In the first half of the 2000s many studies on technology transfer have focused in particular on the role of institutions, first of all the universities and the Offices of Technology Transfer (Lambooy, 2004; Bercovitz et al., 2001; Siegel et al., 2003). Despite the increasing attention paid to the institutional role within the process of technology transfer, there is still no consensus in the literature about the determinants of the links between universities and industry (Giuliani et al., 2010). Giuliani et al., (2010) identify two predominant theoretical approaches (Giuliani et al., 2010, p. 749): 1) "evolutionary" and "resource-based view" approaches: in this case the formation of links depends on the capabilities and skills of the actors (single researcher or organizations) who take part, 2) "institutional" approach: the formation of links instead depends on the context in which the actors are established (type of organization, culture, the environment in which the research takes place, etc.). As we have already mentioned, in particular, there is a recent literature on the characteristics of

individual researchers and their role in determining university-industry relationships (e.g. Bercovitz and Feldman, 2008; Boardman and Ponomariov, 2009) and some studies have also tried to combine the two approaches in a complementary manner (e.g. Giuliani et al., 2010; Landry et al., 2010; Perkman et al., 2011). Nevertheless conclusive results in the literature on the determinants of the linkages between universities and industry do not seem to be present yet. (Giuliani et al., 2010, p. 749). First of all, at the theoretical level the two approaches that have prevailed until a few years ago, seem, by themselves, unable to explain the real determinants of U-I interactions due to the presence of different actors (individual vs. organization), stakeholders, logics, etc. This limitation seems now overtaken by a complementary vision of the two theories (e.g., D'Este and Fontana, 2007; Landry et al., 2007b; Boardman, 2009; Landry et al., 2010; Giuliani et al., 2010). In rare cases it has also been sought to understand how participation in activities of technology transfer and the diffusion of the same organizational practice is influenced by the work context in which the individual researcher is operating (e.g. Bercovitz and Feldman, 2008). In particular, the distance that at different levels (cultural, political and technological: cfr Ansari et al., 2010; Fiss and Zajac, 2004) separates the behavior of a researcher from another one of the same organization (department or research group) was not taken into account or only partially considered (e.g. Bercovitz and Feldman, 2008; Giuliani et al., 2010). Finally, in rare cases, it has been investigated the possible effects of complementarity, substitution or independence between the different modes and channels of interaction U-I (e.g. Bercovitz and Feldman, 2008; Landry et al., 2010 Crespi et al., 2011). At the empirical level instead very few longitudinal studies have examined the heterogeneity in the behavior of the individuals involved in technology transfer activities (e.g., Crespi et al., 2011), however sometimes limiting the analysis to few channels of interaction (e.g. Bercovitz and Feldman, 2008). Finally, with respect to many individual and institutional determinants included in the models of engagement conflicting results have been found.

3. CONCEPTUAL FRAMEWORK

Starting in particular from the work of Bercovitz and Feldman (2008), Giuliani et al., (2010), Landry et al. (2010), Landry et al. (2007b), Stephan et al. (2007) and trying to develop, integrating them where possible, the models proposed in these contributions, we propose a framework of analysis that will help to clarify the determinants that, on the one hand, explain the propensity of an academic to undertake consulting or patenting activities and, secondly, explain the extent of these specific relationships between universities and industry. The framework of analysis is shown in figure 1.

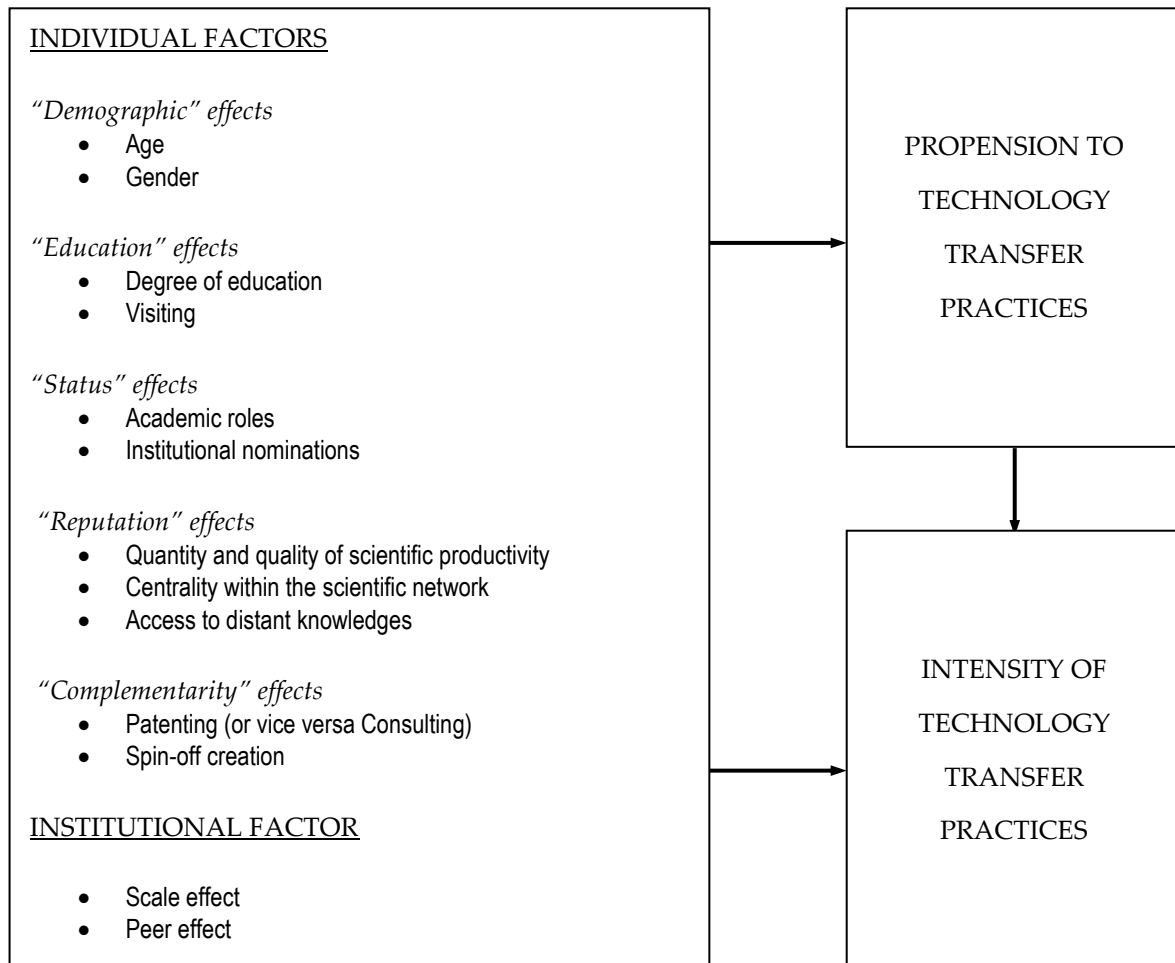

Figure 1: the factors that determine and influence the adoption and intensity of technology transfer practices

Compared to the contributions mentioned above institutional nominations have been included among the "status" effects. Among the "reputation" effects we have considered the "access to distant knowledge". We will verify in fact if the collaboration with foreign colleagues have influence on the extent of university-industry relations or on the propensity to engage in such activities. Compared to the model of Giuliani et al. (2010) we finally have included the effects of what we here call "complementarity". We wonder if the patenting activity can influence the consulting activity and vice versa (as suggested by Landry et al., 2010, or Bercovitz and Feldman, 2008). Finally, we emphasize that at the level of theoretical premise not all factors that influence the amount of university-industry relations can also determine the propensity of an academic to entertain such relationships as suggested in Stephan et al., 2007.

4. METHODOLOGY

Empirical setting and measures

The study is based on a dataset containing the curricular data, the scientific productivity, the number of registered patent and the consulting activities of 301 academics of the University of Siena, active in the field of Life Sciences. The population was selected basing on the following criteria: 1) be still serving at the Università of Siena at 31 December 2010, 2) be at least the author of an article in the Life Sciences area published in peer-reviewed journals.

In particular, the data sources for each section of the dataset are:

- Scientific productivity: search engines and bibliographic databases available at the University of Siena (in particular ISI Web of Science);
- Curricular variables: curriculum vitae available on line on the website of the Departments;
- Patents: free access patent databases available on line;
- Consulting activities: the data were made available by the Liaison Office of the University of Siena.

The variables included in the model are:

A) Dependent variables:

a.1) CT: measures the number of research agreements or consultancy works during the period 1991-2010;

a.2) Patents: measures the number of patents (patent families) registered in period 1991-2010.

B) Independent variables:

B.1) "Demographic" variables:

b.1.1) Age: measure the age (in years) of each academic researchers;

b.1.2) Gender: measured as a dichotomous variable that takes the value "1" if the subject is male and "0" if female.

B.2) "Educational" variables:

b.2.1) SpecPhD: measures the level of education attained by the individual academic through a dichotomous variable that takes the value "1" if the person holds a PhD degree or specialization (the latter in the medical field), "0" otherwise;

b.2.2) Visiting: dummy variable that takes the value "1" if the academic has carried periods of visiting at universities or research centers abroad during their postgraduate training period or already acting as a visiting professor.

B.3) "Status" variables:

b.3.1) Role: dummy variable that takes the value “1” if the academic is full Professor or associate Professor, “0” otherwise;

b.3.2) InstNom: dummy variable that takes the value “1” if the subject had institutional nominations within its Department or University, “0” otherwise.

B.4) “Reputational” variables:

- Quantity and quality of scientific productivity:

b.4.1) NPubl: total number of publications;

b.4.2) IFcum: cumulative impact factor of the researcher.

- The position within the international scientific network and access to distant knowledge:

b.4.3) NetCentr: indicates the centrality of the researcher within the scientific network measured as: $[d(n_i) / (g-1)] \times 100$, where $d(n_i)$ is the index of degree within a network and g is the total number of nodes in the network;

b.4.4) CoautFor: indicates the proportion of foreign co-authors (affiliated to foreign universities) with which the academic has published.

B.5) “Complementarity” variables:

b.5.1) DummyCT: dummy variable that takes the value “1” if the researcher carried out consultancy works, “0” otherwise;

b.5.2) DummyPat: dummy variable that takes the value “1” if the academic has registered a patent, “0” otherwise.

B.6) “Institutional” variables:

b.6.1) SizeDept: For each researcher measures the number of researchers affiliated to their Department;

b.6.2) PeerEffCT: For each subject is measured as the difference between the total numbers of consultancies carried out by the researchers affiliated to the Department and their own;

b.6.3) PeerEffPat: For each subject is measured as the difference between the total number of patents registered by the researchers affiliated to the Department and their own;

Finally, we have included in the model the dichotomous control variable MED that takes the value “1” if the researcher belongs to the medical field, “0” otherwise. It is not possible at present to use the variable spin-off for the small number of academics who have participated in the creation of entrepreneurial activity.

5. RESULTS

In order to investigate the university-industry relationships and a series of relevant factors We have chosen to use a count data model based on the likelihood approach: the zero-inflated negative

binomial (ZINB) model. The choice is motivated both by the discrete nature of the response variables (consultancies and patents) and by the high proportion of zeros within these (cfr Stephan et al., 2007 or Landry et al., 2007b). In particular, the excess of zeros may arise from two distinct processes: in the first case the value “0” is recorded for those academics who have never done consultancy work or registered patents, respectively, in the second case, the “0” can originate from the fact that the academics of the sample did not do some of the two activities investigated in the time window considered.

Tables 1 and 2 show the descriptive statistics of the response variables (number of consultancies and the number of patents) with reference to the dichotomous independent variables used.

Table 3: Descriptive statistics and correlations

The analysis of the correlation matrix shows some problems of collinearity between variables. In particular, the significant correlations between Age and academic Role ($\rho = 0.600$), between SizeDept and PeerEffCT ($\rho = 0.635$), between SizeDept and PeerEffPat ($\rho = 0.601$), between NPubl and NetCentr ($\rho = 0.859$) and between NPubl and IFcum ($\rho = 0.910$), leave doubt about their collinearity. To overcome these problems we have decided to exclude from the analysis the variable NPubl.

We show now the results of the econometric model before processing with reference to consultancies and then to patents. As already mentioned the ZINB model used in the econometric analysis that follows begins with the estimation of the probability that the response variable takes the value zero. To check and initially limit the number of variables to be inserted in the inflate section (the one that estimates the probability of zeros) of the ZINB model we have proceeded to initially and separately estimate a classical logit model. In both case, pre and post removal of six outliers, the results show that

the probability of activating a consultancy work positively depends on the variables Visiting, InstNom, IFcum, SizeDept and Role. The results of the final model are shown in table 4.

Table 4: Results of the zero-inflated negative binomial regression for number of consultancies

Not significant collinear variables were excluded from the analysis.

For the consultancy activity (CT), the probability of being zero increases with the decreasing of the cumulative IF (IFcum) and with the size of Department (SizeDept), as well as it decreases in the presence of institutional nominations (InstNom) and with the academic role (Role).

Gender, Age, Visiting and DummyPat are positive predictors of the number of consultancies. SpecPhD is negatively associated. It is interesting to note that the scientific reputation (IFcum) is a

determinant of the propensity to engage in consulting activities but is negatively associated with the number of the latters. This gives a U-shaped inverted relationship. If the IFcum grows, the number of predicted events (consultancy works) increase up to a certain threshold and then it decrease. The same survey methodology was then carried out with reference to the number of patents (Table 5).

Table 5: Results of the zero-inflated negative binomial regression for number patents

With regard to the patenting activity, the probability that this takes the value “0” increases when PeerEffPat decreases, in correspondence of the Role and finally in the case of a Visiting. Regarding instead to the predictors of the number of patents, only the IFcum and the size of the Department (it is

possible to obtain the same result by replacing the collinear variable PeerEffPat) are positively associated with the number of registered patents.

6. DISCUSSION

First, the comparison between the two types of technology transfer activities shows that the reputation acquired by researchers thanks to the quality of their scientific productivity is a positive predictor of the number of registered patents (complementary effect) but a negative one (beyond a certain threshold) of the number of consultancy works (substitution effect). This result is in line with that part of the literature arguing that a trade-off between scientific publication and university-industry relations exists (e.g. Landry et al., 2007a). Achieving a certain level of scientific quality takes time and dedication subtracted to consultancy activity and vice versa. In the case of patents the relationship is positive. A part of the literature in this regard has shown that the number and quality of publications brings to excel in other activities such as patenting (e.g. Breschi et al., 2008). Figure 2 highlights the two relationships.

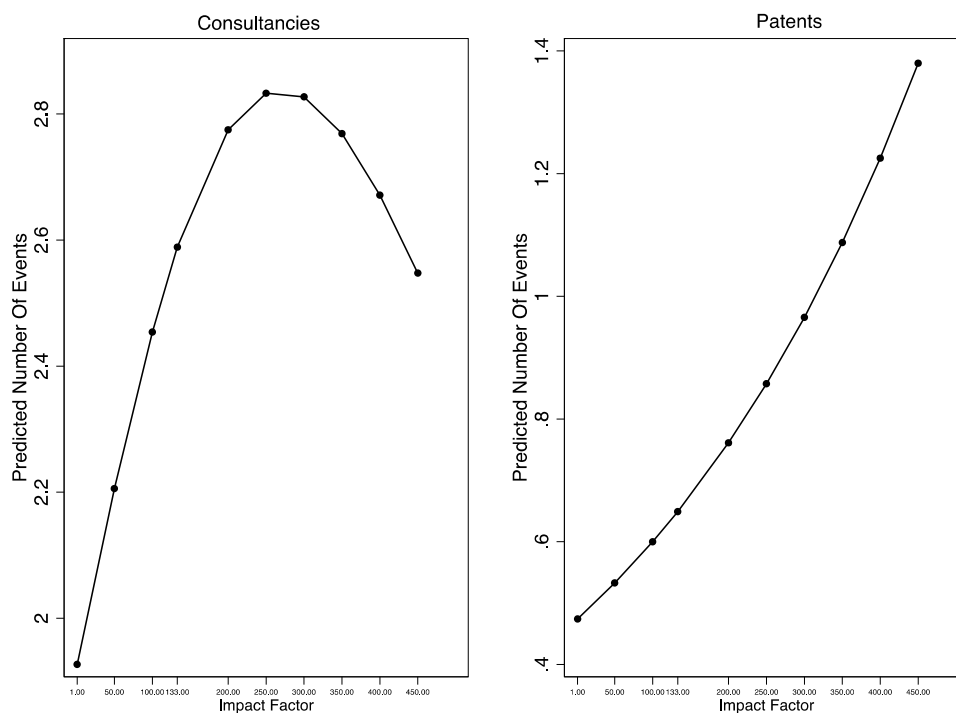

Figure 2: Predict number of events (Consultancies and Patents) as a function of the scientific quality

The patent is a factor whose presence ensures a positive margin in terms of the number of consultancies. This can be attributed to the fact that having a patent can motivate companies to apply for academic collaboration in order to use or to incorporate scientific discoveries into their activities

(see Landry et al., 2010). As regards to the other individual variables, age and gender are positive predictors for the number of consultancies as already part of the literature supports (e.g. Boardman and Ponomariov, 2009). Also a visiting period in a foreign university or research centre increases the number of consultancy works while it decreases in the case of specialization or PhD. In both cases (visiting and degree of education) Giuliani et al. (2010) do not reach significant results. Our result is supported, however, by what the same authors argue: a high specialization level may lead to the academic focus on the scientific productivity (Giuliani et al., 2010, p. 750). Coming to the institutional factors the size of the Department is a positive predictor of the number of patents (see Landry et al., 2010) but also a positive factor in explaining the propensity of the researcher to engage in consulting activity. Compared to the patenting activity, the distance (in terms of patents) from the colleagues of the Department (PeerEffPat) is a key factor to explain the propension and a positive predictor of the number of patents (cf. Bercovitz and Feldman, 2008). Finally, the role and the institutional nominations are significant in explaining the propensity of the academic to undertake consulting activities. The reputation of the subject due to his academic status increases the probability of seeing him involved with the industrial world (cfr D'Este and Patel, 2007; D'Este and Fontana, 2007; Boardman and Ponomariov, 2009).

7. IMPLICATIONS, LIMITS AND FUTURE RESEARCH DEVELOPMENT

The study confirms that the University can no longer be regarded as a “monolithic” actor as claimed, until the end of 80s, by the most of the literature that has dealt with the relationships between university and industry (Link and Tassej, 1989, p. 49). The universities today present themselves as “organized anarchy” (Cohen et al., 1972; March et al., 1976) where the individual characteristics can influence significantly the propensity of the single academic to maintain links with industry (Landry et al., 2010; Giuliani et al., 2010). This raises new problems for the governance of the academy (Kraatz and Ikenberry, 2005; March et al., 1976). New analytical frameworks are necessary to understand and evaluate the technology transfer processes (Landry et al., 2010; Haeussler and Colyvas, 2011; Perkmann et al., 2011) and their diffusion within the organization. The study suggests that policy makers and university administrators have to formulate their knowledge transfer strategies based on portfolios of activities (cfr Landry et al., 2010) rather than on a single technology transfer practice.

In line with the obtained results it is possible to differentiate the activities of the academics to maximize their performance, in particular by identifying the threshold levels among scientific productivity and other technology transfer activities. On this basis it is possible to provide incentives and/or different career development allocating resources to maximize the outcomes of the portfolio of activities rather than a single practice. For example to anchoring the career advancement of single

scholar to the only scientific productivity, as happens in many countries (e.g. Italy), may not be the most effective and efficient way to promote the development of the University limiting, de facto, the capability to raise external funding sources.

The proposed research highlights some limitations. In particular, the analysis was conducted only on one medium size university. A subsequent analysis of most universities (of different sizes) and, possibly belonging to different national systems, would help to further validate the results achieved. Secondly a longitudinal analysis of the phenomenon could allow to strengthen the results. Finally the analysis was carried on a single scientific field, albeit large, the Life Sciences.

REGION OF ORIGIN AND PRODUCT KNOWLEDGE. A CROSS-NATIONAL ANALYSIS OF THE PURCHASING DECISIONS OF CHIANTI CLASSICO WINE

Pucci, Tommaso¹; Rabino, Samuel²; Zanni, Lorenzo¹

¹Department of Business and Law, University of Siena, Italy

²D'amore-McKim School of Business, Northeastern University, Boston, US

ABSTRACT

The paper explores the *country of origin* (COO) effect in the wine sector with particular emphasis on the *region of origin* (ROO) as a factor when evaluating alternatives in the purchasing decision-making process. The ROO identifies key information about the product. It is now generally recognized that the *terroir* is a crucial attribute for the quality of a wine. We have focused on case study of the appellation of Chianti Classico on the German, British, USA and Canadian markets. The choice is motivated by the long history and international reputation of the Chianti Classico. Specifically, the paper aims to answer the following main research questions: what is the importance of the country of origin/region of origin assigned by consumers in an evaluation of Italian wines and the evaluation of Chianti Classico? Is there a relationship between the region of origin and knowledge of wine in the choice processes of the buyers? The image of the Chianti Classico influences the willingness to pay a premium in the analyzed markets included in the current study? Is there a difference in product perception and buying behavior among consumers of "Old" and "New World"? The analysis was conducted on a total sample of 2.380 consumers. The results confirm the importance of the COO and especially the ROO in the process of purchase of wine products. Specifically, it reveals that COO and ROO influence on the purchasing process in different ways, and that knowledge and a familiarity with a brand might have a moderating effect on purchase decisions. It was also found that in cases where consumers were not familiar with the product choices the ROO effect might be positive factor leading to acceptance of higher prices for wines originating in well recognized regions.

Keywords: *Region of Origin, Country of Origin Effect, Knowledge, Wine*

RELEVANT LITERATURE AND THEORETICAL BACKGROUND

During recent years the importance of the "made in" information as a cue in product evaluation has grown considerably (Bloemer *et al.*, 2009) and many scholars have focused their research on the

Country of Origin (COO) (Ashil and Sinha, 2004; Pucci *et al.*, 2012) that is the country where the product is manufactured (Bilkey and Ness, 1982). The COO is a not-physical attribute of the product (*extrinsic cues*) on which consumers can base their purchasing decisions (Cattin *et al.*, 1982; Kakamura and Agarwal, 1999), especially in situations in which *intrinsic cues* (e.g. design, taste, performance, etc.) lack or is not possible to evaluate them. The relevance of the origin depends on the cognitive relations that a consumer establishes between the place of origin of the product and the perceived quality of the attributes of the same (Verlegh and Steenkamp, 1999). This is particularly true for agricultural products (Thode and Maskulka, 1998), where the Region of Origin (ROO) identifies basic information about the product (Ittersum *et al.*, 2003; Keown and Casey, 1995). The ROO is in fact an area with specific characteristics (e.g., tradition, culture, environment, etc.) identifiable from other areas of the Country. The ROO plays a decisive role in particular in the purchasing process of wine's consumers and it is now generally accepted in the literature that the *terroir* is an attribute inextricably linked to the quality of the wine itself (Keown and Casey, 1995; Heslop *et al.*, 2010; Remaud and Lockshin, 2009). The specific characteristics of the wine make it impossible to assess the quality before having consumed the product. Among the extrinsic cues the ROO is therefore one of the fundamental attributes of the wine product on which consumers can base the selection process (Schamel and Anderson, 2003; Perrouy *et al.*, 2006). The importance of ROO is also recognized, in agri-food sector, by the existence of *geographic indications* (GIs) as protected geographical trademark (Čačić *et al.*, 2011). Heslop *et al.*, 2010 suggest that the ROO does not simply describe the origin of the product (extrinsic cue) but it also encompasses intrinsic attributes (e.g. the soil) which contribute to quality and taste of wine product. The ROO is therefore a complex attribute and its effect can be influenced by the knowledge that the consumer has about the product's origin. On the one hand, the literature has shown that the effect of COO in the buying process is negatively associated with the level of product knowledge (Rao and Monroe, 1988; Maheswaran, 1994; Veale *et al.*, 2006). In the case of ROO some researchers suggested that the use of ROO as a promotional instrument increases with the level of expertise of the consumer with respect to the evaluated wine category (Rasmussen and Lockshin, 1999; Guidry *et al.*, 2009; Atkin and Johnson, 2010). Some authors have also suggested that this direct and positive relationship between knowledge and the effects of ROO may not be generalizable to regions whose popularity has spread independently of the region itself (e.g. Chianti, Brunello di Montalcino, Bordeaux, etc.). The research of Losi *et al.*, 2012, suggests for example that in the case of internationally known wine regions, the ROO effect on wine purchasing process is strong not only for experienced consumers but also for those with little knowledge of wine choices.

The present work focuses on evaluating effects of COO in the wine sector with particular emphasis on the ROO as an attribute used by consumers when evaluating choices during. The case study that we develop is the appellation Chianti Classico in the American, German, Canadian and English markets.

The choice is driven to a large extent by the long history and international reputation of Chianti (Keown and Casey, 1995; Famularo *et al.*, 2010). The Chianti Classico appellation, in particular, is the most ancient area in the Chianti Region with a production of approximately 3% of the entire Italian wine production (Malorgio and Grazia, 2007). Secondly the appellation Chianti Classico historically has been oriented toward the generation of sales in export markets. According to the statistical reports of the Chianti Classico Wine Consortium (Consorzio Chianti Classico, 2010) in fact, the four countries under investigation represent the first four in terms of volume of exports.

In particular, we aim to answer the following four main research questions:

1. What is the relative importance of the country of origin/region of origin that might be assigned by consumers when evaluating Italian wines and Chianti Classico ?
2. Does there exist a discernible relationship between the region of origin and knowledge of wine in the decision-making process of the consumer?
3. Does the image of the Chianti Classico brand influences the willingness to pay a premium in the evaluated markets?
4. Do product perceptions and buying behavior differ among consumers of "Old" vs. "New World"?

EMPIRICAL SETTING AND METHODOLOGY

The case study that we explore is that of the Chianti Classico wine. The territory of Chianti Classico was first officially identified in 1716 on legal notice by the Grand Duke of Tuscany Leopold III. At that point the production area (about 70.000 hectares) was delimited according to Italian ministerial decree in 1932 (Malorgio and Grazia, 2007). The recent legislation (ratified in 1996) establishes that the composition of the Chianti Classico wine has to be of minimum 80% Sangiovese grape and for a minimum of 20% of other red grapes varieties as for example Merlot or Cabernet Sauvignon (www.chianticlassico.com).

The research was based on a questionnaire composed of twelve closed questions (five of them using a Likert scale 1-5). The questionnaire concluded with five questions for demographic related questions including gender, age, income, employment and the level of education of respondents. The questionnaire was translated and corrected by a native speaker for each of the four countries included in the study and then retranslated into Italian to reflect any deviations from the understanding of the contained terms. The population of interest represents adults wine consumers. The sample consists of

2,380 consumers. The characteristics and the geographical distribution of the sample are shown in Table 1.

Variables	UK	USA	CANADA	GERMANY
N (n. of respondents)	714	629	494	543
How often do you drink wine?*	3,63	3,65	4,22	3,78
How would you assess your personal knowledge of wine?*	2,84	2,76	3,25	2,60
Annual income **: low	2,66%	29,12%	0,40%	9,52%
medium-low	11,07%	27,52%	1,03%	32,43%
medium-high	21,71%	18,08%	14,55%	38,55%
high	3,64%	21,28%	62,71%	18,59%
I would prefer not to say	60,92%	4,00%	21,31%	0,91%
Education Level **: High School	32,95%	25,82%	8,78%	41,07%
Bachelor Degree	45,27%	56,33%	50,41%	58,16%
Masters or Doctorate Degree	21,78%	17,85%	40,81%	0,77%
Professional Affiliation **: Private sector	23,91%	35,35%	43,59%	53,79%
Self-employed	27,03%	11,15%	30,14%	21,78%

Age (years) **: 18-24	2,10%	7,52%	0,62%	2,95%
25-29	42,72%	17,92%	12,50%	13,08%
30-49	21,43%	48,64%	40,98%	40,52%
50-64	25,91%	20,96%	35,86%	32,22%
Over 65	7,84%	4,96%	10,04%	11,23%

Note: * likert scale 1-5; ** Dichotomous variables

Table 1: Characteristics of the sample

Although the composition of the sample by area appears heterogeneous in terms of socio-demographic variables (age, education level, etc.), the sample size was appropriate considering our focus on cognitive processes *vs* the generalization of overall results (cf. Aiello *et al.*, 2009).

RESULTS

To analyze the main research objective, a question which contained the relevance of different extrinsic and intrinsic cues was asked. Interviewees were initially asked to rate each attribute on a five-point answer scale ranging from “not at all important” to “extremely important”. The chosen cues were selected by different prior researches (Perrouy *et al.*, 2006; McCutcheon *et al.*, 2009; Atkin and

Johnson, 2010; Spielmann and Babin, 2011). Five attributes were chosen: Brand name, COO/Appellation of Origin, Alcohol content, Grape variety and price.

Figure 1 compares the five attributes with reference to the wine in general with those specifically referring to the Chianti Classico wine. Values included in the continuous circles did not suggest a statistically significant difference at level $t < 99\%$. Values included in the dashed lines did not suggest a statistically significant difference at level $t < 95\%$.

With regard to the first research question, analysis indicates that the COO represents a critical attribute when purchasing wine, in particular for Canada (4.08) and Germany (3.83). It is also important, albeit less, for the U.S. (3.50) and the UK (3.05). In the purchasing of Chianti Classico wine the ROO is important for the American consumer (3.91) as well as for German (3.83) and Canadian consumers (3.64). Less important is for the UK market (2.86).

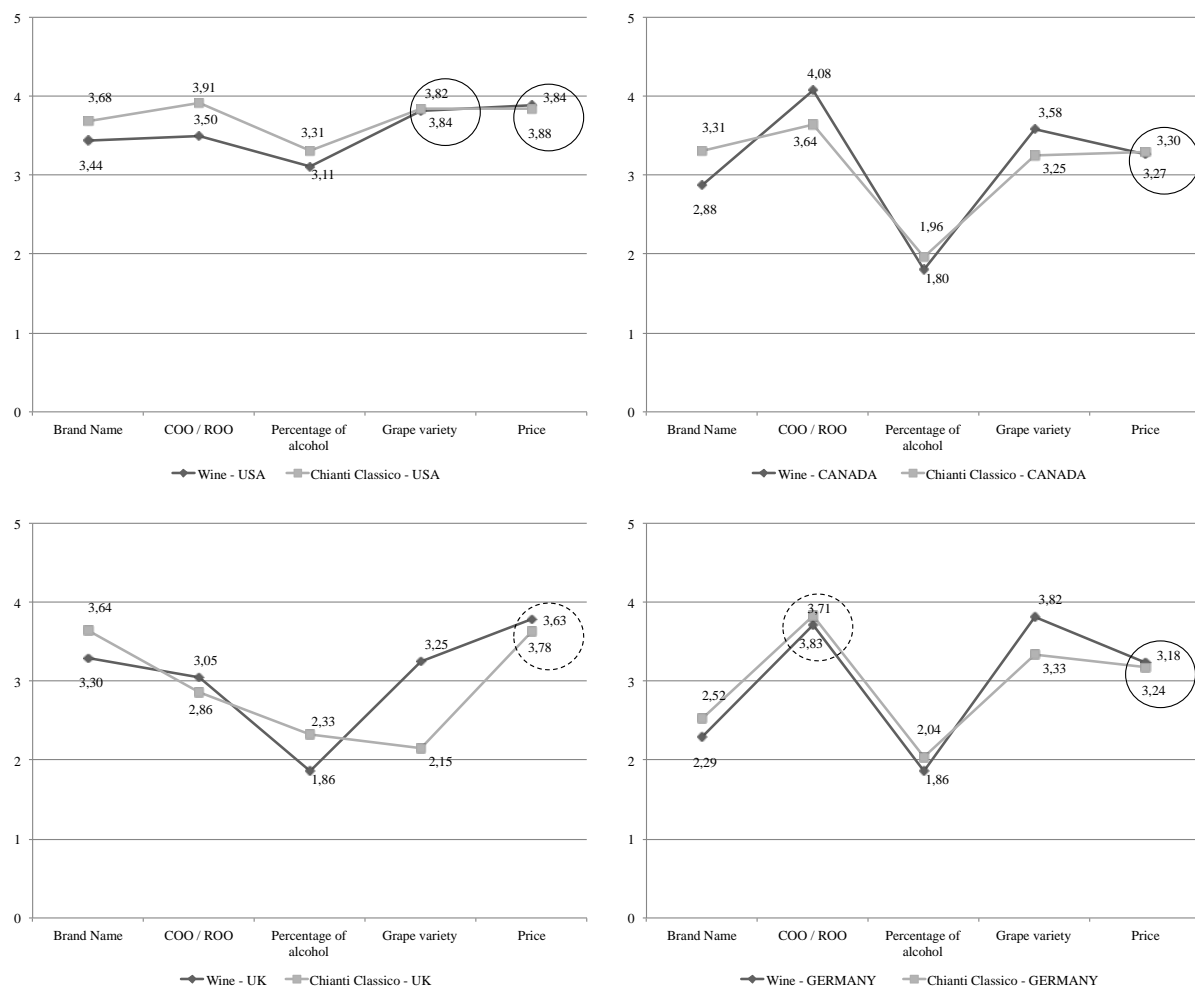

Figure 1: Comparison between relevant attributes in wine purchasing process and those in "Chianti Classico" wine

It also points out that for all four analyzed markets in the case Chianti Classico wine, the brand is more important than it is for the purchasing of wine in general, highlighting the Chianti Classico brand awareness compared to other wines. As for the attribute price, there are no significant differences with regard to the purchase of wine and buy wine Chianti Classico in any of the four markets although the variable appears more decisive with regard to the U.S. and UK. Finally, as regards the percentage of alcohol in the U.S. alone this variable is important.

To answer to the second and third research questions respondents were asked to rate (on a Likert scale) how strongly they associate each attribute with Italian wine and with Chianti Classico wine, from 1 as the lowest level of association to 5 as the highest level of association. In the first case, we attempt to assess the “country-related product image” (CRPI), namely the image of a specific product from a country (Bursi *et al.*, 2012). In the second case, we evaluate the “region-related product image” (RRPI), namely the image of a specific product from a Region. All the attributes were selected by a previous research study Conducted by Zamparini *et al.*, 2010, except from “trendy”, that in Zamparini’s study was called *innovative*. The same scale was used in Losi *et al.*, 2012. Figure 1 compares CRPI and RRPI for each analyzed market. Values included in the circles do not have statistically significant difference at level $t < 99\%$.

First, it is evident that consumers of USA, Canada and UK associate to Chianti Classico wine each of the attributes proposed lower values compared to the same Italian wine (in all three cases, the gray line is in fact always below the darker line used for the CRPI). The image of Chianti Classico therefore seems to have a more significant value compared to Italian wines in general only for the German market.

Tradition/culture and high quality are the attribute with the highest associations with regard CRPI and RRPI for the U.S., Canada and Germany. UK also gives higher values to tradition / culture but acknowledges the major Italian wine elegance. The UK consumers are also those that differentiate more the image of the Chianti Classico wine from that of Italian wine in general.

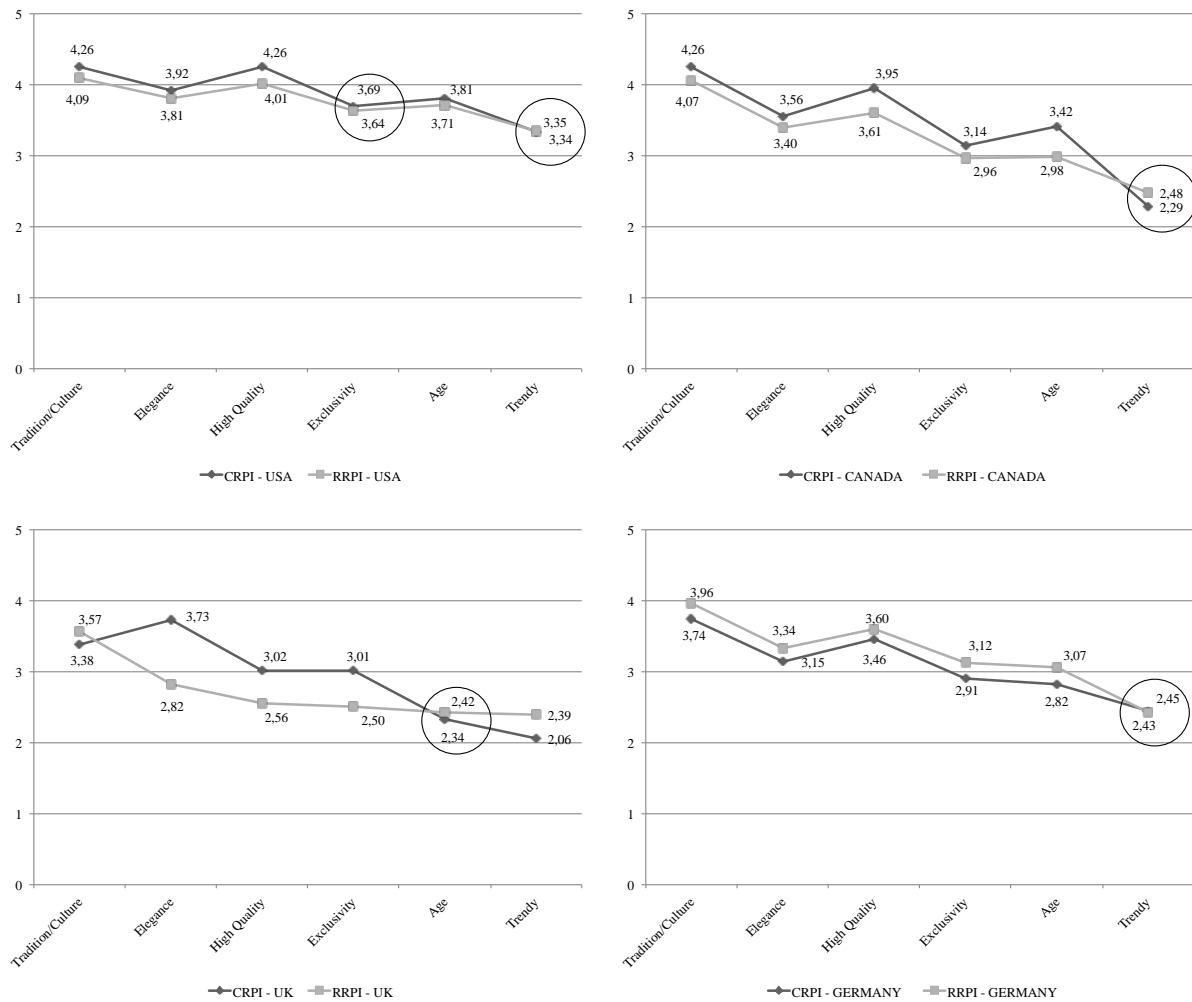

Figure 2: Country-Related Product Image (CRPI) and Region-Related Product Image (RRPI)

USA consumers are those who attribute higher values to all the attributes both in the case of the Chianti Classico wine that in the case of Italian wine in general, and are also those for which the difference between the two perceptions (CRPI and RRPI) is the smallest.

Respondents were asked to assess the level of their wine knowledge (the last question in figure 3) and the level of the Italian wine knowledge. With reference to the Italian wine knowledge, this is rated according to the familiarity of respondents with Italian wine, to their ability to distinguish among different Italian wine regions and to their propensity to search on web some informations about Italian wines.

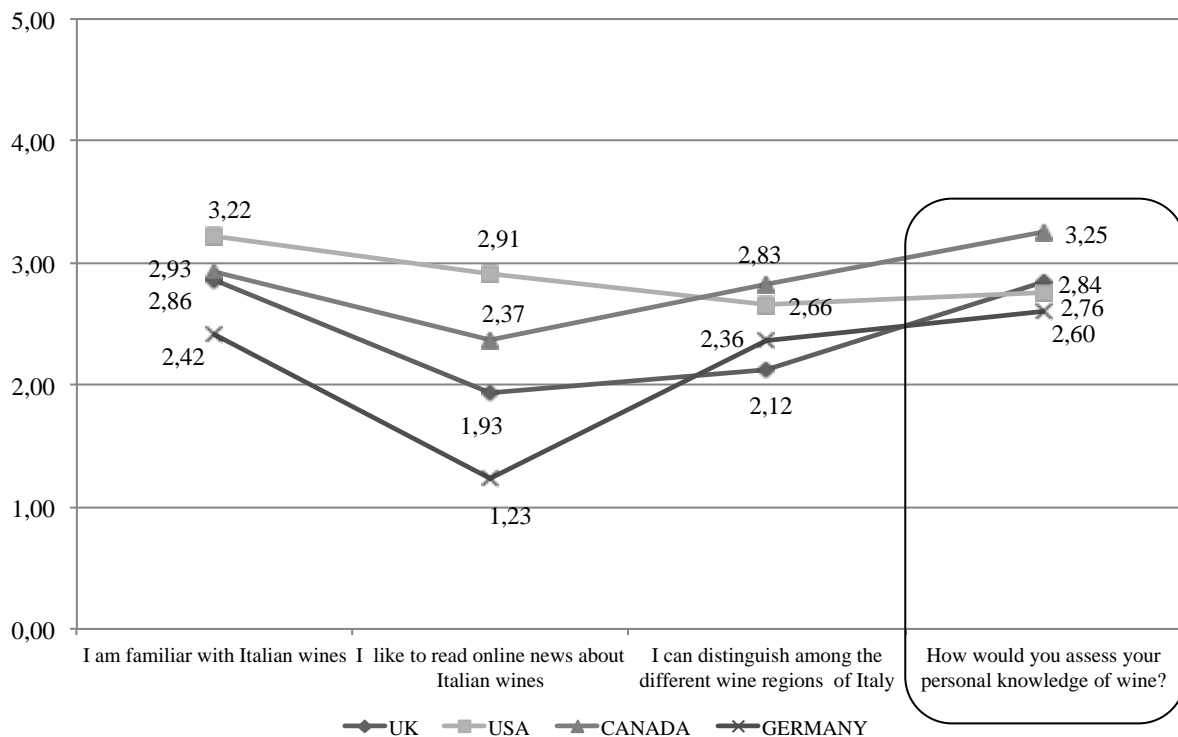

Figure 3: Wine and Italian wine knowledge

Canadian and British are the two groups of consumers with the highest knowledge of the wine products, 3.25 and 2.84 respectively. USA consumers exhibited the highest level of familiarity with Italian wines (3.22), while the Canadians were more able to differentiate among the different Italian wine regions (2.83). In order to gain Table 2 provides consumption information specific to Chianti Classico and shows the percentage of customers within each country that consumed at least once a Chianti Classico wine and visited at least once in the Region.

		UK	USA	CANADA	GERMANY
Have you ever consumed a Chianti Classico wine?	Yes	62,89%	58,05%	92,82%	85,45%
	No	37,11%	41,95%	7,18%	14,55%
Have you ever visited the Chianti Classico region?	Yes	33,61%	9,76%	43,03%	45,49%
	No	66,39%	90,24%	56,97%	54,51%

Table 2: Consumption experience and visit of the Region

Approximately 93% of Canadian respondents consumed at least once, a bottle of Chianti Classico wine and in 43,03% of cases they actually visited the region of production. The Germans have a high level of consumption experience (85,45%). Within the German sample also included were consumers who visited region of Chianti Classico the most (45,49%). Only in 9.76% of cases, however, American respondents also visited the region.

Finally, Table 3 shows the willingness to pay more for an Italian wine and for a Chianti Classico wine.

		UK	USA	CANADA	GERMANY
Are you willing to pay more for Italian wine?	Yes	63,44%	68,10%	61,07%	37,97%
	No	36,56%	31,90%	38,93%	62,03%
Are you willing to pay more for the purchase of a Chianti Classico wine?	Yes	56,58%	50,65%	54,88%	45,67%
	No	43,42%	49,35%	45,12%	54,33%

Table 3: Willingness to pay more for an Italian wine and for a Chianti Classico wine

British consumers, Americans and Canadians in more than 60% of cases are willing to pay more for an Italian wine and in more than 50% of the cases would be willing to pay more for a Chianti Classico wine. Only in 38% of cases, however, German consumers recognized a greater value to Italian wine but in only 46% of cases they were willing to pay more for a bottle of Chianti Classico wine.

DISCUSSION, CONCLUSION AND FURTHER RESEARCH

This empirical analysis carried out confirms the importance of the COO and especially the ROO consideration when examining wine purchase decisions. The role of information on the country/region of origin can have a dual impact on the consumer's evaluation process (Han, 1989): first the so-called “*halo effect*” namely the fact that the COO can serve as a qualitative signal in all those situations in which the consumer is not familiar with the product or the brand; secondly, the “*summary effect*” i.e. the abstraction process that takes place when an image of a country is grounded in previous experiences and perceptions of the attributes that characterize products from that country. In sum, the evaluation of the product quality or brands originating in a specific territory is based on the two effects cited (Yasin *et al.*, 2007; Jaffe and Nebenzahl, 2001).

Despite the importance of COO and ROO in the process of wine purchasing by the consumers of the four countries analyzed, the comparison of Tables 1, 2 and 3 and Figures 1, 2 and 3 indicates a large heterogeneity in the perceptions of the attributes of the Italian wines in general and Chianti Classico wine in particular. This shows how the effect of Country of Origin and Region of Origin depend strongly on the cultural context within which the two phenomena are analyzed.

The USA customers have a low knowledge of wine and use the COO information as an important element during the product evaluation process. The same consumers have a higher knowledge of Italian wine and assign importance to ROO when making choices. Ultimately, Americans were found to be willing to pay more for an Italian wines in general rather than specifically for a Chianti Classico. The British have little knowledge of wine in general is that of Italian wine. COO and ROO have less effect on the purchasing process respect for U.S. consumers; however, are willing to pay more for an Italian wine or a Chianti Classico in particular. Canadians have high level of wine knowledge and a

high knowledge of Italian wines. COO and ROO are important in their buying process and they are willing to pay more for either Italian wines or a Chianti Classico. Even though an high percentage of Germans (85,45%) consumed a Chianti Classico wine, they were found to possess little knowledge of Italian wines and of wines in general. They use ROO and COO as considerations in the decision-making process but are willing to pay more for the Chianti Classico wine.

The results thus confirm that COO and ROO effects play a role the buying process in different ways, and also that knowledge and familiarity with the product might have a moderating effect on choice behavior. Even in cases that reflect a very limited knowledge, the effect of ROO is positive with respect to the willingness to recognize a premium price for wines from well known regions such as Chianti Classico (cf. German consumers), but it is also true that for expert consumers (e.g., Canadians) the effect of ROO is equally positive.

With regard to the final research question, it was concluded that there was no particular evidence that the ROO and COO effects are at work for consumers originating from "New World" (USA and Canada). The same applies for consumers coming from "Old World" (UK and Germany). In this regard, a repetition of our survey in different countries will deepen the understanding with regard to COO and ROO contributions to the overall choice process as experienced by wine consumers.

ABSTRACT

Two of the world's largest markets, the EU and China, have initiated negotiations to lower down their markets' barriers in pursuit of a multi-billion-dollar free-trade deal. Although the European Commission has proposed a new generation of competitiveness-driven bilateral free trade agreements with emerging and developing countries, some EU member countries are skeptical of China's trade practices which have halted Brussels and Beijing negotiations. However, some EU officials have suggested that this agreement will be a stepping stone for future liberalization of the EU economy and that a free trade agreement with China is only a matter of time. The purpose of this study is to investigate the comparative advantage of EU members and China, how complementary trade is between the EU and China and how similar are the exports of these prospective FTA partners. This is a research paper based on secondary data analysis; data is obtained from various official entities. This study uses statistical and machine learning techniques in order to detect meaningful trade relationships between the EU and China.

Keywords: Free Trade Agreements, International Treaties, Bilateral Trade Agreements, Double Taxation Treaties, European Union, China

INTRODUCTION

In recent years, the trade partnership between the EU and China has developed significantly; China has become the EU's biggest source of imports as well as one of the EU's fastest growing export markets. Likewise, the EU has also become China's biggest source of imports. It has been estimated that currently China and Europe's trade surpasses €1 billion a day (European Commission, 2014). Despite this significant trade partnership development, the EU records an important trade deficit with China. This is in part a reflection of China's extraordinary trade evolution, since it became a member of the WTO in 2001 (Rodrik, 2006; WTO, 2011). China's exports rate of growth has been estimated to reach 30 percent a year before the financial crisis. Currently, around 70 percent of all goods manufactured in China are exported (Li et al., 2014).

China's free trade policy has been driven by the need to secure its export growing trend and has been increasingly active in trade agreement negotiations with developed and developing countries. Since 2001, China has signed 12 trade agreements, it has six under negotiation and four under consideration; negotiations under consideration emphasize large markets such as the EU and US markets (Li et al., 2014). For a number of years, China has represented to the developed countries the opportunity of a low-cost labour force (Feenstra and Wei, 2009). Nowadays, this given fact is reversing as China is producing sophisticated components that require high-skill labour force that compete with developed countries' manufacturing products. Such competition has been related to controversial issues associated with anti-dumping and unfair competition (European Commission, 2014).

The aim of this study is to investigate the comparative advantage of EU members and China, how complementary trade is between them and how similar are the exports of these prospective FTA members. The study reported in this paper can provide fundamental knowledge for policy makers in Europe, specially when updating the policy agenda for free trade negotiations. The remainder of this paper is organized as follows: section 2 introduces the conceptual background of bilateral investment agreements. Section 3 presents an overview of related literature in this topic of research, section 4 specifies the methodology utilized in this study. Section 5 presents the findings of our study, while section 6 addresses policy implications. Finally some conclusions and recommendations are provided in the section 7.

CONCEPTUAL BACKGROUND

Although the free trade doctrine dates back to the days of the famous economists Adam Smith and David Ricardo, it is only in the past three decades that countries from around the world have been embracing free trade agreements. The early doctrine of free trade advocated that free trade among countries leads to economic efficiencies through trade diversion. Today, the World Trade Organization (WTO) argues that free trade is directly associated with economic growth and development (WTO, 2011). The WTO promotes free trade negotiations intended at reducing international trade barriers and ensuring fair trade competition for all negotiating countries. Together with its predecessor organization the GATT, the WTO has established a strong international trading system from which 159 countries are members of this organization (WTO, 2014).

Despite the growing recognition of the role of free trade agreements, there is no consensus on the definition of these legal instruments; however, the following definition explains some of the common features of free trade agreements:

"The WTO agreements cover goods, services and intellectual property. They spell out the principles of liberalization, and the permitted exceptions. They include individual countries' commitments to lower

customs tariffs and other trade barriers, and to open and keep open services markets. They set procedures for settling disputes. They prescribe special treatment for developing countries. They require governments to make their trade policies transparent by notifying the WTO about laws in force and measures adopted, and through regular reports by the secretariat on countries' trade policies." World Trade Organization (2014)

Although the term Free Trade Agreements (FTAs) is commonly used for a variety of legal trade instruments such as bilateral trade agreement, regional trade agreement, free trade agreement, reciprocal trade agreement and preferential trade agreement, such instruments are used at different times and in different ways, differing largely from FTAs. Free Trade Agreements comprise preferential arrangements under which tariffs and some other barriers to trade are lowered only for those countries party to the agreement; these barriers for other countries are not reduced by the agreement (Brownsell et al., 2012). Therefore, distinguishing the characteristics of each of these legal instruments is an important endeavor in the assessment of their effects.

RELATED LITERATURE

The rapid increase of international trade flows in recent decades has motivated a large and growing body of academic literature in this field. Some theoretical and empirical papers go back to the fundamentals of the theory of comparative advantage developed by David Ricardo (1817). Ricardo argued that economic prosperity will increase when countries specialize in producing goods that have a lower opportunity cost and engage in trade exchange. The theory of comparative advantage, also known as the international trade theory, is one of the most famous theories in the field of international trade and has been conveyed by a number of economists among them Harberler (1930), Vainer (1937), McKenzie (1954), Jones (1961), Paul Samuelson (2001), Shiozawa (2007). While international trade theory states that benefits from trade come from the specialization in a country's comparative advantage (Maneschi, 1999), the benefits of a country engaging in free trade agreements are stated by the theories of trade agreements.

In today's economic literature, two theoretical approaches that offer a foundation for trade agreement analysis are found: the terms-of-trade theory and the commitment theory. Both theories suggest that countries engage in signing free trade agreements to enhance their economic development policies (Obradovic, 2012). However, these theories differentiate from each other by suggesting different reasons for signing these legal instruments. The terms-of-trade theory suggest that in the absence of trade agreements countries engage in war trade which is detrimental for all countries' economy. This theory states that free trade agreements permit negotiating countries to cooperate and evade such trade war of protectionism (Maggi and Rodriguez-Clare, 2005). Whereas the commitment theory

suggests the benefit in signing a trade agreement follows from the negotiating governments committing to specific policies and to resisting pressures from domestic special interests groups. Although these theories are not mutually exclusive, both theories suggest that identification of the economic benefits for the negotiating countries as imperative (Bagwell and Staige, 2011).

There are considerable advantages for countries that engage in the liberalisation of tariff barriers which is the primary purpose of free trade agreements (Kirkwood 2011). In the present global economy, domestic industry attains significant commercial opportunities that are absent in the domestic economy. Trade liberalisation can be a positive force for economic growth and development; policies that reduce trade barriers facilitate the movement of goods and services, and deliver economic benefits (Stiglitz and Chalton, 2005; WTO, 2011). It has been found that by engaging in trade liberalisation, some countries have boosted their economy following exposure to international competition, via greater innovation and efficiency of domestic industry (Staiger and Tabellini, 1999). Despite some significant advantages that trade agreements may bring to a country, there are also significant challenges that trade liberalisation can deliver to the domestic economy; these can be directly attributed to the levels of skills of the labour force (Obradovic, 2012). However, evidence also suggests that trade liberalisation has not benefited other countries as some sectors of their economies were unable to compete in the international market; those sectors were mainly labour intensive sectors that produced low-priced goods (Stiglitz and Chalton, 2005). The World Trade Organization (WTO) tried to address these issues in the Doha Round in 2001.

The same year that the Doha Round commenced, China became a member of the WTO. China's main reason for joining the World Trade Organization was the securing of access for its export sector into the global market (Li et al., 2014). The incorporation of China as a member of the WTO has greatly benefited its economy, seminal empirical studies have demonstrated the advantages China has obtained from its WTO membership (Van-Hoa, 2008). Chinese economic reforms that started in the late 1970s, have led to the emergence of the Chinese economy based on openness and competition. Today, one of the prominent feature of the Chinese economy is its economic competitiveness expressed in the outsized surplus of its balance of payments due to the outstanding performance of the export sector. The remarkable performance of the export sector is reflected in the impressive growth of Chinese GDP in recent decades (World Bank, 2013). This extraordinary economic growth has led China to surge as an economic and political world leader, impelling an interesting discussions among academic, policy makers and business leaders.

The Chinese export sector has been characterised by its labour intensive manufacturing and low cost of production, features that have been the main attractions for foreign investment (Rios-Morales and Brennan, 2010). Although China is the world's manufacturing base, its considerable global presence in

international trade poses challenges to trading partners; some countries have experienced the decline of their exports due to strong Chinese competition (Feenstra and Wei, 2009). China has become an outstanding competitor in export markets, as well as the world's largest importer of raw material, intermediate inputs, and other goods (WTO, 2011). Furthermore, its manufacturing sector has experienced rapid development and sophistication, producing exports labeled as high-tech (Wang and Wei, 2010). The Chinese government has been actively promoting the rising sophistication of the manufacturing sector through the creation of high-tech industrial zones around the country (Rodrik, 2006). The sophistication of the export sector indicates that manufacturing skills have also been upgraded; enhanced exports are directly attributed to higher levels of skills (Van-Hoa, 2008). Therefore, China has emerged as a direct competitor with producers in developed countries (Feenstra and Wei, 2009).

METHODOLOGY

The availability of comprehensive datasets and the very limited set of empirical studies on EU-China comparative advantages related to free trade agreements have motivated us to employ quantitative approaches to provide an assessment of the potential economic effects of the proposed free trade agreement. This is a research paper based on secondary data analysis; data is obtained from various official entities. This study uses statistical and machine learning techniques in order to detect meaningful and relevant trade relationships between the EU and China.

In order to be able to compare trends for economies that significantly differ in their size, we have computed relative rankings for a closed set of countries consisting of China and 27 EU countries. The computation starts by building two ordered lists of countries in respect of the value of their imports from some target country and exports to the same target country. Table 1 presents the lists for Austria in year 2012 for the total of all commodities.

Table 4: Ordered lists for Austria

Imports from Austria			Exports to Austria		
Country	Imports (in millions of USD)	Import rank	Country	Exports (in millions of USD)	Export rank
Germany	50,000	27	Germany	74,000	27
Italy	11,000	26	Italy	11,000	26
France	7,400	25	Netherlands	8,300	25
-	-	-	-	-	-
Estonia	155	3	Latvia	33	3
Cyprus	127	2	Cyprus	12	2
Malta	44	1	Malta	8	1

The positions of countries in the lists determine their export and import ranks. The country that is first in the list has rank 27 while the last one has rank 1. Taking Austria as an example, Germany has both

import and export ranks of 27 while Malta has both ranks of 1. Relative rank is defined as the difference between the export and the import ranks for the same country:

$$Relative_rank = Export_rank - Import_rank$$

When Austria is the target, then in year 2012 relative ranks for Germany, Italy, Cyprus, Malta and some other countries are 0 because they have identical export and import ranks. The largest relative rank of 9 relates to the Netherlands (export rank 25, import rank 16) while the smallest value of -4 relates France (export rank 21, import rank 25) while China's relative rank is -4 (export rank 15, import rank 19). Higher values of relative ranking are characteristic of more export oriented economies.

The total relative rank for an individual country is the sum of relative ranks computed for in respect of all of the other members of the closed set of 28 countries:

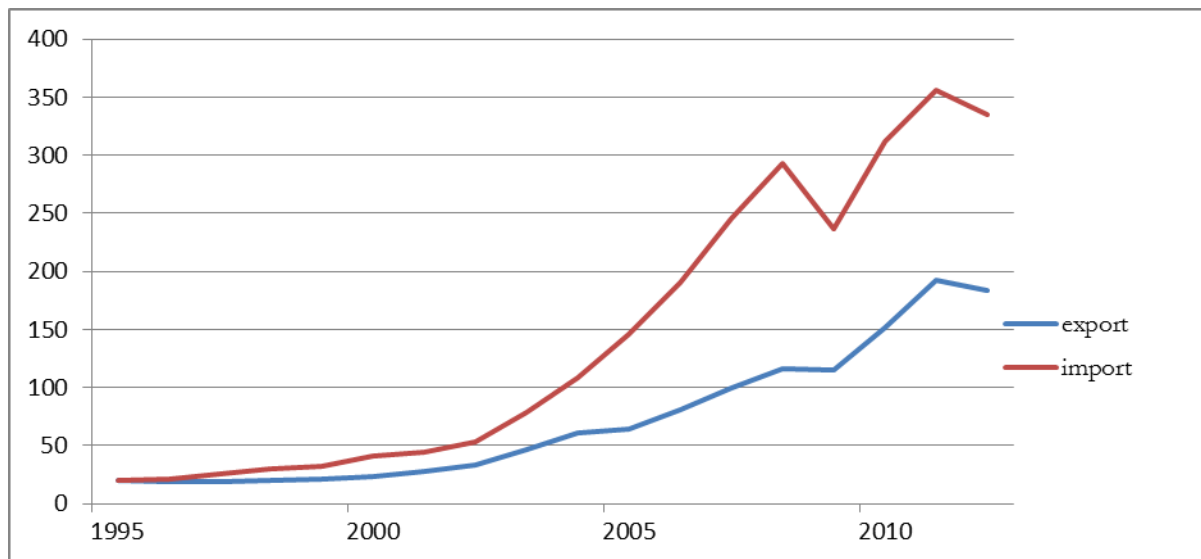

$$Total_relative_rank = \sum_{all_members} Relative_rank$$

For the year 2012 for the total of all product types, the highest total relative rank in the set of 28 countries obtains for China and equals 135. The lowest value obtains for the UK and equals -84.

A characteristic of the above defined measure is that it defines export/import characteristics of a country regardless of the actual size of the economy and regardless of general trends in international trade. For example, it means that in spite of absolute increasing trade data, the ranking of a country can be decreasing. The methodology is especially appropriate for recognizing long term trends.

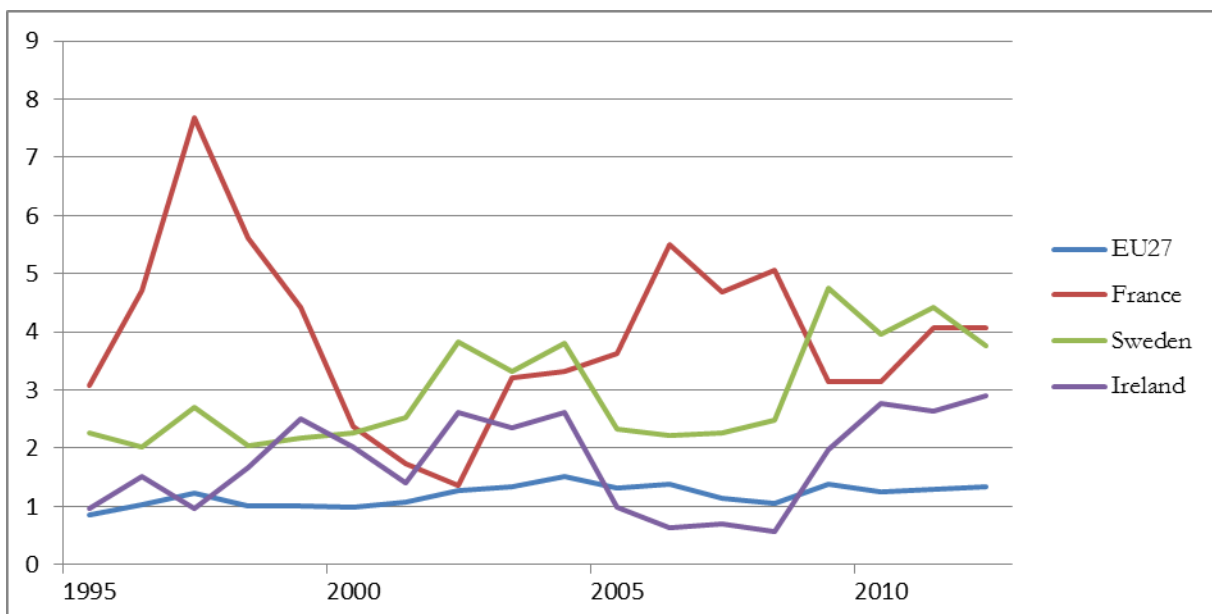

FINDINGS

Our findings suggest that trade between the EU and China have risen at a substantial rate since 2003. In recent years, China has become the EU's biggest source of imports as well as one of the EU's fastest growing export markets. Likewise, the EU has also become China's largest source of imports. It has been estimated that currently China and Europe's trade surpasses €1 billion a day (European Commission, 2014). In the context of the development of this significant trade partnership, the EU records a significant trade deficit with China (figure 1). In 2012, the EU-China trade ratio was 0.55 (total EU exports of goods to China divided by total EU imports of goods from China). It was also found that among the EU countries, Austria and Germany have a positive trade balance with China, with ratios of 1.65 and 1.24, respectively. However, for all other EU countries the ratio was below 1.0.

Figure 1: EU27 to China total exports and total imports (in billions of USD)

Total all commodities EU27 exports and imports from China in billions of dollars.

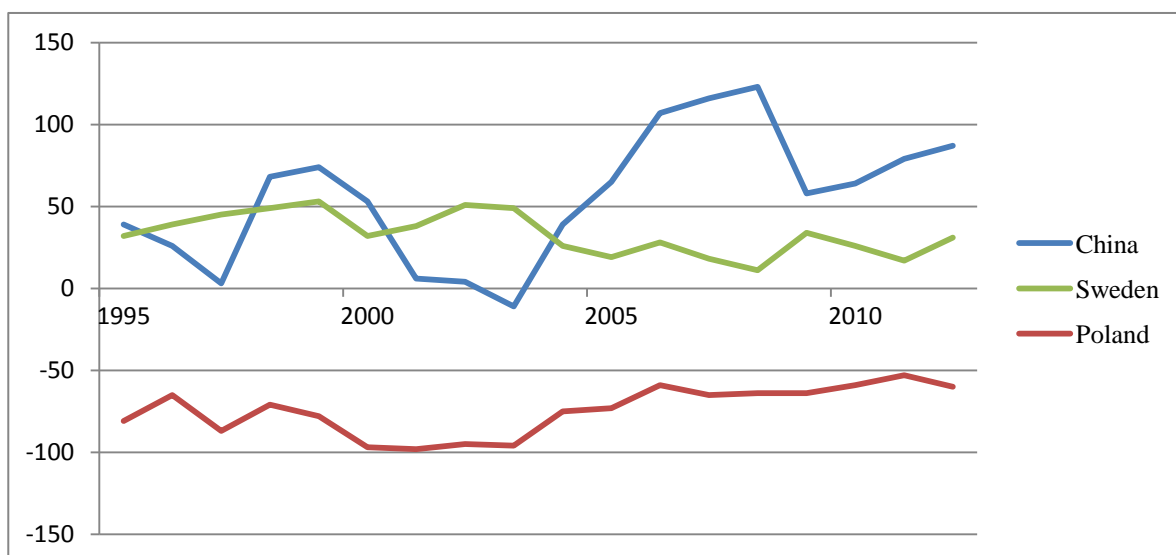

In terms of comparative advantages, we have found that the EU has comparative advantages over China in trade for the following commodities: high-skill (ratio 1.34) and medium-skill technology-intensive manufacturing products (ratio 1.96), road vehicles (ratio 4.57), primary products (ratio 1.69), and chemical products (1.19). For the following items EU has ratios less than one: manufactured goods (ratio 0.48), machinery and transport equipment (ratio 0.67), miscellaneous manufactured articles (ratio 0.13), labour-intensive and resource-intensive manufactures (ratio 0.08), office machines and automatic data processing machines (ratio 0.03).

Figure 2: Ratio of EU exports to and imports from China for high skill manufactures. France, Sweden, and Ireland had highest ratio among all EU27 countries in year 2012.

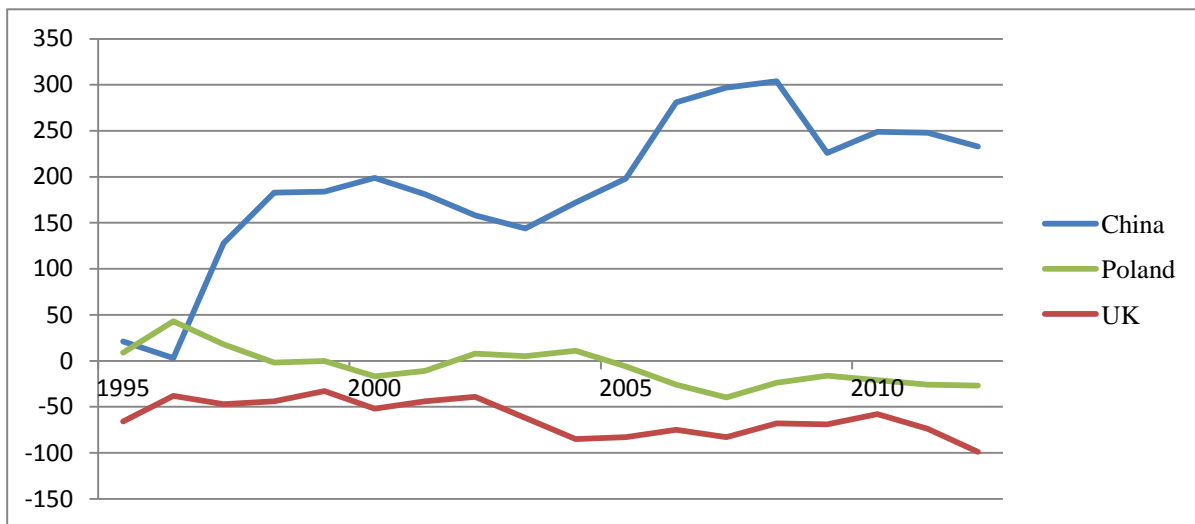

Ratio of exports and imports from China for high skill manufactures. It is presented as a total for all EU27 (blue) and for France, Sweden, and Ireland that had highest ratio among all EU27 countries in year 2012.

High-skill and technology-intensive manufactured products are potentially very relevant for EU. In year 2012 they represented 20% of total EU export. Among EU countries most successful have been France (ratio 4.06), Sweden (ratio 3.77), and Ireland (ratio 2.90) (Figure 2). In this respect the most interesting is Sweden which has recorded an almost constant increase of the export/import ratio of high-skill products with China over a period of 15 years. Large differences among EU countries can be noticed. Many less developed EU countries have a ratio in high-skill products of less than one. Actually, significant changes can be noticed within EU. When we look at the ranking data (Figure 3) then Poland is a success story with increase of almost 35 ranks in the period of 10 years. In year 2002 Poland has been a strong high-skill product importer with relative rank equal -95 while in year 2012 it had relative rank -60. In the same period Sweden has lost almost 25 ranks within EU (from rank 51 to rank 31) in spite of its success in respect of China.

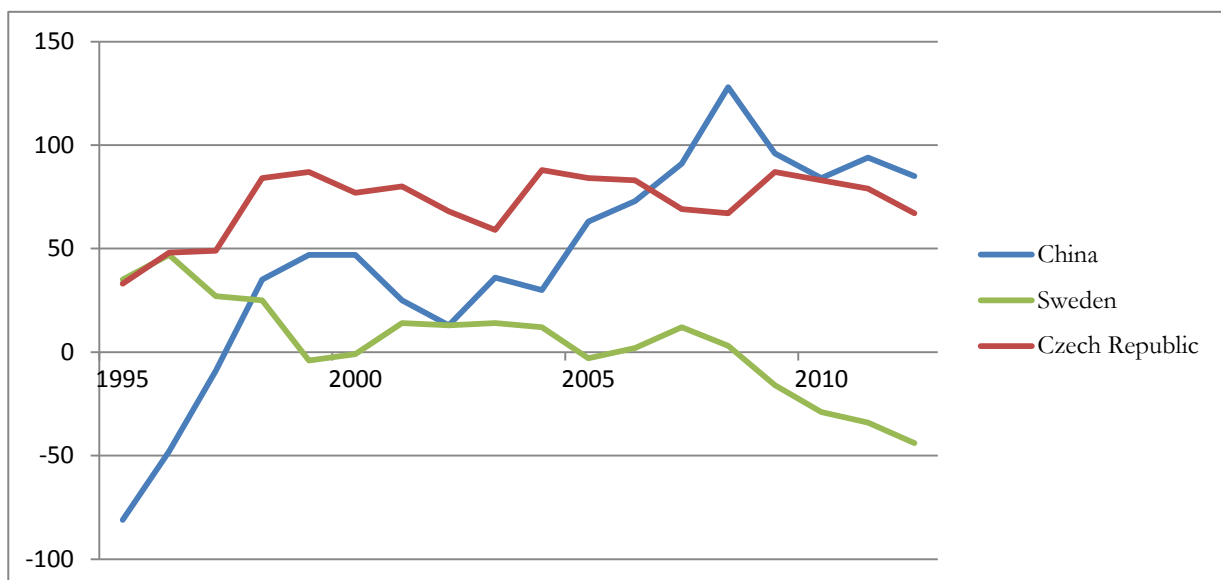

Figure 3: Total relative rank for high-skill and technology-intensive manufactures

In terms of skills, China demonstrates advantage over the EU in labour-intensive and resource-intensive manufactures exports. In terms of relative ranks, China has an almost constantly very high score of between 300 and 350 for labour-intensive products. Even in the case of a free trade agreement it can be expected that that relation will remain very similar. China demonstrates superiority over the EU also in low-skill and technology-intensive manufactured exports. In contrast to labor-intensive products there has been a significant Chinese increase in the period 1995-1999 but now it is almost constant with relative rank about 200 (figure 4). Among EU countries the most significant changes over the period of 10 years for low-skill products are in respect of UK and Poland. UK has lost 60 ranks (from -39 to -99) while Poland has lost 35 ranks (from rank 8 to rank -27).

Figure 4: Total relative rank for low-skill and technology-intensive manufactures

Medium-skill and technology-intensive manufactured exports has been the field of most notable changes in the period of the last 15 years (Figure 5). China has increased its relative rank from -81 to +85! The maximal value has been rank 128 in year 2008. The Czech Republic has been a constant success story within the EU. In the last 15 year period its relative rank has increased from 49 to 67. Even more significant has been the decline of Sweden. Its relative rank has decreased from 27 to -44. It may be assumed that similar trends will continue also in the near future and that changes may be even stronger in case of the free trade agreement with China.

Figure 5: Total relative rank for medium-skill and technology-intensive manufactures

Relative ranking data demonstrate most significant EU-China changes in respect of all food items, beverages and tobacco products, and agricultural raw materials. Currently these goods present a very small part of total trade, but in all of them, the EU has potential for significant export increase consistent with the significant change in the data in the past ten years in favor of EU countries.

The complementarities of the EU and China can provide opportunities for economic development. While the Chinese market becomes significant for EU exports, the EU Commission needs to be aware of the challenges that EU firms might face in the future in terms of competitiveness. EU authorities must ensure that this free trade agreement works both ways.

POLICY IMPLICATIONS

Despite the extraordinary surge in trade between the EU and China and the interest that this topic has impelled among policymakers, market players and scholars, academic research in this particular field of research is limited. This study is contributing to scientific research in the field of international business. It will also provide fundametal knowledge for policy makers in Europe, specially when updating the policy agenda of free trade negotiations.

CONCLUSIONS AND RECOMMENDATIONS

While trade partnership between the EU and China represents enormous opportunities for both markets, the fast growing sophistication of Chinese manufacturing, in the last past decade, denotes some challenges for the European manufacturing sector. Our study confirms that China records a significant trade surplus with Europe. This study also suggests that China has not only developed competitive advantage over the EU in labour-intensive and resource-intensive manufactured exports, but has also demonstrates over the period of the past 15 years, that medium-skill and technology-intensive manufactured exports have developed advantages over the EU. In this sector, China has increased its relative rank from -81 to +85. It may be assumed that similar trends will continue in the near future and that changes may be even stronger in case of the free trade agreement with China.

Behind China's impressive transformation in becoming one the world's biggest trading powers and of the development of its industrial structure has been China's governmental policy regime. These policies of promotion and protection have shaped the export basket with a range of increasingly sophisticated products directed to the export market (Rodrik, 2006) and have been the main driving forces of exports sophistication; hence, China signifies a direct competitor of developed countries' manufacturers (Feenstra and Wei, 2009). Therefore, the EU memebtrs countries and the Commission need to be aware of the challenges that EU firms are likely to face in the future in terms of competitiveness. EU authorities must ensure that any free trade agreement works both ways.

RELATIONSHIP MARKETING IN THE COMMUNITY PHARMACY: THE IMPACT OF NETWORK LOYALTY PROGRAMS ON STORE LOYALTY

Rodrigues, Catarina¹; Nobre, Helena²; Becker, Kip³

¹University of Minho, Portugal

²University of Aveiro, Portugal

³Boston University, Metropolitan College, USA

ABSTRACT

The research was designed to explore the importance of loyalty programs in today's competitive community pharmacy environment. Although this marketing tool is used to promote a loyal behavior of the customer, the results show a weak relationship between program loyalty and store (pharmacy) loyalty. This indicates that in order to create a successful competitive advantage for the pharmacy a loyalty program needs to be of value, rare, not perfectly imitated or easily replaced. When analyzing the value perception construct, the results indicated the importance of the psychological benefits of belonging to a loyalty program. When the loyalty program is implemented, not as a resource strategy, but as a "me too" strategy it is more likely not to meet marketing expectations and the expected benefits. Additionally, the authors analyze the effects of household characteristics on program perceived value.

Keywords: *Network loyalty programs, pharmacy, network strategy, marketing loyalty*

INTRODUCTION

One of the most remarkable trends over the two decade in marketing has been a change of focus from single transactions to relationships (Grönroos, 1994; Hennig-Thurau & Hansen, 2000). The 60's predominated marketing-mix concept and the 4P's model, with the development of industrial marketing and services marketing, has given rise to a need for an alternative approach to the marketing concept (Aijo, 1996; Grönroos, 1996; Gummesson, 1987), that better reflected the relationships that were incorporated in the marketing-mix (Waterschoot & Bulte, 1992). Grönroos (1994, p. 9), extending the initial definition of Leonard Berry in 1983, defines the goal of relationship marketing (RM) as "establish, maintain, and enhance relationships with customers and other partners, at a profit, so that the objectives of the parties involved are met." The most successful buyer-seller relationships are characterized by mutual trust and sharing of information and continuous display of commitment and satisfactory performance of the partner's respective role (Barnes, 1994). The tangible

benefits of the adoption of RM strategies were first published in 1990 by Dawkins and Reichheld. They stated that a higher rate of retention corresponds to a higher profit for the company (Dawkins & Reichheld, 1990). These effects are explained by the fact that a company that targets the retention rate is supported by a solid base of repeat sales (Dawkins & Reichheld, 1990), by the positive word-of-mouth (Bowen & Shoemaker, 1998) and by the fact that a loyal customer tends to spend more than a new one (Bhattacharya & Bolton, 2000). Loyalty is now seen as one of the most important drivers of success in a business (Reichheld, 1996) making it the core goal of any strategic planning in marketing (Dick & Basu, 1994; Diller, 2000). As a result the last decade has seen the blossoming of the loyalty programs (LP) market, especially in retail organizations (Sharp & Sharp, 1997). LP are defined as an integrated system of marketing actions that reward and, therefore, enhance the loyal behavior of the customer through several economic, psychological and sociological mechanisms (Leenheer, van Heerde, Bijmolt, & Smidts, 2007). Despite the wide interest LP, few studies are devoted to the potential impacts of the LP on actual consumer behavior, and the research provides contradictory outcomes (Meyer-Waarden, 2007).

CONCEPTUAL MODEL AND HYPOTHESES OF STUDY

The launch of any LP has as main objective to strengthen the relationship between the focal store and its customers, in order to differentiate it and to provide new approaches to address an increasingly competitive market. In the case of network LPs, where the management of the LP is made by a specific company, but the ownership of the LP is distributed through several firms, it is much easier to establish the firm's critical size, such as number of memberships, but this also means that the firm has limited influence on his LP strategy (Reinartz, 2006). And, recognizing that an LP does entail costs, including financial, labor and psychological capital (Uncles, Dowling, & Hammond, 2003), the authors studied antecedents and consequences of network LPs when applied to community pharmacy business. The conceptual model that forms the basis of the study is presented in figure 1. Based on the bibliographic research, six hypotheses were generated, focusing on the relationships between value perception, program satisfaction, program loyalty and store (pharmacy) loyalty. Additionally, the authors analyze the effects of household characteristics on program perceived value.

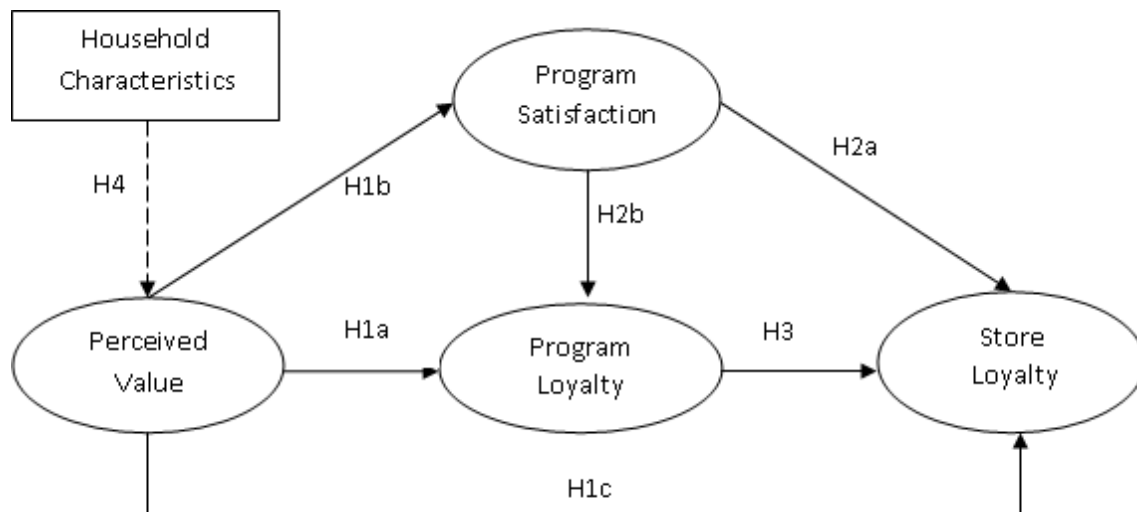

Figure 1 - Conceptual Model

The effects of value perception on loyalty

According to O'Brien and Jones (1995) a LP that effectively promotes store loyalty should combine five elements that, when together, determine the value of the program: (1) cash value of redemption rewards, (2) redemption choice, (3) aspirational value, (4) perceived likelihood of achieving rewards, and (4) the scheme's ease of use. These perceived benefits may help us understand why customers join LP and, as consequence, how this benefits drive loyalty (Mimouni-Chaabane & Volle, 2010).

H1a: The loyalty program will be positively influenced by the program perceived value.

H1b: The program satisfaction will be positively influenced by the program perceived value.

H1c: Value perception positively influences store loyalty.

The mediator effect of satisfaction in the value/loyalty relationship

Satisfied customers tend to concentrate their purchases within the same company more so than those customers who are not satisfied. As a result satisfaction is an important determinant of loyalty (Yang & Peterson, 2004).

H2a: Program satisfaction will have a positive effect on store loyalty.

H2b: Program loyalty will be positively influenced by program satisfaction.

The effects of loyalty programs on loyalty

As referred before, empirical evidence available on the effectiveness of the LP is limited and contradictory (Lewis, 2004; Mägi, 2003; Meyer-Waarden, 2007). Some researchers do express their doubts about the benefits of LP and suggest that, in a competitive market, good programs are imitated. Once the program has become generic across competing firms there would be a return to the initial situation (Meyer-Waarden, 2007; Yi & Jeon, 2003). Despite the empirical evidence, it seems

intuitive that LP members concentrate their purchases on a particular company and are less likely to visit competitors. In the case of network LPs, this relationship between program loyalty and store loyalty may not be observed since the member can distribute their purchases through several firms, and still continue to gather benefits from the LP.

H3: Store loyalty will be positively influenced by program loyalty.

The effects of household characteristics on program perceived value

Not all customers associate the same benefits to a certain LP (Allaway, Gooner, Berkowitz, & Davis, 2006; Mimouni-Chaabane & Volle, 2010), making it plausible that any effect of the LP in the customer behavior will be moderated by some member's characteristics (Mägi, 2003). Because it is difficult to suggest what individual factors are important, or to determine the direction of their impact, the authors did not derive a specific hypotheses related to this assumption but base this on the research related to individual differences as an exploratory character.

H4: The household characteristics influence the program perceived value.

METHOD

A survey was carried out in a community pharmacy in Vila Verde, a town in the north of Portugal. It is also noted that while community pharmacies in Portugal are represented by one major institution they do compete individually in their market environment. The network LP in this environment is analyzed and results shared by several community pharmacies who then gather the combined benefits of their collective effort. The data for this study was collected by using self-administered questionnaires distributed using convenience sample technique. The population of interest for this study was defined as consumers of a focal community pharmacy who were member of the LP. The survey instrument used a comprehensive set of 17 questions that were directly tied to the four constructs of the study. The interval scale was anchored using a Likert type measurement approach. Five response categories with properties labeling for the scale end points form (1) which denotes "strongly disagree", and (5) for "strongly agree". Following the conduction of a pretest to verify the suitability of the terminology used as well as clarity of the instructions and scales, to more questions were added to characterize the type of experience the member as with the LP (reward redemption and membership time length). A total of 72 surveys were validated (See table 1).

Table 1. Seventeen questions of survey and statistical results

Measures	Mean	α	Sources of items of the constructs
<i>Value perception of the LP</i>		0,73	
It is very easy de redeem rewards.	3,60		Sunny Hu, Huang, and Chen (2010)
The selection of products in the redeem catalog is good.	3,55		
The products available for redemption are of good cash value.	3,46		
<i>Program Satisfaction</i>		0,93	
On general, the evaluation of the LP is good.	3,94		Omar, Musa, and Nazri (2007)
I made a good choice when I decided to join this program.	4,18		
The rewards I receive, being a member of the LP, agree with what I expected.	3,59		
Overall I'm satisfied with the LP.	3,81		
<i>Program Loyalty</i>		0,88	
I like the proposed LP more so than other programs.	3,60		Sunny Hu et al. (2010)
I have a strong preference for the proposed LP.	3,83		
I would recommend the proposed LP to others.	4,04		
<i>Store Loyalty</i>		0,85	
<i>Attitudinal aspects</i>			
I have a strong preference for the proposed pharmacy.	4,14		Sunny Hu et al. (2010)
I like this proposed pharmacy more so than others.	4,00		
I give prior consideration to this pharmacy when shopping.	3,97		
<i>Price insensitivity</i>			
I would still continued to be a customer of this pharmacy even if it were raise prices slightly.	2,39		
	4,17		
<i>Word-of-Mouth</i>			
I would highly recommend this pharmacy to my friends and family.	4,17		
	3,46		
I would say positive things about this pharmacy to other people.			
<i>Commitment to the firm</i>			
I would stand by this pharmacy if its service has dropped in standard on rare occasions.			

DATA PROFILE

Customer's sample (N=72) included 53 (76,8%) females and 16 (23,2%) males and more than 50% of the respondents aged between 24 and 44 years old. Most of the individuals had a household of three

people (34,7%) and most of them also didn't have infants in their family household (58,3%). Table 2 provides a general result of costumers sample profile.

Another important statistic was the length of experience with the LP. 70,5% of the respondents claimed that they were members for more than one year, however only 51,4% of them had already redeem points.

Table 2 - Demographic Variables

<i>Sex</i>	
	Male (23,2%)
	Female (76,8%)
<i>Age</i>	
	18-24 years old (12,5%)
	25-34 years old (31,9%)
	35-44 years old (22,2%)
	45-54 years old (6,9%)
	55-64 years old (13,9%)
	+65 years old (11,1%)
<i>Marital Status</i>	
	Single (29,2%)
	Married (59,7%)
	Divorced (8,3%)
	Widower (1,4%)
<i>Family Household</i>	
	1 (11,1%)
	2 (27,8%)
	3 (34,7%)
	4 (18,1%)
	5 (2,8%)
	+5 (2,8%)
<i>Infants</i>	
	Yes (40,3%)
	No (58,3%)

RESULTS

In order to explore the various relationships proposed in the conceptual model, the Pearson's correlation coefficients (R) and the determination coefficient (R^2) were calculated between the latent constructs. The Pearson's correlations between the independent variable perceived value and dependent variables program satisfaction, program loyalty and store loyalty were analyzed. This analysis demonstrated two strong correlations: between perceived value and program satisfaction ($r = 0.74$, $p < 0.01$) and between perceived value and program loyalty ($r = 0.64$, $p < 0.01$). Analysis between the variable perceived value and store loyalty resulted in a moderate correlation ($r = 0.419$, $p < 0.01$). The extracted correlation from the analysis of the independent variable satisfaction and the dependent variable program loyalty has shown to be very strong ($r = 0.82$, $p < 0.01$). Regarding the program satisfaction variable and the variable store loyalty a moderate correlation ($r = 0.496$, $p < 0.01$) was found. Also moderate ($r = 0.493$, $p < 0.01$) is the correlation between the independent variable program loyalty and store loyalty.

To assess whether the program perceived value is dependent on some characteristics of the household, we resorted to the use of the chi-square test (X^2) implemented in the software of statistical analysis SPSS Statistics (v.21 software, IBM SPSS, Chicago, IL). The inferential statistical analysis does suggest that the program perceived value is independent of the number of people in the household ($X^2 = 71.7$, $p = 0.421$, $N = 70$), the existence of infants in the household ($X^2 = 19.1$, $p = 0.163$, $N = 71$) and age ($X^2 = 64.5$, $p = 0.663$, $N = 71$). It is also possible to claim that the program perceived value construct is dependent on the marital status of the member of the program ($X^2 = 70.6$, $p = 0.004$, $N = 71$). See table 3 for results of the hypotheses tested.

Table 3. Results of the Hypotheses Tested

Hypothesis Path	R	R^2	p -value	Results
H1a: Perceived Value – Program Loyalty	0,635	0,403	< 0,01	Supported
H1b: Perceived Value – Program Satisfaction	0,749	0,548	< 0,01	Supported
H1c: Perceived Value – Store Loyalty	0,419	0,175	< 0,01	Supported
H2a: Program Satisfaction – Store Loyalty	0,496	0,246	< 0,01	Supported
H2b: Program Satisfaction – Program Loyalty	0,822	0,676	< 0,01	Supported
H3: Program Loyalty – Store Loyalty	0,493	0,243	< 0,01	Supported

DISCUSSION

One of the primary goals of this study was the evaluation of a network LP from the perspective of the pharmacy costumer. The results provide a more focused and better understanding of the process of developing an effective LP that is able to satisfy their members (consumers) and as a consequence of that satisfaction create a loyalty to the pharmacy. The incorporation of program perceived value and program satisfaction permitted the authors to test the importance of these constructs on the formation of loyalty towards the store program. As highlighted in table 2, the study determined a strong empirical support for several of the hypothesis (H1a, H1b and H2b). The study also determined there was empirical evidence supporting that members of a network LP who recognize value to the program are satisfied with it and, as a result, engage in behaviors that strengthen their relationship with the community pharmacy. These results are in agreement with previous studies (Sunny Hu et al., 2010; Yi & Jeon, 2003). It should, however, be noted that, by splitting the path between program perceived value and store loyalty in two ways it was determined that the positive influence that perceived value has upon store loyalty is stronger if a loyalty program exists. This result is in agreement with previous studies (Sunny Hu et al., 2010; Yi & Jeon, 2003) that explain the mediator effect of program loyalty on store loyalty. However, unlike the outcome of these previous studies that found no significant correlation between program perceived value and store loyalty the authors established a positive correlation, although moderate, between the two constructs.

The results indicate that the value of the loyalty program is perceived by consumers and that these consumers are satisfied with it. It should be noted, however, that many of the program members, while claiming to be satisfied with the loyalty program never actually collected (enjoyed) the tangible benefits which were the possibility of exchanging loyalty points for products. Possibly, the psychological benefits of belonging to the LP and accumulating points have an important role in the construction of their perceptions of value and consumer satisfaction levels, as suggested by Dowling and Uncles (1997) even when these same consumers do not actually participate in the tangible benefits of the program. In line with this reasoning are the results of Arbore and Estes (2013) who explored the role of psychological benefits, and how the LP through the possibility of rewarding its members with prizes or discounts can influence their perceived status.

The assumptions of the authors that the program's perceived value would vary according to age and depending on the type of household were not confirmed. This result contradicts the results of previous studies (Meyer-Waarden & Benavent, 2003) that reported the possession and use of LP is dependent on the different life cycles and that are function, for example, of age and profession.

CONCLUSION

As Barney (1991) stated in his work, in order to any strategic resource to become a sustained competitive advantage it has to be valuable, rare, imperfectly imitable and non-substitutable. The weak correlation between program loyalty and store loyalty could be explained by the fact that this network LP is not exclusive property of the focal pharmacy. This implies that there may be members who are only loyal to the program (not the specific store) and will dividing their purchases among the several pharmacies within the same loyalty program. Regardless of type and goal to be achieved with the LP any program should have as its strategic objective to contribute to increase the operating profit of the company. This finding may have consequences for companies that use a franchise system where a central loyalty program could increase overall firm profits but not promote a unique loyalty/profitability to a specific store. The findings also indicate that as more firms come under competitive pressure to adopt LPs as a marketing tool without a clearly developed strategy such programs may not generate a competitive advantage for the company.

RESEARCH LIMITATIONS

In consideration of limitations or generalizations of research outcomes two factors should be considered. The first relates to the study's external validity as the respondents were selected by convenience so may not be an accurate representation of the population of community pharmacy LP members. A second weakness the endogenous nature of LP meaning that already loyal customers have a higher tendency for engaging in a LP. This phenomenon may artificially enhance the effects of program loyalty on store loyalty.

FIRM AGE AND FIRM PERFORMANCE: A LITERATURE REVIEW

Rossi, Matteo

University of Sannio, Italy

ABSTRACT

Purpose – In the last thirty years the link between firm age and performance has fascinated a lot of scholars. The debate on this topic have produced mixed results, which resulted in extensive economics debate, albeit without a systemic vision. As a result, the firm age literature has not yet developed a paradigm and the purpose of this paper is to present a review of the existing literature.

Design/methodology/approach – Author carried out a review of literature on firm age and performance.

Originality/value – Since 1990 there has been a major attention on firm age and firm performance. To address this important topic paper presents here a review of literature, starting to a simple question: age benefits performance?

Keywords: *firm age, longevity, firm performance, old firms, new firms.*

INTRODUCTION

In biology, aging is a process related with a decline in the physical functioning of a body, such as the capability to remember, move, and hear (Loderer and Waelchli, 2010). It is interesting to know whether firms also weaken/strengthen and increase/lose their ability to compete over time, and to know why that happens.

Early empirical work on firm dynamics looked at firm size but not firm age. The seminal work by Gibrat (1931) led to interest in the firm size distribution (FSD) (e.g. Hart and Prais, 1956; Simon and Bonini, 1958) and also in the relationship between firm size and growth rate (e.g. Hall, 1987; Hart and Oulton, 1996). However, later on interest in firm age began to grow, as some studies included age as an explanatory variable in regressions that investigate differences in firm performance. Nevertheless the relevance of age to firm dynamics has attracted comparatively little attention (Stinchcombe, 1965; Dunne, Roberts, and Samuelson, 1989; Singh and Lumsden, 1990; Brüderl and Schüssler, 1990; Barron, West, and Hannan, 1994; Caves, 1988; Hannan, 1998, Hannan, Pólos, and Carroll, 2003a, b), except in the management literature. <<The prior belief would seem to be that age benefits performance. For one thing, firms learn about their abilities and about how to do things better as they get older. For another,

the available empirical evidence shows that life expectancy increases with age, and that better firms survive. There are, however, reasons to disagree>> (Loderer and Waelchli, 2009: 4).

The paper is organized as follows. Next section outlines a literature review on firm age and firm performance, and finally paper presents the conclusions and managerial implications.

FIRM AGE AND PERFORMANCE: A LITERATURE REVIEW

The relationship between firm age and survival has been investigated by a growing number of scholars (Evans, 1987a,b; Fariñas and Moreno, 2000; Mata and Portugal, 2004; Bartelsman et al., 2005), but the results have not been clear-cut.

An early contribution coined the term “liability of newness” to describe how young organizations face higher risks of failure (Stinchcombe, 1965). More recently, however, authors have referred to the “liability of adolescence” (Bruderl and Schussler, 1990; Fichman and Levinthal, 1991).

For Bruderl and Schussler (1990) it's possible to distinguish <<two periods of an organizational life cycle. In an early phase, referred to as adolescence, death risks are low, because decision makers are monitoring performance, postponing judgment about success or failure. Meanwhile, organizations often live on a stock of initial resources. In a later phase, initial monitoring has ended and organizations are subject to the usual risks of failure>> (Bruderl and Schussler, 1990: 530).

Fichman and Levinthal (1991) develop a research on liability of adolescence that explain why firms face an initial honeymoon period in which they are buffered from sudden exit by their initial stock of resources.

It's possible to underline two different vision in the organization evolution of firms: the first one suggests that old and large organizations become increasingly dominant over their environment, the second one suggests that as organizations age they become less able to respond to new challenges.

Barron et al. (1994) investigate <<which of these visions best characterizes the evolution of state-chartered credit unions in New York City from 1914 through 1990 by analysing the effects of organizational age, size, and population density on rates of organizational failure and growth. The authors find evidence that old and small institutions are more likely to fail, while young and small organizations have the highest growth rates>> (Barron et al., 1994: 381). They identify “liabilities of senescence and obsolescence” according to which older firms are expected to face higher exit hazards once other influences (such as firm size) are controlled for.

Various studies in the Industrial Organization literature, report that life expectancy increases with age (Dunne et al., 1989), and better firms survive (Baker and Kennedy 2002). Hopenhayn (1992) shows that, under plausible assumptions, older firms enjoy higher profits and value. The general thrust of the literature on the survival of firms has taken two directions. One starts from the process of

learning by doing and examines the impact of learning on survival firms (Jovanovic, 1982). He affirms that the longer a firm remains in the market, the more it learns about its true costs and its relative efficiency and the less likely it is to fail.

An alternative, complementary approach is reflected in the work of Gort and Klepper (1982). They view variations in survival as consequences of changes in the rate and character of technological change as an industry evolves over the life cycle of its principal products. This approach is confirmed and extended by Jovanovic and MacDonald (1994a).

Also other studies sustain this point of view. In fact, there is ample empirical support for the proposition that survival and age have a positive relation. Dunne et al. (1989), using Census of Manufactures data for sixteen years (1972-87), find a positive relation between firm age and survival throughout the observed age range. Baldwin and Gorecki (1991) examine entry in Canadian manufacturing industries in the 1970-81 period and find high mortality among entrants. Audretsch (1991) analyse the experience of 11,000 manufacturing firms over a ten year period; he reaches a similar conclusion about the relation of age and survival.

Hopenhayn (1992) develops a dynamic stochastic model for a competitive industry. <<The paper extends long-run industry equilibrium theory to account for entry, exit, and heterogeneity in the size and growth rate of firms>> (Hopenhayn, 1992: 1127). Paper results show that, under acceptable assumptions, mature firms realize higher profits and value.

Baker and Kennedy (2002) realize a study builds on research from both finance and industrial organization and is consistent with a Schumpeterian view of economic development. <<The death of old firms and the subsequent birth of new ones thus greatly hastens economic development. Death by takeover allows a target firm's management to redeploy the assets of the disappearing firm; death by bankruptcy and liquidation often puts those assets into the market for reallocation to new managers>> (Baker and Kennedy, 2002: 351).

Two studies that underline why age could impair performance are Hannan and Freeman (1984) and Leonard-Barton (1992). For these scholars there are different reasons why age could harm performance. In fact they sofferme their attention on the organizational rigidities and inertia. In their perspective age can have adverse effects on performance also because of the organizational rigidities and inertia it brings about and because it impairs the ability of firms to perceive valuable signals. This conduct often makes sense, because it helps firms focus on their core skills and raise reliability and accountability (Hannan and Freeman, 1984). Codification makes it hard to recognize, accept, and implement change when doing so would be appropriate. Also age reduces flexibility and discourages change. At the same time, whatever learning benefits the firm can capture in its established lines of

business, they probably decline over time. As pointed out above, the stock of learning might increase at a decreasing rate. Overall, older firms could therefore lose their competitive edge.

More recently, other researchers have analysed the role age plays in the performance of surviving firms (Calvo, 2006; Garnsey et al., 2006; Stam and Wennberg, 2009).

Calvo has investigated age effects by focusing specifically on samples of young firms. In his article he tests Gibrat's Law for small, young and innovating Spanish firms: <<All the results reject Gibrat's law and support the proposition that small firms have grown larger. Additionally, the results show that old firms grow less than young ones, and innovating activity – both process and product – is a strong positive factor in the firm's survival and its employment growth>> (Calvo, 2006: 117).

Garnsey et al. (2006) explore processes and paths of new firms growth. They <<find that new firm growth is non-linear and prone to interruptions and setbacks to an extent overlooked in the literature. From the model of development used, five propositions are drawn concerning measurable features of new firms' growth paths; these relate to patterns of survival, continuousness of growth, turning points, reversals and cumulative growth>> (Garnsey et al., 2006: 1).

Another important analysis on the role age plays in the performance of surviving firms was conducted by Stam and Wennberg (2009). They present empirical evidence on the effects of research and development (R&D) on new product development, interfirm alliances and employment growth during the early life course of firms. << The main finding of this study is that R&D plays several roles during the early life course of high-tech as well as high-growth firms. The effect of initial R&D on firm growth seems to be through increasing levels of interfirm alliances in the first post-entry years. R&D efforts enable the exploitation of external knowledge>> (Stam and Wennberg, 2009: 85).

Coad (2010) studies the processes of firm growth by applying a vector autoregression model to longitudinal panel data on French manufacturing firms. He observes the coevolution of key variables such as growth of employment, sales, gross operating surplus, and labour productivity growth. <<Preliminary results suggest that employment growth is succeeded by the growth of sales, which in turn is followed by growth of profits. Generally speaking, however, growth of profits is not followed by much employment growth or sales growth. Quantile regressions highlight some asymmetries between negative-growth and fast-growth firms>> (Coad, 2010: 1677).

Other scholars (Cabral and Mata, 2003; Angelini and Generale, 2008; Cirillo, 2010) have tracked the evolution of the firm size distribution overtime, for cohorts of ageing firms.

Using a comprehensive data set of Portuguese manufacturing firms, Cabral and Mata, (2003) show that the firm size distribution is significantly right-skewed, evolving over time toward a lognormal distribution. <<Past conventional wisdom has held that expected firm growth rates are independent of size (Gibrat's Law), and that the firm size distribution is stable and approximately lognormal. Recent

empirical evidence, however, shows that the first of these facts does not hold when considering more complete data sets than those used in the past. In this paper, we show that the second fact a lognormal distribution of firm size also fails to hold in more complete data sets>> (Cabral and Mata, 2003: 1083). Their paper document two stylized facts about the firm size dimension: the distribution of young firms is very skewed to the right (most of the mass is on small firms); and the skewness tends to diminish monotonically with firm age (the distribution of older firms is more symmetric than that of young firms). Their paper presents a simple theoretical model in which financial constraints determine the observed FSD evolution, and provides supporting empirical evidence. Starting from this article Angelini and Generale (2008) focus the attention on the evolution of firm size distribution. They develop a study based on a sample containing survey-based measures of financial constraints for Italian firms. Main results are: <<Our main results, based on a sample containing survey-based measures of financial constraints for Italian firms, can be summarized as follows. First, the negative link between financial constraints and firm size is confirmed: firms that declare to be constrained are on average smaller than those that do not. Second, when narrow definitions of financial constraints are adopted, such constraints seem to be a real problem for a small minority of firms. Third, financial constraint problems are found to be relatively more frequent among very young firms, those up to six years of age, but not enough to alter the previous two conclusions>> (Angelini and Generale, 2008: 435-437). Cabra and Mata contribution inspire also Cirillo's research (2010). In fact, he realises a similar analysis with Italian firms using the CEBI database, also considering firms' growth rates.

Other research has focused on differences in performance and behaviour across firms of different ages. For example, it has been suggested that the age of a firm is positively related to its productivity levels: <<In our sample of long-lived large firms, we find that differences in the mix of workers across businesses are significantly related to differences in productivity levels across businesses, but there is little discernible relationship between changes in productivity and changes in worker mix>> (Haltiwanger et al., 1999: 97).

Brown and Medoff (2003) investigate the relationship between how long an employer has been in business (firm age) and wages. They find that firms that have been in business longer pay higher wages: <<Another interesting (though, given the size of our sample, somewhat tentative) conclusion is that the relationship between firm age and wages is not monotonic. Wages fall as firm age increases, but this relationship appears to be reversed among older firms>> (Brown and Medoff, 2003: 694). The seniority rules in the organization was studied by Loderer and Waelchli (2009). In many firms, under a seniority principle, employees who have been with the organization longer have benefits at the expense of rookie employees. Whatever the reason for their existence and acceptance within the organization, seniority rules in compensation can provide inadequate incentives for managers to

perform. If so, the performance of older firms could deteriorate with the age of the organization (Loderer and Waelchli, 2009: 7).

A relation between firm age and performance could also be induced by the age and tenure of the managers within the organization. Finkelstein and Hambrick (1990) underline three different reasons why older managers could be responsible of organizational inertia:

1. <<as individuals spend time in an organization, and particularly as they succeed and climb the organization's hierarchy, they become convinced of the wisdom of the organization's ways>> (Finkelstein and Hambrick, 1990: 486),
2. << Related to the effects tenure has on commitment to the status quo are those it has on risk taking. At one level, commitment derives from certain "psychological risks" of change>> (Finkelstein and Hambrick, 1990: 487), and
3. <<Finally, tenure tends to restrict information processing. Over time, organization members develop habits, establish "customary" information sources, and rely more and more on past experience instead of on new stimuli>> (Finkelstein and Hambrick, 1990: 487).

Bartelsman et al. (2005) realize a comparative analysis of firm demographics and survival in OECD countries. <<While average firm size differs across countries, due to both sectoral specialization and within-sector characteristics, we find similar degrees of firm churning across countries. In most of them, about 20% of firms enter and exit most markets every year; and about 20–40% of entering firms fail within the first 2 years of life. However, post-entry growth of successful entrants is much higher in the USA than in Europe, which may be indicative of barriers to firm growth as opposed to barriers to entry>> (Bartelsman et al., 2005: 365).

An interesting research was developed by Bellone et al. (2008). They examine market selection – in French manufacturing in the nineties – along the firm life cycle. This article <<argues that the determinants of firm survival have different effects depending on firm age. Results show that exiting firms display low levels of profitability and productivity. This selection process is more severe for young firms because industry structures favour the survival of mature firms>> (Bellone et al., 2008: 753).

Firm life cycle, obsolescence and firm's original endowments are main topics of two important studies developed by Agarwal and Gort (1996, 2002). They report evidence that hazard rates initially fall and then rebound as firms get older. The authors see survival as the trade-off between obsolescence of a firm's original endowments, on the one hand, and net investments and learning-by-doing, on the other. Eventually, the increase in endowments falls below the obsolescence rate. This could be explained with two reasons:

- the first one is that the stock of learning increases at a decreasing rate (important lessons are learned first and there is only a finite stock of information to be learned about a technology);
- the second one is that the adaptability of old endowments diminishes and investment opportunities in new technology shrink as the product market ages.

In 1996, they examine entry, exit and the survival of firms in terms of evolutionary changes in the market from the first introduction of a product to maturity of the market. Agarwal and Gort (1996) show the key role that the evolutionary stage of the product cycle plays in determining entry, exit and survival rates of firms: <<Entry rates appear to be affected profoundly by stage-related changes in both the rate of technical advance and the form that innovations take. Exit is determined largely by stage-related changes in the intensity of competition. Survival rates reflect both market and individual firm attributes. The role of market attributes, once again related to the stage of the product cycle, is reflected initially in rising hazard rates for early entrants in new markets. The power of market attributes is also reflected in the higher survival rates for new entrants than for incumbents for high-technology products>> (Agarwal and Gort, 1996: 497).

In 2002, Agarwal and Gort starting from a simple question: <<What is it, other than random shocks, that determines the probability of survival for a firm in a given market?>> (Agarwal and Gort, 2002: 184), analyse Firm Life Cycles and Firm Survival. They show that <<firm survival is crucially dependent on both the product and the firm life cycles. With regard to the firm life cycle, there appear to be two spans of time over which hazard rates decline. The decline continues until the obsolescence of initial endowments finally raises hazard rates... The relation of survival to age of the firm is not simply an empirically observed regularity, but follows an endogenously determined path predicted by the life cycle of the firm. The result that technology intensive industries are associated with higher hazard rates is explained by the faster obsolescence of initial endowments in such industries>> (Agarwal and Gort, 2002: 190).

Huergo and Jaumandreu (2004a,b) have investigated how probability of innovation and productivity growth, change across the firm age distribution. In the first article they look at the probability of introducing innovations by manufacturing firms at different stages of their lives. Their results show that <<the probability of innovating widely varies by activity, and that small size per se broadly reduces the probability of innovation, but also that entrant firms tend to present the highest probability of innovation while the oldest firms tend to show lower innovative probabilities>> (Huergo and Jaumandreu, 2004a: 193). In a second article authors look directly at the impact of firms' age and (process) innovations on productivity growth. They found <<that firms enter the market experiencing high productivity growth and that above-average growth rates tend to last for many years, but also that productivity growth of surviving firms converges. Process innovations at

some point then lead to extra productivity growth, which also tends to persist somewhat attenuated for a number of years>> (Huergo and Jaumandreu, 2004b: 541).

Autio et al. (2000) observe that 'born global' firms, experience faster growth in international sales than their older counterparts. They interpret this finding as evidence that younger firms are better able to develop export capabilities because they are better able to learn how to succeed in uncertain environments. <<The central contributions of this study include the introduction of the concept of "learning advantages of newness" and a confirmation of the usefulness of knowledge-based and learning views for understanding international expansion issues. We proposed that as firms get older, they develop learning impediments that hamper their ability to successfully grow in new environments and that the relative flexibility of newer firms allows them to rapidly learn the competencies necessary to pursue continued growth in foreign markets>> (Autio et al., 2000: 919).

Berger and Udell (2005) analyse the source of small business finance, and how capital structure varies with firm size and age. They identify some notable qualitative differences between the financing of small business in different age (infants, adolescent, middle-aged, old): <<We identify four different source of equity and nine different sources of debt, and show how the capital structure changes with the size and age of the firm>> (Berger and Udell, 2005: 50).

Similarly, Reid (2003) tracks small businesses in their first few years after inception and observes that the debt ratio decreases over time. He expounded a dynamic theory of the small firm <<assuming entrepreneurs maximise business value over a finite time horizon>>. He conducts a research on thirty-five key financial variables for one hundred and fifty new small business starts over a three year period after inception. Principal results are: <<(a) Steady growth of output (sales), including some phases of consolidation, (b) Steady growth of capital, as measured by fixed assets, (c) Sensitivity of debt (observable also through gearing) to the interest rate on long-term debt, (d) Absence or deferral of dividend payments, (e) Retiral of debt when sales are consolidated. This could be attributed to a cheap equity regime, (f) Increase in debt when sales are rising. This could be attributed to a cheap debt regime, (g) Arguably a sensitivity of equity (observable also through gearing) to the relative costs of debt and equity>> (Reid, 2003: 283).

An interesting research was conducted by Coad et al. (2010). They analyse the firm performance related to firm age between 1998 and 2006, for Spanish manufacturing firms. They begin their work with a simple question: do firms deteriorate with age (like milk) or do they improve with age (like wine)? <<In this paper we found evidence supporting both the milk hypothesis and the wine hypothesis. As evidence that firms improve with age, we found that ageing firms experience rising levels of productivity, profits, larger size, lower debt ratios, and higher equity ratios. Furthermore, older firms are better able to convert sales growth into subsequent growth of profits and productivity.

On the other hand, we also found evidence that firm performance deteriorates with age. Older firms have lower expected growth rates of sales, profits and productivity, they have lower profitability levels (when other variables are controlled for), and also that they appear to be less capable to convert employment growth into growth of sales, profits and productivity. Analysis of the growth rate distributions for different age groups shows that older firms are less likely to experience fast growth, while they are just as likely as younger firms to experience rapid decline>> (Coad et al., 2010: 26). Furthermore their results that younger firms are more successful at converting employment growth into growth of sales, profits, and productivity. Meanwhile, older firms look to do better at converting sales growth into growth of profits and productivity.

The analysis of literature review shows that there isn't an unique point of view on relationship between longevity and performance. This brief literature review has shown that, although progress has been made in our understanding of how firm age affects firm performance, there are still many opportunities remaining for improving our understanding of how firm behaviour changes as firms grow older.

CONCLUSIONS

Although firm age has attracted the attention of a big number of scholars, results have often been mixed. The complexity of the phenomenon is attested to by the fragmentation of the literature, which has prevented the formulation of a general theory on this topic. Most of the existing researches has been empirical work.

These considerations are equally valid for the relation between firm age and firm performance. The large part of studies are focused generically on firm performance, only a little part of these studies are focused on financial performances.

The heterogeneity of scholarly contributions in this field is also related to the difficulty of defining the subject of investigation: firm age can be studied referring to young firm or old firm. Also on performance the analysis can be conducted on innovation performances, organizational performances, financial performances, or other performances. However, all these considerations can explain only partially the excessive fragmentation of the literature. Naturally, literature fragmentation is not limited to the field of firm age and performance, but in this field it provides a clear opportunity for progress. To take advantage of this opportunity, however, it is necessary to conduct a comparison of the various themes, methods of investigation, and data used. Only in this way will it be possible to explore in depth this topic, which remains controversial as far as methodology, objectives, and results are concerned because of its extreme complexity.

EXPLORING CONTINUITY OF CARE IN INTEGRATED HEALTH CARE SETTINGS

Rudawska, Iga

Faculty of Economics and Management, University of Szczecin, Szczecin, Poland

ABSTRACT

Continuity of care is considered to be an important feature of high quality health care. It is a wide-ranging concept, that encompasses several different aspects of health care. However, it is not often evaluated explicitly, because of the lack of suitable measurement instruments. Therefore, the purpose of this paper is to identify chronic patients' experiences and values associated to continuity in care. In order to accomplish this purpose a single focus group interview with 12 chronic ill patients has been carried. Collected responses were analysed thematically and grouped into dimensions of continuity of care. As a result of the study, eight dimensions of experienced continuity of care were identified: patients' involvement, decision-making support, cross-boundary continuity, coordination of activities, communication with the patient, problem solving, availability, and patient-centeredness. This study develops a patient-based framework for evaluating continuity of care. Is also identifies key transition points with problems of lack of continuity.

This paper is part of the research project financed by National Science Centre in Poland (No. 2012/05/B/HS/02213).

Keywords: *relationship management, quality indicators, patients' experience, health care, qualitative study*

INTRODUCTION

Health care is becoming more patient-centred and, as a result, the experience of users of care and evaluation of their experience are considered seriously, and used to evaluate the delivery of care (Vrijhoef *et al.*, 2009; Wagner *et al.*, 2005). There is considerable amount of literature about patient satisfaction and experience (Linder-Pelz, 1982; Pascoe, 1993), but it is not clear how to appropriate the instruments are to measure patient experience with care in integrated health care settings. The issue becomes even more important when, quality and satisfaction tools validated by health plans are implemented as a marketing instrument. This is especially the case in current policies towards the integration of health care in Poland.

Integration of care is defined by the WHO as “bringing together inputs, delivery, management and organization of services related to diagnosis, treatment, care, rehabilitation and health promotion wherein integration is regarded as a means to improve the services in relation to access, quality, user satisfaction and efficiency” (Gröne and Garcia-Barbero, 2001). Considering patients’ perspective in this integrated care approach, a measurement instrument is needed to appropriately evaluate the experience of chronically ill people.

Continuity of care is considered to be an important feature of high quality integrated health care. It is a wide-ranging concept, that encompasses several different aspects of health care. There is evidence that continuity of care is linked with greater patient satisfaction (Schers et al., 2005; Mechanic, 2004). However, it is not often evaluated explicitly, because of the lack of suitable measurement instruments. Therefore, the purpose of this paper is to identify chronic patients’ experiences and values associated to continuity in care. The study has been based on the research project sponsored by the National Science Centre in Poland (No. 2012/05/B/HS/02213).

THEORETICAL FRAMEWORK

The term of continuity of patient care appears in numerous discussions as a fundamental aim of integrating the process of health care service provision in Europe (Antunes and Moreira, 2011). In turn, patient satisfaction is a reflection of the problems occurring during a service provision process. Any loopholes in the process coordination, be it between service providers themselves, or between patients and care providers, can thus be treated as threats to continuity of patient care, which impacts on the achieved treatment results (Weinberg et al., 2007). In the context of integrated health care, continuity of patient care is understood as a qualitative dimension concerning seamlessness of health care process provision. The legacy that the 1990’s left behind is the perception of continuity of care from the patient’s perspective, as the patient’s experience of a coordinated and seamless progress/development of care (Cowie et al., 2009).

Currently, researchers use multi-dimensional models to describe the discussed concept. One such model is Haggerty’s team interpretation, treating continuity of care as a combination of (Haggerty, 2003):

- informational continuity – ability of a service provider, from the patient’s perspective, to take the right decisions based on sufficient information source regarding patient’s medical history;
- management continuity – ability of a service provider/network of service providers, from the patient’s perspective, to establish a cohesive care management plan;
- relational continuity – ability of a service provider, from the patient’s perspective, to continue the provision of care by medical professionals the patient is familiar with.

What is crucial in this interpretation for further consideration is adding long-term relations to continuity as well as concentrating on an individual patient and his/her needs. In turn, concentration on an individual patient lies close to the concept of patient/client-oriented care, and more broadly to human-oriented care (Kodner, 2003).

In this paper we adopt multi-dimensional concept of continuity established by G.K. Freeman (Freeman et al., 2003). He defined continuity of care as experiencing a coordinated and smooth sequence of health services by patients. In order to achieve it, according to G. Freeman (Freeman et al., 2003), a health care system needs to feature:

- continuity of information – ensuring information transfer following the patient in the system,
- cross-boundary and team continuity – ensuring effective communication between professionals and services and with patients,
- flexible continuity – ensuring adjustments to patient's needs over time,
- longitudinal continuity – minimizing the number of physicians treating a given patient in a given health care unit (such as family physician practice),
- relational continuity – assigning one or more individuals with whom the patient can establish and maintain a relationship in the therapeutic process.

What has emerged clearly from above discussion of defining continuity of care is that there is still considerable conceptual and empirical debate surrounding this issue. Based on empirical findings and the conceptual development of the continuity of care concept, continuity of care understood as service quality indicator is now often believed to be the antecedent of patients' satisfaction (Kasper *et al.*, 1999; Schneider and White, 2004). Approached from our proposed vantage point, the measurement of continuity of care would be thus about a perception (*this is what I observe*), perhaps relative to expectations; the measurement of patient satisfaction would be about an evaluation (*this is what I feel*).

Purpose and Method

The main purpose of this paper is to identify chronic patients' experiences and values associated to continuity in care. To accomplish it a qualitative study was carried out. The qualitative study comprised of a single focus group interview (FGI) conducted in the form of an open discussion with 12 patients suffering from a chronic condition, who may be treated as informants. The procedure of the focus group interview followed the guidelines set forth for that type of study (Krueger, 1994).

The study was guided by two research questions:

- what variables do patients perceive to be significant in the continuity of care?,
- how can the isolated elements be grouped in order to establish a model of evaluating patient care quality in the respect of continuity of care?

Potential participants of the patients' panel were intentionally selected through a community interview. The criteria of participants' selection for the focus group interview were as follows: the patient is an adult, the patient suffers from a chronic medical condition

- on account of a chronic illness the patient has frequent (over 7 times a year) contact with the health care system, the patient is able to participate in a meeting lasting approximately 2 hours.

An analysis of transcripts of the gathered material allowed identifying 56 comments defining patients' needs, feelings, preferences and experiences in respect of health care in chronic conditions. Subsequently, the statements were entered into ATLAS.ti software program for management of qualitative study data. Preliminary analysis involved encoding the comments from the transcript of the FGI. Then the author assigned the encoded comments to several central categories by applying Strauss' and Corbin's method of comparison in pairs (Glaser and Strauss, 2009). The names of sets were identified on the basis of the literature of the subject dedicated to integrated health care. Their understanding and interpretation were also submitted to discussion with patients during the plenary panel.

RESULTS

The qualitative study comprised of a focus group interview (FGI) conducted in the form of an open discussion with patients suffering from a chronic condition, who may be treated as informants. Tables 1,2,3, and 4 show the patients' characteristics.

Number of chronic diseases	Number of FGI participants
1	5
2	3
3	2
More than 3	2

The central categories (labels) comprised: patient involvement, decision-making support, availability, communication, organization and coordination of the service provision process, continuity, problem resolution and focus on the patient. As a result, a schedule of central categories and sub-categories was compiled describing the dimensions of service quality provided to chronically ill patients, which can be treated as indicators and sub-indicators in the evaluation of service quality delivered to the analysed patient segment (Table 5).

Groups of indicators identified in the literature and confirmed by the FGI - main category (in brackets – reference to the Freeman's model)	Contents of indicator groups identified via the FGI – sub-indicators
1. Patient's involvement (Freeman's team continuity)	-patient's opinion
	-time devoted to hear the patient
	-information on subsequent stages of therapy, action scenarios
	-history taken by the physician with extended patient's involvement
	-patient's involvement in decision making
2. Decision-making support (Freeman's continuity of information)	-guidelines concerning patient's conduct
	-consultations conducted by other means than the traditional method
	-provision of printed material
	-organized community support
3. Cross-boundary continuity (Freeman's cross-boundary continuity)	-relational continuity
	-organizational continuity

	-informational continuity
4. Organization of care provision and activities coordination (Freeman's longitudinal continuity)	-action coordinator, case manager
	-standardization of care over chronically ill patients
	-cohesion of medical advice
	-information exchange between physicians
	-comprehensive care
	-diagnostics
	-timely services (time coordination)
	-multi-disciplinary teams
5. Communication with the patient (Freeman's relational continuity)	-communication with the patient regarding purpose of care
	-communication with the patient regarding health promoting conduct and prophylactics
	-standardization of gathering patient's history
	-explaining the therapeutic process and its expected results to the patient
6. Problem resolution (Freeman's continuity of information)	-therapy planning
	-impact of a disease on life quality
	-emergency cases and exacerbation of a disease
	-continuity of care and treatment
7. Availability (Freeman's flexible continuity)	-sensitivity of the system to patient's suggestions
	-availability of various services at one location
	-possibility of choice
	-therapy waiting time
8. Focus on the patient (Freeman's experienced continuity)	-availability of information as to where and how to arrange matters
	-empathy demonstrated by the personnel
	-respecting patient's rights
	-evaluation of the system from a patient's perspective

Table 5. Central categories and their detailed dimensions of continuity of care delivered to chronically ill patients identified in the FGL.

Source: own research.

Most of the indicators (central categories) identified above, such as patient involvement, decision-making support, problem resolution, communication with the patient, activities organization and coordination, flexibility and availability refer to the process of service provision to patients with

chronic conditions. The remaining ones, i.e. ensuring continuity in its various dimensions, focus on the patient, are of structural nature.

DISCUSSION AND FINDINGS

Analysing the results obtained through the FGI, it is worth emphasizing that the chronically ill patients themselves rarely use terms such as: “continuity of care”, “coordination”, “therapy planning”, “integration of care” to describe their experience, needs and feelings with regard to systematic use of health services. Furthermore, assigning a particular experience or need expressed in a patient’s comment to one of the eight main categories was problematic at times on account of mutual interrelation of individual dimensions and possibility of illustrating a number of various sub-categories with a single comment at the same time.

Patients described their previous experience with health care system in regard to continuity as the care they have been receiving since the diagnosis identifying their chronic condition was made. They were referring to check-ups and systematically repeated tests related to a given chronic disease. Some declared that “patients need to demand the tests from their doctors,” (P5, female, 64 years old) “the patient more often than not reminds the doctor of it,” (P4, female, 63 years old) or they articulated their needs for such tests by saying: “a family doctor should recommend that a patient of a particular age (i.e. an elderly patient) take the tests that the patient is entitled to on account of his/her age” (P8, female, 73 years old). The respondents were also referring to the significance of continuity of care by demonstrating their concern resulting from deficiency of care:

-“intervals between visits [are] 9, 10 months – I believe that it is too rarely. It is hard to refer to a doctor you see so seldom as your attending physician” (P1, male, 41 years old).

High frequency of visits and consultations resulting from exacerbation of condition symptoms seems to be the parameter describing the quality of care delivered to a chronically ill patient. This component acquires particular significance at the start of therapy, where the patient’s ignorance is confronted with the need to deal with a chronic condition on an everyday basis. Hence patients particularly value extensive consultations with numerous specialists at initial episodes of chronic diseases, which improve their understanding of the circumstance they are in. The effect of such an attitude to the service recipient, which in fact constitutes an indicator of the focus on the patient (patient in the centre), involves closer adherence to therapy regime and acceptance of any related inconveniences.

Experience of longitudinal continuity may be perceived as a pre-condition necessary for the establishment of relational continuity. Patients appreciate the situations in which they are recognizable. It builds their sense of security, which may contribute to achieving better therapeutic

results: “when I come to the outpatient clinic, everyone knows me, greets me and it is very pleasing” (P3, male, 81 years old).

The element of continuity of care in chronic diseases that the patients value is the possibility of obtaining assistance/consultation in emergencies. Flexible continuity also manifests itself through service provider’s readiness to change appointment dates suitably to patients’ preferences. Here is an account of one of the FGI’s participants describing her experience in this regard: “they have their schedules, and I have mine” (P12, female, 45 years old). A majority of patients experience lack of flexible continuity, especially with respect to the waiting time for scheduled consultations and delays in making appointments. Here are several responses recorded during the FGI:

- “there was no problem with issuing a referral, however there was one with actually making use of it” (P2, female, 39 years old).

Communication and its continuity appear to be another important component of patient care in patient-service provider relation. The quality of communication is chiefly defined as the ability to listen to the other party and to convey a certain amount of information, including on the course of therapy, any possible adverse effects, any risk related to a procedure, expected results. Patients’ experience in this respect related during the group interview was rather negative. The following patients’ accounts are symptomatic:

- “I had no idea that [if] I take Eutyrox it will cause diabetes. No one has informed me of that” (P6, female, 70 years old),

- „The doctor just whizzed by” (P9, female, 69 years old).

The element of continuity of care in chronic diseases that the patients value is the possibility of obtaining assistance/consultation in emergencies. Since the needs of chronically ill patients change over time, they find it important that medical professionals react quickly enough. Such situations may thus be related to flexible continuity, which involves adaptation of a service to the patients’ needs. One such option is provision of services by medical professionals selected by the patient. Here is how one of the interview participants perceives the phenomenon: “I have a regular cardiologist, however not the one I would have liked, but the one I had to choose” (P7, female, 62 years old).

Erosion of continuity may occur at any stage of the process of patient care provision, although the greatest risk of it appearing exists in the course of a patient’s transfer from one stage of health care to another, for instance from primary health care to secondary specialist outpatient care, from outpatient care to hospital-based setting, or from hospital-based setting to primary care. Transition of the patient from one stage of care to another typically involves exacerbation of symptoms; it necessitates more extensive diagnostics or a hospital discharge. All of the above situations generate a different demand for health care and different intensity of health care services consumption. The loopholes in the

continuity of health care may therefore result in delays of care provision, misinformation, or problems of a communicative nature. Consequently, the patient may seek alternative solution to the medical problem, disregard medical advice, or even decide to discontinue treatment.

ORIGINALITY / VALUE

The results of the conducted qualitative study constitute an important premise for the construction of a methodological tool, comprising a set of indicators describing continuity of care from the perspective of the patient. Identification of the dimensions of health care continuity over chronically ill patients in Polish health care settings as well as identification of any possible loopholes in such continuity constitutes a vital cognitive value of this stage of methodological procedure.

The developed framework provides an assessment of various dimensions of continuity of care that is applicable to integrated health care settings in Poland but could also serve as a reference list for evaluating continuity of care in other settings. Assessment of these aspects of patients' experience is of particular value in relation to chronic disease management in Poland and other countries that face aging societies.

As does most research, this study has certain limitations that affect the interpretation of the results and simultaneously suggest directions for further research. The study was conducted in a single region (West Pomerania). Including other regions of Poland might have identified contextual boundaries to the findings. Moreover, the study is comprised of a single FGI and could have benefited from including additional ones.

Additional research related to continuity of care could examine whether some quality dimensions are common across health care levels (primary care, out-patient specialist care, in-patient care) or relevant only for particular level (in that case out-patient). It could also refine the assessment tool referring perceived quality of integrated health care programmes. Finally, further research could address the value of different integrated delivery schemes and overall success of the patient relationship management.

Despite above mentioned limitations, the findings reported in this paper offer a better understanding of relationship marketing in health care settings.

CUSTOMER PERCEIVED VALUE IN BUSINESS-TO-BUSINESS

MARKETING: IS IT STILL ENOUGH?

Russo, Ivan; Confente, Ilenia; Cobelli, Nicola

Department of Business Administration, The University of Verona, Verona, Italy

ABSTRACT

This study provides a better understanding of business relationships between suppliers and industrial buyers. Based on previous research models, we explored the value drivers that industrial buyers, in particular health professionals, perceived as relevant in the hearing-aid distribution industry. A nationwide online survey was the principal data-collection instrument. Based on previous research, we evaluated several drivers measuring the perceived value delivered by hearing-aid suppliers, including offer quality, service elements, relationship costs and personal interaction. We researched not only the customer value (CV) but also the ability of the suppliers to anticipate customer needs. The results demonstrated that other than offer quality, none of these drivers represents or affects the customer value. However, these drivers were found to affect the anticipation of customer needs, surprisingly demonstrating that succeeding in each of the drivers reflects the anticipation of customer needs but not customer value.

Keywords: *customer value, supplier–customer relationships, customer value anticipation, business-to-business relationship, health-care professionals, industrial marketing, service quality, service marketing, switching cost, vendor evaluation.*

INTRODUCTION

Research investigating customers' perceptions of value generally distinguishes between 'desired value' (what the customer desires to receive) and 'received value' (the customer's perceptions about the value delivered). This perspective can be termed 'value for the customer'.

Woodruff (1997) found that many apparently different definitions were actually in fact similar, generally involving a trade-off between what the customer receives, identified as quality, benefits, worth, or utilities, and what they give in exchange. Ulaga and Eggert (2006) highlighted that in business-to-business (B2B) contexts, relationship benefits seem to represent a strong potential for differentiation in key-supplier relationships. According to Flint *et al.* (2002), the implication for managers is that they should attempt to understand the whole-value hierarchy of their offering and avoid defining it strictly by its attributes. Buyer value can be created at any point in the chain by

making the buyer either more effective in their markets or more efficient in their operations. The notion of value has been at the heart of marketing for nearly 20 years (Ritter and Walter, 2012). Before communicating the value offering to customers, companies should translate the value-delivery strategy into detailed actions and activities to be undertaken at any level of the organisation. Customer value has been found to measure some important aspects that are generally not included in customer-satisfaction measurements. Measuring customer value can be of particular help in today's changing and highly competitive business environment because it allows a comparison between alternative offerings and provides data that is useful for understanding and anticipating customers' current and future needs.

Research has demonstrated that deeper insight into the sources of value creation can create superior value propositions in a competitive global marketplace (Anderson and Narus, 2008; Blocker *et al.*, 2011; Heinonen *et al.*, 2013). Business marketers have cited the need for greater understanding of the drivers of customer value as a priority (Anderson and Narus, 2008).

Our study focused on customers' perceived value (CV) defined as the customers' perceived trade-off between benefits and sacrifices within relationships (Lam *et al.*, 2004; Ulaga and Eggert, 2006; Blocker *et al.*, 2011; Prior, 2013). and customer value anticipation (CVA) in B2B contexts.

This study aimed at contributing to the debate on customer value by advancing its exploration and considering the business relationship between suppliers and industrial buyers (their customers) of health-care services. We tested different constructs (offer quality, personal interaction, service support, supplier know-how, relationship costs, operational costs) to measure the value perception delivered by their suppliers.

The research model of this study is based on the need for more research on measuring the constructs of the B2B context in different complex industry sectors (Blocker *et al.*, 2011; Lindgreen *et al.*, 2004; Ritter and Walter, 2012; Prior, 2013). The choice of health-care services was due to the increasing attention of scholars on such services in the B2B context (Crié and Chebat, 2012). This study attempts to address the calls of previous research to provide new insight into customer value through a national online survey conducted in Italy exploring customers' value perceptions and CVA at the retailer level in the hearing-solutions industry in Italy.

LITERATURE

Most recent B2B literature (Walter *et al.*, 2001; Nyaga *et al.*, 2010; Lepak *et al.*, 2007; Ritter and Walter, 2012) simply defines customer value as a trade-off between benefits and sacrifices perceived by the customer in a supplier's offering. The benefits and sacrifices perceived, and hence the perception of value, may vary depending on the changes in the importance given to the distinct elements of the

offering. Ulaga and Eggert (2006) found that in B2B contexts, relationship benefits seem to represent a strong potential for differentiation in the key-supplier relationship. Core differentiators would be represented by service support and the interpersonal interaction with the supplier firm and, secondarily, by the supplier firm's expertise and ability to improve a customer's time to market. Relationship value in the B2B context is a dynamic process, and the nature and characteristics of the value sought are constantly changing across different supply-chain members (Cannon and Homburg, 2001).

Research on building customer-value theory in B2B contexts has focused on defining the concept of customer value (Woodruff, 1997), measuring its antecedents (Ulaga and Eggert, 2006), and exploring value creation as a process (Grönroos, 2008) that dynamically unfolds in relationships (Blocker and Flint, 2007; Flint *et al.*, 2002). Smith and Colgate (2007) identified four major categories of value that organisations can create: functional/instrumental value, experiential/hedonic value, symbolic/expressive value, and cost/sacrifice value.

Blocker *et al.* (2011) tested the role of proactive customer orientation for creating customer value in global markets. Their hypothesis was based on the consideration that the higher complexity of a multinational context makes it more difficult for customers to evaluate providers and fosters feelings related to ambiguity and risk. Understanding the customer's value chain and their end values and goals in the value hierarchy is very useful in discovering the customer's unexpressed and latent needs. Another interesting area of research is the CVA dimension that is defined as the kind of capability that can be seen as a dynamic capability (Eisenhardt and Martin, 2000), itself an extension of the resource-based view of the firm, and more specifically, a specific kind of dynamic capability termed an 'operant resource' (Flint *et al.*, 2011). There are several operations of business using different customer-value constructs (Smith and Colgate, 2007; Russo and Cardinali, 2012). However, there remains a gap in the literature on the role anticipation on the part of the supplier plays in contributing to the level of value customers perceive suppliers help to create.

Blocker *et al.* (2011) model provided a relevant contribution to the literature by exploring the antecedents of customer value, for example, standards. Starting from this point, our study allowed us to compare the value constructs measured by Blocker *et al.* (2011) as applied to the ICT industry context. We particularly considered the following key factors: the offer quality, personal interaction with employees, support services, supplier's know-how and relational/transactional costs from the perspective of specialized hearing-aid buyers. Table 1 lists the hypothesis of our study.

	Research Hypotheses
	HP1 OFFER QUALITY
	HP1a The offer quality of products and services provided by the main supplier has a positive effect on customer-value perceptions in a B2B context.
	HP1b The offer quality of products and services provided by the main supplier has a positive effect on CVA perceptions in a B2B context.
	HP2 PERSONAL INTERACTION
	HP2a The personal interaction and the relationship with the main supplier has a positive effect on customer-value perceptions in a B2B context.
	HP2b The personal interaction and the relationship with the main supplier has a positive effect on CVA perceptions in a B2B context.
	HP3 SERVICE SUPPORT
	HP3a The service support provided by the main supplier has a positive effect on customer-value perceptions in a B2B context.
	HP3b The service support provided by the main supplier has a positive effect on CVA perceptions in a B2B context.
	HP4 SUPPLIER KNOW-HOW
	HP4a The specialised expertise and know-how of the supplier has a positive effect on customer-value perceptions in a B2B context.
	HP4b The specialised expertise and know-how of the supplier has a positive effect on CVA perceptions in a B2B context.
	HP5 RELATIONSHIP COSTS
	HP5a The amount of relationship costs derived from the partnership with the main supplier has a negative effect on customer-value perceptions in a B2B context.
	HP5b The amount of relationship costs derived from the partnership with the main supplier has a negative effect on CVA perceptions in a B2B context.
	HP6 SWITCHING COSTS
	HP6a The costs that a business customer faces to switch from one supplier to another have a positive effect on customer-value perceptions in a B2B context.
	HP6b The costs that a business customer faces to switch from one supplier to another have a positive effect on CVA perceptions in a B2B context.
	HP7 CUSTOMER VALUE AND CVA
	HP7a The ability of the supplier to anticipate the customer's needs has a positive effect on customer-value perceptions in a B2B context.
	HP7b The overall customer-value perceptions have a positive effect on the evaluation of CVA by business customers.

Table 5. *Research hypothesis*

Our study concentrated on the analysis of the manner in which value is perceived and evaluated by specialist buyers, particularly focusing on the supplier's ability to deliver value, as well as its capability to anticipate value .

METHODS

Data sample and collection

Data collection focused on perceived value drivers with business customers working in the health-care

service. We surveyed key informants (i.e. acting industrial buyers) about their perception of the value delivered by their main provider of hearing aids.

The health industry was selected for several reasons. The complexity of the products in the market has driven final customer to search for advice from trustworthy and reliable sources. As such, this industry represents a good example of a changing marketing-channel structure that has emerging actors who have adopted a larger role in the manufacturer/end customer exchange.

We used the following participant inclusion criteria:

- professionals enabled by law to resell hearing aids
- professionals running a business at the retail level
- professionals with the freedom of choice of their suppliers
- voluntary participation.

We identified 840 health-care professionals belonging to the Italian Audiologists Association (ANA) who met the criteria. However, 340 were excluded because they were actors of structured hearing-aid distribution chains (i.e. franchisees) and therefore, did not meet the freedom of choice criterion. We selected 500 health-care professionals who met the criteria and sent them an email with a link to a secure web survey. This survey was completed after a pre-test that refined the structure of the survey, and the items involved in the survey.

In September 2013, a pilot survey was administered on a convenience sample of 20 participants. The principal finding was that respondents, due to their cultural background, found it difficult to understand some of the items of the original version of the questionnaire. Consequently, it was necessary to refine the structure of the survey and of some of the items listed in the survey, by providing examples for each item proposed.

Questions were divided into two main sections. Section A surveyed the demographic characteristics of respondents and the information about the relationship with their key hearing-aid supplier (e.g. experience with hearing-aid products, length of the partnership, total expenditure with their main supplier). Section B surveyed customer-value constructs adopting a 1–7 Likert scale (i.e. 1=highly dissatisfied to 7=highly satisfied).

We received 317 complete responses; all respondents were audiologists running a small business in the Italian hearing-aid distribution industry. They purchased products/services from hearing-aid suppliers and they were enabled by law to resell them to hearing-impaired end users. They were the key players in the transaction between suppliers and the hearing-impaired end users, evaluating the best value offering and advising the final customers.

On average, respondents had been working for several years within this industry and seventeen per cent had experience of 'more than 30 years'. Thirty-eight per cent declared having long-term

experience in the industry (i.e. from 20 to 30 years), and 39 per cent indicated having 'from 10 to 20 years' experience. Only six per cent had fewer than 10 years' experience within the industry.

Forty-three per cent of the participants declared having a long-term relationship of more than 7 years with their main supplier, and 40 per cent of respondents declared 70 per cent to 90 per cent of their total expenditure was to their main supplier. At least 20 per cent stated they received 90 per cent of their products from their main supplier.

Data analysis

Respondents were asked to evaluate the main value drivers provided their main hearing-aid supplier. This included the main value drivers highlighted by previous research in other B2B industries (Blocker, 2011; Blocker *et al.*, 2011; Ulaga and Eggert, 2006, Lam *et al.*, 2004). In addition, the construct of CVA was added to the model, first as a predictor, then as the dependant variable (Flint *et al.*, 2011).

Customer-value constructs	Items	Min	Max	Mean	Std dev
Offer quality	3	1.333	7.000	5.035	1.092
Personal interaction	3	2.333	7.000	5.634	1.003
Service support	3	1.000	7.000	3.358	2.21
Supplier know-how	3	1.000	7.000	3.623	2.003
Relationship costs	3	2.000	4.667	3.086	0.457
Switching costs	3	2.000	7.000	4.956	1.727
CVA	4	1.000	6.250	2.721	1.00
Customer value	3	2.000	7.000	5.213	0.744

Table 6. *Customer-value constructs*

Data were analysed through descriptive statistics, a correlation analysis among the main constructs and a linear regression model exploring the effect of the value drivers on the overall customer value and on the CVA perceived by business customers. The following regression models were elaborated using R software:

a)

$$\text{Customer Value} = \beta_0 + \beta_1 \text{ Offer Quality} + \beta_2 \text{ Personal interaction} + \beta_3 \text{ Service support} + \beta_4 \text{ Supplier know how} + \beta_5 \text{ Acquisition costs} + \beta_6 \text{ Switching costs} + \beta_7 \text{ Customer value anticipation} + \varepsilon$$

b)

Customer Value Anticipation =

$$\beta_0 + \beta_1 \text{ Offer Quality} + \beta_2 \text{ Personal interaction} + \beta_3 \text{ Service support} + \beta_4 \text{ Supplier know how} + \beta_5 \text{ Acquisition costs} + \beta_6 \text{ Switching costs} + \beta_7 \text{ Customer value} + \varepsilon$$

To assess reliability, we assessed the internal consistencies. The value of the normalised Cronbach's alpha was 0.72, in line with the minimum value of 0.7 suggested by Cortina (1993). The value of Cronbach's alpha for each item was also examined to verify whether the exclusion of any items could improve the overall alpha.

FINDINGS

Table 3 presents the main correlations among the drivers, highlighting a strong and positive correlation between the different value drivers (e.g. personal interaction, service support, supplier know-how) with the evaluation of the ability of hearing-aid suppliers to anticipate customers' needs (i.e. CVA).

Customer-Value Constructs	Correlation of Constructs							
	1	2	3	4	5	6	7	8
1. Offer quality	1							
2. Personal interaction	-0.166	1						
3. Service support	-0.487**	0.483**	1					
4. Supplier know-how	-0.417*	0.632**	0.913** *	1				
5. Relationship costs	-0.504**	0.444**	0.690** *	0.665***	1			
6. Switching costs	-0.081	0.614	0.414*	0.601***	0.517**	1		
7. CVA	-0.097	0.603***	0.663** *	0.758***	0.353	0.550**	1	
8. Customer value	0.410**	0.225	0.054	0.125	0.023	0.231	0.247	1

Table 7. *Correlation of constructs*

The results confirm previous research that has found value creation to be a dynamic process (Grönroos, 2008), where providers need to identify and anticipate latent needs (Blocker *et al.*, 2011).

Very few constructs are connected to customer value. For example, this is seen in offer quality having a positive relationship with overall customer value. Generally, relationship costs and switching costs are not correlated with customer value or CVA.

The first regression analysis focused on the effect of several value-drivers constructs on the overall customer-value perception (Table 4).

Customer-Value Constructs	Regression Analysis For Customer Value			
	Estimate	STD error	T value	PR(> T)

Table 9. Regression analysis for customer value anticipation

The results demonstrate that all these constructs (adopted from previous literature) do not represent or affect the evaluation of customer value apart from the perception of offer quality.

However, this result is not the same when considering CVA, the perception and evaluation of which might be the result of business customers' perception of almost each value-driver construct (Table 5).

In this case, all the value constructs are significant and positively related to CVA. The conclusion is that some customers might come to expect suppliers to anticipate their needs and desires (even if they themselves cannot). As shown by Grönroos (2011), suppliers' actions can be more effective if they are able to anticipate and provide solutions to unexpressed needs. In addition, relationship costs negatively affect the ability of the main supplier to anticipate customer needs, as the more the customers need to spend and invest to maintain the relationship with the supplier, the less the supplier is able to satisfy their customers' needs effectively. In such a scenario, competitive advantages can be obtained by suppliers identified by customers as able to match their needs spontaneously with a flexible offer (Prior, 2013).

IMPLICATIONS

This study has allowed us to investigate the different constructs of value perceived in the B2B relationship. Further, this study contributes to the B2B marketing and relationship literature about health-care buyers' (at the retail level) perceived value towards their main suppliers. This study also provides useful implications in the analysis of the manner in which these buyers can affect the value proposition from the supplier in the B2B context, identifying different factors of importance of value drivers, and evaluating the supplier's ability to deliver value in a specific business context. The relevance of our findings is that CVA capabilities appear to be an operant resource that may offer a competitive business advantage.

This study addresses the need to assess the increasing complexity of understanding the roles (Flint *et al.*, 2011), relationships, and drivers among buyers, suppliers, and other parties in marketing channels (Prior, 2013; Ritter and Walter, 2012).

Our study found that the technical features of the product were of secondary importance. In dealing with their customers, hearing-aid suppliers should move away from concentrating on the technical features of a device to focusing on the provision of support for its successful operation. This implies that suppliers should grant ongoing practical support and service to customers by also anticipating their needs on the basis of their wider and deeper knowledge of the market. We have demonstrated that buyers desire proactive suppliers. CVA capability seems to be a distinguish resource offering potential competitive advantages in competitive sector. From a business-management perspective, the results suggest that effective cooperation between suppliers and specific buyers is required. Improving the cooperation of all these service-network participants is paramount to improving product and services provision to end users.

CONCLUSION

Our study confirms the importance of strong cooperation between hearing-aid suppliers and the retailer. The justification of the necessity of this cooperation lies in the fact that retailers do not resell a standard product. Rather, they offer their final clients a personalised solution that includes the device, several fittings, and assistance services. Final clients search for a unique hearing solution and expect the audiologist to be flexible and sympathetic, just as audiologists as retailers expect their suppliers be proactive in offering flexible and anticipating solutions, indirectly matching final clients' expectations. In sum up, it seems that the value-anticipation process is intrinsic to this market. Further consideration could be given to the possibility of adopting a vertical integration process that would allow the supplier and retailer work in very close contact to ensure their perspective of the offer system is similar.

Our results are limited to aspects of CV and CVA operationalised in a specific business context and our research does not explain to how this is done. Future research on CV and CVA could be conceptualised in a more complex manner, particularly focused on understanding how suppliers might effectively anticipate the needs of the customers.

STRUCTURAL CAPITAL IN KNOWLEDGE ECONOMY: GENERAL INSIGHTS

Russo, Giuseppe; Rosa Lombardi; Federica Evangelista

Department of Economics and Law, University of Cassino and Southern Lazio, Cassino, Italy

ABSTRACT

Purpose – The paper aims at analysing the role of structural capital in the current scenario, defining the management and evaluation profiles.

Methodology – The research approach is based on a qualitative methodology with the application of a single method approach. The sources of research are of a secondary type (paper, news, journal open access).

Findings – The findings of research originate from systematization of international literature. The objective is to represent the strong and weak points of the management and economic evaluation profiles of structural capital.

Originality/value – Structural capital favours the circulation of knowledge within a company and stimulates the creation of long term value. In this way, accessibility to company knowledge plays a rather important role if analysed from an internal perspective as well as from an external perspective.

Keywords: *structural capital, intellectual capital, management, economic assessment.*

INTRODUCTION

In the past decades, international literature (Lev, 1999; Guthrie and Petty, 2000; Stewart, 1997) has actively examined the theme of intellectual capital.

Despite the fact that taxonomy on this theme is varied, the paper analyses the structural capital and its management and assessment profiles. The objective is to offer the academic community and experts in this field with an updated conceptualization on this theme.

So, the objective of the research is in defining the role of structural capital in contemporary organizations (Zanda, 2011). Structural capital can be interpreted by starting with the definition of intellectual capital. Through a qualitative research approach, international literature on this topic is examined, supposing that the creation of long term value is generated by the very best management of structural capital.

The structure of the article is the following. After the introduction, section two analyses the literature related to intellectual capital, structural capital, its management profiles and economic appraisal.

Section three describes the research approach adopted. Section four illustrates the research results. Section five illustrates the final considerations, the limits and future perspectives of the study.

LITERATURE REVIEW

Intellectual Capital in Knowledge Economy

Ever since the Nineties, the attention focused on knowledge has resulted in confirmation of the strategic role of intellectual capital (Petty and Guthrie, 2000; Kaufmann and Schneider, 2004).

This immateriality is seen as a range of intangible resources that, if correctly appraised in company management (Darroch, 2005; Du Plessis, 2007), result in an increase in long term company value (Chen et al, 2005).

The OECD (1999) considers intellectual capital as the economic value of two categories of intangible company resources: structural capital (or organizational) and human capital. The structural capital of a company refers to elements such as the characteristics of computer systems and distribution networks; human capital includes internal company resources (personnel) as well as external company resources (customers and suppliers). The definition identifies a specific distinction of the term intellectual capital and intangible resources, often mistakenly used as synonyms.

Peterson and Bjurstrom (1991) highlight another definition of intangible resources. The authors classify company intangibilities into three macro categories: human capital, market capital and confidence capital. Human capital includes a range of qualities that characterize the resources used within the company, such as leadership (Bennis and Nanus, 1985; Bradford and Cohen, 1984; Friedman, 1985; Mintzberg, 1973), motivations, know-how and the ability to achieve the objectives; the capital market identifies the perception that customers have of the company and of its products; finally, confidence capital indicates the opinions as well as the behaviour of company stakeholders with regards to the company, as well as the ability of the company to prove its reliability.

Edvinsson, Saint-Onge and Petrash (Edvinsson and Malone, 1997) have drawn up a model called the Value Platform. It can identify the inter-relations that are important for the creation of value. They identify human capital, organizational capital and customer capital as elements of intellectual capital.

Stewart (1999) defines intellectual capital as “all intellectual material – knowledge, intellectual features, experience – that may be made available to create wealth”. According to the author, intellectual capital consists of three conceptual dimensions: human capital, relational capital and structural capital.

Structural capital represents coded and non coded company knowledge, technology, inventions, formal and informal organizational procedures, best practices, patents, databases and Intranet networks.

Structural Capital and Its Management

Structural capital is an expression of the organizational and management aspects of a company; it can be defined through the range of coded and non coded knowledge of the characteristics of a contemporary company.

Sullivan (2000) examines the intellectual activities deriving from the innovations produced by intellectual capital. Intellectual assets include programmes, inventions, processes, databases, methodologies, industrial projects and intellectual property rights (patents, copyrights, brands, trade secrets) on which the company can claim property rights.

As far as Sveiby is concerned (1997) structural capital (or the internal structure) includes a range of patents, models, administrative systems and software created by employees and owned by the organization. Company culture is also included.

Company culture plays a very important role in the development or organizational aspects that can generate, management and maintain intellectual capital within the organization; it includes a range of rules, values and principles that affect the decisions made by company employees.

This generates a dynamic interdependence between human capital and structural capital. The knowledge and skills of each individual play a very important role in the creation of structural capital. Individual knowledge is appraised, diffused among company employees and transformed into action. The role played by structural capital in the creation of value has resulted in the need for development of its management methods aimed at greater availability of knowledge within the organization (Sánchez et al., 2000).

The increase in this immateriality favours the circulation of knowledge within the company and stimulates the creation of long term value (Teece, 2000; Varian, 2005).

In this way, accessibility to company knowledge plays a very important role if analysed from an internal as well as external perspective.

Starting from the internal perspective, intangible goods require adequate management methods as they are characterized by a high level of dispersion. This characteristic results in the need for collection and coding.

A creative approach to coded knowledge presumes its conceptualisation with regards to the new situation.

The creation of knowledge generates resistance by the holders, who fear that they may lose their prestige and contractual power with regards to the organization. Furthermore, the knowledge of the competitors can be copied and new costs related to use of internal personnel as well as requests for external consultancy may arise.

In order for knowledge to be diffused within the organisation and contribute to the creation of new internal capital, the company must develop:

- a leadership focused on knowledge management initiatives (Alavi and Leidner, 1999; Bollinger and Smith, 2001) that stimulates personnel to favour the exchange of knowledge;
- a culture that encourages the development and use of cognitive capital, also in a modern manner;
- operative systems that favour sharing of the knowledge assets by employees;
- an organizational structure of a reticular type in which individuals are assigned shared values and objectives. This kind of organisational structure allows for the outlining of variable responsibilities, which in turn stimulate individuals towards greater creativeness and dynamism in answering external requests.

Structural capital belongs to the organisation in its entirety. It may be reproduced and made available to each individual (Stewart, 2002; Daum, 2003).

An analysis of accessibility of structural capital involves problems related to knowledge management. The development and creation of new knowledge also requires important investments. Consequently, the demand to protect such knowledge from imitations and embezzlement by others, so that the company may take advantage of the economic benefits deriving from creation of the innovative idea. The methods of protection that contemporary organizations make use of also include a technical protection and a legal protection.

The technical protection limits access to knowledge developed through access control. Legal protection, however, allows the modern company to legally protect the knowledge developed against improper use by others, that may use them without any right to do so.

Legal or technical protection of structural company capital has two results. It stimulates company investments in terms of research and development but at the same time it limits the diffusion of knowledge and, subsequently, the creation of new knowledge due to the effect of its accumulation.

The Economic Value of Structural Capital

The economic value of structural capital may be estimated through the use of three main approaches: the cost-based approach, the value-based approach and the real option-based approach.

The cost-based approach is based on historical cost and on reproduction cost for an estimate of the economic value of structural capital.

The historical cost includes all costs borne by the company related to invention and application activities of a technology. This method is not easy to apply: many mutual costs borne in the various research centres exist and the total of costs may not adequately represent the value of technology. The cost of reproduction represents all of the costs required for the creation of an element of utility similar

to the technology included in the estimate. The application of this method includes some limits: the difficult identification of replacement knowledge in terms of utility and the ones available on the market as well as the uncertainty that the costs borne for the creation of technology may guarantee the same results.

The value-based approach assesses the future economic benefits that technology can provide to the profitability of a company. While approaching the estimate, however, two problems arise: identification of the flow of expected economic benefits, choice of the rate of updating such benefits and the definition of the life of technology.

The flow of expected economic benefits may derive from future differential profit generated by the difference between economic benefits achieved before the use of new technology and the economic benefits that will be achieved by introduction of the same.

In this way, assessment of technology, carried out through updating of the flows of future benefits, updated at an adequate rate of remuneration for pure capital and risk investment, represents a theoretical value of general exchange, equal and neutral, that satisfies the seller as well as the buyer. The exchange value of the technology is represented in the following formula (Zanda et al., 2005):

$$W_x = \sum_{s=1}^k C_s (1+i)^{-s}$$

where:

W_x is the economic value of technology;

C_s is the flow of competitive benefits or differentials provided by technology to the company in k number of years;

i is the discount rate of benefit flows that takes into consideration risk and remuneration for pure capital investment.

The value-based approach has been applied by Ferrata (Ferrata, 2007). He estimates the economic value of base research through the insurance related logic, considering some aspects such as the need for new knowledge as indicated by demand, conclusion of basic research of the laboratory problems including in the project, the benefits deriving from the sale of each unit of product following the development of technology. The assessment of basic research can be represented in the following formula (Ferrata, 2007):

$$Y = \sum_{s=1}^k p_i (\Delta R_{i\% - m})_{r\% - t - m}$$

where:

- Y value of the basic research project with k as the alternatives of use;
- k markets involved in the research field;
- P_i probability of exceeding the limits that do not allow for the use of knowledge on the market i ;
- i minimum net incomes, estimated with reference to the market i ;
- $r\%$ discount rate;
- m estimate of the time necessary to make the project operative on the market i ;
- t the period of time in which the cash flows generated by the market i are expected to extend i .

Another approach suitable to an estimate of the economic value of structural capital is the real option-based approach. This starts with the doctrine (Amram, 1999, Black and Scholes, 1971) that considers it suitable for the assessment of applied research as the method, characterized by rationality, objectivity and neutrality, can enhance the investments characterized by a high level of uncertainty. The real option is set up as an option related to an investment project.

The problems innate in this method refer to the definition of contractual conditions, to be clarified on each occasions, and compliance of the investment with some characteristics: the value of the investment is affected by contingent values, the uncertainty of the investment results in the need for further information; the possibility of making changes to the strategy underway; flexibility of the investment, the entrepreneur may choose several alternative businesses. As the investment adopts several strategies, it has high growth possibilities.

The assessment process includes several types of real options: development real options, connected with "platform investments" for the implementation of other projects; deferment real options, related to the opportunity of postponing the decision related to further investments for a certain period of time; real flexibility options, typical of research projects in which the final objectives can be easily changed. The real options of abandonment provide the executor with the possibility of interrupting the project within a certain period of time, at advantageous conditions, in the hypothesis in which it is no longer convenient in future investment developments.

Existence of the real options can be empirically proved starting with a preference for investments in research with greater liquidity on the market between two investments with the same characteristics.

The approach proposed by Amran and Kulatilaka (1999) articulates the real option model in four phases: definition of the mathematical model according to the characteristics and sources of uncertainty; application of the assessment model of the option (Cox et al., 1979; Black and Scholes, 1972); examination of the results achieved according to the data included in the model; possible

redefinition of the investment according to the re-elaboration of strategies or results that are not in line with expectations of management.

RESEARCH APPROACH

The research approach is based on the qualitative method (Maylor and Blackmon, 2005; Myers, 2013). Research investigates into the topic of structural capital, emphasizing the role undertaken by the latter in the economy of knowledge. Therefore, special attention is given to the following aspects:

- the notion of structural capital;
- the profiles of management and enhancement of structural capital;
- definition of the correct trade-off between accessibility and protection of company structural capital.

The acquisition of data has been carried out using the single-method approach (Yin, 1994). The sources of research are of a secondary nature and have been selected using the following research:

- 20 scientific articles have been selected related to the topics: “intellectual assets”, “knowledge management”, “structural capital” and “real option”;
- 2 databases have been used, 20 scientific articles have been consulted through the EBSCO database, found through research using the word “intellectual capital”; through Google Scholar 10 scientific articles have been consulted using the keyword structural capital;
- several websites, news and open access journals have been consulted.

FINDINGS AND DISCUSSIONS

The results of research are born from an analysis of international literature related to structural capital. Structured knowledge stimulates the accumulation of knowledge inside and outside of the organization that has generated it; they may inspire the creation of new technologies (Choen and Levinthal, 1989) and the formulation of new ideas.

Among the aspects investigated, it can be seen that the traditional methods of social capital assessment are not capable of assessing investments into applied research, enhancing opportunities. The high level of uncertainty in the results of investments makes it difficult to estimate the value of technology (starting with costs necessary to create an equivalent technology of use) and to attribute sure profitability or financial flows to the same.

The real options reply to this requirement, even if their main elements (current price, applicable price, method of execution of the option), in the Option Pricing Model, are not easy to identify.

Another element of reflection is the choice between protection or diffusion of knowledge.

The protection of structural capital offers the organisation the achievement of a leading position in the market and the acquisition of adequate economic returns aimed at covering the costs borne for the creation and development of knowledge.

An excessive level of protection of intellectual property limits access to new knowledge, restricting its accumulation process. Breakage of the balance between old knowledge and new knowledge therefore occurs.

The trade-off between accessibility of structured knowledge and its protection does not have just one solution. The very best solution derives from an analysis of structural capital involved in the protection and the ability of the innovator to take hold of the economic benefits created by it (Tan et al., 2007; Maditinos et al., 2011; Kannan, and Aulbur 2004).

The measure in which new knowledge can be imitated by competitors depends on the simplicity with which technology is understood and communicated. This characteristic is a result of the nature of knowledge (tacit or coded) of the team to lead that the innovator enjoys on the market and the life cycle of structural capital.

Correct management of structural capital requires a connection between the life cycle of technology and management of intellectual property. A universal approach may not be sufficient (Chesbrough, 2006).

The forms of protection of intangible goods are not always successful in playing the role of protection. An example of this is represented by the illegal copies of goods or the possibility of developing goods that are similar to those of the innovator.

This situation results in a reduction in earnings of the original manufacturers/inventors of the goods and an increase in costs borne by them for appeals deriving from the violation or presumed violation of intellectual property.

The solutions proposed for limitation of these phenomenon include granting of open source knowledge. The editorial contents of goods, texts, images, videos and software through specific user licenses are shared by several operators, who can use them and make changes freely.

The use of this form of liberalization for products that are difficult to protect is recommended, as the open source concession of structured knowledge results in a reduction of economic returns of the inventors; the manufacturing companies can compensate the economic losses suffered through the sale of complementary products.

However, if the company owns ideas and patents that are not used because they are not functional for the activity carried out, the trade-off between accessibility and the protection of structural capital may

be mitigated through their transfer (including by means of a license) to companies capable of taking advantage of their potentials (Chesbrough, 2006).

Often companies do not use all of the ideas developed and patented. As far as the company system is concerned, these ideas represent a waste of resources. They are demoralizing for the human resources that have created them and may slow down the flow of innovation.

The license or transfer of part of the structural capital unused allows for diffusion of the knowledge developed and the development of new knowledge to companies capable of capturing the potentials (Rappaport, 1986).

At the same time, the company owning the patent may take advantage of the economic benefits of this technology that, otherwise, would have been worthless.

CONCLUSIONS, LIMITS AND PERSPECTIVES

A lot of literature can be attributed to intellectual capital. The companies that take advantage of internal knowledge for the creation of innovation and of efficient and effective production processes guarantee a position of competitive advantage.

Contemporary companies are rich, vital and competitive when they own a high level of intellectual capital.

In this regard, company performance is seen in its entirety, as the range of results achieved, considering the tangible and intangible elements.

This document has introduced an updated conceptualisation of structural capital to the intangible components, with special reference to management and assessment profiles.

With regards to external management of company knowledge, the trade-off between accessibility of structural capital and its protection has been investigated. The protection of structural capital, on the one hand, guarantees remuneration of investments made to the entrepreneurs; on the other hand it favours the emergence of illegal forms of acquisition of knowledge.

On the contrary, the opening of structured knowledge favours the circulation of new knowledge and has active participation in the creation of further knowledge. In this case, all of the organizations benefit from the economic results of the idea, reducing proceeds for the company that invented it. However, this does not represent a disincentive for the inventor company in creating further investments in terms of knowledge, limiting the development and increase of internal company capital.

Contemporary companies tend to favour the correct balance between sharing and protection. In this regard, the achievement of long term stable results is preferred.

The limits of the article include its theoretical form and the fact that the analysis carried out represents an updated conceptualization of literature, found through the research method previously illustrated. Therefore, future research aims at aims at systematizing the main literature on the topic of structural capital with the objective of providing another qualitative analysis.

GOVERNANCE, ACCOUNTABILITY AND PARTICIPATORY BUDGET BETWEEN MYTH AND REALITY. THE ITALIAN CASE

Russo, Salvatore

Department of Management, Ca'Foscari University, Italy

ABSTRACT

This paper explores the implications of participatory budget (PB) in Italy, inspired by insights and reflections on public governance, accountability, participation and inclusion of citizens in the local authority expenditure decisions. In particular it focuses on the characteristics of the context in which PB has encountered practical implementation, the way by which it is realized, the most common type of intervention and, finally, the criticalities in the units of analysis. The conclusions give way to considerations on actions still required to promote PB, so that it can really be seen as a tool for improving accountability.

Keywords: *Public governance, participatory budget, accountability*

INTRODUCTION

In the last twenty years, the public sector has been characterized by innovative processes and managerial tools with new visions and trends (Hood, 1991; Rhodes 1996; Lapsley, 2008). Among these, a logic of participation and citizens involvement has emerged with the aim of diffusing the adoption of new forms of governance and promoting shared decision making. The need to build a system of *participating mode of citizenship* and *collaborative governance* appears pressing in order to connect policy effects with both expectations and needs of different social groups by discharging accountability (Newman *et al.*, 2004). This is modifying the conventional rules of democracy, in order to encourage participation, dialogue, consensus and various expressions of interests in those contexts traditionally reserved to the policy maker (Lehtonen, 2006).

If the New Public Management (NPM) has revised the role of the citizen by assimilating it to that of a customer in a “marketized” Public Administration, a new emergent vision makes the citizen an active subject in a process in which the citizen’s role is integrated with government and based on a new vision of the accountability paradigm (Hummels, 1998; King *et al.* 1998; Goetz and Jenkins, 2001;

Ackermann, 2004). The same concept of public value, in its evolution, has considered the “co-participation” as key-element to pursue public interest (Moore, 1995). Consequently, the very concept of public governance should benefit from the enrichment deriving from the direct involvement of citizens in public decision-making, thus stimulating the activation of accountability processes in which politicians, managers and citizens are fully involved (Bekke *et al.*, 1995). This represents a starting point for new theorizations as well as *multilevel governance* (Rhodes, 1996; Stoker, 1996; Pierre e Stoker, 2000; Irving and Stansbury, 2004; Soma and Vatn, 2010) or *collaborative governance* (Newman *et al.*, 2004; Fung and Wright, 2001; Fung, 2006).

Among the heterogeneous instruments of the participative democracy, undoubtedly, the PB plays an important role both for the impact exercised on society as a whole and for the involvement of several social groups in the resource allocation process. “At the heart of such initiatives is the right to increase councillors’ decision-making, with more localized citizen involvement in determining resource allocations” (Mitlin, 2004:6).

From a review of the literature it is possible to observe that several experiences in those poor areas of the world where the citizens’ involvement in public decision-making is encountered as an useful support for the construction of a priority scale taking into account political needs, social and economic differences (Eberlei, 2001, 2007). These initiatives have also influenced the most industrialized countries with the adaptation of both methods and instruments to the context requirements, so that it is now possible to discuss how this has come about and what the concrete effects are (Ebdon, 2000; Gaventa, 2004; Lehtonen 2006, Sintomer *et al.*, 2008).

In Italy, an increasing number of municipalities have been implementing participatory budgeting, so this may be considered a good starting point for some interpretative reflections and empirical observations. Coherently, this paper explores the relationship between Local Authorities and citizens’ participation, and aims to answer the following questions: 1) what does mean the PB in the evolutionary forms of public governance?; 2) what are the main benefits and criticalities in the PB implementation in the Italian municipalities?

The first section of the paper is dedicated to the concepts of governance, participative and deliberative democracy. The second section is devoted to the instruments mainly used in the implementation of participatory democracy. The third section focuses on the PB. The fourth section examines the case of some Italian municipalities that have initiated experiences of participatory budgeting. Finally, discussion and conclusions.

2. PUBLIC GOVERNANCE, PARTICIPATIVE AND DELIBERATIVE DEMOCRACY

From the point of view of the public management theory that, over the last two decades, has supported changes in both the organization and structure of the public sector, firstly it is possible to observe the ethical dimension that has focused on the relations and integration between administrators and administered. The reforms have sought to transform the culture of public organizations, which includes encouraging employees to think of citizens as customers to be served instead of clients to be managed (Hood, 1991; Osborne and Gaembler, 1992; Saarelainen, 1999).

NPM has paid excessive attention to the possibility of exercising market control rather than democratic control, thus emphasizing the customer role of citizens and reducing their political role (Hood, 1991, Ferlie et al., 1996, Lapsley, 2008). However, what has taken a non-negligible meaning, together with the key principles of effectiveness, efficiency, responsibility and accountability, is the transparency in the action of the public administration. Transparency, in terms of a strong concept of responsibility, is powerfully rooted in the phenomenon of participatory democracy, and can be reached only by providing highly organized tools and means for citizens' activism in the political process. Transparency is also strongly related to the concept of self-governing, according to which citizens do not have only an impact on the services offered by the public administration but also take part in the production process, firstly as co-decision-makers on "what" and "how" to produce, and secondly as co-producers of the service (Sjöblom 1999:22).

A complementary perspective is provided by the stakeholder theory. It assumes that a company (public or private) has a series of constituent groups depending on the context of the activities in which they operate (Freeman, 1984; Jones and Wicks, 1999). The concept of stakeholders in the public administration assumes a wide meaning compared with private firm, as all the individuals or their social and economic groups are holders of a "stake", which derives from their role in society (Handley and Howell-Moroney, 2010). Stakeholders are not primarily seen as actors who can influence the organization's continuity, but as individuals and groups who have a legitimate claim on the organization to participate in the decision-making process simply because they are affected by the organization's practices, policies and actions (Hummels, 1998:1408). By highlighting the ways for a change through the development of a new administration model based on cooperation, collaboration and integration, this implies an overrun of what is traditionally indicated as a sort of bipolarism that sees citizens and administrators as antagonists. In this regard, the use of the term "co-governance" suggests properly that the borders between state and civil society are vanishing (Goetz and Jenkins, 2001; Ackerman, 2004; Arena, 2006).

In the field of public policy two different paths in this approach are proposed: the method of pressure and the method of comparison (Bobbio, 2002, 2004, 2006). The first, which is related to the expression “participatory democracy”, considers participation as a tool to give a voice to weak social subjects, who are marginalized or traditionally excluded, through social movements or associations. The method of pressure responds to an idea of participatory democracy which is supported by social movements and is reflected in the “participatory budget” experiments carried out in the Latin American countries and, in general, in those countries whose economies are particularly disadvantaged. (Abers, 1998; De Sousa Santos, 1998; Allegretti, 2001; Gret and Sintomer 2002; Harnecker, 2003)

In contrast, the method of comparison, which coincides with deliberative democracy, is based on the assumption that civil society has a pluralist nature. It does mean participation as a comparison of dialogic nature, between citizens which have conflicting ideas, different points of view or opposing interests, in order to draw up common solutions and to find a common ground or, at least, to clarify the terms of the conflict for finding a common ground of action. The relationship is no longer of dualistic type between people and administration, but is rather a multi-voiced dialogue in which the public administration assumes a neutral role and is equal to the other actors (Pellizzoni 2005: 23).

Comparison and co-decision are two crucial moments in validating the deliberative process, which are not longer guided only by elected bodies, but are determined by a majority, built for a specific purpose and therefore, legitimized to choose. The difference between the theory of deliberative democracy and other theories of democracy is consequently locus (Chambers, 2003:308). Deliberative democracy is ‘talk-centric’ not ‘voting-centric’.

The experiences referring to the deliberative democracy theory are based on two essential points: the use of comparison argued and the inclusion of all the interests and points of view that are affected by the social actors. In substance if in the model of participatory democracy the citizens are invited to take part in the debate, by opinions, suggestions and, sometimes, direct claims, in the deliberative model they are directly involved in decision-making process and are able to determine the outcome (Heimans, 2002).

Both models reflect the transition from a traditional view, towards a vision in which the citizens become co-protagonists in the decision-making processes. From a preliminary analysis of studies in the literature of international bodies (World Bank, International Monetary Fund, etc.) on the subject of stakeholder participation in the implementation of the Poverty Reduction Strategy Process (PRS) (Eberlei, 2001, 2007), one can observe a multiple approach in the methods of interaction between politicians and citizens, at the various stages of the political cycle. The degrees of participation, which

are normally considered to be formal, vary and may take the form of the following actions: 1) sharing of information; 2) consultation, 3) joint decision; 4) partnership; 5) control.

Contributions from policy studies (OECD, 2001) consider that engaging citizens in policy making is a core element of good governance, and contributes to building public trust in government, raising the quality of democracy and strengthening civic capacity. Because of its direct interest in the problem at stake, this study deserves a more detailed analysis. The OECD's vision of citizens' involvement encompasses three levels: a) access to information; b) Consultation; c) Active participation.

It acknowledges equal standing for citizens in setting the agenda, proposing policy options and shaping the policy dialogue, although the responsibility for the final decision or policy formulation rests with government" (OECD 2001: 23; Gramberger, 2001).

Accountability represents one of the ten guiding principle proposed by OECD (2001) for engaging citizens with policy making (the other are Commitment, Rights, Clarity, Time, Objectivity, Resources, Co-ordination, Evaluation, Active citizenship).

On the one hand, this marks the abandonment of the conventional interpretations of the public government supported by the concept of power coming from the authority (typical of the traditional public administration) and, on the other hand, it introduces the power of communication as a source of an innovative idea of co-shared administration. This is based essentially on the principles both of "subsidiarity" and "organisational autonomy", since the first legitimates the autonomous citizens' initiative in the alliance with the public administration to solve problems of general interest; the second, in its relational dimension, needs to establish in a pluralist society equal relations between the different areas of interests, both public and private (Arena, 2006: 82; Bourgon 2007).

That assertion allows to sustain a sequential logic, by starting from the concept of co-shared democracy, passing through the phase of participatory democracy or dialogical, and coming to that is commonly reported as the democracy of stakeholders. In this last paradigm, public governance represents the phenomenon to which politicians, citizens and interest groups contribute in an active way. On this innovative concept of governance, accountability and transparency of public action exercise a strong influence (Dwyer, 2005). In fact, accountability does not exercise its strength only in the operational phase of reporting from the decision-maker to the citizen, but it is inevitably a substantial component of reinforcement in the opening behavior that the decision-maker implements, by making citizens sharing the same decisions and putting them in a position to evaluate the effectiveness and the outcome of policies, both *ex ante* (programming) and *ex post* (control of results). We talk in this way about *social accountability* defined by the World Bank (2005:1) as "an approach towards building accountability that relies on civic engagement, i.e., in which it is ordinary citizens and/or civil society organizations who participate directly or indirectly in exacting accountability".

3. PARTICIPATORY BUDGET AS AN INSTRUMENT OF CO-SHARED LOCAL GOVERNANCE

Among the different forms that currently seem develop the paradigm of deliberative democracy, the PB approach, in which interests of the participants intersect and integrate, seems to have reached a certain degree of success, keeping its original features and treating predefined arguments on which decisions have to be made (Gret and Sintomer, 2002; Bobbio, 2002). In this approach, citizens and/or organizations in civil society are actors in the decision-making process together with the representative bodies.

PB allows the citizens of an area (neighbourhood, regeneration or local authority area) to participate in the allocation of part of the local Council's or other statutory agency's (health services, police) available financial resources. PB aims to increase transparency, accountability, understanding and social inclusion in local government affairs. PB applies to a varying amount of the local Council's budget and the actual process is developed to suit local circumstances (PB Tool kit, 2008:4).

PB directly involves local people in making decisions on local spending and priorities for a defined public budget. PB processes can be defined by geographical area (whether that refers to a neighbourhood or to a larger area) or by theme. This means engaging residents and community groups in discussions and voting on spending priorities, making spending proposals, and voting on them, as well as giving local people a role in the scrutiny and monitoring of processes and results, in order to inform subsequent PB decisions.

The legitimacy of the power to manage the common resources of the collectivity derives from the mandate granted by the citizens to the elected representatives. However, in this historic phase, which is characterized by a scarcity of public resources together with the presence of strong social pressures, the complicated and complex system of rules determines conditions that undermine the representative mechanisms. So, it generates a deep split between both consensus and/or political opportunity and the capacity of the public administration to respond to the real needs of the community. The PB as a tool mainly used in areas of the world that are particularly depressed economically are characterized by strong social contrasts, seems to be a solution in western countries to improve the performance of public services and face to the fiscal stress (Ebdon and Franklin, 2006). The main factors inspiring the PB approach in Latin America have reference to: scarcity of resources, fiscal decentralization, need for transparency in policy and resource allocation (Roberto, 1996; Heimans, 2002; Cabannes, 2004; Afonso, 2006). PB is not a document but a pervasive process engaging all those who have an interest in public administration. The reference to local government is frequently mentioned as a cause of the various bottom-up experiences that have been increasing in

many countries. PB does not reverse the roles in local government but creates a synergy in the knowledge of public interest between politicians and citizens.

Many contributions to the literature tend to highlight two different profiles in the PB approach. "The experiences fall between simple consultation with citizens, whereby the executive and legislative branches retain all the power, and deliberative experiences, in which the decisions of PB councilors have real power and are endorsed by the municipal council" (Cabannes, 2004:28; cfr. Heimans, 2002).

The implementation of PB would demonstrate that the democratic and transparent administration of the financial resources is a powerful and very appropriate way to avoid corruption or deviation of the public funds, generating popular public participation.

The first PB experience was launched by the workers' party in 1989 in Porto Alegre, capital of the Brazilian State of Rio Grande do Sul. The workers' aim was to fight serious problems related to power concentration, resource waste, political affairs and corruption. That experience led the way for similar experiences all over the world (Abers, 1998; De Sousa Santos, 1998; Allegretti, 2001; Gret and Sintomer, 2002; Harnecker, 2003). Over 300 Brazilian municipalities adopted PB between 1989 and 2004, and cities in at least 30 other countries also have adopted PB (Wampler and Avritzer, 2006; Cabannes, 2004). The phenomenon has also caught on in Europe, where there are different rules in the various countries because PB does not imply a definition of rules but is a philosophy permeating the process of elaboration. More than 300 municipalities in countries such as Venezuela, Canada, Spain, France and Chile, and the UK have already used PB. In the UK, for example, experiences of PB began to catch on in the cities of Salford and Manchester in 2000. A 2008 report by the PB unit - a project of the charity Church Action (Participatory budgeting in the UK: values, principles & standards, 2008) – claims that 22 pilot projects have led to some form of participatory budget. The objective was to ensure that by 2012 each local authority area should have a PB.

Aspects of the PB Process

The process of PB generally requires citizens to be engaged in decision-making. It extends the succession of stages of the cycle annual budget formulation and approval which afford investments and projects to be allocated to the emerging local needs. In the participation process for the budget formulation, procedures and activities are not scheduled and, on the basis of indications from the experiences already gained in different countries, it is possible to design a sort of prototype of the process articulation as follows:

- preparation of feasibility studies to support the evaluation of the investments or projects;
- preparation of a proposal in the areas concerning the participatory process;
- monitoring process in the budget approval;
- monitoring in the budget management with specific reference to the priorities;

- monitoring the provision process (competitive tenders, contracting);
- monitoring services provision for the public works.

In these activities it is reasonable to think about the joint attention paid by both public administration and citizens to budget performance.

PB involves citizens and political forces in collaboration, therefore it has the prerogative to include in the resource allocation process those who traditionally are not involved in political decisions. There are really no universal rules about the application of PB. The methodologies may vary depending on the local authority and its requirements. So there are rules which determine the percentage amount of resources to entrust to the citizens' decisions.

Given the citizens' involvement, PB creates opportunities for greater effectiveness in the distribution of public funds and increases social cohesion. According to the advocates of PB, this implies a certain amount of advantages (Heimans, 2002:10) as citizens' empowerment and promotion of public learning; democratization of macroeconomic policy; integration among different social groups; co-shared economic and social growth.

Certainly PB is not a "consolation prize" for citizens but a decision-making instrument that is able to rebuild a relationship of trust between institutions and citizens

at the same time the risks is that "people may view PB as just another bandwagon" while it is a new way of planning and budgeting. Therefore, the risk is that may be a mystification of the participation tool (Wampler and Avritzer, 2006). Other risks are: a potential impact on fiscal discipline of the increased demands on governments through participation; an erosion of the legitimacy of established democratic institutions, such as parliament, in favour of less accountable civil society organizations; an escalation of conflict over resource allocation and distribution among participating social groups; the "capture" of participatory processes by local elites, by the most vocal constituencies or by those with vested interests. In this sense the PB represents a tool for modernising local governance and activating the community to improve the local public services.

4. THE ITALIAN WAY TOWARDS CITIZENS' PARTICIPATION

As in most European States – according to the OECD report 2009 - also in Italy, in the last few years there has been the introduction of some form of citizen participation, in particular in the local authorities (mostly the Municipalities). There are also experiences that have launched a regional form of participation, by codifying methods and tools. This is the emblematic case of the Tuscany Region, which approved a law in 2007 whose content promotes regional instruments of deliberative democracy (Floridia, 2008; OECD 2009). Other experiments are in progress in other regions (Lazio Region, Emilia-Romagna Region)

In general, the administration of the local authority recalls closely the concepts of participatory democracy and deliberative democracy and particularly the small-size municipalities are more involved than others.

The advent of ITC and the start of e-Governance projects simplify the accessibility to the public administration by the use of web sites (for example online forums, wikis) and speed up the dialogue between public and institutions. It is the substance of the policies and the immediate tangibility of their effects to involve citizens by pushing them towards forms of organization where they can take an active part in the dialogue and be present in the choices relating to resource allocation.

Further the recent reforms in Italy have introduced new figures of responsibility and have embedded in the public rules principles of efficiency, effectiveness and economy that did not previously feature in any law. This change has strongly contributed to move their culture towards the dissemination of a management logic based on results, at the top of which there is the principle of accountability of the organizational units in the achievement of the objectives.

The new managerial approach has meant a revolution in terms of prevailing strategic objectives, using the human resources as the main source of competitive advantage, in a management process which sees the co-sharing of objectives within the organization and a tendency to continuous improvement.

The challenge of the programming and control (P&C) system consists precisely in its capacity for adaptation and depends upon the elasticity of response to the context of reference. The P&C system, which constitutes a cross-operating system on which the different stages of activities and translation of political intent depend, is thus a fertile ground for allowing citizens participate in decision-making. It enables a cyclical transition from strategy to programming, management and reporting, by providing in each of these steps appropriate monitoring activities and forms of control. So doing programming extends in a horizontal span and is able to predict what will happen at every step.

In this succession forms of interaction between politicians and citizens, public officials and citizens may take place in a traditional way (for example with forms of questioning in municipal councils) or with innovative instruments. The implementation of P&C systems requires not only a certain degree of innovation in the instruments used, but also a change at the organizational level, through the involvement of all the operational units and the coordination of all activities. This implies a redefinition of the strategies and a change of management in a results-oriented logic. In addition, the complexity of the control system impacts on the quality of the external information, by improving the excise of responsibilities and the guarantee of greater transparency that comes from the public (Garlatti e Pezzani, 2000; Hinna, 2004;Pezzani, 2005).

The need to comply with accountability, considered one of the main factors underpinning the path of deliberative democracy, is part of that change in the culture of public administrations which considers

as the aspects of economy as the ethical aspects of management, by opening the way for new reflections on the perspective for improving the performance of the local authority. This is a tool that allows for comparison and the sharing of common objectives, and can be seen also as an instrument for the reduction of potential social conflict. The information function seeks to give account to the citizens of the use of public resources and the accomplishment of strategic objectives. At the same time, it meets the requirements for greater accountability from the internal offices, thus playing a strong motivational role.

In the light of this recent innovation the role and the meaning of PB should be interpreted by considering it as a dynamic process in which politicians, civil servants and citizens are involved. That surely may influence P&C system and the way politicians and public manager discharge accountability. The degree of inclusiveness, the importance of participation in decision-making processes, their extension, the channels of communication and the evaluation mechanisms are unquestionably the keys to a successful PB experience. Further PB may also support the local authority in facing the difficulties and constraints currently present in the system of public finance.

5. THE RESEARCH

On the basis of the theoretical conditions highlighted a research has set up by formulating a series of questions that have engaged the development of an empirical survey focused on a set of Italian municipalities that have acquired considerable experience on the participatory budget.

The survey was carried out by paying attention to the selection of municipalities, either well-documented in the literature or for having placed the project details on their own websites. The keyword inserted for their detection was “participatory budget”, assuming that the term in itself requires a continuous relationship with the citizens, so that occurs mainly by using channels such as Internet. The sample is based on only 11 local authorities (provinces capital and municipalities) that between 2009 and 2011 have collaborated with the research team. The first item has aimed to explore the ways in which PB has been implemented and how it was structured. Secondly, we asked “whether” and “to what extent” the PB is able to affect the programming process. Finally, “if” the PB is really able to ensure greater accountability of public decision-makers and managers in respect of citizens’ expectations, and can it ensure a long-term sustainability. That was followed identifying contacts with the responsible units for participatory budget. Subsequently, a questionnaire containing 20 questions was designed with reference to the following modules: characteristics of context; mode of citizens’ involvement; process execution; aims and achievements.

It should be specified that, in Italy, the PB has been implemented, especially in the municipalities located in the central and northern regions since 2000, except for some experience such as

Grottammare (Ascoli Piceno), which started in the early 1990s. In different local contexts, however, the PB was often put out of action or replaced by social reporting, another tool for discharging accountability. This last, while encouraging the citizens' contribution in the phase of countercheck and audit, seems to limit the concrete incisiveness of the citizens' participation. In some cases, the interviewees themselves made it possible to further deepen the experience, especially from the point of view of the setting-up of the PB process, to highlight the differences characterizing the practices of the citizen participation model.

The aim of the research was to find out the tangible benefits of the PB experience and include the stories of participatory democracy within local policies that imply the creation of deliberative arenas, debates and dialogues, by which the representative democracy mechanisms can be innovated. This was also to verify if these experiences really operate for the benefit of the majority of the population and what direction is followed by the PB process in any interviewed municipality.

Findings

The procedures of the PB are very different and depend on the context where the process is implemented. The experiences are almost all addressed towards progressive experiments that have highlighted the strong points of the PB. These consist mainly in adjusting its rules so that the process can always adapt to the characteristics of individuals, by reestablishing the relationships among the different institutions and groups of the civil society. It is considered a tool of aggregation and permits the abandonment of old forms of policy for guaranteeing a transparent administration in the choices made by local governments. In fact they are different experiences even if, through the networks for the exchange, as in the case of the URBAL program, it is to build a consciousness of mutual benefit (between public administration and civil society). Moreover, in a few years, some experiences are trying to formalize the process, in order to make sure a certain continuity and to develop particular skills in the field but, above all, with aim of practicing more and more a "legitimizing policy", after the electoral vote. In this perspective the PB is used as an instrument putting in relationship the *representative democracy* with some moments of *deliberative democracy*. The observed experiences reveal that the joining element is the location of some fundamental steps in the construction of PB, such as: *emerging needs*, *priority voting* (all participants brainstorm a list of ideas), *verification of feasibility* and *insertion of specific expenses* in the annual budget. In detail, every Municipality interviewed has been trying to adapt the process to the demands and characteristics of the participants and to what the administration would really like to achieve.

Characteristics of context

Since the municipalities were chosen exclusively on the basis of the indispensable condition that they had completed a PB experience, their characteristics are heterogeneous as regards the number of

inhabitants and the composition of the population. Firstly, the data about PB come from small and medium-sized municipalities (54%) and only 5 (46%) are provincial capitals. The geographical area mostly concerned is North Italy.

Almost all of the municipalities are run by centre-left governments, under which it has been chosen to apply the participatory budgets. Only in two cases (Grottammare and Isola Vicentina), the government is represented by a civic list, composed of individuals not belonging to any political party.

In the majority of cases, the option of introducing the PB has been a political choice, proposal by the Mayor and town counselors, while presenting the electoral program. The Italian case that inspired the PB in most cases (Castel Maggiore, Isola Vicentina, Ivrea, Modena and Vimercate), is Pieve Emanuele (MI), which was one of the first Italian municipalities to implement a participatory process, thus maturing a large experience in this field. Among the international experiences, the inspiring PB case is that of Porto Alegre, as well as those of the Latin America (Bel Horizonte-Capoliveri), with which a relationship of interchange and cooperation, within the European programs, has been initiated

It is important to highlight the role that some municipalities such as Modena, Ivrea and Castel Maggiore have had in spreading the experience. Through seminars and conferences, they have been proposed moments of comparison among local authorities which have activated or would like implement experiences of participative democracy. The aim was to make known, analyze and compare the various experiences, so as to develop cooperation between institutions and improve and disseminate the forms of participation. In some cases, in which a large resonance to the communication was given for empowering participation (for example in Ivrea), the Municipality has joined the work table "URP of URP"¹, on the topic "communicate the participation", by focusing attention on the aspects of communication in the context where citizens are included in the decision-making process. Through a comparison of analogous experiences there has been an attempt to deepen the role that communication plays in the PB implementation, both in general and in relation to the different phases that characterize the co- shared processes.

In all the cases surveyed the PB path has been formalized as a new management tool by means of specific regulations. This is subjective compared to every experience, but only in two towns attention has been paid to including the PB in the "accounting rules" of the institution. Collaborations with other local authorities have been initiated especially for spreading the experience and for a comparison, but it is not a very common practice (only four municipalities out of 11). In most cases, a special office is activated to manage the PB steps and it's properly called "Participation Office". In the

¹ URP in Italy is Ufficio Relazioni con il Pubblico, "Public relations Office" in the public administration

other cases it is related to the financial service, or social policies service. Rarely, the PB management is entrusted with the competence of the Communication Office, or of the Financial services.

Rules for citizens' involvement

The main forms of citizens' involvement for bringing them closer to the public administration choices are questionnaires during the periodical quarter assemblies, the institution of a participation office, posting flyers, the continuous updating of the municipal web site. In particular, in Ivrea a "Suggestions" box was opened, as well as an area on the website for sending proposals, comments and suggestions on how to achieve and improve the process of citizen participation; in Bergamo some citizens were interviewed and small focus groups (with a maximum of ten people) were organized; Reggio Emilia distributed a tabloid newspaper describing the various stages of the process to all families resident in the quarter where the PB was implemented. The instruments used to involve citizens frequently are: the grid of priorities and votes, the operational plan, as an instrument of resources allocation to each project, questionnaires and polls, postcards, modules of proposals.

In the municipalities of Bergamo, Castel Maggiore, Grottammare, Isola Vicentina, Ivrea, Reggio Emilia and Udine the administration has launched training courses for citizens and public officials, to improve the approach to this experience and to ensure the proper conduct of the participatory process. These training sessions are carried out, in particular, during assemblies. In particular, in Udine, initial conferences have been activated to find out more about the experiences of Brazilian city of Santa Maria Rio Grande do Sul, with which Udine has established a cooperation inside the URBAL project. In Ivrea pilot meetings were organized with the trade union representatives and four associations which play an important role in the economic context of the territory in order to discuss the experience of past and on-going participation.

As regards the age groups of the participating population is not very accurate since some of the municipalities have not carried out a monitoring process. On average, it is possible to say that the most involved residents fall into the 45-55 age band. Since this is especially important if one considers that young people, the most important resource to enable the process to really affect a cultural change in programming, is not very present.

Themes and criticalities of the PB process

In the municipalities of Bergamo, Castel Maggiore, Ivrea and Udine, the participatory process takes place over the whole year, from January to December. In other municipalities, instead, the process is concentrated in the second half of the year, after the formal approval of the budget. The subjects discussed are chosen according to the citizens' preferences and their emerging needs in Grottammare, Isola Vicentina, Ivrea, Reggio Emilia and Udine. Instead in Bergamo, Castel Maggiore, Cinisello Balsamo, Modena and Vimercate the themes that will be discussed on assembly and among those in

which will vote the proposals, shall be selected by the mayor and by the Municipal Council, and are more the themes of culture and leisure, public works and environment. In the Municipality of Trento the themes are chosen by a committee, formed by the mayor, three assessors and by the representatives of constituencies. On the one hand, this choice is made to avoid the citizens' proposals going beyond both the competences and resources of the administration, but on the other hand it may be so restrictive that it discourages the public from proposing measures to implement. For that reason, even if the proposals are not present in the predefined areas of intervention and therefore they cannot be discussed in this occasion, a list of them will still be reported to the competent bodies. Generally to assign predefined themes for addressing participation offers a clear point of reference and reassures the citizenship, above all in the preliminary approach to PB.

In Castel Maggiore there are two types of assemblies: public assemblies, open to all, and thematic assemblies, reserved for associations and organisations in the area, concerning education, the regional economy, the nonprofit sector, the area of production and commerce, trade organizations and unions. Also the number of assemblies carried out is rather variable but in any event, beyond the assemblies for listing the emerging needs, other assemblies are made to get a feedback information about what the administration has actually done for implementing feasible actions.

In the quarters of Ivrea, Isola Vicentina and Modena the costs linked to the PB procedure were attributed to a specific item inherent respectively to services for the participation. In all the other experiences analyzed, specific items and relative costs are divided according to department, with the other items of the various sectors concerned.

In Modena the proposals emerging from the assemblies are subject to an examination by means of tables of territorial comparison, so the administration may assess the financial and technical feasibility. In Reggio Emilia, as well as in Grottammare, the evaluation is entrusted in the technical work tables, involving all competent leaders in the field, the project team, the representatives of each quarter and the citizens' delegates appointed during the meetings. The work table shall submit to control the proposals on the basis of two factors, the technical and legal feasibility and the compatibility of the acts already adopted; finally, estimates costs and time of implementation.

The area of co-decision on which major projects were achieved, as in most of the experience examined, is that of Culture and leisure (73%); immediately after Public Works (64%), Welfare (64%), Environment (55%), Safety (37%) Mobility (37%). This shows how the PB may be used for investment in infrastructure even if it requires at the same time a great capacity for alternatives selection that often the respondents/participants do not have. As a result, with reference to these areas the BP represents a test bench of legitimization and a guide in the choices that the political bodies have to translate in action.[¶]

With reference to the PB investigated, firstly it emerged the need to clarify what the areas of competence were with reference to the proposed measures, mistakenly charged to other institutions. Contextually politicians (and their delegates) had to dissolve the initial mistrust, by launching issues and stimulating participation. In fact in the most recent experience, several obstacles depend on the difficulties encountered to explain how the PB proposals have to be submitted, where these are required. Often this does not lead to a successful path, because who is confused in the face of topics and issues that require specific skills, in addition to the common civic sense, tends to abandon the assembly of PB.

Secondly, there are some communication difficulties due also to the gap between citizens and administrations which often are not able to get people involved in participation.

For example in the municipality of Isola Vicentina, the project of BP was used as a tool to build a scenario on the future of the town, by defining a comprehensive a long run plan in which the actions indicated by citizens in assemblies were consistent with the project, in order to save resources and to maximize the social utility. The PB experience has not been successful and the citizenship has not seen the implementation of those projects as compared to the initial forecasts.

In the town of Modena instead the assemblies have been spread in a non-homogeneous manner, without continuity and in this case, emphasis was placed on the low quality of the proposals that were viewed as a sort of “shopping list”. Consequently, in 2008, the PB was suspended because of problems in the constituencies, from both political and organizational points of view. The principal obstacle seems to be derived from the representative bodies that have seen in PB a sort of field invasion, that is an obstacle in the regular flow of the decision-making process. Without abandoning the way to participation, that is always seen as an opportunity, the administrators tried to address the technical difficulties deriving from the non-inclusion of PB in the procedures of the municipality and chosen to give priority to targeted interventions. From 2010 onwards is in fact proposed a new path focused on municipal areas that tries to involve those social groups, in particular young people and migrants, which traditionally have been very active in public life. The process hesitate in the detection and selection of projects considered to be worthy and compatible with their inclusion in the programming documents to be translated into financial expenses in annual budget. Among the cases analyzed, just two experiences have been completely abandoned (Cinisello Balsamo and Isola Vicentina)

6. CONCLUSIONS

If from the theoretical point of view the BP gets its justification in the development of democratic dynamic and represents the most allusive procedure of deliberative democracy, from the operative

point of view the PB approach represents a method to joint to P&C system. Its performance depends on the tenacity and the conviction by which it is implemented and, especially, on the impact that may have internally and externally. Unlike management tools that are only recently introduced into the culture of the local government, the BP imposes itself as a path to have a multifunctional impact, acting in several directions. First of all, it acts on the political level and consequently on both the economic-financial and management levels. From a political perspective the PB gives its greater contribution to enable the decisions on investment policy in the territory and on themes of common interest where the citizens' preferences are mediated by the policy capacity of government, the involvement of political bodies and the reaction of the public personnel responsible for the coordination of all activities related to the PB process.

This may create a strong strategic value to advantage of the investment planning and in particular, of the annual budget operation. At the economic and financial level the PB enables citizens to take part in the resources allocation process, although in most cases it reserves to citizens only a residual investment quota, or even anchored to a so specific investment, that the procedure doesn't appear convincing and convenient compared to the arising overheads costs. In this regard, the participation, by its very nature, affects only investment expenses for the benefit of the entire community (i.e. public works etc.). Besides, it would be questionable to imagine that co-decisions may relate to the resources allocation regarding the current expenditure. In such a way the PB becomes an instrument for ensuring significance to the financial management of the investments, according to the principles of transparency, efficiency and effectiveness.

From the organizational and management perspective the process has repercussions both inside and outside the institution. Internally, the PB is an instrument for innovation that primarily affects the economic-financial area and communications. Both areas should coordinate for the execution of the operations of citizens' involvement and document completion, bringing it up only in the last phase of approval by political body. This requires the deployment of a set of skills that are able to support the high flow of information generated and the interaction of the main players in the various phases of participation. No activation of a proper process may involve the approach's failure. It's no accident that successful PB experiences are largely the result of a path undertaken by small municipalities, which are intrinsically facilitated by many more relationships rooted in the social fabric than larger municipalities have, because, in this last case the plurality of interests makes cohesion more difficult to reach. In the municipalities with a greater population density, not infrequently the PB process takes place by a territory partitioning in quarters or districts and its coordination often involves just a few parts of the city. In general, in order that BP can play a key role, it must not be a simple consultation, but a true voluntary process of opening from the administrative apparatus to participation, by sharing

of decision-making process and control by the citizens with their direct involvement in public choice and with the activation of the necessary flow of information needed to make participants aware of choices taken. Only by this way the PB may be an effective instrument of deliberative democracy and a strengthening of the programming process getting a positive impact on governance. The experimentation of PB in different Italian local governments not only showed an important educational content and a capacity to mobilize resources by spreading the concept of active citizenship through a more dynamic vision of democracy and its effects, but it has also helped to improve the transparency of the process, by stimulating a greater awareness of the concept of accountability of political bodies and managers. It has also permitted to those administrations that have dared to risk in this opening to control and direct involvement of citizens in our own, the construction of social pacts, inclusive of most vulnerable members of citizenship, and the growth of political consensus. In this sense, the PB represents an instrument of consensual strategic choices, supported by a co-sharing of difficulties, expectations, objectives and benefits, in the medium and long term. The implementation of PB is not the construction of a instrumental model but arises as the construction of a relational model able to simplify the choices and the tasks of public decision-makers, with the involvement of the users of these choices.

TITLE: IMPACT FINANCING FOR IMPACT ENTREPRENEURSHIP**Saltini, Tommaso**

Università Cattolica del Sacro Cuore – ALTIS, Italy

ABSTRACT

The research aims at understanding how policy makers and public institutions can interact with different investors' categories in order to design regulations and innovative investments funds. The scope of these instruments is to encourage impact entrepreneurs to start up sustainable businesses focused on finding solutions in order to face needs and problems affecting society.

The paper proposes a phased consequential plan, summing up priorities to be carried out by policy makers in order to catalyze impact capital for impact entrepreneurship. The plan presents consequential activities to be implemented by policy makers, instruments to set in place and actors to get involved. Different structures of impact capital funds, designed to catalyze both private and public capital, are also presented. Public capital can be crucial to encourage and catalyse both local and international investors as well as to bring in technical and financial expertise. Setting up public-private funds, both as co-investors and as guarantor, the public actor acts as a catalyst for first-time impact capital investors, creating the conditions and confidence for subsequent operations through demonstration effects.

Overall, the paper identifies key issues and instruments in order to pursue both social impact and financial results, thereby fostering a comprehensive development. Furthermore, the paper brings out the fact there is a growing set of investors categories and entrepreneurs that are willing and able to create both social and financial value.

Keywords: *Entrepreneurship, Impact Capital, Venture Capital, Venture Philanthropy, Sustainable Development, Policy maker.*

INTRODUCTION AND LITERATURE REVIEW

This research aims at understanding how policy makers and public institutions can interact with traditional investors in order to design regulations and innovative investments funds. The scope of these instruments is to encourage impact entrepreneurs to start up sustainable businesses focused on finding solutions in order to face needs and problems affecting society.

According to the most recent literature, impact investing has the potential to unlock significant sums of private investment capital to complement public resources and philanthropy in addressing global challenges (Bugg-Levine A., 2013; Clark C., Emerson J., Thornley B, 2013; Clark C., Kleissner L., 2013, Johnson K., Lee H., 2013; Saltuk Y., 2011; JP Morgan Report, 2010). Studies and reports published by The Global Impact Investing Network have been taken into consideration as well (www.thegiin.org). Impact investments are identified as investments made into companies, organizations, and funds with the intention of generating social and environmental impact alongside a financial return (Saltuk Y., Bouri A., Mudaliar A., Pease M., 2013; O'Donohoe N., Leijonhufvud C., Saltuk Y. 2010; Bugg-Levine A., Emerson J. 2011, Rangan V.K., Appleby S., Moon L. 2011). Both public capital and private capital converge in impact investing as well as venture philanthropy organizations are doing (Kohn H., Karamchandani A., Katz R., 2012, Thornley B., Wood D., Grace K., Sullivant S. 2011). Venture philanthropy organizations are also innovating their approach to investing in both profit and non-profit entities, providing them with both financial and nonfinancial support in order to increase their societal impact (EVPA Publication 2012). Nowadays, the venture philanthropy approach includes the use of the entire spectrum of financing instruments (grants, equity, debt, etc.) and pays particular attention to the ultimate objective of achieving societal impact (OECD Development Centre, 2014; Balbo L, Mortell D, Ostlander P, 2008; Cummings Metz A., Hehenberger L., 2010). Impact investments are carried out mainly by impact capital funds, but both venture philanthropy organizations and profit driven venture capital are increasingly committed to investments focused on social and environmental impact (Saltuk Y. 2011; Richter K. H., 2011). Impact capital funds are operating with the same technical features of venture capital ones, providing professional equity co-invested with the entrepreneur to fund an early stage venture, and providing seed or start-up financing (Black B., Gilson R., 1998; Bygrave W.D., Timmons J.A. 1992). The key characteristics of venture philanthropy funds as well as venture capital and impact capital funds are high engagement, tailored financing, multi-year support, non-financial support, involvement of networks, organizational capacity building and performance measurement (Buckland L., Hehenberger L., Hay M., 2013; Grossman A., Appleby S., Reimers C., 2013). Venture philanthropy, impact capital and venture capital funds differ in terms of priority given to social return and financial return. While venture capital funds are exclusively focused on financial return, impact capital funds are committed to impact investments (Credit Suisse, 2012; Morino M., 2012). These investments may generate a financial return, but the societal impact comes first. It is a so-called impact first strategy. Grant funding carried out by venture philanthropy funds, on the other hand, involves the provision of non-repayable donations to the social purpose organization supported. This is the case of an impact only strategy (Grossman A., Appleby S., Reimers

C., 2013; Credit Suisse and the Schwab Foundation for Social Entrepreneurship, 2012; Godeke S., Pomares R., 2009).

Literature related to venture capital industry development has also been taken into consideration (Black and Gilson, 1998; Gompers P., Lerner J., 1998, 1999; Gilson 2003; Landstroem H, 2007). Furthermore, the paper is carried out based on potential lessons learned from other countries in setting up venture capital instruments focused on developing a specific region or industry [Israel (Avnimelech 2008; Avnimelech and Teubal 2003; 2004a; 2004b;), Germany (Becker and Hellmann 2005), Italy (Finlombarda 2002, 2003)] drawing important conclusions for emerging countries. Previous work has stressed the importance of a proper policy framework and supporting programs for fostering venture capital industry development (Avnimelech 2008; OECD 2000; 2004; 2006; Saltini 2006; 2013). However, this paper does not address the literature and the theoretical papers dealing with the venture capital industry but focuses instead on the interrelation that exists with the impact investing prospective. The results and contribution offered are strongly driven from the empirical analyses carried out in the selected countries of the Mediterranean Region and Europe.

METHODOLOGY AND OBJECTIVES

The considerations reported are based on the experience of special funds set up in a number of countries putting together both public and private resources. Information has been collected also looking at European investments funds investing in the Mediterranean region, i.e., countries around the Mediterranean Sea with the inclusion of Jordan. Moreover, empirical country analyses have been carried out in the following countries: Egypt, Jordan, Tunisia, Palestine, and Israel. Five junior researchers spent time over three years (November 2006, February 2010) along with a senior researcher (from 2006 until 2013) meeting key stakeholders, grouped in the three main categories: investors and fund managers; entrepreneurs and industry associations; and officers of public institutions and international organizations.

The empirical research was supported and carried out in collaboration with the United Nations Industrial Development Organization (UNIDO) field offices in Cairo, Tunis and Amman and from the headquarter based in Vienna. Empirical analysis was also carried out in the Lombardy Region of Italy, interacting particularly with policy makers, investors and philanthropists.

The following categories of actors were interviewed and proposals drawn with their support: regional investors, incubators, accelerators and technology parks, entrepreneurs from investee companies, investors, philanthropists, officers from public institutions and international organizations (multilateral organizations for development – MODs, development financial institutions DFIs). International regional conferences in Dubai, London, Bethlehem, Tel Aviv, Amman and Milan, in the

period 2006-2010, were also attended and proved to be useful for collecting significant information, and data and feedback from stakeholders.

Country empirical analyses have also been carried out spending long periods in the field researching in close cooperation and getting engaged with local and international stakeholders networks (Saltini 2006; 2009a; 2009b; 2010; 2013).

The first objective of this paper is to summarize, proposing a phased consequential plan, priorities to be carried out by policy makers in order to catalyze impact capital for impact entrepreneurship. The plan presents consequential activities to be implemented by policy makers, instruments to set in place and actors to get involved.

The second objective is to outline different structures of impact capital funds that aim at leveraging resources from different partners, investing both private and public capital. Consistently, the paper aims at drawing policy-makers attention to the emerging markets of the Mediterranean region as well sharing practical input to plan potential cross-border initiatives. Priorities and fund structures outlined have been developed using case studies, literature reviews and empirical analyses carried out at country level in the Mediterranean region.

The paper underlines the importance of coordination among different stakeholders to set up the right policy to create preliminary conditions for launching innovative financial instruments and investment models for sound and sustainable development affecting positively environment and society. Several impact capital actors' categories need to act simultaneously in setting up innovative funds willing and able to ensure a positive and effective impact.

Considerable research remains to be done on impact investing policy and on practical investment schemes that can be set up, also with governments' contributions, to catalyze impact investors.

A PLAN FOR POLICY MAKERS TO FOSTER IMPACT INVESTING

Governments setting proper policies play a crucial role for directing potential investors (public national and multilateral institutions, investment funds, foundations, individuals) into investments which have a social and environmental impact. The role a government chooses to play may be as a direct participant as co-investors in the market, or influencing through regulations (Thornley B., Wood D., Grace K., Sullivant S. 2011).

Policy makers must play an important role to ensure impact financing for impact entrepreneurship. A complete set of policies must be set in place geared toward the local and regional conditions that continuously enable the following of changes in circumstances and market evolution (Gompers P., Lerner J., 1998, 1999, 2001). Programs should focus on confronting specific country system failures and

aim at leveraging positive conditions present in the local context. A critical factor is policy makers' capabilities that should be able to set priorities and translate them into programs and policies. Hence assembling skilled teams of policy makers, academic experts, and specialized professionals, is mandatory in order to design the appropriate policy to catalyse impact financing (Rangan V.K., Appleby S., Moon L. (2011). To create a venture capital industry significant efforts and coordination among different actors are required (Gilson R.2003). As learned from empirical analyses, two critical factors must drive policy maker attention: long-term timing and strategic markets development. Policies that support impact investing aim at creating investment ecosystems with a long-term prospective. Public resources must be committed to develop strategic markets and industrial sectors, so leading other sources of private capital, coming spontaneously while protected by policy objective.

Policy makers must pay attention to allow preliminary conditions to emerge in order to catalyse impact capital investors and afterwards they must design regulations and invest public resources to start up and foster the beginning phase. Past successful experiences, and failures of European and American policy makers attempting to set up the venture capital funds to foster high-tech industry during the 80s and 90s, help to understand how important it is to create a positive environment (Becker R., Hellmann T., 2005; Florida R. and Smith D.F., 1993).

The design of a comprehensive policy framework represents a key issue for setting up a new impact capital industry, particularly for countries where social problems are spreading and where political turmoil is a threat. Empirical analyses carried out in the Mediterranean region confirm the importance of the government role to design good policy (Saltini 2006, 2009a, 2009b, 2010).

The Israeli and some European country experiences, both successful and unsuccessful, also support this evidence (Avnimelech 2008; Avnimelech and Teubal 2004a, 2004b; Finlombarda 2002, 2003; OECD 2000, 2004, 2006).

A phased plan is here proposed to foster impact investing for impact entrepreneurship, particularly in emerging markets. Key players (such as government bodies, development financial institutions, multilateral development organizations, universities, R&D centres, multinational enterprises, philanthropic funds and NGOs as well as private investors) need to act simultaneously in setting up special programs and policies to encourage the emergence of impact capital funds aiming at improving economic development ensuring positive impact on society.

A long-term economic development strategy should be adopted in order to phase the emergence, the beginning and the development of the impact capital industry in a specific region or country. Governments play a special role throughout the three-phased approach proposed. The policy makers can either influence impact capital development or play a direct role directing capital and participating with different level of involvement in setting up supporting programs and impact funds.

Governments along with universities and, in emerging markets as well, multilateral organizations for development and NGOs, have a significant role in pursuing the preliminary objectives of the emergence phase. Economic stability, reached through a sound investments policy framework, is a key factor to catalyse investors. However, impact capital, both from the investors and entrepreneurs side, is a people-intensive business. Technical assistance is crucial, improving training offer and cultural awareness, and is a way to contribute to the development of impact business models (Bugg-Levine A., 2013). Conditions to generate impact and make a contribution are always to be able to learn, as well as investment passion and creativity in solving problems. In this phase, it is important to improve the ability to take the initiative, and to foster the desire, particularly in the young generations, to do business to find effective solutions.

To pursue and reach economic sustainability it is necessary to move away from the logic of exploitation and short-term financial speculation. It is necessary to create new financial entities that work with new spirit to develop long-term strategies, creating value innovating products and optimizing production through process innovations.

In the beginning phase, the first objective is to support impact entrepreneurs to design and validate business models (Kohn H., Karamchandani A., Katz R., 2012). Extremely challenging but particularly relevant in emerging markets is to focus upon supporting R&D activities, the enhancement of innovation capabilities, and the stimulation of entrepreneurship culture. Therefore, governments should commit resources to enhance R&D programs and projects, in order to create new products and services for launching innovative impact businesses and for innovating traditional industries as well. A second objective must be to design policies directing capital more toward impact opportunities (Thornley B., Wood D., Grace K., Sullivan S. 2011). This can happen by launching supporting programs and pilot funds, coordinating public and private capital, invested with the principal aim of generating other impact funds. In this phase, key actors are the impact investors, both impact first and financial first investors (Monitor Institute, 2009; Richter K. H., 2011). Coordinating actors and integrating the different investing instruments is also crucial to ensure long-term sustainability for both impact entrepreneurs and impact funds investing in small and growing businesses.

In the development and consolidation phase it is important to launch a different typology of impact funds and to elaborate policy to foster their stability and capacity to implement long-term investment strategies. Attention must be paid to assure both social and financial return and to design a methodology to measure them. The design of proper development policies can increase the amount of impact capital. Policies dealing with investments rules and policies that provide co-investment increase the supply of impact investing capital by catalysing private investors, through risk sharing with governments (Kohler J, Kreiner T, Sawhney J, 2011). When an equity investor is investing in

small risky businesses, the involvement in the business development process of capacity development organizations, such as NGOs, MODs, DFIs or any other technical assistance organizations with specific industry expertise, is also appreciated.

In order to improve the exit opportunities for investors, policy makers must regulate properly also the merger and acquisitions market, in particular by improving transparency and financial information credibility (Hill K. 2007).

During the consolidation phase crises can arise. In this case, priority should be given to assuring a minimum level of activity in start-ups, targeting innovation. During critical times government involvement and forms of direct financial support can be a determining factor in the industry's survival and therefore help to overcome the crisis and reach a stronger consolidation status (Gilson R. 2003; Karaomerlioglu D.C., Jacobsson S. 2000).

PHASE 1 – EMERGENCE			
Objectives	Activities	Actors involved	Instruments
Good Governance and Economic Stability	Ensuring economic stability, setting up investment regulations, labour and contract laws, taxes, regulations, intellectual property system, and policy for innovation.	Governments	Policy framework
Human Capital	Promoting entrepreneurial culture and increasing awareness of innovative financial instruments for impact. Fostering passion and creativity in solving problems. The educational system needs to be improved and the linkage tightened between research and industry.	Governments, Universities, MODs, NGOs.	Trainings, courses, Scholarships, Executive Programs.
Capacity Building	Facilitating understanding about the value of looking for “impact” as entrepreneurs and as investors. Campaigns and training to stimulate awareness and demand for impact. Networking to share success stories and failures.	Governments Universities Students Entrepreneurs Investors	Summer Schools, trainings, courses Research and publications. Events.
PHASE 2 – BEGINNING			

Objectives	Activities	Actors involved	Instruments
Design and Validate Business Model	<p>Designing and setting up training and coaching to turn business ideas into business models, business models into business plans.</p> <p>Subsidize supporting programs to get civil society stakeholders involved.</p> <p>Improving programs and projects to create a suitable environment for R&D, innovation and technology applied to impact business model and in traditional sectors as well.</p> <p>Grant programs for impact start-ups.</p> <p>Promoting business incubator and tech park for impact.</p>	<p>Governments, Impact Entrepreneurs</p> <p>NGOs</p> <p>Business Angels</p> <p>MODs</p>	<p>Grants</p> <p>Supporting programs, Mentoring programs, Incubator, Tech park.</p>
Directing Capital	<p>Subsidize supporting programs investing public resources</p> <p>Co-investments.</p> <p>Supporting programs financed by public and private capital with the ultimate goal of fostering focus on impact.</p> <p>Introducing tax relief to support impact investors and technology transfer for impact business model.</p> <p>Improving regulations to better frame funds structures and operations.</p> <p>Setting up impact funds coordinating government direct participation and private capital.</p> <p>Setting up special funds as pilot initiatives to develop strategic markets and industries.</p>	<p>Governments, Venture Philanthropy Org., Foundations, Individuals, DFIs.</p>	<p>Supporting Programs, Guarantees, Tax Incentives, Pilot IMPACT FUNDS</p>
Networking and Coordination	<p>Improving investors' attitude and mind-set toward impact investing.</p> <p>Foster networking and partnerships among private and public actors in order to widen spectrum of exits.</p>	<p>Governments, Impact Entrepreneurs, Impact</p>	<p>National and Promotional impact actors committees</p>

	Supporting the establishment of a national impact investors/actors association. Bridging the gap between investors and entrepreneurs. Encourage investors and managers to be committed to impact capital mission and values. Promote good practices to catalyse national and international impact investors.	investors, Ind. Associations DFIs, MODs.	Roundtables Conferences
PHASE 3 – DEVELOPMENT & CONSOLIDATION			
Objectives	Activities	Actors involved	Instruments
Social Return & Financial Return	Promoting multiple use of investing instruments. Consolidate and enrich policy framework increasing the number of public and private co-investment funds. Promote good practices to catalyse national and international impact investors. Scale impact funds scheme of success. Scale impact business model of success. Assisting target companies to improve internal capacities and offering managers and entrepreneurs strategic advice to ensure both social and financial impact.	Impact Entrepreneurs, Local and international impact investors.	IMPACT FUNDS (soft loan, quasi-equity, equity)
M&A Market	Creating the emergence of conditions for alternative exit opportunities for impact investors, supporting consolidation and facilitating M&A operations. Improving transparency of market information and financial information credibility.	Governments, Investors Networks, Industry Associations.	Regulations Information Sharing Corporate Governance

Source: own elaboration

DFIs – Development Financial Institutions

MODs – Multilateral Organizations for

Development

MNEs – Multinational Enterprises

NGOs – Non-Governmental Organizations

The overall objective of the proposed **phased plan for policy makers to foster impact capital for impact entrepreneurship** is to improve access to financial resources and catalyse impact financing. Impact entrepreneurs must be supported to get access to grants as well to debt and equity instruments. They must also be helped to understand if and when they need capital, as well as to understand terms for transition from one form of source of financing to another.

What appears to be crucial is that policies and programs should not create dependence on aid and grants, from private philanthropy and government programs. In the long term, any business, whether social or profit focused, should be scaled and provide returns to its investors.

IMPACT FUNDS, BETWEEN PUBLIC AND PRIVATE

Government institutions, along with development financial institutions, multilateral development organizations and NGOs, can facilitate the setting up of innovative impact capital funds, with participation by both private and public capital. These funds are the key instruments of the development phase of the proposed plan for policy makers. However, actors' awareness must be pursued during the emergence phase. Different actors must be brought together in order to design common strategies, draft regulations and commit resources.

Impact capital funds, leveraging public and private capital, must be launched during the beginning phase. Impact funds, which leverage public and private resources and know-how, must have a well-focused mission to invest in industries that are crucial for the country's development and should also be geared to develop depressed strategic sectors. These instruments thus have the final goal of setting up new companies and supporting growth of micro-small enterprises operating in underdeveloped regions. Different funds should be set up according to geography, industry, human capital group (youth, women, etc.), and country priorities (Kohler J, Kreiner T, Sawhney J, 2011; Godeke S., Pomares R., 2009). Therefore, public capital can be crucial to encourage and catalyse both local and international investors as well as to bring in technical and financial expertise. Public actors can reduce the risk of investing for impact, not only in depressed regions and in rational industries with steady growth, but also in the beginning phase of the impact industry development. This phase is still characterized by an incomplete policy framework and by the absence of certain investors' categories, actors' know-how and financial instruments in the market. The public actor acts as a catalyst for first-time impact capital investors, creating the conditions and confidence for subsequent operations through demonstration effects (Bouri A., Mudaliar A., GIIN, 2013). Public involvement to foster the development of a new

impact capital industry is desired but it is important to recall that the government as facilitator and investor should have the ultimate goal of creating self-sustainable markets rather than creating conditions for dependency. After target goal achievement, public actors are expected to timely remove their presence. Pressuring governments to take action as facilitators and investors also presents considerable risk, as this involvement could become too intrusive, thereby stifling real development. Risk of distortions is high and must be avoided. With particular reference to experiences analyzed in Israel, Italy, Germany and Turkey (EIF 2011; Avnimelech G., M. Teubal 2003; Finlombarda 2002, 2003; Becker R., Hellmann T., 2005) as well as with reference to the empirical analysis carried out in the Mediterranean region, funds schemes are proposed to be developed by mutual involvement of public and private players. Funds structures proposed should be properly adapted to address country and region specific weaknesses and challenges.

Public-private, fund of funds

A fund of funds can be set up as a national, international, and public-private partnership. A fund of funds is considered in this paper as a co-investor in other impact capital funds. The fund may also use part of the capital allotment to directly invest and co-invest in enterprises (Ramsinghani M., 2011; Strachman D. A., 2009; Bygrave W.D., Timmons J.A., 1992).

Public-private fund of funds is a financial tool that has been used with good incisiveness in several developed countries, to support venture capital funds focused on seed and early investment stages. The fund structure proposed refer to Yozma Fund in Israel, to ERP-EIF Dachfonds and LfA-EIF Facility in Germany, and iVCi in Turkey. (EIF 2011; Avnimelech, G., M. Teubal, 2004, and Israel Venture Association, www.iva.co.il).

A fund of funds is based on an agreement signed by parties that commit capital to invest in venture capital whose target is strictly related to the principles and priorities jointly indicated by the investors involved. Public-private fund of funds represent a good instrument to make use of public resources due to its multiplying positive effect of mobilizing and directing private funds to priority areas and strategic industries. This instrument is particularly useful to boost impact funds to invest in start ups and to help scaling business model with impact. A fund of funds structure is attractive to institutional investors, as it creates a portfolio approach that spreads the investment risk. The fund of funds approach also enables the government to support the growth of the key market and industry without

distorting or competing with other investors categories active in the country.

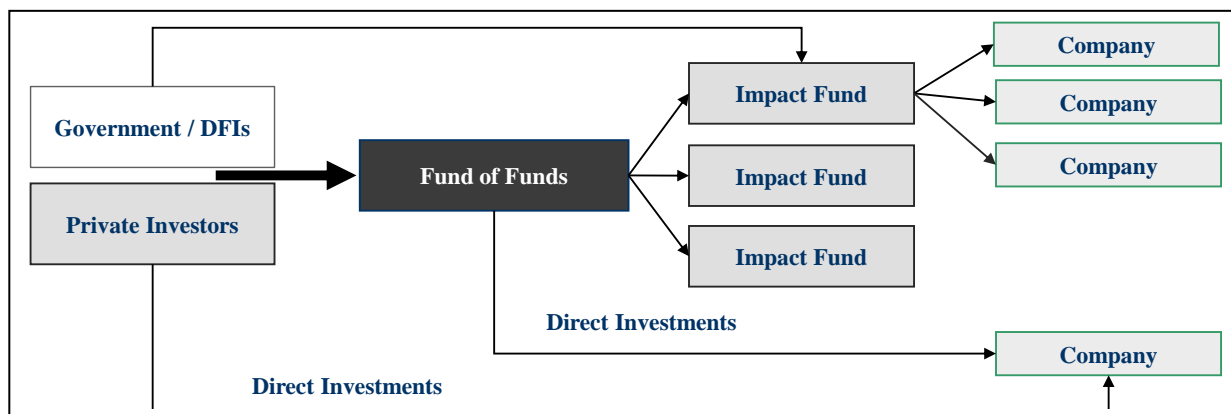

Figure 2. Public private, fund of funds.

Public actors involved such as the ministry of industry, universities, research institutions, etc.) co-invest in private initiatives. The public actor in charge underwrites shares of fund of funds' capital (share A) together with public and private institutional investors (share B).

The fund regulations establish ex ante that the public actor in charge underwrites shares of the fund that have different rights than the shares underwritten by institutional investors and by other private investors that invest in daughter funds in which the fund of funds co-invests. Shares A have a limitation on the maximum return in terms of IRR (Internal Rate of Return).

A development financial institution can also act as co-investor in a fund of funds instead of the government and thereby represents the public interest in the partnership.

Capital guaranteed impact fund

A capital guaranteed impact fund is an equity fund set up for raising private capital through a management company, whereby the capital is guaranteed by a public entity (ministry, central bank, development agencies in case of emerging markets and development countries, etc.).

The guarantor works adjacent to an impact fund, encouraging private investors investing either in other impact funds with a regional or industry focus or investing directly in impact enterprises, reducing the risk of losing the invested capital. The fund is managed by independent qualified managers and financed with private capital. The investments are guaranteed by a public entity, which has as its objective the increasing development of new, promising micro and small impact enterprises and strategic industries.

The fund firms and their managers are requested to follow specific guidelines dictated by the governments or related public institutions. So, the funds are provided to foster all those sector and economic activities that are considered priority objectives.

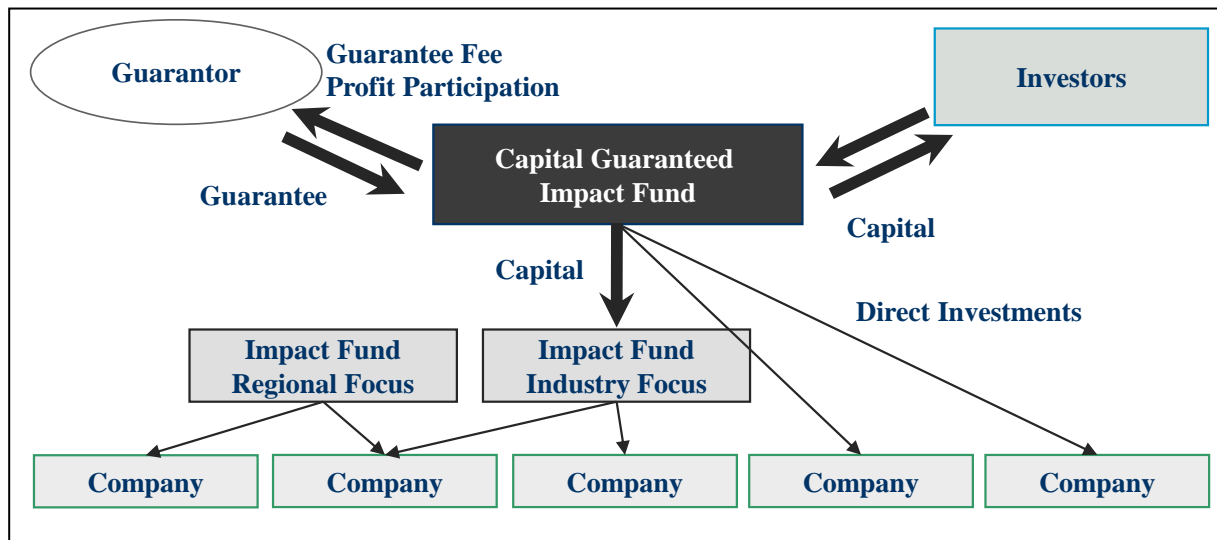

Figure 3. *Capital guaranteed impact fund.*

The impact fund is guaranteed by a governmental institution (guarantor) committing itself to repurchase a percentage of the participation (net of dividends) if the value of the latter, after a certain period of time (7-10 years) is evaluated lower than the original investment on the basis of predefined mechanisms. Acting as guarantor, the public actor can foster sustainable development without an immediate disbursement. The public actor will receive a guarantee fee from the fund and it will benefit from profit sharing. Furthermore, it will play an active role appointing some board members and exercising a veto right for investments exceeding a pre-established amount. Reducing the risk to invest on small business model focus on impact solutions, the guarantor spurs investors and so catalyzes local and foreign capital resources.

Three partners impact fund

The proposed scheme should be consist of three partners: government or international public institution such as a regional development financial institution, private investors and multilateral development organizations or non-governmental organizations. The use of a three partners impact fund is a recommended structure for developing countries with high risk factors and where the financial system is weak.

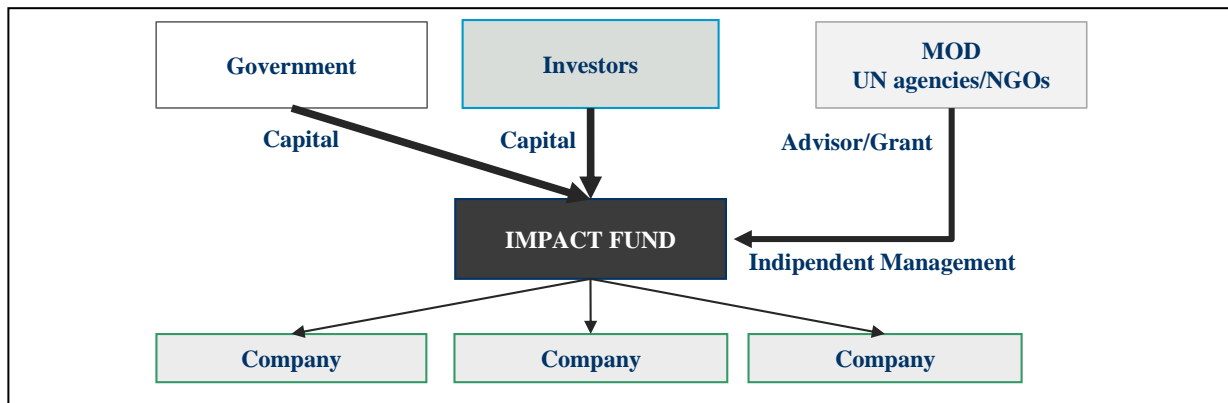

Figure 4. Public private, fund of funds.

In the proposed scheme, government plays an active role as investor and in controlling the impact capital fund. Nevertheless, an independent and reputable management team must run the fund. Management is the key factor for any successful venture capital firm and particularly for an initiative driven by public money (Bygrave W.D., Timmons J.A., 1992; Gompers P., Lerner J., 1998).

A crucial role in setting up an impact fund, where the government is leading as investor, can be played by a third partner, represented by a multilateral development organization or by a non-governmental organization.

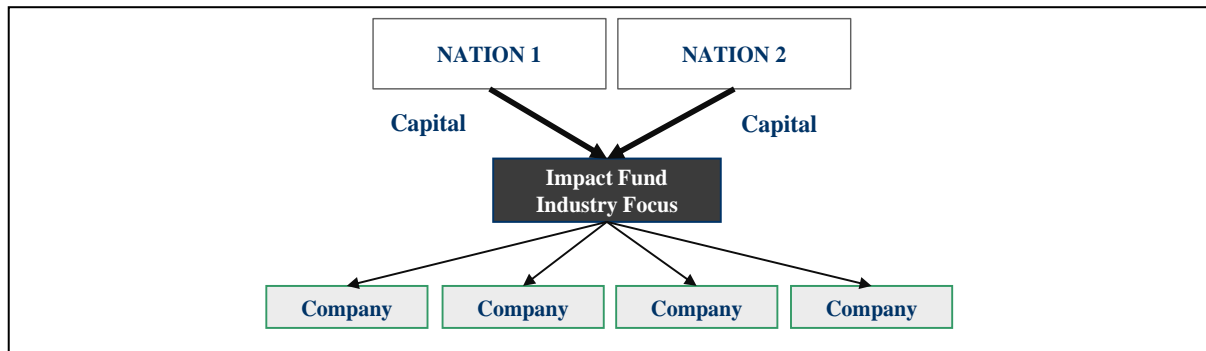

This category of actors, usually due to internal regulation constraints, cannot act as investors but only as facilitators investing grants capital.

Multilateral organizations for development, such as UN agencies and international NGOs, are willing to sustain government driven initiatives for industrial development. These stakeholders can therefore play an important role in the reduction of agency administrative costs, which are higher than usual when the impact fund is committed to invest in micro and small businesses. Intensive mentoring and monitoring activities need to be offered to foster the numerous companies in the portfolio. As well as making this important contribution, the benefit would consist in selecting a good flow of deals, by pointing out type and size of promising suitable investors.

An international and reputable actor, such as a UN agency, is a significant plus in securing the new fund nature and for highlighting the strong idealism for development of the institutional public investor which will commit financial public resources.

Bi-national Fund

A bi-national fund is established when two nations pledge a predetermined sum for the pursuit of common objectives. A direct participation of public institutions or ministries is foreseen. An agreement which defines the content of the project, its objectives, and activities to be carried out, is jointly prepared by the authorities and officers involved.

Figure 5. *Bi-national Fund*.

A similar initiative can be also be promoted by other parties, especially those preferably belonging to a specific region with common development objectives and where businesses and political interaction positively characterize country relations. A board of directors is appointed by the two governments, and is independent in its decision-making.

The bi-national fund represents a good instrument to streamline R&D projects, as well as to foster knowledge and capabilities sharing. This instrument has been specifically used by the Israeli government in the last few decades to consolidate relationships with historical friendly nations such as U.S. and Canada, as well as to explore new possibilities with nations such as Korea and Singapore.

For emerging countries, this instrument could represent a concrete support to improve overall economic and trade relations within key country partners. A bi-national fund is a good vehicle to favor synergies between companies from the two nations and facilitate technology transfer.

RESULTS AND CONTRIBUTIONS

The paper proposes a phased plan for policy makers in order to encourage long-term and strategic planning to foster impact capital for impact entrepreneurship.

Concrete impact capital schemes bringing together public and private actors were also elaborated and recommended to catalyse new resources.

The first empirical confirmation, coming from experiences and information collected in the field, is about the importance of bringing together social impact and financial return. These two factors are crucial for personal, corporate and society success.

Policy and investment strategy cannot be geared only toward the good of either the individual or a single community, but indeed to the common good for the entire collectivity. Policy makers have a key role in influencing stakeholders through laws and regulations set up to catalyse impact investors and supporting impact entrepreneurs.

The research underlines the fact that governments can provide direct and indirect financial support

fostering investments in low-income communities and toward depressed industries and markets. When private capital seeks social and environmental benefits, there is an opportunity for governments to design partnerships and set up innovative funds.

The emergence and development of the impact capital industry will improve the matching between pure investors and philanthropist, as well as private and public actors.

Pursuing impact is a means, not only to prevent improper exploitation but also a good way to foster human creativity, industry potentiality and nation development. The paper brings out the fact that there is a growing set of investors categories and entrepreneurs that are willing and able to create both social and financial value. Giving importance and attention to the single person, the future, the environment, and to the importance of giving a contribution for the “others” around us, have an increasing value for a sound business development. The intention to generate impact must not be considered incompatible with the effective capacity to generate profit. In the society, challenges and needs are changing, but the need of partnership and to develop long-term strategy as well as need to face the difficulties the new generation are facing is consistent.

The paper proposes practical action at policy level and concrete investment schemes that can enable countries to become more competitive in attracting investments, overcoming barriers and maximising the impact of both local and international investors.

The research clarifies the importance of bringing all actors categories closer to working for impact. Players that play a key role are not only investors and entrepreneurs, but also all those stakeholders that can facilitate operations and preliminary conditions emergence such as governments, multilateral organizations for development, development financial institutions, universities, industry associations and specialized professionals.

A STRUCTURAL MODEL PROPOSAL FOR INTERNAL CORPORATE SOCIAL RESPONSIBILITY

Sánchez-Hernández, M.I.¹; Gallardo-Vázquez, D.²

¹Business Administration and Sociology, University of Extremadura, Spain

²Financial Administration and Accountancy, University of Extremadura, Spain

ABSTRACT

The understudied internal side of Corporate Social Responsibility has the emphasis on employees as strategically important to pursuit responsible actions. This paper considers responsible human capital business practices as key factors explaining competitive success across firms. The purpose of this article is to demonstrate that Internal Corporate Social Responsibility is a good management framework for business competitiveness. Supported by the scarce academic literature in the field, the article starts by the definition of selected indicators to build constructs and to develop a structural model able to explain several relationships of causality between the internal side of Corporate Social Responsibility, business innovation, performance and competitive success with structural equation modeling as selected methodology. The conclusion after the statistical analysis procedure applied to a sample of 590 firms in the Mediterranean region of Extremadura in Spain is significantly positive, confirming three of the four hypotheses developed in the conceptual model. To finish, some suggestions for the future research agenda emerge from this first attempt to approach the internal side of responsibility to competitiveness in business management.

Keywords: *Corporate Social Responsibility, CSR, Internal Corporate Social Responsibility , ICSR, Human Resources, HR, competitiveness*

INTRODUCTION

According to the renewed definition by the European Commission, Corporate Social Responsibility (CSR) is the responsibility of enterprises for their impacts on society with reference to collaborate with stakeholders "to integrate social, environmental and ethical concerns, respect for human rights and consumer concerns into their business operations and their core strategy" (COM 2011:7). Matten and Moon (2008: 405) highlighted the heterogeneity of the definitions of CSR when they expressed that "CSR is an umbrella term overlapping with some, and being synonymous with other, conceptions of business-society relation". In general terms, CSR have been considered "an organization's obligation to maximize its positive impact on stakeholders and to minimize its negative impact" (Ferrell et al.

2008: 38). Although CSR is constantly evolving, Agliata et al. (2010) set up the most important key concepts around the term. They highlight the stress on corporate management as promoter of responsible actions, the explicit reference to global interests, the reference to overcoming strict legal obligations and the integration in the performance of the company's activities.

In strategic terms, CSR is considered a source of competitive advantage (Branco and Rodrigues 2006; Porter and Kramer 2006; McWilliams and Siegel, 2011). In turn, the understudied internal side of CSR has the emphasis on employees as strategically important to pursuit responsible actions. The focus of this work is the study of Internal Corporate Social Responsibility (ICSR) in business and the question is whether responsible human capital business practices could be considered key factors explaining competitive success across firms or not. The purpose is to demonstrate that ICSR is a good management framework for business competitiveness.

After this introduction, in the following sections the focus turns to the various aspects of ICSR in order to define the construct. After that, a structural model is built considering also innovation and performance as strategic variables. Methodology and statistical results are briefly presented with attention in conclusion in the future research agenda.

THE ICSR THEORETICAL BACKGROUND

Taking into account the strategy of Corporate Social Responsibility (CSR) established in recent years by a big number of companies, two theories are supporting the framework in which the ICSR is supported. First, we highlight the Theory of Stakeholders. The so-called stakeholders or groups of interest were defined as "those groups or individuals who can affect or are affected by the achievement of entity objectives" (Freeman, 1984: 25). Nowadays it is generally accepted that stakeholders are those individuals or groups whose objectives depend on what the organization is doing and from which the organization depends (Johnson et al. 2008). The term stakeholder include owners and shareholders, employees, suppliers, creditors, customers, debtors, government, unions, nonprofit organizations and the public in general. According to the theory, it is generally recognized that CSR has two dimensions: external and internal. The definitions from Atkinson et al. (1997) and Frooman (1999) have special emphasis on the goal of this work. According to Atkinson et al. (1997) two groups of interest are distinguished, those qualified "from the environment" (customers, shareholders and society) and those qualified "from the process" (owners, employees and suppliers). From this point of view, the second collective, and specially the employees, are the focus of the ICSR. Complementary, Frooman (1999) distinguished two groups of collectives. The "strategic collective" referring those that affect the operational process of the organization and the "moral collective" affected by the actions of the organization. According to the internal vision of CSR, the moral one

would involve special attention of the company being considered the collective in whom internal performances are based and will be mainly those affected by the business actions.

The second theory supporting the study is *The Theory of Resources and Capabilities*. According to Cardona (2011) the study of business strategy has been developed around two major perspectives: the *competitive environment view*, which analysis has been derived from the model of the five competitive forces developed by Porter (1980) and the key success factors, and the complementary *resources and capacities view* for the achievement of competitive advantages sustainable in the long-term, where human resources are considered key factors for competition.

Assuming Grant's postulate (2010), the business strategy is focused on the pursuit of profits, consisting of achieving competitive advantages and ensuring the survival and prosperity. To identify the sources of business profits, we do special attention to the relevant aspects to the organizations by themselves: their unique and heterogeneous resources and capabilities, which should be oriented according to the strategy to be implemented, in a process of permanent adjustment, given the turbulence of the market and competition in all sectors. According to several authors (Barney, 1991; Peteraf, 1993; Teece et al, 1997; Sáez de Viteri, 2000; Grant, 2010; Cardona, 2011), sources of competitive advantages exist within the organization and human capital is one of them. It includes people with the potential of learning, openness to change, adaptability, teamwork ability, personal relationships, leadership, entrepreneurship, as well as psychological and sociological aspects. Consequently, the internal focus of CSR could be considered also a source of competitive advantages that need to be studied.

BUILDING A STRUCTURAL MODEL FOR ICSR

When companies are involved in CSR activities, the internal dimension determinates relations with their internal stakeholders, specially their employees. Taking into account that classical organizational boundaries have become obsolete because "what once was 'outside' the organization is now 'inside' and vice versa" (Schoemaker et al. 2006, 449) we found in this fact a fundamental reason for the emergence of the internal face of CSR.

Nowadays the external side of CSR and the internal one are more related than ever showing higher interconnectivity as have been shown by Sánchez-Hernández and Grayson (2012). The emphasis on employees as strategically important to a firm's success has contributed to the interaction of strategy and Human Resources (HR) management issues (Barney, 2001).

According to Acedo et al. (2006), human capital is a key factor explaining performance differences across firms. Schomaker et al. (2006) argued that treating HR management and CSR separately is an outdated approach because organizations develop towards open systems where cooperative action is

based on the willingness of humans to bring in and develop their talents as part of communities of work. Crook et al. (2011) have pointed out the importance of “specific” employees, referring to the best and brightest human capital available in the labor market, to achieve high performance.

In addition, the relationship between performance and competitive success has been noted in business strategy fieldwork by Porter (1980, 1991) and other authors (i.e. Spanos and Lioukas, 2001; Wagner and Schalteggers, 2003). Previous work has demonstrated the mediation role of innovation between CSR and performance (Gallardo-Vázquez and Sánchez-Hernandez, 2012). Innovation, that is intrinsically about identifying and using opportunities to create new products, services, or work practices (Van de Ven, 1986) could be also identified as a mediator variable when considering ICSR because it is widely accepted that improvements on HR management have a positive impact on innovation (Subramaniam and Youndt, 2005). Based on the above, the conceptual model proposed (Figure 1).

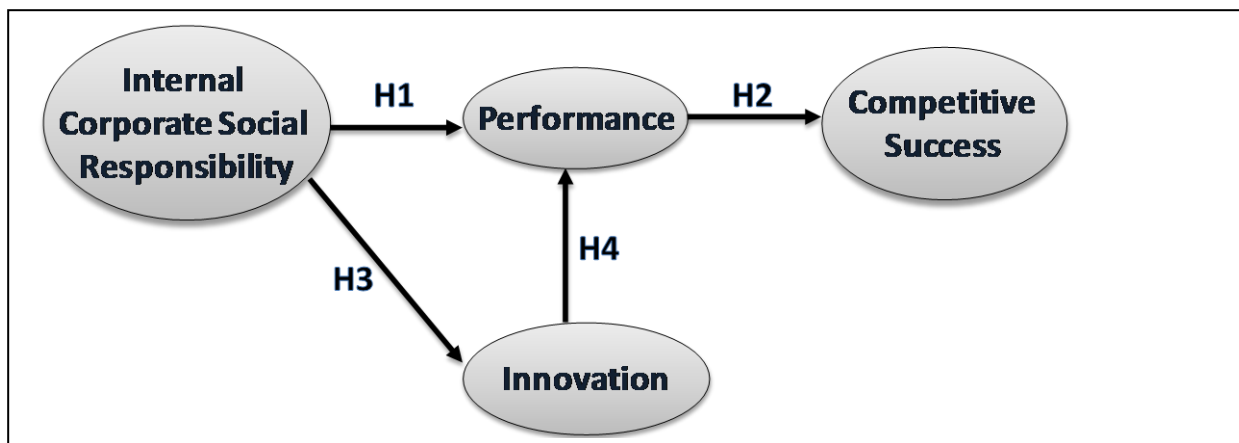

Figure 1. *structural model proposal*

The model includes four related latent variables that make up the proposed causal relationships defined in the following hypotheses:

H1: *There is a direct and positive relationship between the ICSR and performance*

H2: *There is a direct and positive relationship between performance and competitive success*

H3: *There is a direct and positive relationship between the ICSR and innovation*

H4: *There is a direct and positive relationship between innovation and competitive success*

MEASURES

According to the ICSR principles, the primarily internal *stakeholders* guarantee in companies is the facilitation of employment (recruiting employees, guarantee jobs and wages) particularly taking into account special goals such as job security and the raising of the employment for women and ethnic

minorities. The final purpose will be to improve quality of life of employees ensuring a healthy work environment and to avoid any discrimination in payment and social exclusion. The selected indicators reflecting ICSR actions are shown in table 1 (from ICSR1 to ICSR18) selectively supported by Turker (2009), Agudo-Valiente et al. (2012), Gallardo-Vázquez and Sánchez-Hernández (2012), Lu et al. (2012) and Pérez et al. (2012).

We support the employment of people at risk of social exclusion (ICSR 1)
We value the contribution of disabled people to the business world (ICSR 2)
We are aware of the employees' quality of life (ICSR 3)
We pay wages above the industry average (ICSR 4)
Employees compensation is related to their skills and their results (ICSR 5)
We have standards of health and safety beyond the legal minimum (ICSR 6)
We are committed to job creation (fellowships, creation of job opportunities...) (ICSR 7)
We foster our employees' training and development (ICSR 8)
We have human resource policies aimed at facilitating the conciliation of employees' professional and personal lives (ICSR 9)
Employees' initiatives are taken seriously into account in management decisions (ICSR 10)
Equal opportunities exist for all employees (ICSR 11)
We participate in social projects to the community (ICSR 12)
We encourage employees to participate in volunteer activities or in collaboration with NGOs (ICSR 13)
We have dynamic mechanisms of dialogue with employees (ICSR 14)
We understand the importance of pension plans for employees (ICSR 15)
We put into practice specific actions to raise awareness, to educate, and to inform employees on the principles and actions related to CSR (ICSR 16)
The values related to CSR are present in the vision and strategy of the firm (ICSR 17)
We are active members of organizations, business, or professional association of discussion groups that promote the implementation of CSR (ICSR 18)

Table 1. *Selected indicators to measure icshr*

To measure performance, innovation and competitive success we have considered scales previously used by Gallardo-Vázquez and Sánchez-Hernández (2012). Performance is considered a reflective construct with eight indicators (from P1 to P8) as well as innovation with ten (from INV1 to INV10) and competitive success with ten indicators (from C1 to C10).

CONTEXT OF THE STUDY, SAMPLE AND PROCEDURE

The information for this investigation was collected from business services managers in the Autonomous Community of Extremadura, in southwester Spain. The broad argument to choose services in this work is that the fit between Human Resources Management and CSR strategy is greater in services than it is in manufacturing supporting highlighting the internal side of CSR.

Moving to justify the selected region, we have to say that since 2010, a special plan for the promotion of CSR exists in the Region. The main pillars for building a responsible culture in the region are: The *Law of CSR* in Extremadura (15/2010 of 9 December) and the *Decree* (110/2013 of 2 July) for the establishment of the Autonomous Council for the promotion of Social Responsibility of Extremadura, the Office of Corporate Social Responsibility, and the Procedure for qualification and registration of socially responsible companies.

The representative sample of regional business services comprised 590 SMEs with their corresponding predetermined substitute firms to control the non-response index. The objective universe was drawn from Spain's Central Enterprise Directory (SCED). Before beginning the study, we calibrated the representativeness of the sample of firms that were to participate in the survey. To this end, weighting coefficients were established according to the defined strata of the firms in the sample. Possible biases relative to the characteristics of the total population of the Directory were checked for using statistical tests comparing the structure of the sample with the total population of the SCED. The results justified the validity of the sample for the purposes of the study. A pilot test was also carried out in order to check that the survey would be appropriately interpreted by the respondent.

The administration of one *ad hoc* questionnaire was by telephone interviews with business services managers. They were carried out using the CATI system (Computer Aided Telephone Interviewing). The participation index was 11.07%, corresponding to the percentage of firms in which a valid interlocutor agreed to participate in the study. A total of 590 completed surveys were collected, which resulted in a response rate of 11.07%.

EMPIRICAL RESULTS

In order to validate the ICSR scale, a structural equations model (SEM) have been tested considering it very suitable for research interests where the phenomena in question is relatively new and where the theoretical model and their measures are not well formed (Chin, 1998). The purpose of SEM is double. The first step is to analyze whether the theoretical concepts are properly measured by the observed indicators. This analysis has been carried out for the two attributes *validity* (measuring what one really wanted to measure) and *reliability* (whether the process is stable and consistent). To this end, we have calculated the individual item reliability, the internal consistency or reliability of the scales, the average variances extracted (AVE), and the discriminant validity. A brief of main results are shown in table 2.

Constructs	Reliable Indicators	Loadings (λ)	AVE	Crombach's Alpha	Composite Reliability
ICSR	ICSR 7	0,746	0,5044	0,8200	0,8683
	ICSR 8	0,724			
	ICSR 9	0,716			
	ICSR 10	0,673			
	ICSR 11	0,799			
	ICSR 14	0,689			
Performance	P1	0,918	0,7541	0,8910	0,9242
	P2	0,922			
	P3	0,766			
	P4	0,859			
Innovation	I3	0,635	0,5055	0,8913	0,9105
	I5	0,692			
	I6	0,678			
	I7	0,770			
	I8	0,685			
	I9	0,732			
	I10	0,664			
	I11	0,763			
	I12	0,777			
	I13	0,699			
Competitive Success	C1	0,769	0,6096	0,8427	0,8862
	C2	0,787			
	C3	0,834			
	C5	0,729			
	C6	0,781			

Table 2. *Main results for the measurement model*

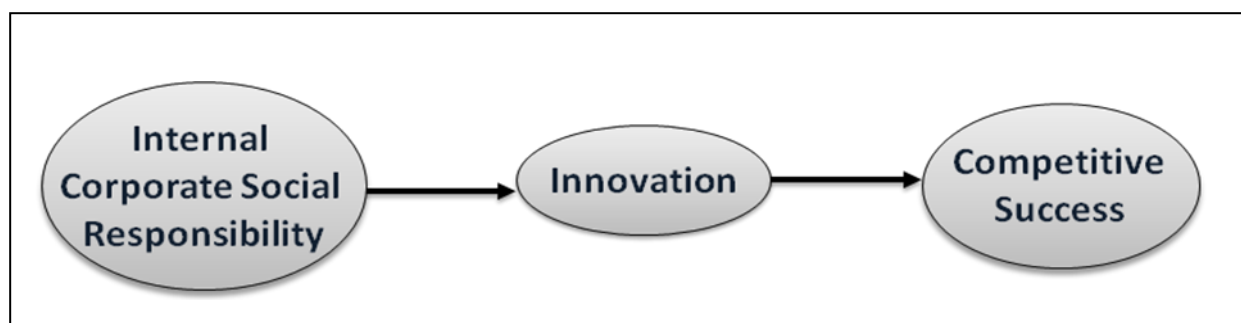

The second step of the analysis of the structural model consists of the estimation of the assumed causal and linear covariance relationships among exogenous and endogenous latent constructs. In this last stage of the analysis, the hypotheses have been tested by examining the magnitude of the standardized parameters estimated between constructs with the corresponding t-values that indicate the level of significance. We have employed bootstrap routine (Chin, 1998), a non-parametric re-sampling technique that offers the *t-statistic* values. An overview of the results can be inferred from table 3.

Table 3. *Main results for the structural model*

HYPOTHESIS / Structural relation A → B	Original path coefficients (β)	Mean of sub-sample path coefficients	Standard error	t-value
<i>H</i> ₁ : ICSR → Performance	0,1350	0,1201	0,1193	1,1318
<i>H</i> ₂ : Performance → Competitive Success	0,2114	0,2415	0.0958	2,2059**
<i>H</i> ₃ : ICSR → Innovation	0,3913	0,4205	0,0918	4,2585***
<i>H</i> ₄ : Innovation → Competitive Success	0,2607	0,2771	0,1003	2,5989***

DISCUSSION AND CONCLUSION

We have established a set of indicators that define ICSR as a result of a dynamic process that provides information about a firm's actions in responsible HR management. The set of developed indicators will help to build a fluid and meaningful dialogue with employees of the firm, allowing continuous improvement and, as has been demonstrated empirically, increasing the firm's competitiveness. The conceptual model has been tested empirically confirming hypothesis *H*₂, *H*₃ and *H*₄. The first hypothesis has been rejected and the relationship between ICSR and firm performance has not been confirmed probably because performance depends highly on external factors not considered here. Consequently, the validated model is show in figure 2 where innovation is a mediator variable between ICSR and competitive success in accordance with previous work in CSR (Gallardo-Vázquez and Sánchez-Hernández, 2012) where ICSR was not isolated from the holistic construct of firm responsibility.

Figure 2. *validated model*

This study highlights the importance of the emergence of new frameworks to understand CSR and one of them is the interplay between ICSR and other strategic variables to pursuit competitiveness. As regards the usefulness and implications of this research in business practice, it facilitates managers the work of definition and development of indicators for measuring the variables involved in diagnosing their position respect to ICSR. The validation of the model that includes these linkages empirically reliable will help HR managers and CSR managers to work together and to understand why they should pay attention to issues of HR and CSR with a holistic view and what to expect from the efforts they make towards employees' quality of life.

From the point of view of the theory, this research initiates other future researchers to perform, on the basis of the variables considered. Furthermore, the results confirm that ICSR will play an important role in the competitive success of business in the Mediterranean area in the near future. Being managers aware of this fact, they will surely want to take the path of responsible HR management.

Some limitation of the study are recognized as the survey was aimed at executives of firms in a unique Mediterranean region, with a particular job position and not only HR managers or CSR managers. The procedure therefore only represents the perception described by managers. However, we will reinforce the present pioneer study by different views and methods in order to contrast and compare the results obtained. We shall also be continuing to use the validated ICSR measurement scale here to test alternative structural models to know whether ICSR influences other strategic variables related to firm competitiveness.

THE SUCCESS FACTORS OF A SICILIAN MARKET-ORIENTED WINE COOPERATIVE

Schimmenti, Emanuele¹; Borsellino, Valeria^{1*}; Asciuto, Antonio¹; D'Acquisto, Marcello¹; Di Gesaro, Mariarosa¹; Zinnanti, Cinzia¹

Department of Agricultural and Forest Sciences, University of Palermo, Palermo, Italy

ABSTRACT

Wine cooperatives have a long tradition in Sicily, as well as in Italy and in Europe. The objective of this paper is to reconstruct the general framework of the Sicilian wine cooperatives that still account for nearly 80% of the regional wine grapes production. In this context we examine the productive, organizational and commercial strategies of a case study: Cantine Settesoli. Founded in Menfi (Western Sicily, Italy) in 1958 on the initiative of a group of wine grape-growers, the Cantine Settesoli has developed over the decades and now represents the major bottled wine cooperative in Sicily, whose 2,135 members own 5% of Sicilian vineyards. With its four wine-making plants, a volume of grapes processed in the last three-year financial period (2011-13) of more than 43,000 tons of grapes per year, an average annual turnover of €47.7 million, and a constant attention to environmental and social issues, Cantine Settesoli stands out as the protagonist in the wine scene, both national (especially with the brands Settesoli and Mandrarossa) and international (with the brand Inycon). It effectively implements traditional and innovative tools of productive, commercial and strategic management, thus representing a model of successful firm in a regional context of cooperatives generally pegged to productive and commercial strategies product-oriented.

Keywords: *Wine cooperatives; Sicily; management; strategy; success; performance*

INTRODUCTION

Wine cooperatives in Europe were established between the mid and late 1800s (Touzard et al., 2008; Pomarici, 2009) in order to cope with the economic difficulties of growers and also following the prevailing political ideology and sociological influences of the time (Touzard et al., 2008). These cooperatives are now continuing to be a vital economic resource, especially for growers with small vineyard plots. In 2010, in Sicily 40,629 wine-growing farms (equal to 10.4% of the national total), of which 41.4% had a wine growing area less than one hectare and 85.5% less than 5 hectares (Istat, 6th Agricultural census). The Sicilian companies when considered on an individual scale do not appear to have any opportunity to compete in the wine market, however when merged within a cooperative

business model, the results are substantially different, showing improved trading power in wine sale (Di Vita et al., 2013). As a result, wine cooperatives (thanks to public funds) are able to invest in technology, innovation and research, improve quality wine, promote new forms of packaging, reduce processing unit costs due to economies of scale (Copa-Cogeca, 2010). It must, however, be emphasized the growing presence of new country producers and exporters (Australia, United States, Chile, etc) - which in a very short time have shown efficient competitive capabilities in technical and economic terms (Ciasullo and Festa, 2013)-, the reform of wine Common Market Organisation (CMO) – targeted to reduce the productive potential of European Union (EU) countries and to guide the supply towards quality production (Pomarici, 2009)-, and in addition, the change in consumer's profile (MiPAAF, 2013; Lanfranchi et al., 2014), particularly in developed countries -linked to the economic development of society and the change of wine-consumption habits-, which have significantly influenced both the structure of the sector and the balance between demand and supply of EU wine production, making it extremely challenging for those companies that operate within it, including cooperatives.

This is the context that fits the economic and productive activity of the wine-growing farms in Sicily. Between 2010-2011, 626 Sicilian bottling companies (private and cooperative) were accounted for a total bottled volume of 193 million pieces (Torcivia, 2012a), most of which produced by private companies; in contrast, a significant share of the regional production of wine grapes is delivered directly to wine cooperatives, which for several years have gone through a process of downsizing also due to the prevailing strategy of producing and selling musts and bulk wines. However, if on the one hand the number of cooperatives within the wine industry in Sicily has decreased, revenues -at least for larger companies- is on the rise, as well as figures concerning bottled wine (in terms of both pieces and turnover), which still remain in the modest numbers' bracket (18.0%) in comparison to the overall supply of regional wine (Torcivia, 2012b).

Data presented by the Regional Department of Agriculture, Rural Development and Mediterranean Fisheries ranks Sicily first in the list of the Italian regions for overall land under wine grapes in 2013, accounting to 103,063 hectares. In the same year grape production amounted to 856,387 tons, while the overall wine production amounted to 6,150,007 hectolitres. In recent years, in face of a marked alternating production with downward trend, there has been a gradual decline in wine growing areas, due to their abandonment, characterized by low profitability, and to the implementation of the interventions provided by the wine CMO (Schimmenti et al., 2013), which led to an intense process of restructuring and conversion of vineyards in Sicily (Borsellino et al., 2012), resulting in quality improvement of wine-grapes which effectively allows to obtain excellent wines. This trend is confirmed in the Sicilian wine trade flows that, in the period 2000-2011 (Inea, 2013) have shown a significant contraction of exports in terms of quantity (-66.0%, due to the decrease in exports of bulk

wines and musts), meanwhile showing an opposite trend in terms of value (+5.7%), related to the increasing amount of bottled wines.

Within the regional wine industry, Cantine Settesoli, subject of this study, differs distinguishably from the other cooperatives, as it has been able to combine tradition and strong local rooting with the new trends that shape wine industry. The aforementioned is, in fact, now the largest wine cooperative in Sicily for bottled volumes (about 2/3 of the net sales revenue in 2013, of which approximately 62% of all overseas turnover), and has a primary place in the national and international wine market.

The objective of this paper is to illustrate the way in which a cooperative society, encompassing the entire value chain, made its productive, organizational, sales and marketing strategies, a point of strength for the commercial success, and a model of market-oriented firm in a regional association context generally characterised by production and commercial strategies product-oriented; the above statement encompasses a strong enough reason to investigate, after a brief introduction on wine cooperatives in Sicily, all stages of the supply chain and the economic and financial performances of this case study.

LITERATURE REVIEW

In the EU, over 60% of agricultural produce is marketed by cooperatives (Copa-Cogeca, 2010) that nowadays, like other businesses, are facing increasing competitive pressures and have to cope both with new market opportunities and with a greater diversification of consumers' needs and preferences. Cooperatives, unlike private firms, sustain a more conservative attitude revealing traditional preference for the low-cost focus strategy (Salavou and Sergaki, 2013) and facing greater difficulty in adopting market-oriented strategies (Bono et al., 2012). The above statement supports Hardesty (2005), who found that many agricultural cooperatives have chosen a cost-leadership strategy, producing as a *private label* supplier, but only few cooperatives have developed national brands, because of their structural characteristics. Traditional cooperative governance model, in fact, can partially affect development path and efficiency of the cooperatives (Bono et al., 2012) and also the implementation of a market-oriented strategy (Hardesty, 2005; Beverland, 2007; Bono et al., 2012; Couderc and Marchini, 2011). In order to gain competitive positions both within and outside Europe, cooperatives have to move towards more market orientation (Beverland, 2007), by formulating innovation strategies (Perlines et al., 2013), improving quality, distribution management, distribution channels and marketing conditions (Hardesty, 2005; Beverland, 2007), as well as productive efficiency. The current economic situation, with the entrance on the world productive scenario of new countries (Crescimanno and Galati, 2013) with a more aggressive marketing policy (Ciasullo and Festa, 2013) and new competition tools (brands, grape varieties and PGI products), has forced wine cooperatives

to adapt and respond to the new wine market competition arena (Coelho and Castillo-Girón, 2011) by increasing their size, seeking to establish strategic alliances, pursuing mergers with other cooperatives, rationalizing assets, improving the professionalism of their workforces, implementing innovative capital acquisition methods and formulating strategies to expand into multi-country markets (Pomarici, 2009; Perlina et al., 2013). Maietta and Sena (2008, 2010) analysed Italian wine firms and found that cooperatives are well-equipped to cope with increasing market competition and financial constraints. Bono et al. (2012) and Couderc and Marchini (2011) observed that wine cooperatives had successfully improved their competitive position through two main different strategies outlined below: structural costs (bottling plant, storage hall, marketing and sales efforts) saving and marketing large volumes of bulk tailored wine made for market leaders “*négociants*” and their private labels (“differentiated” B2B market), or the implementation of processing activities in order to shift their product range from bulk to bottled wine with their own brands (B2C market). More recently, Schamel and Santos Arteaga (2013) reveal that Alto Adige (Italy) wine cooperatives manage to organize their production decision in such a way to be able to compete -and even beat- with private wineries in terms of wine quality and reputation. Barros and Santos (2007) highlight that Portuguese wine cooperatives are allowed to be more efficient than their private counterparts thanks to different resources, scale economies and organizational structure.

The cooperative sector is pivotal within the Italian wine industry in terms of diffusion, numbers and strategic relevance, covering in some regions (Abruzzo, Sicily and Trentino-Alto Adige) over 65% of the regional wine grape production (Capitello and Agnoli, 2009); Sicily, Veneto and Emilia-Romagna represent on a whole around 60% of the overall national wine production from cooperatives (Pomarici, 2009). Cooperatives take also part in important consortium, as the Chianti Classico one, carrying out operations of purchasing, production and bottling (Gaeta and Corsinovi, 2013). Recent studies analyse and verify the health status of wine cooperative sector both at domestic level (Pomarici, 2009; MiPAAF, 2013; Ufficio Studi di Mediobanca, 2014;) and in some local contexts (Maietta and Sena, 2008, 2010; Capitello and Agnoli, 2009; Chinnici et al., 2011; Couderc and Marchini, 2011; Torcivia, 2012a, b; Schamel and Santos Arteaga, 2013). These studies outline a new Italian wine cooperation system, whose productive focus shifted to the production of valuable products (bottled or aging wines) that reach directly, even with effective branding policies, the final market, especially the international one, from which a growing wine demand is observed (in face to a significant and structural decline in domestic consumption).

SURVEY METHODOLOGY

In order to outline the framework of Sicilian wine cooperatives, in the absence of complete and comprehensive official data, we used records published in previous papers related to this theme (Torcivia, 2009, 2012b) and provided by the Regional Department as well as data collected directly from the web page of the Sistema Informativo Agricolo Nazionale (SIAN).

The investigation of the Cantine Settesoli carried out through direct interviews and a survey questionnaire used in previous researches (Schimmenti et al, 2011; Schimmenti et al, 2013) and adapted to the wine sector. The questionnaire (organised into three sections, the first one relating to the general characteristics of firm, the second part relating to the analysis of the technical aspects of production and processing, and the third one concerning the commercial aspects as well as aspects involving the use of hardware and software's infrastructure), submitted to Settesoli managers on several stages due to the complexity of the cooperative activities, allowed the collection of data concerning production, processing and trading topics with reference to the financial years of 2011-2013 (each financial cycle opens on July 1st and ends on June 30th of the following year, therefore the data collected refer to the grape-harvests 2010-2012), and socio-structural and managerial aspects referred to the 2013 year, thereby reconstructing all the stages of supply chain. The study also provided the evaluation of the cooperative's performance by analysing its financial statements of the last three administrative-accounting years (2011-2013), made comparable by performing the reclassification of the Balance Sheet (based on financial criteria) and Income Statement (on the basis of value added), and the determination of the main financial ratios: profitability ratios (ROI, ROS, ROT and ROD), structural indicators of assets (the rate of the circulating assets and the rate of the fixed assets), of the liabilities (financial autonomy and debt ratios) and of balance sheet (equity-to-fixed-assets ratio, working capital and current ratio, and quick ratio). ROI, ROS and quick ratio were also compared with those ones obtained from other surveys on the regional and national wine sector (Ufficio Studi di Mediobanca, 2014; MiPAAF, 2013).

WINE COOPERATIVES IN SICILY

Wine cooperatives in Sicily were born in the '30s, but began to have relevance only in the early '70s, showing a substantial growth up to 2001, when 102 active cooperatives were recorded. In the following years, up until now, the sector has experienced a significant reduction in numbers, especially due to product management issues or to the phenomena of merging and acquisitions (Torcivia, 2012b).

In 2013, based on the SIAN data, the cooperatives which have regularly declared their wine production were 59, with a total of over 0.7 million tons of wine-grapes delivered, with a ratio of 82%

among the production of wine-grapes within the regional production; those deliveries have concerned in prevalence white grapes (0,5 million tons) as opposed to the black ones. The presence of wine cooperatives has always been more consistent in the province of Trapani (33 units in 2013) province has the regional leadership in terms of wine growing area, followed by the provinces of Palermo and Agrigento with a significantly lower number of cooperatives (respectively, 12 and 9). Moreover, according to the data collected from the SIAN web page in 2013, there were 19,471 wine-grape suppliers (both members of cooperatives that non-members) within such companies; in particular, there are only three cooperatives with over 1,000 suppliers: Cantine Colomba Bianca (1,836 units), Cantine Settesoli (1,691 units) and Cantine Ermes (1,045 units). When taking into consideration the vineyard area, only Cantine Settesoli and Cantine Colomba Bianca exceed, individually, the threshold of 4,000 hectares of vineyards, while within the processing aspect only four coops (Cantine Colomba Bianca, Cantine Ermes, Cantine Settesoli and Cantine Europa) processed more than 40,000 tons of grapes each.

RESULTS

Managerial, socio-structural and productive aspects

The organization of Cantine Settesoli is very complex and articulated. More specifically, the winery has established an organizational structure in which managerial responsibilities of the various business functions, broken down by sector technical management and distribution channel/destination market, are delegated to managerial roles with specific skills according to a pyramidal system of responsibility.

Founded in Menfi (in province of Agrigento, Western Sicily) in 1958 with the legal status of agricultural cooperative society, Cantine Settesoli's mission is to enhance the wine grape production of its members, and to protect and improve the conditions and activities of members operating within the local area. Its vineyards' areas, which extend for about 5,500 hectares, make it not only the largest vineyard in Sicily (covering around 5% of the regional wine growing area), but also a great source of employment for farmers and more generally for the local population as a result of the generated satellite activities. The members of the cooperative amount to 2,135 (of which 1,841 delivered their production in the 2012 harvest), mostly represented by farmers; at the same time the cooperative resorts to non-members wine-growers.

In 2013, the number of permanent employees accounted for 47 units (14 staff units more than in 2011), while seasonal workforce was employed for a total of 26,091 working days (1,184 days more than in 2011).

The four wine-making plants, together with bottling, packaging and storage of wines cover an area of 18,960 square metres, with the addition of squares, cars parking, roofed areas, etc. with an overall outer surface of 94,783 square metres.

In the “vineyard Settesoli” the most common method of grape growing is the simple spurred cordon, and the cultivation of both indigenous and non-indigenous grape varieties (black and white grape) can be found.

Processing and commercialisation

After the harvest (in recent years mechanised harvesting of white grapes during the night has been introduced) and the delivery of grapes to the cooperative, the process of winemaking begins in its different stages: crushing, fermentation and subsequent classification of each batch in order to create specific *cuvée*. The production cycle is completed by an automated line for bottling and packaging, with an effective capacity of about 9,500 pieces/hour (bottle, bag in box and tetra-brick). The data regarding the last 4 grape harvests show a remarkable production variability, with a minimum peak in 2011 (41,213 tons of processed grapes) and a maximum peak in 2013 (55,982 tons), mainly ascribable to climatic conditions (Table 1).

In the three grape harvests 2010-2012, there has been an increase in the average price paid per ton, due to the increase in sales prices both in Italy and abroad; the aforementioned confirms the validity of the company’s strategy to focus on wine quality and on the more lucrative markets.

Items	Grape harvest			
	2010	2011	2012	2013*
Grape processed (tons)	45,222	41,213	43,150	55,982
Grape harvest surface area (Ha)	5,317	5,377	5,430	5,479
Average price paid (€/ton)	380	460	470	n.a.

Table 1. *Table 1: Production and income data.*

* The figure of the grape harvest 2013 will be recorded in the year 2014, it is not available in this survey.

Cantine Settesoli focuses its commercial strategy on brand’s reputation, on the perceived value of the product and a complete line of products which has three brands of packaged wine -Settesoli, Mandrarossa and Inycon- covering all price and consumption ranges.

Inycon, available only on foreign market, has successfully been sold for over 10 years within the major grocery chains in the United Kingdom. The brand is also becoming popular within other markets such as Belgium, the Netherlands and Switzerland.

In Italy, however, the company has decided to focus solely on Settesoli and Mandrarossa lines. For the Settesoli label the company has created a national sales network to ensure a widespread presence

across the country through large-scale retail channels (around 15). The brand, aimed at a target audience of consumers who ask for a good wine at an affordable price, includes three product lines: the line “Settesoli GD” (with a final price of 3.50 - 4.50 €/bottle), the line “Porta Palo” (2 €/bottle), and the line “Torre Solada (1.20 €/tetra-brick).

The “Mandrarossa” wines represent the top range: produced from a careful selection of grape varieties, are marketed towards a medium-high target (Ho.Re.Ca, etc.) market, with an average sales price of about 10 €/bottle.

Finally, in addition to the three aforementioned brands, part of wine is bottled and marketed with *private labels* of channel stores, whilst another part is sold in bulk quantities.

Most of the cooperative revenues (the average figure for the three years amounted to 47.7 million €/year) derives from the sale of packaged wine, followed at a considerable distance from the bulk one; the revenue generated by the sale of musts and other minor products is very low. Packaged wine is primarily marketed in the foreign market, while the bulk wine and the musts are addressed to the national market (Table 2).

The business strategies adopted by the company for bottled wines are closely linked to different markets and distribution channels: within the international market, business relationships are managed through a joint venture with a British partner, while in the national market the medium-term objective is to propose, especially in the large-scale retail channel, increasing volumes of product with excellent value for money. It is not, however, disregarded the sale of products at reasonable prices (tetra-brick) driven by specific demands of consumers with limited disposable income. The business strategy of the company provides, among other things, the launch of new products and packaging.

Financial year	Products	Italy				Foreign markets		Total	
		Sicily		Other regions					
		€	%	€	%	€	%	€	%
2011	Bulk wine	1,739,099	13	10,167,040	76	1,471,545	11	13,377,684	100
	Packaged wine	5,114,015	18	3,125,232	11	20,171,950	71	28,411,197	100
	M.C./M.C.R.	42,898	3	1,301,227	91	85,795	6	1,429,920	100
2012	Bulk wine	1,223,763	8	11,625,753	76	2,447,527	16	15,297,043	100
	Packaged wine	6,530,009	21	4,353,339	14	20,211,931	65	31,095,279	100
	M.C./M.C.R.	43,439	3	1,288,685	89	115,837	8	1,447,961	100
2013	Bulk wine	1,178,320	10	10,133,554	86	471,328	4	11,783,202	100
	Packaged wine	7,522,478	24	4,388,112	14	19,433,068	62	31,343,658	100
	M.C./M.C.R.	48,661	4	1,021,883	84	145,983	12	1,216,527	100

M.C./M.C.R.: Concentrated grape must/Rectified Concentrated Grape Must.

Informatisation and communication

The cooperative utilizes very innovative hardware and software tools for various activities, such as orders, sales and quality management, warehouse operations, payroll activities, contract management and marketing operations.

Cantine Settesoli has two websites (www.cantinesettesoli.it and www.mandrarossa.it) providing a wide variety of information and services: wine shop, where consumers can buy products directly from the cellar. The Internet is also used to access banking services, to source new customers and suppliers, for on-line purchasing and for e-learning.

On each label of the Cantine Settesoli packaging there is a stamped identification code that allows to travel backwards through all stages of the supply chain. In addition, on Settesoli and Mandrarossa labels there is the QR Code that refers the consumer to an iPad app created by the cooperative and promoted for the first time at the 2013 Vinitaly.

The process of the Settesoli brand-building began some years ago with a strong marketing strategy promoted on national TV, on Sky Sports channels, on some of the press, the web, and through the marketing at both national and international wine fairs.

Throughout the year, Cantine Settesoli welcomes enthusiasts and professionals from all over the world for guided tours (in several languages) which start from the vineyard and continue and conclude in the cellar with a wine-tasting.

Research and development

The company, also with the collaboration of Regional bodies, has been actively involved in research and development, in order to keep up to date with new technological means of production, wine quality improvements, sourcing of raw material and embrace a sustainable method of packaging its products.

The cooperative has also embarked on a long research program aimed at broadening its ampelographic base and hence improve the quality of their wines; the results of such research are then transferred to all the members.

The company has recently developed a photovoltaic system with a total capacity of 537 kWp and a biomass plant that generates “clean” heat and power through the use of led lamps, and has also adopted fibreless wood paper for its packaging operations.

In 2003, the company has also successfully achieved the major goal to be able to fully trace and certify each stage of the production cycle; and currently it has a large number of quality certifications, some of which are explicitly required by the foreign market.

Finally, the company supports and embraces humanitarian programs.

Economic and financial performance

The economic and financial analysis of a cooperative operating in the agri-food system must encompass various factors that characterize these types of company, such as the limited equity capital, participation of members in the financing under various forms and the mutualistic aims pursued (MiPAAF, 2009). Transformation cooperatives tend to remunerate their members at a greater rate than

the market prices; therefore, their income statements do not generally indicate profits, with a significant impact on the financial ratios.

As noted above, this study has taken into consideration the financial statements of Cantine Settesoli of the last three administrative-accounting years (2011-2013). The analysis carried out, with reference to the composition of the assets, shows a high prevalence of current assets, which stood stable at around 72-73%, mainly represented by trade and other receivables (consisting mostly in short-term loans to customers and members) and wine inventories, while fixed assets, principally composed of the tangible assets, are approximately 27-28% (Figure 1).

The examination of the company's liabilities shows an overall low level of capitalization (net equity) - that is distinctive among cooperative societies- and a significant use of borrowed capital -among which current liabilities have a clear and growing prevalence- that is offset by a gradual reduction in consolidated liabilities (consisting mostly in self-financing members, which amounted last year to just over €9 million, and in medium-long term liabilities).

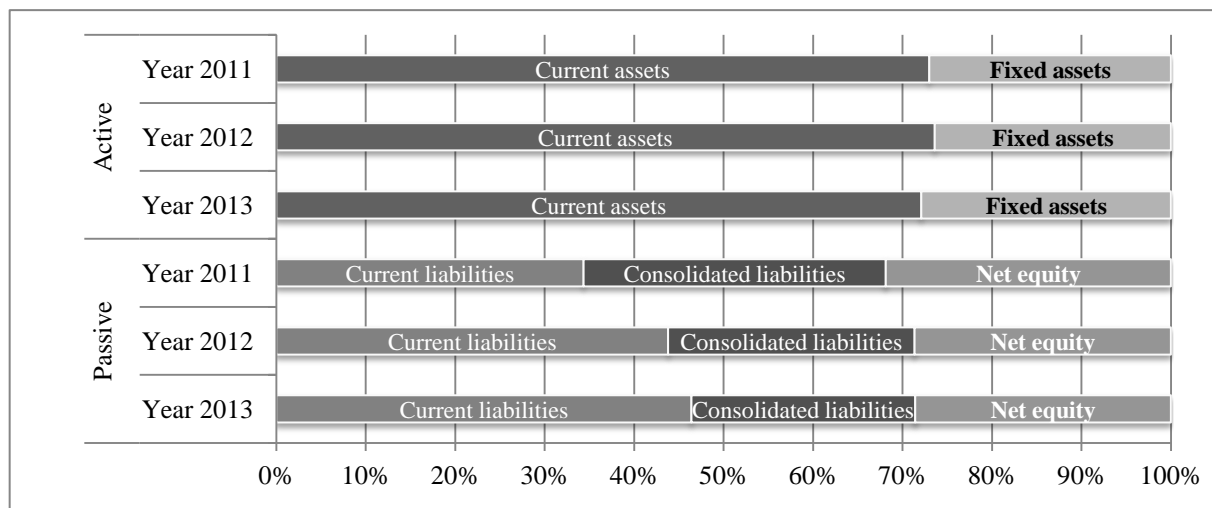

Figure 1. Evolution of the equity structure in the triennium 2011-2013.

An examination of income statement highlights a significant proportion of raw material costs (varying between 69.5% and 72.4% in the three investigated years) and the breakeven reached at the end of the financial year, taking into account the distribution of profits to members.

The value added shows an increasing trend (from €6.8 million to €6.9 million) but fluctuates when considered in relative terms; a similar trend was noted for the gross operating margin. The operating income of Cantine Settesoli shows an increasing trend (reaching €511,588 in 2013). Financial charges show a negative trend due to increased exposure to the banking system (from -€608,109 to -€907,995).

More specific information on the company's profitability may be obtained by reading the ROI, which has increased the given figures slightly by around 1% (Table 3). These values are lower than the average in the sample of 33 Italian cooperatives (3.0% in 2012) and in the sample of regional wine firms, coops and not (1.3% in 2012) as reported on the wine sector survey carried out by the Ufficio

Studi di Mediobanca (2014).

Indices	Financial years		
	2011	2012	2013
ROI	1.01%	1.06%	1.24%
ROS	1.40%	1.47%	1.84%
ROT	0.72	0.72	0.68
ROD	1.21%	1.25%	1.49%
Leverage	3.14	3.49	3.50
Rate of the circulating assets (Elasticity)	73.0%	73.6%	72.1%
Rate of the fixed assets (Rigidity)	27.0%	26.4%	27.9%
Financial autonomy ratio	31.9%	28.7%	28.6%
Debt ratio	68.1%	71.3%	71.4%
Equity-to- fixed-assets ratio	1.18	1.09	1.02
Working capital	24,366,514 €	20,727,553 €	17,961,124 €
Current ratio	2.13	1.68	1.55
Quick ratio	1.38	1.05	0.84

Table 3: Balance sheet ratios in the triennium 2011-2013.

From the analysis of ROS, its growth appears to be steady inclined, which signifies a positive sales policy accrued by the company, although the figures are still relatively low when compared with those ones collected by MiPAAF (2013), related to others medium-large wine cooperatives (2.4% in 2011). Within the three years, ROT figures show stable values, whilst low ROD values (albeit increasing) indicate the careful choices made by the cooperative in accepting external sources of finance. Finally, the leverage shows an increase in corporate debts.

Among the structural indicators, those relating to assets confirm the high degree of elasticity of the invested capital, which denotes the ability of the cooperative to adapt suitably to changing market conditions; whilst the composition of the liabilities highlights the lack of financial autonomy that may cause difficulties in accessing to credit, settlement of liabilities and development. Referring to balance sheet indicators, the equity-to-fixed-assets ratio assumes decreasing values but higher than 1, expressing a sustainable situation in terms of the strength of the company's assets. The assessment of cash equivalents by the cooperative was made through the determination of the working capital and the current ratio, which indicate, respectively in absolute and relative terms, a good availability of the firm even though in steady decrease. Within the analysis of the company's solvency, the quick ratio shows, in 2013, a situation in which short-term debt may be extinguished only by the return in liquid form of a part of inventories. The above is in line with data reported in the survey on the national wine cooperation carried out by the MiPAAF (2013).

DISCUSSION AND CONCLUSION

The winemaking industry has represented for many years a leading market within national and Sicilian agro-food sector, which continues to be object of investments. Within the same sector, wine

cooperatives play an important role, especially in those regions, as the case of Sicily, where supply is fragmented. The Sicilian cooperatives in recent years have reported a numerical scaling, although a high number of product-oriented companies still concentrate most of the regional wine supply, without having been yet oriented towards the production specialization (in alternative to bottling) achievable, according to Couderc and Marchini (2011), through the production of bulk wine suitable to contract specifications aimed at satisfying market leaders as *négociants* and their private label (B2B differentiation strategy). Herein we analysed the activities of the supply chain implemented by the cooperative Cantine Settesoli, a very prominent wine-producing market-oriented company on both regional and national level, whose evolution has ensured an efficient management and beneficial outcomes for its members.

To keep up with the ever changing wine market, the cooperative Settesoli, which ranks first in terms of bottled wine within the Sicilian wine cooperatives, has the goal to increase the production of the more profitable brands, although it still sells a significant amount of bulk wine. At the same time, the cooperative is aware of the various markets demands and the different consumers and therefore is inclined to continue with the production of more affordable wine products that can be used on a daily basis.

The cooperative carries out on-going research and development aimed at improving the quality of its produced wines, through the use of technical means and advanced technologies.

On an international level Cantine Settesoli has established a very prosperous joint venture with a British partner, and on a national level it has established trading affiliations with the large-scale retail channels (main distribution channel in Italy) -despite they have proven to be costly and lengthy with their payments (60-90 days)- and with the restoration, in which the most criticality concerns payment timing (in many cases over 120 days).

By investing about 3% of its turnover in marketing and promotion as well as having increased its sales in the domestic and international markets, Cantine Settesoli plays a pivotal role among the local community, also in terms of tourist attraction by promoting and participating to wine and gastronomic events. From a management point of view, these initiatives have greatly increased the complexity of the business and its programming and created the need for relevant managerial skills, but requiring at the same time the use of external financing due to the lack of financial autonomy, characteristic of agri-food cooperatives and in particular of wine cooperatives.

Cantine Settesoli successfully implements traditional and innovative management tools, and given its growth prospects, it can be viewed as a business model to be followed, as part of a cooperative Sicilian wine system that must face an increasingly competitive market. In this regard, future research could be directed towards the study of those Sicilian cooperatives still product-oriented but able to develop

themselves towards a B2C market or to differentiate their B2B strategy through the offer of “differentiated” bulk wines.

EXPATS IN LUXEMBOURG: HOW CULTURAL SPECIFICITIES IMPACT THE USE OF SOCIAL NETWORKING TECHNOLOGIES AND HUMAN RESOURCE PRACTICES IN LUXEMBOURG

Schinzel, Ursula

United Business Institutes, Luxembourg

ABSTRACT

The purpose of this research is to investigate, in this world of global mobility, the cultural and language characteristics of Luxembourg that may influence the tendency of HR specialists in Luxembourg to utilise NSNT. The methodology is first a profound literature review in global mobility, in HRM and NSNT, second interviews in 41 companies, and third questionnaires in 1 company with 134 filled-in questionnaires, evaluated in SPSS. Findings are: first, the author finds that HR managers are reluctant to using NSNT, keeping practices surprisingly mainly unchanged. Second, looking at the specific political, economic and historical context of Luxembourg using Hofstede's cultural dimensions, the author finds that Luxembourg has a high level of 'Uncertainty-Avoidance', 'Long-Term-Oriented' combined with 'Happiness'. Limitations are the comparatively small sample size, the data collected only in one company, and the lack of a strong theory to link culture and happiness, and could all have biased the results and their interpretations. Practical implications are given for expats, their spouses and family coming for work to the Grand Duchy of Luxembourg, trying to cope with the cultural and linguistic specificities described in this research, especially in the HR Domain and global mobility. Regarding social implications, the author hypothesizes that the reluctance to use NSNT is related to Luxembourg's high score on 'Uncertainty-Avoidance' and that Luxembourgish language is used as an identifier. The originality of this research lies in its usefulness for expats, global managers, in their attempt of integration into Luxembourg.

Keywords: *Global mobility, expats, Human Resource Management (HRM), Social Networking, cross-cultural management, Hofstede's cultural dimensions*

INTRODUCTION

The purpose of this study is to explain to expats, their spouses and family coming for work to the Grand Duchy of Luxembourg, in this world of global mobility trying to cope with the cultural and

linguistic specificities described in this research, especially in the Human Resources Domain the impact of social networking technologies on human resources practices in Luxembourg while analysing the cultural pattern of Luxembourg. Digital social networks like LinkedIn, Viadeo, Xing, Facebook and Twitter have revolutionised human resources practices. This research investigates (1) global mobility and expats, (2) dimensions of culture, (3) economic, geographical, political and social context in Luxembourg, (4) Luxembourg's history, (5) culture and language, (6) Luxembourgish language, (7) Human Resource Management, and (8) social networking technologies. In this world of global mobility, this research investigates the extent of the use of new social networking technologies in Luxembourg, considering its cultural pattern. For expats, their spouses and family, the Grand Duchy of Luxembourg and its specific place in Europe are detailed. The research will be undertaken within the specific political, economical and historical context of Luxembourg. Hofstede's dimensions of culture are discussed: 'Individualism/Collectivism', 'Power Distance', 'Masculinity/Femininity', 'Uncertainty Avoidance', 'Long-Term Orientation/Short-Term Orientation', 'Indulgence versus Restraint' and 'Monumentalism'. The hypothesis is discussed that this reluctance to use social networking technologies is founded in Luxembourg's high score on 'Uncertainty Avoidance'. Also the fact, that the Luxembourgish language, a challenge for all expats, is used as an identifier in the Grand Duchy, might represent a brake to the extent of use of new social networking technologies. Human Resources Practices have a historical background and have developed throughout the years. While standard HRM was for a long time exclusively about HR administration, it is nowadays still about HR administration but also about recruiting and staffing best practices, talent management, and more and more about communication, new social technologies and e-HR. The research question is: Why have human resources specialists in Luxembourg been reluctant to utilise new social networking technologies, considering its special cultural pattern following Hofstede? Interviews, questionnaires and case studies are performed in 41 companies in Luxembourg. Results are presented. Conclusion, references and appendices follow.

GLOBAL MOBILITY

Globalization of business intends global mobility of people. These people move from one country to another, moving their entire family and homes, taking on responsibilities and encountering challenges never thought of (Brookfield 2011). Cross-national collaboration (Hinds et al. 2011) is increasing, bringing increasing complexity, fragmentation (Tharenou 2005) and employees' careers challenges, given the intensity of global mobility and repeated staff transfers (Shaffer et al. 2012).

Most expat destinations are United States, China, and United Kingdom (Brookfield 2011). Despite some recent research, there is a lack in knowledge concerning expatriation, especially in small, so far

unexplored countries, such as the Grand Duchy of Luxembourg. This research intends to provide information both for companies and individuals, facilitating the expatriation process into Luxembourg, providing insight into (1) global mobility, (2) Luxembourg's special culture, (3) Luxembourg's history, (4) Luxembourg's language, (5) Human Resource management practices in general (6) social networking technologies in general and in Luxembourg.

Among the existing literature the research is investing into research of short-term international assignments in multinational companies facing cost issues together with rising staff mobility, including short-term, commuter, rotational, contractual and virtual assignments (Tahvanainen et al. 2005). It is also researching into career choices, challenges and career consequences associated with corporate global employees – flexpatriates, short-term assignees and international business travellers (Shaffer et al. 2012). When staffing global positions, challenges arise through the manageability of multiculturalism (Harvey et al. 2011) trust – affective and competence-based – helps subsidiary acquiescence to headquarters. Intercultural aspects of collaboration across national boundaries are researched by Hinds et al. (2011) using social networks and technology use to illustrate how cultural differences generate different behaviour, explaining potential incompatibilities in the global workplace. This shows that mostly the complexity of global staffing in expatriate assignments is underestimated and more strategy is needed for global staffing (Collings et al. 2007; Welch et al. 2007). Also the complexity of work-family conflict, psychological turbulences in international assignments and exacerbating effects of the expat-commitment are researched by Shaffer, Harrison, Gilley, and Luk (2001).

DIMENSIONS OF CULTURE

Geert Hofstede (1980), in his monumental research on culture at IBM, has instigated worldwide research efforts. Culture has been found to have dimensions, the question is not if, but how many. Hofstede initially came up with four dimensions - Individualism versus Collectivism, Uncertainty Avoidance, Power Distance, and Masculinity versus Femininity. He later added a fifth dimension , Long-term versus Short-term Orientation (Bond and Hofstede 1983), and has just added a sixth dimension - Indulgence versus Restraint (Hofstede 2001) and together with Minkov (2011) is about to add a seventh dimension - Monumentalism.

Hofstede (1980) defines culture as the “collective programming of the mind which distinguishes the members of one human group from another”. Hofstede defines Uncertainty avoidance (UAI) as “the extent to which people feel threatened by uncertainty and ambiguity and try to avoid these situations” (Hofstede 2001). He defines Individualism (IDV) as “people looking after themselves and their immediate family only, versus people belonging to in-groups that look after them in exchange for

loyalty" (Hofstede 2001). The individualism/collectivism cultural dimension has been researched in detail by Triandis (1995) and Triandis and Gelfand (1998) dividing into four dimensions: vertical and horizontal individualism and vertical and horizontal collectivism. Power Distance (PDI) is defined as "the extent to which less powerful members of a society accept and expect that power is distributed unequally" (Hofstede 2001). Masculinity/Femininity (MAS) is defined as: "the dominant values in a masculine society are achievement and success; the dominant values in a feminine society are caring for others and quality of life" (Hofstede 2001). Hofstede (2001) defines Long-Term Orientation (LTO) as "the extent to which a society exhibits a pragmatic future-orientated perspective rather than a conventional historic or short-term point of view." Hofstede defines Indulgence versus Restraint (IVR) as: "Indulgence stands for a society that allows relatively free gratification of basic and natural human drives related to enjoying life and having fun. Restraint stands for a society that suppresses gratification of needs and regulates it by means of strict social norms" (www.geerthofstede.nl). Minkov defines Monumentalism (MON) versus Flexumility as: high pride, immutable identities, values, norms and beliefs (Minkov 2011).

Today, Hofstede's work is known, accepted, praised, replicated, and also criticized. Some significant culture studies have followed Hofstede. They include culture research projects such as the Chinese Value Survey by Bond et al. (2004), Cameron and Quinn (2011), De Mooij (2011), Gert Jan Hofstede et al. (2002), the GLOBE by House et al. (2004), the European Value Survey and the World Value Survey by Inglehart (2005, 2008, and 2011), Minkov (2011), Schein (2009), Schwartz (1990), Smith (2006; 2002), Triandis (1982 and 1995), Trompenaars and Hamden-Turner (1997). Researchers besides the Hofstede era are Scholz and Böhm (2008) who specialize into Human Resources and Lewis (2006) who specializes in language programming. Researchers beyond the Hofstede's era, such as Nakata (2009), Briley (2009), and Hong (2000), have extended cultural research into psychology, anthropology, and philosophy.

In 2010, together with his son Gert Jan Hofstede and Michael Minkov, Hofstede published "Cultures and Organizations, Software of the Mind, Third Edition". In this edition Hofstede et al. surprised with a sixth dimension of culture titled "indulgence versus restraint", or "subjective well-being" or "happiness," constructs. The influence of Minkov is not only felt by the addition of a seventh dimension of culture titled "Monumentalism", but also Hofstede's advice not to invest further in data collection, but to rather use secondary data, as Minkov (2010) who analyzed Inglehart's data from www.worldvaluessurvey.org, has done.

Geert Hofstede's research has not only been subject to enthusiasm (Sorge 1983, Triandis 1982), or to reviews (Cooper 1982, Eysenck 1981, Smith 2002, Smith 2006) but also to criticism, contestation and controversy (McSweeney 2002, Roberts and Boyacigiller 1984, Søndergaard 1994). Hofstede states: "I

made a paradigm shift in cross-cultural studies, and as Kuhn (1970) has shown, paradigm shifts in any science meet with strong initial resistance" (Hofstede 2002). The discussion exchange between Hofstede and McSweeney is regarded as closed by Hofstede. Hofstede also had an exchange with Hampden-Turner and Trompenaars (1997) about the validity of their filled-in questionnaires. The debate between Hofstede and the GLOBE led Smith to write his 2006 article about the famous elephants. The five main criticisms of Hofstede's approach have been enumerated by Hofstede (2002) himself: "(1) Surveys are not a suitable way of measuring cultural differences; (2) Nations are not the best units for studying cultures; (3) A study of the subsidiaries of one company cannot provide information about entire national cultures; (4) The IBM data are old and therefore obsolete; and (5) Four or five dimensions are not enough."

This study takes on the second challenge of Hofstede's criticism, namely, that national boundaries are not the best unit of analysis of studying culture, and uses the example of Luxembourg to demonstrate that language is a better identifier of culture rather than geographical boundaries of nations. It compares data collected in three subsidiaries of one company in Germany, France and Luxembourg, to demonstrate that Luxembourg's dimensions of culture are not proxies for the average values found by Hofstede in France and Germany, but rather are unique and a result of Luxembourgish, which, along with French and German, is one of the official languages of the Grand Duchy. Hence, the next section delineates background information about Luxembourg such as economic, geographical, political, social, historical and language, as well as some research reports about culture and happiness in Luxembourg, followed by a set of hypotheses.

ECONOMIC, GEOGRAPHICAL, POLITICAL AND SOCIAL CONTEXT IN LUXEMBOURG

Luxembourg is a parliamentary democracy with a constitutional monarch at its head. Along with Belgium, Germany, France, Italy and the Netherlands, the Grand Duchy was one of the signatories of the Treaty of Rome in 1957. The ensuing creation of the EEC (European Economic Community) and EURATOM (European Atomic Energy Community) formed the nucleus of the later EU. On 18 April 1951 it was a founding member of the CECA (Communauté Européenne du Charbon et de l'Acier, or in English, European Coal and Steel Community), the Paris treaty, together with the Federal Republic of Germany, France, Italy, the Netherlands and Belgium. In Luxembourg, European cultures meet on a small piece of land, that hosts people with high level of tolerance. The European Commission has its seat in Brussels and Luxembourg. On May 1st, 2004, ten new countries joined the European Union, including seven former Eastern Bloc countries. On January 1st, 2007 two more such countries joined, establishing the current membership at 27 countries.

The Grand Duchy of Luxembourg's motto is: "Mir wölle bleiwe wat mir sinn", which in English means "We want to remain what we are". The capital of Luxembourg carries the same name as the monarchy. Official languages are German, French, and Luxembourgish. The Government is a Parliamentary Democracy and a Constitutional Monarchy. The Grand Duke's name is Henri; the Prime Minister is Jean-Claude Juncker. The population is growing fast, as in 2009 it was approximately 493,000, in 2010 it was approximately 502,000 and in 2011 it was approximately 511,000. It is the world's only remaining Grand Duchy. It has the second highest Gross Domestic Product per capita (\$84,829; IMF 2011) in the world. It is a founding member of ECSC (European Coal and Steel Community), European Union, NATO, OECD; it has been part of the euro zone since 1999. This shows its high interest in European integration. The small army often is the subject for a laugh: it consists of around 800 soldiers. There is no navy and no air force. Luxembourg is the host to 17 NATO AWACS airplanes, one A400M military cargo plane that are shared with Belgium, and 3 NATO Boeing 707.

Luxembourg is one of the smallest European countries, it measures 2,586 km², 82 km long and 57 km wide at its longest and widest points. Until the 1960 the steel industry was the engine of Luxembourg's economy; after 1960, the banking and financial sector took over. The Luxembourgish language is a German dialect from the Mosel region, filled with French and Dutch words and expressions. Luxembourgish is one of the three national languages. In school, pupils speak and study in German, French, Luxembourgish, and may later study English, Portuguese and Italian.

Luxembourg's total population consists of 511,800 inhabitants of whom 290,500 (56.76%) are Luxembourgers and 221,300 (43.24%) are foreigners (data from statec, 2011). During the day time, 138,700 cross-border workers come to Luxembourg to work: 74,100 French, 37,800 Belgian, and 37,500 German. This means a total of 357,800 for domestic employment. 357,800 people were working in Luxembourg in 2010, out of them 219,100 were residents and 138,700 were cross-border workers. 39% of the domestic employment consists of cross-border workers.

The capital of Luxembourg had approximately 94,000 inhabitants in 2011, 60% of whom were foreigners. During the day, this equation changes dramatically, as the work force is commuting into the town of Luxembourg from Germany, France and Belgium. The TGV link makes Luxembourg only two hours away from Paris. RTL (Radio Television Luxembourg) and SES ASTRA (Société Européenne des Satellites); European Skype, eBay and Amazon are headquartered in Luxembourg. Working in Luxembourg is described in detail by American Chamber of Commerce (2010).

There are 45,000 European civil servants, out of this number 9,500 are present in Luxembourg; this means 5.5% of the Luxembourg active population. 42.3% of the Luxembourgers are civil servants (IPSE, 2010). The European Institutions in Luxembourg are: Secretariat of the European Parliament,

European Council (2nd), Court of Justice and Court of Auditors. There are also: European Investment Bank, European Investment Fund, European Union Publications Office, and Eurostat. The European Institutions are distributed following: Brussels hosts the Commission, Council of Ministers, European Council (1st), Parliament (2nd). Strasbourg hosts the Parliament, Luxembourg hosts the Parliament (secretary), Council (2nd), Court of Justice, Court of Auditors. Frankfurt hosts the European Central Bank, see more information on the website of the Office for Official Publications of the European Union <http://ec.europa.eu/publications>.

There is very little research in general about Luxembourg. The existing literature is mostly descriptive (Background Note Luxembourg 2006, Dumont et al. 2008, paperJam). The most recent publication, in French, on history and politics in Luxembourg has been written by Haag (2011) and includes excellent photographs underlining his detailed historical overview. One recent publication is from IPSE (2010), in German, but it does not relate in any way to Hofstede's dimensions, nor does Spizzo's book published in 1995.

LUXEMBOURG'S HISTORY

Despite all the wars in Europe Luxembourg still survives. Despite all the requests from the European partners for fiscal homogeneity, despite the demands to abolish the borders and the ending of bank secrecy, and the exchange of information on bank accounts, Luxembourg still survives. Luxembourg is a small country, and it is strongly attached to the rock it is built on, like a medieval defensive city (Spizzo 1995).

Luxembourg has always stayed politically 'neutral'. This 'neutrality' has often been compared with Switzerland's neutrality. Luxembourg was able to stay neutral between its two mighty neighbouring countries, France and Germany. Therefore the 'privileges', namely, low direct and indirect taxes, low or non-existent income tax, work opportunities, low unemployment, high salary, cheap gasoline, cigarettes, alcohol, and more, are seen as a unifying identifier for the Luxembourgers. These privileges make the difference between the 'in-group' and the 'out-group' (Briley 2005), between 'being Luxembourger or not'.

After World War I the need was to assure national identity, to make people understand why it was important to be 'Luxembourgers', to give value to the concept of 'citizenship', and being a 'Luxembourg citizen'. Only when Nazism engulfed this small country, because to the Germans this small piece of land seemed to be German, did the linguistic aspect attain its importance.

History shapes the character of a nation. Haag (2011) states, that Luxembourg developed from a provincial town to a European capital, an international financial centre, and a worldwide freight centre. In 2008 the Clausen zone was created for entertainment, in 2005 the Philharmonic Orchestra

was inaugurated, the MUDAM in 2006 and the Congress Centre in 2012 (Haag 2011). The 2010 Mercier report puts Luxembourg in 20th position among 221 towns for its quality of life (Haag 2011 p. 541). Prominent European personalities, such as Robert Schumann, Jean-Claude Juncker, and Jacques Santer, are from Luxembourg (Haag 2011). RTL – Radio Television Luxembourg, SES Astra – Société Européenne des Satellites, and EIB – European Investment Bank - are important companies from Luxembourg (Haag 2011). Luxembourgers are trilingual, sometimes quadri-lingual or quinti-lingual, or command even more languages, as described in the following.

CULTURE AND LANGUAGE

The relationship between ‘culture and language’ has been studied by Kashima and Kashima (1998), testing the use of first- and second-person singular pronouns (‘I’ and ‘you’) in correlation with Individualism, and by doing so correlating language and culture. The relationship between ‘cultural background’, ‘language’, ‘geographic region’ and ‘ethnic identity’ was researched by Taylora et al. (1973). Lewis (2006) specializes in research on ‘language programming’ in relation to cross cultural leadership. Sherzer (2009) investigates the relationship between grammar and culture, where language conditions thought, perception and world view. Bi-cultural’s ability of frame switching through language has been researched by Briley et al. (2005) and Hong et al. (2000). Language has been identified as a manipulator of consumers’ behaviour (Briley et al. 2005; Hong et al. 2000).

As argued earlier, Luxembourg with its special Luxembourgish language as well as other official languages, and its unique demand for the command of Luxembourgish as a condition for citizenship, provides an appropriate background for testing the role of language as an identifier of culture. Luxembourg’s language is described next, followed by the relevant hypotheses.

LUXEMBOURGISH LANGUAGE

Today, 320,000 people are Luxembourgish native speakers. The Luxembourgish language (Spizzo 1995) has become the discriminating factor to distinguish between those who are able to benefit from Luxembourgish citizenship and those who are not. Luxembourgish possesses the characteristics of a dialect, proven by the fact that there is no translation of the Bible into Luxembourgish. Luxembourgish is a spoken language and does not have a long written tradition (Spizzo 1995). The language defines the in-group (Briley 2005) and the out-group. Those who speak Luxembourgish are part of the in-group and those who do not speak the language are part of the out-group. Official documents are in French or in German. Mostly, French is used for bureaucratic issues, and German is used for the religious ceremonies. This dialect has become the discriminating element for citizenship.

In order to benefit from all of the advantages of the Luxembourgish nationality one has to be able to speak Luxembourgish. Citizenship is only awarded to people who speak Luxembourgish (Spizzo 1995). The language, therefore, provides access to the advantages and rights associated with citizenship.

Luxembourgish authorities are an example of long-term orientation; they were able to adapt and react to some of the crises in the steelmaking industry and in the banking system, always with the objective of guaranteeing stability and wealth for the people. It seems as if there was an invisible line of stability and wealth that was guaranteed throughout the centuries. Typical words for the national identity are wealth, privileges, stability through the maintenance of the attractiveness of the country compared to neighbouring countries, because of its industry, its labor market, its fiscal benefits, all key for the success of the country. Being part of this system and the feeling it gives is the glue of the country, the sense of being part of it (Spizzo 1995).

Following the description of Luxembourg and its culture, it is argued that Luxembourg's dimensions of culture are not proxies for the average values found by Hofstede in France and Germany, but rather are unique and a result of Luxembourg's language, which is also the official country language since 1984. The following hypotheses are offered:

Hypothesis 1: Native Luxembourgers scores on the PDI, UAI, IDV, MAS, LTO, IVR, MON cultural dimensions are significantly different from the scores of non-Luxembourgers in Luxembourg.

If hypothesis 1 is corroborated then the scores on Hofstede's dimension should reflect a tendency of Luxembourgish native language speakers to score differently than the scores of French, German and Foreigners in Luxembourg. The following hypothesis is offered:

Hypothesis 2: There are significant differences between Hofstede et al.'s (2010) PDI, UAI, IDV, MAS, LTO, IVR, MON cultural dimensions estimates for Luxembourg and the empirical values found in this study for Luxembourgers with Luxembourgish Nationality.

HUMAN RESOURCE MANAGEMENT

Human Resources Practices have a historical background and have developed throughout the years (Armstrong 2009, Bratton and Gold 1999) and with the changing world of work (Krautand Korman 1999). Twenty years ago, Human Resources Policies were mostly related to Administration (Mahoney and Deckop 1986): salary, vacation, absence, work hours, headcount and accounting. In many companies, the accounting department was part of the Human Resources Department. Following this administrative trend, arrived a movement focused on motivation (Kuvaas and Dysvik 2009). Human Resources became centred on motivation of employees, recruiting, training, evaluation, and

recognition. More recently Human Resources (Gilley and Maycunich 2000) is driven by communication (English et al. 2007), (Bada and Madon 2006), international HR (McLean and McLean 2001), recruiting in the globalised HR world (Sparrow 2007) and networking (Tixier 2004, Slagter 2009).

Standard HRM is about recruiting and staffing best practices (Ryan et al. 2003), talent management (Tansley et al. 2007), HR administration (Mahoney and Deckop 1986), communication (Curtis et al. 1989) and e-HR (Lengnick-Hall and Lengnick-Hall 2006).

Martin and Reddington (2010) are developing a model of e-human resources, focusing on the relationship between HR strategy, e-HR goals and architectures and positive and negative e-HR outcomes in their publication "Theorizing the links between e-HR and strategic HRM: a model, case illustration and reflections." Following Scandula and Williams (2000) it's about "Research methodology in management, and about current practices, trends, and implications for future research." Collins and Clark (2003) make the link between strategic HRM practices and social networks to deduct as a result the increase of performance. Marchington (2008) sees the following topics as main HRM topics: absenteeism, job satisfaction and relational co-ordination, global HRM, job and role design, recruitment, appraisal, the HR business partner model, and the role of HR in international mergers and acquisitions. Kuvaas and Dysvik (2009) write about "Perceived investment in employee development, intrinsic motivation and work performance." Scullion et al. (2007) published "International human resource management in the 21st century: emerging themes and contemporary debates." Tixier (2004) asks "Does the evolution of the human resources practices imply the implementation of an information system?" Slagter (2009) sees "HR practices as predictors for knowledge sharing and innovative behaviour: a focus on age." HRM research also goes into strategic HRM (Mäklä et al. 2012) and Control systems that might prevent managers from unethical behaviour, because it gives them a feeling of being treated fairly (Langevin and Mendoza 2013).

SOCIAL NETWORKING TECHNOLOGIES

Following Boese 2009; Cross et al. 2003; Cross and Thomas 2009, Fernandez et al. 2000, HRM standard practices and e-HRM (Martin and Reddington 2010), digital social networks like LinkedIn, Facebook (Kirkpatrick, 2010) and Twitter have revolutionised human resources practices. Google has changed the way we see our world (Auletta 2009) and changes our habits (Jarvis 2009), and the internet does modify our brain (Carr 2010). Some even wish to make the internet stop (Zittrain 2009). Due to the social technologies, we have to reconsider how we can live and win in a transformed world (Li and Bernoff 2008), and how we interact in times of Facebook (Stengel 2010), where the new digital generation grows up with naturally, contrary to the generations before them (Tapscott 2009).

Historically, Barnes (1954) was the founder of the definition of social networks and his research dates back to 1954. This study was followed by works from Rees (1966) on information networks in labour markets, and by Milgram (1967), who tested the “small world”. De Schweinetz (1932) was the forerunner of economists and sociologists who distinguished between the formal and the informal methods used to find a job. Granovetter (1973, 1985, and 1995) studied the informal methods of finding a job according to him, discovering the “forces of the weak ties”.

In more recent literature, Dodds et al. (2003) conduct an experimental study of search in global social networks. Fernandez et al. (2000) study the networks at a phone centre. Godin (2008) studies people’s behaviour in ‘tribes’.

Sammartino McPherson (2009) describes Tim Berners-Lee (2000) who imagined a world wide web, encouraging social interactions, giving people without huge technical competences and knowledge the possibility to publish online content, free of charge, unlimited in space and time and the opportunity to interact with others.

The research paper from Hasgall and Shoham (2007) is “Digital social network and the complex organizational systems”, where social networks in organisations are viewed as a shared knowledge system backed by management.

An interesting article is to be found from Jones (2010) about how to use Twitter, Facebook and LinkedIn in recruitment. Boese (2009) writes about standard HRM practices and social network analysis.

In the view of Shirky (2009 and 2010) people go through different stages of “Gin, Television and Social Surplus”. Firstly, they meet in pubs for a drink and later they spent their free time watching TV. Next, they reach the phase where they like to share and communicate, to produce and not only to consume. Following Tapscott (2009) the reluctance for the use of new technologies lies within the generation gap. He describes the “Net-Generation” as learners who are rethinking talent and management, and who are in networks and in families.

Hypothesis 3:

Hypothesis 3: HR specialists in Luxembourg are reluctant to utilise new social networking technologies due to their specific cultural identity. As a result, the practical techniques used related to recruiting, integration, evolution, training, talent management and the evaluation of employees remain largely unchanged. This hypothesis is based upon on an assumption that needs to be justified. What causes this reluctance? Specific cultural facts, differences in nationalities, or age, or gender or other facts (Fisher and Howell 2004, Reddington et al. 2010)? What has been the extent of the use of new social networking technologies in Luxembourg? Why have human resources specialists in

Luxembourg been reluctant to utilise new social networking technologies? How do they do HRM? How to make them use the new technologies?

My work engages in debates resulting from my review of HRM Practices in general, based on relevant literature, ERP (Lengnick-Hall and Lengnick-Hall 2006) and theory in comparison to the practices currently in use. My work will show that Luxembourg is different from other markets, confirming Greenwald and Kahn's (2005) "All Strategy is Local". Luxembourg has a specific work environment that is not in-line with the theories of the globalised world (IPSE 2010, AmCham 2010).

- Which standard HRM practices (Kuvaas and Dysvik 2009; Marchington 2008) in recruiting, evaluation, information gathering, training, outplacement were typically used in the past by Luxembourg companies and are still used?
- When used, which social networking technologies do companies prefer and how does their use impact performance (Collins and Clark 2003)? A look into the past and into the future of Networking in Luxembourg.
- Is the local use of these Social Networking Technologies affected by cultural specificities (McLean and Campbell 2003), (Scullion et al. 2007) or age (Tapscot 2009)? What is the impact of the specific cultural identity and language (Jameson 2007)?

METHODS

Respondents

- Collecting primary data via Participant Observation, following Saunders et al. (2009), Strauss and Corbin (2008), Taylor and Bogdan (1998), Wilson (2010): participation at seminars, conferences, meetings, dinners, breakfasts, networking events, organised by: e.g. hrone, POG, AmCham, Chamber of Commerce, Sacred Heart University, IGS, Recruitment Matters (<http://www.recruitmentmatters.com/news/newsletter/index.html>), in e.g. Hotel Sofitel, Hotel Hilton, BGL BNP Paribas, Banque de Luxembourg, Dexia...
- Collecting primary data via Face-to-Face Interviews and questionnaires with e.g. Luxair, HSBC, Deloitte, eurosript, Lindab, RTL, European Investment Bank, ZithaKlinik, Ernst & Young, Banque Privée Edmond de Rothschild, Cactus, Delphi, fast, aims, Rita Knott Consulting, Thierry Ernst Consulting, Ville de Luxembourg, Municipality of Sanem, University of Luxembourg, Ketterthill, Soludec, SES Astra, John Zink, Paul Würth, Centre de Recherche Public Henri Tudor (2008), Office des Publications de l' Union Européenne, KPMG, Oostvogels, Equity Fund among others, in total 41 companies. Case study with ZithaKlinik and Centre de Recherche Public Henri Tudor

- Collecting primary data via Hofstede's original questionnaires in one company: Lindab Buildings, Diekirch.

Instruments

- My questionnaire has been used in paper and online to enquire about HRM practices and the impact of digital social networks on these HRM practices in Luxembourg and Hofstede's (2001) original questionnaire has been used to measure his cultural dimensions. The questions concerning HRM practices are: (1) 'What means is your company using in recruiting?' (2) 'Which digital social networks does your company use?' (3) During the recruitment process, how does your company gather information about a candidate?' (4) After the recruitment process, how does your company gather information about its employees?' (5) 'What are the advantages of digital social networks?' (6) 'What are the disadvantages of digital social networks?' (7) 'Did the use of digital social networks change the role of the human resource specialists in Luxembourg? If yes, how? If not, why not?' (8) 'Do you see any risks, dangers while using digital social networks in the human resource practices of recruiting, evaluation, evolution, training....' (9) 'Which internet pages are accessible in your company? (is Facebook accessible?' (10) 'How is networking mainly done in Luxembourg?'
- Excel is used to come up with the graphs resulting from the above questions.
- Nationality does not always correspond to native language and therefore questionnaires were distributed in English, French and German.
- A pilot study was conducted to pre-test the questionnaire's face validity.
- As ethical concerns may emerge at all stages of the research (Elms et al. 2010), precautions have been taken to ensure confidentiality. Questionnaires have been anonymous. Equity in treatment regardless of gender, race or nationality was always guaranteed (Robertson 2008).
- Hofstede's (2001) original questionnaire has been used to measure his cultural dimensions. Questions have been added to measure respondents' happiness and background information.
- After the initial screening and cleaning of the collected data, Hofstede's (2010) original formula, were used to calculate Hofstede's cultural dimensions **Power Distance Indicator (PDI), Uncertainty Avoidance Indicator (UAI), Individualism-Collectivism (IDV), Masculinity-Femininity (MAS), Long-Term Orientation (LTO), Indulgence Versus Restraint (IVR, Monumentalism (MON)**. Pearson Correlations were calculated among all variables.
- One question was used to measure Happiness: "Are you a happy person always, usually, sometimes, seldom, or never?"

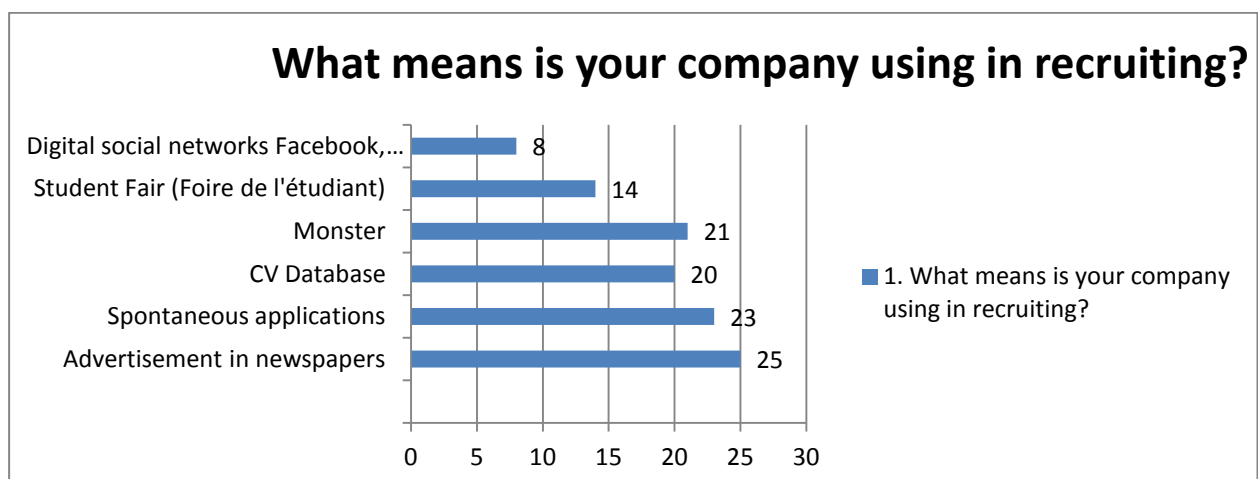

- The following Demographic data served as **control variables**: native language, command of other languages, gender, age, hierarchical rank and education. Age was measured in an eight-point scale, educational background and rank were measured on a seven-point scale.

RESULTS

Human Resource Managers in Luxembourg are reluctant to use digital social networks, due to their cultural identity. Human Resources practices have a historical and cultural background and has developed throughout the years. The recruitment sector has been revolutionised by Facebook, LinkedIn, Xing, Twitter and Blogger, but not so in Luxembourg. This is given by the high score in 'Uncertainty Avoidance' following Hofstede.

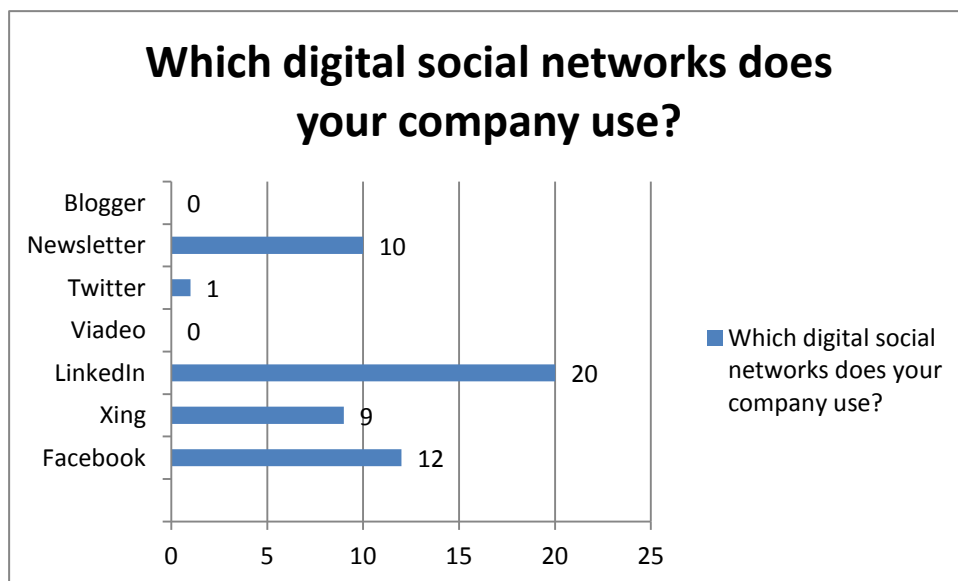

The means used in recruiting are mainly advertisement in newspapers (25) and spontaneous applications (23). Digital social networks (8) are far the less used mean in recruiting, see the following table.

Table 1

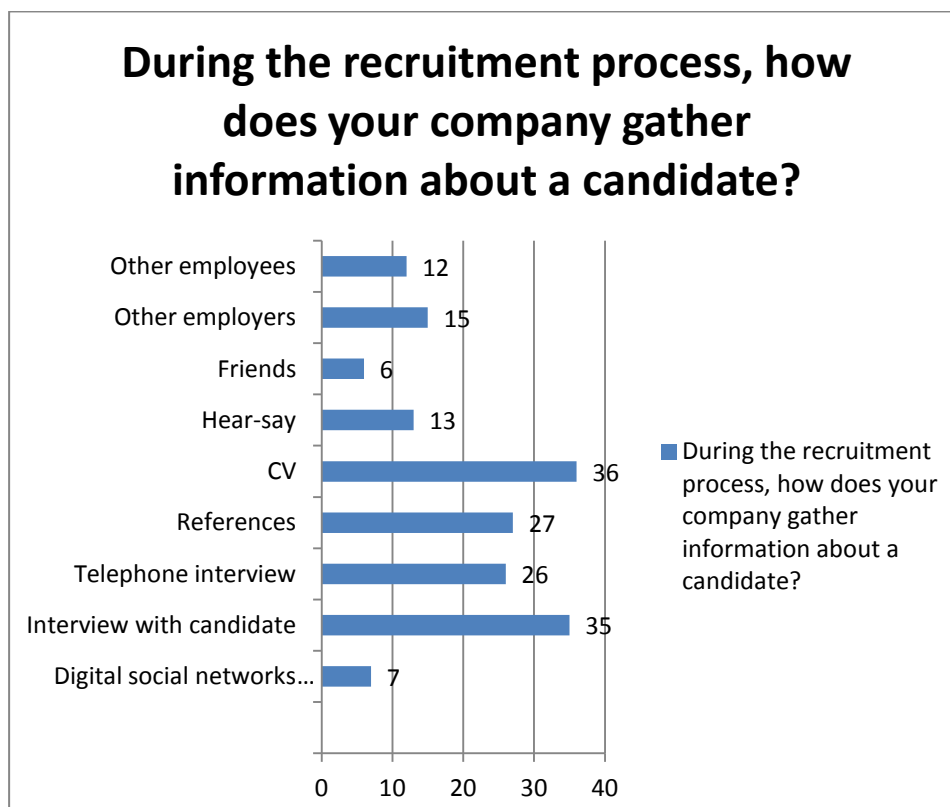

When companies use digital social networks, they mainly use LinkedIn (20), followed by Facebook (12), Newsletter (10), and Xing (9), see the following table.

Table 2

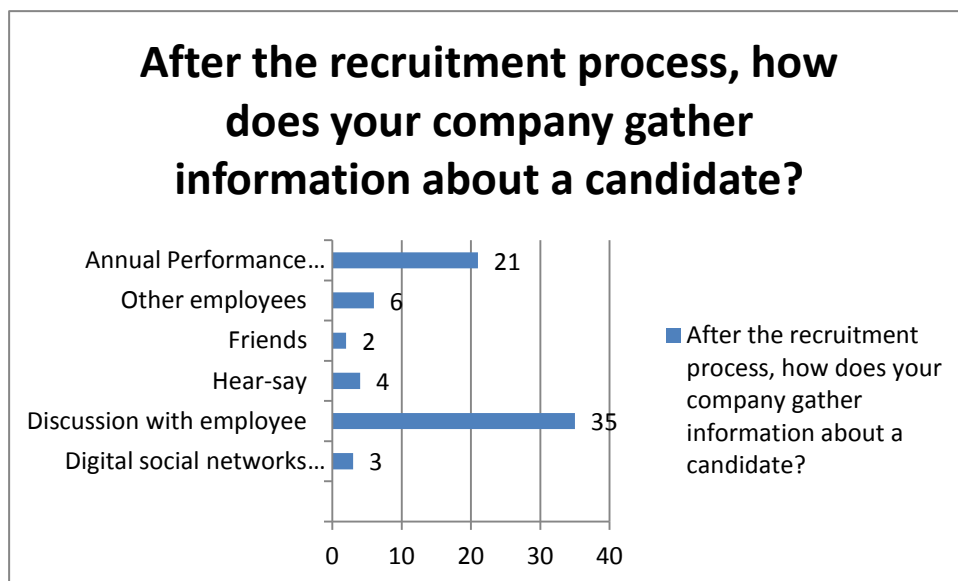

During the recruitment process companies gather information about the candidate using mainly the CV (36) and the Interview with the candidate (35). Friends (6) and digital social networks (7) are the least used means, see the following table.

Table 3

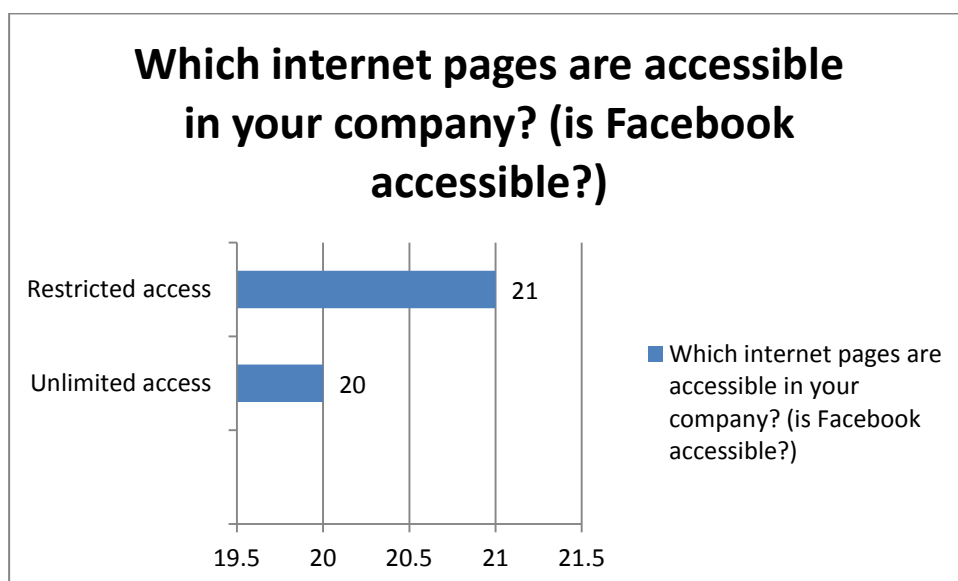

After the recruitment process, companies gather information about an employee mainly through discussion with the employee (35) and the annual performance evaluation (21). Friends (2) and digital social networks (3) are the least used means, see the following table.

Table 4

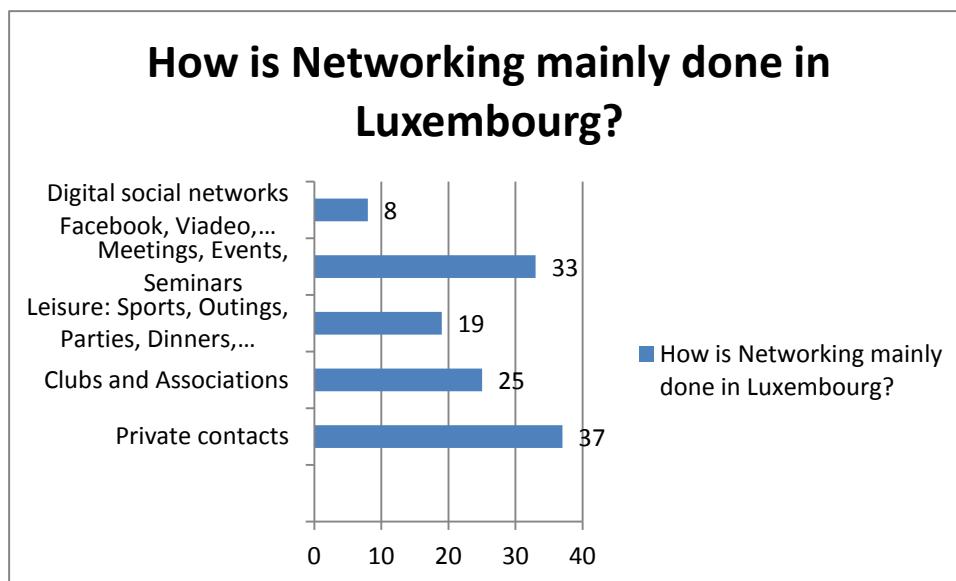

Which internet pages are accessible in a company are shown in table 5. This shows that most companies have restricted their internet access (21), compared to unlimited access (20).

Table 5

How networking is mainly done in Luxembourg is shown in table 5. This shows that most networking is done through private contacts, (37), followed by meetings, events, seminars (33), clubs and associations (25) and leisure (19).

Table 6

What are the advantages of Digital Social Networks? was answered as follows:

- Growing its network, connecting to former colleagues or friends where you lost contact
- Increases network, spreads brand awareness, no cost
- (Re) connecting to people; discover other social network forms. Contacting people without facing or calling them. Timeless networking (anytime in day and night)
- It can help to find someone who can answer you a specific question. Especially LinkedIn is very useful there
- The world just got smaller!
- Easy to use and to find information you need
- Quickly found information
- It gives you a first impression to be confirmed or not
- I have 2 daughters: 24 and 22 years old who are on Facebook, with the style of live of the students' live, Erasmus contacts, their way of keeping contact in the entire world, with students they didn't see for some months. To find back friends that one wishes to find back. To exchange information.
- Faster creation of a network, widening of one's network
- Broad database, normally quite actual information
- Big space of information, fast work, easy communication
- Accessibility, information available quicker
- Being able to reach fast a number of people whom I couldn't contact by any other means. Our site: "Your future at Deloitte": We find them at their homes, they don't need to move. The number of people! The different profile of the people, their diversity, the entire world, the

world is getting very small.

- A lot of information is available. Fast.
- Contact passive candidates.
- Contact candidates out of location.

In your opinion, what are the disadvantages of Digital Social Networks? was answered as follows:

- None
- Low quality
- If you allow too many details to be shown to public users there might be a lack in privacy
- People may lie about their experience, job title...
- Lack of personal touch
- Very little usage potential for finding the right staff. People tend to exaggerate their skills and don't talk about deficiencies. Endorsements might help a bit, but when you look at them they don't seem to be more than a friendly turn.
- It's not always easy to control if information found is trustfully
- No confidentiality
- No control on distribution of information
- Private info, not always accurate
- The content is not trustful
- It is an advantage and a disadvantage: fast communication, a lot of information
- The contact has to be private, personal. I don't want to make public what is private. It's the illusion of transparency. In the world of the companies, one has to be transparent, that means invisible. Therefore one doesn't say the truth anymore.
- To share too much information with everyone. The 1st degree of this kind of network.
- Not confidential enough, sometimes too transparent
- If not used properly, may lead to abuse. Private data access. Information posted may not be 100% accurate
- One can create a profile that isn't true. One can create an identity without being it. As recruiter one tries to get known. You have to control the posts, not to allow dialogues politically not correct. One has to manage this every day.
- I am not really up to date to reply to this question.
- Information is not as complete as a CV.

Do you see any risks, dangers while using Digital Social Networks? was answered as follows:

- Lowering of Quality
- No – Which ones?
- We talk about the professional environment, right? Then I don't see many risks. The situation is different of course for tools like Facebook etc where people show pictures that the world shouldn't see and that are impossible to delete.
- The main risk is that it is so easy to use / make contact that there is a temptation to leave "face-to-face"-contact by side
- See disadvantages
- Preservation of private life
- Of course, there are risks associated by using DSN but it doesn't affect on recruitment process
- Yes, it can not be your only resource.
- This mix of private life – professional life. Facebook has a non-stop memory. You cannot delete the memory of Facebook. Even if I have nothing to hide, I don't want to show it to everyone.
- The limits of the network: "ok, we are linked, yes, and what now?" The weak border between the private and the professional.
- Reliability of information, respect of personal data, standard demand driven streamlining of data, over-simplification of search = interesting profiles not taken into account
- Risks in confidentiality. Risks of copies. Risks of discretion.
- Yes: reputation. Information is spread fast, without control. Not to be deleted: it is on the net, it will stay there forever.
- Privacy. Not suitable photos.
- Approach people not matching our requirements/criteria.
- No, very helpful too, especially for HR people

The below correlation matrix shows that Luxembourgers are characterised for being long term oriented, they indulge in life, they are uncertainty avoidant, and they are happy.

Table 7**Correlations among all variables (N=134)**

	PDI	UAI	IDV	MAS	LTO	IVR	MON	HAPPY	GENDER	AGE	EDUCATION
PDI	-										
UAI	-.021	-

* $p < .05$; ** $p < .001$

The figure above closes this chapter on data analysis. The next paragraph is on limitations of this study.

LIMITATIONS

Thus, the comparatively small sample size, the data collected only in one company, and the lack of a strong theory to link culture and happiness, could all have biased the results and their interpretations. Yet, it is likely that scores that were found to be significant in a small sample are likely to be made even more significant in a larger sample. Also, focusing on one small country and one company has provided the opportunity to indirectly control for many exogenous variables that otherwise would have the potential to 'contaminate' the relationships between the variables. The next paragraph is on discussion and implications.

DISCUSSION AND IMPLICATIONS

The purpose of this study was to explain, in this world of global mobility, the cultural and language characteristics of Luxembourg that may influence the tendency of human resources specialists in Luxembourg to utilise new social networking technologies such as LinkedIn, Viadeo, Xing, Facebook and Twitter. Increasingly global mobility (Tahvanainen et al. 2005), more collaboration across borders (Hinds et al. 2011), strategy in global staffing (Collings et al. 2007), complexity, struggling the work-family balance (Shaffer et al. 2001), trust building (Harvey et al. 2011), career consequences (Shaffer et al. 2012) this research is interesting for expats, their spouses and family coming for work to the Grand Duchy of Luxembourg, trying to cope with the cultural and linguistic specificities. Tharenou (2005) finds out the main reasons why people accept expat work: money, professional development and challenging content; and why people won't accept expat work: family commitments and disruption.

The study is the result of the link between literature on standard HRM practices, e-HRM (Martin and Reddington 2010) and practice in Luxembourg business life (IPSE 2010, AmCham 2010).

It provides an answer for HRM specialists to the question: "How to be successful in multicultural, international Luxembourg?" Cultural identity, intercultural communication, language and international business are discussed by Jameson (2007). How to do business with social networks in international trade (Rauch 2001)?

HR Managers will be made aware of the usefulness of digital social networks and may potentially implement them into their current HRM Practices (Guler and Guillen 2010).

The aim is to analyse Luxembourg and its way of business while continuing to evolve with changing technologies. The questions discussed go deep into the analysis of everyday business life, cultural identity, language and international trade in Luxembourg (Horner 2009, Kingsley 2009, Davis 2009). One must genuinely accept and understand the meaning of "Mir wëlle bleiwe wat mir sinn". If one does not make an effort to integrate into Luxembourg's specific business culture, success in Luxembourg may never be possible (Background Notes 2006; Neefs and Laures 2010).

By employing a unique sample that includes respondents who speak French, German and Luxembourgish in France, Germany and Luxembourg this study has managed to corroborate the notion that language is a good identifier of culture. While scores in this study for French and Germans in France and Germany resemble to a great extent Hofstede's scores for these two countries, and while scores in this study resemble Hofstede's estimates for Luxembourgers who speak any official language of the Grand Duchy, Hofstede's estimates varied to a great extent from this study scores for Luxembourgers who command Luxembourgish as their mother tongue. This is a unique testimony for the relationships between language and culture, while controlling for country.

Some proven relationships between culture, represented by such dimensions as Long Term Orientation, and high level of Indulgence, and happiness, have been corroborated in this study. It is self evident that two measures, that measure similar concepts, namely, Indulgence on a national level and Happiness on the individual's level should be related to each other. The Grand Duchy's political, social and economic stability allows people to plan for the long term, thereby providing support for people's need for security and life predictability. It is possible that this is the key for the relationship between Long Term Orientation and Happiness in Luxembourg found in this study. To validate this argument it is worth citing Hofstede himself: "At 70 Luxembourg has a high score on uncertainty avoidance which means that as a nation they are quiet reluctant to test unknown territories. Security is a key word in Luxembourg; there is not one activity which is not depending on some sort of security control from authorities; from banker's money to safety exits in a restaurant. It makes the live in Luxembourg very safe, but some would argue a bit boring. New ideas, new methods, new management techniques must first be proven to work in other countries in order to be accepted in Luxembourg. Historically more "farmers" than "traders" the inhabitants kept that good old "common sense" made of cautiousness which has proven to be profitable for a country who managed not to be at war since the Napoleonic time! (<http://geert-hofstede.com/luxemburg.html>). Since this is the first time that such efforts are being made to find the relationship between happiness and culture, those results should be taken cautiously.

Not surprisingly, Indulgence was found to be significantly related to Individualism and Masculinity, two concepts that are part of Indulgence definition. The significant relationship between Indulgence and Monumentalism, and the significant negative relationship between Monumentalism and age, may indicate that younger people tend to be more individualistic, monumental and, therefore, happy. This hypothesis could only be corroborated by enlarging the sample size, a fact which would allow conducting more sophisticated statistics than mere correlation.

This research could be used by expat-Managers, HR professionals, recruiters, head-hunters and HR directors in Luxembourg and globally wishing to collaborate with Luxembourg, who would like to consider evolving technologies and their potential use in Luxembourg's business environment with its cultural identity (Jameson 2007) in international trade (Rauch 2001).

FUTURE RESEARCH

Future studies could focus on strategies and challenges of global human resource management, researched by Ananthram and Chan (2013) concentrating on the challenges they enumerate: degree of standardisation of HR, foreign industrial relations, labour laws, time zones, cross cultural differences and cultural sensitivity, leadership development, communication, expatriates' adjustments,

inflexibility and work-family balance (Ananthram and Chan 2013), and evolve further into the two branches of the current research: first, focus on the relationship between language and culture and empirically validate it for other languages. Thus, in-country studies comparing the dimensions of culture could be conducted in places such as Switzerland that contains four official languages, in Germany where a minority command Turkish as a mother tongue, or even in China where the people of the south command Mandarin while the people of the north command Cantonese, and yet they all belong to the same Hun group. A second possible avenue for future research could focus on the influence of culture over people's happiness. Since a new cultural dimension, namely Indulgence, is now available, happiness could be measured at both the national culture level and the individual's state of mind. Expansion of the current research model and the use of its instruments in a number of other organizations and countries have the potential to strengthen the validity of the current research findings by generalizing them over new populations, and by making them more specific. In any case, be it the study of language and culture or culture and happiness, larger samples would allow for the application of more sophisticated statistical methods, such as regression models, that would allow the exploration of the relative influence of language over culture, and cultural dimensions over happiness. Thus, despite its limitations, the current study has paved the way for major replications and refinements and the substantiation of very important hypotheses that have theoretical as well as practical implications for researchers, managers and others, across the globe.

In this world, where millions of people migrate from one country to another, and where communities become greatly diverse, the ability of the use of countries' national boundaries as the fault lines that define culture dimensions, to explain and predict management and other societal behaviours, is very limited. Students of culture should make it their habit to measure social units' cultural dimensions by varying the respondents across languages, and maybe even across dialects, rather than across common national boundaries.

**WHY NETWORKS, A SHARED LANGUAGE AND STORYTELLING
HELP ORGANISATIONAL ADVANTAGE IN MICROFOUNDATIONS –
INTERNATIONAL ENVIRONMENTS AND STRATEGIC HUMAN
RESOURCE MANAGEMENT**

Schinzel, Ursula

United Business Institutes, Luxembourg

ABSTRACT

This research, based on Nahapiet and Ghoshal (1998), investigates why networks, a shared language and storytelling help organisational advantage in microfoundations in international environments, especially in Strategic Human Resource Management (SHRM). The first part of this paper is dedicated to an in-depth literature review. In the second part, the research method is explained: survey questionnaires were developed based on Nahapiet and Ghoshal (1998), translated from English to French and German and distributed. The questionnaire consisted of 28 closed questions on a five-point Likert scale and two open questions regarding networks in person or digital networks, producing many direct quotes from the respondents. A total of 253 questionnaires were collected, out of which 246 were usable. One interview was conducted for the purpose of this research, with the objective to validate the results from the questionnaires, but it was not included into this paper. Further research could focus on qualitative research methods, as well as the influence of new media and age. In the third part, the findings of this research are presented: Networks provide access to information, are easily accessible, flexible and efficient, diverse, they are fast, cheap, “Who you know” determines “What you know”, there are obligations, norms, and expectations within a network, and there are issues with trust and confidentiality in networks. Some HR managers have a preference for networks in person compared to digital networks; their respective arguments are presented. A shared language is used as identifier as it defines the in-group and distinguishes from the out-group, is important in social relations, enables people to discuss and exchange information, to ask questions, to conduct business, creates group-specific communication codes, enables the combining of information, the development of new concepts and the creation of new knowledge, and influences our perception. If people do not speak the language, they are kept apart and have restricted or no access to information. Storytelling is used to show and transmit values, norms, and culture, to share knowledge and understanding, it is useful in education and training, it helps to communicate quickly, naturally, clearly; with storytelling one can focus on a vision and plan the future, solve

problems and conflicts, inspire continuous innovation, manage change, and make decisions. It is proposed that networking, in person and in digital form, a shared language as identifier and storytelling are capabilities for shaping the future and success of microfoundations in international environments. Conclusion and discussion, limitations, further research, and references follow.

Keywords: *Strategic Human Resource Management (SHRM), networks, storytelling, language as identifier, international entrepreneurship, microfoundations*

INTRODUCTION

This research, based on Nahapiet and Ghoshal (1998), investigates why networks, a shared language and storytelling help organisational advantage in microfoundations in international environments, especially in Strategic Human Resource Management (SHRM). Survey questionnaires, developed by the author based on Nahapiet and Ghoshal (1998) and consisting of 28 closed and 2 open questions were used to determine the extent of influence of success in microfoundations in international environments. 246 usable questionnaires were collected and one interview was conducted, to validate the findings from the questionnaires. However, the interview was not included into this paper. Practical advice is offered to HR managers of how to use these means for organizational advantage in microfoundations in international environments.

The literature review that follows this introduction concentrates first on microfoundations, second on Human Resource Management, globalisation and e-HRM, third on networks, forth on digital social networks, fifth on language as identifier, and finally on storytelling in organisations. The literature review is followed by the methods chapter [[are you sure “part” is the right word?]]. The results follow the methods chapter. The findings to the research questions are presented: Why do you think networks, a shared language and storytelling help organisational advantage in microfoundations? The additional research question is: “Do you prefer networks in person to digital networks like Facebook, LinkedIn, and Twitter?” Findings are presented, issues with networks in person and with digital networks are shown, and reasons why respondents would prefer networks in person or digital networks are demonstrated. Conclusion and discussion, research limitations, and future research follow.

LITERATURE REVIEW

MICROFOUNDATIONS

Microfoundations have gained in influence in strategic management over the last years. Individuals have a basic influence on strategic management, is the argument. Strategic human resource management is one field of research interests besides economics, psychology, sociology, motivation, cognition, marketing, strategy, entrepreneurship, communication, and others. Foss (2010, p. 12) defines microfoundations as “foundations of something, namely aggregate concepts and/or relations between aggregate variables”, ... it is “an instance of reductionism”, ... “of how individual decision-making influence firm behaviour”. The discussion between “methodological individualism” versus “methodological collectivism” goes “whether individuals (“micro”) or social collectives (“macro”) have explanatory primacy”.

The interest in the theory of the firm started nearly 40 years ago now. The theory of firm scholars focusses on the causes of “organisational advantage”, contrary to its failure (Nahapiet and Ghoshal, 1998, p. 242). They include trust, networks, network ties, network configuration, shared narratives and shared language and codes in their research of the organisational advantage. They see the roots of intellectual capital in the social relations and structures - “who knows who” affects “what you know”. In strategy, Porter (1996) was the pioneer, initiating a loop of decade-long discussion and theory on business structures, procedures and performance, slowing down any positive development (Teece, 2007). Teece says (2007, p. 510) “Fortunately, the existing literature on strategy, innovation, and organization and the new literature on dynamic capabilities have identified a panoply of processes and routines that can be recognized as providing certain microfoundations for dynamic capabilities.” He says that new opportunities are sensed through scanning, creation, learning, and interpretive activity. “Opportunities get detected by the enterprise because of two classes of factors. First, as stressed by Kirzner (1973), entrepreneurs can have differential access to existing information. Second, new information and new knowledge (exogenous or endogenous) can create opportunities, as emphasized by Schumpeter (1934)”.

This chapter [[you said “part” before]] finishes with the call of Teece et al. (1997, p. 530): “Researchers in the field of strategy need to join forces with researchers in the fields of innovation, manufacturing, and organizational behaviour and business history”. The next chapter is on HRM with a focus on today’s challenges, globalisation, and e-HRM.

HUMAN RESOURCE MANAGEMENT, GLOBALISATION AND E-HRM

HR practices have developed throughout the years (Armstrong, 2009) and with the changing world of work (Scholz and Böhm, 2008). Twenty years ago, HR practices were mostly related to administrative issues such as salary, vacation, absence, work hours, headcount and accounting. In many companies,

the accounting department was part of the HR department. Following this administrative trend a movement that focused on employees' motivation, recruitment, training, evaluation, talent management and recognition (Kuvaas and Dysvik, 2009).

More recently HRM is driven by communication, international HR, Strategic HRM, global HRM and recruitment in the globalised world, migration and geographical (im)mobility and networking and e-HRM (Stone and Dulebohn, 2013).

Rising staff mobility, including short-term international assignments in multinational companies and transfers, commuters, as well as rotational, contractual and virtual assignments, brings increasing complexity, fragmentation of employees' careers, the taking on of responsibilities and encountering challenges never thought of previously (Shaffer, 2001, 2012), increasing networking, and e-HRM. e-HRM influences all HR activities and their usage, through cost reduction, decision-making, IT system, and IT security. e-HRM focuses on the relationship between HR strategy, e-HR goals and architectures and positive and negative e-HR outcomes (Martin and Reddington, 2010). e-HRM influences human resource planning, recruitment, selection, performance management, work flow, training, compensation, and performance cost reduction, strategic HRM (Collins and Clark, 2003; Porter, 1996), change in usage, including training, especially e-learning, decision-making, and information systems combined with IT security. The next chapter is on networks with a focus on digital social networks.

NETWORKS

Networks provide access to resources (Nahapiet and Ghoshal, 1998, p. 246), networks are an important source and determine information benefits. Networks - "Who you know" determine "What you know". There are three forms of information benefits: access, timing and referrals. Networks provide efficient screening and distribution of information and knowledge. Networks allow speed in getting the right information. Networks allow people in the network the opportunity to provide, combine, exchange information and also give referrals with the information. Nahapiet and Ghoshal (1998, p. 252) state this reputational endorsement influences the value of the information.

Networks come in different forms, either in person or in digital form. Granovetter (1973) identified the role of the "loose ties" in information exchange in networks. These ties allow the transmission of information. The network structure depends on its density, connectivity, hierarchy, flexibility and ease of information exchange and the accessibility for the network members to the information (Nahapiet and Ghoshal, 1998, p. 252). The lower costs of accessing information through networks, especially through digital networks, are one of the advantages, besides the diversity and efficiency of the network information structure.

DIGITAL SOCIAL NETWORKS

Digital social networks like LinkedIn, Facebook (Kirkpatrick, 2010) and Twitter have revolutionised human resources practices (Cross and Thomas, 2009). Google has changed the way we see our world and our habits (Auletta, 2009), and the internet has modified our brain (Carr, 2010). Some even wish to stop the use of the internet (Zittrain, 2009). Due to the social networking technologies, we have to reconsider how we can live and win in a transformed world (Li and Bernoff, 2008), and how we interact in times of Facebook (Stengel, 2010), where the new digital generation of digital natives grows up, contrary to the generations before them. Tapscott (2009) has identified the reluctance to use new technologies as a result of the generation gap. He describes the “Net-Generation” as learners who are rethinking talent and management, and who are in networks and in families.

Social networks in organisations are viewed as a shared knowledge system backed by management, as standard HRM practices and social network analysis (Boese, 2009), and used especially in recruitment (Jones, 2010).

“The internet is among the few things humans have built they truly don’t understand. The internet is the largest experiment of anarchy in the history” (Schmidt and Cohen, 2013, p. 3). “Think of all the websites visited, ... of every job found, ... consider what the lack of top-down controls allow: the online scams, the bullying campaigns, the hate-group websites and the terrorist chat rooms. Through the power of technology, age-old obstacles to human interaction, like geography, language and limited information, are falling” (Schmidt and Cohen, 2013, p. 3). “Communication technologies will continue to change our institutions from within and without” (Schmidt and Cohen, 2013, p. 11). The benefits of networks are efficiency, flexibility, accessibility, diversity of information, low cost, high speed, “Who you know” determines “What you know”. Issues with digital networks relate to confidentiality, obligations, norms, and expectations within a network, the trustworthiness of the network members and the information provided. The next chapter is on language and especially on language as identifier.

LANGUAGE AS IDENTIFIER

Language is used as identifier. It is used to determine the “in-group” and to distinguish it from the “out-group” (Briley et al., 2005, p. 353). The ability of bi-cultural people of frame switching through language has been researched by Briley et al. (2005) and Hong et al. (2000). Language plays an important role in social relations, in exchange, sharing of context, transfer of information, conception, perception and knowledge creation (Nahapiet and Ghoshal, 1998, p. 253). Nahapiet and Ghoshal (1998, p. 253) suggest a shared language has three ways of influence on exchange: first on social relations, second on perception, and third enhances the combination capabilities. For the first point, a

shared language enables people to “discuss and exchange information, ask questions, and conduct business in society”. In cases where people do not speak the language, they are kept apart and have restricted or no access to this information. This is because first, a shared language is linked to our social relations, it is about “who knows who” – “who knows what” – “who speaks what (language)”. Second, a shared language is important for the development of new concepts, of new knowledge. The shared communication codes are important for the combination and transmitting of information. Third, a shared language influences our ways of perception. Our awareness is influenced by our language.

Benefits of a shared language are “defines the in-group, distinguishes from the out-group”, creates group-specific communication codes, is important in social relations, is used as identifier, enables the development of new concepts and creating new knowledge, enables the combining of information, enables people to discuss and exchange information, to ask questions, to conduct business, influences our perception, and if people do not speak the language, they are kept apart and have restricted or no access to this information. The next chapter is on storytelling, more precisely the use of storytelling in organisations and its benefits.

STORYTELLING IN ORGANISATIONS

Storytelling is used in organisations for many different purposes. These range from communicating a complex idea to solving problems, making decisions, planning for the future, (Denning, 2011) and training (Davidson, 2004). It is also used to state the organisation’s norms, values and the culture, to disseminate knowledge, to manage change and to focus on a vision (Boyce, 1996; Boje, 2008).

Following Denning (2004, p. 44, p 150-153) the objectives of storytelling in organisations are 1) to communicate a complex idea and to spark action, 2) to communicate who you are, 3) to transmit values, 4) to get people working together in a group or community 5) to tame the grapevine or neutralize negative gossip, 6) to share information and knowledge, 7) to lead people into the future. For Denning (2011) and Clark (2004), storytelling is a tool to achieve business purposes.

There are a number of different approaches to developing profiles to help people plan their future work with storytelling. Some approaches examine the high-value forms of organisational storytelling: communicate complex ideas, communicate who you are, transmit values, promote team work, stop rumours, share information and knowledge and lead people into the future (Denning, 2011; Sharp, 2000), to manage conflicts, address issues, resolve conflict and face challenges, and to lead more efficiently (Friedman, 2009). This is how Coca-Cola uses stories to build stronger emotional bonds, for example with the “Happiness Factory”.

Stories are beneficial for organisations, they are mainly used to inspire success. By telling stories, there is a connection with the audience, storytelling makes the audience involved and excited, which may not have been the case otherwise. It helps the younger generation to learn, to access and to connect with tradition. Stories are beneficial in education and learning (Davidson, 2004). The internet is used to tell stories (Paula Kahumbu, interviewed by David McKenzie. (<http://edition.cnn.com/2012/10/01/world/africa/paula-kahumbu-kenya-lions/index.html?eref=edition>). Stories tend to stick in the mind longer than abstract ideas alone (Heath and Heath, 2008).

Scholz and Böhm (2008) investigate human resource research in Europe with the objective of avoiding fatal and expensive mistakes. Valid for Europe, this is even truer for the world. Information on the different socio-economic, political and cultural conditions in the world could contribute to better understanding between counterparts. Personality, culture and human nature are the three levels of uniqueness in mental programming. Stories, again, could help prevent misunderstandings between cultures.

METHOD

Survey questionnaires were used to determine the extent to which networks, a shared language and storytelling influence the success of microfoundations in international environments. A standardised questionnaire was developed, based on Nahapiet and Ghoshal (1998), consisting of 28 closed questions in form of a five-point Likert scale and 2 open questions, producing many direct quotes from the respondents. The questionnaire consisted of five parts: (1) Assessment of the organisational advantage of networks, (2) of a shared language, (3) of storytelling, (4) two open questions on the preference of 'networks in person' to 'digital networks', (5) questions on personal data such as job, industry, gender, age, native language, other languages spoken, nationality, birth nationality, residency, origin, and education. The original English version was translated by native speakers into French and German and back-translated into English for validity check. Over the summer of 2013, they were distributed to business people in Luxembourg and Germany and to participants at different academic conferences. This explains the high percentage of doctorates in the sample. One interview was conducted to confirm the validity of the questionnaire's results, but it was not further evaluated for this research. Future research is necessary to do so.

RESULTS

The results of the questionnaire are shown in the following chapter. A five-point Likert scale was used and average, median, minimum and maximum per question were calculated.

The first question: **“Why do you think Networks help organisational advantage?”** was answered as follows: the highest average score was for the answer “Provide access to information” with an average of 4.29 out of 5. The second highest score went to the answer “Accessibility, easy access to information, flexibility and efficiency” with an average of 4.01 out of 5. The third highest score was to the answer “High Speed (Timing) to this information” with 3.94 out of 5. “Low cost of access to information scored with 3.83 out of 5 came in fourth place. “Who you know” determines “What you know” (brings together information from different sources and disciplines)” scored 3.74, “Diversity of information” scored 3.69, “There are obligations, norms, and expectations within a network” scored 3.57, “Trust (trustworthiness of the network members and the information provided)” scored 3.46, and last place took “Confidentiality” with 3.06 out of 5. The median for nearly all questions was 4, although the median score for “Trust” was 3.5 and “Confidentiality” was 3. The current discussion on confidentiality, espionage, listening and recording of all digital information finds its confirmation here. Minimum was 1 and maximum was 5 for all responses.

The second question: **“Why do you think a shared language helps organisational advantage?”** was answered as follows: The highest average score was for the answer “A shared language is important in social relations” with a score of 4.24 out of 5. The second highest score went to the answer “Enables people to discuss and exchange information, to ask questions, to conduct business” with an average of 4.20 out of 5. The third highest score was to the answer “A shared language is used as identifier” with an average of 3.97 out of 5. “Creates group-specific communication codes” scored 3.90, “Enables the combining of information” scored 3.74, “Enables the development of new concepts and creating new knowledge” scored 3.68, “Influences our perception” scored 3.66. The lowest average score was 3.62 for both “Defines the in-group and distinguishes from the out-group” and “In case people don’t speak the language, they are kept apart and have restricted or no access to information”. The median was 4 for all responses. Minimum was 1 and maximum was 5 for all responses.

The third question: **“Why do you think Storytelling helps organisational advantage?”** was answered as follows: The highest average score was for the answer “Show and transmit values, norms, and culture”, with an average of 4.07 out of 5. The second highest score went to the answer “Share knowledge and understanding” with an average of 3.99 out of 5. The third highest score was “Useful in education and training” with an average of 3.84 out of 5. “Communicate quickly, naturally, clearly” scored 3.72, “Focus on a vision” scored 3.59, “Solve problems and conflicts” scored 3.47, “Inspire continuous innovation” scored 3.45, “Manage change” scored 3.37, “Focus and plan the future” scored 3.31. The lowest score was for the answer “Make decisions” with an average of 3.17 out of 5. The median was 4 for most responses, with a 3 for “manage change”, “focus and plan the future” and “make decisions”. Minimum was 1 and maximum was 5 for all responses.

The two open questions produced many direct quotes from the respondents. Here is what respondents said: The question: **“Do you prefer Networks in person to Digital Networks like Facebook, LinkedIn, and Twitter?”** was answered as follows:

201 prefer networks in person, 57 respondents prefer digital networks, 12 say both are important. Respondents who say both networks are important, have no preference, as both have advantages and disadvantages. Here is what some of the respondents said:

“I use both – they both have their advantages and disadvantages, preferring the personal contact that allows me to use also “other channels” than the digital way.”

“I believe that it may be important to distinguish between a) being introduced to the network or creating a network and b) the consequent network contact. If a) then I would prefer networks in person since I get a better sense of other people by seeing them in person and talking to them face-to-face. But if it is an ongoing network with people who I already “know” then it really doesn’t matter”.

“I prefer to better know the people in my network – by meeting them I can assess their knowledge, motives, trustworthiness and the quality of the information we can exchange. Digital networks have the potential to be less trustworthy and potentially less useful. The best solution is combination of networks that provides opportunities for face-to-face contacts and digital network contacts.”

Respondents who prefer “networks in person” argue: Networks in person are based on a personal relationship, the relationship is real, not artificial, eye contact is important, high confidentiality, people contact, private contact, personal contact, I am close to the person, to the other people, there are confidentiality issues with digital networks, trustworthiness of the information, lower risk of distribution of negative rumours, security, trust, better communication, better understanding, better interaction, it is our habit, my expectations are met, confidential information is kept among few insiders, to talk is always better to avoid misunderstanding, face-to-face is better, because you can see the behaviour of the person, The body language is important. There is no body language in digital networks, Greater honesty and more substantial conversation than in digital networks, I can see the emotions of my contact. You cannot see emotions in digital networks, besides emoticons ☺ ☹ , exchange of emotions, of trust, spending time together, team building activities, reliability of the source of information. Here what some respondents say:

“The private, personal contact with people facilitates the building and the maintenance of

relationships.”

“Networks such as Facebook, LinkedIn and Twitter are extremely easy to join and therefore get logged up with people joining in on a whim or “just in case”. Personal networks require more personal investment and therefore are entered into more selectively and with more thought as to their relevance and benefits.”

“Digital networks cannot replace personal contact.”

Issues with networks in person are: there are obligations with networks, there are expectations in networks, and networks are time consuming.

Reasons why respondents would prefer “digital networks” are: Easy accessibility of information, low cost, diversity of information, speed of access and publication, flexibility, efficiency, and digital networks are an easy way to have access to private lives.

One respondent says:

“I do not network a lot but, I prefer digital networks if I need to find a piece of information since it provides the access. It is low cost, fast, and diverse and in most circumstances it does not hold any obligations.”

Issues with digital networks are: Confidentiality issues, misuse of trust, false expectations, digital networks are not my world, I am not member of Facebook, Twitter, etc., digital networks are lacking personal contact and therefore are less efficient, superficiality, there are pictures put on Facebook without the permission of the person in the picture, while digital networks are growing, personal contact is lost among people, digital networks are too time consuming, the quality of the information is not always given. Respondents say:

“Networking is convenient but sometimes causes troubles, especially when we connect with someone who we don’t know well.”

“I want nothing more than to be kept in peace. I keep contact with people with whom I want contact. That’s all.”

“Do you really know who you are networking with?”

“I am old! So, I am not used to digital networks, which also seem less rich in context.”

Is the preference for networks in person or digital networks a question of age? Will the younger generation be more reliant on digital networks? Or will the current trend of digitalisation be reversed due to abuse, espionage, and cyber-criminality? Will the future show us where the world will go? More and more digital contacts, faster, free of charge, always available, and everywhere accessible, is this the future? Or will we prefer deep private contacts without superficiality, but with trust, with honesty, with real friendships – far away from +500 Facebook friends – real experiences, events, parties, and relationships? Is the choice to be made between real life and digital life? Is it a matter of age or culture, or gender or education or job category, or nationality and languages spoken? Further research will be necessary to find an answer to these questions, as well as to the following questions: Have we reached the limitations of the digital world? Are we approaching the limits of the e-era, of e-recruiting, e-HRM, e-banking, and e-relationships?

CONCLUSION AND DISCUSSION

The findings of this research are: networks, a shared language and storytelling help the organisational advantage in microfoundations in international environments. **Networks** are strong among HR managers, with a preference to networks in person compared to digital networks. Networks are a big help to the organisational advantage in microfoundations because, first, they provide access to information, second they provide this information easily, in a flexible manner, and efficiently, and third, they are fast. The cost for this information is low, because of the network. Advantages of networks in person are trustworthiness, confidentiality, reliability, security, good communication, personal contact, body language, eye contact, exchange of emotions, spending time together, building teams, and honesty. Issues with networks in person are that there are obligations, expectations, and it is time consuming.

Advantages of digital networks are the ease of access to information, low cost, speed of access, flexibility, efficiency, and diversity of information.

Issues with digital networks are confidentiality, trust, the lack of personal contact and the perceived lack of information quality, and increased time devoted to using them.

Globalisation, the internet, knowledge management help the organisational advantage in microfoundations in international environments.

A **shared language** is important in social relations. It enables people to discuss and exchange information, to ask questions and to conduct businesses. Language is used as an identifier. It also creates group-specific communication codes and influences our perception, enables us to combine information, to develop new concepts and create new knowledge. If you do not speak the language,

you are not the “in-group”, but the “out-group”, you are kept apart and have restricted access to information. This is how a shared language helps organisational advantage in microfoundations.

Storytelling is a powerful means of SHRM. Storytelling enables the distribution and transmission of values, norms and culture. It is used to share knowledge and understanding and is useful in education and training. Storytelling allows people to communicate, inspires innovation, helps to solve problems and conflicts, to focus and plan the future, to focus on a vision and to take decisions.

It is proposed that networking, in person and in digital form, a shared language as identifier and storytelling are capabilities for shaping the future and success of microfoundations in international environments.

LIMITATIONS

The comparatively small sample size is a factor that threatens the generalisation of the findings, as well as the weak theoretical connection between SHRM, the use of networks, a shared language, and storytelling.

FURTHER RESEARCH

The main objective of this research was to investigate why networks, language and storytelling help organisational advantage in microfoundations. Survey questionnaires were used to determine the extent to which networks, language, and storytelling influence the success of microfoundations. Further research could focus on qualitative research methods, using more interviews, as well as the influence of new media and age. Interviewing could be of advantage to this research. Indeed, one interview was conducted for the purpose of this research, which validated the findings from the questionnaires. But, it was not included into this paper.

Further research could be made in the domain of new media, comparing digital networks to networks in person, raising the question of the influence of the age of the person on this preference. Furthermore, the limitations of e-HRM, of e-recruiting, e-learning could be the centre of interest in future research.

Another path of further research could be the possible negative outcomes of storytelling.

THE ROLE OF NETWORKS IN INTERNATIONALIZATION OF BORN GLOBAL INFORMATION TECHNOLOGY FIRMS: THE CASE OF SMES IN LITHUANIA

Sekliuckiene, Jurgita

Department of Strategic Management, School of Economics and Business, Kaunas University of Technology, Kaunas, Lithuania

ABSTRACT

This study explores the phenomenon of the born global firms and network as a core activity in internationalization process, especially for entrepreneurial SMEs from small countries. Study aims at filling the gap by providing a comprehensive empirical analysis on this issue in small Central and Eastern European country Lithuania. Despite limited resources that usually characterize new entrepreneurial developments, born global companies achieve substantial international sales in early stage and rapid internationalization, they are niche oriented and usually create innovations. Understanding the internal and external reasons which stimulate born global companies to be involved in international market and network role in the internationalization process were main research questions. Lithuanian SMEs information technology companies were investigated. In the article the internationalization motives are provided which influence the growth of Lithuanian born global information technology firms in terms of network and entrepreneurial quality. Finally, the research contributes to the phenomenon of born global firms and may be useful to SMEs reaching for a more successful penetration to foreign markets.

Keywords: *born global, networks, international entrepreneurship, information technology industry, Lithuania.*

INTRODUCTION

Because of the growth of international business integration and globalization, internationalization of services companies became as a necessity trying to remain and develop their business despite the size of firm, managed resources, and type of the activity. Also, internationalization process is becoming an important strategic element in reaching for sustainable growth of the firm. Relevancy of theory and practice are grounded on the possibility to explore preconditions of internationalization that enables susceptible to knowledge information technology firms. Those born global firms usually distinguish for entrepreneurial performance, ability to act internationally, and the influence of networks to them. In

addition, born global firms achieve good results by acting in networks. The research problem was analyzed by such scholars as Onkelinx and Sleuwaegen (2010), Johanson and Vahlne (2003) and others, who were exploring internationalization of MNEs. Internationalization stages were investigated by such scholars as Vasilchenko and Morrish (2011), Gonzalez and Sieglind (2012). Sheppard and McNaughton (2011) as well as Kontinen and Ojala (2012) are the researchers who were exploring factors that determine a rapid internationalization process of born global firms, models, and barriers. The biggest number of researches was done in the concept formation of born global firms; however, the information of the activity of this phenomenon, particularly the network among born global firms is missing. Over the last few years an increase of researchers and practitioners' interest in network influence to the internationalization of born global companies is noticed. The researches were done by Andersson and Wictor (2003), Autio *et al.* (2000), and Zhou *et al.* (2007). The researches are focused on entrepreneurial characteristics of born global firms from Scandinavian countries, Ireland, Israel, and USA. The research based on entrepreneurship on network processes was analyzed by Slotte-Kock and Coviello (2010). However the internationalization of born global Lithuanian firms and the role of network is quite a new subject requiring deeper analyses.

The research problem is supposed by fast changes, which determine that internationalization strategies of born global firms from emerging markets, as Lithuania is one of the emerging countries in Central and Eastern Europe. Therefore, network among born global firms, motives and barriers that condition decision making, and a search for new successful internationalization path are one of the most relevant scientific fields.

The research problem may be revealed by following questions: what are internal and external factors that stimulate the penetration of Lithuanian information technology firms to international markets? what are the external linkages of born global companies acting in networks? Aim of the article - to explore involvement of Lithuanian born global information technology firm in networks and what the role of networks is.

Due to the limited research in Lithuania on the topic, the systematic and comparative literature analysis and empirical approach to tackling this issue by applying a qualitative research of information technology companies were employed.

LITERATURE REVIEW

Although internationalization is an essential factor for the growth potential of born global companies, it is quite difficult process and requires a lot of companies' resources. Limitation of resources and experience as well as the possible risk to organization are the key factors disturbing the internationalization of SMEs. In spite of this, the number of born global within SMEs is constantly

increasing, these firms are successful in penetration to international markets, and their main characteristic is a rapid internationalization to foreign markets. Scientific literature provides a variety of firms which started their activities in international markets from the very beginning after the establishment, and these were called High Technology Start-Ups, International New Ventures, International Entrepreneurs. However, it is noticed that most of the scholars analyzing the performance of these companies describes them as Born Global firms (Knight and Cavusgil, 2004; Rialp *et al.*, 2005; Gabrielsson *et al.*, 2008; and others). According to Hagen *et al.* (2012), the increasing number of dynamic firms is noticed, which penetrate to international markets after a short period of their establishment, entering many foreign countries and lay under obligation to those countries. Such firms export their production up to 25% to the foreign markets (Andersson and Wictor, 2004). As Luostarinen and Gabrielsson (2006) state, at the beginning of their activities, born global firms sell up to 50% of their production outside their countries. In comparison with traditional firms, born global companies are more specialised and niche oriented with unique, innovative products that are either more custom made or more standardised (Dib *et al.*, 2010; Freeman *et al.*, 2012). They target a narrow customer segment, which might be geographically distributed (Aspelund and Moen, 2010). Born global firms see themselves as owning or possessing a source of competitive advantage in foreign markets by way of their expertise, unique product features, better technical service, knowledge competences or a combination thereof (Evangelista, 2005; Kudima *et al.* 2008). Born global companies usually work very entrepreneurial. International entrepreneurship of these companies associated with international oriented and experience, proactive, risk – taking behavior that crosses national border, level of technical and know-how knowledge (Dib *et al.*, 2010; Hartsfield *et al.*, 2008). The firm's entrepreneurial orientation contributes to its ability to create processes, practices, and decision making activities that are linked with successful entrance to foreign markets (Knight and Cavusgil, 2004; Roudini and Osman, 2012). The managers of firms that follow an international entrepreneurial orientation stress the importance of having a proactive and innovative approach to operating in international markets. This orientation in foreign environments supports a firm's awareness of key strategic initiatives that enable international success (Knight and Cavusgil, 2004).

According to Knight, Cavusgil (2009), and Halldin (2012), the origination of born global enterprises was stimulated by following aspects: 1) Advancement of technologies in production and transportation systems. 2) The enforcement to specialise in order to sustain competitiveness of the firm; it determined the emergence of many niche oriented markets. In order to function in niche oriented markets, firms had to increase the number of their customers by moving to global markets. 3) Advancement of information technology. 4) The advantages of small firms: better reaction, flexibility, adaptability. 5) Globalization based on knowledge, which eliminated many international trade barriers. 6) Trends in

the world networks, which formed because of advancement of information technology. In addition, for the use of social networks, born global firms are able to master global market information and effectively apply it to the business expansion. (Oviatt and McDougall, 1995; Freeman and Cavusgil, 2007; Hartsfiel *et al.*, 2008; Schulz *et al.*, 2009).

In the perspective of network theories, internationalization is associated with a creation of new networks and grounded on theories of dependency of social exchanges and resources based view (Johanson and Vahlne, 2003). Relationships among participants in network appear because of the aim to exchange valuable resources, and this interface continues until it is beneficial for both of the parties. When the network is already established, enterprises share among them all the works what means a dependency on each other (Sasi and Arenius, 2008). Gilchrist (2009) states that network is a movement and share of ideas, information, knowledge, practise and experience, and exchanges among members aiming at common interest of creating added value in a particular field. According to a provided definition, three key network elements may be exhibited: a common aim of the participants, collective relations, and operations in the network. The network of born global companies comprises of collective relations among firms and external members (clients, suppliers, business agents, competitors, universities, and other players), who could have an ability to propose something in exchange of something to other members of the network (Hite and Hesterly, 2001; Zhou *et al.*, 2007). Born global company may mobilize resources through external relationships to pursue its goals (Johansson, 2005). Entrepreneurial enterprises situated in a network of existing and to be formed relations with important upstream (e.g. suppliers, parent company), downstream (e.g. distributors, customers) and horizontal actors (e.g. competitors, alliances, universities,). These relations derive characteristics from the resource requirements of the company and as such also influence the growth of the firm in two important respects. Firstly by way of influencing the identification of opportunities, and secondly by influencing how the opportunities are acted upon and realized (Johansson, 2005).

Network theory stresses that networks help the firm overcome any resource constraints that they encounter; also provides better access to resources and international opportunities, and international network relationships reduce risk while entering foreign markets. Network is essential for a born global firm in overcoming any resource constraints that it encounters (Kocak and Abimbola, 2009). In the initial stages, born global firms leverage their networks to generate organizational skills and competencies, including technological capabilities (Cavusgil and Knight, 2009). Network relationships also generate the social capital that provides a better access to resources and international opportunities and the means by which to overcome the liabilities of newness and foreignness (Kocak and Abimbola, 2009). Therefore, after internationalization is well underway, managerial focus shifts to developing human resources to support further growth. Subsequently, the firm turns its emphasis to building its

client and distribution base. For born global firms networks are critical for generating social capital and provide for the acquisition, mobilization, and development of the needed resources (Cavusgil and Knight, 2009).

BRIEF OVERVIEW OF LITHUANIAN INFORMATION TECHNOLOGY INDUSTRY

Lithuanian IT services firms distinguish for their orientation to export markets. Several years ago Lithuanian firms were competing in foreign markets mainly for low labor costs. In the last years Lithuanian IT companies have been participating in the international exhibitions, have been creating clusters and high added valued products that are successful over the world. The results were increase of export volumes, emergence of new clients and increase of foreign investments to Lithuanian IT sector (Ivanovas, 2013). In 2012 the main export markets of Lithuanian companies provided IT services were Denmark (23,7 % of the total sector export; the value was 15 million Litass, 1 EUR=3.456 Litass), Singapore (respectively 16,6 % and 10 million Litass), USA (respectively 11,8 % and 7 million Litass), Finland (respectively 8,3% and 5 million Litass), and Germany (respectively 8,1 % and 5 million Litass) (Dovydenas *et al.*, 2012). Moreover, exports of computer and information services continued their steady growth in Lithuania. The export of IT services reached 114,2 percent in the period of 2010-2012, and exports took about 2.5% of overall country's exports in 2011 (Enterprise Lithuania, 2011). In addition, there is forecasted a fast export growth of IT services. Such a rapid growth of IT services export was mostly influenced by direct foreign investments to IT services sector. Finally, qualification of Lithuanian IT firms meets all the set requirements. That is shown by such companies as DeutchBank, which was provided of software by Alna Software, Nokia, which became a partner with a creator and producer of telecommunication products Teltonika, and Bentley Sytems, which works with Lithuanian programmers for twelve years (Penkios svarbiausios Lietuvos IT sektoriaus raidos tendencijos, 2013).

METHODOLOGY

The empirical research aim was to explore factors affecting companies' internationalization and companies international entrepreneurship; the importance of partnership and network in born global companies activities. Based on relevant management literature described earlier, the investigation dimensions were identified: stimulation of the origination of born global enterprises and internationalization motives and assesment of the the role of network as the core activity in value creation. The following specific objectives (SO) have been formed:

SO1: to identify the motives that have impact on involvement of the born global firms in international activities and international entrepreneurship. Such exploratory variables were explored: external and internal factors, affecting the beginning of international activities.

SO2: to assess the external relations and the role of network in born global companies activities. The research criteria were investigated: profile of main partners and the external linkages between horizontal, upstream and downstream actors, sustainability of collaborations, partner finding methods, scale and scope of the networks, benefits of being involved in networks and barriers to networking.

On the ground of Lithuanian Statistics Department (2013) 2185 firms belonged to Lithuanian IT sector in 2012. Small and medium sized enterprises were the predominant ones in IT sector and comprise around 84% of all IT firms. IT enterprises are united by Infobalt Lithuania association, which is a locally and internationally recognized representative of Lithuanian ICT industry. Infobalt Lithuania cooperates with the state institutions of Lithuania and other partners. Association is a member of Digital Europe and World Information Technology and Services Alliance (WITSA), international ICT industry organizations. Based on the data of the association, around 150 Lithuanian IT enterprises are exporting on a regular basis. Other firms are limited to the local market or export their production to foreign markets occasionally.

The research sample was 28 companies (E1, E2, E3, ..., E28) that were selected from Infobalt Lithuania database, accepted to be surveyed by using an interview. Such criteria for choosing the respondents for qualitative research have been selected: 1) the company should be involved in international activities; 2) income derived from foreign markets includes more than 25 % . The semi – structured questionnaire has been developed and content analysis has been made. Selected companies agreed to participate in an hour-long semi-structured interview. The approach allowed the researcher to ask supplementary questions. The organisations chosen for the collection of qualitative information through semi - structured interviews are listed in Table 1.

The sample is not representative for the population, but it is significant if compared to IT companies that started their international activities in the first three years from their establishment. Some of interviewed companies were not actively involved in other international networks and it is another limitation to research.

Enterprise	Number of employees in Lithuanian SMEs company / number of employees in foreign subsidiaries*	Year of establishment	The beginning of international activities	Sales in foreign markets, approx. (%)
E 1	10/0	2009	2009	70 %

*Size of the company estimated by number of employees, when micro sized enterprise has 1- 9 employees, small sized has 10 – 49 employees, medium sized has 50 – 249 employees, large sized more than 250 employees (Law on Small and Medium Business Development, 2010).

Table 1. *Sample characteristics: Lithuanian information technology born globals*

Characteristic data of the surveyed companies revealed that the majority of the companies are micro sized: 11 companies involved in the research have up to 10 employees, 8 companies small sized, and have from 14 to 50 employees, other surveyed medium sized companies have up to 80 employees, and only one company has 210 workers. The survey was carried out in April – May 2013.

RESULTS

SO1: to identify the motives and factors, that have impact on involvement of the born global firms in international activities. Managers of the SMEs companies that took part in the research have pointed

out that they work in the markets of European countries, USA, Asia, and Africa. Information technology services are mainly exported to USA, Latvian, and German markets. These markets are attractive for Lithuanian IT companies due to diversification of the business risk, protection from national currency depreciation, opportunities of involvement in international networks by offering an innovative product which is being created by the cluster of Lithuanian IT firms.

Main motives which push born global companies to act quickly in international markets are risk distribution and small Lithuanian market, in which companies do not have a possibility to expand their business and to find a segment of the market for provided services: *"In Lithuania there was no market which can be oriented for service", "<...> the Lithuanian market is too small for us", "<...> in Lithuania we did not find our market segment"*. The aim to foothold in foreign markets for Lithuanian IT sector companies is not so important, and the least important thing – competitors operating in the local market.

The external factors compared with internal ones do not have a significant impact on the international start-up activity and entrepreneurship of Lithuanian born global IT companies. The worst impact on firms has information technology spread, which may be considered to contribute to accelerating firm's presence in the foreign markets, their ability to compete with much larger companies. Partnership also affects company's internationalization. It can be seen that networking and cooperation with partners for Lithuanian born global IT sector companies provides valuable knowledge and makes it easy to start-up internationally, predisposes joint-ventures start-up. Partially, the beginning of the international activities of the enterprise is driven by increasing competition in the international market. The managers of companies mentioned that accelerating development of information technologies leads to greater support of non-financial public institutions, and as a result companies are learning on their own more often. An accelerating pace of information technologies predisposes born global IT sector companies to connect to networks.

Lithuanian IT sector companies collect information about the customers, competitors and service sales systematically. Only few companies in foreign markets perform market research in foreign countries due to the high costs. Company's decision making are mostly influenced by the international environment. Cooperation with partners and network as well as local market influence strategic decisions only partially. The biggest part of Lithuanian IT sector companies entered international market rapidly and immediately. These companies have entrepreneurial characteristics: the ability to respond rapidly to changing customer needs and environmental factors, ability to take risky decisions, interest in future forecasts. Results of the study shows that in several companies the income from international markets is almost 100%, and these companies are solely oriented to foreign markets.

SO2: to assess the external relations and the role of network in born global companies activities. Research results revealed that born global IT companies collaborate with various national and

international organizations. Most of the companies (25 out of 28) stated that they collaborate with foreign market (where their firms operate) companies: *"Our main partners are foreign companies. And we have lots of benefits from the cooperation with them"*. However many Lithuanian born global companies cooperate with Lithuanian firms (17 out of 28) operating in Lithuania. Managers of surveyed company noted that *"cooperation with Lithuanian organizations helps to compete abroad and we are cooperating with Lithuanian Business Support Agency, Enterprise Lithuania"*, *"<...>when a task-specific knowledge is needed, then we appeal to Lithuanian companies with necessary expertise for that"*.

Representatives of IT companies have stated that companies are cooperating with customers (13 out of 28) when providing service (*"Our customers are our partners, since cooperation with them improves our quality of services provided"*, *"<...> clients help us to figure out pros and cons of the services provided in the most efficient way"*, *"<...> in collaboration with clients we create new products"*). Horizontal cooperation with educational institutions and universities (12 out of 28) is useful, because *"collaboration with universities brings us considerable benefit. Cooperating with educational institutions we organize surveys, idea development workshops"*, *"<...> we are taking various projects in collaboration with universities, and it brings benefits to both the company, students and university. One of our main partners is Kaunas University of Technology with an innovative platform, start-up space and variety of technological solutions and services"*.

The most popular partner finding method of SMEs companies is Internet (16 out of 28) and the recommendations of friends and acquaintances (16 out of 28). The surveyed managers of IT companies noted, that *"first of all, we are looking for partners we could collaborate with; then, we are searching for contacts of those firms on Internet, and finally, we are trying to make acquaintance of them"*, *"<...> when I want to collaborate with someone, I ask my colleagues and friends for recommendations or necessary contacts, and only then I begin to search for it through other channels"*.

The active search is performed in Lithuanian institutions, which provide business support and affiliate search engines. Enterprise Lithuania is one of the main founding partners of Startup Lithuania movement which promotes the development of new entrepreneurial companies and their business acceleration (www.startuplithuania.lt/) by involving them in specialized events, supporting in finding investors, providing trainings and consultations. For the SMEs companies investment may be the gate opener to the international markets because trade channels can be formed through the new partner network and using their experience, specific knowledge of the market. The managers mentioned that *"in the partner search database the provided information allows to select the firms easier and faster to whom might be able to cooperate"*, *"<...>the best way for us to find foreign partners we might collaborate with is through the partner search database provided by Association of Lithuanian Chambers of Commerce, Enterprise Lithuania, Startup Lithuania"*.

A part of Lithuanian born global IT sector companies is looking for partners in international exhibitions, fairs and conferences. The analysis of the study showed that majority of the surveyed companies participate in the association Infobalt Lithuania activities, however in other international networks participate only 15 out of 28 surveyed subjects. 3-7 companies are usually running in the network. The few companies are involved in network with 14-15 firms: upstream actors (suppliers), downstream actors (distributors, customers) and horizontal actors (competitors). Companies adapt and align their networks to gain the resources they need to ensure successful emergence and growth. Partnership with strong foreign companies is substantial. Strong partner which actively participate in an international network provides the access to necessary resources, skills and competencies. Such activities which are being developed between network partners were identified: knowledge sharing (26 out of 28), experience (21 out of 28), creation and production of innovative products (14 out of 28), consolidation in the foreign markets (13 out of 28), research and development activities (7 out of 28), costs sharing (2 out of 28). The managers mentioned: *„While collaborating, not only we transfer our knowledge to partners, but also we get a lot of information from them which is useful for our activity”, „We often arrange meetings where we are able to share our knowledge with partners because that is a way to improve firm performance”, „In order to avoid mistakes that were done by us or by our partners, it is important to share the experience”.*

Acting in the network with other companies, Lithuanian IT sector companies gain a competitive advantage on the local and foreign markets. The effect of network promotes and stimulates innovation, which is very important in order to maintain a competitive advantage in the local and foreign markets: *“In cooperation with business firms we gain experience which is applied in reality. Our position in the foreign markets is consolidated by the network”, „<...> acting in networks let us to get useful information from professionals of different fields as well as to share our ideas with them”.*

The interviewed managers have agreed that cultural attitudes are main barriers that influence the development of international networks and social capital. Communication disturbance because of unclear information or information abundance have been named as main barriers by most respondents (*„<...> information abundance may result in reduction of relationships with partners; although the information may be of a high importance, because of the large amount of information it is not always read on time”, „<...> at the early stage of cooperation it is usually difficult to understand partners as the manner of communication is different as well as the ways of exchanging information”). At the beginning of international business activities many firms confront with language barrier described as follows: „As soon as we began to collaborate with foreign partners, we faced a language barrier as it was quite difficult to understand the accent of employees”, „<...> at the early beginning, employees were not good at spoken English and it was not*

so easy to communicate with partners face to face". Finally, the collaboration is not enhanced because of unobtainable tasks and results that are planned with partners, and steady adjustments to the partners.

CONCLUSION

The data of the empirical research revealed, that internationalization of Lithuanian born global information technology firms is determined by external (IT development, partnership, and network) and internal factors (manager's knowledge and skills, firm's innovation, unique services) which become catalyst for motives to emerge. The accelerator of internationalization becomes the effect of network and partnership support between born global companies and their partners. In some cases the partner is university. University's innovation centres or start – up spaces works like platforms for new entrepreneurial firms, providing them with support, knowledge and infrastructure. The part of the surveyed companies usually has the network of 14-15 national and international business firms, upstream, downstream and horizontal actors. It is important to have a strong partner which could access to new partners in networks and provided necessary resources for the development of new products seeking the growth and the development of Lithuanian born global company. The company's position in international markets is strengthened by network with different institutions, international associations. It also enhances cooperation between enterprises, development and implementation of new projects, customer search; provides an opportunity to share knowledge and experiences, and to learn from the partners. However, the part of the surveyed Lithuanian information technology firms is not involved in the international networks. There are several possible explanations for that. Firstly, Lithuanian government and universities started to actively promote entrepreneurial star-up activities only few years ago. During the last two years there were lots of start-up events, conferences, workshops, IT business missions which were very successful. These events encourage young entrepreneurs quickly start international activities. The multinational players entering the market like Barclays, Western Union, and IBM impacted on the costs of human resources, and competitiveness of Lithuanian SMEs. Nevertheless, this reason might be as an accelerator in the nearest future. Highly qualified employees with work and network experience in multinationals might start to run their own SMEs business. This finding suggests a necessity of further research on international entrepreneurial orientation in information technology industry and network development of Lithuanian born global issues. The further research could be enriched with comparison between different types of businesses: micro, small and medium sized enterprises.

ABSTRACT

Agricultural Cooperatives maintain an important position in food supply chain. However, their role, nowadays, in Greece has languished for several reasons. One of them is the lack of strategy. This problem is connected with the difficulty of applying appropriate competitive methods. The situation becomes even more difficult for cooperatives if we consider that they have to compete with dynamic private food businesses. This paper attempts to identify differences in the strategic orientation of agricultural cooperatives and private food firms established in the Northern part of Greece. Thirty five private food firms and 29 agricultural cooperatives were participated in the current study. Data were collected by means of a questionnaire aimed to evaluate 21 methods of strategic orientation on a seven point Likert type scale. Principal Component Analysis was performed to identify strategic orientations. The empirical findings support that these organizations adopt seven strategic orientations (Axis1: Strategic orientation of marketing focus, Axis2: Product Customization, Axis3: New Products, Axis4: Expansion and Efficiency, Axis5: External funding and pricing, Axis6: Product quality focus, and Axis7: Resources and Production). However, cooperatives differ significantly from private firms in two of them capturing elements of marketing focus and new products. As such, the former remain traditional and cost-oriented without innovative elements while the latter invest in differentiation and focus strategy, trying to become more innovation driven. Based on the particular findings, practitioners and policy-makers advance their knowledge on how organizations within the food sector of a European country, namely Greece, establish their basis of competitive advantage.

Keywords: *competition, generic strategies, agricultural cooperatives, food firms*

INTRODUCTION

Strategic orientation is the competitive actions or the overall orientation that a firm adopts in the market in order to become more competitive (Zheng, Yang and McLean, 2010). It is an extremely important weapon for firm policy and operational decisions as it describes the direction that a firm should follow in order to achieve its goals as well as the potential alternatives to change its performance (Philipsen, et al., 2013). Cooperative firms are no exceptions to this principle. Their performance cannot be adequately measured unless evaluated in the context of strategy options and the strategies actually pursued by them (Kalogeras et al., 2005).

Porter's typology (emerged in 1980) seems to be the most popular paradigm in the literature on business strategy. According to his original model of distinctive generic business-level strategies, there are four different strategies (differentiation, low cost, low cost focus, and differentiation focus strategy) which determine how a firm develops an advantage with respect to competitors in the same industry or in similar market environments along with the relative merits in terms of performance outcomes. Although Porter did not coin the terms cost leadership and differentiation, he first discussed the importance of choosing and focusing on one of the alternatives (Dess and Davis, 1984).

In Greece, the majority of the agricultural cooperatives prefer competitive methods based purely on competitive pricing *"make the product and sell it"* than the differentiation strategy *"choose the value, provide the value and communicate the value"* (Kalogeras et al., 2005). However, this strategy is no longer considered the best practice for the Greek food sector which should focus on the optimization of the product added value in order to produce legitimate economic benefits for cooperative members (Baourakis et al., 2002).

Based on the above, the current study examines the competitive methods that follow 35 private food firms and 29 agricultural cooperatives in Northern Greece. The objectives of the study are: 1) to uncover the dimensions of the strategic orientations adopted by the sampled organizations, 2) to compare the private food firms and agricultural cooperatives relative to the parts and the dimensions of their strategic orientations, and c) to develop two typologies (one for private food firms and one for agricultural cooperatives) concerning the dimensions of their strategic orientations. This empirical study contributes to the research on generic strategies in several respects. First, it enhances the empirical evidence on competitive methods and generic strategies within Europe. The use of data from a European country, namely Greece, constitutes a contrasting example that projects a view beyond the US context, which dominates the literature (Salavou and Sergaki, 2013). Second, this study underlines differences in the competitive methods of agricultural cooperatives (29) and private food firms (35) established in the Northern part of Greece and provide vital evidence at the national level (the food sector is of great importance for the Greek economy).

RESEARCH FRAMEWORK

According to Porter (1996, p. 68), “*Strategy is the creation of a unique and valuable position, involving a different set of activities*”. The meaning of strategic positioning is to choose those activities that yield superior profitability because there are different from rivals’ and consequently they create a sustainable competitive advantage (Minarik, 2007). Porter proposes three different approaches to strengthening competitive advantages: Overall cost leadership, differentiation, and focus. The first emphasizes on low cost relative to competitors. The second strategy requires that the firm creates something unique which permits the firm to command higher than average prices. The third strategy requires that a firm concentrates on a specific group of customers, geographic markets, or product line segments (Dess and Davis, 1984). All three strategies have important benefits for the firm.

Strategic orientations within an industry are represented by the views of the manager of the firm about the competitive methods that the firm uses. Porter (1980) recognizes that the strategies that companies use to compete in an industry can differ in a wide variety of ways, and he proposes a number of “strategic dimensions” that should capture the possible differences among the strategic orientation of companies in a given industry. These dimensions are comprised of competitive methods that include brand identification, channel selection, technological leadership, cost positioning, service and leverage, among others.

Dess and Davis (1984) developed a questionnaire with a 21 competitive dimension instrument in order to measure a firm’s strategic position in the context of Porter’s classification of topology and demonstrate the viability and usefulness of categorizing firms within an industry into strategic groups on the basis of their intended strategies. The study concluded that the three main strategy types were present and consistent with Porter’s contention that commitment to at least one of the three generic strategies will result in higher performance than if the firm becomes stuck in the middle. Furthermore, they found that the low cost cluster had the highest average return on total assets. The significance of the above mentioned study lies in both developing an instrument which could be used to depict a firm’s strategic orientation as well as in the establishment of the usefulness of the Porter typology in describing business level strategy.

Gilinsky et al. (2001) examined whether different strategies are associated with different firm sizes. The empirical results demonstrated that small firms focus on a well-defined customer group and serve local markets. Larger firms focus on responding to customer needs and new product, as well as in innovation.

Marques et al (2000) adopted the same 21-item competitive methods questionnaire of Dess and Davis (1984) and applied it in 12 Portuguese crystal industry firms. They discovered that the two groups of

firms with positive returns on equity pursued a cost leadership strategy based on efficiency of production and cost leadership strategy based on production innovation.

In Greece the evidence is limited. Only few empirical studies (Salavou et al., 2013; Papadopoulou et al., 2012) in the food sector examine the generic strategies that agricultural cooperatives and private food firms adopt in relation with their performance level. More specifically, Salavou et al. (2013) concluded that Greek agricultural cooperatives show greater proclivity for the low-cost focus strategy. The successful implementation of this strategy requires particular consideration to the organizational structure, management control and compensation policy of the cooperative. On the contrary, the private food firms emphasize on differentiation-based strategies. Finally, the choice of the appropriate generic strategy (pure or hybrid) is of vital importance for their economic viability. Papadopoulou et al. (2012) concluded that Greek agricultural cooperatives are mainly focused on specific geographic areas with low cost products (low-cost focus strategy). This attitude is in line with their preference to be followers (i.e., imitate competitors) rather than pioneers (i.e. innovate).

The preferences of the private food firms for market oriented strategies are in line with former empirical researches in Greece (Salavou, 2010, Salavou et al., 2009, Spanos et al., 2001). These researches also report on the association of strategies (pure and hybrid) with performance for firms competing either at home or in foreign markets. All of them conclude that the hybrid, and not the pure, is the dominant form of competitive advantage.

Salavou and Halikias (2009) investigated 82 Greek exporting private firms. They empirically examined types of exporting firms, strategy orientations and profitability of differential emphasis. Spanos et al. (2001) examined 147 Greek manufacturing firms, following the Dess and Davis' (1984) 21 competitive dimension questionnaire. Their findings indicated that together with strategies both industry and firm asset effects significantly contributed to firm success.

The current study tries to investigate the specific competitive methods that adopt 35 private food firms and 29 agricultural cooperatives in Northern Greece, in order to address the following question: Do agricultural cooperatives need to be as strategic oriented as private food firms? More specifically, strategic actions of firms and cooperatives, without a priori theoretical assumptions and settled general strategy axes were studied. Secondly, a typology of private food firms and agricultural cooperatives, based on their strategic "behavior" was performed.

Analyzing the strategic profile of the Greek Agricultural Cooperatives and Private food firms is extremely important for several reasons: Firstly, cooperatives constitute significant players with a long history in Northern Greece. Secondly, the food sector constitutes 17% of total number of the Greek enterprises, contributing 22% of total employment and 21% of annual turnover in the manufacturing

industry (Salavou et al., 2013). Thirdly, Northern Greece is dominated by isolated rural places with limited access to resources needed for survival or development (Salavou et al., 2013).

MATERIALS AND METHODS

Thirty five agricultural cooperatives and 72 private food firms, all of them established in Northern Greece, were approached for participating to the research. The final sample consisted of 64 organizations, including 35 private food firms (IOFs) and 29 agricultural cooperatives in Northern Greece. The response rate was 82.9% for the agricultural cooperatives and 48.6% for the private firms. Although the sampled organizations cannot be considered as a random sample, in the statistical sense, however it is a representative one because it includes almost the whole number of agricultural cooperatives in Northern Greece (29 out of 35) and a relative large and adequate portion of the private food firms. Data were collected during 2009 by a structured questionnaire through personal interviews with the top management, consisting mainly of general managers and sales managers. In order to pre-test the research questionnaire, the general managers of three agricultural cooperatives and three private food firms, not included in the final sample, were interviewed to ascertain the comprehensiveness and phrasing of the questionnaire items. The questionnaire included specific questions to evaluate 21 methods of strategic orientation on a seven point ordinal scale (1: not significant at all, 2: too little significant, 3: a little significant, 4: moderately significant, 5: significant enough, 6: very significant, 7: extremely significant), (see full list in Table 2). This measure is based on a 7-point Likert-type scale adopted by Dess and Davis (1984).

First of all an analysis of given answers was carried out using methods of descriptive statistics. Thereby we investigated the importance that firms of the sample are giving to the applied methods of strategic orientation. In order to satisfy part of the objective number 2, we used the Mann-Whitney test to determine the differences among all methods of strategic orientation between private and cooperative firms (at $P < 0.05$). Because of no previous experience and knowledge about how the methods of strategic orientation are linked we applied the Principal Component Analysis (PCA) method, with Varimax rotation, (Hair et al., 2010) on the total sample of private and cooperative firms. We expected that PCA would reveal structural components or dimensions of strategic orientation given the answers on the 21 questions. Answering to objective number 1, the implementation of this method revealed seven general strategic axes for the firms and the cooperatives of the sample: Axis 1: Strategic orientation of marketing focus, Axis 2: Product Customization, Axis 3: New Products, Axis 4: Expansion and Efficiency, Axis 5: External funding and pricing, Axis 6: Product quality focus, and Axis 7: Resources and Production.

The reliability and the internal consistency of the derived axes were examined by computing and evaluated the corresponding Cronbach's α (alpha) reliability coefficient and the average Discrimination Index (DI), respectively. Generally, values of Cronbach's $\alpha \geq 0.70$ and values of average $DI \geq 0.20$ are considered satisfactory (Nunnally and Bernstein, 1994). For each axis an average score per organization was computed as the mean value of the responses to the items that mainly load on the specific axis (Spector, 1992).

A series of Wilcoxon tests was applied to find the statistically most significant axes of strategic orientation. Then applying the Mann-Whitney test we statistically tested the differences between private and cooperative food firms relative to the seven axes of strategic orientation; these comparisons enabled us to fulfill objective number 2. In all hypotheses testing procedures involving the Mann-Whitney and the Wilcoxon tests the observed significance level (P -value) was computed with the Monte-Carlo simulation method, utilizing 10,000 re-sampling circles (Mehta & Patel, 1996). This approach leads to valid inferential conclusions even in case where the statistical and the methodological presuppositions of the Non-Parametric tests are not satisfied.

At a next stage, following Aggelopoulos et al. (2013) and in order to satisfy the objective number 3, the Hierarchical Cluster Analysis method was applied using as input variables the scores of organizations on the seven strategic orientation axes. The construction of the clusters was based on the Ward's criterion, while the square of the Euclidean distance was used to measure the (dis)similarity of the business units (Hair et al., 2010). Before entering the analysis, the input variables were transformed into z -scores. The validity of the cluster solution (results non shown) was tested by a methodological scheme proposed by Michos et al. (2012) and Zafiriou et al. (2012). The contribution of each strategic orientation axis in cluster formation was identified by examining the magnitude and the statistical significance of the corresponding R^2 coefficients of determination estimated by the application of a series of one-way ANOVAs; cluster membership was used as the independent variable and each of the seven strategic orientation axes as the dependent. The value of R^2 indicates the percentage of variance of the examined variable accounted by the differences between the clusters. Finally, for testing the ability of each strategic orientation axis in predicting the cluster membership we performed a Categorical Regression Analysis with optimal scaling (Meulman, 2003) cluster membership was entered in the analysis as the dependent categorical variable and the axes scores as the predictors. Categorical regression can accommodate nominal, ordinal, and scale variables. Nominal and ordinal variables are optimally transformed into interval variables. After this process, multiple regression analysis is applied to these transformed variables. All the statistical analyses were accomplished by the SPSS v.15.0 statistical package enhanced with the modules Exact Tests (for Monte-Carlo simulation) and Categories (for Categorical Regression).

RESULTS

For the first step of the analysis, each chief executive officer (CEO) was asked to rate the importance of each competitive method to the success of the economic organization's overall strategy. Further down, the questionnaires were separated into two groups (cooperatives and private food firms) and examined the CEOs' answers according to the competitive methods that they apply in their firm/cooperative. The 64 responses were initially analyzed using Principal Component Analysis. Table 1 presents the most important competitive methods that are used in private food firms and cooperatives in Northern Greece, based on the CEOs' evaluation of each competitive method's contributions to each economic organization's strategic orientation.

Methods of strategic orientation	Cooperatives		Private Firms		Mann-Whitney (<i>P-value</i>)
	Mean	Std. Deviation	Mean	Std. Deviation	
E1: Development of new products	3.90	1.8	5.11	1.4	0.003
E2: Customer service	6.38	0.8	6.57	0.8	0.168
E3: Operating efficiency	5.79	1.0	5.97	1.0	0.425
E4: Product quality control	6.17	1.0	6.60	0.6	0.048
E5: Experienced/trained staff	5.66	1.1	6.20	0.8	0.046
E6: Maintain a high level of stock	4.01	1.9	4.60	1.7	0.207
E7: Competitive pricing	5.83	0.8	5.20	1.2	0.015
E8: Wide range of products	4.97	1.5	5.20	1.2	0.609
E9: Improvement of existing products	5.33	1.3	5.74	1.1	0.156
E10: Establishment of brand name	5.51	1.4	6.14	1.0	0.047
E11: Change in technical and marketing methods	4.16	1.4	4.81	1.5	0.075
E12: Change in production processes	4.23	1.5	4.83	1.8	0.088
E13: Distribution channels control	4.14	1.6	5.83	1.3	<0.001
E14: Sourcing	4.98	1.7	4.04	1.7	0.015
E15: Minimization of use of external funding (from outside)	4.25	1.7	4.33	1.7	0.777
E16: Serve specific geographic areas	4.82	1.6	4.74	1.5	0.773
E17: Expansion in new markets (geographic or product)	4.70	1.4	4.23	1.5	0.218
E18: Ability to produce specialized products	3.78	1.9	4.83	1.7	0.025
E19: Products in market segments with high pricing	3.22	1.8	6.00	1.3	<0.001
E20: Advertising	4.17	1.5	5.63	1.3	<0.001
E21: Industry reputation	5.22	1.2	5.54	1.4	0.285

Table 1. Importance of the methods of strategic orientation: Cooperatives vs Private Firms

Regarding the Cooperatives, the statistical analysis revealed that the following competitive methods were viewed as most critical to the achievement of strategic success (Table 1): “Customer service” (6.38), “product quality control” (6.17), “operating efficiency” (5.83), “competitive pricing” (5.79), “experienced & trained staff” (5.66) and “improvement of existing products” (5.33). The lowest rated competitive methods that contribute to organizational strategic success included the “development of new products” (3.93), “ability to produce specialized products” (3.78) and “promotion of products in market segments with high pricing” (3.22).

Regarding the Private Food Firms, the following competitive methods were viewed as most critical to the achievement of strategic success: “product quality control” (6.60), “customer service” (6.57), “experienced and trained staff” (6.20), “establishment of brand name” (6.14), “products in market segments with high pricing” (6.00), as well as on “operating efficiency” (5.97). The lowest rated competitive methods that contribute to organizational strategic success included: “minimization of the external funding” (4.33), “expansion in new markets” (4.23) and “resourcing” (4.04). Table 1 reports the statistical significant differences among competitive methods for private and cooperative food firms. Then we tested all the differences among methods of strategic orientation between private and cooperative food firms, using Mann - Whitney test (Table 1). In particular, private and cooperative food firms differ in the following methods: “Development of new products”, “product quality control”, “experienced/ trained staff”, “competitive pricing”, “establishment of brand name”, “distribution channels control”, “resourcing”, “ability to produce specialized products”, “products in market segments with high pricing”, and “advertising”.

Table 2 presents the main results of PCA and Item Analysis. Only loadings >0.50, in absolute value, are presented for better interpretation. The Principal Component Analysis revealed seven axes of strategy which explain 72.2% of the total variance (Table 2).

The *first axis* (F1) explaining 25.2% of the total variance, refers to the adoption of the following methods: E16 “servicing specific geographic areas”, E21 “industry reputation”, E11 “change in technical and marketing methods”, and E20 “advertising”. The reliability and the consistency of this axis was measured respectively by the indices: Cronbach’s alpha (0.79) and average Discrimination Index (DI) (0.59). The average score of this axis was 4.9. So this axis could be named as “Axis of marketing strategy and functions”.

The *second axis* (F2), labeled product customization explaining 11.0% of the total variance, is associated with the questions E8 “wide range of products”, E18 “ability to produce specialized products”, and E2 “customer service (Cronbach’s alpha=0.76 and average DI=0.39). The average score of this axis was 5.3. The *third axis* (F3), labeled *new products* explaining 9.4% of the total variance, consists of four competitive methods: E1 “development of new products”, E5 “experienced/ trained staff”, E13

"distribution channels control", and E₁₉ "products in market segment with high pricing" (Cronbach's alpha=0.74 and average DI=0.55). The average score of this axis was 5.1. So it could be characterized as "*Axis of orientation to the specialized products of high added value*".

The *fourth axis (F₄)*, labeled *expansion and efficiency* explaining 8% of the total variance, is linked with the following two competitive methods of strategic orientation: E₃ "operating efficiency" and E₁₇ "expansion in new markets (geographic or product)". So it could be called as the "*Axis of expansion and efficiency*" (Cronbach's alpha=0.75 and average DI=0.38). The average score of this axis was 5.2.

The *fifth axis (F₅)*, labeled *external funding and pricing* explaining 7.1% of the total variance (Cronbach's alpha=0.71 and average DI=0.35), is associated with the following two methods of strategic orientation: E₇ "competitive pricing" and E₁₅ (minimization of use of external funding). The average score of this axis was 4.9.

The *sixth axis (F₆)*, labeled product quality focus explaining 5.8% of the total variance, consists of two competitive methods: E₄ "product quality control" and E₉ "improvement of existing products" (Cronbach's alpha=0.72 and average DI=0.50). The average score of this axis was 6.0.

Finally, the *seventh axis (F₇)*, labeled resourcing and production explaining 5.3% of the total variance, is associated with the following two methods of strategic orientation: E₁₂ "change in production processes" and E₁₄ "resourcing" (Cronbach's alpha=0.75 and average DI=0.38). The average score of this axis was 4.5.

After creating the axes for applied methods of strategic orientation, it is observed that axes with higher importance are the following: F₆ (control and improvement of product quality) with average score 6.0, F₂ (product and customers) with average score 5.3, and F₄ (expansion and efficiency) with average score 5.2. According to a series of Wilcoxon tests the axis F₆ was the most significant ($P < 0.001$ in all comparisons) and the axis F₇ the least significant ($P < 0.05$ in all comparisons). Observing Table 3 the researchers conclude that the differences in strategic orientations are statistically significant in only two axes, namely the marketing focus (F₁ axis) and new products (F₃). Both axes comprise competitive methods of the "differentiation" strategy.

According to the Principal Component Analysis as well as the Mann-Witney test, cooperatives are more cost-oriented (they mainly choose competitive pricing and resourcing). On the contrary, private food firms are more marketing and innovation oriented (they choose the following methods: development of new products, product quality control, experienced/ trained staff, establishment of brand name, distribution channels control, production of specialized products, products in market segments with high pricing as well as advertising).

The analysis of the results reveals that the competitive methods of cooperatives in Greece belong to the cost leadership strategy. On the other hand, private food firms apply competitive methods more of

“differentiation” strategy and less of the “differentiation focus” generic strategy. Earlier empirical result (Salavou, 2010 on Greek firms of the services sector implies that the hybrid form of competitive advantage, which places high emphasis on low cost, is the prevailing and the best-performing strategic choice. In a related vein, evidence from Greek manufacturing private firms (Spanos et al., 2004) shows that pure generic strategies are less profitable than hybrid strategy combinations. Consequently, regarding the need of cooperatives for innovation and marketing techniques, they should leave pure strategy and gain more “hybrid” strategic orientation, combining competitive methods from both generic strategies in order to become more competitive. *Methodological Note for PCA*: The minimum sample size needed in PCA (in order to achieve stability of the results) is an extremely controversial issue. It is affected by many factors such as the communality of the variables, the ratio of the number of components to the number of variables and the size of the components’ loadings. According to Preacher and MacCallum (2002) and MacCallum et al. (1999) as long as the communalities of the variables are high >0.60 (smallest communality in our data 0.61, data not shown), or the average communality to be at least 0.70 (0.72 in our case). the sample size is not so crucial. Based on the above discussion the sample size used in the present study is statistically adequate. Hierarchical Cluster Analysis revealed three clusters (Table 4): cluster E1 which includes 14 cooperatives (48.3% of the total sample), E2 which includes 8 cooperatives (27.6% of the sample), and E3 which includes 7 cooperatives (24.1% of the sample).

Table 3. Differences in strategic orientations between Cooperatives and Private Firms

According to Table 4, cluster E₁ includes cooperatives with higher values in strategic axes F₁ “Axis of marketing strategy and functions”, F₂ “product customization”, F₅ “external funding and pricing”, F₆ “product quality”, F₇ “resourcing and production”, and lower values in axes F₃ “new products” and F₄ “expansion and efficiency”. Cluster E₂ includes cooperatives with low values in all the studied strategic axes. Cluster E₃ consists of cooperatives which appear to have the higher values in all the studied strategic axes. According to the values of R^2 the strategic axes F₃, F₄, and F₇ had the higher contribution in cluster formation. Relative Importance index indicates that strategic axes F₃, F₇, and F₁ had the higher predictive ability (for cluster membership prediction).

Table 4. Cooperatives' clusters profile relative to the average scores of the seven strategic axes

Hierarchical Cluster Analysis also revealed three firm clusters (Table 5): cluster G₁ which consists of 11 firms (31.4% of the total firms participating in the study), G₂ which includes 12 firms (34.3%), and G₃ which also includes 12 firms (34.3%). According to Table 5, cluster G₁ consists of firms with the higher values in all the studied strategic axes. Cluster G₂ includes firms with moderate value in strategic axis F₁ “Axis of marketing strategy and functions”, F₃ “new products” and F₅ “external funding and pricing”. Firms in cluster G₂ have high values in strategic axes F₂ “product customization” and F₆ “product quality”, and low value in F₄ “expansion and efficiency” and F₇ “resourcing and production”. Cluster G₃ includes firms with low values in all the studied strategic axes.

+ K-W: Kruskal-Wallis test *P* value. ^a For each strategic axis mean values followed by different boldface exponential letter are statistically significant different at *P*<0.05, according to a series of Mann-Whitney tests.

Table 5. Firms' clusters profile relative to the average scores of the seven strategic axes

According to the values of *R*², the F₃, F₆, and F₄ strategic axes had the higher contribution in firms' cluster construction. Relative Importance Index indicates that the strategic axes F₃, F₄, and F₅ had the higher predictive ability (for cluster membership prediction).

A comparison between firm and cooperative overall performance indicated a significant difference (at *P*<0.05, according to a Mann-Whitney test), meaning that firms overall performance (mean score=5.2) is higher compared to cooperative performance (mean score=4.5).

CONCLUSIONS

Research efforts have yielded so far empirical evidence in support of a positive "strategy-performance link" which implies that strategy and performance are positively correlated and that strategic orientation generates competitive advantage (Minarik, 2007, Miller and Friesen, 1986).

The main issue this study raises is whether agricultural cooperatives need to be as strategic oriented as private food firms. The empirical findings of this study confirm that agricultural cooperatives need to be as strategic oriented as private food firms (in a pure or hybrid form) to sustain competitive advantage (either based on cost or on differentiation). The competitive methods of "differentiation strategy" will help cooperative to consolidate its competitive advantage and survive in the hypercompetitive market. In particular, the empirical evidence provided here identifies differences in

the strategic orientation of 64 organizations – 35 private food firms and 29 agricultural cooperatives-established in the Northern part of Greece. Although these organisations adopt seven strategic orientations, cooperatives differ significantly from private firms in two of them capturing elements of marketing focus and new products. As such, the former remain traditional and cost-oriented without innovative elements while the latter invest in differentiation and focus strategy, trying to become more innovation driven.

The particular results corroborate prior evidence in Greece (Salavou et al., 2013, Papadopoulou et al., 2012) claiming that agricultural cooperatives sustain a more conservative approach towards cost cuttings. However, the successful implementation of this strategy requires particular consideration to the organizational structure, management control and compensation policy, which in great extent lack from cooperatives. Furthermore, the cost-oriented strategy is in line with their preference to be followers (i.e., imitate competitors) rather than pioneers (i.e. innovate).

The preferences of the private food firms for market oriented strategies are in line with a former research of Salavou and Halikias (2009) in 82 Greek exporting private firms. They empirically examined types of exporting firms, strategy orientations and profitability of differential emphasis. They found out that firms that strongly emphasize on marketing competitive methods (i.e. brand identification, control of distribution channels, innovation in marketing techniques/methods and advertising) achieve a higher export profitability level than firms placing the greatest importance on low cost competitive methods (i.e operating efficiency, competitive pricing and minimizing use of outside financing). Literature on agricultural cooperatives worldwide (Nilsson et al., 2007, Kalogeras et al., 2005), also supports that marketing oriented cooperatives are more competitive than those who advance low-cost drivers to gain a profitable cost leadership position in the market.

This empirical study contributes to the research on generic strategies in several respects. First, it enhances the empirical evidence on competitive methods and generic strategies within Europe concerning the extent to which firms pursue Porter's generic strategies or combinations of them. Second, this study builds on limited work related to the applicability of Porter's typology to private firms and agricultural cooperatives competing in the food sector in Greece (Salavou et al., 2013, Papadopoulou et al., 2012, Salavou, 2010, Salavou et al., 2009, Spanos et al, 2004; Spanos et al., 2001), advancing thus our knowledge of the differences in the competitive methods that they follow (the food sector is of great importance for the Greek economy). Overall, our findings point to tangible implications for practitioners in one European country namely Greece, but could have a wider appeal, provided that these findings are confirmed in comparable national contexts within the EU. In addition, as we have mentioned earlier the scientific evidence from Greece is very limited. Data and

results from the current study could be proved very useful for future comparisons as they have been collected before Greek economic crisis.

First, sustaining a competitive advantage based strictly on cost might create obstacles and it hinders the exploitation of competitive methods reflecting differentiation elements. The managers are advised to carefully select their competitive methods without excluding some elements of “differentiation strategy”, because there are very important for firms operating in a hypercompetitive era. Third, if we consider that private firms are more competitive than agricultural cooperatives in Greece, we would suggest to the managers of cooperatives to consider some successful private food firms as examples of “best practices”. This would suggest to adopt a more marketing driven orientation and/ or alternatively to combine competitive methods of “low cost” strategy” with competitive methods of “differentiation” strategy in order to change their profile and become more competitive. Finally, results from typology strategies revealed significant differences among cooperatives, indicating higher competitiveness and policy development strategies.

ECONOMIC EVALUATION OF SHORT-TERM DECISIONS IN WINEGROWING FARMS

**Sgroi, Filippo; Di Trapani, Anna Maria; Squatrito, Riccardo; Testa, Riccardo; Tudisca,
Salvatore**

Department of Agricultural and Forestry Sciences, University of Palermo, Italy

ABSTRACT

The majority of small sized Sicilian winegrowing farms are placed in the first part of the supply chain. In this way they are subjected to the grapes prices fixed by the wineries, becoming price takers. This situation determines marginal revenues lower than average costs and in short-term a reduction of farmer income that it can allow to farm bankruptcy. In this context farmer should adopt economic strategies in order to obtain higher profit in a more and more competitive market. The aim of this paper is to understand whether, decreasing labor cost in short-term by means of process innovation, average costs of small sized Sicilian winegrowing farm do not exceed marginal revenues.

Keywords: *Average cost, competitive advantage, marginal revenue, profit.*

INTRODUCTION

The choices that an entrepreneur can make to achieve a competitive advantage may be short and long-term. This distinction is crucial as in the short term the entrepreneur can act only on variable production factors (Begg et al., 2011). In the short term, it is difficult to radically change the production process or the production orientation of an enterprise. These choices are indeed strategies better implemented over the long term. Therefore, given a combination of production factors, the entrepreneur can only modify the input affecting business productivity (e.g. by increasing the amount of fertilizer), or decide to act on any input allowing to lower production costs such as those relative to labor (by mechanizing a given agricultural operation thereby increasing the productivity of the labor factor). These choices become fundamental for an entrepreneur who operates in a market where average cost is higher than marginal revenue (Messori and Ferretti, 2010; Schotter, 1995). In fact, in this situation the enterprise produces a loss for each unit of product. To offset this situation, without altering the whole productive structure of the company, the entrepreneur may introduce process innovations that enable him/her to drive down the average cost below the marginal revenue, thus producing a profit (Tudisca et al., 2013a). This situation can be maintained as long as competitors do not imitate this strategy (Tudisca et al., 2013b). The imitation of the strategy on the part of competitors

will lead to a decreasing marginal revenue until it equals the average cost of production or even drops lower than it, thus restoring the previous situation. The successful business formula, for an entrepreneur operating in highly competitive environments, consists in emerging strategies that enable the company to create and maintain its competitive edge (Tudisca et al., 2014a; Crescimanno et al., 2013; Szabó and Popovics, 2009; Invernizzi, 2004; Coda, 1988). In this work, we have analyzed how a wine-growing farm which operates in conditions of average costs greater than marginal revenues can gain a competitive advantage in the short term.

COMPETITIVE ADVANTAGE

A competitive advantage is the result of a strategy that leads the enterprise to occupy and maintain a favourable position in the market in which it operates, with the effect of keeping its profitability higher than its competitors. It manifests itself in the ability of the enterprise to create value for the market that is greater than the one developed by the competition and that is also lower than the costs incurred to create it. A competitive advantage is therefore the expression of a position that is superior to that of competitors in the same strategic grouping (Fontana and Caroli, 2006; Parnell, 2002).

Such a situation proves highly convenient in the marketplace of undifferentiated goods and services, as exemplified by the case of commodities, where the entrepreneur often works in conditions of average cost (AC) higher than marginal revenue (MR) (Figure 1).

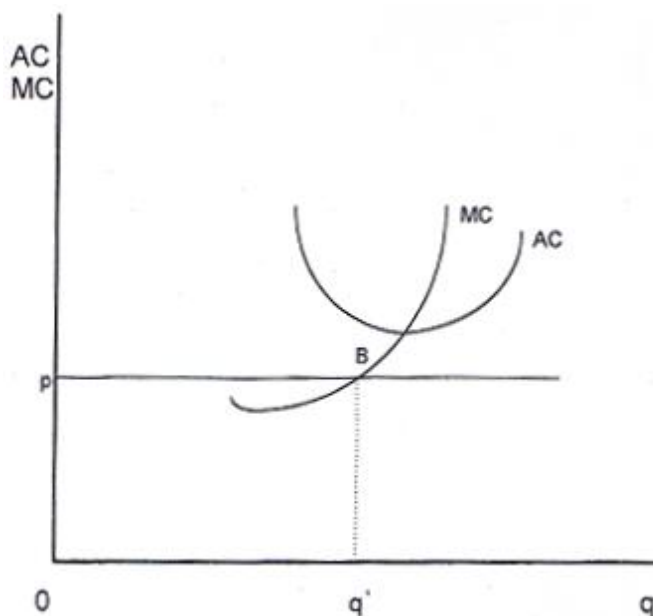

Figure 1 – Enterprise operating with average costs higher than marginal revenues

In B point, where marginal cost (MC) is equal to price (p) and to MR, enterprise has a loss for each unit of output produced.

In this situation, achieving a level of total unit costs lower than that of competitors, is the only way to achieve a position of competitive advantage (Favotto, 2007). In this case, the enterprise can operate with a level of average costs lower than the marginal revenue and thus determine a profit for the business (Figure 2).

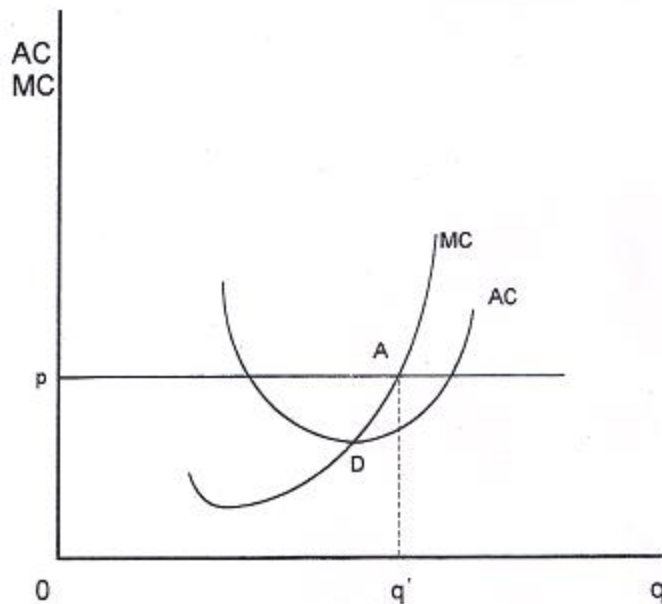

Figure 2 – Enterprise operating with average costs lower than marginal revenues

So, in point A the AC is lower than price and thus enterprise realizes a profit.

At the present time, the ability to contain costs to the greatest possible extent represents an indispensable competitive condition for many agricultural businesses that go no further than the first stage of the production chain.

The ability of a farm to operate at a level of unit costs lower than competitors allows it to control the competitive level of prices. The company can lower the sales price of its offer to a level which, whilst remaining above its own average cost, is lower than that of its competitors (Pellicelli, 2005; Peteraf, 1993). The latter are bound to lose market shares in favour of the cost-leading company, unless competitors quickly lower their average costs and follow the lowering of prices, or increase the value of their supply (Besanko et al., 2001).

This situation determines an increase in demand, which elicits an increase in production of the enterprise; this growth increases the exploitation of economies of scale and the accumulation of experience. Furthermore, it can also favour a greater control of the supply chain. The increase in demand allows the enterprise to strengthen its cost advantage, putting it into a position to reduce the sales price again and foster more demand. However, even if this situation is applicable to the industrial sector, it is not particularly suitable for the agricultural sector where supply is rigid in the short term, depending on the characteristics of the activity carried out (Guerrieri et al., 1995;

Prestamburgo and Saccomandi, 1995). However, the entrepreneur may still reach the market with a lower average cost for the produced units that depend on the production structure assumed as a long-term choice (Rispoli, 2002; Volpato, 2000).

It is necessary to highlight that the advantage resulting from cost leadership does not necessarily translate into a decrease in price. It is in fact clear that if the cost-leading enterprise keeps the price of its supply at the levels of the average costs of the competitors, this has an important effect on the financial structure of the company and on its investment capacity. All other conditions remaining equal, the greater margin allows, on the one hand, a higher level of self-financing and, on the other hand, higher returns on risk capital (Santeramo et al., 2012; Coeurderoy and Durand, 2004). In the first case, the enterprise increases its net assets, and hence at the same financial leverage, the stock of debt that it is able to run up. In the second case, it creates more favourable conditions for the possible acquisition of new risk capital. In both situations, the greater margins of income generated by cost leadership are reflected in the increase of available financial sources. The increased sources of funding, in fact, foster investments (in fixed and working capital) and the expansion of the enterprise's turnover. In a situation of market stability, the higher levels of available sources allow the company to make investments that improve efficiency or that allow it to develop differentiating features in its offer, compared to its competitors. Cost leadership leads to a greater capacity for company growth and/or it strengthens its competitive position in terms of increasing cost advantage or even differentiation (Kaniovski, 2005; Ferrucci, 2000).

Cost advantage is primarily pursued through actions aimed at the most important cost determinants in the activities of the value chain where most of the costs lie. This position is obtained from the exploitation of production economies (scale and experience), which is a typical strategy of enterprises that aim at cost-based leadership. In relatively stable markets with a ratio between optimal minimum dimension and total demand that is not exceedingly low, the capacity of the company to take on a dimension with a more efficient production level (being able to defend its corresponding market share) represents a strategy that competitors find difficult to imitate and which thus leads to a sustainable competitive advantage.

The innovation of process or of product is a second path to reach a sustainable cost advantage, at least in the medium term. Thanks to innovation, the company can rely on better technologies than its rivals, allowing it to produce under conditions of greater efficiency or to create a product that, at the same value to the client, has lower production costs (Desai et al., 2001).

MATERIALS AND METHODS

In this study, an analysis aimed at determining cost leadership of a small sized enterprise was conducted within a winegrowing farm producing grapes of Merlot cultivars in Sicily, the largest island in the Mediterranean sea with a typical climate with hot and dry summers and mild winters (Grillone et al., 2014; 2012; D'Asaro et al., 2012). The grapes produced are not transformed into wine inside of the farm but are sold to processing firms. These types of firm are widespread in Sicily (Tudisca et al., 2014b). The research was geared to answer one question: starting from a situation where average cost is greater than marginal revenue how can the farm gain a competitive advantage. The data were collected through a direct interview (Tudisca et al., 2014c).

The strategy aimed at acquiring a condition of cost advantage results from a process that can be described according to a rational procedure using the value chain (Porter, 1980).

The analysis should start by analyzing the various steps that lead to obtaining the output. In this phase, we analyzed operating costs incurred by the farm in relation to the single activities of the value chain (Collins and Montgomery, 1997; Airoidi, 1980). For each activity, the proportion of operating costs that it entails is estimated. This phase leads to highlighting the activities which are crucial, from a costs point of view, and that consequently have more weight in the strategy here examined. Cost advantage is a condition that must be assessed in relative terms: that is, it depends on the level of the farm's costs compared to its competitors, rather to the average cost of the strategic rival grouping. The second phase consists in comparing the costs incurred by the farm for the implementation of the various activities to those that competitors face in the corresponding activities of the value chain (Pontiggia, 2001; Perrone, 1990). This phase depends on the actual availability of data that the entrepreneur has regarding the cost structure of the firm being compared. In most cases, considering the level of technology, this information is easily obtainable also thanks to the experience that the entrepreneur has of the sector; where experience is lacking, average data of the sector could be used for reference. The comparison with competitors is an essential stage of the procedure, as it highlights two basic conditions for the subsequent devising of the strategy for cost leadership. First of all, sustainability; it is clear that the company may seek to implement this strategy only if it has a cost structure at least potentially better than that of competitors. Second of all, it focuses on the activities that are critical for the determination of cost advantage, highlighting those where there are major differences with respect to competitors.

The third phase can be defined as "operational". In this phase, we have the logical passage between the process phase that outlines the general situation that is "critical" in terms of cost, and the phase relevant to the devising of the strategy. In this third phase, the determinants of level of costs are studied. These determinants are evaluated with reference once again to the individual activities of the

value chain, with attention mainly to those activities that the previous two stages have identified to be the most critical from the point of view of the overall cost trend.

The determinants of the level of costs also concern the interdependencies between the activities of the same value chain and those between the activities of different value chains. Even the study of factors from which the cost trend depend must be carried out within the limits of available information, in a comparative way with respect to competitors .

On the basis of observations of the various determinants of costs, we proceed to define the strategy to achieve the position of advantage over competitors. This strategy can go in two different directions: on the one hand, it can be oriented to detect interventions on cost determinants aimed at achieving the best result in the various activities of the value. Alternatively, it can innovate the organization of these activities in relation to the constraints and opportunities inherent in the features of the various cost determinants (Roy and Vézina, 2001; Sharp and Dawes, 2001).

The last phase identifies the actions to be taken in order to implement the strategy defined in the previous phase and the new procedures that can be used for that purpose.

RESULTS AND DISCUSSION

The results obtained show that the total cost of production amounted to 40.37 Euro/q, of which 27.43 Euro/q are represented by costs for cultivation operations whereas 12.95 Euro are the calculated costs (Table 1).

Costs	Ex ante situation case study			Competitor			Ex post situation case study		
	€/ha	€/q	%	€/ha	€/q	%	€/ha	€/q	%
Soil working	6.17	1.49	3.7	164.50	1.65	4.0	148.80	1.49	4.5
Soil cleaning	8.38	2.02	5.0	195.60	1.96	4.8	201.60	2.02	6.1
Fertilization	10.97	2.63	6.5	186.32	1.86	4.6	263.16	2.63	8.0
Winter pruning and tying	22.13	5.31	13.2	586.00	5.86	14.3	215.00	2.15	6.5
Treatments	299.68	3.00	7.4	245.00	2.45	6.0	299.68	3.00	9.1
Green Pruning	425.00	4.25	10.5	485.00	4.85	11.9	425.00	4.25	12.9
Irrigation	150.00	1.50	3.7	150.00	1.50	3.7	150.00	1.50	4.6
Harvesting	723.16	7.23	17.9	810.00	8.10	19.8	300.00	3.00	9.1
A) Total costs of cultivation operations	2,742.70	27.43	67.9	2,822.42	28.22	69.1	2,003.24	20.03	61.0
Management and general expenses	140.00	1.40	3.5	140.00	1.40	3.4	140.00	1.40	4.3
Taxes	156.60	1.57	3.9	134.00	1.34	3.3	156.60	1.57	4.8
Interests	48.32	0.48	1.2	49.27	0.49	1.2	36.00	0.36	1.1
System reinstatement	634.59	6.35	15.7	623.54	6.24	15.3	634.59	6.35	19.3
Interests on land capital	315.00	3.15	7.8	315.00	3.15	7.7	315.00	3.15	9.6
B) Total of calculated costs	1,294.51	12.95	32.1	1,261.81	12.62	30.9	1,282.19	12.82	39.0
C) Total Cost (A+B)	4,037.21	40.37	100.0	4,084.23	40.84	100.0	3,285.43	32.85	100.0
D) Value of Production	3,500.00	35.00		3,500.00	35.00		3,500.00	35.00	
E) Profit (D-C)	-537.21	-5.37		-584.23	-5.84		214.57	2.15	

*Table 1 - Economic results**Source: our processing of directly collected data*

In the first group, as well as in other studies (Tudisca et al., 2011), the greatest value is represented by costs associated with winter pruning and tying (5.31 Euro/q) and those relative to harvesting (7.23 Euro/q). These costs together account for 31.3% of the total cost of production. Within the same field of costs of cultivation operations, green pruning entails 10.5% of the total cost of production followed by treatments (7.4%), fertilization (6.5%), the tilling of soil and irrigation, that represent 3.7% each. Within the frame of calculated costs, significant importance is represented by the cost of reinstatement of the plantation (15.7% of the total), followed by the interest on the land capital (7.8%), taxes (3.9%), general expenses (3.5%) and interest (1.2%). Even the competitors have a cost structure very similar to that of the enterprise examined. The minor differences that exist are due to the construction of the average data which reflects the various business situations of the area under investigation.

At this point, as mentioned in the methodology, within the scope of the production process, the entrepreneur can act on some costs that determine the lowering of the total cost of production. Compared to the situation of the competitors, our entrepreneur may act on the costs of winter pruning and harvesting (Kunihiro, 2013; Sarig, 2012). In particular, other studies carried out (Tudisca et al., 2013c) show that process innovations may be introduced in the company regarding pruning even with small surfaces, while for harvesting, as large land surfaces are required, the entrepreneur finds advantageous introducing third party harvesting. In perspective, the total cost of production is lowered from 40.37 Euro/q to 32.85 Euro/q (-18.6%). Even compared to the average situation of the competitors the cost is lowered by 19.6%. The comparison of the new situation (after acting upon process innovation) with that of competitors leads to a clear economic advantage of the company examined compared to competitors.

CONCLUSIONS

The evaluation of entrepreneurial decisions are crucial for creating and maintaining a competitive advantage. In this regard, neoclassical theory teaches us that among the possible options that the entrepreneur considers, he/she chooses those that allow him/her to achieve the maximum profit. In this work, we have analyzed the input an entrepreneur, who produces undifferentiated products, can act upon in order to create a competitive advantage.

The empirical analysis developed on a case study highlights that the innovation process determines a decrease in the average cost of production and which, equally to marginal revenue, lead the company from a loss to a condition of profit. This strategy is also applicable to small and medium-sized enterprises.

Process innovations thus lead the enterprise to achieve a competitive advantage that can be kept as long as competitors do not imitate the same strategy. However, even if the strategy is imitated by

other companies, the entrepreneur will always find it convenient to innovate (as long as the average costs are equal to marginal revenues) because, most likely, the market will lower prices and thus remaining anchored to a technological structure that is not state-of-the-art, would determine heavy losses to business.

AN EXPLORATORY RESEARCH ON FAN'S BRAND COMMITMENT TO BASKETBALL TEAMS

Shuv-Ami, Avichai¹; Thrassou, Alkis²; Vrontis, Demetris²

¹Marketing & Advertising Department, College of Management, Israel

²School of Business, University of Nicosia, Cyprus

ABSTRACT

The current study is exploratory research that focuses on fan commitment to basketball clubs and supports that this is consequent to a series of attachments that extend further to, and transcend, just loyalty and satisfaction. The research utilizes the 4E's commitment scale, identifying commitment to have four underlying dimensions: (a) an "evaluation attachment" - the evaluation of brand performance relative to alternatives (b) an "experiential attachment" represents consumer satisfaction with the brand experience (c) an affective component of brand commitment is represented by the "emotional attachment" - the feelings of loyalty toward the brand and (c) an "engagement attachment" that encompass the degree of involvement with the brand. Methodologically, the research is based on two empirical survey studies, with separate and independent identities, with samples of 360 and 272 respondents respectively. Using Exploratory Factor Analysis (EFA) and nomological network analysis the research established the validity and reliability of a new and multi-dimensional scale to measure fans commitment (4E) to their basketball team (club). The value of the research lies primarily in its development of this multi-dimensional scale that provides a better insight to fans behavior than past researches' uni-dimensional scale. Furthermore, the dimensions of this new scale provide a better understanding of the four important constructs of loyalty, involvement, satisfaction and performance; themselves representing four types of fan attachments to their club.

Keywords: *Basketball, Club, Fans, Commitment, Brand, Attachment, Loyalty, Involvement, Satisfaction, Performance*

INTRODUCTION

Sport marketing literature has dealt with the concept of fans' loyalty (Mahony et al., 2000) and fans' satisfaction (Kennett et al., 2001); however, only few studies (Bee and Havitz, 2010; Mahony et al., 2000) actually examined the concept of fans' commitment to their team. Even these, only used a direct

and single scale to measure fans' psychological commitment. Following Keller and Lehmann's (2006) work, this research study suggests that in sport marketing, commitment to a Basketball club is a series of attachments that extend further to, and transcend just loyalty and satisfaction. Utilising Shuv-Ami's (2012) 4E's commitment scale, we suggest that the commitment of fans to their Basketball club has four underlying dimensions: (a) the feeling of loyalty that represents the emotional attachment (b) the degree of involvement with their team, which represents the engagement attachment (c) the calculative component of commitment is based on satisfaction, which reflects the attachment consequent to the shared experiences with the team and (d) the perception of relative brand performance as the functional or evaluative attachment.

BRAND COMMITMENT – THE THEORETICAL FOUNDATION

Most researches in marketing agree that *brand commitment* represents the relationship between the consumer and the brand. Nonetheless, while one school of thought views this type of relationship as reflecting an exchange-like nature (exchange perspective), the other views it as reflecting an attachment or a bond to the brand (attachment perspective). The exchange perspective views commitment as the desire to continue the durable and valued relationship with the brand in the future (Moorman, Zaltman and Deshpande 1992; Morgan and Hunt, 1994; Dholakia, 1997; Samuelson and Sandvik, 1997; Gurviez and Korchia, 2002; Johnson et al., 2006; Walsh et al. 2010; Belaid and Behi, 2011). The exchange perspective also involves such concepts as: developing stable relationships with partners; accepting short-term sacrifices in order to maintain relationships; and assuring the stability of the relationships (Anderson and Weitz, 1992). This exchange provides customers with the confidence of maintaining the brand's functional and affective benefits, which are greater than the benefits from ending the relationship (Geyskens et al., 1996).

The attachment perspective of brand commitment is viewed as the psychological and economic attachment that a consumer may have towards a particular brand (Thomson et al., 2005). In recent years, research in marketing using the attachment perspective of brand commitment (Hur et al., 2011; Iglesias, Singh and Casabayó 2011; Royo-Vela and Casamassima, 2011) relied mainly on the affective commitment component of employees to their workplace and were carried out primarily in the context of organizational behavior (Meyer and Allen, 1991). Klein et al. (2009), defined commitment as the degree to which individuals perceive that they are bound to a given target, recognizing that the bond or the attachment may also represent feelings and not just perceptions. The relationship with the brand is based on a "series of attachments" (Keller and Lehmann 2006, p. 745) and on brand equity as the critical driver (Park et al., 2010).

Following the above theoretical framework, this research suggests that brand commitment includes four types of attachments: the functional or "evaluation attachment" - the evaluation of brand performance relative to alternatives, the "experiential attachment" represents consumer satisfaction with the brand experience, the "emotional attachment" - the feelings of loyalty toward the brand and the "engagement attachment" that encompass the degree of involvement with the brand.

DEVELOPING THE HYPOTHESES

The 4E's (Evaluation, Experiential, Emotional and Engagement) attachments to the brand commitment scale are reflective (Shuv-Ami, 2012). That is, the direction of causality (Jarvis et al., 2003) relates to the calculative and affective components of commitment, and from them to the specific measures of the 4E's. Brand commitment, defined here as "a degree of attachment" to the brand, is reflected in each of the four dimensions that underline it. It is a reflective model whose dimensions reflect a high correlation (Jarvis et al., 2003). These four related constructs have been widely discussed in the marketing literature. This scale combines loyalty, involvement, satisfaction and performance to represent the degree that the 4E's are attached to the brand or brand commitment. From the above theoretical research therefore it is hypothesized here that:

H1: Four oblique factors - involvement, satisfaction, loyalty and performance - suffice to account for covariations of the brand commitment scale items.

The second hypothesis attempts to establish the nomological validity of the brand commitment scale suggested in the current research. This scale's validity is tested against four variables: overall attitude, the preferred brand, purchase intention and recommendation.

Models and theories of consumer behavior (e.g., Howard and Sheth 1969, Oliver 1999), suggest that attitude affects satisfaction and loyalty, which in turn affect preference. Since satisfaction and loyalty are part of the commitment scale (as constructed in the current research and as suggested by Allen and Meyer (1990), it is methodologically valid to hypothesize that compared to the uncommitted consumer, most committed consumers will display a higher overall regard and preference for the brand they are committed to. In the "Customer Development Process" model (Kotler and Keller, 2009, p.157), clients who are members in a customer club tend to be brand advocates. Similarly, Hofmeyr and Rice (2000, p.6) argued that "at a higher end of commitment, committed consumers act as advocates for the brand, exhorting others to use it." We therefore hereby hypothesize that:

H2: The total score of brand commitment will correlate positively with overall attitude toward the brand, recommendation and purchase intentions, and brand preference.

RESEARCH METHODOLOGY

The research is based on two separate empirical survey studies, with separate and independent identities.

1. Study 1 comprised 360 Israeli basketball fans. Participants ages ranged between 17 to 77 with a mean age of 36.9 ($sd = 14.2$). 56% were males, while 58% had higher academic education.
2. Study 2 comprised 272 Israeli basketball fans. Participants ages ranged between 17 to 81 with a mean age of 38.1 ($sd = 14.5$). 59% were males, while 58% had higher academic education.

A major purpose of the present research analysis was to construct a new operationalization for the re-conceptualized brand commitment construct for fans of sport clubs. All four measures of the suggested commitment dimensions adopted from Shuv-Ami (2012) used three items on a 10-point agree-disagree scale.

Additionally, overall attitude was measured accordingly: "Please rate from 1 to 10 the way you generally feel about (think of) your team, where one indicates 'a very poor brand' and 10 'a very good brand'". Recommendation intention was measured using a modified Markey and Reichheld (2008) advocate measure (Net Promoter Scores - NPS): "Please rate from 1 to 10 how likely are you to recommend to your friends or relatives to be a member of your team fans' club, where 1 indicates 'Definitely will not recommend' and 10 'Definitely will recommend'". Purchase intention was measured by the question "Please rate from 1 to 10 how likely are you to go to your team's games next season, where 1 indicates 'Very unlikely' and 10 'Very likely'".

RESULTS

STUDY 1: Exploratory Factor Analysis

The 12-items Brand Commitment Scale was subjected to exploratory factor analysis with oblique rotation. According to the criteria of eigenvalue > 1 and Scree test (Hair et al., 2006) four factors were extracted. On the basis of the hypothesized structure and items content, we labeled the four factors: involvement, satisfaction, performance and loyalty. These factors accounted for 88.8% of the common variance, above the recommended minimum threshold of 60%. The four factors solution is presented in table 1. With the exception of one item, all items loaded highest on the appropriate factor and had substantive loadings that exceeded .5. Only one item which presumed to reflect loyalty loaded one of the involvement factor as well. No other item found to have cross loading exceeded .4 on the non-primary factor.

Alpha coefficients for the three-item performance, involvement, loyalty, and satisfaction were .95, .93, .92, and .92, respectively. Correlations among the unit-weighted scale scores were similar to those between the factors. Correlations among the factors ranged between .66 to .86 and none of the correlation were found to exceed .90, suggesting some discrimination between the factors. The substantial correlations found between the factors justified the use of the oblique rotation and suggested higher order constructs.

Table 1: Factor analysis of the basketball brand commitment scale

Brand commitment items	Factors				Communalities
	Performance	Involvement	Loyalty	Satisfaction	
– I connected and am emotionally involved with my Basketball team	.96				.93
– My Basketball team is important for me	.94				.91
– I am involved and interested in my Basketball team	.83				.91
– I am satisfied with the way my Basketball team meets my expectations		.98			.89
– I am satisfied with my Basketball team		.97			.89
– I am satisfied with the way my Basketball team suites my needs		.74			.85
– My Basketball team has higher quality than other competing teams		.51	.48		.84
– My Basketball team has advantages that other competing teams don't			.97		.91
– In most aspects, my Basketball team is better than other competing teams			.95		.92
– I will not stop being a fan of my Basketball team even if they lose every game this season				.72	.88
– I will not become a fan of another Basketball team even if my Basketball team loses every game this season	.39			.61	.88
– I consider myself loyal to my Basketball team	.38			.59	.84
Rotated eigenvalue	3.60	3.22	2.48	1.36	
% of explained variance ^a	30.0%	26.8%	20.7%	11.3%	
<u>Correlations and reliabilities (in parentheses)</u>					
Performance	(.95)				
Involvement	.66**	(.93)			
Loyalty	.67**	.76**	(.92)		
Satisfaction	.86**	.77**	.73**	(.92)	

Note. N = 360.

All factor loadings > .30 are presented in the table.

a. Rough estimates based on eigenvalues from the orthogonal, varimax rotation (cannot be estimated for the oblimin

rotation due to confounded factors contribution).

****** $p < .01$

STUDY 2: Nomological network

Brand commitment scale items were as in study 1 (above). The internal reliabilities for the brand commitment sub-scales were high: involvement $\alpha = .91$; satisfaction $\alpha = .92$; loyalty $\alpha = .94$, and performance $\alpha = .93$. Internal reliability for the total scale was high as well (Cronbach's $\alpha = .96$).

The nomological validity of the basketball brand commitment scale was assessed by testing its relations with three relevant scales in its hypothesized nomological network. Table 3 presents the correlations between the research variables. As expected, results indicate significant and strong correlations between the basketball brand commitment scores and overall attitudes, recommendation, and intention. Thus, these correlations provide evidence for the nomological validity of the basketball brand commitment scale.

Table 3. Correlations between the research variables.

	Brand commitment	Overall attitude	Recommendation	Intentions
Overall attitude	.58***	--		
Recommendation	.64***	.66***	--	
Intentions	.52***	.45***	.62***	--

Note. *** $p < .001$

CONCLUSIONS AND FURTHER RESEARCH

Using Exploratory Factor Analysis (EFA) and nomological network analysis the current research established the validity and reliability of a new and multi-dimensional scale (Shuv-Ami, 2012) to measure fans commitment (4E) to their basketball team. A multi-dimensional scale of fans commitment may provide a better insight to fans behavior than previous uni-dimensional scale researches (e.g. Mahony et al., 2000; Bee and Havitz, 2010) suggested in the sport marketing literature. The dimensions of this new scale provide better understanding of four important constructs loyalty, involvement, satisfaction and performance. These constructs represent four types of attachments fans may have to their basketball club.

As for all brands, the attachment of fans to their basketball team is both functional and emotional (Rusbult and Buunk, 1993; Klein et al., 2009). While the functional aspect of the attachment represents the evaluation of the team *performance* ("evaluation attachment") and the *satisfaction* with the experience the fan has with his team ("experiential attachment"), the emotional aspect of the

attachment represents the feelings of *loyalty* ("emotional attachment") and *involvement* with everything that related to the team ("engagement attachment"). Thus the commitment of fans to their club is a composite of all of these four dimensions and not uni-dimensional.

The research suggests that brand commitment, as measured by the 4E's scale, is a valuable and valid concept in measuring fans' attachment to their basketball club. Future research may study the impact of this measure on each dimension of basketball team commitment with regards to fan behavior, both at the game and outside it. More importantly though, this research has, peripherally, also highlighted the need to study and analyze fans in a multi-dimensional and multi-context manner. This will not only provide valuable scholarly knowledge, but will also furnish clubs with an understanding of the fans' true and underlying needs/wants and the means to achieve the maximum commitment; and ultimately maximize both the number of fans and the benefits to the club, per fan. It is suggested therefore that further research is undertaken with the task of delineating the fan's profile both in terms of exhibited behavior and its causes; and to construct a comprehensive value chain/cycle incorporating all stakeholders.

In club management terms: be it towards economic, social or other type of subjectively perceived club 'success' (Rossi et al., 2013; Kartakoullis et al., 2013a), a club's destiny is largely defined by its ability to build and sustain a substantial mass of fans. Where the latter are 'real' in the scientific, above-presented sense, it is difficult to even differentiate between the club and its fans. Their relationship is more than strong, it is symbiotic. Understanding the nature of fan commitment, and comprehending its breadth, depth and cause is key to understanding the club itself and the way forward.

LOCAL TOURISM AND SOCIAL MEDIA: THE EFFECTS OF DIGITAL TECHNOLOGY ON CUSTOMERS AND TERRITORY¹

Silvestri, Cecilia; Piccarozzi, Michela

Department of Economics and Management (DEIM), University of Tuscia, Viterbo, Italy

ABSTRACT

This paper aims at analyzing the impact of web tools, especially social networks, on local tourism, paying attention to the effects of the strategies used for the valorization of the territory. A Facebook page was created to promote a tourism event in the Tuscan Maremma in Italy. Its users activity has been monitored. Thanks to Insights, it was possible to analyze the increase in consumer's personal liking of the event during two editions, 2010-2011, and the increase in arrivals and stays on the territory during the same period. The results of data analysis show that Facebook is a powerful communication tool, a suitable means for spreading information, and thus, a tool for the valorization of the territory for tourism purposes.

Keywords: *Tourism, Territory, Social Network, Facebook, Consumer, Communication Tools.*

INTRODUCTION

The continuous media evolution leads to endless transformation of society and economy, of production and consumption system, of companies' organizational structure (Arnesano, 2011; Artusi, 2008; Caruso, 2003; Cercola, 1999; Ciriaco, 2000; Di Matteo and Caroli, 2001; Kotler 2007, 2011; Kotler and Armstrong, 2006). The traditional media (daily newspaper, radio broadcast...) spread information through a *one-to-many system* and they are characterized by poor interactivity and information asymmetry; the message, in fact, is selected by an editor and the reader/audience can not intervene or choose the contents. The limited spread of traditional media and their communication method have caused a drastic revolution in the communication system since the second half of the 90's. Internet has grown out of many factors: the globality of the web, the rejection of one-to-many communication system and the willingness to help people spread their ideas (*many-to-many communication system*). Personalized communication develops. It exploits the direct contact with consumer and it enables producers to get important information on preferences, attitudes and

¹ This papers the shared work of Silvestri who wrote the §1.1, 2, 2.1, 3.1, 3.2 and Piccarozzi who wrote the Introduction, § 1.2, 3.3 and Conclusion

comments about products. Thanks to the evolution of the communication tools, the internet has been gradually improved over the years, shifting from the Web 1.0, characterized by static pages, to the more recent Web 2.0 which allows users to test new functions, and finally, to the web 3.0 which uses sophisticated software for better data management (Alexandru and Acatrinei, 2011; Caruso, 2003; Chlebišová, et al., 2011; Ciriaco, 2000; Fidler, 2000; Hinnis, 1982; Maurya, 2011). Micelli and Prandelli, 2000; Minestrone, 2006; Pastore and Vernuccio, 2008; Perrini, 2000; Raiport and Jaworsky, 2001; Verona and Prandelli, 2006; Miguéns et al. 2008; Milano et al. 2011; Sigala et al., 2012). The change in communication tools and in consumer behavior leads also to the change in marketing: from a passive and product-oriented marketing (Kotler, 2007, 2010;) to relationship marketing (Alvarez et al., 2011; Contaldo and Largo, 2006, Costabile, 2001, Gambetti et al. 2012; Lanier et al., 2013) and then to web marketing (Cercola, 1999; Chiarvesio and Di Maria, 2011, Croli, 2009; Cozzi, 2010; Di Matteo and Caroli, 2001; Eccleston and Griseri, 2008; Estanyol, 2012; Ferrandina, 2007; Franch, 2010; Lutz, 2011; Micelli and Prandelli, 2000; Prandelli and Verona, 2002; Verona and Prandelli, 2006)

The relationships with consumers have already been built before the introduction of internet (Aaker 1991, 1996; Busacca, 2000; Chaudhuri, Contaldo and Largo, 2006, Costabile 2001; Delgado et al., 2003; Gronroos, 1994; Holbrook 2001; Kapferer, 2004; Keller, 1993, 2003; Schmitt, 1999; Vicari, 1995) but this tool enables companies to gain important information easily, less expensively and more effectively. For the first time companies can get in touch with consumer cheaply while he stays at home in order to provide personalized information to him, to get reviews, comments and complaints. Companies can let consumers produce the product directly by creating a real dialogue with him (websites, emails, chat). Web marketing develops from that prerequisite. Ferrandina (2007) describes the web marketing as “the marketing applied to the web; the set of techniques and tools which allows developing market relationships through the internet”. The traditional communication tools enable companies to reach a large amount of users and potential consumers, but a poor segmentation is created. On the web, defining exactly the target is necessary in order to build a customer relationship based on confidence and to provide the most personalized product to the customer (Chiarvesio and Di Maria, 2011, Cozzi, 2010; Croli, 2009; Estanyol, 2012; Franch, 2010; Kotler et al. 2010; Lutz, 2011; Qirici et al. 2011; Zarabara, 2009).

THEORY

Tourism industry has been one of the first sectors to recognize the potential of internet for its business. Online tourism success depends on many factors, including very competitive prices, differentiated offer and new services offering. All these factors have gradually changed users attitudes (Abella-Garce's et al, 2004; Baloglu and Pekcan, 2006; Buhalis, 2003; Cozzi 2010; Elliott and Boshoff, 2009;

Hussein, R. et al, 2012; Martini 2005; Qirici et al. 2011; Scorrano, 2011; Verdinejad, et al. 2011; Zarabara, 2011). Getting, producing and spreading information are very important actions for the tourism activity. An effective information management is fundamental because of the intangibility of tourist products and services, and the distance between tourist products/services and consumers (such a distance can generate an elevated risk perception during the purchasing phase) (Alkharabsheh et al., 2011; Cozzi 2010; Crowston and Myers, 2004; Drèze and Zufryden, 2004; Martini 2005; Niemann et al., 2008; Scorrano, 2011; Thébault et al., 2013).

Technology evolution has several effects on tourism. The information is more accessible, the consumers can compare products with tourist destinations more and more explicitly and they can organize their holiday all by themselves (Abella-Garcés et al, 2004; Elliott and Boshoff, 2009; Hussein, R. et al, 2012 Kotler et al., 2007; Patricia, 2008; Primorac et al., 2012; Smithson et al, 2011; Yu-Lun et al. 2012).

Finally, travel arrangements through travel agencies tend to decrease because of the availability of online holiday packages.

Tourism is an international economic sector and the most extended one. The sector of international travels generates a turnover of more than one trillion dollars and counts more than one billion travelers (Kotler et al. 2010). Technology helps boost tourism and guarantee traveler's positive experience during the holiday.

The most innovative tourism companies use technology to redefine their organizational structure (running cost optimization) and to foster the relationships with their business partners in order to generate value for their customers. The potential of the internet to promote and sell tourist products is closely related to internet usage and diffusion among the final consumers. In 2012 more than two billion online users were counted¹. Online commercialization initiatives undertaken by traditional producers and tourism companies (Tour Operators, Travel Agencies) represent a threat to traditional brokerage companies such as retail travel agencies. The whole system is jeopardized by the launch and the development of online competitors and by the increasing competition offered by operators which use tools that allow independently managing the relationship with customer wherever he is, and which sell products at competitive prices through that new online tool. The consequence is a disintermediation in the tourism industry and the death of traditional suppliers (Chiappa , 2013; Cozzi 2010; Chiervesio, Di Maria 2011; Elliott and Boshoff, 2007; Primorac et al., 2012; Sanayei et al. 2011; Smithson et al, 2011).

After strong growth, even the brokerage websites that intermediate between company and customer (Venere, Expedia) have undergone a change in trend. As highlighted in 2006 by Jupiter in his research

¹ [<http://www.internetworldstats.com/stats.htm>]

and stressed by Michelle Higgins in an article appeared in the New York Time in February 2007, online promotions have been increasing as well as people's inclination to book directly through the website of the service provider (hotels, etc.) without needing brokerage websites. However, the presence on brokerage websites is required to gain visibility and findability (Zarabara, 2011).

Tourism services belong to that category of services that most enjoys online visibility and generates high volume of sales thanks to the internet (Hussein, R. et al, 2012 Kierzkowsky et al. 1996, Kotler, 2010; Primorac et al., 2012; Yu-Lun et al. 2012).

Tourism services are, in fact, perfect for online business. Because of their complexity, they can be placed on a website, exploiting multimedia and hyperlink communication (Clerides et al., 2008; Cozzi, 2010; Dunn et al., 2009; Elliott and Boshoff, 2007; Hills and Cairncross , 2011; Hussein, R. et al, 2012; Martini 2005; Martini, 2009; Patricia, 2008; Primorac et al., 2012; Yu-Lun et al. 2012;

The social network is a powerful tool to promote tourism. Nowadays social networks represent marketing strategies utilized by tour operators, even by those that were more skeptical towards the web because of a low knowledge and awareness about those new communication tools. The characteristics of social networks like Facebook that drive the tour operators to choose them are the following: (1) virality (interesting news or particular applications spread more rapidly and exponentially, such as viruses); (2) website's high visitor frequency; (3) high availability of information about unique users (Facebook offers its clients a specific profile of people on the social network in order to better invest in advertising) (Bellstrom, 2011; Borgato et al. 2009, Conti 2010, De Moya and Jain, 2013; Smithson et al, 2011; Verdinejad, et al. 2011; Zehrer and Grabmüller, 2012). Facebook is a perfect virtual place for managing, promoting and spreading information about any kind of event. No matter the kind of event (a conference, a dinner for few people, a public meeting), when managing an event, Facebook is the perfect tool to spread the word, to encourage word-of-mouth, to promote attendance and to publish multimedia materials about the event (Bellstrom, 2011; Conti, 2010; De Moya and Jain, 2013; Zehrer and Grabmüller, 2012). Creating an advertising campaign on Facebook is simple, immediate and suitable for all people thanks to a platform which enables users to create an advertisement without needing an intermediary. Facebook offers a wide range of tools for every need to develop advertising/promotional campaigns. With regard to marketing and promotion, other two important qualities of this tool are the flexibility and the possibility to limit the target. Several tools are available for advertising a product, a service or a company and for finding contents outside Facebook with the aim of sharing them on the social network, increasing, therefore, the word-of-mouth (Conti, 2010). Moreover, page admins can understand if people are engaging with the content they publish. Thanks to *Insights*, Facebook provides page admins aggregated anonymous insights about people's

activity on their page¹. This is an efficient tool to analyze and verify the impact the contents published on the social network's pages have on users, obtaining information about tastes, attitudes and preferences of consumers.

All this is also due to the change in consumers' behavior and tourism structures. On the one hand, the user makes a more and more clever use of the web. Some time ago, the user hardly found what he needed, now he can use websites and search engines better. On the other hand, hotel industries have improved their online marketing strategies, reaching their target directly (Kotler et al., 2007; 2010; Zarabara, 2011). As documented by the *European Travel Commission*² and the research of BDRC (March 2008)³, figures explain why tourism industry should invest in web marketing as well as in territory valorization for tourism purposes.

CASE STUDY

The case study aims at demonstrating that the web is a valid tool of territory promotion and valorization for tourism purposes, and at verifying the impact of social networks on users. The studied event was organized to promote an Italian area of the Tuscan Maremma, in particular a municipality in the province of Grosseto. The aim was to attract the highest number of national and international guests in order to revalue the territory and the local traditions in a completely different way. The organizers wanted guests and residents to live an amazing experience and not a simple holiday. The emotional aspect and the event engagement played an important role in the event's success. Another important aspect was the multithematicity of the event that allowed developing different tourism typologies: wine and food, sport, wealth and culture. Both editions took place in June and July. The first edition took place from July 15-18, 2010, the second one from June 24 to July 2, 2011. The choice of the time period was not accidental, but it was due to the intention of creating a captivating event during months of low tourism demand. Studies on local territory have showed that the presence of tourists on the territory is strong only in August, therefore an intervention in tourism development has been necessary in June and July. Furthermore, the research has proved that the presence of foreign tourists in July is stronger than in June. The event's aim was also to extend the duration of the stay. Data has shown that the average length of stay is 2,38 days; the average length of stay of foreign tourists is 1,27 day more than the average of Italians (average length of stay of tourists from 2005 to 2009)⁴.

¹ [<http://www.facebook.com/help/search/?q=insights#!/help/pages/insights>]

² [<http://www.etcnewmedia.com>]

³ [<http://www.travolution.co.uk>]

⁴ [www.regione.toscana.it]

With regard to the communication tools utilized, the creators of the event invested much in social networks as Facebook, Twitter and Youtube in order to avoid using the traditional and static communication method that does not inspire confidence and does not communicate with people anymore. The social networks established great interaction among people who clicked “like” or followed the event’s page.

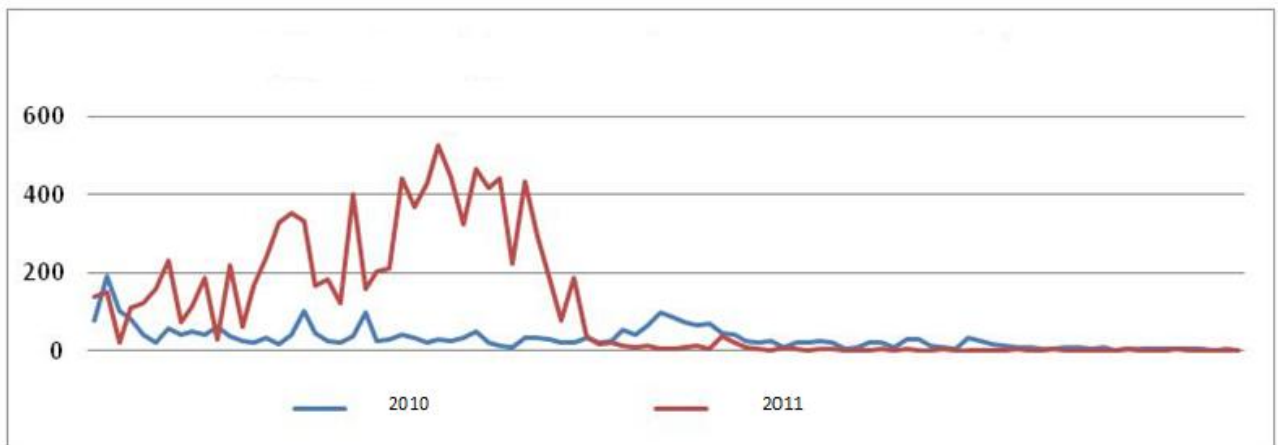

The communication tools chosen, that is web and social networks, aimed at boosting the number of real people that could know and talk about the event, fostering, then, a faster and more immediate word-of-mouth. The objective was to create a 2.0 event in which the audience could become an integral part of the show. Particular initiatives were adopted to drive tourists to generate positive conversation on the territory that hosted them.

METHOD

The Facebook page of the event was launched on 30 May, 2010. Through the *Insights* (a data collection that provides an overview of all the activities on the page) it is possible to analyze the increase in liking due to the powerful communication tool, Facebook, by making a comparison between the two editions. The analysis focuses on the same time frame, that is from 1 June to 31 August.

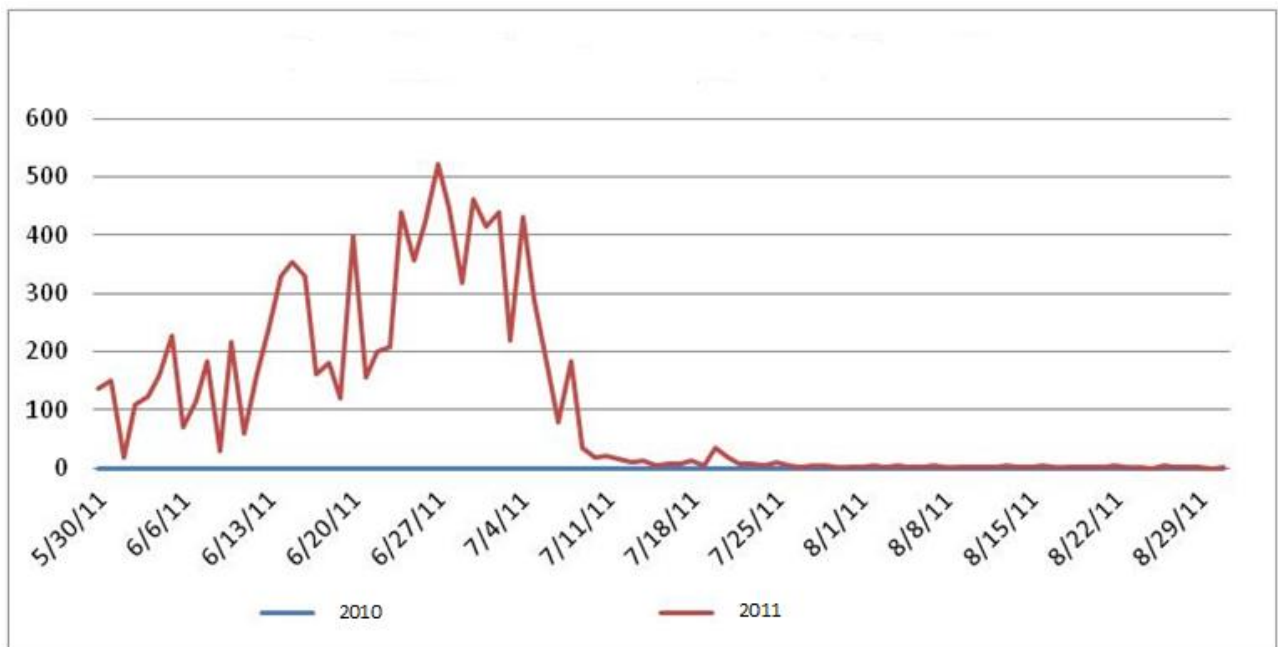

FINDINGS AND DISCUSSION

Few hours after the registration on Facebook, 79 users registered on the page and the next day 191 users interacted with the Facebook page. In the days before the beginning of the event the number of followers increased. On 13 May, 2013 the users registered were 1.729. When confronting data, a remarkable increase in the number of active users can be observed during the second edition. In 2011 people who liked the page increased; active users’ interaction increased daily: 439 users registered on the opening day of the event (on 24 June, 2011) and a peak of 524 users on 27 June, 2011. After the end of the event a similar growth was observed, although a sharp decrease in the number of users occurred immediately after the event and it lasted until the end of the period under scrutiny. However, the number of daily active users in the second edition increased considerably, showing a triple figures growth, as evidenced by the comparison between the first edition in 2010 and the second one in 2011. (Fig.1)

Figure 1 – Daily active users, 2010-2011

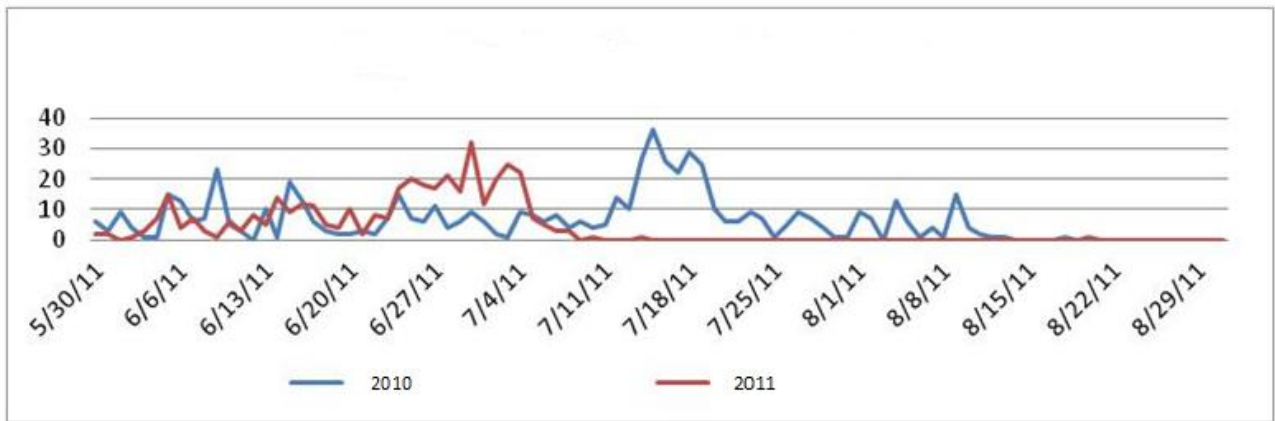

[https://www.facebook.com/#!/insights/?sk=po_100353203347936:Insights users pages](https://www.facebook.com/#!/insights/?sk=po_100353203347936:Insights%20users%20pages)

By analyzing posts, it is possible to observe that during the first edition post views were almost null, during the second edition the research shows different results. The increase in post views was also due to the help of those people who attended the event in 2010 and who contributed to word-of-mouth.(Fig. 2)

Figure 2 – Post views, 2010-2011

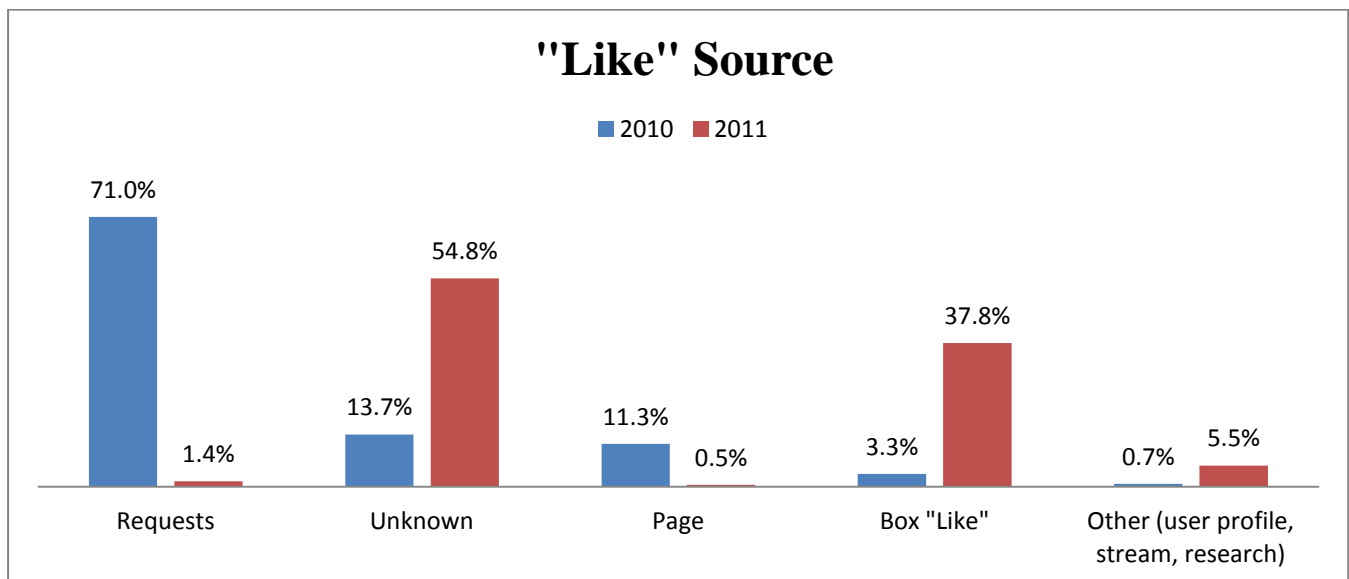

Source: [www.facebook.com: Insights daily active users](https://www.facebook.com/#!/insights/?sk=po_100353203347936:Insights%20users%20pages)

With regard to “likes” on posts, it is important to reaffirm that the two editions took place in different time frame. “Likes” on posts in 2010 had had steady trend for the three months taken into consideration. The trend in 2011 was not that steady. Users clicked “like” on posts especially during the nine days the event lasted (Fig. 3).

Figure 3 – “Likes” on posts, 2010-2011

Source: www.facebook.com: Insights daily active users

The research shows differences in the “like” source between the two editions. The main source in 2010 was fan page request, in the second edition the “unknown” sources (sources that Facebook does not include in data collection) prevailed. Moreover, more users clicked “like” directly on the web site of the event. It is clear that Facebook users search for the event page autonomously and they register by clicking “like”. (Fig.4)

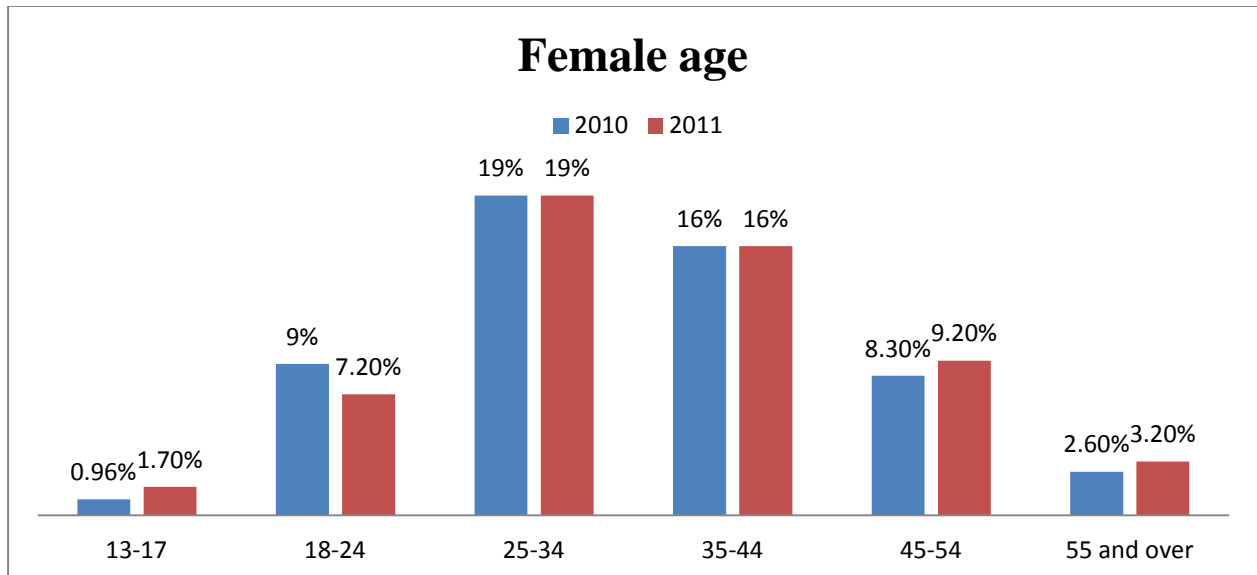

Figure 4 – “Like” Source, 2010-2011

www.facebook.com: Insights “Like” Source

Facebook Insights analyzes demographic data about the users who like the page based on the age and gender information they provide in their users profiles. The percentage of females registered on the page in 2011 was at 56.30%, reporting a 0.8% growth from 2010, which was at 55.86%. By comparing

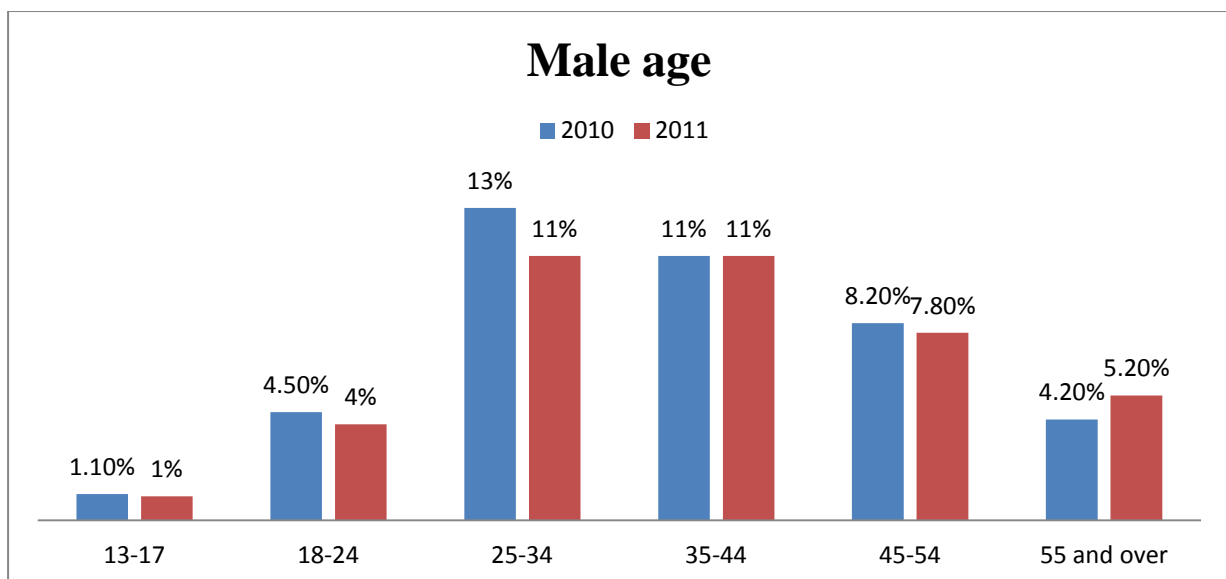

the demographic data concerning the two editions of the event, it is clear that the percentage of women aged between 25 and 34 years, and 35 and 44 years held steady, whereas there was an increase by 77.1% in the number of users aged between 13 and 17 years, by 10.8% in the number of women aged between 45 and 54 years, and by 23.01% in the number of people over 55 years old. The number of users aged between 18 and 24 years decreased by 20.0%. (Fig.5)

Figure 5 – Demographic data, Women 2010-2011

Source: our elaboration of data <https://www.facebook.com>: demographic data

Figure 6 – Demographic data, Men 2010-2011

Source: our elaboration of data <https://www.facebook.com>: demographic data

The percentage of males registered on the page in 2011 was at 40%, showing a 4.8% decrease from 2010, which was at 42% . In 2011 the number of people aged between 18 and 24 years (4.50% in 2010,

4.0% in 2011), 25 and 34 years (13% in 2010, 11% in 2011), 45 and 54 years (8.20% in 2010, 7.80% in 2011) decreased. The percentage of people aged between 13 and 17 years, 35 and 44 years held steady. The second edition recorded an increase in number of people over 55 years (4.20% in 2010, 5.20% in 2011) (Fig.6). Finally, by observing the graphs of figure 5 and 6, it is possible to point out that women were more engaged than men with the Facebook event page both in 2010 and in 2011. Only men over 55 used the social network more than women.

Moreover, one of the goal of the event was to captivate especially young people aged between 25 and 34 years and both editions succeeded in doing it, despite a small decrease in 2011.

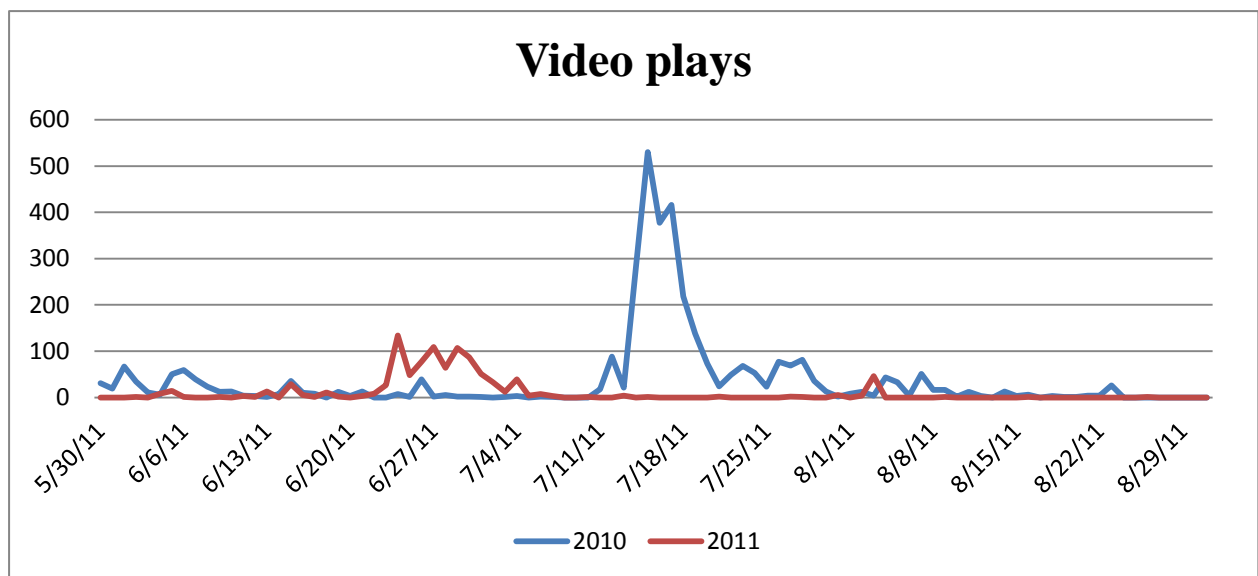

Important information also concerns the countries of origin, the Facebook location data, sorted by country, about the people who liked the page. It deals with information useful to identify the potential guests and the virality of the web page.

1.463 Italians liked the event in 2011, recording a 29% increase from 2010 when they were 1.133. The number of Americans (13 in 2010, 17 in 2011), English people (7 in 2010, 16 in 2011) and Argentines (6 in 2010, 9 in 2011) increased. The number of Spaniards decreased (9 in 2010, 7 in 2011).

With regard to data sorted by Italian cities, both in 2010 and in 2011 most guests came from Rome (552 people in 2010, 636 in 2011); there was a strong increase in number of tourists from Milan (109 people in 2010, 223 in 2011).

Insights allows page admins to observe data concerning media consumption by users including “photo views” and “video plays”.

Video plays and photo views occurred especially during the duration of the event both in the first edition and in the second one. In 2010, however, media consumption also continued after the end of the event, that was probably due to the different length of the event. All this proves that users logged in to Facebook page to relive the memories of that past experience. (Fig. 7)

Figure 7 – Video plays, 2010-2011

Source: <http://www.facebook.com/>: media consumption

However, as figure 7 shows, users were more engaged in media consumption during the first edition than during the second one. Curiosity was probably what drove people to click on the posts.

Facebook page became a tool for the description and popularization of the event, showing good interaction with audience. It was a good virtual place where users could give excellent feedback about the emotions experienced.

The comparison of such data is important, the event surely reached its main goal of touching its audience emotively. The emotions were conveyed thanks to positive word-of-mouth which may be considered the most powerful advertising tool.

Another goal of the event was to increase the number of tourists in June and July on the territory. When comparing data of 2009 and 2010, it can be observed an increase in arrivals by 18,27% in June 2010, and 4% in July 2010. Data concerning presence shows an increase by 16.09% in June and 4.52% in July¹. June and July gave the best figures of the last five years in terms of presence. The increase in presence was by 4.62% in June 2011 and 11,01% in July 2011, compared to 2010. Data proves that in 2011 tourists stayed longer in the accommodation establishments of the territory. Data confirms that the event succeeded in boosting the tourism sector in the studied area during June and July, a period of low tourism demand. Furthermore, the study shows a strong increase in arrivals and stays in the second edition of the event, probably thanks to positive word-of-mouth and innovative communication.

¹ www.regione.toscana.it (2002), "Statistical information": ARRIVALS refer to the number of guest arrivals in accommodation establishments, they represent the frequency of the demand for accommodation services. PRESENCE indicates the intensity of the phenomenon and it is measured with the duration of the stay of tourists in the accommodation establishments.

CONCLUSION

A real evolution of communication tools has occurred over the years. The Web 2.0 has led to changes in society and it has demonstrated that the web can be a good tool to communicate with consumer. Moreover, the Web 2.0 has played a specific role in the local marketing and in the tourism sector. The tourism product is historically a good product for sale at a distance. Internet is a perfect tool to sell tourism products since it provides potential customers, already willing to purchase products at a distance, with an additional way to assess the offer. In some cases, web sites and social networks have replaced paper. Customers surf, search, buy, study, exchange opinions and ideas. Customer wants to be informed. In an age in which it is not clear if globalization has brought advantages or disadvantages to global economy, it is possible to affirm that the advantages are tangible in the tourism sector. Internet gives huge visibility to all online tourism providers which do not fear global competition (contrary to other economic entities that fear it) because they sell a territory-bound product (Zarabara, 2011).

Web presence based only on a web site is not enough to benefit business entities, it is necessary to access many social network sites potential customers are familiar with: thanks to social networks, it is possible to communicate with customers, making them feel important. Moreover, the web facilitates the exchange process, reduces the waste of resources and makes the promotional activity efficient.

Customer loyalty is important in this context, actually, it is crucial. A loyal customer conveys his satisfaction to all his contacts, talking positively about his experience. Word-of-mouth is a good tool since it occurs among people with similar characteristics who, after having had a good experience, talk about it to other people, creating curiosity among potential visitors. The consumer has become more demanding, he purchases a product only after careful research, and internet is the most suitable tool to acquire information (Costabile, 2001; Kotler and Keller, 2007).

Tourists follow such a method: they visit blog and social networks to get information, to discuss, to dialogue, to exchange opinions. Exploiting the internet to promote a territory is a golden opportunity, since the tourists using the web to plan their holiday are always more numerous.

For this study case the communication occurred exclusively via web (web site of the event and social networks). The visibility of the event increased, causing a rise in the number of tourists that attended the event in 2011.

The goal of the event's Facebook page was to let tourists have a touching experience and it was achieved in both editions. Users left comments on the Facebook page both during the event and after it. Between 2009 and 2011, strong increases in arrivals and stays on the territory were registered. Important data for the event, especially because an innovative communication system was chosen to

communicate. Facebook gave huge visibility to the event both in Italy and abroad, if considering the large number of foreign users who clicked “like” on the page.

However, the research has limitations. First, it is not possible to statistically analyze and demonstrate the level of users loyalty. Through the study of the data obtained it is proved only the level of attendance and engagement in terms of number of active users and “likes” on posts. Moreover, it is not possible to statistically determine the existence of a relationship of dependence and interdependence between the increase in arrivals and stays on the territory and the number of people who attended the event actively.

This research aims at describing the strong impact that social networks have on users and how these tools can be valid to promote and to sponsor a territory for tourism purposes.

The purpose is to extend the research to measure and monitor the level of users loyalty and word-of-mouth, to compare the efficiency of traditional communication methods with the new ones (web sites and social networks) and finally, to verify the existence of a relation between communication tools and eventual increase in consumer feedback.

MODEL OF CUSTOMER BEHAVIOR ON GAMBLING MARKET – INTERNATIONAL PERSPECTIVE

Smyczek, Sławomir; Matysiewicz, Justyna

University of Economics in Katowice, Poland

ABSTRACT

Gambling holds prominent position in Western culture and is leisure activity that most adults participate in and enjoy at some level (Dickerson, Allcock, Balszczyński, Nicholls, Williams & Maddern, 1996). However over the last two decades of changes in the economic and political climate have seen rapid growth in gambling industry with legislation allowing for introduction new forms and expansion of existing forms of gambling also in transitional economies. This has result in greater availability of and access to multiply forms of gambling in the community than ever before. Changes in infrastructure on gambling market influence very strongly on gambling behavior of customers. The importance of this issue stems from the fact that may have a significant impact on income and expenditure of households. There is also very important sociological and psychological aspect of gambling behavior, particularly when it takes the form of pathology. The purpose of the paper was to investigate gambling behavior among consumers in different European countries and identify factors determining decision of consumers on gambling market. Very important purpose of paper was also identification profile of consumers making games, and verify hypothesize model of gambling behavior of consumer from European courtiers. To reach purposes presented above survey was conducted with the use of a structured questionnaire in Germany, Poland, Romania, Spain and Ukraine. The results shows that consumer behavior on gambling in European markets are strongly determined by perceived risk associated with particular gambling games. Analysis shows consumer gambling behavior as result of information processing and social interaction. And finally, the strongest influence on gambling behavior have emotional states during profit-and-loss cycle.

Keywords: *gambling, customer behavior , European market*

INTRODUCTION

Consumer behavior on the market of gambling and betting presents an interesting theoretical issue and an important aspect of consumer financial behavior both on the economic and social level. Gambling holds prominent position in Western culture and is leisure activity that most adults

participate in and enjoy at some level (Dickerson, Allcock, Balszczynski, Nicholls, Williams & Maddern, 1996). However over the last two decades of changes in the economic and political climate have seen rapid growth in gambling industry with legislation allowing for introduction new forms and expansion of existing forms of gambling also in transitional economies. This has result in greater availability of and access to multiply forms of gambling in the community than ever before. Changes in infrastructure on gambling market influence very strongly on gambling behavior of customers. The importance of this issue stems from the fact that may have a significant impact on income and expenditure of households. There is also very important sociological and psychological aspect of gambling behavior, particularly when it takes the form of pathology.

The purpose of the paper was to investigate gambling behavior among consumers in selected European countries and identify factors determining decision of consumers on gambling market. Very important purpose of paper was also identification profile of consumers making games, and verify hypothesize model of gambling behavior of consumer from European courtiers. To reach purposes presented above survey was conducted with the use of a structured questionnaire in Germany, Poland, Romania, Spain and Ukraine.

CONSUMER FINANCIAL BEHAVIOR AND GAMBLING – THEORETICAL BACKGROUND

Financial behavior represents one of the most important elements of consumer behavior, since the financial aspect appears in the process of buying, borrowing or receiving goods and services. Due to financial constraints, consumers are forced to make many economic analyzes, and consequently choices connected with saving or consuming. One of the first attempts at producing a more comprehensive presentation of the problem of consumer financial behavior was made by Londqvist (1981), who developed a hierarchical four-level model of financial behavior:

- managing budget,
- making and keeping buffer savings,
- financing purchases,
- investing and accumulating wealth.

In accordance with this model, on the level of budgeting, consumers divide their income (from work, wealth, social benefits or other sources, etc) into different expense groups. In the first place, they cover the so-called non-commodity expenses, and take decisions about loan repayment, etc. The remaining part of the income (so-called acquisition fund) is spent on food, clothing, cosmetics, communication, leisure and other conventional, at a definite economic development of the society, indispensable goods and services. If these expenses do not exceed the current income, one can talk

about the phenomenon of the so-called residual savings, or, in other terms, unintended saving. If, in turn, the current income goes beyond the excess limit, the consumer enters the phase of the so-called unconscious borrowing (Foxall & Goldsmith, 2008).

On the second level, i.e. buffer savings and financial security, consumers consciously put aside part of their income as a security in case of unforeseen events and as their own or their family's future financial provisions. In this respect, traditional consumer behavior consisted in keeping surplus funds at home, making term-deposits, or regular allocating funds on bank savings accounts. Due to current development of the financial services market, on this level consumer behavior comes down to buying various insurance policies. It is noteworthy that making and keeping savings requires financial self-restriction connected with planned allocation of part of consumer income (especially at a low income level), as well as self-discipline (e.g. abstaining from unscheduled spending of savings on current consumption) (Callebaut, 1994).

The third level of consumer behavior pertains to making expenses (achieving consumption goals). Wishing to finance a definite market transaction (acquisition of a durable e.g. a car), consumers may either save or borrow financial means. Part of consumers do not want to get indebted and prefer to save money for some future transaction, which is referred to as goal-saving. There is also a group of consumers who do not like to wait until they have saved some money for product purchase, or else do not want to use money from a deposit, so they apply for a loan or a credit (Katona, 1975). Repayment of a consumer credit for such a transaction may be treated as a form of backward saving.

The last, fourth level mainly relates to behavior demonstrated by consumers with a higher income level and refers to accumulation and allocation of capital through investments, speculations, etc. These activities are intended to gain financial benefits from high interest rate and profits (dividends) exceeding the inflation rate. At this level consumers also decide about accumulation of their assets, and turn to financial professionals and tax consultants for advice on how to maximize their capital profits and avoid paying taxes (Antonides & van Raaij 2003).

All levels of the financial behavior form a hierarchical structure, as each consumer gets involved in the first level i.e. managing cash and budget, and then, depending on his/her income level, moves on to the second, third and fourth level. Consumers who take decisions at a certain level of financial behavior are also engaged in lower levels, e.g. at the saving level they usually keep some buffer savings and manage their budget and cash in order to meet a certain goal. It is noteworthy that financial behavior of higher hierarchical levels calls for greater consumer knowledge about managing financial resources, about a market situation, as well as specificity of financial services. Additionally, all decisions taken in this respect call for bigger involvement on part of the consumer (Nicosia, 2006).

Practically, financial behavior appear in two institutional configurations, i.e. on the market and outside the market (Engel, Blackwell & Mirniard, 2006). The first configuration comprises consumer behavior on the financial services market and other types of financial behavior (e.g. paying taxes, gambling, or foreign currency speculations). Difference between the areas of financial behavior appears both on the subject and object level. The behavior demonstrated by an individual consumer encompasses exclusively decisions connected with services offered by various financial institutions such as banks, insurance companies, investment funds, brokerage houses, etc. (Solomon, Bamossy, Askegaard & Hogg, 2010).

It is worth emphasizing the fact that behavior represented by an individual is not always of consumer character. An individual is a consumer only when he or she uses definite financial services in order to satisfy certain consumer needs e.g. taking on a loan, using credit cards or buying some foreign currency for purchase of goods abroad. On the financial services market an individual loses the status of a consumer when his or her decisions are of gainful character e.g. buying foreign currency for speculative purposes, or of investing character e.g. purchasing shares on the stock market. Such behavior is referred to as productive (Nicosia, 2006).

Other types of financial market behavior include services of other organizations such as casino or lottery, as well as financial relations existing between the consumer and the state e.g. tax filing. The second institutional configuration relates to financial behavior in a household and comprises activities connected with managing financial resources and using definite financial services. Consumer financial behavior on the market (spending behavior) comprises, in turn, a group of activities relating to choices about buying / using services of financial institutions or other organizations. At that point, however, it should be mentioned that it is impossible to make a sharp distinction between consumer behavior on the financial services market and in a household. Both these areas are tightly connected and they affect each other in terms of saving, borrowing, insuring, investing or paying (Phipps & Simmons, 2007).

In developed economies, among various areas of financial behavior on the financial services market, consumer behavior occupies a special place, which explains why it has been chosen as a subject of further analyzes. This type of behavior is revealed in the process of searching, buying, using, assessing and allocating financial services which satisfy consumer needs (Wells & Prensky, 2008). The analysis of consumer behavior on the financial services market consists in considering consumer decisions about using their own resources (time, money, efforts) for buying definite financial services. This necessitates making an analysis of types of financial services used by consumers and consumer motives for using a definite financial service. It is also important to find out where, when and how often these services are used by the consumer (Swiatowy, 2006).

Consumer behavior on the financial services market occurs as a three-stage process consisting of need arousal, purchasing strategy and post-purchase behavior (Smyczek, 2007). In the first place, the consumer becomes aware of financial needs, prioritizes them and assesses possibilities of satisfying these needs. The purchasing strategy is mainly focused on searching for information in order to find possible solutions, on assessment of different financial services capable of satisfying a given need and on forms of payment. The third stage comprises the process of using a purchased service as well as consumer behavior being a consequence of satisfaction or dissatisfaction with a service (Rice, 2007).

Since consumer behavior on the financial services market is concerned with purchasing and using services, a distinction can be drawn between the behavior demonstrated by the consumer and by the buyer. It is not necessary for the consumer to personally use purchased services, whereas the buyer is not always the consumer or the user of purchased services. However, in the case of the financial services market, the service buyer is usually the service user. The inseparability of a service and a service provider proves that financial services are first sold, and later rendered and consumed at the same time (Harrison, 2000). The direct contact between the consumer provider and the consumer constitutes an integral part of the process of provision of financial services.

To sum up, it is worth emphasizing the fact that consumer behavior accounts for a big share of a broadly understood financial behavior, representing one of the most significant activity areas of contemporary people. Consumer behavior on the financial services market, and other types of market and household behavior, are tightly connected, complimentary with each other and mutually conditioned. Altogether they form an integral cycle of financial behavior intended to satisfy consumer needs. It should be borne in mind, however, that financial behavior comprises activities which include managing budget, saving, borrowing, investing, arranging insurance, filing tax declarations and paying taxes, doing extra work, speculating gambling, (e.g. foreign currency) and managing property (Antonides & van Raaij, 2003).

Despite considerable progress in the science on consumer behavior (both on the theory and teaching level as well as on the empirical one), it can be stated that so far research into consumer financial behavior has been limited mainly to analyzes related to consumer use of the market offer of particular financial institutions. In the subject literature, the problem of consumer behavior on the gambling market is raised extremely rarely.

In Polish the word gambling („hazard”) comes from the Arab language and denotes „dice” or „game of dice”. The dictionary of foreign words and phrases refers to gambling as a risky undertaking, risk-exposure, a game for money or other goods mainly determined by sheer luck (Latuska, 2001). Another

dictionary defines the concept of gambling as a risky operation the result of which is exclusively dependent on luck, or as a game of risk or exposure to risk (Doroszewski, 2000).

In the EU legislation, gambling falls within three categories, namely: games of chance, betting and gaming machines (Gambling Law, 2009). According to law, games of chance are luck-related operations where winners win money or certain goods. They include (Gambling Law, 2009):

- keno game (the game in which players win by correct marking off randomly chosen numbers and the payout value is the product of a played-in sum and a multiplier determined for consecutive winning stages),
- lotteries,
- TV bingo,
- cylindrical games (where players mark off numbers, signs or other characters and the prize depend on the predetermined ratio of the paid-in sum to the final prize; the result of the game is determined by means of a cylindrical machine),
- card games such as black jack, poker or baccarat, dice games, bingo games and lotteries: non-cash, promotional or mobile lotteries (phone calls or text messages).

Betting consists in wagering on various contest results such as sports competition with participation of people and animals, and on future events. (Gambling Law, 2009). Machine gaming comprises all types of games played on various mechanical, electro-mechanical or electronic machines, including computers. Players play chance-based games (machine gaming also comprise mechanical, electro-mechanical or electronic machines . They are designed for commercial reasons where players do not have a possibility of winning money or some goods, but the game is strictly of chance character) for money or some definite goods (in machine gaming the possibility of prolonging a game is another form of non-cash prize. Players do not have to pay in for participation in the game and can play a new game even by using a non-cash prize received in the previous game).

Bearing in mind the above, it can be concluded that consumer behavior on the gambling market refers to the courage of an individual revealed in the risk of obtaining something valuable (stake) and in his or her hope of achieving some great value, in other words, of satisfying a certain need – prize (Griffiths, 1995). It should be added that the prize or loss depend on events that are unknown to the consumer at the very moment of decision-taking.

It is noteworthy that, like in the case of consumption needs, the gambling ones are of continuous character and satisfaction of one need at a certain moment of time is followed by another urge to satisfy it again (Brenner & Brenner, 1990). Subject literature distinguishes several essential motives which stimulate the recurrence of gambling need satisfaction. The most common ones include: perceived value of money, time lapse between games, amount of money lost during the last game,

perceived probability of winning, the number of close-to-win situations, personal or non-personal nature of gambling, availability of gambling rooms, advertising or rules of a definite gambling game (Griffiths, 1995). To sum up, consumer behavior on the gambling market presents an interesting and important part of financial behavior, being one of the most crucial activities of the contemporary man.

HYPOTHESIS AND CONCEPTUAL MODEL

The real world setting implies dealing with an abundant complexity of financial markets, but modeling customer behavior itself presents even greater challenge. To address this complexity, the question of gambler decision making will be more narrowed focusing on relevant (but most likely interdependent) sub-questions (Lovric, Kaymak & Spronk, 2008):

1. Profiling gamblers on their preferences and risk attitude,
2. Information processing and learning,
3. Social interaction and peer influence,
4. The role of emotions and intuition.

The crucial concept for gambling, and decision making in general, is the concept of risk. Unfortunately, there are many definitions of risk with its meaning varying across different domains. In standard decision theory, a risky prospect is expressed as a set of events and event-contingent outcomes, with probabilities assigned to each event. Knight (1921) made the distinction between decisions under risk and decisions under uncertainty, with risk being measurable (quantitative) and uncertainty non-measurable (non-quantitative). However, it is possible to conceive decision under risk as a special case of decision under uncertainty, where under risk objective probabilities are used, and under uncertainty subjective probabilities are used. The most influential theories for decisions under risk and uncertainty are known as Expected Utility Theory (Bernoulli, 1954; von Neumann & Morgenstern, 1944), Prospect Theory (Kahneman & Tversky, 1979), Rank-Dependent Utility Theory (Quiggin, 1982, Schmeidler, 1989), and Cumulative Prospect Theory (Tversky & Kahneman, 1992). Traditional economics and finance have been dominated by these probabilistic models of uncertainty. However, other theories for dealing with uncertainty, ambiguity, or vagueness exist: e.g. fuzzy set theory (Zadeh, 1965), Dempster-Shafer theory (Shafer, 1976), and rough set theory (Pawlak, 1991). Loomes (1999) suggests that the current evidence in literature is more in favor of the notion that individuals have only basic and fuzzy preferences, and that each decision problem triggers its own preference elicitation. This is in line with the claim that preferences are constructed (not elicited or revealed) as a response to a judgment or choice task (Bettman et al., 1998).

A decision maker's attitude towards risk can be characterized as risk-aversion, risk-seeking (risk-tolerance, risk-taking, risk-loving), or risk-neutrality; and can be defined in a classical sense as a preference between a risky prospect and its expected value (the method of revealed preference). In these theoretical considerations risk attitude is usually captured through the curvature of utility function, or alternatively, through nonlinear weighting of probabilities. But a strong empirical phenomena that is driving risk aversion to a large extent is known as loss aversion (Kahneman & Tversky, 1979, Markowitz, 1952). "Losses loom larger than gains," and while people are typically risk-averse for gains, they are risk-seeking in the domain of losses (Kahneman & Tversky, 1979). This highlights reference dependence, i.e. the importance of reference point against which outcomes are coded as losses or gains.

Slovic (1998) argues that although knowledge of the dynamics of risk taking is still limited, there is an evidence of little correlation in risk-taking preferences across different domains and situations. Only those tasks highly similar in structure and payoffs have shown any generality. Also, previous learning experiences in specific risk-taking settings seem more important than general personality characteristics. Furthermore, risk attitude can change depending on the outcomes of previous decisions. Thaler and Johnson (1990) found that previous gains increase risk-seeking behavior (*house money effect*), while in the presence of previous losses, those bets which offer a chance to break even seem particularly attractive (*break-even effect*). These are examples of what Thaler refers to as *mental accounting*. It is an important question whether gamblers have risk attitudes related to the gains and losses defined on the individual game level (*narrow framing*), on parts of the games (for example during one session / day), on the overall games, or on their total wealth. Accordingly,

H1, The gamblers perception of risk affect on creation of gamblers behavior on market.

Any market participants are exposed to a constant flow of information, ranging from quantitative financial data to financial news in the media, and socially exchanged opinions and recommendations. Processing all this information is a daunting task, so it would not be surprising that during this process people apply many heuristics. According to the representativeness heuristic people may overreact to a series of evidences, and see patterns where they do not exist. However, people can sometimes underreact to news, i.e. in the light of a new evidence they update their beliefs conservatively, and not in a fully Bayesian manner (Lovric, Kaymak & Spronk, 2008).

Processing information from the environment is important as it gives inputs for decision making, it updates beliefs, gives feedback on game strategies, and fosters learning. However, the *confirmation bias* may play an important role in how gamblers acquire and process this information. It suggests that

people have a tendency to search for information that supports their current beliefs and decisions, while neglecting information that confronts those beliefs (Lovric, Kaymak & Spronk, 2008).

Oberlechner and Hocking (2004) study information sources, news, and rumors in the financial market. In this study consumers rated the importance of different information sources, such as wire services, personal contacts, analysts, daily newspapers, television etc. An interesting finding of this study is that the information speed, expected market impact, and anticipated market surprise are rated as more important than the reliability of the source, and the accuracy of information. According,

H2, The gamblers information processing affect on creation of gamblers behavior on market.

Financial economists have borrowed more from the psychology of the individual than from social psychology (Hirshleifer, 2001). Financial theorists have examined how information is transmitted by prices, volume, or corporate actions. However, person-to-person and media contagion of ideas and behavior also seems important.

Shiller (1990) has emphasized the importance of conversation in the contagion of popular ideas about financial markets. In a survey of individual consumers, Shiller and Pound (1989) found that almost all of the consumers who use a particular financial services had their attention drawn to it through direct interpersonal communication. The influence of conversation on trading may arise from individuals overconfidence about their ability to distinguish pertinent information from noise or propaganda (Hirshleifer, 2001).

Social psychology provides evidence of various social effects which might be important in the context of gambling as well. *Conformity effect*, or the tendency of people to conform with the judgment and behavior of others, was studied by Asch (1956). Bond and Smith (1989) confirmed the conformity effect, showed its historical change, and emphasized its cultural dependence. Other important effects are *fundamental attribution error* and *false consensus effect* (Hirshleifer, 2001). *Herding behavior* or mimetic contagion has been proposed as the source of endogenous fluctuations (bubbles and crashes) in markets (Topol, 1991).

H3, The gamblers social interaction affect on creation of gamblers behavior on market.

Emotions have powerful effects on decisions, and decision outcomes have powerful effects on emotions (Mellers et al., 1998). Emotions can have both a predecision and postdecision effect. Most of the research focused on a unidimensional model in which a predecision emotion can be either positive or negative. However, a more detailed approach is needed given the variety and domain-specificity of

emotions. Positive emotions are shown to increase creativity and information integration, promote variety seeking, but also cause overestimation of the likelihood of favorable events, and underestimation of the likelihood of negative events. Negative emotions promote narrowing of attention and failure to search for alternatives. They promote attribute-vs. alternative-based comparisons. One of the most studied emotions that can follow a decision is the feeling of regret. Gilovich and Medvec (1995) showed that in the short run people experience more regret for actions rather than inaction, while in the long run they experience more regret for their inactions. Anticipated emotions, such as regret and disappointment, have drawn most attention of economist, whereas immediate emotions (experienced at the moment of decision making) have been mainly studied by psychologists (Loewenstein, 2000). Loewenstein (2000) emphasizes that economists should also pay attention to immediate emotions and a range of visceral factors which influence our decisions.

One evidence for the importance of emotions in decision making comes from patients with brain lesions in regions related to emotional processing. Shiv et al. (2005) made an experiment with 20 rounds of investment decisions (choosing whether to invest 1 dollar in a risky prospect with a 50-50 chance of winning 2.5 dollars or nothing), and found that target patients (with brain lesions in emotion-related areas of brain) made more investments than the normal participants and control patients, and thus earned more on average. Normal and control patients seem to have been more affected by the outcomes of previous decision - upon winning or losing they adopted a conservative strategy and less invested in subsequent rounds. However, the inability to learn from emotional signals (Somatic Marker Hypothesis, Damasio et al. (1996)) can also lead to unadvantageous decisions such as excessive gambling. Thus, emotion and cognition both play a crucial role in decision making.

Loewenstein et al. (2001) propose "*risk-as-feelings*" perspective on decisions under risk and uncertainty, which differs from classical cognitive-consequentialist perspective in the sense that feelings or affects play a crucial role in decision making: emotional evaluations of risky choices may differ from cognitive, and when such a divergence occurs, they often drive behavior. Both emotional and cognitive evaluations are influenced by expected outcomes (and expected emotions) and subjective probabilities, however, emotional evaluations are also influenced by a variety of factors, such as vividness of associated imagery, proximity in time, etc.

Goldberg and von Nitzsch (2001) describe a personal experience of a trader (market participant) who goes through various emotional states during profit-and-loss cycles. The feelings of hope and fear, depending on the success or failure on the market, can be transformed to the states of euphoria or panic. During these transitional states there is a selective perception of information - positive information is perceived and often exaggerated, while negative information is ignored. In final states of euphoria or panic, information has almost no role to play (Goldberg and von Nitzsch, 2001). Even

though individuals differ, the authors emphasize that everyone runs the risk of inability to make rational decisions under pressure.

H4, The gamblers behavior is influenced by their emotional states during profit-and-loss cycle.

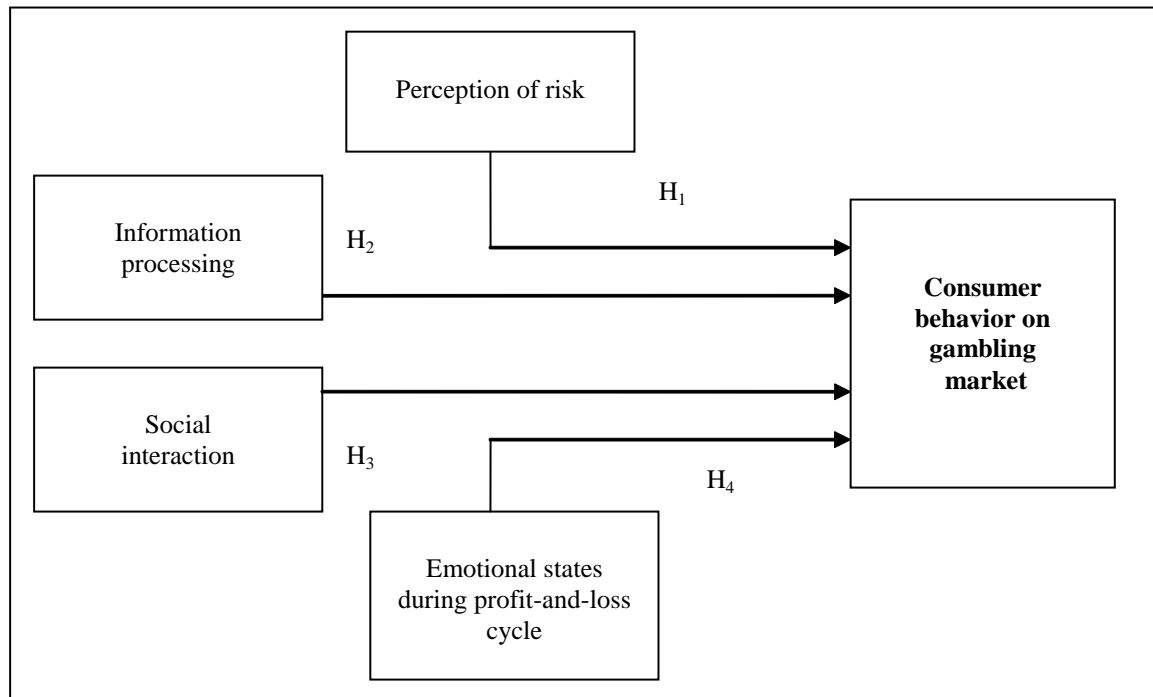

Figure 1. Conceptual model of consumer behaviour on gambling market

RESEARCH METHODS

In order to verify the hypothesized model the direct research was carried out on test groups of consumers from five European countries. The study of gambling behavior on the German, Polish, Romanian, Spanish and Ukrainian markets were conducted by means of a survey questionnaire on a group of 1,000 respondents in each country. Reach were done in 2012. The average questionnaire content equaled 54%, but after verification of the material, 47% questionnaires were approved for further analysis. The choice of the countries was deliberate and based on 2 criteria: 1) legality of gambling operators on market, 2) possibilities of on-line gambling. Ukraine was selected as country with problems of legality of gambling operators on market (since 2009 this activity is illegal). Germany was selected as country with the most liberal gambling law. Spain is country which first legalized gambling online and is one of the biggest gambling market in Europe, Romania is going to legalized, and finally Poland is country, where gambling online is illegal.

Table 1. Respondents' characteristics

Characteristics	Germany	Poland	Romania	Spain	Ukraine
<i>Gender</i>					
Female	42.2	49.7	47.9	46.9	41.7
Male	57.8	50.3	52.1	53.1	58.3
<i>Age</i>					
18-24	13.8	19.3	17.2	15.4	14.6
25-34	17.3	22.0	25.5	24.1	20.3
35-44	26.5	19.4	17.7	29.3	26.3
45-54	20.4	19.0	17.9	13.6	15.9
55-64	11.9	12.8	12.0	11.2	13.7
65+	10.1	7.5	9.7	6.4	9.2
<i>Education</i>					
Below high school	57.8	42.4	53.8	56.1	64.6
High school	29.8	41.4	36.5	47.9	27.5
Higher education	12.4	16.2	9.7	11.8	7.9
<i>Employment status</i>					
Full time	63.5	69.4	76.4	67.9	79.8
Part time	14.2	6.7	11.6	16.9	3.9
Own business	12.6	14.8	4.8	8.4	6.1
Unemployed	9.7	9.1	7.2	6.8	10.2
<i>Workplace</i>					
Finance/banking/investment	21.8	27.1	19.3	18.9	14.5
Other	78.2	72.9	80.7	81.1	85.5
<i>Financial situation</i>					
Very bad	2.5	1.7	3.1	2.4	7.2
Bad	32.7	20.9	30.4	29.7	41.3
Average	41.7	52.1	49.3	47.2	37.8
Good	19.2	18.2	14.5	14.5	8.5
Very good	3.9	7.1	2.7	6.2	5.2

All surveys were conducted with the use of a structured questionnaire, translated into national languages. The base questionnaire was designed with three parts. The first part was dedicated to behaviors of consumer on gambling market according to simply model of consumer behavior (Schiffman & Kanuk, 2010). In the second part was the use of Likert's scale which referred to factors influence consumer behavior on gambling market according to hypothesized model. Scale to measure mentioned factors was based on literature review and previous studies (Lovric, Kaymak & Spronk, 2008). The third part describe features of respondents. Once the questionnaire was prepared, the measurements were evaluated by three experts – marketing and statistics professors, in terms of their wording/meaning and consistency.

All the collected data from first part of questionnaire were analyzed separated according to different countries because of identification differences in consumer behavior on gambling market. Data from the second part of questionnaire were analyzed together by means of AMOS 5 program. In the first place, the attempt was made to produce a set of variables responsible for the development of consumers' behavior on gambling market. The scale included 21 variables. The scales were first

refined using Cronbach's alpha and exploratory factor analysis (EFA). The results indicate that five item in scale was deleted due to its low item-total correlation (0.20). Other items of the scales used had satisfactory item-total correlations (>0.30) as well as Cronbach's alpha (>0.70) (Nunnally & Bernstein, 1994). The EFA extracted four factors at an eigenvalue of 1.56 and 61.07 per cent variance extracted. In addition, all factor loadings were greater than 0.50. In conclusion, the refining step indicates that all items measuring the constructs were satisfactory. Consequently, they were used for the main survey.

In the next stage Cronbach's alpha and CFA were used to assess the measures of constructs based on the data collected from the main survey. The Cronbach's alphas of four constructs were above 0.64 and were respectively. The CFA results of the final measurement model indicate that the model received an acceptable fit to the data: the Chi-square value was significant (Chi-square = 591.329, $df = 79$, $p < 0.001$). A significant Chi-square, however, might be an artifact of sample size, thus other fit indices are more indicative. We present six common fit indicates, guidelines regarding the indices' recommended values, and the indices' values for CFA models in Table 2. The indices indicate good overall fit to the data.

Table 2. Fit indices, recommended values and the model values for the confirmatory factor analysis

Fit index	Guidelines	Model's values
1. REMSEA	< 0.08	0.071
2. NFI	> 0.90	0.919
3. GFI	> 0.90	0.947
4. AGFI	> 0.90	0.903
5. Bollen's Delta 2	> 0.90	0.916
6. RNI	> 0.90	0.922

In addition, all factor loadings were significant and substantial (>0.50). Therefore, it can be concluded that these measures were satisfactory with the requirement for convergent validity. Also, the correlations between contacts, together with their standard errors, indicated that the discriminates validity was achieved (e.g., Steenkamp et al., 2003).

MAIN RESULTS AND DISCUSSION

In study of consumer behavior on the gambling market were taken into consideration such demonstrations of gamblers decisions as: the range of played games, needs and reasons for gambling, determinants of gambling, expenditures on gambling, and perceived consequences of gambling-addiction. The gathered information also allowed determination of a consumer-player profile.

a) knowledge of gambling games and range of played games

The study results have shown that consumers' knowledge of gambling in European countries is very limited, and, to put it more clearly, created mainly by media, as the greatest number of respondents (almost everybody) have indicated such gambling games as machine games (jackpots) and casino games: roulette as well as card games. A relatively high percentage of respondents, spontaneously

referred to sports betting and internet gambling as gambling games. Interestingly enough of respondents pointed at home-played games for money as a form of gambling. However, only very limited of the questioned people identifies gambling with lotto or quiz text messaging.

Table 3. Spontaneous knowledge of gambling games among European customers

Gambling games	Percentage				
	Germany	Poland	Romania	Spain	Ukraine
Machine games (jackpots)	95.2	94.2	96.4	94.2	90.1
Roulette	90.4	96.1	92.1	75.3	80.5
Card games	86.5	87.3	87.7	73.8	67.0
Sport betting	80.9	67.5	62.4	69.8	21.4
Internet gambling	61.3	59.0	79.2	88.1	83.6
Home-played games	39.6	28.2	89.7	73.0	91.3
Lotto	35.8	18.7	21.8	60.5	7.6
Quiz text message	22.5	6.9	3.9	6.7	5.1
Others	7.2	3.8	11.6	5.9	17.9

In the case of supported knowledge, almost everybody qualified sports lotteries as gambling, next to machine gaming and casino games. It is extremely surprising that despite recognizing quiz text messaging as a gambling game, majority of respondents in all questioned CEE countries have not considered it strictly gambling.

According to the study, respondents played diverse forms of gambling games, and almost all of them played the lottery. Over 50% of all investigated European countries took part is sports betting and the same number played machine games at least once in their lifetime. Nearly quarter tried internet gambling games and only few of them have visited a casino for gambling.

Table 4. Using level of gambling games among European customers

Gambling games	Percentage				
	Germany	Poland	Romania	Spain	Ukraine
Lotto	80.7	88.7	71.8	84.1	77.6
Sport betting	62.4	67.5	62.4	42.6	21.4
Machine games	98.1	94.2	96.4	89.2	90.1
Home-played games	44.1	28.2	89.7	75.2	91.3
Internet gambling	54.6	59.0	79.2	87.9	83.6
Quiz text message	10.6	6.9	3.9	9.1	5.1
Card games	88.9	87.3	87.7	73.8	67.0
Roulette	92.7	96.1	92.1	82.4	80.5
Others	4.1	3.8	11.6	7.3	17.9

b) needs and reasons behind gambling

Consumer reasons for gambling are diverse country to country, but mainly related to fun and entertainment, escape from a daily routine and day-to-day problems and to leisure in the company of

friends. And only few of respondents regard gambling as a form of earning money (main income source).

Table 5. Reasons and motives of gambling among European customers

Gambling motives	Percentage				
	Germany	Poland	Romania	Spain	Ukraine
Fun	98.1	94.2	96.4	89.2	90.1
Entertainment	92.7	96.1	92.1	82.4	80.5
Escape form daily routine	88.9	87.3	87.7	73.8	67.0
Escape for day-to-day problems	72.4	67.5	62.4	20.6	21.4
Leisure	54.6	59.0	79.2	87.9	83.6
Earning money	10.6	6.9	3.9	9.1	5.1
Others	4.1	3.8	11.6	7.3	17.9

In order to confirm respondents' reference to gambling as entertainment, respondents were asked to indicate their favorite free time activities on a 7-point scale. The results have shown that respondents beloved pastime is watching TV or films, listening to music and meeting friends. In the research, gambling was assessed as an activity which provides the lowest level of pleasure.

Table 6. Favorite free-time activates of European customers

Activities	Percentage				
	Germany	Poland	Romania	Spain	Ukraine
Watching TV	98.1	94.2	96.4	89.2	90.1
Watching films	92.7	96.1	92.1	82.4	80.5
Listening musing	88.9	87.3	87.7	73.8	67.0
Meeting friends	72.4	67.5	62.4	20.6	21.4
Gambling	54.6	59.0	79.2	87.9	83.6
Others	4.1	3.8	11.6	7.3	17.9

Respondents were also requested to determine which would bring them most pleasure: winning a gambling game, winning a sports competition or a scientific or artistic contest. The results have revealed that the greatest satisfaction would be drawn from winning sports competitions and scientific and artistic contests. Only very narrow group of respondents chose gambling as the greatest pleasure-provider.

Table 7. Source of pleasure for European customers

Type of winning	Percentage				
	Germany	Poland	Romania	Spain	Ukraine
Winning gambling	98.1	94.2	96.4	89.2	90.1
Winning sports competition	92.7	96.1	92.1	82.4	80.5
Winning artist or scientific contest	88.9	87.3	87.7	73.8	67.0

c) determinants of consumer behavior on gambling

The study shows that consumers habits constitute the main determinant of consumer choice of a gambling game. Other factors include distance from the place of residence and security of a transaction.

Table 8. Determinants of gambling among European customers

Gambling games	Percentage				
	Germany	Poland	Romania	Spain	Ukraine
Habits	98.1	94.2	96.4	89.2	90.1
Place of residence	92.7	96.1	92.1	82.4	80.5
Security of transaction	88.9	87.3	87.7	73.8	67.0
Level of prize	72.4	67.5	62.4	20.6	21.4
Extra services	54.6	59.0	79.2	87.9	83.6
Professional service	44.1	28.2	89.7	75.2	91.3
Others	4.1	3.8	11.6	7.3	17.9

Over 50% of respondents finances their participation in gambling with current earnings, 28.7% with savings and only 2.5% with money from previous winnings. It seems worrying that over 16% of respondents borrow money to be able to play the games.

With respect to financing games with current earnings, one should highlight the fact respondents approach it with caution spending on gambling no more than 25% of their income. In most cases they use 5% or less of their earnings (50.4%), or between 10 and 25% (27.9%). Only 1.7% of respondents exceed 50% of their income playing the games.

d) consumer-player profile

The main gamblers on the European gambling market are middle-aged men, with secondary education, running single or 3-member households. The players live in big or medium-size cities and obtain the income level of average.

Table 9. Gamblers profile in European markets

Characteristics	Germany	Poland	Romania	Spain	Ukraine
<i>Gender</i>					
Female	42.2	49.7	47.9	46.9	41.7
Male	57.8	50.3	52.1	53.1	58.3
<i>Age</i>					
18-24	13.8	19.3	17.2	15.4	14.6
25-34	17.3	22.0	25.5	24.1	20.3
35-44	26.5	19.4	17.7	29.3	26.3
45-54	20.4	19.0	17.9	13.6	15.9
55-64	11.9	12.8	12.0	11.2	13.7
65+	10.1	7.5	9.7	6.4	9.2
<i>Education</i>					
Below high school	57.8	42.4	53.8	56.1	64.6
High school	29.8	41.4	36.5	47.9	27.5
Higher education	12.4	16.2	9.7	11.8	7.9

<i>Employment status</i>					
Full time	63.5	69.4	76.4	67.9	79.8
Part time	14.2	6.7	11.6	16.9	3.9
Own business	12.6	14.8	4.8	8.4	6.1
Unemployed	9.7	9.1	7.2	6.8	10.2
<i>Workplace</i>					
Finance/banking/investment	21.8	27.1	19.3	18.9	14.5
Other	78.2	72.9	80.7	81.1	85.5
<i>Financial situation</i>					
Very bad	2.5	1.7	3.1	2.4	7.2
Bad	32.7	20.9	30.4	29.7	41.3
Average	41.7	52.1	49.3	47.2	37.8
Good	19.2	18.2	14.5	14.5	8.5
Very good	3.9	7.1	2.7	6.2	5.2

e) consequences of gambling

As results show, majority respondents do not see any negative consequences of gambling for themselves. Interestingly enough, almost the same number of respondents perceive the threat of gambling for other people and for the whole society. In the case of negative consequences of gambling respondents pointed out harmful phenomena including family problems, indebtedness, loss of friends, works problems, theft, and fighting.

Table 10. Consequences of gambling for European customers

Type of consequences	Percentage				
	Germany	Poland	Romania	Spain	Ukraine
Family problems	98.1	94.2	96.4	89.2	90.1
Indebtedness	92.7	96.1	92.1	82.4	80.5
Loss of friends	88.9	87.3	87.7	73.8	67.0
Works problems	72.4	67.5	62.4	20.6	21.4
Theft	54.6	59.0	79.2	87.9	83.6
Fighting	44.1	28.2	89.7	75.2	91.3
Others	4.1	3.8	11.6	7.3	17.9

In majority of cases respondents are satisfied with gambling. Surprisingly, respondents do not trust institutions offering gambling services. According to study results, majority of respondents are determined to play various gambling games in the future. A considerably lower percentage of respondents would recommend gambling to their friends, but with respect to children. Majority of them try to prevent their children from various gambling games.

f) results in hypothesized model – testing main effects

After examination of measurements used to measure constructs, focuses of study turns to theoretical structure hypothesized. Investigation of hypotheses was pursued, basically, by levels of adjustment of theoretical model, and by significance and magnitude of estimated coefficients of regression (Hair et al., 1998).

Table 11. Estimated coefficients in consumer gambling behavior model

Relationship in model	Hypotheses	
Dependent variable: Consumer gambling - perception of risk	$R^2 = 0.71$ 0.62 (6.53)	H ₁
Dependent variable: Consumer gambling - information process	$R^2 = 0.67$ 0.59 (5.84)	H ₂
Dependent variable: Consumer gambling - social interactions	$R^2 = 0.79$ 0.79 (6.05)	H ₃
Dependent variable: Consumer gambling - emotional states	$R^2 = 0.83$ 0.70 (6.28)	H ₄

T-values in parenthesis. Based on one-tailed test: t-values > 1.65, $p < 0.05$; e t-values > 2.33, $p < 0.01$. Coefficients in bold are statistically significant

Results provide support for all 4 homological relationships specified in our theoretical model. These relations reflect impact of: 1) consumer perception of risk on consumers behavior on gambling market, 2) different information processes on consumers behavior on gambling market, 3) social interactions of consumers on their behaviors on gambling market, and finally 4) consumer emotional states on their gambling behavior.

In addition, table 11 shows the explained variance (R^2) for each dependent variable in conceptual model. R^2 of 0.71 indicates that construct: positive perception of risk by consumers, considerably, the variation in consumer gambling behavior. Effects of consumer perception of risk on consumer gambling behavior established in hypothesis H₁, was confirmed. R^2 of 0.67 and R^2 of 0.79 indicates positive correlation between information processing and social interactions and gambling behavior. H₂ and H₃ was confirmed. Impact of consumer emotional states on gambling behavior of customers established H₄, was supported by findings ($R^2 = 0.83$).

CONCLUSIONS

The research shows that gambling games are treated by consumers as a form of relaxation and leisure. Winning is mainly a matter of luck, whereas skills play a marginal role. Consumers try to behave rationally on the gambling market. They finance their gambling operations predominantly with current earnings and in gambling they follow their own habits and take into account transaction security. Gambling is perceived as a gripping activity, and therefore respondents would like to protect

their children from the access to different forms of gambling. Nonetheless, they would recommend the games to their friends.

The results shows that consumer behavior on gambling in Europe are strongly determined by perceived risk associated with particular gambling games. Analysis shows consumer gambling behavior as result of information processing and social interaction. And finally, the strongest influence on gambling behavior have emotional states during profit-and-loss cycle.

From practical point of view, the research shows that managers of casinos and other gambling institutions should focus on educational activities of consumers in Europe, concerning scale of their activities and strategy building consumer trust to those institutions. Consequently, information strategies should be developed and focus on consumer information processes and social interactions. Finally, gambling institutions in Europe should convey to consumers their responsibility for children protection against gambling.

It should be borne in mind that this research has some limitations, which, however, can be turned into an opportunity for future research. Undoubtedly, future research should be more intensely focused on investigating what should constitute viable gambling behavior in the context of well-developed and transitional economies. Similarly, it may be necessary to consider and embark on research into the most effective campaigns for proper gambling activities. Ultimately, it is the research that is likely to inform policymakers on the most sensible strategies to be implemented. Invariably, this calls for further research in different countries from the region as well as for comparative analyzes to be made between well-developed countries and countries in emerging markets. In addition, it would be proper to commence with a more comprehensive study of consumers' perception of how they win, loss and manage money.

INWARD EXPORT – A CONSUMER ANALYSIS ON SERVICE SATISFACTION

Sousa, Catarina; Meneses, Raquel

School of Economics and Management, University of Porto, FEP, Porto, Portugal

ABSTRACT

The aim of the present study is to provide further research on the inward export phenomenon, giving considerable attention to what drives the foreign consumer satisfaction in the service home country. Such phenomenon is common among tourism companies that internationalize without leaving their home country, meaning that the consumers have to travel to the service home country. This conceptual paper shows that several services may affect the foreign tourist stay, which can have different impacts on their overall satisfaction. Not only the core service, but also other complementary services, as well as, its surroundings, might have an influence on how the consumer perceives their visit and therefore, on their will to return. Thus, this study provides a broader understanding of consumers expectations so service companies can respond to or exceed such expectations, and consequently, leverage their position leading to consumer overall satisfaction.

Keywords: *Inward export, consumer satisfaction, service quality, international service strategies, tourism.*

INTRODUCTION

Globalization and internationalization have been very scrutinized themes over the past decades (Welch and Luostarinen, 1988; Andersen, 1993; Whitelock, 2002; Etemad, 2004; Knight, 2004; Lang, 2006; Negrea, 2012). Following this line, and taking into consideration the growing importance of services in internationalization, many authors have studied several topics on this matter, like international barriers, modes of entry and drivers of international performance (see Lommelen and Matthyssens, 2005; c.f. Bianchi and Drennan, 2012). Such research, although very important, leaves behind one aspect that underlines some service industries like education, tourism or healthcare (Björkman and Kock, 1997; Bianchi, 2010). There are a number of service companies that, due to a location's unique feature or the impossibility of dislocating the service abroad, require that the consumer has to physically travel to the service home country (Björkman and Kock, 1997). This inward movement, named importing customers (McLaughlin and Fitzsimmons, 1996), inward export (Björkman and Kock, 1997) or domestically located service exports (Roberts, 1999), comprises service companies where producing

and consuming are simultaneous activities and occur in the home country of that entity (Bianchi and Drennan, 2012).

At the service level, customer satisfaction might elucidate on service quality. It can also be source to improve market share, profitability and positive word-of-mouth, increase purchase and preserve consumers (Anderson *et al.*, 1994; Oliver, 1997 in Bianchi and Drennan (2012)). And, as Bianchi and Drennan (2012) conclude in their investigation, customer satisfaction is not only a result of functional attributes from the core service, such as service performance but it is also influenced by elements of the peripheral service, like the relationship between customers and service providers.

As mentioned above, tourism can be one service sector that falls within the spectrum of inward exports, as the foreign consumer has to move to the service home country to experience it (Björkman and Kock, 1997). This sector can be an instigator for domestic firms to develop knowledge on foreign consumer behavior and create international promoters, allowing some small companies to overcome internationalization barriers (Poulis and Yamin, 2009). Additionally, it is to remark that the Portuguese tourism sector shows a dynamic growth and has an important contribution on Portugal's economic activity (Sustainability Reports, 2010, 2011). According to the Sustainability Reports of 2010 and 2011 from "*Turismo de Portugal*", the tourism consumption on the Portuguese economical territory represented about 8.8% of its GDP in 2009, and about 9.2% in 2010. The same organization mentions that the balance of trade for tourism was about 5.7 billion Euros in 2012 and grew to 6.1 billion Euros in 2013, and the goal is to have an average growth of 9.5% per year until 2015. This expected dynamic makes the tourism a compelling sector for research and understanding.

In summary, this study will concentrate on the global service strategy of inward exports, focusing on the tourism sector, to explore what drives the satisfaction of the foreign consumer in the service home country. Thus, it seems eloquent to question: what are the determinants and their weight on the tourist overall satisfaction at the service home country?

This conceptual study is then divided in two parts, whereas the first presents a description of the global service strategies and the second part concentrates on the inward export strategy, describing the different services that might affect the foreign consumer satisfaction.

LITERATURE REVIEW

Throughout literature services are defined as being intangible when comparing to products, but as Shostack (1977) underlines this may not be the main distinguishing characteristic. This is, as the author also concludes, because some services have important tangible elements that will influence the "reality" of the service in the consumers mind. The complexity associated to services, whether it is their intangibility or the degree to which services are embodied in goods, makes them more challenging to

internationalize, and entities should detach from a product marketing approach (Shostack, 1977; Vandermerwe and Chadwick, 1989; Bianchi, 2011). Additionally, Cicic *et al.* (1999) argue that it is the characteristic of inseparability (production and consumption are simultaneous activities) that has the biggest impact when selling services abroad.

Lommelen and Matthyssens (2005, p. 97) define international service as "a service that is offered in foreign markets and/or to foreign customers" and there are several categories for services' internationalization strategies.

Global service strategies

According to McLaughlin and Fitzsimmons (1996) service firms can chose between five strategies to internationalize. A first strategy proposed by the authors, named multicountry expansion, seems pertinent when consumers have to physically travel to the service facility in order to benefit from it. Commonly, this strategy replicates the home country service in several locations but it requires a special attention in terms of the front-office, since it is important to adapt to the local culture.

A second strategy underlines that some service companies choose to internationalize following their corporate clients, which may require the service firm to adapt their service package and employ people that are sensitive to the local business practices (Fischer, 1991; Cooper and Lybrand, 1992, in McLaughlin and Fitzsimmons (1996)). Nevertheless, as McLaughlin and Fitzsimmons (1996) suggest, this strategy might create a tunneling vision because the service firm can ignore potential markets with growing middle classes, leaving competing local companies free to provide for them and if successful, they may become international competitors.

Service offshoring is another global service strategy and it can be defined as the outsourcing of a service in a foreign location (Fitzsimmons and Fitzsimmons, 2011). The offshore of back-office activities is very common because of their informational nature, which makes them prone to be executed anywhere in the world, leaving the company to focus on its core business (McLaughlin and Fitzsimmons, 1996).

A fourth global strategy is "beating the clock" and "describes the competitive advantages gained owing to the fact that one can bypass the constraints of the clock and the constraints of the domestic time zones, including time-based domestic work rules and regulations" (McLaughlin and Fitzsimmons, 1996, p. 54).

Finally, importing customers sustains on the concept that, due to a location's unique attribute or the impossibility of moving the service to another country, consumers will have to travel to the service home country (Björkman and Kock, 1997).

Inward export

Whether it is called importing customers (McLaughlin and Fitzsimmons, 1996), inward exports (Björkman and Kock, 1997) or domestically located service exports (Roberts, 1999), in all of them prevails the idea of foreign clients being "forced" to move to the service home country so they can enjoy the service. For example, tourism, healthcare and education are services that fall within the spectrum of the internationalization strategy in analysis (Björkman and Kock, 1997; Bianchi, 2010; Heung *et al.*, 2010). Bianchi and Drennan (2012) underline that for such service firms, production and consumption are simultaneous (the 'moment of truth') and take place in the service providers home country (see also Kandampully and Promsivapallop, 2006). Thus, it becomes essential for the firm to develop the foreign language skill and cultural sensitivity during customer-employee contact, and "transportation infrastructures and logistics management will be required to accommodate the visiting customers" (McLaughlin and Fitzsimmons, 1996, p. 52). For these service firms, McLaughlin and Fitzsimmons (1996, p. 52) argue that "differentiation will occur through customization and complexity of the service". As some authors conclude, there can be several factors that consumers take into consideration when choosing a destination, whether it is a service like education or tourism (Heung *et al.*, 2010; Bianchi and Drennan, 2012; Peña *et al.*, 2012). For the present study, these factors are divided between: core, peripheral and facilitator services, and surroundings.

The core service

Some service companies possess unique features concerning the environment where the company is located and firm specific resources and/or capabilities that prevent the service to be transferable across borders (Björkman and Kock, 1997; Roberts, 1999; Bianchi, 2010, 2011). Specifically, service's infrastructures (Björkman and Kock, 1997; Heung *et al.*, 2010) and atmosphere (as, for example, the Valamo Monastery in Finland (Björkman and Kock, 1997)) influence service quality and firms reputation, as well as marketing and communication strategies and cultural intelligence (Bianchi, 2010). These firm specific resources are distinctive features and portray the core service (the reason for the company to exist) that stimulates the foreign consumer to travel abroad (Patterson *et al.*, 1998; Kandampully and Promsivapallop, 2006). The core service can be the most important determinant for customers overall satisfaction, as Patterson *et al.* (1998) conclude for foreign students in Australia. In such study they verify that the interviewed students take greatly into consideration the learning experience and their achievements as students. Rahman and Shil (2012) also demonstrate that the core service is very important, since young consumers prefer to visit a natural park in Bangladesh by themselves, dismissing the tour guides offered by the park.

The definition of inward export has underlying a high involvement between service provider and customer at the moment of production and consumption (Bianchi, 2010, 2011; Bianchi and Drennan, 2012). This 'moment of truth' can be important to develop a good relationship between them, especially the first contact, which can be the foundation for a satisfied client (Yung and Chan, 2002). In their study, Styles *et al.* (2005, p. 122) argue for service firms with high face-to-face contact that some performance drivers "(...) were high levels of customer service, interpersonal skills, and a local presence in some form". On the other hand, Roberts (1999) states that, due to the high face-to-face contact when exporting, the service company should have cultural sensitivity, local knowledge, desire to protect intangible assets and confidentiality. As for the consumer, when moving to the service home country, he will be faced with a new and uncertain environment which may lead to conflicts that emerge from cultural differences and communication errors during the delivery process (Bianchi, 2010, 2011). The findings of the same author reveal that cultural differences, besides creating miscommunication, may mislead consumers' expectations and in consequence, lead to dissatisfaction. Thus, it is important for service firms "(...) to have a thorough understanding of individual international market preferences and needs, and adapt properly to market variation to achieve long term performance" (Bianchi, 2011, p. 287). For example, Heung *et al.* (2010) argue that medical facilities should meet consumers expectations, providing a medical care of international standards. To achieve that, as the authors also state, the destination place should have a good communication structure and multilingual employees. Nevertheless, these service companies cannot dismiss the domestic consumers as they can be a relevant portion of their revenues, like Björkman and Kock (1997) note that only 7 to 10 percent of the customers are foreign at the Valamo Monastery in Finland.

The peripheral services

Kandampully and Promsivapallop (2006) discuss in their study that customer needs are becoming more complex and so, service firms should broaden their core service offering by having non-core supporting activities. For example, Bianchi and Drennan (2012) conclude that international students satisfaction (or dissatisfaction) can be a result of services like accommodation or personal services (such as health services) when in the host country, which are neither a part nor can be controlled by the core service, the school. Still, such services can be an opportunity for the service company to gain a competitive advantage (Kandampully and Promsivapallop, 2006). Moreover, Heung *et al.* (2010, p. 237) declare that for medical tourism, even though the core service is the "medical treatment, attractive hospitality and travel options are also essential" which would require an efficient coordination between the healthcare and tourism sector.

In this line, Kandampully and Promsivapallop (2006) define peripheral services as a combination of goods, services and experiences that complement the core service, and can either positively or negatively, influence the consumer's evaluation of the service (Gabbott and Hogg, 1996; Kandampully and Promsivapallop, 2006). On the other hand, Patterson *et al.* (1998) states that the peripheral services are other services related to the consumers stay in the domestic country of the core service (the one that stimulates the consumer to travel) necessary for the consumers survival in the new country. These peripheral services have a great impact on overall customer satisfaction (Gabbott and Hogg, 1996; Anderson *et al.*, 2008; Bianchi and Drennan, 2012) and may influence how consumers view the core service (Reimer and Folkes, 2009; Bianchi and Drennan, 2012). Jin *et al.* (2012) strengthen this idea by concluding that service firms can benefit greatly when they highlight in a service package, the customized peripheral attributes that the consumer can enjoy.

For exemple, Rahman and Shil (2012) studying the satisfaction of young tourists visiting a natural park in Bangladesh, conclude that the food service is important for their satisfaction, particularly if it they were price friendly and portrayed national culture. In a study about rural tourism, Peña *et al.* (2012) verify that the perception of a destination to a rural tourist is influenced by the offer of complementary services, such as cultural services (like monuments, museums, concerts), activities in the nature (like mountain sports, water sports, etc.) and gastronomy offer.

Facilitator services

Service quality and consequently consumer satisfaction, is commonly accessed only after purchasing or during consumption (Parasuraman *et al.*, 1985). Zeithaml *et al.* (1993) discuss four factors that influence consumer expectations: past experience, explicit service promises (such as advertising), implicit service promises (for example, price and tangibles associated to the service) and word-of-mouth. On the other hand, consumer perceptions of the service vary with customers characteristics specifically, demographic (such as age or genre) and situational (like previous experience) characteristics (Anderson *et al.*, 2008). Thus, it is important that service companies choose carefully their communication strategies, as they can be a way of attracting foreign consumers to the domestic market, besides having an influence on their expectations and consequently, on their satisfaction (Zeithaml *et al.*, 1993; Bianchi, 2010, 2011). Communication activities can be performed through travel agents, participation in trade shows, exploit of the internet, direct marketing, international visits by service company staff and establishing relationships and partnerships with relevant social actors (Björkman and Kock, 1997; Bianchi, 2010, 2011).

Another important input to transmit to customers what the service can be is, as mentioned before, word-of-mouth (Zeithaml *et al.*, 1993). This type of communication conveyed by consumer reports,

friends or family (Zeithaml *et al.*, 1993) is the most influencing communication activity to attract foreign customers to the service home country. Bianchi (2010) concludes such in her investigation, demonstrating that over 50 percent of overseas customers were recruited through word-of-mouth.

The inward export strategy requires the foreign consumer to travel to the service home country and so, tourism offices (Meiriño *et al.*, 2013) and transportation infrastructures need to efficiently assist the new customers (McLaughlin and Fitzsimmons, 1996). In their investigation, Bianchi and Drennan (2012, p. 103) demonstrate that some foreign students were satisfied because of the good transportation system in Australia, since "it [is] quick and saves time", as quoted by one student. Contrarily, Meiriño *et al.* (2013), studying Ribeira Sacra in Spain as a tourism destination, notices that consumers were unhappy with the public transportation services because they were scarce.

All these points (communication activities, travel agents, transportation infrastructures, tourism offices) are then proposed as facilitator services, which help the foreign consumers to be aware of the core service and facilitate their arrival at the new country, so they can experience it.

Surroundings/Environment

In their study, Vajcnerová *et al.* (2012) present four dimensions to evaluate the quality of a tourism destination, being one the influence that the environment has on the consumer, to which they call attractions. This dimension includes natural and cultural-social attractions, for example weather and cultural facilities, respectively. Likewise, Bianchi and Drennan (2012) determine that the good weather was a determinant of students satisfaction, whereas Meiriño *et al.* (2013) conclude that safety, a peaceful environment, hospitality and the historical patrimony were influential as well.

Lichrou *et al.* (2008) propose that tourism destinations should be viewed beyond an aggregate of services, attractions, infrastructures, activities and environmental resources. In turn, the intangible and dynamic properties of such place should be considered, as they can have cultural and symbolic meaning to consumers. Nevertheless, when the foreign consumer has to physically travel to a new country and experience a new culture, there is a possibility that differences may arise when he/she meets with other consumers or with other service providers (Bianchi, 2010, 2011). For example, Bianchi and Drennan (2012) note while studying international students satisfaction, that some students felt discriminated or not accepted by local or foreign people as they were experiencing transportation services (see also Patterson *et al.*, 1998).

These previous mentioned singularities characterize a location and create a picture for the customer of the environment they will enjoy. Björkman and Kock (1997) note in their study of the Arctic Safaris Ltd, that is the Northern Finland's nature that enables consumers to experience the uniqueness of what that

service company has to offer. This country-of-origin effect is an important differentiation factor for consumers, like Bianchi (2010) concludes when students choose Australia as a base for their education.

CONCLUSION

As demonstrated previously, there are different types of services that influence the consumer overall service satisfaction. For example, Peña *et al.* (2012) demonstrated, for rural tourism, that three particular dimensions influence how the consumers perceive a rural destination: the unique rural environment, the characteristics of the services demanded and the complementary services/activities that consumers can experience (such as culture and gastronomy). On the other hand, the model created by Heung *et al.* (2010) shows that there is a combination of services from both the demand and supply side that affect a consumers' choice for a particular destination when it comes to medical tourism.

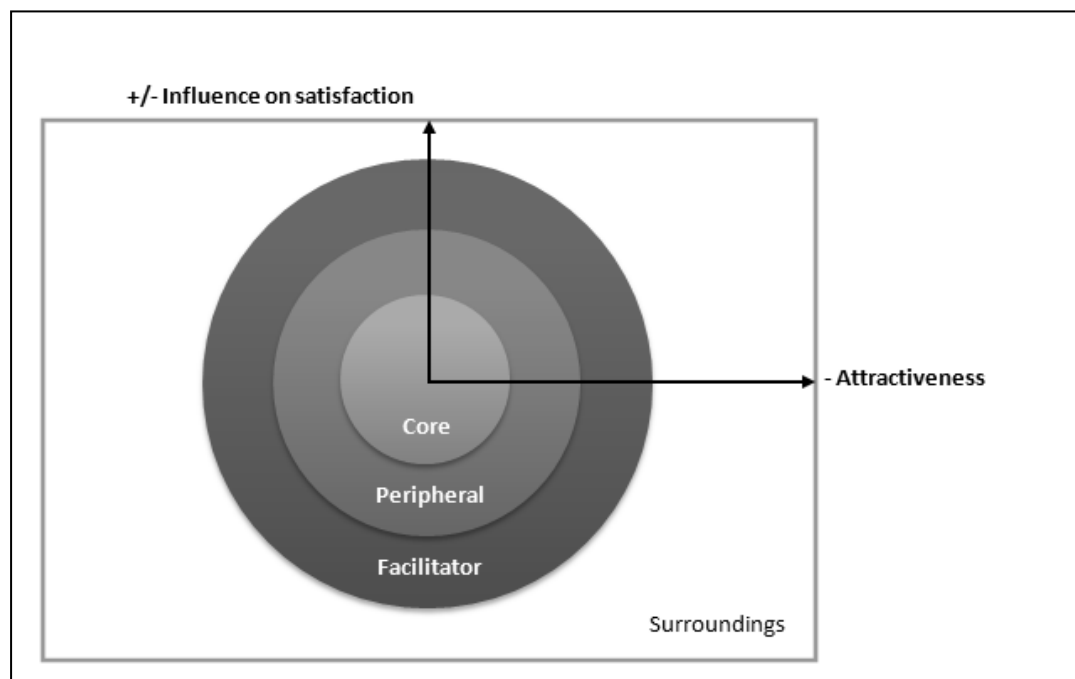

Moreover, there are diverse opinions on how all these services affect consumer perception and on the weight they represent to overall satisfaction. Some authors argue that core and peripheral aspects of a service have an asymmetric influence on consumers evaluation of the overall service (Gabbott and Hogg, 1996; Yung and Chan, 2002; Kandampully and Promsivapallop, 2006; Jin *et al.*, 2012). This is justified by the fact that there are (core) elements of the service that the consumer is expecting to enjoy, so little weight they would have on their satisfaction, being the peripheral services the major contributors to overall satisfaction. For example, Anderson *et al.* (2008), performing a study on air travel industry, demonstrate that both core and peripheral services "are significantly associated with increased overall satisfaction" (p. 374) but a variable related to the core business, the flight environment, is not. In contrast, there is also evidence that the core service has very big impact on customer (dis)satisfaction (Patterson *et al.*, 1998), particularly when consumers think that some core elements are absent (Gabbott and Hogg, 1996; Yung and Chan, 2002), which discourages consumers to enjoy such service.

In summary, and due to the different determinants of consumer overall satisfaction, which varies from the core service, to peripheral services and to service facilitators, Model 1 is proposed (see Figure 1). The core service is what drives the consumers to travel to the service home country (Patterson *et al.*, 1998) and are the service attributes which the consumer is expecting to enjoy (Gabbott and Hogg, 1996). The peripheral services, on the other hand, are other services related to the core service that the foreign customers need for their prolonged stayed in the new country (Patterson *et al.*, 1998). It is also proposed that facilitator services are those necessary to invite and facilitate the arrival and stay of the foreign consumer, meaning that these services are the ones that initiate the process of the inward exports, like communication strategies (Björkman and Kock, 1997; Bianchi, 2010, 2011). Lastly, the surroundings are

another proposed variable that influences the consumers' permanence at the new country, since they can also affect their perceptions of service quality.

As mentioned previously, literature shows some divergences on how these different services affect overall satisfaction, so it is suggested that, as consumers' experience services that are "further" from the core service, its influence on their satisfaction can either augment or diminish. This means, respectively, that consumers may give greater value to complementary services as opposed to the core service, or give more importance on core attributes of the service and less to other attributes, as it follows the line in Figure 1. Additionally, it is expected that services less centered to the core service will have a smaller impact on consumers' choice to travel to the service home country. So in Figure 1, it is proposed that the attractiveness of a service will diminish from the core service to the surroundings, unless the consumers' impulse to travel to the service home country came from a desire to enjoy the weather or the natural/cultural scenery of that country.

EVALUATION OF THE NATIONAL HIGHER EDUCATION SYSTEM'S COMPETITIVENESS: THEORETICAL MODEL

Stonkienė, Marija¹; Matkevičienė, Renata¹; Vaiginienė, Erika²

¹Vilnius University, Lithuania

²Research Institute for Changes, Lithuania

ABSTRACT

Purpose: This article aims to evaluate the peculiarities of the national higher education sector and propose a theoretical model for the evaluation of the competitiveness of the national higher education system. The proposed evaluation model for the evaluation of the competitiveness in the national higher education system has been designed by adapting the diamond model suggested by M. E. Porter. M. E. Porter's diamond model has been adapted by taking into account the fact that although higher education is market-driven, higher education outcomes are related to the public interest, thus, the assurance of the functioning of the higher education system is the area of public responsibility. M. E. Porter's diamond model has been modelled taking into consideration the specificity of higher education.

Design / methodology / approach: The research is based on literature review.

Findings and originality / value: The theoretical novelty of this article is associated with a new concept of competitiveness in the national higher education system and with a new theoretical model applied to evaluate the competitiveness of the national higher education system.

Keywords: *Higher education, higher education system competitiveness*

INTRODUCTION

Researchers involved in the analysis of the development of higher education systems draw attention to the fact that globalisation, the increasingly growing costs for public sector (including higher education), the actualisation of knowledge economy, are changing performance of higher education sector's perception and evaluation, operating conditions, functions and mission of the institutions of higher education, resulting changes in the national higher education systems, alterations in the national higher education policies and new strategic goals set for the sector (*Globalization and Education: Critical ...*, 2000; *Globalization and Educational Restructuring ...* 2003).

Under the influence of the changing social conditions the majority of world's national higher education systems have undergone changes that resulted in altered objectives of the participants of this sector, i.e., to increase the competitiveness of these systems, to ensure a special status of higher

education institutions in the national systems and the world, to increase their capacity to attract sources alternative to state funding (Deem, Mok, and Lucas, 2008 , p. p. 83 - 84). J. L. Demeulemeester notes that the change in the national higher education systems is characterized by certain common features: reductions in state funding, introduction of a new ratio of education funding provided by students and state resources, introduction of new public management, increase in internationalisation and others (Demeulemeester , 2011, p.p. 2).

The scholars note that the application of neo-liberal ideology is primarily applicable to the changes in higher education funding (Ferlie, Musselin, and Andresani, 2008; Deem, Hillyard, and Reed, 2007; Schimank, 2005, et al.). B. Jessop, N. Fairclough and R. Wodak argue that the market-based neo-liberalism involves the promotion of entrepreneurship in the higher education sector, the application of new strategic paradigms promoting the attraction of investments in higher education development and, as a result of these developments, the changes in management of the higher education system (Jessop, Fairclough, and Wodak, 2008 , p. p. 30). The analysis of the competitiveness of higher education phenomenon reveals that scientific works do not present concept of higher education competitiveness, and dominating multi-aspect definition of the field shows that the competitiveness of higher education, its research and evaluation suggest new complex (interdisciplinary or even multidisciplinary) themes in the field of higher education research.

The objective of this article is to present a model of the analysis of the competitiveness of the national higher education system. This objective aims at discussing the peculiarities of higher education in defining the concept of competitiveness in higher education system, analysing and introducing M. E. Porter's diamond model adapted to carry out the research of the competitiveness of the national HE system.

PECULIARITIES OF HIGHER EDUCATION SYSTEM, FORMING A UNIQUE CONCEPT OF HIGHER EDUCATION COMPETITIVENESS

Traditionally, higher education in Europe has been part of the state-led social policy, ensured by public funding (*Reforming higher education. ...* , 2004). The conception of higher education as a field of public responsibility has been developing under the influence of a concept of higher education as part of public well-being, based on both the classical university tradition of free education and the interference of the state in arranging and providing higher education.

The emergence of globalisation and the rise of knowledge-based society had a major impact on the systemic and institutional changes in higher education systems (*Globalization and Educational Restructuring. ...* , 2003), especially in growing market tradition in higher education (Shin, Harman, 2009). In summary, the studies of the impact of globalisation on higher education carried out by

various scholars, have identified the following crucial change of directions in higher education triggered by globalisation:

- massification of higher education;
- change in higher education management (privatisation included);
- change in responsibility and accountability for the quality of higher education;
- internationalisation of education;
- ranking of higher education institutions (Shin, Harman, 2009, p. p. 3).

Scholarly insights account for the emergence of pre-conditions for the global competition as well as conditions for its development or a continuously emerging trend of global competition in higher education. S. Marginson notes that an open information environment, the development of networked relationships that strengthen international flows do not indicate the existence of an international education system, the local context is important for the interactions between universities or activities of knowledge-based clusters (Marginson, 2004, p. p. 176). S. Marginson argues that the local context leads to a new corporate autonomy of a number of universities from the illiberal state institutions (Marginson, 2004, p. p. 176). The importance of the national context is attributed to national resources and national needs. To define these intertwined contexts of higher education as well as the impact of their elements on higher education sector, S. Marginson and G. Rhoades have introduced a new term – *glonacal* (*glonacal* = *global* + *local* + *national*) (Marginson, Rhoades, 2002). This approach allows to identify the peculiarities of global competitiveness in higher education: creating of opportunities and conditions for institutions of higher education to compete on a global scale increases their competitive potential on the local and national scale; enhancing of the global competitiveness of higher education institutions can be ensured by national resources, global competitiveness can be affected by the activities of higher education institutions at the national level. The suggestibility of the higher education system to the global, local and national contexts indicates the potential sources for raising competitive advantage initiatives that emphasizes the specificity of competitive conditions provided for the higher education system and indicates the potential peculiarities characteristic to the evaluation of the competitiveness of the higher education system that requires distinctive approaches to measure competitiveness.

Market ideology applied in higher education and being promoted by globalisation is based on the economic neoliberalism doctrine that ascribes the significance to market power, deregulation, seeks reduction of public expenditure on higher education as well as on other social services and the input of new higher education funding sources. Neo-liberalism in higher education is primarily associated with the idea of academic capitalism where any institution or professional attempts under the market conditions or *marketlike* conditions in order to raise funds alternative to public funding from the

budget (Slaughter, Leslie, 1997). The idea of academic capitalism is based not only on commercialisation of scientific knowledge in the market (patenting, licensing or establishing *spin-off enterprises*, etc.) or marketlike conditions (obtaining funding by grants, establishing various partnerships of higher schools and business organisations, raising funds from tuition fees, etc.), but also includes other activities of higher education institutions that are changing the interaction between higher schools and their social environment. Market relations in higher education are characterized not only by the idea of academic capitalism but also by the concepts of new public management and entrepreneurial universities (Deem, 2001).

The researchers, while highlighting the advantages of the input of market relations in higher education, note that the application of the neo-liberal ideology is primarily associated with positive changes in higher education funding (Ferlie, Musselin, Andresani, 2008; Deem, Hillyard, Reed, 2007; Schimank, 2005, et al): the change in the activities of higher education institutions, the development of their entrepreneurship, the promotion of competition among higher education institutions, higher education systems (higher education institutions, being the participants of the higher education system compete to attract academic resources, commercialise scientific knowledge, academic services). Another advantage of market ideology is that the market assigns resources to research on a competitive basis, which leads to the usability of scientific knowledge, research, i.e. specific potential commercial benefits.

However, in addition to the advantages of market relations in higher education, possible negative consequences of the input of market relations are visible: the limitation of access to scientific knowledge due to commercialisation, the restriction on innovation diffusion, potential threats to academic freedom, the underestimation of fundamental research, the training of specialists of narrow specialisation, the advent of specialised research. Subsequently, the shrinkage of higher education as a public good, accompanied by declining public support is identified as a negative impact.

This means that, seeking to meet the public interests of the university, the cost-benefit paradigm should not to deny the distinctive approach to higher education as a public good, but ensure the fulfillment of satisfying the public interests delegated to higher education institutions and include other public expectations traditionally attributed to higher education as the area of public responsibility (e.g. fundamental research should be considered as the public good, to ensure a broad dissemination of the findings of scientific research, the establishment of higher education institutions, the diversity, applicability of higher education results, the availability of higher education, etc.).

The experts of the World Bank note that even though higher education and other public sector institutions compete with each other for the state budget funding, the financing of higher education from these resources remains important for three reasons: the investment in higher education

provides benefits in terms of economic and social development; the market disadvantages largely influence inaccessible loans to part of the students; higher education is important for the development of basic and secondary education (*Constructing Knowledge Societies ...*, 2002, p. p. 76) .

Taking into account these peculiarities of higher education as that of an area of specific activity, while dealing with the concept of higher education competitiveness, it is appropriate to evaluate the aspect of the competitiveness of higher education as a whole of long-term economic and social welfare growth conditions. The involvement of the higher education system in the process of increasing the state (public) welfare requires the input of not only the needs of the market, but also of the social state (society needs) aspect into the concept of the competitiveness in higher education. So, it is assumed that higher education competitiveness is related not only to economic factors as a whole, but also with the development of the context –the environment of the political, social and other capacity of higher education. Therefore, it is argued that neo-liberalistic access based on the change of operating conditions of higher education institutions forms a distinctive (specific) concept of higher education competitiveness.

The examined peculiarities of higher education define the specifics of the concept of higher education (including higher education sector) competitiveness. A.Kemnitz draws attention to the fact that the scientific literature shows little interest in the investigation of competition of the higher education sector (Kemnitz, 2004). Scientific research carried out on the issues of higher education competitiveness focuses on different aspects of competitiveness of the higher education sector – educational service market problems (Adelman, 2000; Marchese, 2000, et al.), the impact of demographic factors on higher education (Altbach et al., 2009 Swailes, 2001, Keller, 2001, et al.), tuition fees (Geiger, 2004, Hughes, 2011, Ehrenberg, 2000), changes in higher education funding (DelRey, Racionero, 2010, Curs, Singell, 2010, Johnstone , 2004 et al.) or changing priorities of the state, international organisations, assigned to the relevant fields of scientific work.

Scholarly attention is low in discussing the concept of higher education competitiveness as there is no detailed evaluation of the competitiveness of the higher education system, sector or institution, or factors forming a competitive edge. Having evaluated the operational peculiarities of the higher education sector, the fact that the evaluation of the state performance as that of the competitive entity, involves a relevant component of public interest satisfaction, it is believed that the construction of the concept of competitiveness of the higher education system should include the know-how of modern definitions of the states' competitiveness.

Therefore, it is appropriate to comprehend the competitiveness of the national higher education system as the capacity of the higher education system to create, maintain and develop the higher education environment in which the higher education system can compete not only nationally, but

also globally as well as increase the welfare level of the society, the public. This concept is based on the establishment and assurance of the operating environment of the higher education system, i.e., providing the conditions for competitive operation of the higher education system. The interaction of the national higher education system and the state competitiveness enables to evaluate the application of the state competitiveness research models in order to explore the competitiveness of the national system of higher education.

M. PORTER'S DIAMOND MODEL ADAPTED TO EVALUATE THE COMPETITIVENESS OF THE HIGHER EDUCATION SYSTEM

M. Porter's diamond model is one of the most widely applied instruments for the evaluation of the competitiveness designed primarily to assess the national competitiveness, later adapted to evaluate the competitiveness of economic sectors (Porter, 1990).

This model evaluates the internal and external factors that create the advantages in the context of global market: internal factors such as demand conditions (consumers and their specific needs), industrial sectors, as well as the strategy, structure and competitiveness of the entity (depending on the country's legal conditions, the country's cultural peculiarities), and important external factors are considered to be the state institutions (the government) and opportunities.

While evaluating the feasibility of *M. Porter's diamond model* in examining the competitiveness of the national higher education system it is necessary to take into account the peculiarities of the national higher education system. Given the peculiarities of the outcomes of the performance (mission) of the higher education system, considering competitiveness of the higher education system (higher education sector, higher education institutions) as the ability of the system of higher education (higher education sector, higher education institutions) to create, maintain and develop the higher education environment in which the higher education sector is not only able to compete, but also raise public and state welfare, the analysis of the national higher education system's competitiveness should assess both, the competitive conditions ensuring the capacity of the higher education system and the higher education system's ability to respond to the goals related to satisfying the public interests, set by the society and state, as well as to increase the level of the public and state welfare.

Considering the fact that the higher education system's operational outcomes are significant to both the public and the state it should be noted that the development of conditions facilitating the growth of competitive capacity of the system of higher education, first of all, depends on the state policy and the performance of state institutions. The role of the state institutions is associated with the elimination of information asymmetry shortcomings that are characteristic to the market (or *quasi-market*) of higher education, so the assessment of the competitiveness of the higher education system

(higher education sector) must include the discussion of state activities in the field (the accreditation of higher education institutions, the assessment of the quality of the performance, the external evaluation of all activities, actions directed to satisfy the public interest). Apart from the fact of the higher education sector's ability to generate financial resources as significant in terms of the diversification of income sources, raising funding sources alternative to state budget funds, also important to point out that the investigation of the conditions that ensure competitive edge of national higher education system, the conditions offered to higher education institutions must be evaluated first, as well as the given opportunities to compete for funding alternative to state budgetary financing (both for higher education and research).

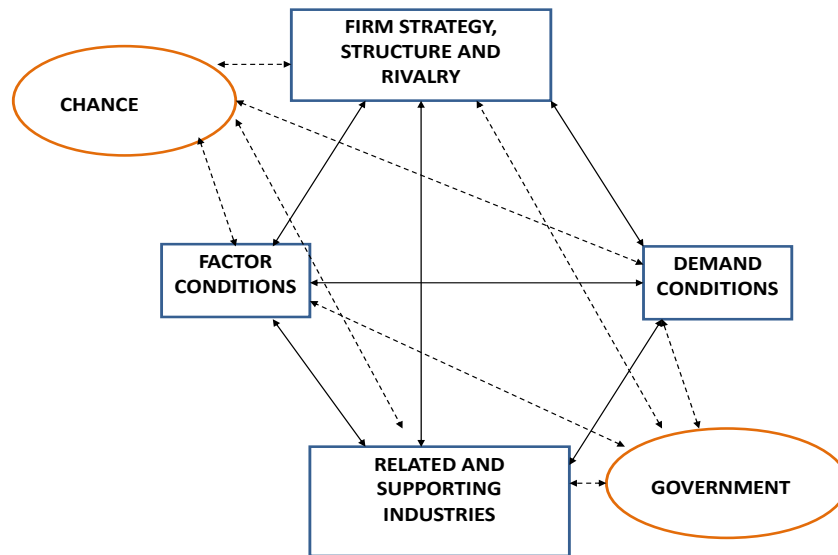

The application of a mixed approach: based on resources and competencies, is considered to be the most appropriate in examining the conditions that boost the competitiveness of the national higher education system.

The application of the approach requires to evaluate appropriate competencies and the quality of the performance relevant to both carrying out the missions of higher education and managing the system of higher education, the higher education system's ability to create and maintain diversity in the system of higher education (in terms of its institutions, courses, etc.). It should be noted that the status and prestige of the system of higher education (higher education institutions) is related to assessment of the quality of competencies of higher education system and performance of appropriate activities. Attention is drawn to the fact that the assessment of the competitiveness of higher education highlights the competition among higher education institutions providing educational services, whereas the competition of institutions carrying out scientific activities (research) is not based on the assessment of institutions, and is only visible in the competition with regard to the financing of activities.

The highlighted aspects in the assessment of the competitiveness of the higher education system (sector) require the adaptation of M. E. Porter's *diamond model* that is based on the belief that it will be possible to apply it in researching both the entire system and the higher education as an economic sector, however, is considered that in order to assess the competitiveness, the presence of the market (or *quasi-market*) is the condition necessary in both cases.

The adapted M. E. Porter's *diamond model* (Figure 1) shows that the development of the national higher education system (sector) is considered to be an integral part of a complex network that includes a variety of public life sectors of the national state that play an equally important role in increasing the state's economic competitiveness and implementing other significant efforts to create welfare state.

Figure 1. M. E. Porter's diamond model adapted to examine the competitiveness of the national higher education system (sector) (developed by the authors by M.E. Porter's *diamond model*)

In this model one of the external factors, i.e., *the government institutions (the government)* are seen as a partner which role in the system is essential: the national system of higher education depends on the decisions made by the government institutions. The impact made by the governmental institutions is associated with other sectoral policies influencing the development of the higher education system. Another external factor - *the opportunities* – is conceived in the model in their traditional meaning, as unexpected events affecting the change of a competitive ability or a competitive situation.

The internal factors of the national higher education system (sector) are considered to be *the internal factors* that play a decisive role in operational activities of the higher education system (sector):

- *Factors of production* of the higher education system (sector) that are perceived as the resources and competencies (*the input*) necessary to carry out the higher education system's (sector's) functions (defined by distinguishing the traditional university missions, i.e., teaching and research). Resources and competencies can be identified as the resources and competencies of the teaching and research quality or the resources and competencies of the status of the national higher education system. These resources comprise both the country's basic factors (geographic location, demographics, etc.) and general factors (developed general economic infrastructure as well as the infrastructure of higher education system, intellectual capital, et al.) and specialisation factors (e.g., skilled human resources, crucial for their specific skills, advanced research, study methods and techniques, innovation, etc.), important evaluating aspects of the resources are those of resources development, renewal as well as the speed of use and efficiency. A distinctive resource of the higher education system is those seeking for higher education, their "quality" directly related to the operational quality

of the higher education system and the evaluation of the outcomes received from this system. Therefore, the “factors of production” include the higher education system’s international cooperation, participation in research networks, arrangement of international education, attraction of foreign students for study, attraction of foreign scientists, professors to participate in the study process of the national higher education institutions.

- This model presents *the conditions for the demand* of the outcomes of the higher education system’s (sector’s) performance in terms of the applicability (marketability) of the learning (study) outcomes and research findings of the higher education system; this internal factor can be defined as the output of the third university mission: the applicability of the outcomes of the higher education systems is associated not only with meeting the market needs, but with satisfying the public interest, so the evaluation of the outcomes of the higher education system’s performance should take into account the fact that only part of these outcomes can be evaluated by economic categories or quantitative indicators.

- Two other internal factors: 1) the higher education system’s (sector’s) management, funding, structure and 2) the higher education system’s (sector’s) accountability, accreditation, assessment are closely inter-related as they indicate the significance of the role of the state in the system of higher education and describe the importance of this role.

The assurance of the efficiency of the national higher education system is associated with the management, structure and financing of the higher education system (sector), (similar coverage limits are observed in the factor derived by Michael E. Porter’s *diamond model*): the conditions governing the higher education system’s (sector’s) operating conditions as well as conditions for higher education institutions in terms of their establishment, management, performance and financing from the state budget funds, indicates the volume and characteristics of the competition taking place between the participants operating within the system (sector) of higher education.

Other internal factor that is considered to be accountable for satisfying the public interest of the national higher education system, in accordance to Michael E. Porter’s *diamond model* is shown as a factor comprising the serving and related industrial sectors. The relevance of the accountability of the higher education system (sector) is associated with the accountability of the higher education system (sector) as that of the entity operating in the sphere of satisfying public interests. The accreditation and evaluation are related to the duty of the state to ensure the rights of higher education consumers. All together, this internal factor can be described as that of public agent institution’s (Cave, Kogan, 1990, p.p. 183).

Adapted *Diamond model* by Michael E. Porter to examine the competitiveness of the national higher education system (sector) is intended to explore the environment in which higher education systems (sectors) not only compete but also seek to improve the welfare level of the society, the public.

DISCUSSION AND CONCLUSIONS

The analysis of the scientific approach to factors determining competitiveness reveals that of a variety of concepts of competitiveness correlates with diverse theoretical sources available one valuation of competitiveness. The internal and external economic factors, economic characteristics are considered to be most significant.

Undoubtedly, the analysis of the competitiveness of the higher education sector like that of any other sector of the economy, involves such significant factors as the general macro-economic factors revealing the context of the higher education system, the analysis of which is relevant in forecasting the performance of the higher education sector. When applying the approaches that examine the competitiveness of the economic sector proposed by the scientists to investigate the competitiveness of the higher education system should evaluate the peculiarity of higher education, i.e., meeting the public objectives and public interests, as have been already discussed. It is believed that the traditional economic sector approach related to the pursuit of economic benefits, applied for the competitive assessment of the higher education sector is hampered by the features of the higher education sector.

The application of the method (with appropriate exceptions) to measure the advantages of systems' performance indicators are possible only in evaluating the national competitiveness of the entities of the higher education sector (higher education institutions). Globally, the method applied to measure the advantages of the performance indicators in the higher education sector is hindered by the peculiarities of the national higher education systems, differences in higher education sectors of the nations. It is believed that the assessment of the competitiveness in the higher education sector should apply the approach that evaluates the competitive advantage of the existing system with its legal, political, economic, social and other factors. The appropriateness of this approach is based on the development of higher education environment that encourages, enables and ensures a competitive higher education system that will take an active part in increasing the standard of public (society) welfare and satisfying the public interests.

The article proposes a model for examining the higher education system (including higher education institutions) that assigns significance to the assessment opportunities of higher education as that of a system: the assessment of the performance of higher education institutions and factors that determine their performance (human, financial, material and other resources; management, leadership, etc.), the ability of higher education institutions to monitor the environment (performance of other higher

education institutions, the system of higher education, the performance of other public sector institutions; interpretation of policy/decisions made by the state institutions) and, depending on the changes in the environment to introduce internal changes (the ability to compete on services, human resources, etc.).

The analysis of the components of the competitive model adapted to the higher education system highlights the component of human resources (researchers, higher education administrators, lecturers, students, etc.): the overall competitiveness evaluation system is based on the human competencies, ensuring the performance of higher education institutions, its assessment, potential demand or final outcomes. One more aspect is worth mentioning - the assurance of public welfare: the competitiveness of the higher education system does not determine profit of any particular organisation, but targets at developing knowledge as a basis for the creation of new knowledge, development of exclusive competencies, i.e., the sustainability of the system is ensured on the basis of the circulating knowledge within the system, resulting in the creation of added value to society and the state.

The issues of competitiveness in the analysis of the higher education system (especially –of the institutions) are associated with both global and local context, emphasis is laid on the benefit gained from the development of competitive environment resulting in changes introduced not only in individual sectors of the economy, but also in the state. The application of this scientific approach to the assessment of the competitiveness in the higher education system signifies the relevance of evaluating both the local and global contexts. The higher education sector's competitiveness is unique due to the exceptional role of the state (government): state's (government's) role may be crucial in determining the structure, operating principles of the overall higher education system. The analysis of scientific model targeted at the evaluation of the applicability of higher education research activities, for the competitiveness evaluation revealed that the financial and international cooperation aspects are observed as the most significant aspects in assessing competitiveness in this area of higher education. These important aspects are also evaluated by the proposed adaptation of M. E. Porter's *diamond model*.

A high-quality higher education system which involves active participation of the public at large is a mandatory requirement to ensure the state's development and international competitiveness.

UNDERSTANDING WOMEN ENTREPRENEURS WORKING IN A CONFLICT REGION

Sultan, Suhail Sami

College of Business and Economics, Birzeit University, Palestine

ABSTRACT

Purpose: The main purpose of this research is to get a thorough and deep understanding of women entrepreneurship working in an Arab and conflict country such as Palestine.

Methodology: The study used the quantitative method. The researcher distributed 100 questionnaires on a group of women who are categorized as being entrepreneurs and who own and run their businesses. The judgmental sampling technique used to select these women, based on prior knowledge of the researcher and use of different networks.

Findings: The results of the research paper show that Palestinian women have positive perception towards entrepreneurship. Women start their businesses driven by opportunity rather than necessity. The main characteristics of women entrepreneurs' enterprises are more likely to be in consumer oriented businesses, and small ventures hiring between 3-10 jobs. Culture, and access to finance are the main challenges of women entrepreneurs.

Practical implications: Understanding women entrepreneurs will assist decision makers in Palestine to issue policies to eliminate the barriers these enterprises are facing. Therefore, number of entrepreneurs will increase and economic situation will improve.

Originality: Due to the lack of literature discussing women entrepreneurship in Middle Eastern context, the research discusses women entrepreneurs based on the particularities of conflict regions such as Palestine.

Keywords: *Entrepreneurship, Women, Palestine*

INTRODUCTION

While a lot of studies identifying women entrepreneurship success factors have been carried out in advanced countries, economic research on entrepreneurship in developing economies is less developed and only a few studies have used a rigorous scientific approach. The presence of women around the world driving small and entrepreneurial organizations has had a tremendous impact on employment and on business environments worldwide (Minniti & Arenius, 2003). However, it is still the gap in the research and dissemination of information about female entrepreneurship. Nearly one-

third of all the businesses in the formal economy are women-owned, and women entrepreneurs are expected to be playing an even larger role in informal sectors (Bowen & De Clercq, 2008).

In recent years, there has been a considerable and growing interest in entrepreneurs and entrepreneurship (Davidsson, 2006) at both national and international levels because it symbolizes innovation and a dynamic economy (Gnyawali & Fogel, 1994). Nevertheless, the topic of female entrepreneurship has been relatively neglected both in society and the social sciences, despite the fact that generations of women from across the world have contributed to their environment, demonstrating encouraging signs of entrepreneurial spirit (Global Entrepreneurship Monitor, 2004).

In Palestine, women's entrepreneurship is increasingly recognized as an important factor for economic growth and development. However, The number of women entrepreneurs in Palestine are relatively low, due to a number of factors. Palestinian women entrepreneurs face obstacles, despite deliberate attempts by the Palestinian Authority to encourage female entrepreneurship.

OBJECTIVES

Women's entrepreneurship, particularly in Palestine, deserves attention, in order to access an underutilized resource and increase economic growth, entrepreneurship can offer new opportunities for women and hence generate income and create wealth for themselves and their families. Thus the main objective of this research is to get a thorough and deep understanding of female entrepreneurs in Palestine.

METHODOLOGY

In order to understand women entrepreneurship in Palestine, the researcher used different sources and methods for data collection:

Secondary data. Where the researcher relied on surveying the literature relevant to the topic, including the statistical tables, publications issued by governmental and non-governmental organization, research papers, articles and editorials.

Primary data. The researcher distributed 100 questionnaires on a group of women who are categorized as being entrepreneurs and who own and run their businesses. The judgmental sampling technique used to select these women, based on prior knowledge of the researcher and use of different networks.

The aim of this questionnaire was to get a thorough understanding of the factors affecting women. The main points that were tackled in the questionnaire are: (a) influencing factors in the decision to launch a venture; and (b) problems encountered by female business owners.

LITERATURE REVIEW

Palestine consists of two separated parts: West Bank and Gaza Strip. In the fourth quarter of 2013, the unemployment rate in Gaza Strip was 31.0% compared with 20.3% in the West Bank, and the unemployment rate for males in Palestine was 21.2% compared with 35.3% for females. The highest unemployment rate in the fourth quarter 2013 was 41.1% among youth aged 20-24 years. For years of schooling, the unemployment rate among females with 13 years of schooling or more was 46.7% (PCBS, 2014).

Although Islam declared woman capable of exercising all her rights with no exception and to pursue her social and economic activities, yet, women in Palestine, like women in many Middle Eastern countries, struggled against inequality and restrictive practices in economic participation and family roles. Many of these unfair practices and limitations are said to originate from local cultural traditions (Haber & Reichel, 2007), and creating obstacles towards rights and liberties reflected in laws dealing with criminal justices, economy, education and health care.

This is due to many factors. Some of which are: the slow growth in the region influences economies towards low demand for female labor. In addition, the traditional view that men are the breadwinners further obstructs the employment of women and contributes to an increase in women's unemployment relative to men; the uncertain security situation and internal political tensions (Freedomhouse, 2010) imposing constraints on women and limiting their access to employment opportunities, freedom of movement; and the Arab culture that defines the roles of men and women, men are expected to support their families and women to take care of house and family and hence culture promoted that the right place for the woman is her house.

In Palestine, there is no law that prohibits women's work or ownership of a business exists. However the business environment is still highly affected by gender issues. Women entrepreneurs have their fair share of challenges and constraints that hinder their economic participation and thus make their contribution rates lower than men. Nonetheless, the situation of women in Palestine has seen lots of changes, all aiming at improving the overall status of women. More women are turning into entrepreneurship and hence contributing to the development and economic growth of their country.

In Palestine, as all Arab women entrepreneurs, are faced with external barriers such as lack of financing, exclusion from male-dominated informal networks and the social attitude that business ownership is a male activity. Such barriers are mainly informal barriers based on cultural norms, values and customs (Mohsen, 2007).

DATA ANALYSIS

Women aged 25-35 are the most entrepreneurially active. It is noticeable that the involvement in entrepreneurial activities decreases with the increase in age, where women aged 55-64 are the least active. As well, it is noticed that entrepreneurial activity increases with education, till it reaches its highest rate among secondary certificate holders (40%), the highest second rate is for completed university degree holders (18%) and then college/technical category (12%). Almost (40%) of the respondents started their own businesses without having any previous experiences while (25%) of the respondents were working in full time jobs and (35%) were engaging in part time jobs. In Palestine women who are living in rural regions (almost 60%) are more entrepreneurially active and (80%) of them are married.

For many individuals, the entrepreneurial process starts with a personal assessment dealing with attitudes and perceptions towards entrepreneurship. In Palestine, women (80% of the respondents) have a positive attitude towards entrepreneurship. When women were asked whether people perceive starting a new a business a desirable career choice, the majority of women were very positive about it. Starting a business requires some basic skills such as planning, technical skills, marketing and monetary skills. When women were asked if they think they have the required skills to start a business, (60%) of the respondents showed that they are still struggling to get their basic needs. When women were asked whether fear of failure would prevent them from starting their own businesses, the answers showed moderate rate (50% of the respondents).

Women were asked if they started their businesses due to “necessity entrepreneurship,” which has to become an entrepreneur because you have no better option, from “opportunity entrepreneurship,” which is an active choice to start a new enterprise based on the perception that an unexploited or underexploited business opportunity exists. Women in Palestine are driven by both motives and with the same intensity, and this is due to unstable political situation leading to worsening economic situation, creating need for capturing any opportunity in the market to start a business and, at the same time, to alleviate poverty and support family on one side and as a substitute for employment.

Almost (80%) of the respondents did not create jobs while (20%) created (1-5) jobs. It is predictable because, the majority of the respondents are working in consumer oriented firms and in business services with almost no activities outside Palestine.

Women in Palestine are looking for better standards of living. They realized the particular nature of their societies and endeavored to achieve for themselves what others can't do it for them. When women were asked about what made them launch their ventures, the answers is to alleviate poverty especially with the unstable political situation which contributes to deteriorating not only women's

status in the community but the stability of families in specific and society in general. Table (1) presents the influencing factors in the decision to become entrepreneurs.

Table (1). Influencing Factors in the Decision to be Become Entrepreneur

No.	Factor	Percentage (%)
1.	Income generation	60
2.	Dissatisfaction with current job	55
3.	Use the time in something useful and be productive	45
4.	Self-actualization	40
5.	Financially and economically independence realization	25
6.	Contribution to the Economic progress of the country	15
7.	Attainment of status in the society	10
8.	Flexibility in time-allocation between family and house	10

Although the percentage of women-owned enterprises is in increase, yet women are still facing many constraints and difficulties that may hinder the growth and development of their businesses. Women were asked to specify the problems they encounter in their attempt to manage and run their ventures. Table (2) presents the main challenges that are facing women to start their own businesses.

Table (2). Challenges facing Women Entrepreneur

No.	Challenge	Percentage (%)
1.	Culture	84
2.	Lack of support services	82
3.	Access to finance	55
4.	Registration process	52
5.	Laws and regulation	50
6.	Political instability	32
7.	Poor infrastructure	18
8.	Lack of technology	10

Women are faced with cultural limitations that restrict their image to a typical housewife. There was almost a consensus among women on the role played by the prevailing culture on holding them back not only in terms of owning and running the business but when it comes to their rights in movement, joining workforce, political participation and freedom of choice. They believed that norms, traditions and attitudes of the conservative society pose a burden on them. They feel their societies still perceive them as housewives no matter how educated they are or how successful in their businesses they are.

The traditional role puts another limiting factor on women entrepreneurs which is the work - home role conflict. The combination of two jobs, one at work and one at home, is difficult for women in Palestine where poverty and lack of infrastructure can make the most basic tasks harder and time-consuming for them.

Lack of training, information and support services also perform against the growth of women's entrepreneurship. Women stated that they don't possess the required knowledge or skills of a successful businesswoman though they believe that they cannot grow without the right tools and skills and at the same time, they find it hard to acquire these skills, due to its cost or scope.

Access to finance poses itself as a hindering factor in addition to the complicated and bureaucratic business registration process. Women feel it is more difficult for them to access finance and they sensed gender-discrimination especially when applying for loans from banks, who, according to women, require male guarantor and to provide more collaterals. Also, when they seek funding from their families or friends, they feel they are not sometimes taken seriously. However, on a positive side, they expressed "somehow" their satisfaction with micro-credits organizations, due to their "softer" stipulations compared to banks.

Though there is no law that forbids women's ownership of business of any type, however women believed it is the applications of these laws that slow down their entrepreneurial endeavors. Women expressed their dissatisfaction with the mechanisms with which laws and regulations are applied.

Another factor that may hold up women's venture's growth is the complicated and cumbersome business environment. According to the Palestinian women, procedures are complex, length and costly, i.e. obtaining licenses and permits. Paying taxes and bankruptcy and exit procedures, all are working against them and hence may drive them towards the informal sector.

Other hindering factors are the political instability and war threats, lack of skilled and dedicated labor, the limited market expansion opportunities, poor infrastructure, and lack of access to technology and innovation.

FINDINGS AND RECOMMENDATIONS

FINDINGS

1. The demographics of the early stage women entrepreneurs can be described as, educated with post-secondary certificates and higher, their age fall between 25-44, married, live in the urban areas.
2. Women have positive perception towards entrepreneurship.
3. Fear of failure is moderate among women.

4. Women start their businesses driven by opportunity and necessity.
5. The main characteristics of women entrepreneurs' enterprises are 1) more likely to be in consumer oriented businesses, 2) small ventures hiring between 1-5 jobs.
6. Women entrepreneurs are claiming culture, access to finance, and business environment as the main challenges to start their businesses.

RECOMMENDATIONS

The main recommendations are the following:

1. The society should change its norms and attitudes towards women entrepreneurs
2. Banks and microfinance credit institutions should pay more attention to women entrepreneurs
3. The Ministry of National Economy should restructure the procedures to support women entrepreneurs
4. Further research should focus on informal women entrepreneurs.

THE PATH OF SUSTAINABILITY STARTS FROM BENCHMARK DESTINATIONS

Tardivo, Giuseppe; Scilla, Angela; Viassone, Milena

Department of Management, University of Turin, Italy

ABSTRACT

Literature largely accepts that the future competitiveness of destinations will depend on their ability to take advantage of their economic, natural and cultural resources in a sustainable way. For these reasons, managers often seek to establish strategies and operational procedures leading the achievement of a sustainable competitive advantage for tourist destinations. Even though the tourism sector is not the typical field where the benchmarking methods are widely used, such approaches could be successfully if they will be applied to evaluate destination sustainability and to manage the performances of tourist destinations. This paper aims at providing a descriptive and prescriptive framework of features that a destination pursuing the path of sustainability should develop. We proceed with a systematic analysis of related literature and analyzing 82 awarded European tourist destinations for sustainability in the last 5 years. Our goal is the creation of a set of best practices for tourist destinations, thus providing also an important contribution to the literature.

Keywords: *Tourist Destination, Benchmark, Sustainable Destination, Tourist Strategies, Ecolabel.*

INTRODUCTION

Despite the difficult economic scenario characterized the last 7 years, especially for advanced economies,, the tourism sector confirms its positive trend as one of the fastest growing sectors in the twenty-first century, generating the 9% of world GDP . (Wto, 2014). In 2013 it has experienced, a year of further strengthening of international tourism (1.087 billion), an increase of 5% compared to the previous year. Europe has attracted the largest number of tourists (563.4 million, +5,4% than 2012), becoming the most visited region in the world with 52% of all international arrivals, a growth rate of 5% in Europe is remarkable including many comparatively mature destinations. Tourism receipts grew by 4% in real terms, accounting for 42% of receipts worldwide (WTO, 2014).

For the reasons we had explained, tourism continues to be an important driver of development, prosperity and well-being (Weaver, 2006; Scheyvens and Momsen, 2008): it enhances economic growth and encourages local development by increasing employment and national income (Szivaz *et al.*, 2003; Torres and Momsen, 2004; Na Sakalnakorn and Naipinit, 2011).

But a competitive challenge among several destinations is shaking the tourist sector. Each tourist destination, who want to win the challenge and to maintain its competitive advantage, has to plan some strategic actions to be taken. This strategic planning must ensure a balance between the quality and quantity of a supply, and balance it with a corresponding level of demand respecting socio-economic development, environmental factors and sustainability.

For these reasons, managers often try to establish strategies and operational procedures leading the achievement of sustainable competitive advantage of tourist destinations, including benchmarking techniques (Kozak and Rimmington 1999). the main goal of regional governments and destination management institutions is to succeed in this competitive struggle by increasing the competitiveness of their destination. The quality of strategic planning and final strategies become a key factor of competitiveness.

The combination of competitiveness-sustainability is particularly emphasized in the context of tourist destinations and it assumed, therefore, an important role in the international literature of recent decades (Franch *et al.*, 2010; Hong 2009; Enright and Newton, 2005; Ritchie and Crouch 2003; Hassan 2000).

The aim of this study is therefore to identify the features a tourist destination has to possess or develop in order to follow the path of sustainability. Benchmarking techniques allow the detection of these characteristics and, even though they are not widely used in the tourism sector, such approaches could be successfully applied.(Luštický and Kincl, 2012).

To achieve our aim we will apply a qualitative analysis based on the literature review and on the study of factors influencing the economic, social and environmental sustainability of a tourist destination.

THEORETICAL BACKGROUND

According to Godfrey and Clarke (2002), sustainability becomes a synonymous of competitiveness in a long term. So, providing tourism destination with sustainability allows its development and enhancement in long-term.

To control the effects and consequences of tourism decisions, managers and territorial Actors need to be informed. They may use several indicators, as quantitative measures and qualitative reports, that serve as managerial tools in the process of tourism development. For example, through these information and data, they can (Jurdana, 2011):

- o identify easily some important and urgent problems in order to undertake appropriate measures;

- o identify influences and act before they will be seriously damaged support sustainable development, minding limits and opportunities;
- o help managers for a better evaluation and responsible decision making.

Tourism industry not only needs economic indicators but also environmental and social change indicators: they not simply measures current conditions but also serve as “early warning” devices to alert managers of imminent problems (Jurdana, 2011).

Tourism theory recognised the basic importance of environmental quality to ensure the future existence of most kinds of tourist destinations. Tourism managers have been willing to incorporate environmental measures into current management strategies and methods because they can generate lower costs (first aspect) and/or higher revenues and profits (second aspect).

The first aspect usually refers to energy, water and other resource saving programs and thus, in many cases, it results in cost reductions; it is also economically attractive for environmental managers and easily supported by business and political forces located at the destination. The second aspect requires higher environmental awareness, more information and co-ordination, public management and substantial (public) financial resources; it is much more exacting and expensive to manage. It also requires a long-term view; it brings present costs and future benefits (Mihalič, 2000).

According to literature, the sustainability of a tourist destination must be measured, identifying some economic, environmental and social indicators (Butler 1991; Pigram 1990; Carbone, 2005; Weaver, 2006; Schevenes and Momsen, 2008; Jurdana and Frleta, 2011; Albu 2012).

Guidelines of sustainable prizes and ecolabels contain several of these sustainability and competitiveness indicators.

Normally, the main function of ecolabels or sustainability prizes in tourism is to attract tourists, they are a factor of consumer choice, but accreditation may also be used as a criterion by regulatory agencies to grant permits; promotion agencies for their inclusion in marketing campaigns; and insurance underwriters to issue policies and set premiums. (Buckley, 2002).

As a sustainable development tool, it has some advantages, such as showcasing good practice and encouraging voluntary improvements; it also has its drawbacks, such as the fact that it is not equitable and efficient (Sasidharan et al., 2002).

The criteria allowing to obtain sustainability prizes can become successfully guidelines for local actors and managers in strategic planning for sustainable development of their tourist destination. Benchmarking with other tourist destinations would allow, with a systemic point of view, the creation of a virtuous cycle for the long-term development.

RESEARCH MODEL

The research question of the present study is:

Q: What are the main features that a destination choosing to be sustainable should follow?

This objective is particularly important because current literature doesn't propose a shared illustrative framework to be followed by destinations which pursue the path of sustainability.

This objective is achieved throughout a qualitative research based on a review of literature and on a frequency analysis of the several factors affecting destination sustainability of 82 benchmark European destinations (awarded with important sustainable prizes), classified in five macro-areas: environmental management, eco-tourism/natural assets, supporting assets, cleaner production and tourism carrying capacity. Table 1 shows sample characteristics (Tardivo *et al.*, 2014).

SAMPLE DESCRIPTION

The sample used in our research is composed of 82 benchmark European tourist destinations awarded in the last five years with the six most important prizes for sustainability:

- Environmentally Sustainable City Award, that aims to reward the adoption of higher standards of sustainable development for cities;
- Blue Flags, a voluntary eco-label awarded to more than 3850 beaches and marinas in 48 countries across Europe, South Africa, Morocco, Tunisia, New Zealand, Brazil, Canada and the Caribbean;
- Eden European Destination of Excellence, a project promoting development models of sustainable tourism across the European Union;
- Tourism for Tomorrow's Awards, one of the world's highest accolades in the Travel & Tourism industry, aimed at recognizing best practices in sustainable tourism within the industry worldwide;
- European Green Capital Award, an award for a European city based on its environmental record;
- European Prize for Tourism and Environment, a prize that the European Union assigns to destinations belonging to Member States that distinguish themselves for these two assets.

The sample is composed of variegated tourist destinations (towns, regions, beaches, etc.) and this heterogeneity allows to determine the main common characteristics that make them excellent. Even if we consider in our analysis only awarded European destinations, this sample could be considered representative for our purposes since they provide guidelines to follow for tourist destinations voted

to sustainability. At the same time, focusing our analysis on the European area allows us to operate with comparable and accessible data.

For each destination we have collected data about the six above-mentioned factors, each of whom classified in 4 to 11 sub-factors that can assume different levels (i.e. for the water shortage the levels are high, on average and low; for networks are excellent, good, scarce, etc.). In this way, it has been possible to compute the frequency registered by the different levels of each sub-factors. We got the value of each index directly by the websites of the different awards or by the tourist website of each destination. We decided to analyze only those factors and sub-factors that satisfy criteria of accessibility and comparability; this means that only sub-factors available and computed with the same methodology in all the Countries have been considered in our analysis.

ANALYSIS AND DISCUSSION OF RESULTS

Results show how each dimension registers the highest percentages in particular features that can constitute a framework for sustainable destinations that would like to become a benchmark in this field. In Table 1 we can notice how, as long as the dimension of *environmental management* is concerned, all destinations register an efficient energy supply and the presence of tourism ecolabelling; this last one is considered a valuable environmental management tool in tourism (Buckley, 2002; Font, 2002) and can be present in the form of ISO 3166-2; UNI EN ISO 9001:2008; UNI CEI 11352, UNI-EN-ISO 14001, eea, ISO 50001, UNI EN ISO 9001. UNI EN ISO 27001. ECOLABEL and EMAS (university and hotel). Despite this, they are too expensive, they require time and their criteria focus on environmental management (Synergy, 2000; Tardivo *et al.*, 2014).

Table 1: The highest frequencies for environmental management

Environmental Management	Low Water shortage	61%
	Crime indices on average or only in a few areas	46%
	Good quality of energy efficiency	96%
	Good quality of buildings	83%
	Efficient energy supply	100%
	Very rich resources of sea water	45%
	Mild climate	59%
	Environmental agreement (Covenant of Mayors and/or Blue flags)	59%
	Presence of tourism ecolabelling	100%

Source: Adaptation from Tardivo *et al.* (2014)

With the term “ecotourism” we refer to “ecologically sustainable tourism with a primary focus on experiencing natural areas that foster environmental and cultural understanding, appreciation and conservation” (Ecotourism Australia, 2003). It shows (Table 2) the highest percentages with respect to high nature conservation, emphasized by Spilanis *et al.* (2014) as the preservation of the ecosystem capability of providing humans with goods and services essential for their survival and for the local quality of life. In the same way, also increasing tourist development is present in 96% of destinations, symptom of their efforts to invest more and more in this sector. A very high percentage is also registered by artistic and cultural heritage, confirming tourists’ interest in elements of the culture and nature of the host countries supported by Osmanković *et al.* (2010). Percentages lower than 50% are registered only by criteria like *mostly hilly and mountain natural assets* and by *high percentage of protected areas*. The first aspect could be interpreted in a positive way because it is a signal of destinations capable of becoming benchmark despite several obstacles that a hilly or mountain territory can determine (Tardivo *et al.*, 2014); as for the second, despite it is a fundamental indicator of environmental protection - given that the presence of protected areas implies the existence of regulations, norms and limitations affecting tourism development (Bosetti *et al.*, 2006) -, it is not present in more than half of the destinations under inspection.

Table 2. The highest frequencies for ecotourism/natural assets

Ecotourism/Natural assets	Mostly hilly and mountain natural assets	46%
	Presence of beach assets	54%
	Employment in tourism as key point in the employment of destination	83%
	Artistic and cultural heritage	89%
	Congested traffic	67%
	High nature conservation	99%
	High percentage of protected areas	46.5%
	Increasing tourism development	96%

Source: Adaptation from Tardivo *et al.* (2014)

Table 3 shows how the total of destinations has telephone/mobile in line with other national/European areas and almost the total (97%) owns an intensive internet network. This reflects a current trend that shows a high importance and diffusion of mobile communication (Dabholkar, Thorpe e Rentz, 1996). Poor rates are registered by the level of sanitation that is good only in 61% of destinations due to the difficulty of accessing such services as a consequence of a fragmented territory and of cuts in public spending for this sector (Tardivo *et al.*, 2014).

Table 3. The highest frequencies for supporting assets

Supporting assets	Good networks	82%
	Good sanitation access only in some areas	61%
	Intensive internet network	97%
	Telephone/mobile in line with other national/European	100%
	Restaurants in line with other national/European areas	68%
	Numerous lodging	52%
	Historical/cultural tours (Entertainment)	50%
	Natural tours (Entertainment)	50%

Source: Adaptation from Tardivo et al. (2014)

Results for clean production (Table 4) can't be read in a very positive way because they show an optimal level of pollution only in half of the destinations, discrete hygiene and sanitation in 60% of cases (with respect to this, it is important to signal the dramatic situations of services in Andalusia and Stockholm (Tardivo et al., 2014)). Anyway, the most critical datum is registered by recycling waste, low in 44% of destinations, symptom of a not-so-well ingrained awareness of its importance in European destinations, apart for some sporadic cases like Stockholm.

Table 4. The highest frequencies for clean production

Clean production	Optimal level of pollution	50%
	Low percentage of recycling waste	44%
	On average waste generated	83%
	Discrete hygiene and sanitation	65%

Source: Adaptation from Tardivo et al. (2014)

With reference to "tourism carrying capacity" (Table 5), customer care and image collect the highest frequencies: the first one shows high level in 96% of destinations and confirms the increasing importance of the aspects pertaining to the customer (satisfaction levels, etc.) emphasized by Cernat and Gourdon (2012); the second one, high in 94% of destinations, can even contribute to forming destination brands and these two concepts can influence customers' loyalty to a destination (Tasci and Kozak, 2006). High percentages are registered also with regard to good food quality: in fact, local food can become an attraction to tourists thereby increasing the circulation of tourist expenditure through the local economy (Hall and Wilson, 2009). Also number of days of the visit ranges from 4 to 7 in 92% of cases, symptom of destinations not affected just by an excursion flow.

Table 5. The highest frequencies for tourism carrying capacity

Tourism carrying capacity	N. of tourist on average	84%
	High customer care	96%
	Good food quality	92%
	Good level of service	70%
	Good tourist information	49.5%
	Standard furnishing of furniture	72%
	Homogeneity of tourism flows	50%
	Public expenditure in tourism manager (on average)	41%
	Discrete (30-50 Euros) expenditure par day	48%

4 to 7 days of visit	92%
High lodging occupancy	88%
Discrete (60-100 euros) hotel prices	72%
High safety	70%
Positive image	94%

CONCLUSIVE REMARKS

Results of this research provide a descriptive and prescriptive framework of features that a destination pursuing the path of sustainability should develop. However, sustainability seeks some balance between economics and society: in fact, economic activity and strong social structures can promote a healthy environment and, in turn, healthy ecosystems can enrich the lives of the people who live, work and play in those environments (Flint *et al.*, 2002).

This paper shows how, for environmental management, the highest percentages are registered with by “good quality of energy efficiency” (96%) and tourism ecolabelling (100%) while ecotourism/natural assets show very high values for “high nature conservation” (99%) and “increasing tourism development” (96%). For what concerns supporting assets, the best performances are reached by the datum “Telephone/mobile in line with other national/European areas” (100%) and the “intensive internet network” (97%) while “on average waste generated” (83%) is the sub-factor showing the highest frequency with regard to clean production.

Finally, the tourist carrying capacity is prevalently based on “high customer care” (96%) and “good food quality” (92%).

This research proposes several managerial implications: first, the framework could represent a good guideline to be considered by policymaking in the formulation of their strategic plans for particular destinations (Tardivo *et al.*, 2014); second, these characteristics could lead tour operators to create specific tours in sustainable destinations, created with the tourists, suitably sensitized on these aspects. Furthermore, this research can offer guidelines not only for destinations that choose the path of sustainability but also for tourism investors that would help assess the level of sustainability of their investments in some destinations in terms of environmental risk or added value for the local community.

Starting from this basis, important strategies can be drawn like, for example, a campaign of sensitization towards the adoption of recycling waste, low in 44% of cases, or a major emphasis on the creation of protected areas, present in high percentages only in 46.5% of destinations.

Furthermore, given the high importance attributed to customer care and to image, a higher involvement of tourists in the creation of travel offers should be evaluated and particular campaigns focused on the image of uniqueness of a sustainable tourist destination should be developed.

The future diffusion of the culture of sustainability not only in the entrepreneurial field but also in tourism will strongly change the management of destinations. This doesn't mean that the traditional objective of destination (consisting in the attraction of tourists) will disappear but it will have to coexist (Tardivo *et al.*, 2014). Despite the relevance of this paper both for literature and for managerial purposes, it must be viewed in the light of important limitations: first, it analyzes just frequencies of the different features and doesn't provide a global index of sustainable benchmark destinations; second, it analyzes just destinations of a limited area (Europe) and in a limited period of time (5 years); third, it considers the criteria used by the organizations that deliver awards as the best way to measure the sustainability of an area without involving experts on this topic in this evaluation. Finally, it doesn't propose a distinction among the different typologies of destinations, often characterized by peculiarities that should be taken into account.

These suggestions could be very useful in order to develop this paper in the future, enriching it with a quantitative approach able to result in a more complete assessment of the level of sustainability of a tourist destination, maybe integrated with a Delphi methodology including also bodies, tourist operators, tourists and other important stakeholders in the process of measurement. Furthermore, a similar methodology could be applied to every destination awarded at world level up to now: in this way, destinations would have a very exhaustive framework of features to follow in order to become sustainable.

ACKNOWLEDGEMENTS

An acknowledgement goes to Roberta Pinto for her help in the collection of the data.

PROMOTING TOURISM TO BOOST EXPORTS: AN EMPIRICAL INVESTIGATION

Teerakapibal, Surat

Department of Marketing, Thammasat Business School, Thammasat University, Thailand

ABSTRACT

This study examines the causal relationship between tourism expansion and exports growth using Thai macroeconomic data. A series of bivariate Vector Autoregressive (VAR) models are estimated. Long-run equilibrium relationship between international tourist arrivals and exports volume is investigated using Johansen rank tests for cointegration, whereas the short-run equilibrium relationship is determined by Granger causality tests. Though results fail to reject that long-run equilibrium relationship between the two factors does not exist, evidence for a bi-directional causality is found. Empirical findings justify the potential of tourism marketing programs on international trade growth. Conversely, exports promotion programs are identified as a means to reinforce tourism industry development.

Keywords: *Tourism marketing; Exports expansion; Cointegration; Granger causality*

INTRODUCTION

International trade allows for exchanges of capital, goods, and services across national borders and territories. Its economic, social, and political importance has been recognized for millennia. In 2012, international merchandise trades totaled US\$17.3 trillion. While top 10 merchandise traders accounted for 51% of world merchandise trade, developing economies capture 42% of the market (World Trade Organization, 2013). Adopting the export-led growth strategy, nations expand their exports in order to speed up their industrialization process. This is based on the belief that the exports growth generates technological spillovers and other externalities to the economy (Balassa, 1978; Feder, 1982; Kormendi & Meguire, 1985; Marin, 1992). Specifically, countries manage to gain hard currency through trade to import commodities manufactured more cheaply internationally to improve productivity (Goldstein & Pevehouse, 2008).

As a result, countries initiate a variety of measures to strengthen their capability to compete in the global market. In January 2010, U.S. President Obama launched the National Export Initiative (NEI) with the goal to renew and revitalize efforts to promote American exports abroad. Programs ranging from improved advocacy, trade promotions, export financing, to trade liberalizing agreements negotiations markedly boost U.S. goods and services exports from US\$ 1.58 trillion in 2009 to a record

high of US\$2.20 trillion in 2012 (Department of Commerce, 2013). Interestingly, the South Korean President Lee Myung-Bak took a less direct approach to foster exports of its national goods and services. In 2009, he assembled a Presidential Council on Nation Branding to proactively shape and manage the South Korean image and reputation. Driven by the spread of popularity of South Korean culture, world's appetite for its national products soars. In particular, South Korean exports increase from US\$ 364 billion in 2009 to US\$ 560 billion in 2013 (Korea International Trade Association, 2014). Remarkably, Korea Tourism Organization reports that South Korea enjoys an approximately 55.75% increase in number of tourists which corresponds to a 51.77% rise in tourism receipts during the same time period (Korea Tourism Organization, 2014).

Marketing literatures have investigated how national factors influence consumer product evaluation processes. In particular, consumers form positive or negative feelings towards a country based on cultural, political, historical, and economic factors. These perceptions, in turn, influence consumers' evaluations and purchase intentions of products from that particular nation (Hong & Kang, 2006; Klein *et al.*, 1998; Mahesrawan & Yi, 2006). On the other hand, another stream of researches (such as Roggenbuck *et al.*, 1990; Weiler & Hall, 1992; Chronis, 2005; Mitchell, 1998; Palmer, 2005; Richards, 2002) argues that "travel offers one of the few contemporary opportunities outside of the education industry where explicitly designated, non-vocational learning about other times, places, and people takes places" (Falk, 2012). Moreover, Shan & Wilson (2001) and Kulendran & Wilson (1998) specifically argue that more foreign tourists to a host country generally increase the image of the country for its goods and services (Katircioglu, 2009). Therefore, it is likely that consumers may update their perceptions towards the country while travelling and adjust their preference for that nation's products. Consequently, the nations which manage to bolster its tourism could experience an upsurge in international demands for its exports.

The objective of this paper is to examine if there exist a cointegration and causal link between tourism growth and exports expansion with the following questions:

1. Does increase in number of tourists translate to exports expansion?
2. Does increase in exports drive tourism growth?
3. Does the causality between tourism and exports growth run in both direction?

Empirical evidence of a relationship between international tourism and exports growth will urge governments to consider foreign visitors not only as a source of income domestically but also as prospective importers. In other words, tourism marketing will emerge as a tool to promote exports. Conversely, governments should acknowledge that exporting merchandise to foreign nations can also act as a nation brand ambassadors. In addition, if the causative process is bi-directional then both

exports and tourism promoting programs must be instituted concurrently for optimal growth of the nation.

The rest of the paper is organized as follows. In the next section, I describe the time series data utilized in the analysis. Methodology which includes unit root tests for stationarity of time series, tests for a long-run relationship, and Granger causality tests are then explained along with empirical results. Finally, I conclude in the last section with discussions and conclusions.

DATA AND METHODOLOGY

Data

Thai macroeconomic data are used for the analysis as exports is a major economic factor in Thai economy. In 2012, Exports of goods and services accounted for an estimate of 75% of Thai GDP in 2012 (The World Bank, 2014). At the same time, Thailand has been extensively promoting its tourism. “Amazing Thailand” is the slogan for tourism marketing. In 2013, Bangkok, its capital, was identified as the most visited city in the world by the 2013 Global Destination Cities Index, while Suvarnabhumi airport was the world’s most geotagged location on Instagram (Quan, 2013; Abramson, 2013). Statistically, the tourism industry comprised of approximately 6.7% to the country’s GDP in 2007 (Bangkokpost.com, 2008).

This paper employs international tourist arrivals data collected by Immigration Bureau, Thailand, published on the Thai Ministry of Tourism and Sports website. The data contain number of foreign visitors who visit Thailand (*tourists*) during January 2008 to December 2013. Though tourism receipts data are also available, the number of tourist arrivals has been utilized as a reasonable proxy for tourism expansion (Kim *et al.*, 2006; Wang & Godbey, 1994). In order to investigate the relationship between number of tourists and exports, monthly exports (*exports*) data made available by the Bank of Thailand spanning over the same period are also included in my analysis. Both time-series data are shown in Figure 1.

As both variables are of different units, they are transformed using natural logarithmic function to facilitate interpretation of coefficients. In particular, coefficients in log-log models represent elasticities, which measure the resulting percentage change in the dependent variable due to a percentage change in an explanatory variable. $\ln(\text{tourists})$ and $\ln(\text{exports})$ plots can also be found in Figure 1.

Number of tourists and value of Thai exports (million baht), 2008-2013

Unit root and cointegration tests

Stationarity requires that the mean, the variance, and the autocovariance of a series are not time varying (Engle & Granger, 1987; Enders, 1995). Granger & Newbold (1974) suggest that conventional econometric techniques such as the ordinary least square method will yield biased results when variables of interest are non-stationary or exhibit a unit root. As a result, it is a necessary first step to transform the data to their stationary form prior to analysis. Unit root test is a means through which

the order of integration of variables can be identified. In this study, the Dickey-Fuller test is used to test the following hypotheses:

$$H_0: \alpha = 1 \quad H_a: |\alpha| < 1$$

, where α is the autoregressive coefficient. In order to test for a unit root, I allow time series to follow 3 distinct types of models:

1. The zero mean model

$$y_t = \alpha y_{t-1} + \varepsilon_t \quad (1)$$

2. The constant mean model

$$y_t = \mu + \alpha y_{t-1} + \varepsilon_t \quad (2)$$

3. The trend model

$$y_t = \mu + \beta t + \alpha y_{t-1} + \varepsilon_t \quad (3)$$

, where y_t is the time series and ε_t is the white noise error.

The results of testing the order of natural logarithm of *tourists* and *exports* are provided in Table 1. The tests suggest that $\ln(\text{tourists})$ is non-stationary under the specifications of the zero mean (p-value = 0.6883 and 0.8014) and constant mean (p-value = 0.1311 and 0.3330) models. Interestingly, the null hypothesis of non-stationary when it is tested with the trend model (p-value = 0.002 and 0.004) is rejected. Similarly, the tests support the null hypothesis of non-stationary for $\ln(\text{exports})$ when the zero mean (p-value = 0.6842 and 0.7994) and constant mean models (p-value = 0.0963 and 0.1663) are employed. On the other hand, the tests of stationarity yield mixed results when the autoregressive coefficient is estimated using the trend model (p-value = 0.0301 and 0.0911).

Common methodologies in transforming non-stationary time series to their stationary form include first differencing and time-trend regression. Based on the aforementioned results, first differencing is the appropriate trend removal procedure. Table 1 also contain results of the Dickey-Fuller tests of non-stationarity for $\Delta \ln(\text{tourists})$ and $\Delta \ln(\text{exports})$. Specifically, $\Delta \ln(\text{tourists})$ is found to be stationary under all 3 different specifications: zero mean (p-value = 0.0001 and < 0.0001), single mean (p-value = 0.0001 and 0.0001), and trend (p-value = 0.0001 and < 0.0001) models. Likewise, first differenced series of natural logarithm of *exports* is also found to be stationary across all models: zero mean (p-value = 0.0001 and < 0.0001), single mean (p-value = 0.0001 and 0.0001), and trend (p-value = 0.0001 and < 0.0001). In sum, the variables are $I(1)$ and the first differenced series should be used for analysis.

Variable	Specification	r	p-value	t	p-value
ln(tourists)	zero mean	0.04	0.6883	0.42	0.8014
	single mean	-9.69	0.1311	-1.89	0.3330
	trend	-48.52	0.0002	-5.13	0.0004
Dln(tourists)	zero mean	-107.18	0.0001	-7.14	< 0.0001
	single mean	-108.04	0.0001	-7.12	0.0001
	trend	-110.13	0.0001	-7.16	< 0.0001
ln(exports)	zero mean	0.02	0.6842	0.41	0.7994
	single mean	-10.86	0.0963	-2.33	0.1663
	trend	-22.07	0.0301	-3.21	0.0911
Dln(exports)	zero mean	-123.18	0.0001	-7.78	< 0.0001
	single mean	-123.98	0.0001	-7.75	0.0001
	trend	-123.9	0.0001	-7.69	< 0.0001

Table 1

Dickey-Fuller unit root tests

As a unit root is present in both time series, it is necessary to test whether they are cointegrated. Though traditional analyses require time series to be stationary, researchers argue that information may be lost if data are differenced (Engle & Granger, 1987; Watson 1994). In brief, the non-stationary time series in Y_t are cointegrated if there is a linear combination of them that is stationary or $I(0)$. That is, cointegration means that non-stationary variables are integrated in the same order with the residuals stationary. It is believed that cointegrated time series with a long-run equilibrium relationship cannot drift too far apart from the equilibrium because economic forces will act to restore the equilibrium relationship (Zivot & Wang, 2006). Statistical tools such as the error correction model (ECM) utilize the concept of cointegration to study the link between long-run equilibrium relationship and short-run dynamic adjustment mechanisms.

Results for tests of cointegration are shown in Table 2. Based on the Johansen cointegration rank tests, the null hypothesis of no cointegration is not rejected as the trace statistics (9.77) is less than the critical value (12.21) (Johansen & Juselius, 1990; Johansen, 1988; Johansen, 1995a; Johansen, 1995b). Therefore, results suggest that long-run equilibrium between number of tourists and amount of exports does not exist. Consequently, vector autoregressive models (VAR) will be utilized to analyze the time series.

Hypothesis	Eigenvalue	Trace	Critical Value
Ho: rank = 0 Ha: rank > 0	0.13	9.77	12.21
Ho: rank = 1 Ha: rank > 1	0.03	1.54	4.14

Table 2

Cointegration rank test using trace

VAR model

I conjecture that there exists a relationship between tourism growth and international trade. In particular, it is believed that these variables are not only contemporaneously correlated to each other, but they are also correlated to each other's past values. Therefore, models with exogenous variables are not appropriate (Sims, 1980). In this study, the vector autoregressive model (VAR) will be estimated to fit the time series data. VAR allows for an estimation of a short-run dynamic relationship among endogenous variables. As previously discussed, the first differenced series will be used and error correction terms will not be included in the VAR model. The p^{th} -order bivariate VAR system is given by:

$$\begin{bmatrix} \Delta \ln(\text{tourists})_t \\ \Delta \ln(\text{exports})_t \end{bmatrix} = \delta + \Phi_1 \begin{bmatrix} \Delta \ln(\text{tourists})_{t-1} \\ \Delta \ln(\text{exports})_{t-1} \end{bmatrix} + \dots + \Phi_p \begin{bmatrix} \Delta \ln(\text{tourists})_{t-p} \\ \Delta \ln(\text{exports})_{t-p} \end{bmatrix} + \varepsilon_t \quad (4)$$

, where $\delta = \begin{bmatrix} \delta_1 \\ \delta_2 \end{bmatrix}$ is a constant vector and Φ_i is a 2×2 matrix of parameters. ε_t is a vector of white noise process with $\varepsilon_t = \begin{bmatrix} \varepsilon_{1t} \\ \varepsilon_{2t} \end{bmatrix}$ such that $E(\varepsilon_t) = 0$, $E(\varepsilon_t \varepsilon_t') = \Sigma$, and $E(\varepsilon_t \varepsilon_s) = 0$ for $t \neq s$.

A series of bivariate VAR systems of different orders are estimated using VARMAX procedure in SAS. In order to determine the optimal number of lags, p , to be included in the model, 2 distinct information criteria are calculated: Corrected Akaike Information Criteria (AICC) and Schwartz Bayesian Criteria (SBC).

$$AICC = \log(|\bar{\Sigma}|) + \frac{2r}{T-k} \quad (5)$$

$$SBC = \log(|\bar{\Sigma}|) + \frac{r \log(T)}{T} \quad (6)$$

, where r denotes the number of parameters estimated, k is the number of dependent variables, T is the number of observation used to estimate the model, and $\bar{\Sigma}$ is the maximum likelihood estimate of Σ . Table 3 reports criterion values for models with different number of lags. As the optimal number of lags is associated with the model yielding the smallest criterion value, results suggest that 9th-order VAR process best characterizes the time series data of interest.

No. of lags	AICC	SBC
1	-8.75	-8.57
2	-8.85	-8.55
3	-8.77	-8.36
4	-8.71	-8.21
5	-8.76	-8.17
6	-8.70	-8.03
7	-8.79	-8.07
8	-8.97	-8.21
9	-9.00	-8.23
10	-8.88	-8.13
11	-8.68	-8.97
12	-8.35	-7.79
13	-8.07	-7.71

Table 3
Model comparison

Granger causality tests

Enders (1995) proposes that granger causality test is best suited to determine whether the lags of one variable significantly enter into the equation for another variable. This sense of causality is defined by Granger (1969) and Sims (1972). This methodology is employed in this paper to determine not only the relationship between tourism and exports growth but rather their causality. Though a conventional F-test may be utilized to test the restriction that all lags of the variable do not enter significantly into VAR model specification, this paper employs Wald statistic instead. Consider (4) in the following form:

$$\begin{bmatrix} \Phi_{11}(B) & \Phi_{12}(B) \\ \Phi_{21}(B) & \Phi_{22}(B) \end{bmatrix} \begin{bmatrix} \Delta \ln(\text{tourists})_t \\ \Delta \ln(\text{exports})_t \end{bmatrix} = \begin{bmatrix} \delta_1 \\ \delta_2 \end{bmatrix} + \begin{bmatrix} \varepsilon_{1t} \\ \varepsilon_{2t} \end{bmatrix} \quad (7)$$

, where $\Phi_{ij}(B)$ are vectors of coefficients.

According to (7), the variable $\Delta \ln(\text{tourists})_t$ causes $\Delta \ln(\text{exports})_t$ if $\Phi_{21}(B)$ is not statistically different from zero. On the other hand, $\Phi_{12}(B) = 0$ would infer that $\Delta \ln(\text{exports})_t$ does not cause $\Delta \ln(\text{tourists})_t$. The implication of this model structure is that future values of the process $\Delta \ln(\text{tourists})_t$ can either be influenced by its own past value and not by the past value of $\Delta \ln(\text{exports})_t$ or both, and vice versa. For the case where the future $\Delta \ln(\text{tourists})_t$ are not affected by the past values of $\Delta \ln(\text{exports})_t$, it would be more appropriate to model $\Delta \ln(\text{exports})_t$ separately from $\Delta \ln(\text{tourists})_t$. That is, the VAR model is unnecessary.

The CAUSAL statement under VARMAX procedure in SAS is employed to conduct Granger causality tests. Specifically, Wald statistic is calculated for the 2 following sets of hypotheses:

$$H_0: \Phi_{12}(B) = 0 \quad H_a: \Phi_{12}(B) \neq 0$$

and

$$H_0: \Phi_{21}(B) = 0 \quad H_a: \Phi_{21}(B) \neq 0$$

As suggested by Pindyck & Rubinfeld (1991) and Shan & Sun (1998), tests are performed for different lag selections to examine robustness of results. Table 4 provides chi-square and corresponding p-value for Granger causality tests. The null hypothesis that exports growth do not 'Granger cause' increased number of tourists is rejected across practically all models except for 1st-order VAR (p-value < 0.0001 for model with the optimal number of lags). Consistency in results suggest the export-led tourism growth hypothesis. Interestingly, tourism growth also induces greater export volumes as results allows for rejection of the null hypothesis that tourism growth does not 'Granger cause' exports expansion (p-value < 0.0001 for model with the optimal number of lags). Though absence of cointegration refutes the existence of a long-term relationship, short-run reciprocal feedback is evident between the two series.

Hypothesis	Chi-square	p-value
Ho: Exports do not 'Granger cause' number of tourists		
Ha: Exports 'Granger cause' number of tourists		
Optimal number of lag:		
9	38.17	< 0.0001

Table 4

Granger-causality wald tests for exports and number of tourists

DISCUSSIONS AND CONCLUSIONS

Using Thai macroeconomic data, this study empirically tests for both short-run and long-run equilibrium relationships along with the direction of causality between exports growth and international tourist arrivals expansion. Johansen rank tests for cointegration show that a long-run equilibrium relationship does not exist between the two time series. However, results do not entirely discourage tourism marketing as a means to boost exports. Results from Granger causality tests applied to a series of VAR model confirm short-run equilibrium relationship. In particular, I find that tourism growth 'Granger cause' an increase in international trade. Similarly, exports expansion

'Granger cause' a surge in number of tourist arrivals. Together, the bi-directional causality suggests that stimulating both factors can tremendously enhance the nation's productivity output.

Results from this study provide several future research directions. For instance, the VAR models could be expanded to include other factors such as the GDP of tourists' home country, exchange rates, and a measure for the distance between Thailand and tourists' country of residence. Furthermore, it may be worthwhile to determine if tourism marketing is effective in raising exports for all countries alike. Such results could lead to better understanding of the root cause for the relationship between exports and tourism growths.

In sum, this paper suggests that governments should implement tourist-attracting policies as a means of economic development as it does not only support the tourism industry but also expand exports volumes. Conversely, programs supporting merchandise exports must be adequately sponsored by governments as they produce externalities to the tourism sector.

THE CONTRIBUTION OF FRENCH LITERATURE AUTHORS TO THE FRENCH LAW AND POLICY ON TECHNICAL WORKS

Theodoropoulou, Konstantina ; Katsakiori, Panagiota

Hellenic Open University, Greece.

ABSTRACT

Public management depicts the dominant political tendencies in each country and is influenced by globalized Europe's policies. The new public management is the current innovation of the capitalistic system in public administration which pushes the state away from the traditional bureaucratic model of organizing public services towards managerialism: a management based on market rules. Can this tool be used efficiently in all public spheres? Can we, for example, protect our monuments through Public-Private Partnerships and produce a new generation of laws on avant-garde agriculture methods and products, exemplified by Biological Agriculture?

Since the age of Enlightenment, society went through a deep reform using reason and scientific method to challenge ideas grounded in tradition and faith. Great men, writers, politicians and architects, such as Victor Hugo, Antoine-Chrysostome Quatremère de Quincy, Prosper Mérimée, Eugène Viollet-le-Duc, André Malraux, Le Corbusier, Antoine de Saint-Exupéry, the pioneer of science-fiction genre Jules Vernes etc. inspired people through their life and work and contributed to the gradual development of our perception for humanity, science, conservation, legislation and policies. For instance, the great novelist Malraux, as Culture Minister, proposed the so-called "Malraux law", in 1962, on the "safe-guarded" domains and thus he achieved to prevent entire neighborhoods, in Paris and other french cities, from demolition. The intention of this essay is to perceive critically the way the state manages heritage and examine the possibilities of management in the area of new scientific discoveries.

Keywords: *Public - Private Partnership (PPP), French legislation, Monuments, Discoveries, New Public Management (NPM), Culture*

INTRODUCTION

Philosophy, art and politics have contributed to the evolution of French technical legislation especially in the fields of heritage law and innovative technologies, such as aeronautics, nuclear power, renewable energy, etc. Indeed, French writers, politicians and architects, such as Victor Hugo,

Antoine-Chrysostome Quatremère de Quincy, Prosper Mérimée, Eugène Viollet-le-Duc, André Malraux, Antoine de Saint-Exupéry, the pioneer of science-fiction genre Jules Vernes etc. influenced through their work, as writers or civil servants of the State, the establishment of technical legislation adopted today at international level.

RESTORATION IN FRANCE

In France, the cradle of Enlightenment, since the 18th century, the importance and didactic value of the remainings of the past have been clearly realized. During the Revolution, the Crown and Church property became national and the term "Historic monument" emerged. The new term in fact meant "National monument": the estate of French people, which should be protected as part of nation's identity, and be preserved for future generations. The destruction of monuments during the period 1729-1794, led to reactions: the disasters were branded as vandalisms, the first public museums were created (Louvre, museum of monuments of France) and simultaneously began the first attempts of recording and indexing nationwide the monumental national wealth.

In 1793, the "Provisional Committee for the Arts" expedited a National Assembly, with instructions for indexing and maintaining the objects that could be beneficial for the arts, science and education. Indexing along with the characterization of monuments (classification) are two innovative, internationally, protective measures which will contribute decisively over the years to enrich, deepen and widen the concept and purpose of monumental protection. In the first three decades of the 19th century, remnants of medieval past in France, such as gothic cathedral churches and castles (*chateaux*), emerged as the most important French monuments, main expression and contribution of French culture in the European cultural scene.

Although the concept of "Historic Monuments" existed since the Revolutionary period, many ancient buildings, especially religious ones, once made national property, were dismantled or destroyed. It wasn't until the spread of the Romantic Movement a generation later (with the publication of *Le Génie du Christianisme*, by Chateaubriand in 1802, and *Notre-Dame de Paris* by Victor Hugo in 1831), that institutions began to become aware of the necessity of preservation. Since 1819, the state budget contained a provision for historic monuments and in 1830, the Interior Minister, François Guizot, created the post of Inspector of Historic Monuments, a key-position for protection, and Ludovic Vitet was named the first Inspector of Historic Monuments, succeeded in 1834 by Prosper Mérimée.

The first list of Monuments of National Importance was published in 1840. It was only much later, in 1893, that the function of Head Architect of Historic Monuments was created. In 1913, a law specified the framework and criteria for monument protection. After World War I, this protection began to

include private property, edifices and artworks from the modern (1453-1789) and contemporary (after 1789) epochs.

The restoration doctrine was formalised in 1931, by the *Athens Charter*, which advocated an "enlightened criticism" in interventions, and urged each country to address the concerns relative to the conservation of historic sites within the framework of national legislation. The principle of restoration was the preservation of existing edifices. However, good intentions were often hindered by the limited knowledge concerning the objects to be restored, as art history was only just emerging as a scientific discipline in the nineteenth century. (<http://www.reims-cathedral.culture.fr/restoration-in-france.html>)

CONTRIBUTION OF FRENCH AUTHORS TO HERITAGE PROTECTION

Antoine Quatremère de Quincy (1755-1849) was leader of the French Academy under Napoleon, theorist and historian of 18th century French art and artistic biographer. Quatremère initially studied law before taking courses in art and history at the Collège de Louis-le-Grand. He also trained as a sculptor. After visiting Naples and later Rome, he became interested in Classical Greek sculpture and architecture. He wrote several essays on architectural theories, winning a competition sponsored by the *Académie des Inscriptions et Belles-Lettres* in 1785. Based on his belief that style and function were inseparable in architecture, Quatremère orchestrated the renovation of the Parisian church of St. Genevieve into the Panthéon, France's national mausoleum. He also advocated the use of the Neo-Classical style in other buildings.

The events of French Revolution caused him to become an advocate for artistic freedom and copyright. He was elected a deputy to the Legislative Assembly in 1791, but during the Reign of Terror imprisoned for two years, and nearly executed twice (1793 and 1795). After being exiled to Germany in 1797, Quatremère began reading the works of Immanuel Kant (1724-1804), and Gotthold Lessing, subsequently incorporating their philosophical ideas into his own theories on aesthetics. As a member of the Council of the 500 in 1797, he served both there and later as a member of the *Académie des Inscriptions et Belles Lettres* in 1804.

In 1815, as the *Intendant Général des Arts et Monuments Publics*, he published a critical evaluation of French museum practices aimed at the practices of the museum builder Alexandre Lenoir, entitled "Considérations Morales". While serving as the Secrétaire Perpétuel to the Académie des Beaux-Arts from 1816-1839, Quatremère gave funeral orations of Académie members. His important essay on the fine arts, "*Essai sur la nature, le but et les moyens de l'imitation dans les beaux-arts*", was published in 1823 and translated into English by 1837. Quatremère was instrumental in assisting the career of Guillaume-Abel Blouet by convincing the Académie Royale d'Architecture to publish Blouet's

important report on monuments restoration, *Restauration des thermes d'Antonin Caracalla à Rome* in 1828. He also published biographies of several Italian artists, including Antonio Canova (1823), Raphael (1824), and Michelangelo (1835).

Quatremère's theories epitomized the Academy's stance of the Greco-Roman style as the only appropriate building type for architects. This would be challenged in succeeding generations by architectural historians such as Jean-Baptiste Lassus and Eugène Viollet-le-Duc. Quatremère was the last "armchair" archaeologist, eschewing the excavation site for personal and sometimes romantic interpretations of art. However, Quatremère strongly argued for keeping works of art *in situ* and against Napoleon's conglomerate museum. He successfully put forward the idea that the true heritage of Rome was the Roman sky, the topography of its hills, the mentality of its inhabitants, the music of its language, its monuments and once exiled to the banks of the Seine or elsewhere, they would have lost their true value. (Poulot, 2011)

Victor Hugo (1802-1885) was a French novelist, poet and dramatist, the most important and prominent representative of the Romantic movement. He is considered one of the greatest and best known French writers. His best-known works are the novels "*Les Misérables*" (1862) and "*Notre-Dame de Paris*" (1831) also known in English as "*The Hunchback of Notre-Dame*". In France, Hugo's literary fame comes first from his poetry but also rests upon his novels and his dramatic achievements. Though a committed royalist when he was young, Hugo's views changed as the decades passed, and he became a passionate democrat. His work touches upon most of the political and social issues and artistic trends of his time. (<http://en.wikipedia.org>)

His interest for the french medieval monuments is depicted in his romantic/ gothic novel "*The Hunchback of Notre Dame*" that was published in 1831 and quickly translated into other languages across Europe. The title refers to the Notre Dame Cathedral in Paris, on which the story is centered. Victor Hugo began writing the novel in 1829, largely to make his contemporaries more aware of the value of Gothic architecture, which was neglected and often destroyed to be replaced by new buildings, or defaced by replacement of parts of buildings in a newer style. For instance, the medieval stained glass panels of Notre-Dame de Paris had been replaced by white glass to let more light into the church. This explains the large descriptive sections of the book, which far exceed the requirements of the story. A few years earlier, Hugo had already published a paper entitled *Guerre aux Démolisseurs* (*War to the Demolishers*) specifically aimed at saving Paris' medieval architecture.

The case (ypothesis) of this epic drama presents the heroine, gypsy Esmeralda, dancing in the courtyard of the church "Notre Dame" where she attracts the attention of archdeacon Claudius Froll who desires to conquer her and tries to kidnap her with the help of Quasimodo the bell-ringer, a very ugly but vigorous man. Esmeralda manages to avoid abduction thanks to the intervention of a group

of soldiers under the officer Phoebus de Satoper, whom she meets after a few days. Phoebus falls in love with Esmeralda and later the jealous Archdeacon kills him and lets Esmeralda be accused of murder. Esmeralda prefers death rather than surrender to the appetites of the priest who suggests to free her with terms. Esmeralda is led to the gate of the temple for execution where Quasimodo intervenes, out of love, and saves her by bringing her inside the Temple. After many adventures, Esmeralda is eventually arrested and executed. Quasimodo kills the Archdeacon by pushing him of the spire from where they were watching Esmeralda's execution. At the end, Quasimodo dies at the cemetery next to Esmeralda's body where he was found hugging her dead body.

The popular novel-masterpiece had a great impact on the audience and attracted thousands of tourists in Paris who wanted to visit the Cathedral of Notre Dame. It also inspired a renewed appreciation for pre-Renaissance buildings, which thereafter began to be actively preserved. Indeed, the City of Paris soon after the publication of the book acted for the restoration of the much-neglected Cathedral of Notre Dame. The first archaeological companies were already established in France since 1820 and they were focusing in the study of medieval art, while in 1832, Hugo published a new pamphlet about the values of a building: "*There are two things in an edifice: its use and its beauty. Its use belongs to its owner, its beauty to everyone. Thus, the owner exceeds his rights in destroying it.*" The idea of cultural heritage protection clearly derives from this text.

In 1841, after three unsuccessful attempts, Hugo was finally elected to the "*Académie française*", solidifying his position in the world of French arts and letters. Thereafter he became increasingly involved in French politics. He was elevated to the peerage by King Louis-Philippe in 1841 and entered the Higher Chamber as a *pair de France*, where he spoke against the death penalty and social injustice, and in favour of freedom of the press and self-government for Poland. However, he was also becoming more supportive of the democratic form of government and, following the 1848 Revolution and the formation of the Second Republic, was elected to the Constitutional Assembly and the Legislative Assembly.

When Louis Napoleon III seized complete power in 1851, establishing an anti-parliamentary constitution (*Coup d'état*), Hugo openly declared him a traitor to France and lived in self-exile until 1870. While in exile, Hugo published his famous political pamphlets against Napoleon III, *Napoléon le Petit* and *Histoire d'un crime* and in 1859, he refused a granted amnesty by Napoleon III, as it meant he would have to curtail his criticisms of the government. It was only after Napoleon III fell from power and the Third Republic was proclaimed that Hugo finally returned to his homeland, where he was promptly elected to the National Assembly and the Senate. Victor Hugo not only was a great writer but also a great politician who believed in human rights and freedom. He was buried into the Panthéon.

Because of his concern for the rights of artists and copyright, he was a founding member of the “*Association Littéraire et Artistique Internationale*”, which led to the Berne Convention for the Protection of Literary and Artistic Works. However, in Pauvert's published archives, he states strongly that “*any work of art has two authors : the people who confusingly feel something, a creator who translates these feelings, and the people again who consecrate his vision of that feeling. When one of the authors dies, the rights should totally be granted back to the other, the people*”. (<http://en.wikipedia.org>)

In 1834, the role of *Inspector General of Historical Monuments* was appointed to **Prosper Mérimée (1803-1870)**: french dramatist, historian, archaeologist, and short story writer with studies on law as well as in Greek, Spanish, English, and Russian. Mérimée, through his institutional role, contributed to the protection of cultural heritage, as he was responsible to identify sites for conservation and give a scientific opinion for the purpose of conservation and restoration and the necessity for future projects on monuments of the State. He was a born archaeologist, combining linguistic faculty of a very unusual kind with accurate scholarship, with remarkable historical appreciation, and with a sincere love for the arts of design and construction. In 1837, the Committee of Historical Monuments was established of volunteers to assist Mérimée in his work. Due to his untiring action the Office of Historical Monuments (*Service des Monuments Historiques*) was also created, while parallelly he formed the theoretical basis for the development of the doctrine for the total stylistic restoration of monuments.

Today, in France - in honor to Prosper Mérimée - exists “The Base Mérimée”, which is the French database of monuments listed as having national significance in history, architecture or art. It was created in 1978, and placed online in 1995, by the French Ministry of Culture, division of architectural heritage. The database is periodically updated and contains information derived from the first survey of historic monuments made by Mérimée in 1840 and cultural heritage inventory, specifically: religious, domestic, agricultural, educational, military and industrial architecture. The 1840's first official list of Monuments of National Importance included 1.034 edifices, mostly medieval, and all of which were public property.

Important works of Mérimée are the restoration of Cluny (baths in Paris), and the discovery of a textile project “The Lady and the Unicorn” which is often considered one of the greatest works of art of the Middle Ages in Europe. *The Lady and the Unicorn* (*La Dame à la licorne*) is the modern title given to a series of six tapestries woven in Flanders of wool and silk, from designs drawn in Paris around 1500. The tapestries were rediscovered in 1841 by Prosper Mérimée in Boussac castle where they had been suffering damage from their storage conditions and are on display in the National Medieval Art Museum (*Musée national du Moyen-Âge or Musée de Cluny*) in Paris since 1882. The Museum is housed

in the gothic-style Hôtel de Cluny, a 15th century mansion which was built atop the foundations of Roman thermal baths.

Mérimée's contribution to the salvation of monuments is major. He understood the importance of both mobile monuments (*objets mobiliers*) and historical buildings (*des immeubles*). This distinction will later be depicted in the law of 31 december 1913 for the historical monuments. He also considered the display of antiquities such as "*The Lady and the Unicorn*" in a monument - museum such as "*Les Thermes de Cluny*" and the "*Hotel de Cluny*". So, not only we meet the use of a monumental complex (hotel and baths) as a museum but also the exhibition of mobile antiquities into historical buildings. The act of converting monuments from "dead and scattered" historical facts into living "forms" was central to Romantic cultural theory and art history. It is a kind of archeology, the archeology of revivification. (Haley, p.19)

Eugène Viollet-le-Duc (1814-1879) was a French architect and theorist, famous for his interpretive "restorations" of medieval buildings. Born in Paris, he was a major Gothic Revival architect. Viollet-le-Duc was rebellious and anticlerical. He refused to enter the "*École des Beaux-Arts*" and obtained practical experience in several architectural offices. In 1835, he returned from study in Italy.

In 1849, Mérimée inspector general of a committee responsible for the awarding of restoration projects of historical monuments (*Historique general des Monuments*) commissioned Viollet-le-Duc the restoration of *Romanesque abbey of Vézelay*, where he proceeded on a stylistic restoration and replaced the pointed vaults of the 13th century with semicircular vaults, characteristics of the 12th century, to achieve a sense of unity in the church, but also to highlight the changes of character at the building. This work was the first of a long series of restorations. Viollet-le-Duc's restorations at *Notre Dame* brought him national attention, since the value of the cathedral, as a national monument, was already understood through Victor Hugo's novel.

Viollet-le-Duc's "restorations" frequently combined historical fact with creative modification. For example, under his supervision, Notre Dame was not only cleaned and restored but also "updated", gaining its distinctive third tower in addition to other smaller changes. Viollet-le-Duc wrote that restoration is a "*means to reestablish [a building] to a finished state, which may in fact never have actually existed at any given time*". The type of restoration employed by Viollet-le-Duc, was decried by John Ruskin as "a destruction out of which no remnants can be gathered: a destruction accompanied with false description of the thing destroyed". This argument is still a current one when restoration is being considered for a building or landscape. In removing layers of history from a building, information and age value are also removed which can never be recreated. However, adding features to a building, as Viollet-le-Duc also did, can be more appealing to modern viewers. However, modern conservation

practice considers Viollet-le-Duc's restorations too free, too personal, too interpretive, but some of the monuments he restored might have been lost otherwise.

Viollet-le-Duc is considered by many to be the first theorist of modern architecture. Sir John Summerson wrote that "there have been two supremely eminent theorists in the history of European architecture - Leon Battista Alberti and Eugène Viollet-le-Duc. His architectural theory was largely based on finding the ideal forms for specific materials, and using these forms to create buildings. His writings centered on the idea that materials should be used 'honestly'. He believed that the outward appearance of a building should reflect the rational construction of the building. His theories of rational architectural design link the revivalism of the Romantic period to the 20th-century Functionalism.

(<http://en.wikipedia.org>)

André Malraux (1901 - 1976) was a French surrealist novelist, art theorist, resistance leader, 2nd world war hero and was appointed by President Charles de Gaulle as Minister of Information (1945–1946) and subsequently as France's first Minister of Cultural Affairs during de Gaulle's presidency (1959–1969).

He was arrested at the tender age of 21 for attempting to steal bas-reliefs from a Khmer temple in Cambodia, a precocious act that presaged a lifelong obsession with art, and art collecting, in all its forms. On his return to France, Malraux launched two fine-press series, *la Sphère* and *Aux Aldes* and published *The Temptation of the West* (1926). The work was in the form of an exchange of letters between a Westerner and an Asian, comparing aspects of the two cultures. This was followed by his first novel *The Conquerors* (1928), and then by *The Royal Way* (1930) which reflected some of his Cambodian experiences. In 1933, Malraux published *Man's Fate (La Condition Humaine)*, a novel about the 1927 failed Communist rebellion in Shanghai, which was awarded the 1933 Prix Goncourt. His first book on art, *Oeuvres gothico-bouddhiques du Pamir*, on his experience with southeast Asian art appeared in 1930 and after his father death, he participated on excavations in Iran and Afghanistan.

During the 1930s, Malraux was active in the anti-fascist Popular Front in France. At the beginning of the Spanish Civil War he joined the Republican forces in Spain as a volunteer, serving in and helping to organize the small Spanish Republican Air Force. After the war, Malraux was awarded the Médaille de la Résistance and the Croix de guerre. The British awarded him the Distinguished Service Order. Shortly after the war, General Charles de Gaulle appointed Malraux as his Minister for Information (1945–1946) and soon after that, in 1947 his art-historical career began in earnest. He issued, the first volume, *Le Musée Imaginaire*, of his most-important art series, *La Psychologie de l'art*, a work he had been formulating since 1935. The second volume, *La Creation artistique* appeared in 1948 and volume three, *La monnaie de l'absolu*, was published in 1949. In 1951, Malraux expanded and reissued *La*

Psychologie de l'art as the *The Voices of Silence (Les Voix du Silence)*, the first part of which has been published separately as *The Museum without Walls*. In 1952, A two-volume picture book, *Le musée imaginaire de la sculpture mondiale* was published, followed, in 1957, by a philosophical narrative on art, *La métamorphose des dieux*.

When de Gaulle returned to the French presidency in 1958, Malraux became France's first Minister of Cultural Affairs, a post he held for 11 years. Among many initiatives, he launched an innovative program to clean the blackened facades of notable French buildings, revealing the natural stone underneath. He also created a number of cultural centers (art museums, libraries), known as *Maisons de la Culture*, in provincial cities, and worked to preserve France's national heritage. He also oversaw the restoration of the Louvre Museum colonnade to its original state (<http://en.wikipedia.org>).

Malraux's legacy as an art theorist is uneven. His art books emphasized ideas rather than original scholarship. His project, the "Imaginary Museum" or his "museum without walls," as he described it, is an archive that he began in 1947, a montage of photographs of art from all around the globe and throughout history, stretching from Roman sculptures to Impressionist painting. Given that the breadth and diversity of today's world of art far surpasses the capacities of any single art museum, or even two or three, and that many of the objects are in any case not moveable, *the musée imaginaire* is an imaginary collection of all the works, both inside and outside art museums, that we today regard as important works of art. Malraux's idea to use photographs of art objects from different cultures in his books, opened a whole different world to the European reader and art lover. Through art books the public is introduced to the culture and creations of different civilisations that in other cases would have to travel thousands of miles to meet. He also suggested that art is universal. (<http://www.dictionaryofarthistorians.org>)

In 1996, in recognition of his contributions to French culture, his ashes were moved to the Panthéon, on the twentieth anniversary of his passing.

PUBLIC MUSEUMS IN FRANCE

During the 19th century, the creation of public museums was an innovative intervention of the state in the economy and constituted a public policy for the protection of monuments. Public museums were based on the old regime's confiscated royal collections (antiquities, paintings, etc) which were exhibited in palatial monuments, such as The Louvre and Versailles. Between 1895 and 2004, France's national museums constituted a solidary community of institutions directly depending on the Ministry of Culture through the RMN (*Réunion des Musées Nationaux*), reflecting the concept of the unity of the nation's collections.

The most important reforms touching on the status of national museums over the last two decades were devoted to the development of a new system of museum management and financing. National museums have progressively been detached from the centralising management of the RMN which was thought to be too restrictive and incapable of providing the dynamic approach needed to react to the development of a fast changing cultural economy. The first major transformations took place in the 1990s when the Louvre (1992) and Versailles (1995) were given the status of autonomous state

establishments, allowing them to manage their own budgets and profits directly and to increasingly turn to private funding in order to complete their budgets for acquisitions, and to expand their activities.

Autonomous in terms of their budget, the museums can use the profits that they generate and reinject them directly back into their own projects. However, they retain their status as public establishments: their staff remain state employees and they are administered according to the public law regime. Generally speaking, new financing policies, although providing continued support from the central government, have placed requirements on museums to seek out additional and novel methods of financing through commercial strategies (the development of museum shops as a rule dates back to the 1980s) and patronage and more generally by developing the range of services that they offer, styling themselves as cultural operators. It is this new politique “de l’offre” that perhaps best sums up the spirit of development at work over the last decade.

(<http://liu.diva-portal.org/smash/get/diva2:557284/FULLTEXT01.pdf>)

CULTURAL PPPS IN FRANCE

A public–private partnership (PPP) is a government service or private business venture which is funded and operated through a partnership of government and one or more private sector companies. PPP involves a contract between a public sector authority and a private party, in which the private party provides a public service or project and assumes substantial financial, technical and operational risk in the project. In some types of PPP, the cost of using the service is borne exclusively by the users of the service and not by the taxpayer.

Typically, a private sector consortium forms a special company called a "special purpose vehicle" (SPV) to develop, build, maintain and operate the asset for the contracted period. In cases where the government has invested in the project, it is typically (but not always) allotted an equity share in the SPV. The consortium is usually made up of a building contractor, a maintenance company and bank lender(s). It is the SPV that signs the contract with the government and with subcontractors to build the facility and then maintain it. In the infrastructure sector, complex arrangements and contracts that guarantee and secure the cash flows make PPP projects prime candidates for project financing.

(<http://en.wikipedia.org>)

In the cultural context, the use of PPP contracts by the French Administration remains restricted. However, successful examples of cultural PPPs in France are: a. the Theatre of Archipelago in Perpignan that hosts a cross-border festival, shows and co-productions and has been in operation since October 2011, b. The Marine Museum in Biarritz, a thermal-balance building that requires no heating in the winter or air conditioning in the summer, for a scientific approach to oceanography

through experiments and c. the National Museum of Civilisations of Europe and of the Mediterranean in Marseille: an ancient fortress which was closed for centuries is now connected with the main museum through a long bridge, offering to visitors a “museum-walk”. This intervention indicates the approach to the legal principle of sustainability for the historical monuments and underlines the importance of heritage for local communities. (Evangelatou *et al.*, 2013). On the other hand, failed case of cultural PPP is the project for the enhancement of the computers system in the Palace of Versailles. The failure was due not to mere incapacity of the private partner but to various reasons and the French museum managed to resume its normal operation soon, without making use to the contracting out, again (Vassilakou and Maniatis, 2012).

HERITAGE MANAGEMENT

Cultural heritage management (CHM) is the vocation and practice of managing cultural heritage/resources. It is a branch of cultural resources management (CRM), although it also draws on the practices of cultural conservation, restoration, museology, archaeology, history and architecture. CHM involves the identification, interpretation, maintenance, and preservation of significant cultural sites and physical heritage assets, along with intangible aspects of heritage, such as traditional skills, cultures and languages. It is especially active, in emergency cases of in danger monuments, where the focus is often upon rescue or salvage archaeology.

CHM has its roots in the rescue archaeology and urban archaeology undertaken throughout Europe after World War II and the succeeding decades. Salvage projects were hasty attempts to identify and rescue archaeological remains before they were destroyed to make room for large public-works projects or other construction. In the early days of salvage archaeology, it was nearly unheard-of for a project to be delayed because of the presence of even the most fascinating cultural sites, so it behooved the salvage archaeologists to work as fast as possible. Although many sites were lost, much data was saved for posterity through these salvage efforts.

In more recent decades, legislation has been passed that emphasizes the identification and protection of cultural sites, especially those on public lands. The public face of CHM, and a significant source of income to support continued management of heritage, is the interpretation and presentation to the public, where it is an important aspect of tourism. Communicating with government and the public is therefore a key competence. (<http://en.wikipedia.org>)

CONCLUSION

During the last three centuries, in Europe, there have been many radical changes in many aspects of public life: politics, ideology, economics, society, culture, science, technology. From the foundation of

public museums and the creation of terms such as national monument and restoration to public administration and heritage management, many steps have been made for the amelioration of the legislation, policies and management. Gradually there has been a turn from the public to the semi-public and collaborations between private and public parties are favored, even through public-private partnerships. Successful paradigms of cultural pppts show that it is a tool that can be used for cultural projects. It hasn't yet applied in restoration technical works, however if applied correctly, it should provide a wonderful outcome.

THE COMPETITIVENESS OF THE URUGUAYAN RURAL TOURISM SECTOR AND ITS POTENTIAL TO ATTRACT GERMAN TOURISTS

G. Topolansky Barbe, Federico¹; M. Gonzalez Triay, Magdalena²; Häufe, Cornelia¹

¹School of Business, The Royal Agricultural University, United Kingdom,

²School of Business, University of Gloucestershire, United Kingdom,

ABSTRACT

The main purpose of this article is to assess the competitiveness of Uruguayan rural tourism sector against its main competitors from Argentina and Brazil, as perceived by Uruguayan stakeholders on the supply side. The article will also evaluate the potential of Uruguay as a rural tourism destination in attracting German tourists. Two different questionnaires were administered, one to Uruguayan rural tourism stakeholders and another one to potential German tourists in Germany. The findings indicate that the main strengths of Uruguayan rural tourism offer, compared to Argentina and Brazil, are the hospitality and friendliness of local people; the natural and cultural attractions; and the country's security and safety. Main weaknesses identified were the poor management of several destination components that are key to create a successful tourism destination and poor management of the 'demand conditions' component of Dwyer and Kim's (2003) integrated model.

Keywords: *Competitiveness, Rural tourism, Dwyer and Kim's (2003) framework, German tourists, Uruguay*

INTRODUCTION

Uruguay has a population of 3.3 million habitants and receives around two million tourists each year (Gallardo, 2010).

Tourism is a relatively new industry that has grown rapidly becoming one of the world's largest providers of employment (World Travel and Tourism Council, 2011). The fact that tourism products can only be consumed "in situ", means that the revenue generated by the tourism sector is kept within the tourist receiving destination (Ferreira and Estevão, 2009). However, many tourist destinations lose revenue to other countries' economies and therefore the "leakage effect" must also be taken into consideration (Mill, 2002). Tourism - if conducted in a sustainable way - can provide an alternative for local or national development by improving income levels, employment and tax revenues in the

tourist receiving country (Barbosa *et al.*, 2010). All these benefits make rural tourism an attractive option to develop rural areas in Uruguay.

Whereas in many other countries rural tourism is one of the leading touristic activities, in Uruguay its importance has been neglected for a long time. Rural tourism in Uruguay was initially originated as a business initiative from a group of Uruguayan farmers with entrepreneurial skills looking for additional sources of income (Bentancur, 2008). However, it took a lot of time, for the government to realize the potential of rural tourism (Brida *et al.*, 2008). Alternative forms of tourism are less influenced by the seasonality and would reduce the strong dependency that Uruguayan tourism has on summer tourists that opt for a beach holiday along the south-east coast of the country. A successful marketing strategy pursued by the Uruguayan government has been to develop a country's brand, under the name of 'Uruguay Natural', to promote the country's image abroad as an idyllic tourism destination with plenty of natural and 'unspoilt' surroundings.

Objectives

In light of the rapid development of rural tourism during the past few years, and the Government efforts to promote and enhance the rural tourism offer in Uruguay, it becomes imperative to assess the competitiveness of the Uruguayan rural tourism sector. However, there is very limited research done on the competitiveness of Uruguay as a rural tourist destination in attracting foreign tourists (Mackinnon *et al.*, 2009). The objective of this study is to partially fill this gap by assessing how competitive Uruguayan rural tourism is and evaluating if Uruguay represents an attractive market for German tourists looking for agro tourism. The German market was chosen because it is one of the top tourist generating countries and one of the biggest spenders in international tourism (The World Tourism organization, 2010). Moreover, most tourists - from outside South America - selecting Uruguay as a tourist destination come from Germany, USA and Australia (Mintur, 2011).

COMPETITIVENESS

There are several definitions of competitiveness in the tourism literature (Wilde and Cox, 2008). Scott and Lodge's (1985, p.3) definition of competitiveness refers to 'a country's ability to create, produce, distribute, and service products in international trade while earning rising returns on its resources'. Other scholars such as Newall (1992) believe that national prosperity can only be achieved by increasing the quality and quantity of goods and services that are successfully marketed to international and domestic consumers. According to Barbosa and colleagues (2010) competitiveness is the ability to survive and achieve profitable growth in competing or new markets. Other researchers refer to competitiveness as an opportunity to develop more sustainable communities (Ferreira and Estevão, 2009).

To assess the competitiveness of a tourist destination it is important to consider the principles of comparative and competitive advantage and how they interact with each other (Wilde & Cox, 2008). Natural endowments may form a source of comparative advantage; however, the way that organizations add value to these resources will give some organizations a competitive advantage over competing tourists' destinations (Crouch and Ritchie, 1999).

Competitive advantage is concerned with the most effective use of the available resources to provide consumers with more value than competitors (Barbosa *et al.*, 2010). Competitive advantage can be achieved either by differentiation or by offering a similar perceived tourist product than competitors at a lower cost (Jobber, 2006). Dwyer and Kim (2003) conclude from a review of existing literature that competitiveness is associated with three mayor groups of thoughts: the comparative advantage and/or price competitiveness perspective; the strategy and management perspective and the historical and socio-cultural perspective.

There are also several frameworks developed with the purpose of looking at destination competitiveness from the tourism industry perspective (Ferreira and Estevão, 2009). Some of the most relevant ones are briefly discussed below.

As a response to the continuous development of different types of tourism and changes in tourism demand, Crouch and Ritchie (1999) developed a 'Conceptual Model of Destination Competitiveness' to analyse the competitiveness of tourism destinations. The model is based on the theories of comparative advantage (Smith, 1776; Ricardo, 1817) as well as on two of the most popular strategic models 'Porter's Five Forces' and 'Porter's Diamond' (Valdez *et al.*, 2010). It focuses on long-term economic prosperity and incorporates economic, ecologic, social, cultural and political aspects of the destination country (Ritchie and Crouch, 2003). Crouch and Ritchie's model is considered one of the most appropriate frameworks to understand the interplay and relationship between the various factors influencing the tourism competitiveness (Armenski *et al.*, 2007).

Dwyer and Kim (2003) and Dwyer *et al.*, (2004) also developed a holistic model to help identifying the underlying variables of a country's tourism competitiveness. Dwyer and Kim's (2003) 'Integrated Model'- as shown in Figure 1 - aims to improve Crouch and Ritchie's (1999) model by developing a framework that reflects a more realistic relationship between the major elements of destination competitiveness.

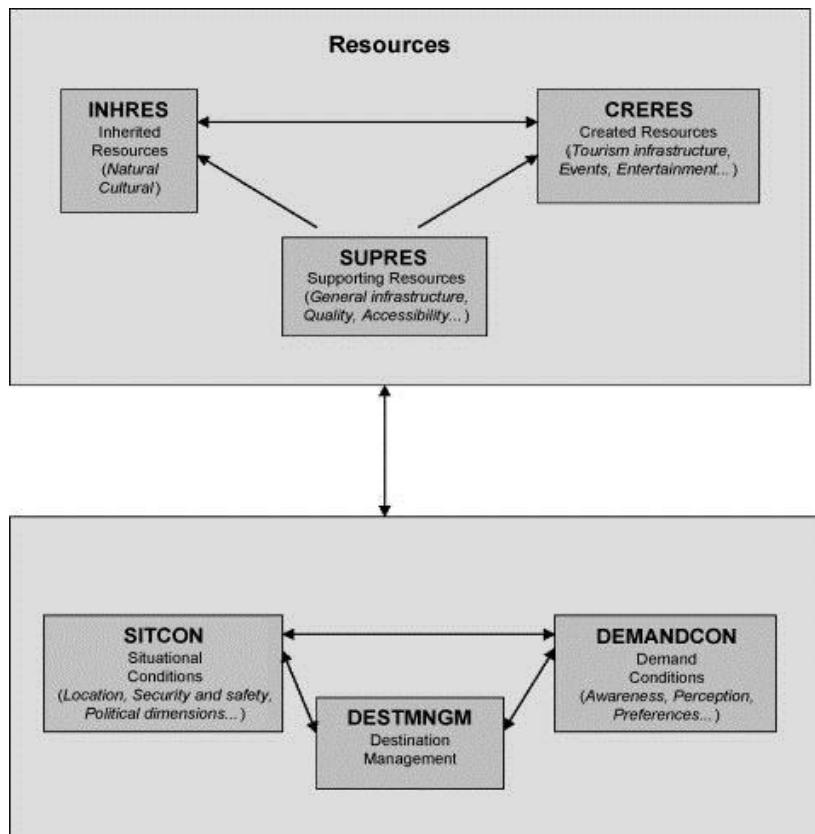

Fig. 1. Dwyer and Kim's Integrated Model of Destination Competitiveness

Dwyer and Kim's (2003) integrated model of tourist destination competitiveness was empirically tested in Australia, Korea and Slovenia (Gomezelj and Mihalic, 2008). The authors of these studies suggested that further research should be conducted to identify the relative importance of the different determinants of competitiveness within the context of specific destinations and specific visitor market segments (Gomezelj and Mihalic, 2008) and the importance of different elements of destination competitiveness in increasing the number of tourists from different market segments (Dwyer and Kim, 2003). By unveiling the determinants that define the competitive position of rural tourism in Uruguay and by understanding the customer profile of potential German rural tourists this paper has addressed some of these gaps.

The model to be employed in this research must be capable of explaining the success of tourism destinations in attracting international tourists. The general conceptual model of destination competitiveness developed by Crouch and Ritchie (1999) and further refined (Ritchie and Crouch, 2003) is the model that best meets these requirements. This model was selected for several reasons. First, this model has been widely reported in the tourism literature and has been the basis for a large number of other research studies into destination competitiveness. Second, the model is based on at least eight years of research and has been refined and developed over an extensive period of time. Third, the model has a holistic approach that makes it suitable to be applied to any destination and tourism market.

METHODS

A positivist, deductive research approach was deemed the most appropriate approach to address the objectives of this research. The application of a well-known framework to the Uruguayan rural tourism sector has helped to identify the competitive position of Uruguayan firms within the selected industry. Two structured questionnaires were developed to collect the data, one administered to Uruguayan key rural tourism stakeholders, and another one to potential German tourists. A total of 185 questionnaires were completed. To establish validity, questionnaires were scrutinized by a panel of experts in the field. The first questionnaire was administered to 76 Uruguayan rural tourism stakeholders with knowledge or experience relevant to the topic. The sample size is the suggested to get results that are representative (with 95% confidence level) of the universe of Uruguayan rural tourism farms.

Participants were required to make judgements regarding the importance of the main factors and sub-factors detailed in the Crouch and Ritchie model of destination competitiveness. Respondents were asked to rank different Uruguayan competitiveness parameters against a five-point Likert scale, comparing Uruguay against its main competing tourist's destinations: Argentina and Brazil. The collected data was transferred to GenStat for statistical analysis.

The criteria used to determine the sampling frame was based on: existence of a homepage, website quality, total product offer, activities in the surrounding area, price, location and proximity to main roads. The chosen tourists' farms are distributed all over the country and therefore it could be said that the results are a fair representation of the rural tourist industry in Uruguay.

The second questionnaire was administered to a convenience sample of 109 potential German tourists. The study used the right sample size in order to get results that are representative of potential tourists attending "The Equitana fair" with a 95% confidence level. This questionnaire had two main parts. The first part aimed at revealing the attractiveness of Uruguay as a rural destination and the second part looked at the general characteristics of German tourists. The Equitana fair event, held in Essen Germany was recommended by travel agencies - supplying services to people interested in rural tourism - as the most suitable event to collect data from potential German tourists interested in rural tourism. Respondents come from different regions of Germany as depicted in figure 2.

Fig. 2. Geographic origin of German participants by state (in percentage)

RESULTS

I) Competitiveness of the Uruguayan Rural Tourism sector

In this section, the data collected from questionnaire one is presented against the main six competitiveness determinants suggested by Dwyer and Kim (2003).

		Mean	SD
Natural Endowed Resources	Attractiveness of Climate to German tourists	4,00	0,93
	Cleanness/Sanitation	3,80	0,41
	Marvels of Nature	4,20	0,77

Demand Conditions	International Awareness of Destination	3,15	0,66
	International Awareness of Destination Products	3,15	0,66
	Overall Situation for Rural Tourism in Uruguay	3,08	0,73
	Overall	3,12	0,68
Demand Factors		3,12	0,68

Table 1 Competitiveness determinants

Inherited resources

Results from this study indicate that Uruguay as a rural tourism destination is well positioned compared to its South American competitors (overall grade 3.95 out of 5) in most of the attributes within this group (Table 1). Whereas *natural inherited resources* are graded with an overall mean score of 4.20, *culture and heritage* only attained an overall mean score of 3.74. The highest rating in this group of indicators was assigned to the *country's unspoiled nature* (4.70) whereas the lowest scored was assigned to the *level of cleanness and sanitation* with only 3.80 points. For these two factors a low standard deviation (0.41/0.45) indicates a high level of agreement between the respondents.

Created resources

There was much agreement among respondents about a slight superiority of Uruguay's created resources compared to its counter rivals from Argentina and Brazil (Table 1). Results indicate that Uruguay's main strengths lie in its *airport efficiency and quality* as well as its *nature based activities*.

Within this group of indicators, *recreational activities* such as special events and festivals that take place in Uruguay are rated above average, with a mean score of 3.86. This suggests that Uruguay is more competitive on this area than the competitor destinations. The standard deviation reveals that most participants share this opinion. Although created resources look promising for the future of Uruguayan rural tourism sector, standard deviation divergences need to be considered and therefore results should be interpreted with appropriate caution.

Supporting factors

Uruguay is considered to be more competitive than its direct rivals in most of the supporting factors, with most attributes rated higher than three. The rating of supporting factors indicates that the main competitive advantage of Uruguay as a rural tourist destination lies in the *hospitality from residents towards tourists*, which contributes to a positive experience while staying in Uruguayan farms. Supporting factors together with inherited resources have the highest average mean scores of 3.97 and 3.95 respectively, suggesting that these are the two main determinants of Uruguay's favourable competitive situation. Whilst some supporting factors are perceived as good or very good compared to competing countries, the *quality and quantity of training programs* to enhance service quality has a low rating, with a mean score of 3.15.

Destination management

The results indicate that most respondents agree on the perception (SD: 0.55) that *human resource management* is one of the key factors limiting a further development of the selected industry. Results from the other groups of indicators within destination management are rated higher than human resource management. However, within the group of indicators for "destination policy, planning and development", the *existence of clear policies in rural tourism* scored particularly low. The indicator with

the lowest rating within this dimension is *the promotional activities of national tourist organisations in Germany*, with a rating of 2.77, which shows that is the only indicator where Uruguay is clearly perceived to be less competitive than its direct rivals.

Situational conditions

Factors within this determinant can form the basis of competitive advantage in attracting tourist to Uruguayan rural farms. The overall ranking is positive but particularly, the *German business environment* factor has been rated very high by the majority of respondents. As shown in table one, *political stability* is another area where Uruguay has a clear competitive advantage against Argentina and Brazil, with a rating value of 4.25. However, this study has also identified the following areas where Uruguay is perceived to be less competitive: *quality of research input; access to venture capital; domestic business environment; and foreign investment*.

Demand Conditions

Dwyer and Kim's (2003) argue that demand conditions are influenced by the *international awareness of the destination and its products*. The findings from this research suggest that the international awareness of Uruguay as a key rural tourist destination is similar to those of its direct competitors.

PROFILE OF POTENTIAL GERMAN TOURIST

This section will present the findings from the questionnaire carried out to German respondents at the Equitana fair.

General characterization of participants

Results indicate that 70% of participants travel with their partners. Within this group, 33% also travel with kids. Among the remaining participants, 19% tend to travel with friends and 11% travel alone. Most participants (65.06%) stated that relaxation and leisure was their prime motivation for travelling followed by sport and adventure (24.01%), culture (8.43%) and lastly social reasons (2.40%). The data collected indicates that, on average, a German tourist would spend 1,000 euros per week. Most respondents indicated that they tend to plan their holidays at least half a year in advance.

In spite of the lack of knowledge about Uruguay - as a rural tourist destination - 71.08% of respondents would consider travelling to Uruguay on a holiday. It is important to note that 10 participants had already been to Uruguay and all of them would like to return to Uruguay in the near future. Among those who would not consider Uruguay as a potential destination, the 13 hours flight was identified as the main factor that would discourage these potential tourists from visiting Uruguay.

Results from this study show that the travel patterns of those Germans willing to select Uruguay as a rural destination can be broken down as follows: 50.85% travel more than once a year, 35.60% travel

once a year, 3.39% travel every other year and 10.17% travel less frequently. Most participants (69%) who considered Uruguay as a potential rural tourist destination would like to stay in the country for about three weeks.

Participants declared that they gather information about travel destinations from the internet (26.05%), friends and relatives (22.33%), tourism catalogues (13.03%), newspaper (11.16%), television (10.70%), tourist agencies (8.37%), magazines (5.12%) and newsletter (3.26%). When asked about their preferred way of receiving information the ranking was clear: 39.81% opted for information sent by email, 29.13% for information sent by post, 25.24% are happy to search for information on internet and only 5.82% like to receive newsletters.

Most of the respondents (95%) who expressed their desire to travel to Uruguay were very interested in participating in some of the activities offered by Uruguayan touristic farms. Table two below depicts the ranking of participants' activity preferences. Most participants (91.07%) were very enthusiastic about the idea of participating in several days trail rides.

Activity	Rank	Level of Participation
Riding	1	98,21
Cattle Drive	2	87,5
Branding	3	71,43
Walks	3	71,43
Biking	4	55,36
Drilling/Harvesting	5	42,86
Polo	5	42,86
Fishing	6	17,86

Table 2 Participants' activity preferences

CONCLUSIONS

Overall, compared to its main regional competing destinations, Uruguay does not possess a very strong comparative position. However, tourism stakeholders on the supply side rated Uruguay's *natural endowed resources* and *hospitality* as the most competitive indicators. The authors believe that Uruguayan respondents have underestimated the marvels of nature that attract international tourists to competing destinations such as Argentina or Brazil. To overcome the lack of marvels of nature Uruguay should concentrate on adding value through offering high standard accommodation, excellent hospitality and service, and excellent marketing.

The findings suggest that Uruguay will have to create and convey the right message focussing on the range of activities offered in rural farms and their surrounding areas. The high level of correspondence between the profile of German tourists and the characterization of nature-based and

adventure tourists has revealed the significant potential of Uruguay as a rural tourism destination for Germans looking for nature and soft-adventure tourism.

The high *level of security* and the *peacefulness* that characterise Uruguay's rural areas are highlighted in the literature and are accredited with Uruguay's high fidelity level (Cotelo, 2011). This high fidelity level has been confirmed with the help of the data collected from German participants. Therefore, tourism stakeholders should capitalize on the excellent security levels of the country.

This study also recommends improving the indicators that are responsible for the relatively poor rating of destination management. For instance, it is necessary to establish a good educational system especially for participants on the supply side of rural tourism. This study has also identified opportunities where the public and private sector can work together to improve the competitiveness of Uruguayan rural tourism. The areas on which both sectors should focus on are: promotional activities in Germany, the development of clear rural tourism policies and a better integration of the sector into the country's development strategies.

The rural tourism sector has not benefited from any tax reductions that traditional sectors of tourism in Uruguay have enjoyed in the past. Considering the potential of rural tourism to improve the economic situation of rural areas the government should consider implementing tax incentives to help rural farms to improve their competitive advantage. If rural farms attract more foreign tourists it could have 'spill over' benefits for many people in surrounding areas. Tax benefits would also help the rural tourism sector to offer a more competitive product which will help to attract price-sensitive tourists such as Germans.

ABSTRACT

The present research is mapping opinions regarding the consumers' correspondence to the development of a pilot implementation of a business networking model with the use of IT in Greek wood and furniture sectors. The participating enterprises are aiming to their cross - firm cooperation related to the procurement of materials and intermediate products and outsourcing. Based on specially constructed questionnaire, the researchers addressed to 66 consumers of wood and furniture products. Findings have shown that, the potentiality of developing the proposed dynamic network, could constitute an innovative proposition which finds resonance to the consumers of wood and furniture products, based to the characteristic of real time purchases. The expected benefits of participating in such a network, could constitute a fundamental competitive advantage of the network's enterprises. This fact is deemed to be of great importance for wood and furniture sectors, especially during the present economic downturn. Furthermore, supporting strategies should be developed. It seems that wood and furniture enterprises have not yet managed to develop trustworthy relationships among them and to spot the opportunities they have in developing cooperative activities using high technology, acquiring a fundamental competitive advantage. In order for this target to be achieved, they should focus to specific cooperative activities and to the exchange of entrepreneurial practices, without this strategic choice be in confrontation to their independent operation.

Keywords: *business network, business model, innovation, value creation, wood & furniture enterprises, e-Furniture, consumers' research.*

INTRODUCTION

The present market study, has been implemented under the context of the research project "*Dynamic networking of furniture manufacturing enterprises with the use of intelligent software agents (e - Furniture)*", by the Department of Wood and Furniture Design & Technology - TEI of Thessaly. The project is funded by the operational program "*Competitiveness & Entrepreneurship*" of the National Strategic

Reference Framework 2007-2013 (NSRF 2007 - 2013), action "*Supporting of SME's clusters for R&D activities*". The project is dealing with the implementation of industrial research aiming to the introduction of the related technology and experimental development of a prototype, intelligent agent based, IT system for supporting "smart" networking of manufacturing and trading furniture and wooden products enterprises. The participating enterprises are aiming to their cross - firm cooperation related to the procurement of materials and intermediate products and outsourcing. The use of the specific system is expected to lead to the reduction of procurements' and offering services' cost, facilitation of outsourcing for the cooperative firms and integration of the products' and services gamut, having as a consequence the augmentation of customers' satisfaction and firms' competitiveness.

Motivation

Traditionally, competition of enterprises was a static meaning, with basic production factors to be responsible for the success or failure of a firm. But not any longer. Modern competition is unpredictable and extremely dynamic. The industrial and entrepreneurial competitive advantage is changing rapidly, because of the development of new innovative technology, shortness of products' life cycle and the introduction of new global competitors in the sector, such as China, Russia and India. It constitutes a reality that Greek furniture enterprises are facing during the last period, an unprecedented uncertainty and significant problems, as a result of the Greek and European economic downturn and recession, but also because of specific problems and stiffness of the sector in the country (Papadopoulos *et al.*, 2012; 2009). Thus, strategic differentiation through the adoption of new business models based on innovation and extroversion, is more than ever out of great importance for the Greek wood and furniture enterprises. In that way they will be able to become more competitive and secure their viability.

LITERATURE REVIEW

During the last years there is a significant number of research highlighting the contribution of entrepreneurial strategy in business performance (Demeter, 2003). This tendency, includes research that brings forward the relation between business performance and manufacturing and other technology that is been used (Beaumont and Schroeder, 1997; Das and Narasimhan, 2001), quality management techniques (in relation to business personnel and to products/elements of enterprises) (Dow *et al.*, 1999) and the sum of the entrepreneurial strategy (Robb and Xie, 2005; Li, 2000). On the contrary, marketing research and its applications, highlights the central role of the products and services value for the consumer or, the total evaluation by the consumers regarding the usability or value of products in purchasing decision (Gao *et al.*, 2005; Woodruff, 1997; Anderson, 1995). The

capability in providing products with high added value for the consumers is considered as a fundamental element for enhancing competitiveness (Lindgreen and Fynstra, 2005; Sweeney and Soutar, 2001). Furthermore, modern consumer is more than ever oriented towards the direction of product's value, giving simultaneously more importance to the best possible relation of quality/price. They tend to be also, more well informed and demanding (Peter and Olson, 2002; Blackwell *et al.*, 2001).

Under this context, enterprises are almost obligated to adjust their products, processes and the way they approach their customers, following a model through which they could provide the higher possible value, based to knowledge, innovation, strategic differentiation and the understanding of consumers' needs. Consumers' behavior could constitute a tool for creating and developing successful marketing strategies with multiple benefits for the enterprises (Schiffman and Kanuk, 2000; Assael, 1998). For instance, better understanding of customers' needs presupposes a plainly more rational use of business sources.

Value creation for enterprises and for consumers' constitutes the core of every successful business model (Zott and Amit, 2010; Morris *et al.*, 2005; Melville *et al.*, 2004; Chesbrough and Rosenbloom, 2002). It could also constitute one of the most fundamental elements behind the success of a product, service or technology in the market. In traditional business models the proposed value towards the consumers is mainly based on meanings such as quality, design, functionality, low price or cost. Furthermore, traditional business models are aiming to bring forth ways in selling products/services to the consumers (Osterwalder *et al.*, 2010). New business models presupposes the creation of new values and consumers awareness such in tacit and explicit values (Tukker, 2004), stressing these kind of customers' needs, offering to the enterprises the competitive advantage, creating new opportunities in the market based on inspirational innovations.

Greek furniture production and trading are facing a continuous recession, because of the economic crisis, which has as result a significant number of sector's enterprises to be at stagnation stage for a long period or to have stopped their operation (Papadopoulos *et al.*, 2012; 2009). Besides these very negative indexes for the furniture sector, a number of inhibitory factors contributes towards this unpleasant situation such as, high labor costs, the lack of raw materials and of specialized personnel, the small size of the Greek enterprises, the irrational organization of firms, the lack of new production technologies and the deficient infrastructures in the sector (Papadopoulos, 2006).

Nevertheless, according to a recent study in Greece (Trigkas *et al.*, 2012), the majority of the innovating wood and furniture enterprises are adopting existing production and distribution processes moving towards marginal improvements. Thus, we could argue that there is a growing need for the development of innovative promotion and distribution methods for the Greek wood and furniture

industries. On the contrary, according to the same research, it seems that Greek wood and furniture enterprises have not been able yet, to develop mutual relations and to several other organizations, based on trust, in order to effectively move towards the exchange of knowhow and best practices flows. As a consequence, the improvement of the cooperation between the sector's enterprises is deemed of high importance, since the enhancement of cross firms bounds and of cooperative activities, along with constant investments in modern technology and the exchange of best entrepreneurial practices, could enhance the sector's competitiveness (Trigkas *et al.*, 2012), without this strategic choice to be in confrontation with the independent entrepreneurial activity of firms. .

According to another research of Papadopoulos *et al.*, (2012), the bigger Greek furniture enterprises are preferring to invest in processes reducing the production costs in order to confront the existing competition. On the contrary, SMEs' choose strategic differentiation applying specific initiatives regarding their business model, since they could not become competitive regarding the production cost. Finally, despite the economic crisis and the dramatic consequences in families' income in Greece, a recent study (Papadopoulos *et al.*, 2014) has shown that Greek consumers are willing to pay extra for the added value that a furniture product may offer, based on technological and ecological innovations, satisfying specific needs. The same study concludes to "*Greek furniture enterprises will have to focus to differentiation from the competition, innovating through the production and promotion of furniture products of high added value, a fact that could ensure a significant fraction of the internal market and boost extroversion (exports)*".

GOAL AND SCOPE DEFINITION

The present research will constitute a useful guide for furniture enterprises, since it is based to a pilot implementation of business networking model with the use of IT, a model that is introduced for the first time in Greece. The present market study is mapping opinions regarding the consumers' correspondence to the development of such a network using sophisticated technology, which will aim to their service in real time according to their preferences and needs in furniture products, satisfying simultaneously the firm's needs in materials etc. The expected outcome has mainly to do with the clarification of the opinions of the target group and potential stakeholders regarding the design, development and operation of a dynamic business network, in order to lead to required decision making regarding the forthcoming steps of the research on the network's characteristics and operational elements.

RESEARCH METHOD

The primary data collection and elaboration followed the methodology of gathering, processing and editing according to the basic principles of marketing research (Gordon and Langmaid, 1988; Tull and Hawkins, 1990; Doyle, 1998; Aaker et al. 2004; Siomkos and Mavros 2008). Questionnaires were specially constructed for the purpose of the study with short and precise questions. The research was conducted by skilled researchers who addressed directly the entrepreneurs or executive members of the firms by personal face-to-face interviews.

The questionnaire included 13 questions on issues such as the cooperation and trust magnitude of consumers towards wood and furniture enterprises, their general attitude regarding the development and implementation of such a business network, product's characteristics, services, benefits and services, as structural elements of the network's operation according to their needs and preferences in real time. The final group of questions had to do with the profile of the participants in the study in order to detect the specific characteristics of the potential users of "smart networks" in wood and furniture products. The research took place during the period January 2013 - February 2014 using random sampling of 250 consumers all over Greece. Finally, a 26,4% of the sample corresponded translating to a number of 66 consumers. The questionnaire had been uploaded to <http://inflab.kard.teilar.gr/e-Furniture/index.php/el/surveysgr?id=95> and the participants were notified by e - mails. A content validity of the questionnaire was used before its launch to the internet based on diligent discussions with wood and furniture enterprises and scientific experts in the field and literature review. A pilot questionnaire was addressed to five consumers and from this pre - sampling we manage to improve several parts of the questionnaire, improving its quality and shaping the final questionnaire (Dillman, 2000).

Data were edited and processed using SPSSWIN ver 17.0 and all the related tests of *frequencies*, *descriptives* and *cluster analysis* were made (Howitt and Cramer, 2003; Siomkos and Vasilikopoulou, 2005; Norusis, 2007), in order to detect the groups of consumers based to specific characteristics of their profile and the integration range of the network's attributes - operations.

RESULTS AND DISCUSSION

The results of the study are considered to be of great importance constituting a core element of the entire e-Furniture research project, under the context of the direct consumers' service according to their needs and preferences, but also under the prism of targeted and quick sales for the enterprises, offering a high added value service to their customers.

Regarding the question, which would be the initial impression of the consumers in case that a firm participated in a cooperative network giving them the opportunity to buy from distance,

automatically and at a real time, its products, the majority of the participants (42,6%) has stated that they would have a positive attitude against this potentiality, while the 37% would be very positive, as it is presented to the next Table 1. These results are considered to be quite encouraging, since the potentiality of developing the proposed dynamic network, could constitute an innovative proposition which finds resonance to the consumers of wood and furniture products, based to the characteristic of real time purchases.

Respond	Percentage %	N
Positive	42.6%	23
Very positive	37.0%	20
Skeptical	13.0%	7
Neutral	7.4%	4

Table 1. *Initial consumers' attitude towards networking enterprises for real time purchases*

The above mentioned opinion is also based to the expected benefits for the consumers themselves (Figure 1), which have stated at a percentage of 60,5% that they could achieve time saving, 39,5% completed solutions according to their needs and preferences, 37,2% better prices, 16,3% better design and guarantees and 11,3% less stress during products' selection and purchase. The specific expected benefits, according always to the participants' opinion, could constitute fundamental competitive advantage of the network's enterprises. This fact is deemed to be of great importance for wood and furniture sectors, especially during the present economic downturn, which are facing a vertical decline to their financial and production amounts, in order to boost their entrepreneurial activity via "smart", affordable ways of selling and provision of completed solutions. These three competitive advantages constitute the basis of the competition mainly by multinational companies operating in Greece (Spanos *et al.*, 2004; Porter, 1986).

Figure 1. *Expected benefits for the consumers by a potential dynamic networking of wood and furniture enterprises*

However, the 13% of the consumers that had a skeptic attitude against the potentiality of such a network and making purchases through this (Table 1), pose as basic hesitations (Figure 2): the willingness to be at personal contact with several enterprises in order to judge themselves the reliability and trust they could have towards them (62%), as well as the hesitation that this method of selling will not offer them the best possible quality, at a percentage of 25%, while a 13% poses several other reasons. Thus, it is of great importance the participating enterprises in such a network to secure the mutual trust of the consumers, providing them quality products and solutions. Thoughtfully, this effort should be supported by several supplementary strategies such as quality certifications, implementation of quality management systems, feedback processes, after sales service, etc. in order to bend as much it is possible whichever hesitation may exist towards this kind of a cooperative business model.

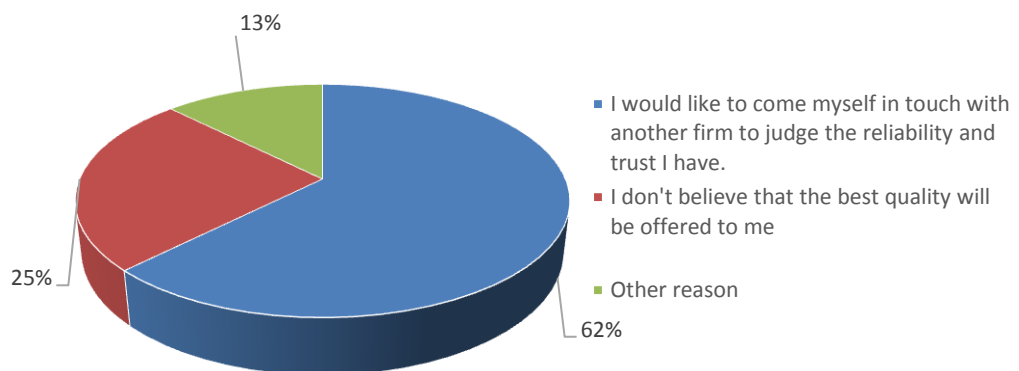

Figure 2. *Basic hesitations by the consumers regarding the potential participation of the enterprises in a dynamic cooperative network*

The characteristics to which the consumers give special attention before they move towards the purchase of a furniture product and which will have to constitute a structural information regarding the capabilities of the developing network, are presented in the next Figure 3. Results show that the capability of integrated services to the consumers should exist, that ensure products' quality, low prices, design and guarantees at 31,4%, 31,1%, 21,1% and 14% respectively.

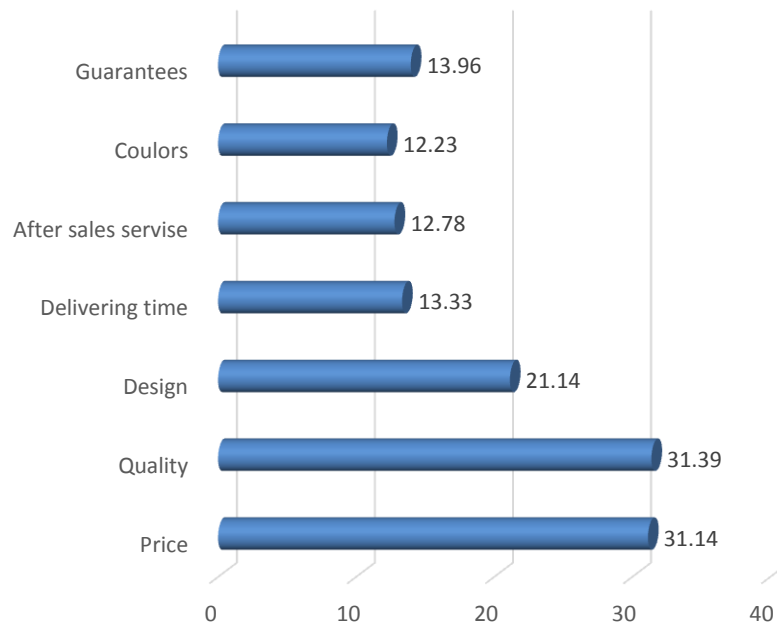

Figure 3. *Volume (%) of significance of wood and furniture products purchasing characteristics*

Simultaneously, the presentation of furniture products, along with the capability of the combination of their characteristics and selling methods according to the consumers' preferences in real time, should be focused in attributes such as (Table 2): low price (33,3% of the responses considers it as quite significant and a 27,8% very significant), prototype and functional design (29,6% and 38,9% respectively), the offering guarantees (31,5% and 37% respectively), as long as after sales service at a percentage of 24,1% and 31,4% respectively, according to the significance volume for the consumers before they move towards the purchase of products. Thus, the developing network will have to embed to its operation these attributes, which fundamentally, are representing the expected benefits as competitive advantages of the network.

ATTRIBUTES	NOT SIGNIFICANT	LOW SIGNIFICANC E	SIGNIFICAN T	QUITE SIGNIFICANT	VERY SIGNIFICAN T
Brand name	18,52%	16,67%	35,19%	12,96%	7,41%
Low price	5,56%	7,41%	22,22%	33,33%	27,78%
Payments of no interest	22,22%	22,22%	16,67%	5,56%	11,11%
Quality	1,85%	3,70%	5,56%	11,11%	22,22%
Guarantees	1,85%	7,41%	12,96%	31,48%	37,04%
Prototype and functional design	1,85%	5,56%	12,96%	29,63%	38,89%
Colours	3,70%	5,56%	25,93%	29,63%	18,52%
After sales service	5,56%	7,41%	22,22%	24,07%	31,48%

Existence of a shop near my residence	11,11%	12,96%	31,48%	16,67%	9,26%
Other	1,85%	3,70%	1,85%	1,85%	3,70%

Table 2. *Significance of wood and furniture products' attributes during the purchasing process*

Finally, some other attributes that the project's network could embed, as a result of the selling methods' improvement, products distribution, after sales service and the building of a trustworthy environment between customers and enterprises, have to do mainly with customers service attributes (77,5%), selling according the customer's preferences (70%), low pricing (52,5%) and the avoidance of mistakes in ordering (30%). Non observance of these attributes constitute one of the major reasons for interrupting cooperation with a firm, according to the responds of the participants as they are presented in next Figure 4.

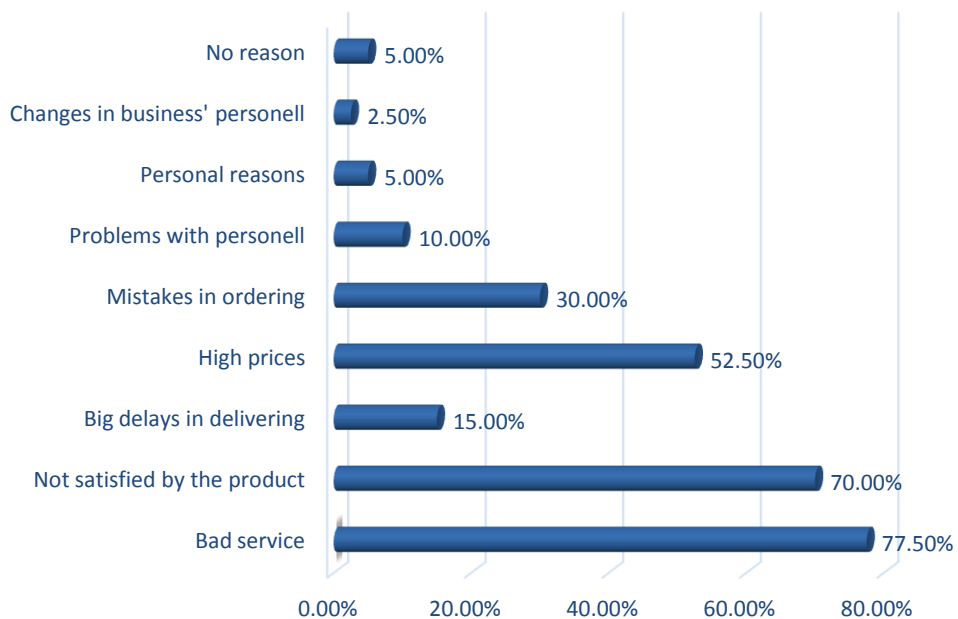

Figure 4. *Basic reasons for interrupting cooperation with wood and furniture enterprises*

The consumers profile that had participated to the present market research have shown that (Table 3), the majority (57,5%) were singles of 21 - 30 years old. A percentage of 32,5% states private employees with freelancers and students to follow (22,5% and 25% respectively). The average net monthly income is in majority (45%) below 1.000€ with these having income between 1.000€ - 2.000€ (30%) to follow. Their education has to do at a percentage of 67,5% with higher education, with post graduate studies to follow at a percentage of 25% of the responds. Regarding the kind of their residence, the majority (47%), has stated that lives in a single residence below 100 square meters with the residences of total surface between 100 – 150 square meters to follow (49% and 35% of the responds respectively).

Age	Percentage	Marital status	Percentage
< 20	0,00%	Single	57,50%
21-30	57,50%	Married	17,50%
31-40	20,00%	With 1-2 children	22,50%
41-50	20,00%	With 3 children and more	2,50%

3.000 – 5.000 €	2,50%		
> 5.000 €	7,50%		

Table 3. *Basic demographic characteristics of the participants' profile*

CONCLUSIONS - PROPOSALS

Modern consumer of wood and furniture products, is more than ever, oriented towards the value of products, focusing to the best possible relation of quality and price. Especially during the present economic downturn having limited sources for purchasing, he gives special significance to market research for wood and furniture products with high added value for him (value for money).

Thus, it is of great importance the study regarding the basic attributes, functions and services that the project's developing business dynamic network could integrate under the context of the direct customers' service based to their needs and preferences, along with the focused and quick selling procedure for the enterprises, offering a high standard of customers' service. The potentiality in developing such a dynamic network could constitute an innovative proposal finding resonance in wood and furniture consumers based to the characteristic of purchasing in real time. The majority of the participants in the present research has stated that they have a positive till very positive attitude against this potentiality.

Results show that there must be the capability of integrated customers' services, which could ensure products' quality, low prices, design, and guarantees. Simultaneously, the presentation of the products along with the capability for combination of characteristics and real time sells according to customers' preferences, should focus in attributes such as: low prices, prototype and functional design, guarantees and after sales services. Regarding the expected benefits for the customers themselves, it is recorded the time saving, the opportunity for perceiving of integrated services, better prices, better design, bigger guarantees and less stress during the choice of products. The specific expected benefits, according always to the opinion of the participant consumers, could constitute fundamental competitive advantages of the network's enterprises. This fact, is of great importance during the present economic situation for the sectors of wood and furniture, which face a vertical decline to their financial and production magnitudes and wishes to boost their enterprises through "smart" entrepreneurial ways for selling products and integrated services, reachable for the consumers.

Furthermore, this effort should be supported by supplementary strategies such as: quality certifications, implementation of quality management systems, feedback processes, after sales service, etc. in order to bend existing skepticism that may occur against to such a cooperative business model. Finally, some more attributes that should embody the project's network have to do mainly with: customers service, products sales according to the customers' needs and preferences, sustain of low prices and avoidance of mistakes in ordering, as a result of sales, delivering and after sales service improvement, along with the development of a relationship of mutual trust between the customer and the firm.

It seems that wood and furniture enterprises have not yet managed to develop trustworthy relationships among them and to spot the opportunities they have in developing cooperative activities using high technology, acquiring a fundamental competitive advantage. In order for this target to be achieved, they should focus to specific cooperative activities and to the exchange of entrepreneurial practices, without this strategic choice be in confrontation to their independent operation. However, results indicate the adequate cooperation the Greek wood and furniture enterprises develop with their customers, based to mutual trust relationships, a fact that is perceived as very positive for both sectors. All is needed is for the firms to give the opportunity to the consumers to get to know one another and their products, after a systematic market research and spot value elements for themselves. The present research is proposed to be continued in order the number of the participating consumers to become much higher including all the age categories. Finally, the present research could be combined with a market study of the e-furniture's project participating enterprises, in order for the

results to maximize their benefits and simultaneously satisfy in the best possible way the needs and preferences of the firms' customers.

ACKNOWLEDGEMENTS

This research is part of the project under the title "*Dynamic networking of furniture manufacturing enterprises with the use of intelligent software agents (e - Furniture)*" and has been conducted by the Department of Wood and Furniture Design & Technology - TEI of Thessaly. It has been co-financed by the European Union (European Fund for Regional Development) and Greek national funds through the Operational Program "*Competitiveness and Entrepreneurship*" of the National Strategic Reference Framework (NSRF) - Research Funding Program: *Supporting of SME's clusters for R&D activities*.

ABSTRACT

The quality of the environment is a public domain, and since environmental problems are the result of human choices and not of the autonomous function of the environment, people are called upon to deal with the consequences of their choices. The environmental activation and behaviour of people depends on the interest they show in environmental issues, and also on their environmentally responsible behaviour. A change in the way of thinking and dealing with environmental problems in the daily life of citizens is essential in order to enjoy a sustainable society with a sustainable future.

More specifically, in the present paper, valuable information was collected regarding the environmental habits of the public in Greece, while the latter also stated who they consider to be responsible for the environmental issues the country is facing, and who should bear the cost of environmental protection. The citizens' views were collected with the use of a questionnaire and simple random sampling. Factor and Cluster Analysis were then applied, in order to examine the potential existence of individual citizen types, and in order to compare them with the views of citizens as to who should pay for the cost of environmental protection, and with the personal characteristics of the interviewees.

Keywords: *environmental behaviour, cost of environmental protection, environmental responsibility and quality of life.*

INTRODUCTION

The environmental problems of the planet have led many researchers to study changes in basic human values, principles, attitudes and behaviours vis-à-vis nature and its protection (Dunlap and VanLiere, 2008, Ewert et al., 2005, Kaplan, 2000, Trobe and Acott, 2000, Zelezny and Schultz, 2000). During the last four decades, environmental issues and more recently the problem of climate change in particular,

have become some of the main public and political concerns of our times (Hansen, 2011). The growth of industry and technology, overpopulation and overconsumption, along with the pressure for a continuously greater exploitation of earth's natural resources, are the main reasons behind the emergence of major environmental problems (Kalaitzides and Ouzounis, 2000).

Environmental concerns constitute a threat for environmental sustainability and many of them are rooted in human behaviour (DuNann Winter and Koger, 2004; Gardner and Stern, 2002; Vlek and Steg, 2007). In order to address them, a change in human behaviour is considered to be essential. This can be achieved through various improvement techniques that anyone can adopt, in order to reduce their negative impact on the environment (Midden et al., 2007, Gausset, 2013). Therefore, changes in environmental behaviour on a personal level can lead to changes in sustainability on a social level (Eilam and Trop, 2012).

Environmental activation and human behaviour depend on the interest people show in environmental issues, and on their environmentally responsible behaviour. It is often observed that environmental attitudes and environmental behaviour are related to people's values (Stern, 2000). The public's environmental awareness is related to the attitudes that determine the behaviour of people, while the term environmental behaviour is defined as the result of conscious actions undertaken by a person, in order either to minimize the negative impact of human activities on the environment or to improve the latter (Kollmuss and Agyeman, 2002).

All citizens have a responsibility to protect the environment, which is why public awareness is deemed essential, so that people are involved in the adoption and implementation of decisions regarding environmental protection and upgrading. This constitutes the most promising investment for a better future from an environmental perspective. Thus, in the present paper, an effort is made to examine the relation between the personal characteristics of the interviewees, their environmental sensitivity and their views on who should bear the cost of protecting the environment. This will allow us to formulate diverse policies that could affect the attitude of various social groups vis-à-vis environmental protection, since several studies have indicated that environmental behaviour is related to specific socio-demographic characteristics (Johnson et al., 2004; Franzen and Meyer, 2010).

RESEARCH METHODOLOGY

The collection of material in this research was carried out through a structured questionnaire. The questionnaire consists of 23 multidisciplinary variables, and those who participated in the research attempted to capture public opinion on environmental issues and the views of people about the media and especially newspapers (this paper presents only a part of a broader research). The questions were very carefully composed because they had to attribute the data that the researcher needed and

the questions had to be reliable, which means that they had to give all respondents the same type of information (Siardos, 1997). Thus, a pilot questionnaire was prepared and the final application was made on a limited scale; the final research questionnaire was compiled due to the help of the pre-sampling questionnaire. The method of closed questions in combination with prepared answers was chosen because the former do not require much effort from the person being asked, facilitate the interview and reduce its duration and, in addition, they help to easily and quickly code the questionnaire (Daoutopoulos 1994; Filias et al., 2000).

To investigate the attitude of the public, simple random sampling was applied. This method was chosen because of its simplicity and the fact that, when compared to other methods, it requires less knowledge about the population under study (Matis, 1992; Kalamatianou, 2000). The survey was carried out through telephone interviews; 2401 people were interviewed, but pre-sampling was conducted prior to these interviews. It was held from June 2009 to March 2010 all over Greece. The telephone interviews were conducted with the help of CATI (Computer Aided Telephone Interviewing). The data were then encoded and processed with the help of the SPSS statistical programme. Descriptive statistics were used as well.

We applied factor analysis to the multi-theme variables, i.e. environmental behaviour and who people consider to be responsible for the environmental problems affecting our country. Factor analysis is a multivariate technique for identifying whether the correlations between a set of observed variables stem from their relationship to one more latent variable in the data, each of which takes the form of a linear model (Siardos, 1999; Field, 2005; Karlis, 2005). Next, orthogonal (Varimax) and oblique (Oblimin) rotation of the axes was applied. The selection of the number of factors is a dynamic process, which presupposes the evaluation of the model in a repeating fashion. In particular, we can use Kaiser's rule, the variance percentage that can be explained or the scree plot (Karlis, 2005). In all three cases where this was applied, three factors were selected. The rotation of the principal components matrix aims at increasing the interpretive ability of the model (Karlis, 2005). In the present paper, second-order factor analysis was also applied to the factors that emerged in relation to the two multi-theme variables, i.e. environmental behaviour and who people consider to be responsible for the environmental problems affecting our country. The factor values used were those that resulted from the oblique rotation, so that non-orthogonal and subsequently correlated factors would be used where possible. Finally, cluster analysis was applied to the previous loadings of the final factors in order to examine the potential existence of individual citizen types according to the factors from the final factor analysis and in order to compare them with the citizens' views on who should bear the cost of environmental protection and with the personal characteristics of the interviewees.

RESULTS

Any effort to protect the environment, in order to create an environmentally sustainable society bears a certain cost, which needs to be covered, so that the necessary infrastructure is created in society. The results of the present research focus on the public's views as to who should bear the cost of environmental protection. The interviewees were also asked to evaluate how often they carry out certain environmental actions in their daily life, and also to mention who they consider to be responsible for the country's environmental problems.

As regards the socio-demographic profile of the interviewees, the percentage of male and female respondents was almost equally distributed, with the females accounting for 50.8% of the total sample. Regarding age groups, the majority belonged to the younger group (18-30 years old) representing 34.2% of the total, whereas the middle-aged groups of 31-40, 41-50 and 51-60 years made up 21.4%, 24.1% and 14.2% of the sample respectively. Only few respondents were over the age of 60 (6.1%). Moreover, the results have shown that, approximately half the respondents were married (56.7%) and 39.1% were single; 50.8% of the respondents had no children, 39.2% had one or two, while 10% had more than one. In terms of their profession, 29.1% were public servants, 23.8% were private employees, 13.7% were self-employed and 13.3% were students. Finally, the research also revealed that the majority of respondents were high school graduates, while 26.2% studied at the University.

Description of research characteristics

The public's views on who should bear the cost of environmental protection are quite clear (Table 1). Over half the respondents (54.7%) believe that the cost should be covered by the government, while 24.4% of the public observe that we ourselves should agree to a lower standard of living, i.e. should agree to reduce our consumption rate. The latter group of people have raised awareness, since they place environmental protection over their personal interests and quality of life, and therefore share a deep ecological consciousness. When the interviewees were asked about whether indirect taxes should be imposed on citizens (e.g. on fuel, drinks and tobacco) 15.0% were in agreement; when asked about direct taxes being imposed, e.g. higher income tax, then only 5.7% of the respondents agreed with this view, while 0.2% did not answer this question. From the answers given by citizens, it can be seen that people have not realized that effective environmental protection would involve them changing their views about themselves and the world around them.

	Frequency	%
Government	1313	54.7
Direct taxes (income tax)	138	5.7
Indirect taxes (fuel, drinks, tobacco)	361	15.0
We must accept lower living standards	585	24.4
Do not know	4	0.2
Total	2401	100.0

Table 1. *Frequency and percentage results on who should bear the cost of environmental protection*

The public's environmental behaviour was then evaluated, and they were asked to estimate how often they carry out specific actions (Figure 1). More specifically, we observe that 33.7% of the respondents never recycle, as opposed to 25.4% who state that they carry out this activity very often. As regards the use of energy-saving appliances, it is observed that they are sometimes used by 32.9%, and 26.9% sometimes use special energy-saving light bulbs. Regarding organic products, 31.0% mention that they rarely buy them, and 35.6% state that they sometimes waste water. Furthermore, regarding the use of a car to cover short distances, 41.5% of the respondents said that they rarely or never use it, and 33.0% said that they sometimes visit their local park. Finally, as regards throwing litter in public spaces, 45.8% of those asked said that they never do this, while 13.4% mentioned that they often or very often do this.

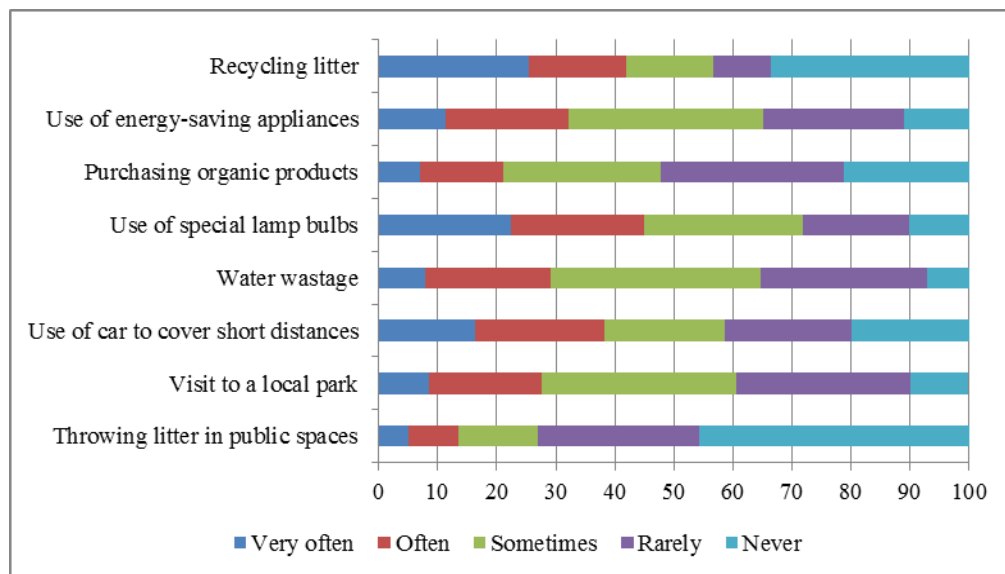

Figure 1. *Evaluating the environmental behaviour of the public*

Figure 2 presents the public's views on who they consider to be responsible for the environmental problems of Greece. It is observed that 60.1% of the respondents believe that the state and businesses are largely responsible for the country's environmental problems, while over half (57.6%) the respondents state that we ourselves are responsible to a large extent. In addition, almost 30% of the

interviewees mention that education and the Mass Media are also largely responsible for the country's environmental problems.

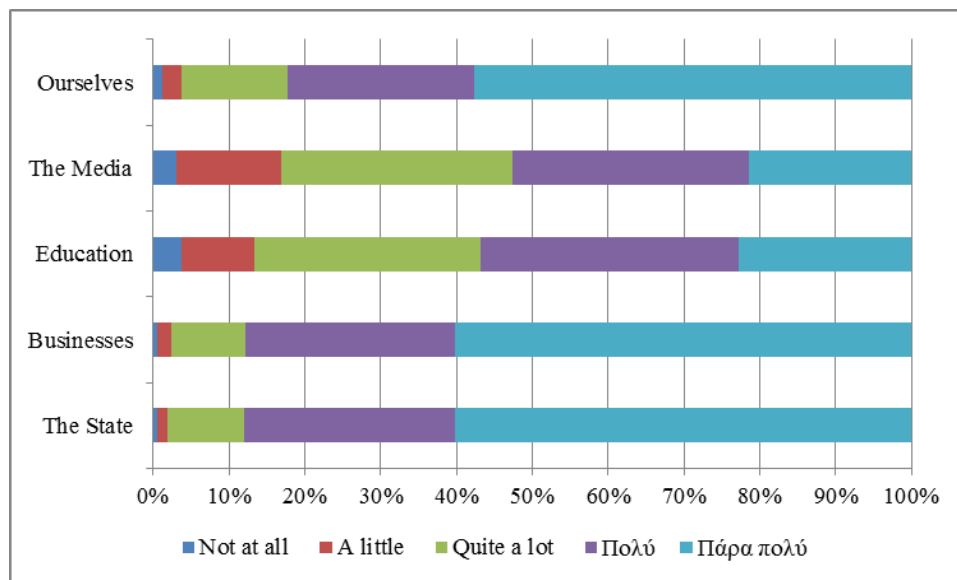

Figure 2. Who does the public consider to be responsible for the environmental problems facing the country?

The application of factor analysis

Factor analysis was applied to the multi-theme variable on environmental behaviour that examines the public's habits regarding certain actions that they perform in their daily life. Before the application of factor analysis on the above variables, we tested our data in order to ensure that they were appropriate for our purpose and, in addition, we investigated whether all the variables were appropriate for use in the model (we did the same regarding the application of factor analysis below). The results of the factor analysis are presented in Table 2. The higher the loading of a variable in a factor, the more this factor is responsible for the total variance of degrees in the variable under study. The variables that belong in each factor are those for which the loading (columns 1, 2, 3) is higher than 0.5 in that particular factor.

Variable	Factor loadings					
	before rotation			after rotation		
	1	2	3	1	2	3
Use of energy-saving appliances	0.756	0.331	-0.038	0.821	-0.052	0.077
Use of energy-saving lamp bulbs	0.713	0.324	-0.113	0.791	-0.022	0.000
Purchasing organic products	0.609	0.352	-0.019	0.696	0.030	0.094
Recycling litter	0.507	-0.036	-0.109	0.451	-0.240	-0.096
Use of car to cover short distances	-0.378	0.642	-0.239	-0.022	0.778	-0.081
Water wastage	-0.355	0.656	-0.217	0.002	0.775	-0.056

Throwing litter in public spaces	-0.511	0.472	0.287	-0.293	0.581	0.378
Visit to a local park	0.173	0.237	0.899	0.122	-0.064	0.935

Table 2. *Table of factor loadings with regard to environmental behaviour, before and after rotation.*

According to these results, the first factor includes the variables ‘use of energy-saving appliances’, ‘use of energy-saving lamp bulbs’, ‘purchasing organic products’ and ‘recycling litter’ (this is included because the value 0.451 is very close to 0.5). This factor could be given the title “social ecological behaviour” of citizens regarding environmental protection. The second factor with the title “personal ecological behaviour” includes the variables ‘use of car to cover short distances’, ‘water wastage’ and ‘throwing litter in public spaces’. The third factor only includes the variable ‘visit to a local park’, and can be named “acquaintance with nature”.

Factor analysis was then used on the multi-theme variable regarding the public’s views on who is responsible for the environmental problems of the country. After the application (Table 3), the first factor that includes ‘the Media’ and ‘education’ can be given the title “knowledge and education providers”. The second that includes the variables ‘businesses’ and ‘the state’ can be named “decision makers”. The third factor can be given the title “personal responsibility” and includes the variable ‘Ourselves’.

Variable	Factor loadings					
	before rotation			after rotation		
	1	2	3	1	2	3
The Media	0.763	-0.259	-0.332	0.859	0.122	0.083
Education	0.766	-0.304	-0.268	0.847	0.093	0.155
Businesses	0.473	0.652	0.251	-0.006	0.827	0.166
The State	0.523	0.594	-0.099	0.227	0.758	-0.098
Ourselves	0.522	-0.362	0.750	0.182	0.049	0.965

Table 3. *Table of factor loadings with regard to those responsible for environmental problems, before and after rotation.*

Next, factor analysis was applied on the factors that emerged from the two above factor analyses (Table 4). Its aim was to examine how the factors of the two factor analyses are related.

The first factor includes the variables ‘social ecological behaviour’ and ‘decision makers’ and can be given the title “central environmental policy”. In order for the citizens to express a more environmentally-friendly behaviour, they expect more environmentally-friendly products to be manufactured by technology, and for the state to support their promotion (e.g. by subsidizing part of their value). The second factor includes the variables ‘knowledge and information providers’ and ‘acquaintance with nature’ and can be termed “environmental education”. It seems that citizens expect

the Media and education to bring them closer to nature. The third factor includes the variables ‘personal responsibility’ and ‘personal ecological behaviour’. In fact, the negative sign in the latter reveals that the more responsible the citizens consider themselves to be for environmental problems, the less likely they are to use their car to cover short distances, waste water and throw litter in public spaces. This can therefore be characterized as “environmental awareness”.

Variable	Factor loadings					
	before rotation			after rotation		
	1	2	3	1	2	3
Social ecological behaviour	0.747	0.176	0.102	0.737	0.181	0.153
Decision makers	0.617	-0.078	0.425	0.728	-0.156	-0.116
Knowledge and information providers	0.218	0.688	-0.145	0.184	0.712	0.032
Acquaintance with nature	-0.152	0.692	-0.189	-0.174	0.708	-0.074
Personal responsibility	0.422	-0.243	-0.547	0.162	-0.067	0.711
Personal ecological behaviour	-0.156	0.167	0.675	0.127	-0.025	-0.700

Table 4. Table of factor loadings that emerged from the two above factor analysis, before and after rotation

Description of citizen clusters

Following the application of factor analysis and the emergence of the factors, and in order to examine the potential existence of individual citizen types in the initial sample, cluster analysis was used. The application of cluster analysis pointed towards two citizen types (Table 5). The solution with the above-mentioned number of clusters was considered to be the best in describing the highest number of statistically significant differences. Table 5 presents the degree of participation of each factor in the relevant cluster. More specifically, the persons in CL1, have a negative impact on the central environmental policy and a moderately positive impact on environmental awareness, while the persons in CL2 have a moderately positive impact on the central environmental policy and a weakly negative impact on environmental awareness.

	Central environmental policy PC1	Environmental education PC 2	Environmental awareness PC3
CL1(37.9%)	-0,904	0,076	0,460
CL2(62.1%)	0,552	-0,046	-0,281

Table 5. Average factor loadings for each cluster

The ANOVA table indicates which variables contribute the most to the cluster solution. Variables with large mean square errors provide the least help in differentiating between clusters. For example, factor PC2 (environmental education) has the highest mean square error and the lowest F statistically.

Therefore, this factor is not as important as the other two factors, particularly PC1, as regards the formulation and differentiation of the clusters (Table 6).

	Cluster		Error		F	Sig.
	Mean Square	df	Mean Square	df		
Central environmental policy (PC1)	1197,962	1	0,501	2399	2390,864	0,000
Environmental education (PC 2)	8,482	1	0,997	2399	8,508258	0,004
Environmental awareness (PC 3)	310,355	1	0,871	2399	356,3	0,000

Table 6. *Analysis of variance*

The two citizen clusters provided statistically significant differences, after the application of the X² test of independence, in relation to the variable concerning who should bear the cost of environmental protection, and also in relation to age, educational level, profession and family status. More specifically, the persons in CL1, have a negative impact on the central environmental policy and a moderately positive impact on environmental awareness; they are aged 18-30 years or over 60 years of age, mainly single, and graduates of primary, lower secondary or upper secondary school. As regards their profession, they are farmers, pensioners, unemployed or students and state that the cost of environmental protection should be imposed through indirect taxes and that people should accept a lower standard of living. The persons in CL2 have a moderately positive impact on the central environmental policy and a weakly negative impact on environmental awareness. They are aged 41-60 years, married, graduates of technical schools or University, and work as employees in the private or public sector, or are self-employed. They believe that the cost of environmental protection should be covered through citizens' income tax, and also by the Government through the funding it receives.

DISCUSSION AND CONCLUSIONS

The overall conclusion we are led to by this research is that, in general terms, citizens are not aware in their majority of the fact that their present is connected to their future and that their actions shape their tomorrow. This is seen in the fact that 54.7% of citizens state that the cost of environmental protection should be covered by the government. In actual fact however, the state revenue that any government is called upon to manage, comes from indirect and direct taxes, which are considered to be the solution by 20.7% of citizens. More specifically, 15.0% of citizens agree to indirect taxation (e.g. an environmental tax on fuel). Indirect taxes can be used by the government in order to discourage the

undesirable use of products that negatively affect the environment (Pearse, 1998). They are based on the “he who pollutes must pay” principle and therefore bring about a reduction in pollution, since the revenue from taxation helps the government improve environmental conditions (Kula, 1994). More specifically, in Sweden during the 1980s, the government imposed indirect taxes on fertilisers, in order to limit their use, and also carried out training programmes for farmers, which were financed by the taxes in question (Roadman, 1999). At a European Union level, the authorities are positively predisposed towards the imposition of environmental taxes and charges (Gizari-Xanthopoulou, 2003). As regards the payment of direct taxes, only 5.7% of citizens agree with this proposal, although it is more just from a social perspective, since the taxes increase depending on the citizens’ income, which means that wealthy people will pay proportionately more money for environmental protection than the poor (Jacobs, 1991). Furthermore, 24.4% of citizens are environmentally aware and realize that in order to protect the environment, they need to reconsider their attitude towards the environment and accept a lower standard of living. In another survey carried out by Manolas et al. (2004) concerning citizens’ views in a city of Northern Greece, namely Orestiada, as to who should cover the cost of environmental protection, it was similarly noted that 86.8% of citizens believe that this responsibility lies with the government. These findings are to a great extent consistent with the results of a similar study which was conducted among teachers of elementary and secondary schools in Greece, with regard to who should bear the responsibility for the state of the environment, and who should bear the cost of its protection (Manolas and Tampakis, 2010).

Next, a study was made into how the factors related to the environmental habits of citizens are connected with who they consider to be responsible for environmental problems; this led to the identification of two citizen types. The first type includes citizens with specific socio-demographic characteristics, who have a negative impact on the central environmental policy and a moderately positive impact on environmental awareness. They believe that the cost of environmental protection should be covered by citizens through indirect taxes and that we should accept a lower standard of living. The second citizen type includes citizens who have a moderately positive impact on the central environmental policy and a weakly negative impact on environmental awareness. They believe that the cost of environmental protection should be imposed through income tax, and that the Government itself should also cover this cost through the funding it receives. We therefore observe that the citizens who consider themselves to be responsible for the environment are more likely to accept a lower standard of living in order to try and protect it than others. It would not be wrong to generalize and state that any solution to environmental problems should first involve citizen awareness of the problem, an acceptance of their responsibility and then an acceptance of the sacrifices that need to be made.

What is essential for citizens to understand is that for future generations to be able to live in a healthy environment, people today need to reconsider their attitude towards the environment and take the necessary measures for its protection.

ABSTRACT

This Neuromarketing study compares the brain responses of men and women watching TV advertisements. High density EEG was used to record the neural activity of 10 female and 10 male participants while watching video stimuli based on an oddball paradigm with a frequent-rare ratio of 75%-25%. The advertisements were chosen according to their main target: male and female.

The sLORETA analyses showed that the prefrontal, fronto-temporal, anterior cingulate (ACC) and parieto-occipital cortices experienced higher activation during the visualization of TV ads, for both female and male participants. Specifically, the prefrontal cortex activity was found to be positively correlated to the likeability, attractiveness and pleasantness scores obtained in a questionnaire.

Furthermore, the results from multiple analyses indicated statistically significant differences between male and female participants in most of the electrodes. Females presented higher frequencies' power and P300 amplitudes, as well as activated more brain areas related with emotions, particularly the ACC. Thus, it is suggested that men and women employ distinct cognitive strategies when processing TV advertising stimuli and, consequently, that neuromarketing methodologies and techniques are appropriate to assess the efficiency and effectiveness of ads in different segments, such as those defined by gender and age.

Keywords: *Neuromarketing, EEG, Gender, Advertisements, Oddball Paradigm, sLORETA*

INTRODUCTION

Neuromarketing is a research field that employs techniques and practices from Neurosciences in order to increase the knowledge about the human behavior in a Marketing context (Lee *et al.*, 2007; Banks *et al.*, 2012;). This leads to the study of Marketing issues using different types of data, collection and processing methodologies, and scientific instruments whose rigor has been validated in the neuroscience field (Hotz, 2008; Ariely & Berns, 2010).

This research study focuses on the way men and women's brains react to television advertisements, as gender is commonly used by marketers and advertisers as a core segmentation strategy whose success depends on a deep understanding of how men and women process marketing information, judge products, and behave in the marketplace (Putrevu, 2001). Since a TV commercial shows many elements that may stimulate the participant in a very short period, the electroencephalogram, or EEG, due to its excellent temporal resolution, presents itself as a reliable neuroimaging instrument to register the experimental data (Ohme *et al.*, 2009). In particular, the EEG analysis of the Event-Related Potentials (ERPs) can help define the activation time-frame of certain mental operations, like the ones involved in attention, language processing, perception and memory, that are processed in milliseconds (Teplan, 2002; Vecchiato *et al.*, 2012). The study of ERPs, and especially the P300 component are starting to be used in Neuromarketing (Ma *et al.*, 2008). The P300 is a late positive peak mainly influenced by the frequency of stimulus presentation and the relevance of the task (Bledowski *et al.*, 2004). It has been linked to higher-order cognitive processes of attention allocation, memory updating, and classification of stimuli. The attention resources required to process a given stimulus are thought to be directly proportional to the P300 amplitude. When the paradigm is held constant, the P300 has a higher peak for the stimuli that have either negative or positive emotional value to the participant, than for stimuli with neutral emotional value (Gray, 2004). Therefore, an oddball paradigm was selected for this experiment since it elicits the P300, while also increasing the statistical significance of the results by repeating the stimulus presentation.

To systematize, this research seeks to answer the following questions:

- Q1) What are the areas of the brain that have an important function when people are exposed to a TV advertisement?
- Q2) Is there a significant difference between men and women's brain responses to TV ads?
- Q3) If the answer to the previous question is "yes", then what are the specific elements in the TV ad causing that difference?
- Q4) Are the EEG, sLORETA® and oddball paradigm effective and efficient techniques and methodologies for a Neuromarketing research?

Finally, it is important to note that the use of neuroimaging to probe the consumers' brain needs a deep reflection within neuroethics, because it is necessary to ensure that the parties who are involved in the research are protected from possible exploitation, or that the public in general is protected from eventual highly effective advertising that compromise consumers' psychological autonomy. In order to comply with this concerns, the goals, risks and benefits of Neuromarketing research must be explicitly and clearly stated (Hotz, 2008; Murphy, 2008).

LITERATURE REVIEW

Previous studies attest the difference between male and female brain responses to certain stimuli. For instance, Neuroscience studies supported in the Marketing field validate the existence of gender differences at a biological level. These differences appear during the 8th week of gestation, when testosterone bathes the brain of the male fetus, causing the deactivation of areas involved in communication and activating regions associated with aggression and sex. On the other hand, the female fetus does not receive the testosterone bath, and so it has more regions related with emotions activated and it develops stronger interhemispheric connections. Thus, women tend to show more developed multitasking skills than men, and are more effective at processing emotional and rational information simultaneously (Putrevu, 2001; Ifezue, 2010; Pradeep, 2010; Sun *et al.* 2010). Other experiments in the Neuroscience field showed that: ERPs' potential, such as the P300, tended to be more significant in female than in male participant (Bötzel & Grüsser, 1989; Steffensen, 2008) and men and women recruit different brain regions for spatial navigation (Grön, 2000).

Reviews carried out in the marketing field suggest that: gender differences can be also identified at a cognitive, behavioral and social level (Putrevu, 2001; Sun *et al.* 2010); men are most aroused when presented with sexual sources, such as nudity, while females are more influenced by romantic sources and tend to have an interest increase for male models (Ifezue, 2010); and males benefit from nonverbal reinforcement, and females benefit more from verbally descriptive messages (Putrevu, 2001). As for survey-based Marketing studies, the results indicate that: mood effects while processing advertisements vary with gender [$n = 282 - 165 \text{♀} - 117 \text{♂}$] (Martin, 2003); women characteristically score higher on intensity measurements of both positive and negative emotions [$n = 740 - 409 \text{♀} - 331 \text{♂}$] (Moore, 2004); information is more important for males, while entertainment is more important for females, that are also more influenced by the interaction effect of information and entertainment [$n = 134 - 87 \text{♀} - 47 \text{♂}$] (Sun *et al.*, 2010); males were more aware of individualist messages, while females noted the collectivist emotional appeals present in the public-service announcements and were more persuaded by their content [$n = 578, 312 \text{♀} - 266 \text{♂}$] (Andsager *et al.*, 2002).

As for Neuromarketing, there is one study using MEG that considered gender to understand the neural mechanisms involved in the behavior of purchasing day-to-day items (Braeutigam *et al.*, 2004). That study indicated that at around 300 ms women activated regions of the brain related to category-specific knowledge, whereas men activated regions related to spatial memories. Also, there were larger γ -waves for women when a product's preference was high. Additionally, in the many tests carried out by Neurofocus, a Neuromarketing company recently acquired by Nielsen, 90% of their studies detected differences between the cerebral reaction of male and female participants (Pradeep, 2010).

METHODOLOGY

Variables

Two variables were considered in this experiment. The first was the gender of the participant (male; female). The second were the dynamic visual stimuli ('TVad'; 'VidSeg'). Regarding the last variable, its two levels consisted in edited mute video segments. The 'TVad' segments were 5 different TV advertisements with elements that would provoke different reactions among the male and female genders. As for the 'VidSegs' they were 5 different video segments where there were no references to brands, as well as an absence of human faces and no elements that *apriori* might elicit different reactions among the two genders. Furthermore, each one of the 'VidSeg' segments had also to be related to its corresponding 'TVad' segment, in a way that their background and colors were alike.

Participants

The sample used in the research consisted of 20 healthy caucasian participants of the same nationality (mean age: 22,1 years), where 10 of them were male and the other 10 were female. They were all right-handed, had an age between 20 and 24, and had secondary education.

The sample size of this research is in the same order of magnitude of various other Neuromarketing EEG studies, such as Bledowski *et al.* (2004), Gray (2004), Huettel (2004), Ma *et al.* (2008), and Astolfi *et al.* (2009).

Questionnaire

A questionnaire was administered to the participants and via email to other individuals of the same age range (20 to 24 years old) and education as the participants, making a total of 51 questionnaire answers. The main purpose of this questionnaire was to complement the EEG results with data obtained from a traditional marketing research technique. Three different scales (yes/no, Likert and semantic differential) were used to assess the 21 questions for each of the 5 'TVads'.

The oddball paradigm

The oddball paradigm was selected as it provided statistical power and significance to the results. It consists in randomly presenting two types of stimuli, one of them infrequently (oddball or target stimuli), and the other more frequently (standard stimuli) (Huettel, 2004). In this experiment, the target stimuli ('TVad' segments) and the frequent stimuli ('VidSeg' segments) were in a 25%-75% proportion. The participants were not asked to discriminate in any way the target and the standard stimuli presented in the video, thus this was a passive oddball paradigm.

Stimuli presentation

The video stimuli consisted of a set of 5 blocks, presented in random order. Each block contained the two types of dynamic visual stimuli with the same duration that were repeated in a proportion that enabled the use of the oddball paradigm. The composition of each block was: B1- Gioia (TVad) & Clouds (VidSeg); B2- Super Bock (TVad) & Street (VidSeg); B3- Nespresso (TVad) & City (VidSeg); B4- Gio (TVad) & Sea (VidSeg); B5- L'Oréal (TVad) & House (VidSeg).

Figure 1: Sample frames from the 5 selected TV advertisements. From left to right, B1- Gioia (perfume for women), B2 – Super Bock (beer), B3- Nespresso (coffee), B4 – Gio (perfume for men) and B5 – L'Oréal (cosmetic product)

The ratio of TVads to VidSegs was 25% to 75%, a rare-frequent stimuli proportion with a considerable amount of stimuli repetition. Each TVad segment was repeated 5 times, while each VidSeg segment was repeated 15 times. Thus, all the twenty participants were exposed to many presentations of the same stimulus, which consequently increased the number of analyzed cases ('TVad': $5 \times 20 = 100$; 'VidSeg': $15 \times 20 = 300$).

In between the segments of a block, there were inter-stimuli intervals (ISI) with a 4 seconds duration, consisting of a white background with a black dot in the middle, and it was used to obtain a baseline register between the presentation of each commercial.

Data acquisition and analysis

EEG was recorded from 61 Ag/AgCl electrodes, divided in 14 groups, using the 10-10 standard system (Oostenveld, 2001). 60 electrodes registered the electrical brain activity in the scalp, while the VEOG (vertical electro-oculography) measured the eye movements and blinks from the sub-orbit of the right eye, and the supra-orbit of the left eye (Waismann *et al.*, 2003; Astolfi *et al.*, 2009). The EEG signal was digitally recorded offline with a sampling rate of 2000 Hz. The data was then processed with Analyzer® 2.0, starting with an automatic raw data inspection that limited brain electrical activity to a minimum of $0,5 \mu V$. The processed data was then segmented based on the type of stimuli: 'TVad', 'VidSeg', and ISI. Finally, the EEG records of those segments were averaged for each individual, and a grand average was later performed for all the participants, 10 male and 10 female participants.

The multiple analyses developed to meet the objectives of this experiment included:

I) statistical analyses of the answers to the questionnaire, which were subjected to a dimension reduction, using exploratory factor analysis (EFA) following the good practices of Hair *et al.* (2010).

The software used was the IBM SPSS®, the extraction method was the “Maximum Likelihood” with Eigenvalues greater than 1, and the “Direct Oblimin” was chosen as the method of rotation. The factor analysis was performed on 255 cases (51 respondents x 5 ‘TVads’) and the questions were grouped in five factors, attaining a Kaiser-Meyer-Olkin (KMO) value of 0.836 and Cronbach’s Alpha for total reliability of 0.817. These five factors were responsible for 75.88% of the total variance.

II) t-test analysis of the EEG records of the male/female participants.

III) frequency analysis, where frequency brain maps were generated by Analyzer®, to show the distribution of the frequency wave bands in the scalp, for all the video stimuli. The selected frequency spectrum (4-60 Hz) covers the Theta, Alpha, Beta and Gamma waves. The Delta waves were not taken into account as the amplitude of these waves, enhanced by the oddball paradigm, was considerably higher than the remaining (Başar, 2001).

IV) inspection of the amplitude and latency of ERPs.

V) results coming from standardized low resolution electromagnetic tomography (sLORETA) which provided additional information about the localization of the neural sources responsible for the electrical activity recorded in the scalp. The sLORETA was selected to complement the results obtained with the EEG recording, because it presented an approximate solution for the inverse problem with an accurate localization (5 mm) of the neural sources in 3D space (Pascual-Marqui, 2002).

All the t-test analyses performed in the multiple analyses were two-tailed, with $\alpha=0,05$, except for the calculation of the t-threshold with sLORETA, where one-tailed tests ($A>B$) were used.

RESULTS

Questionnaire results

The detailed information about the five factors provided in Table 1 indicates that, besides the acceptable reliability value of factor 4, the remaining factors were very reliable (DeVellis, 2003). The resulting data enabled to display graphically how all the respondents classified the 5 ‘TVads’ (see Figure 2).

	Name	Total σ	Reliability	Question	Scale Anchors	
					1	7
Factor 1	General depiction of the ad	29.41%	0.845	Likeability of the ad Feelings after watching the ad Classification of the ad Informational content of the ad	did not like very annoyed low attraction insufficient	liked very much very pleased high attraction more than enough
Factor 2	Humour	22.12%	0.856	Humorous content of the ad Humor of protagonist(s)	not funny not funny	very funny very funny
Factor 3	Attitude towards product and brand	10.33%	0.875	Probability of buying the product Product usage Product attitude Brand attitude Brand familiarity	not likely never not favorable not favorable very low	very likely very frequently very favorable very favorable very high
Factor 4	Gender of target audience	8.20%	0.672	Fame of the protagonist(s) Gender target of the ad Interest of the protagonist(s)	not famous male not interesting	very famous female very interesting
Factor 5	Sensuality	5.62%	0.871	Sensuality of the protagonist(s) Sensuality content of the ad Beauty of the protagonist(s) Aesthetic content of the ad Sensations conveyed by the ad	not sensual not sensual not beautiful ugly low intensity	very sensual very sensual very beautiful beautiful high intensity

Table 1: Detailed description of the factors resulting from the EFA.

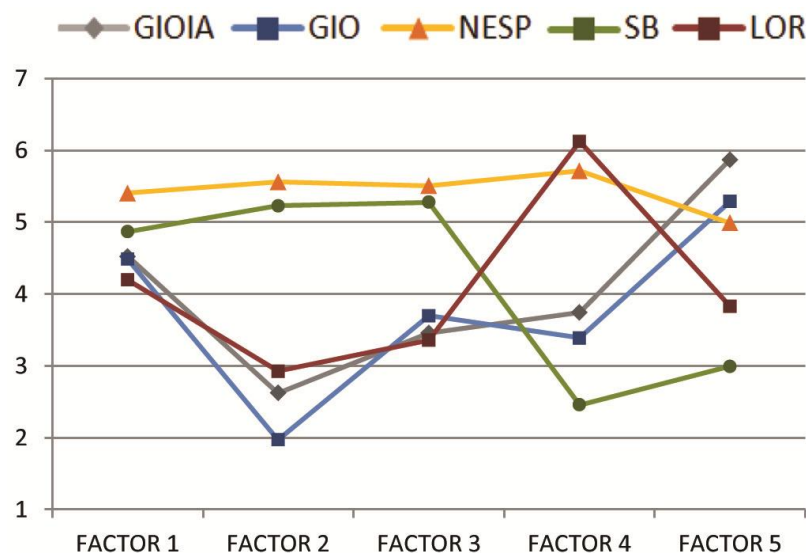

Figure 2: All participants' answers to the questionnaire grouped in factors, for all 'TVads'.

Gioia and Gio 'TVads' varied similarly along the five factors. As for the Nespresso 'TVad', it obtained steadily high scores in the five factors and thus can be inferred to be the most successful of the 'TVads'. Finally, the Super Bock and L'Oréal 'TVads' displayed almost symmetrical scores. The L'Oréal advertisement attained overall lower scores (except for factor 4) it was not very effective for the population associated with this experimental sample, as it targeted an older female audience, not represented by the young female sample.

EEG results for full TV advertisements

In this analysis, the grand averaged EEG records of 10 female and 10 male participants were compared, using an independent t-test. For almost all the groups of electrodes and for all the 'TVads,' the p-value was 0% ($p=0,00$), implying that the EEG records of female participants were statistically different from the male.

As for the frequency brain maps, the more interesting results showed that female participants had very active Alpha frequencies in the occipitotemporal area, particularly in the occipital region, whereas the male participants had a much smaller activity of Alpha waves concentrated only in the occipital cortex. Moreover, female participants had slightly less Alpha activity for the Super Bock and Aqua di Gio advertisements, which implies that female participants paid more attention or processed more information while watching these 'TVads', as Alpha rhythms have been inversely related to neural engagement (Feige *et al.*, 2005).

Finally, higher Beta and Gamma power was detected in the advertisements with protagonists which were ranked higher in terms of sensuality/ sexiness and beauty (Gioia for male participants, and Gio for female participants). Beta and Gamma waves were associated with attention engagement, especially over the frontal and central areas (Başar, 2001; Braeutigam, 2004). *Beta oscillations imply higher levels of information processing, and Gamma waves reflect stages where information is actively processed, as those involved in cognitive or motor functions* (Niedermeyer, 2005).

EEG results for segmented dynamic visual stimuli (0-850 ms)

This analysis focuses on the statistical results coming from t-tests, the ERPs' latencies, and frequencies, for the initial 850 ms of the TV advertisements and frequent stimuli.

Considering the male and female participants as two independent samples, t-tests were used to compute the difference of the EEG records' mean values of the 10 female participants with the 10 male. The groups of electrodes that did not attain statistical significance in terms of gender difference were the left and right frontal pole, left frontal, right temporal, as well as left and right occipital, for the Gioia 'TVad'; the central and right parietal, for the Nespresso ad; and lastly the left occipital together with the left and central parietal, for the Gio advertisement. The Super Bock and L'Oréal advertisements were the only 'TVads' with significant results for all the groups of electrodes, which might have to do with the fact that both were considered by the respondents of the questionnaire to be clearly targeting a male (Super Bock) and female (L'Oréal) audience.

In the ERP analysis, the P300 was considered to be the largest positive deflection in absolute value within the 300 to 700 ms epoch (Gray, 2004). For example, in Figure 3 (Gioia 'TVAd') it is possible to discern a positive peak at around 300 ms for both male and female participants. Additionally, a positive deflection was also observed 300 ms after stimulus onset in occipitotemporal channels. Sites

T6 and PO10 had a higher P300 for male participants than female. As for the Nespresso commercial, the prefrontal electrodes registered a clear peak at 380 ms that was especially prominent in female participants. Regarding the Gio ad, in the prefrontal channels there was a small positive peak at 300 ms for male and female participants, though female also registered a pronounced late positive potential at 600 ms.

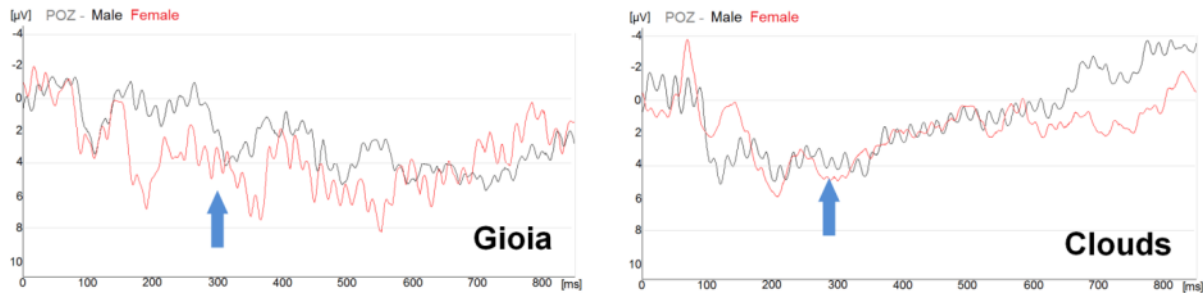

Figure 3: Averaged ERPs from 10 female (in red) and 10 male (in black) participants for the Gioia 'TVad' and Clouds 'VidSeg', in the POZ electrode. The P300 component is indicated by a blue arrow.

As for the frequency analysis, it reinforced the validity of selecting the 'VidSegs' as the standard stimuli in the oddball paradigm, because 'VidSegs' Street, City, Sea, and House, displayed little to no activity of Beta and Gamma rhythms in the participants' scalp, which suggests that, unlike the 'TVads' that had Beta and Gamma power, the 'VidSegs' did not involve explicit cognitive processes (Başar, 2001; Braeutigam, 2004). Other relevant results indicate a high prefrontal Gamma (39 to 46 Hz) activity in the Gioia 'TVad' for male participants, while female had also similar Gamma power distribution for the Gio 'TVad'. Concerning the Super Bock ad, female participants displayed left frontotemporal Gamma activity, whereas male displayed it in the right frontotemporal region. The Nespresso advertisement, in accordance with the results obtained from the full TV advertisement frequency analysis, showed barely no Beta and Gamma wave band activity, particularly in males. Finally, there was a thin frontal distribution of these wave bands for the female participants, when watching the L'Oréal commercial.

sLORETA (0-850 ms)

This analysis compared the areas of the brain that were activated during the participants' responses to the 'TVads', against their responses to the baseline from the corresponding Blocks, for a small time interval of 0 to 850 ms. The calculations were performed by grouping the 10 female (or male) individual averaged data from the EEG recorded during the presentation of the 'TVad', and the ISI belonging to the respective Block. These groups were then compared using a one-tailed paired t-test, where $A('TVads') > B(ISI)$.

The sLORETA generated 3D models of the participants' brains, more specifically the grey matter (Lancaster, 2000). In Figures 4 to 8 it is possible to see the slice view maps displaying the differences between the 5 'TVads' and their respective baseline EEG registers.

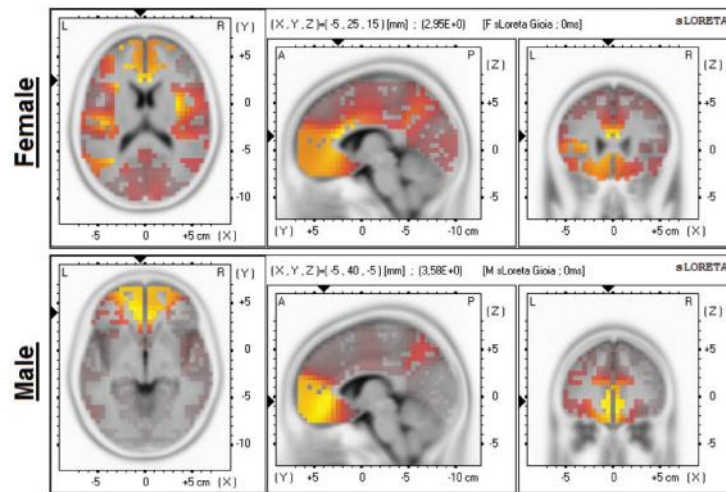

Figure 4: Slice view map of the brain of 10 female and 10 male participants, for a 0-850 ms segment (Gioia vs ISI).

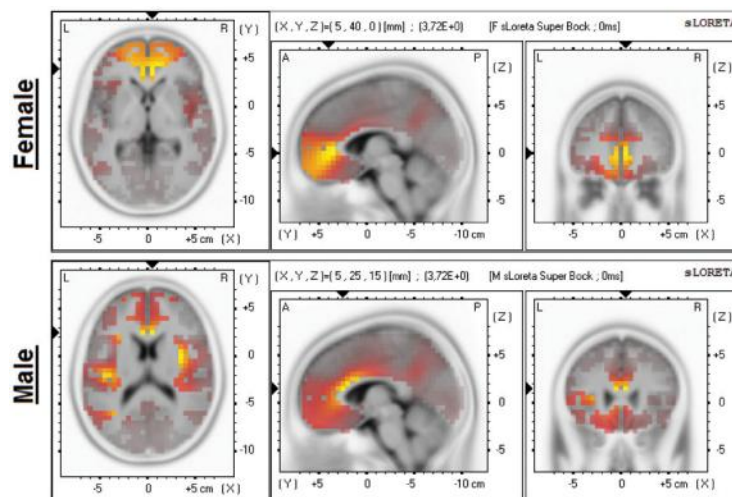

Figure 5: Slice view map of the brain of 10 female and 10 male participants, for a 0-850 ms segment (Super Bock vs ISI).

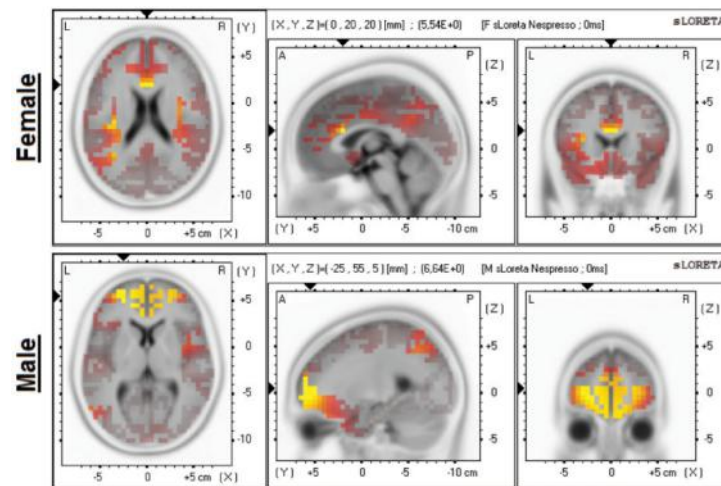

Figure 6: Slice view map of the brain of 10 female and 10 male participants, for a 0-850 ms segment (Nespresso vs ISI).

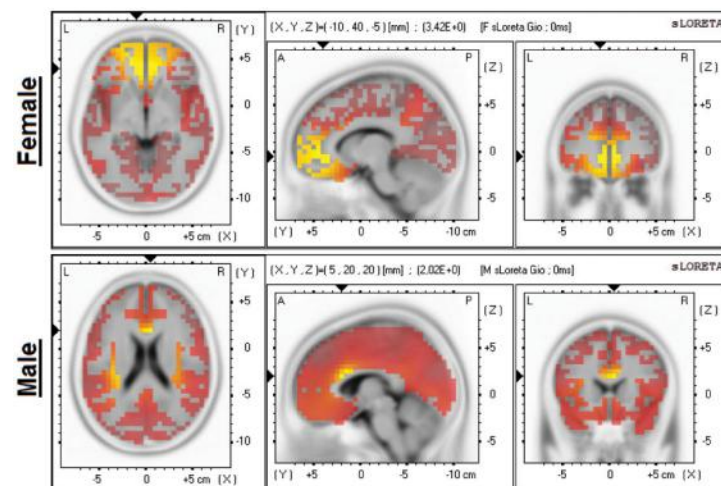

Figure 7: Slice view map of the brain of 10 female and 10 male participants, for a 0-850 ms segment (Gio vs ISI).

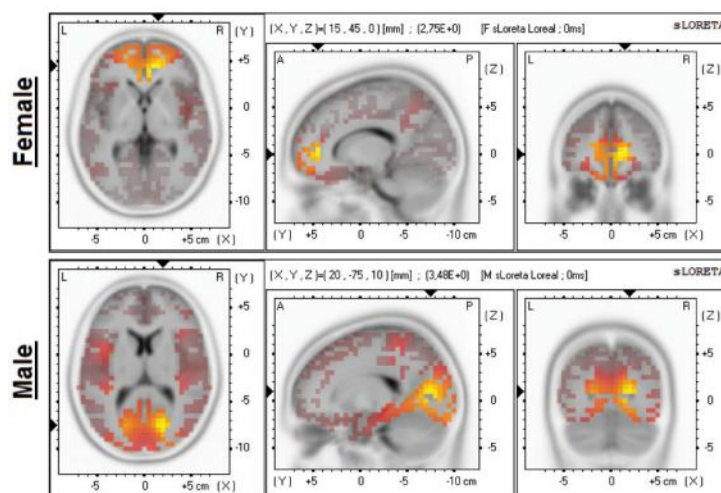

Figure 8: Slice view map of the brain of 10 female and 10 male participants, for a 0-850 ms segment (L'Oréal vs ISI).

DISCUSSION

Throughout the multiple analyses performed, the prefrontal, frontal, frontotemporal, parieto-occipital and occipital cortices, as well as the limbic system, experienced greater activation for the 'TVads' than for the 'VidSegs' and ISI. P300 peaks, which are positively correlated with attention, were elicited in those areas. There was also higher activity for the wavebands associated with cognitive processing (Beta and Gamma). Consequently, those brain areas are thought to have an important role in the processing of the TV advertisements stimuli. Particularly, in the sLORETA results, the prefrontal cortex (medial frontal cortex) and ACC stood out for their involvement in the processing of emotions conveyed by the 'TVads', and the prefrontal cortex activity was found to be positively related to the likeability, attractiveness, and pleasantness of the 'TVad'. The prefrontal cortex has been implied to be involved in high-level planning, regulating emotions, and higher-order cognitive processes (Plassmann *et al.*, 2008). This answers the 1st research question.

Furthermore, the results point out clear differences between male and female responses to TV ads: females usually presented higher frequencies' power and ERPs' components than males (Bötzel & Grüsser, 1989; Steffensen, 2008). In addition, females usually activated more brain areas than males, in particular the anterior cingulate cortex (ACC). Thus it is possible to suggest there are different patterns of neural activity depending on the gender, leading to distinct strategies and cognitive patterns employed by men (heuristic approach) and women (elaborative approach), which is in accordance to the findings of Martin (2003).

It is also important to point out that a small peak appeared at around 600 ms in the Gioia advertisement, for both male and female participants, whereas in the Gio ad there was a sharp P600 for females, and no relevant positive deflection for males at that specific time. Knowing that the P600 has been suggested to be an erotic preference indicator (Waismann, 2003), and having in mind that Gio's protagonist received the highest scores for the sexiness/ sensuality criterion from female participants it is possible to infer that female participants had an arousal response to the Gio 'TVad'. On the contrary, Gioia did not elicit prominent P600 even though the protagonist also scored high in that criterion for both male and female participants. A probable explanation is that the female protagonist in the Gioia ad was wearing clothes, while Gio's protagonist was bare-chested and only wore swimming trunks, which has more propensity to stimulate arousal in females. Thus, the 2nd research question is addressed.

Regarding the 3rd research question, and based on the answers to the questionnaire, the protagonists, the humorous content and the familiarity with the brand of the 'TVad', were the elements most likely causing the differences observed, as they strongly influence the overall likeability and attractiveness of the advertisements.

Finally and critically, the independent t-tests confirmed the significant differences between the male and female participants' neural activity for most groups of electrodes and ads.

CONCLUSION

To sum up, by using techniques and methodologies such as the EEG, sLORETA®, and the oddball paradigm, alongside with a questionnaire, this Neuromarketing study presented results that pointed out significant differences between the way male and female participants process the TV advertisements stimuli. Therefore, the 4th research question is validated.

It is thus suggested that this type of study is appropriate to assess the impact of ads in different segments, such as gender and age, since neuroscience can complement traditional marketing with rigorous, reliable and scientifically-sound methodologies and techniques, allowing greater insight on the neural mechanisms behind consumer behavior. Additionally, Neuromarketing studies require smaller sample sizes than conventional studies (Hotz, 2008; Pradeep, 2010), enabling more effective and cost-efficient marketing campaigns.

²Department of Economic and Legal Studies (Diseg), University "Parthenope", Naples, Italy

ABSTRACT

Social media are leading to major changes in business and consumers' behaviour. The aim of this paper is to achieve a deeper understanding of an emerging way of involving consumers into the business development, based on their increasing willingness to assume a proactive role that goes beyond the co-creation of value - in terms of their participation through social marketing tools - to include financial support of producers. For this purpose we have chosen a case study approach, analysing the unique feature of Naked Wines ("NW") experience, a prominent online wine retailer established in UK since 2008. NW consumers can choose to invest in wines, before that they are produced, financing the business of winemakers and they can have a leading role in the evaluation process (i.e. tasting and scoring) of wines.

The paper is organized in four sections. In the first, we explain why and how multichannel marketing (off-line and on-line and) is used to cope with changes in consumers' behaviour. Then, we look at the relation between wine business and the multichannel marketing in UK. The following section focus on NW in order to highlight: roles and responsibilities of two consumers' profiles (Angels and Archangels), relationships with winemakers, and interaction devices in use (marketplace, blog, app). Finally, through the analysis of some questionnaires, administrated online to the Archangels, we attempt to investigate on their motivations, commitment and feedback, to improve NW activities in the future.

Keyword: *Multichannel marketing, Wine industry, Naked Wines, Disintermediation, Crowd founding, Social proof.*

INTRODUCTION

Social media are leading to major changes in the way to do business and to reach and to engage consumers. The aim of this paper is to achieve a deeper understanding of an ongoing evolution of consumers' role based on their increasing willingness to assume a proactive role, that goes beyond the co-creation of value - in terms of their participation through social marketing tools - to include direct

financial support of producers. For this purpose, we have chosen a case study approach, analysing the experience of Naked Wine ("NW"), an online specialist wine retailer established in UK since 2008, that developed a successful online business based on the disintermediation of middlemen and on the building of a direct relationship between producers and consumers, who took a proactive role in directly financing winemakers. Our qualitative analysis is based on secondary data taken from NW websites, press reports and articles as well as primary data gathered through interviews, based on a questionnaire - administrated online to the more involved individuals who participate in Naked Wines business, the so-called Archangels.

The paper is organized in four sections. Firstly, we briefly analyze how the evolution of available technologies (e.g. internet and mobile devices) and changes in consumer behaviour has led to the development of multichannel marketing approach, i.e. traditional marketing channels are integrated with non-conventional ones. After this, we look at the relation between wine business and the multichannel marketing in UK. E-commerce has become one of the most profitable opportunity to catch consumers, exploited by large grocery retailers and direct-to home wine specialists. In the third section, we highlight the distinctive and unique feature of NW business model. In particular, we discuss: roles and responsibilities of two specific profiles of consumers (Angels and Archangels), relationships with winemakers, and interaction devices in use (marketplace, blog, app). Finally, we present the results of the interviews and discuss the characteristics of Archangels and their commitment and motivations to participate.

MULTICHANNEL MARKETING TO FACE NEW TRENDS IN CONSUMER BEHAVIOUR

The changes in the society of the postmodern era is undoubtedly related to the rapid evolution of technologies available to businesses and consumers determining, therefore, a broader view of the traditional concept of marketing (Simmons, 2008).

In the third millennium, consumers are characterized, among other things, by a renewed need for sociability (Boaretto et al., 2011). In this social context, new relationships arise based on the need to establish a group or a community and tribe. These social entities share a common interest as well a passion or it may be a previous/rediscovered bond of friendship, etc. One of the characteristics of this type of relationships is the facility with which it is possible to enter or to exit by this particular social context and the absence of relative costs. The implication for marketing is that consumers can move from one purchase scenario to another with a dramatic mobility, never experienced before. It is this "enhanced" capability that defines the mobility as one of the dimensions that characterize postmodern consumption (Semprini, 2006). Mobility has two dimensions: physical and mental (conceptual).

The physical mobility refers to the worldwide as well local movement of people, goods, informations and money. This event has been increased in last decades thanks to new technologies. The mental mobility is related to the capability to develop more activities at the same time. That implies a stratification of contexts (Boaretto et al., 2011). in which it is possible to travel, to socialize, to purchase and to work in the same context (train, station, airplane, etc.) using, for example, a wifi connection.

The expression homo mobilis refers to a person/consumer/client that has the opportunity to be steadily wireless connected to satisfy daily needs. The so-called mobile devices are capable to allow this condition. Through the last generation of these instruments, such as smartphone and/or tablet, the mental mobility condition is facilitated. In this scenario, people display needs through multi-modal patterns and for this reason are involved traditional marketing methods as well those of non-conventional marketing. In particular, Kaplan (2012: 130) defines mobile marketing as “any marketing activity conducted through a ubiquitous network to which consumers are constantly connected using a personal mobile device”. Consumers to satisfy their own needs use the online channel (e.g. promotion via web, email, blogs, websites, mobile connectivity devices) such as the off-line channel, e.g. traditional media, in-store promotions, events, to get information and compare the characteristics of the products/services before purchase. This scenario defines the cross-channel behaviour: the potential consumer/user performs the act of purchase using/passing through (in the marketing literature, these people are called web surfers giving the idea of the dynamic of their consumer behaviour) from a marketing channel to another (Arikan, 2008). The significance of the different channels and their related tools is connected to the phase of the buying cycle to which they refer. For the overall effectiveness of multichannel marketing strategy is crucial the continuous “contact” between the marketer and his/her customer. So, it is defined the multichannel marketing that “refers to marketing communications delivered on multiple media in parallel and, hopefully, in a coordinated fashion. The term also implies that responses to marketing initiatives are accepted from multiple channels” (Arikan, 2008: 8).

In a traditional marketing context, it could happen that the target segment remains “uncovered” due to a lack of tools to follow customers in their new status of mobility. However, that does not happen in the multichannel marketing scenario because through the lift effect it is possible to create opportunities for interaction with the customer depending on the physical place/mental state in which she/he finds. This condition allows capitalizing the value of the relationship with the customer for every point of contact. Using the applications of mobile marketing, such as those that refer to the mobile social media group - that “allows the creation and exchange of user-generated content” (Kaplan, 2012: 131) – the company can interact with the customer in those stages where traditional marketing cannot reach he/she. However, it is useful to clarify that it is not a condition of “control” of the customer but a new opportunity for interaction with him/her – e.g. the follower pages or “I like/I dislike” on the social

networks as Facebook.

The co-creation strategy works in synergy with the lift effect. That means that the experiences and the suggestions of consumers become part of the contents of communications and strategy firm: "...buyers what to be in charge" (Arikan, 2008: 7). The best way to involve and associate the consumers consists in giving them the opportunity to leave their impressions and suggestions in the web hosting company (Mangold and Faulds, 2009). One of the most used tools is the feedback through a blog. In many situations, contributors are rewarded with special mentions and with the offer of dedicated services. In this way the company is able to optimize the entire marketing campaign: picking up the real needs, making a more effective communication strategy and reducing the costs of deploying content available through interface devices, avoiding a potential failure if it is not "... listened customers' voice" (Waisberg and Kaushik, 2009). The last but not the least advantage of the co-creation strategy is that it allows the activation of earned media. In fact, thanks to the comments let on the social networks and corporate websites, the company expands its benefits, in terms of: brand and corporate reputation, buyers' confidence, credibility and transparency, improved efficiency in sales management. In particular, the e-commerce sites to increase the confidence of buyers exploit the social proofing i.e. the fact that people tend to believe that decisions and actions taken by the majority reflect the correct behaviour in a given situation. If customers can see how other people are using a site, which products they are buying, this provides them with a security. So, to take advantage of this behaviour, e-commerce sites need to create an experience, which shows to potential customers that they're not the only people making the same purchase decision.

WINE INDUSTRY AND MULTICHANNEL MARKETING IN UK

An interesting case of multichannel marketing approach is the wine market in the UK. In the UK supermarkets hold a 45% share in wine sales, followed by specialty stores (25%), on-trade (20%), and small businesses and grocers (CBI, 2011). From 2007, economic scenario has hit all players in British wine market, as well as, has caused a change in the habits of purchase. In this period, grocery retailing has become increasingly concentrated in the hands of few chains (e.g. Tesco, Asda, Sainsbury's, Marks & Spencer). The strategies of large grocery retailers are, on the one hand, the same as always, to sell larger quantities, subtracting them to the competitors through price based strategies; on the other hand, to develop strategies to capture consumers everywhere and every time. The price based strategies aim at a competitive price compared to competitors and, at the same time, which may provide added value to the bottle. In recent years, the solution adopted by British retailers aims to exclusive or semi-exclusive agreements with large wineries, in order to obtain labels with their own brand or that of the producer but exclusively for their market. The major retailers have exploited the internet technologies

to create opportunities to develop competitive advantage through streamlined operational costs and e-commerce have offered the opportunity to meet needs of the consumer for a more efficient use of the time devoted to the purchase, as well as a price advantage and to introduce innovative new services to capture consumer interest and deliver customer benefits (Ellis-Chadwick et al., 2007).

Wine consumption increased slightly, despite the negative influence of high taxation and consumption off premise has grown more than consumption on premise (Rabobank, 2013). In addition there are more people who say they feel competent and they attribute to the grape variety (i.e. the first criterion of purchase in the UK) and the terroir more importance than before, at the time of purchase (Wine Intelligence, 2013). In this last decade, the wine consumer behaviour is evolving in a way that reflects market changes and the novelties in the information and communication systems. New segments are defined in addition to the traditional ones. In particular, there exist consumers belonging to the segment defined “tribal”, for which the sense of belonging derives from being part of a group; others belong to the group “being there” who wish to share consumption experiences; finally, there is a segment of wine consumers so called “transparency” that looks at traceable honesty to reassure their sense of responsibility (Halstead, 2014). In the mobile marketing scenario, a large number of applications - designed for mobile devices - allow consumers to get closer to the world of wine, in a personal way and without the mediation of an “expert”. This aspect satisfies not only those who want to shop in the most convenient way (both in terms of price and time) but mainly those who are newcomers to the wine world and those who want to share their experiences of consumption.

In Britain, online wine sales are now an important retail vector channel. According to a Wine Intelligence report (Schmitt, 2013), the UK online wine market accounts for 11% of total wine sales in the country (worth £800 million). The sector has grown by 470% in the past 8 years – equivalent to a compound annual growth rate of 21%. Much of the recent growth has come from consumers using supermarket home delivery services to order wine, as opposed to the more traditional direct-to-home wine specialists who generally sell wine by the case. The growth of online grocers and the proliferation of handheld mobile devices have been such that 25% of UK wine consumers are now shopping online. Tesco has captured about a quarter of all internet wine sales in Britain and the Tesco Wine web site (Tesco Wine by the Case) provides wine selections very convenient respect to the variety offered and delivered in short time (a day or a few hours). In addition to the leading supermarkets and specialist shops which sell wine online, there is a number of online-only wine stores and wine clubs which are growing in popularity, some supply to restaurants and stores in addition to customers, while others are oriented towards delivering wine directly to the consumer. Among them Naked Wines is the most visited UK online wine retailer in the drinks category and the 18th most visited drinks website globally (Tabraham, 2013).

NAKED WINES: INNOVATION IN WINE BUSINESS

In 2008, Naked Wine (NW) was launched in UK as an online wine retailer. The company sells wines mostly produced by medium-small sized independent winemakers from around the world. NW ships an average of 20,000 bottles every day and it has over than 200,000 online customers. The company structure is formed by Naked Wines Int. which operates in three reference markets (i.e. UK, USA and Australia) and controls the financial aspects through two distinct companies (Naked Wines Prepayments Trustee Co Ltd. and Naked Fine Wine Bonds plc).

The innovative idea of the business is to offer to customers a very different experience of buying and consuming from those usually based on shopping standard wines in supermarkets. NW customers can choose to invest in wines - before that they are produced - financing the business of winemakers and they can have a proactive role in the evaluation process (i.e. tasting and scoring) of wines. Moreover, to all the customers is guaranteed, thanks to a very efficient logistics, the delivery of orders within the next day, with a full money back guarantee. From the supply side the innovative idea is the participation of independent producers - who by their productive and financial dimensions - would have difficulties to sell into conventional marketing channels. In this way, Naked Wines has become the first online marketplace that brings together small independent producers of wine, enhancing it, and creating a direct sales model jumping the inefficiencies and costs of long distribution channels with the various stages of mediation, thus facilitating producers.

Naked Wines - who: wine Angels/Archangels and winemakers

Naked Wine is based on the participation of two customer profiles, the Angels and the Archangels, who assume different roles and responsibilities.

Naked Wine Angels are a very special group of people who support winemakers by investing £20/month into their NW account towards their next order. In exchange, they pay an angel price saving at least 25% and up to 50% every time they buy. They get access to a whole host of other benefits such as: a free premium bottle every month if they order a case, or/and invitations to exclusive tasting events. The funds collected from Angels and Archangels are invested by NW in financing new suppliers.

Some Angels can assume a more proactive role becoming Archangels. Archangels are required to be ambassadors of the company with which they communicate directly on a closed area of the website. They are asked to undertake different functions. They are involved in reviewing, tasting and searching of wines; to examine the website looking for weaknesses; to help new members to be confident with the community and to feel that they are in a friendly and helpful environment; to give consumers ideas of what wines they might try, given their tastes, and encourage them to try new products. Archangels should support Angels in different ways; mainly, assisting them in the website use, being confident

with wines' reviews, advising them on some new tasted wines and in general engaging them to be part of the community. Respect to the relationship with the producers, Archangels operate as a promoter suggesting their wines to new Angels.

Naked Wines currently works with more than 130 small-medium sized winemakers across 13 countries. There are two profiles of eligible suppliers: winegrowers with bottled wine ready to be placed in the market, or producers who needs a financing to support future production. NW supports their orders, production costs, salaries, trading and shares a per-bottle profit with them. When the wine is ready for selling, the winemakers send samples to NW, where they are tasted and judged by experts who will decide whether or not to buy them. The wine before to be put in the network is analyzed to ensure that it complies with the EU standards and if it does not pass the conformity test it will be returned, at no cost, to the producer. NW is interested in long-term relationships and works, only, on a cost plus basis. The idea is to develop a strategic win-win relationship to get quality up and prices. Winemakers benefits are: get cash flow early, don't incur in debts or finance/storage costs, know in advance exactly how much to bottle and when.

Naked Wines - where: NW marketplace, Blog, App

The web is the action's context in which the company operates. The Naked wines marketplace is a virtual market where producers pitch their wines and consumers make their bids. Each month, NW invites some winemakers to propose their wines, displayed on a virtual shelf, ready to be chosen by consumers at the best price negotiable – which includes shipping, delivery and 10% commission to Naked Wines. The deal is on if the bids reach a minimum volume; in this case the wines will be shipped directly from the winemaker in one go and without additional costs.

Through the online platform, NW offers a social experience with an innovative approach to customers' relationship – engaging them in its philosophy - not limiting to be just an e-commerce site (Quispel, 2013). Sociality and interaction are promoted through the individual online blog - Naked me - and the smartphone App available exclusively for the Angels. Naked Me is a personal feed, where is displayed everything that's relevant to the customer (e.g. a list of wines from the last order; updates from the followers, including recommendations; in case of Angels: free bottle alerts; stock alerts for favourite wines). Moreover, it is possible to interact chatting with winemakers or joining in discussion groups. The Naked Wines Mobile is the place where, exclusive for Angels, it's possible: to see the videos uploaded by the winemakers; to improve their knowledge about wines; to search for friends, offering them to become Angels; to chat with the winemakers on their message boards or into groups; to give scores to wines sharing them on Facebook or Twitter; to order wines.

Naked Wines - how: disintermediation and social proof

NW business model has two the distinctive features that need to be highlighted: disintermediation and social proof. Disintermediation refers to the process of “cutting out the middleman”, that means the reduction of number of links in the supply chain by eliminating certain functions and intermediaries. Naked Wine is a prominent case of double disintermediation in wine industry, e.g. distribution and financial function (Veseth, 2013). On the one hand, by direct sales, NW cuts out agents and distributors that contribute with, more or less, a margin of 50%, to the final price of a wine bottle. On the other side, NW collects finance to sustain winemakers through a large pool of backers (i.e. Angels/Archangels), cutting standard financial intermediates and exploiting the web opportunities of crowd funding (Mollick, 2014). Moreover, NW uses loan interest rates more convenient than those charged by banks. In September 2013, NW launched a financial bond to raise funds for fine wines offering consumers 7% gross in cash interest p.a. or 10% gross in Wine Credits p.a. (a credit to their Naked Wines account) - raising £5 million in a month. They create a new company to issue the bonds, Naked Fine Wine Bonds plc, which holds and/or invests money in wines and owns the wines until they are ready for sale, when they will be sold to other companies in the Naked Wines Group for onward sale to Naked Wines' customers. In particular, NW invests only in grapes, barrels, bottles, and other direct production and administration costs. The mechanism of Fine Wine Bonds (FWB) gives the chance to operate in a kind of futures market; so when wines are imported into the UK the consumers have the opportunity to buy fine wines, prior than the others, at a competitive price. Finally, FWB might help to minimize the risk associated to bad weather conditions and poor harvests, recruiting different winemakers from many regions. The second distinctive feature of NW is the enhanced exploiting of the potential of offered by social proofing. Naked Wines makes effective use of consumer reviews and user comments across its website. Entering the home page, it is possible to notice the innovative and wide approach to customer relations. They are encouraged to become actively involved in the project in various ways: by communicating directly with the winemakers, commenting on the wines and providing suggestions on the website forum. They can eventually build a profile and find new companions enthusiasts to share ideas and experiences, e.g. visits with wine tasting in the cellars of the producers.

INTERVIEWS' RESULTS: ARCHANGELS' PROFILE AND MOTIVATIONS

To assess Archangels' motivations with Naked Wines, 17 interviews were carried out through questionnaires administrated online. The principal socio-demographic characteristics of our sample are: i) respondents belongs to a wide range of ages, from 30 to 60 years; ii) nearly a quarter of them are women; iii) they have a medium/high education level - on the basis of the information provided about their job. The survey consists of 6 questions and aims to investigate about motivation, commitment and feedback in business development. For each question, the main results are reported below.

1) How did you find Naked Wines?

About half of respondents have found NW through a discount voucher or an advert flyer, while only 2 of them surfing into the online wine clubs.

2) Why did you decide to become an Angel and then an Archangel of Naked Wines?

Only 5 of respondents stated that the main reason that led them to become an Angel, was purely the price. For the most part of them, the motivations are more complex and are also the reasons by which they have agreed to become Archangels i.e. through the invitation of other Archangels or of NW. The given answers allow identifying the following three basic motivations: a) I like the business approach and the quality of wine; b) I like the social aspect and the online community, that permits me to learn more about wine and to discuss about it with other interested people; c) I like interacting with small boutique winemakers, supporting and promoting them.

3) What are the benefits of being an Angel and an Archangel?

Mainly, the benefits of being an Angel are related to the cost of wines, given that there are discounts available to support monthly financial commitments. Instead, the benefits of being an Archangel are perceived differently, consistent with three basic motivations outlined above.

The first group of Archangels highlighted that the most valued benefits are related to the opportunities to test wines and to participate at special events. Archangels have indeed the benefits from get sent wine samples - to try, to rate and to give a feedback - before that they are proposed onto the website. Occasionally there are special events for Archangels run by Naked Wines, such as tastings and meeting with new winemakers in order to find new wines to trade. Wine tours and invitations to trade fairs are potentially available on a selective basis. Recently, few Archangels went to California looking for of new wines and a team of them visited the Prowein Wine Fair in Germany and the International Tastings in London. Those initiatives are highly appreciated.

In the second group, there are those who overall enjoy to belong to an active community and to interact with customers (Angels and Archangels), winemakers and NW staff. It's interesting to quote two answers that - among all - better summarise the enthusiastic motivations: "I like to buy, taste and discuss about wine with like minded people in a friendly and welcoming environment. NW has also allowed me to expand my tastes in wine. I now tend to buy wines based on the opinions of people who I trust (not marketing people)" - "Of being an Angel – being part of something truly different, and having the opportunity to interact with other angels and winemakers. The angel discount obviously is an added bonus! Sometimes, I think they take my opinion of what they should do more seriously than my employers do...".

Finally, to the third group belong Archangels who particularly appreciate the benefits of having a relationship with winemakers, to get a different understanding of their world and to support producers

that may not be able to sell in supermarkets. In particular, these Archangels appreciate the opportunity: to choose winemakers to 'champion'; to commit themselves to make their wines known to Angels; to build up a relationship with the winemaker and - if feasible - to visit the vineyards. One interviewee refers: "Finding people like Carmen Stevens, the first black female winemaker, and seeing her sell her wine within 48 hours is a joy to behold".

4) What are the responsibilities of being an Angel or Archangel?

The primary responsibility, in both situations, is to commit to regular supplies of money upon which Naked Wines can guarantee associated funding to winemakers. In our survey, other Archangel duties are differently ranked: 13 consider that the main responsibility is to be active on the site, while 4 give priority to the interaction and the promotion of winemakers. Some of them (5) feel also the responsibility to promote Naked Wines and to be their ambassador.

5) What is the relationship between you other customers, winemakers and the company?

Overall, the relationships are deemed very satisfactory. Some of them make friendships during wine tastings events while others have direct contacts with winemakers visiting their vineyards.

6) What would you suggest to Naked Wines to improve in the future?

Overall, Archangels interviewed have shown a strong appreciation for Naked Wines, that has introduced a world-class model for accessing and distributing wines and that excels in customer relationships. The recent new idea - Fine Wine Bond - has been particularly appreciated to meet the demand for more aged wines. They consider the wine reviews fundamental to ensure that a high quality product is always available. They suggest that a strategic focus must be in place to identify new winemakers who are able to supply products even better than the current portfolio. One Archangel suggests that, perhaps, an independent committee (comprising not only Naked Wines staff but also Archangels and external industry experts) should be introduced to ensure a better offering. It is interesting to bring the comment of an Archangel about the criticality related to the growing differentiation of proposed wines. "I am always keen to see the number of new wines on the site grow, but would not want to see that number grow to such an extent that as customer, I struggle to keep up with some of the options. Taking the Laithwaite's (a British wine e-commerce site) as an example, they currently have 15 different producers of New Zealand Sauvignon Blanc, a style I love. Naked currently stock three producers' wines, each of which has a distinct character. As there are only three producers to choose from, I can try all of their wines and interact effectively with each winemaker about those wines". Many Archangels, however, have expressed concerns over the future challenges. Naked has grown so fast that the functionality of the site has to be sorted and requires some upgrades. The website should have to be continually updated to keep pace with what people want from it and that is felt as a bit of a challenge. Some complain that having so many customers could be frustrating for some when a

wine is quickly out of stock. However, they hope that Naked expansion into Australia and more so in the USA will help to solve the stock shortage, and in particular that the Naked winery in Napa will bring some great wines at fair prices in the near future. Moreover, a lot of Archangels emphasize that the model to work it still needs to be somehow small and intimate at the same time. Actually, the problem to solve for NW is how far they can expand without losing the personal touch they have with the customers who want to be involved and feel part of a team. One Archangel suggests that they could include sherries and other fortified wines, liqueurs and perhaps diversify into whisky or brandy, working with small suppliers and giving them a chance to have a relationship with their customers directly.

DISCUSSION OF RESULTS

In this paper we investigate Naked Wine experience as a case study to achieve a deeper understanding of an innovative business model where the role of consumers goes beyond the co-creation of value to include financial support to producers. In particular, we address two broad topics: a) how this business model works and the Web 2.0 tools are exploited to support it; b) how and why the Archangels (key actors among NW consumers) are actively involved and become funders and promoters.

Our contribution to the field of social media marketing is the analysis of the consumers' motivations to participate through social marketing tools to business development, by exploiting an unique data base - gathered by one of the authors during her intership at NW - describing the motivations that led the most proactive consumers in NW network (the Archangels) to take a distinctive role in the development of NW network

According to our analysis, NW business model has two main distinctive features. First of all, Naked Wine is a case of "double" disintermediation in wine industry. On the one hand, by direct sales, NW cuts out agents and distributors that contribute with, more or less, a margin of 50%, to the final price of a wine bottle. On the other hand, cutting traditional intermediaries, NW exploits the web opportunities for crowd funding to sustain winemakers through a large pool of backers (i.e. angels/archangels), who in exchange get a price discount on the their orders. The second distinctive feature is the outstanding use, based on the active participation and involvement of Archangels, of one of the most effective techniques on e-commerce sites to increase the confidence of buyers: the social proof. Findings from our interviews offer some inside on costumers' motivations and commitment. The Archangels, although supporting financially the producers primarily to get a price discount on wine, strongly appreciate the quality of wine, the social aspect of the online community, that allow them to interact with other customers (Angels and Archangels) and NW staff and, last but not least, to interact with winemakers, financially supporting and promoting them. Overall, Archangels interviewed have shown

a strong appreciation for Naked Wines, that has introduced a world-class model for accessing and distributing wines and that excels in customer relationships. Many Archangels, however, have expressed concerns over the future challenges, emphasizing that the model to work needs to be somehow small and intimate at the same time. Actually, the problem to solve for NW is how far they can expand without losing the personal touch they have with the customers who want to be involved and feel part of a team.

The results of our exploratory research are to be considered as a first step towards a future analysis that could further investigate the opportunities that arise from consumers acting as investors to support producers, that is of particular significance in sectors characterized by the presence of small producers, such as wine and food, where crowd funding can be an important alternative to bank lending and to selling shares in a stock exchange.

COMMUNICATION FOR EDUCATIONAL PURPOSES THROUGHOUT SOCIAL NETWORKS SITES

Viassone, Milena

Department of Management, University of Turin, Italy

ABSTRACT

Nowadays Social Networks Sites (SNSs) are becoming more and more popular in the communication among University students. Even if the last five years have witnessed an increasing interest in their usage, their educational functions are still limited and not developed just like their potential. The aim of this paper is to assess the usage of SNSs for educational purposes and to evaluate the perception of University students towards it. Despite numerous researches have examined SNSs, a few studies have investigated their educational purpose and evaluated the perception of university students for this scope. This paper offers the opportunity to bridge this gap and to address important prospects. The analysis is carried out through the administration of a questionnaire to 125 University students in Northern Italy. In addition to their general information and usage of SNSs for educational aims, they express their perception on the basis of a 5-points Likert scale. Results show how students prevalently use them to interact with their classmates and not with their professors. This is only an explorative study carried out on a sample limited to University students in Northern Italy but it might be useful to develop important paths of development for SNSs.

Keywords: *Social Networks Sites (SNSs); University Students Perception; Educational Tools; Facebook; Likert Scale; Interactive Communication.*

INTRODUCTION

The ever increasing importance of social networks sites (SNSs) – like Myspace, Facebook, Twitter, etc. - in the communication among University students is particularly due to their interactive and multidimensional features. On the one hand, these tools offer several advantages in terms of saving time, risk and money since they allow for interactivity and cooperation among students as well as students with teachers without meeting in a particular place (Asabere, 2012) while, on the other, they can represent a challenge for students, professors and administrators. Furthermore, they offer several resources and services such as messaging, blogging, group discussion, etc. and students are avid users of these sites (Haneefa and Sumitha, 2011), also because they are user-friendly, student-centered and

student-controlled (Bowers-Campbell, 2008, p. 82). Despite their increasing attractiveness for University, they are prevalently commercially driven: substantially, they are the result of an adaptation by educators and application builders (Weber, 2012). Moreover, even if they have enormous potential (Madge *et al.*, 2013; Schwartz, 2009) with online courses, their educational functions are still limited and not sufficiently developed. The most researches focus their attention on the real usage of SNSs by students and on their impact on their scholar performances but a few studies have investigated their educational aim (Schwartz, 2009; Selwyn *et al.*, 2008) and almost none of them has evaluated the perception of University students for this specific scope. This paper offers the opportunity to bridge this literature gap and to address important prospects. The purpose of this paper is indeed to assess the usage of social networks for educational aims and to evaluate the perception of University students towards this kind of usage and the relative purpose. This study is focused on the highest education sector, i.e., it is carried out in a University (that of Turin, in Northern Italy) and it is performed through a qualitative investigation involving 125 University students. The first part of the paper is devoted to the definition of SNSs, their educational purpose and attitudes of students towards them; whereas the second one investigates their usage for educational purpose and the relative evaluation of perceptions of University students towards them, by highlighting the main consequences they can provoke on the educational system in order to define a new integrative framework of analysis and development.

SNSS FOR EDUCATIONAL PURPOSES: A REVIEW OF LITERATURE

The important topic of SNSs for educational purposes is largely debated in literature and its diffusion is increasing. One out of four highly-educated students in the United States now takes at least one online course during his/her undergraduate career (Allen & Seaman, 2010). As supported by Weber (2012), approximately 75% of all online adults maintain at least one social network profile. SNSs are becoming more and more sophisticated and many operate on a free service model that turns out to be very attractive to educational institutions in developing countries with small education budgets.

Karimi and Khodabandelou (2013) support the idea that SNSs such as Facebook have become popular among millions of users including highly-educated students and they have become a significant part of students' life.

Anyway, researchers seem to have divergent opinions on three fundamental issues like usage of SNSs, their real purpose and perception of SNSs.

With respect to the usage of SNSs, different opinions appear in literature: some researchers support the idea that SNSs could further improve learning and sharing of information among learners and teachers (Ferdig, 2007; Maloney, 2007; Pence, 2007; Simoes and Gouveia, 2008) According to Ellison

(2010) SNSs usage is generally devoted to the management of group projects, the coordination of meetings, chat and message about homeworks, sharing learning experiences and research findings (Hussein *et al.*, 2012); for example, students at the University of North Carolina prefer debating on Facebook versus the standard course management system, listing pre-existing familiarity and user experience as key factors (Stutzman, 2008).

Selwyn (2009, p. 161) shows how students discuss throughout SNSs about five main themes: recounting and reflecting on the University experience, exchange of practical information, exchange of academic information, displays of supplication and/or disengagement and 'banter'.

Yu *et al.* (2010) suggested how social networking of University students with peers and professors could be a way for obtaining information, knowledge, social acceptance and support. In the same way, Kosik (2007) noticed that students use Facebook for academic purposes, particularly to connect people and to get information about assignments while Chu and Meulemans (2008) found that SNSs are used in order to communicate with other students about school, instructors and courses. Professors could use Facebook to facilitate instructor-to-student and student-to-student course communication, manage class projects, answer questions, etc. (Abdelraheem, 2013).

On the opposite way, Mazman and Usluel (2010) and Vivian and Barnes (2010) believe that SNSs are used only for informal learning. This opinion is supported by Hamat *et al.* who, in an important study in 2012, found how the majority of respondents makes use of SNSs to interact and communicate with their peers with the purpose of informal learning.

On the real education purpose and effectiveness of the social networks, there are also controversial opinions. While according to Madge *et al.* (2009; 2013) SNSs are mainly used both as "a social glue" that helps students familiarize with other students, to deepen the knowledge of their interests, ideas and as a potentially useful tool for promoting effective academic practice, several other researchers are diffident towards the use of SNSs for educational purposes (Kumar, 2010; Kennedy *et al.*, 2008; Oliver and Goerke, 2007; Donnison, 2007). A consistent literature found that University students use SNSs prevalently to communicate with family and friends, to pass time and for entertainment (Sponcil and Gitimu, 2012; Sheldon, 2008) and mainly for social purposes (Boyd and Ellison, 2007; Lampe *et al.*, 2008; Madge *et al.*, 2009). Enriquez (2010) shares the same opinion and declares that "the problem is that most people have Facebook or other social networking sites, their e-mails and maybe instant messaging constantly running in the background while they are carrying out their tasks". Additionally, Szwelnik (2008) shows how students express their unease at the idea of their instructors having a presence in what these students consider their 'private personal space'. On the base of all these considerations, the real effectiveness of SNSs for educational purposes turns out to be uncertain.

This suggests that SNSs have the potential to promote cooperative learning but this must be developed testing it to University students so to help us in this scope.

With respect to the perception, there is convergence in literature in supporting the idea of a positive perception of SNSs by students. Someone emphasizes the strict link between SNSs and attitude to academic life: according to Dorum *et al.* (2010) SNSs are associated with positive attitudes to academic, social and personal aspects of students' life; Irwin *et al.* (2012) show how students think that a *Facebook* page could facilitate their learning, by means of an increased interaction with instructors and notifications for course information. Furthermore, Keenan and Shirii (2009) explored how SNSs encourage friendliness through the use of Facebook, Twitter and LinkedIn.

Other researchers associate the use of SNSs with good students' performances: Mazer *et al.* (2007) demonstrate how their usage results in good performances from users in terms of effective learning which has resulted in a positive learning climate among students. Madge *et al.* (2009) noticed that 53% of students who participated in a survey were positive about the use of Facebook for teaching and learning as long as the focus was on administrative matters.

On the other side, Karl and Peluchette (2011, p. 220) notice a negative perception of SNSs by students, maintaining how many of them feel uncomfortable to become friends with teachers and how they aren't so keen of dealing with teachers for educational purposes because they consider SNSs as a social space (Madge *et al.*, 2009, pp. 150_151).

METHODOLOGY OF RESEARCH

The present study aims at (1) investigating the usage of SNSs for educational purposes and (2) to evaluate the perception of University students towards this kind of usage and the relative purpose. These objectives are achieved throughout the administration of a questionnaire structured in four main sections to 125 University students: a first part describes general data of university students; the second one investigates their usage of social networks for educational purposes by means of 7 closed-reply questions; a third section provides their evaluation in order to draw future strategies - this part has been obtained throughout a 5-points Likert Scale (1= I completely disagree; 5: I completely agree) that allows for the evaluation of 17 items structured in 4 main dimensions: learning, commitment/motivation, communication with classmates, communication with professors; finally, the very last section proposes a balance about the importance of social networks for learning purposes throughout open questions. The questionnaire has turned out to be a suitable tool for the measurement of this variable: in fact, it shows a high validity of content and reliability, emphasized by a high level (0.894) of the Cronbach's Alpha, that results in a high level of internal consistence of the scale used with the sample of reference.

SAMPLE

The research involved 125 University students (40% male; 60% female) aged between 18 and 35 (86.4 of whom in the range 21-26 years) recruited between October 2013 and November 2013 in Northern Italy. The choice of exploring only perception of students in this age range is dictated by the fact that this range of population is the one using SNSs most easily and can represent a more and more increasing segment for educational purposes if SNSs is able to satisfy its needs. This number of questionnaires (125) constitutes a representative sample for our exploratory research, which aims at a deep understanding the point of view of University students. The sample is made up of students only (and not by professors or administrators) because we want to understand if these tools could be accepted and considered efficient for this purpose before proposing them to subjects probably more reluctant to use them. The qualitative research based on a structured questionnaire supports the emerging of the real motivations at the basis of the use of SNSs for educational purposes. Respondents are University students involved in a process of learning and with a certain knowledge of these tools.

ANALYSIS AND DISCUSSION OF RESULTS

The first purpose (investigating the usage of SNSs for educational purposes) is based on the frequency analysis of the usage of social networks for educational purposes by University students and results confirm its increasing diffusion (Schwartz, 2009; Selwyn *et al.*, 2008): in fact, most University students (61%) uses SNSs for this purpose almost 1-3 times a week and, in terms of usage, the first place is held by Facebook (87.2%) followed by YouTube (4.8%), MySpace (1.6%) and Skype (1.6%). This large diffusion of SNSs for educational purposes confirms what supported by Weber (2012) who emphasizes their attractiveness for Universities – more and more provided with a small education budget - due to the free service model on which they operate. It is also a confirmation of the thinking by Karimi and Khodabandelou (2013), that consider SNSs an important segment in which to invest in the future.

Despite the several possible usages of SNSs, University students prevalently use them in order to interact with their classmates, i.e., to get help on academic subjects from their classmates (48.4%) and to contact their classmates to arrange for group discussions (23.8%).

This confirms what suggested by Yu *et al.* (2010) and Kosik (2007) who describe SNSs as a tool used by students especially to obtain information.

With respect to the interaction with other students/professors, SNSs are considered useful to exchange information about the exam rules (36%) and to discuss class assignments (32%). This is reflected in the results of a study by Hussein *et al.* (2012) who maintain how University students use SNSs for sharing their learning experiences and research findings, getting latest information and developing academic

networks. Similar conclusions are drawn by Kosik (2007) who found how students use Facebook for academic purposes, particularly to connect to people in their classes and to get information about assignments.

University students attribute SNSs the role of facilitator of their learning (Kosik, 2007; Chu and Meulemans, 2008), mostly thanks to participation in general discussions about course topics (38.3%) and throughout an improved interaction with professors and fellow students (21.7%).

In particular, messages (39.2%) and comments (17.5%) result the most used functions of SNSs allowing them to interact better with other classmates in order to discuss and share doubts and information. This reflects results obtained by Ellison in his study in 2010 where SNSs usage for educational purposes was mostly devoted to chats and messages related to homeworks.

With regard to the purpose, scarce results are shown with reference to their utility in the interaction with professors: in fact University students found SNSs useful to contact their lecturers “somehow” (35%) or “just a little” (19.2%). This utility turns out to be very or extremely important only in 43.3% of cases and main functions used are messages (39.2%) and chat (30%). This datum confirms the opinion of Karl and Peluchette (2011, p. 220) that found that many students are uncomfortable with becoming friends with teachers or they prefer not to interact with them for educational purposes (Madge et al., 2009, pp. 150_151).

These results are further emphasized with respect to the second investigation: in fact, students expressed a quite negative perception of SNSs for educational purposes, supporting data by Karl and Peluchette (2011, p. 220) who found out that several students felt uncomfortable with becoming friends with teachers: in our study, three dimensions (learning, commitment, communication with professors) out of four show the highest percentages at levels 1, 2 than at levels 4, 5. The highest level of negative perception (levels 1 and 2) is registered by the items “I have a better interaction with my professor throughout social networks” (70.5%) and “Using the social network enhances my interest in the subject” (64.2%). This shows a certain reluctance to use SNSs in order to interact with professors confirming what supported by Meulemans and Chu (2006) in one of their researches. We can notice that most respondents make use of SNSs to interact and communicate with their classmates for the purpose of informal learning: the most positive peak is shown by the item “I can share and solve my doubts throughout social networks” (54.9% at levels 4, 5), confirming results of the study carried out by Mazman and Usluel (2010), Vivian and Barnes (2010) and Hussain *et al.* (2012). The single item which doesn’t collect positive results with respect to communication with classmates is “Social networks increase my creativity and interactivity with the class”. These results show how students accept to use SNSs for educational purposes only in the communication with their peers who are

considered as a part of their social circle while they exclude professors/lecturers from it, confirming results of previous researches (Hamat *et al.*, 2012).

Table 1. Evaluation of perceptions of University students towards SNSs for educational purposes

	1	2	3	4	5
1. Learning					
Social networks facilitate my learning	10.7	32.2	34.7	14.9	7.4
Thanks to social networks I'm able to learn more concepts about the different subjects	13.2	33.9	38	10.7	4.1
Thanks to social networks I prepare the exams better	24.2	22.5	30	19.2	4.2
Social networks help me reach project objectives	20	30.8	30.8	15	3.3
Using the social networks enhances my interest in the subject	20	44.2	25	7.5	3.3
2. Commitment/Motivation					
I enjoy my time when using social networking tools for educational purposes	16.4	42.6	26.2	12.3	2.5
I would like a higher usage of social networks for educational purpose by professors	10.7	24.6	31.1	21.3	12.3
I'm more interested in committing to course activities because of the use of social networks by professors	14.9	33.1	30.6	16.5	5
3. Communication with classmates					
Social networks increase my creativity and interactivity with the class	10.8	24.2	38.3	20.8	5.8
Throughout social networks I can participate in group discussions about lectures, projects, exams	2.5	16.5	34.7	37.2	9.1
Throughout social networks I learn more about my classmates	8.3	18.2	28.1	35.5	9.9
I can share and solve my doubts throughout social networks	4.1	9.8	31.1	36.9	18
Online discussions help me to develop a sense of collaboration with the class	6.7	20	38.3	26.7	8.3
4. Communication with professors					
I have a better interaction with my professor throughout social networks	36.1	34.4	16.4	9	4.1
Throughout social networks I can get more information from my professors in shorter time	21.3	39.3	21.3	14.8	3.3
The communication between students and professors throughout these tools enforce their relationship	19.7	35.2	29.5	12.3	3.3
Social networks allow me to know my professors better	21.7	28.9	32.5	12	4.8

Source: personal elaboration.

Finally, a certain attitude towards SNSs for educational purposes is only expressed with regard to the interaction with their classmates and only limited to particular aims like discussion, exchange of information and cooperation. These results show how SNSs for educational purposes are in a first stage in Italian University and how many efforts should be carried out in order to develop these interesting tools.

CONCLUSIVE REMARKS

Results show an increasing usage of SNSs by young people (Karimi and Khodabandelou, 2013) who can constitute an important segment to invest in the future but only for peculiar services and functions they are available to accept. In fact, despite SNSs could have a bright future also in the educational field with regard to the interactivity and exchange of information among classmates, their acceptance in the dialogue students-professors is not so consolidated both by students and professors. University students who adopt SNSs for educational scopes consider their utility in order to share information, doubts, etc. overall but they don't consider them as tools capable of easing their learning and their preparation for the exams. This is related to fact that they think professors are not so ready and available to use them for learning purposes.

These data support completely what maintained by Karl and Peluchette (2011, p. 220) who suggested a certain uncomfortableness by students with becoming friends and by (Madge *et al.*, 2009, pp. 150_151) who found out that students were not very keen to interact with teachers and considered SNSs as a social space.

However, SNSs are well used by University students and may be excellent tools to be integrated into the learning resources of university courses. Results from this study indicate that students are receptive to incorporating SNSs (in particular Facebook) into their academic lives and think they could enhance communication and interaction with their peers (Irwin *et al.*, 2012). In order to develop the use of these tools, in the future it will be necessary to pull down important barriers like the scarce attitude towards their usage by professors/lecturers. In fact, they could really facilitate in the dialogue with lecturers easing their preparation and improving learning at 360° as supported by several authors (Ferdig, 2007; Maloney, 2007; Pence, 2007; Simoes and Gouveia, 2008).

This not-so-positive perception of University students towards SNSs for educational purpose with respect to the three dimensions (learning, commitment, communication with professors) should be viewed as an incentive to deeply understand their motivations and correct possible erroneous scruples they have towards their usage for communicating with professors.

This paper opens possible future implications and developments: first results of this paper should push professors to improve the usage of SNSs - with lectures on YouTube, creation of groups on

Facebook, upload of the videos of lectures, the creation of exercises to solve in groups via SNSs - in order to develop the dialogue with their students. This purposeful behavior by students should be viewed as an encouraging sign to continue on this path, providing always new innovations able to meet or to anticipate their future needs. Furthermore, also the development of appropriate learning strategies in order to encourage newcoming university students to use technology for learning opportunities should be considered (Ellis and Newton, 2009).

At the same time, given the important potential that these tools could have for educational purposes in the future, if these barriers were to be pulled down, teachers should be adequately provided with the time to deal with this level of learning support (Van Doorn and Eklund, 2013). Furthermore, in order to encourage the usage of SNSs by students, important efforts should be carried out in order to improve their security and privacy and protect the misuse of copyrighted materials (Haneefa and Sumitha, 2011).

Finally it has been demonstrated that the mistrust of SNSs has also led to the fact that many teachers have the same feeling of rejection towards technology used by students because in their opinion it interferes with the natural flow of traditional education (Handely 2007). So, whether or not the ways of working, doing research and learning remain on the sidelines of this revolution is up to teachers and the attitudes of students (Vidal *et al.*, 2011).

Although this research offers important suggestions and enrich existent literature on this topic, there are some limitations which should be taken into account. First of all, this research is an exploratory study based on a limited size sample and it finds application only in Northern Italy. In the future, it is possible to further develop this research by extending the same study to professors and analyzing, on a wider sample, the motivations that prevent students or professors from adopting SNSs for educational purposes in order to develop future strategies.

ABSTRACT

This paper analyzes the influence of technological turbulence, organizational management dynamic capability and operational capabilities for innovation on export market effectiveness. Based on the dynamic capability view, we investigate the effect of technological turbulence on organizational management dynamic capability, and how this latter contributes to leverage operational capabilities for innovation in order to benefit performance in export markets. To test the hypotheses, we carry out a structural equation model, using a sample of 471 exporting manufacturers firms that operate from Portugal. The results demonstrate that technological turbulence is an antecedent factor of organizational management dynamic capability, which in turn has a significant impact on the development of firms' operational capabilities for innovation, specifically innovativeness, innovation strategy, and technological capability. However, the findings only establish that innovation strategy and technological capability have a significant direct effect on export market effectiveness. Implications for scholars and practitioners are discussed along with suggestions for future research.

Keywords: *Dynamic capability; Innovation; Export market effectiveness.*

INTRODUCTION

It is necessary to research more deeply the relationship between dynamic capabilities, innovation, and firms' export market effectiveness (Weerawardena and Mavondo, 2011). As the export environment becomes more dynamic and uncertain, the need to continuously adapt and innovate becomes imperative for the success of industrial firms (Tomiura, 2007, Yam *et al.*, 2004). Innovation is the key strategic tool to improve market position in such complex environment (Chadha, 2009, Lisboa *et al.*, 2011).

The dynamic capability view suggests that, in order to outperform competitors and ensure continuous innovation, firms must possess dynamic capabilities (e.g., Eisenhardt and Martin, 2000, Teece *et al.*, 1997). They allow firms to upgrade or reconfigure operational capabilities (Helfat and Peteraf, 2003, Hill and Rothaermel, 2003, Zahra *et al.*, 2006) in order to address rapid changes in business

environment (Teece *et al.*, 1997). Competitive advantage results not from dynamic capabilities by themselves, but from the configuration of operational capabilities they create (Eisenhardt and Martin, 2000, Helfat and Peteraf, 2003, Makadok, 2001, Zollo and Winter, 2002).

Due to emerging technologies, fast changes in customer needs, and accelerated competition, deploying and understanding dynamic capabilities is important for innovation and export contexts (Danneels, 2002, Gebauer, 2011, Teece, 2007, Winter, 2003). Dynamic capabilities require the creation and assimilation of firms continuous innovation in order to respond to the customer needs and technological opportunities (Teece, 2007). Innovation involves a continuous search for new knowledge that goes beyond the existing knowledge associated with firms' current operational activities (March, 1991).

Dynamic capabilities are an evolving concept (Newbert, 2007, Rindova and Kotha, 2001), which has to be studied as an integrated model that *establishes the connection* between its antecedents and its effects (Hung *et al.*, 2010, Wang and Ahmed, 2007). Investigation in this field focuses particularly on conceptual analyses, while *empirical studies are still* quite sparse (Cepeda and Vera, 2007, Helfat and Peteraf, 2009). In addition, limited research exists about how dynamic capabilities are created, and how they interplay with operational capabilities in order to generate firms' superior value (Weerawardena and Mavondo, 2011, Winter, 2003, Zahra *et al.*, 2006).

Highlighting these gaps in the literature, we develop an approach that bridges dynamic capabilities, operational capabilities for innovation, and performance in export markets. We seek to contribute toward emerging the dynamic capability view, focusing on identifying the components of dynamic capabilities and operational capabilities for innovation, relevant to export market effectiveness.

The article is organized as follows. The next section offers the theoretical foundation and the conceptual framework. Then, we describe the empirical procedures and present the results. Finally, we discuss the most important conclusions, implications and limitations of the findings.

THEORETICAL BACKGROUND AND HYPOTHESES

Innovation capabilities, such as innovativeness, innovation strategy and technological capability are critical for the success of manufacturing firms (Terziovski, 2010, Yam *et al.*, 2010, Yam *et al.*, 2011). They are a kind of special assets that include technology, processes, knowledge, experience and organization (Guan *et al.*, 2006). Innovativeness, innovation strategy and technological capability are related with firm's operational functions, and so they are operational capabilities for innovation (cf., Cepeda and Vera, 2007), that can be further subdivided into specific skills or competences.

Considering that export market and innovation represent a high degree of uncertainty and change, dynamic capabilities are critical for innovation in the export context (e.g., Lee and Kelley, 2008, Lisboa

et al., 2011). Dynamic capabilities enable firms to keep strong and flexible operational capabilities for innovation (Wang and Ahmed, 2007, Zahra *et al.*, 2006). The improvement of operational capabilities to respond to market changes benefits the way firms operate, and help managers to realize how these improvements can be valuable (Cepeda and Vera, 2007).

One important component of dynamic capabilities is organizational management capability (Hung *et al.*, 2010). Organizational management dynamic capability allows to develop operational capabilities (Helfat and Peteraf, 2003, Zahra *et al.*, 2006) through the flexibility and the alignment of internal capabilities with external demand (Álvarez and Merino, 2003, Camuffo and Volpato, 1996). It focuses on improving existing operational capabilities in order to meet customer needs and finally to enhance performance (Helfat and Peteraf, 2003).

In this study, we intend to demonstrate that organizational management dynamic capability is a response to technological turbulence and that it has a significant impact on operational capabilities on innovation (i.e., innovativeness, innovation strategy and technological capability), which, in turn, contribute to superior export market effectiveness. The conceptual model is presented in Fig. 1.

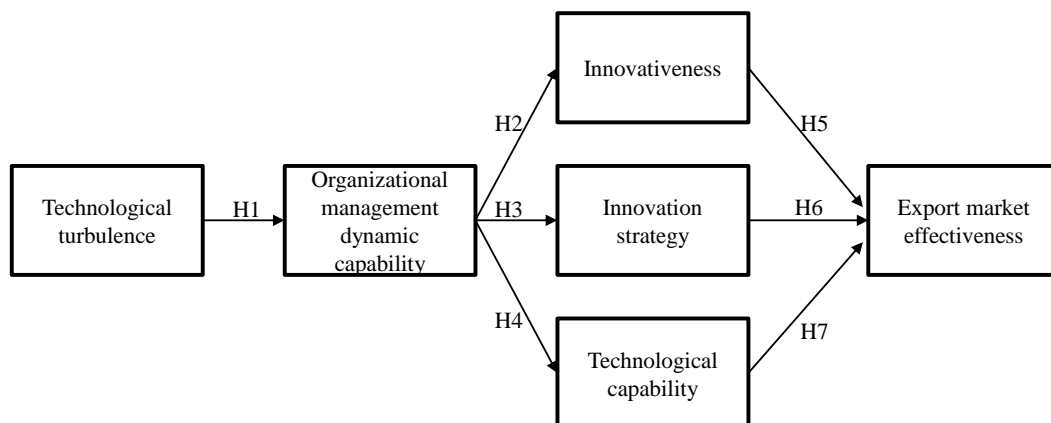

Fig. 1. Hypothesized relationships.

Technological turbulence and organizational management dynamic capability

Technological turbulence refers to the extension of technological advances in the industry (Kaleka, 2012). The more dynamic and hostile an environment, the greater the probability of firms to demonstrate organizational management dynamic capability in order to adapt to technological turbulence (Teece, 2007, Wang and Ahmed, 2007).

Hypothesis 1. Technological turbulence positively influences organizational management dynamic capability.

Organizational management dynamic capability and innovativeness

Organizational management dynamic capability keep managers and work teams informed about markets and technologies changes (Camuffo and Volpato, 1996, Teece, 2007). The unexpected situations in the environment, such as customer needs unfilled, or changes in market trends, stimulate

a firms' culture of continuous experimentation of new ideas and procedures (Eisenhardt and Martin, 2000, Jong and Hartog, 2007, Zahra *et al.*, 2006). In addition, the organizational management dynamic capability promotes the knowledge sharing and cooperation between work teams, which leads to synergetic benefits by solving problems that combine this knowledge in innovative ways (Bierly III and Chakrabarti, 1996, Brown and Duguid, 1991). In order to provide solutions to business challenges and problems, managers change routines and develop a culture of innovativeness that is shape to accept high levels of internal change (Teece, 2007, Teece *et al.*, 1997).

Organizational management dynamic capability leads firms to frequently try out new ideas, new ways to do things, and to be creative in their methods of operation, contributing for the development of innovativeness (Figueiredo, 2003, Teece, 2007).

Hypothesis 2. Organizational management dynamic capability positively influences innovativeness.

Organizational management dynamic capability and innovation strategy

Innovation strategy requires firms to focus not only on internal resources and capabilities but also on external links to the market (Grant, 1991, Poon and MacPherson, 2005). The assessment of external factors must precede the formulation of objectives and competitive methods for innovation (Dess, 1987, Khandwalla, 1976). Organizational management dynamic capability, by continually focus on markets and their constantly changes, enable firms to develop the most suitable innovation strategy (Poon and MacPherson, 2005).

Moreover, the implementation of innovation strategy depends on the extent to which different functional departments share and combine resources for realizing such strategy (Tsai and Ghoshal, 1998, Van de Ven, 1986). The interaction between the various functional departments implies to cultivate good working relationships, and accommodate multiple and sometimes even conflicting viewpoints (Cheng *et al.*, 2010, Clercq *et al.*, 2008, Luca and Atuahene-Gima, 2007). Organizational management dynamic capability promotes the communication, coordination, knowledge sharing, and exchange between different functional departments, and thus decrease the risk of potential conflicts (Gatignon and Xuereb, 1997, Xie *et al.*, 1998). Hence, firms *with* organizational management dynamic capability *are* better prepared to implement and adopt tools and techniques related to innovation strategy (Nijssen and Frambach, 2000).

Hypothesis 3. Organizational management dynamic capability positively influences innovation strategy.

Organizational management dynamic capability and technological capability

A central component of technological capability is Research and Development (R&D) activities (e.g., Kyläheiko *et al.*, 2011, Roper and Love, 2002, Zahra, 1996). R&D is the most important intangible expenditure in innovation (Evangelista *et al.*, 1997). Technological capability, such as extensive R&D

activities and projects, represent the investment in the creation of technological knowledge that leads to improvement and successful innovation (e.g., Renko *et al.*, 2009, Wang and Kafouros, 2009, Yam *et al.*, 2010, Yam *et al.*, 2011, Zhou and Wu, 2010).

Organizational management dynamic capability takes a critical role in the development and accumulation of technological capability (e.g., Figueiredo, 2003, Wang and Ahmed, 2007). This dynamic capability promotes the *intra-firm knowledge* dissemination, and ensures the creation of new technological knowledge through the continuous interaction of several functional viewpoints and interests (Figueiredo, 2003, Zhou and Wu, 2010). In addition, it stimulates employees' active involvement in internal activities, which leads them to understand the principles underlying the technology and to move on to new actions in response to future market changes (Figueiredo, 2003, Sanchez, 1995). Hence, organizational management dynamic capability leads firms to invest heavily in certain R&D projects, to use the long term know-how in such projects, and to develop superior technological capabilities (Bierly III and Chakrabarti, 1996).

Hypothesis 4. Organizational management dynamic capability positively influences technological capability.

Innovativeness and export market effectiveness

Innovativeness is an important determinant of various performance outcomes, including market position (e.g., Hult *et al.*, 2004, Rhee *et al.*, 2010), financial position (e.g., Calantone *et al.*, 2002), and firm value in the stock market (e.g., Rubera and Kirca, 2012). Firms with a higher culture of innovativeness develop a superior competitive advantage (Hult and Ketchen, 2001), which enable them to reinforce outcomes from it (Damanpour, 1991, Hurley and Hult, 1998). Hence, innovativeness is likely to result in superior export market effectiveness (e.g., Calantone *et al.*, 2002, Hult *et al.*, 2004, Rhee *et al.*, 2010).

Hypothesis 5. Innovativeness positively influences export market effectiveness.

Innovation strategy and export market effectiveness

Prior studies have demonstrated that innovation strategy has a great influence in growth and organizational performance of manufacturing firms (e.g., O'Regan *et al.*, 2006, Poon and MacPherson, 2005, Terziovski, 2010). Innovation strategy strengthens behaviors and promotes internal cooperation in the development of innovative activities that, in turn, allow firms to increase their performance (e.g., Akman and Yilmaz, 2008, Hart, 1992). Firms create innovative products that stimulate costumers and outperform competitors, expand their existing markets or create new ones, and achieve distinctive market positions (He and Wong, 2004, Lawson and Samson, 2001). Hence, innovation strategy is expected to enhance export market effectiveness.

Hypothesis 6. Innovation strategy positively influences export market effectiveness.

Technological capability and export market effectiveness

Technological capability represents the firms' internal effort to create a stock of scientific and technical knowledge (Kyläheiko *et al.*, 2011, McEvily *et al.*, 2004, Quintana-García and Benavides-Velasco, 2008), that leads to more efficient processes for developing and testing new products and ideas (Criscuolo *et al.*, 2010). Firms with superior technological capability are more innovative (e.g., Martínez-Román *et al.*, 2011), and have a bigger performance (e.g., Coombs and Bierly, 2006, Ortega, 2010). Technological capability allows firms to develop and introduce new products in the market (Renko *et al.*, 2009), create differentiated and high quality products (Yam *et al.*, 2010), and have more competitive prices by reducing production cost (Kafouros *et al.*, 2008, Yam *et al.*, 2010). Hence, technological capability improves competitiveness and leads to superior export market effectiveness (Yam *et al.*, 2004).

Hypothesis 7. Technological capability positively influences export market effectiveness.

METHODOLOGY

This study was conducted in 2012, using a sample of Portuguese exporting manufacturers. An online questionnaire was the basis of the data used to test the model. The final sample size was 2740 firms. We obtained 471 valid questionnaires, which corresponds to a response rate of 17%. This is a very satisfactory response rate, given that the average top management survey response rates is in the range of 15% to 20% (Menon *et al.*, 1996). Our model includes 35 observable indicators, which determines a 13:1 ratio of sample size to number of free parameters (see Bentler, 1989 in Westland, 2010).

RESULTS

In this model, each item was restricted to load on its priori specified factor, with the factors themselves allowed to correlate with one another. The overall chi-square for this model is significant ($\chi^2=286.41$, $df=137$, $p<0.00$). Four measures of fit were examined: the comparative fit index (CFI=0.98), the incremental fit index (IFI=0.98), the Tucker-Lewis fit index (TLI=0.97) and the root mean square error of approximation (RMSEA=0.048). The results suggest that the scale measures were internally consistent, able to provide a good fit of the factor model to the data.

The conceptual framework depicted in Fig. 1 was tested using structural equation modeling. The results suggest a good fit of the model to the data ($\chi^2=429.97$, $df=145$, $p<0.00$, $\chi^2/df=2.97$, CFI=0.96, IFI=0.96, TLI=0.96, RMSEA=0.065).

Consistent with H1, technological turbulence positively influences organizational management dynamic capability ($\beta=0.41$, $t\text{-value}=6.78$). In line with H2, H3 and H4, organizational management dynamic capability has a significant positive impact on innovativeness ($\beta=0.66$, $t\text{-value}=9.18$),

innovation strategy ($\beta=0.72$, $t\text{-value}=9.21$), and technological capability ($\beta=0.66$, $t\text{-value}=9.27$). Contrary to expectations, no significant association is found between innovativeness and export market effectiveness ($\beta=0.04$, n.s.), thus H5 is rejected. Finally, consistent with H6 and H7, innovation strategy and technological capability have a significant positive impact on export market effectiveness ($\beta=0.18$, $t\text{-value}=2.66$ and $\beta=0.17$, $t\text{-value}=2.63$, respectively).

DISCUSSION AND IMPLICATIONS

This article advances understanding on dynamic capabilities, specifically organizational management dynamic capability, and operational capabilities for innovation, namely innovativeness, innovation strategy and technological capability, and their impact on export market effectiveness, through the application of the dynamic capability view in the export context. In this sense, we clarify the nature of organizational management dynamic capability, by explaining its measures, antecedent and effects. We empirically test innovativeness, innovation strategy and technological capability as the output of organizational management dynamic capability, and the indirect impact of organizational management dynamic capability on export market effectiveness.

Taking into account that nowadays industrial exporting firms face a constantly changing environment, characterized by high technological turbulence, the results highlight the need for managers to cultivate organizational management dynamic capability in order to respond to rapid changes in technology. Managers' examination of technological breakthroughs in the industry influences the development of the necessary flexibility to coordinate and improve operational capabilities for innovation, and to align internal capabilities with customers' needs. This way, firms are able to articulate more and upgrade innovativeness, innovation strategy and technological capability.

The study highlights the importance of firms' organizational management dynamic capability in the export context, with an environment open to global competition and characterized by rapid technological changes. Organizational management capability is a dynamic capability that enables firms to respond to technological turbulence while developing the flexibility required for upgrading operational capabilities in order to meet the customers' needs.

This study takes the position that innovation strategy and technological capability are key operational capabilities for achieving a superior performance in export market. When managers develop innovation strategy and technological capability to enhance market performance effectively, they should also develop organizational management dynamic capability in order to improve them. Firms should look for synergies between organizational management dynamic capability and innovation strategy as well as technological capability in order to survive and grow in export markets.

LIMITATIONS AND DIRECTIONS FOR FUTURE RESEARCH

This study presents some suggestions for future research regarding the theoretical and methodological limitations.

We conceptualized organizational management dynamic capability using three measurement items. Other elements of organizational management dynamic capability could exist and be measure. Research may continue by consulting other scholars' interpretations of dynamic capabilities and/or by using a multidimensional construct of dynamic capabilities. Moreover, it is probable that different industries have different dynamic capabilities. This is also a subject that worth further investigation.

Future research may consider other types of operational capabilities for innovation, such as manufacturing, learning, and resources allocation capabilities, among others. It would be also interesting to analyze the impact of organizational management dynamic capability on these other capabilities.

Longitudinal data may improve this type of investigation, analyzing how organizational management dynamic capability can improve operational capabilities for innovation over time. Because the firm's environment is constantly changing, it is important that future research assess the extent and speed of change that organizational management dynamic capability enables. The cross-sectional data used in this study may not be adequate to observe the short and long-term impact of organizational management dynamic capability on operational capabilities for innovation.

Future studies are encouraged based on samples from various countries, since we only used firms based in Portugal. However, investigation that examines dynamic capabilities in the exporting field was developed with single-country samples (e.g., Chadha, 2009, Lisboa *et al.*, 2011).

ACKNOWLEDGMENTS

This research was supported by Portuguese Foundation for Science and Technology (FCT) through the project PEst-OE/CED/UI4016/2014, and Center for Studies in Education, Technologies and Health (CI&DETS).

ASSESSMENT OF THE BRAIN REACTIONS TO SOUND AND PICTURE IN ADVERTISING

Vidigal Costa, João¹; Lucas de Freitas, Carlos¹; Paiva, Teresa²

¹Centro de Estudos de Gestão, Instituto Superior Tecnico, Universidade de Lisboa, CEG-IST, Portugal

²Centro de Electroencefalografia e Neurofisiologia Clínica, CENC, Lisbon, Portugal

ABSTRACT

In this exploratory research, the main objective was to study the influence of sound and picture in advertising, by observing the neural responses of subjects from both genders. The EEG was recorded for 11 female and 11 male participants, during the presentation of 2 television ads.

A local frequency analysis pointed key moments of the ad. Also, a sLORETA analysis showed that during the first second, one of the ads triggered greater neural activation than the other, for both genders, especially in areas related with visual and auditory integration, as well as specific decision-related structures.

It was concluded that sound and picture amplify each other's effects in advertising. Also, a local frequency and a sLORETA analysis can successfully point to effective moments of a marketing campaign.

Keywords: *Neuromarketing, EEG, TV advertisement, Wavelet Transform and sLORETA*

INTRODUCTION

Neuromarketing is an emergent field, which consists in "looking at consumer behavior from a brain perspective" (Morin, 2011). Basically, Neuromarketing is the combination, as the name implies, of Neurosciences and Marketing, providing to the second the powerful machinery and insights from the first.

A number of marketing agencies have since started using neuroimaging tools, to better understand the commercial problems of their clients. Most scientific works establish the definition of neuromarketing, as "a field of study concerning the application of neuroscience methods to analyze and understand human behavior related to markets and marketing exchanges" (Babiloni, 2012).

Neuromarketing is able to provide directly obtained information, about the neural reactions of individuals (Lee et al., 2007). It can even be suitable to judge a product before it even exists, as its fast execution could mean that a concept was swiftly tested, and if the results didn't meet the standards,

the manufacturer could abandon that concept early on, in its production process (Ariely & Berns, 2010).

Numerous techniques, used in a neuroscientific context, can be transported for neuromarketing, like electroencephalography (EEG), functional magnetic resonance imaging (fMRI), facial electromyography (EMG) or the measuring of the galvanic skin response (Hess, 2009; Mendes, 2009).

One of the most important analysis of the EEG is that of the waveform. From a waveform perspective, an assessment is made on the basis of grouping the different components, according to the frequency interval to which they belong. So, there are five main brain wave patterns: alpha, beta, delta, theta and gamma.

Alpha waves are generally found in the EEG's of most adults, when they are awake and in a quiet, resting state of thinking. Beta waves may replace alpha waves, in a case of a subject's attention being directed to a specific type of mental activity. Theta and Gamma waves play an important role in memory activation. Theta waves also play a role in emotional processing and gamma waves in attention. Delta waves are characteristic of specific sleep stages (Guyton & Hall, 2006).

To make a thorough frequency analysis, the Wavelet Transform was used. The Wavelet Transform gives a local frequency analysis of non-stationary signals (like EEG) over a time interval, decomposing the signal from the time domain to a time-frequency domain. This means that with this method, one can know the evolution of each desired frequency over time.

For a better mapping of the brain activity, a software package (sLORETA) was used. The sLORETA (Standardized Low Resolution Electromagnetic Tomography) software allows a good approximation for the solution of the inverse problem of EEG, that is, to determine the localization of the neuronal generators of the EEG responses. Since brain activity is spatially distributed, and therefore is not simply originated by single point sources, this is a better solution than, for instance, dipole fitting (Pascual-Marqui, 1999), and it depicts these phenomena with the lowest localization error from all the 3D localization methods (Pascual-Marqui, 2002), and a 5 mm spatial resolution (Fuchs et al., 2002; Pascual-Marqui, 2002), which is close to what some fMRI systems are able to offer (fMRI's strongest point is usually the good spatial resolution).

In this research, the focus was on studying the reaction to different TV ads from the same brand and product. EEG will be used to acquire the reactions of the participants, which will be analyzed to better understand factors like feelings, levels of attention and arousal. It will be complemented with a standard consumer questionnaire. The main aims were:

- Verify if a simple experimental paradigm, with only target stimuli, can be reliable for a neuromarketing analysis;
- Attest if neural responses can point to key moments of an ad. If so, recognize when those occur;

- Identify what structures show the most significant differences between different ads;
- Observe the importance of sound in the context of advertisement;
- Analyze the usefulness of methods, like the Wavelet Transform and sLORETA, in Neuromarketing studies.

METHOD

Participants

The sample was comprised of 22 subjects (50 % of each gender). All the subjects were right-handed, had normal or corrected vision, and had no diagnosed neurological issues. All the subjects were Caucasian, had the same nationality, and were all young adults with ages between 22 and 28 years old. The sample was selected by convenience, and is comprised of family members, friends and colleagues.

Paradigm

The paradigm of this experiment consisted in the showing of two different TV commercials, under four conditions: audiovisual form (*Sound & Picture*), with *Sound Only*, with *Picture Only* and with the *Sound Swapped*. Each stimulus was shown six times.

The two commercials advertised the same product, a women's perfume called J'adore, produced by Dior (Figure 1). Both ads star Charlize Theron, a famous actress.

The paradigm was structured in E-Prime®.

Figure 2. Image of the protagonist during the first commercial and second commercial, respectively.

Questionnaire

A questionnaire was applied immediately after the experiment, to complement the Neuromarketing data. It assessed participant information, brand and product opinion, opinion on the first ad and opinion on the second ad, and was designed with Qualtrics®.

Using ANOVA and Kruskal-Wallis, the responses of both genders were compared, to observe if there were significant differences, with $\alpha = 0.05$.

Repeated measures ANOVA and Friedman tests were computed to verify any significant differences between the two ads, again with $\alpha = 0.05$.

Equipment

The amplifier used for all the acquisitions, was a BrainVision® QuickAmp 72, which allowed the amplification of the very small currents obtained through the EEG system. The sampling rate used for all the acquisitions was 2000 Hz, to prevent aliasing.

The electrode cap used here follows the 10-10 system, with 63 Ag/AgCl electrodes and is made of a spandex-like material. An additional pair of electrodes was used to obtain the vertical components of eye movements, to remove those artifacts.

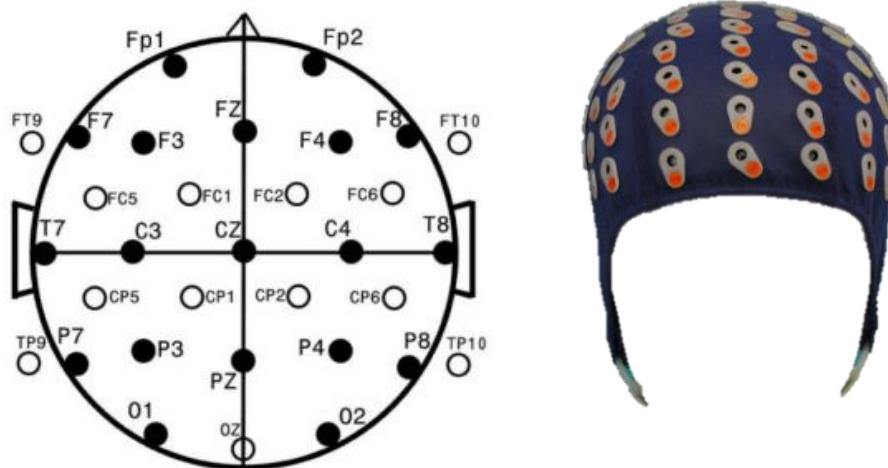

Figure 3. On the left, a schematic of the electrode placement used in a 10-10 system is presented. On the right, the picture presents an example of a similar system.

Signal processing

A wavelet transform was obtained for each stimuli. This resulted in the normalized powers of the theta, alpha, beta and gamma bands, over time, from each repetition of the stimuli. The averaged EEG data of each subject was obtained and exported, for use in sLORETA. The frequency data was grand-averaged across subjects.

The sLORETA data was used for t-tests over time ($\alpha=0.05$), to detect moments where there were significant differences between stimuli, and then their LORETA transformed data was tested, to compare the average neural activity in those intervals.

RESULTS

Questionnaire results

Most of the ad based questions didn't present significant differences between genders. The question about whether the protagonist was well known, was the only exception, and shown that for both ads, females remembered her the most.

In the case of brand and product based questions, the results show a greater experience with Dior products in general, and J'adore in particular, from women, as well as a greater desire to acquire and use them in the future, and a higher interest in this kind of product altogether, which, given the nature of the product, was to be expected.

There was only one item where differences were significant: the song of the second ad was better known from outside of the context of the commercial, than the song of the first ad. Also, the standard deviations and means, for the question about the possible improvement of the opinion on the product, were exactly the same.

Time-frequency results

A strong bilateral theta activation occurred, over the anterior region of the frontal cortex, for almost the whole duration of the ads. When the sounds of both ads were changed, both presented very similar patterns of activation, however they presented less medial prefrontal theta activity than their original counterparts. Still, these theta peaks covered a good portion of the commercial. Figures 2 and 3 present two examples of the results obtained in this analysis, over the frontal region of the brain.

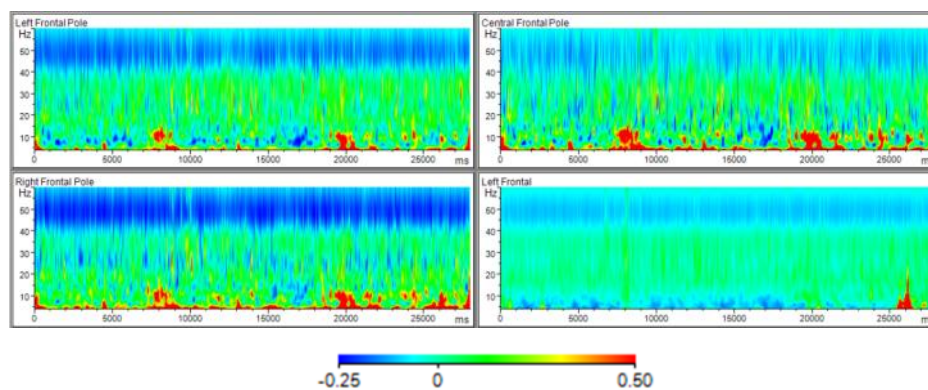

Figure 4. Grand averaged power spectrum of the 22 participants, for the whole duration of the first ad, when sound and picture were presented. The x-axis represents time (0 to 28 seconds), the y-axis represents the frequency domain (4 to 60 Hz) and the colors represent the spectral power (-0.25 to 0.50 μV^2).

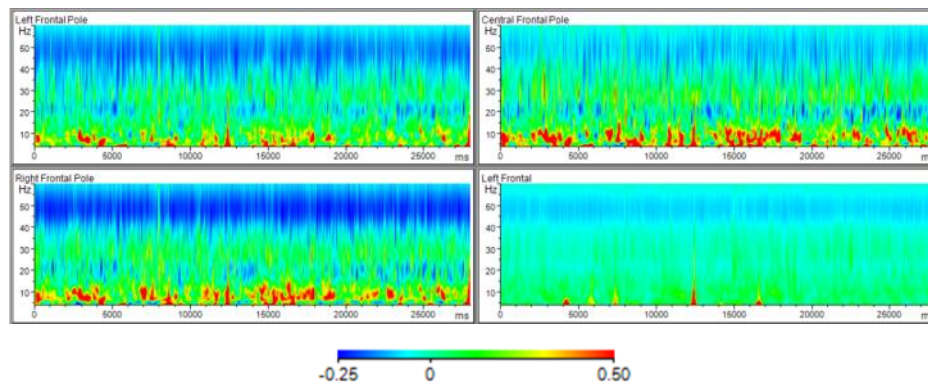

Figure 5. Grand averaged power spectrum of the 22 participants, for the whole duration of the first ad, when sound and picture were presented. The x-axis represents time (0 to 28 seconds), the y-axis represents the frequency domain (4 to 60 Hz) and the colors represent the spectral power (-0.25 to $0.50 \mu V^2$).

In both *Sound Swapped* stimuli, frontotemporal theta peaks were observed. For instance, there are two clear theta frontotemporal synchronizations, for the first ad, that come right around the same time as two lines of the monologue, that in this case cannot be heard (“Gold is Cold” and “Don’t Pretend”). There are similar peaks in the *Sound Only* condition of the same commercial over the 6th, 12th and 13th seconds, which actually are right around the time of the first and third lines of monologue.

In the first ad, the *Picture Only* present right temporoparietal peaks, very close to three key visual moments of the ad, where a close up to the actress is shown: first, the moment when she takes the net off her hair; second, when she starts taking off her bracelets and finally, when she starts unzipping her dress.

Several theta occipital peaks were elicited for the multiple conditions, including those with no picture or no sound. The *Sound Swapped* conditions and *Picture Only* condition, for the first ad, did not generate these spikes.

The two conditions that held more constant alpha activity, especially over anterior frontal regions and the occipital cortex, were the two *Sound Only* conditions. The first commercial presented considerably more alpha synchronizations than the second one, for the whole set of conditions. Yet, in most moments that alpha oscillations have a power increase, it was most often followed by a decrease and increase in beta activity.

For the first ad, all the conditions present increased alpha activity after the 20th second. In the case of the first condition for this ad, this happened systematically until the end of that stimulus, while for the two remaining conditions, containing picture, that was not as significant, but still, some beta activity spikes followed alpha synchronizations/desynchronizations. A beta peak occurred around the 23rd second, another at the 24th second when the perfume is shown and another at the 27th second, when

the brand name is shown and also mentioned by Theron. Also in the Picture & Sound condition, the other main peaks seemed to be around the time that Theron takes off her necklace and when she took off her bracelets.

Still, the biggest difference between that first condition and the other two that showed picture for the first ad, was that they show more alpha synchronizations/ desynchronizations, coupled with beta synchronizations right up to the 8th second.

The *Picture Only* condition presented more beta synchronizations than any other for the same ad. Almost all of the beta synchronizations that occur in this condition have also been observed in either one, or both the *Sound & Picture* and *Sound Swapped* conditions.

Only the Sound Swapped condition showed increased beta activity for the first 4 s of the second ad. For this condition, there were also beta peaks around the time that Theron is shown again, this time getting dressed, and from the moment she enters the catwalk, up to when she is filmed from behind. Finally, there were other beta synchronizations when the bottle of J'adore is shown, when its name appears and when the Dior name appears.

For the Sound & Picture condition of the same ad, the key beta peaks occurred for the close-up to Grace Kelly, the first moment where Marilyn Monroe is shown, in which she mentions the brand name, when Charlize Theron enters the catwalk (where the Dior name was strategically in the background), when the bottle of the perfume appears and finally when its name fades into the screen. Most gamma peaks over the prefrontal cortex, occurred around the same time as beta peaks. The only exceptions happened in the Sound & Picture condition of the first advertisement, around the 17th second, right after one of the lines of the monologue ("Feel what's real"), and on the 3rd second of the second ad, for the same condition. The *Sound Only* condition of the first ad elicited an exceptionally high amount of synchronizations in this frequency band, over the temporal lobe, for the first half of the commercial.

sLORETA

The interval from 663 ms to 694.5 was observed to be the time in which larger differences occurred between the first and second ads, in their first second, for female subjects. Then, a t-test with spatial localization was performed over that interval, in which the following regions were identified as having differences of the type A(Ad2)>B(Ad1):

Left Hemisphere: Medial Frontal Gyrus Brodmann Area (BA) 6;

Right Hemisphere: Precentral Gyrus (BA 4, 6, 43, 44), Inferior Frontal Gyrus (BA 44, 45, 47), Insula (BA 13), Superior Temporal Gyrus, (BA 13, 21, 22, 38), Fusiform Gyrus (BA 20), Inferior Temporal Gyrus (BA 20, 21), Temporal Lobe Sub-Gyral (BA 21) and Middle Temporal Gyrus (BA 21, 22).

There were also differences of the opposite type, in the Middle Occipital Gyrus (BA 19).

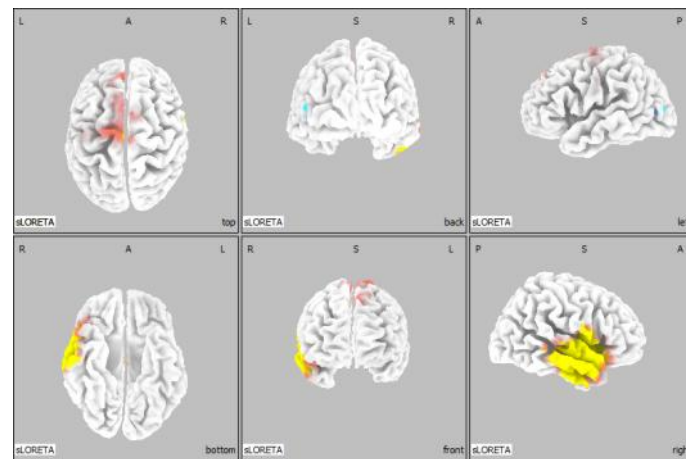

Figure 6. 3D mapping of the significant differences between the two ads, for the 11 female subjects.

Yellow and red represent differences of A > B type, and blue of the B > A type.

In the case of men, the interval between 538.5 ms and 572.5 ms was where the most significant differences were found in the first second. All differences were of the type A(Ad2)>B(Ad1), and occurred in the following regions:

Left Hemisphere: Superior Frontal Gyrus (BA 8), Middle Frontal Gyrus (BA 8), Posterior Cingulate Gyrus (BA 30), Limbic Lobe Sub-Gyral (BA 31), Precuneus (BA 7, 19, 31), Superior Temporal Gyrus (BA 21, 22, 42), Middle Temporal Gyrus (BA 21), Transverse Temporal Gyrus (BA 42) and Cuneus (BA 7, 19, 30);

Right Hemisphere: Cingulate Gyrus (BA 31), Precuneus (BA 7, 19, 31), Supramarginal Gyrus (BA 40), Superior Temporal Gyrus (BA 22, 39), Middle Temporal Gyrus (BA 39), Cuneus (BA 7), Precuneus (BA 31) and Middle Occipital Gyrus (BA 19).

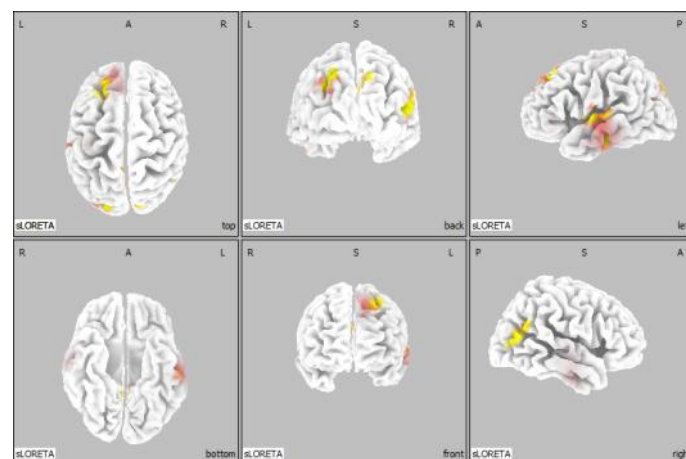

Figure 7. 3D mapping of the significant differences between the two ads, for the 11 male subjects.

Yellow and red represent differences of A > B type.

DISCUSSION

In terms of frequency analysis, Sammler *et al.* (2007) argued that pleasant music generated increased theta activity, over the frontal midline, which was observed, as there was a strong activation over the anterior region of the frontal cortex, for almost the whole duration of the ads, except for the two muted videos. These have been linked to emotional processing. The frontotemporal theta peaks, found in both Sound Swapped videos, were originated from the perception of portions of their sound as deviant (Choi *et al.*, 2013). Moreover, the right temporoparietal theta peaks were generated by visual memory encoding processes. Bilateral activations of this kind were due to retrieval (Sauseng *et al.*, 2004). Numerous occipital theta peaks, elicited for the multiple conditions, occurred due to episodic memory retrieval (Lee *et al.*, 2010).

The constantly large alpha activity in both *Sound Only* stimuli occurred because of the lack of visual input (Toscani *et al.*, 2010). Some subjects actually reported after the end of the experimental procedure, that they had closed their eyes during these. As was verified in this study multiple times, alpha synchronizations and desynchronizations have been seen to work as an anticipatory response, when followed by beta activity peaks (Babiloni *et al.*, 2006). Besides, the beta rhythm is a mark of increased processing by cortical structures, and so, a good indicator of attention.

Finally, the gamma band plays a role in attention and memory (Jensen *et al.*, 2007). The gamma synchronization in the prefrontal region, which occurred at the 3rd second of the second ad, was probably due to the opening notes of the song that accompanies the ad, and the image of the protagonist entering the dressing room. Also, the multiple temporal peaks in this band, for the *Sound Only* condition of the first ad, point to an increase in auditory perception (Crone *et al.*, 2001).

With the sLORETA analysis, it was seen that men and women had inverse reactions to both ads in the middle occipital gyrus, which were related with differences of spatial attention (Mangun *et al.*, 1998). Females had higher levels of spatial attention for the first ad, probably because of visual elements like the protagonist's dress, while males were more focused on the second one. The right inferior frontal gyrus is stimulated when important attentional elements are perceived (Hampshire *et al.*, 2010), and the left medial frontal gyrus is connected with approach behavior (Talati & Hirsch, 2005). On the other hand, the right fusiform gyrus and inferior temporal gyrus, which were more active in the second ad for females, are structures involved in face processing (Gross, 2008; Rossion *et al.*, 2012). This was perhaps caused by the faces of photographers shown in the beginning of the stimulus. Both genders had increased processing in the superior and middle temporal gyrus, in areas that play important roles in musical processing and voice recognition, caused by prior memories of the song of the commercial, also verified in the questionnaires. Men, also, presented increased activation of the transverse temporal gyrus (BA 42), which is an area of auditory integration too.

The fact that men presented more activation of BA 8 for the second ad shows a more successful memorization (Astolfi *et al.*, 2008). The precuneus (BA 7) and the supramarginal gyrus (BA 40), also more active in this case, are responsible for memory retrieval, showing that not only was the memory formation more effective here, but so was memory retrieval (Lundstrom *et al.*, 2005). In the limbic lobe, there was also an increased activation of the posterior cingulate gyrus, important for evaluative judgment (Zysset *et al.*, 2002).

CONCLUSIONS

During this exploratory research, we used a simple paradigm with no standard stimuli, to approximate the experiment to a natural watching of TV commercials. It proved to be effective to produce relevant frequency and LORETA data.

The frequency analysis and LORETA analysis were vital to obtain pertinent results for this study. The wavelet transform and the sLORETA technique allowed the study of the neural responses over the whole ad and a good localization of the sources of those responses for specified time intervals.

Thanks to the wavelet transform, it was possible to pinpoint moments, where memory, attention and emotional processes were particularly elicited. This was observed for the first commercial in moments where either the brand, or the product, were presented, as well as in moments where the protagonist is highlighted. In the second commercial, besides these moments, times where other famous figures appeared also generated greater responses.

Using sLORETA, differences in the initial responses, from one commercial to the other, were verified mainly in auditory processing regions, in the temporal lobe, and regions related with selective visual attention, for both genders. Also, structures in the frontal and parietal lobes related to memory processes, in the occipital and temporal lobe for face specific processing and zones of the limbic system related with attitude formation.

It was observed that replacing the sound of one ad with the other did change the attention responses considerably, even though it did not clearly modify the preference of one song over the other. Also, sound alone seemed to be much less effective to catch the subjects' attention when compared with the *Sound & Picture* condition, and in some cases it was even perceived as deviant by the subjects. So, from the point of view of the advertisers, reusing the image of an older ad with new sound effects seems to be less effective.

Moreover, picture by itself also presented loss of some of the effects found in the *Sound & Picture* condition like emotional reactions, and the use of just sound seemed to lose the attention of the subjects. It seems that these two elements amplified each other, as the combination of both did not just generate a superposition of their individual reactions, but also, generated more constant emotional

reactions and more attention peaks, which, due to their larger average amplitudes show that these reactions occurred more consistently across subjects. So, a TV commercial seems to be generally more effective in creating involvement, than a radio commercial, for instance.

ABSTRACT

Revolution of knowledge and the knowledge-based economy have as foundation the knowledge with their role in the contemporary economy.

In recent decades it has been noted and taken into account the favourable evolution of economic importance, information technology, human capital, economic processes, capabilities and skills of the organization as organic factors related to knowledge.

Intellectual capital is renowned as a vague and somehow confusing concept, due to its boundaries that are not well-defined, and interact more often with the concept of human capital.

Due to the development of modern society and its implications, the human factor continues to be a pawn in the process of production, a fact proven by his creative ability and responsiveness to self-development. The human factor, the qualification of the labour force and its rational use is the vital elements of adaptation to the effects of transformation of science in direct production, force the pace and extent of economic development, and exploitation of natural resources.

One of the key elements that support the profitability of the company is represented by intellectual capital, which is why it increases its significant level.

The Organization for Economic Cooperation and Development (OECD, 1999) describes the "intellectual capital" as the economic value of two types of intangible assets relating to a company, such as: organizational or structural capital and human capital.

Globalization and the growth of technological change have led to the creation of a high performance workplace. In this environment, intellectual capital is and remains the foundation of our success.

Keywords: *intellectual capital, value, human capital, exposure, knowledge based economy, structural capital, external capital, internal capital.*

INTRODUCTION

As time and technology develops and resizes permanently, in a very short time, the theoretical and practical concepts of the economy are being redefined.

Due to these developments, the results of intellectual work are the ones that prevail for each nation.

Due to these developments, the results of intellectual work are the ones that prevail for each nation.

Therefore elements such as scientific and technological research, education employment, sophisticated software, advanced telecommunication and electronic finances have become key sources of labor tomorrow, but nothing is more important than knowledge organization itself.

The New Economy is an economy dominated more global influences and speed, often in real time communications and information, regardless of distance. Basic features are globalization and digitization, which gives intangibility international transactions, both trade and direct investment. It is characterized by the appearance of new types of companies, new industries and the provision of services (Marian Covlea, 2010).

On the basis of the knowledge revolution, knowledge-based economy, is a key part in the knowledge that you have them in the contemporary economy (Cristina Burghilea, 2012).

Knowledge means the cumulative and aggregate inventory data and information, but also skills arising from their use by the receiver. Skills depend on the intellectual capacities (perception, judgment) of the receiver, and the main feature of knowledge (which is coming out in preference to the data and information) is their ability to generate added value through their appropriate use.

We live through excellence in a world dominated by intangible services. Any economic resource can no longer be harnessed properly without the contribution of intangible investment.

The intellectual capital of an organization is made up of human capital (*know-how of its employees*) and its structural capital (*organizational and intellectual property*). In other words, its main ingredients are human capital (which is the potential value of the company assets), intangible assets and intellectual property.

A good human capital management might create intangible value for the company.

Nowadays intangible assets based on intellectual capital and raw materials are represented by knowledge and information.

FEEDBACK ON THE VALUE OF INTELLECTUAL CAPITAL

In today's competitive environments has proved that our creation of value can be retrieved in a company's intellectual capital, to the disadvantage of physical and financial capital.

According to the accounting-financial studies conducted by the companies listed on the stock exchange it can be observed and documented the same significant gaps permanent existing between the book value of accounts of organisations and their market value (Cuganesan et al., 2006). In support

of this hypothesis is also the analysis made available to the public by the consulting firm Accenture, which indicates that, for the intensive and detailed knowledge of the company, its assets and tangible resources include usually between fifteen and twenty-five percent of the value of the company (Ballow et al., 2004). The same study shows that that most of the companies listed in the United States of America, expectations of future increase in value (as opposed to current incomes) comprise nearly 60 percent of the current value of the company. Therefore, the adoption of a formal framework to facilitate the reporting of intellectual capital is a way for businesses to identify explicitly, auditing and managing intangible sources of value creation and their communication both internally and externally (Petty et al., 2009).

THE PRESENTATION OF INTELLECTUAL CAPITAL

Intellectual capital is made up of stocks and knowledge flow available within an organization. They can be considered as intangible resources, tangible resources that together form the market value of a business.

Intangible resources are defined as factors other than financial assets and physical processes that contribute to generating value of a company and its control (Ion Anghel, 2008).

The multiplicity of definitions and approaches of this concept on the one hand show their importance, but at the same time, the difficulty of expressing something as "untouchable".

"Intellectual capital is intellectual material - knowledge, information, intellectual property, experience - that can be used to create wealth" (Stewart, 1997).

Another definition might be rendered as follows: *"Intellectual capital means intellectual material which signifies was formalized, captured and used so produces an asset of far greater value"* (Stewart, 1997:67).

In other words, intellectual capital encompasses everything that every employee knows in a company and can be used to develop its competitive capacity.

Most times this term was associated with a dynamic intangible resources and activities that underpin sustainable competitive advantage of organizations, but both theoretically and practically this form did not contain the essence of terminology.

Intellectual capital may include potential knowledge such as: customer list, benefit from contracts, intellectual input of employees or management processes.

Nowadays the concept of intellectual capital is considered abstract, but in the economy is defined as *"an estimate of a person's ability to produce income through labor"* (Di Bartolo, 1999), the latter may be the starting point desire for success of a company.

As stated Bontis, intellectual capital is a collection of resources related intangible flows.

In one of his works, Edvinsson, names intellectual capital as a (hidden) of intangible assets that do not often appear in the balance sheet.

Harrison and Sullivan, said that this element is knowledge or science that can be converted into profit (the benefits).

Roos: intellectual capital represents all the knowledge of the companies and the translation of this knowledge into practice through trademarks, patents and other brands.

According to Brookings, the difference dntre inventory value and what someone is willing to pay for it.

According to the literature, we can mention the idea of defining intellectual capital as a product obtained by the combination of technical developments, economic and social, political elections or implied and cultural value system underpinning decisions.

Most of the times it was considered to be "good name" of team leadership in any organization. Expansion of intellectual capital can be achieved if the organization is present innovation and creativity.

Intellectual capital includes four categories of intangible assets, namely:

a) activ market: trademarks of market segments, reserve orders (to the extent that the production process can fly), distribution channels, assignment contracts, licensing or franchising etc. Used effectively, the assets of this organization creates competitive advantages in the market;

b) infrastructure assets: technology, work methodology, specific techniques that make an organization to function effectively. This type of assets the culture of the organization, its financial structure, databases management systems. These values determine how employees work and communicate with each other, intercompartmental relationships within the organization;

c) intellectual property assets: copyright, software patents, industrial designs, trademarks, product, service (industrial, commercial), know-how, technical secrets manufacturing etc. ;

d) human values: the professional skills of employees, including experience, ability to state and solve problems, leaders etc. Such values are crucial to the organization because it is expensive to hire, train and maintain them at a high level. Talent and professional skills are in possession of the human factor, not the organization for which he works.

In the case of the Romanian television Company, intellectual capital is playing an extremely important role in the development of the institution and the increase in the value and brand awareness in the audiovisual field. With the investment in intellectual capital, the company will ensure increasing success.

Human capital represented by employees, is subject to a rigorous selection process and subsequent training programs and continuous improvement so that exhibit a high degree of professionalism,

which is consistent with current and future requirements and demands of the market.

The high level of skill and education of personnel ensures competitiveness of Romanian television Society in the field of mass-media by promoting with the help of six television channels: TVR1, TVR2, TVR3, TVR, TVR International News and TVR HD and five Studios (Cluj, Craiova, Iași, Timișoara, Târgu-Mureș) values such as public interest, pluralism of ideas and opinions in conditions of impartiality and promote high standards of ethics and professionalism.

PRESENTATION OF THE MODELS OF INTELLECTUAL CAPITAL

In the literature there are presented several models highlight the structure of intellectual capital, the best-known highlight patterns of composition of brainpower is presented in the following order.

THE EDVINSSON MODEL

As a result of the experience of the company Skandia has come to the conclusion that both financial capital and the intellectual part of the market value of a company's intellectual capital is made up of human capital and structural capital, exactly as shown in the following figure.

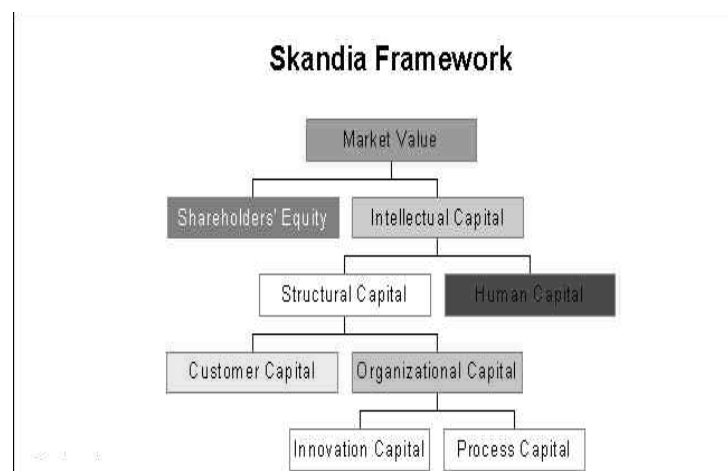

Figure 1 Skandia Framework

(Source: Skandia and adapted from Bontins, 2000)

Given Edvisson's statements, the market value of the company is given the capital and intellectual capital, having the form of presentation:

- ✓ human capital - tacit or explicit knowledge highlighted that people have the ability to generate their knowledge, values, attitudes, skills, know-how, philosophy and culture - useful for the organization's mission;

- ✓ organization capital represented by combining explicit and tacit knowledge, formal and informal structures due to efficiency and effectiveness and develop organizational activity of the

company. It also includes culture (tacit knowledge and informal), structure (formal and explicit knowledge) and organizational learning (renewal of the tacit knowledge and explicit processes, formal and informal);

✓ structural capital includes all the powers and elements of human capital infrastructure support.

SVEIBY'S MODEL

This model of human capital components defined in the internal structure of company management and training methods at the level of the company and the external structure of the company's customers and the individual components, which consists of the education, training and improvement of the individual, as shown in Figure 2.

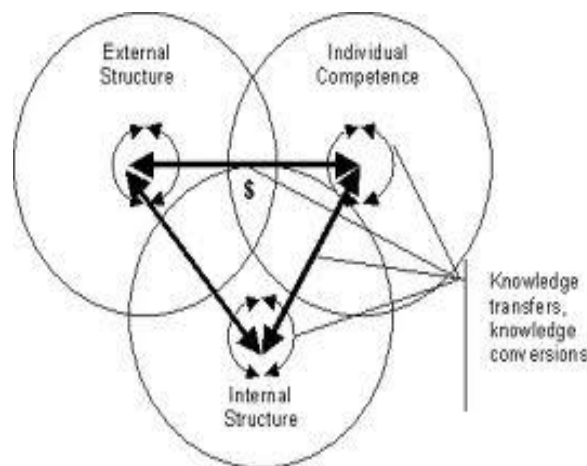

Figure 2 The Sveiby Model

(Source: Sveiby, 1997)

Human capital refers to the talents or powers held training and education, as well as the experience and value characteristics of an organization.

External capital comprises relationships with suppliers, customers and the brand, trademarks and reputation.

Internal capital refers to the knowledge embedded in organizational structures and processes, and includes patents, part of research and development, systems and technology.

THE MODEL IN ACCORDANCE WITH "THE TECHNOLOGY BROOKER'IC"

The model is based on the idea that market assets, intellectual property-based assets, assets based on human resources and specific infrastructure assets are components of intellectual capital, as follows:

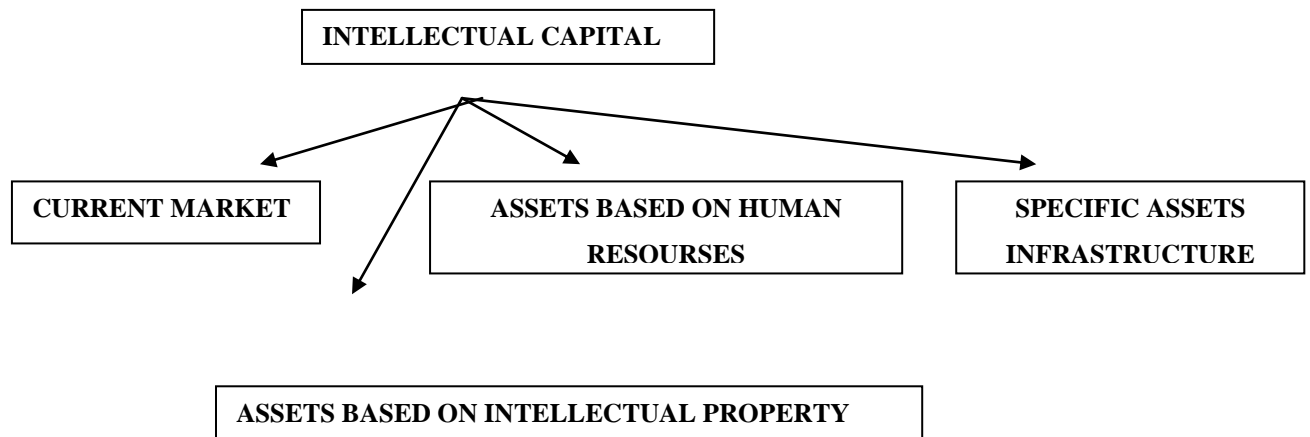

Figure 3 The Model as “The technology broker’IC”

(Source: Data processed by author, 2014)

THE MAGIC (MEASURING AND ACCOUNTING INTELLECTUAL CAPITAL)

This model appeared in the european project MAGIC, which had the goal of developing a methodology for intellectual capital, but also a reliable measurement. According to the model, intellectual capital is made up of: human capital, organisational capital, capital and market capital of innovation, as shown in Figure 4.

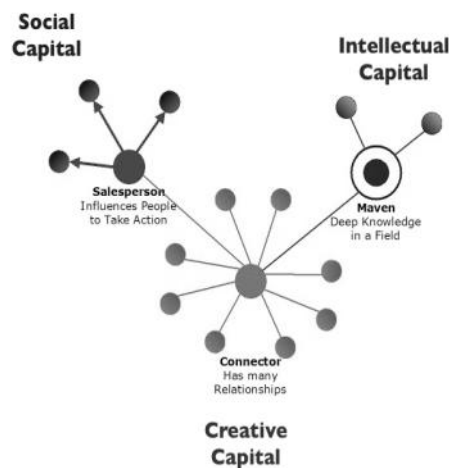

Figure 4: The MAGIC Model

(Source: Harold Jarcho, 2011)

An overview of the perspective of recognizing intellectual capital composition shows that the concept of intellectual capital is often associated with human capital (considered in all 4 models as the main element of intellectual capital). Thus the analysis of the four models we see that we must make an

accurate distinction between the two forms of capital (human and intellectual). Intellectual capital is composed by other elements in addition to human capital (organizational, market or innovation).

Also the models presented reinforce the idea of intellectual capital to be considered a hidden treasure, with the purpose of helping the company to develop technologization society, digitization and hence knowledge.

Of the four models presented show that the conceptual development of intellectual capital was made in two different directions: the first direction turned to the need for growth and development companies, and competitive capacity market, using data from harnessing the benefits of the intangible assets. The second direction is related to the desire to increase corporate success through investment in intellectual capital.

CONCLUSIONS

Due to the fact that we live in a world dominated by intangible services, it is observed that economic resources can be recovered only through intangible investment.

Intellectual capital is a concept somewhat vague and confusing, its boundaries are not well defined, and often interact with the concept of human capital.

In accordance with the entire contents of this article, we demonstrated that intellectual capital is considered an intangible element.

Intellectual capital exposure models presented in this article reinforce the idea that intellectual capital is considered a hidden treasure, with the purpose of helping the company to develop technologization society, digitization implicit knowledge.

Intellectual capital comprises besides the existence of stock or assets, resources and the ability of the organization to transform a resource to another. Pure presence resources can not generate value. Harnessing these resources, especially how to transform a resource to another, are very important and for this reason it is necessary to find a solution for presentation of those resources.

We are in a perpetual stage of redefining and renaming the economy, society, ours as individuals, so physical things do not have the same meaning, with a focus on knowledge. It is important for every company to invest in the creation of intellectual capital, both through human capital by means of training and managers, and by implementing structural capital.

In conclusion, regardless of the benefits that the company provides intellectual capital and the major role it plays can not be included in the financial statements. Remains significant "hidden treasure behind Financial Statements", the currency of the new millennium.

THE ROLE PLAYED BY CITIZEN SERVICE CENTRES IN FACILITATING E-GOVERNMENT DIFFUSION IN GREECE.

Voutinioti, Anastasia

ATEI of Peloponnese, Greece.

ABSTRACT

The aim of this research is to investigate the role of 'Citizen Service Centers' (CSCs) in e-Government adoption in Greece. The ultimate aim is to contribute to the understanding of the role CSCs, third parties, play within the e-Government services' mechanism. This paper by using a case study approach, shows that CSCs improve availability, accessibility and enhance trust, privacy and security issues and could play an major role in bridging the gap between e-Government implementation and demand; and thus adoption and diffusion of e-services in Greece. At the practical level, the research aims to help e-Government policy makers to better plan, design and implement policies and strategies to increase the take up of e-Government services.

Keywords: *e-Government, e-Government adoption, e-Government implementation, intermediaries, Citizen Service Centres (CSCs), e-KEP, Greece.*

1. INTRODUCTION

Governments around the world decided to go online by employing modern information and communication technologies, in order to improve government processes (e-administration), offer e-services, connect citizens (e-citizens and e-services) and build interactions with and within civil society. These e-services are deployed through government portals and different other channels. Among them, third parties or intermediaries are used to provide a direct connection between service providers and their clients. They have become a central issue to leverage the e-government relationship with their stakeholders, government, citizens and businesses (Al-Sobhi et al., 2009). This is particularly significant as most of the existing e-government systems alone fail to resolve the coordination between stakeholders (Heeks, 2003a).

In developed countries a number of studies have been conducted to determine factors that encourage citizens to use e-government services; relatively few researches have been examined these issues in other countries, like Greece (Tambouris et al., 2004; Karavasilis et al., 2010). In addition, research that could promise to explore the role of the intermediaries in the e-Government context is vitally important (Al-Sobhi et al., 2009). Therefore, the understanding of what influences citizens to adopt e-

government services in addition to the role played by the intermediaries, has research value and implications for strategy makers and researchers.

The contribution of this paper is to examine the roles played by intermediaries and the main aim is to investigate their potential value in e-government service delivery. The results of this study should support government agencies in developing a better intermediation and reintermediation strategy that help reducing the gap between e-Government readiness and citizens' ability to adopt the new e-services.

The remainder of this paper is organized as follows: the next section reviews literature on intermediaries and their roles on electronic environment and on e-Government in particular. Section three illustrates the background of e-government in Greece and the roles of Citizen Service Centres in the Greek initiative. In section four, the adopted research methodology is presented. In section five, results are presented and discussed, while section six summarises and discusses the key findings; and finally section seven concludes by outlining implications and recommendations for policy makers.

2. LITERATURE REVIEW

A main principle of the e-government systems is to deliver e-services for different stakeholders, but many times these principles are not met due to barriers, like lack of infrastructure, digital divide, and low trust. Then third party entities can provide citizens a useful access gateway and support for e-government services, especially if they are consolidated alongside information technology (Bailey and Bakos, 1997). These third party entities under different names (Intermediaries, Cyber cafés, or Telecentres) have been widely used for years all over the world (Furuholt and Kristiansen, 2007) and have technology, skills and knowledge on critical government factors that are necessary for successful government-to-citizen (G2C) relationships (Al-Sobhi et al., 2009). They have been mostly termed intermediaries (Heeks, 2002). They consist of a physical space and premises, are equipped with ICT and administrators (officers) to assist citizens with different government agencies (Bailey and Bakos, 1997).

Intermediaries' presence stems from e-commerce; they have been establishing relationships between the service providers and service requesters. Their relationships have been examined and are changeable over time as a result of the environmental and social conditions (Ehrlich and Cash, 1999). Chircu and Kauffman (1999) identify a variety of strategies that appear in the relationship between players that change from intermediation to disintermediation and reintermediation (IDR strategies cycle). Disintermediation means the removal of the physical intermediary from the service delivery channels (Chircu and Kauffman, 1999). With the emergence of Internet applications and the growth of e-business, there was increasing concern that the roles of intermediaries were being eliminated or

subject to disintermediation (Gellman, 1996). Disintermediation cost theory has been criticised by a number of researchers (Chircu and Kauffman, 1999; Bailey and Bakos, 1997). Instead of disintermediation, intermediaries could return (reintermediation), especially if they are “facilitated with information technology” (Bailey and Bakos, 1997). The term reintermediation refers to the emergence of new intermediaries in electronic service environment by re-establishing them in the centre of the e-service transaction process (Chircu and Kauffman, 1999; Bailey and Bakos, 1997); they add value for the service provider and requester in many aspects. Besides facilitating communication between service providers and their customers (Janssen and Kilevink, 2009), they work as a partner for helping a service requester access services provided electronically (Al-Sobhi et al, 2010). In other cases they result in increasing their roles when factors, such as trust may influence their position (Datta and Chatterjee 2008; Bailey and Bakos, 1997).

In e-Government literature an intermediary is an important element in the e-services domain and it may play a key role in helping the stakeholders to engage with new e-Government services. They can help in improving e-government adoption and decrease the challenges that occur; they help increase accessibility of e-services, by offering more points of availability for the public; they support different government agencies in the delivery of e-services, as their tasks involve management of electronic service delivery and operations on related systems; they act as mediators for citizens who require access to e-government services because of the digital divide. In many cases they support the promotion of e-services (Sein, 2009) as well as the training and education needs of citizens, by facilitating the assisted use of technology. In other cases their establishment (Al-Sobhi et al., 2009) was influenced by the difficulty in verifying the identity of stakeholders (e-identification). In summary, the intermediary entity can be conceptualized along several dimensions. Their services can range from simply providing physical access to facilitating use through online and offline service and all the way to activism (Sein, 2009).

Intermediaries can be government organizations or “Civil Society” (Gronlund, 2000) consisting of non-governmental organizations (NGOs) and concerned citizens such as activists and religious voluntary bodies (Wahid et al., 2011), as well as aid organizations (Bailey, 2009). In a few cases, especially in the developing world, these intermediaries, termed mostly internet or cyber cafés, or telecentres, provide help to users in accessing the Internet through services such as trouble shooting, tips etc (Mutula, 2003; James, 2005; Tan, 2007). They may also provide additional services such as fax, digital photos, and some go further and conduct training and education to users and prospective users (Kristiansen et al., 2003).

Beyond the above roles, intermediaries can also take an activist role with the aim of empowering disadvantaged groups; Tan (2007) examined the role of volunteer women organizations in Tanzania

and Madon & Sahay, (2002) the role played by an NGO on behalf of slum dwellers in India. Madon (2000) examined the use of the Internet in sectors such as agriculture, health and education, and derived some conclusions for government intervention, including the important role of intermediary institutions. The DNet project in Bangladesh (Sein and Furuholt, 2009), explicitly uses intermediaries, run by women who use mobile phones. This advances the empowerment of women and also leverages the power of mobile phones that is perhaps the driving force behind the next ICT wave (Heeks, 2008).

In other cases, especially in Africa many internet access points are either set up by organizations such as NGOs or are arranged by organizations (Mukerjee, 2008). In the latter role, these organizations do not set up telecentres or cafes themselves, but provide financial, infrastructural and consulting support to entrepreneurs to do so.

Kantor Pelayanan Terpadu (KPT) One-Stop Services is an example of an organizational intermediary in Indonesia e-Government. Its operators are the contact point with the citizens. Intermediation is indirect with the scope of providing a “packaged” service consisting of online and offline services. This can be described as “Government Intermediary” which provides simpler processes to citizens who need to get certain permits and licences (Sein and Furuholt, 2009).

All over Europe (e.g. Finland, Germany, Spain) there are government organizations that operate one - stop- shops services for the public. In Spain the Offices “060”, run by government organizations support citizens in obtaining information and guidance about the services provided by the public administration. In some of them there is also launching the processing of these public services (UN DESA, 2012).

In other countries UK and Italy, Public Private Partnerships have been established between entrepreneurs and government organizations. In Italy, Reti Amiche initiative adopted with the aim of bringing the public administration closer to the citizen. By utilization of existing in the private sector networks and channels (Post Office, Tobacconists, large-scale retail trade outlets, ATMs, etc.), provide user friendly and easily found access points. More than 70 per cent of these front desks are Lottery, Betting Offices and Tobacconists. They mostly issue documents such as passports, birth, marriage and death certificates and residence permits; and also payment transactions such as social contributions for domestic help, taxes and fines (UN DESA, 2012).

In all cases reported, intermediaries are local and close to citizens to address their particular needs. In addition citizens are also more likely to trust a local intermediary than the government reflecting the general distrust of governments, especially in developing countries (Sein et al., 2008).

While the interaction between a user and an intermediary happens at an individual level, there is also an organization level of intermediation. Recent trends at new public service production and delivery

models, distinguish front offices from back offices. Thus, front offices may materialise as Internet portals, call centres, or physical one-stop-shops, all enabled and assisted by ICTs, while back offices can be located anywhere and their interconnection, collaboration and co-ordination will become more crucial than ever (EIPA, 2003). This new service production and delivery model provides an opportunity for down-sizing and integrating back offices and thus making administration more efficient and streamlined; additionally by developing high quality services with more relational approaches in the front offices, making government more user centric (Millard et al., 2004).

The concept of using a third party to the vision of e-Government highlights the increasing importance of intermediaries – i.e. public partners, private and social in the delivery of public services and in the exercise of democratic governance. Governments will need to better understand the potential of these actors, in order to develop stronger, more innovative and longer term collaborative models and partnerships with them.

3. E-GOVERNMENT IN GREECE

A number of initiatives have been deployed by the Greek government to assist e-Government and ICT adoption and diffusion. These initiatives were driven by European Union (EU) funding, on respective actions through the Community Support Framework (CSF) periods (Hahamis et al., 2005). Since the late 1990s, initiated from the EU funding and guidelines, Greek government has cultivated its web presence by establishing web portals to offer electronic service delivery to their citizens. That period, being in line with the above, the national e-Government modernization agenda included the establishment of the Citizen Service Centers (CSCs -KEP in Greek), the intermediaries, to facilitate government service delivery and seamless interaction to citizens. They have been seen as an initial model of multi-channel strategies for e-Government service delivery.

Nowadays there are 1060 CSCs running under the supervision of Greek municipalities, operate all over the country and mostly work on behalf of citizens as a front-end of government agencies to deliver seamless e-services (Tambouris et al., 2004). Therefore there is an increased convenience for both citizens and businesses in using the CSCs as a multi-service vending facility. So far, they have provided mostly face-to-face contact with citizens and enjoyed their trust (Tambouris et al., 2004). They are gradually being transformed to e-CSCs, following government legislation and technical requirements in terms of security, data protection and electronic transactions.

Although Greek government has invested heavily in e-Government implementation, there have been varying results and delayed outcomes. The empirical findings illustrate that the adoption and diffusion of e-Government in Greece comes second last, in the 27 EU countries (European Commission, 2010).

4. RESEARCH METHODOLOGY

To empirically explore and validate the arguments set out above, a qualitative case study approach was considered suitable (Walsham, 1993). A case study examines a phenomenon in its natural setting, employing multiple methods of data collection to gather information from one or a few entities, e.g. people, groups, or organisations (Yin, 2003). He also argues that the main advantage of semi-structured interviews is the flexibility they offer in understanding events by getting close to it, providing rich primary data and more detailed information. In this research, semi-structured interviews constituted the main data source.

Heraklion city, a large city in population terms in Crete region, Greece was selected in this experiment. The rationale for selecting it is because of its importance in terms of e-Government in Greece. Heraklion launched e-government services in late 1990s and over the last years, the Heraklion e-Government initiative has operated a set of different e-Government projects and it scores high in the e-Government agenda in Greece. For the three last years (2012, 2013 and 2014), Heraklion was announced 'smart21 community' of the world, by Intelligent Community Forum.

As Heraklion initiatives adopted CSCs in 2002, findings of this research will support central and local government in Greece, to develop strategic plans in order to assist the adoption and diffusion of e-government services.

One set of interviews was conducted between November and December 2013, by visiting a large government department at Heraklion. Two high officials were interviewed, using semi-structured interviews, which offered the opportunity to obtain an overview of e-government implementation, as well as the challenges facing e-government. Other set of interviews with the directors of the two CSCs and staff set out to collect data from the CSC organisations were carried out at the same time, by visiting the two CSCs in Heraklion.

5. RESEARCH FINDINGS

Interviews with high e-Government officials identified a number of challenges currently facing the CSCs and e-Government implementation. They mentioned that e-services provided or the e-Government projects overall are not fully implemented yet and only selected services are available online. This has resulted in lack of consistency in promoting the idea of e-Government and it is also having a negative influence on the adoption of e-services into society. Another key challenge highlighted by both interviewees was the integration of different government departments along with infrastructure. They concluded that implementing an efficient e-Government infrastructure is not an easy task and needs funding, time and effort from all government agencies. Employees' scepticism was also mentioned to be one of the important challenges in terms of e-Government services.

Another issue mentioned is technologies themselves are still a problem in recent times. There are still great concerns about the privacy of personal and financial information and security issues in implementing e-Government technologies in combination to low trust in government; security of information flow is highly important in the Greek context, where citizens are less exposed to online services. Thus training people (staff as well as citizens) in the usage of ICTs is a very important issue in the e-Government strategy. Another key issue is e-identification which has not been fully established yet in Greece.

5.1 The roles of CSCs in facilitating e-Government services

To complement the interviews with government officials, interviews were conducted with managers and staff of two CSCs in Heraklion. The focus of CSCs in Heraklion and all over the Country is mainly on connecting government departments with their stakeholders (citizens and businesses). In addition, CSCs' role is to control the transactions flow between different government departments and agencies on behalf of citizens, in both directions. CSCs' well-trained officers were found to assist citizens and business with government services, some of them being accessed through the central Government portal "Ermis" or e-KEP. Both CSC managers argued that there are always people on their premises waiting on line to get serviced for different reasons. Some Heraklion CSCs visitors do not have internet access at all, while others are having difficulties to use internet to obtain e-Government services; others are not happy with new technology gateways, especially minority groups and those with low education. In many cases also citizens need CSCs assistance because of lack of trust, information privacy and security. Interviewees highlighted the role of CSCs, as a third trusted party that take responsibility on behalf of citizens for all transactions. In this respect of providing personal information on transactions, CSCs have an important role as well; to build trust between government and citizens in relation to the e-services. Another very important role found, is that CSCs, having the legal authority, authenticate citizens in e-services that require it. Besides the above, CSCs managers stated that awareness of e-Government services in the Heraklion community is low; and if the citizens were aware of the benefits of e-Government, it would promote the adoption rate of e-Government services.

While mentioning various roles of CSCs, interviewees agreed upon the one of training the citizens to self-use new technologies and government e-services, is essential. However their services are limited to giving support to get services, due to their limited resources, capabilities and time. It has been clearly indicated a positive attitude from CSCs' staff to promote the training of Heraklion citizens in using e-services gateways, but it has not been achieved yet.

6. DISCUSSION AND CONCLUSIONS

Besides the qualitative case study (interviews) with Greek government agencies and managers of

CSCs, literature review was used to explore the above themes. According to Al-Sobhi et al. (2009), the success of e-Government will be influenced by three dimensions: 1) factors influencing implementation; 2) factors influencing adoption and usage by citizens 3) role of intermediaries in bridging any gap between implementation and adoption. Accordingly, if there are difficulties on implementation or impediments on adoption they are mediated by intermediaries.

As this research has discovered, the establishment of CSCs in Greece, mostly through physical presence, have been proven to be partially successful in bridging the gap between e-Government implementation and citizens' adoption of e-services. Even if CSCs are trying to transform to e-CSCs, their webpage (www.e-ker.gov.gr) is underutilized by the public. Furthermore, the results of this investigation show that CSCs' visitors are also influenced by a low level of trust in technology, in Greek central and local government. The enhancement of 'trust' on e-Government by intermediaries has been previously acknowledged in different contexts (UN DESA, 2012).

The interviews indicate that their agencies only provide support on behalf of citizens who apply for services (i.e. workers completing the tasks on behalf of the citizens), by accessing e-KEP and 'Hermis' and other government webpages. Another important finding is that there is no individual training offered to citizens by CSCs in self-using the e-services. Training citizens in the self-usage of e-Government services should be a major role of CSCs, as more e-services are implemented and offered on line and citizens' ICT literacy increases.

The findings of the research are in line with other research undertaken in Saudi Arabia (Al-Sobhi et al., 2009) that takes into account intermediaries. Similar results also have been obtained in research regarding citizens' interaction with electronic services in municipalities, in Attica (Kalogridis, 2007; Karavasilis et al., 2010; Delitheou and Maraki(2010); Voutinioti, 2013). They have found that citizens' interaction with municipal websites is mostly restricted to sourcing of information material rather, than to engaging in interactions or transactions. A few reasons for this attitude revealed in the study include: citizens' concern for the safety of their personal data, low educational level and the complexity of municipal electronic services provided.

7. IMPLICATIONS FOR POLICY MAKERS

Findings contribute to theory by understanding the drivers of e-Government adoption as well as the role of the CSCs. This research has practical implications for practitioners and strategy makers to further enhance delivery of e-services through multi-channel service delivery and the ways in which e-citizens might increase their willingness to interact online.

E-Government websites alone do not influence to e-Government services adoption; different segments of the population have different needs and make contact with government via different channels

(multi-channel delivery). In Greece a great majority of the population is likely to seek help (from CSCs) to interact with government online. Indeed, this study emphasises the very important channel and intermediary (CSC), to assist communication with citizens online and to act as a trusted gateway towards e-services.

Roman and Colle, (2003), pointed out that intermediaries have to change as the environment changes (reintermediation), must go beyond their initiatives and emphasize the importance of community needs assessments. CSCs have to be dynamic, transformational, adopt structure other than their initial and play different roles in the transition process. As CSCs' staff is well ICT trained they should inform visitors about the availability of e-services, using new technology (computers, PDAs, smartphones, laptops); and also they should train visitors in using e-services, while transforming to e-CSCs. By assisting to self-using the new technology waiting lines will be diminished and this model is scalable as adoption rate increases (Al-Shobhi et al, 2009). Their roles in awareness, promotion and training, are very important because they operate at the local level and they are capable of reaching easily the target group. As availability of e- services increases, promote the e-services provided at the Central Government Portal 'Hermis' and strongly promote e-identification offered there. Assist users in starting the authentication procedure and in creating and establishing an electronic locker, so most of regularly used certificates and permits are stored there, being easily accessible when needed. The above should be done along with general promotion of services set up through TV, newspapers, radio, social media etc, in order to promote e-Government benefits. Thus they can gradually be transformed to e-CSCs and the traditional offices have to operate as informational Customer Service Centers, providing mostly information, like the ones in Europe.

Among the different channels, mobile-based technologies hold tremendous promise in developed and in developing countries and in particular in rural areas, and can be expected to play a leading role in multichannel service delivery (UN DESA, 2012). As e-services are gradually been available as m-services too, encourage their use, provide help and assistance with these as well.

Enhance the already established Public Private Partnerships so private operated government authorised partners work in parallel with the municipal CSCs on pay (Post Offices, private new technology companies and voluntary sector). In fact this has already been done in a small scale with the Post Office organization in rural areas and with the accountants for e-tax services. By doing so, they will help in achieving greater access to public services (Klievink & Janssen, 2008). They also refer that experience in the private sector has shown that the creation of a competitive intermediary market will encourage intermediaries to continually improve their services and so contribute to greater take-up of e-enabled public services. Then there will be established a competitive market for intermediaries in public sector delivery too.

The basic assumption in most of the studies (UN DESA, 2012) is that a multichannel service delivery is needed. It is defined as involving the organizational interactions that make up the network, rather than as just a collection of access routes for delivering the service. In multichannel service delivery, all channels should be integrated and coordinated. Front office applications communicate to each other and support the service provision with centrally stored and accessible data. Reports are that the profile of the intermediaries (intelligent intermediaries) who add human skills and knowledge to the presence of ICT, is thus critical for projects that want to reach especially disadvantaged and socially excluded groups (Heeks, 2003b). Public-private partnerships and use of existing private sector channels can help governments to include more citizens in service delivery. Technology alone cannot guarantee that the benefits of multichannel platforms will reach large – and eventually all – parts of the population. Technology needs to be socially and culturally embedded and understood in order to be used effectively to create value. Traditional channels, ideally supported by a robust layer of technology, are still the only option in most parts of the world (UN DESA, 2012). The aforementioned require administrative reforms in most cases and are a matter of policy choice.

EXPATRIATE'S GLOBAL ENTREPRENEURIAL COMPETENCE AND IT'S CROSS-CULTURAL DETERMINANTS

Wang, Christina Yu-Ping¹, Jaw, Bih-Shiaw², Wang, Chen-Yu³

Institute of Human Resource Management, National Sun Yat-sen University, Republic of China

ABSTRACT

Our research attempts to bridge OB and international management (IM) literature by employing competence-based theory to investigate expatriate's entrepreneurial competence from the cross-cultural viewpoint. By making an empirical research using SEM with sample of 230, the results reveal that expatriate's Big-Five personality, cultural intelligence (CQ), and cross-cultural adjustment are the key determinants which constitute expatriate's entrepreneurial competence to strive for expatriate's entrepreneurship in a cross-cultural context..

Keywords: *entrepreneurship, expatriate's entrepreneurial competence, Big-Five personality, cultural intelligence, cross-cultural adjustment.*

INTRODUCTION

Derived from previous cross-cultural literature rooted from international management (IM), MNCs are continuously sending expatriates abroad for international assignments (GMAC, 2007). Positive performance of expatriates' cross-border activities will lead to company's business success. However, expatriate's negative outcomes will cause firm's investment failure, and likely lead to loss of human capital for the organization (Farh et al., 2010). The main reason of expatriate's adverse cross-border performance can be attributed to misunderstand of local culture, and inappropriate interaction with local people (Johnson et al., 2006). Namely, it is inevitable that expatriates have to be capable of adapting different cultures, and reducing ethnocentrism conscious (Caligiuri and Tarique, 2012), which can facilitate their entrepreneurial outcomes in a cross-cultural context.

Contrast to cross-cultural viewpoint, literatures from OB theory also emphasize the importance of individual's personality, such as extraversion, openness to experience, conscientiousness, and emotional stability, which lead to entrepreneurial success (Zhao et al., 2010). However, taken from a competence-based perspective to investigate the cross-cultural phenomenon, individual who works under a diverse cultural environment should not only equipped with entrepreneurial personality, but also need to possess a set of cultural-specific knowledge, skills and capabilities to strive for

entrepreneurial success in terms of interacting successfully with the people who have different cultural backgrounds (Johnson et al., 2006).

Although current research from OB, entrepreneurial theory and cross-cultural literature have emphasized the importance of individual's personal traits and cross-cultural adaptation (Johnson et al., 2006; Lee and Sukoco, 2010) on expatriates' performance abroad, few studies have taken a competence-based perspective to examine how expatriates generate cross-cultural adaptation and initiatives especially under a cross-cultural context. To bridge the research gap in current literature, our study aims to integrate OB and cross-cultural literatures and adopts the competence-based theory to build an integrative framework in quest for critical factors, which shapes expatriate's entrepreneurial competence in order to facilitate their cultural adaptation and entrepreneurship at host.

Accordingly, we find that the combinative effect of expatriate's Big-Five personality, cultural intelligence, and cross-cultural adjustment are critical to facilitate expatriate's initiatives at host. We propose that expatriate's Big-Five personality, CQ and cross-cultural adjustment, jointly enable expatriate's to exert initiatives more efficient both internally and externally in terms of leveraging different resources between and among subsidiaries, local stakeholders, and corporate headquarter (HQ) for entrepreneurial performance.

LITERATURE REVIEW AND THEORETICAL DEVELOPMENT

Expatriate's entrepreneurship

Entrepreneurship is the action of creating new products and process that consist of external, internal and risk-taking initiatives in order to tap into new market opportunities (Lumpkin and Dess, 1996; Birkinshaw and Ridderstrale, 1999). As talent is the critical asset that will bring MNCs entrepreneurial success, expatriate's external, internal and risk-taking initiatives will be the most important capacity for MNCs to execute entrepreneurial activities in the host country. Expatriate's external initiative represents that individuals exploit market opportunity outside the boundaries of corporation (Birkinshaw and Ridderstrale, 1999; Zahra and George, 2002) in order to create new product and services (Drori et al., 2006; McDougall and Oviatt, 2003). In contrast, internal initiative means finding the opportunity within the boundaries of corporation (Birkinshaw and Ridderstrale, 1999). Hence, individual who foresees those non-profit investments or inefficient operations within the whole corporation will proactively take actions to strive for performance outcome (Birkinshaw and Ridderstrale, 1999). In addition, entrepreneurship is also characterized with risk-taking (Covin and Slevin, 1991; Miller, 1983). Individuals with high entrepreneurial orientation will not only create new ideas (Gibson and Dibble, 2008), they will also proactively overcome difficulties and persistently fulfill

the development of those new ideas into execution (Morris et al., 1994). These individuals are keen to adopt necessary behavioral adjustments in a cross-border situation. (Betaman and Crant, 1993)

Expatriate Big-Five personality

The Big-Five personality is defined from a taxonomy of many personal traits (Barrick and Mount, 1993 ; Digman, 1990). Zhao et al. (2010) suggest that conscientiousness and emotional stability are also related to individual's entrepreneurial activities. High conscientiousness people will demonstrate hardworking and be achievement-oriented (Ciavarella et al., 2004) in order to take challenges and encourage themselves to take calculated risks in the host environment. While taking high risk activities in the host country, individual can feel more psychological stress and experience negative emotions. Therefore, expatriate's emotional stability is important to encourage individual to persist his current task and to endure complications in the host environment.

Zhao et al., (2010) also propose that entrepreneurial function of seeking new opportunity is related to individual's creativities and openness to new ideas (Ciavarella et al., 2004; Morrison, 1997). Hence expatriates with high openness to experience are likely to take challenges, remain curious to learn how to interact with local counterparts, and act more sociable in maintaining cooperative relationships in order to seek for external and internal initiatives in host context.

Expatriate's cultural intelligence and cross-cultural adjustment

In order to deal with these cross-cultural issues, not only personality is important to influence expatriates' entrepreneurial spirit (Thomas and Mueller, 2000), individual's cultural intelligence (CQ) and cross-cultural adjustment (Johnson et al., 2006) are key variables of expatriate's entrepreneurial competence.

Earley and Ang (2003) define that CQ is a capability for people to effectively deal with cultural diversity, which is a set of cross-cultural competence that consists of cognitive, motivation and behavioral elements (Johnson et al., 2006; Earley, 2002). Cognitive CQ represents knowing *specific cultural knowledge*, and the ability to develop *strategic thinking* in a cross-cultural context (Earley et al., 2006). CQ is the capability that enables individual to discover subtle nuances that guide them in their cultural adaptation and adjustment (Earley et al., 2006).

Additionally, CQ emphasizes not only knowledge, but also personal motivation which enables individual to sustain difficulties and challenges when they encounter cultural shock (Earley et al., 2006). Lastly, behavioral CQ represents individual's ability to observe, recognize, or adapt to local behavior appropriately in the intercultural environment and discover specific cultural signals from local people and adapt themselves to adjust with people in a cross-cultural situation (Earley et al., 2006).

Alternatively, cross-cultural adjustment enhances expatriate's happiness and satisfaction at host, and enable them to adapt themselves to appreciate local culture (Searle and Ward, 1990; Aycan, 1997; Peltokorpi, 2008). Hence we consider cross-cultural adjustment is the competence that characterized with expatriate's *work adjustment* (including responsibility, performance and work effectiveness), *life adjustment* (the adaptation to local food, shopping, satisfaction with local life), and *cultural adjustment* (the adaptation to local norm, culture and interaction with local people). These abilities will improve expatriate's entrepreneurial performance at host environment.

Cross-cultural adjustment allows expatriates to conduct behavioral adjustment at host. This will aid to reduce uncertainties at work and non-work environment (Aycan, 1997; Briody and Chrisman, 1991; Feldman and Bolino, 1999). Well-adjusted expatriate knows how to learn right behavior on the job from their colleagues. Additionally, expatriates who actively interact with local people, or are fascinated with host social life (Caligiuri and Lazarova, 2002) will help them to establish good relationships and behave appropriately in the cross-cultural context.

Towards a framework of expatriate's entrepreneurial competence in cross-cultural context

Derived from the OB literature and competence-based theory, expatriates' cultural cognition, cultural motivation and their behavioral adaptation to meet with local culture (Ang et al., 2006; Earley et al., 2006) are viewed as learning-driven competences (CQ and cross-cultural adjustment). However, expatriate's inherent personality will spur the combinative effects with expatriate's CQ and cross-cultural adjustment at host. Ang et al., (2006) propose that expatriates who possess positive personal traits are more curious about and likely to take new ideas into account in their strategic thinking; which enables developing broad-minded cognitive, possessing self-efficacy and self-confidence to bring them motivation and full of energy to establish a good relationship with stakeholders (Leiba-O'Sullivan, 1999). Additionally, these individuals are cooperative and trustful to interact with host people (Mendenhall and Oddou, 1985), and are conscientious with their local tasks even when they encounter obstacles and problems (Ones and Viswesvaran, 1997).

As presented in the above literature, it reveals that the combinative effects of expatriate's inherent personality, CQ, and cross-cultural adjustment strive for expatriate's entrepreneurial initiatives in the host environment. We emphasize that expatriate's personality, CQ, and cross-cultural adjustment constitute **expatriate's entrepreneurial competence**, which can effectively facilitate their entrepreneurial initiatives in a cross-cultural context. Hence, we hypothesize:

H1: Expatriate's entrepreneurial competence (Big-Five personality, CQ, and cross-cultural adjustment) has positive effect on entrepreneurship

METHOD

Sample

Survey questionnaires are administrated to MNCs in Taiwan and China covering manufacturing (25.2%), service (25.7%), electronic and information technology (25.2%), trading (8.3%) and financial industries (4.3%). Eliminating those non-reply and incomplete questionnaires, valid survey amounts for 230 (The validity rate equals to 88%; the effective response rate equals to 23%). Survey items are distributed by post and e-mail to those expatriates originated from Taiwan (n=190) and other nationalities (n=40); 36.5% of our sample are assigned to China, 14.8% to North America, 27.3% to Asian countries, 11.7% to Taiwan, and 4.8% to European countries. The demographics of our sample consist of 55.2% male, 59.6% married. Surveyed expatriates' age range from 20 to 65 years old, the majority age group falls between 31-40 (50.9%).

We adopt SEM to conduct confirmatory factor analysis to define dimensions of variables used in current research framework (Personality (Zhao & Seibert, 2006; Ang et al., 2006; and Huang et al., 2005). Cultural intelligence (Earley & Mosakowski 2004; Earley & Ang, 2003). Cross-cultural adjustment (Black et al., 1989; Huang et al., 2005). Entrepreneurship (Birkinshaw & Ridderstrale, 1999; McDougall & Oviatt, 2000; Morris et al., 1994).

ANALYSIS AND RESULT

Harmon's one factor test

Harman's single factor is used to examine the potential CMV issues by using exploratory factor analysis. We put all the survey items together using a principle component analysis and varimax rotation method to examine the potential CMV problem (Harmon, 1967). As the result, the first factor accounted for only 23.38 percent of the variance. This reveals that the relationships among the variables used in this study have no systematic variance with our measurements.

Structure equation model

.SEM is adopted to test the casual effect between expatriate's entrepreneurial competence and entrepreneurship. The model fit is reasonable which demonstrated as follow: $\chi^2/df = 2.866$, $P = 0.003$, $RMR = 0.008$, $GFI = 0.970$, $CFI = 0.975$, $RMSEA = 0.090$. We confirm that expatriate's entrepreneurial competence (including expatriate's Big-Five personality, CQ and cross-cultural adjustment) has positive effect on entrepreneurship (internal initiative, external initiative, and risk-taking innovation initiative) (expatriate's entrepreneurial competence \rightarrow entrepreneurship, $\beta = 0.861^{***}$, $p < 0.001$, figure 1).

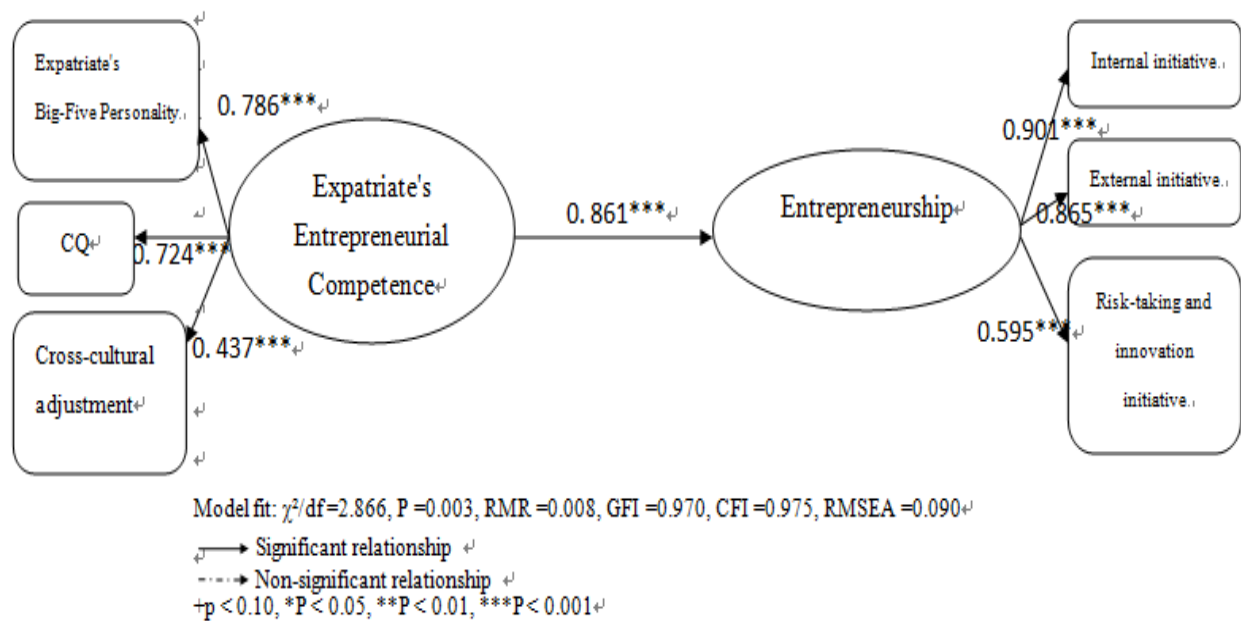

Figure 1

CONCLUSION

Rooted from competence-based theory, this paper portrays expatriate's entrepreneurial competence and its antecedents (namely Big-Five, CQ and cross-cultural adjustment) in a cross-cultural context. We bridge OB literature to make contribution in competence-based theory by investigating and testifying the antecedents of expatriate's entrepreneurial competence when working under a foreign context. Doing so allows us to **integrate CQ, cross-cultural adjustment, expatriate's Big-Five personality and operationalize these three variables to deploy the concept of "entrepreneurial competence"**, seeking to unlock the antecedents that enable expatriates in their cross-border entrepreneurial successes on foreign assignments. We utilized competence-based theory to unfold the essence of assignment success for expatriates as our attempt to intercept IHRM literature and international management (IM) literature to make contribution in theory development.

In terms of managerial implications, past studies confirmed the prediction of individual traits to entrepreneurial outcomes (Zhao et al., 2010; Ciavarella et al., 2004). Zhao et al. (2010) suggest that conscientiousness and emotional stability are related to individual's entrepreneurial activities. High conscientiousness people will demonstrate hardworking and are achievement-oriented (Ciavarella et al., 2004) when undertaking foreign assignments. Such personal traits encourage expatriates to take challenges and calculated risks in a cross-cultural context.

On the other hand, institutional factors such as cultural distance, political distance, geographic distance, and economic distance are likely to create hurdles for expatriates in their entrepreneurial performance at host (Ghemawat, 2001). Despite that previous literatures verify the essentialness of

personal traits to expatriate's entrepreneurial success, it is also noted that expatriate's knowledge, skill, and ability reinforce and facilitate expatriate's local understandings, which in turn help them think strategically in cultural situations. (Earley & Mosakowski, 2004; Earley, Ang & Tan, 2006). Thus, expatriate's entrepreneurial competence enables expatriate to detect appropriately behavioral roles (Earley & Ang, 2003) and make accurate decisions in cross-cultural context. (Earley et al., 2006). These capabilities help expatriate overcome performance hurdles, such as liability of foreignness and cultural distances. In fact, recent study has also shown that CQ inevitably reduces expatriates' anxiety, while positively fortify their communication ability and job satisfaction abroad (Bucker, Furrer, Poutsma & Buyens, 2014); Cross-cultural adjustment has also been proved as a crucial ability to enhance expatriate's initiated performance and job satisfaction at host (Nolan & Morley, 2014).

To a greater extent, this study makes contribution by conceptualizing the essence of entrepreneurial competence constituted Big-Five personality, CQ, and cross-cultural adjustment. Our research bridges OB literature with IM research to shed light on expatriates' cross-border competence for their work-life adaptation at host. It is also insightful to MNCs in their international talent management by means of offering an exceptional standard of selection criteria and human resource practices in grooming and developing potential talents for MNCs' entrepreneurial performance. Further research in empirical analysis with larger sample size is encouraged to illuminate theory development in the future.

CSR DEVELOPMENT OPPORTUNITIES: MARKETING CULTURE PERSPECTIVE

Žostautienė, Daiva; Susnienė, Dalia

Panevėžys Faculty of Technologies and Business, Kaunas University of Technology

ABSTRACT

Purpose – The purpose of this study is to scientifically ground theoretical insights on development opportunities of corporate social responsibility taking into account marketing culture perspective and to develop methodological provisions enabling empirical research.

Design/methodology/approach – The study is based on general scientific investigation research methods, i.e. systematic approach for scientific literature analysis on social responsibility and marketing culture issues in order to clarify the development opportunities of social responsibility in a company from marketing culture perspective, and to prepare the theoretical framework for the integration of cultural aspects in the research of social responsibility.

Findings – Theoretical studies and insights revealed beneficial social responsibility development opportunities in a company from marketing culture approach.

Originality/value – There is no debate on corporate social responsibility as a phenomenon and its relevance for development of stakeholder perspective, however, more active manifestation of social responsibility in companies is still an issue, especially focusing on customers, suppliers, competitors and employees. Namely this emphasises interdisciplinary and multidimensionality of the topic, as the above named stakeholders are especially relevant to marketing as market actors, and employees as internal marketing actors, whereas acceptance / non-acceptance of changes in the organization is an integral part of the organization's culture. By employing such triple construct approach, corporate social responsibility development opportunities were set forward.

Keywords: *corporate sustainability, social responsibility, corporate culture, marketing culture.*

INTRODUCTION

The importance of corporate social responsibility for sustainable development isn't negotiable, but the implementation of it into corporate activity is often faced with the problems. Undoubtedly business and marketing can become more sustainable from the perspective of people, planet and profit. However, for many marketers the pursuit of sustainability takes them into uncharted territory, and confronts them with many new and difficult questions. What are the benefits of incorporating social, ethical and environmental issues into day-to-day decisions making? How can business identify and make the most of the opportunities arising from the new agenda? How can companies address these issues without being accused of 'bandwagon jumping' or superficial responses? These are just some of the difficult and complex questions being asked (Charter et al., 2002). Striving for sustainability often implies reconsideration of conventional management and marketing principals, of stakeholder relationships, of clearer accountability and openness, and higher levels of innovation and co-operation.

Scientists agree that corporate social responsibility can give a competitive advantage for the organization, but at the same time its implementation meets with the difficulties as it requires the limited resources such as time, human resources, financial resources (Mazurkiewicz, Crown, Bartelli, 2005; Perrini, Pogutz, Tencati, 2006; Jenkins, 2006; Hakala, 2012). The distribution of these resources a lot of depends on the cultural environment of the organization. Different organizational culture types can dominate in companies from different industries and countries nevertheless companies should reflect new sustainability challenges in this millennium by re-examining the social and environmental impacts of their marketing strategies. This means re-evaluating their product and service portfolios, as well as the way these products and services are created, produced and marketed. However, this can be a complex challenge for marketers as it comprises company performance influence on stakeholders taking into account raw materials in the initial stage of production and finalizing with the influence long after the disposal of it. In this way marketers will feel that traditional frame of their activity has much expended.

The aim of this paper is to identify the opportunities of corporate social responsibility development within the organization through the corporate marketing culture perspective. The study is based on general scientific investigation research methods, i.e. systematic approach for scientific literature analysis on social responsibility and marketing culture issues in order to clarify the development opportunities of social responsibility in a company from marketing culture perspective, and to prepare the research methodology as well as theoretical assumptions for the research.

CSR AS CORPORATE AND MARKETING CULTURE FOR SUPERIOR PERFORMANCE

The role of marketing in the achievement of superior performance by virtue of sustainability and responsibility practices is explained by the existing literature (Drongelen, Nixon, & Pearson, 2000). Bronn and Vironi (2001) recommend that marketers should apply the triple bottom line theory to build reputation, while Ratnayake and Liyanage (2009) indicate that management practitioners should move away from a one-dimensional financial perspective of business relationships to a holistic view of societal relationships for incorporating sustainability into the culture of the organization (fig. 1).

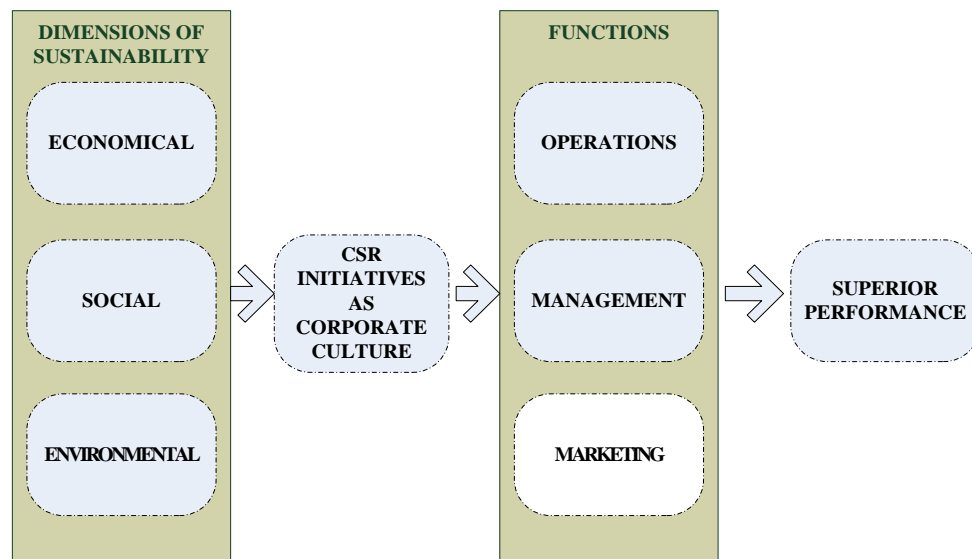

Figure 8. Linking sustainability, functions and performance (adapted from Gupta, Kumar, 2013).

Elkington (1998) used the triple bottom line theory to recommend sustainability as a cultural revolution for organisations, based on seven initiatives that can be detailed as follows:

- (1) markets should be driven by competition, i.e. the old market paradigm considers them to be compliant but the new paradigm of driving sustainability as a corporate culture highlights that they should be considered as competitive;
- (2) to drive the corporate culture of sustainability, managers should change their consideration of corporate value from hard to soft, i.e. pay greater attention to human values;
- (3) companies should become more open and transparent in their operations contrary to the traditional closed way of operation to demonstrate their thinking, priorities and commitments through activities;
- (4) the technology life-cycle should be related to the efficiency of the function it performs during its life-cycle rather than considering it as a product;

- (5) business partnerships should be seen as symbiotic instead of subversive and competitors should be seen as cooperating with each other through a relationship for a common cause;
- (6) time in business should be considered as longer rather than wider with philosophies such as just-in-time to expand horizons and encourage creativity;

The above discussed thoughts imply that corporate governance should become inclusive rather than exclusive by its design and value chain if an organization wants to change the corporate culture towards adoption of sustainability practices for converting its sustainability-driven actions into socially responsible initiatives.

SIGNIFICANCE OF CORPORATE CULTURE FOR CSR DEVELOPMENT

Managers find corporate culture important in organizations because it provides a non-mechanistic, flexible and imaginative approach to understanding how organizations work (Wilson, 1992). Kotter, Heskett (1992) found that culture significantly influenced organizational performance when it either helped the organization to anticipate or adapt to environmental change or interfered with its adaptation. It also serves as the social glue that holds the organization together by providing appropriate standards guiding employees' behaviour (Robbins, 1996). Werner (2007: 28) summarises the functions of organizational culture as follows: it creates an organization identity that distinguishes one organization from another; it gives organizational members a sense of identity; identifying with the organization creates greater commitment to organizational goals and objectives; guides employees in terms of acceptable behaviours and attitudes, especially when they have to make decisions and solve problems; creates social systems stability with its associated emotional security; and serves as a yardstick for evaluating and correcting deviant behaviours and for rewarding desired behaviours.

Culture differs in organizations; hence Harrison (1993: 11) also describes organizational culture as the "distinctive constellation of beliefs, values, work styles, and relationships that distinguish one organization from another". In other words, organizational culture includes those qualities of the organization that give it a particular climate or feel. These definitions suggest that organizational culture distinguishes one organization from another organization. Therefore, organizational culture is to an organization what personality is to an individual (Ledimo, 2013).

Culture is articulated in the organization, in order to shape the way in which organizational members should behave. However, these patterns of values, norms, beliefs, attitudes, principles and assumptions may be unwritten or non-verbalised behaviour that describe the way in which things get done; to give the organization its unique character (Brown 1998; Arnold 2005).

Übüs, Ü., Alas, R. (2009) conducted an empirical study in 2007-2008 about four different culture types and eight different countries - Estonia, China, Japan, Russian, Czech, Finnish, German and Slovakian .

They made the implications – there is connection between organizational culture and corporate social responsibility. Three organizational culture types – clan, hierarchy and adhocracy predict corporate social responsibility. One organizational culture type – market predicts one facet of corporate social responsibility – the firm performance concerning social issues. This denotes that managers in the organizations with dominating market culture should take the interests of all agents - customers, subcontract firms, consumers, stock holders, employees, trade unions, public administrations and local communities into account.

Corporate culture has significant influence to its employees as it helps to create an internal climate that promotes the self-control and consistency of behaviour, enables the staff to better understand the expectations of the organization towards them, encourages to transform the everyday routine into valuable and important actions and connects the organization with values that are important to the society. Schein (1984) notes that values describe what ought to be, rather than what is. Values therefore have a motivational or aspirational role in organization.

EMPLOYEE INVOLVEMENT IN CORPORATE CULTURE

Corporate culture and its capabilities become resources for the competitive advantage and employee perceptions of CSR activities play an important role in employee attachment to their organization as well as corporate performance (E.M. Lee et al., 2013). Strategically involving sustainability in the culture of the organization through processes can be achieved by creating a workplace wherein employees feel safe to express themselves and share information and their personal ideas about the influence of organization actions on its eco friendliness (Galbraith et al., 2002). An ethos of open communication can make employees feel that they are part of an organization's initiative and encourage them to contribute to the mission of their organizations, which is to become a socially responsible business (Smith, 2010). Such open communications motivate every individual involved with the organisation to express his/her opinion and drive its socially responsible initiatives towards success (Bernaur & Caduff, 2004).

Organizational culture is crucial in understanding employee behaviour and involving them to create it. Literature review indicates that organizational culture has a strong influence on employees' behaviour and attitudes (Arnold 2005; Martins & Martins 2009; Werner 2007). It involves standards, beliefs and norms that prescribe how employees should behave (Robbins 1996). Thus, it is essential for organizations to assess organizational culture in order to develop strategies to address aspects of organizational culture affecting employee behaviour negatively and to leverage on the positive aspects.

This emphasis on current organizational culture compels organization to develop reactive human resource management interventions to address aspects of culture negatively perceived by employees. This limits organizations from engaging employees further to determine their preferred organizational culture. An investigation or assessment of employees' current and preferred organizational helps to identify gaps and helps to adopt a proactive approach in culture development and change using relevant human resource management strategies.

MARKETING CULTURE AS A PART OF ORGANIZATIONAL CULTURE

Marketing, in theory and practice, refers to the market activities of an organization, with the intent to reap economic and social advantages. These activities are influenced by organizational culture. According to Cameron and Quinn (1998), culture defines the core values, assumptions, interpretations and approaches that characterise an organization. Consequently, marketing culture is not only influenced by organizational culture but may also be considered a component of it. Deshpande and Webster (1989) have identified few conceptual studies, which relate organizational culture to marketing.

Organizational culture reveals the internal behaviour of the organization, whereas the marketing culture, as an element of organizational culture, encompasses internal behaviour and relationships with the environment, because the very purpose of marketing reflects the environment orientation, i.e., focus to customer, while seeking for objectives beneficial for the organization.

Several different definitions of marketing culture or market-oriented culture are found in the literature, where the most important of which are those of Webster (1995), Narver and Slater (1990) and Deshpande, Farley and Webster (1993). Webster (1995) views marketing culture as unwritten organization policy and rules, which describe the behavioural norms of organizational members, or as the reflection of the importance of the marketing function in all spheres of organization activity, or, further still, as the means, by which marketing activities are implemented in the organization. Webster (1993) asserts that an organization's marketing culture may be verified by means of measurements of service quality, interpersonal relations, sales-orientation, organization, internal communication and innovativeness. Similarly, Narver and Slater (1990) have developed and empirically tested a model of market-oriented culture, based on orientation toward the consumer, competition and functional inter coordination. In presenting market orientation as a characteristic of organizational culture, Narver and Slater (1990) define market orientation as a very important organizational culture trait, by means of which companies most effectively provide added value to the consumer and strengthen their market position. Marketing culture is defined as a component of organizational culture, comprised of a set of the dominant values, norms, means and behaviour, which characterizes the individuality of the

organization through its interaction with market actors. According to E.H.Schein (1992), values can be defined as a concept of the aim, either explicit or implicit, that is inherent to an individual or group and that affects the choice subject to prevailing customs, method and outcome of actions. Norms (rules) differ from values by a higher degree of specificity and association with certain behaviour. In an organization, values constitute the grounds for the development of specific behavioural norms (rules). Norms (rules) are set for expected behaviours or their outcomes, which are at least in part common to the social group. Means include accounts, agreements, rituals and language, which are created within an organization and have a strong meaning that is characteristic to symbols (Schein, 1992). Behaviours refer to organization's models of behaviour.

ELEMENTS OF MARKETING CULTURE AS THE PRECONDITIONS FOR CSR DEVELOPMENT

The implementation of the changes in the organizations a lot of depends on the dominating culture and it's expression. One of the key forms of culture expression refers to *values* (fig. 2). Values manifesting in marketing activities of the organization comprise the fundament of marketing culture. Values may serve as some of the main connecting chains in a certain group of people, although the values of the group members do not always coincide; however, from the organization perspective, values are important in that they direct the staff for common activity. Values are generally analysed from the individual and societal points of view. Social values refer to things considered important and significant by the society; however, these values may vary from one society to another. Individuals, based on their values 'what should be', reflecting the values common to the society and humanity (Jucevičienė, 1996, p. 47), judge what is good and what is bad. Values strongly influence the priorities of employees, decisions being made and behaviours in the organization and it is, therefore, useful to evaluate the influence of values to organizational culture. The more members of the organization acknowledge one or another value (aggregate of values), the lesser is the occurrence of conflicts in an organization. The following values of marketing culture: open communication and employee responsibility are very important strengthening the market orientation and sustainability of the organization. Companies upholding open communication as the key value of marketing culture have a strong marketing culture, because information is spread in the entire organization instead of being kept the responsibility of marketing managers. Employee responsibility as a value of marketing culture enables decentralized making of decisions, thus making the influence of authority and hierarchical levels less important and facilitating the market orientation processes (Vranesevic et al. 2002). According to Strautmanis (2007), social responsibility should be a part of organizational culture.

Development of social responsibility is a change in values orientation, whose task is shaping the attitudes, transformation of the personal position so that it matches individual and public interests.

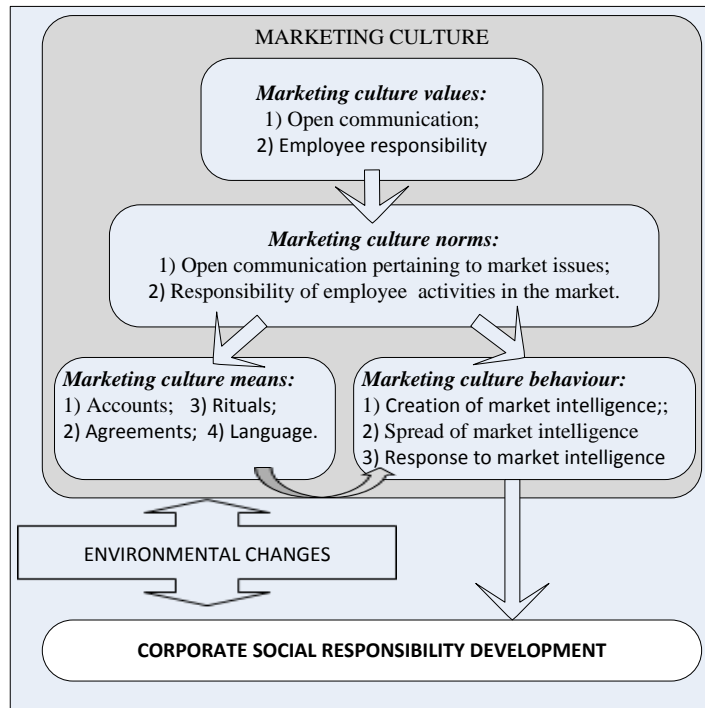

Figure 9. Elements of marketing culture as the preconditions for CSR development.

Norms (rules) form in the society and lesser groups of people as a certain desired behaviour directing or even committing to behave in line with the norms (rules) accepted within the group. In marketing culture, norms (rules) can be revealed based on values, while showing the forms and ways of norm expression in marketing. A norm is a kind of idea that exists in the minds of group members and requires for appropriate behaviour (Schein, 1992). Norms form a special code of conduct for a specific group and indicate the behaviours determining the activities of group members (Homburg, Pflesser, 2000). In order to function, norms have to be accepted by the group members. According to Juščius and Snieska (2008) only the organizations, which aim to save all universally accepted ethical standards of social behaviour, can expect a positive attitude and support in the society. Moreover, helping to solve social and ecological problems, they get competitive advantages and ensure their successful work in future.

Marketing culture means, such as accounts, agreements, rituals and language, represent the more visible stratum of culture with verbal, behavioural or physical components (Homburg, Pflesser, 2000). Marketing culture means is the most analysed stratum of marketing culture, though we have to understand that marketing culture means include more than just, for example, information systems

(Jaworski, Kohli, 1993; Kohli, Jaworski, 1990), and encompass the entirety of physical and verbal means used in marketing. Accounts may be related to conversations of employees about other colleagues, whose behaviour is a great example of social oriented behaviour. Accounts motivate the staff and impel them to commit to the organization. An example of social oriented agreement which can become the Ritual could include social events, for example, meetings with manufacturers of green goods or regular awards for social oriented staff members. Language may also specify the level of market and social orientation. For example, social oriented discussions (as opposite to the discussions only about organization's internal problems) during the meetings show a higher level of social orientation.

Behaviors of marketing culture. Based on literature on organizational behaviour and marketing as well as the scientific insights referred to above, components distinguished by A.K.Kohli and B.J.Jaworski (1990) are used when examining the market-oriented behaviours:

- 1) Creation of market intelligence;
- 2) Spreading of market intelligence;
- 3) Responding to market intelligence.

Intelligence is perceived as the ability to correctly anticipate, basing upon the necessary information and individual or organization (organizational) culture. Creation of market intelligence occurs through the alignment of activities of separate divisions, organization of joint meetings and product improvement in line with the customer needs. When creating the marketing intelligence, it is important that product improvement should be carried out not only in line with customer needs but evaluating social responsibility, offering friendly environment products.

The spreading of market intelligence is conducted by disseminating the information about the customer product priorities and essential changes in business within the organization and to the general public. This dimension of marketing culture is assessed subject to whether the information about product priorities of customers and changes in the company. Dissemination of information within the organization should not be protracted and the information about the fulfilment of customer needs, social projects should reach all employees of the organization.

A. McWilliams and D. Siegel (2001) notes, that organization, which is complying with the laws, cannot yet be called socially responsible. Responding to market intelligence is carried out through the meetings with the customers and customer opinion surveys, evaluations of changes in the environment and response to them as well as the attempts made to meet the customer needs, educating customer and society.

Marketing culture through its elements presented above helps to attain economic and non-economic benefits and affects the organization performance as social responsible organization. It also helps to

build an exceptional and long-term competitive advantage, because it is not difficult to copy the products and presentation specifics of competitors; however, the development of social oriented culture is a lengthy process and is not easily achievable.

MARKETING OPPORTUNITIES IN THE DEVELOPMENT OF CSR

Sustainability and responsibility, when practiced as value of an organisation's culture, develops new marketing opportunities for managers (Teece & Pisano, 1994). Marketing culture is, thus, an element of organizational culture, which manifests itself through relationships between the organization and other market actors. Market actors are consumers, partners, government institutions, competitors and other companies, which have ties to the organization. Based on the above, it may be assumed that marketing culture will manifest itself through organization marketing activities (interaction with the environment) or through internal marketing activities. Practices of sustainability enable marketers to communicate about the orientation of their organization's values and beliefs towards not only satisfying the needs of customers but also towards improving the life of its stakeholders as the organization's prime objective (Menon & Menon, 1997). It enables marketers to create a differentiation by communicating the organization's social responsibility initiatives, such as using environmentally friendly material for packaging the products, or reducing carbon footprints by minimising the use of paper by avoiding hard copy mailing and instead communicating electronically (Shrivastava, 1995). Designing target-based campaigns leads to reduction of the waste produced as a result of promotional campaigns (Frame & Newton, 2007). Marketing initiatives, such as creating awareness about the benefits of sustainable products or services can position the organization above competitors and enable it to enjoy a better reputation (Menon & Menon, 1997). Such initiatives act as a stimulus for customers to buy green products and improve the long term viability of the business by helping organizations to leverage on its socially responsible innovations for economic, social and environmental dividends (Boulatoff & Boyer, 2009). Sustainability-based green initiatives of a organization when acknowledged by entities operating both internally and externally to the organisation influence the organization's reputation and become its identity over a period of time (Rodrigues & Child, 2008) (fig. 3).

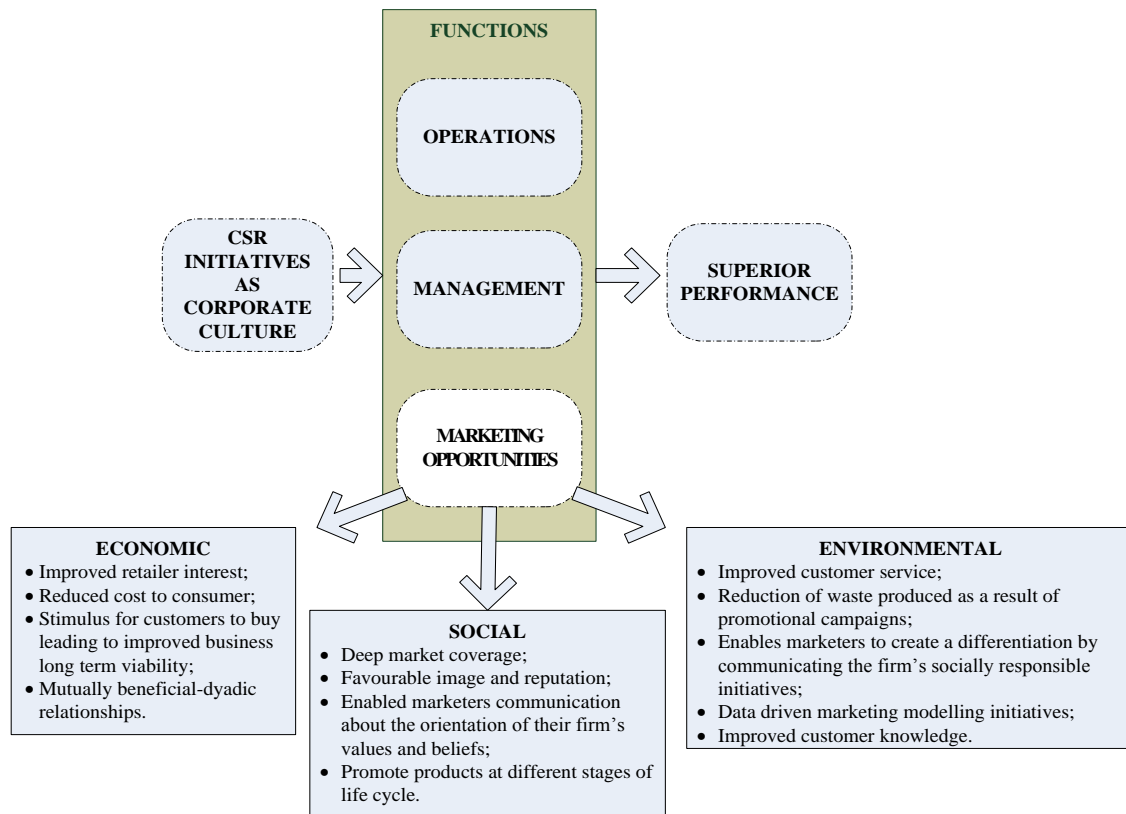

Figure 10. Marketing opportunities from sustainability dimensions.

Introduction of sustainability dimensions through its elements (presented above) helps to attain economic and non-economic benefits and affects the company performance: sales volumes, profit and success in selling new products. It also helps to build an exceptional and long-term competitive advantage, because it is not difficult to copy the products and their presentation peculiarities of competitors; however, the development of customer-oriented culture is a lengthy process and is not easily achievable.

The role of marketing in reacting to sustainability issues will be different among companies depending on their industry, size, corporate / marketing culture and whether the style of marketing they follow is classically focused towards customer, technology (product) or communications.

Marketing activity and implementation in different surroundings necessitate a detailed analysis of these activities, and their integration into a given economic, social and cultural environment is not an easy task as the same actions of marketing are interpreted differently in different cultural surroundings. Therefore, organizations have to take into account cultural differences when defining their CSR policies and communicating to stakeholders in different countries (Bird, Smucker, 2007).

Often, for commercial purposes, organization leaders and owners make decisions that are inconsistent with the intrinsic principles of social responsibility. However, in pursue of sustainable development, different company activities as well as marketing culture aspects cannot contradict the principles of

social responsibility. Rather, the ideas must complement each other and become cohesive interrelated. Marketing culture values and norms should be reflected in the social responsibility ideas. Organizations allocate funds for social projects, but often treat that as one of marketing tools instead of equivalent partnership and systematic cooperation with the stakeholders. Therefore, the need to look for the organization's opportunities in the implementation of social responsibility principles, one of the possible solutions is the development of socially responsible marketing culture by incorporating it into unified company strategy.

CONCLUDING REMARKS AND DISCUSSION

This paper has created a research agenda for sustainability issues regarding CSR development opportunities from marketing culture perspective in the business domain. Since corporate sustainability and social responsibility research highlights new challenges and opportunities for businesses, the research focused on the company's ability to practice socially responsible initiatives from corporate and marketing culture perspective and create new opportunities for operations, management and marketing.

In companies where the decision to pursue sustainability is based more on corporate values or broader issues of CSR, marketers may be handed a mandate to pursue sustainability through the revision and re-alignment of corporate strategy. Therefore, corporate strategy, culture and governance should reflect sustainability practices and socially responsible initiatives in its design and value chain. Such implemented practices and initiatives offer diverse benefits, i.e. organization identity that distinguish it from the others; a sense of identity for organizational members; greater commitment to organizational goals and objectives; acceptable behaviours and attitudes of employees in making decisions and solving problems; and stability of social systems. Stability could be achieved through the corporate culture as it has significant influence upon its employees. Their perceptions of CSR activities play an important role in affection towards their organization as well as corporate performance. Organizational culture is crucial in understanding employee behaviour and their involvement in the creation of it. Marketing culture, as an element of organizational culture, encompasses external behaviour and relationships with the environment, as the very purpose of marketing reflects the environment orientation, i.e., focus on customer with the intention to seek beneficial objectives for the organization. Therefore, this research emphasises communication as a very important aspect of marketing culture within a CSR framework contributing to the responsible decision-making. Companies supporting open communication as the key value of marketing culture have a strong marketing culture, because information circulates in the entire organization and becomes not only the responsibility of marketing managers. Employee responsibility as a value of

marketing culture enables decentralized decision process, thus making the influence of authority and hierarchical levels less important and facilitating the market orientation processes.

Further research should aim to find the relationships between organizational/marketing culture and corporate social responsibility. Organizational and marketing culture changes over time and possible consequences on corporate social responsibility should be studied.

BOOK OF CONFERENCE ABSTRACTS

NEW ROLES AND TRADITIONAL EXPECTATIONS – ACADEMIC LEADERS IN EIGHT EUROPEAN COUNTRIES

Aarrevaara, Timo

University of Helsinki, Finland

ABSTRACT

The structural changes in public organisations have resulted in a development path which requires staff with a leadership role to carry out the reforms. This has been reflected in Finland within its universities, which transferred from direct government control from the beginning of 2010. At the same time, it has led to a contradictory entrepreneurial culture and bureaucratic processes in university decision making and operations. This is because the universities are still largely government-funded organisations with a financial system in which academics are subjected to market forces and competitive funding schemes. However, the types of entrepreneurial practices required of academics and the style of new leadership are not clear.

For example, government productivity programs are based on increasing performance expectations with fewer staff resources, but at the same time there has been a restriction of the traditional role of academic leaders. Implementation of the changes occurred first of all for the leaders, who are also responsible for operational performance. In this way the changes are taking place at universities outside the leaders' regular work load. In this regard, it is evident that the disengagement in state universities has meant the erosion of academic leaders' authority. The question is how academic leaders can enhance their role as managers.

This presentation raises questions about the type of operational principles academic leaders hoped for, and the role they aspired to for themselves. Although the presentation concerns universities, the cases presented show a more general role in public and private leadership. The main themes of the presentation are the content of work; the skills academic leaders require ; changes in the leadership role; differentiation from the traditional profession; and professionalism as a requirement for those occupying academic managerial posts. The presentation also looks at examples of leadership changes. The data are based on the 11,900 European responses to the Changing Academic Profession (CAP) survey (2008-2011), and 60 interviews of Finnish academics conducted in 2011 as part of the EUROAC project that was conducted in eight European countries.

EVALUATION OF THE IMPLEMENTATION OF AGRICULTURAL INVESTMENTS UNDER THE RURAL DEVELOPMENT PROGRAMME (RDP) 2007-2014

Aggelopoulos, Stamatis¹; Pavloudi, Alexandra¹; Chioteris, Cpyros²

¹Dpt. of Agricultural Technology, Direction of Agricultural Economy, Alexander Technological Educational Institute of Thessaloniki, Greece

²Hellenic Consulting, Greece

ABSTRACT

Evaluation of the Implementation of Agricultural Investments under the Rural Development Programme (RDP) 2007-2014.

The Greek agriculture faces the necessity to be adapted to a very difficult and constantly changing international environment. At the same time, the prolonged economic crisis in Greece makes imperative the development of the Agricultural Economy as the main pillar of development.

Based on the structural features of Greek agriculture and considering the new requirements and guidelines of rural policy, as they arise from the axes of the new Common Agricultural Policy, it is necessary for adequate measures to be taken. The main objective of these measures is mainly the improvement of the competitiveness of the agricultural sector, but also the maintenance of the economic and social cohesion of Greek agriculture. Given that, it is necessary to modernize Greek farms, in order to improve their productive and environmental performances in a highly competitive international environment, the Rural Development Programme 2007-2014 constitutes the basic way for implementing investments and modernization of farms, aiming to boost the agricultural income and the agricultural employment, but also to reduce the long-term trend of disinvestment.

The Investment funding programs of the EU for Greek farm businesses were applied for the first time in 1983 (nationally shareholding 30% and Community 70%), in the context of a targeted effort to converge the Greek Rural Economy and the economy of other EU countries. It is worth mentioning that in agriculture the exception of funds for the implementation of investment programs presents significant difficulties, due to the nature of farming and the large investment required. In particular, the Rural Development Programmes for farm businesses and commercial farm businesses include Financing Measures designed to facilitate producers to invest in modern capital equipment (mainly technological) and thus improve the effectiveness and productivity of farm businesses.

The purpose of this paper is the evaluation of the implementation of Agricultural Investments under the Rural Development Programme (RDP) 2007-2014. In particular, it investigates the implementation of the financing per Measure and per RDP Axis, both diachronically and by Region. Furthermore, a

typological analysis of a sample of the investment plans (using the Hierarchical Cluster Analysis and Principal Component Analysis), which relate to the financing of the farm businesses from key Measures of this Programme. The conclusions of the paper constitute a mechanism of rational evaluation of the system of Greek agriculture financing and they are expected to guide the improvement of the implementation of the new Rural Development Programme 2014-20.

BACKPACKER TOURISTS: WOM ANTECEDENTS

Alves, Sandra¹; Abrantes, Jose Luis¹; Seabra, Claudia¹; Nogueira, Maria Jose¹; Herstein, Ram²

¹Polytechnic Institute Of Viseu - Higher School Of Technology And Management, Portugal

²The College Of Law And Business , Israel

ABSTRACT

This study examines the antecedents of *Word-of-Mouth* (WOM) message content of *backpackers* tourists. We propose a model in which travel the sense of belonging, social interaction places and cultural activities are key mediating constructs between travel motivations and *Word-of-Mouth* (WOM) message content to *backpackers* tourists. The model is empirically examined by means of a survey conducted with 656 *backpackers* from 75 different countries. A structural equation model indicates that travel motivation, sense of belonging, the place where social interaction occurs and the cultural activities undertaken by *backpackers* are important antecedents of *Word-of-Mouth* content. Theoretical, managerial and marketing implications of this study are discussed. Directions for future research are also presented.

JOINING THE PILGRIMAGE BY HOSTING PILGRIMS

Ambrósio, Vitor

Escola Superior de Hotelaria e Turismo do Estoril, Portugal

ABSTRACT

To go on a pilgrimage for more than one day obliges pilgrims to look for accommodation. The logistic concerning the overnight stay is strongly related to the number of pilgrims, their economic status and their pilgrimage philosophy/behaviour.

Also the solidarity of the host communities may play an important role in this decision process. In fact religion is one of the components of the collective history and identity, not only of the receiving local community, but also visitors, whose personal beliefs necessarily influence their attitudes.

In this article the research focus is on accommodation provided by local people without charge or for a small amount of money.

By hosting the pilgrims the interviewed (local population) state that they live and take part in the pilgrimage.

LITERATURE REVIEW

The literature review identified the lack of research in this area. In fact no book or article was found directly related to this subject. Nevertheless some indirect literature is used to reinforce/emphasize subjects related to the organization of pilgrimages.

OBJECTIVES AND RESEARCH METHODOLOGY

Objectives

The goal of this article is to answer the question of departure: Do locals join the pilgrimage by hosting the pilgrims?

Using two quotations from the interviewers is probably the best way to show that the answer for the question is Yes.

"The pilgrimage is not just walking; it comprises many other aspects like receiving pilgrims, praying or being supportive. Any time I host pilgrims in my house I feel joy, lightness and the feeling of having accomplished a good deed." (Carlos, Azores, Portugal).

"With their savings, many people buy a luxury car, others a second home, we bought an old house and rebuild it for receiving pilgrims. To be in contact with pilgrims make me feel that I'm on the Camino every day." (Lúcio, Barcelos, Portugal).

Methodology

The methodology followed was first the direct observation, taking part in three different pilgrimages:

- ❑ in Minho Province (North Portugal) towards Santiago de Compostela;
- ❑ in Ribatejo Province (Center of Portugal) towards Fátima;
- ❑ around São Miguel island in Azores (Portuguese archipelago).

During the pilgrimages the author was in contact with other pilgrims and paid attention, besides pilgrims' experiences and feelings, to other variables as: group size; signage, meals, carried items, healings and accommodation.

In these pilgrimages the author was lodged by local population without any monetary cost or for a small amount of money.

The second part of the research is based on interviews (qualitative data) with local people who open their houses to pilgrims (the interviews took place some weeks or months after the pilgrimages). The goal of these interviews was to know if local people were receiving pilgrims only for solidarity purposes or also as a way of participating in the pilgrimage.

Those experiences and the contact with the referred hosts allow to state that they all take part in the pilgrimage spirituality and in its process.

CONCLUSIONS

The pilgrimage is not only done by those who walk. Many of pilgrims' good memories are embodied with local population hospitality.

The hospitality performance is strongly related with the characteristics of each pilgrimage.

The interviewed (local population) live the pilgrimage without walking the road and each one of them feel that is taking part in the pilgrimage.

A pilgrimage is more alive as greater is the number of actors participating in its whole.

MOBILE MARKETING: FUTURE'S PROMOTIONAL CHANNEL

Amirkhanpour, Monaliz

Faculty of Business, Education & Professional Studies (BEPS), University of Gloucestershire, UK

ABSTRACT

The purpose of this research is to investigate the role and importance of mobile marketing. This will be achieved by theoretically defining mobile marketing; exploring its significance in adopting a multi-channel marketing approach by marketers and business owners; investigating its role in integrating with social media; and proposing a conceptual framework towards its utilization in the wider strategic marketing context.

Mobile marketing has emerged as a new addition to the portfolio of marketing communication tools. Every day more businesses are incorporating mobile marketing into their marketing mix in order to communicate effectively with their customers. The main purpose of mobile marketing is to increase the awareness level of the businesses by assisting them in gathering relevant information about the needs and preferences of their target customers in a timely and profitable manner.

Entering the mobile channel requires a high-level strategic plan. Mobile strategy is the framework that defines how various mobile tactics such as mobile websites, mobile apps and other mobile marketing communication tools are used to satisfy the customers' needs and achieve the specified marketing goals. Furthermore, a successful mobile strategy depends on a harmonious balance between: (1) the brand, (2) the customers, and (3) the environment. The brand, the customers, and the environment have identical importance in a mobile strategy; however, a successful mobile strategy is one that is uniquely customized to the specific brand and the target customers.

From a methodological perspective, the research is based on theory at this stage of development and it is enhanced by secondary data. Theoretical considerations from the literature are further conceptually developed to construct a mobile marketing provisional framework towards empirical validation.

Taking the research studies on mobile marketing into careful consideration, it is evident that there is a lack of awareness and knowledge among marketers that plan to adopt and integrate mobile marketing into their direct marketing communications. This is due to the limited number of research studies exclusively dedicated to mobile marketing communications using smartphones and tablet PCs. With the rapid mobile technology developments, marketing through the mobile channel is getting pervasive and not negligible in the upcoming years. Therefore, to entirely adopt mobile as a new element of the marketing mix, marketers are required to evolve along with it. Otherwise, they will gradually lose a large number of customers who are mobile.

Consequently, it should be taken into consideration that mobile marketing opens new horizons for businesses and marketing managers which will ultimately result in increasing sales and consumer traffic, driving offline sales up by incorporating location-based search strategies, and building customer loyalty and trust by asking for their permission prior to initiating a marketing dialogue with them. The research outcomes do add to the growing knowledge concerning mobile marketing and set the basis for a more refined understanding through a more comprehensive perspective on the topic.

DOES ORGANIC CERTIFICATION OF WINE MATTER FOR BRAND EQUITY?

Antonazzo, Anna Paola; Fiore, Mariantonietta; Contò, Francesco

Department of Economics, University of Foggia, Italy

ABSTRACT

New consumption trends and evolution of consumers behaviour are increasingly ruling marketing strategies of firms, especially in the wine sector. The role played by intangible characteristics of wine such as quality, sustainability and origin on consumers preferences has been widely examined over years by wine marketing research (Barber et al., 2006; Forbes et al., 2009; Halstead, 2002). In particular, new research focuses on how brand equity and organic label affect wine consumers preferences and drive purchasing decisions (Bauer et al., 2011; Lerceneux et al., 2012). Despite the literature on wine marketing within business to consumers environments is quite exhaustive, the business to business marketing perspective is often overlooked, especially about the role that brand equity can play in buyers purchasing decisions. Furthermore, the increasing concerns of consumers and customers on environmental issues and the interest of wine industry to understand customers perception of organic wines, make the attempt to explore the linkage between the brand equity and organic components of wines worth to be investigated properly.

According to a definition of Aaker (1999) brand equity is the set of assets and liabilities associated with brands image, adding (or subtracting) value to companies on the market. Measuring brand equity is demonstrated to be a complicate task due to consumers cognitive and perceptions aspects involved. Even more challenging can be the identification of measurements of brand reputation in business-to-business marketing where buyers decision are made on more rational basis compared to consumers decisions (Kuhn et al., 2008; Rosenbröijer, 2001). Previous works highlighted a linkage between brands and organic products addressing positive effect of organic label on the attractiveness of the brand (particularly respect to *private brands*) (Bauer et al. 2009). Other works estimate how reputation of a brand effects efficacy of organic products labels in terms of quality perceived by consumers (Larceneux, Benoit-Moreau, & Renaudin, 2011). Nevertheless, the literature seems to be lacking on effects that organic certification have on brand reputation of wine companies and whether organic wines supply can represent a leverage of competitive advantage enhancing brand equity perception. The attempt of the paper is ascertaining whether and to what extent cause/effect relationship can be observed between differentiation strategies of wine supply such as production of organic wines and the level of reputation of the corporate brand (brand equity).

The empirical strategy will consist of a survey on local wine-shop or wineries buyers perception of wine companies brand assets, data collection on producers characteristics and estimation of the

econometric model. Data will be collected on a sample of buyers and producers of the Apulia region (Italy). Following Aaker (1999) brand equity model, based on loyalty to brand, perceived quality, leadership, perceived value, uniqueness and awareness attributes, an indicator of brand equity will be built and used as dependent variable in the econometric model. The data processing will focus on techniques of statistical inference for the detection of possible cause-effect relationships between the observed variables and the degree of brand equity revealed by the interviewed. In particular, the econometric model used is a Ranked Logit Model, where the dependent variable (brand equity levels) will be explained by independent variables related to characteristics of wine producers such as sales volume, age of company, orientation to export, judgments on wines expressed by accredited national wine guides, delivery characteristics, level of product differentiation and organic wines production. The results could provide interesting insights on sources of brand equity in business-to-business wine marketing and indications on strategic use of brand equity and its communication channels aimed at increasing reputation attached to local wine companies.

ELICITING INDIVIDUAL PREFERENCES FOR RESPONSIBLE INVESTMENTS

Apostolakis, George¹; Kraanen, Frido²; Van Dijk, Gert^{1,2}

¹Nyenrode Business Universiteit, Breukelen, The Netherlands

²TIAS School for Business and Society, Tilburg University, Tilburg, The Netherlands

ABSTRACT

Impact and socially responsible investments have increasingly gained momentum over the past few years. Institutional investors, such as pension funds, are proactively integrating such practices into their investment strategy as they realize that sustainability and social responsibility are part of their fiduciary duty (Koedijk and Slager, 2011). Nevertheless, the preferences of pension funds' beneficiaries that investments should meet such criteria, have not been sufficiently investigated yet. The literature suggests contradictory findings about the financial performance of such responsible funds compared with the conventional ones in the long run and therefore concrete conclusions cannot be established yet. However, we may argue that responsible funds have greater administrative costs over the conventional ones. Therefore our research objective is twofold: first we seek to answer the question to what extent individuals would sacrifice a small part of their expected pension income in exchange for investments which add social value. Second, we aim to examine whether individuals are capable of making consistent choices with regard to investment decisions that affect their well-being. In this study, which is based on a discrete-choice modeling framework, we present how members of a Dutch administrative pension organization make trade-offs between different investment criteria such as Impact Investments (ImI), Socially Responsible Investments (SRI), Social Initiatives (SI), and their willingness to accept a lower pension in the selection process of a responsible investment portfolio, given the opportunity of such a choice.

The framework to elicit individuals' preferences is based on the random utility theory (see (McFadden, 1986; Louviere et al., 2000)). Empirical data for this study was collected from individuals who work in the care and welfare sector in the Netherlands, using a web-based discrete choice survey. Each survey instrument contained 10 choice profiles and compared 4 attributes of 2 different responsible investment portfolios. The attributes varied from 2 to 10 levels according to a full profile choice-conjoint design. The result of the analysis, of the Hierarchical Bayes (HB) regression models, shows the relative effect of ImI criteria, SRI criteria, SI and the willingness to accept a lower pension on the selection of a responsible investment portfolio.

This article also presents our findings with regard to the construal level theory and the psychological distance theory Trope and Liberman, (2010). Liberman et al., (2007) argue that although a greater psychological distance is associated with more desirable outcomes, in the end, individuals are more

likely to implement the closer in distance outcomes, considered being more feasible. Thus, we construct measures of the temporal, special, social and hypothetical dimensions of the psychological distance toward responsible investments. Several policy recommendations stem from our research: different strategies can bridge the psychological distance gap; framing, nudging, communication strategies and the improvement of the financial knowledge are only a few of the strategies that aim to transcend behavioral biases.

ORGANIZATIONAL INTERVENTION FOR INCREASING INTERPERSONAL INTERACTIONS AND CREATIVITY

Arieli, Sharon¹; Rubel – Lifschitz, Tammy¹; Elster, Andrey¹; Sagiv, Lilach¹; Ekelund, Bjørn Z.²

¹The Hebrew University of Jerusalem, School of business Administration

²Human Factors, AS

ABSTRACT

Organizations encourage their employees to engage in practices that increase performance and facilitate the achievement of their business objectives. In this research we focus on interpersonal interactions and creativity, which are often associated with personal and organizational successes. The current research experimentally examine whether these types of behaviors are malleable and can be shaped by organizational intervention. We suggest that a 2-hour intervention, which evokes openness to other people and ideas, can change the way individuals think about others, and perform creatively. This research question was tested using an organizational intervention named Diversity IceBreaker that was developed by Bjørn Z. Ekelund, and was successfully implemented in multiple organizations in Europe and the US. The intervention creates a non-judgmental environment that emphasizes the advantages of diversity in personality types, through self-revealing and humoristic interpersonal interactions (Ekelund, 2010). We hypothesized that the intervention: 1) will amplify positive emotions, decrease negative emotions, and increase trust (Study 1); and 2) will facilitate creativity and awareness for social identity (Study 2).

In Study 1, 211 Israeli undergraduate business students were invited to take part in a workshop on interpersonal communication for partial course credit. They were assigned to eight groups in which they experienced a 2-hour intervention. The participants completed a short questionnaire at the beginning and at the end of the intervention, including measures of positive and negative affect (PANAS, Tellegen, Watson, & Clark, 1988), and trust (adapted from Yamagishi, 1988). As hypothesized, positive affect increased and negative affect decreased following the workshop $t(210)=2.42, 2.56$, both $p<.01$. Also as hypothesized, participants' trust increased following the workshop $t(210)=1.86, p<.05$.

Study 2 focused on creativity and social identity, and included 82 participants, who were assigned into four workshops. The order of the creativity task versus the identity task was manipulated: Participants were randomly assigned into "creativity-first" versus "identity-first" condition. Creativity was assessed using a divergent thinking task (Wallach & Kogan, 1965). As expected, the ideas provided by the participants after the workshop were more novel than those provided prior the workshop $t(79)=2.11, p<.05$. Identity was assessed using the Twenty Statement Test (Kuhn &

McPartland, 1954). Also as hypothesized, participants described themselves more in relational terms after the intervention than prior to the intervention $t(79)=1.95, p<.05$. Importantly, the extent to which participants described themselves in individualistic terms did not change following the workshop. Thus, the workshop simultaneously facilitated both autonomy (leading to personal creativity) and social engagement.

In sum, a 2-hour intervention which created a friendly and open atmosphere increased individuals' trust and affective well-being (Studies 1-2) as well as their creativity and relational identity (Study 2). The experimental setting enabled us to establish causality and assure that this intervention has an effect on participants' affective well-being, creativity and identity. Future research could investigate the resistance of these effects over time, and try to replicate them in real-life organizational settings.

SERVITIZATION: A CONTENT ANALYSIS AND EVIDENCE FROM MOBILE PHONE INDUSTRY

Augurio, Alessandro; Castaldi, Laura; Turi, Claudio

Department of Economics, Second University of Naples, Capua, Italy, e-mail:

ABSTRACT

PRINCIPAL TOPIC

One of the most important phenomena of modern economy is *servitization*, conceived as the impetuous advance of the service sector compared to agriculture and manufacturing industry.

On the supply side, the servitization is the evolution of the offering from a simply material product to one that is inseparable from services (Vandermerwe and Rada, 1988). Indeed, the increasing importance of services has been pushing the firms to offer a product-service system (PSS) (Baines et al., 2007), made of a variable mix of tangible (the product) and intangible components (a mix of services), both of them fundamental for the generation of value.

MAIN PURPOSE

The aim of the study is to investigate the phenomenon of servitization through an in-depth activity of literature review, using the content analysis technique, and a survey of the mobile phone industry.

The choice of this industry is due to the great importance that services have been taking during the last years.

Today's handsets are not simply traditional phones but better mobile computing platforms for voice communication and content and services fruition, i.e., what has been named a mobile ecosystem (Mitchener, 2009). This is moving competition from physical attributes (e.g., handiness, battery life, signal reception, etc.) to soft components of handsets (operating systems, online marketplaces, graphical user interfaces) and, on demand side, it is allowing vast personalization of devices' functional capabilities.

METHOD/STRUCTURE

The work is organized as follows.

The first part consists in a systematization of the literature about servitization using *content analysis*. This research technique, reducing a complex phenomenon in a set of defined categories, facilitates its analysis and interpretation (Harwood and Garry, 2003). In particular basing on an initial - general and

ample - literature review, the content analysis is carried out considering the most influential international works, selected according to the impact factor of the journals they were published by.

The second part of the work analyses how servitization, enhanced by the introduction of the iPhone and the launch of the App Store, has changed the mobile phone industry both on the supply and demand sides.

FINDINGS

The work carries out an overall and unitary analysis of the most important studies about servitization, analysing meaning, defining characteristics and effects of the phenomenon. This should permit to draw useful managerial implications, mainly regarding the development of new capabilities necessary to run the transition from the product to the PSSs (Oliva and Kallenberg, 2003).

Then, moving from theory to practice, the study focuses on the mobile phone industry and analyses how it has been changing from a product-oriented industry, where the value of the offering was strongly dependent on the characteristics of devices, to a service-oriented industry, where handsets are mobile platforms used to access a large choice of services. As a consequence the value chain has been changing, centring on users who can define, thus personalize, the characteristics of their devices, and shape them on their exact needs.

This has made the offering more customizable and complex than in the past, asking firms for the aforesaid competence development and consequently for organizational changes.

Keywords: *Servitization, mobile phone, value chain.*

AN INQUIRY REGARDING THE IMPLEMENTATION OF INTELLIGENT SYSTEMS IN LOGISTICS NETWORKS, NECESSARY FOR SOCIAL INNOVATION

Balint, Antoniu Ovidiu¹; Burghilea, Cristina²; Gheorghiu, Anca²

¹Business Administration Doctoral School, The Bucharest University Of Economic Studies, Romania

²Hyperion University From Bucharest, Romania

ABSTRACT

The history of human premises is accompanied by researches and confrontations generated by human groups that attempted to find and provide favorable living areas, to serve their needs and interests determined by their needs of life. Thus, we can talk, compare and analyze different economic indicators like developed and undeveloped regions, poor and rich regions, agricultural and industrial regions, urban and rural areas. Differences and discrepancies that are more obvious in economic terms between regions on a global, continental, regional, national and even sub national scale are creating economic inequalities and the improvement of the standards of living together with the deterioration of the natural environment represent the major challenges of the current technological civilization (Mulgan, 2006).

The content of this paper is focused on the implementation of Intelligent Systems (I.S.) especially Intelligent Transport Systems (I.T.S.) in logistics projects that are necessary for the development of social innovation, which transfigures the interactional approach to all phases and stages of projects involved in the logistic process. This includes the structuring of design, analysis, strategy, planning, financing and completion of projects, creating conditions for interconnections of all activities involving logistics projects in a primary flow, towards all operations, actions and phases of the implemented projects, forming secondary logistics projects involving resources, time and costs of the initial project.

Regional development projects or secondary logistics projects represent the tools by which local authorities or local companies initiate the implementation of economic or industrial objectives, in accordance with the regional strategies, plans or programs needed for regional development or social innovation. Regional development or social innovation through projects allows rational allocations of funds and effective allowance of the local resources in accordance with the development priorities of the regions or with the regional policies (Mulgan *et al.*, 2007).

In terms of regional development in the European area especially in the European Union (E.U.) zone, transnational and multi-sector projects require the use of design tools and network interconnections between different elements and components of the regional European areas (population, economic

and financial potential, social and cultural indicatives etc.) requiring the taking into account of the capacity of these tools to analyze, schedule and implement these projects ensuring the necessary objectives required for all problems faced by regions: inequality, pollution, poor technology, administrative distortions, inadequate infrastructure etc.

The projects promoted by the E.U. provides all the methodology and all the necessary logistics systems and also the operational factors needed for proper implementation of the regional objectives developed in various areas while the regional and rural areas targeted by the governmental authorities have been given more attention and interest necessary to achieve these projects (Mortensen *et al.*, 2002). The principles, objectives and criteria for the selection of joint-projects that are implemented at a regional and/or local area allow the E.U. to harmonize and link the financial efforts that are focused on areas that need developed to the logic of concentric priorities according to three criteria: the type of project that needs to be implemented, the nature destination of the funds and priority investment in certain projects that are needed by the local community.

Regional development projects that have a deep impact on the bioeconomic environment at a local and regional area can be improved with the help of Intelligent Systems (I.S.) and especially with the help of modern logistic networks that are used and are implemented as a coherent and unified system within the European area as a priority to unify the diversity of differentiated regional and local (urban and rural) systems in all states in the E.U. and at all levels providing premises for success and performance of these projects.

The regional development programs needed for social innovation and stimulation of the bioeconomic environment that are promoted by the E.U. were decisively marked by the establishment, development and expansion of the E.U., which has passed through the institutions, bodies and gradual convergence of principles, objectives and instruments of European regional development strategies and policies.

In our opinion, at the present time, Europe is faced more and more with disparities at a regional level which is influencing the economic development, traditions and the mentalities of the local population which have a deep impact on the social and institutional structures that are specific to each region; all these discrepancies must be harmonized, in an effort to create a common European space, fairly accessible to all inhabitants within the E.U.

CORPORATE SOCIAL RESPONSIBILITY AND CROSS-CULTURAL SENSITIVITY: MODELING THE TEACHING EFFECT ON INTERNATIONALISATION

Belyaeva, Zh.S.¹; Zvereva, O.M.²; Beliaeva, V.S.¹

¹Graduate School of Economics and Management, Ural Federal University (Russia)

²Institute of Radioelectronics and Information technologies– RTF, Ural Federal University (Russia)

ABSTRACT

The concept of corporate social responsibility as a key to future sustainable strategy is widely used in the most innovative corporations, advanced economies countries and Universities. Starting from 50s of the last century the corporate world have tried to tailor or to neglect different models of economic, social, legal and philanthropic vectors to reschedule their strategy to be responsible, sustainable and paying the investments back. Although social investments and social entrepreneurship are becoming a hot topic, we found that there is a literature gap in finding, what are the key competences to prepare and form successful entrepreneur in regards to global education internationalization and socializing imperative in international business.

We assume that the portrait of the innovative entrepreneur corresponds to a model combining leadership skills, social responsibility and cross-cultural awareness, which would be based on international peculiarities of legal, social and economic systems. On the other hand, the realities of today incorporate IT competences and creative/innovating thinking, which all together contribute to business sustainable development because it potentially has positive effect on both personal and/or corporate financial and social outcomes. One of the most important challenges calls for a specifically tailored learning programmes at Universities, while the growing number of CSR related schools, sustainable management for industry courses obviously retreats the urgency. This type of innovation also contributes to business sustainability. However the specific effect on these outcomes can be highly influenced by the national context in which the “cohort” of participants develops their activities.

METHODOLOGY

Based on the described above approach we have developed short summer programme "Sustainable Business Development: IT, Innovations Strategies". After pre-selection process accepted participants are asked to prepare a presentation on their vision of CSR in their countries and creatively present it at the beginning of the summer school. On the first day of the school, the participants are divided into 4 groups: Industrial Business (employers), Government (regulators), Universities (educative structures and science), Service Sphere (Consulting Companies). Using an institutional approach and employing a

sample of 120 participants, we study whether national institutional conditions impose a moderating effect on the relationship between different layers of education system and thus surplus knowledge driven strategy ambitions for the future top-managers. We also have examined the effect of short programmes on the internationalization of Universities as a side-effect. The first objective was to develop a scale that enabled the measurement of students' sensitivity to sustainability and hence, effectiveness of programmes. We aimed at measuring 3 types of Russian and international students – young managers with 3-8 years working experience, students studying economics and management, and students studying technical sciences. To measure the extent to which an individual values corporate social strategy before and after programme, in other words Education Programme Effectiveness, a forty-five question survey instrument was developed, which consisted of the following three sections aimed on understanding of programme demand for students, business structures and University. The first unit of questions aimed to measure students' sensitivity to corporate social performance; the second captured cross-cultural sensitivity to internationalized education programmes at home and abroad; and, the third was used to collect demographic characteristics. In developing the survey, we have discovered an important detail in regards to testing the teaching effect of the short programme in a foreign language. The questionnaire was revised to leave 35 questions. We attempted to assess the effectiveness of programs in the development of the internationalization of education at the university (first unit), and susceptibility to social responsibility (second unit), and cross- cultural tolerance (third unit). We have studied the following types of sample: participants of the summer school (Russian and foreign, both technical and economic education profile) – 36%, foreign university students who have not participated in the thematic school – 10%, Russian university students who have not been involved in summer school, – 54 %. Although the sample is not highly representative for complex statistical analysis so far, we have rather interesting preliminary results.

SOME PRELIMINARY RESULTS

The first group of questions gave some contradictory results. The respondents would be very interested in interdisciplinary master programmes taught in English, although only 20% would stay at home University. The second group – about 84% would not work for a company with bad CSR-reputation, but the wage would change mind of a 41% of those. Of course we had clear difference between those who attended the school, it turned out that the students hardly know (or think) about volunteering-possibilities, and also a lot of them have no idea what is social responsibility today. 53% consider CSR as a charity action. Since the majority of respondents were males, the women's rights issues are less important than the issues of minorities and people with disabilities. The third unit of questions indicates cross-cultural tolerance and interdependence: the respondents are very open to the people of

other nationalities and cultures; they are not ignorant to non-native speakers of Russian. A sufficient number of respondents would like to live and work abroad, but most prefer just to travel there for short vacations. It is interesting to see the significant difference between Chinese and Papua New Guinea students who are enrolled to UrFU, but were not participating in the School described above.

DISCUSSIONS AND FURTHER RESEARCH

The present paper opens perspectives to systematize the evaluation system of internationalization of education programs at UrFU, and also the development of statistical and marketing tools to develop a comprehensive strategy to enter the international education market. Obviously, these short programmes contribute to the growth of interdisciplinary competences in the field of economics and management, information technology, responsible leadership and intercultural communication. The main aim of this framework is to help students appreciate the wide-ranging perspectives on sustainability; to get them thinking about what the different “flavors” of sustainability mean for organizations – the structural and cultural implications; to critique how different organizations approach sustainability; to debate the different solutions and business cases for organizations pursuing sustainability; and to consider the wider macroeconomic implications of corporate sustainability. The authors have found that this framework generates a good deal of class discussion because it counterposes different sustainability perspectives with the neoclassical “business-as-usual” thinking that underpins the possible education programme at UrFU. Our results show that regulatory and normative dimensions do not have the same influence on that relationship, creating implications for academia, managers, and education policy makers.

EVALUATION OF INNOVATIVE CAPACITY OF A RUSSIAN HIGH-TECH PHARMACEUTICAL ENTERPRISE AND ITS POTENTIAL FOR INNOVATION

Bengoa, Dolores S.1; Alenina, Karina A.2; Vlasova, Yuliya3

International Business School at Vilnius University, Lithuania

Higher School of Economics – Perm Branch, Russia

ABSTRACT

There is an imperative need for companies to remain dominant in the pharmaceutical market. Challenges like the high speed of global business development, strong competition or economics powers are setting the standards too high for the pharmaceutical businesses. In order to achieve this competitive sustainability companies have to provide the best of their human capital and technological resources to reach great innovation levels.

According to McKeown, (2008) innovation relates to the use of more effective and efficient ways for making an invention or an idea valuable, but also, enforcing an invention for monetary or economic gain. Over the years, innovation has seen nations, regions, and economic entities developed at a greater scale due to increased efficiency and productivity (Filho, 2005). There are various factors on a macro and micro level that influence the degree of innovation in any given business organization or even affecting the entire industry. Those include changes in the business environment, changes in the structure of markets and market forces affecting more the macro level and, the level of education and scientific knowledge in an organization, research and development of skills within the workforce, and changes in the business culture and beliefs within the society, affecting more the micro level.

Pharmaceutical's innovation has been the lion's share in the pharmaceutical sector for many years around the world (Dubey and Dubey, 2010). Most probably because the pharmaceutical industry "stands at the center of the health of nations, rich and poor nations alike" as Rao (2008, p.103) explained. Nevertheless, there is a current decline success rate in the pharmaceutical industry due to a number of reasons: reduce number of new product approval, an increase in the costs of innovation, long research and development cycle and potential patent expiration (Dubey and Dubey, 2010; Huang, 2012) impacting on the overall pharmaceutical growth.

The paper explores reasons and motives that positively influence the innovative capacity and the potential for innovation in the Russian pharmaceutical market.

The paper begins with a review on existing literature in the field of pharmaceutical and innovation. It addresses in a detailed manner the reasons and factors which determine the innovation capacity and the potential for innovation of pharmaceutical firms. It continues with the research methodology and

finally, the third part entails the presentation and discussions of the results obtained from the study, drawing some conclusions, recommendations and suggestions for further research.

The study adopts a case study research design and uses both primary and secondary data. *Primary data was obtained from questionnaires administered directly and through email to various Russian high-tech pharmaceutical enterprises.* A total population of 100 respondents is targeted. Stratified and simple random sampling techniques are used to select a sample size of 50 respondents. The data is to analysed through descriptive statistics and later presented in frequency tables, graphs and computed percentages.

The applicability of this study might contribute with regional economists, practitioners, analysts, policymakers, government agencies and investors who will be *able to determine whether their investments are operating optimally and also* to scholars and researchers since there is a lack in literature in this specific field and concretely in the Russian market.

The study identifies that a broad working experience has the tendency to increase the innovative capacity and potential for the innovation of the high-tech Russian pharmaceutical enterprises. Access to education increased the knowledge base of the staff members and, hence, the level of innovation. Allocation of resources for innovation is important for any pharmaceutical enterprise aspiring to increase its innovative capacity and potential for innovation.

Based on the findings and conclusions of the study, the researchers recommend that management should ensure that they minimise employee turnover to increase the skills of the employees, with the hiring of staff to be done based on academic qualifications. Additionally, monetary and non-monetary resources should be allocated evenly for innovation purposes.

Keywords: *Innovative Capacity, High-tech Pharmaceutical Enterprise, Potential for Innovation, Russia*

HANDLING DIFFERENT MANAGERIAL LOGICS IN THE PUBLIC SECTOR: A TALE FROM THE LAND OF THE FJORDS

Berg, Laila Nordstrand

Department for political science and management, Faculty of economics and social sciences, University of Agder, Norway

ABSTRACT

In Norway, as other western countries, the public sector has been facing administrative reforms influenced by New Public Management, NPM. The ideological foundation behind NPM asserts that the sector can improve by introducing managerialism, technology and values emanating from the private sector (Pollitt & Bouchaert 2011). The NPM-influenced reforms are taking different trajectories in different countries, but their purposes and approaches are rather similar: 1) increased efficiency, 2) enhanced accessibility for clients/users, 3) reduce public consumption, and 4) increase managerial accountability (Christensen & Lægreid 2011). This paper focuses on the last aspect, i.e. on how managers are dealing with new institutional frameworks introduced by reforms. Management – or the lack of it- is both seen as one of the *problems* in the public sector, but also as a *solution* to the different problems facing the sector (Degeling & Carr 2004).

A comparative approach is chosen, by analyzing management in two different sectors in Norway, the hospital and the higher education (HE) sectors. In the hospital sector, a particular focus is given to the management reform leading to the introduction of unitary and professional neutral management (HOD 1999). One particular feature of this reform in Norway is that nurses can now become leaders, thus supervising the activities of medical professionals like doctors. In addition, a second reform process is also taken into consideration (HD 2001), namely, the one transferring the ownership of Norwegian hospitals from the counties to the state, which resulted in the introduction of new organizational structures and, in turn, changed the hospitals from public administrative bodies into public enterprises. When it comes to the HE sector, the starting point for our analysis is that of the 2003 Quality Reform which included many aspects associated with NPM, namely: a strong emphasis placed on quality, accreditation and accountability; changes in the distribution of public funding towards teaching and research (with a performance element); efficiency; the rise of ‘strategic science’ regimes (e.g. centers of excellence and innovation); and the institutionalization of a professionalized managerial structure (in tandem with traditional academic structures) within universities. These ‘innovations’ have, amongst other things, led to stronger rationalization, increasing competition, and the centralization of decision making procedures, thus setting in motion a series of related tensions

and dilemmas around the ways in which HE systems and institutions are steered and internally governed.

Due to the high level of expertise and task complexity, the occupational groups in hospitals and universities are considered as *professionals* (Freidson 2001), which, in turn, are considered by some as the key actors of the modern welfare state (Kuhlmann 2006). In this position they are given autonomy and professional self-regulation and the right to serve clients and patients (Molander & Terum 2008). Professionals can also be viewed as political actors (Scott 2008) and have the power to acts as mediators between the state and citizens, and in this manner they can pursue their own interests and become a political problem (Abbott 1988; Freidson 1970; Larson 1977). What is more, professionals play an important role in the implementation of government-led reforms (Eymeri-Douzans 2011).

The work of professionals is embedded in the norms and values of the institutions they inhabit, but also originate from their early socialization while undertaking formal training/education (Scott 2008). Different professional types are embedded with various values and norms. This can be viewed as different “institutional logics”, defined as principles that guide and motivate actions for groups and individuals in organizations (Friedland & Alford 1991; Thornton & Ocasio 2008). Logics are historical patterns of cultural symbols and material practices that are socially constructed (ibid). Different logics can work side by side in an organization, yet more often, logics can be conflicting and competitive (Greenwood, Raynard, Kodeih, Micelotta & Lounsbury 2011). That said, within a given local setting – hospital or university - institutional logics serve the critical function of binding the work undertaken by different professionals together (Byrkjeflot 1997), thus guaranteeing a certain degree of organizational coherence albeit not always visible to the naked eye (Cohen & March 1986; Cohen, March & Olsen 1972).

In the context of this paper, the institutional logics in focus are related to professional logics, where various types of professionals have distinct ideals on how to practice management (Abbott 1988; Freidson 1994). Hospitals and Universities, as part of the public sector, are also characterized by a *political logic*, framed around the just access to public services (Scott, Ruef, Mendel & Caronna 2000) and the redistribution of common goods (Thornton, Ocasio & Lounsbury 2012). Administrative procedures are important to reassure equal treatment (Hood 1991; Osborne 2011). Lastly, we take stock of the effects accrued to the rise of a market logic, introduced by NPM and with emphasis on efficiency, economic control and management (Scott et al. 2000).

Given this, the paper compares the types of logics characterizing managers in the two public sectors in Norway, and thus its research question are as follows:

1. *How has management in Norwegian hospitals and universities been affected by the introduction of NPM-inspired reforms?*

2. *How do hospital and university managers in Norway cope with (mediate between) the tensions and dilemmas arising from the interplay of the different institutional logics within their respective organizations?*

These questions are highlighted by a multilevel qualitative study. Research question 1 is highlighting the system dynamics at a macro level with literature review from Norway and globally. The focus is on the effects from NPM in structural changes with consequences for leadership and organization. Research question 2 is focusing on the meso- and micro level to illuminate effects from NPM and the introduction of market logic in institutions characterized of professional logics in management. The empirical material comprises semi-structured interviews with formal leaders at different levels in the institutions. From the hospital sector, we have interviewed 18 managers in a medium sized general hospital in Norway. This is managers at the three levels below the CEO, with a general manager responsibility, sitting in profession neutral positions. The managers come from the medical and nursing profession. From the university sector, we have interviewed 18 managers, of which 8 were at the central administration (Rector, Vice Rector and Administrative Directors) and 10 were at the sub-unit level (Dean and Department Heads).

The findings from this study indicate that, across both sectors management has been introduced, but not in a pure form. The term “hybrid management” has been used to describe the combination of logics. Hybrid here indicates a combination of logics that normally are not combined under one organizational roof or sub-unit. Ironically, NPM reforms have resulted in increased bureaucracy, so hospital and university managers alike are influenced by a “neo-bureaucratic” logic. That said, the data show that the professional logics are resisting the logic of management and therefore the professionals involved (academics, nurses, doctors, etc.) are not leaving the former logic behind, but develop it further as to include the different logics within the organization and that are required to reach daily tasks and strategic objectives. In this hybridity of management, leadership and leaderism becomes important aspects. Hospital and university leaders are emphasizing the relational aspects of the roles, and leadership acts as a catalyzer to handle the different logics in management.

Key words: *leadership, management, professional management, hybrid management, hospitals, higher education, Norway*

CREATE, BUILD AND MANAGE ONLINE BRANDS FOR INTERNET COMPANIES

Bilro, Ricardo Godinho; Loureiro, Sandra Maria Correia

Marketing, Operations and General Management Department, Instituto Universitário de Lisboa, (ISCTE-IUL), Portugal

ABSTRACT

RESEARCH AIMS

The primary objective of this ongoing research is to identify the main assets that create brand success for internet-only companies. Based on an extensive and systematic literature review, this study seeks to identify the constructs who drive online brands for a successful life. Eighteen articles were identified and from those some preliminary reflections were taken.

BACKGROUND

As Internet usage grows, brands are becoming even more important than they have been in other channels or environments. With new options emerging every day from many unknown providers from all over the world, customers want to choose a supplier that represents a set of values or attributes that are meaningful, clear, and trusted (Kwon and Lennon, 2009). With the proliferation of products, goods and services are easily duplicated or replaceable; brands become in this vein an important asset for simplifying the decision-making process for consumers. Therefore, if we are able to properly manage this asset, then we can create difference, relevance, and affinity (Otim and Grover, 2006). In fact, one of the main factors that consumers use for first distinguishing providers is brand name, which is known to be positively related to perceived levels of brand trust (Ruparelia et al., 2010).

Stand-alone internet companies such as major players like Google, Facebook, Twitter, Amazon or eBay or even small internet businesses worldwide faces the challenge of creating, building and managing a brand that does not carry attributes or values of the physical world. Many authors support that the ease of establishing a brand and the significance of branding in cyberspace are more difficult and more important than many initially suggested (Delgado-Ballester and Hernández-Espallardo, 2008).

METHODOLOGY

Search Strategy for Quality Papers

The searches for papers with relevance for this research were made in ABI/INFORM Complete. Having as a starting point that the purpose of this Systematic Literature Review is to use only the best quality papers available were used several filters to leach the database: full-text papers, peer reviewed papers and scholarly journals criteria were selected.

In order to be able to carry out the quality journals selection, was used the Journal Quality List – Fiftieth Edition (5th July 2013), compiled and edited by Professor Anne-Wil Harzing. From this one, was chosen to use the WIE 2008 – WU Wien Journal Rating May 2008 List, which includes only A/A+ journals, and from these were considered all the journals that are under the decided scope of study.

Scope of Study

We selected all the papers from the following subject areas: Marketing, Entrepreneurship, General Management & Strategy and Management Information Systems - Knowledge Management. With this choice we tried to ensure that we could cover the maximum possible study areas that could address this research topic.

Time Frame to be Examined

For the time frame to be examined in this systematic literature it was considered the web 2.0 phenomenon as a starting point of the date range to be examined. Web 2.0 describes sites that use the technology beyond static pages from previous sites. The term Web 2.0 was proposed by O'Reilly in 2005 and it has quickly become the new buzzword of Silicon Valley, and references to a turning-point O'Reilly identify in 2004 (Constantinides and Fountain, 2007).

SYSTEMATIC LITERATURE OUTCOME

Several Researches for the Literature Review

The expressions that best defines the subject of the study were linked to "online" and "internet". Thus, it was concluded that the core of the research would take place with the keywords "online", "brand" and "internet companies". These keywords were joined by terms that reflect the scope of the study, i.e., how to "create", "build" and "manage" online brands.

This way we have reached the terms used in the five researches carried out in this literature review. The choice to perform of this strategy was taken in order to fulfil the objective of trying to include as many articles available on the subject.

The Aggregate Outcome of the Search Strategy

The sum of the results obtained from the literature review search is shown in Figure 1 as a flow diagram.

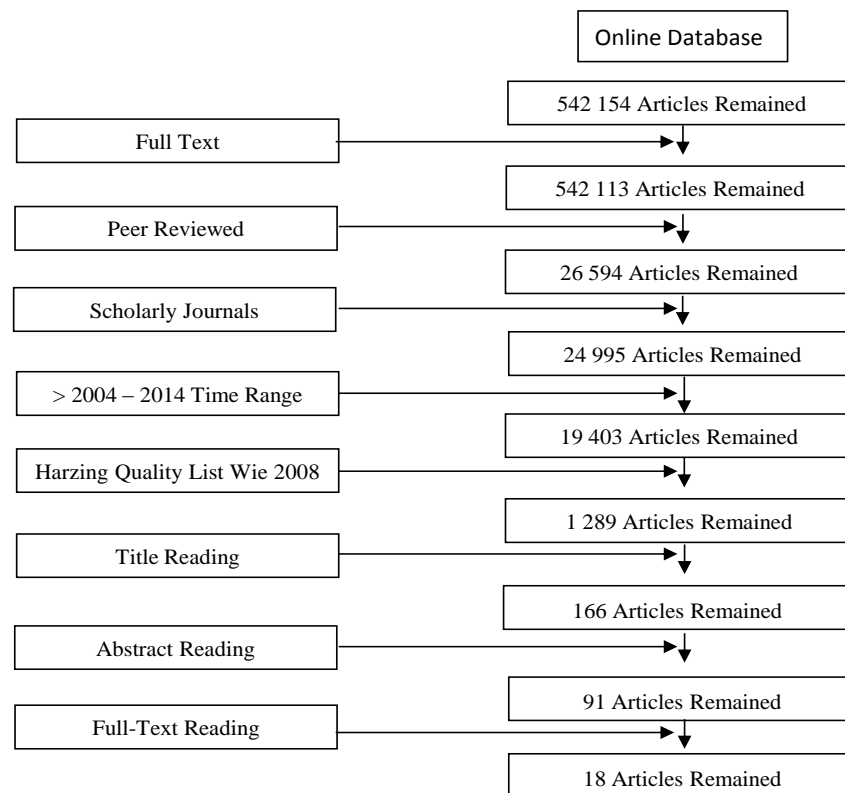

Figure 2. Sum of Searches Selection Process

Data Extraction Form

In this systematic literature review was created and used a data extraction form in order to extract the data from the selected papers and also to be able to document the process of data extraction. Regarding the elements extracted from the papers they were divided in three main groups: general information, study characteristics and main results. An example with three recent and relevant papers is attached as Appendix.

PRELIMINARY FINDINGS

At this point, we can draw preliminary findings and synthesis. As far as we can observe the Trust construct represents an important role in the online brand life cycle management, regardless we are referring to e-tailers, services providers or product supplier. In the intangible world of online brands, customers are very sensitive to the confidence on online brands and this construct can be crucial for companies to achieve success. Indeed, trust appears by far as main appraiser for online brand loyalty and customer quality judgment constructs. Other assets as consumer engagement (thru experience, habit or even through online communities) and repurchased intention motivations are not to ignore at this moment as important constructs that influence online brand management and that can lead to an

explanatory model for the theoretical question under study. Detailed results of this research will be presented at the EuroMed 2014 conference.

Keywords: Internet Marketing, Online Marketing, Digital Marketing, Online Brands, Internet Companies, Online Environment, Online Brand Quality Perception

APPENDIX

Paper Number	Authors and Year of publication	Journal	The base theory of the study or construct	Adopted methodology and sample (and characteristics)	Main Conclusions	Limitations and future research	Managerial Implications
1	Hur, Ahn, Kim (2011)	Management Decision	Brand Community Commitment; Loyalty Behaviours; Brand Loyalty	Quantitative approach; Primary data; Partial Least Squares (PLS) Analysis; one-on-one personal interviews; sample size of 200 Chinese female online brand community users (based on Beijing or Shanghai)	Identified that brand community trust and affect leads to brand community commitment; and that brand community commitment leads to brand loyalty behaviours; brand community commitment have a strong effect on word-of-mouth	Limited to treat brand community commitment as a unidimensional construct; future research may consider Multidimensional constructs and relational variables, such as self-congruity; consider generate more valid measurement items for WOM through other measurement scales in communication and loyalty areas	Brand community activities influence relationship among community participants, brand and the company; enhancing customers' loyalty through a space in which customers can directly participate; trust and affect are vital factors in enhancing customers' brand community; commitment word-of-mouth marketing mediated by brand communities very effective
2	Benediktus et al. (2010)	Journal of Retailing	Trust Construct; Purchase Intentions	Quantitative Approach; Hypotheses testing through online scaled response questionnaire; Primary data; Study 1: sample size of 302 undergraduate students; Study 2: sample size of 261 nonstudent respondents	Favourable consensus information led to increased trustworthiness perceptions and purchase intentions; physical presence stimulates trustworthiness of unknown retailers, but brand familiarity presents similar level of benefits (convey trustworthiness with consumers and increase purchase intentions)	Both studies examined effects for only one product category; Future research can compare physical store presence effect across products with search-dominant versus experience-dominant attribute; can also include other trust cues as price disclosure, real-time advice and ease-of-navigation	Consumers are very cautious when making purchases on the Internet, therefore retailers should develop trust with their consumers through brand familiarity, physical presence and consensus information
3	Sashi (2012)	Management Decision	Customer Engagement; Relationship Marketing	Examination of practitioner views of customer engagement followed by a discussion of its links to the relationship marketing; Formulation of a conceptual model.	Customer engagement focus on customers and their needs, provide superior value relative to competitors (generating, disseminating, and responding to customer needs and market orientation) and build trust and commitment with customers.	Implicit hypothesis need empirical studies; Future research can examine the mix of social media, other digital media, and non-digital media appropriate for each stage of the customer engagement cycle	Connect and interact between sellers and current customers with potential customers and succeed in turning them into transactional customers creates the possibility of their transition through subsequent stages of the customer engagement cycle, with some of them eventually becoming fans; Customer engagement turns customers into fans.

ANTECEDENTS AND CRITICAL SUCCESS FACTORS IN CONTRACTUAL NETWORKS: NEW INSIGHTS FROM ITALIAN CASE STUDIES

Cantele, Silvia; Vernizzi, Silvia

Department of Business Administration, University of Verona

ABSTRACT

Networks are motivated by, among other things, the need to improve production efficiency, share research and development skills and gain access to new markets. Each of these aspects has become increasingly important, especially for small to medium enterprises, whose resources are often significantly constrained (Ahuja 2000; Håkansson et al. 2009).

The literature on networks is vast and can be traced in both the strategic (Ahuja 2000; Barney 1991; Gulati 2007; Lavie 2007) and organisational (Grandori & Soda 1995; Knight & Harland 2005; Verwaal & Hesselmanns 2004) fields. Among the different networks' forms and agreements, both structured and informal, we focus on a tool introduced in 2009 by Italian law to improve firms' competitiveness and innovation attitude. The tool, named '*contratto di rete*' ('business network contract') is a private agreement between two or more firms aimed at exchanging information or services, collaborating in determined fields to attain the firms' business purposes or jointly managing common activities. The business network contract is a form of structured and flexible cooperation that allows firms to share information, resources and activities while maintaining their legal autonomy and independence. Since its introduction, the business network contract regulation has often been updated. In March 2014, registered contracts in Italy numbered 1,380, with 6,594 firms involved.

In the literature, many studies focus on the antecedents of networks and strategic alliance performance (Christoffersen 2013); however, there is a lack of consensus about what makes the business network contract effective. This paper intends to contribute to the existing literature by investigating how the antecedents blend and contribute effectively to the success of networks in realising those strategic aims not achievable by single firms. In line with the explanatory nature of our research objective, we chose a theoretical sampling case-study approach (Eisendhart 1989; Yin 1994; Siggelkow 2007; Easton 2010). We selected two network case studies: Racebo, a vertical network among producers and subcontractors for the automotive and motor industry aimed at responding to global competition and the economic downturn of the industry; and Rete per la tutela dei funghi di bosco (Safeguarding forest mushrooms network), a network among forest mushroom producers aimed at enhancing the quality of the product and improving firms' competitiveness.

As showed in the literature concerning the antecedents of strategic alliances (Christoffersen 2013), these alliances rely on some behavioural attributes: commitment, trust and cooperation. Our research

highlights the ways in which these attributes are connected and the other elements critical to the success of a network contract.

From the analysed case studies, we found that the *commitment* required by a network contract can be relatively low. All the firms agreed that the contract can produce relevant advantages for small to medium enterprises with only a small investment because its first function is to allow small firms to reach a 'critical mass' with respect to the different aims stated, from time to time, by the network (e.g., access to foreign customers requiring a turnkey product, dialogue with the institutions to obtain a new product's regulation, greater power over distribution channels). The commitment can be relatively low if firms *trust* each other and if some operative decisions can be delegated to a charismatic leader (usually the president of the network), reducing the occurrence of deadlocks in decision making. This leadership requirement appears to be a new element, adding to those already cited in the literature, such as unequivocal power relationships (Koenig & van Wijk 2001) and control (Christoffersen 2013). The creation of trust among firms in a network is a basic antecedent of *cooperation*, which the interviewed firms usually relate to a willingness to share information and common management issues. This sharing is dependent on the level of *transparency* of the firms and is a fundamental element in the construction of the network's strategy. Another common element emerging from the interviews was a step-by-step definition of the strategic actions of the network—a type of emerging strategy that enlarges on what the firms agreed to in the original network contract. Transparency exposes firms to vulnerability and requires an open-minded approach to business, in which the entrepreneur reduces the tendency to individualism and the fear of losing their 'identity' in order to reach *cultural compatibility* with their partners. Both case studies were characterised by the presence of second-generation entrepreneurs, an element that appears to favour a more open business culture, although only if first-generation entrepreneurs are willing to trust the younger network members.

Other relevant factors affecting network success include firms' dissimilarities (Christoffersen 2013). The interviewed firms agreed on these propositions: *size differences* can be a problem in networks due to the consequent differences in investment capacity; and *geographic distance* can be a concern in terms of governance because it discourages participation in meetings, where strategic and operating decision are often taken. *Industry relatedness* is usually the impetus for a network contract because firms often form a network to collaborate, to share a common business activity and/or to solve common problems. The level of industry relatedness is connected to the *competition* issue, which was treated differently in each of the analysed cases. In the Racebo case, the firms formed a supply-chain network in which the presence of two directly competing firms was excluded. In the mushroom producers' case, the firms cooperated without competitive intent, with the aims of solving a common production and product quality issue, and creating a competitive advantage for the network's firms in order to challenge those

outsiders using 'unfair' competition. In both cases, the emerging idea is that the competitive advantage of the network firms defeats the companies outside the network while a cooperative intent prevails over a competitive intent inside the network (Stiles 2001). The exclusion of direct competitors from the network is a method of transferring conflicts outside the contract boundaries. Interviewed firms articulated feelings such as envy of the network firms' success and reported the construction of an 'invisible wall' dividing the network from the rest of the world.

Conflict is also present inside the contract, and usually relates to a different vision of the operating solutions to reach common network purposes. Conflicts regarding these purposes are usually solved by choosing strategies on which all the network participants agree. However, a certain level of conflict is unavoidable because although network firms become part of a new collaborative entity—metaphorically referred to as a 'flexible elephant' (Network Case 1—Director of a participating firm)—network contracts leave the participant firms autonomous. Therefore, the governance and management of the network is based on a balance in which *personal relationships* play a crucial role. All of the interviewed firms agreed that personal relationships must be cultivated among network firms, and stressed the importance of informal meetings to strengthen the sense of belonging to the 'group'. Formal and informal meeting occasions reinforce trust and create unplanned strategic opportunities that characterise a form of collaboration that is formalised but not in all the details and possible outcomes of the contract. In both analysed cases, the natural consequence of network contracts has been (or is expected to be) a merger between some of the companies, because 'network contract is an engagement' (Network Case 1—President of the network).

The idea that a network produces unexpected positive side effects, including a common intention to create a more competitive critical mass, could be one of the reasons why firms usually report difficulties in *measuring* the direct economic impact of network participation. Instead, the success of the alliance is usually measured through operating indicators, such as the concrete results of specific common initiatives, or it is described in terms of good perceptions stemming from the extrinsic evidence of ongoing participation and the *commitment* of the firms in the network. The research highlights a logical loop in which the different antecedents or critical success factors described in the literature are connected, as evidenced by the case studies: commitment is related to trust, cooperation and transparency, and requires some features of cultural compatibility and a certain balance in dissimilarities and relatedness; competition and conflict inside and outside the network can be managed by nurturing personal relationships; and network success measurement is not a primary issue for the analysed firms, and can be appreciated in terms of the ongoing commitment of the participating companies.

PERCEIVED BUYER CONFIDENCE IN BUYER-SUPPLIER RELATIONSHIPS

Chao, Emmanuel

Faculty of Economics and Social Science, University of Agder, Norway

ABSTRACT

Suppliers and buyers in business to business (B2B) relationships seek to build closer relationships to improve efficiency of the transactions. At the same time, they are vulnerable for potential hazards, such as opportunism. Foresighted managers are likely to choose exchange partners to whom they are confident that they will not behave opportunistically. While the notion of trust has been extensively conceptualized and analysed, surprisingly few scholars have focused on the concept of confidence and the antecedents of this in B2B relationships. Despite the importance of confidence in business relationship, very few scholars have empirically investigated the antecedents of this concept. In line with previous literature, this paper maintains that trust and control are the key sources for confidence. We use networks and reputation as indicators for trust, and ex ante contractual efforts and ex post contractual specifications as indicators for control. All these indicators have a positive impact on confidence. Trust and control seem to supplement each other as sources for confidence.

AN INVESTIGATION INTO THE IMPACT OF CORPORATE REBRANDING UPON CORPORATE PERFORMANCE IN A BOTTOM OF PYRAMID (BOP) CONTEXT: A CASE STUDY FOR TELECOM INDUSTRY IN BANGLADESH

Choudhury, Mohammad R. Uddin¹; Melewar, TC²

¹Middlesex University, London

²School of Business, Middlesex University, London

ABSTRACT

In a small developing country- Bangladesh, five companies out of six in the telecom industries did corporate re-branding in recent times. Re-branding also observed in other industries as well. Therefore, this research is going to investigate the relationship between corporate rebranding and corporate performance in a bottom of pyramid (BOP) context. In order to do that the identified research objectives are: to present a conceptual and empirical analysis of corporate re-branding in telecom industry in Bangladesh; to explore the impact of corporate re-branding upon company performance in telecommunication companies and to find out the critical factors for success or failure of re-branding in a Bottom of Pyramid context.

1. INTRODUCTION: RELATIONSHIP OF THE PROPOSED RESEARCH TO PREVIOUS WORK

In an increasingly competitive business world, survival and success depend on the aptitude to evolve gradually to meet new challenges that arise (Dubey and George, 2012). Some organizations elect to go much further and see corporate rebranding (CR) as the best way to remain competitive (Tevi and Otubanjo, 2013). Corporate rebranding is usually expressed by change of name, logo or even changes of slogan of a company. But in this modern business world it is not simply a tactical change in name or logo (Kay, 2006). It is an important marketing strategy decision of the corporation undertaken as a result of a change in the customer or employee base, new products and services or a revisited strategic position and value proposition (Cettier and Schmitt, 2008). Sometimes corporation can do re-branding for its international development and shift in emphasis from one business line to another (Melewar, Hussey and Srivoravilai 2005). Numerous prominent companies rebranded themselves such as Philip Morris, British Steel, Andersen Consulting, Silly PepsiCo, ExxonMobil and SciFi Channel etc. (Dubey and George 2012, Male, 2010, McCarthy, 2008). Cettier and Schmitt (cited above) in their study revealed that half of all rebranding activities were successful in the period 1995 to 2004. However, most of the recent corporate re-branding was unsuccessful (Male, 2010).

So, it is clear that corporate re-branding entails risk (Bravo, Montaner and Pina, 2009). That means the new brand may fail to attract new customers and potentially alienate existing ones. Despite the entailed risk corporations are involved in rebranding activities with the hope of better corporate performance. In line with the developed countries, many corporations of developing countries also rebranded in last decade (Machado, et. al., 2012). In a small developing country Bangladesh, five companies out of six in the telecom industries observed corporate rebranding in recent times. Rebranding also observed in other industries as well. The recent corporate rebranding in Bangladesh influences the researcher to undertake this study.

1.1 Rationale for this research

Previous research related to branding revealed that the consumers of developing countries, also known as Bottom of the Pyramid (BOP) customers, are not concern about the branding and corporate identity (Dubey and George, 2012). However, Companies (MNC's and Local) operating at BOP level are focusing on branding and re-branding activities to create unique corporate identity (Machado et. al, 2012). The vast literature on brand management has largely ignored corporate rebranding. But few researchers acknowledged the importance of corporate rebranding and its entailed complexities and risks (Tevi and Otubanjo, 2013).

In the available literature of corporate rebranding researchers mainly focused on developed countries and world renowned companies (Bravo, Montaner and Pina, 2009). However, few studies are also available for developing countries (Machado, et. al., 2012) and as per my knowledge no study was conducted in the context of developing country Bangladesh. Moreover, the reasons to rebrand can come from changing external conditions, weaker competitive position, changing ownerships structures and/or changes in corporate strategy (Hankinson and Lomax, 2006; Muzellec and Lambkin, 2006). All those factors are related to organizational perspective. One of the possible reasons for recent rebranding at telecom industry in Bangladesh can be changes of ownership structure. So, it raised an important research question, whether costly rebranding activities only for changes of ownership structure is helping the companies to improve corporate performance in a BOP context or not. The empirical investigation will help to develop a new theory regarding driving forces for rebranding and subsequent corporate performance in the context of developing country. It is yet to be identified that which factors influences the company to be rebranded though they are operating at BOP level and what are the driving forces for success and failure of rebranding activities in a BOP context. Therefore, the researcher is interested to explore the organizational perspective of rebranding for telecom industry in Bangladesh which will contribute to the literature by developing a comprehensive framework for rebranding at BOP context.

1.2 Research Objectives and Questions

1.2.1 Objectives

- To present a conceptual and empirical analysis of corporate re-branding in telecom industry in Bangladesh.
- To explore the impact of corporate re-branding upon company performance in telecommunication companies.
- To find out the critical factors for success or failure of re-branding in a Bottom of Pyramid context.

1.2.2 Research Questions

- i) Are the main reasons for corporate rebranding in telecom industry in Bangladesh different from developed countries?
- ii) Is there any long-term impact of corporate rebranding upon corporate performance for the organizations operating at telecom industry in a country of BOP consumers?
- iii) What were the critical factors behind the success and failure of corporate rebranding in BOP level?

2. METHODOLOGY

Glaser (1992), defines methodology as the theory of methods and gives an insight to the audience to gain better understanding of past research and give basic idea on how to proceed in future (Gammelgaard, 2004). In the 20th century, qualitative research has not received widespread use and acceptance. However, today the use of qualitative research is increased as a result of inefficiency in quantitative research. The aim of qualitative or interpretive studies is to reveal subjectivity, complexities, nuances, uniqueness and details that are usually ignored in quantitative studies (Klein and Myers, 1999; Mason, 2002). At the same time, qualitative results frequently express verbally the interpretation of something into text which could create an understanding of relationships or complex interactions.

To accomplish the aim of this research and to answer the research questions, the researcher has opted for a qualitative methodology by adopting a case study method to gather rich information and an insight into the phenomenon. According to Denzin and Lincoln (2005) qualitative research means “a situated activity that locates the observer in the world. It consists of a set of interpretive, material practices that make the world visible”.

2.1 Research Strategy: Case Study

This research adopts a case study strategy for the study. Eisenhardt (1989) stresses that “the case study is a research strategy which focuses on understanding the dynamics present within a single setting”. It is been proven from past research that case study can be used in both qualitative and quantitative research (Yin, 2009; Yin, 1994; Eisenhardt, 1989; Ellram, 1998). Case studies are often recommended for

exploratory and theory building research (Eisenhardt, 1989; Handfield and Melnyk, 1998; Yin, 2009). Yin (2009), explains a “case study is an empirical inquiry that investigates a contemporary phenomena in-depth and within its real life context, especially when the boundaries between the phenomena and the context are not clearly evident”. Therefore, the use of case study strategy in understanding the rebranding and corporate performance relationship in the Bangladeshi telecom industry context is justified.

Regarding the number of cases in a case study, there is also an overlapping argument whether to use single or multiple cases. This actually relates with what generalisations can be drawn from case studies. Both Eisenhardt (1989) and Yin (1994) suggest that one or many cases can be included in a case study. Yin (1994) and Irani et al. (2008), for example, claim that there is nothing wrong in using one case in case study research because “one can often generalise on the basis of a single case” (Flyvbjerg, 2006). Other researchers, such as Ellram (1996), claim that a single case is used to “test a well formulated theory, an extreme or „unique case”, or a case which represents a previously inaccessible phenomenon”. However, in this research, the researcher believes it is good to have multiple cases in order to gain rich data about the rebranding and corporate performance relationship for theory building and replication purposes (Eisenhardt, 1989; Miles and Huberman, 1994 and Yin, 2009).

It is significant to note that in order to perform a qualitative case study research it should be guided by case study protocol as suggested by past researchers (Eisenhardt, 1989; Rowley, 2002; Yin, 1994). This protocol needs to include an overview of the project, field procedures and case study questions (Rowley, 2002). The next section will discuss this in detail.

2.2 Case Study Protocol

Case study protocol is a set of guidelines for performing research which aim to summarise the constructs of the conceptual model (Eisenhardt, 1989). It has been identified as a key approach of increasing the reliability of case study research and is intended to guide the researcher in carrying out data collection. Ellram (1996), in a similar argument, explains that description of the data collection in a thorough protocol will increase the reliability of the research project. For the purpose of this research, a well-established methodological guideline is adopted, as suggested by Eisenhardt (1989), Flynn et al. (1994), Meredith (1993), Voss (2003), and Yin (1994) in order to increase validity of the research findings. According to Eisenhardt (1989), case study protocol is divided into three phases. The researcher will follow these three steps in conducting this research. The first phase is known as getting started where, at this phase, it includes the process of selecting the case and crafting an instrument protocol. In phase two, known as entering the field, data collection, analysis of the data and shaping the propositions is completed. In phase three, which Eisenhardt (1989) named as reaching

closure phase, it represents enfolded literature. In other words, at this stage, the researcher makes comparison with conflicting literature and comparisons with similar literature. Also, at these phases, theoretical saturation will be reached when the researcher discovers that every respondent says the same thing and, at this stage, closure of the case study research is reached.

However, stage two starts with the primary data collection through interview. Interview is a purposeful conversation between two or more people (Kahn and Cannell, 1957) where the interviewer directs the interview and the interviewee, known as the respondent, responds to the questions of the research (Easterby Smith et al., 2008; Robson, 2002). Interviews help the researcher to obtain valid and reliable data that are pertinent and relevant to the research questions and research objectives. The primary data collection method in this research is semi-structured interview conducted with five organisations (out of six organizations in telecom industry five organizations rebranded) along with observation and document review. These 5 organisations represent 5 case studies.

In this research, the cases are selected based on a purposive sampling technique. A purposive sampling technique enables the researcher to select cases that will best enable researchers to answer the research questions and research objectives. This type of sample is frequently used when working with small samples such as in case study research and when the researcher wishes to select cases that are particularly informative (Neuman, 2005; Saunders et al., 2009).

2.3 Research Design

It could be concluded that the researcher designed this research with critical flows; taking into consideration the issue of rigour and trustworthiness in this research as it is emphasised that rigour is significant to both qualitative and quantitative study; it is important to note every process involved in performing this research. The flow of the research design taken in this research is literature review; develop proposition; develop conceptual model; exploration to the field, validating and improving the proposed model; sampling; designing case study protocol; research process; data collection; data analysis; trustworthiness of the research; revised propositions and revised model etc.

2.4 Data Analysis

2.4.1 Transcribing the Qualitative Data

In this research, before the data is analysed, the researcher firstly transcribed the data from the interview from the recording (Saunders et al., 2009). The interview is audio recorded and subsequently transcribed which reproduces a verbatim written (word processed) account. As claimed by Saunders et al. (2009), the transcribing process is about not only being interested in what participants said, but also the way they said it. In this research, the task of transcribing the data from recorded to written text took much time because not only the words but also the tone of what is said is

transcribed; in addition the participant's non-verbal communications are recalled. It needs to ensure that it can be linked to the contextual information that locates the interview.

2.4.2 Qualitative Data Analysis

It is recognised that all qualitative data analysis including case study should follow a general analytic strategy, which defines priorities for what to analyse and why (Yin, 2009). It is similar to what has been proposed by Miles and Huberman (1994) and Silverman (2005). It should be noted that a helpful starting point is to play with the data. Yin (2009) and Miles and Huberman (1994) set guidance in order to comprehensively describe and summarise the data from the fieldwork. They are, for example, to put the information in different groups; make a category and place the evidence within categories; create data displays such as flowcharts or graphics to examine the data; tabulate the frequency of different factors and see the relationship among factors. In this research, data analysis will be started within the case analysis and follows with cross-case analysis. Each of the findings will be explained properly. There are approximately 15 methods of analysing qualitative data and this research adopts qualitative content analysis or thematic analysis. It has been chosen as it could determine the effect of the findings through the development of the research proposition as a result from having reached saturation for every code.

2.4.3 Qualitative Content Analysis

Qualitative content analysis, also known as thematic analysis, is one of the popular methods in analysing qualitative data. It is an interpretation method for qualitative interviews (Kolbarcher, 2006; Zhang and Wildemuth, 2006) which involves activity like summarising raw data into categories or themes based on valid understanding and interpretation. This process uses inductive reasoning, by which themes and categories emerge from the data through the researcher's careful analysis and continuous comparison. Also, importantly this process should not exclude deductive reasoning, where a deductive thematic analytic approach is also useful in this process (Miles and Huberman, 1994; Patton, 2002). According to Hsieh and Shannon (2005), there are three approaches to qualitative content analysis, namely, conventional qualitative content analysis, directed content analysis and summative content analysis. However, in this research eight steps of qualitative content analysis (Zhang and Wildemuth, 2006) will be followed.

2.4.4 Strategies and Techniques Use in the Qualitative Data Analysis

This research will use two general strategies as proposed by Yin (2009): developing case description; and relying on theoretical proposition. Data analysis will be started with a case by case analysis, also known as within case analysis. The cross-case analysis will also be performed where the researcher looks at the similarities and differences featured among the case. In highlighting the research findings in this thesis, the researcher also uses a case-ordered descriptive matrix in order to provide descriptive

data from all the cases (Miles and Huberman, 1994). It should be explained, here, that the researcher will also use a case-ordered effect matrix to discuss the findings in each case and overall conclusion as suggested by Miles and Huberman (1994). What is more, as a result the conclusion of each theme will be made for every case discussion.

2.4.5 Tools in Analysing Qualitative Data

Qualitative content analysis could be done manually and with the existence of software computer tools. As suggested by Bazeley (2002), the use of computer software in analysing qualitative data can increase the rigour. In the last decade, many researchers have mainly used manual thematic analysis in order to analyse qualitative data. However, at present with the development of information technology (IT), the use of computer software can be seen as strategic tools to help the researcher to conduct analysis systematically. In this research, the researcher will use the NVivo 9 software in order to deal with the complexity of data as it functions as a strategic project management tool where all the interview data could be stored in one place, together with other sources such as documents, observation notes and photographs taken during observation. At the same time, an analysis notes folder can be added and this, of course, will make the analysis process more organised, systematic and comfortable to the researcher when undertaking analysis, thus enabling the coding process to be performed more systematically, with data from coding easily been derived through matrix coding tasks.

2.4.6 Verification, Validation and Triangulation

As an interpretive researcher, it should be highlighted, here, that there is a difference between determining the effect of the findings from qualitative research with the positivist research paradigm which mostly uses structural equation modelling (SEM). Even in evaluating the quality of the research, the criteria are different and a positivist paradigm uses validity, reliability and objectivity to value the quality of research. According to Bradley (1993) these three conventional criteria are not suitable for the interpretive paradigm that uses qualitative content analysis as the method of analysis as they are different in basic assumptions, research purpose and conclusion process. In order to ensure rigour and to validate and verify this current research, the researcher will deal with the issue of trustworthiness by following the rules developed by Lincoln and Guba (1985) and also followed by other qualitative researchers (Zhang and Wildemuth, 2006). It is significant to highlight that in evaluating interpretive research work, the researcher must make sure that they have these four criteria, namely, credibility, transferability, dependability and confirmability (Lincoln and Guba, 1985). Each of these four criteria has a different description and points to ensure the certainty of the research. According to Bradley (1993), credibility refers to “adequate representation of the constructions of the social world under study”. In other words, it actually ensures the accuracy of the

research. For example, in this research, triangulation, checking interpretation against fresh data, peer debriefing and member checking will also be performed. This process is recognised to enhance the credibility of the research (Lincoln and Guba, 1985).

3. CONCEPTUAL FRAMEWORK

As the case study method would be followed for this research, a conceptual framework has been developed and presented in the figure below. The developed conceptual model as a result of the discussions so far, will be validated during the empirical fieldwork. Figure shows that there are three main factors being explored in this research, namely internal, external and outcome factors, with regard to rebranding at BOP level, and each of these factors consists of several sub-factors. The main outcome expected is a significant positive effect of rebranding on company profitability. Figure also highlights “other factors” as the researcher believes other issues may come to light during the empirical work in consequence of the respondents wanting to share ideas during the interview sessions. This is because, as mentioned earlier, the research is based on BOP customer that might influence the relationship as claimed by previous researcher. Also, specifically, at the end of the interview, respondents will be asked whether there are any other matters they might want to share, and from this prompting, other factors may emerge.

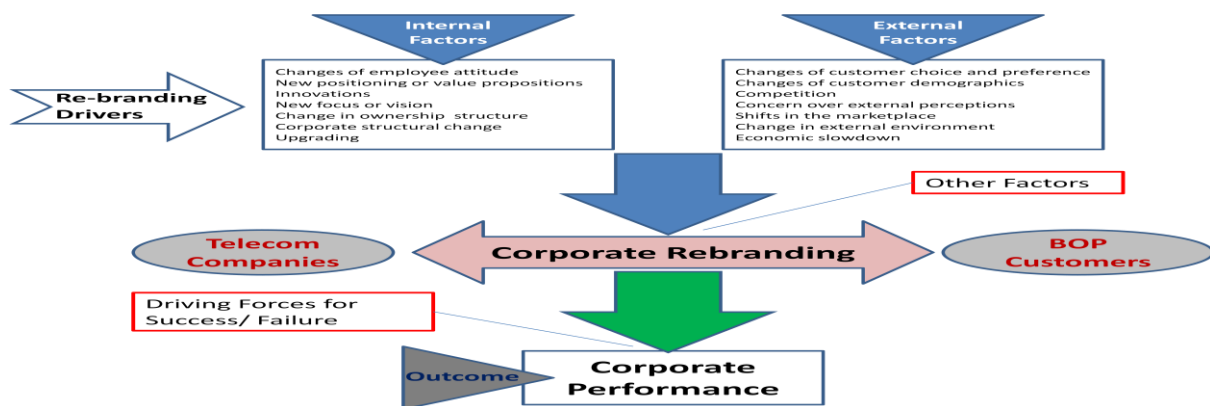

Figure: Conceptual Framework

Source: Researchers own development

4. EXPECTED OUTCOMES

This research has been undertaken as a result of the inability of previous studies to provide a clearer understanding of the issue rebranding and its success at BOP level. As discussed earlier, the internal

and external factors have an import influence on the rebranding programme. However, it is expected that the factors that influence the companies to be rebranded could be different for developing countries specially the countries with BOP population. Therefore, this research will further explore the re-branding driver in order to enhance the current theory relating to the rebranding practices. Additionally, researcher expects that rebranding at BOP level will have a positive impact on company performance in the long run though the impact on short run could be negative. As the research will be carried out specifically for the Bangladesh telecom industry which is a developing country with BOP population and it is expected that the critical factors for success or failure would not be the similar in regards to developed country. Finally, other factors might emerge from the research which will help to explain the rebranding activities in BOP market.

THE REFORM OF GOVERNMENTAL ACCOUNTING STANDARDS IN GREECE: DECISION-MAKING THROUGH THE “GARBAGE CAN”

Cohen, Sandra; Karatzimas, Sotirios

Department of Business Administration, Athens University of Economics and Business, Greece

ABSTRACT

The last decades the New Public Financial Management (NPFM) concept promotes the necessity of using financial management techniques for the development of an efficient and effective public sector. The changes of financial reporting systems emphasising on the application of accrual based accounting and even towards the adoption of international accounting standards (e.g. International Public Sector Accounting Standards) constitute typical forms of NPFM reforms (Guthrie *et al.*, 1999; Lapsley *et al.*, 2009). The reasons leading to such reforms could be traced in the need for improved accountability, transparency and decision-usefulness of the information provided by the public sector requested by the numerous different users (Kober *et al.*, 2010). These users are members of the parliament and constituents of the state, but also other interested parties, such as lenders and other resource providers. Especially in periods of severe global recessions, states have to abide by recommendations deriving from external resource providers (Carpenter and Feroz, 2001). Therefore, resource dependency plays also a significant role in the accounting reforms in the public sector.

Within this context, the Greek central government recently proceeded in the reform of its governmental financial reporting system. The Greek state assigned this task to a commission of experts which brought together public sector executives and external consultants. The output of the commission was a set of new accounting standards under the modified-cash basis of accounting which superseded the until-then applied cash based standards. This move intended to improve the quality and usefulness of the provided accounting information, which had been questioned by both external organizations such as the International Monetary Fund (IMF), the European Commission (EC) and the Organization for Economic Cooperation and Development (OECD), as well as by internal users (voters and public managers) (Ministry of Finance, 2009). Furthermore, this reform was launched as an interim step before a future move to full accrual accounting (Cohen *et al.*, 2014).

The scope of the present paper is to study the standard setting process in the central government level in a country that operates under special circumstances of financial strain. Greece has been deeply injured by a severe financial crisis that has been evident to the country since 2009, and resulted to the country's entering in 2010 the financial support mechanism of the IMF, the European Central Bank (ECB) and the E.C., commonly referred to as Troika. The fund providers within the technical memoranda emphasize and demand the modernizing of Greek public sector, indicating several

structural reforms that touch upon financial management and governmental accounting systems. Within this framework, we analyze the decision-making process during the development of the new set of accounting standards by unraveling the role of different actors. As the success of such reforms relays heavily on the role and incentives of the involved actors (Niskanen, 1971; Giroux, 1989) we apply the theoretical lens of public choice theory in an attempt to understand the incentives of bureaucrats, external consultants, voters, political leaders and resource providers that have played a role in the reform process. Decision-making in the public sector is characterized by limited economic rationality, which often drives public sector entities towards acting as “organized anarchies” (Cooper *et al.*, 1981). The garbage can model provides insights that facilitate the understanding of the choices made while deciding on the set of governments accounting standards. Our theoretical framework is informed by the outcome of interviews and informal discussions with members of the commission that developed the new set of accounting standards, as well as by relevant archival data (e.g. IMF and OECD reports, Greek Ministry of Finance reports, etc.).

We consider that Greece is an interesting setting to study accounting standards decision making in the central government level, mainly for two reasons: First, because the country is under a vortex of financial and administrative reforms and this transition is very important if seen through the light of Greece’s resource dependency. Second, because the Greek public sector is characterized by a deeply cultivated bureaucracy (Sotirakou and Zeppou, 2005). This latter characteristic offers another interesting dimension to the research; how decisions are made –and who eventually makes them– in a country where strong bureaucracy prevails. The findings indicate the lack of effective monitoring of the process from both politicians and external resource providers. Eventually, the set of standards developed is largely the outcome of the incentives and the cooperation of bureaucrats and consultants. The results moreover, provide evidence of unclear technology, fluid participation and problematic preferences, which indicate decision-making through the “garbage can”.

USING CHOICE EXPERIMENTS TO EVALUATE CONSUMERS PREFERENCES ON ORGANIC WINES

Contò, Francesco¹; Fiore, Mariantonietta¹; Antonazzo, Anna Paola¹; Marchesino, Luca²

¹Dept. of Economics, University of Foggia, Italy

²Daunia Rurale LAG, Apulia Region, Italy

ABSTRACT

OBJECTIVES

Although research on consumers preferences towards organic food appears copious and exhaustive, much is still to be accomplished about the perception of consumers with respect to organic wine. The new European regulation on organic wine clearly opens new opportunities of growth and competitiveness for producers. The establishment of the Reg. (EC) No 834/2007 complemented by Reg. (EU) No 203/2012 marking the transition from the “made from organic grapes” label to the “organic wine” label, enhanced the economic-ecological and social meaning of oenological products. Although the wine consumer retains a tendency to focus more on the price of the product and still appears distracted from the packaging and brand awareness (Forbes & Dean, 2013; Mueller & Szolnoki, 2010), new trends in preferences move towards innovative oenological products characterized by low content in sulphites and lower content in alcohol. Exposed to the pressure of demand changes, evolution of consumer preferences and competition of global markets, wine producers might see in consumer expectations for quality, sustainability and safety a significant opportunity to differentiate their products according to different markets segments particularly focusing on higher added value products (Chiodo et al., 2011). When selecting a product the consumer is often unable to give a scale of priorities and a monetary value to product's attributes. Instead, the consumer chooses the product as a whole or by means of its complexity of tangible and intangible attributes. Wine belongs to a product category whose consumption can be considered of hedonistic type (Scarpi, 2005), since it stimulates ‘multi-sensory, fantasy and emotional aspects of consumer's usage experience’ (Hirschman and Holbrook, 1982 p.92). Moreover, wine consumption assumed over years, an important cultural and social value among habitual consumers. The evocative meaning of wines recall the territory of origin and this function especially emerge among consumers inclined to travel in wine regions (Santos & Ribeiro, 2005). Interesting might be in our opinion, to address monetary value of organic attribute of wines within a target of consumers willing to consumption of quality wine and travel to live the evocative experience that wine can bring with itself. The work has the aim to address the value that this particular segment of consumer gives to the "organic" component of wines compared to other

attributes such as Protected Designation of Origin, region of origin and price. The study might imply interesting marketing suggestions for local wine companies selling their organic wines through the HORECA distribution channel, that mostly supplies foreign visitors.

METHODOLOGY: CHOICE EXPERIMENTS DESIGN AND MODEL ESTIMATION

The methodology consists of Choice Experiments (CE), which has its origins in Conjoint Analysis methods, used as well in marketing research and transport economics (Louviere and Hensher 1982, Louviere and Woodworth 1983). The CA methods have evolved and developed as Choice Experiments (CE) to address the economic value of public goods (Burton and Pearse, 2001; Burton et al., 2001; Travisi and Nijkamp, 2004). CE tools combine the theory of value (Lancaster, 1966) and the Random Utility Model (RUM) proposed by McFadden (1974) to assess consumer preferences. In the field of contingent valuation elicitation the choice models have received increasing attention in recent years showing significant advantages compared to other tools. The choice modelling is applicable in situations of discrete choice or when the decision-makers choose among a set of alternatives where the number of alternatives is a finite set and in case they are mutually exclusive. Moreover, the set of alternatives must be exhaustive: all possible alternatives are included and the respondents have to choose an alternative contained in the collection. The CM also differs from other methods because the Declare Preferences respondents are shown various alternative descriptions of the property that differ from the different levels made by the attributes through which they are described, and asked them to choose the alternative that most prefer. The CM, then, is based on the theory demand by Lancaster (1966), whereby each well can be described according to a set of characteristics (Hanley, 1998). The goods are different, so, for the different intensity or size that can take on different characteristics. Consequently, the utility that it arises from the consumption of these goods is seen as a weighted sum of the utilities attributable to each feature (attribute). The basic theoretical assumption is that individuals in their actual behavior as buyers, are able to choose between alternative options, each one characterized by a finite number of attributes articulated in different levels (Burton, 2001). With reference to purchase choices, according to the Random Utility Model (RUM), the consumer takes their own choices, identifying alternatives, providing the highest level of utility, i.e. the probability that a consumer chooses an alternative characteristic increase the utility associated with it. The experimental design section explores the construction of the design and the descriptive statistics of the sample. Under the suggestions of the prominent literature on the consumer preferences of wine and the choice experiments we proposed to the respondents the choices of three products characterized by four attributes. The methodology implied the creation of a hypothetical market of wines with multiple

choice alternatives defined on different levels of the relevant attributes. For each set of products respondents were asked to select the most preferred one. We considered the following attributes level for the organic wine: (i) origin: for the purpose of the research we chose to add attributes that states the consumer preference towards wine produced in the Apulia region or produced in the rest of the national territory; (ii) the core attribute of characterizing the consumer choice is the organic label (presence/absence); (iii) Protected Designation of Origin (presence/absence); (iv) three level of prices: 3-7 €/bottle; 7-12 €/bottle; 12-20 €/bottle. The Choice Experiments were conducted in June and July of 2013 in South Italy. The data have been collected during the event “Calici di Stelle” (“Starry Glasses”), in Trani (Apulia, South Italy), which is an annual wine tasting event fostering the tourism of wine in regions whose wine companies invest particularly on high quality and sustainability of their products. The survey was administered to be exhaustive and representative of the Italian population in terms of age and gender. Only respondents over 18 years old have been surveyed. The questionnaire on consumers’ preferences was composed of four parts. The first part contains questions about personal information and socioeconomic characteristics of the respondents. The second part investigates the attitudes of consumers toward the consumption of organic foods, as well as attitudes towards the environments. The latter allowed to elicit consumer’s preferences about organic food products, occasion of purchase and their awareness about organic food product benefits of consumption related to human health and the environment. The third part of the questionnaire focused on wine consumption behaviour and preferences. The fourth and last part contains the Choice Experiment sets sections. The questionnaires were submitted through face-to-face interviews to 300 respondents, but complete questionnaires were collected only in 258 cases.

EXPECTED RESULTS

Fulfilling the informative gap on the consumers perception of the organic components may foster competitiveness of local producers on competitive global markets. An important step in the interpretation of the results obtained with the estimation of the CM is the determination of path worth, such as the monetary value of the utility that the consumer assigns to a change in the level of one of the attributes typifying the product. Once analyzing the data we expect to obtain indicators on WTP for attributes of local wines with particular regards to organic component, we expect to obtain a quantitative of the monetary value of each component and a hierarchy of values associated with each attribute of the product in order to provide important indications to wine market operators.

A GENERALIZED LOTKA-VOLTERRA MODEL (GLVM) ADEQUACY OF A VOTING PROCESS

Costea, Carmen¹; Balta, Cornel²

¹Spiru Haret University

²Soc Univ. Alexandru Lapusneanu

ABSTRACT

The paper is developed as an application of a generalized Lotka-Volterra model (GLVM) used for the actual voting process analyze and forecasting. Initially started as a comparative basis between Argentinean and Romanian political systems, the research is now developed on Romanian comparative public data from polls and newspapers in order to build the new model parameters. The main goals of this paper are: a) to give an *ansatz* about the meaning of the three parameters' model in an electoral process and correlated them with real data; b) to predict the result for the next Romanian presidential situation before the Fall presidential election.

ARGUMENT

People and scientists use to say that life is complex; however politics is even more. What looks good in a domain could be rocky path through the wilderness of so called opportunities in another one.

The human cognition process constitutes a process of exchange information among individual to check, correct or not some 'personal observations' in order to reach preliminary conclusions. The dynamic processes link citizens to various mental models including entities and large numbers of practical choices seen as opportunities. To pick it up correctly, one needs to understand the realities as they are not as they look to be.

Mental models include different ingredients and structures as ideology, religion, education level, expectations, and beliefs, internal and external norms, lining up a complex system to lashing interrelated degrees of freedom.

The complexity, as a relevant and elusive property of social systems has to be considered when analyse and adopt different behaviours in response to different situations [1, 2]. Mental models allow us to manage ourselves in ordinary life and being the basis of our own decision-making processes.

The high complexity of human individuals together with the relations among them requires new methods to describe the continuous change of social paradigms that characterizes the contemporary society. Each socio- political system, as a whole, performs day-to-day evaluations that help distinguishing between desirable and non-desirable evolutions of diverse social trends according to particular political, ethical, and ideological attitudes and norms in the model's workings [3].

The fast irruption of the Information and Communications Technologies (ICT) into individuals' life, like socioeconomic uncertainty, labour stress, the digital divide and its consequent inequality, as well as other problems such as regulatory frames, data protection, privacy, security, intellectual copyright [4], augments the complexity of social systems to a degree not seen before in the human history.

The basic fact is that into the Information Society the interaction among individuals, companies, and governments occurs at great speed, not only between them but also among themselves. Therefore new tools are necessary for evaluating and prospecting this complex dynamics in any areas like social, psychological, economical, industrial, legal, ethical as systematic paths to understand that the impact of the ICT in Society is irreversible and unavoidable. Elections times are, as well, among those dynamic elements.

THE MODEL APPLICATION

The decision making in all stamens requires a careful risk management. The abundance of information, at times contradictory, at times wrong, which the individuals belonging to every subsystem receive, increases the difficulties in the process of transforming information into the knowledge necessary to make a decision-action, leaving always a doubt with respect to its quality, that is to say, as a result of the complex dynamics of the IS, the decision-actions taken will always have a margin of uncertainty.

In this contribution we applied a generalized Lotka-Volterra (L-V) model used some years ago to describe the competition between websites[5] and recently to find hung scenarios and contrarians' dynamics in sociology [6]. Now we evaluate its potential to analyze and forecast modelled capabilities to the actual voting process.

The first problem is to define which data (polls) are represented by the model parameters, as well as if the *ansatz* shown below is or not correct. Our first attempt considered a comparative analyse between Romania and Argentina last presidential elections. At the time, we used public polls and newspapers for Romania to predict the Argentinean future results ¹[9]. This new contribution will bring up to our attention the political horizons of the members of a given political system, in terms of the L-V model.

¹ It deserves a special paragraph to explain why this two countries. There are several reasons to do so, among which we can enumerate the following: a) both democracies are relatively young (Argentina since 1983, Romania, 1989), b) Argentina is a presidential and Romania a semi presidential representative democratic republics. Meantime the President of Argentina is both head of state and head of government, Romania has President and Prime Minister charges; c) Both have Senate and Chamber of Deputies. In the Argentinean case the Senate President is the Nation Vice President and they are elected as a whole. Instead in Romania President and Prime Minister may come from different parties. Once elected the President remains independent. d) Both electoral systems have ballotage, and e) probably the most important MAS approach to political prospection and alliance analysis ³ there are more than two or three structured parties which gives rise to a game of alliances.

In this sense the different candidates are “agents” of the system, whose chances are measured by polls. No political considerations are taken into account, neither the simulations presented reflects political opinions of the authors. Only public information has been used to check the qualities of the model and make a new prediction for the future fall elections.

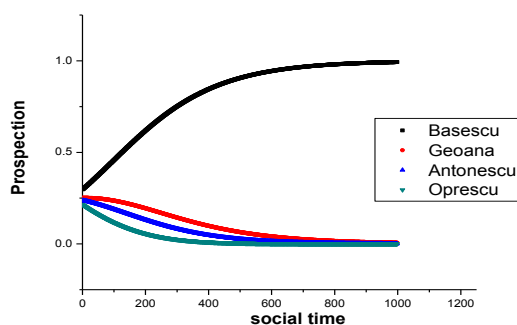

We have started with the 2009 case and the CCSB data regarding the elections which took place on November 26, 2009 and ended on December 6. Now, we know both the final results and the final alliances achieved. Now we can “prospect” chances of different other alliances and compare them with the result. We prospect the horizon of each agent of the Romanian political system, assuming the following considerations: a) positive percentage represents the positive image, and it is represented by the β parameter; b) the remaining percentage is the negative image and is used to determine the initial conditions of each agent, taken them as the inverse of the negative image.

The 2009 initial numerical simulation considered the candidates using data from another CCBS poll (July, 2009), where the public opinion efforts focused on investigation of potential alliances between two parties (PDL and PNL+PSD) and the independent candidate.

Table I

Candidate	Positive image	Party
Sorin Oprescu	0.45	Independent
Traian Basescu	0.37	PDL
Crin Antonescu	0.35	PNL
Mircea Geoana	0.32	PSD

Data from Table I is plotted in Figure 1:

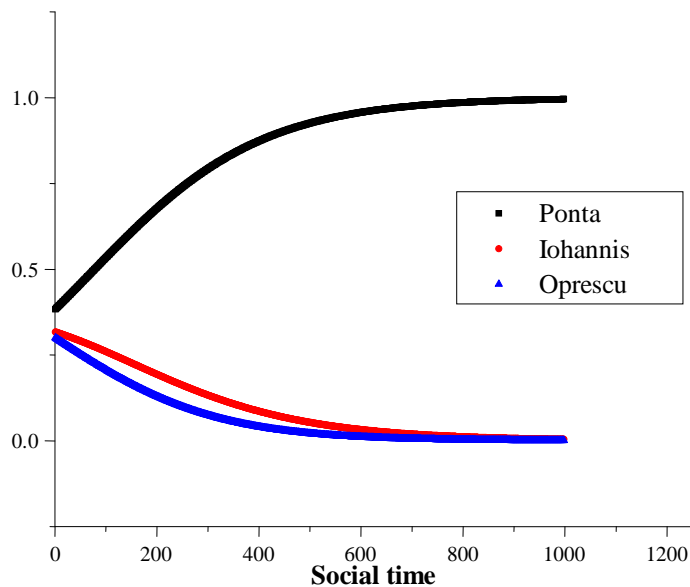

Simulations, as well as initial conditions have been normalized for the sake of simplicity. So: $f_i(0)$ are: 0.132, 0.170, 0.1760 and β 's are: 0.483, 0.372, 0.349, 0.341, 0.318, 0.270. The $\gamma_{i,j}$'s are +1 for all the simulations (competitive scenario), unless some alliance is explicated. The α' is, interpreted here as the growth rate of the candidate i are equal to +1, in all simulations.

Tabel II

Case B	Positive Image	Party
Victor Ponta	0.46	PSD
Klaus Iohannis	0.25	PNL+PDL
Sorin Oprescu	0.16	Independent

The numerical simulation (data from Table II) is plotted in Figure 2.

Prospection

The research proves that the *ansatz* on model parameters validated the 2009 Romanian results got by using the Romanian polls, and secondly validated them, based on the Argentinean election results. The model used this way may prove the need for other versions of alliances for the new Romanian elections based on the vote intentions and the positive images of potential candidates in less than 100 days before the new elections.

Keywords: multi agent simulations, complex behaviour, nonlinear dynamics, political prospection.

ORGANIZATIONAL ANTECEDENTS OF MANAGERIAL ORIENTATIONS

Dahan, Gavriel¹; Shoham, Aviv²

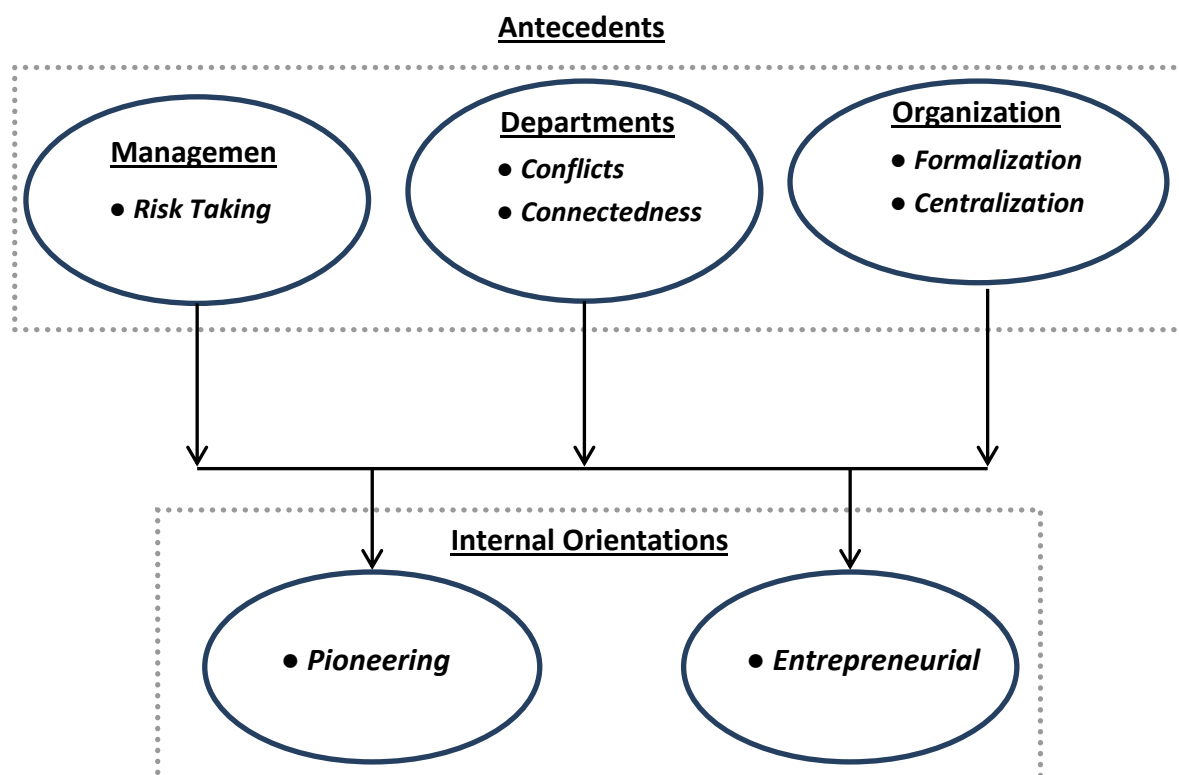

¹Department of Economics, Western Galilee College, Israel

²Department of Business Administration, University of Haifa, Israel

ABSTRACT

Strategic orientations have attracted scholars' attention across disciplines. The pros and cons of such orientations have been studied extensively. However, studies have focused mainly on outcomes of such orientations but less so on their antecedents. Against this background, we developed and tested a model of organizational antecedents of pioneering and entrepreneurial orientations.

THE MODEL

ANTECEDENTS

As presented in the model above, this research focuses on internal orientations and organizational antecedents since managers control such factors. Based on Jaworski and Kohli (1993), antecedents include three multi-faceted sets of factors: management, departments, and the organization.

INTERNAL ORIENTATIONS

Prior studies have argued that firms should develop and use multiple orientations (Hakala, 2011) since no single orientation leads to superior performance in all situations (Noble, Sinha and Kumar, 2002). Our research focused on pioneering and entrepreneurial orientations. Although the conceptualizations of these orientations overlap to an extent (e.g., risk taking and innovation), we used distinct operationalization taken from the literature thus minimizing operational overlaps. We claim that pioneering and entrepreneurial orientations represent different world-views and lenses through which firms view and act on the environment.

RESULTS

Our model aimed to find relationships between an antecedents and internal orientations such pioneering and entrepreneurial orientations.

We conducted two regression models. Each of models examined separately what antecedent impact pioneering and entrepreneurial orientations.

The main findings show that **Risk Taking** was found significant ($p < 0.05$) and effect on both orientations. Additionally, we suggest that adopting a risk taking could improve the success of opportunities and responding to competitive threats in the marketplace which eventually increase firm performance.

EXPLORING THE LINK BETWEEN VALUE CHAIN MODELS AND LEADERSHIP COMMUNICATION

De Lange, Lucrezea

Communication Science Department, University of the Free State (UFS), Bloemfontein, South Africa

ABSTRACT

Organisations need to **perform**, but it is becoming more and more difficult. The effect of globalisation, together with the global economic crisis of 2008-2009 has had a serious impact on businesses (Mahoney 2011). In the competitive environment that organisations are finding themselves in, successful organisations are those that manage their businesses from a market perspective (Barker & Angelopulo 2006). In 1985 Michael Porter developed the **value chain**, which has since become a common phenomenon in organisational management. This model describes the activities and processes within and around an organisation while relating them to an analysis of the competitive strength of the organisation (Recklies 2001).

With the value chain's contribution to organisational effectiveness established, the focus moved to the role of manager or leaders in organisational performance. The important role of the leader in the **leadership process** has been emphasised consistently in history and literature (Bratton, Grint & Nelson 2005). It is acknowledged that unsurpassed quality and service delivery are no longer the only assets that distinguish a company from its competition. The value chain framework can be used as powerful analysis tool for the strategic planning of a company and to build the organisational model ensuring an effective leadership model (Stonehouse & Snowden 2007:257). Leadership is vital to organisational effectiveness, and by far the most influential component to organisational resilience, longevity, and brand recognition (Hawkings 2008). But the value chain and leadership processes should not be isolated activities, therefore Kaiser and Overfield (2010) developed the **leadership value chain** to integrate these two very important performance drivers. These authors address the fact that contemporary society requires organisational leaders to find specific ways to cope with broader roles and responsibilities. As such, organisational decision makers are now choosing to add value to their companies by enhancing the quality of their leaders (Bratton, Grint & Nelson 2005).

Another aspect closely linked to organisational performance and effectiveness is **communication** and **effective leadership communication**. When CEOs and other senior executives in all industries and countries are asked to list the most important skills a manager must possess, the answer consistently includes – good communication skills. However, in a review of the top MBA programmes across the USA, strategic integrated communication courses were not included in the core curricula. Business communication is the only form of communication training that features as elective in some of these

programmes. An investigation into the prescribed modules of MBA courses at business schools and universities across South Africa yielded similar results.

Another aspect closely linked to communication, is the growing importance of stakeholder relations and stakeholder communication (De Paula 2006). Not only have organisations become boundary-less entities with the entire world as their domain, but they have also experienced a multiplication of stakeholders. Contemporary organisations no longer question whether or not they should be communicating with these stakeholder groups, but rather how to manage communication across stakeholder groups. One can therefore deduct that organisational performance and stakeholder relations are closely linked. Consequently, just as the value chain and leadership processes had to be incorporated it is argued that it could be beneficial to organisations if communication is integrated within the leadership value chain. This view is supported by Niemann (2005) who states that organisations the world over should be taking a more professional and integrated approach to communication.

Against this background the aim of this paper is to analyse and discuss the leadership value chain and contextualise it within an integrated communication approach. A qualitative literature review will be employed with conceptual analysis as research strategy. Conceptual research will be used to analyse the leadership value chain components and link it to the fundamental principles of integrated communication. Conceptual research is considered by Friedl, De Vos and Fouche (in De Vos 2002) as a type of advanced literature review and accepted method of textual investigation, particularly in the field of communication and therefore relevant to this study (De Vos 2002). The researcher sampled documents on the basis of their potential manifestation or representation of important theoretical constructs related to the leadership value chain model and integrated communication. The results of this study could yield valuable insight with regard to the way in which communication can be integrated in the leadership value chain, which are utilised by both large and small enterprises alike.

Keywords: *Leadership value chain, strategic integrated communication, stakeholder relations, conceptual analysis*

MANAGERS' VOICES IN CONFLICT SITUATIONS – OPENING DOORS, WAITING FOR THEM TO OPEN OR STAYING BEHIND CLOSED DOORS: GENDER PERSPECTIVE

Desivilya Syna, Helena¹; Yagil, Dana²

¹Department of Sociology and Anthropology, The Max Stern Yezreel Valley College, Israel

²Department of Human Services, University of Haifa, Israel

ABSTRACT

RESEARCH AIMS

The current study aimed to illuminate the **construal of voice** by upper echelon managers: perception of voice as in-role versus extra-role behaviors and discerning its functions in exercising power and exerting influence in organizations. In addition it was designed to elucidate the strategies managers use to meaningfully express their voices, to unravel the mechanisms whereby their voices are suppressed and explore their reactions to such silencing attempts. This paper focuses on the **meaning of voice** and its **manifestations** in **organizational conflict** situations, while embracing **gender perspective**. The current research endeavor constitutes a new departure in voice research by looking at the construal of both voice and silencing as well as focusing on upper echelon managers, previously hardly studied in this domain.

THEORETICAL BACKGROUND

Effective strategic management at the upper echelons constitutes a vital component of organizational sustainability in the current complex socio-political, economic and cultural environment. The capacity to openly express critical opinions concerning organizational policy and present propositions for changes deems essential in promoting such goals (LePine & Van Dyne, 2001). The latter vital capability constitutes a challenge for managers as it requires them to engage conflicts rooted in both structural and process aspects of organizations.

The complex contemporary reality makes organizations vibrant sites of conflicts within and between stakeholder groups (Bidwell et. al, 2013; Desivilya Syna, 2011; Kolb and Putnam, 1992; Putnam, 2010). Each party attempts to shape organizational practices, using intra-organizational negotiation with the other parties and mobilizing internal as well as external support. Disputes and discords stem from divergent expectations and perceptions of different actors and their tendencies to control organizational processes and outcomes. Consequently, **power** concerns are salient in organizational

settings, sometimes in an explicit form, but more often in a symbolic fashion (Desivilya Syna & Rottman, 2012; Fuller, 2011; Putnam, 2010).

Thus, the main query explored in this paper revolves around manifestations of the need for control of upper echelon managers in conflict situations; namely, how do women and men at the top of organizations maneuver in the course of actual conflict in order to meaningfully express their voice, thereby asserting their organizational positions but at the same time minimizing personal costs.

Voice has been construed as behavior that challenges the status quo with the intent of improving a situation rather than merely criticizing it (LePine & Van Dyne, 1998). It includes such behaviors as speaking up about organizational issues and suggesting changes to strategies, structures and processes (Van Dyne et al., 1995; Van Dyne & LePine, 1998). The prevailing trend in the literature has been to construct voice as employee's **extra-role** behavior; namely, actions not required by formal job definitions. Presumably, the construal of voice in manager's position is quite distinct; constitutes an inherent component of her or his job that is **in-role** behavior. We have examined the latter assumption in the current study.

Due to the complex socio-political and economic reality, which affects today's organizations, upper echelon managers are not always capable of voicing their concerns, expressing critical opinions and suggesting radical policy changes. Thus, investigation of voice suppression mechanisms and strategies used by senior managers to engage such silencing attempts, especially in conflict situations appears vital. Some evidence in this regard comes from research on gender in organizations, suggesting that women are often accorded visibility on the superficial level, albeit implicitly silenced (Simpson & Lewis, 2005). In a similar vein, Clair *et al.* (2012) showed that demographically atypical professionals are often subtly silenced and marginalized. Suppression and silencing of voices, especially at the upper echelons of organizations can have detrimental effects on the quality of strategic decisions and thereby on organizational members and the public in the society at large. Yet, extant research has hardly examined the ways whereby senior managers' expressions of genuine concerns are halted and how do they react to such attempts. The current study attempted to shed some light on the suppression mechanisms and upper echelon managers' strategies to deal with silencing attempts. This study also endeavored to discern the role of gender in construal of voice and silencing, voicing strategies and reactions to silencing while facing organizational conflicts. Previous research on women's voices in management and specifically in conflict situations show that female managers in comparison to male managers often attend organizational discords and engage organizational power issues rather differently (Desivilya Syna and Palgi, in press; Kolb and McGinn, 2011).

In sum, the **central questions** examined in the current study were:

- How do upper echelon managers – women and men - construe voice in conflict situations? Do they view it as intra-role versus extra-role behaviors?
- What kind of strategies female and male managers at upper echelons of organizations employ to voice their concerns in conflict situations?
- How do upper echelon managers perceive the attempts to suppress their voices in conflict situations?

METHODOLOGY

The study attempted to encourage the study participants to reflect upon their management practice: discern the meaning and role of voice in their management practice, elucidate their strategies of voicing and reactions to silencing. To accomplish this goal a qualitative methodology was employed.

Study Participants. Twenty nine managers (13 women and 16 men) at upper echelon positions in private (e.g., a head of operation division in industry), public (e.g., head physician of a medical department in major public hospital, head of academic administration in an academic institution) and third sector organizations (e.g., a manager of NGO) were recruited to participate in the study. A snow-ball technique was used to invite senior managers to take part in this research, starting with acquaintances and asking them to suggest other prospective participants. To protect the participants' rights and comply with research ethics principles, all the identifying information of the participants was transformed into codes and all the data is kept solely in the research team's records. Upon the completion of data analyses the participants will receive the summary of findings.

The Research Tool. The research tool was **in depth individual interview** conducted face-to-face with each participant. It was designed to elucidate each participant's construal of their respective experiences of voicing (focusing on their choice of strategies), suppression of their voices and their reactions to such attempts. The current paper focuses on a subset of three questions focusing on managers' voice in conflict situations:

- **Situations of disagreement:** *"Situations of disagreement are quite frequent at upper echelons of organizations, could you please describe your experiences in this area."*
- *"Please describe a recent case of a disagreement with somebody at work (your peers or superior). Who was the other person? What have you done? What has the other person done? What were the outcomes?"*
- **Expressed criticism:** *"Please give me an example of a situation when you expressed criticism with regard to something that happens in your organizations (not criticism of your subordinates). To whom have you expressed it? How? What were the reactions?"*

- **Criticism not expressed:** *"Please describe a case where you have been critical with regarding to something in your organization but you have not expressed your criticism. Why?"*

INITIAL FINDINGS AND CONCLUSIONS

Data analysis entailed content analysis, which was executed in accordance with the principles of qualitative research: ensuring that at least two of the researchers analyzed each interview to accord further validity to the interpretation. The data were analyzed in three main stages: in the first, "open coding", we read each group interview from beginning to end to gain an initial impression of the main emerging themes. Then we conducted a mapping analysis, in which we laterally assembled the data. Finally, we reverted back to each interviews for a focused analysis, aiming to identify the interviewees' construal with regard to the concepts and notions arising from the professional literature (Lincoln & Guba, 1985; Shkedi, 2003; Strauss and Corbin, 1998).

Initial Findings

The meaning of voice in conflict situations

The findings strongly suggest that senior managers – both women and men – construe voice and exerting influence as **in-role behavior**; namely, an integral component of their job definition. Thus, their role expectations entail challenging the status quo and express their genuine views concerning organizational issues. This finding lends support to our assumption that the definition of voice in manager's position is distinct in comparison to employees for whom voice constitutes an extra-role behavior. The in-role perception of voice becomes even **more salient in conflict situations** with peers or superiors as they sharpen the divergence between the manager and the opponent and precipitate the need to engage the conflict while asserting one's own position. The conflicts indicated by the study participants have revolved around "stolen" credit for ideas, discordant views with regard to work procedures, organizational policies, human resources in general or specific employees. Most of the conflict issues reveal overt or hidden power struggles between the manager and his or her adversary.

Gender and construal of voice. Lack of voicing tends to be **rationalized**, by and large **attributed to external sources**, such as the superior's autocratic management style, organizational culture, and unbearable potential cost for the organization and employees. **Men** seem to exhibit **stronger tendency** for **rationalizing** paucity of voice and assign blame to external factors in comparison to women. For male managers refraining from genuine and open expression of their concerns in conflict situations is antithetical to normatively prescribed behavior. By contrast, female managers appear to be more aware than men of their difficulties in expressing genuine voices, hence more likely to ascribe lack of voicing to internal factors.

Patterns of voicing: gender perspective

In line with Fuller's contention (2011), both women and men at upper echelons of organizations find it quite difficult to exhibit a nonconformist stance and behavior. Yet, our findings suggest that gender plays a significant role in voicing patterns. Male managers tend to "*open doors*" that is voice their concerns rather forcefully, directly and act swiftly, although following strategic calculations (long term goals, potential personal costs versus gains). Female managers appear to be more reserved, often waiting for "*doors to open*"; namely, act behind the scene building coalitions, collecting data and evidence to support their claims.

The findings also show that voicing attempts reflect **dynamic patterns** which may be inaugurated by active and direct moves, tactically paused and resumed embracing a more cooperative orientation later on. Depending on the nature of the conflict, especially its importance, women and men alike seem to be quite **persistent** in expressing their concerns in conflict situations.

Perceptions of silencing and managers' reactions

Both men and women report experiences of silencing attempts by their opponents in conflict situations. These acts are perceived as attempts to undermine their power positions and impede their influence in organizations. The managers' reaction appears to be contingent on organizational culture, perceived price of responding with high resolve, availability of support and importance of the conflict issues. Gender seems to matter in this domain: while women attempt to restore their position using mainly cooperative *turns*, otherwise remain "*behind closed doors*" or exit the relationships (or the organization altogether), men tend use "*counter moves*" or "*restorative turns*" (Kolb, 2004).

Initial Conclusions

Initial findings point to construal of **voice as in-role behavior** by both female as well as male managers, designed to exert influence and sustain organizational senior position. Consequently, lack of voicing tends to be rationalized. **Voicing patterns** are dynamic in nature, reflecting persistence in managers' attempts to express their genuine concerns, while modifying tactics along the way.

Silencing attempts in conflict situations are interpreted as *moves*: the adversaries' intention to undercut one's position. The reactions revolve around restoration of managers' influence and position.

Power and influence figure prominently in conflict experiences of upper echelon managers. **Gender appears to play a significant role** in the construal of voice, patterns of voicing and in reactions to silencing in conflict situations.

FIRM GROWTH AND LIQUIDITY CONSTRAINTS IN MANUFACTURING AND SERVICE SECTORS: A COMPARATIVE ANALYSIS AT INDIVIDUAL INDUSTRIAL LEVEL

Donati, Cristiana

Second University of Naples, Capua, Italy

ABSTRACT

We use a large firm-level panel data set to analyze the relevance of liquidity constraints on firm growth in Italy. In most European countries mainstream financial institutions are scantily able to provide affordable credit facilities to small firms. Thus, these firms are forced to finance their growth almost exclusively through retained earnings. We estimate a dynamic version of Gibrat-law, incorporating cash flow as a measure of financial constraints, for different size classes of SME and for several industries in manufacturing and service sectors. The findings show that, in general, small manufacturing firms have higher growth-cash flow sensitivities with respect to medium firms without relevant differences between the four Pavitt technological sectors considered. Conversely, our results highlight, for the services, a significant heterogeneity in the impact of liquidity constraints on firm growth. In particular, for small firms that belong to Knowledge Intensive Market Services liquidity constraints appear relatively more severe in comparison with what occurs in the traditional service industries. Validation of Gibrat-law in the services suggest that an important group of industries, with a superior capacity of encouraging firm's competitiveness, need more financial resources to promote their growth and that of the manufacturing sectors with whom they are connected.

In the last decades the debate on the validity of the so called *Gibrat's Law*, or *Law of Proportional Effect* (LPE) and the empirical analysis conducted to ascertain if firm growth rates are uncorrelated with the initial firm size, has led to an increase in the number of studies concerning manufacturing firms, while few studies have focused on investigating if LPE holds for the service industry.

Some contributors pointed out (Audretsch *et al.* 1999 and 2004, Teruel-Carizosa 2010) that the pattern of firm growth in the manufacturing and service industries is different for the presence in the first sector of higher sunk costs. Some empirical analysis (centered on few individual service industries) found that LPE holds for service sectors, but some recent works found evidence of the opposite outcome (Oliveira and Fortunato 2008 and Teruel-Carizosa 2010). Analyzing growth's dynamic in the service sector is crucial, since this industry, in the last decades, has increased its contribution to the GDP, to the process of job creation and more in general to the economic performance of a country. Moreover the use of new technologies is directly or indirectly incorporated in the activities of many service industries; this means that not only many service firms provide information in different forms but also

that the use of information and communication technology (ICT), from firms belonging to this industry, allows the standardization of many service activities making them more similar to mass-production goods. In our work, we consider different kinds of services firms, that differ in the degree of technological intensity, analyzing in particular those firms belonging to knowledge intensive market services, that are significant users of high technology (in terms of ICT capital) and relatively highly skilled workforce, because the role of this kind of services appears crucial to promote the competitiveness of an economy. Indeed firms operating in this sector are particularly able to meet the demands of modern highly competitive business environment. Moreover, these kind of sectors represent the natural by-product of modern knowledge economies within which increasing specialization induces the need for professional agents in the markets for external knowledge (Consoli and Eiche-Hortelano 2010).

To explain the possible deviation from Gibrat's law and following a recent stream of literature (see Oliveira and Fortunato 2006 and 2008) we make use of financing constraint literature. In particular this work is centered on a large sample of Italian small and medium size (SME) firms since this category represents almost the total of Italian firms.

In the last decade, in Italy, the wave of mergers and acquisitions, have reduced the number of banks and created large national and multinational bank holding companies. Thus the increasing functional distance, that separates the decision center of a bank from its operational branches, changed lending behavior and relationship between banks and firms. Moreover, considering that for SME firms the wedge between the cost of internal and external finance may be huge, we want to ascertain how the presence of liquidity constraints impacts on firm growth, verifying if some important differences exist between SME of different size classes and between individual industries of both manufacturing and service sector. To this aim and to draw some policy implications we split our sample considering not only different size classes of SME firms but also some individual industries inside manufacturing and service sector with a different degree of technological adoption.

To our knowledge this work represent the first attempt to study liquidity constraints on firm growth analyzing the differences that prevail inside manufacturing and service sectors depending on technological classification of each industry examined. In particular, in the services, we compare the results obtained looking at the skill composition of the workforce and at the indicators of innovation intensity that characterized some sectors. Moreover the development of firms that produce ICT or knowledge intensive market services, like Scientific R&D Advertising and Market research, Other Professional, Scientific and Technical Activities, appears crucial to sustain the growth of manufacturing firms that need using this kind of services to maintain or improve their competitiveness on international markets. Therefore we focused our attention on a group of services

that are significant users of high technologies and use relatively highly skilled workforce, since the progressive use of technology in production, the international sourcing of manufacturing goods and other social factors, have increased, over the last decade, the relevance of this kind of services to guarantee the competitiveness and the innovative capacity of a country.

Using a very large dataset our findings show that LPE does not hold for all SME firms regardless the fact that they belong to a manufacturing or services industries. Considering the manufacturing industries in particular we can conclude that all small firms (firms with less than 51 employees) tend to be liquidity constrained. Comparing the results obtained for the size class, conventionally defined, of very small firms (less than 20 employees) with those obtained for the more comprehensive size class of small firms, we notice that in four sectors the sensitivity of growth to cash-flows appear higher in very small firms than it is in small firms. These four industries are characterized by a medium-high or high level of technology adoption. However, on restricting the analysis to the subsamples of very small firms, we notice that industries whose growth appears more financially constrained are widely spread in all individual industries examined regardless the level of technology adoption. In most cases, instead, medium firms (51-250 employees) of both manufacturing and services industries do not seem to suffer from liquidity constraints. These findings are consistent with the hypothesis of asymmetric information according to which in the credit market small firms represent for the bank more opaque borrowers and, for this reason, are more likely subjected to credit rationing.

Contrary to the findings of Oliveira and Fortunato (2008) , suggesting that financial structure does not impact on firm growth, our results reveal that, as regards the service industry, only high technological sectors seem not to suffer from the presence of liquidity constraints. The sensitivity of the growth rates to the cash-flow appears, relatively high not particularly for the traditional services, but, above all, for small firms belonging to ICT-services (Computer programming, Consultancy and Related activities) and, more in general, for small firms of Knowledge Intensive Market Services. In the manufacturing liquidity constraints hinder the growth of small firms with different level of technology adoption, instead, in the service sectors small firms with high skilled workforce and with high R&D intensity appear more liquidity constrained than firms belonging to the traditional services. This result show that, an important group of services industries, with a superior capacity of encouraging firm competitiveness, need more financial resources to promote their growth and that of the manufacturing sectors with whom they are connected.

MOTIVES, EXPECTATIONS AND ECONOMIC RESULTS OF MERGERS AND ACQUISITIONS IN THE KIBBUTZ INDUSTRY

Edom, Sara¹; Edur, Ram²; Kroll, Yoram³

¹Ashkelon College, Israel

²Ben Gurion University, Israel

³Ono Academic College (OAC), Israel

ABSTRACT

This study examines motives, expectations and economic results of the 21st century revolution in which public and private investors purchased equity in kibbutz industrial companies. The results show that in the period 2000-2011, assets, sales and equity indeed grew more in the kibbutz industrial companies that joined with external partners, than companies that remained fully owned by a kibbutz. However, in terms of efficiency, profitability and deleveraging, the results of the M&A processes were disappointing.

INTRODUCTION

In this study, we investigated the motives and expectations of mergers and acquisitions (M&A) and examine the economic results of private acquired firms, kibbutz¹ owned industrial firms in the period 2000 – 2011.

The purpose of this study is double:

1. To learn the motives and expectations of the three parties involved in the M&A, the owner - the kibbutz, the board of directors of the industrial company and the investor – the external partner.
2. To examine the impact of M&A on the financial performance of the acquired firm in the post M&A period.

M&A is one of the principal ways to implement growth strategy (Feito-Ruiz and Menendez-Requejo 2010). M&A activity grows constantly. Grant Thornton's 2013 survey found growth of 56% in cross-border M&A in the world during 2008 – 2013, and 28% of the companies planned to grow in the coming year through M&A (Hughes, 2013). The trend of M&A is driven by global competition, macroeconomic constraints, economics of scale, entrance into new markets, opportunities, adoption of modern technologies, synergy, diversification, risk diversification, survival of firms in distress (Feito-

¹In Israel there are 275 kibbutzes; in 2011 the kibbutz population was 1.8% of the population of Israel. A kibbutz is a kind of commune. The first kibbutz was established in 1910; most of the kibbutzes have existed for over 50 years, and they are multi-generational communities.

Ruiz and Menendez-Requejo 2010), market timing, agency motives and hubris, response to industry and economic shocks (Hien, Kenneth and Qian, 2012).

Most empirical studies have investigated M&A of publicly traded companies. Only a few studies have investigated the economic performance of private firms undergoing M&A (Feito-Ruiz and Menendez-Requejo 2010; Richards T. and Manfedo M. 2003). The few studies that investigated M&A of private firms analyzed a case (Steen A. and Welch L. S. 2006) or were based on financial reports received from State authorities (Ravenscraft D. and Scherer M. F. 1989) or from the National Bank (Shim J. and Okamuro H. 2011).

In parts of Europe, Asia and Latin America, many more businesses are private and family-owned rather than publicly owned; family firms play a significant role in the domestic and global economy (Drik 1990). Private firms, family firms and cooperatives act in similar environmental conditions as other firms, and use the same strategy of M&A for survival and growth (Richards T. and Manfedo M., 2000; Feito-Ruiz and Menendez-Requejo, 2010). Despite the important role of private firms in the economy and the fact that private firms also use the M&A strategy, most studies investigated public companies. The main reason for understating of the impact of M&A on financial performance of private firms is the lack of data on private firms after M&A, which often no longer exist as distinct companies, or become entities of the acquiring firm (Tuch and O'sullivan, 2007).

The uniqueness of this research is the investigation of the economic performance of private industrial firms both pre- and post- M&A. The analysis of the economic performances are based on annual accounting reports. The existence of a unique database of multi-years of annual accounting reports of all the kibbutzes and their industrial companies in the kibbutz movement has made possible the current study. This study included only kibbutz industrial companies; private firms have not been included in the research group or the control group, since private firms do not allow publication of their economic performance data.

The kibbutz industry sector is about 10% from the Israeli industrial sector (sales and employees)¹. In the mid-1990s, there were 393 industrial companies in the kibbutzes, most of which were owned by the kibbutz only²; at the end of 2005 only 72% of the industrial companies was owned by the kibbutz only, and at the end of 2011, it decreased to 48%.

Over time, the kibbutz industrial companies have integrated into the global economy and thus have become increasingly similar to other industrial companies.

METHODS

Empirical studies that investigated the impact of M&A on economic performance of firms did so using two methods (Tariq H. I., Abdulati A. A. and Radwa M. A. 2011):

1. **Evaluation of the excess return of the shares** of the acquirer and the acquired because of the declaration of the M&A. The studies that used this method usually found excess return to the acquired firm and underperformance to the acquirer (Andrade G., Mitchell M. and Stafford E. 2001; Dickerson A. P., Gibson H.D. and Tsakalotos E. 1997; D. Ravenscraft, and M. F. Scherer 1987; Shinha N., Kaushik K. P. and Chaudhary T. 2010)

2. **Accounting reports-analysis:** The disadvantages of this method are the availability and accessibility of data of this kind. Studies that have used this method found no significant improvement in the performance of the firm after the M&A (Tuch C., and O'sullivan N. 2007).

In the current study, we use annual financial accounting reports; performance was assessed using two methods:

- A. A comparison of the change in economic performance between the research group of firms with external partners to that of the control group, which consisted of firms without partners,- in the timeframe of two years prior to and two years following the year of joining with the external partner.
- B. Comparison of economic performance indices over a period, between the group of firms with partners and the group of firms without partners. The comparison has been made for two periods:
 - 1. 2001-2009 included 11 firms with partners throughout the whole period.
 - 2. 2005-2009 included 24 firms with partners throughout the whole period.

The motives and expectations were investigated by the analysis of 75 cases out of the 100 M&A in the first decade of the 2000s. In each case the managers of the kibbutz or/and the industrial company who lead the M&A process were interviewed. The data was collected by using a quantitative questionnaire.

MAIN FINDINGS

Motives and expectations: each of the three parties involved in the merger-acquisition has different goals; the goals of the kibbutz and the owner of the company, were different from those of the governing board of the company. The goal of the board was more similar to those of the investor-partner than to those of the kibbutz - the owner. The most important goals of the kibbutz in diluted holdings were risk diversification and raising of capital to finance the business growth and ensure business continuity. The most important goals of the board of directors was to increase sales and

profitability, and finance the growth of the business. The most important goals of the investor-partner were to increase revenue and profit. The shared goals of the three parties involved in the M&A transaction was business growth and increase of profitability. The economic findings suggest that sales and assets have grown in industrial companies with partners more than in industrial companies without partners, whereas the efficiency indices increase more in the companies without partners than in those with partners. These findings support the kibbutz leader's assessment that the goal of growth of business has been achieved and the goal of increased profitability and management improvement has been achieved only partly.

PUTTING CARROLL'S MODEL INTO TEST: THE CASE OF LEBANON AND TUNISIA

El Dirani, Ali¹; Yahiaoui, Dorra²; Golli, Adel³

¹American University Of Science And Technology

²Kedge Business School

ABSTRACT

The literature on Corporate Social Responsibility (CSR) is rich with pioneering conceptualizations that attempt to capture CSR's meanings, drivers, domains, effects and environment criteria. However, one of the most highly cited work and progressive CSR thinking during 1970s remains Carroll's landmark work. Carroll (1979) presented an interesting taxonomy which reconciles CSR types in a four-facet model that includes the economic, legal, ethical and discretionary domains of social responsibility. The domain of economic responsibility is the foundation for all other domains with the legal responsibility being an affirmative action and the ethical responsibility being a reaction action and finally the discretionary responsibility being a proactive action which placed on the apex. Carroll's four domains are aggregative and businesses are expected to fulfil them simultaneously. In this sense, their business decisions are expected to have economic, legal, ethical and discretionary basis to achieve a balanced orientation towards different stakeholders. This is the essence of Carroll's model, which was revealed during a critical period of time when the CSR field of literature was still in its infant and early inception stage in the 1970s. It could be argued too that this model was among the first, if not the first; models which was tested and qualified within a set of collected data. Carroll's model was timely and one of the earliest theoretical propositions within the literature.

Early CSR academics as well as practitioners needed this model to gain legitimacy and credibility for their CSR case and argument. For instance, drawing on Carroll's model many scholars came after and made their contributions. Wood (1991) in her model on social performance (CSP) extended Carroll's model and emphasized the importance of social responsiveness process. The stakeholder theory perspective brought by Freeman (1984) completed the picture by stressing the importance of maintaining a balanced relationship with different stakeholders and responding to their needs. Carroll himself provided in 1991 a stakeholder/responsibility matrix which links economic, legal, ethical and philanthropic responsibilities to stakeholder groups, e.g. employees, customers, community. Again, Wood and Jones (1995) suggested using a stakeholder framework to assess outcomes of CSP whether they meet stakeholders' needs or not. We can see

here how Carroll's model became a focal point and important reference for many later important conceptualizations with the CSR literature.

This model was set and mainly used in the particular context of Western countries (Garriga and Melé (2004), Waddock et al. (2002)). However, little research focused on using this model in less developed countries (Jamali and Mirshak (2007), Golli and Yahiaoui (2009), Ibrahim et al. (2012), Jamali and El Dirani (2013)) and check its applicability and ability to explain CSR dynamics. Rather than taking the model as for granted and irrespective of the context where it's being studied, our papers attempts to explore the validity of Carroll's model in the particular context of Lebanon and Tunisia. Findings from both countries could generate enriching and insightful knowledge about CSR in the absence of in-depth and institutional research efforts in both countries as compared to theoretical and managerial CSR advancement in other contexts as for example in UK, Australia and the USA.

For this purpose, we made a qualitative study within 18 case studies that were selected based on their level of CSR activity. An in-depth interview was conducted with managers responsible for CSR (15 in Lebanon and 17 in Tunisia). The interviews lasted between one and two hours. Our interview questions were designed to cover CSR understanding, CSR domains and activities and whether or not Carroll's taxonomy is practical and sufficient in meeting and fitting CSR knowledge and practices in Lebanon and Tunisia. Although we prepared an interview guide prior to interviews, however semi-structured interviews helped us to be more flexible in the sequence of questions in light of the progress of the interviews. Secondary data were also collected from CSR reports and web materials. The interviews were transcribed and with the documents mentioned they were analyzed using coding method whereby codes were initiated and grouped as they were identified from the data and the conceptual categories. For internal validity, within case-analysis and cross-case analysis were conducted by identifying the similarities between the cases (Yin, 2009).

Our investigation made it possible for us to recommend some developments to be introduced to Carroll's model to make it more flexible and holistic or benefiting from some models presented within the literature on strategic CSR among different factors to take into account in international context. We recommend in this perspective Porter and Kramer's 2006 and Waddock and Graves's 1997 models that appear to be more flexible and practical to follow CSR as it develops from a pure philanthropic and unsystematic approach to a more strategic CSR approach in Lebanon and Tunisia, away from CSR taxonomies.

THE (R)EVOLUTION OF WINE MARKETING MIX – FROM THE 4PS TO THE 4ES

Festa, Giuseppe; Ciasullo, Maria V.

University of Salerno, Italy

ABSTRACT

Wine has emerged in latest decades as one of the most interesting market throughout the world, both for Old World countries (Italy, France, Spain, and others based in Europe) and for New World countries (US, Chile, Argentina, South Africa, Australia and New Zealand, only to mention the most important ones). It is a common opinion that Old World countries are still focused on wine production, while New World countries are more focused on wine marketing (Resnick, 2008).

The 4Ps (product, price, promotion, and place) are the traditional framework by which marketing academicians, managers and professional implement the operating stage of the marketing management process (McCarthy, 1960). This framework is very powerful because it can be used in every sector or market, in which, however, the 4 Ps need to be contextualized (see for example the 4cs of Lauterborn, 1990, now mostly used in service marketing).

Starting from the model of the 4Ps, in this article the authors will develop a theoretical framework for a contextualized version of wine marketing mix, that can be based on the 4Es (expertise, evaluation, education, and experience) as a 'global' marketing technique. In the case of wine, in fact, the utility of the product needs to be explained and understood (product – expertise), and appreciated not only in terms of money, but in a more general judgment (price – evaluation); furthermore, the perception of the product shall be combined to the occasion of present/future consumption (communication – education), that enriches the overall situation of purchase (distribution – experience).

The study is oriented to develop a theoretical framework about wine marketing mix that constitutes an original concept of the authors, able to be applied and recognized in every wine market, domestic or international. Bases of the research are a huge literature review about marketing mix in general and wine marketing in particular, together with an adequate set of in-depth interviews with wine entrepreneurs, managers, sommeliers, operators, and wine lovers, so to justify the exploratory nature of this research (further studies are forthcoming to verify the statistical validity of the model).

CROSS-BORDER FUNDING AND MICROFINANCE MISSION DRIFT: EVIDENCE FROM SUB SAHARAN AFRICA

Forkusam, Akem Noela

School of Economics and Law, University of Oldenburg, Oldenburg, Germany

ABSTRACT

INTRODUCTION

CGAP Cross-border funder survey (2012) shows that despite the financial crisis, cross-border commitments to microfinance institutions (MFIs) in Sub Saharan Africa (SSA) increased by 12 percent per year on average between 2009 and 2011 to reach close US \$ 2.7 billion. This funding could be seen as an additional source of capital for MFIs (Swanson, 2008). However, these funds are provided by public and private investors with each having different motives. Most public funders use microfinance as a tool to achieve development goals such as poverty reduction and financial inclusion (El-Zoghbi et al., 2011, p.1). On the contrary, for some private investors, microfinance is a new emerging asset where high profit could be maximized (Dieckmann 2007). For other private investors microfinance presents an opportunity to diversify their investment portfolios, while also achieving social and environment objectives-socially responsible investors (El-Zoghbi et al., 2011, p.1). This article provides an evaluation of whether these different foreign sources of capital affect the dual mission of MFIs.

Recent studies Martins and Winkler, 2013; Mersland and Urgeghe, 2013; Mersland et al., 2011 have identified different dimensions of foreign involvement on microfinance mission drift. However, the literature has been silent on cross-border commitments, which consists of public and private funding. Furthermore, the study uses data from SSA which is the poorest region (World Bank, World Development Indicators 2013) and the region with lowest banked households (CGAP and World Bank, 2010, p.4).

THEORY AND HYPOTHESIS

The research builds its arguments on two theories; capital structure and agency costs. Firstly, the capital structure theory assumes that in a perfect capital market, homogenous expectations, absence of taxes, and no transaction costs, the value of a firm is unaffected by the way it is financed (Modigliani and Miller 1958). However, empirical researches (Boateng, 2004; Miller and Modigliani, 1966) show that in the real world, capital structure decisions do affect firm value and performance. In the same

vein, it could be argued the capital structure (debt, equity, grants and guarantee) employed by an MFI could either promote or prevent the MFI from drifting from its mission.

Secondly, the agency cost theory presumes that the separation of ownership (shareholders) and management (agents) can affect capital structure choice and firm value (Jensen and Meckling 1976). The decision to use large amounts of foreign funding may generate agency problem between maximizing profits and maximizing outreach. This means that MFIs receiving foreign funding (debt, equity, donations, guarantees) may be forced to respond to funders pressures to operate more efficiently and may therefore choose to serve less poor clients with lower delivery costs, implying mission drift. Based on the above discussion, the research includes cross-border funding as represented by cross-border commitments in the model based on the following main hypotheses:

Hypothesis 1a: Cross-border funding is positively related to financial performance

1b: Cross-border funding is negatively related to social performance

RESULTS

By using the ordinary least squares dummy approach which controls for unobservable factors (such as regulatory environment, macroeconomic and political stability) the findings show that cross-border funding positively affects average loan size, thereby rejecting the hypothesis that mission drift occurs. The findings also indicate that cross-border funding positively affects financial performance in terms of operational self sufficiency. However, all these significance relationships disappear, once country dummies are accounted for. Due to the fact cross-border commitments is concentrated in two sub regions-West and East Africa, sensitivity analyses were performed to see if the above results might change. The results show that cross-border commitments positively affect return on assets (ROA) only in MFIs in West Africa, while it is insignificant in the other sub regions.

DISCUSSION

Using a dataset of 212 MFIs from 30 SSA countries accessed over a three-year (2007, 2009, and 2011) period. The study finds that cross-border funding does not influence either the social or financial performance of MFIs, once time and country effects are controlled for. This could mean that the relationship between cross-border funding and mission drift is not robust. Based on this result, there is no evidence of the occurrence of mission drift. The above findings are broadly in line with the recent findings by Winkler and Martins (2013) in Latin America.

The main limitation of the research is that cross-border commitments data is provided only at the country level and not at the MFI level. Moreover, data for some years are missing (2008 and 2010), since surveys are carried out biennially.

INTEGRATION OF INCLUSIVE CULTURE TO DRIVE INNOVATION AND PERFORMANCE IN UNSTABLE ENVIRONMENT

Gouda, Hanan

International Cooperation, Arab Academy for Science, Technology and Maritime Transport, AASTMT, Alexandria, Egypt

ABSTRACT

Due to globalization of markets and diversification of the work force, managers in any organizations have to face frequently cross-cultural interactions for negotiation purposes or business practices or even within individual interactions.

Any business or organization is responsible for increasing the rate at which technological advances are used within the manufacturing of a product or the delivery of the service they offer, in order to increase their output. Most organizations have faced massive changes and transformations for the purpose of innovation.

To enhance the interactional aspect of the innovation process, the concern is to create a comprehensive internal organizational culture, the progression of personnel competences and organization abilities simultaneously, which is the effective approach to achieve an improved organizational productivity and attain competitive advantage.

Diversity being a key component of accomplishing an innovation culture, it Could be a implicit factor proceeding against organizational efforts to raise and strengthen the culture and the processes that support innovation.

The integrated process should be influencing the development of individuals, languages, concepts, skills and behaviors that promote insertion. In a theoretical approach, we are trying to give a perspective of the positive and negative impacts of the culture, which may affect the integration of an innovation process in a multicultural work environment. The objective is to prevent any major conflict or drawback due to cultural perspectives that may restrain the productivity of the organization. The research addresses the problems that faces configuration of insertion concepts and tools in a projected innovation process, focusing on the concept of teams in a work environment within an Egyptian organization at the core of an unstable political situation.

Keywords: *Culture, international management, implications to business practices, intercultural interactions, integration, innovation, technology, productivity, cross-cultural, unstable economy, adaptations methods, management challenges.*

FUNDING INNOVATIVE SMES OF TRADITIONAL SECTORS

Harel, Ronen; Kaufmann, Dan

The Department of Business Administration, Guilford Glazer Faculty of Business and Management, Ben Gurion University of the Negev, Israel.

ABSTRACT

The growing interest in innovative SMEs stems from the fact that they are perceived as a main engine of economic growth and job creation. Still, these companies face obstacles in the form of inaccessibility to funding, especially those companies which are based on knowledge and innovation and whose assets are primarily intangible in nature.

This study points to the funding difficulties of innovative SMEs that operate in traditional sectors ("ITSME") and asks whether current conditions point to the existence of a market failure.

The study explores the financial tools available in Israel and their relevancy to ITSMEs by conducting in-depth interviews with different financial actors who provide financial services. These include venture capital funds, banks, private equity, mezzanine funds and key players from the public sector.

In our study we identify the existence of a market failure relating to the funding of ITSMEs and suggest that the venture capital, private equity, and mezzanine funds models cannot provide adequate funding solutions for ITSMEs in Israel.

In light of the importance of these firms to the economy, governmental intervention is required, if more innovative activity of ITSMEs is desired. To this end, the study suggests a novel funding scheme that ties private equity funds to ITSMEs.

The study contributes to the literature by identifying groups of highly innovative firms operating within traditional sectors and by using a qualitative approach to analyze the relevancy of different financial mechanisms to their needs.

Keywords: *SME, innovative SMEs in traditional markets, lack of access to finance, market failure, banks, venture capital funds, private equity funds, mezzanine financing, government involvement in SME funding.*

DEVELOPING AND TESTING A WORK DESIGN TAXONOMY OF KNOWLEDGE WORKERS' JOBS

Hernaus, Tomislav

Department of Organization and Management, University of Zagreb, Croatia

ABSTRACT

Organizations are facing increasing workplace diversity and continuously struggle to manage business complexity. Thus, managers and HRM experts are required to design jobs for different employee groups and occupations within today's hypercompetitive environment. They shape the content, function and relational aspects of jobs by changing a number of design parameters or work characteristics (e.g., Campion, 1988; Cordery and Parker, 2007). As a result, jobs often vary among employees in degree of task overlap, number and nature of tasks performed, as well as in level of interaction and interdependence.

Work design interventions are not a new topic (e.g., Lawler III *et al.*, 1973; Hackman and Oldham, 1980; Parker and Wall, 1998; Holman *et al.*, 2010). The research domain is broad and still evolving, as a wider range of work characteristics has been recently examined (e.g., Parker *et al.*, 2001; Morgeson and Humphrey, 2006; Grant, 2007; Humphrey *et al.*, 2007, Dierdorff and Morgeson, 2013). Nevertheless, past studies were dominantly focused on "individual", one-dimensional job/work characteristics of non-knowledge workers. However, scholars realized that certain patterns of working practices in general (e.g., MacDuffie, 1995; Ketchen Jr and Shook, 1996) and job/work design bundles specifically (e.g., Fleishman and Quaintance, 1984; Meyer *et al.*, 1993; Morgeson and Humphrey, 2008) capture the complexity of organizational life. Additionally, individuals seem to observe their jobs as patterns of several work characteristics (Stone and Gueutal, 1985). Therefore, a configurational or systems approach to work design should be applied (e.g., Johns, 2010; Munyon *et al.*, 2010). A multidimensionality of work characteristics need be emphasized and studied more systematically (e.g., Parker and Ohly, 2008; Grant *et al.*, 2010).

Although a significant number of work-related or work design configurations have already been identified in the literature (e.g., Drazin and Van de Ven, 1985; Naughton and Outcalt, 1988; Campion *et al.*, 2005; Zoghi *et al.*, 2005; Burton *et al.*, 2006; Cordery and Parker, 2007; Valeyre *et al.*, 2009; Holman and McClelland, 2011; Morgeson and Garza, 2013), the majority of those classifications are typologies of various job quality and work organization issues, and they do not represent "pure" work design configurations. In addition, we still lack empirical insights about work design of knowledge workers – an increasingly important and voluminous group of employees (e.g., Drucker, 1959; Davenport, 2005; Levenson, 2012). Therefore, the main purpose of the present research is to examine the bundling

nature of work characteristics and to develop the work design taxonomy of knowledge workers' jobs. In addition, distinct work design clusters are evaluated for performance in order to determine (in)appropriate working practices.

The exploratory work design study was conducted on the sample of 512 employees from 48 large-sized Croatian organizations. A cross-sectional and cross-occupational research design was applied in order to include knowledge workers – managers and professionals – from a variety of different jobs, occupations and industries. The data were collected by using the adapted *Work Design Questionnaire* (see Morgeson and Humphrey, 2006), a comprehensive instrument and a general measure of work design consisted of 65 items on a 5-point Likert-type scale measuring 12 work design variables and 2 outcome variables. The survey questionnaire was focused on gathering perceived task, knowledge and social characteristics of knowledge workers' jobs and subjective measures of their both task and contextual performance.

A four-step analytical approach was taken. Firstly, the R-mode analysis was conducted. A factor analysis with varimax rotation was followed by a Ward's hierarchical cluster analysis to reduce the number of job-descriptive elements and identify the desired job-analysis dimensions (see Harvey, 1986). Secondly, non-hierarchical *k-means* clustering method was applied to establish the work design taxonomy. The analysis verified the existence of three-cluster solution that was further described, compared and validated through non-parametric tests for the equality of means. Lastly, determined work design (WD) clusters were analysed separately for managers and professionals, and work performance outcomes of each occupational group were determined and examined.

Work characteristics across WD clusters differ significantly thus validating the proposed taxonomy. The high-enriched jobs were reported within the first WD cluster (N=212; mean range from 3.70 to 4.71) consisted of 57.55% of managers and 35.39% of professionals. On the other hand, low-enriched jobs were present within the third WD cluster (N=72; mean range from 2.53 to 3.51), dominantly occupied by professionals. However, most professionals (46.38%) were classified within the second WD cluster (N=228; mean range from 3.15 to 4.15) and were assigned to handle medium-enriched jobs. Managers in high- and medium-enriched jobs provided the same level of work performance as their professional counterparts. Yet, managers occupying low-enriched jobs were significantly less successful regarding both task and contextual performance outcomes than professionals within the same jobs were.

The present study investigated and confirmed that conventional occupational groups of knowledge workers (managers and professionals) potentially vary within and between each other in the extent and nature of work characteristics. By using a larger number of work characteristics, the work design taxonomy was developed and three WD clusters for knowledge workers were proposed. Both

managers and professionals were significantly represented within high-enriched and medium-enriched clusters, which emphasize the similarity of their jobs. As their jobs and performance do not differ significantly, managerial and professional career tracks can be easily switched thereby improving organizational flexibility and responsiveness. However, this is not valid for low-enriched jobs, as managers are not challenged enough to provide a considerable work effort. In such work environment, managerial jobs should be enriched. Ultimately, the examined relationship between work design configurations and performance outcomes of occupational groups provided useful insights for making work design decisions within the knowledge economy.

CYPRUS “DOWNSTREAM PETROLEUM INDUSTRY” & COMPETITIVE ADVANTAGE

Homayoon, Morvarid; Valiantis, Marios

University of Nicosia

ABSTRACT

Cyprus is located at the crossroads of Europe and the Middle East and its strategic location has made it a reputable international business and services center. In 2004, Cyprus became a full member of the European Union (EU). In January 2011, Noble Energy announced the discovery of one the largest offshore natural gas reservoirs in the world, near Cyprus (offshore Israel) which would benefit Cyprus as well as Europe. The oil and gas industry has grown strongly over the past decade and its outlook is equally positive especially in the Eastern Mediterranean areas. The natural gas revenue can change the national economy and could potentially have an impact on the people's livelihood. According to Cyprus government officials, the recent findings of the natural gas could strengthen the country's financial position, wealth, and standard of living of Cypriots in the near future. But is Cyprus going to achieve this economic growth? Reviewing the past and present studies of the oil & gas countries shows that many countries, after finding oil and natural gas economically collapsed (Ex: Dutch disease) but, there are also many countries that had economic growth. What is really the reason behind these two different results?

Norway is one of the most famous examples of the oil & gas countries with economic growth, Norwegians have been enjoying a high standard of living for many years which is not only due to the country having oil and natural gas deposits, but also because of Norway developing the “Science of using oil & natural gas”.

The oil & gas sector is operating in an environment of unpredicted opportunity, mixed with a high degree of volatility and risk. Therefore the science of using oil and gas which makes a solid innovation strategy on the ways of adding value to the oil and natural gas will help the country to be different in its competitive position. According to Porter, the value chain is a device that helps to identify the independent, economically viable segment of the industry. In every industry there are various activities that must take place to transform inputs of raw materials, knowledge, labor, and capital into end products purchased by customers. The oil and gas value chain has three main segments: Upstream (Exploration and production); Midstream (Transportation and Trading); and Downstream (Refining and Marketing). The industry value chain starts with exploration and ends with products sold to consumers such as gasoline, heating oil, natural gas for heating and power generation, and thousands of petrochemical products. Some countries which have oil and gas reserves

try to be competitive in the upstream industry and some others in the downstream industry but what about Cyprus? Can Cyprus be a competitive player in its oil & gas downstream industry?

As was mentioned before Norway is one of the headline countries that by achieving the science of using oil & gas, has gained and continues to gain profits from its oil and gas industry. The fact that oil & gas countries can gain profits from selling the oil and gas is obvious but the competitive advantage will appear when a country can build a strong industry which focuses on selling petrochemical products. Therefore, the main aim of this paper is to indicate the role of Cyprus's downstream petroleum industry and the ways of adding value to the Cyprus's natural gas.

Following the aim of the study the objectives are to study and review the past and present literature of the oil and gas countries which have been successful in developing a competitive downstream industry, especially Norway, and comparing them to Cyprus in order to indicate how this industry can be profitable for Cyprus as a competitive advantage. According to the aim and objectives of this study, inductive approach is going to be applied. The structure of this research is not numerical so qualitative information and primary data focusing on in-depth interviews will be used as well as getting help from secondary data.

TOURISM DEVELOPMENT IN ANGKOR WAT IN CAMBODIA: A WAY TOWARDS SUSTAINABLE SOCIAL AND ECONOMIC DEVELOPMENT IN AN UNDERDEVELOPED COUNTRY?

Homlong, Nathalie¹; Springler, Elisabeth²

¹Volda University College

²University of Applied Sciences bfi Vienna

ABSTRACT

To promote economic growth in less developed economies, standard economic approaches focus mostly on export driven development strategies and are encouraged by trade agreements. As it was shown already by Singer-Prebisch (see Oatley 2010), less developed economies focusing on export based strategies are exporting mostly agricultural goods, which suffer from low income elasticity and cannot achieve sustainable economic development. Furthermore weaknesses of standard economic approaches are visible when looking not only at the experiences of e.g. many Latin American economies, but also at the New Member States of the European Union, which are transition economies. Despite of economic models stating that input factors converge (see e.g. H-O-S models), these developments cannot even be observed in economies of the European Union, which are already regarded as higher developed.

Consequently alternative economic models aim to integrate factors, which are neglected in standard economic approaches (Weissenbacher 2008; Jäger/Springler 2012): space, time and the specific structural and institutional settings of regions and nations.

Models, which focus on structural and institutional settings, are closely related to approaches of Structuralism and Keynesian approaches. These models show the importance of protective measures of national authorities and are critical towards free trade policies. Additional models dealing with the importance of space are closely related to economic geographic approaches. In this respect especially Myrdal's (1973) discourse, which distinguishes regional backwash and spread effects, sheds light on the dual effects of sector promotion on regional development – including socio-economic effects.

Applying these alternative approaches, the proposed paper aims to critically reflect on the effects of the promotion of the tourism sector in Cambodia. Does the increase of tourism – especially in the region Siem Reap – foster sustainable growth in Cambodia?

The temples of Angkor Wat, which are located in Siem Reap, are among the top tourism destinations in Cambodia. Visitation figures show two-digit annual growth rates, and are now at approximately 2 million visitors per year. Besides the textile industry, tourism is the most important industry in this underdeveloped country.

Tourism development is promoted as a way towards development for the region, and tourism has indeed been creating jobs in Siem Reap. Based on these positive trends the question arises whether the local population is benefitting from tourism development – is Siem Reap experiencing sustainable social development through tourism? This question is investigated with the help of the following indicators: 1. Standard of living, which includes the type of housing, access to clean water and sewage systems of the population. 2. The economic standing of the population, measured by housing prices, food prices and income levels. And 3. Potential for development: indicators related to education, like school enrollment and education levels. The paper furthermore analyses the structure of ownership of tourism related enterprises in Siem Reap (locally or foreign owned). The methods applied are analysis of statistical data as well as interviews with NGOs and tourism associations in Siem Reap.

Keywords: *alternative economic models, tourism, sustainable development, Cambodia, Siem Reap, Angkor Wat.*

UNDERSTANDING CELEBRITY TRUST CONSTRUCT, ITS DIMENSIONS AND ITS IMPACT ON OTHER BRAND RELATED CONSTRUCTS

Hussain, Shahzeb; Melewar, T C

Middlesex University London

ABSTRACT

Trust plays a major role in generating relationships between consumers and brands. Because of trust, consumers' belief that the brand has qualities that make it unique, competent, consistent, and honest. In the last few years, several researchers have explored trust within the context of brand management (Delgado, et al. 2006; Soh et al., 2009). However, thorough analysis of literature reveals that there are still wider gaps, which need to be explored further. Recent trends, based on the decrease of level of trust in the context of brand management, also give emphasis to explore trust in more details (Lantieri et al., 2007). One of the areas within brand management context, where trust can be explored further is of celebrity endorsement.

A similar construct to trust i.e. trustworthiness, although, has been an area of interest for many researchers, but previous literature reveals that both trust and trustworthiness are two different contexts, both with different meanings and conceptual characteristics (Morgan and Hunt, 1994; Mayer et al., 1995; Delgado et al., 2006; Soh et al., 2009). Trust is defined as a willingness of a party to be vulnerable to the actions of another party based on the expectation that the other will perform a particular action important to the person or trustor (Mayer et al., 1995; Morgan and Hunt, 1994). This definition of trust suggests that people do not only belief on the source (or celebrity), but also show their confidence and willingness to use that knowledge (appeared from the celebrity) as the basis of their actions (Morrow et al., 2004, Soh et al., 2009). Trustworthiness, on the other hand, refers to the honesty, dependability and trustworthy of the source (Erdogan, 2010). These definitions explain that trust is based on all the three cognitive, emotional and behavioral dimensions (Lewis and Weigert, 1985; McAllister, 1995). Trust is cognition based in that we choose whom we trust, in which respect and under what circumstances, and we base the choice on what we take to be good reasons, constituting evidence of trustworthiness (McAllister, 1995). Trust is also affective based. Affective based trust is generated on the basis of feelings generated by the level of care and concern, the partner demonstrates (Marrow et al., 2004; Johnson et al., 2005). There is a third component of trust, behavioural dimension of trust, which is constituted by the actions that flow from both cognitive and affective trust, and can be described as consequence of, both, cognitive and affective trusts (Johnson and Grayson, 2005). Trustworthiness, on the other hand, is only based on the cognitive dimension of

trust and fails to cover the real meanings (infact, trust in all other contexts like psychology, sociology, social psychology and in business studies is studied based on both two dimensions).

Researchers have, further, argued that trust between two parties is not only build on cognitive trust or on partner's reputation, but is also build on the basis of affective trust or feelings, generated by the level of care and concern (or benevolence), which the opposite partner shows. These feelings give rise to the perceived strength of the relationship between partners and are truly important in the context of 'business to consumer' marketing, where contractual agreements (compare to other contexts, like, business to business and interorganizational context) are less, and main source of trust is based on the good-will or benevolence, generated by the informant or celebrity (Johnson-George and Swap, 1982; Johnson and Grayson, 2005).

These gaps and confusions give rise to conduct a research and explore trust, further, within the context of celebrity endorsement. Therefore, an exploratory research would be conducted and a celebrity-trust scale would be formed. This scale would, then, be used to examine the influence of celebrity-trust and its both two dimensions on advertising credibility, brand credibility, brand equity and, on performance and reputation of the firm. Findings from this study would help researchers and practitioners to clearly understand meanings of trust within celebrity endorsement context.

RESEARCH QUESTIONS

The research questions are:

- What is trust in the context of celebrity endorsement? Is it based on both cognitive and affective dimensions? What are the components in each dimension?
- Whether the developed measurement of trust in celebrity endorsement significantly and sufficiently correlated with other constructs (i.e. advertising credibility, brand credibility, brand equity and, on performance and reputation of the firm)

OBJECTIVES

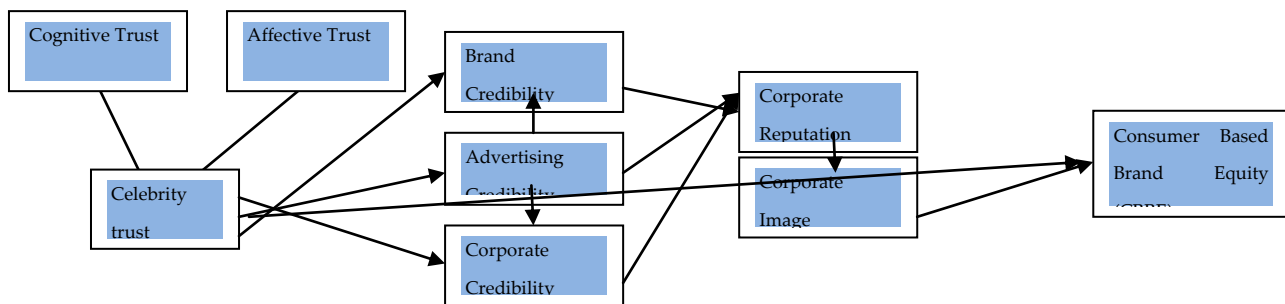

The main objectives are:

- To explore the meaning of trust within the celebrity endorsement context,
- To create a valid and reliable celebrity endorsement trust scale,

- To use the celebrity-trust scale and its dimensions to examine the impact of celebrity trust on advertising credibility, brand credibility, brand equity and on performance and reputation of the firm (and some other related variables)

CONCEPTUAL FRAMEWORK (AND RESEARCH HYPOTHESES)

Based on above mentioned research questions and objectives, given conceptual framework and hypotheses are given.

(Figure.1. Conceptual Framework)

- Hypothesis.1: Cognitive trust has an effect on Affective trust
- Hypothesis.2: Celebrity trust is based on Cognitive trust, and not on Affective trust
- Hypothesis.3: Celebrity Cognitive trust has a higher effect on Advertising Credibility compare to Affective trust
- Hypothesis.4: Celebrity Cognitive trust has a higher effect on Brand Credibility compare to Affective trust
- Hypothesis.5: Celebrity Cognitive trust has a higher effect on Corporate Credibility compare to Affective trust
- Hypothesis.6: Advertising Credibility has a positive effect on Brand Credibility
- Hypothesis.7: Advertising Credibility has a positive effect on Corporate Credibility
- Hypothesis.8: Brand Credibility has a positive effect on Corporate Reputation
- Hypothesis.9: Advertising Credibility has a positive effect on Corporate Reputation

- Hypothesis. 10: Corporate Credibility has a positive effect on Corporate Reputation
- Hypothesis.11: Corporate Reputation has a positive effect on Corporate Image
- Hypothesis.12: Corporate Image has a positive effect on Consumer Based Brand Equity (CBBE)
- Hypothesis.13: Celebrity cognitive trust has higher effect on CBBE compare to Celebrity Affective trust

METHODOLOGY

To develop a celebrity-endorsement scale, a multi-stage research design would be employed. The design would be modelled after Churchill (1979), and would include his recommended eight steps for developing valid measures of marketing constructs.

These eight steps are:

- Specify domain of a construct,
- Generate a sample of items from literature reviews, surveys and insight,
- Collect initial data,
- Purify the measure by assessing reliability and dimensionality,
- Collect new data,
- Reassess reliability,
- Assess construct validity and
- Develop norms.

These steps are divided into three stages: (1) the identification stage, (2) the reliability stage and (3) the validation stage. In the first stage, the domain of the construct would be specified through the review of literature, based on trust (Step 1). Next, with the help of prior literature, meanings of trust from dictionary and interviews with the consumers, initial pool of items would be generated (Step 2). To confirm the content validity of items (generated from prior literature, meanings from dictionary and

interviews), marketing academics and practitioners would be involved in the process to develop and identify items for the reliability stage.

In the reliability stage, a survey would be conducted (Step 3). The data from survey would be split in two halves. The first half of the data would be analyzed by using exploratory factor analysis (Step 4). Exploratory factor analysis would be used to explore structures of the construct and to spot appropriate items for the construct measurement. The second half (Step 5) of the data set would be analyzed by using confirmatory factor analysis to validate the structure of the measurement items proposed in the first data set (Step 6).

In the validation stage, a new data set would be collected by the survey of a complete different population (Step 7). The data would be analyzed by using confirmatory factor analysis to reassess the reliability of the scale. Concurrent validity of the scale would then be examined by testing if the scale would be able to distinguish between the groups who point out different levels of trust. Construct validity would further be taken based on Convergent, Discriminant and Nomological validity. These tests would be taken to confirm that constructs, which are either related or not related or related positively in the theoretically predicted way, are in reality true.

DATA COLLECTION

Based on the formation of trust scale and testing the hypothesis, both Qualitative research method (first two steps of creation of scale) and Quantitative research method (rest of the steps in the creation of the scale) would be used. Most part of the research, however, would be based on Quantitative research method, apart from first two steps of scale formation, where Qualitative research method would be employed. For Qualitative method, interviews with marketing academics, practitioners and consumers would be taken, whereas, for Quantitative method, surveys would be conducted, which would be based on data from consumers. Target population for surveys would be consumers and data would be collected from United Kingdom.

CONTRIBUTION TO KNOWLEDGE

As it's already mentioned above that the measurement used at the place of trust (i.e. trustworthiness) in celebrity endorsement context is insufficient and lacks in a strong theoretical underpinning. The following study would aim to contribute into the knowledge by providing a sufficient scale and by analysing celebrity-trust with other brand related constructs.

Keywords: *celebrity endorsement, trust, cognitive trust, affective trust, corporate credibility, corporate reputation, consumer based brand equity*

INNOVATION IN OFFSHORE OUTSOURCING: CONSIDERATIONS UNDER STRATEGIC INTERACTION.

Irfan, Irfan¹; Musau, Andrew^{1,2}

¹*Department of Economics and Business Administration, University of Agder, Norway*

²*School of Social Sciences, University of Trento, Italy*

ABSTRACT

Research in inter firm cooperation has focused on how individual firms can reduce cost and speed up innovation by sharing their respective competencies. Evidence based on empirical research has shown that improvement and innovation is dependent on knowledge sharing and technological transfer which both depend on strategic interaction. Recent research also indicates the classical view that innovation is initiated under the breast of a single entity or vertically isolated R&D units no longer holds.

This study addresses essential conditions under which innovation can be mutually created in inter firm cooperation across borders i.e. offshore outsourcing. Offshore outsourcing entails the client (outsourcer) delegating business functions and decision making rights to a vendor (outsourcer) located in foreign location.

We employ insights from Game Theory with respect to vendor- client relationship. This serves as a framework to explain risk, rationality, payoffs and other elements that affect innovations across borders by incorporating open innovation, outsourcing, goodwill and competence trust.

We conduct a longitudinal holistic case study of a leading Pakistani textile and apparel company dealing with some of the world's leading brands. The analysis focuses on how the company and its main client share resources and technology necessary for innovation under an environment where opportunistic behavior can emerge. This study finds that cooperation in the long term can be sustained if the cost of opportunistic behaviors in the present period is high. In particular if the vendor believes that he stands to gain a lot from future transactions, he will refrain from acting opportunistically. Goodwill and competence trust also have a positive effect on maintaining client-vendor relationship and can foster innovation.

Keywords: *Innovation, Game Theory, Offshore Outsourcing, Payoff, Opportunistic behavior*

IMPLEMENTING LEAN WAREHOUSING BY USING A WAREHOUSE MANAGEMENT SYSTEM AT THE SAME TIME. A POTENTIAL ANALYSIS

Kallinger, Simon

School of Business Department of Management & MIS, University of Nicosia, Republic of Cyprus

ABSTRACT

This WIP paper will give an overview about the current scientific status of Lean Warehousing and up-to-date Warehouse Management Systems (WMS). Lean Warehousing bases on the methods of Lean Production with aiming on increasing of efficiency and effectiveness of warehouse operations. A simple definition for a lean warehouse quoted by Chua and Katayama (2009, p. 3) "...would be a warehouse, that is capable to operate in such manner that the throughput is optimized for warehousing activities". But it will be shown, that the Lean Warehousing approach doesn't consider standard functions of up-to-date WMS, which already have lean functions inside and already do increase efficiency in warehouses. Beside the core functions: inventory control, storage location management, order picking, replenishment, receiving and shipping, a WMS offers a wide range of additional features like batch picking and many others which lead to waste reduction according to the leading thoughts of Lean Thinking, which are avoiding waste and continuous improvement (Myerson 2012). So, both Systems WMS and Lean Warehousing aiming at the same goals and this gap will be closed by comparing these set of functions with the proposed lean methods and tools from the literature review to achieve lean operation in the warehouse. Companies who are planning to implement Lean Warehouse should combine it with their WMS in use to get the most potential out of them.

INTRODUCTION

Today's supply chains have to cope with volatile markets and extremely high customer demands in a highly competitive global market, which allows comparing prices within seconds by the internet. Therefore, companies have to face this challenge and are looking for methods to speed up processes and to do their logistics operation as efficient as possible. Hence lean thinking will be applied in nearly all business operation: Lean Production, Lean Management, Lean Supply Chain and others. The most recent is Lean Warehousing, which tries to adopt lean methods and lean tools for warehouse operations like 5S, KANBAN, MUDA, KAIZEN and JIDOKA just to name a few. There is some academic literature about Lean Warehousing (Spee and Beuth 2012; Sobanski (2009)), which explain these tools and describe how to implement and also give a view what to expect and what to avoid in order not to fail. But you can't find the information about the interaction between Lean Warehousing and Warehouse Management Systems (WMS). Indeed Augustin (2010) states that it will be from a great help, but don't

speak about the areas in which there is an overlap and also Dickmann (2008) writes that it makes absolutely sense to link a KANBAN Management with a WMS. Already 1997 in volume number 27 3/4 of the International Journal of Physical Distribution & Logistics an article was published about lean logistics by D. T. Jones et al. (1997), which indicated a gap concerning the right operating systems for lean logistics in asking the question “What are the right warehouse types, locations and operating systems for lean logistics?” (D.T. Jones et al 1997, p. 171). This research question already implicate that the usage of the operating system – a warehouse management system – should be used to achieve lean logistics. Until now the academic literature still don’t provides an answer, whether in context with lean logistics, nor with lean warehousing - which is a specified form of lean logistics applied in warehouse operations only.

DESIGN/METHODOLOGY/APPROACH

Systematic literature review about Warehouse Management Systems and Lean Management in general and Lean Warehousing in particular was used to attain the latest state of these approaches and methods. Now the research goes ahead with primary research starting with an initial model derived from the findings from the literature review. Further research tactics like interviews, questionnaires, focus groups will be used to gather new information on this topic. These results will then be discussed, compared to the initial model and interpreted to present a new model of lean warehouse implementation by considering WMS accordingly.

FIRST FINDINGS

The literature reviews show that the current status of science is still in the state to define which lean methods are suitable for usage in the field of warehousing and which not and to explain how to analyze and how to implement, but without considering WMS. But in fact almost every company with logistics operations uses WMS or an ERP with a logistic module for execution and managing. It was found that approximately 2/3rd of the proclaimed lean tools for lean warehousing could be managed and improved by using corresponding WMS modules like, for example, a forklift guidance system (MUDA), KANBAN, sensors on conveyors (JIDOKA) and JIT etc. Further, it seems that the only thing which is not covered with Standard WMS's, are methods and tools which deal with personnel management and teamwork, like regular team meetings and tools for process analysis like 5WHYS, VALUE STREAM MAP etc.

RESEARCH LIMITATIONS

This survey doesn't consider ERP-Systems, which also provide various warehouse management functions and are absolutely sufficient for many companies and many ERP software companies have incorporated lean functionalities, including one-piece-flow KANBAN signals and sequencing etc. So this could be an idea for future research.

PRACTICAL IMPLICATIONS

The outcome of this research could be of great help for software vendors of warehouse management systems to extend their software according the identified gaps between Lean Warehousing and their WMS and to adapt their modules accordingly or to engineer new modules for lean tools for a CIP process. For warehouse manager and Supply Chain Managers it could be also of great benefit to review their warehouse operations and WMS functions to identify on which lean level they currently are. Further, they can use the identified model to plan their lean warehouse project/introduction.

In general the findings would support a sustainable economic development. Bozer states (2012, p. 3) "Although warehouses and distribution centers are vital facilities in a supply chain, applications of Lean in warehousing has been lagging compared to manufacturing and SCM. This created a gap of knowledge for Lean warehousing."

ORIGINALITY/VALUE

The author will cover the introduced gap by assessing the different lean methods in line with the typical warehouse operations. As result it will end up in a potential analysis, which will be very helpful for managers preparing their decision to implement lean warehousing or even WMS vendors to use it as developing guideline, as well.

MY NAME IS ROLLAND, LOUIS ROLLAND

Karidi, Ioanna; Tzigkou, Dimitra

Technological Education Department of Ionian Islands, Greece.

INTRODUCTION

The conduction of public business activity is subject to rules attributed to the Frenchman Louis Rolland (1877-1956). Louis Rolland, a Professor of the Law School in Paris tried to systematize the basic principles that should govern the operation of a public service in 1938, by creating "Rolland Principles". Rolland's basic principles are: the principle of continuity of public services, the principle of mobility or adjustment and the principle of equality. These principles are worldwide and widely acceptable throughout the business community. The same principles are valid for public contracts as well. The purpose of this article is to discover if Rolland's principles are valid nowadays. The basic questions raised are: Is Louis Rolland diachronic? Are there any applications based on the principles in the 21st century? Are there examples of these principles existing in the case of Greek society?

PRINCIPLE OF CONTINUITY OF PUBLIC SERVICES

The principle of continuity of public services requires constant, or, in other words, without stopping, running services. The State's intervention to cover the deficits of public businesses of mutual benefit aims to ensure continuous operation. Rolland's first principle was destined to find a typical example of its application in the field of public enterprises two generations later. In the Greek legal system, constitutional provisions guarantee the continuous operation of public services for the whole society. This is the case of "Greek Radio Television" (G.R.T/E.R.T.) which was the first founding member of the European Broadcasting Union (EBU) in 1950. In 11.06.2013, the Greek Government announced the closure of the Greek Radio Television, turning off live the signal of the public channels, shortly before the end of the program that day. The black on the screens that prevailed that day was a unique event in the history of the member countries of the European Broadcasting Union. For this reason, the employee's union prosecuted a lawsuit to the Government in the Council of State, the supreme administrative court of Greece. The Council of State ordered the suspension of the decision for the closure of E.R.T. only for the parts concerning a) the suspension of the transmission of broadcasting and the operation of websites of E.R.T. S.A and b) the inactivity of the frequencies of E.R.T. S.A. Therefore the Government was forced to proceed with the foundation of a new company to replace E.R.T. This case constitutes a verification of Rolland principle for the continued provision of community service as a public service, like radio and television, despite the fact that the Constitution does not require, explicitly at least, the existence of that kind of service.

PRINCIPLE OF ADJUSTMENT OR MOBILITY

According to the principle of adjustment or mobility, it is necessary that the basic needs of citizens are satisfied, as they are shaped and changed in the framework of socio-economic development. The versatility and adaptability of services are needed to monitor the needs of services of general interest. This situation justifies the changes that occur regularly in public services, which must adapt to technical progress and the evolution of social demand. A Greek example that perfectly reflects this principle is the creation of additional lanes to Attica Tollway. Attica Tollway is a pioneering project constructed on a concession basis and is one of the biggest co-financed road projects in Europe. It constitutes the ring road of the greater metropolitan area of Athens and the backbone of the road network of the whole Attica Prefecture. In Attica Tollway, the public institution called for the creation of an extra lane due to the high utilization of the lane towards Spata as a result of the high resettlement to this area. So, although not foreseen in the relevant contract, the concessionaire was obliged to proceed with widening but with corresponding financial rewards.

PRINCIPLE OF EQUALITY

According to the principle of equality, public companies must respect the principle of equal treatment of citizens. This means that, arbitrary discrimination is not allowed, although differential treatment is possible, if warranted by special circumstances. An essential contractual obligation is imposed between the concessionaires and the users of services even if not explicitly foreseen in the concession contract or in ratifying the convention law. In the case of illegal exclusion of the use of the licensed service, the concessions can file a lawsuit in a court of law, claiming the retribution of financial reconciliation. The public service must be guided by the public interest, without being influenced by private interests. A typical example of application of the principle of equality in the Greek reality is the decision of the Council of State regarding to provisions to families having many children. Members of such families are rewarded with entrance to Universities. The Plenary of the Council clarified that acceptance to Universities is in line with the Constitution “only when the evaluation criteria are purely academic, in other words, the candidates are examined only in relation to their ability in courses and skills relevant to the subject area of the Department of School or School”. According to the above decision, the principle of equality is applied among prospective students without social distinctions between them. The Greek Government is invited to implement this decision.

CONCLUSION

From the analysis of Rolland's principles and their application in the Greek reality, the timelessness of Rolland's principles is perceived. These principles are applied for the social good and interest. Through these principles, the reasonable functioning of public services for the benefit of social interest is ensured. The above mentioned examples belonging to the Greek society are contemporary and subject to the principles of Louis Rolland. They were chosen because of their great importance in the Greek society. In the future, examination of whether Rolland's principles are still valid and applicable in the case of the private sectors of Greece and other countries as well can become the subject of a more thorough research.

OPENING THE “BLACK-BOX” OF PLACE-BASED LEADERSHIP. DECONSTRUCTING THE ROLE OF UNIVERSITY SENIOR LEADERSHIP IN CITY/REGIONAL DEVELOPMENT

Karlsen, James¹; Benneworth, Paul²; Pinheiro, Rómulo¹

¹University of Agder & Agderforskning

²University of Twente

ABSTRACT

Recent inquiries have brought together the concept of institutional entrepreneurship with the study of change within regional innovation systems (Sotarauta and Mustikkamäki 2011). In so doing, they have shed light on the potential for addressing unanswered queries regarding broader regional development processes by looking at the ‘micro foundations’ (Powell and Colyvas 2008) of city-regions and regional development. Seminal studies following the “old” institutionalism tradition remind us that leadership and power are intertwined (Selznick 1984). One area where these foundations remain to be adequately addressed pertains to the role of leadership and power in local economic development, particularly in the tensions between collective regional leadership (Sotarauta 2007) and ‘happy family stories’ (Lagendijk and Oinas 2005). To address this issue, we therefore seek to: (a) explicate how actors constellate within particular regional contexts to create strategic leadership capacity; and (b) explore how these competitive and co-operative tensions play out in practice. Some scholars conceive of institutional entrepreneurship as a strategic relay of power and knowledge in time (Sotarauta and Mustikkamäki 2011). What is more, power is salient in situations involving a constellation of social actors/networks (Owen-Smith and Powell 2008) either within a given organizational field (DiMaggio 1991) or a specific geographic/governance setting (Charles and Benneworth 2001). Hardy and Maguire (2008: 201) contend that “actors do not ‘have’ power, instead they occupy (or fail to occupy) subject positions that, in turn, allow them to exercise power in – and on – a particular field or regional governance setting.

In this paper, we frame our analysis around one particular set of regional development actors, university senior managers (rectors, vice-rectors, etc.), and explore the roles they play in the construction and evolutions of power fields within particular regional development contexts. In particular, we focus on the subject positions played by university senior managers both in their own internal (university) networks, but also within regional policy and corporate governance processes.

The empirical material is drawn from recent qualitative studies on the regional role of universities in Northern Europe – Norway (Tromsø), Finland (Oulu) and the Netherlands (Twente). In each of the three cases, universities have historically been called upon to play an active role in regional

development *inter alia* by help preventing negative 'lock-in' and contribute to regional upgrading by contributing to path- extension and/or creation (Garud and Karnoe 2012). Yet, such processes are politically and normatively laden thus raising conflicts and volitions (Pinheiro et al. 2012). Due to the multiplicity of roles that universities play – within and beyond the region (Benneworth and Hospers 2007) – they are both part of the problem and part of the solution to some of these tensions. Hence, the paper address the following research problem: *What role do senior university managers play in shaping regional coalitions and power networks, and what effects (if any) do these have in processes of regional development and upgrading?*

Conceptually, we adopt the *Strategic Relational Approach* (SRA) devised by Jessop (2001) and further developed by Lagendijk and colleagues (Lagendijk 2007; Varró and Lagendijk 2012). SRA assumes that macro-level structures are inherently relational (i.e. rooted in space and time) and, thus, are subject to strategic manipulations by certain agents who, in turn, embark into collective initiatives to (re-) shape such structures at various levels (macro/meso/micro). According to SRA, strategies and practices are the result of 'structurally-inscribed strategic selectivity', i.e. they are both a reflection of past events (*path-dependency*) as well as future trajectories (*path-shaping*); with actions and solutions becoming discursively mediated and understood against the backdrop of individuals' natural cognitive limitations or information asymmetries (see Simon 1991). More importantly, this process leads to the rise of new discursive and hegemonic (i.e. uncontested) practices which, over time and as they diffuse, are adopted and legitimated by other powerful agents and organizations, hence becoming regularized and institutionalized in new forms of (local and regional) governance. More specifically, the paper illuminates the kinds of roles that university senior managers play, and interprets them in light of the territorial developmental, regional upgrading and institutional entrepreneurship literatures.

ELDER EMPLOYEE RETENTION AND RECRUITMENT IN LITHUANIA: PREVAILING ATTITUDES AND PRACTICES, PERCEIVED BARRIERS AND POTENTIAL DRIVERS

Kazlauskaite, Ruta¹; Pupieniene, Irena²; Buciuniene, Ilona¹

¹ISM University of Management and Economics, Lithuania

²AB Vilniaus Baldai, Lithuania

ABSTRACT

The national and historical contexts play a highly relevant role in the understanding of the prevailing attitudes and stereotypes towards diverse groups of employees (Kamenou, 2007; Syed & Özbilgin, 2009); however, so far it has been mainly studied from the Western country perspective, which underlines the relevance of research undertaken in other contexts (Shen et al, 2009; Jonsen, Maznevski & Schneider, 2011).

This paper aims to explore the main factors that affect elder employee employability in Lithuania, which represents the so far under-researched post-Soviet context. It is also noteworthy that elder employees will not only make a major source of labour in the country in the near future due to fast decreasing and ageing overall population. Elder employees (55 plus) also constitute the most widely discriminated social group in the country's labour market, which is in contrast to the general EU situation, where elder employees do not even fall under the top three most discriminated social groups (Eurobarometer, 2012). It should also be taken into account that elder employees represent a unique labour generation in Lithuania and other Baltic countries, as their educational background and considerable part of work experience date back to the Soviet times. Therefore the paper approaches the elder employee employability issue in Lithuania by seeking to identify employer attitudes to elder employees, prevailing recruitment and retention practices, and perceived barriers and potential drivers in dealing with an ageing workforce.

The study is built on a qualitative approach comprising semi-structured interviews with 20 most senior HR or general managers (where organisations did not have an HR function/position) from different size, industry and sector organisations.

Empirical findings show that no specific, designed/ adopted for elder employees in particular, HRM policies or practices related to their recruitment and retention are employed by organisations in Lithuania. Similar to Western countries, negative attitudes towards elder employees prevail in organisations in Lithuania. The reasons behind those attitudes are by and large parallel to those found in other countries; however, a number of specific factors (absence of skills, attitudes to work, personality features) related to the Soviet heritage have been identified too. Besides the study has

determined a number of individual, organisational and institutional-sociocultural level factors (barriers and drivers) that have an impact (positive or negative) on elder employee employability.

THE ROLE OF SOCIAL INNOVATION IN CREATING A METHODOLOGICAL FRAMEWORK ADAPTED TO REALITY

Kchaich Ep Chedli, Mariem; Floricel, Teodora Bianca

The Bucharest University of Economic Studies, Romania

ABSTRACT

This paper presents a methodological framework that can be applied for analysing social innovations in the process of business continuity and can be used by companies to adapt their activities to the current market demands. These innovations are intended for an innovative company, with employees ready for new ideas.

The article focuses on several parts: the first part refers to the concept of social innovation, the second one show how social innovation can be analysed, focusing on methodological aspects and the third part presents the conclusions. Innovation is a complex concept and it cannot be defined without tracking all aspects and interactions which were identified in the innovation cycle.

Given the present economic crises and the low interest in applied social innovation, people tend to choose not making changes in their life and work despite new and innovative ideas; this can be taken as an approach for to avoiding risks and activity disruptions.

As results our expectations merge within the idea that a complex society requires complex answers at all problems and personalised applications of any new theory or idea. Therefore the purpose of the paper is to propose concrete ideas of social innovation that can be easily put into practice.

SPORT SPONSORSHIP: THE IMPACT OF SPONSOR IMAGE ON PURCHASE INTENTION OF FANS

**Koronios, Konstantinos¹; Psiloutsikou, Marina²; Kriemadis, Athanasios¹; Zervoulakos, Pavlos¹;
Leivaditi, Eleni¹**

¹Department of Sport Management, University of Peloponnese, Sparti, Greece

²Department of Marketing and Communication, Athens University of Economics and Business, Athens, Greece

ABSTRACT

The purpose of this study is to examine the impact of sponsor image on one major behavioral outcome, fans' purchase intention. Furthermore, following the sponsorship literature, we explored whether sport activity involvement and team attachment enhance sponsor's image among football fans. We tested our hypotheses empirically using a questionnaire sent to the fans of a prominent Greek football team. A total of 618 questionnaires were successfully completed and analyzed by means of the SPSS. Our findings show that Sponsor Image has a significant effect on the purchase intention ($R^2=0,813$, $p<0.001$) regardless of the product fit. Sponsor image was weakly linked with sport involvement and team achievement.

INTRODUCTION

Sponsorship is a company's investment in cash or kind, for creating a business-to-business relationship with a sport team, in order to gain publicity and awareness within a certain target audience, via the support of an activity, not directly linked to their business (Biscaia et al., 2013). Sport is a natural area for sponsorship, given that sponsors are more willing to invest in sport associations and clubs, which have a strong bond with a mass audience, as goodwill toward them is possible to be transferred to the sponsor's brand or products (Madrigal, 2001). Despite the evident importance of sponsorship activities, academic research has mainly focused on the evaluation of abstract corporate sponsorship instead of actual team sponsors (Biscaia et al., 2013). The purpose of this study is to single out the key variables in the sponsorship relationship, as well as to examine the impact of actual sponsors' image on football fans' purchase intention. Furthermore, in accordance with sponsorship literature, the role of sport activity involvement and team attachment was investigated, in enhancing sponsor's image between football fans.

THEORETICAL BACKGROUND

According to sponsorship literature, it is crucial to investigate whether sponsorship produce some form of benefit to sponsoring companies in terms of fans' attitudes towards the company itself or their intention to purchase the company's products (Pope, 1998). Sport activity involvement and team attachment are among the main attitudinal constructs which play a crucial role in the formation of sponsor image and by extension in sponsorship behavioral outcomes, such as purchase intention (Alexandris et al., 2007). Sport activity involvement refers to the degree to which an individual shows interest in a particular sport activity and is positively related to attitude towards sponsors (Biscaia et al., 2013). Team attachment represents a form of psychological connection toward a sports club, refers to the connectedness of an individual's self-concept and the experience of the sports club's success and failures as one's own, and it can influence individual's willingness to engage in behaviors and attitudes that support the club and by extension, the sponsors (Gwinner and Swanson, 2003). Recent research addressed a variety of attitudinal and behavioral variables, such as sponsor image and purchase intentions, as high level sponsorship outcomes (Alexandris et al., 2007). Furthermore, the relatedness of sponsor's product fit to the sponsored team has been shown to be an important factor in determining how fans respond to sponsorship (Biscaia et al., 2013). However, research regarding sponsorship effectiveness remains both tenuous and contentious, as the interactions between the proposed variables are complex and dynamic.

METHODOLOGY, RESEARCH DESIGN AND DATA ANALYSIS

The empirical data for this study were collected from a prominent Greek football team's fan clubs base making reference to its actual current sponsors (Smith, et al 2008). We ran a quantitative research. A total of 618 questionnaires were collected by a team of 5 researchers, and were completed in the presence of the surveyors. We draw our sample from fan club members because they represent a significant part of the entire fan base targeted by sponsors. The method used for the purpose of this research, is consistent with previous studies of similar issues and populations (Smith, et al 2008). A total of 618 questionnaires were successfully completed and analyzed by means of the SPSS

RESULTS, DISCUSSION AND IMPLICATIONS/CONCLUSIONS

Sponsor Image was measured with three distinct variables i.e. corporate image, product/service image and corporate quality. We also measured purchase intention for the products/services of each sponsor. Using single regression analysis, all three independent variables were found to have a significant ($p < 0.001$) positive effect with the intention to purchase the sponsors' products/services. Corporate image and product/service showed a strong effect ($R^2=0.813$ and $R^2=0.734$ respectively) whereas the effect of corporate quality was found to be weak ($R^2=0.110$). The correlation between the first two was extremely

strong ($r=0.948$, $p<0.001$); therefore, to avoid multicollinearity issues, we ran a multiple regression using only the first one and the corporate quality variable. When examined together, corporate quality was not found to have a significant effect, thus leaving only the effect of the corporate image to significantly explain purchase intention. ($R^2=0.813$, $p<0.001$). To control for a possible effect of the product fit, we ran an additional multiple regression analysis using as independent variables the 14 evaluations of each sponsor's corporate image. All but one were found to have a significant effect on purchase intention with a cumulative $R^2=0.729$ ($p<0.001$). When the independent variables were weighted by the respective product fit, the effect on the intention to purchase was found to be much lower. Unexpected as this might be, it may well be evidence of an even stronger effect of sponsor image on intention to purchase. Fans have the intention to purchase the products of their team's sponsors even when they are not specifically interested in the product category they belong. This is certainly a proposition that needs to be further researched. Sport involvement was found to have a significant positive correlation with the sponsor image, although weak ($r=0.25$, $p<0.001$). In regard to sponsor image, a small differentiation was also found between those who watch their team's matches alone and those who watch them publicly (in the field or at a café) with friends. The latter have a more positive opinion for the team's sponsors. Team achievement was not found to be significantly linked with sponsor image. Team attachment was found to have a significant ($p<0.001$) but weak positive correlation with sponsor image.

EVALUATING THE INTERNATIONALISATION PROCESS OF SMES IN THE UK CHEMICAL DISTRIBUTION INDUSTRY: THE CASE STUDY OF A MEDIUM-SIZED CHEMICAL DISTRIBUTION COMPANY

Kyriakidou, Niki; Lampadariou, Evripidis

Faculty of Business and Law, Leeds Metropolitan University, UK

ABSTRACT

Scope and Importance: The UK Chemical Distribution Industry is an integral part of the UK Chemical Industry. According to the American Chemistry Council's Global business of Chemistry (available at: www.americanchemistry.com/Jobs/EconomicStatistics/Industry-Profile/Global-Business-of-Chemistry, accessed April 2014), in 2012, the UK chemical industry was ranked tenth regarding its worldwide influence and reference. Small Medium Enterprises (SMEs) operating in the Chemical Industry are extremely important as they are an effective mechanism to generate employment and promote economic growth (Chawla et. al, 2010; Dobbs and Hamilton, 2007; Mortelmans and Reniers, 2012; Lussier, 2010). Business literature recognises that internationalisation has a positive impact on firm performance and has been long established as an important characteristic of firms experiencing high growth (Bianchi and Ostale, 2006; Javalgi and Todd, 2011; Hessels and Parker, 2013; Lu and Beamish 2001; Mudambi and Zahra 2007; Pangarkar, 2008; Zhou *et al.*, 2007). Currently, there is very limited business research investigating the internationalisation process of SMEs in the UK Chemical Distribution Industry. Therefore, the scope of this study is to offer an insight in this area by initially focusing on the internationalisation activities of a typical SME operating in this industry.

Theoretical background and importance: Overall, there are three models that explain how firms gradually intensify their activities in foreign markets (internationalisation process): the gradual internationalization (Uppsala model), the radical internationalization (or born global firms and international new venture) and the radical but late internationalization (born-again global firms) (Olejnik and Swoboda, 2012; Calof and Beamish, 1995). In general, SMEs in the UK Chemical Distribution tend to gradually intensify their activities in foreign markets by first gaining experience from the domestic market before moving to foreign markets and tend to start their foreign operations from culturally and/or geographically close countries (Chemagility, 2008; Flavell-While, 2012; Hornke, 2012; Mortelmans and Reniers, 2012). This is in line with the Uppsala model and therefore this study will be based on the same model. The current research study is focusing on The White Sea and Baltic Company Ltd (WSB); one of the leading medium-sized distributors of speciality chemicals in the UK.

Research Questions: Reflecting on the theoretical framework of the project, the scope of the study is dual; first to evaluate the current internationalisation strategy of one of the leading distributors of

speciality chemicals in the UK and secondly to identify the skills and capabilities of its international managers that could be associated / have an impact on its success.

Methodology: This is a pilot study of a larger research project started in May 2013, focusing on SMEs operating in the UK Chemical distribution that sell directly or through sales agents to international markets. A small scale research project was conducted to examine the internationalization strategy of the WBS. The research strategy adopted is a case study approach. Face-to-face in-depth interviews with 5 senior managers with exporting responsibilities and the Managing Director of the company have been conducted.

Key Findings: Preliminary findings reveal that WBS is more reactive to internationalization and that there is no clearly defined strategy or skills development plan. International managers working in the Chemical Distribution Industry support the view that when venturing into the foreign markets, firms are facing uncertainty and risks which entails a process of learning and adaptation.

Practical Implications: This is the first study conducted in the UK Chemical Distribution Industry that aims to assess the existing internationalisation strategy; identify the challenges, needs and skills required for the target groups to explore internationalization; help Chemical SMEs overcome any barriers identified by proposing an appropriate a business strategy; and the development of “soft skills” which are needed to build the employees cross cultural capability in the SMEs operating in the Chemical Distribution Industry.

INCENTIVISING EMPLOYEE SUSTAINABILITY BEHAVIOUR THROUGH HUMAN RESOURCE MANAGEMENT

Leidner, Sarah

University of Southampton (UK)

ABSTRACT

Organisations have realised the need to ensure long-term survival in the external environmental and social environment. The reasons for this can be attributed to a changing and more environmentally aware society, which can put enormous pressures on policy makers, institutions and organisations alike. Indeed, organisations have begun to implement measures that reduce the impact on the natural and social environment, not only to comply with legal obligations, but also to gain competitive advantage (del Brio *et al.*, 2007). However, the problem of how to instigate sustained environmental behaviour change at all levels in the organisation is one that is yet to be successfully addressed (Jackson *et al.*, 2011). This presentation aims to provide an overview of the literature surrounding sustainability behaviour through sustainable Human Resource Management (HRM) in order to develop a better understanding of the role of HR in developing sustainability-driven behaviour change among employees. The extant empirical and theoretical evidence in these areas of research are brought together and the gaps within the literature are identified. Furthermore, this presentation will report on the initial results of a planned study into the challenges organisations are currently facing in achieving increased sustainable practice in employees and outline the planned methodological approach for the next stages of this research project.

SUSTAINABILITY THROUGH HRM

HRM bears a high potential to strategically embed sustainability commitments into all levels of the organisation. Daily *et al.* (2003) identified that improved environmental performance should be supported by human resource practices. Wilkinson *et al.* (2001) emphasised that if sustainability resides within HRM, a more holistic and long-term perspective and application would be beneficial. Furthermore, the authors (*ibid*, p. 2144) state that '*motivating and encouraging employees to assume a proactive environmental posture becomes the new objective of the human resource strategy*'. Indeed, the literature highlights that after the development from personnel management to HRM to strategic HRM, the next stage in the evolution of HRM would be sustainable HRM. Further research that addresses these emerging new paradigms for HRM is needed, particularly to develop a better understanding on how it can improve sustainability behaviours of employees and organisations.

Filling the gap identified by exploring the ways in which sustainability can be implemented through HRM perspective forms an important part of this study.

The greening of HR depends on the strategic integration of sustainability aspects into the overall business strategy and on management support. Through HRM, the general policies and practices of an organisation can be aligned to the organisation's wider sustainable development objectives, which are considered fundamental in achieving these. Research carried out in Brazilian manufacturing companies indicated that managers perceive some HR activities as more promising to achieve environmental management objectives than others (Jabbour and Santos, 2008). This could be the case because individuals feel more inclined to espouse activities they deem meaningful. This perspective indicates that the underlying success factor for sustainability issues could reside within the behavioural intentions of organisations and employees. Therefore, the study aims to explore behaviour constructs that can have an effect on sustainability initiatives.

ENVIRONMENTAL TRAINING

Environmental training (ET) can be seen as an antecedent to increased sustainability behaviour in organisations. An extensive and systematic analysis of the extant literature in the area of ET was conducted by Jabbour (2013). The work includes a comprehensive list of the most relevant published papers in this area and, as a result of the analysis, the author provides suggestions for future research considering a variety of factors such as national context, sectors, methodologies, analytical tools, focus on ET, phases and benefits of environmental management (EM). The extant literature is mainly conceptual or exploratory and there is a paucity of research that focuses on integrating and systemising the acquired knowledge in this area. Potentially, this knowledge could help organisations to implement ET and manage more strategically and coherently with the overall business strategy.

GREEN BONUSES

To promote sustainability behaviour on an individual level, organisations can embed sustainability aspects into their bonus systems, and thus, motivate employees to achieve the desired behaviour by offering financial incentives. It has been highlighted that for some companies, because it is relatively easy to perform well in the area of sustainability, these kinds of bonuses could be used as an easy way of ensuring extra income in exchange for little effort (in Kolk and Perego, 2013). Furthermore, external benchmarks have been subject to extensive criticism in terms of reliability and relevance. This shows that research in green bonus schemes is still nascent. Thus, this presentation will report on relevant organisational examples from a pilot study, which informed the choice of a mixed-methods approach.

SUSTAINABLE BALANCED SCORECARD

It is claimed that there is a misconception about the benefits of pursuing a sustainability agenda (Nidumolu et al., 2009). The authors state that CEOs mistakenly ponder the benefits against the costs of implementing sustainability, because their research shows that 'sustainability is the mother lode of organizational and technological innovations that yield both bottom-line and top-line results' (Nidumolu et al., 2009, p. 2-3). In other words, pursuing a sustainability agenda goes beyond breaking even financially, which is often a reason for rejecting initiatives. Some organisations have already realised the potential long-term benefits of a sustainability agenda and begun to treat it as an integral part of their performance management systems. For example, Royal Dutch Shell PLC have created and implemented a balanced scorecard system for executives that includes environmental properties and that has a direct effect on annual bonuses (Hua, 2011). Thus, empirically testing if sustainability aspects of a balanced scorecard system in particular could incentivise sustainability behaviour in employees forms an important part of this on-going study.

FINDING NEW WAYS TO MOTIVATE KNOWLEDGE WORKERS: WHY GAMIFICATION CAN BE A SOLUTION

Mæhle, Natalia

SNF Centre for applied research at NHH, Bergen, Norway

ABSTRACT

As the global economy is moving into the knowledge-intensive direction and a new breed of knowledge workers (so called digital natives) is on its way, there is a need for intensive management innovations. To address this issue, the goal of the current paper is to explore an innovative way to motivate knowledge workers, i.e. gamification. Gamification – the use of game elements and game design techniques in non-game contexts, e.g. in workplace environments – has the potential to combine the intrinsic motivational factors and digital technologies to address the new generation of knowledge workers. By invoking cognitive intrinsic motivations (e.g. feelings of mastery) and using the social aspects of games, gamification is able to induce an increase of engagement and motivation, stimulate creativity, and improve learning processes and knowledge diffusion. In the current paper, we evaluate the state of research on the use of gamification in business context and study the examples of employing gamification for motivating knowledge workers.

As the global economy is moving into the knowledge-intensive direction and a new breed of knowledge workers (so called digital natives) is on its way, there is a need for intensive management innovations. Knowledge workers are those who “think for a living” (Davenport, 2005, p. 10), and they cannot be “managed” in the traditional way because they resist a command and control culture (Horwitz et al., 2003). Digital natives pose additional challenges to management as they bring with them both unique knowledge of digital technologies and higher requirements for applying it in the workplace. To address this issue, the goal of the current paper is to explore an innovative way to motivate knowledge workers – gamification, i.e. the use of game elements and game design techniques in non-game contexts, e.g. in workplace environments (Werbach and Hunter, 2012). We evaluate the state of research on the use of gamification in business context and study the examples of employing gamification for motivating knowledge workers. Due to the limited research on gamification, this study acts as a starting point for further exploration of the use of gamification in the workplace.

There have been many studies looking on the motivation of knowledge workers. Their main idea is that use of extrinsic motivation (e.g. promotion, bonuses or an increase in salary) is not very effective strategy for managing knowledge workers (Horwitz et al., 2003). Creative motivation often stems from intrinsic factors such as curiosity, satisfaction, and positive challenge (Amabile, 1996). Therefore, the factors that are important in motivating knowledge workers include challenging work, creating a work

culture permitting relative autonomy, celebrating achievement and developing a sense of purpose, direction and excitement (Horwitz et al., 2003).

Using games in the workplace is not completely new. The use of role-playing games in team building and “Employee of the Month” contests have been there for a long time. However, gamification takes it up to a new level and employs digital technology to add “gamefulness” to existing systems and make the everyday work experience more exciting. Companies can use gamification in various ways. For instance, they may motivate employees to provide process or product improvement suggestions with levels, points and leaderboards. Or they may add a series of fun “missions” to boost participation in their professional development programs (as Deloitte Learning Academy did). The gamified solutions enable goal-setting by providing objectives, rewards, tracking, and monitoring the given activities and in this way invoke cognitive intrinsic motivations, e.g. feelings of mastery (Werbach and Hunter, 2012). The social aspects of games are also an important driver of motivation. Employees can collect badges, rise in high-score lists and collect points for social reasons, such as receiving recognition. Moreover, knowledge workers value their knowledge and do not share it easily. Companies need to provide necessary incentives for knowledge sharing. A game community based on the virtual interaction among its members can promote the necessary information exchange, social learning and viral diffusion of knowledge. The research shows that gamification increases and improves social cohesion by strengthening relationships and mutual trust (Galletta, 2013).

Many companies have already employed gamification, and it is predicted that by 2015 50% of organizations will gamify their processes (Gartner, 2011). For instance, Google employees are encouraged to play during their lunch break by betting fake money, Goobles, on certain outcomes as part of a company-wide predictions market. Google believes that it helps to generate creative ideas and encourages Google employees to work harder to achieve a certain outcome they have predicted. Canon’s repair technicians learn by dragging and dropping parts into place on a virtual copier. Cisco has developed a simulation game called myPlanNet in which players become CEOs of service providers, and adopted gaming strategies to enhance its virtual global sales meeting and call center, lessening call time by 15 percent and improving sales between 8 percent and 12 percent.

However, in some cases gamification may promote competition and individual achievement while complex business problems need cooperation (Spencer, 2013). Designing an effective gamified solution requires informed application of game design. It is important to use right game elements in a right way to create a unique game experience, which is fun, engaging, and motivating. More research on how to apply gamification in the workplace environments is necessary.

GUIDED EFFECTUAL ENTREPRENEURSHIP: A TRIZ-BASED APPROACH

Malefane, Lebusa

Centre for Innovation & Entrepreneurship, Vaal University of Technology

ABSTRACT

The theory of effectuation advances a decision process employed by entrepreneurs that differ substantially from traditional views of decision-making, dealing with uncertainty and managing risk. Entrepreneurs that employ this theory develop the capacity to take decisions under conditions of uncertainty and take calculated risks when approaching markets. However, the theory of effectuation was developed on the basis of expert entrepreneurs (Sarasvathy 2008) and has not been sufficiently modified to deal with novice entrepreneurs within the Small to Medium enterprises.

In modifying effectuation, we used a heuristic problem-solving technique called TRIZ theory to assist novice entrepreneurs in the space of small to medium enterprises. TRIZ is a powerful creative problem-solving technique that has proved useful in guiding decisions and actions in complex engineering projects (Savransky 2000, Rantanen and Domb 2002, Polivinkin 1995, Pitso 2013).

In this presentation, we share the conceptual and theoretical framing of the guided decision-process approach employed by novice entrepreneurs that have been selected purposely from a pool of community members that have been explicitly trained on this guided decision process approach. This mainly qualitative study makes use of vignettes to present the results of the observation, semi-structured and videotaped data drawn from three budding entrepreneurs that were seed-funded on the basis that they made use of the guided decision process approach.

THE IMPACT OF BEHAVIORAL BRANDING IN BRAND LOVE: HOW BRAND-CONSISTENT EMPLOYEE BEHAVIOR AFFECTS THE CONSUMER-BRAND RELATIONSHIP

Manarioti, Agapi¹; Kaufmann, Hans-Ruediger²

¹University of Nicosia, Cyprus

²Business School, University of Nicosia, Cyprus and International Business School at Vilnius University, Lithuania and Vitez University, Bosnia and Herzegovina

ABSTRACT

On an average day, people see thousands of brand images. Given how ubiquitous brands have become in people's everyday lives, it is important that research uncovers the ways in which brand exposure can affect behavior (Fitzsimons et al, 2008) and how the nature of brand-consumer relationship changes.

Recent works in this fledgling research stream (Carroll & Ahuvia, 2006; Batra, Ahuvia and Bagozzi, 2012, Loureiro, Kaufmann and Vrontis, 2013) introduced the term "brand love" to describe "the degree of passionate, emotional attachment a satisfied consumer has for a particular trade name" (Carroll & Ahuvia, 2006, p. 82). In this framework, the relationship between the brand and the consumer has become stronger and deeper, and consumers tend to demonstrate greater repurchase intentions (Thomson & MacInnis 2005; Carrol & Ahuvia, 2006; Batra, Ahuvia and Bagozzi, 2012; Loureiro, Kaufmann and Vrontis, 2013), less price sensitivity (Thomson & MacInnis 2005; Batra, Ahuvia and Bagozzi, 2012), resistance to negative information about the brand (Batra, Ahuvia and Bagozzi, 2012) and engagement in positive word of mouth (Carroll & Ahuvia, 2006; Batra, Ahuvia and Bagozzi, 2012).

The concept of brand love is rooted in interpersonal love, despite the fundamental differences between the two concepts. Although consumers do not usually select the word "love" when describing their relationship with the brand (Batra, Ahuvia and Bagozzi, 2012), it is their tendency to "humanize" the brands (Morhart, Herzog and Tomczak, 2009) that allows "love" to elicit. Those human characteristics form the "brand personality" (Aaker, 1997; Kim, Han and Park, 2001) that enables consumers to express themselves (Belk, 1988) through the brand and to ultimately connect with it (Ghodeswar, 2008).

From an internal company point of view, the human face of a brand is its representatives, and the brand personality is deeply influenced by internally held values (De Chernatony, 1999). Therefore, since brand attachment is a critical factor for the brand love construct (Loureiro, Kaufmann and Vrontis, 2013) and internally held values determine the brand personality (De Chernatony, 1999), the brand consistent employee behaviour seems related to the brand love relationship. This assumption is enforced by Henkel's (2007) definition of behavioural branding, as the mix of employee behaviours that directly or indirectly determine brand experience and brand value. For the consumer, it is those

interactions with the brand representatives- among others- that will “encourage the development of meaning and invoke strong emotions in reference to the attachment object” (Thomson & MacInnis, 2005, p. 78).

Conclusively, what a brand expresses is based on the brand identity that emerges inside the organization (Kapferer, 1997), as a result of an ongoing dialogue among core values, vision, culture, brand positioning and brand personality, and formed relationships (De Chernatony, 1999). From this point of view, consumers will evaluate a brand as self-expressive and engage themselves in a brand love relationship (Carroll and Ahuvia, 2005; Loureiro, Kaufmann and Vrontis, 2013) when those representing the brand facilitate the expressiveness of the brand by performing in an in-role and extra role brand value consistent manner (Kaufmann *et al*, 2012).

Building on the common ground between behavioural branding and brand love concepts, this paper will present an innovative synthesized initial model combining those two constructs suggested to be validated in further empirical research. With an initial focus in the retail cosmetics market, which is considered to be hedonic (Schifferstein and Hekkert, 2011 p.111) and therefore more “loveable” (Carroll & Ahuvia, 2006), a hybrid methodology (Albert *et al*, 2008) is proposed, for populating a list of brands that are perceived by consumers as loved and for evaluating the personnel behaviour towards those brands. As proposed by Albert *et al* (2008), applying projective methods for the population of the Loved Brand Catalogue will prevent the research from the bias of introducing the word “love” to the interviewees, (Malhotra, 2004 in Albert *et al*, 2008), while in depth interviews with first line personnel of the brand will document the extent to which-if any- brand building behaviour exists and impacts the brand-consumer relationship.

This synthesis of two significant concepts in the branding literature, apart from the contribution to the branding field, it will also bear managerial implications, providing the managers with a an extended approach in the leverage of consumer- brand relationship.

INNOVATING IN PERIODS OF ECONOMIC CRISIS: EVIDENCE FROM THE OECD DATA AND THE TOP INVENTORS

Markatou, Maria

National and Kapodistrian University of Athens, Greece

ABSTRACT

The economic crisis that started in 2008 has negatively affected the majority of countries. Nearly all OECD countries have suffered a fall in GDP and trade flows and an increase in unemployment. The global economic crisis has also limited entrepreneurship and underpinned innovation, while the recorded severe drop in demand may have negative implications for long-term economic growth. The crisis has revealed weaknesses (and strengths) which pre-existed, across countries, sectors and firms. Business innovation and R&D activities couldn't stay untouched. International figures show that Business enterprise R&D activities and expenditures as well as patent filings were hit by the crisis. However, large firms have recovered quickly, as confirmed by their growth rates in R&D investments and sales of top corporate R&D investors. Large medium-tech manufacturers have been hit strongly. Generally, more destruction could be seen than creation.

In this context the paper examines the effects of the international crisis on the production of innovation for the whole OECD area, based on patent records and their use as indicators of innovation performance and output for a period of 13 years. The results are presented for the whole period of analysis and by comparing between the 'before crisis' and 'after crisis' periods. Three points need to be further clarified: First, the analysis starts by the whole aggregated level and ends up at the level of technology for each OECD country. Second, the paper results are presented at total, national, sectoral and technological level. Third, indicators of technological advantage are calculated at total and sectoral level for each OECD country. The paper results could be useful; as they show to what extent the economic crisis has affected the production of innovation, how its effects are reflected in the world economy and the technological landscape and which countries have been more hit by it.

TOP INVENTORS AND PATENT ASSIGNEES FACING THE GLOBAL ECONOMIC CRISIS: ARE THERE IMPLICATIONS FOR INTERNATIONAL BUSINESS?

Markatou, Maria

National and Kapodistrian University of Athens, Greece

ABSTRACT

The economic crisis that started in 2008 has negatively affected the majority of countries. Nearly all OECD countries have suffered a fall in GDP and trade flows and an increase in unemployment. The global economic crisis has also limited entrepreneurship and underpinned innovation, while the recorded severe drop in demand may have negative implications for long-term economic growth. The crisis has revealed weaknesses (and strengths) which pre-existed, across countries, sectors and firms. Business innovation and R&D activities couldn't stay untouched. International figures show that Business enterprise R&D activities and expenditures as well as patent filings were hit by the crisis. However, large firms have recovered quickly, as confirmed by their growth rates in R&D investments and sales of top corporate R&D investors. Large medium-tech manufacturers have been hit strongly. Generally, more destruction could be seen than creation.

Empirical evidence shows that the distribution of patent applications is highly skewed in terms of company size, with a few large enterprises being responsible for the majority of patent applications. Empirical evidence also shows that the great majority of top inventors and patent assignees are large enterprises. Taking into consideration this reality, major questions are being emerged and need to be answered: How do the top inventors and patent assignees face the current global economic crisis? How are they responding to it? What could be the effects on their patent portfolios? Are there any possible implications for international business?

In this context the paper studies the reaction and the response of the top inventors and patent assignees on the global economic crisis, based on the examination of their patent portfolios from the year 2008 to 2013, namely the beginning of the crisis. The analysis starts with the patenting trends of the whole OECD area, secondly at technological level, thirdly at country level and finally results will focus on the top inventors and patent assignees. Obviously the patent portfolios are the center of results and based on that the analysis has a longitudinal and qualitative content, as the latter relies on describing the technological content of the patent portfolios. An attempt will be provided to compare between the 'before crisis' and 'after crisis' patenting trends. The paper results could be useful; as they attempt to show to what extent the global economic crisis has affected the production of innovation

among the top inventors and patent assignees and if these effects could have implications for international business.

CORPORATE ETHICS AND KNOWLEDGE SHARING: ARE THEY RELATED? THE MODERATING ROLE OF ORGANIZATIONAL JUSTICE

Mavromati, Marina; Dimitriades, Zoe

Department of Business Administration, University of Macedonia, Thessaloniki, Greece

ABSTRACT

In recent years, knowledge has been recognized as a fundamental resource of competitive advantage conducing to corporations' sustainability (Chan and Chao, 2008; Wong, 2005). The process of knowledge management includes a number of activities, but the most frequently discussed is knowledge sharing (Ford, 2001 in Al-Alawi et al., 2007). Highlighting the importance of this resource, Lin (2007) notes that organizations' moral challenge is to manage it effectively while the unwillingness towards knowledge sharing should be regarded as a crucial ethical issue (Lin, 2007; Lin and Joe, 2012). Indeed, Styhre (2002, p.232) proposes that knowledge-based economy is founded "on the ethics of sharing, an ethics of giving", while Baskerville and Dulipovici (2006, p.6) argue that in an economy of sharing "employees share knowledge as a form of self – expression".

In previous studies, organizational justice was found to affect knowledge sharing via trust or organizational commitment (Lin, 2007; Fang and Chiu, 2010; Schepers and Berg, 2007; Oldham, 2003 in Cabrera and Cabrera, 2005). In addition, De Long and Fahey (2000) highlight the role of culture suggesting that an ethical and trusting organizational culture acts as a facilitator to the knowledge-sharing process (Ruppel and Harrington, 2001; McDermott and O'Dell, 2001; Bock et al., 2005).

In the proposed theoretical framework organizational justice is examined as a potential moderator of the relationship between knowledge sharing and corporate ethics. Previous studies in Greece have focused on organizational justice (Palaiologos et al., 2011; Coyne et al., 2013), knowledge sharing (Brachos et al., 2007; Chatzoglou and Vraimaki, 2009) and ethics (Kavali et al., 2001; Peppas and Peppas, 2000) but not on the relationship among these three variables. The paper aims to contribute to the knowledge sharing literature by suggesting potential drivers in an economy of sharing.

WELLBEING: FROM AN ILLUSORY MODEL TO A TANGIBLE RESERVE

Mihoreanu, Larisa¹; Viciu Tania Georgia¹; Bondrea Aurelian²

¹The Bucharest University Of Economic Studies, Romania

²Spiru Haret University, Romania

ABSTRACT

Wellbeing is a multifaceted artificial conception that depicts the satisfaction of persons contained by an area or economy, and subsequently, its development characterizes one of the uppermost and most challenging goals for politicians. The toil in measuring and controlling this variable stands in determining its relationship with additional time-honoured and perceptible financial, political or societal meters. As a consequence, the paper strains to outspread the variety of pointers by propositioning and empirically testing the relation that occurs amid the level of quality of life and the value added by services to total GDP.

INTRODUCTION

Quality of life represents an interdisciplinary topic that was developed in order to understand and mitigate the social and economic problems both at national and individual levels. The types of relations that exist between this concept and economic, political and social indicators, both in the form of prerequisites or consequences, are significantly complex and insufficiently studied.

The paper continues on the trend of supporting the importance of including population measures in the estimations of quality of life indicators, rather than simply developing an indicator based solely on economic indices. Nevertheless, the impact that quality of life has on the development of an economy, and the opposite function, continues to represent a unresolved scholarly debate with potentially important effects on the creation of future strategies.

Recent studies stress the importance of these indicators and their rising influence on the development and implementation of public policies. David Cameron's speech given in 2006 at the *Google Zeitgeist Europe Conference* illustrates the political approach toward quality of life concepts. Cameron, then a member of the British opposition party, stated that "improving our society's sense of well-being is, [...], the central political challenge of our times". Therefore, quality of life studies represent a topic of interest that can play an active role in public policies. Previous scientific debates have portrayed these indices as tangible, rather than illusive concepts, which can be used as a proxy for implementing such policies.

The current discussion deals with the impact that the structure of an economy can manifest on the general quality of life experienced by the population and the possibility of considering the

“tertiarization” of an economy as a prerequisite for increasing the general well-being of the population.

In this manner the article strides to justify the possibility of viewing the economic restructuring as a comprehensive indicator for determining, understanding and predicting future levels of quality of life.

LITERATURE REVIEW

The concept of quality of life can be defined from three approaches, comprising normative ideals, experience of individuals and satisfaction of preferences (Diener and Suh, 1997). While the first two approaches are difficult to quantify and assess, they have a strong impact on the final result, in the form of the well-being perceived at individual level. The determinants for the quality of life can be either objective or subjective. Objective indicators, comprising economic, political, health related aspects sum up the opportunities for achieving a specific level of well-being in a given region at a certain time, however, not the actual level perceived by individuals (Costanza, 2008). The way in which people experience their needs, hence, the quality of their lives, is ultimately subjective (Ekins and Max-Neef, 1992). Thus, the analysis of statistic indicators, if possible, has to be complemented by a comprehensive assessment based on direct communication with individuals.

That being said, the latter of the three approaches proves to be more tangible, being widely accepted and utilized by policymakers, as it incorporates the economic notions of utility and efficiency. Moreover, previous findings suggest that subjective well-being is consistently correlated with the level of income across nations (Diener and Biswas-Diener, 2002).

Nevertheless, studies have pointed out that indicators such as GDP per capita are insufficient in predicting the level of quality of life, as other factors in the form of measures of poverty, inequality, health status, education status, gender bias, empowerment, governance and subjective well-being play a significant role (McGillivray, 2005). Assessing the quality of life solely through this economic indicator proves to be a flawed undertaking as GDP per capita disregards the income distribution in any economy. Furthermore, GDP was never intended as a measure of population well-being, representing merely the tally of products and services bought and sold in a given period (Cummings et al. 2003, 160).

Thus, the current discussion will emphasize the importance of determining other economic and development indicators that could help describe and predict the level in quality of life across economies.

There are arguments to support the notion that the “natural process” of human society evolution implies an unavoidable transformation from agricultural based activities to industry and ultimately towards services (Cheng and Blanchard, 2009). Since the middle of the twentieth century studies

indicated that most, if not all, of the world developed economies were shifting their focus from industry and were fast becoming predominantly services based (Fuchs, 1969).

The migration of labour and capital from agriculture and industry to the services sector has altered consumption patterns as well as many population measurements. The tertiarization of economies has been synchronized with a sharp rise in female employment and, as a consequence, has generated further demand for services. This phenomenon takes place as households with working wives have been shown to spend increased percentages of total income on the acquisition of services (Fuchs, 1980).

While there are telling differences between the concepts of quality of life and standard of living, the latter representing a great component of the former, their assessment can be seen as being intertwined. Changes in the economic structure and the evolution of average productivity have influenced the standard of living in the last decades and concurrently have dictated shifts in terms of improving the quality of life (Easterlin, 2000). In the last three decades of the twentieth century, at the end of the tertiarization process in the United States, the average productivity has grown sharply, leading to new levels in quality of life. As a telling measurement of this phenomenon, the necessary working hours for an average individual to acquire a new television set shifted between 1974 and 1994 from 3 weeks to 3 days (Templeton, 1999).

DISCUSSIONS

Either directly or in mediated forms, the structural change of an economy, through the increased role of the services sector, both in terms of employment or productivity can be perceived as having a significant impact on the well-being of individuals.

The quality of life index, as already computed by well-established institutions, represents a synthetic indicator constructed from a combination of economic, social, political and environmental datasets. Its relevance can be tested by observing the correlation it generates in relation with other well established indicators which were not utilized in its initial formation.

Through an empirical approach, the relation that exists between the value added by services as percentage of GDP and the quality of life index can be assessed. By using dataset provided by the World Bank and the International Living Quality of Life Index for the years 2009 and 2010, the results can be identified for a number of 148 and 123 nations respectively. The exclusion of economies from the analysis was performed solely on the basis of lack of information for the chosen time frame.

The main hypothesis tested states that the larger the contribution of services to GDP, the higher the level of quality of life becomes.

The results for the first year (see Table no.1) indicate a correlation coefficient of approximately 0.68 which can be tested for a level of confidence corresponding to 99%. As the regression involves a single independent variable, the coefficient of determination, has the same value as the correlation, implying that 68% of the variation in quality of life can be supported by the variation of the value of services in overall value of GDP.

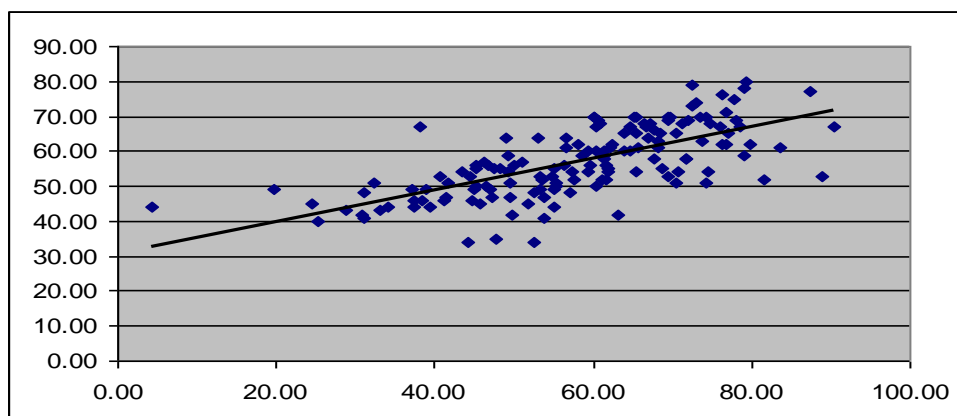

Table no.1 The relation between services percentage in GDP and the quality of life index across countries in 2009.

Source: Computed based on datasets provided by International Living Quality of Life Index, <http://www1.internationalliving.com/qofl2011/> , and The World Bank Indicators, <http://data.worldbank.org/indicator>

The plot chart, while being slightly more spread out, retains the basic shape of a linear function (see Figure no.2).

Figure no.2 Plot chart describing the relation between services percentage in GDP and the quality of life index across countries in 2010.

Source: Constructed based on datasets provided by International Living Quality of Life Index, <http://www1.internationalliving.com/qofl2011/> , and The World Bank Indicators, <http://data.worldbank.org/indicator>

The results for the two cross-section analyses support the existence of a linear function in the form of:

$$\underline{Y = 30 + 0.45 X} \quad \text{Equation (1)}$$

Where: Y represents the quality of life index;

X represents the value added by services to GDP (in percentages).

According to the initial findings, this relation can be used to predict changes in quality of life levels based on the evolution of economies in terms of services to GDP. As most developing countries are still fully engaged in a process of transition from agriculture and industry towards services, their future quality of life is expected to grow. Thus, special interest arises in the case of nations that are still relying predominantly on industry and manufacturing while concurrently manifesting little success in bolstering their service sector.

CONCLUSIONS

Quality of life represents a complex concept describing the average level of satisfaction, fulfilment and security. While subjective measurements are vital in describing individual perception, policymakers

rely predominantly on objective indicators, as they are easily and comprehensively quantifiable. Previous studies point out that economic indicators like GDP per capita and other income values, while being extremely necessary in developing policies, are not sufficient in describing the phenomena. Thus, other realistic and tangible indicators have to be identified and tested, as to widen the range of tools which could be used in assessing and predicting quality of life.

The current discussion identifies a significant relation between the value added by services to GDP and the quality of life index, characterized by a linear single variable regression, a correlation coefficient of 0.68 and a level of confidence of 99%.

The discussion can be augmented by incorporating more cross-section years and possibly identifying more economic structure indicators to the relation.

ASSURANCE LEVEL FOR SUSTAINABILITY REPORTING: EVIDENCE FROM GRI

Moggi, Sara¹; Pagani, Alessandra²

¹Department of Business Administration, University of Verona, Verona, Italy

²Department of Business Government Philosophy Studies, University of Roma Tor Vergata, Roma, Italy

ABSTRACT

Sustainability reports have become a part of the disclosure of companies. As shown in a study by KPMG (2013), the number of sustainability reports accounts for 93% of the companies in the G250 index. Despite the importance demonstrated by the increasing attention paid to sustainability reporting, with few exceptions (see the France Law 77/69 of 1977, which introduced the requirement of a social report for companies with more than 720 employees; this number was decreased to 300 in 1982), this practice is not mandatory by law. There are conflicting opinions about the mandatory publication of sustainability reports. Manetti and Becatti (2008, p. 289) stated that this gap “could be bridged by means of generally accepted principles for sustainability reporting, above all if the public authorities were to intervene with *ad hoc* legislative provisions.” On the other hand, a wider range of standards and improved flexibility of the tool would favor the extension of its use to several contexts and industries (Kolk, 2004).

Despite the increasing diffusion of sustainability reporting, it is still considered a secondary tool and is not used by shareholders, lenders, customers, employees, or local communities (Gray, 2001). However, in the post-Enron era, companies have an increasing need for transparency in order to regain the trust of their stakeholders. In fact, the financial crisis has increased the attention paid to the quality of a firm’s information and the transparency and credibility related to the management’s activities.

To fill the gap of credibility, it is necessary that a professional third party, as a professional, guarantee the disclosure of the sustainability report. The survey recently published by KPMG (2013) indicated that the number of assured reports has increased. This survey revealed that the percentage of G250 companies that published a sustainability report and decided to invest in external assurance rose from 46% in 2011 to 59% in 2012. Furthermore, two out of three of these companies choose to employ one of the Big 4: accounting firms. This result is consistent with the assumption that the auditor is a third party that cuts the agency costs related to the financial statement prepared by managers (Jensen and Meckling, 1976; Krishnan, 2003). Hence, the perceived reputation and assurance competencies of the Big 4 accounting firms have propelled them to their dominant position in the global market with regard to the assurance of sustainability reports (O’Dwyer, 2011).

This rising trend is also demonstrated by the attention paid to sustainability reports by several accounting international institutes, which, in recent years, have published a few documents for guide auditors in the assurance role. Previous studies (Junior Mori *et al.*, 2014; Manetti and Becatti, 2008) found that the two international assurance standards ISAE 3000 (IAASB, 2011) and AA1000 AS (ISEA, 2008) are the most frequently used. In January 2005, the International Auditing and Assurance Standard Board (IAASB) issued the ISAE 3000. It addresses qualified accounts auditors, and it concerns the external verification of non-financial reports. The ISAE 3000 identifies two different levels of assurance: reasonable assurance and limited assurance. Instead, the Institute of Social and Ethical Accountability (ISEA) published the AA1000 AS in March 2003. The AA1000 AS provides practitioners with a methodology to evaluate how and in which measure a company tries to identify, prioritize, and respond to its sustainability issues. Both assurance standards were updated in 2011 and 2008, respectively.

Researching the main differences in the users of the two standards, previous studies found that the ISAE 3000's definition of assurance is more technical than that of the AA1000 AS. According to Junior Mori *et al.* (2014), non-accounting professionals are likely to use the AA1000 AS framework, and accounting firms prefer ISAE 3000.

This paper aims to build on previous studies on assurance standards and assurance quality levels by performing an in-depth analysis in light of the materiality principle in sustainability reporting. In our analysis, we consider private companies that published their reports in the Global Reporting Initiative (GRI) database in 2013. To access the most complete and up-to-date database, we asked GRI directly to download an extraction on 20 March 2014. We analyzed all reports published by 189 private companies with levels A+, B+, and C+, which were checked by GRI and assured by an external independent entity. Despite the findings of previous studies that considered only the A+ level, we believe that according to the new GRI G4 guidelines, the level of accountability follows the principle of *materiality*. Therefore, it is not directly linked to the number of indicators provided. The materiality principle entails the quality of the report's accountability and not the number of indicators afforded (GRI, 2013).

Based on our review of the previous research on sustainability report assurance, we decided to apply the analysis framework built by Manetti and Becatti (2008) because it was inspired by the ISAE 3000 assurance standard, which is the major standard used by auditors and professionals. We conducted a qualitative content analysis, which was completed separately by both researchers. In the case of ambiguous findings deriving from the content analysis of each document, we reached a common result by applying triangulation to other related documents directly downloaded from the company website. The content analysis of the 189 documents allowed us to identify the following aspects:

- World Region (Kolk and Perego, 2010)

- Type of assurance provide (accountant, small consultancy, and engineering firm)
- Assurance provider (Big 4/Non Big 4) (Simnett *et al.*, 2009)
- Stakeholders panel provided or expert opinion
- Parts of report assured (Deegan *et al.*, 2006)
- Level of assurance (combination, moderate, reasonable, high, and not specified)
- Use of ISAE 3000 and/or AA1000 AS

We may add further aspects of the analysis, depending on the second phase of the content analysis, which, following the qualitative method proposed by Mayring (2000), is carried out in two times. The main idea is “to give explicit definitions, examples and coding rules for each deductive category, determining exactly under what circumstances a text passage can be coded with a category. Those category definitions are put together within a coding agenda” (p. 270). In the first step of the qualitative content analysis, we defined a wide set of open labels of the main aspects analyzed in the previous studies on sustainability report assurance. In the second phase of the content analysis, we merged and enriched the complete collection of labels found by the two researchers in the previous phase and identified definitive labels to use in the second round of the content analysis of the reports.

The first results showed that the majority of the reports GRI checked (53.45%) were not assured. According to Mock *et al.* (2009), the reason could be the costs related to this service. On the other hand, as underlined by De and Sen (2002), these costs could be recovered by the increased credibility of the company for stakeholders.

Simnett *et al.* (2009) found that factors of country and industry have a significant relation to the demand for assurance in voluntary reporting. Regarding the region, the analysis revealed that most of the assured reports were from European companies (49.21%). According to Simnett *et al.* 2009) in common-law countries, companies are shareholder-oriented, but in code-law countries, companies prefer a stakeholder-oriented approach. Regarding the factor of industry, several authors (Manetti and Becatti, 2008; Junior Mori *et al.*, 2014) demonstrated that because the mining, production, utilities and finance industries are more exposed to social risk, companies in these sectors pay increasing attention to the credibility of their reports and to assurance conducted by a third party. The majority of the sample analyzed (73.54%) was composed of A+ level assured reports. Regarding the type of assurance provided, 69.31% of the sample was supported by accountants. In particular, companies at the A+ level used the services of the Big 4 auditing firms. Moreover, the lack of a mandatory regulatory framework for the assurance of sustainability reporting has led to competition between auditors and consultants/advisers (Simnett *et al.*, 2009; Zorio *et al.*, 2013).

The findings of this study provide evidence of the current state of the assurance of sustainability reporting, bring the results of previous studies on this topic up to date, and show a unique picture of the practice of assurance after the financial crisis.

This study is the first step in a large research project that includes further analyses of the data collected. A later stage of this research will investigate the reasons that drive the compliance with assurance in sustainability reports from the points of view of both managers and accountants.

THE IMPACT OF MOTIVATION, LEARNING RESOURCES AND STYLES IN STUDENT'S LEARNING PERFORMANCE

Moreira, Rui; Seabra, Cláudia; Abrantes, José Luís; Rego, Belmiro

Higher School of Education, Polytechnic Institute of Viseu, Portugal

ABSTRACT

Modern education is based on a completely different teaching-learning process approach. The role of participants changed: the teacher is a guiding element and promoter of learning, however, the student is an active and essential element in the learning. It is clear that this change in the learning process, involves the teacher in a more technological education. To meet and motivate the students, the teacher which needs to be self-taught, integrator, communicator, questioning, creative, collaborative, efficient, generator of knowledge and an information diffuser committed to the changes of this new era. The main goal of the present study is to deepen the understanding of the influence of learning resources, namely ICT in learning styles and learning performance in lower education students. Using a sample of more 357 students, a structural model reveals that students' learning performance depends directly on their learning styles, motivation and involvement with ICT and teachers' learning resources and interest and motivation with a specific subject. Discussion centers on the implications of this scale for theory development and management decisions. The results yield recommendations for schools, teachers, and education administrators. Teachers and schools managers may better understand the learning environment preferred by students and what impacts their learning performance. Directions for future research are also presented.

Keywords: Pedagogy; Learning Performance; Learning Resources; Learning Styles.

FINANCIAL MARKETS VOLATILITY AND INVESTORS' BEHAVIOUR: ANTECEDENTS OF SMALL INVESTORS' RISK TAKING PROFILES

Mouzoura, Georgia

Faculty of Business, Education and Professional Studies, University of Gloucestershire, UK

ABSTRACT

Risk and uncertainty play a role in almost every important economic decision. As a consequence, understanding individual attitudes towards risk is intimately linked to the goal of understanding and predicting economic behavior. Significant research has attempted to identify the determinants of risk tolerance. In the past years, numerous studies have attempted to identify the demographic factors that determine risk tolerance. The proposed study aims at examining, under the behavioural finance perspective, the drivers and antecedents of individual investors' risk-tolerance profiles for which little is known, so far. Research, up to date, examines investment risk tolerance mostly in terms of individuals' demographic characteristics. However, nothing is published on the effects of culture. This study will attempt to narrow this literature gap for the benefit of all parties concerned; academia, financial services firms and investors. Theoretical and practical implications of this research are also discussed.

INTRODUCTION

Any investor is exposed to risk given that there is uncertainty about the financial outcome of the investment. In this light, investor risk tolerance can be seen as 'the extent to which an individual chooses to risk experiencing a less favourable financial outcome in the pursuit of a more favourable financial outcome' (Davey 2002), or the level of uncertainty that an investor is comfortable with in regard to investments. Whether measured for the purpose of self-assessment or for documentation of investment suitability, financial risk tolerance is assumed to be a fundamental issue underlying a number of financial decisions. Risk tolerance is an extremely complex phenomenon that is studied by disciplines such as economics, psychology, finance, and management science (Roszkowski, 1993). In this study, we use the definition from the finance literature. Risk is measured by the investment volatility. Risk tolerance refers to people's attitudes and behavior regarding financial risk (Roszkowski, 1993). Review of the literature in the area of the individual's investment risk attitude shows several underlying factors that determine the level of risk tolerance. Among the most important socioeconomic factors are gender, age, and wealth. It is amply documented that risk is a factor that shapes individuals' decisions, including financial and investment decisions, (Lipe, 1998; and Yang and

Qiu, 2005). Thus, understanding the factors that determine risk attitudes is imperative in understanding individuals' decisions. Determinants of risk attitudes of individual investors are of great interest in a growing area of finance known as behavioral finance. Behavioral finance focuses on the individual attributes, psychological or otherwise, that shape common financial and investment practices, (Ritter, 2003). Despite great interest in this area, not much research looks at the underlying factors that may lead to individual differences and play a significant role in determining people's financing and investment strategies in emerging markets. In this latter approach cultural theory has been important. This paper uses new data and new methodology in an attempt to address some of the challenging questions surrounding this concept.

DESIGN/APPROACH/METHODOLOGY

In this research investigation a deductive approach is applied. A substantial body of knowledge in the research area of market volatility already exists. In addition, the decision for the development of a theoretical framework and hypotheses was informed by the literature review making the deductive approach possible in this study. Furthermore, all theories described in the theoretical framework will be compared to the empirical findings of the study. The research will adopt different methodological tools for its different aspects, combining quantitative with qualitative methods, as well as primary data and secondary data. That mixture of data is essential for the successful achievement of the objectives required for this research.

Secondary data from an extensive literature review in order to construct a solid theoretical base on which empirical research will be designed and helps to access the techniques used by other researchers, to formulate appropriate testable hypotheses and built the research instrument regarding: volatility of published market data, interconnections between market volatility and risk-tolerance of individuals, under the perspective of behavioural finance, culture and its consequences, with a special focus on risk-tolerance in general and investment risk-tolerance in particular, effects of demographics on risk-tolerance.

Examining the drivers and antecedents of the small investors' risk taking profiles considering factors such as demographic characteristics i.e. gender, age, occupation etc psychological and cultural values, will be done by collecting data that will measure the risk and cultural profiles and can statistically be analyzed to give valuable results on the relationship between respondents' demographic and cultural characteristics and respective cultural profiles. Looking for an appropriate cultural model for this research, Hofstede's cultural dimension model was chosen, which is the most used and well known when trying to understand cultural values. Hofstede's cultural dimensions theory is a framework for cross-cultural communication. It describes the effects of a society's culture on the values of its

members, and how these values relate to behavior, using a structure derived from factor analysis. The theory has been widely used in several fields as a paradigm for research, particularly in cross-cultural psychology and international management. Financial risk tolerance has been measured using several techniques. The techniques can be separated into measures based on observing risky behavior and measures using surveys to ask questions that gauge one's willingness to assume risk in given situations (Hanna, Gutter, & Fan 2001; Hanna & Lindamood, 2004). The interview is a necessary tool for understanding the many behavioural attributes that investors may exhibit. The development of a research instrument to measure investment risk tolerance and assess the effects of identified antecedents on the same will be use for data collection. The data collection will include descriptive statistics and correlations for they key variables, regression analysis both multiple and logistic, multivariable analysis, factor analysis and structural equations modeling and will be coded and analyzed by using statistical software programs.

ORIGINALITY/VALUE/EXPECTED IMPLICATIONS

Since published research in this research stream is rather limited, there is significant opportunity for this proposed research project to provide innovative, theoretical and practical knowledge for considerably enhancing current understanding on the subject and initiating an investigative stream for future research. The importance of the research relates to its focus on the culture characteristics which are largely overlooked by existing research. Focusing on the understanding of small investors' attitudes towards financial risk will be beneficial for all parties concerned; academia, financial services firms and investors. It adds considerable value to academic knowledge on the fundamental discussion on small investors' risk taking profiles. Small investors' benefit of knowing their risk tolerance drivers will widen the array of their choices according to their needs and also it will also contribute a related framework to the existing literature. A number of possible future studies using the same experimental set up are apparent. Large randomized controlled trials could provide more definitive evidence. This research has thrown up many questions in need of further investigation. Various additional theoretical perspectives would also need attention on the basis of this research, in addition to widening the scope of the research.

EFFECTIVE USE OF PRODUCT PLACEMENT IN THE INTEGRATED MARKETING COMMUNICATION MIX

Mulder, Dalmé

Department of Communication Science, University of the Free State (UFS), South Africa

ABSTRACT

With the move away from traditional communication methods (Dahlen, Lange & Smith 2010) product placement has become a popular method to establish contact between brands and their target audiences. This type of brand touch point is used increasingly as marketing communication strategy to break through the communication clutter that viewers are exposed to daily (Belch & Belch 2009). However, it is important to identify the strength that product placement as marketing communication technique has in order to offset the weaknesses of other marketing communication techniques (Kitchen & Proctor 2002) or to supplement them. However, as the cost of product placements are spiralling upward and considered as unreasonably high by many brand managers (Shimp & Andrews 2013), it is important that a product placement strategy should be methodically chosen to enhance the placement's effectiveness and to contribute to the overall effectiveness of the integrated marketing communication (IMC) campaign. IMC considers all touch points, or sources of contact, that a customer has with the brand as potential delivery channels for messages and makes use of all communications methods that are relevant to customers (Shimp 2007). The aim of this paper is to attempt to indicate how to enhance the recall and recognition of placed products, while strategically positioning it within the IMC mix.

A combined quantitative and qualitative research methodology was employed in this study. In the quantitative approach, questionnaires and the Tobii T120 Eye-tracker device together with Tobii Studio 1.5.0 software, and a Logitech webcam were used. With the Tobii Eye-Tracker, eye position and gaze direction are estimated. The methods used to analyse the data included gaze plots, heat maps, bee swarms and areas of interest (AOI). Respondents were exposed to scenes in two different South African soap operas, each containing examples of different types of product placement. The respondents' recall and recognition of the placed products were explored. After the respondents watched the video clips, a screen shot was shown to them to evaluate if they could recognise the product that featured in the scene. The respondents then answered questions regarding the milieu (setting), the actors and the product, or whatever they noticed in the image. The study population targeted was Afrikaans speaking, third year marketing communication students (2013) of the University of the Free State. Only Afrikaans speaking respondents were selected as the dominant language used in the selected soap operas is Afrikaans. Selection criteria were that the respondents

had to be regular viewers of the selected soap operas and it had to be one of their favourite programmes. Convenience sampling technique was used (Marlow 2001). A total of 21 respondents took part in this study, but three of the respondents' eyes did not register on Eye-tracker and their interviews had to be discarded.

The conclusions drawn from the research were merged with the basic principles of IMC to provide guidelines on the manner in which product placements should strategically be integrated into the marketing communication mix to enhance the effectiveness thereof. The results suggest that product placement could have great effect in an integrated marketing communication mix because viewers recall the placed products more often if they have been exposed to the brand previously through other marketing communication techniques. Aspects that could enhance recall and recognition of placed products pertained to first and foremost to the combination of techniques used, prominence and colour as elements of the placement impacted the results of recall and recognition, the importance of guiding the viewers' eye motion towards the product, the timing of exposure and also the context of the scenes.

In the current marketing environment filled with communication clutter, marketing managers should take note of the fact that product placement could play an important role in the integrated marketing communication mix - if it is strategically and meticulously planned, and used as one component of the mix supported by other marketing communication elements.

ABSTRACT

The formation of Islamic financial institutions and system including takaful is a “back-to-religion” signal in Muslim world that believe Shariah must be followed in a Muslim’s daily life. It is evidenced with more new Islamic bank and takaful licenses are issued to show Malaysian government’s strong commitment to promote the country as an international Islamic financial hub in the Asian region, Although the Takaful industry has seen double-digit growth for the past few years, but it is reported that the industry still suffers from a lack of penetration in the market, and still performs at lackluster levels and large potential takaful market still remain untapped to its fullest. Technically, Takaful is different from conventional insurance because from Takaful concept point of view a company is not the ‘insurer’ insuring the participants but the participant is actually mutually insuring one another. Conceptually, Takaful is an arrangement by a group of people with common interests to guarantee or protect each other from certain defined misfortunes. There have been calls for Takaful industry to apply entrepreneurial orientation (EO), marketing orientation (MO) and societal concept (CSR) to make the industry more competitive. This study is to assist the Takaful operators and Takaful agencies in the country to identify ways to improve their business performance based on the concept of EO, MO and CSR and ultimately grow the Takaful industry in the future. Purposive sampling will be adopted where Takaful agency will become the respondents whose criterion meets the purpose of the study. PLS – SEM will be used to analyse the data and finding will be presented.

THE IMPACT OF THE GREEN INVESTMENT ON INDUSTRY AND SOCIETY: NINE BENEFITS

Negulescu, Oriana¹; Doval, Elena²

¹Spiru Haret University, Faculty of Management Brasov, Transylvania University of Brasov, Doctoral School

²Spiru Haret University, Faculty of Management Brasov

ABSTRACT

The green investment, as a concept, is quite new. Nevertheless the concept captures the investment is made in a company or in the public area that has the scope to reduce the carbon effect on the environment and/or to avoid the environment damage. However, after an introduction that summarizes different approaches of this concept, the paper is discussing how green investment is understood in Romania by the managers and the executives. Based on a question regarding the benefits of the green investments, as part of a larger survey conducted in 2013, this study is aiming to emphasize the impact of the green investments on different industries and on people in Romania. The organizations questioned are belonging to ten industries and the survey has covered half of the Romania's counties, getting a representative sample, although, the research has used a qualitative approach. The benefits of the green investments that have been emphasized in this research are: new markets; new jobs; economic stability; high return on investments; ethics in business; social responsibility and cooperation. In addition, two other benefits specifically to the people are underlined. The green investments are usually pushed on by six main drivers: renewable resources; clean energy, wastes management; IT; innovation and environment regulations. Furthermore, considering the above mentioned drivers of the green investments and the benefits, the paper is providing a conceptual model to provoke the organizations for consequently implementing the green investments, in order to reach out the benefits for the entire society, after all.

METHODOLOGY, FINDINGS AND DISCUSSION

The methodology used in this study is a research based on a survey and in addition, the observation, the analysis and personal judgment. The question about the green investments' effects is part of a larger survey which has been conducted in 2013 on a representative sample of 400 companies located on 21 counties, out of which 374 answers were valid (5.17% error). The entire population considered is composed by around 500,000 companies. The interesting fact is that only 186 (49.73%) of the organizations are interested in the green investments, called here the sub-sample 1, and the other 50.27% are not investing in greening the organization, called here the sub-sample 2. In the entire sample, only 119 persons are in charge with the environment activities. The organizations questioned

are belonging to the following 10 industries: agriculture (including farms, forests and fisheries); constructions; transportation; research; processing industry; energy; commerce; tourism; banks and insurance; and other services. The variables are: new markets; new jobs; economic stability; high return on investments; ethics in business; social responsibility and cooperation. However, the data analysis (the total data and the structure by industry) refers to the sub-sample 1. Therefore, the total frequency and the frequencies by the industry for the seventh variables mentioned above are presented and discussed. The answers have been provided by the organizations' managers (69.4%) and the executives (30.6%), out of which 91.9% were males and 8.1% females. In brief, the main findings emphasize that the new markets (including new beneficiaries, clients and consumers) are representing 38.2% of the benefits, followed by the economic stability and high return on the investment (17.2% each), better ethics in business (10.8%), new jobs creation (8.1%), social responsibility (6.5%) and finally, the cooperation between the organizations and the organizations and the public sector (1.6%). The main descriptives have been calculated: the mean, the standard deviation, the variance, the kurtosis and the skewness. Furthermore, the Kolmogorov-Smirnov test for nonparametric variables has been applied. The distribution of the variables is Normal with the parameters: the mean (location=2.6183) and the standard deviation (scale=1.70832). The analysis by industry is highlighting the top 5 industries that are considering the green investment and its benefits in their strategy, i.e. the processing industry, followed by commerce, transportation, other services and constructions. A model of the green investments benefits is designed as being determined by several drivers, as the followings: the renewable resources; the clean energy; the wastes management; the use of IT; the innovation, as well as the environment regulations. Nevertheless, the impact of the green investments on the industry and on the people is summarized in the conceptual model proposed, considering other two benefits, apart of the survey. The society is the main beneficiary of the greening the industry by investments. A healthy and safety life and social wellbeing, could not be assure in a polluted environment and a dramatically climate changing, but in a green environment.

CONCLUSIONS

About 50% of the Romanian organizations are interested in the green investments. Most of the organizations are considering that the main benefit of the green investment is the new markets (including new beneficiaries, consumers and clients), as the society tends to purchase green products and services. Even if the green investments are making new jobs and the benefit for the society is to be huge, only 8% of the organizations are considering this aspect as a benefit. The conceptual model proposed in the paper has a practical scope, i.e. to give a signal to all managers to invest green. This model ought to be adapted to the specific industry.

ACKNOWLEDGEMENT

This paper is supported by the Sectoral Operational Programme Human Resources Development (SOP HRD), ID 134378 financed from the European Social Fund and by the Romanian Government.

³College University of Insaniah, Malaysia

ABSTRACT

The intense competition in the global higher education sector calls for higher learning institutions to design winning strategies for attracting foreign students. As Malaysia positions itself as a regional education hub and strives to consummate this status, the nation's higher education institutions must be equipped with knowledge on how to attract quality foreign students. China is an important market for MHEIs, and students from China make up the largest single country group of students in Malaysia. For this trend to continue, MHEIs must continue to enhancing students' experiences through value in education and relationship with students and placement institutions/organizations they partner with to secure these students. Drawing on several theories (e.g. social exchange and relationship marketing theories), this study aims to examine the impact of relational dynamics (trust, competence, commitment, communication and pre-emptive conflict handling) on relational response and return (satisfaction, loyalty and return on relationship). Using a survey approach, 321 questionnaires were collected from Chinese's students in China, who are contemplating studying overseas. Findings show that commitment and communication are positively related to satisfaction and loyalty, while commitment, satisfaction and loyalty are positively related to return on relationship. Long term orientation (LTO) was found to moderate the relationship between relational dynamics and return on relationship. Overall, the study makes important theoretical and managerial contributions to the literature and higher learning institutions.

INTRODUCTION

Ministry of Higher Education (MoHE) Malaysia target to enroll 200,000 of international student to Malaysia institution by 2020. Increasing in the number of enrolling international students in Malaysia contribute to RM600 billion to Malaysia's economy (Chi, 2011). Due to the encouragement of fierce entering of international students to pursue their education in Malaysia institution, there is necessary for the nation's higher education institutions to equip with marketing knowledge or strategic to attract quality international student by focusing and understand on their need. Sheth *et al.* (1991) identified few factors that in the research for international student decision to study in Malaysia institution

among them are epistemic, functional and emotional consumption values or a combination of these values. China is one of the biggest markets for Malaysia Higher Education Institutions (MHEIs) in internationalization of Malaysia higher education (MoHE, 2011). The critical issues faced by Malaysia higher education marketing with regard to China's student is attracting quality foreign students, providing quality education to student and increasing student's satisfaction together with loyalty (Arokiasamy, 2011). There are numerous studies investigate the relational dynamics practice in the relationship marketing (Sohail, 2012); nonetheless, research noted that cultural could influence the efficiency of relationship marketing and one of it was long term orientation (LTO) (Ryu *et al.*, 2007). LTO involves in Confucian dynamism where include hard work, face-saving in relationship, future-planning and values' perseverance, exists between among Chinese due to their life style practice and heritage (Wang *et al.*, 2008). This may create moderation effect to the RM strategy and incurred long duration. Using social exchange and relationship marketing theories, this study was designed with the purpose of uncovering the relationship between relational dynamics (trust, competence, commitment, communication and pre-emptive conflict handling) and relational response/return behaviours (satisfaction, loyalty and return on relationship) of relationship marketing in the education sector. Furthermore, this study sought to examine how long term orientation (Confucian dynamism) interacts with relational dynamic in influencing relationship return behaviours.

METHODOLOGY

Using a convenience sampling survey, 400 questionnaires had been distributed to the students from the list of MHEIs sourcing students from China were derived from MOHE and Immigration services, which involve the student visa section. 321 responses were used for analysis into SPSS to examine the hypothesized relationships.

FINDINGS AND CONTRIBUTIONS

The study found direct effects of commitment and communication on satisfaction and loyalty and direct effect of commitment, satisfaction and loyalty on return on relationship among international student in Malaysia. An important novel finding is the influence of long term orientation as moderating factor between the relationship of relational dynamics and return on relationship.

This study expands the application of the relational dynamics and return on relationship in the context of international students from China by including long term orientation as moderating variables. The findings beneficial for local Malaysia higher education either public higher education or private higher education in recruiting more quality students from foreign country. Handling international students' psychological and cross cultural adjustment during the period of pursuing

their studies in Malaysia, can furthering to tighten up the Malaysia with international student business relationship.

AUDIT QUALITY AND GOING-CONCERN OPINION: EMPIRICAL STUDIES DURING THE FINANCIAL CRISIS

Pagani, Alessandra; Gaetano, Alessandro

Department of Business Government Philosophy Studies, University of Roma Tor Vergata, Roma, Italy

ABSTRACT

PURPOSE AND THEORETICAL FRAMEWORK

The global financial crisis has increased the attention of regulators, standard setters, and investors to the auditor's assessment of and reporting on a company's ability to continue as a going-concern (Carson *et al.*, 2013). The empirical issue examined in this paper is the relation between the audit quality and the probability that a financially distressed company would receive a going-concern opinion. According to the previous literature, we adopt the DeAngelo's (1981) two-dimensional definition of audit quality as the probability that an auditor will both discover and report a breach in an accounting system. More in general, audit quality refers to the auditor's capabilities to individuate misstatements and errors in the client's financial documents, as well as the auditor's independence to report those misstatements and errors. Furthermore, the auditor should provide a professional opinion about the reliability of the information contained in the financial statements. Because audit quality is not directly observable, previous studies have used different signals as a proxy of audit quality, such as accrual-based measures and the auditor's propensity to issue a going-concern modified audit opinion. In this study, we adopt the auditor's propensity to issue a going-concern modified audit opinion as a proxy of audit quality. In particular, the audit opinion may provide stakeholders with useful information that could reduce agency costs. However, it is difficult to associate different types of audit opinion with different levels of audit quality, because every audit's client has a unique history. Several authors presume that a lower grade of audit quality is represented by an increase in the likelihood that an auditor issues a going-concern opinion when a company subsequently goes bankrupt (e.g. Knechel and Vanstraelen, 2007). Previous studies have considered different proxies to investigate the economic trade-offs facing the auditor during the decision-making process regarding the issuance of a going-concern opinion. Krishnan and Krishnan (1996) demonstrated that the audit opinion decision is influenced by the client size and the auditor litigation risk. DeFond *et al.* (2002) indicate that loss of reputation and litigation costs compromise the auditor's independence. Vanstraelen (2002) reaches the same conclusions relating to the levels of audit fees and the loss of audit clients in the Belgian context. In Spain, Ruiz-Barbadillo *et al.* (2004) demonstrate that both the entity's financial problems and the

auditor's level of independence affect the probability that a financially distressed entity would receive a going-concern opinion.

In Italy (the context of the present research), the Civil Code requires the ability of an entity to continue as a going concern (art. 2423-*bis* c.c.) that it is defined as *the going-concern assumption*¹. The going-concern assumption is a fundamental principle in the preparation of financial statements. Consequently, the problem of verifying the existence of the assumption of going concern is relevant for the auditors' activities. In this regard, the ISA No. 570 provides guidelines about the auditor's verification for the correctness of the going-concern assumption used as a basis for the preparation of financial statements. This going-concern verification is fundamental for the auditor's opinion. In particular, the auditor's responsibilities are to obtain appropriate audit evidence regarding the appropriateness of management's use of the going-concern assumption in the preparation of the financial statement and to conclude whether material uncertainty exists in terms of the entity's ability to continue as a going concern (Provasi and Riva, 2014).

METHODOLOGY

In this research, we analyze 305 listed entities to investigate the relation between audit quality and the probability for a financially distressed company to receive a going-concern opinion between 2007 and 2011 in Italy. We chose the Italian context to fill the gap in worldwide studies of this issue. The period selected reveals the effects of financial crisis. Following Ruiz-Barbadillo *et al.* (2004), this study investigates the auditor's decision-making process in the presence of going-concern uncertainties. The going-concern decision is divided into two phases. The first phase concerns the identification of an entity with a potential going-concern problem. The second phase concerns the determination of whether a company with a going-concern problem should receive a going-concern opinion. Consequently, the auditor's decision-making process will depend on the auditor's competence in the first phase and on the auditor's independence in the second phase (DeAngelo, 1981). According to the literature (Vanstraelen, 2002, Geiger and Raghunandan, 2002, Ruiz-Barbadillo *et al.*, 2004, Geiger *et al.*, 2014), we identify an entity as financially stressed if it exhibits one or more of the following features in the financial statements under audit: 1) negative working capital, 2) negative retained earnings or 3) bottom-line loss. In addition, consistent with Reynolds and Francis (2001) and Ruiz-Barbadillo *et al.* (2004), we have examined the subsequent fiscal year financial statement in order to identify the existence of relevant sales of assets or the issuance of new debt or equity, because such mitigating

¹ In Italy, the going-concern assumptions are contained in: 1) Civil Code, Article 2423-bis; 2) No OIC. 5 - Financial Statements for company in liquidation; 3) No OIC. 11 - Financial Statements, objectives and postulates; 3) IAS 1 - Presentation of Financial Statements; 4) Auditing Standard no. 570 - Going Concern; 5) The Bank of Italy / Consob / Isvap. 2 of 6 February 2009; and 6) Consob Communication no. 9012559 (6 February 2009).

factors could influence the auditor's decision-making process. Entities that have one or both mitigating factors are excluded from the sample. In our research, we identify 305 potentially financially distressed entities. Of this sample, 28 entities received a going-concern opinion.

In order to investigate the relation between audit quality and the auditor's opinion for financial distressed entities, we use the following logistic regression model:

$$GOING-CONCERN = F (CLIENTSIZE, AUDITORSIZE, RECEIVABLE, INVENTORY)$$

CLIENTSIZE is a proxy of the expected cost of possible client loss if the auditor issues a qualified opinion. It is represented by the ratio of clients' assets to total clients' assets of the auditor. AUDITORSIZE is a proxy used to capture the reputation effect. It is measured by the ratio of sales audited by each auditor to sales audited in the entire audit market. RECEIVABLE and INVENTORY are proxies for potential losses from litigation. RECEIVABLE is calculated as receivables to total assets, and INVENTORY is the ratio of inventories to total assets.

FINDINGS AND IMPLICATIONS

Table 1 describes the univariate analysis of the explanatory variables classified according to the existence of going-concern opinion (GC) or lack thereof (NO GC).

Variables	Univariate Analysis					
	Mean		Median		Standard Deviation	
	NO GC	GC	NO GC	GC	NO GC	GC
CLIENTSIZE	0.539	0.210	0.249	0.130	0.881	0.236
AUDITORSIZE	0.204	0.164	0.233	0.198	0.071	0.096
RECEIVABLE	0.245	0.221	0.215	0.170	0.163	0.159
INVENTORY	0.041	0.058	0.000	0.011	0.079	0.110

Table 2. *Univariate analysis of the proxies*

The findings show that there are relevant differences between financially distressed entities that received a going-concern opinion and those that did not. In more detail, the variables CLIENTSIZE and AUDITORSIZE, which describe the economic trade-off related to the expected cost of possible client loss and reputation costs, underline a clear difference between the two groups. Regarding the variables RECEIVABLE and INVENTORY, which measure the litigation risk, the findings show that the entities with going-concern opinions have slightly higher value than those without going-concern opinions.

Providing an in-depth analysis on the relation between audit quality and the issuance of a going-concern opinion during the financial crisis, our research should be useful to regulators, practitioners, academics and standard setters, as they evaluate auditor performance in the Italian context.

THE IMPACT OF THE ECONOMIC CRISIS ON HIGHER EDUCATION IN CYPRUS: MARKETING SERVICES TO SATISFY INTERNAL CUSTOMERS AT THE UNIVERSITY OF NICOSIA

Papasolomou, Ioanna; Iacovidou, Melpo; Thrassou, Alkis

School of Business, University of Nicosia, Cyprus

ABSTRACT

The paper investigates the decisions and actions implemented within the University of Nicosia, a private tuition-paying university, following effects of the economic crisis in its effort to view and treat students as “internal customers”. It examines the university’s efforts to instill a more “student centered” culture aimed at addressing and satisfying the needs of its students as these are especially shaped by the current economic crisis by using primary data provided by the student support office of the university. Although universities were somewhat lucky, in being granted partial exemption from the “haircut”, they still lost millions of euros, out of which running expenses as well as salaries of faculty and staff is paid. The university has to cope with the loss on its deposits, liquidity problems and an expected decrease in future revenues and cash collections. The management of the university studied has recognized the need for instilling a strong “customer orientation” in its internal market focusing on students’ so as to increase student retention and maintain the graduation rates. A number of initiatives and activities have been launched within the university under the umbrella of student/customer orientation.

INTERNAL MARKETING: BUILDING A STRONGER AND MORE REPUTABLE HEALTH AND FITNESS CENTRE IN CYPRUS

Papasolomou, Ioanna; Melanthiou, Yioula; Shiokourou, Nicol

¹Department of Marketing, School of Business, University of Nicosia, Cyprus

ABSTRACT

The aim of this paper is to discuss the theoretical underpinnings and managerial implications of a research study that was carried out in one of the biggest Health and Fitness Centers in Cyprus, the Sana Hiltonia Health and Fitness Center situated in Nicosia. The study's primary aim was to shed light onto the underlying ideas and practice of Internal Marketing (IM) within the specific organization as well as explore the rationale for its adoption and practice through the perceptions, attitudes and experiences of the company's management, employees and external customers.

Berry et al. (1976) first introduced the IM term as a solution to the problem of consistently delivering high service quality. According to Ahmed and Rafiq (2004) over the next thirty years or so the concept of IM has gone through various phases of development and evolution founded on three notions namely: employee motivation and satisfaction (Berry 1981), customer orientation (Gronroos 1981), as well as strategy implementation and change management (Winter 1985). Despite its popularity and growing literature IM failed to be widely adopted by organizations. This is largely due to the lack of a single unified definition of what IM is. The term 'IM' was firstly defined in Berry's (1981) article according to which: "IM is about viewing employees as internal customers, viewing jobs as internal products that satisfy the needs and wants of these internal customers while addressing the objectives of the organization." IM is the philosophy of treating employees as customers and it is the strategy of shaping job-products to fit human needs." Gronroos (1985, p. 42) extended the notion of IM to a method of motivating personnel towards customer-consciousness and sales mindedness to include the use of marketing-like activities in this pursue: "...holding that an organisation's internal market of employees can be influenced most effectively and hence motivated to customer-consciousness, market orientation and sales-mindedness by a marketing-like internal approach and by applying marketing-like activities internally." Eventually, IM began to be recognized as a method for managing employees towards the achievement of organizational goals.

The Cyprus business sector depends predominately on the production of services ranging for example from banking, hospitality and tourism, higher education, auditing, legal services, health and fitness. The Sana Hiltonia Health and Fitness centre embarked on an attempt to implement IM in an effort to gain a competitive advantage by strengthening service quality and customer satisfaction. The researchers employed a single-case study approach that concentrated on one single service

organization. The organization studied has a strong corporate reputation and a large strong market share in the specific industry. The case study research approach was adopted in order to help understand the practice of IM through exploring the perceptions and experiences of the manager and employees working in various positions within the organization. Since the head office had adopted IM in order to improve service quality and customer satisfaction there was a need to explore the IM perceptions and experiences of both internal and external customers. Primary data was collected through the use of personal face-to-face interviews with the Sana Hiltonia manager and eleven employees. For this reason the study was primarily qualitative in nature integrating both qualitative and quantitative data. There was also a need to explore the perception of external customers in relation to the quality of service and customer focus. A total of 220 questionnaires were distributed to external customers in order to investigate the impact of IM on service quality and customer satisfaction. From these, 150 were completed and returned.

The study reveals that although the centre's manager perceives IM as a strategic process that aligns, motivates and empowers the company's employees towards the achievement of organizational goals the company has failed to adopt and implement a strategically formal IM approach. The tools used to implement the IM ideas are not strategically integrated. There is a lack of effective coordination and management of the IM initiative which demonstrates that in the organization studied IM is simply an ad hoc tactic that encompasses various activities some of which are formally planned and assessed. These are the non-monetary rewards and personal development programs. This approach results in confusion and inconsistencies in the way IM is understood and practiced by the employees and hence jeopardizing its effective implementation.

The study revealed that there is a strong recognition of the importance of employees by both the centre's manager and external customers. Happy and motivated employees are seen as a prerequisite for achieving superior service quality and customer orientation. The employees are also perceived as the organisation's source of gaining competitive advantage and achieving differentiation in a sector which is characterized by intense competition and homogeneity.

The findings that emerged from analyzing the data received from the centre's external customers revealed that the external customers feel that the employees' commitment and dedication towards achieving service excellence has the potential to transcend internal and external service encounters and create a culture that nourishes service excellence and leads to customer retention and loyalty. However, the management has not yet found a way to design, develop, implement and manage the IM effectively and hence, has not yet achieved the goals that motivated the organization to adopt IM in the first place.

ABSTRACT

This paper responds to the lack of research in the area of Internal Marketing (IM) and its practice within the business sector by investigating the perceptions held by senior level managers regarding the IM underlying ideas and implementation within the International Business Centre (IBC) of a leading bank in Cyprus (Bank A), whose name cannot be revealed for confidentiality reasons. At the time the study was contacted, the bank's IBC was the leader in the Cyprus banking industry in terms of the number of customers, customer service and information technology. The study sought to identify the rationale behind the adoption and implementation of IM and the extent to which the specific IM implementation strategy was successful.

There is a lack of knowledge and understanding in the existent IM literature in relation to whether the IM concept is practised within the business sector and the way in which it is practised. Internal Marketing refers to the application of marketing management knowledge which was originally developed for external marketing – on the 'internal market', that is the employees. At the heart of the concept is the idea of viewing and treating employees as 'internal customers'. The concept has the potential to get employees in tune with existing conditions and procedures as well as with changes. There is evidence to suggest that internal marketing is any form of marketing within an organisation which focuses staff attention on the internal activities that need to be changed in order to enhance external market place performance. By treating employees as customers, the employees' attitudes will change, employees will become more motivated and service minded which has the potential to lead to better service quality and a competitive advantage in the market place.

The study adopted the case study research methodology to investigate the extent to which a formal internal marketing strategy was been implemented, managed and monitored throughout the three regional International Business Centres (IBCs) of the bank studied. The researchers used triangulation by retrieving primary data through observation and personal face-to-face interviews with employees and managers working at different levels within the bank's regional IBCs.

The focus of the study was an in-depth investigation and cross-examination of the perceptions, feelings, attitudes and experiences with IM provided by different organisational members working at different managerial levels to establish whether there was a perceptual gap and inconsistencies in the

way IM was conceptualised and practiced. The researchers interviewed: the director of the IBB, five regional IBCs managers, eight middle managers, and eleven lower level employees.

The study revealed that the managers' interviewed had no clear view of the IM concept and even though they recognised some of the key IM ideas it was clear that the bank had not adopted an IM approach, one which was formally and strategically implemented across divisions. The managers interviewed related IM with external customer service and external customer satisfaction failing to recognise the importance of achieving employee satisfaction as a prerequisite for external customer satisfaction. A number of discrepancies emerged revealing that the current IM approach appears to be a "facade" hiding away an aggressive approach to 'sell' the bank's corporate brand and organizational goals and strategies (such as customer focus and orientation) to its employees. It was clear that the specific organization had adopted IM as a way to manipulate its workforce towards the achievement of organizational strategies by pretending that it cares for the welfare of its employees. The lower level employees claimed that the bank did not implement IM which highlights that the current implementation approach is ineffective. The majority of the lower level employees consider that IM is implemented in order to "show off" and pretend that the bank has a caring face towards its employees.

The rationale behind the adoption of IM within the IBCs was primarily as a change mechanism and the minimization of the employees' resistance to change. The bank had embarked on a series of internal changes and IM was seen as a strategy for overcoming the employees' resistance, fear and scepticism towards change. The study also revealed that IM was adopted in order to demonstrate that the bank (management) cares for its employees as a way to motivate them to work harder towards the achievement of organizational goals such as the achievement of customer satisfaction and sales mindedness.

The study revealed that the IM implementation approach was considered to be successful by the branch managers. However the perception held by the lower level employees and by the majority of the middle-level managers was that the IM practice was unsuccessful. This finding demonstrates that there is a perceptual gap between senior and lower level employees. This gap can lead to conflicts and frictions not only within the units/branches themselves but between different departments.

The study's findings have implications not only for other organisations in the banking sector but also for the wider services sector in Cyprus and Europe. Employees are the backbone of the organisation. They are 'breathing' and 'living' the values of the organisation. They experience the company's organisational culture on a daily basis. They are also interacting with other organisational members. The way they are viewed and treated has a direct impact on their attitudes and behaviour towards the external customers. Any initiative or strategy adopted at a headquarter level must be carefully

implemented and monitored throughout the organisational units/departments in order to ensure its successful implementation. Failure to do so can result in employee dissatisfaction, frustration, and the whole process can be counter-productive. Although the bank studied 'embraced' internal marketing at a headquarter level as a change mechanism it failed to effectively monitor its implementation resulting in confusion, dissatisfaction and internal conflicts.

THE RELATIONSHIPS BETWEEN CORPORATE DIPLOMACY AND SUSTAINABILITY IN THE FRAMES OF GLOBALISATION: A RESEARCH NOTE ON EVIDENCE FROM THE HOTEL INDUSTRY IN GREECE.

Paraschaki, Maria¹; Tsoukatos, Evangelos²; Kaufmann, Hans-Ruediger³

ABSTRACT

In the academic area, there appear several approaches of the term corporate diplomacy. In this study, these are recorded and categorised into two groups. The first group includes those defining the concept via its purpose, which is sustainability. The second includes those defining the concept as the management of the relationships between the company, as a system, with its systemic environment. Related to the latter, the objective of this study is to examine the relationship between corporate diplomacy and sustainability, in globalisation and, simultaneously, in crisis circumstances, as moderator factors. (Porter, 1980; London, 1999; Steger, 2003; Kostecki & Naray, 2007; Naray, 2008; Ordeix-Rigo & Duarte, 2009; Kocmanova, et al., 2011; Asquer, 2012; Sarfati, 2012; Macnamara, 2012). This study will seek to achieve its objective based on theory development and testing. Towards this end, it introduces three levels of corporate diplomacy: the basic corporate diplomacy in the frames of corporate policy, the passive corporate diplomacy and the energetic corporate diplomacy. At the energetic corporate diplomacy, the relationships between the company with its systemic environment are managed in such a way as the semi-autonomy of the system-company to be guaranteed. At the basic corporate diplomacy, the influences by the systemic environment are stronger than the inter-systemic relationships, leading corporate policy to be adjusted in these influences. Passive diplomacy is introduced, in this study, as the intermediate level between the other two (Dekleris, 1989). Regarding sustainability, three pillars are recognised in the literature: natural environment sustainability, social responsibility and capital preservation (Kocmanova, et al., 2011; Jones, et al., 2014). For every pillar, we introduce also three levels of sustainability measurement (consumption, preservation and promotion). This study examines the possible interconnections between the corporate diplomacy levels and the pillars of sustainability, towards establishing a, so far not existing, integrated approach of developing a universal corporate diplomacy concept (Steger, 2003; Kocmanova, et al., 2011; Asquer, 2012; Sarfati, 2012; Macnamara, 2012; Jones, et al., 2014). Comparative analyses of the above-mentioned relationships will be conducted based on empirical evidence from the hotel industry in Greece. The hotel industry was chosen because this sector seems to be directly

influenced by globalisation, but less by the existing financial crisis in Greece (www.itep.gr; www.sete.gr; Jones, et al., 2014). The study will encompass the qualitative research method of a case study, applying the research techniques of expert interviews. From the population of hotels in Greece, the sample comprises the managers of five and four stars hotels (Saunders, et al., 2009). This choice is due to the fact that corporate diplomacy and sustainability are issues of concern of the higher levels in the managerial hierarchy and of large businesses, on which this research is focusing (Steger, 2003; Muldoon, 2005; Asquer, 2012). A limitation of this study is that it is confined to the hotel industry of specific star categories, and one country only.

As this research is in the sphere of social science, the empirical data are directly affected by the evolution of social phenomena (Saunders, et al., 2009). One such phenomenon is globalisation which limits the protective role of the state in favour of the markets, introduces new morals and cultural values and via emigration introduces new law cultures and affects labour relations. Apparently, globalisation influences companies' sustainability (Deligianni-Dimitrakou, 2008; Kocmanova, et al., 2011). During the past ten years, globalization, as a phenomenon, has been developed dynamically, while as a concept has been widely researched (Deligianni-Dimitrakou, 2008; Gills, 2011; Farrar & Mayes, 2013; Jones, et al., 2014). On the other hand, the concept of corporate diplomacy has been relatively set aside in the literature, during this period of time. The contradiction in the dynamics of the two concepts' development implies to verify the existing academic gap and contributes to the research originality (Muldoon, 2005; Gills, 2011; Macnamara, 2012).

Summarizing, this research will seek to cover the academic gap of the relationship between corporate diplomacy and sustainability, in globalisation circumstances (Steger, 2003; Muldoon, 2005; KostECKI & Naray, 2007; Sarfati, 2012; Macnamara, 2012). This research contributes to a better understanding of the concepts involved and their interrelationship, against the background of the new standards introduced by globalisation. From a practical perspective, this improved understanding will assist corporations to achieve sustainability balancing between the three pillars of sustainability, possibly, also, in crisis circumstances.

THE QUEST FOR NON-TECHNOLOGICAL INNOVATION IN CREATIVE INDUSTRIES

Parga-Dans, Eva¹; Martín-Ríos, Carlos²

¹Facultad de Ciencias Humanas y de la Educación. Universidad Técnica de Ambato, Ambato, Ecuador

²Maine Business School, University of Maine, Orono, Maine, USA

ABSTRACT

Non-technological innovation is an essential asset for firms in the creative industries to survive and succeed in an increasingly competitive market. However, research on disruptive non-technological innovation is insufficiently documented, leading to questions about the role and relationship between the main non-technological innovations: business model innovation (BMI) and management innovation (MI). Greater understanding of the advantages of each innovation positioning and their significance for innovation performance is critical for cultural industries where unpredictability and the accelerating pace of change pervade the innovation decisions. Drawing on four exemplary cases of archaeological firms in Spain, this paper explores the innovation process dynamics found in such cases. The study argues that, in order to cope with the changing dynamics of their activity, creative firms need disruptive business model innovation and, at the same time, a portfolio of complementary organizational innovation initiatives.

Innovation is essential for entrepreneurial firms in creative industries where a complex institutional environment and limited management resources, exacerbated by the reliance on highly skilled human capital, drives increasing commercial competition within the industry. The international financial crisis between 2007-2008 and further economic downturn, has intensified their search for innovative solutions to shrinking business opportunities. Recent studies on innovation in creative industries have shown certain peculiarities, particularly their reliance on non-technological sources of innovation (Franklin et al., 2013). In the event of convoluted economic conditions, the pioneer firm attempts innovative business model solutions (Foss and Stieglitz, 2014). That source of innovation tends to be disruptive and, in creative business, first-mover status is a precarious position on which to rest business practices and model. This is the situation confronting most entrepreneurial firms in creative industries when determining whether to pursue a disruptive innovation (McKelvie and Wiklund, 2008).

In his work on disruptive innovation, Christensen (1997) asserts that, for pioneering firms, disruptive business model solutions may provide a competitive advantage in the fast-paced competitive challenges of dynamic sectors. However, as we contend in this work, the success of business model innovations might require further innovation solutions in the form of new management practices (Mol and Birkinshaw, 2009; Preston et al., 2009). First movers might be disadvantaged by their lack of

experience to foresee, giving a chance to second movers, who may have a more systematic, strategic approach toward innovation. This does not imply that some first movers often have a clear advantage over followers, but as Schnaars (1994) recognizes, innovation studies need to acknowledge the huge amount of uncertainty that innovative activity brings in. This is even more critical in a changing economic landscape, where firms are forced to constantly reposition their strategy and offer new services.

The study of organizational innovativeness in creative industries requires systematic research into the dynamics associated with the determinants of innovation adoption. The newness of certain innovations may be detrimental to early adopters. Alternatively, for first-movers and early-movers of non-technological innovations, business model innovations allow for faster-growing, profitable innovation success. This is a remarkable quest for small firms that the literature has not addressed yet. Specifically, to what extent does the level of non-technological innovation disruption contribute to innovation success?

To address this research question, this study explores the success path taken by firms in the creative industries in terms of introducing disruptive business model innovations. We do so by drawing on commercial archaeological service in Spain and by qualitatively analyzing four such firms. Commercial archaeology represents a relatively modern business activity, which took off as a result of favorable legal requirements on heritage protection and an endless service demand from the construction activity occurred during this period had an extraordinary development at the beginning of the 21st century. This context strengthened the creation of numerous archaeological firms. However, the economic and financial downturn that began in mid-2007 severely affected this business activity, 42% of archaeological firms wiped out in four years and survivor companies were forced to innovate in order to adapt to the changing environment.

Our study of four exemplary cases traces the innovation pathways taken by these firms. We observed that to cope with failure and an unstable market environment, these four archaeological firms were prone to adopt new business models in order to redefine their activities and to explore new market venues. During the first few years of economic slowdown archaeological firms brought to life new business models, even if assuming high risk with little guarantee of success. Once pioneers introduced new business models as a way to stay abreast of slumbering market opportunities and large competition among competing firms, other archaeological firms attempted first-movers' innovations. However, our findings show these next-to-first movers not only adopted new business models but they also attempted systematic management innovation initiatives. That was deemed by interviewees at these firms as way to secure successful implementation of innovations in the business structure and to maintain these innovations over an extended period. In conclusion, our preliminary results show that

disruptive non-technological innovation strategies help entrepreneurial firms in creative industries to cope with changes in the activity.

CULTURAL HERITAGE VALORIZATION PROCESSES AS ENABLERS OF SUSTAINABLE TOURISM IN ECUADOR

Parga-Dans, Eva

Facultad de Ciencias Humanas y de la Educación. Universidad Técnica de Ambato, Ambato, Ecuador

ABSTRACT

Cultural heritage protection, management and valorization are essential tools for sustainability and valuation in Latin America countries. An interesting case is the *National Plan for Good Living* (2013-2017) advanced by the Ecuadorian government. This paper presents a work-in-progress research on the identification and characterization of Ecuadorian cultural heritage valorization model as it relates to cultural tourism planning and development, entrepreneurship and empowerment of indigenous communities. Research on tourism, entrepreneurship and local communities is considered essential in the formulation of a national policy and strategy. Ecuador exemplifies an ideal research context due to its strategic resources—natural and cultural diversity, and its economic and social characteristics and quandaries. Empirical evidence of different heritage valorization processes is presented through four case studies that exemplify integrative programs of cultural heritage protection, management and valorization.

Cultural heritage protection and valorization is a cornerstone of the current Ecuadorian political model as is reflected in the *National Plan for Good Living* (2013-2017). This paper presents work-in-progress research on the identification and characterization of the Ecuadorian cultural heritage valorization model in relation to cultural tourism development, local entrepreneurship and empowerment of indigenous communities. This topic is considered critical in the formulation of a national policy and local strategies. Ecuador illustrates an excellent research context due to its strategic natural and cultural resources, its economic and social characteristics and dilemmas.

The overcoming accumulation model based on extractive industries has become a topical debate on the various methods of development in Ecuador. Historically, Ecuador has been characterized by a succession of ups and downs in exports of the country's main products: cocoa, banana, oil, flowers and fruit. This analysis indicates that economic growth in Ecuador has been characterized by an extractive model, based on the consumption and export of natural resources (Villalba, 2013). The *Good Living* approach opens new perspectives and offers an alternative paradigm to the previous development model. From this point of view, discussions of the *Good Living* and its application in government policy are particularly relevant. Specifically, the relationship between socioeconomic uses of cultural heritage and tourism development offers an interesting area of research (Iorgulescu et al., 2011; Poria and Ashworth, 2009; Aas et al., 2005).

Tourism is a relatively new economic activity in Ecuador and has grown exponentially in a short period of time, being the third most important economic activity in the country, after oil extraction and production of banana, attracting about 700,000 visitors per year (Ruiz-Ballesteros, 2011). Cultural tourism and its impact on local communities is a hot topic in academics and is currently being explored in the Ecuadorian context (Ballesteros and Carrion, 2007; Estrella Duran, 2007; Korovkin, 2001; Gould, 1999). It is therefore a priority to theorize about the uses of heritage valorization models in relation to sustainable tourism development.

The recent empowerment of communities in Ecuador coincides with the rise of indigenous movements and their political role since the final decades of the twentieth century (Estrella Duran, 2007). The indigenous communities are integrated into the political and administrative organization of the state (Organization and Management Act of Municipalities 2004) and the Constitution of 2008 recognizes indigenous rights. These communities are often in charge of guarding the community property (land) and have their own decision-making system. In this context, rural and indigenous communities have begun to consider participating in tourism activities, sometimes through community tourism formulas and developing entrepreneurship initiatives. Currently, about 60 rural and indigenous communities offer community tourism activities in Ecuador. It is estimated that these activities benefit some 15,000 people directly and indirectly (Ruiz-Ballesteros, 2011). Community tourism becomes a vehicle to meet the needs of indigenous communities and a way to achieve self-management of their lands and resources (Gould, 1999).

In this sense, to what extent has Ecuador developed heritage valorization processes under sustainable parameters with the environment and local communities?

This research is characterized by its exploratory nature. Empirical evidence is presented through four in-depth case studies: Baños, Cuenca, Galapagos and Ishkay Yaku as representative locations of the Ecuadorian natural and cultural diversity (mountains, city, coast and Amazon). Through these illustrative cases, the relationship between cultural heritage valorization and tourist impact is explored by means of a variety of data sources, using semi structured interviews, focus groups and participant observation.

This multimethod field study indicates that cultural heritage valorization processes can serve as an important enabler of tourism activities. It also shows that tourism planning, political involvement and community participation may facilitate productive capabilities, local entrepreneurship and the empowerment of communities involved by providing sustainable tourist activities.

HUMAN RECOURSE MANAGEMENT, FLEXIBILITY AND THE SUPPORT OF ENTREPRENEURIAL BEHAVIOR IN FINNISH UNIVERSITIES. A RESEARCHERS' PERSPECTIVE AND MANAGEMENT VIEW.

Pekkola, Elias¹; Kuoppala Kari¹, Lyytinen Anu¹; Siekkinen Taru²; Stenvall Jari¹

ABSTRACT

The reform of the steering and funding of Finnish public agencies has been aligned with the OECD's recommendation of more market driven policies and new public management. In Finnish universities this has meant increased financial autonomy and growth in share of non-budgetary Funding. This has forced universities to apply new entrepreneurial practices in their resource acquisition as well as more centralized and managerial practices in their decision making. Competitive funding of the research has change the personnel structure of the universities. The waste majority of researchers (non-teachers) are currently working in projects on temporary basis. Regardless the strategic importance of project-funded-research for the mission and funding of universities, the employees working with project funding are regarded often as peripheral workforce.

Our paper draws on the experiences of the Finnish researchers employed in eight largest universitiesin Finland (survey, N 810) and from the interviews of HR-manager of these universities (N 8). In the paper, the HRM practices are approached from the perspective of individual project researchers. We are interested in the practices, incentives and organizational structures that support individuals for entrepreneurial activities as well as the congruence of researchers' reality and management view. Our hypothesis are that the current HRM-practices do not support entrepreneurial research work and that the centrally steered HR-policy do not reach the operational management of research projects. We argue that at least part of these peripheral project researchers should be considered core workforce for the universities.

Keywords: *Reform of Public sector, University, Finland, Human Resource Management, Flexible organization, Researchers, Academic work*

INTRODUCTION

The Finnish University system has undergone a drastic change during 1990 and 2000. The transformation of the university system culminated to the reform of university legislation in 2009 that changed the legal status of the universities from state bureaus to legal entities under public law or

foundations. It enabled an independent employers' policy and gave financial autonomy for universities. (Tirronen & Nokkala 2009, Aarrevaara et al. 2009, Pekkola & Kivistö 2012). In the meanwhile, the share of non-budget funding of the universities has grown and became essential for the research function of universities.

The ratio between non-budgetary funding and budgetary funding has grown from 0.17 1989 to 0.58 in 2001 and after that stabilized to be approximately in 0.55. The changes in the financial steering of the universities, has had an impact to the personnel structure of the universities. Whereas the number of budget funded teaching staff has remained the same for last 30 years, the number of researchers working with competitive funding has increased fourfold during the same time period. In addition, the number of the administrative personnel has grown significantly. (Kota 2009.) In addition, according to Statistics Finland the absolute number of the research personnel has grown in the universities but the number of full time equivalent employees has in fact degreased during the last few years (Statistic Finland 2009).

There has been a policy goal to strengthen the institutional management of universities. During the latest reform the institutional basis of management of Finnish universities has been incrementally changing from collegial towards more managerial. Starting from 1996 onwards the role of rector (equivalent to vice-chancellor in British system) has been emphasized as CEO-like manager. In 2009, after lengthy discussion, the collegial election of the rector was replaced with board selection procedure. In addition full-time deanship was made possible with amendment of law in 2005. Moreover, the role of external stakeholders in the top and middle-level management of the universities has been strengthened. (Pekkola & Kivistö 2012.)

Decramer et al (2012) have used institutional perspective when analyzing performance management in higher education institutions. Human Resource Management (HRM) is connected both to the changes in the organizational environment and to the organizational internal changes. It can be said that one of attempts to strengthen managerialism in universities is HRM (Waring 2013, 397). Human Resource practices have increasingly converged when universities' role as an employer has strengthened and universities have started to adopt HRM as the management tool to monitor and direct the work of academics. (Gordon & Whitchurch 2007; Slaughter & Leslie 1997; Waring 2013, 397). By emphasizing the close congruence between organizational objectives and strategies for managing academic staff the HRM strengthens the role of the institutional management and seeks to create unitary organization (Waring 2013, 400–402). We doubt if the strengthened institutional management and steering core has reached the grass root level of the research (project) management.

In our paper we are seeking answers to four questions:

- How the recent university reform has changed the HR-policies of universities?

- What kind of HRM practices are employed in Finnish universities among project researchers?
- How do they support entrepreneurial activities?
- How well institutional HR-policies are transferred to practice?

The paper is based on the initial results and data of a two-year-project “Fixed-term university researchers in the Finnish knowledge economy” funded by the Finnish Work Environment Fund. The data consist a survey (N 810) conducted in 2013 among the researchers employed by eight largest universities in Finland and the interviews of the HR-managers in respective universities. The data is analyzed mainly by utilizing descriptive statistics. The connection between HR-practices and entrepreneur activities is studied by utilizing correlation analysis and regression.

Table 1. Research question, assumptions, methods and data

	Assumptions	Data	Methods
Research Question			
How the university reform has changed the HR-policies of universities?	The independent status as employer has force universities to develop their own policies and practices	Documents, interviews	Content analysis
What kind of HRM practices are employed in Finnish universities among project researchers?	Practices are rare Practices are unsystematic	Survey	Descriptive statistics
How do they support entrepreneurial activities?	With systematic and predictable HRM entrepreneurial activities	Survey	Regression, correlation analysis
How well institutional HR-policies are transferred to practice?	The HR-policies are not transformed to project management	Survey and Interviews	Descriptive statistics & Content analysis

HUMAN RESOURCE MANAGEMENT: POLICIES AND PRACTICES IN ACADEMIC ORGANIZATIONS

HRM approaches developed in business organization cannot be straightforwardly applied in an academic environment in which collegiate values, academic freedom and autonomy are deeply rooted (Edgley-Pyshoen & Huisman 2011; Waring 2013, 26). Universities have also traditionally been bottom-heavy and loosely-coupled organizations in which disciplines constitute the dominant force of action. This means that academics often build their careers in certain disciplines rather than in a certain institutions. Academic disciplines, in turn, differ in terms of academic careers concerning how appointments are organized, how new academics are recruited and what role performance indicators play in recruitment. (Becher & Trowler 2001; Clark 1983; Strike & Taylor 2009, 193–194; van den Brink & Fruytier 2013, 180–195). These are some of the peculiarities that we have to take into account.

Gordon and Whitchurch (2007, 2) emphasize that the national and local HRM responses of universities to the macro level social forces can be and are distinct and often result in managerial and collegial preferences as mixtures of institutional missions, traditions and cultures (Gordon & Whitchurch 2007). They observed that, in spite of national differences, characteristic for the HRM of higher education institutions is a combination of “hard tools” such as recruitment and retention, rewards and incentives as well as “soft tools” of staff and career development and motivation. They concluded that the great challenge is to blend these two approaches together at institutional and local levels and to develop human resource management design that makes flexible and individual solutions. (Gordon & Whitchurch 2007; see also Waring 2013, 400–401.) The Survey data gives an overview on the Finnish case.

There are few well known conceptual models of HRM, which originate from the USA: the Harvard model, the Michigan model and the MIT model. From the perspective of this research proposal the developmental studies from the Harvard University are most interesting. The Harvard researchers (Beer et al 1984; see also Paauwe 2004) paid attention to the description of human resource flows.

Human resource flows are conditioned by both requirements of organization and needs of individual. The aim of our research, too, is to compare organizational policies and individual perceptions on HR-practices. Organizational requirements are simply business plans and targets and in connection HR flows. Individual needs are made up of personal objectives and career plans including individual plans for career development. In the academic context individual career development plans include both scientific and other kind of careers. HR flows in universities as well as in other organizations are conditioned by social institutions like legislation, state regulating organs, labor unions, common social values and public policies. (Beer et al 1984; see also Paauwe 2004.) We try to capture this dynamics by triangulating the different kind of data.

DISCUSSION: FLEXIBLE UNIVERSITY

As a conclusion of our study we will identify the role of HR-practices and entrepreneurial activities within a frame work of flexible organization. We rely on Atkinson’s (1985&1986) model on flexible firm that offers one approach to organize organization’s human resource in efficient way. His model is based on the distinction of the workforce into peripheral and core groups. The peripheral group of employees is composed on individuals whose skills are easily replaceable, they are needed only for short time period and they are needed only during the peak times of the production. The type of the organizational flexibility of this peripheral group is numerous flexibility meaning the alteration of the number of the workforce. In contrast, the core group of employees are vital for the organization because of their skills, experience and knowledge. The organizational flexibility of this core group is

mainly functional, meaning the alteration of the content of the work. Among the researcher the most common flexibility is numerous one. We argue that at least some of the project researchers are essential for the universities core function (research) and that the functional flexibility could be used as optimal way of utilizing this resource if the organization and the researchers are entrepreneurial.

FASHION AND FACE CONSCIOUSNESS – EVIDENCE FROM A CROSS-CULTURAL STUDY

Pfajfar, Gregor¹; Shoham, Aviv²; Anil, Nihat³; Pesämaa, Ossi⁴; Makovec Brenčič, Maja¹

³Vize Vocational College, Kırklareli University, Turkey.

⁴Hanken School of Economics, Finland.

ABSTRACT

Fashion and brand preferred consumption always attracted special attention of academic researchers (e.g. Liao & Wang, 2009; Pentecost & Andrews, 2010; Pookulangara & Shephard, 2013), some even claiming brand consciousness to be the most influential factor on consumption (Zhang & Kim, 2013). Although its definition may be universal (the extent of an individual's interest in and attention to the latest fashion trends, having a style up to date with what's new on the market; Manrai et al., 2001), there are reported market differences in fashion consciousness between developed and less developed countries (Parker, Hermans & Schaefer, 2004). For example, consumers in Eastern Europe have always been interested in Western style, thus their exposure to Western brands and advertising affected consumer values to change from former collectivist to individualistic values (Manrai et al., 2001). The key to explain these cultural differences in behavioral sciences holds in culture-specific values, mianzi or face in particular (Zhang, Doom & Leeftang, 2014).

People in Eastern societies are under constant pressure to live up to expectations of others in order to "save face" (Parker, Hermans & Schaefer, 2004). As "face" refers to "a sense of favourable social self-worth that a person wants to maintain in relational and network contexts" (Zhang, Doom & Leeftang, 2014), people with high face consciousness will care more about their self-image and others' appraisal (Liao & Wang, 2009). Thus, collectivistic Eastern consumers with a greater face consciousness (desire to enhance, maintain and avoid losing face in relation to others in social activities) may place more emphasis on publicly visible possession than Western consumers do (Bao, Zhou & Su, 2003). In fact, novelty and fashion conscious consumers are not just motivated by a concern for the avoidance of losing face (Parker, Hermans & Schaefer, 2004), but are actually gaining face from being trendy (Bao, Zhou & Su, 2003; Liao & Wang, 2009). On one hand, Eastern consumers use luxury fashion goods not just to show their status or boost their self-recognition, but are also an essential symbol of group identity, determining wearer's social position and esteem (Zhang & Kim, 2013). On the other hand, Westerners' fashion consciousness is driven by their need for uniqueness (Bian & Forsythe, 2012; Ko & Megahee, 2012) and authentic life, expressing their inner values and tastes through affinity for highly personalized products (Parker, Hermans & Schaefer, 2004). Here, we observe the rise of material values

in Western societies and face consciousness in the Eastern societies. Materialism and face were found to influence brand consciousness differently, as they are basically two different constructs. Materialism being rooted in the modern economic lifestyle is based on individualistic cultures focusing on hedonic meanings mainly related to consumer behavior; while face existed since ancient times in collectivist cultures representing a social concept of the self, addressing interpersonal significance and being related to almost all respects of life (Liao & Wang, 2009). In sum, the concepts of face and fashion consciousness have a different meaning across cultures and may consequently differently impact consumer behavior.

A call for a good measurement instrument for the face consciousness concept (Bao, Zhou & Su, 2003), led us to expand the set of proposed cultural dimensions elaborated in the previous literature to independence, power and social inequality as cultural-specific antecedents (these were selected as they are social norms highly rooted in the culture) to face consciousness. We believe that fashion is a good proxy of culture. Thus, our goal is to propose a new model, evaluating the interconnectivity between face consciousness, interpersonal influence, fashion consciousness and brand consciousness. We claim that fashion explains the way we act, behave and communicate. Furthermore, fashion is determined by our cultural orientations and is strengthened by how we communicate through others and our brands. In sum, the idea of this paper is to enhance the understanding of consumer decision behavior with relation to face and fashion consciousness across cultural contexts.

This is a multi-country study. In total we received 650 number of responses and 525 observations were usable. The final data contain information from individuals as follows: 193 Slovenian, 177 Turkish and 155 Israel. Countries were selected in the sample based on several criteria: a) they belong to Eastern group of countries, b) are at different level of development, c) differ in national cultural values. Israel was selected as it is the most developed country in the Middle-East (Eurostat, 2014) and culturally most similar among Eastern countries to the West, particularly to USA (Hofstede, 2001). Turkey was selected as it is currently one of the fastest growing economies in the world, and at the same time at the cross-road between Europe and Asia, where Western values are mixed with Eastern values. Finally, Slovenia was selected as one of the typical representatives of Eastern Europe, being at the average development of European Union countries (Čater & Čater, 2011). Furthermore, sample has an average age of 44.64 years in Slovenia, 40.08 in Turkey and 35.68 in Israel. All samples are relatively equal across gender and biased towards married couples. A structured questionnaire with eight established scales and 25 items was used. Since these scales were developed in English, back-translation was used to ensure equivalence of items. The same approach was used in all three countries.

Structural equation modeling (SEM) was used to establish if a theoretical model fits the observed data. Confirmatory factor analysis (CFA) followed by a structural model is a popular approach and its

estimated χ^2 and normed- χ^2 test how well the model fits the data (Anderson and Gerbing, 1988). A country-stacked model with no cross-country constraints as an initial baseline model was used here (Bagozzi & Yi, 2012). These initial goodness-of-fit statistics were acceptable (CFI = .96, RMSEA = .028, SRMR = .052, and $\chi^2 = 1052.332$ [df = 741; $p \leq .000$, $\chi^2/\text{df}=1.420$]). When testing the baseline model, the data supported an eight-construct model in all three countries, indicating that they exhibit the same factor structure ($\chi^2 = 1052.332$ [df = 741; $p \leq .000$, $\chi^2/\text{df}=1.420$]; CFI = .96, RMSEA = .028 and SRMR = .052). Furthermore, independence and its expected positive relationship on face were not supported in any of the three countries. Face consciousness was proven to have a significant positive relationship on fashion consciousness to the highest extend in Turkey and on brand consciousness in Israel.

In sum, this study has provided a new conceptual model for testing fashion and face consciousness in cross-cultural context. In line with these goals, it provided also a first test of several scales' reliability and validity. Second, finding that the role of face consciousness in fashion and brand preferred consumer purchases was mostly supported in three different countries (Slovenia, Israel and Turkey) strengthens the argument for the generalizability of the face-fashion consciousness model. Third, this paper tested an integrative model for face consciousness, which provided some support for the roles of several antecedents and consequences proposed by Bruner and Kumar (2007) as important topics for further research. Finally, this paper posits face and fashion consciousness under the loop of different cultural communication antecedents, offering important implications for cross-cultural research.

LOOSE- OR TIGHT- COUPLING? EXPLORING THE INTERPLAY BETWEEN DECOUPLING, SLACK AND RESILIENCE IN PUBLIC ORGANIZATIONS

Pinheiro, Rómulo¹; Ramirez, Francisco², Trondal, Jarle³

¹Dept. of Political Science and Management, University of Agder, Norway

²Graduate School of Education, Stanford University, USA

ABSTRACT

This paper contributes to this special track by critically exploring a major (taken for granted) assumption in today's strategic debates on public organizations such as universities, i.e. the prevalent notion that, in today's complex higher education environment, 'fit for purpose' is a function of the degree through which strategies, structures, activities and academic norms and values ought to be tightly coupled with one another, and the idea that this tight coupling is to enhance universities' abilities to respond to an increasing complex set of external demands and expectations, including but not limited to their generative and/or developmental role at the national and regional levels. There is a burgeoning interest on the notion of *resilience* within the organizational science literature. Similarly, neo-institutional scholars have recently re-discovered the relatively unexplored domain of *decoupling* both within and across organizational boundaries, a topic going back to the seminal work of Karl Weick (Weick 1976). Further, management theorists have long argued for the criticality of organizational *slack* on firms' performance, innovation, the sustainability of competitive advantages, etc. The paper explores the interplay between these three relatively distinct yet not necessarily dissociated organizational dimensions – *decoupling*, *slack* and *resilience* – within the context of an external, global interconnected environment characterized by volatility, financial austerity and increasing competitiveness on the one hand, and the gradual erosion on the levels of trust and legitimacy enjoyed by governments in general and publicly- run and funded organizations in particular.

Following Weick (1976) and others, we have chosen to focus on public educational institutions (i.e. universities) as the object of analysis. The rationale for this choice is twofold. First, universities, the world over, are facing increasing pressures to respond, more efficiently, to a wide range of societal demands and stakeholder groups; from governments to industry to local communities. Second, professionalization and managerialism have led to the rise of strategic science regimes in higher education, manifested in an attempt – by the steering core of universities (central and unit levels) – to more tightly couple internal structures and activities as a means of responding to the manifold challenges posed by drastic changes in their technical (operational) and institutional (regulative) environments. One of the ways in which universities have attempted to cope with these new set of

environmental demands lies on *de-institutionalizing* traditional structures and practices (e.g. collegial decision making) and, in turn, replacing them - *re-institutionalization* - with features associated with more entrepreneurial (i.e. 'fit for survival') models, characterized by a tighter internal coupling amongst strategic aims, internal structures, primary activities and behavioral postures.

Following the notion, and solid empirical evidence that *requisite variety* which suggests that the internal diversity of an organization (in terms of its information, operations, and mental models) should match the external variety of the environment for effective adaptation (Gray 2000; Popadiuk and Choo 2006), our main argument in this paper is that ongoing efforts to enhance tight-coupling across university structures, functions and activities have the potential for *reducing* (rather than enhancing) adaptive capacity at the organizational level. This is due to the fact that decoupling (e.g. different academic groups with similar interests doing different things) has the potential to generate *organizational slack* – defined here as internal repositories of knowledge, solutions, technologies, and world views - which, when/if “managed” in a proper manner, can become a valid strategic asset for universities whilst coping with drastic environmental change and/or while facing serious performance and/or legitimacy- related crisis (Geiger and Makri 2006; Huang and Chen 2010). Moreover, in this paper we contend (and empirically demonstrate) that the levels of organizational slack within a given university are directly associated with the degree of resilience to external events and stakeholders' demands, e.g. increasing calls for a more direct contribution of university groups and primary activities to local, regional and national socio-economic needs and circumstances.

The paper is organized as follows. After presenting the three theoretical constructs and the relationships between them, we review the literature on organizational change and adaptation in higher education, providing evidence of a general move towards a tighter coupling of strategies, structures, activities, and behavioral postures. We then move on to suggest an integrated (novel) conceptual model depicting the relationship amongst the three constructs or variables and, consequently, the potential and realized (synergic) effects on internal university dynamics on the one hand and processes of adaptability to the external environment on the other. Despite its strong conceptual focus, the paper has immediate consequences for the ongoing discourses, strategic postures and managerial practices surrounding the modernization of (European) higher education.

ABSTRACT

The Nordic countries are well-known for their traditional emphasis on equality of opportunity. This paper traces the role of women leaders in academia in Norway, Sweden Finland and Denmark. In so doing, it takes stock of the number of female leaders (2004-2014 period) at the level of management and leadership structures (Rector, Vice-Rector, Director, etc.) within higher education institutions – both university and non-university sectors, in addition to the types of programs and initiatives (national and institutional levels) aimed at promoting gender equity in higher education. Qualitatively (interview data), the study sheds light on the differences and similarities as regards the roles and experiences (including major challenges) facing a selected number of current and past female university leaders across the region. The study contributes to new insights on the role of women leaders/managers within the context of a changing academic landscape, including the ways in which females at the top of the managerial higher education ladder have contributed to innovative and responsible solutions with the potential for unleashing significant structural and cultural changes in the institution of (Nordic) academia.

WOMEN ENTREPRENEURS AND THEIR ROLE IN COMPANY CREATION EVIDENCES FROM A SAMPLE OF INNOVATIVE TECH STARTUPS

Pisoni, Alessia; Bielli, Simona

Department of Economics - University of Insubria, Italy

ABSTRACT

Entrepreneurial activity fosters the innovation and technological change of a nation (Schumpeter, 1943). Moreover, entrepreneurship is key for the economic growth of the country (Shane, 1995) and for job creation, especially when referring to new ventures (Vesper, 1996; Stangler and Kedrosky, 2010; Kane, 2010). For all these reasons, entrepreneurship has attracted the interest of scholars since many decades. In this field of research, a specific stream of research related to female entrepreneurship appears in the 1980s (Rodriguez and Santos, 2009) because of the increasing number of women that decide to turn into entrepreneurship. Nevertheless, women remain still underrepresented among entrepreneurs even/also in western industrialized countries¹ (GEM, 2013; GEM women's report, 2012; Carter and Brush, 2004; Kelley et al., 2013). Furthermore, this disparity raises questions about the entrepreneurial process/path started by women.

Gender appears to be a relevant factor, because women may still encounter many barriers in undertaking the entrepreneurial process. Empirical results are consistent with this hypothesis (Bates, 2002); the barriers faced by women owned businesses are qualitatively different than those faced by men owned firms. Such a difficulty can be determined by several aspects, like contextual factors, social structures, and family and organized life (Brush and Hisrich, 1991). According to Carter's and Brush's (2004) framework, it is possible to identify four categories of assets and attributes that affect, differently, men and women experiences in starting a new firm: human and financial capital, intentions, risk propensity, and family business background.

Moreover, research that investigates on the differences between businesses carried on by male and female entrepreneurs have been carried out by scholars from several countries (Cliff, 1998; Rosa and Hamilton, 1994; Alsos et al., 2006). First of all, "soft" facts, i.e. motivational drivers, have been taken into consideration while analyzing male and female entrepreneurs (Manolova et al., 2007). According

¹ According to GEM – Global Entrepreneurship Monitor (2013) and to GEM – Women's Report (2012) results again confirmed that in most economies the female entrepreneurs are outnumbered by males. Women's participation in early stage entrepreneurship varies markedly around the world. For example, Sub-Saharan African rates of female early-stage entrepreneurship are comparable to their male equivalents. On the counterpart, the lowest relative rates of involvement in entrepreneurship by women can be found in several MENA economies and some European economies, where less than 50% of the early-stage entrepreneurs are women. As far as US, according to National Women's Business Council (august 2013), only 17.5% of employer businesses are 51% owned by one or more women. Yet, 18.8% of employer firms are at least 30% owned by women and have a woman in a leadership role.

to Manolova, Brush, Edelman's study (2007) on the US context, there are significant differences in motivations for starting a new business. Men result to be motivated by financial gains, self-realization and autonomy, while for women status is the main motivational driver. Other scholars argue that self-employment and financial independence are also important factors for women (Hanson and Pratt, 1991; Peters and MacDonald, 1994).

Secondly, some scholars focus on the differences in the growth rate of the companies founded by female and their male counterparts. The main difference arises in the fundraising process. Some studies have been carried out in different national contexts (i.e. Alsos et al., 2006, focus on Norway; Carter and Rosa, 1998, focus on Scotland; Watson, 2002, focuses on Australia; Verheul and Thurik, 2001, focus on the Netherlands, Hussain et al., 2010, focus on China) to try to identify the possible gender differences in fundraising and their possible reflection on company growth. Scholars outlined the difficulties that female entrepreneurs face in the early stage phases of a startup arguing that women entrepreneurs start companies with lower funding (Watson, 2002; Hussain et al., 2010) and that women-led startup are undercapitalized (Carter, 2000; Brush et al., 2004). Scholars are trying to better understand the difficulties that women face in raising financial capital, although we are still far away from an exhaustive explanation (Greene et al., 2001; Carter et al., 2006). The result is that, typically, women raise capital from relatives and friends (Reynolds and White, 1997). Moreover, women-led/owned business are often described as low performing in terms of revenues, size and rate of growth (Cliff, 1998; Gottschalk and Niefert, 2011). Industry, initial financial capital, education background, previous working and entrepreneurial experience, family entrepreneurial attitude have been investigated by different scholars as variables affecting venture performance (Fischer et al., 1993; Rosa et al., 1996; Watson, 2002; Fairlie and Robb, 2009; Gottschalk and Niefert, 2011). According to Fischer et al. (1993) there are mainly two theoretical perspectives to explain such differences in performance between women- and men-owned ventures. On the one hand, they suggest that women are disadvantaged in access to resources, i.e. in terms of human capital (education and working experiences) or financial capital. On the other hand, women have a different attitude towards risk and therefore adopt a different approach to business. However, scholars/research reach controversial results on these issues. First of all, the impact of education on venture performance has been debated a long and is still an open issue. Secondly, even though several studies show that experience has a positive impact on performance, other scholars proved that the gender gap (women have less managerial experience than men) seems to be insignificant for certain performance indicators (Fischer et al., 1993). Third, there is insofar no empirical evidence that female-entrepreneurs consciously choose to establish small firms, or organizations that grow less or slowly compared to man's companies, because of different attitudes toward risk or different values than their male-counterpart

(Manolova et al., 2007; Hanson and Pratt, 1991; Peters and MacDonald, 1994). To sum up, gender differences in venture performance are far away to be fully explained/covered by empirical studies. This is especially true if we consider that different national contexts have not been investigated yet under this perspective (Alsos et al., 2006).

Furthermore, other scholars analyze the contribution/role of women in team-created ventures. Although much literature on entrepreneurship focuses on entrepreneurs as individuals, many new ventures are formed by team of individuals. Godwin, Stevens and Brenner (2006), for example, focus on mixed-sex founding team and show how partnering with men may help women entrepreneurs to overcome the above mentioned prevalent obstacles providing them a sort of “legitimacy” in male-dominated contexts (i.e. access to resources/industries and diverse social networks).

Literature on female entrepreneurship has insofar focused on the aspects of analysis summarized above. Notwithstanding the increase of entrepreneurial activity among women, from the literature review it arises a substantial lack of studies focused on female entrepreneurship during the startup phase (Manolova et al., 2007). For this reason, this paper aims at filling the gap by analyzing a sample of female CEO of early stage startups. We decided to focus on the CEO being the lead person in the founders’ team and the key figure for the company and for its early strategic choices (Papadakis and Barwise, 2002). In particular we address the following research question: which are the common traits of women leading a startup founding team (CEO) and how these characteristics shape the initial phases of their newly established company?

To shed light on the proposed issue, we used Mind the Bridge 2013 dataset composed of 205 innovative new ventures from all over the world. In 2013 they voluntarily participated to Mind the Bridge Foundation¹ Survey 2013, performed with the purpose of studying the peculiarities of different entrepreneurial ecosystems. From the database emerges that 21 startups are led by female CEO. Mind the Bridge 2013 dataset contains up-to-date data on the company profiles (year and place of establishment, industry, no. of employees, business idea description in terms of source/motivational drivers/supporters and company investment profile) and data on the founding team (nr of founders, gender, role played in the startup, education background, previous work and entrepreneurial experience). Drawing from the above described theoretical framework, we focus the analysis on the traits that women leading a startup founding team (CEO) have in common and the role played by them in shaping the initial phases of their newly established company. Further evidence is presented on the reasons behind the choice of appointing a female CEO, their professional/entrepreneurial and education background. Peculiarities of their startups are presented such as industry, product (source of the business idea) and performance indicator, such as the amount of capital raised.

¹ Mind the Bridge is a non-profit (501 c3) corporation based in San Francisco running several entrepreneurial education and acceleration programs for innovative startups.

These findings could represent a starting point for future academic research to be performed with the support of solid econometric analysis. For policy makers these could provide further evidence on the high tech business started/led by women.

HUMANITARIAN LOGISTICS: LESSON FROM MERAPI VOLCANIC ERUPTION OF INDONESIA

Purnomo, Boyke Rudy¹; Suhada, Thontowi Ahmad²

¹Department of Management, Faculty of Economics and Business, Universitas Gadjah Mada, Indonesia; Faculty of Economics and Social Science, University of Agder, Norway.

²Center for Economics and Public Policy Studies (CEPPS/PSEKP), Universitas Gadjah Mada, Indonesia.

ABSTRACT

This study conducted as a response of Merapi Volcano eruption in 2010 which killed 34 people, injured 58 people, made more than 40.000 people evacuated from their residence, and causing financial losses more than USD 320 million (BNPB, 2010). The purpose of study is to examine the humanitarian logistics practices during and after the eruption, particularly on the strategies, processes, type of flows and actors aspects. In addition, this study also focusing on the design and management of supply chain drivers, namely facility, inventory, transportation, sourcing and information. Case study approach was conducted on the leading humanitarian organization, MER-C, during and after the eruption. In-depth interview with key actors, observation in-and-out of the organization as well as documents review were used in order to achieve method triangulation.

The data reveal that responsiveness used as a core strategy in humanitarian logistics management. The process designed to optimize the flow of information, funds, personnels, health services, as well as medical and non-medical logistics. Donators, suppliers, logistic division of humanitarian organization, and voluntarily medical personnels became the main actors in this activities. In addition, to support the responsiveness strategy, facilities and inventory location placed close to the beneficiaries. Inventories was managed by anticipatory buying in bulk at the beginning, although on some items turned over supply. For carrying those inventory, transportation modes and routes are managed flexibly under the supervision of logistic division. Further, information was managed using a reactive-pull system and anticipatory-push system, and decisions about sourcing medical logistic was conducted using an integrated approach. Finally, even though responsiveness is becoming the main strategy in the humanitarian logistics management, but some activities carried out in-house to improve the cost effectiveness of operation.

INTRODUCING TECHNOLOGY-ENABLED HEALTH CARE: (A CASE STUDY - U.K. COMMUNITY HEALTH CARE)

Rajput, Vije¹; Cropper, Steve²

¹GP, Stonydelph Health Centre, Staffordshire, UK.

²Centre for Social Policy, Keele University

ABSTRACT

The introduction of change, in particular where it carries a strong sense of innovation, remains a contested area of knowledge and of practice. In (UK) health care, where expectations associated with innovation are especially weighty in the politically and economically charged context in which health care currently sits, the development of a body of strong, practical knowledge about innovation management is a priority. The paper reports a case study, in which new technology to support health care is introduced into a specific care team to create a form of practice known as 'telehealth'.

Research into technology-supported innovation in health care, specifically, is rather sparse, but there is a wealth of literature on innovation implementation and diffusion, in general, on which to draw. But in their encyclopaedic review of the general innovation literature Greenhalgh et al (2005) note that "the evidence regarding the implementation of innovations was particularly complex and sparse, and it was difficult to disentangle from that regarding change management and organizational development in general." (p 610) And they note that "a striking feature was the tiny proportion of empirical studies that acknowledged, let alone set out to study, the complexities of spreading and sustaining innovation in service organizations." (610). Their suggestion is for future studies that are theoretically-driven, process-oriented and sensitive to context and the dynamic interactions between the particular factors that enable or militate against innovation.

The paper also responds to suggestions that 'further process-based studies are needed to provide a clearer evidence base for recommendations on how to facilitate the adoption and assimilation of beneficial new technologies' (Robert et al, 2010) and that 'of a burgeoning empirical literature, very little ...makes informed recommendations for those seeking to improve their organisations.' (Williams, 2011). It seeks, therefore, to contribute to development of an understanding - practically-based and -oriented, but with theoretical foundations - of the processes of adoption and assimilation of innovative change to health care.

We draw on work on two complementary bodies of theory. First, we draw on a recent typology of forms of 'institutional work' (Lawrence and Suddaby, 2006), which provides a repertoire for "intelligent, situated institutional action" (p219). Such action serves to change or to maintain institutions - 'rules and shared meanings...that define social relationships, help define who occupies

what position in those relationships and guide interaction..." (p216). The boundaries between professional and lay action and between human carers and technology in health care practice are two such institutions under renegotiation and central to our case. Second, we draw on actor-network theory (eg Law, 1994), identified by Robert et al (2010: p6) as an approach to be explored further in healthcare innovation studies, since it highlights the 'generative power of the socio-technical network as a whole' rather than any one element in isolation, in explaining how change and stabilisation occur. We use these theoretical perspectives to present and analyse the basic 'chronology' of innovation – adoption, assimilation and routinisation, continuation and sustainability - that is now well-accepted in the literature as a framework (eg Williams, 2011). We analyse the process of change, that is, the sequence of events in relation to its intended (and realised) outcome, using the typology of forms of institutional work. Specifically, we focus on how the governance, legitimation, and alignment/integration of the elements of practice occurred to make the outcome realisable. And we give an account of the 'intelligences' contributed by differing professional groups as they negotiated the terms of the reordering; that is, the way different actors made sense of and so structured their contributions to the reordering.

The telehealth system that forms the specific focus of the paper invites and supports patients with a long-term condition – diabetes – to participate more fully in their care and to ensure that care resources are effectively targeted in ways that require very limited investment, either by the NHS, by the professionals or by the patients themselves. Systematic research into the value – the outcomes for patients and for the NHS - realised by this innovation (telehealth) is underway. This paper traces and examines the natural history of co-creation of value that this reconstitution of care practices enables. The case is of a UK Clinical Commissioning Group, able to access the technology enabling telehealth and associated expertise through the UK NHS working with a health care provider organisation responsible for delivering diabetes care to a small population. We identify and explore tensions that practitioners from the health service organisations report arose in what was a most straightforward technology-supported innovation. We argue that the case we present is valuable because the tensions and the complexities arising in the process of introduction of the new practice may, perhaps, be seen the more clearly because of the straightforwardness of the technology itself. Those complexities relate to the micro-processes of innovation and value co-creation and are drawn from analysis of interviews with eight individuals directly involved in the process of introducing telehealth – a technologist, service managers, technology advisors, a GP, and Nurse Specialists. Ethical approval for the study was based on an interview guide that explained the study purpose as "to gather an account, from a variety of different perspectives and experiences, of the implementation of diabetes telehealth in this Clinical Commissioning Group". The five substantive sections of the interview were intended to

cover the chronology and process of implementation, as follows: 1) The Health care innovation, 2) The processes of decision and pre-arrival planning for use, 3) The arrival of the technology and first steps to implementation, 4) Trialing, learning and review – who involved, where was first use etc., 5) Bedding in (routinisation – becoming ‘unproblematic’, a normal part of practice).

Our reading of the interviews focused on identifying and extracting: (first reading) the basic chronology of events; (second reading) identification of key themes – governance, legitimization, alignment; and (third reading) the pattern of forms of institutional work and the way the socio-technical system started to reform. The paper explores the following:

- a) *The governance of innovation*: including how organisational attention to innovation was in tension with the emergence of individual projects and entrepreneurship and practical questions about the authorisation context – expectations of responsibility, discretion, approval and control, and accountability – throughout the innovation process. These findings have implications for the ways in which innovation might best be managed at the organisational level and for the work of individual innovation entrepreneurs.
- b) *Strategies of justification and legitimation*. Within this broad question of governance, we explore the terms in which the act of imagination that started and sustained the innovation was communicated, appraised and negotiated in and between health care organisations for its ‘fit’, potential value and viability and how specific sites or locales for innovation may emerge.
- c) *Issues encountered in making innovation ‘stick’ and spread....* a simple and flexible technology was introduced, but not as a validated ‘package’ of practice. Rather the innovation process gathered and ‘stitched together’ a set of fragments to form the new practice routine. We distinguish between achievements of alignment and integration that emerge from that process and suggest implications for (continuing) leadership (institutional work). Finally, we reflect on work beyond the immediate innovation site as the potential for adaptation and translation of the experience to other contexts is assessed.

THE ASSESSMENT OF CANDIDATES TO MULTINATIONAL FIRMS – UTILIZING THE CONCEPTS OF LIFE SPACE, AND ENVIRONMENTAL AND CULTURAL VARIABLES, AS A SUBSTITUTE TO PERSONALITY VARIABLES.

Rimmer, Avigdor

Department of Human Resources, Western Galilee College, Israel

ABSTRACT

There are difficulties in obtaining a reliable and valid assessment of candidates for multinational firms, where the assessors are not of the local culture. Research data of interviews including general impressions, bio-data as well personality tests shows cultural biases. The assessment focuses on the candidate competencies and personal traits, while knowledge related to the candidate's life situation, his priorities or people who may influence his career decisions, is not part of the assessment. Culture definitions in different terms and weights of the role of work versus family, religion or leisure, professional, situational and other social and factors are often missing.

Thus, we assert that the data to be used for the selection and/or development of candidates from all over the world seems to be of limited use, when we ignore environmental factors.

An alternative approach is proposed based on the theoretical concept of Kurt Lewin's Life Space. The basic idea is to focus on the current subjective life situation of the individual and look for the individual central issues in life, instead of assuming that the person himself is everybody's central choice. The candidate is asked to draw a personal Graph, where elements are central people or central events in his career, and these elements are depicted as points. If he/she finds connection among people and/or events, he/she uses a line to show the connection. The early paper and pencil version of such an exercise was introduced to several scores of candidates for a multinational software company in various countries, such as the USA, Israel, Cyprus, Ireland, Poland, Romania, Austria, Czech Republic, India and Slovakia among others. All of the candidates were supposed to work in a different culture, most of them to be relocated. The results proved to be fruitful as an aid to the interviewing process by relieving cultural biases. Characteristics such as the different role of family in various cultures, varying roles of religion, and the degree of motivation to work "around the clock" were supposed to fit the Israeli pattern of software workers, before using the graph. After using the graph, a very different pattern was revealed. The broader picture assisted with the dialogue with candidates (Rimmer, 2008). A new version of this tool is currently being introduced; it is more quantitative and has been developed as a software tool (the software was developed by Pilat of HI Capital group L.T.D., all rights reserved). The research examines the possible contribution of the new tool as an aid to interviews in a multinational environment and addresses the following questions:

1. To what degree does the new tool helps interviewers to form a better understanding of the candidates, as measured first by the qualitative tool, and later by the quantitative questionnaire. The tool is compared with the current bio data and interview procedure.

2. How does the new tool compare with other assessment procedures with regards to reliability, concurrent validity, and relative weight in the integrated assessment process.

We intend to further develop the study along two parallel lines:

1. Develop a theory for candidate descriptions in which our own personality is not necessarily the center of our life, and situational as well as cultural factors are given the appropriate weight. New meanings to net concepts will be introduced – size, connectivity, focal points, in people life.

2. Further develop the methodology of personal net drawing to enhance the effectiveness of the tool, and improve the validity of quantitative measures derived from the personal net.

SUSTAINING GLOBAL ECONOMIC GROWTH: THE ROLE OF SOVEREIGN WEALTH FUNDS

Rios-Morales, Ruth¹; Mihai-Yiannaki, Simona²; Schweizer, Max³

³School of Management and Law, Zurich University of Applied Sciences, Switzerland

ABSTRACT

Introduction – In the highly volatile global financial system dominated by risk aversion, liquidity pressures and asset write-downs, sovereign wealth funds (SWFs) have emerged as a critically important source of capital. SWFs represent the outcome of the highly skewed imbalances between debtor nations and nations with surpluses. Although the contribution of these funds has been widely recognized, speculation about the motives and objectives of these large funds has remained a source of controversy and debate among policymakers, market players and scholars. Two main reasons account for such concerns: the large magnitude that these funds represent and the role of national governments in the management of these large funds. SWFs represent the largest concentration of capital that the world has ever known. It has been estimated that the funds exceed five trillion dollars; this figure is expected to grow by 2015 to 12 trillion dollars. While global conditions continue to hinder the availability of capital resources, SWFs continue to increase their role as global sophisticated investors, proposing an alternative not only to encourage global economic growth, but also sustainability. The proposed research project seeks to evaluate the implications of SWFs in the global economic-financial system and their potential as source for sustaining global economic growth. SWFs have begun to tilt the balance of the governance of international macroeconomics.

Design/methodology/approach – The mixed methods of research (quantitative and qualitative techniques) will be utilized; as such an approach is appropriate for the validation of results through triangulation. The range of quantitative methods can enable the identification of the most significant variables influencing the role of SWFs in the global financial system. Whilst, the use of qualitative techniques will assist with the collection of primary data from policy makers of selected countries; the qualitative techniques will also permit us to compare strategic policies among holding countries of SWFs. Qualitative data will be collected through the survey method of research that utilizes questionnaires and interviews.

Findings – We expect that our results will clarify the factual impact of SWFs in the global economic system. Although SWFs represent the outcome of the highly skewed imbalances between debtor nations and nations with surpluses, this research project suggests that SWFs remain a potent capital source for global economic growth. We expect that our findings will demonstrate the great potential

that SWFs represent as providers of the much needed liquidity and investment for sustaining global economic growth. It has been observed that these gigantic funds are tilting the balance of governance of international macroeconomics. The proposed research shall also contribute with important facts that the world policymakers need, so they can carry-out the necessary economic policy adjustments of global governance. We expect that this research project will deliver new empirical knowledge, theoretical and methodological advances and contribute to embryonic academic literature in this important field of research.

Originality/value – The phenomenon of SWFs is not a new one, the first SWF was established in 1953; however, the participation of SWFs as active global financial investors is novel. Although in recent years considerable attention has been drawn to these financial instruments and their impact on the global economy, scholarly research on the topic of SWFs remains limited. To date, no theories have been developed to analyze and forecast the impact of these new global financial players. In spite of the limited scholarly research found on the topic of SWFs, two main perspectives can be identified concerning with this topic. The core of the argument of these two perspectives has been conveyed in the above section (literature review). One perspective is much more apprehensive to the beneficial role of SWFs, while the other perspective considers that SWFs are bringing benefits to the global economy. Although SWF are receiving significant attention from policy makers, market players and scholars much remains unknown. Therefore, we consider, whilst the global economic situation continues to hinder the accessibility of capital resources, SWFs are offering an alternative source for sustaining global economic growth. Nonetheless, there is a need for international macroeconomic cooperation in which multinational financial institutions and governments alike work out together a global program, one in which these new financial players (SWFs) are consider as one of the possible solutions to future economic prospects.

LABOR UNIONS' EFFECTS ON MERGERS AND ACQUISITIONS SUCCESS: UNIONIZED M&A VERSUS NON-UNIONIZED M&A

Rozen-Bachar, Ziva¹; Weber, Yaakov²; Tarba, Shlomo Y.³

¹Department of Political Sciences, Western Galilee College, Acre, Israel

ABSTRACT

The continuing global financial crisis accelerates the natural conflict between labor unions' interests in job security and higher wages, and employers' interests in maximizing efficiency (Becker and Olson, 1989), which emphasizes the importance of understanding how labor unions influence M&A activity. On one hand, the long crisis encourages companies to reduce costs, diversify firm activity and exploit their activities to new geographic markets through the Merger and Acquisition (M&A) strategy (Grave et al., 2012). On the other hand, the ongoing global crisis forces many companies to cut jobs, which emphasizes the importance of labor unions for the workers, particularly during workforce reductions and organizational change. From the point of view of the workers, labor unions should protect them from losing their jobs, particularly if they hold permanent jobs (Davidsson and Emmenegger, 2013).

The main concern of the decisionmakers that engage in M&A activity is that unionized M&A may result in a complicated integration process without improving efficiency or realization synergy potential. In light of that, from the point of view of the managers and policymakers that engage in M&A activity, several important questions arise: (i) Do labor unions influence M&A success? (ii) Do labor unions lead to more complicated integration processes that may harm integration success? (iii) Are there differences between non-unionized M&A and unionized M&A, with regard to M&A success that reflects through the outcomes of synergy success and efficiency success?

The existing literature that attempts to explain M&A success and failure has traditionally focused on strategic and financial factors (Stahl et al., 2013), and recently more studies have been exploring the sociocultural and human resources factors (Weber and Tarba, 2013), but still the existing literature lacks studies that examine the industrial relations factors on M&A success. There are a few studies – most of them earlier studies – that examined the relationship between M&A activity and labor unions (Armah and Peoples, 1997; Fallick and Hassett, 1996; Heywood and Peoples, 1994; Rosett, 1990), but these studies focused mainly on the motives for acquiring unionized firms or on the consequences of the M&A activity on the unions' power.

This study seeks to fill some of these gaps. The goal of the present study is to explore the effect of labor unions on M&A success, and in particular, on integration success, synergy success and efficiency

success, which reflect the main objectives of M&A and the complexity of the M&A process. Moreover, exploring the relationship between the labor unions and M&A success, by comparing unionized M&A and non-unionized M&A, may provide one layer of understanding, while exploring the role of labor unions as a mediator variable between the types of M&A and M&A success will help to obtain a deeper layer of understanding regarding the effect of labor unions on M&A success. The type of M&A influences the match and relationship between the acquirer and the target, which may also affect M&A success (Calipha et al., 2010). Therefore, recognizing the types of M&A may help to predict which type of M&A is more vulnerable for failure, and how the labor unions influence the relationship between the types of M&A and M&A success.

To address this goal, the present study developed mediation model in order to explain how labor unions affect M&A success. The suggestion research model is novel, and may help to understand how labor unions mediate the relationship between the types of M&A and M&A success. The model also takes into account the different stages of the M&A process. The model includes three pairs of types of M&A: international versus domestic, related versus unrelated, and different size versus similar size, which reflect the differences between the types of M&A with regard to the complexity of the integration process. The model also includes five mediator variables in order to explore the impact of labor unions on M&A success: non-unionized M&A, unionized M&A with union of the acquirer, unionized M&A with union of the target, unionized M&A with one union (acquirer or target), and unionized M&A with two unions (acquirer and target). Based on the literature, hypotheses were developed and tested using a sample of 394 public companies (197 acquirer companies and 197 target companies) that were involved in mergers or acquisitions.

Most of the companies that included in the sample were from USA, but the sample included companies from varied sectors. The sample was drawn from M&A sourcebook edition 2002, published by NVST.

The results of the study highlight the novelty of the research, particularly with regard to the differences effect on M&A success between the labor union variables. The study indicates that unionized M&A with one union, either acquirer or target, leads to both integration success and synergy success, while unionized M&A with two unions, both acquirer and target, leads to failure of the integration process. These results may suggest that the integration process becomes more complicated due the political in-fight, if the M&A involves two unions. The study even indicates that the union of the acquirer leads to a failure of the integration process, while the union of the target leads to efficiency success. This difference suggests that if the motive for the M&A is efficiency-seeking, then a target with firm with a labor union may allow the reducing of costs, while an acquiring firm with a labor union may complicate the integration process, resulting in failure.

Nevertheless, the study indicates that unionized M&A has more negative effects on M&A success than non-unionized M&A does. The results confirm the argument that unions reduce profitability. Moreover, the study indicates that non-unionized M&A leads to synergy success and efficiency success, without negative effect on the integration process. This suggests that the integration is less complicated in non-unionized M&A, resulting in improved efficiency and realization of synergy potential.

A BIBLIOMETRIC STUDY ON THE ENTREPRENEURIAL ORIENTATION (2001-2013)

Saidi, Sana¹; Chebbi, Hela²; Sellami, Mohamed²; Weber, Yaakov³

¹Esc Troyes Business School

²Ede Paris Business School

³School Of Business Administration, College Of Management

ABSTRACT

The entrepreneurial orientation is a crucial component of the entrepreneurship and strategic fields. Since the 80s, more researchers are studying the main characteristics of an entrepreneurial firm in different contexts: reflecting risk-taking, innovativeness, proactiveness, autonomy, and competitive aggressiveness (Miller, 1983; Lumpkin et Dess, 1996 ; Basso et al. 2009). Today, no research was interested to sum up the main works on this subject. This paper provides a bibliometric study of articles over a period of thirteen decades (2001-2013).

The bibliometric studies' aim is to understand the evolution of a particular research field and to describe what appears (White and McCain, 1998). The bibliometric studies are based on the mathematical and statistical methods of patterns that appear in the publication (Diodato, 1994, Ramos-Rodríguez and Ruíz-Navarro 2004). Based on this aim, we conducted quantitative and qualitative analysis. A total of 312 papers were gathered from the EBSCO data base.

The following table details the number and the methodology of these papers.

2001-2013	Articles					Total
	Quantitative methodology (Qn)	Qualitative methodology (Ql)	Mixed methodology (M)	Conceptual (C)		
				Literature review	Theoretical framework	
Articles published in ABS ranked journals						
Number	132	13	0	11	7	163
Frequency	81%	8%	0%	6,7%	4,3%	100%
Articles published in « ABS unranked » journals						
Number	105	19	3	11	11	149
Frequency	70,5%	12,8%	2%	7,4%	7,4%	100%
Total of papers						
Number	237	32	3	22	18	312
Frequency	76,0%	10,3%	1%	7,1%	5,8%	100%

For each of these 312 published papers, the following information was gathered:

articles types	Title Author (s) Year Journal Key words Theories Main results Added value, limits and future research	Concept	Panel	Period of study	Context	Data collection methods	Analysis methods
Art. C		X					
Art. Qn			X	X	X	X	X
Art. Ql			X	X	X	X	X
Art. M			X	X	X	X	X

All these collected information was analyzed through qualitative and quantitative methods. First, frequency measurements and rankings were elaborated in order to classify the main content of the 312 papers: contexts, review ranking and methodology. Four main clusters of research are identified: quantitative (Qn), qualitative (Ql), conceptual (C) and Mixed (M).

2001-2013		Articles					Total

* Benchmarking reports, government and academic publications, prospectuses, archival, focus group, Documentary analysis.							

For the qualitative analysis part, a content analysis is elaborated by using the « Freeplane » software (Version 1.2.23). First, it aims to sum up the main concepts used by researchers since 2001 to study the entrepreneurial orientation (EO). The determinants and the consequences of this concept were highlighted for each cluster. The map example concerning the conceptual papers is as following :

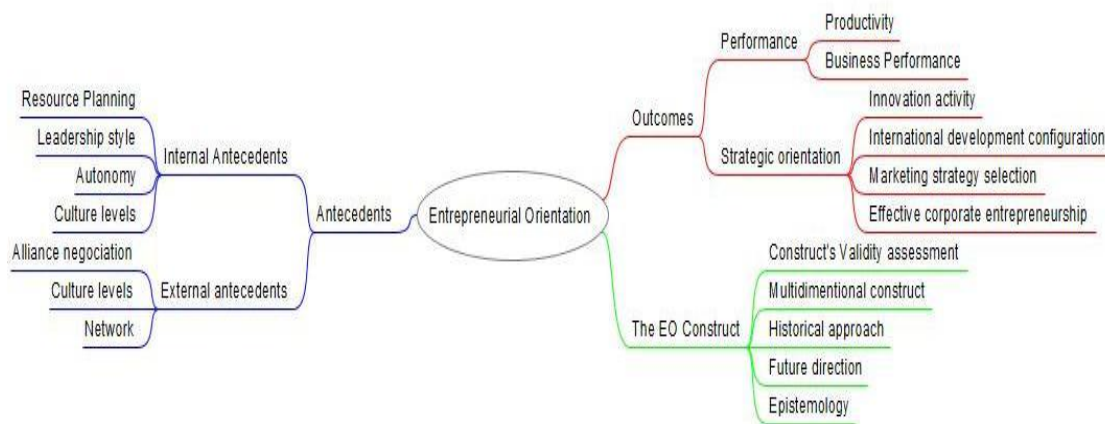

Figure 11: EO: Determinants and consequences of entrepreneurial orientation (conceptual papers, 2001-2013)

Second, all the used theories in the 312 papers were analyzed in order to identify and give a better understanding of the main approaches of the Entrepreneurial orientation concept. Thirteen approaches were identified as shown in the following figure.

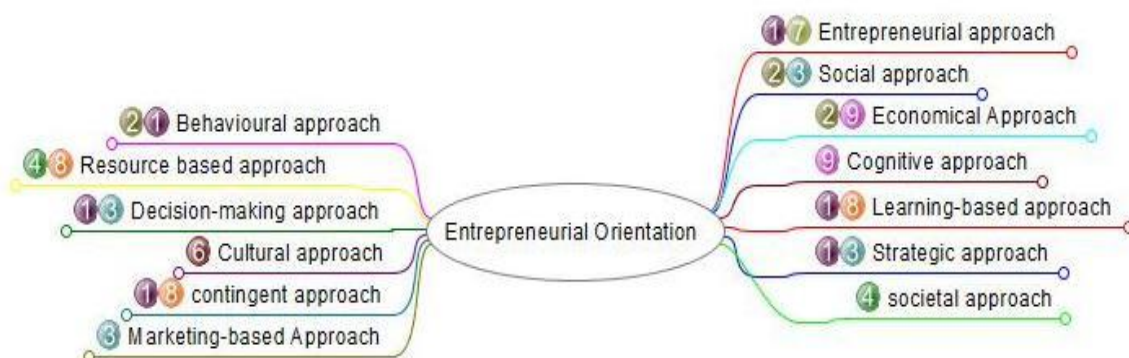

Figure 12 : Theories and approach to study the entrepreneurial orientation concept (2001-2013)

ENHANCING EMPLOYMENT MOBILITY IN EUROMEDITERRANEAN BASIN WITH DEADALUS

Sakka, G¹; Frangeskidou, A.²

¹University of Nicosia and Youth Board of Cyprus, Cyprus

²University of Nicosia, Cyprus

ABSTRACT

During the last years, European Union (EU) mainly emphasises on training, education and employment (Kafouros, 2010) and focuses on increasing mobility across European countries and enhancing lifelong learning. Information technology and the use of Internet affect the Human Resource Management reality (Mansourvar and Yasin, 2014) and contribute to the above. Through the online career portals and several web tools related to job searching and career advising, the EU aims to increase employability for its citizens and to face the unemployment rate that especially affects youth. Therefore youth, employers, job seekers, students, entrepreneurs, governmental and non-governmental institutions are the main stakeholders of these portals (Stemmer et al., 2004).

Euroguidance, Eures, Ploteus, European Youth Portal, Eurodesk, EU Careers and *Deadalus* are only some of the European portals that are designed to satisfy EU objectives for training, education and employment. For the implementation of the above goals it is crucial to ensure the service quality of the portals and of the Webpages related to job searching and career advising (Zeithaml et al., 2002).

Deadalus (euro-meDiterranean cAreer and Employment aDvisor portal for the mobility of young residentS) is a new online job searching and career advising portal with the aim to meet the needs expressed in the labour market of Mediterranean basin and to forecast the future needs. *Deadalus* comes to add an additional value to the existing portals and offers its services to both, European and Mediterranean countries.

The aims of the study are to examine the existing online career portals via primary and secondary resource data and propose ideas for the development of the euro-meDiterranean cAreer and Employment aDvisor portal for the mobility of young residentS. An objective of the survey is to trace the main criteria that are necessary for the creation of a quality portal via literature review analysis. Further objective is to examine in depth the deficiencies of the portals currently in use via observations and quantitative survey (questionnaires) with the stakeholders. Further, in combination

of the survey data *Deadalus* portal will be developed and tested via nine pilot workshops in Cyprus, Lebanon, Italy, Tunisia, Greece and Palestine. Participants in each of these workshops will be the main stakeholders via quota sampling (youth, students and job seekers; entrepreneurs and employers; governmental and non-governmental institutions). These pilot workshops are essential for the evaluation, improvement and the development of the final portal of *Deadalus*.

The literature review analysis indicates the main criteria guaranteeing the quality of the portals and their functionality (Stemmer, et al., 2004; Mansourvar and Yasin, 2014) like feedback, communication and complaint opportunities (Yang et. al, 2004; Stemmer, et al., 2004), customisation and personalisation (Venable, 2010; Liljander et al., 2002), confidentiality, safety and privacy (Venable, 2010; Stemmer, et al., 2004), easiness of use (Zeithaml et al., 2002; Venable, 2010), reliability and validity, trust, responsiveness, storage capacity, portal aesthetics, privacy, accuracy of information, processing spread technology thrill (Zeithaml et al., 2002), interesting links and supportive services, as well as quality and variation of job postings (Liljander et al., 2002). The theoretical observations also illustrate as a gap the fact that in most online job portals the users could not find easily the information they needed, and usually there was not much information to help them (Stemmer, et al., 2004; Mansourvar and Yasin, 2014). Also it has been argued that job seekers sometimes were confused with the mass of information, claiming that they need only accurate and necessary data (Yang et al., 2004; Liljander et al., 2002).

Further, an empirical study was developed in order to assess the existing online employment portals through questionnaires distributed to jobseekers, employers and government officials in Cyprus, Lebanon, Italy, Tunisia, Greece and Palestine. The results indicated in accordance to the aforementioned literature review that most of the employment websites lack professionalism appeal, are not friendly, search engines are not comprehensive and that there is no credibility and safety but confusion. The study therefore shows outmost recommendations for enhancing the functionality of a new career portal such as *Daedalus* and innovative suggestions such as the accession of a category-section for minority groups of job seekers like elderly people seeking employment after retiring, immigrants, people with special needs, long-term unemployed and also female entrepreneurs.

Deadalus portal, taking into consideration the literature review, observation and questionnaire data, will be developed and tested via nine pilot workshops in Cyprus. The results of these workshops with the combination of the results of other similar workshops that will take place in the other Euromediterranean countries will determine the final *Deadalus* online career portal.

Keywords: *Deadalus, Euromediterranean Basin, mobility, online career portals, information technology, job, employment, training.*

TOWARDS A FRAMEWORK FOR CHANGE: DESTINATION MARKETING IN NORTH-WEST ENGLAND

Scott, Peter²; Rowland, Caroline²; Moore, Neil²

¹Liverpool John Moores University, UK

²Chester Business School, University of Chester, UK

ABSTRACT

This conceptual paper is concerned with the ways in which destinations or places are marketed in the UK and in particular with the ways that a specific sub-region in North-West England called Cheshire and Warrington is marketed. The context within which the research is situated has been shaped by a significant change in UK government policy, by international changes in practice and by emerging themes in the literature surrounding the subject area.

In 2011 the Minister for Tourism and Heritage in the UK Government's Department for Culture, Media and Sport published a new Government Tourism Policy (Department for Culture, Media and Sport 2011 *Government Tourism Policy*). This document records that 200,000 businesses operate in the British tourism industry contributing over £50bn to GDP and providing 4.4% of employment. Tourism is also one of the fastest growing sectors in the British economy (Department for Culture, Media and Sport 2011 *Government Tourism Policy*). The policy document sets out the UK government's position with regard to the visitor economy including an intention to create new independent tourism bodies, to ensure that these bodies have a responsibility to engage in destination management rather than destination marketing and to significantly reduce the public funding of destination management and destination marketing activity in the future. Such a policy change will require the private sector to fill the funding gap that will be created if destination marketing/management is to continue to function in a similar way to the way in which it has functioned in the past. This may entail the establishment of a new and novel form of public-private partnership.

Exploration of the extant literature relating to this field has identified a number of emerging themes and issues. These include debates over how the consolidation of the body of literature concerning this subject area can best be achieved (Gertner, 2011; Hankinson, 2010); the lack of empirical evidence that pertains to this subject area (Gertner, 2011); the feasibility and/or desirability of differentiation in the complex area of destination marketing (Anholt, 2009); the role of stakeholders in destination marketing (Hanna and Rowley, 2011; Kavaratzis and Hatch, 2013) and the process of place or destination marketing (Eshuis, Braun and Klijn's 2013).

The aim of the research is to establish an insight into how a destination marketing organisation can engage with its stakeholders in order to operate effectively in circumstances of reduced government

support. To achieve this the paper explores the ways in which a change of emphasis from destination marketing to destination management can be accomplished, how stakeholder engagement can best be achieved through the management of change and implications for leaders as they implement this change.

The research focuses upon the geographical sub-region of Cheshire and Warrington which is located in the North-West of England. The annual value of the visitor economy in this sub-region is £2.5bn (whycheshire.com). The study adopts an interpretivist stance and will analyse qualitative data derived from semi-structured interviews with destination marketing stakeholders and practitioners.

The key stakeholders in terms of their power and interest in respect of the destination marketing of the sub-region are the 53 corporate partners of the destination marketing organisation in the sub-region (whycheshire.com). These corporate partners include one of the UK's largest issuers of credit cards, one of the world's foremost manufacturers of luxury vehicles and many other smaller commercial entities. Appropriate interviewees will be sought from amongst this group of corporate partners in addition to destination marketing practitioners.

The data will be analysed by in-depth reading and re-reading in order to identify emerging key themes. It is anticipated that an appropriate software package e.g. NVivo will be utilised to facilitate exploration and analysis of the data.

The research is expected to make a valuable contribution to the subject area of destination marketing in several ways. Firstly, it will contribute valuable empirical data to a domain that is currently underdeveloped. Secondly, it will contribute to the development of a conceptual model which, after being applied and tested, will describe the optimum configuration of a public-private partnership in destination marketing/destination management. This will partially address the acknowledged need for theory-building in the field of destination marketing (Gertner, 2011). Finally the research will contribute to practice by offering valuable insight into the perceptions of stakeholders in the destination management process. This insight will be particularly useful to destination management practitioners. The importance of these contributions is contextualised by the very considerable value of the tourism industry to the British economy.

THE INFLUENCE OF MARKET INTELLIGENCE AND MARKETING MIX ADAPTATION EFFORTS ON THE PERFORMANCE OF ISRAELI BORN GLOBALS

ABSTRACT

INTRODUCTION AND CONCEPTUALIZATION

Born globals (BGs) are often viewed as a unique breed of international entrepreneurial small and medium enterprises (SMEs), with the potential for accelerated internationalisation and a global market vision (Gabrielsson & Kirpalani, 2012; Gabrielsson, Kirpalani, Dimitratos, Solberg, & Zucchella, 2008).

When considering international marketing strategy of international new ventures, a review by Aspelund et al. (2007) has revealed that previous research largely ignored critical international marketing strategy question, concerning the standardisation versus adaptation/localisation of marketing mix elements (Ryans, Griffith, & White, 2003; Theodosiou & Leonidou, 2003). This question is of particular importance, both due to the effects international marketing strategy has on international firm performance in general (Cavusgil & Zou, 1994; Knight, Madsen, & Servais, 2004; Leonidou, Katsikeas, & Samiee, 2002), and the effect standardisation and/or adaptation strategy has on firm performance in particular (Shoham, 1999; Zou, Andrus, & Norvell, 1997).

Since BGs often need to deal with operations in dynamic and volatile markets (Efrat & Shoham, 2012), as well as with liabilities of newness, smallness and foreignness (Zahra, 2005), they must also exhibit strong abilities to learn, adapt and change (McDougall & Oviatt, 1996). More specifically, marketing orientation is defined as organization-wide generation, dissemination, and responsiveness to market intelligence (Kohli & Jaworski, 1990). Authors suggested that successful BGs devote active efforts to collecting and generating market-related intelligence (Gabrielsson et al., 2008; Zhou, Wu, & Luo, 2007). Nevertheless, the relationship between BGs' market intelligence efforts and their performance has, thus far, largely gone unstudied.

Hence, the current study is seeking to address these gaps, while contributing to the understanding of BGs' post-establishment performance.

METHODOLOGY

Data was collected from Israeli BGs, in line with Knight et al.'s (2004) operational definition for BGs, using an online questionnaire sent to a member of the managerial team. We ended up with 69 firms (23.5% response rate).

Measures

Performance was measured using the EXPERF scale developed by Zou et al. (1998). The scale includes nine items which are divided into three sub-scales of three items each measuring financial, strategic, and satisfaction aspects of firm's performance.

Market Intelligence Generation was measured using the ten items from Jaworski and Kohli (1993) scale for the intelligence generation aspect of market orientation.

Marketing adaptation was measured based on Lages et al.'s (2008) STRATADAPT scale. We have included only sixteen of these items, incorporating items representing product, price and promotion element of the marketing mix.

FINDINGS AND DISCUSSION

Our analysis shows that market intelligence generation efforts positively and significantly affect BGs performance ($p < 0.001$). In this sense, our findings are consistent with earlier findings suggesting that market orientation in general impacts firm performance (Kocak & Abimbola, 2009; Kropp et al., 2006; Morgan et al., 2004; Wang et al., 2009).

Table 1. Regression Results

	B	s.e.	Exp (β)	VIF
Intercept	7.445	11.672	-	-
Product Adaptation	0.077	0.122	0.074	1.160
Price Adaptation	0.031	0.144	0.031	1.722
Promotion Adaptation	-0.079	0.143	-0.076	1.621
Sales Force Adaptation	0.302*	0.135	0.290	1.422
Market Intelligence Generation	0.380***	0.112	0.377	1.059
BG Maturity	5.404	4.019	0.153	1.100
R ²	.272 (R ²); .201 (R ² adjusted)			
F-Statistic	3.854**			
N	69			

Notes: significance levels - † $P < 0.1$, * $P < 0.05$; ** $P < 0.01$; *** $P < 0.001$

Our findings also show that while the sales force dimension of promotion adaptations impact BGs performance ($p < 0.05$), neither adaptation nor standardisation in product, price and the advertising dimension of promotions impact BG performance. Here, with respect to promotion, our findings may be somewhat similar to those by Zou et al. (1997), who showed that adaptation of customer service was significantly correlated with export intensity, while standardised promotion was not. More specifically, with respect to adaptation of sales force, our findings are also similar to those of Shoham

(1996), who identified a significant effect of sales force management adaptation on sales, profits and profit change in his sample of US manufacturing exporters.

Moreover, the finding of non-significant effects of marketing mix elements on performance supports earlier studies showing similar results (Navarro et al., 2010; O'Cass & Julian, 2003; Samiee & Roth, 1992), while further exhibiting that such findings also hold when breaking them into the specific components of product, price and advertising dimension of promotions. We concur with earlier calls for more nuanced analysis acknowledging potential contingencies (Katsikeas, Samiee, & Theodosiou, 2006; Schilke et al., 2009; Theodosiou & Leonidou, 2003). More specifically, more detailed analysis of particularities associated with specific target markets, industries, timing, and co-alignment with other firm strategies may all be relevant to understanding discrepancies in results; especially, when evaluating effects of marketing adaptation and standardisation strategies on firm performance.

Moreover, the same logic can also explain an additional interesting observation indicating that market intelligence generation efforts do not significantly correlate with any of the marketing mix adaptation elements. Here, one may again suggest that marketing intelligence informs both adaptation and standardisation of marketing mix elements at the same time, and that both occur simultaneously with respect to different specific elements and market contexts.

INTERNATIONAL STUDENTS AND THEIR DISSERTATIONS: LET'S NOT PUT SQUARE PEGS INTO ROUND HOLES

Smith, Simon M.

University of Chester

ABSTRACT

To many, the dissertation remains the crowning glory, the pinnacle of the undergraduate bachelor degree experience. For the uninitiated, this experience represents a significant challenge rife with potential stresses and burden. This is especially true for those students writing their dissertation in their second or third language. The idiom presented in the title is deliberate to highlight how easy it is to confuse those unfamiliar with a particular concept. Thus, add the language challenge to the already well-documented challenges surrounding dissertations (e.g. Day and Bobeva, 2007; Huang, 2007) and we can see how such a metaphor begins to emphasize the potential journey of a non-native speaker of English. This abstract presents some of the data from a yearlong study within a UK university that tracks a cohort of just over 300 international students completing their final year dissertation. Importantly, an innovative approach to assessing international student dissertations is examined. This leads to findings and recommendations within an under-researched area of study (e.g. Greenbank *et al.*, 2008; Huang, 2007; Todd *et al.*, 2004) and helps to encourage academics to contemplate the incorporation of similar innovations.

The innovative dissertation approach moved away from the traditions of submitting one large final document. Instead, the assessment was split into four parts: a research proposal leading to formative feedback; a literature review representing 2000 words and 30% of the summative assessment; a data findings and analysis submission representing 2000 words and the next 30% of the assessment; and a final full dissertation submission of 6000, whereby only 2000 words were assessed for the final 40%. Data were collected within a longitudinal approach using surveys at five different time points across the academic year before and after each assessment element. 310 dissertation students were involved in the study and the total number of usable responses from all questionnaires were 546. The nationalities used within the data collected were Chinese (participant frequency of 282), German (131), French (63) and Spanish (13) and the participant frequency represented the course cohort distribution effectively well. The following provides a breakdown of the questionnaires at the five different time points:

- Questionnaire 1: 144 responses (46.5%)
- Questionnaire 2: 104 responses (33.5%)
- Questionnaire 3: 172 responses (55.5%)

- Questionnaire 4: 79 responses (25.5%)
- Questionnaire 5: 47 responses (15%)

Where responses were considered particularly low in the final questionnaire distribution compared to other time points, 7 in-depth semi-structured interviews were carried out to compensate for this. The quantitative data were fed into SPSS and analysed using relevant statistical tests.

Two research questions were addressed:

1. How does the innovative assessment approach used on the dissertation impact on students' experience?
2. What differences exist regarding nationality within the dissertation experience?

In terms of assessments, there were a number of distinct findings. One main area of focus links to the receiving of the first summative mark and feedback. Compared to later summative assessments, students were particularly unhappy with their first mark and the feedback that came with it. This becomes even more significant when considering that students were generally happy with the module up until that moment. However, happiness took a significant dip and did not recover until the final questionnaire. This shows how crucial the building process was for these international students. If they had followed traditions and submitted only one piece of work (and this could include the formative aspect of the research proposal), their experiences could have been much different. These students may not have achieved the overall success and satisfaction they desired. Within the innovative approach applied, the students had a chance to develop and adapt, and this was reflected by the final questionnaire and interviews. This is also supported by an increase overall in the average grade of each student.

In terms of nationality, it may not be surprising that Chinese students highlighted more difficulties with transition into UK studies, had greater concerns over how challenging the assessments would be, and struggled more with understanding their lecturers. However, empirical evidence is lacking in terms of tracking and understanding these issues. This was significant, for example, because Chinese student concerns over how challenging the assessments were fell into line with other nationalities by questionnaire 4. Here there is a sense of how long and arduous the journey could be for a student from China, but not impossible to overcome. Interestingly, the Chinese students recorded the highest averages in terms of happiness with the module, even though they clearly had the greatest issues. This could be put down to cultural differences and how these students respect their teachers, or possibly it could be because they have journeyed much further in terms of overcoming such issues and felt highly rewarded by this. This example is set amidst other distinct findings and it is clear that different nationalities can potentially experience dissertations in a uniquely different way.

The data highlights and supports that innovation is indeed worthwhile within the dissertation experience (Akister *et al.*, 2009; Carroll and Ryan, 2005). This study outlines and examines one such successful approach. Thus, academics in higher education could and probably should confront the difficulties encountered by international students within the dissertation process. After all, the results can potentially increase student success and satisfaction, and this will only serve to improve student feedback and contribute to the reputation of the institution.

THE USE OF TWITTER IN BRANDING

Snyman, Annette; Mulder, Dalmé

Department of Communication Science, University of the Free State (UFS), South Africa

ABSTRACT

Social media has taken the marketing world by storm. The father of the modern computer, John Von Neumann (1903-1957), once said: "It would appear that we have reached the limits of what it is possible to achieve with computer technology, although one should be careful with such statements, as they tend to sound pretty silly in 5 years" (Shultz, 2011). It is almost 40 years later and his statement is validated by the rapid change in technology. For companies to avoid being seen as out dated five years from now, it is essential to make the brand available to its customers in any network or social media form available. This task may seem easy enough, but the social media platform of an organisation can also seed perceptions of distrust and negligence when the messages are not well constructed. In spite of the immense potential social media has to offer for a company, this medium is not always used to its fullest potential. It is the era of social media where relationships are nurtured via this channel rather than actual conversation. Therefore, it is necessary for all companies to invest in social media marketing. One cannot begin to imagine the possibilities that social media create for brands to communicate with their target audience. Within the cosmic boundaries set by social media, this study will focus on how Twitter can be used to create an online presence of a brand that leads to long term relationships.

Twitter is one of the emerging social media channels that is shaping brand communication on a global scale at a mere 140 characters a time. Although Twitter is seen as a social media platform with little impact, the number of followers that could be attained 'tweets' another story. This article focuses on the way in which marketers or businesspersons can utilise this social media platform to promote the brand image by improving the brand's online presence. By investigating traditional branding strategies and characteristics of an integrated marketing strategy, a framework was created to formulate effective social media messages. This framework was then used to analyse all the Twitter posts of a South African university between 1 January 2013 and 31 July 2013. This timeframe included the posts from the university's Twitter page before and after the first semester, and therefore an adequate number of posts were gathered. The general benefits of the social media sites, as well as the specific branding elements of this university were integrated to analyse specific posts.

Twitter posts are created by the social media staff of this institution and although they are given a structure in which they have to formulate messages, one cannot ignore the fact that their personalities, situations and even their emotions have an influence on their posts.

Nevertheless, studying the posts of the institution can spawn a broad spectrum of benefits that they or any other company can make use of in future. Most institutions only engage in two way communication to improve relationships with different stakeholder groups. Therefore, it is essential for companies to have a framework to serve as the basis when creating social media messages for this specific channel. When a company has a strong IMC strategy, they are seen as transparent and more trustworthy (Koekemoer, 2004:35). By inspecting if the Twitter messages contribute to the overall IMC strategy of the brand, one can determine if this communication platform serves its purpose of motivating stakeholders when they come in contact with the brand.

The relation between the Twitter posts and the way it fits into the IMC strategy of the university was unclear and therefore a case study was ideal to use. By following this qualitative approach, it was clearly indicated how this university made use of its Twitter profile to retain its position under the top five universities in South Africa. The results portrayed the importance of IMC characteristics in social media messages for the messages to contribute to the overall brand image of the institution. The results also indicated that in order for a brand to reach a successful online presence, marketers should embrace technology and set out certain objectives to be reached for each social media message. The main objective for social media messages should be to make the core values of a company visible in all online activities. This suggested framework captures the essence of using social media in branding and can be adapted to any company's branding strategy. The framework will further also be valuable to start-up companies as it enhances the development of a new brand. By ensuring that the foundation for social media messages reflects the overall branding strategy, a company will be able to create a strong online presence. When each online brand message contains an IMC characteristic, a core value of the institution and a motivational objective, there are no boundaries that can be set for how far the 'little blue bird' can take the any company.

THE GRADUAL INTERNATIONALIZATION PROCESS OF PORTUGUESE COMPANIES DESPITE AN URGENCY TO EXPORT AND INTERNATIONALIZE: ADAPTING TO LOCAL MARKETS AND BEING OPEN TO CHANGE

Sousa, Tiago D.¹; Au-Yong-Oliveira, Manuel¹; Borges Gouveia, Joaquim^{1,2}

²GOVCOPP

ABSTRACT

This research sought to answer the following question: What are the international strategic practices currently being adopted by Portuguese companies, so that they, in the midst of a much publicized internal economic crisis, may triumph in international markets? Internationalization strategies are of paramount importance to companies from small countries and which are undergoing an economic crisis, such as is the case of Portugal, at the time of writing. According to Sune Carlson, international firm strategies advance according to trial-and-error and by gradually acquiring relevant market information. This rationale was the basis for the very popular Uppsala internationalization process model. Is this currently true also for Portuguese companies, or are they forced to accelerate the process due to rapidly declining domestic markets, occurring in the midst of harsh austerity measures? The study thus involved four case studies and qualitative research. Present in diverse international markets, the case companies chosen carefully plan the whole spectrum of internationalization activities in which they are involved, in order to achieve maximum effectiveness. We conclude that the gradual internationalization process, described in the literature, is being followed by Portuguese companies, despite an additional urgency to export and internationalize, in view of diminishing domestic markets.

DISCUSSION

The internationalization of business is currently one of the most important happenings in World economics (Viana & Hortinha, 2005). In an era of globalization a number of different actors, such as certain internationalization-related professional managers, consultants and researchers, share the view that industrial and strategic analyses should always take into account the global context (Zou & Cavusgil, 1996). The World is ever more connected, with increasingly more exchanges of goods, merchandise, information, and financial and human resources between countries (Rugman & Verbeke, 2004), new opportunities appearing every day, both for companies and for consumers

(Pogrebnyakov & Maitland, 2011). Commercial transactions between countries (Merino & Vargas, 2013) have intensified and firms increasingly look to the market on a global scale (Zou & Cavusgil, 1996). Firms offer products and services at different geographical locations Worldwide in increasing variety (Pogrebnyakov & Maitland, 2011). Internationalization strategies need to be constantly re-defined and updated, especially those related to Research and Development (R&D), production, subcontracting, and commercialization (Zou & Cavusgil, 1996). One of the most important aspects of global strategy is related to marketing, which involves direct interaction with customers and competitors present in specific markets (Zou & Cavusgil, 1996). International marketing can be defined as a “multinational process of planning and executing the conception, price, promotion of ideas, goods and services to create exchanges which satisfy individual and organizational objectives” (Onkvisit & Shaw, 1993, cited in Ilhéu, 2009, p.21), where the focus is that activity, especially commercial activity, occurs in more than one country (Ilhéu, 2009). Indeed, multinational companies tend to operate in a significant number of countries, where they seek to adjust their marketing practices to the local environment (Viana & Hortinha, 2005), be they cultural, administrative, geographic and / or economic aspects that warrant special attention (Ghemawat, 2001). So as to remain at the forefront of different markets, in relation to competitors, it is essential to be flexible and innovative, as products quickly lose market leadership (Rugman & Verbeke, 2004). Only with this capability to develop knowledge (Rugman & Verbeke, 2004), adapting to different markets and providing solutions to customer needs (Viana & Hortinha, 2005), can companies be winners in international commerce (Rugman & Verbeke, 2004). Thus, one may ask the following question: What are the international strategic practices currently being adopted by Portuguese companies, so that they, in the midst of a much publicized internal economic crisis, may triumph in international markets? “For many Portuguese companies, the size of the [Portuguese] market makes internationalizing a necessity” (Luís Portela, of Bial, cited in Ilhéu, 2009, p.13). Furthermore, internationalization strategies are of paramount importance to companies from small countries and which are undergoing an economic crisis, such as is the case of Portugal, at the time of writing. “Significant models in the field of international business describe the internationalization process as a gradual development taking place in distinct stages and over a relatively long period of time” (Melin, 1992, p.102). In the internationalization process model (Johanson & Vahlne, 1977) “a firm gradually increases its international involvement... sequential from the initial export activities to the setting up of foreign production units” (Johanson & Wiedersheim- Paul, 1975, as cited in Melin, 1992, p.103). “Each firm goes through a number of logical steps of international behavior, based on ‘its gradual acquisition, integration and use of knowledge about foreign markets and operations, and on its successively increasing commitment to foreign markets’” (Johanson & Vahlne, 1977, as cited in Melin,

1992, p.103). According to Sune Carlson, international firm strategies advance according to trial-and-error and by gradually acquiring relevant market information (Forsgren, 2002). This rationale was the basis for the very popular Uppsala internationalization process model (Forsgren, 2002; Chetty & Campbell-Hunt, 2003). Is this currently true also for Portuguese companies, or are they forced to accelerate the process due to rapidly declining domestic markets, occurring in the midst of harsh austerity measures? Portugal requested a financial bailout, in 2011, and subsequently acquired a debt of €78 billion (from the International Monetary Fund, the European Central Bank, and the European Commission) which has greatly affected a number of domestic industries, forcing companies to export and internationalize. Accordingly, the objective of this study was to analyse the internationalization strategies and practices currently being adopted by a number of Portuguese companies.

The study thus involved four case studies and qualitative research, in the form of semi-structured interviews, using an interview script, which was divided into two parts: the first with regards to firm activity; the second part with regards to the internationalization process – main markets, entry modes, barriers, destination market selection factors, obtaining market information, strategic effectiveness factors, contact with entities supporting the internationalization process, among others; questions which were based on previous research and surveys by organizations such as AICEP and Deloitte. The interviews averaged 25 minutes in length, were audio recorded, and were transcribed in full. The Portuguese companies studied operate in: 1) The retail industry (accessories); 2) The production and sale of packaging (metal and plastic) and related products and services, including the filling of packages with certain products (e.g. aerosols); 3) The assembling and test of electronic and telecommunications equipment; and 4) Components for kitchen and closet furniture and doors. Present in diverse international markets, the case companies chosen carefully plan the whole spectrum of internationalization activities in which they are involved, in order to achieve maximum effectiveness. The interviewees are decision-makers at these companies (Expansion Director, Human Resource Director, Director/Shareholder, Co-Director, respectively), involved in the internationalization process. A number of practices were reported as a result of the study which may serve as guidelines for other companies seeking to expand their businesses abroad. Thus, knowledge of the local markets being expanded to, having partnerships with other companies in the industry, possessing contacts with professionals and organizations in the business area or market, being resilient and adaptable and being able “to recover quickly from difficulties” (Oxford Dictionaries online), having an innovation capability to produce new products, having managers with experience in internationalization, and focusing on success – in order to become a leader – are some guidelines for other companies similarly seeking to expand to markets abroad. Only with considerable team flexibility, dedication and determination, can companies expand successfully into international

markets. The companies justify the effectiveness which they achieve in their internationalization efforts as only being possible “with teams capable of studying the local market, and which try to adapt to the market and be open to change” (Director of Expansion at one of the companies). The Director of Human Resources interviewee stated also that: “only with sure, consolidated steps, can one be successful [in the internationalization process]”. Thus, we conclude that the gradual internationalization process, described in the literature, is being followed by Portuguese companies, despite an additional urgency to export and internationalize, in view of diminishing domestic markets.

THE SPREADING OF THE SHIELD METHODOLOGY TO IMPROVE THE CORPORATE COMPETITIVENESS

Spanò, Isabella

Italian Ministry of Labour, Territorial Directorate of Parma - University of Modena and Reggio Emilia, Italy

The abstract is written in a personal capacity and does not bind the Administration to which the author belongs.

ABSTRACT

PURPOSE

The recent and still on-going world wide economic crisis has caused adverse changes in exposure to psychosocial risks, to such a point that the management efforts are focused on these risks and the means to ensure the health of workers and reduction of expenses - internal diseconomies - for example those relating to sick leave (Houdmont et al., 2012).

Since the nineties (Bertera, 1990), the literature based on empirical research has amply demonstrated that health promotion programs in the workplace, improving health benefits for employees, reduce health care costs for the employer, in such a way to prove the link between healthy workplaces and business productivity (Lowe, 2003).

However, a specific application of a cost-benefit analysis to compare business costs of safety prevention and non-prevention, resulting from non-commercial risks, including psychosocial ones, did not even exist until the advent of the SHIELD methodology (Social Health Indicators for Economic Labour Decisions).

The economic approach of SHIELD is aimed at helping management to adequately develop a risk prevention policy. This was designed and then tested by Golzio (Golzio, 2011; 2014). At the heart of this method lies the reclassification of security expenses across prevention and non-prevention costs. Amongst the latter there are also sanctioning costs, which represent the state's efforts – with the help of public employees to ensure the effectiveness of sanctions, labour inspectors in particular – to avoid through prevention, or substituting by the internalising, the transfer costs (external diseconomies) from the company to society at large, which entail in extra profits for the company itself and causes social inequality.

The purpose of this research is to assess the degree of understanding, acceptance and the possible spread of the SHIELD methodology up to a broad level of managers in medium-sized companies, and to also consider and evaluate the possible role, which is played by labour inspectors/health and safety

inspectors, to facilitate implementation of this economic approach as "consultants" to employers/managers.

DESIGN/METHODOLOGY/APPROACH

After this fairly detailed presentation of the SHIELD methodology, the first part of the research document focuses on the use of the Delphi technique, as carried out in the past in order to measure the development of a more unified framework for the Health and Executive Safety (HSE) program on *'Health, Work and Wellbeing'*, in terms of promoting management standards (Cox et al., 2009).

The second part of the document provides a detailed example for applying the Delphi technique to promote the SHIELD methodology, by submitting a questionnaire to be completed by employers and/or managers.

The third part of this paper discusses the "consultation" role of State inspectors, which must be properly enhanced in this period of global recession (Vega, 2009). From this point of view a specific training or "education of the stakeholders" – namely the inspectors – (Cox, 2011; 2013) is proposed in order to ensure implementation of the SHIELD methodology.

The findings feature a comprehensive evaluation of these combined approaches, to effectively implement the SHIELD methodology.

FINDINGS

The research, taking into account the great advantage of using SHIELD methodology, above all highlights and analyses two means of promoting this methodology, as detailed previously.

ORIGINALITY/VALUE

The key original feature of this research is the implementation of the Delphi technique to spread the SHIELD methodology, and to also consider the possible activities of labour inspectors/health and safety inspectors to promote use of this methodology by virtue of specific training.

SOCIAL INNOVATION AND HOW MARKETING 3.0 IS CHANGING CUSTOMER RELATIONSHIP MANAGEMENT

Toma, Mihaela¹; Ionescu, Alexandru²

¹Business Administration Doctoral School, The Bucharest University of Economic Studies, Romania

²Economics Doctoral School, The Romanian Academy, Romania

ABSTRACT

Through this paper the authors seek to provide answers to a series of questions of topical interest and specialized theory regarding the relations between social innovation and new concept of marketing 3.0 in order to learn how marketing 3.0 is affecting and transforming the concept of Customer Relationship Management. In the last years, customer expectations have changed as well as they see the products and services. Companies should change their optics and concentrate on customers from other perspectives than they did until now. The results should be social satisfaction and a good relationship between companies and their customers.

First, the authors will explain the social innovation concept, what it is and how it can be directed to the new concept of marketing 3.0.

Most of the things that are now granted in our lives usually appeared for the first time as an innovation. Geoff Mulgan describes how in specific periods in our history, civil society provided the perfect scene for creating social innovation. The wave of industrialization and urbanization was accompanied by various forms of social enterprise and innovation: building societies, cooperatives, trade unions, etc (Mulgan, 2006).

Social innovation represents all the activities and services that are motivated by the goal to meet a social need and are spread through organizations that have a social activity core. The starting point for innovation is usually an idea or a need that is not being met.

Marketing 3.0 shows that the welfare of consumers and society is the next big challenge for companies. Consumers demand more from themselves and so should the companies do.

The product value is now defined by the consumer. Companies that will adopt the new era in Marketing have bigger missions, visions and values to contribute to the world because they aim to provide solutions that address problems in the society (Kotler, 2010). The new updated version of marketing lifts this concept to the area of aspirations, values and spirits. Furthermore, it perfectly combines emotional size with the human spirit.

Even if the macroeconomic environment changes, the consumer behavior will change too, this leading to changes in the traditional marketing techniques. Over the past 60 years marketing techniques of influencing consumer behavior have evolved from the marketing centered on products (Marketing

1.0) to the marketing focused on consumption (Marketing 2.0). Marketing 3.0 is the stage when companies change their vision from focusing on the profitability to the consumer.

In the industrial era, marketing 1.0 was meant to sell products to all willing consumers wanting to buy them; it was initiated by production technology development. Marketing 2.0 came as a result between information technology and Internet; it represents the fact that the value of a product is established by the consumer and not by the companies, while marketing 3.0 represents a new era where companies are using Business Intelligence (BI) tools to predict and anticipate the need of the consumers.

Since 2000, information technology has penetrated the mainstream market and developed into what is considered to be the new wave technology (Kotler, 2010).

Some characteristics of Marketing 3.0 are as follows (Kotler, 2010):

- Objective: make the world a better place
- Enabling forces: new wave technology
- How companies see the market: whole human with mind, heart and spirit
- Key marketing concept: value
- Company marketing guidelines: corporate mission, vision and values
- Value propositions: functional, emotional, and spiritual
- Interaction with consumers: many-to-many collaboration

Having the above mentioned points, the concept of Customer Relationship Management will change as well. Phan (2010) stated that “Customer Relationship Management (CRM) is a customer-focused business strategy that dynamically integrates sales, marketing and customer care service in order to create and add value for the company and its customers”.

In order to test the three mentioned concepts: social innovation, marketing 3.0 and customer relationship management, the authors propose a research to see if the companies in Romania are prepared to embrace the new era of marketing 3.0 and if they are offering new ideas of social innovation. At later stages, another researches can be done in order to emphasize the differences between different countries in adopting marketing 3.0; for instance: developed countries vs. developing countries.

The authors of the article built a 2.670 contacts database from various industries, different companies, with different functions. A quantitative study will be run through a questionnaire that will be spread through a link via e-mail and LinkedIn network. The database will be first segmented by industry; we can choose industries where we expect that the impact of social innovation is higher and where the adoption of marketing 3.0 has premises to have a higher impact in the first phase (where consumers will be more impacted).

Keywords: *social innovation, marketing 3.0, innovation, customer relationship management, customer expectation*

EX-COMBATANTS AS ENTREPRENEURS: SECURING LIVELIHOODS IN WEAK INSTITUTIONAL SETTINGS

Torjesen, Stina

University of Agder, Norway

ABSTRACT

Ex-combatants face a threefold challenge of returning to society when war ends: social, political and economic. In the economic sphere reintegration back into society entails a move away on the part of the combatant from the livelihood support mechanism associated with the militia networks. Instead, as part of economic reintegration, combatants must obtain long-term gainful employment (formal or informal) or initiate other legitimate income-generating activities, which allows them to support him/herself and any dependants (Torjesen 2013). With few employment opportunities readily available and restrictions in access to land, many ex-combatants become entrepreneurs in the informal economy. When doing so they draw on experiences from the conflict years. Even if difficult and traumatic, war experiences often endow ex-combatants with important assets. They enlarge their networks, travel more widely and acquire new skills. At the same time, informal as well as (malfunctioning) formal institutions evolve in the course of war and these pose considerable constraints on entrepreneurs (Berdal and Zaum 2013).

This paper explores the relevance of theories of entrepreneurship to economic strategies adopted by ex-combatants in Tajikistan and Afghanistan. In particular it explores whether findings from other settings with a challenging institutional environments may hold relevance for post-conflict entrepreneurs. One strand of this literature looks at political entrepreneurs and notes that these agents take advantage of their positional power to maximize economic rewards (Kshetri 2009, Stark 1996). This resonates with the situation in many post-conflicts settings where many war-time leaders and former top commanders dominate the political as well as the economic spheres. Similarly to the way the soviet nomenclature successfully transitioned into wealthy capitalists after communism, wartime leaders often successfully transform from military figures to thriving business owners with considerable political influence or position (Torjesen 2012).

The more interesting question, however, may be how the former lower ranking ex-combatants perform as entrepreneurs when initiating their economic activities in the aftermath of war. While the war years offer them some social capital, they still lack the political influence enjoyed by their former commanders: How do these entrepreneurs compensate for weak political clout when attempting to succeed in a skewed post-war market place? The paper highlights mechanisms found among entrepreneurs in other 'high velocity' environments (Wright et al. 2005) and assesses the extent to

which they explain choices made by ex-combatants. Particularly relevant insights from other setting may include, as Wright et al. (2005) highlight: findings on network linkages (Spicer et al., 2000), the usefulness of environmental scanning (May et al., 2000), the need for risk taking (Makhija and Stewart, 2002) and the relationship between institutional transitions and adaptive capabilities (White and Linden, 2002).

The paper ends with a comment that the literature on entrepreneurship so far seems underutilised by organisations and policy makers that attempt to address the plight of ex-combatants. It notes some immediate insights that might be readily assessed and, possibly, acted on by these organisations.

FINANCING HIGHER EDUCATION FOR PROSPERITY: A COMPARATIVE STUDY OF TURKEY AND EU

Tosun, Ayşe Nil; Bağdadioğlu, Necmiddin; Tosun, Mustafa Umur

Hacettepe University, Faculty of Economics and Administrative Science, Department of Public Finance

ABSTRACT

Nowadays, there is an increasing competition for where to spend scarce public resources in many countries. Designing a higher education system which will lead to a prosperous future involving less poverty and fairer income distribution is costly. Weighting public against private benefits derived from higher education, its costs could theoretically be covered through either full funding of government or self-finance of students or a combination of both. In practice one could find examples of each financial approach but recently in many European countries, national systems and institutions have been initiated some sort of cost sharing scheme involving financial contribution from students or their parents.

For example, in Australia the government has announced in the fall of 2000 that universities would introduced a tuition fees system. For instance, in Germany in January of 2005, after a long debate, the country's Supreme Court decided that individual states could introduce tuition fees. In Sweden, even though public higher education is free, the institutions may charge a small fee. In the United Kingdom, each constituent country sets its own policy and decides its own funding methodology via its individual funding council. Furthermore, there are many other differences between countries in financing higher education system, like credit systems, spending discretion in universities. In this study the theoretical background of the free public education especially free higher education is discussed. Then the findings of the International Comparative Higher Education and Finance Project is compared with statistics belong to Turkish Higher Education System. Comparing the higher education finance approaches pursued in EU and its prospective candidate Turkey, this paper identifies, among others insufficient credit mechanism, lack of autonomy in determining students' fees particularly by public universities and absense of spending discretion in public universities as important shortcomings of the Turkish higher education system.

ABSTRACT

RESEARCH AIMS

The main goals of the study in progress are: (a) learn about the image of four countries - Greece, Israel, Poland and Portugal - as foreign travel targets in the eyes of young Greeks, Israelis, Poles and Portuguese; (b) examine its impact on their willingness to travel and their actual choice of tourist destination; (c) elucidate the effects of contextual factors such as cultural values, prior traveling experience, sources of travelling information and the use of social networks (such as Facebook) on shaping the image and intention to travel to each of the four destinations and (d) examine the attitudes towards risk taking of young Greeks, Israelis, Poles and Portuguese with regard to their travelling abroad. The study seeks to discern similarities and differences in young tourists' perceptions with regard to the four travelling destinations.

THEORETICAL BACKGROUND

The global economic crisis is impelling countries to promote incoming tourism as one of their leading industries. The number of international tourists has exceeded one billion in the year 2012 and is anticipated to reach well over 1.8 billion by the year 2030 (UNWTO 2013). Concurrently, the number of potential destinations increases every year as more and more countries discover the economic

potential of tourism. In order to understand the choice of a specific destination it is important to explicate the destination selection process (Son & Pearce, 2005). Thus, researchers focused on the concept of *destination image* (Baloglu & McCleary, 1999; Govers, Go & Kumar, 2007; Moura, Gnoth & Deans, 2014; Pike, 2002). The findings point out that the potential destination competes mainly on the basis of the image held by the tourists. Consequently, policy makers in a destination have to invest efforts in creating and projecting abroad a favorable image. In order to accomplish this marketing task, each destination needs a good understanding of its image in the eyes of potential tourists along with a grasp concerning the perceptions of rivalry destinations (Javalgi, Thomas & Rao, 1992).

Several studies revolved around the factors shaping tourists' impressions of destinations. Among these factors were prior traveling experience and cultural values. **Travelling experience** tends to produce a more **favorable image** with regard to the destination and more **tolerant attitudes** of the experienced tourists in comparison to novices (Andreu, Bigne & Cooper, 2001; Beerli & Martin, 2004).

Prior studies examined the role of **cultural values** in shaping tourist destination image. For example, a recent study showed that information displaying incongruent cultural values concerning a destination on a website tended to produce a more favorable destination image in comparison to information portraying congruent values (Moura, Gnoth & Deans, 2014). The authors argue that cultural congruity enhances the familiarity of the user with the destination site, thus reducing possible novelty elements.

Reisinger and Crotts (2009) examined the effects of Hofstede's cultural dimensions on perceptions of touristic destinations. They found differences between tourists from Southeast Asian and Western countries on specific cultural dimensions, such as measures of the value of long-term commitments, respect for the past and tradition, persistence, patience, and social stability of a nation. The study also showed that tourists from the United Kingdom were more individualistic and less risk-averse than all other nationalities.

Other studies focused on the **source of information** as a factor shaping a destination image. Extant findings portray rather equivocal and often contradictory findings in this domain. Hence, the current study attempts to expand knowledge concerning the effects of various sources of information about destinations (e.g., travel-related websites, social networks, local and international news, travel agencies) on destination images in the eyes of young tourists. The current research underscores explicating the effects of **social media** as this is presumably the most frequently used source of information by young tourists.

HYPOTHESES

- a. Prior experience: Experienced tourists to the four destinations will exhibit more tolerant attitudes towards a destination in contrast with first time visitors. This hypothesis is based on

the findings of Andreu, Bigne & Cooper (2001) that tourists who had previously visited Spain exhibited a more favorable opinion concerning the “value for money” and “culture” than those who had not previously visited Spain.

- b. Sources of information: the impact of the internet (e.g., travel-related websites, social networks such as Facebook) on destination images in the eyes of young tourists is expected to be stronger than the impact of other source of information (e.g., travel agencies, and other media sources). Although, Beerli & Martin (2004) found that the main source of information which influenced the tourists' cognitive image was the travel agency, whereas internet was not a significant factor, we believe that in 2014 (ten years later) the impact of the social networks on attitudes and decision making of young people is much stronger and more crucial than in the past.
- c. Congruent/ incongruent cultural values: perceived incongruent cultural values concerning a destination (in the eyes of a young tourist) will tend to produce a more favorable destination image in comparison to perceived congruent values. This hypothesis is based on Moura, Gnoth & Deans (2014) findings. The authors argue that cultural congruity enhances the familiarity of the user with the destination site, thus reducing possible novelty elements. For this reason, leisure tourism represents a context in which high congruity seems inappropriate.
- d. Cross-cultural differences and similarities among young tourists. On the one hand we expect to find similarities in the main factors affecting young people from different countries to travel abroad, but on the other hand we expect to find different factors affecting the images of destination countries in the eyes of young from different countries. For example, we expect that the factors affecting young Israelis who served in the army to travel abroad will be different from young people from other countries. Since we do not have a solid hypothesis we leave this as an open research question. The same applies to the attitudes towards and willingness to take risks when travelling abroad especially with regard to the Greek and Portuguese young tourists.

METHODOLOGY

The study is conducted simultaneously in four countries: Greece, Israel, Poland and Portugal. The reasons for choosing these countries are as follows: Poland attempts to increase tourism of young people, especially from Israel as part of the effort to rebuild the relationships between the two countries. Greece and Portugal suffer from economic crisis and in both countries tourism constitutes a significant driving force of the economy. Due to the harsh economic situation, those countries are interested in expanding tourism to new markets including young tourists and Israelis. Israel experiences a protracted national conflict reflected among other negative experiences in a high prevalence of terror, and tourism is one of the main sources of foreign income. In addition the four

countries are represented in EMRBI seeking to extend areas of comparative research. The study focuses on young people - ages 20 to 30. The research takes place in several academic institutions and attempts to recruit matched samples of about 200 students of various academic study areas (women and men) in each country, statistically sampling students through the lists of mandatory classes.

A functionally equivalent self-report structured questionnaire will be administered in each of the countries in their respective languages: Greek, Hebrew, Polish and Portuguese.

At the first step, the data will be statistically analyzed separately in each of the four countries. This phase will yield mainly descriptive statistics. Subsequently, the four data sets will be pooled and advanced statistical analyses will be conducted with the aim to unveil causal relations between variables horizontally across the combined population of students.

Initial results of the comparative study will be presented at the EuroMed 2014 conference.

DETERMINANTS OF FIRM COMPETITIVENESS: THE CASE OF MANUFACTURING FIRMS IN GREECE

Tsoukatos, Evangelos; Voulgaris, Fotini

Technological Educational Institute of Crete, School of Management and Economics, Department of Accounting and Finance

ABSTRACT

Purpose: On evidence from Greek manufacturing small, medium and micro enterprises, this study aims at analyzing and modelling determinants of firm-level competitiveness. The study assimilates firm, industry and institutional level, innovation, R&D and technology, elements to investigate their integrated and individual effects on firm competitiveness, while also investigating between factors interconnections.

Design/methodology/approach: The study investigates the integrated and individual effects of innovation, R&D and technology at firm, industry and institutional levels on firm competitiveness. At the same time, it investigates interconnections between the former. 400 manufacturing small, medium and micro enterprises from all industry sectors were surveyed. Drawing from previous literature the research instrument was designed to provide evidence on innovation, R&D, inter-firm cooperation as well as institutional and technology related organizational practices and perceptions. Aspects of firm performance and export activity were also considered. Firm competitiveness was measured in terms of profitability, market share as well as cost efficiency. Exploratory factor analysis and reliability analysis were employed for factor extraction and the theoretical model was tested through Structural Equations Modelling analysis.

Findings: The findings suggest that all three sets of explanatory factors had a positive impact on firm performance and competitiveness, both individually and on the aggregate. At the same time the estimated model sheds light on the interconnections between factors. Firm – level innovation proved to have the strongest effect, among factors, on firm competitiveness.

Originality/Value: The Greek industry is seriously hit by the economic crisis, which is even more the case with the country's manufacturing sector. The originality/value of this study rests upon two pillars. First, this is the first study investigating the effects of firm, inter-firm and institutional level management aspects on firm performance and competitiveness, thus providing policy makers and management with valuable insight on that matter. Second, the study is implemented under severe crisis conditions; thus, providing unique opportunities for creating both practical and theoretical knowledge that will prove useful in the post-crisis era.

Implications: The findings have implications for practitioners, managers and policy makers. Managers get valuable insight on the positive effects of innovation, R&D and technology on firm performance when it comes for them to devise strategies towards enhancing their firms' competitiveness. Policy makers should support institutional and inter-firm cooperation and provide support for the application of innovation and new technology. Manufacturing products should not compete on price only but mainly on quality and product differentiation so that manufacturing firms' competitiveness is maintained, imports are substituted, the trade deficit is decreased and subsequently the growth of the manufacturing sector is restarted. Innovation and R&D can successfully contribute towards the formation of competitive advantage in dynamic markets worldwide.

PUBLIC - PRIVATE PARTNERSHIPS WITH EMPHASIS ON FAILED CASES

Tzigkou, Dimitra

Technological Education Department of Ionian Islands, Greece.

ABSTRACT

According to the Special Secretariat for Public Private Partnership (PPP), PPPs establish a vital modification to the construction of public organization and the establishment of qualitative services to citizens. They usually are long-term contracts, concluded between the public sector and the private one, either for immobile constructions or for delivery of services. PPP is a modern world-wide tool and exemplifies the school of thought in New Public Management (NPM). NPM movement began in the United Kingdom under Prime Minister Margaret Thatcher, so as municipal government to come up against with economic recession and tax revolts.

The success of a PPP contract depends on many factors, such as the completeness of the contract outline and, the accuracy and clarity of the contract terms, and their success is not always guaranteed. There are several examples of failed PPPs, some of which are discussed and analyzed below, in order to discover the reasons of failure and how these can be avoided. A comparison of a successful and an unsuccessful is also given so as to emphasize the importance of proper design of a PPP program. The main questions examined here are: Which are the main reasons behind a failure? How a failure can be confronted by the public sector? Was it the public or the private sector that had the greater responsibility for the failure?

LONDON UNDERGROUND PPP, UNITED KINGDOM

In 1998, the UK Government suggested the renovation of the London Underground using a PPP. In 2002, London Underground Limited (LUL) signed 30-year contracts with the Metronet and Tube Lines consortiums for the maintenance and regeneration of the lines. LUL operated the transport system, whereas the engineering consortiums were responsible for the infrastructure renovation. There were several problems in the conduct of this PPP from its beginning. On one hand, the agreement involved high profits for the consortiums with small amount of risk from their side and contracts with complicated terms. On the other hand, practical problems such as high costs and safety consequences also existed. As a result, in 2007, Metronet visited the administration and the publicly owned Transport for London took over its contracts while two years later, the works of Tube Lines had a funding shortfall and demanded further public money. In May 2010, Transport for London bought out Tube Lines and the PPP efficiently ended and characterized as a non-reciprocal partnership.

ARENA ZAGREB, CROATIA

Arena Zagreb is the largest sports hall in Croatia and it was opened in 2009. The project was established between the City of Zagreb, the Republic of Croatia and the Ingra-TriGranit consortium as a non-reciprocal PPP. The contract between the partners involved the payment of the maintenance costs to Ingra for the next 28 years. In July 2009, the company was already 600.000€ in debt. In order to cover the costs of loans, Arena Zagreb presented events for 71 days. It was expected that the Arena would be employed for 154 days until the end of the first year, but finally it was impossible to produce profit. By the end of the second year, the maintenance costs were 4 times higher than predicted in the contract. Ingra invested for Arena Zagreb and Zagreb Holding, which was the City of Zagreb's municipal company, paid the funds. Ingra decided to close down Arena Zagreb and required at least €4 million in order to open it again. At the end of January 2011, the City of Zagreb and Zagreb Holding covered the debt to Ingra and the Chief of Zagreb's Department for Finance Slavko Kojic claimed that the Arena was too expensive and it could have been constructed for one third of the total cost.

COMPARISON OF PUBLIC PRIVATE PARTNERSHIPS OF ROAD CONCESSIONS IN CHILE AND MEXICO

In this section, a successful PPP taken place in Chile from 1993 till 2001 is discussed and compared with an unsuccessful one taken place in Mexico during the years 1987 and 1995. In the first case, Chile was awarded with 21 road concessions that worth \$5 billion on a competitive basis. The bidding started with smaller projects, in order to research the market and decrease the risk for the private sector. The bidding achieved to attract 27 consortiums and more than 40 Chilean and foreign companies from 10 different countries. The specific program was characterized as transparent and competitive, with just one minimum revenue guarantee. This PPP turned to a success because the procurement process was transparent and the Government made adjustments as the program was developed. In addition, the project was focused on creating public awareness (tolling culture) and managed to attract international firms that brought finance and credibility.

In the case of Mexico, 52 projects were awarded 25 of which were competitively tendered. By the end of 1995, the 34 projects had reached a financial closure of \$9.9 billion in private investment. The shortest concession period (maximum 15 years) would win, but this action would lead to very high tolls. As a result, the road concessions were bound to have a parallel toll free road. The overrun average of construction cost was 25% and average actual revenues were about 30% below forecast. Only 5 of the total projects met or exceeded targets and, as a result, the average of the toll road fee was increased. The government took over 23 projects and paid outstanding debt to Mexican Banks and to

construction companies. The reasons for the failure in this case can be tracked in the combination of small contract duration and low traffic resulted in high tolls, the existence of free roads contributed to financial distress of concessionaires and, the program resulted in massive Government bail-out.

CONCLUSION

In this submission, one case of successful PPP and 3 cases of failed ones are analyzed, in order to find out the reasons for this failure. The main result of this research is that the reasons for a PPP failure may vary. They may be attributed to inadequate or non-existent feasibility studies, including unrealistic traffic forecasts and undefined public contribution of funds. Or, they can be a consequence of reasons such as: a poor legal framework and enforcement, a weak institutional capacity and PPP strategy, lack of thorough financial and economic analysis, an inappropriate sharing of risks or, lack of competitive procurement and the public resistance.

So, PPPs should not be presented as the only solution for public sector facing budget limitations. Instead, every time the organizational and economic choices of PPPs should be examined carefully and, the real added value over other choices should be given. An influence, according to the regulations and managerial implications of NPM, could positively affect and even improve failed cases of PPPs. This can be a subject of future study on other kinds of PPPs.

TEACHING FOR CREATIVITY IN CYPRIOT UNIVERSITIES: MAJOR CHALLENGES FOR ACADEMICS

Varnava-Marouchou, Despina

Management and Marketing Department, European University, Cyprus

ABSTRACT

There is, as yet, a shortage of conclusive research evidence suggesting ways of developing creativity amongst students in Cypriot universities. The **purpose** of this study is to explore the creative and effective teaching approaches adopted by university instructors.

The paper provides evidence – based suggestions and at the same time forms an opportunity for academics to convert ‘small c’ creativity, (McWilliam and Dawson, 2008) into specific pedagogical practices which are so often missing from local Universities. ‘Small c’ or everyday creativity, activates the capacity of students to innovate, and to respond to problems in fresh and novel ways, rather than allowing students to respond mindlessly and automatically (Sternberg 2010, p 3) .

The paper reports on the findings of a research project which aimed to explore ways of fostering creativity in the universities and by doing so help to fill the missing gap in Higher Education (HE) research in Cyprus.

The **aim** of the paper is twofold: **First** it reports on the findings regarding the awareness of academics by exploring their attitudes and perceptions on the importance of creativity including techniques and teaching approaches as applied in the university context **Second**, it explores a range of good practices and approaches, adopted by university teachers, that go beyond the traditional instructional methods and provoke curiosity, initiative, and questioning amongst our students and which promote student centeredness. The emphasis is to move from the content (of what lecturers teach) to the outcome (what a student will be able to do).

The study employed a mixed **method of inquiry** that involved both a **qualitative as well as quantitative approach**. Data was gathered from a wide spectrum of participants who , in one way or another taught a variety of subjects in different universities across the six main universities of the island and took the form of focus group , in-depth interviews, including an extensive questionnaire which was answered by more than 100 academics

The preliminary **findings** clearly indicated that academics have an encompassing view of creativity. Nearly all academics believed that creativity can be applied to every part of knowledge and that creativity can be implemented to every discipline. Although the majority of the academics studied, were active in promoting creativity in their teaching, they reported obstacles that limited their capability to foster creativity in an effective and meaningful way. Based on these results, we argue

that there is a discrepancy between what teachers perceive creativity and the how they apply creativity during their teaching. This suggests that there is room for improvement in the way creativity is fostered in universities and this could take the form of policy changes and the introduction of training and development programs specifically on creativity teaching approaches.

MANUFACTURING FIRM PERFORMANCE: EVIDENCE FROM EUROPEAN, SCANDINAVIAN AND BALKAN COUNTRIES

Voulgaris, Fotini; Lemonakis, Christos; Garefalakis, Alex

Department of Accounting and Finance, School of Management and Economics, TEI of Crete, Greece

ABSTRACT

Purpose: The study aims at analyzing the performance of manufacturing firms in European and Scandinavian countries in terms of financial measures and compares them with that of Greece and Balkan countries. The study also aims in examining the effect of firm productivity and other factors on export intensity.

Design/methodology/approach: The study investigates the financial performance of manufacturing firms in North and South European, Scandinavian and Balkan countries and compares them in terms of size, growth, profitability, productivity, leverage, liquidity and capital intensity. A Multivariate Analysis of Variance and a T- test of means are used to check for differences and to compare their performance with the performance of the core European countries. Furthermore, through econometric modeling, the effect of firm level productivity on country export intensity is investigated, controlled for FDI, R&D, labor productivity and cost of financing. The period of the study is 2008-2012, covering the post economic crisis effects. A total of 1159 firms from seventeen (17) countries are included in the sample. Data were taken from the Datastream data base.

Findings: The findings suggest that there exist statistically significant differences in size and performance, among the countries, with North European and Scandinavian firms exhibiting the best performance. Greek firms fall behind and show similarities to the Balkan countries. Also a positive correlation is found between firm productivity and export intensity.

Originality/Value: To the best of our knowledge this is the first comparative study that investigates firm performance and characteristics of manufacturing firms in European, Balkan and Scandinavian countries, based on firm level financial data and the effect of firm level productivity on exports, controlled for other micro and macro variables.

Implications: The findings have implications for academia, practitioners, managers and policy makers of developing countries, such as Greece and the Balkans. The State and firm managers can get valuable insight on manufacturing firm performance detect the factors that need improvement. Findings provide information to global investors by comparing the financial characteristics of firms in different countries. Availability of low cost financing, R&D, innovation, foreign ownership and labor productivity, which are shown to have a strong impact on export intensity, should be supported by

policy makers. The development of technological and R&D cooperation among European manufacturing firms is also suggested.

FAMILY OWNERSHIP AND MODES OF INNOVATION: THE CASE OF SOUTHERN NORWAY

Wallevik, Kristin; Jørgensen, Geir; Ricke, Michael

Agderforskning, Kristiansand, Norway

ABSTRACT

Our focus is on innovation and development in traditional industries in Agder, a region in the southern part of Norway; one of the most heavily burdened labor-cost countries in the world. Despite the cost challenges, the firms in the region have maintained their international competitiveness in heavy and other traditional industries over a prolonged period of time, through good and bad economic climates, and have avoided the exodus experienced by other superficially similar regions. A substantial portion of these firms are family owned. More specifically, the paper will present a case study from the Agder region, including empirical data from 220 of the region's firms, in six separate industrial branches encompassing the extreme shock period of 2006-2012. The study also includes 20 in-depth interviews focusing on the effect of family ownership on the modes of operation and innovation, as well as economic development. Our main research question is whether family ownership affects the modes of operation and innovation and hence, enhances competitiveness in certain industries.

INTRODUCTION

This paper analyzes how firms innovate to remain competitive in traditional industries, with a specific emphasis on modes of innovation in family firms. According to Jensen et al. (2007), firms organize their innovation strategies along two primary axes. The first, the Science, Technology, Innovation method (STI), is an approach where the research project is the starting point for the process of innovation, either within the firm or through cooperation with universities or research institutes. An alternative innovation approach, Doing, Using, Interacting (DUI), lends itself to innovation where product and process learning occurs on the job and through interactions with the customer in order to customize or develop a product. Critical factors to the success of DUI are a highly skilled workforce, flat organizational structure, and decentralized responsibility, in addition to demanding customers and suppliers. Isaksen and Karlsen (2010) maintain that firms' that distinguish themselves concerning innovation combine the STI method of innovation with the DUI type, in a so-called Complex and Combined Innovation (CCI). Our findings propose that family firms tend to innovate in the DUI or CCI modes of innovation, focusing on existing knowledge within the organization in combination with external partners and networks.

THEORETICAL FRAMEWORK

In the analysis on how family firms operate and innovate, we will propose a theoretical construct derived from social capital theory focusing on; social reputation and responsibility, trust, social relations, shared visions and knowledge (Granovetter, 1985; Burt, 1992). Arregle et al. (2007, p. 77) describe family social capital as “one the most enduring and powerful forms of social capital”. In an innovation context, one could then argue that the social capital in family firms can contribute positively in responding to changes in the business environment. Adler and Kwon (2002) state that social capital may affect resource exchange on different levels enhancing the creation of intellectual capital, inter-firm learning, supplier interactions, product innovation, and entrepreneurship. In addition, perspectives developed from analyses on the German Mittelstand will be discussed; focusing on ownership, long term perspectives, local commitment and workforce, to mention some (Simon, 1992; 1996; 2009). Based on the special characteristics of the family firm we also discuss different modes of innovation in line with the framework presented by Jensen (2007) and Isaksen and Karlsen (2010), analyzing the special characteristics of family firms into this innovation framework.

DATA AND METHOD

We employ proprietary financial and governance data composed of multiple variables covering the empirical characteristics of 220 of Agder’s firms in six separate branches from 2006-2012. The chosen branches can be classified as traditional industries like: 1) the process industry, 2) the oil- and gas-extraction equipment and machinery industry, 3) the leisure boat industry, 4) the mechanical industry, 5) the wood processing and wood working industry, and 6) the food processing industry. Also, we have conducted 20 in-depth interviews with owners and/or top managers to obtain a better understanding of how family firm characteristics affect the innovation process in these firms. Here we focus on tacit knowledge, knowledge sharing and development, effects of organizational structure, management and leadership, long term perspectives and traditions, as well as the owners’ commitment to the local community.

Our main research questions are:

- 1) Does family ownership affect the way firms operate and innovate?
- 2) Are there attributes within the family ownership structure that nurture special modes of innovation?
- 3) Are there some industries where family ownership appears to enhance innovation and competitiveness more than others?

FINDINGS AND CONCLUSION

In this paper we focus on how the attributes of family ownership like; long term traditions and perspectives, the local community, organizational structure and other family firm characteristics, affect the modes of operation and innovation. Even though firms innovate differently we find that the family firms in our sample tend to have more incremental innovations in line with the Doing, Using, Interacting (DUI) method, compared to the more research based methods of innovation. Furthermore, we find that family ownership seems to be an asset within some industries. This especially seems to apply to the industries we can define into the “Mittelstand framework”; where focus is on combining increased competitiveness through new development with the maintaining of long term local traditions. One of the clusters within the mechanical industry in our sample is the Lister Alliance and their slogan is: “Deeply rooted – always moving”. This gives a description of how many of these firms work with innovation.

ABSTRACT

For the last three decades, the management literature has been trying to explain the paradox of the dismal performance track record of both cross-border and domestic mergers and acquisitions (M&A) vs. their increasing activity in terms of the number of deals and the volume of involved capital. Recent meta-analytic studies on acquisitions (King, Dalton, Daily, & Covin, 2004; Stahl and Voigt, 2008) have not provided clear answers for why M&A remain popular despite of their high failure rate. A possible answer to this paradox is that the existing research on M&A provides a limited and insufficient understanding of the phenomenon, especially concerning the post-merger integration process (Gomes, Weber, Brown, & Tarba, 2011; Weber, Tarba, & Reichel, 2011). These findings pose a great challenge for researchers in the field of M&A and suggest a need to continue to research in-depth and in-breadth the parameters that influence the overall M&A success (Weber et al., 2011).

To address this, in our research, we use the concepts of strategic agility. While the concept of strategic agility has received increasing attention, it has neither received consistent treatment nor clear articulation of its effects on a firm's performance (Weber and Tarba, 2014). Instead, strategic agility has remained an elusive term with many definitions across various situations. The first contribution of this research is the clarification of the concept of strategic agility based on common theme that emerged in recent years.

Second, we will use the concept of strategic agility to develop theoretical explanations for the current paradox on M&A that was described above. More specifically, we show that acquisition processes and outcomes vary primarily based on whether the acquirer possesses strategic agility in terms of:

- a. Identifying suitable targets, and,
- b. Integrating them with the acquiring firm to create value.

This research provides clear directions for future research and managerial implications for executives to improve M&A performance.

HOW MENTORING CAN IMPACT WOMEN'S USE OF VOICE

Whitehead, Lisa; Falkenberg, Joyce

School of Business and Law, University of Agder, Kristiansand, Norway

ABSTRACT

The aim of this paper is to contribute to the explanation of predictors of voice.

In this paper we report the findings of a study on the impact of mentoring on an individual's identity and her use of voice or silence in different situations.

An individual's identity focuses on the question of *who I am* in relation to others (Goffman, 1959; Mead, 1934; Whetten and Godfrey, 1998) as well as *who I would like to become* (Markus and Nurius, 1986). We argue that individual identity is important at an organizational level in defining a person's work-related self, which in turn is related to the use of voice in an organization.

Mentoring provides a form of social support *from* an individual with advanced experience and knowledge (the mentor) *to* a less experienced and knowledgeable individual (the protégé) for the purpose of advancing the protégé's development and career (Sosik and Lee, 2002).

The paper reports on a qualitative study of a pilot mentoring program spanning across two Norwegian heavy industry clusters. The program was specifically developed for this group starting with 10 protégés and their mentors. The protégés were middle managers, eight women and two men; five of the mentors were women, five were men.

Findings of the research indicate that mentors contributed to protégés' concept of self (identity), for example, in terms of becoming more strategic as managers. In terms of voice, they gained an understanding of the use of upward communication including issue selling (Dutton *et al.*, 2001) and silence (Morrison and Milliken, 2000, 2003) and became aware of tactics and targets of voice such as how to frame information, when, where, with whom to voice their views or concerns (Dutton *et al.*, 2001; Piderit and Ashford, 2003).

By including individual identity, the paper contributes to the explanation of predictors of the use of voice or silence in Morrison's 2011 model, as well as how voice or silence can be used in an organization. The paper also contributes to our further understanding of the tactics and targets of voice in issue selling upwards (Dutton *et al.*, 2001; Piderit and Ashford, 2003).

THE DETERMINANTS OF HRM PRACTICES' TRANSFER PROCESS WITHIN MERGER AND ACQUISITION

Yahiaoui, Dorra¹; Chebbi, Hela²; Weber, Yaakov³

³School Of Business Administration, College Of Management

ABSTRACT

The question of how practices travel from one organization to another has recently attracted growing attention of several social sciences (Guillen, 2001; Meyer et al, 1997), technology (Rogers, 1995) and management (Weber and Tarba, 2010; Weber and Fried, 2011; Weber, Rachman-Moore and Tarba, 2012; Teerikangas, Very and Pisano, 2011; Kostova and Roth, 2002; Djelic, 1998; Gooderham et al., 1999; Flood et al., 2003; Gamble and Huang, 2009; Yahiaoui, 2010) fields. However, research on intra-organizational knowledge transfer and especially the HRM practices transfer are much more abundant than those conducted on inter-organizational context (Weber, Rachman-Moore and Tarba, 2012; Ahuja and Katila, 2001; Bjorkman et al, 2007; Ranft and Lord, 2002; Sarala and Vaara, 2010; Haleblian et al. 2009). Although one of the main objectives of M&A is to seize the synergy potential through knowledge transfer (Weber, 2012), few studies point on the complexities of this transfer and mixed results (Junni et al., 2012; Weber, Tarba and Rozen Bachar, 2011)

The recent increase in number of mergers and acquisitions versus their high failure rate (Weber, 2012) as well as the ambiguity, difficulties and uncertainty (Björkman et al, 2007) caused by the integration of two separate organizations make the study of knowledge transfer necessary and urgent. Recent studies have point on the importance of HRM practice transfer to acquisition performance and the need for more studies (Birkinshaw et al., 2000; Weber and Fried, 2011; Weber et al., 2012). . For example, what are the main characteristics of HRM practice's transfer process? What are the similarities and differences between the HRM practice's transfer and the knowledge transfer process? How these practices are articulated, re-contextualized and re-used by the acquirer and the target? What about the factors that may influence the integration of these practices within a new group?

According to Junni et al (2012), knowledge transfer in general can be affected by four main categories of variables: knowledge characteristics, sources and recipient characteristics, such as similarities and differences, absorptive and disseminative capacity (Gupta and Govindarajan, 2000; Cohen and Levinthal, 1990), and the relationships between them and knowledge integration mechanisms. These may be transferred by such practices as training, autonomy and communication (Weber and Tarba, 2010) or sociocultural mechanisms such as values and shared identity. For example, some of those can be done by joint training program (Breseman et al., 1999) and use of expatriates. Based on these four

categories, Junni et al (2012) described factors affecting knowledge transfer in a specific context of M&A.

Category	Variables and details	Authors
Knowledge characteristics	Different functional knowledge, tacitness, social embeddedness, specificity, causal ambiguity	Lam, 1997 ; Bresman et al, 1999 ; Schoenberg, 2001 ; Ranft and Lord, 2002
Sources and recipient characteristics	Differences of knowledge bases, knowledge asymmetry, retention and complementarity, strategic similarity, Age of company, target autonomy, cultural differences (national and corporate)	Lam, 1997 ; Ranft and Lord, 2000 ; Ahuja and Katila, 2001 ; Capron et al, 2001 ; Castro and Neira, 2005 ; Westphal and Shaw, 2005 ; Tsang, 2008 ; Zou and Ghauri, 2008 ; Vaara and Monin, 2010
The relationship between Source and recipient	Direction of knowledge transfer, fear of exploitation and contamination, acquisition motive, target autonomy, affinity for partner, respect, trust, positive attitude, identification, perceived expertise of source by recipient, social conflict.	Lam, 1997; Capron, 1999; Empson, 2001; Castro and Neira, 2005; Schweizer, 2005; Westphal and Shaw, 2005, Tsang, 2008, Junni and Sarala, 2011; Junni, 2011.
Management (Knowledge integration mechanisms)	Communication, integration speed, norms, procedures, normative integration, interaction (formal/informal), group/individual work, incentives, expatriate deployment, integration (cultural/operational)	Ranft and Lord, 2000 ;Junni and Sarala, 2011 ; Sarala and Vaara, 2010; Westphal and Shaw, 2005)

Table 1 An overview of empirical knowledge transfer studies in M&A (adapted to Junni and al (2012, p 113-117))

It is interesting that certain factors influencing the knowledge transfer in Merger and acquisition are common to those highlighted by previous research made on managerial practices' transfer within Multinationals such as organizational identification, trust, integration, complementarity, relational context (Kostova and Roth, 2002), negotiation and conflict resolution abilities (Leyland, 2005), intensive communication, national culture and strategic similarities (Flood et al., 2003; Bartlett et Ghoshal, 1988). However, the relationships between the source and the recipient of knowledge are more complex in M&A than in other situations such as multinational organizations. For example, knowledge transfer process needs a climate of affinity, mutual respects and trust (Junni and Sarala, 2011; Bresman et al, 1999; Cabrera and Cabrera, 2005) that are often missing in M&As due to culture clash, stress and negative attitudes, lack of cooperation and commitments, and high level of turnover of top executives and key talents after the merger (Weber, and Drori, 2011; Weber, Shenkar and Raveh, 1996; Weber, 1996). The characteristics of the acquirer and the target are also fundamental in the knowledge transfer process, such as the absorptive and the disseminative capacities that can affect the effectiveness of the knowledge transfer process (Junni et al., 2012).

According to these various researches, we can notice that a special attention was paid to the acquirer, the target firm in a knowledge operation, the interests of the knowledge transfer and the factors that would, influence this process. However, most of these researches were made on knowledge transfer and no one on HRM practices within Merger and acquisition. Several factors that would influence the transfer process were highlighted but no research describes the conditions, the legitimacy and the obstacles that encounter the HRM practices traveling between the two entities. We still do not have any idea about the actors involved in the process and the interaction between the actors of both units. Moreover, the empirical evidence is not clear-cut. Thus, the aim of this paper is to deal in depth with the HRM practices' transfer process in Merger and acquisition. We first focus on the literature review on the knowledge transfer process in Mergers and Acquisition then on the HRM practices' transfer process in Multinationals. Thereafter, we compare the two literatures, and highlight the similarities and differences of the factors influencing the transfer process and the role played by the actors in the re-contextualization and re-use of selected practices. We rely on this comparison to formulate research proposals that aim to examine the determinants of HRM practices' transfer process in mergers and acquisitions. These proposals will be used in the future for an empirical study.

EXPLORING CROSS-CULTURAL ADJUSTMENT AND MOTIVATION OF EXPATRIATES IN THE EUROPEAN PARLIAMENT

Zacharaki, Eleni¹; Giannacourou, Maria²

¹European Parliament, Brussels

²School of Social Sciences, Hellenic Open University, Greece

ABSTRACT

Throughout the past decade, there has been a growing body of literature about persons that were not sent abroad by a parent company but who individually chose to expatriate. The Self-Initiated Expatriates (SIEs) constitute a much bigger and therefore more influential group than Assigned Expatriates (AEs), (Carr et al, 2005). However, they still remain “*an almost hidden aspect of the international labour market*” (Jokinen et al, 2008), increasing pressure for HRM to recognize the emerging reality and implement suitable practices to ensure employees’ performance at expected standards. Most studies that focus on expatriate assignments compare differences of AEs and SIEs based on individual backgrounds, task related variables and lifestyle. However, there is evidence suggesting that such broad categorization of expatriates is simplified since, especially within the SIE category, there exists a number of subgroupings with different characteristics (Suutary and Brewster, 2000). Thus, among SIEs literature, research focuses mainly on multinational companies leaving other subcategories, such as those working within international organizations such as the European Institutions, un-researched, (Dabic, et al, 2013).

PURPOSE

The objective of this exploratory study is to present new information, based on empirical research, on this largely unstudied subgroup by examining what influences the decisions of European citizens coming from 28 different Member-States, to expatriate from their country of origin and come to work in the European Parliament as well as their cross-cultural adjustment. A deeper understanding of the motivational factors to expatriate as well as of work and social adjustment may have useful implications for effective cross cultural human resources management.

DESIGN/METHODOLOGY/ APPROACH

This exploratory study is a web based survey among European Parliament employees. The online survey was considered suited since employees are located in three places: Brussels, Strasbourg and Luxembourg. Participants, selected to cover a wide range of nationalities, were informed for the link

by email. The research instrument, a three-part structured questionnaire in English, included thirty-five (35) questions. The first part explored demographic information including how long employees had worked in the European Parliament and their intended length of stay. The second part explored motivation using a Likert type scale and it was based on a selection of factors presented in the literature, particularly on Doherty et al. 2011. The third part, explored cross-cultural adjustment of participants (general, interaction, and work adjustment using Black and Stephens's scale, (1989).

FINDINGS

In this study, the preliminary results are presented based on a limited sample of 43 returned questionnaires (from 13 nationalities) out of the 57 which were initially sent out. The analysis presents some indications concerning self-initiated motivation and adjustment, some of which exhibit similarities with findings from other studies on this group, while others challenge existing research.

Thus, regarding motivational factors, it seems that SIEs in the European Parliament were mostly motivated by their "interest to the specific job offer", "potential for skills development" as well as "professional challenge". This shows that the employees are motivated to work and learn, since they like their job and want to develop their skills, encompassing thus, the cosmopolitan focus of viewing this experience as an opportunity for personal development (Inkson and Myers 2003; Mayrhofer, et al. 2008) that distinguishes SIEs from AEs, but also exhibiting traits of self-directed career management (Doherty et al. 2011). In addition, slight differences were noticed in the prioritization of motivational factors among men and women. Men rated "personal development" as most important motivational factor whereas women rated "the specific job they were offered". This could imply that women were more interested in the job itself, pointing to limited career possibilities at home, whereas for men maybe the job was just an "instrument" in order to achieve "personal development".

These findings are also comparable with research results by Petrokopi and Froese, (2009) supporting the idea that SIEs *"tend to perceive their overseas experience as a means of self-development or part of some personal agenda."* Doherty et al (2011) also found that expatriates are often motivated *"by the desire for adventure and exploration, as they want to increase their self-knowledge and learn about the world."* Dickmann et al. (2008), believes that typical motives of the decision to expatriate are linked to the job that has been offered, the opportunity to have new experiences and the financial impact of working abroad. Additionally, Stahl and al. (2002) found that career development and job issues were the principal reasons for accepting a work abroad, whereas Tung's findings (1998) indicated that expatriates value the opportunity to acquire new skills and experiences as motives for expatriation.

As far as cross-cultural adjustment is concerned, the analysis showed that SIEs in the European Parliament were averagely adjusted and that their interaction adjustment with host country nationals was rated low. The majority associated with expatriates from other nationalities, suggesting that nationality is not a significant factor in shaping expatriates' task-related informal networks (Suvarierol, 2011), as well as social interactions. This is also evident in participants' responses regarding interactions with colleagues, in which the vast majority reported getting along very good with their colleagues, which implies that the diverse cultural backgrounds are not perceived as a barrier to creating a common working culture and emphasizing career orientation and positive attitudes towards the new work role.

Increasing cross-cultural adjustment is important because it has been found to increase job satisfaction and performance, as well as to reduce the turnover of expatriates (Bhaskar-Shrinivas et al.2005). Training and mentoring as well as providing support in non-work related issues will help organisations' international staff be effective in a shorter period of time. More research in that area would be important for recruitment services and human resources departments suggesting different personal drivers that may have an impact on SIEs cross-cultural adjustment.

LIMITATIONS/IMPLICATIONS

The study adds to the literature on self-expatriation supplying tentative evidence on the existence of a distinct category of "officials" working in international organizations that combine characteristics of self and assigned expatriates. These "officials" being highly educated, younger and more cosmopolitan, feeling at ease to interact with expatriates from other nationalities are motivated more by career and personal aspirations than economic benefits. However, the relatively small sample raises concerns with regards to the risk of creating a generalization.

ORIGINALITY/VALUE

This study, being the first to present data about those on self-initiated foreign work experience in the European Parliament, contributes to the on-going research on self-initiated expatriates in international political institutions.
