriots to buy certain types of car in the coming years can be predicted fairly well. In the case of the business Mediterranean model we can involve the differences of culture in order to gather the best way to trade and develop business whatever the differences and the length of cultures.

The Hofstede dimensions of culture are group-level constructs. Dimensions of national culture are about societies; dimensions of organizational culture about organizational units. Neither is about individual differences between members of society or organizations. Comparing survey responses between individuals does not yield similar patterns to the cross-population comparisons on which the Hofstede dimensions are based. This kind of issue is known among scholars as the distinction between levels of analysis. If we take into account the Islamic financial model we can find the basis of the system according to one item from the system :

RECONCILING PUBLIC AND PRIVATE PARTNERS FOR OPERATING AIMS

According to their culture and know how, public and private partners have different expectations and aims for their own performance. Nonetheless, they are obliged to be agreed on the Essential.

Public partners are under pressure to improve the wealth both for citizens and companies by selecting areas of the most urgent needs and by helping everyone to be involved with their point of view and in action.

Private partners are looking for business with the highest profit and the lowest risk in order to be in the good agreement with shareholders in spite of many problems of employment supported mainly by public partners.

Thereby, how reconciling the two partners in keeping their aims by creating a new way of cooperation without being in arguing?

Before, we have to precise that public partners are evaluated by the vote of the electors and private partners by the vote of the shareholders. Both are periodically on the way to accept many hard conditions to survive.

Therefore, the first point and prior idea for each one is to preserve the status of its position to maintain themselves or simply to exist.

Personal relationships and continuity are serious issues notably in the vision where everyone expects in the improvement of what they can realize for both citizens and companies.

In other words, each one try to be the leader to renew the management to satisfy their voters but in reality they blocked each other.

The only issue of this question is to modify relationships between the two partners as so to find another sense of performance. This is a real challenge to use differences as « checks and appropriate size » to achieve public and private purposes. This requires negotiating the structure of what they want to do in advance.

The results of such negotiations reflect the power of each partner in outside the partnership; the main advantage is the creation of a balance of power for the partners.

If we would stay on the idea that one of them is more powerful than the other one, we can create nothing with this basis. By the way, it's another idea of partnerships instead of having competitors with the aims to still get more and more, the partners become unified for operating aims. We completely change the message towards citizens and companies. Then, we enter in a strategy « win and win ».

However, to ensure relatively fair partnerships, public partners should not overtake their power in transforming it in a judgment of each situation they set up and private partners should be in a position sometimes to understand and to accept the public policy in favor of companies.

Negotiation in detailed terms such as those can plainly mean that on a hand, the new partnership costs by the involvement on another hand, the partnership make benefits for everyone because the balance is earned and the results can be measured.

The object relates mainly to the advantages which the private and public partners can mutually bring while ceasing looking itself like competitors.

They have to gain while collaborating on joint projects instead of systematically seeking to remain on closed aspects relating to their prerogatives. In other words: why not to make so that the public and private partners lay down common objectives in order to reach a decisive advantage for those which they represent and often are find themselves in the two camps. for example: we can belong to the public sector and to be interested by the results of the private companies, just like we can be in a private company and be interested in the performances of the public sector. In short terms: each sector is complementary especially if there are jointly laid down objectives.

We have to explain : operating aims :

In the private sector : companies need many services from public sector : for example education, transportation, social services, country services like water distribution, energy

In the public sector : citizens and civil servants need activities, profit, employment from companies

Then : If we consider that the sectors are in competition and completely different each other we can fall the success for everyone in the country. That's to say : collaboration is possible for the two sectors in order to succeed.

In transportation we can have both private and public companies on the same markets.

In this context, each company can make profit and create employment if the organization of transportation is discussed and share in the sense of the passenger.

In that exemple, we see the real advantage for everyone : shareholders, citizens, government, civil servants.

Then operating aims are agreement in competition organized in order to give advantages for everyone.

But we can think competition is wrong in this aspect of negotiation.

It seems to be true if we forget that government and mainly European Community is the keeper of competition in every country of EC.

It's a kind of guarantee to recognise aims like genuine and real systems of cooperation between the two sectors.

In this context, we can accept a new economic and politic agent represents by European Community.

The third agent is for citizens and companies the real issue of their own aims.

THE INFLUENCE OF ISLAMIC FINANCE ON FIRM'S CAPITAL STRUCTURE

Miglietta, Nicola; Battisti, Enrico

Department of Management, University of Turin, Italy

ABSTRACT

The aim of this paper is to investigate the different instruments and sources of capital structure in Islamic finance, highlighting the peculiarities and distinctive features compared to the traditional corporate finance. For traditional finance, theories about capital structure and its value creation for shareholders (*shareholder's value*), a fundamental element of the financial goal of a corporation, have characterized several research determined the principles underpinning the modern corporate finance. Using an exploratory research methodology, this work, after resuming such models for capital structure's construction, explores the main financial sources linked to Islamic finance, identifying the major differences and similarities with traditional corporate finance.

Keywords: *Islamic Finance; Capital Structure; Profit and Loss Sharing; Ribā; Gharār; Maysīr; Harām; Value Creation.*

1. INTRODUCTION

The set of legal institutions, financial instruments and companies that operate in accordance with the teachings and traditions of the *Shari'ah* (Islamic law) is the so-called Islamic finance. In the world there are more than 1.5 million Muslims and operate more than 350 financial institutions classified as Islamic Financial Institution (IFI). In the coming years it is estimated that the Assets Under Management (AUM), potentially managed in accordance with the principles of Islamic finance, which currently stands at 1.5 trillion dollars, could exceed 6 trillion (Grewal, 2013). To this date, the transformations that took place in the Islamic world during the last decades have marked the finance and, unlike the '70s (period in which began the transfer of capital from the Arab world to the West), there is an Islamic finance that can be defined as such because of its supervening governance rules. This phenomenon is relatively new and fast-growing, it has taken on increasing significance and implications raised so relevant as to have attracted the interest of various researchers and scholars of finance (e.g. Solè, 2007; Iqbal and Mirakhor, 2007; Gomel *et al.*, 2010; Krasicka and Nowak, 2012; Grewal, 2013). However, a large part of the financial community ignores, with particular reference to the capital structure, the specificity of the phenomenon and, in consideration of this, we believe the

above subject worthy of study. This derives in part from some basic assumptions. First, the high debt that characterizes today's companies has increased the effects of distortions in the risk-return relationship on which is founded the modern corporate finance (Miglietta and Battisti, 2011). The instability that ensued has created a selection of companies that, in order to survive, have developed strong adaptation skills to front the changing financial systems. Secondly, aspects such as transparency, social responsibility and the containment of speculation, which summarize the principles of Islamic finance and are only partly shared by the traditional corporate finance, summarize an idea of finance closely linked to the real economy (Salvi and Miglietta, 2013). In this sense, Islamic finance suggests specific procedures for selecting investments, prohibits the use of derivative financial instruments and imposes strict limits on indebtedness (which does not provide for the payment of interest but a remuneration based on the progress of the business whose implicit risk is shared with the lender) (Askari *et al.*, 2010).

Islamic finance is based on religious-legal principles laid down by the *Shari'ah* geared mainly to highlight what is denied to do, rather than on what is lawful to do instead. In fact, according to a fundamental principle of *Shari'ah*, "everything is permitted, provided it is not expressly prohibited". Transparency, social responsibility and the containment of speculation are the other principles on which Islamic finance based.

In economic and financial terms, the main requirements examined by numerous researchers (e.g. Kahf and Khan, 1992; Warde, 2000; Siddiqi, 2004; Gatto, 2008; Hamaui and Mauri, 2009), are:

- prohibition of *ribā* (fixed or determinable payments of interest on funds lent);
- prohibition of economic practices that involve excessive uncertainty (*gharār*) and speculation (*maysīr*);
- all conducts prohibited by the Koran (cd. *Harām*) are prohibited. Examples of prohibited activities by Koran are those related to tobacco, pornography, arms trade, alcohol, pork and gambling.

These principles offer interesting insights about the opportunity to interpret and measure the sources of funding for Islamic finance. In this regard, the methodology used in this work was exploratory where, drawing inspiration from the relationship between corporate finance (that can be defined as "traditional") and capital structure (equity and debt), we have defined the fundamentals and the system of financial decisions with the aim to capture the similarities and differences between conventional and Islamic finance.

2. CAPITAL STRUCTURE'S CONSTRUCTION: BASIC CONCEPT AND THEORETICAL BACKGROUND

The corporate finance, outside the borders of Islamic economics (or better, according to the approach in this paper we define as “traditional”), is an area of finance dealing with the financial decisions that businesses must undertake, the related tools, analysis and assessment techniques to be developed to support these decisions (Tardivo *et al.*, 2012). As noted above, for the Islamic firm, finance represents the sum of legal institutions and financial instruments in accordance with the dictates and traditions of the *Shari'ah*. However, the system of financial decisions does not present particular differences (from a “substantial” viewpoint), in addition to the constraints dictated by *Shari'ah* which imposes a classification of financial instruments that must be structured on the basis of the individual features of the same. The traditional enterprise, regardless of the legal form necessary to the exercise of a particular activity, can be represented as a large box containing a set of assets that have been financed by raising funds of equity or debt. Financing alternatives, along with the investment choices and providing for the return on capital employed, represent the system of financial decisions (e.g. Haris and Raviv, 1991; Damodaran, 2011; Brealey *et al.*, 2011). Even the Islamic firm, for to finance the activity, may use, in addition to the self-financing, instruments of debt or equity. The activities should be those not expressly prohibited by the *Shari'ah* and funding instruments must comply with the principles already mentioned. We believe that the guiding principles that underpin the traditional corporate finance can be applied also to the Islamic firm that, from this point of view, is not different from all the other companies. Each company must decide where invest its financial resources (investment decisions), how to find the necessary funds (financing decisions) and how much cash return to shareholders (dividend decisions).

The traditional corporate finance states that investment decisions should be oriented to activities and projects that have a positive net present value, with a yield a return (expected return) greater than the cost of capital employed. In practice, the yield a return is measured by cash flows and their distribution over time, taking into account the positive and negative collateral effects of the project. The level of yield increases for riskier projects and reflect the financing mix used.

First, reported to Islamic finance, you need to ask how the evaluation approach changes in the presence of a prohibition of interest (*ribā*) which excludes the monetary value of time (*time value for money*)?

In fact, the absence of an opportunity cost of capital connected to the value of the currency in time would seem to exclude a traditional evaluation approach. However, despite the *Shari'ah* prohibits to consider the monetary cost of time as opportunity cost of capital, the use of standard benchmarks is a common practice followed by Islamic bank; it creates some doubts of interpretation but, in fact, solve the evaluation problem from the practical point of view (Shaikh, 2009). The financing decisions have a

direct impact on the definition of a capital structure. In this sense, according to the traditional finance, must be built a composition of sources that maximize the value of the investments, in line with the riskiness of the project. Financing decisions determine the capital structure (*capital structure*) of an enterprise, which gives rise to the determination of the minimum investment return represented by the cost of capital (Miglietta, 2004). The composition of the sources varies from company to company and must aim to minimize the *Weighted Average Cost of Capital* (WACC). In this sense, for the same expected return on investment, increase value creation for shareholders. Islamic finance is rich in financial instruments of the company that are structured using architectures similar to those of conventional finance and *debt-based* ones are the most widely used mode (Von Pock, 2007).

Secondly, how is it possible to reconcile this kind of tools within a scenario that prohibits the use of an interest rate (*interest free economy*)?

Even in this case, the prohibition is theoretical, in practice and in the operation of the instruments, there are a number of applications which, while giving rise to further perplexity from regulatory point of view, are defined *Shari'ah compliant* and then recognized as not prohibited. The system called *profit and loss sharing*, the *mark-up financing*, and the *fees* due on loans (and other technicalities) can be traced to the notion that the traditional finance is represented as the cost of borrowing money or financial.

The religious principles and bans that follow should therefore be subject, from time to time, to interpretation (Haron *et al.*, 2009). This activity is entrusted to the Islamic jurists who study instruments to observe the precepts. The prohibition of interest is absolute; it means that it is always prohibited. However, it is allowed the profit margin. The uncertainty in the contracts and transactions (the prohibition of *gharar*) makes a contract void. This prohibition is not absolute, and a reasonable uncertainty can be tolerated without invalidating the transaction executed. From the combination of different forms of financing can be configured many financial transactions that recall the patterns of traditional finance (*swaps*, *joint ventures* and *project financing*). The dividend policy, finally, determines the methods and the extent of the cash flows that the company returns to its owners. This is typically done in two cases: when there are no investment opportunities and based on the characteristics of the shareholders.

In the scheme of reference of traditional corporate finance, the objective coincides with the firm's target. The majority of scholars agree that this objective is the maximization of value (e.g. Rappaport, 1986; Guatri, 1991). Islamic finance does not have a different objective from the traditional one. Entrepreneurial activity must be carried out to create a profit and the objective of its management should be the maximization of the value of economic capital invested. According to legal precepts and religious principles, there is another objective, equally important and not only linked to maximize the value but also the maximization of collective welfare and the community.

By analyzing the characteristics of Islamic firm, its objective function does not differ from that of the so-called traditional company, but rather amplifies the concept of “value”, extending from the economic capital to the common welfare. In fact, any business activity spread to create an “added value”, which is then re-distributed or reinvested in the asset. For Islamic finance, and in accordance with the principles that govern it, that value is not measured only from the point of view of stakeholders (in respect of contributed capital), but also from the point of view of the target communities and its individuals, who have more general and extensive interests, related to well-being and demands of the community.

3. VALUE CREATION WITH THE OPTIMAL CAPITAL STRUCTURE FOR TRADITIONAL CORPORATE FINANCE

3.1. *Cost of debt*

In traditional corporate finance, financing (loan) implies a remuneration that is expressed in an interest rate. The cost of debt is defined as the remuneration requested by third parties who finance the firm according to the risk they endured. In formula:

$$K_d = i \times (1 - t)$$

Where i denotes the gross interest rate paid to third parties, and t the tax rate.

How do you determine the interest? It is necessary to distinguish between short-term debts and medium-long term debts. For short-term debt is subject to a rate equal to the market price, adjusted by any expectations of a rise or fall. For medium-long term debt is necessary to consider the interest rate applied to loans with equivalent characteristics. Introducing the default risk that we will have:

$$K_d = (r_f + \delta \times D/(E+D)) \times (1 - t)$$

Where r_f is the interest rate *unlevered* (represents the minimum rate applicable in relation to the size of the company and the guarantees offered); δ the coefficient of variation in the cost of debt to changes in leverage (D/E) and, finally, $D/(D + E)$ the capital structure related to the debt.

3.2. *Cost of equity*

According to the traditional corporate finance the cost of equity is the return required to invest capital in a risky activity and represents the opportunity cost of capital incurred for failing to invest the capital in another activity of the same degree of risk. How do you estimate this return?

Following the logic of the models of risk and return (for example, Capital Asset Pricing Model), it is necessary to identify a rate of return relative to risk-free assets and a second component represented by the “premium” required to invest in a risky activity. With reference to a risk free return there should be no default risk and there should be no intermediate cash flows. The risk premium on the other hand depends on the characteristics of investors and the market. The market premium on the other hand

depends on the characteristics of investors and the market. To estimate this component are available historical data on premiums, adjusted and integrated in real terms, divided according country-risk and approaches based on the implied equity premiums. The market premium, finally, must be parameterized with the type of investment through the estimation of a factor called beta. This coefficient is closely related to the capital structure of the company and take on different values depending on the level of indebtedness.

The cost of equity is then expressed as follows:

$$K_e = r_f + \text{Beta}_{\text{levered}} \times MP$$

where r_f is the risk free interest rate, MP is the market premium, defined as the difference between the yield a return (expected return) and the risk free interest rate. The *levered* Beta of the firm represents the systematic risk involved in the investment and expresses the change in the price of a security to changes in the market index. This coefficient is related to the capital structure by the following relationship:

$$\text{Beta}_{\text{levered}} = \text{Beta}_{\text{unlevered}} [1 + (1 - t) D/E]$$

The cost of equity, depending on the structure, becomes:

$$K_e = r_f + \text{Beta}_{\text{unlevered}} [1 + (1 - t) D/E] MP$$

4. VALUE CREATION WITH THE OPTIMAL CAPITAL STRUCTURE FOR ISLAMIC FINANCE

4.1. Cost of debt: Murabahah and Ijara

The *Murabahah* is a financial instrument that belongs to the type of debt, in that it provides that the contract price paid by the customer to the bank to obtain the asset, which it acquired on behalf of the former, is equal to that paid by bank to the manufacturer of the goods covered by the contract plus a *mark - up*, defined at the time of conclusion of the contract. According to the current practice within the Islamic banking system, the *mark - up* is defined on the basis of a *benchmark* rate of return, which generally consists of an interbank interest rate (Pisol *et al.*, 2012). The contract price of a *Murabahah* (P_C) can be expressed by the following formula:

$$P_C = I \cdot (1 + k_{\text{MUR}})$$

Where, I is the capital outlay incurred by the bank to purchase the asset for the customer's account and k_{MUR} is the contact's *mark - up* set by the bank by way of remuneration for the brokerage service it played. For the firm k_{MUR} represents the cost that it incurs when it decided to resort to this form of financing.

Determining the price/cost of such funding sources, some sources confirm that the rate of return set by an Islamic bank on a contract of *Murabahah* and, therefore, the cost to be borne by a firm that decides to

use that tool, are a function of a number of factors. Some of these factors are the cost of funding incurred by the bank (represented by the rate of return on deposits) and the risk premium, which depends on the creditworthiness of the borrower (e.g. Usmani, 2002; Biancone, 2012).

The cost of a contract of *Murabahah* can, therefore, be expressed by the following formula:

$$k_{MUR} = \{r_b + [\pi E(r) + (1 - \pi) E(L)]\} \times (1-t)$$

Where:

- r_b is the rate of return *benchmark* that, in practice, may be established or an interbank interest rate applied in the major Western banking systems (such as *LIBOR*), or the one in force in the country where the single Islamic bank operates (for example, for Pakistan the *KIBOR* - Kerachi Inter Bank Offer Rate), or the *BLR* (Basing Lending rate) practiced by conventional banks that have headquarters in Islamic Country (Hasan, 2011).
- $[\pi E(r) + (1 - \pi)E(L)]$ is the *default spread*, defined by the bank as a result of a loan applicant evaluation conducted on the company, which aims to estimate its probability of failure equal to $(1-\pi)$, the efficiency $E(r)$ and the expected loss $E(L)$. That increase, applied to the *benchmark* rate, is used to cover the credit risk to which the bank is exposed under a contract of *Murabahah*, which is, in turn, reflected in the contract price (P_c) (Rosly, 2011).

Based on the above, it is clear that the manner in which it is determined the cost of a contract of *Murabahah* (k_{MUR}) is similar to that which is followed in determining the cost of debt capital in the conventional financial system (k_d). In both cases, the base rate chosen as a reference, is increased by *default spread* which is a function of the creditworthiness of the borrower.

The *Ijarah* belongs to the category of debt, as it recognizes to the bank a guaranteed fixed return for the service it provided. As required by that form of contract, in fact, the rent that, periodically, the company is required to pay to the lessor bank is defined in such a way as to allow it to return disbursement, argued in an earlier period, for the purchase of the asset being *Ijarah*, and at the same time, obtain a profit margin. In practice, even with reference to this context, the literature informs that most of the Islamic banks, for to determine the required return, using as a benchmark the interest rate charged on loans from their conventional equivalents which present similar contract terms dell'*Ijarah* to those being evaluated (e.g. Kamal *et al.* 2008; Ahmad *et al.*, 2011; Hanif, 2011). The determination of the profit margin for the Islamic bank is achieved by adding to the interbank interest rate at 1 year (in force in the Country in which it has operational headquarters) a spread, which amount varies according to a number of factors, such as what is below the *Ijarah* (which can be a building, a vehicle and a system), the duration of the contract and the creditworthiness of the counterparty. It follows that the final value is almost always in line with the interest to be applied in conventional financial systems for comparable loans.

The cost of an *Ijarah* for an enterprise (k_{ij}) then, can be represented by the following formula:

$$k_{ij} = (r_b + spread) \times (1 - t)$$

Once again emerges, just as we have seen with reference to the contract of *Murabahah*, the mode of remuneration of the funder, carried out according to the same risk factors that, in the context of conventional finance, is a function of the cost of debt capital.

4.2. Cost of equity

In traditional corporate finance, the estimated cost of equity of a company is calculated using the *Capital Asset Pricing Model* (CAPM). The same assessment in Islamic finance, involves having to consider the different principles that govern the fundamentals: the lack of interest (*riba*), and sharing in the profits / losses of the company (*Profit and Loss Sharing*).

As is known, the formula underlying the CAPM states that:

$$E(r_i) = k_e = r_f + \beta_i [E(r_m) - r_f]$$

It follows that the expected return on a risky activity $E(r_i)$ and, therefore, the cost of supporting the issuing undertaking to reward those who decide to invest in that specific activity (k_e), is equal to the yield of a security risk-free (r_f), plus a risk premium, $[E(r_m) - r_f]$, assigned by the market to risky assets, weighted by a coefficient that measures the degree of systemic risk that has that specific activity compared to the market, the beta of the firm (β_i). The fact that, within the Islamic financial system, there is no provision (in theory) the opportunity to enjoy an interest rate, would imply the inapplicability of the CAPM to estimate the cost of equity due to the impossibility of identify rate *risk-free* (Damodaran, 2011).

However, we have examined how the process of formation of the cost of debt in Islamic finance provides a mechanism for the formation of the same cost based on a benchmark derived from traditional finance and equivalent to the "cost basis" of the same source which, through the application of a different principle (the *mark-up*), it forms a "cost complement". We believe that also in the process of estimating the cost of risk capital, in Islamic finance, can be associated with a "minimum return" that the lender expects the investment made. Combining this return to a situation of "minimal risk", the total cost could be determined by a similar mechanism that suggested by the CAPM. Some authors, still on the subject of not applicability of CAPM in Islamic finance, have identified as the rate to be used in substitution of the *risk-free* rate, the *zakat rate* (e.g. Ahmed and El-Ashker, 1987). These scholars, starting with the recognition that every Islamic investor is required to pay a capital tax (*zakat*), regardless of whether it is invested (in which case the sampling is done on the yield obtained) or is maintained in liquid form, they calculated what should be the minimum return required by an investor for Islamic ensure that there is a depletion of its capital. The minimum return is equal to the rate

applied to capital in the levy *zakat* (*z*). In any case, accepting a "traditional" approach, the cost of risk capital, *ceteris paribus*, would be equal to:

$$k_e = r_b + \beta \times \text{ERP}$$

Where:

- k_e is the cost of equity;
- r_b is the interest rate charged by operators in the context of *pricing* of Islamic financial contracts *mark - up financing*, considered as a proxy rate *risk - free* used by conventional finance;
- β is a parameter that measures the degree of risk specific activity to be financed;
- ERP is the equity risk premium, which reflects the judgment that investors have on the degree of risk involved in a given market and represents the premium required by them on investment in securities traded on it.

As is well known, there is an alternative model for calculating the cost of equity (K_e) and is represented in the traditional finance, the formula of Gordon about *Dividend Discount Model* (DDM), according to which:

$$k_e = (D_1/P_0) + g$$

Where " D_1 " is the value of the expected dividends for the year ahead, " P_0 " is the price at time 0, the action of which it is estimated the cost and " g " is the growth rate of dividends.

However, this model in underdeveloped markets such as Islamic ones, that is not completely efficient, makes the assessment of the price of the company rather difficult if not relatively reliable. Proceeding in the estimate of the cost, according to the approach derived from the CAPM and founded on a different relation between risk and return, but it is assumed to always be a correlation that corresponds to a higher risk for a higher yield, could be detected individual parameters: r_b , β and ERP (*Equity Risk Premium*):

- a. As a *proxy* for the rate *risk - free*, r_b , in an Islamic context would tend to assume the same value of a western interbank rate, such as LIBOR, taking into account the fact that, in their current operations, Islamic banks employ this parameter rate as a benchmark against which is defined as the cost of *Murabahah* and *Ijarah*;
- b. The specific activity of β can be estimated taking into account the fact that it reflects the policies adopted by the individual company and appears to be a function of three variables (the type of activity carried out by the company, the intensity of its operating leverage and that of financial leverage); applying, in this sense, the procedure known in traditional finance, the so-called *bottom-up*. As is known, the decomposition of beta in the three determinants allows to estimate the value without having to have a time series of prices of the target of evaluation (method *bottom - up*), but proceeding to estimate the *unlevered beta* of a sample of comparable listed.

Once you have calculated the average *unlevered beta* for the selected sample, we proceed to correct this value for the current debt ratio of the company being valued, reaching, so, to define the *beta levered*

- c. The *Equity Risk Premium* (ERP) can be estimated using the following formula

$$\text{ERP} = \text{ERP required of a mature market} + \text{Award for Market Risk}$$

The ERP required in emerging markets, such as Islamic is a function of the country risk, which captures risk factors such as the degree of volatility of the inflation rate, the economic growth rate and the degree of transparency of the market.

As is known, the country risk can be expressed in terms of the degree of volatility that have yields of securities traded on an *emerging market* than that which characterizes the securities traded on the mature market. This estimate can be made based on calculating the Relative Standard Deviation of the market being analyzed (x), obtained by dividing the standard deviation of the price of the shares traded on it with one that have securities traded on a mature market taken as a reference. To estimate the cost of equity of an Islamic enterprise, therefore, the risk premium of the market (ERP) can be estimated following the approach adopted by Damodaran, with reference to the Equity Risk Premium in the U.S. Market, assuming as it has a Country Risk equal to zero (Damodaran, 2013).

5. CONCLUSION AND SUGGESTIONS FOR FURTHER RESEARCH

As discussed above, the financing instruments of Islamic finance based on the *mark-up*, are inclined to assume a cost structure very similar to that of sources relating to traditional corporate finance. The scarcity of available data, however, leaves open a wide field of research for the future development of the knowledge on the topic. It should be recognized that, in a "mixed" system, can emerge situation of *trade-off* that may enable the assessments on the optimization of financial choices. As an example, analyzing the report of the *State Bank of Pakistan* (Ahmad and Hussain, 2012) concerning the trend of interest rates charged by Islamic banks and foreign ones operating in the country, emerges as the return required by an Islamic banks in range of operation to *mark - up financing* is less than that required by a foreign bank on a traditional loan (16,20% compared to 17% - period March 2012).

The availability of these data allows facing another research topic linked to the possibility to analyze how a hypothetical use of Islamic capitals by a conventional firm in the form of Equity affects the WACC. In this paper we have seen that an increase in the level of leverage of the company can translate into an increase in its probability of failure that would result in:

- an increase in the cost of conventional debt (k_d), since the additional financial obligations assumed by the company through the conclusion of the *Murabahah* it would increase the risk of

insolvency, which would result in deterioration of its creditworthiness, which could lead to a renegotiation of the terms of conventional financing by banks;

- an increase in the cost of *equity* (k_e), inasmuch an increase in the debt capital translates into an increase in the financial risk of the issuing undertaking (reflected in its *beta levered*, β_l) and, therefore, an increase in the required return by the shareholders;

These results introduces new spaces for future research and empirical tests on the theoretical results obtained in the present work, in particular with reference to the WACC.

INTEREST RATES LIBERALIZATION OR ECONOMY CONTROL- THE CASE OF THE CHINESE BANKING SYSTEM

Mihai-Yiannaki, Simona¹; Rios-Morales, Ruth²

¹Department of Accounting Economics and Finance , European University Cyprus, Nicosia, Cyprus

²Centre of Foreign Affairs and Applied Diplomacy, Zurich University of Applied Sciences, Switzerland.

ABSTRACT

The Chinese Central Bank decided on June 8th and July 6th, 2012 on the duplication and consecutive cut of the deposit and loan interest rates, together with the simultaneous loosening of the interest rate floating range of their financial institutions. Unquestionably, these measures resulted in a drastic change of the operating strategies of the whole banking system, for both nationalized and the private commercial banks.

The paper aims at following up on the causes and effects of these decisions in the Chinese banking arena, predicting a higher possible level of bad loans and followed by a higher systemic risk due to the major three banks reaction and copy-cat decision in fixing interest rates. The research methodology is utilizing the GARCH (1,1) model and the VaR to identify the way the interests are adjusted and study if this decision was towards a real liberalization or rather a controlled interest rate change by the authorities.

Eventually, the Chinese interest rate liberalization bring with it good and bad news to the economy, while the essence remains in how such liberalization is handled and what is it aimed for the entire economy.

Keywords: *interest rates liberalization, GARCH model, VaR, risk management, commercial banking, China, economic models, central bank, emerging economy*

INTRODUCTION

The term structure of interest rates, determining the relationship between yields on a bond and time to maturity, but also access to credit, and monetary policies, plays a fundamental role in economics and finance, including also in the derivatives pricing, hedging, and risk management (Hong et al, 2013).

The BOC (Bank of China) was the 3rd of all four, prodigious and nationalized commercial banks of China that was listed on the Chinese mainland and Hong Kong Stock Exchange since 2006. The development of BOC was under the influences of both government policies and of the financial market, factors which led to a number of calculated acts, the nature of which was determined to be imperative, in order to successfully adapt not only to the financial development and to the government policies, but

also to increase profitability and to attain a potential risk decrease in order to become more profitable and competitive worldwide.

Richard Harris (2014) an Interment fund executive in Hong Kong mentioned that the Chinese government's world-record US\$4 trillion of foreign reserves could back local government borrowing, but this is not cash with which to pay off irresponsible debt accumulation. The aim of this research was to investigate Chinese interest rate liberalization, especially the way interest-rates adjustment affected the development of BOC, through the analysis of BOC's returns, risks and stock price and consequently be able to provide certain recommendations for the banking system. In this respect, we have looked into the following aspects:

- The impact of interest rate on profitability
- The effects of interest rate on stock price
- The influence of interest rate on risks

For bringing the study and its results closer to the readers, we adapted the paper structure, presenting first the methodology, then the literature review supporting directly the results analysis, followed by conclusions, recommendations, study limitation and further research., references and five appendices including the calculations of the models selected for this research.

METHODOLOGY

Our process of sample selection using secondary data analysis (Sekaran and Bougie, 2010) uses the following defining elements:

1. One-year deposit and loan interest rates, overnight Shanghai inter-bank offering interest rate, quarterly NII and equity of three banks: BOC (Bank of China), CCB (China Construction Bank) and CMBC (China Merchants Bank), and their daily stock price and turnover sourced from these banks' websites.
2. The size of the sample: due to the requirements, minimum sample sizes of GARCH (1,1) and VaR were both 500 as the size of the data sample.
3. The time period of sample: the release time policy and other related factors; according to the principles above, this study selected a one-year and daily overnight Shanghai Offered interest rate, stock price and stock turnover of BOC in 500 days between September, 2010 and November, 2012.

The data analysis' steps used in this study are the following:

1. Research of NII and operating revenue from BOC's quarterly, the half year and annual financial reports and then compared the proportions of NII accounting for operating revenue in each quarter from 2007 to 2012 to analyze the importance of NII to BOC profits (Molyneux and

Thornton, 1992).

2. Collected each quarterly return on equity (ROE) of BOC in the period of 2007 to 2012 from the BOC quarterly, both the half- a- year and annual financial reports, and then calculated the ROE. Noticed that this research used the NII instead of net income because its purpose was to discuss the relationship between interest rate and profits.
3. Calculated the change rate of ROE in local currency.
4. Collected and calculated the average deposit and loan interest rates and their change rate in each quarter. Discussed how the interest rate might impact net interest income and equity of BOC and the influence on its profitability. And then it also needed to compare the results of BOC to the results of CMBC.

Secondly, by aiming at the ways that interest rate impacted stock price, this research adopted adjusted GARCH (1,1) model to measure interest rate changes affecting the stock price volatility (Hong et al., 2013, Morgan. & Smith, 1987). Previous to this, it needed to verify whether the stock price had established any correlation between banks.

Therefore, the specific solution steps of this part were:

1. Used Spearman Correlation to calculate correlation coefficients between each of the two banks as shown in Appendix 1. If the coefficients were large enough, then it continued using GARCH(1,1) in order to resolve the question (Hong et al., 2007).
2. The variables were daily variations of SHIBOR r_i and daily stock returns of BOC μ_i . Moreover, r_i was calculated through the followed formula:

$$r_i = R_i - R_{i-1} \quad (3.1)$$

where R_i was i th day SHIBOR inter-bank offered overnight rate. μ_i was shown as:

$$\mu_i = \ln\left(\frac{S_i}{S_{i-1}}\right) \quad (i = 1, 2, \dots, n) \quad (3.17) \quad (\text{Hull, 2010})$$

where S_i was the i th day BOC's closing price in SSE Composite Index.

The specific steps to resolve this question were the following:

1. Introduced interest rate as an exogenous variable into adjusted GARCH(1,1) the formula being 3.11 in order to analyze the effects of interest rates on stock price from the aspect of the rise and fall of the rate. The research for the successful contemplation of the question was achieved by Excel.
2. Compared the results of BOC with two other banks in order to answer the research question, based on the results shown in Appendix 2, 3 and 4.

Thirdly, by using VaR (value at risk) to measure the bank's risk, the use of several key factors was considered mandatory, such as the market value of the portfolio, holding period, confidence level and annual volatility.

The specific procedures to achieve VaR were the following:

1. Collected daily trading turnover of BOC stock in the sample and calculated the average turnover using arithmetic mean formula:

$$\text{Turnover Average} = \frac{\sum \text{Daily trading turnover}}{\text{No. of days}} \quad (3.18)$$

The turnover average could be thought as an item of market value of portfolio.

2. Calculated the annual volatility σ_{annual} using historical data and then calculated the daily volatility σ_{daily} through accomplishing the following process:

First of all, let the return during the i th interval μ_i be calculated by formula 3.17. (Hull, 2010)

Then calculated the usual estimate s of the standard deviation of the μ_i by using the formula:

$$s = \sqrt{\frac{1}{n-1} \sum_{i=1}^n (\mu_i - \bar{\mu})^2} \quad (3.19)$$

where $n+1$ was the number of observations, S_i was the value of variable at the of i th interval ($i = 0, 1, \dots, n$), $\bar{\mu}$ was the mean of the μ_i . The standard deviation s was regarded as σ_{annual} . (Hull, 2010)

3. Used the GARCH(1,1) model to get the results of BOC annual volatility. Because σ_1^2 did not exist, so it could not ensure σ_2^2 . By adopting the Excel tool and using the sample variance of daily stock return μ_i (saw the formula 3.16) as σ_2^2 to get out the parameters in turn. Eventually all parameters joined into the GARCH (1,1) formula to calculate other σ_n^2 .
4. Figured out the daily volatility σ_{daily} , the size of sample was 500. So set $\tau = 1/500$ then the estimate for the daily volatility σ_{daily} should be (Hull, 2010, 2nded):

$$\sigma_{\text{daily}} = \sigma_{\text{annual}} / \sqrt{500} \quad (3.20)$$

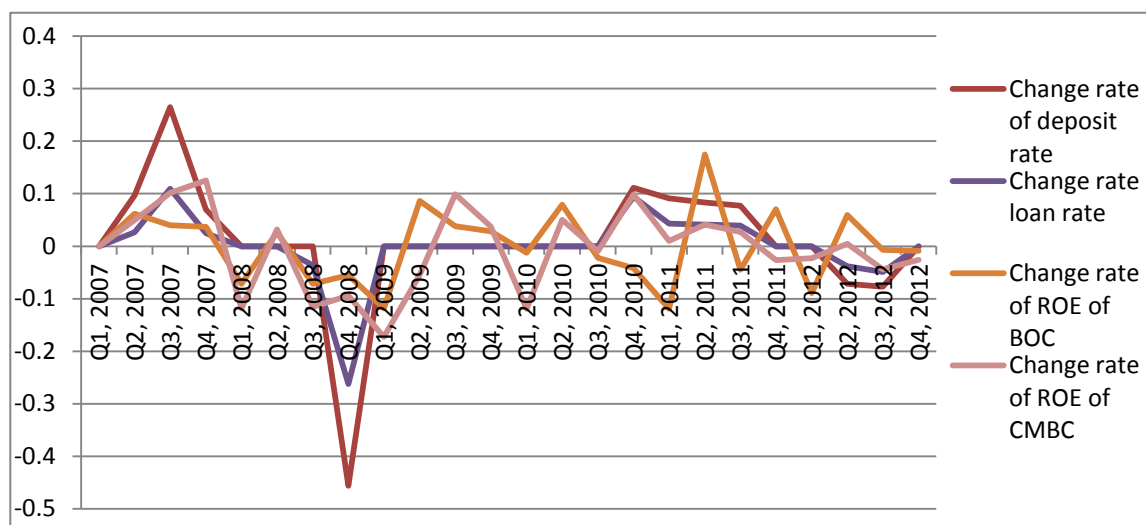

5. Substituted two different confidence levels into VaR model and discussed. It did not mean that the higher confidence level the better for the banks, the reason being that that profit was directly proportional to the risk- there would not be any profit without business risks. (Hull, 2010, 2nded). According to the estimated default probabilities as indicated by the rating class table from Christopher James (1996), the coverage level of class A (of these banks) should be 99.89%. Therefore, this paper chose the two confidence coefficients 95% and 99.89% to see the differences in variability of the results, if the case.
6. Calculated the two other banks' VaR (Jorinon, 2001): the private bank CMBC and the nationalized commercial bank CCB, and then compared and discussed them in relation to BOC. This research question was achieved by Excel in Appendix 5.

Although, there is no perfect model used to resolve all the similar problems of GARCH (1,1), this model was used both in researching the relationships between interest rate and stock price, as well as evaluating the risk, repeatedly. The comparison with the results' analysis of other banks helped provide some comprehensive information on BOC in order to understand its unique characteristics.

LITERATURE REVIEW AND ANALYSIS OF RESULTS

As shown in the following Figure 1, ROE fluctuation trends of BOC and CMBC were basically the same, but fluctuation of BOC was obviously stronger and more advanced than CMBC. Besides, they were not linked to fluctuations of interest rates. When interest rates rose, ROE might appear either as an upward or a downward trend (Kaufman, 1980, Chen 2007); even if interest rates did not change, the banks ROE fluctuating would still occur.

Figure 1 Trends of Interest Rates & Their Change Rates and ROEs & Their Change Rates

(<http://www.boc.cn/investor/ir3/> & <http://www.cmbchina.com/CMBIR/intro.aspx?type=report>)

Table 1 Results of Each Bank using GARCH(1,1) Method under 5% Confidence Level from Research results.

	BOC	CCB	CMBC
α	0.0280000000	0.0280000008	0.0280000007
β	0.9590000000	0.9700000000	0.9700000010
ω	0.0000011990	0.0000007000	0.0000005992
V_L	0.0000922308	0.0003500014	0.0002996003
Persistence	0.9870000000	0.9980000008	0.9980000017

From the table above, persistence of BOC was very high, at 98.7%, meaning that volatility had a high persistence with an impact on stock price that would be sustained over a long term. One of the reasons

of the weak relation between interest rate and stock price was that China's interest rate controls limited the interest rate floating (Chen, 2007). Due to the fact that China's financial reform was still at a preliminary stage, the development of financial market consists of many deficiencies: incomplete market system, lack of market risk-defending and regulatory ability, scarce trading products and tools, etc (Alpera and Anbar, 2011, Feyzioğlu, et al, 2009, Wright and James, 1996). As a result this has driven investors (mainly individual investors) to asset allocations that were converted between money market and capital market with difficulty. Interest rate in terms to the role of cash flow regulation was not obvious and less effects on the stock market volatility.

The second reason was the time-lag and conditionality of stock price to monetary policy, which could reduce the interest rate regulation function greatly, and may even achieved the opposite effect against the monetary policy goal (Mc Kinnon, 1973). The theory effect of interest rate adjustment on the stock market would become clear only through the overall mentality of the market tending to stabilization.

The third reason was the difference of real interest rate and nominal interest rate. Only when the nominal interest rates and real interest rates changed in the opposite direction, real interest rates could really reflect theory effect of impact of interest rate adjustment on the stock market. Nominal interest rates were slashing, due to the fact that the price of commodities fell faster and larger and as a result the real interest rates were likely to remain at high levels.

The fourth reason was the most direct reason affecting stock volatility, which was the relative price of the BOC stock. Early in the development of the stock market, the speculative phenomenon was prevailing and it caused the relative price of the stock of quite a lot of large listed companies to be were higher, and of course BOC was one of them as one of the big four banks. Although after several years of adjustment, the situation improved, but the risk was not completely eliminated. The high stock relative prices weakened the cuts effects, which limited the share price's raise potential when interest rates decreased.

In addition, the excessive speculation and irrational behaviors of the Chinese investors often made stock market volatility deviate from the economic law. It led to the inverse relationship between interest rate and stock price lacking of solid foundation. The stock market could not act as a barometer of monetary policy affecting on the economy, which weakened the effect of monetary policy.

Through the combination of a number of researchers in the theoretical analysis of the stock market in China, it was easy to discover that China's stock market was still a weak form efficient market which meant that the past historical market information was fully reflected in the current stock price. The market had not any rapid response after the interest rate continued to rise; the investors could also get a certain number of abnormal profits. The interest rate was out of action in short term.

Table 2 The VaR Results of Each Bank using Historical Data Estimating Volatility Method

	BOC	CCB	CMBC
Average trading turnovers	29,168,510	38,457,933	61,400,806
σ_{daily}	0.041488%	0.048312%	0.065204%
$\sigma_{500days}$	0.927694%	1.080296%	1.458009%
VaR at 95.00%	19,904.96	30,561.24	65,853.15
VaR at 99.89%	37,052.10	56,888.24	122,582.39

It could be obviously proven that, the daily volatility and yearly volatility of BOC were both less than that of the other two banks. It indicated that once the interest rate was changed, the volatility of BOC stock price and risks of holding share were both smaller than the rest. Although the volatility of CCB was bigger than BOC's, it was nevertheless more closed to it. CMBC volatility, obviously, was the largest one among the three, direct proportional to the risk of CMBC holdings.

For volatility analysis, risks of investing state-owned commercial banks were generally less than investing in private commercial banks. One of the reasons was that the state-owned banks were more cautious on loans compared to private banks, which generally only lent to large projects fostered by state policies or large state-owned enterprises, thus the risk of bad loans was small; vis-à-vis, private banks lending conditions and audit conditions were looser than state-owned, which led to high profit but once interest rates increased it would increased their bad loans risk. However, it is only in 2014, or more recently, when we noticed that Chinese property companies are buying stakes in banks and raising fears that the country's already stretched developers are trying to obtain preferential financing from their lenders (Rabinovitch and Noble, 2014).

According to the analysis of the VaR, this model was mainly affected by two aspects: annual volatility and average trading volume. Observing the average trading volume only and compared with the other two, the average volume of BOC was the minimum, even less than half of CMBC. This was likely due to the fact that the profitability of the banks was relatively lower, and a low volatility led to reduced investment profits, thereby the trading volume per day was small. However, combined with annual volatility, the possible maximum loss was also the smallest, even though under every confidence coefficient -interest rate risk, BOC's was the smallest in the three.

Utilizing Excel Solver to process data under the GARCH(1,1) (Formula 3.8) model and then draw the ω, α, β and daily volatility σ_{daily} , and then use the formula (4.1) to get V_L

$$V_L = \frac{\omega}{1 - \alpha - \beta} \quad (4.1)$$

Then formula 4.2 was used to calculate the volatility σ_{daily} of BOC, CMBC and CCB in 500 days.

$$E[\sigma_{n+k}^2] = V_L + (\alpha + \beta)^n(\sigma_n^2 - V_L) \quad (4.2)$$

It asserted results from above and calculated these banks' VaR through also utilizing Excel. The confidential level was also selected 95% and 99.89%.

Table 3 The VaR Results of Each Bank using GARCH(1,1) Method

	BOC	CCB	CMBC
α	0.0280000000	0.0280000008	0.0280000007
β	0.9590000000	0.9700000000	0.9700000010
ω	0.0000011990	0.0000007000	0.0000005992
V_L	0.0000922308	0.0003500014	0.0002996003
Persistence	0.9870000000	0.9980000008	0.9980000017
GARCH(1,1)	0.044393	0.066544	0.111275
Overall MLE	1618.526468	1549.931285	1405.098037
σ_{daily}	0.920982%	0.920983%	0.920985%
$\sigma_{500days}$	0.92736185%	1.0816653%	1.4594519%
VaR at 95.00%	19,897.83	30,599.98	65,918.32
VaR at 99.89%	37,038.83	56,960.35	122,703.71

The results above clearly proved the fact that, using the VaR model that was based on the GARCH(1,1) in order to calculate data, could basically reflect the similar characteristics to the former method. It could be said that the use the two methods in calculating the volatility of stock price was in both cases effective. The confidence was higher, the range of probability was greater, and then the probability of the biggest losses that the banks suffered was bigger.

There were great different values of daily volatility between using historical data method and GARCH(1,1). The first reason should be that the calculation principles were discrepant: the former only focused on the daily stock return μ_i and used standard deviation as the annual volatility; although GARCH(1,1) also used μ_i , it introduced parameters to anticipate the process. Another reason was that they used different formulas to compute the daily volatility: the former only depended on

annual volatility, but the latter not only depended on annual volatility but also depended on the coefficients.

In addition, the influence of interest rate changes on BOC non-performing loans rate was also evident: as interest rates rose, the opportunity cost of loan would be expanded, the difficulty of the enterprise repayment and default risk would increase, thereby causing the ratio of bank bad debts would increase; As interest rates declined, the opportunity cost of lending shrunk inevitably thus causing BOC's bad debts rate to drop down.

But, due to the fact that BOC carried a lot of obligations regarding policy loans and strict systems of examination and approval, it therefore usually only lent the enterprises that the government would pay for, just as any other nationalized commercial bank in China did. These enterprises were large enough, which did not allow them to have measurable sensitivity to interest rates basically. In this case, when interest rates rose, the difficulty of the enterprise repayment became bigger and caused delinquency rates get higher in private banks than BOC. All in all, there was still a weak relationship between interest rate and BOC risk. However this cannot be extended to the other two banks that may encounter due to their risk higher NPL (non performing loans) levels in the near future.

CONCLUSION AND RECOMMENDATIONS

It appears there was not a direct influence of interest rate on BOC profitability because the funding gap and duration gap controlled by managers could change the profitability of bank in general, while the results of the research confirm this also. Due to the fact that the influence of the interest rate on stock price was based on a variety of external factors, there was an ordinary correlation between interest rate and stock price. The volatility and value-at-risk of BOC were both smaller than of the other two banks. It indicated that the investment risk of BOC was lower than others and that BOC looks safer than the other two banks.

How does the Chinese interest rate liberalization impact the development of BOC on its profits?

Interest margin occupies an important position on the main profit of BOC at about 70%, because of the wide interest rate spread (Hong et al, 2013), the low social welfare level of the Chinese population, the segregation of financial business, China's underdeveloped capital markets and fewer financial instruments.

These factors create high NII proportion of the operating income collectively. Due to the fact that there is not a direct relationship between interest rate and NII and equity and that the two variables can be adjusted by funding gap and duration gap respectively, managers therefore are able to change the character and size of the two gaps either together or respectively in order to fit the change of interest rates so as to influence the ROE used to measure BOC profitability (Gup and Kolari, 2005). Comparing

to CMBC, BOC can adjust the gaps beforehand, the reason may be BOC could get the information in advance as a state-owned bank and it has to adjust early as a large size bank, despite time lags.

How does the Chinese interest rate liberalization influence the development of BOC on its stock price?

According to the results of Spearman Correlation (Appendix 1), the coefficients between each of the two banks are about 99%. This means that once a bank stock price is increased, others stock prices will follow. This phenomenon is more obvious between the state-owned banks. The changes in interest rates impacting on BOC stock price volatility indeed exist, but the number is very small. The reason is that there are still other important factors influencing the BOC stock volatility, such as interest rate control, real interest rate, relative price, investor expectation and behaviors, weak market efficient form and time lag effect of monetary policy (Cheng, 2007).

In addition, compared with the private bank CMBC and with the nationalized bank CCB, the volatility of BOC stock price is smaller, which means that the price volatility of the BOC share is more difficult to be influenced by external factors than the other two banks. The GARCH(1,1) results show that the persistence of each bank was about 99%, which illustrates that the volatility of interest rate exists in a long-term impact on the volatility of stock price.

How to identify and measure the interest rate risks of BOC?

The results of VaR clearly proved the fact that, by using a VaR model that is based on the historical data and GARCH(1,1) it reflected the similar characteristics, which showed that both methods used to calculate the volatility of stock price are effective. Risks of investing state-owned commercial banks are generally less than that of the investing private commercial banks. The reason is that the state-owned banks are more cautious on loans compared to private banks and only lend to large projects fostered by state policies or large state-owned enterprises, thus the risk of bad loans is small.

Comparing BOC's VaR with that of the other two banks, the reasons of minimum average volume of BOC include low volatility of stock price and low profitability. Besides, the higher the confidence level the greater the range of probability, and then the higher the probability of larger losses that banks will suffer. In addition, the rise of interest rates also causes the increase of the ratio of bank bad debts. But the bad debts extent of BOC was lower than private banks because it was under control of government.

Conclusions about the research hypotheses

There are indeed existing impacts of interest rate on BOC profitability, stock price and stock volatility though indistinctive.. The correlations among the banks' share prices are very strong, but it cannot indicate that it is all about the interest rate. The high persistence of each bank illustrates that, the banks stock price volatility impact on interest rate is long-term and is not changed easily in the short run.

Due to the Chinese complex financial environment, immature investors' psychology and other multiple important variables acting together, the influence of interest rate is very unidentified and difficult to be measured. Finally, compared with private banks, BOC has a relative low market risk which depends on strictly enforcing the monitoring systems, the latest inside story, and the bank looks to be more cautious on offering loans, as a state-owned bank.

Recommendations

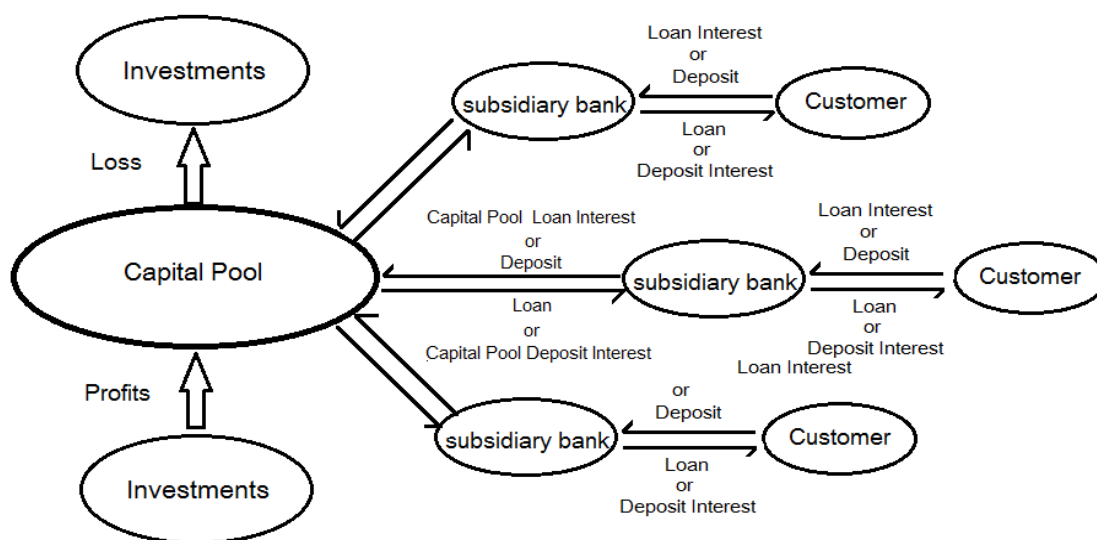

The suggestions include two main aspects which include the increase of its earnings and the control and reduction of risks in line with the analyzed elements, as follows:

1. *Increase earnings* may include the increasing of income and the reduction of expenditures. However, both employ different strategies:

1) Reduction of the costs and losses from the capital pool

BOC uses capital pool to manage all the subsidiary banks capital uniformly in long-term duration. The BOC subsidiary bank must save deposit money from customers into Capital Pool to get capital interest deposit interest (part of subsidiary bank incomes) and take out money from it to provide loans to customers and also they need to pay capital pool loan interest (part of subsidiary bank expenses). The whole process is shown as follow:

Figure 2. Operating Process of BOC's Capital Pool

As the diagram indicates, the net interest incomes spreads of subsidiary banks equal to "loan interest - capital pool loan interest - deposit interest + capital pool deposit interest". This measure might be good for mitigating risks, but it will cause the decrease of the income of subsidiary banks and the increase of operating costs. Therefore, BOC should optimize the capital pool strategy to increase the real net interest income of subsidiary banks.

2) Optimize loan structures

Because the bargaining power of small, medium and micro -sized enterprises are lower than that of large high quality loan customers and therefore the loan interest rates pricing for small, medium and micro -sized enterprises are higher than large high quality loan customers. This is one way to improve the profit of BOC. In order to decrease the influence of interest rate adjustment to the profit as much as possible, BOC should deversify more efforts to developing the intermediate and derivative business rather than interest income related.

3) Other measures

BOC may strengthen pricing management and improve pricing level, not only should further implementation of fine management complete the costs and benefits of accounting, but also it should have risks pricing power based on the credit risk, market risk and operation risk, so as to work out the rate interval you could handle, for the final deposit and loan interest rates pricing to provide technical support to prevent blind competition. BOC should also continue to develop the financial derivatives innovations.

2. Control and reduce the risks refers to three key strategies of BOC:

1) Scattered loan to spread out risk

In the past BOC was only lending loans to large state-owned enterprises which needed a lot of money and whose loan life was very long. Due to current circumstances these enterprises are restructuring a self-sustaining economic model. Thus this situation leads to high risk in terms of the repayment of the debt. BOC should begin to change the customer structure, from large and high bargaining power enterprises transferring to small, medium and micro-sized enterprises.

2) Operational risk management

The bank must continue in promoting the New Basel III Capital Accord operational risk project implementation, complete the bank operational risk management system, optimize the operational risk management information system, promote the integration of group operation risk monitoring platform construction, develop the operational risk management evaluation and capital measurement and improve the meticulous management. (Mihai Yiannaki , 2012).

3) Capital management

BOC needs to accord the medium and long-term capital planning requirements of the group to strengthen internal capital management, optimize the assets structure, in order to make the capital base further compaction. It should also continue to strengthen the capital management, improve the capital budget precision and efficiency, control risk asset scale reasonably, reduce the average weight of risk assets in order to realize the transformation from capital consumption to capital saving and promote the sustainable development of business.

In addition, it should increase the comprehensive benefit evaluation efforts, improve the weight of capital return index in the performance evaluation, guide the branch institutions and business department to develop the comprehensive benefit of higher capital take up less business preferentially, improve capital efficiency, to go “light capital” development way (Rose and Hudgins, 2012).

RESEARCH LIMITATIONS

As an empirical research paper, there must be some limitations that cannot be conquered. First of all, although this research focuses on the interest rate, it ignores the influence of inflation on the interest rate. Real interest rate is the real impact index of financial market behavior and banks profits.

Secondly, there is insufficient accuracy in the application of calculation formula and models. ROA, despite its small values should be used to analyze the impact of interest rate on profitability instead of ROE, because ROA could overcome the drawbacks of ROE, although there may be other off balance sheet activities involved in the creation of the NII (Gup and Kolari, 2005, and Crojé and de Beer, 2010). Besides, there are shortcomings in using GARCH and VaR to measure volatility and risk of banks (Sensarma and Jayadev, 2009).

Thirdly, because the Bank of China has been listed on the Chinese Stock Exchange since 2006, the data used to analyze is so limited that they cannot illustrate the conclusion of the research adequately. In addition, considering the reliability of the lack of data in the sample selection issues makes the peak data bigger and the results are dispersed and not obvious.

Fourthly, the data come from secondary research which sometimes cannot express the authenticity and integrality but always tend to the policy of government, which leads to an inaccurate conclusion of the research.

In addition, this research ignores the relationships among profits, stock price and risks but analyzes these aspects separately, as per Lobo (2000).

FURTHER RESEARCH

According to the limitations of this research and in order to make it better through further research, it could be indicated that there are three aspects that can be of great assistance: establish the precise models and select the appropriate sample for data analysis, join the two factors inflation rate and real interest rates instead of the nominal interest rate to study the relationships between interest rate liberalization and performance of BOC; pay more attention into analyzing the interrelation and interaction between and among the banks' profitability, stock issues and risks (Mihai Yiannaki, 2013).

NOTES:
1. Use Solver to set the value of \$O\$6
2. By changing \$O\$1:\$O\$3
3. The constraint is that \$O\$4 <= 1.
4. Click on "Options" and select Assume ?

A SUSTAINABLE EUROPEAN MODEL OF LEADERSHIP, INNOVATION AND MANAGEMENT IN THE HEALTH & MEDICAL CARE SECTOR

Mihoreanu, Larisa

The Bucharest University of Economic Studies, Romania

ABSTRACT

The general objective of the large research is to identify and assess the characteristics, limitations and opportunities related to managing legal performing and sustainable businesses in the field of Health & Medical Care sector in order to build a new, innovative model, assuming that policy design is indeed an important new area of design there are implications and opportunities for the design community needs and business models. The specific or task objectives of the research program are the following: • highlight the role of the Health and Medical Care sector in the development of a sustainable growing economy, as mentioned in further more detailed objects and topics; • explore the application of health services management in the world and Europe; • understand the structure of health systems in the context of a multicultural region, in order to see the contributions that they bring to the maintenance and improvement of the population's health state; • analyse the dynamics between the various components of the health systems in different regions; • understand the concept and dimensions of Health system performance; • explore national, organizational, provider, and patient interventions to improve the performance of health systems; • provide some guidelines to policy makers based on the lessons learned from the outcomes given by the different models and systems analysed within the context they were implemented in.

Keywords: *bio leadership, sustainable development, healthcare sector, pharmaceutical industry.*

The contemporary social and business environments are characterized by ongoing economic crisis and unsounded structural changes manoeuvred with austerity. Various sectors of activity make laboured effort to cope with internal causes and external forces during a long and difficult process to improve efficiency, competitiveness and profitability. As the entire economy the health sector requires sustainable complex growth in all fields of market and society, depending on macro indicators as they look at the moment. [Nature Reviews, vol. 11. p.3] [NHS Commissioning (2012) Developing the NHS Commissioning Board, p. 1-3]. The main line of reasoning resides in the complex the health care sector should play for all socio-economic, institutional, societal and political fields and operations. A reasonable good health is an indispensable requirement for the human welfare and has to be sustained

by economic and social development in order to be able to sustain the good systems health and support the humankind rights. The Articles 25 of the Universal Declaration of Human Rights states *“Everyone has the right to a standard of living adequate for the health and well-being of himself and of his family, including food, clothing, housing and medical care and necessary social services, and the right to security in the event of unemployment, sickness, disability, widowhood, old age or other lack of livelihood in circumstances beyond his control.”*

Despite the fact the European Union Area is positioning in the top regarding the care for health towards its citizens, there are still lots of differences to be amended at regional levels. Also will be important to understand the European health system role and position in attracting new people, creating new value through innovation of new treatments, investing in science and research, develop new therapies with high impact on the population.

Health systems' performance varies from one country to another, but the discrepancies factors are not known enough. The Governments, the keepers of the health care systems, are more focused on the public care while disregard the private one. The history of health systems is not a longer one, dating from the century 20th but its evolvable rate is much higher. Western Europe used to be at the forefront in founding national health systems to protect its workers [Department of Health <https://www.gov.uk/government/organisations/department-of-health>]. Such models were progressively externalised to other countries; therefore the present project is an attempt to better understand this transformation and to capture the present state of the art in order to predict the next state that will respond better to the needs of the patients today and tomorrow.

In Europe, Britain was the first in 1948 to set up a National Health Service (NHS) which kept its name until today, just after attempts made by Russia (1917) and New Zealand (1938) the same year when the Universal Declaration of Human Rights was finalised. For that reason the British system will be one of the systems that will be the focus of this project as it set an international example [Chatora R, Tumusiime P Health Sector Reform and District *Health Systems*, Jan 2004; 13-40].

The UK healthcare system [Department of Health <https://www.gov.uk/government/organisations/department-of-health>] is in the hands of the British Government for England only, and under the responsibility of Scottish, Welsh and Northern Ireland Executives respectively due to their devolved administration systems, each has their own model of public-private funded healthcare. The general taxation is providing the funds to the UK citizens and offers access to a public healthcare, and for that reason offering also a good system for pooling risks.

At a glance, the Western European countries' health systems are highly structured, have efficient systems for taxation, strong regulatory framework and sufficient employees in their institutions within a fairly stable political or economical environment. In England, in April 2013 a new health and

care system became operational. Highly ambitious, its purpose relies in the Health and Social Care Act. At a national level: NHS England, Public Health England, the NHS Trust Development Authority and Health Education England will take on their full range of responsibilities [Department of Health <https://www.gov.uk/government/organisations/department-of-health>]

Medical care Management necessitates urgent modifications and originative implementations of a matching reform. This will come along with a collateral study of what happens on the Pharmaceutical market, there where the research and development activity remains the wellbeing bases for all nations. Nevertheless, the focus of this project remains the finding of the best answer to the question of what is the best for medical services delivery - through public or private providers and what the appropriate mix of financing mechanisms: government expenditure, out of pocket, or various types of insurance

The pharmaceutical industry is also confronted with challenges such as intellectual property protection, advancing candidate drugs to the next milestones, regulatory compliance. To maintain income despite underperforming research and development (R&D) portfolios, rounds of mergers and acquisitions have occurred such that only 11 of 42 members of PhRMA existing in 1988 now survive [Nature Reviews, vol. 11. p.3]. A first consequence of all this change resides in reordering of the top ten pharmaceutical companies as ranked by market capitalization, although eight of the top ten companies in 2001 were still in the top ten in 2011.

The pharmaceutical industry is currently facing the key challenges of declining R&D productivity, higher barriers to commercial success for innovative drugs and substantial imminent losses of revenue from successful products due to generic competition. Awareness of these challenges has catalysed — and continues to drive — considerable reorganizations in the R&D structures of large pharmaceutical companies.

Among the goals of such reorganizations has been the promotion of the type of entrepreneurial culture and behaviour that is considered to thrive in smaller biotechnology companies [Nature Reviews, Vol. 11, p. 5] in the hope that this will increase R&D productivity. Indeed, industry observers have attributed some of the present crises in the pharmaceutical industry to the discouragement of entrepreneurial behaviour by limitations inherent in the unwieldy bureaucracies that can proliferate in large pharmaceutical companies [Nature Reviews, vol. 11. p. 17-18]. Interestingly, an assessment of the value of small biotechnology companies was driven by the innovation and science in the one or two products moving through their pipelines [Nature Biotechnology Vol. 22, p. 1215 – 1217].

The role of middle managers — defined as those individuals in large pharmaceutical companies who are not at the executive level but who lead large groups or departments and have considerable responsibilities for the successful conduct of projects and programmes — emerged as an important

concern in the productivity of discovery units, even more so than in the case of development. One of the distinguishing characteristics of the biotechnology researchers refers to their closeness to science and their desire to retain the proximity [Nature Biotechnology Vol. 22, p. 1215 – 1217]. However, in other large pharmaceutical companies, excessive concern with milestones often detracts from the ability of research teams to remain close to science [Nature Reviews, vol. 11. p.3]. In the following five years, similar to the recent past, society will face dramatic changes, will witness a big loss in the market capitalization in the pharmaceutical sector because of the fact that the patent protection on today's blockbuster drugs will disappear and, with that, the big profits for the "Large Pharma" companies [Nature Reviews, vol. 11. p. 17-18]

Challenges can be found when trying to find treatments for more complex disorders such as cancer, obesity, mental disorders and others such as orphan conditions which are called rare and are mainly unknown for the health care professional and completely lack of treatment. [Nature Reviews, Vol. 11, p. 5] [NHS Commissioning (2012) Clinical Advisory Group for Prescribed Services Final Recommendations, p. 1-227] These conditions, not easy to understand and manage, require more consideration to avoid unimaginable consequences.

Innovation is apparently the key solution but it necessitates a favourable environment that can support the *take-off* of new ideas and their successful implementation, and will not destabilize or hinder the entrepreneurial energies [Nature Reviews, Vol. 9, p. 683-689]. Nowadays new challenges test the health and medical care sectors pressuring the need to adapt for better serving patient have needs, and diminishing the society costs burden.

Some of these new challenges are coming from the emerging markets with big needs of investment in their Health Care infrastructure. Considering this, the evolution of today society accentuates also the importance of ICT serving the health care but not as an outcome *per se*, but as a mean in improving the living conditions of society as a whole or for segments of society. The main objective in developing and implementing ICT products is to assure the increase of the quality of life and social development.

Another challenge is represented by the treatment of the specific conditions and the lack of appropriate management and public policies in the field. In the meanwhile we don't have to neglect that the evolution of nowadays society underlines the importance of information and communication technologies (ITC), not as a result *per se*, but as means of improvement of the living conditions which depend on both socio-economic aspects and the life style the man adopts. This is the reason why health related quality of life remains an indicator to take into consideration more and more within the set of measures regarding the efficiency in health care.

The nature of the diseases changed towards more complex and new conditions emerged and increased their incidence within a growing global population in such a way that what was rare before,

starts to be recognized more often and needs particular care and new innovative treatments. Present interest in the potential of translational medicine to find 'the right drug for the right patient' requires the integration of several activities. These include the search for biomarkers that not only help to select compounds at a preclinical stage, but also help to predict, stratify and monitor the patients and subgroups who will experience the requisite efficacy of the compound and an acceptable level of adverse events. To achieve this, collaboration between research and post marketing surveillance groups is also highly necessary. There is also a high need for a personal touch with the new model of customised medicine even for complex diseases like cancer. Ageing populations represent a new challenge for the society due to the age specific related conditions such as diabetes, hypertension, arthritis, dementia, and various form of cancer.

Establishing and maintaining an entrepreneurial culture during drug development is perhaps easier than during the research stage as the activities associated with this later phase are closer to product realization and clinical application. The inherent sense of urgency associated with the development stage is driven by the competitive environment, in which time to market with a differentiated product is an important determinant of success. Thus, the creation of special product teams for individual efforts and for therapeutic franchises, which are called by development and commercial leaders, is more likely to foster the entrepreneurial behaviours we have identified, such as ownership, outcome focus, passion and conviction, and the ability to recruit the best people. During the research stage, however, entrepreneurial behaviours are often compromised by several characteristics. These include:

- increasing size and complexity of any research groups;
- larger portfolios and a focus on increasing the number of 'shots on goal';
- focused middle managers on timelines and portfolios, instead of science, technology and leveraging external knowledge;
- influence on the commercial department (too early in the process);
- the evolving science and technology impact on organizational complexity;
- possibility of alignment between Head of R&D and CE.

As previously said, the aim of this project remains focused on studying the needs, expertise, resources and limitations of the different actors: pharmaceutical industry, hospitals, and patient associations, regulatory bodies in the Health & Medical Care sector, academia, and to offer a sustainable model of innovation, leadership and management that will better answer the needs of today's patient at the European level [Vasile, A., Mihoreanu, L., Bondrea, A., An Insight into the Rationality of Economic Entities: Emerging from Crises with New Approaches to Social Sciences, 6th EMRBI Conference Estoril, Portugal, 23-24.09.2013][Vicious, T.G., Mihoreanu, L., Groan, L. (2013) Contemporary "Homo Economics": Defining Wellbeing at the Crossroads of Economic Growth and Business Ethics, The 6th ERMBI Estoril, Portugal, 23-24.09.2013]. The major job is to take out some of the error from the trial-and-error process of drug discovery and management, so that the same level of expertise or resources

that big companies have at their disposal be put at a general disposal onto a large model/portal/platform. The model's aim will be to bridge the clinical needs to the scientific discoveries from the public domain or industry within a Public – Private partnership [J., Bessant, J. (2011) *Managing Innovation: Integrating Technological, Market and Organizational Change* (John Wiley & Sons, 4th Edition: London)]. The evaluation of the social impact of new technological configurations will also be based on a theoretical conceptual framework, gathering the Compendium of Approaches for Impact Assessment of ICT-for-Development Projects (ICT4D) of Heeks, Molla (2009) and Gigler's studies on evaluation framework based on the capability approach (2004) and on 'informational capabilities' (2011) perspectives.

The final research approach will be a multidisciplinary one, at the borderline between different diseases, adequate pharmacology, entrepreneurial methods implemented, managerial theories and practices and ITC methods all having multiple effects on the quality of life. Under such a frame the wealth will not be considered as an issue but the distribution of wealth is! This way, the innovative process will translate through science into new commercial drugs and make recommendations to policy makers focusing on the need to implement a sustainable model which will add value to the society by improving patients' health and most importantly their quality of life.

ABSTRACT

As the amount of debt has gradually increased, particularly in recent years, Portugal is currently one of the European countries exhibiting one of the highest levels of overall indebtedness, including in both sovereign and private sectors. Indeed, this condition is the outcome of increasing levels of debt assumed not only by the government, but also by companies and families, being the later mostly due to mortgage loans and due charges. This paper focuses on the study of borrowing by Portuguese households. The research has been made in respect to the notion of debt, the consequences of recent developments in debt, among other factors. In order to analyze the factors that are most associated with debt, a study was developed using two multiple regression models, one using a longer time series and another shorter, evaluating the effect of several variables, such as consumption, savings, unemployment, inflation and interest rates, in order to check whether they could be associated with a higher level of debt.

INTRODUCTION

In less than twenty years, Portugal increased from a leverage ratio of just over 18% in 1990 to a rate of 130% of disposable income in 2007 (Frade, 2003). This was one of the highest increases in the rate of indebtedness of the European Union's countries. Although this data does not serve to indicate the risk of default of families allows, nevertheless, to show how the Portuguese were able to take advantage

during recent decades of favorable conditions associated with the opening of the credit market and the sharp decline in interest rates, the rising real incomes and improvements in the labor market that have led to a significant decline in the unemployment rate.

However, with the recent reversal of the economic cycle, the Portuguese population lives now difficult days and is faced with gloomy news about the state of the Portuguese economy; rising taxes, rising unemployment, cuts in subsidies, reductions in wages among other things, that the Portuguese people have to cope with. This situation is strongly associated with unbridled consumption experienced in recent years, which led to indebtedness of Portuguese Families. For many families the credit is a way to manage a short income budget, resulting in families that give use to credit cards and end up spending more than what they actually earn. It is for this reason that they have been living in standards far beyond their means. These factors have now led many families to renegotiate their loans leading many other to a situation of insolvency.

This status often creates a vicious cycle of debt since, after contracting a loan, families tend to have difficulties in settling this to respond before their financial commitments, so they tend to repeat the process, contracting new loans even leading to situations out of over-indebtedness (outstanding principal and interest value greater disposable income). The rapid accumulation of debt by households also justifies increased monitoring of their ability to repay loans. If the ability to continue to pay the debt on a regular and timely is particularly affected and a significant number of families fail to repay their loans, there may be consequences on financial stability in two main parts. On the one hand, on the financial situation of households own. On the other hand, from the point of view of the parties providing the credits. The current condition of the Portuguese financial sector portrays very well this consequence.

This study aims to determine the determinants and effects of borrowing by Portuguese Families. For such, several topics are researched, such as the concept of debt, debt indicators in Portugal, explanatory theories of debt, the factors influencing the debt will be studied; the effects of debt/debt in the economy, and finally analyzing whether the factors influencing the debt are negatively or positively associated. Household debt results from imbalances between receipts and expenditures of households, ie the result of mismanagement families with what you earn and what you can spend. However, debt is also related to loans that are granted to households, since we live in an era in which credits are made immense, often credits in order to pay other claims are also made. Thus, the problem of indebtedness arises when families can not meet their obligations.

DEBT FRAMEWORK

According to OCR Macro (2001), it is argued that although there is no common European definition of indebtedness, this can be defined as the result of an imbalance between spending and consumer income, thus leading to a failure to make payment under a or more debts, ie when the level of debt is unsustainable. The debt has been the subject of several studies in recent decades. This has been understood as a multifaceted behavior, since it had the contribution of various disciplines such as psychology, economics, sociology and political science. Indeed, according to Lea, Webley and Levine (1993), contract or having debts is not only related to economic variables, since these authors were studied by social and psychological variables to justify the debt, such as social support debt, styles financial management, consumer behavior, among other variables.

For Friedman (1957), one of the bases of the indebtedness theories is the theory of permanent income. This theory explains consumer behavior in relation to consumption and the formation of expectations. This considers the permanent income as a proportion of income that people consider in the future and maintain transitional income as the deviation of current income relative to permanent. According to this author the permanent consumption is defined by consumption that is planned by individuals, the transitional consumption results of specific factors in life such as job loss. This theory argues that the consumption plan of individuals depends on their expectations regarding permanent income, having a key role in making financial decisions.

Authors such as Modigliani and Brumberg (1954) and Wärneryd (1989), argue that the theory of life cycle is another perspective to explain consumer behavior. This theory is based on two assumptions which are: "individual behavior is oriented to the future"; and individuals optimize their resources throughout life; when you are optimizing their resources lifelong, individuals are sensitive to changes in interest rates; this income is an indicator of what the future will yield. Thus, individuals are rational economic actors, ie individuals who trace their financial behavior for the future in order to maintain a pattern of stable life. Young individuals tend to borrow at midlife settle debts incurred in the initial phase of your life and start worrying about the savings, so use them in retirement to maintain a stable standard of living (Modigliani and Brumberg 1954).

There are several factors that, according to several authors, influence the debt (eg Raaij and Gianotten, 1990). According to Raaij and Gianotten (1990), the people with higher income spend and contract more loans and show a greater propensity to use credit cards. In the study by Boddington and Kemp (1999), they found that the sex of the individuals also influences the debt. These authors found that men have higher amounts of debt to women. To Godwin (1998), the household size is another factor that is related to the increase in debt. The marital status of individuals, according to Kinsey (1981), is also related to the debt, because the study was carried out by these authors concluded that when one

is married, spending on credit cards are higher. According Lea et al. (1995) when a household is composed of a greater number of children of this household debt is higher, thus the number of children is another factor influencing the debt.

The educational level is indicated as another factor, as referred by Canner and Lockett (1991), and Lea et al. (1993), that influences the debt. These authors argue that households with less schooling and households with a higher level of education tend to have more debt relative to income. Cameron and Golby (1990) argue that age is negatively correlated with the amount of debt held by households. The debt is related to the life cycle in which it is the aggregate, since the financial commitments usually increases with age, and older individuals are more likely to have higher than younger individuals debts. Another factor that is related to debt are the attitudes to credit cards, since individuals who have a favorable attitude to credit cards have a higher likelihood of having multiple cards, have a higher level of indebtedness and are more subject advertising (Chien and Devaney 2001; Davies and Lea 1995). Social class, according to Solomon, Bamossy and Askegaard (2002) influences the debt, because when the individual belongs to a higher social stratum, believes that it is more advantageous to use credit to purchase luxury goods than those who belong to middle class or casualties. Bird, Hagstrom, and Wild (1997), argue that the employment situation is also strongly linked to debt, since the employed people tend to have a greater number of debts of the unemployed.

Factors influencing on debt

Braucher (2006), argues that excessive debt can be understood through two factors, cultural factors and structural, as can be seen in the following table.

Structural factors	
1. <u>Credit supply</u> - Legal framework; - Promotion Techniques of credit risk management and credit available to credit institutions.	2. Seeking Credit -Insecurity of income / wage stagnation; -Reduced social protection in sickness, unemployment and disability;
Cultural factors	
3. <u>Affect supply</u> - Ideology of market liberalization; - Culture of indebtedness; - Marketing to the over-indebted; - Having as target the over-indebted; - Explore the minorities have been excluded from traditional banking.	4. <u>Affect demand</u> Culture-satisfaction of needs and desires; -Development of expectations regarding future income by individuals (media influence); -Debt is more accepted and considered normal; -Savings is becoming less common; -Cognitive biases (eg, optimism)

Source: Adapted from Braucher (2006).

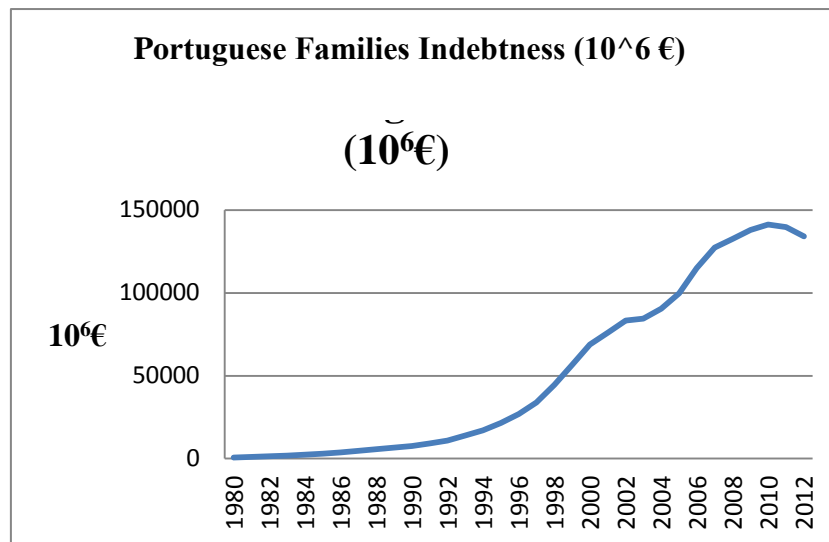

Table 1 - Structural and Cultural Factors Influencing Over-indebtedness

The large increase in debt by households, according to Worthington (2006), constitutes a threat to the welfare of this, which leads to a successive increase of the debt in default and many orders of insolvency or over-indebtedness, this has been more sense in Western societies. This is a situation that entails a greater number of consequences for the individual and undermines your budget or your household balance, which leads to strong implications for social and psychological level these individuals, leading to an increased level of financial stress Worthington (2006). Once the economic and social consequences of over-indebtedness are important is essential to analyze the trend of debt and proceed to study the nature and extent of over-indebtedness. In addition to the implications for society, one can not forget the problems that over-indebtedness leads to the real sector of the economy, because the increase in cases of families unable to meet their financial commitments affect levels of trust necessary for the normal functioning of credit market.

The study of over-indebtedness of households, can be done from two perspectives, namely the microeconomic and macroeconomic perspective (OEC 2002). Studies of microeconomic origin, household indebtedness, are very important at the present time, due to the high level share of this sector and the increase of the breaches. This work studies the individual data of concrete, broken households by socio-economic characteristics, with the aim of assessing the extent and nature of the cases. The use of macroeconomic aggregates using data to establish through empirical models, the relationship between the number of cases of over-indebtedness and the evolution of certain socio-economic variables may be regarded as a solid approach according to existing literature.

The portuguese Debt case

Over recent year, according to Faria and Noorali (2004), the indebtedness of Portuguese Families increased a dramatic pace. A value of about 20% of disposable income in 1990 to 40% in 1995, arriving in 2004 to reach a value of 118%. For Flour (2007), this large increase was predictable and can be understood as part of the catching-up process. During this period the sharp decline in the rates of nominal and real interest, the abolition of some legal barriers as well as the climate of increased competition between banks, provided access to credit to a broader set of households compared to the previous decade.

The large growth of household indebtedness, according to the Centre on Consumer Debt, CSG (2002), reflected the rational adjustment of families and alterations to credit institutions, both supply-side and demand-side credit. On the supply side, the liberalization and deregulation of the Portuguese financial system and the consequent increased competition in the credit market have led institutions to invest in the segment of loans to individuals with low levels of debt. On the demand side, changing cultural patterns, the decline in interest rates, the increase in disposable income and the containment of unemployment have also promoted the growing indebtedness of Portuguese Families.

Over the years the public debt of countries has increased in most advanced economies and this trend was accompanied by a dynamic GDP growth. In many countries, including Portugal, public debt increased, on average about 30% of GDP in the sixties to just over 60 % of GDP in the last decade (Rother and Westphal, 2012). As the debt increases is important to analyze the economic impact as well as the strategy to exit the crisis. For Reinhart and Rogoff (2010) the debt in peacetime can be considered more problematic for the future growth of an economy, since the debt tends to be persistent for long periods of time compared to the explosions of debt in times of war. These authors argue that the economic and financial crises are conducive to contribute to the accumulation of public debt. The financial and economic crisis that has come to feel since 2008 has placed considerable strains on the debt and in general on the public finances of the euro area countries. The ratio of the budget deficit in the euro area increased rapidly from 0.7 % of GDP in 2007 to 6 % of GDP in 2010, while the gross government debt rose from 66% to 85 % of GDP in the same period.

According Rother and Westphal 2012, the literature on the relationship between public debt and economic growth is scarce, but has gained great importance. However, the existing literature points to a negative link between the ratio of government debt to GDP and the growth rate of steady state GDP per capita. However, some endogenous growth models show that it may be possible there is a positive impact on the transition to the steady state, depending on the type of public goods financed with debt.

In the study by Reinhart and Rogoff (2010), where we analyzed the evolution of public debt and the rate of GDP growth over more than two centuries, they concluded that there is a long period for a weak relationship between public debt and growth debt/GDP below a threshold of 90 % of GDP and above this threshold, the ratios average growth rate falls by one percentage point.

VARIABLES THAT INFLUENCE THE INDEBTEDNESS

The indebtedness of Portuguese Families can be influenced by several factors, as previously mentioned. However at this point the variables (or factors) that will be used in the case study, what more can influence household debt, and the following are presented: Income of Families Portuguese; Savings of Portuguese Families; household consumption; the unemployment rate; the inflation rate; the interest rate; GDP.

ANALYSIS MODELS DEBT

Methodology

Household debt has been a major obstacle in resolving the deep economic and social crisis that Portugal is going through. Given this situation it is intended, at this point, make a study on the indebtedness of Portuguese Families, ie analyze which determinants and effects of borrowing by Portuguese Families. For this one goes to use two statistical estimation models.

Samples and Models

For this study will resort to an econometric model that has as dependent variable the "Indebtedness of Portuguese Families", a separate component, called the constant (β_0) is not influenced by the different explanatory variables. This study consists of two models, the first model where observations total 33, while the second model consists of 10 observations. Statistical data are presented as a time series. The Model 1 consist of six independent variables as the disposable income, savings accounts, the private consumption the unemployment rate, the inflation rate and the interest rate. The Model 2 consists of four explanatory variables being the disposable income, the rate unemployment, the interest rate housing loans to GDP. In order to study, interpret and analyze the data contained in gretl software, a statistical model, the OLS model will be used. The main problem consists in estimating the model that is best suited to the characteristics of the subject in question, ie the "Indebtedness of Portuguese Families".

Hypotheses to be tested

At this point we want to identify those factors that may influence the indebtedness of Portuguese Families, using the development of hypotheses. Thus, one can formulate the following research

hypotheses, for Model 1:

H1: The disposable income of individuals is positively associated with household debt.

H2: The savings is negatively associated with household debt.

H3: Private household consumption is positively associated with household debt.

H4: The unemployment rate is negatively associated with household debt.

H5: The inflation rate is positively associated with household debt.

H6: The interest rate is negatively associated with household debt.

Regarding Model 2, we intend to test the following hypotheses:

H1: The disposable income of individuals is positively associated with the indebtedness of Families.

H2: Interest rate housing loans is negatively associated with the indebtedness of Families.

H3: Unemployment rate is positively associated with the indebtedness of Families.

H4: The GDP is positively associated with the indebtedness of Families.

Analysis and discussion of results

Univariate analysis

Over the years the indebtedness of Portuguese Families, measured in this study through borrowings by them, has been increasing steadily and quite sharply since 1980. But it was from the year 1992 we noticed the most increase in debt. Regarding household consumption, this has also increased over the years he has had a more significant increase from the year 1989 with the value 28.3046 billion euros, though there was a decrease in the last two years under review. However, variables such as savings, the unemployment rate and inflation rate fluctuations have had quite a few over the years under study, and saving a larger peak in 2012 with € 14,452,500,000, the inflation rate in 1984 with 28 38% and the unemployment rate also in 2012 with 16.80% (as can be seen in the following table). Regarding the performance of individuals, these have gradually increased during most of the years under study, with a decrease in recent years.

Descriptive Statistics, using the observations 1980 - 2012				
	Average	Minimum	Maximum	Standard Deviation
End_	51626,3	26849,0	729,000	141210,
Rend__Disp_	46428,0	45368,4	4399,33	86694,4
Poup	7736,34	8305,30	1230,40	14452,5
cons	60768,6	60819,8	3145,21	114957
Tx_des	0,0728047	0,0669218	0,0401534	0,168058
Tx_inf	0,0814515	0,0422000	-0,00830000	0,283800
Tx_juro	0,0919697	0,0700000	0,000000	0,250000

Table 2 - Descriptive statistics

Bivariate analysis

By analyzing the correlation matrix it follows that the dependent variable is more correlated with saving, consumption and the interest rate, ie the increase of these variables is involved with the study variable. However, it also appears that the use is related to the interest rate and the rate of inflation and the inflation rate is related to the interest rate.

Correlation coefficients using all observations 1980 - 2012							
End_	Rend__Disp_	Poup	cons	Tx_des	Tx_inf	Tx_juro	
1	0,7678	0,8189	0,9465	0,6686	-0,7105	-0,8607	End_
	1	0,6346	0,7032	0,5997	-0,5662	-0,6304	Rend__Disp_
		1	0,9129	0,509	-0,8423	-0,8833	Poup

				1	-0,2598	-0,3758	Tx_des
					1	0,9276	Tx_inf
						1	Tx_juro

Table 3 - Correlation matrix

Multiple regression analysis

Given the variable under study, the indebtedness of Portuguese Families of two multivariate analysis models were constructed to sustain the developed theoretical concepts and hypotheses as defined.

Analysis of the estimated model (model 1)

The estimation model that is presented below was estimated by the method of least squares (OLS). Thus, the following model was obtained:

$$\text{End}_- = -34230,8 + 0,193254 \text{ Rend_Disp}_- - 3,52141 \text{ Poup} + 1,29804 \text{ Cons} + 349975 \text{ Tx_des} + 236641 \text{ Tx_inf} - 212104 \text{ Tx_juro}$$

In the model obtained previously had a R-Squared (R²) of 0.974941, which means that the estimated model is satisfactory. As for the adjusted coefficient of determination, is a coefficient which discounts the effect of a large number of explanatory variables. Thus it can be seen that the model formulated is 0.969158. The formulated model can check the level of significance of each variable and its probative value. Thus, it appears that the significance level of 5% the income variables available and interest rate and constant are statistically significant and savings, consumption, unemployment rate and inflation rate variables are statistically significant and a significance level of 1%. Finalmente, o modelo respeita as hipóteses clássicas do modelo de regressão múltipla, nomeadamente homocedasticidade, ausência de autocorrelação dos erros e distribuição normal dos resíduos.

Analysis of the estimated model (model 2)

As previously stated this model was constructed over a shorter range (10 observations). Thus were obtained the following format:

$$End_{-} = -182581 + 0,365418 Rend_{-} - 190487 Tx-Juro_{habi} + 136961 Tx_{des} + 1,63188 PIB$$

In the model obtained previously made an R2 of 0.990384, which means that the estimated model is satisfactory, it is 0.982691 also high. In the model formulated it turns out that the significance level of 1% is it constant and a significance level of 10% the variables unemployment rate and GDP. What demonstrates that these variables may not be sufficient to explain the dependent variable.

Finally, the model satisfies the classical assumptions of multiple regression including homoscedasticity, no autocorrelation of errors and a normal distribution of residuals model.

Discussion of results

At this point of the thesis are made comparisons between the results obtained and the expected results. In Table 4 it can be seen that the results obtained for each of the study variables and the expected results for Model 1.

Variables	Expected Results	Obtained Results	Significance
Income	+	+	95%
Savings	+	-	99%
Consumption	+	+	99%
Unemployment rate	-	+	99%
Inflation Rate	+	+	99%
Interest Rate	-	-	95%

Table 4 - Comparison of results (Model 1)

It also appears that the variables household savings and unemployment have not had the results the same as expected. Regarding savings, theories pointed to a positive association with the debt, but this has not turned out so the savings are negatively associated with debt, ie the more the savings increase more debt decreases. Regarding the unemployment rate, this was also not the result we expected, since the theories suggested a negative association towards the debt and turned out to be a positive association, ie the higher the unemployment rate, indebtedness. For the remaining variables (income, consumption, inflation rate and interest rate), it was found that the result was equal to the expected outcome variable interest rate is negatively associated to debt, so its increase results in a decreased in debt. Variable yield, consumption and inflation are positively associated, since the increase these variables leads to an increase of the variable debt households.

The following table (Table 5) relating to Model 2, it can be seen that only the variable rate of unemployment had a result different from the result expected. The income variable interest rate

housing loans to GDP submitted a result equal to the expected result.

Variables	Expected Results	Results Obtained	Significancia
Income	-	+	
Unemployment rate	-	+	90%
Interest rate for housing loans	-	-	
GDP	+	+	90%

Table 5 - Comparison of Results (Model 2)

It was also found that the variables income and GDP are associated with the indebtedness of families in a positive way, so that the increase of these variables leads to an increase in household debt dependent variable. Only the variable interest rate housing loans had a negative towards the debt variable, so the increase in this variable leads to a decrease in debt variable association. When making a comparison between the two models (model 1 and modelo2), one can conclude that the variables that both models had in common even reached the results, we conclude also that both variables were not meeting with expected, but the results are better specified variables in Model 1 since they have greater statistical significance. Thus, it appears that to study the indebtedness of Portuguese Families, in this particular case is better than model 1 model 2 because model 1 is best explained and model 2 is not sufficient to analyze a fact so important to worldwide.

CONCLUSIONS

This study's main objective was to determine what the determinants and effects of borrowing by Portuguese Families, since this topic is fairly current and only now has given a greater importance by modern literature on debt. To enable it to meet this objective, we carried out a research study, using firstly existing literature on the debt. Portugal has a large debt level, which was progressing very rapidly over the years, so its rate evolved much since the 90s to the present day, which meant that the risk of debt also increased sharply.

The debt can be defined as a result of an imbalance between spending and income of the consumer, in this particular case of Portuguese Families is also associated with loan commitments, most commonly mortgage and consumer debt, being mortgage loans the main source of debt. This can have a negative effect on the economy, since the increase in debt may cause a long term decrease in the growth rate of a country's economy, as families are indebted and do not have as much capacity to consume, having to pay debt interests and fess, which may result the country economy to fall into recession.

There are several factors that can lead to debt. In the examination made in this paper, referring to model 1 these factors include disposable income, savings, consumption, unemployment rate, inflation rate and interest rate. As for Model 2, the variables examined were disposable income, the interest rate of loans to housing, unemployment and GDP. While making this study it was concluded that all variables used could bring significance to the model, ie, they are all important when studying the debt

because they gave predictive explanation power to the model. Regarding Model 2 only two variables, the unemployment rate and GDP, have some significance to the model, but it is not enough to demonstrate that the chosen variables in Model 2 are satisfactory when analyzing household debt.

After obtaining the results of the regression model one can conclude that there was an association between the independent variables and the dependent variables. We also found that most of the results were against the expected results, namely the variables income, consumption, unemployment, inflation and interest rate. As in the model with 2 variables yield, interest rate housing loans to GDP. Thus it is concluded that the study variables in Model 1 are determinants of debt, which was not observed in model 2, and that the income variables available, private consumption, unemployment and inflation are positively associated with debt that is, an increase these variables results in an increase in the debt variable. As the savings and interest rate variables are negatively associated to debt, so when there is an increase in these variables the debt decreases.

It can also be noted that for the purpose of this paper, ie to analyze the determinants and effects of household debt in Portugal, the model 1 is the most powerful, since the variables associated with the model have more statistical significance, being therefore concluded that that this model was better specified.

When comparing the results obtained with the expected results, it can be concluded that four of the variables were against the expected result, as the variable interest rate presented a negative association with respect to debt and equities, while consumption and inflation exhibit a positive association with respect to the indebtedness of Portuguese Families. The other variables, such as the savings and unemployment, had also a model result opposite to the expected result.

It is important to note that increasing debt is a hot topic, this is due to the phase of crisis that Portugal, and other developed economies, are going through, so it continues to be important to develop studies on it such as to research other possible effects on the economy caused by indebtedness by other than households, such as by corporations, and the financial sector.

LAST MARKETING COMMUNICATION CHALLENGES IN LUXURY BRAND MARKETS: A COMPARATIVE ANALYSIS

Mosca, Fabrizio; Casalegno, Cecilia; Feffin, Alessandro

Department of Management, University of Turin, Italy

ABSTRACT

Marketing communication strategies, together with instruments and actors involved in their planning process, need to confront themselves on the one hand with the evolution of technology and the other with the transformation of consumer behavior.

This research project assumes that companies should change their strategic action, if they want to communicate with their changing target. What happens in luxury mature markets?

The intent is to empirically examine how luxury companies communication strategies evolve towards a stronger relationship with the audience. This involves a continuous interaction and sharing of content and values in terms of enhancement (luxury brands value enhancement through exclusive content, so as to enhance the consumer experience), expression (strategic action for a more effective communication, in order to reach considered markets goals) and empathy (ability to establish a relationship with the customer can be more intimate). Eventually, it is stressed that, in the present context, the players who have the most authority and esteem are the ones that have a higher number of impressions on social networks and a higher frequency of video views and shares content online.

Keywords: *Integrated marketing communication, user generated content (UGC), luxury goods, mature markets, social networks, reputation, innovation, consumer behaviour, brand experience, engagement.*

INTRODUCTION

Media continuous evolution has led to the consequent approach between business and target audience even in those markets where, traditionally, the business- consumer has always been top-down (Schultz, DE, 1992). In which way the technological progress is lived and declined in communication from luxury companies in mature markets?

Given that consumption is essentially a communication system that is expressed through a multitude of languages, the greater the stratification of a society, the more languages will be spoken and will be much more complex to analyse consumption dynamics. This is especially true for luxury goods (Chevalier, Mazzalovo, 2012), in a context where the use of communication is experiencing a transition

from “linear to multi device” (Mattiacci, 2012). The “future” of the luxury communication will be the result of a number of macro trends, some of which are already on the market, able of influencing the system of consumption both in general and in the specific context of the high quality products markets. In addition, if it is true that the traditional marketing mix variables are declined in a particular way within the luxury markets, it is necessary to wonder what is appropriate to share and communicate with the target audience manifesting a growing interaction propensity.

The main aim of the present research has some starting point. First of all, worldwide firms, nowadays, look ahead to the integrated communication tools as the most strategic way to improve their assets and business, especially over discontinuities (Casalegno et al., 2012). Secondly, managers have to consider that building a strong brand communication structure could be valid for all the stakeholders as extended audience (Kliatchko, 2008), since communication is not a *two-way* factor (Grunig, 2001) anymore. The present research has therefore a threefold goal: it wants to investigate how luxury brand communication has been evolved in the latest years, it focus the attention on the analysis of social and viral marketing new trends, it suggests a new application model in order to better manage new communication tools available in this multidirectional communication era, considering that the integration among various communication tools is nowadays the condition through which a firm can protect the core of its intangible competitive advantage.

THE CHANGE OF LUXURY GOODS COMMUNICATION AS STRATEGIC LEVER FOR A WIDER AWARENESS.

While the power of mass media is undergoing a decline, due above all to generation Y media attitudes, there is a growing interest in new media generated by the consumers themselves, or the so-called user-generated content (UGC): blogging, podcasting, online video (eg : Youtube, Vimeo), social networking (Facebook, Twitter, Printrest, Google plus). Internet is getting the real “backbone of the media system” (CENSIS, 2012). The trend sees all organizations dealing with the programming of a communication plan that integrates all the tools with which they intend to interface with their stakeholders (Schultz, Tannenbaum, Lauterborn, 1993; Romano, 1988; Krugman et al., 1994; Collesei, 2002; Duncan, Mulhern, 2004; Aiello, Donvito, 2005; Collesei, Ravà, 2008; Belch, Belch, 1998, 2009). Companies don’t just have to be present on the web through “websites showcases,” but also they need to become the real protagonists in the process of information and experience creation and exchange, providing to users and brand followers dedicated spaces, content and additional services. The concept of integrated marketing communication - strictly related to the integrated firm communication (Romoli Venturi, Casalegno, De Palma, 2014) - becomes inseparable from the one concerning common values sharing with stakeholders: people talk about social values of corporate social responsibility, which assumes an

attitude of protection of the environment (geographical, economic and social) on which the organization (firm, when for profit) intends to develop its strategic action. Porter and Kramer refer to the concept of social innovation (2011): they see in the sharing of values between the business community and the organization main key to competitive advantage. The above macro trends are to consider in addition to already well-established factors, such as: the '90s West economic development, which led to a consolidation of high value product markets, traditionally recession proof; the opportunities arising from the internationalization and expansion which gave way to luxury brands to approach with success new markets; the emergence of the internet and social web related phenomena. In this context, consumers in mature markets have been characterized by a series of changes that led to contradictions and paradoxes. It is thus possible to consider three macro trends that will contribute to a substantial change in consumption related to competitive environments considered (Corbellini, Saviolo, 2007). The first is the search of experience and personal gratification. The decade in which we live (2010-2020) is characterized by the centrality of the experience (Mosca, Casalegno, Feffin, 2013). The focus is no longer on "what", but on "how" people buy things. Therefore, Kotler (2006, 2009) third "P" - distribution - is becoming increasingly important in major luxury markets strategies and the point of sale becomes the final touch point in the integrated communication process. Here the consumer can impart, through tangible and intangible elements, the image of the brand itself (Mosca, 2011). The second is the technology pervasiveness. Nowadays, it is evident the overwhelming role technology has had on the purchase and use of goods scenario. In fact, thanks to advances in innovation, final consumers have changed their behaviour and role in the purchase, from passive to active users, expressing the desire to produce content and participate to products and services development of what they are "invited" to consume (Mosca, Casalegno, Feffin, 2013). The information technology increasing development (Rifkin, 2000) and the continuous compression of products life cycle reinforce new consumption mechanisms will be focused not in the possession of the product, but in wealth and consumption experiences sharing. Eventually, the third is named iper-mediation (Corbellini, Saviolo, 2007). The social stratification, in fact, has always been the basis of the luxury and fashion goods consumption in a ostentatious logic, this logic has always been related to show the others. To these motivation, that could be defined "historical", in recent years it is to add others consider luxury consumptions to satisfy personal needs, well defined as "self realization" needs (Mosca, 2011). The contemporary presence of these two different consumption logics have taken to the birth of some bubbles demand (Brondoni, 2007), they are paradoxes, new buying behaviours. In recent years researchers and managers can find that various consumption forms are living together: from the more traditional buying behaviours (well described in the Conspicuous Consumptions Veblen Model), to the birth of the connoisseurs, ecc (Corbellini, Saviolo, 2007). This is due to the on-going changes related to

purchasing schemes used by a customer defined (Okonkwo, 2010) as smart, well informed, always looking for brand new experiences and relationships. He/she is powerful, influent, individualist, but at the same time he/she looks for constant connections with the community.

THE LOC MODEL: A NEW SUGGESTION FOR A BETTER LUXURY COMMUNICATION.

In a new scenario where web experience is based on the exchange, sharing and collaboration, the luxury consumers are certainly not been immune to this revolution (Atwal, Alisair, 2009). In fact, especially in this particular competitive environment, consumers are looking for a deep and intimate relationship with brands (already suggested time ago by Roberts, 2005) that emphasize the recognition, respect, dialogue and collaboration with their costumers. On the other hand, costumers tend to reject those brands that do not recognize them the involvement and attention they require. In this scenario dominated by a stronger relationship between people and technology, communication and web, the luxury goods marketing requires new communication model based on 7E (4E +3E): Experience, Exclusivity, Engagement and Emotion (already perceptible in Okonkwo articles, for example), in addition to other 3E risen from the opportunities that the web, and in particular the social web, have brought in communication: Expression, Enhancement and Empathy (Mosca, Casalegno, Feffin, 2013).

Experience. During the recession and post-recession, unlike other markets, the traditional consumer of luxury does not have significantly limited their consumption. While the luxury market and the spending on luxury goods has grown, on the other side luxury consumers have become more selective, informed and a little bit cynical. Today, the purchase decisions of luxury consumers revolves around the question: " Is it worth it ?". In this scenario, the luxury companies had to provide a unique and compelling/engaging experience (Okonkwo, 2005). Some authors have observed how the next decade will be characterized by the centrality of the experience. An example of this trend is offered by the luxury maison Burberry in the opening of his flagship store in London on September 14, 2012 in the heart of London. The flagship store, thanks to technology developed by the brand, is designed in order to increase customer's engagement (and purchases) through in-store digital and tactile experience that shows the historical and artistic heritage of the brand. It was developed as the physical expression of Burberry.com, in fact rooms in the flagship store follow the sections of the website available online, diving costumers in a digital and physical combined experience. In conclusion, the strategy put in place by Burberry not only allows costumer to increase the perceived value of the brand improving their shopping experience, but allows to increase the permanence, in terms of the time spent in the store, creating desire to return and repeat the experience.

Exclusivity. In marketing exclusivity is considered as arising from the second P of marketing mix: the price. The exclusivity, however, has always been the cornerstone of luxury's strategies and no appearance has never been more intensely protected. It is widely believed that the use of the digital marketing's levers in luxury strategies could "put in jeopardy the exclusivity of the brand," but, on the contrary, they offer a real opportunity and an elegant way to control and develop such exclusivity increasing at the same time the visibility of the brands. As a result, the players of the luxury market have created exclusive platforms for consumers, as for instance the community. This expedient has been used, for example, by Burberry for its *Art of Trench*. Each maison, in fact, has a special icon which distinguishes one from another. For Burberry this icon is trench coat. For his symbol garment, it has been created a real fashion social network that collects shoots of characters, famous and not, who wear the icon of the company.

Engagement. Engagement in the luxury goods is granted and often evoked by one thing: the story. Any video, online experience or a simple post on Facebook, which is equipped with an engaging content, constitutes a story that arouses emotions and involves the viewer in a unique experience. Today, in the luxury markets, convince the consumer to buy is not sufficient. Convince them, however, to participate at an exclusive trip with and within the brand is the key to success and that is what stories make. Tiffany, for example, reported a significant increase in sales, after that the public and the press greeted with enthusiasm the microsite developed by the brand: *What Makes Love True* and mobile application *Engagement Ring Finder*; the two elements of digital marketing that conveyed the powerful and engaging history of the brand Tiffany in achieving the true love. Tiffany has decided not to focus only on selling products, but on an entire way of life.

Emotion. The combination of the three variables previously described, give life to the fourth element of the luxury marketing: emotion. Without the proper application of this key variable, the success of luxury brands is not sustainable in the long run. The reason is simple. The luxury firms have to do with a consumer that can buy almost anything he/she wants. In this context, the physical product acquires secondary importance in favor of what luxury consumers are really looking for: a more personal experience or an engaging story that will inspire in them a particular emotion.

Enhancement: enrichment of the content of luxury through exclusive content, that could be shared, in order to increase the consumer experience.

Expression: internet gives the chance to manage the communication time and spaces. This has given way to a communication that is more charming, elegant and dream-like, able to reach a specific target market which until now was not possible with the only above the line media.

Empathy: new UCG media are able to give to luxury firms personal information about customers and allowing companies to establish a more intimate relationship with the customer, that is in line with the

inversion of the traditional scheme communication that has influenced the current scenario in almost all markets.

The LOC model has been tested previously (Mosca, Casalegno Feffin, 2013) on a sample of about 600 people, for most part of generation Y and all within what are called mature markets. In this present study, the objective will be to test, in particular, the last model 3E that refer to more interaction with the target audience.

WEB 2.0 STRATEGIES IN LUXURY MARKETS: A COMPARATIVE ANALYSIS.

In order to better define development trends in luxury markets communication strategy, the case analysis methods have been considered to underline, when possible, different and similar firms' media attitudes. The analysis has been based on ways through which global luxury goods firms integrate their communication tools each other, by focusing the attention on web and social strategies. To do that, the comparative analysis of thirty international cases – chosen to represent in an equal way different luxury brands markets - allows to estimate not just the on line presence, but even the contents different players post in order to share with the online audience. The surveys of the major social platforms (Facebook, Twitter, LinkedIn, YouTube) have been carried out at two different times. A first survey was carried out on a daily basis from April 14th 2013 to May 14th 2013, while a second survey was carried out after 10 months (March 14th, 2014). Were examined just such periods of time as it does not fluctuate - media and sales volumes – due to seasonal origin (eg: Christmas, Valentine's Day, Easter). The intent was to understand how the luxury markets players are approaching their use of social media tools in the field of wide consume and, more importantly, what kind of reaction from the audience these media strategies generate.

RESULTS ANALYSIS AND FINDINGS

The analysis allowed estimating the "web activity" of the thirty firms operating in the luxury markets, not only in quantity (number of like, followers and share), but also in terms of quality on the basis of the content published on line by the same businesses.

The interpenetration of the two surveys also allows to study the evolution underway in the new media, as far as the luxury sector as a whole, and to propose a hypothesis for management to optimize communication online.

Table 1 shows that over the years luxury firms have gradually developed a direct presence in the online media landscape, following the path already traced by the most advanced companies in the consumer products. Most companies have a Facebook page and is present through its own channel on YouTube. Concerning online contents and the typology of what posted by luxury firms, the daily report (April 2013-May 2013) has shown what follows in figure 1 and in figure 2.

Figure 1. The luxury firms online contents (daily monitoring 14th of April 2013- 14th of May 2013, considering the major social networks).

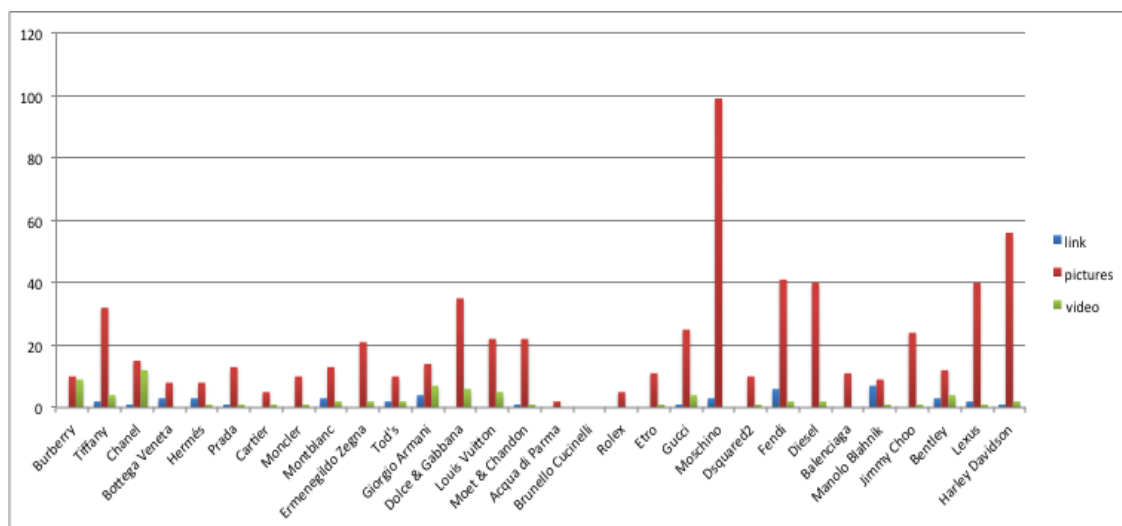

Figure 2 – Online contents purpose (daily monitoring 14th of April 2013- 14th of May 2013, considering the major social networks).

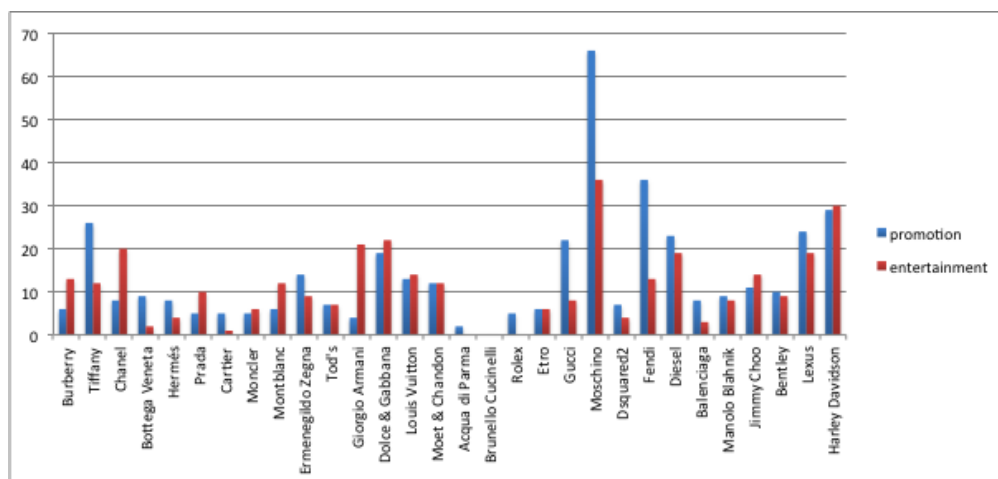

Figure 3 shows the awareness linked to new online media in terms of likes / shares and followers. This first analysis of social media use doesn't consider the use of LinkedIn due to its scarce use by luxury firms; is to underline this democratic social media use. Figure 4 also highlights (taking into account the top 10 companies analysed in terms of online visibility) as the firms use the YouTube channel to manage their communication. Such use of the web, in fact, allows companies to disseminate films that have a duration that gives the chance to build the idea of "dream" and the dreamlike landscape typical of the communication of the luxury brand. The data relating to other social media are to be considered: comparing the number of brands like Chanel with the one related to one of the most famous brand in the consumer market, such as Benetton, it turns out that that the number of like and share the first is twice that of the second. The above is as relevant as ever, taking into account the shortest time from brands like Chanel have developed their own online presence

Figure 3. The UCG success in luxury markets". (Monitoring of May 2013, compared with March 2014).

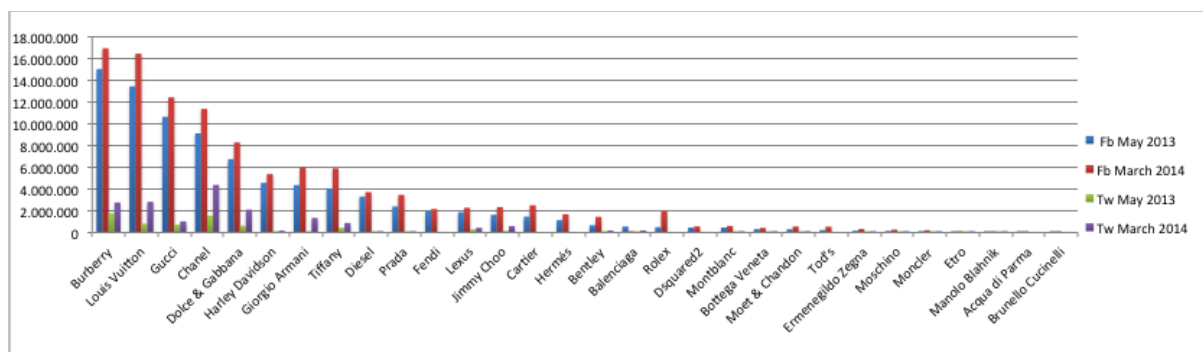

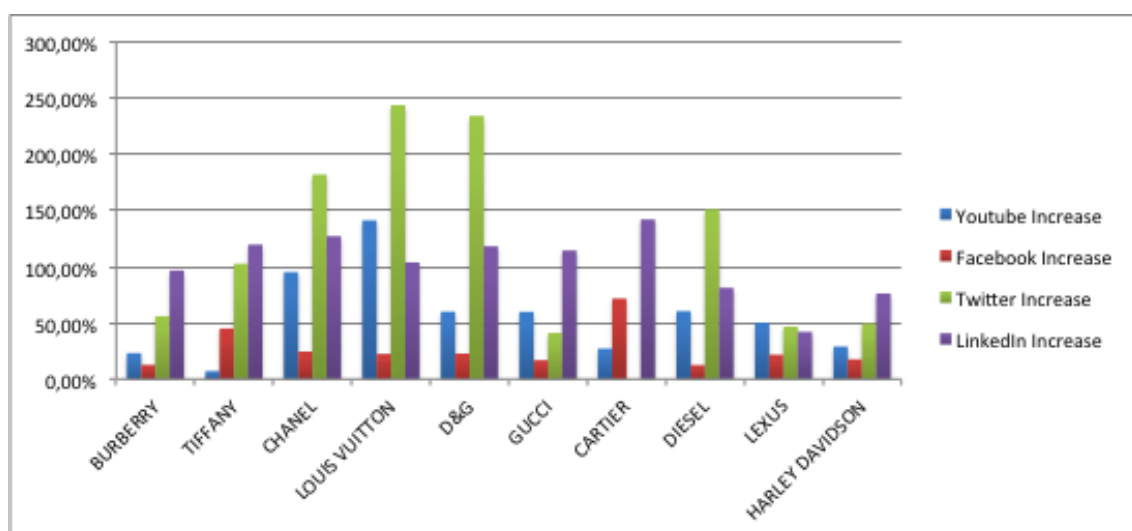

Figure 4. The top 10 luxury firms in terms of visibility" (Monitoring of May 2013, compared with March 2014).

Considering the different increases of visibility, the research has focused the attention on the possible correlation between the Facebook likes and Twitter followers, the one concerning Facebook likes and

LinkedIn followers, the one concerning YouTube official channel visualisations and Facebook likes and the one concerning the increase of Twitter followers and YouTube visualisations. The used formula has been the Pearson-Bravais correlation index:

$$C(x,y) = \frac{(x - \bar{x})(y - \bar{y})}{\sqrt{(x - \bar{x})^2} \sqrt{(y - \bar{y})^2}} \cdot \frac{1}{n-1}$$

In which: $C(x;y)$ is the correlation to test; x is the augment of Twitter, LinkedIn and YouTube followers/visualizations; y is how much can augment the number of Facebook likes. Despite is not possible to say that the used sample can be statistically relevant - because of the scarce number of analysed players - the results can be interesting for an early stage research, because empirically show what is possible to reach by simply using the qualitative knowledge of social media use. Results show that the correlation doesn't exists between Facebook and Twitter (in this case the correlation is $C(x;y) = -0,011$), nor between Facebook and LinkedIn ($C(x;y) = -0,011$), while between YouTube and Facebook is negative ($C(x;y) = -0,3$). If we consider the augment of Twitter followers ($= x$) and the increase of YouTube visualizations ($= y$), is possible to underline a correlation between the two factors ($C(x;y) = 0,69$).

MANAGERIAL IMPLICATIONS AND RESEARCH LIMITS.

Whereas, therefore, the web experience is based on the exchange, sharing and collaboration, consumers of luxury in mature markets are certainly not been immune to this revolution. Instead, they need to share their passion for luxury brands with other users on the network and trust you more and more of the opinions of the latter "acquaintances unknown" within the forum or blog. This is what literature sustains (Okonkwo, 2009): since the luxury is an identity, a concept – rather than a good or a service – luxury firms have to face the internet challenge if they want to lever on the emotion and they want to share their philosophy and their emotional values (Okonkwo, 2009) strictly tied to the brand. The existing literature (Campbell, Pitt, Parent, Berthon, 2011) can help managers in understanding that even in these particular markets it is possible to use democratic tools like internet and social medias, in order to improve values sharing and audience commitment, but little has been written concerning the concept of polarization of consumer behaviour. This should be considered especially in the areas of luxury, as it allows management to assess the intake of new strategic levers able to lead to the creation of a stable long-term relationship with their target. The results of this research can serve as a framework for all organizations wishing to compete in the luxury good markets. It considers that, especially in this particular competitive environment, consumers are looking for a deep and intimate relationship with brands that emphasize recognition, respect, dialogue and collaboration. On the

contrary, they tend to reject those brands that do not damage their involvement and attention they require. In addition, they tend to abandon those businesses that are not able to convey experiences, values, and, above all, excellent product concepts consistent between the real world and the online environment. In this perspective, the integrated communication takes on an increasing importance in the management of luxury brands.

Moreover, from the integrated marketing communication perspective, luxury markets players have to apply the same logic, but not with the same contents, of the consumer goods ones in the use of media tools. The approach to integration between old and new media is a duty. The integration between old and new media, together with the distribution systems, is strategic on one hand to renovate a luxury brand and transfer to the consumer the sense of modernity and innovation of the brand and, on the other, to build long lasting and strong relationships based on trust, able to provide customer loyalty in a second time.

Generation Y is more prone to web and social communication (CENSIS, 2013) and, more in general, young people used, nowadays, to spend most of their time online represent that part of the population between 15 to 20 years will be able to be a part of the demand for luxury. Even nowadays young people with money to spend are a significant test target for luxury player if we consider that this target is global, strongly attracted and influenced by luxury brands, innovative and it has an occasional access to the consumption of luxury goods.

The research presents some limits that can be turned in further steps. The biggest is that it is necessary to test luxury global users perception, whereas in mature markets perceptions and media habits may differ from those in other geographic markets. The use of a survey through which you are unable to test a sample of the world population, which well represents the universe to be tested, will be the next step of the research. This will take to reach media habits segmentation, distinguished by geographic area, can be a useful tool for managers of luxury companies.

CONSUMER BEHAVIOR IN CHOICE OF FOOD AND BRANDING

Nair, Suja .R¹; Maram, Hari Krishna²

¹Jain University, Bangalore, India

²Imperial College of Business Studies , Bangalore, India.

ABSTRACT

Purpose: To understand the conceptual link to consumer food choice behavior and learn on how to add to customer value through branding is proposed.

Methodology: Through a literature review the paper distinguishes the concepts relevant to consumer behavior and branding. The effects of these concepts while analyzing: consumer behavior in general and their food consumption behavior are discussed drawn from studying various research implications.

Findings/Practical value: A number of research studies signifying the influence of the interplay of diverse fields on the consumer behavior in the choice of food and in adding to customer value through branding were identified. The outcomes of these research studies should be of interest to behavioral researchers trying to analyze food consumption behavior among individuals.

Keywords: *Consumer behavior, interdisciplinary, diversity, consumer decision making process, brand equity, food conception value, customer value, consumer evaluation of food, branding strategy.*

INTRODUCTION

All marketing activities are evolved around the 'consumer', the key contributor to the growth of the organization. Consumer behavior calls for the study of human responses to the products, services and the marketing mix elements. Food is one of the basic needs of human beings, a source of nutrition for the body, serving a social and cultural function whose consumption has hedonic value. Trying to understand food consumption behavior is highly complex and very challenging because of the diverse influences of a wide range of science and social science disciplines. Over the past many decades there have been tremendous changes occurring in the pattern of consumers' food choice behavior, visible in the way they go about food shopping and seeking eatery options. This has resulted in organizations opting for modifications in food production, processing and distribution.

In the context of globalization today, we have tried to examine studies involving food choice among consumers from different places. The purpose of this paper is through analysis of various studies develop a framework of food choice behavior and further evaluate the extent to which branding can

influence choice of food. The structure of the paper is as follows. The paper commences with a brief discussion on the terms 'Consumer Behavior' and 'Food Choice' and then an over-view of few studies will help to identify factors affecting food choice. We will then examine certain studies involving influences on food choice behavior and through discussions try to ascertain whether branding can influence food choice among consumers. Towards the end of the paper we have attempted a framework that will show the link between factors influencing food choice and branding.

In short, through discussions and analysis we propose to seek answer to the question whether branding can influence and add value to consumer food choice behavior.

'CONSUMER BEHAVIOR' AND 'FOOD CHOICE'

Consumer Behavior, has been defined as *the decision process and physical activity individuals engage in when evaluating, acquiring, using or disposing of goods and services (Loudon and Della Bitta, 2006).*" The conceptual analysis of consumer behavior is greatly characterized by its **interdisciplinary** (namely, the fields of Philosophy, Psychology, Sociology, Anthropology etc.) nature. The study and analysis of the purchaser's behavior is mainly centered on three variables: the process of decision making in purchasing, factors influencing the purchase behavior and the one of the consumer (Rabontu and Boncea, 2007). Involvement of the many variables and their tendency to interact and influence one another makes the study of consumer behavior very complex. So, typically, models or frameworks of consumer behavior are developed and used to deal with this complexity.

This paper will focus on **Food Choice**, which refers to the human eating behaviour or food selection expressed in terms of what food people *like* and *choose* to eat. We will briefly examine few studies that have identified factors affecting food choice among individuals.

- Sheperd's study (1985), states that factors affecting food choice can be divided into three:
 - * Food (physical/chemical properties, nutrient content)
 - * Person (Perception of sensory attributes, psychological factors-personality, moods)
 - * Economic and Social (Price, availability of brand, social /cultural-attitudes)
- Steenkamp (1993) felt that any comprehensive analysis of food consumption behavior mandates taking into consideration the interactions between three types of determinants or factors, namely, properties of the food, factors related to the person and environmental factors.

Properties of the food include the physical and chemical properties and nutrients content (physical form, macro nutrients proportions, fiber contents, energy value) and specific substances (sugar, seasoning, salt etc.). *Factors related to the person* include biological (for instance, sex, age, body

weight), psychological and personality factors. *Environmental factors* include socio-cultural, economic and marketing factors.

- Popkin, Duffey and Larsen's study (2005), illustrates environmental influences on consumers' food choice, physical activity and energy balance. The environment includes macro and community level factors at the external level i.e. economic, legal and policy influences. It also examines ways in which the external environment affects food choice and diet, physical activity and obesity issues among the larger population.

From the above studies we propound that factors which typically affect consumers' food choice are: (a) the food product, (b) the individual person and (c) certain external environmental factors. These factors could influence the decision making process which will then lead to the consumer making a food choice. For instance, assume a family of four visits a 'Pizza Hut' outlet to try out the food offerings there. Their final choice of food will greatly depend on the offerings (its nutritional content), the persons (their age, health consciousness and gender) and external environment factors (culture, social background, price value equation, etc.).

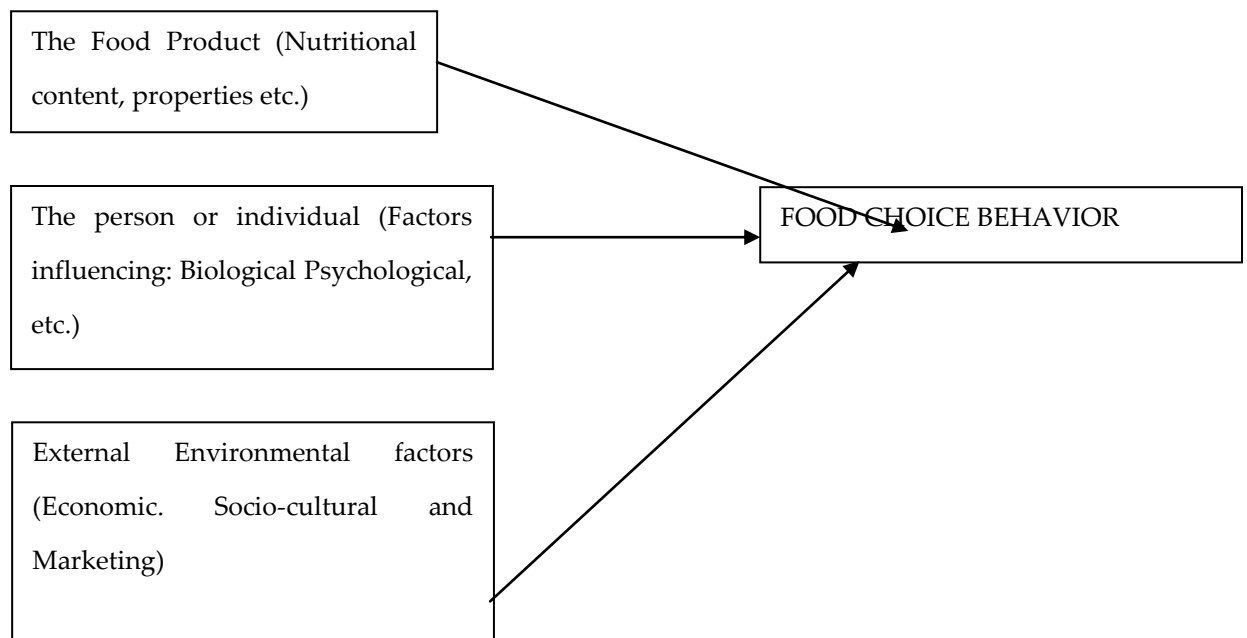

Figure 1: Factors affecting consumer's food choice

STUDIES TO EXAMINE INFLUENCES ON CONSUMER'S FOOD CHOICE BEHAVIOR :

The consumer behaviour discipline works on the assumption that to be successful, organization's must determine the specific needs and wants of their targeted market and deliver the desired satisfaction better than competitors (Schiffman and Kanuk ,2005).The study of consumer behavior is complex because of its multidisciplinary approach. An early attempt to illustrate this can be traced to

the *Self-Concept theory* (Grubb, Grathwohl, 1967) which laid the theoretical foundation of a model of consumer behavior by examining the relationship between the psychological characteristics (an individual's self concept) and the symbolic value he associates to the goods he buys. Tybout and Hauser's study (1981) called for the creation of a marketing audit based on a conceptual model of consumer behavior which can be used for evaluating marketing strategy decisions. {Marketing audit is a comprehensive assessment of all angles (both internal and external influences) of marketing operations in an organization}. The findings suggest that by measuring the variables in the model and mapping their relationships, the managers will be able to identify strategies for altering consumers' behavior and subsequently evaluate the impact of these also. Another popular representation of consumer behavior is depicted in the Engel, Blackwell and Miniard ,1982 model ,(Loudon and Della Bhatta, 2006) which suggests viewing consumer behavior as a decision process comprising of five activities (motivation and need recognition ,search for information, evaluation of alternatives, purchase and outcomes) which occur over a period of time.

Analyzing food choice behavior:

While embarking through various research studies attempting to analyse food choice among individuals, one can gain a perspective on the evolving consumer behavior.

- We start by briefly going through few studies wherein the researchers' attempt to analyse consumer food choice on the basis of a certain *framework or model*.

* The Meulenberg and Steenkamp study attempted to analyse consumer behavior with respect to food through interplay between behavior and economic research of consumer food choice. Such integrated approaches permitted the researchers to link the behavioral concept to the economic concept characteristics and further extend the findings of the research to more actionable marketing research such as product development.

* Consumers are very much concerned about the quality and safety of the food they consume revealed a study (Chang, Tseng, Chu, 2013). This study involving consumers from Taipei, in Taiwan attempted to examine the role of a food traceability system that can create value in food exchange. The European Union (EU) General Food Law Regulation defines traceability as," the ability to trace and follow a food, feed, food-producing animal or substance through all stages of production and distribution" (*ibid*, p.1362). The study used a modified 3M framework to examine the relationship between consumer personality (elemental, compound, situational and surface traits) and a food traceability system. The findings revealed that consumers with elemental traits of 'openness, conscientiousness, extroversion and material and body needs' presented the two compound traits of 'need for learning' and 'health consciousnesses'. The latter traits influenced consumer 'concern for food value' and 'perception of food traceability labels'.

- The following studies substantiate that consumer food choice is greatly influenced by the *interplay of certain variables and external factors*.

* Steenkamp's study (1993) on the basis of review of literature had made a classification of the determinants of food consumption behavior by concentrating on a single or few related factors. This study suggests that researchers from consumer behavior discipline (because of its interdisciplinary background) need to take a broader approach by integrating determinants from several categories. For instance examine how physical characteristics of the product and social /cultural factors together can influence perceptions on food? How the interactions between cognitive and cultural and physiological induced effects can affect food choice and so on.

* Luomala's study (2004) with reference to Finnish consumers, emphasized on one food attribute factor, namely, meaning that consumers attach to 'the origin -of-food', which would influence their decision making especially in terms of their attitude, evaluation, willingness to buy and choose food.

*A study by Pliner and Mann (2004) tried to examine the effect of social influence and palatability on food choice and the amount of food consumed. The experiment revealed that social influence manipulation had no effect on participants' food choices with most of them choosing the palatable food. The findings of the study highlighted the importance of palatability in food eating behaviour. The study demonstrated that when individuals were asked to select from two foods, of which they would eat a moderate amount, (informational) social influence was ineffective in inducing them to consume the unpalatable food.

* Popkin, Duffery and Larsen's study (2005) had examined the environment (in the external context including both the macro and community level) factors that influences the diet and physical activity, causing health disparities among the U S population. These researchers emphasized on the need to foster interdisciplinary approaches as well as develop an understanding of the factors that mediate and moderate the association between the environment, physical activity and health outcomes.

Thus, the above studies demonstrate that marketers will need to examine the efficacy and impact of the various factors which influence consumer's choice of food when initiating marketing of food products.

- There has been a growing awareness among consumers about the benefits of healthy eating. Such health conscious consumers seek to evaluate the nutritional content value and healthy benefits when making food choices. This aspect is illustrated in the following studies which will throw more light on how consumers make *healthy eating choices*.

*Bui and Kemp's study (2011), attempted to examine variables that are crucial in the brand building process especially for 'healthy' brands among USA consumers. The findings indicated three essential

variables: brand credibility, commitment and connection, to be of utmost importance for the development of branding strategies for such "Healthy Brands".

*Bui, et al.'s study (2013) tried to evaluate how parents in the US make food product choices for their children by looking into the nutritional information provided on the label. The findings of the study indicated that parents are more likely to choose healthier options for their children when a food group information system (providing specific nutrient claims complementing a nutrient claim) is utilized.

*Walsh's study (2014) involving North America University students tried to examine whether priming a healthy eating goal can cause depleted consumers to prefer healthier snacks. This research implied that associating brands with health related claims may or may not affect the consumer food choice, which was dependent on the state of depletion of the consumer. I.e. when consumers are depleted, health related claims are unlikely to have an impact, whereas, in a state of no depletion it is more likely that health related claims affect their food choice.

* Wang's study (2013) involving undergraduate students from Northern University, Taiwan, tried to investigate consumer attitudes towards visual packaging and its hierarchical impact on perceived food quality and brand preference. The results showed that attitudes towards visual packaging directly influence consumers' perceived food product quality and brand preference and indirectly influences food product value.

The above section of studies imply that with the growing segment of health conscious customers, food manufacturers and marketers need to re-work their product lines and visual packaging to create 'healthy versions' of product brands through effective communication and brand management systems.

- With advances in the field of Science and Technology it is likely that consumer food choice will be more evolved in the future. This mandates food marketers to work towards *creating good food retail experience* and value consumption for a *long term growth*. The following studies will illustrate how food marketers can work towards this.

*Saarijarvi, Kuusela and Rintamaki (2013) through a case study of a major Finnish food retailer attempted to explore and analyze how Internet based service applications can facilitate customers' post-purchase experiences in food retailing context. This type of service application provided customers four distinct types of information including: Playing, Check-pointing, Learning and Goal orientation, which facilitated their post-purchase food retail (utilitarian or hedonic nature) experiences and the degree of transformation varying from low to high. Such experiences not only generate positive word of mouth but can pave the way for long term loyalty too.

* Dagevos and Ophem's exploratory study (2013), worked towards the development of a consumer centred concept of value in the field of food i.e., Food Consumption Value (FCV). FCV encompasses

four elements; Product value, Functional value, Process value and Ethical considerations along with Location value and Emotional value. The study propounds viewing value of the food market beyond its traditional 'nutritional aspect' and 'value for money'. It suggests that feelings a food can arouse are valuable intangibles and very crucial for value creation and building competitiveness in the long run. Thus, marketers need to strive towards creating post-purchase positive experience and customer centric value in food consumption for a long term growth.

CAN BRANDING INFLUENCE FOOD CHOICE BEHAVIOUR?

How a brand is identified from the consumers' perspective is the core of a good brand building program. Generally, the power of a brand name is referred to as brand equity. Aaker referred to brand equity as a set of brand assets and liabilities linked to a brand, its name and symbol that add to or subtract from the value provided by a product or service to a firm and/or to that firm's customers (Sheth and Mittal, 2003, p.399). For the investors, brand equity will be the brand evaluation measured as the financial worth of a brand name. While, for the customer, brand equity will be the value of the brand when compared to that of the competitor's brands.

❖ We will now examine few studies to determine whether branding can influence the choice of food behavior among individuals.

*Firms need to work towards effective brand building and management because there exists a symbiotic relationship between brands and the cognitive behavior of consumers (Rajagopal, 2006).

* Kathuria and Gill's study (2013) in India revealed that while a majority of consumers had brand awareness of branded rice, only half of them were aware of branded sugar. Since the factors influencing purchase of selected branded commodity food products were flavour, aroma and absence of the usage of insecticides/pesticides and adulterants, the researchers felt that marketers need to work towards creating brand awareness among consumers and frame marketing strategies for different market segments based on demographics.

* A study to understand 'Adapting to slow food movement and brand management' (2012) and Massa and Testa's (2012) study highlighted the role of ideology in brand strategy with reference to large scale food retailing in Italy. The study concluded that a strong and effective communication retailer ideology that is shared with consumers, who in turn are also asked to participate in the construction of meanings of the retail setting (store layout), can work out to be a powerful tool in brand strategy.

* While trying to explore the antecedents in a hedonic consumable product such as the chocolate market, it was found that brand satisfaction is the most significant factor for brand loyalty followed by brand value and brand equity (Kuikka and Laukkanen, 2012). This study further indicated that testing

of the moderating effect of the hedonic value showed brand satisfaction on attitudinal loyalty to be significantly stronger among consumers with high hedonic value when compared to consumers with low hedonic value.

*A study to analyze the relative importance of brand-packaging and taste in affecting brand preferences for manufacturer and store brands in food product categories indicated that once the product is consumed taste is the strongest attribute determining the choice of the preferred stimulus and influence of price and product brand packaging are specific to the product category analyzed (Mendez, Oubina and Rubio, 2011).

The above few studies on the relevance of branding for food products indicate that creating brand awareness, the role of ideology, brand satisfaction, taste, price and packaging duly influence food brand choices. The broad purpose of a brand strategy is to identify ways to develop brand satisfaction among consumers, which will then lead to brand loyalty and ultimately result in brand equity in the long run.

On the basis of the discussions in the paper reiterating the complexity and interplay of the various factors and variables affecting consumer food choice we have attempted at developing a framework which will show how branding can also be used as an aid to the consumer decision making process in this regard.

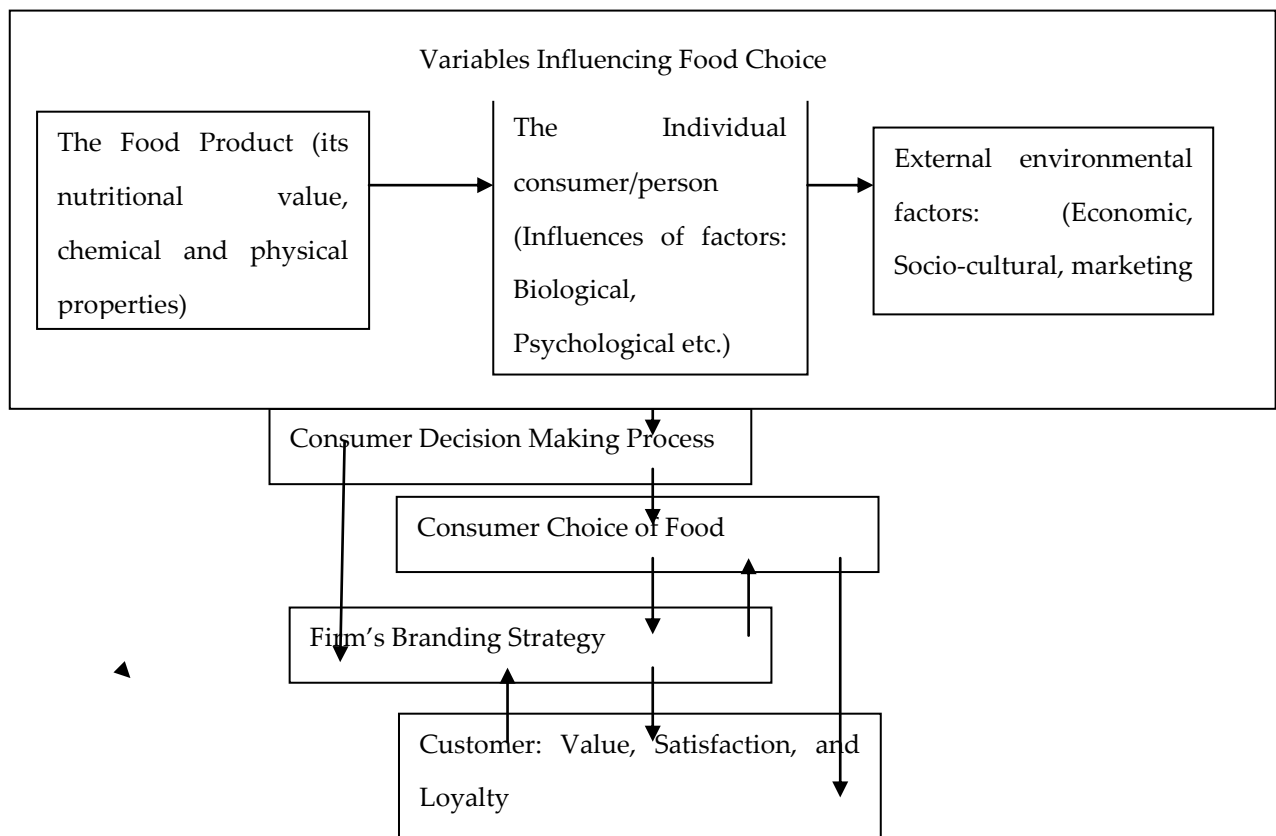

Figure 2: Framework linking factors influencing consumer food choice and branding.

From the above framework one can see that the variables influencing food choice affect consumer's decision making which results in them selecting or choosing the food. This can be observed and used by the firm to work out a branding strategy aimed at increasing customer value, satisfaction and loyalty. Another view suggests that an awareness of the variables influencing consumer food choice and affecting their decision making can be used by the firm to plan a branding strategy which can influence consumers' food choice resulting in enhanced customer value, satisfaction and loyalty in the long run. This reiterates that food marketers can use branding to effectively influence consumers food choice behavior positively.

CONCLUSIONS AND LIMITATIONS

The above discussion have conveyed that analysing consumer choice of food is highly complex involving the interplay of many variables such as health and nutrition, social and other environmental factors, informational (food labels and packaging) and post-purchase retail experiences .Nevertheless, an understanding of the impact of the various influences can be used by food marketers to work out a suitable branding strategy and create customer (brand) value for their products.

A limitation of this paper is that all discussions and analysis have been done on the basis of secondary research data. A primary data survey would have helped to learn more on the current happenings in this field of study and also substantiate whether the earlier findings hold good even today. Another limitation is that although attempts were made to refer to studies from various regions, it was not possible to obtain much information from many of the developed countries (other than a few) and even from emerging and growing economies such as Asia (barring a few), the Middle East and African countries. Even though consumption of food is a basic need, the social and cultural variations amongst different regions will affect the way it is consumed. So as to obtain a broader perspective, analyzing food choice behaviour of consumers from across the world would be interesting. Today, when the world is referred to as a global village and marketers are seeking to expand their market across seas, it will really be interesting to learn more on the variations in food choice among consumers across various regions, and this also can be an area of probing and researching in the future.

ABSTRACT

The paper's purpose is to look into the factors aiding entrepreneurship in India. It highlights parameters that lead to successful entrepreneurship. Entrepreneurial intentions too have been dealt with. A range of issues and themes have been examined through secondary research. The overview includes data from salient published articles that empirically assessed the effects of variables, both from internal/external/environmental context on entrepreneurship. The primary research includes an exploratory study through a survey being conducted over a sample size of thirty entrepreneurs in the city of Mumbai, India. The findings and results will be used by other researchers and business support agencies in this field not to forget the fact that higher education

Keywords: *Entrepreneurship, Success factors, Eco system, Education and Course Design*

INTRODUCTION

DEFINITIONS OF ENTREPRENEURSHIP

In the early 20th century, Schumpeter, J., insisted that entrepreneurship was far too important a part of capitalism to be ignored. He proposed that innovation or the use of an invention to create a new product or service was the driving force behind the creation of new demand for goods and services. The market was, therefore, not perfect but chaotic because of the regular occurrence of entrepreneurs entering the market with new innovations. This process of "creative destruction" destroyed the static market described by the neoclassicists and created a dynamic market which had continuous changes in buyer and supplier behavior. It was these entrepreneurs who developed innovations to create new demand that was the mechanism of wealth creation and distribution. Influenced by the Austrian school, (Kirzner, I, 1973), made a further contribution to entrepreneurship theory. He defined

entrepreneurs as individuals who grasp opportunities for pure entrepreneurial profit and they did this by uncovering unnoticed profit opportunities by being alert to them. Whereas (Stevenson, H's 2006) in his definition included the following factors, pursuit of opportunity; rapid commitment and change; multi-stage decision making; using other peoples' resources, managing through networks and relationships and compensating for value created . Entrepreneurship, a much debated topic, has been defined by (Collins and Moore, 1970) in the for-profit literature as "the catalytic agent in society which sets into motion new enterprises, new combinations of production and exchange." According to Low and MacMillan (1988) or Bygrave and Hofer (1991), the entrepreneur can be defined as a person with a special gift for recognizing opportunities and the capacity to mobilize external resources, generally the property of others, to exploit said opportunities. Low and MacMillan's define entrepreneurship as "creation of new enterprise" (Low and MacMillan, 1988). According to Shane and Venkataraman (2000), entrepreneurship is a field of business, that seeks to understand how opportunities, create something new (new products or services, new markets, new production processes, new ways of organizing) and are discovered or created by individuals (entrepreneurs) and how various means are used to exploit or develop these opportunities into business ventures. To put it simply, entrepreneurship involves recognizing an opportunity to create a new business venture (Eckhardt & Shane, 2003). Entrepreneurship has been considered as the engine of economic growth (Schumpeter, 1942) and has gained importance over the years.

LITERATURE REVIEW

Young, E.C., & Welsch, H.P. (1993) suggest through their study that the factors affecting entrepreneurship are financial independence, zeal to supplement family income, family encouragement and other encouraging support groups, luxury of developing a hobby, extension of credit from suppliers & discriminatory practices. Business regulation factors like recession, inflation, government regulations, high interest rates, federal taxes, state insurance, high wages and financial factors like seasonal fluctuations of cash, lack of working capital, lack of financial information and lack of working capital are other factors which influence entrepreneurship. The negative factors are recruiting problems, business obstacles like obtaining a loan, finding good location, lack of counsel or knowledge and individual obstacles like lack of encouragement, lack of confidence in customers and risk of start up.

Startienė, G., & Remeikienė, R (2008) suggest through their study that there are various factor groups affecting gender gap in entrepreneurship such as demographic factors like immigration; economic factors like labour market, unemployment; institutional and government factors like capital availability ; organizational factors; social and psychological factors; and cultural factors. They have

further considered various factors which “Push” or increase the gender gap and “Pull” or decrease the gender gap. Whereas Gaddam, S. (2007) proposes, two factors influencing entrepreneurship, external and internal. The external factors can be broadly classified into economic factors like trade policies, taxation levels, patents, government intervention, regulations and monetary policies and per capita income. The internal factors can be classified into the need for achievement, locus of control and risk bearing capacity. Other factors are demographic factors like age, experience, education; environmental factors ; cultural factors like the recognition that is given to venture creators, the prevailing attitudes towards success and failure and the degree to which people regard the pursuit of opportunities as socially legitimate; social factors like lifestyle, tastes and preference . This list is not exhaustive; it is just a broad classification. Rani, B., & Rao, D. (2007) suggest through their study that the factors influencing women entrepreneurship include factors viz, wanting to be self employed (business sector), gain prestigious status, profit motive, utilizing professional expertise, providing employment to others, education or economic status of husband or father, work home conflict, making fruitful use of free time, and benefiting from government initiatives. Other factors stated are socio personal such as resistance from family, indifferent attitude of society, male dominance, limited liberty given to women; motivational factors such as run the business successfully, setting up another enterprise, expansion, socio economic needs; locational factors such as power supply, industrial environment, credit facility, availability of raw material, skilled man power. The discouraging factors are discouragement from family, competition, labour problems (industry), inadequacy of credit and difficulty in getting technical know-how (service sector).

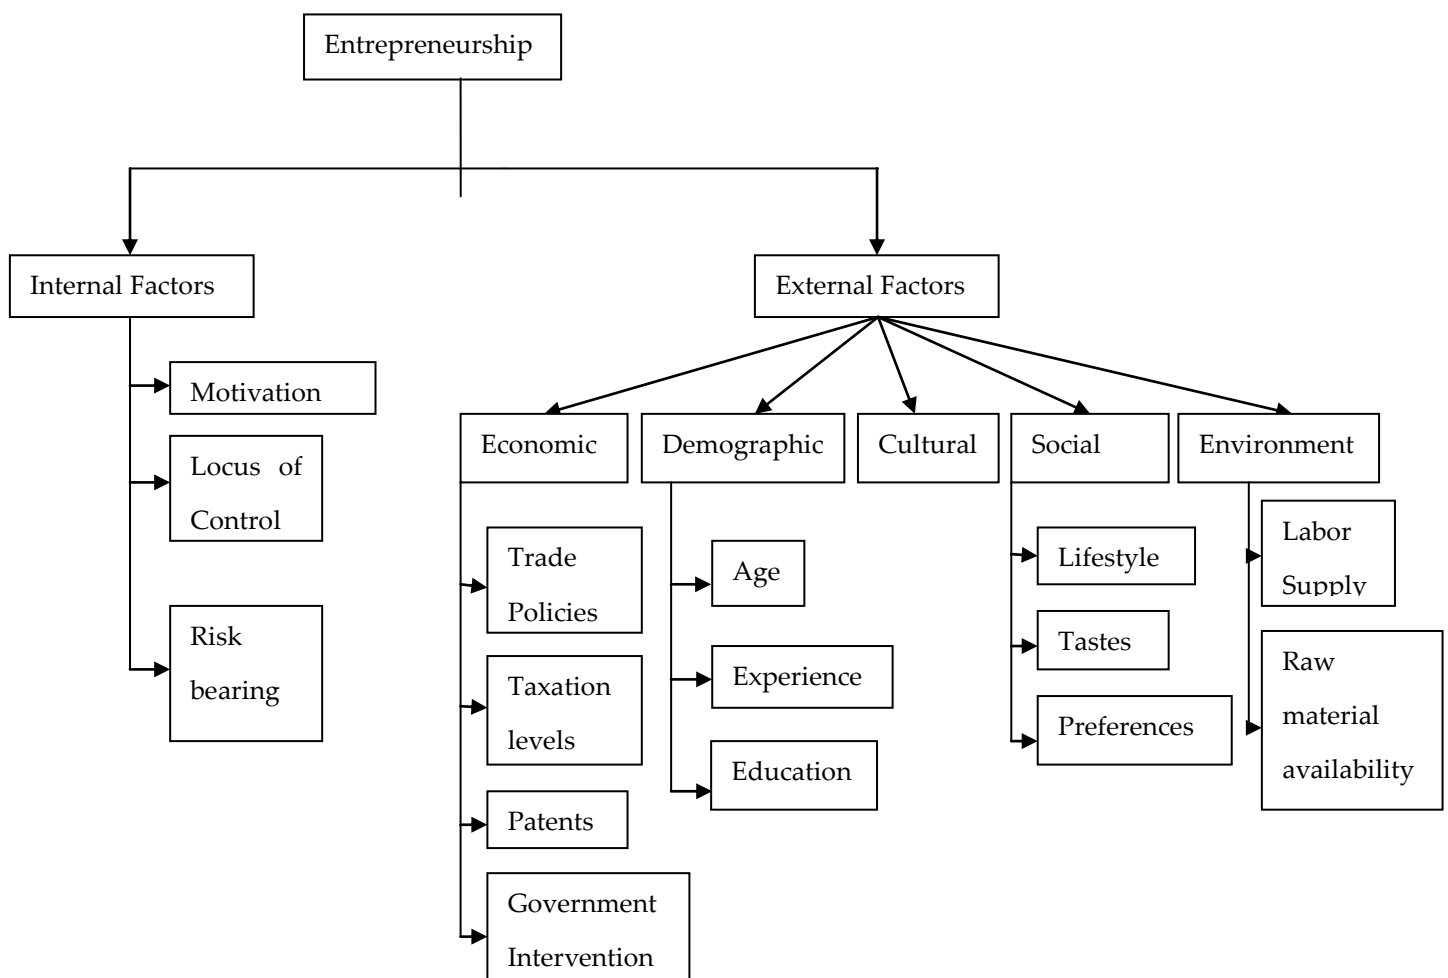

Ertuna Z.E. and Eda, G. (2011), have investigated the role of higher education with regard to the entrepreneurial intentions and traits of university students in Turkey. They suggest that that the factors affecting the intentions are locus of control; need for achievement; innovativeness; risk taking ability. Other factors which control it are gender and family background of an individual. Wage rate and unemployment rate are the extrinsic factors which are not considered in the study. Religion, family income, self efficacy and energy level are other factors which influence entrepreneurial intentions.

Nabi, G & Holden, R. (2008) suggest through their study that university education influences individual's career-orientation and mindset towards self-employment. Factors such as attitude towards entrepreneurship in terms of perceived desirability of entrepreneurship as a career option, perceived feasibility in starting up (e.g. entrepreneurial skills and personality traits) and a willingness to act (i.e. actually a start up). Perceived desirability (e.g. poor image, lack of personal desire), perceived feasibility (e.g. lack of finance, skills, self-efficacy), propensity to act on decisions (e.g. lack of self efficacy to follow through or start up a new business) are other factors. There is a gap between

intent and action. They suggest that evolutionary approaches, be used to develop students as reasonable adventurers and to develop an enterprising mindset. Fresh B-school graduates are increasingly shunning the security of a steady job and striking out on their own. (Gohain, M.P. 2014)

Kshetri, N suggests through his study that there are three institutional pillars which affect entrepreneurship- regulative, normative and cognitive. Regulative component contains factors like government support towards entrepreneurship, strong rules of law and enforcement mechanism. Normative component contains factors like societal perception of entrepreneurs and societal expectation from entrepreneurs. Cognitive component deals with factors like assessment of entrepreneurship as an occupation and relationship between culture and entrepreneurship.

Lewis, Prestin; Lu, Wei; Yin Hao; Li, Yong; Vaccaro, Louis C suggest through their study that there are three major forces that govern entrepreneurship environment- culture, economics and policy. Culture is determined by number of hours worked, likeliness to become an entrepreneur and social network (level of trust and strength). Economic environment is determined by chances that the venture will succeed and funding opportunities whereas different policies that affect entrepreneurship are taxation policy, legal approval to start a business and government sponsored programs to start a business.

METHODOLOGY & RESEARCH DESIGN

Entrepreneurs have been on a rapid growth phase over the past decade. With an increase in numbers comes greater competition and quest for perfection. There exists the need for an in depth study which will help understand the growth of entrepreneurs. Resources available to most entrepreneurs are scarce and limited. In India 38.8% entrepreneurs are necessity entrepreneurs, while around 35.9% fall under the opportunity entrepreneurs' category (Global Entrepreneurship Monitor, Global report 2013).

The researchers have attempted to establish the factors that influence entrepreneurship in India. Secondary research for theoretical comprehension and primary for current practices being undertaken was attempted through quantitative research. The survey questionnaire was adapted & modified from, (Cohoon. J. M., Wadhwa M & Mitchell M, 2010), *The Anatomy Of An Entrepreneur*, are successful women entrepreneurs different from men. Prior to administering the modified questionnaire inputs were drawn from six academicians in the area of entrepreneurship. They contributed in providing critique in constructing the modified questionnaire. Empirical, conceptual and works of practitioners were chosen for concept understanding from databases of Ebsco, Proquest and the internet. Entrepreneurship is a vast area and hence the study has been limited to only the factors influencing entrepreneurship. Unfortunately, no reliable database of entrepreneurs from which to draw exists. Existing lists of entrepreneurs are limited in their scope, tend to contain many inaccuracies and require considerable purging and correcting.

The success of venture creation depends on the individual, environment, economic and financial factors. An assessment of factors influencing entrepreneurship would ensure that the right eco system for breeding successful entrepreneurs exists. Entrepreneurs do not have the luxury of time or resources when starting up, hence awareness of the relevant aspects that support growth would prove useful. Once entrepreneurial motivating factors, challenges in setting up ventures and the external conditions are identified, the entrepreneurs can work towards overcoming these challenges. Knowing aspects of entrepreneurial success will be a value addition to the upcoming entrepreneurs.

The sampling methodology used was convenience or judgment sampling. Further as these respondents knew others in the same field a purposive method of snowball sampling was resorted to. In order to improve the response rate, purposive sampling was included as a part of the survey design. The sample consisted of alumni entrepreneurs, guest speakers who had visited a business school campus, entrepreneurial friends & acquaintances. Permission for data collection was obtained from the respondent, later a multi-part online instrument (e.g., a survey) through the administering of a structured questionnaire with thirty seven questions was used to obtain data.

The researchers faced a non-response error. One hundred and thirty four questionnaires were

administered. Two reminders too were also sent. Forty responses received were screened to check for errors of which four were found erroneous and were discarded. This reduced the total sample size to thirty six. Organizations like; Thane entrepreneurs' network & United India that support entrepreneurship were also sent the questionnaires to forward to their networks.

Inferential statistics has been the method used where statistics gathered from a sample has been used to reach conclusions regarding the population. The responses were then coded and later the data was tabulated in MS Excel. The data analysis was then carried out using statistical software SPSS. The following methods of analysis were used, frequency distribution, t test, testing of hypothesis, ANOVA, discriminant analysis. All hypotheses were tested at 5% level of significance. Participants were informed that the study was being conducted to complete an academic paper and that their responses would be kept confidential and their participation was voluntary. It was assumed that the respondents are truthful when responding to questions on the survey and that entrepreneurship is critical to them.

RESULTS OF THE STUDY

The respondents were given a set of parameters and asked to determine their perception towards. A five point rating scale was used to judge the responses, where (1) = Not at all important, (2) = not important, (3) = neither important nor unimportant, (4) = important and (5) = very important. Similarly challenges were rated, where (1) indicates not a challenge, (2) indicates small challenge, (3) indicates somewhat of a challenge (4) represents big challenge (5) indicates extremely big challenge.

On conducting a frequency distribution for the socio economic standing the entrepreneur, members in the family who have started a business's before the entrepreneur, marital status and children in the family, the following results were obtained.

Table 2 Socioeconomic standing of family				
	Frequency	Percent	Valid Percent	Cumulative Percent
Parents are professional with a college education, and more often with postgraduate degree	13	36.1	36.1	36.1
Parents are individuals who have become rich within their own lifetimes.	9	25	25	61.1
Parents are lower – paid white collar workers, but not manual laborers, hold a diploma or a Bachelor degree.	6	16.7	16.7	77.8
Parents are people who have been born into and raised with wealth; mostly consists of old “noble” or prestigious families.	6	16.7	16.7	94.4
Parents are people who have been born into and raised with wealth; mostly consists of old “noble” or prestigious families.	2	5.6	5.6	100
Total	36	100	100	

Therefore the sample suggests that maximum number of entrepreneurs come from highly educated families where parents are professionals with post graduates degrees. This is followed by individual whose parents have become richer in their life time. The least number of entrepreneurs come from families with rich forefathers.

Table 3 Members of the family started businesses before the entrepreneur				
	Frequency	Percent	Valid Percent	Cumulative Percent
First in my immediate family to start a business	18	50	50	50
Other	18	50	50	100
Total	36	100	100	

Thus the results show that 50% of the entrepreneurs under the study are first generation entrepreneurs.

Table 4 Marital status when the entrepreneur started his/her first business				
	Frequency	Percent	Valid Percent	Cumulative Percent
Single				
Married	25	69.4	69.4	69.4
Total	11	30.6	30.6	100
	36	100	100	

The findings suggest that individuals start business when they have lesser family obligations, i.e. when they are unmarried or single.

Table 5 Number of children living in the household				
	Frequency	Percent	Valid Percent	Cumulative Percent
None	24	66.7	66.7	66.7
2	7	19.4	19.4	86.1
1	2	5.6	5.6	91.7
3	2	5.6	5.6	97.2
4	1	2.8	2.8	100
Total	36	100	100	

The sample suggests that entrepreneurs' start ventures, when they have less family obligation that is no children.

H0: There is no significant difference in the various motivational factors across the city of birth

H1: There is significant difference in the various motivational factors across the city of birth

The city of birth has been divided into four groups; (1) metropolitan cities (2) tier 1 cities (3) tier 2 cities and (4) tier 3 cities. At a significance level of 0.05, it is observed that there is no significant difference in the various motivational factors across the city of birth.

Independent sample t test

In the present study, for the two hypotheses a two tailed test was used and a 0.05 level of significance seemed appropriate for this decision. The method is measured on a five point scale where (1) indicates not at all important, (2) indicates unimportant, (3) neither important nor unimportant (4) represents important (5) indicates very important.

Hypothesis 2

H0: There is no significant difference in the way various factors affect solo entrepreneur and team of entrepreneurs

H1: There is significant difference in the way various factors affect solo and team of entrepreneurs

Table 6 Group Statistics						Table 6 Group Statistics

	Team	22	4	0.98	0.208						

At a significance level of 0.05 it is observed that there is significant difference in the way various factors affect solo entrepreneur and team of entrepreneurs for business factor contractual obligations:

documentation, paperwork and approvals from the government {Solo entrepreneur (M=4.5, S.D.=0.96)}, {Team of entrepreneurs (M=3.73, S.D.=1.35)} with solo entrepreneur giving more importance than team of entrepreneurs; for financial factor (lack of working capital) , {Solo entrepreneur (M=4.29, S.D.=1.32)} {Team of entrepreneurs (M=4.55, S.D.=0.51) with team of entrepreneurs giving more importance than solo entrepreneur and other factors (company's founding team), {Solo entrepreneur (M=3.86, S.D.=1.46)}{Team of entrepreneurs (M=4.73, S.D.=0.55)} with team of entrepreneurs giving more importance than solo entrepreneur. Apart from these three parameters, there is no significant difference in the way various factors affect solo entrepreneur and team of entrepreneurs.

A point to note is, two factors, namely business factor (exemptions provided by the government to entrepreneurs) and financial factors (capital availability), are sensitive at a 0.10 level of significance.

Descriptive analysis

The sample as a whole considered the following factors important; economic factors (low economic activity in the economy); business factors (contractual obligations - documentation, paperwork and approvals from the government); financial factors (seasonal fluctuations of cash); financial factors (lack of financial information); financial factors (capital availability); other factors (prior industry / work experience, lessons you learned from your previous successes, company's founding team; technological factors (access to technology and applications, readiness of status of technology and access to technology and competence networks). Additionally, the following factors are considered to be between "important" and "very important" where the inclination is towards being "very important" by our sample of entrepreneurs; financial factors (lack of working capital) and other factors (lessons you learned from your previous failures).

Overall situations relating to financial factors and technological factors are considered important by entrepreneurs. Whereas cultural factors relating to the caste and religion is considered unimportant.

Hypothesis 3

H0: There is no significant difference in the various challenges faced by solo entrepreneur and team of entrepreneurs

H1: There is significant difference in the various challenges faced by solo entrepreneur and team of entrepreneurs

The method is measured on a five point scale where (1) indicates not a challenge, (2) indicates small challenge, (3) indicates somewhat of a challenge (4) represents big challenge (5) indicates extremely big challenge. At significance level of 0.05, it is observed that the challenges faced by solo and team of entrepreneurs significantly differ for the challenge "Lack of confidence in me by customers" (Solo

entrepreneur: Mean 2.07 and Standard deviation 1.439; Team of entrepreneurs: Mean 2.09 and Standard deviation 0.868). Apart from this challenge, there is no significant difference in the various challenges faced by solo and team of entrepreneurs. But there is one challenge, "Amount of time and effort required", which is sensitive at a 0.10 level of significance.

Descriptive analysis

Lack of prior experience in running a business, lack of available mentors or advisors and amount of time and effort required is "somewhat of a challenge" according to our sample set of entrepreneurs. Rest all the factors range between "small challenge" and "Somewhat of a challenge".

Discriminate analysis

Canonical correlation shows that there is a strong relationship between predicted variables in the results generated. The most important is the coefficient matrix. It represents the highest loading variables in the affecting entrepreneurship. The most important factors affecting entrepreneurship positively are, exemption provided by the government to entrepreneurs (17); business factors: control over timelines to repay loans (14), barriers to entry (10) and economic factors: per capita income (9). Whereas, the most important factors affecting entrepreneurship negatively are, in economic factors: presence of high income level in the country (-13); cultural factors: the religion the entrepreneur belongs to (-9); business: determination of lending rates of the financial institutions (-9) and business factors: government regulation on sourcing of products (-7).

Further for solo entrepreneurs, the most important factors positively influencing are, business: control over timelines to repay loans (368), exemption provided by government to entrepreneurs (328); cultural: the degree by which people regard entrepreneurship as a career (301); business: entry barriers to enter (288) and finally economic: price level of the product/service they were offering (272). Whereas, the factors affecting entrepreneurship negatively are, in economic factors: presence of high income group (-315); financial factors: capital availability (-295) business factors: presence of industrial clusters (-270) and lastly financial: lack of working capital (-270).

For team of entrepreneurs, the most important factors influencing positively are, business: control over timelines to repay loans (238); cultural: degree to which people regard entrepreneurship as a career (190); business: exemption provided by business to entrepreneurs (177), entry barriers to enter (176) and ultimately economic: price level of the product or service you were offering (175). Whereas, factors affecting entrepreneurship negatively are, in economic factors: presence of high income group (-315); financial: capital availability (-183); business: presence of industrial clusters (-181); economic: presence of high income group (-173) and business: tax, customs duty levied by the government (-125).

Company's founding team	33.379	40.428
(Constant)	-536.161	-284.497
Fisher's linear discriminant functions		

LIMITATIONS OF THE STUDY

The family background of the entrepreneur could have been assessed with more in depth questions on the education of the parents & place of birth. Additionally, data not being captured in this study include, whether the entrepreneur started a venture, closed it and followed this with being employed in an organization and later starting a new venture. The difficulty encountered in the research was that only entrepreneurs were considered, instead a specific target population could have been determined. Serial entrepreneurship, family managed businesses amongst others were all categorized as entrepreneurs. Being a India centric study one cannot apply the outcome in Toto across geographical areas. Care must be exercised to invoke cultural considerations with minimal of changes in the survey format which would enlarge the scope of study and its usefulness.

CONCLUSION

As revealed by this study it is obvious that there exists a plethora of factors which impact the issue of 'wanting to be 'an entrepreneur which in turn does not permit gross generalization. However factors like educational background of parents, parents who have grown rich during their lifetime, role and extent of government involvement besides availability of capital have a pronounced impact in driving entrepreneurship. It should also be noted that 50% of entrepreneurs were first generation entrepreneurs lending further credence to the factors mentioned herein.

ESTABLISHMENT OF THE NATIONAL PROGRAMME OF VOCATIONAL GUIDANCE IN LITHUANIA: CHALLENGES AND PERSPECTIVES

Nazelskis, Eugenijus¹; Laurinaitis, Arūnas²

¹Vilnius University International Business School, Lithuania

²Lithuanian Confederation of Industrialists, Lithuania

ABSTRACT

In Lithuania, where its economy is recovering from crisis, many industrial enterprises encounter sharper increased shortages of qualified workers. However, in most cases, this shortage in the country's labor market is not around some one particular occupation that raises selectively the requirements for human qualifications in knowledge, health, or psychic particularities, but for multitude of popular vocations, such as for long- distance drivers, welders, cooks, etc.

The national labor market frequently encounters paradoxical situations; during times of high unemployment and expanded educational levels employers ask the state for permission to import third country specialists because of deficits in many vocations. For some occupations such shortages already existed for several years with no indications of future improvement.

Balancing the demand and supply of skilled workforce in the labor market is a challenge of vocational guidance. Current skills mismatches in the labor market indicate, that the currently applied national program for vocational guidance in the national education system is not able to solve these skills mismatches. This prompts the search for ways and means for improving the situation.

This article, while seeking to achieve a balance between supply and demand as well as rational utilization of available human capital, analyses the causes of the continuous deficit of skilled workforce in various fields. It also will provide recommendations to correct the situation.

Keywords: *Vocational guidance, human resource management, skills mismatches, labour market*

INTRODUCTION

The relevance of the subject theme is based on the contemporary situation in Lithuania's labor market, characterized by asymmetry and disproportion between supply and demand of workforce, because there is a surplus of some specialists and a shortage of others. Furthermore, contradictory situations

appear, when despite of high unemployment and big supply of educated workforce employers ask for state's permission to import middle level professionals (drivers, welders, cooks, etc.) from the third countries, because such skilled workers can not be found in the local labour market. Such shortages exist in Lithuanian labor market for several years now with no visible indications of change in the future.

At the same time statistical data indicate that one fourth of university and college level graduates in social science studies are forced to take jobs as common laborers upon their arrival in the labor market. Among the graduates in engineering manufacturing and processing studies this index reaches almost a half, while among graduates of agricultural and veterinary studies it reaches 60 percent (Lithuanian Labour Exchange, 2014). The number of the graduates of universities going to the initial VET schools for retraining is also increasing.

According to data of the Ministry of Education and Science, 423 graduates of higher education entered vocational schools: 222- university graduates, 201 college, while in year 2012 such number of people almost doubled - it grew to 812, who have diplomas of higher education , 464 of them are university graduates , 348 – college (Jukneviute, 2013) .

However, the situation, where most people work below their qualifications can last a long time, since experts note that young people are not reacting to the labour market needs and tend to make the same preferences in choosing their fields of studies to become economist, lawyer, psychologist, business administrator, manager. They face the biggest risk of unemployment. One of the reasons of this situation is that a significant part of young people choose their vocational pathway without prior evaluation of the employment possibilities. Therefore it is not surprising, that a major part of young people having attained higher education degree, but unable to find jobs must re-qualify and often end - up looking for work outside Lithuania, choosing the life of emigrants.

All this urges us to study and analyse the reasons for evoking deformations in the market place and in utilization of human capital as well as to search for ways and means to correct the situation.

Vocational guidance plays crucial role in dealing with labour market mismatches in many countries. Effective vocational guidance can act as a remedy of existing skills mismatches (when it is provided to the unemployed persons), but it's most important target should be prevention of structural unemployment by directing youth to the vocational pathways providing qualifications that are in demand in the labour market. We claim that strategic and long-term prevention of structural unemployment and skills mismatches requires systemic national programme of vocational guidance with the key role played by employers. In this paper we will try to provide the arguments for this statement by analysing of the role of enterprises in the process of vocational guidance, disclosing the attitudes of enterprises to their involvement of in the vocational guidance and providing arguments

for the establishment of the national programme of the employers led vocational guidance.

To solve the above tasks the were applied different research methods :

- a) Systemic analysis of the different factors and features of the involvement of enterprises in the vocational guidance based on the desktop research.
- b) Analysis of available statistical data.
- d) Empirical research consisting of : 1) Interviews with employers and leaders of associated business structures; 2) Questionnaires for surveying of leaders in associated structures.

Interviews were performed in three economic sectors :

- 1. Transport.
- 2. Metal processing industry.
- 3. Information technology.

THE ROLE OF ENTERPRISES IN THE PROCESS OF VOCATIONAL GUIDANCE

The role and importance of enterprises in choosing vocation and, in general, in vocational guidance becomes apparent when an individual at some point has to find answers to himself: what I want to be? What path in my life I should take? And what profession or occupation I should choose?

The answer is not an easy one as choice of a profession or occupation is a complex and responsible individual psychological act. It results in huge psycho-social consequences not only to a person himself, but also the entire society.

Occupational choice and its subjective and objective factors are the central objects of vocational guidance and its research. Choice of occupation or profession involves numerous contradictions and conflicts between the objective factors defined by the labour market demand and subjective factors, that are defined by the needs and intentions of learners and employees. Theories of psychology, sociology and education science focus on the different aspects of these factors and involvement of enterprises in the vocational guidance process. For example, the theory of occupational choice offered by Parsons is focused on the fit of the personality to the work environment, while the theories of dynamic personality are focused on the complex interdependencies between the dynamic change of personality and the process of the choice of occupation or profession. Very similarly, the theories focused on the structure of personality (Axelrod, Ginzberg, Ginsburg, Miller, Super), motivation (Maslow, Vrum) and individual's choices (Holland, Tyler) stress the complexity and changeability of personality as the key factors in the choice of occupation or profession. These theories also bring the concepts of occupational choice oriented to the personality and subjectivity, such as the concept of casual occupational choice, internal impulse of the occupational choice (Yolland), free development of

personality (Holland, Ginzberg, Super). Obviously, these theories and concepts considered the role of enterprises as secondary factor in the process of occupational choice led by the persons. Very different attitudes to subjective and objective factors of vocational guidance were typical for the theories and concepts developed by the scientists from the former Soviet Union. The concepts of human existence developed by Vygotski, Rubinstein and Leontiev placed socially useful work at the centre of human existence largely ignoring the personal needs and interests of humans. Such theoretical assumptions largely influenced development of vocational guidance in the Soviet Union.

Lithuanian scientist L. Jovaiša has developed psychosocial theory of vocational guidance targeted to the optimal usage of personal resources in the vocational training and subsequent work. He discerned three main factors of the occupational choice: 1) requirements of occupations and professions, 2) demands of economy and labour market; 3) vocation of person for certain work or occupation. This model of vocational guidance is rather similar to the model proposed by S. Fukuyama, who discerned the following factors of mature occupational choice: 1) self-analysis of the personal features and resources; 2) knowledge and awareness of the world of work; 3) introduction to occupation and its requirements by practicing the concrete occupations. All these factors require systemic pedagogical support. For example, young people need methodical guidance and help from teachers in performing self-analysis of their personal features and resources. Equally so, in analysing the requirements of work and occupations young people need both access to information about occupations and consultations provided by the teachers and professionals. Referring to the models of vocational guidance proposed by Jovaiša and Fukuyama there can be discerned several types of requirements of systemic vocational guidance related to above mentioned factors: work process requirements, labour market needs and personal vocation for the occupation. These requirements present different implications to the involvement of enterprises in the vocational guidance. Referring to the work process requirements there can be discerned availability of information about the work processes and monitoring of the changes of work processes. Effective vocational guidance requires access to comprehensive, systemic and regularly updated information about the contents of work processes in the different occupations and professions. Availability of such information can be ensured by the different measures and instruments, such as occupational standards, national and sectoral databases of occupations and qualifications, catalogues and registers of occupations and qualifications (for example, national repertory of the descriptors of occupations in France – ROME, or the open system of information and guidance on occupations and qualifications AIKOS in Lithuania). In spite of the domination of the national governments in designing and implementation of these measures in many countries, the involvement of enterprises and social partners by providing information and expertise is of crucial importance for the quality of these measures. Monitoring of the occupational change also

requires solid and concerted efforts of research institutions, enterprises and other social partners. It ensures relevant updating of the information about the work process requirements, what is of crucial importance for vocational guidance in the current context of fast changes in the world of work. Referring to the factors of vocational guidance related to labour market needs, there can be discerned labour market forecasting and exercising influence to the development of labour market needs. Effective vocational guidance requires reliable information about the labour market changes, that can be provided by systemic and regular labour market needs forecasting. In the nowadays conditions of the fast and unpredictable social and economic change labour market forecasting is very often undervalued and its reliability is doubted. However, despite of its multiple limitations, labour market forecasting is absolutely indispensable not only for the long term labour market policies and strategies, but also for the vocational guidance. Relevance and reliability of labour market needs forecasting highly depend on the involvement of employers in this process on the enterprise, sector and national levels. National and European strategies of the knowledge-based economy often require from the state and social partners to take more responsibilities and to make more efforts to improve the quality of employment and to enhance the demand for high-quality and knowledge intensive jobs. Enhancement of the demand for such jobs is perceived as a key factor for development of competitive economy. Referring to the factors of vocational guidance related to personal vocation, there can be mentioned orientation of the educational process to assistance for learners to discover their personal vocation and to strengthen it. This orientation requires from educational institutions to become more open to the world of work by establishing stronger cooperation with enterprises and involving the skilled employees and professionals in the educational process. Implementation of the competence based paradigm in the education process also fits to this purpose. Providing to young learners systemic pedagogical and psychological support in discovering and nurturing their personal vocation becomes very challenging undertaking for general and vocational education providers in the context of dynamically changing occupations, work processes and labour market. It requires to restructure the education process by including different propaedeutic and work-based learning measures.

Development of vocational guidance can be based on the different methodological principles, that can even contradict each other. Hupfer and Spöttl (2014) discern the principles of vocationalism and employability. The object of vocationalism is development of an occupational identity through mastering of the professional domain, while the principle of employability is focused on the market oriented dispositions and attitudes that ensure the competitive features of person in the labour market. This principle is based on the assumption of the domination of economic organisation of work and disregards educational and vocational-pedagogical principles of the work and its organisation.

These two principles, if taken separately, lead to the different models of vocational guidance. The principle of vocationalism requires comprehensive and holistic vocational guidance based on the systemic consideration of the different subjective factors, such as needs of development of personality and occupational identity, ethical and moral aspects of work. Vocational guidance ruled by the principle of employability will be more focused on the requirements of workplaces and orientation to the „objective“ requirements of workplaces to the performance, such as concrete sets of knowledge and skills to perform the work tasks. It turns to the different roles and involvement to the employers in these models. In the model of vocational guidance based on the vocationalism, the main role of employers is active participation in the educational process by providing the comprehensive information about work processes, involving skilled employees and experts in the preparation and execution of vocational guidance measures, designing and implementing different propaedeutic and apprenticeship measures and events in order to disclose to young people the holistic picture of work processes and professionals. Enterprises treat their participation in the vocational guidance not only from the point of view of their business interests, but also from the point of view of public social responsibility. In the model of vocational guidance based on the employability the enterprises participate in this process by „marketing“ their offered workplaces and presenting the requirements of skills, competences and qualifications. Here the participation of enterprises in vocational guidance processes is more strictly based on the current needs of recruitment and human resource management.

2. INVOLVEMENT OF BUSINESSES IN CAREER GUIDANCE

The problem of the shortage of skilled workforce in specific sectors of economy of Lithuania has been discussed for a number of years. Interestingly, the biggest shortages of skilled workforce is noticed in ordinary and middle skilled occupations, rather than any specific or unique professions with special requirements for skills and competences.

The number of work permits issued to foreign nationals in the Republic of Lithuania indicates the shortage of skilled workforce and its extent on the domestic labour market. The data are provided in Figure 1 below.

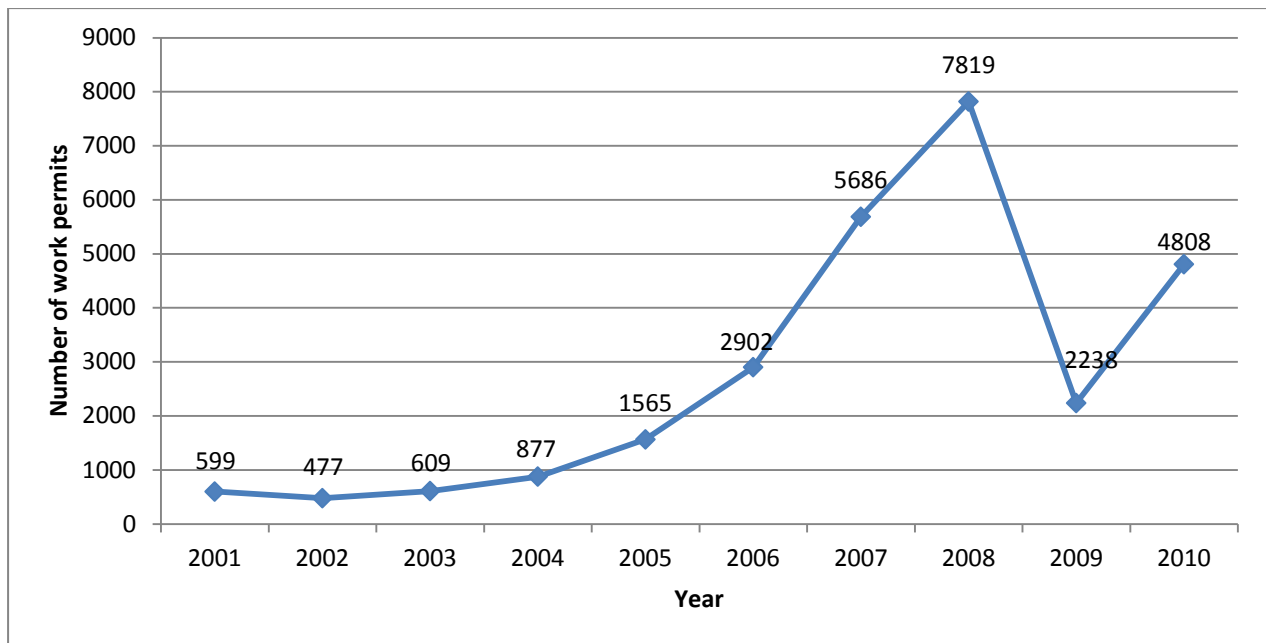

Fig.No. 1. Number of work permits issued to third-country nationals

According to the data contained in Figure 1, in the recent decade, the number of work permits issued to foreign nationals in Lithuania has been significantly growing, and it has already reached a four-digit level. This causes concern, however, one should also remember that third-country nationals are employed only in the sectors that face the shortage of professionals from Lithuania and EU member states. According to the data of the Lithuanian Labour Exchange of 2010, long-distance drivers, hull assemblers, welders and cooks (Foreign Nationals in Lithuania, 2011) were in the highest demand.

In terms of the shortage of certain occupations, the labour market situation, from a time perspective, continues to deteriorate, as the gap between the supply of and demand for the lacking occupations is still widening. The number of work permits for specialists of different occupations (especially the truck drivers) is rather important (Figure 2).

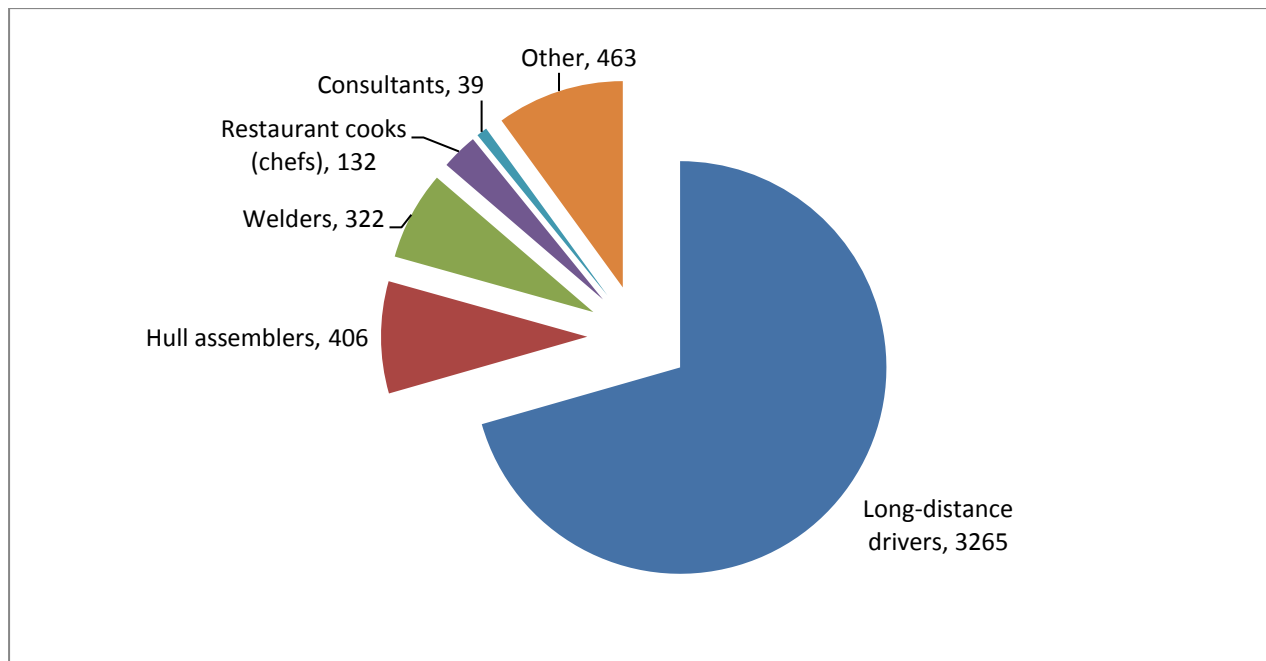

Fig. No.2. Distribution of work permits issued to foreign nationals in the Republic of Lithuania by occupation, 2012

In 2012 alone, Lithuania issued 4,125 work permits to these third-country professionals.

Admittedly, the demand for cargo truck drivers might be still increasing in the future, as in 2011 alone 6,300 cargo truck driver job vacancies were registered for international carriage of goods, and only 1,100 of these were filled by Lithuanian drivers (Kleinauskas, 2012). At the same time, statistics reveal that, at present, two thirds of long-distance cargo truck drivers are aged between 40 and 60. ("Mercedes-Benz" Intends to Tackle the Shortage of Drivers by Using Innovative Methods). The ageing of cargo truck drivers also causes concern over the sufficient number of these professionals in the future.

With the widening gap between supply and demand, the domestic labour market situation is also becoming more complicated in relation to welding professionals. Statistics show that the labour market demand for welders was increasing even under the conditions of economic crisis: in 2009, 2010 and 2011 there were 1,700, 2,400 and 3,000 welding job vacancies respectively (Suvirintojų nuo emigracijos nesustabdo ir 4 tūkst. Lt atlyginimas, Delfi, 2012).

Above described situation enhanced to carry out research in order to clarify the reasons for the persistent shortage of individual occupations on the labour market and to explore the involvement of companies in vocational guidance.

In February 2014 there have been interviewed representatives of the several sectoral associations of business enterprises. These include: (1) Lithuanian National Road Carriers Association "Linava", which at present joins 954 carriers – transport companies owning around 20,000 commercial vehicles for international carriage of goods and approximately 3,000 buses and trolleybuses for carriage of

passengers; (2) Lithuanian Welders Association that unites representatives of the welding industry (machinery production, metalworking) - there are approximately 700 companies engaged in welding technologies; and (3) National Association of the Information and Communication Technologies (ICT) Industry “Infobalt”, which currently unites 138 Lithuanian ICT companies and research and education institutions. These companies and organisations employ over 10,000 ICT specialists.

It should be noted that the ICT industry it suffers from a dramatically widening gap between supply of and demand of skilled employees. Data contained in Figure 3 (Brazauskas, 2011) show the shortage of ICT specialists and the perspectives of meeting the demand.

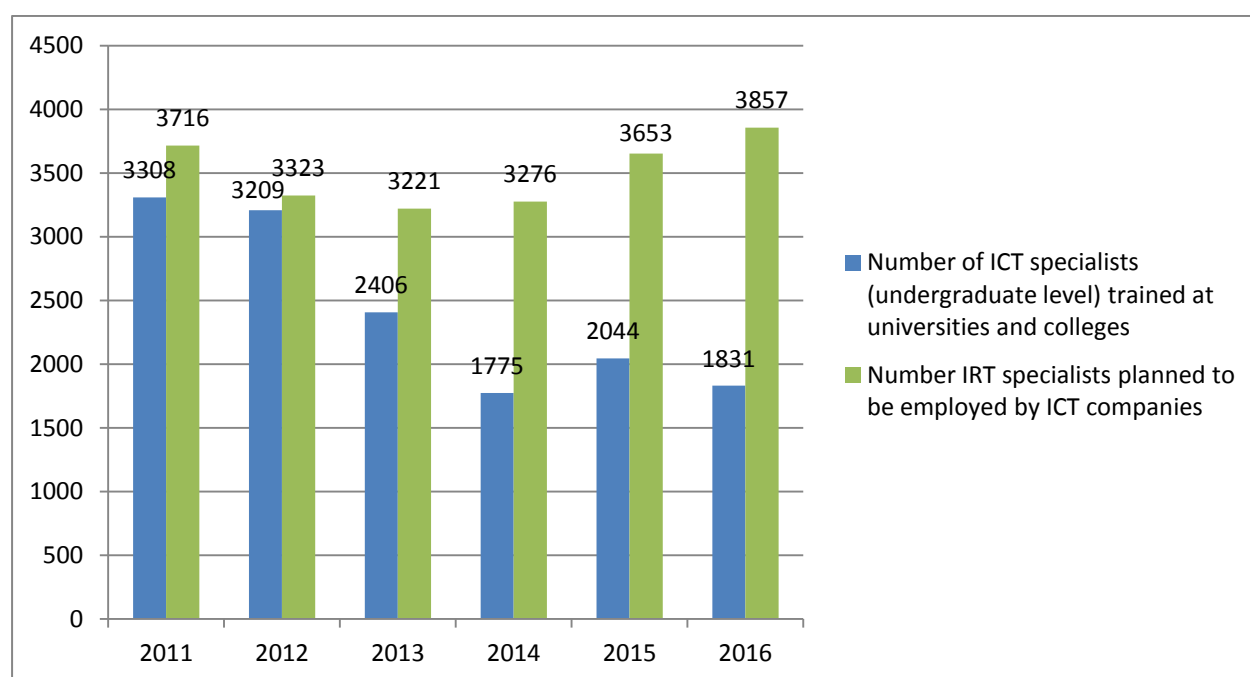

Fig. No.3: Training of IT professionals and their demand in the domestic economy

In 2011-2016, the gap between the supply of and demand for ICT specialists will reach 6,000. This estimate does not consider possible increase in specialist mobility and entry of potential investors to this Lithuanian sector, which might widen the gap even further.

The data contained in Figure 3 reveal that the gap on the labour market between the supply of and demand for IT specialists is further widening. In 2011-2016, the shortage of IT specialists is expected to reach 6000. Lack of skilled employees hinders the promotion of investments in the country's economy and impedes the development of economy and individual industries.

Research was primarily aimed at establishing the groups of professionals that were the most required in the above mentioned sectors.

The data obtained were systematised on the basis of Lithuanian Classification of Occupations. They are provided in Table 1 below.

Table No.1. Number of lacking workers by professional group

Association name	Professional group					
	Management	Experts	Technicians and junior experts specialists	Servants	Skilled workers	Unskilled workers
Linava	-	-	-	-	2,500	-
Infobalt	300	7,000	2,700	-	-	-
Welders Association	-	500	200	-	3,800	-

Statistics provided in Table 1 show that three sectors alone need 17,000 skilled workers. This implies that filling these job vacancies would lead to a significant decrease of the unemployment rate in Lithuania. On 1 February 2014, the unemployed registered with local labour exchange offices numbered 210,900. They accounted for 11.5% of the country's population of working age, including 111,700 unemployed males and 99,300 unemployed females. On 1 February 2014, there were 24,000 registered young unemployed persons under the age of 25. (Lithuanian Labour Exchange, Information, 2014).

Some labor market forecasts failed in detecting the shortage of IT specialists. Although it was estimated that (see Table 1) the requirement of IT specialists would reach 6,000 in 2016, the study shows that already now 10,000 persons are required.

The managers of the above mentioned associations were asked about the reasons for the shortage of workers in their sectors. Taking into consideration the possible variety of causes of the shortage of experts on the labour market, the managers of the associations were requested to name five key reasons for the shortage of skilled workforce. In addition, they were asked to rate their answers from 5 to 1, where 5 points were given to the most important aspect. The data obtained were systematised and are provided in Figure 4 below.

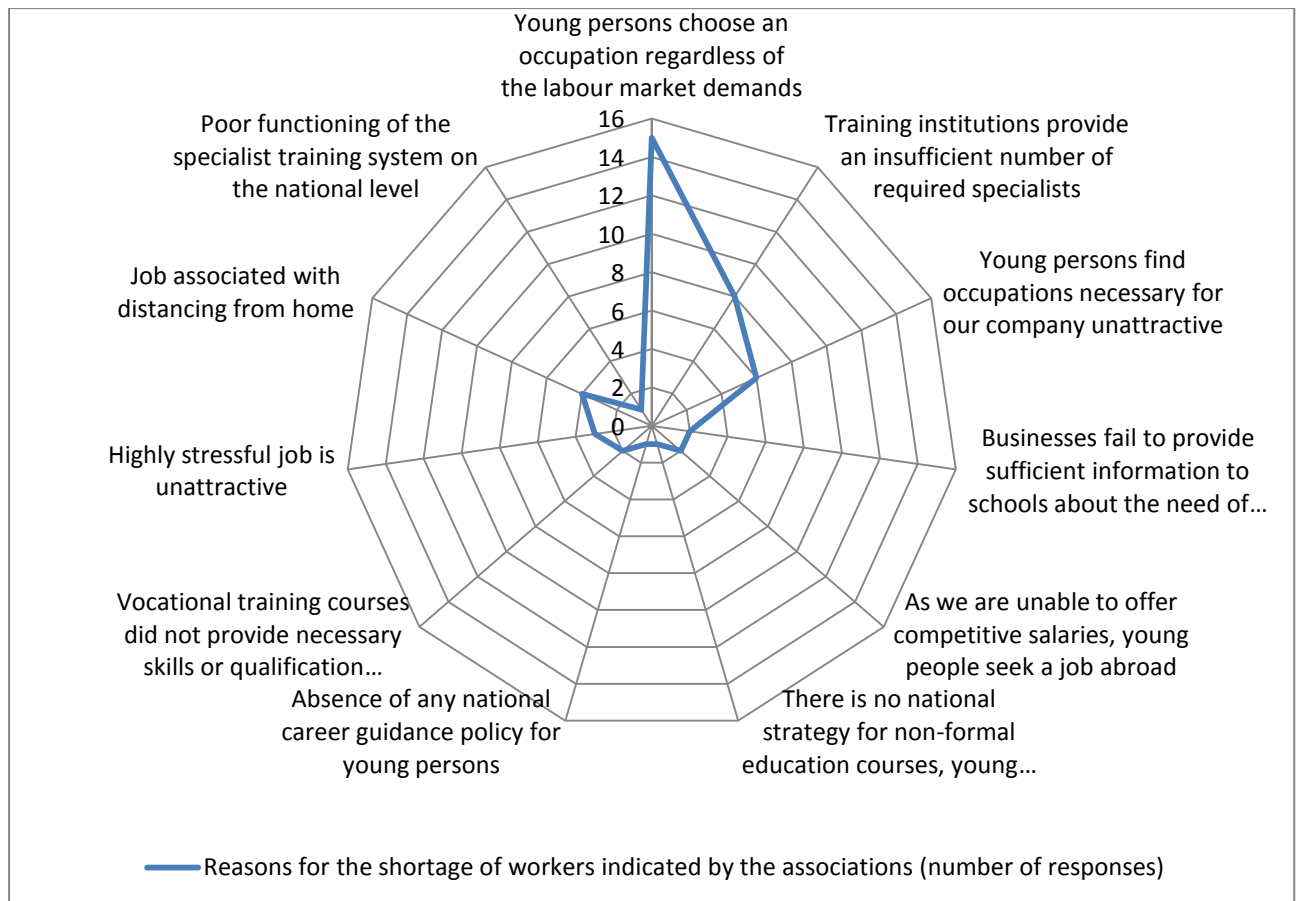

Fig.No.4. Key reasons, as seen by associations, for the shortage of certain occupations on the domestic labour market

According to Figure 4, there are 11 main reasons why companies suffer the shortage of workers. Yet, the fact that young persons choose an occupation regardless of the labour market needs is predominant among other reasons. This implies that the responsibility for the shortage of certain skilled workers or specialists basically rests with those who choose their occupation.

However, such a position taken by the respondents raises doubts and a number of questions as to: (1) the objectivity and moral correctness of this attitude; (2) the sufficiency of efforts of businesses to encourage young people to opt for occupations that are absolutely necessary for the country's economy; (3) extent of the usage of human resources potential in meeting business requirements for necessary occupations; and (4) the need for employers to change their attitude to both young persons and their occupational choice.

Such issues are reasonable and well-founded. For instance, whenever the shortage of cargo truck drivers is mentioned, it is often claimed that this is a male-dominated occupation, and this stereotype is still common in Lithuania. However, in the USA and Canada women working as cargo truck drivers account for 5% of the overall number of truck drivers. Americans admit that they are not satisfied with such situation and target to increase the employment of women in this position to

achieve that women would make at least 10% of total cargo truck drivers. It should be noted that the cases where man and wife, father and daughter, couples, etc. work as long-distance drivers are quite common in the United States. For driving pairs, this is not only the way to earn money, but also the possibility of travelling together, communicating, enjoying their work and life. The United Kingdom, France, Sweden and some other countries even have organisations promoting employment of women for cargo truck driver jobs. Such organisations are particularly successful in Sweden. However, there are no considerations of this employment niche for women in Lithuania. Respondents say, that one of the reasons for excluding such an occupation as an option for choice is distancing from the family. However, the practice of other countries demonstrates that, in a number of cases the occupation of a long-distance driver can unite families rather than to pull them apart.

Reasons related to the quantity and quality of specialist training come in second place. It should be noted that, according to the interviewed business associations, the initial VET schools and higher education establishments fail to meet the needs of quantity and quality of skilled specialists.

In some cases, as for example, in case of welders the graduates of initial VET schools do not have all certificates that are needed for the immediate work after employment. Here the problem lies in the insufficiency of the contents of provided qualifications for the execution of work tasks. It's no wonder that employers who recruit such persons still need to devote a great deal of effort and money to their further vocational training for them to obtain documents necessary for the job. For this reason, when recruiting staff, employers give priority to persons with all needed qualifications and professional experience rather than young graduate specialists. This partially explains why the problem of youth unemployment persists in Lithuania, though at the same time there is a shortage of professionals in the different fields (like, for example, welding).

The current situation shows that the issues related to training of specialists of specific areas need to be tackled in order to increase youth employment. It could be possibly dealt with through a better cooperation between employers and training institutions and by joining efforts in the preparation of occupational standards and their integration in curricula. Nevertheless, documents and surveys (Nazelskis, Tutlys, 2013) reveal that this kind of cooperation is still rather weak.

Studies of Peter Drucker, a famous American manager and the author of a number of research papers, are valuable in dealing with the sensitive and complicated issue of specialist training. Taking into consideration worldwide social transformations and the role of organisations in transformation processes, this researcher claims that: "Only the organisation can convert the specialised knowledge of the knowledge worker into performance, and the human capital to the structural capital" (Drucker 1994:88). Due to the need of highly skilled workers the involvement of organisations in specialist training become an objective necessity.

Further, the representatives of business associations were asked about their involvement in vocational guidance. The data obtained were systematised and are provided in Table 4 below.

Table No. 4. Involvement of business associations in vocational guidance

Item	Association name	Yes	No	No answer
1	Linava			+
2.	Infobalt	+		
3.	Welders Association	+		

Not all associations gave a positive answer to the question about their involvement in vocational guidance. This implies that not all of them are practically engaged in such activities. Since the association “Linava” gave no answer to the successive questions related to vocational guidance, this is a well-founded assumption.

Following the question about the involvement of companies and associations in vocational guidance, respondents were further asked about the forms of their involvement in vocational guidance. Their responses were systematised and are provided in Table 5 below.

Table No. 5. Main forms of vocational guidance used by companies and associations

Item	Association title	Forms of vocational guidance
1	Infobalt	<ol style="list-style-type: none"> 1. Tours for teachers and pupils arranged at the company; 2. On-line lessons for pupils; 3. Cooperation with informatics teachers association LInMA; 4. Prizes for the Informatics Olympics and informatics competition “Bebras”; 5. Organisation of the event “IT naktis” (IT Night); 6. Implementation of the project “Demola”, in which business representatives (mentors) and students together develop new products focused on the solution of a specific problem raised by a company.
2.	Welders Association	<ol style="list-style-type: none"> 1. Evaluation of new vocational training curricula; 2. Market survey conducted and three draft curricula (welding coordinator, brazer and plastics welder) prepared in 2007-2008; 3. A curriculum prepared for MIG/MAG welders in 2012.

It should be noted that the data contained in Table 5 speak of a controversial and interesting phenomenon – companies are convinced that they participate in vocational guidance, but their indicated forms of involvement show that these representatives have rather distorted understanding of the contents of vocational guidance. Bigger part of their indicated measures hardly have anything in common with vocational guidance on the whole or play only a secondary role in the vocational guidance process. In addition, their indicated measures evidence, that vocational guidance provided by economic entities lacks clear structure and focus.

In this context, it is worth mentioning that modern information technologies offer wide opportunities for economic entities to take part in vocational guidance and provision of information about occupations and skills needs. Specifically, the development of specialised websites allows the

provision of information about occupations, their need, prospects and requirements of each specific occupation for human skills, knowledge, health and physiological characteristics.

Also, it should be reminded that persons choosing an occupation, planning their future and seeking vocational retraining should be aware of social and economic aspects of a specific occupation, such as salary rates, social benefits, health implications, cultural and routine conditions, possibilities to attain qualification, training institutions providing required training, etc.

Practice shows that preparation of specialised information publications, articles and radio or television broadcastings dedicated to young persons, parents, teachers, redundant workers and jobseekers are also effective in vocational guidance. These measures, however, are missing in the analysis of the provision of vocational guidance by companies and their associations.

Likewise, the analysis of the provision of vocational guidance by companies and associations shows the lack of an proactive approach of economic entities in the organisation of joint information events with the Lithuanian Labour Exchange for: (a) redundant workers; (b) the long-term unemployed; and (c) persons whose occupation is redundant on the labour market and who thus are unable to find a job according to their specialisation. It needs to be reminded that these groups form a tremendous reserve for the supply of necessary workers.

Further, to ensure the objectivity of the assessment of activities of companies and associations in the field of vocational guidance, informantss had to answer the following two clarifying questions: (1) Does your company (association) implement any vocational guidance programme? In response to this question, all respondents frankly admitted having no such programme; (2) How much money do you allocate for vocational guidance? Responses to this question reveal that the Welders Association allocates a considerable amount for vocational education of pupils (up to LTL 200,000 a year), including non-formal education and professional development of teachers (LTL 1.3 million in two years). This association also provides LTL 2.75 million (EU funds, budget funds and companies' funds) for work with students. However, no funds are specifically used for vocational guidance purposes.

Summarised findings of the empirical research show that individual segments of the Lithuanian labour market are facing a critical situation caused by the shortage of skilled workers. At the same time, the research reveals that economic entities, which should be the most concerned about the sufficient supply of professionals on the labour market, fail to take any part in vocational guidance or their involvement is very limited and episodic.

NECESSITY FOR CHANGING THE ATTITUDE OF ECONOMIC ENTITIES TO VOCATIONAL GUIDANCE AND FOR SPECIALIST TRAINING IN ORDER TO DEVELOP THE NATIONAL PROGRAMME FOR VOCATIONAL GUIDANCE IN THE EDUCATION SYSTEM

Statistics speaking of the shortage of professionals in specific areas of the country's labour market, first of all, encourage finding ways and measures to rectify the situation; second, it becomes evident that the existent National Programme for Vocational Guidance in the Education System and the vocational guidance system functioning within its framework are incapable of fully ensuring the supply of skilled professionals that are required for the country's economy and labour market. However, it would be wrong to attribute full responsibility for the current situation on the Lithuanian labour market only to pedagogical vocational guidance provided by education institutions. On the contrary, even from a retrospective view of the history of Lithuanian pedagogical vocational guidance, education workers have significantly contributed to the development of vocational guidance in Lithuania and the global theory and practice of vocational guidance. Their contribution becomes even more visible in the context of vocational guidance in Lithuania and historical changes.

It should be noted that, in vocational guidance, a number of democracies followed the evolutionary path. In our country vocational guidance was altogether banned for a long time. This prohibition was imposed in 1936 by the special resolution of the Central Committee of the Communist Party of the Soviet Union on pedagogical deviations in the people's commissariat education system. This resolution categorically prohibited vocational guidance research or the use of test methods and stopped the application of any psychological techniques and professional selection.

Following Lithuania's annexation and incorporation in the USSR in 1940, the abovementioned resolution automatically came into force in Lithuania and was valid until the middle of the last century. As rightly noted by K.G. Pelikian (Пиликян 2009:38-45), a prominent researcher of the USSR history of vocational guidance, this prohibition was lifted in the mid 40's of the last century owing to the efforts, courage and ingenuity of A.Volkovsky, L.Jovaiša, M.Vinogradova, G.Galkytė, M.Kopanev, B.Uspensky and other researchers who argued for the necessity of training young persons for occupation.

Lithuanian education workers (L.Jovaiša, G.Galkytė, etc.) substantially contributed to the revival of vocational guidance. With the revival of vocational guidance, Lithuanian researchers channelled tremendous efforts into theoretical foundations of vocational guidance, experimental research and practical use of research results. Important contribution in the development of theoretical foundations was made by L.Jovaiša and S.Kregždė, who were destined not only to open the door to vocational guidance, but also to lay theoretical foundations in this area.

While building theoretical foundations for vocational guidance, L.Jovaiša came up with an idea and developed a vision, which is dealing with objectively existent contradictions between the public demand for skilled professionals required to secure the functioning of the country's economy and the needs, abilities, subjective attitude to work and career choices of a particular person by training and educating of a person and through the personality development. Thus, then prevalent administrative, party and military mobilisation measures, which helped to ensure staffing in a number of cases, were opposed with a tailored education system dedicated to pupils' professional focussing, development of their ability to choose an occupation with full awareness and assistance in their career choices, when needed.

It should be further noted that vocational guidance, as being closely associated with the need to give answers to complicated philosophical questions about the human being, ideals, values, etc. of the society and of an individual, naturally covers fundamental problems for young people that encourage search for the meaning of human life and allow for real possibilities of achieving one's life goals. Such responses already entail a number of further questions about human rights and freedoms enjoyed in the country, personal life management possibilities, rational use of human potential in economy and a number of other factors affecting personal and society's life.

By referring to vocational guidance and personal aspects of career choice, L.Jovaiša found an effective method and measure allowing for: (1) the change of the government's and society's attitude to a person; and (2) the extension of human rights and freedoms and a conscious and responsible management of personal life. Conditions were also provided for the commencement and promotion of scientific discussions on critical issues of the social life of that time.

It should, however, be admitted that, regardless of the achievements of the time in vocational guidance, under the conditions of planned economy vocational guidance could function only within a strict framework: it was fully regulated by the state which planned how many persons were to be admitted to universities, higher vocational technical schools (now transformed to the universities of applied science), vocational and technical training schools, etc. In addition, graduates of training institutions were compulsorily appointed to perform certain jobs for a set number of years. As a result, economic entities did not have to take care of staffing or compete for workers, as only a timely application sufficed to ensure the supply of necessary specialists. However, such practice did not stimulate companies and organisations to take part in vocational guidance and created a stereotype that the vocational choice was personal, family or training institutions' concern.

Further, in Lithuania's transition from the planned economy to the market economy, vocational guidance received considerably less attention. Young persons were left to make their own choices. In other words, previous achievements in the area of vocational guidance were lost, though nothing new

was created. Naturally, such a vocational guidance situation led to the misbalance on the country's labour market, which faces severe shortage of some occupations and, at the same time, the redundancy of other occupations.

With the final shift to the market economy, vocational guidance again was brought into focus. High aspirations towards vocational guidance were associated with the National Programme for Vocational Guidance in the Education System approved by Order No ISAK-2332 of the Minister of Education and Science of 3 December 2007. The Programme was revised by Order No V-580 of the Minister of Education of Science of the Republic of Lithuania of 25 June 2013.

Yet, a few years after the approval and revision of the Programme, the labour market situation seems to be even deteriorating with the increasing youth emigration, disproportion between supply and demand on the labour market and the shortage of experts of specific areas.

Naturally, in order to balance supply and demand on the labour market, it is necessary to change the attitude of companies and organisations to vocational guidance, as surveys show that economic entities poorly understand their position, role and importance in terms of the choice of career and vocational guidance, and also its benefits for individuals, economic entities and the society as a whole. Therefore, to make sure that economic entities take a different approach to vocational guidance, it is important that companies and organisations fully understand the advantages of effective vocational guidance. In this context, research data provided by S.N.Kurovskaja (Куровская, 2009:23) are indeed useful. Based on the experience of foreign states and research findings concerning the benefits of career guidance for population and economic entities, she provides the following data: (1) effective vocational guidance reduces the time and costs of vocational training by 2-2.5 times; (2) reduces staff turnover by three times; and (3) increases performance efficiency by 20-30%.

Significant research in relation to the importance of the choice of career and its effect on economic entities is introduced by researcher A.Zaicev (Зайцев, 2011). He conducted research in 2010 after surveying the employed from Western Europe, Eastern and Central Europe and Russia as regards their satisfaction with their career choices.

This research revealed that Western Europeans dissatisfied with their career choices accounted for maximum 15%, the majority of which are workers employed at production facilities. At the same time, such workers in Eastern Europe and former Soviet Union countries accounted for 30%, while in Russia dissatisfied persons aged between 40 and 50 made up to 50%. Notably, a number of respondents openly admitted that they consider their jobs as servitude and that they only perform their duties from 9 a.m. to 6 p.m. and are ready to change their occupation at the earliest opportunity.

The findings of this research make it evident that, from the employer's perspective, building a team of like-minded individuals, readily investing in staff training and professional development, increasing

corporate performance efficiency, ensuring business stability or reducing staff turnover pose a serious problem, as due to the wrong choice of career quite a significant number of workers look forward to the first opportunity to change the occupation they dislike.

At the same time, it should be admitted that the change of employers' attitude to vocational guidance and even their good will alone might be insufficient in order to use the available human capital in a rational way and to balance the labour market situation, as the provision of vocational guidance requires special knowledge and abilities to carry out specialised research and use the outcomes in practice.

In other words, in order to meet changing demand of the economy for workers, a number of tasks related to career choices need to be performed by practitioners working in companies and organisations, because it is economic entities, seeking a competitive advantage, who should be the most concerned about the availability of professionals of relevant areas. This is why the engagement of practitioners in vocational guidance is an objective necessity, which encourages companies and organisations to have specialists who are capable of using participatory research based methods and to develop the information and know-how about work processes and occupations.

According to a widely used definition of the modern human resource management saying that "human resource management is understood as a systematic and uninterrupted process aimed at satisfying ever changing staffing needs of a company and at formulating a staffing policy in order to ensure long-term and effective company's operation" (Чукупеев, Корытова, 2010:14), in modern companies and organisations the responsibility for meeting the staffing needs, as a rule, rests with HR managers. For this reason, taking into account the importance of their professionalism and the necessity of their contribution to vocational guidance, the analysis of the preparedness of HR experts for the provision of vocational guidance is inevitable.

Looking to the position of human resource management within the system of the study fields of higher education in Lithuania, human resource management is not regarded as an separate field or branch of science and makes a part of management science studies. We can assume, that it indicates certain lagging behind of human resource management studies in Lithuania comparing to other countries, where this management area has developed into an independent branch of science, including active research, defence of doctoral theses and award of doctoral degrees in human resource management.

In Lithuania, human resource management studies makes part of corporate management studies (code S190) in the study field Management and Administration. In other words, human resource management studies are mainly focused on individual companies, while the studies of human resource management on the sectoral, regional or national levels remain ignored.

Deeper analysis of study programmes of human resources management reveals, that at present, eight Lithuanian higher education institutions train specialists more or less related to human resource management.

Table No. 6. Human resource management programmes of Lithuanian higher education institutions

Item	Education institution	Programme title	Degree awarded
1.	Vytautas Magnus university	Career and Career Guidance	Bachelor Degree in Andragogy; Bachelor Degree in Educational Sciences before 2010
		Career Designing	Master Degree in Educational Sciences;
2.	Šiauliai University	Career Education	Master Degree in Educational Sciences
			Master Degree in Human Resource Management (qualification description is being prepared)
3.	Lithuanian University of Education Sciences	Career Designing	Master Degree in Career Education; Master degree in Educational Sciences before 2010
4.	Klaipėda University	Career Designing	Master Degree in Career Education; Master degree in Educational Sciences before 2010
5.	Mykolas Romeris University	Leadership and Change Management	Master Degree in Human Resource Management; (Master Degree in Public Administration before 2010)
6.	The General Jonas Žemaitis Military Academy of Lithuania	Personnel Management	Bachelor in Public Administration
		Human Resource Management	Master Degree in Human Resource Management (qualification description is being prepared); Master Degree in Management and Business Administration before 2010
7.	Kaunas University of Technology	Strategic Leadership	Master Degree in Human Resource Management
		Human Resource Management	Bachelor Degree in Human Resource Management
		Human Resource Management	Master Degree in Human Resource Management
		Leadership	Bachelor Degree in Human Resource Management
8.	Vilnius University	Human Resource Management	Master Degree in Human Resource Management (Master Degree in Management and Business Administration before 2010)

In terms of the level of provided degrees and qualifications, universities provide study programmes on the (1) bachelor and (2) master level. However, degrees related to vocational guidance are awarded in different areas, including educational sciences, career education or human resource management.

The analysis of study programmes and their descriptions shows that graduates of educational sciences are qualified for work in: (a) a number of education institutions and their management institutions; (b) labour market services; (c) labour exchange offices; (d) vocational and career guidance centres; and (e) staff training and career guidance services of enterprises, firms, companies and other organisations.

Definitely, experts of this area are prepared to engage in vocational guidance. The negative aspect is that the possibilities of using them in companies are highly limited, as there are no large companies in Lithuania which could afford to have their own staff training and vocational guidance centres. Even the major Lithuanian concerns cannot afford experts with narrow specialisation in their HR units due to high costs, as modern HR management units perform a wide range of functions requiring knowledge in a number of human resource management areas.

A similar situation is with career designing experts, who, during their studies, gain fundamental theoretical knowledge in educational sciences, career designing and psychology, required for human resource development in education and labour market systems.

Admittedly, these professionals are very valued by specialised companies engaged in recruitment and selection of employees and providing services to a number of other companies in the country, because these experts are trained to assess personal skills and abilities by using descriptions, tests, surveys, evaluation scales and other methods. In practice, even large industrial companies hire specialised companies for staff selection, because this is more cost-effective than in the case of own experts within the HR management structure.

It may be reasonably assumed that, depending on financial possibilities, the needs of businesses may be best answered by professionals who completed study programmes of human resource management and handling, personnel management and strategic leadership. Yet, these programmes do not cover vocational guidance. This suggests that it would be reasonable to integrate the course of vocational guidance in human resource management programmes in order to balance the supply of and demand for workers on the labour market, as the availability of vocational guidance experts in companies and organisations would allow for further development in the area of vocational guidance.

Conclusions and Recommendations

Lithuanian companies and organisations still have a poor understanding of their position, role and functions in the process and within the framework of career choice and vocational guidance and the impact on the formation, accumulation and effective use of the human capital.

Unless a number of companies and organisations change their focus and approach to the planning of their staffing needs and the stern attitude to vocational guidance, it is quite unlikely that the situation on the Lithuanian labour market will develop in a positive way, structural unemployment will decrease on the domestic labour market, the rate of youth employment and the efficiency of the use of human capital will increase and the state will comply with its international obligations.

The research reveals that economic entities, which should be the most concerned about the sufficient supply of professionals on the labour market, fail to take any part in vocational guidance or their involvement is very limited and episodic. It also shows that economic entities neither implement any vocational guidance programmes nor allocate any funds for their implementation.

Current gap between the current supply of and demand for occupations on the labour market is caused by axiological differences manifested in the discrepancies between a personal choice and learning of a given occupation and employers' needs and expectations rather than by the human factor or intellectual, physical or physiological possibilities of following occupations that are in demand on the labour market.

In order to ensure that economic entities take a different approach to vocational guidance, it is important that companies and organisations fully understand the advantages of efficient vocational guidance. Furthermore, it would be reasonable to integrate the course of vocational guidance in human resource management programmes in order to balance the supply of and demand for workers on the labour market, as the availability of vocational guidance experts in companies and organisations would allow for further development in the area of vocational guidance.

PROVIDING SERVICE QUALITY IN EXCLUSIVE RESTAURANTS: A SURVEY OF DINERS IN THREE RESTAURANTS AT A GAUTENG CASINO COMPLEX

Nicolaides, Angelo

Graduate School of Business Management, University of South Africa

ABSTRACT

A number of studies have established that service quality has a direct impact on a restaurant's profitability. This study made an empirical assessment of customers' perceptions and expectations of service to measure service quality in three restaurants in a casino complex in Gauteng Province in South Africa. The research helped to assess the levels of customer satisfaction with service provision in three restaurants and identified factors that contribute to customer satisfaction and dissatisfaction; It also determined the current status of service and compared and ranked three restaurants service provision. Another importance was the aiding in the establishment of customer service standards for the restaurants concerned. The tipping of waitrons was also used as an indicator of customer satisfaction with service provision in general. A three-column SERVQUAL instrument was used together with part of the Fishbein model. The study was able to firstly determine and analyze service gaps that exist in the service delivery procedure to measure service quality as well as general customer satisfaction and secondly, to evaluate customers' attitudes towards the service measure attributes of similar restaurants in the same location. The findings offer implications to improve service quality in restaurant business in general.

Keywords: *Service quality, tipping, restaurants, SERVQUAL, Fishbein model.*

INTRODUCTION

In the last few decades, service quality and customer satisfaction have become critically important aspects for restaurant owners and managers to consider if they are serious about expanding or even keeping an existing business. In South Africa there are a number of restaurant chains as well as unique restaurants that resemble what were previously referred to as steakhouses in the period 1960-1980. Hsieh & WU (2007:1) maintain that service quality is a server's endeavour that is observable by a diner throughout a service encounter. This will ultimately influence the outcome of the service. When we speak of the quality of service executed this refers to the promptness, friendliness or attentiveness of

the person who is serving (Bodvarsson et al., 2003). Since competition for business is becoming increasingly greater, it is especially managers who try to maintain existing customers while seeking to attract new ones. The aspect which attracts customers the most is service quality excellence.

The dining experience comprises tangible and intangible elements. The tangible elements can easily be improved, but the intangible aspects of restaurant service require great attention. Researcher indicates that the ability to deliver high quality service provision will provide long-term financial viability and lead to more sustainable business success (Keiser, 1988). Researchers have postulated that there exists a very strong relationship between customer satisfaction and loyalty to restaurants (Szymanski and Henard, 2001) and the notion that service quality excellence impacts business profits has been apparent for a number of years (Baker & Crompton, 2000; Zeithaml & Bitner, 2000). A study conducted by Bodvarsson et al. demonstrates that predicted service quality significantly affects the size of a tip that a waiter obtains (Bodvarsson et al. 2003; Parrett, 2006). Tipping is considered to be an efficient way of rewarding workers for good work and serves as a major incentive to encourage service quality excellence (Lynn et al., 1993:478; Lynn 2003:140). Consequently, tipping can be used as an indicator of customer satisfaction. This is directly linked to the idea of superior quality of service which is undoubtedly an aspect that can add value to a restaurant's product offerings and ultimately impacts on a restaurant's bottom-line as it leads to customer loyalty via repeat visits (Lee, Barket, & Kandampully, 2003). The key purpose of this study was primarily to understand the restaurants' levels of service quality as per customers' perceptions of service delivered, the customers' satisfaction levels with service provision, and thirdly the customers' assessment regarding other restaurants in the same location. The findings of the research were anticipated to provide useful service quality provision suggestions for the restaurants involved.

MOTIVATION FOR THE STUDY AND RESTAURANT BACKGROUND

The research was conducted in order to:

1. assess the levels of customer satisfaction with service provision in three restaurants;
2. identify factors that contribute to customer satisfaction and dissatisfaction;
3. determine the current status of service;
4. compare and rank three restaurants service provision;
5. help establish customer service standards for the restaurants concerned.

There were three restaurants involved in the study. The largest restaurant in the study case, which shall be termed 'X', is a privately owned franchise operation which has a large number of restaurants in operation in Gauteng. This operation has 364 seat capacity and 12 waitrons, 15 cooks/chefs, 4 cleaning

staff, 2 front of house managers and 3 floor managers who may not all work at the same time, but rather in varying shifts. The cuisine served could be considered to be wholesome family meals and the menu has a large variety of dishes. Items on the menu range from pizzas, salads, and farinaceous dishes to antipasto, meat, fish and vegetarian fare. There is also a selection of starters and desserts to choose from. Drinks include coffees, teas, soft drinks and alcoholic beverages. The targeted customers include casino walk-ins, families and friends going out for either lunch or dinner, and from time-to-time, special events such as engagement parties, birthday parties etc, for which an upstairs 'private area' seating for 120 is available. This establishment also prepares special breakfast menus for Saturday mornings. This popular brand name family restaurant has appealing furnishings that create a homely ambience and it is easily accessible and pleasant to be in. It is a casual to smart dress code restaurant.

Restaurant 'Y' has a capacity of 188, with 9 waitrons -4 of whom are seasonal and 3 cooks/chefs. It staffs 3 cleaning staff, 1 front of house manager and 2 floor managers and 4 cleaning staff. Restaurant 'Z' has a capacity of 165, with 5 fulltime waitrons and 5 seasonal waitrons. It has 2 chefs/cooks, 1 front of house manager and 1 floor manager as well as 4 cleaning staff. Both restaurants 'Y' and 'Z' are privately owned and not part of any franchise operation and only a short distance from restaurant 'X' both offer various styles of steak and other meals in what are seemingly silver-service cuisine set-ups with high back chairs and stylish candle holders and wine glasses, for example. They would be considered to be luxury restaurants. The menus both include appetizers, soups, antipasto, salads, entrées (steaks), dessert, and a selection of soft drinks and alcoholic beverages. In each of the restaurants, 'X', 'Y' and 'Z', the customers can select whatever they wish to order and thus can create their own series of courses which will comprise their ultimate meal. The style of the decor in these restaurants makes diners feel they should dress up to eat there, although there were a number of casually dressed diners present at the times the research was conducted.

This study will hopefully serve as a practical guideline for the managers of the three restaurants under review, especially the floor managers and waitrons. The outcome of this study will be to further develop the service quality provision of staff in order to satisfy customers' needs and expectations so as to maintain customer loyalty and enhance profits.

LITERATURE REVIEW

Research clearly shows that it costs a lot more to attract new customers to a restaurant, than to retain existing customers (Oliver, 1999; Rosenberg & Czepiel, 1983). Restaurants in today's food and beverage industry are thus required to satisfy customers through continuous service quality excellence, and indeed, should do so in any event (Gabbie & O'Neil, 1996). In fact, customers need to be delighted with the service they obtain. Service quality means the difference between the customers' expectations of

service delivery and their perceived service. The service provided to customers by a restaurant has a huge and immediate impact on the company's profits since it is directly related to customers' perceptions of services rendered and to general satisfaction. Repeat business and customer loyalty demand service quality excellence (Zeithaml & Bitner, 2000). What is tricky to determine is which intangible characteristics are most important to a customer (Berry & Parasuraman, 1991).

The research aimed at measuring service quality through analysing the tipping of waitrons by customers as well as by attempting to comprehend the perceptions of customers concerning the service provided. Customer expectation refers to uncontrollable factors including past experiences, personal needs, word of mouth, and external communication about service. Customer perception refers to customers' feelings of pleasure / displeasure or the reaction of the customers' in relation to the performance of the restaurant staff in satisfying their needs.

The literature suggests that there is a strong correlation between tipping amounts indicating customer satisfaction and repeat business by satisfied customers which ultimately leads to enhanced profitability for a restaurant business (Azar, 2007; Parrett, 2006; Getty & Getty, 2003; Tsang & Qu, 2000). Lynn et al. (1993), considers tipping to be an almost "pervasive consumer behaviour" of significant economic value. As stated earlier, it is vital for a restaurant operation to fully comprehend its customers' attitudes towards service quality provision, assuming that this is in fact happening (Kandampully, 1997). The customers' attitudes concerning service provision cannot be measured simultaneously on SERVQUALS five service measure attributes. What can be used here is the Fishbein model.

USING SERVQUAL

The perceptions of the customers in the service process is crucially important as the business needs to be aware if there is any discrepancy between perceived service and that expected by the customers (Parasuraman, Zeithaml, & Berry, 1985). Where there is a clear incongruity this is generally referred to as the service "gap" (Oliver, 1981). Parasuraman, Zeithaml, & Berry, (1985), developed the SERVQUAL model which is still widely used today to evaluate service quality. The SERVQUAL (Gap model) is an instrument used for measuring service quality, in terms of the discrepancy between customers' expectations regarding service offered and the perception of the service received by them; Respondents are required to answer questions about both their expectation and their perception.

Parasuraman, Zeithaml, & Berry broke service quality down into five dimensions, namely. Reliability, Responsiveness, Tangibles, Assurance and Empathy. They evaluated service quality by subtracting a customer's score that is based on a perception of the service provider's performance, from the customer's expected score. Where customers were satisfied with service quality provision, there has

been higher service quality which resulted in higher satisfaction levels. The dimension of Reliability relates to what is considered to be accurate and highly dependable service provision. Responsiveness relates to the desire of a server to provide prompt service to the customer. The Tangible dimension relates to the equipment used, physical facilities as well as the appearance of the waitrons, for example (waitron is a non-gender specific term for waiter or waitress). Assurance related to the product knowledge of the waitrons, their welcoming attitudes, as well as their ability to be trusted. The Empathy dimension relates to their ability to come across as genuinely caring for the needs of the customers. The scores obtained by using the SERVQUAL model thus represent the variation between expected and perceived service quality. Literature supports the use of SERVQUAL (Gap model) as a valid and reliable measure of the quality of the service for food and beverage operations, for example (Stevens, Knutson, & Patton, 1995; Nel & Pitt, 1993).

THE FISHBEIN MODEL

Ajzen and Fishbein, (1980), developed a model which is based on the hypothesis that a customers' behaviours are the result of a cognitive process in which they systematically processes all accessible information. This information describes beliefs, attitudes and behaviour for a wide range of attitude measurement. Consequently by using both SERVQUAL and the Fishbein model to evaluate service quality provision levels and satisfaction, the customers' attitudes can be assessed as an evaluation of a psychological item which is encapsulated in five attributes namely, good or bad, harmful or beneficial, pleasant or unpleasant, likeable, dislikeable (Fishbein, 2000). Such a methodology can help in understanding the attitudes of customers towards a restaurant and also allows for the measurement of these qualities in different restaurants.

The beliefs, attitudes and behaviours of customers are evaluated using the Fishbein Model. Beliefs refers to the knowledge that a customer has concerning objects, their attributes, and their benefits. The objects would include the products (food and beverage), people (restaurant staff), companies, and things about which people hold beliefs and attitudes such as quality service provision. The attributes are the characteristics or features than an object may or may not possess. The benefits include all the positive outcomes that attributes might provide to the customer such as enjoyment of food, relaxing ambience, quality service, value for money etc. It is important to realize that people buy a whole lot of benefits, not product attributes.

The cognitive component of the tripartite model is generally assessed by using a version of the multi-attribute or Fishbein model where:

$A_o = \sum B_i E_i$ and where: A_o = the overall attitude toward object o

B_i = the strength of the belief that object o has some particular attribute i

E_i = the evaluation of the goodness or badness of attribute i

In this model, evaluative component consequently serves as something of a weight. The Fishbein model is well utilised by consumer researchers and greatly assists to measure restaurant customers' attitudes towards the SERVQUAL's five attributes. It is nonetheless not necessary to adopt its mathematical equation for the research. The model was modified in this research using Solomon's theory (2002) to suit the requirements of the study, in that consumer behavior is a study of all the processes involved when customers or groups of customers, choose to buy and use, services, ideas, or experiences to satisfy their particular needs and desires. The 'exchange' aspect when a customer goes to a restaurant, and when they are given and receive something of value, is a fundamental part of marketing. Consumer behavior thus involves a wide variety of participants. Customers also influence on the buying processes as they tell friends and family about their varied experiences when dining out.

In another model as developed by Bodvarsson et al (1997), it is the waitrons who are requested to report on tips received by them for service rendered to diners as the latter tend to exaggerate on this aspect. Bodvarsson et al.'s suggest that there is a strong two-way causal relationship between the diners' experience of service quality provision and the percentage of tips received. The waitrons' expectations of tips to be received has an influence on the quality of service which is supplied and the service quality provision also influences the amount of tip that is dispensed (Bodvarsson et al., 2003).

TIPPING

Tipping is a complimentary payment for service rendered in the context of restaurants by customers to waiters, in particular, but is not exclusive to hospitality *per se*. Tipping is generally considered to be a social norm and many diners feel a need to tip because others around them are tipping tip and as such it is expected (Azar, 2005). If diners do not tip, those with them may perceive them to be stingy and they consequently feel pressurised to tip so that those accompanying them will respect them more. Generally speaking then, tipping may be regarded as a social convention that most customers in South Africa would adhere to (Bodvarsson et al., 2003). In a survey conducted by Azar (2007) to assess whether repeating diners' tips were more sensitive to service quality provision than tips of non-repeating diners, the findings suggested that the tips of repeating diners are less sensitive to service quality provision than the tips of non-repeating diners. Consequently we may say that future service provision as a motivation for customers to tip is not supported by the literature and therefore only social norms appear to motivate tipping patterns. Parrett's (2006) conducted a study in Virginia in the United States to address the issue of why diners tip and how much they tip. The results demonstrated that age as a control variable, had a marked effect on tip size. Older people tend to tip more as well as more frequently than younger people (Parrett, 2006). Parrett also found that diners who pay with cash

tend to tip more than diners who pay using credit cards. Furthermore, when there were less than 3 diners at a table, tip size decreased; while for tables of more than three diners, tip size increased. Sill (2004) states that service is very important and restaurants should not over-promise and under-deliver. Research in the United States has also indicated that Blacks are less familiar than Whites with tipping norms and this suggests that the Black-White differences in tipping, can be significantly reduced by making customers aware of tipping norms (Lynn, 2006 a).

METHODOLOGY

The methodology was mixed, and was thus both quantitative and qualitative in nature.

The quantitative data was analytical and it allowed the researcher to arrive at a universal statement. A survey described and explained tipping issues and had a quantitative analysis and questionnaires were utilised.

The qualitative methodology used aim was detail and depth of understanding to demonstrate and understand possibilities, but not necessarily on how frequently they occur but it produced descriptive data, which was generally the participants' own words pertaining to their experience or perception of service quality provision. The researcher was thus more concerned with understanding rather than explaining. He was seeking novel or unanticipated findings and the theme of the research was essentially phenomenological where the participants' perspectives were the empirical point of departure. This was basically a focus on real-life experiences. The researcher was able to interpret and describe the actions of various people, including employees and customers. The SERVQUAL instrument as well as the theory of Ajzen & Fishbein, were adopted to achieve some of the research objectives. In addition a seven-item, five-point Likert scale (Question 1) was used to measure the practice of tipping as a social rule in the area. The SERVQUAL was used to measure customer satisfaction with service quality provision, while the Fishbein model was used for multi-attribute attitude assessment.

SERVQUAL RESEARCH

The greatest part of the survey was designed on a three-column approach and the five attributes as defined in the SERVQUAL model as postulated by Parasuraman, Zeithaml and Berry (1988). In this approach, a brainstorming session was conducted and the selected group of five employees from the different restaurants met for just less than two hours to discuss and define the variables/factors for each of the five attributes as defined in the SERVQUAL (also known as the Gap Model) adopted. Each of the appointed members were in supervisory positions as front-line servers. As a result of the brainstorming meeting, 35 variables were created and used to illustrate and measure an attribute of the SERVQUAL

model. The factors to be evaluated were included in the survey (Questions 1-5) and each factor was measured on a scale of 1 (extremely low) to 10 (extremely high). The second part of the survey was designed to evaluate SERVQUAL's five service measure attributes for the respective restaurants. The questionnaire was pre-tested with a convenience sample of approximately 15 customers using a collaborative participant pre-testing method. Data for the main study was collected during June and July 2012 by means of a self-administered survey. Customers were approached by the researcher/s after dining at either restaurant X, Y or Z. and after they had paid their bills.

SAMPLE USED

Since it is easier to study a representative sample of a population, rather than an entire population, a sample was used. Sampling was thus used to select a group with the view to determine the characteristics of a large group (the population). The sample should display the same characteristics as the population. Stoker's sample size (1985) as quoted in De Vos et al (2002), suggests that from a population of 1000, 14% should be used thus comprising 140 respondents. The researcher opted to use 200 respondents as an appropriate sample size. The target sample for the proposed study consisted of adult diners (>18 years of age) at three restaurant, X, Y and Z, in a casino complex in Gauteng province, South Africa. The units of analysis were thus the individual adult diners to the restaurants in question and they were a segment of the population that is representative of the entire population (Chase, 1967). The respondents were stratified according to age and randomly selected on the basis of convenience sampling (accidental sampling). Random selection means selecting a sample in such a way that each member of the population has an equal chance to be selected. In a random sample then, the researcher assumes that the characteristics of the sample approximate those of the general population. This approach takes people or other units that are readily available, such as those that arrive on the scene by simple happenstance. It contributes towards validity and reliability and to a large degree eliminates biases. Customers who were previously allowed to express an opinion were eliminated from the study on subsequent arrivals at the restaurants in question.

This method was used as it is similar to that used by Mukherjee and Nath (2005) for similar studies on service quality. This study aimed to achieve a minimum sample size of 200 respondents. The realised sample size of the study amounted to 212 questionnaires, with a favourable response rate of 94.33%. A total of 200 questionnaires were analysed. The survey was distributed using a person-to-person method to individual restaurant customers as they left either restaurant X, Y or Z. They were given the survey on a hard board with a pen attached and a gift pack comprising of a box of Belgian chocolates. The researcher provided guidelines and instructions on how to respond to the survey questions. Data

was gathered over a nine day period and 212 surveys were completed of which 200 were used. Unusable surveys were eliminated.

THE SERVICE GAPS

The SERVQUAL of Parasuraman et al (1988), was used to compare customers' expectations with their experiences so as to demonstrate where service delivery has either strengths or weaknesses. As in most Gaps Theory research, the clearest gap, Gap 1, was the one between customers' expectations of service provision and their perceptions of the service provision that they actually received in the restaurants.

This was the most critical gap that required study by making using of a three-column SERVQUAL. Gap 2 was the discrepancy between management assumptions that customers require fast service and service delivery. Gap 3 was the discrepancy between management targets of food been delivered within ten minutes of an order being placed and actual service provision. Gap 4 related to the discrepancy between the service quality provision as evaluated by customers' attitudes on the service attributes amongst each of the three restaurants. Gap 5 related to general perceptions of poor service quality provision.

It is important to bear in mind that service quality provision is by its very nature a highly subjective concept and with this in mind, what the customers' think about service quality provision is essential to success for any food and beverage operation. Customer satisfaction clearly results from a service

encounter and by assessing if expectations are met when compared to actual performance in a restaurant. The service quality would relate to how a customer feels about a restaurant's excellent service provision or otherwise. Value would relate to how a customer relates the quality of a dining experience with the price paid and if it was 'good value for money' or if there is some psychological benefit such as relaxation away from an otherwise humdrum daily routine.

THE SURVEY TOOL

Voluntary Survey: RESTAURANT X Y Z (circle establishment- researcher will assist.
Respondent number: _____ (number provided by researcher/s)

Dear patron

In an effort to improve service quality levels in restaurants in general, kindly complete the survey as accurately and honestly as possible. Thank you for your willingness to assist in this research initiative. The purpose of the survey is to determine the levels of service quality provision in each of three restaurants and some aspects are related to tipping of waitrons. The survey should take about seven minutes to finish. You will remain anonymous throughout this highly confidential survey. Answers provided will be utilised only for research on service quality provision. Answers cannot be right or wrong. Answer by inserting a cross (X) in the relevant block.

Please indicate your age:

18 - 25	
26 - 35	
36 - 45	
46 - 55	
56 - 65	
66 - 99	

Your gender (place an X on your selection)

Male	Female
------	--------

Your race

Black	White	Coloured	Indian
-------	-------	----------	--------

Question 1.

Kindly consider each statement below carefully and indicate the extent to which you

agree or disagree with each one. (Please mark with an (X) 1 for “strongly agree”, 5 for “strongly disagree” or select an option in-between).

	Extent of response	Strongly agree	Agree	Neutral	Disagree	Strongly disagree
1.1	Whenever I eat out my tipping is a unique amount	1	2	3	4	5
1.2	I tip varying amounts, not only the accepted 10%	1	2	3	4	5
1.3	A standard tip percentage is important	1	2	3	4	5
1.4	I tip based on quality service provision	1	2	3	4	5
1.5	I decide what to tip before I order	1	2	3	4	5
1.6	I increase my tip size if the waitron is presentable or good looking	1	2	3	4	5
1.7	I tip all waitrons' the same amount at all restaurants I visit	1	2	3	4	5
1.8	I tip more if the waitron comes across as caring	1	2	3	4	5

Question 2.

Service quality provision: Read each statement carefully and then indicate the extent to which you agree or disagree with each. (Please mark (X) 1 for “strongly agree”, 5 for “strongly disagree” or select an option in-between.)

	Extent of response	Strongly agree	Agree	Neutral	Disagree	Strongly disagree
2.1	The waitron immediately attended to me	1	2	3	4	5
2.2	Waitrons were in close proximity	1	2	3	4	5
2.3	My order was correctly provided	1	2	3	4	5
2.4	Service delivery was prompt	1	2	3	4	5
2.5	The ambience of the restaurant is inviting	1	2	3	4	5
2.6	Relaxing background music was available	1	2	3	4	5
2.7	Waitrons were neatly attired	1	2	3	4	5
2.8	Place settings were correct	1	2	3	4	5

	Extent of response	Strongly agree	Agree	Neutral	Disagree	Strongly disagree
2.9	The food was tasty	1	2	3	4	5
2.10	The restaurant was very noisy	1	2	3	4	5

Question 3.

Tipping by customer: Read each statement carefully and then indicate the extent to which you agree or disagree with each statement. (Please mark (X) 1 for “strongly agree”, 5 for “strongly disagree” or select an option in-between.)

	Extent of response	Strongly agree	Agree	Neutral	Disagree	Strongly disagree
3.1	I was brought up to tip	1	2	3	4	5
3.2	I decide how much I will tip if at all	1	2	3	4	5
3.3	My tip is always 10% of the total bill even if service is poor	1	2	3	4	5
3.4	I will not tip if service is poor	1	2	3	4	5
3.5	I am influenced by my friends when I decide how much to tip	1	2	3	4	5
3.6	I do normally ever tip	1	2	3	4	5
3.7	My tip size depends on service provision	1	2	3	4	5
3.8	Money is tight and I cannot afford to tip	1	2	3	4	5
3.9	If waitrons are polite I tip more	1	2	3	4	5
3.10	I tip good looking waitrons more	1	2	3	4	5
3.11	Waitrons whom I know get greater tips	1	2	3	4	5
3.12	I tip females more	1	2	3	4	5
3.13	I don't tip unprofessional waitrons	1	2	3	4	5
3.14	My tip size depends on my total dining experience.	1	2	3	4	5

Question 4. Which methods of payment did you utilise? (*Please select only one.*)

Credit card	1
Debit card	2
Cash	3
Other e.g. cheque	4

Question 5.

5.1 What was the total bill? R _____

5.2. How much did you tip the waitron? R _____

5.3 I will / **will not** recommend this establishment (delete whichever does not apply)

Part 2 of the Survey evaluates SERVQUAL attributes as well as tip size in Tables 1 and 2 respectively.

At the end of the survey, customers could make general comments on any aspect.

EVALUATION OF THE 5 SERVQUAL (GAP) DIMENSIONS FOR THE RESPECTIVE RESTAURANTS.

In this part of the survey, there were two questions. Customers were required to give a score on a scale (1 to 10) on their expectation from the restaurant about each attribute so as to gauge their reflection on the service quality provision experienced by them. Question two (Table 1) was designed to measure the importance of the five attributes for multi-attribute attitude measurement. An aggregated scale measurement, which is considered to be valid, was used to measure the reliability of the methods of data collection. Respondents were requested to rate the five attributes based on their perceived importance. Table 2 measured tipping of waitrons.

Part 2.

Table 2: Service evaluation (SERVQUAL) factors as identified by 'brainstorm' group and univariate descriptive statistics

	<i>n</i>	<i>mean</i>	<i>Standard deviation</i>
A. Service Measure Dimension:			
Reliability			
Service Evaluation Factors			
(1) Food that was served was as requested	200	4.22	0.76
(2) Food looked appetising	200	4.32	0.65
(3) Food was very tasty	200	4.14	0.74
(4) Waitrons were efficient	200	4.24	0.80

B. Service Measure Dimension: Responsiveness Service Evaluation Factors			
(5) Waitrons were well trained	198	4.55	0.62
(6) Incorrect orders were immediately replaced	200	4.34	0.66
(7) Waitrons were on hand	198	4.38	0.64
(8) Food was served in under 15 minutes	193	4.46	0.81
(9) Waitrons assisted each other	192	4.37	0.63
C. Service Measure Dimension: Assurance Service Evaluation Factors			
(10) Waitrons asked about service regularly	200	4.38	0.58
(11) Waitrons knew what menu items included	200	4.44	0.80
(12) Same meal selections were identical for different customers	200	3.36	1.11
(13) Service was generally good	195	4.95	0.95
(14) The bill was accurate	200	4.03	0.93
D. Service Measure Dimension: Empathy Service Evaluation Factors			
(15) Staff welcomed customers	198	4.38	0.62
(16) Staff were courteous in all dealings	196	4.55	0.79
(17) Staff were handled well by managers	200	4.23	0.80
(18) Staff were sincerely sorry for errors made	200	4.18	0.81
E. Service Measure Dimension: Tangibles Service Evaluation Factors			
(19) Dining area was clean and presentable	200	4.24	0.82
(20) Toilets were clean	198	4.55	0.62
(21) Furnishings were appealing	190	4.22	0.73
(22) Menus were easy to understand	194	4.13	0.72
(23) Seats were comfortable	198	4.25	0.83
(24) Customers felt safe in the restaurant	200	4.38	0.65
(25) Staff were appropriately and neatly attired	200	4.21	0.71

“Strongly agree” was coded as 1, “Agree” as 2, “Neutral” as 3, “Disagree” as 4 and “Strongly disagree” as 5. The lower the mean score for an item, the stronger customers’ agreement with that item. The items in the scale were all reverse scored and thus the lower the mean score for an item, the lower the customer’s level of agreement with the item. Since the items all tend to fall between 4 and 5, this indicates that the customers’ have a strong level of agreement with the items in the scale. Where there is a minor standard deviation (relative to that of other items) this indicates that customers tended to

answer the item in a similar fashion. All the items have relatively low standard deviations which mean that all the customers tended to concur in their responses to the questions posed.

Table 3. SERVQUAL Attribute evaluation factors

Service Attribute Measured	Evaluation factors for service provision	Perceived customer service provision rating	Tolerable or minimum service provision rating	Customers desired service provision rating
Reliability (relates to what is considered to be accurate and highly dependable service provision)	1	8.56	8.36	8.70
	2	8.98	8.77	8.86
	3	9.20	8.18	8.66
	4	8.34	8.44	8.65
		8.44	7.90	8.90
Responsiveness (relates to the desire of a server to provide prompt service)	5	8.32	8.26	9.10
	6	8.46	8.55	8.55
	7	8.31	8.45	8.50
	8	7.87	7.66	8.00
	9	8.55	8.40	8.55
Assurance (relates to the product knowledge)	10	7.56	8.12	9.08
	11	8.33	8.35	8.88
	12	8.49	8.55	8.67
	13	9.08	8.00	8.88
	14	8.89	9.10	9.60
Empathy (relates to staff ability to come across as genuinely caring for the needs of the customers)	15	8.80	7.77	8.50
	16	8.56	7.88	7.90
	17	8.70	8.34	8.89
	18	7.60	7.25	8.07
Tangibles (relates to the equipment used, physical facilities as well as the appearance of the staff)	19	8.47	8.24	8.87
	20	7.90	8.00	8.33
	21	8.05	8.35	8.36
	22	7.68	8.08	8.70
	23	7.33	8.77	8.62
	24	8.33	8.12	8.79
	25	7.85	7.88	8.62

Part 2 of survey

Table 4: Univariate descriptive statistics for tipping of waitrons

Item	<i>n</i>	<i>Mean</i>	<i>Standard deviation</i>
Tipping variance			
Whenever I eat out my tipping is a unique amount	200	4.21	0.76
I tip varying amounts, not only the accepted 10%	200	3.88	0.89
A standard tip percentage is important	197	3.57	1.27
I tip based on quality service provision	200	3.30	1.43
I decide what to tip before I order	199	3.19	1.30
I increase my tip size if the waitron is presentable or good looking	200	4.11	0.99
I tip all waitrons' the same amount at all restaurants I visit	200	3.46	1.08
I tip more if the waitron comes across as caring	200	4.23	0.79

An answer of “Strongly agree” was coded as 1, “Agree” as 2, “Neutral” as 3, “Disagree” as 4 and “Strongly disagree” as 5. It is evident that where there is a lower mean score for an item, the stronger the customer’s ranking of agreement with that item. Where there is a large standard deviation this indicates that customers tended to answer the item in somewhat of a unique way. However, all of the items have relatively high standard deviations, which indicate that customers were inclined to be at variance in their answers to the question posed.

Table 5: Univariate descriptive statistics waitron efficiency and ambience

Item	N	Mean	Standard deviation
The waitron immediately attended to me	200	4.12	0.98
Waitrons were in close proximity	200	4.25	0.86
My order was correctly provided	200	3.20	1.28
Service delivery was prompt	200	3.99	1.12
The ambience of the restaurant is inviting	200	4.04	0.87
Relaxing background music was available	200	4.01	0.86
Waitrons were neatly attired	200	3.96	1.06
Place settings were correct	196	4.14	0.99
The food was tasty	200	3.77	1.13
The restaurant was very noisy	199	4.33	0.52

A response of “Strongly agree” was coded as 1, “Agree” as 2, “Neutral” as 3, “Disagree” as 4 and “Strongly disagree” as 5. It is apparent that the lower the mean score for an item, the stronger the customers’ levels of agreement with that particular item. Where there is a minor standard deviation (relative to that of other items) this indicates that customers tended to answer the particular question in about the same way. These items have relatively low standard deviations and this means that customers tended to agree in their responses to the question posed. All of the 200 customers answered the payment mode- question 4. Of these, 165 or 82.5% paid by means of credit card. 21 or 10.5% paid by debit card. 5 or 2.5% paid cash and 9 or 4.5% paid by other such as cheque.

Some studies on tipping in the United States have examined the possibility that race differences in tipping vary with the race of the waitron (Lynn, et. al. 2006; Willis, 2003). In each of these studies, the interaction between customer and waitron race was not significant. In this study tipping by race, produced an interesting finding. Blacks left smaller average restaurant tips than Whites, suggesting

that Blacks tip less than Whites do even when provided comparable levels of service. It did not make a difference that the waitron was black. It appears that Blacks do not know that it is customary to tip 10 percent of the bill size in South African restaurants.

A five point Likert scale was used to measure the customers' tipping behaviour at the restaurants. This measure included 14 Likert scale statements of which the scale points were labelled: 1 = Strongly agree, 2 = Agree, 3 = Neutral, 4 = Disagree and 5 = Strongly disagree. The Cronbach alpha coefficient for the 14 items was 0.84 indicating internal consistency reliability. In restaurant X, in which tip size was assessed, the results indicate that the smallest bill size that customers received was R18,50 and the largest bill size was R2656.00. The average bill size of each of the three establishments is R259.70 and the bill size variable has a standard deviation of 87.44. The total number of bills processed was 201 and the average tip size for credit card transactions was R20.00. Cash tips were pocketed directly by the waitrons and there is no record for such. Minimum tip size was R2.50 and maximum was R35.00. The standard deviation was 4.77 and the mean was R15.89. Over a three and a half week period (01 April 2012 to 25 April 2012) at restaurant X, the employee tip report indicates that a directly tipped total of R27327.64 was gained by a total of 12 waitrons. This gives an average tip gain over the period for each waitron of R2277.30. By category of sales at each of the three restaurants, the largest tips were obtained at dinner times, followed by lunch and then breakfast. The highest tip amounts were for tables of more than four guests and the least at tables with only one guest. Virtually all of the waitrons were black employees and 70% of these were women. The largest tips were paid to men.

A multiple item rating scale was utilised to assess various determinants of service quality provision the restaurants X, Y and Z. This encompassed ten Likert scale items. The scale points were categorized as follows: 1 = Strongly agree, 2 = Agree, 3 = Neutral, 4 = Disagree and 5 = Strongly disagree. The Cronbach alpha coefficient for the ten items was 0.87, which indicates that there is acceptable internal consistency reliability. Higher overall scores indicated a higher level of service quality provision experienced by customers.

FINDINGS

The most stated gaps in the study related to "waitron responsiveness", "inadequate assurance" and "clean ablution facilities". In each case customers felt more quality was required. The key demographic profile of the survey respondents was males who especially like to visit Restaurant X. Most customers are between 36 to 45 years of age (21%). while customers between 56 and 65 years of age (11.5%-all in that age category), patronised Restaurant X. It was clear from the research that the desired satisfaction levels of expected service provision the customers' hoped to receive, was predominantly from Restaurant X. The least acceptable establishment was Restaurant Y. The score for

the multi-attribute attitude measurement was calculated by making use of a modified equation as per Solomon (2002): Where, A is the overall attitude toward the restaurant, B the strength of the belief that the restaurant has any type of attribute (i), (i) the SERVQUAL attribute of a restaurant, (j) the restaurant, (k) the customers of a restaurant, (I) the customer evaluation of the strength or weakness of the attribute (i), (n) indicates the total number of customers. In making use of this equation, a customer's attitude towards a restaurant's service quality provision was measured based on the total of the products obtained by multiplying the mean values of each of the SERVQUAL attributes and their respective mean value of importance.

Restaurant X had the highest total mean attitude (8.94) and Restaurant Z (7.96), while Restaurant Y had the lowest total mean attitude (7.66). The variance between each of these three restaurants is thus small. The findings do however suggest that customers of Restaurant X expect a certain kind of service given that it is part of a restaurant franchise brand. Not surprisingly then, it achieved the highest Assurance attribute rating. In some cases, service failure on the part of a waitron or kitchen staff, was exacerbated by poor floor management techniques where managers failed to effectively deal with failures and where public arguments with customers were almost a norm. Restaurant X, as the most popular restaurant of the three investigated should reassess the attributes of Empathy and Tangibles for improvement if it is desirous of obtaining a greater market share. The research is clear that Restaurant X generally provides quality service to its customers. There are however concerns with ablution facilities that are not as clean as patrons would like them to be. The same applied to Restaurants Y and Z. Service was generally in line with what customers' expected but portions were not considered to be value for money in either of the restaurants. There was also an observation that meals were not balanced nutritionally and that vegetables, for example, had to be paid as an extra item in some cases. Customers felt this was not acceptable.

Service performance levels as perceived by customers were generally above the "minimum service level," but were however below the level of service that customers desire. The least problematic area for Restaurant X, was between perceived and desired service delivery presented for the attribute Responsiveness. This indicated that the restaurant's service is comparatively good. The Tangibles attribute was also fairly good. For restaurants Y and Z, service delivery was considered to be poor and prices were "unrealistic". The fastest service was at Restaurant Z, but that also had the least customers. The dirtiest ablution facility was at Restaurant Y. Waitrons in this restaurant were also sloppily dressed and the least empathetic. The training of waitrons was considered to be in need of improvement although it was acceptable, perhaps indicating a complacency amongst the South African consumer. Noise levels were the highest at Restaurant X, which is not surprising given that it

had the most customers overall. The seating and ambience in all three restaurants was acceptable but could be improved. Dining areas were all 'fairly clean', but the method of cleaning tables after others had just eaten at a table was considered 'laughable'. Menu items were acceptable, but prices were considered to high for certain items. The Assurance and Reliability attributes were consistent in Restaurant X-although some customers disagreed. It was mentioned in one customer comment that the floor manager of Restaurant Z was a 'pig'. After a complaint was made about cold food, he told the customers they were welcome to go elsewhere if they were not happy. Any customer service failure such as this, especially the information provided by the customer at the time that the complaint is lodged, should be viewed as a critical marketing research data, which is necessary not only for immediate service recovery but for the improvement of future performance which will hopefully lead to customer loyalty. Seventeen of the customers surveyed commented that they found prices to be higher than what they recalled from previous visits to each of the three restaurants. Restaurant customers typically store prices of meals in their memories (Grewal et al., 1998). Consequently, if the prices on a menu are higher than what the customer expects to pay, customer satisfaction will be negatively affected. It is thus important, for restaurants to have competitive menu prices for the market segment in which they seek to position their offerings.

Parking of vehicles was not problematic and customers felt safe in the casino complex, given that the area is boomed and that there is a visible security personnel presence. The evidence suggests that there is room for improvement in all three restaurants, especially Y and Z. especially tangibles need improvement. Better waitron training could also to a large degree result in better service quality provision in all three restaurants. The poorest floor management was in Restaurants Y where the person 'irritated' customers by constantly asking if everything was alright. Waiters should be certain and concise when taking orders, and meals and drinks must be delivered to diners within a reasonable time, ideally within 15 minutes. This requires effective training. It is also clear that South African customers who opt to pay using a credit or debit card tend to leave larger tips than those paying with cash. Previous studies have demonstrated that regular customers tend to leave larger tips than new customers (Azar, 2007) and this was found to be the case in this research.

The researcher was able to evaluate the service quality provision, and gained greater understanding of the customers' satisfaction levels as well as attitudes toward SERVQUAL's service attributes. It was discovered that there is indeed a large variance in service quality provision, which manifested itself in the tipping of waitrons. Based on comments obtained in the survey, it is apparent that waitrons who serve customers well develop a relationship with them that promotes service quality provision. This concurs with Fernandez (2004) who states that personal connections are what drive excellent service quality. From comments made, it is also clear that tip size provided by a customer at a restaurant is

not only affected by the quality of service they receive, but also by the economic state of the country. However, despite economic downturns, prompt and good quality service, is likely to result in bigger tips for waitrons' and in return patronage, but black customers must be educated about the customary 10% tip in South Africa. If we rank the restaurants in terms of the findings, Restaurant X would in 'gold medal' position, Restaurant Z would obtain 'silver' and Restaurant Y would obtain 'bronze'. The findings of this research provide useful suggestions to the restaurants in question for taking any necessary corrective actions to improve their service quality provision but there were some limitations.

STUDY LIMITATIONS

SERVQUAL is a simple and useful model for qualitatively exploring and assessing customers' service experiences. It is widely used by service delivery organizations and is considered to be an efficient model in helping a business to intensify its efforts in. However SERVQUAL's five dimensions are not universals, and do not draw on established economic, statistical and psychological theories. Service quality provision is also linked to employee satisfaction, which was not investigated in this study. SERVQUAL does to an extent illustrate the core of what service quality provision may mean including price, but it may also include other psychological and economic benefits. The intangibility, heterogeneity and inseparability of services create problems for managers and employees and thus also for customers.

The results of the study are based on a relatively small sample size which has been chosen from a small geographic during a short time period. Although the sample is reliable, it would be more accurate to expand this research throughout the province of Gauteng. There may well be other relevant restaurant service quality provision attributes that could influence customers' expectations and perceptions about their overall dining experience that are not included in this study.

The sample size of $n=200$ was acceptable, but a bigger sample would have allowed for more authoritative analyses and findings. There could also have been more restaurants evaluated and ideally three from the same brand of franchise as Restaurant X. More efficient scales could be developed where individual items can be grouped together to reflect the construct which is to be measured. The nature of the environment was problematic as respondents were approach after leaving a restaurant where they had dined and were initially distrustful. There was also, in some cases extremity bias, where diners responded to questions by ticking the same number in a Likert scale, for all the items in a scale.

CONCLUSION

The results of the gap analysis make it clear that the restaurant service providers did not meet customers' expectations. The indication is that overall restaurant service quality fell below the customers' expectations and that satisfaction was not as high as it should have been. There is thus room for service quality provision improvement in each of the restaurants. The three restaurants in this study could improve service quality provision through especially the dimensions of responsiveness, reliability and assurance. While how a waitron behaves may not directly influence customer satisfaction with a meal, it may have an indirect effect on customer satisfaction via quality service provision.

In terms of the findings of this study, three of the biggest gaps related to "waitron responsiveness", "inadequate assurance" and "clean ablution facilities", meaning that customers' expected much more responsive waitrons, greater assurance that quality of service and food would be good, and cleaner rest rooms than was actually experienced. All of the attributes in Table 3, with the widest statistically significant gaps represent severe deficits and require the significant attention of restaurant managers and staff in terms of making required improvements. The findings indicate that most of the customers' expectations concerning restaurant quality service provision are best explained by the subsequent factors, namely, appearance and ambience of facilities, a feeling of assurance, personalized service, satisfaction, responsiveness and reliability of waitrons. The latter determined the tip size they obtained to a large extent. The results thus strongly suggest that restaurant managers must train staff effectively and make certain that they provide timely service. The competence and efficiency of staff is critical to success. This will mean that there is accurate billing and service that is free of errors, leading to enhanced levels of customer satisfaction.

The critical strategy to retain customers is to improve service recovery quality, and by having a quick response to service failure. Consequently restaurant managers must immediately begin to focus attention on ensuring that future service delivery levels are high and seek to enhance the strength of customer relationships with each of the complaining customers. Managers should thus be attentive to recovery service quality as much as they are to service quality provision and should therefore enhance complaint management by having suggestion boxes at the front-desk or present customers with survey material to assess quality matters. Managers should formulate a competitive strategy based on a modified model of service quality provision to keep loyal customers and to enhance customer relationship management. Customer satisfaction undoubtedly has a major and direct effect on customers' behavioural intentions. Despite its shortfalls and limitations, this study implies some new contributions. The findings contribute to the development of a service quality provision excellence approach that will help to identify customers' expectations and hopefully encourage staff performance

improvement in the three restaurants studied. The results may thus expand knowledge of restaurant service quality provision that could drastically improve business for the restaurants involved as well as restaurants in general.

ABSTRACT

The present paper discusses some of the findings of an ongoing “Green & Smart Furniture” (GSF) research project. It actually focuses on third-age consumers’ behavior and interest in purchasing smart and eco-friendly wooden furniture. The research reveals the critical elements for a successful design and production of GSF products that will enhance both needs and expectations of the consumers. Thus, 399 specially constructed questionnaires were gathered during 2013, which were further elaborated and statistically analyzed with SPSS ver 17.0.

Results are quite encouraging for the enterprises that would decide to design and produce smart and eco-friendly wooden products. Consumers show a significant interest in purchasing GSF at a percentage of 70%. They are willing to pay an extra amount of 9% in average than regular prices of conventional furniture. The most important factors in purchasing GSF have been found to be price, quality, functionality, safety and ergonomics, as well as the type of raw materials.

Keywords: *Green Wooden Furniture, Smart Furniture, GSF, Market research, Consumers’ Behaviour, Third age, Greece, sustainability*

1. INTRODUCTION

European Union, is one of the biggest manufacturers, traders and consumers of wooden product in the world (European Commission, 2013). Furthermore, the sector of furniture manufacturing in the E.U. has a strong presence internationally, mainly because of the high quality standards in technical and aesthetical level (UEA, 2005). During the period 2000-2007, furniture industry has known significant growth because of a sum of specific conditions. Nevertheless, there is in general a growing concern related to the environmental consequences that occur by the production, use and disposal of goods during the end of their life (Humphrey and Schmitz, 2001).

The knowledge on environmental consequences of the materials that are been frequently used in a particular industrial sector, constitutes enterprises capable to improve their products and their production processes by an environmental point of view and thus to accelerate their entrance to the emerging markets of green products (Nedermark, 1998).

Many furniture manufacturers at a global level, understand the responsibility they have in making environmental friendly furniture, since green products in general that are gradually been introduced in markets, force the designers of products to include environmental criteria in the production processes and in final products (Maxwell and van der Vorst, 2003; Shapiro and White, 1999) and thus the number of such enterprises is growing constantly (Fronzel et al., 2007; Epstein and Roy, 2006).

Regarding Greek furniture sector, a related study of Papadopoulos et al., (2010) has shown that the majority of the Greek furniture enterprises are strongly support green entrepreneurship and certification of wood regarding its environmental impacts. Through this process, the firms believe that they will be able to develop new fields of entrepreneurial activity, based to certified ecological furniture products, enhancing their competitiveness and innovative activity (Trigkas et al., 2011).

2. LITERATURE REVIEW

2.1 Green wooden products

Eco-furniture or “green” furniture, is defined as a product of furniture designed to minimize the environmental impact during its whole life-cycle (Albino et al., 2009; Baumann et al., 2002) and thus furniture with characteristics of environmental compatibility, taking into consideration all the stages in furniture life-cycle (Alhola 2008; Progetto Life, 2005).

Several research initiatives have been launched during the last years regarding furniture design and production that are environmental friendly. The ‘Life Environmental Ecofriendly furniture project’ has been launched in Italy during 2001 aiming in developing furniture prototypes with elements compatible to environmental protection, taking under consideration all the stages of a furniture life cycle (Progetto Life, 2005).

A very interesting initiative was also the Finnish Furniture Panel launched in 2004 focusing to environmental impacts of furniture during their life cycle, further aiming in finding solutions regarding the development of the sustainable growth of the furniture industry in the country (Finnish Furniture Panel, 2005; Nissinen and Parikka, 2007). Additionally, several web sites were developed, containing all the related information regarding issues concerning ecological furniture, for manufacturers as long for the consumers (Ecosmes, 2005; Nordic Ecolabelling, 2003; GRIP, 1998).

2.2 Smart furniture

Furniture constitutes part of our everyday living environment especially inside buildings, through which the user comes to a direct interactive contact in executing several activities. Studying daily routine and needs of a person through its interaction with furniture and utilizing technology, it is possible to develop new uses for furniture that will contribute to the improvement of quality of life.

Smart furniture constitutes the future evolution and tendency in furniture industry (Tokuda et al., 2003; Zongdeng and Wenjin, 2010). Thus, a smart furniture product has the capability to alter a conventional space into an intelligent spot that includes computing systems (Ito et al., 2003). Since a smart furniture is equipped with computing networks, sensors (Mavrommati et al., 2003) and several information technology devices, it could offer many different services, either by itself or in cooperation with other devices and items of the everyday human environment under the context of a Ubiquitous Computing (UmpiComp) environment (Wuliji, 2009). UmpiComp environments, regard the method in including and using computing systems in a way that constitutes them available to our everyday living environment, making them simultaneously "invisible" to the user (Weiser, 1993).

In a related study (Karvelas, 2007), some of the research projects in the field are presented, regarding smart furniture in networking to ubiquitous computing systems and environments.

Indicatively we refer the construction of a smart table which can recognize what and how much we are eating and which has been developed by a research team of the National University of Taiwan. The Dietary-Aware Dining Table using sensors for measuring the weight of objects and RFID technology in identifying objects, could know the amount and the type of food that has been consumed by the users during one meal (Chang et al., 2006).

Another example has to do with the Drift Table and the Key Table which were developed under the context of the project for residential technologies of Equator IRC, as smart furniture embedding functions such as, slow moving presentations of aerial photos, which their speed, direction and height are defined by the disposal of objects on its surface and their weight, or such as in understanding the mood of the user by the force that he put objects on the surface, using weight sensors (Gaver et al., 2004; Boucher et al., 2006).

The E.U. is also giving special attention in the development of smart furniture for the third age through the funding of the WIDER project (2014), in order to give the opportunity to furniture industries across Europe to innovate and differentiate from the competition and to produce this kind of products.

2.3 Target group for Eco and Smart furniture

The U.S. Congress spends approximately \$1.5 trillion for health care services on a yearly basis, while the forthcoming years the population of the third age is expected to become bigger than the younger

one (AAHSA, 2003; Dishman, 2004). The percentage of the U.S. population that is expected to be over 65 years old, shows constantly a growing tendency and it is foreseen to reach the 18,2% of the country's total population in 2025, with this tendency to be global (Dishman, 2004).

Furthermore, the improvement of living and the evolutions in the medicine science have contributed to the increment of the expected living, since during the second half of the 20th century expected living has been increased by 30-40 years (Huth, 1986, Pennathur et al., 2003). According to the forthcoming evolutions in medicine science and biochemist, the expected living is foreseen to be further increased for 20-30 years during the next generation (Pennathur et al., 2003).

Ageing in the third age is manifested usually through the reduction of stamina, ware down of bones and muscles atrophy, slowing down of senses and spiritual capabilities, loss of balance and slowing down of person's activity and mobility (Pheasant, 1986 in Comfort, 2003a; Burke, 1990).

Many research efforts has been made internationally during the last years regarding the design and development of products that would make easier the way of living of the aged people improving their surrounding space, especially in residencies, aiming to the confrontation or to the tempering of the negative consequences of ageing (Anderson, 1975; Demirbilek, 1999; Haigh, 1993; Naqvi et al., 1994; Pinto et al., 2000; Comfort, 2003a; Jönsson, 2003; Pennathur et al., 2003; Nikopoulos, 2010).

Thus the target group for "smart and eco furniture" under the context of the present research, has to do with the third age to which the research could offer many solutions in improving their everyday living, through becoming more independent, reduction of health care costs, improvement of their quality of life, securing spare time for persons that are involved to their treatment, improvement of their capabilities and cure until a level through everyday treatment. Regarding furniture enterprises, such an effort could have economic benefits in case of their mass production.

The aim of the present research under the context of the project GSF – Green and Smart (Eco-logical) Furniture, was to register the opinions and the correspondence of furniture consumers of the third age regarding smart and sheer ecological furniture, having as a main scope the introduction of the criteria according to which the first furniture with the above mentioned elements, will be designed at a European level.

3. RESEARCH METHOD

A research instrument was developed to serve as the basis for collecting data pertaining to the study's parameters. All questionnaire items were constructed using self-typing 5-point Likert scales. Furthermore a number of questions would be of multiple-choice type. Both are well-accepted practices in this type of research. It should be noted that most questions reflect perceptions of the interviewed sample in order to outline the trends regarding GSF for the specific target group.

The items pertaining to each scale were pre-tested with 5 face-to-face interviews. The pre-testing process allowed the researchers to assess the content validity of items and ensure that interviewees understood the research instrument as they were intended.

The questionnaire included 4 different groups of interest and a total of 23 questions. The first group of questions regarded the general characteristics of furniture products that are currently used by the consumers. The second group included 9 questions related to the awareness of the consumers regarding the meaning of ecology and the inclusion of technology in furniture products specifically, but also into their everyday living in general. The third group constitutes of questions related to the type, specific characteristics and elements of smart and ecological furniture which could be developed as long the amount that the consumers are willing to pay extra in acquiring such a product. Finally, the fourth group was formed by questions regarding the profile of the consumers that have participated in the research in order to highlight the specific characteristics of the potential consumers of smart and ecological furniture.

The research was addressed to a random sample of 399 consumers from different regions of the country during 2013. Questions were selected in such a way in order to be short and comprehensive for the best possible convenience of the participants.

Before the launch of the study, a content validity test was conducted regarding the questionnaire. This test was based on discussions with furniture enterprises and specialized scientists in the furniture field along with the extended literature reviewing. Following this, a pilot questionnaire was tested to 10 consumers. The pre-sampling results indicated the points that needed to be further clarified improving the quality of the questionnaire (Dillman, 2000).

The construct validity was based on the test of unidimensionality of the elements constituting each factor, as well as the content validity of each factor separately. We used Factor analysis according to the method of Principal Component Analysis. Regarding the content validity of the research variables, the statistical factor of Cronbach's Alpha was used (Siomkos and Vasilikopoulou, 2005; Chantzoudis et al., 2009; Sarigiannidis et al., 2009).

Data were processed and analyzed using the statistic package SPSSWIN ver 17.0 and all the related tests of Frequencies, Descriptives, Crosstabs, Correlation analysis and Cluster analysis were made (Norusis, 2007; Howitt and Cramer, 2003), in order to highlight the specific characteristics of the potential consumers of smart and ecological furniture and the range of integration regarding attributes – functions of the furniture products.

4. RESULTS

The sample consists mainly of people between 61 - 75 years old, of low and average annual family income ranging from 5.000€ to 20.000€. Furthermore, the majority states that they live in towns in detached residences with a surface from 50 to 100 square meters, while the 24,0% of them owns bigger spaces (101 - 120 square meters). The majority live with husbands/wives or the rest of the family.

The analysis of the first group of the research's questions delineated the contemporary use of furniture in residences and their specific characteristics regarding people of the third age. Spending most time, in their living room (at a percentage of 40,4%) and kitchen (at a percentage of 32,6%) the target group places great importance on chairs (27,9%) and tables. Wooden furniture comes also first to the participating consumers' favor regarding everyday use.

A 54,4% of the target-group consumers admit that they are not willing to replace conventional furniture with green and smart ones unless it is cheaper (Figure 1). This finding is quite normal considering the squeezed income in the current difficult economic climate in Greece during the last 4 years. However, there are also three more criteria that seem to have a significant role in purchasing GSF: a) health condition (50,4%), b) assistance of GSF to everyday living (49,4%) and c) environmental protection along with the improvement of their everyday living conditions (49,1%). The last criterion confirms further previous relative researches (Papadopoulos et al., 2010; Trigkas et al., 2011) regarding the role of environmental protection in developing new target groups and markets for the furniture and wood sectors in Greece and in general, as well as for the development of new entrepreneurial opportunities under the context of green entrepreneurship. The awareness of contemporary consumers of environmental issues indicates that the area of green furniture should be an alternative aspect under consideration by furniture enterprises when forming their competitive strategies.

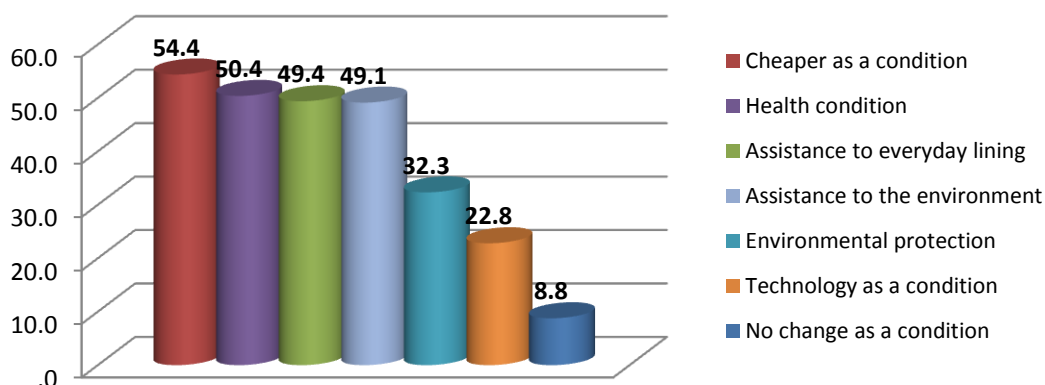

Figure 1. *Criteria for changing conventional furniture with smart and ecological ones*

The analysis of the answers to the third-group questions indicated characteristics and properties desired by GSF in regard to:

- environmental and natural resources protection,
- technology and its applications

- the specific needs and demands of end users and their surrounding space.

Therefore, the most important criteria using a 5-Linkert scale (with 1 as very much) appear to be:

- a) sustainability regarding natural resources' use (ranking 1.72),
- b) production processes that respects the environment (1.74),
- c) energy saving during production and use (1.79) and
- d) to be manufactured by recyclable materials (1.82).

Attributes such as ergonomics, safety, use of ecological finishing materials, the ability of reusing the components in the end of life-cycle and the use of innovative materials, follow at a lower significance ranking.

It should be mentioned that these findings coincide with EU policies on furniture's value chain, which set among major priorities the production and use of products that minimize their environmental footprint, in the context of efficient use of resources and sustainability. Forest products should follow the Cascade principle according to the European Commission (2013), and thus present a life cycle of: a) production, b) reuse, c) recycle, d) bioenergy production and e) eco-disposal of wooden products

CHARACTERISTICS AND PROPERTIES OF ECOLOGICAL FURNITURE	Rank	Std. Dev.
Preservation of natural resources	1.72	.963
Environmental friendly production process	1.74	1.042
Energy saving	1.79	.971
Use of recyclable materials	1.82	.938
Safety and Ergonomics	1.86	.937
Use of ecological varnishes	1.91	1.148
Material reusability	2.02	1.113
Use of innovative materials	2.37	1.193

Table 1. *Criteria that ecological furniture should meet (ranking 1 till 5, with 1=very much and 5=not at all)*

The familiarity of third-age consumers with technology was further explored as well as the range of inclusion of computing systems into several technological applications and functions. 36.3% of the respondents consider the use of technology as a good idea while the 31.6% consider it as quite necessary and a 25% stated that technology helps a lot their everyday living. These consumers seem to have bigger familiarity with technology mainly regarding applications such as the use of mobile phones (2,54), home automations like automatic wind screens and lightning (3,39), use of audiovisual

means such as TV, DVD, projectors. (3.43), and IT and internet at a ranking of 3.79 and 4.00 respectively.

Focusing more on the specific characteristics and properties of smart furniture, the analysis of the results has revealed that the anthropocentric design constitutes the basic property of the furniture product with technological characteristics to follow. Such attributes could be the capability of warning for health problems of the person at home or the capability to communicate with the user and interact with its environment.

These findings could be further correlated with the results of Table 2, regarding the aims that smart furniture should achieve. Thus, at a declining significance ranking, the participants consider that smart furniture should facilitate user's everyday living > execute some routine activities > secure an independent everyday living of the person > generate a pleasant environment inside the house.

Aims regarding the health of the user, such as the function of becoming a warning device in health and safety issues and the monitoring of the person's health in general follow with a ranking of 2.03. Chi square test has shown that a statistical significant correlation exists between groups of ages and a) the property of facilitating the communication with other people outside the house (Pearson $\chi^2 = 33.53$, for a significance level >99.9% Approx. Sig= 0.001) and b) monitoring of person's health (Pearson $\chi^2 = 32.51$, for a significance level >99.5% Approx. Sig= 0.005). Hence, the older the person, the bigger becomes the need of communication with other people and the monitoring of their health.

PROPERTIES AND CHARACTERISTICS OF SMART FURNITURE	Rank	Std. Dev.
Facilitation of user's everyday living	1.40	.760
Facilitation of user's routine works	1.73	1.137
The independent everyday living of users	1.87	1.062
Pleasant environment inside the houses	1.88	1.064
Its function as a warning device regarding user's health and safety issues	1.89	1.130
Monitoring of user's health	2.03	1.510
Securing the user's privacy	2.07	1.189
Interaction with other furniture	2.26	1.286
Communication with person outside the house	2.49	1.383

Table 2. *Properties and characteristics of smart furniture (ranking 1 till 5, with 1=very much and 5=not at all)*

Thus, anthropocentric design is significant for smart furniture with the potential to facilitate user's everyday routines in a pleasant environment inside the house with parallel simple and easy-to-use technological support in health issues such as monitoring and warning.

Finally, the three most important factors that influence the participants' decision in purchasing GSF appear to be price, quality and functionality of the furniture as presented in Table 3. The rest of the factors follow, such as safety and ergonomics, environmental protection, technology and the design.

FACTORS	Rank	Std. Dev.
Price	1.40	.821
Quality	1.43	.750
Functionality	1.53	.820
Safety and ergonomics	1.60	.862
Raw materials	1.70	.926
Environmental protection	1.81	1.009
Technology	2.29	1.295
Design	2.40	1.326

Table 3. Factors and range of influence in purchasing smart and ecological furniture (ranking 1 till 5, with 1=very much and 5=not at all)

The above mentioned factors of Table 3 are correlating each other and the correlation analysis using the Pearson correlation coefficient (Pcc) indicates that at a significance level of 0.01 the factors that affect positively each other in order for a consumer to buy GSF are the following:

- Quality in relation to a) raw materials used for manufacturing (Pcc = 0.606), b) functionality (Pcc = 0.469), c) ergonomics and safety (Pcc=0.412).
- Price in relation to a) quality (Pcc = 0.365) and b) functionality (Pcc = 0.229).
- Functionality in relation to a) safety and ergonomics (Pcc = 0.626) and b) raw materials used in manufacturing (Pcc = 0.560).
- Design in relation to a) technology (Pcc = 0.624) and b) ergonomics and safety (Pcc = 0.455).

Based on these findings, it is speculated that the added value for the GSF consumer is significantly related to economic factors, which is quite expected within the context of the severe Greek economic crisis. Qualitative characteristics and facilitation of everyday routine of users follow indicating that the main criteria regarding the decision of purchasing GSF are not substantially different of those for the conventional furniture. Nevertheless, firms will have to detect these specific elements that will allow them to achieve differentiation during production, including the incorporation of sophisticated technology and environmental protection in their products.

Following the above mentioned findings and according to Table 4, it is observed that the consumers' preferences, regarding the functions that a smart furniture could have, are mainly oriented towards: a) the convenience in maintenance and cleaning (1.64), b) convenience in movement (1.67), c) safety (1.71) and d) support of persons for changing spots of the furniture or adjustment of its dimensions according to their anthropometric characteristics.

FACTORS INFLUENCING PURCHASING DECISION	Rank	Std. Dev.
---	------	-----------

Convenient maintenance and cleaning	1.64	.974
Supporting of furniture to persons with the capability of easy movement	1.67	1.109
Safety of furniture	1.71	.938
Supporting of furniture to persons to change from sitting in vertical position and vice versa (chair/bed)	1.72	1.079
Supporting of furniture to persons with movement and adjustment to the anthropometric characteristic (height of table)	1.83	1.217
Informing of relatives for health problems	1.92	1.290
Other characteristic	2.33	2.309
Informing of relatives for routine activities	2.76	1.566

Table 4. *Functions of a GSF (ranking 1 till 5, with 1=very much and 5=not at all)*

The functions of smart furniture should secure convenience and adjustments to individual anthropometrics and kinesiology according to age and safety. The average consumer of the third age, according to the research, thinks of multifunctional furniture, which will furthermore contribute towards the reduction of everyday living cost through the satisfaction of a wider range of needs.

Of significant importance are also the findings presented in Figure 2 which concern the extra amount of money that the consumers are willing to pay in order to buy GSF. A rather satisfactory 27.4% states that are willing to pay a 5-10% extra for GSF compared to conventional furniture. Adding the percentage of those who are willing to pay an extra 1-5% (22.4%) and an extra 11-15% (18.6%), a cumulative percentage of 68% of the research sample seems willing to pay till 15% more for GSF in relation to a conventional furniture.

These findings are quite significant, since besides the economic downturn and its dramatic consequences to the family income and the furniture sector in Greece, consumers are willing to pay extra for the added value of a furniture product with technological and ecological innovations to satisfy specific needs. This information is quite valuable for the furniture manufacturing sector; it actually can constitute an important recommendation regarding competitive strategies based on differentiation. Reconsideration of low-cost business strategies towards innovation and differentiation are quite sufficient to secure a significant part of the internal market and furthermore, to boost extroversion within the crisis context (Papadopoulos et al., 2012; Trigkas et al., 2012; Papadopoulos et al., 2010).

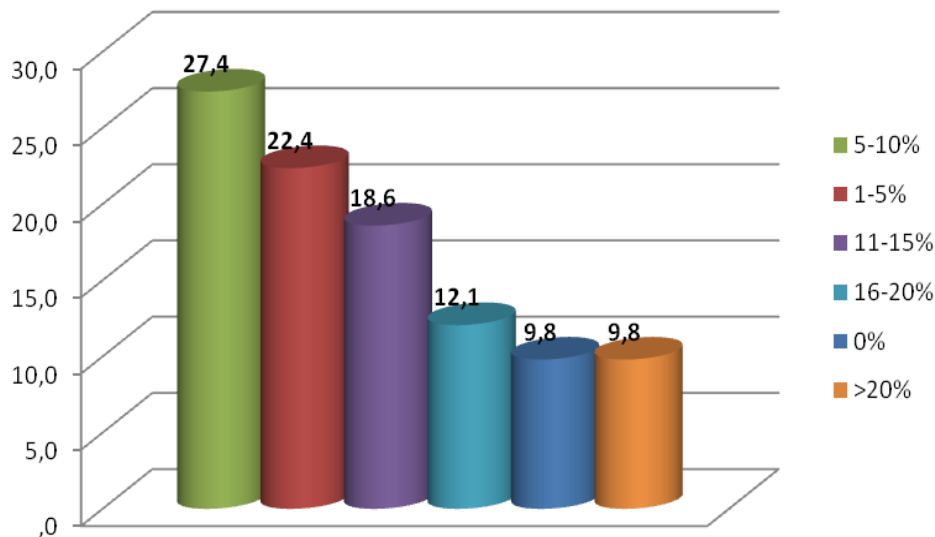

Figure 2. Extra amount of money that consumers are willing to pay for a smart and ecological furniture

Thus, according to the above mentioned results, it seems that there exists a "critical mass" of consumers of GSF in Greece, which can constitute a significant market for innovative Greek furniture enterprises during the period of the economic recession. Furthermore, the specific type of furniture can also support export activities which are rather rare for the Greek furniture sector.

Using cluster analysis we tried to focus more on the preferences of the target group of potential GSF consumers in relation to their specific characteristics and profile, such as their age and income. Table 5 presents the basic GSF properties and characteristics in relation to the consumers' age. Thus, it seems that for almost the sum of the age groups, these properties are convenience in maintenance and cleaning and the convenience in moving the furniture, especially for ages over 66 years old, as well as supporting in changing positions when sitting. The capability of warning for health problems seems to play a significant role for ages over 75 years old.

Age Groups	Furniture Attributes	Rank
<50 years	Safety	1.50
	Convenience in maintenance and cleaning	1.56
50-55	Moving the furniture	1.56
	Convenience in maintenance and cleaning	1.73
56-60	Convenience in maintenance and cleaning	1.70
	Safety	1.75
61-65	Adjustment to anthropometrics	1.61
	Supporting in changing position from sitting into vertical and vise versa	1.74
66-70	Safety	1.75
	Moving the furniture	1.77
71-75	Convenience in maintenance and cleaning	1.47
	Moving the furniture	1.50
76-80	Convenience in maintenance and cleaning	1.39
	Warning relatives for health problems	1.61
>80 years	Convenience in maintenance and cleaning	1.00
	Moving the furniture	1.00

Supporting in changing position from sitting into vertical and vise versa	1.00
Adjustment to anthropometrics	1.00

Table 5. *Groups of consumers according to age and furniture attributes (ranking 1 till 5, with 1=very much and 5=not at all)*

What are the main reasons that our target group would decide to pay an extra amount of money? The research indicated (Table 6) that there are actually different criteria for different ranges of percentages of extra amounts. More precisely, the actual purchase price and the level of quality are the main criteria for people who are willing to pay 1-15% more for GSF. The actual price seems to be the only criterion for paying more than 20% since there is a common perception that GSF will be rather expensive. However, the people who seem willing to pay an extra amount of 1-5% expect also better ergonomics, safety, functionality and assurance that environmental protection has been taken into account during production. On the contrary, the results show the willing to pay of the consumers an extra amount from 16-20% has to do mainly with the design of a GSF.

Extra amount	Criteria in purchasing	Rank
1-5%	Quality	1.12
	Safety - ergonomics	1.12
	Environmental protection	1.16
	Price	1.16
	Functionality	1.16
6-10%	Price	1.20
	Quality	1.20
11-15%	Quality	1.65
	Functionality	1.71
16 – 20%	Design	4,00
>20%	Price	1.19

Table 6. *Groups of consumers according to the extra amount they are willing to pay in purchasing a GSF and purchasing criteria (ranking 1 till 5, with 1=very much and 5=not at all)*

5. CONCLUSIONS - PROPOSALS

Wooden furniture is still the first preference of the participants of the research, regarding everyday use. Thus, wood could constitute the basis for the construction of a GSF, since it is by its nature an ecological material having the minor environmental footprint in relation to other materials. This property can be even of greater value when wood comes from certified sustainable managed forests and if the wood products bear the relevant labeling at European and international level according to UNECE and FAO (2012).

The criterion of price in relation to the quality plays the most fundamental role in the purchasing decision of GSF and the willingness to change conventional furniture. Modern consumers that belong to the third age seem to have a great awareness regarding environmental issues, a fact that enterprises should take into consideration and include to their planning and strategy.

GSF properties and characteristics of special interest seem to be the promotion of sustainability in natural resources use, the environmentally friendly production process, energy saving during its production and recyclable materials (when other than wood).

Regarding the "smart" - technological characteristics of the GSF, the significant ones are these of the ability to warn for health problems of the person, the ability to communicate with the end users and the ability to interact with its environment, with ergonomic design as a core element. Thus, the participants in the present research consider that "smart" furniture should facilitate their everyday routine and secure independence of the person. Regarding the specific technological applications that could be included to smart furniture, the technology of mobile phones seems to be more familiar to the users with the use of audiovisual means and use of computers and internet to follow.

The main criteria regarding the purchasing decision of GSF do not substantially differentiate in relation to conventional furniture products, a fact that can direct furniture enterprises towards the development of their competitive advantages. Nevertheless, regarding their manufacturing strategy they should detect these elements that differentiate them from competition and allow them to achieve their targets, including sophisticated technology and environmental protection in their products.

The majority of the sample state that are willing to pay an extra amount of 9% in average of the price of a conventional product, while the 2/3 of the consumers could afford a 15% extra amount. This percentage is of great importance if we take under consideration the reduced available income of the consumers because of the economic crisis in Greece during the last 4 years. This percentage is higher than the one found in a relevant study regarding the market of furniture with only ecological characteristics (Papadopoulos et al., 2013). A 10% states that they are not willing to pay extra, a fact that can be explained because of the reasons mentioned above.

These findings are quite encouraging regarding the existence of potential GSF consumers in Greece and indicate that third-age consumers are willing in purchasing GSF that includes sophisticated characteristics and properties focused on their needs which also comply with ecological standards. The capability in warning a familiar person to the GSF user for health problems seems to play a significant role for ages over 75 years old, which are these group of ages that usually need medical care.

The present research is the first in Greece and at European level, according to our knowledge. We could argue that it promotes the development of innovation for furniture manufacturing industries, in

order to approach an extended range of consumers, through the production of GSF. Thus, a new pathway is opening in confronting the difficulties and strong competition that furniture sector faces at national and European level, and recover the crisis (Papadopoulos et al., 2013). Furthermore, findings constitute an optimistic message towards furniture manufacturing sector; firms should redesign their strategy (Papadopoulos et al., 2009), focusing in differentiation by including GSF products in their portfolio, innovating through the production and promotion of furniture products with high added value. This fact could secure a share of the domestic market and boost extroversion, which is of great importance. This optimistic thesis is further certified by the findings of a previous study regarding only ecological furniture (Papadopoulos et al., 2013), where Greek and Cypriot enterprises consider the development of ecological furniture very positively, without mentioning the inclusion of "smart" elements.

Findings also certify the research of Tokuda et al., (2003) and Zongdeng and Wenjin, (2010), that "smart" furniture constitutes the future trend and evolution in the furniture industry.

The present research has certain limitations. Further research could be extended to a bigger sample of consumers in Greece and other countries e.g. Cyprus, Italy, Germany, Spain, France, Russia, Portugal, Israel etc. In this way, we could have a holistic picture of trends and tendencies in these countries too and develop a more concrete portfolio of characteristics and properties of innovative green and smart furniture.

ACKNOWLEDGEMENTS

This research has been co-financed by the European Union (European Social Fund - ESF) and Greek national funds through the Operational Program "Education and Lifelong Learning" of the National Strategic Reference Framework (NSRF) - Research Funding Program: ARCHIMEDES III. COMPETENCE OF BOLLYWOOD CELEBRITIES IN GENERATING BRAND RECALL IN KOLKATA

Patra, Supriyo¹; Datta, Saroj Kumar²

¹Department of Business Administration, ST. Xavier's College (Autonomous), Kolkata, India

²School of Business, Galgotias University, India

ABSTRACT

Kolkata is known world over as the “**City of Joy**” and is also treated as the cultural hub of India. Brands from within the country as well as from abroad are trying to connect with their target audience of Kolkata. Advertisers are making use of both **rational and emotional appeals** in their advertising campaign in order to position their brands in the mind of the target audience in Kolkata

Celebrity endorsement has become very prominent in mass media and advertisers are signing the **Bollywood Celebrities** for their brand endorsement purpose with the expectation of creating brand recall and preference among the target audience.

The **objective** of this paper is aimed at determining the proficiency of selected Bollywood Celebrities in generating **Brand Recall** among the respondents of different **gender** and **age groups** in Kolkata.

Primary research was conducted with cross sectional research design by applying survey method among a randomly selected sample of 400 respondents in Kolkata with a structured questionnaire. Independent sample t-test and ANOVA techniques were used for analyzing the data.

The **findings** show that all the selected Bollywood celebrities are **highly familiar** among the respondents. There is no significant difference in their brand recall generation capacity among **male and female** respondents. However, they are having a significant impact in generating brand recall among the respondents belonging to the age group (18-25) years compared to the others three age groups selected for the study.

Keywords: Bollywood, Brand Recall, Globalization, Kolkata, Celebrity, Media.

INTRODUCTION

Bollywood Celebrities from the Hindi film Industry in Mumbai are having huge fan following in India and are also seen endorsing brands across product categories be it FMCG, Consumer Durables, Service brands and even they are a part of various social awareness campaigns.

As per reports available based on a study conducted by AdEx India a division of TAM Media research, Celebrity Endorsement Advertising volume witnessed a growth by 26% in January - June 2013 in comparison with January - June 2012.

From the same study it is evident that the Hindi Film Stars (HFS), actors and actresses from Bollywood, Mumbai captured 80% of Celebrity Advertising in terms of Advertisement Volume in January - June 2013 followed by Sports Celebrities, Television Actors and Actresses.

One of the major developments in the business world during the decade of the 90's was the Globalization of markets. The emergence of a largely borderless world has created a new reality for all types of companies. Swiss- based Nestle and Netherlands- based Unilever is among two of world's largest consumer product companies because they have learned the art of marketing their brands to consumers in countries around the world. Two of the world's major marketers of cellular telephones are from Scandinavian countries. Nokia is based in Finland and Ericsson is located in Sweden.

In the era of Globalization, multinational corporations trying to connect with the Indian target audience are quick to realize this trend and are hiring famous Bollywood celebrities for their brand endorsement purpose.

A study conducted among MBA students of Pune in India to determine the association between celebrity advertising and brand recall shows that recall for female celebrity advertisement is lesser compared to that of male celebrity (Dhotre and Bhola 2010).

Branding in some form or the other has been around for centuries. The initial intention was for craftsmen and others to identify their unique work so that the customers could easily recognize them.

It is worthy to note that marks have been found on early Chinese porcelain, on pottery jars from ancient Greece and Rome and on goods from India dating back to about 1300B.C.

According to (Keller, 2007) Procter and Gamble put the first brand management system in to place, whereby each of their brands had a manager assigned to only that brand who was responsible for its financial success.

According to (Keller, 2007), Branding is treated as a means to distinguish the goods of one producer from those of another. According to the American Marketing Association (AMA) a brand is a "name, term, sign, symbol or design, or a combination of them, intended to identify the goods and services of one seller or group of sellers and to differentiate them from those of competition".

Celebrity endorsement enhances product information and creates awareness among consumers. It helps them to recall the brands of the durable products (Balakrishnan & Kumar 2011).

A study conducted by (Bimal et. al. 2012) reveals that celebrity endorsers are used by the companies for brand equity. It has also showed that consumer think that celebrity endorsed advertisement are reliable and they have the knowledge. They are able to recall the product, the consumers feel associated and it has also helped in influencing the demand of the products.

In the present situation it is extremely relevant to understand the proficiency of the Bollywood celebrities in generating brand recall as huge amount of money is paid to these celebrities as endorsement fees and they are also occupying huge amount of space and time in print and audio visual media as brand endorser.

Branding challenges and opportunities

In the words of (Keller, 2007) the reality is that although brands may be as important as ever to consumers, brand management may be more difficult than ever. A number of developments have occurred recently that have complicated marketing practices and made the job of brand manager even challenging.

- Savvy Customers
- Brand Proliferation
- Media fragmentation
- Increased Competition
- Decreasing Brand loyalty
- Learning Advantage
- Consideration Advantage
- Choice Advantages

The recent report about the Best Global Brands of 2013 published by Interbrand shows that Apple has secured the top position followed by Google and others. The list of top 10 best global brands is presented in the figure below.

2013 Rank	2012 Rank	Brand	Brand Name	Region/Country	Sector	Brand Value (\$m)	Change in Brand Value
1	2		Apple	United States	Technology	98,316	28%
2	4		Google	United States	Technology	93,291	34%
3	1		Coca-Cola	United States	Beverages	79,213	2%
4	3		IBM	United States	Business Services	78,808	4%
5	5		Microsoft	United States	Technology	59,546	3%
6	6		GE	United States	Diversified	46,947	7%
7	7		McDonald's	United States	Restaurants	41,992	5%
8	9		Samsung	South Korea	Technology	39,610	20%
9	8		Intel	United States	Technology	37,257	-5%
10	10		Toyota	Japan	Automotive	35,346	17%

Figure-1 Top 10 Global Brands of 2013 (Source *interbrand.com*)

On focusing our attention from the Global context to Indian situation we see that the Most Trusted Brand of 2013 as per a study conducted by *economictimes.indiatimes.com* in Indian context is Colgate followed by Dettol, Clinic Plus and others.

Between unexpected climbers and widely anticipated slips, India's largest brands continue to command a lion's share of the trust of its consumers. The list of top twenty five most trusted brands is presented in the figure below. The figures in brackets represent brand ranks from Most Trusted Brand 2012 study.

Figure-2 Most Trusted Brand of 2013 in Indian Context (Source economictimes.indiatimes.com)

In order to cope up with this challenging situation of connecting with the culturally diverse Indian target audience MNC's and the domestic players are taking the celebrity route to brand building.

Celebrity endorsement in India

In India now it has become a common phenomenon among advertisers and their advertising agencies to use Indian Celebrities for promoting their brands. Celebrities are considered as “any individual who enjoys public recognition and who uses this recognition on behalf of a consumer good by appearing with it in an advertisement” (McCracken, 1989).

This definition of celebrity is considered in this study and it encompasses Movie stars from Bollywood Mumbai. In this study the term “Celebrity” will encompass a variety of endorsements including those in explicit mode “I endorse this product”, the implicit mode “I use this product”, the imperative mode “You should use this product” and the co present mode “the celebrity appears with the product” (McCracken, 1989).

LITERATURE REVIEW

According to (Keller, 2007) Brand Awareness consists of brand recognition and brand recall performance. Brand Recognition relates to consumers' ability to confirm prior exposure to the brand when given the brand as a cue.

Brand Recall relates to consumers' ability to retrieve the brand from memory. It requires that the consumers correctly generate the brand from memory when given a relevant cue.

In the words of (Keller, 2007) Brand Awareness also involves linking the brand- the brand name, logo, symbol and so forth- to certain association in memory. Brand Recall can further be classified as unaided recall and aided recall.

According to (Keller, 2007) in unaided recall consumer recall the brand unaidedly where as in aided recall various types of cues are presented to help the consumer recall the brand.

Effect of celebrity endorsement on Brand Awareness-Recall has been an area of research that has been studied by researchers. A celebrity was better than other endorsers in enhancing brand name recall (Friedman and Friedman 1979).

A study conducted among MBA students of Pune in India to determine the association between celebrity advertising and brand recall shows that recall for female celebrity advertisement is lesser compared to that of male celebrity (Dhotre and Bhola 2010).

It is also evident from existing literature that a celebrity was better in enhancing brand name recall than a non-celebrity (Petty et. al. 1983). A physically attractive celebrity paired with an attractiveness-related product could enhance brand name recall (Kahle and Homer 1985).

Misra and Beatty (1990) also showed that celebrity/product congruency is better in enhancing brand name recall than an incongruent or irrelevant celebrity.

However different findings emerged from a study conducted by (Costanzo and Goodnight 2005). The results presented in their study, however, found that a celebrity recognized in a magazine advertisement did not increase consumer recall of the brand endorsed by the celebrity for both professional athlete celebrities and other entertainment celebrities who are not professional athletes (Costanzo and Goodnight 2005). The results of their study raise questions relative to using celebrity endorsements to enhance brand recall. Celebrity endorsement enhances self-brand connections when consumers aspire to be like the celebrity, but harms them when consumers do not; this effect is more pronounced when the brand image is congruent with the celebrity's image (Escalas and Bettman 2009).

Another study conducted on "Effectiveness of Celebrity Advertisements" by (Rajeswari et. al. 2010) highlighted that factors like age, gender, viewers' status, monthly family income, educational qualification, period of awareness of celebrity advertisements and the type of celebrities (Film stars, Sports stars, Professional models and TV personalities) have close relationship with the level of effectiveness of celebrity advertisements.

However factors like family type and frequency of watching the advertisements have no significant relationship with the level of effectiveness of celebrity advertisements.

Celebrity endorsement enhances product information and creates awareness among consumers. It helps them to recall the brands of the durable products (Balakrishnan & Kumar 2011).

From review of existing literature it is seen that contradictory findings emerged regarding the effect of celebrity endorsement on Brand recall. Most of the earlier studies were conducted with students and were experimental in nature. Hence the present study is conducted not just among students but respondents of different gender and age groups in Kolkata.

Research Objectives & Hypothesis

The study is undertaken with the following broad objectives-

- First to determine the Brand Recall generation capacity of Bollywood celebrities among **male and female** respondents in Kolkata.

- Second to understand the Brand Recall generation capacity of Bollywood celebrities among respondents of different **age groups** selected for the study in Kolkata.

Keeping the above objectives in mind the following hypothesis are formulated-

H01: There is no difference in Brand Recall score of Bollywood celebrities among male and female respondents in Kolkata.

H02: There is no difference in Brand Recall Score of Bollywood celebrities among respondents of different age groups in Kolkata.

Research Methodology

In the first part of the study 10 Bollywood Celebrities were selected based on a pilot study conducted among 50 respondents in Kolkata depending on their familiarity and Popularity. Thereafter, the brands endorsed by each of these 10 Indian Celebrities were tracked from advertisements featuring in Television and News papers during the study period as presented in table 1.

Sr. No	Bollywood Celebrities	Celebrity Gender	Brand Endorsed	Number of Brands Endorsed
1	Amitabh Bachchan	Male	Reid & Taylor, Boroplus, Eveready, Parker Pen, Binani Cement, ICICI prudential, Cadbury Dairymilk, Tanishq, Navratna oil, Just Dial, Gujarat Tourism	11
2	Shah Rukh Khan	Male	Nokia, Linc, Airtel, Sunfeast, Fair & Handsom, Belmont, Dish TV, Videocon, Emami Sona Chandi Chywanprash, Pepsodent, Hyundai i10, Nerolac, IIPM, Gitanjali Jewels	14
3	Amir khan	Male	Inova , Coca cola, Tata Sky, Samsung Mobile, Titan, Parle G	6
4	Saif Ali Khan	Male	Lays, Asian Paints, Lenevo, Royal Stag, Airtel Digital TV, Airtel Voice Message, Taj Mahal Tea	7
5	Ranbir Kapoor	Male	Pepsi, Tata Docomo, Panasonic, John Players, Hero Moto Corp,	5
6	Salman Khan	Male	Mayur, Chloromint	2
7	Aishwarya Rai Bachchan	Female	Lux, L'oreal (Hair colour), Longines	3
8	Katrina Kaif	Female	Slice, Pantene, Veet, Nakshtra, Godrej Renew	5
9	Kareena Kapoor	Female	Vivel, Sony Vaio, Lakme, Gitanjali Jewels	4
10	Priyanka Chopra	Female	Nikon's, Lux, Levis, Nokia, Asmi Jewellery, Garnier	6

Table 1 Brand endorsement details of 10 selected Bollywood celebrities (source the researchers' survey)

Cross sectional research design was applied for collecting the primary data by survey method from the respondents of Kolkata. A structured questionnaire was administered for collecting the data. The Target population was defined in terms of elements-male and female 18 years to 49 years, sampling unit-household, and extent- city of Kolkata. The Sample Size was arrived at 400 for the study keeping in mind the availability of time, resources, and sample size used in similar studies. The sample size was also selected keeping in mind 95% confidence level and 5% confidence interval.

The first question was asked to ascertain the familiarity of the Bollywood celebrities. The next two questions were asked to find out the Brand Recall score of the Bollywood celebrities. The actual number of correct brands unaidedly recalled against a celebrity is noted for calculating the Unaided Brand Recall score of that celebrity. Similarly the actual number of correct brands aidedly recalled against a celebrity is noted for calculating the Aided Brand Recall score of that celebrity. The Unaided and Aided Brand recall Score of the Bollywood celebrities among male and female respondents are presented in table 2 and table 3 respectively.

Sr. No	Bollywood Celebrities	Unaided Brand Recall Score	Aided Brand Recall Score
1	Amitabh Bachchan	302	1197
2	Shah Rukh Khan	316	1532
3	Amir khan	246	574
4	Saif Ali Khan	162	570
5	Ranbir Kapoor	226	430
6	Salman Khan	64	112
7	Aishwarya Rai Bachchan	191	290
8	Katrina Kaif	202	397
9	Kareena Kapoor	156	268
10	Priyanka Chopra	170	314

Table 2 Unaided and Aided Brand recall score of Bollywood celebrities among male respondents (source the researchers' survey)

Sr. No	Bollywood Celebrities	Unaided Brand Recall Score	Aided Brand Recall Score
1	Amitabh Bachchan	226	950
2	Shah Rukh Khan	231	1248
3	Amir khan	168	438
4	Saif Ali Khan	153	494
5	Ranbir Kapoor	156	298
6	Salman Khan	48	64
7	Aishwarya Rai Bachchan	199	297
8	Katrina Kaif	143	391
9	Kareena Kapoor	147	265
10	Priyanka Chopra	154	338

Table 3 Unaided and Aided Brand recall score of Bollywood celebrities among female respondents (source the researchers' survey)

Similarly, the Unaided and Aided Brand recall Score of the Bollywood celebrities among respondents of different **age groups** of Kolkata is presented in table 4 and table 5 respectively.

Sr. No	Bollywood Celebrities	(18-25) years	(26-33) years	(34-41) years	(42-49) years
1	Amitabh Bachchan	386	84	38	20
2	Shah Rukh Khan	396	80	51	20
3	Amir khan	290	78	32	12
4	Saif Ali Khan	204	61	40	10
5	Ranbir Kapoor	298	52	24	8

10	Priyanka Chopra	500	86	50	14

Table 5 Aided Brand recall score of Bollywood celebrities among respondents of different age groups (source the researcher's survey).

RESEARCH FINDINGS

It is clearly evident that all the respondents in Kolkata are having 100% familiarity with the selected Bollywood celebrities. Shah Rukh Khan is having the maximum Brand Recall generation capacity among both male and female respondents followed by Amitabh Bachchan. The list of five top Bollywood celebrities in terms of their Brand Recall generation score is presented below in table 6.

Unaided Brand Recall Score among male	Aided Brand Recall Score among male	Unaided Brand Recall Score among female	Aided Brand Recall Score among female
Shah Rukh Khan	Shah Rukh Khan	Shah Rukh Khan	Shah Rukh Khan
Amitabh Bachchan	Amitabh Bachchan	Amitabh Bachchan	Amitabh Bachchan
Amir Khan	Amir Khan	Aishwarya Rai Bachchan	Saif Ali Khan
Ranbir Kapoor	Saif Ali Khan	Amir Khan	Amir Khan
Katrina Kaif	Ranbir Kapoor	Ranbir Kapoor	Katrina Kaif

Table 6 Top Five Bollywood celebrities in terms of their Unaided and Aided Brand recall Score among male and female respondents of Kolkata (source the researcher's survey).

It is interesting to note that regarding the first hypothesis the results of the independent sample t-test for Unaided Brand Recall shows t statistic of 1.436 with 18 degrees of freedom. The corresponding two-tailed p-value is 0.168, which is more than 0.05 and 0.01. Similarly for Aided Brand Recall the t

statistic is 0.499 with 18 degrees of freedom. The corresponding two-tailed p-value is 0.624 which is more than 0.05 and 0.01.

Therefore the null hypothesis is accepted at 5% significance level which means the Brand Recall score of Bollywood Celebrities is same among male and female respondents in Kolkata.

GROUP STATISTICS

Gender of The Respondents			N	Mean	Std. Deviation	Std. Error Mean
UN AIDED BRAND RECALL SCORE	MALE		10	203.5000	74.07991	23.42613
	FEMALE		10	162.5000	51.66398	16.33758

Independent Samples Test

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
UN AIDED BRAND RECALL SCORE	Equal variances assumed	1.215	.285	1.436	18	.168	41.00000	28.56046	-19.00330	101.00330
	Equal variances not assumed			1.436	16.080	.170	41.00000	28.56046	-19.52102	101.52102

Group Statistics

Gender of The Respondents			N	Mean	Std. Deviation	Std. Error Mean
AIDED BRAND RECALL SCORE	MALE		10	568.4000	448.82518	141.93098
	FEMALE		10	478.3000	353.81007	111.88457

Independent Samples Test

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
AIDED BRAND RECALL SCORE	Equal variances assumed	.328	.574	.499	18	.624	90.10000	180.72786	-289.595	469.79515
	Equal variances not assumed			.499	17.069	.624	90.10000	180.72786	-291.084	471.28432

In regard to the second hypothesis, one way between groups ANOVA was conducted. The F value is 67.318 with 3 degrees of freedom for Unaided Brand Recall score and the F value is 12.552 with 3 degrees of freedom for Aided Brand Recall score and both are significant. Multiple comparisons were done and mean difference is significant at 0.05 levels.

Hence the second null hypothesis is rejected and it is evident that the Brand Recall Score of the Bollywood celebrities in the age group (18-25) years is significantly different compared to the other three age groups selected for the study as shown below.

	Sum of Squares	df	Mean Square	F	Sig.

DISCUSSION

Effect of celebrity endorsement on Brand Awareness-Recall has been an area of research that has been studied by researchers. A celebrity was better than other endorsers in enhancing brand name recall (Friedman and Friedman 1979).

It is also evident from existing literature that a celebrity was better in enhancing brand name recall than a non-celebrity (Petty et. al. 1983). A physically attractive celebrity paired with an attractiveness-related product could enhance brand name recall (Kahle and Homer 1985).

Celebrity endorsement enhances self-brand connections when consumers aspire to be like the celebrity, but harms them when consumers do not; this effect is more pronounced when the brand image is congruent with the celebrity's image (Escalas and Bettman 2009).

A study conducted among MBA students of Pune in India to determine the association between celebrity advertising and brand recall shows that recall for female celebrity advertisement is lesser compared to that of male celebrity (Dhotre and Bhola 2010).

We have conducted the present study among a wider demographic profile of respondents in Kolkata and it contradicts the findings of the above mentioned study. It is evident from the present study that Brand Recall Score of the male Hindi Film Stars (HFS) is same as the Brand Recall Score of the female Hindi Film Stars (HFS) among both male and female respondents of Kolkata.

Interestingly, different findings emerged from a study conducted by (Costanzo and Goodnight 2005). The results presented in their study, however, found that a celebrity recognized in a magazine advertisement did not increase consumer recall of the brand endorsed by the celebrity for both professional athlete celebrities and other entertainment celebrities who are not professional athletes (Costanzo and Goodnight 2005).

They conducted their study with a convenience sample of business students only but we have conducted the present study with respondents from different demographic profile and not just students in Indian cultural context.

Another study conducted on "Effectiveness of Celebrity Advertisements" by (Rajeswari et. al. 2010) highlighted that factors like age, gender, viewers' status, monthly family income, educational qualification, period of awareness of celebrity advertisements and the type of celebrities (Film stars, Sports stars, Professional models and TV personalities) have close relationship with the level of effectiveness of celebrity advertisements.

The present study is having some resemblance with the above mentioned study and also goes a step further in presenting the fact that there is a substantial variation in Brand Recall Score of Hindi Film Stars (HFS) among the respondents of the four age groups selected for the study. The Brand Recall Score of the Hindi Film Stars (HFS) in the age group (18-25) years is significantly different compared to the other three age groups. It is seen from review of existing literature that Celebrity endorsement

enhances product information and creates awareness among consumers. It helps them to recall the brands of the durable products (Balakrishnan & Kumar 2011).

The findings of the present study is not just having resemblance with the earlier study mentioned above but also takes it forward. The results of the present study not just include brands of Durable products but also Fast Moving Consumer Goods and Service brands.

LIMITATIONS & SCOPE FOR FURTHER RESEARCH

Since the study is conducted with just 10 Bollywood celebrities and is restricted to the geographical region of Kolkata it might go down as a limitation of the present piece of work.

The phenomenon of brand endorsement by celebrities is a contemporary and challenging area for research. In future building on this piece of research, celebrities from other profession and their role in generating brand recall can be studied in a wider geographic context.

CONCLUSION

In today's dynamic and cut throat competitive market environment brands are leaving no stone unturned to connect with their target audience. The Bollywood Celebrities are enjoying high familiarity among the respondents in Kolkata and are endorsing multiple brands across different product categories. They are proficient enough in generating brand recall among respondents of both the gender but their brand recall competency is significantly higher among the respondents in the age group between (18-25) years compared to the respondents of the other age groups who are slightly older.

THEORETICAL AND PRACTICAL IMPLICATIONS

On the academic scene although the phenomenon of Celebrity Brand endorsement have been studied from different perspective across the globe, in Indian context and specially in Kolkata the impact of Bollywood celebrities in generating brand recall is not much evident in existing literature. Therefore in this research a modest attempt has been made to understand the brand building process with Bollywood celebrities in Kolkata which is expected to contribute to the existing body of knowledge.

This piece of research is expected to provide valuable practical insight to advertisers in taking note of the fact that Bollywood Celebrities are having significant Brand Recall among the respondents belonging to the age group (18-25) years in Kolkata.

A CONCEPTUAL FRAMEWORK OF NEED, FIT AND VALUE BASED CO-CREATION WHILE EXTENDING OR CREATING THE BRAND

Paul, Soumi¹; Peretti, Paola²; Datta, Saroj Kumar³

¹Supreme Knowledge Foundation Group of Institutions, India

²Stockholm School of Economics, Sweden

³VIT Business School, VIT University, India

ABSTRACT

Purpose: The previous findings suggest there is a place for value development and the use of co-creation in the marketing by engaging the customers in the process by providing complete transparency and a proper feedback loop. One area of business where co-creation can return significant dividends is on extending the brand or brand category. Whilst consumers have few unmet needs, having more choice of products and services than they have ever had, they do not appear to be entirely satisfied. Now a day's people do not want products; they want solutions to their problems. They are, however, in an ideal position to suggest improvements to a product or new category that they might have been using or looking for. It ensures to fit with need, which creates value associated with innovation and business creation.

Methodology: The research methodology used in this study is a state-of-the art of this topic. The idea is to convert all the main topics around the value co-creation concept and to identify research gaps and implications and suggest possible need for further researches.

Findings: This article, through an in depth literature review analysis, identifies this paradigm shift and it presents a conceptual model of value co-creation activity based on company-customer-brand management perspective. The objective is to offer an agenda for future research of this emerging paradigm. The study proposes Company-customer-brand based Co-creation research framework.

Implications: Constant innovation is essential to ensure that the offerings meet the needs of customers well. By providing productized offering instead of generic offerings, the company can incorporate the features that would cater to the emerging needs of customers. The study suggests companies can undertake innovations by adopting co creation to offer more values to customers. It also ensures the way to the move from theory to practice.

The paper highlights the need to reconsider the role of consumers in the co-creation process and identifies various gaps in the knowledge of brands and their management that have become apparent because of the changing market environment. No longer can marketers afford to rely on the untested assumption that increases in customer satisfaction and share

will translate automatically into higher financial performance. This dilemma suggests a reformulation of the marketing discipline as about developing and managing intangible assets – customer and channel relationships and brands – to maximize economic value. We call this value-based marketing. This view of marketing is theoretically appealing and places marketing activities in a pivotal role in the strategy formulation process. We hope this typology and research agenda fosters greater appreciation for an investigation into this important phenomenon.

Originality: The study points to the critical role of creating visibility for change as well as the importance of the infrastructure supporting changes. It is ascertain that the findings support the needs for degree of freedom in both way communication of customers and marketing departments in new product/brand development and changes.

Keywords: *Conceptual model of value co-creation, consumer co-creation; brand management; brand value co-creation.*

INTRODUCTION

The focus of effective value creation has been emerged and proved to be a current concern in the present decade. Fit with need which creates value associated with innovation and business creation has been already discussed for so long in previous years. In the past, the process of value creation was almost confined within the business. Previously the entire marketing process starting from product design, production, marketing promotion, branding and control of sales channels could be performed in-house with minimal consumer input (see Figure 1). The role of the consumer was seen solely at the end-of-line points of consumer interaction, not during the process of value creation. Value creation occurs when the company has the resources and capabilities to produce a product or service that is desired by market participants like customers. They describe the promising, active role consumers may play in the previously firm-dominated world of new product development and even in brand development. This is the high time for understanding of co creation process from both customer and company side. Since 1995 the literature has analyzed the potential impact of the Internet in terms of consumer marketing. Mahajan and Wind (1989)¹ anticipated the Internet's possible contribution as an element able to create discontinuity in the trend, generating a profound change in the market dynamics and, therefore, with implications on the performance of entire sectors and businesses. The Internet can change consumers' behavior unpredictably (Fox, 1995; Molenaar, 1996), with an impact

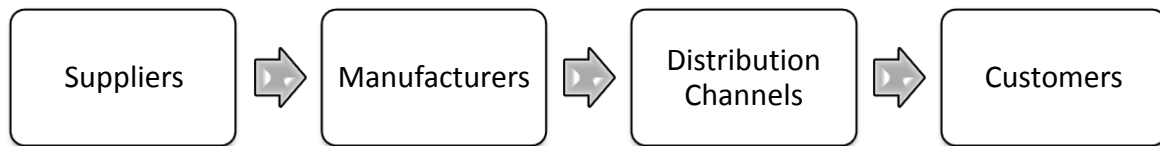

¹ Quoted and translated by A. Peterson, S. Balasubramanian and Bronnenberg BJ, (1997), Exploring the Implication of the Internet for Consumer Marketing, "Journal of the Academy of Marketing Science, 25/4, 329-346.

on conventional marketing and its main activities (Peterson et al, 1995). This situation creates challenges and opportunities that organizations must take into account, in terms of brand management (De Chernatony, 2004).

According to Prahalad and Ramaswamy (2000), the customer's role has undergone a change and the customers have become "co-creators of value" instead of being passive. In particular the co-creation or co-production process is grounded on an aware and stimulated co-operation between companies and consumers, which interact through their operating resources (skills, knowledge, competencies, experience, physical and immaterial spaces, etc.) to co-create value about brands, products and/or services of the same companies. The term co-creation implies collaboration between the firm and some other entity. In this particular context, the consumer collaborates in the creation of value. Knowledge is a source of competitive advantage since it fosters innovation (Grant, 1996; Nonaka & Takeuchi, 1995). Thus, the knowledge provided by customers may help companies to adequately assess and fulfill customers' needs, and reduce the risks of product failure (Ogawa and Piller, 2006). This interaction can take place anywhere within the business operation (not just at the point of sale). Geoffrey Moore's *Crossing the Chasm* (1999) highlighted the importance of companies working with early adopter customers. In addition, MIT professor Eric von Hippel wrote about user-created innovation in his *Sources of Innovation* (1994). The previous findings suggest there is a place for value development and the use of co-creation in the marketing by engaging the customers in the process by providing complete transparency and a proper feedback loop. This study assumes that valuable innovations may be produced outside the firm (Chesbrough, 2003), and from different players, such as customers, suppliers, manufacturers, universities. In this paper, the focus is on company's one specific stakeholder - the customer.

One area of business where co-creation can return significant dividends is on extending the brand or brand category. Whilst consumers have few unmet needs, having more choice of products and services than they have ever had, they do not appear to be entirely satisfied. Nowadays people do not want products, they want solutions to their problems. They are, however, in an ideal position to suggest improvements to a product or category that they might have been using or looking for. Previous conceptualizations and measures overlook consumers' as co-creators of brand value in terms of line extension, brand extension etc. In extension, brand equity is predominantly considered as a consumer based rather than company based. Brand equity can be defined as how much the consumers are willing to pay premium in order to enjoy the brand.

RESEARCH METHODOLOGY

The research methodology used in this study is a state-of-the art of this topic. The idea is to cover all the main topics around the value co-creation concept (see Figure 2) and to identify research gaps and implications and suggest possible need for further researches.

Figure 2 – Literature Review: analysis of different components of consumer co-creation, brand management perspective.

Source: personal work

Research Objectives

Main objectives are the following ones:

- to collect, document, scrutinize, and critically analyze the current research literature on value elements in marketing and how co-creation between the sender (firm) and receiver (consumer) happens;
- to establish the scope of company - consumer co-creation in a marketing strategy like brand extension, line extension etc .

- The study will propose directions for the firms when and how in various stages implementing extension strategy involving consumers may help in sustaining as well as improving brand's equity.

LITERATURE REVIEW

The following literature stream intends to identify all the different components of a possible model of consumer co-creation. According to the theoretical perspective of "working consumer" proposed by Cova and Dalli (2009), consumer co-creation is analyzed in multiple theoretical perspectives. These theoretical perspectives, although with different approaches and aims, have addressed the value co-production and co-creation constructs, and put in evidence that consumers, by their knowledge, competencies, skills and experience are always actively involved as value co-creators. In particular, this is known as the theoretical perspective of value co-creation (Prahalad and Ramaswamy, 2004, 2000) and it is part also of the theoretical perspective of S-D Logic (Lush and Vargo, 2004, 2006) or value co-producers (Norman and Ramirez, 1993). On the other side there is the theoretical perspective of consumption experience, the one that happens during the consumption experience stage (Carù and Cova, 2007; Holt, 1995, 2002; Prahalad and Ramaswamy, 2004). Finally it is important to remember that consumers can have an active role also during the phase of service production (service co-production), interacting with operational resources (i.e.: front office employees) of the company, in the theoretical perspective of co-production (Bitner, 1990; Eiglier and Langeard, 1977; Lovelock, Wirtz, 2007; Bitner, Booms and Tetreault, 1990).

Co-Creation

The consumer collaboration work on different brand interacting blocks that represent spaces in which the company and/or its customers actively participate to create brand equity. These blocks are the following ones: production (execution) of the operational activities related to components of an existing product or services or their mix (i.e.: defining a package) closely designed by the company and not changeable by the consumers; brand offering system improvement (product, service, experience related), which added value in terms of benefits (functional and psychosocial) and attributes (tangible and intangible) for the consumers; brand offering system innovation. The consumer collaboration is generally stimulated and designed by the companies and takes place on all these areas.

Co-creators

In this scenario recent developments provide a growing number of consumers a greater role in the exchanges with companies (Hoyer et al 2010) consumers are only willing to share their creative ideas, honestly state their product preferences, and spend significant amounts of time modifying existing product concepts if their expectations are met. Considering that, consumers' motivations depend on personality and that motivations are quite heterogeneous among user groups. As there are numerous personal characteristics and personality traits that affect consumers' motives, in the following we concentrate on those characteristics that either relate to consumers' creativity as main prerequisites for their ability to make valuable and innovative contributions to a firm's new product development process. Co-creators are persons with exploratory behavior with the tendency to explore or investigate new environments, like the following ones:

- **Innovators:** According to Thomke and von Hippel (2002, p. 78), *"Turning customers into innovators requires no less than a radical change in management mind-set."* Specifically, co-creation's highly interactive nature may require firms to adopt an open culture in which their goals, activities, and processes are highly transparent and collaborative (Ogawa and Piller 2006; Prahalad and Ramaswamy 2004).
- **Novelty seeker:** novelty seeking (NS) is a personality trait associated with probing activity and long associated with unmet human needs. In this particular context we are mainly talking about product based need. Novelty seekers turn out to be one of the crucial predictors in various decision making activities.
- **Early adopter:** this specific target has creation and construction behaviours that allow them to design and provide the products that the later adopters will follow.

Organizations are also getting involved in co creation following the thought of C.K. Prahalad and Venkat Ramaswamy of Co-Creating Unique Value with Customer . Companies applied the principles to a broader range of business activities and beyond of traditional marketing practices. Companies engaged customers in the delivery of their experience. The case study of Harley Davidson reveals bikers riding together and customizing their motorcycles according to their need. Personalized experience value and thus knowledge of need, and finally delivering the value which fit their need.

Motivation for Co-Creation

Little is known about **why customers** contribute to co-creation projects initiated by producers. Motivated consumers to make more and even better contributions or attract additional consumers interested in the topic. Many consumers appear to be increasingly less fulfilled by the act of consumption itself but begin to engage in creative contributions to fulfill own psychological benefits (Thompson et al. 2006). Mainly of the customers who are "dissatisfied with available choices and want

to co-create value and thereby co-create value".Based on the literature review analysis, we can summarize that main motivations for co-creation are the following ones: interest in innovation; to gain knowledge; to show ideas; to get monetary rewards etc .

Organizational benefits

Organizational benefits that co-creation can generate are the following ones:

- **Innovation of existing business – Prolong the brand life cycle / product life cycle.**

One of the main benefit is that co-creation will allow to prolong product life cycle.Product's superiority is in itself no longer sufficient to guarantee its success. The fast pace of technological development and the increased speed with which imitations turn up on the market have dramatically shortened product life cycles. Product life cycle refers to the phases, starting from the product's first launch into the market until its final withdrawal. To prolong the life cycle of a brand or product an organization need to use skillful marketing strategies. Reputed companies rarely withdraw the product from the market rather than they try to extend the life of the product through innovative extension strategy.

- **Innovation in an enterprise – Constant orientation.**

For example Brand orientation is closely related to the idea of innovation. It is a deliberate approach to work with brands, both internally and externally. Strong brands offer several advantages to firms such as entry barriers to competitors (Karakaya and Stahl, 1989), opportunity for brand extensions (Pitta and Katsanis, 2001),etc. Urde (1999) presents a brand Orientation model that focuses on brands as strategic resources. According to him *"Brand Orientation is an approach in which the processes of the organization revolve around the creation, development, and protection of brand identity in an ongoing interaction with target customers with the aim of achieving lasting competitive advantages in the form of brands"* (p. 117-118).

- **Creation of future business – NPD by line extensions , brand extensions.**

Participatory branding brings users, brands & suppliers together and that's good for customer-focus. Assessing customers need of their favourite brand to their service , for new product under the same brand name and assessing customers need for absolutely new brand's creation.

Two way process of Value Co-Creation

Value co-creation is an emerging business, marketing and innovation paradigm describing how customers and end users could be involved as active participants in the design and development of personalized products, services and experiences (Prahalad&Ramaswamy, 2004; Etgar, 2008; Payne,

Storbacka, &Frow, 2008). Co creation is here defined broadly as the creation of value by consumers. Interpretations of value and the processes of value creation are rapidly evolving from product- and firm-centric perspectives (e.g. Porter, 1980) to 'personalized consumer experiences' (Prahalad&Ramaswamy, 2004). We are emphasizing here for two way process of value creation on the idea generation, and virtual process of communicating those ideas by maintaining proper feedback loops. You cant just ask customers what they want and then try to give that to them. By the time you get it built, they'll want something new" , Steve Job. So ,the smart way is to involve your customers on the value making process.

Ideation contests :This willingness to collaborate on the consumer side is willingly accepted by firms, since they know that new perspectives and consumers' knowledge can lead to ideas with higher commercial attractiveness (Urban and von Hippel 1988; Lilien et al. 2002). Many firms today actively build infrastructures to integrate consumer input into their innovation funnel . One of the tools applied in this contest is ideation contests as a form of co-creation to get easy access to a worldwide pool of talented people in order to generate fresh ideas (Schweitzer et al. 2012; Terwiesch & Xu 2008). Participating users apply their skills, experience, and creativity to provide a solution for a particular need . They do this in order to develop new products under an established brand or absolutely new brand that better meet consumers' wants and needs and to decrease the high failure rates of new product introductions, especially common in extension strategies.

Virtual process: consumers are considered a valuable source of innovation. Researchers aswell as consultants claim to virtually engage consumers in co-creation activities such as the generation, design, refinement, and testing of ideas and new product concepts. More recently, however, the discursive power model advocating co-creativity between consumer and firm has emerged (e.g. Holt, 2002), largely enabled by the emergence of new technologies. In addition, technological advances provide consumers easy access to knowledge, which in turn enhances their abilities and access to design tools to apply their knowledge. The internet facilitates collective co-creation by connecting individuals with other consumers or the firm (Blazevic and Lievens 2008). the Internet increases access to knowledge that can enhance consumers' ability to engage in creative pursuits. 'crowdsourcing' processes (e.g. wikis and open-source software) (see, e.g., Anderson, 2006; Howe, 2009; Jenkins, 2008; Leadbetter, 2009; Li & Bernoff, 2008; Scoble& Israel, 2006; Tapscott, 2008; Tapscott& Williams, 2007). The process of co creation is largely enabled by the emergence of new technologies that facilitate multimedia and immersive exchange (e.g. virtual worlds, role-playing, content sharing, ideation contests, collective intelligence, and social-networking websites). Organization may create a separate tab in their company website for submitting customers requirements , they may dubmit design which actually fit their need and it may continue up to final value creation.

Feedback process : An open feedback loop to reflect upon the impact of the chosen interventions which lead to a new docking phase due to the new situation created by those interventions. Instead of traditional Branding Co-creation branding is On demand. Participating, Messageing, Experienceing can be maintained through proper feedback loop. Very less chances of product failure because the product or Content ideas that customers already know (because it was their idea only).

Scope of Co-Creation

Co-creation is a form of marketing strategy or business strategy that emphasizes the generation and ongoing realization of mutual firm-customer value. It views markets as forums for firms and active customers to share, combine and renew each other's resources and capabilities to create value through new forms of interaction, service and learning mechanisms.

Line or category Co-Creation

Typically, customers (or users) have the most accurate and detailed knowledge about their need while manufacturers (or providers) have the most accurate and detailed knowledge about how best to solve these needs. Unfortunately, most new products fail to deliver on their objectives (Christensen 1997). Hence, marketing scholars and practitioners have duly devoted substantial attention toward improving this co creation processes. Traditional marketing thought and practice largely views new product or category development as entire firm-based. A new perspective in which customers are active co-creators of the products they buy and use is currently challenging this established paradigm. Innovation co-creation practices are strongly growing in many organizations. For example, Swarovski invited designers and creative consumers from all over the world to engage in a watch design contest. More than 1,650 participants joined to showcase their talent and submit their designs. In total, they created over 2,000 different watches. The generated content served as basis for a book on watch trends.

BRAND CO-CREATION

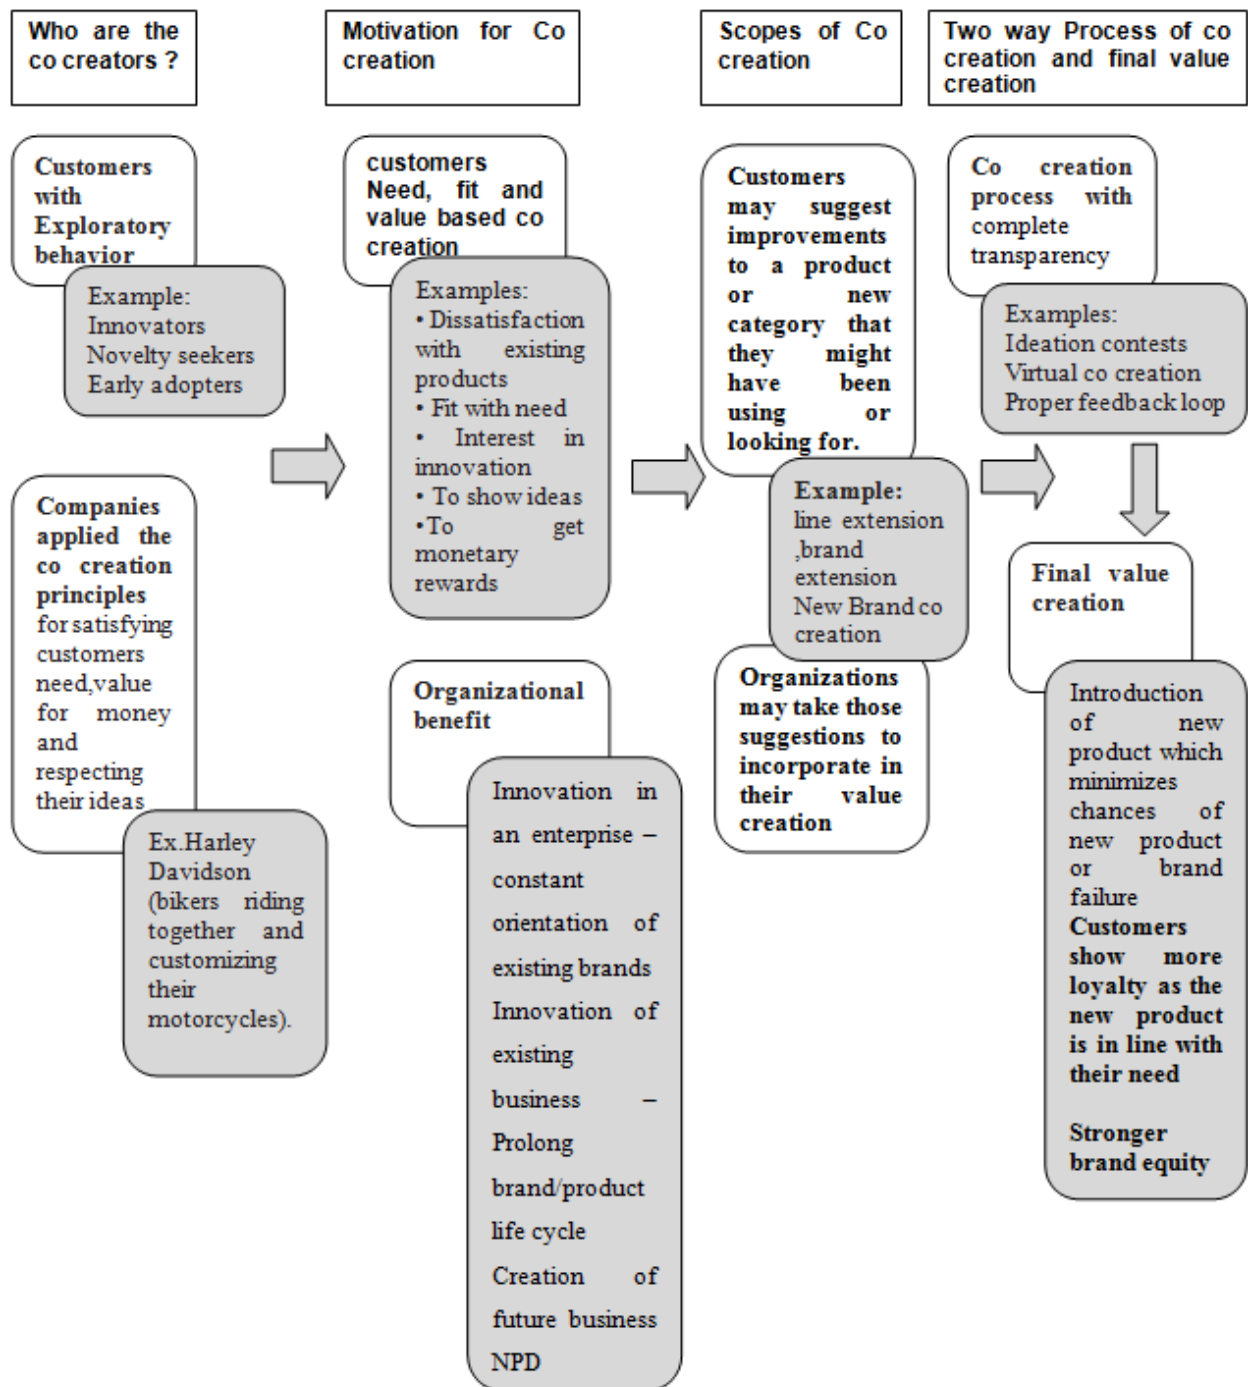

Customer brand co-creation is defined as a collaborative activity in which customers actively contribute to the creation of brand identity and image as well as idea, information, product, service and experience offered under particular brand. This research seeks to explore brand co-creation as an innovative brand development approach and a unique experience for consumers. Participation of customers in brand co-creation leads to an increased level self-brand connection. This study has important managerial implications by demonstrating that during turbulent times, companies can reduce their expenses on new brand development projects as well as establish a strong connection between consumers and a brand before the brand is launched to the market. To date, brand

development has been studied from a limited perspective on "how to" design successful logos and brand names (Lehmann and Keller 2006; Christodoulides 2008). Representatives of the brand design research stream are traditionally considered mainly by consultants and managers as the active creators of a brand identity and image that would then be projected to consumers (Lowrey and Shum 2007; Henderson and Cote 1998). In contrast to new brand development outsourced to brand consultants and advertising agencies that cost hundreds of thousands of dollars (Keller and Lehmann 2006; Keller 2008), customer brand co-creation may become a valuable strategy as well as a unique and meaningful consumer brand experience (Prahalad 2004). It may ensure the successful launch of new brand due to the fact that it was originated by prospective customers, who envision new brand and became loyal to it from the start of its introduction to the market (Payne et al. 2008). Moreover, these enthusiasts of brand co-creation may spread positive word-of-mouth (WOM) and accelerate the speed of brand growth. Scholars paid limited attention to the option of customers being active participants in brand development. Few studies that considered brand co-creation described the successful stories of service co-creation (Boyle 2007) and car share experience (Payne et al. 2008).

KEY FINDINGS

A substantial portion of the research was concerned about trends emerged in the past decade involving consumer co-creation. In marketing research, yet there is a dearth of studies exploring how companies are involving ordinary customers in their innovation process (Hoyer et al., 2010). Existing marketing and innovation studies on Co creation focus on customer relationship management and ignore new product development (Hoyer et al., 2010), with a few exceptions (Prügl and Schreier, 2006; Rowley et al., 2007; Füller and Matzler, 2007; Kohler et al., 2009; Kristensson and Magnusson, 2010; Füller et al., 2011). There is a research gap exists concerning the mutual interests and roles of an organization as well as a customer, the simple process that we may follow to go from theory to practice at any size of organization, the impact of this value creation feature on new product-related outcomes like brand extension, line extension etc. This paper is one of the pioneering studies to explore consumer "co-creation" within a framework of developing co-creation process in the context of introducing an extension and introducing a new brand as well.

Figure 3 – Company – customer-brand management perspective value based, fit based, need based Co-creation Research Framework

Source : personal work

PRACTICAL IMPLICATION

The paper highlights the need to reconsider the role of consumers in the co-creation process and identifies various gaps in the knowledge of brands and their management that have become apparent because of the changing market environment.

No longer can marketers afford to rely on the untested assumption that may increases in customer satisfaction and share will translate automatically into higher financial performance. This dilemma suggests a reformulation of the marketing discipline as about developing and managing intangible assets – customer and channel relationships and brands – to maximize economic value. We call this value-based marketing. This view of marketing is theoretically appealing and also places marketing activities in a pivotal role in the strategy formulation process. Marketing strategy lies at the heart of value creation. It is the platform on which are based growth, profitability and return on investment. Marketing strategy defines the choices about which customers the business will serve and how it will create customer preference. By targeting appropriate markets and creating a differential advantage the firm gains the opportunity to grow and create the margin spread that is the basis for value creation. Finally social implications are so important. We support the call for the value-based marketing by emphasizing and redefining the role of customers as co creators.

CONCLUSIONS

In today's highly competitive marketplace, a growing number of firms are placing increased reliance upon innovation as a means of achieving growth and profitability. Unfortunately, most new products fail because they do not adequately satisfy customer wants or needs. Thus, as a means of minimizing market failure and enhancing financial performance, an increasing number of firms are empowering customers and allowing them to actively participate in the product or brand category extension process. As we have shown, this customer empowerment can take a number of distinct forms. Although co-creation types has its own potential benefits and challenges, they all lie outside the boundary of traditional worldview, and hence, are contributing to the emergence of an exciting new paradigm. Thus, firms should look beyond the confines of their traditional extension approaches and develop effective strategies for identifying and harnessing the ideas, skills and talents of their customers. Moreover in today's turbulent environment, continuous improvement and effective design & change have become requirements for all organizations. As a result, designing and managing organizational change has been a frequently studied topic over the last decade). Yet, literature suggests that about 70% of all change initiatives fail (Beer & Nohria, 2000), clearly indicating despite the wealth of methodologies and guidelines for change that are available today, we still know less than we should. The study points to the critical role of creating visibility for change as well as the importance of the infrastructure supporting changes. It is ascertain that the findings support the needs for degree of freedom and adjusts to mistakes that explicitly consider the role of marketing departments in new product development and changes. We hope this typology and research agenda fosters greater appreciation for and investigation into this important phenomenon.

FUTURE RESEARCH

In the era of globalization, the marketing activities of companies need to have a global orientation. If it is not done, the customers of certain countries would be alienated and they would not be amenable to using the company's products. These may require some degree of customization. Researchers may work on co creation while customization.

INNOVATIVE STARTUPS, THE IMPACT OF FOUNDERS' CHARACTERISTICS ON THE EARLY STAGE: A CLUSTER ANALYSIS

Peppeoni, Federica¹; Pisoni, Alessia²; Onetti, Alberto²

¹CrESIT – Research Centre for Innovation and Life Science Management, University of Insubria, Italy

²Department of Economics, University of Insubria, Italy

ABSTRACT

The paper aims at analyzing the process of startup creation at its very early stage, investigating the connection between the distinctive traits of the entrepreneurs and the arising profiles of the new ventures. In order to do so, we performed a cluster analysis on a sample of Italian innovative startups and their founders. The peculiar features that are statistically significant for the clusterization provide useful information on the initial phases of the innovative venture creation. The results of our exploratory study yield valuable knowledge on the Italian context. Findings suggest that some specific traits of the entrepreneurial profile of the new venture (mainly educational background and previous experience), may have an initial imprinting effect on its firm profile and, hence, its likelihood to grow and to be successful.

Keywords: *new venture/startup, entrepreneurial profile, founders, founding team/early founding team/new venture team, fundraising.*

INTRODUCTION

The positive impact that new venture creation has on economic growth, innovation and job creation has been proved (Audretsch, 2003). Entrepreneurs are responsible for the economic development through the introduction of innovative ideas, in terms of products, processes, markets and organization. In order to reach this goal an entrepreneur must be able to successfully implement these innovations, which means to satisfy a (new) customer and thus, across job supply, providing economic growth. As stressed by Cuervo, Ribeiro and Roig (2010), the competitiveness of a country's firms, which determines the creation of its wealth and dynamism, relies fundamentally on the capabilities of its entrepreneurs and managers. As reported by Reynolds (2004), the junction or "choice point" in which an individual decides to get into the startup process is influenced by three groups of variables, those related to individuals, their characteristics and personal background, to their motivations and cognitive features, and finally to the context or environment in which the process takes place. From each of these variables depends the output of the process that is the

possibility that the firm is born, develops and grows, or that it ceases. Therefore, creating a new firm is not so simple. It takes different abilities, knowledge and skills, whose impact on the process may depend on the stage of its development (Klotz et al., 2014). For this reason, and given the relevance of the phenomenon of new venture creation, this paper attempts to shed new light on the role played by the characteristics of the entrepreneur(s) in the very early stage of the above mentioned startup process. Thus, we think that the proposed cluster analysis may help in providing useful information on the process of new ventures creation. The study is focused on a specific national context, Italy.

The paper is structured in 4 sections. Section 1 provides a comprehensively review of the literature on entrepreneurial characteristics affecting the startup process. On the basis of the theoretical framework previously described, section 2 presents the research design and the methodology. Section 3 describes the analytical procedure and cluster profiles. Section 4 discusses findings, provides concluding remarks and future research implications.

LITERATURE REVIEW: THE ENTREPRENEURIAL PROFILE AND THE STARTUP PROCESS

In prevailing literature, entrepreneurship is often linked to the discovery and exploitation of profit opportunities (March, 1991). Anyway, as noted by Freeman (1982), firms do not arise spontaneously from opportunities in the absence of human action, but instead are founded through the exploitation of organizational efforts made by individuals. This is consistent with more recent literature on the so called “personality approach/perspective” on opportunity identification, i.e. an individual’s unique personality is assumed as the key driving force for entrepreneurial activity. Many authors distinguish entrepreneurs from other individuals by looking for particular cognitive traits, such as risk propensity, need for achievement and self-confidence (Brockhaus, 1980) in order to detect the individual traits that delineate the successful entrepreneur (Timmons and Spinelli, 1994). In particular, two factors are strongly related to the ability to identify new business opportunities: entrepreneurial alertness, i.e. a unique attitude to sense environmental variations and recognize related opportunities (Kirzner, 1978) and prior knowledge and experience (Shane, 2000). Aldrich and Zimmer (1986) pointed out that a more comprehensive explanation for new firm creation would be that of specifying how individual experience impacts the likelihood that people will found firms. Individual’s prior knowledge and experience could be considered both as arising from work experience (Cooper et al., 1994), as well as from education (Gimeno et al., 1997). An organic attempt to systematize the field of study of entrepreneurship was made by the Entrepreneurship Research Consortium (ERC). The ERC demonstrated that for developing a representative portrait of entrepreneurial activity, individuals should be studied in real time, while involved in the startup process (Gartner et al., 2004). In doing so,

they classified the main variables affecting new venture creation. The first group of variables relates to the individual's personal characteristics, such as: age, gender, race and ethnicity, region of residence, household structure, personal background (i.e. educational background, work experience and functional expertise). The second group is related to the entrepreneur's cognitive features, i.e. motivational drivers that lead an individual to choose the entrepreneurial career rather than others. As pointed out by Shaver (1985), reasons for getting into a business (or not) matter, because they are generally considered as the basis of intentions.

Even though prevailing literature on entrepreneurship seems to be concentrated on the role of the individual entrepreneur, today new innovative firms are more likely to be founded by teams rather than individuals (Gartner et al., 1994; Beckman, 2006). To this regard, Cooper and Daily (1997) found that successful high-growth firms are usually built around a team. Further studies reported that team-founded firms have higher success rates, if compared to firms started by single founders (Ensley et al., 2006). In particular, scholars have increasingly recognized the role played by founding teams/early founding teams/new venture teams (NVT) (Ucbasaran et al., 2003; Klotz et al., 2014) in shaping the new venture in its early stages of development and growth. Research on NVTs has focused mainly on the impact that factors such as team members' basic demographic features, team composition, team members' networks, have on new venture performance. Insofar, studies on NVTs analyze how experience (education background, specialization and functional experience) of team members positively affect firm performance (Beckman, 2006). Furthermore, the relationship between NVT composition, i.e. heterogeneity vs. homogeneity (educational background, age, diversity of views and skills of each team member), and firm performance despite being in-depth investigated still remains an open/controversial issue (Hmieleski and Ensley, 2007). Social capital and business network are other important NVT input variables. Furthermore, Wright, Hmieleski, Siegel and Ensley (2007) assert that there is a lack of knowledge regarding how individuals and teams impact the effectiveness through which innovative ventures are created and subsequently grown. They also underline the central role played by individuals and teams in the development and growth of technology-based ventures. This is why studying the formation of startup companies means analyzing the characteristics of their founders and how these features affect the output of the entrepreneurial process, i.e. the "initial imprinting effect of NVT" (Klotz et al., 2014).

Gaps identified and research focus

There are not many empirical/qualitative updated works related to the analysis on the characteristics of Italian startups and their founders, although this topic is of primary importance to understand the startup process. The novelty of this work is, thus, represented by the exploration of a population on which we have no great prior knowledge, in a significant, yet peculiar, phase of its life. Under this

perspective, our work differentiates itself from other studies (Grandi and Grimaldi, 2003; Colombo et al., 2004; Colombo and Grilli, 2010; Colombo and Piva, 2012) mainly because of the analysis performed (no previous cluster analysis on the population of Italian startup/NVT) and the target population (focus on a very early stage). In our analysis we try to collect knowledge on startups' characteristics during the very first steps of their lives, and not ex post. As reported by Foo, Wong and Ong (2005), we know little about early phases of teams engaged in new venture activities and how variables as human capital affect team outcomes. The broad majority of researches on this matter are often performed when the venture has already successfully formed. One major challenge of studying early entrepreneurship in the Italian scenario is, as reported by Colombo and Piva (2012), to find complete information and univocal estimates on the Italian population of new innovative ventures. This is due to the fact that most individuals who are defined as "self-employed" by official statistics actually are salaried workers with atypical employment contracts. On the basis of official data, such individuals cannot be distinguished from entrepreneurs that create new ventures (Colombo and Grilli, 2005). The relevance of this work is represented by the exploration of a population that has so far been little studied, because of the already mentioned difficulties, and is in a peculiar instant of its life. For these reasons it is so important to look at startups even when they are not yet fully incorporated or operative, to better figure out how they evolve and what are the characteristics driving this evolution.

RESEARCH DESIGN AND METHODOLOGY

The core of this study is to explore the characteristics of Italian startups and of their founders, as a team and as individual entrepreneurs, as these topics appear to be the most critical factors both in the startup process and for company development and growth (Ucbasaran et al., 2003). We also focus on factors enhancing the development of the business idea and on team formation, analyzing factors that refer to the startup as a whole ("company specific factors") as well as to single individuals composing the entrepreneurial team ("human capital"). In our work we combine data profiling the new ventures with the aggregation at team level of the individual characteristics of team members (i.e. entrepreneurs). Throughout this union we aim at identifying consistent clusters and the features that are significant for clusterization. In doing so we used dummy and categorical ordinal variables and we classified them using hierarchical cluster analysis. We run the classification following a post-hoc or no a priori technique, whose purpose is to define groups according to the data, as explained by Wedel and Kamakura (2002). In order to perform our analysis we chose the method of cluster analysis, since it "...can provide very rich descriptions of configurations without overspecifying the model" (1996, p. 442). As measure of proximity we use the squared Euclidean distance, and the hierarchical method is used to approach the analysis. Since we aim at producing an exploratory classification of observations,

taking into account that neither the clustering variables nor the number and nature of the resultant groups are strictly linked to deductive theory, the chosen method to identify clustering variables is the inductive one. In fact, as suggested by Ketchen and Shook (1996), we tried to consider as many variables as possible because it was not foreseeable what variables differentiate among observations. Moreover, as reported by Punj and Stewart (1983), there are no clear guidelines to determine the boundaries of clusters. Therefore, the use of many clustering variables is expected to maximize the likelihood of discovering meaningful differences. Due to the fact that our sample of data does not contain outliers, we decided not to use variables standardization. After transforming non-ordinal categorical variables into dummy variables, we needed to correct multicollinearity of data by reducing from k to $k - 1$ the possible modalities that the variable can assume. We also performed several tests to assess that this operation does not compromise the quality of the information provided.

To perform our analysis we chose a hierarchical algorithm that is the Ward's method (Ward, 1963). As stressed by Ketchen and Shook (1996), Ward's method is best suited for studies that present two characteristics: (i) the number of observations in each cluster are expected to be approximately equal; (ii) there are no outliers. Within our data set, it assigns observations with similar entrepreneurial and firm characteristics into progressively larger endogenously determined clusters. For determining the number of clusters in a data set, with regard to hierarchical methods, we followed the basic procedure as explained by Ketchen and Shook (1996). In order to evaluate the reliability of the obtained results we performed cluster analysis multiple times, changing algorithms and methods. In this way reliability is indicated by the degree of consistency in solutions (Ketchen and Shook, 1996).

Sample description

The final sample is composed of 107 Italian innovative startups and 254 entrepreneurs, spread into the different founding teams. Data were collected by the Mind the Bridge Foundation (MTB), a non-profit (501 c3) corporation based in San Francisco, through its business plan competition thought to scout new business projects with a strong commitment to innovation and marked ambitions of growth. As stated by Foo, Wong and Ong (2005), using data of participants of a business plan competition can be quite useful and relevant (i.e.: identify teams engaged in the early stages of the entrepreneurial process; scout firms and founders characteristics and perform longitudinal studies, monitoring the phenomenon in a specific area or region). The questionnaire submitted to the founders of the startups participating to the MTB Business Plan Competition was designed by MTB-CrESIT (Research Centre for Innovation and Life Science Management of Insubria University). More specifically, data gathered contains information on the new venture, such as the year of incorporation and place of establishment,

sector, number of founders, business description and available market data, company investment profile (capital raised and investors typology). Moreover, demographic information on the founders and management's team are collected, such as date and place of birth, gender, education path, role played in the new venture, prior working experiences and prior entrepreneurial experience. Answers were on a voluntary basis and respondents could complete the questionnaire from June to July 2012. A small part of the received applications were discarded as being partially incomplete.

FINDINGS: ANALYTICAL PROCEDURE AND CLUSTER PROFILES

The analytical procedure we performed consisted of three main stages: identification of the number of clusters, assignation of observations to clusters, assessment of the stability of cluster's solution (Stock and Zacharias, 2011). The findings of our analysis consist of three clusters, each one with its own characterization, and a set of variables which turned out to be significant for clusterization. The identification of the number of clusters was made using the dendrogram, as there were no significant jumps in the agglomeration coefficients. After the identification of the number of clusters by using the Ward linkage, the 107 firms of the sample are assigned into the three groups. The following table 1 summarizes the cluster distribution of variables, included in the research model, as a percentage of the total.

The level of significance of each variable is verified through a Chi-Square test. To calculate Chi-Square (χ^2), we used a cross-tabulation which shows the frequencies of joint occurrences between variables. We tested the significance using $\alpha = 0.05$. There are five variables that are significant for the clusterization (p-value < 0.05), which are the following: (i) the startup has been funded ($\chi^2 = 28.08$; df¹ 2; p-value 0.000); (ii) the amount of capital raised to date ($\chi^2 = 85.979$; df 14; p-value 0.000); (iii) at least one co-founder has one previous job experience ($\chi^2 = 17.942$; df 2; p-value 0.000); (iv) average number of previous work experiences, as an aggregate of the team ($\chi^2 = 35.344$; df 4; p-value 0.000); (v) average years of previous job experience, as an aggregate of the team ($\chi^2 = 52.584$; df 12; p-value 0.000).

	4 previous experiences	5%	4%	3%

The following table 2 summarizes the characteristics of the three identified clusters. The clusters profiles show significant differences in terms of entrepreneurial profile (mainly educational background and previous experience also at international level) and in terms of startup fundraising ability (amount and source of funding).

Table 2: Summary of clusters profiles

	Techno entrepreneurs - 1st generation startups (19.5%)	Employees turned entrepreneurs - Born into crisis startups (50%)	Proven entrepreneurs - Scalable startups (29.6%)
Entrepreneurial profile	Technical background Startup is their first work experience Prior entrepreneurial attempts Scarce managerial background No prior job experience	Several previous job experiences Long career as employees Low entrepreneurial attitude	High level of education Solid managerial background Prior job and entrepreneurial experiences International experience
Firm profile	Mainly funded through Bootstrapping One-man bands or small teams Business idea originated during the educational path	Limited ability to attract funds Business idea originated within work environment	Outstanding ability to raise capital and attract structured sources of funding Larger teams

According to the distinctive features characterizing the identified clusters, we titled: Cluster 1: Techno entrepreneurs - 1st generation startups; Cluster 2: Employees turned entrepreneurs - Born into crisis startups; Cluster 3: Proven entrepreneurs - Scalable startups.

DISCUSSION AND CONCLUSION

Cluster 1: Techno entrepreneurs - 1st generation startups

“Techno entrepreneurs” are young entrepreneurs with a prevailing technical background and no prior job experience. In the majority of cases techno-startuppers are young adults whose first job experience is represented by the creation of a startup. In other cases, they are research fellows with a technical profile. Some of the latter declare previous entrepreneurial experience, although more likely via academic spin-offs rather than startups per se. The companies created by techno-startuppers (that we define as “1st generation startups”) raise funds mainly from co-founders (57%). The average amount of

capital received is quite small, comprised between 1 and 10 thousand Euros (38%). Some peculiar traits of these founders may explain why these startups raise limited funding. These include weak managerial background and almost no prior work experience that may compromise their ability in attracting more structured sources of funding. The founding teams are pretty lean (24% of the startups included in this cluster are one-man bands, i.e. only one founder). These ventures operate mainly in high-tech fields. Not surprisingly, the inspirational source of their business idea is represented primarily (62%) by the educational path undertaken by the co-founders, which is also responsible for their team formation often at an academic institution.

Cluster 2: Employees turned entrepreneurs - Born into crisis startups

Founding teams within this group are formed by individuals who mainly come from more conventional job positions. In fact, as reported by recent studies published by Italian Chambers of Commerce, with the advent of the financial crisis a lot of people who lost or were unsatisfied with their jobs reinvented themselves into startupper (a sort of “career pivoting”). This explains why among these teams we find individuals with a high level of job experience and long employment tenure. For these reasons we decided to label them as “Employees turned Entrepreneurs”. Individual achievement in many cases acts as a trigger in the decision of such individuals to become entrepreneurs. Thus, the need for independence and for self-recognition may turn into a strong push to become self-employed (Johnson et al., 2004). The companies created by these employees-turned-startupper are what we define “Born into crisis startups”. Within this cluster, startups show a limited ability to raise capital (only 44% of them received external funds). The co-founders background is responsible for the low entrepreneurial attitude characterizing these startups. The prior work environment plays a critical role in this group, being the main source of inspiration of the business idea. Note that in 20% of the teams there is at least one female co-founder.

Cluster 3: Proven entrepreneurs - Scalable startups

Proven entrepreneurs are highly educated and experienced. This group is characterized by the highest level of education: 13% of the founders have a Ph.D. and almost one out of ten a MBA. They have strong managerial background (more than half of them have a degree in Business Administration) and are quite experienced. Almost all of them present prior job experience and 38% a previous entrepreneurial experience. Such percentage may look a little small. In fact, we believe that teams involved in these startups are driven and motivated by a precise and structured entrepreneurial idea, which explains why they are so good at fundraising. Furthermore, these founding teams present a broad international experience, as 31% of the co-founders had at least one job experience abroad and 25% attained a degree in a foreign university. The work environment (50%) represents the most

common place for future co-founders first meeting. This could mean that after they met and developed the business idea, which has quite varied origins, into an effective business model (Onetti et al., 2012; Onetti and Zucchella, 2014), they decided to become full-time entrepreneurs. Co-founders are characterized by different sources of specific knowledge, performing a good balance between technical and managerial skills. This seems to be a successful ingredient for the exploitation of the business idea. Evidence of this success is provided by the high amount of funds raised by these startups. Thus, we called the founders of such startups “Proven Entrepreneurs”. We define the companies that originated by these teams as “Scalable Startups”, since these ventures have greater efficacy in raising capital and, therefore, higher chances to succeed. All of them were successful at fundraising, and more than 30% raised more than 200 thousand Euros (50% more than 100 thousand Euros). They were able to attract funds from structured sources such as seed funds, foundations, accelerators and venture capitalists. Teams tend to be larger (22% of them are composed of more than four founders).

According to these clusters, some general considerations emerge. The degree of fundraising is significantly different. The first cluster displays scarce variety among the sources of funding and a limited ability to obtain medium-high amounts of capital. The second group shows limited abilities to raise capital: small percentage of firms with little funding. The third cluster, instead, presents an outstanding ability in raising money. The level of job experience of the founders is also fairly varied. The first cluster has a low level of experience at the aggregate level, both in terms of number of previous jobs and years of employment. The second group includes a sample of firms whose founders show a high level of work experience. The third cluster displays a good level of job experience and a stronger international attitude. These results are supported by literature. In fact, Shane and Khurana (2003) affirm that differences in career experience lead to differences in evaluations, by potential entrepreneurs themselves and by others, of an entrepreneur’s ability to: (i) access resources that help entrepreneurs in starting organizations; (ii) adapt to the role of the entrepreneur; (iii) continuously adapt the business model to market needs/changes.

Therefore, previous work experience is key in both venture creation and fundraising. First of all, Haveman and Cohen (1994) argue that individual’s career experiences have an impact on firms foundings. Furthermore, Shane and Khurana (2003) stress out that one of founders’ harder task is to convince others to reallocate resources in non-traditional ways. They state that if individuals are successful in their prior careers, they will be more likely able to convince not only potential investors, but also employees and other stakeholders. Hence, prior experience and career is positively related to the ability of obtaining resources. Shane and Cable (2002) provide evidence that experience is positively related to the ability of obtaining resources. For instance, they show that prior

entrepreneurial experience is an important predictor of the ability to obtain funds for a new venture. We have also seen that to be relevant for the final output are the characteristics of the entrepreneurial team as a whole. Indeed, today at the helm of innovative firms it is more likely to find NVT rather than one-man bands.

We believe these results to be very interesting, as they remark how work and international experience are crucial success factors for startups at the very early stage, as those participating to a business plan competition. In fact, these features are strong enablers of fundraising, which happens to be vital at this particular time, allowing startups to get off the ground and consequently grow. Then, our findings support the argument, inspired by competence-based theories, that founders' capabilities and knowledge are a driver for startups growth. Innovative firms founded by individuals who have a higher level of work experience exhibit superior growth, with all else equal (Colombo and Grilli, 2005). Moreover, Colombo and Grilli (2005) asserted that startups established by such individuals are more likely to obtain external private equity financing, which of course has a sizeable positive effect on growth. The latter relationship is clearly visible in our results as well. Founders of firm belonging to cluster 3, in fact, present qualified international working experiences, so contributing to their startups' ability to attract huge amount of funds from various sources.

With regard to further research, we identified two directions that, in our opinion, appear to be especially promising. First of all, recent studies (Klotz et al., 2014) suggest to examine how the characteristics of the firm are influenced by the stage of team development. For instance, firms and teams features may differ from the idea evolution phase to the exploitation phase. From the results presented in this work, it seems clear what are the team characteristics driving the startup evolution at a very early stage. Further analysis could highlight how those features may differ when the company reaches a later stage of development and fundraising is no longer the primary need. In addition, a cross-country analysis should be performed to better understand the positioning of the Italian startup ecosystem, and to allow to overcome the country specificities of the sample that lead to results that are not fully generalizable. Since accounting for the role of individuals in the startup process is critical for advancing theory, a cross-country comparison of sample of entrepreneurs/new venture teams may represent stimulating challenges for future research.

ABSTRACT

Textile and tourism sectors are two important industries in the Portuguese economy. However, its high exposure to both internal and international economic volatility make the companies operating in these economic sectors particularly vulnerable to economic crises, such as the ones which have been impacting Portugal and the European Union.

The objective of this paper is to evaluate and understand the impact of size and age on the financial health of textile and tourism companies, measured by economic indices.

An empirical based model is proposed. Its implications are derived and tested on a sample of 4061 Portuguese companies from textile and tourism sectors, during the period 2005-2009.

The findings suggest that age has a major impact on the risk of failure, rather than size. Whereas the effect of age is generally positive regarding the financial health of the company, the effect of size is less clear and ultimately depends on the age of the company.

Keywords: *Age, size, business failure, textile and tourism industries.*

INTRODUCTION

Although the first empirical studies of bankruptcy prediction have been developed around the thirties by Fitzpatrick (1932) and Smith and Winakor (1935), the topic gained a new visibility and new academic relevance in the sixties, with the researches of Beaver (1966) and Altman (1968). Since then a growing number of researchers has investigated on this topic.

At a time when the national and international scene is marked by an economic and financial crisis, and in times of market downturn and economic difficulties, to understand why some companies fail and others don't, is a topic of extreme interest. The economic consequence of company's failure is enormous, especially for employees, investors and creditors.

During the last four decades a growing number of researches came up with formulas to predict the bankruptcy of a company. The set of predictive variables proposes on the studies is considerably

heterogeneous. Age and size are two variables well investigated, however previous research is not clear about how age and size affects business failure, especially we do not know how these models perform when tested with Portuguese companies.

The objective of this paper is to evaluate and understand the impact of size and age on the financial health of textile and tourism companies, measured by economic indices, and therefore also evaluates their risk of failure. Its implications are derived and tested on a sample of 4061 Portuguese companies from textile and tourism sector.

LITERATURE REVIEW

It can be said that in all these decades of empirical research on bankruptcy prediction failed to produce agreement on which variables are good predictors and why. (Hol et al., 2002) However, in all those models mentioned above, there are several works that, through different perspectives consider size, age and sector as key variables to explain the probability of failure and growing businesses.

Some studies have concluded that the size is negatively correlated with the probability of failure (Thompson, 1976; Altman et al. 1977; Ohlson, 1980; Evans, 1987; Hall, 1987; Chen and Lee, 1993; Audretsch and Mahmood 1995; Cummins et al. 1995 or Turetsky and McEwen, 2001).

Chen and Wong (2004) reported that one of the main factors which significantly affect the financial health of companies is its size. Honjo (2000) used a proportional hazards model to show that software companies with an important size are less likely to fail. Turetsky and McEwen (2001) argue that large firms are expected to have better risk management. For Berger and Udell (1995), the oldest the company is, the lower are costs of external financing. In the same sense, Holmes et al. (1994) mention that smaller companies often have more limited access to financing and a greater financial cost. Mazzi (2011) reported that family firms are, in general, significantly younger than nonfamily firms. Similar finding was obtained by Villalonga and Amit (2006), Lee (2006) and Miller et al. (2007).

Serrano et al. (2005) argue that small firms are more likely to fail than large enterprises. The authors added that the ratios depend on the size of the company, but the way it does it, varies over different countries. Buehler et al. (2006) found that the percentage of companies that fail decrease with age.

In the literature on corporate risk there are also authors who use size as an explanatory variable in their models of business failure prediction (Ohlson, 1980; Peel et al., 1986; Peel and Peel, 1988 or López et al., 1998).

The results obtained by Audretsch and Mahmood (1995) suggest that exposure to the risk of new firms tend to be larger in highly innovative sectors. These authors argue that new firms can reduce the risk of failure by increasing their size, indicating that the structure of ownership and size of young companies have influence on the probability of survival. Audretsch (2001) finds that young companies do not

have economies of scale. He also states that some companies manage to successfully grow and others remain small and ultimately may have to exit the market.

On the subject we also highlight the contributions of Fariñas and Moreno (2000) and Calvo and Garcia (2006). Using a sample of Spanish companies Fariñas and Moreno (2000) concluded that the failure of firms declines with age and size. Calvo and Garcia (2006) carried out an empirical study to analyze the structure of financial risk the Spanish industry in the period 1997-2001, analyzing the impact of the size and age of the company. The findings of the will towards the existence of an inverse relationship between the size and age of the company and its financial risk. Concerning the impact that causes the size and age of the company on risk variables analyzed, these authors concluded that the size factor is more relevant than the ability to return the ancient debt and economic profitability of the company, and a higher incidence in antiquity capitalization and financial stability of the companies.

METODOLOGY

Selection of the sample

To develop this study, we used the information of the annual accounts (balance sheet and income statement) collected from the SABI database. The sample comprises 4061 companies from sectors of textile and tourism. The information collected refers to the year 2005-2009.

Variables

The variables are the size and age. The variable age measures the time in years since the constitution of the company till the year of 2009. This variable is categorized in three categories: less than 5 years, between 5 and 15 years and more than 15 years.

For the size of the companies we follow the Commission Recommendation 96/280/EC of 3 April 1996, considering four categories. The size of the company is measured also in an ordinal scale: micro companies, small companies, medium companies and large companies. However, due to the inexistence of large companies with less than 5 years, and the relative very low frequency of large companies in the sample, the analysis was performed excluding those companies. Hence only three categories for size were considered in the analysis.

Five continuous indices were collected to measure the financial health of the company. These five variables have a great power to discriminate and classify the financial state and the risk of failure of the company according to Calvo and Garcia (2006).

These indices are:

$X1 = (\text{Net profit} + \text{Depreciation expense} + \text{Provisions}) / \text{Liabilities};$

$X2 = (\text{Current assets} - \text{Current Liabilities}) / \text{Total assets};$

$X3 = \text{Equity} / \text{Total assets};$

$X4 = \text{Operating profit (or loss)} / \text{Total assets.}$

Statistical Analysis

Since there are four metric dependent variables (the four indices) and two ordinal predictor variables (size and age), the first goal is to evaluate the significance of the differences across groups defined by the predictor variables, to be able to conclude the significance of the impact of at least one of the predictor variables (size or age) on the indices measured.

Univariate analysis of variance (ANOVA) is a statistical technique that is used to determine whether samples are drawn from populations with equal means, so it is the adequate statistical instrument to evaluate the impact of predictors on each of the five dependent variables separately. This approach has the disadvantage of ignoring the possibly correlation between the dependent variables, and so a significant or nonsignificant ANOVA may be identified erroneously.

When one wants to simultaneously explore the relationship between several categorical independent variables and two or more continuous dependent variables, the statistical technique recommended is the multivariate analysis of variance (MANOVA), which is an extension of ANOVA. MANOVA procedure optimally combines the multiple dependent variables into a single value that maximizes the differences across groups, assessing how the dependent variables differ as a whole across the categories of the independent ones. Only after a significant MANOVA individual ANOVAs are performed to evaluate the impact of predictors on each of the dependent variables.

Therefore, MANOVA seems to be the adequate procedure as a starting point of the present study, as MANOVA can detect differences among the dependent variables, even when univariate tests show no differences. If a significant difference is achieved, separate ANOVAs can be employed to address the individual differences for each dependent variable.

Before applying these statistical procedures, it is important to check the presence of outliers. ANOVA and MANOVA are especially sensitive to outliers and their effect on Type I error.

The assumption of univariate normality in case of ANOVA or multivariate normality in case of MANOVA must be also checked. As in ANOVA, MANOVA tests are believed to be robust against violations of multinormality when the individual group sizes are large enough, which means that the impact on the final results are negligible. Monte Carlo studies (Mardia 1971; Olson 1974) show that departures from multivariate normality of MANOVA test statistics may reduce statistical power, but generally with only small effects on the type I error.

The next issue to be addressed is the equality levels of variance (in the case of one dependent variable, ANOVA) or equality of the covariance matrices (in the case of multiple dependent variables, MANOVA) across the groups, so that the variance (ANOVA) or the covariance matrices (MANOVA)

for each group, are not concentrated in only a limited range of the categories of the predictor variables. If unequal variance/covariance across groups is present, the standard errors are affected and consequently the results of the tests. The effect of this is more severe when the sample size of the groups are small or very different.

In the present study some extreme points for each group were identified and eliminated prior to the analysis. The assumption that the data on each group conforms to a multivariate normal was checked and found to be violated. The same happens with the univariate normality distributions. The equality of the covariance matrices is also not met, nor the equality of variances for each of the dependent variables.

With these obstacles it is advisable to perform alternative procedures.

A nonparametric method, based on permutation tests, permutational MANOVA (McArdle, 2001; Anderson, 2001) was performed. For the permutational MANOVA (Anderson, 2001) the test statistic is a multivariate analogue to Fisher's F-ratio. The p-values are estimated using permutations. Under a true null hypothesis, the groups of multivariate observations can be exchangeable. Thus, permutations are performed to achieve new values for the statistic, giving the entire distribution of the statistic under a true null hypothesis.

This test is a test for differences in location among groups of multivariate observations. The test requires that the observations are independent and that they have similar distributions. It does not require the assumption of multivariate normality as MANOVA does. However, this test (as the parametric one) is sensitive to heterogeneity of variances. This means that a significant difference among groups may be due to differences in dispersion and/or differences in location. Although the statistic sensitivity to differences in variances among groups, it takes no account on the covariances among variables, as the parametric MANOVA (which assumes not only the equality of the variances but also that the covariances of the variables do not differ across groups) (Anderson, 2001). Hence, this test is less demanding concerning assumptions than the parametric MANOVA. The test was performed resorting on the vegan R package (R, 2011; Oksanen et al, 2013)

The results achieved by the permutational MANOVA are resumed in table 1

	Degrees of freedom	Sums of squares	p-value
Size	2	5.62	0.008
Age	2	34.41	0.001
Size*Age	4	7.84	0.009

Table 1. *Permutational MANOVA*

The interaction term represents the joint effect on the dependent variables of the two predictors, size and age. If the interaction is nonsignificant the effects of the factors are Independent, which means that the effect of one factor is the same for each level of the other factor and the main effects can be interpreted directly. The result ($p=0.009$) points to the existence of strong evidence of interaction between size and age. Hence, the main effects of size and age must be interpreted with caution. Those main effects show that the variable age shows a little stronger impact than size over the dependent variables.

A parametric MANOVA was also performed (table 2), despite the unmet assumptions, to compare to the results obtained by the permutational MANOVA. The results show moderate to strong evidence of interaction, confirming the findings already obtained with the permutational MANOVA. Concerning the main effects, the outcome points to a nonsignificant result concerning size, and reinforces the strong effect of age (table 2) achieved by the preceding test.

		Statistic	p-value
Size	Pillai's Trace	0.002	0.344
	Wilks' Lambda	0.998	0.344
	Hotelling's Trace	0.002	0.344
	Roy's Largest Root	0.002	0.111
Age	Pillai's Trace	0.027	< 0.001
	Wilks' Lambda	0.973	< 0.001
	Hotelling's Trace	0.028	< 0.001
	Roy's Largest Root	0.026	< 0.001
Size*Age	Pillai's Trace	0.008	0.018
	Wilks' Lambda	0.992	0.018
	Hotelling's Trace	0.008	0.018
	Roy's Largest Root	0.006	< 0.001

Table 2. MANOVA

As both MANOVAs show significant results, the study of the impact of size and age on each of the four dependent variables is required. As the sampled populations have distributions away from normality and do not have similar variances, four permutational ANOVAs and four two-way ANOVAs were undertaken and compared. Moreover, the results were also reported by a robust alternative to the sample mean and median for estimating the location (Huber's M-estimator) for each of the dependent variables.

Table 3 displays the results obtained by the parametric and permutational ANOVAs with both main and interaction effects.

Independent	Predictors	Parametric ANOVAs		Permutational ANOVAs	
		Sums of Squares	p-value	Sums of Squares	p-value
x1	Size	0.279	0.573	0.98	0.131
	Age	1.747	0.030	1.39	0.061
	Size*Age	1.173	0.320	1.17	0.317
x2	Size	1.907	0.028	0.73	0.262
	Age	16.208	0.000	14.40	0.001
	Size*Age	3.591	0.009	3.59	0.015
x3	Size	0.318	0.492	3.67	0.003
	Age	16.966	0.000	18.52	0.002
	Size*Age	2.647	0.019	2.65	0.025
x4	Size	0.036	0.460	0.240	0.007
	Age	0.086	0.160	0.090	0.128
	Size*Age	0.430	0.001	0.430	0.011

Table 3. *Univariate ANOVAs (parametric and permutational ANOVAs)*

Only variable X1 show no evidence of interaction between size and age. By checking the sum of squares and the p-values of each dependent variables, it is patent the bigger importance of age over size in explaining the financial risk of failure, except for variable X4, where size becomes significant ($p = 0.007$) for the permutational ANOVA. This result must be interpreted with caution, since this is also the variable that shows the stronger evidence of interaction.

The results are supported by Huber's M-estimator (Huber 2009) (table 4) for each group across each of the dependent variables. These results also reveal a direct association between age and the financial health of the companies (except for the impact on variable x4 of micro and small companies), which means that older companies have less risk of failure. This direct association is also found when analyzing the association between size and the dependent variables without controlling for age. However, when controlling for age, one achieve to different results (table 4). The interaction between age and size does not allow the interpretation of the impact of size alone, as interaction can confound the effect of size.

		x1	x2	x3	x4
Micro companies	Less than 5 years	,077	,017	,136	,046
	Between 5 and 15 years	,083	,104	,262	,030
	More than 15 years	,076	,188	,374	,022
Small companies	Less than 5 years	,067	,002	,151	,038
	Between 5 and 15 years	,098	,057	,257	,034
	More than 15 years	,103	,176	,389	,029
Medium companies	Less than 5 years	,061	-,199	,133	,011
	Between 5 and 15 years	,078	,029	,298	,031
	More than 15 years	,121	,188	,413	,034

Table 4. *Huber's M-estimators*

CONCLUSION

In the economic literature there are many studies to consider size and age as key variables to explain the probability of failure and growing businesses. The objective of this paper is to evaluate the impact of size and age on the financial health of textile and tourism companies, measured by economic indices. From empirical study we can draw the following conclusions.

Age has a stronger impact on the risk of failure than size. This result is not consistent with the obtained by Quirós and Lisboa (2014) and Pérez et al. (2004). However, due to the significant interaction effect present, the individual results must be controlled for the effects of the other predictor. Particularly, this is true concerning the effect of size.

The impact of size must be interpreted independently for each level of age. Whereas the effect of age is generally positive regarding the financial health of the company, the effect of size is less clear and depends on the age of the company.

Due to the inexistence of large companies with less than 5 years, and the relative very low frequency of large companies in the sample, the analysis was performed excluding those companies. To overcome this limitation, a larger sample will be used in a future research, in order to try to have a proxy sample of every industry.

RADICAL INNOVATION OF BUSINESS MODEL - IS BUSINESS MODELLING A KEY TO UNDERSTAND THE ESSENCE OF DOING BUSINESS?¹

Philipson, Sarah

University of Gävle & Linnaeus University, Sweden

ABSTRACT

'Business model' is a fairly new academic concept; competing with Porter's 'sustainable strategic competitiveness' and 'strategic fit' (Porter, 1996), Prahalad & Bettis 'dominant logic' (Prahalad & Bettis, 1986) to give key explanatory understanding of firm performance.

We discuss business modelling based on an action research case and show just how fundamental it is. It links fundamental academic discussion of recent decades around concepts such as 'sustainable competitive advantage', 'structural capital' and 'tacit knowledge'.

Keywords: *business model, value, customer needs, competitive advantage, dominant logic, strategy.*

BACKGROUND

Business Model is "...a system that solves the problem of identifying who is (or are) the customer(s), engaging with their needs, delivering satisfaction, and monetizing the value." (Baden-Fuller & Haefliger, 2013).

The concept of business modelling is fairly new and has been discussed in academia the last twenty years (Bettis & Prahalad, 1995; Sawhney, 1999; Amit & Zott, 2001; Stähler, 2002/2013-08-05; Chesbrough & Rosenbloom, 2002; Osterwalder, 2004; Chesbrough & Schwartz, 2007; Andriopoulos & Lewis, 2009; Chesbrough, 2010; Doz & Kosonen, 2010; Mets, 2009; Teece, 2010; Yunus, Moingeon & Lehmann-Ortega, 2010; Teece, 2010 and Baden-Fuller & Haefliger, 2013). But in many ways it has similarities with the earlier concepts of dominant logic (Prahalad & Bettis, 1986; Bettis & Prahalad, 1995), and strategic fit (Porter, 1996). Business models are considered as part of the strategy subfield

¹ Acknowledgement. I am indebted to one of the anonymous reviewers of the *7th Annual Conference of the EuroMed Academy of Business. Confronting Contemporary Business Challenges through Management Innovation, Kristiansand, 18-19 September 2014*, for invaluable comment on an earlier version of this paper, to Professor Emeritus Robert Desman, Mgt & Entrepreneurship at Kennesaw State University, Atlanta, Georgia.

and the most important journals in which the issue is discussed are the 'Strategic Management Journal' and 'Long Range Planning'.

Both theoretically and practically there is a lack of studies: "The paucity of literature (both theoretical and practical) on the topic is remarkable, given the importance of business design, particularly in the context of innovation. The economics literature has failed to even flag the importance of the phenomenon, in part because of an implicit assumption that markets are perfect or very nearly so. The strategy and organizations literature has done little better. Like other interdisciplinary topics, business models are frequently mentioned but rarely analyzed...", Teece (2010:192).

One reason may be that it draws from and integrates a variety of academic and functional disciplines, gaining prominence in none, Chesbrough & Rosenbloom (2002:533). And for practitioners Bettis & Prahalad (1995:7) suggest that their research suggested how difficult highly intelligent managers found thinking strategically about businesses with different characteristics or their own core business, when the industry structure changed significantly.

Hence, it is still valid to present and interpret practical examples in the form of cases of business modelling. We provide such a case based on our own action research.

THE CASE, ABB TRUCK SERVICE

Between 1982 and 1994 the author worked as a management consultant for the ABB group. In 1988 Bengt Svensson, then CEO of ABB Truck - a subsidiary of ABB - suggested that we should re-engineer the business rationale of the service division of the company. ABB Truck produced big electrical forklift trucks for the European car, food and roll-on/roll-off industry. They lifted between 1,2 and 7 ton. In the Swedish market the service business had some 225 service technicians and 75 middle managers and administrators. The blue-collar workers' union enthusiastically supported the project. ABB Truck Service was a business unit of ABB Truck AB, serving and repairing complicated machines at the customers' sites.

The business was limited to the Swedish market, as the mother company; ABB Truck AB, only sold to the European market and did not have a large enough market share outside Sweden to motivate a repair and service business, which instead was done by the partners' selling the machines.

METHOD

This case study is an example of action research, a set of different methodological approaches based on Dewey (1933), Lewin (1946) and Argyris (1993), all after Lüscher & Lewis (2008). The researcher was hired as project manager of a major change project in the company, a filial to Asea Brown Boveri, ABB. The reference group was the CEO of the company, the strategic business unit manager and the

chair of the blue-collar workers union. In the case I was not only a consultant with a specific task. I had worked with ABB Truck since 1985 (and with ABB since 1982) and had been working with organizational change in marketing, production, services, and made the specification for software to manage the short term rental fleet. During 8 months I was hired as regional general manager for sales and services, and negotiated a five-year rental contract (capital and service) with the Volvo Car Corporation for 500 machines. The expertise necessary for the re-engineering project was acquired by a large number of interviews and observation of all kind of employees in the SBU and through monthly dialogues in the reference group.

THE PURPOSE

The purpose was formulated to

- (1) *Radically improve the value* for the industrial customers. This was interpreted as halving the down-time of the machines.
- (2) *Radically reduce costs*, in order to be competitive in the long run – give value for money.
- (3) *Loyalise the service technicians* by a better work environment by empowerment, as *their tacit knowledge was key to competitiveness*. Their union was interested in ensuring the long-term competitiveness of the company, hence securing the jobs. This ensured their co-operation. As we intended to radically reduce the number of white-collar jobs, we did not expect to be able to co-operate with the white-collar union. “Johan S.”, the local chair of the blue-collar workers union, “Metal”, was heavily involved both in the envision and realization of the system as a member of the reference group and a key dialogue partner.

Porter (1996) proposes that to make a competitive advantage sustainable it must be *embedded in the organisation* so that competitors cannot just imitate a few specific traits of the offering, they would have to imitate the whole organisation. To create such sustainable advantage we had to create new structural capital and *assure* that *the tacit knowledge of the workforce* did not leave at the end of the working day.

THE RE-ENGINEERING PROCESS

The process was conducted in seven distinct but overlapping phases:

- 1) Formulate a new business idea.
- 2) Innovating a new way of organizing the business,
- 3) Develop new systems supporting the new organization.
- 4) Develop new routines for how to use the new system.
- 5) Educating the work force in the new work methods, systems and routines.

- 6) Implementation of the new organization.
- 7) Rationalization to achieve the second goal.

A NEW BUSINESS MODEL

We started by building a vision for how the division would function seven years after the start of the project. The Service workers should become 'virtual entrepreneurs', ordering spare parts and reporting work done. Through portable computers, with mobile phones as modems the technician should access exploded blueprints on central server for searching solutions to the problems with the faulty machine. Then the technician would order spare parts over the computer. These were to be flown in, arriving at the customer's site the next day. After repair the technician reported his work through the server. An invoice was automatically generated and sent to the customer. With a printer under the passenger seat of the service car the technician would give the customers small quotes. – Hence, an integrated workflow.

NEW CONCEPT FOR ORGANIZING THE BUSINESS; NEW WORKFLOW

The number of workshops was to be reduced, the technician at the customer's site would do the lion's share and only occasionally would a machine be brought in to the workshop. We would centralize the spare parts warehouse to enable overnight delivery from the nation's principle airport; there would no longer be any spare parts administrators at local workshop. The new workflow was developed with detailed flow mapping and was discussed in a reference group including the CEO of ABB Truck, the union leader, the division manager and the division controller.

It meant that the structural capital of the company was increased, by the development of new systems and new routines. But the company also needed the *tacit knowledge* (Polyani, 1966) of the technicians; the 'sticky' solutions knowledge (von Hippel, 1994). In order to secure this tacit knowledge, we considered their *loyalty* as essential. We achieved this by empowering them; they were to become their own masters in all elements of the work that was not embedded in the structural capital. This can be seen as an example of "...business model are substantially more complex and more dynamic with *two-sided business models*..." (Baden-Fuller & Haefliger, 2013) [Our emphasis].

NEW SYSTEMS

A systems architecture was then specified that could uphold this vision. We specified a central server, an IBM AS400 machine, which hosted all manuals with construction designs that could be "exploded" down to the smallest level of detail. It also hosted the database of the spare parts warehouse.

The architecture for a client system for the technicians was designed. To actually make the necessary server and client software, a computer consultancy was engaged. Every step of the coding was verified and *the researcher was the interface between business knowledge and information technology*. Installed in a portable computer, the technicians were given access to the server through a dial-up connection over a mobile phone. They also had a small printer installed under the passenger seat of their car. At the time this was new technology. We did not invent this, but this, at the time *new technology, enabled a radically re-invented business model*.

The project work included

- 1) Functional specification of a new spare parts system.
- 2) Functional specification of technicians' order and reporting system.
- 3) Project management of systematisation and programming done by outside computer consultants.

NEW ROUTINES

The implementation was not self-evident. A model routine was developed for the workers and leaders to learn what to make out of the system.

EDUCATING THE WORK FORCE

Together with the labour union's representatives we educated the technicians in the use of the systems and the routines.

IMPLEMENTATION

The new spare parts centre was built near Arlanda, outside Stockholm. Personal computers, mobile phones, and printers were bought for 225 technicians. In 1992, four years after the project had started, all technicians had received education and the necessary equipment.

RATIONALIZATION

A major rationalization was that two-thirds of the 75 administrators were made redundant. Most of them were given pre-pension or other jobs in the ABB group. This rationalization of course influenced the future price of services, and hence the value for money offered to clients.

RESULTS

The downtime of customers' machines were reduced from 3 days to 1,5 day. Overhead was reduced from 75 to 25 employees. The change took 4 years, from 1988 to 1992. When the whole ABB Truck group was taken over by Cargotec some years later, they closed the whole company except the new way of operating the service business, giving it a value of 200 MUS \$.

The most important effects where enhanced *quality of service*:

- The instant access to manuals reduced the time to find the defective detail and hence the time the machine was non-operational.
- The technician previously had ordered the spare part by phone from a local spare parts centre, where an administrator would manually identify if he had the part in stock. If not he had to order it from the factory. Often this entailed delays of three to four days. In the new organization the immediate order of spare-parts reduced the time to get the part, and hence the time the machine was non-operational. The missing part was sent by parcel post the same day from a centralized shipment centre close to Arlanda, the main Swedish airport, arriving at the client's site before noon the next day.
- The technicians where authorized to give the client minor quotes (up to some 1000 euros in present value), immediately printing the quote on his printer.
- The technician reported work time and spare parts used over the system, directly generating an invoice in the central server. Apart from being the most important rationalising element, it meant that the quality of the information of the invoice increased, passing information directly from the primary source to the invoice.

All this were only changes in the technological service support system, but all of them radically increased the quality of service, as well as decreasing the cost; hence the future price of the service.

The overall process can be viewed as a design process, where the service was engineered or re-engineered. This design has consequences for the technological support system, as well as for the actual service delivery system; both of the latter influencing the quality of service.

THEORETICAL INTERPRETATIONS

This case is an example of *organizational innovation*. "...new business models can themselves represent a form of innovation.", Teece (2010:176). To change the 'dominant logic' (Bettis & Prahalad, 1995; cf. also Levitt, 1960) in an industry, it is necessary to establish radical goals for the project. These goals are an example of what Prahalad (2006) calls the 'innovation sandbox', the *challenging requirements for the project that is the necessary for radical innovation*. You should "...start by identifying the core constraints that they must overcome to achieve a breakthrough innovation.",

Prahalad (2006:3). To halve the downtime is different from incremental innovation based on gradual increase of effectiveness. The requirement to reduce the overhead more than 50% was also radical. Both requirements were inspired by the at the time current 'T50'-projects (halve-the-time) running in the ABB group. Of course the demands were less radical than the examples Prahalad (2012) gives, of reducing the price for cataract surgery or a cooker for the Indian poor to 1/50th of the extant price. But it is still radical, as the theoretical limit of the machine down-time – by flying in spare-parts 'à la minute' – would be some 6 hours and to an exuberant, not sustainable cost. We had to base our change on standardised parcel post.

CUSTOMER NEEDS

"The chances of good design are greater if entrepreneurs and managers have a deep understanding of user needs...", Teece (2010:190). The formulation of the principles of the organisational change, must be based on intimate knowledge of the customers' needs, "The starting point of the process was a detailed and in-depth understanding of the consumer...", Prahalad (2012:7). Innovations are often "...based on intuitive hunches rather than informed understanding...", Margolin (1997:227). See also Prahalad (2010). "Rather than researching markets, they must immerse themselves in the lives of their target consumers.", Prahalad (2006:7). The innovators that Prahalad (2012:7) studied used video-ethnography to identify not only what people *say* they need. Many researchers have identified this intimate knowledge as a key for successful innovation and competitiveness. The strategy researcher Porter (1990) identified '*commitment to the target group*' [our emphasis] as a key antecedent to international competitiveness. This commitment permits the firm to gain an intimate knowledge of the customers. The entrepreneurship researcher von Hippel (1994) identified the '*stickiness of needs information*' as a key issue for innovation, i.e. how to understand customers' needs. Instead of ethnography von Hippel developed a method called the lead-user theory for how to learn these needs before the competitors, von Hippel (1986); Herstatt & von Hippel (1992); Urban, & von Hippel (1998); Olson & Bakke (2001); Liien et al. (2002); Lüthje & Herstatt (2004); Lettl et al. (2006), and Franke et al. (2006). These issues are discussed in many journals in different subfields, but the most important are 'Management Science', 'The Journal of Product Innovation Management', and 'Design Studies'.

The reference group had an intimate knowledge of the business and the customers through visiting customers, and used the knowledge of other employees, most prominently that of the CEO and the union leader. But in retrospect it was *risky* not conducting a more systematic in-depth study of the needs of the clients.

BUSINESS MODEL

Research about business models is young, and "...relatively little concepts and tools exist to help managers capture, understand, communicate, design, analyze and change the business logic of their firm.", Osterwalder (2004:22).

Stähler (2002/2013-08-05) gave one of the earliest summaries of the essential elements of a business model.

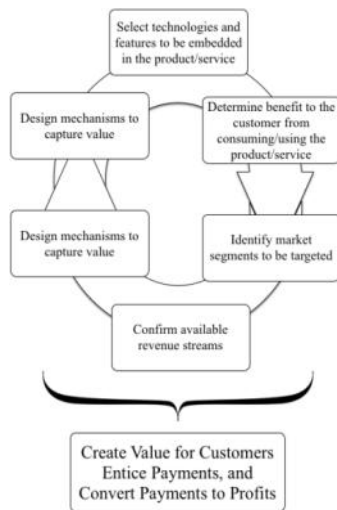

Image 1. Stähler's model, figure after Osterwalder, (2004:31)

The *value proposition* of ABB Truck Service was to reduce downtime for the customers' machines. The *architecture* was an integrated workflow that in more than 98% of the time gave the customer access to the machine within 36 hours. The price for customers was cost-based. In retrospect it could be questioned if this *pricing model* captured value the best; alternatives could have been a fixed price for each type of intervention or even a diminishing price after 36 hours had past – even if that might involve heavy extra costs for ABB Truck Service. But, in the complete re-engineering this was one of the few stable parameters in the game!

Recently Teece (2010) gave the definition, which is today most accepted in the literature: "The essence of a business model is in defining the manner by which the enterprise delivers value to customers, entices customers to pay for value, and converts those payments to profit." "In essence, a business model embodies nothing less than the organizational and financial 'architecture' of a business.", Teece (2010:172, 173). "We define the business model as a system that solves the problem of identifying who is (or are) the customer(s), engaging with their needs, delivering satisfaction, and monetizing the value.", Baden-Fuller & Haefliger (2013:419). Or, a "...business model should be able to link two dimensions of firm activity value creation and value capture...". (Baden-Fuller & Haefliger (2013:419). Expressed in this way it is the essence of classical economy (Smith, (1776/1970:131; Ricardo, 1817/1971:55; Marx, 1933/1969:15), use value for exchange value.

Teece presented the following table as a summary of the most important elements of a business model:

BM component	Questions to ask
Value Proposition	What value does the company create for customers and partners?
Product/Services	What does the firm sell?
Architecture	How and through what configuration is value created?
Revenue Model	How does the company earn money?

Table 1, *Business model*, Teece (2010:173).

BUSINESS MODELS AND STRATEGY

"...a business model is more generic than a business strategy. Coupling strategy analysis with business model analysis is necessary in order to protect whatever competitive advantage results from the design and implementation of new business models.", Teece (2101:180). Strategy is conceived as being thought out in advance, or *planned*. This *ex ante* assumption is valid in some cases, where the business model is a set-up that has been conceived in advance. For instance, Southwest Airlines may be have actually been built based on a pre-conceived strategy, Porter (1996). However, the more common situation involves strategy evolving as a result of a learning process, either by *conscious experimenting* (known in literature as 'agility'), or the as a result of *learning from unplanned reactive responses* to competition or customer responses. This situation seems to have occurred with IKEA, where what has been perceived in retrospect as a planned process, was actually more the result of adaptation to customer response (Porter, 1996).

The fundamental strategy question is how does one build a sustainable competitive advantage and get a super normal profit. It not enough to develop a successful business model to assure competitive advantage, as imitation is so easy, Teece (2010:173). Porter (1996:62) wrote that a company could outperform rivals only if it can establish a difference that it can preserve. Such a difference can be sustained if it can make many choices embedded in organizational praxis, which necessitate competitors to imitate not only discrete advantages. Hence that competitive advantage grows out of the entire system of activities. Rivals will get little benefit from imitation, unless they successfully match the whole system, Porter (1996:73-74). In the ABB Truck Service case the new competitive advantages were based on a large set of new activities: the online access to blow-ups of design drawings – online-order of spare parts – overnight delivery of spare parts – direct operator reporting

of work done – immediate central invoicing. In order to copy the new achieved advantages, a competitor has to copy all elements, including training of the work force, and effective routines for handling of the system.

The new 'business model' we developed fulfils 'Rosenbloom's criteria', Chesbrough (2010:355):

1. Articulates the value proposition
2. Identifies a market segment and specify the revenue generation mechanism
3. Defines the structure of the value chain required to create and distribute the offering and complementary assets needed to support position in the chain
4. Details the revenue mechanism(s) by which the firm will be paid for the offering
5. Estimates the cost structure and profit potential
6. Describes the position of the firm within the value network linking suppliers and customers
7. Formulates the competitive strategy by which the innovating firm will gain and hold advantage over rivals.

Chesbrough & Rosenbloom (2002:535) mean that strategy and business development is different and that strategy is superimposed on business models:

- The business model starts by creating value for the customer, and constructs the model around delivering that value. There is some attention to capture in a portion of the value created, but the emphasis upon value capture and sustainability much stronger in the realm of strategy.
- A second difference lies in the creation of value for the business, versus creation of value for the shareholder.
- A final difference is in the assumptions made about the state of knowledge held by the firm, its customers and third parties. The business model construct consciously assumes that this knowledge is cognitively limited, unbiased by the earlier success of the firm. Strategy generally requires careful, analytic calculation and choice, which assumes that there is a great deal of reliable information available. It similarly assumes that any cognitive limitations on the part of the firm are of limited importance.

We disagree, in our view the business model, *how the firm intends to create value for a set of customers*, is a *prerequisite for profits*, which thus are *conditional* of the value-creation – unless profits are a result of a rip-off, see image 2.

Economy and energy

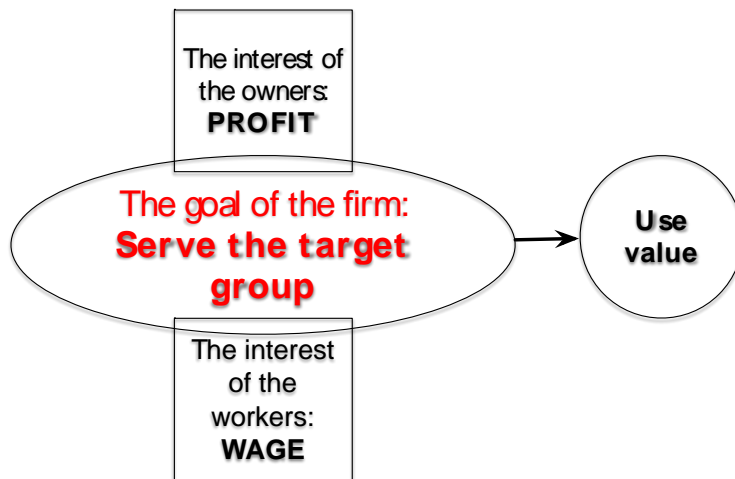

Image 2. Economy and Energy, own.

ANALYSIS OF THE CASE

We created a new business model by delivering superior value to a lower cost. To make this business model sustainable new structural capital, by new systems and routines, was created and to keep the tacit knowledge in the firm we empowered them in order to loyalise them.

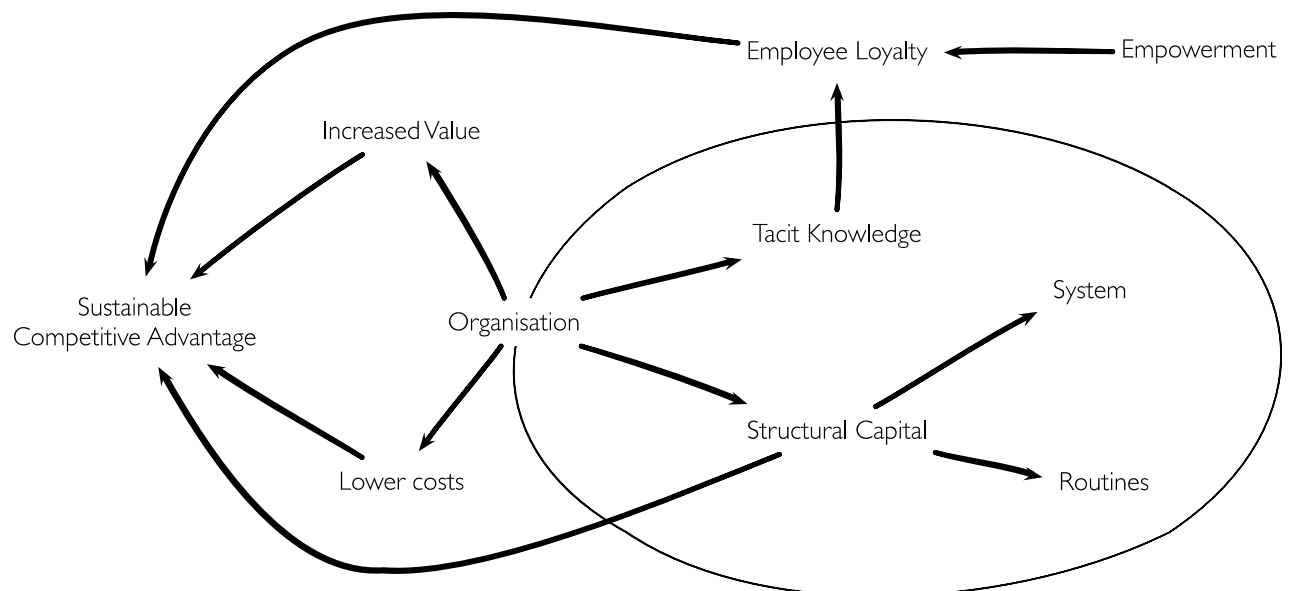

Image 3. The Case, own.

CONCLUSIONS

The case presented shows business modelling as key to achieving sustainable competitive advantage. More case studies will improve the scientific understanding of business modelling at the present stage of development.

OTHER CONCEPTS AND IMPLICATIONS

The case could be viewed from many other perspectives, not discussed here: the *performance effects of workers' empowerment* (McEwan & Sackett, 1998; Vidal, 2007; Udo & Ebiefung, 1999; Waldeck & Leffakis, 2007; Waldeck, 2007), *strategies for implementing organisational change* (Gupta, Chen & Chiang, 1997; Khazanchi, Lewis & Boyer, 2007), *service innovation theories*, and many others. Specialized researchers study each of these issues, and often have specific journals more or less dedicated to such studies.

DOES FINANCE IMPROVE BUSINESS PERFORMANCE IN THE INFORMAL ECONOMY?

Pontus, Engström; Trond, Randøy

School of Business and Law, University of Agder, UiA, Kristiansand, Norway

ABSTRACT

This study investigates the impact of financial capital (microfinance) on the performance of micro-enterprises in the informal economy. The theoretical basis for this study is the Schumpeterian notion that entrepreneurs are able to create value due to their ability to make new resource combinations, of which financial capital is one of the most important and easily convertible resources. To test our hypotheses we apply a cross-sectional unique dataset of microenterprises in the informal sector in Ecuador. We observe how the provision of micro-loans, as a measure of financial capital, allows micro-entrepreneurs to multiply their income generating opportunities and achieve a higher return on equity (ROE). In addition, greater debt financing is positively related to the operating efficiency, measured as return on assets (ROA). Critical to the decision to exploit an entrepreneurial opportunity is also the entrepreneur's financial literacy, and we find that entrepreneurs with a higher financial literacy achieve higher performance than others. However, an important observation is that growth comes at the expense of performance up to a certain size, implicating that diminishing economies of scale negate the positive effects of debt financing in the informal sector. Our results suggests that lending is best suited for firms with an asset size greater than USD 129.000. This has an important policy implication in that growing the size of a small business, through increased debt financing, may not necessarily lead to enhanced overall performance.

Keywords: *microentrepreneurs, financial capital, microfinance, informal economy, financial literacy, firm performance*

INTRODUCTION

Microenterprises are the common economic backbone of most poor and emerging economies. Most of these enterprises operate in the legal "shadow" or the informal economy¹, representing up to 70% of GDP in some emerging economies versus 13% in higher income OECD countries (Schneider et al. 2010).

¹ The informal economy is commonly defined as those income generating activities which are "unregulated by the institutions of society, in a legal and social environment in which similar activities are regulated" (Portes et al. 1989, p.12).

While research on the informal economy exists, it has largely been anecdotal with little theoretical underpinning (Webb et al. 2013), and has to a large extent been overlooked by mainstream entrepreneurship research (Bruton et al. 2008). In line with the call for future research on funding of microenterprises (Moss et al. 2014; Bruton et al. 2013), this study specifically assess if and how access to finance enhances entrepreneurial performance of microenterprises in the informal economy.

Microfinance has over the recent years emerged as a significant funding source for microenterprises in poor countries (CGAP 2014), supported by increasingly professionalized microfinance institutions (Randøy et al. 2013). Microfinance has been advocated as a tool to facilitate entrepreneurship and eradicate poverty (Pitt & Khandker 1998;). While the link between access to finance and poverty has been extensively researched (Roodman & Morduch 2013; Khandker 2005), the link between access to finance and entrepreneurship in the informal sector has not. In our review of existing research we thus identify a gap in the literature, which due to microenterprises significant role in developing economies should be of public policy interest, and also help develop entrepreneurship theory (Bruton et al. 2013), both from a financing perspective but also from a growth aspect.

We use Ecuador as the empirical context of this study, which we argue is a representative example when studying entrepreneurship in the informal economy (World Bank 2012). First, there is an extensive informal economy (Canelas 2014; Schneider et al. 2010; Albornoz et al. 2011), and second there are well-developed regulated microfinance institutions specifically targeting the informal economy. Third, due to unique access to inside information from one major microfinance institution, we get access to microenterprises that have been seeking external financing from a microfinance institution. Forth, we also have data that allow us separate financing of business related activities versus financing of consumption. By assessing poor microentrepreneurs and their microenterprises in the informal side of an emerging economy, as called for by Moss et al. (2014), we are adding to the existing literature on the performance of microenterprises in the informal sector (De Mel et al. 2008; Honig 1998).

This article is organized as follows. First follows a review of entrepreneurship literature relating to entrepreneurial performance and access to financial capital in the informal sector. Second a series of hypotheses are developed. Third, the unique research methodology is presented including constructs and measures. Following this we test the hypothesis using an OLS regression technique. Last we discuss and conclude the findings, its limitations and implications for scholars as well as practitioners.

THEORY DEVELOPMENT AND HYPOTHESES

Where traditional banking does not reach out to needy microenterprises, the entrepreneur must bear the full risk of the project and, if possible, do the financing him- or herself (Knight, 1921). Business

owners of microenterprises in the informal economy typically rely to a large degree on internal financing, as external formal bank-based debt or equity financing is not available to these actors. If external financing is available, it often comes at a high cost from moneylenders or other kind of informal providers of capital, so high that it deters from making any investments. Therefore microfinance institution comes in as a third alternative, bridging the formal and the informal economy, typically with much lower interest rates than informal money lenders¹. In seeking debt to finance an expanding business, the microentrepreneur, or the capitalist part of this individual, is also sharing the risk with external sources (e.g. the microfinance institution). If the entrepreneur is successful, the lending activity results in an improved performance of the business. We argue that little research attention has been made to the nature of the entrepreneurial opportunities in the informal sector, and the type of returns an entrepreneur can achieve.

If the entrepreneur is the specialist in risk-taking or alleviating uncertainty (Knight 1921), seeking an external financier may not only be a sign of lacking financial capital, but rather that the risks involved are too great for the entrepreneur to bear alone. We argue that the adverse self-selection by the entrepreneur, partly based on asymmetric information that the other sources of funding do not possess, makes the entrepreneur better informed about his or her capabilities. In order to deal with such adverse selection by entrepreneurs, the microfinance bank would conduct careful credit screening and apply interest rates and fees in order to compensate for the uncertainty of overly risky and/or unprofitable entrepreneurial investments or activities, and also to deter from these. If these interest rates are set too high, then none of the proposed investments will be undertaken, if set too low, the bank's operations become unsustainable. To an entrepreneur, the cost of financing (cost of capital) is thus something to be weighted against the available opportunities and their economic returns. If a positive spread exists between the cost of borrowing and the investment opportunities, then financial theory says that value can be created through reinvesting and growing the business. The microenterprise should invest up to the point when the marginal benefit from an incremental investment is equal to the marginal cost.

Schumpeter (1934) describes the success of entrepreneurs in terms of an entrepreneurial profit. The empirical entrepreneurship literature uses various measures of performance such as efficiency, growth, profit, size, liquidity, success/failure, market share and leverage, often with a focus on the consequence of good performance. Among these measures, efficiency, growth and profit are the most common (Murphy et al. 1996). Increasingly some are also using a return to capital measure (McKenzie & Woodruff 2008; De Mel et al. 2008), but this is typically unavailable due to insufficient accounting numbers (requiring both income statement and balance sheet numbers).

¹ The term moneylenders refers to informal providers of credit that are commonly charge 100% per year or more in interest rates and apply harsh collection methods.

Firm performance may be viewed from two perspectives – the entrepreneur-perspective and the firm perspective. From an entrepreneur-perspective, the main interest is the generated income in relation to the capital the entrepreneur has invested, the equity commitment, hence the most appropriate measure is Return on Equity (ROE). Return on Assets (ROA) on the other hand measures the return on all capital invested and is therefore a better proxy of the firm's operating performance or efficiency.

Financial capital provides a medium of exchange and trade, and facilitates investments. This might be taken for granted in developed economies, but getting access to working capital is a major challenge among poor micro-entrepreneurs in the informal economy. The ability to exit the barter economy, where exchanging goods and services is complex and expensive, provide potential large saving to the entrepreneur. Research shows that financial capital as a medium of exchange lowers transaction costs and makes operating a business more efficient (Savings 1971; Jack & Suri 2011).

Financial capital may either be internally generated funds or available through external financing. In this study, the external financing will be seen as provision of debt from microfinance institutions. Financing a firm is dependent on the reinvestment opportunities and the availability of financing – which together make up the nature of the entrepreneurial opportunity (Shane & Venkataraman 2000). The decision to seek and obtain "financing" is essentially a decision to exploit an entrepreneurial opportunity, preceded by the discovery phase.

In capital constrained areas of the world, the lack of financing severely hinders entrepreneurship and firm growth (Ayyagari et al. 2008). Lacking capital is therefore a business risk, which affects the performance of the firm. While the seminal study by Modigliani & Miller (1958) proposes that capital structure (debt / equity ratio) is independent to performance of the firm, the intention by the authors was not to argue that capital structure is irrelevant (Miller 1988). In terms of the impact of financing on the performance of micro enterprises, there are a limited number of studies, especially from a less developed country and the informal economy.

Honig (1998) studied microenterprises in the informal economy in Jamaica, finding among other things the importance of considering heterogeneity among microenterprises, such as separating between those with employees and those with no employees. The study showed that those who received a business loan had a higher income, especially among the self-employed. Copestake et al. (2001) found in the case of Zambia that business performance and household income significantly improved upon taking a second loan, but for those, nearly half of the clients, who did not continue with their second loan fared worse. A qualitative case study by Hietalahti & Linden (2006) on poor women in the northern eastern South Africa revealed that some of the poorest women were able to improve their life modestly with access to microloans, but also highlight that the conditions for successful entrepreneurship differs depending on the degree of poverty.

In a recent quantitative study, Mahmood & Rosli (2013) study on Malaysian microenterprises that microcredit had a significant impact on the performance. A number of studies applying randomized control trials (RCTs) have in addition looked at the impact of business grants, also a form of financing, to microentrepreneurs. McKenzie & Woodruff (2008) found in an RCT on Mexican microenterprises monthly returns to capital of 20-33 percent which corresponded to a return between 3 and 5 times higher than the charged interest rate. The RCT did not adjust the returns for the opportunity cost of pursuing an alternative activity as argued by for instance Shane & Venkataraman (2000), therefore exaggerating the performance. De Mel et al. (2008) found in a study on Sri Lanka a monthly return on capital of 4.6-5.3% (55%-63% annually), also higher than prevailing interest rates, here deducting an opportunity cost of labor.

Because of the grant focus of existing randomized control studies, little attention is paid to how debt (the main instrument used in microfinance) affects firm performance. In addition, the randomized control trials are focused on very tiny businesses. Berge et al. (2011) looked at the effects of a small business grant, USD 60. De Mel et al. (2008) used a business grants of USD 100 to USD 200 to businesses with a maximum asset size of USD 1,000, where the size of these grants in some cases were equal to a value greater than the original capital invested. Small and equal grant based RCTs fail to take into account the different business needs, where a relatively small grant to a larger microenterprise, for instance with assets worth USD 1,000, will have a relatively little impact in comparison to the same size grant to a very small microenterprise with for instance assets worth USD 100. This study looks at the effect of an average total debt financing of between USD 2,628 and USD 41,623, thus capturing the effects of a more business varied financing, given the various nature of the businesses.

If microenterprises are provided with microfinance debt, we expect to see a positive impact on firm performance. Thus, one should expect the return on equity to increase and more earnings generated as these microenterprise are able to increase their disposable assets. In Figure 1, this is illustrated as the debt is used to acquire income-generating assets (the equity multiplier). If the reinvestment opportunities can be done at a rate of return which is higher than the lending rates, then value is created. Lacking capital is thus a constraint which hinders entrepreneurs from optimizing a realizable set of investment opportunities (Evans & Jovanovic 1989), including having access to sufficient working capital. In a setting where there are entrepreneurial opportunities present, financing allows the entrepreneur to exploit these opportunities. Net of interest expense and amortization, the microentrepreneur reaps the reward through an improved ROE, thus:

Hypothesis 1: Financing through microdebt is positively related to entrepreneurial performance (ROE). Lacking access to debt not only prevents micro entrepreneurs from expanding their income generating activities, but it also hinders experimentation in general or using cash as a resource cushion (Cyert &

March 1963; Bourgeois 1981). While debt allows the income generating activities to be expanded, through the availability of financing and debt, the operating efficiency (ROA) can also be improved, if the entrepreneur can select opportunities with higher margins and or asset turnover. The second hypothesis thus reads:

Hypothesis 2: Financing through microdebt is positively related to entrepreneurial operating performance (ROA).

In the discovery of an entrepreneurial opportunity and the subsequent exploitation, the rate of borrowing needs to be compared against the expected financial return from the assets that the borrowing provides, especially when the financing is done with a regulated microfinance institution. This demands a certain level of financial literacy. Honig (1998) found in a Jamaican context different results based on education, suggesting no benefit to performance from high school education, but rather from college education. Thus, we suggest that entrepreneurs that are financially literate should outperform those who are not, such that:

Hypothesis 3: Financial literacy is positively related to entrepreneurial performance (ROE, ROA)

RESEARCH METHOD

Researching poor microentrepreneurs in emerging/developing economies provide a number of inherent challenges. Obtaining detailed data from the informal economy is for instance difficult as micro-entrepreneurs typically do not maintain financial records and in addition often mix family and business transactions. These challenges also include getting access to respondents, sample selection biases, the respondents weak knowledge of financial terminology; their ability to respond to surveys (with numbered Likert scales to mention one such challenge). Many of these challenges have been overcome with our unique research design.

In order to get access to microenterprise we have collaborated with Banco D-Miro from Ecuador. This microfinance institution is a regulated microfinance institution with 41.000 clients, based in the coastal regions, where a large part of the economy is informal. Banco D-Miro is owned by the Norwegian NGO Mission Alliance, a faith-based Christian organization. The roughly 100 credit officers who work at Banco D-Miro have manually collected financial data, partly through manually filled out application forms, but also including home visits, for the overall assessment of risk and credit worthiness of the clients. Prior to credit approval, the branch manager reviews the credit application. As credit default does not benefit the branch manager or the credit officer, this process vows for a better quality data, than an entirely self-reported measure of entrepreneurial performance. The data is very detailed and allows for fine-grained analysis of both income statements and balance sheet items, even separating family and business income and assets, thus allowing us to focus specifically on the performance of the

micro-enterprise. Data relating to both the balance and the income statement is obtained at the moment the microentrepreneur's sought financing for their opportunities.

In addition to the data collected through the survey and the data collected by the credit officers of D-Miro, Ecuador's microfinance institutions are by law required to report information to a credit bureau, which provide us with more individual credit information than is common in many other emerging informal economies (World Bank 2013). This process provides for complete picture of the microentrepreneurs financial situation, including loans to other financial institutions.

Lastly, to achieve a sufficient and representative sample for the statistical analysis we have used three available client categories of approximately 250 clients each: 1) clients who did not renew the loan, 2) clients with payment problems and 3) clients with no payment problems. All in all 755 microfinance clients are included. The respondents were then split into two groups, of which 480 had debt and 275 did not at the time of the loan application.

As a measure of the dependent variable, we are using the ROE and ROA in line with the discussion above. To avoid that outliers drive the results, the yearly ROE and ROA have been winsorized at the 5% level, such that for ROE, firms with an Equity of less than \$2,500, had the equity set to \$2,500, and for ROA, firms with a total assets less than \$3,200 dollar, used an asset value of \$3,200 (a similar approach to Hvide & Møen 2010). While the median ROE and ROA remained the same, at 73% and 63% respectively, the variance dropped by 94 and 96% to 73% for ROE and 28% for ROA.

In addition, since the microentrepreneur does not pay a formal salary to him/herself, we have added a proxy number for the opportunity cost of labour into the reported income, in line with suggestions from past research (Shane & Venkataraman 2000). While the minimum wage is intended to set a wage floor, the actual floor may be much lower in the informal sector if formal jobs or alternatives are not available. Canelas (2014) find, using data from the National Statistics and Census Institute of Ecuador, that informal wage workers earn on average 91% of the minimum wage during 2010-2012. We therefore assume that the opportunity cost of labour for the informal sector in Ecuador in 2013 to be the actual minimum wage of USD 318 multiplied by 91%, i.e. USD 289. As a result the median ROE was reduced from 63% to 44% and the median ROA from 63% to 37%.

Financial capital can be equity or debt. In the microfinance industry, the initial and most widely form of capital provided is microdebt. In this study we will look at two groups of micro-entrepreneurs; one group with debt (480 firms) and the other group with no debt (275 firms) at the time of seeking a new loan with Banco D-Miro.

Building upon a previously tested concept (Lusardi & Mitchell 2011a) we have used three questions to test entrepreneurs understanding of the financial concepts, compounded interest, inflation and

risk/diversification. The first two questions are directly from Lusardi & Mitchell (2011) whereas the third question was adapted to better fit this context. Three questions were asked:

Suppose you had \$100 in a savings account and the interest rate was 2% per year. After 5 years, how much do you think you would have in the account if you left the money to grow: more than \$102, exactly \$102, less than \$102?

Imagine that the interest rate on your savings account was 1% per year and inflation was 2% per year. After 1 year, would you be able to buy more than, exactly the same as, or less than today with the money in this account?

Do you think that the following statement is true or false? Investing everything in one opportunity usually provides a more certain economic reward than investing smaller amounts in many different opportunities.

We control for the entrepreneur's gender as many microfinance programs typically favour women over men. In addition we control for age, education, and size. We use total assets, here Winsorized at the 5% level, for size and also include a transformed size-square measure to capture some of the unique characteristics of size. In addition, we control for industry using the definitions proposed by the United Nations for the informal sector (United Nations 2008, p. 279-281). Often, the informal sector is numerically dominated by manufacturing, repair services and trade. In the context of the informal sector of Ecuador, the sample is dominated by wholesale and retail trade (53%), of which the most common forms are clothing establishments, food and grocery retail, bazaar and cosmetics followed by a number of smaller commercial businesses of varying kind. Following wholesale and retail trade was manufacturing (18%), restaurants (8%), agriculture, forestry and fishing (6%), transportation (5%), other personal service activities (4%), education; human health and social work activities (2%), construction (2%), repair services (2%) etc. Furthermore, the urban vs rural characteristics may also explain differences in performance (Honig 1998), wherefore this is also controlled for using the ratio of urban to rural persons living within the city area to which each microentrepreneur belongs using data from the National Statistics and Census Institute of Ecuador (INEC 2011).

ANALYSIS AND RESULTS

As seen in Table 1, the average annual revenue of the microenterprises is USD 26,688. These statistics are generally not available in previous research (Honig 1998; Copestake et al. 2001), which most often leaves us with the definition of a microenterprise as a business with less than 10 employees. Most firms in the data set have below 10 employees, with a limited number having reportedly up to 15 employees.

	No debt sample (N=275)			Debt sample (N=480)			Full sample (N=755)	
	Mean	Min	Max	Mean	Min	Max	Mean	Std. Deviation

Table 1. *Descriptive statistics*

In terms of background variables, our sample include 12% rural microentrepreneurs and finds that 35% have completed primary school, 59% had finished or had some sort of secondary school degree, with only 4% attaining a higher degree beyond secondary education. In a similar study, Magill & Meyer (2005) found that for urban Ecuadorian enterprises, 46% had finished primary school, 41% had some or had completed a secondary education with 12% having an education beyond the secondary education. They note that these levels are higher than for the general population.

In line with Honig (1998), we have segmented the regression results based on being a business without employees or with employees. In addition, due to the informality, the notion of employment is vague, wherefore we also select those who say that at least two individuals, apart from themselves, work in their business. The regression in Table 4 indicates that when controlling for gender, age, urban vs rural, education and industry, there is a significant positive association between debt-funded microentrepreneurs and higher ROE for all cases and subgroups. This supports our first hypothesis that an increased level of debt is positively related to firm performance. Hypothesis two is also supported in that debt financing has a positive impact on the operating performance of the firm, ROA. In terms of financial literacy, we find support that individuals with higher financial literacy also perform better. However, a deeper look at the analysis reveals that this only holds true among the microenterprises with no employees, suggesting that practitioners need to specifically teach financial literacy to these clients, prior to engaging in financing.

Among the control variables, the general level of education of the micro entrepreneur is not shown to have any impact on performance of the microenterprises they own. However, male entrepreneurs with no employees have a higher ROA than female. In addition, rural based microenterprises with no employees have higher performance. Among the industry controls, none of the industries had a significant impact on performance (ROE and ROA).

Size is negatively related to performance, however not all the time. In other words, adding another fridge or scaling the businesses in this local business environment comes at a cost since demand is fairly constant. By squaring the size factor we find that the size factor actually improves performance above a certain threshold (see figure 1). Up to a certain size, taking on debt is negative to the performance of the firm. This finding is supported by industry research from US Aid who found in their review of the informal sector in Ecuador that most microentrepreneurs were not convinced debt represented an opportunity to grow (Magill & Meyer 2005): "Credit is not seen as a positive tool to grow a business, but rather as a cost or penalty to be avoided at almost any cost" (p. 118), and recommend MFIs to exercise caution when "focusing on credit as a solution to the problems facing microentrepreneurs".

Table 2. *Regression analysis*

However, after a certain size, financing starts to add value. In figure 1 below, it is shown that taking on debt worsens the performance for firms below USD 137.000 for ROA and USD 129.000 for ROE, in other words at the higher end of the sample used in this analysis. If the entrepreneur has employees, this lowers the break-even point somewhat. This has important policy implications. It illustrates how MFIs could analyze their existing clientele to find the cut-off point where financing does and does not add value. This allows MFIs to refocus their attention on the larger microenterprises where economic development and value creation is taking place, and avoid the smaller firms where financing actually depresses the performance on average.

In addition to separating between firms with no employees and firms with employees, the nature or industry may also show different effects (see Table 2), depending on the local conditions. The two largest industries represented in the sample are wholesale (and retail) trade and manufacturing, representing 71% of the sample. The regression analysis yields similar results for debt as an impact on the returns on the return for the wholesale trade sector, but is not yielding as strong signals for the manufacturing sector. We also see a different representation and impact of gender in wholesale trade.

DISCUSSION AND CONCLUSION

This study finds that that microfinance as a tool to assist microenterprises in their growth, does not necessarily allow for value creation in the informal economy. Specifically, the study finds that while debt in itself improves performance, the increased size of the firm negates the positive effects on performance from debt financing. We operationalize entrepreneurial performance as the microenterprises' Return on Equity (ROE) and its overall Return on Assets (ROA). We observe that the Ecuadorian microenterprises in our sample on average show very high average financial returns (adjusted ROA of 45% and ROE of 59%), which assuming no impact on returns from growth would lead us to assume growth is value creating. However, in the highly competitive environment of the informal economy in emerging economies, the incremental growth results in a drop in returns which

negates the value creation from growth. We call this the debt-growth trade-off. This has previously been identified as anecdotal evidence by practitioners (Magill & Meyer 2005), cautioning donor organizations to push finance as a means to support economic development, which is here given robust empirical support.

Financial competencies are generally seen as an important prerequisite for successful financial planning (Lusardi 2012), and we see the same pattern among microenterprises in Ecuador. Specifically, we find that microenterprises' that are owned and managed by more financial literate micro-entrepreneurs display significantly higher financial performance, both in term of ROA and ROE. This suggests that financial literacy plays a role in the discovery and the decision to exploit an entrepreneurial opportunity in relation to a situation where external debt financing is required.

Specifically, this study makes three contributions to the microfinance and entrepreneurship, microfinance and growth literatures. First, it extends capital structure theory to micro-enterprises in emerging economies, and shown how financial return numbers can be successfully estimated even when being in the informal economy. Second, it adds to the literature on entrepreneurship, microfinance and growth literature by highlighting how debt impacts micro-enterprises' financial return, specifically in relation to the size of the business, where smaller businesses see diminishing economies of scale, whereas the economies of scale occur mostly among the larger microenterprises. This has been recently called for by Bruton et al. (2011). Third, we contribute to the social entrepreneurship literature by establishing a connection between the social mission of a microfinance institution and its (potential) ability to reduce poverty is misdirected when specifically targeting the poorest and smallest businesses.

The study is not without limitation. We are limited by the fact that we attempt to infer causality (the impact of debt on performance) using a cross-sectional dataset. We have tried to reduce this problem by selecting micro-enterprises with and without debt prior to being include in the sample (and by that have an element of longitudinal design), and by trying to control for other potentially confounding variables such as gender, age of entrepreneur, industry etc. In future research, we suggest that the issue is pursued with longitudinal data. Another limitation is that there might be institutional and cultural variables that make generalizing beyond Ecuador difficult. This study is limited to micro-enterprises that have pursued on particular microfinance institution. For example, the fact that D-Micro is pursuing social goals, even though this is the norm in the industry, might impact the self-selection of microentrepreneurs that pursue this particular microfinance institution.

In terms of policy recommendations for practitioners, this study highlights that microfinance institutions and other donor organizations need to assert caution when extending credits to microentrepreneurs in the informal sector. The results highlight that larger microenterprises may

benefit more, and thus be a more suitable target when trying to create economic development. Our data also shows that financial literacy is important in the entrepreneurial process, particularly firms with a few several employees.

THE USE OF SOCIAL MARKETING IN SMOKING PREVENTION: A STUDY OF GENERATION Y'S SMOKERS' SUGGESTIONS

Priporas, Constantinos-Vasilios¹; Kamenidou, Irene²

London, UK

²Business Administration, Eastern Macedonia and Thrace Institute of Technology, Kavala, Greece

ABSTRACT

The aim of this study was to explore Generation Y smokers' perspectives on youth smoking prevention in the social marketing framework in Greece. A qualitative study was adopted using 10 mini focus groups with smokers of Generation Y to enable an in-depth exploration of the research issue to be undertaken. The findings provide social marketers and policy makers with a better understanding of what the targeted audience value about smoking prevention practices. The participants proposed that prevention campaigns could include practices such as an anti-smoking education for parents, anti-smoking education in elementary schools, the creation of more public sports fields in order to enable young people to have more access to sports activities, celebrity visits and speeches in schools, intense anti-smoking advertising campaigns, and a few suggested the prohibition of smoking in public places with the simultaneous imposition of huge fines for smoking. For social marketers and social policy makers, these are important and effective suggestions since they come from younger and older generation Y smokers from a nation with a very high rate of tobacco consumption and offer a more wide-ranging strategic approach to youth anti-smoking campaigns.

Keywords: *social marketing, smoking prevention, generation Y, focus groups, Greece*

INTRODUCTION

One of the main issues in social marketing is smoking and how to reduce and prevent it (Brenkert, 2002). The harmful effects of smoking on human health are documented in a considerable number of longitudinal research studies, though it seems that the results of such surveys do not tend to persuade smokers (Slovic, 2000) and use of tobacco products continues to be a major public health concern in the 21st century.

In Greece, the smoking population is considered to be amongst the highest in the world. According to the OECD (2011) for the year 2009, 40% of Greek adults smoked, smoking more than 3,000 cigarettes per person in 2007 (The Economist, 2008) rising to 4,313 for the year 2012 (Nation Master.com).

According to the European Commission (2012), Greece is a country where smoking increased rather than decreased from 2009 and even though the taxes on each cigarette package make up more than 75% of its retail price (WHO, 2011, p.68), Greeks are the heaviest smokers in the world. This situation has sparked warnings from health experts since the country is facing a smoking epidemic which could have significant effects on the economy and on the cost of running health services (Vardavas and Kafatos, 2007).

In this context, this paper presents the findings from a qualitative study on generation Y smokers' suggestions about adolescent smoking prevention in the context of social marketing. It is very important to underline that generation Y (people who were born roughly between 1977 and 1994) are an essential target for marketing since little academic research into this generation has been done especially in the social marketing context. The research was carried out in Greece, where very limited research has been conducted in the field of social marketing (Polyzoidis, 2013) and where the marketing culture needs more development (Rivero and Theodore, 2013). These findings could serve as reference for future studies on the topic and this research could contribute to reducing and preventing smoking in Greece and countries with similar problems through research-led social marketing programs.

SOCIAL MARKETING AND ANTI-SMOKING CAMPAIGNS

Social marketing campaigns are used to foster change and encourage behaviors that will improve the health or well-being of the target audience or of society as a whole (Wharf-Higgins, 2011; Quin et al., 2010). Although social marketing tends to focus on behavioral change there are two different approaches to this. The main approach (downstream social marketing) focuses on the individual and on creating personal incentives to encourage them to change their behavior. The other approach (upstream social marketing) focuses on systems change and focuses on changing policy and environments to promote behavioral change. Upstream approaches are similar to those usually undertaken by public health researchers which suggest the potential for beneficial inter-disciplinary work (Hoek and Jones, 2011).

The effectiveness of social marketing campaigns has been questioned. Wolburg (2006) stated that social marketing campaigns are not always as effective as expected. The problem faced by some social marketing campaigns is that they set out to persuade large numbers of people to change their behavior even though people are already fully aware of the potential consequences of this behavior (Rotfeld, 2001). Some social campaigns have even had unintended negative (boomerang) effects (Ringold, 2002), where people reacted against the prescriptiveness of a campaign (Brehm and Brehm, 1981). For example, there have been cases of increased cigarette smoking among college student

smokers in response to antismoking messages (Wolburg, 2006). These kinds of reactions are most common among younger people, especially adolescents because of their desire for independence, individuality, and their rejection of authority (i.e., Miller et al., 2006).

In order for a person to make the rational choice to not smoke, they must have complete information and be able to process it efficiently. However, the addictive qualities of nicotine and the effectiveness of tobacco marketing also leads consumers away from making rational choices (Wayne et al., 2004).

It is clear that the main difficulty for social marketing campaigns, compared to traditional campaigns, lies in the fact that the marketers are attempting to influence an audience to change their behavior from something that is familiar and accepted to something that is new and sometimes more difficult than their normal habits. Nevertheless, social marketing has been criticized for not treating people like autonomous beings. Social marketing campaigns have claimed that marketing's focus on the individual largely ignores the social, economic and environmental factors that influence individual health behaviors (Donovan, 2011).

METHODOLOGY

Given the exploratory nature of the study and the scarcity of studies in the field focusing on the Generation Y perspective, qualitative research was considered ideal since it provides insights and understanding of the problem setting. Focus group interviews were used, to get participants opinions about a particular issue (Andronikidis and Lambrianidou, 2010; Kapoulas et al., 2004) and because they allow researchers to understand consumers' everyday behavior and experiences and how they interpret reality in their own terms (Threlfall, 1999).

In this study the researchers adopted the concept of the "mini-focus group" (Keegan, 2009; Edmunds 1999; Krueger, 1994). Their group sizes ranged from five to six participants with a total of 56 participants in 10 focus groups. Each session lasted about 100 minutes on average, ranging from 90 minutes to 2 hours (Edmunds, 1999) in order to avoid any possible fatigue or loss of interest (Packer-Muti, 2010). In all circumstances the time was sufficient to allow discussion on all areas of interest that arose. The groups were formed so as to be fairly homogeneous, mainly in terms of age. The sessions were conducted in the facilities of a consulting firm in Thessaloniki, with which one researcher was associated with. One of the researchers took on the role of the moderator (Hartman, 2004) and ensured that all group discussions were constructive and went smoothly without problems (Churchill and Iacobucci, 2002). The sessions ended with participants final thoughts and remarks and then the moderator-researcher provided a brief summary of what had been discussed to ensure that their interpretation of the discussion was correct.

Generally a convenience sampling was adopted, however, participants were selected based on their relevance to the study and their ability to discuss the research issue; participants had to be smokers and in the age range of 18-35 (Generation Y). The focus groups followed a semi-structured format with participants discussing the open-ended predetermined questions introduced by the moderator. The questions were developed to guide discussion and in order to elicit specific details. The main research question was "What actions in the social marketing context should be taken by policy makers, non-profit organisations and the community in order to prevent adolescents' smoking". A discussion guide was prepared to help ensure that the focus groups covered the topic of interest and were all conducted in a similar manner. The discussions were videotaped for data analysis to limit the bias and full transcripts were produced as soon as possible after the sessions. The focus groups were then transcribed and a content analysis procedure was then undertaken. This paper will focus only on suggestions for smoking prevention, especially for young people.

Demographic profile of the participants

A total of 56 adult smokers participated in the ten focus groups. The ages of the sample varied between 18 and 34 years old, while the largest proportion, 35 (62.5%) were between 18 and 25 years old and the rest 21 (37.5%) were between 26 and 34 years old. Referring to gender, 30 (54%) were males. The majority, 41 (73%) were single while the rest 15 (27%) were married and 13 of them had one or two children. Half of the respondents were University students, while the rest of the participants reported to be salaried employees (14, 25%), public employees (8, 14%) and professionals (6, 11%). In terms of the educational level of the non-university students, 13 (23%) indicated that they had a bachelors degree; 12 (22%) had a high school diploma-vocational degree; and 3 (5%) had a masters degree.

FINDINGS AND DISCUSSION

The vast majority of respondents, 50 (89%) smoked a particular brand of cigarettes. Regarding the number of cigarettes smoked daily; 12% smoked up to 9; 30% smoked 10-15, 23% smoked 16 to 20 and 35% smoked 21+ cigarettes. Additionally, 45 participants (80%) stated that they started smoking before the age of 18 and the main reason for this was peer pressure (50%) and curiosity (40%). All respondents knew the harmful consequences of smoking, while 27 (48%) of them had tried to quit smoking. In addition, when they were asked what they would do if their children started smoking the vast majority answered that they would try to discourage them from smoking (52; 93%).

Prevention campaigns

Social marketing campaigns by providing knowledge on an individual and community level can be an effective tool for health education and behavioral change strategies. This requires the targeting of influential people in communities who have the authority to make institutional policy and legislative change (Andreasen, 2006; Hastings et al., 2000). Traditionally, public policies to limit smoking have predominantly relied on tools such as increasing cigarette price through taxation, restrictions on smoking in public places, school programmes, advertising regulations, information campaigns and regulations on youth access to tobacco products, and large graphic warning labels on packages (Pierce et al., 2012).

The participants (younger and older Gen Y-ers) proposed that the prevention campaign should include six main initiatives which expressed similar opinions. These should be focused on parents (family), schools, and the state (municipal authorities and government). They were:

1. Anti-smoking education starting with parents, especially smokers
2. Anti-smoking education in elementary schools
3. Celebrity spokespersons in schools
4. Intense anti-smoking advertising campaigns
5. The creation of more sports fields so that children can take part in physical activities
6. Prohibition of smoking in public places and the simultaneous imposition of huge fines on smokers

Parents anti smoking education

Various studies show that parental smoking increases the likelihood of smoking by their children (Otten et al., 2007; Vardavas et al., 2007). The majority of respondents asserted that smoking prevention starts with parents, especially if they are smokers, pointing out that children accept parental influence on their behaviour, considering it as "normal" and "right". They characteristically stated:

"...it is crucial that parents are "trained" not to smoke in the home or near their children. If they attend some anti-smoking seminars, it would be very helpful in getting them to move in the right direction..... Both of my parents smoke in front of me and my brother, in the house,..... everywhere, anywhere. Why should I consider smoking bad for my health? Why would I understand at 12, 13, 14 years old that my parents which loved each other and us would do something so harmful like committing long-term suicide? They were grownups and our paradigm in life - the same goes for all kids - we follow the example of our parents. We consider their behavior right, acceptable and that we should replicate it in the future" (Male, 21, FG3)

As prior research indicates, family plays a vital role in youth smoking behavior. McNeal, (1987) emphasizes that children model their parent behaviors and attitudes. Sancho et al. (2011) state that children are spending less time talking and interacting with parents and more time exposed to media and interacting with friends which is in accordance with the study of Kristjansson et al. (2008) who suggested that the amount of time parents spend with their children could be a factor in protecting their children from taking up smoking.

Anti-smoking education in the elementary school

Schools are places where social behaviours are modelled and reinforced (Lovato et al., 2010). For most participants, anti-smoking education in elementary school was considered to be the most effective way to prevent smoking. Heavy smokers particularly insisted that anti-smoking education must start at elementary school, but shouldn't stop there and should be continued to gymnasium and lyceum. For example, one of the participants stated:

".....I believe that smoking prevention education programs must start with the 4th to 6th graders at elementary school at the latest, innovative ideas should be used. For example, there could be a glass box with an electronic mouth inside that is attached to lungs. In this box the teacher could put some clothes inside. This mouth could smoke 2-3 cigarettes in the box and after an hour or two, the teacher could take out the clothes and give it to the children to smell. This awful smell is a way to encourage children to dislike smoking, especially if the teacher emphasizes that their skin, mouth and hair also smell this way. Additionally, the lung could change color or texture by smoking day by day and at the end of the year it would be obviously altered. I do understand that this is costly, but the cost in the long run is very small compared to the benefits" (Male, 26, FG4).

Researchers have found that if tobacco use begins in elementary school it increases greatly in middle school and therefore prevention should begin in early elementary school (e.g. Wilson et al., 2002), while Ellickson et al. (1993) state that the younger one starts smoking, the more resistant they are to change. Kolbe et al. (2001) state that anti-smoking educational plans and strategies which are school-based are very important in order to discourage students from smoking, because school takes up many hours of the day for children and adolescents (Watts et al., 2010).

Celebrities as anti-smoking spokespersons

Many participants focused on the role that celebrities could play in smoking prevention, especially if they were invited to schools or the schools could go e.g. to the theatre and actors could talk about smoking and its consequences. One of them stated that it all adds up to self confidence and "loving" yourself, and that's the point that celebrities should focus on. They typically asserted:

"We should use celebrities that young people admire and want to be like, to deliver speeches in schools and highlight the negative effects of smoking...Some of them used to smoke and gave up. Let them tell their story. Adolescents do not listen to their parents about giving up smoking or to never trying it, because if a parent smokes, then their advice to not smoke will fall into a gap, and because at their age they want to be rebels - starting in their own home!" (Male, 30, FG9).

"...there are certain celebrities (musicians, athletes, actors) that are role models for many teenagers and they could deliver a series of speeches in schools all over Greece about smoking and its harmful consequences. Also there could be a day where the teacher takes the class to a play, where actors give anti-smoking messages" (Female, 26, FG4).

Studies on celebrity endorsements of anti-tobacco messages have been shown to be effective in improving the understanding of the dangers of smoking and encouraging people to quit smoking (Chapman and Leask, 2001; Seghers and Foland, 1998). In these campaigns celebrities can discuss the consequences of smoking for their careers, particularly in how it can affect their talents, for example, the band Boyz II Men argued that smoking had negatively affected their singing (Farrelly et al., 2003).

Anti smoking advertising campaigns

Many participants stated that there is a need for an anti-smoking campaign. Older participants stated that these campaigns should be mainly televised, focusing on the consequences by using images of smokers' vital organs as a main theme. On the other hand, younger Gen Yers focused on the internet and social media for antismoking campaigns. The following extracts outline this view:

"...there is a need for very intense anti-smoking TV advertising campaigns focusing on pictures of smokers' vital organs.....maybe this way the adolescents will be shocked and avoid smoking" (Male, 33, FG8).

Anti-smoking TV campaigns tend to focus more heavily on the severity of harm than on self-efficacy and subjective norms (Cohen et al., 2007). The successful use of threat is largely determined by how an individual copes with the threat being communicated, and their level of health resistance (Dickinson-Delaporte and Holmes, 2011). Fear appeals are considered to be highly persuasive and thus they are very often used by health marketers to influence an audience. However, they should be exercised with caution since they can generate guilt, envy, anger, sadness (Dillard and Anderson, 2004), or even chronic anxiety (Gallopel-Morvan et al., 2011).

Additionally, some younger participants emphasize the usefulness of the Internet in social advertising campaigns.

"..... I believe a good and very effective way of targeting adolescents is to use the Internet for anti-smoking advertising campaigns, since we spend long hours "surfing" and do not watch TV. There are

so many pop up ads, even in YouTube when we are watching a music video.why not have anti-smoking messages especially from the bands or the singers?, this would certainly be more effective than other images such as smokers' lungs and teeth...." (Male, 18, FG9).

Lately, the use of the internet and web technologies in health promotion has become an increasingly widespread and popular practice (Waters et al., 2011), even as a potentially essential resource in health behavior change intervention and programs (Marcus et al., 2007). Additionally, internet and social media usage by children and adolescents is among their most common activities these days (Kaiser Family Foundation, 2010).

Public sports fields-physical activities

Many respondents believe that there is a positive association between smoking prevention and sports activities. For example, a father with a small kid stated:

"...I wish we had had a sports field in my neighborhood when I started smoking..... Now nearby our house there is a small field,..... and when my son reaches the age of 5 or 6 I will go there to play with him and maybe he will like the sports and join a sports team and this way he can avoid this bad habit" (Male, 33, FG7).

Taras (2005) asserts that physical activities programs can "help children develop social skills, improve mental health, and reduce risk-taking behaviors". Several studies found that individuals involved in all forms of physical activity tend to smoke less (i.e., Kristjansson et al., 2008).

Prohibition of smoking in public places and tax increases

The initiatives which received the least support were the prohibition of smoking in public places (i.e., restaurants, cafes, bars), the imposition of huge fines on smokers and tax increases on cigarettes. Mainly light smokers and older participants suggested these initiatives, while other thought this would just motivate them to purchase cigarettes from the "black market".

More specifically a light smoker stated:

"...although, I am a smoker I believe that we have to respect the rights of nonsmokers, especially in places like cafes, and restaurants where a lot of people gather and many of them are non-smokers and adolescentsA solution could be a general prohibition on smoking in all public places with imposition of huge fines on smokers and owners. Many countries have a very strict anti-smoking law...so do we.... But it is just for existing and not for being applied" (Male, 25, FG5).

Social marketing literature (e.g. Hoek and Jones, 2011) indicates that legislation is often a necessary antecedent for individual behavior change where the sought change is immensely difficult for individuals to accomplish. In Greece, anti-smoking policy does exist, and has been in place for many

years. However, factors such as the spirit of tolerance towards individual life styles that runs through Greek society and the fact that Greece is a tobacco producing country have contributed to their failure. Additionally the existence of a pro-tobacco culture and a growing number of teenage smokers is making the problem worse (Vardavas and Kafatos, 2007).

CONCLUSIONS

The meaning of social marketing contains a justification for involvement in social issues, such as antismoking campaigns (Kotler et al., 2002). Thus, social marketing could be applied to behavioural change and attitudinal change towards smoking mainly through prevention and by approaching young people before they start smoking.

In Greece, the smoking population is considered to be the largest one in the world and has a high initiation percentage of teenagers to smoking. Thus, it is imperative for non-profit organizations and central and local governmental authorities to discourage young people from starting smoking with the assistance of social marketing initiatives. To our knowledge, this paper is the first attempt to present the suggestions of generation Y, younger and older adult smokers' on smoking prevention for children and adolescents in the social marketing context. The main proposals of the study's participants incorporate practices such as parents' anti-smoking education, more engagement by local communities by providing more public sports facilities so that children can take part in physical activities, celebrities speeches in schools, anti-smoking education in elementary school, intense anti-smoking advertising campaigns, and the prohibition of smoking in public places with simultaneous impositions of huge fines on smokers. Although, these findings are partly similar to indications in the literature, they offer a more holistic and modern view especially from an underexplored population (Generation Y smokers) in a heavy smoking country.

Limitations and suggestions for future research

It is important that some restrictions of the research, which offer opportunities for further research, are recognized. This article presented the results of qualitative research, which was exploratory in its nature. The examination of a small number of generation Y participants, although adequate for this study's purposes, restricts our ability to make generalizable claims related to anti smoking initiatives in the context of a social marketing campaign.

Despite the limitations, this study contributes to current knowledge about what kind of anti-smoking campaigns Generation Y smokers ask for in order to act proactively towards smoking. Further research can pursue and validate the current findings of this research with new facts and a larger nationwide sample. Despite the increase in public health consciousness of the direct and indirect

effects of smoking, adolescents still try tobacco products. Recognizing the different prototypes of smoke initiation is essential since these differences have important implications for prevention and research. Understanding the micro and macro social context (e.g., family, friends, school) of adolescent smoking is the first step towards designing and implementing smoking prevention programs (Kristjansson et al., 2008).

THE ADOPTION OF ACADEMIC TECHNOLOGY TRANSFER PRACTICES: AN INDIVIDUAL LEVEL PERSPECTIVE

Pucci, Tommaso; Zanni, Lorenzo

Department of Business and Law, University of Siena, Italy

ABSTRACT

The study aims to explore what are the determinants and the intensity of the adoption of academic technology transfer practices. Starting from the analysis of the literature we propose a conceptual model to explain which are the determinants of university-industry relations and how they influence such relations. The model is tested on the faculty of the University of Siena active in the area of Life Sciences with specific reference to consulting and patenting activities. The results show how the University can no longer be regarded as a “monolithic” actor, but as an organization in which the adoption and diffusion of an organizational practice are influenced significantly by the individual characteristics of each subject of the organization. It highlights in particular how a certain scientific reputation is associated positively with the number of registered patents and negatively, over a certain threshold, to the number of consultancies carried out. It finally highlights an “imperfect complementarity” between patenting and consultancies. The latter increased in the presence of a patent, but not vice versa. It therefore seems to exist a trade-off between scientific reputation and university-industry relationships. The achievement of a certain level of scientific quality initially favors the provision of consultancy work, but over a certain threshold, the scientist begins to focus on the scientific productivity. Conversely, with regard to patent, the relationship is positive and the scientific excellence in some way facilitates the transfer of the scientific results in an exploitable asset (the patent).

Keywords: *organizational behaviour, technology transfer, academic entrepreneurs, life sciences, university-industry linkages*

1. INTRODUCTION

The studies on the technology transfer practices, and in particular on the patenting activity, explode since the 80s also on the wave of some significant public policies adopted by the United States. If we focus on academic technology transfer the theme begins to find ample space in scientific journals since the mid- 90s. More recently, many studies in the literature have explored the ways in which individual academics choose and manage their engagement activities with industry (e.g., D’Este and Patel, 2007;

Landry et al., 2010; Giuliani et al., 2010; Colyvas and Haeussler, 2011; Perkmann et al., 2011). The University has in fact begun to support its two historic and traditional missions of education and advancement of knowledge through basic research also with a third mission: to contribute to the economic development of a country or region (Etzkowitz et al., 2000, p. 313). Academic Institutions may in fact contribute to the potential for innovation and R&D (Lazzeroni and Piccaluga, 2003) as suppliers of human capital at different levels and degrees of specialization, such as technology transfer centers promoting the economic exploitation of scientific results, as producers par excellence of new knowledge or as centers of regional development through the management of innovation projects in the area. The way in which this occurs covers a broad spectrum of activity that goes beyond the simple management of intellectual property rights (Cohen et al., 2002; D'Este and Patel, 2007). Surely the activities mostly explored in the literature were (Landry et al., 2007): Patenting (Henderson et al., 1998; Mowery et al., 2002), Licensing (Thursby and Thursby, 2002) and Spin-off (Link and Scott, 2005; Shane and Stuart, 2002). However, it is now generally recognized that, alongside these, other types of university-industry relations should be considered: consultancy works, joint research programs, and also informal activities such as meetings, seminars, etc (Giuliani et al., 2010; Landry et al., 2010).

We aim to answer to the following research questions: 1) What are the determinants that explain the propensity of an academic to engage in consulting and patenting activities? 2) What are the determinants that have a significant influence on the number of consultancies and the number of patent registrations? 3) Is there a complementary relationship between the two types of activities, and between these and the performance of collateral domains (e.g. scientific productivity)?

2. THEORETICAL BACKGROUND
